airline passengers
may vary...

but they all share in the same high
spark plug reliability when they fly in

BG equipped planes

There is considerable variety among the steadily increasing number of people who prefer to travel by air. But whether they are men or women, old or young, on business or pleasure-bent, they are all beneficiaries of the utmost ignition reliability when the aircraft in which they fly are equipped with **BG** Spark Plugs.

FOR AIRCRAFT ENGINES . . . AIRCRAFT SPARK PLUGS

THE BG CORPORATION

NEW YORK 19, N. Y.

SERVING WORLD AVIATION FOR OVER 33 YEARS

HELPING TO BROADEN the skyways of tomorrow!

The planes of tomorrow are on the drawing boards of the aviation industry today. When they are ready to take to the air, the right fuels and lubricants will be waiting for them. This fact is assured by research projects such as those currently under way in the laboratory of the Standard Oil Company at Whiting, Indiana.

Right now, Standard offers the important fuels and lubricants that are in high favor with pilots of all types of planes. For example, for light-plane owners, there's STANDARD 80/87-octane clear aviation gasoline for maximum take-off power and smooth, economical cruise. For heavier aircraft, STANDARD 91/98- and 100/130-octane aviation gasolines assure top performance.

Standard Airport Dealers have these products right now. Count on them to supply your needs every time. And remember, when the planes of tomorrow come off the production line, Standard will be there with the finest products made to keep 'em flying!

There's no power like air power

The "Sunday Punch" that comes out of a compressed air hose carries a hint of things to come in the aviation field. ¶ Here, at Walter Kidde & Company, we've become intrigued with the vast possibilities of pneumatics as a power source in flight. We've found that, considering weight, availability of the medium and other factors, pneumatic power is extremely efficient for actuating airborne equipment. We've designed a lightweight air compressor that delivers large volumes of high pressure air at high altitudes . . . built lightweight aircraft pneumatic regulators and other accessories. ¶ If you're working on airborne pneumatic problems, perhaps we can cooperate with your engineers by exchanging experience and advice.

Problems in AIRCRAFT IGNITION SHIELDING

come easy to

Titeflex engineers

TITEFLEX has devoted years of research to the development of aircraft ignition shielding and related products. For this reason the answer to design problems on aircraft ignition shielding are usually arrived at quickly by the TITEFLEX Engineering Department. When the answer is not immediately available, we undertake the necessary research to arrive at a satisfactory solution.

You can save time—and money—by consulting TITEFLEX on your ignition shielding requirements. No problem is too tough for our engineers and production men to undertake. We would like to prove our unique ability in this specialized field and invite you to write for complete details.

Confidence is born of Experience!

One solo doesn't make a flyer. The skilled pilot is a product of hundreds, even thousands of hours of flying time. And so it is with aviation equipment... planes... fuels and lubricants.

The confidence which the aviation industry places in Phillips 66 Products has been earned over the years, under exacting conditions. Today, Phillips 66 Aviation Gasoline is used by many major airlines. Whether you fly for business or pleasure, this record speaks for itself. The Aviation Department, Phillips Petroleum Company, Bartlesville, Oklahoma.

AVIATION PRODUCTS

IN PERSONAL PLANES
THE TREND IS TO LYCOMING

LYCOMING
PUTS THE PACE IN THE
PIPER PACER...
AND POWERS THE SUPER CUB

The superb combination of **Lycoming** power and Piper design has brought an increasingly widespread acceptance for two new Piper planes.

The new four-place Piper Pacer provides high performance and safe, economical transportation—on cross-country flights the cost per passenger is less than for bus fare. Such outstanding economy requires—in addition to efficient air-frame design and low first cost—the low fuel and oil consumption and the low service maintenance provided by **Lycoming's** O-290-D 125-horsepower engine.

Lycoming powers the Piper Super Cub, too. This famous plane offers greater rate of climb, faster cruising speed, shorter take-off—greater all-round performance with the 115-horsepower **Lycoming** O-235-C. You can be sure of your plane when it's...

News Picture Highlights...

FAIREY 17 TURBOPROP DEMONSTRATES CAPABILITIES

HMS Illustrious is about to feel the impact of the new Fairey 17 anti-sub plane landing on its deck for the first time. The plane is powered by an Armstrong Siddeley Double Mamba turning coaxial propellers. Note the excellent pilot visibility, a major

consideration in carrier-based planes. The right-hand photo shows the Fairey's novel wing-folding scheme, each wing breaking in two places to permit stowage aboard cramped carrier quarters. The plane features a retractable "dustbin" radar installation.

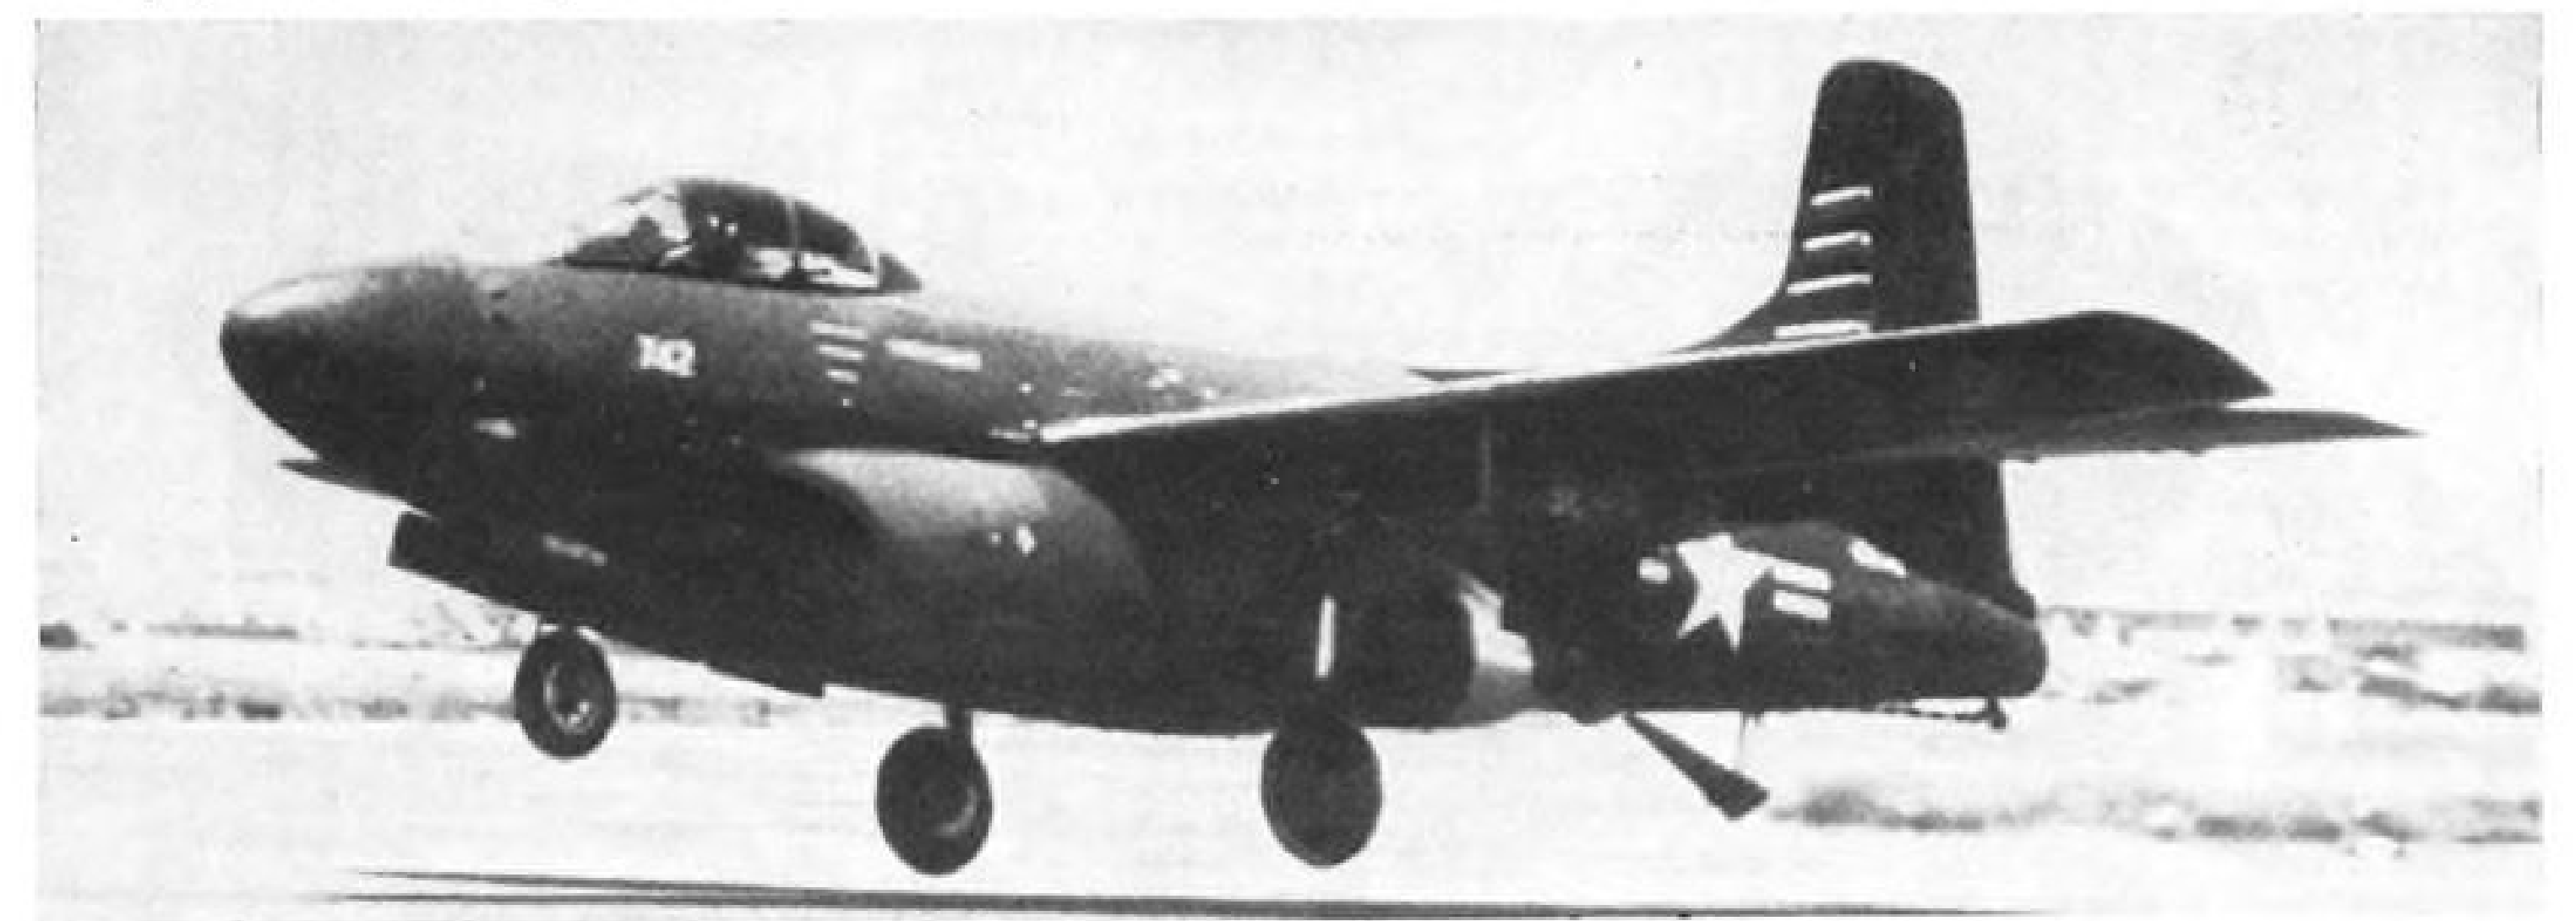

BRITISH TURBOPROP FIGHTER

Unusual view of Westland's single-place strike-fighter built for Britain's Royal Navy points up the craft's high-lift wing flaps in extended position. The Wyvern has an Armstrong Siddeley Python turboprop rated at 3670 shp. on takeoff.

NEW S-52 VERSION TESTED

First flight view of Sikorsky's new S-52-2 copter, a roomier version of the S-52-1. The three-seater is powered by a 245-hp. Franklin and has a top speed of about 118 mph. Cruising range is about 415 mi. USAF has designated the craft YH-18A.

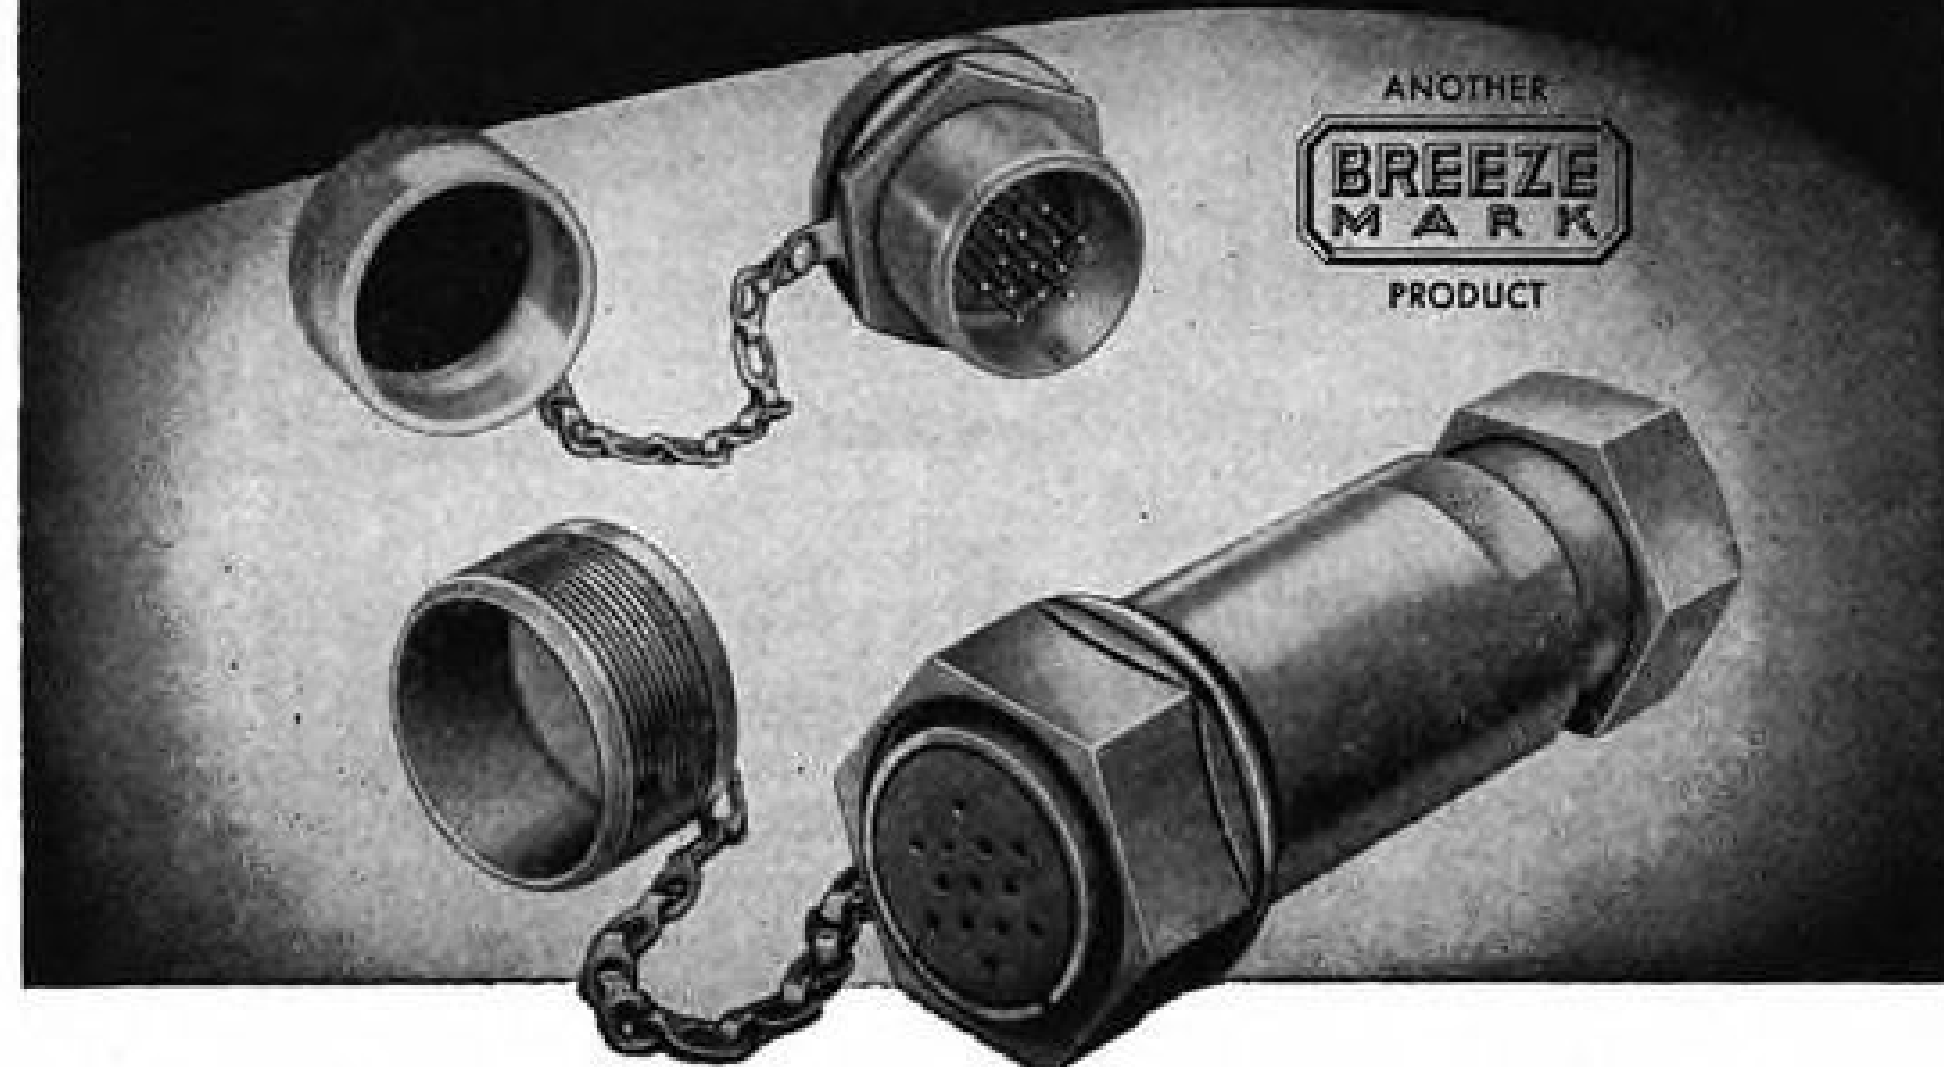

SKYKNIGHT BECOMES AIRBORNE

Powerful Douglas F3D Skyknight night fighter takes off at Los Angeles on a test flight. The big carrier-based two-seater is powered by two Westinghouse J-34s mounted at either side of the

fuselage under the wings. The F3D is in the 600-mph. class and can operate well over 40,000 ft. The plane incorporates a tunnel escape hatch for emergency exit.

Specify **BREEZE** "Monobloc" Waterproof and Pressure Sealed **CONNECTORS**

The only APPROVED Monobloc System for Advanced Radar, Communications, and Electronic Equipment

Breeze "Monoblocs", with single piece plastic inserts, offer outstanding advantages in assembly, wiring, mounting and service in the field.

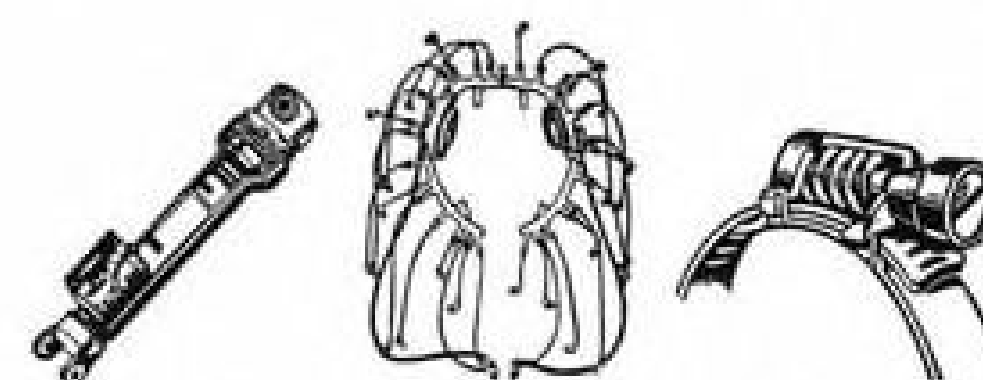

Single piece inserts make a tighter unit, eliminate the air spaces within conventional multiple-piece inserts, greatly reduce the opportunity for moisture shorts.

Removable contact pins make possible bench soldering of leads, quick, error free assembly of Breeze Waterproof Connectors and panel-type "Monobloc Miniatures."

Single-Hole Panel Mounting is all that is required for either Waterproof or Pressure Sealed types.

Pressure Sealed types are available for values up to and including 75 psi, or they can be specially engineered for greater pressures. They meet specified requirements of shock, vibration, salt spray, humidity and temperature cycling from -65° to +185° F.

Breeze "Monobloc" Waterproof and Pressure Sealed Connectors are engineered to your requirements in aluminum, brass or steel—in all sizes and capacities. They are fully tested and approved... cost no more than ordinary types.

Other Breeze Precision Products

ACTUATORS: All types, sizes. Complete control systems engineered to requirements. Above: Landing gear actuator Fairchild Packet.

RADIO SHIELDING: For any type of high or low tension system. New type "unit leads" or re-wirable leads. Flexible shielded conduit.

"AERO-SEAL" Worm-Drive Hose Clamps. Vibration proof, uniform clamping, use again and again. All clamps have stainless steel bands.

NEWS DIGEST

DOMESTIC

Lockheed R60 Constitution transports are back in service with the Navy Fleet Logistics Wing. To prove their mettle for airlift, one of the big transports carried the entire supporting personnel of Carrier Air Group 7 from Norfolk, Va., to Quonset Point, R. I.

Pan American Airways last week was refused authorization by CAB to operate a system of domestic routes. The Board declared that it denied PanAm's recommendation for service between Boston-New York-Philadelphia-Baltimore-Washington-Miami because such service was not required by the public convenience and necessity. PanAm commented: "... There seems to be a double standard on the subject of competition. Competition continues to be increased on the thin overseas routes ... yet ... Pan American is supposed to be too much competition for the domestic market, which is far larger..."

Park Air Lines' feeder certificates have been canceled by CAB. In the same action it denied permission to Mid-Continent Airlines to acquire Parks, and instead awarded the north central portion of the Parks route to Mid-Continent and the Mississippi valley and Great Lakes portion to Ozark Airlines. The Board declared that "Parks has had ample chance to establish service. ... The interest of the public precludes any further pampering of an air carrier that has repeatedly delayed using its authorization."

American Airlines has purchased four Convair-Liners from Airfleets, Inc., Convair subsidiary. Possible reason: To hedge against further military demands on Airlines' four-engine equipment.

First production de Havilland Comet flew for the first time July 27 at Hatfield, England, one year to the day after the prototype Comet made its maiden flight. In the intervening year the first Comet has flown over 320 hr. And the testing program is due for stepup with two planes ready for flight now.

Redesignation of three new fighters and a bomber have been announced by USAF, in line with a new simplification policy. Some of the changes have already been noted in AVIATION WEEK. The sweptback Republic YF-96A jet fighter, reportedly favored for escort fighter contracts, is renamed the F-84F. North American's F-95A, with a radar in the nose and aircoop below it, goes back to its original designation of

F-86D. Lockheed's F-97 night fighter with the big J-48 Pratt & Whitney engine with afterburner, is now renamed the F-94C. And Boeing's four-jet version of its sweptwing B-47, returns to its original nomenclature of B-47C instead of YB-56A.

Bendix Aviation Corp.'s new union contract includes a pension plan comparable to the General Motors-UAW plan with a ceiling of \$117.50 monthly. The agreement with UAW-CIO covers 12,000 workers in five plants and will be in force for three years with annual wage reopenings. Union leaders say the total economic gains amounted to 19 cents per hour.

First RB-36 conversion from B-36A has been completed by Convair's Ft. Worth division. The modifications include replacement of 3000-hp. Wasp Majors with 3500-hp. powerplants, installation of four J-47 turbojet pods and fitting the bomb bay with complex photographic equipment.

First P4M-1 Mercator delivery has been made by Glenn L. Martin Co. to Fleet Squadron VP-21, NATC, Patuxent. The four-engine patrol plane has two nacelles, each housing a P&W R-4360 Wasp Major and an Allison J-33 turbojet in tandem. Nineteen Mercators are on order.

Third International Air Fair of Aero Club of Michigan (Aug. 11-13) has been ordered by CAA to move from Willow Run Airport to Detroit-Wayne County Airport to separate the show from regular traffic at Willow Run.

FINANCIAL

Republic Aviation Corp. reports a six months' net income of \$698,803, after taxes, with sales for the period totaling \$29,566,356. Backlog is \$43,500,000. For the corresponding period last year, net income was \$317,883 on sales of \$17,779,302.

Boeing Airplane Co. had net earnings of \$5,964,162 for the six-month period ending June 30. Sales and other income came to \$140,288,981. Backlog at June 30 came to \$319,515,164.

INTERNATIONAL

KLM Royal Dutch Airlines is first commercial airline to get CAA operational approval to use the Sperry Zero Reader. Connie installation and flight tests were handled at Lockheed Air Terminal and MacArthur Field.

HANSEN

COUPLINGS

GIVE YOU **2 Big Advantages**

1. Quick Connection AND Disconnection

2. Instant Automatic Flow or Shut-Off

● With Hansen couplings you save precious minutes every time you connect or disconnect a fluid line carrying gas, liquid or grease.

To connect, you merely push plug into socket—flow starts instantly. To disconnect, pull back sleeve on socket—coupling disconnects. Flow is shut off instantly and automatically.

From a wide range of available sizes and types, you can select a Hansen coupling exactly suitable for your application—each type engineered to meet its specific requirements.

...ULTRA-MODERN AVIATION FUELING

**Cities Service joins with Eastern Air Lines
to inaugurate another great advance**

The *Flat-Tops* are on duty now—making notable service records. With these remarkable new tank trucks, Cities Service is fueling Eastern Air Lines planes at LaGuardia, Newark, and Boston's Logan Airport. Never before has there been any approach to the safe, speedy, convenient fueling now made possible by Cities Service *Flat-Tops*.

You'll be interested in major *Flat-Top* features listed here. Each one adds evidence that Cities Service is in the forefront of aviation progress. That's why fields offering Cities Service products are winning preference today, among those eager for top-notch quality and service.

New York • Chicago

In the South: Arkansas Fuel Oil Co.

Cities Service Aviation Gasolenes
Cities Service Koolmotor Aero Oils
Cities Service Cisco Solvent Engine Cleaner
Cities Service Trojan Aero Greases
and Aviation Specialty Products

A FEW FLAT-TOP FEATURES

NO REELS . . . All hose lies flat—out of sight—on wide, flat metal grating above tank.

UTMOST SAFETY . . . Remote hydraulic drive from tractor engine, to slave pump, to high-speed fuel pump, keeps prime power far away from fuel outlets.

HINGED LADDER . . . Rises from flat position on grating; elevates and rotates as required; locks in place, with hose lifted on guide rails. No more auxiliary ladders to cause injury or damage.

SINGLE VALVE TO DE-FUEL . . . This is just one of many features for new simplicity and surety . . . for definite savings of time and labor with this extremely efficient tank truck equipment.

WHO'S WHERE

In the Front Office

Tom A. Murphy and Henry Lehne have been named vice presidents of Republic Aviation Corp. Murphy, an AF colonel and wartime AF representative at Republic, left the service in 1945 to become national aviation sales manager for Reynolds Metals Co. He joined Republic in 1948 and has served as subcontracts manager, purchasing director, factory manager and assistant general manager. Lehne has been sales manager for the company for three and a half years and participated in contracts for the F-84 and other postwar planes.

Robert E. Johnson has been appointed to the new position of director of public relations and advertising and assistant to the president of United Air Lines. He takes over the duties held by Gail Borden, who resigned as public relations director. Johnson started his aviation career in 1929 when he joined Boeing.

Richard L. Johnson has been made vice president—finance and Jess W. Sweetser has been named vice-president—sales for Glenn L. Martin Co. Daniel A. Evatt has resigned as a director and vice president—finance. Johnson, once assistant to the vice president—comptroller of Douglas Aircraft, came to Martin from foreign service with ECA. Sweetser was a member of Curtiss-Wright's Washington staff during World War II, and was active in the Aircraft War Production Council during that period.

Charles H. Colvin, recently named executive vice president of G. M. Giannini & Co., has been placed in charge of all the company's manufacturing and engineering activities on both coasts.

Changes

► Among the Manufacturers—Philip D. Terry has been appointed sales engineer for William R. Whittaker Co. . . . Flt. Lt. Bruce Warren has been given two years leave by the Royal Canadian Air Force to aid in the flight test program of Avro Canada's CF-100 twin-jet fighters. . . . William G. Eager, Jr., has been made Navy sales manager for Glenn L. Martin Co.

John B. Taylor, Jr., has been appointed assistant director of research at Ethyl Corp.'s Detroit laboratories. . . . Frank Wallis has joined the sales staff of Zenith Plastics Co.

► Among the Airlines—B. J. Talbot has been named European director for Northwest Airlines, succeeding K. D. McKenzie who has been transferred to New York. Kenneth B. Haugen has been made the carrier's chief of flight standards.

Honors and Elections

Arthur F. Kelly, Western Air Lines' vice president—sales, has been named by the USAF to its national advisory Air Staff Committee for Reserve Policy. . . . Harry W. Strangman, Douglas Aircraft treasurer, has been elected to the Controllers Institute of America.

INDUSTRY OBSERVER

► Competition for Allison in the turbine propeller powerplant field is moving up. Thousands of visitors at the Pratt & Whitney Aircraft 25th anniversary show caught a glimpse of the new PT-2 turboprop (rated at more than 5500 equivalent shaft hp.) in the nose of a B-17 flying test bed grooming for its first flight. Allison's T-40 double turboprop, also rated at 5500 equivalent shaft hp., is the only large American turboprop now flying. But another serious competitor is the Northrop-developed Turbodyne, recently purchased by General Electric (AVIATION WEEK July 31).

► Air conditioning for jet fighters is a growing field into which some of the pressurized cabin equipment people are moving. Fairchild Stratos and Hamilton Standard cabin pressurization department are vying for North American Aviation business. Stratos cools the cockpit of the YF-93A jet fighter. Hamilton Standard is making the air conditioning system for the F-86D (F-95A) jet fighter and will deliver the first unit this summer. Both systems use similar principles, with air as the refrigerant.

► USAF has confirmed the previously reported installation of the big Pratt & Whitney J-48 engine in the two-place Lockheed night fighter. Production version will be designated the F-94C (formerly the F-97A). First experimental F-94 with the J-48 installation was the F-94B.

► A new alternate powerplant installation for Martin's 4-0-4 transport will be recommended for two proposed high-density versions with 48- and 52-passenger cabins. The powerplant is a 2500-hp. version of the Pratt & Whitney R-2800 engine, designated R-2800-CB-17. Earlier 4-0-4s will have the 2400-hp. R-2800-CB-16 powerplants.

► In addition to the Kaman shipboard helicopter contract announced by Navy last week, Sikorsky division of United Aircraft has two contracts out of the same competition for an undisclosed quantity of its HOSS model, a roomier version of the S-52.

► Royal Canadian Mounted Police are looking at a three-place Canadian-built helicopter, with possible orders for police work in view. Designated model SG Mark VI-D, the copter is manufactured by Inter City Airlines and was demonstrated at Dorval Airport to eight RCMP representatives.

► Besides Hamilton Standard's big new eight-blade dual-rotation turbopropeller, the division is developing a new single-rotation propeller for the Air Force. It's described as the largest propeller the division has ever built, presumably with a diameter up beyond the 20-ft. mark.

► A new automatic parachute release system announced by Air Materiel Command equipment laboratory contains a timer and an aneroid element. Both controls are set by the airman before bailout, so that the chute will open automatically if he loses consciousness. It is designed to permit free falls from high altitude bailouts or high-speed plane bailouts, with the automatic opening device taking over at the pre-selected time interval or altitude.

► Australia Commonwealth Aircraft Corp. is now preparing to build the new sweptwing Hawker P.1081 fighter which Trevor Wade recently flew from London to Brussels in 21 min. The Australians decided to go for the later model, in place of the Hawker P.1052 jet fighter which had originally been slated for Commonwealth production.

► Senate Armed Services Committee has unanimously approved the bill authorizing transfer of USAF's electronics laboratory from Eatontown, N. J., to Griffiss AFB, Rome, N. Y. Reasons given for move were economy and national security. Sum of \$3.1 million will be allocated to complete the transfer.

Procurement Goal Pushed to \$7.7 Billion

More funds asked for Naval planes, foreign air aid.

By Alexander McSurely

The biggest Naval air arm since World War II was in the making last week to take its place alongside the planned new 69-group Air Force.

In addition, fresh foreign military aid commitments totaling \$4 billion were expected to provide a sizeable U.S.-built fleet of new planes for the free nations of Europe lined up with the U.S. against Soviet aggression.

► **More Navy Planes**—A new boost in Navy funds—\$950 million—and the \$4 billion were submitted as additional requests from President Truman, members of the House Appropriations Committee said last week, to be added to the \$10.5 billion previously asked (AVIATION WEEK July 31). The grand total of foreign and domestic funds now sought on an emergency basis last week stood at \$15.4 billion.

House Appropriations committeemen last week were holding 12-hour continuous sessions trying to get the complicated arithmetic of this huge emergency budget request straightened out. Some astute Washington observers thought the bill might even be rammed through both House and Senate by some time this week.

The new Navy funds bring the total allocated for Navy air power in 1951 up to \$2.3 billion. This is just over the total of \$2.29 billion which had been budgeted for both Air Force and Navy planes in the regular 1951 fiscal year budget bill, now approved by both houses of Congress.

► **Foreign Planes**—How much of the foreign aid funds was earmarked for air power had not yet been fixed last week, but it was assumed that at least \$1.2 billion of the total foreign aid for 1951 would go for planes. Some Washington sources reported a plan to send at least 1000 U.S. jet fighters to Europe in addition to whatever "moth-ball" planes of World War II were reactivated for our allies.

Members of the House Appropriations Committee said the extra Navy funds were needed to start building the Navy's plane strength to a level comparable to that sought for the Air Force.

The Rising Air Power Budget

Still more emergency funds requested by President Truman last week boosted totals for 1951 airpower budget high above the July 24 figures (AVIATION WEEK July 31). Latest additions were \$900 million more for Navy aircraft procurement, and an undetermined figure for aircraft procurement for foreign aid, estimated at around \$1 billion.

With these additions here is what the 1951 air power budget, including foreign aid, looked like last week (all sums are in billions of dollars):

Total domestic appropriation request	\$11.4
Total foreign aid appropriation request.....	4.0
Total emergency request	15.4

For Procurement

Total previously allotted for new planes (domestic), emergency request	\$3.3
New additional Navy funds requested.....	0.9
New emergency total.....	4.2
Allocation previously agreed upon by Congress for 1951 Air Force and Navy planes.....	2.29
Total now budgeted for 1951 (domestic) Military plane procurement	6.49
Amount previously allocated by Congress for planes for foreign aid	0.284
Estimated share of \$4 billion new request for foreign aid to go for military planes.....	1.0
Total estimated for air power in 1951 budget.....	\$ 7.7

► **Ten Big Carriers**—Even before the additional plane funds were added to the Navy's budget, Chairman Carl Vinson of the House Armed Services Committee reported that three big aircraft carriers would be activated, bringing the total to ten, and six small carriers bringing the total number of light carriers to 14. Among the carriers are a new one now, nearing completion, and the carrier Essex, now under modernization.

The new proposed 69-group U. S. Air Force status last week was viewed in Washington as the equivalent of an actual 70-group Air Force.

The original 70-group Air Force called for:

- 4 Heavy bomber groups
- 21 Medium and light bomber groups
- 22 Day fighter groups
- 3 All-weather fighter groups
- 6 Strategic reconnaissance groups

- 4 Tactical reconnaissance groups
- 10 Troop carrier groups

In addition to these 70 groups of planes, there were to be 22 separate squadrons in support, plus the 27 National Guard groups.

► **Pattern Changed**—Pentagon sources last week indicated, however, that the new 69-group Air Force pattern would be changed considerably from the original 70-group concept. Obvious first step is to expand tactical aviation as previously forecast (AVIATION WEEK July 17). But further beefing up of the country's already formidable heavy bomber strength is also in prospect, with orders for more B-36s seen in the cards.

First tangible indications of the way the new emergency funds are to be spent were given last week when the Air Force sent out letters of intent to more than 200 manufacturers. It was

understood that these letters were on a "when-and-if" basis, as far as money not already allocated by Congress was concerned. But the \$1.5 billion already agreed upon by Congress for the regular 1951 Air Force budget was understood to be committed. Tentative allocations were made for planning purposes on the additional \$2.7-billion emergency plane fund for the Air Force requested by President Truman.

Some Navy letters of intent also went out to manufacturers last week.

► **Top Contractors**—Air Force listed the names of 14 major prime contractors who received what was presumably the bulk of the new plane and engine orders. These included:

Bell Airplane Corp.; Boeing Airplane Co.; Consolidated Vultee Aircraft Corp.; Douglas Aircraft Co.; Fairchild Engine & Airplane Corp.; Lockheed Aircraft Corp.; North American Aviation, Inc.; Northrop Aircraft Inc.; Piasecki Helicopter Corp.; Republic Aviation Corp.; United Aircraft Corp.; Allison division, General Motors Corp.; General Electric Corp.; and Wright Aeronautical Corp.

Conspicuous by absence on this major list were Glenn L. Martin Co. and the Curtiss-Wright Airplane Division.

On the basis of this list it was indicated that the following planes could be expected to make up the bulk of the first orders:

Boeing B-47, B-50 and C-97; Consolidated Vultee B-36; Douglas C-124; Fairchild C-119; Lockheed F-80 and F-94; North American F-86 including the F-86D version; Northrop F-89; Piasecki H-21; Republic F-84.

► **Trainer Business**—There appeared a strong probability that North American's T-28 trainer, and perhaps its B-45 light jet bomber, also might come in for some of the contracts.

Definite announcement of Navy commitments was still limited to the McDonnell Aircraft Corp. report of Banshee contracts last week, but it was assumed that additional contracts would be let or already had been placed for such planes as the Grumman F9F jet fighter, the Lockheed P2V patrol bomber, Douglas AD and F3D planes and probably for the Chance Vought XF7U and Martin patrol planes.

► **4300 Estimate**—The Air Force did not disclose how many planes would be built under the new contracts, but estimates put the total figure around 4300 planes. The old 70-group Air Force program called for a yearly production of 5200 planes to keep an air force of 12,400 modern planes with 8100 reserve planes.

Before the stepup, the 48-group Air Force was on a basis of only 3000 modern planes with 1500 modern planes in reserve, and an annual procurement basis of around 1500 planes.

Britain Ups Aircraft Production

Expanded jet fighter output will account for most of the \$280 million additional defense expenditures.

(McGraw-Hill World News)

London—Expanded production of jet fighter aircraft—de Havilland Vampire 5s and Gloster Meteor 8s (and some 9s and 10s, which are photo-reconnaissance types)—will absorb the largest share of the \$280 million additional outlay for defense equipment now being undertaken by the British government to meet the growing threat of war.

These two basic jet fighter types are already in production for the RAF, and the new defense spending will merely mean increasing the orders already placed.

One estimate here gives the probable additional numbers of planes as 1000. With the necessary spare engines, this would cost an estimated \$84 million.

► **The Lion's Share**—This was clearly suggested by Defense Minister Emmanuel Shinwell in a speech in the House of Commons. He stated that one of the biggest items in the extra defense outlay would be the provision of additional fighter aircraft to increase the RAF's plane-reserve strength.

Prime Minister Attlee, supplementing Mr. Shinwell's information, indicated that the RAF would get "rather more than half" of the \$280 million. Of the rest, the Army would get a rather larger share than the Navy, he said.

This additional outlay for production and research compares with a provision of about \$916 million for these items in

the estimates for this current year.

The RAF's share will also cover, Shinwell said, a speeded-up program of overhauling and putting into combat-readiness the substantial number of stored surplus aircraft used in the last war, the expedited reconstruction of the nation's radar warning chain, and extensions and repairs to certain airfields in the United Kingdom. Some stockpiling of spares and equipment will also be provided for.

► **Near Capacity**—The aircraft companies to be affected by the additional fighter production are de Havilland Aircraft and de Havilland Engine companies, and Gloster Aircraft Co. and Rolls-Royce Ltd., makers of the Derwent turbojet engines for the Meteor.

Both de Havilland Engine and Rolls-Royce are already working at near-capacity, and they may both find some difficulty in further increasing their rate of output. The de Havilland Aircraft Company has of late been shifting all of its Vampire production to a new factory acquired about a year ago at Chester, to make more room at the parent factory at Hatfield for production of the Comet jet airliner.

Only about a quarter of the Chester factory's floor space is now occupied. So if an adequate labor force can be found in that area, there should be ample capacity for more rapid production of the Vampire. (English Electric, builder of large numbers of Vam-

CADETS TO EVALUATE NEW T-31

Two improved Fairchild T-31 trainers, like the one above, are participating in a unique evaluation of three new basic trainer types being conducted by USAF students at Randolph AFB, Tex. Groups of pilots will fly each of the three types and then be transferred to single- and two-engine trainers. Their ratings will then be referred back to their basic trainers. Changes in the 320-hp. Lycoming-powered T-31 include installation of VHF and ADF radio, wing landing lights which will indicate gear in

locked position to tower personnel to prevent wheels-up landings, larger capacity brake system, new instrument lighting, steerable tailwheel of the F-51 type, improved cockpit ventilation and installation of a new blind-flying instrument hood. The plane has a gross weight of 3900 lb. and a top speed of about 170 mph. The basic design built for the Navy and designated XNQ-1, first flew in 1947 and has over 1000 hr. flight time. Note huge single-piece sliding canopy.

pires in the later years of the war and in the early post-war years, has now shifted entirely to production of the Canberra twin-jet light bomber.)

Gloster Aircraft, a member of the Hawker-Siddeley group, is already fully occupied with Meteor production. But a further enlargement of its existing practice of subcontracting manufacture of Meteor components to other firms in the group should make possible the handling of new orders.

At present rates of production, the additional 1000 planes (as estimated) would probably represent about 18 months' production—and unless the production rate can be speeded up (which is not too likely in view of the engine bottleneck), the effect of the new orders would be to prolong the existing backlog of production by that amount.

► **Shadow Factories**—Naturally, attention turns to the possibility of using the "shadow factories" erected for munitions production during the recent war. The Government took pains to assure the Opposition that this capacity was still available and that planning for the use of it was well advanced.

In the House of Lords, Viscount Addison, Government Leader, stated: "The shadow factories have not been dispensed with. They have turned to the manufacture of other things, but . . . the capacity of turnover and the readiness of turnover has never been so great as it is today. The Joint War Production Staff has scheduled this capacity to a very large extent, and in some cases we have given orders to certain firms to keep their war production alive although we were not sure whether we required their products at that time."

Viscount Addison referred mainly, he said, to the manufacture of certain types of aeroplanes. (Firms he probably had in mind were Handley Page, Reading, Ltd., who are producing 14 Marathon transports for British European Airways despite BEA's reluctance to adopt the type; A. V. Roe & Co. Ltd., Britain's premier bomber builders in the last war, but who haven't succeeded in finding any commercial market for their postwar aircraft; and others, including those working on research projects for future aircraft, like Armstrong-Whitworth, Boulton-Paul, and Fairey Aviation, who have also been partly occupied with other aircraft production.)

But the conclusion that can be drawn from activity so far, is that the expanded production of fighter aircraft will not draw on these shadow factories.

► **Army Needs**—The army, too, will need additional equipment, as outlined by Mr. Shinwell. Although it has adequate stocks of small arms, mortars, field guns and artillery, plus ammunition for these, the army will need more anti-aircraft guns, fire-control predictors,

anti-tank weapons, and a considerable number of specialized vehicles.

The reconditioning of stored tanks will be given a high priority, Mr. Shinwell disclosed. The British motor-manufacturing industry, which has at present some surplus capacity due to the shortage of sheet steel, could well take on the additional work of military vehicle production. But any such activity would be at the expense of commercial production—and would mean a contraction of exports.

The Navy will speed up the modernization of its existing ships, especially its anti-submarine vessels, make good its deficiencies in naval aviation, armament, and minesweeping equipment and stores, and to a certain extent accelerate the program of new ship construction.

Guided missile research, which Mr. Shinwell admitted still has a good way to go before such weapons can be put into use, will be further stimulated. So will research into counter-measures against mining and submarine attack; radar warning and fighter-control equipment; and anti-tank and anti-aircraft devices. Production of such equipment will not begin until "in the course of the next few years."

► **Defense Burden**—The British were spending \$2184 million on defense this year, even before the extra commitment was undertaken. This represented 23.6 percent of the total Government expenditure for the year, and was equivalent to about 7.6 percent of the total

national income, or \$42 per head.

Mr. Shinwell cited, for comparison, Russia's probable defense expenditures as being not less than 13 percent of her national income, with which she maintains an army of some 175 active divisions (one-third of which are mechanized), and tank divisions possessing about 25,000 tanks (of which an appreciable number are in immediate readiness in the Soviet Zone of Germany). This means about 2,800,000 men under arms—a figure which could be doubled upon mobilization. This land force is backed up, he said, by about 19,000 military aircraft, including jet fighters and bombers of the latest design, and by considerable naval forces including strong submarine fleets, many of modern design.

The British defense expenditure, according to Mr. Shinwell, "bears comparison to that of any of our allies and friends," but it is not more of a burden than the \$1050 million the British were spending in 1938. And it represents even less of a defense, since armament items cost twice or three times as much now as in 1938. A jet fighter costs 150 percent more than a 1938 Hurricane; a modern destroyer costs double what one cost in 1938.

► **How to pay**—The British are firmly determined to pay for this out of increased taxation, and there is shaping up another nice bit of Anglo-American misunderstanding over the opposing views of the suggestion, made by Mr. Acheson in Washington recently that

the U.S. allow countries receiving Marshall Aid to use some of their "counterpart funds"—that is, the local currency set aside to match the amount of dollar aid received from the U.S.—to finance defense expenditure.

As far as Britain is concerned, there is seen no reason here for linking the amount of her defense expenditure to the amount of counterpart funds.

One thing is clear: The U. S. isn't planning to underwrite the cost with dollars. Whatever else may come out of the current meetings in London of the deputies of the North Atlantic

Treaty countries, the most that the U.S. is likely to do is to provide some small additional dollar aid for financing the dollar cost of special machine tools and certain critical raw materials required for military production that can only be obtained in dollar areas.

This additional aid would be in most respects exactly like the normal ECA aid, and would be matched by the country in question setting aside an equivalent amount of "counterpart funds," the European regional office of the Mutual Defense Assistance Program told AVIATION WEEK.

Aircraft Re-Hiring Starts Slowly

Employment due to be doubled, but manufacturers move carefully until new orders are confirmed.

About half a million aircraft workers are going to be needed to forge the new U.S. air power ordered by President Truman.

Analysis of a wide range of industry reports and opinions indicates that an increase in the number of aircraft industry workers approximately double the June 1950 figure of 250,000 will be required to do the job.

Under present conditions there appear to be only local manpower supply problems to contend with. But if Selective Service moves on the all-out basis reported as its ultimate mobilization goal, both aviation productive manpower and the vital research and development personnel face the threat of induction.

A representative of the Defense Department serving on an inter-departmental committee in Washington is supporting, reliable sources say, an all-out draft without regard to scientific qualifications or employment, for a full mobilization program.

John F. Victory, executive secretary of the National Advisory Committee for Aeronautics, who is carrying on a vigorous drive for a more enlightened administration of selective service, points out that Britain, Germany and Russia all had effective national service provisions in World War II.

► **Scientific Suicide**—"Here in the United States," says Victory, "we flirted with scientific suicide. We permitted enrollment in our scientific institutions to be cut to little more than 10 percent of their former level. We adopted a policy that men 26 or younger could serve their nation best only in the fighting forces. Our manpower control thinking was in terms of numbers of men and masses of equipment rather than brains of men and quality of equipment."

Cited also is a statement by Dr. Vannevar Bush, head of the Office of Sci-

entific Research and Development.

"We managed to maintain our staffs during the war in spite of the system and not because of it and it consumed far more time and energy than it should have. A group of enlightened military men with the strong support of Secretary Stimson did produce some order out of chaos. But the problem of keeping young scientists in the laboratories was one of the toughest and most irritating problems we faced in the war."

The youth of the nation's top expert researchers on missiles, radar and other electronics developments, which will presumably be vital to national defense in any drawn-out military struggle, is cited by research heads as another important reason for freezing in their jobs the key scientists, regardless of age.

A serious effect was expected at some aviation companies, because of the large number of reservists and National Guard members among aircraft employees, who would be subject to call, unless special exemptions were made for them.

A draft, under the present 26-year age limit was expected to have less serious consequences in siphoning off highly skilled company personnel, especially if it did not include veterans of World War II. Manpower analysts concluded that many of the top skilled aircraft industry personnel were older than 26. Presumably these would be spared and could be counted on to train additional younger men.

► **Slow Progress**—AVIATION WEEK polled principal airframe and engine manufacturers who were listed by the USAF as receiving letters of intent committing over \$4 billion for planes. They reported slow progress in employment of new personnel.

• **Boeing Airplane Co.** with three plants at Seattle, Renton and Wichita, and with three airplanes to build (C-97, B-50 and B-47), will need

"several thousand new employees" to add to its present group of 28,500 workers, a spokesman said.

• **North American Aviation, Inc.**, Los Angeles, reported it is now hiring at the rate of 50 a day, but that manpower requirements are not great at this time and that new workers are being hired mainly to work on the F-51 Mustang reconditioning orders, and for specialized skills.

• **General Electric Corp.** expects the major additional manpower requirements for its J-47 jet engine production in the Lockland, Ohio, assembly plant, will be problems for GE's 256 subcontractors who make the engines' components and ship them to Lockland for assembly. Enlargement of the Lockland assembly crew will be a relatively small percentage of the total additional manpower required. Additional manpower will be needed, in amounts not yet determined, at the Lynn, Mass., GE jet engine plant.

• **Fairchild Engine & Airplane Corp.** is calling back some furloughed employees, and hiring some new ones in specific categories at the Hagerstown, Md., aircraft division, but is building up its force slowly. Similar conditions were reported at its Ranger engine plant.

• **Douglas Aircraft Co.** contemplated no immediate hiring plan for its accelerated program of manufacturing C-124 transports at Long Beach, Calif., authorized by letter of intent. Previously Douglas had 80 of the big transports on order. A temporary hiring program for 1200 to 1500 additional employees to recondition B-26 Invader bombers from the mothball fleet was started two weeks ago.

• **Curtiss Wright Corp.** was still awaiting further word on its contracts, but had a small-scale employment program under way to increase production of engines and propellers already scheduled.

• **Consolidated Vultee Aircraft Corp.**, was expected to hire additional personnel at Ft. Worth and probably at San Diego, but there were no firm figures as to manpower boosts. Convair's letter of intent called for additional B-36 bombers, beyond the 1951 budgetary requirements, indicating a further stepup in strategic bomber strength.

• **Republic Aviation Corp.** has recalled about 1400 employees recently laid off and will add them in a gradual buildup as needed, before starting any larger-scale employment program. Republic's letter of intent calls for F-84 jet fighters, presumably of the E type now in production, and possibly the new swept-wing F-84.

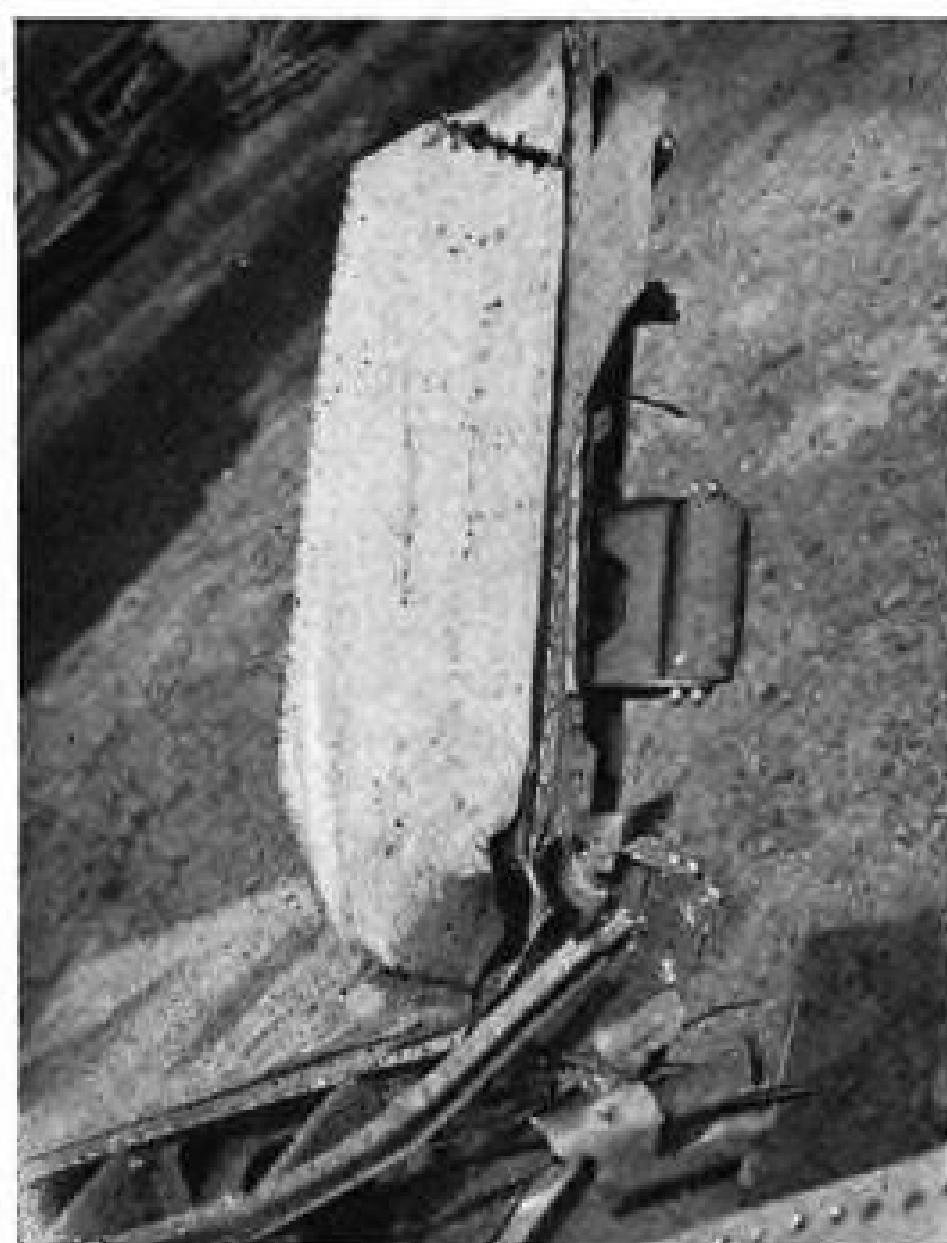

• **United Aircraft Corp.** Early last week was still awaiting arrival of its letters of intent before launching any manpower program to increase its present employment.

KAMAN DESIGNS A WINNER

Artist's conception of Kaman Aircraft Corp. HOK-1, winner of Navy-sponsored design competition between Kaman, Sikorsky, Hiller and Bell. The copter weighs approximately 3500 lb. and can carry a pilot and three passengers. Converted to an aerial ambulance it can carry two stretcher patients and a medical attendant. A single engine drives two meshing rotors. Pitch of the

rotor blades can be changed by a small servo-control motor. Note twin vertical fins at the rear of the plane in place of the more familiar anti-torque rotor. Concurrent with the design competition, Navy has just completed evaluation flight tests at the Patuxent Air Test Center of the two-place Kaman K-225 helicopter designed for liaison purposes.

F-80 CAME HOME after wing hit cable.

MORE wing damage—F-80 got home.

AA SHELL put this hole in stabilizer.

How Jet Planes Survive Battle Damage

U. S. jet aircraft have seen their first combat in Korea and already have answered many questions about how such planes would fare against enemy guns (AVIATION WEEK July 31). Last week graphic evidence of the ruggedness of Lockheed F-80s came to hand: the photographs on this page, and the following report of the Lockheed service representative, Noble G. Heuter, in Korea, which was especially cleared for AVIATION WEEK. Some parts of Heuter's report were cut out by Air Force censors for security reasons.

We have lost three F-80Cs due to enemy action without the loss of a single pilot.

One aircraft blew up an ammunition train and got caught in the explosion. The pilot pulled 13 Gs trying to avoid debris, but came back with holes in the leading edge, elevator and many scars from fragments.

Another F-80 flew into a trap (cables strung between two peaks), lost both tip tanks and wing tips—had two 40-mm. shells thru his nose section shattering the wind-shield and bending the barrel of the tunnel gun so that it stuck out at right angles to the original position—sheared off approximately fourteen inches of the vertical fin and rudder. The pilot then climbed to 13,000 ft. and bailed out. He claimed the controls were a little sloppy and was afraid he might lose control so elected to get out while he could.

Another F-80C ran into another cable trap. The cable sheared off his pitot tube, cut into the leading edge to the forward spar, tore both tip tanks off, sheared the left wing tips off plus 20 in. of the aileron. The pilot climbed to 30,000 ft. and came home. He landed downwind at 170 mph. with the stick hard over and the tab full up—rolled to a stop then taxied up to the line under his own power.

Another F-80C was hit from beneath,

the shell entering the aft section at station 352 tearing a hole in the tail pipe two inches square where it entered and another hole five inches square where it came out. The shell then tore part of bulkhead 376, finally blowing a hole in the stabilizer to fin fillet approximately four inches square. The pilot said the aircraft handled normally. Damage from heat was negligible. Two other F-80Cs have had single shells pierce the burner cans. The pilots claimed the engine operated normally. The airframe around this area was slightly blackened.

I hope to send along pictures of some of the battle damage if Intelligence gives me an OK.

The 265-gal. tanks are made from three center sections from Fletcher tanks and the casting from a Beech tank. Four baffles are bolted to the

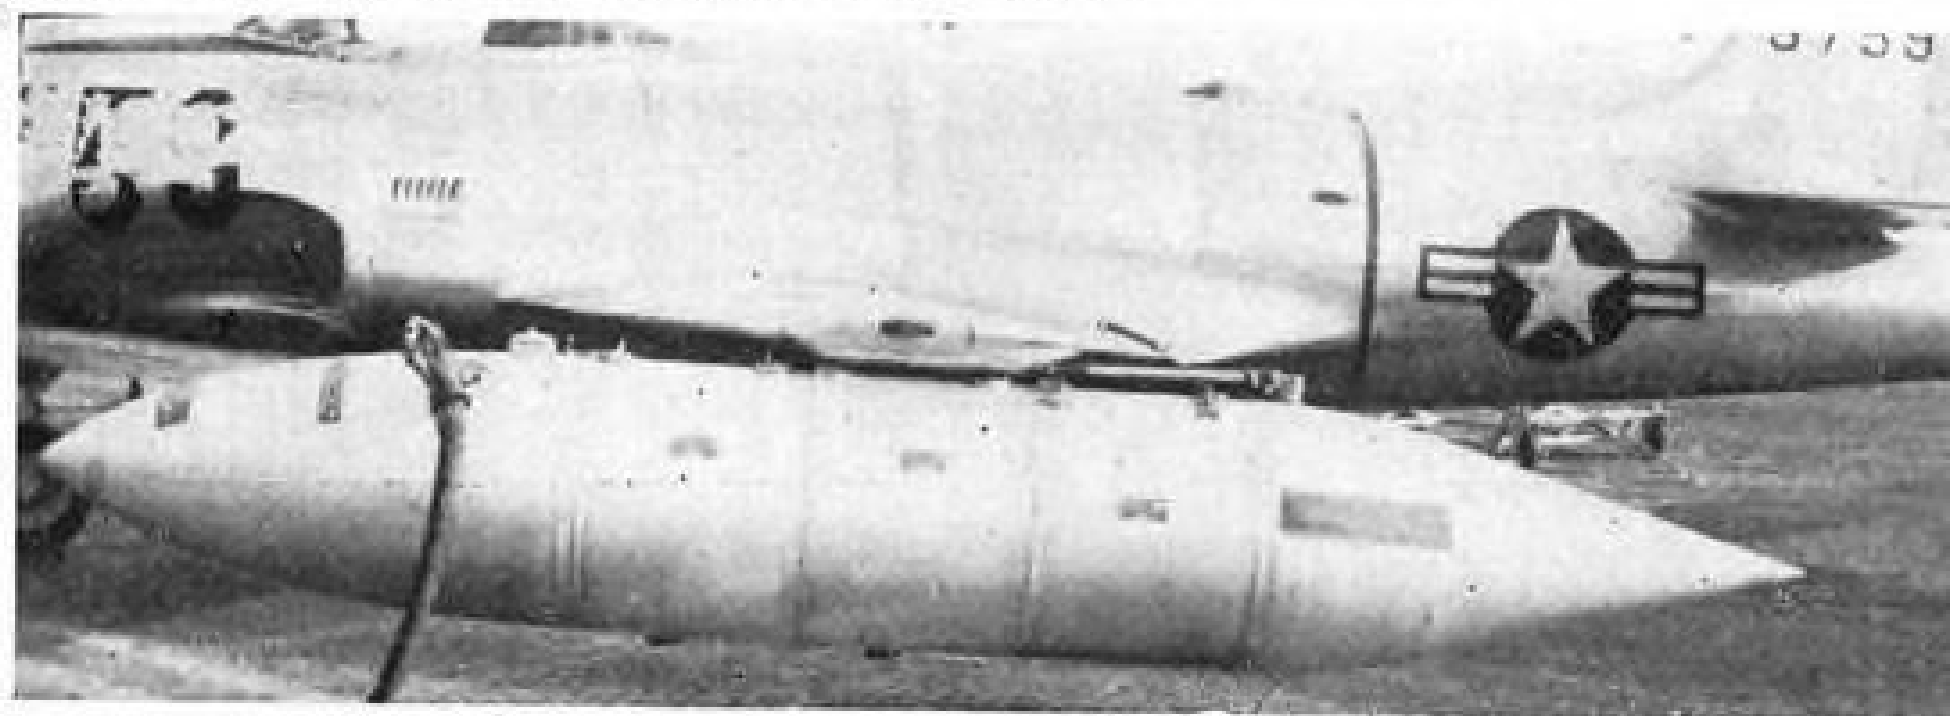

SHELL through tailpipe caused no fire.

section bulkheads to prevent sloshing. An extension rod approximately 44 in. long is used to hold the sections.

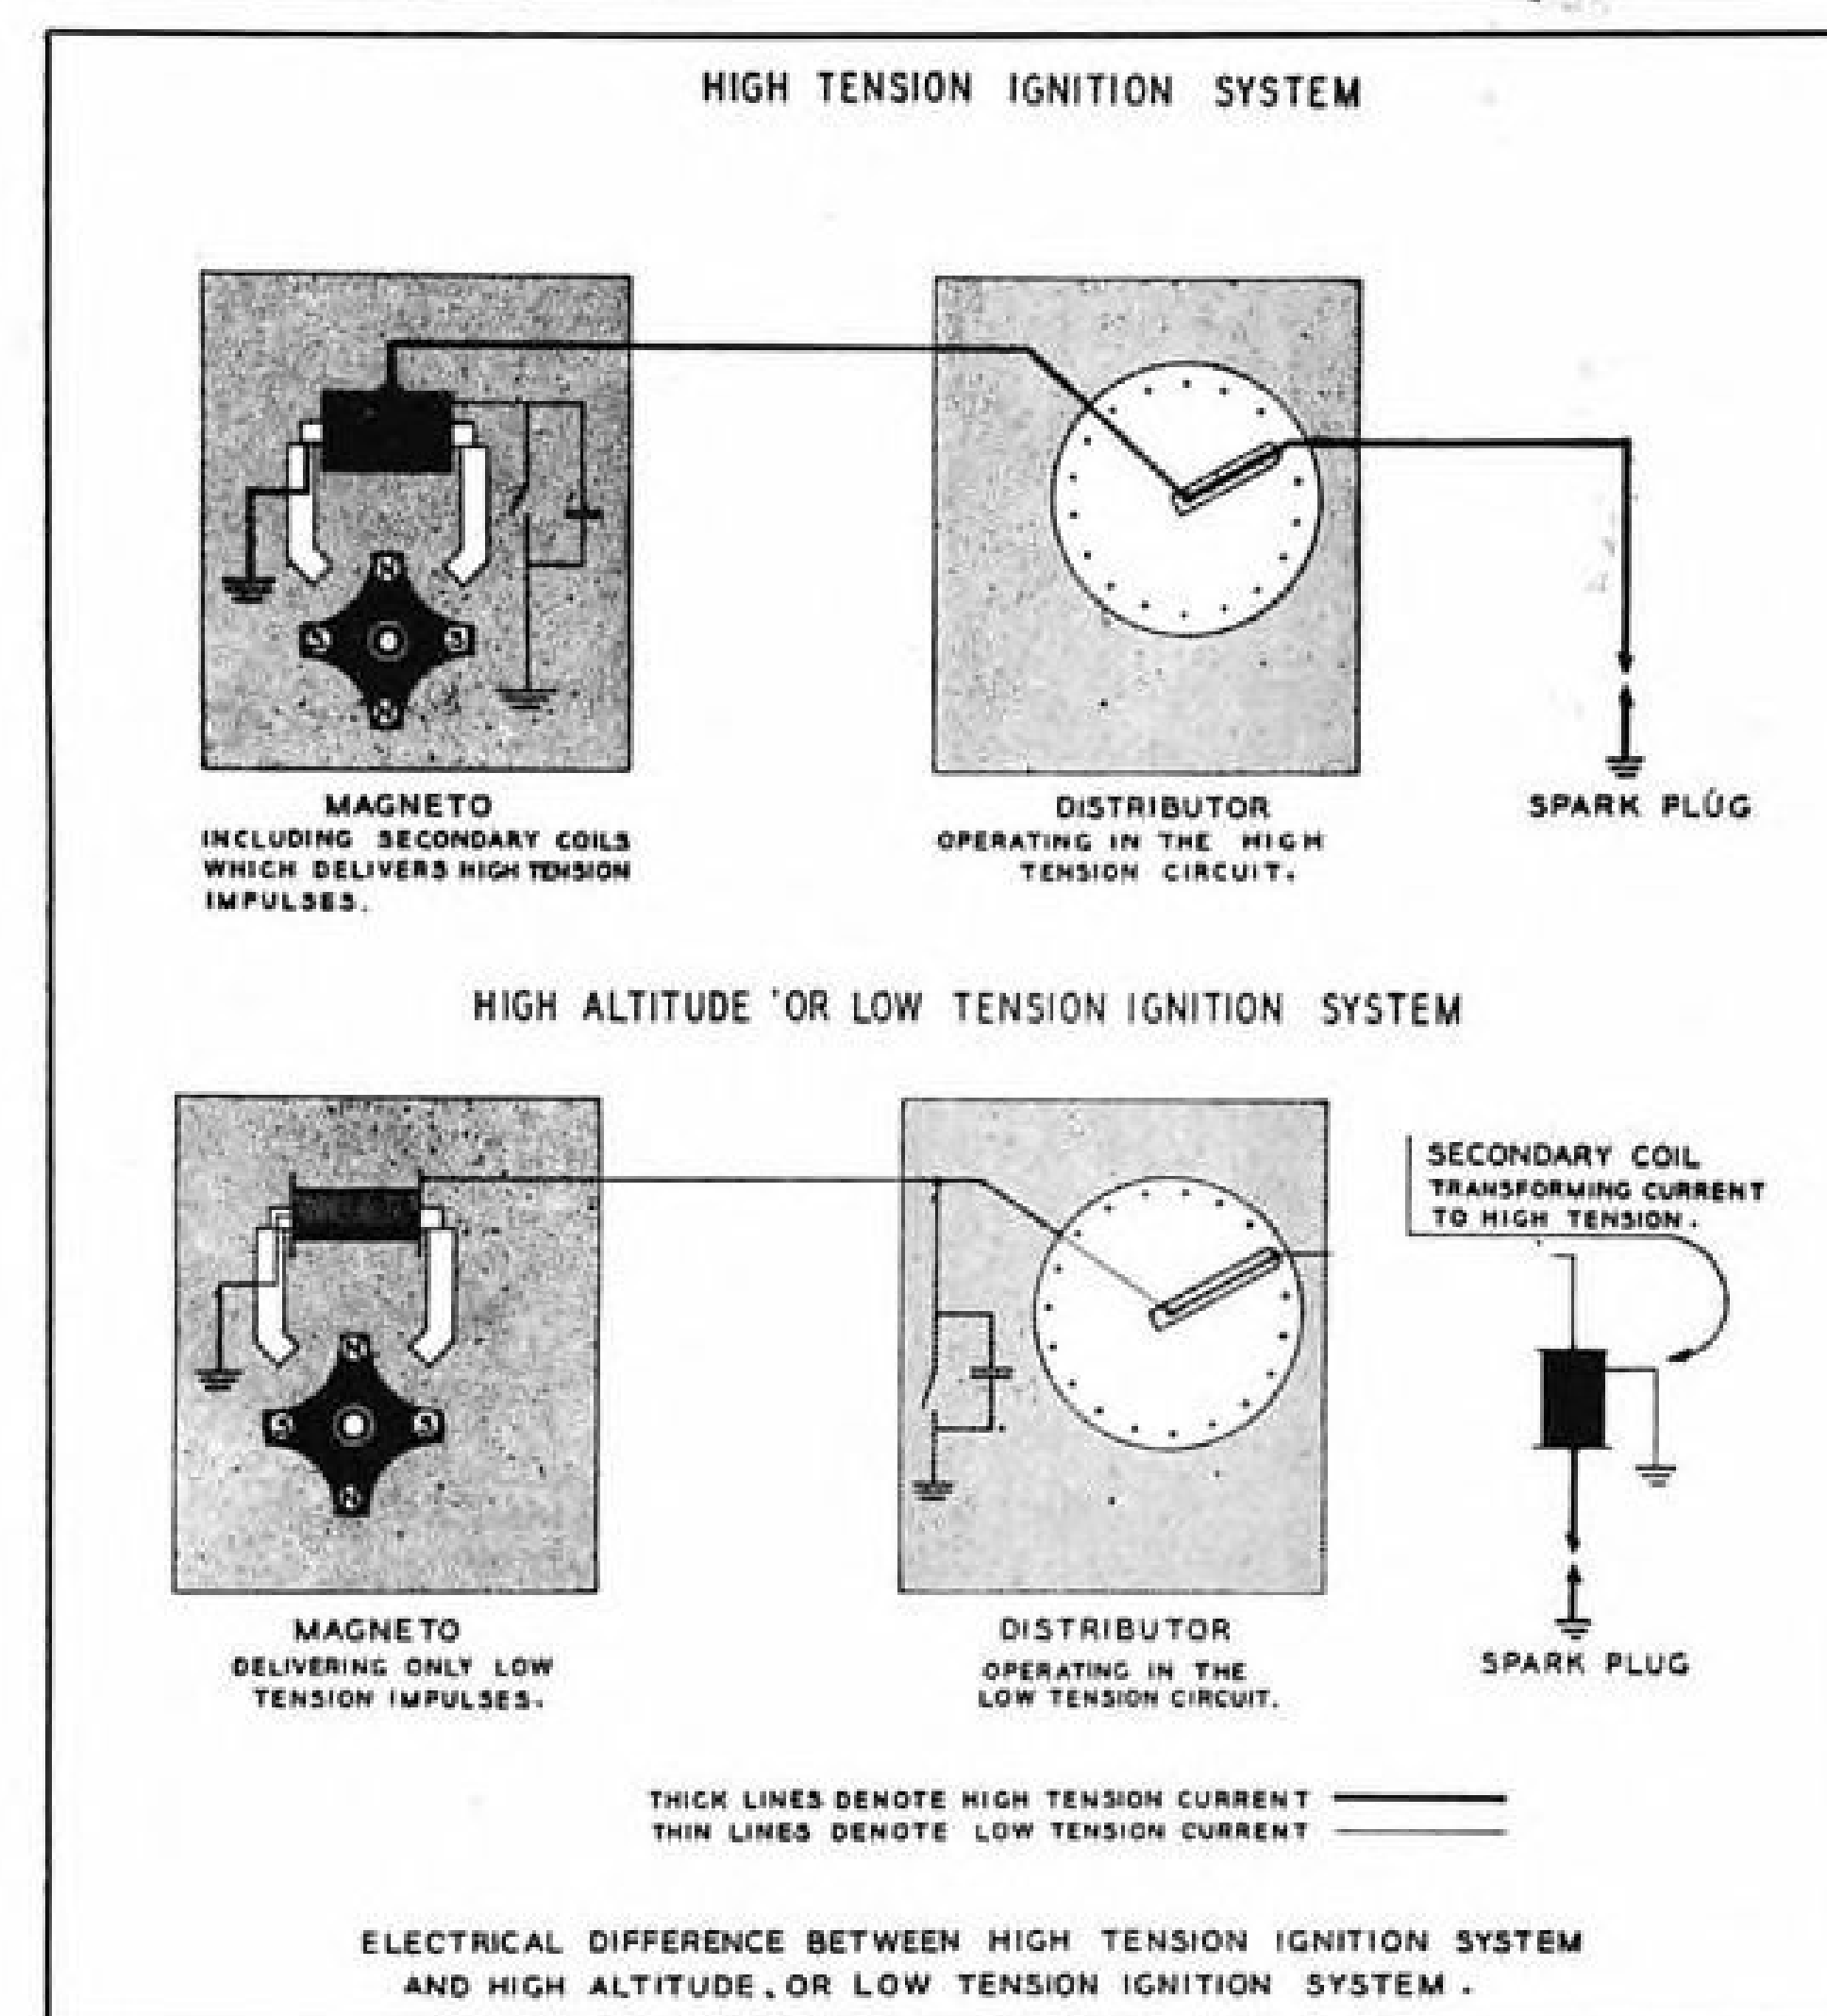

Now they are hanging four rockets in addition to the 265-gal. tanks.

They have been keeping me going night and day . . . but will make a report of a more technical nature shortly. Enthusiasm for the F-80—highly complimentary. What a job they are doing—a job that they were never designed to do—that is, low-level strafing three to four hundred miles away from their base. The beating they are taking with every pilot wearing a G suit is remarkable.

LARGER WING TANK was improvised by adding extra center sections.

EQUIPMENT

Low Tension System Gaining Favor

American buys \$1 million worth of Bendix Scintilla equipment for all R-2800s; increased plug life seen.

By George L. Christian

With a \$1-million order in its pocket from American Airlines for low-tension ignition systems (AVIATION WEEK July 3), Bendix-Scintilla has catapulted this equipment into the "big time" of ignition business.

When AA's conversion of more than 400 engines is completed, approximately three-quarters of all scheduled airlines' R-2800 engines will be so equipped. Eastern Air Lines and TWA engineers have confirmed that the system will be installed in their recently ordered Martin 404s.

Although the low-tension system has seen considerable airline service on such aircraft as DC-6s, Constellations, Convair 240s and the SAAB 90A2, American's order is significant because it represents a fleet-wide conversion to a single ignition system and because of impressive results obtained during

vigorous service tests. The airline's conversion costs, Bendix says, will run to another \$1 million.

Prolonged Plug Life—According to Bendix' Scintilla Magneto division, at Sidney, N. Y., the following plug times were obtained on low tension-equipped engines in tests conducted during the last year:

AIRLINE	SPARKPLUG	TIME
AA	Champion R37S-1	864 hr.
AA	Champion R37S-1	812 hr.
Panagra	Champion R37S-1	984 hr.
Panagra	B. G. RB-19R-2	878 hr.
EAL	Champion R37S-1	811 hr.

NOTE: The EAL tests were on a Constellation with R-3350 BD1 engines; all the others were on DC-6s with R-2800 engines.

No plug was removed for malfunctioning, Scintilla claims, and the average erosion rate for the tests was .0014-.0015 in./100 hr. The division estimates that AA's DC-6s averaged twice

as many landings and takeoffs as Panagra's.

"Compare these figures with average high tension data for the same engine which show sparkplug removal at approximately 300 hr. and erosion rates of .003-.005 in./100 hr.," says a Scintilla engineer, "and you can understand one of American's major reasons for changing over."

R-2800 engine operators may expect to change plugs every 600 hr., or once per engine change, he added, because the low tension system reduces erosion rate by as much as 65 percent and also aids materially in firing partially fouled plugs.

Altitude Test—Scintilla cites an incident during the test of the first low tension ignition system in a pressure chamber. The operator inadvertently increased the chamber altitude to 60,000 ft. instead of the intended 30,000 ft. The low tension system continued to fire perfectly. This test has been repeated on each system developed to date. Yet, a jump-gap type high tension distributor will spark up to 10 in. at that altitude, says the company.

When a pilot had a rough engine in earlier days, chances were he could reach forward and find a dead cylinder by feel. Today complex instruments are required. Engine vibration had little effect on a Curtiss Jenny's wooden, fixed-pitch prop. Dead cylinders and the vibration they cause in modern engines have posed serious design problems to manufacturers of today's constant speed, controllable pitch propellers.

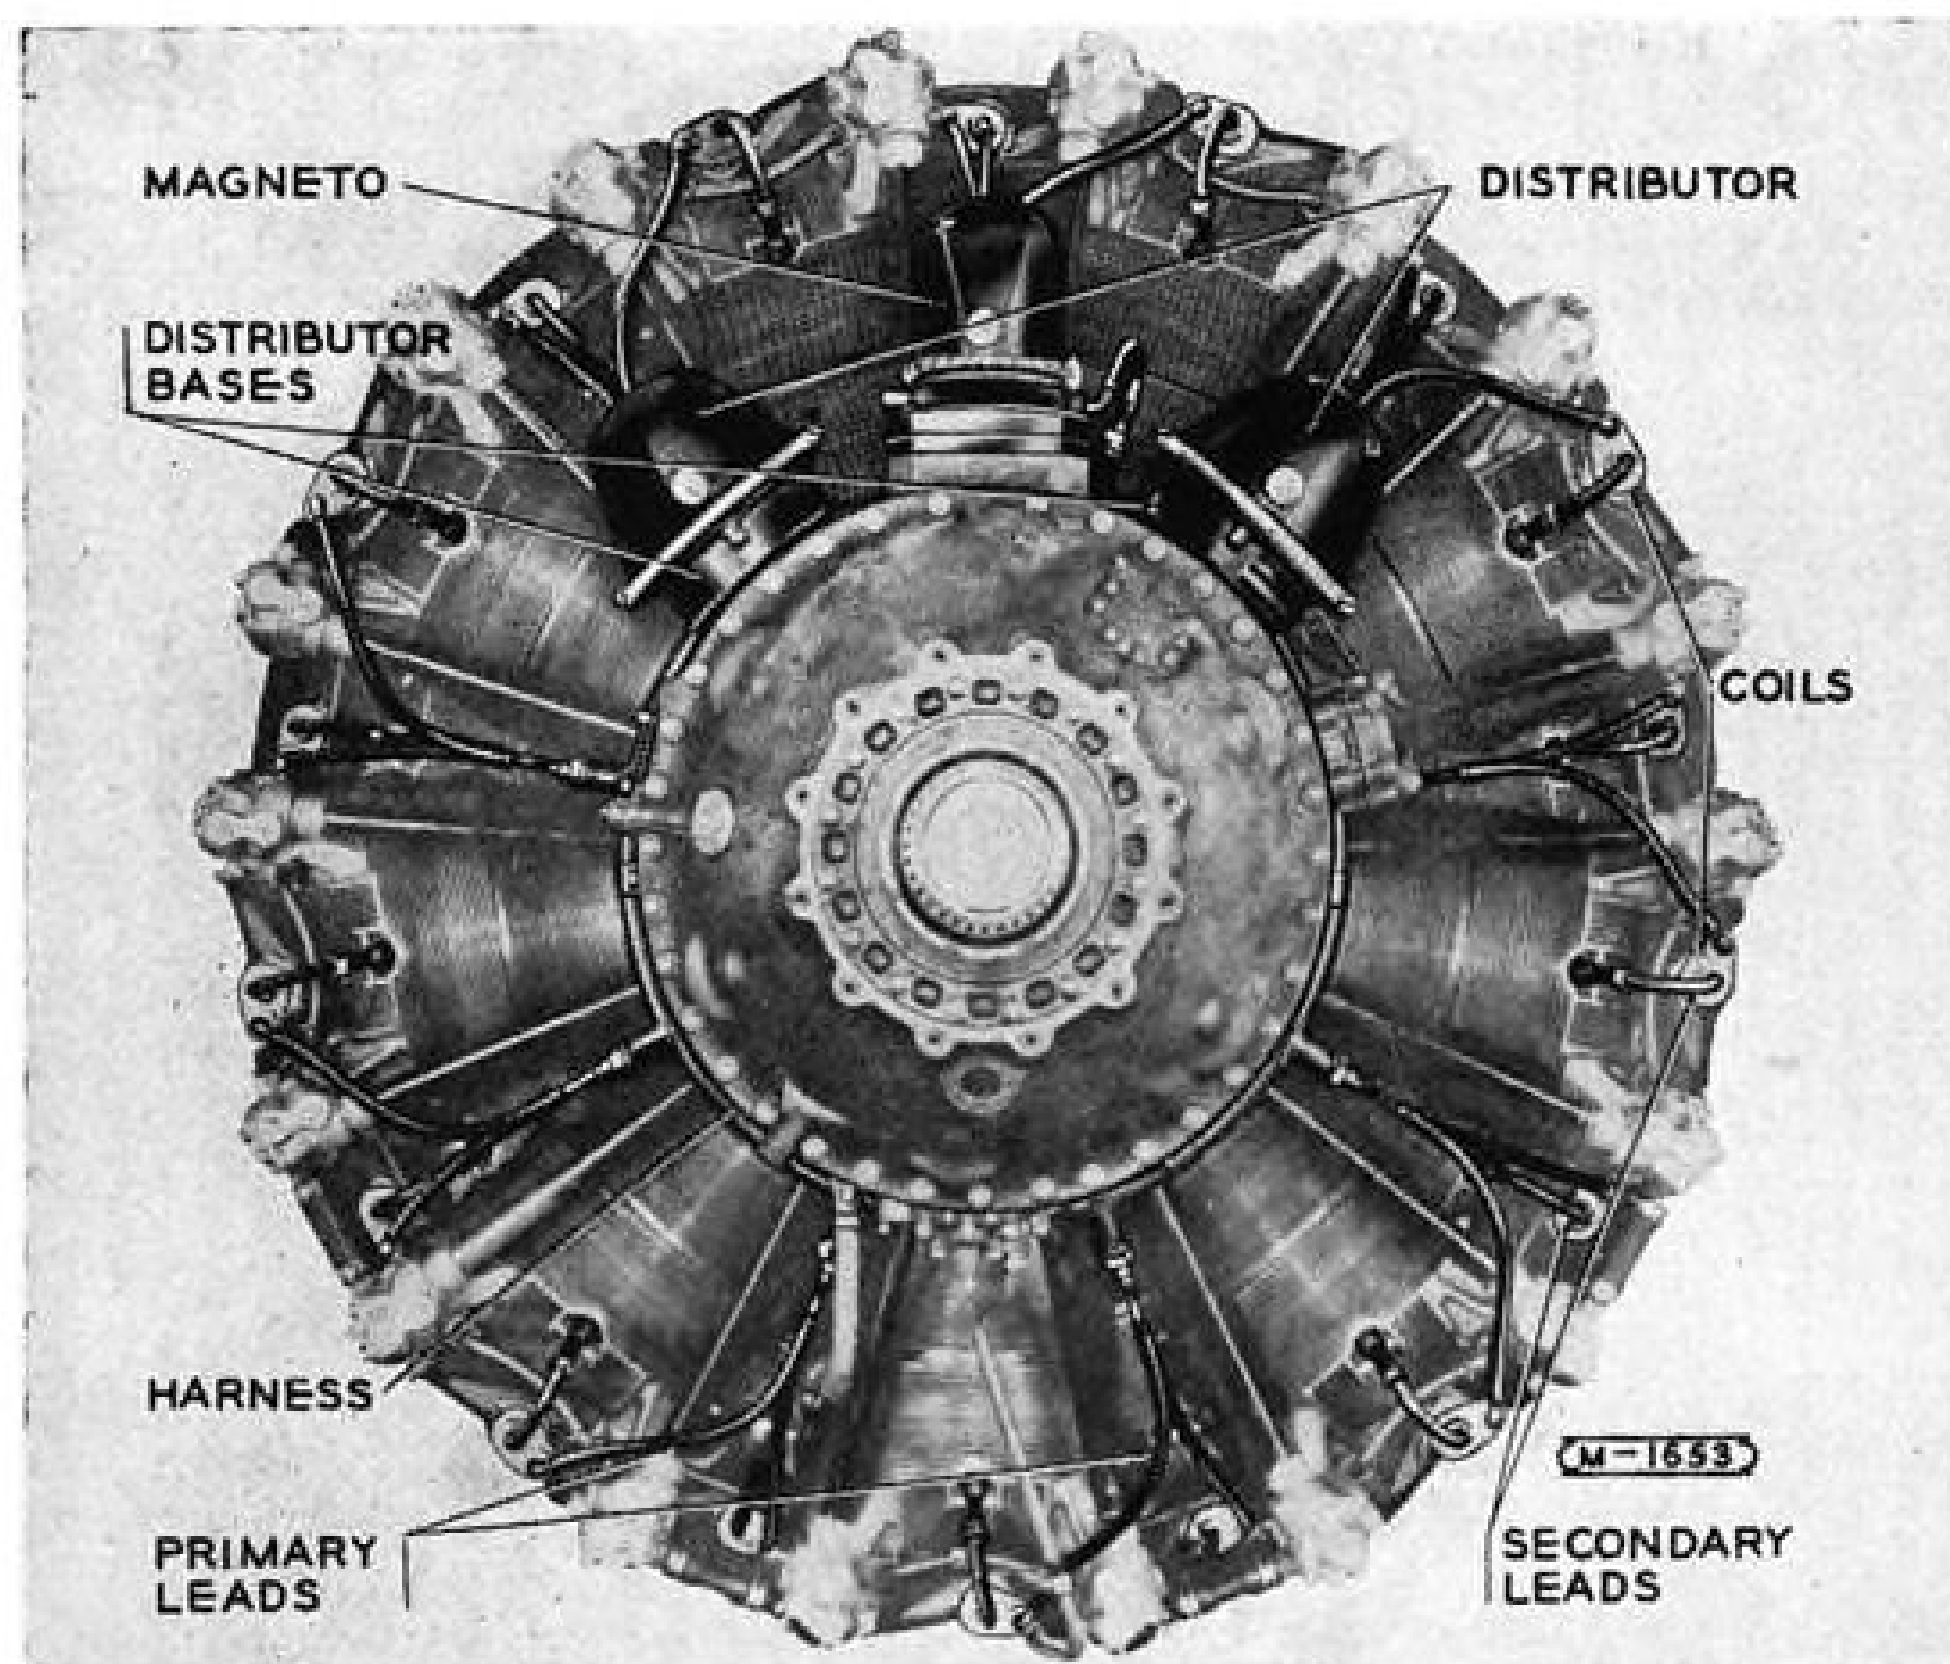

Primary requirements of an ignition system for current reciprocating engine aircraft, according to Scintilla, are:

- Electro-mechanical design simplification.
- Reduction of sparkplug erosion.
- Increased ability to fire partially fouled plugs.

First Low Tension System—Scintilla first tackled the problem of developing low tension ignition systems in 1938 for use on large, stationary, internal combustion engines.

The company devised the "LA" system of ignition. The magneto generated low tension current which was fed to the distributor and leads. A transformer adjacent to each plug converted it to high tension current.

It soon became evident that this type of ignition equipment was particularly adaptable to aircraft engines. This idea was given sudden stimulus by the behavior of aircraft engines during the Battle of Britain, where combat operating altitudes first reached 30,000 ft. Much engine malfunctioning was traced

FRONT VIEW of R-2800 mounting low tension system. Note coils adjacent to plugs.

to erratic spark behavior in the distributor.

In 1941 Scintilla gave priority to two projects in an effort to solve this difficulty:

- **Supercharging** the distributor compartment. This was done and proved successful.

- **Developing a low tension aircraft ignition system.** Once the full potential of this study was realized, the company decided to increase its efforts to create a successful aircraft application. Factors were relative simplicity of the system, its ability to reduce plug erosion and reduce susceptibility to plug fouling.

By 1942, Scintilla had delivered its first two systems to the Wright Aeronautical Corp. for evaluation—one for the R-1820, the other for the R-3350 engine.

During the next year, Pratt & Whitney received a system for the R-2800. P&W and CAA approvals for this engine were not received until 1947, and USAF approval came through in 1949.

Currently, the company is also making low tension equipment for the P&W R-2180E and R-4360C.

► **Ignition System Classification**—Scintilla recommends that ignition systems be classified. The following was cited as a sample method:

- **High Tension Systems**—Distribution of more than 1000 v.

- (a) Audio frequency

- (b) High frequency

- **Low Tension Systems**—Distribution of less than 1000 v.

- (a) Audio frequency

- (b) High frequency

Of these four classifications, Scintilla

asserts that the low tension, audio frequency system offers the maximum return to the operator when considering initial system and plug costs, ultimate performance and overall maintenance.

► **Low Tension Benefits**—Robert Boyer, Scintilla senior sales engineer, has completed an analysis which purportedly shows that a low tension ignition will reduce:

- **Sparkplug erosion rate** by as much as 65-70 percent.

- **Off-schedule ignition unit removal rate** by up to 50 percent.

- **Airline delays**, due to ignition trouble, possibly 30 percent.

- **Ratio of unscheduled sparkplug removals** per 1000 hr. to scheduled plug removal time by as much as 43 percent.

Other advantages claimed are reduced flash-over at altitude, and a weight saving of 10 lb. per engine.

An arrangement of the R-2800 low tension system to give the equivalent of two 9-cylinder magnetos instead of one 18-cylinder magneto offers less radio noise.

► **Low Tension Theory**—Boyer said that the removal of the secondary coil from the magneto and the transformation of voltages adjacent to the sparkplug brought about these advantages. Since the capacitance of the secondary circuit is greatly reduced, the energy discharged across the electrode gap is decreased.

The three factors controlling sparkplug erosion are heat, time and the accompanying electrical force (energy). These are all diminished, he claimed, with low tension.

Minimum leakage resistance is the

gauge of the ability of an ignition system to fire a partially fouled sparkplug. It will vary with the frequency or rate of rise of voltage on the center electrode. The frequency is controlled mainly by the electrical constants of the secondary circuit—inductance in the secondary coil and capacitance. Since these are both greatly reduced in low tension, rate of voltage rise is increased and minimum leakage resistance is reduced 60 percent.

Boyer added that this was also true for high frequency ignition, even to a greater degree, but claimed an advantage in the lower cost of plugs for the low tension system.

► **Outlook**—Scintilla sees a bright future for its low tension system and claims:

- **Dollars and cents advantage** of the system can justify conversion and reimbursement of its low initial cost.

- **Industry acceptance** of the principle of low vs. high tension ignition is growing.

- **Continued military use** of reciprocating engine aircraft now seems indicated, on which low tension systems will be used.

- **Rapid development** is taking place of low tension ignition equipment for engines for non-aviation purposes.

The division presently is engaged in the development and manufacture of aircraft and missile ignition systems (jet, rocket motor and reciprocating engine), ignition analyzers and switches, radio interference filters, electrical connectors and related products. New applications include industrial engines, jeeps and outboard motors.

Redifon Will Make Dehmel Simulators

Dehmel flight simulators will soon be built in England, Roy T. Hurley, president of the Curtiss-Wright Corp., Caldwell, N. J., has announced.

An international licensing agreement, negotiated through Curtiss-Wright's Propeller division, allows Redifon, Ltd., London to produce flight simulators for American- and European-designed aircraft. They will be built under patents held by the American company.

"The Redifon agreement has important economic and military significance," Hurley said. "It was negotiated in accordance with the stated policies of the U. S. government to build up European defenses and to aid soft currency countries to become self-sufficient by enabling them to produce for themselves equipment they require at the lowest possible expenditure of dollars."

Curtiss-Wright says the first simulator to be built by Redifon will be for the Boeing 377 for delivery to British Overseas Airways Corp.

When emergency power is needed your batteries **MUST BE GOOD**

Nothing less than *complete dependability* is good enough for your aircraft batteries. They must be *ready to respond instantly* when needed . . . *able to handle heavy power loads momentarily* and *deliver every time* they're called upon. You'll find those characteristics in all Exide Aircraft Batteries—the very best that long experience, engineering knowledge and manufacturing skill can produce.

The outstanding performance of Exide Aircraft Batteries is being demonstrated daily in commercial, government and personal planes of every kind. Wherever used, you can always count on your Exide Aircraft Batteries for dependability, long life and low cost maintenance.

world's lightest structural metal!

Every pound of unnecessary weight stripped from a plane has its effect in increased performance. Whether performance is measured in terms of speed, range, load, rate of climb, or a combination of these factors, more extensive use of magnesium will serve to improve it. Why? Because properly designed magnesium structures are significantly lighter than those built from any other material.

Magnesium is at least 33 1/3% lighter than any other structural metal, yet for all this lightness, it is remarkably strong and versatile. Whether you're designing aircraft equipment, or working on the design of the aircraft itself, think first of magnesium! It is the most logical material when lightness is important. For technical information about magnesium write to Dow. To see case studies of successful magnesium applications, ask for your free copy of "How Magnesium Pays".

For ultimate light weight and strength use MAGNESIUM

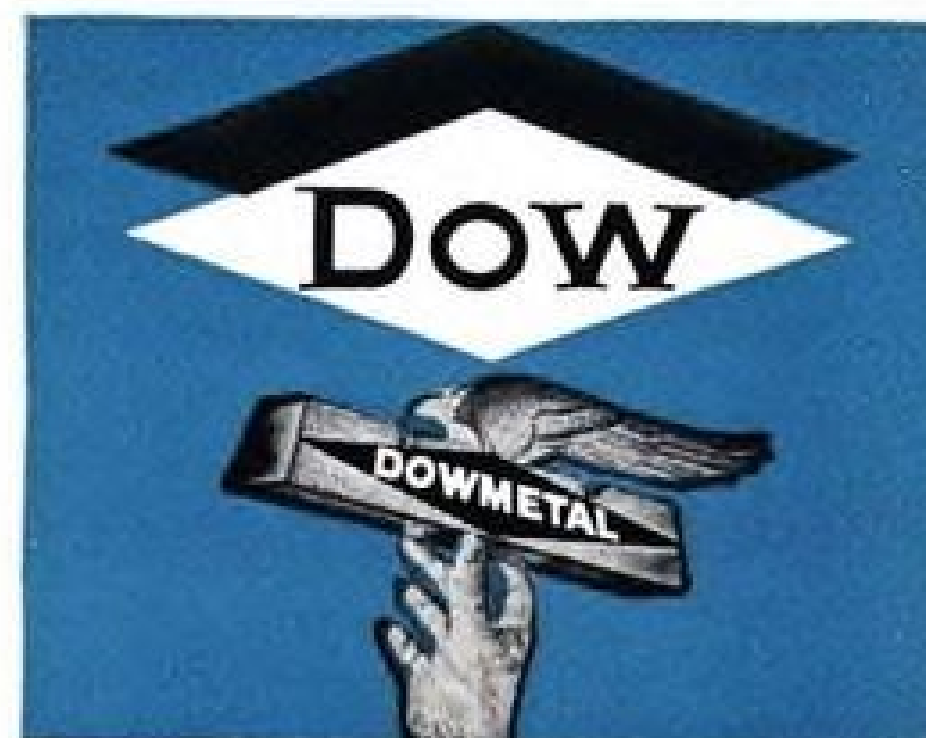

Formed magnesium "waffle grids" like that pictured above were used on the entire wing trailing edge and some portions of the fixed control surfaces of the B-36. To keep its weight at a minimum, over 8000 lbs. of light, strong magnesium sheet and extrusions were designed into the structure of this giant aircraft—proof of the value of the lightest structural metal in the world.

NEW AVIATION PRODUCTS

Apron Refueler

A fresh approach to aircraft refueling—doing away with trucks and departing from the usual conception of pit refueling—is exhibited in the Aero Cell, a telescopic refueler recently developed by the Wattpar Corp., New York.

This compact, relatively small installation contains many convenient features aimed at making aircraft refueling more efficient. It already has created considerable interest in airport circles. The Port of New York Authority now is studying one installed at Teterboro Airport, New Jersey.

Manufacturer of the Aero Cell is the Combustion Equipment division of Todd Shipyards Corp., 81-16 Forty-Fifth Ave., Elmhurst, Queens, L. I., N. Y. Wattpar is responsible for engineering and sales.

The Aero Cell is a completely self-contained mechanism, except for underground supply lines feeding it electrical current, fuel and fire extinguishing fluid. It consists mainly of a cylindrical steel cell perched on a hydraulic lifting jack. By flipping a dead-man electric switch, the cell can be extended to a maximum height of 12 1/2 ft. in less than a minute, or can be retracted into the ground, flush with the apron surface.

An integral cover at the top of the device is strong enough to support the weight of the heaviest commercial craft now used, according to Todd. The cell, about 5 ft. in diameter and 3 ft. high, contains fuel hose, ground wire, meter, fueling and defueling controls, CO₂ hose and nozzle, small walk-way and protective railing which automatically extends and retracts as the cell is raised or lowered.

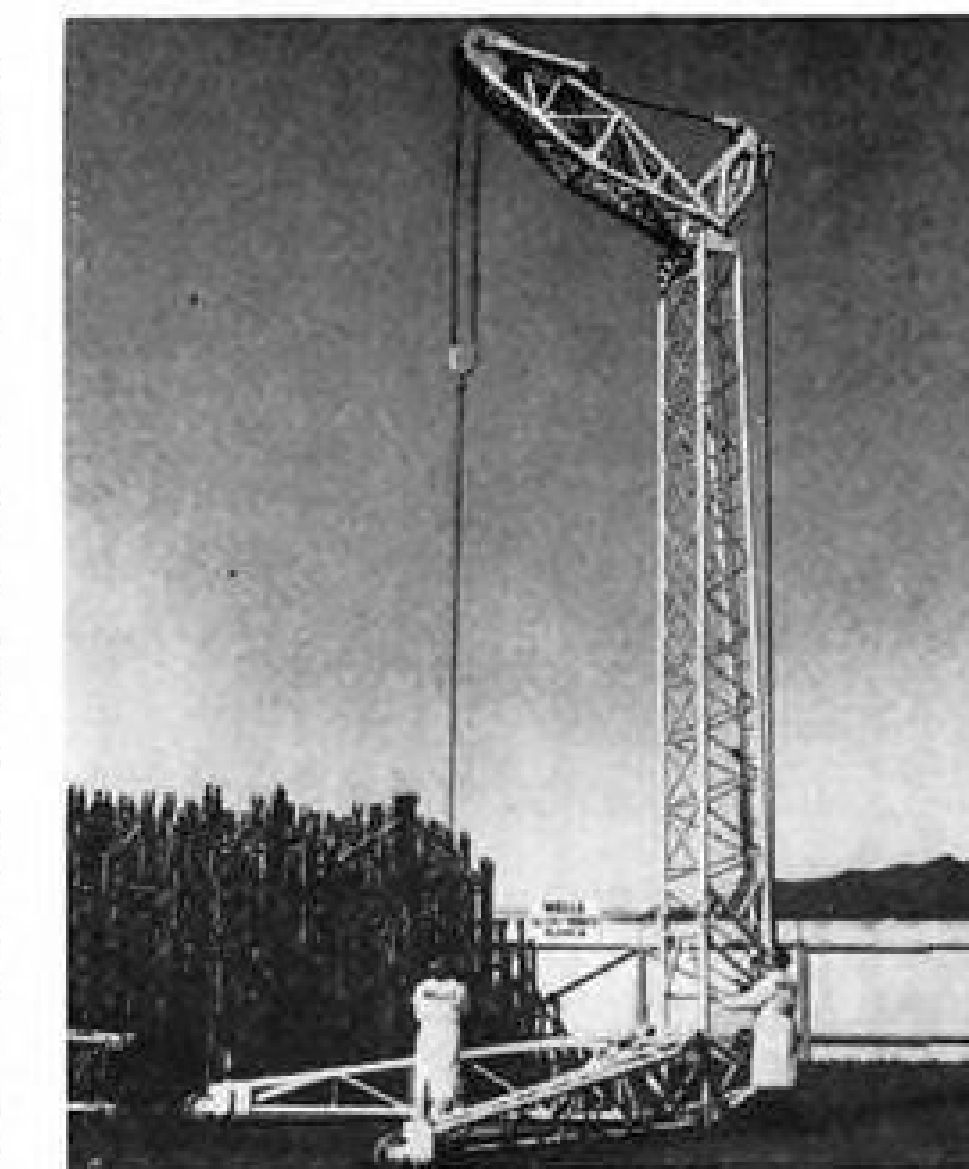

These units are designed to be installed in pairs on the apron, so that when the plane taxis into position a cell will be located aft of each wing. To operate, an attendant steps on the flush cover of the refueler, opens a switch cover and raises it to a height somewhat above that of the wing trailing edge. He then projects the walk-

way which extends to a point several inches above the wing structure and past the trailing edge. The walk-way does not have to touch the wing at any point, but provides an easy step-down to the wing surface.

To refuel, the operator opens the access cover to the hose compartment in the cell, presses a refueling switch and pulls the hose and nozzle over the walk-way to the wing tank filler opening.

Todd feels standard, quantity-produced Aero Cell units would cost less and be more efficient than underground refueling pits built specially for each airport—each time by a different contractor. An advantage over regular pits is that the hose is delivered practically on the spot for upper wing surface refueling, removing the need for manually lifting and dragging it up and over the leading or trailing edge of the wing. For underwing fueling, the hose can be pulled out with the cell remaining flush in the ground.

Wattpar says Aero Cells can be provided with special equipment to boost fuel delivery well over 200 gpm.

Big Plane Aid

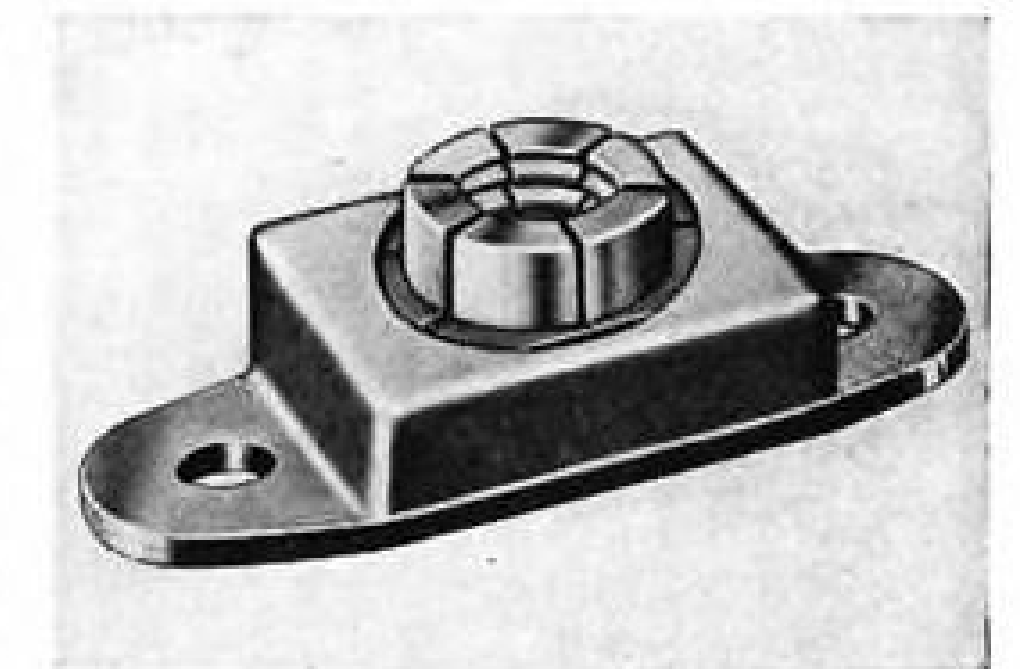

A new addition to the family of aircraft ground handling equipment is the AH2 hoist developed by Wells All-Steel Products, 10717 Chandler Blvd., N. Hollywood, Calif. This device is designed for maintenance operations around large planes. It has a working height of more than 30 ft. and a 10,000 lift capacity.

A prime advantage claimed by the maker is that it can be rapidly disassembled into 10 small sections and airfreighted to a new location. The hoist is said to be highly maneuverable, permitting it to be towed quickly to a

new position or moved a fraction of an inch for installation problems requiring accurate and close positioning. It is particularly useful for installing engines, gun turrets, tail sections and similar work.

Manually- and electrically-operated versions of the hoist are available. Lift speed by hand is 4 ft./min. and about 6 ft./min. when the winch is electrically driven either on 24v. d.c. or 110/220/440v. a.c. current.

The unit moves on a triangular-shaped structural base, mounting ball-bearing action, solid rubber tires. Leveling jacks are provided for overcoming field irregularities. Net weight of hoist is 5400 lb.

Lightweight Nutplate

Floating-type, self-locking nut plate, made by Nutt-Shel Co., 317 East 2nd St., Los Angeles, Calif., is lightweight part conforming to Specifications AN-N-5 and -10. Unit has same dimensions as AN366F and AN362F stationary nut plates and is designed to withstand high axial loads and temperatures up to 550F. of the nut is approximately 3/8 in. from center in all directions.

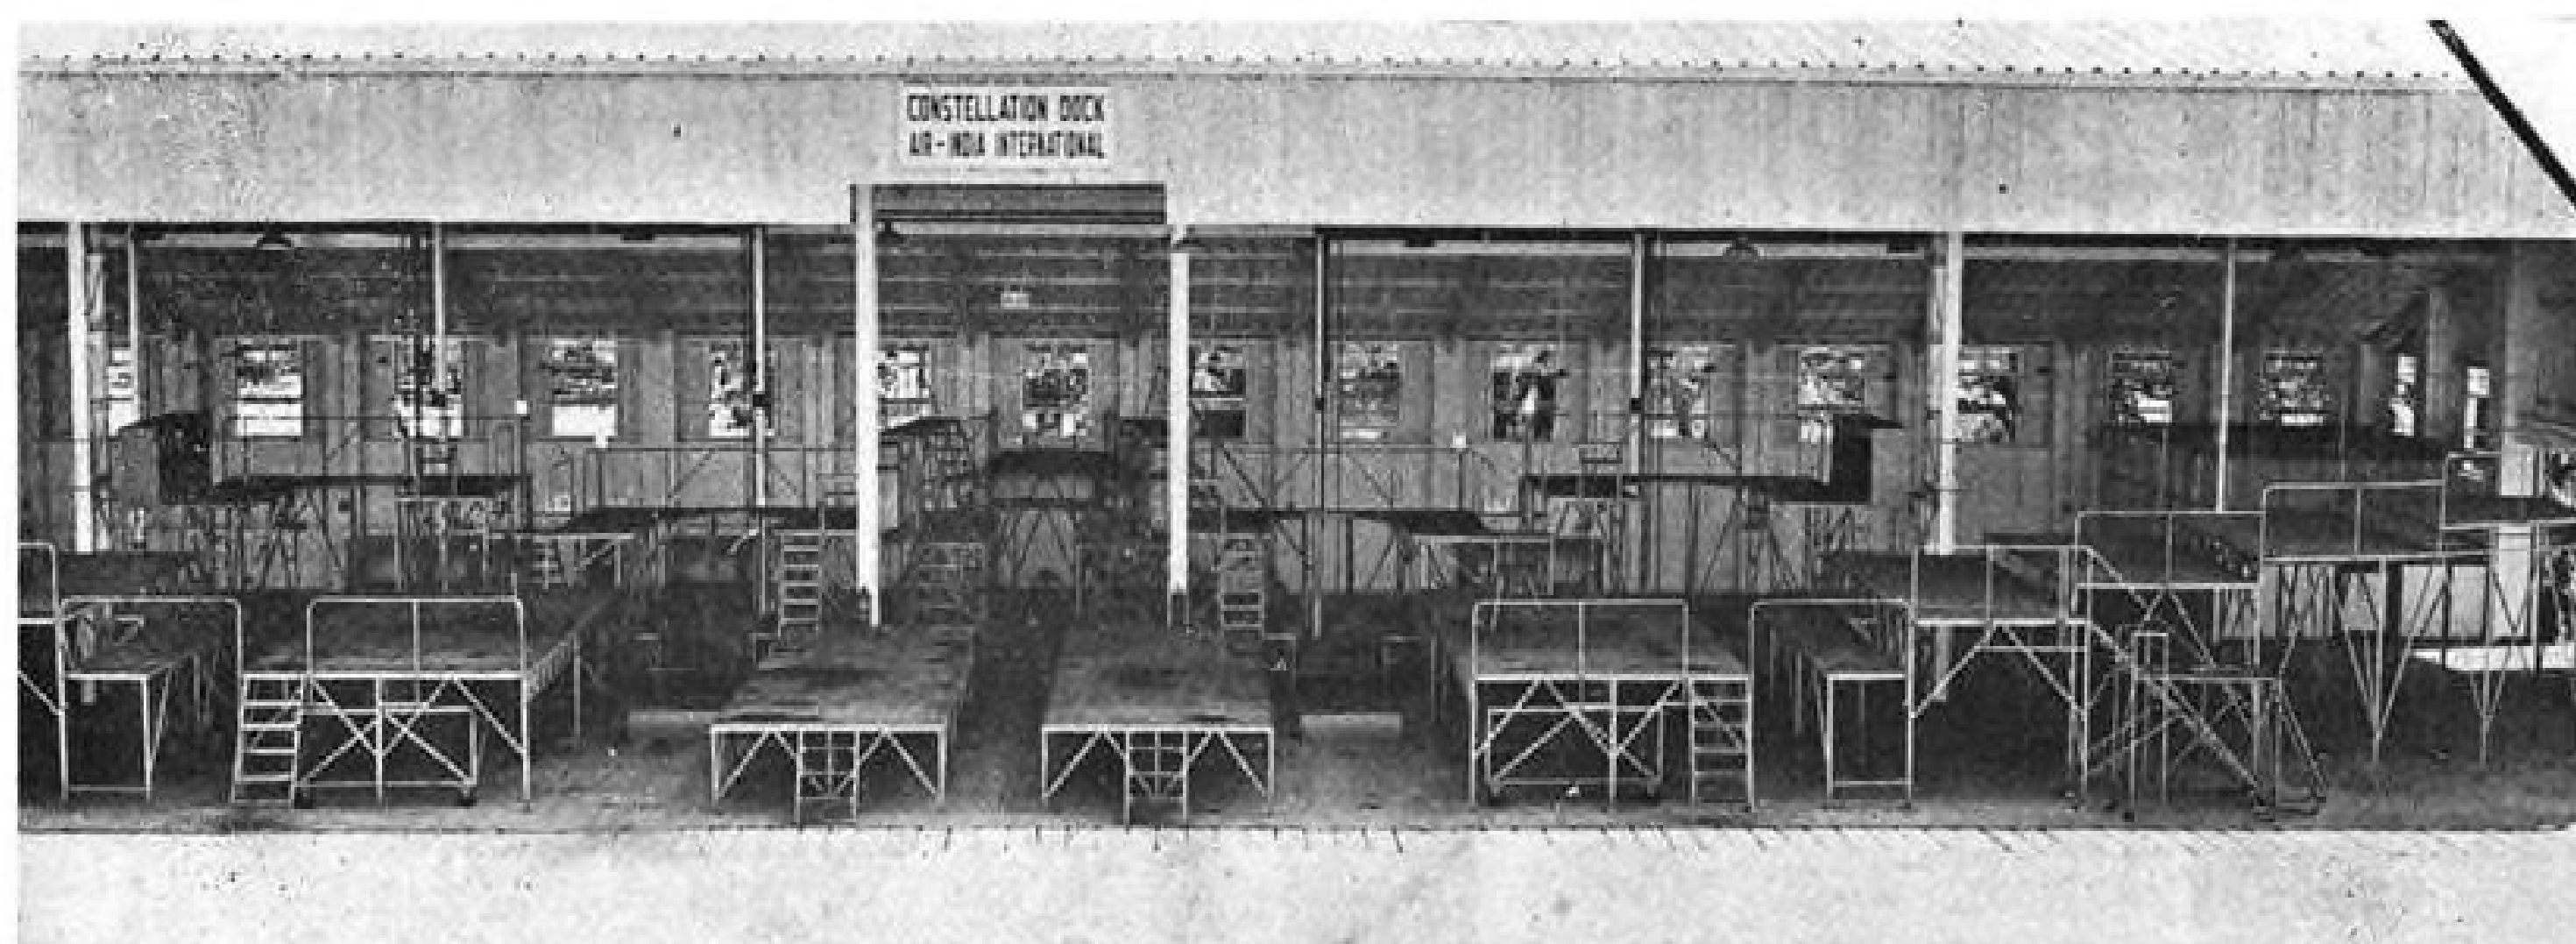

Replaces Templates

A new instrument designed to transfer on transparent paper the exact contour of a model, doing away with the need for cutting and fitting templates, is being marketed by Inter-Lakes Engineering Co., 4845 Bellevue Ave., Detroit 7, Mich.

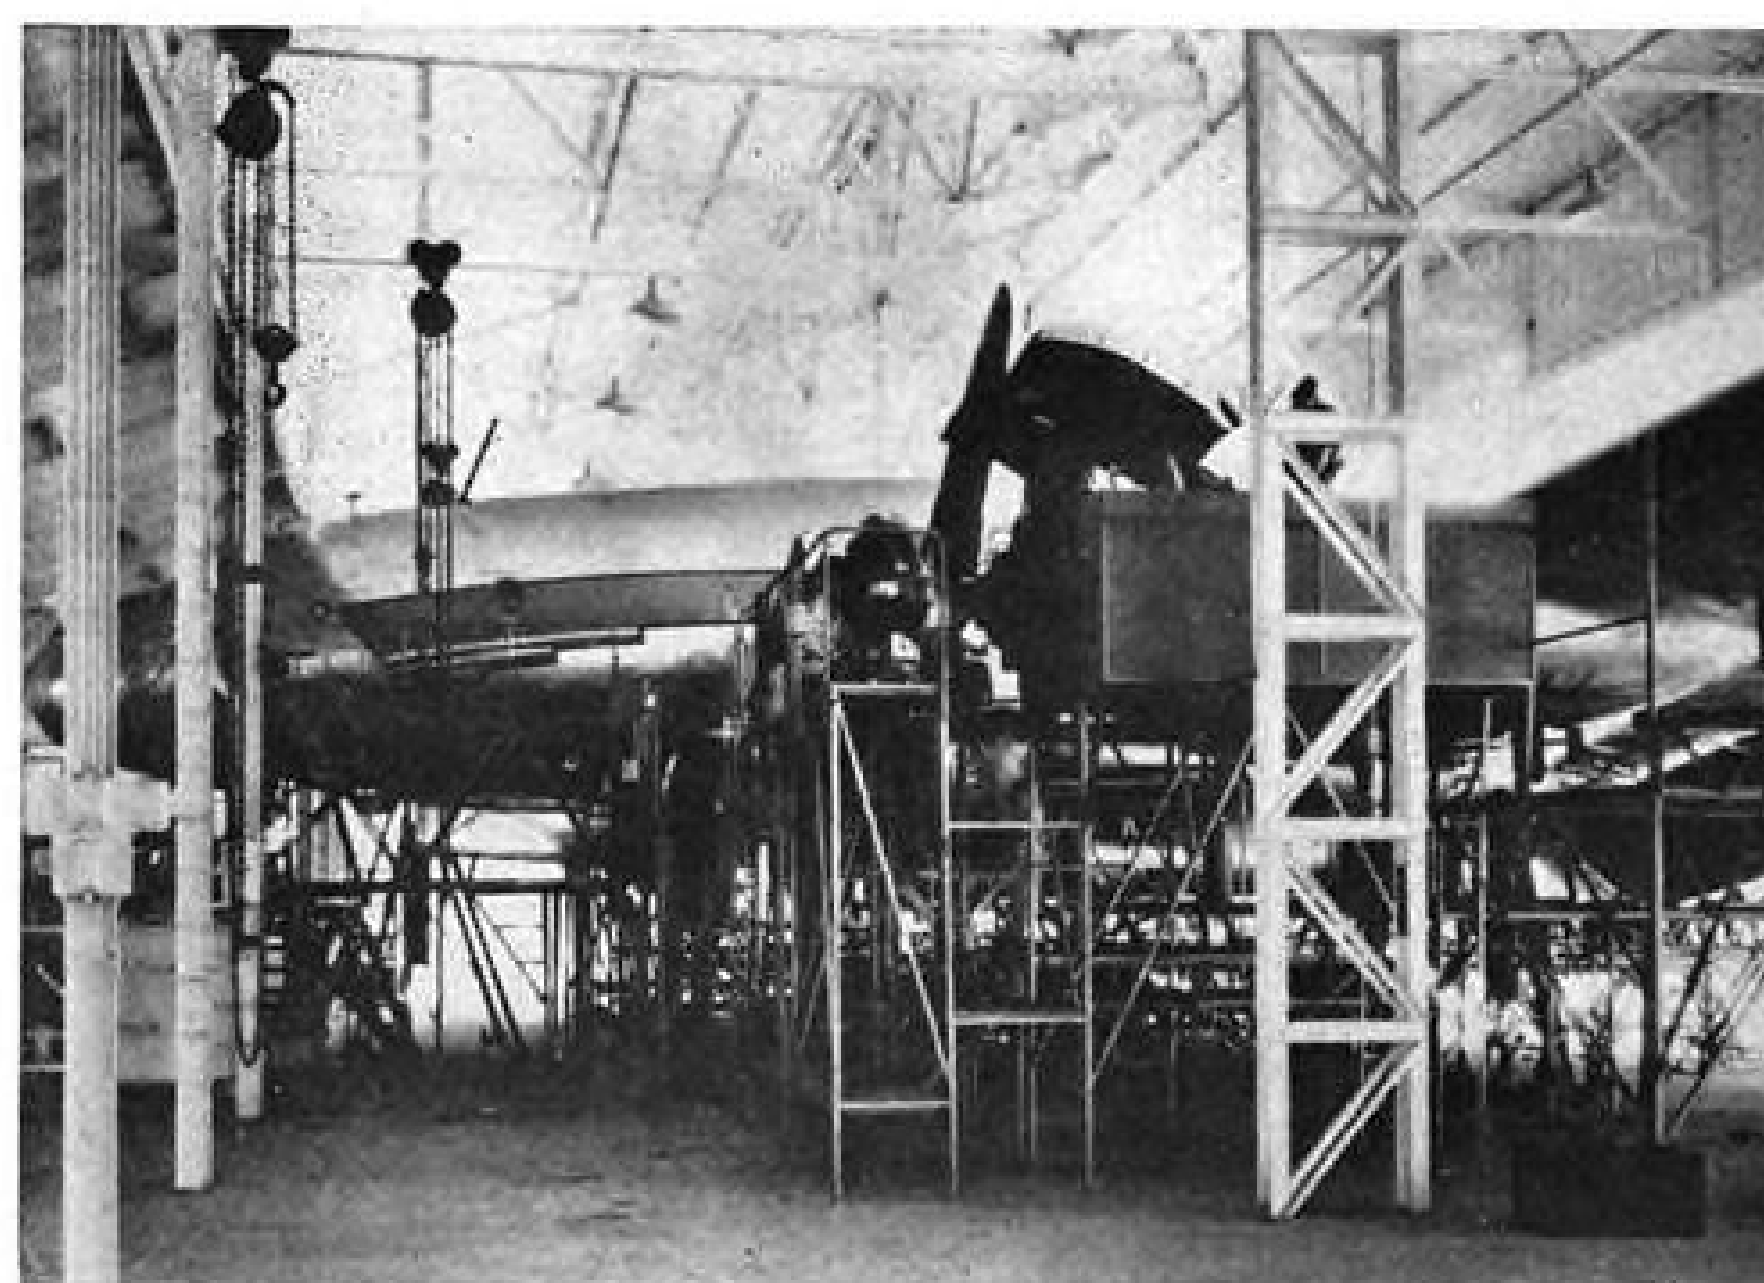

Called the "Dupligrath," the device is said by its maker to be suitable for securing concave readings in forming dies which frequently cannot be checked with ordinary templates. The firm says it also can be used to show accurately the amount of spring-back and warp in a jet blade, a stamping die and other parts.

The device reportedly will speed inspection procedures in manufacture of products which require close following of models. It gives cross-section lines relative to each other, usually on vellum, which are checked against the draft or layout. The firm points out this results in a full contour check as compared with only a spot dimensional check by former methods.

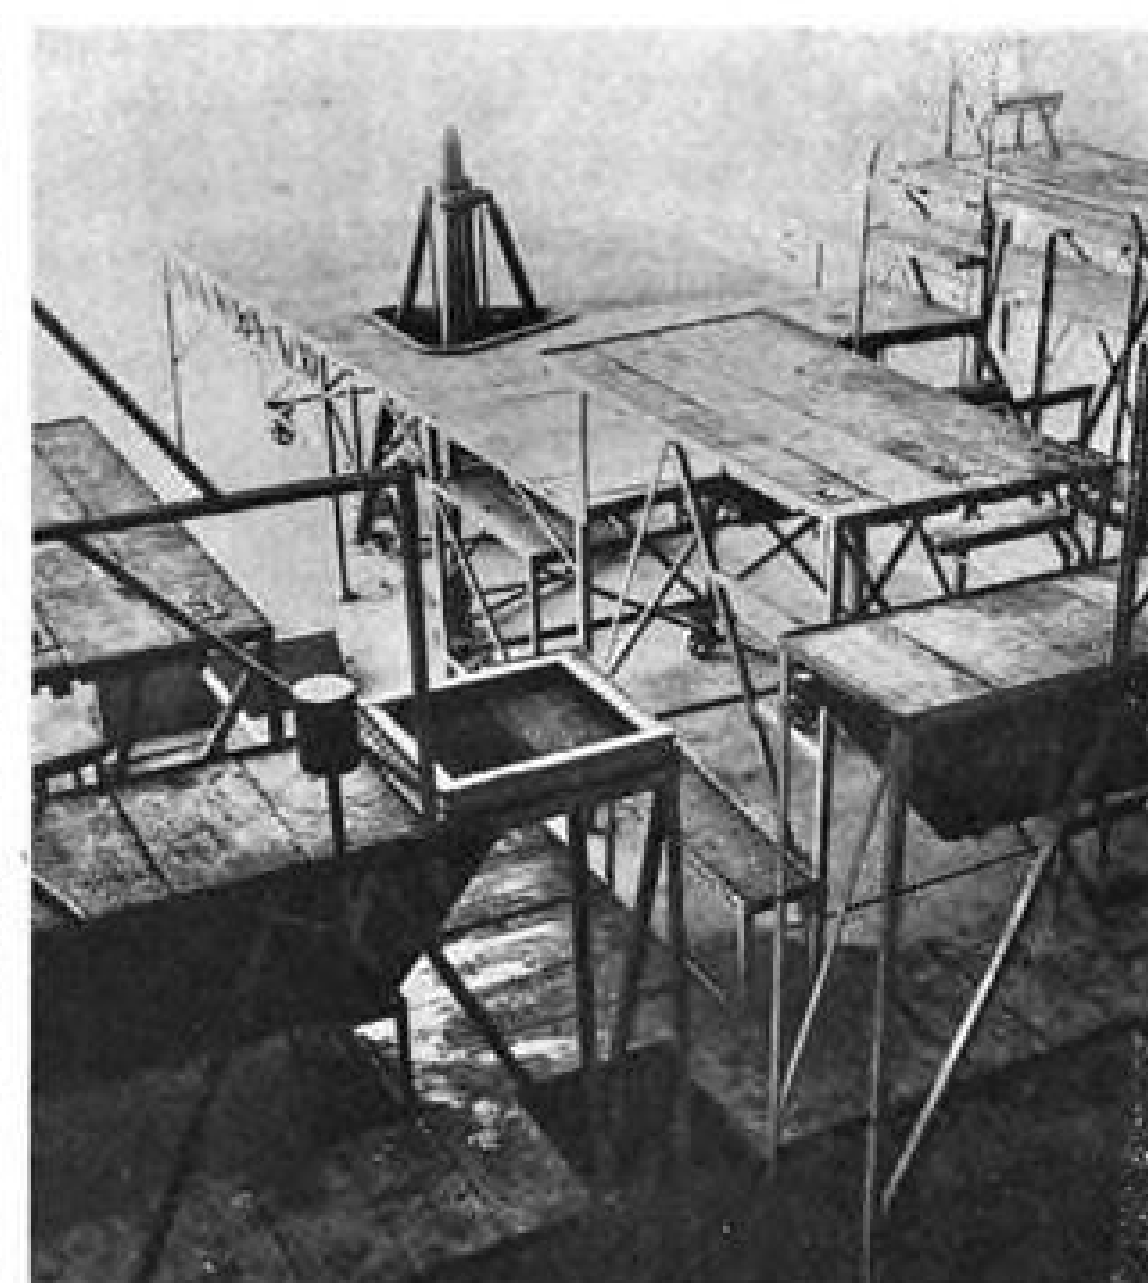

AVIATION WORLD NEWS

GENERAL VIEW shows work platform of the maintenance dock, homemade by Air-India International engineering personnel.

CONNIE is undergoing routine inspection at Bombay International Airport. No. 2 engine platform (right) has wing jacks in position.

Air-India Maintenance Simplified

Work dock for servicing company's Constellations incorporates many safety and timesaving features.

Bombay—A new work dock designed to take some of the work out of maintenance and overhaul of Air-India International Ltd.'s Constellations has recently been completed here by the Eastern Hemisphere carrier.

The dock consists of a series of work platforms arranged to give convenient access to any part of the aircraft forward of the main cabin door. Safety rails surround all the platforms. Warning lights and buzzers have been incorporated to guide those working on the planes and keep them out of the way of whirling propellers.

► **Quick Entry**—The aircraft is moved

into position by a tractor tugging a cable attached to the plane's nose-wheel strut. An electrically driven winch will be incorporated in the system soon.

The entire docking operation takes about five minutes. It is controlled by one man working "stop and go" lights visible to the tractor driver and the person at the plane's brakes. Main wheel chocks on the ground stop the plane when it has entered the dock completely. The chocks are removable to permit retraction of landing gear and work on the wheels.

These design features are calculated to make maintenance work quicker:

- Platform flaps which can be lowered out of the way to permit free rotation of any of the propellers.
- Monorail over each engine carrying three-ton block and tackle for removing and installing powerplants and propellers.
- Built-in jacks, hydraulically operated, for lifting the plane off the ground.
- Direct-current generator with voltage regulation for providing 24v. dc supply to operate aircraft services independently of the plane's batteries.
- Mobile hydraulic rig for ground-checking hydraulic services.
- Propeller dollies, on which props can be threaded after removal by means of overhead gantry, for convenient storage until needed.
- **Home-Grown**—The dock, except for the hangar in which it is housed, was designed and built entirely by Air India engineering personnel.

Newer Look

British rework of old designs gives new types at minimum cost.

(McGraw-Hill World News)

London—British aircraft engineers have been busy giving some of their old designs the New Look—thus getting up-to-date types with a minimum strain on the budget. The refurbished craft are by Vickers (the VC-3 transport), Gloster (F. R. 9 and P. R. 10 photo Meteors) and Scottish Aviation (Pioneer communications plane).

The Vickers V.C. 3 planned as a Viking replacement is still in the design project stage and no decision has yet been made to produce a prototype. It incorporates the tricycle landing gear used on the Varsity RAF bomber crew trainer now in quantity production. The V.C. 3 would carry 27 passengers at a cruising speed of 183 knots over stages up to 1375 nautical mi. A crew of two and steward would be standard.

The V.C. 3 would presumably be powered with two Bristol Hercules of approximately 2000 hp. each.

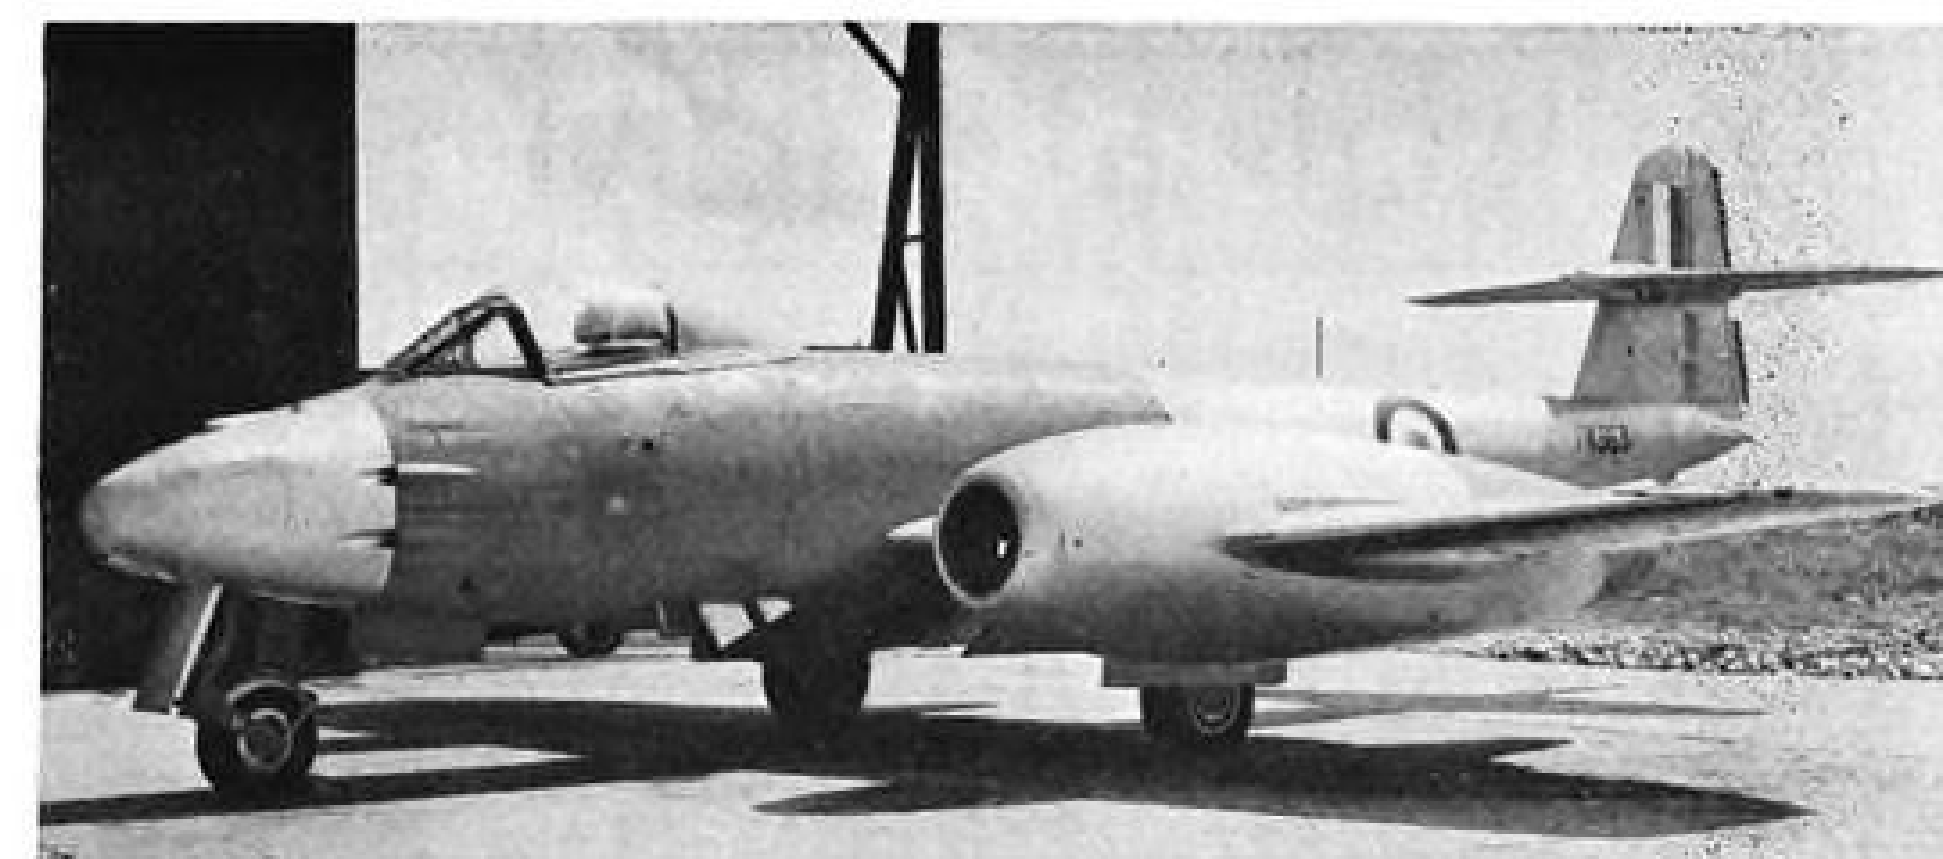

► **Meteor Development**—Gloster's continued development of the basic Meteor design has resulted in two photographic reconnaissance versions:

• **F. R. 9** has three camera mounts in addition to four 20-mm. cannon. The nose has been slightly lengthened and fitted with a flat slightly down-angled window for one camera position. Two other windows in the side of the nose permit oblique photography.

• **P. R. 10** is an unarmed high-altitude camera plane having the F. R. 9's nose plus additional camera mounts in the rear of the fuselage. For optimum high-altitude performance the Meteor 3's longer span wings are fitted to the P. R. 10, as is the Meteor 4's tail assembly. Cockpit and ejector seat are as in the Mk. 8.

► **New Pioneer**—Scottish Aviation's new Pioneer is a five-place commercial version of the A.4/45 liaison plane developed for the RAF several years back. Instead of the 250-hp. DH Gipsy Queen fitted to the A.4/45, the Pioneer is now powered by an Alvis Leonides nine-cylinder radial power plant of 520 hp. Top speed is given as 162 mph., cruising speed as 150 mph. and range as 400 mi. at 120 mph. Service ceiling is 23,000 ft. Takeoff run is said to be 80 yd. and landing run 66 yd.

During flight trials at Prestwick, Scotland, the Pioneer is reported to have repeatedly taken off within the width of the runway. This performance is made possible by the use of full-span

F. R. 9, developed from Gloster Meteor design, mounts three cameras and four 20-mm. cannon.

METEOR P. R. 10, unarmed high-altitude photo plane, has Meteor 3 wing and Meteor 4 tail.

VICKERS VC-3, shown here in artist's drawing, may replace the Viking transport.

slots and Fowler and split flaps reaching over 50 percent of the wing span. The Pioneer is now undergoing

flight trials for an airworthiness certificate and is expected to go into service in Australia following approval.

Bulgarian-Soviet Air Group Formed

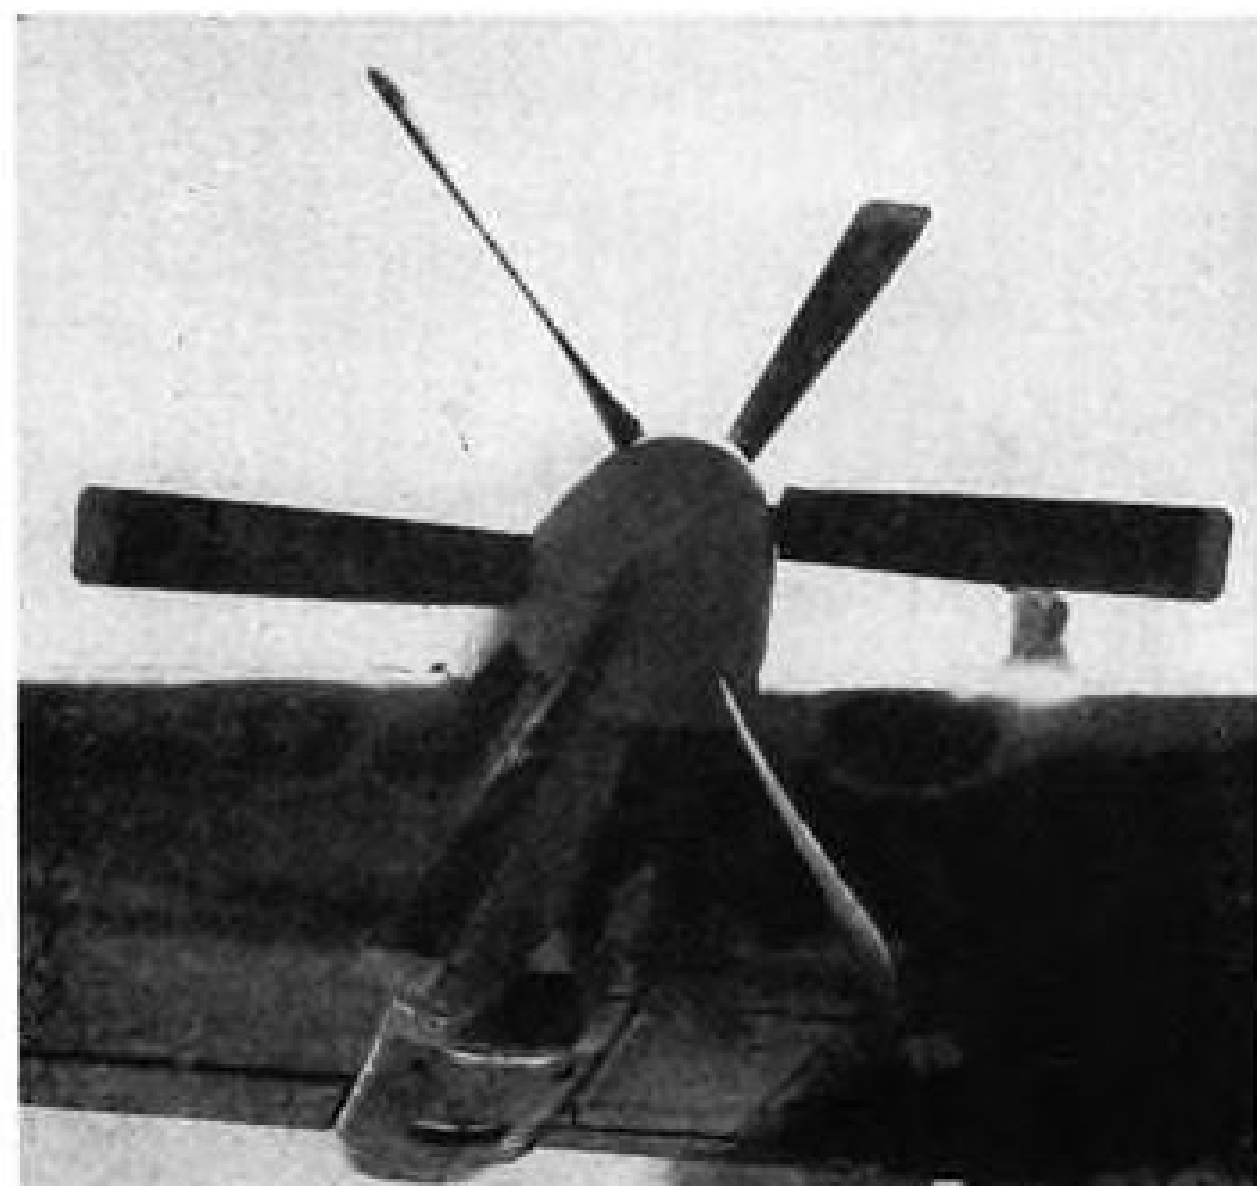

(McGraw-Hill World News)

Sofia—A Bulgarian-Soviet Air Company has been established here to run Bulgaria's domestic airways. Succeeding the former Bulgarian Air Communications, the new company is operating three Black Sea routes.

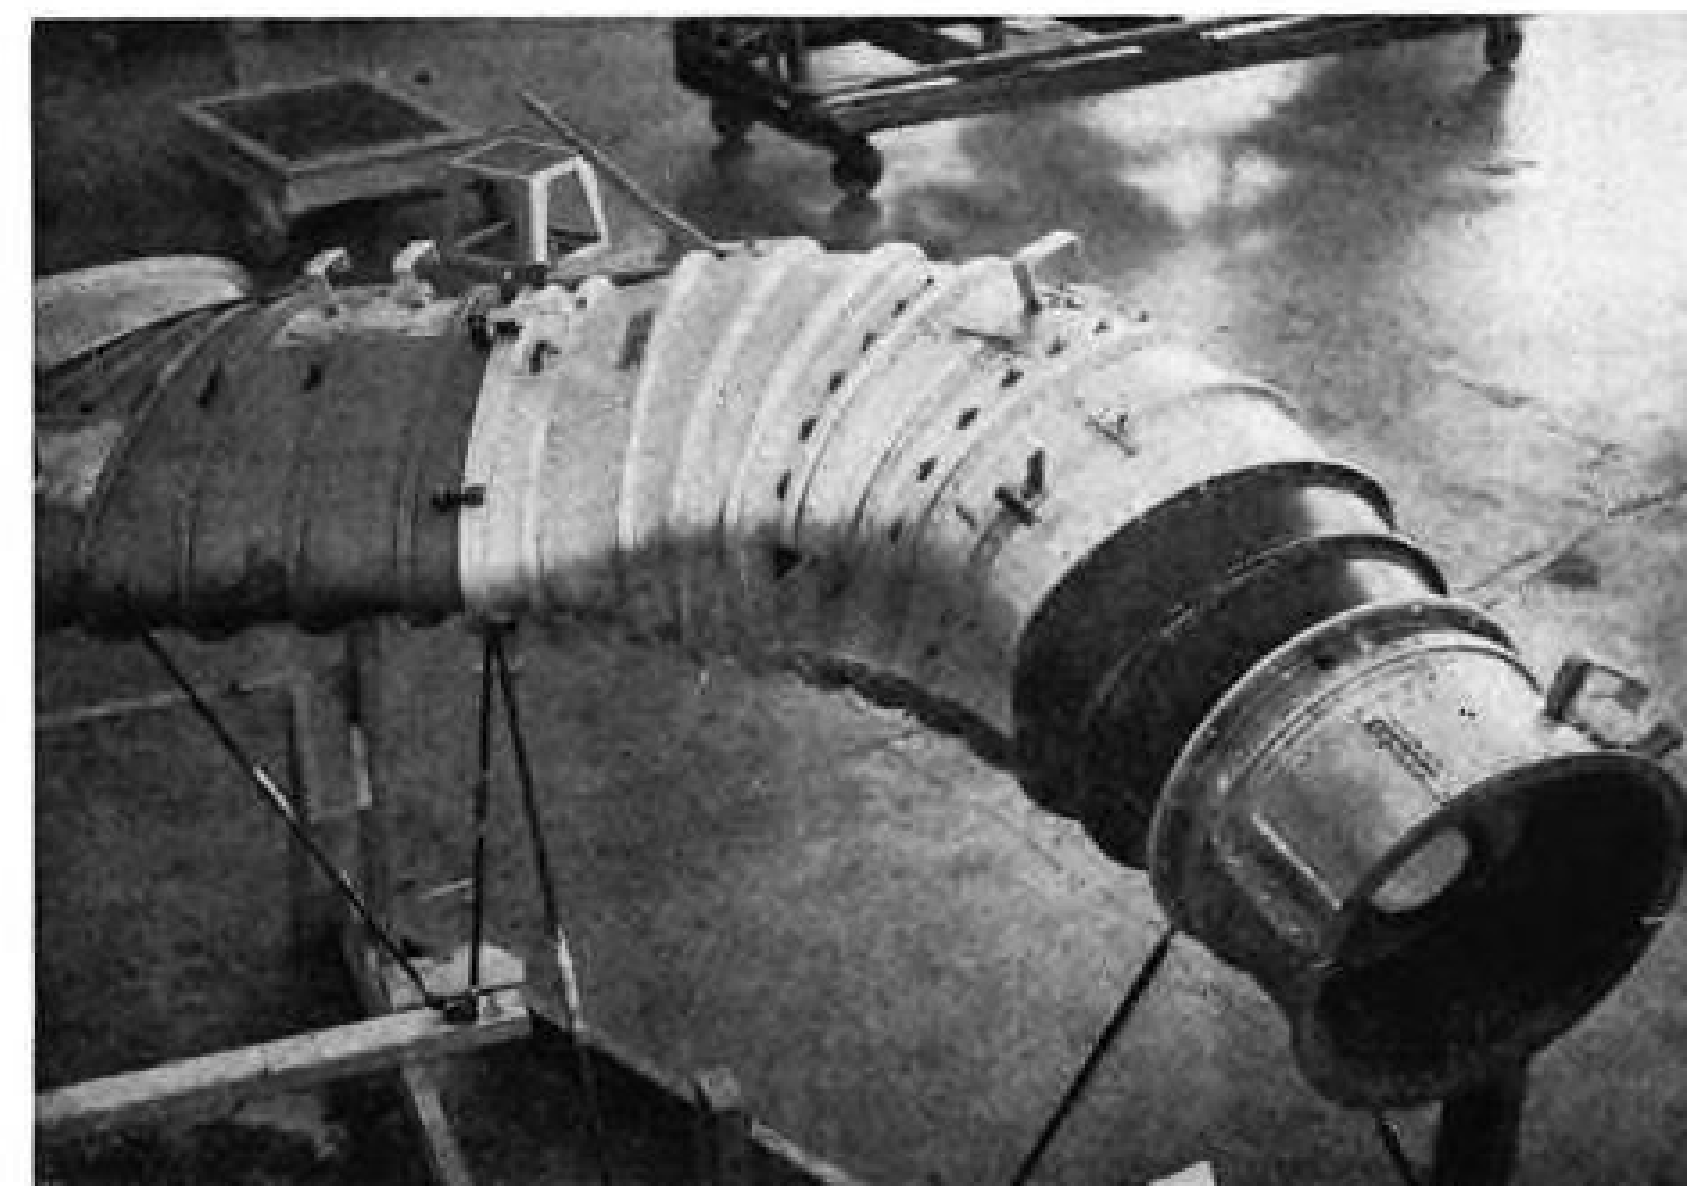

It is reported that the new company is a 50-50 partnership between the Bulgarians and the Russians. Two-engine Soviet planes, described as "noiseless," with 20-passenger capacity are operating on the runs (about 450 kilometers between Sofia and the Black Sea).

Close relations are being maintained between the Bulgarian line and the Czechoslovak Airways, which operate the thrice-weekly line Sofia-Prague via Budapest, and with the Soviet Airways, which run between Sofia and Moscow.

AERONAUTICAL ENGINEERING

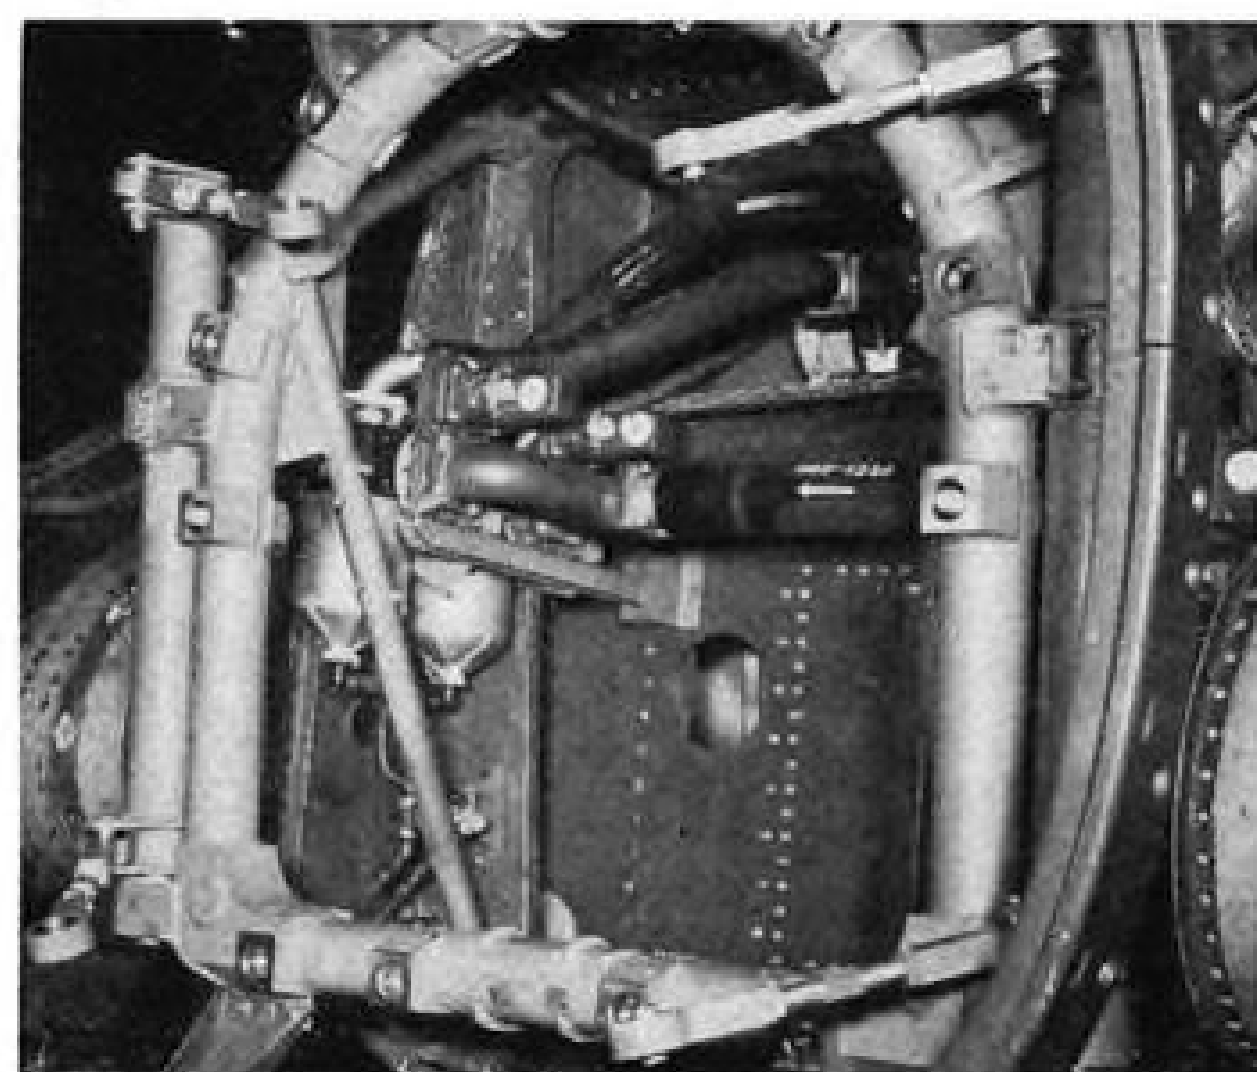

CLEAN nacelle fairing has high-speed oil cooler inlet. Engine intakes are behind propeller pressure peak.

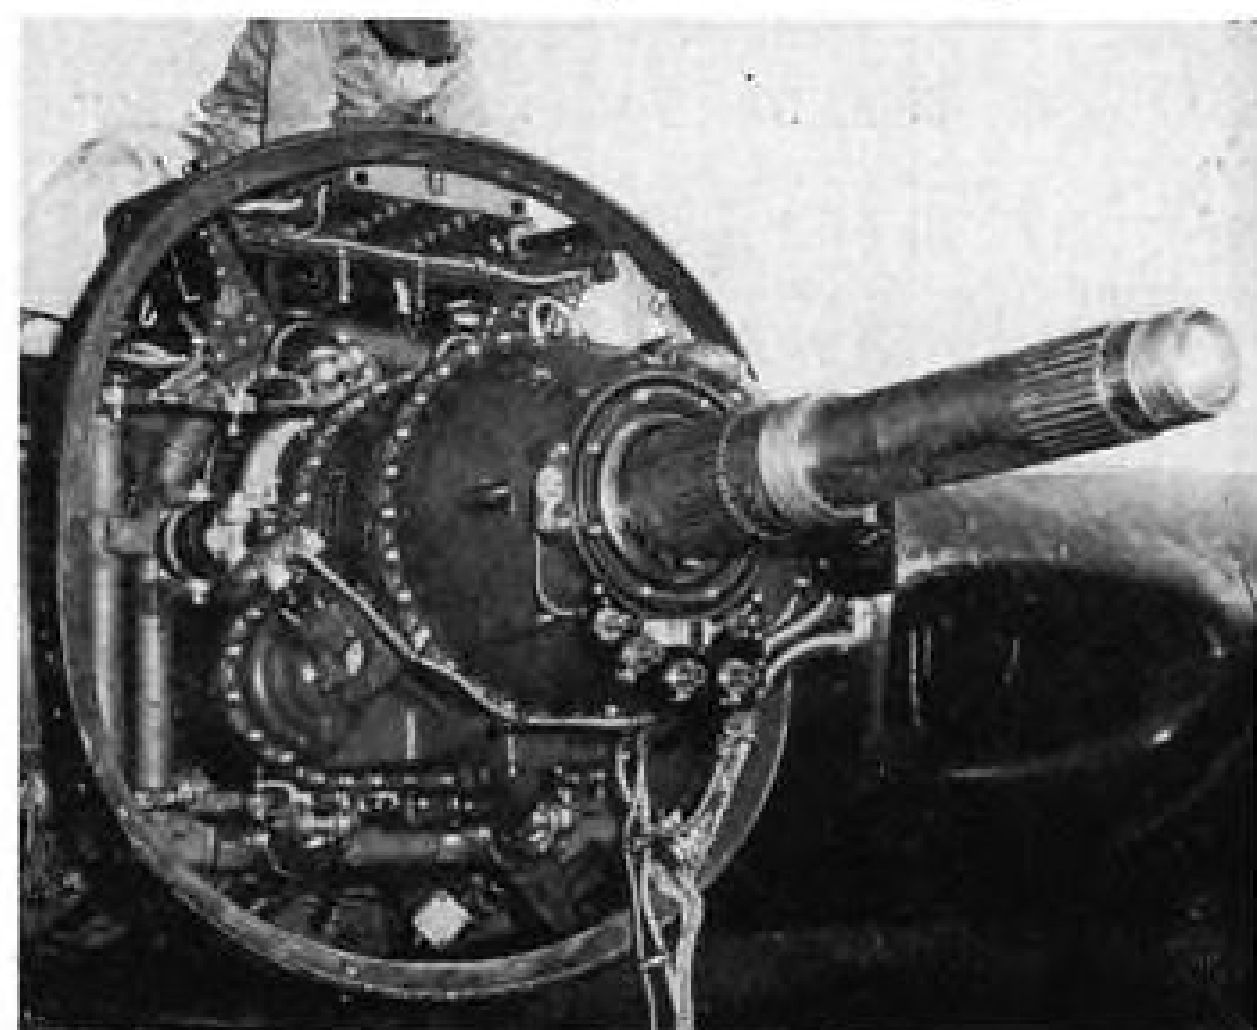

DUCT for engine air, one of eight units, splits to go around drive shaft, returning to a round section at the compressor face, concentric with shaft.

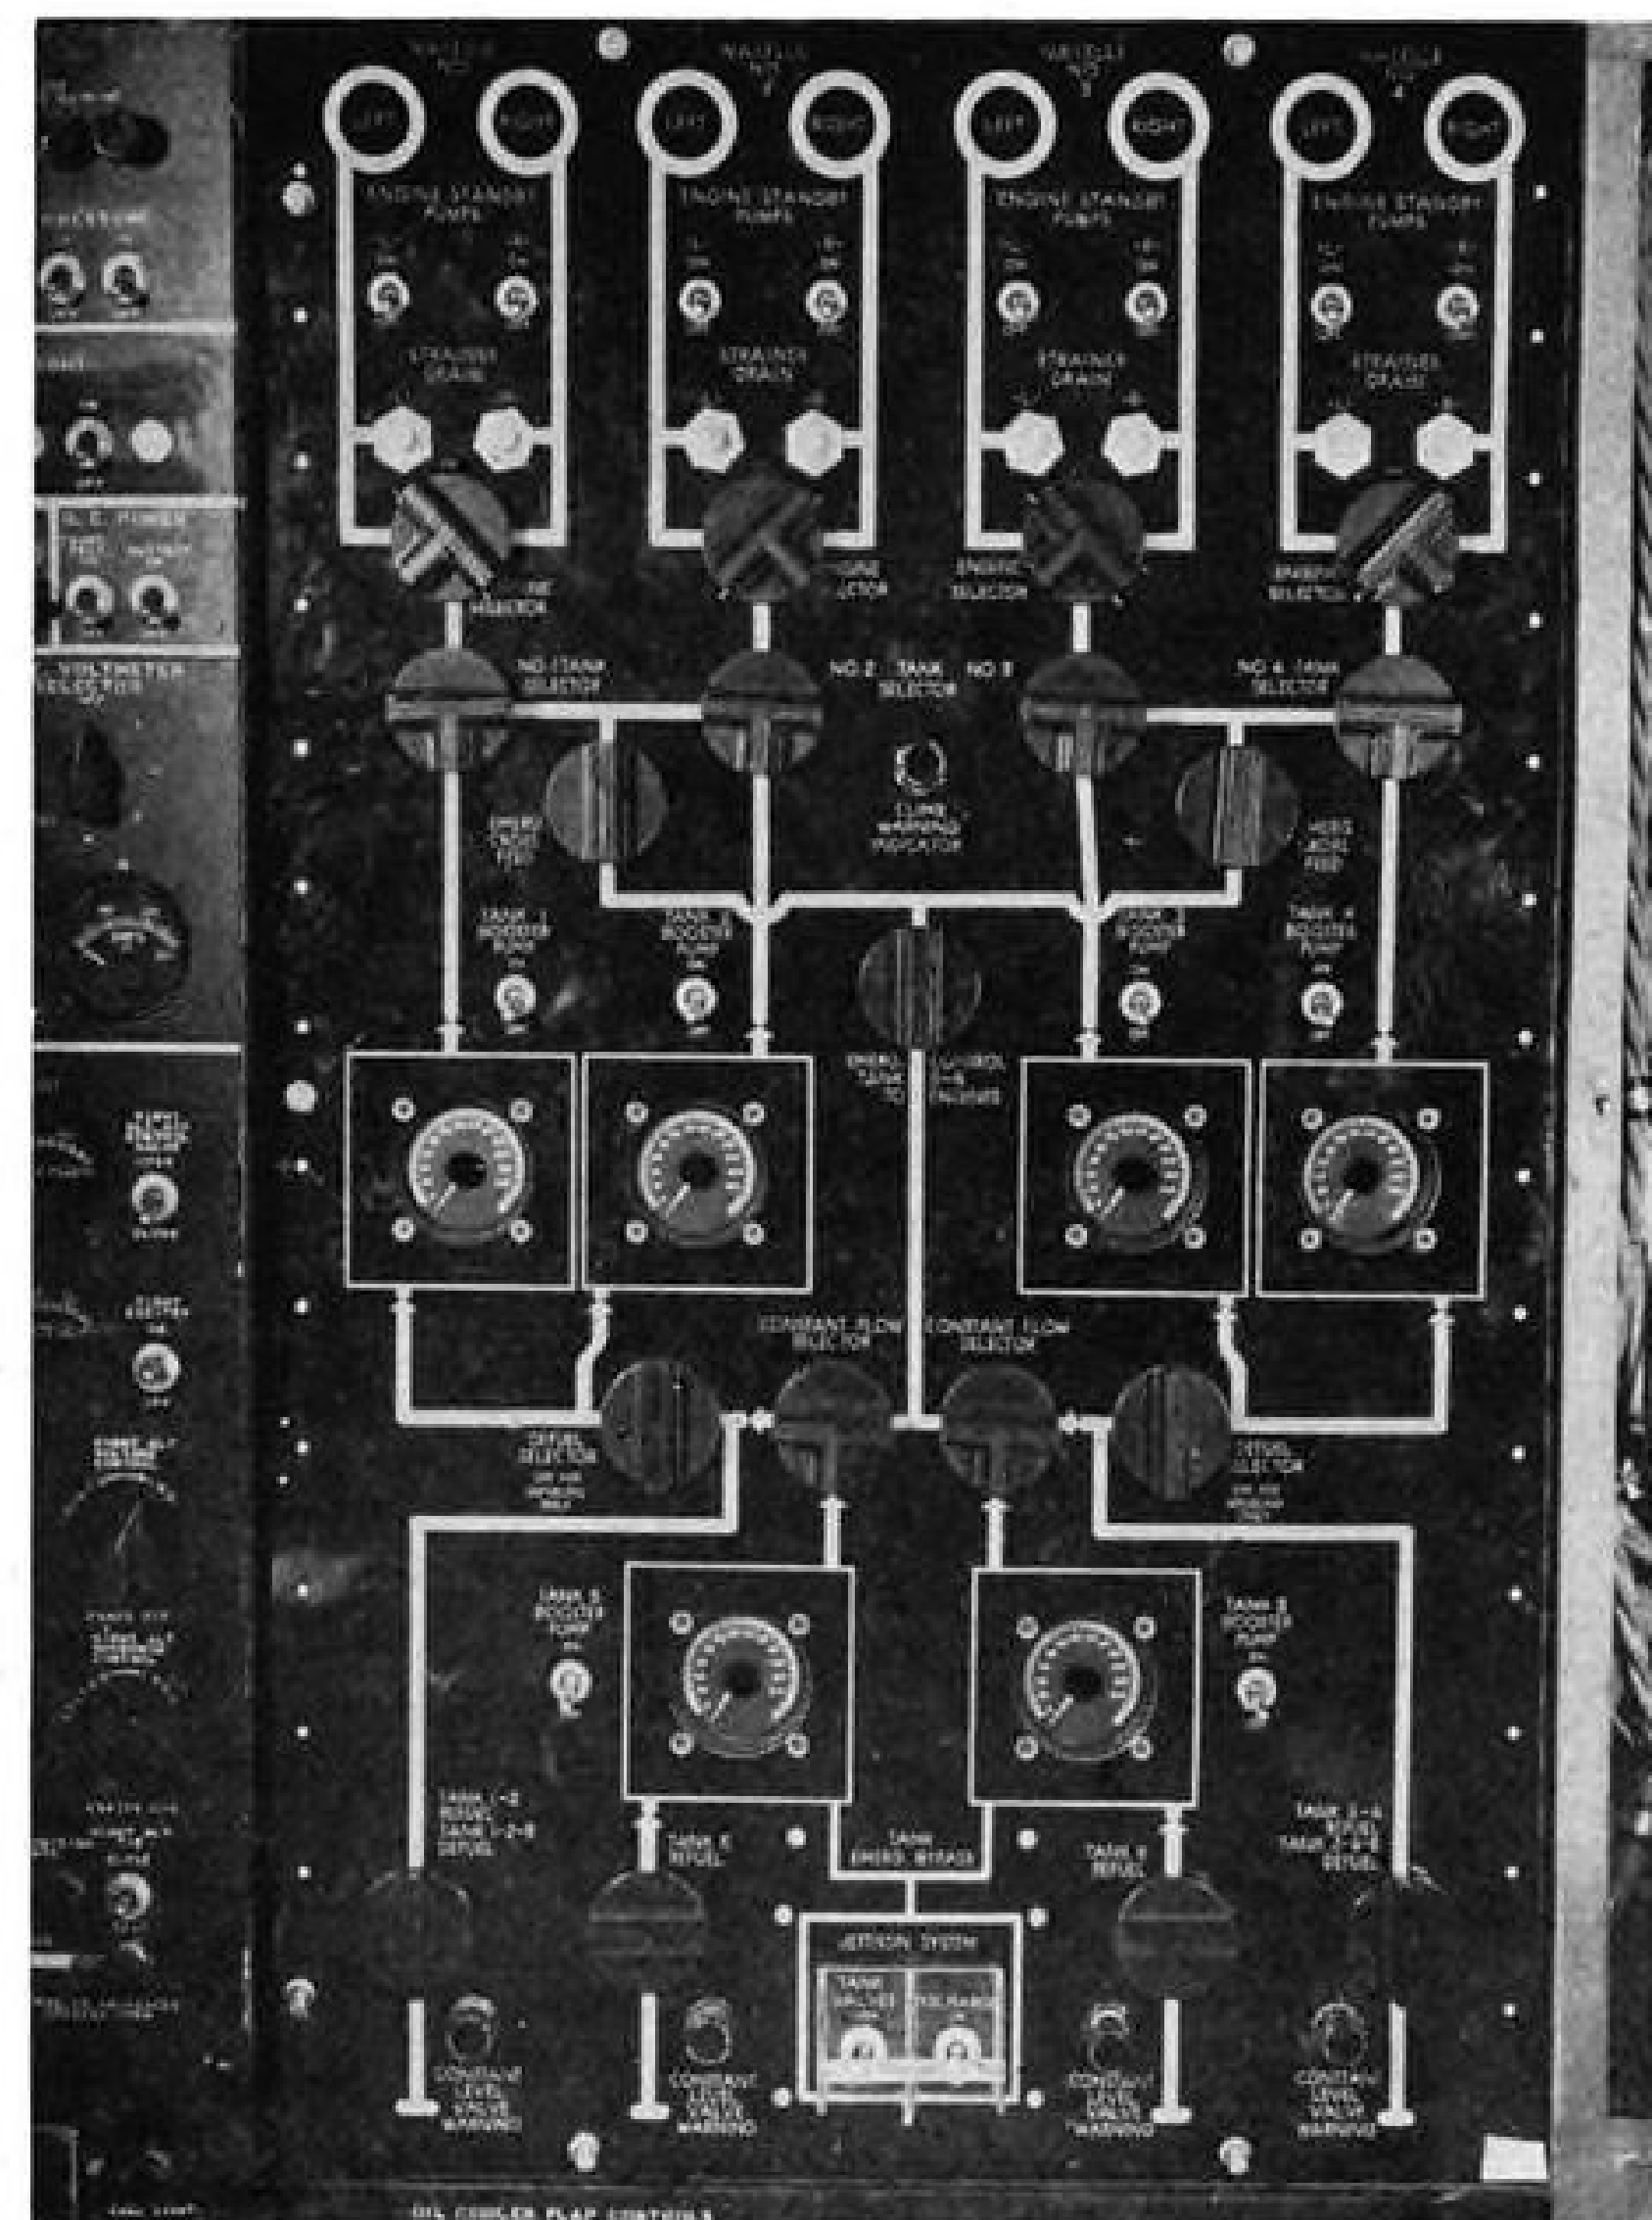

Turboprop Installation Design Highlights

SUPPORT structure for gear box, showing the paired connection bases for six Dynafocal mountings.

GEAR BOX installation, with four mounts visible.

FUEL controls and system schematic, with quantity gages in "tank" squares.

PAIRED POWER UNITS of the compact Allison XT40-A-4 turboprop, seen from the bottom, looking forward. Behind oil cooler rear face are bleed-air augmentors to improve on-the-water cooling.

on XP5Y-1

First details of Convair's XP5Y-1 powerplant installation (Allison XT-40) point up some of the problems to be faced by designers of turboprop aircraft.

The accompanying photos and some powerplant data were presented by F. H. Sharp of Consolidated Vultee Aircraft Corp., in a paper "Current Turboprop Power Plant Installations," at the recent annual summer meeting of the Institute of the Aeronautical Sciences, in Los Angeles.

Convair's giant flying boat was designed to be self-sufficient in advance areas and be able to operate from unprepared bases.

To that end, the entire powerplant can be maintained and serviced from the wing. Auxiliaries can be mounted or demounted with special hoisting equipment carried aboard the craft.

Much attention has been given to getting the necessary air into the engine and coolers in the most efficient manner. Compressor intakes are located in the wing leading edge, within the propeller disk, for maximum ram effect.

Ram air passes with a minimum of disturbance through a split duct (which divides around the drive shaft) to the engine inlet.

The oil cooler, slung below the engine inlets, is supplied with cooling air from what appears to be an NACA high-speed type of inlet. Because the cooling problem is amplified when the boat is on the water, pressure air is bled from the engine compressor section into an ejector just downstream of the oil cooler.

AVIATION WEEK

First in Aviation

The aviation industry's only weekly magazine . . . read and preferred by those who count . . . in engineering, management, production, operations, civil and military.

- 1. Largest advertising volume* of any aviation magazine by a wide margin.
- 2. Largest editorial staff of any aviation magazine.
- 3. Largest number of paid subscribers** of any aviation business magazine . . . sold at the highest rate, \$6 per year. Circulation leader in the most important buying categories—air transportation, airframe manufacturing, aircraft engine manufacturing, accessory manufacturing . . . top penetration in the air services.
- 4. Decisive winner of seventeen reader preference studies conducted by leading manufacturers, advertising agencies, distributors and research centers.

You can reach everyone who is anyone in aviation through AVIATION WEEK.

* measured in dollars or pages.

KOHLER

Precision Parts

FOR LATEST

JET AIRPLANES

The increasing demand for Kohler Precision Parts by leading manufacturers of the newest jet airplanes and other aircraft is the result of the undeviating high standards of Kohler production. With an organization thoroughly experienced and skilled in precision workmanship, Kohler maintains *full facilities in one plant*, under unified supervision, for forging, sand-casting, tooling, machining, finishing, assembling, testing and inspecting. This assures efficient service and prompt deliveries, as well as unfailing product reliability.

In current aircraft production, extensive use is being made of Kohler drain valves, single swing check valves, double swing check valves, 1500 PSI and 3000 PSI check valves, fluid injection nozzles, dump valves, drip valves, metering valves, and many other parts. In addition, Kohler engineers will gladly assist you in developing valves and fittings for any special requirements you may have.

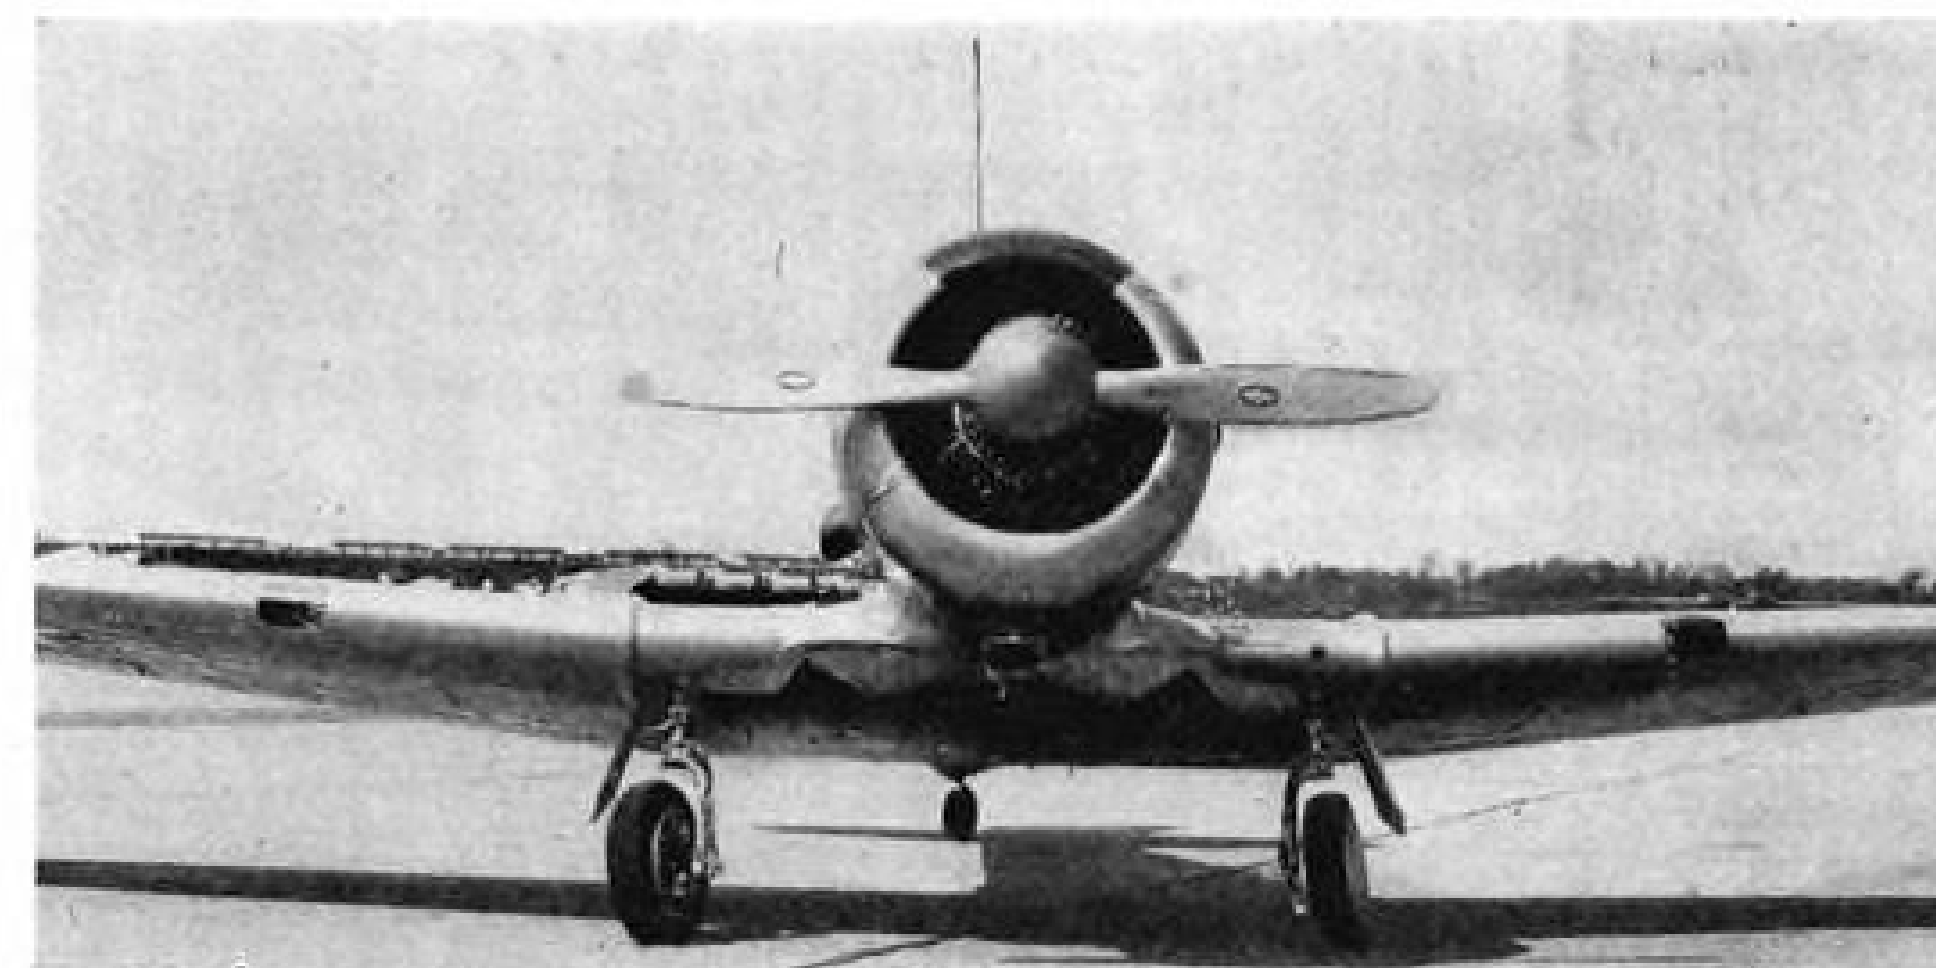

Send for our complete, illustrated catalog

with full descriptions and specifications on valves and fittings for all aircraft, industrial and automotive applications. Kohler Co., Dept. 17-U, Kohler, Wisc.

Goodyear crosswind gear on T-6 trainer has 30-deg. caster either side of center.

Charts show variation of wheel side load with drift for Geisse swiveling gear.

Swivel Gear Interest Quickens

New developments in progress of swiveling landing gear promise to create additional aviation interest in this means of making crosswind landings safe.

• John H. Geisse, former CAA consultant, has brought out his own new simplified type of swiveling gear. He estimates it can be put on an airplane as original equipment at cost to manufacturer for labor and material of only \$15 a unit.

• Goodyear Aircraft Corp. has announced sale of its first crosswind wheels to the Air Force. Air Materiel Command will install seven of the sets on T-6 trainers for evaluation in pilot training.

• Capital Airlines already has taken delivery of its first Douglas Super DC-3 with Goodyear crosswind wheels, and will put it and two sister ships on Southern routes, for the first commercial transport service experience on the

crosswind gear in this country.

Difference in performance between the Geisse gear and others developed under CAA sponsorship, including the Goodyear crosswind wheels, lies principally in the restriction preventing the wheels from swiveling inward. They will turn out, but not in. Geisse studied the problem of side loads on the wheels and determined that this restriction was an added safety feature that was desirable.

He has selected a maximum side-load of about $\frac{1}{4}$ the weight of the airplane as a ratio for good performance and adequate taxi control.

The former CAA consultant brought out his new design in an effort to persuade aircraft manufacturers to build it themselves and install it on their own planes as original equipment, and has no immediate plans to manufacture it himself. He is negotiating for its adoption as original equipment with

such firms as Piper and Cessna, and is also discussing its possible use with the military services.

Geisse explains the theory of his new device like this:

It is essential that the main wheels be capable of generating some side force. Otherwise only the propeller thrust would control the path while on the ground.

Caster restraints in the form of cams, springs or hydraulic units have been used with castered mainwheels to enable the wheels to provide this side force. With such devices the sideload is equally distributed between the two main wheels. In the Geisse gear, the downwind wheel casters out without restraint. The desired side load is obtained entirely from the upwind wheel which cannot turn inward, because of inward castering stops.

Parts used in a Piper Clipper installation of the Geisse gear included: A caster spindle made integral with the wheel axle and provided with a notched collar to stop inward castering; a spindle bearing connected to the Piper landing gear strut; a split ring to hold the spindle in its bearing, a light torsion spring to hold the wheel against the stop in the air, and a cap to anchor one end of the spring and hold the split ring in place.

The spindle bearing was sloped pointing toward the ground, ahead of the wheel. This arrangement would cause a tendency for the wheels to turn in, without the inward castering stops. No shimmy dampers are provided, and they are apparently unnecessary due to the fact that the wheels will not caster through center.

Besides the Piper Clipper installation, the Geisse gear has been flight and taxi tested on a Bellanca Cruisair, and on a Twin Beech executive transport, by modifying existing swiveling gears on these planes to incorporate the new Geisse principle.

The former CAA consultant has stated that owners of existing aircraft now in the market for crosswind gears would be "unwise" to wait for his gear development to become commercially available, thus foregoing the advantages of crosswind gears until his device would be ready for sale.

Zero Reader Orders

Production orders for an undisclosed number of Zero Reader flight instruments to equip USAF Northrop F-89 jet all-weather interceptors have been announced by Sperry Gyroscope Co., Great Neck, N. Y.

The Zero Reader has already been designated for installation in the North American F-86D, all-weather version of the Sabre, according to Sperry.

WORLD LEADER IN JETS....

First in All-Weather Defense

..LOCKHEED

THE F-94 JET FIGHTER

The Lockheed Aircraft Corporation is the largest producer of jet aircraft in the world.

Lockheed has built almost as many jet airplanes as all other U.S. manufacturers combined. In fact, jet aircraft have come off the Lockheed production line at the rate of more than one a day—every day for more than five years.

First American operational jet was the Lockheed F-80, the famous *Shooting Star*, still the backbone of many U.S. squadrons. The first American jet trainer was the Lockheed T-33, which today continues to be the only U.S. jet trainer airplane.

Now, another "first" is being produced in quantity at the Lockheed jet plant. The F-94 All-Weather Interceptor-Fighter is the first production all-weather jet to go into service for the U.S. Air Force.

The F-94 provides America with around-the-clock, around-the-calendar defense. Advanced radar equipment permits this speedy jet to intercept and engage aircraft in total darkness and in adverse weather which would ground today's standard fighters.

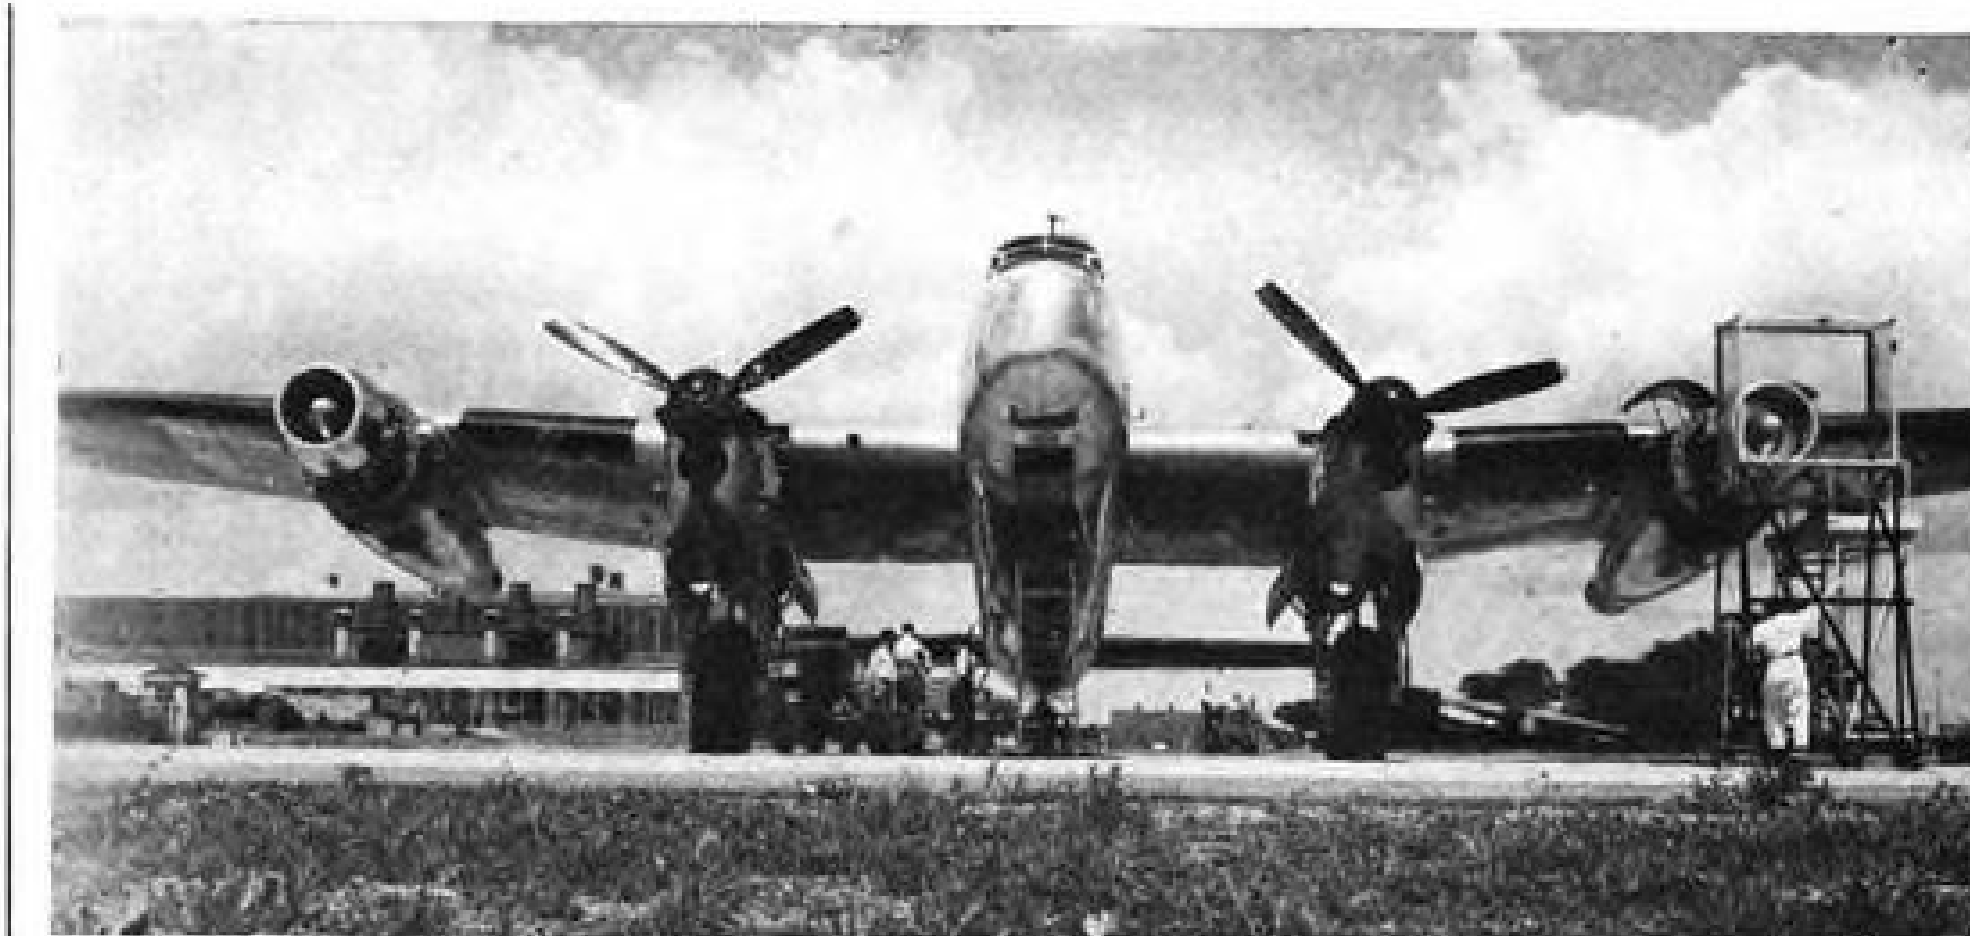

Afterburners provide F-94's with spectacular speed and maneuverability. And smooth, steady flight—characteristic of all Lockheed jets—makes the F-94 a perfect gun mount for its powerful armaments.

The experience obtained in the design, development and manufacture of these practical jet airplanes is invaluable in the Lockheed laboratories where the planes of the future are taking shape today.

Aircraft Corporation, Burbank, California

Look to Lockheed for Leadership

Avro's Orenda Gets Flight Check

Flight testing of the Orenda, powerful turbojet engine being built by Avro Canada, has begun at Malton Airport near Toronto.

Two of the engines have been installed in the outboard nacelles of a converted Lancaster bomber originally made by Victory Aircraft, Avro Canada's forerunner. The engines will thus be tested over a wide range of flight conditions to supplement the hundreds of ground run hours already accumulated on the Orenda.

Purpose of the flight tests is to confirm the performance of the engines before installing them in the CF-100, Avro Canada's all-weather fighter. (Rolls Royce Avons are presently fitted in the CF-100.)

Much emphasis will be placed on evaluation of fuel system and controls. Flight maneuvers will subject the en-

gine to loads and accelerations not possible to simulate in ground tests.

► **Bomber Conversion**—The converted Lancaster is powered by two Rolls Royce Merlin piston engines in the inboard nacelles, in addition to the two Orendas. Flight can be sustained by these piston engines alone.

Simple fairings were substituted for the front and rear gun turrets on the Lancaster. Complete winterization of the aircraft has been done, for possible extension of the flight testing into arctic conditions.

A test observer's instrument panel has been installed at the navigator's position, and photopanels are located in the rear of the fuselage.

Performance data on the Orenda are secret. So are all the data on the Lancaster, as far as endurance, range and performance go.

DH Comet Features Submerged Antennas

The sleek look of de Havilland's jet-powered transport, the Comet, is due in part to a completely submerged antenna system developed by Marconi's Wireless Telegraph Co., Ltd., England. The Comet is the first British civil aircraft to be so fitted, although the Airspeed Ambassador is slated to have such a system.

Fin of the Comet is electrically insulated from the fuselage attachments and serves as a high frequency antenna. Dielectric tips of fin and stabilizer house the VHF and ILS aeriels. A medium frequency grid antenna is submerged in a dielectric panel in the nosewheel doors, and the ADF loop is installed in the fuselage top under flush dielectric windows.

The ILS glide path indicator antenna is placed behind the windshield and the ILS marker, DME and radio altimeter antennas are all housed in underside fillets.

In addition to the submerged antenna system, the remainder of the Comet's radio communication and navigational aid equipment has been engineered and constructed by the Marconi company.

Test Fire-Resistant Hydraulic Fluid

A Civil Aeronautics Administration DC-4 has passed 280 hours of flying time with Hollingshead H-2 flame-resistant fluid in its hydraulic system at the Standardization Center in Oklahoma City. Only minor problems, such as seal swelling and filter clogging, have developed.

A CAA DC-3, operating from the same base, has accumulated several hundred hours using Hollingshead U-4 fluid.

Corrosion of magnesium brake components has been the only trouble encountered so far with this low-pressure system.

... **Tribute to**

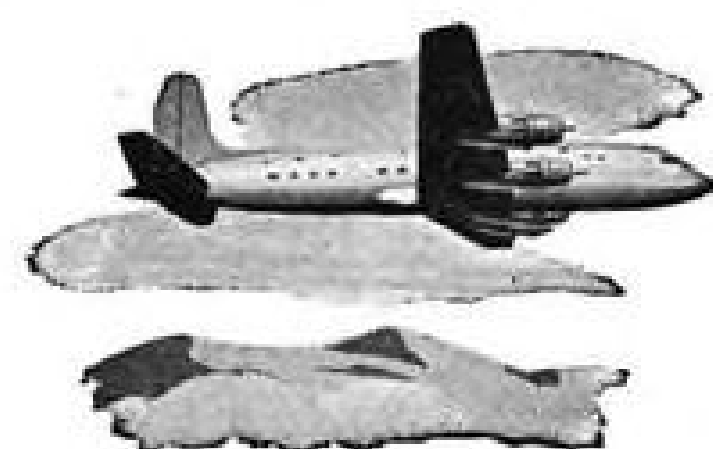

An Unparalleled Combination of Experience and Specialization!

Through years of leadership in the field of aircraft communications, Bendix Radio has built up an organization of specialists unequalled anywhere. If you could meet these men, engineers, technicians and production experts, you would realize that the superiority of *your* Bendix Radio equipment isn't unusual—it's *all* that way—just look what these men have accomplished: They *pioneered* Radar, G.C.A., V.H.F. Omni-Range navigation systems and many other developments for both military and civil use; they have made Bendix Radio equipment famous all over

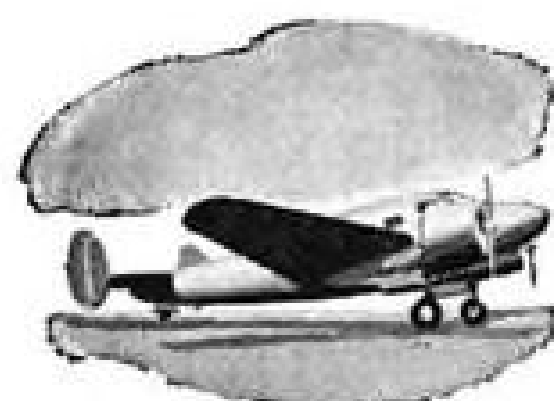

the world for performance and dependability on the job—that includes everything from simple battery-operated range receivers to complete communication systems; in addition, they have made Bendix Radio's manufacturing facilities the largest and finest in the industry. They're busy men at Bendix Radio, and they're working with but one thought in mind—to build constantly better radio equipment for you. Keep these men in mind and you will understand why more planes fly more miles with Bendix Radio than any other make.

Whatever the Plane or Purpose...

PERFORMANCE

Every major airline relies on Bendix Radio communication and navigation equipment—a preference based on sterling performance under every conceivable flight condition in all parts of the world.

FLEXIBILITY

Buying job-designed Bendix Radio allows you to choose for yourself, from a single reliable source, any type of installation, or any combination of equipment—because Bendix Radio builds a complete line of aviation radios.

ECONOMY

For the private flyer, Bendix Radio builds airline quality equipment at prices exactly proportioned to every job and every purse—from a small battery-operated receiver on up.

ADVANCED DESIGN

In the present defense program, Bendix Radio is engaged in helping to find answers to completely new problems. Bendix Radio builds equipment for America's newest Air Force planes.

Copter Analysis

Piasecki reviews ten failings of present-day rotary wing craft.

By David A. Anderton

What's wrong with today's helicopters?

Ten things, said Frank N. Piasecki, chairman of the board of Piasecki Helicopter Corp., and designer of tandem helicopters. And then he proceeded to enumerate and discuss the major arguments against rotary wing craft.

When he finished, the audience—a joint meeting of the American Society of Mechanical Engineers, the Institute of Aeronautical Sciences and the American Helicopter Society—had heard the ten faults laid squarely at the feet of designers. They had also heard some suggestions for tomorrow's copters.

► **Blame Divided**—The ten troubles split up on a six and four basis, with the larger number placed at the door to the

structures room. Aerodynamicists draw the other four squawks. And the complete list reads like this:

► **Structural Responsibility:**

Dependability (freedom from minor annoyances which can ground ship); maintenance (where it is a function of engineering restrictions on the operating life of rotating parts); all-weather operations (but only where blade strength or resistance to erosion or arctic conditions are factors); vibration; complexity; cost.

► **Aerodynamic Responsibility:**

Flying qualities; payload (but where increases come from bettered lifting efficiencies); range (not by adding fuel, but by subtracting drag; speed).

► **Dependability**—Helicopter operations have been hampered by a number of annoyances such as oil pump pressure loss, lubrication system blocks, bearing brinelling, clutch wear and the like.

The solution, said Piasecki, will

Surface Combustion Corporation
2375 Dorr Street
Toledo 1, Ohio

Attention: Mr. James W. Ashby, Sales Manager

Gentlemen:

To say that the installation of Janitrol package heaters in our DC-3 aircraft four years ago solved our major winter operation problem, is putting it mildly!

In fact, prior to the installation of Janitrol heaters, it was not uncommon for us to have the majority of our crews engaged in trying to keep the steam heating systems in operation during the winter months. However, upon installation of the Janitrol package heaters, the time spent in heater maintenance has been reduced to the point where it is of no consequence, and delays due to heater malfunctioning are rare, indeed.

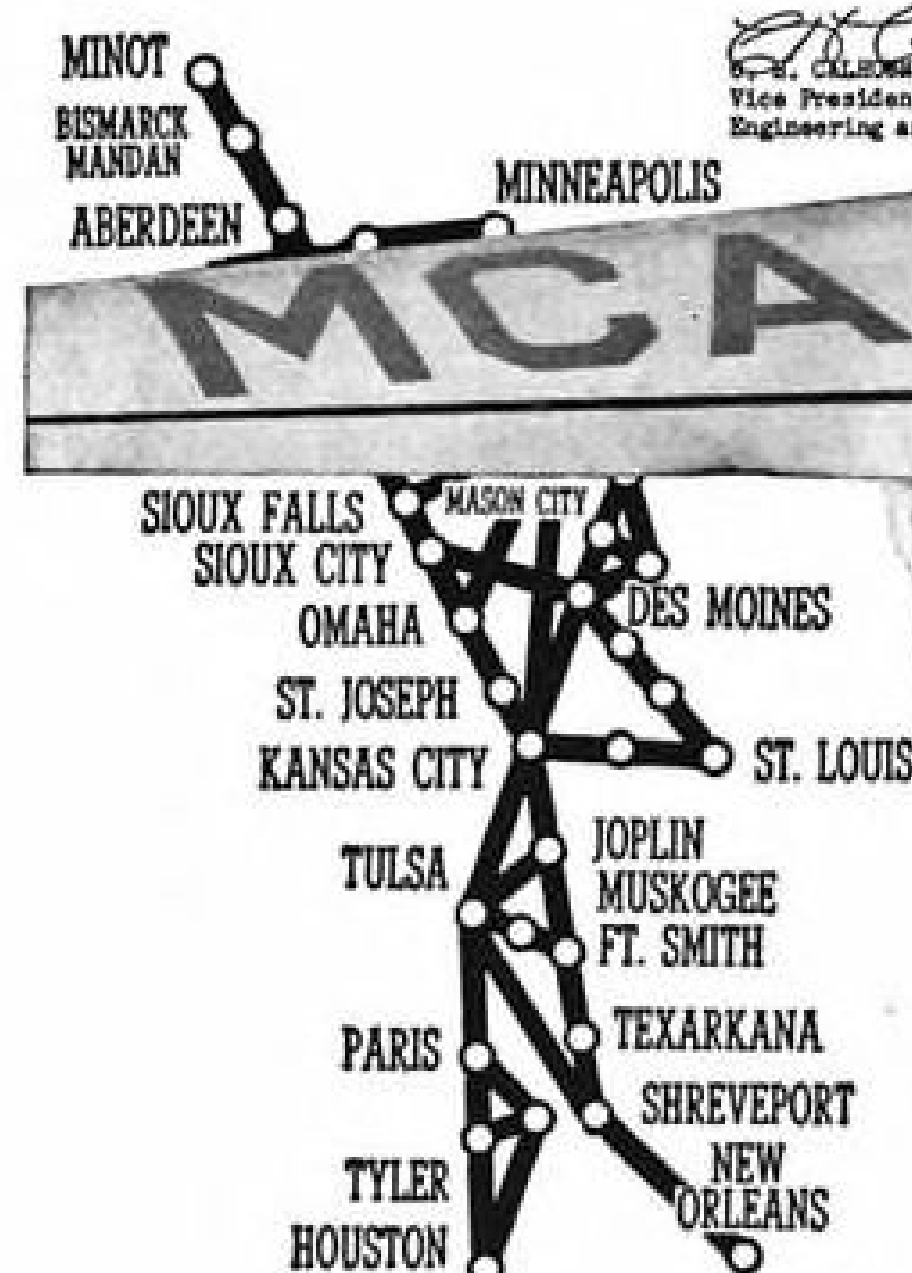

Since converting from steam systems to Janitrol package heaters, our fleet has grown from 10 to 20 DC-3 aircraft, and our heater maintenance has been reduced to a fraction of the time required to maintain the steam systems. In addition, the ground heating provisions in our package heaters have contributed greatly to the comfort of our passengers in enabling them to board a comfortably-heated airplane during the coldest weather.

As you know, our route extends from Minot, North Dakota to southern terminals of New Orleans, Louisiana, and Houston, Texas. Despite such temperature extremes, the Janitrol heaters have proven themselves equal to all occasions.

Yours very truly,

MID-CONTINENT AIRLINES, INC.

W. C. CULLEN
Vice President -
Engineering and Maintenance

Flying from deepest south straight north through the heart of America, you run into temperature extremes almost any day of the year. No wonder Mid-Continent Airlines is glad to have dependable heating all along the line on a routine basis . . . with its fleet of 20 DC-3s standard-equipped with Janitrol package heaters . . . Thanks, Mid-Continent, for your letter, and congratulations on your award for one of the industry's best safety records . . . Putting it mildly, we believe you'll continue to find "Janitrol heaters" an important item to write into aircraft specifications. Your nearest Janitrol representative is always at your service.

NAS INTERNAL WRENCHING AIRCRAFT BOLTS

...are made to latest NAS Specifications. Threads are fully formed by rolling after heat treatment, an important UNBRAKO feature. Full range of standard sizes.

CLOSE-TOLERANCE,
HIGH-STRENGTH,
SHEAR BOLTS

EXTERNAL WRENCHING NUTS

...incorporate the famous FLEXLOC self-locking principle and one-piece, all-metal construction. The exceptional reliability of this construction has been proved by the millions of FLEXLOCS used in the aircraft industry.

Other outstanding advantages include:
Maximum tensile with minimum weight
Approved under latest NAS Specifications
Large bearing surface
Positive self-locking—"won't shake loose"
Temperature range to +550° F.

No special tools needed—use standard 12-point socket or box wrenches. Designed for use in cramped quarters
Sizes from 1/4" to 3/4" NF Thread Series
Send for samples and information.

ONE-PIECE SELF-LOCKING NUTS

The one-piece FLEXLOC is both a stop and a lock nut, due to its resilient segments which lock *positively*, even under extreme vibration. Torque is unusually uniform—within a few inch pounds. "Thin" and "regular" types; NC and NF threads. Officially approved by many U. S. depts., bureaus, etc., and CAA for aircraft use.

Write for further information on these UNBRAKO and FLEXLOC Products.

SPS STANDARD PRESSED STEEL CO.
JENKINTOWN 3, PENNSYLVANIA

come from more accurate knowledge of loading conditions, the operating stresses produced by those loads, quality control and endurance proof tests. "No effort should be spared during the design of a new helicopter in investigations of this nature on all dynamic parts."

► **Maintenance**—Today's copters require the highest percentage of maintenance hours to be spent in the removal and disassembly of major components for periodic inspection and overhaul.

One reason for the disparity between rotary and fixed-wing craft is in the engineering restrictions on the operating life of the copter parts. Contributing to these restrictions are lack of operating experience, isolated failures, incomplete stress values and insufficient statistical data on load size and occurrence.

The cure, it was stated, would come when sufficient numbers of rotor hubs and transmissions have accumulated long service life without failures, permitting an extension of the arbitrarily-limited overhaul period.

Piasecki added a pertinent comment: "The maintenance factor is directly under the designer's control, and with sufficient emphasis upon it in his design, further progress can be made."

► **All-Weather Operations**—Humidity, temperature, rain and dust damage the ordinary rotor blade severely. Blade icing is a problem. Cold affects lubricants.

And so, the designer calls for metal blades, uses the latest results of lab testing of the blade icing problem, and selects a suitable arctic lubricant.

► **Vibration**—"Much humor is expended on the helicopter because of its vertical bounce as well as its vertical lift. Most of this humor stems from real causes although it is frequently exaggerated. All the causes of vibration emanating from the rotor system are not fully known as yet, but means to investigate them as to their seriousness and their effect on the structure as well as methods by which their discomforting feeling can be eliminated are definitely known and available to the designer.

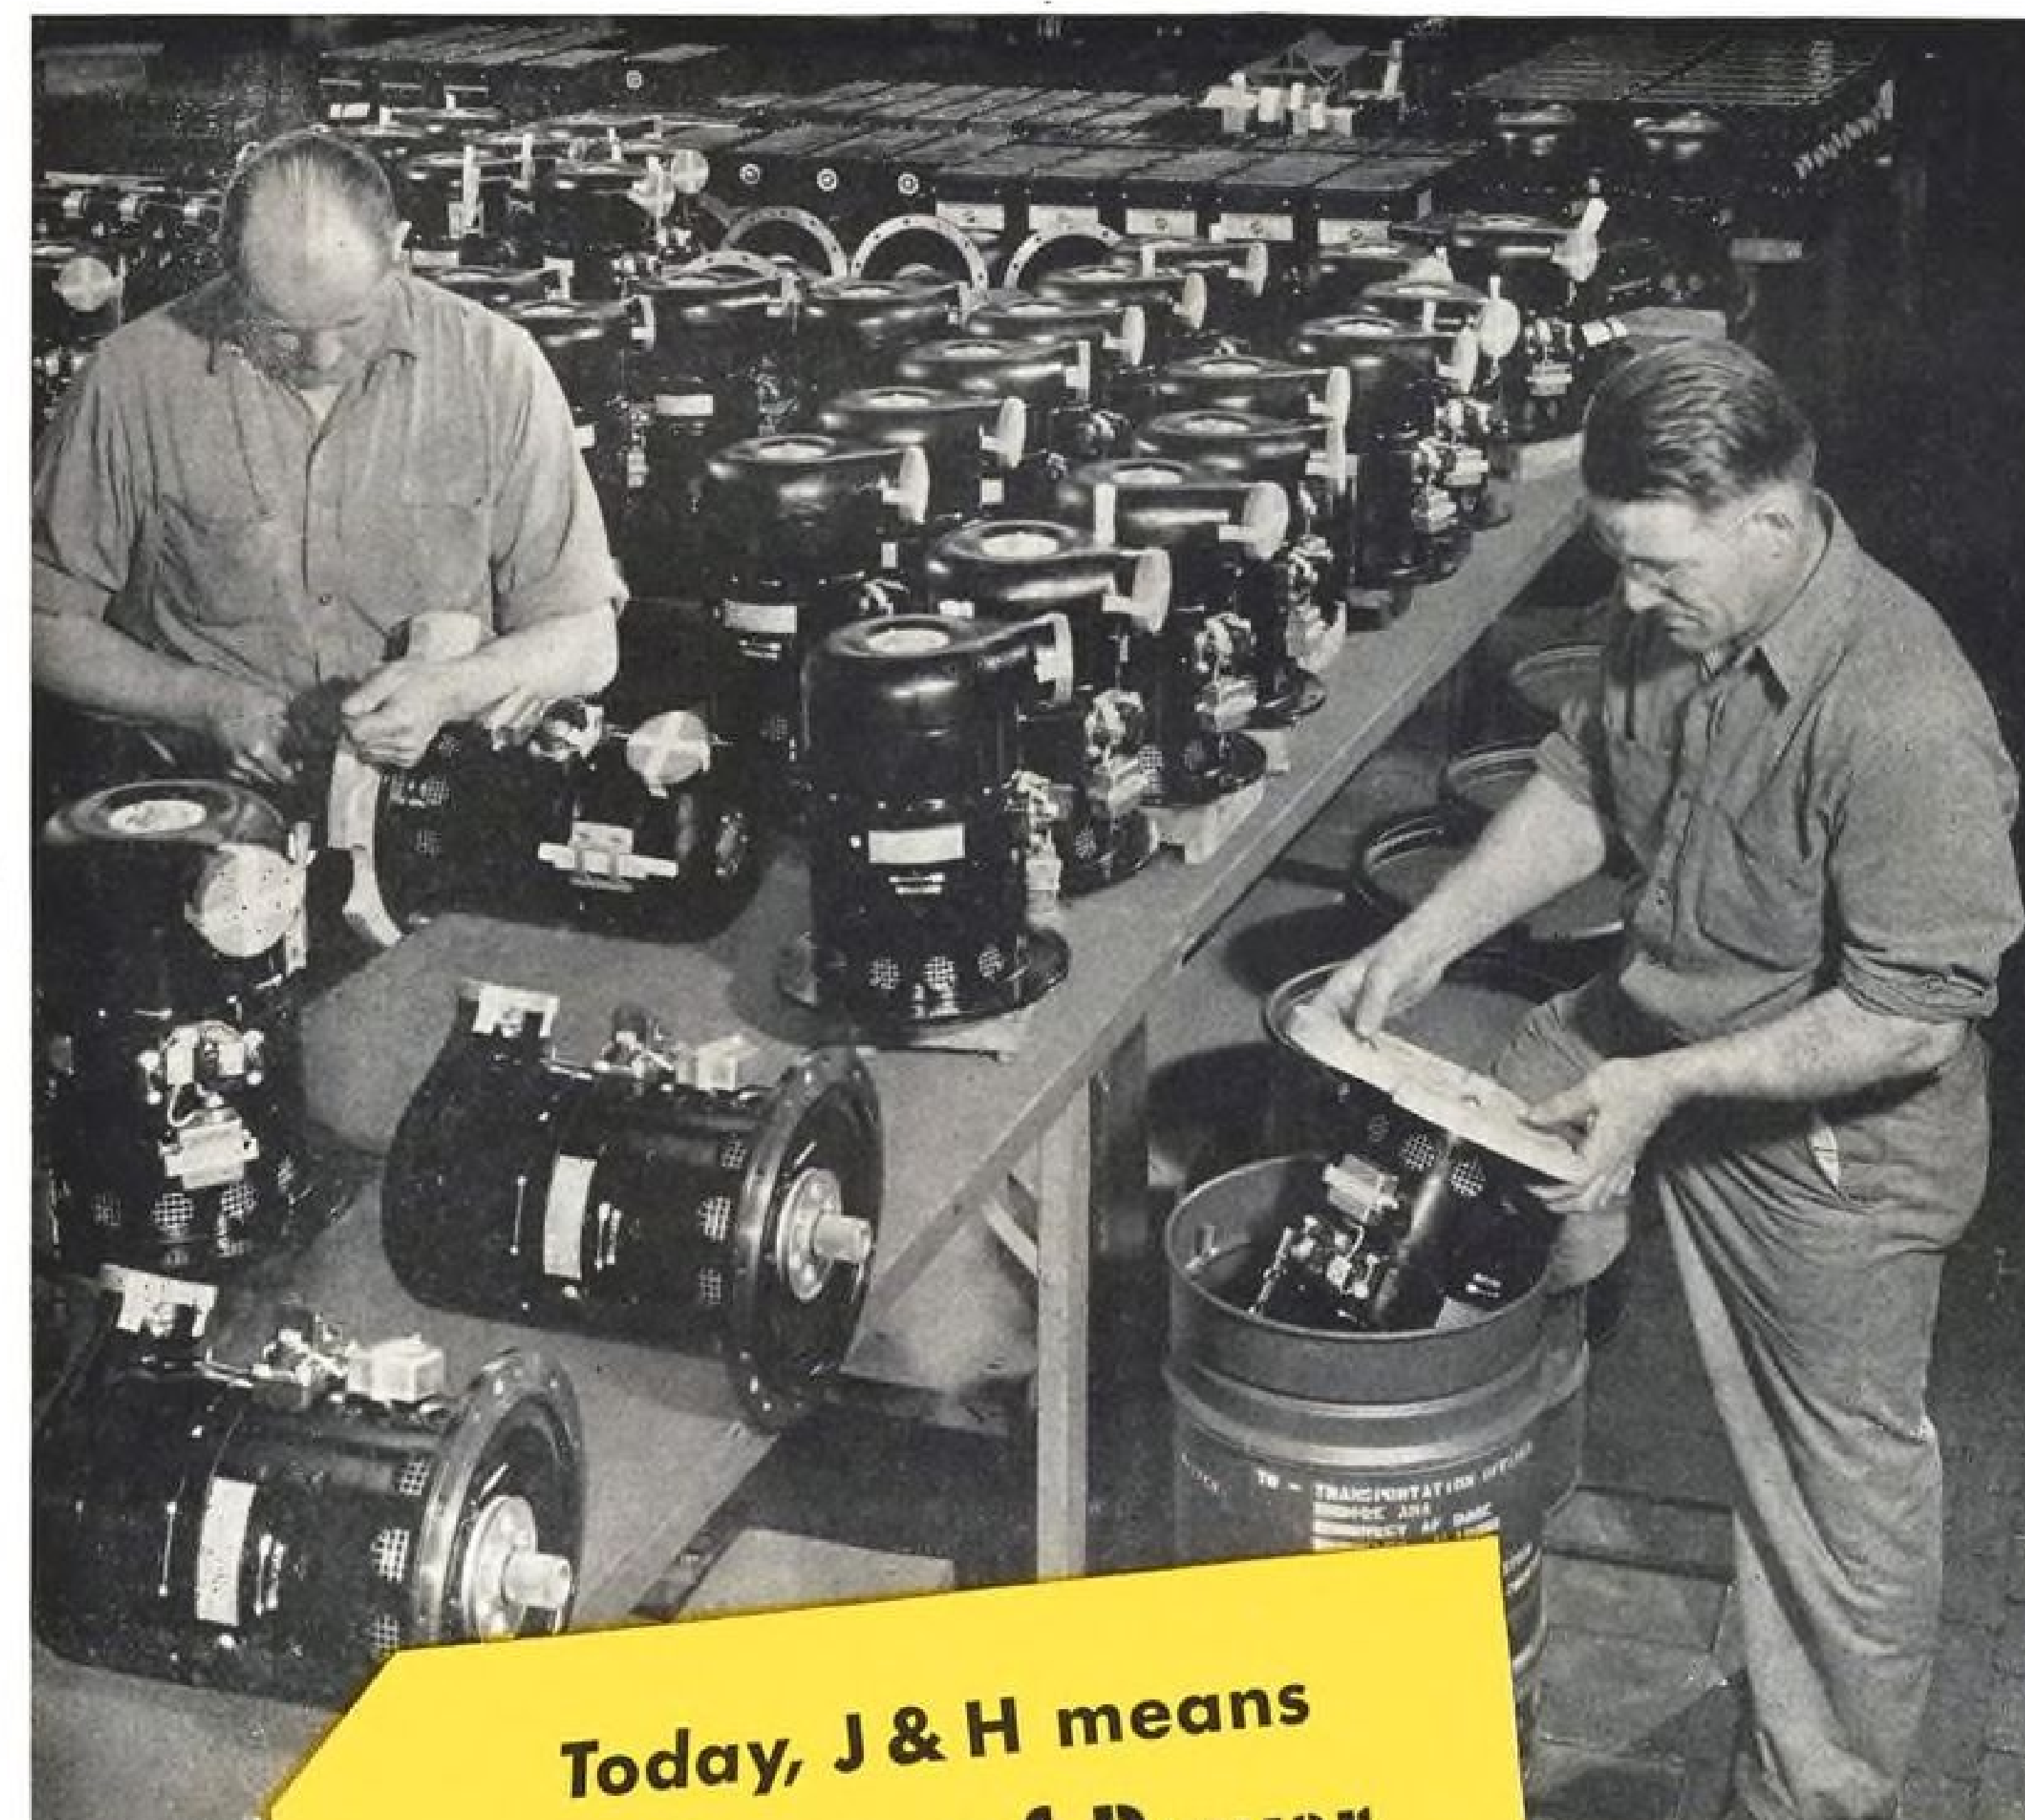

"These considerations must be given to the design in its original conception . . ."

► **Complexity**—Rotating parts cause most of the complexity of copter construction.

Basic simplification of complaint does not seem attainable without eliminating the present transmission scheme entirely, going to jet rotors, for example.

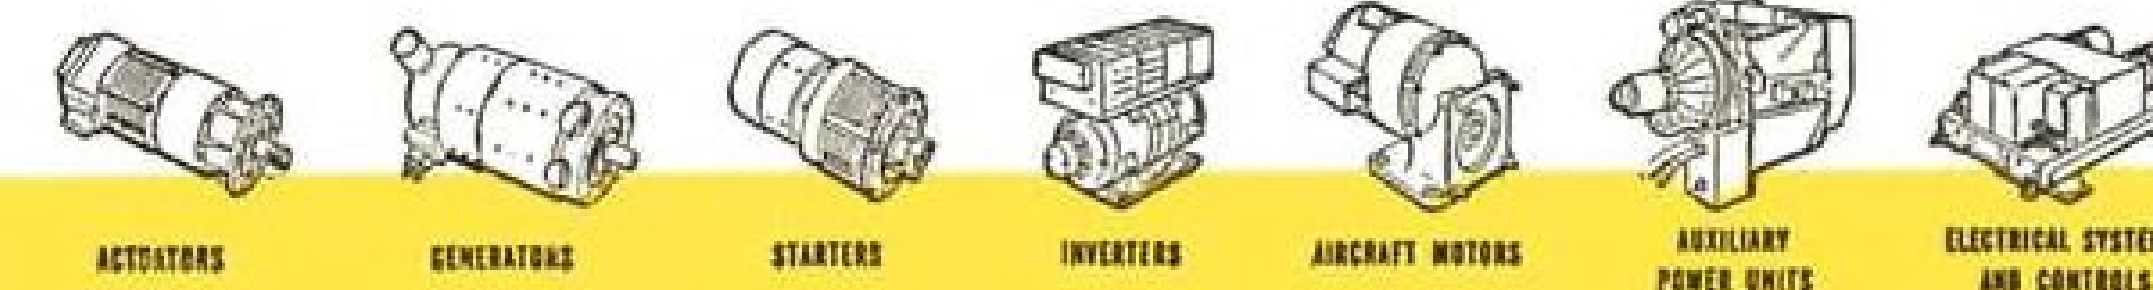

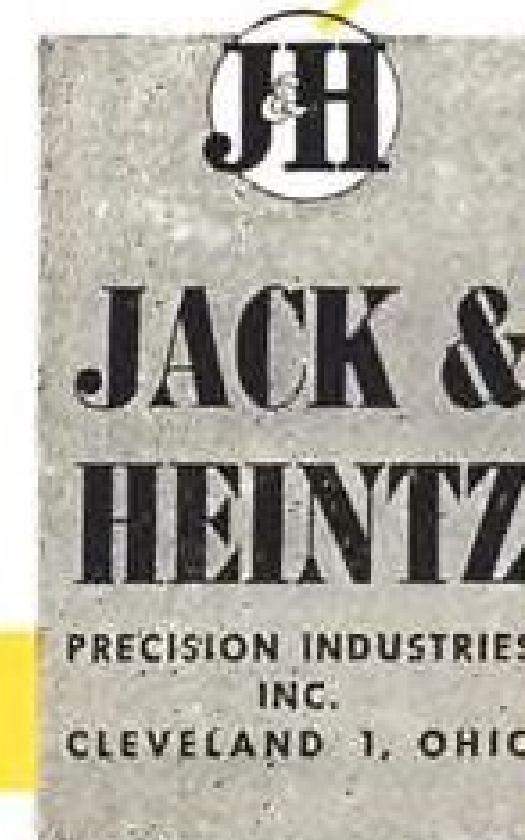

"Much can be done, however, in simplifying detail design."

► **Cost**—Rotary wing craft are penalized with many mechanical components, expensive to manufacture in small lot production. And of course, the helicopter has not had the benefit of any

BETTMANN ARCHIVE

... the prime requisites and the mark of the master pilot throughout the ages.

But no hand, however staunch, no eye, however steady, could master the modern high-speed aircraft without aid from its complex instrumentation and control systems. These are the systems that strengthen the pilot's hand a hundred-fold... that present to his watchful eye, instantly and accurately, his progress in flight.

★ And the heart of these systems is frequently a small, high-precision electric motor produced by Kollsman engineers—outstanding specialists in the field.

★ Each unit in Kollsman's line of miniature special purpose motors represents the solution to a particular control problem. Each one has been engineered to provide specific performance characteristics, with the same high degree of precision for which Kollsman instruments and optics are known.

★ The skill and experience of Kollsman engineers are available to you in the solution of your instrumentation and control problems. Address: Kollsman Instrument Division, Square D Company, 80-08 45th Avenue, Elmhurst, N. Y.

large-scale production orders, so that tooling costs could be amortized over many aircraft.

The implications here are fairly obvious, too. Designing for the application of existing machine tools, standardization of materials and processes, and volume production are the answers. And the first two can be supplied by careful design.

► **Flying Qualities**—The primary criticism here was insufficient stability, resulting in "excessive pilot effort to maintain continuous blind flight."

Loads can actually be reduced by the use of bungee or servo systems, thereby relieving some of the strain on the pilot.

While the problem of blind flight in the hovering regime is one that has not been completely licked, methods to achieve this have been conceived. Although Piasecki did not specifically mention it, the rotor-attitude sensor developed by Bell Aircraft Co. (AVIATION WEEK June 26, 1950) would appear to be one of the applicable methods.

► **Payload**—Piasecki stated that the useful load of the largest helicopter is less than one-tenth that of the largest airplane.

This disparity can be cured both by increases in aircraft size, and improvements in the lifting efficiency; both of these cures are design.

There seems to be, for example, no obvious limit to the practical size of the helicopter rotor. One project, said Piasecki, plans a diameter sufficient to lift a light tank.

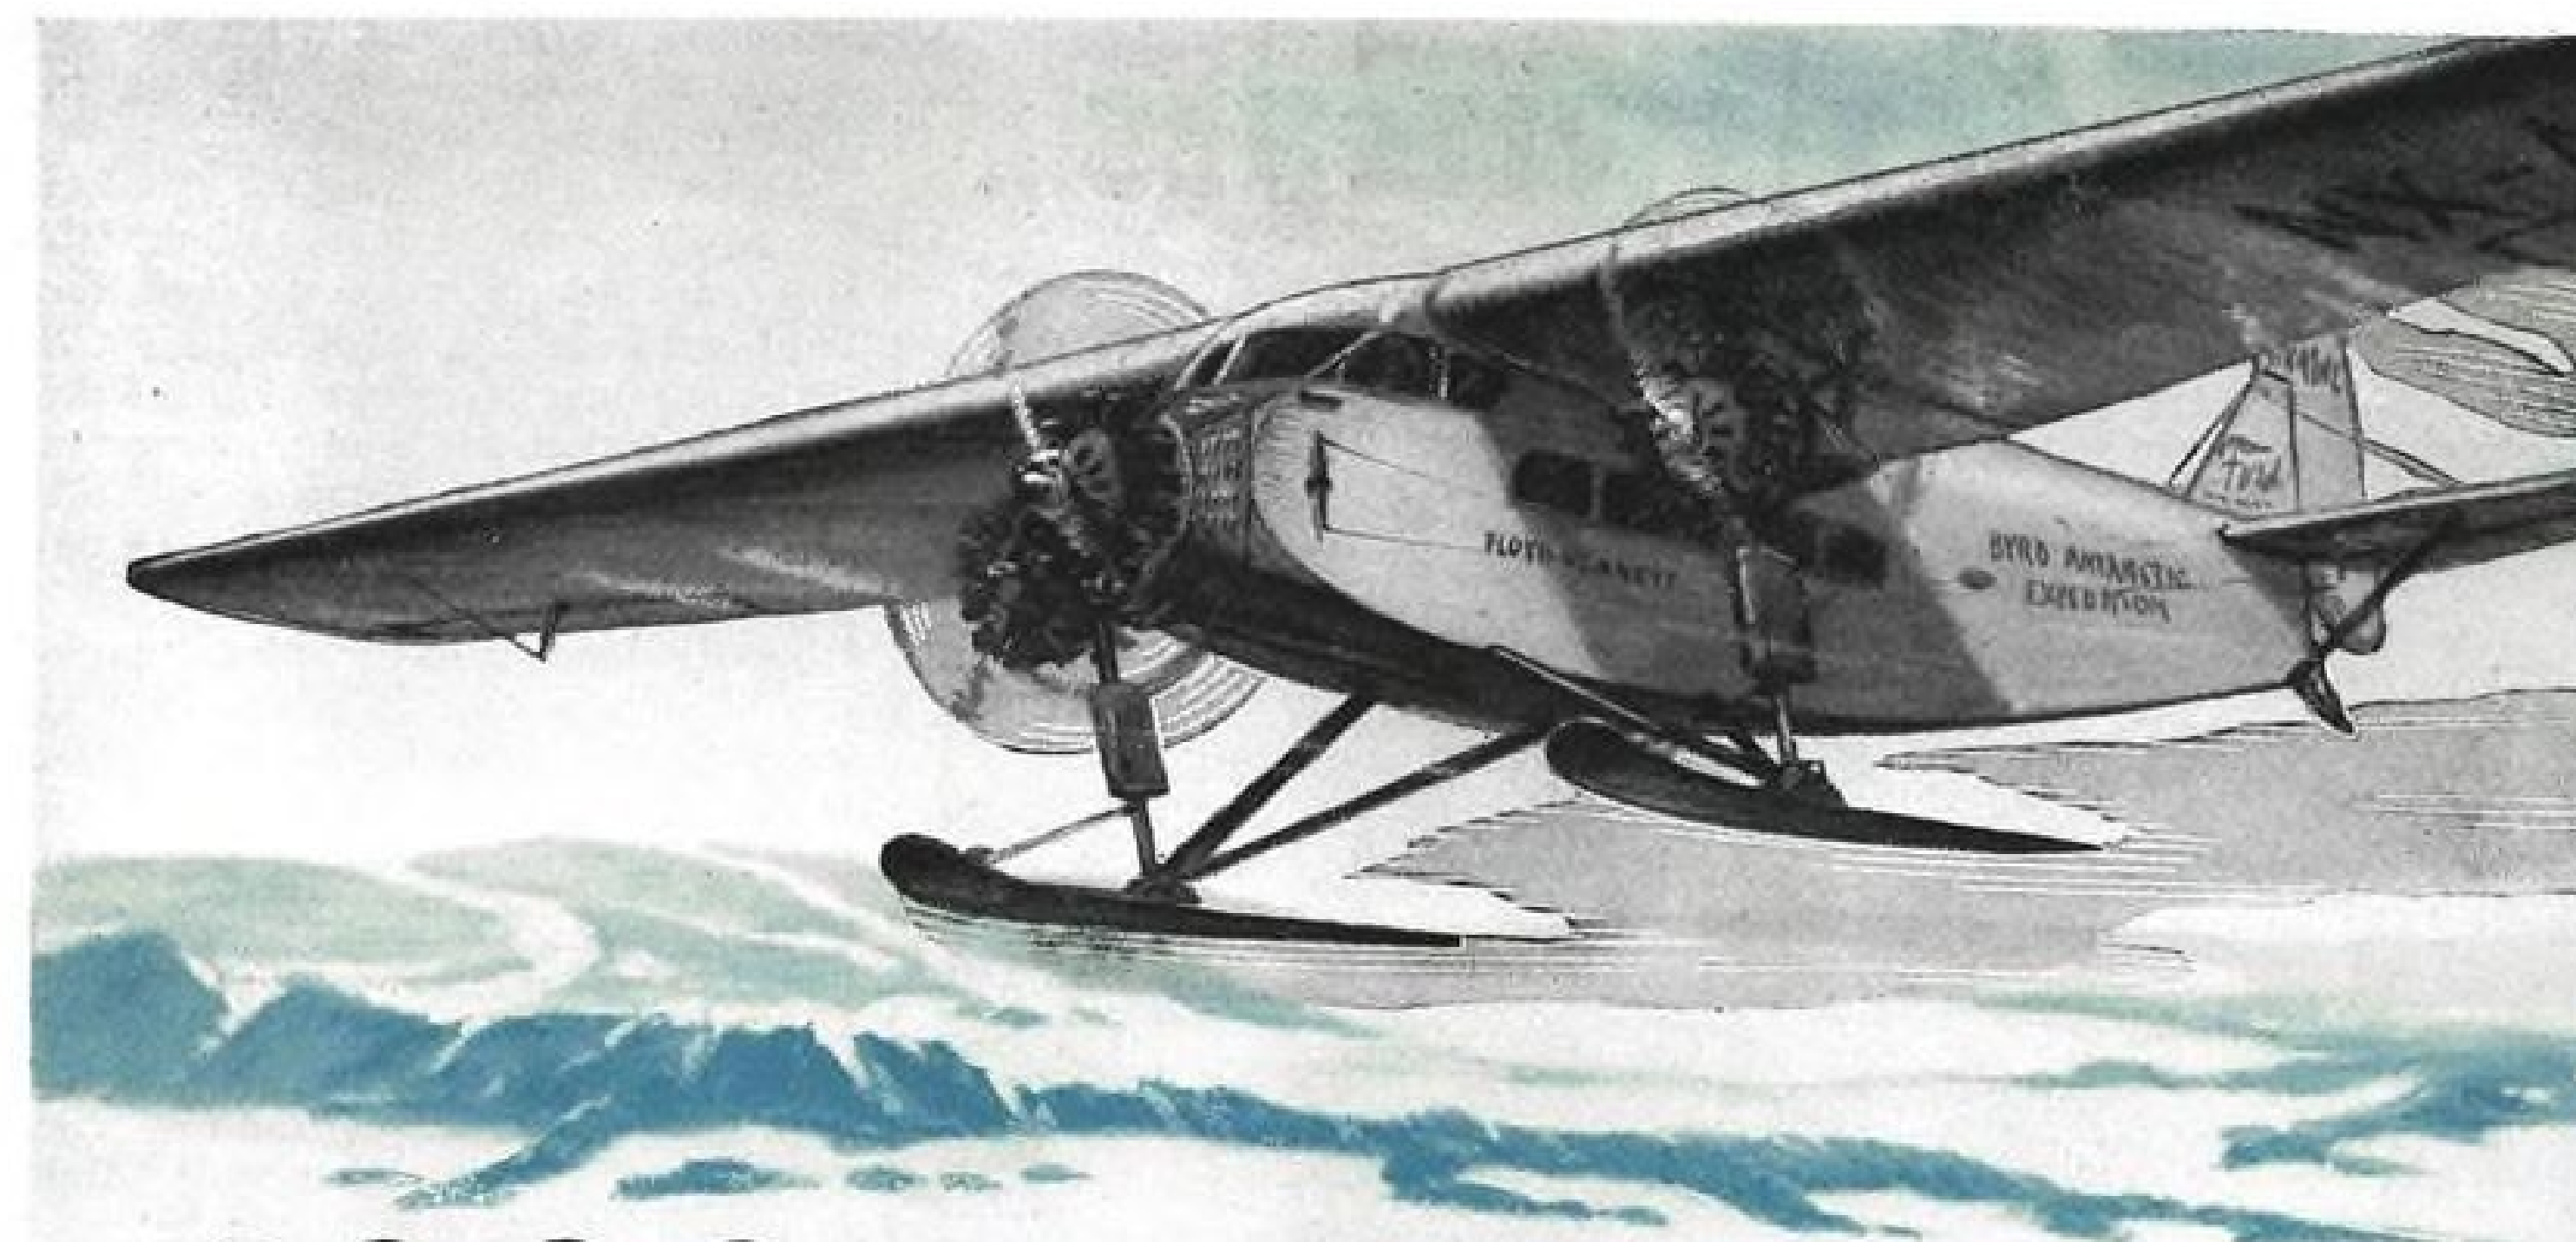

Rotor disk loadings (analogous, but not comparable to airplane wing loadings) can be increased to boost the lifting capacity of present-day ships. Generally, this means higher sinking speeds in autorotation, but research programs will provide information for the designer.

Structural and aerodynamic efficiency increases also will improve the weight-carrying characteristics of copters, whose current useful load capabilities represent about one-third of the gross weight. For driving the rotors, a gas turbine, instead of the present piston engine, can increase the useful load by 35 percent. Payload, contrasted with useful load, depends on range; but even at 200 miles, the improvement due to the turbine is almost 20 percent.

► **Range**—Since most helicopter missions are short-range, this particular problem does not appear too bad. It can be licked by design, and it seems desirable to do so.

Any drag reduction, for example, benefits the range—and drag reduction is one of the chief functions of aerodynamicists.

Piasecki also said that the range could be extended by flight refueling,

1929

Alcoa Aluminum flew with Byrd over the bottom of the world

It was no place for men or machines. They called it Little America, a frozen outpost on the edge of the Antarctic. From this dreary base, Admiral Byrd and his crew headed their Ford Tri-motor monoplane due south into the unknown—and flew

back a few anxious hours later marked for fame as the first aerial explorers of the South Pole. It was a milestone in flight-metal history, too. Byrd's plane was all-metal—with spars, bulkheads and skin of Alcoa Aluminum!

1950

Alcoa again produces Magnesium Sheet and Plate

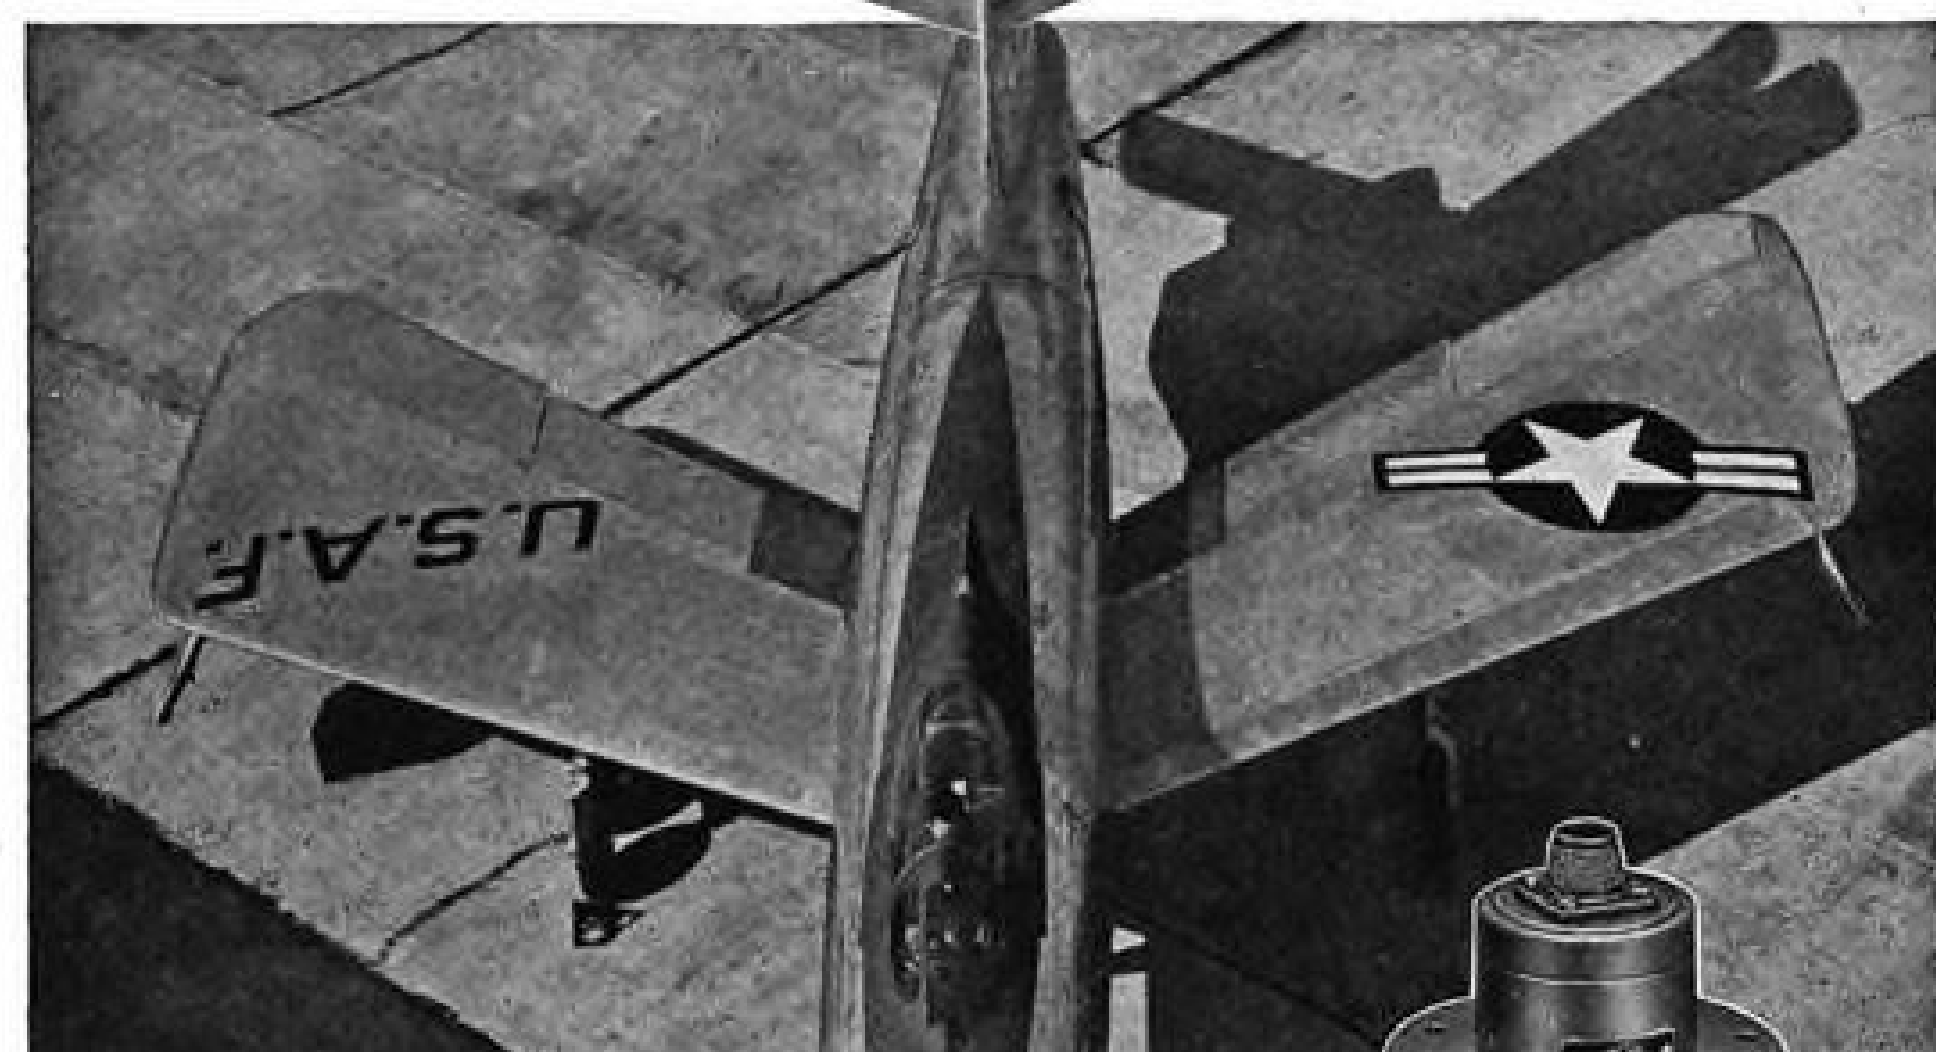

Today each step forward in high-speed aircraft performance demands a tighter ratio of thrust to weight. Greater stiffness, thicker sections. Often, magnesium alloys are the answer. To meet this growing need, Alcoa has resumed production of magnesium sheet and plate—in addition to extrusions, forgings and castings of all types. New, improved alloys cover an ever wider scope of physical requirements.

For aluminum and magnesium, in all forms—look to Alcoa as your "Flight-metal Headquarters". ALUMINUM COMPANY OF AMERICA, 1800H Gulf Bldg., Pittsburgh 19, Pa.

Send for your free copy of "Designing with Magnesium". Contains full information on properties and fabricating practices.

AEROTEC FLOAT SWITCHES...

Custom Built
for

REPUBLIC'S LATEST JET FIGHTER

Republic's XF91 Interceptor utilizes 20 Aerotec Float Switches to assure dependable indication and control of propulsive fuels.

Aerotec's proved record of efficient automatic controls on the thousands of F47's and F84's that have been and are in service earned its consideration when the XF91 was in the development stage.

The XF91 is one of the many Navy and Air Force fighters that advantageously employ Aerotec's policy of designing a specific control for each individual problem.

Whether the application calls for float switches, valves, diaphragm or bellows pressure switches, Aerotec's representatives throughout the country, specially picked for their knowledge of the aircraft industry, are ready to offer assistance on any automatic aircraft control problem you may have.

depending on the helicopter's unique ability to hover above the tanker, whether afloat or land-based.

This is a bit like solving the problem by avoiding it, because any aircraft range can be increased through the addition of fuel. What is important is that the range parameter of miles per gallon, or gallons per hour, be optimized through design—aerodynamic cleanliness, increased load-carrying ability, engine improvements.

► **Speed**—Hand in hand with the problem of range is that of speed. Piasecki stated that "... we have made excuses to ourselves in the past by pointing out that the function of our aircraft is not to travel great distances and therefore high speeds were not a necessary part of our performance requirements."

Technically, the thing that keeps helicopter speeds pegged to a low level is stalling of the retreating blade. And, as is well known, stalling can be overcome by either increased speed or reduced angle of attack.

Those two features, said Piasecki, can be done. And he again hammered at the point of drag reduction, stating that the external cleanliness of the helicopter still does not equal that of the 1935 airplane.

To go faster, one needs more power, even with clean aircraft. A little prognostication by the speaker, who verbally added a propeller or jet thrust to the helicopter designs, led to a guess-timated speed in excess of 250 mph., nearly doubling today's operating velocities.

► **Composite Design**—There are all the improved components and pieces for tomorrow's rotary-winged craft. Piasecki did not pick them up and put them together, probably preferring to do that later in a military competition. But taken in sum, the helicopter could be:

- **Larger**, because of increased structural efficiency.
- **Faster**, due to higher rotational tip speeds and aerodynamic cleanliness.
- **Stronger**, because of increased disk loading and the substitution of the superior power-weight ratio of the gas turbine.
- **Safer**, with special technique for blind flight, with vibrationless airframes and extended service life.
- **Simpler** helicopters, with metal blades, easy maintenance and accessibility, and simplification in the detail design.

► **On the Way**—So, bigger and better rotary winged craft are in the offing. Their proximity depends on the designers, on research programs, on customer needs—and of course, on some fair-sized government orders.

And if the manufacturers take Piasecki's advice, the only thing tomorrow's helicopters will have in common with today's will be rotating wings.

**With 19,000 Flying Hours Between Them—
Four Businessmen Tell Why...**

"RYAN NAVION HAS THE QUALITIES PROVEN MOST IMPORTANT"

—BEN, WILLARD, ROBERT AND TOM McGAHEY

"More pleased with our choice every day," write four businessmen-brothers, all former transport or military pilots, now operating their own Chrysler-Plymouth dealership in Miami, Florida. "We spent many hours testing the various personal-business planes, but we chose the Navion as it had the qualities proven most important for our purpose." Two to ten thousand hours experience as

Air Force, Navy and Pan American pilots taught these 4 men to recognize the value of the Navion's unique combination of speed and safety; ruggedness with ease-of-flying. They found, too, the Navion "flies like a big plane; rides like a big plane. Service pilots should know that the Navion handles like a real plane. It's comfortable, good looking; and the tricycle gear makes cross-wind landings simple."

Ryan Navion

NO OTHER PLANE COMBINES SO MANY FEATURES SO WELL

THERE'S A NAVION FOR EVERYONE—PRICES START AT \$9485.00

«NAVION UTILITY 205. The ideal plane for those who want modern, safe air transportation at minimum cost. Features 205 hp. Continental engine, has 55 cu. ft. cargo space, lifts 1029 lbs. payload with full tanks. Ideal for ranchers, contractors, etc.

«NAVION DELUXE 205. Room for four big people with plenty of luggage in cabin so big it permits changing seats in flight. Superbly sound-proofed and ventilated. Equipped with dual controls, VHF radio, cowl flaps. Safe and easy to fly.

««NAVION SUPER 260. Lycoming-powered to cruise at an honest 170 mph. Ten minutes to 10,000 ft. Outcruises, outclimbs, lands shorter than anything in its class. The 260 is the Navion at its very finest. Write today for complete free information.

Indicator Monitors Power Supply

Bendix development warns of a.c. supply failure, low voltage; features small size, lightweight indicator.

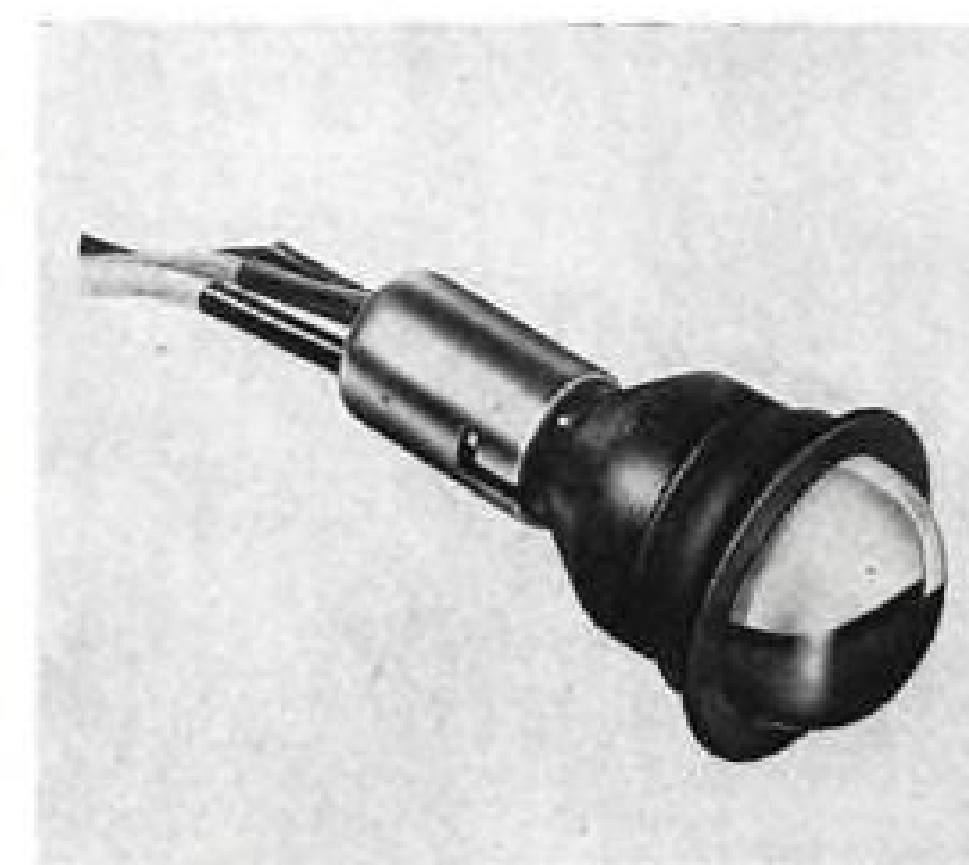

Failure of power supply for gyroscopic flight instruments can now be detected quickly by means of a new warning device.

Now in production at the Eclipse-Pioneer division of Bendix Aviation Corp., the indicator will give warning of either low system voltage or failure in one or more phases of the ac power supply.

And this warning will occur several minutes before gyros begin precession, which gives the pilot ample time to switch to a standby power supply.

►Small Size—Physically, the power failure indicator is about the size of a standard vacuum tube. It is normally mounted near the electric gyro flight instruments.

Principle of the indicator depends upon the stall torque characteristics of a tiny induction motor mounted inside.

A cup-shaped indicator card, half painted black and half luminescent, is mounted on the front end of the rotor shaft.

A glass cover, half painted black and half transparent, encloses the moving card.

Normally, the induction motor is energized by the ac power supply. The rotor works against a hair spring which permits rotation until the hair spring torque equals the motor torque.

►Display Method—Under these conditions, the instrument face is completely black.

Should the system voltage drop to 22 volts from its normal value of 26 volts, the hair spring begins to overcome the motor torque, and the luminescent half of the moving card begins to show.

The degree to which the card becomes visible depends on the amount of voltage drop.

Should the system voltage drop below 18 volts, or should power failure occur in any phase, the luminescent half of the moving card becomes completely visible.

►Specifications—Eclipse-Pioneer Division designates the power failure indicator as Type 36200, with two subtypes whose difference lies in the color of luminescent paint available—yellow or orange.

Weight of the indicator is about 6 oz., including plug and leads. It has a polarized, bayonet-base socket, with three 36-in. leads.

Power required is 26v., 400-cycle, 3-phase alternating current, with a phase rotation of A-C-B.

For Vital Control Circuits in Curtiss Electric Propellers

**IT'S BENDIX-SCINTILLA
ELECTRICAL CONNECTORS**

... THE FINEST MONEY CAN BUY

Unfailing dependability is the standard set by Curtiss propellers and American Airlines in their selection of equipment. Bendix-Scintilla is therefore the logical choice for the electrical connectors in the Curtiss Electric propellers on American Flagships. In fact, wherever circuits must be arranged to connect and disconnect with ease and certainty Bendix-Scintilla is the choice. Remember whenever there is no compromise with quality—it pays to specify Bendix-Scintilla electrical connectors—the finest money can buy.

CHECK THESE ADVANTAGES

- Moisture-proof
- Radio Quiet
- Single-piece Inserts
- Vibration-proof
- Lightweight
- High Insulation Resistance
- Easy Assembly and Disassembly
- Fewer Parts than any other Connector
- No additional solder required

**SIoux Wet Valve
Face Grinding Machine**
*More Dollar Value than
ever before*

Wet Grinding eliminates heat and distortion, producing finest finish and factory precision. Wet Grinds Valves, Valve Ends, Tappets and Rocker Arms.

**SIoux PERFECTED
DUAL ACTION**
VALVE SEAT GRINDER
with Ball Bearing Holder

Precision work in fast time by the almost unbelievable speed of this valve seat grinder. Perfected dual action provides controlled fine vibration for grinding accuracy and dispersion of cuttings. Uniform finish is assured.

SALES & SERVICE

Public Forum

**Free monthly aviation
meetings begun as sales
aid by Teterboro school.**

Teterboro School of Aeronautics is going after prospective students with a new sales approach—monthly aviation forums open to the public.

The first session, staged without the extensive publicity planned for later meetings, garnered two students. In addition, the school's head, Charles Willis, former president of Willis Air Service, believes the talks will serve two other purposes: Boost morale of the present student body and build company prestige.

Willis also believes the new idea will cut considerably the cost to the school of \$20 for each new student lead.

► **Candid Speaking**—Willis is planning to get speakers for these forums who can candidly discuss current aviation operations and problems without being tied down in their remarks by official connections.

Each forum will present three speakers. Willis now is negotiating for local radio station cooperation and may have the discussions recorded for broadcasting.

As part of the forum idea, the audience will be taken on a tour of the schooling facilities to stir interest in signing up. The school's records show that most of those taken on such a tour have signed up for courses.

Willis considers the forums a good tonic for continuing interest in the courses. He estimates that about 25 percent of his students drop out before completion, and feels that by offering them lively discussions by men active in different phases of the industry, the original enthusiasm of the students can be maintained.

Civilian Schools To Train AF Mechs

The Spartan School of Aeronautics at Tulsa, Okla., and Cal-Aero Technical Institute, Glendale, Calif., have been awarded contracts totaling \$592,000 for training 550 USAF airplane and engine mechanics.

The two schools, sharing equally in the contracts, will train 275 enlisted personnel each. Training periods will last 36 weeks, which is the same length of time utilized by current military

technical schools giving the identical instruction.

The program is being tried by USAF to test the practicability of technical training by civilian contract. It follows completion of a study which was conducted last year by Stanford Research Institute.

Report of the Institute pointed out that substantial budgetary savings could be effected through elimination of administrative overhead ordered in military organization. Accompanying military administrative facilities, functions and personnel needed for manning a military training base (technical or non-technical) are often exorbitant in cost unless a high quantity of trained personnel are graduated continually, it was said.

The two schools were chosen from among 41 civilian agencies submitting proposals to the Air Force for the test training project.

Training by the two schools was scheduled to begin last week and will be completed by June 30, 1951.

Air Fair Aid

Detailed suggestions for planning a safe-and-sane air fair can be found in a new Civil Aeronautics Administration booklet. Airport operators interested in staging local air shows can pick up many handy pointers.

STEVE WITTMAN'S BUTTERCUP

This neat little high-wing monoplane, built by racing pilot Steve Wittman back in 1938 to flight test his flexible steel single strut landing gear, is still used by him to test new design ideas and to provide transportation to air meets. The Buttercup seats two side by side. It is powered by an 85-hp. Con-

Included are suggestions on sponsors, financing, committees, program, exhibits and follow-up. An appendix describes an actual "well-run, well-planned and effective" air fair. Pointed up is how such a display can be handled as to educational medium and still provide entertainment, rather than have it degenerate into a "thrill-chill-spill" affair, as many do.

The booklet is available for 20 cents from the Supt. of Documents, Government Printing Office, Washington 25, D. C.

BRIEFING FOR DEALERS AND DISTRIBUTORS

► **Plane Ownership**—More than one-ninth of U. S. private planes are located in California, with Los Angeles county registration (3399) accounting for nearly three times the number of any other U. S. county. Upper Middle West and East hold the lead in total number of planes. California has 10,594 planes registered, Texas 6983, and Illinois has 4829.

► **Hiller Time Payments**—A "buy-as-you-fly" plan to make helicopter purchases easier on the pocketbooks of potential private and operator customers has been worked out by Hiller Helicopters. The Palo Alto, Calif., firm has established a "helicopter acceptance division," using a capital reserve built up from steadily increasing sales to finance purchases.

tinental fitted with a swept-blade racing prop. Top speed is said to be 150 mph., cruising speed 130 mph., and landing speed 30 mph. A tapered tubular-type flexing landing gear is now undergoing testing on the plane. Wittman has also built a four-place personal plane, now being tested.

AIR FORCE CONTRACTS

May Awards Total \$189 Million

Contracts for \$189 million are included in the list of May awards released by the Air Force (AVIATION WEEK July 31, p. 32). In this total are 53 cost-plus-fixed-fee contracts worth \$75 million. The awards do not yet reflect increased contract activity resulting from the Korean war nor procurement of confidential items.

Alphabetical listing of contracts begins here, with completion of publication scheduled next week.

AC Spark Plug div., General Motors Corp., Flint, Mich., types AC-181 and F-67 spark plugs, Sept., 1950, \$62,054; 813 each plug assemblies, July, 1950, \$7520.

Acme Construction Co., Dayton, dynamic model flying field, Sept., 1950, \$19,474.

Acme Visible Records, Inc., Cincinnati, files, July, 1950, \$44,227.

Adel Precision Products Corp., Huntington, W. Va., electrically bonded cushion clips, Sept., 1950, \$24,491.

Aerocrafts, Austin, safety belts, July, 1950, \$36,028.

Aero Supplies, Los Angeles, nuts, Sept., 1950, \$6583.

Aeroli Products Co., S. Hackensack, N. J., spray cleaner and handbook data and engineering data, Nov., 1950, \$19,093.

Aeroljet Engineering Corp., Azusa, Calif., study of rocket fire protection, Oct., 1951, \$120,560.

Aeronautics, Bureau of, Washington, components of radar set, July, 1950, \$76,500; to transfer funds for performance of administrative services, Mar., 1951, \$40,000.

Aeroquip Corp., Jackson, Mich., half couplings, Sept., 1950, \$5130; hose fittings, Aug., 1950, \$33,606.

Air Speed Tool Co., Los Angeles, portable pneumatic drill, Sept., 1950, \$23,789.

Aircooled Motors, Inc., Syracuse, N. Y., conversion of 10 model 0-335-3 engines to model 0-335-5 engines for H-13 helicopter, Aug., 1950, \$24,878; ten 0-335-2 aircraft engines used in H-13 helicopter, Nov., 1950, \$31,167.

AirResearch Mfg. Co. div., Garrett Corp., Los Angeles, heat exchanger, Sept., 1950, \$14,513.

Airquipment Co., Burbank, Calif., 113 each trailer with storage rack, Oct., 1950, \$50,612.

Akeley Camera, Inc., New York, overhaul, repair and modification of Akeley photo-theodolite units, June, 1951, \$44,875.

Aluminum Company of Amer., Washington, aluminum alloy sheet, Oct., 1950, \$5389.

American Bosch Corp., Springfield, Mass., magneto assemblies and spare parts, Dec., 1950, \$84,003; gaskets for maintenance of ignition harnesses, Oct., 1950, \$5931.

American Finishing Co., Memphis, water-proof fabric, Aug., 1950, \$51,900.

American Gas Accumulator Co., Elizabeth, N. J., asymmetrical blue plastic lens, July, 1950, \$5070; cable adapter assembly, plug assembly and receptacle assembly, Aug., 1950, \$109,009; white lamp lens assembly, type M-1 elevated runway marker, Oct., 1950, \$14,300; clip cone and fixture assembly, Aug., 1950, \$34,850; lamp assembly, Aug., 1950, \$7020.

American Graded Sand Co., Chicago, cleaning compound, Sept., 1950, \$15,288.

American Hair and Felt Co., Chicago, hair felt, July, 1950, \$21,710.

American Pad and Textile Co., Greenfield, Ohio, L-2 flying jackets, Dec., 1950, \$259,660.

American Phenolic Corp., Chicago, transmission lines and connectors, Apr., 1951, \$103,336.

American Society of Mechanical Engineers, New York, publications of the Applied Mechanics Review, Apr., 1951, \$10,000.

American Steel Co., Pittsburgh, cotter pins, Sept., 1950, \$20,837.

American Steel and Wire Co., Cleveland, steel wire, July, 1950, \$7875.

American Time Products, Inc., New York, rate recorder watch, June, 1950, \$7302; tuning forks, etc., June, 1951, \$7800.

Ampro Corp., Chicago, miscellaneous photographic spare parts, Dec., 1950, \$11,071.

Anseo div., General Aniline Film Corp.,

Binghamton, N. Y., densitometer, Aug., 1950, \$17,050.

Apex Tire Rubber Co., Pawtucket, R. I., plugs, Sept., 1950, \$8664.

Apple, W. A., Textile Mfg. Co., Dayton, flight engineer case, Oct., 1950, \$5835; parachute harness assembly, Sept., 1950, \$301,530.

Armour Research Fdn., Chicago, special function generator for electronic analog simulation, Feb., 1951, \$26,949.

Armstrong-Blum Mfg. Co., Chicago, power hacksaw, Nov., 1950, \$88,384.

Armstrong Cork Co., Lancaster, Pa., rubber tape cork, July, 1950, \$7903.

Auto-Valve, Inc., Dayton, drain valves, Oct., 1950, \$8700.

Automatic Electric Sales Corp., Chicago, installation of automatic central office telephone equipment work to be performed at certain AF bases, Apr., 1951, \$67,619.

Aviation Engineering Corp., Ozone Park, N. Y., exhaust thermometers, Feb., 1951, \$21,230.

Aviators Clothing Co., Inc., Beacon, winter type flying helmets, Nov., 1950, \$33,832.

B. G. Corp., New York, spark plugs, July, 1950, \$26,790.

Baird Associates, Inc., Cambridge, Mass., infra-red viewer, May, 1951, \$35,300.

Ballantine Laboratories, Inc., Boonton, N. J., portable voltmeters, Sept., 1950, \$13,860.

Barber-Colman Co., Rockford, Ill., thermistor element actuator assembly, box assembly, Aug., 1950, \$20,650.

Barden Corp., Danbury, Conn., ball bearings, Sept., 1950, two contracts, \$32,290, \$14,731.

Battelle Memorial Institute, Columbus, O., research on the problem of heat transfer from a supersonic stream at high temperatures and heat fluxes, June, 1951, \$23,000; research and development to determine causes of cracking in high-strength weld metals, Oct., 1951, \$20,441; research on molybdenum-base alloys prepared by powder metallurgy techniques, Aug., 1951, \$37,100.

Bausch and Lomb Optical Co., Rochester, N. Y., focalscope-aerial camera, auto collimator, Oct., 1950, \$7650.

Beech Aircraft Corp., Wichita, aircraft spares, June, 1950, \$68,217; metal short range seat, Nov., 1950, \$46,750.

Bell-Howell Co., Chicago, A-4A cameras, June, 1950, \$7481.

Bendix Aviation Corp. Pacific div., No. Hollywood, actuator assembly, Dec. 1950, \$12,480; hydraulic accumulators, Nov., 1950, \$6422.

Bendix Products div., Bendix Aviation Corp., South Bend, Ind., spare parts for T-6, AT-16, C-47 and B-21 aircraft, June, 1950, \$151,754; industrial planning survey on strut sources, Mar., 1951, \$110,000; spare parts for wheels and brakes, June, 1951, two contracts, \$26,052, \$22,096; carburetors, spare parts and fuel system spare parts, Apr., 1951, \$757,082; carburetor spare parts, Apr., 1951, \$494,447.

Bendix Radio div., Bendix Aviation Corp., Baltimore, components for radio compass, Feb., 1951, \$105,347; spare parts for radar set, Apr., 1951, \$275,000.

Bertram, Harvey P., Co., Cincinnati, electric fan, Sept. 1950, \$9532.

Bird Electronic Corp., Cleveland, antenna, Mar., 1951, \$78,389.

Bitley Electric Co., Erie, Pa., crystal holders for making radio crystal units, Feb. 1951, \$71,000.

Blue Anchor Overall Co., Philadelphia, type D-2 air crew caps, Nov., 1950, \$12,008.

Bode-Finn Co., Dayton, spares for M-2 Cletrac tractor, Sept., 1950, \$6670.

Boeing Airplane Co., Seattle, spare parts for B-29 aircraft, July, 1950, three contracts, \$13,711, \$779,774, \$96,908; spare parts for C-97C airplanes to be provisioned under Case 30, Aug., 1951, \$887,222; producibility study on B-47 airplane, July, 1951, \$561,514; design, install in a B-50 aircraft broadband zero-drag flush antenna, Feb., 1951, \$55,000; additional modification and instrumentation of government-owned B-50A airplane, June, 1950, \$12,078; kits for C-97 series airplanes and miscellaneous engineering changes, Dec., 1950, \$85,335; kits for retrofit of master change No. 256 on B-29 and B-50 airplanes, Mar., 1951,

\$12,160; miscellaneous kits for retrofit of master change Nos. 281, 310 and PRR 1075, Apr., 1951, \$35,891; kits and parts for retrofitting of B-50 change No. 320, Aug., 1950, \$22,915; master list of MCR PRR and PCR changes which have been accomplished on all B-50 airplanes, July, 1950, \$10,350; additional special tools and ground handling equipment transportation dolly assemblies, Nov., 1950, \$160,000; additional turbosupercharger flight test program on government-owned B-50, June, 1950, \$78,420.

Boeing Airplane Co., Wichita, spare parts for B-29 and B-50 airplanes, Aug., 1951, \$10,561.

Bohn Aluminum-Brass Corp., Detroit, spare parts C-2 and F-1 truck tractors, Jan., 1951, \$5598.

Bolsey Corp. of America, New York, 35mm. still cameras, Sept., 1950, \$14,762.

Bone Engineering Corp., Glendale, Calif., design and finish propeller test rig pedestal assembly, July, 1950, \$8458.

Beeze Cop., Newark, N. J., ignition harness assemblies, July, 1950, \$9950.

Bristol Mfg. Corp., Bristol, R. I., type N-1 flying shoes, Oct., 1950, \$106,425.

Brown, Gordon D., Associates, Beverly Hills, Calif., tie down devices, July, 1950, \$95,550.

Browne, Stewart R., Mfg. Co., New York, electric lamp assembly worklight extension, July, 1950, \$54,790.

Brubaker-Ugrin Engrs., Beverly Hills, Calif., hand operated iron and commercial data, Sept., 1950, \$21,073.

Buchbaum, S. and Co., Chicago, container assembly, Oct., 1950, \$17,100.

Burlington Mills, Burlington, Wis., hair felt, June, 1950, \$5564.

Canadian Commercial Corp., Montreal, Canada, spare parts for maintenance of C-47, Dec., 1950, \$25,000; spare parts for maintenance of C-47 and C-54 aircraft, Dec., 1950 \$500,000.

Capewell Manufacturing Co., Hartford, Conn., parachute harness adapter, Dec., 1950, \$5400.

Cappel, MacDonald Co., Dayton, emergency sustenance kit, Oct. 1950, \$151,172.

Cardell Manufacturers, Dayton, stand assembly, Feb., 1951, \$76,725.

Carlisle Tire, Rubber div., Carlisle, Pa., tubes, May, 1951, \$18,149.

Chase Aircraft Co., Inc., W. Trenton, N. J., repair of XC-123 airplane which incurred damage during taxi accident, June 1950, \$125,000.

Cherry River Co., Los Angeles, blind rivets, Sept., 1950, \$7333.

Chicago Aerial Survey Co., Chicago, photographic printers, Nov., 1950, \$12,085.

Chicago Pneumatic Tool Co., Detroit, driver, pneumatic portable, Aug., 1950, \$31,800; drill, pneumatic portable, Sept., 1950, \$10,920.

Cincinnati Engine-Parts Co., Cincinnati, spare parts for C-13, C-13A A-APU powerplants, Nov., 1950, \$16,894.

Circo Products Co., Cleveland, metal parts cleaner, Aug., 1950, \$7475.

Clark, David, Co., Inc., Worcester, Mass., regulating valves, Jan. 1951, \$22,149.

Clark Metal Products Inc., Fairfield, Conn., dehydrator plugs, Feb., 1951, \$9450.

Cleveland Automatic Machine, Cincinnati, screw machine, Oct., 1950, \$16,638.

Cleveland Pneumatic Tool, Cleveland, industrial planning survey of strut sources, Feb., 1951, \$68,544.

Collins Radio Co., Cedar Rapids, Iowa, radio receivers spare parts instruction book, Aug., 1950, \$30,176.

Color Service Co., New York, training reproductions, June, 1950, \$10,000.

Commonwealth Engineering Co., Dayton, furnish and install radiological test equipment, July 1950, \$7347.

Consolidated Photo Engravers Equipment, Chicago, furnish and install collimator mount on large vertical test camera, July 1950, \$17,500; installation of large vertical test camera, July 1950, \$6563.

Consolidated Radio Products Co., Chicago, film magazines, Dec., 1950, \$75,000.

Consolidated Vultee Aircraft div., Consolidated Vultee Aviation Corp., Ft. Worth, Tex., swinging of J-1 compass and furnishing services on 16 SAC B-36B airplanes, Nov., 1950, \$8027; rework, repair and maintenance of XB-36 airplane, Nov., 1950,

\$40,266; additional funds required for plane conversion, Nov., 1950, \$1,828,413; technical order kits, Nov., 1950, \$67,443.

Continental Aviation and Engineering Corp., Detroit, development by flight test of a speed density fuel distributor on a government-furnished L-17B aircraft, Sept., 1950, \$25,402.

Continental Electronics Ltd., Brooklyn, connectors, plug receptacle, Nov., 1950, \$19,511.

Continental Motors Corp., Muskegon, Mich., type 0-190-1 engines for L-16A aircraft, Aug., 1950, \$52,171; engine packets, Dec., 1950, \$123,338.

Cook Electric Co., Chicago, switch, pressure, emergency fuel warning and pressure, emergency fuel, July 1950, \$9574.

Cooley Electric Manufacturing Corp., Indianapolis, electric ovens and maintenance data, Oct. 1950, \$18,710.

Cornelius Company, Minneapolis, air compressors, Dec., 1950, \$74,330; air compressors, Sept., 1950, \$12,958.

Craig Machine, Inc., Danvers, Mass., shelter, Oct., 1951, \$350,486.

Crescent Film Laboratories, Chicago, film reproductions, June, 1950, \$20,000.

Curtis Auto Devices, Inc., Bedford, Ind., drain valves, Oct., 1950, \$5125.

Curtiss-Wright Airplane div., Curtiss-Wright Corp., Columbus, Ohio, modification of one government-owned constant velocity servo simulator, Sept., 1950, \$9826; reconditioning of B-29A aircraft, Mar., 1951, \$6,000,000; overhaul of auxiliary power units, Mar., 1951, \$250,000.

Curtiss-Wright Propeller div., Curtiss-Wright Corp., Caldwell, N. J., propeller assembly and spinner assembly controls for 4360-53 engine test stand, Mar., 1951, \$33,768; propeller assemblies and 22 slip ring housing assemblies for support of C-121 aircraft, Feb., 1951, \$275,160; installation and spare propeller assemblies, controls, spare blade assemblies and spare parts for B-36 airplanes, July 1952, \$4,383,623; propeller spinner and control spare parts for B-50 series aircraft, June, 1951, \$1,322,800.

Da-Lite Screen Co., Inc., Chicago, projection screens, July, 1950, \$7207.

Dake Engine Co., Grand Haven, Mich., press arbors, Nov., 1950, \$9403.

Darling, L. A. Co., Bronson, Mich., ripcord assembly, Sept., 1950, \$16,650.

Davies Laboratories, Inc., Riverdale, Md., response analyzer and engineering data and handbook of operation and service instructions, Mar., 1951, \$62,700.

Division Chemical Corp., Baltimore, dehydrating agent, Sept., 1950, \$37,440.

Dayton Aircraft Products, Inc., Dayton, hand operated heater, Jan., 1951, \$35,728; antenna insulators and tension units, Sept., 1950, \$11,135.

Deleo Products div., General Motors Corp., Dayton, motor assembly, handbook data, July, 1950, \$10,163.

Delcon Co., Los Angeles, lock nuts, July, 1950, \$50,000.

Denison Engineering Co., Columbus, Ohio, hydraulic test stand and maintenance data, engineering data and export packaging, Dec., 1950, \$476,098.

Detroit Bolt and Nut Co., Detroit, carriage bolts, Sept., 1950, \$5905.

Dictaphone Corporation, Dayton, recorder-reproducers, July, 1950, \$11,871.

Douglas Aircraft Co., Inc., Long Beach, Calif., spare parts for maintenance of C-74 aircraft, Dec., 1950, \$34,563.

Douglas Aircraft Co., Inc., Santa Monica, Calif., miscellaneous equipment items, Feb., 1952, \$25,878; rework, repair, modification or overhaul, Oct., 1950, \$15,000; revisions to C-124A static test program, Jan., 1951, \$66,790; old spare parts for maintenance of B-26 aircraft, Nov., 1950, \$12,866; spare parts for maintenance of B-26 aircraft, Dec., 1950, \$39,433; spare parts for maintenance of C-47 aircraft, Dec., 1950, \$36,860; spare parts for maintenance of C-47 aircraft, Dec., 1950, \$72,666; spare parts for maintenance of C-47 aircraft, Nov., 1950, \$23,658.

Duffy Construction Co., Cleveland, protection and maintenance at Government Aircraft Plant No. 7, June 1950, \$50,897; protection and maintenance at Government Aircraft Plant No. 3, June 1950, \$65,488.

Dumont Aviation-Supply Co., Long Beach, Calif., rivets, universal head, Sept., 1950, \$13,330.

Durham Aircraft Service, Inc., Woodside, N. Y., overhaul O-type aircraft engines and their accessories, July 1950, \$41,668.

Eastern Rotorcraft Co., Willow Grove, Pa., tie-down devices, Oct., 1950, \$45,000.

Eastman Kodak Co., Rochester, N. Y., photographic film and paper, Sept., 1950, \$28,500; photographic film, Aug., 1950, \$5261; photographic film, paper and plates, July, 1950, \$6134; photographic film, June, 1950, \$72,199; photographic film, Sept., 1950, \$9054; engineering data for AA-1 sight, Feb., 1951, \$29,000; chemicals, Aug., 1950, \$6780.

Eclipse-Pioneer div., Bendix Aviation Corp., Teterboro, N. J., engine-driven aircraft generator, Dec. 1950, \$77,470; fuel pressure indicators; Dec., 1950, \$5351; terminal liner spacer stud, Dec., 1950, \$8455; pressure indicators and transmitters, Dec., 1950, \$16,773; fuel flow transmitter, Dec., 1951, \$20,488; fuel flow indicator, Dec., 1951, \$5721; aircraft starters, Dec., 1950, \$74,353; type J-8 indicator, Sept., 1951, \$2,244,553; starter assembly, Dec., 1950, \$187,698; multi-purpose pressure indicators, Dec., 1951, \$13,256; multi-purpose transmitter, Feb., 1952, \$37,097; pressure indicators and transmitters, Oct., 1950, \$24,736; wrenches, punch bearings, fixture holders, spring removers, locking drive shaft tools, Oct., 1950, \$9022; type C-30 fuel pressure indicators, Aug., 1951, \$17,506; type B-20 oil pressure indicators, Sept., 1951, \$18,069.

Economy Die-Stamping Co., Grand Rapids, Mich., metal shipping containers, Sept., 1950, \$8586.

Edo Corp., College Point, N. Y., float and strut assemblies, Mar., 1951, \$203,745.

Elec Inc., Chicago, modification of alternators and exciters, June 1950, \$151,200.

Elastic Stop Nut Corp. of America, Union, N. J., aircraft nuts, Aug., 1950, \$5975; nuts, Sept., 1950, \$7528; nuts, Aug., 1950, \$24,151.

Electric Auto-Lite Company, Port Huron, Mich., cable, aircraft, low tension, Sept., 1950, \$21,823.

AIR TRANSPORT

War Needs May Hit Bargain Rates

Meanwhile, ten-fold air coach rise, while regular traffic drops, pushes carriers ahead of last year.

Air coach and other bargain fares may be the first victims of any further demands by the military for certificated airline planes.

Together with first-of-the-week family fares and excursion rates, air coach is promotional. If a further squeeze develops on airline equipment, there will be no need for special traffic-generating tariffs.

Certificated airlines use four-engine planes exclusively for their air coach services. That's the only type of equipment being sought by the military. Besides, family fares, excursion rates and air coach cater extensively to passengers who would be "non-essential" riders during an emergency.

►Why Take Less?—High-capacity air coach planes would be much in demand if seat space tightened up severely. But since the carriers could easily fill all the seats with 6-cents-a-mile passengers, the temptation to eliminate 4- or 4½-cents-a-mile tariffs is obvious.

Even some of air coach's most ardent boosters have been looking askance at the service recently. (Northwest Airlines has already disclosed plans to boost coach fares.) Whether increased traffic at coach rates balances revenue lost through diversion of first-class business is still the subject of hot argument by the carriers and government officials.

Civil Aeronautics Administration traffic analysts, in a privately circulated memorandum, said recently that "evidence of increasing diversion of regular-fare passengers to coach flights is apparent."

►Coach Up Ten-Fold—During the first four months of 1950, total revenue passenger miles flown by domestic scheduled carriers increased 10 percent over the same 1949 period—rising from 1,973,562,000 to 2,165,612,000. But regular-fare traffic alone fell off from 1,949,040,000 passenger miles to 1,918,999,000 passenger miles.

Ten-fold increase in coach traffic accounted for the entire gain. Coach revenue passenger miles numbered only 24,522,000 in the first four months of 1949 but soared to 246,613,000 in the same period this year. By last April, the certificated domestic airlines' coach business represented 12 percent of their total passenger miles flown.

Overall domestic airline passenger load factor during Apr., 1950, was

about the same as in the same 1949 month. However, 75 percent of the low-priced coach seats were filled last April, compared with only 58 percent of the regular-fare seats.

►Railroad Headache—The railroads are badly worried over the air coach threat. While airlines were offering fare savings through coach expansion, the railroads boosted rates.

Result is that the decline of both first-class and rail coach business has continued steadily since 1946. During the first quarter of 1950, the nearly 10-percent gain in airline passenger traffic contrasted with a 16-percent drop in railroad parlor and sleeping car patronage.

Whereas the airlines handled 33.3 percent of combined air and rail first-class traffic in first-quarter 1949, the proportion jumped to 39.3 percent in the same period this year.

►Low Blows Seen—Air coach is hitting the railroads' passenger business "in the breadbasket," according to the Federation for Railway Progress. What's worse, the federation, founded by Chesapeake & Ohio Railway's outspoken board chairman, Robert R. Young, thinks the airlines' low-fare service is responsible for some blows below the breadbasket.

Origin of air coach, FRP recalls, was with old equipment operated by veterans on a shoestring and with irregular and often inconvenient schedules.

BEA STARTS PROPJET AIRLINER SERVICE

First scheduled airline service use of a gas turbine-propeller transport was scheduled by British European Airways for July 29 when this four-engine Vickers Viscount was to make the line's regular London-Paris mid-day run and return. The Viscount was then to be used for crew training until Aug. 3

Now, the federation complains, air coach is big business, with the certificated airlines operating the newest and fastest equipment on regular schedules between major domestic traffic centers. ►CAB the Culprit—The Civil Aeronautics Board is regarded as the culprit who let the evil genie out of the bottle. "CAB's policy appears to be to get the business no matter how much it costs, and the taxpayers will straighten everything out later," FRP declares. It defines air coach as "airplane service at railroad fares."

Four-cents-a-mile air coach is cheaper than first-class rail fares plus charges for lower berth on a Pullman. In some cases, it is also cheaper than rail coach, besides providing substantial time savings.

►Fares Compared—The federation notes that between New York and Chicago, the lowest certificated airline coach fare is \$29.60 one-way, compared with \$30.71 for rail coach and \$48.64 for Pullman with lower berth. Air coach is also cheaper than rail coach from New York to Cleveland, Detroit, Milwaukee and Pittsburgh. On the transcontinental run from New York to Los Angeles, the \$110 coach fare charged by TWA and American Airlines compares with \$72.52 by rail coach and \$134.43 by Pullman with lower berth.

Railroad streamliners such as Seaboard's "Silver Meteor," New York Central's "Pacemaker," Southern's "Southerner" and Southern Pacific's "Daylights" will be the first to feel the pinch from air coach, according to the railway federation. "Air Coach," it concludes, "is a new technique to promote an old policy of cream skimming."

►Complaint Rejected—Chicago & Eastern Illinois Railroad, which operates the "Dixie Flagler" streamliner from Chicago to Miami, has made the

when it would go again on the London-Paris run for two weeks to help handle the August holiday rush. Viscounts are scheduled to go into full operation with BEA in 1952. The craft has four Rolls-Royce Darts and can seat 40 passengers. A number has been ordered by BOAC for Caribbean service.

only formal complaint to CAB against air coach. It said that Eastern Air Lines' and Delta Air Lines' Chicago-Miami coach tariffs would result in revenues below the cost of operations, adding that the Civil Aeronautics Act, properly construed, prohibits such fares. CAB approved the tariffs despite the railroad objection.

How much revenue has air coach diverted from the rails? The surface carriers aren't sure, but estimate it at "hundreds of thousands of dollars."

The federation cites a CAB survey showing that almost 31 percent of the air coach travelers in April and May, 1949, were diverted from the railroads. And between San Francisco and Los Angeles (where air coach is in full flower), the Southern Pacific's morning and noon "Daylights" lost 8.7 percent of their passengers during first-half 1949, while competing airline passenger traffic gained 17.2 percent.

► **Worry Over Airlines**—FRP thinks that air coach is here to stay even though its low fares place the airlines' financial strength in jeopardy. The federation (which sometimes doesn't see eye-to-eye with the Association of American Railroads) thinks the railroads must counter attack now, both with improved equipment and lower fares.

"Too often," FRP warns, "the railroads have seen, without applying the lesson, that a full train of two-cent-per-

mile passengers will produce a higher net return than a half-empty one at current coach fares." The federation noted that despite three coach fare increases since 1946, which brought the level from 2.2 to 3.375 cents a mile, Eastern railroads suffered a persistent decline in passenger traffic and revenue.

Navigator Shortage Hits Pacific Airlift

A severe shortage of qualified navigators is plaguing commercial airlines participating in the Pacific airlift under contract to the military.

As a result, the Civil Aeronautics Board has promulgated a special Civil Air Regulation authorizing limited flight navigator certificates. Object is to tap the large pool of former military navigators who have not obtained certificates for commercial operations.

► **Full Test Deferred**—Applicants for limited certificates must have served on active duty as a rated military navigator for at least six months since Dec. 7, 1941. They must demonstrate to CAA their competence to navigate aircraft, but they will not be required to pass the full written test for an unlimited navigator's certificate for three months.

The limited certificate will expire after three months, and can not be renewed. Crewmen possessing the limited ticket will be permitted to serve only on airline operations conducted pursuant

to contracts with the Defense Department.

CAA has issued more than 800 regular flight navigator certificates since Aug. 1947. But perhaps half have gone to crewmen who are also pilots.

Surveys showed that comparatively few qualified navigators were available for the emergency airlift. Federal regulations require the airlines to include navigators in their crews on long over-water hops.

► **Training Program**—American Airlines, which has made seven of its DC-4s available for the Pacific airlift, is accepting applications for navigator posts. Candidates must have 500 actual hours of aerial navigation experience, either commercial or military, and must be physically qualified.

Acceptable candidates will be given transportation to the West Coast, where they will undergo training in a navigation school operated by Pan American Airways. They will draw salary during the training. Candidates failing to complete the training course will be given return transportation to point of origin.

Feeder Exec Pay Bumps CAB Ceiling

Feederline executives who want to earn more than \$12,000 annually may have to change jobs.

The Civil Aeronautics Board, in tentatively setting new mail rates for Trans-Texas Airways, disallowed the portion of President R. E. McKaughan's salary which was over \$12,000. McKaughan was paid \$22,498 last year and \$25,000 in 1948, with a small part of expense being allocated to the company's Sales and Service division.

► **Ruling Explained**—CAB said it does not question the integrity or the value of the services of the TTA president from the viewpoint of the carrier's stockholders. But, it concluded, "where the carrier relies so heavily on mail pay support, we believe that for rate-making purposes the maximum salary which should be underwritten by the government is \$12,000 per year."

McKaughan was the highest-paid feederline executive last year. Runner-up was All American Airways President Robert Love, who received \$15,000.

CAB tentatively increased TTA's mail pay for back periods to permit the carrier to show a 7 percent profit on its recognized investment. The mail rate per plane mile was boosted from 63 cents to 65 cents.

A proposed incentive sliding scale mail rate for the future will permit Trans-Texas to break even at a passenger load factor slightly in excess of 22 percent.

Rooftop Heliport for Los Angeles

Los Angeles is to get a rooftop passenger heliport on top of a twelve-story downtown building.

The heliport will be financed by the Pacific Mutual Life Insurance Co. and be located on the firm's building at Sixth and Grand. Los Angeles Airways, which now operates certificated mail and express helicopter service, will lease the rooftop facilities. LAA has already applied to the Civil Aeronautics Board for authority to operate passenger helicopters in and around the Los Angeles area.

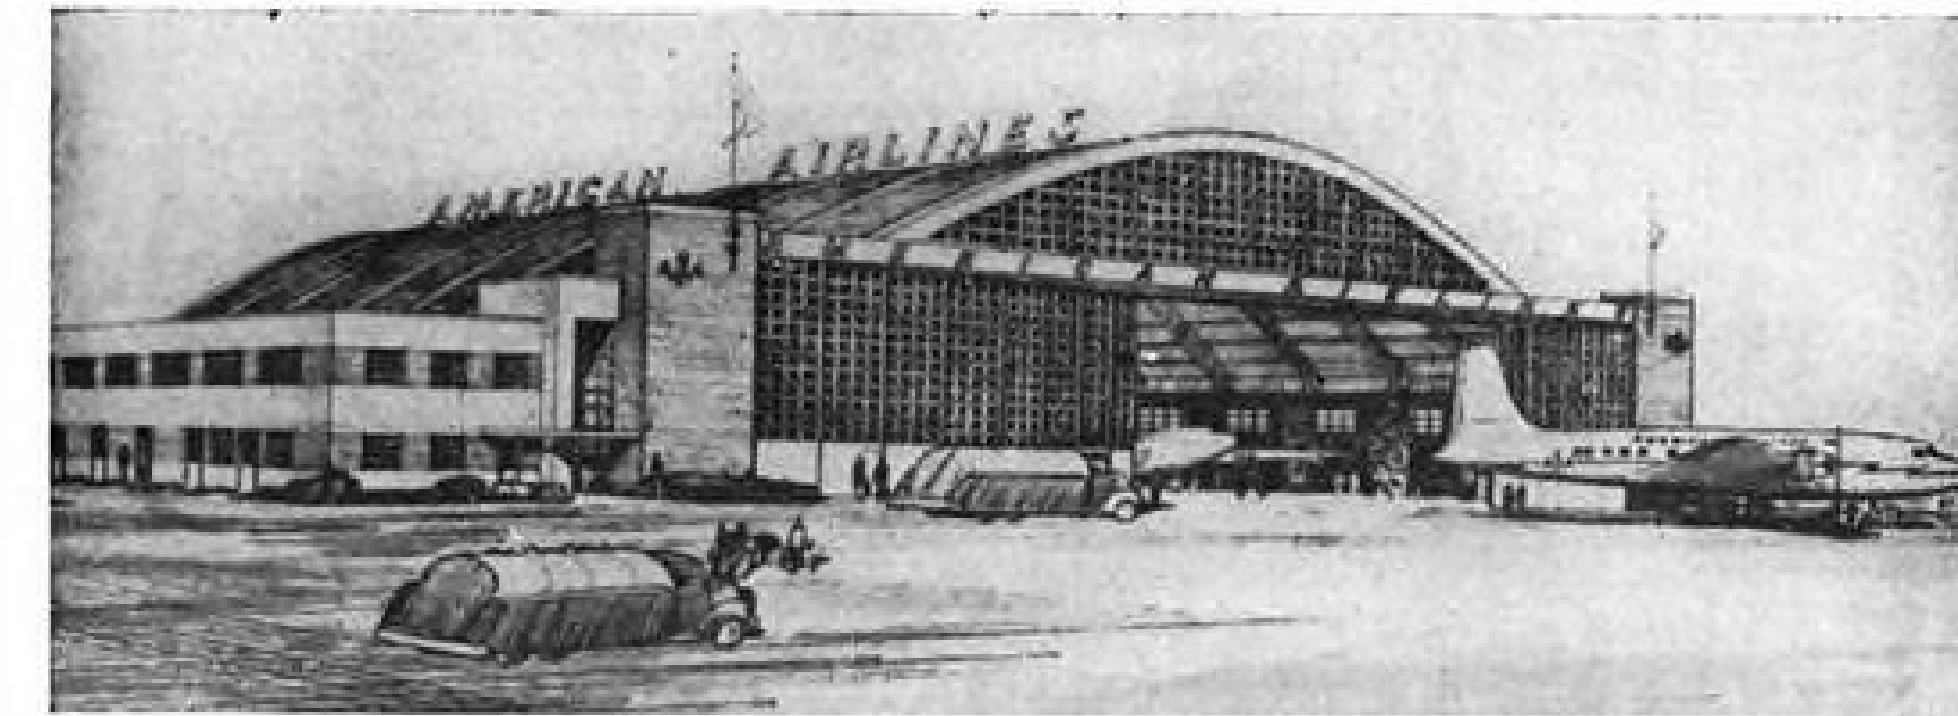

► **Six Minutes to Airport**—Plans for the heliport include a luxurious top-story passenger lounge reached by express elevator and connecting directly with the helicopter landing area by escalators. Air passengers would be able to reach Los Angeles International Airport from the downtown rooftop in six minutes. Connections would be timed for all major airline schedules.

LAA President Clarence M. Belinn foresees an eventual web of passenger heliports throughout Southern California. Pasadena is already making plans for a passenger helicopter terminal.

Belinn has expressed interest in helicopters designed to seat 12-20 passengers. The company's two-year-old mail service is conducted with Sikorsky S-51s.

Modern Exemption Denied by CAB

Modern Air Transport, one of the best-known nonscheduled operators on the Eastern seaboard, has been denied an individual exemption which would have permitted it to continue its irregular services.

AMERICAN'S SOUTHERN HEADQUARTERS

Artist's sketch shows the \$2-million combination hangar and office building which American Airlines will erect at the new Greater Fort Worth International Airport. Construction is expected to start this month, with completion scheduled for September, 1951. The building will be 305 ft. wide by 225 ft. deep, providing 40,750 sq. ft. of hangar area adjoined by 43,700 sq. ft. of

The Civil Aeronautics Board said Modern had operated from New York to Miami, San Juan and Buffalo with excessive regularity. In January, 1949, at the request of CAA and CAB, a federal district court in New York issued an injunction prohibiting the company from engaging in other than irregular operations.

► **Record Cited**—Modern has been active since 1947. During the first quarter of this year it made 82 flights between New York and Miami, and 16 between New York and San Juan. The carrier owns two DC-3s but has also been using DC-4s. Its business has been generated principally through ticket agencies, including 26 in the New York area alone.

CAB said Modern had demonstrated such a disregard for compliance with Board regulations that it is not in the public interest to entrust the company with authority to render irregular air services. The Board's order is to be effective on Aug. 13 unless Modern requests reconsideration or a hearing.

CAA Consolidates Air Facilities

The Civil Aeronautics Administration has announced consolidation of airport traffic control tower and airway communications stations at 16 municipal airports. The order followed tests at Lynchburg, Va., and Colorado Springs, Colo., airports where the combined operation was found satisfactory.

Other airports in the combined status will include: Augusta, Ga.; Big Spring, Tex.; Bismarck, N. D.; Brownsville, Tex.; Burlington, Vt.; Columbia, S. C.; Duluth, Minn.; Helena, Mont.; Pocatello, Ida.; Portland, Me.; Sioux City, Ia.; Sioux Falls, S. Dak.; Topeka, Kans.; and Tri-City Airport, Tenn.

The consolidation is limited to air-

ports which have normally not more than 5000 landings or takeoffs per month of all types of planes. Communications stations, including all communications equipment except that which can be operated by remote control, will be moved into the tower. The combined arrangement will require training of operators to be qualified both as communicators and traffic controllers. A program for training combination operators is being established by CAA.

Troubleshooter for El Presidente

A special "troubleshooter" C-46 cargo plane has been assigned to watch over Pan American World Airways' newly inaugurated El Presidente flights between New York and Buenos Aires.

The plane contains a complete "power package," including a Pratt & Whitney R-4360 engine with nacelle and accessories, cost of which is \$117,000, PAA says. Also aboard is all the equipment for handling the 5500-lb. powerplant—a Bellfield tower for hoisting, a dolly and all required special tools.

Based at Rio de Janeiro, the C-46 is manned by a pilot, copilot and two engine mechanics who are on call at all hours.

Seattle Crash Suit

The 19th damage suit filed at Seattle as the result of the crash one year ago at Seattle Boeing Field of a nonscheduled airliner brings damages sought to more than \$300,000.

Named as defendants in the latest action—for \$11,500—are Air Transport Associates, Inc., Air Transport Associates Sales Co., Inc. and Air Line Services, Inc. This is the first suit to name both the service airlines and ticket selling corporations as defendants.

Seven persons were killed when the plane, with 32 persons aboard, struck electric wires and exploded in a residential area shortly following takeoff.

Braniff Posts Profit

Braniff Airways turned in a \$402,000 net profit during the first six months of 1950, and President T. E. Braniff has predicted an equally profitable second half.

This year's earnings compare with an \$18,700 loss during the same 1949 period. Operating revenues exceeded last year's figures by \$1,217,000, although expenses also increased by \$785,000. Revenue passenger mileage was up 9.5 percent.

Recent leasing of a DC-4 for military service in the Pacific is not expected to affect the carrier's earnings adversely.

SABENA PICKS UP AIRMAIL COPTERS

Two Bell 47-D1 helicopters to be used by Sabena for air mail pickup and delivery service in Europe are loaded into one of the airline's DC-4 cargo planes at Idlewild for transport to Belgium. The Brussels copter route will be operated by Sabena under

contract with the Belgian post office. Daily stops will be made at Libramont, Liege, Tongres, Hasselt, Beringen, Turnhout, Herenthals, Antwerp and back to Brussels. The service is expected to make possible 24-hr. New York-Belgium airmail deliveries.

ALL ROPES look ALIKE... but...

Rope wire viewed under a microscope with 100 magnification and the correct McQuaid-Ehn grid superimposed and matched to the sample for classification.

THERE'S MORE THAN MEETS THE EYE...

Steel used for Wickwire Aircraft Cord is measured for proper grain size by the exacting McQuaid-Ehn test. Typical samples are carburized to 1750° F., cooled slowly, polished and etched; then examined under a high-powered microscope for the proper matching of a McQuaid-Ehn grid to the size of the crystals. Thus, we make sure that steel going into Wickwire Aircraft Cord conforms to the definite grain size that will give the longest and

most dependable aircraft service. Such quality control of basic properties is possible only with a company like Wickwire... where manufacture is integrated from molten metal to finished rope... where the know-how of 52 years experience goes into the making of every wire rope.

For your free copy of "Know Your Ropes" write to: Wire Rope Sales Office, Wickwire Spencer Steel Division of C.F. & I., Palmer, Mass.

Venezuela Begins Airport Work

(McGraw-Hill World News)

Caracas—Grading and drainage have been started by the Venezuelan Ministry of Public Works at Palo Negro, where a giant airport is to be built in the next few years. It will have two 10,000-ft. runways, costing an estimated \$10 million. A large terminal and several hangars are also included in the project, scheduled for completion by 1955.

At the same time, a longer runway, at Maiquetia, the international airport serving Caracas, is under construction. This new runway, scheduled for completion before the end of this year, will be a mile long and 165 ft. wide. Its ten-in. asphalt-covered pavement is being designed to take the heaviest commercial aircraft.

TTA Feeder Route

Trans-Texas Airways has received Civil Aeronautics Board authorization to operate an additional feeder route from Mission-McAllen-Edinburg, Tex., to San Antonio and Victoria, Tex., via Alice, Corpus Christi and Beeville. CAB denied the applications of Val-Air Lines, Inc., to conduct service from Texas points in the lower Rio Grande Valley to San Antonio and Houston.

Grand Canyon Copter

Helicopter service from an asbestos mine site within the Grand Canyon in northern Arizona is being operated by Arizona Helicopter Service. The mine is patented land, staked out in 1903, and is the only place an aircraft is authorized to land within the park grounds. Now used as a sightseeing medium, it is planned to carry ore out of the canyon within a year.

SHORTLINES

► All American—Has asked the Civil Aeronautics Board for new routes between Williamsport, Pa., and Cleveland, O., via Bradford, Pa., Jamestown, N. Y., and Erie, Pa.; between Scranton-Wilkes Barre, Pa., and Hagerstown, Md., via Hazelton and Harrisburg, Pa.; and between Cleveland and Cincinnati via Mansfield, Marion, Columbus and Springfield, O.

► American—Plans to step up its cargo sales effort despite the transfer of seven DC-4 airfreighters to the Pacific airlift. Company's six remaining airfreighters will serve 16 cities instead of 20 as formerly, but greater use of space on

combination passenger-cargo planes will be sought. In May and June, when AA carried close to 3 million ton miles of freight monthly, 53 percent was handled aboard passenger-carrying DC-6s and Convairs.

► Braniff—First-half 1950 freight revenues were up 188 percent internationally and 62 percent domestically over the same 1949 period.

► British Overseas Airways—Plans to convert its fleet of Dakotas (DC-3s) into "Super Dakotas" through cockpit and instrument standardization, better soundproofing, addition of built-in passenger steps, and other improvements. Thirty-three seats will be available on short runs instead of the usual 28. Radio officers will no longer be carried, permitting a \$280,000 annual saving. BEA expects its "Super Dakotas" to be in service another 5 or 6 years.

► Capital—Is sending 16 crewmen to the West Coast along with its two cargo C-54s being used in the Pacific airlift. Company shops modified the planes by installing wing and fuselage tanks that increased fuel capacity from 1800 to 3700 gal. and range from 1650 to 3300 miles. Radio equipment was also modified for long-range service.

► Central—Has purchased three C-47s and has options on six more. The Ft. Worth carrier hopes to get CAB permission to use the transports on its certificated feeder routes. It now operates single-engine Beech Bonanzas.

► Chicago & Southern—Reported \$148,207 net profit in first-half 1950 against \$296,621 profit in the same period last year. Earnings included \$5775 on the international route to Venezuela and \$142,432 domestically. Dividend of 20 cents a share payable Aug. 15 was declared. . . . First of five new Constellations will be delivered shortly. They will go in service in October on Chicago-Houston and Chicago-Memphis links.

► Flying Tiger Line—Says it is conducting its domestic scheduled freight operations "as usual" despite the use of company personnel and equipment in the Pacific airlift. . . . Tigers and the Furniture Manufacturers Assn. of So. Calif. have formed an airfreight shipping pool to permit the furniture producers to dispatch 5000-lb. lots to Eastern markets at the new low specific commodity rates.

► KLM—Will attempt to restore its financial equilibrium in 1951 by means of sharp economies. The carrier suffered heavy losses last year, and the

ONE SOLUTION FOR ALL YOUR TUBING PROBLEMS

OSTUCO

MANUFACTURES • SHAPES • FABRICATES

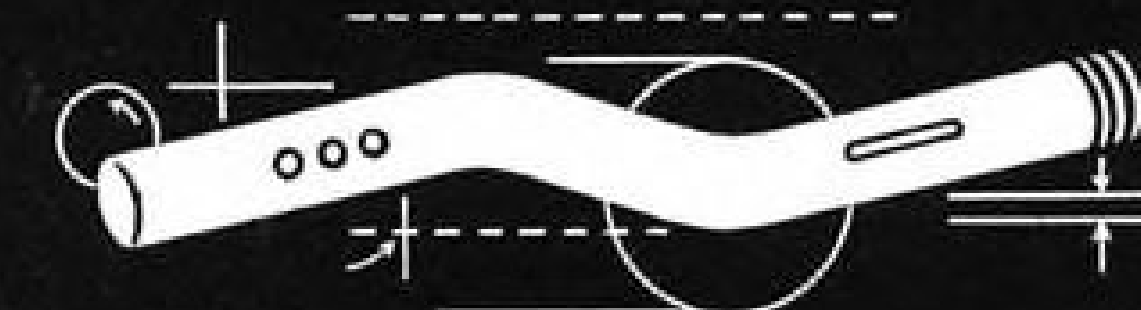

No matter how many or how varied the tubing problems in the parts or products you produce, there's one right answer—OSTUCO.

OSTUCO's "Single Source" operation—with complete modern facilities for manufacturing, shaping, and fabricating tubing, all in one plant—speeds deliveries, assures uniform high quality, and cuts your final costs.

Shipments from one supplier or one location to another are eliminated. Single control of production greatly reduces rejects and prevents errors in meeting your exact requirements. Responsibility is clearly fixed.

For both seamless and electric-welded steel tubing in a broad range of sizes and shapes—for finished or semi-finished parts—you can count on OSTUCO for full satisfaction. Write direct or to our nearest Sales Office for new free booklet "Fabricating and Forging Steel Tubing."

Dutch government does not intend to grant further subsidies.

► **Mid-West Airlines**—Carried 3272 passengers and 113,906 lb. of mail in its single-engine Cessna 190s during first-half of 1950. The feeder also completed 83 percent of its scheduled miles. Average passenger's trip was 144 miles.

► **Pan American**—Company's military operations to the Orient are now substantially larger than its commercial services in the Pacific.

► **Slick**—Reported a profit in June for the second straight month and achieved the first profitable quarter in its history. Company was in the red for first-half 1950, but officials see a good chance that the deficit will be wiped out by year-end. Goal is 3,500,000 ton miles of freight monthly by December.

► **Transocean**—Has started work on a Navy contract calling for an estimated one million miles of bush flying and airlift in connection with exploration and development of petroleum reserves near Point Barrow, Alaska, on the Arctic Ocean. William L. Wood has been named general manager and director of operations for TAL's Arctic Circle flying. . . . Company has recalled 90 air-men and 100 maintenance men for duty in connection with military flights in the Pacific.

► **Turner Airlines**—Has called on CAB to revoke Parks Air Lines' air carrier operating certificate. Turner, an applicant for Parks' routes, says PAL started service on its feeder system "in wilful violation of CAB's orders."

► **United**—Allison division of General Motors Corp. has advised UAL that it can't deliver turboprop engines for commercial use for three years. Current cost of one engine is about \$115,000—more than the price of a new pre-war DC-3.

CAB SCHEDULE

Aug. 7—Prehearing conference on application of Compania Dominicana de Aviacion for foreign air carrier permit from Ciudad Trujillo, Dominican Republic to San Juan, P. R., and Miami. (Docket 4364)

Aug. 7—Resumption of hearing in enforcement proceeding against Trans American Airways, Great Lakes Airlines, Golden Airways, Edward Ware Tabor and Sky Coach Airtravel, Inc. (Docket 4161)

Aug. 7—Hearing in West Coast Airlines—Southwest Airways merger case. (Docket 4405)

Aug. 9—Hearing on Mid-West Airlines' pilot wage scale. (Docket 4515)

Aug. 14—Resumption of hearing on renewal of Southwest Airways' feeder certificate and service suspension at certain United Air Lines points in the area. (Docket 3718 et al)

ACTUATORS for the most exacting design requirements!

SPECIAL MOTORS • SPECIAL GEARING

COMPLETE PACKAGED POWER UNITS FOR EVERY AIRCRAFT APPLICATION

High performance airplanes demand high performance actuators with maximum load capacity, life and reliability. Hoover units are measuring up to the most severe test and flight conditions on production airplanes and new planes still in test stage.

• To solve a difficult pressurization problem on a heavy bomber, Hoover designed this actuator which is controlled by a direct pressure measuring device through a potentiometer. It includes a 9360 to 1 triple planetary reduction gear, and the motor shaft can be braked so sharply that travel of the output shaft is limited to 1/2 degree.

• This actuator was designed by Hoover to withstand the severe loads encountered during in-flight adjustment of the horizontal stabilizer of a jet fighter. The actuator weighs only 12.5 pounds, yet will withstand an ultimate load of 15,000 pounds without failure.

• For positive cockpit sealing, Hoover built into this power unit a unique torque limiting clutch with no frictional parts, the load being transmitted by spring-loaded rollers. It has operated 5,000 consecutive times with a maximum variation in torque of 15% from specified value.

HOOVER

ELECTRIC COMPANY

2100 South Stoner Avenue • Los Angeles 25, California

For a decade, Hoover-designed actuators have been specified on the highest performance airplanes. Consult us for the solution to your actuation problems. Experimental or Production quantities.

CPI HIGH TEMPERATURE SWITCH

for

- DE-ICING SYSTEMS
- HEAT EXCHANGERS
- HEATERS
- STRUCTURE OVER-HEAT INDICATION

Low Thermal mass gives fast thermal response. Withstands extreme under or overshoots of temperature. Used on America's outstanding military aircraft for thousands of hours of actual flight time. Precision made to the most critical instrument standards. Approved by AMC. Write for full details. Inquiries on special problems of thermal control are invited.

WHAT'S NEW

New Books

Each step in design, construction and operation of all types of punches and dies is carefully explained in **Simplified Punch and Die Making**, by James Walker and Carl C. Taylor. The authors are experienced tool designers and engineers who have directed much developmental work in die making and tool fabrication.

Practicality is the keynote of the book—it is aimed at the working tool designer. All of the tools have been constructed and have worked in production.

Book is published by the Macmillan Company, 60 Fifth Ave., New York 11, N. Y. Price is \$5.

If you're stumped by technical German (almost the official language of the missile industry) and the word happens to begin with any letter between A and K, you can find the English counterpart in the first, and only available, volume of the **German-English Technical Dictionary**.

If the word begins with L, or further down the alphabet, you'll have to wait until October for the second volume.

This dictionary, edited by Dr. Kurt F. Leidecker from data compiled by the U. S. Air Force, contains over 100,000 terms. In its present form, it is an expanded version of two interim editions of technical German which were issued by the Air Documents Division of the Air Force.

Our principal interest stems from the profusion of aircraft terms, but a civil engineer, a physicist or a geographer should find the dictionary equally useful.

The German-English Technical Dictionary is published and sold by S. F. Vanni, 30 West 12 St., New York City. Cost of both volumes is \$35.—D.A.A.

Service Manual

A new addition to Drake's Aircraft Mechanic Series, **Aircraft Engine Maintenance and Service**, has just been published by the Macmillan Co.

The 235-page book is written to "bring before laymen, students, teachers and certificated aircraft engine mechanics the fundamentals of aircraft maintenance and service."

The liberally illustrated text includes chapters on top overhaul, disassembly, overhaul inspection, repair and replacement of engine parts, assembly and engine run-in after overhaul and propeller maintenance and service.

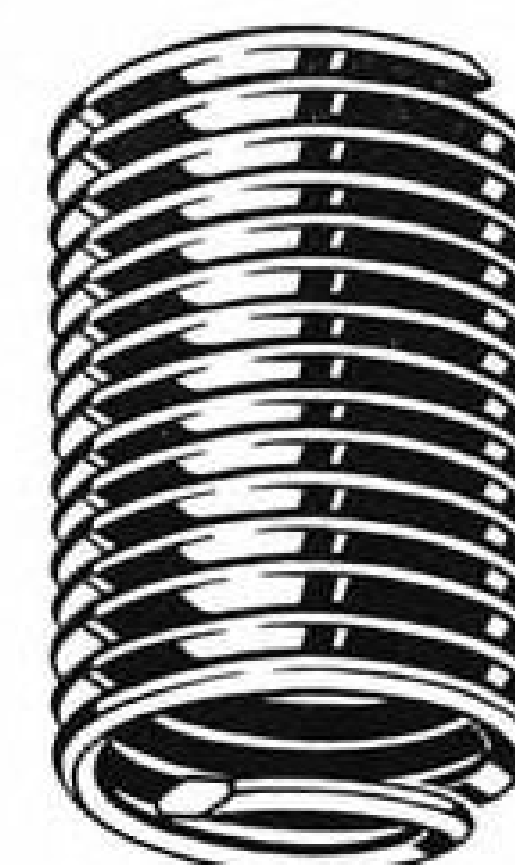

Written in non-technical language, the book emphasizes CAA required inspection and approved repairs.—GLC

STOP THREAD FAILURE IN AIRCRAFT AND ACCESSORIES

DESIGNERS and production men can improve, strengthen and permanently protect all threaded members economically with **Heli-Coil® Inserts**.

Precision-formed of stainless steel or phosphor bronze wire, they meet every specification requirement for aircraft, military and industrial use. They are lighter in weight and require less space than solid bushings... they greatly increase the strength of threads in aluminum, magnesium and light castings of iron or steel. Galling, seizure, corrosion and electrolysis are prevented by Heli-Coil Inserts. They are easy to install, save overhaul time, and eliminate inventory of oversize bolts, screws and studs.

For mounting or assembling any aircraft unit, from the power plant to the oil filter, from the spark plugs to master rod assemblies... for these and hundreds of other uses... **Heli-Coil** is the one positive answer.

Write for your copy of Bulletin No. 248, containing complete specifications and design data.

What's Ahead in Congress

War Investigations

Congress will keep a close eye on the expanding war mobilization program.

The War Investigating Subcommittee, named last week by Chairman Millard Tydings of the Senate Armed Services Committee, will fill the role of the famed Truman Committee of World War II, whose harsh, and sometimes questionable criticism of the performance of aircraft manufacturers and Air Force officials in a few isolated cases was balanced by considerable helpfulness to the industry and the military in solving manpower, priority, and other problems.

Freshman Sen. Lyndon Johnson (D., Tex.), a lieutenant commander on the aircraft carrier Midway in the last war and an aggressive proponent of air power, heads the group, which includes: Sen. Virgil Chapman (D., Ky.); Sen. Estes Kefauver (D., Tenn.); Sen. Lester Hunt (D., Wyo.); Sen. Styles Bridges (R., N. H.); Sen. Leverett Saltonstall (R., Mass.); and Sen. Wayne Morse (R., Ore.).

On the House side of the Capitol, Chairman Carl Vinson's Armed Services Committee has already quietly moved forward in closed-door sessions with top defense officials to determine the reasons for the poor U. S. showing in Korea in the light of the \$50 billion spent on defense over the past four years; the present status of the country's defense; and the requirements to assure U. S. capability to meet future Russian challenges. Shortly, Vinson, Capitol Hill's spokesman for the Joint Chiefs of Staff, will make a floor speech outlining the present status and future defense requirements. But whenever reprimanding is called for, Vinson will do it in private.

Meanwhile, resolutions for two additional House investigations are being pushed: Rep. Clarence Cannon is seeking authorization to set up a war investigating subcommittee of the Appropriations Committee, of which he is chairman; and Rep. Emanuel Celler, the New York New Dealer who has made a specialty of attacking corporations, is backing a seven-member special House investigating committee to scrutinize war contracts. The House leadership is expected to leave war investigating in the competent hands of Vinson's Armed Services group.

Airmail Separation

A \$200,000 appropriation has been voted the Senate Interstate and Foreign Commerce Committee, headed by Sen. Edwin Johnson, for studies looking to the establishment of service mail pay rates on domestic airline routes.

Johnson plans to contract with private accounting firms for the studies. His theory is that the lion's share of "subsidy" to air carriers should be written off as subsidy to the towns which are being furnished uneconomical service.

Wrangling in the House Interstate and Foreign Commerce Committee over legislation authorizing the Civil Aeronautics Board to make a \$300,000 study and directing it to separate service mail payments from subsidy payments to air carriers appears to be much ado about

nothing: The House Appropriations Committee has already served notice it will approve funds for a CAB study.

Prototype Testing

Chances for enactment of legislation authorizing the Civil Aeronautics Administration to spend \$12.5 million over a five-year period on testing of prototypes for new commercial transport and cargo planes is enhanced by Congress' decision to remain in session indefinitely. The bill is now before the Senate for action.

Independent air carriers will open their drive against it today in testimony before the House Interstate and Foreign Commerce Committee. They claim it will do nothing toward solving the pressing need for additional airlift, but will only subsidize the development of "luxury liners" to accommodate an infinitesimal proportion of the population.

New Laws

Aviation measures on which Congress completed recent action will:

- Permit CAA to finance advanced engineering or other training of 25 of its personnel annually, or conduct its own advanced training courses.
- Authorize the Secretary of Agriculture to apply rules and regulations designed to protect U. S. agriculture from importation and spread of injurious pests to air commerce.
- Make false identification of aircraft a criminal offense, subject to a \$1000 fine, three years imprisonment, or both. The measure is aimed at deterring illegal immigration and smuggling by air.

PAA Investigation

Count on the House Judiciary Subcommittee, headed by Rep. Celler, to veer away from an investigation of Pan American Airways—until the heat over the recent North Atlantic merger decision has subsided. The subcommittee was scheduled to open hearings on monopoly charges against PAA in July. "It's still on our agenda—the staff is studying the matter," Celler told AVIATION WEEK. "But because of the Korean situation, I don't think we'll be able to get around to hearings for a few months, at least." If PAA's acquisition of American Overseas Airlines "is related to its monopoly position in the airline industry, I am sure the staff will investigate it," he said.

Air Safety Board

The House Interstate and Foreign Commerce Committee is set to approve legislation setting up an Independent Air Safety Board, being aggressively pushed by the Air Line Pilots Assn. But the overwhelming odds at present are that the legislation will be killed off in the Senate.

(Editor Robert H. Wood, whose editorials usually appear on this page, is on vacation.)

ZERO reader available NOW for immediate installation

THE INSTRUMENT which has received such high acclaim from all who have flown it... the Sperry Zero Reader... is now available for immediate delivery after years of flight testing.

- Developed by Sperry with the co-operation and encouragement of All-Weather Flying Division, USAF, and the Air Transport Association, the Zero Reader greatly simplifies the pilot's job of routine flying as well as making

manual approaches on Instrument Landing Systems.

- The Zero Reader shows on one indicator... heading, attitude, altitude and instrument landing information... data normally supplied by five essential instruments. By merely keeping the two pointers of the instrument at zero, the pilot has at his fingertips the only manual system approaching the performance of stabilized automatic flight control.

- This simpler technique for flying, navigating and making manual instrument approaches is another step in the attainment of all-weather operations.

- Our nearest district office will be glad to give you full information.

Zero Reader-Trade Mark Pat. pending

NOW!

ESNA spans the temperature field

-65°F to +1200°F

with **SELF-LOCKING ELASTIC STOP NUTS**

—famous *Elastic Stop Nuts* protect
permanently against **VIBRATION! IMPACT!**

With the addition of the new Z-550 and Z-1200 series, ESNA now has a specific nut design for all temperatures ranging from minus 65° F. to plus 1200° F. Self-locking, in both fully seated and positioned settings, these fasteners provide permanent protection against *vibration, impact and stress reversal*.

The two new nut designs represent the most efficient solution found by ESNA engineers after detailed research and production line studies of fastening problems encountered under elevated temperatures. Both fully meet ESNA standards for controlled quality and full interchangeability on class 3 bolts with minimum torque scatter. This controlled torque which is a feature of all ESNA nuts assures uniform bolt loading and permits more compact design, with resulting weight reduction. It also simplifies maintenance problems and speeds up field replacements.

Specifically, for applications between -65° F. and +250° F., the nut with the famous red fiber collar offers unequalled protection against vibration, thread corrosion and liquid seepage. The ZM and ZE nuts are designed for sustained temperatures up to 550° and the Z-1200 series has been engineered to withstand multiple cycles of exposure to extreme temperatures up to 1200° F. without seizure. Like all Elastic Stop Nuts, these fasteners are readily removed—do not damage threads or gall the finish—and they can be reused.

HERE'S A CHALLENGE: Send us complete details of your toughest bolted trouble spot. We'll supply test nuts—FREE, in experimental quantities. Or, if you want further information, write for literature. Elastic Stop Nut Corporation of America, Union, N. J. Representatives and Agents are located in many principal cities.
