6	Particle Energy/Intensity	End point energies of beta transitions and discrete energies of alpha particles, neutrons and protons are given in MeV units and their intensities in percent.
7	Spin and Parity	Nuclear spin or angular momentum of the nuclides in units of $\hbar/2\pi$; parity is positive or negative.
8	Magnetic Dipole Moment	Magnetic dipole moments in nuclear magneton units. An absolute value is indicated in the absence of a positive or a negative sign.
9	Electric Quadrupole Moment	Electric quadrupole moments in barn units (10^{-24} cm^2). An absolute value is indicated in the absence of a positive or a negative sign.
10	Gamma Ray Energy/Intensity	Gamma ray energies are given in MeV units and intensities in percent. Annihilation radiation (ann.rad.) refers to the 511.006 keV photons emitted in the annihilation of positrons in matter.

NEUTRON SCATTERING AND ABSORPTION PROPERTIES

Norman E. Holden

This table presents an evaluated set of values for experimental quantities that characterize the properties for scattering and absorption of neutrons. The neutron cross section is given for room temperature neutrons, 20.43 °C, corresponding to a thermal neutron energy of 0.0253 electron volts (eV) or a neutron velocity of 2200 meters/second. The neutron resonance integral is defined over the energy range from 0.5 eV to 0.1×10^6 eV, or 0.1 MeV.

Bound neutron scattering lengths and neutron cross sections averaged over a Maxwellian spectrum at 30 keV for astrophysical applications are also presented. A list of the major references used is given below. The literature cutoff date is January 2003. Uncertainties are given in parentheses. Parentheses with two or more numbers indicate values to the excited state(s) and to the ground state of the product nucleus.

Table Layout

Column Number	Column Title	Description
1	Isotope/Element	For elements, atomic number and chemical symbol are listed. For nuclides, mass number and chemical symbol are listed. Isomers are indicated by the addition of m, m1, or m2.
2	Isotopic Abundance	In atom percent.
3	Half-life	Half-life in decimal notation. μ s = microsecond; ms = millisecond; s = second; m = minute; h = hour; d = day; y = year.
4	Thermal Neutron Cross Sections	Cross sections for neutron capture reactions in units of barns (10^{-24} cm ²) or millibarns (mb). Proton, alpha production and fission reactions are designated by σ_p , σ_a , σ_f , respectively. Separate values are listed for isomeric production.
5	Neutron Resonance Integrals	Resonance integrals for neutron capture reactions in barns (10^{-24} cm ²) or millibarns (mb). Proton, alpha production and fission reactions are designated by $R.I._p$, $R.I._a$, $R.I._f$, respectively. Separate values are listed for isomeric production.
6	Neutron Scattering Lengths	Bound coherent scattering lengths for neutron scattering reactions in units of femtometers (fm), which is equal to fermis (10^{-13} cm).
7	Maxwellian Averaged Cross Section	Astrophysical cross sections, averaged over a stellar neutron maxwellian spectrum characterized by a thermal energy of 30 keV, expressed in barns (10^{-24} cm ²), millibarns (mb) or microbarns (μ b).

COSMIC RADIATION

A.G. Gregory and R.W. Clay

The Nature of Cosmic Rays

Primary cosmic radiation, in the form of high energy nuclear particles, electrons and photons from outside the solar system and from the Sun, continually bombards our atmosphere. Secondary radiation, resulting from the interaction of the primary cosmic rays with atmospheric gas, is present at sea-level and throughout the atmosphere.

Secondary radiation is collimated by absorption and scattering in the atmosphere and consists of a number of components associated with different particle species. High energy primary particles can produce large numbers of secondary particles forming an extensive air shower. Thus, a number of particles may then be detected simultaneously at sea-level.

Primary particle energies accessible in the vicinity of the Earth range from $\sim 10^8$ eV to $\sim 10^{20}$ eV. At the lower energies, the limit is determined by the inability of charged particles to traverse the heliosphere to us through the outward-moving solar wind. The upper energy limit is set by the practicality of building detectors to record particles with the extremely low fluxes found at those energies (O.C. Allkofer, 1975a; J.G. Wilson, 1976).

Primary Cosmic Rays

Primary Particle Energy Spectrum

Figure 1 shows the spectrum of primary particle energies. This includes all particle species. In differential form it is roughly a power law of intensity versus energy with an index of ~ -3 . There appears to be a knee (a steepening) at a little above 10^{15} eV and an ankle (a flattening) above $\sim 10^{18}$ eV. Figure 2 emphasizes the features in the spectrum at the highest energies through multiplying the flux with a strongly rising power law of energy. This figure should be used with caution as errors for the two axes are not now independent.

Data on the high energy cosmic ray spectrum are uncertain largely because of limited event statistics due to the very low flux which might best be measured in particles per square kilometer per century. The highest energy event recorded to 1995 had an energy of 3×10^{20} eV (D.J. Bird et al., 1993).

It is expected that the highest energy cosmic rays will interact with the 2.7 K cosmic microwave background through photoproduction or photodisintegration. These interactions will appreciably reduce the observed flux of cosmic rays with energies above 5×10^{19} eV if they travel further than ~ 150 million light years. This process is known as the Greisen-Zatsepin-Kuz'min (GZK) cutoff (P. Sokolsky, 1989).

At energies below $\sim 10^{13}$ eV, solar system magnetic fields and plasma can modulate the primary component and Figure 3 shows the extent of this modulation between solar maximum and minimum (E. Juliusson, 1975; J. Linsley, 1981).

Primary Particle Energy Density

If the above spectrum is corrected for solar effects, the energy density above a particle energy of 10^9 eV outside the solar system is found to be $\sim 5 \times 10^5$ eV m $^{-3}$. As the threshold energy is increased, the energy density decreases rapidly, being 2×10^4 eV m $^{-3}$ above 10^{12} eV and 10^2 eV m $^{-3}$ above 10^{15} eV. The energy density at lower energies outside the heliosphere is unknown but may be substan-

tially greater if the particle rest mass energy is included together with the kinetic energy (A. W. Wolfendale, 1979).

Primary Particle Isotropy

This is measured as an anisotropy $(I_{\max} - I_{\min})/(I_{\max} + I_{\min}) \times 100\%$, where I , the intensity (m $^{-2}$ s $^{-1}$ sr $^{-1}$), is usually measured with an angular resolution of a few degrees.

The measured anisotropy is small and energy dependent. It is roughly constant in amplitude at between 0.05 and 0.1% (with a phase of 0 to 6 hours in right ascension) for energies between 10^{11} eV and 10^{14} eV and appears to increase at higher energies roughly as $0.4 \times (\text{Energy(eV)}/10^{16})^{0.5}\%$ up to $\sim 10^{18}$ eV. The latter rise may well be an artifact of the progressively more limited statistics as the flux drops rapidly with energy. It appears possible that a real anisotropy has been observed at the highest energies (above a few times 10^{19} eV) with a directional preference for the supergalactic plane (this plane reflects the directions of galaxies within about 100 million light years) (A.W. Wolfendale, 1979; R.W. Clay, 1987; T. Stanev et al., 1995).

Primary Particle Composition

The composition of low energy cosmic rays is close to universal nuclear abundances except where propagation effects are present. For example, Li, Be, and B which are spallation products, are overabundant by about six orders of magnitude.

Composition at 10^{11} eV per nucleus

Charge	1	2	(3–5)	(6–8)	(10–14)	(16–24)	(26–28)	≥ 30
% Composition	50	25	1	12	7	4	4	0.1
(10% uncertainty)								

Measurements at higher energies indicate that there is an increase in the relative abundances of nuclei with charge greater than 6 at energies above 50 TeV/nucleus (K. Asakimori et al., 1993) ($1 \text{ TeV} = 10^{12} \text{ eV}$).

Cosmic ray composition at low energies is often quoted at a fixed energy per nucleon. When presented in this way, protons constitute roughly 90% of the flux, helium nuclei about 10% and the remainder sum to a total of about 1%.

Certain radioactive isotopic ratios show lifetime effects. The ratio of Be 10 /B 9 abundances is used to measure an "age" of cosmic rays since Be 10 is unstable with a half life of about 1.6×10^6 years. A ratio of 0.6 is expected in the absence of Be 10 decay and a ratio of about 0.2 is found experimentally (E. Juliusson, 1975; P. Meyer, 1981).

At higher energies, composition determinations are indirect and are rather contradictory and controversial. Experiments aim to differentiate between broad composition models. The measurement technique is based on studies of cosmic ray shower development. A rather direct technique for such studies is to use fluorescence observations of the shower development to determine the atmospheric depth of maximum development of the shower. Such observations suggest a heavy composition (large atomic number) at energies $\sim 10^{17}$ eV which changes with increasing energy to a light composition (perhaps protonic) above $\sim 10^{19}$ eV (T. K. Gaisser et al., 1993).

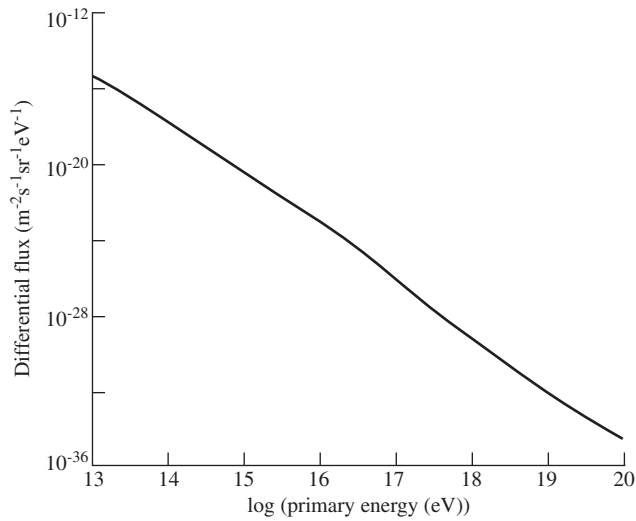

FIGURE 1. The energy spectrum of cosmic ray particles. This spectrum is of a differential form and can be converted to an integral spectrum by integration over all energies above a required threshold (E). Insofar as the spectrum approximates a power law of index -3 , a simple conversion to the integral at an energy $E/1.8$ is obtained by multiplying the differential flux by the energy and dividing by 0.62 .

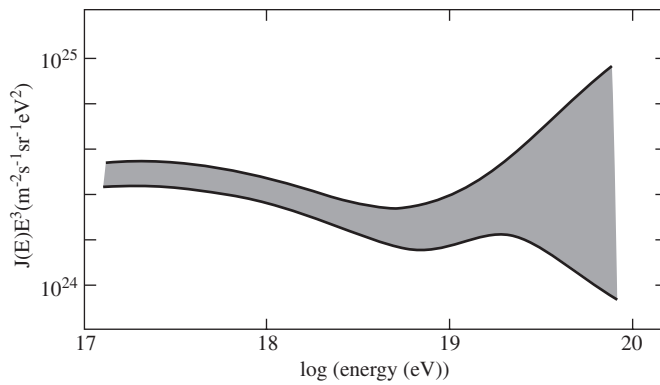

FIGURE 2. Energy spectrum at the highest energies. This spectrum (after Yoshida et al., 1995) has the differential spectrum multiplied by energy cubed. It is from a compilation of a number of measurements and indicates the good general agreement at the lower energies and a spread due to inadequate statistics at the highest energies.

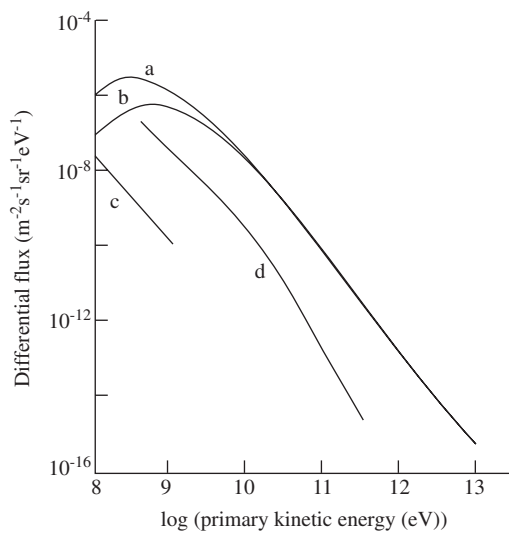

FIGURE 3. Energy spectrum of particles at lower energies. (a) Solar minimum proton energy spectrum. (b) Solar maximum proton energy spectrum. (c) Gamma-ray energy spectrum. (d) Local interstellar electron spectrum.

Primary Electrons

Primary electrons constitute about 1% of the cosmic ray beam. The positron to negative electron ratio is about 10% (J. M. Clem et al., 1995).

Antimatter in the Primary Beam

The ratio of antiprotons to protons in the primary cosmic ray beam (at about 400 MeV) is about 10^{-5} . At about 10 GeV the ratio is about 10^{-3} . At the highest measured energies (10 TeV), the upper limit to the ratio is about 20% (M. Amenomori et al., 1995; S. Orito et al., 1995).

Primary Gamma-Rays

The flux of primary gamma-rays is low at high energies. At 1 GeV the ratio of gamma-rays to protons is about 10^{-6} . The arrival directions of these gamma-rays are strongly concentrated in the plane of the Milky Way although there is a diffuse, near isotropic background flux and some point sources have been detected.

Since the absorption cross section for gamma-rays above 100 MeV is approximately 20 mbarn/electron, less than 10% of gamma-rays reach mountain altitudes (A. W. Wolfendale, 1979; P. F. Michelson, 1994).

Sea-Level Cosmic Radiation

The sea-level cosmic ray dose is 300 millirad·yr⁻¹ and the sea-level ionization is 2.2×10^6 ion pairs m⁻³s⁻¹. The sea-level flux has a soft component, which can be absorbed in about 100 mm of lead (about 100 g·cm⁻² of absorber) and a more penetrating (largely muon) hard component. The sea-level radiation is largely produced in the atmosphere and is a secondary component from interactions of the primary particles. The steep primary energy spectrum means that most secondaries at sea level are from rather low energy primaries. Thus the secondary flux is dependent on the solar cycle and the geomagnetic latitude of the observer.

Absolute Flux of the Hard Component

Vertical Integral Intensity $I(0) \sim 100 \text{ m}^{-2}\text{s}^{-1}\text{sr}^{-1}$
 Angular dependence $I(\theta) \sim I(0) \cos^2(\theta)$
 Integrated Intensity $\sim 200 \text{ m}^{-2}\text{s}^{-1}$
 (O.C. Allkofer, 1975b).

Flux of the Soft Component

In free air, the soft component comprises about one third of the total cosmic ray flux.

Latitude Effect

The geomagnetic field influences the trajectories of lower energy cosmic rays approaching the Earth. As a result, the background flux is reduced by about 7% at the geomagnetic equator. The effect decreases toward the poles and is negligible at latitudes above about 40°.

Flux of Protons

The proton component is strongly attenuated by the atmosphere with an attenuation length (reduction by a factor of e) of about 120 g·cm⁻². It constitutes about 1% of the total vertical sea level flux.

Absorption

The soft component is absorbed in about 100 g·cm⁻² of matter. The hard component is absorbed much more slowly:

Absorption in lead, 6% per 100 g·cm⁻²
 Absorption in rock, 8.5% per 100 g·cm⁻²

Absorption in water, 10% per 100 g·cm⁻²

(Absorption for depths less than 100 g·pd cm⁻² is given by K. Greisen, 1943.)

Altitude Dependence

The cosmic ray background in the atmosphere has a maximum intensity of about 15 times that at sea level at a depth of about 150 g·cm⁻² (15 km altitude). At maximum intensity, the soft and hard components contribute roughly equally but the hard component is then attenuated more slowly (S. Hayakawa, 1969).

Cosmic Ray Showers

High energy cosmic rays produce particle cascades in the atmosphere which can be detected at sea level provided that their energy exceeds about 100 GeV (such low energy cascades may be detected by using the most sensitive atmospheric Cerenkov detectors). The primary particle progressively loses energy which is transferred through the production of successive generations of secondary particles to a cascade of hadrons, an electromagnetic shower component (both positively and negatively charged electrons and gamma-rays) and muons. The secondary particles are relativistic and all travel effectively at the speed of light. As a result, they reach sea level at approximately the same time but, due to Coulomb scattering (for the electrons) and production angles (for the pions producing the muons), are spread laterally into a disk-like shower front with a characteristic lateral width of several tens of meters and thickness (near the central shower core) of 2 to 3 m. The number of particles at sea level is roughly proportional to the primary particle energy:

Number of particles at sea level $\sim 10^{-10} \times \text{energy (eV)}$.

At altitudes below a few kilometers, the number of particles in a shower attenuates with an *attenuation length* of about 200 g·cm⁻², i.e.,

particle number = original number $\times \exp(-(\text{depth increase})/200)$

The above applies to an individual shower. The rate of observation of showers of a given size (particle number at the detector) at different depths of absorber attenuates with an *absorption length* of about 100 g·cm⁻² (J.G. Wilson, 1976).

Atmospheric Background Light from Cosmic Rays

Cosmic ray particles produce Cerenkov light in the atmosphere and produce fluorescent light through the excitation of atmospheric molecules.

Cerenkov Light

High energy charged particles will cause the emission of Cerenkov light in air if their energies are above about 30 MeV (electrons). This threshold is pressure (and hence altitude) dependent. A typical Cerenkov light pulse (at sea level, 100 m from the central shower core) has a time spread of a few nanoseconds. Over this time, the photon flux between 430 and 530 nm would be $\sim 10^{14} \text{ m}^{-2}\text{s}^{-1}$ for a primary particle energy of 10^{16} eV . For comparison, the night sky background flux is $\sim 6 \times 10^{11} \text{ photons m}^{-2}\text{s}^{-1}\text{sr}^{-1}$ in the same wavelength band (J.V. Jelley, 1967).

Fluorescence Light

Cosmic ray particles in the atmosphere excite atmospheric molecules which then emit fluorescence light. This is weak compared to the highly collimated Cerenkov component when viewed in the direction of the incident cosmic ray particle but is emitted

isotropically. Typical pulse widths are longer than 50 ns and may be up to several microseconds for the total pulse from distant large showers (R.M. Baltrusaitis et al., 1985).

Effects of Cosmic Rays

Cerenkov Effects in Transparent Media

Background cosmic ray particles will produce Cerenkov light in transparent material with a photon yield between wavelengths λ_1 and λ_2

$$\sim (2\pi/137)\sin^2(\theta_c) \int_{\lambda_1}^{\lambda_2} d\lambda / \lambda^2 \text{ photons(unit length)}^{-1}$$

where θ_c (the Cerenkov angle) = $\cos^{-1}(1/\text{refractive index})$.

This background light is known to affect light detectors, e.g., photomultipliers, and can be a major source of background noise (R.W. Clay and A.G. Gregory, 1977).

Effects on Electronic Components

If background cosmic ray particles pass through electronic components, they may deposit sufficient energy to affect the state of, e.g., a transistor flip-flop. This effect may be significant where reliability is of great importance or the background flux is high. For instance, it has been estimated that, in communication satellite operation, an error rate of about 2×10^{-3} per transistor per year may be found. Permanent damage may also result. A significant error rate may be found even at sea level in large electronic memories. This error rate is dependent on the sensitivity of the component devices to the deposition of electrons in their sensitive volumes (J.F. Ziegler, 1981).

Biophysical Significance

When cosmic rays interact with living tissue, they produce radiation damage. The amount of the damage depends on the total dose of radiation. At sea level, this dose is small compared with doses from other sources but both the quantity and quality of the radiation change rapidly with altitude. Approximate dose rates under various conditions are:

Dose rates (mrem·yr⁻¹)
 Sea level cosmic rays, 30
 Cosmic rays at 10 km (subsonic jets), 2000
 Cosmic rays at 18 km (supersonic transports), 10,000
 (c.f., mean total sea level dose, 300)

Astronauts would be subject to radiation from galactic (0.05 rads per day) and solar (a few hundred rads per solar flare) cosmic rays as well as large fluxes of low energy radiation when passing through the Van Allen belts (about 0.3 rads per traverse).

Both astronauts and SST travellers would be subject to a small flux of low energy heavy nuclei stopping in the body. Such particles are capable of destroying cell nuclei and could be particularly harmful in the early stages of the development of an embryo. The rates of heavy nuclei stopping in tissue in supersonic transports and spacecraft are approximately as follows:

Stopping nuclei ((cm³ tissue)⁻¹ hr⁻¹)
 Supersonic transport (16 km), 0.0005
 Supersonic transport (20 km), 0.005
 Spacecraft, 0.15
 (O. C. Allkofer, 1975a; O. C. Allkofer et al., 1974).

Carbon Dating

Radiocarbon is produced in the atmosphere due to the action of cosmic ray slow neutrons. Solar cycle modulation of the very low energy cosmic rays causes an anticorrelation of the atmospheric ¹⁴C activity with sunspot number with a mean amplitude of about 0.5%. In the long term, modulation of cosmic rays by a varying magnetic field may be important (A.A. Burchuladze et al., 1979).

Practical Uses of Cosmic Rays

There are few direct practical uses of cosmic rays. Their attenuation in water and snow have, however, enabled automatic monitors of water and snow depth to be constructed. A search for hidden cavities in pyramids has been carried out using a muon "telescope."

Other Effects

Stellar X-rays have been observed to affect the transmission times of radio signals between distant stations by altering the depth of the ionospheric reflecting layer. It has also been suggested that variations in ionization of the atmosphere due to solar modulation may have observable effects on climatic conditions.

TECHNIQUES FOR MATERIALS CHARACTERIZATION

Experimental Techniques Used to Determine the Composition, Structure, and Energy States of Solids and Liquids

H. P. R. Frederikse

The many experimental methods, originally designed to study the chemical and physical behavior of solids and liquids, have grown into a new field known as Materials Characterization (or Materials Analysis). During the past 30 years a host of techniques aimed at the study of surfaces and thin films has been added to the many tools for the analysis of bulk samples. The field has benefited particularly from the development of computers and microprocessors, which have vastly increased the speed and accuracy of the measuring devices and the recording of their output. Materials characterization was and is a very important tool in the search for new physical and chemical phenomena. It plays an essential role in new applications of solids and liquids in industry, communications, and medicine. Many of its techniques are used in quality control, in safety regulations, and in the fight against pollution.

In most Materials Characterization experiments the sample is subjected to some kind of radiation: electromagnetic, acoustic, thermal, or particles (electrons, ions, neutrons, etc.). The surface

analysis techniques usually require a high vacuum. As a result of interactions between the solid (or liquid) and the incoming radiation a beam of a similar (or a different) nature will emerge from the sample. Measurement of the physical and/or chemical attributes of this emerging radiation will yield qualitative, and often quantitative, information about the composition and the properties of the material being probed.

The modern tendency of describing practically everything in this world by a combination of a few letters (acronyms) has also penetrated the field of Materials Characterization. The table below gives the meaning of the acronym for every technique listed, the form and size of the required sample (bulk, surface, film, liquid, powder, etc.), the nature of the incoming and of the emerging radiation, the depth and the lateral spatial resolution that can be probed, and the information obtained from the experiment. The last column lists one or two major references to the technique described.

Technique	Sample	In	Out	Depth	Lateral resolution	Information obtained	Ref.
Optical and Mass Spectroscopies for Chemical Analysis							
1. AAS Atomic Absorption Spectroscopy	Atomize (flame, electro, thermal, etc.)	Light, e.g., glow discharge	Absorption spectrum	—	—	Concentration of atomic species (quantitative, using standards)	1,2
2. ICP-AES Induct. Coupled Plasma – Atomic Emission Spectroscopy	Atomize (flame, electro, thermal, ICP, etc.)	—	Emission spectrum	—	—	Concentration of atomic species (quantitative, using standards)	3
3. Dynamic SIMS Dynamic Secondary Ion Mass Spectroscopy	Surface	Ion beam (1–20 keV)	Secondary ions; analysis with mass spectrometer	2 nm–1 μ m (or deeper: ion milling)	0.50 nm	Elemental and isotopic analysis; depth profile (all elements); detection limits: ppb–ppm	4
4. Static SIMS Static Secondary Ion Mass Spectroscopy	Surface	Ion beam (0.5–20 keV)	Secondary ions, analysis with mass spectrometer	0.1–0.5 nm	10 μ m	Elemental analysis of surface layers; molecular analysis; detection limits: ppb–ppm	4
5. SNMS Sputtered Neutral Mass Spectroscopy	Surface, bulk	Plasma discharge; noble gases: 0.5–20 keV	Sputtered atoms ionized by atoms or electrons; then mass analyzed	0.1–0.5 nm (or deeper: ion milling)	1 cm	Elemental analysis $Z \geq 3$; depth profile; detection limit: ppm	4,6
6. SALI Surface Analysis by Laser Ionization	Surface	e-beam, ion-beam, or laser for sputtering	Sputtered atoms ionized by laser; then mass analyzed	0.1–0.5 nm up to 3 μ m in milling mode	60 nm	Surface analysis; depth profiling	7
7. LIMS Laser Ionization Mass Spectroscopy	Surface, bulk	u.v. laser (ns pulses)	Ionized species; analyzed with mass spectrometer	50–150 nm	5 μ m–1 mm	Elemental (micro)analysis; detection limits: 1–100 ppm	8
8. SSMS Spark Source Mass Spectroscopy	Sample in the form of two electrodes	High voltage R.F. spark produces ions	Ions – analyzed in mass spectrometer	1–5 μ m	—	Survey of trace elements; detection limit: 0.01–0.05 ppm	9
9. GDMS Glow Discharge Mass Spectroscopy	Sample forms the cathode for a D.C. glow discharge	Sputtered atoms ionized in plasma	Ions – analyzed in mass spectrometer	0.1–100 μ m	3–4 mm	(Bulk) trace element analysis; detection limit: sub-ppb	9,10
10. ICPMS Induct. Coupled Plasma Mass Spectroscopy	Liquid-dissolved sample carried by gas stream into R.F. induction coil	Ions produced in argon plasma	Ions – analyzed in quadrupole mass spectrometer	—	—	High sensitivity analysis of trace elements	11
Photons — Absorption, Reflection, and Electron Emission							
11. IRS Infrared Spectroscopy	Thin crystal, glass, liquid	I.R. light (W-filament, global, Hg-arc)	I.R. spectrum	—	—	Electronic transitions (mainly in semiconductors and superconductors); vibrational modes (in crystals and molecules)	12,13,14
12. FTIR Fourier Transform I.R. Spectroscopy	Solid, liquid; transmission or reflection	White light (all frequencies)	Fourier Transform of spectrum (interferometer)	—	—	Spectra obtained at higher speed and resolution	15
13. ATR Attenuated Total Reflection	Surface or thin crystal	—	—	μ m's	—	Atomic or molecular spectra of surfaces and films	16
14. (μ)-RS (Micro-) Raman Spectroscopy	Solid, liquid (1 μ m–1 cm)	Laser beam, e.g., Ar-line, YAG-line	Raman spectra	0.5 μ m	0.5 μ m	Molecular and crystal vibrations	12,14,17

	Technique	Sample	In	Out	Depth	Lateral resolution	Information obtained	Ref.
15.	CARS Coherent Anti-Stokes Raman Spectroscopy	Solid, liquid (50 μm –3 cm)	Pump beam (ω_p)+ probe beam (ω_s)	Anti-Stokes spectrum	–	–	High resolution Raman spectra	14
16.	Ellipsometry	Transparent films, crystals, adsorbed layers	Polarized light	Change in polarization	0.05 nm–5 μm	25 μm (or sample thickness)	Refractive index and absorption	18,19
17.	UPS Ultraviolet Photo-electron Spectroscopy	Surfaces, adsorbed layers	u.v. light, 10–100 eV; 200 eV (synchrotron)	Electrons	0.2–10 nm	0.1–10 nm	Energies of electronic states of surfaces and free molecules	20,21
18.	PSD Photon Stimulated Desorption	Surfaces with adsorbed species	Far u.v. light $E > 10$ eV	Ions – analyzed with mass spectrometer	0.1–2 nm	–	Structure and desorption kinetics of adsorbed atoms and molecules	22
X-Rays								
19.	XRD X-Ray Diffraction	Single crystals, powders, films	X-rays: $\lambda = 0.05$ –0.2 nm (6–17 keV)	Diffacted X-ray beam	1–1000 μm	0.1–10 mm	Identification of crystallographic structures; all elements (low Z difficult)	23,24
20.	XRF/EDS X-Ray Fluorescence/Energy Dispersive Spectroscopy	Thin films, single layer	Prim. X-ray beam $\lambda = 0.02$ –0.1 nm 12–80 keV	Fluorescent X-rays	1–100 μm	10 mm	Elemental analysis; all elements except H, He, Li – (EDS also used in XRD, SEM, TEM and EPMA)	25,26
21.	EXAFS Extended X-Ray Absorption Fine Structure	Films, foils	High intensity X-rays (synchrotron)	Spectrum near absorption edge	nm– μm	–	Local atomic structure: order/disorder in vicinity of absorbing atom	27
22.	XPS/ESCA X-Ray Photo-electron Spectroscopy/ Electron Spect. for Chemical Analysis	Surfaces, thin films (≈ 20 atomic layers)	Soft X-rays (1–20 keV)	Core electrons; valence electrons	0.5–10 nm	5 nm–50 μm	(Quantitative) identification of all elements in surface layer or film	28,29
Electrons								
23.	CL Cathode Luminescence	Insulators, semiconductors	Electrons 5–50 keV	Photons 0.1–5 eV	1 nm–2 μm	1 or 2 μm	Energy levels of impurities and point defects	30
24.	APS Appearance Potential Spectroscopy	Surface (≈ 20 atomic layers)	Electrons (energy scan) 50–2000 eV	X-rays to pinpoint electron energy threshold	–	–	Identification of surface species	21, see also C
25.	AES Auger Electron Spectroscopy	Thin films, surfaces	Electrons 3–10 keV	Auger electrons 20–2000 eV	0.3–3 nm	≈ 30 nm	Elemental composition of surface (except H, He); detection limit 0.1–1%	28,29
26.	EELS Electron Energy Loss Spectroscopy	Very thin samples (<200 nm)	Electrons (100–400 keV)	(Retarded) electrons; minus 1–1000 eV	<200 nm	1–100 nm	Local elemental concentration; electronic structure, chem. bonding; interatomic distances	31
27.	EXELFS Extended Electron Energy Loss Fine Structure	Thin films	Electrons (100–400 keV)	Electrons energies 0–30 eV above edge	<200 nm	1–100 nm	Density of states of valence electrons (above Fermi level)	27,32
28.	ESD Electron Stimulated Desorption	Adsorbed species	Electrons $E > 10$ eV	Ions – analyzed with mass spectrometer	–	–	Structure and desorption properties of adsorbed atoms and molecules	22
29.	ESDIAD ESD-Ion Angular Distribution	(See ESD)	(See ESD)	Directional dependence of emitted ions	–	–	Geometries of adsorbed species (atoms or molecules)	22
30.	EPMA Electron Probe (X-Ray) Micro Analysis	Solid conductors and insulators <1 cm thick	Electrons 5–30 keV	Characteristic X-ray 0.1–15 keV	100 nm–5 μm	1 μm	Elemental analysis, $Z \leq 4$, major, minor and trace amounts	33,34
31.	LEED Low Energy Electron Diffraction	Surface	Mono-energetic electron beam 10–1000 eV	Diffacted electrons	0.4–2 nm	<5 μm	Crystallographic structure of surface; resolution: 0.01 nm	35
32.	RHEED Reflection High Energy Electron Diffraction	Surface	Electron beam at grazing angle 5–50 keV	Reflected electrons	0.2–10 nm	<5 μm	Surface symmetry	36,37
33.	SEM Scanning Electron Microscopy	Bulk, films (conducting)	High energy electrons usually ≈ 30 keV	Secondary and backscattered electrons	1 nm–5 μm	1–20 nm	Surface image, defect structure; resolution 5–15 nm; magnification 300,000 \times	33,34
34.	(S)TEM (Scanning) Transmission Electron Microscopy	Thin specimen – <200 nm	High energy electrons typically 300 keV	Transmitted and diffracted electrons	(Sample thickness)	2–20 nm	(Defect) structure of cryst. solids; microchemistry; high resol.: 0.2 nm	33
35.	FEM Field Emission Microscopy	Metals, alloys (sharp point)	–	Electron emission (with appl. electric field – 50 kV)	≈ 0.5 nm	10–100 nm	Surface image, crystallographic structure	34
36.	STM Scanning Tunneling Microscopy	Polished or cleaved surface (conducting)	Tunneling current controls distance between sample and very sharp tip		1–5 nm	2–10 nm	Atomic-scale relief map of surface; resolution: vert. 0.002 nm, hor. 0.2 nm	39
37.	SPM Scanned Probe Microscopy	Very flat surface	Any field: e.g. mechan. vibration recorded with laser probe; same with magnetic, electric or thermal field		1–100 nm	1–100 nm	Surface-magnetic field, surface-thermal conductivity, etc.	39a
38.	AFM Atomic Force Microscopy	Very flat surface	Similar to STM; force measured with cantilever spring		0.5–5 nm	0.2–130 nm	Surface topography with atomic resolution; interatomic force	40

	Technique	Sample	In	Out	Depth	Lateral resolution	Information obtained	Ref.
Ions and Neutrons								
39.	ISS (or LEIS) Ion Scattering Spectroscopy (Low Energy Ion Scattering)	Surface	Ion beam He ⁺ or Ne ⁺ <3 keV	Sputtered ions (energy analysis)	0.1–0.5 nm	1–100 μm	Elemental analysis (better for low Z) detection limits: 0.01–1%	41
40.	FIM Field Ion Microscopy	Surface: metals, alloys; very sharp tip	(He gas above sample)	He ions + high electric field produce image	≈0.1 nm	0.1–2 nm	Atomic structure of surface	34,42
41.	RBS Rutherford Back Scattering	Solids, thin films	Mono-energetic ions (H ⁺ or He ⁺) 0.5–3 MeV	Backscattered ions	10 nm–1 μm	1 mm	Element identification (Li to U) detection limit: 0.01–1%	46
42.	NRA Nuclear Reaction Analysis	Solids, thin films	Mono-energetic ions (Li, Be, B, etc.) 200 keV–6 MeV	Protons, deuterons ³ He, α-particles, γ-rays	0.1–5 μm	10 μm–10 mm	Element identification (all) detection limit: 10 ⁻¹² –10 ⁻²	47
43.	PIXE Particle Induced X-ray Emission	Thin films, surface layers	High energy ions (H ⁺ or He ⁺)	Characteristic X-rays	<10 μm	1 μm–2 mm	Trace impurities: Z>3 detection limit: 0.1–100 ppm (depending on sample thickness)	48
44.	INS Ion Neutralization Spectroscopy	Surface	He-ions (≈5 eV)	Electrons	—	—	Energies of valence electrons	49
45.	NAA Neutron Activation Analysis	Bulk, >0.5 g	Thermal neutrons	Characteristic γ-rays, (≈1 MeV)	Bulk	—	Trace concentrations (of isotopes) of elements: trans. metals, Pt-group; detection limit: 10 ⁸ –10 ¹⁴ atoms/cm ³	43
46.	N(P)D Neutron (Powder) Diffraction	Crystalline solids	Thermal neutrons E ≈0.0025 eV	Diffacted neutrons	Bulk	—	Crystallographic structure; porosity, particle size	44
47.	SANS Small Angle Neutron Scattering	Inhomogeneous solids; powders; porous samples	Thermal neutrons 2 θ = 10 ⁻² –10 ⁻⁴	Scattered neutrons	1–25 mm	—	Average size of inhomogeneities; range: 1 nm–1 mm	45
Acoustic								
48.	SLAM Scanning Laser Acoustic Microscopy	Bulk, film	Acoustic wave produced by laser 1 MHz–1 GHz	Reflected acoustic wave	μm–cm	0.1–20 mm	Defect structure; thickness measurement	50
Thermal								
49.	DTA Differential Thermal Analysis	Specimen and reference sample	Uniform heating	Temperature difference	Bulk	—	Phase transitions, crystallization	51
50.	DSC Differential Scanning Calorimetry	Specimen and ref. sample	Controlled heating	Measure heat required for equal temperature	Bulk	—	Phase transitions, crystallization; activation energies	51
51.	TGA Thermo Gravimetric Analysis	Bulk, 1–100 g	Controlled heating	Weight as function of temperature (and time)	Bulk	—	Decomposition, non-stoichiometry, kinetics of reaction	52
Resonance								
52.	EPR (ESR) Electron Paramagnetic (Spin) Resonance	Paramagnetic solids or liquids	Microwave radiation in magnetic field 3–300 GHz; 1–100 kG	Microwave absorption (at resonance)	Bulk	—	Local environment of paramagnetic ion; concentration of paramagnetic, species; detection limit: 10 ¹¹ spins/cm ³	53,54
53.	ECR Electron Cyclotron Resonance	Semiconductors, metals; free electrons (low temperature)	Microwave radiation in magnetic field 10–30 GHz; 5–10 kG	Microwave absorption (at resonance)	Bulk	—	Electronic energy bands, effective masses	55
54.	Mössbauer Effect	Source and absorber	Mono-energetic γ-rays: 5–100 keV	Mössbauer spectrum (Doppler shifted (lines)	50 m	1 cm	Interaction between nucleus and its environment (local electric, magnetic fields; bonds; valency; diffusion, etc.)	56
55.	NMR (MRI) Nuclear Magnetic Resonance (Magnetic Resonance Imaging)	Solids, liquids	R.F. radiation + magnetic field; e.g. for protons: 60 MHz, 14 kG	R.F. absorption	<1 cm	1 cm	Quant. analysis; local magnetic environment; diffusion; imaging	58
56.	ENDOR Electron Nuclear Double Resonance	Solids, liquids	R.F. + microwave radiation in magn. field.	Microwave absorption	—	—	Hyperfine interaction → local atomic structure	54
57.	NQR Nuclear Quadrupole Resonance	Solids	R.F. radiation 0.5–1000 MHz	R.F. absorption	—	—	Asymmetry of the charge distribution at the nucleus	55,59
Other								
58.	BET Brunauer-Emmett-Teller	(Large) surface area 1–20 m ² /g	Adsorbed gas (e.g., N ₂ at low temp.) as function of pressure (monolayer coverage)		—	—	Surface area measurement	60

SYMMETRY OF CRYSTALS

L. I. Berger

The ability of a body to coincide with itself in its different positions regarding a coordinate system is called its symmetry. This property reveals itself in iteration of the parts of the body in space. The iteration may be done by reflection in mirror planes, rotation about certain axes, inversions and translations. These actions are called the symmetry operations. The planes, axes, points, etc., are known as symmetry elements. Essentially, mirror reflection is the only truly primitive symmetry operation. All other operations may be done by a sequence of reflections in certain mirror planes. Hence, the mirror plane is the only true basic symmetry element. But for clarity, it is convenient to use the other symmetry operations, and accordingly, the other aforementioned symmetry elements. The symmetry elements and operations are presented in Table 1.

The entire set of symmetry elements of a body is called its symmetry class. There are thirty-two symmetry classes that describe all crystals that have ever been noted in mineralogy or been synthesized (more than 150,000). The denominations and symbols of the symmetry classes are presented in Table 2.

There are several known approaches to classification of individual crystals in accordance with their symmetry and crystallochemistry. The particles that form a crystal are distributed in certain points in space. These points are separated by certain distances (translations) equal to each other in any chosen direction in the crystal. Crystal lattice is a diagram that describes the location of particles (individual or groups) in a crystal. The lattice parameters

are three non-coplanar translations that form the crystal lattice. Three basic translations form the unit cell of a crystal. August Bravais (1848) has shown that all possible crystal lattice structures belong to one or another of fourteen lattice types (Bravais lattices). The Bravais lattices, both primitive and non-primitive, are the contents of Table 3.

Among the three-dimensional figures, there is a group of polyhedrons that are called regular, which have all faces of the same shape and all edges of the same size (regular polygons). It has been shown that there are only five regular polyhedrons. Because of their importance in crystallography and solid state physics, a brief description of these polyhedrons is included in Table 4.

The systematic description of crystal structures is presented primarily in the well-known *Strukturbericht*. The classification of crystals by the *Strukturbericht* does not reflect their crystal class, the Bravais lattice, but is based on the crystallochemical type. This makes it inconvenient to use the *Strukturbericht* categories for comparison of some individual crystals. Thus, there have been several attempts to provide a more convenient classification of crystals. Table 5 presents a compilation of different classifications which allows the reader to correlate the *Strukturbericht* type with the international and Schoenflies point and space groups and with Pearson's symbols, based on the Bravais lattice and chemical composition of the class prototype. The information included in Table 5 has been chosen as an introduction to a more detailed crystallophysical and crystallochemical description of solids.

TABLE 1. Symmetry Operations and Elements

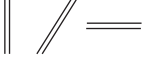

Symmetry operation	Name	Symmetry element		Presentation on the stereographic projection	
		Symbol		Parallel	Perpendicular
		International (Hermann-Mauguin)	Schoenflies		
Reflection in a plane	Plane	m	C_s		
Rotation by angle $\alpha = 360^\circ/n$ about an axis	Axis	$n = 1, 2, 3, 4$ or 6	C_n		
		$n = 2$	C_2		
		$n = 3$	C_3		
		$n = 4$	C_4		
		$n = 6$	C_6		
Rotation about an axis and inversion in a symmetry center lying on the axis	Inversion (improper) axis	$\bar{n} = \bar{3}, \bar{4}, \bar{6}$	C_{ni}		
		$\bar{n} = \bar{3}$	C_{3i}		
		$\bar{n} = \bar{4}$	C_{4i}		

TABLE 1. Symmetry Operations and Elements

Symmetry operation	Name	Symbol		Presentation on the stereographic projection	
		International (Hermann-Mauguin)	Schoenflies	Parallel	Perpendicular
		$\bar{n} = \bar{6}$	C_{6i}		
Inversion in a point	Center	$\bar{1}$	C_i		
Parallel translation	Translation vector \vec{a} , \vec{b} , \vec{c}				
Reflection in a plane and translation parallel to the plane	Glide-plane	a, b, c, n, d			
Rotation about an axis and translation parallel to the axis	Screw axis	n_m ($m = 1, 2, \dots, n - 1$)			
Rotation about an axis and reflection in a plane perpen- dicular to the axis	Rotatory- reflection axis	\bar{n} $\bar{n} = \bar{1}, \bar{2}, \bar{3}, \bar{4}, \bar{6}$	S_n		

TABLE 2. The Thirty-Two Symmetry Classes
Class name^a and its symbol – International (Int) and Schoenflies (Sch)

Crystal symbol	Primitive		Central		Planal		Axial		Plane-axial		Inversion primitive		Inversion-planal	
	Int	Sch	Int	Sch	Int	Sch	Int	Sch	Int	Sch	Int	Sch	Int	Sch
Triclinic	1	C_1	1	C_1										
Monoclinic			—		m	C_s	2	C_2	2/m	C_{2h}				
Ortho- rhombic					mm2	C_{2v}	222	D_2	mmm	D_{2h}

TABLE 3. The Fourteen Possible Space Lattices (Bravais Lattices)

Crystal system	Metric category of the system	No. of different lattices in the system	Lattice type ^a (marked by +)					No. of identi- points per unit cell	Characteristic parameters (marked by +)						Description of characteristic parameters $a \in X, b \in Y, c \in Z$ $\alpha \in (b, c), \beta \in (a, c), \gamma \in (a, b)$	Symmetry of the lattice	
			P	C	I	F	R		a	b	c	α	β	γ		Int	Sch
Triclinic	Trimetric	1	+					1	+	+	+	+	+	+	$a \neq b \neq c, \alpha \neq \beta \neq \gamma$	1	C
Monoclinic	Trimetric	2	+	+				1 or 2	+	+	+				$a \neq b \neq c, \alpha = \gamma = 90^\circ \neq \beta$	2/m	C_{2h}
Orthorhombic	Trimetric	4	+	+	+	+		1, 2 or 4	+	+	+				$a \neq b \neq c, \alpha = \beta = \gamma = 90^\circ$	mmm	D_{2h}
Trigonal (rhombohedral)	Dimetric	1					+	1	+					+	$a = b = c, 120^\circ > \alpha = \beta = \gamma \neq 90^\circ$	3m	D_{3d}
Tetragonal	Dimetric	2	+		+			1 or 2	+		+				$a = b \neq c, \alpha = \beta = \gamma = 90^\circ$	4/mmm	D_{4h}
Hexagonal	Dimetric	1	+					1	+		+				$a = b \neq c, \alpha = \beta = 90^\circ, \gamma = 120^\circ$	6/mmm	D_{6h}
Isometric (cubic)	Monometric	3	+		+	+		1, 2 or 4	+						$a = b = c, \alpha = \beta = \gamma = 90^\circ$	m3m	O_h

^a Designations of the space-lattice types: P – primitive, C – side-centered (base-centered), I – body-centered, F – face-centered, R – rhombohedral.

TABLE 4. The Five Possible Regular Polyhedrons

Polyhedron	Symmetry (Schoenflies)		Form of faces	Number of ^a		
	Class	Elements		Faces (F)	Edges (E)	Vertices (V)
Tetrahedron	T	$4C_3, 3C_2$	Equilateral triangle	4	6	4

Cube (hexahedron)	O	$3C_4 4C_3 6C_2$	Square	6	12	8
Octahedron	O	$3C_4 4C_3 6C_2$	Equilateral triangle	8	12	6
Pentagonal dodecahedron	J	$6C_5 10C_3 15C_2$	Regular pentagon	12	30	20
Icosahedron	J	$6C_5 10C_3 15C_2$	Equilateral triangle	20	30	12

^a Per formula by Leonhard Euler: $F + V - E = 2$

^a The first letter denotes the crystal system: triclinic (a), monoclinic (m), orthorhombic (o), tetragonal (t), hexagonal (h) and cubic (c). Trigonal (rhombohedral) system is denoted by combination hR. The second letter of Pearson's symbol denotes lattice type: primitive (P), edge-(base-) centered (C), body-centered (I) or face-centered (F). The following number denotes number of atoms in the crystal unit cell.

^b Standard ASTM E157-82a has the Bravais lattices designations as following: C – primitive cubic; B – body-centered cubic; F – face-centered cubic; T – primitive tetragonal; U – body-centered tetragonal; R – rhombohedral; H – hexagonal; O – primitive orthorhombic; P – body-centered orthorhombic; Q – base-centered orthorhombic; S – face-centered orthorhombic; M – primitive monoclinic; N – centered monoclinic; A – triclinic.

IONIC RADII IN CRYSTALS

Ionic radii are a useful tool for predicting and visualizing crystal structures. This table lists a set of ionic radii R_i in Å units for the most common coordination numbers CN of positive and negative ions. The values are based on experimental crystal structure determinations, supplemented by empirical relationships, and theoretical calculations. The notation sq after the coordination number indicates a square configuration, while py indicates pyramidal.

The advice of Howard T. Evans and Marvin J. Weber in preparing this table is appreciated.

POLARIZABILITIES OF ATOMS AND IONS IN SOLIDS

H. P. R. Frederikse

The polarization of a solid dielectric medium, \mathbf{P} , is defined as the dipole moment per unit volume averaged over the volume of a crystal cell. A component of \mathbf{P} can be expanded as a function of the electric field \mathbf{E} :

$$P_i = \sum_j a_j E_j + \sum_{j,k} b_{jk} E_j E_k$$

For relatively small electric fields in isotropic substances $\mathbf{P} = \chi_e \mathbf{E}$, where χ_e is the electric susceptibility. If the medium is made up of N atoms (or ions) per unit volume, the polarization is $\mathbf{P} = N \mathbf{p}_m$ where \mathbf{p}_m is the average dipole moment per atom. The polarizability α can be defined as $\mathbf{p}_m = \alpha \mathbf{E}_0$, where \mathbf{E}_0 is the local field at the position of the atom. Using the Lorentz method to calculate the local field one finds:

$$\mathbf{P} = N\alpha(\mathbf{E} + 4\pi\mathbf{P}) = \chi_e \mathbf{E}$$

Together with the definition of the dielectric constant (relative permittivity), $\epsilon = 1 + 4\pi\chi_e$, this leads to:

$$\alpha = \frac{3}{4\pi N} \left(\frac{\epsilon - 1}{\epsilon + 2} \right)$$

This expression is known as the Clausius-Mossotti equation.

The total polarization associated with atoms, ions, or molecules is due to three different sources:

1. Electronic polarization arises because the center of the local electronic charge cloud around the nucleus is displaced under the action of the field: $\mathbf{P}_e = N\alpha_e \mathbf{E}_0$ where α_e is the *electronic polarizability*.

2. Ionic polarization occurs in ionic materials because the electric field displaces cations and anions in opposite directions: $\mathbf{P}_i = N\alpha_i \mathbf{E}_0$, where α_i is the *ionic polarizability*.
3. Orientational polarization can occur in substances composed of molecules that have permanent electric dipoles. The alignment of these dipoles depends on temperature and leads to an *orientational polarizability* per molecule: $\alpha_{or} = p^2/3kT$, where p is the permanent dipole moment per molecule, k is the Boltzmann constant, and T is the temperature.

Because of the different nature of these three polarization processes the response of a dielectric solid to an applied electric field will strongly depend on the frequency of the field. The resonance of the electronic excitation in insulators (dielectrics) takes place in the ultraviolet part of the spectrum; the characteristic frequency of the lattice vibrations is located in the infrared, while the orientation of dipoles requires fields of much lower frequencies (below 10^{10} Hz). This response to electric fields of different frequencies is shown in Figure 1. Values of the electronic polarizabilities for selected atoms and ions are given in Table 1.

To convert to SI, use the relation $\alpha(\text{SI})/\text{C m}^2\text{V}^{-1} = 1.11265 \cdot 10^{-16} \alpha(\text{cgs})/\text{cm}^3$.

CRYSTAL STRUCTURES AND LATTICE PARAMETERS OF ALLOTROPES OF THE ELEMENTS

H. W. King

The crystal structures of the allotropic forms of the elements are presented in terms of the Pearson symbol, the Strukturbericht designation, and the prototype of the structure. The temperatures of the phase transformations are listed in degrees Celsius and the pressures are in GPa. A consistent nomenclature is used, whereby all allotropes are labeled by Greek letters. The lattice parameters of the units cells are given in nanometers (nm) and are considered to be accurate to ± 2 in the last reported digit.

This compilation is restricted to changes in crystal structures that occur as a result of a change in temperature or pressure. Low-

temperature structures are included for the diatomic and rare gases, which show many similarities with respect to the metallic elements. The elements identified with an asterisk (*) have polymorphic structures based on different molecular configurations. The crystal data given for these elements refer to the most stable structure at room temperature.

Reprinted with the permission of ASM International from T.B. Massalski, Ed., *Binary Alloy Phase Diagrams*, ASM International, Metals Park, Ohio, 1986; certain data on rare earth elements were provided by K.A. Gschneidner.

PHASE TRANSITIONS IN THE SOLID ELEMENTS AT ATMOSPHERIC PRESSURE

This table gives the phase transition temperatures for the elements that can exist in two or more crystalline forms (allotropes). The crystal phases are labeled by Greek letters in the most common conventions, although some variation is found. All data refer to normal atmospheric pressure.

LATTICE ENERGIES

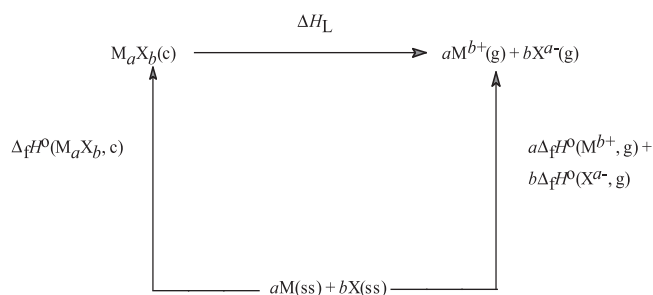

H. D. B. Jenkins and H. K. Roobottom

THERMOCHEMICAL CYCLE AND CALCULATED VALUES

Table 1 contains calculated values of the lattice energies (total lattice potential energies), U_{POT} , of crystalline salts, M_aX_b . U_{POT} is expressed in units of kilojoules per mole, kJ mol^{-1} . M and X can be either simple or complex ions. Substances are arranged by chemical class.

Also listed in the table is the lattice energy, $U_{\text{POT}}^{\text{BFHC}}$, obtained from the application of the Born–Fajans–Haber cycle (BFHC) described below, using the “Standard Thermochemical Properties of Chemical Substances” table in Section 5 of this *Handbook*, References 1 through 4, and certain other data that are given in Table 3 below.

The lattice enthalpy, ΔH_L , is given by the cycle:

where (ss) is the standard state of the element concerned.

The lattice enthalpy, ΔH_L , is obtained using the equation:

$$\Delta H_L = a\Delta_f H^\circ(M^{b+}, g) + b\Delta_f H^\circ(X^{a-}, g) - \Delta_f H^\circ(M_aX_b, c)$$

and is further related to the total lattice potential energy, U_{POT} , by the relationship:

$$\Delta H_L = U_{\text{POT}} + \left[a \left(\frac{n_M}{2} - 2 \right) + b \left(\frac{n_X}{2} - 2 \right) \right] RT$$

where n_M and n_X equal 3 for monatomic ions, 5 for linear polyatomic ions and 6 for polyatomic non-linear ions.

METHOD OF ESTIMATION OF VALUES NOT TABULATED

In cases where the lattice energy is not tabulated and we want to furnish an estimate, then the Kapustinskii equation (Ref. 5) can be used to obtain a value (in kJ mol^{-1}):

$$U_{\text{POT}} = \frac{121.4 z_a z_b v}{(r_a + r_b)} \left(1 - \frac{0.0345}{(r_a + r_b)} \right)$$

where z_a and z_b are the moduli of the charges on the v ions in the lattice and r_a and r_b (in nm) are the thermochemical radii given in Table 2. The r_a for metal ions is taken to be the Goldschmidt radius (Ref. 6).

To cite an example, if we wish to estimate the lattice energy of the salt $[\text{NH}_4^+][\text{HF}_2^-]$ using the above procedure, we see that Table 2 gives the thermochemical radius (r_a) for NH_4^+ to be 0.136 nm and that for HF_2^- (r_b) to be 0.172 nm. The lattice potential energy is then estimated to be 700 kJ mol^{-1} compared with the calculated value of 705 kJ mol^{-1} and the Born–Fajans–Haber cycle value of 658 kJ mol^{-1} .

THE MADELUNG CONSTANT AND CRYSTAL LATTICE ENERGY

If U is the crystal lattice energy and M is the Madelung constant, then^a

$$U = \frac{NMz_iz_je^2}{r}(1 - 1/n)$$

Substance	Ion type	Crystal form ^b	M
Sodium chloride, NaCl	M ⁺ , X ⁻	FCC	1.74756
Cesium chloride, CsCl	M ⁺ , X ⁻	BCC	1.76267
Calcium chloride, CaCl ₂	M ⁺⁺ , 2X ⁻	Cubic	2.365
Calcium fluoride (fluorite), CaF ₂	M ⁺⁺ , 2X ⁻	Cubic	2.51939
Cadmium chloride, CdCl ₂	M ⁺⁺ , 2X ⁻	Hexagonal	2.244 ^c
Cadmium iodide (α), CdI ₂	M ⁺⁺ , 2X ⁻	Hexagonal	2.355 ^c
Magnesium fluoride, MgF ₂	M ⁺⁺ , 2X ⁻	Tetragonal	2.381 ^c
Cuprous oxide (cuprite), Cu ₂ O	2M ⁺ , X ⁻	Cubic	2.22124
Zinc oxide, ZnO	M ⁺⁺ , X ⁻	Hexagonal	1.4985 ^c
Sphalerite (zinc blende), ZnS	M ⁺⁺ , X ⁻	FCC	1.63806
Wurtzite, ZnS	M ⁺⁺ , X ⁻	Hexagonal	1.64132 ^c
Titanium dioxide (anatase), TiO ₂	M ⁴⁺ , 2X ⁻	Tetragonal	2.400 ^c
Titanium dioxide (rutile), TiO ₂	M ⁴⁺ , 2X ⁻	Tetragonal	2.408 ^c
β-Quartz, SiO ₂	M ⁴⁺ , 2X ⁻	Hexagonal	2.2197 ^c
Corundum, Al ₂ O ₃	2M ³⁺ , 3X ⁻	Rhombohedral	4.1719

^a N is Avogadro's number, z_i and z_j are the integral charges on the ions (in units of e), and e is the charge on the electron in electrostatic units ($e = 4.803 \times 10^{-10}$ esu). r is the shortest distance between cation-anion pairs in centimeters. Then U is in ergs ($1 \text{ erg} = 10^{-7} \text{ J}$).

^b FCC = face centered cubic; BCC = body centered cubic.

^c For tetragonal and hexagonal crystals the value of M depends on the details of the lattice parameters.

The Born Exponent, n is:

Ion type	n
He, Li ⁺	5
Ne, Na ⁺ , F ⁻	7
Ar, K ⁺ , Cu ⁺ , Cl ⁻	9
Kr, Rb ⁺ , Ag ⁺ , Br ⁻	10
Xe, Cs ⁺ , Au ⁺ , I ⁻	12

For a crystal with a mixed-ion type, an average of the values of n in this table is to be used (6 for LiF, for example).

ELASTIC CONSTANTS OF SINGLE CRYSTALS

H. P. R. Frederikse

This table gives selected values of elastic constants for single crystals. The values believed most reliable were selected from the original literature. The substances are arranged by crystal system and, within each system, alphabetically by name. A reference to the original literature is given for each value; a useful compilation of published values from many sources may be found in Reference 1.

Data are given for the single-crystal density and for the elastic constants C_{ij} in units of 10^{11} N/m², which is equivalent to 10^{12} dyn/cm².

ELECTRICAL RESISTIVITY OF PURE METALS

The first part of this table gives the electrical resistivity, in units of $10^{-8} \Omega \text{ m}$, for 28 common metallic elements as a function of temperature. The data refer to polycrystalline samples. The number of significant figures indicates the accuracy of the values. However, at low temperatures (especially below 50 K) the electrical resistivity is extremely sensitive to sample purity. Thus the low-temperature values refer to samples of specified purity and treatment. The references should be consulted for further information on this point, as well as for values at additional temperatures.

The second part of the table gives resistivity values in the neighborhood of room temperature for other metallic elements that have not been studied over an extended temperature range.

ELECTRICAL RESISTIVITY OF SELECTED ALLOYS

These values were obtained by fitting all available measurements to a theoretical formulation describing the temperature and composition dependence of the electrical resistivity of metals. Some of the values listed here fall in regions of temperature and composition where no actual measurements exist. Details of the procedure may be found in the reference.

Values of the resistivity are given in units of $10^{-8} \Omega \text{ m}$. General comments in the preceding table for pure metals also apply here.

^m Uncertainty in resistivity is $\pm 2\%$ up to 300 K and $\pm 4\%$ above 300 K.

ELECTRICAL RESISTIVITY OF GRAPHITE MATERIALS

L. I. Berger

At normal conditions, the only stable crystallographic modification of carbon is graphite. The quasi-stable diamond turns into graphite starting from about 1000 °C in air. In industry, a graphitic material is commonly called either *carbon*, if it consists of small and low-oriented crystallites, or *graphite*, the material with highly ordered structure. In the 1970s, the first carbon filaments of about 7 nm in diameter were grown by Morinobu Endo at the University of Orleans, France, by the vapor-growth technique. In 1985, Sir Harold Walter Kroto of Sussex University, UK, and Richard E. Smalley and co-workers at Rice University discovered spherical carbon molecules, C₆₀ (or C60), consisting of combinations of carbon atoms organized into hexagons and pentagons, named *buckminsterfullerenes* or *fullerenes* and possessing very promising mechanical and electrical properties. In 1991, Sumio Iijima, NEC Labs, Japan, and David S. Bethune, IBM Almaden Labs, observed the carbon atomic groups in the form of tubes capped by halves of the fullerene molecules and formed on the cathodes of carbon arc devices. The length of the tubes could be up to tens of micrometers and the diameter, naturally, is equal to that of the fullerene molecule. These tubes, called *nanotubes*, may be single wall (SWNT) or consist of several concentric tubes with a common axis (multi-walled nanotubes, MWNT). Two-dimensional *graphene* is another crystallographic modification of

graphite (Saroj Nayak, Rensselaer U., 2004) that is a flat hexagonal network of carbon atoms with a thickness equal to the carbon atom size. The nanotube may be considered as formed by strips of graphenes turned into a cylinder. The character of the electrical conductivity (metallic or semiconductive) of a SWNT depends on orientation of the carbon hexagons of the nanotube surface regarding its axis (the chiral angle [Ref. 1]). The following table contains some typical data on electrical and electronic properties of graphite materials.

PERMITTIVITY (DIELECTRIC CONSTANT) OF INORGANIC SOLIDS

H. P. R. Frederikse

This table lists the permittivity ϵ , frequently called the dielectric constant, of a number of inorganic solids. When the material is not isotropic, the individual components of the permittivity are given. A superscript S indicates a measurement made under constant strain ("clamped" dielectric constant). If the constraint is removed, the measurement yields ϵ^T , the "unclamped" or free dielectric constant.

The temperature of the measurement is given when available; the symbol r.t. indicates a value at nominal room temperature. The

frequency of the measurement is given in the last column (i.r. indicates a measurement in the infrared).

Substances are listed in alphabetical order by chemical formula.

PROPERTIES OF SUPERCONDUCTORS

L. I. Berger and B. W. Roberts

The following tables include superconductive properties of selected elements, compounds, and alloys. Individual tables are given for thin films, elements at high pressures, superconductors with high critical magnetic fields, and high critical temperature superconductors.

The historically first observed and most distinctive property of a superconductive body is the near total loss of resistance at a critical temperature (T_c) that is characteristic of each material. Figure 1(a) below illustrates schematically two types of possible transitions. The sharp vertical discontinuity in resistance is indicative

of that found for a single crystal of a very pure element or one of a few well-annealed alloy compositions. The broad transition, illustrated by broken lines, suggests the transition shape seen for materials that are not homogeneous and contain unusual strain distributions. Careful testing of the resistivity limit for superconductors shows that it is less than 4×10^{-23} ohm cm, while the lowest resistivity observed in metals is of the order of 10^{-13} ohm cm. If one compares the resistivity of a superconductive body to that of copper at room temperature, the superconductive body is at least 10^{17} times less resistive.

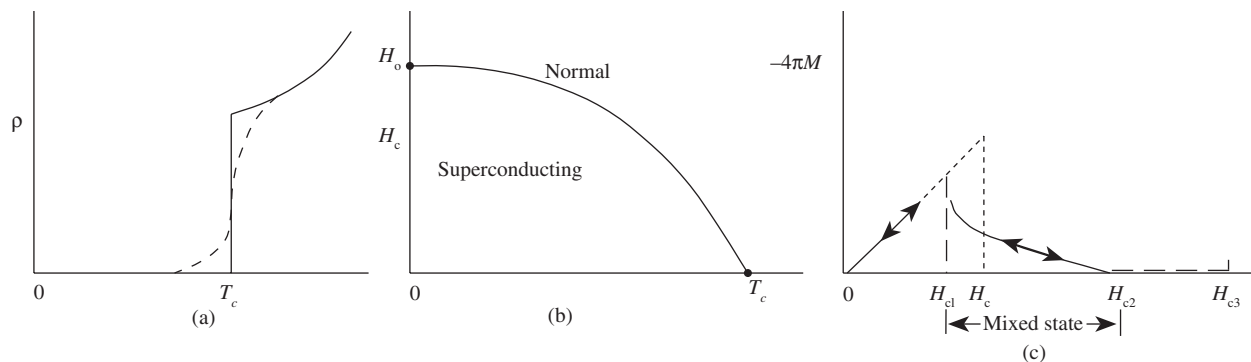

FIGURE 1. Physical properties of superconductors. (a) Resistivity vs. temperature for a pure and perfect lattice (solid line); impure and/or imperfect lattice (broken line). (b) Magnetic-field temperature dependence for Type-I or “soft” superconductors. (c) Schematic magnetization curve for “hard” or Type-II superconductors.

The temperature interval ΔT_c , over which the transition between the normal and superconductive states takes place, may be of the order of as little as 2×10^{-5} K or several K in width, depending on the material state. The narrow transition width was attained in 99.9999% pure gallium single crystals.

A Type-I superconductor below T_c , as exemplified by a pure metal, exhibits perfect diamagnetism and excludes a magnetic field up to some critical field H_c , whereupon it reverts to the normal state as shown in the H - T diagram of Figure 1(b).

The magnetization of a typical high-field superconductor is shown in Figure 1(c). The discovery of the large current-carrying capability of Nb_3Sn and other similar alloys has led to an extensive study of the physical properties of these alloys. In brief, a high-field superconductor, or Type-II superconductor, passes from the perfect diamagnetic state at low magnetic fields to a mixed state and finally to a sheathed state before attaining the normal resistive state of the metal. The magnetic field values separating the four stages are given as H_{c1} , H_{c2} , and H_{c3} . The superconductive state below H_{c1} is perfectly diamagnetic, identical to the state of most pure metals of the “soft” or Type-I superconductor. Between H_{c1} and H_{c2} a “mixed superconductive state” is found in which fluxons (a minimal unit of magnetic flux) create lines of normal flux in a superconductive matrix. The volume of the normal state is proportional to $-4\pi M$ in the “mixed state” region. Thus at H_{c2} the fluxon density has become so great as to drive the interior volume of the superconductive body completely normal. Between H_{c2} and H_{c3} the superconductor has a sheath of current-carrying superconductive material at the body surface, and above H_{c3} the normal state exists. With several types of careful measurement, it is possible to determine H_{c1} , H_{c2} , and H_{c3} . Table 6 contains some of the available data on high-field superconductive materials.

High-field superconductive phenomena are also related to specimen dimension and configuration. For example, the Type-I superconductor, Hg, has entirely different magnetization behavior in high magnetic fields when contained in the very fine sets of filamentary tunnels found in an unprocessed Vycor glass. The great majority of superconductive materials are Type-II. The elements in very pure form and a very few precisely stoichiometric and well annealed compounds are Type I with the possible exceptions of vanadium and niobium.

Metallurgical Aspects. The sensitivity of superconductive properties to the material state is most pronounced and has been used in a reverse sense to study and specify the detailed state of alloys. The mechanical state, the homogeneity, and the presence of impurity atoms and other electron-scattering centers are all capable of controlling the critical temperature and the current-carrying capabilities in high-magnetic fields. Well-annealed specimens tend to show sharper transitions than those that are strained or inhomogeneous. This sensitivity to mechanical state underlines a general problem in the tabulation of properties for superconductive materials. The occasional divergent values of the critical temperature and of the critical fields quoted for a Type-II superconductor may lie in the variation in sample preparation. Critical temperatures of materials studied early in the history of superconductivity must be evaluated in light of the probable metallurgical state of the material, as well as the availability of less pure starting elements. It has been noted that recent work has given extended consideration to the metallurgical aspects of sample preparation.

Symbols in tables: T_c : Critical temperature; H_0 : Critical magnetic field in the $T = 0$ limit; θ_D : Debye temperature; and γ : Electronic specific heat.

TABLE 1. Selective Properties of Superconductive Elements

Element	T_c (K)	H_0 (oersted)	θ_D (K)	γ (mJ mol ⁻¹ K ⁻¹)

TABLE 4. Superconductive Compounds and Alloys

All compositions are denoted on an atomic basis, i.e., AB, AB₂, or AB₃ for compounds, unless noted. Solid solutions or odd compositions may be denoted as A_xB_{1–x} or A_zB. A series of three or more alloys is indicated as A_xB_{1–x} or by actual indication of the atomic fraction range, such as A_{0–0.6}B_{1–0.4}. The critical temperature of such a series of alloys is denoted by a range of values or possibly the maximum value.

The selection of the critical temperature from a transition in the effective permeability, or the change in resistance, or possibly the incremental changes in frequency observed by certain techniques is not often obvious from the literature. Most authors choose the

mid-point of such curves as the probable critical temperature of the idealized material, while others will choose the highest temperature at which a deviation from the normal state property is observed. In view of the previous discussion concerning the variability of the superconductive properties as a function of purity and other metallurgical aspects, it is recommended that appropriate literature be checked to determine the most probable critical temperature or critical field of a given alloy.

A very limited amount of data on critical fields, H_c , is available for these compounds and alloys; these values are given at the end of the table.

HIGH-TEMPERATURE SUPERCONDUCTORS

C. N. R. Rao and A. K. Raychaudhuri

The following tables give properties of a number of high-temperature superconductors. Table 1 lists the crystal structure (space group and lattice constants) and the critical transition temperature T_c for the more important high-temperature superconductors studied so far. Table 2 gives the energy gap, critical current density, and penetration depth in the superconducting state. Table 3 gives electrical and thermal properties of some of these materials in the normal state. The tables were prepared in November 1992 and updated in November 1994.

ORGANIC SUPERCONDUCTORS

H. P. R. Frederikse

Although the vast majority of organic compounds are insulators, a small number of organic solids show considerable electrical conductivity. Some of these materials appear to be superconductors. The superconducting organics fall primarily into two groups: those containing fulvalenes (pentagonal rings containing sulfur or selenium) and those based on fullerenes, involving the nearly spherical cluster C_{60} .

The transition temperatures T_c of the fulvalene derivatives are shown in Table 1. The abbreviations of the various molecular groups are listed in Table 2 and their chemical structures are depicted in Figure 1. Most of the T_c 's are between 1 and 12 K. Several of the compounds only show superconductivity under pressure.

The fullerenes are A_3C_{60} compounds, where A represents a single or a combination of alkali atoms. The C_{60} cluster is shown in

Figure 2a, while Figure 2b illustrates how the alkali atoms fit into the A_3C_{60} molecule to form the A15 crystallographic structure. Their superconducting transition temperatures range from 8 to 31.3 K (see Table 3).

PROPERTIES OF SEMICONDUCTORS

L. I. Berger

The term *semiconductor* is applied to a material in which electric current is carried by electrons or holes and whose electrical conductivity, when extremely pure, rises exponentially with temperature and may be increased from its low “intrinsic” value by many orders of magnitude by “doping” with electrically active impurities.

Semiconductors are characterized by an energy gap in the allowed energies of electrons in the material that separates the normally filled energy levels of the *valence band* (where “missing” electrons behave like positively charged current carriers “holes”) and the *conduction band* (where electrons behave rather like a gas of free negatively charged carriers with an effective mass dependent on the material and the direction of the electrons’ motion). This energy gap depends on the nature of the material and varies with direction in anisotropic crystals. It is slightly dependent on

temperature and pressure, and this dependence is usually almost linear at normal temperatures and pressures.

Data are presented in five tables. Table 1 lists the main crystallographic and semiconducting properties of a large number of semiconducting materials in three main categories: “Tetrahedral Semiconductors” in which every atom is tetrahedrally coordinated to four nearest neighbor atoms (or atomic sites) as for example in the diamond structure; “Octahedral Semiconductors” in which every atom is octahedrally coordinated to six nearest neighbor atoms—as for example the halite structure; and “Other Semiconductors.”

Table 2 gives electrical, magnetic, and optical properties, while Tables 3 and 4 give more details on the semiconducting properties and band structures of the most common semiconductors. Table 5 lists semiconducting minerals with typical resistivity ranges.

TABLE 1. Physico-Chemical Properties of Semiconductors (Listed by Crystal Structure)

Substance	Molecular weight	Average atomic weight	Lattice parameters (Å, room temp.)	Density (g/cm ³)	Melting point (K)	Microhardness, N/mm ² (M-Mohs Scale)	Specific heat, J/kg·K (300 K)	Debye temp. (K)	Coefficient of thermal linear expansion [10 ⁻⁶ K ⁻¹ (300K)]	Thermal conductivity [mW/cm·K (300K)]

PbTe	0.25	4 in [111] at "L"	0.21	0.029	5.5
Bi ₂ Te ₃	0.13	6			~0.05

TABLE 5. Resistivity of Semiconducting Minerals

Mineral	ρ (ohm · m)	Mineral	ρ (ohm · m)
Diamond (C)	2.7	Pentlandite, (Fe, Ni) ₄ S ₄	1 to 11 × 10 ⁻⁶
Sulfides		Pyrrhotite, Fe ₇ S ₄	2 to 160 × 10 ⁻⁶
Argentite, Ag ₂ S	1.5 to 2.0 × 10 ⁻³	Pyrite, FeS ₂	1.2 to 600 × 10 ⁻³
Bismuthinite, Bi ₂ S ₃	3 to 570	Sphalerite, ZnS	2.7 × 10 ⁻³ to 1.2 × 10 ⁴
Bornite, Fe ₂ S ₃ nCu ₂ S	1.6 to 6000 × 10 ⁻⁶	Antimony-sulfur compounds	
Chalcocite, Cu ₂ S	80 to 100 × 10 ⁻⁶	Berthierite, FeSb ₂ S ₄	0.0083 to 2.0
Chalcopyrite, Fe ₂ S ₃ Cu ₂ S	150 to 9000 × 10 ⁻⁶	Boulangerite, Pb ₅ Sb ₃ S ₁₁	2 × 10 ³ to 4 × 10 ⁴
Covellite, CuS	0.30 to 83 × 10 ⁻⁶	Cylindrite, Pb ₃ Sn ₄ Sb ₂ S ₁₄	2.5 to 60
Galena, PbS	6.8 × 10 ⁻⁶ to 9.0 × 10 ⁻²	Franckeite, Pb ₅ Sn ₃ Sb ₂ S ₁₄	1.2 to 4
Haverite, MnS ₂	10 to 20	Hauchecornite, Ni ₄ (Bi, Sb) ₂ S ₁₄	1 to 83 × 10 ⁻⁶
Marcasite, FeS ₂	1 to 150 × 10 ⁻³	Jamesonite, Pb ₄ FeSb ₆ S ₁₄	0.020 to 0.15
Metacinnabarite, HgS	2 × 10 ⁻⁶ to 1 × 10 ⁻³	Tetrahedrite, Cu ₃ SbS ₃	0.30 to 30,000
Millerite, NiS	2 to 4 × 10 ⁻⁷	Arsenic-sulfur compounds	
Mineral	ρ (ohm m)	Mineral	ρ (ohm m)
Molybdenite, MoS ₂	0.12 to 7.5	Arsenopyrite, FeAsS	20 to 300 × 10 ⁻⁶
Cobaltite, CoAsS	6.5 to 130 × 10 ⁻³	Hessite, Ag ₂ Te	4 to 100 × 10 ⁻⁶
Enargite, Cu ₃ AsS ₄	0.2 to 40 × 10 ⁻³	Nagyagite, Pb ₆ Au(S,Te) ₁₄	20 to 80 × 10 ⁻⁶
Gersdorffite, NiAsS	1 to 160 × 10 ⁻⁶	Sylvanite, AgAuTe ₄	4 to 20 × 10 ⁻⁶
Glaucodote, (Co, Fe)AsS	5 to 100 × 10 ⁻⁶	Oxides	
Antimonide		Braunite, Mn ₂ O ₃	0.16 to 1.0
Dyscrasite, Ag ₃ Sb	0.12 to 1.2 × 10 ⁻⁶	Cassiterite, SnO ₂	4.5 × 10 ⁻⁴ to 10,000
Arsenides		Cuprite, Cu ₂ O	10 to 50
Allemontite, SbAs ₃	70 to 60,000	Hollandite, (Ba, Na, K) Mn ₈ O ₁₆	2 to 100 × 10 ⁻³
Lollingite, FeAs ₂	2 to 270 × 10 ⁻⁶	Ilmenite, FeTiO ₃	0.001 to 4
Nicolite, NiAs	0.1 to 2 × 10 ⁻⁶	Magnetite, Fe ₃ O ₄	52 × 10 ⁻⁶
Skutterudite, CoAs ₃	1 to 400 × 10 ⁻⁶	Manganite, MnO OH	0.018 to 0.5
Smaltite, CoAs ₂	1 to 12 × 10 ⁻⁶	Melaconite, CuO	6000
Tellurides		Psilomelane, BaMn ₉ O ₁₈ · 2H ₂ O	0.04 to 6000
Altaite, PbTe	20 to 200 × 10 ⁻⁶	Pyrolusite, MnO ₂	0.007 to 30
Calavarite, AuTe ₂	6 to 12 × 10 ⁻⁶	Rutile, TiO ₂	29 to 910
Coloradoite, HgTe	4 to 100 × 10 ⁻⁶	Uraninite, UO ₂	1.5 to 200

DIFFUSION DATA FOR SEMICONDUCTORS

B. L. Sharma

The diffusion coefficient D in many semiconductors may be expressed by an Arrhenius-type relation

$$D = D_0 \exp(-Q/kT)$$

where D_0 is a frequency factor, Q is the activation energy for diffusion, k is the Boltzmann constant, and T is the absolute temperature. This table lists D_0 and Q for various diffusants in common semiconductors.

Abbreviations used in the table are

- AES – Auger Electron Spectroscopy
- DLTS – Deep Level Transient Spectroscopy
- SEM – Scanning Electron Microscopy
- SIMS – Secondary Ion Mass Spectrometry
- $D(c)$ – Concentration Dependent Diffusion Coefficient
- D_{\max} – Maximum Diffusion Coefficient
- (f) – Fast Diffusion Component
- (i) – Interstitial Diffusion Component
- (s) – Slow Diffusion Component
- (||) – Parallel to c Direction
- (⊥) – Perpendicular to c Direction

PROPERTIES OF MAGNETIC MATERIALS

H. P. R. Frederikse

Glossary of Symbols

Quantity	Symbol	Units	
		SI	emu
Magnetic field	H	A m^{-1}	Oe (oersted)
Magnetic induction	B	T (tesla)	G (gauss)
Magnetization	M	A m^{-1}	emu cm^{-3}
Spontaneous magnetization	M_s	A m^{-1}	emu cm^{-3}
Saturation magnetization	M_0	A m^{-1}	emu cm^{-3}
Magnetic flux	Φ	Wb (weber)	maxwell
Magnetic moment	m, μ	A m^2	erg/G
Coercive field	H_c	A m^{-1}	Oe
Remanence	B_r	T	G
Saturation magnetic polarization	J_s	T	G
Magnetic susceptibility	χ		
Magnetic permeability	μ	H m^{-1} (henry/meter)	
Magnetic permeability of free space	μ_0	H m^{-1}	
Saturation magnetostriction	$\lambda (\Delta l/l)$		
Curie temperature	T_C	K	K
Néel temperature	T_N	K	K

Magnetic moment $\mu = \gamma \hbar J = g \mu_B J$

where

γ = gyromagnetic ratio; J = angular momentum; g = spectroscopic splitting factor (~ 2)

μ_B = Bohr magneton = $9.2741 \cdot 10^{-24} \text{ J/T} = 9.2741 \cdot 10^{-21} \text{ erg/G}$

Earth's magnetic field $H = 56 \text{ A m}^{-1} = 0.7 \text{ Oe}$

For iron: $M_0 = 1.7 \cdot 10^6 \text{ A m}^{-1}$; $B_r = 0.8 \cdot 10^6 \text{ A m}^{-1}$

1 Oe = $(1000/4\pi) \text{ A m}^{-1}$; 1 G = 10^{-4} T ; 1 $\text{emu cm}^{-3} = 10^3 \text{ A m}^{-1}$

1 Maxwell = 10^{-8} Wb

$\mu_0 = 4\pi \cdot 10^{-7} \text{ H m}^{-1}$

Relation between Magnetic Induction and Magnetic Field

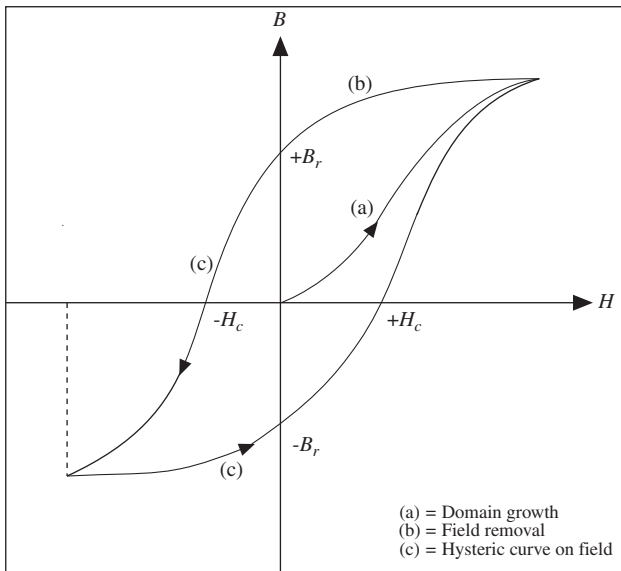

FIGURE 1. Typical curve representing the dependence of magnetic induction B on magnetic field H for a ferromagnetic material. When H is first applied, B follows curve (a) as the favorably oriented magnetic domains grow. This curve flattens as saturation is approached. When H is then reduced, B follows curve (b), but retains a finite value (the remanence B_r) at $H = 0$. In order to demagnetize the material, a negative field $-H_c$ (where H_c is called the coercive field or coercivity) must be applied. As H is further decreased and then increased to complete the cycle (curve c), a hysteresis loop is obtained. The area within this loop is a measure of the energy loss per cycle for a unit volume of the material.

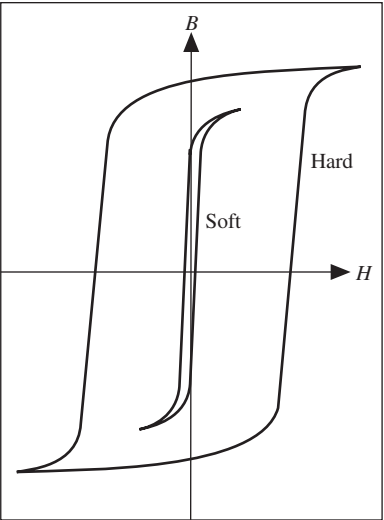

FIGURE 2. Schematic curve illustrating the B vs. H dependence for hard and soft magnetic materials. Hard materials have a larger remanence and coercive field, and a correspondingly large hysteresis loss.

Magnetic Susceptibility of the Elements

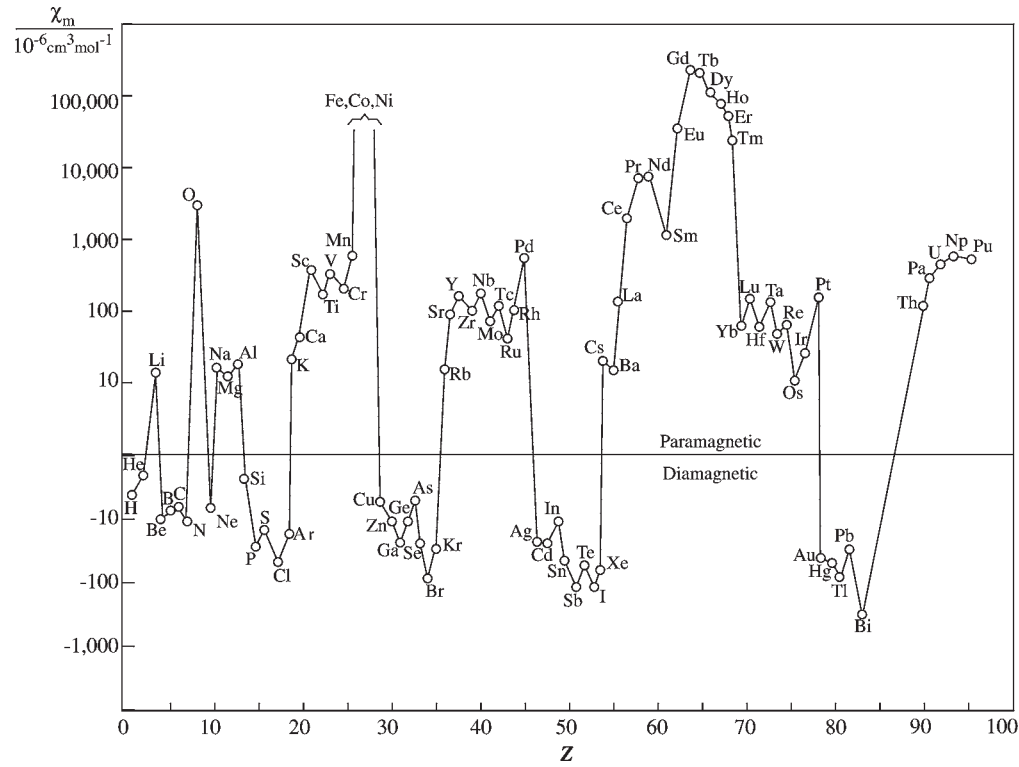

FIGURE 3. Molar susceptibility of the elements at room temperature (cgs units of $10^{-6} \text{ cm}^3/\text{mol}$). Values are not available for $Z = 9, 61,$ and $84\text{--}89$; Fe, Co, and Ni ($Z = 26\text{--}28$) are ferromagnetic. Data taken from the table “Magnetic Susceptibility of the Elements and Inorganic Compounds” in Section 4.

Applications of High-Permeability Materials

Applications	Requirements
Power applications	
Distribution and power transformers	Low core losses, high permeability, high saturation magnetic polarization
High-quality motors and generators, stators and armatures, switched-mode power supplies	
Instrument transformers	
Audiofrequency transformers	Low core losses, high permeability, high magnetic polarization
Pulse transformers	High permeability
Cores for inductor coils	
Audiofrequency	Low hysteresis, high permeability
Carrier frequency	Very low hysteresis and eddy current loss
Radiofrequency	High permeability at low fields
Miscellaneous	
Relays, switches Earth leakage circuit	High permeability, low remanence, low coercivity
Magnetic shielding	Low core loss for AC applications

Applications of High-Permeability Materials

Applications	Requirements
Magnetic recording heads	High initial permeability, low or zero remanence
Magnetic amplifiers Saturable reactors Saturable transformers Transformer cores	Rectangular hysteresis loops, low hysteresis loss
Magnetic shunts for temperature compensation in magnetic circuits	Low Curie temperature, appropriate decrease in permeability with increase in temperature
Electromagnets in indicating instruments, fire detection, quartz watches, electromechanical devices	High permeability, high saturation magnetic polarization
Magnetic yokes in permanent magnet devices, such as lifting and holding magnets, loudspeakers	High permeability, high saturation magnetic polarization

ORGANIC MAGNETS

J.S. Miller

Magnetic ordering, e.g., ferromagnetism, like superconductivity, is a property of a solid, not of an individual molecule or ion, and very rarely occurs for organic compounds. In contrast to superconductivity, where all electron spins pair to form a perfect diamagnetic material, magnetic ordering requires unpaired electron spins; hence, superconductivity and ferromagnetism are mutually exclusive.

The vast majority of organic compounds are diamagnetic (i.e., all electron spins are paired), and a relative few possess unpaired electrons (designated by an arrow, \uparrow) and are paramagnetic (PM), i.e., they are oriented in random directions. A few organic solids, however, exhibit strong magnetic behavior and magnetically order as ferromagnets (FO) with all spins aligned in the same direc-

tion. In some cases the spins align in the opposite direction and compensate to form an antiferromagnet (AF). In some cases these spins are not opposed to each other and do not compensate and lead to a canted antiferromagnet or weak ferromagnet (WF). If the number of spins that align in one direction differs from the number of spins that align in the opposite direction, the spins cannot compensate and a ferrimagnet (FI) results. Metamagnets (MM) are antiferromagnets in which all the spins become aligned like a ferromagnet in an applied magnetic field. Above the ordering or critical temperature, T_c , all magnets are paramagnets (PM). Organic magnets all possess electron spins in p -orbitals, but these may be in conjunction with metal ion-based spins.

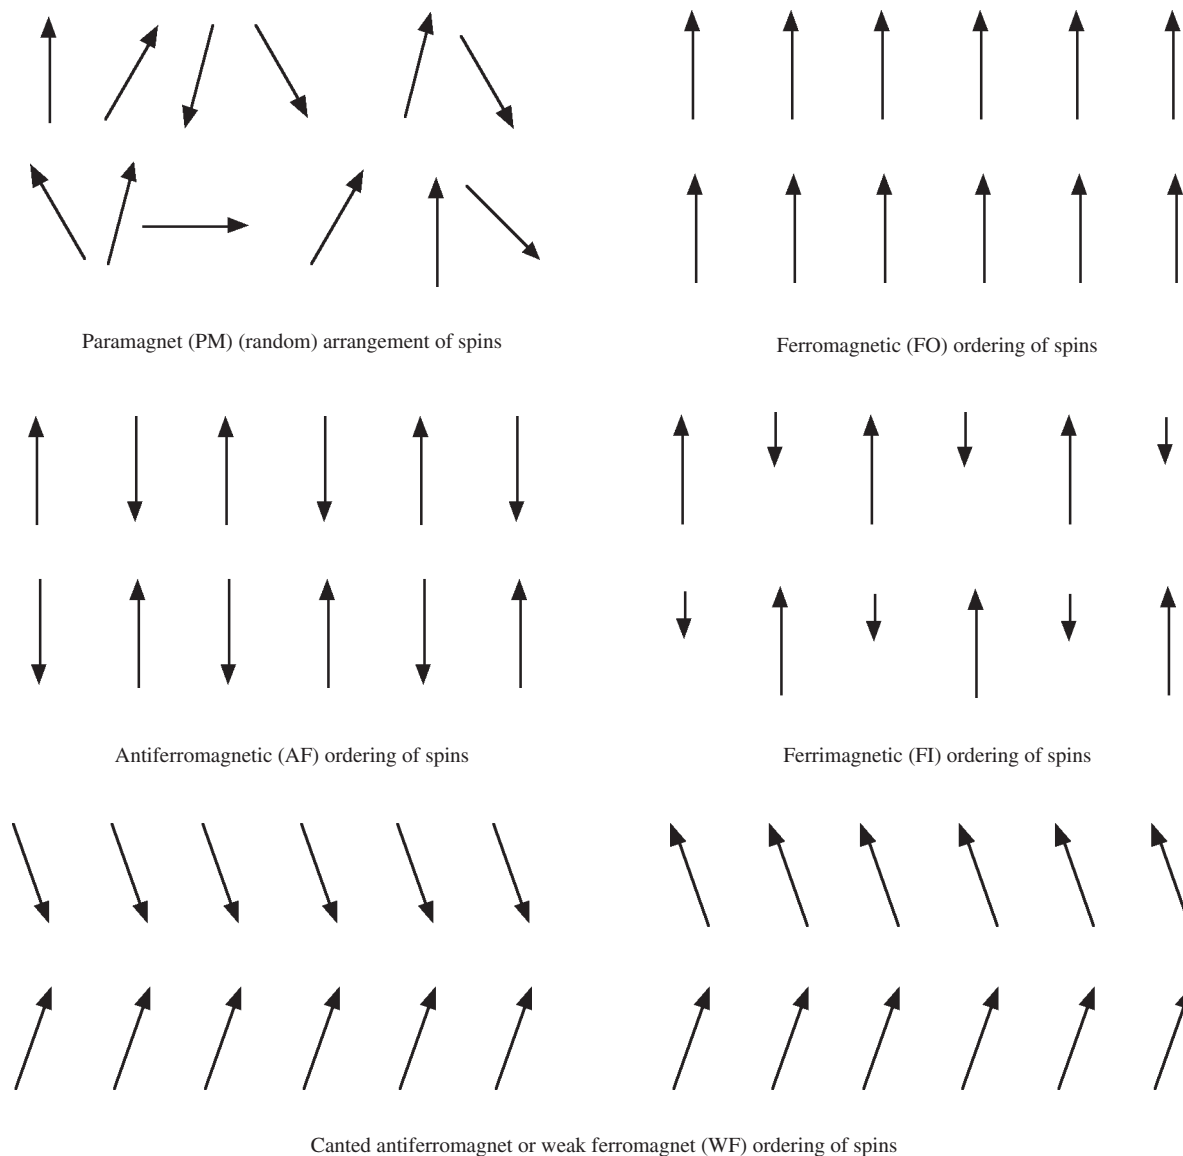

FIGURE 1. Schematic illustration of the different types of magnetic behavior.

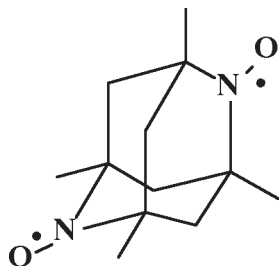

Summary of the Critical Temperature, T_c , Saturation Magnetization, M_s , Coercive Field, H_{cr} , and Remanent Magnetization, M_r , for Selected Organic-Based Magnets

ELECTRON INELASTIC MEAN FREE PATHS

Cedric J. Powell

The inelastic mean free path (IMFP) of electrons impinging on a solid surface is defined as the average of distances, measured along the trajectories, that electrons with a given energy travel between inelastic collisions in the substance. It is an important parameter in analyzing results from surface characterization techniques such as Auger electron spectroscopy, X-ray photoelectron spectroscopy, low-energy electron diffraction, and others. IMFPs can be measured by the elastic-peak electron spectroscopy technique and other methods, and they can be calculated from optical data. A detailed analysis of the experimental and theoretical considerations in obtaining reliable IMFP values can be found in References 4 and 5.

Table 1 below gives recommended IMFP values for 41 elemental solids in the energy range 50 eV to 30 000 eV. All values in Table 1 are taken from Reference 1. Table 2 gives IMFP values for several inorganic compounds and organic materials in the range 50 eV to

2 000 eV. The entries in Table 1 are listed by atomic number, while substances in Table 2 are listed in alphabetical order by name, with inorganic compounds preceding the organic materials. IMFP values are given in Ångström units ($1 \text{ Å} = 10^{-10} \text{ m}$).

ELECTRON STOPPING POWERS

Cedric J. Powell

Numerical data are given for mass collision electron stopping powers in 41 elemental solids for energies between 100 eV and 30 keV. These stopping powers were determined with an algorithm that utilizes experimental optical data for each solid.

The stopping power for electrons and other charged particles in matter is often needed in calculations of electron transport in a medium, particularly in radiation physics and in descriptions of signal generation in analytical techniques such as electron-probe microanalysis and Auger electron spectroscopy. The stopping power is defined as the average rate at which the charged particles lose energy at any point along their trajectories. For electrons, it is customary to separate the total stopping power into two components, the collision stopping power due to inelastic-scattering events of the electrons in a medium and the radiative stopping power due to the emission of bremsstrahlung in the electric field of the atomic nucleus and atomic electrons (Ref. 1). For electron energies less than 30 keV, the radiative stopping power is less than 1% of the collision stopping power (Ref. 1), and is neglected in the numerical data given here.

Numerical data for collision and radiative stopping powers at electron energies between 10 keV and 1 GeV have been published for materials of interest in radiation physics and dosimetry (Ref. 1). Similar data can also be obtained from a website of the National Institute of Standards and Technology (Ref. 2). The collision stopping powers were calculated from the theory of Bethe (Refs. 3 and 4) and recommended values of the one material-dependent parameter, the mean excitation energy (Ref. 1). While the Bethe theory is expected to be valid for electron energies much larger than the largest K-shell binding energy of atoms in the particular material, the Bethe stopping-power equation is frequently utilized to calculate stopping powers for energies of 10 keV and above (Refs. 1

and 2). Detailed analyses of the Bethe stopping-power theory have been published (Refs. 1 and 4).

The Table below gives mass collision stopping powers for 41 elemental solids at energies between 100 eV and 30 keV (Ref. 5). The mass collision stopping power is the collision stopping power divided by the mass density of the solid. The mass collision stopping powers in the Table were determined by interpolation with a clamped cubic spline from the published data (Ref. 5), which had been calculated with an algorithm that utilizes experimental optical data for each solid. Comparisons with collision stopping powers from the Bethe stopping-power equation showed root-mean-square differences of 9.1% and 8.7% for energies of 9.897 keV and 29.733 keV, respectively (Ref. 5). This level of agreement was considered satisfactory on account of uncertainties of the algorithm and optical data used for the calculations as well as uncertainties of the mean excitation energies used with the Bethe equation. The mass collision stopping powers in the Table are given in units of MeV cm²/g for a range of relativistic kinetic energies, T . The elemental solids are listed in order of atomic number.

ELECTRON WORK FUNCTION OF THE ELEMENTS

The electron work function Φ is a measure of the minimum energy required to extract an electron from the surface of a solid. It is defined more precisely as the energy difference between the state in which an electron has been removed to a distance from the surface of a single crystal face that is large enough that the image force is negligible but small compared to the distance to any other face (typically about 10^{-4} cm) and the state in which the electron is in the bulk solid. In general, Φ differs for each face of a mono-crystalline sample.

Since Φ is dependent on the cleanliness of the surface, measurements reported in the literature often cover a considerable range. This table contains selected values for the electron work function of the elements which may be regarded as typical values for a reasonably clean surface. The method of measurement is indicated for each value. The following abbreviations appear:

TE – Thermionic emission
 PE – Photoelectric effect
 FE – Field emission
 CPD – Contact potential difference
 polycr – Polycrystalline sample
 amorp – Amorphous sample

Values in parentheses are only approximate.

SECONDARY ELECTRON EMISSION

The secondary emission yield, or secondary emission ratio, δ , is the average number of secondary electrons emitted from a bombarded material for every incident primary electron. It is a function of the primary electron energy E_p . The maximum yield δ_{\max} corresponds to a primary electron energy $E_{p\max}$ (see figure). The two primary electron energies corresponding to a yield of unity are denoted by the first and second crossovers (E_I and E_{II}). An

insulating target, or a conducting target that is electrically floating, will charge positively or negatively depending on the primary electron energy. For $E_I < E_p < E_{II}$, $\delta > 1$ and the surface charges positively provided there is a collector present that is positive with respect to the target. For $E_p < E_I$ or $E_p > E_{II}$, $\delta < 1$, and the surface charges negatively with respect to the potential of the source of primary electrons.

OPTICAL PROPERTIES OF SELECTED ELEMENTS

J. H. Weaver and H. P. R. Frederikse

These tables list the index of refraction n , the extinction coefficient k , and the normal incidence reflection R ($\phi = 0$) as a function of photon energy E , which is expressed in electron volts (eV). To convert the energy in eV to the wavelength in μm , use $\lambda = 1.2398/E$. To compute the dielectric function $\tilde{\epsilon} = \epsilon_1 + i\epsilon_2$ from the complex index of refraction $\tilde{N} = n + ik$, use $\epsilon_1 = n^2 - k^2$ and $\epsilon_2 = 2nk$.

The optical constants in these tables are abridged from three more extensive tabulations:

- *Optical Properties of Metals* (OPM), Volumes I and II, *Physics Data*, Nr. 18-1 and 18-2, J. H. Weaver, C. Krafka, D. W. Lynch, and E. E. Koch, Fachinformationzentrum, Karlsruhe, Germany.
- *Handbook of Optical Constants* (HOC), Vol. I, 1985, and Vol. II, 1991. E. D. Palik, Ed., Academic Press, Inc., London.
- *American Institute of Physics Handbook* (AIPH), 3rd Edition, D. E. Gray, Ed., McGraw-Hill, New York, 1972.

The first two of these major sources provide detailed comparisons of all optical data available in the literature at the time of the compilation. For critical applications the reader should refer to the original work. References for individual metals and semiconduc-

tors are listed at the end of the tables. Generally, tabulated values for the optical properties are accurate to better than 10%. Data in parentheses are extrapolated or interpolated values. For most elements the spectral range covered is from the far infrared (0.010 or 0.10 eV) to the far ultraviolet (10, 30 or 300 eV). The intervals between successive energies in the tables are chosen in such a way that the major spectral features are preserved.

Very small values of k are expressed in exponential notation, e.g., $1.23\text{E-}5$ means 1.23×10^{-5} .

The following table is convenient for associating the energy entries in these tables with the corresponding wavelengths:

λ	E/eV	λ	E/eV
1 mm	0.00124	6000 Å	2.066
500 μm	0.00248	5000 Å	2.480
100 μm	0.01240	4000 Å	3.100
50 μm	0.02480	3000 Å	4.133
10 μm	0.12398	2000 Å	6.199
5 μm	0.24797	1000 Å	12.398
1 μm	1.240	400 Å	30.996

OPTICAL PROPERTIES OF SELECTED INORGANIC AND ORGANIC SOLIDS

L. I. Berger

Optical properties of materials are closely related to their dielectric properties. The complex dielectric function (relative permittivity) of a material is equal to

$$\varepsilon(\omega) = \varepsilon'(\omega) - j\varepsilon''(\omega),$$

where $\varepsilon'(\omega)$ and $\varepsilon''(\omega)$ are its real and imaginary parts, respectively, and ω is the angular frequency of the applied electric field. For a non-absorbing medium, the index of refraction is $n = (\varepsilon\mu)^{1/2}$, where μ is the relative magnetic permeability of the medium (material); in the majority of dielectrics, $\mu \approx 1$.

For many applications, the most important optical properties of materials are the index of refraction, the extinction coefficient, k , and the reflectivity, R . The common index of refraction of a material is equal to the ratio of the phase velocity of propagation of an electromagnetic wave of a given frequency in vacuum to that in the material. Hence, $n \geq 1$. The optical properties of highly conductive materials like metals and semiconductors (at photon energy range above the energy gap) differ from those of optically transparent media. Free electrons absorb the incident electromagnetic wave in a thin surface layer (a few hundred nanometers thick) and then release the absorbed energy in the form of secondary waves reflected from the surface. Thus, the light reflection becomes very strong; for example, highly conductive sodium reflects 99.8% of the incident wave (at 589 nm). Introduction of the effective index of refraction, $n_{\text{eff}} = (\varepsilon')^{1/2} = n - jk$, where $\varepsilon' = \varepsilon - j\delta/\omega\varepsilon_0$, δ is the electrical conductivity of the material in S/m, and $\varepsilon_0 = 8.8542 \cdot 10^{-12}$ F/m is the permittivity of vacuum, allows one to apply the expressions of the optics of transparent media to the conductive materials. It is clear that the effective index of refraction may be smaller than 1. For example, $n = 0.05$ for pure sodium and $n = 0.18$ for pure silver (at 589.3 nm). At very high photon energies, the quantum effects, such as the internal photoeffect, start playing a greater role, and the optical properties of these materials become similar to those of insulators (low reflectance, existence of Brewster's angle, etc.).

The extinction coefficient characterizes absorption of the electromagnetic wave energy in the process of propagation of a wave through a material. The wave intensity, I , after it passes a distance x in an isotropic medium is equal to

$$I = I_0 \exp(-\alpha x),$$

where I_0 is the intensity at $x = 0$ and α is called the absorption coefficient. For many applications, the extinction coefficient, k , which is equal to

$$k = \alpha \frac{\lambda}{4\pi},$$

where λ is the wavelength of the wave in the medium, is more commonly used for characterization of the electromagnetic losses in materials.

Reflection of an electromagnetic wave from the interface between two media depends on the media indices of refraction and on the angle of incidence. It is characterized by the reflectivity, which is equal to the ratio of the intensity of the wave reflected back into the first medium to the intensity of the wave approaching the interface. For polarized light and two non-absorbing media,

$$R = \frac{(N_1 - N_2)^2}{(N_1 + N_2)^2},$$

where $N_1 = n_1/\cos\theta_1$ and $N_2 = n_2/\cos\theta_2$ for the wave polarized in the plane of incidence, and $N_1 = n_1\cos\theta_1$ and $N_2 = n_2\cos\theta_2$ for the wave polarized normal to the plane of incidence; θ_1 and θ_2 are the angles between the normal to the interface in the point of incidence and the directions of the beams in the first and second medium, respectively. The reflectivity at normal incidence in this case is

$$R = [(n_1 - n_2)/(n_1 + n_2)]^2$$

For any two opaque (absorbing) media, the normal incidence reflectivity is

$$R = \frac{(n_1 - n_2)^2 + k_2^2}{(n_1 + n_2)^2 + k_2^2}.$$

In the majority of experiments, the first medium is air ($n \approx 1$), and hence,

$$R = \frac{(1 - n)^2 + k^2}{(1 + n)^2 + k^2}.$$

The data on n and k in the following table are abridged from the sources listed in the references. The reflectivity at normal incidence, R , has been calculated from the last equation. For convenience, the energy E , wavenumber $\bar{\nu}$, and wavelength λ are given for the incidence radiation.

ELASTO-OPTIC, ELECTRO-OPTIC, AND MAGNETO-OPTIC CONSTANTS

When a crystal is subjected to a stress field, an electric field, or a magnetic field, the resulting optical effects are in general dependent on the orientation of these fields with respect to the crystal axes. It is useful, therefore, to express the optical properties in terms of the refractive index ellipsoid (or indicatrix):

$$\frac{x^2}{n_x^2} + \frac{y^2}{n_y^2} + \frac{z^2}{n_z^2} = 1$$

or

$$\sum_{ij} B_{ij} x_i x_j = 1 \quad (i, j = 1, 2, 3)$$

where

$$B_{ij} = \left[\frac{1}{\epsilon} \right]_{ij} = \left[\frac{1}{n^2} \right]_{ij}$$

ϵ is the dielectric constant or permeability; the quantity B_{ij} is called impermeability.

A crystal exposed to a *stress* \mathbf{S} will show a change of its impermeability. The photo-elastic (or elasto-optic) constants, P_{ijkl} , are defined by

$$\Delta \left[\frac{1}{\epsilon} \right]_{ij} = \Delta \left[\frac{1}{n^2} \right]_{ij} = \sum_{kl} P_{ijkl} S_{kl}$$

where n is the refractive index and S_{kl} are the strain tensor elements; the P_{ijkl} are the elements of a 4th rank tensor.

When a crystal is subjected to an *electric field* \mathbf{E} , two possible changes of the refractive index may occur depending on the symmetry of the crystal.

1. All materials, including isotropic solids and polar liquids, show an electro-optic birefringence (Kerr effect) which is proportional to the square of the electric field, \mathbf{E} :

$$\Delta \left[\frac{1}{n^2} \right]_{ij} = \sum_k K_{ijkl} E_k E_l = \sum_{k,l=1,2,3} g_{ijkl} P_k P_l$$

where E_k and E_l are the components of the electric field and P_k and P_l the electric polarizations. The coefficients, K_{ijkl} , are the quadratic electro-optic coefficients, while the constants g_{ijkl} are known as the Kerr constants.

2. The other electro-optic effect only occurs in the 20 piezoelectric crystal classes (no center of symmetry). This effect is known as the Pockels effect. The optical impermeability changes linearly with the static field

$$\Delta \left[\frac{1}{n^2} \right]_{ij} = \sum_k r_{ij,k} E_k$$

The coefficients $r_{ij,k}$ have the name (linear) electro-optic coefficients.

The values of the electro-optic coefficients depend on the boundary conditions. If the superscripts T and S denote, respectively, the conditions of zero stress (free) and zero strain (clamped) one finds:

$$r_{ij}^T = r_{ij}^S + q_{ik}^E e_{jk} = r_{ij}^S + P_{ik}^E d_{jk}$$

where $e_{jk} = (\partial T_k / \partial E_j)_S$ and $d_{jk} = (\partial S_k / \partial E_j)_T$ are the appropriate piezo-electric coefficients.

The interaction between a *magnetic field* and a light wave propagating in a solid or in a liquid gives rise to a rotation of the plane of polarization. This effect is known as *Faraday rotation*. It results from a difference in propagation velocity for left and right circular polarized light.

The Faraday rotation, θ_F , is linearly proportional to the magnetic field H :

$$\theta_F = VH$$

where l is the light path length and V is the *Verdet* constant (minutes/oersted-cm).

For ferromagnetic, ferrimagnetic, and antiferromagnetic materials the magnetic field in the above expression is replaced by the magnetization M and the magneto-optic coefficient in this case is known as the Kund constant K :

$$\text{Specific Faraday rotation } F = KM$$

In the tables below the *Faraday rotation* is listed at the saturation magnetization per unit length, together with the absorption coefficient α , the temperature T , the critical temperature T_c (or T_N), and the wavelength of the measurement.

In the tables that follow, the properties are presented in groups:

- Elasto-optic coefficients (photoelastic constants)
- Linear electro-optic coefficients (Pockels constants)
- Quadratic electro-optic coefficients (Kerr constants)
- Magneto-optic coefficients:
 - Verdet constants
 - Faraday rotation parameters

Within each group, materials are classified by crystal system or physical state. References are given at the end of each group of tables.

ELASTO-OPTIC COEFFICIENTS (PHOTOELASTIC CONSTANTS)

LINEAR ELECTRO-OPTIC COEFFICIENTS

Name				r_{41}
Cubic ($\bar{4}3m$)	Formula	$\lambda/\mu\text{m}$	pm/V	
Cuprous bromide	CuBr	0.525	0.85	
Cuprous chloride	CuCl	0.633	3.6	
Cuprous iodide	CuI	0.55	−5.0	
Eulytite (BSO)	$\text{Bi}_4\text{Si}_3\text{O}_{12}$	0.63	0.54	
Germanium eulytite (BGO)	$\text{Bi}_4\text{Ge}_3\text{O}_{12}$	0.63	1.0	
Gallium arsenide	GaAs	10.6	1.6	
Gallium phosphide	GaP	0.56	−1.07	
Hexamethylenetetramine	$\text{C}_6\text{H}_{12}\text{N}_4$	0.633	0.78	
Sphalerite	ZnS	0.65	2.1	
Zinc selenide	ZnSe	0.546	2.0	
Zinc telluride	ZnTe	3.41	4.2	
Cadmium telluride	CdTe	3.39	6.8	

Cubic (23)	Formula	$\lambda/\mu\text{m}$	r_{41}	
			pm/V	
Ammonium chloride (77 K)	NH_4Cl	—	1.5	
Ammonium cadmium langbeinite	$(\text{NH}_4)_2\text{Cd}_2(\text{SO}_4)_3$	0.546	0.70	
Ammonium manganese langbeinite	$(\text{NH}_4)_2\text{Mn}_2(\text{SO}_4)_3$	0.546	0.53	
Thallium cadmium langbeinite	$\text{TL}_2\text{Cd}_2(\text{SO}_4)_3$	0.546	0.37	
Potassium magnesium langbeinite	$\text{K}_2\text{Mg}_2(\text{SO}_4)_3$	0.546	0.40	
Bismuth monogermanate	$\text{Bi}_{12}\text{GeO}_{20}$	—	3.3	
Bismuth monosilicate	$\text{Bi}_{12}\text{SiO}_{20}$	—	3.3	
Sodium chlorate	NaClO_3	0.589	0.4	
Sodium uranyl acetate	$\text{NaUO}_2(\text{CH}_3\text{COO})_3$	0.546	0.87	
Trenhydrobromide	$\text{N}(\text{CH}_2\text{CH}_2\text{NH}_2)_3 \cdot 3\text{HBr}$	—	1.5	
Trenhydrochloride	$\text{N}(\text{CH}_2\text{CH}_2\text{NH}_2)_3 \cdot 3\text{HCl}$	—	1.7	

Tetragonal ($\bar{4}2m$)	Formula	T_{tran}	r_{41}	r_{63}
		K	pm/V	pm/V
Ammonium dihydrogen phosphate (ADP)	$\text{NH}_4\text{H}_2\text{PO}_4$	148	24.5	−8.5
Ammonium dideuterium phosphate (AD*P)	$\text{NH}_4\text{D}_2\text{PO}_4$	242	—	11.9
Ammonium dihydrogen arsenate (ADA)	$\text{NH}_4\text{H}_2\text{AsO}_4$	—	—	9.2
Cesium dihydrogen arsenate (CsDA)	CsH_2AsO_4	143	—	18.6
Cesium dideuterium arsenate (CsD*A)	CsD_2AsO_4	212	—	36.6
Potassium dihydrogen phosphate (KDP)	KH_2PO_4	123	8.6	−10.5
Potassium dideuterium phosphate (KD*P)	KD_2PO_4	222	8.8	23.8
Potassium dihydrogen arsenate (KDA)	KH_2AsO_4	97	12.5	10.9
Potassium dideuterium arsenate (KD*A)	KD_2AsO_4	162	—	18.2
Rubidium dihydrogen phosphate (RDP)	RbH_2PO_4	147	—	15.5
Rubidium dihydrogen arsenate (RDA)	RbH_2AsO_4	110	—	13.0
Rubidium dideuterium arsenate (RD*A)	RbD_2AsO_4	178	—	21.4

Tetragonal (4mm)	Formula	T_{tran}	r_{13}	r_{33}	r_{51}
		K	pm/V	pm/V	pm/V
Barium titanate	BaTiO_3	406	8	28	—
Potassium lithium niobate	$\text{K}_3\text{Li}_2\text{Nb}_5\text{O}_{15}$	693	8.9	5.9	—
Lead titanate	PbTiO_3	765	13.8	5.9	—
Strontium barium niobate (SBN75)	$\text{Sr}_{0.75}\text{Ba}_{0.25}\text{Nb}_2\text{O}_6$	330	6.7	1340	42
Strontium barium niobate (SBN46)	$\text{Sr}_{0.46}\text{Ba}_{0.54}\text{Nb}_2\text{O}_6$	602	~180	35	—

NONLINEAR OPTICAL CONSTANTS

H. P. R. Frederikse

The relation between the polarization density P of a dielectric medium and the electric field E is linear when E is small, but becomes nonlinear as E acquires values comparable with interatomic electric fields (10^5 to 10^8 V/cm). Under these conditions the relation between P and E can be expanded in a Taylor's series

$$P = \epsilon_0 \chi^{(1)} E + 2\chi^{(2)} E^2 + 4\chi^{(3)} E^3 + \dots \quad (1)$$

where ϵ_0 is the permittivity of free space, while $\chi^{(1)}$ is the linear and $\chi^{(2)}$, $\chi^{(3)}$ etc. the nonlinear optical susceptibilities.

If we consider two optical fields, the first $E_j^{\omega_1}$ (along the j -direction at frequency ω_1) and the second $E_k^{\omega_2}$ (along the k -direction at frequency ω_2) one can write the second term of the Taylor's series as follows

$$P_i(\omega_1\omega_2) = 2\chi_{ijk}^{\omega_1+\omega_2} E_j^{\omega_1} E_k^{\omega_2}$$

When $\omega_1 \neq \omega_2$ the (parametric) mixing of the two fields gives rise to two new polarizations at the frequencies $\omega_3 = \omega_1 + \omega_2$ and $\omega_3' = \omega_1 - \omega_2$. When the two frequencies are equal, $\omega_1 = \omega_2 = \omega$, the result is Second Harmonic Generation (SHG): $\chi_{ijk}(2\omega, \omega, \omega)$, while equal and opposite frequencies, $\omega_1 = \omega$ and $\omega_2 = -\omega$ lead to Optical Rectification (OR): $\chi_{ijk}(0, \omega, -\omega)$. In the SHG case the following convention is adopted: the second order nonlinear coefficient d is equal to one half of the second order nonlinear susceptibility

$$d_{ijk} = 1/2\chi^{(2)}$$

Because of the symmetry of the indices j and k one can replace these two by a single index (subscript) m . Consequently the notation for the SHG nonlinear coefficient in reduced form is d_{im} where m takes the values 1 to 6. Only noncentrosymmetric crystals can possess a nonvanishing d_{ijk} tensor (third rank). The unit of the SHG coefficients is m/V (in the MKSQ/SI system).

In centrosymmetric media the dominant nonlinearity is of the third order. This effect is represented by the third term in the Taylor's series (Equation 1); it is the result of the interaction of a number of optical fields (one to three) producing a new frequency $\omega_4 = \omega_1 + \omega_2 + \omega_3$. The third order polarization is given by

$$P_j(\omega_1\omega_2\omega_3) = g_4 \chi_{jklm} E_k^{\omega_1} E_l^{\omega_2} E_m^{\omega_3}$$

Third Harmonic Generation (THG) is achieved when $\omega_1 = \omega_2 = \omega_3 = \omega$. In this case the constant $g_4 = 1/4$. The third order nonlinear coefficient C is related to the third order susceptibility as follows:

$$C_{jklm} = 1/4\chi_{jklm}$$

This coefficient is a fourth rank tensor. In the THG case the matrices must be invariant under permutation of the indices k , l , and m ; as a result the notation for the third order nonlinear coefficient can be simplified to C_{jm} . The unit of C_{jm} is m^2V^{-2} (in the MKSQ/SI system).

Applications of second order nonlinear optical materials include the generation of higher (up to sixth) optical harmonics, the mixing of monochromatic waves to generate sum or difference frequencies (frequency conversion), the use of two monochromatic waves to amplify a third wave (parametric amplification) and the addition of feedback to such an amplifier to create an oscillation (parametric oscillation).

Third order nonlinear optical materials are used for THG, self-focusing, four wave mixing, optical amplification, and optical conjugation. Many of these effects — as well as the variation and modulation of optical propagation caused by mechanical, electric, and magnetic fields (see the preceding table on "Elasto-Optic, Electro-Optic, and Magneto-Optic Constants") are used in the areas of optical communication, optical computing, and optical imaging.

PHASE DIAGRAMS

H. P. R. Frederikse

A phase is a structurally homogeneous portion of matter. Regardless of the number of chemical constituents of a gas, there is only one vapor phase. This is true also for the liquid form of a pure substance, although a mixture of several liquid substances may exist as one or several phases, depending on the interactions among the substances. On the other hand a pure solid may exist in several phases at different temperatures and pressures because of differences in crystal structure (Reference 1). At the phase transition temperature, T_{tr} , the chemical composition of the solid remains the same, but a change in the physical properties often will take place. Such changes are found in ferroelectric crystals (example BaTiO_3) that develop a spontaneous polarization below T_{tr} , in superconductors (example Pb) that lose all electrical resistance below the transition point, and in many other classes of solids.

In quite a few cases it is difficult to bring about the phase transition, and the high- (or low-) temperature phase persists in its metastable form. Many liquids remain in the liquid state for shorter or longer periods of time when cooled below the melting point (supercooling). However, often the slightest disturbance will cause solidification. Persistence of the high temperature phase in solid-solid transitions is usually of much longer duration. An example of this behavior is found in white tin; although gray tin is the thermodynamically stable form below T_{tr} (286.4 K), the metal remains in its undercooled, white tin state all the way to $T = 0$ K, and crystals of gray tin are very difficult to produce.

A *phase diagram* is a map that indicates the areas of stability of the various phases as a function of external conditions (temperature and pressure). Pure materials, such as mercury, helium, water, and methyl alcohol are considered one-component systems and they have *unary* phase diagrams. The equilibrium phases in two-component systems are presented in *binary* phase diagrams. Because many important materials consist of three, four, and more components, many attempts have been made to deduce their multi-component phase diagrams. However, the vast majority of systems with three or more components are very complex, and no overall maps of the phase relationships have been worked out.

It has been shown during the last 20 to 25 years that very useful partial phase diagrams of complex systems can be obtained by means of thermodynamic modeling (References 2, 3). Especially for complicated, multicomponent alloy systems the CALPHAD method has proved to be a successful approach for producing valuable portions of very intricate phase diagrams (Reference 4). With this method thermodynamic descriptions of the free energy functions of various phases are obtained that are consistent with existing (binary) phase diagram information and other thermodynamic data. Extrapolation methods are then used to extend the thermodynamic functions into a ternary system. Comparison of the results of this procedure with available experimental data is then used to fine-tune the phase diagram and add ternary interaction functions if necessary. In principle this approximation strategy can be extended to four, five, and more component systems.

The nearly two dozen phase diagrams shown below present the reader with examples of some important types of single and multicomponent systems, especially for ceramics and metal alloys. This makes it possible to draw attention to certain features like the kinetic aspects of phase transitions (see Figure 22, which presents a time-temperature-transformation, or TTT, diagram for the precipitation of α -phase particles from the β -phase in a Ti-Mo alloy; Reference 1, pp. 358–360). The general references listed below and the references to individual figures contain phase diagrams for many additional systems.

(a) Metastable.

Experimental time–temperature–transformation (TTT) diagram for Ti-Mo. The start and finish times of the isothermal precipitation reaction vary with temperature as a result of the temperature dependence of the nucleation and growth processes. Precipitation is complete, at any temperature, when the equilibrium fraction of α is established in accordance with the lever rule. The solid horizontal line represents the athermal (or nonthermally activated) martensitic transformation that occurs when the β phase is quenched.

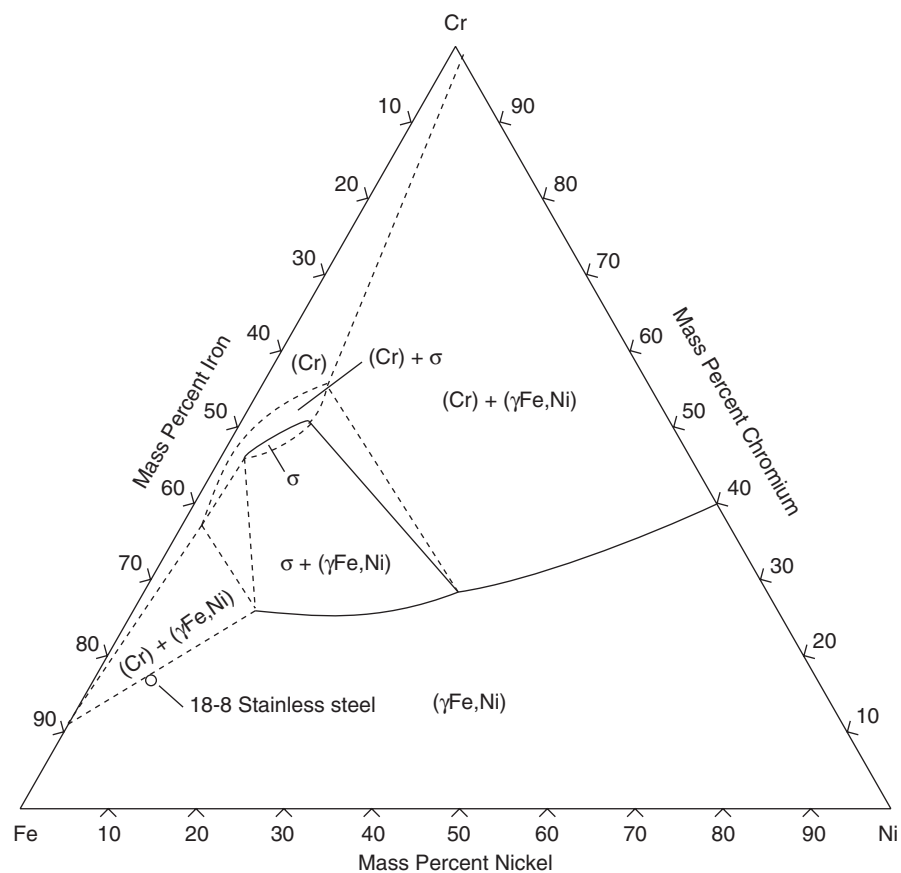

FIGURE 23. The isothermal section at 900 °C (1652 °F) of the iron-chromium-nickel ternary phase diagram, showing the nominal composition of 18-8 stainless steel.

PROPERTIES OF SELECTED MATERIALS AT CRYOGENIC TEMPERATURES

Peter E. Bradley and Ray Radebaugh

The design of systems for operation at cryogenic temperatures requires the use of material properties at these low temperatures. The properties at cryogenic temperatures can be much different than the room-temperature values. In addition, some properties can be strong functions of temperature. Property data at cryogenic temperatures are not easy to find. Many measurements were made at the National Institute of Standards and Technology (NIST) and other laboratories about 50 years ago. Some of the results were published in reports that are now out of print, which makes the results unavailable to most researchers. To correct that problem, NIST initiated a program to critically evaluate cryogenic material properties and to curve fit the available data for temperatures in the range of about 4 K to 300 K. The parameters for the curve fit, as well as a graph of the curve, are available on the website www.cryogenics.nist.gov. Click on "Material Properties" to find the list of materials. The properties available include thermal conductivity, specific heat, linear thermal expansion, thermal expansion coefficient, and Young's modulus. Not all properties are available for all materials. The materials currently in the database are ones commonly used in the construction of cryogenic hardware.

The tables presented here are the calculated values using the equations given on the website. In general the equations fit a single set of data to within about 1 % to 2 %, but often several sets of data are used in determining the best fit, in which case deviations can be significantly higher, such as 5 %. The website specifies the deviation of the fit relative to the experimental data for each property and each material. Uncertainties in the experimental data usually are in the range of 2 % to 5 %, and variations from sample to sample can also lead to similar uncertainties, especially in thermal conductivity. Some well-characterized materials, such as silicon, are used for standard reference materials. Thus, uncertainties in the experimental data for the thermal expansion coefficient of silicon are usually less than 0.2 %, and the standard deviation of the curve fit to the data is less than about 0.2 % over most of the temperature range.

Copper referred to here is of very high purity 99.99% (4N or better) and may be considered oxygen-free (sometimes referred to as OFHC-oxygen free high conductivity). Values are given with respect to the RRR (Residual Resistivity Ratio) which correlates the thermal resistivity and electrical resistivity as the impurity effect and is primarily additive in resistivity. Higher RRR values indicate higher purity and lower electrical and thermal resistance leading to higher thermal conductivity. Standard high-purity copper such as grade 101 or 102 has an RRR value of approximately 100. Higher values may be obtained with considerable effort at minimizing trace impurities by special annealing techniques that can achieve an RRR of about 1000 or greater in some special instances. Specially obtained high RRR value copper is often used only when very low temperatures (< 40 K), and necessarily high thermal conduction at low temperature, are required. Most commercial copper is electrolytic tough pitch (ETP) with a purity of at least 99.9% and is designated as Grade 110. Its RRR is also about 100, so its properties are nearly the same as those of OFHC with an RRR of 100.

Ti 15-3-3-3 has a nominal composition of 15% V, 3% Cr, 3% Sn, 3% Al, balance Ti. For the specific measurements documented by Canavan and Tuttle (Ref. 29), the exact composition is 14.88% V, 3.13% Cr, 2.88% Sn, 3.01% Al, bal. Ti. The composition for brass is 65% Cu, 32% Zn, 3% Pb which is free machining. The composition for BeCu is 2% Be, 0.3% Co, balance Cu.

HEAT CAPACITY OF SELECTED SOLIDS

This table gives the molar heat capacity at constant pressure of representative metals, semiconductors, and other crystalline solids as a function of temperature in the range 200 to 600 K.

THERMAL AND PHYSICAL PROPERTIES OF PURE METALS

This table gives the following properties for the metallic elements:

t_m :	Melting point in °C
t_b :	Normal boiling point in °C, at a pressure of 101.325 kPa (760 Torr)
$\Delta_{\text{fus}}H$:	Enthalpy of fusion at the melting point in J g ⁻¹
ρ :	Density at 25 °C in g cm ⁻³
α :	Coefficient of linear expansion at 25 °C in K ⁻¹ (the quantity listed is 10 ⁶ × α)
c_p :	Specific heat capacity at constant pressure at 25 °C in J g ⁻¹ K ⁻¹
λ :	Thermal conductivity at 27 °C in W m ⁻¹ K ⁻¹

THERMOPHYSICAL PROPERTIES OF STAINLESS STEEL 310

Stainless steel is used in a wide variety of applications, especially at high temperatures. This table gives properties of a reference standard Stainless Steel 310 certified by the U. K. National Physical Laboratory. The properties are:

a : thermal diffusivity in $\text{mm}^2 \text{s}^{-1}$
 c_p : specific heat capacity at constant pressure in $\text{J g}^{-1} \text{K}^{-1}$
 ρ : density in g cm^{-3}
 k : thermal conductivity in $\text{W m}^{-1} \text{K}^{-1}$

With kind permission from Springer Science+Business Media: International Journal of Thermophysics, 28, 674, 2007, Table II.

THERMAL CONDUCTIVITY OF METALS AND SEMICONDUCTORS AS A FUNCTION OF TEMPERATURE

This table gives the temperature dependence of the thermal conductivity of several metals and of carbon, germanium, and silicon. For graphite, separate entries are given for the thermal conductivity parallel (\parallel) and perpendicular (\perp) to the layer planes. The thermal conductivity of all these materials is very sensitive to impurities at low temperatures, especially below 100 K. Therefore, the values given here should be regarded as typical values for a highly purified specimen; the thermal conductivity of different specimens can vary by more than an order of magnitude in the low-temperature range. See Reference 2 for details.

THERMAL CONDUCTIVITY OF ALLOYS AS A FUNCTION OF TEMPERATURE

This table lists the thermal conductivity of selected alloys at various temperatures. The indicated compositions refer to weight percent. Since the thermal conductivity is sensitive to exact composition and processing history, especially at low temperatures, these values should be considered approximate.

THERMAL CONDUCTIVITY OF CERAMICS AND OTHER INSULATING MATERIALS

Thermal conductivity values for ceramics, refractory oxides, and miscellaneous insulating materials are given here. The thermal conductivity refers to samples with the density indicated in the second column. Since most of these materials are highly variable, the values should only be considered as a rough guide.

THERMOELECTRIC PROPERTIES OF METALS AND SEMICONDUCTORS

Lev I. Berger

There are three thermoelectric phenomena that result from correlation between propagation of heat through a conductor and displacement of the current carriers in the conductor. The Seebeck effect (Ref. 1) consists of formation of an electric current in an electrical circuit formed by two dissimilar conductors if the contacts between the conductors are held at different temperatures. A reverse phenomenon, the Peltier effect (Ref. 2), consists of formation of a temperature difference between the contacts in a circuit of this type if an electric current is created in the circuit by an external current source to which the circuit is connected. W. Thomson (Lord Kelvin), who explained both effects (Refs. 3,4), predicted and experimentally confirmed the existence of another thermoelectric phenomenon, named the Thomson effect, which consists of absorption or release of heat in a uniform conductor with a current passing through it when a temperature gradient (positive or negative) is present along the current direction.

The electromotive force, ΔU , which creates the Seebeck current in the circuit, is the algebraic sum of the emf's created in each of the conductors, and is proportional to the temperature difference, ΔT , between the electrical contact points: $\Delta U = \Delta U_1 + \Delta U_2 = \alpha_1 \Delta T + \alpha_2 \Delta T$. The coefficient of proportionality, α , called the Seebeck coefficient or thermoelectric power or thermal electromotive force (thermal emf), of each of the two materials depends on the electrical properties and temperature of the material. The Peltier effect is measured by the amount of heat, ΔQ , released or absorbed in a unit of time (in addition to the Joule heat) at a contact of two dissimilar conductors with electric current ΔI passing through the contact: $\Delta Q = \Pi \Delta I$. Thomson showed that $\Pi = \alpha T$. The Thomson effect's heat, dQ , released or absorbed in a unit of time along a part of a conductor of length dx is proportional to the current magnitude I , the temperature gradient along the conductor $\partial T/\partial x$, and the increment dx : $dQ = \tau I (\partial T/\partial x) dx$. Thomson showed that the magnitude of the coefficient of proportionality, τ , later named the Thomson coefficient, depends on only the properties of the conductor and the ambient temperature and correlates with the other thermoelectric parameters of a material through the equation $\tau = T(\partial \alpha/\partial T)$.

Another thermoelectric phenomenon, called the Bridgman effect or the internal Peltier effect (Ref. 5), occurs when an electric current passes through an anisotropic crystal, resulting in absorption or liberation of heat because of non-uniformity in current distribution.

In view of the correlations between α , Π , and τ , we need only to present data for one of these parameters, namely, thermal emf α and its dependence on temperature. These values are presented below,

first for metals and then for semiconductors. In accordance with modern theory of solids, thermal emf in semiconductors is up to three or even four orders of magnitude higher than that in metals (Ref. 9).

The accuracy of the data presented in this table is dependent on a number of factors. The thermal emf of a material is sensitive to negligibly small amounts of impurities in the material, which may be below the limits of sensitivity of the chemical analysis; to orientation of crystal grains in a sample of the material, and to thermal processing of the material.

FERMI ENERGY AND RELATED PROPERTIES OF METALS

Lev I. Berger

In the classical Drude theory of metals, the Maxwell-Boltzmann velocity distribution of electrons is used. It states that the number of electrons per unit volume with velocities in the range of $d\vec{v}$ about any magnitude \vec{v} at temperature T is

$$f_B(\vec{v})d\vec{v} = n \left(\frac{m}{2\pi k_B T} \right)^{3/2} \exp \left(-\frac{m\vec{v}^2}{2k_B T} \right) d\vec{v}$$

where n is the total number of conduction electrons in a unit volume of a metal, m is the free electron mass, and k_B is the Boltzmann constant. In an attempt to explain a substantial discrepancy between the experimental data on the specific heat of metals and the values calculated on the basis of the Drude model, Sommerfeld suggested a model of the metal in which the Pauli exclusion principle is applied to free electrons. In this case, the Maxwell-Boltzmann distribution is replaced by the Fermi-Dirac distribution:

$$f(\vec{v})d\vec{v} = 2 \left(\frac{m}{h} \right)^3 d\vec{v} \left\{ \exp \left[\left(\frac{m\vec{v}^2}{2} - k_B T_0 \right) / k_B T \right] + 1 \right\}^{-1}$$

Here h is the Planck constant and T_0 is a characteristic temperature which is determined by the normalization condition

$$n = \int d\vec{v} \cdot f(\vec{v})$$

The magnitude of T_0 is quite high; usually, $T_0 > 10^4$ K. So, at common temperatures ($T < 10^3$ K), the free electron density of a metal is much smaller than in the case of the Maxwell-Boltzmann distribution. This allows us to explain why the experimental data on specific heat for metals are close to those for insulators.

The maximum kinetic energy the electrons of a metal may possess at $T = 0$ K is called the Fermi energy, e.g.,

$$E_F = \frac{\hbar^2 k_F^2}{2m} = \left(\frac{e^2}{2k_B} \right) (k_F r_B)^2$$

where k_F is the Fermi momentum or the Fermi wave vector

$$k_F = (3\pi^2 n)^{1/3}$$

e is the electron charge, and r_B is the Bohr radius

$$r_B = \hbar^2 / m e^2 = 0.529 \cdot 10^{-10} \text{ m}$$

Another, more common expression for the Fermi energy is

$$E_F = \frac{1}{2} m v_F^2$$

where $v_F = \hbar k_F / m$ is the Fermi velocity which can be expressed using the concept of the electron radius, r_s . It is equal to radius of a sphere occupied by one free electron. If the total volume of a metal sample is V and the number of conduction electrons in this volume is N , then the volume per electron is equal to

$$\frac{V}{N} = \frac{1}{n} = \frac{4}{3} \pi r_s^3$$

and

$$r_s = \left(\frac{3}{4\pi n} \right)^{1/3}$$

The following table contains information pertinent to the Sommerfeld model for some metals. The magnitudes of T_0 are calculated using the expression

$$T_0 = \frac{E_F}{k_B} = \frac{58.2 \cdot 10^4}{(r_s / r_B)^2} \text{ K}$$

PROPERTIES OF COMMERCIAL METALS AND ALLOYS

This table gives typical values of mechanical, thermal, and electrical properties of several common commercial metals and alloys. Values refer to ambient temperature (0 to 25 °C). All values should be regarded as typical, since these properties are dependent on the particular type of alloy, heat treatment, and other factors. Values for individual specimens can vary widely.

HARDNESS OF MINERALS AND CERAMICS

There are several hardness scales for describing the resistance of a material to indentation or scratching. This table lists a number of common materials in order of increasing hardness. Values are given, when available, on three different hardness scales: the original Mohs Scale (range 1 to 10); the modified Mohs Scale (range 1 to 15), and the Knoop Hardness Scale. In the last case, a load of 100 g is assumed.

CAP	cellulose acetate propionate	MBS	methyl methacrylate butadiene styrene terpolymer
CAR	carbon fiber	MDPE	medium density polyethylene
CED	cohesive energy density	MDI	methylene diphenylisocyanate
CFRP	carbon reinforced plastics	MF	melamine-formaldehyde resin
CMC	carboxymethylcellulose	MP	melamine phenolic
CN	cellulose nitrate	MWD	molecular weight distribution
COC	cycloolefin copolymer	M_n	number-average molecular weight
COP	copolyester thermoplastic elastomer	M_v	viscosity-average molecular weight
CPE	chlorinated polyethylene	M_w	weight-average molecular weight
CPVC	chlorinated poly(vinyl chloride)	M_z	Z-average molecular weight
CR	neoprene	NBR	poly(butadiene- <i>co</i> -acrylonitrile); nitrile butadiene rubber
CTA	cellulose triacetate	NR	natural rubber
CTFE	chlorotrifluoroethylene	OSA	olefin modified styrene acrylonitrile
C_s	chain transfer constant	P	phenolic
DAIP	diallyl isophthalate plasticizer	PA	polyamide; nylon
DAP	diallyl phthalate plasticizer	PA6	polyamide 6, nylon6
DNA	deoxyribonucleic acid	PA11	polyamide 11, nylon11
DP	degree of polymerization	PA12	polyamide 12, nylon12
DRS	dynamic reflectance spectroscopy	PA46	polyamide 46, nylon46
DS	degree of substitution	PA66	polyamide 66, nylon6-6
EAA	ethylene acrylic acid copolymer	PA66/6T	polyamide 66/6T
EC	ethyl cellulose	PA610	polyamide 610, nylon6-10
ECTFE	ethylene-chlorotrifluoroethylene copolymer	PA612	polyamide 612, nylon6-12
EEA	ethylene-ethyl acetate copolymer	PA666	polyamide 666
EGG	Einstein-Guth-Gold equation	PAA	poly(acrylic acid)
EMAC	ethylene-methyl acrylate copolymer	PAEK	polyaryletherketone
EnBA	ethylene butyl acetate	PAI	polyamide-imide
EP	epoxy resin	PAK	polyester alkyd
EPDM	poly(ethylene- <i>co</i> -propylene) crosslinked	PAL	polyaniline
EPM	ethylene-propylene copolymer	PAN	polyacrylonitrile
EPR	ethylene propylene rubber	PARA	polyaryl amide
EPS	expanded polystyrene	PAS	polyarylsulfone
ET	thiokol	PB	polybutylene
ETFE	ethylene tetrafluoroethylene polymer	PBAN	polybutylene-acrylonitrile copolymer
EU	polyether polyurethane	PBD	polybutadine
EVA	ethylene-vinyl acetate copolymer	PBI	polybenzimidazole
EVOH	ethylene-vinyl alcohol copolymer	PBN	poly(butylene naphthalate)
FEP	fluorinated ethylene propylene	PBS	polybutadiene-styrene copolymer
FRP	fibrous glass reinforced polyester; fiber reinforced plastic	PBT	poly(butylene terephthalate)
		PC	polycarbonate

PC/ABS	polycarbonate/acrylonitrile butadiene styrene blend	PVA	poly(vinyl alcohol); sometimes poly(vinyl acetate)
PCB	polychlorinated biphenyl	PVAc	poly(vinyl acetate)
PCCE	poly(cyclohexylene dimethylene cyclohexanedicarboxylate), glycol and acid comonomer	PVB	poly(vinyl butyral)
PCL	polycaprolactone	PVC	poly(vinyl chloride)
PCT	poly(cyclohexylene terephthalate)	PVCA	copolymer of vinyl chloride and vinyl acetate
PCTA	poly(cyclohexylene dimethylene terephthalate) copolyester	PVDA	polyvinylidene acetate
PCTFE	polychlorotrifluoroethylene	PVDC	poly(vinylidene chloride)
PCTG	poly(cyclohexylene dimethylene terephthalate) copolyester	PVDF	poly(vinylidene fluoride)
PCT-G	glycol modified polycyclohexyl terephthalate	PVF	poly(vinyl fluoride)
PE	polyethylene	PVK	poly(vinyl carbazole)
PEBA	polyether block amide or polyester block amide	PVOH	poly(vinyl alcohol)
PEEK	poly(ether ether ketone)	PVP	poly(vinyl pyrrolidone)
PEG	poly(ethylene glycol)	RIM	reaction injection molding
PEI	polyetherimide	RNA	ribonucleic acid
PEK	polyetherketone	ROMP	ring opening metathesis polymerization
PEKEKK	polyetherketone etherketone ketone	ROP	ring opening polymerization
PEKK	polyetherketoneketone	S	radius of gyration
PEN	poly(ethylene naphthalene)	SAN	poly(styrene- <i>co</i> -acrylonitrile)
PEO	poly(ethylene oxide)	SB	styrene butadiene copolymer
PES	polyethersulfone	SBR	poly(butadiene- <i>co</i> -styrene) elastomer
PET	poly(ethylene terephthalate)	SBS	styrene butadiene styrene block copolymer
PET-G	glycol modified poly(ethylene terephthalate)	SEBS	styrene ethylene butylene styrene block copolymer
PEX	crosslinked polyethylene	SI	silicon
PF	phenol-formaldehyde resin	SIS	styrene isoprene styrene block copolymer
PFA	perfluoroalkoxy	SMA	poly(styrene- <i>co</i> -maleic anhydride)
PI	polyimide, polyisoprene	SMC	sheet molding compound
PIB	polyisobutylene	SMMA	styrene methyl methacrylate copolymer
PIR	polyisocyanurate	SMS	styrene/ α -methyl styrene
PK	polyketone	SN	sulfur nitride
PLGA	poly(lactic- <i>co</i> -glycolic acid)	SR	synthetic rubber
PMAN	polymethacrylonitrile	SRP	styrene-rubber plastics
PMMA	poly(methyl methacrylate)	SVA	styrene vinyl acrylonitrile
PMP	polymethylpentene	TDI	toluenediisocyanate
PMS	polymethylstyrene	TEO	thermoplastic elastic olefin
PNF	poly(phosphonitrilic fluorides)	TGA, TG	thermal gravimetric analysis
PO	polyolefin	TMC	thick molding compound
POM	polyoxymethylene, polyformaldehyde, acetals	TMMV	threshold molecular weight value
PP	polypropylene	TPA	polyamide thermoplastic elastomer
PPA	polyphthalamide	TPC	copolyester thermoplastic elastomer
PPC	chlorinated polypropylene, polyphthalate carbonate	TPE	thermoplastic elastomer
PPE	poly(phenylene ether)	TPE-O, TPO	thermoplastic elastomer - olefinic
PPI	polymeric polyisocyanate	TPE-S, TPS	thermoplastic elastomer - styrenic
PPO	poly(phenylene oxide)	TPU	thermoplastic urethane
PPOX	poly(propylene oxide)	TPX	poly-4-methylpentene
PPS	poly(phenylene sulfide)	TVO	thermoplastic vulcanites
PPSU	poly(phenylene sulfone)	T_c	ceiling temperature; cloud-point temperature
PPT	poly(propylene terephthalate)	T_g	glass transition temperature
PS	polystyrene	T_m	melting point temperature
PS-b-PI	polystyrene/polyisoprene block copolymer	UF	urea-formaldehyde resin
PSO, PSU	polysulfone	UHMWPE	ultrahigh molecular weight polyethylene
PTFE	polytetrafluoroethylene, Teflon	ULDPE	ultra low-density polyethylene
PTME	poly(tetramethylene terephthalate)	ULPE	ultra linear polyethylene
PTMT	poly(tetramethylene terephthalate)	UP, UPE	unsaturated polyester (thermoset)
PU	polyurethane	VA	vinyl acetate
PUR	polyurethane rubber	VAE	vinyl acetate ethylene
		VLDPE	very low-density polyethylene
		WLF	Williams-Landel-Ferry equation
		WS	polyurethane
		XLPE	crosslinked polyethylene
		XPS	expandable polystyrene

PHYSICAL PROPERTIES OF SELECTED POLYMERS

The physical properties of polymers are important parameters in determining their behavior and performance in a wide range of applications. This table lists some examples of general representative physical properties (including mechanical properties) of representative polymeric compounds. For glass transition temperatures of selected polymers, see pages 13-10 through 13-16 in this section. Some of the properties in this table are defined as follows:

The **heat deflection temperature** (HDT), or heat distortion temperature, is the temperature at which a polymer or plastic sample deforms under a specified load (normally either 0.455 MPa or 1.82 MPa).

The **crystalline melting point** is the temperature (or temperature range) at which a crystalline solid changes its state from solid to liquid. Although the phrase would suggest a specific temperature, most crystalline compounds actually melt over a range of a few degrees or less.

The **coefficient of linear thermal expansion** is the fractional change in length per °C change in temperature at constant pressure.

The **compressive strength** of a material is the maximum uniaxial compressive stress (compressive force per unit area) reached when the material fails completely on being subjected to a load that pushes it together.

The **tensile strength** is a measure of the ability of a material to withstand pulling stresses. It is defined as the stress (stretching force per unit area) required to break a specimen. Polymers are approximately 20 % stronger in compression than in tension.

The **flexural strength**, or cross-breaking strength, of a material is a measure of the bending strength or stiffness of a specimen expressed as the stress required to break a specimen by exerting a torque on it.

The **impact strength** is a measure of the energy needed to break a sample. The term toughness is sometimes used to describe the impact strength of a material. The notched izod impact test is a single point test that measures the resistance of a material to impact from a swinging pendulum. Izod impact is defined as the kinetic energy needed to initiate fracture and continue the fracture until the speci-

men is broken. Izod specimens are notched to prevent deformation of the specimen upon impact. This test can be used as a quick and easy quality control check to determine if a material meets specific impact properties or to compare materials for general toughness.

The **ultimate elongation** is a measure of how far a material will stretch before breaking, expressed as a percentage of its original length.

The properties of the following polymers are presented in this table:

PET	poly(ethylene terephthalate)
PBT	poly(butylene terephthalate)
PC	polycarbonate
Nylon 6,6	poly(iminoadipoyliminohexamethylene)
Nylon 6	poly[imino(1-oxohexamethylene)]
PPO	poly(phenylene ether)
POM	polyoxymethylene
LDPE	low-density polyethylene
HDPE	high-density polyethylene
UHMWPE	ultrahigh molecular weight polyethylene
iPP	isotactic polypropylene
ABS	copolymer of acrylonitrile, butadiene, and styrene (extrusion grade)
PTFE	polytetrafluoroethylene, Teflon
PCTFE	polymonochlorotrifluoroethylene
PVDF	poly(vinylidene fluoride)
PVF	poly(vinyl fluoride)
PVC (rigid)	poly(vinyl chloride)
PVC (plasterized)	poly(vinyl chloride)
PMMA	poly(methyl methacrylate)

NOMENCLATURE FOR ORGANIC POLYMERS

Robert B. Fox and Edward S. Wilks

Organic polymers have traditionally been named on the basis of the monomer used, a hypothetical monomer or a semi-systematic structure. Alternatively, they may be named in the same way as organic compounds, i.e., on the basis of a structure as drawn. The former method, often called “source-based nomenclature” or “monomer-based nomenclature,” sometimes results in ambiguity and multiple names for a single material. The latter method, termed “structure-based nomenclature,” generates a sometimes cumbersome unique name for a given polymer, independent of its source. Within their limitations, both types of names are acceptable and well-documented.¹ The use of stereochemical descriptors with both types of polymer nomenclature has been published.²

Traditional Polymer Names

Monomer-Based Names

“Polystyrene” is the name of a homopolymer made from the single monomer styrene. When the name of a monomer comprises two or more words, the name should be enclosed in parentheses, as in “poly(methyl methacrylate)” or “poly(4-bromostyrene)” to identify the monomer more clearly. This method can result in several names for a given polymer: thus, “poly(ethylene glycol),” “poly(ethylene oxide),” and “poly(oxirane)” describe the same polymer. Sometimes, the name of a hypothetical monomer is used, as in “poly(vinyl alcohol).” Even though a name like “polyethylene” covers a multitude of materials, the system does provide understandable names when a single monomer is involved in the synthesis of a single polymer. When one monomer can yield more than one polymer, e.g., 1,3-butadiene or acrolein, some sort of structural notation must be used to identify the product, and one is not far from a formal structure-based name.

Copolymers, Block Polymers, and Graft Polymers. When more than one monomer is involved, monomer-based names are more complex. Some common polymers have been given names based on an apparent structure, as with “poly(ethylene terephthalate).” A better system has been approved by the IUPAC.¹ With this method, the arrangement of the monomeric units is introduced through use of an italicized connective placed between the names of the monomers. For monomer names represented by A, B, and C, the various types of arrangements are shown in Table 1.

Table 2 contains examples of common or semi-systematic names of copolymers. The systematic names of comonomers may also be used; thus, the polyacrylonitrile-*block*-polybutadiene-*block*-polystyrene polymer in Table 2 may also be named poly(prop-2-enenitrile)-*block*-polybuta-1,3-diene-*block*-poly(ethenylbenzene). IUPAC does not require alphabetized names of comonomers within a polymer name; many names are thus possible for some copolymers.

These connectives may be used in combination and with small, non-repeating (i.e. non-polymeric) junction units; see, for example, Table 2, line 8. A long dash may be used in place of the connective -*block*-; thus, in Table 2, the polymers of lines 7 and 8 may also be written as shown on lines 9 and 10.

IUPAC also recommends an alternative scheme for naming copolymers that comprises use of “copoly” as a prefix followed by the names of the comonomers, a solidus (an oblique stroke) to separate comonomer names, and the addition before “copoly” of any applicable connectives listed in Table 2 except -*co*-.

Table 3 gives the same examples shown in Table 2 but with the alternative format. Comonomer names need not be parenthesized.

TABLE 1. IUPAC Source-Based Copolymer Classification

No.	Copolymer type	Connective	Example
1	Unspecified or unknown	- <i>co</i> -	poly(A- <i>co</i> -B)
2	Random (obeys Bernoullian distribution)	- <i>ran</i> -	poly(A- <i>ran</i> -B)
3	Statistical (obeys known statistical laws)	- <i>stat</i> -	poly(A- <i>stat</i> -B)
4	Alternating (for two monomeric units)	- <i>alt</i> -	poly(A- <i>alt</i> -B)
5	Periodic (ordered sequence for 2 or more monomeric units)	- <i>per</i> -	poly(A- <i>per</i> -B- <i>per</i> -C)
6	Block (linear block arrangement)	- <i>block</i> -	polyA- <i>block</i> -polyB
7	Graft (side chains connected to main chains)	- <i>graft</i> -	polyA- <i>graft</i> -polyB

TABLE 2. Examples of Source-Based Copolymer Nomenclature

No.	Copolymer name
1	poly(propene- <i>co</i> -methacrylonitrile)
2	poly[(acrylic acid)- <i>ran</i> -(ethyl acrylate)]
3	poly(butene- <i>stat</i> -ethylene- <i>stat</i> -styrene)
4	poly[(sebacic acid)- <i>alt</i> -butanediol]
5	poly[(ethylene oxide)- <i>per</i> -(ethylene oxide)- <i>per</i> -tetrahydrofuran]
6	polyisoprene- <i>graft</i> -poly(methacrylic acid)
7	polyacrylonitrile- <i>block</i> -polybutadiene- <i>block</i> -polystyrene
8	polystyrene- <i>block</i> -dimethylsilylene- <i>block</i> -polybutadiene
9	polyacrylonitrile—polybutadiene—polystyrene
10	polystyrene—dimethylsilylene—polybutadiene

TABLE 3. Examples of Source-Based Copolymer Nomenclature (Alternative Format)

No.	Polymer name
1	copoly(propene/methacrylonitrile)
2	<i>ran</i> -copoly(acrylic acid/ethyl acrylate)
3	<i>stat</i> -copoly(butene/ethylene/styrene)
4	<i>alt</i> -copoly(sebacic acid/butanediol)
5	<i>block</i> -copoly(acrylonitrile/butadiene/styrene)
6	<i>per</i> -copoly(ethylene oxide/ethylene oxide/tetrahydrofuran)
7	<i>graft</i> -copoly(isoprene/methacrylic acid)

Source-based nomenclature for non-linear macromolecules and macromolecular assemblies is covered by a 1997 IUPAC document.¹¹ The types of polymers in these classes, together with their connectives, are given in Table 4; the terms shown may be used as connectives, prefixes, or both to designate the features present.

TABLE 4. Connectives for Non-Linear Macromolecules and Macromolecular Assemblies

No.	Type	Connective
1	Branched (type unspecified)	branch
2	Branched with branch point of functionality <i>f</i>	<i>f</i> -branch
3	Comb	comb
4	Cross-link	ι (Greek iota)
5	Cyclic	cyclo
6	Interpenetrating polymer network	ipn
7	Long-chain branched	l-branch
8	Network	net
9	Polymer blend	blend
10	Polymer-polymer complex	compl
11	Semi-interpenetrating polymer network	sign
12	Short-chain branched	sh-branch
13	Star	star
14	Star with <i>f</i> arms	<i>f</i> -star

Non-linear polymers are named by using the italicized connective as a *prefix* to the source-based name of the polymer component or components to which the prefix applies; some examples are listed in Table 5.

TABLE 5. Non-Linear Macromolecules

No.	Polymer name	Polymer structural features
1	poly(methacrylic acid)- <i>comb</i> -polyacrylonitrile	Comb polymer with a poly(methacrylic acid) backbone and polyacrylonitrile side chains
2	<i>comb</i> -poly[ethylene- <i>stat</i> -(vinyl chloride)]	Comb polymer with unspecified backbone composition and statistical ethylene/vinyl chloride copolymer side chains
3	polybutadiene- <i>comb</i> -(polyethylene; polypropene)	Comb polymer with butadiene backbone and side chains of polyethylene and polypropene
4	<i>star</i> -(polyA; polyB; polyC; polyD; polyE)	Star polymer with arms derived from monomers A, B, C, D, and E, respectively
5	<i>star</i> -(polyA- <i>block</i> -polyB- <i>block</i> -polyC)	Star polymer with every arm comprising a tri-block segment derived from comonomers A, B, and C
6	<i>star</i> -poly(propylene oxide)	A star polymer prepared from propylene oxide
7	5- <i>star</i> -poly(propylene oxide)	A 5-arm star polymer prepared from propylene oxide
8	<i>star</i> -(polyacrylonitrile; polypropylene) (<i>M_r</i> 10000: 25000)	A star polymer containing polyacrylonitrile arms of MW 10000 and polypropylene arms of MW 25000

Macromolecular assemblies held together by forces other than covalent bonds are named by inserting the appropriate italicized connective between names of individual components; Table 6 gives examples.

TABLE 6. Examples of Polymer Blends and Nets

No.	Polymer name
1	polyethylene- <i>blend</i> -polypropene
2	poly(methacrylic acid)- <i>blend</i> -poly(ethyl acrylate)
3	<i>net</i> -poly(4-methylstyrene-ι-divinylbenzene)
4	<i>net</i> -poly[styrene- <i>alt</i> -(maleic anhydride)]-ι-(polyethylene glycol; polypropylene glycol)
5	<i>net</i> -poly(ethyl methacrylate)- <i>sign</i> -polyethylene
6	[<i>net</i> -poly(butadiene- <i>stat</i> -styrene)]- <i>ipn</i> -[<i>net</i> -poly(4-methylstyrene-ι-divinylbenzene)]

Structure-Based Polymer Nomenclature

Regular Single-Strand Polymers

Structure-based nomenclature has been approved by the IUPAC⁴ and is currently being updated; it is used by *Chemical Abstracts*.⁵ Monomer names are not used. To the extent that a polymer chain can be described by a repeating unit in the chain, it can be named “poly(repeating unit).” For regular single-strand polymers, “repeating unit” is a bivalent group; for regular double-strand (ladder and spiro) polymers, “repeating unit” is usually a tetravalent group.⁹

Since there are usually many possible repeating units in a given chain, it is necessary to select one, called the “constitutional repeating unit” (CRU) to provide a unique and unambiguous name, “poly(CRU),” where “CRU” is a recitation of the names of successive units as one proceeds through the CRU from left to right. For this purpose, a portion of the main chain structure that includes at least two repeating sequences is written out. These sequences will typically be composed of bivalent subunits such as -CH₂-, -O-, and groups from ring systems, each of which can be named by the usual nomenclature rules.^{6,7}

Where a chain is simply one long sequence comprising repetition of a single subunit, that subunit is itself the CRU, as in “poly(methylene)” or “poly(1,4-phenylene).” In chains having more than one kind of subunit, a seniority system is used to determine the beginning of the CRU and the direction in which to move along the main chain atoms (following the shortest path in rings) to complete the CRU. Determination of the first, most senior, subunit is based on a descending order of seniority: (1) heterocyclic rings, (2) hetero atoms, (3) carbocyclic rings, and lowest, (4) acyclic carbon chains.

Within each of these classes, there is a further order of seniority that follows the usual rules of nomenclature.

Heterocycles: A nitrogen-containing ring system is senior to a ring system not containing nitrogen.^{4,9} Further descending order of seniority is determined by:

- the highest number of rings in the ring system
- the largest individual ring in the ring system
- the largest number of hetero atoms
- the greatest variety of hetero atoms

Hetero atoms: The senior bivalent subunit is the one nearest the top right-hand corner of the Periodic Table; the order of seniority is: O, S, Se, Te, N, P, As, Sb, Bi, Si, Ge, Sn, Pb, B, Hg.

Carbocycles: Seniority⁴ is determined by:

- the highest number of rings in the ring system
- the largest individual ring in the ring system
- degree of ring saturation; an unsaturated ring is senior to a saturated ring of the same size

Carbon chains: Descending order of seniority is determined by:

- chain length (longer is senior to shorter)
- highest degree of unsaturation
- number of substituents (higher number is senior to lower number)
- ascending order of locants
- alphabetical order of names of substituent groups

Among equivalent ring systems, preference is given to the one having lowest locants for the free valences in the subunit, and among otherwise identical ring systems, the one having least hy-

drogenation is senior. Lowest locants in unsaturated chains are also given preference. Lowest locants for substituents are the final determinant of seniority.

Direction within the repeating unit depends upon the shortest path, which is determined by counting main chain atoms, both cyclic and acyclic, from the most senior subunit to another subunit of the same kind or to a subunit next lower in seniority. When identification and orientation of the CRU have been accomplished, the CRU is named by writing, in sequence, the names of the largest possible subunits within the CRU from left to right. For example, the main chain of the polymer traditionally named “poly(ethylene terephthalate)” has the structure shown in Figure 1.

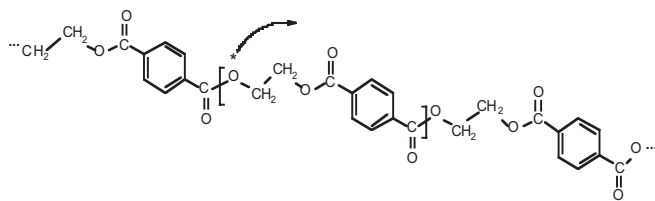

Figure 1. Structure-based name: poly(oxyethyleneoxyterephthaloyl); traditional name: poly(ethylene terephthalate).

The CRU in Figure 1 is enclosed in brackets and read from left to right. It is selected because (1) either backbone oxygen atom qualifies as the “most senior subunit,” (2) the shortest path length from either -O- to the other -O- is via the ethylene subunit. Orientation of the CRU is thus defined by (1) beginning at the -O- marked with an asterisk, and (2) reading in the direction of the arrow. The structure-based name of this polymer is therefore “poly(oxyethyl eneoxyterephthaloyl),” not much longer than the traditional name and much more adaptable to the complexities of substitution. As organic nomenclature evolves, more systematic names may be used for subunits, e.g., “ethane-1,2-diyl” instead of “ethylene.” IUPAC still prefers “ethylene” for the -CH₂-CH₂- unit, however, but also accepts “ethane-1,2-diyl.”

Structure-based nomenclature can also be used when the CRU backbone has no carbon atoms. An example is the polymer traditionally named “poly(dimethylsiloxane),” which on the basis of structure would be named “poly(oxydimethylsilylene)” or “poly(oxydimethylsilanediy).” This nomenclature method has also been applied to inorganic and coordination polymers⁸ and to double-strand (ladder and spiro) organic polymers.⁹

Irregular Single-Strand Polymers

Polymers that cannot be described by the repetition of a single CRU or comprise units not all connected identically in a directional sense can also be named on a structure basis.¹⁰ These include copolymers, block and graft polymers, and star polymers. They are given names of the type “poly(A/B/C...),” where A, B, C, etc. are the names of the component constitutional units, the number of which are minimized. The constitutional units may include regular or irregular blocks as well as atoms or atomic groupings, and each is named by the method described above or by the rules of organic nomenclature.

The solidus denotes an unspecified arrangement of the units within the main chain.¹⁰ For example, a statistical copolymer derived from styrene and vinyl chloride with the monomeric units joined head-to-tail is named “poly(1-chloroethylene/1-phenylethylene).” A polymer obtained by 1,4-polymerization and both head-to-head and head-to-tail 1,2-polymerization of 1,3-butadi-

ene would be named “poly(but-1-ene-1,4-diyl/1-vinylethylene/2-vinylethylene).”¹² In graphic representations of these polymers, shown in Figure 2, the hyphens or dashes at each end of each CRU depiction are shown *completely within* the enclosing parentheses; this indicates that they are not necessarily the terminal bonds of the macromolecule.

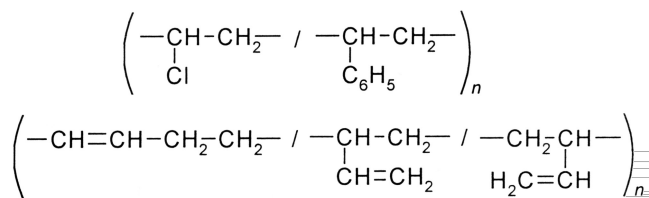

Figure 2. Graphic representations of copolymers.

A long hyphen is used to separate components in names of block polymers, as in “poly(A)—poly(B)—poly(C),” or “poly(A)—X—poly(B)” in which X is a non-polymeric junction unit, e.g., dimethylsilylene.

In graphic representations of these polymers, the blocks are shown connected when the bonding is known (Figure 3, for example); when the bonding between the blocks is unknown, the blocks are separated by solidi and are shown *completely within* the outer set of enclosing parentheses (Figure 4, for example).^{10,13}

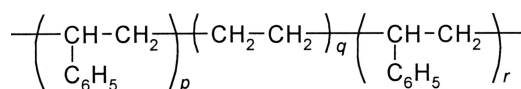

Figure 3. polystyrene—polyethylene—polystyrene.

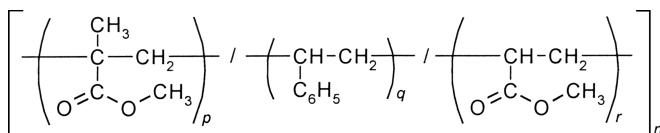

Figure 4. poly[poly(methyl methacrylate)—polystyrene—poly(methyl acrylate)].

Graft polymers are named in the same way as a substituted polymer but without the ending “yl” for the grafted chain; the name of a regular polymer, comprising Z units in which some have grafts of “poly(A),” is “poly[Z/poly(A)Z].” Star polymers are treated as a central unit with substituent blocks, as in “tetrakis(polymethylene silane).”^{10,13}

Other Nomenclature Articles and Publications

In addition to the *Chemical Abstracts* and IUPAC documents cited above and listed below, other articles on polymer nomenclature are available. A 1999 article lists significant documents on polymer nomenclature published during the last 50 years in books, encyclopedias, and journals by *Chemical Abstracts*, IUPAC, and individual authors.¹⁴ A comprehensive review of source-based and structure-based nomenclature for all of the major classes of polymers,¹⁵ and a short tutorial on the correct identification, orientation, and naming of most commonly encountered constitutional repeating units were both published in 2000.¹⁶

12. Poly(1,3-butadiene) obtained by polymerization of 1,3-butadiene in the so-called 1,4- mode is frequently drawn incorrectly in publications as $-(\text{CH}_2-\text{CH}=\text{CH}-\text{CH}_2)_n-$; the double bond should be assigned the lowest locant possible, i.e., the structure should be drawn as $-(\text{CH}=\text{CH}-\text{CH}_2-\text{CH}_2)_n-$.

SOLVENTS FOR COMMON POLYMERS

Abbreviations:

HC: hydrocarbons

MEK: methyl ethyl ketone

THF: tetrahydrofuran

DMF: dimethylformamide

DMSO: dimethylsulfoxide

Polyethylene (HDPE)	HC and halogenated HC
Polypropylene (atactic)	HC and halogenated HC
Polybutadiene	HC, THF, ketones
Polystyrene	ethylbenzene, CHCl_3 , CCl_4 , THF, MEK
Polyacrylates	aromatic HC, chlorinated HC, THF, esters, ketones
Polymethacrylates	aromatic HC, chlorinated HC, THF, esters, MEK
Polyacrylamide	water
Poly(vinyl ethers)	halogenated HC, MEK, butanol
Poly(vinyl alcohol)	glycols (hot), DMF
Poly(vinyl acetate)	aromatic HC, chlorinated HC, THF, esters, DMF
Poly(vinyl chloride)	THF, DMF, DMSO
Poly(vinylidene chloride)	THF (hot), dioxane, DMF
Poly(vinyl fluoride)	DMF, DMSO (hot)
Polyacrylonitrile	DMF, DMSO
Poly(oxyethylene)	aromatic HC, CHCl_3 , alcohols, esters, DMF
Poly(2,6-dimethylphenylene oxide)	aromatic HC, halogenated HC
Poly(ethylene terephthalate)	phenol, DMSO (hot)
Polyurethanes (linear)	aromatic HC, THF, DMF
Polyureas	phenol, formic acid
Polysiloxanes	HC, THF, DMF
Poly[bis(2,2,2-trifluoroethoxy)-phosphazene]	THF, ketones, ethyl acetate

GLASS TRANSITION TEMPERATURE FOR SELECTED POLYMERS

Robert B. Fox

Polymer names are based on the IUPAC structure-based nomenclature system described in the table "Naming Organic Polymers." Within each category, names are listed in alphabetical order. Source-based and trivial names are also given (in italics) for the most common polymers. The table does not include polymers for which T_g is not clearly defined because of variability of structure or because of reactions taking place near the glass transition.

All values of T_g cited in this table have been determined by differential scanning calorimetry (DSC) except those values indicated by:

(D) dynamic method
(Dil) dilatometry
(M) mechanical method

Polymer name	Glass transition temperature (T_g /K)
ACYCLIC CARBON CHAINS	
<i>Polyalkadienes</i>	
Poly(alkenylene) <i>Polyalkadiene</i> $-\text{[CH=CHCH}_2\text{CH}_2\text{]}-$

DIELECTRIC CONSTANT OF SELECTED POLYMERS

This table lists typical values of the dielectric constant (more properly called relative permittivity) of some important polymers. Values are given for frequencies of 1 kHz, 1 MHz, and 1 GHz; in most cases the dielectric constant at frequencies below 1 kHz does not differ significantly from the value at 1 kHz. Since the dielectric constant of a polymeric material can vary with density, degree of crystallinity, and other details of a particular sample, the values given here should be regarded as only typical or average values.

SECOND VIRIAL COEFFICIENTS OF POLYMER SOLUTIONS

Christian Wohlfarth

Second virial coefficients characterize the thermodynamic behavior of a dilute polymer solution. They are usually defined via the concentration dependence of the osmotic pressure, π , of a polymer solution:

$$\frac{\pi}{c_B} = RT \left[\frac{1}{M_n} + A_2 c_B + A_3 c_B^2 + \dots \right] \quad (1)$$

where:

A_2, A_3	second, third osmotic virial coefficient
c_B	(g cm ⁻³) concentration of polymer (B)
M_n	number-average relative molar mass of the polymer
R	gas constant
T	(measuring) temperature

However, most experimental data are measured by light scattering. Scattering methods enable the determination of A_2 via the common relation:

$$\frac{Kc_B}{R(q)} = \frac{1}{M_w P_z(q)} + 2A_2 Q(q) c_B + \dots \quad (2)$$

where:

K	a constant that summarizes the optical parameters of a scattering experiment
M_w	mass-average relative molar mass of the polymer
$P_z(q)$	z-average of the scattering function
q	scattering vector $q = \frac{4\pi}{\lambda} \sin \frac{\theta}{2}$
$Q(q)$	function for the q -dependence of A_2
$R(q)$	excess intensity of the scattered beam at the value q

λ	wavelength
θ	scattering angle

In the dilute concentration region, the virial equation is usually truncated after the second virial coefficient which leads to a linear relationship. A linearized relation over a wider concentration range can be constructed if the Stockmayer-Casassa relation between A_2 and A_3 is applied:

$$A_3 M_n = \left(\frac{A_2 M_n}{2} \right)^2 \quad (3)$$

The values of second virial coefficients depend on the chosen polymer-solvent pair, on temperature and pressure, and on molar mass. In good solvents, a scaling relation can be applied for the molar mass dependence:

$$A_2 = \alpha M_w^{-\beta} \quad (4)$$

The constants α and β for a number of polymer-solvent pairs are given in the table below. They were newly fitted to experimental data by a non-linear least-squares fitting procedure. Experimental data were taken from a recent table of experimental A_2 -values in Ref. 1. The unit of A_2 (used to determine the constants α and β) is cm³ mol g⁻². The used unit for the molar mass is g mol⁻¹.

PRESSURE–VOLUME–TEMPERATURE RELATIONSHIPS FOR POLYMER MELTS

Christian Wohlfarth

Numerous theoretical equations of state for polymer liquids have been developed. These, at the minimum, have to provide accurate fitting functions to experimental data. However, for the purpose of this table, the empirical Tait equation along with a polynomial expression for the zero pressure isobar is used. This equation is able to represent the experimental data for the melt state within the limits of experimental errors, i.e., the maximum deviations between measured and calculated specific volumes are about 0.001–0.002 cm³/g.

The general form of the Tait equation is:

$$V(P,T) = V(0,T)\{1 - C \ln[1 + P/B(T)]\} \quad (1)$$

where the coefficient C is usually taken to be a universal constant equal to 0.0894. T is the absolute temperature in K and P the pressure in MPa. The volume V is the specific volume in cm³/g. The Tait parameter $B(T)$ has the very simple meaning that it is inversely proportional to the compressibility κ at constant temperature and zero pressure:

$$\kappa(0,T) = -[1/V(0,T)](dV/dP) = C/B(T) \quad (2)$$

The $B(T)$ function is usually given by:

$$B(T) = B_0 \exp[-B_1(T-273.15)] \quad (3)$$

but, sometimes a polynomial expression is used:

$$B(T) = b_0 + b_1(T-273.15) + b_2(T-273.15)^2 \quad (4)$$

The zero-pressure isobar $V(0,T)$ is usually given by:

$$V(0,T) = A_0 + A_1(T-273.15) + A_2(T-273.15)^2 \quad (5)$$

where A_0, A_1, A_2 are specific constants for a given polymer (the expression $T-273.15$ is used because fitting to the zero-pressure isobar is usually done in terms of Celsius temperature). Other forms for $V(0,T)$ are also found in the literature, such as

$$V(0,T) = A_3 \exp[A_4(T-273.15)] \quad (6)$$

or

$$V(0,T) = A_5 \exp(A_6 T^{1.5}) \quad (7)$$

where A_3 and A_4 or A_5 and A_6 are again specific constants for a given polymer.

The Tait equation is particularly useful to calculate derivative quantities, such as the isothermal compressibility and the thermal expansivity coefficients. The isothermal compressibility $\kappa(P,T)$ is derived from equation (1) as:

$$\kappa(P,T) = -(1/V)(dV/dP) = 1/[P + B(T)][1/C - \ln(1 + P/B(T))] \quad (8)$$

and the thermal expansivity $\alpha(P,T)$ as:

$$\alpha(P,T) = (1/V)(dV/dT) = \alpha(0,T) - PB_1\kappa(P,T) \quad (9)$$

where $\alpha(0,T)$ represents the thermal expansivity at zero (atmospheric) pressure and is calculated from any suitable fit for the zero-pressure volume, such as equations (5) through (7) above.

Because polymer melt PVT-behavior depends only slightly on polymer molar mass above the oligomeric region, usually no information is given in the original literature for the average molar mass of the polymers.

Table 1 summarizes the polymers or copolymers considered here and the experimental ranges of pressure and temperature over which data are available. In Table 2 the Tait-equation functions, with parameters obtained from the fit, are given for 90 polymer or copolymer melts.

UPPER CRITICAL (UCST) AND LOWER CRITICAL (LCST) SOLUTION TEMPERATURES OF BINARY POLYMER SOLUTIONS

Christian Wohlfarth

Liquid–liquid demixing in solutions of polymers in low molar mass solvents is not a rare phenomenon. Demixing depends on concentration, temperature, pressure, molar mass and molar mass distribution function of the polymer, chain branching and end groups of the polymer, the chemical nature of the solvent, isotope substitution in solvents or polymers, chemical composition of copolymers and its distributions, and other variables. Phase diagrams of polymer solutions can therefore show quite complicated behavior when they have to be considered in detail (see Ref. 1a).

Polymer solutions can undergo demixing when cooling a homogeneous solution as well as when heating such a solution. The corresponding cloud-point curves show a maximum (UCST behavior) or a minimum (LCST behavior). For common polymer solutions, the LCST region is at higher temperatures (in many cases near the critical temperature of the solvent) than the UCST region. The temperature range between both extrema provides the essential information where the one-phase region of a polymer solution can be found. In the case of monodisperse polymers the extrema are equal to the critical points. However, in the case of polydisperse polymers with distribution functions, these extrema are threshold temperatures whereas the critical point shifts to higher concentrations on the shoulder of the cloud-point curve. Usually, the critical concentration is much more strongly influenced than the critical temperature. Thus, the table below does not distinguish between threshold and critical temperatures.

UCST and LCST values depend somewhat on pressure. LCST values in the table are usually given at the vapor pressure of the solvent at this temperature. UCST values are measured in most cases at normal pressure; data at higher pressures are neglected

here. The interested reader can find such information, for example, in Refs. 76, 84, 104, 157, 165, 177, 185–187, or 192.

However, UCST and LCST values of a given polymer/solvent pair depend strongly on the molar mass of the polymer. In the case of monodisperse polymers, this dependency can be described in good approximation by the so-called Shultz-Flory plot (see Refs. 6 and 8):

$$\frac{1}{T_{\text{crit}}} = \frac{1}{\theta} \left[1 + \text{const.} \cdot \left(\frac{1}{\sqrt{r}} - \frac{1}{2r} \right) \right] \quad (1)$$

where r denotes the number of segments of a polymer (being proportional to the degree of polymerization or to the molar mass or molar volume of the polymer). Extrapolation to $r \rightarrow \infty$, i.e., to infinite molar mass, leads to the value of the θ -temperature. This θ -temperature is the highest temperature for UCST behavior or the lowest temperature for LCST behavior and a given polymer/solvent pair. In the case of polydisperse polymers, the segment number in equation (1) is to be replaced by its weight average, r_w (related to M_w). The constant in equation (1) reflects further thermodynamic properties of the given polymer/solvent pair, but should not depend on molar mass. A detailed discussion can be found in Ref. 1b.

The table gives the UCST and LCST values for selected polymer/solvent pairs at specified values of the molar mass, as measured by the number average M_n , mass average M_w , or viscosity average M_η . Further information on the molar mass dependence of UCST and LCST can be found in the references.

VAPOR PRESSURES (SOLVENT ACTIVITIES) FOR BINARY POLYMER SOLUTIONS

Christian Wohlfarth

The vapor pressure of a binary polymer solution is given by the activity of the solvent A , a_A . Solvent activities in polymer solutions are measured either by the isopiestic method applying a reference system whose solvent activity is precisely known or by determining the solvent partial pressure, P_A^s , and calculating the activity of the solvent by equation (1):

$$a_A = (P_A / P_A^s) \exp \left[\frac{(B_{AA} - V_A^L)(P - P_A^s)}{RT} \right] \quad (1)$$

where B_{AA} is the second virial coefficient, P_A^s is the saturation vapor pressure, and V_A^L is the molar volume of the pure solvent A at the measuring temperature T . The exponential term is neglected in quite a lot of original papers, however, and only the reduced vapor pressures are given (such data are indicated by an asterisk in the table below). Vapor pressures of polymer solutions have been measured since the 1940s, but the amount of experimental data for polymer solutions is still relatively small in comparison to low-molecular mixtures and solutions. The data scatter with respect to temperature, concentration, molar mass, and other polymer characterization variables. Furthermore, the concentration range for measuring vapor pressures in good thermodynamic quality is often limited to the polymer mass fraction range between 0.4 and 0.85. A recent review on methods for the measurement of vapor pressures/solvent activities of polymer solutions and on related problems is given in Ref. [1]. Experimental data have been collected in several books [2-6].

The table in this *Handbook* provides data for a number of polymer solutions as smoothed values over the complete range of solvent activities between 0 (polymer mass fraction = 1) and 1 (polymer mass fraction = 0). For this purpose, the data were selected from data books [4-6] as well as from a number of original sources [7-22] which are not included in these books. The appropriate data were smoothed. The final table provides then the polymer mass fractions at given fixed solvent activities between 0.1 and 0.9. Of course, the user must keep in mind that the activity vs. concentration range of the experimental data is sometimes smaller than the below given complete range, thus the smoothed data should be used with sufficient care.

Generally, vapor pressures or solvent activities of binary polymer solutions depend on molar mass. However, for high molecular weight polymers (well above the oligomer region), this molar-mass dependence can be neglected in many cases. Therefore, the table below presents only data for polymer solutions where the number average molar mass, M_n , is in the order of 10^5 g/mol or even higher, therefore, the molar mass is not specified. The temperature is

stated, even though the temperature dependence of a_A is relatively small for the temperature ranges where most of the experimental data exist.

SPECIFIC ENTHALPIES OF SOLUTION OF POLYMERS AND COPOLYMERS

Christian Wohlfarth

Enthalpies of solution or mixing, expressed as the enthalpy change per unit mass of polymer, are given in the table at infinite dilution, i.e., a very small amount of polymer and a large excess of solvent were mixed isothermally to form a homogeneous solution. By thermodynamics, $\Delta_{\text{sol}} H_{\text{B}}^{\infty}$ or $\Delta_{\text{M}} H_{\text{B}}^{\infty}$ are obtained from the following derivatives:

$$\Delta_{\text{sol}} H_{\text{B}}^{\infty} = \lim_{m_{\text{B}} \rightarrow 0} \left(\partial_{\text{sol}} h / \partial m_{\text{B}} \right)_{P, T, m_{j \neq \text{B}}} \quad (1)$$

$$\Delta_{\text{M}} H_{\text{B}}^{\infty} = \lim_{m_{\text{B}} \rightarrow 0} \left(\partial_{\text{M}} h / \partial m_{\text{B}} \right)_{P, T, m_{j \neq \text{B}}} \quad (2)$$

with a unit of J/g. Thus, they are the partial specific enthalpies of solution or mixing of the polymer B at infinite dilution where $\Delta_{\text{sol}} h$ or $\Delta_{\text{M}} h$ is the extensive enthalpy of the solution or mixing process.

The state of the polymer before dissolution can significantly affect the enthalpy of solution. The dissolving of a semicrystalline polymer requires an additional amount of heat associated with the disordering of crystalline regions. Consequently, its enthalpy of

solution is usually positive and depends on the degree of crystallinity of the given polymer sample. An amorphous polymer below its glass transition temperature, T_{g} (see the T_{g} -table of this Section), often dissolves with the release of heat. The enthalpy of solution of a glassy polymer is additionally dependent to some extent on the thermal history of the glass-forming process. An amorphous polymer above T_{g} can show endothermic or exothermic dissolution behavior depending on the nature of the solvent and the interaction energies involved as is the case for any enthalpy of mixing. This enthalpy of mixing is then independent of any crystalline or glassy aspects of the polymer. It can be obtained without difficulties for liquid/molten polymers mixed with a solvent. Therefore, the enthalpies given in the table are either enthalpies of solution or enthalpies of mixing, depending on the state of the polymer.

The enthalpies depend on temperature and molar mass. The necessary molar mass information for a system is provided in the table (if available) by the corresponding number average, M_{n} , mass average, M_{w} , or viscosity average, M_{v} , values of the polymer as given in the original sources. Outside the oligomer range, specific enthalpies of solution or mixing do not remarkably depend on molar mass, however. More enthalpy data of polymer-solvent systems can be found in Ref. 106.

SOLUBILITY PARAMETERS OF SELECTED POLYMERS

Christian Wohlfarth

The concept of cohesive energy density and solubility parameter was introduced by Hildebrand:

$$\delta^2 = \frac{\Delta U_m^{LV}}{V_m} = \frac{\Delta H_m^{LV} - RT}{V_m} \quad (1)$$

V_m is the molar volume, ΔU_m^{LV} is the molar energy of vaporization, and ΔH_m^{LV} is the molar enthalpy of vaporization. Units for the solubility parameter are $(\text{MPa})^{1/2} = (\text{J}/\text{cm}^3)^{1/2} = 0.4887(\text{cal}/\text{cm}^3)^{1/2}$. The energy of vaporization is not accessible for polymers, but cohesive energy density of polymers can be determined from PVT-data. However, common ways for determining polymer solubility parameters use thermodynamic properties of polymer solutions and their relations to excess enthalpy or excess Gibbs energy per unit volume. These excess quantities are related to the (square) difference between the solubility parameters of solvents and polymers, i.e. $(\delta_1 - \delta_2)^2$.

$$\frac{H^E}{V} \sim (\delta_1 - \delta_2)^2 \quad \text{or} \quad \frac{G^E}{V} \sim (\delta_1 - \delta_2)^2 \quad (2)$$

Often, the Flory-Huggins solvent-polymer interaction parameter is applied instead of H^E or G^E . There are some books (Refs. 1–3) giving details for such procedures as well as extensive tables of polymer solubility parameters from which the table below is extracted. Methods for calculating solubility parameters can be found in Refs. 4–7.

ASTRONOMICAL CONSTANTS

Victor Abalakin

The constants in this table are based originally on the set of constants adopted by the International Astronomical Union (IAU) in 1976. Updates have been made when new data were available (Ref. 4). All values are given in SI Units; thus masses are expressed in kilograms and distances in meters.

The astronomical unit of time is a time interval of one day (1 d) equal to 86400 s. An interval of 36525 d is one Julian century (1 cy).

Defining constants

Astronomical unit

$$\text{au} = 1.49597870700 \times 10^{11} \text{ m (exact)}$$

Speed of light

$$c = 299792458 \text{ m s}^{-1} \text{ (exact)}$$

Primary constants

Light-time for unit distance (1 ua)

$$\tau_A = 499.004786 \text{ s}$$

Equatorial radius of Earth

$$a_e = 6378140 \text{ m}$$

Equatorial radius of Earth (IUGG value)

$$a_e = 6378136 \text{ m}$$

Dynamical form-factor for Earth

$$J_2 = 0.001082636$$

Geocentric gravitational constant

$$GE = 3.986004 \times 10^{14} \text{ m}^3 \text{ s}^{-2}$$

Constant of gravitation

$$G = 6.67428 \times 10^{-11} \text{ m}^3 \text{ kg}^{-1} \text{ s}^{-2}$$

Ratio of mass of moon to that of Earth

$$\mu = 0.01230002$$

$$1/\mu = 81.300587$$

General precession in longitude, per Julian century, at standard epoch J2000

$$\rho = 5028''.796$$

Obliquity of the ecliptic at standard epoch J2000

$$\varepsilon = 23^\circ 26' 21''.448$$

Derived constants

Constant of nutation at standard epoch J2000

$$N = 9''.2025$$

Solar parallax ($\pi_0 = \arcsin(a_e/\text{ua})$)

$$\pi_0 = 8''.794143$$

Constant of aberration for standard epoch J2000

$$\kappa = 20''.49552$$

Flattening factor for the Earth

$$f = 1/298.256 = 0.00335282$$

Heliocentric gravitational constant ($GS = A^3 k^2 / D^2$)

$$GS = 1.32712438 \times 10^{20} \text{ m}^3 \text{ s}^{-2}$$

Ratio of mass of sun to that of the Earth ($S/E = (GS)/(GE)$)

$$S/E = 332946.0$$

Ratio of mass of sun to that of Earth + moon

$$(S/E)/(1 + \mu) = 328900.56$$

Mass of the sun ($S = (GS)/G$)

$$S = 1.98844 \times 10^{30} \text{ kg}$$

Ratios of mass of sun to masses of the planets

Mercury

$$6023600$$

Venus

PROPERTIES OF THE SOLAR SYSTEM

The following tables give various properties of the planets and characteristics of their orbits in the solar system. Certain properties of the sun and of the earth's moon are also included.

Explanations of the column headings:

- *Mass*: mass of the planet in units of 10^{24} kg
- *Radius*: radius at the equator in km
- *Density*: mean density in g/cm^3
- *Flattening*: degree of oblateness, defined as $(r_e - r_p)/r_e$, where r_e and r_p are the equatorial and polar radii, respectively
- *Potential coefficients*: coefficients in the spherical harmonic representation of the gravitational potential U by the equation

$$U(r, \phi) = (GM/r) [1 - \sum_n (a/r)^n P_n(\sin \phi)],$$

where G is the gravitational constant, r the distance from the center of the planet, a the radius of the planet, M the mass, ϕ the latitude, and P_n the Legendre polynomial of degree n .

- *Gravity*: acceleration due to gravity at the surface
- *Escape vel.*: velocity needed at the surface of the planet to escape the gravitational pull
- *Dist. to sun*: semi-major axis of the elliptical orbit in astronomical units (1 ua $\approx 1.496 \cdot 10^8$ km)
- ϵ : eccentricity of the orbit
- *Ecliptic angle*: angle between the planetary orbit and the plane of the earth's orbit around the sun
- *Inclin.*: angle between the equatorial plane of the planet and the plane of the planetary orbit
- *Orbit period*: period of revolution around the sun measured in years
- *Rotation period*: period of rotation of the planet measured in hours. A negative value indicates retrograde rotation.
- *Albedo*: ratio of the light reflected from the planet to the light incident on it
- *No. of satellites*: Number of confirmed satellites; this includes satellites that have not been named.
- T_{sur} : mean temperature at the surface
- P_{sur} : pressure of the atmosphere at the surface

The last four entries in the table are *dwarf planets* as defined by the International Astronomical Union. These are bodies in orbit around the sun that are massive enough to adopt a near-spherical shape as a result of their self-gravity, but are appreciably smaller than the major planets. *Plutoids* form a subset of the dwarf plan-

ets; their orbits are larger than that of Neptune (see Ref. 9). As of 2008, the IAU has recognized the names for three plutoids: Pluto, Eris, and Makemake.

The following general information on the solar system is of interest:

Mass of the earth = $M_e = 5.9736 \cdot 10^{24}$ kg
 Total mass of planetary system = $2.669 \cdot 10^{27}$ kg = $447 M_e$
 Total angular momentum of planetary system = $3.148 \cdot 10^{43}$ kg m² s⁻¹
 Total kinetic energy of the planets = $1.99 \cdot 10^{35}$ J
 Total rotational energy of planets = $0.7 \cdot 10^{35}$ J

Properties of the sun:

Mass = $1.9884 \cdot 10^{30}$ kg = $332943 M_e$
 Radius = $6.9551 \cdot 10^8$ m
 Surface area = $6.079 \cdot 10^{18}$ m²
 Volume = $1.409 \cdot 10^{27}$ m³
 Mean density = 1.411 g/cm³
 Gravity at surface = 27398 cm/s²
 Escape velocity at surface = $6.177 \cdot 10^5$ m/s
 Effective temperature = 5780 K
 Total radiant power emitted (luminosity) = $3.8427 \cdot 10^{26}$ W
 Surface flux of radiant energy = $6.322 \cdot 10^7$ W/m²
 Flux of radiant energy at the earth (Solar Constant) = 1366.4 W/m² (Ref. 8)

SATELLITES OF THE PLANETS

This table gives characteristics of the known satellites of the planets. The parameters covered are:

- Orbital period in units of earth days. An R following the value indicates a retrograde motion.
- Distance from the planet, as measured by the semi-major axis of the orbit
- Eccentricity of the orbit
- Inclination of the satellite orbit with respect to the equator of the planet
- Mass of the satellite in kilograms
- Radius of the satellite in kilometers
- Geometric albedo, which is a measure of the fraction of incident sunlight reflected by the satellite.

Since this is a very active field of research, the Internet sites listed below should be consulted for the most recent data.

* In June 2008 the International Astronomical Union decided on the name *plutoid* for the category of transneptunian dwarf planets. Plutoids are celestial bodies in orbit around the sun at a semimajor axis greater than that of Neptune and sufficiently massive to adopt a near-spherical shape. See <www.iau.org/public_press/news/release/iau0804/>.

INTERSTELLAR MOLECULES

Frank J. Lovas and Lewis E. Snyder

A number of molecules have been detected in the interstellar medium, in circumstellar envelopes around evolved stars, and comae and tails of comets through observation of their microwave, infrared, or optical spectra. The following list gives the molecules and the particular isotopic species that have been reported so far. Molecules are listed by molecular formula in the Hill order. All species not footnoted otherwise are observed in interstellar clouds, while some are also found in comets and circumstellar clouds. The list is updated through October 2013 and lists 186 molecules (337 isotopic forms).

l- before the isotopic species indicates a linear configuration, while *c*- indicates a cyclic molecule.
^a Reported only in circumstellar clouds
^b Reported only in comets

MASS, DIMENSIONS, AND OTHER PARAMETERS OF THE EARTH

This table is a collection of data on various properties of the Earth. Most of the values are given in SI units. Note that 1 ua (astronomical unit) = 149,597,870 km.

ACCELERATION DUE TO GRAVITY

The acceleration due to gravity is tabulated here as a function of latitude and height above the Earth's surface. Values were calculated from the expression

$$g/(\text{m/s}^2) = 9.780356 (1 + 0.0052885 \sin^2 \phi - 0.0000059 \sin^2 2\phi) - 0.003086 H$$

where ϕ is the latitude and H is the height in kilometers.

ϕ	$H = 0$	$H = 1 \text{ km}$	$H = 5 \text{ km}$	$H = 10 \text{ km}$

DENSITY, PRESSURE, AND GRAVITY AS A FUNCTION OF DEPTH WITHIN THE EARTH

This table gives the density ρ , pressure p , and acceleration due to gravity g as a function of depth below the Earth's surface, as calculated from the model of the structure of the Earth in Reference 1. The model assumes a radius of 6371 km for the Earth. The boundary between the crust and mantle (the Mohorovicic discontinuity) is taken as 21 km, while in reality it varies considerable with location.

OCEAN PRESSURE AS A FUNCTION OF DEPTH AND LATITUDE

The following table is based upon an ocean model which takes into account the equation of state of standard seawater and the dependence on latitude of the acceleration of gravity. The tabulated pressure value is the excess pressure over the ambient atmospheric pressure at the surface.

PROPERTIES OF SEAWATER

In addition to the dependence on temperature and pressure, the physical properties of seawater vary with the concentration of the dissolved constituents. A convenient parameter for describing the composition is the salinity, S , which is defined in terms of the electrical conductivity of the seawater sample. The defining equation for the practical salinity is:

$$S = a_0 + a_1 K^{1/2} + a_2 K + a_3 K^{3/2} + a_4 K^2 + a_5 K^{5/2},$$

where K is the ratio of the conductivity of the seawater sample at 15 °C and atmospheric pressure to the conductivity of a potassium chloride solution in which the mass fraction of KCl is 0.0324356, at the same temperature and pressure. The values of the coefficients are:

$$\begin{aligned} a_0 &= 0.0080 & a_3 &= 14.0941 \\ a_1 &= -0.1692 & a_4 &= -7.0261 \\ a_2 &= 25.3851 & a_5 &= 2.7081 \\ \Sigma a_i &= 35.0000 \end{aligned}$$

Thus when $K = 1$, $S = 35$ exactly (S is normally quoted in units of ‰, i.e., parts per thousand). The value of S can be roughly equated with the mass of dissolved material in grams per kilogram of seawater. Salinity values in the open oceans at midlatitudes typically fall between 34 and 36.

It is customary in oceanography to define the pressure at a given point as the pressure due to the column of water between that point and the surface. Thus by convention $P = 0$ at the sea surface. To a good approximation the pressure in decibars (dbar) can be equated to the depth in meters. Thus at 45° latitude the pressure is 5000 dbar at 4902 m, 10000 dbar at 9700 m.

The first table below gives several properties of seawater as a function of temperature for a salinity of 35. The second and third give density and electrical conductivity as a function of salinity at several temperatures, and the fourth lists typical concentrations of the main constituents of seawater as a function of salinity. The final table gives the freezing point as a function of salinity and pressure.

ABUNDANCE OF ELEMENTS IN THE EARTH'S CRUST AND IN THE SEA

This table gives the estimated abundance of the elements in the continental crust (in mg/kg, equivalent to parts per million by mass) and in seawater near the surface (in mg/L). Values represent the median of reported measurements. The concentrations of the less abundant elements may vary with location by several orders of magnitude.

Element	Abundance	
	Crust mg/kg	Sea mg/L

SOLAR IRRADIANCE AT THE EARTH

The solar luminosity (total radiant power emitted by the Sun) is $3.86 \cdot 10^{26}$ W, of which about 1366 W m^{-2} (the solar irradiance or “solar constant”) reaches the top of the Earth’s atmosphere. To a zeroth approximation, the sun can be considered a black body with an effective temperature of 5780 K, which implies a peak in the radiation at around $0.520 \text{ }\mu\text{m}$ ($5200 \text{ }\text{\AA}$). The actual solar spectral emission is more complex, especially at ultraviolet and shorter wavelengths. The graph in Fig. 1, which was taken from Ref. 1, summarizes the solar irradiance at the top of the atmosphere in the range $0.3 \text{ }\mu\text{m}$ to $10 \text{ }\mu\text{m}$.

While the solar irradiance has been known for some time to undergo both long-term and short-term variations, accurate measurements have become possible only recently. Figure 2, which is taken from Ref. 4, shows the variation over the last 35 years.

U.S. STANDARD ATMOSPHERE (1976)

A Standard Atmosphere is a hypothetical vertical distribution of atmospheric temperature, pressure, and density that is roughly representative of year-round, midlatitude conditions. Typical uses are to serve as a basis for pressure altimeter calibrations, aircraft performance calculations, aircraft and rocket design, ballistic tables, meteorological diagrams, and various types of atmospheric modeling. The air is assumed to be dry and to obey the perfect gas law and the hydrostatic equation which, taken together, relate temperature, pressure, and density with vertical position. The atmosphere is considered to rotate with the Earth and to be an average over the diurnal cycle, the semiannual variation, and the range from active to quiet geomagnetic and sunspot conditions.

The U.S. Standard Atmosphere (1976) is an idealized, steady-state representation of mean annual conditions of the Earth's atmosphere from the surface to 1000 km at latitude 45° N, as it is assumed to exist during a period with moderate solar activity. The defining meteorological elements are sea-level temperature and pressure and a temperature-height profile to 1000 km. The 1976 Standard Atmosphere uses the following sea-level values that have been standard for many decades:

Temperature — 288.15 K (15 °C)
 Pressure — 101325 Pa (1013.25 mbar, 760 mm of Hg, or 29.92 in. of Hg)

Density — 1225 g/m³ (1.225 g/L)
 Mean molar mass — 28.964 g/mol

The parameters included in this condensed version of the U.S. Standard Atmosphere are:

Z — Height (geometric) above mean sea level in meters
 T — Temperature in kelvins
 P — Pressure in pascals (1 Pa = 0.01 millibars)
 ρ — Density in kilograms per cubic meter (1 kg/m³ = 1 g/L)
 n — Number density in molecules per cubic meter
 ν — Mean collision frequency in collisions per second
 l — Mean free path in meters
 η — Absolute viscosity in pascal seconds (1 Pa s = 1000 cP)
 k — Thermal conductivity in joules per meter second kelvin (W/m K)
 ν_s — Speed of sound in meters per second
 g — Acceleration of gravity in meters per second square

The sea-level composition (percent by volume) is taken to be:

N ₂ — 78.084%	He — 0.000524
O ₂ — 20.9476	Kr — 0.000114
Ar — 0.934	Xe — 0.0000087
CO ₂ — 0.0314	CH ₄ — 0.0002
Ne — 0.001818	H ₂ — 0.00005

The T and P columns for the troposphere and lower stratosphere were generated from the following formulas:

	T/K	P/Pa
$H \leq 11000 \text{ m}$	$288.15 - 0.0065 H$	$101325(288.15/T)^{-5.25577}$
$11000 \text{ m} < H \leq 20000 \text{ m}$	216.65	$22632 e^{-0.00015768832(H-11000)}$
$20000 \text{ m} < H \leq 32000 \text{ m}$	$216.65 + 0.0010(H-20000)$	$5474.87(216.65/T)^{34.16319}$

where $H = rZ/(r + Z)$ is the geopotential height in meters and r is the mean Earth radius at 45° N latitude, taken as 6356766 m. For altitudes up to 32 km, $\rho = 0.003483677(P/T)$ in the units used here. Formulas for the other quantities may be found in the references.

GEOGRAPHICAL AND SEASONAL VARIATIONS IN SOLAR RADIATION

This table gives the amount of solar radiation reaching a unit area at the top of the Earth's atmosphere per day as a function of latitude and approximate date. It is based upon a solar constant (total energy per unit area at the Earth's average orbital distance) of 1373 W/m². Absorption of radiation by the atmosphere is not taken into consideration.

MAJOR WORLD EARTHQUAKES

The United States Geological Survey maintains a database of historic earthquakes throughout the world (Reference 1). The table below is extracted from that database; it includes about 300 major earthquakes, based upon the magnitude and the degree of destruction. All recorded earthquakes of magnitude 7.5 or greater are listed, even if the fatalities are unknown or small. The death toll is often a rough estimate; in many cases the true toll could be much greater. More details on the exact location and degree of destruction can be found in References 2 and 3.

The magnitude is given on the Richter scale, which was developed in 1935 by Charles F. Richter of the California Institute of Technology as a mathematical device to compare the size of earthquakes. The magnitude of an earthquake is measured by the logarithm of the amplitude of waves recorded by seismographs. Adjustments are included for the variation in the distance between the various seismographs and the epicenter of the earthquake. On

the Richter Scale, magnitude is expressed in whole numbers and decimal fractions, e.g. 6.3. Because of the logarithmic basis of the scale, each whole number increase in magnitude represents a ten-fold increase in measured amplitude; as an estimate of energy, each whole number step in the magnitude scale corresponds to the release of about 31 times more energy than the amount associated with the preceding whole number value.

WEATHER-RELATED SCALES

Saffir-Simpson Hurricane Scale

- **Tropical Storm**
Winds 39–73 mph
- **Category 1 Hurricane** — winds 74–95 mph (64–82 knots); pressure greater than 980 mbar; storm surge 3–5 ft (1.0–1.7 m)
No real damage to buildings. Damage to unanchored mobile homes. Some damage to poorly constructed signs. Also, some coastal flooding and minor pier damage.
— Examples: Irene 1999 and Allison 1995
- **Category 2 Hurricane** — winds 96–110 mph (83–95 knots); pressure 979–965 mbar; storm surge 6–8 ft (1.8–2.6 m)
Some damage to building roofs, doors and windows. Considerable damage to mobile homes. Flooding damages piers and small craft in unprotected moorings may break their moorings. Some trees blown down.
— Examples: Bonnie 1998, Georges (FL & LA) 1998 and Gloria 1985
- **Category 3 Hurricane** — winds 111–130 mph (96–113 knots); pressure 964–945 mbar; storm surge 9–12 ft (2.7–3.8 m)
Some structural damage to small residences and utility buildings. Large trees blown down. Mobile homes and poorly built signs destroyed. Flooding near the coast destroys smaller structures with larger structures damaged by floating debris. Terrain may be flooded well inland.
— Examples: Keith 2000, Fran 1996, Opal 1995, Alicia 1983 and Betsy 1965

- **Category 4 Hurricane** — winds 131–155 mph (114–135 knots); pressure 944–920 mbar; storm surge 13–18 ft (3.9–5.6 m)
More extensive curtainwall failures with some complete roof structure failure on small residences. Major erosion of beach areas. Terrain may be flooded well inland.
— Examples: Hugo 1989 and Donna 1960
- **Category 5 Hurricane** — winds 156 mph and up (135+ knots); pressure less than 920 mbar; storm surge 19+ ft (5.7+ m)
Complete roof failure on many residences and industrial buildings. Some complete building failures with small utility buildings blown over or away. Flooding causes major damage to lower floors of all structures near the shoreline. Massive evacuation of residential areas may be required.
— Examples: Andrew (FL) 1992, Camille 1969 and Labor Day 1935

Fujita Tornado Damage Scale

The original Fujita Scale was modified by NOAA in February 2007 and is now called the Enhanced Fujita Scale (EF). It is an operational scale based on the estimated speed of three-second wind gusts, as indicated by typical damage levels. The table below describes the damage levels according to the original scale. In the enhanced scale, the damage is measured by a more elaborate set of criteria (see <http://www.spc.noaa.gov/efscale/ef-scale.html>).

EF Number	3 s Gusts (mph)	Typical damage (according to the original Fujita Scale)
0	65–85	Light damage. Some damage to chimneys; branches broken off trees; shallow-rooted trees pushed over; sign boards damaged.
1	86–110	Moderate damage. Peels surface off roofs; mobile homes pushed off foundations or overturned; moving autos blown off roads.
2	111–135	Considerable damage. Roofs torn off frame houses; mobile homes demolished; boxcars overturned; large trees snapped or uprooted; light-object missiles generated; cars lifted off ground.
3	136–165	Severe damage. Roofs and some walls torn off well-constructed houses; trains overturned; most trees in forest uprooted; heavy cars lifted off the ground and thrown.
4	166–200	Devastating damage. Well-constructed houses leveled; structures with weak foundations blown away some distance; cars thrown and large missiles generated.
5	Over 200	Incredible damage. Strong frame houses leveled off foundations and swept away; automobile-sized missiles fly through the air in excess of 100 meters (109 yd); trees debarked; incredible phenomena will occur.

Beaufort Wind Scale

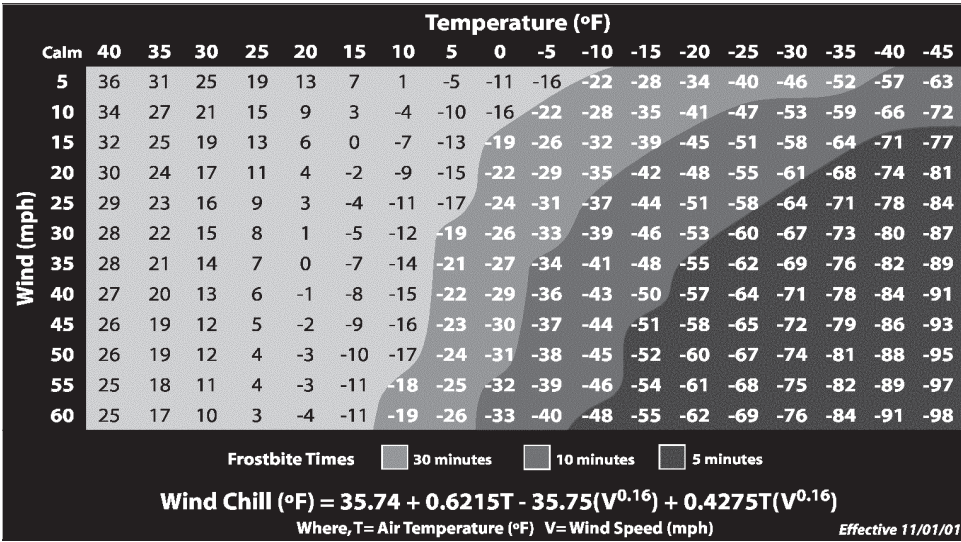

The Beaufort Wind Scale was devised by British Rear-Admiral Sir Francis Beaufort in 1805 based on observations of the effects of the wind.

Force	Wind (knots)	WMO classification	Appearance of wind effects	
			On the water	On land
0	< 1	Calm	Sea surface smooth and mirror-like	Calm, smoke rises vertically
1	1–3	Light Air	Scaly ripples, no foam crests	Smoke drift indicates wind direction, still wind vanes
2	4–6	Light Breeze	Small wavelets, crests glassy, no breaking	Wind felt on face, leaves rustle, vanes begin to move
3	7–10	Gentle Breeze	Large wavelets, crests begin to break, scattered whitecaps	Leaves and small twigs constantly moving, light flags extended

Force	Wind (knots)	WMO classification	Appearance of wind effects	
			On the water	On land
4	11–16	Moderate Breeze	Small waves 1–4 ft. becoming longer, numerous whitecaps	Dust, leaves, and loose paper lifted, small tree branches move
5	17–21	Fresh Breeze	Moderate waves 4–8 ft taking longer form, many whitecaps, some spray	Small trees in leaf begin to sway
6	22–27	Strong Breeze	Larger waves 8–13 ft, whitecaps common, more spray	Larger tree branches moving, whistling in wires
7	28–33	Near Gale	Sea heaps up, waves 13–20 ft, white foam streaks off breakers	Whole trees moving, resistance felt walking against wind
8	34–40	Gale	Moderately high (13–20 ft) waves of greater length, edges of crests begin to break into spindrift, foam blown in streaks	Whole trees in motion, resistance felt walking against wind
9	41–47	Strong Gale	High waves (20 ft), sea begins to roll, dense streaks of foam, spray may reduce visibility	Slight structural damage occurs, slate blows off roofs
10	48–55	Storm	Very high waves (20–30 ft) with overhanging crests, sea white with densely blown foam, heavy rolling, lowered visibility	Seldom experienced on land, trees broken or uprooted, “considerable structural damage”
11	56–63	Violent Storm	Exceptionally high (30–45 ft) waves, foam patches cover sea, visibility more reduced	
12	64+	Hurricane	Air filled with foam, waves over 45 ft, sea completely white with driving spray, visibility greatly reduced	

Wind Chill

The following chart prepared by the U. S. National Weather Service gives the temperature perceived by an average person as a function of the real air temperature and the wind speed. The current scale was adopted in 2001.

INFRARED ABSORPTION BY THE EARTH'S ATMOSPHERE

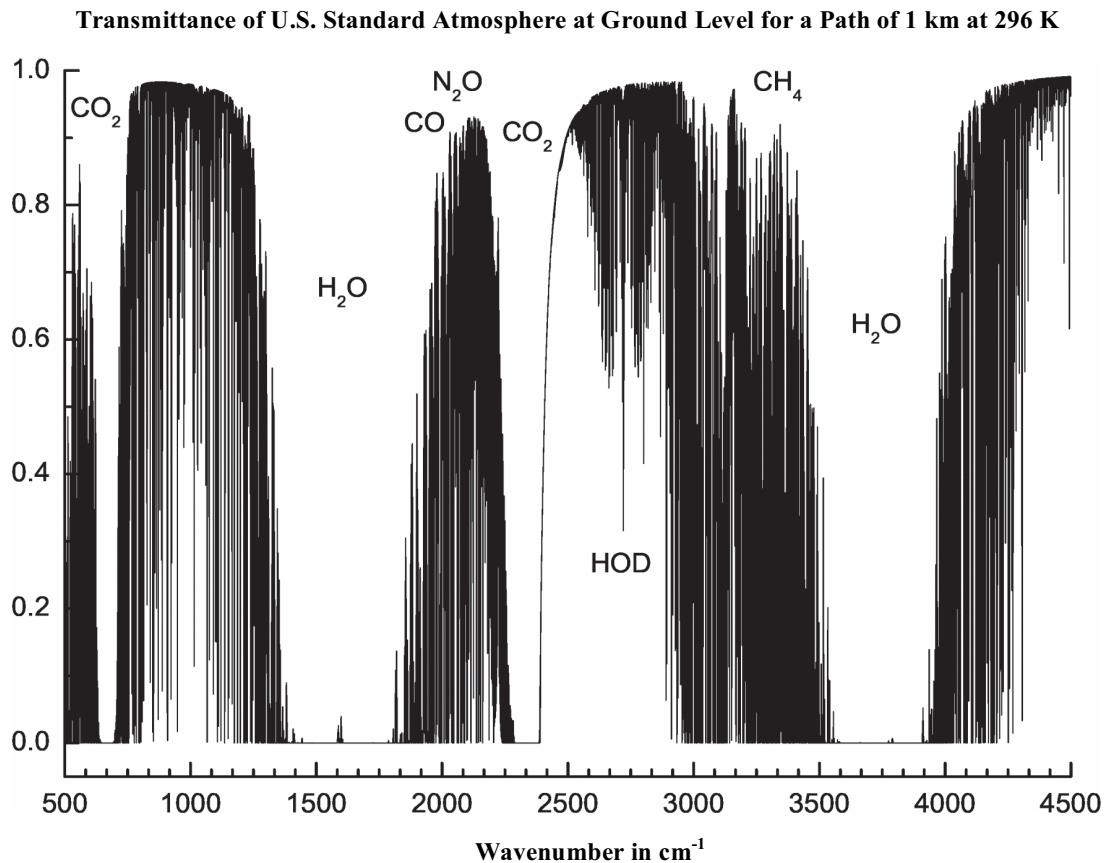

Several constituents of the Earth's atmosphere absorb infrared radiation. At ground level the strongest absorbers are H₂O and CO₂, but 30 to 40 other compounds can make significant contributions. The centers of the most important absorption bands are listed below:

Molecule	Vibrational mode	Band center in cm ⁻¹
H ₂ O	Bend	1595
H ₂ O	Symmetric O-H stretch	3657
H ₂ O	Antisymmetric O-H stretch	3756
CO ₂	Bend	667
CO ₂	Antisymmetric C-O stretch	2349
O ₃	Bend	701
O ₃	Antisymmetric O-O stretch	1042
O ₃	Symmetric O-O stretch	1103
N ₂ O	Bend	589
N ₂ O	N-O stretch	1285
N ₂ O	N-N stretch	2224
CO	C-O stretch	2143
CH ₄	Degenerate deformation	1306
CH ₄	Degenerate stretch	3019

The HITRAN Molecular Spectroscopy Database (References 1 and 2) is a compilation of wavenumbers and intensities of more than 1.7 million spectral lines of atmospheric constituents. It is a valuable resource for calculating transmission of the atmosphere, radiative energy transfer, and other phenomena. The graph below, which was supplied by Walter J. Lafferty (Reference 3), gives the transmittance of the atmosphere for one set of conditions.

ATMOSPHERIC CONCENTRATION OF CARBON DIOXIDE, 1958–2014

The data in this table were taken at the Mauna Loa Observatory in Hawaii and represent averages adjusted to the 15th of each month. The last column gives the average over the year. The concentration of CO₂ is given in parts per million (ppm) by volume. Data from other measurement sites may be found in Ref. 3.

The 2014 data from Ref. 2 are preliminary as of Jan. 6, 2015, and may change slightly with further analysis.

The first graph (Ref. 1) illustrates the seasonal variation of CO₂ concentration and the steady increase over the last 50 years. The second graph (Ref. 4) summarizes the growth in global emissions of CO₂ into the atmosphere as a result of burning of fossil fuels.

GLOBAL TEMPERATURE TREND, 1880–2014

This table and graph summarize the trend in annual mean global surface temperature from 1880 to 2014. The values were calculated from the global mean temperature anomalies in Ref. 2 by assuming an absolute global mean of 14.00 °C, which is the best estimate for the 1951–1980 period. The 95% confidence interval for comparing the annual mean temperature values for recent years is 0.05 °C. The values given here are for the annual mean land-ocean temperature.

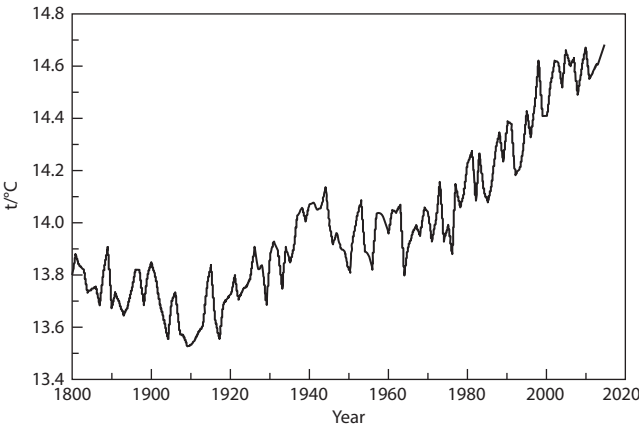

Reference 1 gives links to more extensive data sets that cover individual months, seasons, and zonal regions.

Annual Mean Global Temperature 1880–2014

GLOBAL WARMING POTENTIAL OF GREENHOUSE GASES

The Global Warming Potential (GWP) of a gas is a measure of the degree, relative to carbon dioxide, to which the presence of that gas in the atmosphere will contribute to a long-term increase in global temperature. The calculation of the GWP for a given gas takes into account the efficiency of the gas in absorbing solar radiation (primarily determined by the infrared spectrum of the compound) and the time the compound will remain in the atmosphere before it is removed by natural processes. Thus if a pulse of 1 kg of the gas is emitted to the atmosphere at the same time as a pulse of 1 kg of CO₂, the GWP compares the warming effect of the gas relative to CO₂ over various time horizons.

This table, which is taken from the 2007 report of the Intergovernmental Panel of Climate Change (IPCC), gives the life-time in years and the radiative efficiency in watts per square meter for a concentration of one part per billion for the major compounds identified in the Kyoto Protocol as contributing to global climate change. Radiative efficiency is a measure of the radiative forcing that influences the energy balance in the Earth-atmosphere system. The last four columns of the table give the Global Warming Potential, first as estimated in 1995 for a 100 year time horizon, and then as estimated with improved data in 2007 for 20-,

100-, and 500-year horizons. The calculation of a GWP involves a number of assumptions, and other measures have been proposed (see Reference).

The list of compounds includes those identified in the Montreal Protocol as contributing to ozone depletion, since these compounds also contribute to global warming. It also includes compounds used or proposed as replacements for the ozone-depleting compounds but which still have global warming potential.

ATMOSPHERIC ELECTRICITY

Hans Dolezalek, Hannes Tammet, John Latham, and Martin A. Uman

I. SURVEY AND GLOBAL CIRCUIT

Hans Dolezalek

The science of atmospheric electricity originated in 1752 by an experimental proof of a related earlier hypothesis (that lightning is an electrical event). In spite of a large effort, in part by such eminent physicists as Coulomb, Lord Kelvin, and many others, an overall, proven theory able to generate models with sufficient resolution is not yet available. Generally accepted and encompassing textbooks are now more than 20 years old. The voluminous proceedings of the, so far, nine international atmospheric electricity conferences (1954 to 1992) give much valuable detail and demonstrate impressive progress, as do a number of less comprehensive textbooks published in the last 20 years, but a general theory as indicated above is not yet created. Only now, are certain related measuring techniques and mathematical possibilities emerging.

Applications to practical purposes do exist in the field of lightning research (including the electromagnetic radiation emanating from lightning) by the establishment of lightning-location networks and by the now developing possibility of detecting electrified clouds that pose hazards to aircraft. Application of atmospheric electricity to other parts of meteorology seems to be promising but so far has seldom been instituted. Because some atmospheric electric signals propagate around the Earth and because of the existence of a global circuit, applications for the monitoring of global change processes and conditions are now being proposed. Significant secular changes in the global circuit would indicate a change in the global climate; the availability of many old data (about a span of 100 years) could help detect a long-term trend.

The concept of the “global circuit” is based on the theory of the global spherical capacitor: both the solid (and liquid) Earth as one electrode, and the high atmospheric layers (about the ionosphere) as the other, are by orders of magnitude more electrically conductive than the atmosphere between them. According to the “classical picture of atmospheric electricity,” this capacitor is continuously charged by the common action of all thunderstorms to a d.c. voltage difference of several hundred kilovolts, the Earth being negative. The much smaller but still existing conductivity of the atmosphere allows a current flowing from the ionosphere to the ground, integrated for all sink areas of the whole Earth, of the order of 1.5 kA. In this way, a global circuit is created with many generators and sink-areas both interspaced and distributed over the whole globe, all connected to two nodes: ionosphere and ground. Within the scope of the global circuit, for each location, the current density (order of several pA/m²) is determined by the voltage difference between ionosphere and ground (which is the same for all locations but varying in time) and the columnar resistance reaching from the ground up to the ionosphere (in the order of 10¹⁷ Ωm²).

Natural processes, especially meteorological processes and some human activity, which produce or move electric charges (“space charges”) or affect the ion distribution, constitute local generators and thereby “local circuits,” horizontally and/or in parallel or antiparallel to the local part of the global circuit. In many cases, the local currents are much stronger than the global ones, making the measurement of the global current at a given location and/or during a period of time very difficult or, often, impossible. The strongest local circuits usually occur with certain weather conditions (precipitation, fog, high wind, blown-up dust or snow, heavy cloudiness) that make measurement of the global circuit impossible everywhere; but even in their absence local generators exist in varying magnitudes and of different characters. The

separation of the local and global shares in the measured values of current density is a central problem of the science of atmospheric electricity. Aerological measurements are of high value in this regard.

The above description is within the “classical picture” of atmospheric electricity, a group of hypotheses to explain the electrification of the atmosphere. It is probably fundamentally correct but certainly not complete; it has not yet been confirmed by systems of measurements resulting in no inner contradictions. In particular, extraterrestrial influences must be permitted; their general significance is still under debate.

Within this “classical picture” a kind of electric standard atmosphere may be constructed as shown in Table 1.

Values with a star, *, are rough average values from measurement. A star in parentheses, (*), points to a typical value from one or a few measurements. All other values have been calculated from starred values, under the assumption that at 2 km 50% and at 12 km 90% of the columnar resistance is reached. Voltage drop along one of the partial columns can be calculated by subtracting the value for the lower column from that of the upper one. Columnar resistances, conductances, and capacitances are valid for that particular part of the column which is indicated at the left. Capacitances are calculated with the formula for plate capacitors, and this fact must be considered also for the time constants for columns.

According to measurements, U , the potential difference between 0 m and 65 km may vary by a factor of approximately 2. The total columnar resistance, R_c , is estimated to vary up to a factor of 3, the variation being due to either reduction of conductivity in the exchange layer (about lowest 2 km of this table) or to the presence of high mountains; in both cases the variation is caused in the troposphere. Smaller variations in the stratosphere and mesosphere are being discussed because of aerosols there. The air–Earth current density in fair weather varies by a factor of 3 to 6 accordingly. Conductivity near the ground varies by a factor of about 3 but only decreasing; increase of conductivity due to extraordinary radioactivity is a singular event. The field strength near the ground varies as a consequence of variations of air–Earth current density and conductivity from about 1/3 to about 10 times of the value quoted in the table. Conductivity near the ground shows a diurnal and an annual variation which depends strongly on the locality: air–Earth current density shows a diurnal and annual variation because the Earth–ionosphere potential difference undergoes such variations, and also because the columnar resistance is supposed to have a diurnal and probably an annual variation.

Conductivities and air–earth current densities on high mountains are greater than at sea level by factors of up to 10. Conductivity decreases when atmospheric humidity increases. Values for space charges are not quoted because measurements are too few to allow calculation of average values. Values of parameters over the oceans are still rather uncertain.

Theoretically, in fair weather conditions, Ohm’s law must be fulfilled for the electric field, the conduction current density, and the electrical conductivity of the atmosphere. Deviations point to shortcomings in the applied measuring techniques. Data which are representative for a large area (in the extreme, “globally representative data,” i.e., data on the global circuit), can be obtained on the ground only by stations on an open plane and only if local generators are either small or constant or are independently measured. Certain measurements with instrumented aircraft provide globally representative information valid for the period of the actual measurement.

TABLE 1. Electrical Parameters of the Clear (Fair Weather) Atmosphere, Pertinent to the Classical Picture of Atm. Electricity (Electric Standard Atmosphere)

Part of atmosphere for which the values are calculated (elements are in free, cloudless atmosphere)	Currents, I , in A; and current densities, i , in A/m ²	Potential differences, U , in V; field strength E in V/m; $U = 0$ at sea level	Resistances, R , in Ω ; columnar resistances, R_c , in Ω m ² and resistivities, ρ , in Ω m	Conductances, G , in Ω^{-1} ; columnar conductances G_c , in Ω^{-1} m ² ; total conductivities, γ , in Ω^{-1} m ⁻¹	Capacitances, C , in F; columnar capacitances, C_c , in F m ⁻² and capacitivities, ϵ , in F m ⁻¹	Time constants τ , in seconds
Volume element at about sea level, 1 m ³	$i = 3 \times 10^{-12}$	$E_0 = 1.2 \times 10^2$	$\rho_0 = 4 \times 10^{13}$	$\gamma_0 = 2.5 \times 10^{-14}$	$\epsilon_0 = 8.9 \times 10^{-12}$	$\tau_0 = 3.6 \times 10^2$
Lower column of 1 m ² cross section from sea level to 2 km height	$i = 3 \times 10^{-12}$	At upper end: $U_1 = 1.8 \times 10^5$	$R_{c1} = 6 \times 10^{16}$	$G_{c1} = 1.7 \times 10^{-17}$	$C_{c1} = 4.4 \times 10^{-15}$	$\tau_{c1} = 2.6 \times 10^2$
Volume element at about 2 km height, 1 m ³	$i = 3 \times 10^{-12}$	$E_2 = 6.6 \times 10^1$	$\rho_2 = 2.2 \times 10^{13(*)}$	$\gamma_2 = 4.5 \times 10^{-14}$	$\epsilon_2 = 8.9 \times 10^{-12}$	$\tau_2 = 2 \times 10^2$
Center column of 1 m ² cross section from 2 to 12 km	$i = 3 \times 10^{-12}$	At upper end: $U_m = 3.15 \times 10^5$	$R_{cm} = 4.5 \times 10^{16}$	$G_{cm} = 5 \times 10^{-17}$	$C_{cm} = 8.8 \times 10^{-16}$	$\tau_{cm} = 1.8 \times 10^1$
Volume element at about 12 km height, 1 m ³	$i = 3 \times 10^{-12}$	$E_{12} = 3.9 \times 10^0$	$\rho_{12} = 1.3 \times 10^{12(*)}$	$\gamma_{12} = 7.7 \times 10^{-13}$	$\epsilon_{12} = 8.9 \times 10^{-12}$	$\tau_{12} = 1.2 \times 10^1$
Upper column of 1 m ² cross section from 12 to 65 km height	$i = 3 \times 10^{-12}$	At upper end: $U_u = 3.5 \times 10^5$	$R_{cu} = 1.5 \times 10^{16}$	$G_{cu} = 2.5 \times 10^{-17}$	$C_{cu} = 1.67 \times 10^{-16}$	$\tau_{cu} = 6.7 \times 10^0$
Whole column of 1 m ² cross section from 0 to 65 km height	$i = 3 \times 10^{-12}$	At upper end: $U = 3.5 \times 10^5$	$R_c = 1.2 \times 10^{17}$	$G_c = 8.3 \times 10^{-18}$	$C_c = 1.36 \times 10^{-16}$	$\tau_c = 1.64 \times 10^1$
Total spherical capacitor area: 5×10^{14} m ²	$i = 1.5 \times 10^3$	$U = 3.5 \times 10^5$	$R = 2.4 \times 10^2$	$G = 4.2 \times 10^{-3}$	$C = 6.8 \times 10^{-2}$	$\tau = 1.64 \times 10^1$

Note: All currents and fields listed are part of the global circuit, i.e., circuits of local generators are not included. Values are subject to variations due to latitude and altitude of the point of observation above sea level, locality with respect to sources of disturbances, meteorological and climatological factors, and man-made changes. For more explanations, see text.

II. AIR IONS

Hannes Tammet

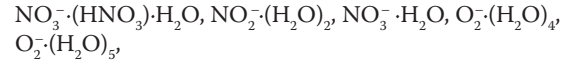

The term “air ions” signifies all airborne particles that are the carriers of the electrical current in the air and have drift velocities determined by the electric field.

The probability of electrical dissociation of molecules in the atmospheric air under thermodynamic equilibrium is near to zero. The average ionization at the ground level over the ocean is $2 \cdot 10^6$ ion pairs $\text{m}^{-3}\text{s}^{-1}$. This ionization is produced mainly by cosmic rays. Over the continents the ionizing radiation from soil and from radioactive substances in the air each add about $4 \cdot 10^6$ $\text{m}^{-3}\text{s}^{-1}$. The total average ionization rate of 10^7 $\text{m}^{-3}\text{s}^{-1}$ is equivalent to 17 $\mu\text{R/h}$, which is a customary expression of the background level of the ionizing radiations. The ionization rate over the ground varies in space due to the radioactivity of soil, and in time depending on the exchange of air between the atmosphere and radon-containing soil. Radioactive pollution increases the ionization rate. A temporary increase of about 10 times was registered in Sweden after the Chernobyl accident in 1986. The emission of Kr^{85} from nuclear power plants can noticeably increase the global ionization rate in the 21st century. The ionization rate decreases with altitude near the ground and increases at higher altitudes up to 15 km, where it has a maximum of about $5 \cdot 10^7$ $\text{m}^{-3}\text{s}^{-1}$. Solar X-ray and extreme UV radiation cause a new increase at altitudes over 60 km.

Local sources of air ions are point discharges in strong electric fields, fluidization of charged drops from waves, etc.

The enhanced chemical activity of an ion results in a chain of ion-molecule reactions with the colliding neutrals, and, in the first microsecond of the life of an air ion, a charged molecular cluster called the *cluster ion* is formed. According to theoretical calculations

in the air free from exotic trace gases the following cluster ions should be dominant:

A measurable parameter of air ions is the electrical mobility k , characterizing the drift velocity in the unit electric field. The mobility is inversely proportional to the density of air, and the results of measurements are as a rule reduced to normal conditions. According to mobility the air ions are called fast or small or light ions with mobility $k > 5 \cdot 10^{-5} \text{ m}^2 \text{ V}^{-1} \text{ s}^{-1}$, intermediate ions, and slow or large or heavy ions with mobility $k > 10^{-6} \text{ m}^2 \text{ V}^{-1} \text{ s}^{-1}$. The boundary between intermediate and slow ions is conventional.

Cluster ions are fast ions. The masses of cluster ions may be measured with mass spectrometers, but the possible ion-molecule reactions during the passage of the air through nozzles to the vacuum chamber complicate the measurement. Mass and mobility of cluster ions are highly correlated. The experimental results⁵ can be expressed by the empirical formula

$$m \approx \frac{850 \text{ u}}{[0.3 + k / (10^{-4} \text{ m}^2 \text{ V}^{-1} \text{ s}^{-1})]^3}$$

where u is the unified atomic mass unit.

The value of the transport cross-section of a cluster ion is needed to calculate its mobility according to the kinetic theory of Chapman and Enskog. The theoretical estimation of transport cross-sections is rough and cannot be used to identify the chemi-

cal structures of cluster ions. Mass spectrometry is the main technique of identification of cluster ions.²

Märk and Castleman⁴ presented an overview of over 1000 publications on the experimental studies of cluster ions. Most of them present information about ions of millisecond age range. The low concentration makes it difficult to get detailed information about masses and mobilities of the natural atmospheric ions at ground level. The results of a 1-year continuous measurement⁶ are as follows:

	+ ions	- ions	unit
Average mobility	1.36	1.56	$10^{-4}\text{m}^2\text{V}^{-1}\text{s}^{-1}$
The corresponding mass	190	130	u
The corresponding diameter	0.69	0.61	nm
The average concentration	400	360	10^6m^{-3}
The corresponding conductivity	8.7	9.0	fS

The distribution of tropospheric cluster ions according to the mobility and estimated mass is depicted in Figure 1.

The problems and results of direct mass spectrometry of natural cluster ions are analyzed by Eisele² for ground level and by Meyerott, Reagan and Joiner⁵ for stratospheric measurements. Air ions in the high atmosphere are a subject of ionospheric physics.

During its lifetime (about 1 min), a cluster ion at ground level collides with nearly 10^{12} molecules. Thus the cluster ions are

able to concentrate trace gases of very low concentration if they have an extra high electron or proton affinity. For example, Eisele² demonstrated that a considerable fraction of positive atmospheric cluster ions in the unpolluted atmosphere at ground level probably consists of a molecule derived from pyridine. The concentration of these constituents is estimated to be about 10^{-12} . Therefore, air-ion mass and mobility spectrometry is considered as a promising technique for trace analysis in the air. Mass and mobility spectrometry of millisecond-age air ions has been developed as a technique of chemical analysis known as "plasma chromatography."¹ The sensitivity of the detection grows with the age of the cluster ions measured.

The mechanisms of annihilation of cluster ions are ion-ion recombination (on the average 3%) and sedimentation on aerosol particles (on the average 97% of cluster ions at ground level). The result of the combination of a cluster ion and neutral particle is a charged particle called an *aerosol ion*. In conditions of detailed thermodynamic equilibrium the probability that a spherical particle of diameter d carries q elementary charges is calculated from the Boltzmann distribution:

$$p_q(d) = (2\pi d/d_0)^{1/2} \exp(-q^2 d_0/2d)$$

where $d_0 = 115 \text{ nm}$ (at 18°C). The supposition about the detailed equilibrium is an approximation and the formula is not valid for particles less than d_0 . On the basis of numerical calculations by Hoppel and Frick³ the following charge probabilities can be derived:

d	3	10	30	100	300	1000	3000	nm
P_0	98	90	70	42	24	14	8	%
$p_{-1}+p_1$	2	10	30	48	41	25	15	%
$p_{-2}+p_2$	0	0	0	10	23	21	14	%
$P_{q>2}$	0	0	0	0	12	40	63	%
k_1	15000	1900	250	28	5.1	1.11	0.33	$10^{-9}\text{m}^2\text{V}^{-1}\text{s}^{-1}$

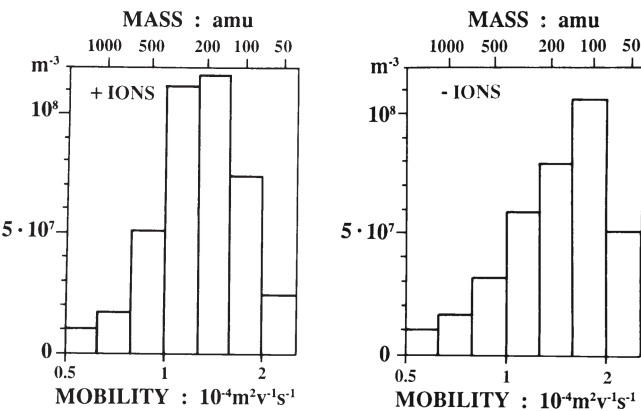

FIGURE 1. Average mobility and mass spectra of natural tropospheric cluster ions. Concentrations of the mobility fractions were measured in a rural site every 5 min over 1 year.⁶ Ion mass is estimated according to the above empirical formula.

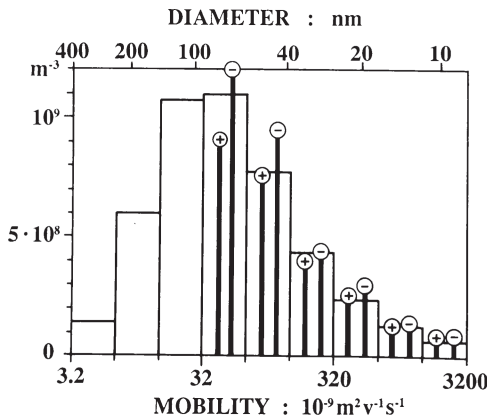

FIGURE 2. Mobility and size spectra of tropospheric aerosol ions.⁶ The wide bars mark the fraction concentrations theoretically estimated on the basis of the standard size distribution of tropospheric aerosol. The pin bars with head + and - mark average values of positive and negative aerosol ion fraction concentrations measured in a rural site every 5 min during 4 months.

The last line of the table presents the mobility of a particle carrying one elementary charge. The distribution of the atmospheric aerosol ions over mobility is demonstrated in Figure 2.

Although the concentration of aerosol in continental air at ground level is an order of magnitude higher than the concentration of cluster ions, the mobilities of aerosol ions are so small that their percentage in air conductivity is less than 1%.

A specific class of aerosol ions is condensed aerosol ions produced as a result of the condensation of gaseous matter on the cluster ions. In aerosol physics the process is called ion-induced nucleation; it is considered as one of the processes of gas-to-particle conversion. The condensed aerosol ions have an inherent charge. Their sizes and mobilities are between the sizes and mobilities of cluster ions and of ordinary aerosol ions. Water and standard constituents of atmospheric air are not able to condense on the cluster ions in the real atmosphere. Thus the concentration of condensed aerosol ions depends on the trace constituents in the air and is very low in unpolluted air. Knowledge about condensed aerosol ions is poor because of measurement difficulties.

III. THUNDERSTORM ELECTRICITY

John Latham

The development of improved radar techniques and instruments for in-cloud electrical and physical measurements, coupled with a much clearer recognition by the research community that establishment of the mechanism or mechanisms responsible for electric field development in thunderclouds, culminating in lightning, is inextricably linked to the concomitant dynamical and microphysical evolution of the clouds, has led to significant progress over the past decade.

Field studies indicate that in most thunderclouds the electrical development is associated with the process of glaciation, which can occur in a variety of incompletely understood ways. In the absence of ice, field growth is slow, individual hydrometeor charges are low, and lightning is produced only rarely. Precipitation — in the solid form, as graupel — also appears to be a necessary ingredient for significant electrification, as does significant convective activity and mixing between the clouds and their environments, via entrainment.

Increasingly, the view is being accepted that charge transfer leading to field-growth is largely a consequence of rebounding collisions between graupel pellets and smaller vapor-grown ice crystals, followed by the separation under gravity of these two types

of hydrometeor. These collisions occur predominantly within the temperature range -15 to -30 °C, and for significant charge transfer need to occur in the presence of supercooled cloud droplets.

The field evidence is inconsistent with an inductive mechanism, and extensive laboratory studies indicate that the principal charging mechanism is non-inductive and associated — in ways yet to be identified — with differences in surface characteristics of the interacting hydrometeors.

Laboratory studies indicate that the two most favored sites for corona emission leading to the lightning discharge are the tips of ephemeral liquid filaments, produced during the glancing collisions of supercooled raindrops, and protuberances on large ice crystals or graupel pellets. The relative importance of these alternatives will depend on the hydrometeor characteristics and the temperature in the regions of strongest fields; these features are themselves dependent on air-mass characteristics and climatological considerations.

A recently identified but unresolved question is why, in continental Northern Hemisphere thunderclouds at least, the sign of the charge brought to ground by lightning is predominantly negative in summer but more evenly balanced in winter.

IV. LIGHTNING

Martin A. Uman

From both ground-based weather-station data and satellite measurements, it has been estimated that there are about 100 lightning discharges, both cloud and ground flashes, over the whole Earth each second; representing an average global lightning flash density of about $6 \text{ km}^{-2} \text{ yr}^{-1}$. Most of this lightning occurs over the Earth's land masses. For example, in central Florida, where thunderstorms occur about 90 days/yr, the flash density for discharges to earth is about $15 \text{ km}^{-2} \text{ yr}^{-1}$. Some tropical areas of the Earth have thunderstorms up to 300 days/yr.

Lightning can be defined as a transient, high-current electric discharge whose path length is measured in kilometers and whose most common source is the electric charge separated in the ordinary thunderstorm or cumulonimbus cloud. Well over half of all lightning discharges occur totally within individual thunderstorm clouds and are referred to as intracloud discharges. Cloud-to-ground lightning, however, has been studied more extensively than any other lightning form because of its visibility and its more practical interest. Cloud-to-cloud and cloud-to-air discharges are less common than intracloud or cloud-to-ground lightning.

Lightning between the cloud and Earth can be categorized in terms of the direction of motion, upward or downward, and the sign of the charge, positive or negative, of the developing discharge (called a *leader*) that initiates the overall event. Over 90% of the worldwide cloud-to-ground discharges is initiated in the thundercloud by downward-moving negatively charged leaders and subsequently results in the lowering of negative charge to Earth. Cloud-to-ground lightning can also be initiated by downward-moving positive leaders, less than 10% of the worldwide cloud-to-ground lightning being of this type although the exact percentage is a function of season and latitude. Lightning between cloud and ground can also be initiated by leaders that develop upward from the Earth. These upward-initiated discharges are relatively rare, may be of either polarity, and generally occur from mountaintops and tall man-made structures.

We discuss next the most common type of cloud-to-ground lightning. A negative cloud-to-ground discharge or *flash* has an overall duration of some tenths of a second and is made up of vari-

ous components, among which are typically three or four high-current pulses called *strokes*. Each stroke lasts about a millisecond, the separation time between strokes being typically several tens of milliseconds. Such lightning often appears to “flicker” because the human eye can just resolve the individual light pulse associated with each stroke. A drawing of the components of a negative cloud-to-ground flash is found in Figure 3. Some values for salient parameters are found in Table 1. The negatively charged *stepped leader* initiates the first stroke in a flash by propagating from cloud to ground through virgin air in a series of discrete steps. Photographically observed leader steps in clear air are typically 1 μ s in duration and tens of meters in length, with a pause time between steps of about 50 μ s. A fully developed stepped leader lowers up to 10 or more coulombs of negative cloud charge toward ground in tens of milliseconds with an average downward speed of about 2×10^5 m/s. The average leader current is in the 100 to 1000 A range. The steps have pulse currents of at least 1 kA. Associated with these currents are electric- and magnetic-field pulses with widths of about 1 μ s or less and risetimes of about 0.1 μ s or less. The stepped leader, during its trip toward ground, branches in a downward direction, resulting in the characteristic downward-branched geometrical structure commonly observed. The electric potential of the bottom of the negatively charged leader channel with respect to ground has a magnitude in excess of 10^7 V. As the leader tip nears ground, the electric field at sharp objects on the ground or at irregularities of the ground itself exceeds the breakdown value of air, and one or more upward-moving discharges (often called upward leaders) are initiated from those points, thus beginning the *attachment process*. An understanding of the physics of the attachment process is central to an understanding of the operation of lightning protection of ground-based objects and the effects of lightning on humans and animals, since it is the attachment process that determines where the lightning connects to objects on the ground and the value of the early currents which flow. When one of the upward-moving discharges from the ground (or from a lightning rod or an individual) contacts the tip of the downward-moving stepped leader, typically some tens of meters above the ground, the leader tip is effectively connected to ground potential. The negatively charged leader channel is then discharged to earth when a ground potential wave, referred to as the first *return stroke*, propagates continuously up the leader path. The upward speed of a return stroke near the ground is typically near one third the speed of light, and the speed decreases with height. The first return stroke produces a peak current near ground of typically 30 kA, with a time from zero to peak of a few microseconds. Currents measured at the ground fall to half of the peak value in about 50 μ s, and currents of the order of hundreds of amperes may flow for times of a few milliseconds up to several hundred milliseconds. The longer-lasting currents are known as *continuing currents*. The rapid release of return stroke energy heats the leader channel to a temperature near 30,000 K and creates a high-pressure channel which expands and generates the shock waves that eventually become thunder, as further discussed later. The return stroke effectively lowers to ground the charge originally deposited onto the stepped-leader channel and additionally initiates the lowering of other charges that may be available to the top of its channel. First return-stroke electric fields exhibit a microsecond scale rise to peak with a typical peak value of 5 V/m, normalized to a distance of 100 km by an inverse distance relationship. Roughly half of the field rise to peak, the so-called “fast transition,” takes place in tenths of a microsecond, an observation that can only be made if the field propagation is over a highly conducting surface such as salt water.

After the first return-stroke current has ceased to flow, the flash, including charge motion in the cloud, may end. The lightning is then called a single-stroke flash. On the other hand, if additional charge is made available to the top of the channel, a continuous or *dart leader* may propagate down the residual first-stroke channel at a typical speed of about 1×10^7 m/s. The dart leader lowers a charge of the order of 1 C by virtue of a current of about 1 kA. The dart leader then initiates the second (or any subsequent) return stroke. Subsequent return-stroke currents generally have faster zero-to-peak rise times than do first-stroke currents, but similar maximum rates of change, about 100 kA/ μ s. Some leaders begin as dart leaders, but toward the end of their trip toward ground become stepped leaders. These leaders are known as *dart-stepped leaders* and may have different ground termination points (and separate upward leaders) from the first stroke. Most often the dart-stepped leaders are associated with the second stroke of the flash. Nearly half of all flashes exhibit more than one termination point on ground with the distance between separate terminations being up to several kilometers. Subsequent return-stroke radiated electric and magnetic fields are similar to, but usually a factor of two or so smaller than first return-stroke fields. About one third of all multiple-stroke flashes has at least one subsequent stroke that is larger than the first stroke.

Cloud-to-ground flashes that lower positive charge, though not common, are of considerable practical interest because their peak currents and total charge transfer can be much larger than for the more common negative ground flash. The largest recorded peak currents, those in the 200- to 300-kA range, are due to the return strokes of positive lightning. Such positive flashes to ground are initiated by downward-moving leaders that do not exhibit the distinct steps of their negative counterparts. Rather, they show a luminosity that is more or less continuous but modulated in intensity. Positive flashes are generally composed of a single stroke followed by a period of continuing current. Positive flashes are probably initiated from the upper positive charge in the thundercloud charge dipole when that cloud charge is horizontally separated from the negative charge beneath it, the source of the usual negative cloud-to-ground lightning. Positive flashes are relatively common in winter thunderstorms (snow storms), which produce few flashes overall, and are relatively uncommon in summer thunderstorms. The fraction of positive lightning in summer thunderstorms apparently increases with increasing latitude and with increasing height of the ground above sea level.

Distant lightning return stroke fields are often referred to as sferics (called “atmospherics” in the older literature). The peak in the sferics frequency spectrum is near 5 kHz due to the bipolar or ringing nature of the distant return-stroke electromagnetic signal and to the effects of propagation.

Thunder, the acoustic radiation associated with lightning, is sometimes divided into the categories “audible,” sounds that one can hear, and “infrasonic,” below a few tens of hertz, a frequency range that is inaudible. This division is made because it is thought that the mechanisms that produce audible and infrasonic thunder are different. Audible thunder is thought to be due to the expansion of a rapidly heated return stroke channel, as noted earlier, whereas infrasonic thunder is thought to be associated with the conversion to sound of the energy stored in the electrostatic field of the thundercloud when lightning rapidly reduces that cloud field.

The technology of artificially initiating lightning by firing upward small rocket trailing grounded wire of a few hundred meters length has been well-developed during the past decade. Such “triggered” flashes are similar to natural upward-initiated discharges from tall structure. They often contain subsequent strokes which,

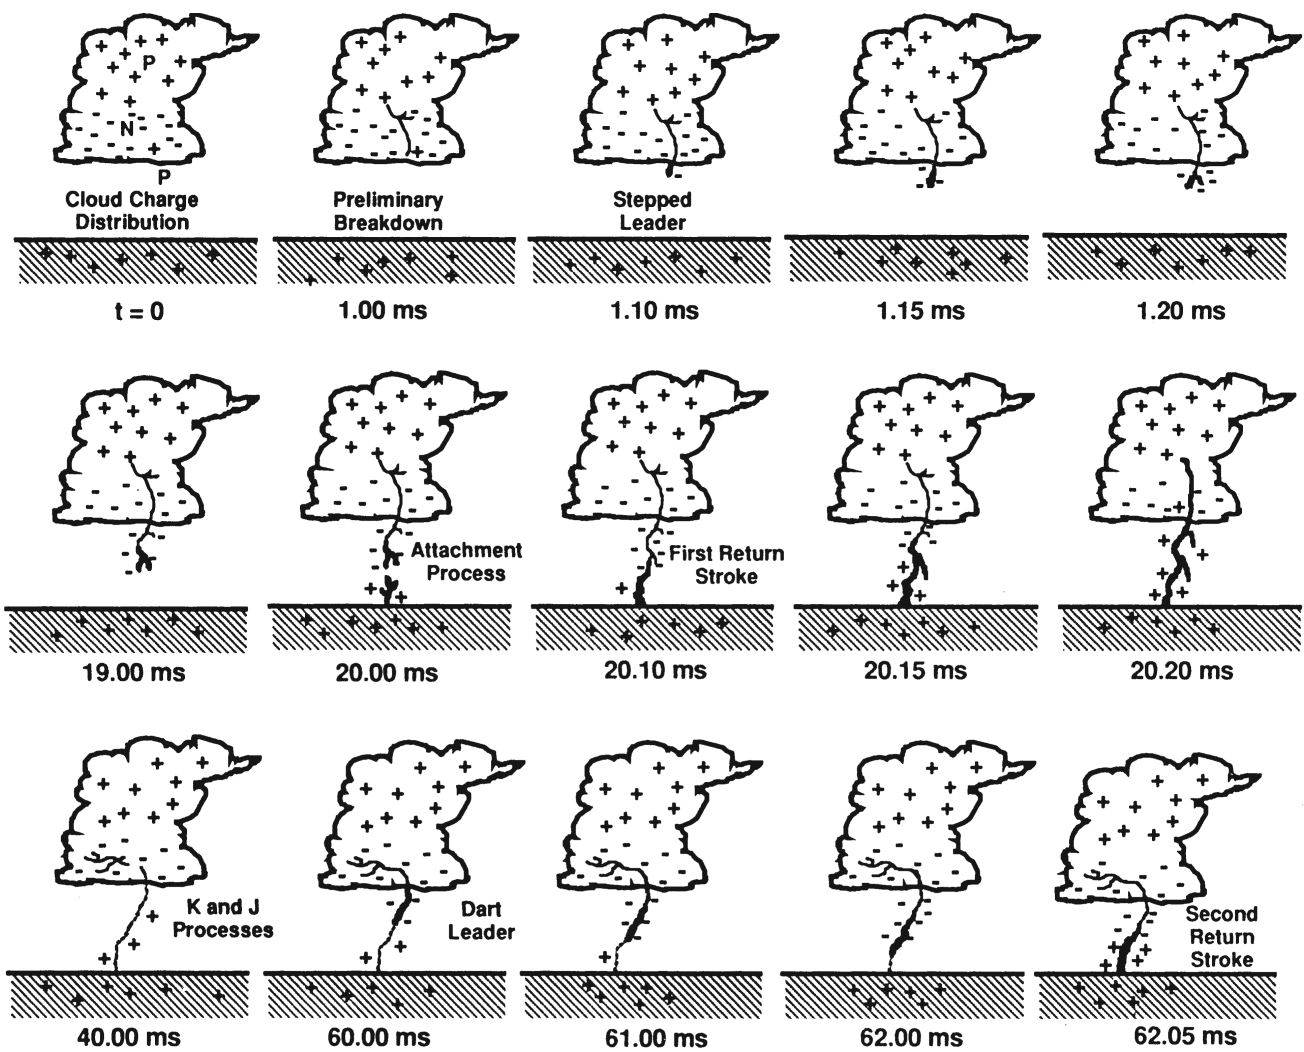

FIGURE 3. Sequence of steps in cloud-to-ground lightning.

when they occur, are similar to the subsequent strokes in natural lightning. These triggered subsequent strokes have been the subject of considerable recent research.

Also in the past 10 years or so sophisticated lightning locating equipment has been installed throughout the world. For example, all ground flashes in the U.S. are now centrally monitored for research, for better overall weather prediction, and for hazard warning for aviation, electric utilities and other lightning-sensitive facilities.

Information on lightning physics can be found in M. A. Uman, *The Lightning Discharge*, Academic Press, San Diego, 1987; on lightning death and injury in *Medical Aspects of Lightning Injury*, C. Andrews, M. A. Cooper, M. Darveniza, and D. Mackerras, Eds.,

CRC Press, Boca Raton, FL, 1992. Ground flash location information for the U.S., in real time or archived, is available from Geomet Data Service of Tucson, AZ, which is also a source of the names of providers of those data in other countries.

Table 2 has data for cloud-to-ground lightning discharges bringing negative charge to earth. The values listed are intended to convey a rough feeling for the various physical parameters of lightning. No great accuracy is claimed since the results of different investigators are often not in good agreement. These values may, in fact, depend on the particular environment in which the lightning discharge is generated. The choice of some of the entries in the table is arbitrary.

TABLE 2. Data for Cloud-to-Ground Lightning Discharges

	Minimum ^a	Representative values	Maximum ^a
Stepped leader			
Length of step, m	3	50	200
Time interval between steps, μ s	30	50	125
Average speed of propagation of stepped leader, m/s ^b	1.0×10^5	2.0×10^5	3.0×10^6
Charge deposited on stepped-leader channel, coulombs	3	5	20
Dart leader			
Speed of propagation, m/s ^b	1.0×10^6	1.0×10^7	2.4×10^7
Charge deposited on dart-leader channel, coulombs	0.2	1	6
Return stroke ^c			
Speed of propagation, m/s ^b	2.0×10^7	1.0×10^8	2.0×10^8
Maximum current rate of increase, kA/ μ s	<1	100	400
Time to peak current, μ s	<1	2	30
Peak current, kA	2	30	200
Time to half of peak current, μ s	10	50	250
Charge transferred excluding continuing current, coulombs	0.02	3	20
Channel length, km	2	5	15
Lightning flash			
Number of strokes per flash	1	4	26
Time interval between strokes in absence of continuing current, ms	3	60	100
Time duration of flash, s	10^{-2}	0.5	2
Charge transferred including continuing current, coulombs	3	30	200

^a The words maximum and minimum are used in the sense that most measured values fall between these limits.

^b Speeds of propagation are generally determined from photographic data and are "two-dimensional." Since many lightning flashes are not vertical, values stated are probably slight underestimates of actual values.

^c First return strokes have longer times to current peak and generally larger charge transfer than do subsequent return strokes

SPEED OF SOUND IN VARIOUS MEDIA

The speeds of sound in various solids, liquids, and gases are given in these tables. While only a single parameter ν is needed for liquids and gases, sound propagation in isotropic solids is characterized by three velocity parameters. For a solid of infinite extent (or of finite extent if all dimensions are much larger than a wavelength), there are two relevant quantities:

ν_l : velocity of longitudinal waves
 ν_s : velocity of shear waves

For a cylindrical rod with a diameter much smaller than the wavelength:

ν_{ext} : velocity of extensional waves along the rod. (Torsional waves in the rod are propagated at the same speed as shear waves in an infinite solid.)

Table 1 lists values for a variety of solid materials. Table 2 covers liquids and gases; values for cryogenic liquids are given at the normal boiling point. Table 3 gives the speed of sound in pure water and in seawater of salinity $S = 3.5\%$ as a function of temperature. All values are in meters per second and are given for normal atmospheric pressure.

SPEED OF SOUND IN DRY AIR

Eric W. Lemmon

These values were calculated from the equation of state for dry air (average molecular weight 28.96) treated as a real gas. Values refer to standard atmospheric pressure. The speed of sound varies only slightly with pressure; at two atmospheres and -100°C the value decreases by 0.16%, while at two atmospheres and 80°C the speed increases by 0.05%. For additional values, see the table in Section 6 labeled “Thermophysical Properties of Air.”

CHARACTERISTICS OF HUMAN HEARING

The human ear is sensitive to sound waves with frequencies in the range from a few hertz to almost 20 kHz. Auditory response is usually expressed in terms of the *loudness level* of a sound, which is a measure of the sound pressure. The reference level, which is given in the unit *phon*, is a pure tone of frequency 1000 Hz with sound pressure of 20 μPa (in cgs units, $2 \cdot 10^{-4} \text{ dyn/cm}^2$); loudness level is usually expressed in decibels (dB) relative to this reference level. If a normal observer perceives an arbitrary sound to

be equally loud as this reference sound, the sound is said to have the loudness level of the reference. The sensitivity of the typical human ear ranges from about 0 dB, the threshold loudness level, to about 140 dB, the level at which pain sets in. The minimum detectable level thus represents a sound wave of pressure 20 μPa and intensity (power density) 10^{-16} W/cm^2 .

The following figure illustrates the frequency dependence of the threshold for an average young adult.

The relation between loudness level and frequency for a typical person is expressed by the following table:

Sound pressure level in dB relative to 20 μPa	Frequency in Hz					
	125	500	1000	4000	8000	10000
10			10	18		
20		16	20	28	11	
30	4	27	30	37	21	17
40	17	39	40	45	30	26
50	34	52	50	54	38	35
60	52	65	60	64	47	44
70	70	76	70	73	56	54
80	86	86	80	83	66	64
90	98	96	90	94	77	74
100	108	105	100	106	88	86

Thus, a 10,000 Hz tone at a pressure level of 50 dB seems equally loud as a 1000 Hz tone at a pressure of 35 dB.

The term *noise* refers to any unwanted sound, either a pure tone or a mixture of frequencies. Since the sensitivity of the ear is fre-

quency dependent, as illustrated by the above table, noise level is expressed in a frequency-weighted scale, known as A-weighting. Decibel readings on this scale are designated as dBA. Typical noise levels from various sources are illustrated in this table:

Source	Noise level in dBa
Rocket engine	200
Jet aircraft engine	160
Light aircraft, cruising	140
Tractor, 150 hp	115
Electric motor, 100 hp at 2600 rpm	105
Pneumatic drill	100
Subway train	90
Vacuum cleaner	85
Heavy automobile traffic	75
Conversational speech	65
Whispered speech	40
Background noise, recording studio	25-30

Recommended noise thresholds in the workplace have been established by the American Conference of Government Industrial

Hygienists. Some examples of the maximum safe levels for different daily exposure times are given below.

Duration of exposure	Max. level in dBa
24 h	80
8 h	85
4 h	88
1 h	94
30 min	97
15 min	100
2 min	109
28 s	115
0.11 s	139

No exposure greater than 140 dBa is permitted. Further details may be found in Reference 3.

STANDARD ITS-90 THERMOCOUPLE TABLES

The Instrument Society of America (ISA) has assigned standard letter designations to a number of thermocouple types having specified emf-temperature relations. These designations and the approximate metal compositions that meet the required relations, as well as the useful temperature ranges, are given below:

Type B	(Pt + 30% Rh) vs. (Pt + 6% Rh)	0 to 1820 °C
Type E	(Ni + 10% Cr) vs. (Cu + 43% Ni)	–270 to 1000 °C
Type J	Fe vs. (Cu + 43% Ni)	–210 to 1200 °C
Type K	(Ni + 10% Cr) vs. (Ni + 2% Al + 2% Mn + 1% Si)	–270 to 1372 °C
Type N	(Ni + 14% Cr + 1.5% Si) vs. (Ni + 4.5% Si + 0.1% Mg)	–270 to 1300 °C
Type R	(Pt + 13% Rh) vs. Pt	–50 to 1768 °C
Type S	(Pt + 10% Rh) vs. Pt	–50 to 1768 °C
Type T	Cu vs. (Cu + 43% Ni)	–270 to 400 °C

The compositions are given in weight percent, and the positive leg is listed first. It should be emphasized that the standard letter

designations do not imply a precise composition but rather that the specified emf-temperature relation is satisfied.

The first set of tables below lists, for each thermocouple type, the emf as a function of temperature on the International Temperature Scale of 1990 (ITS-90). The coefficients in the equation used to generate the table are also given. The second set of tables gives the inverse relationships, i.e., the coefficients in the polynomial equation that expresses the temperature as a function of thermocouple emf. The accuracy of these equations is also stated.

Further details and tables at closer intervals may be found in Reference 1.

NOTE—Temperature ranges and coefficients of equations used to compute the above table: The equations are of the form $E = c_0 + c_1 t + c_2 t^2 + c_3 t^3 + \dots c_n t^n$, where E is the emf in millivolts, t is the temperature in degrees Celsius (ITS-90), and $c_0, c_1, c_2, c_3, \dots$ are the coefficients. In the 0 °C to 1372 °C range there is also an exponential term that must be evaluated and added to the equation. The exponential term is of the form $c_0 e^{c_1(t-126.9686)^2}$, where t is the temperature in °C, e is the natural logarithm base, and c_0 and c_1 are the coefficients. These coefficients are extracted from Reference 1.

REFERENCE POINTS ON THE ITS-90 TEMPERATURE SCALE

The International Temperature Scale of 1990 is described in Section 1 of this *Handbook*, where the defining fixed points are listed. The Consultative Committee on Thermometry (CCT) of the International Committee on Weights and Measures (CIPM), which oversees the temperature scale, has recommended a number of secondary reference points whose values have been accurately determined with respect to the primary fixed points. The most accurate of these, referred to as “first quality points”, satisfy several criteria involving purity of the material, reproducibility, and documentation of the measurements. The CCT also lists “second quality points” that do not yet satisfy all the criteria but are still useful. These secondary reference points help fill in the gaps between the primary fixed points.

The table below describes these secondary reference points, along with the primary points. The values are listed on both the Kelvin and Celsius scales, together with an estimate of uncertainty. Full details are given in the reference.

The entries are listed in order of increasing temperature.

RELATIVE SENSITIVITY OF BAYARD-ALPERT IONIZATION GAUGES TO VARIOUS GASES

Paul Redhead

The ion current I_+ in a hot-cathode ionization gauge is given by $I_+ = KI_e P$. The gauge constant is $K = (I_+/I_e)(1/P)$, where I_e is the electron current, and P the pressure. The sensitivity is given by $S = KI_e = I_+/P$. The constant K is independent of pressure below about 10^{-3} Pa.

Relative sensitivities for different Bayard-Alpert ionization gauges may differ by as much as $\pm 15\%$ as a result of differences in applied voltages, electron current, and electrode structure. The table below presents the average of the measurements of 12 experimenters on Bayard-Alpert ionization gauges in various gases. The sensitivity relative to nitrogen is tabulated.

Gas		Relative sensitivity $S/S(N_2)$
Helium	He	0.18
Neon	Ne	0.31
Argon	Ar	1.4
Krypton	Kr	1.9
Xenon	Xe	2.7
Nitrogen	N ₂	1.00
Hydrogen	H ₂	0.43
Oxygen	O ₂	0.96
Carbon monoxide	CO	1.0
Carbon dioxide	CO ₂	1.4
Water	H ₂ O	0.93
Sulfur hexafluoride	SF ₆	2.3
Mercury	Hg	3.5
Methane	CH ₄	1.6
Ethane	C ₂ H ₆	2.6
Propane	C ₃ H ₈	3.5
Butane	C ₄ H ₁₀	4.3
Ethene	C ₂ H ₄	1.3
Propene	C ₃ H ₆	1.8
Acetylene	C ₂ H ₂	0.61
Allene	C ₃ H ₄	1.3
1-Propyne (Methyl acetylene)	C ₃ H ₄	1.4
Benzene	C ₆ H ₆	3.8

LABORATORY SOLVENTS AND OTHER LIQUID REAGENTS

This table summarizes the properties of 574 liquids that are commonly used in the laboratory as solvents or chemical reagents.

The properties tabulated are:

M_r :	Molecular weight
t_m :	Melting point in °C
t_b :	Normal boiling point in °C
ρ :	Density in g/mL at the temperature in °C indicated by the superscript
η :	Viscosity in mPa s (1 mPa s = 1 centipoise) at 25 °C
ϵ :	Dielectric constant (permittivity) at the temperature in °C indicated by the superscript (otherwise at ambient temperature)
μ :	Dipole moment in Debye units
c_p :	Specific heat capacity of the liquid at constant pressure at 25 °C in J/g K
vp:	Vapor pressure at 25 °C in kPa (1 kPa = 7.50 mmHg)
FP:	Flash point in °C
Fl. lim.:	Flammable (explosive) limit in air in percent by volume
IT:	Autoignition temperature in °C

TWA and STEL: Exposure limits for allowable airborne concentration in parts per million by volume at 25 °C and atmospheric pressure. TWA refers to an 8-hour time-weighted average and STEL to a short-term limit. More details on threshold limits can be found in Sec. 16.

Data on the temperature dependence of viscosity, dielectric constant, and vapor pressure can be found in the pertinent tables in this *Handbook*.

MISCIBILITY OF ORGANIC SOLVENTS

The chart below gives qualitative information on the miscibility of pairs of organic liquids. Two liquids are considered miscible (indicated by **M** in the chart) if mixing equal volumes produces a single liquid phase. If two phases separate, they are considered immiscible (**I**). An entry of **P** indicates two phases whose volumes dif-

fer appreciably, suggesting a partial miscibility of the components. The symbol **R** indicates a reaction between the components. All data refer to room temperature.

The codes for the columns are:

A Acetone
B Benzaldehyde
C Benzene
D Butyl acetate
E Butyl alcohol
F Carbon tetrachloride
G 2-Chloroethanol
H Chloroform
I *o*-Cresol

J Diethyl ether
K *N,N*-Dimethylaniline
L Dipentylamine
M Ethyl alcohol
N Ethylene glycol
O Ethylene glycol monoethyl ether
P Formamide
Q Furfuryl alcohol
R Glycerol

S Methyl isopropyl ketone
T Nitromethane
U 1-Octanol
V 1,3-Propanediol
W Pyridine
X Triethylenetetramine
Y Triethyl phosphate

DENSITY OF SOLVENTS AS A FUNCTION OF TEMPERATURE

The table below lists the densities of several common solvents over the temperature range from 0 °C to 100 °C. The values have been calculated from the REFPROP program where equations are available or from the Rackett Equation (as indicated with an asterisk) using parameters in Ref. 1. Density values refer to the liquid at its saturation vapor pressure; thus, entries for temperatures above the normal boiling point are for pressures greater than atmospheric pressure.

DEPENDENCE OF BOILING POINT ON PRESSURE

The normal boiling point of a liquid is defined as the temperature at which the vapor pressure reaches standard atmospheric pressure, 101.325 kPa. Calculated values from the REFPROP program of the boiling point and the change in boiling point with pressure, $\Delta t/\Delta p$ in units of both °C/kPa and °C/mmHg, are given in the table below. For those fluids marked with an asterisk, values are calculated from the representation of the vapor pressure by the Antoine Equation with constants taken from Ref. 1,

$$\ln p = A_1 - A_2/(T + A_3)$$

where p is the vapor pressure, T is the absolute temperature, and A_1 , A_2 , and A_3 are constants. The correction to the boiling point is generally accurate to 0.1 °C to 0.2 °C as long as the pressure is within 10% of standard atmospheric pressure.

A slightly less accurate estimate of $\Delta t/\Delta p$ may be obtained from the Clausius-Clapeyron equation, with the assumption that the change in volume upon vaporization equals the ideal-gas volume of the vapor. This leads to the equation,

$$\Delta t/\Delta p = RT_b^2/[p_0 \Delta_{\text{vap}} H(T_b)]$$

where R is the molar gas constant, p_0 is 101.325 kPa, T_b is the normal boiling point temperature (absolute), and $\Delta_{\text{vap}} H(T_b)$ is the molar enthalpy of vaporization at the normal boiling point. Values of the last quantity may be obtained from the table "Enthalpy of Vaporization" in Section 6.

EBULLIOSCOPIC CONSTANTS FOR CALCULATION OF BOILING POINT ELEVATION

The boiling point T_b of a dilute solution of a non-volatile, non-dissociating solute is elevated relative to that of the pure solvent. If the solution is ideal (i.e., follows Raoult's Law), the amount of elevation depends only on the number of particles of solute present. Hence the change in boiling point ΔT_b can be expressed as

$$\Delta T_b = E_b m_2$$

where m_2 is the molality (moles of solute per kilogram of solvent) and E_b is the Ebullioscopic Constant, a characteristic property of

the solvent. The Ebullioscopic Constant may be calculated from the relation

$$E_b = R T_b^2 M / \Delta_{\text{vap}} H$$

where R is the molar gas constant, T_b is the normal boiling point temperature (absolute) of the solvent, M the molar mass of the solvent, and $\Delta_{\text{vap}} H$ the molar enthalpy (heat) of vaporization of the solvent at its normal boiling point.

This table lists E_b values for some common solvents, as calculated from data in the table "Enthalpy of Vaporization" in Section 6.

CRYOSCOPIC CONSTANTS FOR CALCULATION OF FREEZING POINT DEPRESSION

The freezing point T_f of a dilute solution of a non-volatile, non-dissociating solute is depressed relative to that of the pure solvent. If the solution is ideal (i.e., follows Raoult's Law), this lowering is a function only of the number of particles of solute present. Thus the absolute value of the lowering of freezing point ΔT_f can be expressed as

$$\Delta T_f = E_f m_2$$

where m_2 is the molality (moles of solute per kilogram of solvent) and E_f is the Cryoscopic Constant, a characteristic property of

the solvent. The Cryoscopic Constant may be calculated from the relation

$$E_f = R T_f^2 M / \Delta_{\text{fus}} H$$

where R is the molar gas constant, T_f is the freezing point temperature (absolute) of the solvent, M the molar mass of the solvent, and $\Delta_{\text{fus}} H$ the molar enthalpy (heat) of fusion of the solvent.

This table lists cryoscopic constants for selected substances, as calculated from data in the table "Enthalpy of Fusion" in Section 6.

Compound	$E_f/\text{K kg mol}^{-1}$	Compound	$E_f/\text{K kg mol}^{-1}$
Acetamide	3.92	1,4-Dioxane	4.63
Acetic acid	3.63	Diphenylamine	8.38
Acetophenone	5.16	Ethylene glycol	3.11
Aniline	5.23	Formamide	4.25
Benzene	5.07	Formic acid	2.38
Benzonitrile	5.35	Glycerol	3.56
Benzophenone	8.58	Methylcyclohexane	2.60
(+)-Camphor	37.8	Naphthalene	7.45
1-Chloronaphthalene	7.68	Nitrobenzene	6.87
<i>o</i> -Cresol	5.92	Phenol	6.84
<i>m</i> -Cresol	7.76	Pyridine	4.26
<i>p</i> -Cresol	7.20	Quinoline	6.73
Cyclohexane	20.8	Succinonitrile	19.3
Cyclohexanol	42.2	1,1,2,2-Tetrabromoethane	21.4
<i>cis</i> -Decahydronaphthalene	6.42	1,1,2,2-Tetrachloro-1,2-difluoroethane	41.0
<i>trans</i> -Decahydronaphthalene	4.70	Toluene	3.55
Dibenzyl ether	6.17	<i>p</i> -Toluidine	4.91
<i>p</i> -Dichlorobenzene	7.57	Tribromomethane	15.0
Diethanolamine	3.16	Water	1.86
Dimethyl sulfoxide	3.85	<i>p</i> -Xylene	4.31

FREEZING POINT LOWERING BY ELECTROLYTES IN AQUEOUS SOLUTION

CORRECTION OF BAROMETER READINGS TO 0 °C TEMPERATURE

The following corrections are used to reduce the reading of a mercury barometer with a brass scale to 0 °C. The number in the table should be subtracted from the observed height of the mercury column to give the true pressure in mmHg (1mmHg = 133.322 Pa). The table is calculated from the formula

$$\Delta h = -0.0001634 \, h t / (1 + 0.0001818 \, t),$$

where h is the observed column height in mm and t the Celsius temperature. This relation is based on thermal expansion coefficients of $181.8 \cdot 10^{-6} \, ^\circ\text{C}^{-1}$ for mercury and $18.4 \cdot 10^{-6} \, ^\circ\text{C}^{-1}$ for brass.

$t/^\circ\text{C}$	Observed Height in mm

DETERMINATION OF RELATIVE HUMIDITY FROM DEW POINT

The relative humidity of a water vapor–air mixture is defined as 100 times the partial pressure of water divided by the saturation vapor pressure of water at the same temperature. The relative humidity may be determined from the dew point t_{dew} , which is the temperature at which liquid water first condenses when the

mixture is cooled from an initial temperature t . This table gives relative humidity as a function of the dew point depression $t - t_{\text{dew}}$ for several values of the dew point. Values are calculated from the vapor pressure table in Section 6.

DETERMINATION OF RELATIVE HUMIDITY FROM WET AND DRY BULB TEMPERATURES

Relative humidity may be determined by comparing temperature readings of wet and dry bulb thermometers. The following table, extracted from more extensive U.S. National Weather Service tables, gives the relative humidity as a function of air temperature

t_d (dry bulb) and the difference $t_d - t_w$ between dry and wet bulb temperatures. The data assume a pressure near normal atmospheric pressure and an instrumental configuration with forced ventilation.

	$(t_d - t_w)/^{\circ}\text{C}$

CONSTANT HUMIDITY SOLUTIONS

Anthony Wexler

An excess of a water soluble salt in contact with its saturated solution and contained within an enclosed space produces a constant relative humidity and water vapor pressure according to

$$RH = A \exp(B/T)$$

where RH is the percent relative humidity (generally accurate to $\pm 2\%$), T is the temperature in kelvin, and the constants A and B and the range of valid temperatures are given in the table below. The vapor pressure, p , can be calculated from

$$p = (RH/100) \times p_0$$

where p_0 is the vapor pressure of pure water at temperature T as given in the table in Section 6 titled "Vapor Pressure of Water from 0 to 370 °C".

STANDARD SALT SOLUTIONS FOR HUMIDITY CALIBRATION

Saturated aqueous solutions of inorganic salts are convenient secondary standards for calibration of instruments for measurement of relative humidity. The International Union of Pure and Applied Chemistry has recommended salt solutions for calibrations in the range of 10% to 90% relative humidity, and the American Society for Testing and Materials has published similar standards. The data in this table are taken from the IUPAC recommendations, except for K_2CO_3 and K_2SO_4 , which are ASTM recommendations.

Details on the preparation and use of these standards may be found in References 1 and 2. Data for other salts are given in Reference 3.

LOW-TEMPERATURE BATHS FOR MAINTAINING CONSTANT TEMPERATURE

A liquid–solid slurry is a convenient means of maintaining a constant temperature environment below room temperature. The following is a list of readily available organic liquids suitable for

this purpose, arranged in order of their melting (freezing) points t_m . The normal boiling points t_b are also given.

Compound	$t_m/^\circ\text{C}$	$t_b/^\circ\text{C}$	Compound	$t_m/^\circ\text{C}$	$t_b/^\circ\text{C}$
Isopentane (2-Methylbutane)	–159.9	27.8	Ethyl acetate	–83.6	77.1
Methylcyclopentane	–142.5	71.8	Dry ice + acetone	–78	
3-Chloropropene (Allyl chloride)	–134.5	45.1	<i>p</i> -Cymene	–68.9	177.1
Pentane	–129.7	36.0	Trichloromethane (Chloroform)	–63.6	61.1
Allyl alcohol	–129	97.0	<i>N</i> -Methylaniline	–57	196.2
Ethanol	–114.1	78.2	Chlorobenzene	–45.2	131.7
Carbon disulfide	–111.5	46	Anisole	–37.5	153.7
Isobutyl alcohol	–108	107.8	Bromobenzene	–30.6	156.0
Toluene	–94.9	110.6	Tetrachloromethane (Carbon tetrachloride)	–23	76.8
Acetone	–94.8	56.0	Benzonitrile	–12.7	191.1

* The useful expressions for correlations between the atomic and weight concentrations of an alloy components are:

$$f(a, A_k) = \frac{f(w, A_k)}{M_k \sum_{i=1}^N \frac{f(w, A_i)}{M_i}} \quad \text{and} \quad f(w, A_k) = \frac{M_k \cdot f(a, A_k)}{\sum_{i=1}^N M_i \cdot f(a, A_i)} \quad (i = 1, \dots, k, \dots, N)$$

where $f(a, A_i)$ and $f(w, A_i)$ are the atomic and weight concentrations of component A_i , respectively, and M_i is the atomic weight of this component.

WIRE TABLES

The resistance per unit length of wires of various metals is tabulated here. Values were calculated from resistivity values in the tables “Electrical Resistivity of Pure Metals” and “Electrical Resistivity of Selected Alloys”, which appear in Section 12. In prac-

tice, resistance may vary because of differing heat treatments and metal composition. The values in the table refer to 20 °C, but values at other temperatures may be calculated from the following resistivity data:

Metal	Resistivity in $10^{-8} \Omega \cdot \text{m}$ at temperature			
	0 °C	20 °C	25 °C	100 °C
Aluminum	2.417	2.650	2.709	3.56
Brass (70% Cu, 30% Zn)	5.87	6.08	6.13	6.91
Constantan (60% Cu, 40% Ni)	45.43	45.38	45.35	45.11
Copper	1.543	1.678	1.712	2.22
Nichrome (79% Ni, 21% Cr)	107.3	107.5	107.6	108.3
Platinum	9.6	10.5	10.7	13.6
Silver	1.467	1.587	1.617	2.07
Tungsten	4.82	5.28	5.39	7.18

STANDARD FITTINGS FOR COMPRESSED GAS CYLINDERS

Thomas J. Bruno and Paris D.N. Svoronos

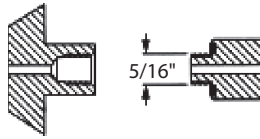

The following table presents a partial list of gases and the Compressed Gas Association (CGA) fittings that are required to use those gases when they are stored in, and dispensed from, compressed gas cylinders (Refs. 1 and 2). These fittings are matched to gas cylinder content for safe operation, and substitution and adaptation should be avoided.

Gas	Fitting
Acetylene	510
Air	346
Carbon dioxide	320
Carbon monoxide	350
Chlorine	660
Ethane	350
Ethylene	350
Ethylene oxide	510
Helium	580
Hydrogen	350
Hydrogen chloride	330
Methane	350
Neon	580
Nitrogen	580
Nitrous oxide	326
Oxygen	540
Sulfur dioxide	660
Sulfur hexafluoride	590
Xenon	580

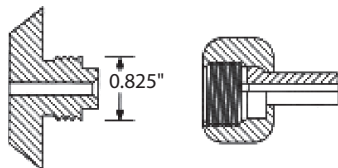

The following graphic shows the geometry and dimensions of common CGA fittings for compressed gas cylinders (Ref. 1).

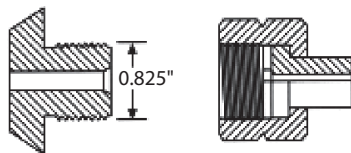

Connection 110 - Lecture bottle outlet for corrosive gases - 5/16" - 32 RH INT., with gasket

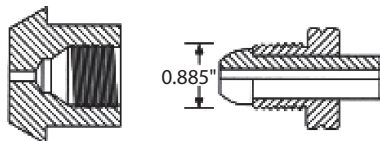

Connection 170 - Lecture bottle outlet for non-corrosive gases 9/16" - 18 RH EXT. and 5/16" - 32 RH INT., with gasket

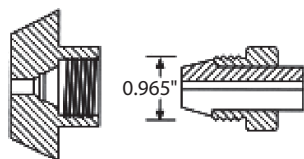

Connection 320 - 0.825" - 14 RH EXT., with gasket

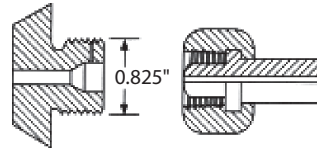

Connection 330 - 0.825" - 14 LH EXT., with gasket

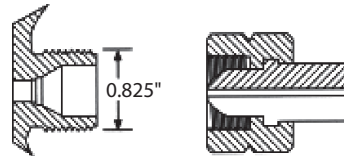

Connection 510 - 0.885" - 14 LH INT.

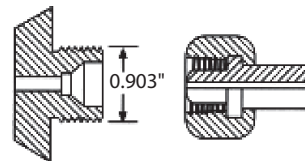

Connection 580 - 0.965" - 14 RH INT.

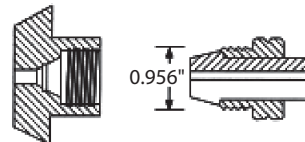

Connection 326 - 0.825" - 14 RH EXT.

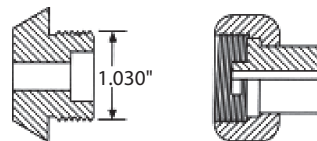

Connection 350 - 0.825" - 14 LH EXT.

Connection 540 - 0.903" - 14 RH EXT.

Connection 590 - 0.956" - 14 LH INT.

Connection 660 - 1.030" - 14 RH EXT., with gasket

PLUG AND OUTLET CONFIGURATIONS FOR COMMON LABORATORY DEVICES

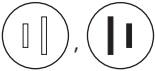

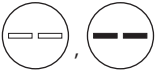

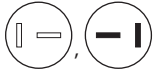

Thomas J. Bruno and Paris D.N. Svoronos

The following schematic diagrams show typical plug (P) and outlet receptacle (R) configurations used on common laboratory instruments and devices (Refs. 1 and 2). These figures will assist in identifying which circuits and capacities will be needed to operate different pieces of equipment. Good laboratory practice requires the use of the appropriate plug-outlet combination, without alteration.

Lab Data

DENSITY OF VARIOUS SOLIDS

This table gives the range of density for miscellaneous solid materials whose characteristics depend on the source or method of preparation.

DENSITY OF ETHANOL–WATER MIXTURES

This table gives the density of mixtures of ethanol and water as a function of composition and temperature. The composition is specified in weight percent of ethanol, i.e., mass of ethanol per 100 g of solution. Values from the reference have been converted to true densities.

DIELECTRIC STRENGTH OF INSULATING MATERIALS

L. I. Berger

The loss of the dielectric properties by a sample of a gaseous, liquid, or solid insulator as a result of application to the sample of an electric field* greater than a certain critical magnitude is called *dielectric breakdown*. The critical magnitude of electric field at which the breakdown of a material takes place is called the *dielectric strength* of the material (or *breakdown voltage*). The dielectric strength of a material depends on the specimen thickness (as a rule, thin films have greater dielectric strength than that of thicker samples of a material), the electrode shape**, the rate of the applied voltage increase, the shape of the voltage vs. time curve, and the medium surrounding the sample, e.g., air or other gas (or a liquid — for solid materials only).

Breakdown in Gases

The current carriers in gases are free electrons and ions generated by external radiation. The equilibrium concentration of these particles at normal pressure is about 10^3 cm^{-3} , and hence the electrical conductivity is very small, of the order of $10^{-16} - 10^{-15} \text{ S/cm}$. But in a strong electric field, these particles acquire kinetic energy along their free path, large enough to ionize the gas molecules. The new charged particles ionize more molecules; this avalanche-like process leads to formation between the electrodes of channels of conducting plasma (streamers), and the electrical resistance of the space between the electrodes decreases virtually to zero.

Because the dielectric strength (breakdown voltage) of gases strongly depends on the electrode geometry and surface condition and the gas pressure, it is generally accepted to present the data for a particular gas as a fraction of the dielectric strength of either nitrogen or sulfur hexafluoride measured at the same conditions. In Table 1, the data are presented in comparison with the dielectric strength of nitrogen, which is considered equal to 1.00. For convenience to the reader, a few average magnitudes of the dielectric strength of some gases are expressed in kilovolts per millimeter. The data in the table relate to the standard conditions, unless indicated otherwise.

Breakdown in Liquids

If a liquid is pure, the breakdown mechanism in it is similar to that in gases. If a liquid contains liquid impurities in the form of small drops with greater dielectric constant than that of the main liquid, the breakdown is the result of formation of ellipsoids from these drops by the electric field. In a strong enough electric field, these ellipsoids merge and form a high-conductivity channel between the electrodes. The current increases the temperature in the channel, liquid boils, and the current along the steam canal leads to breakdown. Formation of a conductive channel (bridge) between

the electrodes is observed also in liquids with solid impurities. If a liquid contains gas impurities in the form of small bubbles, breakdown is the result of heating of the liquid in strong electric fields. In the locations with the highest current density, the liquid boils, the size of the gas bubbles increases, they merge and form gaseous channels between the electrodes, and the breakdown medium is again the gas plasma.

Breakdown in Solids

It is known that the current in solid insulators does not obey Ohm's law in strong electric fields. The current density increases almost exponentially with the electric field, and at a certain field magnitude it jumps to very high magnitudes at which a specimen of a material is destroyed. The two known kinds of electric breakdown are thermal and electrical breakdowns. The former is the result of material heating by the electric current. Destruction of a sample of a material happens when, at a certain voltage, the amount of heat produced by the current exceeds the heat release through the sample surface; the breakdown voltage in this case is proportional to the square root of the ratio of the thermal conductivity and electrical conductivity of the material. A semi-empirical expression for dependence of the breakdown voltage, V_B , on the physical properties and geometry of a sample of a solid material for the one-dimensional case is

$$V_B = [A \rho \kappa / a \phi(d)]^{1/2}$$

where A is a numerical constant related to the system of units used, ρ and κ are the volume resistivity and thermal conductivity of the sample material, a is a constant related to the chemical bond nature and crystal structure of the sample material, and $\phi(d)$ is a function of the sample geometry, first of all, thickness, d (see, e.g., Ref. R6). In the majority of materials, $\phi(d)$ increases with d , hence, the magnitude of V_B is greater in the thinner samples of a particular material.

The electrical breakdown results from the tunneling of the charge carriers from electrodes or from the valence band or from the impurity levels into the conduction band, or by the impact ionization. The tunnel effect breakdown happens mainly in thin layers, e.g., in thin p-n junctions. Otherwise, the impact ionization mechanism dominates. For this mechanism, the dielectric strength of an insulator can be estimated using Boltzmann's kinetic equation for electrons in a crystal.

In the following tables, the dielectric strength values are for room temperature and normal atmospheric pressure, unless indicated otherwise.

* The unit of electric field in the SI system is newton per coulomb or volt per meter.

** For example, the U.S. standard ASTM D149 is based on use of symmetrical electrodes, while per U.K. standard BS2918 one electrode is a plane and the other is a rod with the axis normal to the plane.

TABLE 1. Dielectric Strength of Gases

Material	Dielectric* strength	Ref.	Material	Dielectric* strength	Ref.
Nitrogen, N ₂	1.00		Trichlorofluoromethane, CCl ₃ F	3.50	1

COEFFICIENT OF FRICTION

The coefficient of friction between two surfaces is the ratio of the force required to move one over the other to the force pressing the two together. Thus if F is the minimum force needed to move one surface over the other, and W is the force pressing the surfaces together, the coefficient of friction μ is given by $\mu = F/W$. A greater force is generally needed to initiate movement from rest than to continue the motion once sliding has started. Thus the static coefficient of friction μ (static) is usually larger than the sliding or kinetic coefficient μ (sliding).

This table gives characteristic values of both the static and sliding coefficients of friction for a number of material combinations. In each case Material 1 is moving over the surface of Material 2.

The type of lubrication or any other special condition is indicated in the third column. All values refer to room temperature unless otherwise indicated. It should be emphasized that the coefficient of friction is very sensitive to the condition of the surface, so that these values represent only a rough guide.

ALLOCATION OF FREQUENCIES IN THE RADIO SPECTRUM

In the United States the National Telecommunications and Information Administration (NTIA) has responsibility for assigning each portion of the radio spectrum (9 kHz to 300 GHz) for different uses. These assignments must be compatible with the rules of the International Telecommunications Union (ITU), to which the United States is bound by treaty. The current assignments are given in a wall chart (Reference 1) and may also be found on the NTIA web site (Reference 2). The list below summarizes the broad features of the spectrum allocation, with particular attention to those sections of scientific interest. The references should be con-

sulted for details of the allocations in the frequency bands listed here, which in some cases are quite complex.

Frequency range	Allocation
9–19.95 kHz	Maritime communication, navigation
19.95–20.05 kHz	Standard frequency and time signal (also at 60 kHz and 2.5, 5, 10, 15, 20, 25 MHz)
20.05–535 kHz	Maritime and aeronautical communication, navigation
535–1605 kHz	AM radio broadcasting
1605–3500 kHz	Mobile communication and navigation, amateur radio (1800–1900 kHz)
3.5–4.0 MHz	Amateur radio
4.0–5.95 MHz	Mobile communication
5.95–13.36 MHz	Mobile communication, amateur, short-wave broadcasting
13.36–13.41 MHz	Radioastronomy
13.41–25.55 MHz	Mobile communication, amateur, short-wave broadcasting
25.55–25.67 MHz	Radioastronomy
25.67–37.5 MHz	Mobile communication, amateur, short-wave broadcasting
37.5–38.25 MHz	Radioastronomy
38.25–50.0 MHz	Mobile communication
50.0–54.0 MHz	Amateur
54.0–72.0 MHz	TV channels 2–4
72.0–73.0 MHz	Mobile communication
73.0–74.6 MHz	Radioastronomy
74.6–76.0 MHz	Mobile communication
76.0–88.0 MHz	TV channels 5–6
88.0–108.0 MHz	FM radio broadcasting
108.0–118.0 MHz	Aeronautical navigation
118.0–174.0 MHz	Mobile communication, space research, meteorological satellites
174.0–216.0 MHz	TV channels 7–13
216.0–400.05 MHz	Mobile communication
400.05–400.15 MHz	Standard frequency and time satellite (also 20 and 25 GHz)
400.15–406.1 MHz	Meteorological aids (radiosonde)
406.1–410.0 MHz	Radioastronomy
410.0–470.0 MHz	Mobile communication, amateur
470.0–512.0 MHz	TV channels 14–20
512.0–608.0 MHz	TV channels 21–36
608.0–614.0 MHz	Radioastronomy
614.0–806.0 MHz	TV channels 38–69
806–1400 MHz	Mobile communication, navigation
1400–1427 MHz	Radioastronomy, space research
1427–1660 MHz	Various navigation and satellite applications
1660–1710 MHz	Radioastronomy, space research, meteorology
1710–2655 MHz	Various navigation and satellite applications
2655–2700 MHz	Radioastronomy, space research
2.7–4.99 GHz	Various navigation and satellite applications
4.99–5.0 GHz	Radioastronomy, space research
5.0–10.6 GHz	Various navigation and satellite applications
10.6–10.7 GHz	Radioastronomy, space research
10.7–15.35 GHz	Various navigation and satellite applications
15.35–15.4 GHz	Radioastronomy, space research
15.4–22.21 GHz	Various navigation and satellite applications

Frequency range	Allocation
22.21–22.5 GHz	Radioastronomy, space research
22.25–23.6 GHz	Various navigation and satellite applications
23.6–24.0 GHz	Radioastronomy, space research
24.0–31.3 GHz	Various navigation and satellite applications
31.3–31.8 GHz	Radioastronomy, space research
31.8–42.5 GHz	Various navigation and satellite applications
42.5–43.5 GHz	Radioastronomy
43.5–51.4 GHz	Various navigation and satellite applications
51.4–54.25 GHz	Radioastronomy, space research
54.25–58.2 GHz	Space research
58.2–59.0 GHz	Radioastronomy, space research
59.0–64.0 GHz	Satellite applications
64.0–65.0 GHz	Radioastronomy, space research
65.0–72.77 GHz	Various navigation and satellite applications
72.77–72.91 GHz	Radioastronomy, space research
72.91–86.0 GHz	Various navigation and satellite applications
86.0–92.0 GHz	Radioastronomy, space research
92.0–105.0 GHz	Various navigation and satellite applications
105.0–116.0 GHz	Radioastronomy, space research
116.0–164.0 GHz	Various navigation and satellite applications
164.0–168.0 GHz	Radioastronomy, space research
168.0–182.0 GHz	Various navigation and satellite applications
182.0–185.0 GHz	Radioastronomy, space research
185.0–217.0 GHz	Various navigation and satellite applications
217.0–231.0 GHz	Radioastronomy, space research
231.0–265.0 GHz	Various navigation and satellite applications
265.0–275.0 GHz	Radioastronomy
275.0–300.0 GHz	Mobile communications

ABBREVIATIONS USED IN THE ASSESSMENT AND PRESENTATION OF LABORATORY HAZARDS

Thomas J. Bruno and Paris D. N. Svoronos

The following abbreviations are commonly encountered in presentations of laboratory and industrial hazards. The reader is urged to consult the references (Refs. 1 and 2) for additional information.

CC – Closed Cup; method for the measurement of the flash point. With this method, sample vapors are not allowed to escape as they can with the open cup method. Because of this, flash points measured with the CC method are usually a few degrees lower than those measured with the OC. The choice between CC and OC is dependent on the (usually ASTM) standard method chosen for the test.

COC – Cleveland Open Cup, see Open Cup

IDLH – Immediately Dangerous to Life and Health; the maximum concentration of chemical contaminants, normally expressed as parts per million (ppm, mass/mass), from which one could escape within 30 minutes without a respirator, and without experiencing any escape impairing (severe eye irritation) or irreversible health effects. Set by NIOSH. Note that this term is also used to

describe electrical hazards.

LEL – Lower Explosion Limit; the minimum concentration of a chemical in air at which detonation can occur.

LFL – Lower Flammability Limit; the minimum concentration of a chemical in air at which flame propagation occurs.

MSDS – Material Safety Data Sheet; a (legal) document that must accompany any supplied chemical that provides information on chemical content, physical properties, hazards, and treatment of hazards. The MSDS should be considered only a minimal source of information, and cannot replace additional information available in other, more comprehensive sources.

NOEL – No Observed Effect Level; the maximum dose of a chemical at which no signs of harm are observed. This term can also be used to describe electrical hazards.

OC – Open Cup; also called Cleveland Open Cup. This refers to the test method for determining the flash point of common compounds. It consists of a brass, aluminum or stainless steel cup, a heater base to heat the cup, a thermometer in a fixture and a test flame applicator. The flash point is the lowest temperature at which a material will form a flammable mixture with air above its surface. The lower the flash point, the easier it is to ignite.

PEL – Permissible Exposure Level; an exposure limit that is published and enforced by OSHA as a legal standard. The PEL may be expressed as a time-weighted-average (TWA) exposure limit (for an 8 hour workday), a 15 minute short term exposure limit (STEL), or a ceiling (C, or CEIL, or TLV-C).

RTECS – Registry of Toxic Effects of Chemical Substances; a database maintained by the National Institute of

References

2. Bruno, T. J., and Svoronos, P. D. N., *CRC Handbook of Basic Tables for Chemical Analysis*, 3rd Ed., CRC Press, Boca Raton, FL, 2011.

Occupational Safety and Health (NIOSH). The goal of the database is to include data on all known toxic substances, along with the concentration at which toxicity is known to occur. There are approximately 140 000 compounds listed.

STEL – Short Term Exposure Level; an exposure limit for a short-term, 15 minute, exposure that cannot be exceeded during the workday, enforced by OSHA as a legal standard. Short-term exposures below the STEL level generally will not cause irritation, chronic or reversible tissue damage, or narcosis.

REL – Recommended Exposure Level; average concentration limit recommended for up to a 10 hour workday during a 40 hour workweek, by NIOSH. TLV – Threshold Limit Value; guidelines suggested by the American Conference of Governmental Industrial Hygienists to assist industrial hygienists with limiting hazards of chemical exposures in the workplace.

TLV-C – Threshold Limit Ceiling Value; an exposure limit which should not be exceeded under any circumstances.

TWA – Time-weighted average concentration for a conventional 8 hour workday and a 40 hour workweek. It is the concentration to which it is believed possible that nearly all workers can be exposed without adverse health effects.

UEL – Upper Explosion Limit; the maximum concentration of a chemical in air at which detonation can occur.

UFL – Upper Flammability Limit; the maximum concentration of a chemical in air at which flame propagation can occur.

WEEL – Workplace Environmental Exposure Limit; set by the American Industrial Hygiene Association (AIHA).

Some abbreviations that are sometimes used on material safety data sheets, and in other sources, are ambiguous. The most common meanings of some of these vague abbreviations are provided below, but the reader is cautioned that these are only suggestions:

EST – Established; estimated

MST – Mist

N/A, NA – Not applicable

ND – None determined; not determined

NE – None established; not established

NEGL – Negligible

NF – None found; not found

N/K, NK – Not known

N/P, NP – Not provided

SKN – Skin

TS – Trade secret

UKN – Unknown

INCOMPATIBLE CHEMICALS

The term “incompatible chemicals” refers to chemicals that can react with each other

- Violently
- With evolution of substantial heat
- To produce flammable products
- To produce toxic products

Good laboratory safety practice requires that incompatible chemicals be stored, transported, and disposed of in ways that will prevent their coming together in the event of an accident. Tables

1 and 2 give some basic guidelines for the safe handling of acids, bases, reactive metals, and other chemicals. Neither of these tables is exhaustive, and additional information on incompatible chemicals can be found in the following references.

1. Urben, P. G., Ed., *Bretherick's Handbook of Reactive Chemical Hazards*, 5th Ed., Butterworth-Heinemann, Oxford, 1995.
2. Luxon, S. G., Ed., *Hazards in the Chemical Laboratory*, 5th Ed., Royal Society of Chemistry, Cambridge, 1992.
3. *Fire Protection Guide to Hazardous Materials*, 11th Ed., National Fire Protection Association, Quincy, MA, 1994.

TABLE 1. General Classes of Incompatible Chemicals

A	B
Acids	Bases, reactive metals
Oxidizing agents ^a	Reducing agents ^a
Chlorates	Ammonia, anhydrous and aqueous
Chromates	Carbon
Chromium trioxide	Metals
Dichromates	Metal hydrides
Halogens	Nitrites
Halogenating agents	Organic compounds
Hydrogen peroxide	Phosphorus
Nitric acid	Silicon
Nitrates	Sulfur
Perchlorates	
Peroxides	
Permanganates	
Persulfates	

^a The examples of oxidizing and reducing agents are illustrative of common laboratory chemicals; they are not intended to be exhaustive.

TABLE 2. Examples of Incompatible Chemicals

Chemical	Is incompatible with
Acetic acid	Chromic acid, nitric acid, hydroxyl compounds, ethylene glycol, perchloric acid, peroxides, permanganates
Acetylene	Chlorine, bromine, copper, fluorine, silver, mercury
Acetone	Concentrated nitric and sulfuric acid mixtures
Alkali and alkaline earth metals (such as powdered aluminum or magnesium, calcium, lithium, sodium, potassium)	Water, carbon tetrachloride or other chlorinated hydrocarbons, carbon dioxide, halogens
Ammonia (anhydrous)	Mercury (in manometers, for example), chlorine, calcium hypochlorite, iodine, bromine, hydrofluoric acid (anhydrous)
Ammonium nitrate	Acids, powdered metals, flammable liquids, chlorates, nitrites, sulfur, finely divided organic or combustible materials
Aniline	Nitric acid, hydrogen peroxide
Arsenical materials	Any reducing agent
Azides	Acids
Bromine	See Chlorine
Calcium oxide	Water
Carbon (activated)	Calcium hypochlorite, all oxidizing agents
Carbon tetrachloride	Sodium
Chlorates	Ammonium salts, acids, powdered metals, sulfur, finely divided organic or combustible materials
Chromic acid and chromium trioxide	Acetic acid, naphthalene, camphor, glycerol, alcohol, flammable liquids in general
Chlorine	Ammonia, acetylene, butadiene, butane, methane, propane (or other petroleum gases), hydrogen, sodium carbide, benzene, finely divided metals, turpentine
Chlorine dioxide	Ammonia, methane, phosphine, hydrogen sulfide
Copper	Acetylene, hydrogen peroxide

Chemical	Is incompatible with
Cumene hydroperoxide	Acids (organic or inorganic)
Cyanides	Acids
Flammable liquids	Ammonium nitrate, chromic acid, hydrogen peroxide, nitric acid, sodium peroxide, halogens
Fluorine	Everything
Hydrocarbons (such as butane, propane, benzene)	Fluorine, chlorine, bromine, chromic acid, sodium peroxide
Hydrocyanic acid	Nitric acid, alkali
Hydrofluoric acid (anhydrous)	Ammonia (aqueous or anhydrous)
Hydrogen peroxide	Copper, chromium, iron, most metals or their salts, alcohols, acetone, organic materials, aniline, nitro-methane, combustible materials
Hydrogen sulfide	Fuming nitric acid, oxidizing gases
Hypochlorites	Acids, activated carbon
Iodine	Acetylene, ammonia (aqueous or anhydrous), hydrogen
Mercury	Acetylene, fulminic acid, ammonia
Nitrates	Sulfuric acid
Nitric acid (concentrated)	Acetic acid, aniline, chromic acid, hydrocyanic acid, hydrogen sulfide, flammable liquids, flammable gases, copper, brass, any heavy metals
Nitrites	Acids
Nitroparaffins	Inorganic bases, amines
Oxalic acid	Silver, mercury
Oxygen	Oils, grease, hydrogen, flammable liquids, solids, or gases
Perchloric acid	Acetic anhydride, bismuth and its alloys, alcohol, paper, wood, grease, oils
Peroxides, organic	Acids (organic or mineral), avoid friction, store cold
Phosphorus (white)	Air, oxygen, alkalis, reducing agents
Potassium	Carbon tetrachloride, carbon dioxide, water
Potassium chlorate	Sulfuric and other acids
Potassium perchlorate (see also chlorates)	Sulfuric and other acids
Potassium permanganate	Glycerol, ethylene glycol, benzaldehyde, surfuric acid
Selenides	Reducing agents
Silver	Acetylene, oxalic acid, tartartic acid, ammonium compounds, fulminic acid
Sodium	Carbon tetrachloride, carbon dioxide, water
Sodium nitrite	Ammonium nitrate and other ammonium salts
Sodium peroxide	Ethyl or methyl alcohol, glacial acetic acid, acetic anhydride, benzaldehyde, carbon disulfide, glycerin, ethylene glycol, ethyl acetate, methyl acetate, furfural
Sulfides	Acids
Sulfuric acid	Potassium chlorate, potassium perchlorate, potassium permanganate (similar compounds of light metals, such as sodium, lithium)
Tellurides	Reducing agents

EXPLOSION (SHOCK) HAZARDS

Table 1 lists some common classes of laboratory chemicals that have potential for producing a violent explosion when subjected to shock or friction. These chemicals should never be disposed of as such, but should be handled by procedures given in *Prudent Practices for Disposal of Chemicals from Laboratories*, National Academy Press, 1983, chapters 6 and 7. Additional information on these, as well as on some less common classes of explosives, can be found in L. Bretherick, *Handbook of Reactive Chemical Hazards*, 5th ed., Butterworth-Heinemann, Oxford, 1995.

Table 2 lists some illustrative combinations of common laboratory reagents that can produce explosions when they are brought together or that form reaction products that can explode without any apparent external initiating action. This list is not exhaustive, and additional information on potentially explosive reagent combinations can be found in *Manual of Hazardous Chemical Reactions, A Compilation of Chemical Reactions Reported to be Potentially Hazardous*, National Fire Protection Association, NFPA 491M, 1991, NFPA, Quincy, MA.

TABLE 1. Shock-Sensitive Compounds

Acetylenic compounds, especially polyacetylenes, haloacetylenes, and heavy metal salts of acetylenes (copper, silver, and mercury salts are particularly sensitive)

Acyl nitrates

Alkyl nitrates, particularly polyol nitrates such as nitrocellulose and nitroglycerine

Alkyl and acyl nitrites

Alkyl perchlorates

Amminemetal oxosalts: metal compounds with coordinated ammonia, hydrazine, or similar nitrogenous donors and ionic perchlorate, nitrate, permanganate, or other oxidizing group

Azides, including metal, nonmetal, and organic azides

Chlorite salts of metals, such as AgClO_2 and $\text{Hg}(\text{ClO}_2)_2$

Diazo compounds such as CH_2N_2

Diazonium salts, when dry

Fulminates (silver fulminate, AgCNO , can form in the reaction mixture from the Tollens' test for aldehydes if it is allowed to stand for some time; this can be prevented by adding dilute nitric acid to the test mixture as soon as the test has been completed)

Hydrogen peroxide becomes increasingly treacherous as the concentration rises above 30%, forming explosive mixtures with organic materials and decomposing violently in the presence of traces of transition metals

N-Halogen compounds such as difluoroamino compounds and halogen azides

N-Nitro compounds such as N-nitromethylamine, nitrourea, nitroguanidine, and nitric amide

Oxo salts of nitrogenous bases: perchlorates, dichromates, nitrates, iodates, chlorites, chlorates, and permanganates of ammonia, amines, hydroxylamine, guanidine, etc.

Perchlorate salts. Most metal, nonmetal, and amine perchlorates can be detonated and may undergo violent reaction in contact with combustible materials

Peroxides and hydroperoxides, organic (see Chapter 6, Section II.P)

Peroxides (solid) that crystallize from or are left from evaporation of peroxidizable solvents (see Chapter 6 and Appendix I)

Peroxides, transition-metal salts

Picrates, especially salts of transition and heavy metals, such as Ni, Pb, Hg, Cu, and Zn; picric acid is explosive but is less sensitive to shock or friction than its metal salts and is relatively safe as a water-wet paste (see Chapter 7)

Polynitroalkyl compounds such as tetranitromethane and dinitroacetone nitrile

Polynitroaromatic compounds, especially polynitro hydrocarbons, phenols, and amines

TABLE 2. Potentially Explosive Combinations of Some Common Reagents

Acetone + chloroform in the presence of base

Acetylene + copper, silver, mercury, or their salts

Ammonia (including aqueous solutions) + Cl_2 , Br_2 , or I_2

Carbon disulfide + sodium azide

Chlorine + an alcohol

Chloroform or carbon tetrachloride + powdered Al or Mg

Decolorizing carbon + an oxidizing agent

Diethyl ether + chlorine (including a chlorine atmosphere)

Dimethyl sulfoxide + an acyl halide, SOCl_2 or POCl_3

Dimethyl sulfoxide + CrO_3

Ethanol + calcium hypochlorite

Ethanol + silver nitrate

Nitric acid + acetic anhydride or acetic acid

Picric acid + a heavy-metal salt, such as of Pb, Hg, or Ag

Silver oxide + ammonia + ethanol

Sodium + a chlorinated hydrocarbon

Sodium hypochlorite + an amine

WATER-REACTIVE CHEMICALS

This table lists some common laboratory chemicals that react violently with water and that should always be stored and handled so that they do not come into contact with liquid water or water

vapor. Procedures for decomposing laboratory quantities are given in *Prudent Practices for Disposal of Chemicals from Laboratories*, chapter 6; the pertinent section of that chapter is given in parentheses.

Water-Reactive Chemicals

Alkali metals (III.D)
Alkali metal hydrides (III.C.2)
Alkali metal amides (III.C.7)
Metal alkyls, such as lithium alkyls and aluminum alkyls (IV.A)
Grignard reagents (IV.A)
Halides of nonmetals, such as BCl_3 , BF_3 , PCl_3 , PCl_5 , SiCl_4 , S_2Cl_2 (III.F)
Inorganic acid halides, such as POCl_3 , SOCl_2 , SO_2Cl_2 (III.F)
Anhydrous metal halides, such as AlCl_3 , TiCl_4 , ZrCl_4 , SnCl_4 (III.E)
Phosphorus pentoxide (III.I)
Calcium carbide (IV.E)
Organic acid halides and anhydrides of low molecular weight (II.J)

TESTING REQUIREMENTS FOR PEROXIDIZABLE COMPOUNDS

Thomas J. Bruno and Paris D. N. Svoronos

Because some compounds form peroxides more easily or faster than others, prudent practices require testing the supply on hand in the laboratory on a periodic basis. The following list provides guidelines on test scheduling (Refs. 1 and 2). The peroxide hazard of the compounds listed in Group 1 is on the basis of time in storage. The compounds in Group 2 present a peroxide hazard primarily due to concentration, mainly by evaporation of the liquid. The compounds listed in Group 3 are hazardous because of the potential of peroxide-initiated polymerization. When stored as liquids, the

peroxide formation may increase, and therefore these compounds should be treated as Group 1 peroxidizable compounds.

Group 1 Test Every 3 Months

Divinyl acetylene
Isopropyl ether
Potassium
Sodium amide
Vinylidene chloride

Group 2 Test Every 6 Months

Acetal
Cumene
Cyclohexene
Diacetylene
Dicyclopentadiene
Diethyl ether
Dimethyl ether
1,4-Dioxane
Ethylene glycol dimethyl ether (glyme)
Methyl acetylene
Methyl isobutyl ketone
Methyl cyclopentane
Tetrahydrofuran
Tetrahydronaphthalene (tetralin)
Vinyl ethers

Group 3 Test Every 12 Months

Acrylic acid
Acrylonitrile
Butadiene
Chloroprene
Chlorotrifluoroethene
Methyl methacrylate
Styrene
Tetrafluoroethylene
Vinyl acetate
Vinyl acetylene
Vinyl chloride
Vinyl pyridine

TESTS FOR THE PRESENCE OF PEROXIDES

Thomas J. Bruno and Paris D. N. Svoronos

Peroxides may be detected qualitatively with one of the following test procedures^{1,2}:

Ferrithiocyanate Test:

Reagent Preparation, in sequence:

Add 9 g $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$ to 50 mL 18 percent (vol/vol) $\text{HCl}_{(\text{aq})}$
add 1-3 mg granular Zn
add 5 g NaSCN

After the red color fades, add an additional 12 g NaSCN, decant leaving unreacted Zn.

Upon mixing this reagent with a peroxide-containing liquid, the colorless solution will produce a red color, the result of the conversion of ferrothiocyanide to ferrithiocyanide. This test is very sensitive, and can be used to detect peroxides at a concentration of 0.001 percent (mass/mass).

Potassium Iodide Test:

Reagent Preparation:

Make a 10 percent (mass/mass) solution of KI in water.

Upon mixing this reagent with a peroxide-containing liquid, a yellow color will appear within one minute.

References

2. Bruno, T. J., and Svoronos, P. D. N., *CRC Handbook of Basic Tables for Chemical Analysis*, 3rd. Ed., CRC Press, Boca Raton, FL, 2011.

Acidic Iodide Test:

Reagent Preparation:

To 1 mL of glacial acetic acid, add 100 mg KI or NaI.

Upon mixing this reagent with an equal volume of a peroxide-containing liquid, a yellow coloration will appear. The color will appear dark or even brown if the peroxide concentration is very high.

Perchromate Test:

Reagent Preparation:

Dissolve 1 mg of $\text{Na}_2\text{Cr}_2\text{O}_7$ in 1 mL of water, add a drop of dilute $\text{H}_2\text{SO}_{4(\text{aq})}$. Upon mixing this reagent with a peroxide-containing liquid, a blue color will develop in the organic layer indicating the formation of the perchromate ion.

PYROPHORIC COMPOUNDS – COMPOUNDS THAT ARE REACTIVE WITH AIR

Thomas J. Bruno and Paris D. N. Svoronos

The following listing provides the classes of compounds, with some examples, that can undergo spontaneous reaction upon exposure to air (Refs. 1 to 4). In some cases the reaction is vigorous, while in others, the reaction is more subdued, or will only occur if other conditions (such as temperature, humidity, or a reactive surface) are present. The reader is advised to check the literature for more specific information.

Alkali metals* (sodium, potassium, potassium/sodium alloy, lithium/tin alloys)
Alkylaluminum derivatives (diethylaluminum hydride)
Alkylated metal alkoxides (diethylethoxyaluminum)
Alkylboranes
Alkylhaloboranes (bromodimethyl borane)
Alkylhalophosphines
Alkylhalosilanes
Alkyl metals
Alkyl non-metal hydrides
Boranes (diborane)
Carbonyl metals (pentacarbonyl iron, octacarbonyl dicobalt, nickel carbonyl)

Complex acetylides
Complex hydrides (diethylaluminum hydride)
Finely divided metals* (calcium, zirconium)
Grignard reagents
Haloacetylene derivatives
Hexamethylnitrato dialuminum salts
Metal hydrides (germane, sodium hydride, lithium aluminum hydride)
Non-metal hydrides
Some nonmetal (organic) halides (dichloro(methyl)silane)
Spent hydrogenation catalysts (can be especially hazardous because of adsorbed hydrogen; for example, Raney nickel)
White phosphorus

*Note that the reactivity depends on the particle size and the ease at which oxides are formed on the metal surface.

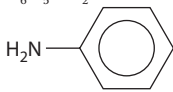

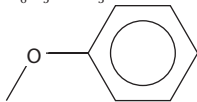

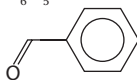

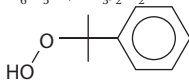

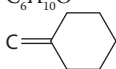

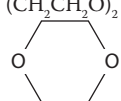

FLAMMABILITY HAZARDS OF COMMON SOLVENTS

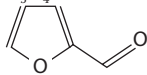

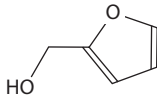

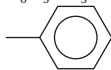

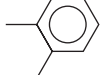

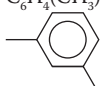

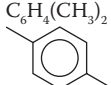

Thomas J. Bruno and Paris D.N. Svoronos

The following table lists relevant data regarding the flammability of common organic solvents (Ref. 1).

SELECTION OF LABORATORY GLOVES

Thomas J. Bruno and Paris D. N. Svoronos

The following table provides guidance in the selection of protective gloves for laboratory use (Refs. 1–5). If protection from more than one class of chemical is required, double gloving should be considered.

Glove Material	Resistant to:
Viton	PCBs, chlorinated solvents, aromatic solvents
Viton/Butyl	acetone, toluene, aromatics, aliphatic hydrocarbons, chlorinated solvents, ketones, amines and aldehydes
SilverShield and 4H (PE/EVAL)	morpholine, vinyl chloride, acetone, ethyl ether, many toxic solvents and caustics
Barrier	wide range of chlorinated solvents, aromatic acids
PVA	ketones, aromatics, chlorinated solvents, , xylene, MIBK, trichloroethylene; DO NOT USE WITH WATER/AQUEOUS SOLUTIONS
Butyl	aldehydes, ketones, esters, alcohols, most inorganic acids, caustics, dioxane
Neoprene	oils, grease, petroleum-based solvents, detergents, acids, caustics, alcohols, solvents
PVC	acids, caustics, solvents, solvents, grease, oil
Nitrile	oils, fats, acids, caustics, alcohols
Latex	body fluids, blood, acids, alcohols, alkalis
Vinyl	body fluids, blood, acids, alcohols, alkalis
Rubber	organic acids, some mineral acids, caustics, alcohols; not recommended for aromatic solvents, chlorinated solvents

SELECTION OF PROTECTIVE LABORATORY GARMENTS

Thomas J. Bruno and Paris D. N. Svoronos

The following table provides guidance in the selection of special protective garments that are used in the laboratory for specific tasks (Refs. 1 and 2).

References

Material	Type of Garment	Common Use
Cotton/Natural Fiber/Blends	Coveralls; lab coats; sleeve protectors; aprons	For dry dusts, particulates and aerosols
Tyvek	Coveralls; lab coats; sleeve protectors; aprons; hoods	For dry dusts and aerosols
Saranax/Tyvek SL	Coveralls; lab coats; sleeve protectors; aprons; hoods; level B suits	Aerosols; liquids; solvents
Polyethylene	Barrier gowns; aprons	Body fluids
Polypropylene	Clean room suits; coveralls; lab coats	For dry dusts; non-toxic particulates
Polyethylene/Tyvek (QC)	Coveralls; aprons; lab coats; shoe covers	Moisture; solvents
Polypropylene	Coveralls; lab coats; shoe covers; caps; clean room suits	Non-toxic particulates; dry dusts
Tychem BR; Tychem TK	Full level A and level B suits	Highly toxic particulates; dry dusts
CPF	Full level A and level B suits; splash suits	Highly toxic chemicals; gases; aerosols
PVC	Full level A suits	Highly toxic chemicals; gases; aerosols

SELECTION OF RESPIRATOR CARTRIDGES AND FILTERS

Thomas J. Bruno and Paris D.N. Svoronos

Respirators are sometimes desirable or required when performing certain tasks in the laboratory, provided adequate ventilation prevents asphyxiation or oxygen deficiency conditions from developing. Oxygen deficiency conditions require the use of a self-contained breathing apparatus or a hose mask with blower. There is a standardized color code system used by all manufacturers for the specification and selection of the cartridges and filters that are used with respirators (Ref. 1). The following table provides guidance in the selection of the proper cartridge using the color code. We note that the use of respirators in the laboratory is subject to regulation and management. In the United States, for example, before a respirator can be used, a medical evaluation must be performed to establish that the user has sufficient lung capacity and

that the use of the respirator would not cause health problems. This evaluation must be performed by a physician or nurse, and if performed by a nurse, the evaluation must be approved and signed by a physician. The respirator must be fitted properly by an industrial hygienist or other trained personnel, and that fitting procedure must adhere to an established protocol with approved equipment. Finally, training by an industrial hygienist or other appropriate personnel must be provided.

Reference

1. Bruno, T. J., and Svoronos, P. D. N., *CRC Handbook of Basic Tables for Chemical Analysis*, 3rd. Ed., CRC Press, Boca Raton, FL, 2011.

Color Code	Application
Gray	Organic vapors, ammonia, methylamine, chlorine, hydrogen chloride, and sulfur dioxide or hydrogen sulfide (for escape only) or hydrogen fluoride or formaldehyde.
Black	Organic vapors, not to exceed regulatory standards.
Yellow	Organic vapors, chlorine, chlorine dioxide, hydrogen chloride, hydrogen fluoride, sulfur dioxide, or hydrogen sulfide (for escape only).
White	Chlorine, hydrogen chloride, hydrogen chloride, hydrogen fluoride, sulfur dioxide, or hydrogen sulfide (for escape only).
Green	Ammonia and methylamine.
Orange	Mercury and/or chlorine.
Purple	Solid and liquid aerosols and mists.
Purple + gray	Organic vapors, ammonia, methylamine, chlorine, hydrogen chloride, and sulfur dioxide or hydrogen sulfide (for escape only) or hydrogen fluoride or formaldehyde; solid and liquid aerosols and mists.
Purple + black	Organic vapors, and solid and liquid aerosols and mists.
Purple + yellow	Organic vapors, chlorine, chlorine dioxide, hydrogen chloride, hydrogen fluoride, sulfur dioxide, or hydrogen sulfide (for escape only); solid and liquid aerosols and mists.
Purple + white	Chlorine, hydrogen chloride, hydrogen chloride, hydrogen fluoride, sulfur dioxide, or hydrogen sulfide (for escape only); solid and liquid aerosols and mists.
Purple + green	Ammonia, methylamine, and solid and liquid aerosols and mists.

In addition to the cartridges specified in the table, particulate filters are available that can be used alone or in combination with those cartridges specified.

MATERIALS COMPATIBLE WITH AND RESISTANT TO 72 PERCENT PERCHLORIC ACID

Thomas J. Bruno and Paris D. N. Svoronos

Perchloric acid is used in the preparation of ion pairing agents for HPLC (see Section 8 dealing with this topic), and must be handled with great care since it can be a very powerful oxidizing agent. Cold perchloric acid at a concentration of 70 percent (mass/mass) or less is not considered a very strong oxidizing agent. At concentrations of 73 percent or higher, or at lower concentrations but at higher temperatures, perchloric acid is a powerful oxidant. The

following table provides some guidance in handling this material in the laboratory (Ref. 1).

Plastics
Polyamide (nylon)
Modacrylic ester, Dynel (35–85%) acrylonitrile
Polyester (dacron)
Bakelite
Lucite
Micarta
Cellulose-based lacquers, Metals
Copper
Copper alloys (brass, bronze, etc.) for very shock-sensitive perchlorate salts
Aluminum (dissolves at room temperature)
High nickel alloys (dissolves), Others
Cotton
Wood
Glycerin-lead oxide (letharge)

PROTECTIVE CLOTHING LEVELS

Thomas J. Bruno and Paris D. N. Svoronos

In the United States, OSHA defines various levels of protective clothing, and sets parameters that govern their use with chemical spills and in environments where chemical exposure is a possibility. A summary of the definitions is provided below (Refs. 1 and 2).

References

1. OSHA Technical Manual, Section VIII, Chapter 1, Chemical Protective Clothing, 2003.
2. Bruno, T. J., and Svoronos, P. D. N., *CRC Handbook of Basic Tables for Chemical Analysis*, 3rd. Ed., CRC Press, Boca Raton, FL, 2011.

Level A:

Vapor protective suit (meets NFPA 1991), pressure-demand, full-face SCBA, inner chemical-resistant gloves, chemical-resistant safety boots, two-way radio communication.

Protection Provided: Highest available level of respiratory, skin, and eye protection from solid, liquid and gaseous chemicals.

Used When: The chemical(s) have been identified and have high level of hazards to respiratory system, skin and eyes; substances are present with known or suspected skin toxicity or carcinogenicity; operations must be conducted in confined or poorly ventilated areas.

Limitations: Protective clothing must resist permeation by the chemical or mixtures present.

Level B:

Liquid splash-protective suit (meets NFPA 1992), pressure-demand, full-facepiece SCBA, inner chemical-resistant gloves, chemical-resistant safety boots, two-way radio communications.

Protection Provided: Provides same level of respiratory protection as Level A, but somewhat less skin protection. Liquid splash protection is provided, but not protection against chemical vapors or gases.

Used When: The chemical(s) have been identified but do not require a high level of skin protection; the primary hazards associated with site entry are from liquid and not vapor contact.

Limitations: Protective clothing items must resist penetration by the chemicals or mixtures present.

Level C:

Support function protective garment (meets NFPA 1993), full-facepiece, air-purifying, canister-equipped respirator, chemical resistant gloves and safety boots, two-way communications system.

Protection Provided: The same level of skin protection as Level B, but a lower level of respiratory protection; liquid splash protection but no protection to chemical vapors or gases.

Used When: Contact with site chemical(s) will not affect the skin; air contaminants have been identified and concentrations measured; a canister is available which can remove the contaminant; the site and its hazards have been completely characterized.

Limitations: Protective clothing items must resist penetration by the chemical or mixtures present; chemical airborne concentration must be less than IDLH levels; the atmosphere must contain at least 19.5% oxygen.

Not Acceptable for Chemical Emergency Response.

Level D:

Coveralls, safety boots/shoes, safety glasses or chemical splash goggles

Protection Provided: No respiratory protection, minimal skin protection.

Used When: The atmosphere contains no known hazard; work functions preclude splashes, immersion, potential for inhalation, or direct contact with hazard chemicals.

Limitations: The atmosphere must contain at least 19.5% oxygen.

Not Acceptable for Chemical Emergency Response

Optional items may be added to each level of protective clothing. Options include items from higher levels of protection, as well as hard-hats, hearing protection, outer gloves, a cooling system, etc.

CHEMICAL FUME HOODS AND BIOLOGICAL SAFETY CABINETS

Thomas J. Bruno

Engineered safety equipment is preferred over the reliance on personal protective equipment, and the fume hood is one such engineered safety device that is nearly ubiquitous in laboratories. Laboratories concerned with biological specimens (microbes, spores) also commonly are equipped with biological safety cabinets. The following section provides basic information on the function and application of these devices. The purpose here is not to provide design or installation instructions, since most users will find this equipment already installed in their work spaces. Rather, this information is to allow optimal use to be made of the installation that is preexisting.

Types of Chemical Fume Hoods

Most of the chemical fume hoods considered here consist of a cabinet or enclosure set at waist level (above a table or storage cabinet) that is connected to a blower located above the hood or external to the hood through a duct system. The cabinet has an open side (or sides) to allow a user to perform work within. A movable transparent sash separates the user from the work. Most chemical fume hoods have a sill that functions as an airfoil at the work surface below the sash. The connection to the blower might be by use of a v-belt, or it may be direct drive. This allows provision of a smooth flow of air with minimal turbulence. In some installations, axially mounted blowers are used, especially if multiple hoods are ducted into a common blower. Baffles located in the rear of the cabinet provide control of the air flow patterns, and can usually be adjusted to provide the best air flow around the experiment or procedure being performed. Many chemical fume hoods are equipped with air flow indicators, low flow monitors and alarms, and differential pressure sensors to allow the user to operate safely. The major types of chemical fume hoods include the standard/conventional, walk-in, bypass, variable air volume, auxiliary air, or ductless types. Additional types include snorkels and canopies that are portable. Each type must be understood to be operated most efficiently within specifications (see the section below on safe operation).

Standard or Conventional:

The standard chemical fume hood utilizes a constant speed motor, and for this reason the volume of air drawn into the hood will change with movement of the sash position. As the sash is lowered, the velocity of the air drawn into the hood will increase.

Bypass:

The bypass chemical fume hood is very similar to the standard/conventional hood except that as the sash is lowered, a vent is opened above the sash to allow additional air flow into the hood. This prevents a large increase in velocity in the working area inside the hood.

Variable Air Volume:

The variable volume chemical fume hood controls the volume of air drawn into the hood as a function of sash position, while maintaining the face velocity of the air at a constant rate, within the specifications required. These types of chemical fume hoods are more energy efficient than the standard or bypass hoods because they minimize costs incurred by laboratory heating and cooling.

Auxiliary Air:

The auxiliary air chemical fume hood includes an additional blower that injects air into or at the face of the hood, providing additional flow inside the enclosed cabinet. These types of hoods are rarely installed in renovations or new construction, but may be encountered in older laboratories. They are less desirable than the standard/conventional, bypass or variable volume types because they require a great deal of energy to operate (although the early designs featured the addition of an auxiliary air stream that was not air conditioned). These devices are mechanically more complex than other types, and consequently more prone to maintenance problems.

Walk-In Hood:

The walk-in hood is a chemical fume hood that is mounted directly on the laboratory floor or a slightly raised chemical resistance platform. It is used for the ventilation of larger pieces of equipment, with the advantage that these pieces of equipment can be wheeled in and out of the walk-in hood. The walk-in hood typically uses two separate sashes.

Ductless Hoods:

This type of chemical fume hood does not duct the air flow to outside the laboratory, but rather the air flow is returned to the room or interstitial space after passing through a means to remove contaminants. The contaminants may be removed by HEPA filters, activated carbon cartridges, adsorbents, or catalyst beds. The means of contaminant removal must be inspected and serviced at regular intervals.

Laminar Flow Hood (Clean Bench):

Related at least in principle to ductless hoods are laminar flow hoods, sometimes called clean hoods. These are devices intended to protect the work being performed from particulates in the air, which is accomplished by bathing the work area with HEPA filtered air either blown at low velocity over the work area or blown from the bottom of the hood as an air curtain. Only approximately 10 % of the air flow is through the face of the hood. These are intended to protect the work or samples inside the hood, not primarily the user. These units should not be used in place of chemical fume hoods, rather they are used to protect the work from dust or pollen.

Snorkels and Canopies:

Snorkels are flexible ducts routed from a blower duct that can be placed temporarily atop or near an experiment to provide some measure of protection. A canopy is similar, but it incorporates an additional bell shaped collector that might be suspended above an experiment, but for the same purpose as that for the snorkel.

Chemical Fume Hood Operations

While the operation of chemical fume hoods is straightforward, safe operating practices must be observed. The face velocities should be optimized at between 80 and 120 fpm. Face velocities in excess of 125 fpm can cause turbulent flow and allow outflow of contaminants from the hood and potentially expose the user to hazards. Face velocities are checked periodically by facilities managers. Ideally, chemical fume hoods are located in low traffic areas of the laboratory, away from entry doors. Safe operation of chemi-

cal fume hoods requires observance of the following practices, divided into primary (applicable to all installations) and secondary (applicable on a case by case basis):

Primary Guidelines:

- Before using the chemical fume hood, ensure that it is in working order. A simple air flow test can be done with a laboratory wipe, or one can observe the flow monitor if one is present. Be aware of clattering sounds that might indicate a broken belt, or screeching sounds that might indicate a failed or failing bearing.
- The motor of the chemical fume hood should be running at all times, except for maintenance. If a switch is located inside the laboratory, it should be equipped with a lockout to protect maintenance staff.
- Users should perform all work at least six inches inside the plane of the sash
- The user should avoid placing his/her head inside the chemical fume hood, beyond the plane of the sash.
- Laboratory occupants should avoid traffic in front of the chemical fume hood to minimize turbulence.
- Users should avoid rapid movements in front of the chemical fume hood; this includes rapidly raising and lowering the sash.
- Keep the sash closed down as far as possible.
- The baffles of the chemical fume hood should be free of obstruction.
- If a heating device such as a hot plate is being used in the hood, the interior air flow can be dramatically changed by convection. In those instances, the lower baffles of the hood should be closed or minimized and the middle baffles fully opened to accommodate the convection.
- Equipment located inside the cabinet that can potentially disrupt the air flow should be raised above the level of the lower baffles by a small shelf or blocks.
- Hoses and power cords that must be run into the chemical fume hood from the outside should be run through the airfoil beneath the sash.

Secondary Guidelines:

- Some chemical fume hoods have a small cup sink located inside the cabinet. Water should be run into this sink periodically to maintain it free of obstruction and to keep the P-trap full and thereby prevent sewer gas back up.
- It is imperative to prevent the discharge of chemicals into the cup sink.
- Some chemical fume hoods have compressed air lines that allow the use of air operated equipment such as vortex tubes (for heating and cooling). When using vortex tubes inside a fume hood, the sash should be fully closed because additional air flow inside the hood is present.
- In a power outage, lower the sash to within an inch of the fully closed position.
- Evaporations and digestions with perchloric acid must only be done in a specifically designed and designated perchloric acid chemical fume hood. The same considerations apply for the use of radionuclides and infectious agents.

Types of Biological Safety Cabinets (BSC):

Biological safety cabinets, as distinct from chemical fume hoods, are enclosed ventilated cabinets intended to provide both a

clean and a safe working environment for aerosols and biological hazards. All exhaust air is HEPA-filtered as it exits the biosafety cabinet, removing harmful bacteria and viruses. The Centers for Disease Control (U.S.) lists three classes of biological safety cabinets, Classes I, II, and III.

Class I cabinets are open front negative pressure cabinets that provide personnel and environmental protection but do not provide protection to the sample or media (the product) being used in the cabinet. There is air flow into the cabinet (at a face velocity of 75 fpm) that can potentially cause sample contamination. Class I cabinets are often used to enclose specific equipment (centrifuges, harvesting equipment or fermenters) or ongoing procedures (cultures) that potentially generate aerosols. BSCs of this class are either ducted (connected to the building exhaust system) or unducted (recirculating HEPA-filtered exhaust back into the laboratory, provided there is an interlock with the building exhaust system). Some Class I cabinets are used for animal cage changing and these typically require frequent HEPA filter changes due to odoriferous compounds saturating the filter.

A Class II biological safety cabinet provides protection for both the worker and the sample or product, making it suitable as a sterile compartment for cell culture. This type of cabinet is the most versatile and most common, with face velocities similar to those of Class I. There are four types of Class II cabinets, the main features of which are discussed below. Note that there are additional differences among the types in Class II (types A1, A2, B1 and B2), primarily concerning the geometry of the air flows and placement of HEPA filters.

Type A1 (formerly Type A) does not have to be duct vented (although it is possible to connect to building ventilation systems by use of canopy exhaust connections), which makes it suitable for use in laboratories inaccessible to ductwork. This cabinet can be used for use of low to moderate hazard agents that do not include volatile toxic chemicals and volatile radionuclides. The supply air is HEPA filtered to present the sample or media being used with a particulate free air stream with a face velocity of at least 75 fps. This type of BSC cannot be used for volatile and toxic compounds and solvents because small quantities of these materials can quickly load the filter. Type A2 differs from Type A1 in that protection of the operator and the environment is only afforded if the exhaust line is canopy vented to the building exhaust. The face velocities of these units are at least 100 fps.

Type B1 cabinets must be hard vented, with 50 % of the air exhausted from the cabinet while 50 % can be recirculated back into the room. This cabinet may be used with etiologic agents and traces of volatile and toxic chemicals and radionuclides required as an adjunct to microbiological studies (if the work is done in the directly exhausted portion of the cabinet). The air intake velocity of the B1 type is specified to be 100 fps. Type B2 cabinets are must be 100 % exhausted through a dedicated duct. The air intake velocity is specified to be 100 fps. This cabinet may be used with etiologic agents treated with toxic chemicals and radionuclides required as an adjunct to microbiological studies.

The Class III cabinet is designed for highly infectious microbial agents. It is entirely gas tight, with a non-operating view window (cannot be opened). Access to the interior is through a dunk tank accessible through the floor of the cabinet or through a double door system. Both the supply and exhaust gas streams pass through HEPA filters. Heavy duty rubber gloves are used for manipulations in the interior of the cabinet.

GAS CYLINDER SAFETY AND STAMPED MARKINGS

Thomas J. Bruno and Paris D. N. Svoronos

The graphic below describes the permanent, stamped markings that are used on high-pressure gas cylinders commonly found in laboratories (Ref. 1). Note that individual jurisdictions and institutions have requirements for marking the cylinder contents as well. These requirements are in addition to the stamped markings, which pertain to the cylinder itself rather than to the fill contents (Ref. 2).

There are four fields of markings on cylinders that are used in the United States, labeled 1-4 on the figure.

Field 1 – Cylinder Specifications:

DOT stands for the United States Department of Transportation, the agency that regulates the transport and specification of gas cylinders in the United States. The next entry, for example, 3AA, is the specification for the type and material of the cylinder. The most common cylinders are 3A, 3AA, 3AX, 3AAX, 3T, and 3AL. All but the last refer to steel cylinders, while 3AL refers to aluminum. The individual specifications differ mainly in chemical composition of the steel, and the gases that are approved for containment and transport. The 3T deals with large bundles of tube trailer cylinders.

The next entry in this field is the service pressure, in psig.

Field 2 – Serial Number:

This is a unique number assigned by the manufacturer.

Field 3 – Identifying Symbol:

The manufacturer identifying symbol historically can be a series of letters or a unique graphical symbol. In recent years, the DOT has standardized this identification with the “M” number, for example, M1004. This is a number issued by DOT that identifies the cylinder manufacturer.

Field 4 – Manufacturing Data:

The data of manufacture is provided as a month and year. With this date is the inspector’s official mark, for example, H. In recent years, this letter has been replaced with an IA number, for example IA02, pertaining to an independent agency that is approved by DOT as an inspector.

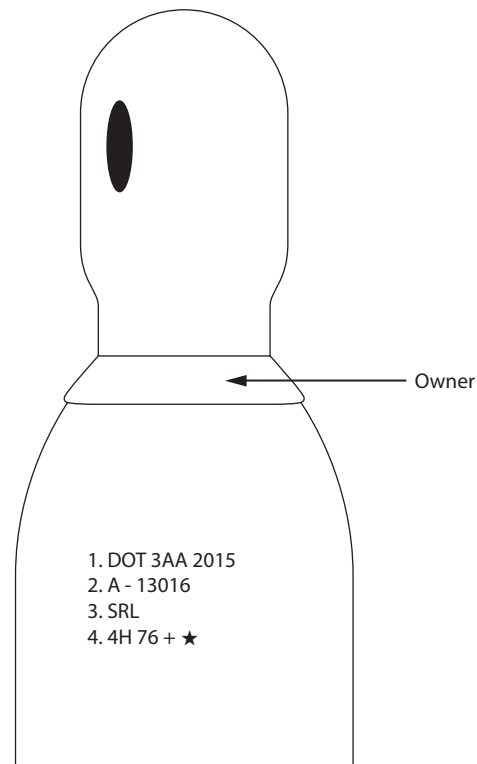

If “+” is present, the cylinder qualifies for an overfill of 10 percent in service pressure.

If “★” is present, the cylinder qualifies for a 10 year rather than a 5 year retest interval.

In some cases, the original insignia of the inspector that performed the first hydrostatic test is found below Field 4. Also stamped on the cylinder will be the retest dates. A cylinder must have a current (that is, within 5 or 10 years) test stamp. On the collar of the cylinder, the owner of the cylinder may be stamped.

FLAMMABILITY OF CHEMICAL SUBSTANCES

This table gives properties related to the flammability of about 900 chemical substances. The properties listed are:

t_b :	Normal boiling point in °C (at 101.325 kPa pressure).
FP:	Flash point, which is the minimum temperature at which the vapor pressure of a liquid is sufficient to form an ignitable mixture with air near the surface of the liquid. Flash point is not an intrinsic physical property but depends on the conditions of measurement (see Reference 1).
Fl. limits:	Flammable limits (often called explosive limits), which specify the range of concentration of the vapor in air (in percent by volume) for which a flame can propagate. Below the lower flammable limit, the gas mixture is too lean to burn; above the upper flammable limit, the mixture is too rich. Values refer to ambient temperature and pressure and are dependent on the precise test conditions. A ? indicates that one of the limits is not known.
IT:	Ignition temperature (sometimes called autoignition temperature), which is the minimum temperature required for self-sustained combustion in the absence of an external ignition source. As in the case of flash point, the value depends on specified test conditions.

Even in cases where very careful measurements of flash point have been replicated in several laboratories, observed values can differ by 3 to 6 °C (Reference 4). For more typical measurements, larger uncertainties should be assumed in both flash points and autoignition temperatures. The absence of a flash point entry in this table does not mean that the substance is nonflammable, but only that no reliable value is available.

Compounds are listed by molecular formula following the Hill convention. Substances not containing carbon are listed first, followed by those that contain carbon. To locate an organic compound by name or CAS Registry Number when the molecular formula is not known, use the table "Physical Constants of Organic Compounds" in Section 3 and its indexes to determine the molecular formula.

THRESHOLD LIMITS FOR AIRBORNE CONTAMINANTS

Several organizations recommend limits of exposure to airborne contaminants in the workplace. These include the Occupational Safety and Health Administration (OSHA), the National Institute for Occupational Safety and Health (NIOSH), and the non-governmental organization, American Conference of Governmental Industrial Hygienists (ACGIH). The threshold limit value (TLV) for a substance (also known as permissible exposure limit, PEL) is defined as the concentration level under which the majority of workers may be repeatedly exposed, day after day, without adverse effects. The TLV recommendations are given in two forms:

- Time-weighted average (TWA) concentration for a normal 8-hr workday and 40-hr workweek.
- Short-term exposure limit (STEL), which should not be exceeded for more than 15 min.

Both kinds of limits are specified for some substances.

The following table gives threshold limit values for a number of substances that may be encountered in the atmosphere of a chemical laboratory or industrial facility. All values refer to the concentration in air at 25 °C and normal atmospheric pressure. Data for gases are given in parts per million by volume (ppm). Values for liquids refer to mists or aerosols, and those for solids to dusts or fumes; both are stated in mass concentration units (mg/m³). In some cases the Comments column includes the statement “Ceiling value”, which in-

dicates a ceiling limit that should not be exceeded even for very brief periods because of acute toxic effects of the substance. The notation “levels as low as possible” in the Comments column indicates such a high degree of hazard that no safe limit can be recommended. The notation NIC 2015 indicates that changes will be made in 2015.

Substances are listed alphabetically by systematic name. The Comments column gives common synonyms (in brackets) and further information on the physical form of the substance and the basis to which the limit is referred. The Formula column gives the molecular formula in the Hill convention for organic compounds and the customary line formula for inorganic compounds. The TWA and STEL limits appear in the last two columns.

Name	Comments	Formula	CAS Reg. No.	Time-weighted average	Short-term exposure limit
Abate	[Temephos]	C ₁₆ H ₂₀ O ₆ P ₂ S ₃	3383-96-8	10 mg/m ³	
Acetaldehyde	[Ethanal] Ceiling value	CH ₃ CHO	75-07-0		25 ppm
Acetic acid	[Ethanoic acid]	CH ₃ COOH	64-19-7	10 ppm	15 ppm
Acetic anhydride	[Acetyl acetate]	C ₄ H ₆ O ₃	108-24-7	1 ppm	3 ppm
Acetone	[2-Propanone] NIC 2015	(CH ₃) ₂ CO	67-64-1	500 ppm	750 ppm
Acetone cyanohydrin	as CN. Ceiling value	C ₄ H ₇ NO	75-86-5		5 mg/m ³
Acetonitrile	[Methyl cyanide]	CH ₃ CN	75-05-8	20 ppm	
Acetophenone	[Methyl phenyl ketone]	C ₈ H ₈ O	98-86-2	10 ppm	
2-(Acetyloxy)benzoic acid	[Acetylsalicylic acid (Aspirin)]	C ₉ H ₈ O ₄	50-78-2	5 mg/m ³	
Acrolein	[2-Propenal] Ceiling value	CH ₂ =CHCHO	107-02-8		0.1 ppm
Acrylamide	[2-Propenamide]	C ₃ H ₅ NO	79-06-1	0.03 mg/m ³	
Acrylic acid	[2-Propenoic acid]	C ₃ H ₄ O ₂	79-10-7	2 ppm	
Acrylonitrile	[Propenenitrile]	CH ₂ =CHCN	107-13-1	2 ppm	
Alachlor	[Acetamide, 2-chloro-N-(2,6-diethylphenyl)-N-(methoxymethyl)-]	C ₁₄ H ₂₀ ClNO ₂	15972-60-8	1 mg/m ³	
Aldrin	inhalable fraction & vapor	C ₁₂ H ₈ Cl ₆	309-00-2	0.05 mg/m ³	
Allyl alcohol	[2-Propen-1-ol]	C ₃ H ₆ O	107-18-6	0.5 ppm	
Allyl glycidyl ether	[AGE]	C ₆ H ₁₀ O ₂	106-92-3	1 ppm	
Allyl propyl disulfide		C ₆ H ₁₂ S ₂	2179-59-1	0.5 ppm	
Aluminum	metal dust and insoluble compounds	Al	7429-90-5	1 mg/m ³	
4-Aminobiphenyl	[p-Biphenylamine]; levels as low as possible	C ₁₂ H ₁₁ N	92-67-1		
4-Amino-3,5,6-trichloro-2-pyridinecarboxylic acid	[Picloram]	C ₆ H ₃ Cl ₃ N ₂ O ₂	1918-02-1	10 mg/m ³	
Ammonia		NH ₃	7664-41-7	25 ppm	35 ppm
Ammonium chloride	[Sal ammoniac]; fume	NH ₄ Cl	12125-02-9	10 mg/m ³	20 mg/m ³
Ammonium perfluorooctanoate		C ₈ H ₄ F ₁₅ NO ₂	3825-26-1	0.01 mg/m ³	
Ammonium sulfamate		NH ₄ NH ₂ SO ₃	7773-06-0	10 mg/m ³	
Aniline	[Benzenamine]	C ₆ H ₅ NH ₂	62-53-3	2 ppm	
Antimony	and compounds, as Sb	Sb	7440-36-0	0.5 mg/m ³	
Antimony(III) oxide (senarmontite)	[Senarmontite]; levels as low as possible	Sb ₂ O ₃	1309-64-4		
Arsenic	and inorganic compounds, as As	As	7440-38-2	0.01 mg/m ³	
Arsine	[Arsenic hydride]	AsH ₃	7784-42-1	0.005 ppm	
Asbestos	all forms; limit is 0.1 fibers/mL		1332-21-4		
Asphalt	fume, as aerosol		8052-42-4	0.5 mg/m ³	
Atrazine	[6-Chloro-N-ethyl-N'-(1-methylethyl)-1,3,5-triazine-2,4-diamine]	C ₆ H ₁₄ ClN ₃	1912-24-9	2 mg/m ³	
Azinphos-methyl	inhalable fraction & vapor	C ₁₀ H ₁₂ N ₂ O ₃ PS ₂	86-50-0	0.2 mg/m ³	
Barium	and soluble compounds, as Ba	Ba	7440-39-3	0.5 mg/m ³	

Name	Comments	Formula	CAS Reg. No.	Time-weighted average	Short-term exposure limit
Barium sulfate	[Barite]	BaSO ₄	7727-43-7	5 mg/m ³	
Benomyl	inhalable fraction	C ₁₄ H ₁₈ N ₄ O ₃	17804-35-2	1 mg/m ³	
Benz[<i>a</i>]anthracene	[1,2-Benzanthracene]; levels as low as possible	C ₁₈ H ₁₂	56-55-3		
Benzene		C ₆ H ₆	71-43-2	0.5 ppm	2.5 ppm
1,2-Benzenediamine	[<i>o</i> -Phenylenediamine]	C ₆ H ₈ N ₂	95-54-5	0.1 mg/m ³	
1,3-Benzenediamine	[<i>m</i> -Phenylenediamine]	C ₆ H ₈ N ₂	108-45-2	0.1 mg/m ³	
1,4-Benzenediamine	[<i>p</i> -Phenylenediamine]	C ₆ H ₈ N ₂	106-50-3	0.1 mg/m ³	
1,3-Benzenedimethanamine	[<i>m</i> -Xylene diamine] Ceiling value	C ₈ H ₁₂ N ₂	1477-55-0		0.1 mg/m ³
Benzenethiol	[Phenyl mercaptan]	C ₆ H ₅ SH	108-98-5	0.1 ppm	
<i>p</i> -Benzidine	[[1,1'-Biphenyl]-4,4'-diamine]; levels as low as possible	C ₁₂ H ₁₂ N ₂	92-87-5		
Benzo[<i>b</i>]fluoranthene	[Benz[<i>e</i>]acephenanthrylene]; levels as low as possible	C ₂₀ H ₁₂	205-99-2		
Benzo[<i>a</i>]pyrene	[2,3-Benzopyrene]; levels as low as possible	C ₂₀ H ₁₂	50-32-8		
<i>p</i> -Benzoquinone	[2,5-Cyclohexadiene-1,4-dione]	C ₆ H ₄ O ₂	106-51-4	0.1 ppm	
Benzoyl chloride	[Benzoic acid, chloride] Ceiling value	C ₆ H ₅ COCl	98-88-4		0.5 ppm
Benzoyl peroxide		C ₁₄ H ₁₀ O ₄	94-36-0	5 mg/m ³	
Benzyl acetate	[(Acetoxymethyl)benzene]	C ₉ H ₁₀ O ₂	140-11-4	10 ppm	
Beryllium	and compounds, as Be	Be	7440-41-7	0.00005 mg/m ³	
Biphenyl	[Diphenyl]	C ₁₂ H ₁₀	92-52-4	0.2 ppm	
Bis(2-aminoethyl)amine	[Diethylenetriamine]	C ₄ H ₁₃ N ₃	111-40-0	1 ppm	
Bis(2-chloroethyl) ether	[Dichloroethyl ether]	C ₄ H ₈ Cl ₂ O	111-44-4	5 ppm	10 ppm
Bis(chloromethyl) ether	[Chloromethyl ether]	C ₂ H ₄ Cl ₂ O	542-88-1	0.001 ppm	
Bis(2-dimethylaminoethyl) ether	[2,2'-Oxybis(<i>N,N</i> -dimethylethanamine) (DMAEE)]	C ₈ H ₂₀ N ₄ O	3033-62-3	0.05 ppm	0.15 ppm
Bis(2-ethylhexyl) phthalate	[Di- <i>sec</i> -octyl phthalate (DEHP)]	C ₂₄ H ₃₈ O ₄	117-81-7	5 mg/m ³	
Bismuth telluride	[Tetradymite]	Bi ₂ Te ₃	1304-82-1	10 mg/m ³	
Boric acid	[Orthoboric acid]; and inorganic borate compounds	H ₃ BO ₃	10043-35-3	2 mg/m ³	6 mg/m ³
Boron oxide	[Boric oxide]	B ₂ O ₃	1303-86-2	10 mg/m ³	
Boron tribromide	[Tribromoborane] Ceiling value	BBr ₃	10294-33-4		1 ppm
Boron trifluoride	[Trifluoroborane] Ceiling value	BF ₃	7637-07-2		1 ppm
Bromacil	[5-Bromo-3- <i>sec</i> -butyl-6-methyluracil]	C ₉ H ₁₃ BrN ₂ O ₂	314-40-9	10 mg/m ³	
Bromine		Br ₂	7726-95-6	0.1 ppm	0.2 ppm
Bromine pentafluoride		BrF ₅	7789-30-2	0.1 ppm	
Bromochloromethane	[Halon 1011]	CH ₂ BrCl	74-97-5	200 ppm	
2-Bromo-2-chloro-1,1,1-trifluoroethane	[Halothane]	C ₂ HBrClF ₃	151-67-7	50 ppm	
Bromoethane	[Ethyl bromide]	C ₂ H ₅ Br	74-96-4	5 ppm	
Bromoethene	[Vinyl bromide]	CH ₂ =CHBr	593-60-2	0.5 ppm	
Bromomethane	[Methyl bromide]	CH ₃ Br	74-83-9	1 ppm	
1-Bromopropane	[Propyl bromide]	C ₃ H ₇ Br	106-94-5	0.1 ppm	
3-Bromopropene	[Allyl bromide]	C ₃ H ₅ Br	106-95-6	0.1 ppm	0.2 ppm
Bromotrifluoromethane	[Halon-1301]	CF ₃ Br	75-63-8	1000 ppm	
1,3-Butadiene	[Divinyl]	C ₄ H ₆	106-99-0	2 ppm	
Butane	both isomers	C ₄ H ₁₀	106-97-8		1000 ppm
2,3-Butanedione	[Diacetyl]	C ₄ H ₆ O ₂	431-03-8	0.01 ppm	0.02 ppm
1-Butanethiol	[Butyl mercaptan]	C ₄ H ₁₀ S	109-79-5	0.5 ppm	
1-Butanol	[Butyl alcohol]	C ₄ H ₁₀ O	71-36-3	20 ppm	
2-Butanol	[<i>sec</i> -Butyl alcohol]	C ₄ H ₁₀ O	78-92-2	100 ppm	
2-Butanone	[Methyl ethyl ketone (MEK)]	C ₄ H ₈ O	78-93-3	200 ppm	300 ppm
2-Butanone peroxide	[Methyl ethyl ketone peroxide] Ceiling value	C ₈ H ₁₆ O ₄	1338-23-4		0.2 ppm
<i>trans</i> -2-Butenal	[<i>trans</i> -Crotonaldehyde] Ceiling value	C ₄ H ₆ O	123-73-9		0.3 ppm
1-Butene	[1-Butylene]	C ₄ H ₈	106-98-9	250 ppm	
<i>cis</i> -2-Butene		C ₄ H ₈	590-18-1	250 ppm	
<i>trans</i> -2-Butene		C ₄ H ₈	624-64-6	250 ppm	
3-Buten-2-one	[Methyl vinyl ketone] Ceiling value	C ₄ H ₆ O	78-94-4		0.2 ppm
2-Butoxyethanol	[Ethylene glycol monobutyl ether (EGBE)]	C ₈ H ₁₈ O ₂	111-76-2	20 ppm	
2-Butoxyethyl acetate	[Ethylene glycol monobutyl ether acetate (EGBEA)]	C ₈ H ₁₆ O ₃	112-07-2	20 ppm	
Butyl acetate		C ₈ H ₁₂ O ₂	123-86-4	150 ppm	200 ppm
<i>sec</i> -Butyl acetate	[1-Methylpropyl acetate]	C ₈ H ₁₂ O ₂	105-46-4	200 ppm	
<i>tert</i> -Butyl acetate		C ₈ H ₁₂ O ₂	540-88-5	200 ppm	
Butyl acrylate	[Butyl 2-propenoate]	C ₇ H ₁₂ O ₂	141-32-2	2 ppm	
Butylamine	[1-Butanamine] Ceiling value	C ₄ H ₁₁ N	109-73-9		5 ppm
<i>tert</i> -Butyl chromate	as CrO ₃ ; Ceiling value	C ₈ H ₁₈ CrO ₄	1189-85-1		0.1 mg/m ³
<i>tert</i> -Butyl ethyl ether	[Ethyl <i>tert</i> -butyl ether (ETBE)]	C ₈ H ₁₈ O	637-92-3	25 ppm	
Butyl glycidyl ether	[BGE]	C ₈ H ₁₄ O ₂	2426-08-6	3 ppm	
Butyl lactate		C ₇ H ₁₄ O ₃	34451-18-8	5 ppm	
1- <i>tert</i> -Butyl-4-methylbenzene	[4- <i>tert</i> -Butyltoluene]	C ₁₁ H ₁₆	98-51-1	1 ppm	
2- <i>sec</i> -Butylphenol		C ₁₀ H ₁₄ O	89-72-5	5 ppm	
Cadmium	metal	Cd	7440-43-9	0.01 mg/m ³	

Name	Comments	Formula	CAS Reg. No.	Time-weighted average	Short-term exposure limit
Cadmium	compounds, as Cd	Cd	7440-43-9	0.002 mg/m ³	
Calcium chromate	as Cr	CaCrO ₄	13765-19-0	0.001 mg/m ³	
Calcium cyanamide	[Calcium carbimide]	CaCN ₂	156-62-7	0.5 mg/m ³	
Calcium hydroxide	[Portlandite]	Ca(OH) ₂	1305-62-0	5 mg/m ³	
Calcium metasilicate	[Parawollastonite]; synthetic, nonfibrous. NIC 2015	CaSiO ₃	1344-95-2	10 mg/m ³	
Calcium oxide	[Lime]	CaO	1305-78-8	2 mg/m ³	
Calcium sulfate	[Anhydrite]	CaSO ₄	7778-18-9	10 mg/m ³	
Camphor, (+)	[1,7,7-Trimethylbicyclo[2.2.1]heptan-2-one, (1 <i>R</i>)-]	C ₁₀ H ₁₆ O	464-49-3	2 ppm	3 ppm
Caprolactam	[6-Hexanelactam]	C ₆ H ₁₁ NO	105-60-2	5 mg/m ³	
Captafol	[Difolatan]	C ₁₀ H ₉ Cl ₄ NO ₂ S	2425-06-1	0.1 mg/m ³	
Captan	inhalable fraction	C ₉ H ₈ Cl ₃ NO ₂ S	133-06-2	5 mg/m ³	
Carbaryl		C ₁₂ H ₁₁ NO ₂	63-25-2	0.5 mg/m ³	
Carbofuran	[7-Benzofuranol, 2,3-dihydro-2,2-dimethyl-, methylcarbamate]	C ₁₂ H ₁₅ NO ₃	1563-66-2	0.1 mg/m ³	
Carbon (graphite)	[Graphite]; except fibers	C	7782-42-5	2 mg/m ³	
Carbon black	[Carbon (amorphous)] inhalable fraction	C	1333-86-4	3 mg/m ³	
Carbon dioxide	[Carbonic anhydride]	CO ₂	124-38-9	5000 ppm	30,000 ppm
Carbon disulfide	[Carbon bisulfide]	CS ₂	75-15-0	1 ppm	
Carbon monoxide	[Carbon oxide]	CO	630-08-0	25 ppm	
Carbon oxysulfide	[Carbonyl sulfide]	OCS	463-58-1	5 ppm	
Carbonyl chloride	[Phosgene]	COCl ₂	75-44-5	0.1 ppm	
Carbonyl fluoride		COF ₂	353-50-4	2 ppm	5 ppm
Cellulose			9004-34-6	10 mg/m ³	
Cesium hydroxide		CsOH	21351-79-1	2 mg/m ³	
Chlordane	[1,2,4,5,6,7,8,8-Octachloro-2,3,3a,4,7,7a-hexahydro-4,7-methano-1 <i>H</i> -indene]	C ₁₀ H ₆ Cl ₈	57-74-9	0.5 mg/m ³	
<i>o</i> -Chlorinated diphenyl oxide			31242-93-0	0.5 mg/m ³	
Chlorine		Cl ₂	7782-50-5	0.5 ppm	1 ppm
Chlorine dioxide		ClO ₂	10049-04-4	0.1 ppm	0.3 ppm
Chlorine trifluoride	Ceiling value	ClF ₃	7790-91-2		0.1 ppm
Chloroacetaldehyde	[2-Chloro-1-ethanal] Ceiling value	C ₂ H ₃ ClO	107-20-0		1 ppm
Chloroacetic acid		CH ₂ ClCOOH	79-11-8	0.5 ppm	
Chloroacetone	Ceiling value	C ₃ H ₅ ClO	78-95-5		1 ppm
α -Chloroacetophenone	[ω -Chloroacetophenone]	C ₈ H ₇ ClO	532-27-4	0.05 ppm	
Chloroacetyl chloride		C ₂ H ₃ Cl ₂ O	79-04-9	0.05 ppm	0.15 ppm
Chlorobenzene	[Phenyl chloride]	C ₆ H ₅ Cl	108-90-7	10 ppm	
<i>o</i> -Chlorobenzylidene malononitrile	Ceiling value	C ₁₀ H ₅ ClN ₂	2698-41-1		0.05 ppm
2-Chloro-1,3-butadiene	[Chloroprene]	C ₄ H ₅ Cl	126-99-8	10 ppm	
Chlorodifluoromethane	[HCFC-22]	CF ₂ HCl	75-45-6	1000 ppm	
Chloroethane	[Ethyl chloride]	C ₂ H ₅ Cl	75-00-3	100 ppm	
2-Chloroethanol	[Ethylene chlorohydrin] Ceiling value	C ₂ H ₅ ClO	107-07-3		1 ppm
Chloroethene	[Vinyl chloride]	CH ₂ =CHCl	75-01-4	1 ppm	
Chloromethane	[Methyl chloride]	CH ₃ Cl	74-87-3	50 ppm	100 ppm
(Chloromethyl)benzene	[Benzyl chloride]	C ₇ H ₇ Cl	100-44-7	1 ppm	
Chloromethyl methyl ether	levels as low as possible	C ₂ H ₅ ClO	107-30-2		
1-Chloro-4-nitrobenzene	[<i>p</i> -Chloronitrobenzene]	C ₆ H ₄ ClNO ₂	100-00-5	0.1 ppm	
1-Chloro-1-nitropropane		C ₃ H ₆ ClNO ₂	600-25-9	2 ppm	
Chloropentafluoroethane	[CFC-115]	CF ₃ CF ₂ Cl	76-15-3	1000 ppm	
2-Chloropropanoic acid	[2-Chloropropionic acid]	C ₃ H ₅ ClO ₂	598-78-7	0.1 ppm	
2-Chloro-1-propanol	[Propylene chlorohydrin]	C ₃ H ₇ ClO	78-89-7	1 ppm	
1-Chloro-2-propanol	[<i>sec</i> -Propylene chlorohydrin]	C ₃ H ₇ ClO	127-00-4	1 ppm	
3-Chloropropene	[Allyl chloride]	C ₃ H ₅ Cl	107-05-1	1 ppm	2 ppm
2-Chlorostyrene		C ₈ H ₇ Cl	2039-87-4	50 ppm	75 ppm
2-Chlorotoluene	[1-Chloro-2-methylbenzene]	C ₇ H ₇ Cl	95-49-8	50 ppm	
Chlorpyrifos	[Phosphorothioic acid, <i>O,O</i> -diethyl <i>O</i> -(3,5,6-trichloro-2-pyridinyl) ester]	C ₉ H ₁₁ Cl ₃ NO ₃ PS	2921-88-2	0.1 mg/m ³	
Chromium	metal	Cr	7440-47-3	0.5 mg/m ³	
Chromium	Cr(III) compounds, as Cr	Cr	7440-47-3	0.5 mg/m ³	
Chromium	soluble Cr(VI) compounds, as Cr	Cr	7440-47-3	0.05 mg/m ³	
Chromium	insoluble Cr(VI) compounds, as Cr	Cr	7440-47-3	0.01 mg/m ³	
Chromium(VI) dichloride dioxide	[Chromyl chloride]	CrO ₂ Cl ₂	14977-61-8	0.025 ppm	
Chrysene	[Benzo[a]phenanthrene]; levels as low as possible	C ₁₈ H ₁₂	218-01-9		
Clopidol	inhalable fraction and vapor	C ₇ H ₇ Cl ₂ NO	2971-90-6	3 mg/m ³	
Coal	dust, anthracite			0.4 mg/m ³	
Coal	dust, bituminous			0.9 mg/m ³	
Coal tar	volatiles, as aerosol		65996-93-2	0.2 mg/m ³	
Cobalt	metal and inorganic compounds, as Co	Co	7440-48-4	0.02 mg/m ³	
Cobalt carbonyl	[Dicobalt octacarbonyl]; as Co	Co ₂ (CO) ₈	10210-68-1	0.1 mg/m ³	

Name	Comments	Formula	CAS Reg. No.	Time-weighted average	Short-term exposure limit
Cobalt hydrocarbonyl	[Tetracarbonylhydrocobalt]; as Co	C ₄ HCoO ₄	16842-03-8	0.1 mg/m ³	
Copper	fume	Cu	7440-50-8	0.2 mg/m ³	
Copper	dusts & mists, as Cu	Cu	7440-50-8	1 mg/m ³	
Cotton	dust			0.1 mg/m ³	
Coumaphos		C ₁₄ H ₁₆ ClO ₅ PS	56-72-4	0.05 mg/m ³	
<i>o</i> -Cresol	[2-Methylphenol]; inhalable fraction & vapor	C ₇ H ₈ O	95-48-7	20 mg/m ³	
<i>m</i> -Cresol	[3-Methylphenol]; inhalable fraction & vapor	C ₇ H ₈ O	108-39-4	20 mg/m ³	
<i>p</i> -Cresol	[4-Methylphenol]; inhalable fraction & vapor	C ₇ H ₈ O	106-44-5	20 mg/m ³	
Cruformate		C ₁₂ H ₁₆ ClNO ₃ P	299-86-5	5 mg/m ³	
Cyanamide	[Cyanogenamide]	H ₂ NCN	420-04-2	2 mg/m ³	
Cyanide ion [CN ⁻]	cyanide salts, as CN. Ceiling value	CN ⁻	57-12-5		5 mg/m ³
Cyanogen	NIC 2015	C ₂ N ₂	460-19-5	10 ppm	
Cyanogen chloride	[Chlorine cyanide] Ceiling value	ClCN	506-77-4		0.3 ppm
Cyclohexane	[Hexahydrobenzene]	C ₆ H ₁₂	110-82-7	100 ppm	
Cyclohexanol	[Cyclohexyl alcohol]	C ₆ H ₁₂ O	108-93-0	50 ppm	
Cyclohexanone	[Pimelic ketone]	C ₆ H ₁₀ O	108-94-1	20 ppm	50 ppm
Cyclohexene	[Tetrahydrobenzene]	C ₆ H ₁₀	110-83-8	300 ppm

LASER HAZARDS IN THE LABORATORY

Thomas J. Bruno and Paris D. N. Svoronos

Lasers are commonly used in the laboratory, although in many instruments, most lasers are embedded in instrumentation and are therefore shielded or protected by optical barriers and interlocks that, when functioning properly, prevent accidental exposure. Care must be exercised when performing maintenance or when changing samples in such instruments. In this section we provide basic information on laser safety and hazards (Refs. 1 to 3). This is by no means exhaustive nor is it meant to substitute for an understanding of the specific safety requirements of instrumentation, or applicable law or regulations. The special case of common laser pointers has received considerable attention recently and is treated separately.⁴ We note that as of 2007, the general practice in the United States is to use the IEC definitions.

Classes of Lasers:

The following is a summary for the laser classes following the ANSI guidelines used in the United States:

Class I

Class I lasers are inherently safe with no possibility of eye damage under conditions of normal use. The safety can result from a low output power (in which case eye damage is impossible even after prolonged exposure), or due to an enclosure preventing user access to the laser beam during normal operation, such as in CD players, laser printers, surveying transits, or measurement instruments.

Class II

The blink reflex of the human eye will prevent eye damage, unless the person deliberately stares into the beam for an extended period. Thus, a Class II laser can cause some eye damage if this is done. Output power may be up to 1 mW. This class includes only lasers that emit visible light. Some laser pointers are in this category.

Class IIIa

Lasers in this class are mostly dangerous in combination with certain optical instruments that change the beam diameter or power density. Output power does not exceed 5 mW. Beam power density may not exceed 2.5 mW cm^{-2} . Many laser sights for firearms and some laser pointers are included in this category.

Class IIIb

Lasers in this class may cause damage if the beam enters the eye directly. This generally applies to lasers powered from 5 mW to 500 mW. Lasers in this category can cause permanent eye damage with exposures of 1/100th of a second or less depending on the strength of the laser. A diffuse reflection (on paper or from a matte surface) is generally not hazardous but a specular reflection from a highly reflective surface can be just as dangerous as direct exposure. Protective eyewear is recommended when direct beam viewing of Class IIIb lasers may occur. Lasers at the high power end of this class may also present a fire hazard and can lightly burn skin.

Class IV

Lasers in this class have output powers of more than 500 mW in the beam and may cause severe, permanent damage to eye or skin without being magnified by optics of eye or instrumentation. Diffuse reflections of the laser beam can be hazardous to skin or eye within the Nominal Hazard Zone. Many industrial, scientific, military, and medical lasers are in this category.

The following is a summary of the laser classes following the IEC guidelines.

Class 1

A Class 1 laser is safe under all conditions of normal use, with no known biological hazard present. This class includes high-power lasers within an enclosure that prevents exposure to the radiation and that cannot be opened without shutting down the laser. This typically requires an interlocking.

Class 1M

A Class 1M laser is safe for all conditions of normal use except when passed through magnifying optics such as microscopes, telescopes, or on optical benches. Class 1M lasers typically produce large-diameter beams, or beams that are divergent. The classification of a Class 1M laser must be changed if the emergent light is refocused.

Class 2

A Class 2 laser is safe for all conditions of normal use because the blink reflex will limit the exposure to no more than 0.25 seconds. It only applies to visible-light lasers (400 nm to 700 nm) limited to 1 mW continuous wave, or more if the emission time is less than 0.25 s or if the light is not spatially coherent. Intentional suppression of the blink reflex could lead to eye injury. Many laser pointers are Class 2.

Class 2M

A Class 2M laser is similar to a Class 2, but it is used in an instrument that may focus the beam. This laser is safe because of the blink reflex provided the beam is not viewed through optical instruments as described above for Class 1M.

Class 3R

A Class 3R laser is considered safe if handled carefully, with restricted beam viewing. These lasers can be hazardous to the human eye if the beam is viewed for extended periods of time or under fixated conditions. Continuous beam Class 3R lasers operating in the visible region are limited in power output to 5 mW. For other wavelengths and for pulsed lasers, other limits will apply.

Class 3B

A Class 3B laser is hazardous if the eye is exposed directly, but diffuse reflections such as from paper surfaces are not harmful. Continuous lasers in the wavelength range from 315 nm to the far

infrared are limited in power output to 0.5 W. For pulsed lasers between 400 nm and 700 nm, the limit is 30 mJ. Other limits apply to other wavelengths and to short pulse lasers. Protective eyewear is typically required where direct viewing of a class 3B laser beam may occur. Class 3B lasers must be equipped with a key switch and a safety interlock.

Class 4

Class 4 lasers include all lasers with beam power greater than those covered in class 3B. By definition, a Class 4 laser can burn the skin, in addition to causing severe and permanent eye damage. This eye damage can result from direct or diffuse beam viewing. These lasers may ignite combustible materials, and thus may represent a fire risk. Class 4 lasers must be equipped with a key switch and a safety interlock. Many industrial, scientific, military, and medical lasers are in this category.

Laser Pointers

Laser pointers, ubiquitous at meetings, shows, and in the classroom, deserve separate consideration because of recent work on actual observed power output. For purposes of classification into the levels discussed above, the typical laser pointer is classified as 3R. The human light aversion response can generally protect against 3R lasers; however, this response is less sensitive in the near infrared range (700 nm to 1400 nm). Thus, to prevent retinal burns, laser pointers must not emit hazardous levels of infrared, and must be Class 1 compliant in terms of accessible emission level (AEL) in that wavelength range. In a testing program undertaken at NIST, cited in Ref. 4, it was found that of the laser pointers randomly chosen and tested, all but two pointers failed to comply by more than 15 % of the specified AEL, and 48 % emitted more than twice the specified AEL at one or more specified wavelength. This indicates a risk of 3B exposure from these devices that are nominally classified as 3R.

GENERAL CHARACTERISTICS OF IONIZING RADIATION FOR THE PURPOSE OF PRACTICAL APPLICATION OF RADIATION PROTECTION

Thomas W. Grove and Thomas J. Bruno

The following table provides practical information to allow the design and implementation of radiation protection in laboratory and industrial environments. Additional information and details can be found in Refs. 1 to 3.

Type (symbol)	Physical Properties	Range	Shielding	Biological Hazards	Comments
Alpha Particle (α)	Very large mass (2 protons, 2 neutrons, 0 electrons) +2 Charge	Very short 3cm to 6 cm (~ 1 inch to 2 inches in air)	Few centimeters of air Sheet of paper Dead (outer) layer of skin	Internally, the source of alpha radiation is in close contact with live body tissue. It can deposit large amounts of energy in a small amount of body tissue. Rarely an external hazard.	Alpha particles of at least 7.5 MeV are required to penetrate the epidermis, the protective layer of skin, which is about 0.07 mm (70 μm) thick. The range of most particles of common emitters (4.5 MeV to 5.5 MeV) is 3 cm to 4 cm in air. Range in air = $0.322E^{3/2}$ cm, when E is expressed in MeV.
Beta Particle (β)	Small mass -1 or +1 Charge -1 charge particle is an electron, +1 charge particle is a positron	Short 6 cm to 600 cm (1 inch to 20 feet in air)	Low atomic number materials Plastic Glass Aluminum	Internal hazard Externally, may be hazardous to the skin and eyes	Beta particles of at least 70 keV are required to penetrate the epidermis. $R_{air} \approx 3.65 \text{ m/MeV}$. The range of beta particles in material in g cm^{-2} (thickness in cm multiplied by the density in g cm^{-3}) is approximately half the maximum energy in MeV. ($R \approx E_{max}/2$). Dose rate (in rad/hr) at 1 cm from a beta point source; $\approx 300 \text{ rad/hr per Curie}$. Dose rate (in rad/hr) in a solution $\approx 2.12\bar{E}C/\rho$; where \bar{E} = average energy in MeV, C = concentration in $\mu\text{Ci cm}^{-3}$, and ρ = density of the solution in g cm^{-3} . The dose rate is about one-half this value at the surface. An aqueous solution of 1 Curie ^{32}P in a glass vial typically produces 3 mrad/hr at 1 meter from Bremsstrahlung. Shielding causes Bremsstrahlung radiation similar to x-rays and gamma rays; generally the higher the atomic number of a material, the more intense is the Bremsstrahlung.
Neutron (n or n ⁰)	Large mass No charge	Very far in air Easily travel several hundred meters High penetrating power due to lack of charge	High hydrogen content material Water Concrete Plastic	External whole body exposure hazard May be external and/or internal hazard Depends on whether source is inside or outside the body Energy dependent	Shielding can be provided by hydrogen rich materials such as hydrocarbons, water, waxes, high water concrete. Can cause neutron activation, in which radio nuclides are formed. Particularly damaging to soft tissue such as the cornea
X-Ray, Gamma Ray (γ)	No mass No charge Electromagnetic wave Similar but place of origin and energy levels may differ	Very far in air Easily travel several hundred meters Very high penetrating power since it has no mass & no charge	High atomic number materials Depleted Uranium Lead Steel Concrete Water	Whole body exposure hazard May be external and/or internal hazard Can be a skin and/or eye hazard Depends on whether source is inside or outside the body Energy dependent	Shielding requires large mass and density materials; lead or depleted uranium are commonly used. Protective clothing and other PPE can guard against ingestion or absorption but not against the radiation itself. Doubling the distance from a point source will result in a reduction of exposure (or dose) by a factor of four. Protective clothing and other PPE can effectively guard against ingestion or absorption of radioactive material but is not usually practical for protecting against x-rays or gamma rays.

RADIATION SAFETY UNITS

Thomas J. Bruno and Paris D. N. Svoronos

Ionizing radiation, consisting of x-rays, gamma rays, alpha particles, beta particles, and neutron particles, is measured and quantified in units of the radioactivity source and dose (Refs. 1 to 4). The radioactivity measures the strength of a source in terms of events of emission per second. Dose is a measure of the energy that is actually absorbed into matter.

Radioactivity:

In the SI system, the bequerel (Bq) has replaced the curie (Ci) as the accepted unit of radioactivity (or simply activity). One Bq is one event of radiation emission (such as a disintegration) per second. It is related to the older unit by:

$$1 \text{ Ci} = 3.7 \times 10^{10} \text{ Bq}$$

$$1 \text{ Ci} = 37 \text{ GBq} = 37 \text{ 000 MBq}$$

The following chart provides a practical guide between the two units:

1 Bq	37 Bq	1 kBq	37 kBq	1 MBq
27 pCi	1 nCi	27 nCi	1 µCi	27 µCi
37 MBq	1 GBq	37 GBq	1 TBq	37 TBq
1 mCi	27 mCi	1 Ci	27 Ci	1 kCi

Class A radionuclides: $0.3 \text{ Bq/cm}^2 = 8.1 \text{ pCi/cm}^2$

Class B radionuclides: $3 \text{ Bq/cm}^2 = 81 \text{ pCi/cm}^2$

Class C radionuclides: $30 \text{ Bq/cm}^2 = 810 \text{ pCi/cm}^2$

Energy:

For ionizing radiation, the energy is measured in electron volts (eV), which is related to other energy quantities by:

$$1 \text{ eV} = 1.60217653(14) \times 10^{-19} \text{ J}$$

Dose:

The older unit of dose, which is defined as the energy that is actually absorbed, is the radiation absorbed dose (RAD). The RAD was defined as the dose that would cause 0.01 J to be absorbed in 1 kg of matter (or 100 ergs per gram). The modern SI unit is the Gray (Gy):

$$100 \text{ RAD} = 1 \text{ Gy}$$

Equivalent Dose:

The equivalent dose (also called the dose equivalent or biological dose) describes the effect of radiation on human tissue, rather than the physical effects of the radiation alone. This quantity is expressed in Sieverts (Sv), and is found by multiplying the absorbed dose, in grays, by a dimensionless quality factor Q (which depends on the radiation type), and by another dimensionless factor N (the tissue weighting factor). Q is also called the Relative Biological Effectiveness (RBE). The factor N depends upon the part of the body irradiated, the time and volume over which the dose was spread, and the species of the subject.

The currently accepted, approximate Q factors are provided below:

Radiation Type	Q
X-rays	1
Gamma rays	1
Beta particles	1
Thermal neutrons (<10 keV)	5
Fast neutrons (10 keV to 100 keV)	10
Fast neutrons (100 keV to 2 MeV)	20
Fast neutrons (2 MeV to 20 MeV)	10
Fast neutrons (>20 MeV)	5
Protons (>2 MeV)	5
Alpha particles	20
Other atomic nuclei	20

The currently accepted N factors for human body parts are provided below:

Body Part	N
Gonads	0.20
Bone marrow	0.12
Colon	0.12
Lung	0.12
Stomach	0.12
Bladder	0.05
Brain	0.05
Breast	0.05
Kidney	0.05
Liver	0.05
Muscle	0.05
Esophagus	0.05
Pancreas	0.05

Body Part	<i>N</i>
Small intestine	0.05
Spleen	0.05
Thyroid	0.05
Uterus	0.05
Bone surface	0.01
Skin	0.01

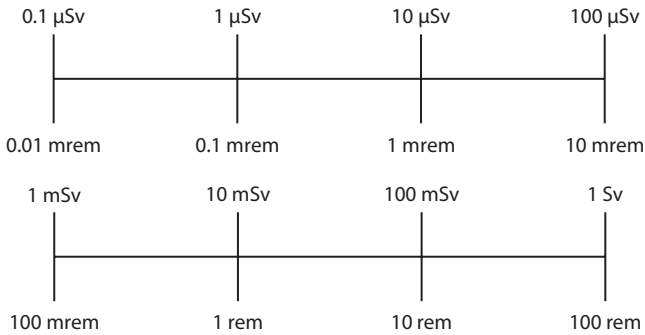

Relative to the effect on humans, the following *N* factors have been suggested for other organisms:

Organism	<i>N</i>
Viruses	0.03 to 0.0003
Bacteria	0.03 to 0.0003
Single cell organisms	0.03 to 0.0003
Insects	0.1 to 0.002
Mollusks	0.06 to 0.006
Plants	2 to 0.02
Fish	0.75 to 0.03
Amphibians	0.4 to 0.14
Reptiles	1 to 0.075
Birds	0.6 to 0.15
Humans (scale definition)	$\equiv 1$

In terms of the older unit, rem (roentgen equivalent in man):

1 rem = 0.01 Sv, assuming *Q* = 1.

The following chart provides a practical guide between the two units:

The approximate effects of full body dosages is summarized below:

Dose, Sv	Effect
1	Nausea
2–5	Hair loss, hemorage, death is possible
>3	Death is likely in 50 % of cases within 30 days
6	Death is likely in all cases

The relationship between nuclide half-lives elapsed and the remaining radioactivity is provided below:

Half-lives elapsed	Percent remaining
0	100
1	50
2	25
3	12.55
4	6.25
5	3.125

RELATIVE DOSE RANGES FROM IONIZING RADIATION

Thomas J. Bruno

It is important to place in perspective the relative ionizing radiation dose acquired in common laboratory settings. The most commonly encountered source is a ^{63}Ni source used in gas chromatographic electron capture detectors and in ion mobility spectrometers (Ref. 1). In both instruments, the source is sealed and has a radioactivity of 15 mCi. The exposures cited refer only to normal operation; it does not consider exposures if the device is dismantled or allowed to overheat.

Background

Natural background consists of the highly variable sum of all ubiquitous sources of ionizing radiation encountered on the planet (Ref. 2). Background in general can be divided into the following four major contributions:

Contribution	Average Dose, mrem/year, United States
Terrestrial contribution	21
Cosmic contribution	33
Airborne radon (and daughter) contribution	228
Internal consumption contribution	29
Total Natural Background	311

In the United States, the average natural background ionizing radiation level is 311 mrem. This is variable due primarily to differences in altitude and primordial radionuclides and their daughters. For example, the averages in the United Kingdom and Finland are 200 mrem and 700 mrem, respectively. Higher levels are found at higher altitudes and regions with a larger radon budget. Within the United States, for example, the background in Denver, Colorado is approximately 450 mrem, while in most of Florida, it is closer to 230 mrem. The terrestrial contribution primarily arises from radionuclides of potassium, uranium, and thorium, and their daughters. The cosmic contribution arises primarily from muons, neutrons, and electrons, and varies with terrestrial magnetic field and altitude. The internal contribution results from consuming radionuclides of potassium and carbon in food and water. By far the largest contribution is from radon and radon daughters. The radon budget results from terrestrial sources of uranium (Ref. 3).

Typical Incremental Increases above Background

Exposure to ionizing radiation in the laboratory results in a dose level in excess of the background levels discussed above (Ref. 4). The following charts place in perspective the additional dose received above background for some common exposures. Since in Figure 1 the ranges are dwarfed by tobacco use, Figure 2 is presented with this contribution removed. This is significant because the tobacco dose is specific to the lungs, and not the whole body. A more relevant comparison for Figure 1 would be obtained by multiplying the listed 8000 mrem by the tissue-weighting factor for the lungs, 0.12.

The high incremental level associated with tobacco use (1 mrem/hr while smoking) results from the accumulation of 210_{Po} (a radon daughter) on tobacco leaves. The incremental dose accrued

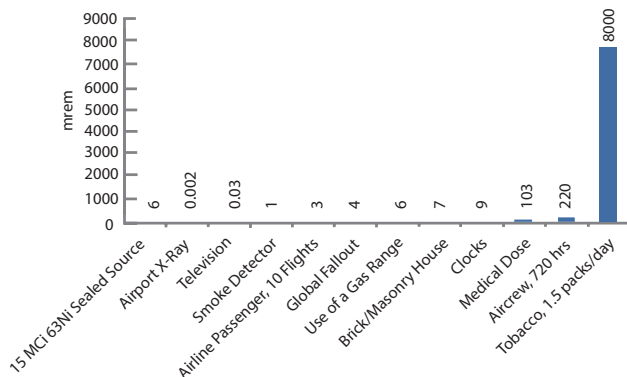

FIGURE 1: A comparison of increments to natural background levels, explicit for the 15 mCi ^{63}Ni sources used in electron capture detectors and ion mobility spectrometers.

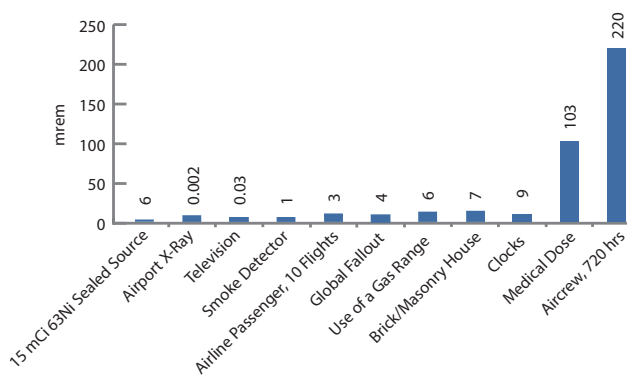

FIGURE 2: The same comparison as in Figure 1, but with tobacco use removed. Thus, the data shown above are all whole body dosages.

by air travel is dependent on altitude, with higher levels associated with higher altitudes, and will range between 0.35 mrem/hr and 0.5 mrem/hr. The incremental dose due to medical imaging or radiation treatment can be misleading. For many individuals the dose can be close to zero, but in the case of radiation treatment it can be much higher. Indeed, patients given certain radiation treatments become incremental sources themselves, resulting in incremental dosages above background to attending medical personnel, caregivers, and the general public. The listing for clocks in both Figures 1 and 2 are for older (even antique) clocks that have dials coated with Ra/ZnS paint to provide illumination.

ANNUAL LIMITS ON INTAKES OF RADIONUCLIDES

K. F. Eckerman

The following table lists, for workers, the annual limits on oral and inhalation intakes (ALI) for selected radionuclides based on the occupational radiation protection guidance of the International Commission on Radiological Protection (References 1 and 2). An intake of one ALI corresponds to an annual whole body dose of 0.02 Sv (2 rem).

The ALI is expressed in the SI unit of activity, the becquerel (Bq), and in the conventional unit, the microcurie (μCi); $1 \mu\text{Ci} = 3.7 \cdot 10^4 \text{ Bq}$. The chemical form of inhaled radionuclides is, in most instances, stated in terms of the rate of absorption to blood from the lungs and the fractional absorption from the small intestine. Types F, M, and S denote chemical forms that are absorbed from the lungs at rates characterized as fast, moderate, and slow, respectively. The time to absorb 90% of the deposited radionuclide, in the absence of radioactive decay, corresponds to about 10 minutes,

150 days, and 7000 days for Type F, M, and S compounds, respectively. Type F compounds can be considered to be more soluble than M or S, S being the most insoluble. Chemical form consideration for ingestion is specified by the fractional absorption from the small intestine, denoted as f_1 . The f_1 values range from 10^{-5} to 1. Higher fractional absorption is associated with greater solubility of the compound.

CHEMICAL CARCINOGENS

The following substances are listed in the *12th Report on Carcinogens, 2011*, released by the National Institute of Environmental Health Sciences (NIEHS) under the National Toxicology Program (NTP). Substances are grouped in two classes:

- **Known to be human carcinogens:** There is sufficient evidence of cancer from studies in humans showing a cause-and-effect relationship between exposure to the substance and human cancer.
- **Reasonably anticipated to be human carcinogens:** There is limited evidence of cancer from studies in humans or sufficient evidence of cancer from studies in experimental animals showing a cause-and-effect relationship between exposure to the substance and cancer. Alternatively, a substance can be listed in this category if there is evidence that it is a member of a class of substances already listed in the Report on Carcinogens or causes biological effects known to lead to the development of cancer.

The NTP report also lists many poorly defined materials such as soots, tars, mineral oils, and coke oven emissions, as well as viruses, sunlight, ionizing radiation, etc. These carcinogenic agents are not included here.

The table lists the substance names normally used in the *Handbook of Chemistry and Physics*. Explanatory comments and additional names and acronyms by which the substance is known are given in the second column. In many cases the primary name given here is different from that used in the NTP report; however, names used in the NTP report appear in the second column. The Chemical Abstracts Service Registry Number (CAS RN) is given in the last column. Extensive details on each substance are given in the reference.

National Toxicology Program, *12th Report on Carcinogens*, 2011, <ntp.niehs.nih.gov/go/roc12>.

Substance	Comments & Other Names	CAS RN
Known to be Human Carcinogens		
Aflatoxins		1402-68-2
4-Aminobiphenyl	<i>p</i> -Biphenylamine	92-67-1
Aristolochic acids		
Arsenic	and inorganic arsenic compounds	7440-38-2
Asbestos		1332-21-4
Azathioprine	6-[(1-Methyl-4-nitro-1 <i>H</i> -imidazol-5-yl)thio]-1 <i>H</i> -purine	446-86-6
Benzene	[6]Annulene	71-43-2
<i>p</i> -Benzidine	includes dyes metabolized to Benzidine; [1,1'-Biphenyl]-4,4'-diamine	92-87-5
Beryllium	and beryllium compounds	7440-41-7
Bis(2-chloroethyl) sulfide	Mustard gas	505-60-2
Bis(chloromethyl) ether	and technical grade Chloromethyl methyl ether	542-88-1
1,3-Butadiene	Divinyl	106-99-0
Cadmium	and cadmium compounds	7440-43-9
Chlorambucil		305-03-3
Chloroethene	Vinyl chloride	75-01-4
1-(2-Chloroethyl)-3-(4-methylcyclohexyl)-1-nitrosourea	Semustine; MeCCNU	13909-09-6
Chloromethyl methyl ether		107-30-2
Chromium	hexavalent compounds only	7440-47-3
Cyclophosphamide	Cyclophosphane	50-18-0
Cyclosporin A	Cyclosporine	59865-13-3
<i>trans</i> -Diethylstilbestrol		56-53-1
Erionite		66733-21-9
Estrogens, steroidal		
<i>N</i> -(4-Ethoxyphenyl)acetamide	in analgesic mixtures; Phenacetin	62-44-2
Formaldehyde	Methanal	50-00-0
Melphalan	<i>L</i> -Phenylalanine, 4-[bis(2-chloroethyl)amino]-	148-82-3
Methoxsalen	with UV-A therapy; 9-Methoxy-7 <i>H</i> -furo[3,2- <i>g</i>][1]benzopyran-7-one; PUVA	298-81-7
2-Naphthylamine	β -Naphthylamine	91-59-8
Nickel compounds	both inorganic and organic	
Oxirane	Ethylene oxide	75-21-8
Radon	source of ionizing radiation	10043-92-2
Silicon dioxide (α -quartz)	respirable size; Silica	14808-60-7
Silicon dioxide (tridymite)	respirable size; Tridymite	15468-32-3
Silicon dioxide (cristobalite)	respirable size; Cristobalite	14464-46-1
Sulfuric acid	in strong acid mists	7664-93-9
Tamoxifen		10540-29-1
2,3,7,8-Tetrachlorodibenzo- <i>p</i> -dioxin	Dioxin; TCDD	1746-01-6

Substance	Comments & Other Names	CAS RN
Thorium(IV) oxide	source of ionizing radiation; Thoria; Thorium dioxide	1314-20-1
Triethylenethiophosphoramidate	Thiotepa	52-24-4
Reasonably Anticipated to be Human Carcinogens		
Acetaldehyde	Ethanal	75-07-0
2-(Acetylamino)fluorene		53-96-3
Acrylamide	2-Propenamide	79-06-1
Acrylonitrile	Propenenitrile	107-13-1
4-Allyl-1,2-dimethoxybenzene	Methyleugenol	93-15-2
2-Amino-9,10-anthracenedione	2-Aminoanthraquinone	117-79-3
1-Amino-2,4-dibromo-9,10-anthracenedione	1-Amino-2,4-dibromoanthraquinone	81-49-2
2-Amino-3,4-dimethylimidazo[4,5- <i>f</i>]quinoline	Me-IQ	77094-11-2
2-Amino-3,8-dimethylimidazo[4,5- <i>f</i>]quinoxaline	MeIQx	77500-04-0
1-Amino-2-methyl-9,10-anthracenedione	1-Amino-2-methylantraquinone	82-28-0
2-Amino-3-methyl-3 <i>H</i> -imidazo(4,5- <i>f</i>)quinoline	IQ	76180-96-6
2-Amino-1-methyl-6-phenylimidazo[4,5- <i>b</i>]pyridine	PhIP	105650-23-5
Azacididine	4-Amino-1-β- <i>D</i> -ribofuranosyl-1,3,5-triazine-2(1 <i>H</i>)-one	320-67-2
Benz[<i>a</i>]anthracene	1,2-Benzanthracene	56-55-3
Benzo[<i>b</i>]fluoranthene	Benz[<i>e</i>]acephenanthrylene	205-99-2
Benzo[<i>j</i>]fluoranthene	Dibenzo[<i>a,jk</i>]fluorene	205-82-3
Benzo[<i>k</i>]fluoranthene	2,3,1',8'-Binaphthylene	207-08-9
Benzo[<i>a</i>]pyrene	2,3-Benzopyrene	50-32-8
2,2'-Bioxirane	Diepoxybutane	1464-53-5
2,2-Bis(bromomethyl)-1,3-propanediol	Pentaerythritol dibromide	3296-90-0
Bis(2-chloroethyl)methylamine hydrochloride	Nitrogen mustard hydrochloride; Mechlorethamine	55-86-7
<i>N,N'</i> -Bis(2-chloroethyl)- <i>N</i> -nitrosourea	Carmustine; BCNU	154-93-8
Bis[4-(dimethylamino)phenyl]methane	Michler's Base	101-61-1
1,3-Bis(2,3-epoxypropoxy)benzene	Diglycidyl resorcinol ether	101-90-6
Bis(2-ethylhexyl) phthalate	DEHP; Di- <i>sec</i> -octyl phthalate	117-81-7
Bromodichloromethane		75-27-4
Bromoethene	Vinyl bromide	593-60-2
1,4-Butanediol dimethylsulfonate	Busulfan	55-98-1
<i>tert</i> -Butyl-4-hydroxyanisole	Butylated hydroxyanisole	25013-16-5
Captafol	Difolatan	2425-06-1
Chloramphenicol		56-75-7
Chlorendic acid	1,4,5,6,7,7-Hexachloro-5-norbornene-2,3-dicarboxylic acid	115-28-6
Chlorinated paraffins (C ₁₂ , 60% Cl)		108171-26-2
4-Chloro-1,2-benzenediamine	4-Chloro- <i>o</i> -phenylenediamine	95-83-0
2-Chloro-1,3-butadiene	Chloroprene	126-99-8
1-(2-Chloroethyl)-3-cyclohexyl-1-nitrosourea	CCNU; Lomustine; Belustine	13010-47-4
4-Chloro-2-methylaniline	also the hydrochloride; <i>p</i> -Chloro- <i>o</i> -toluidine	95-69-2
1-Chloro-2-methylpropene	Dimethylvinyl chloride	513-37-1
3-Chloro-2-methylpropene		563-47-3
Chlorozotocin	2-[[[(2-Chloroethyl)nitrosoamino]carbonyl]amino]-2-deoxy- <i>D</i> -glucose	54749-90-5
Cobalt(II) sulfate	Cobaltous sulfate	10124-43-3
Cobalt-tungsten carbide	powders and hard metal	
Cupferron		135-20-6
Dacarbazine	5-(3,3-Dimethyl-1-triazenyl)-1 <i>H</i> -imidazole-4-carboxamide	4342-03-4
Decabromobiphenyl		13654-09-6
2,4-Diaminoanisole sulfate	1,3-Benzenediamine, 4-methoxy, sulfate	39156-41-7
4,4'-Diaminodiphenyl ether	4,4'-Oxydianiline	101-80-4
4,4'-Diaminodiphenylmethane	also the dihydrochloride; 4,4'-Methylenedianiline	101-77-9
4,4'-Diaminodiphenylmethane dihydrochloride	4,4'-Methylenedianiline dihydrochloride	13552-44-8
4,4'-Diaminodiphenyl sulfide	4,4'-Thiodianiline	139-65-1
<i>cis</i> -Diamminedichloroplatinum	Cisplatin	15663-27-1
Dibenz[<i>a,h</i>]acridine		226-36-8
Dibenz[<i>a,j</i>]acridine	7-Azadibenz[<i>a,j</i>]anthracene	224-42-0
Dibenz[<i>a,h</i>]anthracene	1,2,5,6-Dibenzanthracene	53-70-3
7 <i>H</i> -Dibenzo[<i>c,g</i>]carbazole		194-59-2
Dibenzo[<i>a,e</i>]pyrene	Naphtho[1,2,3,4- <i>def</i>]chrysene	192-65-4
Dibenzo[<i>a,h</i>]pyrene	Dibenzo[<i>b,def</i>]chrysene	189-64-0

Substance	Comments & Other Names	CAS RN
Dibenzo[<i>a,i</i>]pyrene	Benzo[<i>rst</i>]pentaphene	189-55-9
Dibenzo[<i>a,l</i>]pyrene	Dibenzo[<i>def,p</i>]chrysene	191-30-0
1,2-Dibromo-3-chloropropane		96-12-8
1,2-Dibromoethane	Ethylene dibromide	106-93-4
2,3-Dibromo-1-propanol	DBP	96-13-9
2,3-Dibromo-1-propanol, phosphate (3:1)	Tris(2,3-dibromopropyl) phosphate	126-72-7
<i>p</i> -Dichlorobenzene	1,4-Dichlorobenzene	106-46-7
3,3'-Dichloro- <i>p</i> -benzidine	3,3'-Dichloro[1,1'-biphenyl]-4,4'-diamine	91-94-1
3,3'-Dichloro- <i>p</i> -benzidine dihydrochloride	3,3'-Dichloro-[1,1'-biphenyl]-4,4'-diamine dihydrochloride	612-83-9
1,2-Dichloroethane	Ethylene dichloride	107-06-2
Dichloromethane	Methylene chloride	75-09-2
1,3-Dichloropropene (unspecified isomer)	technical grade	542-75-6
Diethyl sulfate		64-67-5
2,3-Dihydro-6-propyl-2-thioxo-4(1 <i>H</i>)-pyrimidinone	6-Propylthiouracil; PROP	51-52-5
1,8-Dihydroxy-9,10-anthracenedione	Danthron	117-10-2
3,3'-Dimethoxybenzidine	and dyes metabolized to 3,3'-Dimethoxybenzidine; Dianisidine	119-90-4
4-(Dimethylamino)azobenzene		60-11-7
2',3-Dimethyl-4-aminoazobenzene	<i>o</i> -Aminoazotoluene; 4- <i>o</i> -Tolylazo- <i>o</i> -toluidine	97-56-3
Dimethylcarbamic chloride	Dimethylcarbamoyl chloride	79-44-7
1,1-Dimethylhydrazine	UDMH	57-14-7
Dimethyl sulfate		77-78-1
1,6-Dinitropyrene		42397-64-8
1,8-Dinitropyrene		42397-65-9
1,4-Dioxane	1,4-Dioxacyclohexane	123-91-1
1,2-Diphenylhydrazine	Hydrazobenzene	122-66-7
1,3-Diphenyl-1-triazene	Diazoaminobenzene	136-35-6
Disperse Blue No. 1	1,4,5,8-Tetraamino-9,10-anthracenedione	2475-45-8
Doxorubicin hydrochloride	Adriamycin	25316-40-9
Epichlorohydrin	(Chloromethyl)oxirane	13403-37-7
1,2-Epoxy-4-(epoxyethyl)cyclohexane	4-Vinyl-1-cyclohexene dioxide	106-87-6
Ethyl carbamate	Urethane	51-79-6
Ethyl methanesulfonate		62-50-0
<i>N</i> -Ethyl- <i>N</i> -nitroso-urea	<i>N</i> -Nitroso- <i>N</i> -ethylurea; ENU	759-73-9
Fluoroethene	Vinyl fluoride	75-02-5
Fuchsin	C.I. Basic Red 9, monohydrochloride	569-61-9
Furan	Oxacyclopentadiene	110-00-9
Glass wool fibers (inhalable)	certain types	
Hexabromobiphenyl (unspecified isomer)	Firemaster FF-1	67774-32-7
Hexachlorobenzene	Perchlorobenzene	118-74-1
1,2,3,4,5,6-Hexachlorocyclohexane, (1 α ,2 α ,3 β ,4 α ,5 α ,6 β)	Lindane	58-89-9
1,2,3,4,5,6-Hexachlorocyclohexane, (1 α ,2 α ,3 β ,4 α ,5 β ,6 β)	α -Hexachlorocyclohexane	319-84-6
1,2,3,4,5,6-Hexachlorocyclohexane, (1 α ,2 β ,3 α ,4 β ,5 α ,6 β)	β -Hexachlorocyclohexane	319-85-7
Hexachlorocyclohexane (unspecified isomer)	all isomers; Lindane	608-73-1
Hexachloroethane	Perchloroethane	67-72-1
Hexamethylphosphoric triamide	HMPA; Tris(dimethylamino)phosphine oxide	680-31-9
Hydrazine		302-01-2
Hydrazine sulfate		10034-93-2
2-Imidazolidinethione	Ethylene thiourea	96-45-7
Indeno[1,2,3- <i>cd</i>]pyrene	1,10-(1,2-Phenylene)pyrene	193-39-5
Kepone	Chlordecone	143-50-0
Lead	and lead compounds	7439-92-1
2-Methoxyaniline	also the hydrochloride; <i>o</i> -Anisidine	90-04-0
2-Methoxy-5-methylaniline	<i>p</i> -Cresidine; 5-Methyl- <i>o</i> -anisidine	120-71-8
2-Methylaniline	also the hydrochloride; <i>o</i> -Toluidine	95-53-4
2-Methylaniline, hydrochloride	<i>o</i> -Toluidine, hydrochloride	636-21-5
4-Methyl-1,3-benzenediamine	Toluene-2,4-diamine; 2,4-Diaminotoluene	95-80-7
2-Methyl-1,3-butadiene	Isoprene	78-79-5
5-Methylchrysene	5-MC	3697-24-3
4,4'-Methylenebis[2-chloroaniline]	MBOCA; 3,3'-Dichloro-4,4'-diaminodiphenylmethane	101-14-4
Methyl methanesulfonate		66-27-3
<i>N</i> -Methyl- <i>N'</i> -nitro- <i>N</i> -nitrosoguanidine		70-25-7

Substance	Comments & Other Names	CAS RN
<i>N</i> -Methyl- <i>N</i> -nitrosoourea	<i>N</i> -Nitroso- <i>N</i> -methyleurea	684-93-5
Methyloxirane	1,2-Propylene oxide	16033-71-9
Metronidazole	2-Methyl-5-nitro-1 <i>H</i> -imidazole-1-ethanol	443-48-1
Mirex	Hexachloropentadiene dimer	2385-85-5
Naphthalene		91-20-3
Nickel	metallic (nickel compounds are known carcinogens)	7440-02-0
Nitrilotriacetic acid	<i>N,N</i> -Bis(carboxymethyl)glycine	139-13-9
2-Nitroanisole	1-Methoxy-2-nitrobenzene	91-23-6
Nitrobenzene		98-95-3
6-Nitrochrysene		7496-02-8
Nitrofen	2,4-Dichloro-1-(4-nitrophenoxy)benzene	1836-75-5
Nitromethane	Nitrocarbol	75-52-5
2-Nitropropane	Isonitropropane	79-46-9
1-Nitropyrene		5522-43-0
4-Nitropyrene		57835-92-4
<i>N</i> -Nitrosodibutylamine	Dibutylnitrosamine	924-16-3
<i>N</i> -Nitrosodiethanolamine	2,2'-(Nitrosoimino)ethanol	1116-54-7
<i>N</i> -Nitrosodiethylamine	DEN; Diethylnitrosamine	55-18-5
<i>N</i> -Nitrosodimethylamine	DMN; Dimethylnitrosamine	62-75-9
4-(<i>N</i> -Nitrosomethylamino)-1-(3-pyridyl)-1-butanone	NNK	64091-91-4
<i>N</i> -Nitroso- <i>N</i> -methylvinylamine	<i>N</i> -Methyl- <i>N</i> -nitrosoethenamine	4549-40-0
4-Nitrosomorpholine	<i>N</i> -Nitrosomorpholine	59-89-2
<i>N</i> -Nitrosornicotine	<i>N'</i> -Nitroso-3-(2-pyrrolidinyl)pyridine	16543-55-8
<i>N</i> -Nitrosopiperidine	1-Nitrosopiperidine	100-75-4
<i>N</i> -Nitrosodipropylamine	<i>N</i> -Nitroso- <i>N</i> -propyl-1-propanamine	621-64-7
<i>N</i> -Nitrosopyrrolidine		930-55-2
<i>N</i> -Nitrososarcosine	<i>N</i> -Methyl- <i>N</i> -nitrosoglycine	13256-22-9
2-Nitrotoluene	1-Methyl-2-nitrobenzene	88-72-2
Norethisterone	19-Norpregn-4-en-20-yn-3-one, 17-hydroxy-, (17 α)-	68-22-4
Ochratoxin A		303-47-9
Octabromobiphenyl (unspecified isomer)		61288-13-9
2-Oxetanone	β -Propiolactone	57-57-8
Oxiranemethanol, (\pm)-	Glycidol	61915-27-3
Oxymetholone	Androstan-3-one, 17-hydroxy-2-(hydroxymethylene)-17-methyl-	434-07-1
Phenazopyridine hydrochloride	3-(Phenylazo)-2,6-pyridinediamine, monohydrochloride	136-40-3
Phenolphthalein	3,3-Bis(4-hydroxyphenyl)-1(3 <i>H</i>)-isobenzofuranone	77-09-8
Phenoxybenzamine hydrochloride		63-92-3
Phenyloxirane	Styrene-7,8-oxide	96-09-3
Phenytoin	also Phenytoin sodium; Dilantin; 5,5-Diphenyl-2,4-imidazolidinedione	57-41-0
Polybrominated biphenyls	PBBs	
Polychlorinated biphenyls	PCBs	1336-36-3
Procarbazine	also the hydrochloride	671-16-9
Progesterone	Pregn-4-ene-3,20-dione	57-83-0
1,3-Propane sultone	1,2-Oxathiolane, 2,2-dioxide	1120-71-4
Propyleneimine	2-Methylaziridine	75-55-8
Reserpine		50-55-5
Riddelline		23246-96-0
Safrole	5-(2-Propenyl)-1,3-benzodioxole	94-59-7
Selenium monosulfide		7446-34-6
Streptozotocin	<i>D</i> -Glucopyranose, 2-deoxy-2-[[[(methylnitrosoamino)carbonyl]amino]-	18883-66-4
Styrene	Vinylbenzene	100-42-5
Sulfallate	<i>N,N</i> -Diethyldithiocarbamic acid, 2-chloroallyl ester	95-06-7
Tetrachloroethene	Perchloroethylene	127-18-4
Tetrachloromethane	Carbon tetrachloride	56-23-5
Tetrafluoroethene	Tetrafluoroethylene	116-14-3
<i>N,N,N',N'</i> -Tetramethyl-4,4'-diaminobenzophenone	Michler's ketone; 4,4'-Methylenebis[<i>N,N</i> -dimethylaniline]	90-94-8
Tetranitromethane		509-14-8
Thioacetamide	Ethanethioamide	62-55-5
Thiourea	Thiocarbamide	62-56-6
<i>o</i> -Tolidine	and dyes metabolized to <i>o</i> -Tolidine; 3,3'-Dimethylbenzidine	119-93-7
Toluene diisocyanate (unspecified isomer)	includes both 2,4- and 2,6- isomers; TDI	26471-62-5

Substance	Comments & Other Names	CAS RN
Toxaphene	Polychlorocamphene	8001-35-2
1 <i>H</i> -1,2,4-Triazol-3-amine	Amitrole	61-82-5
1,1,1-Trichloro-2,2-bis(4-chlorophenyl)ethane	DDT; Dichlorodiphenyltrichloroethane	50-29-3
Trichloroethene	Trichloroethylene	79-01-6
Trichloromethane	Chloroform	67-66-3
(Trichloromethyl)benzene	Benzotrichloride	98-07-7
2,4,6-Trichlorophenol		88-06-2
1,2,3-Trichloropropane	Allyl trichloride	96-18-4

Appendix A

Mathematical Tables

1	Constants	A-2
1.1	Decimal Equivalents of Fractions (inches to mm)	A-2
1.2	Exponential and Hyperbolic Functions and their Common Logarithms	A-3
1.3	Trigonometric Functions to Four Decimal Places	A-4
2	Algebra	A-5
2.1	Quadratic Formula	A-5
2.2	Vector Algebra	A-5
2.2.1	Definitions	A-5
2.2.2	Vectors in Space	A-5
2.2.3	The Scalar, Dot, or Inner Product of Two Vectors	A-6
2.2.4	The Vector or Cross Product of Two Vectors	A-6
2.2.5	Scalar Triple Product	A-6
2.2.6	Vector Triple Product	A-7
3	Geometry	A-7
3.1	Geometry of the Plane, Straight Line, and Sphere	A-7
3.2	Geometry of Curves in Space	A-9
4	Trigonometry	A-10
4.1	Trigonometric Functions in Terms of One Another	A-10
4.2	Hyperbolic Functions in Terms of One Another	A-10
5	Calculus	A-11
5.1	Differentiation	A-11
5.1.1	Differentiation Formulas	A-11
5.1.2	Derivatives of Common Functions	A-12
5.1.3	Vector Operations	A-12
5.2	Orthogonal Coordinate Systems	A-14
5.3	Integration	A-16
5.3.1	Integration Examples	A-16
5.3.2	Transformation of Integrals	A-18
5.3.3	Table of Integrals	A-19
5.4	Differential Equations	A-45
5.4.1	Linear Differential Equations	A-45
5.4.2	Second Order Linear Constant Coefficient Equation	A-45
5.4.3	Homogeneous Solutions of Higher Order Constant Coefficient Equations	A-46
5.4.4	Particular Solutions	A-46
5.4.5	Differential Equation Solution Techniques	A-48
6	Series	A-49
6.1	Fourier Series	A-49

2 ALGEBRA

2.1 QUADRATIC FORMULA

The solutions of the equation $ax^2 + bx + c = 0$, where $a \neq 0$, are given by: $x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$.

2.2 VECTOR ALGEBRA

2.2.1 Definitions

Any quantity which is completely determined by its magnitude is called a *scalar*. Examples include: mass, density, and temperature. Any quantity which is completely determined by its magnitude and direction is called a *vector*. Examples include: velocity, acceleration, force. A vector quantity is usually represented by a boldfaced letter such as \mathbf{V} . Two vectors \mathbf{V}_1 and \mathbf{V}_2 are equal to one another if they have equal magnitudes and are acting in the same directions. A negative vector, written as $-\mathbf{V}$, is one which acts in the opposite direction to \mathbf{V} , but is of equal magnitude to it. The magnitude of \mathbf{V} is written $|\mathbf{V}|$ or simply v . The *unit vector* $\frac{\mathbf{V}}{|\mathbf{V}|}$ (when $|\mathbf{V}| \neq 0$) is that vector which has the same direction as \mathbf{V} , but has a magnitude of unity (sometimes represented as $\hat{\mathbf{V}}$).

The vector sum of \mathbf{V}_1 and \mathbf{V}_2 is represented by $\mathbf{V}_1 + \mathbf{V}_2$. The vector sum of \mathbf{V}_1 and $-\mathbf{V}_2$, or the difference of the vector \mathbf{V}_2 from \mathbf{V}_1 is represented by $\mathbf{V}_1 - \mathbf{V}_2$.

If r is a scalar, then $r\mathbf{V} = \mathbf{V}r$ and this represents a vector r times the magnitude of \mathbf{V} , in the same direction as \mathbf{V} if r is positive, and in the opposite direction if r is negative. If r and s are scalars and $\mathbf{V}_1, \mathbf{V}_2, \mathbf{V}_3$ are vectors then the following rules of scalars and vectors hold:

$$\begin{aligned}\mathbf{V}_1 + \mathbf{V}_2 &= \mathbf{V}_2 + \mathbf{V}_1 \\ (r + s)\mathbf{V}_1 &= r\mathbf{V}_1 + s\mathbf{V}_1 \\ r(\mathbf{V}_1 + \mathbf{V}_2) &= r\mathbf{V}_1 + r\mathbf{V}_2 \\ \mathbf{V}_1 + (\mathbf{V}_2 + \mathbf{V}_3) &= (\mathbf{V}_1 + \mathbf{V}_2) + \mathbf{V}_3 = \mathbf{V}_1 + \mathbf{V}_2 + \mathbf{V}_3\end{aligned}\tag{1}$$

The vector $\mathbf{0}$ is a vector of zero length.

2.2.2 Vectors in Space

1. A plane is described by two distinct vectors \mathbf{V}_1 and \mathbf{V}_2 . Should these vectors not intersect each other, then one can be displaced parallel to itself until they do. Any other vector \mathbf{V} lying in this plane is given by

$$\mathbf{V} = r\mathbf{V}_1 + s\mathbf{V}_2$$

2. A *position vector* specifies the position in space of a point relative to a fixed origin. If \mathbf{V}_1 and \mathbf{V}_2 are the position vectors of the points A and B , relative to the origin O , then any point P on the line AB has a position vector \mathbf{V} given by

$$\mathbf{V} = r\mathbf{V}_1 + (1 - r)\mathbf{V}_2$$

The scalar “ r ” can be taken as the metric representation of P since $r = 0$ implies $P = B$ and $r = 1$ implies $P = A$. If the point P divides the line AB in the ratio $r : s$ then

$$\mathbf{V} = \left(\frac{r}{r+s}\right)\mathbf{V}_1 + \left(\frac{s}{r+s}\right)\mathbf{V}_2$$

3. The vectors $\mathbf{V}_1, \mathbf{V}_2, \mathbf{V}_3, \dots, \mathbf{V}_n$ are said to be *linearly dependent* if there exist scalars $r_1, r_2, r_3, \dots, r_n$, not all zero, such that

$$r_1\mathbf{V}_1 + r_2\mathbf{V}_2 + \dots + r_n\mathbf{V}_n = \mathbf{0}$$

4. A vector \mathbf{V} is linearly dependent upon the set of vectors $\{\mathbf{V}_1, \mathbf{V}_2, \mathbf{V}_3, \dots, \mathbf{V}_n\}$ if

$$\mathbf{V} = r_1\mathbf{V}_1 + r_2\mathbf{V}_2 + r_3\mathbf{V}_3 + \dots + r_n\mathbf{V}_n$$

5. Three vectors are linearly dependent if and only if they are co-planar.

6. All points in space can be uniquely determined by linear dependence upon three *base vectors* i.e., three vectors any one of which is linearly independent of the other two. The simplest set of base vectors are the unit vectors along the coordinate axes. These are usually designated by \mathbf{i}, \mathbf{j} , and \mathbf{k} .

7. If \mathbf{V} is a vector in space, and a , b , and c are the respective magnitudes of the projections of the vector along the axes then

$$\mathbf{V} = a\mathbf{i} + b\mathbf{j} + c\mathbf{k} \quad \text{and} \quad |\mathbf{V}| = \sqrt{a^2 + b^2 + c^2}$$

and the direction cosines of \mathbf{V} are

$$\cos \alpha = a/v, \quad \cos \beta = b/v, \quad \cos \gamma = c/v.$$

8. The law of vector addition yields

$$\mathbf{V}_1 + \mathbf{V}_2 = (a_1 + a_2)\mathbf{i} + (b_1 + b_2)\mathbf{j} + (c_1 + c_2)\mathbf{k}$$

2.2.3 The Scalar, Dot, or Inner Product of Two Vectors

This product is represented as $\mathbf{V}_1 \cdot \mathbf{V}_2$ and is defined to be equal to $v_1 v_2 \cos \theta$, where $v_1 = |\mathbf{V}_1|$, $v_2 = |\mathbf{V}_2|$, and θ is the angle from \mathbf{V}_1 to \mathbf{V}_2 . That is

$$\mathbf{V}_1 \cdot \mathbf{V}_2 = v_1 v_2 \cos \theta = a_1 a_2 + b_1 b_2 + c_1 c_2 = \mathbf{V}_2 \cdot \mathbf{V}_1$$

Note the relations:

$$\begin{aligned} (\mathbf{V}_1 + \mathbf{V}_2) \cdot \mathbf{V}_3 &= \mathbf{V}_1 \cdot \mathbf{V}_3 + \mathbf{V}_2 \cdot \mathbf{V}_3 \\ \mathbf{V}_1 \cdot (\mathbf{V}_2 + \mathbf{V}_3) &= \mathbf{V}_1 \cdot \mathbf{V}_2 + \mathbf{V}_1 \cdot \mathbf{V}_3 \end{aligned} \quad (2)$$

If \mathbf{V}_1 is perpendicular to \mathbf{V}_2 then $\mathbf{V}_1 \cdot \mathbf{V}_2 = 0$, and if \mathbf{V}_1 is parallel to \mathbf{V}_2 then $\mathbf{V}_1 \cdot \mathbf{V}_2 = |\mathbf{V}_1| |\mathbf{V}_2|$. In particular:

$$\begin{aligned} \mathbf{i} \cdot \mathbf{i} &= \mathbf{j} \cdot \mathbf{j} = \mathbf{k} \cdot \mathbf{k} = 1 \\ \mathbf{i} \cdot \mathbf{j} &= \mathbf{j} \cdot \mathbf{k} = \mathbf{k} \cdot \mathbf{i} = 0 \end{aligned} \quad (3)$$

2.2.4 The Vector or Cross Product of Two Vectors

This product is represented as $\mathbf{V}_1 \times \mathbf{V}_2$ and is defined as

$$\mathbf{V}_1 \times \mathbf{V}_2 = |\mathbf{V}_1| |\mathbf{V}_2| \sin \theta \mathbf{1}$$

where θ is the angle from \mathbf{V}_1 to \mathbf{V}_2 and $\mathbf{1}$ is a unit vector perpendicular to the plane of \mathbf{V}_1 and \mathbf{V}_2 and so directed that a right-handed screw driven in the direction of $\mathbf{1}$ would carry \mathbf{V}_1 into \mathbf{V}_2 . Note that

$$\tan \theta = \frac{|\mathbf{V}_1 \times \mathbf{V}_2|}{\mathbf{V}_1 \cdot \mathbf{V}_2}$$

The following rules apply to vector products:

$$\begin{aligned} \mathbf{V}_1 \times \mathbf{V}_2 &= -\mathbf{V}_2 \times \mathbf{V}_1 \\ \mathbf{V}_1 \times (\mathbf{V}_2 + \mathbf{V}_3) &= \mathbf{V}_1 \times \mathbf{V}_2 + \mathbf{V}_1 \times \mathbf{V}_3 \\ (\mathbf{V}_1 + \mathbf{V}_2) \times \mathbf{V}_3 &= \mathbf{V}_1 \times \mathbf{V}_3 + \mathbf{V}_2 \times \mathbf{V}_3 \\ \mathbf{V}_1 \times (\mathbf{V}_2 \times \mathbf{V}_3) &= \mathbf{V}_2(\mathbf{V}_3 \cdot \mathbf{V}_1) - \mathbf{V}_3(\mathbf{V}_1 \cdot \mathbf{V}_2) \\ \mathbf{i} \times \mathbf{i} &= 0, \quad \mathbf{j} \times \mathbf{j} = 0, \quad \mathbf{k} \times \mathbf{k} = 0 \\ \mathbf{i} \times \mathbf{j} &= \mathbf{k}, \quad \mathbf{j} \times \mathbf{k} = \mathbf{i}, \quad \mathbf{k} \times \mathbf{i} = \mathbf{j} \end{aligned} \quad (4)$$

If $\mathbf{V}_1 = a_1\mathbf{i} + b_1\mathbf{j} + c_1\mathbf{k}$, $\mathbf{V}_2 = a_2\mathbf{i} + b_2\mathbf{j} + c_2\mathbf{k}$, and $\mathbf{V}_3 = a_3\mathbf{i} + b_3\mathbf{j} + c_3\mathbf{k}$, then

$$\mathbf{V}_1 \times \mathbf{V}_2 = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \end{vmatrix} = (b_1 c_2 - b_2 c_1)\mathbf{i} + (c_1 a_2 - c_2 a_1)\mathbf{j} + (a_1 b_2 - a_2 b_1)\mathbf{k} \quad (5)$$

Note that, since $\mathbf{V}_1 \times \mathbf{V}_2 = -\mathbf{V}_2 \times \mathbf{V}_1$, the vector product is not commutative.

2.2.5 Scalar Triple Product

There is only one possible interpretation of the expression $\mathbf{V}_1 \cdot \mathbf{V}_2 \times \mathbf{V}_3$ and that is $\mathbf{V}_1 \cdot (\mathbf{V}_2 \times \mathbf{V}_3)$ which is a scalar. This product is called the *scalar triple product* and is written as $[\mathbf{V}_1 \mathbf{V}_2 \mathbf{V}_3]$. Further

$$\begin{aligned} [\mathbf{V}_1 \mathbf{V}_2 \mathbf{V}_3] &= \mathbf{V}_1 \cdot (\mathbf{V}_2 \times \mathbf{V}_3) = (\mathbf{V}_1 \times \mathbf{V}_2) \cdot \mathbf{V}_3 = \mathbf{V}_2 \cdot (\mathbf{V}_3 \times \mathbf{V}_1) \\ &= \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} \\ &= |\mathbf{V}_1| |\mathbf{V}_2| |\mathbf{V}_3| \cos \phi \sin \theta, \end{aligned} \quad (6)$$

where θ is the angle between \mathbf{V}_2 and \mathbf{V}_3 and ϕ is the angle between \mathbf{V}_1 and the normal to the plane of \mathbf{V}_2 and \mathbf{V}_3 . The determinant indicates that it can be considered as the volume of the parallelepiped whose three determining edges are \mathbf{V}_1 , \mathbf{V}_2 , and \mathbf{V}_3 . Note that cyclic permutation of the subscripts does not change the value of the scalar triple product: $[\mathbf{V}_1\mathbf{V}_2\mathbf{V}_3] = [\mathbf{V}_2\mathbf{V}_3\mathbf{V}_1] = [\mathbf{V}_3\mathbf{V}_1\mathbf{V}_2]$ but $[\mathbf{V}_1\mathbf{V}_2\mathbf{V}_3] = -[\mathbf{V}_2\mathbf{V}_1\mathbf{V}_3]$ and $[\mathbf{V}_1\mathbf{V}_1\mathbf{V}_2] \equiv 0$.

2.2.6 Vector Triple Product

The product $\mathbf{V}_1 \times (\mathbf{V}_2 \times \mathbf{V}_3)$ defines the *vector triple product*. The parentheses are vital to the definition.

$$\begin{aligned}\mathbf{V}_1 \times (\mathbf{V}_2 \times \mathbf{V}_3) &= (\mathbf{V}_1 \cdot \mathbf{V}_3)\mathbf{V}_2 - (\mathbf{V}_1 \cdot \mathbf{V}_2)\mathbf{V}_3 \\ &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ a_1 & b_1 & c_1 \\ \begin{vmatrix} b_2 & c_2 \\ b_3 & c_3 \end{vmatrix} & \begin{vmatrix} c_2 & a_2 \\ c_3 & a_3 \end{vmatrix} & \begin{vmatrix} a_2 & b_2 \\ a_3 & b_3 \end{vmatrix} \end{vmatrix}\end{vmatrix}\end{aligned}\quad (7)$$

This is a vector, perpendicular to \mathbf{V}_1 , lying in the plane of \mathbf{V}_2 and \mathbf{V}_3 . Similarly

$$\begin{aligned}(\mathbf{V}_1 \times \mathbf{V}_2) \times \mathbf{V}_3 &= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \begin{vmatrix} b_1 & c_1 \\ b_2 & c_2 \\ a_3 \end{vmatrix} & \begin{vmatrix} c_1 & a_1 \\ c_2 & a_2 \\ b_3 \end{vmatrix} & \begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \\ c_3 \end{vmatrix} \end{vmatrix}\end{vmatrix}\end{aligned}\quad (8)$$

$$\mathbf{V}_1 \times (\mathbf{V}_2 \times \mathbf{V}_3) + \mathbf{V}_2 \times (\mathbf{V}_3 \times \mathbf{V}_1) + \mathbf{V}_3 \times (\mathbf{V}_1 \times \mathbf{V}_2) \equiv 0$$

If $\mathbf{V}_1 \times (\mathbf{V}_2 \times \mathbf{V}_3) = (\mathbf{V}_1 \times \mathbf{V}_2) \times \mathbf{V}_3$ then $\mathbf{V}_1, \mathbf{V}_2, \mathbf{V}_3$ form an *orthogonal set*. Thus $\{\mathbf{i}, \mathbf{j}, \mathbf{k}\}$ form an orthogonal set.

3 GEOMETRY

3.1 GEOMETRY OF THE PLANE, STRAIGHT LINE, AND SPHERE

Assume the position vectors of the fixed points A, B, C, D relative to an origin O are $\mathbf{V}_1, \mathbf{V}_2, \mathbf{V}_3, \mathbf{V}_4$ and the position vector of the variable point P is \mathbf{V} .

1. The equation of the straight line through A parallel to \mathbf{V}_2 is:

$$\begin{aligned}\mathbf{V} &= \mathbf{V}_1 + r\mathbf{V}_2 \\ \text{or } (\mathbf{V} - \mathbf{V}_1) &= r\mathbf{V}_2 \\ \text{or } (\mathbf{V} - \mathbf{V}_1) \times \mathbf{V}_2 &= 0\end{aligned}$$

2. The equation of the the plane through A perpendicular to \mathbf{V}_2 is:

$$(\mathbf{V} - \mathbf{V}_1) \cdot \mathbf{V}_2 = 0$$

3. The equation of the line AB is:

$$\mathbf{V} = r\mathbf{V}_1 + (1 - r)\mathbf{V}_2$$

4. The equations of the bisectors of the angles between \mathbf{V}_1 and \mathbf{V}_2 are:

$$\mathbf{V} = r \left(\frac{\mathbf{V}_1}{|\mathbf{V}_1|} \pm \frac{\mathbf{V}_2}{|\mathbf{V}_2|} \right) \quad \text{or} \quad \mathbf{V} = r(\hat{\mathbf{V}}_1 \pm \hat{\mathbf{V}}_2)$$

5. The perpendicular from C to the line through A parallel to \mathbf{V}_2 has as its equation:

$$\mathbf{V} = \mathbf{V}_1 - \mathbf{V}_3 - \hat{\mathbf{V}}_2 \cdot (\mathbf{V}_1 - \mathbf{V}_3)\hat{\mathbf{V}}_2.$$

6. The condition for the intersection of the two lines $(\mathbf{V} = \mathbf{V}_1 + r\mathbf{V}_3)$ and $(\mathbf{V} = \mathbf{V}_2 + s\mathbf{V}_4)$ is:

$$[(\mathbf{V}_1 - \mathbf{V}_2)\mathbf{V}_3\mathbf{V}_4] = 0.$$

- (a) The common perpendicular to the above two lines is the line of intersection of the two planes

$$[(\mathbf{V} - \mathbf{V}_1)\mathbf{V}_3(\mathbf{V}_3 \times \mathbf{V}_4)] = 0 \quad \text{and} \quad [(\mathbf{V} - \mathbf{V}_2)\mathbf{V}_4(\mathbf{V}_3 \times \mathbf{V}_4)] = 0$$

- (b) The length of this perpendicular is

$$\frac{|[(\mathbf{V}_1 - \mathbf{V}_2)\mathbf{V}_3\mathbf{V}_4]|}{|\mathbf{V}_3 \times \mathbf{V}_4|}.$$

7. The equation of the line perpendicular to the plane ABC is

$$\mathbf{V} = \mathbf{V}_1 \times \mathbf{V}_2 + \mathbf{V}_2 \times \mathbf{V}_3 + \mathbf{V}_3 \times \mathbf{V}_1$$

and the distance of the plane from the origin is

$$\frac{[\mathbf{V}_1 \mathbf{V}_2 \mathbf{V}_3]}{|(\mathbf{V}_2 - \mathbf{V}_1) \times (\mathbf{V}_3 - \mathbf{V}_1)|}$$

8. In general the vector equation $\mathbf{V} \cdot \mathbf{V}_2 = r$ defines the plane which is perpendicular to \mathbf{V}_2 , and the perpendicular distance from A to this plane is

$$\frac{r - \mathbf{V}_1 \cdot \mathbf{V}_2}{|\mathbf{V}_2|}$$

9. The distance from A , measured along a line parallel to \mathbf{V}_3 , is $\frac{r - \mathbf{V}_1 \cdot \mathbf{V}_2}{\mathbf{V}_2 \cdot \hat{\mathbf{v}}_3}$ or $\frac{r - \mathbf{V}_1 \cdot \mathbf{V}_2}{v_2 \cos \theta}$ where θ is the angle between \mathbf{V}_2 and \mathbf{V}_3 . (If this plane contains the point C then $r = \mathbf{V}_3 \cdot \mathbf{V}_2$ and if it passes through the origin then $r = 0$.)

10. For two given planes $\{\mathbf{V} \cdot \mathbf{V}_1 = r, \mathbf{V} \cdot \mathbf{V}_2 = s\}$ any plane through the line of intersection of these planes is given by $\mathbf{V} \cdot (\mathbf{V}_1 + \lambda \mathbf{V}_2) = r + \lambda s$ where λ is a scalar parameter. In particular, using $\lambda = \pm \frac{|\mathbf{V}_1|}{|\mathbf{V}_2|}$ gives the two equations for the two planes bisecting the angle between the given planes.

11. The plane through A parallel to the plane of $\mathbf{V}_2, \mathbf{V}_3$ is

$$\begin{aligned} \mathbf{V} &= \mathbf{V}_1 + r\mathbf{V}_2 + s\mathbf{V}_3 \\ \text{or } (\mathbf{V} - \mathbf{V}_1) \cdot \mathbf{V}_2 \times \mathbf{V}_3 &= 0 \\ \text{or } [\mathbf{V} \mathbf{V}_2 \mathbf{V}_3] - [\mathbf{V}_1 \mathbf{V}_2 \mathbf{V}_3] &= 0 \end{aligned}$$

so that the expansion in rectangular Cartesian coordinates yields (where $\mathbf{V} \equiv x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$):

$$\begin{vmatrix} (x - a_1) & (y - b_1) & (z - c_1) \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} = 0$$

which is the usual linear equation in x, y , and z .

12. The plane through AB parallel to \mathbf{V}_3 is given by $[(\mathbf{V} - \mathbf{V}_1)(\mathbf{V}_1 - \mathbf{V}_2)\mathbf{V}_3] = 0$ or

$$[\mathbf{V} \mathbf{V}_2 \mathbf{V}_3] - [\mathbf{V} \mathbf{V}_1 \mathbf{V}_3] - [\mathbf{V}_1 \mathbf{V}_2 \mathbf{V}_3] = 0.$$

13. The plane through the three points A, B , and C is

$$\begin{aligned} \mathbf{V} &= \mathbf{V}_1 + s(\mathbf{V}_2 - \mathbf{V}_1) + t(\mathbf{V}_3 - \mathbf{V}_1) \\ \text{or } \mathbf{V} &= r\mathbf{V}_1 + s\mathbf{V}_2 + t\mathbf{V}_3 \quad (\text{with } r + s + t \equiv 1) \\ \text{or } [(\mathbf{V} - \mathbf{V}_1)(\mathbf{V}_1 - \mathbf{V}_2)(\mathbf{V}_2 - \mathbf{V}_3)] &= 0 \\ \text{or } [\mathbf{V} \mathbf{V}_1 \mathbf{V}_2] + [\mathbf{V} \mathbf{V}_2 \mathbf{V}_3] + [\mathbf{V} \mathbf{V}_3 \mathbf{V}_1] - [\mathbf{V}_1 \mathbf{V}_2 \mathbf{V}_3] &= 0 \end{aligned}$$

14. For four points A, B, C, D to be coplanar, then

$$r\mathbf{V}_1 + s\mathbf{V}_2 + t\mathbf{V}_3 + u\mathbf{V}_4 \equiv 0 \equiv r + s + t + u$$

15. The following formulae relate to a sphere when the vectors are taken to lie in three-dimensional space and to a circle when the space is two-dimensional. For a circle in three dimensions take the intersection of the sphere with a plane.

- (a) The equation of a sphere with center O and radius OA is

$$\begin{aligned} \mathbf{V} \cdot \mathbf{V} &= v_1^2 \\ \text{or } (\mathbf{V} - \mathbf{V}_1) \cdot (\mathbf{V} + \mathbf{V}_1) &= 0 \end{aligned}$$

- (b) Note that in two-dimensional polar coordinates this is simply

$$r = 2a \cos \theta$$

- (c) While in three-dimensional Cartesian coordinates it is

$$x^2 + y^2 + z^2 - 2(a_1x + b_1y + c_1z) = 0.$$

16. The equation of a sphere having the points A and B as the extremities of a diameter is

$$(\mathbf{V} - \mathbf{V}_1) \cdot (\mathbf{V} - \mathbf{V}_2) = 0.$$

17. The square of the length of the tangent from C to the sphere with center B and radius \mathbf{V}_1 is given by

$$(\mathbf{V}_3 - \mathbf{V}_2) \cdot (\mathbf{V}_3 - \mathbf{V}_2) = v_1^2$$

18. The condition that the plane $\mathbf{V} \cdot \mathbf{V}_3 = s$ is tangential to the sphere $(\mathbf{V} - \mathbf{V}_2) \cdot (\mathbf{V} - \mathbf{V}_2) = v_1^2$ is

$$(s - \mathbf{V}_3 \cdot \mathbf{V}_2) \cdot (s - \mathbf{V}_3 \cdot \mathbf{V}_2) = v_1^2 v_3^2.$$

19. The equation of the tangent plane at D , on the surface of sphere $(\mathbf{V} - \mathbf{V}_2) \cdot (\mathbf{V} - \mathbf{V}_2) = v_1^2$, is

$$(\mathbf{V} - \mathbf{V}_4) \cdot (\mathbf{V}_4 - \mathbf{V}_2) = 0$$

$$\text{or } \mathbf{V} \cdot \mathbf{V}_4 - \mathbf{V}_2 \cdot (\mathbf{V} + \mathbf{V}_4) = v_1^2 - v_2^2$$

20. The condition that the two circles $(\mathbf{V} - \mathbf{V}_2) \cdot (\mathbf{V} - \mathbf{V}_2) = v_1^2$ and $(\mathbf{V} - \mathbf{V}_4) \cdot (\mathbf{V} - \mathbf{V}_4) = v_3^2$ intersect orthogonally is

$$(\mathbf{V}_2 - \mathbf{V}_4) \cdot (\mathbf{V}_2 - \mathbf{V}_4) = v_1^2 + v_3^2$$

3.2 GEOMETRY OF CURVES IN SPACE

Let \mathbf{g} be a natural representation of a regular curve C . The *arc length* is $L = \int_a^b |\mathbf{g}'(u)| du$. At each point

1. <i>Binormal line</i>	$\mathbf{y} = \lambda \mathbf{b}(s) + \mathbf{x}$	8. <i>Radius of curvature</i>	$\rho(s) = \frac{1}{ \kappa(s) }$ when $\kappa(s) \neq 0$
2. <i>Curvature</i>	$\kappa(s) = \mathbf{n}(s) \cdot \mathbf{k}(s)$	9. <i>Rectifying plane</i>	$(\mathbf{y} - \mathbf{x}) \cdot \mathbf{n}(s) = 0$
3. <i>Curvature vector</i>	$\mathbf{k}(s) = \dot{\mathbf{t}}(s)$	10. <i>Tangent line</i>	$\mathbf{y} = \lambda \mathbf{t}(s) + \mathbf{x}$
4. <i>Normal plane</i>	$(\mathbf{y} - \mathbf{x}) \cdot \mathbf{t}(s) = 0$	11. <i>Torsion</i>	$\tau(s) = -\mathbf{n}(s) \cdot \dot{\mathbf{b}}(s)$
5. <i>Osculating plane</i>	$(\mathbf{y} - \mathbf{x}) \cdot \mathbf{b}(s) = 0$	12. <i>Unit binormal vector</i>	$\mathbf{b}(s) = \mathbf{t}(s) \times \mathbf{n}(s)$
6. <i>Principal normal line</i>	$\mathbf{y} = \lambda \mathbf{n}(s) + \mathbf{x}$	13. <i>Unit tangent vector</i>	$\mathbf{t}(s) = \dot{\mathbf{g}}(s)$ with $(\dot{\mathbf{g}}(s) = \frac{d\mathbf{g}}{ds})$
7. <i>Principal normal unit vector</i>	$\mathbf{n}(s) = \pm \frac{\mathbf{k}(s)}{ \mathbf{k}(s) }$ for $\mathbf{k}(s) \neq 0$		

And the osculating sphere is $(\mathbf{y} - \mathbf{c}) \cdot (\mathbf{y} - \mathbf{c}) = r^2$ where $\mathbf{c} = \mathbf{x} + \rho(s)\mathbf{n}(s) - \frac{\dot{\kappa}(s)}{\kappa^2(s)\tau(s)}\mathbf{b}(s)$ and $r^2 = \rho^2(s) + \frac{\kappa^2(s)}{\kappa^4(s)\tau^2(s)}$

Then the moving trihedron is $\{\mathbf{t}(s), \mathbf{n}(s), \mathbf{b}(s)\}$ and

1. If $\mathbf{x} = (x(t), y(t), z(t)) = \mathbf{d}(t)$ is a regular representation of a regular curve C , then the following hold at a point $\mathbf{d}(t)$ of C :

$$|\kappa| = \frac{|\mathbf{x}' \times \mathbf{x}''|}{|\mathbf{x}'|^3} = \frac{\sqrt{(z''y' - y''z')^2 + (x''z' - z''x')^2 + (y''x' - x''y')^2}}{(x'^2 + y'^2 + z'^2)^{3/2}} \quad (9)$$

$$\tau = \frac{\det(\mathbf{x}', \mathbf{x}'', \mathbf{x}''')}{|\mathbf{x}' \times \mathbf{x}''|^2} = \frac{(\mathbf{x}' \times \mathbf{x}'') \cdot \mathbf{x}'''}{|\mathbf{x}' \times \mathbf{x}''|^2} = \frac{z'''(x'y'' - y'x'') + z''(x'''y' - x'y''') + z'(x''y''' - x'''y'')}{(x'^2 + y'^2 + z'^2)(x''^2 + y''^2 + z''^2)}$$

2. The vectors of the moving trihedron satisfy the *Serret-Frenet equations*

$$\dot{\mathbf{t}} = \kappa \mathbf{n}, \quad \dot{\mathbf{n}} = -\kappa \mathbf{t} + \tau \mathbf{b}, \quad \dot{\mathbf{b}} = -\tau \mathbf{n}.$$

3. For any planar curve represented parametrically by $\mathbf{x} = \mathbf{d}(t) = (t, f(t), 0)$,

$$|\kappa| = \frac{\left| \frac{d^2x}{dt^2} \right|}{\left(1 + \left(\frac{dx}{dt} \right)^2 \right)^{3/2}}.$$

4. Expressions for the curvature vector and curvature of a *plane curve* corresponding to different representations are:

Representation	$x = f(t),$ $y = g(t)$	$y = f(x)$	$r = f(\theta)$
Curvature vector \mathbf{k}	$\frac{(\dot{x}\ddot{y} - \dot{y}\ddot{x})}{(\dot{x}^2 + \dot{y}^2)^2}(-\dot{y}, \dot{x})$	$\frac{y''}{(1 + y'^2)^2}(-y', 1)$	$\frac{(r^2 + 2r'^2 - rr'')}{(r^2 + r'^2)^2} \begin{pmatrix} -\dot{r} \sin \theta - r \cos \theta, \\ \dot{r} \cos \theta - r \sin \theta \end{pmatrix}$
Curvature $ \kappa = \rho^{-1}$	$\frac{ \dot{x}\ddot{y} - \dot{y}\ddot{x} }{(\dot{x}^2 + \dot{y}^2)^{3/2}}$	$\frac{ y'' }{(1 + y'^2)^{3/2}}$	$\frac{r^2 + 2r'^2 - rr''}{(r^2 + r'^2)^{3/2}}$

5. For a plane curve, the equation of the *osculating circle* is $(\mathbf{y} - \mathbf{c}) \cdot (\mathbf{y} - \mathbf{c}) = \rho^2$, where $\mathbf{c} = \mathbf{x} + \rho^2 \mathbf{k}$ is the *center of curvature*.

4 TRIGONOMETRY

4.1 TRIGONOMETRIC FUNCTIONS IN TERMS OF ONE ANOTHER

Function	$\sin \alpha$	$\cos \alpha$	$\tan \alpha$	$\cot \alpha$	$\sec \alpha$	$\csc \alpha$
$\sin \alpha =$	$\sin \alpha$	$\pm \sqrt{1 - \cos^2 \alpha}$	$\frac{\tan \alpha}{\pm \sqrt{1 + \tan^2 \alpha}}$	$\frac{1}{\pm \sqrt{1 + \cot^2 \alpha}}$	$\frac{\pm \sqrt{\sec^2 \alpha - 1}}{\sec \alpha}$	$\frac{1}{\csc \alpha}$
$\cos \alpha =$	$\pm \sqrt{1 - \sin^2 \alpha}$	$\cos \alpha$	$\frac{1}{\pm \sqrt{1 + \tan^2 \alpha}}$	$\frac{\cot \alpha}{\pm \sqrt{1 + \cot^2 \alpha}}$	$\frac{1}{\sec \alpha}$	$\frac{\pm \sqrt{\csc^2 \alpha - 1}}{\csc \alpha}$
$\tan \alpha =$	$\frac{\sin \alpha}{\pm \sqrt{1 - \sin^2 \alpha}}$	$\frac{\pm \sqrt{1 - \cos^2 \alpha}}{\cos \alpha}$	$\tan \alpha$	$\frac{1}{\cot \alpha}$	$\pm \sqrt{\sec^2 \alpha - 1}$	$\frac{1}{\pm \sqrt{\csc^2 \alpha - 1}}$
$\cot \alpha =$	$\frac{\pm \sqrt{1 - \sin^2 \alpha}}{\sin \alpha}$	$\frac{\cos \alpha}{\pm \sqrt{1 - \cos^2 \alpha}}$	$\frac{1}{\tan \alpha}$	$\cot \alpha$	$\frac{1}{\pm \sqrt{\sec^2 \alpha - 1}}$	$\pm \sqrt{\csc^2 \alpha - 1}$
$\sec \alpha =$	$\frac{1}{\pm \sqrt{1 - \sin^2 \alpha}}$	$\frac{1}{\cos \alpha}$	$\pm \sqrt{1 + \tan^2 \alpha}$	$\frac{\pm \sqrt{1 + \cot^2 \alpha}}{\cot \alpha}$	$\sec \alpha$	$\frac{\csc \alpha}{\pm \sqrt{\csc^2 \alpha - 1}}$
$\csc \alpha =$	$\frac{1}{\sin \alpha}$	$\frac{1}{\pm \sqrt{1 - \cos^2 \alpha}}$	$\frac{\pm \sqrt{1 + \tan^2 \alpha}}{\tan \alpha}$	$\pm \sqrt{1 + \cot^2 \alpha}$	$\frac{\sec \alpha}{\pm \sqrt{\sec^2 \alpha - 1}}$	$\csc \alpha$

Note: The choice of sign depends upon the quadrant of the angle.

4.2 HYPERBOLIC FUNCTIONS IN TERMS OF ONE ANOTHER

Function	$\sinh x$	$\cosh x$	$\tanh x$
$\sinh x =$	$\sinh x$	$\pm \sqrt{\cosh^2 x - 1}$	$\frac{\tanh x}{\sqrt{1 - \tanh^2 x}}$
$\cosh x =$	$\sqrt{1 + \sinh^2 x}$	$\cosh x$	$\frac{1}{\sqrt{1 - \tanh^2 x}}$
$\tanh x =$	$\frac{\sinh x}{\sqrt{1 + \sinh^2 x}}$	$\pm \frac{\sqrt{\cosh^2 x - 1}}{\cosh x}$	$\tanh x$
$\operatorname{cosech} x =$	$\frac{1}{\sinh x}$	$\pm \frac{1}{\sqrt{\cosh^2 x - 1}}$	$\frac{\sqrt{1 - \tanh^2 x}}{\tanh x}$
$\operatorname{sech} x =$	$\frac{1}{\sqrt{1 + \sinh^2 x}}$	$\frac{1}{\cosh x}$	$\sqrt{1 - \tanh^2 x}$
$\operatorname{coth} x =$	$\frac{\sqrt{1 + \sinh^2 x}}{\sinh x}$	$\frac{\pm \cosh x}{\sqrt{\cosh^2 x - 1}}$	$\frac{1}{\tanh x}$
Function	$\operatorname{cosech} x$	$\operatorname{sech} x$	$\operatorname{coth} x$
$\sinh x =$	$\frac{1}{\operatorname{cosech} x}$	$\pm \frac{\sqrt{1 - \operatorname{sech}^2 x}}{\operatorname{sech} x}$	$\frac{\pm 1}{\sqrt{\operatorname{coth}^2 x - 1}}$
$\cosh x =$	$\pm \frac{\sqrt{\operatorname{cosech}^2 x + 1}}{\operatorname{cosech} x}$	$\frac{1}{\operatorname{sech} x}$	$\pm \frac{\operatorname{coth} x}{\sqrt{\operatorname{coth}^2 x - 1}}$
$\tanh x =$	$\frac{1}{\sqrt{\operatorname{cosech}^2 x + 1}}$	$\pm \sqrt{1 + \operatorname{sech}^2 x}$	$\frac{1}{\operatorname{coth} x}$
$\operatorname{cosech} x =$	$\operatorname{cosech} x$	$\pm \frac{\operatorname{sech} x}{\sqrt{1 - \operatorname{sech}^2 x}}$	$\pm \frac{\sqrt{\operatorname{coth}^2 x - 1}}{1}$
$\operatorname{sech} x =$	$\pm \frac{\operatorname{cosech} x}{\sqrt{\operatorname{cosech}^2 x + 1}}$	$\operatorname{sech} x$	$\pm \frac{\sqrt{\operatorname{coth}^2 x - 1}}{\operatorname{coth} x}$
$\operatorname{coth} x =$	$\sqrt{\operatorname{cosech}^2 x + 1}$	$\pm \frac{1}{\sqrt{1 - \operatorname{sech}^2 x}}$	$\operatorname{coth} x$

Note: Whenever two signs are shown, choose + sign if x is positive, – sign if x is negative.

5 CALCULUS

5.1 DIFFERENTIATION

5.1.1 Differentiation Formulas

In the following formulas u, v, w represent functions of x , while a, c, n represent fixed real numbers. All arguments in the trigonometric functions are measured in radians, and all inverse trigonometric and hyperbolic functions represent principal values.

Let $y = f(x)$ and $\frac{dy}{dx} = \frac{d[f(x)]}{dx} = f'(x)$ define, respectively, a function and its derivative for any value x in their common domain. The differential for the function at such a value x is accordingly defined as

$$dy = d[f(x)] = \frac{dy}{dx} dx = \frac{d[f(x)]}{dx} dx = f'(x) dx$$

Each derivative formula has an associated differential formula. For example, formula 6 below has the differential formula

$$d(uvw) = uv dw + vw du + uw dv$$

1. $\frac{d}{dx}(a) = 0$
2. $\frac{d}{dx}(x) = 1$
3. $\frac{d}{dx}(au) = a \frac{du}{dx}$
4. $\frac{d}{dx}(u + v - w) = \frac{du}{dx} + \frac{dv}{dx} - \frac{dw}{dx}$
5. $\frac{d}{dx}(uv) = u \frac{dv}{dx} + v \frac{du}{dx}$
6. $\frac{d}{dx}(uvw) = uv \frac{dw}{dx} + vw \frac{du}{dx} + uw \frac{dv}{dx}$
7. $\frac{d}{dx}\left(\frac{u}{v}\right) = \frac{v \frac{du}{dx} - u \frac{dv}{dx}}{v^2} = \frac{1}{v} \frac{du}{dx} - \frac{u}{v^2} \frac{dv}{dx}$
8. $\frac{d}{dx}(u^n) = nu^{n-1} \frac{du}{dx}$
9. $\frac{d}{dx}\left(\frac{1}{u}\right) = -\frac{1}{u^2} \frac{du}{dx}$
10. $\frac{d}{dx}\left(\frac{1}{u^n}\right) = -\frac{n}{u^{n+1}} \frac{du}{dx}$
11. $\frac{d}{dx}\left(\frac{u^n}{v^m}\right) = \frac{u^{n-1}}{v^{m+1}} \left(nv \frac{du}{dx} - mu \frac{dv}{dx}\right)$
12. $\frac{d}{dx}(u^n v^m) = u^{n-1} v^{m-1} \left(nv \frac{du}{dx} + mu \frac{dv}{dx}\right)$
13. $\frac{du}{dx} = \frac{1}{\frac{dx}{du}}$ if $\frac{dx}{du} \neq 0$
14. $\frac{d}{dx}[f(u)] = \frac{d}{du}[f(u)] \cdot \frac{du}{dx}$
15. $\frac{d^2}{dx^2}[f(u)] = \frac{df(u)}{du} \cdot \frac{d^2 u}{dx^2} + \frac{d^2 f(u)}{du^2} \cdot \left(\frac{du}{dx}\right)^2$
16. $\frac{d^n}{dx^n}[uv] = \binom{n}{0} v \frac{d^n u}{dx^n} + \binom{n}{1} \frac{dv}{dx} \frac{d^{n-1} u}{dx^{n-1}} + \binom{n}{2} \frac{d^2 v}{dx^2} \frac{d^{n-2} u}{dx^{n-2}} + \cdots + \binom{n}{k} \frac{d^k v}{dx^k} \frac{d^{n-k} u}{dx^{n-k}} + \cdots + \binom{n}{n} u \frac{d^n v}{dx^n}$ where $\binom{n}{r} = \frac{n!}{r!(n-r)!}$ is the binomial coefficient, n non-negative integer, and $\binom{n}{0} = 1$.
17. $\frac{d}{dx}(\log_a u) = (\log_a e) \frac{1}{u} \frac{du}{dx}$
18. $\frac{d}{dx}(\log_e u) = \frac{1}{u} \frac{du}{dx}$
19. $\frac{d}{dx}(u^v) = v u^{v-1} \frac{du}{dx} + (\log_e u) u^v \frac{dv}{dx}$
20. $\frac{d}{dq} \int_p^q f(x) dx = f(q), \quad [p \text{ constant}]$

21. $\frac{d}{dp} \int_p^q f(x) dx = -f(p), \quad [q \text{ constant}]$
22. $\frac{d}{da} \int_p^q f(x, a) dx = \int_p^q \frac{\partial}{\partial a} [f(x, a)] dx + f(q, a) \frac{dq}{da} - f(p, a) \frac{dp}{da}$

5.1.2 Derivatives of Common Functions

Let a be a constant.

$f(x)$	$f'(x)$	$f(x)$	$f'(x)$	$f(x)$	$f'(x)$
$\sin x$	$\cos x$	$\sinh x$	$\cosh x$	x^a	ax^{a-1}
$\cos x$	$-\sin x$	$\cosh x$	$\sinh x$	$\frac{1}{x^a}$	$-\frac{a}{x^{a+1}}$
$\tan x$	$\sec^2 x$	$\tanh x$	$\operatorname{sech}^2 x$	\sqrt{x}	$\frac{1}{2\sqrt{x}}$
$\csc x$	$-\csc x \cot x$	$\operatorname{csch} x$	$-\operatorname{csch} x \coth x$	$\ln x $	$1/x$
$\sec x$	$\sec x \tan x$	$\operatorname{sech} x$	$-\operatorname{sech} x \tanh x$	e^x	e^x
$\cot x$	$-\csc^2 x$	$\coth x$	$-\operatorname{csch}^2 x$	$a^x (a > 0)$	$a^x \ln a$
$\arcsin x$	$\frac{1}{\sqrt{1-x^2}}$	$\sinh^{-1} x$	$\frac{1}{\sqrt{x^2+1}}$	$ x $	$x/ x $
$\arccos x$	$-\frac{1}{\sqrt{1-x^2}}$	$\cosh^{-1} x$	$\frac{1}{\sqrt{x^2-1}}$		
$\arctan x$	$\frac{1}{1+x^2}$	$\tanh^{-1} x$	$\frac{1}{1-x^2}$		
$\operatorname{arc} \csc x$	$-\frac{1}{x\sqrt{x^2-1}}$	$\operatorname{csch}^{-1} x$	$\frac{-1}{ x \sqrt{1+x^2}}$		
$\operatorname{arc} \sec x$	$\frac{1}{x\sqrt{x^2-1}}$	$\operatorname{sech}^{-1} x$	$\frac{-1}{ x \sqrt{1-x^2}}$		
$\operatorname{arc} \cot x$	$-\frac{1}{1+x^2}$	$\coth^{-1} x$	$\frac{1}{1-x^2}$		

5.1.3 Vector Operations

- In Cartesian coordinates, $\nabla = \left(\frac{\partial}{\partial x}, \frac{\partial}{\partial y}, \frac{\partial}{\partial z} \right) = \mathbf{i} \frac{\partial}{\partial x} + \mathbf{j} \frac{\partial}{\partial y} + \mathbf{k} \frac{\partial}{\partial z}$.
- $\nabla \cdot \mathbf{u} = \sum_{i=1}^3 \frac{\partial u_i}{\partial x_i}$ is a scalar while $\mathbf{V} \cdot \nabla = \sum_{i=1}^3 V_i \frac{\partial}{\partial x_i}$ is an operator.
- A vector field \mathbf{V} is *irrotational* if $\nabla \times \mathbf{V} = 0$.
- A vector field \mathbf{V} is *solenoidal* if $\nabla \cdot \mathbf{V} = 0$.
- If u and v are scalars and \mathbf{F} and \mathbf{G} are vectors in \mathbb{R}^3 , then
 - $\nabla(u+v) = \nabla u + \nabla v$
 - $\nabla(uv) = u\nabla v + v\nabla u$
 - $\nabla(\mathbf{F} + \mathbf{G}) = \nabla \mathbf{F} + \nabla \mathbf{G}$
 - $\nabla(\mathbf{F} \cdot \mathbf{G}) = (\mathbf{F} \cdot \nabla) \mathbf{G} + (\mathbf{G} \cdot \nabla) \mathbf{F} + \mathbf{F} \times (\nabla \times \mathbf{G}) + \mathbf{G} \times (\nabla \times \mathbf{F})$
 - $\nabla \cdot (u\mathbf{F}) = u(\nabla \cdot \mathbf{F}) + \mathbf{F} \cdot \nabla u$
 - $\nabla \cdot (\mathbf{F} \times \mathbf{G}) = \mathbf{G} \cdot (\nabla \times \mathbf{F}) - \mathbf{F} \cdot (\nabla \times \mathbf{G})$
 - $\nabla \times (u\mathbf{F}) = u(\nabla \times \mathbf{F}) + (\nabla u) \times \mathbf{F}$
 - $\nabla \times (\mathbf{F} + \mathbf{G}) = \nabla \times \mathbf{F} + \nabla \times \mathbf{G}$
 - $\nabla \times (\mathbf{F} \times \mathbf{G}) = \mathbf{F}(\nabla \cdot \mathbf{G}) - \mathbf{G}(\nabla \cdot \mathbf{F}) + (\mathbf{G} \cdot \nabla) \mathbf{F} - (\mathbf{F} \cdot \nabla) \mathbf{G}$
 - $\mathbf{F} \cdot \frac{d\mathbf{F}}{dt} = |\mathbf{F}| \frac{d|\mathbf{F}|}{dt}$
 - $\nabla^2(uv) = u\nabla^2 v + 2(\nabla u) \cdot (\nabla v) + v\nabla^2 u$

- The operator ∇ can be used more than once. If S is a scalar and \mathbf{V} is a vector, then:

$$\begin{aligned}
 \nabla \cdot (\nabla S) &\equiv \operatorname{div} \operatorname{grad} S \equiv \text{Laplacian } S \equiv \nabla^2 S \\
 \nabla \times (\nabla S) &\equiv \operatorname{curl} \operatorname{grad} S \equiv 0 \\
 \nabla(\nabla \cdot \mathbf{V}) &\equiv \operatorname{grad} \operatorname{div} \mathbf{V} \\
 \nabla \cdot (\nabla \times \mathbf{V}) &\equiv \operatorname{div} \operatorname{curl} \mathbf{V} \equiv 0 \\
 \nabla \times (\nabla \times \mathbf{V}) &\equiv \operatorname{curl} \operatorname{curl} \mathbf{V} \equiv \nabla(\nabla \cdot \mathbf{V}) - \nabla^2 \mathbf{V}
 \end{aligned} \tag{10}$$

7. If $r = |\mathbf{r}|$, \mathbf{a} is a constant vector, and n is an integer, then

Φ	$\nabla\Phi$	$\nabla^2\Phi$
$\mathbf{a} \cdot \mathbf{r}$	\mathbf{a}	0
r^n	$n r^{n-2} \mathbf{r}$	$n(n+1)r^{n-2}$
$\log r$	\mathbf{r}/r^2	$1/r^2$

\mathbf{F}	$\nabla \cdot \mathbf{F}$	$\nabla \times \mathbf{F}$	$(\mathbf{G} \cdot \nabla)\mathbf{F}$
\mathbf{r}	3	0	\mathbf{G}
$\mathbf{a} \times \mathbf{r}$	0	$2\mathbf{a}$	$\mathbf{a} \times \mathbf{G}$
$\mathbf{a} r^n$	$n r^{n-2}(\mathbf{r} \cdot \mathbf{a})$	$n r^{n-2}(\mathbf{r} \times \mathbf{a})$	$n r^{n-2}(\mathbf{r} \cdot \mathbf{G})\mathbf{a}$
$\mathbf{r} r^n$	$(n+3)r^n$	0	$r^n \mathbf{G} + n r^{n-2}(\mathbf{r} \cdot \mathbf{G})\mathbf{r}$
$\mathbf{a} \log r$	$\mathbf{r} \cdot \mathbf{a}/r^2$	$\mathbf{r} \times \mathbf{a}/r^2$	$(\mathbf{G} \cdot \mathbf{r})\mathbf{a}/r^2$

\mathbf{F}	$\nabla^2 \mathbf{F}$	$\nabla \nabla \cdot \mathbf{F}$
\mathbf{r}	0	0
$\mathbf{a} \times \mathbf{r}$	0	0
$\mathbf{a} r^n$	$n(n+1)r^{n-2}\mathbf{a}$	$n r^{n-2}\mathbf{a} + n(n-2)r^{n-4}(\mathbf{r} \cdot \mathbf{a})\mathbf{r}$
$\mathbf{r} r^n$	$n(n+3)r^{n-2}\mathbf{r}$	$n(n+3)r^{n-2}\mathbf{r}$
$\mathbf{a} \log r$	\mathbf{a}/r^2	$[r^2\mathbf{a} - 2(\mathbf{r} \cdot \mathbf{a})\mathbf{r}]/r^4$

8. $\frac{d}{dt}(\mathbf{F} + \mathbf{G}) = \frac{d\mathbf{F}}{dt} + \frac{d\mathbf{G}}{dt}$
9. $\frac{d}{dt}(\mathbf{F} \cdot \mathbf{G}) = \mathbf{F} \cdot \frac{d\mathbf{G}}{dt} + \frac{d\mathbf{F}}{dt} \cdot \mathbf{G}$
10. $\frac{d}{dt}(\mathbf{F} \times \mathbf{G}) = \mathbf{F} \times \frac{d\mathbf{G}}{dt} + \frac{d\mathbf{F}}{dt} \times \mathbf{G}$
11. $\frac{d}{dt}(\mathbf{V}_1 \times \mathbf{V}_2 \times \mathbf{V}_3) = \left(\frac{d\mathbf{V}_1}{dt}\right) \times (\mathbf{V}_2 \times \mathbf{V}_3) + \mathbf{V}_1 \times \left(\left(\frac{d\mathbf{V}_2}{dt}\right) \times \mathbf{V}_3\right) + \mathbf{V}_1 \times \left(\mathbf{V}_2 \times \left(\frac{d\mathbf{V}_3}{dt}\right)\right)$
12. $\frac{d}{dt}[\mathbf{V}_1 \mathbf{V}_2 \mathbf{V}_3] = \left[\left(\frac{d\mathbf{V}_1}{dt}\right) \mathbf{V}_2 \mathbf{V}_3\right] + \left[\mathbf{V}_1 \left(\frac{d\mathbf{V}_2}{dt}\right) \mathbf{V}_3\right] + \left[\mathbf{V}_1 \mathbf{V}_2 \left(\frac{d\mathbf{V}_3}{dt}\right)\right]$
13. If $A = A(t)$ and $B = B(t)$ are matrices then

- (a) $\frac{d}{dt}(AB) = \frac{dA}{dt}B + A\frac{dB}{dt}$
- (b) $\frac{d}{dt}(A \otimes B) = \frac{dA}{dt} \otimes B + A \otimes \frac{dB}{dt}$
- (c) $\frac{d}{dt}(A^{-1}) = -A\frac{dA}{dt}A^{-1}$

5.2 ORTHOGONAL COORDINATE SYSTEMS

In an orthogonal coordinate system, let $\{\mathbf{a}_i\}$ denote the unit vectors in each of the three coordinate directions, and let $\{u_i\}$ denote distance along each of these axes. The coordinate system may be designated by the *metric coefficients* $\{g_{11}, g_{22}, g_{33}\}$, defined by

$$g_{ii} = \left(\frac{\partial x_1}{\partial u_i} \right)^2 + \left(\frac{\partial x_2}{\partial u_i} \right)^2 + \left(\frac{\partial x_3}{\partial u_i} \right)^2,$$

where $\{x_1, x_2, x_3\}$ represent rectangular coordinates. Then define the $\{h_i\}$ by $h_i = \sqrt{g_{ii}}$. Finally, define $g = g_{11}g_{22}g_{33}$ so that $\sqrt{g} = h_1h_2h_3$.

In the following, ϕ represents a scalar, and $\mathbf{E} = E_1\mathbf{a}_1 + E_2\mathbf{a}_2 + E_3\mathbf{a}_3$ and $\mathbf{F} = F_1\mathbf{a}_1 + F_2\mathbf{a}_2 + F_3\mathbf{a}_3$ represent vectors.

$\text{grad } \phi = \nabla \phi = \text{the gradient of } \phi$

$$= \frac{\mathbf{a}_1}{\sqrt{g_{11}}} \frac{\partial \phi}{\partial u_1} + \frac{\mathbf{a}_2}{\sqrt{g_{22}}} \frac{\partial \phi}{\partial u_2} + \frac{\mathbf{a}_3}{\sqrt{g_{33}}} \frac{\partial \phi}{\partial u_3}, \quad (11)$$

$\text{div } \mathbf{E} = \nabla \cdot \mathbf{E} = \text{the divergence of } \mathbf{E}$

$$= \frac{1}{\sqrt{g}} \left\{ \frac{\partial}{\partial u_1} \left(\frac{gE_1}{g_{11}} \right) + \frac{\partial}{\partial u_2} \left(\frac{gE_2}{g_{22}} \right) + \frac{\partial}{\partial u_3} \left(\frac{gE_3}{g_{33}} \right) \right\}, \quad (12)$$

$\text{curl } \mathbf{E} = \nabla \times \mathbf{E} = \text{the curl of } \mathbf{E}$

$$= \mathbf{a}_1 \frac{\Gamma_1}{\sqrt{g_{11}}} + \mathbf{a}_2 \frac{\Gamma_2}{\sqrt{g_{22}}} + \mathbf{a}_3 \frac{\Gamma_3}{\sqrt{g_{33}}} = \begin{vmatrix} \frac{\mathbf{a}_1}{h_2h_3} & \frac{\mathbf{a}_2}{h_1h_3} & \frac{\mathbf{a}_3}{h_1h_2} \\ \frac{\partial}{\partial u_1} & \frac{\partial}{\partial u_2} & \frac{\partial}{\partial u_3} \\ h_1E_1 & h_2E_2 & h_3E_3 \end{vmatrix}, \quad (13)$$

$[(\mathbf{F} \cdot \nabla) \mathbf{E}]_j = \text{the convective operator}$

$$= \sum_{i=1}^3 \left[\frac{F_i}{h_i} \frac{\partial E_j}{\partial u_i} + \frac{E_i}{h_i h_j} \left(F_j \frac{\partial h_j}{\partial u_i} - F_i \frac{\partial h_i}{\partial u_j} \right) \right], \quad (14)$$

$\nabla^2 \phi = \text{the Laplacian of } \phi \text{ (sometimes written as } \Delta \phi \text{)}$

$$\begin{aligned} &= \frac{1}{h_1h_2h_3} \left\{ \frac{\partial}{\partial u_1} \left[\frac{h_2h_3}{h_1} \frac{\partial \phi}{\partial u_1} \right] + \frac{\partial}{\partial u_2} \left[\frac{h_3h_1}{h_2} \frac{\partial \phi}{\partial u_2} \right] + \frac{\partial}{\partial u_3} \left[\frac{h_1h_2}{h_3} \frac{\partial \phi}{\partial u_3} \right] \right\} \\ &= \frac{1}{\sqrt{g}} \left\{ \frac{\partial}{\partial u_1} \left[\frac{\sqrt{g}}{g_{11}} \frac{\partial \phi}{\partial u_1} \right] + \frac{\partial}{\partial u_2} \left[\frac{\sqrt{g}}{g_{22}} \frac{\partial \phi}{\partial u_2} \right] + \frac{\partial}{\partial u_3} \left[\frac{\sqrt{g}}{g_{33}} \frac{\partial \phi}{\partial u_3} \right] \right\}, \end{aligned} \quad (15)$$

$$\text{grad div } \mathbf{E} = \nabla(\nabla \cdot \mathbf{E}) = \frac{\mathbf{a}_1}{\sqrt{g_{11}}} \frac{\partial \Upsilon}{\partial x_1} + \frac{\mathbf{a}_2}{\sqrt{g_{22}}} \frac{\partial \Upsilon}{\partial x_2} + \frac{\mathbf{a}_3}{\sqrt{g_{33}}} \frac{\partial \Upsilon}{\partial x_3}, \quad (16)$$

$$\text{where } \Upsilon = \frac{1}{\sqrt{g}} \left\{ \frac{\partial}{\partial x_1} \left[E_1 \sqrt{\frac{g}{g_{11}}} \right] + \frac{\partial}{\partial x_2} \left[E_2 \sqrt{\frac{g}{g_{22}}} \right] + \frac{\partial}{\partial x_3} \left[E_3 \sqrt{\frac{g}{g_{33}}} \right] \right\}$$

$\text{curl curl } \mathbf{E} = \nabla \times (\nabla \times \mathbf{E})$

$$\begin{aligned} &= \mathbf{a}_1 \sqrt{\frac{g_{11}}{g}} \left[\frac{\partial \Gamma_3}{\partial x_2} - \frac{\partial \Gamma_2}{\partial x_3} \right] + \mathbf{a}_2 \sqrt{\frac{g_{22}}{g}} \left[\frac{\partial \Gamma_1}{\partial x_3} - \frac{\partial \Gamma_3}{\partial x_1} \right] + \mathbf{a}_3 \sqrt{\frac{g_{33}}{g}} \left[\frac{\partial \Gamma_2}{\partial x_1} - \frac{\partial \Gamma_1}{\partial x_2} \right] \\ \text{where } \Gamma_1 &= \frac{g_{11}}{\sqrt{g}} \left\{ \frac{\partial}{\partial x_2} (\sqrt{g_{33}} E_3) - \frac{\partial}{\partial x_3} (\sqrt{g_{22}} E_2) \right\}, \\ \Gamma_2 &= \frac{g_{22}}{\sqrt{g}} \left\{ \frac{\partial}{\partial x_3} (\sqrt{g_{11}} E_1) - \frac{\partial}{\partial x_1} (\sqrt{g_{33}} E_3) \right\}, \\ \Gamma_3 &= \frac{g_{33}}{\sqrt{g}} \left\{ \frac{\partial}{\partial x_1} (\sqrt{g_{22}} E_2) - \frac{\partial}{\partial x_2} (\sqrt{g_{11}} E_1) \right\}. \end{aligned} \quad (17)$$

Example Orthogonal Coordinate Systems

1. Rectangular coordinates $\{x, y, z\}$

Ranges: $-\infty < x < \infty$, $-\infty < y < \infty$, $-\infty < z < \infty$.

$$g_{11} = g_{22} = g_{33} = \sqrt{g} = 1.$$

In this coordinate system the following notation is sometimes used: $\mathbf{i} = \mathbf{a}_x$, $\mathbf{j} = \mathbf{a}_y$, $\mathbf{k} = \mathbf{a}_z$.

$$\begin{aligned}\text{grad } f &= \mathbf{a}_x \frac{\partial f}{\partial x} + \mathbf{a}_y \frac{\partial f}{\partial y} + \mathbf{a}_z \frac{\partial f}{\partial z} \\ \text{div } \mathbf{E} &= \frac{\partial}{\partial x}(E_x) + \frac{\partial}{\partial y}(E_y) + \frac{\partial}{\partial z}(E_z) \\ \text{curl } \mathbf{E} &= \left(\frac{\partial E_z}{\partial y} - \frac{\partial E_y}{\partial z} \right) \mathbf{a}_x + \left(\frac{\partial E_x}{\partial z} - \frac{\partial E_z}{\partial x} \right) \mathbf{a}_y + \left(\frac{\partial E_y}{\partial x} - \frac{\partial E_x}{\partial y} \right) \mathbf{a}_z \\ \nabla^2 f &= \frac{\partial^2 f}{\partial x^2} + \frac{\partial^2 f}{\partial y^2} + \frac{\partial^2 f}{\partial z^2} \\ [(\mathbf{F} \cdot \nabla) \mathbf{E}]_x &= F_x \frac{\partial E_x}{\partial x} + F_y \frac{\partial E_x}{\partial y} + F_z \frac{\partial E_x}{\partial z}\end{aligned}\tag{18}$$

2. Circular cylinder coordinates $\{r, \theta, z\}$

Relations: $x = r \cos \theta$, $y = r \sin \theta$, $z = z$.

Ranges: $0 \leq r < \infty$, $0 \leq \theta < 2\pi$, $-\infty < z < \infty$.

$$g_{11} = g_{33} = 1, \quad g_{22} = r^2, \quad \sqrt{g} = r.$$

$$\begin{aligned}\text{grad } f &= \mathbf{a}_r \frac{\partial f}{\partial r} + \frac{\mathbf{a}_\theta}{r} \frac{\partial f}{\partial \theta} + \mathbf{a}_z \frac{\partial f}{\partial z} \\ \text{div } \mathbf{E} &= \frac{1}{r} \frac{\partial}{\partial r}(r E_r) + \frac{1}{r} \frac{\partial E_\theta}{\partial \theta} + \frac{\partial E_z}{\partial z} \\ (\text{curl } \mathbf{E})_r &= \frac{1}{r} \frac{\partial E_z}{\partial \theta} - \frac{\partial E_\theta}{\partial z} \\ (\text{curl } \mathbf{E})_\theta &= \frac{\partial E_r}{\partial z} - \frac{\partial E_z}{\partial r} \\ (\text{curl } \mathbf{E})_z &= \frac{1}{r} \frac{\partial(r E_\theta)}{\partial r} - \frac{1}{r} \frac{\partial E_r}{\partial \theta} \\ \nabla^2 f &= \frac{1}{r} \frac{\partial}{\partial r} \left(r \frac{\partial f}{\partial r} \right) + \frac{1}{r^2} \frac{\partial^2 f}{\partial \theta^2} + \frac{\partial^2 f}{\partial z^2}\end{aligned}\tag{19}$$

3. Spherical coordinates $\{r, \theta, \psi\}$

Relations: $x = r \sin \theta \cos \phi$, $y = r \sin \theta \sin \phi$, $z = r \cos \theta$.

Ranges: $0 \leq r < \infty$, $0 \leq \theta \leq \pi$, $0 \leq \psi < 2\pi$.

$$g_{11} = 1, \quad g_{22} = r^2, \quad g_{33} = r^2 \sin^2 \theta, \quad \sqrt{g} = r^2 \sin \theta.$$

$$\begin{aligned}\text{grad } f &= \mathbf{e}_r \frac{\partial f}{\partial r} + \frac{\mathbf{e}_\theta}{r} \frac{\partial f}{\partial \theta} + \frac{\mathbf{e}_\phi}{r \sin \theta} \frac{\partial f}{\partial \phi} \\ \text{div } \mathbf{E} &= \frac{1}{r^2} \frac{\partial}{\partial r}(r^2 E_r) + \frac{1}{r \sin \theta} \frac{\partial}{\partial \theta}(E_\theta \sin \theta) + \frac{1}{r \sin \theta} \frac{\partial E_\phi}{\partial \phi} \\ (\text{curl } \mathbf{E})_r &= \frac{1}{r \sin \theta} \left[\frac{\partial}{\partial \theta}(E_\phi \sin \theta) - \frac{\partial A_\theta}{\partial \phi} \right] \\ (\text{curl } \mathbf{E})_\theta &= \frac{1}{r \sin \theta} \frac{\partial E_r}{\partial \phi} - \frac{1}{r} \frac{\partial(r E_\phi)}{\partial r} \\ (\text{curl } \mathbf{E})_\phi &= \frac{1}{r} \frac{\partial(r E_\theta)}{\partial r} - \frac{1}{r} \frac{\partial E_r}{\partial \theta} \\ \nabla^2 f &= \frac{1}{r^2} \frac{\partial}{\partial r} \left(r^2 \frac{\partial f}{\partial r} \right) + \frac{1}{r^2 \sin \theta} \frac{\partial}{\partial \theta} \left(\sin \theta \frac{\partial f}{\partial \theta} \right) + \frac{1}{r^2 \sin^2 \theta} \frac{\partial^2 f}{\partial \phi^2}\end{aligned}\tag{20}$$

5.3 INTEGRATION

The following is a brief discussion of some integration techniques. This introduction discusses a few of the important techniques which may be used, in conjunction with the integral table which follows, to integrate particular functions.

No matter how extensive the integral table, it is a fairly uncommon occurrence to find in the table the exact integral desired. Usually some form of transformation will have to be made. The simplest type of transformation, and yet the most general, is substitution. Simple forms of substitution, such as $y = ax$, are employed almost unconsciously by experienced users of integral tables. Other substitutions may require more thought. Finding the right substitution is largely a matter of intuition and experience.

Several precautions must be observed when using substitutions:

1. Be sure to make the substitution in the dx term, as well as everywhere else in the integral.
2. Be sure that the function substituted is one-to-one and continuous. If this is not the case, the integral must be restricted in such a way as to make it true.
3. With definite integrals, the limits should also be expressed in terms of the new dependent variable. With indefinite integrals, it is necessary to perform the reverse substitution to obtain the answer in terms of the original independent variable. This may also be done for definite integrals, but it is usually easier to change the limits.

And some useful notes

- Any rational function of x may be integrated if the denominator can be factored into linear and irreducible quadratic factors. The function may then be broken into partial fractions, and the individual partial fractions integrated by use of the appropriate formula from the integral table.
- Many integrals may be reduced to rational functions by proper substitutions. For example, $z = \tan \frac{x}{2}$ will reduce any rational function of the six trigonometric functions of x to a rational function of z . (There are other substitutions which may be simpler to use, but this one will always work.)
- Any rational function of x and $\sqrt{ax+b}$ may be reduced to a rational function of z by making the substitution $z = \sqrt{ax+b}$.
- The other main method of transforming integrals is integration by parts. $\int u dv = uv - \int v du$. The critical factor in this method is the choice of the functions u and v . In order for the method to be successful, $v = \int dv$ and $\int v du$ must be easier to integrate than the original integral. Once again, this choice is largely a matter of intuition and experience.

5.3.1 Integration Examples

Example: $\int \frac{x^4}{\sqrt{a^2 - x^2}} dx$

Here we make the substitution $x = |a| \sin \theta$. Then $dx = |a| \cos \theta d\theta$, and

$$\sqrt{a^2 - x^2} = \sqrt{a^2 - a^2 \sin^2 \theta} = |a| \sqrt{1 - \sin^2 \theta} = |a| \cos \theta$$

Notice the absolute value signs. It is very important to keep in mind that a square root radical always denotes the positive square root, and to assure the sign is always kept positive. Thus, $\sqrt{x^2} = |x|$. Failure to observe this is a common cause of errors in integration.

Notice also that the indicated substitution is not a one-to-one function, that is, it does not have a unique inverse. Thus, we must restrict the range of θ in such a way as to make the function one-to-one. Fortunately, this is easily done by solving for θ

$$\theta = \sin^{-1} \frac{x}{|a|}$$

and restricting the inverse sine to the principal values, $-\frac{\pi}{2} \leq \theta \leq \frac{\pi}{2}$.

Thus, the integral becomes

$$\int \frac{a^4 \sin^4 \theta |a| \cos \theta d\theta}{|a| |\cos \theta|}$$

Now, however, in the range of values chosen for θ , $\cos \theta$ is always positive. Thus, we may remove the absolute value signs from $\cos \theta$ in the denominator. (This is one of the reasons that the principal values of the inverse trigonometric functions are defined as they are.) Then the $\cos \theta$ terms cancel, and the integral becomes

$$a^4 \int \sin^4 \theta d\theta$$

By application of integral formulas 263 and 261, we integrate this to

$$-a^4 \frac{\sin^3 \theta \cos \theta}{4} - \frac{3a^4}{8} \cos \theta \sin \theta + \frac{3a^4}{8} \theta + C$$

Now we must perform the inverse substitution to get the result in terms of x . We have

$$\theta = \sin^{-1} \frac{x}{|a|} \quad \text{and} \quad \sin \theta = \frac{x}{|a|}$$

so that

$$\cos \theta = \pm \sqrt{1 - \sin^2 \theta} = \pm \sqrt{1 - \frac{x^2}{a^2}} = \pm \frac{\sqrt{a^2 - x^2}}{|a|}.$$

Because of the previously mentioned fact that $\cos \theta$ is positive, we may omit the \pm sign. The reverse substitution then produces the final answer

$$\int \frac{x^4}{\sqrt{a^2 - x^2}} dx = -\frac{1}{4}x^3 \sqrt{a^2 - x^2} - \frac{3}{8}a^2 x \sqrt{a^2 - x^2} + \frac{3}{8}a^4 \sin^{-1} \frac{x}{|a|} + C.$$

Example: $\int x \sin x dx$

Two obvious choices for integration by parts are $u = x$, $dv = \sin x dx$, or $u = \sin x$, $dv = x dx$. Since a preliminary mental calculation indicates that $\int v du$ in the second choice would be more, rather than less, complicated than the original integral (it would contain x^2), we use the first choice. We have $\{u = x \text{ and therefore } du = dx\}$ and $\{dv = \sin x dx \text{ and therefore } v = -\cos x\}$. Hence

$$\int x \sin x dx = \int u dv = uv - \int v du = -x \cos x + \int \cos x dx = \sin x - x \cos x$$

Of course, this result could have been obtained directly from the integral table, but it provides a simple example of the method. In more complicated examples the choice of u and v may not be so obvious, and several choices may have to be tried. Of course, there is no guarantee that any of them will work.

Integration by parts may be applied more than once, or combined with substitution. A fairly common case is illustrated by the following example.

Example: $\int e^x \sin x dx$

We have $\{u = e^x \text{ and therefore } du = e^x dx\}$ and $\{dv = \sin x dx \text{ and therefore } v = -\cos x\}$. Hence

$$\int e^x \sin x dx = \int u dv = uv - \int v du = -e^x \cos x + \int e^x \cos x dx$$

In this latter integral $\{u = e^x \text{ and therefore } du = e^x dx\}$ and $\{dv = \cos x dx \text{ and therefore } v = \sin x\}$ so that

$$\begin{aligned} \int e^x \sin x dx &= -e^x \cos x + \int e^x \cos x dx = -e^x \cos x + \int u dv \\ &= -e^x \cos x + uv - \int v du \\ &= -e^x \cos x + e^x \sin x - \int e^x \sin x dx \end{aligned}$$

This looks as if a circular transformation has taken place, since we are back at the same integral we started from. However, the above equation can be solved algebraically for the required integral:

$$\int e^x \sin x dx = \frac{1}{2}e^x \sin x - \frac{1}{2}e^x \cos x$$

In the second integration by parts, if the parts had been chosen as $u = \cos x$, $dv = e^x dx$, we would indeed have made a circular transformation, and returned to the starting place.

Example: The following rule is called the **extended rule for integration by parts**. It is the result of $n + 1$ successive applications of integration by parts. If

$$g_1(x) = \int g(x) dx, \quad g_2(x) = \int g_1(x) dx, \quad \dots, \quad g_m(x) = \int g_{m-1}(x) dx, \dots,$$

then

$$\begin{aligned} \int f(x) g(x) dx &= f(x) g_1(x) - f'(x) g_2(x) + f''(x) g_3(x) - \dots \\ &\quad + (-1)^n f^{(n)}(x) g_{n+1}(x) + (-1)^{n+1} \int f^{(n+1)}(x) g_{n+1}(x) dx. \end{aligned}$$

1. A useful special case of the above rule is when $f(x)$ is a polynomial of degree n . Then $f^{(n+1)}(x) = 0$, and

$$\int f(x) g(x) dx = f(x) g_1(x) - f'(x) g_2(x) + f''(x) g_3(x) - \cdots + (-1)^n f^{(n)}(x) g_{n+1}(x) + C$$

For example: if $f(x) = x^2$ and $g(x) = \sin x$ then

$$\int x^2 \sin x dx = -x^2 \cos x + 2x \sin x + 2 \cos x + C$$

2. Another application of this formula occurs if

$$f''(x) = af(x) \quad \text{and} \quad g''(x) = bg(x),$$

where a and b are unequal constants. In this case, by a process similar to that used in the above example for $\int e^x \sin x dx$, we obtain the formula

$$\int f(x)g(x) dx = \frac{f(x) g'(x) - f'(x) g(x)}{b - a} + C$$

For example: if $f(x) = e^{2x}$ and $g(x) = \sin 3x$, then $a = 4$, $b = -9$, and

$$\int e^{2x} \sin 3x dx = \frac{3 e^{2x} \cos 3x - 2 e^{2x} \sin 3x}{-9 - 4} + C = \frac{e^{2x}}{13} (2 \sin 3x - 3 \cos 3x) + C$$

5.3.2 Transformation of Integrals

Assume the following

1. s is the distance along a curve “ C ” in space and is measured from some fixed point.
2. S is a surface area
3. V is a volume contained by a specified surface
4. $\hat{\mathbf{t}}$ is the unit tangent to C at the point
5. $\hat{\mathbf{n}}$ is the unit outward pointing normal
6. \mathbf{F} is some vector function
7. ds is the vector element of curve (that is, $\hat{\mathbf{t}} ds$)
8. dS is the vector element of surface (that is, $\hat{\mathbf{n}} dS$)

then

1. $\int_C \mathbf{F} \cdot \hat{\mathbf{t}} ds = \int_C \mathbf{F}$ and when $\mathbf{F} = \nabla \phi$ then $\int_C (\nabla \phi) \cdot \hat{\mathbf{t}} ds = \int_C d\phi$

2. **Gauss’ Theorem** When S defines a closed region having a volume V :

$$\iiint_V (\nabla \cdot \mathbf{F}) dV = \iint_S \mathbf{F} \cdot \hat{\mathbf{n}} dS = \iint_S \mathbf{F} \cdot dS$$

also

$$\iiint_V (\nabla \phi) dV = \iint_S \phi \hat{\mathbf{n}} dS \quad \text{and} \quad \iiint_V (\nabla \times \mathbf{F}) dV = \iint_S (\hat{\mathbf{n}} \times \mathbf{F}) dS$$

3. **Stokes’ Theorem** When C is closed and bounds the open surface S :

$$\iint_S \hat{\mathbf{n}} \cdot (\nabla \times \mathbf{F}) dS = \int_C \mathbf{F} \cdot ds \quad \iint_S (\hat{\mathbf{n}} \times \nabla \phi) dS = \int_{(c)} \phi ds$$

4. **Green’s Theorem**

$$\begin{aligned} \iint_S (\nabla \phi \cdot \nabla \theta) dS &= \iint_S \phi \hat{\mathbf{n}} \cdot (\nabla \theta) dS = \iiint_V \phi (\nabla^2 \theta) dV \\ &= \iint_S \theta \hat{\mathbf{n}} \cdot (\nabla \phi) dS = \iiint_V \theta (\nabla^2 \phi) dV \end{aligned}$$

5.3.3 Table of Integrals

The following additional points should be observed when using this table.

1. A constant of integration is to be supplied with the answers for indefinite integrals.
2. Logarithmic expressions are to base $e = 2.71828 \dots$, unless otherwise specified, and are to be evaluated for the absolute value of the arguments.
3. All angles are measured in radians, and inverse trigonometric and hyperbolic functions represent principal values, unless otherwise indicated.
4. If the application of a formula produces either a zero denominator or the square root of a negative number in the result, there is usually available another form of the answer which avoids this difficulty.
5. When inverse trigonometric functions occur in the integrals, be sure that any replacements made for them are strictly in accordance with the rules for such functions. This causes little difficulty when the argument of the inverse trigonometric function is positive, since then all angles involved are in the first quadrant. However, if the argument is negative, special care must be used. Thus if $u > 0$,

$$\sin^{-1} u = \cos^{-1} \sqrt{1 - u^2} = \csc^{-1} \frac{1}{u}, \text{ etc.}$$

However, if $u < 0$,

$$\sin^{-1} u = -\cos^{-1} \sqrt{1 - u^2} = -\pi - \csc^{-1} \frac{1}{u}, \text{ etc.}$$

6. B_n and E_n are sometimes used; they represent the *Bernoulli numbers* and *Euler numbers*.

Elementary Forms

1. $\int a \, dx = ax$
2. $\int a \, f(x) \, dx = a \int f(x) \, dx$
3. $\int \phi(y) \, dx = \int \frac{\phi(y)}{y'} \, dy$, where $y' = \frac{dy}{dx}$
4. $\int (u + v) \, dx = \int u \, dx + \int v \, dx$, where u and v are any functions of x
5. $\int u \, dv = u \int dv - \int v \, du = uv - \int v \, du$
6. $\int u \frac{dv}{dx} \, dx = uv - \int v \frac{du}{dx} \, dx$
7. $\int x^n \, dx = \frac{x^{n+1}}{n+1}$, except $n = -1$
8. $\int \frac{f'(x) \, dx}{f(x)} = \log f(x)$, ($df(x) = f'(x) \, dx$)
9. $\int \frac{dx}{x} = \log x$
10. $\int \frac{f'(x) \, dx}{2\sqrt{f(x)}} = \sqrt{f(x)}$, ($df(x) = f'(x) \, dx$)
11. $\int e^x \, dx = e^x$
12. $\int e^{ax} \, dx = e^{ax}/a$
13. $\int b^{ax} \, dx = \frac{b^{ax}}{a \log b}$, ($b > 0$)
14. $\int \log x \, dx = x \log x - x$
15. $\int \frac{dx}{a^2 + x^2} = \frac{1}{a} \tan^{-1} \frac{x}{a}$
16. $\int \frac{dx}{x^2 - a^2} = \begin{cases} -\frac{1}{a} \coth^{-1} \frac{x}{a} \\ \text{or} \\ \frac{1}{2a} \log \frac{x-a}{x+a} \end{cases}$
17. $\int \frac{dx}{\sqrt{a^2 - x^2}} = \begin{cases} \sin^{-1} \frac{x}{|a|} \\ \text{or} \\ -\cos^{-1} \frac{x}{|a|} \end{cases}$
18. $\int \frac{dx}{\sqrt{x^2 \pm a^2}} = \log(x + \sqrt{x^2 \pm a^2})$

$$19. \int \frac{dx}{x\sqrt{x^2 - a^2}} = \frac{1}{|a|} \sec^{-1} \frac{x}{a}$$

$$20. \int \frac{dx}{x\sqrt{a^2 \pm x^2}} = -\frac{1}{a} \log \left(\frac{a + \sqrt{a^2 \pm x^2}}{x} \right)$$

FORMS CONTAINING $(a + bx)$

For forms containing $a + bx$, but not listed in the table, the substitution $u = \frac{a+bx}{x}$ may prove helpful.

$$21. \int (a + bx)^n dx = \frac{(a + bx)^{n+1}}{(n+1)b}, \quad (n \neq -1)$$

$$22. \int x(a + bx)^n dx = \frac{1}{b^2(n+2)}(a + bx)^{n+2} - \frac{a}{b^2(n+1)}(a + bx)^{n+1}, \quad (n \neq -1, -2)$$

$$23. \int x^2(a + bx)^n dx = \frac{1}{b^3} \left[\frac{(a + bx)^{n+3}}{n+3} - 2a \frac{(a + bx)^{n+2}}{n+2} + a^2 \frac{(a + bx)^{n+1}}{n+1} \right]$$

$$24. \int x^m(a + bx)^n dx = \begin{cases} \frac{x^{\frac{m+1}{b}}(a+bx)^n}{\frac{m+1}{b} + \frac{an}{m+n+1}} + \frac{an}{m+n+1} \int x^m(a + bx)^{n-1} dx \\ \text{or} \\ \frac{1}{a(n+1)} \left[-x^{m+1}(a + bx)^{n+1} + (m+n+2) \int x^m(a + bx)^{n+1} dx \right] \\ \text{or} \\ \frac{1}{b(m+n+1)} \left[x^m(a + bx)^{n+1} - ma \int x^{m-1}(a + bx)^n dx \right] \end{cases}$$

$$25. \int \frac{dx}{a + bx} = \frac{1}{b} \log(a + bx)$$

$$26. \int \frac{dx}{(a + bx)^2} = -\frac{1}{b(a + bx)}$$

$$27. \int \frac{dx}{(a + bx)^3} = -\frac{1}{2b(a + bx)^2}$$

$$28. \int \frac{x dx}{a + bx} = \begin{cases} \frac{1}{b^2} [a + bx - a \log(a + bx)] \\ \text{or} \\ \frac{x}{b} - \frac{a}{b^2} \log(a + bx) \end{cases}$$

$$29. \int \frac{x dx}{(a + bx)^2} = \frac{1}{b^2} \left[\log(a + bx) + \frac{a}{a + bx} \right]$$

$$30. \int \frac{x dx}{(a + bx)^n} = \frac{1}{b^2} \left[\frac{-1}{(n-2)(a + bx)^{n-2}} + \frac{a}{(n-1)(a + bx)^{n-1}} \right], \quad n \neq 1, 2$$

$$31. \int \frac{x^2 dx}{a + bx} = \frac{1}{b^3} \left[\frac{1}{2}(a + bx)^2 - 2a(a + bx) + a^2 \log(a + bx) \right]$$

$$32. \int \frac{x^2 dx}{(a + bx)^2} = \frac{1}{b^3} \left[a + bx - 2a \log(a + bx) - \frac{a^2}{a + bx} \right]$$

$$33. \int \frac{x^2 dx}{(a + bx)^3} = \frac{1}{b^3} \left[\log(a + bx) + \frac{2a}{a + bx} - \frac{a^2}{2(a + bx)^2} \right]$$

$$34. \int \frac{x^2 dx}{(a + bx)^n} = \frac{1}{b^3} \left[\frac{-1}{(n-3)(a + bx)^{n-3}} + \frac{2a}{(n-2)(a + bx)^{n-2}} - \frac{a^2}{(n-1)(a + bx)^{n-1}} \right], \quad n \neq 1, 2, 3$$

$$35. \int \frac{dx}{x(a + bx)} = -\frac{1}{a} \log \frac{a + bx}{x}$$

$$36. \int \frac{dx}{x(a + bx)^2} = \frac{1}{a(a + bx)} - \frac{1}{a^2} \log \frac{a + bx}{x}$$

$$37. \int \frac{dx}{x(a + bx)^3} = \frac{1}{a^3} \left[\frac{1}{2} \left(\frac{2a + bx}{a + bx} \right)^2 + \log \frac{x}{a + bx} \right]$$

$$38. \int \frac{dx}{x^2(a + bx)} = -\frac{1}{ax} + \frac{b}{a^2} \log \frac{a + bx}{x}$$

$$39. \int \frac{dx}{x^3(a + bx)} = \frac{2bx - a}{2a^2x^2} + \frac{b^2}{a^3} \log \frac{x}{a + bx}$$

$$40. \int \frac{dx}{x^2(a + bx)^2} = -\frac{a + 2bx}{a^2x(a + bx)} + \frac{2b}{a^3} \log \frac{a + bx}{x}$$

FORMS CONTAINING $c^2 \pm x^2$ or $x^2 - c^2$

41. $\int \frac{dx}{c^2 + x^2} = \frac{1}{c} \tan^{-1} \frac{x}{c}$
42. $\int \frac{dx}{c^2 - x^2} = \frac{1}{2c} \log \frac{c+x}{c-x}, \quad (c^2 > x^2)$
43. $\int \frac{dx}{x^2 - c^2} = \frac{1}{2c} \log \frac{x-c}{x+c}, \quad (x^2 > c^2)$
44. $\int \frac{x dx}{c^2 \pm x^2} = \pm \frac{1}{2} \log(c^2 \pm x^2)$
45. $\int \frac{x dx}{(c^2 \pm x^2)^{n+1}} = \mp \frac{1}{2n(c^2 \pm x^2)^n}$
46. $\int \frac{dx}{(c^2 + x^2)^n} = \frac{1}{2c^2(n-1)} \left[\frac{x}{(c^2 + x^2)^{n-1}} + (2n-3) \int \frac{dx}{(c^2 + x^2)^{n-1}} \right]$
47. $\int \frac{dx}{(x^2 - c^2)^n} = \frac{1}{2c^2(n-1)} \left[-\frac{x}{(x^2 - c^2)^{n-1}} - (2n-3) \int \frac{dx}{(x^2 - c^2)^{n-1}} \right]$
48. $\int \frac{x dx}{x^2 - c^2} = \frac{1}{2} \log(x^2 - c^2)$
49. $\int \frac{x dx}{(x^2 - c^2)^{n+1}} = -\frac{1}{2n(x^2 - c^2)^n}$

FORMS CONTAINING $a + bx$ and $c + dx$

Define $u = a + bx$, $v = c + dx$, and $k = ad - bc$. If $k = 0$, then $v = \frac{c}{a}u$.

50. $\int \frac{dx}{u v} = \frac{1}{k} \log \left(\frac{v}{u} \right)$
51. $\int \frac{x dx}{u v} = \frac{1}{k} \left[\frac{a}{b} \log(u) - \frac{c}{d} \log(v) \right]$
52. $\int \frac{dx}{u^2 v} = \frac{1}{k} \left(\frac{1}{u} + \frac{d}{k} \log \frac{v}{u} \right)$
53. $\int \frac{x dx}{u^2 v} = \frac{-a}{bku} - \frac{c}{k^2} \log \frac{v}{u}$
54. $\int \frac{x^2 dx}{u^2 v} = \frac{a^2}{b^2 ku} + \frac{1}{k^2} \left[\frac{c^2}{d} \log(v) + \frac{a(k-bc)}{b^2} \log(u) \right]$
55. $\int \frac{dx}{u^n v^m} = \frac{1}{k(m-1)} \left[\frac{-1}{u^{n-1} v^{m-1}} - (m+n-2)b \int \frac{dx}{u^n v^{m-1}} \right]$
56. $\int \frac{u}{v} dx = \frac{bx}{d} + \frac{k}{d^2} \log(v)$
57. $\int \frac{u^m dx}{v^n} = \begin{cases} \frac{-1}{k(n-1)} \left[\frac{u^{m+1}}{v^{n-1}} + b(n-m-2) \int \frac{u^m}{v^{n-1}} dx \right] \\ \text{or} \\ \frac{-1}{d(n-m-1)} \left[\frac{u^m}{v^{n-1}} + mk \int \frac{u^{m-1}}{v^n} dx \right] \\ \text{or} \\ \frac{-1}{d(n-1)} \left[\frac{u^m}{v^{n-1}} - mb \int \frac{u^{m-1}}{v^{n-1}} dx \right] \end{cases}$

FORMS CONTAINING $(a + bx^n)$

58. $\int \frac{dx}{a + bx^2} = \frac{1}{\sqrt{ab}} \tan^{-1} \frac{x\sqrt{ab}}{a}, \quad (ab > 0)$
59. $\int \frac{dx}{a + bx^2} = \begin{cases} \frac{1}{2\sqrt{-ab}} \log \frac{a + x\sqrt{-ab}}{a - x\sqrt{-ab}} & (ab < 0) \\ \text{or} \\ \frac{1}{\sqrt{-ab}} \tanh^{-1} \frac{x\sqrt{-ab}}{a}, & (ab < 0) \end{cases}$
60. $\int \frac{dx}{a^2 + b^2 x^2} = \frac{1}{ab} \tan^{-1} \frac{bx}{a}$

61. $\int \frac{x dx}{a + bx^2} = \frac{1}{2b} \log(a + bx^2)$
62. $\int \frac{x^2 dx}{a + bx^2} = \frac{x}{b} - \frac{a}{b} \int \frac{dx}{a + bx^2}$

5.4 DIFFERENTIAL EQUATIONS

5.4.1 Linear Differential Equations

Any linear differential equation may be written in the form $p(D)y = R(x)$ or

$$b_n(x)y^{(n)} + b_{n-1}(x)y^{(n-1)} + \dots + b_1(x)y' + b_0(x)y = R(x) \quad (21)$$

where

- D is the differential operation: $D = \frac{d}{dx}$ (Powers of D denote repeated differentiation: $D^n = \frac{d^n}{dx^n}$)
- $p(D)$ is a polynomial in D (whose coefficients may depend on x)
- y is the dependent variable
- x is the independent variable
- $R(x)$ is an arbitrary function of x

For such an equation, the general solution may be written in the form $y = y_c + y_p$ where y_p is any particular solution, and y_c is called the *complementary function*. These functions satisfy $p(D)y_c = 0$ and $p(D)y_p = R(x)$.

Note that equation (21) can be written in the form $\frac{dy}{dx} = A(x)y + r(x)$ where

$$y = \begin{bmatrix} y \\ y' \\ y'' \\ \vdots \\ y^{(n-1)} \end{bmatrix}, \quad A(x) = \begin{bmatrix} 0 & 1 & 0 & \dots & 0 \\ 0 & 0 & 1 & & 0 \\ \vdots & \vdots & & \ddots & \\ 0 & 0 & 0 & & 1 \\ -\frac{b_0}{b_n} & -\frac{b_1}{b_n} & -\frac{b_2}{b_n} & \dots & -\frac{b_{n-1}}{b_n} \end{bmatrix}, \quad r(x) = \begin{bmatrix} 0 \\ 0 \\ \vdots \\ 0 \\ \frac{R}{b_n} \end{bmatrix}.$$

5.4.2 Second Order Linear Constant Coefficient Equation

Consider $ay'' + by' + cy = 0$, where a , b , and c are real constants. Let m_1 and m_2 be the roots of $am^2 + bm + c = 0$. There are three forms of the solution:

1. If m_1 and m_2 are real and distinct, then

$$y(x) = c_1 e^{m_1 x} + c_2 e^{m_2 x}$$

2. If m_1 and m_2 are real and equal, then

$$y(x) = c_1 e^{m_1 x} + c_2 x e^{m_1 x}$$

3. If $m_1 = p + iq$ and $m_2 = p - iq$ (with $p = -\frac{b}{2a}$ and $q = \frac{\sqrt{4ac - b^2}}{2a}$), then

$$y(x) = e^{px} (c_1 \cos qx + c_2 \sin qx)$$

Consider $ay'' + by' + cy = R(x)$, where a , b , and c are real constants. Let m_1 and m_2 be as above.

1. If m_1 and m_2 are real and distinct, then

$$y(x) = C_1 e^{m_1 x} + C_2 e^{m_2 x} + \frac{e^{m_1 x}}{m_1 - m_2} \int^x e^{-m_1 z} R(z) dz + \frac{e^{m_2 x}}{m_2 - m_1} \int^x e^{-m_2 z} R(z) dz$$

2. If m_1 and m_2 are real and equal, then

$$y(x) = C_1 e^{m_1 x} + C_2 x e^{m_1 x} + x e^{m_1 x} \int^x e^{-m_1 z} R(z) dz - e^{m_1 x} \int^x z e^{-m_1 z} R(z) dz$$

3. If $m_1 = p + iq$ and $m_2 = p - iq$, then

$$y(x) = e^{px} (c_1 \cos qx + c_2 \sin qx) + e^{px} \frac{\sin qx}{q} \int^x e^{-pz} R(z) \cos qz dz - e^{px} \frac{\cos qx}{q} \int^x e^{-pz} R(z) \sin qz dz$$

5.4.3 Homogeneous Solutions of Higher Order Constant Coefficient Equations

For the special case of a linear differential equation with constant coefficients (i.e., the $\{b_i\}$ in Equation (21) are constants), the procedure for finding the homogeneous solution is as follows:

- Factor the polynomial $p(D)$ into real and complex linear factors, just as if D were a variable instead of an operator.
- For each non-repeated linear factor of the form $(D - a)$, where a is real, write a term of the form $c e^{ax}$, where c is an arbitrary constant.
- For each repeated real linear factor of the form $(D - a)^m$, write the following sum of m terms

$$c_1 e^{ax} + c_2 x e^{ax} + c_3 x^2 e^{ax} + \cdots + c_m x^{m-1} e^{ax}$$

where the c_i 's are arbitrary constants.

- For each non-repeated complex conjugate pair of factors of the form $(D - a + ib)(D - a - ib)$, write the following two terms

$$c_1 e^{ax} \cos bx + c_2 e^{ax} \sin bx.$$

- For each repeated complex conjugate pair of factors of the form $(D - a + ib)^m (D - a - ib)^m$, write the following $2m$ terms

$$c_1 e^{ax} \cos bx + c_2 e^{ax} \sin bx + c_3 x e^{ax} \cos bx + c_4 x e^{ax} \sin bx + \cdots + c_{2m-1} x^{m-1} e^{ax} \cos bx + c_{2m} x^{m-1} e^{ax} \sin bx. \quad (22)$$

- The sum of all the terms thus written is the homogeneous solution.

Example For the linear equation

$$y^{(7)} - 14y^{(6)} + 81y^{(5)} - 252y^{(4)} + 455y^{(3)} - 474y'' + 263y' - 60y = 0,$$

$p(D)$ factors as $p(D) = (D - 1)^3 (D - (2 + i))(D - (2 - i))(D - 3)(D - 4)$. The roots are thus $\{1, 1, 1, 2 + i, 2 - i, 3, 4\}$. Hence, the homogeneous solution has the form

$$y_h(x) = (c_0 + c_1 x + c_2 x^2) e^x + (c_3 \sin x + c_4 \cos x) e^{2x} + c_5 e^{3x} + c_6 e^{4x}$$

where $\{c_0, \dots, c_6\}$ are arbitrary constants.

5.4.4 Particular Solutions

The following are solutions for some specific ordinary differential equations. These assume that $P(x)$ is a polynomial of degree n and $\{a, b, p, q, r, s\}$ are constants. If you wish to replace "sin" with "cos" in $R(x)$, then use the given result but replace "sin" by "cos," and replace "cos" by $-\sin$.

1. Particular solutions to $y' - ay = R(x)$

(a) If $R(x) = e^{rx}$,

(b) If $R(x) = \sin sx$,

(c) If $R(x) = P(x)$,

(d) If $R(x) = e^{rx} \sin sx$,

(e) If $R(x) = P(x) e^{rx}$,

(f) If $R(x) = P(x) \sin sx$,

(g) If $R(x) = P(x) e^{rx} \sin sx$,

$$y = -\frac{a \sin sx + s \cos sx}{a^2 + s^2} = -\left(a^2 + s^2\right)^{-1/2} \sin\left(sx + \tan^{-1} \frac{s}{a}\right) \quad y = e^{rx}/(r - a)$$

$$y = -\frac{1}{a} \left[P(x) + \frac{P'(x)}{a} + \frac{P''(x)}{a^2} + \cdots + \frac{P^{(n)}(x)}{a^n} \right]$$

Replace a by $(a - r)$ in formula (1b) and multiply solution by e^{rx}

Replace a by $(a - r)$ in formula (1c) and multiply solution by e^{rx}

$$y = -\sin sx \left[\frac{a}{a^2 + s^2} P(x) + \frac{a^2 - s^2}{(a^2 + s^2)^2} P'(x) + \cdots + \frac{a^k - \binom{k}{2} a^{k-2} s^2 + \binom{k}{4} a^{k-4} s^4 - \cdots}{(a^2 + s^2)^k} P^{(k-1)}(x) + \cdots \right]$$

$$- \cos sx \left[\frac{s}{a^2 + s^2} P(x) + \frac{2as}{(a^2 + s^2)^2} P'(x) + \cdots + \frac{\binom{k}{1} a^{k-1} s - \binom{k}{3} a^{k-3} s^3 + \cdots}{(a^2 + s^2)^k} P^{(k-1)}(x) + \cdots \right].$$

Replace a by $(a - r)$ in formula (1f) and multiply solution by e^{rx}

(h) If $R(x) = e^{ax}$,

(i) If $R(x) = e^{ax} \sin sx$,

(j) If $R(x) = P(x)e^{ax}$,

(k) If $R(x) = P(x)e^{ax} \sin sx$,

$$y = xe^{ax}$$

$$y = -e^{ax} \cos sx/s$$

$$y = e^{ax} \int^x P(z) dz$$

$$y = \frac{e^{ax} \sin sx}{s} \left[\frac{P'(x)}{s} - \frac{P'''(x)}{s^3} + \frac{P^{(5)}(x)}{s^5} + \dots \right]$$

$$- \frac{e^{ax} \cos sx}{s} \left[P(x) - \frac{P''(x)}{s^2} + \frac{P^{(4)}(x)}{s^4} + \dots \right].$$

2. Particular solutions to $y'' - 2ay' + a^2y = R(x)$

(a) If $R(x) = e^{rx}$,

(b) If $R(x) = \sin sx$,

(c) If $R(x) = P(x)$,

(d) If $R(x) = e^{rx} \sin sx$,

(e) If $R(x) = P(x)e^{rx}$,

(f) If $R(x) = P(x) \sin sx$,

$$y = \frac{(a^2 - s^2) \sin sx + 2as \cos sx}{(a^2 + s^2)^2} = \frac{1}{a^2 + s^2} \sin \left(sx + \tan^{-1} \frac{2as}{a^2 - s^2} \right).$$

$$y = \frac{1}{a^2} \left[P(x) + \frac{2P'(x)}{a} + \frac{3P''(x)}{a^2} + \dots + \frac{(n+1)P^{(n)}(x)}{a^n} \right]$$

Replace a by $(a - r)$ in formula (2a) and multiply solution by e^{rx}
 Replace a by $(a - r)$ in formula (2b) and multiply solution by e^{rx} .

$$y = \sin sx \left[\frac{a^2 - s^2}{(a^2 + s^2)^2} P(x) + 2 \frac{a^2 - 3as^2}{(a^2 + s^2)^3} P'(x) \right.$$

$$+ \dots + (k-1) \frac{a^k - \binom{k}{2} a^{k-2} s^2 + \binom{k}{4} a^{k-4} s^4 - \dots}{(a^2 + s^2)^k} P^{(k-2)}(x) + \dots \left. \right]$$

$$+ \cos sx \left[\frac{2as}{(a^2 + s^2)^2} P(x) + 2 \frac{3a^2 s - s^3}{(a^2 + s^2)^3} P'(x) \right.$$

$$+ \dots + (k-1) \frac{\binom{k}{1} a^{k-1} s - \binom{k}{3} a^{k-3} s^3 + \dots}{(a^2 + s^2)^k} P^{(k-2)}(x) + \dots \left. \right]$$

Replace a by $(a - r)$ in formula (2e) and multiply solution by e^{rx} .

(g) If $R(x) = P(x)e^{rx} \sin sx$,

(h) If $R(x) = e^{ax}$,

(i) If $R(x) = e^{ax} \sin sx$,

(j) If $R(x) = P(x)e^{ax}$,

(k) If $R(x) = P(x)e^{ax} \sin sx$,

$$y = x^2 e^{ax}/2$$

$$y = -e^{ax} \sin sx/s^2$$

$$y = e^{ax} \int^x \int^y P(z) dz dy$$

$$y = -\frac{e^{ax} \sin sx}{s^2} \left[P(x) - \frac{3P''(x)}{s^2} + \frac{5P^{(4)}(x)}{s^4} + \dots \right]$$

$$- \frac{e^{ax} \cos sx}{s^2} \left[\frac{2P(x)}{s} - \frac{4P'''(x)}{s^3} + \frac{6P^{(5)}(x)}{s^5} + \dots \right]$$

3. Particular solutions to $y'' + qy = R(x)$

(a) If $R(x) = e^{rx}$,

(b) If $R(x) = \sin sx$,

(c) If $R(x) = P(x)$,

(d) If $R(x) = e^{rx} \sin sx$,

(e) If $R(x) = P(x)e^{rx}$,

(f) If $R(x) = P(x) \sin sx$,

$$y = e^{rx}/(r^2 + q)$$

$$y = \sin sx/(q - s^2)$$

$$y = \frac{1}{q} \left[P(x) - \frac{P''(x)}{q} + \frac{P^{(4)}(x)}{q^2} + \dots + (-1)^k \frac{P^{(2k)}(x)}{q^k} + \dots \right]$$

$$y = \frac{(r^2 - s^2 + q)e^{rx} \sin sx - 2rs e^{rx} \cos sx}{(r^2 - s^2 + q)^2 + (2rs)^2} = \frac{e^{rx}}{\sqrt{(r^2 - s^2 + q)^2 + (2rs)^2}} \sin \left[sx - \tan^{-1} \frac{2rs}{r^2 - s^2 + q} \right]$$

$$y = \frac{e^{rx}}{q + r^2} \left[P(x) - \frac{2r}{q + r^2} P'(x) + \frac{3r^2 - q}{(q + r^2)^2} P''(x) \right.$$

$$+ \dots + (-1)^{k-1} \frac{\binom{k}{1} r^{k-1} - \binom{k}{3} r^{k-3} q + \dots}{(q + r^2)^{k-1}} P^{(k-1)}(x) + \dots \left. \right]$$

$$y = \frac{\sin sx}{q - s^2} \left[P(x) - \frac{3s^2 + q}{(q - s^2)^2} P''(x) \right.$$

$$+ \dots + (-1)^k \frac{\binom{2k+1}{1} s^{2k} + \binom{2k+1}{3} s^{2k-2} q + \dots}{(q - s^2)^{2k}} P^{(2k)}(x) + \dots \left. \right]$$

$$- \frac{s \cos sx}{q - s^2} \left[\frac{2P'(x)}{(q - s^2)} - \frac{4s^2 + 4q}{(q - s^2)^3} P'''(x) \right.$$

$$+ \dots + (-1)^{k+1} \frac{\binom{2k}{1} s^{2k-2} + \binom{2k}{3} s^{2k-4} q + \dots}{(q - s^2)^{2k-1}} P^{(2k-1)}(x) + \dots \left. \right]$$

4. Particular solutions to $y'' + b^2y = R(x)$

(a) If $R(x) = \sin bx$,

(b) If $R(x) = P(x) \sin bx$,

$$y = -x \cos bx/2b$$

$$y = \frac{\sin bx}{(2b)^2} \left[P(x) - \frac{P''(x)}{(2b)^2} + \frac{P^{(4)}(x)}{(2b)^4} + \dots \right] - \frac{\cos bx}{2b} \int \left[P(x) - \frac{P''(x)}{(2b)^2} + \dots \right] dx$$

5. Particular solutions to $y'' + py' + qy = R(x)$ (a) If $R(x) = e^{rx}$,(b) If $R(x) = \sin sx$,(c) If $R(x) = P(x)$,(d) If $R(x) = e^{rx} \sin sx$,(e) If $R(x) = P(x)e^{rx}$,6. Particular solutions to $(D - a)^n y = R(x)$ (a) If $R(x) = e^{rx}$,(b) If $R(x) = \sin sx$,(c) If $R(x) = P(x)$,(d) If $R(x) = e^{rx} \sin sx$,(e) If $R(x) = P(x)e^{rx}$,

$$y = e^{rx} / (r^2 + pr + q)$$

$$y = \frac{(q-s^2) \sin sx - ps \cos sx}{(q-s^2)^2 + (ps)^2} = \frac{\sin \left(sx - \tan^{-1} \frac{ps}{q-s^2} \right)}{\sqrt{(q-s^2)^2 + (ps)^2}}$$

$$y = \frac{1}{q} \left[P(x) - \frac{p}{q} P'(x) + \frac{p^2 - q}{q^2} P''(x) - \frac{p^2 - 2pq}{q^2} P'''(x) \right. \\ \left. + \dots + (-1)^n \frac{p^n - \binom{n-1}{1} p^{n-2} q + \binom{n-2}{2} p^{n-4} q^2 - \dots}{q^n} P^{(n)}(x) \right]$$

In (5b): replace p by $(p + 2r)$, q by $(q + pr + r^2)$, multiply by e^{rx} .
In (5c): replace p by $(p + 2r)$, q by $(q + pr + r^2)$, multiply by e^{rx} .

5.4.5 Differential Equation Solution Techniques

Differential equation	Solution or solution technique
Autonomous equation $f(y^{(n)}, y^{(n-1)}, \dots, y'', y', y) = 0$	Change dependent variable to $u(y) = y'(x)$
Bernoulli's equation $y' + f(x)y = g(x)y^n$	Change dependent variable to $v(x) = (y(x))^{1-n}$
Bessel's equation $x^2 \frac{d^2 y}{dx^2} + x \frac{dy}{dx} + (\lambda^2 x^2 - n^2)y = 0$	$y = c_1 J_n(\lambda x) + c_2 Y_n(\lambda x)$
Transformed Bessel's equation $x^2 \frac{d^2 y}{dx^2} + (2p+1)x \frac{dy}{dx} + (\alpha^2 x^{2r} + \beta^2)y = 0$	$y = x^{-p} \left\{ c_1 J_{q/r} \left(\frac{\alpha}{r} x^r \right) + c_2 Y_{q/r} \left(\frac{\alpha}{r} x^r \right) \right\}$ where $q = \sqrt{p^2 - \beta^2}$
Legendre's equation $(1-x^2) \frac{d^2 y}{dx^2} - 2x \frac{dy}{dx} + n(n+1)y = 0$	$y = c_1 P_n(x) + c_2 Q_n(x)$
Clairaut's equation $f(xy' - y) = g(y')$	One solution is $f(xC - y) = g(C)$
Constant coefficient equation $a_0 y^{(n)} + a_1 y^{(n-1)} + \dots + a_{n-1} y' + a_n y = 0$	There are solutions of the form $y = x^k e^{\lambda x}$.
Dependent variable missing $f(y^{(n)}, y^{(n-1)}, \dots, y'', y', x) = 0$	Change dependent variable to $u(x) = y'(x)$
Euler's equation $a_0 x^n y^{(n)} + a_1 x^{n-1} y^{(n-1)} + \dots + a_{n-1} x y' + a_n y = 0$	Change independent variable to $x = e^t$
Exact equation $M(x, y) dx + N(x, y) dy = 0$ with $\frac{\partial M}{\partial y} = \frac{\partial N}{\partial x}$	Integrate $M(x, y)$ with respect to x holding y constant, call this $m(x, y)$. Then $m(x, y) + \int \left(N - \frac{\partial m}{\partial y} \right) dy = C$
Homogeneous equation $y' = f\left(\frac{y}{x}\right)$	$\ln x = \int \frac{dv}{f(v) - v} + C$ unless $f(v) = v$, in which case $y = Cx$.
Linear first-order equation $y' + f(x)y = g(x)$	$y(x) = e^{-\int f(t) dt} \left[\int e^{\int f(t) dt} g(z) dz + C \right]$
Reducible to homogeneous $(a_1 x + b_1 y + c_1) dx + (a_2 x + b_2 y + c_2) dy = 0$ with $a_1/a_2 \neq b_1/b_2$	Change variables to $u = a_1 x + b_1 y + c$ and $v = a_2 x + b_2 y + c$
Reducible to separable $(a_1 x + b_1 y + c_1) dx + (a_2 x + b_2 y + c_2) dy = 0$ with $a_1/a_2 = b_1/b_2$	Change dependent variable to $u(x) = a_1 x + b_1 y$
Separation of variables $y' = f(x)g(y)$	$\int \frac{dy}{g(y)} = \int f(x) dx + C$

6 SERIES

6.1 FOURIER SERIES

1. If $f(x)$ is a bounded periodic function of period $2L$ (i.e., $f(x+2L) = f(x)$), and satisfies the *Dirichlet conditions*:

- (a) In any period $f(x)$ is continuous, except possibly for a finite number of jump discontinuities.
- (b) In any period $f(x)$ has only a finite number of maxima and minima,

then $f(x)$ may be represented by the *Fourier series*

$$f(x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} \left(a_n \cos \frac{n\pi x}{L} + b_n \sin \frac{n\pi x}{L} \right) \quad (23)$$

where a_n and b_n are given below. This series will converge to $f(x)$ at every point where $f(x)$ is continuous, and to $\frac{f(x^+) + f(x^-)}{2}$ (i.e., the average of the left-hand and right-hand limits) at every point where $f(x)$ has a jump discontinuity.

$$\begin{aligned} a_n &= \frac{1}{L} \int_{-L}^L f(x) \cos \frac{n\pi x}{L} dx, \quad n = 0, 1, 2, 3, \dots, \\ b_n &= \frac{1}{L} \int_{-L}^L f(x) \sin \frac{n\pi x}{L} dx, \quad n = 1, 2, 3, \dots \end{aligned} \quad (24)$$

We may also write $a_n = \frac{1}{L} \int_{\alpha}^{\alpha+2L} f(x) \cos \frac{n\pi x}{L} dx$ and $b_n = \frac{1}{L} \int_{\alpha}^{\alpha+2L} f(x) \sin \frac{n\pi x}{L} dx$ where α is any real number. Thus using $\alpha = 0$:

$$\begin{aligned} a_n &= \frac{1}{L} \int_0^{2L} f(x) \cos \frac{n\pi x}{L} dx, \quad n = 0, 1, 2, 3, \dots, \\ b_n &= \frac{1}{L} \int_0^{2L} f(x) \sin \frac{n\pi x}{L} dx, \quad n = 1, 2, 3, \dots \end{aligned} \quad (25)$$

2. If in addition to the restrictions for (23), if $f(x)$ is an even function (i.e., $f(-x) = f(x)$), then the Fourier series reduces to

$$f(x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} a_n \cos \frac{n\pi x}{L}$$

That is, $b_n = 0$. In this case, a simpler formula for a_n is

$$a_n = \frac{2}{L} \int_0^L f(x) \cos \frac{n\pi x}{L} dx, \quad n = 0, 1, 2, 3, \dots$$

3. If in addition to the restrictions for (23), if $f(x)$ is an odd function (i.e., $f(-x) = -f(x)$), then the Fourier series reduces to

$$f(x) = \sum_{n=1}^{\infty} b_n \sin \frac{n\pi x}{L}$$

That is, $a_n = 0$. In this case, a simpler formula for b_n is

$$b_n = \frac{2}{L} \int_0^L f(x) \sin \frac{n\pi x}{L} dx, \quad n = 1, 2, 3, \dots$$

4. Using the Euler relation $e^{i\theta} = \cos \theta + i \sin \theta$, we obtain the complex form of the Fourier series

$$f(x) = \frac{1}{2} \sum_{n=-\infty}^{n=+\infty} c_n e^{i\omega_n x} \quad (26)$$

where

$$c_n = \frac{1}{L} \int_{-L}^L f(x) e^{-i\omega_n x} dx, \quad n = 0, \pm 1, \pm 2, \pm 3, \dots \quad (27)$$

with $\omega_n = \frac{n\pi}{L}$ for $n = 0, \pm 1, \pm 2, \dots$. The set of coefficients c_n is referred to as the *Fourier spectrum*.

5. If $f(x)$ has period $2L$, if it is expandable by a Fourier series, and if both sine and cosine terms are present, then equations (26) and (27) can be written as

$$f(x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} c_n \sin \left(\frac{n\pi x}{L} + \phi_n \right),$$

where

$$a_n = c_n \sin \phi_n, \quad b_n = c_n \cos \phi_n, \quad c_n = \sqrt{a_n^2 + b_n^2}, \quad \phi_n = \arctan \left(\frac{a_n}{b_n} \right)$$

They can also be represented as

$$f(x) = \frac{a_0}{2} + \sum_{n=1}^{\infty} c_n \cos \left(\frac{n\pi x}{L} + \phi_n \right),$$

where

$$a_n = c_n \cos \phi_n, \quad b_n = -c_n \sin \phi_n, \quad c_n = \sqrt{a_n^2 + b_n^2}, \quad \phi_n = \arctan \left(-\frac{b_n}{a_n} \right)$$

and ϕ_n is chosen so as to make a_n , b_n , and c_n hold.

6. The following table of trigonometric identities is helpful when developing Fourier series. Note that n is an integer.

	n	n even	n odd	$n/2$ odd	$n/2$ even
$\sin n\pi$	0	0	0	0	0
$\cos n\pi$	$(-1)^n$	+1	-1	+1	+1
$\sin \frac{n\pi}{2}$		0	$(-1)^{(n-1)/2}$	0	0
$\cos \frac{n\pi}{2}$		$(-1)^{n/2}$	0	-1	+1
$\sin \frac{n\pi}{4}$			$\frac{\sqrt{2}}{2}(-1)^{(n^2+4n+11)/8}$	$(-1)^{(n-2)/4}$	0

Note also the useful formula for $\sin \frac{n\pi}{2}$ and $\cos \frac{n\pi}{2}$:

$$\sin \frac{n\pi}{2} = \frac{(i)^{n+1}}{2} [(-1)^n - 1]$$

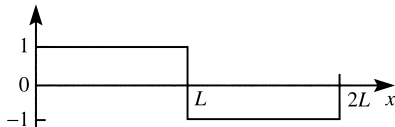

$$\cos \frac{n\pi}{2} = \frac{(i)^n}{2} [(-1)^n + 1]$$

Auxiliary Formulas for Fourier Series

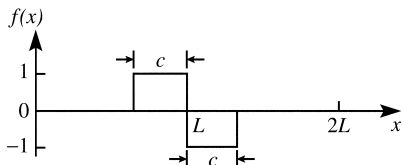

- $1 = \frac{4}{\pi} \left[\sin \frac{\pi x}{k} + \frac{1}{3} \sin \frac{3\pi x}{k} + \frac{1}{5} \sin \frac{5\pi x}{k} + \dots \right] \quad [0 < x < k]$
- $x = \frac{2k}{\pi} \left[\sin \frac{\pi x}{k} - \frac{1}{2} \sin \frac{2\pi x}{k} + \frac{1}{3} \sin \frac{3\pi x}{k} - \dots \right] \quad [-k < x < k]$
- $x = \frac{k}{2} - \frac{4k}{\pi^2} \left[\cos \frac{\pi x}{k} + \frac{1}{3^2} \cos \frac{3\pi x}{k} + \frac{1}{5^2} \cos \frac{5\pi x}{k} + \dots \right] \quad [0 < x < k]$
- $x^2 = \frac{2k^2}{\pi^3} \left[\left(\frac{\pi^2}{1} - \frac{4}{1} \right) \sin \frac{\pi x}{k} - \frac{\pi^2}{2} \sin \frac{2\pi x}{k} + \left(\frac{\pi^2}{3} - \frac{4}{3^3} \right) \sin \frac{3\pi x}{k} - \frac{\pi^2}{4} \sin \frac{4\pi x}{k} + \left(\frac{\pi^2}{5} - \frac{4}{5^3} \right) \sin \frac{5\pi x}{k} + \dots \right] \quad [0 < x < k]$
- $x^2 = \frac{k^2}{3} - \frac{4k^2}{\pi^2} \left[\cos \frac{\pi x}{k} - \frac{1}{2^2} \cos \frac{2\pi x}{k} + \frac{1}{3^2} \cos \frac{3\pi x}{k} - \frac{1}{4^2} \cos \frac{4\pi x}{k} + \dots \right] \quad [-k < x < k]$

Fourier Expansions for Basic Periodic Functions

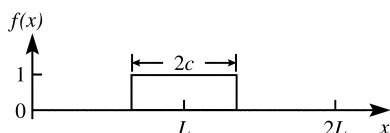

$$1. \quad f(x) = \frac{4}{\pi} \sum_{n=1,3,5,\dots} \frac{1}{n} \sin \frac{n\pi x}{L}$$

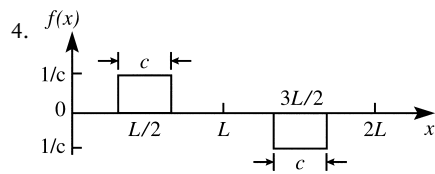

$$2. \quad f(x) = \frac{2}{\pi} \sum_{n=1}^{\infty} \frac{(-1)^n}{n} \left(\cos \frac{n\pi c}{L} - 1 \right) \sin \frac{n\pi x}{L}$$

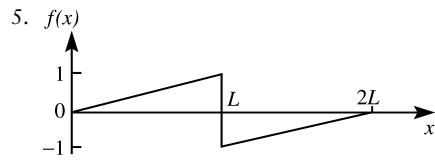

$$3. \quad f(x) = \frac{c}{L} + \frac{2}{\pi} \sum_{n=1}^{\infty} \frac{(-1)^n}{n} \sin \frac{n\pi c}{L} \cos \frac{n\pi x}{L}$$

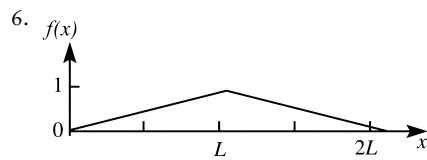

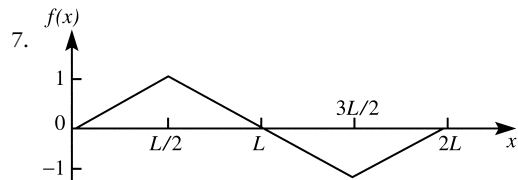

$$f(x) = \frac{2}{L} \sum_{n=1}^{\infty} \sin \frac{n\pi}{2} \frac{\sin(\frac{1}{2}n\pi c/L)}{\frac{1}{2}n\pi c/L} \sin \frac{n\pi x}{L}$$

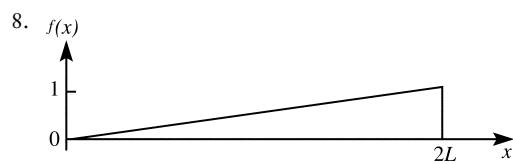

$$f(x) = \frac{2}{\pi} \sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{n} \sin \frac{n\pi x}{L}$$

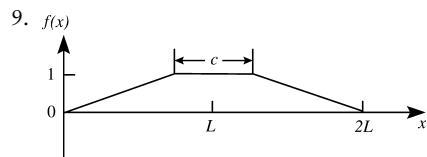

$$f(x) = \frac{1}{2} - \frac{4}{\pi^2} \sum_{n=1,3,5,\dots} \frac{1}{n^2} \cos \frac{n\pi x}{L}$$

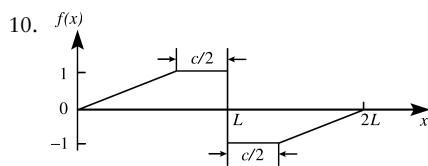

$$f(x) = \frac{8}{\pi^2} \sum_{n=1,3,5,\dots} \frac{(-1)^{(n-1)/2}}{n^2} \sin \frac{n\pi x}{L}$$

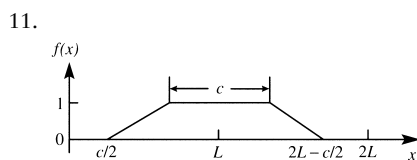

$$f(x) = \frac{1}{2} - \frac{1}{\pi} \sum_{n=1}^{\infty} \frac{1}{n} \sin \frac{n\pi x}{L}$$

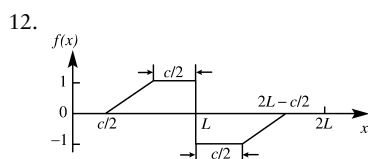

$$f(x) = \frac{1}{2}(1+a) + \frac{2}{\pi^2(1-a)} \sum_{n=1}^{\infty} \frac{1}{n^2} [(-1)^n \cos n\pi a - 1] \cos \frac{n\pi x}{L}; \quad \left(a = \frac{c}{2L}\right)$$

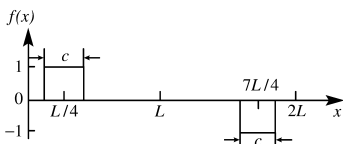

$$f(x) = \frac{2}{\pi} \sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{n} \left[1 + \frac{\sin n\pi a}{n\pi(1-a)} \right] \sin \frac{n\pi x}{L}; \quad \left(a = \frac{c}{2L}\right)$$

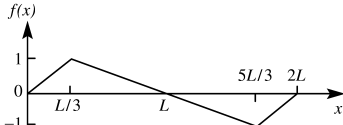

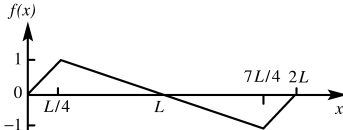

$$f(x) = \frac{1}{2} - \frac{4}{\pi^2(1-2a)} \sum_{n=1,3,5,\dots} \frac{1}{n^2} \cos n\pi a \cos \frac{n\pi x}{L}; \quad \left(a = \frac{c}{2L}\right)$$

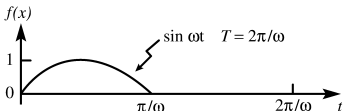

$$f(x) = \frac{2}{\pi} \sum_{n=1}^{\infty} \frac{(-1)^n}{n} \left[1 + \frac{1+(-1)^n}{n\pi(1-2a)} \sin n\pi a \right] \sin \frac{n\pi x}{L}; \quad \left(a = \frac{c}{2L}\right)$$

13. 
$$f(x) = \frac{4}{\pi} \sum_{n=1}^{\infty} \frac{1}{n} \sin \frac{n\pi}{4} \sin n\pi a \sin \frac{n\pi x}{L}; \quad \left(a = \frac{c}{2L}\right)$$

14. 
$$f(x) = \frac{9}{\pi^2} \sum_{n=1}^{\infty} \frac{1}{n^2} \sin \frac{n\pi}{3} \sin \frac{n\pi x}{L}; \quad \left(a = \frac{c}{2L}\right)$$

15. 
$$f(x) = \frac{32}{3\pi^2} \sum_{n=1}^{\infty} \frac{1}{n^2} \sin \frac{n\pi}{4} \sin \frac{n\pi x}{L}; \quad \left(a = \frac{c}{2L}\right)$$

16. 
$$f(x) = \frac{1}{\pi} + \frac{1}{2} \sin \omega t - \frac{2}{\pi} \sum_{n=2,4,6,\dots} \frac{1}{n^2 - 1} \cos n\omega t$$

6.2 BINOMIAL SERIES

The expression in parentheses following certain of the series indicates the region of convergence. If not otherwise indicated it is to be understood that the series converges for all finite values of x .

1. $(x + y)^n = x^n + nx^{n-1}y + \frac{n(n-1)}{2!}x^{n-2}y^2 + \frac{n(n-1)(n-2)}{3!}x^{n-3}y^3 + \dots$ ($y^2 < x^2$)

2. $(1 \pm x)^n = 1 \pm nx + \frac{n(n-1)x^2}{2!} \pm \frac{n(n-1)(n-2)x^3}{3!} + \dots$ ($x^2 < 1$)

3. $(1 \pm x)^{-n} = 1 \mp nx + \frac{n(n+1)x^2}{2!} \mp \frac{n(n+1)(n+2)x^3}{3!} + \dots$ ($x^2 < 1$)

4. $(1 \pm x)^{-1} = 1 \mp x + x^2 \mp x^3 + x^4 \mp x^5 + \dots$ ($x^2 < 1$)

5. $(1 \pm x)^{-2} = 1 \mp 2x + 3x^2 \mp 4x^3 + 5x^4 \mp 6x^5 + \dots$ ($x^2 < 1$)

6.3 REVERSION OF SERIES

Let a series be represented by $y = a_1x + a_2x^2 + a_3x^3 + a_4x^4 + a_5x^5 + a_6x^6 + \dots$ with $a_1 \neq 0$. The coefficients of the series $x = A_1y + A_2y^2 + A_3y^3 + A_4y^4 + A_5y^5 + \dots$ are

$$\begin{aligned} A_1 &= \frac{1}{a_1} & A_2 &= -\frac{a_2}{a_1^3} & A_3 &= \frac{1}{a_1^5}(2a_2^2 - a_1a_3) & A_4 &= \frac{1}{a_1^7}(5a_1a_2a_3 - a_1^2a_4 - 5a_2^3) \\ A_5 &= \frac{1}{a_1^9}(6a_1^2a_2a_4 + 3a_1^2a_3^2 + 14a_2^4 - a_1^3a_5 - 21a_1a_2^2a_3) \end{aligned}$$

6.4 TAYLOR SERIES

1. $f(x) = f(a) + (x-a)f'(a) + \frac{(x-a)^2}{2!}f''(a) + \frac{(x-a)^3}{3!}f'''(a) + \dots + \frac{(x-a)^n}{n!}f^{(n)}(a) + \dots$ (Taylor's Series, increment form)

2.
$$\begin{aligned} f(x+h) &= f(x) + hf'(x) + \frac{h^2}{2!}f''(x) + \frac{h^3}{3!}f'''(x) + \dots \\ &= f(h) + xf'(h) + \frac{x^2}{2!}f''(h) + \frac{x^3}{3!}f'''(h) + \dots \end{aligned}$$

3. If $f(x)$ is a function possessing derivatives of all orders throughout the interval $[a, b]$ then the Taylor's series with remainder term is (for $a \leq x \leq b$)

$$f(x) = f(a) + (x-a)f'(a) + \frac{(x-a)^2}{2!}f''(a) + \cdots + (x-a)^{n-1}\frac{f^{(n-1)}(a)}{(n-1)!} + R_n \quad (28)$$

where

$$R_n = \frac{f^{(n)}[a + \theta \cdot (x-a)]}{n!}(x-a)^n, \quad 0 < \theta < 1.$$

Special cases: There are values $0 < \theta < 1$ and $a < X < b$, such that

$$\begin{aligned} f(b) &= f(a) + (b-a)f'(a) + \frac{(b-a)^2}{2!}f''(a) + \cdots + \frac{(b-a)^{n-1}}{(n-1)!}f^{(n-1)}(a) + \frac{(b-a)^n}{n!}f^{(n)}(X) \\ f(a+b) &= f(a) + bf'(a) + \frac{b^2}{2!}f''(a) + \cdots + \frac{b^{n-1}}{(n-1)!}f^{(n-1)}(a) + \frac{b^n}{n!}f^{(n)}(a+\theta b) \end{aligned} \quad (29)$$

4. Taylor's series for a function of two variables: Define the notation:

$$\begin{aligned} \left(b \frac{\partial}{\partial x} + k \frac{\partial}{\partial y}\right) f(x, y) &= b \frac{\partial f(x, y)}{\partial x} + k \frac{\partial f(x, y)}{\partial y}; \\ \left(b \frac{\partial}{\partial x} + k \frac{\partial}{\partial y}\right)^2 f(x, y) &= b^2 \frac{\partial^2 f(x, y)}{\partial x^2} + 2bk \frac{\partial^2 f(x, y)}{\partial x \partial y} + k^2 \frac{\partial^2 f(x, y)}{\partial y^2} \end{aligned} \quad (30)$$

with an extnsion to higher powers. If $\left(b \frac{\partial}{\partial x} + k \frac{\partial}{\partial y}\right)^n f(x, y) \Big|_{x=a}^{y=b}$ where the bar and subscripts means that after differentiation we are to replace x by a and y by b , then

$$f(a+b, b+k) = f(a, b) + \left(b \frac{\partial}{\partial x} + k \frac{\partial}{\partial y}\right) f(x, y) \Big|_{x=a}^{y=b} + \cdots + \frac{1}{n!} \left(b \frac{\partial}{\partial x} + k \frac{\partial}{\partial y}\right)^n f(x, y) \Big|_{x=a}^{y=b} + \cdots \quad (31)$$

5. Maclaurin series (use $a = 0$ in equation (28))

$$f(x) = f(0) + xf'(0) + \frac{x^2}{2!}f''(0) + \frac{x^3}{3!}f'''(0) + \cdots + x^{n-1}\frac{f^{(n-1)}(0)}{(n-1)!} + R_n \quad (32)$$

where

$$R_n = \frac{x^n f^{(n)}(\theta x)}{n!}, \quad 0 < \theta < 1.$$

6.5 EXPONENTIAL SERIES

$$\begin{aligned} e &= 1 + \frac{1}{1!} + \frac{1}{2!} + \frac{1}{3!} + \frac{1}{4!} + \cdots \\ e^x &= 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \frac{x^4}{4!} + \cdots \\ a^x &= 1 + x \log_e a + \frac{(x \log_e a)^2}{2!} + \frac{(x \log_e a)^3}{3!} + \cdots \\ e^x &= e^a \left[1 + (x-a) + \frac{(x-a)^2}{2!} + \frac{(x-a)^3}{3!} + \cdots \right] \end{aligned}$$

6.6 LOGARITHMIC SERIES

$$\begin{aligned} \log_e(1+x) &= x - \frac{1}{2}x^2 + \frac{1}{3}x^3 - \frac{1}{4}x^4 + \cdots & (-1 < x \leq 1) \\ \log_e(n+1) - \log_e(n-1) &= 2 \left[\frac{1}{n} + \frac{1}{3n^3} + \frac{1}{5n^5} + \cdots \right] \\ \log_e \frac{1+x}{1-x} &= 2 \left[x + \frac{x^3}{3} + \frac{x^5}{5} + \cdots + \frac{x^{2n-1}}{2n-1} + \cdots \right] & (-1 < x < 1) \\ \log_e x &= \log_e a + \frac{(x-a)}{a} - \frac{(x-a)^2}{2a^2} + \frac{(x-a)^3}{3a^3} - + \cdots & (0 < x \leq 2a) \end{aligned}$$

6.7 TRIGONOMETRIC SERIES

Let B_n represent the n^{th} Bernoulli number and let E_n represent the n^{th} Euler number.

- $\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \dots$ (all real values of x)
- $\cos x = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \frac{x^6}{6!} + \dots$ (all real values of x)
- $\tan x = x + \frac{x^3}{3} + \frac{2x^5}{15} + \frac{17x^7}{315} + \frac{62x^9}{2835} + \dots + \frac{(-1)^{n-1}2^{2n}(2^{2n}-1)B_{2n}}{(2n)!}x^{2n-1} + \dots$ ($x^2 < \frac{\pi^2}{4}$)
- $\cot x = \frac{1}{x} - \frac{x}{3} - \frac{x^3}{45} - \frac{2x^5}{945} - \frac{x^7}{4725} - \dots - \frac{(-1)^{n+1}2^{2n}}{(2n)!}B_{2n}x^{2n-1} - \dots$ ($x^2 < \pi^2$)
- $\sec x = 1 + \frac{x^2}{2} + \frac{5}{24}x^4 + \frac{61}{720}x^6 + \frac{277}{8064}x^8 + \dots + \frac{(-1)^n E_{2n}}{(2n)!}x^{2n} + \dots$ ($x^2 < \frac{\pi^2}{4}$)
- $\csc x = \frac{1}{x} + \frac{x}{6} + \frac{7}{360}x^3 + \frac{31}{15,120}x^5 + \frac{127}{604,800}x^7 + \dots + \frac{(-1)^{n+1}2(2^{2n-1}-1)}{(2n)!}B_{2n}x^{2n-1} + \dots$ ($x^2 < \pi^2$)
- $\sin^{-1} x = x + \frac{x^3}{2 \cdot 3} + \frac{1 \cdot 3}{2 \cdot 4 \cdot 5}x^5 + \frac{1 \cdot 3 \cdot 5}{2 \cdot 4 \cdot 6 \cdot 7}x^7 + \dots$ ($x^2 < 1, -\frac{\pi}{2} < \sin^{-1} x < \frac{\pi}{2}$)
- $\cos^{-1} x = \frac{\pi}{2} - \left(x + \frac{x^3}{2 \cdot 3} + \frac{1 \cdot 3}{2 \cdot 4 \cdot 5}x^5 + \frac{1 \cdot 3 \cdot 5}{2 \cdot 4 \cdot 6 \cdot 7}x^7 + \dots \right)$ ($x^2 < 1, 0 < \cos^{-1} x < \pi$)
- $\tan^{-1} x = x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \dots$ ($x^2 < 1$)
- $\tan^{-1} x = \frac{\pi}{2} - \frac{1}{x} + \frac{1}{3x^3} - \frac{1}{5x^5} + \frac{1}{7x^7} - \dots$ ($x > 1$)
- $\tan^{-1} x = -\frac{\pi}{2} - \frac{1}{x} + \frac{1}{3x^3} - \frac{1}{5x^5} + \frac{1}{7x^7} - \dots$ ($x < -1$)
- $\cot^{-1} x = \frac{\pi}{2} - x + \frac{x^3}{3} - \frac{x^5}{5} + \frac{x^7}{7} - \dots$ ($x^2 < 1$)

7 TRANSFORMS

7.1 FOURIER TRANSFORMS

For a piecewise continuous function $F(x)$ over a finite interval $0 \leq x \leq \pi$; the *finite Fourier cosine transform* of $F(x)$ is

$$f_c(n) = \int_0^\pi F(x) \cos nx \, dx \quad (n = 0, 1, 2, \dots)$$

If x ranges over the interval $0 \leq x \leq L$, the substitution $x' = \frac{\pi x}{L}$ allows the use of this definition, also. The inverse transform is written.

$$\bar{F}(x) = \frac{1}{\pi} f_c(0) - \frac{2}{\pi} \sum_{n=1}^x f_c(n) \cos nx \quad (0 < x < \pi)$$

where $F(x) = \frac{F(x+\epsilon) + F(x-\epsilon)}{2}$. Note that $F(x+) = F(x-) = F(x)$ at points of continuity. The formula

$$f_c^{(2)}(n) = \int_0^\pi F''(x) \cos nx \, dx = -n^2 f_c(n) - F'(0) + (-1)^n F'(\pi) \quad (33)$$

makes the finite Fourier cosine transform useful in certain boundary value problems. Analogously, the *finite Fourier sine transform* of $F(x)$ is

$$f_s(n) = \int_0^\pi F(x) \sin nx \, dx \quad (n = 1, 2, 3, \dots)$$

and

$$\bar{F}(x) = \frac{2}{\pi} \sum_{n=1}^\infty f_s(n) \sin nx \quad (0 < x < \pi)$$

Corresponding to equation (33) we have

$$f_s^{(2)}(n) = \int_0^\pi F''(x) \sin nx \, dx = -n^2 f_s(n) - n F(0) - n(-1)^n F(\pi)$$

If $F(x)$ is defined for $x \leq 0$ and is piecewise continuous over any finite interval, and if $\int_0^x F(x) \, dx$ is absolutely convergent, then

$$f_c(\alpha) = \sqrt{\frac{2}{\pi}} \int_0^x F(x) \cos(\alpha x) \, dx$$

is the *Fourier cosine transform* of $F(x)$. Furthermore,

$$\overline{F}(x) = \sqrt{\frac{2}{\pi}} \int_0^x f_c(\alpha) \cos(\alpha x) d\alpha.$$

If $\lim_{x \rightarrow \infty} d^n F/dx^n = 0$, then an important property of the Fourier cosine transform is

$$f_c^{(2r)}(\alpha) = \sqrt{\frac{2}{\pi}} \int_0^x \left(\frac{d^{2r} F}{dx^{2r}} \right) \cos(\alpha x) dx = -\sqrt{\frac{2}{\pi}} \sum_{n=0}^{r-1} (-1)^n a_{2r-2n-1} \alpha^{2n} + (-1)^r \alpha^{2r} f_c(\alpha) \quad (34)$$

where $\lim_{x \rightarrow \infty} d^r F/dx^r = a_r$, which is often useful.

Under the same conditions, define the *Fourier sine transform* of $F(x)$ as follows

$$f_s(\alpha) = \sqrt{\frac{2}{\pi}} \int_0^x F(x) \sin(\alpha x) dx$$

with

$$\overline{F}(x) = \sqrt{\frac{2}{\pi}} \int_0^x f_s(\alpha) \sin(\alpha x) d\alpha$$

Corresponding to (34) we have

$$f_s^{(2r)}(\alpha) = \sqrt{\frac{2}{\pi}} \int_0^\infty \left(\frac{d^{2r} F}{dx^{2r}} \sin(\alpha x) \right) dx = -\sqrt{\frac{2}{\pi}} \sum_{n=1}^r (-1)^n \alpha^{2n-1} a_{2r-2n} + (-1)^{r-1} \alpha^{2r} f_s(\alpha)$$

Similarly, if $F(x)$ is defined for $-\infty < x < \infty$, and if $\int_{-\infty}^\infty F(x) dx$ is absolutely convergent, then

$$f(\alpha) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^\infty F(x) e^{i\alpha x} dx$$

is the *Fourier transform* of $F(x)$, and

$$\overline{F}(x) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^\infty f(\alpha) e^{-i\alpha x} d\alpha$$

Also, if $\lim_{|x| \rightarrow \infty} \left| \frac{d^n F}{dx^n} \right| = 0 \quad (n = 1, 2, \dots, r-1)$ then

$$f^{(r)}(\alpha) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^\infty F^{(r)}(x) e^{i\alpha x} dx = (-i\alpha)^r f(\alpha)$$

7.2 TABLE OF FOURIER COSINE TRANSFORMS

$$F(\omega) = F_c(f)(\omega) = \sqrt{\frac{2}{\pi}} \int_0^\infty f(x) \cos(\omega x) dx, \quad \omega > 0.$$

No.	$f(x)$	$F(\omega)$
1	$\begin{cases} 1 & 0 < x < a \\ 0 & x > a \end{cases}$	$\sqrt{\frac{2}{\pi}} \frac{\sin a\omega}{\omega}$
2	$x^{p-1} \quad (0 < p < 1)$	$\sqrt{\frac{2}{\pi}} \frac{\Gamma(p)}{\omega^p} \cos \frac{p\pi}{2}$
3	$\begin{cases} \cos x & 0 < x < a \\ 0 & x > a \end{cases}$	$\frac{1}{\sqrt{2\pi}} \left(\frac{\sin[a(1-\omega)]}{1-\omega} + \frac{\sin[a(1+\omega)]}{1+\omega} \right)$

Norm: $\int_0^\infty x^\alpha e^{-x} [L_n^{(\alpha)}(x)]^2 dx = \frac{\Gamma(n+\alpha+1)}{n!}$

Rodrigues' Formula: $L_n^{(\alpha)}(x) = \frac{1}{n! x^\alpha e^{-x}} \frac{d^n}{dx^n} \{x^{n+\alpha} e^{-x}\}$

Generating Function: $(1-z)^{-\alpha-1} \exp\left(\frac{xz}{z-1}\right) = \sum_{n=0}^{\infty} L_n^{(\alpha)}(x) z^n$

Inequality: $|L_n^{(\alpha)}(x)| \leq \frac{\Gamma(n+\alpha+1)}{n! \Gamma(\alpha+1)} e^{x/2}; \quad \begin{matrix} x \geq 0 \\ \alpha > 0 \end{matrix}$
 $|L_n^{(\alpha)}(x)| \leq \left[2 - \frac{\Gamma(\alpha+n+1)}{n! \Gamma(\alpha+1)}\right] e^{x/2}; \quad \begin{matrix} x \geq 0 \\ -1 < \alpha < 0 \end{matrix}$

6. **Hermite** *Symbol:* $H_n(x)$ *Interval:* $[-\infty, \infty]$

Differential Equation: $y'' - 2xy' + 2ny = 0$

Explicit Expression: $H_n(x) = \sum_{m=0}^{\lfloor n/2 \rfloor} \frac{(-1)^m n! (2x)^{n-2m}}{m! (n-2m)!}$

Recurrence Relation: $H_{n+1}(x) = 2xH_n(x) - 2nH_{n-1}(x)$

Weight: e^{-x^2}

Standardization: $H_n(1) = 2^n x^n + \dots$

Norm: $\int_{-\infty}^{\infty} e^{-x^2} [H_n(x)]^2 dx = 2^n n! \sqrt{\pi}$

Rodrigues' Formula: $H_n(x) = (-1)^n e^{x^2} \frac{d^n}{dx^n} (e^{-x^2})$

Generating Function: $e^{-x^2+2zx} = \sum_{n=0}^{\infty} H_n(x) \frac{z^n}{n!}$

Inequality: $|H_n(x)| e^{x^2/2} k 2^{n/2} \sqrt{n!} k \approx 1.086435$

8.2 TABLES OF ORTHOGONAL POLYNOMIALS

In the following, $\{H_n, L_n, P_n, T_n, U_n\}$ represent the n^{th} order Hermite, Laguerre, Legendre, Tschebysheff (first kind), and Tschebysheff (second kind) polynomials.

$$\begin{aligned}
 H_0 &= 1 & x^{10} &= (30240H_0 + 75600H_2 + 25200H_4 + 2520H_6 + 90H_8 + H_{10})/1024 \\
 H_1 &= 2x & x^9 &= (15120H_1 + 10080H_3 + 1512H_5 + 72H_7 + H_9)/512 \\
 H_2 &= 4x^2 - 2 & x^8 &= (1680H_0 + 3360H_2 + 840H_4 + 56H_6 + H_8)/256 \\
 H_3 &= 8x^3 - 12x & x^7 &= (840H_1 + 420H_3 + 42H_5 + H_7)/128 \\

 \end{aligned}$$

8.3 BESSEL FUNCTIONS

1. Bessel's differential equation for a real variable x is

$$x^2 \frac{d^2 y}{dx^2} + x \frac{dy}{dx} + (x^2 - n^2)y = 0$$

2. When n is not an integer, two independent solutions of the equation are $J_n(x)$ and $J_{-n}(x)$ where

$$J_n(x) = \sum_{k=0}^{\infty} \frac{(-1)^k}{k! \Gamma(n+k+1)} \left(\frac{x}{2}\right)^{n+2k}$$

3. If n is an integer then $J_n(x) = (-1)^n J_n(x)$, where

$$J_n(x) = \frac{x^n}{2^n n!} \left\{ 1 - \frac{x^2}{2^2 \cdot 1!(n+1)} + \frac{x^4}{2^4 \cdot 2!(n+1)(n+2)} + \frac{x^6}{2^6 \cdot 3!(n+1)(n+2)(n+3)} + \dots \right\}$$

4. For $n = 0$ and $n = 1$, this formula becomes

$$\begin{aligned} J_0(x) &= 1 - \frac{x^2}{2^2(1!)^2} + \frac{x^4}{2^4(2!)^2} - \frac{x^6}{2^6(3!)^2} + \frac{x^8}{2^8(4!)^2} - \dots \\ J_1(x) &= \frac{x}{2} - \frac{x^3}{2^3 \cdot 1!2!} + \frac{x^5}{2^5 \cdot 2!3!} - \frac{x^7}{2^7 \cdot 3!4!} + \frac{x^9}{2^9 \cdot 4!5!} - \dots \end{aligned}$$

5. Table of zeros for $J_0(x)$ and $J_1(x)$. Define $\{\alpha_n, \beta_n\}$ by $J_0(\alpha_n) = 0$ and $J_1(\beta_n) = 0$.

Roots α_n	$J_1(\alpha_n)$	Roots β_n	$J_0(\beta_n)$
2.4048	0.5191	0.0000	1.0000
5.5201	-0.3403	3.8317	-0.4028
8.6537	0.2715	7.0156	0.3001
11.7915	-0.2325	10.1735	-0.2497
14.9309	0.2065	13.3237	0.2184
18.0711	-0.1877	16.4706	-0.1965
21.2116	0.1733	19.6159	0.1801

6. Recurrence formulas

$$\begin{aligned} J_{n-1}(x) + J_{n+1}(x) &= \frac{2n}{x} J_n(x) & nJ_n(x) + xJ'_n(x) &= xJ_{n-1}(x) \\ J_{n-1}(x) - J_{n+1}(x) &= 2J'_n(x) & nJ_n(x) - xJ'_n(x) &= xJ_{n+1}(x) \end{aligned}$$

7. If J_n is written for $J_n(x)$ and $J_n^{(k)}$ is written for $\frac{d^k}{dx^k}\{J_n(x)\}$, then the following derivative relationships are important

$$\begin{aligned} J_0^{(r)} &= -J_1^{(r-1)} \\ J_0^{(2)} &= -J_0 + \frac{1}{x}J_1 = \frac{1}{2}(J_2 - J_0) \\ J_0^{(3)} &= \frac{1}{x}J_0 + \left(1 - \frac{2}{x^2}\right)J_1 = \frac{1}{4}(-J_3 + 3J_1) \\ J_0^{(4)} &= \left(1 - \frac{3}{x^2}\right)J_0 - \left(\frac{2}{x} - \frac{6}{x^3}\right)J_1 = \frac{1}{8}(J_4 - 4J_2 + 3J_0), \text{ etc.} \end{aligned}$$

8. Half-order Bessel functions

$$\begin{aligned} J_{\frac{1}{2}}(x) &= \sqrt{\frac{2}{\pi x}} \sin x \\ J_{-\frac{1}{2}}(x) &= \sqrt{\frac{2}{\pi x}} \cos x \\ J_{n+\frac{3}{2}}(x) &= -x^{n+\frac{1}{2}} \frac{d}{dx} \{x^{-(n+\frac{1}{2})} J_{n+\frac{1}{2}}(x)\} \\ J_{n-\frac{1}{2}}(x) &= x^{-(n+\frac{1}{2})} \frac{d}{dx} \{x^{n+\frac{1}{2}} J_{n+\frac{1}{2}}(x)\} \end{aligned}$$

n	$\left(\frac{\pi x}{2}\right)^{\frac{1}{2}} J_{n+\frac{1}{2}}(x)$	$\left(\frac{\pi x}{2}\right)^{\frac{1}{2}} J_{-(n+\frac{1}{2})}(x)$
0	$\sin x$	$\cos x$
1	$\frac{\sin x}{x} - \cos x$	$-\frac{\cos x}{x} - \sin x$
2	$\left(\frac{3}{x^2} - 1\right) \sin x - \frac{3}{x} \cos x$	$\left(\frac{3}{x^2} - 1\right) \cos x + \frac{3}{x} \sin x$
3	$\left(\frac{15}{x^3} - \frac{6}{x}\right) \sin x - \left(\frac{15}{x^2} - 1\right) \cos x$	$-\left(\frac{15}{x^3} - \frac{6}{x}\right) \cos x - \left(\frac{15}{x^2} - 1\right) \sin x$

9. Additional solutions to Bessel's equation are $Y_n(x)$ (also called Weber's function, and sometimes denoted by $N_n(x)$) and $H_n^{(1)}(x)$ and $H_n^{(2)}(x)$ (also called Hankel functions) These solutions are defined as follows

$$Y_n(x) = \begin{cases} \frac{J_n(x) \cos(n\pi) - J_{-n}(x)}{\sin(n\pi)} & n \text{ not an integer} & H_n^{(1)}(x) = J_n(x) + iY_n(x) \\ \lim_{\nu \rightarrow n} \frac{J_\nu(x) \cos(\nu\pi) - J_{-\nu}(x)}{\sin(\nu\pi)} & n \text{ an integer} & H_n^{(2)}(x) = J_n(x) - iY_n(x) \end{cases}$$

The additional properties of these functions may all be derived from the above relations and the known properties of $J_n(x)$.

10. Complete solutions to Bessel's equation may be written as $c_1 J_n(x) + c_2 J_{-n}(x)$ when n is not an integer or, for any value of n , $c_1 J_n(x) + c_2 Y_n(x)$ or $c_1 H_n^{(1)}(x) + c_2 H_n^{(2)}(x)$.
11. The modified (or hyperbolic) Bessel's differential equation is

$$x^2 \frac{d^2 y}{dx^2} + x \frac{dy}{dx} - (x^2 + n^2)y = 0$$

12. When n is not an integer, two independent solutions of the equation are $I_n(x)$ and $I_{-n}(x)$, where

$$I_n(x) = \sum_{k=0}^{\infty} \frac{1}{k! \Gamma(n+k+1)} \left(\frac{x}{2}\right)^{n+2k}$$

13. If n is an integer,

$$I_n(x) = I_{-n}(x) = \frac{x^n}{2^n n!} \left(1 + \frac{x^2}{2^2 \cdot 1!(n+1)} + \frac{x^4}{2^4 \cdot 2!(n+1)(n+2)} + \frac{x^6}{2^6 \cdot 3!(n+1)(n+2)(n+3)} + \cdots \right)$$

14. For $n = 0$ and $n = 1$, this formula becomes

$$I_0(x) = 1 + \frac{x^2}{2^2(1!)^2} + \frac{x^4}{2^4(2!)^2} + \frac{x^6}{2^6(3!)^2} + \frac{x^8}{2^8(4!)^2} + \cdots$$

$$I_1(x) = \frac{x}{2} + \frac{x^3}{2^3 \cdot 1!2!} + \frac{x^5}{2^5 \cdot 2!3!} + \frac{x^7}{2^7 \cdot 3!4!} + \frac{x^9}{2^9 \cdot 4!5!} + \cdots$$

15. Another solution to the modified Bessel's equation is

$$K_n(x) = \begin{cases} \frac{1}{2} \pi \frac{I_{-n}(x) - I_n(x)}{\sin(n\pi)} & n \text{ not an integer} \\ \lim_{\nu \rightarrow n} \frac{1}{2} \pi \frac{I_{-\nu}(x) - I_\nu(x)}{\sin(\nu\pi)} & n \text{ an integer} \end{cases}$$

This function is linearly independent of $I_n(x)$ for all values of n . Thus the complete solution to the modified Bessel's equation may be written as

$$c_1 I_n(x) + c_2 I_{-n}(x) \quad \text{when } n \text{ is not an integer}$$

or

$$c_1 I_n(x) + c_2 K_n(x) \quad \text{for any value of } n$$

16. The following relations hold among the various Bessel functions:

$$I_n(z) = i^{-m} J_m(iz)$$

$$Y_n(iz) = (i)^{n+1} I_n(z) - \frac{2}{\pi} i^{-n} K_n(z)$$

Most of the properties of the modified Bessel function may be deduced from the known properties of $J_n(x)$ by use of these relations and those previously given.

17. Recurrence formulas

$$I_{n-1}(x) - I_{n+1}(x) = \frac{2n}{x} I_n(x) \quad I_{n-1}(x) + I_{n+1}(x) = 2I'_n(x)$$

$$I_{n-1}(x) - \frac{n}{x} I_n(x) = I'_n(x) \quad I'_n(x) = I_{n+1}(x) + \frac{n}{x} I_n(x)$$

8.4 FACTORIAL FUNCTION

For non-negative integers n , the factorial of n , denoted $n!$, is the product of all positive integers less than or equal to n ; $n! = n \cdot (n-1) \cdot (n-2) \cdots 2 \cdot 1$. If n is a negative integer ($n = -1, -2, \dots$) then $n! = \pm\infty$.

Approximations to $n!$ for large n include Stirling's formula

$$n! \approx \sqrt{2\pi e} \left(\frac{n}{e}\right)^{n+\frac{1}{2}},$$

and Burnside's formula

$$n! \approx \sqrt{2\pi} \left(\frac{n+\frac{1}{2}}{e}\right)^{n+\frac{1}{2}}.$$

n	$n!$	$\log_{10} n!$	n	$n!$	$\log_{10} n!$

8.5 GAMMA FUNCTION

Definition: $\Gamma(n) = \int_0^\infty t^{n-1} e^{-t} dt \quad n > 0$

Recursion Formula: $\Gamma(n+1) = n\Gamma(n)$

$\Gamma(n+1) = n!$ if $n = 0, 1, 2, \dots$ where $0! = 1$

For $n < 0$ the gamma function can be defined by using $\Gamma(n) = \frac{\Gamma(n+1)}{n}$

Special Values: $\Gamma(1/2) = \sqrt{\pi}$

$$\Gamma\left(m + \frac{1}{2}\right) = \frac{1 \cdot 3 \cdot 5 \cdots (2m-1)}{2^m} \sqrt{\pi} \quad m = 1, 2, 3, \dots$$

$$\Gamma\left(-m + \frac{1}{2}\right) = \frac{(-1)^m 2^m \sqrt{\pi}}{1 \cdot 3 \cdot 5 \cdots (2m-1)} \quad m = 1, 2, 3, \dots$$

Special Formulas: $\Gamma(x+1) = \lim_{k \rightarrow \infty} \frac{1 \cdot 2 \cdot 3 \cdots k}{(x+1)(x+2)\cdots(x+k)} k^x$

$$\frac{1}{\Gamma(x)} = x e^{\gamma x} \prod_{m=1}^{\infty} \left\{ \left(1 + \frac{x}{m}\right) e^{-x/m} \right\} \quad (\gamma \text{ is Euler's constant})$$

Properties: $\Gamma'(1) = \int_0^\infty e^{\gamma x} \ln x dx = -\gamma$

$$\frac{\Gamma'(x)}{\Gamma(x)} = -\gamma + \left(\frac{1}{1} - \frac{1}{x}\right) + \left(\frac{1}{2} - \frac{1}{x+1}\right) + \cdots + \left(\frac{1}{n} - \frac{1}{x+n-1}\right) + \cdots$$

$$\Gamma(x+1) = \sqrt{2\pi x} x^x e^{-x} \left\{ 1 + \frac{1}{12x} + \frac{1}{288x^2} - \frac{139}{51,840x^3} + \cdots \right\} \quad (\text{Stirling's asymptotic series})$$

n	$\Gamma(n)$	n	$\Gamma(n)$	n	$\Gamma(n)$	n	$\Gamma(n)$

8.6 BETA FUNCTION

Definition: $B(m, n) = \int_0^1 t^{m-1} (1-t)^{n-1} dt \quad m > 0, n > 0$

Relationship with Gamma function: $B(m, n) = \frac{\Gamma(m)\Gamma(n)}{\Gamma(m+n)}$

Properties:

$$B(m, n) = B(n, m)$$

$$B(m, n) = 2 \int_0^{\pi/2} \sin^{2m-1} \theta \cos^{2n-1} \theta d\theta$$

$$B(m, n) = \int_0^\infty \frac{t^{m-1}}{(1+t)^{m+n}} dt$$

$$B(m, n) = r^n (r+1)^m \int_0^1 \frac{t^{m-1} (1-t)^{n-1}}{(r+t)^{m+n}} dt$$

8.7 ERROR FUNCTION

Definition: $\operatorname{erf}(x) = \frac{2}{\sqrt{\pi}} \int_0^x e^{-t^2} dt$

Series: $\operatorname{erf}(x) = \frac{2}{\sqrt{\pi}} \left(x - \frac{x^3}{3} + \frac{1}{2!} \frac{x^5}{5} - \frac{1}{3!} \frac{x^7}{7} + \dots \right)$

Property: $\operatorname{erf}(x) = -\operatorname{erf}(-x)$

Relationship with Normal Probability Function $f(t)$: $\int_0^x f(t) dt = \frac{1}{2} \operatorname{erf}\left(\frac{x}{\sqrt{2}}\right)$ To evaluate $\operatorname{erf}(2.3)$, one proceeds as follows: For $\frac{x}{\sqrt{2}} = 2.3$, one finds $x = (2.3)(\sqrt{2}) = 3.25$. In the normal probability function table, one finds the entry 0.4994 opposite the value 3.25. Thus $\operatorname{erf}(2.3) = 2(0.4994) = 0.9988$.

$$\operatorname{erfc}(z) = 1 - \operatorname{erf}(z) = \frac{2}{\sqrt{\pi}} \int_z^\infty e^{-t^2} dt \quad (35)$$

is known as the complementary error function.

9 PROBABILITY

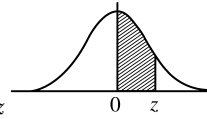

9.1 NORMAL PROBABILITY FUNCTION

$\Phi(z) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{-t^2/2} dt = \frac{1}{2} \left(1 + \operatorname{erf} \left(\frac{z}{\sqrt{2}} \right) \right)$ is the area under the Standard Normal Curve from $-\infty$ to z .

9.2 CONFIDENCE INTERVALS

Common one sample confidence intervals

Parameter	Assumptions	100(1 - α)% Confidence interval
μ	n large, σ^2 known, or normality, σ^2 known	$\bar{x} \pm z_{\alpha/2} \frac{\sigma}{\sqrt{n}}$
μ	normality, σ^2 unknown	$\bar{x} \pm t_{\alpha/2, n-1} \frac{s}{\sqrt{n}}$
σ^2	normality	$\left(\frac{(n-1)s^2}{\chi_{\alpha/2, n-1}^2}, \frac{(n-1)s^2}{\chi_{1-\alpha/2, n-1}^2} \right)$
p	binomial experiment, n large	$\hat{p} \pm z_{\alpha/2} \sqrt{\frac{\hat{p}(1-\hat{p})}{n}}$

Common two sample confidence intervals

Parameter	Assumptions	100(1 - α)% Confidence interval
$\mu_1 - \mu_2$	normality, independence, σ_1^2, σ_2^2 known or n_1, n_2 large, independence, σ_1^2, σ_2^2 known	$(\bar{x}_1 - \bar{x}_2) \pm z_{\alpha/2} \sqrt{\frac{\sigma_1^2}{n_1} + \frac{\sigma_2^2}{n_2}}$
$\mu_1 - \mu_2$	normality, independence, $\sigma_1^2 = \sigma_2^2$ unknown	$(\bar{x}_1 - \bar{x}_2) \pm t_{\alpha/2, n_1+n_2-2} s_p \sqrt{\frac{1}{n_1} + \frac{1}{n_2}}$ $s_p^2 = \frac{(n_1-1)s_1^2 + (n_2-1)s_2^2}{n_1+n_2-2}$
$\mu_1 - \mu_2$	normality, independence, $\sigma_1^2 \neq \sigma_2^2$ unknown	$(\bar{x}_1 - \bar{x}_2) \pm t_{\alpha/2, v} \sqrt{\frac{s_1^2}{n_1} + \frac{s_2^2}{n_2}}$ $v \approx \frac{\left(\frac{s_1^2}{n_1} + \frac{s_2^2}{n_2} \right)^2}{\frac{(s_1^2/n_1)^2}{n_1-1} + \frac{(s_2^2/n_2)^2}{n_2-1}}$
$\mu_1 - \mu_2$	normality, n pairs, dependence	$\bar{d} \pm t_{\alpha/2, n-1} \frac{s_d}{\sqrt{n}}$
$p_1 - p_2$	binomial experiments, n_1, n_2 large, independence	$(\hat{p}_1 - \hat{p}_2) \pm z_{\alpha/2} \sqrt{\frac{\hat{p}_1(1-\hat{p}_1)}{n_1} + \frac{\hat{p}_2(1-\hat{p}_2)}{n_2}}$

9.3 PERCENTAGE POINTS, STUDENT'S T-DISTRIBUTION

This table gives values of t such that

$$F(t) = \int_{-\infty}^t \frac{\Gamma\left(\frac{n+1}{2}\right)}{\sqrt{n\pi}\Gamma\left(\frac{n}{2}\right)} \left(1 + \frac{x^2}{n}\right)^{-\frac{n+1}{2}} dx$$

where n is the number of degrees of freedom. The t -distribution is symmetrical, so that $F(-t) = 1 - F(t)$

9.4 PERCENTAGE POINTS, CHI-SQUARE DISTRIBUTION

This table gives values of χ^2 such that

$$F(\chi^2) = \int_0^{\chi^2} \frac{1}{2^{n/2} \Gamma(\frac{n}{2})} x^{(n-2)/2} e^{-x/2} dx$$

where n is the number of degrees of freedom. For $n > 30$, a normal approximation is accurate: the expression $\sqrt{2x^2} - \sqrt{2n-1}$ is approximately distributed as the standard normal distribution. Thus χ_α^2 , the α -point of the distribution, may be computed by the formula

$$\chi_\alpha^2 = \frac{1}{2} [x_\alpha + \sqrt{2n-1}]^2,$$

where x_α is the α -point of the cumulative normal distribution. For even values of n , $F(\chi^2)$ can be written as

$$1 - F(\chi^2) = \sum_{x=0}^{x'-1} \frac{e^{-\lambda} \lambda^x}{x!}$$

with $\lambda = \frac{1}{2}\chi^2$ and $x' = \frac{1}{2}n$. Thus the cumulative Chi-Square distribution is related to the cumulative Poisson distribution. Another approximate formula for large n

$$\chi_\alpha^2 = n \left(1 - \frac{2}{9n} + z_\alpha \sqrt{\frac{2}{9n}} \right)^3$$

where n = degrees of freedom, z_α = the normal deviate (the value of x for which $F(x)$ = the desired percentile)

x	1.282	1.645	1.960	2.326	2.576	3.090
$F(x)$.90	.95	.975	.99	.995	.999

$\chi_{.99}^2 = 60[1 - 0.00370 + 2.326(0.06086)]^3 = 88.4$ is the 99th percentile for 60 degrees of freedom.

$$F(\chi^2) = \int_0^{\chi^2} \frac{1}{2^{n/2} \Gamma(\frac{n}{2})} x^{n-2/2} e^{-x/2} dx \quad (36)$$

9.5 PERCENTAGE POINTS, F -DISTRIBUTION

This table gives values of F such that

$$F(F) = \int_0^F \frac{\Gamma\left(\frac{m+n}{2}\right)}{\Gamma\left(\frac{m}{2}\right)\Gamma\left(\frac{n}{2}\right)} m^{m/2} n^{n/2} x^{m-2/2} (n+mx)^{-(m+n)/2} dx$$

for selected values of m , the number of degrees of freedom of the numerator of F ; and for selected values of n , the number of degrees freedom of the denominator of F . The table also provides values corresponding to $F(F) = .10, .05, .025, .01, .005, .001$ since $F_{1-\alpha}$ for m and n degrees of freedom is the reciprocal of F_α for n and m degrees of freedom. Thus

$$F_{.05}(4, 7) = \frac{1}{F_{.95}(7, 4)} = \frac{1}{6.09} = .164$$

$$F(F) = \int_0^F \frac{\Gamma\left(\frac{m+n}{2}\right)}{\Gamma\left(\frac{m}{2}\right)\Gamma\left(\frac{n}{2}\right)} m^{m/2} n^{n/2} x^{(m/2)-1} (n+mx)^{-(m+n)/2} dx = 0.90$$

F table for 0.95

$F = \frac{s_1^2}{s_2^2} = \frac{S_1/m}{S_2/n}$, where $s_1^2 = S_1/m$ and $s_2^2 = S_2/n$ are independent mean squares estimating a common variance σ^2 and based on m and n degrees of freedom, respectively.

$$F(F) = \int_0^F \frac{\Gamma\left(\frac{m+n}{2}\right)}{\Gamma\left(\frac{m}{2}\right)\Gamma\left(\frac{n}{2}\right)} m^{m/2} n^{n/2} x^{(m/2)-1} (n+mx)^{-(m+n)/2} dx = 0.95$$

10 PHYSICS RELATED

10.1 CLEBSCH-GORDAN COEFFICIENTS

The Clebsch-Gordan coefficients arise in the integration of three spherical harmonic functions.

$$\begin{aligned} \begin{pmatrix} j_1 & j_2 & j \\ m_1 & m_2 & m \end{pmatrix} &= \delta_{m, m_1+m_2} \sqrt{\frac{(j_1+j_2-j)!(j+j_1-j_2)!(j+j_2-j_1)!(2j+1)}{(j+j_1+j_2+1)!}} \\ &\times \sum_{0 \leq k < \infty} \frac{(-1)^k \sqrt{(j_1+m_1)!(j_1-m_1)!(j_2+m_2)!(j_2-m_2)!(j+m)!(j-m)!}}{k!(j_1+j_2-j-k)!(j_1-m_1-k)!(j_2+m_2-k)!(j-j_2+m_1+k)!(j-j_1-m_2+k)!}. \end{aligned}$$

1. Conditions:

- (a) Each of $\{j_1, j_2, j, m_1, m_2, m\}$ may be an integer, or half an integer.
- (b) $j_1 + j_2 - j \geq 0$
- (c) $j_1 - j_2 + j \geq 0$
- (d) $-j_1 + j_2 + j \geq 0$
- (e) $j > 0, j_1 > 0, j_2 > 0$
- (f) $j + j_1 + j_2$ is an integer
- (g) $j_1 + m_1$ is an integer
- (h) $j_2 + m_2$ is an integer
- (i) $|m_1| \leq j_1, |m_2| \leq j_2, |m| \leq j$

2. Special values:

- (a) $\begin{pmatrix} j_1 & j_2 & j \\ m_1 & m_2 & m \end{pmatrix} = 0$ if $m_1 + m_2 \neq m$.
- (b) $\begin{pmatrix} j_1 & 0 & j \\ m_1 & 0 & m \end{pmatrix} = \delta_{j_1, j} \delta_{m_1, m}$.
- (c) $\begin{pmatrix} j_1 & j_2 & j \\ 0 & 0 & 0 \end{pmatrix} = 0$ when $j_1 + j_2 + j$ is an odd integer.
- (d) $\begin{pmatrix} j_1 & j_1 & j \\ m_1 & m_1 & m \end{pmatrix} = 0$ when $2j_1 + j$ is an odd integer.

3. Symmetry relations: all of the following are equal to $\begin{pmatrix} j_1 & j_2 & j \\ m_1 & m_2 & m \end{pmatrix}$:

- (a) $\begin{pmatrix} j_2 & j_1 & j \\ -m_2 & -m_1 & -m \end{pmatrix},$
- (b) $(-1)^{j_1+j_2-j} \begin{pmatrix} j_2 & j_1 & j \\ m_1 & m_2 & m \end{pmatrix},$
- (c) $(-1)^{j_1+j_2-j} \begin{pmatrix} j_1 & j_2 & j \\ -m_1 & -m_2 & -m \end{pmatrix},$
- (d) $\sqrt{\frac{2j+1}{2j_1+1}} (-1)^{j_2+m_2} \begin{pmatrix} j & j_2 & j_1 \\ -m & m_2 & -m_1 \end{pmatrix},$
- (e) $\sqrt{\frac{2j+1}{2j_1+1}} (-1)^{j_1-m_1+j-m} \begin{pmatrix} j & j_2 & j_1 \\ m & -m_2 & m_1 \end{pmatrix},$
- (f) $\sqrt{\frac{2j+1}{2j_1+1}} (-1)^{j-m+j_1-m_1} \begin{pmatrix} j_2 & j & j_1 \\ m_2 & -m & -m_1 \end{pmatrix},$
- (g) $\sqrt{\frac{2j+1}{2j_2+1}} (-1)^{j_1-m_1} \begin{pmatrix} j_1 & j & j_2 \\ m_1 & -m & -m_2 \end{pmatrix},$
- (h) $\sqrt{\frac{2j+1}{2j_2+1}} (-1)^{j_1-m_1} \begin{pmatrix} j & j_1 & j_2 \\ m & -m_1 & m_2 \end{pmatrix}.$

Using symmetry relations, Clebsch–Gordan coefficients $\begin{pmatrix} j_1 & j_2 \\ m_1 & m_2 \end{pmatrix} \begin{matrix} j \\ m \end{matrix}$ may be put in the standard form $j_1 \leq j_2 \leq j$ and $m \geq 0$.

10.2 MOMENT OF INERTIA FOR DIFFERENT SHAPES

The moment of inertia of a volume V about an axis is $\int_V \rho(\mathbf{r}) d^2(\mathbf{r}) dV(\mathbf{r})$ where ρ is the density and d is the distance of a point to the axis. Often the result can be written in terms of the total mass of the body, $m = \int_V \rho(\mathbf{r}) dV(\mathbf{r})$.

Body	Axis	Moment of inertia
Uniform thin rod of length l	Normal to the length, at one end	$m \frac{1}{3} l^2$
Uniform thin rod of length l	Normal to the length, at the center	$m \frac{1}{12} l^2$
Thin rectangular sheet, sides a and b	Through the center parallel to b	$m \frac{1}{12} a^2$
Thin rectangular sheet, sides a and b	Through the center perpendicular to the sheet	$m \frac{1}{12} (a^2 + b^2)$
Thin circular sheet of radius r	Normal to the plate through the center	$m \frac{1}{2} r^2$
Thin circular sheet of radius r	Along any diameter	$m \frac{1}{4} r^2$
Thin circular ring. Radii r_1 and r_2	Through center normal to plane of ring	$m \frac{1}{2} (r_1^2 + r_2^2)$
Thin circular ring. Radii r_1 and r_2	Any diameter	$m \frac{1}{4} (r_1^2 + r_2^2)$
Rectangular parallelepiped, edges a , b , and c	Through center perpendicular to face ab , (parallel to edge c)	$m \frac{1}{12} (a^2 + b^2)$
Sphere, radius r	Any diameter	$m \frac{2}{5} r^2$
Spherical shell, external radius, r_1 , internal radius r_2	Any diameter	$m \frac{2}{5} \frac{(r_1^5 - r_2^5)}{(r_1^3 - r_2^3)}$
Spherical shell, very thin, mean radius, r	Any diameter	$m \frac{2}{3} r^2$
Right circular cylinder of radius r , length l	The longitudinal axis of the solid	$m \frac{1}{2} r^2$
Right circular cylinder of radius r , length l	Transverse diameter	$m \left(\frac{r^2}{4} + \frac{l^2}{12} \right)$
Hollow circular cylinder, length l , radii r_1 and r_2	The longitudinal axis of the figure	$m \frac{1}{2} (r_1^2 + r_2^2)$
Thin cylindrical shell, length l , mean radius, r	The longitudinal axis of the figure	mr^2
Hollow circular cylinder, length l , radii r_1 and r_2	Transverse diameter	$m \left(\frac{r_1^2 + r_2^2}{4} + \frac{l^2}{12} \right)$
Elliptic cylinder, length l , transverse semiaxes a and b	Longitudinal axis	$m \frac{1}{4} (a^2 + b^2)$
Right cone, altitude h , radius of base r	Axis of the figure	$m \frac{3}{10} r^2$
Spheroid of revolution, equatorial radius r	Polar axis	$m \frac{2}{5} r^2$
Ellipsoid with axes $2a$, $2b$, $2c$	Axis $2a$	$m \frac{1}{5} (b^2 + c^2)$

This page intentionally left blank

SOURCES OF PHYSICAL AND CHEMICAL DATA

In addition to the primary research journals, there are many useful sources of property data of the type contained in the *CRC Handbook of Chemistry and Physics*. A selected list of these is presented here, with emphasis on print and electronic sources whose contents have been subject to a reasonable level of quality control.

A. Data Journals

1. **Journal of Physical and Chemical Reference Data** — Published jointly by the National Institute of Standards and Technology and the American Institute of Physics, this quarterly journal contains compilations of evaluated data in chemistry, physics, and materials science. It is available in print and on the Internet. [scitation.aip.org/content/aip/journal/jpcrd/]
2. **Journal of Chemical and Engineering Data** — This bimonthly journal of the American Chemical Society publishes articles reporting original experimental measurements carried out under carefully controlled conditions. The main emphasis is on thermochemical and thermophysical properties. Review articles with evaluated data from the literature are also published. [pubs.acs.org/journals/jceaax/index.html]
3. **Journal of Chemical Thermodynamics** — This journal publishes original research papers that include highly accurate measurements of thermodynamic and thermophysical properties. [www.sciencedirect.com/science/journal/00219614]
4. **Atomic Data and Nuclear Data Tables** — This is a bimonthly journal containing compilations of data in atomic physics, nuclear physics, and related fields. [www.science-direct.com/science/journal/0092640X]
5. **Journal of Phase Equilibria and Diffusion** — This journal presents critically evaluated phase diagrams and related data on alloy systems. It is published by ASM International and is the successor to the previous ASM periodical *Bulletin of Alloy Phase Diagrams*. [www.asminternational.org/]
6. **Dortmund Data Bank** — Maintains extensive databases on thermodynamic and transport properties of pure compounds and mixtures of industrial interest. The data are distributed through DECHEMA, FIZ CHEMIE, and other outlets. Address: DDBST GmbH, Industriestr. 1, 26121 Oldenburg, Germany [www.ddbst.de].
7. **Cambridge Crystallographic Data Centre** — Maintains the Cambridge Structural Database of over 500,000 organic compounds. The data files and manipulation software are distributed in several ways. Address: 12 Union Rd., Cambridge CB2 1EZ, U.K. [www.ccdc.cam.ac.uk].
8. **FIZ Karlsruhe** — In addition to many bibliographic databases, FIZ Karlsruhe maintains the Inorganic Crystal Structure Database in collaboration with the National Institute of Standards and Technology. The ICSD contains the atomic coordinates and related data on over 50,000 inorganic crystals. Address: Fachinformationszentrum (FIZ) Karlsruhe, Hermann-von-Helmholtz-Platz 1, D-76344 Eggenstein-Leopoldshafen, Germany [www.fiz-karlsruhe.de].
9. **International Centre for Diffraction Data** — Maintains and distributes the Powder Diffraction File (PDF), a file of over 500,000 X-ray powder diffraction patterns used for identification of crystalline materials. The ICDD also distributes the NIST Crystal Data file, which contains lattice parameters for over 235,000 inorganic, organic, metal, and mineral crystalline materials. Address: 12 Campus Blvd., Newton Square, PA 19073-3273 [www.icdd.com].
10. **Research Collaboratory for Structural Bioinformatics** — Maintains the Protein Data Bank (PDB), a file of 3-dimensional structures of proteins and other biological macromolecules. Address: Department of Chemistry and Chemical Biology, Rutgers University, 610 Taylor Road, Piscataway, NJ 08854-8087 [www.rcsb.org].
11. **Toth Information Systems** — Maintains the Metals Crystallographic Data File (CRYSTMET). Address: 2045 Quincy Ave., Gloucester, ON, Canada K1J 6B2 [www.tothcanada.com].
12. **Atomic Mass Data Center** — Collects and evaluates high-precision data on masses of individual isotopes and maintains a comprehensive database. Address: C.S.N.S.M (IN2P3-CNRS), Batiment 108, F-91405 Orsay Campus, France [www.nndc.bnl.gov/amdc].
13. **Particle Data Group** — International center for data of high-energy physics; maintains a database of properties of fundamental particles that is published in both print and electronic form. Address: MS 50-308, Lawrence Berkeley National Laboratory, Berkeley, CA 94720 [pdg.lbl.gov].
14. **National Nuclear Data Center** — Maintains databases on nuclear structure and reactions, including neutron cross sections. The NNDC is the U.S. node in an international net-

B. Data Centers

This section lists selected organizations that perform a continuing function of compiling and critically evaluating data in specific fields of science.

1. **National Institute of Standards and Technology** — Under its Standard Reference Data program, NIST supports a number of data centers in chemistry, physics, and materials science. Topics covered include thermodynamics, fluid properties, chemical kinetics, mass spectroscopy, atomic spectroscopy, fundamental physical constants, ceramics, and crystallography. Address: Office of Standard Reference Data, National Institute of Standards and Technology, Gaithersburg, MD 20899 [www.nist.gov/srd/].
2. **Thermodynamics Research Center** — Now located at the National Institute of Standards and Technology, TRC maintains an extensive archive of data covering thermodynamic, thermochemical, and transport properties of organic compounds and mixtures. Data are distributed in both print and electronic form. Address: Mail code 838.00, 325 Broadway, Boulder, CO 80305-3328 [www.trc.nist.gov].
3. **Design Institute for Physical Property Data** — Under the auspices of the American Institute of Chemical Engineers [www.aiiche.org/dippr/], DIPPR offers evaluated data on

industrially important chemical compounds. The largest project deals with physical, thermodynamic, and transport properties of pure compounds. Address: Brigham Young University, Provo, UT 84602 [dippr.byu.edu].

4. **Dortmund Data Bank** — Maintains extensive databases on thermodynamic and transport properties of pure compounds and mixtures of industrial interest. The data are distributed through DECHEMA, FIZ CHEMIE, and other outlets. Address: DDBST GmbH, Industriestr. 1, 26121 Oldenburg, Germany [www.ddbst.de].
5. **Cambridge Crystallographic Data Centre** — Maintains the Cambridge Structural Database of over 500,000 organic compounds. The data files and manipulation software are distributed in several ways. Address: 12 Union Rd., Cambridge CB2 1EZ, U.K. [www.ccdc.cam.ac.uk].
6. **FIZ Karlsruhe** — In addition to many bibliographic databases, FIZ Karlsruhe maintains the Inorganic Crystal Structure Database in collaboration with the National Institute of Standards and Technology. The ICSD contains the atomic coordinates and related data on over 50,000 inorganic crystals. Address: Fachinformationszentrum (FIZ) Karlsruhe, Hermann-von-Helmholtz-Platz 1, D-76344 Eggenstein-Leopoldshafen, Germany [www.fiz-karlsruhe.de].
7. **International Centre for Diffraction Data** — Maintains and distributes the Powder Diffraction File (PDF), a file of over 500,000 X-ray powder diffraction patterns used for identification of crystalline materials. The ICDD also distributes the NIST Crystal Data file, which contains lattice parameters for over 235,000 inorganic, organic, metal, and mineral crystalline materials. Address: 12 Campus Blvd., Newton Square, PA 19073-3273 [www.icdd.com].
8. **Research Collaboratory for Structural Bioinformatics** — Maintains the Protein Data Bank (PDB), a file of 3-dimensional structures of proteins and other biological macromolecules. Address: Department of Chemistry and Chemical Biology, Rutgers University, 610 Taylor Road, Piscataway, NJ 08854-8087 [www.rcsb.org].
9. **Toth Information Systems** — Maintains the Metals Crystallographic Data File (CRYSTMET). Address: 2045 Quincy Ave., Gloucester, ON, Canada K1J 6B2 [www.tothcanada.com].
10. **Atomic Mass Data Center** — Collects and evaluates high-precision data on masses of individual isotopes and maintains a comprehensive database. Address: C.S.N.S.M (IN2P3-CNRS), Batiment 108, F-91405 Orsay Campus, France [www.nndc.bnl.gov/amdc].
11. **Particle Data Group** — International center for data of high-energy physics; maintains a database of properties of fundamental particles that is published in both print and electronic form. Address: MS 50-308, Lawrence Berkeley National Laboratory, Berkeley, CA 94720 [pdg.lbl.gov].
12. **National Nuclear Data Center** — Maintains databases on nuclear structure and reactions, including neutron cross sections. The NNDC is the U.S. node in an international net-

work of nuclear data centers. Address: Brookhaven National Laboratory, Upton, NY 11973-5000 [www.nndc.bnl.gov].

13. **International Union of Pure and Applied Chemistry** — Address: PO Box 13757, Research Triangle Park, NC 27709-3757 [www.iupac.org]. IUPAC supports a number of long-term data projects, including these examples:
 - a. **Solubility Data Project** — Carries out evaluation of all types of solubility data. The results are published in the Solubility Data Series, whose current outlet is the *Journal of Physical and Chemical Reference Data*. [srdata.nist.gov/solubility/]
 - b. **Kinetic Data for Atmospheric Chemistry** — Maintains a comprehensive database on the kinetics of reactions important in the chemistry of the atmosphere. [www.iupac-kinetic.ch.cam.ac.uk/]
 - c. **Stability Constants Database** — Collection of metal-ligand stability constants and associated software. [www.acadsoft.co.uk]

C. Major Multi-Volume Handbook Series

1. **CRC Chemical Dictionaries** — These originally appeared in print form as the *Dictionary of Organic Compounds*, *Dictionary of Natural Products*, etc. They are now published in electronic form and are available in DVD format [www.crcpress.com] and on the Internet [www.chemnetbase.com]. The consolidated version, called the *Combined Chemical Dictionary*, has data on more than 560,000 compounds spanning all branches of chemistry. The coverage includes physical properties, biological sources, hazard information, uses, and literature references.
2. **Properties of Organic Compounds** — Originally published in three editions as the *Handbook of Data on Organic Compounds*, it is now in electronic form as *Properties of Organic Compounds*. The database includes about 30,000 compounds; physical properties and spectral data (mass, infrared, Raman, ultraviolet, and NMR) are covered. It is offered as CDROM [www.crcpress.com] and by Web access [www.chemnetbase.com].
3. **Beilstein Handbook of Organic Chemistry** — The classic source of data on organic compounds, dating from the 19th century, *Beilstein* was converted to electronic form in the last decade of the 20th century. Over 8 million compounds and 10 million chemical reactions are now covered, with a broad range of physical properties as well as synthetic methods and ecological data. The database is accessed by the CrossFire software [accelrys.com/products].
4. **Gmelin Handbook of Inorganic and Organometallic Chemistry** — A subset of the information in the print series has been converted to electronic form and is now distributed in the same manner as *Beilstein*. In addition to the standard physical properties, the coverage includes a wide range of optical, magnetic, spectroscopic, thermal, and transport properties for about 1.4 million compounds [accelrys.com/products].
5. **DECHEMA Chemical Data Series** — DECHEMA distributes the DETHERM database, which emphasizes data used in process design in the chemical industry, including thermodynamic and transport properties of about 20,000 pure compounds and 90,000 mixtures. Access is available through in-house databases and via the Internet [www.dechema.de].
6. **Landolt-Börnstein Numerical Data and Functional Relationships in Science and Technology** — Landolt-

Börnstein covers a very broad range of data in physics, chemistry, crystallography, materials science, biophysics, astronomy, and geophysics. Hard-copy volumes are no longer published, but the entire collection is available online [www.springermaterials.com].

D. Selected Single-Volume Handbooks

The following handbooks offer broad coverage of high-quality data in a single volume. This list is only representative; an extensive listing of handbooks in all fields of science may be found in *Handbooks and Tables in Science and Technology, Third Edition* (Russell H. Powell, ed., Oryx Press, Westport, CT, 1994).

1. **American Institute of Physics Handbook** — Although an old book, it contains much data that are still useful, especially in acoustics, mechanics, optics, and solid state physics. (Dwight E. Gray, ed., McGraw-Hill, New York, 1972)
2. **Constants of Inorganic Substances** — This book presents physical constants, thermodynamic data, solubility, reactivity, and other information on over 3000 inorganic compounds. Since it draws heavily on Russian literature, it contains a great deal of data that do not make their way into most U.S. handbooks. (R. A. Liden, L. L. Andreeva, and V. A. Molochko, Begell House, New York, 1995)
3. **Handbook of Chemistry and Physics** — Now in the 93rd Edition, the *CRC Handbook* covers data from most branches of chemistry and physics. The annual revisions permit regular updating of the information. Also available on CDROM [www.crcpress.com] and the Web [hbcnetbase.com]. (W. M. "Mickey" Haynes, ed., CRC Press, Boca Raton, FL, 2012)
4. **Handbook of Inorganic Compounds, Second Edition** — This book covers physical constants and other properties for about 3300 inorganic compounds. (Dale L. Perry, CRC Press, Boca Raton, FL, 2011)
5. **Handbook of Physical Properties of Liquids and Gases** — This is a valuable source of data on all types of fluids, ranging from liquid and gaseous hydrocarbons to molten metals and ionized gases. Detailed tables of physical, thermodynamic, and transport properties are given for temperatures from the cryogenic region to 6000 K. Western and Russian literature is covered. (N. B. Vargaftik, Y. K. Vinogradov, and V. S. Yargin, Begell House, New York, 1996)
6. **Handbook of Physical Quantities** — The range of coverage is somewhat similar to the *CRC Handbook of Chemistry and Physics*, but with a stronger emphasis on physics than on chemistry. Solid state physics, lasers, nuclear physics, geophysics, and astronomy receive considerable attention. (Igor S. Grigoriev and Evgenii Z. Meilikhov, eds., CRC Press, Boca Raton, FL, 1997)
7. **Kaye & Laby Tables of Physical and Chemical Constants** — *Kaye & Laby* dates from 1911, and the 16th Edition was prepared in 1995 by a committee of experts. The coverage extends to almost every field of physics and chemistry; data on a limited number of representative substances or materials are given for each topic. (Longman Group Limited, Harlow, Essex, U.K., 1995)
8. **Lange's Handbook of Chemistry** — Provides broad coverage of chemical data; last updated in 2005. Also available on the Web [www.knovel.com]. (James G. Speight, ed., McGraw-Hill, New York, 2005)
9. **Recommended Reference Materials for the Realization of Physicochemical Properties** — This IUPAC book em-

phasizes highly accurate data on substances and materials that can be used as calibration standards. It covers physical, thermal, optical, and electrical properties. (K. N. Marsh, ed., Blackwell Scientific Publications, Oxford, 1987)

10. **The Merck Index** — Now in its 14th Edition (published in 2006), *The Merck Index* is a widely used source of data on over 10,000 compounds, chosen particularly for their importance in biology, medicine, and ecology. A short monograph on each compound gives information on the synthe-

sis and uses as well as physical and toxicological properties. A CD-ROM accompanies the book. (Maryadele J. O'Neil, ed., John Wiley & Sons, Indianapolis, IN, 2006)

E. Summary of Useful Web Sites for Physical and Chemical Properties

Most of the Web sites in the following list provide direct access to factual data on physical and chemical properties. However, the list also includes portals that link to different property databases or describe the procedure for gaining access to electronic sources

of property data. There are also a few chemical directory sites that are useful for obtaining formulas, synonyms, and registry numbers for substances of interest.

Web Site	Address	Comments
ACD/Labs Spectral Data	www.acdlabs.com/products/adh/	Infrared, Raman and NMR spectra collections from Coblenz Society and other sources
Advanced Chemistry Development	www.acdlabs.com	Chemical directory, with programs for estimating physical and spectral properties
Alloy Center	products.asminternational.org/alloycenter/	Physical, electrical, thermal, and mechanical properties of alloys
American Mineralogist Crystal Structure Database	www.geo.arizona.edu/AMS/amcsd.php	Lattice constants of minerals
Atomic Mass Data Center	www.nndc.bnl.gov/amdc	See B.10
Beilstein	www.accelrys.com/products/databases	See C.3
Biocatalysis/Biodegradation Database	umbbd.ethz.ch/	Biocatalytic reactions, biodegradation of chemical compounds
BioCyc	biocyc.org/	Metabolic pathways of microorganisms
BioInfo Bank	www.abren.net/bioinfo/	Portal to ProTherm (protein thermodynamics), ProNit (protein–nucleic acid interactions), biomolecule structures
Biological Macromolecule Crystallization Database	xpdb.nist.gov:8060/BMCD4/index.faces	Crystal data and crystallization conditions for proteins, nucleic acids, and complexes
BRENDA	www.brenda-enzymes.info/	Enzyme nomenclature and properties
Cambridge Structural Database	www.ccdc.cam.ac.uk	See B.5
Carbon Dioxide Information Center	cdiac.esd.ornl.gov/	Data on atmospheric carbon dioxide
Ceramic Properties Databases	ceramics.org/knowledge-center/ceramic-resource-center/	Mechanical, thermal, and other properties of ceramic materials
ChemExper	www.chemexper.com/	Consolidated chemical catalogs from various suppliers; provides physical properties and safety data; links to molfiles and MSDS
Chemfinder	www.chemfinder.com	Chemical directory, with links to several property databases
Chemical Acronyms Database	bl-libg-doghill.ads.iu.edu/chem-web/databases/acronyms/index.php	Useful for associating chemical names and acronyms
Chemical Entities of Biological Interest (ChEBI)	www.ebi.ac.uk/chebi/	Dictionary of molecules and fragments, with identifiers and structures
ChemIDplus	chem.sis.nlm.nih.gov/chemidplus/	Chemical directory
ChemIndustry	www.chemindustry.com/chemicals/	Chemical directory
CHEMnetBASE	www.chemnetbase.com	Portal to <i>CRC Chemical Dictionaries, Handbook of Chemistry and Physics, Properties of Organic Compounds</i> , etc.
ChemSpider	www.chemspider.com	Aggregation of chemical structures and other information from many public sources
ChemSynthesis Chemical Database	www.chemsynthesis.com	References to synthesis; limited property data
CODATA Databases	www.codata.org/resources/databases/	Thermodynamic key values and fundamental constants
Comparative Toxicogenomics Database (CTD)	ctdbase.org/	Chemical – gene/protein interactions
Cool Prop	coolprop.sourceforge.net	Thermophysical properties of 110 pure fluids and pseudo-pure fluids including humid air of interest to the organic Rankine cycle community
CRC Combined Chemical Dictionary	www.chemnetbase.com/	See C.1
Crystallography Open Database (COD)	www.crystallography.net	Crystal data on 52,000 compounds
DECHEMA (DETHERM)	www.dechema.de/en/dtherm.html	See C.5

Web Site	Address	Comments
DIPPR Pure Compound Database	dippr.byu.edu	See B.3
Dortmund Data Bank	www.ddbst.de	See B.4
eMolecules	www.emolecules.com	Portal to databases of chemical suppliers
Enzyme Nomenclature Database	www.expasy.ch/enzyme/	IUBMB nomenclature for enzymes
European Bioinformatics Institute	www.ebi.ac.uk/Databases/	Nucleotide and protein sequences, protein structures, enzyme nomenclature and reactions
FDM Reference Spectra Databases	www.fdm-spectra.com/	Infrared, Raman, and mass spectra
FIZ Chemie Berlin	www.fiz-chemie.de	Portal to Infoterm, Acronyms, thermophysical properties
FIZ Karlsruhe — ICSD	www.fiz-karlsruhe.de	See B.6

Group

Metals are divided into four categories: **Metals**, **Non-metals**, **Liquids**, and **Gases**.

Atomic weights are IUPAC 2013 values abridged to five significant digits. See "Standard Atomic Weights (2013)" in Sec. I for an explanation of the IUPAC notation for atomic weight ranges. Isotopes of elements 113, 115, 117, and 118 have been reported, but element names have not been adopted.

HISTORICAL FIGURES IN CHEMISTRY AND PHYSICS

Lord Kelvin (Baron William Thomson Kelvin)

British physicist, mathematician, and engineer

Born: Belfast, Ireland, June 26, 1824

Died: Largs, Scotland, December 17, 1907

Professor of Natural Philosophy at the University of Glasgow

- Determined the value of absolute zero as $273.15\text{ }^{\circ}\text{C}$.
- Developed forms of the first and second laws of thermodynamics.
- Had an additional career as an electric telegraph engineer and inventor; knighted by Queen Victoria for his work on the transatlantic telegraph project.
- First UK scientist to be elevated to the House of Lords; the name "Kelvin" refers to the River Kelvin which flows close to his laboratory at the University of Glasgow.
- Unit of kelvin for absolute temperature named in his honor.
- Collaborated with James Joule to discover the Joule–Thomson effect that describes changes in the temperature of a gas that is expanded through a throttling valve.
- Elected first president of the International Electrotechnical Commission in recognition of his contributions to electrical standardization.

"If you cannot measure it, then it is not science."

"Accurate and minute measurement seems to the non-scientific imagination, a less lofty and dignified work than looking for something new. But nearly all the grandest discoveries of science have been but the rewards of accurate measurement and patient long-continued labour in the minute sifting of numerical results."

"Let nobody be afraid of true freedom of thought. Let us be free in thought and criticism; but, with freedom, we are bound to come to the conclusion that science is not antagonistic to religion, but a help to it."

John Dalton

English chemist, meteorologist, and physicist

Born: Eaglesfield, Cumberland, England, September 6, 1766

Died: Manchester, England, July 27, 1844

Member of the Manchester Literary and Philosophical Society

- Pioneering work in the development of modern atomic theory that evolved from his meteorological studies.
- First person to study color blindness; his discovery became known as "Daltonism," which became the name for color blindness.
- Known for the law of multiple proportions and the law of partial pressures (known as Dalton's law).
- Unit of dalton to denote one atomic mass unit was named in honor of him; inorganic section of UK's Royal Society of Chemistry is named after Dalton (Dalton Division) and the Society's journal for inorganic chemistry also bears his name (*Dalton Transactions*).

"Matter, though divisible in an extreme degree, is nevertheless not infinitely divisible. That is, there must be some point beyond which we cannot go in the division of matter. ... I have chosen the word 'atom' to signify these ultimate particles."

"I was introduced to Mr. Davy, who has rooms adjoining mine (in the Royal Institution); he is a very agreeable and intelligent young man, and we have interesting conversation in an evening; the principal failing in his character as a philosopher is that he does not smoke."

HISTORICAL FIGURES IN CHEMISTRY AND PHYSICS

Michael Faraday

English chemist and physicist

Born: Newington Butts, England, September 22, 1791

Died: Hampton Court, Middlesex, England, August 25, 1867

Professor of Chemistry at the Royal Institution of Great Britain

- Discovered electromagnetic induction in 1831, the principle behind electric transformers, generators, and electric motors; developed the concept of a field to describe electric and magnetic forces.
- Provided the experimental and a good deal of the theoretical foundation upon which Maxwell developed classical electromagnetic theory.
- First scientist to succeed in liquefying a permanent gas (carbon dioxide, chlorine).
- Unit of farad for capacitance named in his honor.
- Received little formal education; developed a strong relationship with Sir Humphrey Davy after attending his lectures; established a reputation as the outstanding scientist lecturer of his time.
- Responsible for coining familiar terms in electrochemistry such as electrode, cathode, anode, and ion.
- Discovered the laws of chemical electrodeposition of metals from solutions.
- Discovered a number of new organic compounds, including benzene.
- Inventor of the Faraday Cage, used to protect electronic equipment from lightning strikes and electrostatic discharges; radio frequency devices use Faraday Cages to prevent electromagnetic interference.

"I could trust a fact and always cross-question an assertion."

"Nature is our kindest friend and best critic in experimental science if we only allow her intimations to fall unbiased on our minds."

"Nothing is too wonderful to be true, if it be consistent with the laws of nature."

"The lecturer should give the audience full reason to believe that all his powers have been exerted for their pleasure and instruction."

Robert Boyle

Irish-English chemist, physicist, and natural philosopher

Born: Lismore, County Waterford, Ireland, January 27, 1627

Died: London, England, December 31, 1691

Founder of the Royal Society of London

- Best known for Boyle's law which describes the inverse relationship between the absolute pressure and volume of a gas at constant temperature.
- Became known as the founder of modern chemistry; one of the pioneers of the modern experimental method; his work had a strong influence on Sir Isaac Newton.
- Devoted much of his time to theology; promoted the spread of Christianity in the East; contributed to missionary societies; helped to translate the Bible into various languages.
- Founded the Royal Society of London which still exists as the oldest continuous scientific society in the world.
- First prominent scientist to perform controlled experiments and publish his work with details concerning procedures, apparatus, and observations (results).
- The phrase "chemical analysis" was coined by him.

"I look upon experimental truths as matters of great concernment to mankind."

"If the omniscient author of nature knew that the study of his works tends to make men disbelieve his Being or Attributes, he would not have given them so many invitations to study and contemplate Nature."

STANDARD ATOMIC WEIGHTS (2013)

Atomic Number	Element	Symbol	Atomic Weight
1	Hydrogen*	H	1.008 [1.00784; 1.00811]
2	Helium	He	4.002602(2)
3	Lithium*	Li	6.94 [6.938; 6.997]
4	Beryllium	Be	9.0121831(5)
5	Boron*	B	10.81 [10.806; 10.821]
6	Carbon*	C	12.011 [12.0096; 12.0116]
7	Nitrogen*	N	14.007 [14.00643; 14.00728]
8	Oxygen*	O	15.999 [15.99903; 15.99977]
9	Fluorine	F	18.998403163(6)
10	Neon	Ne	20.1797(6)
11	Sodium	Na	22.98976928(2)
12	Magnesium*	Mg	24.305 [24.304; 24.307]
13	Aluminum	Al	26.9815385(7)
14	Silicon*	Si	28.085 [28.084; 28.086]
15	Phosphorus	P	30.973761998(5)
16	Sulfur*	S	32.06 [32.059; 32.076]
17	Chlorine*	Cl	35.45 [35.446; 35.457]
18	Argon	Ar	39.948(1)
19	Potassium	K	39.0983(1)
20	Calcium	Ca	40.078(4)
21	Scandium	Sc	44.955908(5)
22	Titanium	Ti	47.867(1)
23	Vanadium	V	50.9415(1)
24	Chromium	Cr	51.9961(6)
25	Manganese	Mn	54.938044(3)

* The first value for this element is the conventional value to be used if there is no information on the origin of the material. This is followed by the interval in which atomic weights in natural terrestrial materials are known to fall. See page 1-11 for further information.

** Since the element has no stable isotopes and no characteristic isotopic composition, an atomic weight is not tabulated.

FUNDAMENTAL PHYSICAL CONSTANTS - FREQUENTLY USED CONSTANTS

Quantity	Symbol	Numerical value	Unit	Relative std. uncert. u_r
speed of light in vacuum	c, c_0	299 792 458	m s^{-1}	exact
magnetic constant	μ_0	$4\pi \times 10^{-7}$ $= 12.566\,370\,614\dots \times 10^{-7}$	N A^{-2} N A^{-2}	exact
electric constant $1/\mu_0 c^2$	ϵ_0	$8.854\,187\,817\dots \times 10^{-12}$	F m^{-1}	exact
Newtonian constant of gravitation	G	$6.673\,84(80) \times 10^{-11}$	$\text{m}^3 \text{kg}^{-1} \text{s}^{-2}$	1.2×10^{-4}
Planck constant	h	$6.626\,069\,57(29) \times 10^{-34}$	J s	4.4×10^{-8}
$\hbar/2\pi$	\hbar	$1.054\,571\,726(47) \times 10^{-34}$	J s	4.4×10^{-8}
elementary charge	e	$1.602\,176\,565(35) \times 10^{-19}$	C	2.2×10^{-8}
magnetic flux quantum $h/2e$	Φ_0	$2.067\,833\,758(46) \times 10^{-15}$	Wb	2.2×10^{-8}
conductance quantum $2e^2/h$	G_0	$7.748\,091\,7346(25) \times 10^{-5}$	S	3.2×10^{-10}
electron mass	m_e	$9.109\,382\,91(40) \times 10^{-31}$	kg	4.4×10^{-8}
proton mass	m_p	$1.672\,621\,777(74) \times 10^{-27}$	kg	4.4×10^{-8}
proton-electron mass ratio	m_p/m_e	1836.152 672 45(75)		4.1×10^{-10}
fine-structure constant $e^2/4\pi\epsilon_0\hbar c$	α	$7.297\,352\,5698(24) \times 10^{-3}$		3.2×10^{-10}
inverse fine-structure constant	α^{-1}	137.035 999 074(44)		3.2×10^{-10}
Rydberg constant $\alpha^2 m_e c/2\hbar$	R_∞	10 973 731.568 539(55)	m^{-1}	5.0×10^{-12}
Avogadro constant	N_A, L	$6.022\,141\,29(27) \times 10^{23}$	mol^{-1}	4.4×10^{-8}
Faraday constant $N_A e$	F	96 485.3365(21)	C mol^{-1}	2.2×10^{-8}
molar gas constant	R	8.314 4621(75)	$\text{J mol}^{-1} \text{K}^{-1}$	9.1×10^{-7}
Boltzmann constant R/N_A	k	$1.380\,6488(13) \times 10^{-23}$	J K^{-1}	9.1×10^{-7}
Stefan-Boltzmann constant $(\pi^2/60)\hbar^4/\pi^3 c^2$	σ	$5.670\,373(21) \times 10^{-8}$	$\text{W m}^{-2} \text{K}^{-4}$	3.6×10^{-6}
Non-SI units accepted for use with the SI				
electron volt (e/C) J	eV	$1.602\,176\,565(35) \times 10^{-19}$	J	2.2×10^{-8}
(unified) atomic mass unit $\frac{1}{12}m(^{12}\text{C})$	u	$1.660\,538\,921(73) \times 10^{-27}$	kg	4.4×10^{-8}
