PROPERTIES OF FATTY ACID METHYL AND ETHYL ESTERS RELATED TO BIOFUELS

Robert D. Chirico and Michael Frenkel

These tables provide critically evaluated properties and sources of experimental data for fatty acid methyl esters and ethyl esters found in biofuels. All listed property values are based on experimental results reported in Refs. 1 to 103. Critical evaluation was carried out dynamically with the *NIST ThermoData Engine* (TDE) software (Ref. 104). The software algorithms have been described in the literature (see Refs. 105 to 110).

The table of properties lists the common name, molecular formula, Chemical Abstracts Service Registry Number (CASRN), acid code, normal melting temperature (mp/°C), density of the liquid phase at 25 °C and 50 °C near pressure $p = 0.1$ MPa (ρ^{25} and ρ^{50} expressed in $\text{kg} \times \text{m}^{-3}$), vapor pressure p_{sat} at the temperatures 100 °C and 150 °C (p_{sat}^{100} and p_{sat}^{150} in Pa), the normal boiling temperature (bp/°C), heat capacity of the liquid phase at 25 °C and 50 °C near pressure $p = 0.1$ MPa (C_p^{25} and C_p^{50} in $\text{J} \times \text{K}^{-1} \times \text{mol}^{-1}$), and viscosity of the liquid at 25 °C and 50 °C near pressure $p = 0.1$ MPa (η^{25} and η^{50} in $\text{mPa} \times \text{s}$). In some cases, property values for

the liquid cannot be evaluated at 25 °C because the compound is solid at this temperature. In such cases, values are given at 40 °C, as indicated with a superscript “40.” All normal boiling temperatures are estimates based on extrapolation of vapor pressures measured at lower temperatures. The acid code is a common shorthand used in the field. The first number represents the number of carbon atoms in the parent fatty acid, and the second number indicates the number of double bonds present. Values in parentheses are the estimated expanded uncertainties (0.95 level of confidence) (see Refs. 111 to 113) for the property values. A discussion of uncertainty terminology with particular application to thermodynamic and transport properties is given in Ref. 114.

The second table provides up to five data sources reporting experimental measurements of the indicated property. Generally, these are the most important sources that were used in the critical evaluation process. The numbers correspond to those in the reference list.

Compounds	Molecular Formula	CASRN	Acid code	mp °C	ρ^{25} kg m ⁻³	ρ^{50} kg m ⁻³	p_{sat}^{100} Pa	p_{sat}^{150} Pa	bp °C	C_p^{25} J mol ⁻¹ K ⁻¹	C_p^{50} J mol ⁻¹ K ⁻¹	η^{25} mPa s	η^{50} mPa s

COMPOSITION AND PROPERTIES OF COMMON OILS AND FATS

This table lists some of the most common naturally occurring oils and fats. The list is separated into those of plant origin, fish and other marine life origin, and land animal origin. The oils and fats consist mainly of esters of glycerol (i.e., triglycerides) with fatty acids of 10 to 22 carbon atoms. The four fatty acids with the highest concentration are given for each oil; concentrations are given in weight percent. Because there is often a wide variation in composition depending on the source of the oil sample, a range (or sometimes an average) is generally given. More complete data on composition, including minor fatty acids, sterols, and tocopherols, can be found in the references.

The acids are labeled by the codes described in the previous table, "Properties of Fatty Acids and Their Methyl Esters," which gives the systematic and common names of the acids. Thus 18:2 9c,12c indicates a C₁₈ acid with two double bonds in the 9 and 12 positions, both with a *cis* configuration (*cis,cis*-9,12-octadecadienoic acid, or linoleic acid).

The density and refractive index of the oils are typical values; superscripts indicate the temperature in °C.

Notes:

- The composition figure given for oleic acid (18:1 9c) often includes low levels of other 18:1 isomers.

- In some oils where a concentration is given for 18:2 9c,12c (linoleic acid), other isomers of 18:2 may be included.
- Likewise, where a concentration is given for 18:3 9c,12c,15c (α-linolenic acid), other isomers of 18:3 may be included.
- The acid 20:5 6c,9c,12c,15c,17c, which is prevalent in many fish oils, is often abbreviated as 20:5 ω-3 or 20:5 n-3.

The assistance of Frank D. Gunstone in preparing this table is gratefully acknowledged.

^a Jojoba oil consists primarily of wax esters of the acids listed here and long-chain alcohols.

^b Kapok oil also contains up to 15% cyclopropene acids.

^c Stillingia oil also contains 5–10% *trans,cis*-2,4-decadienoic acid (stillingic acid, 10:2 2t,4c).

^d Capelin oil also contains about 10% 16:1.

CARBOHYDRATE NAMES AND SYMBOLS

The following table lists the systematic names and symbols for selected carbohydrates and some of their derivatives. The symbols for monosaccharide residues and derivatives are recommended by IUPAC for use in describing the structures of oligosaccharide chains. A more complete list can be found in the reference.

Common name	Symbol	Systematic name
Abequose	Abe	3,6-Dideoxy-D-xylo-hexose
N-Acetyl-2-deoxyneur-2-enaminic acid	Neu2en5Ac	
N-Acetylgalactosamine	GalNAc	
N-Acetylglucosamine	GlcNAc	
N-Acetylneuraminic acid	Neu5Ac	
Allose	All	<i>allo</i> -Hexose
Altrose	Alt	<i>altro</i> -Hexose
Apiose	Api	3-C-(Hydroxymethyl)-glycero-tetrose
Arabinitol	Ara-ol	Arabinitol
Arabinose	Ara	<i>arabino</i> -Pentose
Arcanose		2,6-Dideoxy-3-C-methyl-3-O-methyl-xylo-hexose
Ascarylose		3,6-Dideoxy-L- <i>arabino</i> -hexose
Boivinose		2,6-Dideoxy-D-gulose
Challose		4,6-Dideoxy-3-O-methyl-D-xylo-hexose
Cladinose		2,6-Dideoxy-3-C-methyl-3-O-methyl-L- <i>ribo</i> -hexose
Colitose		3,6-Dideoxy-L-xylo-hexose
Cymarose		6-Deoxy-3-O-methyl- <i>ribo</i> -hexose
3-Deoxy-D-manno-oct-2-ulosonic acid	Kdo	
2-Deoxyribose	dRib	2-Deoxy- <i>erythro</i> -pentose
2,3-Diamino-2,3-dideoxy-D-glucose	GlcN3N	
Diginose		2,6-Dideoxy-3-O-methyl- <i>lyxo</i> -hexose
Digitalose		6-Deoxy-3-O-methyl-D-galactose
Digitoxose		2,6-Dideoxy-D- <i>ribo</i> -hexose
3,4-Di-O-methylrhamnose	Rha3,4Me ₂	
Ethyl glucopyranuronate	GlcP A6Et	
Evalose		6-Deoxy-3-C-methyl-D-mannose
Fructose	Fru	<i>arabino</i> -Hex-2-ulose
Fucitol	Fuc-ol	6-Deoxy-D-galactitol
Fucose	Fuc	6-Deoxygalactose
β-D-Galactopyranose 4-sulfate	β-D-Galp4S	
Galactosamine	GalN	2-Amino-2-deoxygalactose
Galactose	Gal	<i>galacto</i> -Hexose
Glucitol	Glc-ol	
Glucosamine	GlcN	2-Amino-2-deoxyglucose
Glucose	Glc	<i>gluco</i> -Hexose
Glucuronic acid	GlcA	
N-Glycolylneuraminic acid	Neu5Gc	
Gulose	Gul	<i>gulo</i> -Hexose
Hamamelose		2-C-(Hydroxymethyl)-D-ribose
Idose	Ido	<i>ido</i> -Hexose
Iduronic acid	IdoA	
Lactose	Lac	β-D-Galactopyranosyl-(1→4)-D-glucose
Lyxose	Lyx	<i>lyxo</i> -Pentose
Maltose		α-D-Glucopyranosyl-(1→4)-D-glucose
Mannose	Man	<i>manno</i> -Hexose
2-C-Methylxylose	Xyl2CMe	
Muramic acid	Mur	2-Amino-3-O-[(R)-1-carboxyethyl]-2-deoxy-D-glucose
Mycarose		2,6-Dideoxy-3-C-methyl-L- <i>ribo</i> -hexose
Mycinose		6-Deoxy-2,3-di-O-methyl-D-allose
Neuraminic acid	Neu	5-Amino-3,5-dideoxy-D-glycero-D- <i>galacto</i> -non-2-ulosonic acid

Common name	Symbol	Systematic name
Panose		α -D-Glucopyranosyl-(1 \rightarrow 6)- α -D-glucopyranosyl-(1 \rightarrow 4)-D-glucose
Paratose		3,6-Dideoxy-D- <i>ribo</i> -hexose
Primeverose		β -D-Xylopyranosyl-(1 \rightarrow 6)-D-glucose
Psicose	Psi	<i>ribo</i> -Hex-2-ulose
Quinovose	Qui	6-Deoxyglucose
		β -D-Fructofuranosyl- α -D-galactopyranosyl-(1 \rightarrow 6)- α -D-glucopyranoside
Raffinose		6-Deoxymannose
Rhamnose	Rha	2,3,6-Trideoxy-L- <i>threo</i> -hexose
Rhodinose		
Ribose	Rib	<i>ribo</i> -Pentose
Ribose 5-phosphate	Rib5P	
Ribulose	Ribulo (Rul)	<i>erythro</i> -Pent-2-ulose
Rutinose		α -L-Rhamnopyranosyl-(1 \rightarrow 6)-D-glucose
Sarmentose		2,6-Dideoxy-3-O-methyl-D- <i>xylo</i> -hexose
Sedoheptulose		D- <i>altro</i> -Hept-2-ulose
Sorbose	Sor	<i>xylo</i> -Hex-2-ulose
Streptose		5-Deoxy-3-C-formyl-L-lyxose
Sucrose		β -D-Fructofuranosyl- α -D-glucopyranoside
Tagatose	Tag	<i>lyxo</i> -Hex-2-ulose
Talose	Tal	<i>talo</i> -Hexose
Turanose		α -D-Glucopyranosyl-(1 \rightarrow 3)-D-fructose
Tyvelose	Tyv	3,6-Dideoxy-D- <i>arabino</i> -hexose
Xylose	Xyl	<i>xylo</i> -Pentose
Xylulose	Xylulo (Xul)	<i>threo</i> -Pent-2-ulose

STANDARD TRANSFORMED GIBBS ENERGIES OF FORMATION FOR BIOCHEMICAL REACTANTS

Robert N. Goldberg and Robert A. Alberty

This table contains values of the standard transformed Gibbs energies of formation $\Delta_f G'^{\circ}$ for 130 biochemical reactants. Values of $\Delta_f G'^{\circ}$ are given at pH 7.0, the temperature 298.15 K, and the pressure 100 kPa for three ionic strengths: $I = 0$, $I = 0.1$ mol/L and $I = 0.25$ mol/L. The table can be used for calculating apparent equilibrium constants K' and standard apparent reduction potentials E'° for biochemical reactions. Such a listing is more compact than tabulating the actual apparent equilibrium constants or standard apparent reduction potentials, which would require a very large number of reactant–product combinations. In the table, all reactants are in aqueous solution unless indicated otherwise.

A biochemical reactant is a sum of species. For example, ATP consists of an equilibrium mixture of the aqueous species ATP^{4-} , HATP^{3-} , $\text{H}_2\text{ATP}^{2-}$, MgATP^{2-} , etc. Similarly, phosphate refers to the equilibrium mixture of the aqueous species PO_4^{3-} , HPO_4^{2-} , H_2PO_4^- , H_3PO_4 , MgHPO_4 , etc. Biochemical reactions are written using biochemical reactants in terms of an apparent equilibrium constant K' , which is distinct from the standard equilibrium constant K . This subject is discussed in an IUPAC report (see Reference 1 below).

The apparent equilibrium constant K' and the standard transformed Gibbs energy change $\Delta_r G'^{\circ}$ for a biochemical reaction can be calculated from the $\Delta_f G'^{\circ}$ values by using the relationship

$$-RT \ln K' = \Delta_r G'^{\circ} = \sum \nu_i \Delta_f G'^{\circ},$$

where the summation is over all of the biochemical reactants. The quantity ν_i is the stoichiometric number of reactant i (ν_i is positive for reactants on the right side of the equation and negative for reactants on the left side); R is the gas constant. As an example, the hydrolysis reaction of ATP is

At pH 7.00 and $I = 0.25$ M, $\Delta_r G'^{\circ}$ and K' are calculated as follows:

$$\Delta_r G'^{\circ} = \{-1424.70 - 1059.49 - (-2292.50 - 155.66)\} \cdot (\text{kJ mol}^{-1}) = -36.03 \text{ kJ mol}^{-1}$$

$$K' = \exp[-(-36030 \text{ J mol}^{-1}) / \{(8.3145 \text{ J mol}^{-1} \text{ K}^{-1}) \cdot (298.15 \text{ K})\}] = 2.05 \cdot 10^6$$

An example involving a biochemical half-cell reaction is

At 298.15 K, pH 7.00, and $I = 0$, the standard apparent reduction potential E'° can be calculated as follows

$$E'^{\circ} = -(1/nF) \cdot \{\Delta_f G'^{\circ}(\text{ethanol}) - \Delta_f G'^{\circ}(\text{acetaldehyde})\},$$

where n is the number of electrons in the half-cell reaction and F is the Faraday constant. Then,

$$E'^{\circ} = [-1 / (2 \cdot 9.6485 \cdot 10^4 \text{ C mol}^{-1})] \cdot (58.10 \cdot 10^3 \text{ J mol}^{-1} - 20.83 \cdot 10^3 \text{ J mol}^{-1}) = -0.193 \text{ V}$$

APPARENT EQUILIBRIUM CONSTANTS FOR ENZYME-CATALYZED REACTIONS

Robert N. Goldberg

This table contains values of apparent equilibrium constants K' for selected enzyme-catalyzed reactions at specified temperatures T and pHs. In those cases where the ionic strength I and/or the pMg (pMg = $-\log_{10}[\text{Mg}^{2+}]$) have been reported, the values of these quantities are given. The Enzyme Commission numbers [Ref. 1] of the enzymes that were used to catalyze the reactions are also given.

There are two fundamentally different types of equilibrium constants. This is illustrated by the following example for the hydrolysis of adenosine 5'-triphosphate (ATP) to adenosine 5'-diphosphate (ADP) and phosphate:

The apparent equilibrium constant for the overall biochemical reaction (1) is

$$K' = [\text{ADP}][\text{phosphate}]/([\text{ATP}]c^\circ) \quad (2)$$

The biochemical reactants ATP, ADP, and phosphate each exist in several different ionized and metal bound forms. For example, ATP is an equilibrium mixture of the species ATP^{4-} , HATP^{3-} , $\text{H}_2\text{ATP}^{2-}$, MgATP^{2-} , MgHATP^- , Mg_2ATP^0 . Additional species would also have to be considered if Ca^{2+} were present. Thus, ATP has often been denoted in the literature as ΣATP or as $(\text{ATP})_{\text{tot}}$. When it is clear that one is dealing with total amounts of substances, it is not necessary to use either the Σ or "tot." Thus, these designations are not used in this table. In the above equation, $c^\circ = 1 \text{ mol dm}^{-3}$; it is included to make K' dimensionless. The standard transformed Gibbs energy of reaction $\Delta_r G'^\circ$ at specified conditions of temperature T , pressure P , ionic strength I , pH, and pMg can be calculated from K' :

$$\Delta_r G'^\circ = -RT \ln K' \quad (3)$$

The molar gas constant, R , is equal to $8.314\,472 \text{ J K}^{-1} \text{ mol}^{-1}$. $\Delta_r G'^\circ$ and the apparent equilibrium constant, K' , can be used to calculate the position of equilibrium of overall biochemical reactions.

It is also possible to choose a chemical reference reaction that involves selected solute species:

The equilibrium constant for this reference reaction is

$$K = [\text{ADP}^{3-}][\text{HPO}_4^{2-}][\text{H}^+]/\{[\text{ATP}^{4-}](c^\circ)^2\} \quad (5)$$

Equations and algorithms that relate these two different types of equilibrium constants have been published [Refs. 2–4]. To calculate the equilibrium constant K for the reference reaction from the apparent equilibrium constant K' , or vice versa, one needs the equilibrium constants for the binding of H^+ and for the relevant metal ions to ATP^{4-} , ADP^{3-} , and HPO_4^{2-} .

To avoid confusion between the two different types of equilibrium constants (K' and K) and to avoid ambiguity about whether specific species or sums of species are intended, the word "ammonia," for example, rather than NH_3 or NH_4^+ , is used for total ammonia, and chemical formulas are used for specific chemical species. Other substances such as carbon dioxide (CO_2 , HCO_3^- , and CO_3^{2-}), and phosphate (H_2PO_4^- , HPO_4^{2-} , and PO_4^{3-}) are treated in the same manner. Exceptions are made for water, which is always

written as H_2O , and for gaseous hydrogen and oxygen, which are written as $\text{H}_2(\text{g})$ and $\text{O}_2(\text{g})$, respectively.

For symmetrical reactions, there is no concern about the units used to calculate the value of an equilibrium constant. However, care must be exercised for reactions that are not symmetrical. In such cases, the units " mol dm^{-3} " have been used for all concentrations. As stated above, a c° (1 mol dm^{-3}) is then used to make all equilibrium constants dimensionless.

All substances are assumed to be in aqueous solutions unless specified otherwise.

Values of $\Delta_r G'^\circ$ and K' can also be calculated for many biochemical reactions by using the table "Standard Transformed Gibbs Energies of Formation for Biochemical Reactants" in Section 7 of this Handbook.

Abbreviations

ADP	adenosine 5'-diphosphate
AMP	adenosine 5'-monophosphate
ATP	adenosine 5'-triphosphate
CoA	coenzyme A
GDP	guanosine 5'-diphosphate
GMP	guanosine 5'-monophosphate
GTP	guanosine 5'-triphosphate
IDP	inosine 5'-diphosphate
IMP	inosine 5'-monophosphate
ITP	inosine 5'-triphosphate
NAD_{ox}	β -nicotinamide-adenine dinucleotide, oxidized form
NAD_{red}	β -nicotinamide-adenine dinucleotide, reduced form
NADP_{ox}	β -nicotinamide-adenine dinucleotide phosphate, oxidized form
NADP_{red}	β -nicotinamide-adenine dinucleotide phosphate, reduced form
UDP	uridine 5'-diphosphate
UTP	uridine 5'-triphosphate

THERMODYNAMIC QUANTITIES FOR THE IONIZATION REACTIONS OF BUFFERS IN WATER

Robert N. Goldberg, Nand Kishore, and Rebecca M. Lennen

This table contains selected values for the pK , standard molar enthalpy of reaction $\Delta_r H^\circ$, and standard molar heat-capacity change $\Delta_r C_p^\circ$ for the ionization reactions of 64 buffers many of which are relevant to biochemistry and to biology.¹ The values pertain to the temperature $T = 298.15$ K and the pressure $p = 0.1$ MPa. The standard state is the hypothetical ideal solution of unit molality. These data permit one to calculate values of the pK and of $\Delta_r H^\circ$ at temperatures in the vicinity $\{T \approx (274 \text{ K to } 350 \text{ K})\}$ of the reference temperature $\theta = 298.15$ K by using the following equations²

$$\Delta_r G_T^\circ = -RT \ln K_T = \ln(10) \cdot RT \cdot pK_T, \quad (1)$$

$$R \ln K_T = -(\Delta_r G_\theta^\circ / \theta) + \Delta_r H_\theta^\circ \{ (1/\theta) - (1/T) \} + \Delta_r C_{p\theta}^\circ \{ (\theta/T) - 1 + \ln(T/\theta) \}, \quad (2)$$

$$\Delta_r H_T^\circ = \Delta_r H_\theta^\circ + \Delta_r C_{p\theta}^\circ (T - \theta). \quad (3)$$

Here, $\Delta_r G^\circ$ is the standard molar Gibbs energy change and K is the equilibrium constant for a reaction; R is the gas constant (8.314 472 J K⁻¹ mol⁻¹). The subscripts T and θ denote the temperature to which a quantity pertains, the subscript p denotes constant pres-

sure, and the subscript r denotes that the quantity refers to a reaction. Combination of equations (1) and (2) yields the following equation that gives pK as a function of temperature:

$$pK_T = -\{R \ln(10)\}^{-1} [-\{\ln(10) \cdot RT \cdot pK_\theta / \theta\} + \Delta_r H_\theta^\circ \{ (1/\theta) - (1/T) \} + \Delta_r C_{p\theta}^\circ \{ (\theta/T) - 1 + \ln(T/\theta) \}]. \quad (4)$$

The above equations neglect higher order terms that involve temperature derivatives of $\Delta_r C_p^\circ$. Also, it is important to recognize that the values of pK and $\Delta_r H^\circ$ effectively pertain to ionic strength $I = 0$. However, the values of pK and $\Delta_r H^\circ$ are almost always dependent on the ionic strength and the actual composition of the solution. These issues are discussed in Reference 1, which also gives an approximate method for making appropriate corrections.

BIOLOGICAL BUFFERS

This table of frequently used buffers gives the pK_a value at 25 °C and the useful pH range of each buffer. The buffers are listed in order of increasing pH.

The table is reprinted with permission of Sigma Chemical Company, St. Louis, MO.

Acronym	Name	Mol. wt.	pK_a	Useful pH range
MES	2-(<i>N</i> -Morpholino)ethanesulfonic acid	195.2	6.1	5.5–6.7
BIS TRIS	Bis(2-hydroxyethyl)iminotris(hydroxymethyl)methane	209.2	6.5	5.8–7.2
ADA	<i>N</i> -(2-Acetamido)-2-iminodiacetic acid	190.2	6.6	6.0–7.2
ACES	2-[(2-Amino-2-oxoethyl)amino]ethanesulfonic acid	182.2	6.8	6.1–7.5
PIPES	Piperazine- <i>N,N'</i> -bis(2-ethanesulfonic acid)	302.4	6.8	6.1–7.5
MOPSO	3-(<i>N</i> -Morpholino)-2-hydroxypropanesulfonic acid	225.3	6.9	6.2–7.6
BIS TRISPROPANE	1,3-Bis[tris(hydroxymethyl)methylamino]propane	282.3	6.8 ^a	6.3–9.5
BES	<i>N,N</i> -Bis(2-hydroxyethyl)-2-aminoethanesulfonic acid	213.2	7.1	6.4–7.8
MOPS	3-(<i>N</i> -Morpholino)propanesulfonic acid	209.3	7.2	6.5–7.9
HEPES	<i>N</i> -(2-Hydroxyethyl)piperazine- <i>N'</i> -(2-ethanesulfonic acid)	238.3	7.5	6.8–8.2
TES	<i>N</i> -Tris(hydroxymethyl)methyl-2-aminoethanesulfonic acid	229.2	7.5	6.8–8.2
DIPSO	3-[<i>N,N</i> -Bis(2-hydroxyethyl)amino]-2-hydroxypropanesulfonic acid	243.3	7.6	7.0–8.2
TAPSO	3-[<i>N</i> -Tris(hydroxymethyl)methylamino]-2-hydroxypropanesulfonic acid	259.3	7.6	7.0–8.2
TRIZMA	Tris(hydroxymethyl)aminomethane	121.1	8.1	7.0–9.1
HEPPSO	<i>N</i> -(2-hydroxyethyl)piperazine- <i>N'</i> -(2-hydroxypropanesulfonic acid)	268.3	7.8	7.1–8.5
POPSO	Piperazine- <i>N,N'</i> -bis(2-hydroxypropanesulfonic acid)	362.4	7.8	7.2–8.5
EPPS	<i>N</i> -(2-Hydroxyethyl)piperazine- <i>N'</i> -(3-propanesulfonic acid)	252.3	8.0	7.3–8.7
TEA	Triethanolamine	149.2	7.8	7.3–8.3
TRICINE	<i>N</i> -Tris(hydroxymethyl)methylglycine	179.2	8.1	7.4–8.8
BICINE	<i>N,N</i> -Bis(2-hydroxyethyl)glycine	163.2	8.3	7.6–9.0
TAPS	<i>N</i> -Tris(hydroxymethyl)methyl-3-aminopropanesulfonic acid	243.3	8.4	7.7–9.1
AMPSO	3-[(1,1-Dimethyl-2-hydroxyethyl)amino]-2-hydroxypropanesulfonic acid	227.3	9.0	8.3–9.7
CHES	2-(<i>N</i> -Cyclohexylamino)ethanesulfonic acid	207.3	9.3	8.6–10.0
CAPSO	3-(Cyclohexylamino)-2-hydroxy-1-propanesulfonic acid	237.3	9.6	8.9–10.3
AMP	2-Amino-2-methyl-1-propanol	89.1	9.7	9.0–10.5
CAPS	3-(Cyclohexylamino)-1-propanesulfonic acid	221.3	10.4	9.7–11.1

^a $pK_a = 9.0$ for the second dissociation stage.

TYPICAL pH VALUES OF BIOLOGICAL MATERIALS AND FOODS

This table gives typical pH ranges for various biological fluids and common foods. All values refer to 25 °C.

Biological Materials			
Blood, human	7.35–7.45	Hominy (lye)	6.8–8.0
Blood, dog	6.9–7.2	Jams, fruit	3.5–4.0
Spinal fluid, human	7.3–7.5	Jellies, fruit	2.8–3.4
Saliva, human	6.5–7.5	Lemons	2.2–2.4
Gastric contents, human	1.0–3.0	Limes	1.8–2.0
Duodenal contents, human	4.8–8.2	Maple syrup	6.5–7.0
Feces, human	4.6–8.4	Milk, cows	6.3–6.6
Urine, human	4.8–8.4	Olives	3.6–3.8
Milk, human	6.6–7.6	Oranges	3.0–4.0
Bile, human	6.8–7.0	Oysters	6.1–6.6
Foods		Peaches	3.4–3.6
Apples	2.9–3.3	Pears	3.6–4.0
Apricots	3.6–4.0	Peas	5.8–6.4
Asparagus	5.4–5.8	Pickles, dill	3.2–3.6
Bananas	4.5–4.7	Pickles, sour	3.0–3.4
Beans	5.0–6.0	Pimento	4.6–5.2
Beers	4.0–5.0	Plums	2.8–3.0
Beets	4.9–5.5	Potatoes	5.6–6.0
Blackberries	3.2–3.6	Pumpkin	4.8–5.2
Bread, white	5.0–6.0	Raspberries	3.2–3.6
Butter	6.1–6.4	Rhubarb	3.1–3.2
Cabbage	5.2–5.4	Salmon	6.1–6.3
Carrots	4.9–5.3	Sauerkraut	3.4–3.6
Cheese	4.8–6.4	Shrimp	6.8–7.0
Cherries	3.2–4.0	Soft drinks	2.0–4.0
Cider	2.9–3.3	Spinach	5.1–5.7
Corn	6.0–6.5	Squash	5.0–5.4
Crackers	6.5–8.5	Strawberries	3.0–3.5
Dates	6.2–6.4	Sweet potatoes	5.3–5.6
Eggs, fresh white	7.6–8.0	Tomatoes	4.0–4.4
Flour, wheat	5.5–6.5	Tuna	5.9–6.1
Gooseberries	2.8–3.0	Turnips	5.2–5.6
Grapefruit	3.0–3.3	Vinegar	2.4–3.4
Grapes	3.5–4.5	Water, drinking	6.5–8.0
		Wines	2.8–3.8

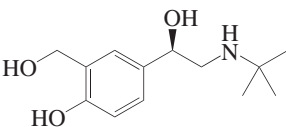

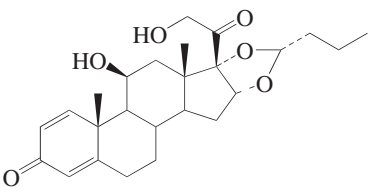

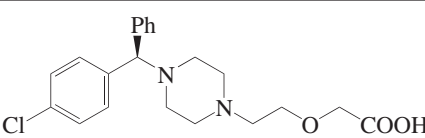

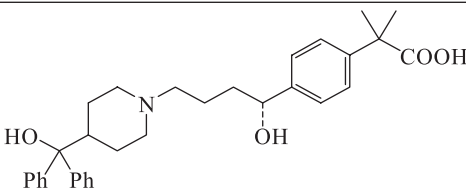

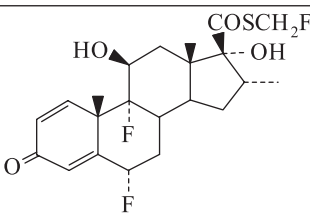

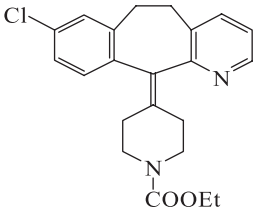

STRUCTURE AND FUNCTIONS OF SOME COMMON DRUGS

This table lists the names, categories, therapeutic uses, and chemical structures of selected drugs. The generic (chemical) name of each drug is given, along with some of the trade names under which it is sold. When available, physical properties are given in italics in the third column. Solubilities are also added in the fourth column. The structure given refers to the active drug, but many of these are packaged as salts or other derivatives. The drugs have been selected to represent a variety of categories; most are widely used throughout the world.

The list is divided into therapeutic categories; within each category the listing is alphabetical by generic name. The index that follows the table can be used to locate a drug by either generic or trade name.

Generic Name	Trade Names	Category and Properties	Applications	Structure
Antiallergic Agents				
1 Albuterol	Proventil; Ventolin; Volmax	β_2 -Adrenergic receptor agonist Slightly soluble in water and soluble in ethanol.	Treatment of troubled breathing caused by asthma, emphysema, and other lung diseases	
2 Budesonide	Budeson; Budamax; Rhinocort; Pulmicort; Inflammide	Glucocorticoid <i>mp</i> 226 °C Soluble in DMSO (100 mM), ethanol (50 mM), chloroform, dichloromethane, and methanol. Insoluble in water.	Management of asthma and treatment of inflammatory bowel disease	
3 Cetirizine	Zyrtec	Histamine H_1 -receptor antagonist Soluble in water.	Treatment of seasonal allergies and hives	
4 Fexofenadine	Carboxyterfenadine; Allegra; Telfast	Histamine H_1 -receptor antagonist Soluble in DMSO (50 mM) and methanol.	Treatment of allergic rhinitis	
5 Fluticasone	Flovent (as propanoate); Flonase (as propanoate); Advair (with salmeterol)	Anti-inflammatory glucocorticoid Soluble in DMSO (≥ 10 mg/ml).	Treatment of asthma and rhinitis	
6 Loratadine	Claritin; Claratyne; Alavert	Long-acting antihistamine <i>mp</i> 136 °C Soluble in DMSO (50 mg/ml), ethanol (77 mg/ml at 25 °C), water (<1 mg/ml at 25 °C), chloroform, and methanol.	Relief of allergy symptoms	

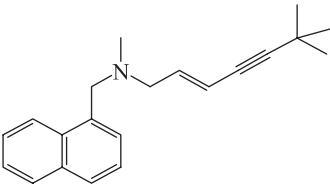

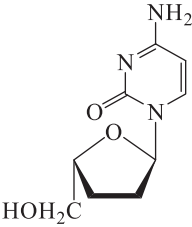

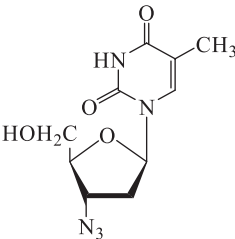

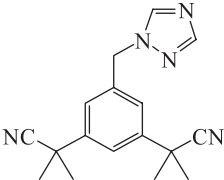

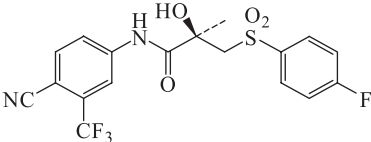

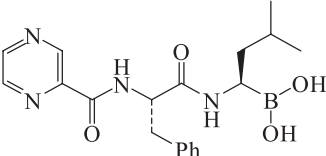

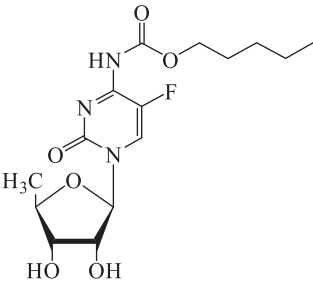

Generic Name	Trade Names	Category and Properties	Applications	Structure
7 Montelukast	Singulair	Leukotriene LTD ₄ receptor antagonist Soluble in ethanol (100 mM), DMSO (100 mM), methanol, water (>100 mg/ml at 25 °C), and DMF (~30 mg/ml).	Control of asthma and relief of seasonal allergies	
8 Salmeterol	Serevent	β ₂ -Adrenergic receptor agonist Soluble in ethanol (50 mM) and DMSO (100 mM).	Treatment of asthma and chronic obstructive pulmonary disease	
9 Tiotropium bromide	Spiriva	Long-acting antimuscarinic bronchodilator Soluble in DMSO and methanol.	Treatment of chronic obstructive pulmonary disease	
Antibiotics				
10 Amikacin	Amikin; Biclin; Chemacin; Flexilite; Negasin	Aminoglycoside antibiotic Soluble in water (50 mg/ml), DMSO (<1 mg/ml at 25 °C), and ethanol (<1 mg/ml at 25 °C). Insoluble in acetone.	Treatment of serious infections resistant to other antibiotics	
11 Amoxicillin	Amoxil; Isimoxin; Ospamox	β-Lactam/penicillin Soluble in water.	Treatment of a broad spectrum of bacterial infections	
12 Azithromycin	Zithromax; Vinzam; Zmax; Azitrocin	Azalide/macrolide antibiotic mp 114 °C Soluble in DMSO (100 mg/ml at 25 °C), ethanol (100 mg/ml at 25 °C), water (<1 mg/ml at 25 °C), DMF (16 mg/ml), and ethanol:PBS (1:1 pH 7.2) (~0.5 mg/ml).	Treatment of bacterial skin, ear, and respiratory infections	
13 Cefaclor	Ceclo; Kefolar; Panacef; Panoral	β-Lactam/cephalosporin Soluble in water (1:100) and 1 N HCl (50 mg/ml).	Treatment of bacterial infections, pneumonia, and urinary tract infections	
14 Ciprofloxacin	Cipro; Ciproxin; Ciprobay; Flociprin; Uniflox	Fluoroquinolone/broad-spectrum antibiotic mp 256 °C Soluble in DMSO.	Treatment of urinary and respiratory tract infections, anthrax, and sexually-transmitted diseases	

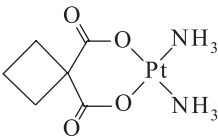

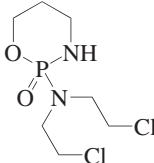

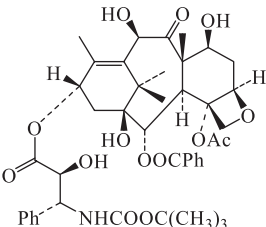

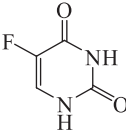

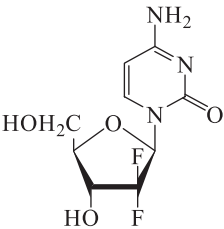

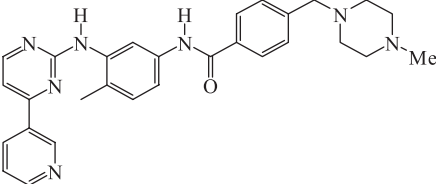

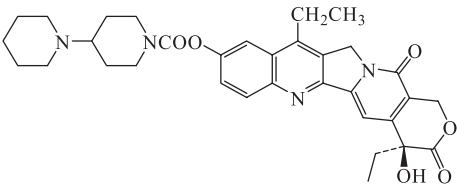

Generic Name	Trade Names	Category and Properties	Applications	Structure
15 Doxycycline	Vibramycin; Adoxa; Doryx; Liviatin; Deoxymykoin	Tetracycline/ broad-spectrum antibiotic Soluble in water (50 mg/ml), DMSO (~1 mg/ml), methanol (1:4), and alcohol (1:60).	Treatment of urinary tract, respiratory tract, and eye infections; anthrax, syphilis, cholera, etc.	
16 Erythromycin	E-Mycin; Erythrocin; Ilosone	Macrolide antibiotic <i>mp</i> 191 °C Soluble in 2 M HCl (50 mg/ml), ethanol, water (50 mg/ml), methanol, and chloroform.	Treatment of bacterial infections, including diphtheria, pertussis, rheumatic fever, venereal disease, etc.	
17 Isoniazid	Laniazid	Antimycobacterial agent <i>mp</i> 171 °C Soluble in water (50 mg/ml), ethanol (27 mg/ml at 25 °C), DMSO (27 mg/ml at 25 °C), and methanol.	Treatment of tuberculosis; reduction of tremors from multiple sclerosis	
18 Linezolid	Zyvox	Oxazolidinone <i>mp</i> 182 °C Soluble in water (<1 mg/ml at 25 °C), ethanol (8 mg/ml at 25 °C), chloroform, methanol, and DMSO (68 mg/ml at 25 °C).	Treatment of serious Gram-positive infections resistant to other antibiotics	
19 Trimethoprim	Triprim; Proloprim; Monotrim	Dihydrofolate reductase inhibitor <i>mp</i> 199 °C Soluble in water (0.4 mg/ml), ethanol (2.6 mg/ml at 20 °C), methanol (12.1 mg/ml), chloroform (22.2 mg/ml at 20 °C), and DMSO (50 mg/ml).	Treatment of urinary tract infections, diarrhea, and ear infections	
Antidiabetic Drugs				
20 Glipizide	Glucotrol; Glydiazinamide; Glibenese; Minodiab	Potassium channel blocker/sulfonylurea <i>mp</i> 208 °C Soluble in water, chloroform, DMF, DMSO (48 mg/ml), and methanol.	Treatment of type 2 diabetes by stimulating insulin secretion in pancreas β-cells	
21 Metformin	Glucophage; Diabex; Diaformin; Fortamet	Antidiabetic biguanide Soluble in DMSO and methanol.	Treatment of type 2 diabetes by enhancing transport of glucose into muscle cells	

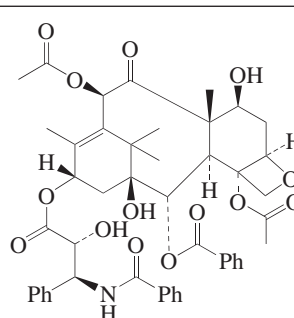

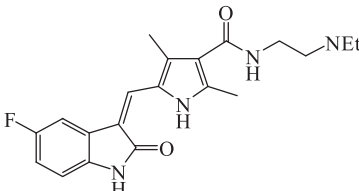

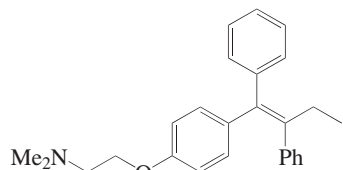

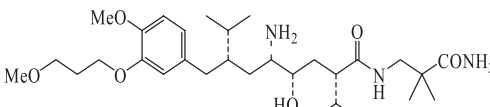

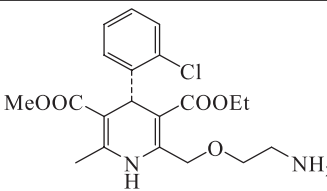

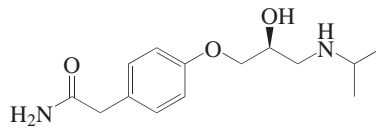

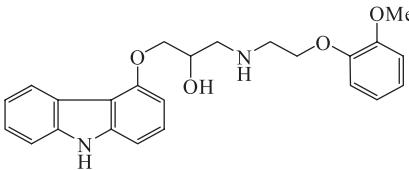

Generic Name	Trade Names	Category and Properties	Applications	Structure
22 Pioglitazone	Actos	Peroxisome proliferator-activated receptor <i>mp</i> 174 °C Soluble in water (<1 mg/ml at 25 °C), DMF, methanol, ethanol (4 mg/ml at 25 °C), and DMSO (79 mg/ml at 25 °C).	Treatment of type 2 diabetes by increasing glucose metabolism and insulin sensitivity	
23 Rosiglitazone	Avandia	Thiazolidinedione Soluble in water (slightly), ethanol (2 mg/ml at 25 °C), DMSO (100 mg/ml), DMF (~10 mg/ml), and methanol.	Treatment of type 2 diabetes by increasing insulin sensitivity. Possible adverse effects on patients with heart problems.	
24 Sitagliptin	Januvia	Dipeptidyl peptidase IV inhibitor Soluble in water and methanol.	Treatment of type 2 diabetes by enhancing the body's ability to lower elevated glucose levels	
Anti-Inflammatory Agents				
25 Acetylsalicylic acid	Aspirin	NSAID Slightly soluble in water, chloroform, DMSO, and methanol.	Pain and fever relief; anticlotting agent	
26 Celecoxib	Celebrex; Onsenal	NSAID (COX-2 inhibitor) <i>mp</i> 158 °C Soluble in DMSO (76 mg/ml at 25 °C), methanol, ethanol (33 mg/ml at 25 °C), water (<1 mg/ml at 25 °C), and dichloromethane.	Treatment of osteoarthritis and rheumatoid arthritis	
27 Ibuprofen	Advil	NSAID (cyclooxygenase inhibitor) <i>mp</i> 76 °C Soluble in ethanol (25 mg/ml), chloroform (1:1), ether (1:2), acetone (1:1.5), aqueous solutions of alkali hydroxides and carbonates, dichloromethane, methanol (50 mg/ml), and ethyl acetate.	Relief of inflammation and pain	
28 Meloxicam	Mobic; Metacam; Metacain	NSAID (cyclooxygenase inhibitor) <i>mp</i> 254 °C Soluble in DMSO and water.	Treatment of osteoarthritis and rheumatoid arthritis	

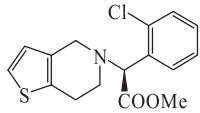

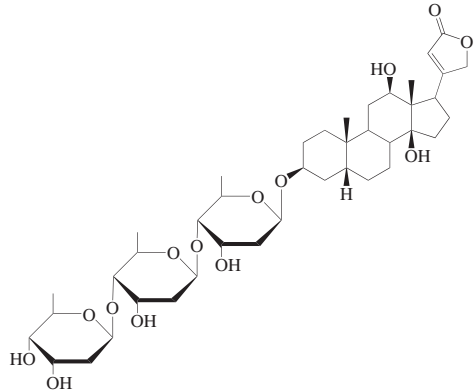

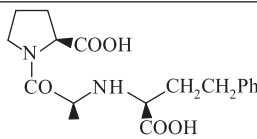

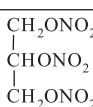

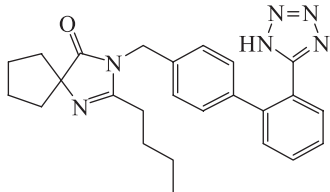

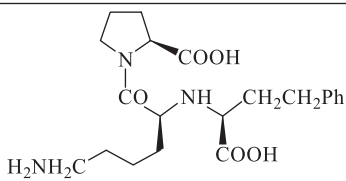

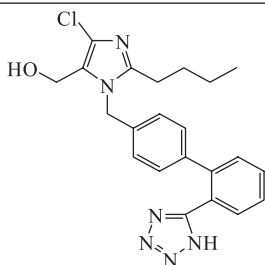

Generic Name	Trade Names	Category and Properties	Applications	Structure
29 Naproxen	Aleve; Naprelan; Anaprox; Naprogesic	NSAID <i>mp</i> 155 °C Soluble in water (22 mg/ml), DMSO (25 mg/ml), DMF, acetone (slightly soluble), ethanol (slightly soluble), and methanol (slightly soluble).	Relief of inflammation and pain	
30 Prednisone	Meticorten; Deltasone	Adrenocortical steroid; anti-inflammatory agent; immunosuppressant Soluble to 50 mg/ml in ethanol:chloroform (1:1), and in water (slightly).	Treatment of asthma and other inflammatory diseases	
Anti-Ulcer Drugs				
31 Cimetidine	Tagamet; Cimetimax; Gastromet; Peptimax	Histamine H ₂ -receptor antagonist <i>mp</i> 142 °C Soluble in DMSO, methanol, and water.	Treatment of peptic ulcer, gastrointestinal bleeding, and gastroesophageal reflux disease	
32 Lansoprazole	Prevacid; SoluTab; Prevpac; Zoton; Prezal	Proton pump inhibitor <i>mp</i> 180 °C Soluble in DMF and methanol.	Treatment of duodenal ulcers and gastroesophageal reflux disease	
33 Omeprazole	Prilosec; Nexium (Mg salt); Losec; Mepral; Mopral; Zoltum	Proton pump inhibitor <i>mp</i> 156 °C Soluble in acetonitrile, DMSO, and ethanol.	Treatment of peptic ulcer, dyspepsia, and gastroesophageal reflux disease	
34 Pantoprazole	Protonix; Pantozol; Rifun	Proton pump inhibitor Soluble in methanol.	Treatment of gastric acid-related conditions	
35 Ranitidine	Zantac; Azantac; Melfax; Rantec; Sostril; Taural	Histamine H ₂ -receptor antagonist <i>mp</i> 70 °C Soluble in water.	Treatment of peptic ulcer, gastrointestinal bleeding, and gastroesophageal reflux disease	
Antiviral and Antifungal Agents				
36 Acyclovir	Zovirax; Zovir; Avirax; Mirolex	Viral DNA synthesis inhibitor <i>mp</i> 225 °C Soluble in water (sparingly), DMSO (50 mg/ml), DMF (1 mg/ml), 1 eq. HCl (50 mM), and dilute alkalis.	Treatment of cold sores, genital herpes, chicken pox, etc.	

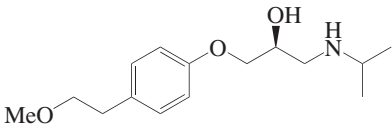

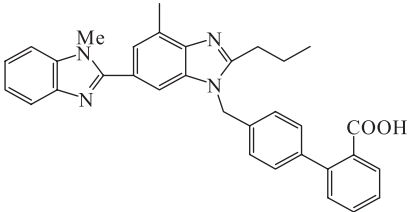

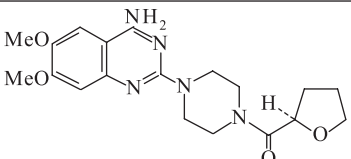

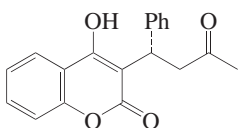

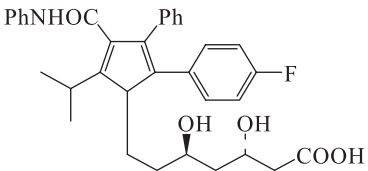

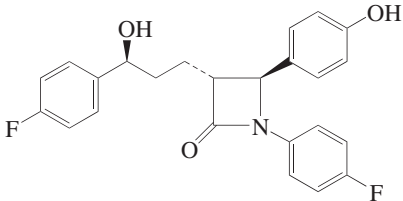

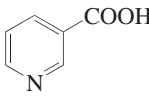

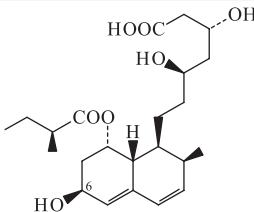

Generic Name	Trade Names	Category and Properties	Applications	Structure
37 Amphotericin	Fungizone; Amfostet; Amphozone	Polyene macrolide antifungal agent <i>mp</i> 170 °C Soluble in DMSO (30–40 mg/ml), acidic water (pH 2) or basic water (pH 11) (~0.1 mg/ml), DMF (2–4 mg/ml), DMF + 1 M HCl (3:1) (60–80 mg/ml), and methanol (slightly). Insoluble in ether.	Intravenous treatment of systemic fungal infections	
38 Efavirenz	Sustiva	Non-nucleoside HIV reverse transcriptase inhibitor <i>mp</i> 131 °C Soluble in methanol.	Treatment of HIV-1 infections (as part of combination therapy)	
39 Fluconazole	Diflucan; Biozolene; Elazor; Triflucan	Cytochrome P450 14 α -demethylase inhibitor <i>mp</i> 139 °C Soluble in water (<1 mg/ml at 25 °C), ethanol (61 mg/ml at 25 °C), and DMSO (61 mg/ml at 25 °C).	Treatment and prevention of superficial and systemic fungal infections	
40 Lamivudine	Epivir; Heptodin; Zeffix	HIV reverse transcriptase inhibitor Soluble in water (46 mg/ml at 25 °C), DMSO (46 mg/ml at 25 °C), methanol, and ethanol (<1 mg/ml at 25 °C).	Treatment of hepatitis B and human immunodeficiency virus	
41 Nevirapine	Viramune	Non-nucleoside HIV reverse transcriptase inhibitor <i>mp</i> 250 °C Soluble in chloroform and methanol.	Treatment of HIV infections (as part of combination therapy)	
42 Oseltamivir	Tamiflu	Neuraminidase inhibitor <i>Foam</i> Soluble in methanol and water.	Prevention and treatment of influenza A and B	
43 Ribavirin	Virazole; Rebetol; Copegus; Ribasphere; Viratek; Cotronak	Nucleoside antimetabolite <i>mp</i> 175 °C Soluble in water (20 mg/ml), DMSO (49 mg/ml at 25 °C), ethanol (<1 mg/ml at 25 °C), and alcohol (slightly).	Treatment of hepatitis C	

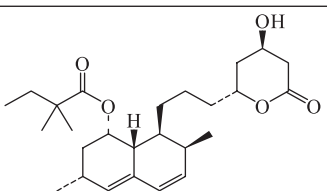

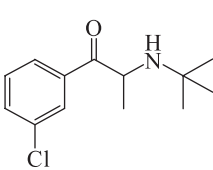

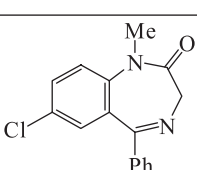

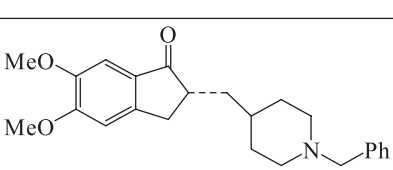

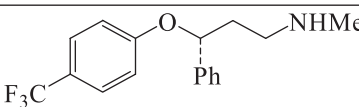

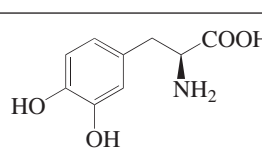

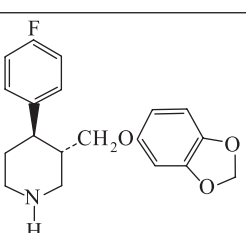

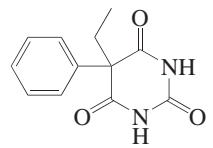

Generic Name	Trade Names	Category and Properties	Applications	Structure
44 Terbinafine	Lamisil	Squalene epoxidase inhibitor Soluble in DMSO (≥ 58 mg/ml at 25 °C), water (<1 mg/ml at 25 °C), and ethanol (≥ 58 mg/ml at 25 °C).	Treatment of fungal infections of the skin and nails	
45 Zalcitabine	Hivid	Pyrimidine nucleoside reverse transcriptase inhibitor Soluble in water (76.4 mg/ml at 25 °C), DMSO (42 mg/ml at 25 °C), and ethanol (<1 mg/ml at 25 °C).	Treatment of HIV infection and AIDS	
46 Zidovudine	Retrovir; AZT; Azidothymidine; Zidovir	Pyrimidine nucleoside reverse transcriptase inhibitor <i>mp</i> 121 °C Soluble in water (50 mg/ml), DMSO, and methanol.	Treatment of HIV infection and prevention of mother-to-child transmission	
Cancer Chemotherapy Drugs				
47 Anastrozole	Arimidex	Aromatase inhibitor; antineoplastic agent <i>mp</i> 81 °C Soluble in chloroform, methanol, ethanol (59 mg/ml at 25 °C), DMSO (59 mg/ml at 25 °C), and DMF (~14 mg/ml).	Treatment of breast cancer in postmenopausal women	
48 Bicalutamide	Casodex	Antiandrogen <i>mp</i> 180 °C Soluble in DMSO (86 mg/ml at 25 °C), DMF (~20 mg/ml), ethanol (7 mg/ml at 25 °C), and methanol (slightly). Insoluble in water.	Treatment of advanced prostate cancer	
49 Bortezomib	Velcade	Proteasome inhibitor Soluble in chloroform, DMSO (200 mg/ml), ethanol (200 mg/ml), and methanol.	Treatment of lymphomas and multiple myeloma	
50 Capecitabine	Xeloda	Antimetabolite Soluble in water (26 mg/ml), ethanol (207 mg/ml), methanol (>40%), DMF (~14 mg/ml), and DMSO (72 mg/ml at 25 °C).	Treatment of breast and colon cancer	

Generic Name	Trade Names	Category and Properties	Applications	Structure
51 Carboplatin	Paraplatin; Carboplat; Erbakar; Nonoplat	Platinum-based anticancer agent Soluble in water (10 mg/ml), saline, DMSO (<1 mg/ml), and ethanol (<1 mg/ml).	Treatment of ovarian cancer	
52 Cyclophosphamide	Cytoxan; Neosar; Cytophosphan; Endoxan; Clafen	Oxazaphosphorine alkylating agent ("Nitrogen mustard") <i>mp</i> 143 °C Soluble in water (100 mM), DMSO (100 mM), and ethanol (52 mg/ml at 25 °C).	Treatment of lymphomas and leukemias, multiple myeloma, and other cancers	
53 Docetaxel	Taxotere	Antineoplastic agent <i>mp</i> 232 °C Soluble in chloroform, dichloromethane, DMSO, ethyl acetate, methanol, and ethanol (25 mg/ml).	Treatment of ovarian, breast, and bronchial carcinomas	
54 Fluorouracil	Efudex; Carac; Fluoroplex; Aducil	Thymidylate synthesis inhibitor <i>mp</i> 243 °C Soluble in DMF (5 mg/ml), DMSO (5 mg/ml), methanol (1 mg/ml), hot water (1 mg/ml), 1 N NH ₄ OH (50 mg/ml), 1 M NaOH, ethanol (10 mM), and water (12.2 g/l at 20 °C).	Constituent of several antineoplastic combinations	
55 Gemcitabine	Gemzar (as hydrochloride)	Antineoplastic and antiviral agent <i>mp</i> 290 °C Soluble in water (100 mM), methanol (slightly), DMSO (50 mM), and acetone. Insoluble in ethanol.	Treatment of lung and pancreatic tumors	
56 Imatinib	Gleevec; Glivec	Protein kinase inhibitor <i>mp</i> 212 °C Soluble in water (<1 mg/ml at 25 °C), ethanol (<1 mg/ml at 25 °C), and DMSO (3 mg/ml at 25 °C).	Treatment of myelogenous leukemia and gastrointestinal tumors	
57 Irinotecan	Camptosar; Camptetin; Topotecin	Topoisomerase I inhibitor Soluble in water and methanol.	Treatment of colorectal cancer	

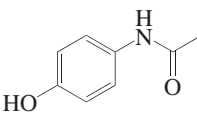

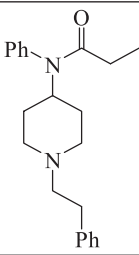

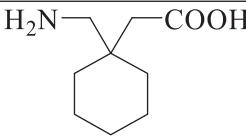

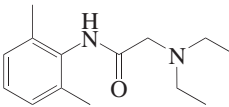

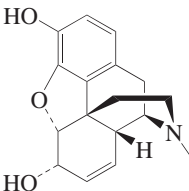

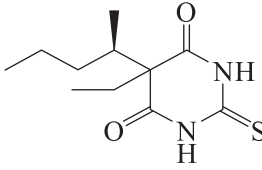

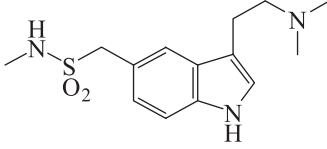

Generic Name	Trade Names	Category and Properties	Applications	Structure
58 Paclitaxel	Taxol; Abraxane; Yewtaxan	Microtubule-stabilizing agent <i>mp</i> 214 °C Soluble in methanol.	Treatment of ovarian, breast, and lung cancer	
59 Sunitinib	Sutent	Tyrosine kinases inhibitor Soluble in water (>25 mg/ml, pH 1.2–6.8), DMSO (>10 mg/ml), and methanol.	Treatment of gastrointestinal and kidney tumors	
60 Tamoxifen	Nolvadex; Soltamox; Tamaxin; Tamoplex; Valodex	Selective estrogen receptor modulator <i>mp</i> 97 °C Soluble in dichloromethane.	Treatment of breast cancer	
Cardiovascular Agents				
61 Aliskiren	Tekturna; Rasilex	Renin inhibitor Soluble in methanol, chloroform, and water.	Treatment of hypertension	
62 Amlodipine	Norvasc	Calcium channel blocker Soluble in DMSO (25 mg/ml), ethanol (25 mg/ml), water (75.3 mg/ml), DMF (25 mg/ml), acetone, chloroform, ethyl acetate, and methanol.	Treatment of hypertension, atrial fibrillation, and angina	
63 Atenolol	Tenormin	β-Blocker <i>mp</i> 147 °C Soluble in water (25 mM), DMSO (18 mg/ml), ethanol (3.4 mg/ml), methanol (50 mg/ml), and water (26.5 mg/ml at 37 °C).	Treatment of hypertension and excessive heart rate	
64 Carvedilol	Coreg; Dilatrend; Eucardic	Calcium channel blocker; β-adrenoceptor blocker Soluble in DMSO (>25 mg/ml), ethanol (10 mg/ml), methanol (33.8 mg/ml), phosphate buffer (pH 4) (0.43 mg/ml at 37 °C), water (slightly), chloroform, methylene chloride, and ethyl ether (slightly).	Treatment of heart failure and hypertension	

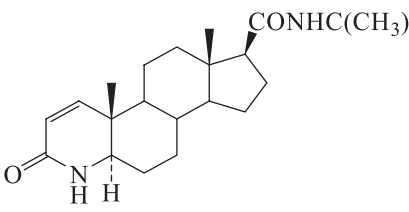

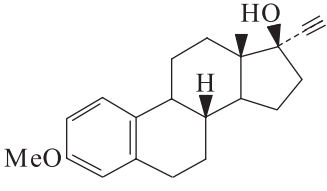

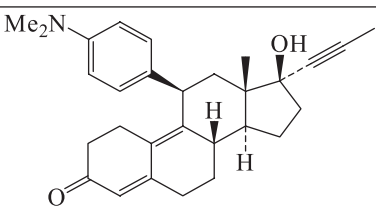

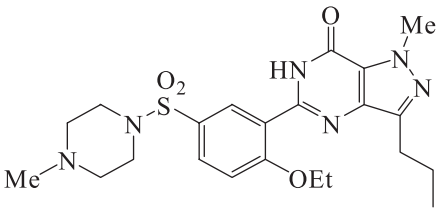

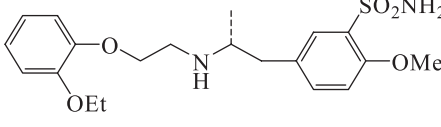

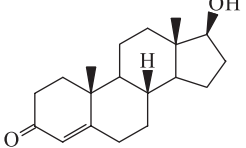

Generic Name	Trade Names	Category and Properties	Applications	Structure
65 Clopidogrel	Plavix; Isocover; Meilax; Tipidyl	Antiplatelet agent Soluble in DMSO.	Prevention of blood clots after stroke or myocardial infarction	
66 Digoxin	Lanoxin; Davoxin; Digacin; Dilanacin; Rougoxin; Digosin; Cordioxil	Cardiac glycoside <i>mp</i> 249 °C Soluble in chloroform, DMSO, methanol, pyridine (50 mg/ml), diluted ethanol, and mixture of chloroform and alcohol. Insoluble in water (64.8 mg/l at 25 °C), ether, acetone, and ethyl acetate.	Treatment of congestive heart failure	
67 Enalaprilat	Vasotec	Angiotensin-converting enzyme inhibitor; antihypertensive agent <i>mp</i> 150 °C Slightly soluble in water.	Treatment of hypertension, atherosclerosis, and congestive heart failure	
68 Glycerol trinitrate	Nitroglycerin	Cardiac stimulant and vasodilator Soluble in acetone, ether, benzene, ethanol, and water (slightly).	Treatment of angina and congestive heart failure	
69 Irbesartan	Aprovel; Avapro; Avalide (in combination with hydrochlorothiazide)	Angiotensin II AT ₁ -receptor antagonist <i>mp</i> 180 °C Soluble in DMSO (>25 mg/ml), ethanol (~0.5 mg/ml), methanol, DMF (~20 mg/ml), and water (<1 mg/ml at 25 °C).	Treatment of hypertension and diabetes-related kidney disease	
70 Lisinopril	Acecomb; Alapril; Carace; Novatec; Novazyd; Vivatex; Zestoretic; Zestril	Angiotensin-converting enzyme inhibitor; antihypertensive agent <i>mp</i> 159 °C Soluble in PBS (1 mg/ml, pH 7.2), ethanol (sparingly), DMSO (sparingly), and DMF (sparingly).	Treatment of hypertension	
71 Losartan	Cozaar; Hyzaar (with hydrochlorothiazide)	Angiotensin II AT ₁ -receptor antagonist <i>mp</i> 184 °C Soluble in ethanol (100 mM) and DMSO (100 mM).	Treatment of congestive heart failure and hypertension	

Generic Name	Trade Names	Category and Properties	Applications	Structure
72 Metoprolol	Lopressor; Toprol XL	β -Adrenergic blocker Soluble in methanol and water.	Treatment of angina and hypertension	
73 Telmisartan	Micardis	Angiotensin II (AT ₁) receptor antagonist <i>mp</i> 262 °C Soluble in DMSO (13 mg/ml at 25 °C), chloroform, DMF (~1.6 mg/ml), and ethanol (<1 mg/ml at 25 °C). Insoluble in water.	Treatment of hypertension	
74 Terazosin	Hytrin; Itrin; Hytrinex; Magnurol; Teraprost; Vasocard; Uroflo; etc.	Antihypertensive agent (α_1 -adrenoceptor antagonist) Soluble to 50 mM in water.	Treatment of hypertension and benign prostatic hyperplasia	
75 Warfarin	Coumadin	Anticlotting agent <i>mp</i> 161 °C Soluble in dioxane and acetone.	Reduction of possibility of stroke or coronary	
Cholesterol-Lowering Drugs				
76 Atorvastatin	Lipitor; Caduet (in combination with amlodipine)	HMG-CoA reductase inhibitor (statin) Soluble in methanol.	Reduction of LDL cholesterol levels by inhibiting cholesterol biosynthesis	
77 Ezetimibe	Zetia	Selective cholesterol absorption inhibitor <i>mp</i> 165 °C Soluble in water (<1 mg/ml at 25 °C), DMSO (82 mg/ml at 25 °C), ethanol (82 mg/ml at 25 °C), and methanol.	Reduction of LDL cholesterol levels by inhibiting dietary cholesterol absorption	
78 Nicotinic acid	Niacin	Lipoprotein synthesis inhibitor Soluble in water (15 g/l at 20 °C), alkali hydroxides, propylene glycol, water (150 g/l at 100 °C), ethanol (12.5 g/l at 25 °C), DMSO (25 mg/ml), methanol, carbonates, and water (15 g/l at 20 °C). Insoluble in diethyl ether.	Reduction of LDL cholesterol levels	
79 Pravastatin	Pravochol	HMG-CoA reductase inhibitor (statin) Soluble in non-polar solvents.	Reduction of LDL cholesterol levels by inhibiting cholesterol biosynthesis	

Generic Name	Trade Names	Category and Properties	Applications	Structure
80 Simvastatin	Zocor; Vytorin (combination with Ezetimibe)	HMG-CoA reductase inhibitor (statin) <i>mp</i> 136 °C Soluble in DMSO (>25 mg/ml), ethanol (>25 mg/ml), water (0.03 mg/l), and methanol.	Reduction of LDL cholesterol levels by inhibiting cholesterol biosynthesis	
Depression and Anxiety Drugs				
81 Bupropion	Wellbutrin; Amfebutamone; Zyban	Dopamine reuptake inhibitor <i>Pale yellow oil</i> Soluble in water (>25 mg/ml), ethanol (193 mg/ml), and 0.1 N HCl (333 mg/ml).	Antidepressant; smoking cessation aid	
82 Diazepam	Valium; Stesolid; Seduxen; Antenex; Calmpose; Livotensin	Benzodiazepine central nervous system depressant <i>mp</i> 125 °C Soluble in DMF and ethanol, slightly soluble in water.	Treatment of anxiety, seizures, muscular spasms, and insomnia	
83 Donepezil	Aricept	Acetylcholine esterase inhibitor Soluble in chloroform (~50 mg/ml) and acetone (~25 mg/ml).	Treatment of Alzheimer's disease	
84 Fluoxetine	Prozac; Sarafem; Adofen; Fontex; Lorian	Selective serotonin reuptake inhibitor Soluble in water (4 mg/ml), DMSO (>5 mg/ml), acetone, acetonitrile, chloroform, and methanol.	Treatment of depression, panic attacks, and obsessive-compulsive disorder	
85 Levodopa	L-Dopa; Larodopa; Bendopa; Veldopa	Precursor to the neurotransmitter dopamine <i>mp</i> 277 °C Soluble in water (66 mg/ml), DMSO (<1 mg/ml at 25 °C), and 0.5 M HCl (50 mg/ml). Insoluble in ethanol and chloroform.	Treatment of Parkinson's disease	
86 Paroxetine	Paxil; Seroxat; Tagonis; Aropax; Motivan	Selective serotonin reuptake inhibitor Soluble in DMSO (25 mg/ml), chloroform, and methanol. Insoluble in water.	Treatment of depression, panic attacks, and obsessive-compulsive disorder	
87 Phenobarbital	Luminal; Fenemal; Gardenal; Barbivis	Anticonvulsant <i>mp</i> 174 °C	Epilepsy control; also used as a sedative	

Generic Name	Trade Names	Category and Properties	Applications	Structure
88 Sertraline	Zoloft; Lustral; Serad; Serlain; Tatig	Selective serotonin reuptake inhibitor Soluble in DMSO (>25 mg/ml), ethanol (10 mg/ml), water (3 mg/ml), 0.1 N HCl (0.51 mg/ml), isopropyl alcohol (4.3 mg/ml), chloroform (110 mg/ml), and dimethylsulfoxide (147 mg/ml).	Treatment of depression, panic attacks, and obsessive-compulsive disorder	
89 Tiagabine	Gabitril	GABA reuptake inhibitor; anticonvulsant Soluble in water.	Treatment of epileptic seizures	
90 Venlafaxine	Effexor; Trewilor; Vandral; Dobupal	Selective serotonin and norepinephrine reuptake inhibitor Soluble in dichloromethane, ethyl acetate, and methanol.	Treatment of anxiety and panic disorders	
Osteoporosis Drugs				
91 Alendronic acid	Fosamax; Adronat; Alendros; Dronal	Farnesyl pyrophosphate synthase inhibitor Soluble in water (40 g/l at 25 °C) and PBS (pH 7.2) (~0.25 mg/ml).	Prevention and treatment of osteoporosis and Paget's disease	
92 Calcitriol	Rocaltrol; Calcijex	Calcium and phosphate metabolism regulator <i>mp</i> 170 °C	Treatment of rickets and osteoporosis	
93 Raloxifene	Evista (as hydrochloride)	Selective estrogen receptor modulator Soluble in DMSO (50 mM), methanol, and ethanol (<1 mg/ml at 25 °C). Insoluble in water.	Prevention and treatment of osteoporosis	
94 Risedronic acid	Actonel (as Na salt); Optinate	Calcium regulator Soluble in water (<1 mg/ml at 25 °C), ethanol (<1 mg/ml at 25 °C), and DMSO (<1 mg/ml at 25 °C).	Treatment of osteoporosis and Paget's disease	

Generic Name	Trade Names	Category and Properties	Applications	Structure
<i>Pain Relief Drugs</i>				
95 Acetaminophen	Tylenol; APAP; Paracetamol; Hedrex; Tramil	Analgesic/antipyretic <i>mp</i> 170 °C Soluble in water (14 g/l at 20 °C), ethanol (100 mM), DMSO (100 mM), methanol (50 mg/ml), and DMF.	Relief of musculoskeletal, neuralgic, and other types of pain	
96 Fentanyl	Duragesic; Actiq; Fentora; Sublimaze	Opioid μ -receptor agonist <i>mp</i> 87.5 °C	Treatment of severe pain; spinal and epidural anesthesia	
97 Gabapentin	Neurotin; Aclonium	Anticonvulsant/analgesic; CNS depressant <i>mp</i> 164 °C Soluble in water (10 mg/mL), PBS pH 7.2 (~10 mg/ml), methanol, ethanol (sparingly), DMSO (sparingly), and DMF (sparingly).	Treatment of neuralgia, pain from shingles, migraine, and epilepsy	
98 Lidocaine	Xylocaine; Xylocard; Lidamantle	Aminoamide anesthetic/antiarrhythmic agent	Local anesthetic for dental procedures	
99 Morphine	Avinza; Contin; Kadian; Roxanol; Meconium; Morfine	Opioid analgesic <i>mp</i> 255 °C Soluble in water (64 mg/ml) and ethanol (1.8 mg/ml).	Pain management, especially in malignant diseases	
100 Thiopental	Pentothal; Penthiobarbital; Thiopentone	Short-acting barbiturate/anesthetic	Induction of presurgical anesthesia	
101 Sumatriptan	Imitrex; Imigrane; Megrelan; Permcran; Sumadol	Selective 5-HT _{1D} receptor agonist Soluble in water (83 mg/ml), DMSO (83 mg/ml), and methanol (very slightly). Insoluble in ethanol and ether.	Treatment of severe migraine headaches	

Generic Name	Trade Names	Category and Properties	Applications	Structure
Reproductive and Urinary System Drugs				
102 Finasteride	Proscar; Propecia; Andozac; Finastid; Procure; Urprosan	5 α Reductase inhibitor <i>mp</i> 252 °C Soluble in water (0.05 mg/ml), DMSO (75 mg/ml at 25 °C), ethanol (75 mg/ml), methanol, and chloroform.	Treatment of benign prostatic hyperplasia and male hair loss	
103 Mestranol	Devocin; Norinyl; Ovastol; Tranel	Estrogen, used in combination as oral contraceptive <i>mp</i> 151 °C Soluble in DMSO (15 mg/ml at 25 °C), water (<1 mg/ml at 25 °C), and ethanol (25 mg/ml at 25 °C).	Prevention of unplanned pregnancy	
104 Mifepristone	Mifeprex; Mifegyne; Corlux; RU 486	Progesterone receptor modulator <i>mp</i> 150 °C Soluble in water (slightly), DMF (~30 mg/ml), ethanol (50 mg/ml), methanol, and DMSO (86 mg/ml at 25 °C).	Termination of pregnancy	
105 Sildenafil	Viagra; Revatio	Cyclic GMP phosphodiesterase inhibitor Soluble in water (3.5 mg/ml), DMSO (23 mg/ml at 25 °C), ethanol (<1 mg/ml at 25 °C), methanol, and DMF (~14 mg/ml).	Treatment of erectile dysfunction and pulmonary hypertension	
106 Tamsulosin	Flomax; Amsulosin; Harnal; Omix	Prostate selective α_1 -adrenoceptor antagonist Soluble in DMSO (100 mM), methanol, and water (10 mM).	Treatment of benign prostatic hyperplasia	
107 Testosterone	Androderm; Androgel; Testrim; Striant	Anabolic steroid hormone Freely soluble in dehydrated alcohol and chloroform. Insoluble in water.	Treatment of male hypogonadism	

Index

The index below lists the trade and generic names for the drugs in this table; the generic names are in bold face. Each entry is referred to by its generic name and the identification number in the

table. An asterisk* beside the trade name indicates a product that is a combination of two drugs.

Name	Generic Name
Abraxane	Paclitaxel (58)
Acecomb	Lisinopril (70)
Acetaminophen	Acetaminophen (95)
Acetylsalicylic acid	Acetylsalicylic acid (25)
Aclonium	Gabapentin (97)

Name	Generic Name
Actiq	Fentanyl (96)
Actonel	Risedronic acid (94)
Actos	Pioglitazone (22)
Acyclovir	Acyclovir (36)
Adofen	Fluoxetine (84)

Name	Generic Name
Adoxa	Doxycycline (15)
Adronat	Alendronic acid (91)
Adrucil	Fluorouracil (54)
Advair*	Fluticasone (5)
Advil	Ibuprofen (27)
Alapril	Lisinopril (70)
Alavert	Loratadine (6)
Albuterol	Albuterol (1)
Alendronic acid	Alendronic acid (91)
Alendros	Alendronic acid (91)
Aleve	Naproxen (29)
Aliskiren	Aliskiren (61)
Allegra	Fexofenadine (4)
Amfebutamone	Bupropion (81)
Amfostet	Amphotericin (37)
Amikacin	Amikacin (10)
Amikin	Amikacin (10)
Amlodipine	Amlodipine (62)
Amoxicillin	Amoxicillin (11)
Amoxil	Amoxicillin (11)
Amphotericin	Amphotericin (37)
Amphozone	Amphotericin (37)
Amsulosin	Tamsulosin (106)
Anaprox	Naproxen (29)
Anastrozole	Anastrozole (47)
Andozac	Finasteride (102)
Androderm	Testosterone (107)
Androgel	Testosterone (107)
Antenex	Diazepam (82)
APAP	Acetaminophen (95)
Aprovel	Irbesartan (69)
Aricept	Donepezil (83)
Arimidex	Anastrozole (47)
Aropax	Paroxetine (86)
Aspirin	Acetylsalicylic acid (25)
Atenolol	Atenolol (63)
Atorvastatin	Atorvastatin (76)
Avalide*	Irbesartan (69)
Avandia	Rosiglitazone (23)
Avapro	Irbesartan (69)
Avinza	Morphine (99)
Avirax	Acyclovir (36)
Azantac	Ranitidine (35)
Azidothymidine	Zidovudine (46)
Azithromycin	Azithromycin (12)
Azitrocin	Azithromycin (12)
AZT	Zidovudine (46)
Barbivis	Phenobarbital (87)
Bendopa	Levodopa (85)
Bicalutamide	Bicalutamide (48)
Biclin	Amikacin (10)
Biozole	Fluconazole (39)
Bortezomib	Bortezomib (49)
Budamax	Budesonide (2)
Budeson	Budesonide (2)

Name	Generic Name
Budesonide	Budesonide (2)
Bupropion	Bupropion (81)
Caduet*	Atorvastatin (76)
Calcijex	Calcitriol (92)
Calcitriol	Calcitriol (92)
Calmpose	Diazepam (82)
Camptetin	Irinotecan (57)
Camptosar	Irinotecan (57)
Capecitabine	Capecitabine (50)
Carac	Fluorouracil (54)
Carace	Lisinopril (70)
Carboplat	Carboplatin (51)
Carboplatin	Carboplatin (51)
Carboxyterfenadine	Fexofenadine (4)
Carvedilol	Carvedilol (64)
Casodex	Bicalutamide (48)
Ceclor	Cefaclor (13)
Cefaclor	Cefaclor (13)
Celebrex	Celecoxib (26)
Celecoxib	Celecoxib (26)
Cetirizine	Cetirizine (3)
Chemacin	Amikacin (10)
Cimetidine	Cimetidine (31)
Cimetimax	Cimetidine (31)
Cipro	Ciprofloxacin (14)
Ciprobay	Ciprofloxacin (14)
Ciprofloxacin	Ciprofloxacin (14)
Ciproxin	Ciprofloxacin (14)
Clafen	Cyclophosphamide (52)
Claratyne	Loratadine (6)
Claritin	Loratadine (6)
Clopidogrel	Clopidogrel (65)
Contin	Morphine (99)
Copegus	Ribavirin (43)
Cordioxil	Digoxin (66)
Coreg	Carvedilol (64)
Corlux	Mifepristone (104)
Cotronak	Ribavirin (43)
Coumadin	Warfarin (75)
Cozaar	Losartan (71)
Cyclophosphamide	Cyclophosphamide (52)
Cytosphophan	Cyclophosphamide (52)
Cytoxan	Cyclophosphamide (52)
Davoxin	Digoxin (66)
Deltasone	Prednisone (30)
Deoxymykoin	Doxycycline (15)
Devocin	Mestranol (103)
Diabex	Metformin (21)
Diaformin	Metformin (21)
Diazepam	Diazepam (82)
Diflucan	Fluconazole (39)
Digacin	Digoxin (66)
Digosin	Digoxin (66)
Digoxin	Digoxin (66)
Dilanacin	Digoxin (66)

Name	Generic Name
Dilatrend	Carvedilol (64)
Dobupal	Venlafaxine (90)

CHEMICAL CONSTITUENTS OF HUMAN BLOOD

This table lists typical concentrations of some of the chemical constituents of human blood. The table covers elements and compounds of relatively low molecular weight. References 1 and 4 give extensive information on enzymes, hormones, vitamins, and other blood constituents.

The values given for the normal range refer to healthy adults who have not been exposed to unusual environmental agents. In keeping with IUPAC practice, all values refer to a volume of one liter, and thus are stated in units of g/L, mg/L, µg/L or mmol/L. Many clinical test results, especially in the United States, are reported on a deciliter (dL) rather than a liter basis; thus the values in this table should be divided by 10 to place them on a dL basis. The symbols S (for serum), P (plasma), and WB (whole blood) in the second column indicate the nature of the blood sample to which the values apply. In some cases only a single mean value has been reported, rather than a range; these are given in italics.

The total volume of blood in a 100 kg (220 lb) adult is 7.5 L for a male and 6.7 L for a female. The corresponding volume of plasma is 4.4 L and 4.3 L, respectively (Reference 1).

Values from Reference 1 are so-called "reference values" against which clinical tests of blood chemistry are compared. In these cases the "normal range" is understood to include about 95% of the population. The remaining 5% may show values outside the normal range without necessarily implying a medical problem. Note that these reference values may vary slightly from one testing laboratory to another, depending on the detailed test procedure.

Accurate measurements on trace elements are very difficult to make, and wide variations can be found in the literature. Preferred measurement methods are discussed in References 2 and 6. Values

for the trace elements can also vary from one country to another, depending on dietary or environmental factors. Thus cadmium levels tend to be higher in Japan because of the prevalence of sea-food in the diet, and lead levels are higher in regions where lead additives are still used in gasoline. Variations with gender, age, geography, and occurrence of diseases are reviewed in Reference 6.

The Critical Values column gives levels that deviate far enough from the normal range to suggest a probable medical issue. Such values from Reference 3 are the Biological Exposure Indexes (BEI) that are specified by the American Council of Government Industrial Hygienists (ACGIH) as danger signals for the levels of pollutants in the workplace.

Valine	S,P	mg/L	24	37		4

* Measured as the percent of hemoglobin bound to CO. Typical value for heavy smokers is 5%–10%. Major symptoms begin around 30%, and respiratory failure sets in at >60%.

** This is the desirable upper limit. Values between 2000 and 2400 mg/L are considered borderline high.

CHEMICAL COMPOSITION OF THE HUMAN BODY

The elemental composition of the “standard man” of mass 70 kg is given below.

NUTRIENT VALUES OF FOODS

The U. S. Department of Agriculture maintains the USDA National Nutrient Database for Standard Reference, which contains over 7000 food items with data on the energy content, minerals, vitamins, and other properties of nutritional interest. The table here includes about 600 common foods extracted from that database. The properties listed are the energy content (in effect, the enthalpy of combustion); the content of carbohydrates, proteins, and lipids (fats); the cholesterol content; and the amount of sodium, potassium, calcium, magnesium, iron, copper, zinc, manganese, phosphorus, and selenium. All values are given for a 100 gram sample of the food.

To conform with common practice in nutritional science, the energy content is given in kilocalories. For conversion to kilojoules, this number should be multiplied by 4.184. For conversion to the avoirdupois units frequently used in the United States, note that:

1 oz = 28.35 g (thus the 100 g basis in this table is approximately 3.5 oz)

1 lb = 453.6 g

The full USDA database covers specific proprietary brands of many processed foods, and it includes vitamin content as well as the minerals given in this table.

Section 8

Analytical Chemistry

Abbreviations and Symbols Used in Analytical Chemistry	8-1
Basic Instrumental Techniques of Analytical Chemistry	8-6
Analytical Standardization and Calibration	8-9
Figures of Merit	8-15
Mass- and Volume-Based Concentration Units	8-16
Detection of Outliers in Measurements	8-17
Properties of Carrier Gases for Gas Chromatography	8-18
Common Symbols Used in Gas and Liquid Chromatographic Schematic Diagrams	8-19
Stationary Phases for Porous-Layer Open Tubular Columns	8-20
Coolants for Cryotrapping	8-21
Properties of Common Cross-Linked Silicone Stationary Phases	8-22
Detectors for Gas Chromatography	8-23
Varieties of Hyphenated Gas Chromatography with Mass Spectrometry	8-25
Solid-Phase Microextraction Sorbents	8-27
Gas Chromatographic Retention Indices	8-30
Eluotropic Values of Solvents on Octadecylsilane and Octylsilane	8-32
Instability of HPLC Solvents	8-33
Detectors for Liquid Chromatography	8-34
Solvents for Ultraviolet Spectrophotometry	8-35
Correlation Table for Ultraviolet Active Functionalities	8-36
Wavelength-Wavenumber Conversion Table	8-39
Middle-Range Infrared Absorption Correlation Charts	8-42
Common Spurious Infrared Absorption Bands	8-48
Nuclear Spins, Moments, and Other Data Related to NMR Spectroscopy	8-49
Properties of Important NMR Nuclei	8-52
Proton NMR Absorption of Major Chemical Families	8-53
Proton NMR Correlation Chart for Major Organic Functional Groups	8-59
Proton NMR Shifts of Common Organic Solvents	8-60
¹³ C-NMR Absorptions of Major Functional Groups	8-67
¹³ C NMR Chemical Shifts of Common Organic Solvents	8-68
¹⁵ N-NMR Chemical Shifts of Major Chemical Families	8-69
Natural Abundance of Important Isotopes	8-71
Common Mass Spectral Fragmentation Patterns of Organic Compound Families	8-72
Common Mass Spectral Fragments Lost	8-74
Major Reference Masses in the Spectrum of Heptacosfluorotributylamine (Perfluorotributylamine)	8-75
Mass Spectral Peaks of Common Organic Solvents	8-76
Common Spurious Signals Observed in Mass Spectrometers	8-82
Chlorine–Bromine Combination Isotope Intensities	8-83
Reduction of Weighings in Air to Vacuo	8-84
Standards for Laboratory Weights	8-85
Indicators for Acids and Bases	8-87
Preparation of Special Analytical Reagents	8-88
Organic Analytical Reagents for the Determination of Inorganic Ions	8-93
Precipitation of Sulfides	8-106
pH Range for Precipitation of Metal Hydroxides and Oxides	8-107

ABBREVIATIONS AND SYMBOLS USED IN ANALYTICAL CHEMISTRY

Abbreviations Used in Analytical Chemistry

A	peak area; surface area of solid granular adsorbent; eddy diffusion term in the Van Deemter equation	CCC	counter-current chromatography
AAA	absolute activation analysis	CCD	charge-coupled device
AAD	atomic absorption detector	CCT	constant current topography
AAS	atomic absorption spectroscopy	CD	circular dichroism
AC	alternating current, affinity chromatography	CE	capillary electrophoresis, counter electrode
ACP	alternating current plasma	CEC	capillary electrokinetic chromatography, capillary electrochromatography
ADXPS	angular dependent X-ray photoelectron spectroscopy	CED	cohesive energy density
AED	atomic emission detector	CFA	continuous flow analysis
AEM	analytical electron microscope (microscopy)	CF-FAB	continuous flow-fast atom bombardment
AES	Auger electron spectroscopy, atomic emission spectroscopy	CFM	chemical force microscopy
AFID	alkali flame ionization detector	CGE	capillary gel electrophoresis
AFM	atomic force microscopy	CHEMFET	chemical-sensing field effect transistor
AFS	atomic force spectroscopy	CI	chemical ionization
AIS	average of individual samples	CID	collision induced dissociation
AL	action level	CIEF	capillary isoelectric focusing
AM	amplitude modulation	CITP	capillary isotachopheresis
AMS	accelerator mass spectrometry	CL	chemiluminescence
AN	area normalization	CLLE	continuous liquid-liquid extraction
ANRF	area normalization with response factors	CMA	cylindrical mirror analyzer
AOTF	acousto-optical tunable filter	COSY	correlation spectroscopy
AP	analytical pyrolysis	CPAA	charged particle activation analysis
APCI	atmospheric pressure chemical ionization	CP/MAS	cross polarization/magic angle spinning
APD	azimuthal photoelectron diffraction	CRDS	cavity ring-down spectroscopy
API	atmospheric pressure ionization	CRF	chromatographic response function
APSTM	analytical photon scanning tunneling microscope	CRM	certified reference material
APT	attached proton test	CT	cryogenic trapping
ARAES	angle resolved Auger electron spectroscopy	CTD	charge transfer device
ARF	absolute response factor	CV	cyclic voltammetry
ARM	atomic resolution microscopy	CV-AAS	cold vapor atomic absorption spectrometry
ARPES	angle resolved photoelectron spectroscopy	CVD	chemical vapor deposition
ARUPS	angle resolved ultraviolet photoelectron spectroscopy	CW	continuous wave
ASE	accelerated solvent extraction	CZE	capillary zone electrophoresis
AsFFFF	asymmetrical flow field flow fractionation	DA	diode array
ATD	above-threshold dissociation	DAD	diode array detector (UV-Vis)
ATI	above-threshold ionization	DADI	direct analysis of daughter ions
ATR	attenuated total reflection	DBE	double bond equivalent
BB	band broadening	DC	direct current
BE	magnetic sector – electric sector tandem mass spectrometer (note: also called a MIKE spectrometer)	DCI	desorption chemical ionization
BEE	magnetic sector – electric sector – electric sector mass spectrometer	DCP	direct-current plasma
BET	Brunauer-Emmett-Teller (adsorption isotherm)	DEP	differential electrolytic potentiometry
BIFL	burst integrated fluorescence lifetime	DEPT	distortionless enhancement by polarization transfer
BIS	Bremsstrahlung isochromat spectroscopy	DETA	dielectric thermal analysis
BL	bioluminescence	DIN	direct injection nebulizer
BLRF	bispectral luminescence radiance factor	DLI	direct liquid introduction
BQQ	magnetic sector – double quadrupole mass spectrometer BTOF	DLS	dynamic light scattering
BTOF	magnetic sector – time of flight tandem mass spectrometer	DMA	dynamic mechanical analysis
CAD	collision activated dissociation	DME	dropping mercury electrode
CAR	continuous addition of reagent	DNMR	dynamic nuclear magnetic resonance
CARS	coherent anti-Stokes Raman spectroscopy	DPP	differential pulse polarography
		DRIFT	diffuse-reflectance infrared Fourier transform
		DSC	differential scanning calorimetry
		DTA	differential thermal analysis
		DTC	differential thermal calorimetry
		EAES	electron-excited Auger electron spectroscopy
		EB	electric sector – magnetic sector tandem mass spectrometer
		EBE	electric sector – magnetic sector-electric sector tandem mass spectrometer
		EC	electrochemical
		ECD	electron capture detector

ECMS	electron capture mass spectrometry	GC	gas chromatography
ECNIMS	electron capture negative ionization mass spectrometry	GC-IR	gas chromatography–infrared
EDL	electrodeless discharge lamp	GCMS	gas chromatography mass spectrometry
EDS	energy-dispersive spectrometer	GDL	glow discharge lamp
EDXRF	energy-dispersive X-ray fluorescence	GDMS	glow discharge mass spectrometry
EELS	electron energy-loss spectroscopy	GE	gel electrophoresis, gradient elution
EFFF	electric field flow fractionation	GEMBE	gradient elution moving boundary electrophoresis
EGA	evolved gas analysis	GFAAS	graphite furnace atomic absorption spectroscopy
EIA	enzyme-linked immunoassay	GLC	gas-liquid chromatography
EI(I)	electron impact (ionization)	GPC	gel permeation chromatography
EIMS	electron impact mass spectrometry	GS	Gram-Schmidt (algorithm)
ELCD	electrolytic conductivity detector	GSC	gas-solid chromatography
ELISA	enzyme-linked immunosorbent assay	GSED	gaseous secondary electron detector
ELSD	evaporative light scattering detector		
EM	electron microscopy		
EMIRS	electrochemically modulated IR spectroscopy	HCL	hollow cathode lamp
EOF	electro-osmotic flow	HCOT	helically coiled open tubular (column)
EPL	enhanced photoactivated luminescence	HDC	hydrodynamic chromatography
EPMA	electron-probe microanalysis	HETCOR	heteronuclear correlation
EPR	electron paramagnetic resonance	HETP	height equivalent of (a) theoretical plate(s)
EPXMA	electron-probe X-ray microanalysis	HG	hydride generation
EQL	estimated quantitation limit	HIC	hydrophobic interaction chromatography
ERD	elastic recoil detection	HMBC	heteronuclear multiple-bond correlation
ESA	electrostatic analyzer	HPAC	high-performance affinity chromatography
ESCA	electron spectroscopy for chemical analysis	HPIAC	high-performance immunoaffinity chromatography
ESEM	environmental scanning electron microscope		
ESI	electro-spray ionization	HPLC	high-performance liquid chromatography, high-pressure liquid chromatography
ESP	electrospray	HPTLC	high-performance thin-layer chromatography
ESR	electron spin resonance	HRCGC	high-resolution capillary gas chromatography
ETA	electrothermal analyzer, emanation thermal analysis	HRGC	high-resolution gas(-liquid) chromatography
EXAFS	extended X-ray absorption fine structure	HS	head space
		HSA	hemispherical analyzer
FAA	flame atomic absorption	HSC	heteronuclear shift correlation
FAAS	flame atomic absorption spectroscopy	HSQC	heteronuclear single quantum coherence
FABMS	fast-atom bombardment mass spectrometry		
FAES	flame atomic emission spectroscopy	IA	isocratic analysis
FAFS	flame atomic fluorescence spectroscopy	IAC	immunoaffinity chromatography
FAM	field analytical method	IAES	ion-excited Auger electron spectroscopy
FAS	flame absorption spectroscopy	IC	ion chromatography
FD	field desorption	ICP	inductively coupled plasma
FD/FI	field desorption/field ionization	ICP-OES	ICP optical emission spectrometry
FES	flame emission spectroscopy	ICR	ion cyclotron resonance
FFEM	freeze-fracture electron microscopy	IDMS	isotope dilution mass spectrometry
FFF	field flow fractionation	IEC	ion-exchange chromatography
FFFF	flow field flow fractionation	IEF	isoelectric focusing
FFM	friction force microscopy	IF	intermediate frequency
FFS	flame fluorescence spectroscopy	IGC	inverse gas chromatography
FFT	fast Fourier transform	ILDA	intensified linear diode array
FGC	fast gas chromatography	IMAC	immobilized metal-ion affinity chromatography
FI	flow injection, field ionization		
FIA	flow injection analysis	INADEQUATE	incredible natural abundance double-quantum transfer experiment
FIB	focused ion beam	INEPT	insensitive nuclei enhancement by polarization transfer
FID	flame ionization detector, free-induction decay		
FIM	field ion microscopy	INAA	instrumental neutron activation analysis
FIFFF	flow field flow fractionation	IP	ion pairing
FNAA	fast neutron activation analysis	IPC	ion-pair chromatography
FOCS	fiber optic chemical sensor	IPG	immobilized pH gradient
FPD	flame photometric detector	IPMA	ion probe microanalysis
FSOT	fused silica open tubular (column)	IR	infrared (spectrophotometry)
FT	Fourier transform	IRN	indicator radionuclide(s)
FT-ICR	Fourier transform ion cyclotron resonance	IRS	internal reflection spectroscopy
FT-IR	Fourier transform infrared (often “FT/IR,” “FTIR,” “FT IR”)	ISCA	ionization spectroscopy for chemical analysis
FT-IRRAS	FT-IR reflection-absorption spectroscopy	ISE	ion selective electrode
FT-MS	Fourier transform mass spectrometry	ISP	ion spray
FWHM	full-width half-maximum	ISS	ion scattering spectrometry

LAMMS	laser micro mass spectrometry	MSPD	matric solid-phase dispersion
LARIMS	laser atomization resonance ionization mass spectrometry	MSRTP	micelle-stabilized room-temperature phosphorescence
LARIS	laser atomization resonance ionization spectroscopy	MWD	microwave (assisted) digestion
LASER	light amplification by stimulated emission of radiation	NAA	neutron activation analysis
LBB	Lambert-Beer-Bouguer law	NCIMS	negative chemical ionization mass spectrometry
LC	liquid chromatography	NDP	neutron depth profiling
LC-LS	multidimensional liquid chromatography	NEXAFS	near edge X-ray absorption fine structure
LDMS	laser desorption mass spectrometry	NHE	normal-hydrogen electrode
LDR	linear dynamic range	NICI	negative ion chemical ionization
LEAFS	laser-excited atomic fluorescence spectrometry	NIR	near-infrared, near-IR
LED	light-emitting diode	NIRA	near-infrared reflectance analysis
LEED	low energy electron diffraction	nm	nanometer
LEEM	low energy electron microscopy	NMR	nuclear magnetic resonance
LEI	laser-enhanced ionization	NOE (nOe)	nuclear Overhauser effect
LESS	laser-excited Shpol'skii spectroscopy	NOESY	nuclear Overhauser effect spectroscopy
LFM	lateral force microscopy	NPD	nitrogen-phosphorus detector, normal photoelectron diffraction
LIDAR	light detection and ranging	NPLC	normal phase liquid chromatography
LIFD	laser-induced fluorescence detection	ODMR	optically detected magnetic resonance
LIMS	laboratory information management system	ODS	octadecylsilane
LLC	liquid-liquid chromatography	OES	optical emission spectrometry, optical emission spectroscopy
LLD	lower-limit detection	OID	optoelectronic imaging device
LLE	liquid-liquid extraction	OMA	optical multichannel analyzer
LNRI	laser non-resonant ionization	OPO	optical parametric oscillator
LO	local oscillator	OPTLC	over-pressured thin-layer chromatography
LOC	lab on a chip	ORD	optical rotary dispersion
LOD	limit of detection	OTE	optically transparent electrodes
LPDA	linear photodiode array	PA	proton affinity
LPSIRS	linear potential-sweep IR reflectance spectroscopy	PAA	photon activation analysis
LRI	laser resonance ionization	PAGE	polyacrylamide gel electrophoresis
LRMA	laser Raman microanalysis	PAH	polycyclic aromatic hydrocarbon
LSC	liquid-solid chromatography	PAS	photoacoustic spectroscopy
LSE	liquid-solid extraction	PB	particle beam
LTP	low-temperature phosphorescence	PC	paper chromatography
MAE	microwave assisted extraction	PCA	principal component analysis
MALDI	matrix-assisted laser desorption source	PCR	polymerase chain reaction
MAS	magic angle spinning	PCS	photon correlation spectroscopy
MCD	magnetic circular dichroism	PCSE	partially coherent solvent evaporation
MCP	microchannel plate	PD	plasma desorption
MDGC	multidimensional gas chromatography	PDA	photodiode array
MDL	method detection limit	PDHID	pulsed discharge helium ionization detector
MDM	minimum detectable mass	PDMS	plasma desorption mass spectrometry, polydimethyl siloxane
MDQ	minimum detectable quantity	PED	pulsed electrochemical detection, plasma emission detector, photoelectron diffraction
MEIS	medium energy ion scattering	PES	photoelectron spectroscopy
MEKC	micellar electrokinetic chromatography	PET	positron emission tomography
MFM	magnetic force microscopy	PFIA	process flow injection analysis
MID	multiple ion detection	PGC	packed-column gas chromatography
MIKE	mass analyzed ion kinetic energy mass spectrometry	pH	negative logarithm of hydrogen ion concentration
MIP	microwave induced plasma, mercury intrusion porosimetry	PICI	positive ion chemical ionization
MIRS	multiple internal reflection spectroscopy	PID	photoionization detector
MLC	micellar liquid chromatography	PIXE	particle-induced X-ray emission
MLLSQ	multiple linear least squares	pK	negative logarithm of an equilibrium constant
MMF	minimum mass fraction	PLE	pressurized liquid extraction
MMLLE	microporous membrane liquid-liquid extraction	PLOT	porous-layer open tubular
MPD	microwave plasma detector	PMT	photomultiplier tube
MPI	multiphoton ionization	ppb	parts per billion
MRDL	maximum residual disinfectant level (in water analysis)	ppm	parts per million
MRI	magnetic resonance imaging	ppt	parts per thousand, parts per trillion
MS	mass spectrometry	PSD	position sensitive detector
MS-MS	tandem mass spectrometry		

PTFE	polytetrafluoroethylene	SIMS	secondary ion mass spectrometry
PTR	proton transfer reaction (in mass spectrometry)	SIRIS	sputter initiated resonance ionization spectroscopy
PTV	programmable temperature vaporizer	SMCL	secondary maximum contaminant level (in water analysis)
PVD	pulsed voltammetric detection, physical vapor deposition	SMDE	static mercury drop electrode
QCL	quantum cascade laser	SNIFTIRS	subtractively normalized interfacial FT-IR spectroscopy
QCM	quartz crystal microbalance	SNMS	sputtered neutral mass spectrometry
QCM	quartz-crystal microbalance	SPAES	spin-polarized Auger electron spectroscopy
QFAA	quartz furnace atomic adsorption	SPE	solid-phase extraction
QIT	quadrupole ion trap	SPME	solid-phase microextraction
qNMR	quantitative nuclear magnetic resonance	SPR	surface plasmon resonance
QQQ, QqQ, Q1qQ3	triple quadrupole mass spectrometer	SRE	stray radiant energy
QTH	quartz tungsten halogen	SRM	standard reference material
QTOF	tandem quadrupole time of flight mass spectrometer	SSMS	spark source mass spectrometry
		SSRTF	solid-surface room-temperature fluorescence
		SSRTP	solid-surface room-temperature phosphorescence
RAA	running annual average	STEM	scanning transmission electron microscope
RBS	Rutherford backscattering spectrometry	STM	scanning tunneling microscope
REELS	reflection electron energy loss spectrometry	SVE	solvent vapor exit
RES	reflection electron spectrometry	SWE	supercritical water extraction
RF	radio frequency		
RHEED	reflection high energy electron diffraction	TCD	thermal-conductivity detector
RI	refractive index, retention index	TCT-GC-MS	thermal cold trap gas chromatography mass spectrometry
RIC	reconstructed ion chromatogram	TD	thermodilatometry
RID	refractive-index detector	TDL	tunable diode laser
RIMS	resonance ionization mass spectrometry	TEA	thermal energy analyzer
RIS	range of individual samples, resonance ionization spectroscopy	TED	thermionic emission detector
RM	reference material	TEELS	transmission electron energy loss spectrometry
RNAA	radiochemical neutron activation analysis	TEM	transmission electron microscope
ROA	Raman optical activity	TET	thermometric enthalpimetric titration
ROESY	rotating frame nuclear Overhauser effect spectroscopy	TFFF	thermal field flow fractionation
RPLC	reversed-phase liquid chromatography	TGA	thermogravimetric analysis
RRDE	rotating ring-disk electrode	TGA-IR	thermogravimetric analysis–infrared
RS	Raman spectroscopy	THEED	transmission high energy electron diffraction
RSF	relative sensitivity factor	ThFFF	thermal field flow fractionation
RTIL	room-temperature ionic liquid	TIC	total ion current chromatogram, tentatively identified compound
RTP	room-temperature phosphorescence	TIMS	thermoionization mass spectrometry
S/N	signal-to-noise ratio	TLC	thin-layer chromatography
SAE	sonication assisted extraction	TLE	thin-layer electrode
SAM	scanning Auger microscopy, self-assembly monolayers	TLM	thermal lens microscopy
SANS	small-angle neutron scattering	TLV	threshold limit value
SAW	surface acoustic wave	TMA	thermomechanical analysis
SAXS	small-angle X-ray scattering	TMS	tetramethylsilane
SBSE	stirbar sorptive extraction	TOCSY	total correlation spectroscopy
SCE	standard calomel electrode, saturated calomel electrode	TOF	time-of-flight
SCF	supercritical fluid	TOF-MS	time-of-flight mass spectrometry
SCOT	support-coated open tubular	TSP	thermospray
SDD	silicon drift detector		
SdFFF	sedimentation field flow fractionation	UHV	ultrahigh vacuum
SEC	size-exclusion chromatography	USE	ultrasonic extraction
SEM	scanning electron microscope	UV	ultraviolet
SERS	surface-enhanced Raman spectroscopy	UVPES, UPS	ultraviolet photoelectron spectroscopy
SFC	supercritical-fluid chromatography	UV-VIS, UV-Vis	ultraviolet-visible
SFE	supercritical-fluid extraction		
SFFF	sedimentation field flow fractionation	VAR	variable angle reflectance
SF-MS	sector field mass spectrometry	Vis	visible (radiation)
SFS	synchronous fluorescence spectroscopy	VOC	volatile organic compound(s)
SHE	standard hydrogen electrode	VOX	volatile organic halogens
SIA	sequential injection analysis	VUV	vacuum ultraviolet
SIDA	stable isotope dilution assay	W	Wein filter (used in mass spectrometry)
		WCOT	wall-coated open tubular

WDS	wavelength dispersive spectrometer	E	electrode potential
WWCOT	whisker-wall coated open tubular (column)	ν	frequency
WWPLOT	whisker-wall (coated) porous layer open tubular (column)	γ	gyromagnetic ratio
WWSCOT	whisker-wall support-coated open tubular (column)	n	refractive index
		h	Planck constant
		H	enthalpy, plate height
		I_0	incident intensity
XAES	X-ray excited Auger electron spectroscopy, X-ray adsorption edge spectrometry	J	coupling constant
XANES	X-ray absorption near-edge spectroscopy	k	coverage factor
XPS	X-ray photoelectron spectroscopy	k'	capacity factor
XRD	X-ray diffraction	m/z	mass-to-elementary-charge ratio (mass spectrometry)
XRF	X-ray fluorescence	Q_{crit}	Q value (outlier test)
XRFS	X-ray fluorescence spectroscopy	q	quadrupole parameter (mass spectrometry)
XRS	X-ray spectroscopy	r	correlation coefficient
		R	resolution
		R_∞	Rydberg constant
ZAF	Z (element number) absorption fluorescence	ρ	density
		s	standard deviation
		s^2	variance
		δ	chemical shift
		δ^*	solubility parameter
		τ	true value of a measured quantity
		τ_{crit}	Chauvanet's criterion (outlier test)
		$t_{1/2}$	half life
		t_M	mobile-phase hold up
		t_R	retention time
		t_R^0	specific retention time
		T	transmittance
		$T1$	spin-lattice relaxation time
		$T2$	spin-spin relaxation time
		\bar{u}	carrier phase velocity
		V_M	carrier hold-up volume
		V_R	retention volume
		V_R^0	specific retention volume
		λ	wavelength, thermal conductivity

Symbols Used in Analytical Chemistry

a	Auger yield, fine structure constant
a_0	Bohr radius
A	absorbance
A	peak asymmetry factor
B	magnetic field strength
$[c]$	concentration of component c
d_p	particle diameter (HPLC stationary phase)
\bar{D}_{ab}	diffusion coefficient
e	electron elementary charge
ϵ	extinction coefficient
E	energy
E_b	binding energy
E_{ea}	electron affinity
E_i	ionization energy

BASIC INSTRUMENTAL TECHNIQUES OF ANALYTICAL CHEMISTRY

Thomas J. Bruno

The following section provides brief descriptions of the major instrumental methods of chemical analysis. Please note that these paragraphs are general descriptions and are not meant to convey a comprehensive knowledge on these topics. The reader is referred to one of many excellent texts on instrumental methods of chemical analysis for additional details.

Gas Chromatography (GC): A separation method in which the sample or solute is vaporized (usually in a solvent, but sometimes neat or free of solvent) and passed through a medium under the influence of a carrier gas. The medium is called the stationary phase, in contrast to the carrier gas, which is mobile. The most common modern stationary phases are based on open tubular or capillary columns, in which the separation medium coats the inside periphery of a tube (typically tenths of millimeters in inside diameter) that is between 25 and 60 meters long. Older media are packed columns, consisting of packed beds, which are still used for gas analysis. In these applications, a solid sorbent is very common, and this is called gas solid chromatography. Some open tubular columns are available with solid sorbents as well. Interactions of the solute with the separation medium affect the separation of the components of the mixture. A wide variety of detectors are available for general or specific applications. One of the most useful combinations is gas chromatography coupled with mass spectrometry (GC-MS). Solutes amenable to analysis by GC are usually of moderate volatility and relative molecular mass, usually not exceeding a molecular mass of 400. The most common stationary phases are cross linked polymers based on dimethyl polysiloxane, the backbone of which can be derivatized with ligands to provide specific interactions. It is also possible to incorporate stereogenic (chiral) stationary phases as well.

Liquid Chromatography (LC, HPLC): A separation method in which a sample or solute (usually in a solvent, but sometimes neat or free of solvent) is passed through a medium under the influence of a carrier liquid. The medium is called the stationary phase, in contrast to the carrier, which is mobile phase. Unlike gas chromatography, where the carrier gas plays little role other than mass transfer, the mobile phase in liquid chromatography is a controllable variable whose polarity and other properties are varied, in addition to the interactions with the stationary phase, to affect separation. The stationary phase in liquid chromatography is usually a micron particle packed bed that requires a high pressure solvent system to cause mass flow. Liquid chromatographic systems have therefore been called high pressure liquid chromatography (HPLC),

although the acronym is usually taken to mean high performance liquid chromatography. Many variations of the method have been developed for specific analysis. For example, gel permeation chromatography is an adaptation used for the separation of polymers. Affinity chromatography is similar in concept to gel permeation chromatography, but uses the specific interaction between an antibody and an antigen. The use of stereogenic (or chiral) stationary phases is also an important development, especially in the analysis of pharmaceuticals.

Thin Layer Chromatography (TLC): A separation method in which a stationary phase (typically a polar adsorbent such as alumina or silica gel) coated on a sheet of plastic, aluminum or glass is used with a mobile phase usually consisting of a solvent or mixture of solvents in a beaker. The solute is applied as a blotted spot just above the end of the adsorbent coated plate, and then the end is immersed into the solvent (but not so far as to immerse the solute spot). Commercial plates are robust, plastic sheets that can be cut to the size desired. In earlier applications, filter paper has been used in TLC, giving rise to the term “paper chromatography”. This term is rarely used today. Solvent is then drawn up through the adsorbent coating by capillary action. Separation results from a combination of interactions with the adsorbent and solvent. Commonly, the separated components are rendered visible by spraying stains or reagents on the plate after separation has been completed. It is also common to view the “developed” plate under an ultraviolet lamp, to visualize spots that may be fluorescent.

Supercritical Fluid Chromatography and Extraction: A separation technique similar to other extraction and chromatographic methods, but in which the mobile phase is actually a fluid in its supercritical fluid state. A supercritical fluid is a fluid that is held above its critical temperature and pressure, and for which no application of additional pressure can result in the development of a liquid phase. Supercritical fluids are unique in that while they possess liquid like densities, the mass transfer properties are very much like those of liquids. Supercritical fluid chromatography remains a niche method that is applicable to pharmaceuticals and other high relative molecular mass solutes. Supercritical extraction, on the other hand, is more widely used as a sample preparation method, especially in pharmaceutical analyses, polymers, and environmental analyses.

Electrophoresis: A family of separation methods based on the motion induced in particles by an applied, uniform electric field. The most common application of electrophoresis is gel electrophoresis, in which sample (typically proteins, amino acids, nucleic acids, etc.) is applied to a channel that is formed in a cross-linked polymer, usually polyacrylamide or agarose (the gel). The speed at which the individual species move through the gel under the influence of the field is determined largely by the size of the species, as expressed by the mass to charge ratio. After separation, the individual species usually appear as discrete bands that may be better visualized by staining with ethidium bromide, silver, or Coomassie Brilliant Blue dye. Other related and more specific techniques include isoelectric focusing,

pulsed field gel electrophoresis, immunoelectrophoresis, and isotachopheresis.

Mass Spectrometry (MS): An analytical technique in which charged particles or radical ions are produced from a sample by either electron impact (bombardment with a stream of electrons) or chemical ionization (interaction with a small charged ion). Analysis on the basis of mass to charge ratio is performed on fragments of the molecule that develop after the initial ionization. The method is very useful for mass determination, and structure determination on the basis of the induced fragmentation pattern. The charged fragments can be separated or analyzed by a magnetic sector, a quadrupole, an ion trap, by time of flight, or by cyclotroning. When coupled to separation techniques such as gas or liquid chromatography, a nearly universal qualitative detection capability is provided. Structure determination can be performed by comparison to well known fragmentation patterns or characteristics. When a mass spectrometer is capable of high mass resolution, a nearly unequivocal identification of a compound formula is possible. While direct interfaces and gas chromatographs are the most common sample introduction techniques, many others are available for specific applications. Matrix assisted laser desorption and ionization (MALDI) is often used in time of flight instruments, and is especially useful for the analysis of biopolymers. Inductively coupled plasma ionization is capable of producing mass spectra at high sensitivity for many metals and some nonmetals. When coupled to liquid chromatography instrumentation, thermospray and electrospray methods have been used with HPLC for analytes that are not amenable to gas chromatography separation. In addition to the interfaces discussed above, tandem mass spectral methods are of great value especially for confirmatory analysis. In this respect, a fragment is selected for further fragmentation and analysis. The most common types of tandem mass spectrometry involve quadrupoles coupled with a time of flight (Q-TOF) and multiple (usually three) quadrupoles in series, called a triple quad (QQQ or QqQ). More details can be found in the entry entitled "Varieties of Hyphenated Gas Chromatography with Mass Spectrometry."

Ultraviolet Spectrophotometry (UV, UV-Vis): A spectroscopic technique that focuses on electronic transitions with the visible and ultraviolet regions of the electromagnetic spectrum for excitation and detection. The practical ultraviolet region extends from 190 to 400 nm in wavelength. The UV region can be divided into subranges: near UV: 300 – 400 nm, mid UV: 300 – 200 nm, far UV: 200 – 122 nm, vacuum UV: 200 – 100 nm. Other divisions are possible, but these are less important for analytical chemistry. The visible region, so called because of the response of human vision, extends from simply light. A typical human eye will respond to wavelengths from about 390 to 750 nm in wavelength. Although it is possible to use ultraviolet visible spectrophotometry for structure determination, it is most often used as a quantitative tool. The wavelength-structure correlations are not as detailed, nor the spectra as sharp, as with other spectroscopic methods such as infrared spectrophotometry. The utility of UV-Vis absorptions for many organic compounds has lead to this instrument being adapted as a detector for liquid chromatography. Related to ultraviolet spectrophotometry is fluorescence spectroscopic methods. In this method, the energy emit-

ted is at a different wavelength (usually longer, of lower energy), and this is typically detected perpendicularly to the incident excitation beam. This makes fluorescence spectroscopy more sensitive than UV-Vis spectroscopy. This type of instrument is also incorporated as a detector for liquid chromatography.

Infrared Spectrophotometry (IR, FTIR): A spectroscopic technique that focuses on molecular vibrations (with a concurrent change in dipole moment) with the infrared (IR) region of the electromagnetic spectrum for excitation and detection. This region is further divided into three separate but overlapping ranges. The near infrared (high energy IR, approximately $14000\text{--}4000\text{ cm}^{-1}$, $0.8\text{--}2.5\text{ }\mu\text{m}$ wavelength) is used to study overtone or harmonic vibrations. The mid range infrared (mid range energy IR, approximately $4000\text{--}400\text{ cm}^{-1}$, $2.5\text{--}25\text{ }\mu\text{m}$ wavelength) is used to study the fundamental vibrations and associated rotational-vibrational combinations. The far-infrared (low energy IR, approximately $400\text{--}10\text{ cm}^{-1}$, $25\text{--}1000\text{ }\mu\text{m}$ wavelength), is close to the microwave region and is used to study rotational transitions. Most modern instruments use the Fourier Transform technique to record the spectrum over all wavelengths, rather than by scanning through the wavelengths. The absorbances of the IR radiation are associated with specific chemical moieties, and a study of the spectra can be used to aid in structure determination. One often uses structure correlation charts to aid in assignment of absorbance bands. An analysis of the intensity of the absorptions can also be used for quantitative analysis.

Nuclear Magnetic Resonance Spectrometry (NMR): A spectroscopic method that takes advantage of magnetic nuclei (nuclei with an odd number of protons and/or of neutrons, having an intrinsic magnetic moment and angular momentum), placed in a magnetic field, will absorb pulses of electromagnetic radiation and then radiate this energy back out. For these nuclei, the energy and signal intensity are proportional to the applied magnetic field. The power of NMR results from the ability to probe the molecular environment around a particular nucleus, thus making it long a tool of the organic chemist. This is done by measurement of the chemical shift (or frequency) of an absorption, and by the analysis of splitting patterns, which are caused by the influence of adjacent nuclei. New high field, high sensitivity instruments have given this technique more applications in analytical chemistry, however. The most commonly studied nuclei are ^1H (proton, the most NMR-sensitive isotope after the radioactive ^3H) and ^{13}C . With high field instruments, additional nuclei are accessible: ^2H , ^{10}B , ^{11}B , ^{14}N , ^{15}N , ^{17}O , ^{19}F , ^{23}Na , ^{29}Si , ^{31}P , ^{35}Cl , ^{113}Cd , ^{129}Xe , ^{195}Pt .

Purge-and-Trap Sampling: Purge and trap sampling is a family of methods that are used to capture the headspace above a condensed phase for subsequent analysis, most often for complex mixtures, environmental samples, etc. The headspace is the vapor space that develops above any condensed (solid or liquid) phase. Thermodynamics assures us that the concentration of a particular analyte found in the headspace will be different than that found in the condensed phase, but often the relationship is predictable. The value in the method comes from the simplicity; sample preparation is usually far simpler than the cleanup that is typically required for many complex mixtures. Purge and trap methods fall into two general categories:

static and dynamic. The dynamic method typically uses a sweep gas to continuously purge vapor analytes into a cold (cryogenic) trap or an adsorbent. Modern dynamic purge and trap methods include PLOT column cryoadsorption, which uses a combined adsorbent and cryotrapping on a high efficiency platform. Static methods typically employ a syringe to pressurize the headspace above a condensed phase, followed by uptake of the pressurized headspace into a trap. A modern static method (that usually is done without pressurization) is solid phase microextraction (SPME). This method utilizes a fiber coated with a stationary phase (similar to stationary phases used for gas and liquid chromatography) at the end of a wire mounted in a syringe needle.

Raman Spectroscopy: A vibrational spectroscopic method that arises from the inelastic scattering of monochromatic radiation by molecules that undergo a change in polarizability during the vibration. This is in contrast to infrared spectrophotometry, in which a change in the dipole moment occurs during the vibration. When radiation (typically light from a laser in the visible, near infrared, or near ultraviolet range) is scattered, a small fraction of the scattered radiation is observed to have a different frequency (the Raman effect). The variations of Raman spectroscopy are used to locate functional groups or chemical bonds in molecules. There are several variations in the approach to Raman spectroscopy. In Resonance Raman spectroscopy, the excitation wavelength is matched to an electronic transition of the molecule, enhancing the vibrational modes. In coherent anti-Stokes Raman spectroscopy (CARS), two laser beams are used to generate a coherent anti-Stokes frequency beam. In surface enhanced Raman Spectroscopy (SERS), surface plasmons (a quantum of plasma oscillation) on a silver or gold colloid on a surface (such as a mirror) are excited by the laser, resulting in an increase in the electric fields surrounding the metal.

Atomic Absorption and Emission Spectroscopy (AA, AES):

Two related spectroscopic methods applied primarily to the analysis of inorganic compounds. Atomic absorption procedures use the absorption of optical radiation (light) by free atoms in the gaseous state. The light can be produced by a hollow cathode lamp, an electrodeless discharge lamp or a deuterium lamp. The light is absorbed by the analyte during an electronic transition, the wavelength of which corresponds to only one element in the analyte, and the width of an absorption line is only of the order of a few picometers. This method can be used for the quantitative determination (on the basis of a calibration curve) of approximately 70 different elements in solution or directly in solid samples. Atomic emission spectroscopy (AES) uses the light emitted by a vaporized sample in a flame, plasma, arc, spark or laser, at a particular wavelength, to determine the atomic spectrum (for determination of the elemental composition) quantity of an element in a sample. The wavelength of the atomic spectral line gives the identity of the element while the intensity of the emitted light is proportional to the number of atoms of the element. No single source, as described above, is optimal for a given sample, and it is the choice of source that distinguishes the various techniques.

Thermal Analysis Methods (TA): A family of analytical techniques in which various properties of a sample are examined as a function of changing temperature at a particular

rate of change. For chemical analysis, the most common thermal analysis techniques include differential thermal analysis (DTA) and thermogravimetric analysis (TGA). There are many others thermal analysis methods available, perhaps the most common of which is differential thermal analysis, used for determination of phase transitions. In chemical analysis, TGA to determine a mass change as a function of temperature. This is used to determine decomposition or degradation temperatures, moisture content of materials (although Karl Fisher coulombic titrimetry is also used for this), the level of inorganic and organic components in materials, decomposition points of explosives, and solvent residues in materials. DTA, on the other hand, monitors temperature change rather than mass change. In this respect, it is useful as a complementary technique to probe the energetic of decomposition, moisture loss, etc. Other thermal analysis methods, such as differential scanning calorimetry (DSC), are not primarily analytical tools but rather thermophysical property measurement tools.

X-Ray Methods: A family of techniques that utilize radiation in the X-ray region, with wavelengths between 0.01 to 10 nanometers (corresponding to frequencies in the 3×10^{16} Hz to 3×10^{19} Hz) to analyze for the presence of elements in a sample. In X-ray fluorescence spectroscopy (XRS), short wavelength X-rays are used to excite secondary or fluorescent X-rays from a sample. The wavelength of X-rays used to excite the sample must be shorter than the expected fluorescence wavelength. The sample is typically presented as a powdered solid on a glass plate, although liquid samples are not uncommon in X-ray fluorescence. For example, the analysis of sulfur in liquid fuels is best accomplished by use of this method. Spectra are generated by changing the incident angle between the source and the sample with a device called a goniometer. The fluorescent signals obtained are very precise and specific, and can rival wet chemical methods for the identification of elements. Auger electron spectroscopy (AES) is a surface analysis method that measures the electrons emitted from a surface by electron bombardment of the surface. This method is considered to be in the same family as X-ray methods because during electron bombardment, the surface can lose energy either by electron emission (the Auger effect, via Auger electron emission) or X-ray emission. These methods are in contrast to X-ray diffraction methods, in which a crystal structure measurement is desired.

Flow Injection Analysis (FIA): An analytical protocol that seeks to replace the manual "test tube and beaker" aspects of wet chemical analysis by injecting an analyte in a flowing stream of carrier reactant. As the analyte flows with the reactant stream, it diffuses into the reactant and product forms. Ultimately, the product zone, under the influence of the moving reactant, is passed into a detector section. The detection devices can consist of the same wide variety as is used in HPLC. The major advantage of flow injection analysis is the automation and decreased uncertainty associated with sampling and reagent addition. Strict control of reagent concentration, flow rate and analyte volume is possible. Modern applications of FIA include the sequential addition of analyte and reactant in a stream so that the two are "stacked" in an inert carrier. They then mix by the parabolic flow profile of a laminar flowing stream in a tube. This arrangement can be miniaturized within a sampling valve, forming the so-called lab-in-a-valve approach.

ANALYTICAL STANDARDIZATION AND CALIBRATION

Thomas J. Bruno

Overview

Most modern instrumental techniques used in analytical chemistry produce an output or signal that is not absolute; the signal or peak is not a direct quantitative measure of concentration or target analyte quantity. Thus, to perform quantitative analysis, one must convert the raw output from an instrument (information) into a quantity (knowledge). This is done by standardizing or calibrating the raw response from an instrument (Refs. 1-4). Here, we briefly summarize the most common methods applied in analytical chemistry, recognizing that this is a very large field. We note that the common use of the term “standardization” is not to be confused with the application of standard methods as specified by regulatory or consensus standard organizations.

Samples

In all of the discussion to follow, we assume that the sample has been properly drawn from the parent population material, and properly prepared. Clearly, the most precise analytical methods and the most painstaking calibration methods are useless if applied to a sample that does not represent reality. Nevertheless, the term “sampling,” which describes the process of obtaining the sample (from the population material), implies the existence of a sampling uncertainty (arising mainly from population material heterogeneity) (Refs. 5 and 6). Thus, the analytical result is an estimate of what would be obtained from the parent population material. The theory, concepts, and nomenclature regarding samples and sampling constitute a complex, statistically based, subspecialty of analytical chemistry well beyond the scope presented here. We begin with some simplified definitions (Ref. 7):

Amount of substance: The amount of substance is the fundamental quantity of material measured in the number of moles.

Analyte: The analyte is the target component or compound in the sample for which one desires a measurement.

Aliquot: An aliquot is a known fraction of a homogeneous mass or volume.

Bias: As applied to sampling, bias refers to a systematic displacement, error, uncertainty, or mistake caused by a flaw in the sampling procedure.

Convenience sample: A sample chosen on the basis of accessibility, expediency, cost, efficiency, or other reason not directly concerned with sampling parameters.

Determination: The determination is the entire analytical procedure or method performed on a test portion.

Matrix: The matrix is the background or carrier material of the sample that includes all components except the analyte(s) of interest.

Phase: The phase describes the physical state of a substance: primarily solid, liquid, gas, but this term might include more detailed descriptions to include supercritical fluid, plasma, etc. Note that the term “vapor” typically refers to a gas phase above and in equilibrium with a condensed phase (often called the headspace in chemical analysis).

Population material: The population material is the entirety of the bulk material from which the sample is drawn. This

might be a plot of earth, a warehouse full of sugar, or a tank of jet fuel.

Quantity: The quantity refers to the mass or volume of a substance.

Random sample: A sample selected so that any portion of the sample has an equal or known chance of being chosen for measurement.

Representative sample: A sample resulting from a sampling process that can be expected to adequately reflect the properties of interest of the parent population. A representative sample may be a random sample. The degree of representativeness of the sample is limited by cost or convenience.

Selective sample: A sample that is deliberately chosen by using a sampling plan that eliminates materials with certain characteristics or selects only a material with other relevant characteristics desired for an analysis.

Test portion: The test portion is the actual material removed from a sample for analysis.

Umpire sample: A sample taken, prepared, and stored in an agreed upon manner for the purpose of settling a dispute, arrived at by agreement that will include the test method and procedure, serving as the basis for acceptance, rejection, or economic adjustment. This is sometimes called a referee sample.

Test portion: The test portion is the actual material removed from a sample for analysis.

Unknown: The unknown is a term that describes the target measurement or unknown quantity that is desired for the analyte, or the analyte itself.

Sampling uncertainty is that part of the total uncertainty in an analytical procedure or determination that results from using only a fraction of the population material. In this respect, sampling by any method is an extrapolation process. Since the sampling uncertainty is usually ignored for an individual analysis on an individual test portion, the sampling uncertainty is considered as being due entirely to the variability of the test portion. It is therefore assessed, when necessary, by replication of the sampling from the parent population material, and statistically isolating the uncertainty thus introduced by analysis of the variance. Typically, the problems associated with liquid population material are less complex but must not be ignored. Sample stratification, concentration and thermal gradients, poor mixing, and gradients associated with flow are all real effects that must be considered. Sampling uncertainty is often minimized by field and laboratory processing, with procedures that can include mixing, reduction, coning and quartering, riffing, milling, and grinding.

Another aspect that must be considered subsequent to sampling is sample preservation and handling. The integrity of the sample must be preserved during the inevitable delay between sampling and analysis. Sample preservation may include the addition of preservatives or buffer solutions, pH adjustment, use of an inert gas “blanket,” and cold storage or freezing.

Calibration and Standardization

External Standard Methods

The external standard method can be applied to nearly all instrumental techniques, within the general limits discussed here, and the specific limitations that may be applicable with individual techniques. This method is conceptually simple; the user constructs a calibration curve of instrumental response with prepared mixtures containing the analyte(s) over a range of concentrations, an example of which is shown in Fig. 1a. Thus, the curve represents the raw instrumental response of the analyte as a function of analyte concentration or amount. Each point on this plot must be measured several times so that the repeatability can be assessed. Only random uncertainty should be observed in the replicates; trends of increasing or decreasing response (hysteresis) must be remedied by identifying the source and adjusting the method accordingly. The calibration solutions should be randomized (that is, measured in random order). Although called a calibration “curve,” ideally the signal versus concentration plot is linear, or substantially linear (that is, areas of nonlinearity are unimportant, otherwise they are localized, minor, and properly treated by the measurement technique). In some cases, the response may be linearizable (for example, by calculating the logarithm of the raw response). If a curve shows nonlinearity in an area that is important for the analysis, one must measure more concentrations (data points) in the region of curvature.

In practice, the line that results from the calibration is fit with an appropriate model, and the desired value for the unknown concentration is calculated. The curve can be used graphically if approximation suffices. Mixtures prepared for external standard calibration can contain one or many analytes. Once a calibration curve is prepared, it can often be used for some time period, provided such a procedure has been previously validated (that is, the stability of the standards and the instrument over the time of use has been assessed). Otherwise, it is best to measure the unknown and the standards within a short period of time. Moreover, if any major change is made to the instrumentation (changing a detec-

tor or detector parameters, changing a chromatographic column, etc.), the standards must be re-measured.

To successfully use the method, the standard mixtures must be in a concentration range that is comparable to that of the unknown analyte, and ideally should bracket the unknown. Multiple measurements of each standard mixture should be made to establish repeatability of points on the curve. Many instrumental methods have operation ranges (frequency, temperature, etc.) in which the uncertainty is minimized, so components and concentrations for standard mixtures must respect this. The standard mixtures should be in the same matrix as the unknown, and the matrix must not interfere with the unknown or other standard mixture components. Any pretreatment of the unknown must also be reflected in the standard mixtures. As with any calibration method, components in the standard mixtures must be available at a high (or at least known) purity, they must be stable during preparation, and must be soluble in the required matrix. Unless the physical phenomenon of a measurement is well understood, extrapolation beyond the curve is not recommended (and indeed is usually strongly discouraged); nevertheless, extrapolation is occasionally done in practice. In those cases, one must be cautious, report exactly how the extrapolation was done, and assess any increase in uncertainty that may result. Note that the curve might not extrapolate through the origin. This is usually the result of adsorption (of components on container walls), carryover hysteresis, absorption (of components in seals or septa), or component degradation or evaporation.

A major consideration with external standardization is that typically, the sample size (for example, the injection volume in chromatography) must be maintained constant for standard mixtures and the unknowns. If the sample size varies slightly, it is often possible to apply a correction to the raw signal. One should not attempt to generate a calibration curve by varying the sample size (that is, for example, injecting increasing volumes into a gas chromatograph). This caution does not preclude serial dilution methods (see below), in which multiple solutions are generated for separate measurement. Other issues that can hinder successful application of the external standards method include instrumental aspects that might not be readily apparent. In chromatographic methods, for example, one can overload the column or detector. In older instruments, settings of signal attenuation were typically made manually, while in newer instruments, this may occur through software, sometimes without operator interaction or knowledge.

Note, *inter alia*, that in Fig. 1a (and indeed all the examples presented here), the uncertainty is only indicated for the variable on the y-axis. In reality, we must recognize that there is uncertainty for the values plotted on the x-axis as well, but we often only treat the largest uncertainty, or the uncertainty that is most important for our application. Note, also, that it is critical to maintain the integrity of standards; decomposition, degradation, moisture uptake, etc., will adversely affect the validity of the calibration.

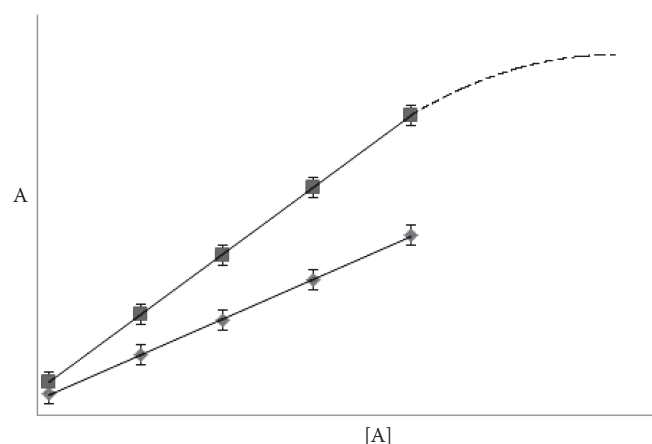

Fig. 1a: An example calibration curve prepared by use of the external standard method. The instrument response is represented by A , and the concentration resulting in that response is $[A]$. While curves for two analytes are shown, in principle, one can plot as many analytes as desired. While five points per analyte have been shown, one can measure as many as required. Note that a region of nonlinearity is shown in the latter part of the curve for one of the components. One would require a larger number of points to adequately represent and fit any nonlinear areas.

Abbreviated External Standard Methods

In many situations in chemical analysis, a full calibration curve is not prepared because of the complexity, time, or cost. In such situations, abbreviated external standard methods are often used. Under no circumstances can an abbreviated method be used if the raw signal response is nonlinear. Moreover, these methods are not generally appropriate for analyses in regulatory, forensic, or health care environments where the consequences can be far-reaching.

Single Standard

This method uses a simple proportion approach to standardize an instrument response. It can be used only when the system

Fig. 1b: An example of a single-point calibration curve. The instrument response is represented by A , and the concentration resulting in that response is $[A]$. The origin (0,0) is assigned as part of the curve, and is assumed to have no uncertainty.

has no constant, determinate error or bias*, and when the reagents used give a zero blank response (that is, the instrument response from the matrix and measurement system only, without the analyte). A standard should be prepared such that the concentration is close to that of the unknown. One then calculates the concentration of the unknown, $[X]$, as:

$$[X] = (A_x/A_s) [S] \quad (1)$$

where A_x is the instrument response of the unknown, A_s is the instrument response of the standard, and $[S]$ is the concentration of the standard.

Single Standard Plus Assumed Zero

This method, illustrated schematically in Fig. 1b, assumes that the blank reading will be zero. One uses a two-point calibration in which the origin is included as the first point. It is important to ensure, by experiment or experience, that such a method is adequate to the task.

Single Standard Plus Blank

If the analytical method has no determinate error or bias, but does produce a finite blank value, then one must also perform a blank measurement, which is subtracted from the instrument response of the standard and the unknown. Then the same procedure (Eq. 1) is used as for the single standard. If multiple samples are to be measured, it is important to measure the blank between each measurement.

Two Standards Plus Blank

When the analytical method has both a determinate error (or bias), and a finite blank value, at least three calibrations must be made: two standards and one blank. The standard concentrations are typically prepared widely spaced in concentration, and the higher concentration should be chosen to represent the limit of linearity of the instrument or method. If this is not practical, the higher concentration should simply be the highest expected concentration of the analyte (unknown). This method is illustrated schematically in Fig. 1c. If multiple samples are to be measured, it is important to measure the blank between each measurement.

Internal Normalization Method

As mentioned above, the raw signal from an analytical instrument is typically not an absolute measure of concentration of the

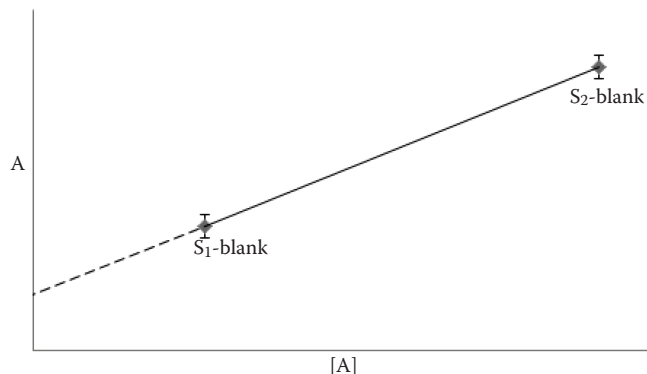

Fig. 1c: An example of two standards plus a blank calibration curve. The blank is subtracted from each of the standards. The instrument response is represented by A , and the concentration resulting in that response is $[A]$.

analyte(s), because the instrument may respond differently to each component. In some cases, such as with chromatographic methods, it is possible to apply response factors, determined from a standard mixture containing all constituents of the unknown sample, for standardization (Ref. 8). The standard mixture is gravimetrically prepared (with known mass percents for each component), and the instrument response is measured, for example as chromatographic areas. The total mass percent and the total area percent each sum to 100. One calculates the ratio of each mass percent to each area, choosing one component as the reference, which is assigned a response factor of unity. To obtain the response factors of all the other components, one divides its (mass%-to-area ratio) with that of the reference. This is done for all components, producing a response factor for all components, except of course for the reference, defined as unity. When the unknown sample is measured, the response factor is multiplied by each raw area, and the resulting area percent provides the normalized mass percent of each component in the unknown.

This method corrects for minor variations in sample size (earlier defined as the test portion), although large differences in sample size must be avoided so that one is assured of consistent instrument performance. Although the method corrects for the different responses of samples, large differences must be avoided. This also means that the detector must respond linearly to the concentrations of each component, even if the concentrations are very different. This may require dilution or concentration of the sample in some situations. In chromatographic applications, all components of a mixture must be analyzed and standardized, since normalization must be performed on the entire sample.

Some techniques, such as gas chromatography with flame ionization detection and thermal conductivity detection, have well defined physical phenomena associated with output signals. With these techniques, there are some limited, published response factor data that can be used in an approximate way to standardize the response from these devices.

In Situ Standardization

While it is rare that an analytical method can be calibrated by use of a single solution, some instances of spectrophotometry and electroanalytical methods can qualify. To use this method one sequentially and incrementally adds known masses of standard analytes to a solution, with an instrument response being measured after each addition. This procedure can only be used if the analytical method itself does not change the analyte concentration

* Determinate error and bias are related terms that describe uncertainty that arises from a fixed cause, and that can, in principle, be eliminated if recognized. Determinate error (or systematic error) is most often associated with a measurement, while bias can be associated with either a measurement or with the sampling procedure.

(nondestructive) and does not lead to a loss of solution volume. A solid crystalline analyte is an example. One must also minimize changes in solution volume over the course of the standardization.

Standard Addition Methods

Samples presented for analysis often are contained in complex matrices with many impurities that may interact with the analyte, potentially enhancing or diminishing a signal from an instrumental technique. In such cases, the preparation of an external standard calibration curve will be impossible, because it might be very difficult to reproduce the matrix. In these cases, the standard addition method may be used. A standard solution containing the target analyte is prepared and added to the sample, thus accounting for the unknown impurities and their effects. While the quantity of target analyte in the target sample is unknown, the added quantity is known, and its incremental additive effect on the instrument signal can be measured. Then, the quantity of the unknown analyte is determined by what is effectively an extrapolation. In practice, the volume of the standard solution added is kept small to avoid dilution of the unknown impurities by no more than 1% of the total signal. This method can only be used if there is a verified linear relationship between the signal and quantity of analyte. If a determinate error is present, then the slope of the line must be known. Moreover, the sample cannot contain any components that can respond as the analyte (that is, masquerade).

Single Standard Addition

In the simplest case, one addition of analyte is made after first measuring the response of the analyte in the unknown sample. Thus, two measurements are required:

$$A_{x_0} = m[X_0] \quad (2)$$

$$A_{x_i} = m([X_0] + [S]), \quad (3)$$

where A_{x_0} is the instrument response of the analyte in the unknown sample, $[X_0]$ is the concentration in the unknown sample, and A_{x_i} is the instrument response upon the addition of the standard, $[S]$ (additive in equation because X and S are the same compound). The assumed slope is the proportionality constant, m . The two equations are solved simultaneously for $[X_0]$. This technique is very rapid and economical, but there are serious drawbacks. There is no built in check for mistakes on the part of the analyst, there is no means to average random uncertainties, and there is no way to detect interference (mentioned above as masquerade).

Multiple Standard Addition

This standard addition method alleviates some of the problems inherent in single standard addition. Here, the unknown sample is first measured in the instrument. Then that sample is "spiked" with incrementally increasing concentrations of the analyte, generating a curve such as that shown in Fig. 1d. The curve should extrapolate to zero signal at zero concentration. The concentration of the analyte in the unknown is read or calculated from the abscissa (x -axis).

Internal Standard Methods

An internal standard is a compound added to a sample at a known concentration, the purpose of which is to exhibit a similar signal when measured in an instrument, but be distinguishable from the signal of the desired analyte. It provides the highest level of reliability in quantitation by chromatographic methods, and is not affected by large differences in sample size (Ref. 8). Unlike

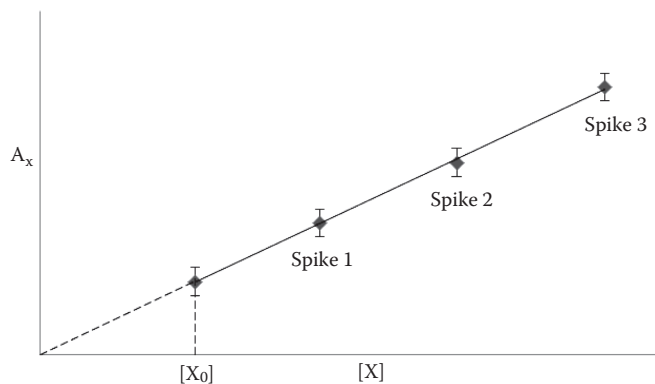

Fig. 1d: An example of calibration by multiple standard addition. Three additions (spikes) of the analyte X are shown, as is the extrapolation to the unknown concentration, X_0 .

the internal normalization method, it is not necessary to elute or measure all the components of the sample, one need focus only on the component(s) of interest. In atomic spectrometry, this method is not affected by changes in gas flow rates, sample aspiration rates, and flame suppression or enhancement. Another situation in which this method is valuable is when the sample matrix is either unknown or very complex, precluding the preparation of external standards.

Multiple Internal Standards

A set of calibration solutions is prepared by mass, containing the target analyte, X , and a standard that is not present in the unknown sample, A . The instrument response (for example, a chromatographic area) is measured for each calibration solution, and a plot is made to establish linearity as in Fig. 1a. The ordinate axis is the ratio of the response of the unknown analyte component, A_x , to the response of the chosen standard, A_s . The abscissa is the ratio of mass of X to the mass of S for that standard mixture. Once the linearity is confirmed in the concentration range of interest, the unknown is spiked with a known mass of S , the instrument response is measured, and the area ratio A_x/A_s is calculated. Either the graph or a fit of the data on Fig. 1e is then used to determine the corresponding mass fraction, from which the mass of X may be determined. Note that the calculations could be simplified if the same mass per volume of the

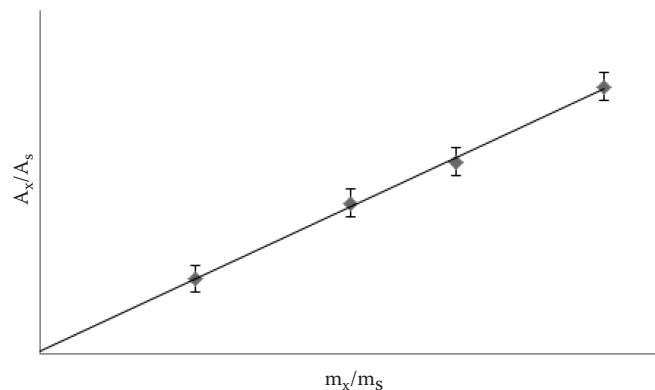

Fig. 1e: An example of the multiple internal standard method. The ordinate (y) axis is the ratio of the response of the unknown analyte component, A_x , to the response of the chosen standard, A_s . The abscissa (x) axis is the ratio of mass of X to the mass of S for that standard mixture.

internal standard is added to both the unknown samples and the calibration standards.

Single Internal Standard

In practice, once the linearity is established for a given mixture, it is no longer necessary to use multiple standards, although this is the most precise method. Subsequent to the verification of linearity, one standard solution can be used to fix the slope, provided it is close in concentration to that of the target analyte. In this case, the mass of the unknown can be found from:

$$X/S = (A_x/A_s)(1/R), \quad (4)$$

where X is the mass of the unknown analyte in the sample, S is the mass of the added internal standard in the sample, A_x and A_s are the instrument responses (areas) of the unknown and internal standard, respectively. R is a ratio determined from the standard solution prepared with both X and S : (mass, unknown analyte/mass, internal standard)/(signal, unknown analyte/signal, internal standard) = R .

$$\left(\frac{\left(\frac{\text{mass, unknown analyte}}{\text{mass, internal standard}} \right)}{\left(\frac{\text{signal, unknown analyte}}{\text{signal, internal standard}} \right)} \right) = R \quad (5)$$

Since R is the slope of the calibration curve discussed above, once linearity is established, one solution suffices. There are many conditions that must be fulfilled in order to use the internal standard method, and it is rare that all of them can actually be met. Indeed, in practice, one tries to meet as many as possible, but those that are mandatory are italicized. The compound chosen *must not be present* already in the unknown. The compound chosen *must be separable from the analyte* present in the unknown. An exception occurs when an isotopically labeled standard is used, in conjunction with mass discrimination or radioactive counting detection. In a chromatographic measurement, this is typically at least baseline resolution, although this would be a minimally acceptable degree of separation. On the other hand, the unknown analyte peak and the internal standard peak should be close to each other (temporally) on the chromatogram. The compound chosen *must be miscible* with the solvent at the temperature of reagent preparation and measurement. The compound chosen must not react chemically with the sample or solvent, or interfere in any way with the analysis. It is critical to maintain the integrity of standards; decomposition, degradation, moisture uptake, etc., will adversely affect the validity of the calibration. In the case of a chromatographic measurement, the same applies to interactions with the stationary phase. The compound chosen must be chemically similar (for example, in functionality, thermophysical properties) to the analyte. If such a compound is not available (for example, in a chromatographic measurement), an appropriate hydrocarbon should be chosen as a surrogate. The standard solution should be prepared at a similar concentration as in the unknown matrix; ratio correction of large differences is no substitute for an appropriate concentration. In a chromatographic measurement, the compound chosen must elute as closely as possible to the analyte, and should not be the last peak to elute (the final peak often shows different geometry such as tailing). The compound chosen must be sufficiently nonvolatile to allow for storage as needed. When there is the potential for the unknown analyte to be lost by adsorption, absorption, or some other interaction with the matrix or container, a compound called a carrier is sometimes added in

large excess. The carrier is similar, chemically and physically, to the unknown analyte, but easily separated from it. Its purpose is to saturate or season the matrix and prevent analyte loss.

Serial Dilution

Serial dilution is less a standardization method as it is a method of generating solutions to be used for standardizations. Nevertheless, its importance and utility, as well as the popularity of its application, warrants mention in this section. A serial dilution is the stepwise dilution of a substance, observant of a specified, constant progression, usually geometric (or logarithmic). One first prepares a known volume of stock solution of a known concentration, followed by withdrawing some small fraction of it to another container or vial. This subsequent container is then filled to the same volume as the stock solution with the same solvent or buffer. The process is then repeated for as many standard solutions as are desired. A ten-fold serial dilution could be 1 M, 0.1 M, 0.01 M, 0.001 M, etc. A ten-fold dilution for each step is called a logarithmic dilution or log-dilution, a 3.16 fold ($10^{0.5}$ fold) dilution is called a half-logarithmic dilution or half-log dilution, and a 1.78 fold ($10^{0.25}$ fold) dilution is called a quarter-logarithmic dilution or quarter-log dilution. In practice, the ten-fold dilution is the most common. The serial dilution procedure is not only used in chemical analysis but also in serological preparations in which cellular materials such as bacteria are diluted. A critical aspect of serial dilution is that the initial solution concentration must be prepared and determined with great care, since any mistake here will be propagated into all resulting solutions.

Traceability

Analytical measurements and certifications often contain a statement of traceability. Traceability describes the “result or measurement whereby it can be related to appropriate standards, generally international or national standards, through an unbroken chain of comparisons (Ref. 9).” Traceability typically includes the application of a reference material (RM) or a standard reference material (SRM) for instrument calibration before standardization for the analytes of interest. The **true value** of a measured quantity (τ) cannot typically be determined. The true value is defined as characterizing a quantity that is perfectly defined. It is an ideal value which could be arrived at only if all causes of measurement uncertainty were eliminated, and the entire population was sampled.

Uncertainty

As stated in Section 2, the result of a measurement is only an approximation or estimate of the true value of the measurand or quantity subject to measurement. In the determination of the combined standard uncertainty and ultimately the expanded uncertainty, it is critical to include the uncertainty of calibration in the process, as discussed above. The process of arriving at the uncertainty U_y of a quantity y that is based upon measured quantities x_1, \dots, x_z is called the propagation of uncertainty. A full discussion of propagation of uncertainty is beyond the scope of this section; a simplified prescription, in the form of general and specific formulae, is provided here. In general, the propagated random uncertainty in y can be determined from:

$$U_y = \sqrt{\left(\frac{\partial y}{\partial x_1} U_{x_1} \right)^2 + \dots + \left(\frac{\partial y}{\partial x_z} U_{x_z} \right)^2}$$

This approach can be used when the uncertainties are random (not systematic), are relatively small, and are independent or uncorrelated (that is, in the absence of covariance). Relatively large uncertainties (such as those approaching the magnitude of the measurand itself) cannot be treated with this approach, especially if the measurand is a nonlinear function of the measured quantity. Note that by convention the use of upper case U_y denotes the expanded uncertainty (which is the uncertainty multiplied by a coverage factor k ; for the 95% confidence level, the coverage factor is 2).

It is possible to reduce this general formulation to more specific formulae in the cases of common mathematical operations. These are provided in Table 1.

Table 1: Specific Formulae for the Propagation of Random, Independent Uncertainty

Measurand Argument	Arithmetic Uncertainty Formula
y (where y is a counted random event over a time interval)	$U_y = \sqrt{y}$
$y = A \times x$ (where A is a constant with no uncertainty)	$U_y = A \times U_x$
$y = x_1 + x_2$	$U_y = \sqrt{U_{x_1}^2 + U_{x_2}^2}$
$y = x_1/x_2$ $y = x_1 \times x_2$	$\frac{U_y}{ y } = \sqrt{\left(\frac{U_{x_1}}{x_1}\right)^2 + \left(\frac{U_{x_2}}{x_2}\right)^2}$
$y = (x_1 \times x_2)/x_3$	$\frac{U_y}{ y } = \sqrt{\left(\frac{U_{x_1}}{x_1}\right)^2 + \left(\frac{U_{x_2}}{x_2}\right)^2 + \left(\frac{U_{x_3}}{x_3}\right)^2}$
$y = \log(x)$	$U_y = \left(\frac{1}{2.303}\right) \left(\frac{U_x}{x}\right)$
$y = \ln(x)$	$U_y = \frac{U_x}{x}$
$y = e^x$	$U_y = y \times U_x$
$y = x^a$	$\frac{U_y}{ y } = a \times \left(\frac{U_x}{x}\right)$
$y = 10^x$	$\frac{U_y}{ y } = 2.303 \times U_x$

FIGURES OF MERIT

Thomas J. Bruno

In the interpretation of results from a particular technique, one often must evaluate the performance of the measurement on the basis of objective measures that are called figures of merit. The following table provides a description of the more common figures of merit used in analytical chemistry. Even more important than the evaluation of performance is the validation of metrology and the assessment of validation. The same terms used as figures of merit are critical in the validation process. Since many standardization bodies will issue their own definitions regarding these terms, it is

not practical to be inclusive; the reader must be aware that other terms may sometimes be substituted for those used here.

Parameter or Metric	Definition	Comments
Accuracy	The deviation of a measured value from the true value (τ), which cannot typically be determined, but which is often approached by use of a standard method under standard conditions.	Can be expressed as: $\text{accuracy} = (x_{av} - \tau)/\tau,$ where x_{av} is the mean of a series of measurements.
Precision	The reproducibility of a series of replicate measurements, typically under the same operating conditions in a relatively short period of time.	High precision does not imply high accuracy; reproducibility and repeatability often are used interchangeably, but the former typically refers to precision between two instruments or laboratories.
Sensitivity	Typically the ability to distinguish between small differences in concentration between samples at a desired confidence level.	Often specified by response to a <i>de facto</i> or consensus standard; a simple measure is the slope of a calibration curve adjusted for recovery in the sampling process.
Limit of Detection (LOD)	The lowest measureable concentration of an analyte by use of a particular metrology at a desired confidence level.	Typically defined as a response that is some multiplicative factor of the noise level; specified signal to noise ratios of 2 to 4 are typical; as with sensitivity, must adjust for recovery in sample preparation processes.
Linear dynamic range (LDR)	The linear range of a calibration curve obtainable with a particular metrology and analyte.	Within the LDR, the difference in response for two concentrations of a given compound is proportional to the difference in concentration of the two samples.
Selectivity (α)	The ability to distinguish the signal of an analyte from the signal of interferences, the matrix or degradants.	Typically expressed as a ratio, such as the ratio of capacity factors in chromatography; sometimes called specificity.
Analysis Speed	The time required for sample preparation and measurement.	Sometimes necessary to include data processing time.
Throughput	The number of samples that can be run in a given time.	Related to ease of automation, below.
Ease of Automation	The ability of a measurement to be performed without operator attention.	Related to throughput, above, since high throughput typically requires automation. and minimal operator attention.
Ruggedness	The response of an instrument or technique to adverse conditions.	Adverse conditions include extremes in temperature, humidity, dust; includes rough handling; closely related to reproducibility, since it carries similar information content; distinguished from robustness, which is the ability of an instrument to remain unaffected by a small but intentional change in operating parameter, and still perform within specification.
Portability	The ability to use an instrument in other than a fixed location or installation	Can include the ability to use a device in the field in addition to the laboratory.
Environmental Acceptability	The efficiency in terms of low waste generation, low power consumption	Also described as sustainability, and often focused on the minimization of use of hazardous substances.
Economics	The sum of costs required to operate the sample preparation, analysis, and data processing steps of a measurement.	Typically includes the costs of equipment, supplies, labor, utilities and insurance; labor cost must consider the skill level required of personnel.

MASS- AND VOLUME-BASED CONCENTRATION UNITS

Thomas J. Bruno and Paris D. N. Svoronos

A variety of concentration units are used in analytical chemistry, and the most common are provided in this table (Ref. 1). The reference below provides additional details.

Parts per Million

Parts per Million	Percent
1 ppm	= 0.0001 %
10 ppm	= 0.001 %
100 ppm	= 0.01 %
1 000 ppm	= 0.1 %
10 000 ppm	= 1.0 %
100 000 ppm	= 10.0 %
1 000 000 ppm	= 100.0 %

Parts per Billion

Parts per Billion	Percent
10	= 0.000 001 %
100	= 0.000 01 %
1 000	= 0.000 1 %
10 000	= 0.001 %
100 000	= 0.01 %
1 000 000	= 0.1 %

Parts per Trillion

Parts per Trillion	Percent
100	= 1×10^{-8} %
10 000	= 0.000 001 %
1 000 000	= 0.000 1 %
100 000 000	= 0.01 %

Because the mass of one liter of water is approximately one kg, mg/L units of dilute aqueous solution are nearly equal to ppm units. The precise equivalence is obtained by dividing by the density, ρ :

$$\text{ppm} = (\text{mg/L})/\rho$$

where the solution density, ρ , is in g cm^{-3} . Some sources will substitute specific gravity for density in the above equation. The spe-

cific gravity is the ratio of the solution density to that of the density of pure water at 4 °C. Since the density of pure water at 4 °C is very nearly 1 g cm^{-3} , the specific gravity is numerically equal (within an uncertainty of 25 ppm) to the solution density when the latter is expressed in units of g cm^{-3} .

Concentration Units Nomenclature

The following table provides guidance in the use of base-10 concentration units (presented in the three preceding tables), since there are differences in usage worldwide.

Number	Number of Zeros	Name (Scientific Community)	Name (United Kingdom, France, Germany)
1000.	3	thousand	thousand
1 000 000.	6	million	million
1 000 000 000.	9	billion	milliard, or thousand million
1 000 000 000 000.	12	trillion	billion
1 000 000 000 000 000.	15	quadrillion	thousand billion

Molar-Based Concentration Units

Molarity*, M:	(moles of solute)/(liters of solution)
Molality, m :	(moles of solute)/(kilograms of solvent)
Normality, N:	(equivalents of solute)/(liters of solution)
Formality, F:	(moles of solute)/(kilograms of solution)

To convert from ppm to formality units:

$$F = \text{ppm}/(1000 \text{ RMM}), \text{ where RMM is the relative molecular mass of the solute } i$$

To convert from ppm to molality units:

$$m = [\text{ppm}/(1000 \text{ RMM})] [1/(1 - tds/1\,000\,000)]$$

where tds is the total dissolved solids in ppm in the solution

To convert from ppm to molarity units:

$$M = [\text{ppm}/(1000 \text{ RMM})] \rho$$

where ρ is the solution density

* This unit is temperature dependent.

DETECTION OF OUTLIERS IN MEASUREMENTS

Thomas J. Bruno and Paris D. N. Svoronos

The field of outlier detection and treatment is considerable, and a rigorous mathematical discussion is well beyond any treatment that is possible here. Moreover, the practice in the treatment of analytical results is usually simplified, since the number of observations is often not very large. The two most common methods used by analysts to detect outliers in measured data are versions of the Q-test (Refs. 1–3, 6) and Chauvenet's criterion (Refs. 4–6), both of which assume that the data are sampled from a population that is normally distributed.

Q-Test

To perform the Q-test, one calculates the Q value given by:

$$Q = Q_{\text{gap}}/R$$

where Q_{gap} is the difference between the suspected outlier and the measured value closest to it, and R is the range of all the measured values in the data set. One then compares the calculated Q value with the critical Q values in the following table:

Number of Observations	Q_{crit} , 90% Confidence Level	Q_{crit} , 95% Confidence Level	Q_{crit} , 99% Confidence Level
3	0.941	0.970	0.994
4	0.765	0.829	0.926
5	0.642	0.710	0.821

Number of Observations	Q_{crit} , 90% Confidence Level	Q_{crit} , 95% Confidence Level	Q_{crit} , 99% Confidence Level
6	0.560	0.625	0.740
7	0.507	0.568	0.680
8	0.468	0.526	0.634
9	0.437	0.493	0.598
10	0.412	0.466	0.568

If the calculated value of Q is greater than the appropriate value of Q_{crit} , then the value is a suspected outlier.

Chauvenet's Criterion

To perform Chauvenet's test on a set of measurements, one first must calculate the mean and standard deviation of the data. Then one calculates:

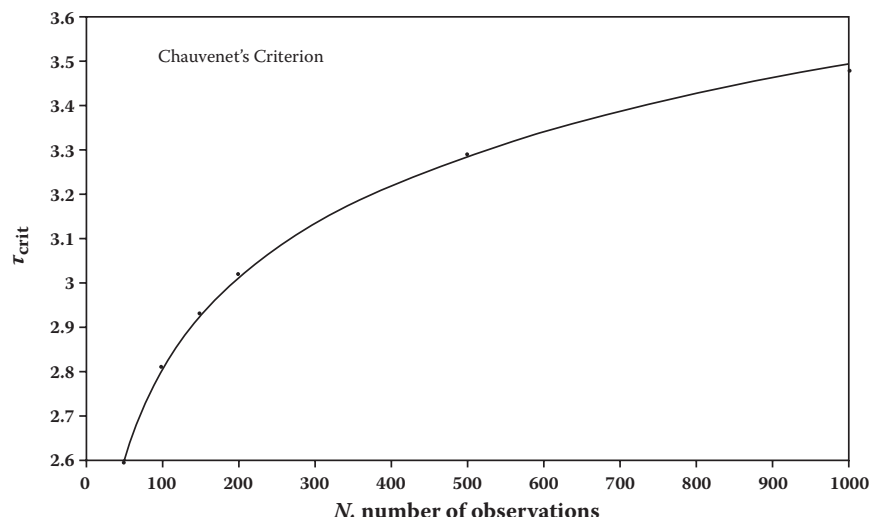

$$\tau = (x_i - x_{\text{ave}})/\sigma$$

where x_i is the suspected outlier, x_{ave} is the mean of all the measurements, and σ is the standard deviation. One then compares the calculated value of τ with τ_{crit} in the following table:

Number of Observations, N	τ_{crit}	Number of Observations, N	τ_{crit}
5	1.65	25	2.33
6	1.73	50	2.57
7	1.81	100	2.81
8	1.86	150	2.93
9	1.91	200	3.02
10	1.96	500	3.29
15	2.12	1000	3.48
20	2.24		

If the calculated value of τ is greater than the value of τ_{crit} , then the value is a suspected outlier.

For numbers of observations between those given in the table, especially for a large number of observations, one may use the following plot to estimate the value of Chauvenet's τ_{crit} :

PROPERTIES OF CARRIER GASES FOR GAS CHROMATOGRAPHY

The following is a list of carrier gases sometimes used in gas chromatography, with properties relevant to the design of chromatographic systems. All data refer to normal atmospheric pressure (101.325 kPa). Additional properties related to the carrier gas, including split ratio, pressure drop in capillary columns, the Martin-James compressibility factor, and the Giddings plate height correction factor can be found in Ref. 2.

M_r : Molecular weight (relative molar mass)

ρ_{25} : Density at 25 °C in g L⁻¹

λ : Thermal conductivity in mW m⁻¹ °C⁻¹

η : Viscosity in $\mu\text{Pa s}$ (equal to 10⁻³ cP)

c_p : Specific heat at 25 °C in J g⁻¹ °C⁻¹

COMMON SYMBOLS USED IN GAS AND LIQUID CHROMATOGRAPHIC SCHEMATIC DIAGRAMS

Thomas J. Bruno

The literature of gas and liquid chromatography frequently contains schematic diagrams that depict analytical apparatus and peripherals. The interpretation of such diagrams can be facilitated by

the following graphics that show the most common symbols used to represent chromatographic components.

STATIONARY PHASES FOR POROUS-LAYER OPEN TUBULAR COLUMNS

Thomas J. Bruno and Paris D. N. Svoronos

The practical application of solid adsorbents in capillary chromatography typically makes use of porous-layer open tubular (PLOT) columns. Early capillary PLOT columns suffered from detector spiking due to particulates becoming dislodged and entering the detector. This was resolved by placing a short length of a polymeric column (usually polydimethyl siloxane) as a particle trap before the detector; however, recent advances in manufacturing methods have resulted in nearly complete binding of particles on the inside of the column. In this table, several of the more common PLOT column stationary phases are listed, along with the separations that may be affected and some additional information. The maximum temperatures listed represent the point of severe resolution loss. The materials are often chemically stable to much higher temperatures. The user should also be aware that the adsorption of water during use will often change retention characteristics dramatically, sometimes resulting in a reversal of positions of adjacent peaks. This can result from traces of water in the carrier gas. Due to surface adsorption of

solutes, some experimentation with temperature may be necessary to prevent tailing or to avoid statistical correlation (or a propagating error) among replicate analyses (Ref. 5). Note that PLOT columns have been used in HPLC for the separation of large molecules such as proteins; this table is limited to smaller molecules.

Phase	Max. Temp./°C	Separation Affected	Notes
Silica gel	250	H ₂ , Air, CO, C ₁ to C ₉ , normal hydrocarbons, alkenes and alkynes, inorganic gases, volatile ethers	Very hydrophilic; requires activation; can be unpredictable; largely replaced by porous polymers; bonded versions are suitable for use with GC-MS, because of the absence of particles.
Alumina, deactivated with KCl	250	C ₁ to C ₈ hydrocarbons, especially useful for resolution of propadiene and butadiene from ethylene and propylene	Least polar of the alumina phases; lowest retention of olefins relative to the corresponding paraffin; specified in many standard methods.
Alumina, deactivated with Na ₂ SO ₄	250	C ₁ to C ₈ hydrocarbons, resolves acetylene from butane and propylene from isobutane	Medium and high polarity phases are available among the alumina phases; specified in many standard methods.
Cyclodextrins	260	Light hydrocarbons (C ₁ to C ₁₀) and halocarbons	α- and β-cyclodextrins have been used; care should be taken with halocarbon analysis, due to the potential of HF contamination of the sample. See the information on cyclodextrin phases in Ref. 5.
Styrene – divinylbenzene	250	C ₁ to C ₉ hydrocarbons; paraffins up to C ₁₂ ; CO from air, ethers, sulfur gases, water	See the information on porous polymers in Ref. 5.
Divinylbenzene ethylene glycol dimethacrylate	280	C ₁ to C ₇ hydrocarbon isomers; CO ₂ , CH ₄ , amines, common solvents, alcohols, aldehydes, ketones	More polar than styrene – divinyl benzene phases.
Molecular sieve, 5A	350	Air and light gas analysis; H ₂ , O ₂ , N ₂ , (CH ₄ , CO, NO, SF ₆ co-elute); thick film phase can resolve Ar from O ₂ at 35 °C; deuterated hydrocarbons	Synthetic calcium aluminosilicate (zeolite) having an effective pore diameter of 0.5 nm CO ₂ is adsorbed strongly; 5A usually gives the best results of all synthetic zeolites; thick and thin film columns are available.
Molecular sieve, 13X	350	Same separations as those performed on 5A, but with C ₁ to C ₉ , alkanes, alkenes, and alkynes being separated as well	Sodium aluminosilicate (zeolite), having a larger pore size than 0.5 nm, thus producing lower retention times and less resolution; 28.6% (mass/mass) water capacity.
Monolithic carbon	350	C ₁ to C ₉ hydrocarbon isomers; acetylene in ethylene; methane	Phase consists of a bonded carbon monolith; historically more suitable for use with GC-MS, because of the absence of particles.

COOLANTS FOR CRYOTRAPPING

Thomas J. Bruno and Paris D. N. Svoronos

The following table provides fluids (in some cases mixtures) that can be used to chill trapping sorbents (or any cold trap) for the purge and trap sampling of solutes (Refs. 1–4). In each case the ratio is mass/mass. Practical use of these methods can require optimization and proper insulation.

PROPERTIES OF COMMON CROSS-LINKED SILICONE STATIONARY PHASES

Thomas J. Bruno and Paris D. N. Svoronos

Modern gas chromatography is most often performed with high efficiency capillary (open tubular) columns coated with a cross-linked polymeric stationary phase. We provide chromatographic data on the two most common cross-linked phases (Ref. 1). These data are useful for the interpretation of chromatograms, and for quality control and assurance. The retention indices presented in these tables were measured at 120 °C isothermally. Retention indices are temperature dependent; the temperature dependence of the Kovats' indices have been studied for many compounds (Ref. 2). For more extensive information on other cross-linked phases, other silicone phases, mesogenic phases, and solid sorbents, the reader is advised to consult Ref. 1.

Phase: 5% Phenyl Dimethylpolysiloxane

Temperature Ranges:

- 60 °C to 325 °C isothermally, –60 °C to 350 °C programmed for < 0.32 mm I.D. columns
- 60 °C to 300 °C isothermally, –60 °C to 320 °C programmed for 0.53 mm I.D. columns
- 60 °C to 260/280 °C for >2.0 µm films

Similar Phases:

DB-5, Ultra-2, SPB-5, CP-Sil 8 CB, Rtx-5, BP-5, OV-5, 007-2 (MPS-5), SE-52, SE-54, XTI-5, PTE-5, HP-5MS, ZB-5, AT-5, MDN-5

Notes: This phase is probably the most commonly used stationary phase in gas chromatography, because it combines boiling point separation with a minor contribution of a specific interaction; typically used as the first phase in any method development; versatile for hydrocarbons and more polar compounds.

Probe Compound	McReynolds Constant	McReynolds Code	Kovats Retention Index
Hexane			600
1-Butanol	66	y'	656
Benzene	31	x'	684
2-Pentanone	61	z'	688
Heptane			700
1,4-Dioxane	64	L	718
2-Methyl-2-pentanol	41	H	731
1-Nitropropane	93	u'	745
Pyridine	62	s'	761
Octane			800
Iodobutane	22	J	840
2-Octyne	35	K	876
Nonane			900
Decane			1000

Phase: Dimethylpolysiloxane

Temperature Range:

- 60 °C to 325 °C for normal operations, periodic operation to 350 °C can be used to facilitate column clean-up
- 60 °C to 260/280 °C for >2.0 µm films

Similar Phases:

DB-1, OV-1, HP-1, DB-1ms, HP-1ms, Rtx-1, Rtx-1ms, CP-Sil 5 CB Low Bleed/MS, MDN-1, AT-1

Notes: Useful for the separation of hydrocarbons, pesticides, PCBs, phenols, sulfur compounds, flavors and fragrances, and some amines; columns are typically stable and low bleed; a good all-purpose column used to begin method development protocols.

Detector	Limit of Detection	Linearity	Selectivity	Comments
Thermal conductivity detector (TCD, katharometer)	1×10^{-10} g propane (in helium carrier gas)	1×10^6	Universal response, concentration detector	Ultimate sensitivity depends on analyte thermal conductivity difference with carrier gas Since thermal conductivity is temperature dependent, response depends on cell temperature Wire selection depends on chemical nature of analyte Helium is recommended as carrier and make-up gas. When analyzing mixtures containing hydrogen, one can use a mixture of 8.5% (mass/mass) hydrogen in helium
Gas density balance detector (GADE)	1×10^{-9} g, H_2 with SF_6 as carrier gas	1×10^6	Universal response, concentration detector	Response and sensitivity are based on difference in relative molecular mass of analyte with that of the carrier gas; approximate calibration can be done on the basis of relative density The sensing elements (hot wires) never touch sample, thus making GADE suitable for the analysis of corrosive analytes such as acid gases; gold sheathed tungsten wires are most common Best used with SF_6 as a carrier gas, switched between nitrogen when analyses are required Detector can be sensitive to vibrations, and should be isolated on a cushioned base
Flame ionization detector (FID)	1×10^{-11} g to 1×10^{-10} g	1×10^7	Organic compounds with C-H bonds	Ultimate sensitivity depends on the number of C-H bonds on analyte Nitrogen is recommended as carrier gas and make-up gas to enhance sensitivity Sensitivity depends on carrier, make-up and jet gas flow-rates Column must be positioned 1 mm to 2 mm below the base of the flame tip Jet gases must be of high purity
Nitrogen-phosphorous detector (NPD, thermionic detector, alkali flame ionization detector)	4×10^{-13} g to 1×10^{-11} g of nitrogen compounds 1×10^{-13} g to 1×10^{-12} g of phosphorous compounds	1×10^4	10^5 to 10^6 by mass selectivity of N or P over carbon	Does not respond to inorganic nitrogen such as N_2 or NH_3 Jet gas flow rates are critical to optimization Response is temperature dependent Used for trace analysis only, and is very sensitive to contamination Avoid use of phosphate detergents or leak detectors Avoid tobacco use nearby Solvent-quenching is often a problem
Electron capture detector (ECD)	5×10^{-14} g to 1×10^{-12} g	1×10^4	Selective for compounds with high electron affinity, such as chlorinated organics; concentration detector	Sensitivity depends on number of halogen atoms on analyte Used with nitrogen or argon/methane (95/5, mass/mass) carrier and make-up gases Carrier and make-up gases must be pure and dry The radioactive ^{63}Ni source is subject to regulation and periodic inspection

Detector	Limit of Detection	Linearity	Selectivity	Comments
Flame photometric detector (FPD)	2×10^{-11} g of sulfur compounds, 9×10^{-13} g of phosphorous compounds	1×10^3 for sulfur compounds 1×10^4 for phosphorous compounds	10^5 to 1 by mass selectivity of S or P over carbon	Hydrocarbon quenching can result from high levels of CO_2 in the flame Self-quenching of S and P analytes can occur with large samples Gas flows are critical to optimization Response is temperature dependent Condensed water can be a source of window fogging and corrosion
Photoionization detector (PID)	1×10^{-12} g to 1×10^{-11} g	1×10^7	Depends on ionization potentials of analytes	Used with lamps with energies of 10.0 eV to 10.2 eV Detector will have response to ionizable compounds such as aromatics and unsaturated organics, some carboxylic acids, aldehydes, esters, ketones, silanes, iodo- and bromoalkanes, alkylamines and amides, and some thiocyanates
Sulfur chemiluminescence detector (SCD)	1×10^{-12} g of sulfur in sulfur compounds	1×10^4	10^7 by mass selectivity of S over carbon	Equimolar response to all sulfur compounds to within 10% Requires pure hydrogen and oxygen combustion gases Instrument generates ozone <i>in situ</i> , which must be catalytically destroyed at detector outlet Catalyst operates at 950 °C to 975 °C Detector operated at reduced pressure (10^{-3} Pa)
Electrolytic conductivity detector (ECD, Hall detector)	10×10^{-13} g to 1×10^{-12} g of chlorinated compounds, 2×10^{-12} g of sulfur compounds, 4×10^{-12} g of nitrogen compounds	1×10^6 for chlorinated compounds, 10^4 for sulfur and nitrogen compounds	10^6 by mass selectivity of Cl over carbon, 10^5 to 10^6 by mass selectivity of S and N over carbon	Only high purity solvents should be used Carbon particles in conductivity chamber can be problematic Frequent cleaning and maintenance is required Often used in conjunction with a photoionization detector For chlorine, use hydrogen as the reactant gas and n-propanol as the electrolyte For nitrogen or sulfur, hydrogen or oxygen can be used as reactant gas, and water or methanol as the electrolyte Ultrahigh purity reactant gases are required
Ion mobility detector (IMD)	1×10^{-12} g	1×10^3 to 1×10^4	10^3	Amenable to use in handheld instruments Linear dynamic range of 10^3 for radioactive sources and 10^5 for photo-ionization sources Selectivity depends on mobility differences of ions Has been used for a wide variety of compounds including amino acids, halogenated organics, explosives The radioactive ^{63}Ni source is subject to regulation and periodic inspection
Mass selective detector (MSD, mass spectrometer, MS)	1×10^{-11} g (single ion monitoring) 1×10^{-8} g (scan mode)	1×10^5	Universal	Quadrupole, multiple quadrupole, ion trap, time of flight, and magnetic sector instruments available (see separate table entitled: "Varieties of Hyphenated Gas Chromatography with Mass Spectrometry") Must operate under moderate vacuum (1×10^{-4} Pa) Requires a molecular jet separator to operate with packed columns Amenable to library searching for qualitative identification Requires tuning of electronic optics over the entire m/e range of interest
Infrared detector (IRD)	1×10^{-9} g of a strong infrared absorber	1×10^3	Universal for compounds with mid-infrared active functionality	A costly and temperamental instrument that requires high purity carrier gas, a nitrogen purge of optical components (purified air will, in general, not be adequate) Must be isolated from vibrations Presence of carbon dioxide is a typical impurity band at 2200 cm^{-1} to 2300 cm^{-1} Requires frequent cleaning and optics maintenance Amenable to library searching for qualitative identification
Atomic emission detector (AED)	1×10^{-13} g to 2×10^{-11} g of each element	1×10^3 to 1×10^4	10^3 to 10^5 , element to element	Requires the use of ultra high purity carrier and plasma gases Plasma produced in a microwave cavity operated at 2450 MHz Scavenger gases (H_2 , O_2) are used as dopants Photodiode array is used to detect emitted radiation

VARIETIES OF HYPHENATED GAS CHROMATOGRAPHY WITH MASS SPECTROMETRY

Thomas J. Bruno

Because of the very powerful and common application of mass spectrometry with gas chromatography, the various technologies warrant more detailed consideration (Refs. 1 to 4). The following table provides basic information on the capabilities and applicability of the most common approaches. Clearly, the use of the single quadrupole is by far the most prevalent and economical method, but the other techniques are important and advantageous. We exclude methods that are typically not interfaced with gas chromatographic separations and that are highly specific in research settings (such as ion cyclotron mass spectrometry, and combined quadrupoles beyond the triple quad, and the various hybrid sector-quad-time of flight-ion trap combinations) that are used in fundamental ion chemistry research. We also exclude magnetic sector instruments that are seldom used with chromatography.

Method (with accepted acronyms and abbreviations)	Modes	Advantages	Limitations
Gas Chromatography Mass Spectrometry GC-MS (single quadrupole, SQ)	Scan, selected ion monitoring (SIM) and Scan/SIM	Relatively simple and relatively inexpensive; compound identification by library search; dynamic range = 10^5 , but typically limited to $>10^4$; mass/charge range = 10^3 to 10^4 , resolution (at $m/z = 1000$) 10^3 to 10^4 for most ions; well-developed hardware and software; used in standard protocols.	Co-elution of compounds compromise library identifications; often user must interpret fragmentation patterns; SIM mode provides higher sensitivity but for target ions only, sensitivity decreases with increasing number of SIM ions; Scan/SIM methods must balance scan and SIM sensitivity requirements.
Gas Chromatography-Mass Spectrometry GC-MS (ion trap, IT)	Scan or selected ion monitoring (SIM); tandem MS-MS; gas or liquid chemical ionization	High sensitivity, compact design; tandem mass spectrometry is possible; dynamic range = 10^4 , but typically limited to $<10^4$; mass/charge range = 10^4 to 10^5 , resolution (at $m/z = 1000$) 10^3 ; well-developed hardware and software; used in standard protocols.	Space charge effects can lead to relatively poor dynamic range, however, for "clean" samples, the dynamic range can be as high as single quadrupole units; specific libraries are limited; SIM is for target ions only with a sensitivity lower than that obtainable by a SIM analysis via single quadrupole, above; MS-MS analyses are limited to approximately 120 to 150 compounds per analysis; MS-MS analysis is typically slower than that done with a tandem MS-MS (process is done in time rather than space).
Gas Chromatography (time of flight) Mass Spectrometry, low resolution GC-TOF	Scan or selected ion monitoring	Identification possible with good chromatographic separations, dynamic range = 10^4 , mass/charge range = 10^5 , resolution (at $m/z = 1000$) 10^3 to 10^4	Unit mass resolution limits identification capability; libraries are limited; if chromatographic separation is poor, comprehensive (GCXGC) might be needed; cannot distinguish neutral losses.
Comprehensive Gas Chromatography (time of flight) Mass Spectrometry, low resolution GCXGC-TOF	Scan or selected ion monitoring; normal column configuration (nonpolar – polar) or reversed column configuration (polar – nonpolar)	Identification possible with good chromatographic separations in two dimensions on a nonpolar (long) and a polar (short) column; identification of families with help of principal component analysis tools; dynamic range = 10^4 , mass/charge range = 10^5 , resolution (at $m/z = 1000$) 10^3 to 10^4 , well-developed hardware and software; used in standard protocols.	Unit mass resolution limits identification capability; libraries are limited; GCXGC may not remedy all aspects of component coelution.

Method (with accepted acronyms and abbreviations)	Modes	Advantages	Limitations
Gas Chromatography Mass Spectrometry (triple quadrupole) GC-MS(QQQ, or QqQ)	Multiple and selected reaction monitoring	Provides product and precursor ion scans; very sensitive for target compounds or functional groups; developed to provide enhanced daughter ion resolution; relatively simple construction with straightforward scanning procedures; no high voltage arcing; dynamic range = 10^5 , mass/charge range = 10^3 to 10^4 , resolution (at $m/z = 1000$) $10^3 - 10^4$.	Unit mass, making identification ambiguous due to multiple structures as source of breakdown mass; empirical formula determination can be difficult, spectra and fragmentations must often be interpreted manually; full scan data can be acquired (similar to the single quad procedure) by turning off the collision cell.
Gas Chromatography (time of flight) Mass Spectrometry, high resolution GC-TOF	Scan or selected ion monitoring, tandem MS-M	Might obviate the need for GCXGC separations with accurate mass determinations; deconvolution software can aid in identification of multiple components under peaks; sensitivity intermediate between multiple reaction monitoring and product ion scan of a QQQ; dynamic range = 10^4 , mass/charge range = 10^5 , resolution (at $m/z = 1000$) 10^3 to 10^4 .	Very large data files (currently approaching 2 Gb), software is currently developmental.
Gas Chromatography Tandem Mass Spectrometry GC-QTOF	Scan or selected ion monitoring, tandem MS-MS	Might obviate the need for GCXGC separations with accurate mass determinations; isolation of parent ions and subsequent fragmentation provides identification; will detect any daughter ion passed into the TOF; sensitivity intermediate between multiple reaction monitoring and product ion scan of a QQQ dynamic range = 10^4 , mass/charge range = 10^5 , resolution (at $m/z = 1000$) 10^3 to 10^4 .	Large data files are produced; Sophisticated software is needed for processing and deconvolution; requires accurate mass and high resolution.

SOLID-PHASE MICROEXTRACTION SORBENTS

Thomas J. Bruno and Paris D. N. Svoronos

While trapping sorbents have been used for many years in headspace analysis (most commonly with gas chromatography), the modern techniques of solid-phase microextraction (SPME) are particularly applicable to survey analyses (Ref. 1). In the following tables, we provide information for the selection and application of the various fibers, modifications to fiber materials, and data on salting out reagents (Refs. 1 to 5). For information on other trapping sorbents, chelating agents, resins, and polymeric phases used for headspace analysis, please consult Ref. 1.

Fiber Selection Criteria

The main fiber selection parameters are polarity and relative molecular mass. The table below provides general guidelines on the applicability of available fibers relative to these two parameters. The fibers are characterized by the extraction mechanism, either adsorption or absorption. Adsorbent fibers contain particles suspended in polydimethyl siloxane (PDMS) or polyethylene glycol (PEG, Carbowax).

Fiber	Type of Fiber	Polarity	RMM Range
7 µm PDMS	Absorbent	Nonpolar	150–700
30 µm PDMS	Absorbent	Nonpolar	80–600
85 µm Polyacrylate	Absorbent	Moderately polar	60–450
100 µm PDMS	Absorbent	Nonpolar	55–400
50 µm Carbowax (PEG)	Adsorbent	Polar	50–400
PDMS-DVB	Adsorbent	Bipolar	50–350
Carbowax-DVB	Adsorbent	Polar	50–350
PDMS-DVB-Carboxen	Adsorbent	Bipolar	40–270
PDMS-Carboxen	Adsorbent	Bipolar	35–180
Carbopak Z-PDMS	Adsorbent	Nonpolar	50–500

PDMS – Polydimethylsiloxane

DVB – Divinylbenzene (3 µm to 5 µm particles)

PEG – Polyethylene glycol

Carboxen – Carboxen 1006 (contains micro-, meso-, and macro-tapered pores) (3 µm to 5 µm particles)

RMM Range – Relative molecular mass range that is the ideal range for optimum extraction. Ranges can be extended by varying extraction times, but results will not be optimized

Phase Material Characteristics

Polydimethylsiloxane (PDMS):

Similar in properties to the OV-1 or SE-30 silicone phases (Ref. 1); non-polar fluid suitable for non-polar or slightly polar analytes; thicker coatings extract more analyte, but require longer extraction times; thicker coatings may show carryover effects; useful for hydrocarbons, aldehydes, ketones, and esters.

Polyacrylate:

Rigid solid material; moderate polarity; diffusion of analytes through bulk is relatively slow because of rigidity of material; relatively higher desorption temperatures required because of rigidity of material; can be oxidized easily at higher temperatures; must use oxygen-free carrier gas and ensure gas chromatographic system is leak-free; fibers are very solvent resistant; darkens to a brown color upon exposure to temperatures in excess of 280 °C, but fiber is generally still usable until color becomes black; useful for alcohols.

Carbowax (polyethylene glycol, PEG):

Similar in properties to the PEG coatings used extensively in chromatography; moderately polar; highly crosslinked to counteract water solubility; sensitive to attack by oxygen at temperatures in excess of 220 °C, at which point the fiber will darken and become powdery; requires use of high purity carrier gas (typically He at 99.999 % mass/mass) treated for oxygen contamination.

Divinylbenzene (DVB):

Similar to the properties of divinylbenzene porous polymer phases; higher polarity than Carbowax, and when combined with Carbowax results in a more polar phase; like polyacrylate, it is a solid particle that must be carried in a liquid to coat on a fiber.

Carboxen:

Similar to the material used in Carboxen porous-layer open tubular (PLOT) columns; structure has an approximately even distribution of macro-, meso-, and micro-pores, making it valuable for smaller analytes; larger analytes can show hysteresis that must be addressed by desorption at 280 °C; useful for hydrocarbons, ethers, aldehydes, and ketones.

Extraction Capability of Solid-Phase Microextraction Sorbents

This table shows the extraction capability of the fibers for acetone, a small, moderately polar analyte, for 4-nitrophenol, a medium size polar analyte, and benzo(GH)perylene, a large nonpolar analyte. This provides a general guideline for fiber selection.

Fiber	Approx. Linear Conc. Range Acetone 10 min Ext ^a (FID)	Approx. Linear Conc. Range 4-Nitrophenol 20 min Ext ^b (GC/MS)	Approx. Linear Conc. Range Benzo(GHI) Perylene 20 min Ext
7 μ m PDMS	100 ppm and up	Not extracted	100 ppt to 500 ppb
30 μ m PDMS	10 ppm and up	10 ppm and up	100 ppt to 10 ppm
85 μ m Polyacrylate	1 ppm to 1000 ppm	5 ppb to 100 ppm	500 ppt to 10 ppm
100 μ m PDMS	500 ppb to 1000 ppm	500 ppb to 500 ppm	500 ppt to 10 ppm
50 μ m Carbowax (PEG)	1 ppm to 1000 ppm	5 ppb to 50 ppm	25 ppb to 10 ppm
PDMS-DVB	50 ppb to 100 ppm	25 ppb to 10 ppm	10 ppb to 1 ppm
Carbowax-DVB	100 ppb to 100 ppm	5 ppb to 10 ppm	50 ppb to 5 ppm
PDMS-DVB-Carboxen	25 ppb to 10 ppm	50 ppb to 10 ppm	100 ppb to 1 ppm poorly desorbed
PDMS-Carboxen	5 ppb to 5 ppm	100 ppb to 10 ppm	Not desorbed
Carbopak Z-PDMS	10 ppm to 500 ppm	5 ppm to 100 ppm	500 ppt to 100 ppb

Note: In each case, the concentration is expressed on a mass basis (e.g., ppm mass/mass).

^a Water sample contains 25% NaCl (mass/mass)

Bonded-Phase Modified Silica Substrates for Solid-Phase Extraction

The following table provides the most commonly used bonded-phase modified silica substrates used in solid-phase extraction

(Ref. 6). Additional information on many of these materials can be found in the table entitled "More Common HPLC Stationary Phases" in the HPLC chapter of Ref. 2.

Phase	Polarity of Phase	Designation
Octadecyl, endcapped	Strongly apolar	C18ec
Octadecyl	Strongly apolar	C18
Octyl	Apolar	C8
Ethyl	Slightly polar	C2
Cyclohexyl	Slightly polar	CH
Phenyl	Slightly polar	PH
Cyanopropyl	Polar	CN
Diol	Polar	2OH
Silica gel	Polar	SiOH
Carboxymethyl	Weak cation exchanger	CBA
Aminopropyl	Weak anion exchanger	NH ₂
Propylbenzene sulfonic acid	Strong cation exchanger	SCX
Trimethylaminopropyl	Strong anion exchanger	SAX

Salting-Out Reagents for Headspace Analysis

The following table provides data on the common salts used for salting out in chromatographic headspace analysis, as applied to direct injection methods and to solid-phase microextraction. Data are provided for the most commonly available salts, although others are possible. Sodium citrate, for example, occurs as the dihydrate and the pentahydrate. The pentahydrate is not as stable as the dihydrate, however, and dries out on exposure to air, forming

cakes. Potassium carbonate occurs as the dihydrate, trihydrate, and sesquihydrate; however, data are provided only for the anhydrous material. The solubility is provided as the number of grams that can dissolve in 100 mL of water at the indicated temperature. The vapor enhancement cited is the degree of increase of the concentration of vapor over the solution of a 2 % (mass/mass) ethanol solution in water at 60 °C.

Salt	Formula	Rel. Mol. Mass	Density/g cm ⁻³	Solubility/g mL ⁻¹ H ₂ O		Vapor Enhancement
				Cold Water	Hot Water	
Potassium carbonate	K ₂ CO ₃	138.21	2.428 at 14 °C	112 ^a	156 ^b	8
Ammonium sulfate	(NH ₄) ₂ SO ₄	132.13	1.769 at 50 °C	70.6 ^c	103.8 ^b	5
Sodium citrate (dihydrate)	Na ₃ C ₆ H ₅ O ₇ × 2H ₂ O	294.10		72 ^d	167 ^b	5
Sodium chloride	NaCl	58.44	2.165 ^e	37.5 ^a	39.12 ^b	3
Ammonium chloride	NH ₄ Cl	53.49	1.527	29.7 ^c	75.8 ^b	2

^a 20 °C

^b 100 °C

^c 0 °C

^d 25 °C

^e Specific gravity, 25 °C/4 °C

GAS CHROMATOGRAPHIC RETENTION INDICES

Thomas J. Bruno

The interpretation of results from chromatographic measurements can often be augmented with an appropriate mathematical treatment of the solute retention that is observed. The goal of the treatment is to make the resulting metric as independent of the instrument as possible. A typical situation that arises from analysis by gas chromatography with mass spectrometry is that the library search routine produces "hits" that are ambiguous if not nonsensical (Ref. 1). The correct interpretation of the mass spectrum must then be done manually (Refs. 2, 3), and the mass spectral data should be augmented by additional analytical techniques. The specific techniques that should be used must be determined on a case-by-case basis by a qualified person. One additional datum that is typically already present in gas chromatography with mass spectrometry detection is chromatographic retention. The raw datum from a chromatographic measurement is a retention time, t_r , of each eluted peak, and a corresponding intensity. Here, we will not treat other aspects of the output, such as the width and shape of the chromatographic signal. The retention time (for a given stationary phase) is dependent on the column temperature, column pressure, column geometry (length and inside diameter; phase ratio), and ambient (atmospheric) pressure.

If the volumetric carrier gas flow rate (at the column exit) is measured and multiplied by the retention time, the retention volume, V_R , is obtained. The adjusted retention volume, V_R' , is the retention volume corrected for the void volume (or mobile phase holdup) of the column. It is obtained by simply subtracting the retention volume of an unretained solute (V_M):

$$V_R' = V_R - V_M \quad (1)$$

While it is possible to calculate the corresponding adjusted retention time, t_r' , by subtracting the retention time of the unretained peak, t_m , it is better to work with volumes since average flow-rate variations between individual analyses are then accounted for. Note that with each level of refinement beyond the raw retention time, a facet of instrument dependence from the resulting parameter is removed. V_R is independent of the flow rate; V_R' is, further, independent of column geometry. Continuing with this approach, the net retention volume, V_N , is defined, by applying a factor, j , to account for the pressure drop across the column:

$$V_N = jV_R' \quad (2)$$

where j is usually the Martin-James compressibility factor³:

$$j = \frac{3}{2} \left[\frac{\left(\frac{P_i}{P_o} \right)^2 - 1}{\left(\frac{P_i}{P_o} \right)^3 - 1} \right] \quad (3)$$

In Eq. 3, P_i is the inlet pressure (absolute) and P_o is the outlet pressure (usually atmospheric pressure). The net retention volume is important because it is independent of the inlet and outlet pressures, as well as being independent of the carrier gas flow rate and column geometry.

The specific retention volume, V_g , corrects the net retention volume for the amount of stationary phase actually on the column, and the column temperature is adjusted or corrected to 0 °C:

$$V_g = (273.15) \frac{V_N}{(W_s T_{col})} \quad (4)$$

where T_{col} is the column temperature (in K), and W_s is the mass of the stationary phase in the column. The V_g value is a characteristic for a particular solute on a particular stationary phase, and is instrument independent. This is a quantity that may be compared from instrument to instrument, and laboratory to laboratory with a high level of confidence provided the stationary phase used is a single, pure compound or a well characterized mixture. If the mass of the stationary phase is not known, or is not meaningful, one may use the net retention volume directly, or one may correct the net retention volume to a column temperature of 0 °C (represented by V_N^0) by simply not including the term for W_s (that is, setting it equal to unity).

It is also extremely valuable to calculate a relative retention, $r_{a/b}$:

$$r_{a/b} = \left(\frac{V_g^b}{V_g^a} \right) = \left(\frac{V_N^b}{V_N^a} \right) \quad (5)$$

where the numerical superscripts refer to the retention volumes of solutes "a" and "b." In this case, solute "a" is a reference compound. The relative retention is dependent only on the column temperature and the type of stationary phase. For reasons of operational simplicity, this parameter is usually one of the best to use for qualitative analysis. It can account for small differences in the column temperature, stationary phase considerations, column history, and minor disturbances in the carrier gas flow rate. It is possible to account for the column temperature by plotting the logarithm of the retention parameters against $1/T$, where T is the thermodynamic temperature. The column pressure is accounted for by variations in the volume measurement; therefore, there is no pressure dependence to these parameters.

We can go beyond the simple retention parameters discussed earlier to incorporate a logarithmic interpolation on a uniform scale by use of the Kovats' retention index (Ref. 4). The isothermal Kovats' retention index is calculated by use of the following defining equation:

$$I_{\text{sample}}(T) = 100 \left[\frac{\log X_s - \log X_L}{\log X_H - \log X_L} + n_L \right] \quad (6)$$

Here, I_{sample} is the dimensionless Kovats' retention index that is a function of both temperature and the stationary phase employed. The terms represented by X are retention parameters of the sample and standards. Following this convention, X_s is the retention parameter of the sample under consideration. Any retention parameter, such as the adjusted retention time, t' , the net retention volume, V_N , the adjusted net retention volume, V_N^0 , and the relative retentions, $r_{a/b}$, can be used. X_s is the retention parameter of the sample under consideration, X_L is the retention parameter of a normal alkane (that is, straight chain or unbranched) of carbon number n_L that elutes earlier than the sample, and X_H is the retention parameter of a normal alkane having a carbon number greater than $n_L + 1$ that elutes after the sample. The retention index of a sample is, therefore, 100 multiplied by the carbon number of a hy-

pothetical normal alkane that shows the same retention parameter on the stationary phase at that temperature. Thus, a sample that has a retention index of 785, for example, would co-elute with a hypothetical normal alkane that has 7.85 carbon atoms. By definition, the retention indices of the normal alkanes (on any stationary phase) are equal to 100 multiplied by the carbon number. Thus, for *n*-hexane, $I = 600$, and so on for the other *n*-alkanes in this homologous series. The zero point in the scale is defined for hydrogen, for which $I = 0$. Kovats' retention indices have been determined for selected compounds on the most common stationary phases [Refs. 5-7].

The temperature dependence of I for a given sample is known to follow a hyperbolic form similar to the familiar Antoine equation used to represent vapor pressure:

$$I_{\text{sample}}(T) = A + \frac{B}{(T+C)} \quad (7)$$

In this equation, A , B , and C are empirically determined constants, and T is the temperature (in °C). A nonlinear fitting routine should be used to determine these constants. When retention indices are available for at least three temperatures, initial values for A , B , and C can be determined by use of the following equations:

$$C = \frac{(T_2 - T_1)(I_3 T_3 - I_1 T_1) + (T_3 - T_1)(I_1 T_1 - I_2 T_2)}{(T_3 - T_1)(I_2 - I_1) - (T_2 - T_1)(I_3 - I_1)}, \quad (8)$$

$$A = \frac{I_2 T_2 - I_1 T_1 + C(I_2 - I_1)}{T_2 - T_1}, \quad (9)$$

$$B = (I_2 - A)(T_2 + C). \quad (10)$$

In these equations, I_1 , I_2 , and I_3 are retention indices of the sample measured at temperatures T_1 , T_2 , and T_3 . When additional retention indices are available at other temperatures, we advocate the use of minimum deviation estimates from these three equations to furnish the starting values for the nonlinear fit. When retention indices at four temperatures are available, the best starting values are obtained from the I_1 , I_2 , and I_3 triplet that minimizes the deviation with the experimental value with that produced by Eq. 7. This approach provides the fastest convergence, and also helps avoid converging to local minima. Predictions made by use of Eq. 7

can be used for retention indices within the measured temperature range as well as extrapolation somewhat beyond that range on a case-by-case basis.

It is also of value to report and use the temperature dependence as a slope coefficient, $\delta I_{\text{sample}}/10^\circ\text{C}$, the variation of I_{sample} for a particular stationary phase over a particular temperature range. While not as reliable as the Antoine-type fit, this coefficient is useful for predictions within the range of the measured results.

In all of the above discussion, one must understand that the column temperature is fixed. The Kovats' retention indices can be made applicable to temperature programmed analysis by use of

$$I = 100 \times \left[n + (N - n) \frac{t_{r(\text{unknown})} - t_{r(n)}}{t_{r(N)} - t_{r(n)}} \right], \quad (11)$$

where I is the retention index, n is the number of carbon atoms in the smaller *n*-alkane, N is the the number of carbon atoms in the larger *n*-alkane, and t_r is the retention time of the indicated peak.

A useful alternative to the Kovats' system is the Lee retention index (isothermal and temperature dependent), based on the polynuclear aromatic hydrocarbon (PAH) standard compounds: naphthalene ($I = 200$), phenanthrene ($I = 300$), chrysene ($I = 400$), and picene or benzo(g,h,i)perylene ($I = 500$). Isothermal (and temperature-dependent) Kovats' and Lee retention indices for many compounds are tabulated in the NIST Chemistry Web Book (Ref. 8).

ELUOTROPIC VALUES OF SOLVENTS ON OCTADECYLSILANE AND OCTYLSILANE

Thomas J. Bruno and Paris D. N. Svoronos

The following table provides, for comparative and interpretive purposes, eluotropic values on bonded octadecylsilane (ODS) and octylsilane (OS) for common solvents used in HPLC (Refs. 1–3). For additional information on common, specific and chiral stationary phases for HPLC, and for solvents, derivatizing reagents, and detectors, see Ref. 3.

Solvent	Eluotropic Value,	
	ODS	OS
Acetic acid	—	2.7
Acetone	8.8	9.3
Acetonitrile	3.1	3.3
1,4-Dioxane	11.7	13.5
Dimethyl-formamide	7.6	9.4
Methanol	1.0	1.0
Ethanol	3.1	3.2
1-Propanol	10.1	10.8
2-Propanol	8.3	8.4
Tetrahydrofuran	3.7	—

INSTABILITY OF HPLC SOLVENTS

Thomas J. Bruno and Paris D. N. Svoronos

Solvents that are commonly used in high performance liquid chromatography frequently have inherent chemical instabilities that must be considered when designing an analysis, or in the interpretation of results (Refs. 1–4). In many cases, such solvents are obtainable with stabilizers added to control the instability or to slow the reaction. Reactive solvents that do not have stabilizers must be used quickly or be given proper treatment. In either case, it is important to understand that the solvents (as they may be used in an analysis) are not necessarily pure materials.

Although not specifically considered below, the preparation of aqueous-organic solvents for HPLC can cause the introduction of impurities. Mixing acetonitrile and water is endothermic and can sometimes exacerbate air dissolution. Buffers are also a special case in that the pH can change due to exposure to air and

the development of microbes (Ref. 4). Buffers should be used the same day of preparation and often incorporate the preservative sodium metabisulfite.

Solvent	Contaminants, Reaction Products	Stabilizers
Ethers		
Diethyl ether	Peroxides ¹	2–3% (vol/vol) ethanol ² 1–10 ppm (mass/mass) BHT (1.5–3.5% ethanol) + (0.2–0.5% water) + (5–10 ppm (mass/mass) BHT)
Isopropyl ether	Peroxides ¹	0.01% (mass/mass) hydroquinone 5–100 ppm (mass/mass) BHT
1,4-Dioxane	Peroxides ¹	25–1500 ppm (mass/mass) BHT
Tetrahydrofuran	Peroxides ¹	25–250 ppm (mass/mass) BHT
Chlorinated Alkanes		
Chloroform	Hydrochloric acid, chlorine, phosgene (CCl ₂ O)	0.5–1% (vol/vol) ethanol 50–150 ppm (mass/mass) amylene ³ various ethanol amylene blends
Dichloromethane	Hydrochloric acid, chlorine, phosgene (CCl ₂ O)	25 ppm (mass/mass) amylene 25 ppm (mass/mass) cyclohexene 400–600 ppm (mass/mass) methanol various amylene methanol blends
Alcohols		
Ethanol	Water, numerous denaturants are commonly added	
Methanol	Water; formal dehydrate (at elevated temperature)	
Acetone	Diacetone alcohol, and higher oligomers	

Note: BHT — 2,6-di-*tert*-butyl-p-cresol.

¹ The peroxide concentration that is usually considered hazardous is 250 ppm (mass/mass).

² Ethanol does not actually stabilize diethyl ether, nor is it a peroxide scavenger, although it was thought to be so in the past. It is still available in chromatographic solvents to preserve the utility of retention relationships and analytical methods.

³ Amylene is a generic name for 2-methyl-2-butene.

DETECTORS FOR LIQUID CHROMATOGRAPHY

Thomas J. Bruno and Paris D. N. Svoronos

The following table provides some comparative data for interpretation of results from the more common detectors applied to high-performance liquid chromatography (Refs. 1-6). In general, the operational parameters provided are for optimized systems, and represent the maximum obtainable in terms of sensitivity and linearity. In this table, the molar extinction coefficient is represented by ϵ .

Detector	Sensitivity	Linearity	Selectivity	Comments
Ultraviolet spectrophotometer	1×10^{-9} g (for compounds of $\epsilon = 10\,000$ to $20\,000$)	1×10^4	For UV-active functionalities, on the basis of absorptivity.	Relatively insensitive to flow and temperature fluctuations; non-destructive, useful with gradient elution; use mercury lamp for 254 nm, and quartz-iodine lamp for 350 nm to 700 nm; often a diode-array instrument is used to obtain entire UV-vis spectrum.
Refractive index detector (RID)	1×10^{-7} g	1×10^4	Universal, dependent on refractive-index difference with mobile phase	Relatively insensitive to flow fluctuations, but sensitive to temperature fluctuations; non-destructive, cannot be used with gradient elution; solvents must be degassed to avoid bubble formations; laser-based RI detectors offer higher sensitivity.
Fluorometric detector	1×10^{-11} g	1×10^5	For fluorescent species with conjugated bonding and/or aromaticity	Relatively insensitive to temperature and flow fluctuations; non-destructive; can be used with gradient elution; often, chemical derivatization is done on analytes to form fluorescent species; uses deuterium lamp for 190 nm to 400 nm, or tungsten lamp for 350 nm to 600 nm.
Electrochemical detectors				
Amperometric	1×10^{-9} g	1×10^4	Responds to -OH functionalities	Used for aliphatic and aromatic -OH compounds, amines, and indoles; pulsed potential units are most sensitive, can be used with gradient elution and organic mobile phases; senses compounds in oxidative or reductive modes; mobile phases must be highly pure and purged of O_2 .
Conductivity detector	1×10^{-9} g	2×10^4	Specific to ionizable compounds	Uses post-column derivatization to produce ionic species; especially useful for certain halogen, sulfur, and nitrogen compounds
Mass spectrometers	Interface dependent	Interface dependent	Universal, within limits imposed by interface	Complex, expensive devices highly dependent on an efficient interface; electrospray and thermospray interfaces are most common; linear response is difficult to achieve.

SOLVENTS FOR ULTRAVIOLET SPECTROPHOTOMETRY

This table lists some solvents commonly used for sample preparation for ultraviolet spectrophotometry. The properties given are:

- λ_c : cutoff wavelength, below which the solvent absorption becomes excessive.
 ϵ : dielectric constant (relative permittivity); the temperature in °C is given as a superscript.
 t_b : normal boiling point.

CORRELATION TABLE FOR ULTRAVIOLET ACTIVE FUNCTIONALITIES

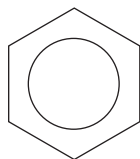

Thomas J. Bruno and Paris D. N. Svoronos

The following table presents a correlation between common chromophoric functional groups and the expected absorptions from ultraviolet (UV) spectrophotometry. While not as informative as infrared correlations, UV can often provide valuable qualitative information. In these tables, λ_{\max} is the wavelength in nm at which the maximum absorption occurs, and ϵ_{\max} is the extinction coefficient.

Isoquinoline		218	80 000	266	4000	317	3500

Note: ϕ denotes a phenyl group.

Wavenumber Adjustments for Bathochromic Shifts (Woodward's Rules)

Conjugated systems show bathochromic shifts in their $\pi \rightarrow \pi^*$ transition bands. Empirical methods for predicting those shifts were originally formulated by Woodward (References 5–7) and Fieser and Fieser (Reference 8). This section includes the most important conjugated system rules. The reader should consult References 6 and 8 for more details on how to apply the wavelength increment data.

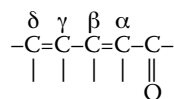

(a) Rules for Diene Absorption

Base value for diene: 214 nm

Increments for each (in nm):

Heteroannular diene	+ 0
Homoannular diene	+39
Extra double bond	+30
Alkyl substituent or ring residue	+5
Exocyclic double bond	+5
Polar groups:	
–OOCR	+0
–OR	+6
–S–R	+30
halogen	+5
–NR ₂	+60
λ Calculated	= Total

(b) Rules for Enone Absorption*

Base value for acyclic (or six-membered) α,β -unsaturated ketone: 215 nm

Base value for five-membered α,β -unsaturated ketone: 202 nm

Base value for α,β -unsaturated aldehydes: 210 nm

Base value for α,β -unsaturated esters or carboxylic acids: 195 nm

Increments for each (in nm):

Heteroannular diene	+0
Homoannular diene	+39
Double bond	+30
Alkyl group:	
α –	+10
β –	+12
γ – and higher	+18
Polar groups:	
–OH	
α –	+35
β –	+30
δ –	+50
–OOCR	
$\alpha, \beta, \gamma, \delta$	+6
–OR	
α –	+35
β –	+30
γ –	+17
δ –	+31
–SR	
β –	+85
–Cl	
α –	+15
β –	+12
–Br	
α –	+25
β –	+30
–NR ₂	
β –	+95
Exocyclic double bond	+5
λ Calculated	= Total

*Solvent corrections should be included. These are: water (–8), chloroform (+1), dioxane (+5), ether (+7), hexane (+11), and cyclohexane (+11). No correction is included for methanol or ethanol.

(c) Rules for monosubstituted benzene derivatives

Parent Chromophore (benzene): 250 nm

Substituent	Increment (in nm)
-R	-4
-COR	-4
-CHO	0
-OH	-16
-OR	-16
-COOR	-16

where R is an alkyl group, and the substitution is on C_6H_5- .

(d) Rules for disubstituted benzene derivatives

Parent Chromophore (benzene): 250 nm

Substituent	Increment (in nm)		
	<i>o</i> -	<i>m</i> -	<i>p</i> -
-R	+3	+3	+10
-COR	+3	+3	+10
-OH	+7	+7	+25
-OR	+7	+7	+25
-O ⁻	+11	+20	+78 (variable)
-Cl	+0	+0	+10
-Br	+2	+2	+15
-NH ₂	+13	+13	+58
-NHCOCH ₃	+20	+20	+45
-NHCH ₃	—	—	+73
-N(CH ₃) ₂	+20	+20	+85

R indicates an alkyl group.

WAVELENGTH-WAVENUMBER CONVERSION TABLE

Thomas J. Bruno and Paris D. N Svoronos

The following table provides a conversion between wavelength and wavenumber units, for use in infrared spectrophotometry (Refs. 1 and 2). Because spectra are presented in different formats, this table is an aid in interpretation.

MIDDLE-RANGE INFRARED ABSORPTION CORRELATION CHARTS

Thomas J. Bruno and Paris D.N. Svoronos

The following charts provide characteristic middle-range infrared absorptions obtained from particular functional groups on molecules (Refs. 1 and 2). These include a general mid-range correlation chart, a chart for aromatic absorptions, and a chart for carbonyl moieties. Charts for near infrared absorptions and for inorganic moieties can be found in the cited references.

Notes:

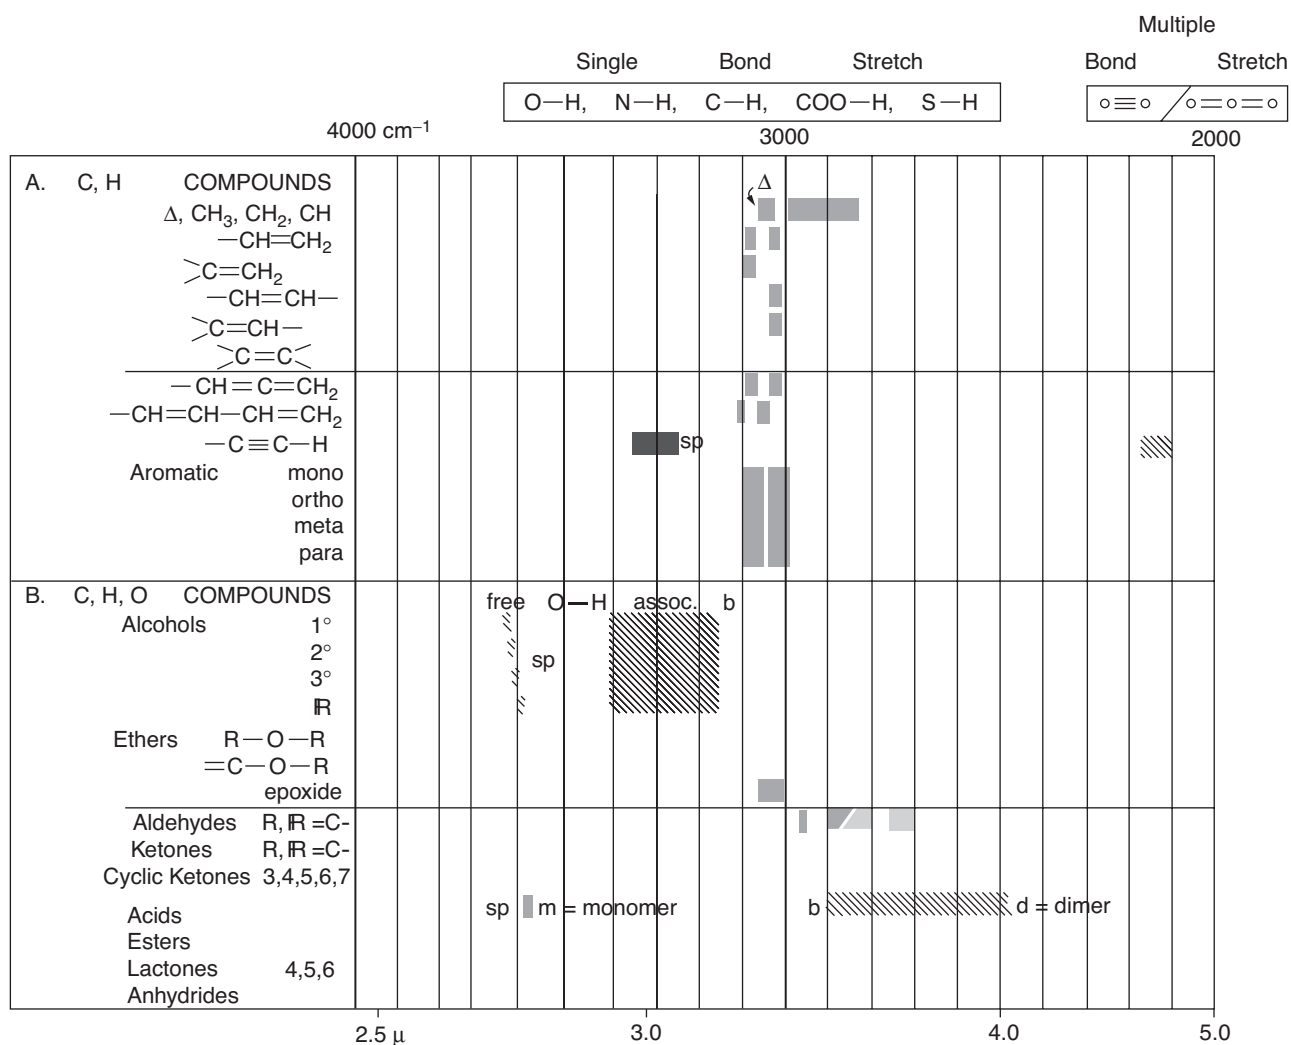

AR = aromatic
b = broad
sd = solid
sn = solution
sp = sharp
? = unreliable

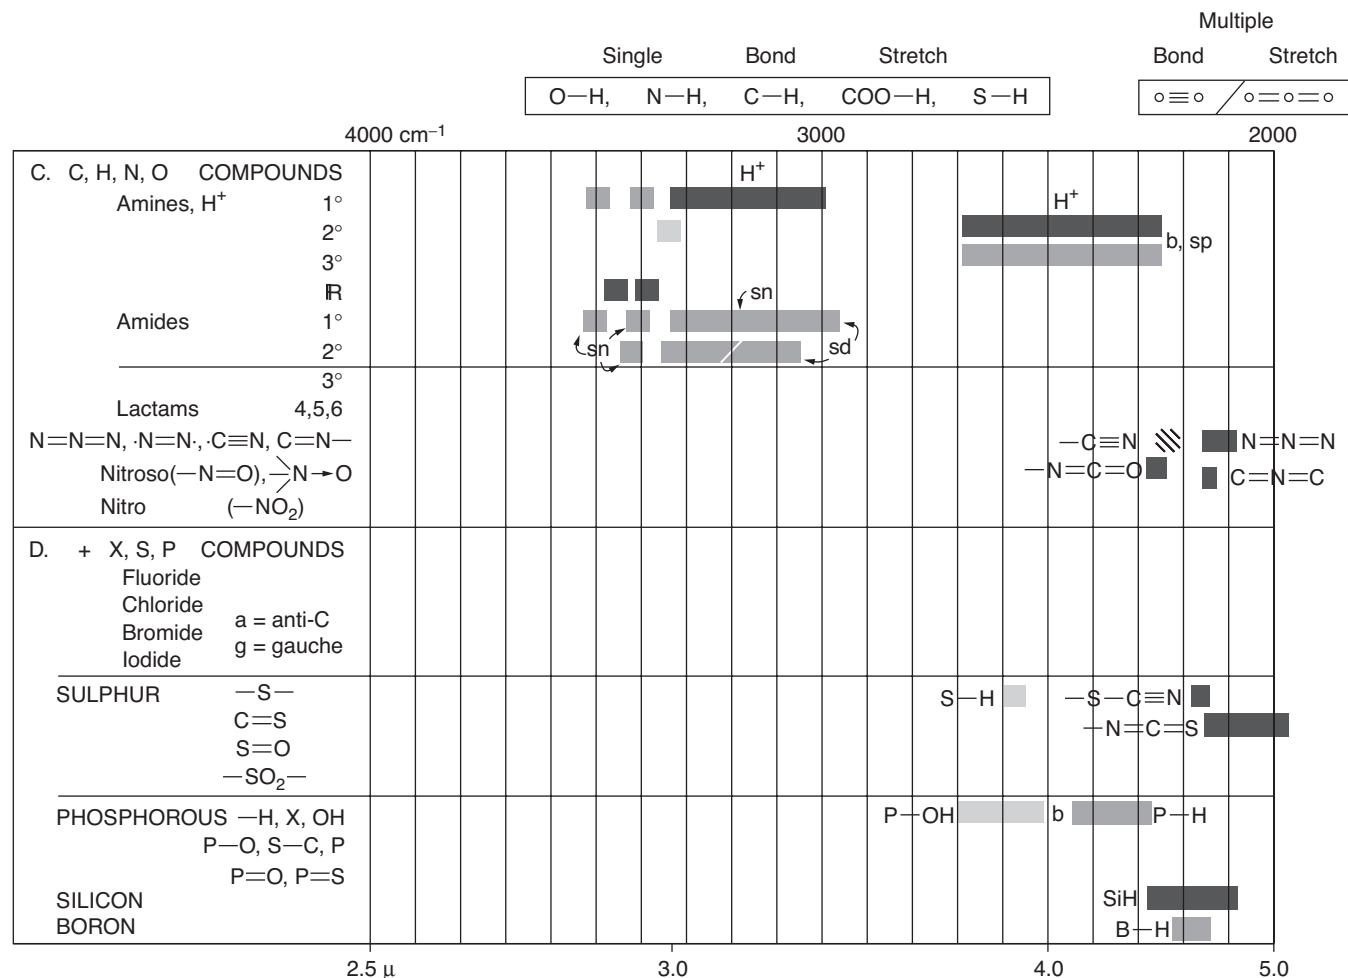

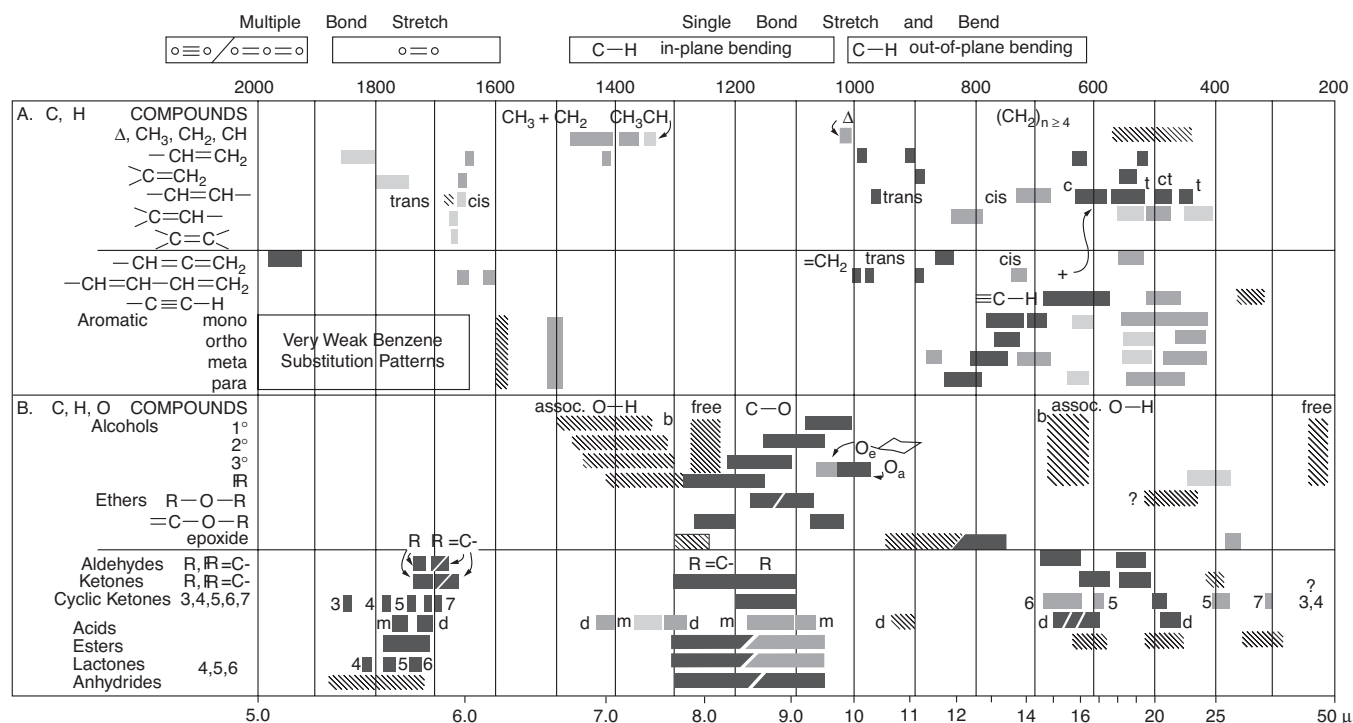

Strong

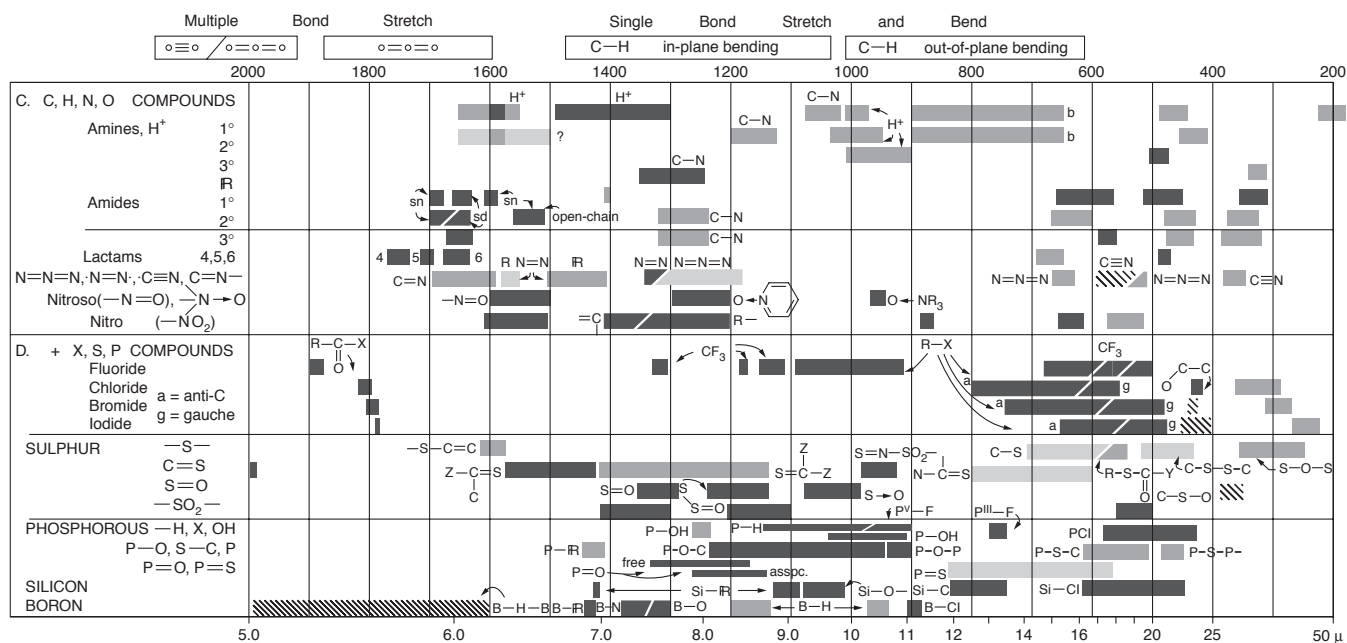

Medium

Weak

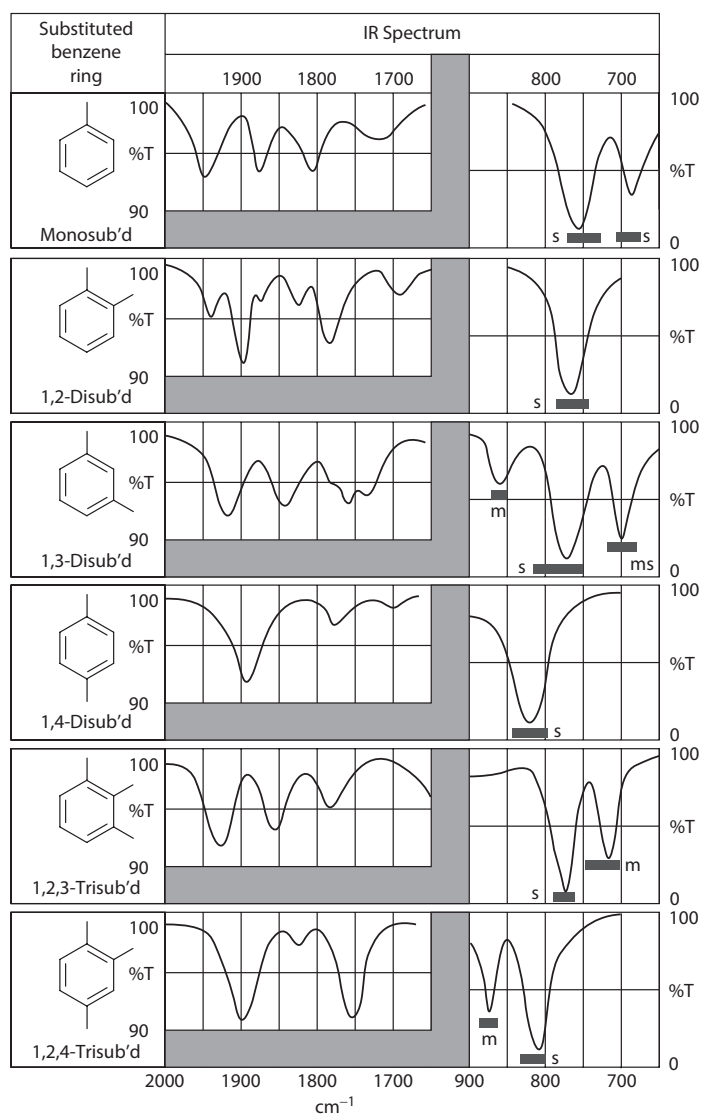

Variable

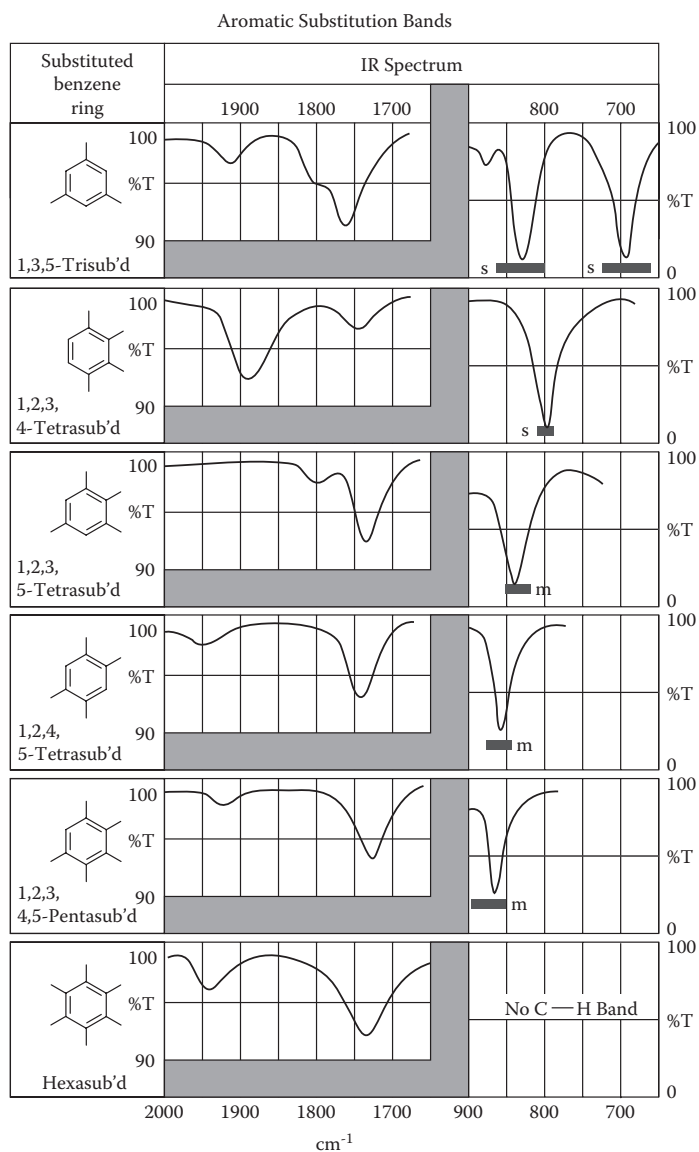

Aromatic Substitution Bands

Group	Wavenumber, cm ⁻¹						
	1850	1800	1750	1700	1650	1600	1550
Acid, Chlorides, Aliphatic		1810–1795 [†]					
Acid Chlorides, Aromatic			1785–1765				
Aldehydes, Aliphatic			1740–1718				
Aldehydes, Aromatic				1710–1685			
Amides				1695–1630*			
Amides, typical value, 1°				1684			
Amides, typical value, 2°					1669		
Amides, typical value, 3°					1667		
	5.41	5.56	5.71	5.88	6.06	6.25	6.45
	Wavelength, μm						

* Electron withdrawing groups at the α-position to the carbonyl will raise the wavenumber of the absorption.

Carbonyl Group Absorptions (continued)

Group	Wavenumber, cm^{-1}						
	1850	1800	1750	1700	1650	1600	1550
Anhydrides, acyclic, non-conjugated		1825–1815***	1755–1745**				
Anhydrides, acyclic, conjugated			1780–1770***	1725–1715**			
Anhydrides, ayclic non-conjugated	1870–1845		1800–1775**				
Anhydrides, cyclic conjugated	1860–1850		1780–1760**				
Carbamates				1740–1683			
Carbonates, acyclic			1780–1740				
Carbonates, five-membered ring		1850–1790					
Carbonates, vinyl, typical value			1761				
	5.41	5.56	5.71	5.88	6.06	6.25	6.45
	Wavelength, μm						

** This band is the more intense of the two.

*** Intensity weakens as colinearity is approached.

Carbonyl Group Absorptions (continued)

Group	Wavenumber, cm ⁻¹								
	1800	1750	1700	1650	1600	1550	1450	1400	1350
Carboxylic acid, monomer	1800–1740								
Carboxylic acid, dimer			1720–1680						
Carboxylic acid, salts				1650–1540			1450–1360		
Carboxylic acid, conjugated				1695–1680					
Carboxylic acid, non-conjugated			1720–1700						
Esters, formate			1725–1720						
Esters, saturated		1750–1735							
Esters, conjugated		1735–1715*							
	5.56	5.71	5.88	6.06	6.25	6.45	6.90	7.14	7.41
	Wavelength, μm								

* Electron withdrawing groups in the α -position to the carbonyl will raise the wavenumber adsorption.

Carbonyl Group Absorptions (continued)

Group	Wavenumber, cm^{-1}								
	1800	1750	1700	1650	1600	1550	1450	1400	1350
Esters, phenyl, typical value		1770							
Esters, thiol, non-conjugated			1710–1680						
Esters, thiol, conjugated				1700–1640					
Esters, vinyl, typical value		1770							
Esters, vinylidene, typical value		1764							
Ketones, dialkyl			1725–1705						
Ketones, α , β -unsaturated				1700–1670					
Ketones, α , β , and α' , β' conjugated				1680–1640					
	5.56	5.71	5.88	6.06	6.25	6.45	6.90	7.14	7.41
	Wavelength, μm								

Carbonyl Group Absorptions (continued)

Group	Wavenumber, cm^{-1}						
	1850	1800	1750	1700	1650	1600	1550
Ketones, in a 5 membered non-conjugated ring			1750–1740				
Ketones, o-hydroxy aryl					1670–1630		
Diketones, 1, 3-enol form						1640–1580	
Lactams, 4 membered ring			1780–1730				
Lactams, 5 membered ring				1750–1700			
Lactones, 5 membered ring			1795–1740				
Lactones, 6 membered ring				1750–1715			
	5.41	5.56	5.71	5.88	6.06	6.25	6.45
	Wavelength, μm						

COMMON SPURIOUS INFRARED ABSORPTION BANDS

Thomas J. Bruno and Paris D. N. Svoronos

The following table provides some of the common potential sources of spurious infrared absorptions that might appear on a spectrum (Refs. 1 and 2). Occasionally, the spectral lines of some impurities can be used as diagnostics; the reader is referred to the references for more details.

Approximate Wavenumber/cm ⁻¹	Wavelength/μm	Compound or Group	Origin
3700	2.70	H ₂ O	Water in solvent (thick layers)
3650	2.74	H ₂ O	Water in some quartz windows
3450	2.9	H ₂ O	Hydrogen-bonded water, usually in KBr disks
2900	3.44	–CH ₃ , >CH ₂	Paraffin oil, residual from previous mulls
2350	4.26	CO ₂	Atmospheric absorption, or dissolved gas from a dry ice bath
2330	4.30	CO ₂	
2300 and 2150	4.35 and 4.65	CS ₂	Leaky cells, previous analysis of samples dissolved in carbon disulfide
1996	5.01	BO ₂ [–]	Metaborate in the halide window
1400–2000	5–7	H ₂ O	Atmospheric absorption
1820	5.52	COCl ₂	Phosgene, decomposition product in purified CHCl ₃
1755	5.7	Phthalic anhydride	Decomposition product of phthalate esters or resins; paint off-gas product
1700–1760	5.7–5.9	>C=O	Bottle-cap liners leached by sample
1720	5.8	Phthalates	Phthalate polymer plastic tubing
1640	6.1	H ₂ O	Water of crystallization entrenched in sample
1520	6.6	CO ₂	Leaky cells, previous analysis
1430	7.0	CO ₃ ^{–2}	Contaminant in halide window
1360	7.38	NO ₃ [–]	Contaminant in halide window
1270	7.9	>SiO–	Silicone oil or grease
1000–1110	9–10	–>Si–O–Si<–	Glass; silicones
980	10.2	SO ₄ ^{–2}	From decomposition of sulfates in KBr pellets
935	10.7	(CH ₂ O) _x	Deposit from gaseous formaldehyde
907	11.02	–>C–Cl	Dissolved R-12 (Freon-12, CCl ₂ F ₂)
837	11.95	NO ₃ [–]	Contaminant in halide window
823	12.15	KNO ₃	From decomposition of nitrates in KBr pellets
794	12.6	CCl ₄ vapor	Leaky cells, from CCl ₄ used as a solvent
788	12.7	CCl ₄ liquid	Incomplete drying of cell or contamination, from CCl ₄ used as a solvent
720 and 730	13.7 and 13.9	Polyethylene	Various experimental sources
728	13.75	–>Si–F	SiF ₄ , found in NaCl windows
667	14.98	CO ₃ ^{–2}	Atmospheric carbon dioxide
Any	Any	Fringes	If refractive index of windows is too high, or if the cell is partially empty, or the solid sample is not fully pulverized

NUCLEAR SPINS, MOMENTS, AND OTHER DATA RELATED TO NMR SPECTROSCOPY

David R. Lide

This table presents the following data relevant to nuclear magnetic resonance spectroscopy:

Z: Atomic number

Isotope: Element symbol and mass number

Abundance: Natural abundance of the isotope in percent. An * indicates a radioactive nuclide; if no value is given, the nuclide is not present in nature or its abundance is highly variable.

I: Nuclear spin

ν : Resonant frequency in megahertz for an applied field H_0 of 1 tesla (in cgs units, 10 kilogauss). The resonant frequency scales with H_0 .

Relative sensitivity: Sensitivity relative to ^1H (=1) assuming an equal number of nuclei and constant temperature. Values were calculated from the expressions:

For constant H_0 : $0.0076508(\mu/\mu_N)^3(I+1)/I^2$

For constant ν : $0.23871(\mu/\mu_N)(I+1)$

μ/μ_N : Nuclear magnetic moment in units of the nuclear magneton μ_N

Q: Nuclear quadrupole moment in units of femtometers squared ($1 \text{ fm}^2 = 10^{-2} \text{ barn}$). Because the determination of quadrupole moments requires knowledge of the electron configuration

near the nucleus, values of Q in the literature tend to scatter considerably. The values quoted here come mainly from the review of Pyykkö (Ref. 3), otherwise from Ref. 1.

The table includes all stable nuclides of non-zero spin for which spin and magnetic moment values have been measured, as well as selected radioactive nuclides of current or potential interest. At least one isotope is included for each element through $Z = 95$ for which data are available. See Reference 1 for a complete listing of spins and moments.

The assistance of P. Pyykkö in providing data on nuclear quadrupole moments is gratefully acknowledged.

PROPERTIES OF IMPORTANT NMR NUCLEI

Thomas J. Bruno and Paris D. N. Svoronos

The following table lists the magnetic properties at higher field strengths required for choosing the nuclei to be used in NMR experiments (Refs. 1–15). The reader is referred to several excellent texts and the literature for guidelines in nucleus selection. For more detailed information on these and other less common nuclei at 10 kG, the reader should consult the table entitled *Nuclear Spins, Moments, and Other Data Related to NMR Spectroscopy* in this section.

PROTON NMR ABSORPTION OF MAJOR CHEMICAL FAMILIES

Thomas J. Bruno and Paris D. N. Svoronos

The following table gives the region of the expected nuclear magnetic resonance absorptions of major chemical families (Refs. 1–12). These absorptions are reported in the dimensionless units of parts per million (ppm) versus the standard compound tetramethylsilane (TMS, structure provided), which is recorded as 0.0 ppm.

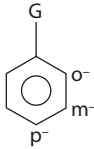

The use of this unit of measure makes the chemical shifts independent of the applied magnetic field strength or the radio frequency. For most proton NMR spectra, the protons in TMS are more shielded than almost all other protons. The chemical shift in this dimensionless unit system is then defined by:

$$\delta = \frac{\nu_s - \nu_r}{\nu_r} \times 10^6$$

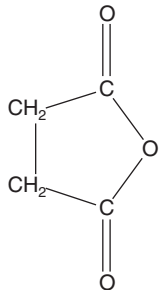

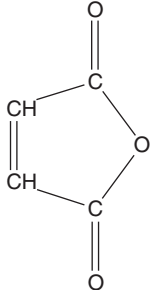

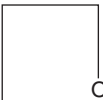

where ν_s and ν_r are the absorption frequencies of the sample proton and the reference (TMS) protons (twelve, magnetically equivalent), respectively. In these tables, the proton(s) whose proton NMR shifts are cited are indicated by underscore. Reference 1 provides additional details on the absorptions of other moieties, as well as correlation charts.

Note: Ar represents aryl.

Some Useful ^1H Coupling Constants

The following chart gives the values of some useful proton NMR coupling constants (in Hz). The single numbers indicate a typical or average value, while in some cases, the range is provided.

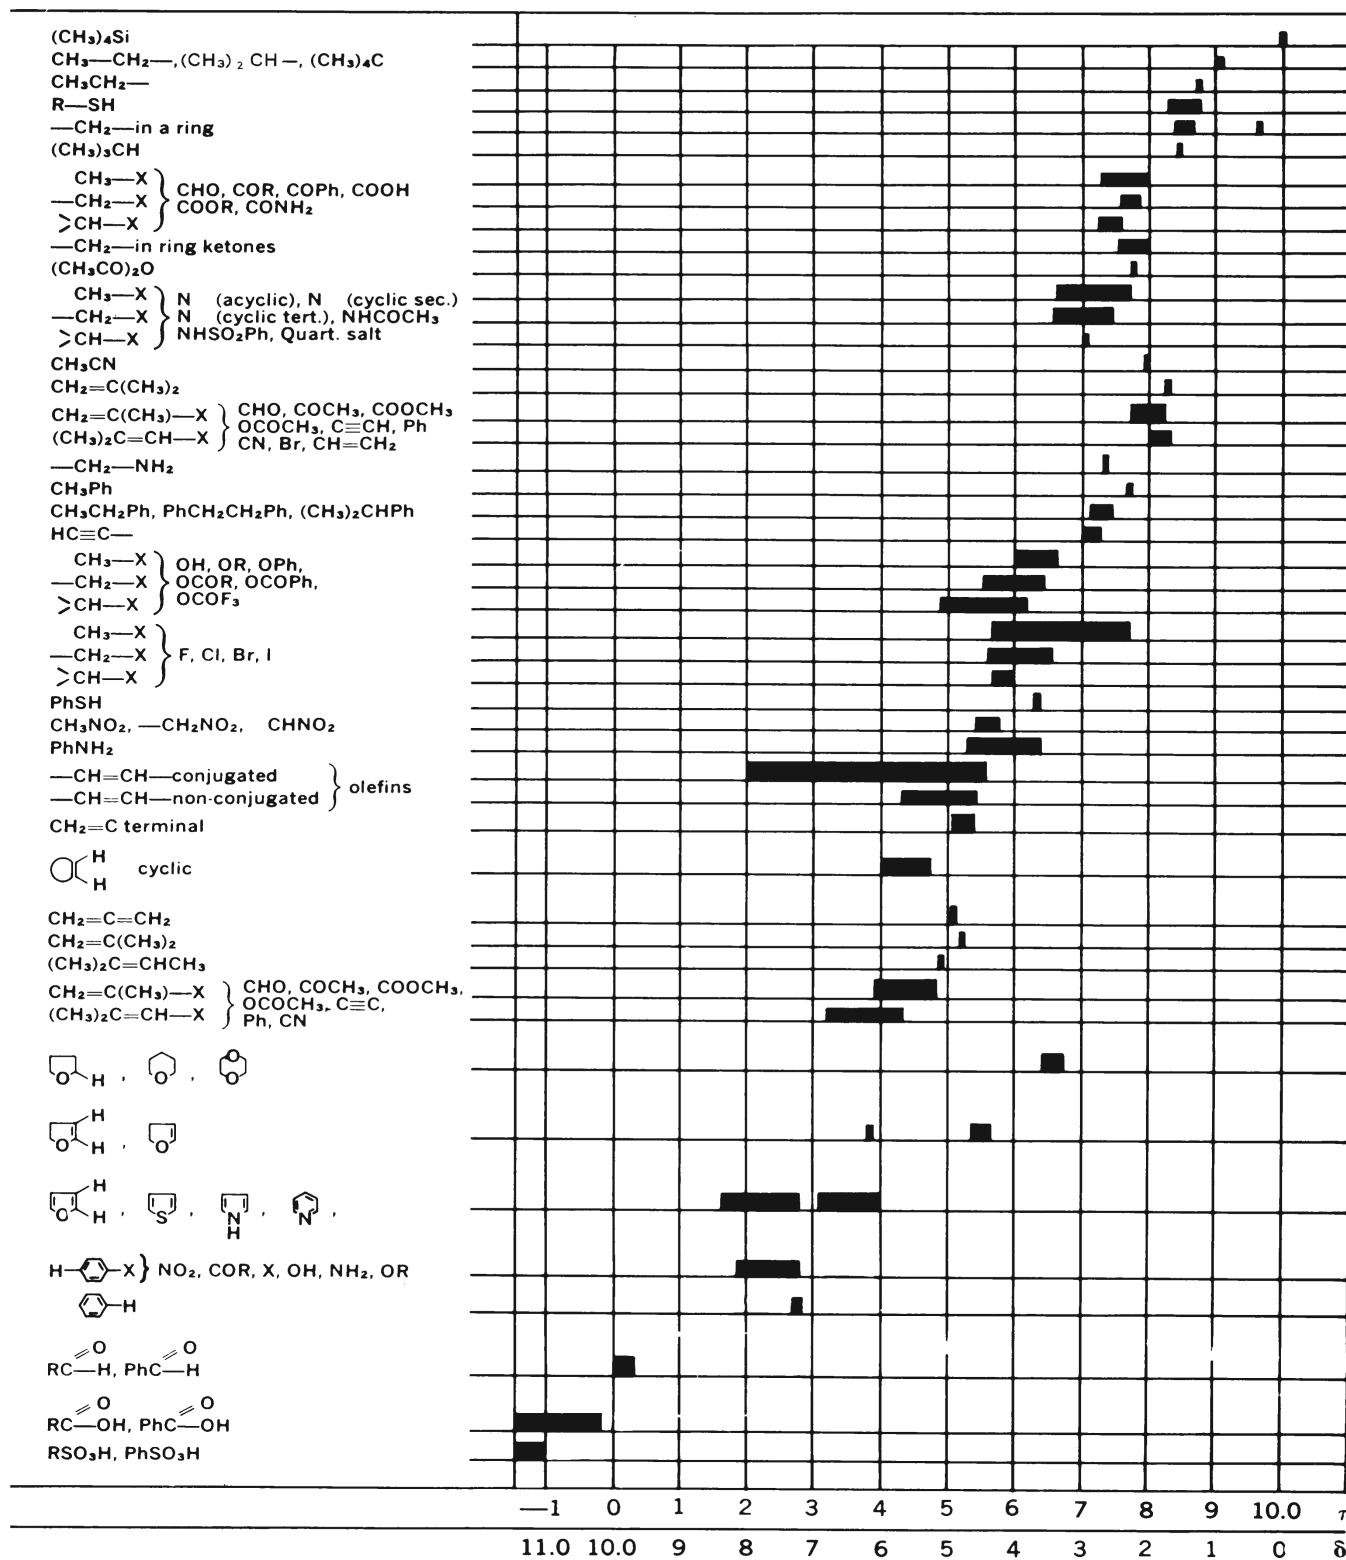

PROTON NMR CORRELATION CHART FOR MAJOR ORGANIC FUNCTIONAL GROUPS

The chart below summarizes the range of chemical shifts for protons in several classes of organic compounds and substituent groups. The chemical shifts δ are given in parts per million relative to tetramethylsilane.

Reference

Mohacsi, E., *J. Chem. Edu.* 41, 38, 1964 (with permission).

PROTON NMR SHIFTS OF COMMON ORGANIC SOLVENTS

The table below lists the ^1H chemical shifts for over 300 organic solvents and liquid reagents. The solvent in which the shift was measured is given in the second column. Shifts are given in parts per million relative to tetramethylsilane (TMS) and are listed in order of smallest to largest shift. In many cases the peaks show additional small splittings. Compounds are listed by the name used in this *Handbook*, with other common names given in parentheses.

¹³C-NMR ABSORPTIONS OF MAJOR FUNCTIONAL GROUPS

Thomas J. Bruno and Paris D. N. Svoronos

The table below lists the ¹³C chemical shift ranges (in ppm) with the corresponding functional groups in descending order. Some typical simple compounds for every family are given to illustrate the corresponding range. The shifts for the carbons of interest are given in parentheses, either for each carbon as it appears from left to right in the formula, or by the underscore (Refs. 1–17). In Ref. 1, the reader can find additional details, correlation charts, additivity rules and the expected ¹³C peaks attributed to common solvents.

δ /ppm	Group	Family	Example (δ of Underlined Carbon)	
220–165	>C=O	Ketones	(CH ₃) ₂ C=O	(206.0)
			(CH ₃) ₂ CHC(=O)CH ₃	(212.1)
		Aldehydes	CH ₃ CHO	(199.7)
			CH ₃ CH=CHCHO	(192.4)
		α,β -unsaturated carbonyls	CH ₂ =CHC(=O)CH ₃	(169.9)
			HCO ₂ H	(166.0)
		Carboxylic acids	CH ₃ C(=O)OH	(178.1)
			HCONH ₂	(165.0)
		Amides	CH ₃ CONH ₂	(172.7)
			CH ₃ CO ₂ CH ₂ CH ₃	(170.3)
140–120	>C=C<	Aromatics, alkenes	CH ₂ =CHCO ₂ CH ₃	(165.5)
			C ₆ H ₆	(128.5)
			CH ₂ =CH ₂	(123.2)
			CH ₂ =CHCH ₃	(115.9, 136.2)
			CH ₂ =CHCH ₂ Cl	(117.5, 133.7)
			CH ₃ CH=CHCH ₂ CH ₃	(132.7)
125–115	–C \equiv N	Nitriles	CH ₃ –C \equiv N	(117.7)
80–70	–C \equiv C–	Alkynes	H–C \equiv CH	(71.9)
			CH ₃ –C \equiv CCH ₃	(73.9)
70–45	>C–O– 	Esters, alcohols	CH ₃ OOCCCH ₂ CH ₃	(57.6, 67.9)
			HOCH ₃	(49.0)
			HOCH ₂ CH ₃	(57.0)
40–20	>C–NH ₂ 	Amines	CH ₃ NH ₂	(26.9)
			CH ₃ CH ₂ NH ₂	(35.9)
30–15	–S–CH ₃	Sulfides (thioethers)	C ₆ H ₅ –S–CH ₃	15.6
30–(–2.3)	>CH–	Alkanes, cycloalkanes	CH ₄	(–2.3)
			CH ₃ CH ₃	(5.7)
			CH ₃ CH ₂ CH ₃	(15.8, 16.3)
			CH ₃ CH ₂ CH ₂ CH ₃	(13.4, 25.2)
			CH ₃ CH ₂ CH ₂ CH ₂ CH ₃	(13.9, 22.8, 34.7)
			Cyclohexane	(26.9)

¹³C NMR CHEMICAL SHIFTS OF COMMON ORGANIC SOLVENTS

The following table gives the expected carbon-13 chemical shifts, relative to tetramethylsilane, for various useful NMR solvents. In some solvents, slight changes can occur with change of concentration.^{2,3}

Solvent	Formula	Chemical shift (ppm)
Acetic acid- <i>d</i> ₄	CD ₃ COOD	20.0 (CD ₃) 205.8 (C=O)
Acetone	(CH ₃) ₂ C=O	30.7 (CH ₃) 206.7 (C=O)
Acetone- <i>d</i> ₆	(CD ₃) ₂ C=O	29.2 (CD ₃) 204.1 (C=O)
Acetonitrile- <i>d</i> ₃	CD ₃ C≡N	1.3 (CD ₃) 117.1 (C≡N)
Benzene	C ₆ H ₆	128.5
Benzene- <i>d</i> ₆	C ₆ D ₆	128.4
Carbon disulfide	CS ₂	192.3
Carbon tetrachloride	CCl ₄	96.0
Chloroform	CHCl ₃	77.2
Chloroform- <i>d</i> ₃	CDCl ₃	77.05
Cyclohexane- <i>d</i> ₁₂	C ₆ D ₁₂	27.5
Dichloromethane- <i>d</i> ₂	CD ₂ Cl ₂	53.6
Dimethylformamide- <i>d</i> ₇	(CD ₃) ₂ NCDO	31 (CD ₃) 36 (CD ₃) 162.4 (C=O)
Dimethylsulfoxide- <i>d</i> ₆	(CD ₃) ₂ S=O	39.6
Dioxane- <i>d</i> ₈	C ₄ D ₃ O ₂	67.4
Formic acid- <i>d</i> ₂	DCOOD	165.5
Methanol- <i>d</i> ₄	CD ₃ OD	49.3
Nitromethane- <i>d</i> ₃	CD ₃ NO ₂	57.3
Pyridine	C ₅ H ₅ N	123.6 (C ₃) 135.7 (C ₄) 149.8 (C ₂)
Pyridine- <i>d</i> ₅	C ₅ D ₅ N	123.9 (C ₃) 135.9 (C ₄) 150.2 (C ₂)
1,1,2,2-Tetrachloroethane- <i>d</i> ₂	CDCl ₂ CDCl ₂	75.5
Tetrahydrofuran- <i>d</i> ₈	C ₄ D ₈ O	25.8 (C ₂) 67.9 (C ₁)
Trichlorofluoromethane	CFC1 ₃	117.6

¹⁵N-NMR CHEMICAL SHIFTS OF MAJOR CHEMICAL FAMILIES

Thomas J. Bruno and Paris D. N. Svoronos

The following table contains ¹⁵N NMR chemical shifts of various organic nitrogen compounds. Chemical shifts are expressed relative to different standards (NH₃, NH₄Cl, CH₃NO₂, NH₄NO₃, HNO₃, etc.) and are interconvertible. Chemical shifts are sensitive to hydrogen bonding and are solvent dependent as seen in the case of pyridine (see footnote a below). Consequently, the reference as well as the solvent should always accompany chemical shift data. All shifts are relative to ammonia unless otherwise specified (Refs. 1–16). A section of “miscellaneous” data gives the chemical shift of special compounds relative to unusual standards. In Ref. 16, the reader can find additional details, correlation charts, and spin-spin coupling ranges.

Chemical Shift Range/ppm	Family	Example (δ)
<930	Nitroso compounds	C ₆ H ₅ -NO (913, 930)
608	Sodium nitrite	NaNO ₂
~500	Azo compounds	C ₆ H ₅ -N=N-C ₆ H ₅ (510)
380–350	Nitro compounds	C ₆ H ₅ NO ₂ (370.3); CH ₃ NO ₂ (380.2); 4-F-C ₆ H ₄ -NO ₂ (368.5); 1,3-(NO ₂) ₂ C ₆ H ₄ (365.4)
367	Nitric acid (8.57 M)	HNO ₃
360–325	Nitramines	CH ₃ NHNO ₂ (355.6); CH ₃ O ₂ CNHNO ₂ (334.9)
350–300	Pyridines	C ₅ H ₅ N (317) ^a (gas); 4-CH ₃ -C ₅ H ₄ N (309.3); 4-NH ₂ -C ₅ H ₄ N (271.5); 4-NC-C ₅ H ₄ N (327.9)
~310	Imines (aromatic)	(C ₆ H ₅) ₂ C=NH (308); C ₆ H ₅ CH=NCH ₃ (318); C ₆ H ₅ CH=NC ₆ H ₅ (326)
310.1	Nitrogen (gas)	N ₂
250–200	Pyridinium salts	C ₅ H ₅ NH ⁺ (215)
260–175	Cyanides (nitriles)	CH ₃ CN (239.5, 245); C ₆ H ₅ CN (258.7); KCN 177.8
~160	Pyrroles, isonitriles	C ₄ H ₄ NH (158)CH ₃ NC (162)
~150	Thioamides	CH ₃ C(=S)NH ₂ (150.2)
120–110	Lactams	HN(CH ₂) ₃ C=O (5-membered ring; 114.7) HN(CH ₂) ₆ C=O (8-membered ring; 117.7)
110–100	Amides	C ₆ H ₅ CONH ₂ (100); CH ₃ CONH ₂ (103.4); CH ₃ CONHCH ₃ (105.8); CH ₃ CON(CH ₃) ₂ (103.8); HCONH ₂ (108.5)
125–90	Sulfonamides	CH ₃ SO ₂ NH ₂ (95); C ₆ H ₅ SO ₂ NH ₂ (94.3)
~100	Hydrazines	C ₆ H ₅ NHNHC ₆ H ₅ (96)
110–60	Ureas	[H ₂ N] ₂ CO (75, 82); [(CH ₃) ₂ N] ₂ CO (63.5); [C ₆ H ₅ NH] ₂ CO (107.7)
100–70	Aminophosphines, aminophosphine oxides	C ₆ H ₅ NHP(CH ₃) ₂ (71.1) C ₆ H ₅ NHPO(CH ₃) ₂ (86.6)
70–50	Aromatic amines	C ₆ H ₅ NH ₂ (55, 59), (–322.3) ^b ; C ₆ H ₅ NH ₃ ⁺ (48), (–326.4) ^b , 26.1 ^c ; p-O ₂ N-C ₆ H ₄ -NH ₂ (70)
40–0	Aliphatic amines	CH ₃ NH ₂ (1.3) ^d , (–371) ^b ; (CH ₃) ₂ NH (–363.3) ^b , (–364.9) ^c , 6.7 ^d ; (CH ₃) ₃ N (–356.9) ^b , (–360.7) ^c , 13.0 ^d
50–10	Isonitriles	CH ₃ NCO (14.1); C ₆ H ₅ NCO (46.5)
65–20	Ammonium salts	NH ₄ Cl (26.1) ⁴ ; CH ₃ NH ₃ Cl (24.5); (CH ₃) ₂ NH ₂ Cl (26.6); (CH ₃) ₃ NHCl (33.8); (CH ₃) ₄ NCl (44.7)
~15	Isocyanates	CH ₃ NCO (14.1)
Miscellaneous:		
(–130)–(–110) and ~ (–212)	Imidazoles	N-methylimidazole (–111.4, pyridine N and –215.7, pyrrole N) ^b
(–345)–(–310) ^b	Piperidine, hydrochloride salts	piperidinium hydrochloride (–344.8); 2-methyl piperidinium hydrochloride (–322.1) ^c
	Decahydroquinolines, hydrochloride salts	trans-decahydroquinolinium hydrochloride (–322.5); cis-decahydroquinolinium hydrochloride (–328.5)

Chemical Shift Range/ppm	Family	Example (δ)
(-293)–(-280) ^f	Enaminones	CH ₃ C(=O)CH=CHNHCH ₃ [(<i>E</i>)-(-294.2); (<i>Z</i>)-(-285.9)]
35–15 ^g	4-Aminotetrahydropyrans, 4-aminotetrahydro-thiopyrans	2,6-diphenyl 4-aminotetrahydropyran (34.5) 2,6-diphenyl 4-aminotetrahydrothiopyran (33.6)
(-325)–(-310) ^c	1-Naphthylamines	8-nitro-1-naphthylamine (313.9)
(-350)–(-300) ^h	Silylamines	HN[Si(CH ₃) ₃] ₂ (-354.2)

^a Varies with solvent. For instance: cyclohexane (315.5), benzene (312.1), chloroform (304.5), methanol (292.1), water (289), 2,2,2-trifluoroethanol (277.1). All chemical shifts relative to ammonia.

^b Upfield from external HNO₃ 1M (CH₃OH).

^c In ppm upfield from external 1M D¹⁵NO₃ in D₂O (DMSO) (Ref. 10).

^d Downfield from anhydrous liquid ammonia, ±0.2 ppm unless otherwise specified.

^e Upfield from external HNO₃ 1M (cyclohexane).

^f Relative to external CH₃¹⁵NO₂.

^g With respect to an external standard of 5M ¹⁵NH₄NO₃ in 2M HNO₃ (¹⁵NH₄NO₃ = 21.6 ppm relative to anhydrous ammonia) (Ref. 9).

^h Relative to N(SiH₃) (50 % in CDCl₃) (Ref. 11).

NATURAL ABUNDANCE OF IMPORTANT ISOTOPES

Thomas J. Bruno and Paris D. N. Svoronos

The following table lists the atomic masses and relative percent concentrations of naturally occurring isotopes of importance in mass spectroscopy (Refs. 1–6).

Element	More Prominent Isotopes (Mass in u, Percent Abundance)	
Hydrogen	¹ H (1.00783, 99.985)	² H (2.01410, 0.015)
Boron	¹⁰ B (10.01294, 19.8)	¹¹ B (11.00931, 80.2)
Carbon	¹² C (12.00000, 98.9)	¹³ C (13.00335, 1.1)
Nitrogen	¹⁴ N (14.00307, 99.6)	¹⁵ N (15.00011, 0.4)
Oxygen	¹⁶ O (15.99491, 99.8)	¹⁸ O (17.9992, 0.2)
Fluorine	¹⁹ F (18.99840, ≈100.0)	
Silicon	²⁸ Si (27.97693, 92.2)	²⁹ Si (28.97649, 4.7) ³⁰ Si (29.97376, 3.1)
Phosphorus	³¹ P (30.97376, ≈100.0)	
Sulfur	³² S (31.972017, 95.0)	³³ S (32.97146, 0.7) ³⁴ S (33.96786, 4.2)
Chlorine	³⁵ Cl (34.96885, 75.5)	³⁷ Cl (36.96590, 24.5)
Bromine	⁷⁹ Br (78.9183, 50.5)	⁸¹ Br (80.91642, 49.5)
Iodine	¹²⁷ I (126.90466, ≈100.0)	

COMMON MASS SPECTRAL FRAGMENTATION PATTERNS OF ORGANIC COMPOUND FAMILIES

Thomas J. Bruno and Paris D. N. Svoronos

The following table provides a guide to the identification and interpretation of commonly observed mass spectral fragmentation patterns for common organic functional groups (Refs. 1–10). It is of course highly desirable to augment mass spectroscopic data with as much other structural information as possible. Especially useful in this regard will be the confirmatory information of infrared and ultraviolet spectrophotometry as well as nuclear magnetic resonance spectrometry.

The reader is referred to other tables in this book for additional information that can be used in assessing or predicting fragmentation patterns, particularly the table of Proton Affinities (p. 10-167) and ionization energies of Gas-Phase Molecules (p. 10-199).

Family	Molecular Ion Peak	Common Fragments; Characteristic Peaks
Acetals		Cleavage of all C–O, C–H and C–C bonds around the original aldehydic carbon
Alcohols	Weak for 1° and 2°; not detectable for 3°; strong for benzyl alcohols	Loss of 18 (H ₂ O — usually by cyclic mechanism); loss of H ₂ O and olefin simultaneously with four (or more) carbon-chain alcohols; prominent peak at $m/z = 31(\text{CH}_2\dot{\text{O}}\text{H})^+$ for 1° alcohols; prominent peak at $m/z = (\text{RCH}\dot{\text{O}}\text{H})^+$ for 2° alcohols and $m/z = (\text{R}_2\text{C}\dot{\text{O}}\text{H})^+$ for 3° alcohols
Aldehydes	Low intensity	Loss of aldehydic hydrogen (strong M-1 peak, especially with aromatic aldehydes); strong peak at $m/z = 29(\text{HC}\equiv\text{O}^+)$; loss of chain attached to alpha carbon (beta cleavage); McLafferty rearrangement via beta cleavage if gamma hydrogen is present
Alkanes		
(a) Chain	Low intensity	Loss of 14 mass units (CH ₂)
(b) Branched	Low intensity	Cleavage at the point of branch; low intensity ions from random rearrangements
(c) Alicyclic	Intense	Loss of 28 mass units (CH ₂ =CH ₂) and side chains
Alkenes (olefins)	Rather high intensity (loss of π -electron) especially in case of cyclic olefins	Loss of units of general formula C _n H _{2n-1} ; formation of fragments of the composition C _n H _{2n} (via McLafferty rearrangement); retro Diels-Alder fragmentation
Alkyl halides	Abundance of molecular ion F<Cl<Br<I; intensity decreases with increase in size and branching	Loss of fragments equal to the mass of the halogen until all halogens are cleaved off
(a) Fluorides	Very low intensity	Loss of 20 (HF); loss of 26 (C ₂ H ₂) in case of fluorobenzenes
(b) Chlorides	Low intensity; characteristic isotope cluster	Loss of 35 (Cl) or 36 (HCl); loss of chain attached to the gamma carbon to the carbon carrying the Cl
(c) Bromides	Low intensity; characteristic isotope cluster	Loss of 79 (Br); loss of chain attached to the gamma carbon to the carbon carrying the Br
(d) Iodides	Higher than other halides	Loss of 127 (I)
Alkynes	Rather high intensity (loss of π -electron)	Fragmentation similar to that of alkenes
Amides	High intensity	Strong peak at $m/z = 44$ indicative of a 1° amide (O=C=NH ₂ ⁺); base peak at $m/z = 59$ (CH ₂ =C(OH)N ⁺ H ₂); possibility of McLafferty rearrangement; loss of 42 (C ₂ H ₂ O) for amides of the form RNHCOCH ₃ when R is aromatic ring
Amines	Hardly detectable in case of acyclic aliphatic amines; high intensity for aromatic and cyclic amines	Beta cleavage yielding >C=N ⁺ <; base peak for all 1° amines at $m/z = 30$ (CH ₂ =N ⁺ H ₂); moderate M-1 peak for aromatic amines; loss of 27 (HCN) in aromatic amines; fragmentation at alpha carbons in cyclic amines
Aromatic hydrocarbons (arenes)	Intense	Loss of side chain; formation of RCH=CHR' (via McLafferty rearrangement); cleavage at the bonds beta to the aromatic ring; peaks at $m/z = 77$ (benzene ring; especially mono-substituted), 91 (tropyllium); the ring position of alkyl substitution has very little effect on the spectrum
Carboxylic acids	Weak for straight-chain monocarboxylic acids; large if aromatic acids	Base peak at $m/z = 60$ (CH ₂ =C(OH) ₂) if alpha hydrogen is present; peak at $m/z = 45$ (COOH); loss of 17 (–OH) in case of aromatic acids or short-chain acids
Disulfides	Low intensity	Loss of olefins (m/z equal to R–S–S–H ⁺); strong peak at $m/z = 66$ (HSSH ⁺)
Phenols	Highly intense peak (base peak* generally)	Loss of 28 (C=O) and 29 (CHO); strong peak at $m/z = 65$ (C ₅ H ₅ ⁺)

Family	Molecular Ion Peak	Common Fragments; Characteristic Peaks
Sulfides (thioethers)	Rather low intensity peak but higher than that of corresponding ether	Similar to those of ethers ($-O-$ substituted by $-S-$); aromatic sulfides show strong peaks at $m/z = 109$ ($C_6H_5S^+$); 65 ($C_5H_5^+$); 91 (tropyllium ion)
Sulfonamides	Intense	Loss of $m/z = 64$ ($SONH_2$) and $m/z = 27$ (HCN) in case of benzenesulfonamide
Esters	Weak intensity	Base peak at m/z equal to the mass of $R-C\equiv O^+$; peaks at m/z equal to the mass of $^+O\equiv C-OR$; the mass of OR and R ; McLafferty rearrangement possible in case of: (a) presence of a beta hydrogen in R' (peak at m/z equal to the mass of $R-C(^+OH)OH$, and (b) presence of a gamma hydrogen in R (peak at m/z equal to the mass of $(CH_2=C(^+OH)OR)$; loss of 42 ($CH_2=C=O$) in case of benzyl esters; loss of ROH via the ortho effect in case of o-substituted benzoates
Ketones	High intensity	Loss of R-groups attached to the $>C=O$ (alpha cleavage); peak at $m/z = 43$ for all methyl ketones (CH_3CO^+); McLafferty rearrangement via beta cleavage if gamma hydrogen is present; loss of $m/z = 28$ ($C=O$) for cyclic ketones after initial alpha cleavage and McLafferty rearrangement
Mercaptan (thiols)	Rather low intensity but higher than that of corresponding alcohol	Similar to those of alcohols ($-OH$ substituted by $-SH$); loss of $m/z = 45$ (CHS) and $m/z = 44$ (CS) for aromatic thiols
Nitriles	Unlikely to be detected except in case of acetonitrile (CH_3CN) and propionitrile (C_2H_5CN)	$M+1$ ion may appear (especially at higher pressures); $M-1$ peak is weak but detectable ($R-CH=C=N^+$); base peak at $m/z = 41$ ($CH_2=C=N^+H$); McLafferty rearrangement possible; loss of HCN is case of cyanobenzenes
Nitrites	Absent (or very weak at best)	Base peak at $m/z = 30$ (NO^+); large peak at $m/z = 60$ ($CH_2=O^+NO$) in all unbranched nitrites at the alpha carbon; absence of $m/z = 46$ permits differentiation from nitro compounds
Nitro compounds	Seldom observed	Loss of 30 (NO); subsequent loss of CO (in case of aromatic nitro- compounds); loss of NO_2 , $m/z = 46$, from molecular ion peak
Sulfones	High intensity	Similar to sulfoxides; loss of mass equal to RSO_2 ; aromatic heterocycles show peaks at M-32 (sulfur), M-48 (SO), M-64 (SO_2)
Sulfoxides	High intensity	Loss of 17 (OH); loss of alkene (m/z equal to $RSOH^+$); peak at $m/z = 63$ ($CH_2=SOH^+$); aromatic sulfoxides show peak at $m/z = 125$ ($^+S-CH=CHCH=CHCHC=O$), 97 ($C_5H_5S^+$), 93 (C_6H_5O); aromatic heterocycles show peaks at M-16 (oxygen), M-29(COH); M-48(SO)

* The base peak is the most intense peak in the mass spectrum, and is often the molecular ion peak, M^+ .

COMMON MASS SPECTRAL FRAGMENTS LOST

Thomas J. Bruno and Paris D. N. Svoronos

The following table gives a list of neutral species that are most commonly lost when measuring the mass spectra of organic compounds. The list is suggestive rather than comprehensive, and should be used in conjunction with other sources [1–5]. The listed fragments include only combinations of carbon, hydrogen, oxygen, nitrogen, sulfur, and the halogens.

MAJOR REFERENCE MASSES IN THE SPECTRUM OF HEPTACOSAFLUOROTRIBUTYLAMINE (PERFLUOROTRIBUTYLAMINE)

Thomas J. Bruno and Paris D. N. Svoronos

The following list tabulates the major reference masses (with their relative intensities and formulas) of the mass spectrum of heptacosafuorotributylamine (CAS No. 311-89-7) (Ref. 1). This is one of the most widely used reference compounds in mass spectrometry. For guidance in the selection of additional reference compounds, the reader is advised to consult Ref. 1.

MASS SPECTRAL PEAKS OF COMMON ORGANIC SOLVENTS

David R. Lide

The strongest peaks in the mass spectra of 375 important organic solvents and other liquid reagents are listed in this table. The m/z value for each peak is followed by the relative intensity in parentheses, with the strongest peak assigned an intensity of 100. The peaks for each compound are listed in order of decreasing intensity. Compounds are listed by the name used in this *Handbook*, with other common names given in parentheses.

Data on the physical properties of the same compounds may be found in Section 15 in the table *Laboratory Solvents and Other Liquid Reagents*.

COMMON SPURIOUS SIGNALS OBSERVED IN MASS SPECTROMETERS

Thomas J. Bruno and Paris D. N. Svoronos

The following table provides guidance in the recognition and interpretation of potentially spurious signals (m/z peaks) that will sometimes be observed in measured mass spectra (Ref. 1). Often, the occurrence of these signals can be predicted by the recent history of the instrument or the method being used. This is especially true if the mass spectrometer is interfaced to a gas chromatograph.

Ions Observed, m/z	Possible Compound	Possible Source
13, 14, 15, 16	Methane*	Chlorine reagent gas
18	Water*	Residual impurity, outgassing of ferrules, septa and seals
14, 28	Nitrogen*	Residual impurity, outgassing of ferrules, septa and seals; leaking seal
16, 32	Oxygen*	Residual impurity, outgassing of ferrules, septa and seals; leaking seal
44	Carbon dioxide*	Residual impurity, outgassing of ferrules, septa and seals; leaking seal; note it may be mistaken for propane in a sample
31, 51, 69, 100, 119, 131, 169, 181, 214, 219, 264, 376, 414, 426, 464, 502, 576, 614	Perfluorotributyl amine (PFTBA), and related ions**	This is a common tuning compound; may indicate a leaking valve
31	Methanol	Solvent; can be used as a leak detector
43, 58	Acetone	Solvent; can be used as a leak detector
78	Benzene	Solvent; can be used as a leak detector
91, 92	Toluene	Solvent; can be used as a leak detector
105, 106	Xylenes	Solvent; can be used as a leak detector
151, 153	Trichloroethane	Solvent; can be used as a leak detector
69	Rough (fore) pump fluid, PFTBA	Back diffusion of fore pump fluid, possible leaking valve of tuning compound vial
73, 147, 207, 221, 281, 295, 355, 429	Dimethylpolysiloxane	Bleed from a column or septum, often during high temperature program methods in GC-MS
77, 94, 115, 141, 168, 170, 262, 354, 446	Diffusion pump fluid	Back diffusion from diffusion pump, if present
149	Phthalates	Plasticizer in vacuum seals, gloves
X – 14 peaks	Hydrocarbons	Loss of a methylene group indicates a hydrocarbon sample

* It is possible to operate the analyzer to ignore these common background impurities. They will be present to contribute to poor vacuum if these impurities result from a significant leak.

** See the table "Major Reference Masses in the Spectrum of Heptacosfluorotributylamine (Perfluorotributylamine) in this section for additional details.

CHLORINE–BROMINE COMBINATION ISOTOPE INTENSITIES

Thomas J. Bruno and Paris D. N. Svoronos

Due to the distinctive mass spectral patterns caused by the presence of chlorine and bromine in a molecule, interpretation of a mass spectrum can be much easier if the results of the relative isotopic concentrations are known. The following table provides peak intensities (relative to the molecular ion (M^+) at an intensity normalized to 100 percent) for various combinations of chlorine and bromine atoms, assuming the absence of all other elements except carbon and hydrogen (Refs. 1–4). The mass abundance calculations were based upon the most recent atomic mass data (Ref. 1).

REDUCTION OF WEIGHINGS IN AIR TO VACUO

When the mass M of a body is determined in air, a correction is necessary for the buoyancy of the air. The corrected mass is given by $M + kM/1000$, where k is a function of the material used for the weights, given by

$$k = 1000\rho_{\text{air}}(1/\rho_{\text{body}} - 1/\rho_{\text{weight}})$$

and ρ is density. The table below is computed for an air density of 0.0012 g/cm³ and for densities of three common weights:

platinum-iridium (21.6 g/cm³), brass (8.5 g/cm³), and aluminum or quartz (2.65 g/cm³).

100	0.001228	0.001184	0.001140
105	0.001290	0.001243	0.001198

Formulas for calculating the density of air over more extended ranges of temperature, pressure, and humidity may be found in the references.

STANDARDS FOR LABORATORY WEIGHTS

Thomas J. Bruno and Paris D. N. Svoronos

The following table provides a summary of the requirements for metric weights and mass standards commonly used in chemical analysis (Refs. 1–3). The actual specifications are under the jurisdiction of ASTM Committee E-41 on General Laboratory Apparatus and are the direct responsibility of subcommittee E-41.06 that deals with weighing devices. These standards do not generally refer to instruments used in commerce. Weights are classified according to type (either Type I or Type II), grade (S, O, P, or Q), and class (1, 2, 3, 4, 5, or 6). Information on these mass standards is presented to allow the user to make appropriate choices when using analytical weights for the calibration of electronic analytical balances, for making large-scale mass measurements (such as those involving gas cylinders), and in the use of dead-weight pressure balances. Some historical context can be found in Ref. 4.

Type — Classification by Design

Type I — One-piece construction; contains no added adjusting material; used for highest accuracy work.

Type II — Can be of any appropriate and convenient design, incorporating plugs, knobs, rings, etc.; adjusting material can be added if it is contained so that it cannot become separated from the weight.

Grade — Classification by Physical Property

Grade S:	Density:	7.7 g cm ⁻³ to 8.1 g cm ⁻³ (for 50 mg and larger)
	Surface area:	not to exceed that of a cylinder of equal height and diameter
	Surface finish:	highly polished
	Surface protection:	none permitted
	Magnetic properties:	no more magnetic than 300 series stainless steels
	Corrosion resistance:	same as 303 stainless steel
Grade O:	Hardness:	at least as hard as brass
	Density:	7.7 g cm ⁻³ to 9.1 g cm ⁻³ (for 1 g and larger)
	Surface area:	same as grade S
	Surface finish:	same as grade S
	Surface protection:	may be plated with suitable material such as platinum or rhodium
	Magnetic properties:	same as grade S
Grade P:	Corrosion resistance:	same as grade S
	Hardness:	at least as hard as brass when coated; smaller weights at least as hard as aluminum
	Density:	7.2 g cm ⁻³ to 10 g cm ⁻³ (for 1 g or larger)
	Surface area:	no restriction
	Surface finish:	smooth, no irregularities
	Surface protection:	may be plated or lacquered
Grade Q:	Magnetic properties:	same as grades S and O
	Corrosion resistance:	surface must resist corrosion and oxidation
	Hardness:	same as grade O
	Density:	7.2 g cm ⁻³ to 10 g cm ⁻³ (for 1 g or larger)
	Surface area:	same as grade P
	Surface finish:	same as grade P
Grade Q:	Surface protection:	may be plated, lacquered, or painted
	Magnetic properties:	no more magnetic than unhardened unmagnetized steel
	Corrosion resistance:	same as grade P
Grade Q:	Hardness:	same as grades O and P

Tolerance — Classification by Deviation¹

CLASS 1			CLASS 2		
Grams	Individual Tolerance/mg	Group Tolerance/mg	Grams	Individual Tolerance/mg	Group Tolerance/mg
500	1.2		500	2.5	
300	0.75		300	1.5	
200	0.50		200	1.0	
100	0.25	1.35	100	0.5	2.7
50	0.12		50	0.25	
30	0.074		30	0.15	
20	0.074		20	0.10	
10	0.050	0.16	10	0.074	0.29
5	0.034		5	0.054	
3	0.034		3	0.054	
2	0.034		2	0.054	
1	0.034	0.065	1	0.054	0.105

CLASS 3		CLASS 4		CLASS 5		CLASS 6	
Grams	Tolerance/mg	Grams	Tolerance/mg	Grams	Tolerance/mg	Grams	Tolerance/mg
500	5.0	500	10	500	30	500	50
300	3.0	300	6.0	300	20	300	30
200	2.0	200	4.0	200	15	200	20
100	1.0	100	2.0	100	9	100	10
50	0.6	50	1.2	50	5.6	50	7
30	0.45	30	0.9	30	4.0	30	5
20	0.35	20	0.7	20	3.0	20	3
10	0.25	10	0.5	10	2.0	10	2
				5	1.3	5	2
				3	0.95	3	2
				2	0.75	2	2
				1	0.50	1	2

¹ In simple terms, the permitted deviation between the assigned nominal mass value of the weight and the actual mass of the weight. Verification of tolerance should be possible on reasonably precise equipment, without using a buoyancy correction, within the political jurisdiction or organizational bounds of a given weight specification.

Applications for Weights and Mass Standards¹

Application	Type	Grade	Class
Reference standards used for calibrating other weights	I	S	1,2,3, or 4 ¹
High-precision standards for calibration of weights and precision balances	I or II ²	S or O ²	1 or 2 ³
Working standards for calibration and precision analytical work, dead-weight pressure balances	I or II ²	S or O	2
Laboratory weights for routine analytical work	II	O	2 or 3
Built-in weights, high-quality analytical balances	I or II	S	2
Moderate precision laboratory balances	II	P	3 or 4
Dial scales and trip balances	II	Q	4 or 5
Platform scales	II	Q	5 or 6

¹ Primary standards are for reference use only and should be calibrated. Since the actual values for each weight are stated, close tolerances are neither required nor desirable.

² Type I and Grade S will have a higher constancy but will probably be higher priced.

³ Since working standards are used for the calibration of measuring instruments, the choice of tolerance depends upon the requirements of the instrument. The weights are usually used at the assumed nominal values and appropriate tolerances should be chosen.

INDICATORS FOR ACIDS AND BASES

Thomas J. Bruno and Paris D. N Svoronos

The following table lists the most common indicators together with their pH range and colors in acidic and basic media. Since the color change is not instantaneous at the pK_a value, a pH range is given where a combination of colors is present. This pH range, which varies between indicators, generally falls between the pK_a with a spread or uncertainty of 1 pH unit. All solutions are either aqueous or ethanol/aqueous (% ethanol, vol/vol) (Refs. 1–4). Reference 4 provides additional solution properties that are related to buffer and solvent properties, and Ref. 5 lists the exact quantities needed for the indicator solutions.

PREPARATION OF SPECIAL ANALYTICAL REAGENTS

Paris D. N. Svoronos and Thomas J. Bruno

This listing of analytical reagents has been updated to include formulations based on more recent research, and to also include safety notes (Refs. 1–3). In the absence of specific cautions, the user must observe sound laboratory practice and housekeeping to avoid exposure and environmental contamination. When less familiar reagents are described, we include a chemical formula and a CAS registry number to avoid ambiguity. When a reagent calls for 95% ethanol, the azeotrope with water is specified unless noted. Additional details can be found in the references listed below.

Aluminon (qualitative test for aluminum). Aluminon is the name for the triammonium salt of aurintricarboxylic acid (5-[(3-carboxy-4-hydroxyphenyl)(3-carboxy-4-oxo-2,5-cyclohexadienylidene)methyl]-2-hydroxybenzoic acid triammonium salt, $C_{22}H_{23}N_3O_9$, CAS No. 569-58-4). Dissolve 1 g of the salt in 1 L of distilled water. Shake the solution well to ensure thorough mixing.

Bang's reagent (for glucose estimation). Dissolve (in the exact order) 100 g of potassium carbonate, 66 g of potassium chloride and 160 g of anhydrous potassium bicarbonate in approximately 700 mL of distilled water at 30 °C. Add (while stirring) 4.4 g of copper (II) sulfate and dilute to 1 L with distilled water after all CO_2 has been released. This solution should be shaken and saved in an air-tight flask. After 24 hours, 300 mL of it are diluted to 1 L with a saturated aqueous potassium chloride solution, shaken gently and used after 24 hours. 50 mL of this solution is equivalent to 10 mg glucose.

Barfoed's reagent (test for glucose). See Cupric acetate.

Baudisch's reagent. See Cupferron.

Benedict's solution (qualitative reagent for glucose). Dissolve 173 g of sodium citrate and 100 g of sodium carbonate in 800 mL of distilled water. Filter, if necessary, and dilute to 850 mL with distilled water. Dissolve 17.3 g of copper (II) sulfate pentahydrate in 100 mL of distilled water. Pour the latter solution, with constant stirring, into the carbonate-citrate solution and dilute to 1 L with distilled water.

Benzidine hydrochloride solution (for sulfate determination). Prepare a paste of 8 g of benzidine hydrochloride ($C_{12}H_8(NH_3)_2 \cdot 2HCl$) and 20 mL of distilled water, add 20 mL of 20% (mass/mass) HCl and dilute to 1 L with distilled water. Each mL of this solution is equivalent to 0.00357 g of H_2SO_4 . Note that the reagent is often called benzidine dihydrochloride.

Bertrand's reagent (glucose estimation). Consists of the following solutions:

1. Dissolve 200 g of Rochelle salt (potassium sodium tartrate, $NaKC_4H_4O_6$) and 150 g of NaOH in sufficient distilled water to make 1.0 L of solution.
2. Dissolve 40 g of copper (II) sulfate pentahydrate in sufficient distilled water to a total of 1.0 L of solution.

3. Dissolve 50 g of iron (III) sulfate and 200 g of H_2SO_4 (sp. gr. 1.84) in sufficient distilled water to a total of 1.0 L of solution.

4. Dissolve 5 g of potassium permanganate in sufficient distilled water to a total of 1.0 L solution.

Bial's reagent (for pentose). Dissolve 1 g of orcinol (5-methyl-1,3-benzenediol, $C_7H_8O_2$, CAS No. 504-15-4) in 500 mL of 30% (mass/mass) HCl to which 30 drops of a 10% aqueous solution of iron (III) chloride have been added.

Boutron — Boudet soap solution: Consists of the following solutions:

1. Dissolve 100 g of pure castile soap (olive oil based) in about 2.5 L of 56% (vol/vol) aqueous ethanol.
2. Dissolve 0.59 g of barium nitrate in 1.0 L of water. Adjust the castile soap solution (1) so that 2.4 mL of it will produce a permanent lather with 40 mL of solution (2). When adjusted, 2.4 mL of this soap solution is equivalent to 220 parts per million of hardness (as calcium carbonate) for a 40 mL sample. See also Soap solution.

Brucke's reagent (protein precipitation). See Potassium iodide mercuric iodide.

Cobaltic cyanide paper (Rinnmann's test for zinc detection). Dissolve 4 g of potassium cobalt (III) hexacyanide ($K_3Co(CN)_6$) and 1 g of potassium chlorate in 100 mL of water. Soak filter paper in solution and dry at 100 °C. Apply a drop of the zinc solution and heat in an evaporating dish. A green disk on the filter paper is obtained if zinc is present.

Congo red. Dissolve 0.5 g of Congo red (3,3'-([1,1'-biphenyl]-4,4'-diyl)bis(4-amino naphthalene-1-sulfonic acid, $C_{32}H_{22}N_6Na_2O_6S_2$, CAS No. 573-58-0) in 90 mL of distilled water and 10 mL of ethanol.

Cupferron (Baudisch's reagent for iron analysis). Dissolve 6 g of Cupferron, the ammonium salt of *N*-hydroxy-*N*-nitrosoaniline ($NH_4[C_6H_5N(O)NO]$) in 100 mL of distilled water. The reagent is good only for one week and must be kept in the dark.

Cupric acetate (Barfoed's reagent for reducing monosaccharides). Dissolve 66 g of copper (II) acetate and 10 mL of glacial acetic acid in water and dilute to 1.0 L.

Cupric oxide, ammoniacal; Schweitzer's reagent (dissolves cotton, linen, and silk, but not wool). Dissolve 5 g of cupric sulfate in 100 mL of boiling water, and add sodium hydroxide until precipitation is complete. Wash the precipitate well, and dissolve it in a minimal quantity of ammonium hydroxide. Bubble a slow stream of air through 300 mL of concentrated ammonium hydroxide solution containing 50 g of fine copper turnings. Continue stirring for 1 hour.

Cupric sulfate in glycerin-potassium hydroxide (reagent for silk). Dissolve 10 g of copper (II) sulfate pentahydrate in 100 mL of water and add 5 g of glycerol. Add 6N KOH solution slowly until a deep blue solution is obtained.

Cupron (precipitates copper). Dissolve 5 g of benzoinoxime in 100 mL 95% ethanol.

Cuprous chloride, acidic (reagent for CO in gas analysis).

1. Cover the bottom of a 2 L flask with a layer of copper (II) oxide about 1.5 cm deep, suspend a coil of copper wire so as to reach from the bottom to the top of the solution, and fill the flask with hydrochloric acid 20% (vol/vol) HCl

(aq) with continuous stirring. When the solution becomes nearly colorless, transfer to reagent bottles, which should also contain copper wire. The stock bottle may be refilled with dilute (6N) HCl until either the cupric oxide or the copper wire is used up. Copper (II) sulfate may be substituted for copper oxide in the above procedure.

2. Dissolve 340 g of copper (II) chloride dihydrate in 600 mL of concentrated HCl and reduce the cupric chloride by adding 190 mL of a saturated solution of stannous chloride or until the solution is colorless. The stannous chloride is prepared by treating 300 g of metallic tin in a 500 mL flask with concentrated HCl until no more tin is dissolved.
3. (Winkler method). Add a mixture of 86 g of copper (II) chloride and 17 g of finely divided metallic copper, prepared by the reduction of 8 g to 12 g of copper (II) oxide with hydrogen gas, to a solution of HCl, made by diluting 650 mL of concentrated HCl with 325 mL of distilled water. After the mixture has been added slowly and with frequent stirring, a spiral of copper wire is suspended in the bottle, reaching all the way to the bottom. The solution is ready to use when the solution becomes colorless.

Cuprous chloride, ammoniacal (reagent for CO in gas analysis).

1. The acid solution of copper (II) chloride as prepared above is neutralized with 6N ammonium hydroxide until the ammonia odor persists. An excess of metallic copper must be kept in the solution.
2. Pour 800 mL of acidic copper (II) chloride, prepared by the Winkler method, into approximately 4 L of water. Transfer the precipitate to a 250 mL graduated cylinder. After several hours, siphon off the liquid above the 50 mL mark and refill with 7.5% ammonium hydroxide solution which may be prepared by diluting 50 mL of concentrated ammonium hydroxide with 150 mL of distilled water. The solution, which should have a faint odor of ammonia should be well stirred and allowed to stand for several hours.

Note: Proper precautions must be taken for the safe handling of gaseous samples that contain CO.

Dichlorofluorescein indicator. Dissolve 1 g dichlorofluorescein ($C_{20}H_{10}Cl_2O_5$, CAS No. 76-54-0) in 1 L 70% (vol/vol) ethanol or 1 g of the sodium salt in 1 L of distilled water.

Dimethylglyoxime, 0.01 N. Dissolve 0.6 g of dimethylglyoxime (2,3-butanedione oxime) in 500 mL of 95% ethanol. This is an especially sensitive test for nickel (II) and produces a very characteristic crimson color.

Diphenylamine (reagent for rayon). Dissolve 0.2 g diphenylamine in 100 mL of concentrated sulfuric acid.

Diphenylamine sulfonate (for titration of iron with $K_2Cr_2O_7$). Dissolve 0.32 g of the barium salt of diphenylamine sulfonic acid in 100 mL of distilled water, add 0.5 g of sodium sulfate and filter off the precipitated barium sulfate.

Diphenylcarbazine. Dissolve 0.2 g of diphenylcarbazine [$(C_6H_5NHNH_2)_2CO$] in 10 mL of glacial acetic acid and dilute to 100 mL with 95% ethanol.

2,4-Dinitrophenylhydrazine (2,4-DNP) Reagent. Dissolve 3 g of 2,4-dinitrophenylhydrazine in 15 mL to 20 mL of concentrated sulfuric acid. Add this solution with stirring to a solution of 10 mL distilled water in 70 mL of 95% hydrous ethanol. Use the filtrate to test for the presence of aldehydes and ketones as follows: To 2 mL of the solution add 10 drops of the unknown. A precipitate (which may be recrystallized from 95% hydrous ethanol) is indicative of a positive test and its melting point

can be matched to the corresponding melting points of various aldehydes and ketones.

Esbach's reagent (estimation of protein). Dissolve 10 g of picric acid and 20 g of citric acid in sufficient distilled water to make a 1.0 L of solution.

Eschka's compound. Two parts of calcinated ("light") magnesia are thoroughly mixed with 1 part of anhydrous sodium carbonate.

Fehling's solution (reagent for reducing sugars).

1. Copper (II) sulfate solution: Dissolve 34.66 g of copper (II) sulfate pentahydrate in distilled water and dilute to 500 mL.
2. Alkaline tartrate solution: Dissolve 173 g of potassium sodium tartrate (Rochelle salt, $KNaC_4H_4O_6 \cdot 4H_2O$) and 50 g of NaOH in distilled water, cool and dilute to 500 mL. Mix equal volumes of solutions (1) and (2) just before using.

Ferric-alum indicator. Dissolve 140 g of iron (III) ammonium sulfate crystals in 400 mL of hot distilled water. Cool, filter, and add enough 6N nitric acid until the 500 mL mark.

Folin's mixture (for uric acid). To 650 mL of distilled water add 500 g of ammonium sulfate, 5 g of uranium (VI) acetate, and 6 g of glacial acetic acid and then dilute to 1.0 L with distilled water.

Formaldehyde — sulfuric acid (Marquis' reagent for alkaloids). Add 100 mL of concentrated sulfuric acid to 5 mL of 37% (mass/mass) aqueous formaldehyde solution.

Froehde's reagent. See Sulfomolybdic acid.

Fuchsin (reagent for linen). Dissolve 1 g of fuchsin (an aniline dye) in 100 mL of ethanol.

Fuchsin - sulfurous acid (Schiff's reagent for aldehydes). Dissolve 0.5 g of fuchsin and 9 g of sodium bisulfite in 500 mL of distilled water, and add 10 mL of concentrated HCl. Keep in well-stoppered bottles and protect from light. The fuchsin used to make the Schiff reagent should incorporate a high content of pararosanilin.

Gunzberg's reagent (detection of HCl in gastric juice). Dissolve 4 g of phloroglucinol (1,3,5-benzenetriol, $C_6H_3(OH)_3$) and 2 g of vanillin ($C_8H_8O_3$) in 100 mL of absolute ethanol.

Hager's reagent. See Picric acid.

Hanus solution (for iodine number). Dissolve 13.2 g of resublimed iodine in 1 L of glacial acetic acid, which should pass the dichromate test for reducible matter. Add sufficient bromine to double the halogen content, as determined by titration (approximately 3 mL). The iodine may be dissolved by heating, but the solution should be cold when the bromine is added.

Hopkins-Cole Reagent (test for presence of the indole ring in the tryptophan moiety of a protein or peptide). Add 5 mL cold water to 10 g of magnesium in a conical flask and add 250 mL of a cold saturated aqueous oxalic acid solution with vigorous stirring. Filter, add 25 mL of glacial acetic acid and dilute with distilled water to the 1.0 L mark. Place 10 drops of the saturated protein or peptide solution in a test tube, add 10 drops of concentrated nitric acid and heat in a water bath for three minutes. Allow the mixture to cool and add 4 mL 6N NaOH. A positive test is confirmed by the formation of a yellow color.

Iodine, tincture of. To 50 mL of distilled water add 70 g of iodine and 50 g of potassium iodide. Dilute to 1 L with absolute ethanol.

Iodo-potassium iodide (Wagner's reagent for alkaloids). Dissolve 2 g of iodine and 6 g of KI in 100 mL of distilled water.

Jones Reagent (test is positive for 1° and 2° alcohols, aldehydes, mercaptans, sulfides and sulfoxides). To 1 mL of 5% (mass/mass) sodium (or potassium) dichromate add 10 drops of the unknown compound. The formation of a green color (sometimes appearing as brown due to the mixture of the green chromium (III) and the unreacted orange chromium (VI) colors) indicates a positive test.

Litmus (indicator). Extract litmus powder three times with boiling alcohol (ethanol or isopropanol), each treatment lasting for an hour. Discard the alcoholic extract. Treat the residue with an equal mass of cold distilled water and filter; then add five times its weight of boiling distilled water. Cool, filter, and combine all aqueous extracts.

Magnesia mixture (reagent for phosphates and arsenates). Dissolve 50 g of magnesium chloride ($\text{MgCl}_2 \cdot 6\text{H}_2\text{O}$) and 100 g of ammonium chloride (NH_4Cl) in 500 mL of distilled water, add a slight excess of NH_4OH , and allow to stand overnight. Filter, make the solution just acidic with HCl , and dilute with distilled water to 1 L. Let stand for several days and separate the precipitated solid by decanting. The decantate should be used just prior to testing; otherwise, if stored for any period of time it becomes turbid.

Magnesium uranyl acetate. Dissolve 100 g of uranyl (VI) acetate dehydrate ($\text{UO}_2(\text{C}_2\text{H}_3\text{O}_2)_2 \cdot 2\text{H}_2\text{O}$) in 60 mL of glacial acetic acid and dilute to 500 mL with distilled water. Dissolve 330 g magnesium acetate tetrahydrate ($\text{Mg}(\text{C}_2\text{H}_3\text{O}_2)_4 \cdot 4\text{H}_2\text{O}$) in 60 mL of glacial acetic acid and dilute to 200 mL. Heat both solutions to boiling until clear; pour the magnesium acetate solution into the uranyl acetate solution, cool and dilute with distilled water to 1 L. Let stand overnight and filter if necessary.

Marme's reagent. See Potassium-cadmium iodide.

Marquis' reagent. See Formaldehyde-sulfuric acid.

Mayer's reagent (white precipitate with most alkaloids in slightly acid solutions). Dissolve 1.358 g of mercury (II) chloride in 60 mL of distilled water and pour into a solution of 5 g of potassium iodide in 10 mL of distilled water. Add sufficient distilled water to a final volume of 100 mL.

Methyl orange indicator. Dissolve 1 g of methyl orange in 1 L of distilled water. Filter, if necessary.

Methyl orange, modified. Dissolve 2 g of methyl orange and 2.8 g of xylene cyanole FF ($\text{C}_{25}\text{H}_{27}\text{N}_2\text{NaO}_6\text{S}_2$, CAS No: 2650-17-1) in 1 L of 50% (vol/vol) ethanol.

Methyl red indicator. Dissolve 1 g of methyl red in 600 mL of ethanol and dilute with 400 mL of distilled water.

Methyl red, modified. Dissolve 0.50 g of methyl red and 1.25 g of xylene cyanole FF ($\text{C}_{25}\text{H}_{27}\text{N}_2\text{NaO}_6\text{S}_2$) in 1 L of 90% (vol/vol) ethanol. Alternatively dissolve 1.25 g of methyl red and 0.825 g of methylene blue in 1 L of 90% (vol/vol) ethanol.

Millon's reagent (for albumins and phenols). Dissolve 1 part of mercury in 1 part of cold fuming nitric acid. Dilute with twice the volume of distilled water and decant the clear solution after several hours. All appropriate precautions must be observed when handling mercury.

Molisch's reagent. See 1-Naphthol.

1-Naphthol (Molisch's reagent for wool). Dissolve 15 g of 1-naphthol in 100 mL of 95% (vol/vol) ethanol or chloroform.

Nessler's reagent (for ammonia). Dissolve 50 g of potassium iodide in the smallest possible quantity of cold distilled water (50 mL). Add a saturated solution of mercury (II) chloride (about 22 g in 350 mL of distilled water will be needed) until an excess is indicated by the formation of a precipitate. Then

add 200 mL of 5 N NaOH and dilute to 1 L with distilled water. Allow to settle and draw off the clear liquid.

Nickel oxide, ammoniacal (reagent for silk). Dissolve 5 g of nickel (II) sulfate in 100 mL of distilled water, and add 6N NaOH solution until nickel hydroxide is completely precipitated. Wash the precipitate well and dissolve in 25 mL of concentrated ammonium hydroxide and 25 mL of distilled water.

Nitron (detection of the nitrate radical). Dissolve 10 g of nitron (1,4-diphenyl-3-(phenylamino)-1,2,4-triazolium hydroxide, $\text{C}_{20}\text{H}_{18}\text{N}_4\text{O}$) in 5 mL of glacial acetic acid and 95 mL of distilled water. The solution may be filtered with slight suction through an Alundum thimble crucible and kept in a dark bottle.

1-Nitroso-2-naphthol. Make a saturated solution 1-nitroso-2-naphthol in 50% (vol/vol) aqueous acetic acid. The reagent should be used as soon as it is prepared.

Nylander's solution (carbohydrates). Dissolve 20 g of bismuth subnitrate ($\text{Bi}_2\text{O}(\text{OH})_3(\text{NO}_3)_4$) and 40 g of Rochelle salt (potassium sodium tartrate, $\text{KNaC}_4\text{H}_4\text{O}_6 \cdot 4\text{H}_2\text{O}$) in 1 L of 8% (mass/mass) aqueous NaOH solution. Cool and filter.

Obermayer's reagent (for indoxyl in urine). Dissolve 4 g of iron (III) chloride in 1 L of aqueous (vol/vol) 40% HCl.

Oxine. Dissolve 14 g of 8-hydroxyquinoline ($\text{C}_9\text{H}_7\text{NO}$) in 30 mL of glacial acetic acid. Warm slightly, if necessary to dissolve. Dilute to 1 L with distilled water.

Oxygen absorbent. Dissolve 300 g of ammonium chloride in 1 L distilled water and add 1 L of concentrated ammonium hydroxide solution. Shake the solution thoroughly. For use as an oxygen absorbent, the gas to be tested is passed through a bottle that is half full of copper turnings filled nearly to the top with this ammonium chloride - ammonium hydroxide solution.

Pasteur's salt solution. To 1 L of distilled water add 2.5 g of potassium phosphate, 0.25 g of calcium phosphate, 0.25 g of magnesium sulfate, and 12.00 g of ammonium tartrate.

Pavy's solution (glucose reagent). To 120 mL of Fehling's solution, add 300 mL of 6N ammonium hydroxide (sp. gr. 0.88) and dilute to 1 L with distilled water.

Phenanthroline ferrous ion indicator. Dissolve 1.485 g of 1,10-phenanthroline monohydrate ($\text{C}_{12}\text{H}_8\text{N}_2 \cdot \text{H}_2\text{O}$) in 100 mL of 0.025 M aqueous iron (II) sulfate solution.

Phenolphthalein. Dissolve 1 g of phenolphthalein in 50 mL of ethanol and add 50 mL of distilled water.

Phenolsulfonic acid (determination of nitrogen as nitrate). Dissolve 25 g of phenol in 150 mL of concentrated H_2SO_4 , add 75 mL of fuming sulfuric acid (approximately 15% SO_3), stir well and heat for 2 hours at 100 °C.

Phloroglucinol solution (pentosans). Make a 3% phloroglucinol (1,3,5-benzenetriol) solution in alcohol. Store in a dark bottle.

Phosphomolybdic acid (Sonnenschein's reagent for alkaloids).

1. Prepare ammonium phosphomolybdate and after washing with distilled water, boil with nitric acid to expel all ammonia. Evaporate to dryness and dissolve in 2 M HNO_3 .
2. Dissolve ammonium molybdate in HNO_3 and treat with phosphoric acid. Filter, wash the precipitate, and boil with aqua regia (a mixture of concentrated nitric acid and concentrated hydrochloric acid, 1:3 vol/vol) until the ammonium salt is decomposed. Evaporate to dryness. The residue is dissolved in 10% (vol/vol) HNO_3 . The solution constitutes Sonnenschein's reagent.

Phosphoric acid — sulfuric acid mixture. Dilute 150 mL of concentrated sulfuric acid and 100 mL of concentrated phosphoric acid with distilled water to a final volume of 1 L.

Phosphotungstic acid (Scheibler's reagent for alkaloids).

1. Dissolve 20 g of sodium tungstate and 15 g of sodium phosphate in 100 mL of distilled water slightly acidified with dilute nitric acid.
2. The reagent is a 10% (mass/mass) solution of phosphotungstic acid in distilled water. The phosphotungstic acid is prepared by evaporating a mixture of 10 g of sodium tungstate dissolved in 5 g of phosphoric acid (sp. gr. 1.13) and enough boiling water to a complete solution. Crystals of phosphotungstic acid will separate.

Picric acid (Hager's reagent for alkaloids, wool and silk). Dissolve 1 g of picric acid in 100 mL of distilled water.

Potassium antimonate (reagent for sodium). Boil 22 g of potassium antimonate with 1 L of distilled water until nearly all of the salt has dissolved, cool quickly, and add 35 mL of 10% (mass/mass) potassium hydroxide. Filter after standing overnight.

Potassium-cadmium iodide (Marme's reagent for alkaloids). Add 2 g of cadmium (II) chloride to a boiling solution of 4 g of potassium iodide in 12 mL of distilled water, and then mix with 12 mL of saturated aqueous potassium iodide solution.

Potassium hydroxide (for CO₂ absorption). Dissolve 360 g of potassium hydroxide in distilled water and dilute to 1 L.

Potassium iodide — mercuric iodide (Brucke's reagent for proteins). Dissolve 50 g of potassium iodide in 500 mL of distilled water, and saturate with mercury (II) iodide (about 120 g). Dilute to 1 L with distilled water.

Potassium pyrogallate (for oxygen absorption). For mixtures of gases containing less than 28% (mass/mass) oxygen, add 100 mL of potassium hydroxide solution (50 g of KOH to 100 mL of distilled water) to 5 g of pyrogallol. For mixtures containing more than 28% (mass/mass) oxygen, the KOH solution should contain instead 120 g of KOH in 100 mL of distilled water.

Pyrogallol, alkaline. The reagent is a mixture of two solutions

1. Dissolve 75 g of pyrogallol in 75 mL of distilled water.
2. Dissolve 500 g of KOH in 250 mL distilled water. When cooled, adjust the solution with distilled water until the concentration is 50% (vol/vol).

For use, add 270 mL of solution (2) to 30 mL of solution (1).

Rosolic acid (indicator). Dissolve 1 g of rosolic acid (C₁₉H₁₄O₃) in 10 mL of ethanol and add 100 mL of distilled water.

Sakaguchi Reagent (for the presence of arginine in proteins or peptides). To 10 drops of the saturated protein or peptide solution, add 5 drops of 6 N NaOH followed by 5 drops of 0.05% (mass/mass) ethanolic 1-naphthol solution and 10 drops of 0.5% aqueous sodium hypochlorite. A positive test is indicated by the formation of a red color that fades away upon standing.

Scheibler's reagent. See Phosphotungstic acid.

Schiff's reagent. See Fuchsin-sulfurous acid.

Schweitzer's reagent. See Cupric oxide, ammoniacal.

Soap solution (reagent for hardness in water). Dissolve 100 g of dry castile soap in 1 L of 80% (vol/vol) ethanol (4 parts ethanol to 1 part distilled water). Allow to stand for several days and dilute with 70% ethanol until 6.4 mL of this solution produces a permanent lather with 20 mL of standardized calcium solution. The latter solution is made by dissolving 0.2 g of calcium carbonate in a small amount of dilute HCl, evaporating to dry-

ness and then dissolving the precipitate with distilled water to a final volume of 1 L.

Sodium bismuthate (for the oxidation of manganese). Heat 20 parts of sodium hydroxide nearly to redness in an iron or nickel crucible and add slowly 10 parts of basic bismuth (III) nitrate which has been previously dried. Add 2 parts of sodium peroxide, and pour the brownish-yellow fused mass onto an iron plate to cool. When cooled, break up in a mortar, extract with distilled water, and collect on an asbestos filter.

Sodium hydroxide (for CO₂ absorption). Dissolve 330 g of sodium hydroxide in distilled water and dilute to 1 L.

Sodium nitroprusside (reagent for hydrogen sulfide and wool). Use a freshly prepared solution of 1 g of sodium nitroferricyanide in 10 mL of distilled water.

Sodium oxalate (primary standard). Dissolve 30 g of the commercial salt of sodium oxalate in 1 L of distilled water, make slightly alkaline with sodium hydroxide, and let stand until clear. Filter and evaporate the filtrate to 100 mL. Cool and filter. Pulverize the residue and wash it several times with small volumes of distilled water. The procedure is repeated until the mother liquor is sulfate-free and is neutral to phenolphthalein.

Sodium plumbite (reagent for wool). Dissolve 5 g of sodium hydroxide in 100 mL distilled water. Add 5 g of litharge (lead (II) oxide) and boil until dissolved.

Sodium polysulfide. Dissolve 480 g of sodium sulfide nonahydrate in 500 mL of distilled water, add 40 g of NaOH and 18 g of sulfur. Stir thoroughly and dilute to 1 L with distilled water.

Sonnenschein's reagent. See Phosphomolybdic acid.

Starch solution.

1. Make a paste with 2 g of soluble starch and 0.01 g of mercury (II) iodide with a small amount of distilled water. Add the mixture slowly to 1 L of boiling distilled water and boil further for a few minutes. Keep in a glass stoppered bottle. If other than soluble starch is used, the solution will not be clear on boiling; it should then be allowed to stand and the clear liquid decanted.
2. A solution of starch that keeps stable indefinitely is made as follows: Mix 500 mL of aqueous saturated NaCl solution (filtered), 80 mL of glacial acetic acid, 20 mL of distilled water and 3 g of starch. Bring slowly to a boil and further heat for 2 minutes.
3. Make a paste with 1 g of soluble starch and 5 mg of mercury (II) iodide using as little cold distilled water as possible. Then pour about 200 mL of boiling distilled water on the paste and stir immediately. This will give a clear solution if the paste is prepared correctly and the water is actually boiling. Cool and add 4 g of potassium iodide. Starch solution decomposes on standing due to bacterial action, but this solution will be stable if stored under a layer of toluene.

Stoke's reagent. Dissolve 30 g of iron (II) sulfate and 20 g of tartaric acid in distilled water and dilute to 1 L. Just before using, add concentrated ammonium hydroxide until the precipitate that is initially formed is redissolved.

Sulfanilic acid (reagent for nitrites). Dissolve 0.5 g of sulfanilic acid in a mixture of 15 mL of glacial acetic acid and 135 mL of recently boiled distilled water.

Sulfomolybdic acid (Froehde's reagent for alkaloids and glucosides). Dissolve 10 g of molybdic acid or sodium molybdate in 100 mL of concentrated sulfuric acid.

Tannic acid (reagent for albumin, alkaloids, and gelatin).

Dissolve 10 g of tannic acid in 10 mL of ethanol and dilute with distilled water to 100 mL.

Titration mixture (residual chlorine in water analysis). Prepare 1 L of dilute HCl (100 mL of HCl (sp. gr. 1.19) in sufficient distilled water to make 1 L). Dissolve 1 g of *o*-tolidine (3,3'-dimethylbenzidine, CAS No. 119-93-7) in 100 mL dilute hydrochloride, stir well and dilute to 1 L using dilute HCl solution.

Tollen's Reagent (confirming the presence of aldehydes). 5 drops of 5% NaOH is added to 2 mL 10% aqueous silver nitrate in a test tube. The insoluble silver (I) oxide dissolved by the drop wise addition of 10% aqueous ammonia (ammonium hydroxide) yields a clear solution. Excess ammonium hydroxide should be avoided as it may give false positive result. Approximately 10 drops of the aldehyde will yield a silver mirror coating on the test tube inner wall, especially if the mixture is warmed up to 50 °C.

Trinitrophenol solution. See Picric acid.

Turmeric tincture (reagent for borates). Digest ground turmeric root with several quantities of distilled water which are discarded. Dry the residue and digest it several days with six times its weight of ethanol. Filter.

Uffelman's reagent (turns yellow in presence of lactic acid).

To a 2% solution of pure phenol in distilled water, add an aqueous solution of iron (III) chloride until the phenol solution becomes violet in color.

Wagner's reagent. See Iodo-potassium iodide.

Wagner's solution (used in phosphate rock analysis to prevent precipitation of iron and aluminum). Dissolve 25 g of citric acid and 1 g of salicylic acid in distilled water and dilute to 1 L. Use 50 mL of the reagent.

Wij's iodine monochloride solution (for iodine number).

Dissolve 13 g of resublimed iodine in 1 L of glacial acetic

acid that will pass the dichromate test for reducible matter. Set aside 25 mL of this solution. Bubble into the remainder of the solution dry chlorine gas (dried and washed by passing through concentrated sulfuric acid) until the characteristic color of free iodine has been dissipated. Add the 25 mL of the iodine solution that was set aside, until all free chlorine has been dissipated. A slight excess of iodine does little or no harm, but an excess of chlorine must be avoided. Preserve in well stoppered, amber colored bottles. Avoid the use of solutions that have been stored for more than 30 days.

Wij's special solution (for iodine number). To 200 mL of glacial acetic acid that will pass the dichromate test for reducible matter, add 12 g of dichloramine T (*N,N*-dichloro-4-methylbenzenesulfonamide, CAS No. 473-34-7), and 16.6 g of dry potassium crystals (in small quantities with continual shaking until all the potassium iodide has dissolved). Dilute to 1 L with the same quality of acetic acid used above and preserve in a dark colored bottle.

Zimmermann-Reinhardt reagent (determination of iron).

Dissolve 70 g of manganese (II) sulfate tetrahydrate in 500 mL of water, add slowly 125 mL of concentrated sulfuric acid and 125 mL of 85% phosphoric acid, and dilute to 1 L with water.

Zinc chloride solution, basic (reagent for silk). Dissolve 1000 g of zinc chloride in 850 mL of distilled water, and add 40 g of zinc oxide. Heat until complete dissolving is complete.

Zinc uranyl acetate (reagent for sodium). Dissolve 10 g of $\text{UO}_2(\text{C}_2\text{H}_3\text{O}_2)_2 \cdot 2\text{H}_2\text{O}$ in 6 g of 30% acetic acid, heat, if necessary, and dilute to 50 mL. Dissolve 30 g of zinc acetate dehydrate in 3 g of 30% acetic acid and dilute to 50 mL. Mix the two solutions, add 50 mg of sodium chloride, allow to stand overnight and filter. Use distilled water in all dilutions.

ORGANIC ANALYTICAL REAGENTS FOR THE DETERMINATION OF INORGANIC IONS

Paris D.N. Svoronos and Thomas J. Bruno

The table entitled Organic Analytical Reagents for the Determination of Inorganic Substances, by G. Ackermann, L. Sommer, and D. Thorburn Burns, has been revamped and considerably expanded for this edition. The many recent advancements in this area have been surveyed, and in this table, we present the major tests, reagents, and some guidance as to the expected result or method of observation. The abbreviations used here are defined in the abbreviations table in this section. In addition, for brevity, when a determination calls for a spectrophotometric measurement at a particular wavelength, for example at 500 nm, we denote this as: "spec λ = 500 nm." No wavelength is specified if it is variable, for example, with pH; here we indicate: "spec determination." When a determination calls for spectrofluorometric determination, the excitation and emission wavelengths are provided thus: spec λ_{ex} = 303.5 nm, λ_{em} = 353 nm. Note that a common surfactant used in many of these tests is cetyltrimethylammonium bromide, abbreviated (CTAB). When relevant, we provide an approximate limit of detection (LOD), and when the uncertainty can vary, this is expressed as a relative standard deviation (RSD). Some of the procedures listed here require the use of hazardous chemicals (carcinogens such as benzene, strong acids such as HF). Appropriate precautions must be observed.

While a great deal of the information presented here is from the recent literature, the reader is referred to several excellent reviews and monographs for additional information (Refs. 1–10).

I. Cations

Determination	Reagents	Results
Aluminum	Alizarin red S	Red color develops; spectrophotometric determination preferred
	Aluminon	Lake pigment stabilized with CTAB
	Chrome azurol S	Spec λ = 500 nm, stabilized with CTAB
	Chromazol KS	Spec λ = 625 nm, stabilized with cetylpyridinium bromide
	Eriochrome cyanine R (also known as mordant blue 3) + CTAB	Red dye lake (pH = 6) stabilized with CTAB
	Eriochrome cyanine R (also known as mordant blue 3) + <i>N,N</i> -dodecyltrimethylammonium bromide (DTAB)	Spec determination by use of cationic surfactants
	8-Hydroxyquinoline	Produces tris(8-hydroxyquinolino) aluminum (Alq3), found in organic light emitting diodes (OLEDs)
	Bromopyrogallol red + cetyltrimethyl ammonium bromide	Spec λ = 627 nm
	Bromopyrogallol red + nonylphenol	Spec λ = 612 nm
	tetradecaethylene glycol ether	Spec λ = 578 nm after separation of aluminum from the matrix materials by chloroform extraction of its acetylacetone complex (pH = 6.5), from an ammonium acetate-hydrogen peroxide medium
Antimony	Pyrocatechol violet	Spec determination of the binary system (pH = 5)
	2,2',3,4-Tetrahydroxy-3',5'-disulfoazobenzene	Isolated as the hexachloroantimonate (V) salt extracted by either toluene or benzene
	Brilliant green	Used for the determination of antimony (III) with EDTA, cyanide or fluoride ions as masking agents
	Bromopyrogallol red	Ternary complex stabilized with CTAB
	Catechol violet	Isolated as the hexachloroantimonate (V) complex after benzene extraction
	Malachite green (basic green 4)	Sensitive color reaction with antimony (III) by use of cationic surfactants
	Phenyl fluorene	Antimony (III)-iodide complex formation in the presence of ascorbic acid
	Potassium iodide	Ion pair or ion association extraction by use of toluene or benzene as solvents
	Rhodamine B	

Determination	Reagents	Results
Arsenic	Silver diethyldithiocarbamate Thiourea	Spec λ = 504 nm to avoid arsenic interference Determination by hydride generation inductively coupled plasma atomic emission spectrometry after reduction of antimony (V) to antimony (III) by thiourea
	Michler's ketone Silver diethyldithiocarbamate Thiourea	Spec λ = 640 nm trophotometric determination of trace arsenic (V) in water Spec λ = 600 nm to avoid antimony interference Determination by hydride generation inductively coupled plasma atomic emission spectrometry after reduction of arsenic (V) to arsenic (III) by thiourea
Barium	Dimethylsulfonazo-III (DMSA-III) Alizarin S red	Spec λ = 662 nm of the chelate complex Red color used spectrophotometrically as a stain to determine the amount of barium in bone
Beryllium	Aluminon	Lake pigment derivative
	Ammonium bifluoride	Derivative detected by fluorescence
	Beryllon II	A resin phase spectrophotometric method that detects a change in absorbance of the resin phase immobilized with beryllon II
	Beryllon III	Determination achieved via third –derivative spectrophotometry and decolorization of excess reagent
Bismuth	Chrome azurol S	Spec determination with chrome azurol S in the presence of EDTA or CTAB
	Eriochrome cyanine R + (CTAB)	Spec λ = 590 nm of ternary complex
	Sulfon black F	Derivative has a long color-development time
	Amberlite XAD-7	Determination system implemented with (HG-ICP-AES) associated with flow injection (FI)
	Sodium azide	Azidodimethylbismuthine precipitate formed by the reaction of the corresponding bismuthine with sodium azide
	Diethyldithiocarbamate	Heterometric micro-determination of lead with sodium diethyldithiocarbamate by use of a mixture of EDTA, cyanide and ammonium hydroxide (λ = 400 nm)
	Dithizone	Orange-red derivative that is extracted in carbon tetrachloride
	Pyrocatechol violet	Spec determination of bismuth (III) with pyrocatechol violet in the presence of septonex CTAB
	Quinolin-8-ol	Determination system implemented with HG-ICP-AES associated with flow injection (FI)
	Thiourea	Determination by HG-ICP-AES
Boron	Xylenol orange	Derivative used for sol-gel thin films that serve as bismuth (III) sensors
	Azomethine H	Spec determination
	Carminic acid	Spec determination
	Curcumin	Spec determination of rosocyanine and rubrocurcumin formed by the reaction between borates and curcumin
	Methylene blue	Spec determination of complex formed between fluoroborate ions and methylene blue after treatment with hydrofluoric and sulfuric acids and extraction with ethylene chloride
Cadmium	2-(5-Bromo-2-pyridylazo)-5-diethylaminophenol (PAR)	Spec determination in the presence of cationic surfactant cetylpyridinium chloride
	Cadion	Determination by β -correction spectrophotometry with cadion and surfactant Triton-X
	Dithizone	Determination of dithizonate derivative by the extraction – spectrophotometric method
	1-(2-Pyridylazo)-2-naphthol (PAN)	Two-dimensional absorption spec determination of complex in aqueous micellar solutions
	4-(2-Pyridylazo)resorcinol	Preconcentration by cloud point extraction of the complex; determination by ICP optic emission spectrometry. Simultaneous spectrophotometric determination of cadmium and mercury
Calcium	Alizarin S	Red dye used in staining bones for calcium determination
	Chlorophosphonazo III	Spec λ = 667.5 nm (pH = 2.2)
	Eriochrome black T + EDTA	Complexometric titration where the initially formed red calcium-eriochrome black T color is replaced with the blue calcium-EDTA color at the end point
Cerium	Glyoxal-bis(2-hydroxyanil)	Spectrophotometric titration of the complex without preliminary extraction
	Murexide	Spec λ = 506 nm (pH = 11.3)
	Phthalein purple	High-performance chelation ion chromatography involving dye-coated resins
	Butaperazine dimaleate propericiazine	Spec determination of the colored complex in a phosphoric acid medium
	Persulfate oxidation to cerium (IV)	UV spec λ = 320 nm
	Propericiazine	Spec determination of the colored complex in a phosphoric acid medium
	Propionyl promazine phosphate (PPP)	Spec λ = 513 nm of the red-colored radical cation formed upon the reaction of PPP with cerium(IV) in a phosphoric acid medium
	N-Benzoyl-N-phenylhydroxylamine	Spec titration of the cerium (IV) complex (pH = 8 to 10)
	Sodium triphosphate	Spec λ_{ex} = 303.5 nm, λ_{em} = 353 nm of the cerium (III) complex

Determination	Reagents	Results
Chromium	8-Hydroxyquinoline	Spec determination of the metal-ligand complex
	Alizarin S	Lake pigment complex formation
	1,5-Diphenylcarbazine	Spec determination during sonication in carbonated aqueous solutions saturated with CCl_4 that produces chlorine radicals
	3-(2-Pyridyl)-5,6 bis(5-(2-furyl disulfonic acid))-1,2,4-triazine disodium salt (ferene-TM)	Indirect spec $\lambda = 593 \text{ nm}$ in aqueous samples with a chromogen ferene-TM
	4-(2-Pyridylazo)resorcinol (PAR)	Spec determination of the ternary chromium-peroxo-par ternary complex
Cobalt	4-(2-Pyridylazo)resorcinol (PAR) + hydrogen peroxide	Spec determination of the ternary chromo-peroxo-PAR mixture after ethyl acetate extraction in 0.1 M sulfuric acid
	4-(2-Pyridylazo)resorcinol (PAR) + xylometazonium (XMH) chloride	Spec determination of the orange-red anionic complex formed in a heated acetate buffer medium ($\text{pH} = 4.0$ to 5.5) and extracted with the xylometazonium (XMH) chloride
	Sulfanilic acid	Spec $\lambda = 360 \text{ nm}$ on the catalytic effect of chromium (VI) in the oxidation of sulfanilic acid by hydrogen peroxide with <i>p</i> -aminobenzoic acid as an activator
	8-Hydroxyquinoline	Spec determination of the metal-ligand complex
	<i>p</i> -Nitroso- <i>N,N</i> -dimethylaniline	Spec determination of the binary complex
	Nitroso-R salt	AAS by use of a continuous on-line precipitation-dissolution procedure
	1-Nitroso-2-naphthol	Spec determination by use of non-ionic surfactant Triton X-100
	1-Nitroso-2-naphthol	Spec Tween 80 micellar determination
	1-Nitroso-2-naphthol	AAS by use of a continuous on-line precipitation-dissolution procedure based on 1-nitroso-2-naphthol
	2-Nitroso-1-naphthol	Spec $\lambda = 530 \text{ nm}$ after isoamyl acetate extraction
Copper	1-(2-Pyridylazo)-2-naphthol + surfactants	Spec $\lambda = 620 \text{ nm}$ of the cobalt complex in the presence of surfactants (Triton X-100 combined with sodium dodecylbenzene sulfonate (DBS)) and trace of ammonium persulfate ($\text{pH} = 5.0$)
	4-(2-Pyridylazo)resorcinol (PAR)	Spec determination of complex at both $\text{pH} = 7.2$ to 7.9 and in $1 \text{ M H}_2\text{SO}_4$
	4-(2-Pyridylazo)resorcinol (PAR) + triethanolamine	Ion-pair reversed-phase high-performance liquid chromatography of the complex
	Bathocuproine disulfonic acid	Spec $\lambda = 470 \text{ nm}$ to 550 nm of the Bathocuproine-disulfonic acid complex after extraction with chloroform and methanol by use of (PLS2)
	Dithizone	Spec determination of the dithizone complex at $\text{pH} = 2.3$
	Neocuproine	Spec determination of the deep orange-red $\text{Cu}(\text{neocuproine})_2^+$ complex color
	Cuprizone	Spec determination of the highly chromogenic copper (III) cuprizone complex
Europium	<i>p</i> -Nitroso- <i>N,N</i> -dimethylaniline	Spec determination of the binary complex
	1-Nitroso-2-naphthol	Spec determination by use of non-ionic surfactant Triton X-100
	4-(2-Pyridylazo)resorcinol	Preconcentration of copper by cloud point extraction of the complex and determination by ICP optic emission spectrometry
	1-Nitroso-2-naphthol	Spec Tween 80 micellar determination
	ChromAsurol S	Spec determination of the binary complex
Gallium	4-(2-Pyridylazo)resorcinol (PAR) + tetradecyl-dimethylbenzylammonium chloride (TDBA)	Spec $\lambda = 510 \text{ nm}$ of the ion-associate complex extracted with chloroform at $\text{pH} = 9.7$
	Chrome azurol S + (CTAB)	Spec $\lambda = 640 \text{ nm}$ of the ternary complex
	Haematoxylin or its oxidized form + (CTAB)	Spec determination of the ternary complex of indium with haematoxylin or its oxidized form in the presence of cationic, anionic and non-ionic surfactants such as (CTAB)
	Pyrocatechol violet + diphenylguanidine	Spec determination of the ternary complex
	8-hydroxyquinoline	Spec determination of the gallium complex
	1-(2-Pyridylazo)-2-naphthol	Spectrofluorimetric determination of Ga(III) with 1-(2-pyridylazo)-2-naphthol in sodium dodecyl sulfate micellar medium
	4-(2-Pyridylazo)resorcinol (PAR)	Extraction and spec $\lambda = 510 \text{ nm}$ of gallium with 4-(2-pyridylazo)resorcinol
	Rhodamine B	Comparison of the determination of gallium by a rhodamine B spectrophotometric method and by an AA method based on preliminary solvent extraction
	Xylenol orange + 8-hydroxyquinoline	Spectrophotometric determination of the ternary complex
	Brilliant Green + Molybdate	Spec $\lambda = 430 \text{ nm}$ of the yellow germanomolybdic acid
Germanium	Phenylfluorone	Spec determination of the complex previously extracted with carbon tetrachloride at $\text{pH} = 3.1$
	5-(4-Diethylaminobenzylidene) rhodanine	Immobilized 5-(4-dimethylamino-benzylidene) rhodanine serves as a stable solid sorbent for trace amounts of gold (III) ions ($\text{pH} = 2$ to 4)
	Di(methylheptyl)methyl phosphonate (DMHMP)	Trace gold determination by on-line preconcentration with flow injection atomic absorption spectrometry, by use of di(methylheptyl)methyl phosphonate (DMHMP) as the immobilized phase loaded onto a macroporous resin
Gold	2-Mercaptobenzothiazole	Radiochemical separation and determination of gold complex matrices employing substoichiometric thermal neutron activation analysis

Determination	Reagents	Results
	Molybdate + nile blue (NB)	A spectrophotometric method based on the reaction of gold(III) with molybdate and nile blue (NB) to form an ion-association complex in the presence of poly(vinyl alcohol)
	Rhodamine B	Aqueous spec determination of gold with rhodamine B and surfactant
Hafnium	Arsenazo III	Spec determination of the arsenazo III complex in 10 M HCl or H ₂ SO ₄
Indium	Bromopyrogallol red	Spec determination of indium after an ether extraction from hydrobromic acid, and benzyl alcohol extraction of its complex with bromopyrogallol red (pH 9.0)
	5-Bromine-salicylaldehyde salicyloylhydrazone (5-Br-SASH)	Spec $\lambda_{\text{ex}} = 395 \text{ nm}$, $\lambda_{\text{em}} = 461 \text{ nm}$ of the indium: 5-Br-SASH chelate in a water-ethanol (63%) medium (pH = 4.6)
	Chrome azurol S	Spec determination of the binary complex
	Chrome azurol S + benzyldodecyldimethyl-ammonium bromide (BDDMAB)	Spec determination of the mixed complex with chrome azurol S and (BDDMAB)
	Chrome azurol S + (CTAB)	Spec $\lambda = 630 \text{ nm}$ of the ternary complex after <i>n</i> -butyl acetate extraction from hydrobromic acid
	Chrome azurol S + cationic surfactants	Spec determination by use of chrome azurol S and surfactants such as CTA, CP, or zephiramine
	Dithizone	Spec determination of the binary complex
	Haematoxylin or its oxidized form + (CTAB)	Spec determination of the ternary complex of indium with haematoxylin or its oxidized form in the presence of cationic, anionic and non-ionic surfactants such as (CTAB)
	8-Hydroxyquinoline	Spec determination of the binary complex
	Methylthymol blue + zephiramine	Spec determination of the ternary complex
	1-(2-Pyridylazo)-2-naphthol (PAN)	Spec determination of the chelate complex after chloroform extraction (pH = 6)
	4-(2-Pyridylazo)resorcinol	Spec $\lambda = 520 \text{ nm}$ after indium extraction from the aqueous phase (pH 5.0 to 5.5) into chloroform with <i>N-p</i> -chlorophenyl-2-furohydroxamic acid and formation of the 4-(2-pyridylazo)resorcinol red chelate
	Pyrocatechol violet	Spec determination of the binary complex
	Pyrocatechol violet + tridodecylammonium bromide	Spec determination of the ternary complex
	Quinalizarin (1,2,5,8-tetrahydroxyanthraquinone)	Spec $\lambda = 565 \text{ nm}$ of the binary 3:1 Quinalizarin:In(III) colored complex in dimethylformamide-water solution
	2,2',3,4-Tetrahydroxy-3',5'-disulfoazobenzene	Spec determination of the binary system (pH = 5)
	Xylenol orange	Spec determination of the ternary complex
Iridium	1,5-Diphenylcarbazine	Spec determination of the complex (pH = 5.0)
	1-(2-Pyridylazo)-2-naphthol	Spec $\lambda = 550 \text{ nm}$ of the red complex (pH = 5.1) after chloroform extraction
Iron	Bathophenanthroline	Determination of iron(II) in the presence of thousand-to-one ratio of iron(III) by use of bathophenanthroline
	Bathophenanthroline-disulfonic acid	Spec $\lambda = 470 \text{ nm}$ to 550 nm of the bathophenanthroline-disulfonic acid complex after extraction with chloroform and methanol
	2,2'-Bipyridine	Spec determination of the iron (II)-2,2'-bipyridine dark red complex
	FerroZine	Spec $\lambda = 562 \text{ nm}$ of iron (II)-ferrozine complex after all iron(III) has been reduced by ascorbic acid
	Hematoxylin + (CTAB)	Spec of the ternary complex. Addition of CTAB shifts λ_{max} from 630 nm to 640 nm
	1-Nitroso-2-naphthol	Spec determination by use of non-ionic surfactant Triton X-100
	1-Nitroso-2-naphthol	Spec determination Tween 80 micellar determination
	1,10-Phenanthroline (o-Phen)	Spec $\lambda = 508 \text{ nm}$ of the Fe(o-Phen)_3^{+2} complex
	1,10-Phenanthroline + bromothymol blue	Spec determination of the Fe(o-Phen)_3^{+2} complex in the presence of bromothymol blue
	Phenylfluorone	Spec $\lambda = 530 \text{ nm}$ of the binary complex (pH = 9.0)
	Phenylfluorone + Triton X	Spec $\lambda = 555 \text{ nm}$ of the binary complex sensitized with Triton X-100 (pH = 9.0)
Lanthanum	Ammonium purpurate	Spec determination of lanthanum with ammonium purpurate as a chromogenic reagent
	Arsenazo III	Spec determination of the lanthanum complexation with reagents of the arsenazo III group on the solid phase of fibrous ion exchangers
	Eriochrome cyanine R (ECR)	Spec $\lambda = 540 \text{ nm}$ of the binary complex
	<i>N</i> -Phenylbenzohydroxamic acid + xylenol orange	Solvent extraction followed by the spec $\lambda = 600 \text{ nm}$ of the ternary complex (pH = 8.8 to 9.5)
Lead	Dithizone	Orange-red derivative that is extracted in carbon tetrachloride
	Sodium diethyldithiocarbamate	Electrothermal AAS determination of the diethyldithiocarbamate derivative extracted in carbon tetrachloride
	Sodium diethyldithiocarbamate	Heterometric micro-determination of lead diethyldithiocarbamate derivative
	4-(2-Pyridylazo)resorcinol	Spec $\lambda = 520 \text{ nm}$ of 4-(2-pyridylazo)-resorcinol:lead (1:1) complex in an ammonia-ammonium chloride medium at pH = 10 after extracting the lead in isobutyl methyl ketone

Determination	Reagents	Results
Lithium	1-(<i>o</i> -Arsenophenylazo)-2-naphthol-3,6-disulfonate (Thoron)	Spec λ = 480 nm of Thoron-lithium complex in an alkaline acetone medium is measured against the reagent as reference
Magnesium	Chlorophosphonazo III Eriochrome black T + EDTA 8-Hydroxyquinoline 8-Hydroxyquinoline + butylamine Titan yellow Xylidyl blue	Spec λ = 669 nm (pH = 7.0) Complexometric titration where the initially formed red magnesium-eriochrome black T color is replaced with the blue magnesium-EDTA color at the end point Volumetric, titrimetric, and colorimetric determination Spec λ = 380 nm of the complex after chloroform extraction Spec determination of magnesium by titan yellow in biological fluids Spec determination of magnesium in biological fluids
Manganese	Formaloxime 1-(2-Pyridylazo)-2-naphthol (PAN)	Spec determination of the formaloxime/ammonia complex (pH = 8.8 to 8.9) Preconcentration determination by use of (PAN) anchored SiO ₂ nanoparticles
Mercury	Dithizone Michler's thioketone 4-(2-Pyridylazo)resorcinol Rhodamine 6G Xylenol orange + amine buffer Xylenol orange + citric acid-phosphate buffer	Spec λ = 500 nm of dithizone complex after chloroform extraction at pH = 0.3 Spec λ = 560 nm of the binary complex in acetate buffer Simultaneous spec determination of cadmium and mercury with 4-(2-pyridylazo)resorcinol Photoelectrochemical determination of mercury (II) in aqueous solutions by use of a rhodamine 6G derivative (RS) and polyaniline (PANI) coated optical probe in a photoelectrochemical cell Spec λ = 590 nm of Hg(II)/xylenol orange complex display a sharp hyperchromic effect in the presence of amine buffers (pH = 7.5) Spec λ = 580 nm of Hg(II)/xylenol orange complex display a sharp hypochromic effect upon substituting amine buffers with a citric acid-phosphate (pH = 7.5)
Molybdenum	Bromopyrogallol red + cetylpyridium chloride Phenylfluorone 8-Hydroxyquinoline-5-sulfonic acid and phenylfluorone Pyrocatechol violet	Sequential injection analysis to the determination of CPC based on the sensitized molybdenum-bromopyrogallol red reaction Spec λ = 560 nm of molybdenum with phenylfluorone (pH of 1.5 to 3) Diffuse reflection spectrometry with 8-hydroxyquinoline-5-sulfonic acid and phenylfluorone after sorbing on a disk of an anion exchange fibrous material Preconcentration (by use of basic anion exchanger AV-17-10P) and determination via diffuse reflection spectroscopy. The colored surface compound to be determined involves Mo(VI) sorption on the resin and subsequent treatment of the concentrate obtained with pyrocatechol violet
Neodymium	Semi-xylenol orange + cetylpyridinium chloride	Fourth-order derivative spectrophotometric determination of the ternary complex
Neptunium	Arsenazo III	Spec after separation by use of thenoyltrifluoroacetone extraction method and determination in 5M HNO ₃
Nickel	2-(5-Bromo-2-pyridylazo)-5-diethylaminophenol Dimethylglyoxime + ammonia Dimethylglyoxime, voltammetry 2,2'-Furildioxime Hematoxylin Hematoxylin + (CTAB) 1-Nitroso-2-naphthol <i>p</i> -Nitroso- <i>N,N</i> -dimethylaniline 2-(2-Pyridylazo)-2-naphthol 4-(2-Pyridylazo)resorcinol 1-(2-Thiazolylazo)-2-naphthol (TAN)	Spec λ = 520 nm and 560 nm of the red-violet complex in water-ethanol (pH = 5.5) Spec λ = 543 nm of the complex Nickel voltammetric determination at a chemically modified electrode based on dimethylglyoxime-containing carbon paste Spec λ = 438 nm after separation by adsorption of its α -furildioxime complex on naphthalene Spec λ = 595 nm of the binary system (pH = 7.8 to 8.3) Spec λ = 608 nm of the ternary system (pH = 7.4 to 8.1) Spec Tween 80 micellar determination Spec determination of the binary complex Derivative spectrophotometry λ = 569 nm determination of nickel complex in Tween 80 micellar solutions Preconcentration of nickel by cloud point extraction of the complex and determination by ICP optic emission spectrometry Flow-injection solid phase spectrophotometry by use of TAN immobilized on C ₁₈ -bonded silica (λ = 595 nm) Spec determination by mean centering of ratio kinetic profile (pH = 5.3) Separation and determination of the complex from a tartrate solution at pH > 2 Spec λ = 610 nm of complex extracted into isopentyl acetate containing di- <i>n</i> -octylmethylamine Spec λ = 520 nm of the complex in strong acidic media
Niobium	Xylenol orange <i>N</i> -Benzoyl- <i>N</i> -phenylhydroxylamine Bromopyrogallol red <i>O</i> -Hydroxyhydroquinonephthalein (Qnph) + hexadecyltrimethylammonium chloride (HTAC) 4-(2-Pyridylazo)resorcinol + citrate Pyrocatechol violet Sulfochlorophenol S Xylenol orange	Determination of the ternary complex by ion-interaction reversed-phase HPLC on a C18 column with a 5 mM citrate buffer (pH = 6.5, λ = 540 nm) Extraction and spec determination of niobium complex in the presence of pyridine and trichloroacetic acid Spec determination of the complex after extraction into amyl alcohol Spec λ = 530 nm of chelate (pH = 5.0)
Osmium	1,5-Diphenylcarbazine	Spec λ = 560 nm of the bluish-violet complex after extraction with isobutyl methyl ketone

Determination	Reagents	Results
Palladium	Thiourea	Spec λ = 540 nm of the red-rose complex in acid medium
	Ammonia + iodide	Thermogravimetric determination of palladium as $\text{Pd}(\text{NH}_3)_2\text{I}_2$
	2,2-bis-[3-(2-Thiazolylazo)-4-hydroxyphenyl-propane], (TAPHP)	Application of TAPHP immobilized on silica beads to determine the palladium concentration in a trans-luminance configuration (pH = 2) by use of flow-through spectrophotometric sensing phase
	2-(5-Bromo-2-pyridylazo)-5-diethylaminophenol	Spec determination of the complex in a sulfuric acid medium in the presence of ethanol
	Dithizone	Volumetric determination of palladium with dithizone in acid medium after extraction of its dimethylglyoxime complex with chloroform; PAS determination of the dithizone extraction solution into a thermally thin solid film
	Dithiazone + iodide	Spec determination of palladium with dithizone, by use of an iodide medium in the presence of sulfite at pH = 3 to 5, to separate platinum
	Dithizone + stannous chloride	Extractive separation and spec determination of palladium in the presence of stannous chloride to separate platinum
	Isonitrosobenzoylacetone	Radiochemical separation and determination of palladium in complex matrices employing substoichiometric thermal NAA
	2-Nitroso-1-naphthol	Spec λ = 370 nm of the violet complex
	4-(2-Pyridylazo)resorcinol	Spec determination of complex at both pH = 7.2 to 7.9 and in 1 M H_2SO_4
Platinum	4-(2-Pyridylazo)resorcinol + diphenylguanidine	Spec determination after extraction of the red Pd(II) chelate with 4-(2-pyridylazo)resorcinol in the presence of <i>N,N'</i> -diphenylguanidine into <i>n</i> -butanol
	<i>N</i> -Phenylbenzimidoylthiourea (PBITU)	Flow injection analysis spec λ = 345 nm of the Pd:PBITU complex in (0.2 to 2.0) M HCl in 10% (vol/vol) ethanol solution
	Dithizone + iodide	Spec determination of platinum with Dithizone, by use of an iodide medium in the presence of sulfite at pH = 3 to 5, to separate palladium
	Dithizone + stannous chloride	Extractive separation and spectrophotometric determination of platinum in the presence of stannous chloride to separate palladium
	2-Mercaptobenzothiazole	Radiochemical separation and determination of platinum complex matrices employing substoichiometric thermal NAA
Protactinium	Arsenazo III	Spec λ = 680 nm of the complex after extraction with 7 N H_2SO_4 and isoamyl alcohol
Rhenium	EDTA + tannic acid	Gravimetric analysis of the tannic acid precipitate (pH = 5.0)
	2,2'-Furildioxime	Spec λ = 532 nm of the complex
	<i>N,N</i> -Diethyl- <i>N'</i> -benzoylthiourea	Spec λ = 383 nm of the green complex in hydrochloric acid medium in the presence of tin(II) chloride
Rhodium	Tin(II)	Spectrophotometric titration for the determination of rhenium by use of tin(II) as the titrant
	1,5-Diphenylcarbazide	Spec determination of the complex after isobutyl alcohol extraction (pH = 5.0)
	<i>p</i> -Nitrosodimethylaniline	Spec λ = 510 nm of the cherry-red binary complex (pH = 4.4)
Ruthenium	1-(2-Pyridylazo)-2-naphthol	Spec λ = 598 nm of the green complex (pH = 5.1) after chloroform extraction
	4-Benzylideneamino-3-mercapto-6-methyl-1,2,4-triazine (4H)-5-one	Spec λ = 620 nm
	1,10-Phenanthroline	Chemiluminescence determination of chlorpheniramine by use of tris(1,10-phenanthroline)-ruthenium(II) peroxydisulfate system and sequential injection analysis; Spec determination of the complex after reducing Ru (IV) to Ru(II)
	Thiourea	Spec λ = 640 nm of ruthenium complex in carbon supported Pt-Ru-Ge catalyst in 5 M HCl
Scandium	1,4-Diphenylthiosemicarbazide	Spec determination of the bright red complex
	Alizarin red S	Cathodic adsorptive stripping of the scandium-alizarin red S complex onto a carbon paste electrode
	Ammonium purpurate	Spec determination of scandium with ammonium purpurate as a chromogenic reagent
Selenium	Chrome azurol S	Spec determination of the binary complex
	Xylenol orange	Spec λ = 553 nm of the binary mixture
	3,3'-Diaminobenzidine	Spec λ = 350 nm of the yellow complex (pH = 3.0)
	2,3-Diaminonaphthalene	Fluorometric determination of the binary complex in water
	Thiourea	Determination of selenium by hydride generation inductively coupled plasma atomic emission spectrometry
Silver	Dithizone	Graphite-furnace atomic-absorption spectrophotometric determination of silver on suspended dithizone particles from acidic sample solutions with ultrasonics to facilitate the separation
Strontium	Eosin + 1,10-phenanthroline	Spec λ = 540 nm to 555 nm of the 1,10-phenanthroline (PHEN) and eosin (2,4,5,7-tetrabromofluorescein) association complexes
	Phthalein purple	High-performance chelation ion chromatography involving dye-coated resins
Tantalum	<i>N</i> -Benzoyl- <i>N</i> -phenylhydroxylamine	Separation and determination of the complex from a tartrate solution at pH < 1.5

Determination	Reagents	Results
Tellurium	Crystal violet (CV) + <i>N,N'</i> -diphenylbenzamidine (DPBA)	Spec λ = 600 nm of Ta(V)-F-CV+ cation complex with a benzene solution of DPBA from sulfuric acid solution
	<i>O</i> -Hydroxyhydroquinonephthalein (Qnph) + hexadecyltrimethylammonium chloride (HTAC)	Spec λ = 510 nm of the complex in strong acidic media
	Malachite green	Spec λ = 623 nm of the complex in HF after extraction with benzene or toluene
	Methyl violet	Spec determination of the complex
	4-(2-Pyridylazo)resorcinol + citrate	Determination of the ternary complex by ion-interaction reversed-phase HPLC on a C18 column in 5 mM citrate buffer (pH = 6.5, λ = 540 nm)
	Phenylfluorone	Spectrophotometric determination from HF-HCl solution with methyl isobutyl ketone
	Victoria blue	Spectrophotometric determination of the complex after benzene extraction
	Ammonium pyrrolidinedithiocarbamate	Differential determination of tellurium(IV) and tellurium(VI) by AAS with a carbon-tube atomizer
	Bismuthiol II	Spec λ = 330 nm of the yellow complex in acidic medium (pH = 3.5) after chloroform extraction
	Dithizone	Differential determination of tellurium(IV) and tellurium(VI) by AAS with a carbon-tube atomizer
Thallium	Sodium diethyldithiocarbamate	Differential determination of tellurium(IV) and tellurium(VI) by AAS with a carbon-tube atomizer
	Thiourea	Determination of selenium by hydride generation inductively coupled plasma atomic emission spectrometry
	Brilliant green	Spec determination of the binary complex after toluene extraction
	Dithizone	Spec λ = 505 nm of the complex after chloroform extraction from a citrate-sulfite-cyanide medium at pH = 10.6
	8-Hydroxyquinoline	Spectrophotometric determination of the metal-ligand complex
Thorium	Rhodamine B	Fluorimetric determination of thallium (in silicate rocks) with rhodamine B after separation by adsorption on a crown ether polymer
	Rhodamine B hydroxide	Spec λ = 565 nm via oxidation of rhodamine B hydrazide by thallium(I) in acidic medium to give a pinkish violet radical cation
	Arsenazo III	Spec determination of the arsenazo III complex in 10 M HCl or H ₂ SO ₄
	Eriochrome cyanine R (ECR)	Spec λ = 540 nm of the binary complex
Tin	Thoron	Spectrophotometric determination of binary complex in tartaric acid
	Xylenol orange	Spec λ = 570 nm of the binary complex (pH = 4.0)
	Xylenol orange + CTAB bromide	Spec λ = 600 nm of the complex sensitized by CTMAB (pH = 2.5)
	Catechol violet + CTAB bromide	Spectrophotometric determination of the green complex
	Pyrocatechol violet (and + CTAB bromide)	Spec λ = 660 nm of the complex (pH = 2.0)
Titanium	Gallein	Spectrophotometric determination of complex in acid medium
	Phenylfluorone	Spec determination of the complex (pH = 1) in 36% aqueous ethanol after a preliminary solvent extraction of the tin as the iodide
	Toluene-3,4-dithiol + dispersant	Spec determination of the complex
	Chromotropic acid	Spec λ = 443 nm of the complex by use of a flow injection manifold
	Diantipyrinylmethane	Spec λ = 390 nm of the yellow complex
Tungsten	3-Hydroxy-2-methyl-1-(4-tolyl)-4-pyridone (HY)	Spec λ = 355 nm of the ternary complex formed in perchloric acid and is extracted by chloroform
	Methylene blue-ascorbic acid redox reaction	Spec λ = 665 nm of the titanium-methylene blue-ascorbic acid redox reaction
	Tiron	Spec λ = 420 nm of the yellow Tiron derivative (pH = 5.2 to 5.6)
	Cyanate	Spectrophotometric determination of tungsten with thiocyanate after both tungsten(VI) and molybdenum(VI) are extracted into chloroform as benzoin α -oxime complexes
	Pyrocatechol violet	Determination of the 2:1 green complex in acid medium which is fixed on a dextran-type anion-exchange resin (Sephadex QAEA-25) by first-derivative solid-phase spectrophotometry (λ = 674 nm)
Uranium	Tetraphenylarsonium chloride + thiocyanate	Gravimetric determination of tungsten with tetraphenylarsonium chloride after its extraction as thiocyanate (pH = 2 to 4)
	Toluene-3,5-dithiol	Spec λ = 630 nm of the toluene-3,4-dithiol derivative after extraction with isoamyl acetate
	Arsenazo III (1,8-dihydroxynaphthalene-3,6-disulfonic acid-2,7-bis[(azo-2)-phenylarsonic acid])	Spec determination of the binary complex
	2-(5-Bromo-2-pyridylazo)diethylaminophenol	Spec λ = 578 nm of the complex (pH = 7.6)
	Chlorophosphonazo III	Spec λ = 673 nm of the complex after extraction into 3-methyl-1-butanol from (1.5 to 3.0) M HCl
	8-Hydroxyquinoline	Spectrophotometric determination of the metal (UO ₂ (II))-ligand complex

Determination	Reagents	Results
Vanadium	2-(2-Pyridylazo)-5-diethylaminophenol (PADAP)	Spec λ = 564 nm of the complex after extraction into methyl isobutyl ketone (pH = 8.2)
	1-(2-Pyridylazo)-2-naphthol (PAN)	Spec λ = 560 nm of the deep red precipitate in ammoniacal solutions extracted with chloroform
	4-(2-Pyridylazo)-resorsinol (PAR)	Spec λ = 530 nm of the intensely deep red complex after extraction into methyl isobutyl ketone (pH = 8.0)
	2-(2-Thiazolylazo)- <i>p</i> -cresol + surfactants	Spec λ = 588 nm of the complex (pH = 6.5) with surfactants such as Triton X-100 or <i>N</i> -cetyl- <i>N,N,N</i> -trimethyl ammonium bromide (CTAB)
	Chrome azurol S	Spectrophotometric determination of the binary complex
	<i>N</i> -Benzoyl- <i>N</i> -phenylhydroxylamine	Spec determination of the violet complex in acidic medium
	3,5-Dinitrocatechol (DNC) + brilliant green	Extraction-spectrophotometric determination of the system V(V)-3,5-dinitrocatechol (DNC)-brilliant green chelate complex
	8-Hydroxyquinoline (oxine)	Extraction with <i>n</i> -butanol and spec λ = 390 nm of a ternary complex (vanadium:oxine: <i>n</i> -butanol = 1:2:2)
	8-Hydroxyquinoline-5-sulfonic acid and phenylfluorone	Diffuse reflection spectrometry with 8-hydroxyquinoline-5-sulfonic acid and phenylfluorone after sorbing on a disk of an anion exchange fibrous material
	4-(2-Pyridylazo)resorcinol (PAR)	Spec determination of the binary complex based on the extraction tetraphenylphosphonium or tetraphenylarsonium chloride
Yttrium	Xylenol orange	Spec λ = 490 nm of chelate (pH = 5.0)
	Alizarin red S	Spec λ = 550 nm of the complex
	Ammonium purpurate	Spec determination of yttrium with ammonium purpurate as a chromogenic reagent
	Arsenazo III	Spec λ = 660 nm of the blue colored complex after preliminary purification with hydroxide and subsequent acidification
Zinc	Eriochrome cyanine R (ECR)	Spec λ = 540 nm of the binary complex
	Pyrocatechol violet	Spec λ = 665 nm of complex
	2-(5-Bromo-2-pyridylazo)-5-diethylaminophenol	Spec determination by use of 2-(5-bromo-2-pyridylazo)-5-diethyl aminophenol in the presence of cationic surfactant cetylpyridinium chloride
	Carbonic anhydrase	Enzymatic determination by use of carbonic anhydrase after removing zinc by dialysis against dipicolinic acid
	Dithizone	Spec λ = 530 nm of binary complex after chloroform extraction
	Eriochrome black T + EDTA	Complexometric titration where the initially formed red zinc-eriochrome black T color is replaced with the blue zinc-EDTA color at the end point (pH = 10)
	7-(4-Nitrophenylazo)-8-hydroxyquinoline-5-sulfonic acid (<i>p</i> -NIAZOXS)	Spec λ = 520 nm of the zinc derivative (pH = 9.2, borax buffer)
	Phenylglyoxal mono(2-pyridyl) hydrazone (PGMPH)	Spec λ = 464 nm to 470 nm of the yellow-orange complex (pH = 7.2 to 8.5) in 40% (v/v) ethanol
	1-(2-Pyridylazo)-2-naphthol (PAN)	Two-dimensional absorption spec determination of complex in aqueous micellar solutions
	1-(2-Pyridylazo)-2-naphthol (PAN)	Preconcentration determination by use of 1-(2-pyridylazo)-2-naphthol (PAN) anchored. SiO ₂ nanoparticles
	4-(2-Pyridylazo)resorcinol	Spec determination at pH = 7.0; preconcentration of zinc by cloud point extraction of the complex and determination by ICP optic emission spectrometry
	1-(2-Thiazolylazo)-2-naphthol (TAN)	Flow-injection solid phase spec λ = 595 nm with TAN immobilized on C18-bonded silica
	Xylenol orange	Spec determination of 1:1 zinc-xylenol orange red-violet complex (pH = 5.8 to 6.2)
	Xylenol orange	Sequential injection analysis (SIA) based on the spec λ = 568 nm of zinc by use of xylenol orange as a color reagent
	Xylenol orange	Spec determination by mean centering of ratio kinetic profile (pH = 5.3)
Zirconium	Xylenol orange + cetylpyridinium chloride	Spec λ = 580 nm of the 1:2:4 ratio for the metal:ligand: surfactant ternary complex (pH = 5.0 to 6.0)
	Alizarin red S	Spec determination of the binary complex after phosphate extraction
	Arsenazo III (1,8-dihydroxynaphthalene-3,6-disulfonic acid-2,7-bis[(azo-2)-phenylarsonic acid])	Spec determination of the binary complex
	<i>N-p</i> -Chlorophenylbenzohydroxamic acid (<i>N-p</i> -Cl-BHA) + morin	Spec λ = 420 nm and fluorimetric determination of the <i>N-p</i> -Cl-BHA greenish yellow complex after extraction with isoamyl alcohol from (0.2 to 0.5) N H ₂ SO ₄ followed by morin addition; it is critical that the morin be very pure
	Pyrocatechol violet	Spec λ = 650 nm of the blue complex in sulfuric acid solution
	Pyrocatechol violet + tri- <i>n</i> -octylphosphine oxide (TOPO)	Spec λ = 655 nm of the blue complex after extraction with tri- <i>n</i> -octylphosphine oxide (TOPO) in cyclohexane
	Morin	Fluorimetric determination of the complex after EDTA addition
	Xylenol orange	Flow injection spectrophotometric determination in sulfuric acid medium

II. Anions

Anion	Method	Results/Comments
Arsenate, AsO_4^{-3}	X-ray absorption near edge structure (XANES)	Use of self-consistent multiple-scattering methods that measure the AsO_4^{-3} adsorption on TiO_2
	Dual detection ion chromatography	Simultaneous determination of AsO_4^{-3} and AsO_3^{-3} (LOD = 0.044 mg/L)
	Ion chromatography/inductively-coupled plasma/MS	Validation established after ultrasonic-assisted enzymatic extraction
	Ion chromatography	Post-column generation and detection of the AsO_4^{-3} molybdate heteropoly ion
	Surface-enhanced Raman scattering (SERS)	Use of Ag nanostructured multilayer films; LOD = 5 $\mu\text{g/L}$
	Liquid chromatography-atomic fluorescence detection	Simultaneous determination of six As ions; LOD < 4 $\mu\text{g/L}$
	LC-ICP/MS	Simultaneous determination of five As ions; LOD < 4 $\mu\text{g/L}$
	HPLC/hydride generation atomic absorption	Simultaneous determination of six As ions; LOD = 3 ng to 9 ng
	Ion exchange determination	Separation of AsO_4^{-3} and AsO_3^{-3} using the weakly basic anion exchanger A63-X4A by difference of respective pK_a values
	Titration	As^{+5} is reduced by NH_2NH_2 and titration with $\text{Br}^-/\text{BrO}_3^-$
Bromide, Br^-	Ion chromatography using electrochemical detection	Use of Ag working electrode; LOD = 10 ppb (mass/mass)
Carbonate, CO_3^{-2}	GC	Carbonation of salt and use of a GC with methanation reformer and a flame ionization detector
	GC-MS	Determination of pentafluorobenzyl derivative
	FTIR	CO_3^{-2} measurement in organic matter (875 cm^{-1} and 712 cm^{-1})
	Gas measurement	Conversion to CO_2 measured by a barometer or manometer
	Ion chromatography	Measurement in the presence of formyl ions
	Photoacoustic IR spectroscopy	Use of several multi-calibration methods typically in sedimentary rocks
	Thermal optical analysis	Use of semi-continuous carbon elemental analyzer
	Liquid chromatography	Use of a C18 HPLC column, MeOH/AcOH mobile phase and UV detection (spec λ = 290 nm)
	Raman spectroscopy	Use of OH stretch band of H_2O as internal standard
	Thermogravimetry	CO_3^{-2} measurement in organic matter after identification of evolved gaseous species
Chlorate, ClO_3^-	Flow injection analysis	Reduction of methylene blue's leuco form to methylene blue followed by optical detection in the visible region
	Spectrophotometry	Reduction to Cl_2 via Ti^{+3} which oxidizes the leuco form of methylene blue
	FTIR	Absorption band at 973 cm^{-1} (λ = 10 277 nm)
	Anodic electrochemical dissociation	Determination made during the anodic dissociation of Ti grade VT-1
	Potentiometric titration	Reduction to Cl^- (pH = 7) using As^{+3} (OsO_4 as catalyst)
	Titrimetric analysis	ClO_3^- converted to Cl^- which is titrated against $\text{Hg}(\text{NO}_3)_2$ (diphenylcarbazone as indicator)
	Titrimetric analysis	Iodometric titration
	Titrimetric analysis	Use of methyl orange (LOD = 10^{-2} μg , mass/mass)
	Potentiometric titration	Selective electrode based on the N,N-butylenebis (salicylideneiminato) copper(II); LOD = 3.0×10^{-6} mol/L
	Spectrophotometry	Determination by oxidation of ascorbic acid (spec λ = 548 nm)
Chromate, CrO_4^{-2}	Ion exchange chromatography	Diaminetetraacetic acid (DCTA)/ CH_3CN used as eluent
	Ion pair chromatography	Tetrabutylammonium hydroxide (TBAH)/aq. CH_3CN used as eluent
	Capillary electrophoresis	KH_2PO_4 buffer (pH = 7)
	Titration	Iodometric titration
	X-ray absorption near edge structure (XANES)	LOD = 10 ppm using a 150 μm synchrotron X-ray beam
	Headspace GC/MS	Use of gas chromatography with a silica PLOT column coupled with mass selective detection
	Headspace GC/MS	Use of gas chromatography with a nitrogen-phosphorus detector; LOD = 0.05 $\mu\text{g/mL}$ to 5 $\mu\text{g/mL}$
	Headspace GC/MS	Use of headspace solid-phase microextraction (SPME); LOD = 0.006 $\mu\text{g/mL}$
	Headspace GC/MS	Determined as the pentafluorobenzylbromide derivative in the presence of TDMBC
	Headspace GC	Use of GC with thermoionic detection (NPD)
Cyanide, CN^-	Headspace GC/MS	Use of GC with the flame ionization detector (FID)
	Headspace GC/MS	Determination after reaction with chloramine-T
	Headspace GC/MS	Derivatization by the pyridine-pyazolone method
	Ion chromatography using electrochemical detection	Use of Ag working electrode; LOD = 1 $\mu\text{g/L}$
	Cyclic voltammetry	Au electrode; LOD = 10^{-5} mol/L to 10^{-6} mol/L

Anion	Method	Results/Comments
	Differential cathodic stripping voltammetry	LOD = 2×10^{-7} M in the presence of 5×10^{-5} M $[S^{-2}]$ and 1×10^{-3} M $[Cu^{+2}]$
	Differential electrolytic potentiometry (DEP)	DEP coupled with the sequential injection/flow analysis (SIA/FIA) of aqueous solutions; con. range 6 $\mu\text{g/mL}$ to 39 $\mu\text{g/mL}$; LOD = 0.31 $\mu\text{g/mL}$; RSD = 2.55
	Isotachopheresis	Determination as $[Au(CN)_2]^{-}$, $[Ag(CN)_2]^{-}$, or $[Cu(CN)_3]^{-2}$ complexes
	Potentiometric determination	Use of PVC sensors responsive to $Ag(CN)_2^{-}$
	Spectrofluorometry	Use of naphthoquinone imidazole boronic-based sensors (M-NQB and p-NQB) with CTAB (spec λ = 460 nm)
	Fluorescence	Derivatization with naphthalene 2,3-dicarboxyaldehyde and taurine (spec λ_{ex} = 418 nm, λ_{em} = 460 nm); LOD = 0.002 $\mu\text{g/mL}$ to 0.025 $\mu\text{g/mL}$
	Argentometric method	Argentometric titration/quantification using KCNS ($FeNH_4SO_4$) as indicator
	Capillary electrophoresis/UV spectrophotometry	Conversion of CN^{-} to SCN^{-} via rhodanese, separated by capillary electrophoresis and measured by UV spectrophotometry (spec λ = 200 nm); LOD = 3 μmol
	Piezoelectric quartz crystal (PQC) sensors	Method makes use of silver coated sensors; LOD = 1.25×10^{-8} mol/L
	Visible spectrophotometry colorimetric assay	Picrate/resorcinol derivative in bicarbonate (spec λ = 488 nm)
	Visible spectrophotometry colorimetric assay	Lithium/sodium picrate derivative (spec λ = 500 nm to 520 nm); LOD = 2.5 $\mu\text{g}/100$ mg sample
	Visible spectrophotometry colorimetric assay	Isonicotinic acid-barbituric acid derivative after treatment with chloramine-T (spec λ = 600 nm)
	Visible spectrophotometry colorimetric assay	4-hydroxy-3-(2-oxoindoline-3-ylideneamino)-2-thioxo-2H-1,3-thiazin-5(3H)-one) HOTT derivative (spec λ = 466 nm)
	Visible spectrophotometry colorimetric assay	Ethanol extraction of the red complex formed on picric acid test strips (spec λ = 500 nm); LOD = 0.5 μg to 1.0 μg
	Visible spectrophotometry colorimetric assay	Derivatization with p-nitrobenzaldehyde followed by reaction with o-dinitrobenzene to yield a purple color; LOD = 10 $\mu\text{g/L}$
	Visible spectrophotometry colorimetric assay	Barbituric or N,N-dimethylbarbituric acid derivative
	Visible spectrophotometry colorimetric assay	Spectrophotometric determination by use of a modified Konig reaction with NaOCl as the chlorinating agent
	Visible spectrophotometry colorimetric assay	Complexation with pyridine or 4-pyridinecarboxylic acid
	Visible spectrophotometry colorimetric assay	Reaction of CN^{-} with Pd-dimethylglyoximate complex that releases dimethylglyoxime, isolated as the Ni derivative
	Visible spectrophotometry colorimetric assay	Determination (spec λ = 570 nm) of pyridine/barbituric acid derivative after chloramine-T derivative
	Visible spectrophotometry colorimetric assay	Measurement of the pyridine-pyrazolone derivative
	Visible spectrophotometry colorimetric assay	Measurement of the isocotinic acid/1-phenyl-3-methyl-5-pyrazolone derivative after reaction with chloramine-T (spec λ = 638 nm)
	Visible spectrophotometry colorimetric assay	Measurement of the derivative with the Hg(II)-p-dimethylaminobenzylidenerhodanine complex (spec λ = 452 nm)
	Visible spectrophotometry colorimetric assay	Measurement of the Hg(II)-diphenylcarbazone derivative (spec λ = 562 nm)
	Visible spectrophotometry colorimetric assay	Measurement of the pyridine-benzidine complex; LOD = 0.02 μg
	Visible spectrophotometry colorimetric assay	Measurement of the pentacyano(N-methylpyrazinium) ferrate (II) complex (spec λ = 658 nm)
	Flow injection analysis	Use of Ag and Pt electrodes to determine CN^{-} as Cu complexes
	Flow injection analysis	Analyzed as the teracyanonickelate (II) complex
	Fluorescent sensors	Fluoresecein derivative emits a green light
	Fluorescent sensors	Naphthoquinone-imidazole boronic-based sensors (spec λ = 460 nm); LOD = 1.4 μM
	FTIR	Use of a horizontal attenuated total reflectance (HATR) accessory; detection range = 0.3 M to 1.0 M
	Chemiluminescence	Measurement of intensity of the reaction with luminal, hemin, and peroxide
	Amperometry/flow injection analysis	Use of a multimeter as a detection device; LOD = 200 $\mu\text{g/L}$
	Photoacoustic IR detection	Applied to the determination of HCN and NCCl in air
	X-ray diffraction	LOD = 0.1 % in waste water analyses
	Coulometric determination	LOD = 10^{-9} mg/100 μL
	Cavity ringdown spectroscopy	Use of external cavity tunable diode laser
CN^{-}/SCN^{-} (only)	Chemical ionization GC/MS	Derivatization with pentafluorobenzyl bromide (PFBBBr) via extraction with ethyl acetate and tetrabutylammonium sulfate (TBAS); LOD = 1 μM (CN^{-}) and LOD < 50 nM (SCN^{-})
Dichromate, $Cr_2O_7^{-2}$	FTIR	Absorption band at 950 cm^{-1}
	Paper electrophoresis-photodensity scanning	Photodensity scanning determination after development with diphenyl carbazide

Anion	Method	Results/Comments
Hypochlorite, ClO^-	Cell voltage variation	Applied to the electrochemical synthesis of sodium dichromate from sodium chromate
	Conductimetric determination	Performed in the presence of CrO_4^{-2}
	Adsorptive stripping voltammetry	Commonly applied to body fluids
	Potentiometric titration	Determination of Pu via the $\text{Fe}^{+2}/\text{Cr}_2\text{O}_7^{-2}$ redox titration
	Sequential injection analysis	$\text{Cr}_2\text{O}_7^{-2}$ determination based on oxidation of pindolol (spec $\lambda = 640 \text{ nm}$)
	Spectrophotometric analysis	Applied to the determination of pyridine derivatives
		Reduction to Cr^{+3} in organic carbon soil analysis
	Titrimetric analysis	Reduction by Fe^{+3} titration
	Thin-layer chromatography (TLC)	Applied to determination of unsaturated fats and further spectrophotometric analysis (spec $\lambda = 350 \text{ nm}$)
	X-ray absorption fine structure spectroscopy	Applied to the speciation of $\text{CrO}_4^{-2}/\text{Cr}_2\text{O}_7^{-2}$ equilibrium
	Titrimetric determination	Iodometric titration
	Polarography	Determination by conversion of Br^- to BrO_3^-
	Spectrophotometry	Oxidation of Ir^{+3} to Ir^{+4} (spec $\lambda = 488 \text{ nm}$)
	Spectrophotometry	Measurement of ClO^- absorbance at $\text{pH} > 7$
	Spectrophotometry	Measurement of chloramine formed by addition of aq. NH_3
Iodide, I^-	Voltammetry	Technique compared to iodometric titration
	Potentiometric titration	ClO^- measured by subtraction of BrO^- in a ClO/BrO^-
	Potentiometric titration	Reduction to Cl^- ($\text{pH} < 7$, OsO_4 as catalyst)
Isocyanates, NCO^-	Ion chromatography using electrochemical detection	Use of Ag working electrode; LOD = 100 ppb
	Mass spectrometry	Use of a proton transfer reaction (PTR), time-of-flight mass spectrometer and high sensitivity PTR quadrupole mass spectrometer
	FTIR	Use of sealed liquid cell for polymer analysis
	HPLC	Analysis of ethanol derivative (spec $\lambda = 245 \text{ nm}$)
	Capillary electrophoresis	Use of tris(2,2'-bipyridine)ruthenium (II) by electrochemiluminescence
	Potentiometric titration	Titration of carboxylic acid hydrazide derivative with NaNO_2
Manganate, MnO_4^{-2}	Spectrophotometric analysis	Conversion of CH_3NCO to CH_3NH_2 and reaction with 1-fluoro-2,4-dinitrobenzene to yield $\text{CH}_3\text{NHC}_6\text{H}_3(\text{NO}_2)_2$ (spec $\lambda = 352 \text{ nm}$)
	Titrimetric analysis	Oxidation of As^{+3} , Cr^{+3} , Sb^{+3} , Te^{+4} , PO_3^{-3} , various carboxylic acids; trimethylammoniated compounds
	Gravimetric analysis	Precipitation of BaMnO_4
	Potentiometric titration	Use of a Pt electrode
	Voltammetry	Use of glassy carbon working electrode
	Spectrophotometry	LOD = 0.185 $\mu\text{g/mL}$; (spec $\lambda = 635 \text{ nm}$)
	Anodic oxidation	Rotating disk electrode
Nitrite, NO_2^-	Gravimetric analysis	Precipitation of BaMnO_4
	Ion chromatography	Use of high capacity, OH^- -selective, anion exchange column with a guard column) in simultaneous determination of BrO_3^- ; LOD = 0.05 $\mu\text{g/L}$; RSD = 3.61 % to 4.77 %
	HPLC	Simultaneous determination of NO_3^- , SO_4^{-2} , and SCN^- ; samples are ultrasonically extracted with $\text{EtOH}/\text{CCl}_3\text{COOH}$ and purified by C18 SPE column (highly retentive alkyl-bonded phase); LOD = 0.01 mg/kg to 0.02 mg/kg ; RSD = 0.87 % to 2.6 %
	HPLC	KOH or NaOH aq. solution used as mobile phase for 10 μL to 25 μL sample size
	Quantitative sequential injection analysis (SIA)	LOD = 0.002 mg/L
	Diffuse UV-visible reflectance method	Reaction of nitrite with sulphadiazine and o-naphthol; LOD = 0.02 mg/L ; RSD = 5 % to 8 %
	Cyclic voltammetry (CV)/pulse voltammetry	Electropolymerization of Nile Blue at pre-polarized glassy carbon electrode (phosphate buffer, $\text{pH} = 7.1$) leading to a NO_2^- sensor
	Cyclic voltammetry (CV)/pulse voltammetry	Use of a solid-state microelectrode formed through the electrochemical co-deposition of Pt-Fe nanoparticles on Au microelectrode
	Cyclic voltammetry (CV)/pulse voltammetry	Use of a sol-gel electrode using 3-aminopropyltrimethoxy silane for covalent immobilization of toluidine blue
	Capillary electrophoresis	Simultaneous determination of NO_3^- and $\text{C}_2\text{O}_4^{-2}$
	Capillary zone electrophoresis	Simultaneous determination of NO_3^- and Cl^- by use of a photoiodide-array detector (PDA)
	UV-visible spectrophotometry	Derivatization with $\text{Zn}(\text{OH})_2$ /basic fuchsin
	UV-visible spectrophotometry	Derivatization with Griess reagent (spec $\lambda = 537 \text{ nm}$); RSD ~1.5 %

Anion	Method	Results/Comments
NO ₂ ⁻ simultaneous NO ₂ ⁻ /NO ₃ ⁻ (only)	Microfluidic gradient elution moving boundary electrophoresis (GEMBE)	Simultaneous determination of NO ₃ ⁻ and NH ₄ ⁺
	Microfluidic gradient elution moving boundary electrophoresis (GEMBE)	Simultaneous determination of NO ₃ ⁻ , Cl ⁻ , C ₂ O ₄ ⁻² , NO ₃ ⁻ , and SO ₄ ⁻²
	Gasometric analysis	The NO ₂ ⁻ concentration is quantified by the formation of N ₂ (g) produced <i>vis a vis</i> its reaction with sulfamic acid
	Seeping layer test paper	Derivatization with p-aminobenzenesulfonic acid/N(1-naphthyl) ethylenediamine dihydrochloride
	HPLC	Pre-column derivatization with Griess reagents (spec λ = 540 nm)
	UV-visible spectrophotometry	Following derivatization with HCl/naphthyl ethylenediamine LOD = 0.5 mg to 18 mg nitrogen per L (NO ₃ ⁻) and 0.5 mg to 5 mg nitrogen per L (NO ₂ ⁻)
	HPLC-UV	LOD = 2.5 mg/kg (NO ₃ ⁻) and 5.0 mg/kg (NO ₂ ⁻)
	GC-mass spectrometry	Quantification of ¹⁵ N-labeled nitrate and nitrite biological fluids
	Chemiluminescence	LOD = 10 nmol/L; RSD = 3 % (200 nmol/L) to 5 % (400 nmol/L)
	Capillary electrophoresis	Use of acid run buffer to revert electroosmotic flow
Oxalate, C ₂ O ₄ ⁻²	Capillary gas chromatography	LOD = 500 µg by use of a flame ionization detector
	Chromogenic strip	Test strip equipped with sorghum leaf oxalate oxidase cross-linked with glutaraldehyde and o-toluidine LOD = 0.07 % of the matrix
	FT-IR (attenuated)	Use of acid run buffer to revert electroosmotic flow
	Capillary electrophoresis	LOD = 500 µg by use of a flame ionization detector
	Capillary gas chromatography	Oxalate oxidase and peroxidase are immobilized on Au electrode
	Flow injection analysis	Analysis of methylated product
	Gas chromatography	LOD = 6 µg/L to 9 µg/L
	Ion exchange chromatography method	Detection at λ = 254 nm; LOD = 20 nmol/L
	Isotachophoresis	System attached to online weak anion exchange chromatography
	LC-tandem MS	Intensity of peak at 1462 cm ⁻¹ is used
Perchlorate, ClO ₄ ⁻	Raman spectroscopy	Analysis of catalytic effect of reaction products of methylene blue/Cr ₂ O ₇ ⁻²
	Spectrophotometric analysis	Analysis of the NaDH → NAD ⁺ reaction with C ₂ O ₄ ⁻²
	Spectrophotometric analysis	Titration against MnO ₄ ⁻
	Titrimetric analysis	Titration against Ce ⁺⁴
	Titrimetric analysis	Analysis of catalytic effect of reaction products of methylene blue/Cr ₂ O ₇ ⁻²
	Spectrophotometric analysis	Analysis of the NaDH → NAD ⁺ reaction with C ₂ O ₄ ⁻²
	Titrimetric analysis	Titration against MnO ₄ ⁻
	Titrimetric analysis	Titration against Ce ⁺⁴
	Spectrophotometry	Yb-pyrocatechol violet complex
	Spectrophotometry	Determination of reddish-violet color produced by adding methylene blue/ ZnSO ₄ in presence of NO ₃ ⁻ LOD = 0.2 ppb
Phosphate, PO ₄ ⁻³	HPLC/MS	Analysis typically performed on tobacco plants
	Capillary electrophoresis	Determination of organic base-phosphate complex
	MS	Use of cationic surfactants
	Ion pair extraction-MS ESI	Titration against H-tetramethylammonium sulfate with various indicators
	Titrimetric analysis	Back titration of excess TiCl ₃ against Fe ₂ (SO ₃) ₂
	Titrimetric analysis	Use of 1037 cm ⁻¹ (Ca ₃ (PO ₄) ₂) and 1010 cm ⁻¹ (MgNH ₄ PO ₄)
	FTIR	Derivatization as Ag ₃ P ₃ O ₉ after formation of Ag ₃ P and further oxidation with HNO ₃
	Gravimetric	Derivatization to GaP
	ESR	Derivatization to AlP
	X-ray electron spectrometry	Derivatization to AlP
Phosphide, P ⁻³	X-ray fluorescence	Derivatization to AlP
	X-ray diffractometry	Derivatization to AlP
	X-ray photoelectron spectroscopy	Derivatization to functionalized GaP
	Fluorescence	Derivatization to Ca ₃ P ₂
	Fluorescence	Enzymatic oxidation to phosphate with NAD ⁺ as co-substrate to produce fluorescence
	³¹ P NMR	Esterification of OH in organic polymers
	Laser Raman spectrometry	Ar-ion laser allows quantitative analysis of H ₂ PO ₃ ⁻ and HPO ₃ ⁻²
	Ion exchange chromatography	Method makes use of conductivity detection
	Visible spectrophotometry	Measurement of 3,5-(O ₂ N) ₂ C ₆ H ₃ COOH derivative
	Raman spectroscopy	Use of <i>ab initio</i> quantum chemical simulation
Silcate, SiO ⁻⁴		

Anion	Method	Results/Comments
	Electron probe microanalysis (EPMA)	Analysis of Na, Mg, Al, Si, K, Ca, Ti, Mn, and Fe salts
	Ion-exclusion chromatography	Use of ascorbate solution as both an eluent and a reducing agent following by molybdate derivatization
	Laser-induced plasma spectroscopy	Use of a Q switched Nd:YAG laser and time-resolved spectroscopy
	Time-of-flight secondary ion mass spectrometry	Use of C60 primary ions
	Laser ablation-inductively coupled plasma mass spectrometry (LA-ICPMS)	No need for internal standard
Sulfide, S^{2-}	Ion chromatography using electrochemical detection	Use of Ag working electrode; LOD = 30 ppb
Sulfite, SO_3^{2-}	Amperometric titration	Use of iodine solution
	Potentiometric titration	Pt wire coated with Hg is balanced against calomel electrode
	Spectrophotometric analysis	Product of reaction with p-rosaniline acid bleached dye and HCHO (spec λ = 560 nm)
	Ion chromatography	
Thiocyanate, CNO^-	Titration analysis	Titration against BrO_3^-
	Coulometric determination	LOD = 10^{-11} mg/100 μ L
	Flow injection analysis	Formation of the 2-(5-bromo-2-pyridylazo)-5-diethylamino-phenol derivative in $Cr_2O_7^{2-}/H^+$
	Flow injection analysis	Analyzed as the teracyanonickelate (II) complex

PRECIPITATION OF SULFIDES

Robert Joyce and Blaine C. McKusick

TABLE 1. Precipitation of Sulfides

Precipitated at pH 7	Not precipitated at low pH	Forms a soluble complex at high pH

BOND LENGTHS IN CRYSTALLINE ORGANIC COMPOUNDS

The following table gives average interatomic distances for bonds between the elements H, B, C, N, O, F, Si, P, S, Cl, As, Se, Br, Te, and I as determined from X-ray and neutron diffraction measurements on organic crystals. The table has been derived from an analysis of high-precision structure data on about 10,000 crystals contained in the 1985 version of the Cambridge Structural Database, which is maintained by the Cambridge Crystallographic Data Center. The explanation of the columns is:

Column 1:	Specification of elements in the bond, with coordination number given in parentheses, and bond type (single, double, etc.). For carbon, the hybridization state is given.
Column 2:	Substructure in which the bond is found. The target bond is set in boldface. Where X is not specified, it denotes any element type. C# indicates any sp ³ carbon atom, and C* denotes an sp ³ carbon whose bonds, in addition to those specified in the linear formulation, are to C and H atoms only.
Column 3:	<i>d</i> is the unweighted mean in Å units of all the values for that bond length found in the sample.

Column 4:	<i>m</i> is the median in Å units of all values.
Column 5:	σ is the standard deviation in the sample.
Column 6:	<i>q</i> ₁ is the lower quartile for the sample (i.e., 25% of values are less than <i>q</i> ₁ and 75% exceed it).
Column 7:	<i>q</i> _u is the upper quartile for the sample.
Column 8:	<i>n</i> is number of observations in the sample.
Column 9:	Notes refer to the footnotes in Appendix 1.

References to special cases are given in a shorthand form and listed in Appendix 2. Further information on the method of analysis of the data may be found in the reference cited below.

The table is reprinted with permission of the authors, the Royal Society of Chemistry, and the International Union of Crystallography.

† The standard deviation in the sample for the bond type is greater than for the other entries.

Appendix 1. (Footnotes to Table)

- Sample dominated by B-CH₃. For longer bonds in B-CH₃ see LITMEB10 [B(4)-CH₃ = 1.621-1.644 Å].
- p(π)-p(π) Bonding with Bsp² and Nsp² coplanar ($\tau\text{BN} = 0 \pm 15^\circ$) predominates. See G. Schmidt, R. Boese, and D. Bläser, *Z. Naturforsch.*, 1982, **37b**, 1230.
- 84 observations range from 1.38 to 1.61 Å and individual values depend on substituents on B and O. For a discussion of borinic acid adducts see S. J. Rettig and J. Trotter, *Can. J. Chem.*, 1982, **60**, 2957.
- See M. Kaftory in *The Chemistry of Functional Groups. Supplement D: The Chemistry of Halides, Pseudohalides, and Azides*, S. Patai and Z. Rappoport, Eds., Wiley: New York, 1983, Part 2, ch. 24.
- Bonds which are endocyclic or exocyclic to any 3- or 4-membered rings have been omitted from all averages in this section.
- The overall average given here is for Csp³-Csp³ bonds which carry only C or H substituents. The value cited reflects the relative abundance of each 'substitution' group. The 'mean of means' for the 9 subgroups is 1.538 ($\sigma = 0.022$) Å.
- See F. H. Allen, (a) *Acta Crystallogr.*, 1980, **B36**, 81; (b) 1981, **B37**, 890.
- See F. H. Allen, *Acta Crystallogr.*, 1984, **B40**, 64.
- See F. H. Allen, *Tetrahedron*, 1982, **38**, 2843.
- See F. H. Allen, *Tetrahedron*, 1982, **38**, 645.
- Cyclopropanones and cyclobutanones excluded.
- See W. B. Schweizer and J. D. Dunitz, *Helv. Chim. Acta*, 1982, **65**, 1547.
- See L. Nørskov-Lauritsen, H.-B. Bürgi, P. Hoffmann, and H. R. Schmidt, *Helv. Chim. Acta*, 1985, **68**, 76.
- See P. Chakrabarti and J. D. Dunitz, *Helv. Chim. Acta*, 1982, **65**, 1555.
- See J. L. Hencher in *The Chemistry of the C≡C Triple Bond*, S. Patai, Ed., Wiley, New York, 1978, ch. 2.
- Conjugated: torsion angle about central C-C single bond is $0 \pm 20^\circ$ (*cis*) or $180 \pm 20^\circ$ (*trans*).
- Unconjugated: torsion angle about central C-C single bond is $20-160^\circ$.
- Other conjugative substituents excluded.
- TCNQ is tetracyanoquinodimethane.
- No difference detected between C2 = C3 and C3 = C4 bonds.
- Derived from neutron diffraction results only.
- Nsp³: pyramidal; mean valence angle at N is in range 108-114°.
- Nsp²: planar; mean valence angle at N is $\geq 117.5^\circ$.
- Cyclic and acyclic peptides.
- See R. H. Blessing, *J. Am. Chem. Soc.*, 1983, **105**, 2776.
- See L. Lebiada, *Acta Crystallogr.*, 1980, **B36**, 271.
- n* = 3 or 4, i.e. tri- or tetra-substituted ureas.
- Overall value also includes structures with mean valence angle at N in the range 115-118°.
- See F. H. Allen and A. J. Kirby, *J. Am. Chem. Soc.*, 1984, **106**, 6197.
- See A. J. Kirby, 'The Anomeric Effect and Related Stereoelectronic Effects at Oxygen', Springer, Berlin, 1983.
- See B. Fuchs, L. Schleifer, and E. Tartakovsky, *Nouv. J. Chim.*, 1984, **8**, 275.
- See S. C. Nyburg and C. H. Faerman, *J. Mol. Struct.*, 1986, **140**, 347.
- Sample dominated by P-CH₃ and P-CH₂-C.
- Sample dominated by C* = methyl.
- See A. Kalman, M. Czugler, and G. Argay, *Acta Crystallogr.*, 1981, **B37**, 868.
- Bimodal distribution resolved into 22 'short' bonds and 5 longer outliers.
- All 24 observations come from BUDTEZ.
- 'Long' O-H bonds in centrosymmetric O---H---O H-bonded dimers are excluded.
- N-N bond length also dependent on torsion angle about N-N bond and on nature of substituent C atoms; these effects are ignored here.
- N pyramidal has average angle at N in range 100-113.5°; N planar has average angle of $\geq 117.5^\circ$.
- See R. R. Holmes and J. A. Deiters, *J. Amer. Chem. Soc.*, 1977, **99**, 3318.
- No detectable variation in S=O bond length with type of C-substituent.

BOND LENGTHS IN ORGANOMETALLIC COMPOUNDS

This table summarizes the average values of interatomic distances of representative metal–ligand bonds. Sigma bonds between *d*- and *f*-block metals and the elements C, N, O, P, S, and As are included. The values are extracted from a much larger list in Reference 1. The tabulated values are the unweighted means of reported measurements on compounds in each category. If four or more measurements are available, the standard deviation is given in parentheses. All values are in Ångstrom units (10^{-10} m).

The first part of the table covers metal–carbon bonds in different ligand categories, while the second part covers metal bonds to

other elements. R stands for any alkyl group; Me for a CH_3 group; C_6R_5 indicates an aryl group; and $\text{C}(=\text{O})\text{R}$ an acyl group. Metals are listed in atomic number order.

STRUCTURE OF FREE MOLECULES IN THE GAS PHASE

David R. Lide

This table gives information on the geometric structure of selected molecules in the gas phase, including the overall geometry, interatomic distances, and bond angles. The molecules have been chosen to provide data on a wide variety of chemical bonds and to illustrate the influence of molecular environment on bond distances and angles. The table is restricted to molecules with conventional covalent or ionic bonds, but it should be pointed out that structure data on many loosely bonded complexes of the van der Waals type have recently become available. The references below contain data on many molecules that are not included here and give additional information such as uncertainties and isotopic variations.

The two techniques for gas phase structure determination are spectroscopy and electron diffraction. The following codes are used to indicate the method used for each set of data:

- ED – Gas phase electron diffraction
- MW – Microwave spectroscopy, including both measurements in bulk gases and molecular beams
- IR – Infrared spectroscopy
- R – Raman spectroscopy
- UV – Electronic spectroscopy in the ultraviolet and visible regions, including fluorescence measurements
- ESR – Electron spin resonance.

In some cases data from two sources have been combined to derive the structure; these are labeled by “ED, MW,” for example.

Because of the internal vibrations that are present in all molecules, even in their lowest energy state, the definition of interatomic distance is not a simple matter. The ideal measure is the equilibrium distance in the hypothetical non-vibrating state, designated by r_e . This is the value of the separation of the atoms at the minimum of the potential function that describes the forces between the two atoms. All other measures represent some form of average, generally complex, over the vibrational motions. Since the potential function is asymmetric and less steep at distances beyond the potential minimum, the average distance is normally greater than r_e . Distances determined by electron diffraction (ED) represent an average over all vibrational states that are populated at the temperature of the measurement; the most common measure is designated r_g . Distances determined by spectroscopy (MW, IR, R, or UV) through measurements on the ground vibrational state of the molecule, designated by r_0 , describe some form of average, not easily defined, over the zero-point vibrations. Another measure that is frequently used in microwave spectroscopy is the “substitution” distance r_s , which is operationally defined through a series of measurements on different isotopic species. In simple cases, r_s often lies between r_0 and r_e and is therefore a closer approximation to r_e . Several other types of averages have been used; good discussions can be found in Volumes II/25 and II/28 of the *Landolt-Börnstein* series (Reference 1) and in References 4 and 5.

Unless otherwise specified, distances and angles given in this table are r_0 values if the method is spectroscopic and r_g values if the method is electron diffraction. When given, equilibrium and substitution distances are designated by r_e and r_s , respectively.

Many interatomic distances and angles calculated by *ab initio* techniques have been reported in the recent literature. However, it should be emphasized that all data in this table are obtained from direct experimental measurements. In a few cases, *ab initio* calculations of vibration-rotation interaction constants have been combined with the primary experimental measurements to derive r_e values in the table.

The number of significant figures in the values is an indication of the precision of the measurement; thus a distance quoted to three decimal places is probably reliable to about 0.005 Å or better. However, discrepancies between r_e , r_0 , and r_s values for the same bond are often the order of 0.01 Å because of vibrational averaging considerations, so care must be taken in comparing bond distances in different molecules. Some distances in simple molecules are given here to four or five decimal places, but little chemical significance can be attached to differences beyond the third decimal place.

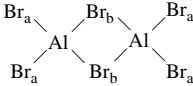

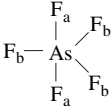

The table is presented in two parts: Part A covers molecules that do not contain carbon while Part B lists carbon-containing molecules. Because many of the entries in Part A are free radicals or other transient species whose systematic chemical names are unfamiliar, the listing in Part A is in order of chemical formula. Part B is ordered by name. In both parts the second column gives information on the overall configuration of the molecule, often indicated by the point group of the equilibrium geometry. Columns 3 through 8 give the values of the bond distances and angles, and the last column indicates the experimental method. Distances are given in Å units, where 1 Å = 10^{-10} m or 0.1 nm. Angles are given in degrees.

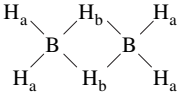

The efforts of Kozo Kuchitsu in preparing an earlier version of this table and in giving advice on the new version are gratefully acknowledged.

CHARACTERISTIC BOND LENGTHS IN FREE MOLECULES

David R. Lide

This is a summary of typical bond lengths in gas-phase molecules. The value given for each bond is near the mid-range of values found in simple molecules. Bond lengths usually vary by 1% or 2%, and often by more, depending on the nature of the other bonds attached to the two atoms in question. References 1 and 2 give measured bond lengths in individual gas-phase molecules, as determined by spectroscopic and electron diffraction methods.

All bond lengths are given in Å (1 Å = 10⁻¹⁰ m).

ATOMIC RADII OF THE ELEMENTS

Manjeera Mantina, Rosendo Valero, Christopher J. Cramer, and Donald G. Truhlar

Atomic radii are not precisely defined, but are nevertheless very widely used parameters in modeling and understanding molecular structure and interactions. Three main classes of radii may be identified: van der Waals radii (which include radii used to characterize steric interactions), covalent radii, and ionic radii. This section is concerned with the first two; ionic radii are covered in another section of the *Handbook* called “Ionic Radii in Crystals.”

There are many scales of van der Waals radii, but they are not fully consistent with one another. The van der Waals radii determined by Bondi [1] from x-ray diffraction data, crystal densities, gas kinetic collision cross sections, critical densities, and liquid-state properties are the most widely used values, but Bondi recommended radius values for only 28 of the 44 main-group elements in the periodic table plus 9 transition metals and one actinide. Rowland and Taylor [2] redetermined nine of the main-group radii from crystal structure data and recommended that Bondi’s values be accepted except for H, for which they recommended a new value; we accepted their recommendation for H and adopted Bondi’s 27 other values for main-group elements. Radii for the 16 remaining main-group elements were determined from electronic structure calculations on selected van der Waals molecules by analyzing the results in a way designed to yield radii compatible with Bondi’s scale for main-group elements [3]. Bondi’s values for the transition metals and actinide are smaller than expected based on ionization potentials and covalent radii, so we do not adopt them, but defer to later recommendations based on analysis of a more extensive set of crystal data. Van der Waals radii for the remaining elements through atomic number $Z = 93$ were taken from Hu et al. [4], who determined them from bond valence parameters (this gives radii usually within 0.1 Å to 0.15 Å of the radii from average atomic volumes in crystals as obtained by statistical analysis of the Cambridge Structural Database [5], but the results show a smoother variation with atomic number). Van der Waals radii for the elements with $Z = 94$ to 103 were based on the work of Guzei and Wendt [6], who modeled the zero-potential distance for the interaction potentials involved in nonbonded steric interactions; we increased their values by 6%, which is the value they found is needed to make their steric radii scale most consistent with Bondi’s van der Waals radii.

Covalent radii are more straightforward, especially for elements that tend to form only single bonds, although some researchers distinguish metallic bonds from covalent bonds. The covalent radii tabulated here are recommendations for single covalent bonds, and they are based on a comprehensive evaluation of experimental data by Cordero et al. [7], who recommended covalent radii for all elements up to $Z = 96$, and on an analysis combining experimental data and theoretical calculations by Pyykkö and Atsumi [8], who recommended single-bond covalent radii for all elements up to $Z = 118$. If one is interested in a specific coordination number, oxidation state, or type of ligand, one might find a more appropriate radius in the specialized literature or in the Characteristic Bond Lengths in Free Molecules table in this *Handbook* since the values in the table below are generic average values. In particular, we give the Pyykkö-Atsumi values for carbon and for $Z = 97$ to 118 and an average of the values from the two sources for all other elements. For Mn, Fe, and Co, Cordero et al. give two values, and we used the lower of these on the average because it corresponds to a smoother periodic trend.

Please note that the van der Waals radii of bromine and lithium have typographical errors in Ref. 3; the correct values (1.85 for Br and 1.82 for Li) in the table below are from Ref. 1.

All values are rounded to the nearest 0.01 Å, but in most cases the uncertainty in the value is of the order of 0.1 Å.

DIPOLE MOMENTS

David R. Lide

This table gives selected values of the electric dipole moment for over 800 molecules. When available, values determined by microwave spectroscopy, molecular beam electric resonance, and other high-resolution spectroscopic techniques were selected. Otherwise, the values come from measurements of the dielectric constant in the gas phase or, if these do not exist, in the liquid phase. Entries are listed alphabetically; compounds not containing carbon are listed first, followed by compounds containing carbon.

The dipole moment is given in debye units (D). The conversion factor to SI units is $1 \text{ D} = 3.33564 \times 10^{-30} \text{ C m}$.

Dipole moments of individual conformers (rotational isomers) are given when they have been measured. The conformers are designated as *gauche*, *trans*, *axial*, etc. The meaning of these terms can be found in the references. In some cases an average value, obtained from measurements on the bulk gas, is also given. Other information on molecules that have been studied by spectroscopy, such as the components of the dipole moment in the molecular framework and the variation with vibrational state and isotopic species, is given in the references.

When the accuracy of a value is explicitly stated (i.e., 1.234 ± 0.005), the stated uncertainty generally indicates two or three standard deviations. When no uncertainty is given, the value may be assumed to be precise to a few units in the last decimal place. However, if more than three decimal places are given, the exact interpretation of the final digits may require analysis of the vibrational averaging.

Values measured in the gas phase that are questionable because of undetermined error sources are indicated as approximate (\approx). Values obtained by liquid phase measurements, which sometimes have large errors because of association effects, are enclosed in brackets, e.g., [1.8].

HINDERED INTERNAL ROTATION

I. Ozier and N. Moazzen-Ahmadi

In asymmetric rotors like methyl alcohol, CH_3OH , and symmetric rotors like CH_3SiH_3 , the methyl group can undergo internal rotation relative to the rest of the molecule, traditionally called the frame (Refs. 1 and 2). Although various different rotating groups are considered here, all have three-fold symmetry. In such cases, the potential V hindering the internal rotation can be written:

$$V(\alpha) = V_3(\frac{1}{2})(1 - \cos 3\alpha) + V_6(\frac{1}{2})(1 - \cos 6\alpha) + V_9(\frac{1}{2})(1 - \cos 9\alpha) + \dots,$$

where α is the deviation from equilibrium of the angle between the top and frame that measures the torsional motion. If only the first two terms are retained, then V_3 is the height of the hindering potential and V_6 is the shape parameter. For symmetric tops like CH_3CH_3 where the top and frame are identical, α is replaced by 2γ and the origin for γ is often taken as the eclipsed configuration. In the expansion, $-\cos 6n\gamma$ is then replaced by $(-1)^{n+1}\cos 6n\gamma$, where $n=1,2,\dots$. In cases where different forms of the expansion have been used in the original works, the values of the parameters published there have been converted to the conventions defined here.

In Tables 1 and 2, values are given for V_3 for a selection of asymmetric and symmetric rotors, respectively. In cases where the higher order parameters have been determined, these are given in the Comments column. Where appropriate, this column also indicates the specific top, isomer, state, and/or isotopomer that has been studied. For ethane, three symmetric top isotopomers are listed to illustrate the isotopic dependence of V_3 and V_6 . In all other cases, only one isotopomer is listed, even if several have been studied. In all but one of these cases, the isotopomer reported is the one with the highest natural abundance. However, CH_3OCDO is listed because the results obtained are more precise than for CH_3OCHO . The molecules are listed alphabetically in Hill order according to the molecular formula.

The determinations listed for the potential parameters are effective values that incorporate to varying degrees effects from other molecular parameters. For example, the apparent value of V_3 can be changed significantly if the reduced rotational constant F is calculated from the structure, rather than being determined independently (Ref. 1). Other examples include such mechanisms as coupling to excited skeletal vibrations (Ref. 2) and redundancies connecting some of the torsional parameters (Refs. 3 and 4). The experimental uncertainties quoted are taken from the original works; no attempt has been made to standardize the definitions. All the potential parameters are given in cm^{-1} . Where the original work has reported these values in other units, the conversion to cm^{-1} has been carried out using standard factors: 1 calorie = 4.1868 joules and 1 calorie/mole = $0.34998915 \text{ cm}^{-1}$ (Ref. 5).

A variety of different methods have been used to measure V_3 , V_6 , and V_9 (Refs. 1 and 2); only a few of the more important will be discussed here. For *asymmetric rotors*, both the pure rotational spectrum and its torsion-rotation counterpart are electric dipole allowed and are affected in lowest order by the leading terms in the torsional Hamiltonian. Both types of spectra have been used extensively to determine V_3 (Ref. 1). For *symmetric tops* with a single torsional degree of freedom, either the permanent electric dipole moment vanishes, as in CH_3CH_3 , or the normal rotational spectrum is independent of V_3 in lowest order, as in CH_3SiH_3 . In the latter case, the molecular beam avoided crossing method can often be used (Ref. 2). The torsion-rotation spectrum is forbidden

in lowest order, but becomes weakly allowed through interactions with the infrared active skeletal vibrations (Ref. 2). By employing long absorption path lengths, this spectrum has been used to determine V_3 in a number of molecules. For both asymmetric and symmetric tops, the most precise determinations of the molecular parameters have been made in cases where both rotational and torsion-rotation spectra have been investigated.

TABLE 1. Asymmetric Top Potential Parameters

Name	Molecular Formula	Line Formula	Ref.	V_3/cm^{-1}	Comments
1 Trifluoromethanethiol	CHF ₃ S	CF ₃ SH	5	500.83 ± 0.03	
2 Methylphosphonic difluoride	CH ₃ F ₂ OP	CH ₃ P(=O)F ₂	6	676 ± 25	
3 Methanol	CH ₄ O	CH ₃ OH	5	373.594 ± 0.007	$V_6 = -1.597 \pm 0.051$ $V_9 = 1.04 \pm 0.20$
4 Methanethiol	CH ₄ S	CH ₃ SH	7	443.029 ± 0.070	$V_6 = -1.6451 \pm 0.0144$
5 Methyldisulfane	CH ₄ S ₂	CH ₃ SSH	8	609.0 ± 14.0	
6 Trifluoromethyl isocyanate	C ₂ F ₃ NO	CF ₃ N=C=O	5	47.8769 ± 0.0051	
7 Trifluoroacetaldehyde	C ₂ HF ₃ O	CF ₃ C(H)=O	9	298 ± 10	
8 Pentafluoroethane	C ₂ HF ₅	CF ₃ CHF ₂	10	1190 ± 4	
9 Acetyl bromide	C ₂ H ₃ BrO	CH ₃ C(Br)=O	11	456.7 ± 10.5	
10 1-Chloro-1,1-difluoroethane	C ₂ H ₃ ClF ₂	CH ₃ CClF ₂	12	1311.8 ± 1.4	
11 Acetyl chloride	C ₂ H ₃ ClO	CH ₃ C(Cl)=O	5	442.74 ± 1.05	³⁵ Cl
12 Acetyl fluoride	C ₂ H ₃ FO	CH ₃ C(F)=O	13	364.3 ± 2.1	
13 Methyl fluoroformate	C ₂ H ₃ FO ₂	CH ₃ OC(F)=O	5	374.1 ± 0.2	
14 Methyl trifluoromethyl ether	C ₂ H ₃ F ₃ O	CH ₃ OCF ₃	5	382 ± 10	CH ₃
15 Acetyl iodide	C ₂ H ₃ IO	CH ₃ C(=O)I	14	455.3 ± 10.5	
16 Methyl cyanate	C ₂ H ₃ NO	CH ₃ OC≡N	5	399.0 ± 17.5	
17 1-Chloro-1-fluoroethane	C ₂ H ₄ ClF	CH ₃ CHClF	5	1334.9 ± 3.8	
18 1,1-Difluoroethane	C ₂ H ₄ F ₂	CH ₃ CHF ₂	5	1163.0 ± 2.5	
19 Acetaldehyde	C ₂ H ₄ O	CH ₃ C(H)=O	15	407.716 ± 0.010	$V_6 = -12.068 \pm 0.037$
20 Thioacetaldehyde S-oxide	C ₂ H ₄ OS	CH ₃ C(H)=S=O	5	285.6 ± 0.3	Z isomer
21 Acetic acid	C ₂ H ₄ O ₂	CH ₃ COOH	16	170.1742 ± 0.0002	$V_6 = -6.4725 \pm 0.0001$
22 Methyl formate	C ₂ H ₃ DO ₂	CH ₃ OC(D)=O	5	400.60 ± 0.03	deuterated
23 Fluoroethane	C ₂ H ₅ F	CH ₃ CH ₂ F	17	1172.1 ± 1.4	
24 Nitrosoethane	C ₂ H ₅ NO	CH ₃ CH ₂ N=O	5	903 ± 25	gauche conformer
	C ₂ H ₅ NO	CH ₃ CH ₂ N=O	5	911 ± 25	cis conformer
25 Acetamide	C ₂ H ₅ NO	CH ₃ C(NH ₂)=O	5	24.949 ± 0.008	
26 Difluorodimethylsilane	C ₂ H ₆ F ₂ Si	(CH ₃) ₂ SiF ₂	18	439.4 ± 2.5	

Name	Molecular Formula	Line Formula	Ref.	V_3/cm^{-1}	Comments
27 <i>N</i> -Nitrosodimethylamine	$\text{C}_2\text{H}_6\text{N}_2\text{O}$	$(\text{CH}_3)_2\text{NN}=\text{O}$	5	145.8 ± 0.25	<i>cis</i> CH_3
	$\text{C}_2\text{H}_6\text{N}_2\text{O}$	$(\text{CH}_3)_2\text{NN}=\text{O}$	5	737.4 ± 13.3	<i>trans</i> CH_3

BOND DISSOCIATION ENERGIES

Yu-Ran Luo and Jin-Pei Cheng

The bond dissociation energy (enthalpy) is also referred to as bond disruption energy, bond energy, bond strength, or binding energy (abbreviation: BDE, BE, or D). It is defined as the standard enthalpy change of the following fission: $R-X \rightarrow R + X$. The BDE, denoted by $D^\circ(R-X)$, is usually derived by the thermochemical equation, $D^\circ(R-X) = \Delta_f H^\circ(R) + \Delta_f H^\circ(X) - \Delta_f H^\circ(RX)$. The enthalpy of formation $\Delta_f H^\circ$ of a large number of atoms, free radicals, ions, clusters and compounds is available from the websites of NIST, NASA, CODATA, and IUPAC. Most authors prefer to use the BDE values at 298.15 K.

The following seven tables provide essential information of experimental BDE values of $R-X$ and R^+-X bonds.

- (1) Table 1: Bond Dissociation Energies in Diatomic Molecules
- (2) Table 2: Enthalpy of Formation of Gaseous Atoms
- (3) Table 3: Bond Dissociation Energies in Polyatomic Molecules
- (4) Table 4: Enthalpies of Formation of Free Radicals and Other Transient Species
- (5) Table 5: Bond Dissociation Energies of Some Organic Molecules
- (6) Table 6: Bond Dissociation Energies in Diatomic Cations
- (7) Table 7: Bond Dissociation Energies in Polyatomic Cations

The data in these tables have been revised through September 2014.

TABLE 1. Bond Dissociation Energies in Diatomic Molecules

The BDEs in diatomic species have usually been measured by spectroscopy or mass spectrometry. In the absence of data on the enthalpy function, the values at 0 K, $D^\circ(A-B)$, are converted to D°_{298} by the approximate equation:

$$D^\circ_{298}(A-B) \approx D^\circ(A-B) + (3/2)RT = D^\circ(A-B) + 3.7181 \text{ kJ mol}^{-1}$$

This table has been arranged in an alphabetical order of the atoms A in the diatomics A-B.

TABLE 3. Bond Dissociation Energies in Polyatomic Molecules

The D_{298}° values in polyatomic molecules are notoriously difficult to measure accurately since the mechanism of the kinetic systems involved in many of the measurements are seldom straightforward. Thus, much lively controversy has taken place in the literature and is likely to continue for some time to come. We will continue updating and presenting our assessment of the most reliable BDE data every year.

The references relating to each of the D_{298}° values listed in Table 3 are contained in the *Comprehensive Handbook of Chemical Bond Energies*, by Yu-Ran Luo, CRC Press, 2007. Many D_{298}° in Table 3 are derived from the equation

$$D_{298}^{\circ}(\text{R-X}) = \Delta_f H^{\circ}(\text{R}) + \Delta_f H^{\circ}(\text{X}) - \Delta_f H^{\circ}(\text{RX})$$

Here, the enthalpies of formation of the atoms and radicals are taken from Tables 2 and 4, respectively, and the enthalpies of formation of the molecules are from reference sources listed in the above *Comprehensive Handbook of Chemical Bond Energies*.

Table 3 presents H-C, C-C, C-halogen, O-, N-, S-, Si-, Ge-, Sn-, Pb-, P-, As-, Sb-, Bi-, Se-, Te-, and metal-X BDEs. The **boldface** in the species indicates the dissociated fragment. The **metal-X** BDEs are arranged on the basis of the Periodic Table with the new IUPAC notation for Groups 1 to 18, see inside front cover of this *Handbook*.

TABLE 6. Bond Dissociation Energies in Diatomic Cations

From thermochemistry, we have

$$D_{298}^{\circ}(\text{A}^{+}\text{--B}) \equiv \Delta_{\text{f}}H^{\circ}(\text{A}^{+}) + \Delta_{\text{f}}H^{\circ}(\text{B}) - \Delta_{\text{f}}H^{\circ}(\text{AB}^{+}) = D_{298}^{\circ}(\text{A--B}) + IP(\text{A}) - IP(\text{AB})$$

Thus, $D_{298}^{\circ}(\text{A}^{+}\text{--B})$ may be derived using the Table 1 and the ionization potentials of species A and AB. The following Table has been arranged in an alphabetical order of the atoms. The **boldface** in the species indicates the dissociated fragment.

TABLE 7. Bond Dissociation Energies in Polyatomic Cations

This Table has been arranged on the basis of the Periodic Table with the IUPAC notation for Groups 1 to 18, see inside front cover of this *Handbook*. The **boldface** in the species indicates the dissociated fragment.

Bond	D ^o ₂₉₈ /kJ mol ^{–1}	Ref.	Bond	D ^o ₂₉₈ /kJ mol ^{–1}	Ref.
(1) Group 1			Na ⁺ –HNO ₃	86.2	1
Li ⁺ –H ₂	27.2	1	Na ⁺ –CH ₄	30.1	1
Li ⁺ –CO	57 ± 13	1	Na ⁺ –CH ₃ OH	98.8 ± 5.7	1
Li ⁺ –H ₂ O	139 ± 8	1	Na ⁺ –CH ₃ CN	125.5 ± 9.6	1
Li ⁺ –NH ₃	156 ± 8	1	Na ⁺ –C ₂ H ₄	44.6 ± 4.4	1
Li ⁺ –CH ₄	130	1	Na ⁺ –CH ₃ OCH ₃	101.4 ± 5.7	1
Li ⁺ –CH ₃ OH	156 ± 8	1	Na ⁺ –CH ₃ C(O)H	114.4 ± 3.4	1
Li ⁺ –CH ₃ OCH ₃	167 ± 10	1	Na ⁺ –MeCOMe	131.3 ± 4.1	1
Li ⁺ –pyridine	183.0 ± 14.5	1	Na ⁺ –C ₆ H ₆	97.0 ± 5.9	1
Li ⁺ –Gly (glycine)	220 ± 9	1	Na ⁺ –pyrrole	103.7 ± 4.8	1
Na ⁺ –H ₂	10.4 ± 0.8	1	Na ⁺ –Gly (glycine)	166.7 ± 5.1	1
Na ⁺ –N ₂	33.5	1	Na ⁺ –Ala (alanine)	167 ± 4	1
Na ⁺ –CO	31 ± 8	1	Na ⁺ –GlyGly (glycylglycine)	203 ± 8	1
Na ⁺ –CO ₂	66.5	1	K ⁺ –H ₂	6.1 ± 0.8	1
Na ⁺ –SO ₂	79.1	1	K ⁺ –CO ₂	35.6	1
Na ⁺ –O ₃	52.3	1	K ⁺ –H ₂ O	74.9	1
Na ⁺ –H ₂ O	91.2 ± 6.3	1	K ⁺ (H ₂ O) ₂ –H ₂ O	67.4	1
Na ⁺ (H ₂ O)–H ₂ O	82.0 ± 5.8	1	K ⁺ (H ₂ O) ₃ –H ₂ O	55.2	1
Na ⁺ (H ₂ O) ₂ –H ₂ O	66.1	1	K ⁺ (H ₂ O) ₄ –H ₂ O	11.8	1
Na ⁺ (H ₂ O) ₃ –H ₂ O	52.7 ± 0.8	1	K ⁺ (H ₂ O) ₅ –H ₂ O	44.8	1
Na ⁺ (glycine)–H ₂ O	75.1 ± 5.3	1	K ⁺ (H ₂ O) ₆ –H ₂ O	41.8	1
Na ⁺ (glutamine)–H ₂ O	52 ± 1	1	K ⁺ –NH ₃	79 ± 7	1
Na ⁺ –NH ₃	106.2 ± 5.4	1	K ⁺ –C ₆ H ₆	80.3	1

ELECTRONEGATIVITY

Electronegativity is a parameter originally introduced by Pauling which describes, on a relative basis, the tendency of an atom in a molecule to attract bonding electrons. While electronegativity is not a precisely defined molecular property, the electronegativity difference between two atoms provides a useful measure of the polarity and ionic character of the bond between them. This table gives the electronegativity X , on the Pauling scale, for the most common oxidation state. Other scales are described in the references.

FORCE CONSTANTS FOR BOND STRETCHING

David R. Lide

Representative force constants (f) for stretching of chemical bonds are listed in this table. Except where noted, all force constants are derived from values of the harmonic vibrational frequencies ω_e . Values derived from the observed vibrational fundamentals ν , which are noted by a, are lower than the harmonic force constants, typically by 2 to 3% in the case of heavy atoms (often by 5 to 10% if one of the atoms is hydrogen). Values are given in the SI unit newton per centimeter (N/cm), which is identical to the commonly used cgs unit mdyn/Å.

^a Derived from fundamental frequency, without anharmonicity correction.

^b Average of symmetric and antisymmetric (or degenerate) modes.

^c Calculated from Local Symmetry Force Field (see Reference 2).

FUNDAMENTAL VIBRATIONAL FREQUENCIES OF SMALL MOLECULES

David R. Lide

This table lists the fundamental vibrational frequencies of selected three-, four-, and five-atom molecules. Both stable molecules and transient free radicals are included. The data have been taken from evaluated sources. In general, the selected values are based on gas-phase infrared, Raman, or ultraviolet spectra; when these were not available, liquid-phase or matrix-isolation spectra were used.

Molecules are grouped by structural type. Within each group, related molecules appear together for convenient comparison.

The vibrational modes are described by their approximate character in terms of stretching, bending, deformation, etc. However, it should be emphasized that most such descriptions are only approximate, and that the true normal mode usually involves a mixture of motions. Abbreviations are:

sym.	symmetric
antisym.	antisymmetric
str.	stretch
deform.	deformation
scis.	scissors
rock.	rocking
deg.	degenerate

In the case of free radicals, strong interactions may exist between the electronic and bending vibrational motions. Details can be found in References 3 and 4. The references should be consulted for information on the accuracy of the data and for data on other molecules not listed here.

All fundamental frequencies (more precisely, wavenumbers) are given in units of cm^{-1} .

SPECTROSCOPIC CONSTANTS OF DIATOMIC MOLECULES

David R. Lide

This table lists the leading spectroscopic constants and equilibrium internuclear distance r_e in the ground electronic state for selected diatomic molecules. The constants are those describing the vibrational and rotational energy through the expressions:

$$E_{\text{vib}}/hc = \omega_e(\nu + \frac{1}{2}) - \omega_e x_e(\nu + \frac{1}{2})^2 + \dots$$

$$E_{\text{rot}}/hc = B_v J(J+1) - D_v [J(J+1)]^2 + \dots$$

where

$$B_v = B_e - \alpha_e(\nu + \frac{1}{2}) + \dots$$

$$D_v = D_e + \dots$$

Here ν and J are the vibrational and rotational quantum numbers, respectively, h is Planck's constant, and c is the speed of light. In this customary formulation the constants ω_e , B_e , etc. have dimensions of inverse length; in this table they are given in units of cm^{-1} .

Users should note that higher order terms in the above energy expressions are required for very precise calculations. The references contain constants for many of these higher terms, as well as more precise values of the lower constants. Also, if the ground electronic state is not $^1\Sigma$, additional terms are needed to account for the interaction between electronic and pure rotational angular momentum. For some molecules in the table the data have been analyzed in terms of the Dunham series expansion:

$$E/hc = \sum_{lm} Y_{lm}(\nu + \frac{1}{2})^l J^m(J+1)^m$$

In such cases it has been assumed that $Y_{10} = \omega_e$, $Y_{01} = B_e$, etc., although in the highest approximations these identities are not precisely correct. Some of the values of r_e in the table have been corrected for breakdown of the Born-Oppenheimer approximation, which can affect the last decimal place. Because of differences in the method of data analysis and limitations in the model, care should be taken in comparing r_e values for different molecules to a precision beyond 0.001 Å.

Entries in the ω_e column that are marked by * give the interval between $\nu = 0$ and $\nu = 1$ states instead of a value of ω_e .

Molecules are listed in alphabetical order by formula as most commonly written. In most cases this form places the more electropositive element first, but there are exceptions such as OH, NH, CH, etc. References 1–5 are evaluated compilations covering many molecules and giving references to the original literature.

LINE SPECTRA OF THE ELEMENTS

Joseph Reader and Charles H. Corliss

The original tables from which this table was derived were prepared under the auspices of the Committee on Line Spectra of the Elements of the National Academy of Sciences National Research Council. The table contains the outstanding spectral lines of neutral (I) and singly ionized (II) atoms of the elements from hydrogen through plutonium ($Z = 1-94$); selected strong lines from doubly ionized (III), triply ionized (IV), and quadruply ionized (V) atoms are also included. Listed are lines that appear in emission from the vacuum ultraviolet to the far infrared. These lines were selected from much larger lists in such a way as to include the stronger observed lines in each spectral region. A more extensive list may be found in Reference 1.

The data were compiled by the following contributors.

J. G. Conway — Lawrence Berkeley Laboratory
 C. H. Corliss — National Bureau of Standards
 R. D. Cowan — Los Alamos Scientific Laboratory
 C. R. Cowley — University of Michigan
 Henry M. and Hannah Crosswhite — Argonne National Laboratory
 S. P. Davis — University of California, Berkeley
 V. Kaufman — National Bureau of Standards
 R. L. Kelly — Naval Postgraduate School
 J. F. Kielkopf — University of Louisville
 W. C. Martin — National Bureau of Standards
 T. K. McCubbin — Pennsylvania State University
 L. J. Radziemski — Los Alamos Scientific Laboratory
 J. Reader — National Bureau of Standards
 C. J. Sansonetti — National Bureau of Standards
 G. V. Shalimoff — Lawrence Berkeley Laboratory
 R. W. Stanley — Purdue University
 J. O. Stoner, Jr. — University of Arizona
 H. H. Stroke — New York University
 D. R. Wood — Wright State University
 E. F. Worden — Lawrence Livermore Laboratory
 J. J. Wynne — International Business Machines Corporation
 R. Zalubas — National Bureau of Standards

All wavelengths are given in Ångstrom units (10^{-10} m). Below 2000 Å the wavelengths are in vacuum (except for the Cu II line at 1999.698 Å, which is in air); above 2000 Å the wavelengths are in air. Wavelengths given to three decimal places have an uncertainty of less than 0.001 Å and are therefore suitable for calibration purposes. In the air region, the elements used most commonly for calibration are Ne, Ar, Kr, Fe, Th, and Hg; in the vacuum region, the most common are C, N, O, Si, Cu.

All data refer to natural isotopic abundance of the elements except that Kr I and Kr II lines below 11,000 Å given to three decimal

places are for ^{86}Kr . A separate table for ^{198}Hg contains accurately known wavelengths that are frequently used for calibration.

A large number of the lines for neutral and singly ionized atoms were extracted from the National Bureau of Standards (NBS) *Tables of Spectral Line Intensities* (Reference 2). The intensities of these lines represent quantitative estimates of relative line strengths that take into account varying detection sensitivity at different wavelengths. They are on a linear scale. For nearly all of the other lines the intensities represent qualitative estimates of the relative strengths of lines not greatly separated in wavelength. Because different observers frequently use different scales for their intensity estimates, these intensities are useful only as a rough indication of the appearance of a spectrum. In some cases the intensity scale is not intended to be linear. In the first and second spectra the intensities of the lines of the singly ionized atom (II) relative to those of the neutral atom (I) should be used with caution, inasmuch as the concentration of ions in a light source depends greatly on the excitation conditions.

Descriptive symbols that follow the wavelength have the following meanings:

c — complex
 d — line consists of two unresolved lines
 h — hazy
 l — shaded to longer wavelengths
 s — shaded to shorter wavelengths
 p — perturbed by a close line
 r — easily reversed
 w — wide

The table is arranged alphabetically by element name (not symbol); for each element the lines are listed by wavelength. References to the sources of data for each element are given at the end of the table, starting on page 10-89.

Sources of Data for Each Element

Numbers following the element name refer to the references on the following pages.

Actinium: 193
 Aluminum: 6,8,81,89,127,144,146,227,228,282
 Americium: 92
 Antimony: 164,167,194,386,406
 Argon: 190,203,204,219,367,368,372,373,374,375,414,421
 Arsenic: 163,168,197,244,280
 Astatine: 188
 Barium: 1,78,111,252,259,277,279
 Berkelium: 53,339
 Beryllium: 15,44,73,102,115,134,135,171,175,198,335
 Bismuth: 1,357,358,359,360,361
 Boron: 66,69,74,94,104,171,221,222
 Bromine: 42,122,124,139,142,240,243,246,248,249,250,316
 Cadmium: 44,285,296,353,399
 Calcium: 16,25,70,150,270
 Californium: 52,331
 Carbon: 22,66,211
 Cerium: 1,136,166,261,305
 Cesium: 78,82,154,155,200,201,259,263,325
 Chlorine: 11,28,30,31,85,233,238,239
 Chromium: 1,379,380,412
 Cobalt: 1,100,125,159,236,276,291
 Copper: 199,273,290,295,324
 Curium: 51,332
 Dysprosium: 1
 Einsteinium: 333
 Erbium: 1,301
 Europium: 1,312
 Fluorine: 68,169,224,225,226
 Francium: 408
 Gadolinium: 1,46,137,151,152
 Gallium: 2,19,62,132,140,141,143,195,281
 Germanium: 5,119,293,340,341,342
 Gold: 38,72,234,393,395
 Hafnium: 1,369,404,410,425
 Helium: 16,94,173,183,317
 Holmium: 1
 Hydrogen: 214
 Indium: 1,132,348,349,350,351,352,353,435,436
 Iodine: 20,21,58,84,124,153,161,176,184
 Iridium: 1
 Iron: 56,63,71,101,105,138,174,278,381,382
 Krypton: 61,121,123,147,208,232,366,390,409,417,421
 Lanthanum: 1,78,79,220,309
 Lead: 54,64,106,256,274,297,283,329,330
 Lithium: 3,15,17,18,37,44,112,284,321,335
 Lutetium: 1,148,310,401
 Magnesium: 4,7,49,83,103,128,129,177,217,269,315,335
 Manganese: 1,126,385,405,433

Mercury (198): 43,50,69,145,229,242
 Mercury (Natural): 34,45,90,117,133,189,235,304,327,328,343
 Molybdenum: 1,383,420
 Neodymium: 1
 Neon: 56,58,69,118,150,230,364,365,371,388,389,400,402,413,430
 Neptunium: 93
 Nickel: 1,294,415,416,422
 Niobium: 1,392,407,431
 Nitrogen: 66,107,108,212,213,318
 Osmium: 1
 Oxygen: 23,24,36,66,69,209,210,215
 Palladium: 1,287,424
 Phosphorus: 179,180,182,336
 Platinum: 1,288
 Plutonium: 91
 Polonium: 47,48
 Potassium: 32,59,60,75,76,86,150,160,172,268,314,322
 Praseodymium: 1,149,306,308,337,338
 Promethium: 196,260
 Protactinium: 96
 Radium: 253,254
 Radon: 251
 Rhenium: 1
 Rhodium: 1,396
 Rubidium: 12,109,130,241,257,258,262,264
 Ruthenium: 1,423
 Samarium: 1
 Scandium: 1,88,150,298,323
 Selenium: 9,80,181,216,245,247,275
 Silicon: 87,170,237,292,319,320
 Silver: 13,99,255,286,289,363,387,398
 Sodium: 178,205,206,207,268,299,334
 Strontium: 1,109,110,218,231,265,279,313
 Sulfur: 29,144,202,209,210,266
 Tantalum: 1,411,426
 Technetium: 35
 Tellurium: 1,344,345,346,347
 Terbium: 1,302
 Thallium: 1,195,348,354,355,356
 Thorium: 1,97,98,156,157,165,434
 Thulium: 1,307
 Tin: 187,191,399,423
 Titanium: 1,378,427,428
 Tungsten: 1
 Uranium: 1,303
 Vanadium: 1,394,397,432
 Xenon: 33,116,118,120,232,384,391,429
 Ytterbium: 1,40,192,311
 Yttrium: 1,77,265,419
 Zinc: 39,55,113,131,185,186,370,376,377
 Zirconium: 1,362,403,418

ATOMIC TRANSITION PROBABILITIES

J. R. Fuhr, W. L. Wiese, L. I. Podobedova, and D. E. Kelleher

For the 91st edition of this *Handbook*, we include new, more accurate data for H, He, Li, Be, B, C I and C II, N I and N II, Na I – IV, Mg I – IV, Al I – III, and Si I – V. The new printed tables contain critically evaluated atomic transition probabilities for about 9000 selected lines of all elements for which reliable data are available on an absolute scale. The material is largely for neutral and singly ionized spectra, but also includes some prominent lines of doubly and more highly charged ions of important elements. A more extensive database can be found in the Internet and CD-ROM editions of the *CRC Handbook of Chemistry and Physics*.

Most of the data are obtained from comprehensive compilations of the Data Center on Atomic Transition Probabilities at the National Institute of Standards and Technology. Specifically, data have been taken from recent critical compilations on H, He, and Li (Ref. 1); on Be and B (Ref. 2); on neutral and singly-ionized C and N (Ref. 3); and on Na (Ref. 4), Mg (Ref. 4), Al (Ref. 5), and Si (Ref. 6). Material from earlier compilations for the elements H through Ne (Refs. 7 and 8) and Na through Ca (Ref. 9) was supplemented by some more recent material taken directly from the original literature. Most of the original literature is cited in the above tables and in recent bibliographies (Refs. 10 and 11); for lack of space, individual literature references are not cited here.

The wavelength range for the neutral species is normally the visible spectrum or shorter wavelengths; only the very prominent near infrared lines are included. For the higher ions, most of the strong lines are located in the far UV. The tabulation is limited to electric dipole - including intercombination - lines and comprises essentially the fairly strong transitions with estimated uncertainties in the 10 % to 50 % range. With the exception of hydrogen, helium, and the alkali metals, most transitions are between states with low principal quantum numbers.

The transition probability, A , is given in units of 10^8 s^{-1} and is listed with as many digits as is consistent with the indicated accuracy. Generally, the estimated uncertainties of the A -values are in the range from 25 % to 50 % for two-digit numbers, 10 % to 25 % for three-digit numbers and 1 % or better for four- and five-digit numbers.

Each transition is identified by the wavelength λ in angstroms and the statistical weights, g_i and g_k , of the lower (i) and upper (k) states [the product $g_k A$ (or $g_i f$) is needed for many applications]. Whenever the wavelengths of individual lines within a multiplet are extremely close, only an average wavelength for the multiplet as well as the multiplet A -value are given, and this is indicated by an asterisk (*) to the left of the wavelength. This also has been done when the transition probability for an entire multiplet has been taken from the literature and values for individual lines cannot be determined because of insufficient knowledge of the coupling of electrons. The wavelength data have been taken either from recent compilations or from the original literature cited in bibliographies published by the Atomic Energy Levels Data Center (Refs. 12 and 13) at the National Institute of Standards and Technology. Wavelength values are consistent with those given in the table "Line Spectra of the Elements," which appears elsewhere in this *Handbook*.

In addition to the transition probability A , the atomic oscillator strength f and the line strength S are often used in the literature. The conversion factors between these quantities are (for electric-dipole transitions):

$$g_i f = 1.499 \cdot 10^{-8} \lambda^2 g_k A = 303.8 \lambda^{-1} S$$

where λ is in Å, A is in 10^8 s^{-1} , and S is in atomic units, which are $a_0^2 e^2 = 7.188 \cdot 10^{-59} \text{ m}^2 \text{ C}^2$.

The table for hydrogen is presented first, followed by the tables for other elements in alphabetical sequence by element name (not symbol). Within each element, the tables are ordered by increasing ionization stage (e.g., Al I, Al II, etc.).

The transition probabilities for hydrogen and hydrogen-like ions are known precisely. Because of the hydrogen degeneracy, a "transition" is actually the sum of all fine-structure transitions between the principal quantum numbers; therefore, the hydrogen table gives weighted average A -values. For hydrogen-like ions of nuclear charge Z , the following scaling laws hold:

$$A_Z = Z^4 A_{\text{Hydrogen}} f_Z = f_{\text{Hydrogen}} S_Z = Z^{-2} S_{\text{Hydrogen}} \lambda_Z = Z^{-2} \lambda_{\text{Hydrogen}}$$

For very highly-charged hydrogen-like ions, starting at about $Z > 25$, relativistic values must be used.

ELECTRON AFFINITIES

Thomas M. Miller

Electron affinity is defined as the energy difference between the lowest (ground) state of the neutral and the lowest state of the corresponding negative ion. The accuracy of electron affinity measurements has been greatly improved since the advent of laser photodetachment experiments with negative ions. Electron affinities can be determined with optical precision, though a detailed understanding of atomic and molecular states and splittings is required to specify the photodetachment threshold corresponding to the electron affinity.

Atomic and molecular electron affinities are discussed in two excellent articles reviewing photodetachment studies which appear in *Gas Phase Ion Chemistry*, Vol. 3, Bowers, M. T., Ed., Academic Press, Orlando, 1984: Chapter 21 by Drzaic, P. S., Marks, J., and Brauman, J. I., "Electron Photodetachment from Gas Phase Negative Ions," p. 167, and Chapter 22 by Mead, R. D., Stevens, A. E., and Lineberger, W. C., "Photodetachment in Negative Ion Beams," p. 213. Persons interested in photodetachment details should consult these articles and the critical reviews of Andersen, T., Haugen, H. K., and Hotop, H., *J. Phys. Chem. Ref. Data* 28, 1511, 1999, Hotop, H., and Lineberger, W. C., *J. Phys. Chem. Ref. Data* 14, 731, 1985, and Andersen, T., Haugen, H. K., and Hotop, H. *J. Phys. Chem. Ref. Data* 28, 1511, 1999. For simplicity in the tables below, any electron affinity which was discussed in the articles by Drzaic et al. or Hotop and Lineberger is referenced to these sources, where original references are given. The development of cluster-ion photodetachment apparatuses has brought an

explosion of electron affinity estimates for atomic and molecular clusters. The policy in this tabulation is to list the electron affinities for the atoms, diatoms, and triatoms, if adiabatic electron affinities have been determined, but to refer the reader to original sources for higher-order clusters. Additional data on molecular electron affinities may be found in Lias, S. G., Bartmess, J. E., Liebman, J. F., Holmes, J. L., Levin, R. D., and Mallard, W. G., *Gas Phase Ion and Neutral Thermochemistry*, *J. Phys. Chem. Ref. Data* 17, (Supplement No. 1), 1988 and on the NIST WebBook at the Internet address <http://webbook.nist.gov/>.

For the present tabulation, the 2010 CODATA value $e/(hc) = 8065.54429 \pm 0.00018 \text{ cm}^{-1} \text{ eV}^{-1}$ (<http://physics.nist.gov/constants/>) has been used to convert electron affinities from the units used in spectroscopic work, cm^{-1} , into eV for these tables. Experimental measurements have improved to the level that the 25 ppb uncertainty in $e/(hc)$ will make a difference in a few cases. For this reason, very accurate electron affinities will be given in cm^{-1} with the relevant references.

Abbreviations used in the tables: calc = calculated value; PT = photodetachment threshold using a lamp as a light source; LPT = laser photodetachment threshold; LPES = laser photoelectron spectroscopy; DA = dissociative attachment; attach = electron attachment/detachment equilibrium; e-scat = electron scattering; kinetic = dissociation kinetics; Knud = Knudsen cell; CT = charge transfer; CD = collisional detachment; and ZEKE = zero electron kinetic energy spectroscopy.

PROTON AFFINITIES

Proton affinity is a useful parameter for describing gas phase ion-molecule reactions in fields such as atmospheric chemistry, plasma chemistry, mass spectrometry, and astrophysics. The proton affinity E_{pa} (often designated in the literature as PA) of a molecular species M is defined as the negative of the enthalpy change for the gas phase reaction

A closely related quantity is the gas phase basicity $\Delta_{\text{base}} G^\circ$ (often designated as GB), which is the negative of the Gibbs energy change for the same reaction. Thus the two are related by

$$\Delta_{\text{base}} G^\circ = E_{\text{pa}} + T\Delta S,$$

where T is the temperature and ΔS is the entropy change in the reaction (which can be calculated if the molecular structure of M and M^+ is known).

Direct measurement of the proton affinity is possible for only a few molecules, mainly olefins and carbonyl compounds. However, these measurements have been used to establish a scale of E_{pa} values that permits proton affinities to be determined for many other molecules, including unstable species and reaction intermediates. The basis for this scale is described by Hunter and Lias in Reference 1.

The E_{pa} and $\Delta_{\text{base}} G^\circ$ values at a temperature of 298 K are tabulated below for selected molecules. Many values are given to one decimal place, but the majority are not accurate to better than one or two kilojoules per mole. The methods of measurement are de-

scribed in Reference 1, which contains a much more extensive and detailed tabulation.

Compounds are listed by molecular formula in the Hill order, but with all compounds that do not contain carbon appearing before those that do contain carbon.

ATOMIC AND MOLECULAR POLARIZABILITIES

Thomas M. Miller

The *polarizability* of an atom or molecule describes the response of the electron cloud to an external field. The atomic or molecular energy shift ΔW due to an external electric field E is proportional to E^2 for external fields that are weak compared to the internal electric fields between the nucleus and electron cloud. The *electric dipole polarizability* α is the constant of proportionality defined by $\Delta W = -\alpha E^2/2$. The induced electric dipole moment is αE . *Hyperpolarizabilities*, coefficients of higher powers of E , are less often required. Technically, the polarizability is a tensor quantity but for spherically symmetric charge distributions reduces to a single number. In any case, an *average polarizability* is usually adequate in calculations. Frequency-dependent or *dynamic polarizabilities* are needed for electric fields that vary in time, except for frequencies that are much lower than electron orbital frequencies, where *static polarizabilities* suffice.

Polarizabilities for atoms and molecules in excited states are found to be larger than for ground states and may be positive or negative. Molecular polarizabilities are very slightly temperature dependent since the size of the molecule depends on its rovibrational state. Only in the case of dihydrogen has this effect been studied enough to warrant consideration in Table 3.

Polarizabilities are normally expressed in c.g.s. units of cm^3 . Ground state polarizabilities are in the range of $10^{-24} \text{ cm}^3 = 1 \text{ \AA}^3$ and hence are often given in \AA^3 units. Theorists tend to use atomic units of a_0^3 where a_0 is the Bohr radius. The conversion is $\alpha(\text{cm}^3) = 0.148184 \times 10^{-24} \times \alpha(a_0^3)$. Polarizabilities are only recently encountered in SI units, $\text{C m}^2/\text{V} = \text{J}/(\text{V/m})^2$. The conversion from c.g.s. units to SI units is $\alpha(\text{C m}^2/\text{V}) = 4\pi\epsilon_0 \times 10^{-6} \alpha(\text{cm}^3)$, where

ϵ_0 is the permittivity of free space in SI units and the factor 10^{-6} simply converts cm^3 into m^3 . Thus, $\alpha(\text{C m}^2/\text{V}) = 1.11265 \times 10^{-16} \times \alpha(\text{cm}^3)$. Persons measuring excited state polarizabilities by optical methods tend to use units of $\text{MHz}/(\text{V/cm})^2$, where the energy shift, ΔW , is expressed in frequency units with a factor of h understood. The polarizability is $-2 \Delta W/E^2$. The conversion into c.g.s. units is $\alpha(\text{cm}^3) = 5.955214 \times 10^{-16} \times \alpha[\text{MHz}/(\text{V/cm})^2]$.

The polarizability appears in many formulas for low-energy processes involving the valence electrons of atoms or molecules. These formulas are given below in c.g.s. units: the polarizability α is in cm^3 ; masses m or μ are in grams; energies are in ergs; and electric charges are in esu, where $e = 4.8032 \times 10^{-10}$ esu. The symbol $\alpha(\nu)$ denotes a frequency (ν) dependent polarizability, where $\alpha(\nu)$ reduces to the static polarizability α for $\nu = 0$. For further information, see Bonin, K. D., and Kresin, V. V., *Electric Dipole Polarizabilities of Atoms, Molecules, and Clusters*, World Scientific, Singapore, 1997; Bonin, K. D., and Kadar-Kallen, *Int. J. Mod. Phys. B*, 24, 3313, 1994; and Miller, T. M., and Bederson, B., *Advances in Atomic and Molecular Physics*, 13, 1, 1977, and Gould, H., and Miller, T. M., *Advances in Atomic, Molecular, and Optical Physics*, 51, 243, 2005. Details on polarizability-related interactions, especially in regard to hyperpolarizabilities and nonlinear optical phenomena, are given by Bogaard, M. P., and Orr, B. J., in *Physical Chemistry, Series Two, Vol. 2, Molecular Structure and Properties*, Buckingham, A. D., Ed., Butterworths, London, 1975, pp. 149–194. A tabulation of tensor and hyperpolarizabilities is included. The gas number density, n , in Table 1 is usually taken to be that of 1 atm at 0 °C in reporting experimental data.

TABLE 1. Formulas Involving Polarizability

Description	Formula	Remarks
Lorentz-Lorenz relation	$\alpha(\nu) = \frac{3}{4\pi n} \left[\frac{\eta^2(\nu) - 1}{\eta^2(\nu) + 2} \right]$	For a gas of atoms or nonpolar molecules; the index of refraction is $\eta(\nu)$
Refraction by polar molecules	$\alpha(\nu) + \frac{d^2}{3kT} = \frac{3}{4\pi n} \left[\frac{\eta^2(\nu) - 1}{\eta^2(\nu) + 2} \right]$	The dipole moment is d , in esu cm ($= 10^{-18}$ D)
Dielectric constant (dimensionless)	$\kappa(\nu) = 1 + 4\pi n \alpha(\nu)$	From the Lorentz-Lorenz relation for the usual case of $\kappa(\nu) \approx 1$
Index of refraction (dimensionless)	$\eta(\nu) = 1 + 2\pi n \alpha(\nu)$	From $\eta^2(\nu) = \kappa(\nu)$
Diamagnetic susceptibility	$\chi_m = e^2 (a_0 N \alpha)^{1/2} / 4m_e c^2$	From the approximation that the static polarizability is given by the variational formula $\alpha = (4/9a_0) \Sigma (N r_i^2)^2$; N is the number of electrons, m_e is the electron mass; a crude approximation is $\chi_m = (E_i / 4m_e c^2) \alpha$, where E_i is the ionization energy
Long-range electron- or ion-molecule interaction energy	$V(r) = -e^2 \alpha / 2r^4$	The target molecule polarizability is α
Ion mobility in a gas	$\kappa = -13.87 / (\alpha \mu)^{1/2} \text{ cm}^2 / \text{V} \cdot \text{s}$	This one formula is not in c.g.s. units. Enter α in \AA^3 or 10^{-24} cm^3 units and the reduced mass μ of the ion-molecule pair in amu. Classical limit; pure polarization potential
Langevin capture cross section	$\sigma(v_0) = (2\pi e / v_0) (\alpha / \mu)^{1/2}$	The relative velocity of approach for an ion-molecule pair is v_0 ; the target molecular polarizability is α and the reduced mass of the ion-molecule pair is μ
Langevin reaction rate coefficient	$k = 2\pi e (\alpha / \mu)^{1/2}$	Collisional rate coefficient for an ion-molecule reaction
Rate coefficient for polar molecules	$k_d = 2\pi d \left[(\alpha / \mu)^{1/2} + cd(2 / \mu \pi kT)^{1/2} \right]$	The dipole moment of the neutral is d in esu cm; the number c is a "locking factor" that depends on α and d , and is between 0 and 1

Description Formula

Modified effective range cross section for electron-neutral scattering
 $\sigma(k) = 4\pi A^2 + 32\pi^4 \mu e^2 \alpha A k / 3h^2 + \dots$

van der Waals constant between two systems A, B
 $C_6 = \frac{3}{2} \left[\frac{\alpha^A \alpha^B E^A E^B}{E^A + E^B} \right]$

Dipole-quadrupole constant between two systems A, B
 $C_8 = \frac{15}{4} \left[\frac{\alpha^A \alpha_q^B E^A E_q^B}{E^A + E_q^B} \right] + \frac{15}{4} \left[\frac{\alpha_q^A \alpha^B E_q^A E^B}{E_q^A + E^B} \right]$

van der Waals constant between an atom and a surface
 $C_3 = \frac{\alpha g E^A E^S}{8(E^A + E^S)}$

Relationship between $\alpha(v)$ and oscillator strengths
 $\alpha(v) = \frac{e^2 h^2}{4\pi^2 m_e} \sum \frac{f_k}{E_k^2 - (hv)^2}$

Dynamic polarizability
 $\alpha(v) = \frac{\alpha E_r^2}{E_r^2 - (hv)^2}$

Rayleigh scattering cross section
 $\alpha(v) = \frac{8\pi}{9c^4} (2\pi v)^4 \times [3\alpha^2(v) + 2\gamma^2(v) / 3]$

Verdet constant
 $V(v) = \frac{vn}{2m_e c^2} \left[\frac{d\alpha(v)}{dv} \right]$

Remarks

Here, k is the electron momentum divided by $h/2\pi$, where h is Planck's constant; A is called the "scattering length"; the reduced mass is μ

For the interaction potential term $V_6(r) = -C_6 r^{-6}$; $E^{A,B}$ represents average dipole transition energies and $\alpha^{A,B}$ the respective polarizabilities of A, B

For the interaction potential term $V_8(r) = -C_8 r^{-8}$; $E^{A,B}$ represents average quadrupole transition energies and $\alpha_q^{A,B}$ are the respective quadrupole polarizabilities of A, B

For an interaction potential $V_3(r) = -C_3 r^{-3}$; $E^{A,S}$ are characteristic energies of the atom and surface; $g = 1$ for a free-electron metal and $g = (\epsilon_\infty - 1)/(\epsilon_\infty + 1)$ for an ionic crystal

Here, f_k is the oscillator strength from the ground state to an excited state k , with excitation energy E_k . This formula is often used to estimate static polarizabilities ($v = 0$)

Approximate variation of the frequency-dependent polarizability $\alpha(v)$ from $v = 0$ up to the first dipole-allowed electronic transition, of energy E_r ; the static dipole polarizability is $\alpha(0)$; infrared contributions ignored

The photon frequency is v ; the polarizability anisotropy (the difference between polarizabilities parallel and perpendicular to the molecular axis) is $\gamma(v)$

Defined from $\theta = V(v)B$, where θ is the angle of rotation of linearly polarized light through a medium of number density n , per unit length, for a longitudinal magnetic field strength B (Faraday effect)

Note: All polarizabilities in the tables are experimental values except those values marked by an asterisk (*), which indicates a calculated result. The experimental polarizabilities are mostly determined by measurements of a dielectric constant or refractive index that are quite accurate (0.5% or better). However, one should treat many of the results with several percent of caution because of the age of the data and because some of the results refer to optical frequencies rather than static. Comments given with the references are intended to allow one to judge the degree of caution required. Interested persons should consult these references. In many cases, the reference given is to a theoretical paper in which the experimental results are quoted. These papers, noted in the References, contain valuable information on polarizability calculations and experimental data which often includes the tensor components of the polarizability.

An empirical additive formula for molecular polarizabilities at 589 nm frequency has been given in Bosque, R., and Sales, J., *J. Chem. Inf. Comput. Sci.* 42, 1154, 2002: $a = 0.32 + 1.51\#C + 0.17\#H + 0.57\#O + 1.05\#N + 2.99\#S + 2.48\#P + 0.22\#F + 2.16\#Cl + 3.29\#Br + 5.45\#I$, where $\#C$ denotes the number of carbon atoms in the molecule, etc. A helium-elimination additive method has been given by Kassimi, N. E.-B., and Thakkar, A. J., *Chem. Phys. Lett.* 472, 232, 2009.

- Maryott, A. A., and Buckley, F., *U. S. National Bureau of Standards Circular No. 537*, 1953. A tabulation of dipole moments, dielectric constants, and molar refractions measured between 1910 and 1952, and used here to determine polarizabilities if no more recent result exists. The polarizability is $3/(4\pi N_A)$ times the molar polarization or molar refraction, where N_A is Avogadro's number. The value $3/(4\pi N_A) = 0.3964308 \times 10^{-24} \text{ cm}^3$ was used for this conversion. A dagger (†) following the reference number in the tables indicates that the polarizability was derived from the molar refraction and hence may not include some low-frequency contributions to the static polarizability; these "static" polarizabilities are therefore low by 1 to 30%.

IONIZATION ENERGIES OF ATOMS AND ATOMIC IONS

The ionization energies (often called ionization potentials) of neutral and partially ionized atoms are listed in this table. Data were obtained from the compilations cited below, supplemented by results from the recent research literature. Values for the first and second ionization energies come from Reference 6. All values are given in electron volts (eV).

Following the traditional spectroscopic notation, columns are headed I, II, III, etc. up to XXX, where I indicates the neutral atom, II the singly ionized atom, III the doubly ionized atom, etc. The first section of the table includes spectra I to VIII of all the elements through rutherfordium; subsequent sections cover higher spectra (ionization stages) for those elements for which data are available.

IONIZATION ENERGIES OF GAS-PHASE MOLECULES

Sharon G. Lias

This table presents values for the first ionization energies (IP) of approximately 1000 molecules and atoms. Substances are listed by molecular formula in the modified Hill order (see Preface). Values enclosed in parentheses are considered not to be well established. Data appearing in the 1988 reference were updated in 1996 for inclusion in the database of ionization energies available at the Internet site of the Standard Reference Data program of the National Institute of Standards and Technology (<http://webbook.nist.gov>). The list appearing here includes these updates.

The list also includes values for enthalpies of formation of the ions at 298 K, $\Delta_f H_{\text{ion}}$, given according to the ion convention used by

mass spectrometrists; to convert these values to the electron convention used by thermodynamicists, add 6 kJ/mol. Details on the calculation of $\Delta_f H_{\text{ion}}$, as well as data for a much larger number of molecules, may be found in the reference and on the Internet site.

X-RAY ATOMIC ENERGY LEVELS

The energy levels in this table are the values recommended by Bearden and Burr on the basis of a thorough review of the literature on x-ray wavelengths and related data. All values are in electron volts (eV). Values in parentheses are interpolated, and an asterisk * indicates a level that is not resolved from the level above it. See Reference 1 for uncertainties in the levels and a complete description of how the recommended values were obtained.

ELECTRON BINDING ENERGIES OF THE ELEMENTS

Gwyn P. Williams

This table gives the binding energies in electron volts (eV) for selected electronic levels of the elements. For metallic elements the binding energy is referred to the Fermi level; for semiconductors, to the valence band maximum; and for gases and insulators, to the vacuum level. The atomic number is listed after the element name.

PHOTON ATTENUATION COEFFICIENTS

Martin J. Berger and John H. Hubbell

This table gives mass attenuation coefficients for photons for all elements at energies between 1 keV (soft x-rays) and 1 GeV (hard gamma rays). The mass attenuation coefficient μ describes the attenuation of radiation as it passes through matter by the relation

$$I(x)/I_0 = e^{-\rho x}$$

where I_0 is the initial intensity, $I(x)$ the intensity after path length x , and ρ is the mass density of the element in question. To a high approximation the mass attenuation coefficient is additive for the elements present, independent of the way in which they are bound in chemical compounds.

The power of ten is indicated beside each number in the table; i.e., 7.41 + 03 means 7.41×10^3 . A vertical line between two columns indicates that an absorption edge lies between those energy values. The various edges are labeled at the bottom of the table.

The attenuation coefficients were calculated with the computer program XCOM (Reference 1), which uses a cross-section database compiled at the Photon and Charged Particle Data Center at the National Institute of Standards and Technology. Their accuracy has been confirmed at all energies by extensive comparisons with experimental attenuation coefficients. Such comparisons for X-ray energies up to 100 keV can be found in Reference 2.

CLASSIFICATION OF ELECTROMAGNETIC RADIATION

Hans Dolezalek

Basic Conversions:

$$c = \lambda \nu = v/k$$

$$\nu = c/\lambda = ck$$

$$\lambda = c/\nu = 1/k$$

$$k = \nu/c = 1/\lambda$$

$$c = \text{speed of light} = 2.99792458 \times 10^8 \text{ m/s}$$

Frequency (ν)	Wavelength (λ)	Wave number (k)	Names of bands	Approximate photon energies
$3 \times 10^0 - 3 \times 10^1 \text{ Hz}$ 3 – 30 Hz	$10^8 - 10^7 \text{ m}$ 100 – 10 Mm	$10^{-8} - 10^{-7} \text{ m}^{-1}$ $10 - 100 \text{ Gm}^{-1}$	ELF-(ELF 1), ITU band no. 1	
$3 \times 10^1 - 3 \times 10^2 \text{ Hz}$ 30 – 300 Hz	$10^7 - 10^6 \text{ m}$ 10 – 1 Mm	$10^{-7} - 10^{-6} \text{ m}^{-1}$ $100 \text{ Gm}^{-1} - 1 \text{ Mm}^{-1}$	SLF-(ELF 2), ITU band no. 2, megameter waves	
$3 \times 10^2 - 3 \times 10^3 \text{ Hz}$ 300 Hz – 3 kHz	$10^6 - 10^5 \text{ m}$ 1 Mm – 100 km	$10^{-6} - 10^{-5} \text{ m}^{-1}$ $1 - 10 \text{ Mm}^{-1}$	ULF-(ELF 3), ITU band no. 3	
$3 \times 10^3 - 3 \times 10^4 \text{ Hz}$ 3 – 30 kHz	$10^5 - 10^4 \text{ m}$ 100 – 10 km	$10^{-5} - 10^{-4} \text{ m}^{-1}$ $10 - 100 \text{ Mm}^{-1}$	VLF, ITU band no. 4, myriameter waves	
$3 \times 10^4 - 3 \times 10^5 \text{ Hz}$ 30 – 300 kHz	$10^4 - 10^3 \text{ m}$ 10 – 1 km	$10^{-4} - 10^{-3} \text{ m}^{-1}$ $100 \text{ Mm}^{-1} - 1 \text{ km}^{-1}$	LF, ITU band no. 5, kilometer waves	
$3 \times 10^5 - 3 \times 10^6 \text{ Hz}$ 300 kHz – 3 MHz	$10^3 - 10^2 \text{ m}$ 1 km – 100 m	$10^{-3} - 10^{-2} \text{ m}^{-1}$ $1 - 10 \text{ km}^{-1}$	MF, ITU band no. 6, hectometer waves	
$3 \times 10^6 - 3 \times 10^7 \text{ Hz}$ 3 – 30 MHz	$10^2 - 10^1 \text{ m}$ 100 – 10 m	$10^{-2} - 10^{-1} \text{ m}^{-1}$ $10 - 100 \text{ km}^{-1}$	HF, ITU band no. 7, decameter waves	
$3 \times 10^7 - 3 \times 10^8 \text{ Hz}$ 30 – 300 MHz	$10^1 - 10^0 \text{ m}$ 10 – 1 m	$10^{-1} - 10^0 \text{ m}^{-1}$ $100 \text{ km}^{-1} - 1 \text{ mm}^{-1}$	VHF, ITU band no. 8, meter waves	
$3 \times 10^8 - 3 \times 10^9 \text{ Hz}$ 300 MHz – 3 GHz	$10^0 - 10^{-1} \text{ m}$ 1 m – 100 mm	$10^0 - 10^1 \text{ m}^{-1}$ $1 - 10 \text{ m}^{-1}$	UHF, ITU band no. 9, decimeter waves ^a	
$3 \times 10^9 - 3 \times 10^{10} \text{ Hz}$ 3 – 30 GHz	$10^{-1} - 10^{-2} \text{ m}$ 100 – 10 mm	$10^1 - 10^2 \text{ m}^{-1}$ $10 - 100 \text{ m}^{-1}$	SHF, ITU band no. 10, centimeter waves ^a	
$3 \times 10^{10} - 3 \times 10^{11} \text{ Hz}$ 30 – 300 GHz	$10^{-2} - 10^{-3} \text{ m}$ 10 – 1 mm	$10^2 - 10^3 \text{ m}^{-1}$ $100 \text{ m}^{-1} - 1 \text{ mm}^{-1}$ ($1 - 10 \text{ cm}^{-1}$)	EHF, ITU band no. 11, millimeter waves	
$3 \times 10^{11} - 3 \times 10^{12} \text{ Hz}$ 300 GHz – 3 THz	$10^{-3} - 10^{-4} \text{ m}$ 1 mm – 100 μm	$10^3 - 10^4 \text{ m}^{-1}$ ($1 - 10 \text{ mm}^{-1}$) ($10 - 100 \text{ cm}^{-1}$)	Part of micrometer waves, includes part of far or thermal infrared; ITU band no. 12	
$3 \times 10^{12} - 3 \times 10^{13} \text{ Hz}$ 3 – 30 THz	$10^{-4} - 10^{-5} \text{ m}$ 100 – 10 μm	$10^4 - 10^5 \text{ m}^{-1}$ $10 - 100 \text{ mm}^{-1}$ ($100 - 1000 \text{ cm}^{-1}$)	Part of micrometer waves includes part of far (thermal) infrared	
$3 \times 10^{13} - 3 \times 10^{14} \text{ Hz}$ 30 – 300 THz	$10^{-5} - 10^{-6} \text{ m}$ 10 – 1 μm (100,000 – 10,000 Å)	$10^5 - 10^6 \text{ m}^{-1}$ $100 \text{ mm}^{-1} - 1 \mu\text{m}^{-1}$	Part of μm waves, part of infrared	$(1.6 - 16) \times 10^{-20} \text{ joule}$ {0.1 – 1 eV}
$3 \times 10^{14} - 3 \times 10^{15} \text{ Hz}$ 300 THz – 3 PHz	$10^{-6} - 10^{-7} \text{ m}$ 1 μm – 100 nm (10,000 – 1000 Å)	$10^6 - 10^7 \text{ m}^{-1}$ $1 - 10 \mu\text{m}^{-1}$	Near infrared, visible, near ultraviolet	$(1.6 - 16) \times 10^{-19} \text{ joule}$ {1 – 10 eV}
$3 \times 10^{15} - 3 \times 10^{16} \text{ Hz}$ 3 – 30 PHz	$10^{-7} - 10^{-8} \text{ m}$ 100 – 10 nm (1000 – 100 Å)	$10^7 - 10^8 \text{ m}^{-1}$ $10 - 100 \mu\text{m}^{-1}$	Part of vacuum ultraviolet	$(1.6 - 16) \times 10^{-18} \text{ joule}$ {10 – 100 eV}
$3 \times 10^{16} - 3 \times 10^{17} \text{ Hz}$ 30 – 300 PHz	$10^{-8} - 10^{-9} \text{ m}$ 10 – 1 nm (100 – 10 Å)	$10^8 - 10^9 \text{ m}^{-1}$ $100 \mu\text{m}^{-1} - 1 \text{ nm}^{-1}$	Part of soft X-rays	$(1.6 - 16) \times 10^{-17} \text{ joule}$ {100 – 1000 eV}
$3 \times 10^{17} - 3 \times 10^{18} \text{ Hz}$ 300 PHz – 3 EHz	$10^{-9} - 10^{-10} \text{ m}$ 1 nm – 100 pm (10 – 1 Å)	$10^9 - 10^{10} \text{ m}^{-1}$ $1 - 10 \text{ nm}^{-1}$	Part of soft X-rays	$(1.6 - 16) \times 10^{-16} \text{ joule}$ {1 – 10 keV}
$3 \times 10^{18} - 3 \times 10^{19} \text{ Hz}$ 3 – 30 EHz	$10^{-10} - 10^{-11} \text{ m}$ 100 – 10 pm (1 – 0.1 Å)	$10^{10} - 10^{11} \text{ m}^{-1}$ $10 - 100 \text{ nm}^{-1}$	Hard X-rays and part of soft γ -rays	$(1.6 - 16) \times 10^{-15} \text{ joule}$ {10 – 100 keV}
$3 \times 10^{19} - 3 \times 10^{20} \text{ Hz}$ 30 – 300 EHz	$10^{-11} - 10^{-12} \text{ m}$ 10 – 1 pm (0.1 – 0.01 Å)	$10^{11} - 10^{12} \text{ m}^{-1}$ $100 \text{ nm}^{-1} - 1 \text{ pm}^{-1}$	Part of soft and part of hard γ -rays (limit at 510 keV)	$(1.6 - 16) \times 10^{-14} \text{ joule}$ {100 keV – 1 MeV}
$3 \times 10^{20} - 3 \times 10^{21} \text{ Hz}$ 300 – 3000 EHz	$10^{-12} - 10^{-13} \text{ m}$ 1 pm – 100 fm (0.01 – 0.001 Å)	$10^{12} - 10^{13} \text{ m}^{-1}$ $1 - 10 \text{ pm}^{-1}$	Part of hard γ -rays and part of “cosmic” γ -rays	$(1.6 - 16) \times 10^{-13} \text{ joule}$ {1 – 10 MeV}
$3 \times 10^{21} - 3 \times 10^{22} \text{ Hz}$ 3000 – 30,000 EHz	$10^{-13} - 10^{-14} \text{ m}$ 100 – 10 fm (0.001 – 0.0001 Å)	$10^{13} - 10^{14} \text{ m}^{-1}$ $10 - 100 \text{ pm}^{-1}$	γ -rays produced by cosmic rays	$(1.6 - 16) \times 10^{-12} \text{ joule}$ {10 – 100 MeV}

Note: Abbreviations used in this table: Å—ångstrom ($1 \text{ Å} = 10^{-10} \text{ m}$); EHz—exahertz (10^{18} hertz); EHF—extremely high frequency; ELF—extremely low frequency; eV—electron volt ($1 \text{ eV} = 1.60218 \times 10^{-19} \text{ joule}$); fm—femtometer (10^{-15} m); GHz—gigahertz (10^9 hertz); Gm—gigameter (10^9 m); HF—high frequency; Hz—hertz (s^{-1}); ITU—International Telecommunications Union; keV—kiloelectron volt (10^3 eV); km—kilometer (10^3 m); LF—low frequency; m—meter; MeV—megaelectron volt (10^6 eV); MF—medium frequency; MHz—megahertz (10^6 hertz); Mm—megameter (10^6 meter); mm—millimeter (10^{-3} meter); μm —micrometer (10^{-6} meter); nm—nanometer (10^{-9} meter); PHz—petahertz (10^{15} hertz); pm—picometer (10^{-12} meter); SHF—super high frequency; SLF—super low frequency; THz—terahertz; UHF—ultra high frequency; ULF—ultra low frequency; VHF—very high frequency; VLF—very low frequency.

^a Also called “microwaves”; not to be confused with “micrometer waves”.

Letter Designations of Microwave Bands

Frequency (GHz)	Wavelength (cm)	Wavenumber (cm^{-1})	Band
1—2	30—15	0.033—0.067	L-Band

SENSITIVITY OF THE HUMAN EYE TO LIGHT OF DIFFERENT WAVELENGTHS

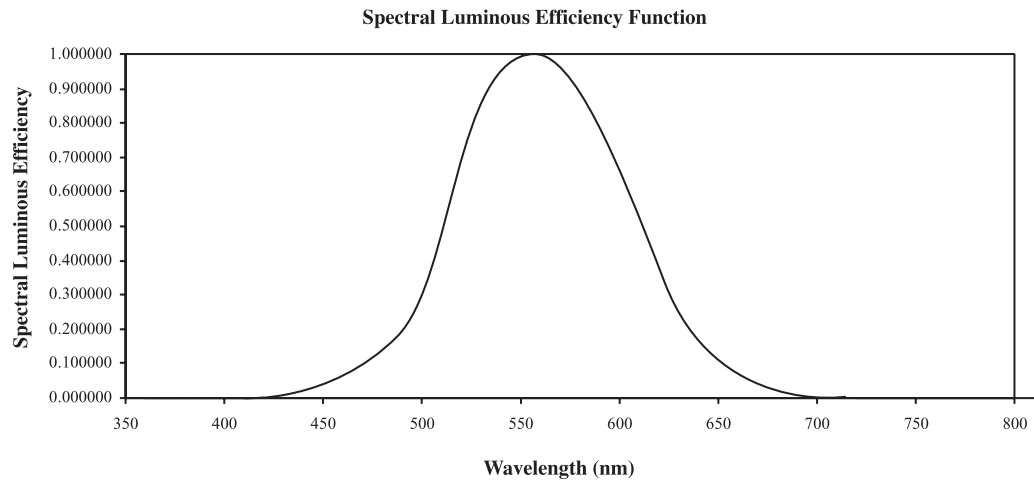

The human eye responds to electromagnetic radiation in the wavelength range from about 360 nm (violet) to 820 nm (red), with a peak sensitivity near 555 nm (green). While the detailed shape of this response curve depends on the individual person, studies on representative samples of human subjects have led to adoption of a standard function relating the perceived brightness (luminous flux) to the actual power of the spectral radiation. This function is referred to as $V(\lambda)$, the photopic spectral luminous efficiency function, and it plays an important role in photometry.

The function $V(\lambda)$, as adopted by the International Commission on Illumination (CIE), is tabulated and plotted below.

BLACKBODY RADIATION

The total power radiated from an ideal blackbody and the wavelength corresponding to maximum power are given here as a function of absolute temperature. Constants used in the calculation are taken from the table “Fundamental Physical Constants”

in Section 1. The radiated power in a band $\Delta\lambda$ at λ_{\max} may be calculated from:

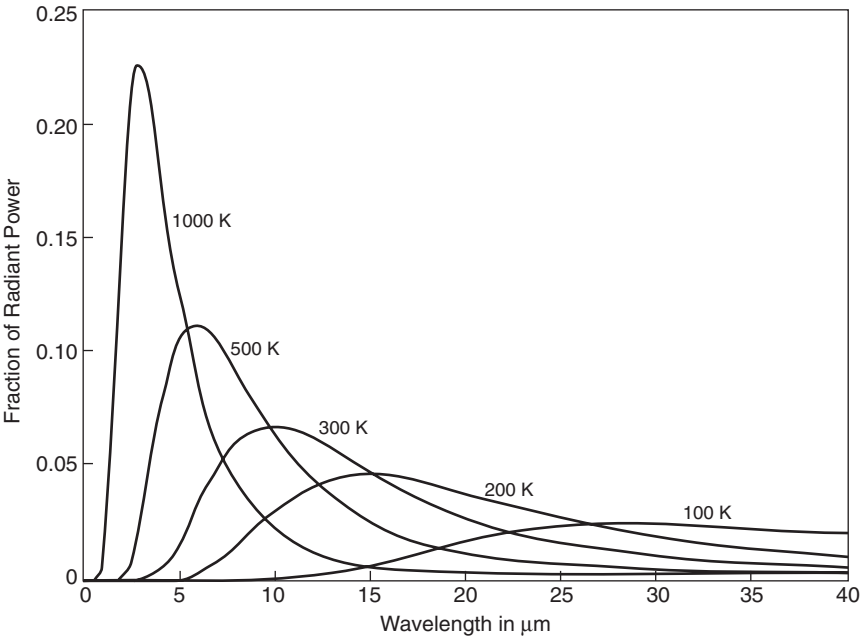

$$P_{\max} = 0.657548 (\Delta\lambda/\lambda_{\max}) P_{\text{tot}}$$

T/K	P_{tot}	$\lambda_{\max}/\mu\text{m}$	T/K	P_{tot}	$\lambda_{\max}/\mu\text{m}$	T/K	P_{tot}	$\lambda_{\max}/\mu\text{m}$

The curves below show, for various temperatures, the fraction of radiant power as a function of wavelength. The function plotted is $P_{\lambda}/\Delta\lambda P_{\text{tot}}$, where P_{λ} is the power at wavelength λ in a small interval $\Delta\lambda$ (in μm), and P_{tot} is the total power.

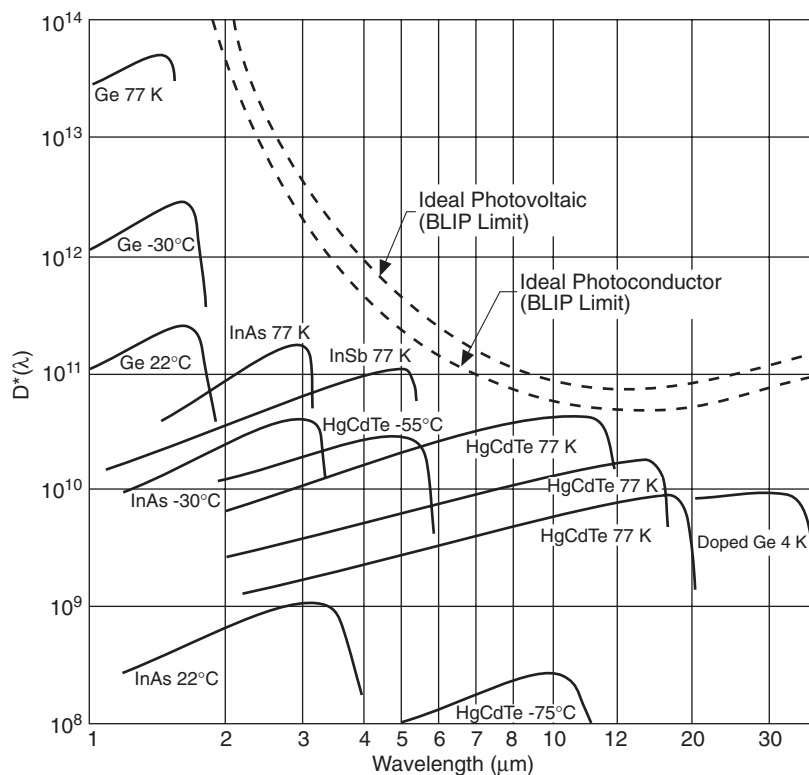

CHARACTERISTICS OF INFRARED DETECTORS

This graph summarizes the wavelength response of some semiconductors used as detectors for infrared radiation. The quantity $D^*(\lambda)$ is the signal-to-noise ratio for an incident radiant power density of 1 W/cm^2 and a bandwidth of 1 Hz (60° field of view). The Ge, InAs, and InSb detectors are photovoltaics, while the HgCdTe series are photoconductive devices. The cutoff wavelength of the latter can be varied by adjusting the relative amounts of Hg, Cd,

and Te (three examples are shown at 77 K). The graph also shows the theoretical background limited sensitivity for ideal detectors which introduce no intrinsic noise.

INDEX OF REFRACTION OF INORGANIC CRYSTALS

This table lists the index of refraction of selected crystalline inorganic compounds. When available, values are given as a function of wavelength in the range from the ultraviolet to the far infrared region. For each compound a value at 589 nm, the wavelength of the principal sodium line, is given. The data have been taken from the references indicated; in many cases, data from a reference have been refitted to generate the index of refraction at the wavelengths used in this table. All values refer to ambient temperature. Entries marked by * are based on extrapolation beyond the range of available experimental data.

Compounds belonging to the cubic crystal system have only a single refractive index value, but other systems are anisotropic, so that the crystal is characterized by two or three unique indexes. Hexagonal, rhombohedral, and tetragonal crystals have two unique indexes that are traditionally labeled n_o and n_e for "ordinary ray" and "extraordinary ray." Orthorhombic, monoclinic, and triclinic crystals are characterized by three indexes that here are called n_x , n_y , and n_z . The table indicates the crystal system for each entry in order to identify the material uniquely.

The refractive index and other optical properties for metals, semiconductors, and certain other compounds can be found in the tables "Optical Properties of Selected Elements" and "Optical Properties of Selected Inorganic and Organic Solids" in Section 12 of this *Handbook*.

REFRACTIVE INDEX AND TRANSMITTANCE OF REPRESENTATIVE GLASSES

Typical values of the index of refraction and internal transmittance (fraction of light transmitted through a one centimeter thickness) are tabulated here for selected types of glasses, as well as for synthetic fused (vitreous) silica. Nominal compositions are given in the first part of the table. The second part gives the index of refraction, relative to air, and the internal transmittance for representative samples of each glass at wavelengths in the infrared, visible, and near-ultraviolet regions. It should be emphasized that a wide variation of these parameters may be found among subtypes of each glass. More detailed data may be found in Reference 3.

Assuming that the Lambert-Beer Law is followed, the transmittance of a glass plate of thickness d (in centimeters) can be obtained by raising the transmittance value in the table to the power d .

INDEX OF REFRACTION OF WATER

This table gives the index of refraction of liquid water at atmospheric pressure, relative to a vacuum, at several temperatures and wavelengths. It is generated from the formulation in Reference 1, which covers a wide range of temperature, pressure, and wavelength. The wavelengths listed here correspond to prominent lines of cadmium (226.50 and 361.05 nm), potassium (404.41 nm), sodium (589.00 nm), Ne (632.80 nm, from a helium - neon laser), and mercury (1.01398 μm).

INDEX OF REFRACTION OF LIQUIDS FOR CALIBRATION PURPOSES

This table gives the index of refraction of six liquids that are available in highly pure form and whose index of refraction has been accurately measured as a function of wavelength and temperature. They are therefore useful for calibration of refractometers. The estimated uncertainty in the values is:

2,2,4-Trimethylpentane	±0.00003
Hexadecane	±0.00008
<i>trans</i> -Bicyclo[4.0.0]decane	±0.00008
1-Methylnaphthalene	±0.00008
Toluene	±0.00003
Methylcyclohexane	±0.00003

Full details are given in the references. This table is reprinted from Reference 1 by permission of the International Union of Pure and Applied Chemistry.

INDEX OF REFRACTION OF AIR

This is a table of the index of refraction n of dry air at 15 °C and a pressure of 101.325 kPa and containing 0.045% by volume of carbon dioxide (“standard air”). The index of refraction is defined by $n = \lambda_{\text{vac}}/\lambda_{\text{air}}$ where λ is the wavelength of the radiation. The index is calculated from the expression

$$(n-1) \times 10^8 = 8342.54 + 2406147(130 - \sigma^2)^{-1} + 15998(38.9 - \sigma^2)^{-1}$$

where $\sigma = 1/\lambda_{\text{vac}}$ and λ_{vac} has units of μm . The equation is valid for λ_{vac} from 200 nm to 2 μm . The table also gives the correction $(n-1)\lambda_{\text{air}}$ that must be added to the wavelength in air to obtain λ_{vac} .

If the air is at a temperature t in °C (ITS-90) and a pressure p in pascals, a value of $(n-1)$ from this table should be multiplied by

$$p[1 + p(60.1 - 0.972t) \times 10^{-10}]/96095.43(1 + 0.003661t)$$

INDEX OF REFRACTION OF GASES

This table gives the index of refraction of several gases at selected wavelengths ranging from the blue to the red region of the spectrum. The entries at 0.5893 μm correspond to the prominent sodium D line in the yellow region. All values refer to gas at a pressure of one atmosphere (101.325 kPa) and at a temperature of 0 °C.

CHARACTERISTICS OF LASER SOURCES

William F. Krupke

Light amplification by stimulated emission of radiation was first demonstrated by Maiman in 1960, the result of a population inversion produced between energy levels of chromium ions in a ruby crystal when irradiated with a xenon flashlamp. Since then population inversions and coherent emission have been generated in literally thousands of substances (neutral and ionized gases, liquids, and solids) using a variety of incoherent excitation techniques (optical pumping, electrical discharges, gas-dynamic flow, electron-beams, chemical reactions, nuclear decay).

The extrema of laser output parameters that have been demonstrated to date and the laser media used are summarized in Table 1. Note that the extreme power and energy parameters listed in this table were attained with laser systems rather than with simple laser oscillators.

Laser sources are commonly classified in terms of the state-of-matter of the active medium: gas, liquid, and solid. Each of these classes is further subdivided into one or more types as shown in Table 2. A well-known representative example of each type of laser is also given in Table 2 together with its nominal operation wavelength and the methods by which it is pumped.

The various lasers together cover a wide spectral range from the far ultraviolet to the far infrared. The particular wavelength of emission (usually a narrow line) is presented for some six dozen lasers in Figures 1A and 1B.

By suitably designing the excitation source and/or by controlling the laser resonator structure, laser systems can provide continuous or pulsed radiation as shown in Table 3.

Besides the method of excitation and the temporal behavior of a laser, there are many other parameters that characterize its operation and efficiency, as shown in Tables 4 and 5.

Although many lasers only emit in one or more narrow spectral "lines," an increasing number of lasers can be tuned by changing the composition or the pressure of the medium, or by varying the wavelength of the pump bands. The spectral regions in which these tunable lasers operate are presented in Figure 2.

^a Pressure dependent.^b Intrinsic efficiency ≡ energy output/energy deposited in gas.

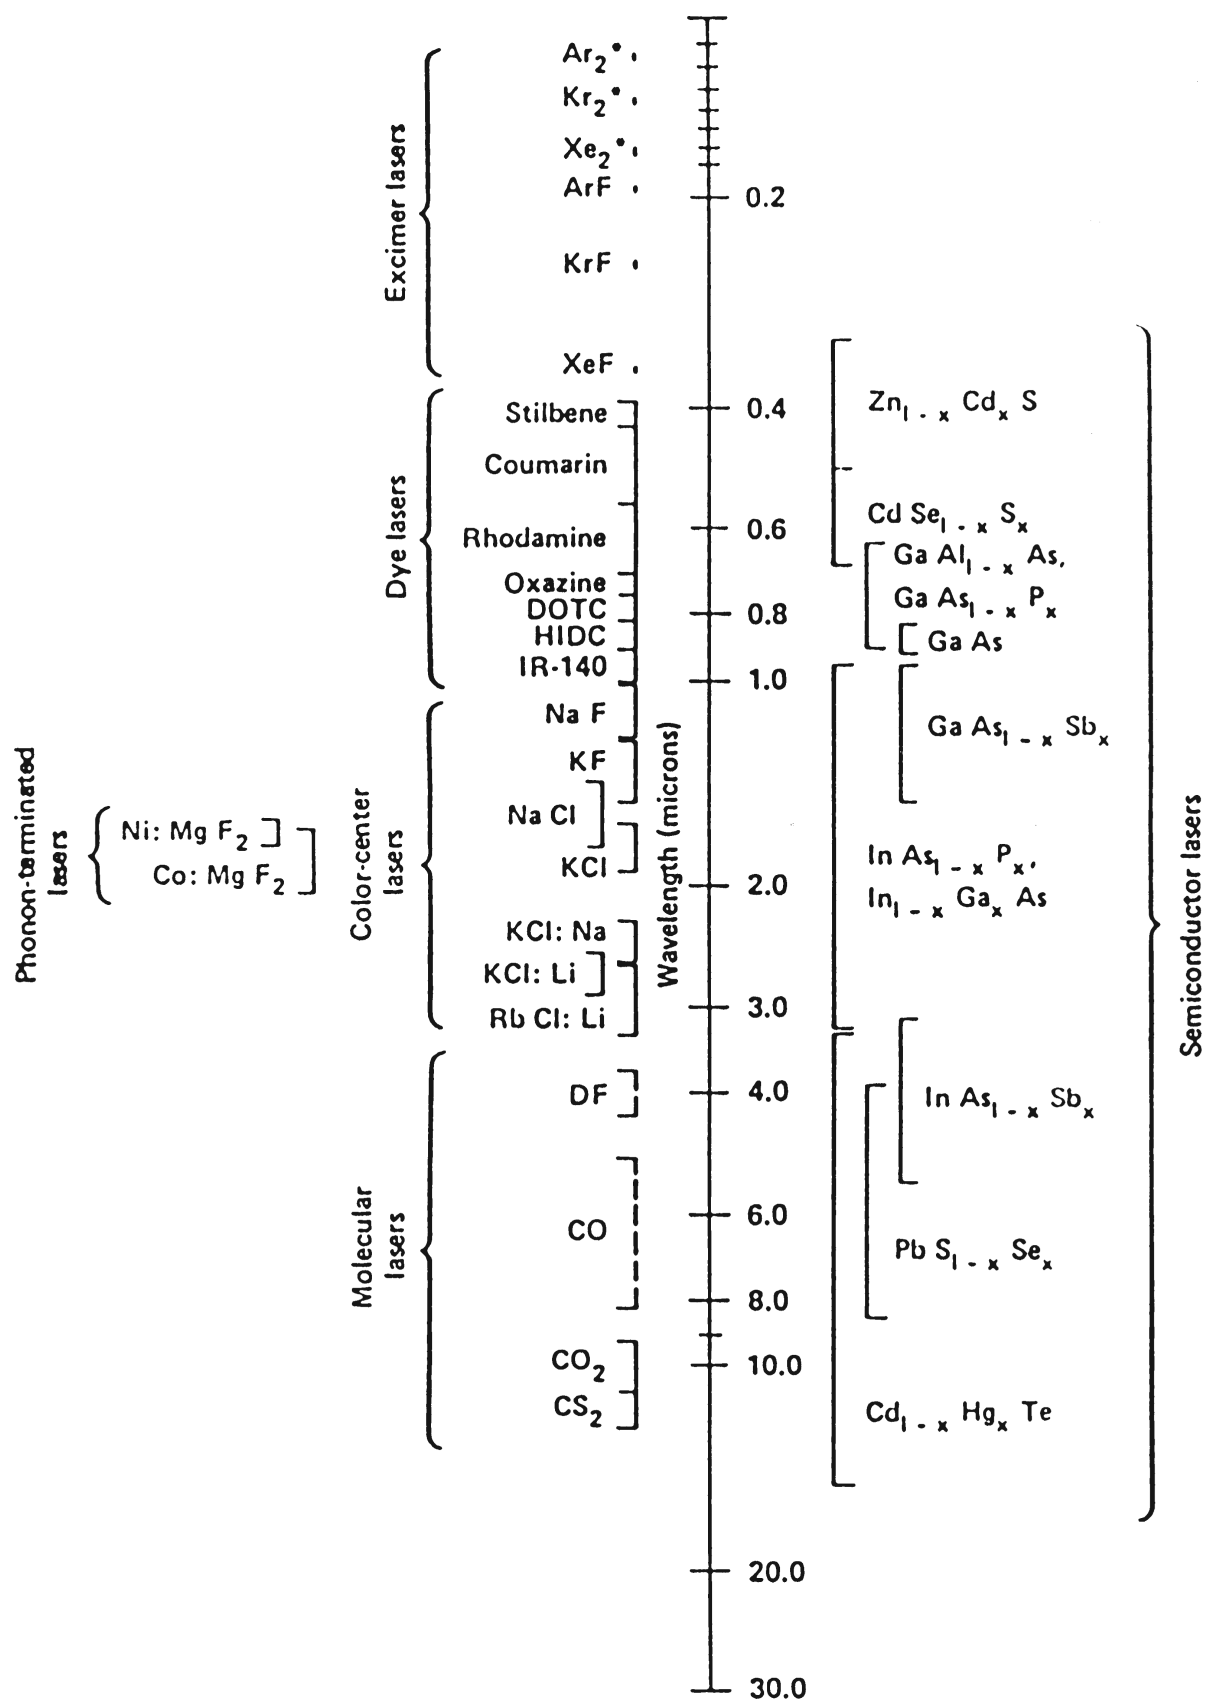

FIGURE 2. Spectral tuning ranges of various types of tunable lasers.

INFRARED LASER FREQUENCIES

Arthur Maki

The CO₂ laser has been the subject of a number of very accurate frequency measurements. Most of the earlier measurements are given by Bradley et al.¹ That analysis was based on a single absolute frequency measurement and many laser frequency differences. New measurements of the methane frequency²⁻⁴ have made it necessary to slightly revise that single absolute frequency measurement. In addition, there have been several other absolute frequency measurements⁵⁻⁷ that have been used here to improve the accuracy of the present tables. New frequency difference measurements have also been added to the database used for the present tables.⁸

Aside from the CO₂ laser transitions, the absorption spectrum of CO has been more accurately and thoroughly measured than any other spectrum. A bibliography of earlier measurements on CO is given by Maki and Wells,¹ and the present tables were calculated from the measurements referred to in that work. In addition, some new and very accurate frequency measurements^{2,3} have been made and were incorporated in the present tables. The frequencies of the rotational transitions of HF and HCl were calculated from constants obtained from fitting the measurements of Evenson et al.^{4,5} and Jennings and Wells.⁶

A new report on infrared wavenumber standards from the International Union of Pure and Applied Chemistry, Commission on Molecular Structure and Spectroscopy, may be found in Reference 7.

Wavenumbers for the $\nu = 1 - 0$ Band of CO

Wavenumber (unc) ^a /cm ⁻¹	Transition	Wavenumber (unc)/cm ⁻¹	Transition
2139.426071(01)	P(1)	2147.081132(01)	R(0)

SUMMARY TABLES OF PARTICLE PROPERTIES

Details of particle properties may be found in the following publication:

Olive, K. A. et al. (Particle Data Group), *Chin. Phys. C* 38(9), 090001, 2014.

Abstract

The *Review* summarizes much of particle physics and cosmology. Using data from previous editions, plus 3283 new measurements from 899 papers, we list, evaluate, and average measured properties of gauge bosons and the recently discovered Higgs boson, leptons, quarks, mesons, and baryons. We summarize searches for hypothetical particles such as heavy neutrinos, supersymmetric and technicolor particles, axions, dark photons, etc. All the particle properties and search limits are listed in Summary Tables. We also give

numerous tables, figures, formulae, and reviews of topics such as the Supersymmetry, Extra Dimensions, Particle Detectors, Probability, and Statistics. Among the 112 reviews are many that are new or heavily revised including those on: Dark Energy, Higgs Boson Physics, Electroweak Model, Neutrino Cross Section Measurements, Monte Carlo Neutrino Generators, Top Quark, Dark Matter, Dynamical Electroweak Symmetry Breaking, Accelerator Physics of Colliders, High-Energy Collider Parameters, Big Bang Nucleosynthesis, Astrophysical Constants, and Cosmological Parameters.

A booklet is available containing the Summary Tables and abbreviated versions of some of the other sections of this full *Review*. All tables, listings, and reviews (and errata) are also available on the Particle Data Group website: <http://pdg.lbl.gov>.

The full Summary Tables are included in the Internet version of the 96th Edition of the *CRC Handbook of Chemistry and Physics*.

TABLE OF THE ISOTOPES

Norman E. Holden

This table presents an evaluated set of values for the experimental quantities that characterize the decay of radioactive nuclides. A list of the major references used in this evaluation is given below. When uncertainties are not listed, they are assumed to be five or less in the last digit quoted. If the uncertainty in the value exceeds five in the last digit, the value is preceded by an approximate sign.

For quasi-stable nuclides, the measured width, Γ , of the resonance is given. To estimate the approximate half-life, the Heisenberg relationship may be used, the half-life = 4.56×10^{-22} seconds / Γ (MeV). The effective literature cutoff date for data in this edition of the table is December 2013.

Table Layout

Column number	Column title	Description
1	Isotope or Element	For elements, the atomic number and chemical symbol are listed. For nuclides, the mass number and chemical symbol are listed. Isomers are indicated by the addition of m, m1, or m2.
2	Isotopic Abundance	The abundance of an isotope in normal terrestrial samples of an element, listed in atom percent.
3	Atomic Mass or Atomic Weight	Atomic mass relative to $^{12}\text{C} = 12$. Atomic weight of elements is given on the same scale.
4	Half-Life/Resonance Width	Half-life in decimal notation. μs = microseconds; ms = milliseconds; s = seconds; m = minutes; h = hours; d = days; and a = years. For quasi-stable nuclides, the measured width at half-maximum of the energy resonance is given.
5	Decay Mode/Energy	Decay modes are α = alpha particle emission; β^- = negative beta emission; β^+ = positron emission; EC = orbital electron capture; IT = isomeric transition from upper to lower isomeric state; n = neutron emission; p = proton emission; sf = spontaneous fission; $\beta\beta$, ECEC, 2p, 2n, 3n = double beta, double EC, two proton and multiple neutron decay. Total disintegration energy in MeV units.
