C A B

**C**AABA, or CAABA, properly signifies a square building; but is particularly applied by the Mahometans to the temple of Mecca, built, as they pretend, by Abraham and Ismaël his son. It is towards this temple they always turn their faces when they pray, in whatever part of the world they happen to be.

This temple enjoys the privilege of an asylum for all sorts of criminals; but it is most remarkable for the pilgrimages made to it by the devout musûlmans, who pay so great a veneration to it, that they believe a single sight of its sacred walls, without any particular act of devotion, is as meritorious, in the sight of God, as the most careful discharge of one's duty, for the space of a whole year, in any other temple.

**CAB**, an Hebrew dry measure, being the sixth part of a seah or sath, and the eighteenth part of an ephah: A cab contained  $2\frac{1}{2}$  pints of our corn measure: A quarter-cab was the measure of dove's dung, or more properly a sort of chick-pease, called by this name, which was sold at Samaria, during the siege of that city, for five shekels.

**CABALIST**, in French commerce, a factor, or person, who is concerned in managing the trade of another.

**CABALLARIA**, in middle-age writers, lands held by the tenure of furnishing a horseman, with suitable equipment, in time of war, or when the lord had occasion for him.

**CABALLEROS**, or **CAVALLEROS**, are Spanish woolls, of which there is a pretty considerable trade at Bayonne, in France.

**CABALLINE** denotes something belonging to horses: This caballine aloes is so called, from its being chiefly

Vol. II. No. 30.

3

C A B

used for purging horses; and common brimstone is called sulphur caballinum, for a like reason.

**CABBAGE**, in botany. See **BRASSICA**.

**CABBAGE-tree**, a name sometimes given to the palm-tree, called by Linnæus, phoenix. See **PHOENIX**.

**CABBAGING**, among gardeners, a term used for the knitting of cabbages into round heads.

**CABBALA**, according to the Hebrew style, has a very distinct signification from that wherein we understand it in our language. The Hebrew cabbala signifies tradition; and the rabbins, who are called cabbalists, study principally the combination of particular words, letters, and numbers, and by this means pretend to discover what is to come, and to see clearly into the sense of many difficult passages in scripture: There are no sure principles of this knowledge, but it depends upon some particular traditions of the ancients; for which reason it is termed cabbala.

The cabbalists have abundance of names, which they call sacred: These they make use of in invoking of spirits, and imagine that they receive great light from them: They tell us, that the secrets of the cabbala were discovered to Moses on mount Sinai; and that these have been delivered down to them from father to son, without interruption, and without any use of letters; for to write them down, is what they are by no means permitted to do. This is likewise termed the oral law, because it passed from father to son, in order to distinguish it from the written laws.

There is another cabbala, called artificial, which consists in searching for abstruse and mysterious significations of a word in scripture, from whence they borrow certain explanations, by combining the letters

†

A

which

which compose it: this cabbala is divided into three kinds, the gematria, the notaricon, and the temura or themurah. The first whereof consists in taking the letters of a Hebrew word for ciphers or arithmetical numbers, and explaining every word by the arithmetical value of the letters whereof it is composed. The second sort of cabbala, called notaricon, consists in taking every particular letter of a word for an entire diction; and the third, called themurah, *i. e.* change, consists in making different transpositions or changes of letters, placing one for the other, or one before the other.

Among the Christians likewise, a certain sort of magic is, by mistake, called cabbala, which consists in using improperly certain passages of scripture for magic operations, or in forming magic characters or figures with stars and talismans.

Some visionaries, among the Jews, believe, that Jesus Christ wrought his miracles by virtue of the mysteries of the cabbala.

**CABBALISTS**, the Jewish doctors who profess the study of the cabbala.

In the opinion of these men, there is not a word, letter, or accent in the law, without some mystery in it. The Jews are divided into two general sects; the karaites, who refuse to receive either tradition or the talmud, or any thing but the pure text of scripture; and the rabbinites, or talmudists, who, besides this, receive the traditions of the ancients, and follow the talmud.

The latter are again divided into two other sects; pure rabbinites, who explain the scripture, in its natural sense, by grammar, history, and tradition; and cabbalists, who, to discover hidden mystical senses, which they suppose God to have couched therein, make use of the cabbala, and the mystical methods above mentioned.

**CABECA**, or **CABESSE**, a name given to the finest silks in the East Indies, as those from 15 to 20 *per cent.* inferior to them are called barina. The Indian workmen endeavour to pass them off one with the other; for which reason, the more experienced European merchants take care to open the bales, and to examine all the skins one after another. The Dutch distinguish two sorts of cabecas; namely, the moor cabeca, and the common cabeca. The former is sold at Amsterdam for about 21  $\frac{1}{2}$  schellinghen Flemish, and the other for about 18  $\frac{1}{4}$ .

**CABENDA**, a port-town of Congo, in Africa, and subject to the Portuguese: E. long. 12°, and S. lat. 4°.

**CABIDOS**, or **CAVIDOS**, a long measure used at Goa, and in other places of the East Indies belonging to the Portuguese, to measure stuffs, linens, &c. and equal to  $\frac{4}{5}$  of the Paris ell.

**CABIN**, in the sea-language, a small room, or apartment, whereof there are a great many in several parts of a ship; particularly on the quarter-deck, and on each side of the steerage, for the officers of the ship to lie in.

The great cabin is the chief of all, and that which properly belongs to the captain or chief commander.

**CABINET**, or **CABBINET**, the most retired place in the finest part of a building, set apart for writing, studying, or preserving any thing that is precious.

A complete apartment consists of a hall, anti-chamber, chamber, and cabinet, with a gallery on one side. Hence we say, a cabinet of paintings, curiosities, &c. **CABINET** also denotes a piece of joiner's workmanship, being a kind of press or chest, with several doors and drawers.

There are common cabinets of oak or of chestnut, varnished cabinets of China and Japan, cabinets of inlaid work, and some of ebony, or the like scarce and precious woods.

Formerly the Dutch and German cabinets were much esteemed in France, but are now quite out of date, as well as the cabinets of ebony, which came from Venice.

**CABIRI**, a term in the theology of the ancient Pagans, signifying great and powerful gods; being a name given to the gods of Samothracia. They were also worshipped in other parts of Greece, as Lemnos and Thubus, where the cabiria were celebrated in honour of them: these gods are said to be, in number, four, *viz.* Axieros, Axiocersa, Axiocersus, and Camilus.

**CABIRIA**, festivals in honour of the cabiri, celebrated in Thebes and Lemnos, but especially in Samothracia, an island consecrated to the cabiri. All who were initiated into the mysteries of these gods, were thought to be secured thereby from storms at sea, and all other dangers. The ceremony of initiation was performed by placing the candidate, crowned with olive-branches, and girded about the loins with a purple ribband, on a kind of throne, about which the priests, and persons before initiated, danced.

**CABLAN**, the name of a kingdom and city of India, beyond the Ganges.

**CABLE**, a thick, large, strong rope, commonly of hemp, which serves to keep a ship at anchor.

There is no merchant-ship, however weak, but has at least three cables; namely, the chief cable, or cable of the sheet-anchor, a common cable, and a smaller one.

Cable is also said of ropes, which serve to raise heavy loads, by the help of cranes, pullies, and other engines. The name of cable is usually given to such as have, at least, three inches in diameter; those that are less are only called ropes of different names, according to their use.

Every cable, of what thickness soever it be, is composed of three strands; every strand of three ropes; and every rope of three twists: the twist is made of more or less threads, according as the cable is to be thicker or thinner.

In the manufacture of cables, after the ropes are made, they use sticks, which they pass first between the ropes of which they make the strands, and afterwards between the strands of which they make the cable, to the end that they may all twist the better, and be more regularly wound together; and also, to prevent them from twining or intangling, they hang,

at

at the end of each strand and of each rope, a weight of lead or of stone.

The number of threads each cable is composed of is always proportioned to its length and thickness; and it is by this number of threads that its weight and value are ascertained: thus a cable of three inches circumference, or one inch diameter, ought to consist of 48 ordinary threads, and weigh 192 pounds; and on this foundation is calculated the following table, very useful for all people engaged in marine commerce, who fit out merchant-men for their own account, or freight them for the account of others.

*A table of the number of threads and weight of cables of different circumferences.*

Circumf.	Threads.	Weight.
3 inches.	48	192 pounds
4	77	308
5	121	484
6	174	696
7	238	952
8	314	1244
9	393	1572
10	485	1940
11	598	2392
12	699	2796
13	821	3284
14	952	3808
15	1093	4372
16	1244	4976
17	1404	5616
18	1574	6296
19	1754	7016
20	1943	7772

**Sheet-anchor CABLE**, is the greatest cable belonging to a ship.

**Serve or plate the CABLE**, is to bind it about with ropes, clouts, &c. to keep it from galling in the hawser.

**To splice a CABLE**, is to make two pieces fast together, by working the several threads of the rope, the one into the other.

**Pay more CABLE**, is to let more out of the ship. **Pay cheap the cable**, is to hand it out apace. **Veer more cable**, is to let more out, &c.

**CABLED**, in heraldry, a term applied to a cross, formed of the two ends of a ship's cable; sometimes also to a cross covered over with rounds of rope, more properly called a cross-corded.

**CABLED-flute**, in architecture, such flutes as are filled up with pieces, in the form of a cable.

**CABO DE ISTRIA**, the capital of the province of Istria, in the dominion of Venice, situated on the gulph of Venice, about twelve miles south of Trieste: E. long.  $14^{\circ} 20'$ , and N. lat.  $45^{\circ} 50'$ .

**CABOCHED**, in heraldry, is when the heads of beasts are borne without any part of the neck, full-faced.

**CABOLETTO**, in commerce, a coin of the republic of Genoa, worth about 3 d. of our money.

**CABUL**, the capital of a province of the same name, on the north-west of India. Both the town and pro-

vince of Cabul were ceded to the Persians in 1739: E. long.  $69^{\circ}$ , and N. lat.  $35^{\circ} 30'$ .

**CABURNS**, on ship-board, are small lines, made of spun yarn, to bind cables, seize tackles, or the like.

**CACACA**, a city of Africa, in the kingdom of Fez.

**CACAGOGA**, among ancient physicians, ointments, which, applied to the fundament, procure stools. Iulus Aegineta directs to boil alum, mixed with honey, for that purpose.

**CACALIA**, in botany, a genus of the syngenesia polygamia æqualis class. The receptacle is naked; the pappus is hairy; and the calix is cylindrical, oblong, and has a kind of small cup at the base. There are 12 species, none of which are natives of Britain.

**CACALIANTHEMUM**, in botany, a synonyme of the cacalia. See **CACALIA**.

**CACAO**, in botany. See **THEOBROMA**.

**CACERES**, a town of Estremadura, in Spain, about seventeen miles south-east of Alcantara: W. long.  $6^{\circ} 45'$ , and N. lat.  $39^{\circ} 12'$ .

**CACHAN**, a city of Persia, situated in a large plain, about 20 leagues from Isfahan.

It is remarkable for its manufactures of gold and silver stuffs, and of fine earthen ware.

**CACHAO**, or **KECHIO**, the capital of the kingdom of Torquin, situated on the western shore of the river Domea: E. long.  $105^{\circ}$ , and N. lat.  $22^{\circ} 30'$ .

**CACHECTIC**, something partaking of the nature of, or belonging to a cachexy. See **CACHEXY**.

**CACHEMIRE**, or **KACHEMIRE**, a province of Asia, in the country of the Mogul. The inhabitants are thought to have been originally Jews, because they speak much of Moses and Solomon, whom they believe to have travelled into their country.

**CACHEMIRE** is also the capital of that province, situated in  $76^{\circ}$  E. long. and  $34^{\circ} 30'$  N. lat.

**CACHEXY**, in medicine, a vitious state of the humours and whole habit. See **MEDICINE**.

**CACHRYS**, in botany, a genus of the pentandria digynia class. The fruit is oval and a little angled. There are but two species, viz: the libanotis, a native of Sicily; and the ficula, a native of Sicily and Spain.

**CACOETHES**, in medicine, an epithet applied, by Hippocrates, to malignant and difficult distempers: when applied to signs or symptoms, it imports what is very bad and threatening; and if given to tumours, ulcers, &c. it denotes a great malignancy.

**CACTUS**, in botany, a genus of the icofandria monogynia class. The calix consists of one leaf, imbricated, and above the fruit. The berry has but one cell, containing many seeds. The species are twenty-three, one of which is the cochineal-plant. See **COCHINEAL**.

**CAD**, or **CADE**. See **CADE**.

**CADARI**, or **KADARI**, a sect of Mahometans, which attributes the actions of men to men alone, and not to the divine decree determining his will; and denies all absolute decrees, and predestination. Ben Aun calls the cadari, the magi or manichees of the mussulmans.

**CADE**,.

**CADÉ**, a cag, cask, or barrel. A cade of herrings is a vessel containing the quantity of 500 red herrings, or of sprats 1000.

**CADÉ-LAMB**, a young lamb, weaned and brought up by hand in a house.

**CADÉ-OIL**, an oil much used in France and Germany: it is prepared from the fruit of a species of cedar, called *oxycedrus*.

**CADÉ-WORM**, in zoology, the maggot or worm of a fly, called phryganea. See **PHRYGANEÆ**.

**CADENCE**, in reading, is a falling of the voice below the key-note at the close of every period. In reading, whether prose or verse, a certain tone is assumed which is called the key-note; and in this tone the bulk of the words are sounded; but this note is generally lowered towards the close of every sentence.

**CADENCE**, in music, according to the ancients, is a series of a certain number of notes, in a certain interval, which strike the ear agreeably, and especially at the end of the song, stanza &c. It consists ordinarily of three notes.

Cadence, in the modern music, may be defined a certain conclusion of a song, or of the parts of a song, which divide it, as it were, into so many numbers or periods. It is when the parts terminate in a chord or note, the ear seeming naturally to expect it; and is much the same in a song, as the period that closes the sense in a paragraph of a discourse.

A cadence is either perfect, consisting of two notes sung after each other, or by degrees conjoined in each of the two parts, and by these means satisfying the ear; or imperfect, when its last measure is not in the octave or unison, but a sixth or third. It is called imperfect, because the ear doth not acquiesce in the conclusion, but expects a continuation of the song. The cadence is said to be broken, when the bass, instead of falling a fifth, as the ear expects, rises a second, either major or minor. Every cadence is in two measures; sometimes it is suspended, in which case it is called a repose, and only consists of one measure, as when the two parts stop at the fifth, without finishing the cadence. With regard to the bass-viol, Mr Rousseau distinguishes two cadences, one with a rest, when the singer, that should shake the cadence, stops a little, before it shakes, on the note immediately above that which requires the cadence; and one without a rest, when the stop is omitted.

**CADENCE**, in the menage, an equal measure or proportion, observed by a horse in all his motions; so that his times have an equal regard to one another, the one does not embrace or take in more ground than the other, and the horse observes his ground regularly.

**CADENE**, one of the sorts of carpets which the Europeans import from the Levant. They are the worst sort of all, and are sold by the piece from one to two paces per carpet.

**CADET**, the younger son of a family, is a term naturalized in our language from the French. At Paris, among the citizens, the cadets have an equal patrimony with the rest. At Caen, in Normandy, the cu-

stom, as with us, is to leave all to the eldest, except a small portion to the cadets. In Spain, it is usual for one of the cadets in great families to take the mother's name.

**CADET** is also a military term denoting a young gentleman who chuses to carry arms in a marching regiment as a private man. His views are, to acquire some knowledge in the art of war, and to obtain a commission in the army. Cadet differs from volunteer, as the former takes pay, whereas the latter serves without any pay.

**CADI**, or **CADHI**, a judge of the civil affairs in the Turkish empire.

It is generally taken for the judge of a town; judges of provinces being distinguished by the appellation of molla's.

In Biledulgerid in Africa, the cadi decides in spiritual affairs.

**CADILESCHER**, a capital officer of justice among the Turks, answering to a chief justice among us.

It is said, that this authority was originally confined to the soldiery; but that, at present, it extends itself to the determination of all kinds of law-suits; yet nevertheless subject to appeals.

There are but three cadileschers in all the grand signior's territories; the first is that of Europe; the second, of Natolia; and the third resides at Grand Cairo. This last is the most considerable: they have their seats in the divan next to the grand vizir.

**CADIZ**, a city and port-town of Andalusia in Spain, situated on the north-west end of the island of Leon, or Lyon, opposite to Port St Mary on the continent, about sixty miles south-west of Seville, and forty north-west of Gibraltar: W. long. 6° 40, N. lat. 36° 30'.

The island it stands on is in length about eighteen miles; the south-west end is about nine broad, but the other end, where the city stands, not above two. It has a communication with the continent by means of a bridge; and, with the opposite shore, forms a bay of twelve miles long and six broad. About the middle of this bay, there are two head-lands, or promontories, one on the continent, and the other on the island, which advance so near together, that the forts upon them, called the Puntal and Matagorda, command the passage; and within these forts is the harbour, which it is impossible for an enemy to enter till he has first taken the forts.

**CADIZADELITES**, a sect of Mahometans very like the ancient stoics. They shun feasts and diversions, and affect an extraordinary gravity in all their actions; they are continually talking of God, and some of them make a jumble of Christianity and Mahometanism; they drink wine, even in the fast of the ramazan; they love and protect the Christians; they believe that Mahomet is the Holy Ghost, practise circumcision, and justify it by the example of Jesus Christ.

**CADMLA**, a metallic substance separated from the ore of zinc by fusion. See **CHEMISTRY**, *Of zinc*.

**CADORIN**, a province of Italy, in the territories of Venice, bounded by the bishopric of Brixen on the north;

north; by Friuli, on the east; by the Bellunese, on the south; and by the Trentin, on the west.

**CADRITES**, a sort of Mahometan friars, who once a-week spend great part of the night in turning round, holding each other's hand, and repeating incessantly the word *hzi*, which signifies living, and is one of the attributes of God; during which one of them plays on a flute. They never cut their hair, nor cover their heads, and always go bare footed; they have liberty to quit their convent when they please, and to marry.

**CADSAND**, an island on the coast of Dutch Flanders, situated at the mouth of the Scheld, whereby the Dutch command the navigation of that river.

**CADUCEUS**, in antiquity, Mercury's rod, or sceptre, being a wand entwisted by two serpents, borne by that deity, as the ensign of his quality and office, given him, according to the fable, by Apollo, for his seven-stringed harp.

Wonderful properties are ascribed to this rod by the poets, as laying men asleep, raising the dead, &c. It is used also as a symbol of peace. The caduceus, as found on some medals, is a common symbol, signifying good conduct, peace, and prosperity.

**CADUS**, in antiquity, a wine-vessel of a certain capacity, containing eighty amphoræ, or firkins, each of which, according to the best accounts, held nine gallons.

**CÆCILIA**, in zoology, a genus of serpents belonging to the amphibia class. The cæcilia has no scales; it is smooth, and moves by means of lateral rugæ or prickles. The upper lip is prominent, and furnished with two tentacula. It has no tail. There are but two species of this serpent, viz. 1. The tentaculata, has 135 rugæ. It is about a foot long and an inch in circumference, preserving an uniform cylindrical shape from the one end to the other. The teeth are very small. It has such a resemblance to an eel, that it may easily be mistaken for one; but as it has neither fins nor gills, it cannot be classed with the fishes. It is a native of America, and its bite is not poisonous. 2. The glutinosa has 340 rugæ or prickles above and ten below the anus. It is of a brownish colour, with a white line on the side, and is a native of the Indies.

**CÆCUM**, or **CŒCUM**, in anatomy, the blind-gut. See p. 260. col. 2.

**CÆMENT**, in a general sense, any glutinous substance, capable of uniting and keeping things together in close cohesion: in this sense, under cæment, are comprehended mortar, folder, glue, &c. but, strictly speaking, the term cæment only denotes a glutinous composition, used in cementing broken glasses, china-ware, or earthen-ware.

One of the finest, and at the same time strongest cæment for this purpose, is the juice of garlic stamped in a stone mortar: this, if the operation is done with care, leaves little or no mark. Another cæment is made by beating the white of an egg very clear, and mixing with it fine powdered quick-lime: or using glass, powdered chalk, and a little lime may be mixed together,

VOL. II. Numb. 30.

3

ther, and dissolved in fair water. With these, the glasses, &c. are to be cemented, and then set in the shade to dry; a caution which should always be observed, whichever of the above cæments is used.

A cæment for cracked chemical glasses, that will stand the fire, may be thus prepared: take wheat-flour, fine powdered Venice glass, and pulverized chalk, or each an equal quantity; of fine brick-dust, one half of the said quantity; and a little scraped lint: mix them all together with the whites of eggs; then, spreading this mixture upon a linen cloth, apply it to the cracks of the glasses, which must be well dried before they are used. Old varnish is another cæment that will answer the same purpose.

**CÆMENT**, among builders, a strong sort of mortar, used to bind bricks or stones together for some kind of mouldings; or in cementing a block of bricks for the carving of capitals, scrolls, or the like. There are two sorts, 1. Hot cæment, which is the most common, made of resin, bees-wax, brick-dust, and chalk, boiled together. The bricks to be cemented with this kind, must be made hot with the fire, and rubbed to and fro after the cæment is spread, in the same manner as joiners do when they glue two boards together. 2. Cold cæment, made of Cheshire-cheese, milk, quick-lime, and whites of eggs. This cæment is less used than the former, and is accounted a secret known but to few bricklayers.

**CÆMENT**, among engravers, jewellers, &c. a composition of fine brick-dust well sifted, resin, and bees-wax, in use among these artificers to keep the metals to be engraven or wrought on firm to the block; and also to fill up what is to be chiselled.

**CÆMENT**, in chemistry, a kind of menstruum compounded of salts, sulphurs, and brick, reduced to dry powders, and strewed betwixt plates of metal, in order to raise their colour, or separate one metal from another. See **CHEMISTRY**.

**CÆMENT-POTS**, or those used in the cæmentation of metals, are made of fine potter's clay, and that either pure, or mixed with sand in different proportions.

**CÆMENTATION**, in a general sense, the corroding of metals in a dry form, by means of the fumes of acid salts. See **CHEMISTRY**, Part II.

**CÆN**, the capital of a county of the same name in Normandy, situated on the river Orne, about seventy-five miles west of Rouen, and thirty south-west of Havre de Grace: W. long. 25°, N. lat. 49° 20'.

It has an university, first founded by king Henry VI. of England, in 1431.

**CÆRFILLY**, a town of Glamorganshire, about five miles north of Llandaff: W. long. 3° 15', and N. lat. 51° 35'.

**CÆRITES**, or **CÆRITUM TABULÆ**, in Roman antiquity, tables or registers in which the names of the Cærites were registered. The people of Cære were accounted citizens of Rome, but had no privilege of voting; hence when a Roman citizen was degraded, if a senator, he was expelled the senate; if a knight, he lost the public horse; and if a plebeian, his name was inserted in the register of the Cærites; that is, he

†

B

was

was subject to all taxes, but incapable of voting or enjoying any public office.

**CAERLEON**, a market-town of Monmouthshire, situated on the river Uske, about sixteen miles south-west of Monmouth: W. long. 3°, N. lat. 51° 40'.

**CAERMARTHEN**, the capital of Caermarthenshire in Wales, situated upon the river Tivy, about five miles from the sea.

**CAERNARVAN**, the chief town of Caernarvanshire in Wales, situated upon the river Menay.

**CAERWIS**, a market-town in Flintshire, in north Wales, about five miles east of St Asaph, and four west of Flint: W. long. 3° 25', N. lat. 53° 20'.

**CÆSALPINIA**, in botany, a genus of the decandria monogynia class. The calix has five segments, the lowest of which is largest; the corolla consists of five petals; the capsule is of the pod kind. There are four species, all natives of the Indies.

**CÆSALPINOIDES**, in botany, a synonyme of the *gleditsia*. See **GLEDITSIA**.

**CÆSAR**, in Roman antiquity, a title borne by all the emperors, from Julius Cæsar, to the destruction of the empire. It was also used as a title of distinction, for the intended or presumptive heir of the empire, as King of the Romans is now used for that of the German empire.

This title took its rise from the surname of the first emperor, C. Julius Cæsar, which, by a decree of the senate, all the succeeding emperors were to bear. Under his successor, the appellation of Augustus being appropriated to the emperors, in compliment to that prince, the title Cæsar was given to the second person in the empire, though still it continued to be given to the first; and hence the difference betwixt Cæsar used simply, and Cæsar with the addition of Emperor Augustus.

The dignity of Cæsar remained the second of the empire, till Alexius Comnenus having elected Nicephorus Melissenus Cæsar, by contract; and it being necessary to confer some higher dignity on his own brother Isaacus, he created him Sebastocrator, with the precedency over Melissenus; ordering, that in all acclamations, &c. Isaacus Sebastocrator should be named the second, and Melissenus Cæsar, the third.

**CÆSARIAN** operation, in midwifery. See **MIDWIFERY**.

**CÆSARIANS**, *cæsarienses*, in Roman antiquity, were officers or ministers of the Roman emperors: They kept the account of the revenues of the emperors, and took possession, in their name, of such things as devolved, or were confiscated to them.

**CÆSTUS**, in antiquity, a large gantlet made of raw hide, which the wrestlers made use of when they fought at the public games.

This was a kind of leathern strap, strengthened with lead, or plates of iron, which encompassed the hand, the wrist, and a part of the arm, as well to defend these parts, as to enforce their blows.

**CÆSTUS**, or **CÆSTUM**, was also a kind of girdle, made of wool, which the husband untied for his spouse the first day of marriage, before they went to bed.

This relates to Venus's girdle, which Juno borrowed of her, to entice Jupiter to love her. See **CÆSTUS**.

**CÆSURA**, in the ancient poetry, is, when, in the scanning of a verse, a word is divided so, as one part seems cut off, and goes to a different foot from the rest; as,

*Mentis* *ri* *nolli*, *numquam* *men* *dacia* *profunt*.

where the syllables *ri*, *li*, *quam*, and *men*, are cæsuras.

**CÆSURE**, in the modern poetry, denotes a rest, or pause, towards the middle of an Alexandrian verse, by which the voice and pronunciation are aided, and the verse, as it were, divided into two hemistichs. See **PAUSE**.

**CAFFA**, in commerce, painted cotton-cloths manufactured in the E. Indies, and sold at Bengal.

**CAFFA**, or **KAFFA**, a city and port-town of Crim Tartary, situated on the south-east part of that peninsula: E. long. 37°, N. lat. 44° 55'.

It is the most considerable town in the country, and gives name to the straits of Caffa, which run from the Euxine or Black sea, to the Palus Meotis, or sea of Azoph.

**CAFFILA**, a company of merchants or travellers, who join together in order to go with more security thro' the dominions of the Grand Mogul, and through other countries on the continent of the E. Indies.

The Caffila differs from a caravan, at least in Persia; for the caffila belongs properly to some sovereign, or to some powerful company in Europe; whereas a caravan is a company of particular merchants, each trading upon his own account. The English and Dutch have each of them their caffila at Gambroon.

**CAFFILA** on the coast of Guzerat or Cambaya, signifies a small fleet of merchant-ships.

**CAFFRARIA**, the country of the Caffers, or Hottentots, in the most southerly part of Africa, lying in the form of a crescent about the inland country of Monomotapa, between 35° S. lat. and the tropic of Capricorn; and bounded on the east, south, and west, by the Indian and Atlantic oceans.

Most of the sea-coasts of this country are subject to the Dutch, who have built a fort near the most southern promontory, called the Cape of Good-Hope.

**CAG**, or **KEG**, a barrel or vessel, that contains from four to five gallons.

**CAGE**, an inclosure made of wire, wicker, or the like, interwoven lattice-wise, for the confinement of birds, or wild beasts.

The cage, in the Roman amphitheatres, was a place wherein savage animals were confined. It was inclosed with iron rails, and open at top, so as to be seen to the bottom by the spectators.

**CAGLI**, a town of the province of Urbino, in the pope's territories, about twenty-five miles south of the city of Urbino: E. long. 14°, N. lat. 43° 15'.

**CAGLIARI**, the capital of the island of Sardinia, situated on a bay of the sea in the southern part of that island: E. long. 9° 12', N. lat. 39°.

**CAGUI**, in zoology, a synonyme of two species of monkey, viz. the jacchus and ædipus. See **SIMIA**.

**CAHERAH**,

**CAHERAH**, or **AL-CAHERAH**, the capital of Egypt, which we call Grand Cairo. See **CAIRO**.

**CAHLO**, the name by which some call the lupus piscis or wolf-fish.

**CAHORS**, the capital of the territory of Querci, in the province of Guienne in France, situated about forty-five miles north of Tholouse: E. long. 1°, N. lat. 44° 25'.

It is the see of a bishop, and has an university.

**CAHYS**, a dry measure for corn, used in some parts of Spain, particularly at Seville and at Cadiz. It is near a bushel of our measure.

**CAJANABURG**, the capital of the province of Cajania, or east Bothnia in Sweden, situated on the north-east part of the lake Cajania, about three hundred miles north-east of Abo: E. long. 27°, N. lat. 63° 50'.

**CAJAZZO**, a town of the province of Lavoro in the kingdom of Naples, situated about sixteen miles north-east of the city of Naples: E. long. 15°, N. lat. 41° 15'.

**CAJEPUT**, an oil brought from the E. Indies, which resembles that of cardamoms.

**CAIFUM**, a city of China, situated in the province of Honan, on the river Croceus, three hundred and fifty miles north-west of Nanking: E. long. 113° 30', and N. lat. 35°.

**CAIMACAN**, or **CAIMACAN**, in the Turkish affairs, a dignity in the Ottoman empire, answering to lieutenant, or rather deputy, among us.

There are usually two caimacans, one residing at Constantinople, as governor thereof; the other attending the grand vizir, in quality of his lieutenant, secretary of state, and first minister of his council; and gives audience to ambassadors. Sometimes there is a third caimacan, who attends the sultan; whom he acquaints with any public disturbances, and receives his orders concerning them.

**CAIMAN**, or **CAIMAN-ISLANDS**, certain American islands lying south of Cuba, and north-west of Jamaica, between 81° and 86° of W. long. and in 21° of N. lat.

They are most remarkable on account of the fishery of tortoise, which the people of Jamaica catch here; and carry home alive, keeping them in pens for food, and killing them as they want them.

**CAINIANS**, or **CAINITES**, in church-history, Christian heretics, that sprung up about the year 150, and took their name from Cain, whom they looked upon as their head and father: They said, that he was formed by a celestial and almighty power, and that Abel was made but by a weak one.

This sect adopted all that was impure in the heresy of the gnostics, and other heretics of those times: They acknowledged a power superior to that of the Creator; the former they called *Wisdom*, the latter, *Inferior Virtue*: They had a particular veneration for Korah, Abiram, Esau, Lot, the Sodomites, and especially Judas, because his treachery occasioned the death of Jesus Christ: They even made use of a gospel, which bore that false apostle's name.

**CAINITO**, in botany. See **CHRYSORHYLLUM**.

**CAIRO**, or **GRAND CAIRO**, the capital of Egypt, situated in a plain at the foot of a mountain, about two miles east of the Nile, and 100 miles south of the mouth of that river: E. long. 32°, N. lat. 30°.

The town is ten miles in circumference, and full of inhabitants. The castle stands on the summit of a hill, at the south end of the town, and is three miles round. The British and other European states have their consuls and factors here, for the protection of trade.

**CAIROAN**, a town of the kingdom of Tunis in Africa, situated on the river Magrida, about eighty miles south of Tunis: E. long. 9°, N. lat. 36°.

**CAINS**, a name given to the Greeks in the isle of Crete, who revolt from the Turks to the Venetians.

**CAISSON**, in the military art, a wooden chest, into which several bombs are put, and sometimes only filled with gun-powder: This is buried under some work whereof the enemy intends to possess themselves, and, when they are masters of it, is fired, in order to blow them up.

**CAISSON** is also used for a wooden frame or chest, used in laying the foundations of the piers of a bridge.

**CAITHNESS**. See **CATHNESS**.

**CAKILE**, in botany. See **BUNIAS**.

**CALABA**, in botany. See **CALOPHYLLUM**.

**CALABASH-tree**, in botany. See **CRESCENTIA**.

**CALABRIA**, the most southerly part of the kingdom of Naples, situated over against Sicily.

There are two provinces of Calabria called the *Hither*, and *Farther Calabria*, with respect to the city of Naples; Cosenza being the capital of the former, and Rheggio of the latter.

**CALADE**, in the menage, the descent or sloping declivity of a rising menage ground, being a small eminence upon which we ride down a horse several times, putting him to a short gallop, with his fore-hams in the air, to make him learn to ply or bend his haunches, and form his stop upon the aids of the calves of the legs, the stay of the bridle, and the cavesson seasonably given.

**CALAHORRA**, a city of Old Castile in Spain, situated on the river Ebro, near the confines of Navarre, about sixty miles north-west of Saragossa: W. long. 2°, N. lat. 42° 20'.

**CALAIS**, a port-town of Picardy in France, situated on the English channel, about twenty-two miles south-east of Dover: E. long. 2°, N. lat. 51°.

**CALAMANCO**, a sort of woollen stuff manufactured in England and in Brabant. It has a fine gloss, and is cleaved in the warp, whence the checks appear only on the right side. Some calamanços are quite plain, others have broad stripes adorned with flowers; some with plain broad stripes, some with narrow stripes, and others watered.

**CALAMINARIS**, or **LAPIS CALAMINARIS**, in natural history, a kind of fossil, the general ore of zinc, of a spongy substance and a lax and cavernous texture, yet considerably heavy.

It is of no determinate shape or size, but is found in masses of a very various and irregular figure. It is, when

when most pure and perfect, of a pale brownish grey. It is found in Germany, Saxony, Bohemia, and England. See *CHEMISTRY, Of zinc*.

After roasting the calamine, in order to purge it of sulphureous or arsenical matter, it is used by physicians in collyria against defluxions of thin acrid humours upon the eyes, for drying up moist running ulcers, and healing excoriations.

**CALAMINT**, in botany. See *MELISSA*, and *MENTHA*.

**CALAMITA**, in natural history, a name given to sty-rax. See *STYRAX*.

**CALAMITA** is sometimes also used for the magnet or load-stone.

**CALAMITES**. See *OSTEOCOLLA*.

**CALAMUS**, in botany, a genus of the hexandria monogynia class. The calix has six leaves; it has no corolla; the berry is imbricated, and contains but one seed. There is but one species, viz. the rotang, a native of India.

**CALAMUS aromaticus**, or sweet-scented flag, in the materia medica, a species of flag called acorus by Linnaeus. See *ACORUS*. The root is generally looked upon as a carminative and stomachic medicine, and as such is sometimes used in practice.

**CALAMUS scriptorius**, in antiquity, a reed or rush to write with.

The ancients made use of styles to write on tables covered with wax; and of reed, or rush, to write on parchment, or Egyptian paper.

**CALANGAY**, in ornithology. See *PSITTACUS*.

**CALASH**, or **CALESH**, a light and very low kind of chariot, used chiefly for taking the air in parks and gardens.

**CALASIRIS**, in antiquity, a linen tunic fringed at the bottom, and worn by the Egyptians under a white woolen garment; but this last they were obliged to pull off when they entered the temples, being only allowed to appear then in linen habits.

**CALATAJUD**, a city of Aragon, in Spain, situated on the river Xalo, about fifty miles west of Saragossa: W. long.  $2^{\circ} 5'$ , N. lat.  $41^{\circ} 15'$ .

**CALATHUS**, in antiquity, a basket, hamper, or panier of osiers, reeds, or twigs, for women to put their work in, or to gather flowers in.

**CALATHUS** was also a vessel, or pan, for cheese-curd and milk; also the name of a cup for wine, used in sacrifices.

**CALATOR**, in antiquity, was a public servant, and a freeman, such as a bailiff or crier, a sumner, to summon courts, synods, and other public assemblies.

**CALATRAVA**, a city of new Castile, in Spain, situated on the river Guadiana, forty-five miles south of Toledo: W. long.  $4^{\circ} 20'$ , N. lat.  $39^{\circ}$ .

*Knights of CALATRAVA*, a military order in Spain, instituted under Sancho III. king of Castile, upon the following occasion. When that prince took the strong fort of Calatrava from the moors of Andalusia, he gave it to the templars, who, wanting courage to defend it, returned it him again. Then Don Raymond, of the order of the Cistercians, accompanied with several

persons of quality, made an offer to defend the place, which the king thereupon delivered up to them, and instituted that order. It increased so much under the reign of Alphonso, that the knights desired they might have a grand master, which was granted. Ferdinand and Isabella afterwards, with the consent of pope Innocent VIII. reunited the grand mastership of Calatrava to the Spanish crown; so that the kings of Spain are now become perpetual administrators thereof.

The knights of Calatrava bear a cross gules, surcharged with green, &c. their rule and habit was originally that of the Cistercians.

**CALCADA**, or **St DOMINGO DE CALCADA**, a city of Old Castile, in Spain, forty-eight miles east of Burgos: W. long.  $3^{\circ}$ , N. lat.  $42^{\circ} 36'$ .

**CALCANEUM**, or **OS CALCIS**, in anatomy. See p. 186. col. 1.

**CALCAR**, in zoology, the trivial name of a species of nautilus. See *NAUTILOS*.

**CALCAR**, in glass-making, a sort of oven, or reverberatory furnace, in which, being well heated, the crystal frit, or bollito, is made.

**CALCAR**, in geography, a town of the duchy of Cleves, and circle of Westphalia, in Germany: E. long.  $5^{\circ} 50'$ , and N. lat.  $51^{\circ} 45'$ .

**CALCARIOUS**, in general, denotes something belonging to, or partaking of the nature of calx. See *CALX*.

**CALCARIUS lapis**, in natural history, the same with lime-stone. See *LIME*.

**CALCEARIUM**, in antiquity, a term used to denote the allowance made the soldiers to buy their shoes.

**CALCEOLUS**, in botany. See *CYPRIPEDIUM*.

**CALCINATION**, in chemistry, the reducing of substances to a calx by fire. See *CHEMISTRY*.

**CALCITRAPA**, and **CALCITRAPOIDES**, in botany. See *CENTAUREA*.

**CALCULUS**, in natural history, properly denotes a little stone or pebble. See *PEBBLE*.

**CALCULUS**, or **CALCULUS HUMANUS**, in medicine, the stone in the bladder or kidneys. See *MEDICINE*, and *SURGERY*.

**CALCULUS** also denotes a method of computation, so called from the calculi, or counters, anciently used for this purpose. Hence,

**CALCULUS SPECIALIS**, or **LITERALIS**, is the same with algebra. See *ALGEBRA*.

**CALCULUS differentialis** is a method of differencing quantities, that is, of finding an infinitely small quantity, which being taken an infinite number of times, shall be equal to a given quantity. See *FLUXIONS*.

**CALCULUS exponentialis**, among mathematicians, a method of differencing exponential quantities, and summing up the differentials of exponential quantities. See *FLUXIONS*.

**CALCULUS INTEGRALIS**, or **SUMMATORIUS**, is a method of summing up differential quantities; that is, from a differential quantity given, to find the quantity from whose differencing the given differential results. See *FLUXIONS*.

**CALDARIUM**, in the ancient baths, a certain vault,

or

or room, made so as to collect the vapours, and produce sweating : whence it signifies a hot-house, bagnio, stove, or sweating-room.

**CALEFACTION**, the production of heat in a body from the action of fire, or that impulse impressed by a hot body upon other bodies about it. This word is used in pharmacy, by way of distinction from coction, which implies boiling ; whereas calefaction is only heating a thing.

**CALENBURG-CASTLE**, the capital of a duchy of the same name, in Lower Saxony, in Germany, situated upon the river Leine, about fifteen miles south of Hanover : E. long.  $9^{\circ} 40'$ , and N. lat.  $52^{\circ} 20'$ .

**CALENDAR**, a distribution of time, accommodated to the various uses of life, but more especially such as regard civil and ecclesiastical polity. See **ASTRONOMY**, *Of the division of time*.

**Julian Christian CALENDAR**. See **ASTRONOMY**, *Of the division of time*.

**Gregorian CALENDAR**. See **ASTRONOMY**, *Of the division of time*.

**CALENDER**, a machine used in manufactories, to press certain woollen and silken stuffs, and linens, to make them smooth, even, and glossy, or to give them waves, or water them, as may be seen in mohairs and tabbies. This instrument is composed of two thick cylinders, or rollers, of very hard and polished wood, round which the stuffs to be calendered are wound : these rollers are placed cross-ways between two very thick boards, the lower serving as a fixed base, and the upper moveable, by means of a thick screw, with a rope fastened to a spindle, which makes its axis : the uppermost board is loaded with large stones weighing 20000 lb. or more. It is this weight that gives the polish and makes the waves on the stuffs about the rollers, by means of a shallow indenture or engraving cut in it.

**CALENDS**, in Roman antiquity, the first day of each month, so called from the Greek [*kalein*], to proclaim : it being customary, on those days, to proclaim the number of holy-days in each month.

The Roman method of reckoning the days of their months has something extremely singular in it : instead of computing forwards, in the natural order of the numbers 1, 2, 3, &c. they reckoned backwards, in the manner expressed in the following verses :

*Prima dies mensis cujusque est dicta calendæ :  
Sex Maius, nonas, Julius, October, & Mars ;  
Quatuor at reliqui : habet idus quilibet octo ;  
Inde dies reliquos omnes dic esse calendæ ;  
Quas retro numerans, dices a mense sequente.*

Hence to find the day of our month answering to that of the calends, to the number of days in the preceding month add two, and from this sum subtracting the number of calends given, the remainder will be the day of our month : thus the fourth of the calends of June is found to answer to the twenty-ninth of May ; and so in other cases.

**CALENDULA**, or **MARYGOLD**, in botany, a genus of the Syngenesia polygamia necessaria class. The receptacle is naked ; it has no pappus ; the calix con-

sists of many equal leaves ; the seeds of the disk are membranaceous. There are eight species, none of them natives of Europe. The flowers of the calendula officinalis, or garden marygold, are said to be aperient and attenuating, as also cordiac, alexipharmic, and sudorific. They are principally celebrated in uterine obstructions, and for throwing out the small pox.

**CALF**, in zoology, the young of the ox-kind. See **Bos**.

Among sportsmen, the term calf is used for a hart or hind of the first year : the same term is also used for the young of the whale.

**Sea CALF**. See **PHOCA**.

**CALF's-snout**, in botany. See **ANTIRRHINUM**.

**CALIACA**, a town of Bulgaria, situated upon the Black-sea, belonging to the Turks.

**CALIBER**, or **CALIFER**, properly denotes the diameter of any body : thus we say, two columns of the same caliber, the caliber of the bore of a gun, the caliber of a bullet, &c.

**CALIBER-compasses**, the name of an instrument, made either of wood, iron, steel, or brass : that used for measuring bullets consists of two branches, bending inwards, with a tongue fixed to one of them ; and the other graduated in such a manner, that if the bullet be compressed by the ends of the two branches, and the tongue be applied to the graduated branch, it will shew the weight of the bullet.

**CALIBER** also signifies an instrument used by carpenters, joiners, and bricklayers, to see whether their work be well squared.

**CALICUT**, a town situated on the Malabar coast, in the hither peninsula of India, subject to its own prince : E. long.  $75^{\circ}$ , and N. lat.  $11^{\circ} 20'$ .

This was the first port the Portuguese made in India, after sailing round the Cape of Good Hope.

**CALIDUCT**, in antiquity, a kind of pipes, or canals, disposed along the walls of houses and apartments, used, by the ancients, for conveying heat to several remote parts of the house, from one common furnace.

**CALIFORNIA**. See **CALLIFORNIA**.

**CALIMUS**. See **CALLIMUS**.

**CALIN**, a compound metal, whereof the Chinese make tea-canisters, and the like. The ingredients seem to be lead and tin.

**CALIPH**, the supreme ecclesiastical dignity among the Saracens ; or, as it is otherwise defined, a sovereign dignity among the Mahometans, vested with absolute authority in all matters relating both to religion and policy.

It signifies in the Arabic, successor or vicar : the Saracen princes assumed this title as descendants from Mahomet ; the caliphs bearing the same relation to Mahomet, that the popes pretend they do to Jesus Christ or St Peter. It is at this day one of the grand signior's titles, as successor of Mahomet ; and of the sophi of Persia, as successor of Ali.

**CALIPPIC PERIOD**, an improvement of the cycle of Meton, of nineteen years, which Calippus, a famous Grecian astronomer, finding in reality to contain nine-

teen of Nabonassar's years, four days, and  $\frac{1}{11}$ , he, to avoid fractions, quadrupled the golden number, and by that means made a new cycle of seventy-six years; which time being expired, he supposed the lunation, or changes of the moon, would happen on the same day of the month, and hour of the day, that they were on seventy-six years before.

**CALIX.** See **CALYX**.

**CALIXTINS**, in church-history, a sect of Christians, in Bohemia and Moravia: the principal point in which they differed from the church, was the use of the chalice, or communicating in both kinds.

**CALIXTINS**, is also a name given to those, among the Lutherans, who follow the sentiments of George Calixtus, a celebrated divine, who opposed the opinion of St Augustine, on predestination, grace, and free-will.

**CALKA**, a kingdom of Tartary, in Asia, to the east of Siberia.

**CALKING.** See **CAULKING**.

**CALKINS**, the prominent parts at the extremities of a horse-shoe, bent downwards, and forged to a sort of point.

Calkins are apt to make horses trip; they also occasion blymes, and ruin the back sinews. If fashioned in form of a hare's ear, and the horn of a horse's heel be pared a little low, they do little damage; whereas the great square calkins quite spoil the foot.

Calkins are either single or double, that is, at one end of the shoe, or at both: these last are deemed less hurtful, as the horse can tread more even.

**CALL**, among hunters, a lesson blown upon the horn, to comfort the hounds.

**CALLS**, *natural and artificial*, among fowlers, a sport much practised during the wooing season of partridges, especially for taking cock-partridges; for which they put a hen into a cage, to call and bring them near. The hen-partridge should be set near a hedge, in a thin, open, wire-cage, so that she may be seen at a good distance: then the net, called hallier, should be placed quite round the cage, each part about the distance of twenty feet: the fowler should retire behind the hedge.

*Artificial CALLS* are best made of box, walnut-tree, or the like: they are formed of the bigness of an hen's egg, bored through from end to end; about the middle there must be a hole hollowed within, to the bottom; then have a pipe of a swan's quill, and the bone of a cat's foot, opened at one end, which must be conveyed into the hole at the end, and so thrust into the hole at the middle; take afterwards a goose-quill, opened at both ends, and put it in at the other end of the call; blow into the quill, and it will make the like noise as the partridge-cock does.

**CALLA**, in botany, a genus of the gynandria polyandria class. The spathe is plain; the spadix is covered with stamules; it has no corolla; the berry contains many seeds. There are three species, none of them natives of Britain.

**CALLABAS**, a town of Indostan in Asia, upon the road from Surat to Agra.

**CALLAO**, a port-town in a little island on the coast of

Pern, in South America, opposite to Lima: W. long  $76^{\circ}$ , and S. lat.  $12^{\circ}$ .

**CALLEN**, a town of Ireland, in the county of Kilkenny, and province of Leinster, about ten miles south-west of Kilkenny: W. long.  $7^{\circ} 22'$ , and N. lat.  $52^{\circ} 25'$ .

**CALLICHTYS**, in ichthyology, the trivial name of a species of silurus. See **SILURUS**.

**CALLICO**, in commerce, a kind of linen manufacture, made of cotton, chiefly in the East Indies, some of which are painted with various flowers of different colours; and others that are never dyed, having a stripe of gold and silver quite through the piece; and at each end they fix a tulle of gold, silver, and silk, intermixed with flowers. This manufacture is brought hither by the East-India company, and is re-exported by merchants to other parts of Europe. The general wear of stained or printed India calicoes in this nation having become a general grievance, and occasioning unspeakable distress upon our own manufacturers, they were prohibited by stat. 7 Geo. I. cap. vii.

**CALLIDRYS**, in ornithology, the trivial name of a species of motacilla. See **MOTACILLA**.

**CALLIFORNIA**, a large country of the West Indies, lying between  $116^{\circ}$  and  $138^{\circ}$  W. long. and between  $23^{\circ}$  and  $46^{\circ}$  N. lat. It is uncertain whether it be a peninsula or an island.

**CALLIGONUM**, in botany, a genus of the polyandria digynia class. The calyx has five leaves; the petals are four; it has two styli; and the capsule is divided into two partitions, each containing two seeds. There is but one species, viz. the polygonoides, a native of mount Ararat.

**CALLIGRAPHUS**, in antiquity, a copist or scrivener, who transcribed, in a fair hand, what the notaries had taken down in notes, or minutes, being generally in a kind of cypher or short-hand, which, as they were in that hand, being understood by few, were copied over fair and at length by persons who had a good hand, for sale, &c.

**CALLING the house**, in the British parliament, is the calling over the members names, every one answering to his own, and going out of the house, in the order in which he is called: this they do, in order to discover whether there be any persons there not returned by the clerk of the crown; or if any member be absent without leave of the house.

**CALLIONYMUS**, in ichthyology, a genus of fishes belonging to the order of jugulares. The upper lip is doubled up; the eyes are very near each other; the membrane of the gills has six radii; the operculum is shut; the body is naked; and the belly-fins are at a great distance from each other. There are three species of callionymus, viz. 1. The lyra, with the first bone of the back-fin as long as the body of the animal, and a cirrus at the anus. It is of the Atlantic. 2. The dracunculus, with the first bone of the back-fin shorter than its body; which is of a spotted yellow colour. It frequents the shores of Genoa and Rome. 3. The indicus, has a smooth head with longitudinal wrinkles; the lower jaw is a little longer than the upper

per one; the tongue is obtuse and emarginated; the apertures of the gills are large: it is of a livid colour, and the anus is in the middle of the body. It is a native of Asia.

**CALLISTEA**, in Grecian antiquity, a Lesbian festival, wherein the women presented themselves in Juno's temple, and the prize was assigned to the fairest. There was another of these contentions at the festival of Ceres Eleusinia, among the Parrhasians, and another among the Eleans, where the most beautiful man was presented with a complete suit of armour, which he consecrated to Minerva, to whose temple he walked in procession, being accompanied with his friends, who adorned him with ribbands, and crowned him with a garland of myrtle.

**CALLOSUM corpus**, in anatomy. See p 285. c. 2.

**CALLUS**, or **CALLOSITY**, in a general sense, any cutaneous, corneous, or osseous hardness, whether natural or preternatural: but most frequently it means the callus generated about the edges of a fracture, provided by nature to preserve the fractured bones, or divided parts, in the situation in which they are replaced by the surgeon.

**CALM**, in the sea language, is when there is no wind stirring.

That tract of sea, to the northward of the equator, between  $4^{\circ}$  and  $10^{\circ}$  of latitude, lying between the meridians of Cape Verde, and of the easternmost island of that name, seems to be a place condemned to perpetual calms: the little winds that are being only some sudden uncertain gusts of very small continuance, and less extent. The Atlantic ocean, near the equator, is very much subject, nay, always attended with these calms.

**CALMAR**, the capital of the province of Gothland, in Sweden, situated on the coast of the Baltic sea, about forty miles north of Carelskroon: E. long  $16^{\circ}$ , and N. lat.  $56^{\circ} 40'$ .

**CALMUCKS**, certain wandering tribes or hords of Tartars, inhabiting the country north of the Caspian sea, under the protection of Russia.

**CALNE**, a borough-town of Wiltshire, about twenty miles north of Salisbury, which sends two members to parliament: W. long.  $2^{\circ}$ , and N. lat.  $51^{\circ} 30'$ .

**CALOGERI**, in church-history, monks of the Greek church, divided into three degrees, the novices, called archari; the ordinary professed, called michrochemi; and the more perfect, called megalochemi: they are likewise divided into cœnobites, anchorets, and recluses. The cœnobites are employed in reciting their office from midnight to sun-set; they are obliged to make three genuflexions at the door of the choir, and returning, to bow to the right and to the left, to their brethren. The anchorets retire from the conversation of the world, and live in hermitages, in the neighbourhood of the monasteries; they cultivate a little spot of ground, and never go out but on Sundays and holy-days, to perform their devotions at the next monastery. As for the recluse, they shut themselves up in grottos and caverns, on the tops of mountains, which they never go out of, abandoning themselves

entirely to Providence: They live on the alms sent them by the neighbouring monasteries.

**CALOMEL**, or dulcified sublimate of mercury, is prepared in the following manner. Take of corrosive sublimate, one pound; purified quick silver, nine ounces. Having powdered the sublimate, add to it the quick-silver, and digest them together in a matrafs, with a gentle sand heat, until they unite; then increasing the heat, let the mixture be sublimed. The sublimed matter, freed from the acrimonious part at top and such mercurial globules as happen to appear distinct in it, is to be reduced into powder, and sublimed again; and this sublimation must be repeated six times. This dulcified mercury, or calomel, is one of the best preparations for general use. The dose, for raising a salivation, is ten or fifteen grains, taken in the form of a bolus, or pills, every night or oftener, till the ptyalism begins. As an alterant and diaphoretic, it is given in doses of five or six grains, a purgative being occasionally interposed, to prevent its affecting the mouth. It answers however much better when given in smaller quantities, as one, two, or three grains every morning and evening, in conjunction with such substances as determine its action to the skin, as the extract or resin of guaiacum; the patient at the same time keeping warm, and drinking freely of warm diluting liquors. By this method of managing it, obdurate, cutaneous, and venereal distempers have been successfully cured, without any remarkable increase of the sensible evacuations.

**CALOPHYLLUM**, in botany, a genus of the polyandria monogynia class. The corolla consists of five petals; the calix has five teeth; and the drupa is globular. There are but two species, viz. the inophyllum, and calaba, both natives of India.

**CALOTTE**, a cap or coif of hair, satin, or other stuff: an ecclesiastical ornament in most popish countries. See CAP.

**CALOTTE**, in architecture, a round cavity or depression, in form of a cap or cup, lathed and plastered, used to diminish the rise or elevation of a moderate chapel, cabinet, alcove, &c. which, without such an expedient, would be too high for other pieces of the apartment.

**CALPE**, the mountain, at the foot of which, towards the sea, Gibraltar stands. It is half a league in height towards the land, and so steep, that there is no approaching it on that side.

**CALQUING**, or **CALKING**, a term used in painting, &c. where the backside of any design is covered with a black or red colour, and the strokes, or lines, traced through, on a waxed plate, wall, or other matter, by passing lightly over each stroke of the design with a point, which leaves an impression of the colour on the plate or wall.

**CALTHA**, in botany, a genus of the polyandria polygynia class. It has no calix; there are five petals; and the capsules are many, containing a great number of seeds. There is but one species, viz. the palustris, or marsh-marygold, a native of Britain.

**CALTROP**, in botany, the English name of the tribulus. See TRIBULUS.

**CALVARIA**,

**CALVARIA**, in anatomy, the hairy scalp. See p. 151.

**CALVARY**, in heraldry, a cross so called, because it resembles the cross on which our Saviour suffered. It is always set upon steps.

**CALVI**, a town of the province of Lavoro, in the kingdom of Naples, situated near the sea, about fifteen miles north of the city of Naples: E. long.  $14^{\circ} 45'$ , and N. lat.  $41^{\circ} 15'$ .

**CALVI** is also the name of a sea-port in the island of Corsica, situated on a bay, on the west side of the island, about forty miles south-west of Bastia: E. long.  $9^{\circ} 5'$ , and N. lat.  $42^{\circ} 16'$ .

**CALVINISTS**, in church-history, those who follow the opinions of John Calvin, one of the principal reformers of the church, in the XVIth century, a person of great parts and industry, and of considerable learning; whose doctrine still subsists in its greatest purity at Geneva, where it was first broached, and from whence it was propagated. This is the prevailing religion of the United Provinces. In England, it is confined among the dissenters; and, in Scotland, it is the only orthodox faith.

The Calvinists are great advocates for the absoluteness of God's decrees, and hold that election and reprobation depend on the mere will of God, without any regard to the merit or demerit of mankind; that he affords to the elect an irresistible grace, a faith that they cannot lose, which takes away the freedom of will, and necessitates all their actions to virtue.

The Calvinists believe that God foreknew a determinate number, whom he pitched upon to be persons, in whom he would manifest his glory; and that having thus foreknown them, he predestinated them to be holy, in order to which he gives them an irresistible grace, which makes it impossible for them to be otherwise.

**CALVITIES**, or **CALVITIUM**, in medicine, baldness, or a want of hair, particularly on the scalp, occasioned by the moisture of the head, which should feed it, being dried up, by some disease, old age, or the immoderate use of powder, &c. See **ALOPECIA**.

**CALUMET**, a symbol of peace among the Indians, in the north of America; It is made of a red stone, like our marble; the head resembles our tobacco-pipes, but larger; and is fixed on a hollow reed, to hold it for smoking: They adorn it with fine wings of several colours, and is the calumet of the sun, to whom they present it, especially if they want fair weather, or rain. This pipe is a pious and safe conduct amongst all the allies of the nation who has it given: in all embassies the ambassador carries it as an emblem of peace, and it always meets with a profound regard; for the savages are generally persuaded, that a great misfortune would befall them, if they violated the public faith of the calumet.

**CALX**, properly signifies lime, but is also used by chemists and physicians for a fine powder remaining after the calcination or corrosion of metals and other mineral substances. See **CHEMISTRY**.

**CALX antimonii**. See **CHEMISTRY**, *Of antimony*.

**CALX nativa**, in natural history, a kind of marly

earth, of a dead whitish colour, which, if thrown into water, makes a considerable bubbling and hissing noise, and has, without previous burning, the quality of making a cement like lime, or plaster of Paris.

**CALX viva**, or **QUICK-LIME**, that whereon no water has been cast, in contradistinction to lime which has been slaked by pouring water on it. See **CHEMISTRY**, *Of lime*.

**CALX**, in anatomy. See **CALCANEUM**.

**CALYCISTÆ**, an appellation given by Linnæus to those botanists who have classed plants according to the different structure of the calyx, or cup of the flower; such was Magnolius.

**CALYPTRA**, among botanists, a thin membranaceous involucre, usually of a conic figure, which covers the parts of fructification. The capsules of most of the mosses have calyptræ. See **BOTANY**.

**CALYX**, among botanists, a general term expressing the cup of a flower, or that part of a plant which surrounds and supports the other parts of the flower.

The cups of flowers are very various in their structure, and on that account distinguished by several names, as perianthium, involucre, spathe, gluma, &c. See **BOTANY**.

**CAM**, a river, anciently called Grant, which, arising in Hertfordshire, runs north-east by Cambridge, and afterwards continues its course northwards, to the isle of Ely, where it falls into the river Ouse.

**CAMÆA**, in natural history, a genus of the semipellucid gems, approaching to the onyx structure, being composed of zones, and formed on a crystalline basis; but having their zones very broad and thick, and laid alternately on one another, with no common matter between; usually less transparent, and more debased with earth, than the onyxes.

1. One species of the camæa is the dull-looking onyx, with broad black and white zones; and is the camæa of the moderns, and the Arabian onyx: This species is found in Egypt, Arabia, Persia, and the East Indies. 2. Another species of the camæa is the dull, broad-zoned, green and white camæa, or the jaspé-cameo of the Italians: It is found in the East Indies, and in some parts of America. 3. The third is the hard camæa, with broad white and chestnut-coloured veins. 4. The hard camæa, with bluish, white, and flesh-coloured broad veins, being the sardonius of Pliny's time, only brought from the East Indies.

**CAMAIEU**, a term in painting, when there is only one colour, the lights and shades being of gold, or on a golden and azure ground. It is chiefly used to represent basso-relievos.

**CAMALDULIANS**, a religious order founded by St Romauld, in a little plain, on the mount Apennine, called Camaldalia, situated in the state of Florence.

The manner of life first enjoined this order was, that they dwelt in separate cells, and met together only at the time of prayer: Some of them, during the two lents of the year, observed an inviolable silence; and others, for the space of an hundred days. On Sundays and Thursdays they fed on herbs, and the rest of the

*Fig. 3.*  
BACTRIANUS or BACTRIAN CAMEL

*Fig. 2.*  
DROMADERICUS  
or AFRICAN CAMEL

*Fig. 1.*  
BRADYPUS or SLOTH

the week only on bread and water. These constitutions were, however, a little moderated some time afterwards. This hermitage is now accounted very rich.

**CAMARA**, in botany. See **LANTANA**.

**CAMARANA**, an island of Arabia in the Red sea, situated in 15° N. lat.

**CAMBAIA**, a city of the province of Cambaia, or Guzarat, in the higher peninsula of India; it is a very large city, and had once a great trade, now removed to Surat: E. long. 72°, and N. lat. 23° 30'.

**CAMAYES**, in commerce, cotton lincens made at Bengal, at Madras, and some other places on the coast of Coromandel.

**CAMBER-beam**, among builders, a piece of timber in an edifice, cut archwise, or with an obtuse angle in the middle, commonly used in platforms, as church-leads, and on other occasions where long and strong beams are required.

**CAMBLET**, or **CAMLET**, a plain stuff, composed of a warp and woof, which is manufactured on a loom, with two treddles, as linens and flannels are.

There are camblets of several sorts, some of goat's hair, both in the warp and woof; others, in which the warp is of hair, and the woof half hair and half silk; others again, in which both the warp and the woof are of wool; and lastly, some of which the warp is of wool and the woof of thread. Some are dyed in thread, others are dyed in the piece, others are marked or mixed; some are striped, some weaved or watered, and some figured.

Camblets are proper for several uses, according to their different kinds and qualities; some serve to make garments both for men and women; some for bed-curtains; others for household-furniture, &c.

**CAMBODIA**, the capital of a kingdom of the same name in India, beyond the Ganges: E. long. 104°, N. lat. 12° 30'.

The kingdom of Cambodia extends from 9° to 15° of N. lat. being bounded by the kingdom of Laos on the north, Cochin-china on the east, the Indian ocean on the south, and by the bay of Siam on the west.

**CAMBRAY**, a city in the French Netherlands, situated on the river Schelde, near its source: E. long. 3° 15', and N. lat. 50° 15'.

It is a large and well-built city, considerable for its linen manufacture, especially cambricks, which took their name from hence.

**CAMBRICKS**, a species of very fine white linen, made of flax at Cambray.

**CAMBRIDGE**, the capital of Cambridgeshire, situated upon the river Cam, about fifty-five miles north of London, and sixty north-east of Oxford.

Cambridge is most remarkable on account of its university, which consists of sixteen colleges, wherein are educated about fifteen hundred students. There are fourteen parishes in the town, which is said to contain about six thousand inhabitants.

*New* **CAMBRIDGE**, a town of New England, about three miles west of Boston; likewise remarkable for

an university, consisting of three colleges: W. long. 70° 4', and N. lat. 42°.

**CAMEL**, in zoology. See **CAMELUS**.

**CAMELFORD**, a borough-town of Cornwall, about twenty miles west of Launceston: W. long. 5°, and N. lat. 50° 40'.

It sends two members to parliament.

**CAMELIA**, in botany, a genus of the monadelphia polyandria class. The calix is imbricated, and consists of many leaves, the anterior of which are longest. There is but one species, viz. the japonica, a native of China and Japan.

**CAMELOPARDALIS**, in zoology, the trivial name of a species of cervus. See **CERVUS**.

**CAMELUS**, or **CAMEL**, in zoology, a genus of quadrupeds belonging to the order of pecora. The characters of the camel are these: It has no horns, it has six foreteeth in the under-jaw; the laniarii are wide set, three in the upper, and two in the lower jaw; and there is a fissure in the upper lip, resembling the cleft in the lip of a hare. The species are four, viz. 1. The dromedarius, or African camel, (Plate LIX. fig. 2.) with one bunch or protuberance on the back. It has four callous protuberances on the fore-legs, and two on the hind ones. The hoof, or rather callous skin of their feet, which is softer than the hoofs of other animals, enables the camel to walk along the sandy paths of warm climates with greater ease; by yielding to the pressure, it is not so subject to be injured by friction. The structure and constitution of the camel is admirably adapted to the climate which produces them. In Africa and Arabia, where this animal is most frequent, and is employed in carrying all kinds of burdens; there is great scarcity of water. The camel has often been observed to travel longer than any other creature without drink. This it is enabled to do, from a singular construction in its stomachs. It is one of the ruminating animals, and has four stomachs. At the top of the second stomach, there are several square holes, which are the orifices of about twenty cavities or sacks, placed between the two membranes which compose the substance of this stomach. These sacks are so many reservoirs which they fill over and above what satisfies their present thirst, and serve for supplying them with water in long journeys through the dry and sandy deserts, where wells or rivers are seldom to be met with. Travellers, when much oppressed with drought, are sometimes obliged to kill their camels, in order to have a supply of drink from these reservoirs. The camel carries very heavy burdens, and travels long, but with a slow pace. They have sometimes been known to travel several days without a fresh supply of water. When fatigued, they lie on their breast. 2. The Bactrianus, or Bactrian camel (fig. 3.), has two bunches on the back, the hindmost of which is by much the largest. It is a native of Africa, and is more rarely to be met with than the dromedary. It is also much swifter in its motion. 3. The glama, or South-American camel-sheep, has a smooth skin, and very short hair; it has a bunch or protuberance on the breast, which se-

cretes a liquor. They are very impatient of cold; are easily tamed, and carry burdens of about fifty or sixty pounds weight. When restive, they are pushed on by squeezing their testicles. When enraged by their driver, they throw out from their mouth a liquor which corrodes and makes the skin rise into blisters. 4. The pacos, or sheep of Chili, has no bunch on the back. It is covered with a fine valuable wool, which is of a blood-red colour on the back of the animal, and white on the belly. It is unfit for carrying burdens, and is kept principally for the sake of the wool, and the flesh, which is exceedingly well-tasted.

**CAMERA** *obscura*, in optics, a machine representing an artificial eye, wherein the images of external objects are exhibited distinctly, in their native colours, either inverted or erect. See **OPTICS**.

**CAMERARIA**, in botany, a genus of the pentandria monogynia class. The flower of which is a petal of a funnel-form, with a cylindrical long tube, ventricose both at the base and top, and a plane limb divided into five lanceolated segments: The fruit is composed of two oblong follicles, bent horizontally, obtuse at both ends, and sending out a lobe on each side, near the base; they have one cell, with one valve, containing numerous, oval, and imbricated seeds, inserted in a large oval membrane at the base. There are two species, *viz.* the *latifolia*, and *angustifolia*, both natives of America.

**CAMERATED**, among builders, the same with vaulted or arched.

**CAMERET-BAY**, in the province of Britany in France, forms the harbour of Brest. See **BREST**.

**CAMERINO**, a town of the ecclesiastical state in Italy.

**CAMERLINGO**, according to Ducange, signified formerly the pope's or emperor's treasurer: At present, *camerlingo* is nowhere used, but at Rome, where it notes the cardinal who governs the ecclesiastical state, and administers justice. It is the most eminent office at the court of Rome, because he is at the head of the treasury. During a vacation of the papal chair, the cardinal *camerlingo* publishes edicts, coins money, and exerts every other prerogative of a sovereign prince; he has under him a treasurer-general, auditor-general, and twelve prelates called clerks of the chamber.

**CAMERONIANS**, a party of presbyterians, which sprung up in Scotland in the reign of king Charles II. They asserted that the king had forfeited his right to the crown, by breaking the solemn league and covenant, which were the terms on which he received it. They pretended both to dethrone and excommunicate him; and broke out into an open rebellion. Upon the revolution, they were reconciled to the kirk, and their preachers submitted to the general assembly of the church of Scotland, in 1690. That sect is now greatly declined. They are few in number, and split into many parties.

**CAMERY**, or **FROUNCE**, in horses. See **FROUNCE**.

**CAMILLE**, and **CAMILLÆ**, in Roman antiquity, a certain number of boys and girls, who assisted in the sa-

crifices to the gods, but more especially attended the *flamen dialis*.

**CAMIS**, or **KAMIS**, in the Japonese affairs, denote the deified souls of illustrious personages, believed to interest themselves in the welfare of their countrymen: In which sense they answer to the deified heroes of antiquity. See **HERO**.

**CAMISARDS**, a name given by the French to the Calvinists of the Cevennes, who formed a league, and took up arms in their own defence, in 1688.

**CAMLETINE**, a slight stuff, made of hair and coarse silk, in the manner of camblet. It is now out of fashion.

**CAMMIN**, a port-town of Brandenburg-Pomerania in Germany, situated on the eastern mouth of the river Oder, about thirty miles north of Stetin: E. long. 15°, N. lat. 54°.

**CAMP**, the ground upon which an army pitch their tents. It is marked out by the quarter-master general, who appoints every regiment their ground.

The chief advantages to be minded in chusing a camp for an army, are, to have it near the water, in a country of forage, where the soldiers may find wood for dressing their viuals; that it have a free communication with garrisons, and with a country from whence it may be supplied with provisions; and, if possible, that it be situated on a rising ground, in a dry gravelly soil. Besides, the advantages of the ground ought to be considered, as marshes, woods, rivers, and inclosures; and if the camp be near the enemy, with no river or marsh to cover it, the army ought to be intrenched. An army always encamps fronting the enemy; and generally in two lines, running parallel about five hundred yards distance; the horse and dragoons, on the wings, and the foot in the centre: Sometimes a body of two, three, or four brigades is encamped behind the two lines, and is called the body of reserve. The artillery and bread-wagons are generally encamped in the rear of the two lines. A battalion of foot is allowed eighty or an hundred paces for its camp; and thirty or forty for an interval betwixt one battalion and another. A squadron of horse is allowed thirty for its camp, and thirty for an interval, and more if the ground will allow it.

The disposition of the Hebrew encampment was at first laid out by God himself. Their camp was of a quadrangular form, surrounded with an inclosure of the height of ten hands-breadth. It made a square of twelve miles in compass about the tabernacle; and within this was another, called the Levites camp. The Greeks had also their camps, fortified with gates and ditches. The Lacedemonians made their camp of a round figure, looking upon that as the most perfect and defensible of any form: We are not, however, to imagine, that they thought this form so essential to a camp, as never to be dispensed with when the circumstance of the place required it. Of the rest of the Grecian camps, it may be observed, that the most valiant of the soldiers were placed at the extremities, the rest in the middle. Thus we learn from Homer, that

that Achilles and Ajax were posted at the ends of the camp before Troy, as bulwarks on each side of the rest of the princes.

The camps of the Romans were generally of an exact square form, or else oblong; though this, without doubt, was often accommodated to the situation of the place. They were always fortified, and a very exact discipline maintained in them, in order to prevent surprises from the enemy.

**CAMP** is also used, by the Siamese, and some other nations in the E. Indies, as the name of the quarters which they assign to the foreigners who come to trade with them.

In these camps, every nation forms, as it were, a particular town, where they carry on all their trade, not only keeping all their ware-houses and shops there, but also live in these camps with their whole families. The Europeans, however, are so far indulged, that at Siam, and almost every where else, they may live either in the cities or suburbs, as they shall judge most convenient.

**CAMPAGNA**, in geography. See **CAMPANIA**.

**CAMPAIGN**, in the art of war, denotes the space of time that an army keeps the field, or is incamped, in opposition to quarters.

**CAMPANIA**, a city of the hither principate in the kingdom of Naples, situated about thirty-five miles south-east of the city of Naples: E. long.  $15^{\circ} 30'$ , N. lat.  $40^{\circ} 45'$ .

**CAMPANIA**, or **CAMPAGNA DI ROMA**, a province of the pope's territories in Italy, extending from the city of Rome south-east, as far as the frontiers of the kingdom of Naples.

**CANPANIFORM**, or **CAMPANULATED**, an appellation given to flowers resembling a bell.

**CAMPANINI**, a name given to a marble of Italy, dug out of the mountains of Carrara, because when it is worked it resounds like a bell.

**CAMPANULA**, or **BELL-FLOWER**, in botany, a genus of the pentandria monogynia class. The corolla is campaniform or bell-shaped, the bottom of which is closed with five valvular nectaria; the stigma is trifid; and the capsule is below the flower, and opens at the sides. There are forty-one species of campanula, only nine of which are natives of Britain, *viz* the rotundifolia, or lesser round-leaved bell flower; the patula, or field bell-flower; the uniloba, or mountain bell-flower; the rapunculus, or rampions; the latifolia, or giant throat-wort; the tracheluna, great throat-wort, or Canterbury bells; and the glomerata, lesser throat-wort, or Canterbury-bells.

**CAMPBELL-TOWN**, a parliament town of Argyleshire in Scotland, situated on the eastern shore of Kintyre, about ten miles west of the island of Arran: W. long.  $5^{\circ} 10'$ , N. lat.  $55^{\circ} 35'$ .

**CAMPDEN**, a market-town in Gloucestershire, about eighteen miles north-east of Gloucester: W. long.  $1^{\circ} 50'$ , and N. lat.  $52^{\circ}$ .

**CAMPEACHY**, or **CAMPECHY**, a town of the province of Yucatan, on the bay or gulf of Mexico: W. long.  $93^{\circ}$ , N. lat.  $19^{\circ}$ .

**CAMPEACHY-WOOD**, in botany. See **HÆMATOXYLUM**.

**CAMPEN**, a port-town, in the province of Overijssel, in the united Netherlands, near the mouth of the river Issel, about forty-two miles north-east of Amsterdam: E. long.  $5^{\circ} 40'$ , and N. lat.  $52^{\circ} 35'$ .

**CAMPHOR**, or **CAMPHERE**, a solid concrete juice extracted from the wood and roots of the *laurus camphora*, which grows in Japan. The camphor is extracted in the same way by which we extract essential oils. As it first sublimes from the wood, it appears brownish, composed of semipellucid grains mixed with dirt. In this state it is exported by the Dutch, and purified by a second sublimation; after which it is reduced to loaves, probably by fusion in close vessels, and in this form it is sold to us. Pure camphor is very white, pellucid, somewhat unctuous to the touch; of a bitterish, aromatic, acrid taste, yet accompanied with a sense of coolness. It has a fragrant smell, somewhat like that of rosemary, but much stronger. It is totally volatile and inflammable; soluble in vinous spirits, oils, and mineral acids; but not in water, alkaline liquors, or the vegetable acids. Camphor is esteemed one of the most efficacious diaphoretics, and has long been celebrated in fevers, malignant and epide-mical distempers. In deliria, where opiates fail of procuring sleep, this medicine frequently succeeds.

*Artificial* **CAMPHOR** is prepared with gum-sandarach and white vinegar distilled, kept twenty days in horse-dung, and afterwards exposed a month to the sun to dry, at the end of which the camphor is found in form of the crust of a white loaf. This is also called juniper-gum, and mastic.

**CAMPHOR-TREE**. See **LAURUS**.

**CAMPHORATA**, in botany. See **POLYCNEMUM**.

**CAMPION**, in botany. See **LYCHNIS**.

**CAMPOIDES**, in botany. See **SCORPIURUS**.

**CAMPREDON**, a town of Catalonia, in Spain, about fifty miles north of Barcelona: E. long.  $2^{\circ}$ , and N. lat.  $42^{\circ} 20'$ .

**CAMPUS MARS**, in ancient customs, an anniversary assembly of our ancestors held on May-day, when they confederated together for defence of the kingdom against all its enemies.

**CAMPUS MARTIUS**, among the Romans, a field, by the side of the Tiber, where the youth exercised themselves in warlike exercises. It was so called, on account of a temple that stood on it, consecrated to the god Mars. The consuls Brutus and Collatinus made it the place for holding the comitia or assemblies of the people, and in after-times it was adorned with a great quantity of fine statues.

**CAMUS**, a person with a low flat nose, hollowed in the middle.

The Tartars are great admirers of *camus* beauties. Rubruquis observes, that the wife of the great Jenghis Kan, a celebrated beauty, had only two holes for a nose.

**CAN**, in the sea-language, as can-pump, a vessel, where-with seamen pour water into the pump to make it go.

**CAN-BUOY**, a larger size of buoy, used to discover dangerous

gerous rocks and shelves, by being placed over them.

**CAN-HOOK.** See **HOOK**.

**CANADA**, or **NEW FRANCE**, an extensive tract of North America, bounded by New Britain and the British colonies on Hudson's bay, on the north; by the river of St Lawrence, the Iroquois, or five Indian nations, the Huron and Illinois lakes, on the east and south; and by unknown lands, on the west. Its chief town is Quebec.

**CANAL** of *communication*, an artificial cut in the ground, supplied with water from rivers, springs, &c. in order to make a navigable communication betwixt one place and another.

The particular operations necessary for making artificial navigations depend upon a number of circumstances. The situation of the ground; the vicinity or connection with rivers; the ease or difficulty with which a proper quantity of water can be obtained; these and many other circumstances necessarily produce great variety in the structure of artificial navigations, and augment or diminish the labour and expence of executing them. When the ground is naturally level, and unconnected with rivers, the execution is easy, and the navigation is not liable to be disturbed by floods; but, when the ground rises and falls, and cannot be reduced to a level, artificial methods of raising and lowering vessels must be employed; which likewise vary according to circumstances.

A kind of temporary sluices are sometimes employed for raising boats over falls or shoals in rivers by a very simple operation. Two posts or pillars of masonry, with grooves, are fixed, one on each bank of the river, at some distance below the shoal. The boat having passed these posts, planks are let down across the river by pulleys into the grooves, by which the water is dammed up to a proper height for allowing the boat to pass up the river over the shoal.

The Dutch and Flemings at this day, sometimes when obstructed by cascades, form an inclined plane or rolling-bridge upon dry land, alongst which their vessels are drawn from the river below the cascade into the river above it. This, it is said, was the only method employed by the ancients, and is still used by the Chinese, who are said to be entirely ignorant of the nature and utility of locks. These rolling-bridges consist of a number of cylindrical rollers which turn easily on pivots, and a mill is commonly built near by, so that the same machinery may serve the double purpose of working the mill and drawing up vessels.

A **LOCK** is a basin placed lengthwise in a river or canal, lined with walls of masonry on each side, and terminated by two gates, placed where there is a cascade or natural fall of the country; and so constructed, that the basin being filled with water by an upper sluice to the level of the waters above, a vessel may ascend through the upper gate; or the water in the lock being reduced to the level of the water at the bottom of the cascade, the vessel may descend through the lower gate; for when the waters are brought to a level on either side, the gate on that side may be easily opened.

But as the lower gate is strained in proportion to the depth of water it supports, when the perpendicular height of the water exceeds 12 or 13 feet, more locks than one become necessary. Thus, if the fall be 17 feet, two locks are required, each having  $8\frac{1}{2}$  feet fall; and if the fall be 26 feet, three locks are necessary, each having 8 feet 8 inches fall. The side-walls of a lock ought to be very strong. Where the natural foundation is bad, they should be founded on piles and platforms of wood: They should likewise slope outwards, in order to resist the pressure of the earth from behind.

Plate LX. fig. 1. A perspective view of part of a canal: the vessel L, within the lock A C.—Fig. 2. Section of an open lock: the vessel L about to enter.—Fig. 3. Section of a lock full of water: the vessel L raised to a level with the water in the superior canal.—Fig. 4. Ground section of a lock. L, a vessel in the inferior canal. C, the under gate. A, the upper gate. G H, a subterraneous passage for letting water from the superior canal run into the lock. K F, a subterraneous passage for water from the lock, to the inferior canal.

X and Y (fig. 1.) are the two flood-gates, each of which consists of two leaves, resting upon one another, so as to form an obtuse angle, in order the better to resist the pressure of the water. The first (X) prevents the water of the superior canal from falling into the lock; and the second (Y) dams up and sustains the water in the lock. These flood-gates ought to be very strong, and to turn freely upon their hinges. In order to make them open and shut with ease, each leaf is furnished with a long lever A b, A b; C b, C b. They should be made very tight and close, that as little water as possible may be lost.

By the subterraneous passage G H (fig. 2, 3, & 4) which descends obliquely, by opening the sluice G, the water is let down from the superior canal D, into the lock, where it is stopt and retained by the gate C when shut, till the water in the lock comes to be on a level with the water in the superior canal D; as represented, fig. 3. When, on the other hand, the water contained by the lock is to be let out, the passage G H must be shut by letting down the sluice G, the gate A must be also shut, and the passage K F opened by raising the sluice K: A free passage being thus given to the water, it descends through K F, into the inferior canal, until the water in the lock is on a level with the water in the inferior canal B; as represented, fig. 2.

Now, let it be required to raise the vessel L (fig. 2.) from the inferior canal B, to the superior one D; if the lock happens to be full of water, the sluice G must be shut, and also the gate A, and the sluice K opened, so that the water in the lock may run out till it is on a level with the water in the inferior canal B. When the water in the lock comes to be on a level with the water at B, the leaves of the gate C are opened by the levers C b, which is easily performed, the water on each side of the gate being in equilibrio; the vessel then sails into the lock. After this the gate C, and the sluice

*Fig. 1.  
Perspective View of part of a CANAL with Locks*

*Fig. 2.  
Section of a Lock*

*Fig. 3. Section  
of a Lock full of Water*

*Fig. 4 plan  
of a  
Lock*

luice K are shut, and the sluice G opened, in order to fill the lock, till the water in the lock, and consequently the vessel, be upon a level with the water in the superior canal D; as is represented in fig. 3. The gate A is then opened, and the vessel passes into the canal D.

Again, let it be required to make a vessel descend from the canal D, into the inferior canal B. If the lock is empty, as in fig. 2. the gate C and sluice K must be shut, and the upper sluice G opened, so that the water in the lock may rise to a level with the water in the upper canal D. Then open the gate A, and let the vessel pass through into the lock. Shut the gate A and the sluice G: then open the sluice K, till the water in the lock be on a level with the water in the inferior canal; then the gate C is opened, and the vessel passes along into the canal B, as was required.

It is almost needless to spend time in enumerating the many advantages which necessarily result from artificial navigations. Their utility is now so apparent, that most nations in Europe give the highest encouragement to undertakings of this kind where-ever they are practicable. The advantages of navigable canals did not escape the observation of the ancients. From the most early accounts of society we read of attempts to cut through large isthmuses, in order to make a communication by water, either betwixt different nations, or distant parts of the same nation, where land-carriage was long and expensive. Herodotus relates, that the Cnidians, a people of Caria in Asia Minor, designed to cut the Isthmus which joins that Peninsula to the continent; but were superstitious enough to give up the undertaking, because they were interdicted by an oracle. Several Kings of Egypt attempted to join the Red-sea to the Mediterranean. Cleopatra was exceedingly fond of this project. Soliman II. emperor of the Turks, employed 50,000 men in this great work. This canal was completed under the caliphate of Omar, but was afterwards allowed to fall into disrepair; so that it is now difficult to discover any traces of it. Both the Greeks and Romans intended to make a canal across the Isthmus of Corinth, which joins the Morea and Achaia, in order to make a navigable passage by the Ionian sea into the Archipelago. Demetrius, Julius Cæsar, Caligula, and Nero, made several unsuccessful efforts to open this passage. But, as the ancients were intirely ignorant of the use of water-locks, their whole attention was employed in making level cuts, which is probably the principal reason why they so often failed in their attempts. Charlemagne formed a design of joining the Rhine and the Danube, in order to make a communication between the ocean and the Black-sea, by a canal from the river Almutz which discharges itself into the Danube, to the Reditz, which falls into the Maine, and this last falls into the Rhine near Mayence: For this purpose he employed a prodigious number of workmen; but he met with so many obstacles from different quarters, that he was obliged to give up the attempt.

The French at present have many fine canals: That of Briare was begun under Henry IV. and finished under the direction of cardinal Richelieu in the reign of Lewis

XIII. This canal makes a communication betwixt the Loire and the Seine by the river Loing. It extends eleven French great leagues from Briare to Montargis. It enters the Loire a little above Briare, and terminates in the Loing at Cepoi. There are forty-two locks on this canal.

The canal of Orleans, for making another communication between the Seine and the Loire, was begun in 1675, and finished by Philip of Orleans, regent of France, during the minority of Lewis XV. and is furnished with twenty locks. It goes by the name of the canal of Orleans; but it begins at the village of Combleux, which is a small French league from the town of Orleans.

But the greatest and most useful work of this kind is the junction of the ocean with the Mediterranean by the canal of Languedoc. It was proposed in the reigns of Francis I. Henry IV. and was undertaken and finished under Lewis XIV. It begins with a large reservoir 4000 paces in circumference, and 24 feet deep, which receives many springs from the mountain Noire. This canal is about 64 leagues in length, is supplied by a number of rivulets, and is furnished with 104 locks, of about eight feet rise each. In some places it passes over bridges of vast height; and in others it cuts through solid rocks for 1000 paces. At one end it joins the river Garonne near Thoulouse, and terminates at the other in the lake Tau, which extends to the port of Certe. It was planned by Francis Riquet in the 1666, and finished before his death, which happened in the 1680.

In the Dutch, Austrian, and French Netherlands, there is a very great number of canals; that from Bruges to Ostend carries vessels of 200 tons.

The Chinese have also a great number of canals; that which runs from Canton to Peking, extends about 825 miles in length, and was executed about 800 years ago.

It would be an endless task to describe the numberless canals in Holland, Russia, Germany, &c. We shall therefore confine ourselves to those that are either already finished, or at present executing in our own country.

As the promoting of commerce is the principal intention of making canals, it is natural to expect that their frequency in any nation should bear some proportion to the trade carried on in it, providing the situation of the country will admit of them. The present state of England and Scotland confirms this observation. Though the Romans made a canal between the Nyne, a little below Peterborough, and the Witham, three miles below Lincoln, which is now almost entirely filled up, yet it is not long since canals were revived in England. They are now however become very numerous, particularly in the counties of York, Lincoln, and Cheshire. Most of the counties betwixt the mouth of the Thames and the Bristol channel are connected together either by natural or artificial navigations; those upon the Thames and Isis reaching within about twenty miles of those upon the Severn. The duke of Bridgewater's canal in Cheshire runs twenty-seven miles on a perfect level; but at Barton it is carried by a very high aqueduct bridge over the Irwell, a navigable river; so that it is common for vessels to be passing at the same time both under and above the bridge.

bridge. It is likewise cut some miles into the hills, where the Duke's coal mines are wrought.

Though a navigable communication between the rivers Forth and Clyde in Scotland had been long talked of, it was never considered with a view to execution till the year 1761, when the ground was surveyed by Mr Smeaton, at the desire of the trustees for fisheries and manufactures in Scotland. From Mr Smeaton's survey and report, the practicability of this canal was fully demonstrated. But, after the scheme became an object of general attention, it was found that a canal of larger dimensions than the one originally proposed would be productive of still greater advantages to the nation. Mr Smeaton was therefore directed to make a second survey, and to report to the intended proprietors an estimate of the expence of making a canal 24 feet broad at bottom, 54 at top, containing seven feet deep of water, and extending from the Forth to the Clyde, a distance of about 31 miles, with a collateral branch to the town of Glasgow, which is about six miles, and another from Bainsford to the river Carron below Carron-works, making in all about 37 miles. This report was approved of, an act of parliament was obtained, and the canal is now cutting upon this very plan. It begins at the Holmerrie in the mouth of the Carron, and terminates at Danmuir-burn-foot on the river Clyde, about seven miles below Glasgow. Above seven miles are already cut, from the Holmerrie westward; a number of hands are likewise employed at the point of partition in Dollater-bog, and the whole is expected to be finished in five years. At the point of partition, which is 168 feet above the level of the sea at low water, a very large reservoir is to be made for supplying the canal; and the vessels are to be raised and lowered by means of 41 locks. Where the course of the canal is intersected by burns or rivers, it is to be carried over them by aqueduct-bridges; three of these bridges will be large, and require considerable labour and expence, *viz.* one over the Grangeburn, one over Bony-mill-burn, and a third over the Kelvin in the Glasgow branch. The expence of executing the whole is computed to be about 150,000 l.

Sea-vessels, about 20 feet wide and 60 feet long, and carrying 70 or 80 tons, may pass along by this canal from the one frith to the other. But it will admit a free passage to vessels of 140 tons, provided they be built in the manner of the flat vessels used by the Dutch. The toll-duty, allowed by the act of parliament, is not to exceed 2 d. a ton *per* mile. Privileged goods, such as lime and lime-stone, are to pay only one third of the usual toll-duty; stones, gravel, and other materials for making or repairing roads, likewise dung, soil, marle, and all sorts of manure, are exempted from paying any toll-duty, provided they do not pass any lock but when the water shall flow over the place made for discharging the overplus-water in the canal.

We must not conclude this article without observing, that in Ireland also the utility of artificial navigations has not been unattended to. Several canals are there making; in particular, one from Loch-Neach to Newry, about 20 miles; and another from the river Shannon to Dublin, about 70 miles.

**CANAL**, in anatomy, a duct or passage through which any of the juices flow.

**CANARIES**, islands, to the number of seven, situated in the Atlantic ocean, between 12° 21' W. long. and between 27° and 29° N. lat. the most easterly of them lying about 150 miles from Cape Non, on the coast of Biledulgerid, in Africa.

**CANARY**, properly so called, is a considerable island, about 150 miles in circumference; the chief town of which is Palma, from whence comes the excellent palm-sack, and other rich wines.

It lies in 16° W. long. and between 27° and 29° N. lat.

**CANARY-bird**. See **FRINGILLA**.

**CANCALE**, a small town of France, near St Malo's, where ships may ride in eight fathoms water, with a sandy bottom.

**CANCELIER**, in falconry, is when a light-brown hawk, in her stooping, turns two or three times upon the wing, to recover herself, before she seizes.

**CANCELLI**, a term used to denote lattice-windows, or those made of cross-bars, disposed lattice-wise; it is also used for rails or ballusters, inclosing the communion-table, a court of justice, and the like, and for the net-work in the inside of hollow bones.

**CANCER**, or **CRAB**, in zoology, a genus of insects belonging to the order of insects aptera. The generic characters are these: They have eight legs, (seldom ten or six), besides the two large claws which answer the purpose of hands. They have two eyes at a considerable distance from each other, and for the most part supported by a kind of pedunculi or foot-stalks; the eyes are likewise elongated and moveable. They have two clawed palpi; and the tail is jointed. There are no less than 87 species of cancer, distinguished principally by the length of their tails and the margins of their breasts. This genus includes the lobster, shrimp, &c.

**CANCER**, in medicine, a roundish, unequal, hard, and livid tumour, generally seated in the glandulous parts of the body, supposed to be so called, because it appears at length, with turgid veins shooting out from it, so as to resemble, as it is thought, the figure of a crab-fish; or, as others say, because, like that fish, where it has once got, it is scarce possible to drive it away. See **MEDICINE**, and **SURGERY**.

**CANCER**, in astronomy, one of the twelve signs of the zodiac, represented on the globe in the form of a crab, and thus marked ( $\var蟹$ ) in books.

**Tropic of CANCER**, in astronomy, a lesser circle of the sphere parallel to the equator, and passing through the beginning of the sign cancer.

**CANCHERIZANTE**, or **CANCHERIZATO**, in the Italian music, a term signifying a piece of music that begins at the end, being the retrograde motion from the end of a song, &c. to the beginning.

**CANDAROR**, the capital of a territory of the same name, subject to Persia: E. long. 67°, and N. lat. 33°.

**CANDIA**, the modern name of Crete, an island situated in

in the Mediterranean sea, between  $22^{\circ}$  and  $27^{\circ}$  E. long. and between  $35^{\circ}$  and  $36^{\circ}$  N. lat.

There is no river of any consequence in the whole island, which is watered by a multitude of rivulets; whereof Lethe is one. Here too is mount Ida, so much celebrated in the writings of the ancients.

**CANDIA**, or **MUTUM**, is the capital of the above island, situated on its northern coast, in  $25^{\circ}$  E. long. and  $35^{\circ} 30'$  N. lat.

**CANDIDATE**, a person who aspires to some public office.

In the Roman commonwealth, they were obliged to wear a white gown, during the two years of their soliciting for a place. This garment, according to Plutarch, they wore without any other cloaths, that the people might not suspect they concealed money for purchasing votes; and also, that they might the more easily show to the people, the scars of those wounds they had received in fighting for the defence of the commonwealth.

**CANDIDATI MILITES**, an order of soldiers, among the Romans, who served as the emperor's bodyguards, to defend him in battle. They were the tallest and strongest of the whole troops, and most proper to inspire terror. They were called *candidati*, because clothed in white, either that they might be more conspicuous, or because they were considered in the way of preferment.

**CANDISH**, a province of the hither India, bounded by Chitor and Malva, on the north; by Orixia, on the east; by Decan, on the south; and by Guzurat, on the west: It is subject to the Mogul.

**CANDLE**, a small taper of tallow, wax, or spermaceti; the wick of which is commonly of several threads of cotton, spun and twisted together.

A tallow-candle, to be good, must be half sheeps, and half bullocks tallow; for hogs tallow makes the candle gutter, and always gives an offensive smell, with a thick black smoke. The wick ought to be pure, sufficiently dry, and properly twisted; otherwise the candle will emit an unconstant vibratory flame, which is both prejudicial to the eyes, and insufficient for the distinct illumination of objects.

There are two sorts of tallow-candles; the one dipped, the other moulded: The former are the common candles; the others are the invention of the sieur le Brege at Paris.

As to the method of making candles, in general; After the tallow has been weighed, and mixed in the due proportions, it is cut into very small pieces, that it may melt the sooner; for the tallow in lumps, as it comes from the butchers, would be in danger of burning or turning black, if it were left too long over the fire. Being perfectly melted and skimmed, they pour a certain quantity of water into it, proportionable to the quantity of tallow. This serves to precipitate, to the bottom of the vessel, the impurities of the tallow, which may have escaped the skimmer. No water, however, must be thrown into the tallow designed for the three first dips; because the wick, being still quite dry, would imbibe the water, which makes

the candles crackle in burning, and renders them of bad use. The tallow, thus melted, is poured into a tub, through a coarse sieve of horse-hair, to purify it still more, and may be used after having stood three hours. It will continue fit for use twenty-four hours in summer, and fifteen in winter.

The wicks are made of spun cotton, which the tallow-chandlers buy in skains, and which they wind up into bottoms or clues. Whence they are cut out, with an instrument contrived on purpose, into pieces of the length of the candle required; then put on the sticks or broaches, or else placed in the moulds, as the candles are intended to be either dipped or moulded. Wax-candles are made of a cotton or flaxen wick, slightly twisted, and covered with white or yellow wax. Of these, there are several kinds; some of a conical figure, used to illumine churches, and in processions, funeral ceremonies, &c. See **TAPER**.

Others of a cylindrical form, used on ordinary occasions.

The first are either made with a ladle or the hand.

To make wax candles with the ladle.

The wicks being prepared, a dozen of them are tied by the neck, at equal distances, round an iron circle, suspended directly over a large basin of copper tinned, and full of melted wax: A large ladle full of this wax is poured gently on the tops of the wicks one after another, and this operation continued till the candle arrive at its destined bigness; with this precaution, that the three first ladles be poured on at the top of the wick, the fourth at the height of  $\frac{1}{4}$ , the fifth at  $\frac{1}{2}$ , and the sixth at  $\frac{3}{4}$ , in order to give the candle its pyradimal form. Then the candles are taken down, kept warm, and rolled and smoothed upon a walnut-tree table, with a long square instrument of box, smooth at the bottom.

As to the manner of making wax-candles by the hand, they begin to soften the wax, by working it several times in hot water, contained in a narrow, but deep caldron. A piece of the wax is then taken out, and disposed by little and little, around the wick, which is hung on a hook in the wall, by the extremity opposite to the neck; so that they begin with the big end, diminishing still as they descend towards the neck. In other respects, the method is nearly the same as in the former case. However, it must be observed, that in the former case, water is always used to moisten the several instruments, to prevent the wax from sticking; and in the latter, oil of olives, or lard, for the hands, &c. The cylindrical wax-candles are either made, as the former, with a ladle, or drawn. Wax-candles drawn, are so called, because actually drawn in the manner of wire, by means of two large rollers of wood, turned by a handle, which turning backwards and forwards several times, pass the wick through melted wax contained in a brass basin, and at the same time through the holes of an instrument like that used for drawing wire fastened at one side of the basin.

Makers of candles are not to use melting-houses, without due entry thereof at the excise-office, on pain of

of 1001; and to give notice of making candles to the excise-officer for the duties, and of the number, &c. or shall forfeit 50*l*. Removing the candles before weighed by the officer, or mixing them with others, is likewise liable to penalties.

**CANDLE** is also a term in medicine, and is reckoned among the instruments of surgery. Thus the *candela fumalis*, or the *candela pro fustitu odorata*, is a mass of an oblong form, consisting of odoriferous powders, mixed up with a third, or more, of the charcoal of willow or lime-tree, and reduced to a proper consistence with a mucilage of guaiacum, ladanum, or turpentine. It is intended to excite a grateful smell without any flame, to correct the air, to fortify the brain, and to excite the spirits.

**Medicated CANDLE**, or **BOUGIE**, in surgery, a small stick of wax in form of a candle, which surgeons introduce into the urethra, either to dilate it and keep it open, or to consume carnosities. There are two sorts of these candles, the one simple, and the other compound. The simple are made of wax, of cat-gut, or even of lead; and the intention of them is to keep the canal of the urethra properly distended. Their thickness, therefore, should be proportioned to the diameter of that canal. The compound bougies are loaded with some medicine capable of producing a suppuration, or of destroying carnosities and excrescences in the urethra. See **SURGERY**.

**CANDLE**. Sale or auction by inch of candle, is when a small piece of candle being lighted, the bystanders are allowed to bid for the merchandise that is selling; but the moment the candle is out, the commodity is adjudged to the last bidder.

There is also an excommunication by inch of candle; when the sinner is allowed to come to repentance while a lighted candle continues burning; but after it is consumed, he remains excommunicated to all intents and purposes.

**CANDLE-BERRY-TREE**, in botany. See **MYRICA**.

**CANDLEMAS**, a feast of the church held on the second day of February, in honour of the purification of the Virgin Mary. It is borrowed from the practice of the ancient Christians, who on that day used abundance of lights both in their churches and processions, in memory, as is supposed, of our Saviour's being, on that day, declared by Simeon, "to be a light to lighten the Gentiles." In imitation of this custom, the Roman catholics, on this day, consecrate all the tapers and candles which they use in their churches during the whole year. At Rome, the pope performs that ceremony himself, and distributes wax-candles to the cardinals and others, who carry them in procession through the great hall of the pope's palace. This ceremony was prohibited in England, by an order of council in 1548.

**CANDLESTICK**, an instrument to hold a candle, made in different forms, and of all sorts of matter.

The golden candlestick was one of the sacred utensils made by Moses to be placed in the Jewish tabernacle. It was made of hammered gold, a talent in weight. It consisted of seven branches, supported by

a base or foot. These branches were adorned at equal distances with six flowers like lilies, and with as many bowls and knobs placed alternately. Upon the stock and six branches of the candlestick, were the golden lamps, which were immovable, wherein were put oil and cotton.

These seven lamps were lighted every evening, and extinguished every morning. The lamps had their tongs or snuffers to draw the cotton in or out, and dishes underneath them to receive the sparks and droppings of the oil. This candlestick was placed in the antichamber of the sanctuary on the south-side, and served to illuminate the altar of perfume, and the table of the shew-bread. When Solomon had built the temple of the Lord, he placed in it ten golden candlesticks, of the same form as that described by Moses, five on the north, and five on the south-side of the holy. But after the Babylonish captivity, the golden candlestick was again placed in the temple, as it had been before in the tabernacle by Moses. This sacred utensil, upon the destruction of the temple by the Romans, was lodged in the temple of Peace, built by Vespasian; and the representation of it is still to be seen on the triumphal arch at the foot of mount Palatine, on which Vespasian's triumph is delineated.

**Water-CANDLESTICK**, a kind of fountain, the spout of which is raised upon a pedestal in form of a large balustrade, which carries a small basin like a table or stand, from which the water falls into a larger basin, level with the alleys in a garden.

**CANDY**, in geography, the capital of the island of Ceylon, situated in the middle of the island: E. long. 79°, N. lat. 8°.

**CANDY**, or **Sugar-CANDY**, a preparation of sugar, made by melting and crystalizing it six or seven times over, to render it hard and transparent. It is of three kinds, white, yellow, and red. The white comes from the loaf-sugar, the yellow from the cassonado, and the red from the muscovado.

**CANDYING**, in pharmacy, the act of preserving simples in substance, by boiling them in sugar.

The performance of this originally belonged to the apothecaries, but is now become a part of the business of a confectioner.

**CANE**, in botany. See **ARUNDO**.

**CANE** denotes also a walking-stick. It is customary to adorn it with a head of gold, silver, agate, &c. Some are without knots, and very smooth and even; others are full of knots, about two inches distant from each other. These last have very little elasticity, and will not bend so well as the others.

Canes of Bengal, are the most beautiful which the Europeans bring into Europe. Some of them are so fine, that people work them into vessels or bowls, which being varnished over in the inside with black or yellow lacca, will hold liquors as well as glass or china-ware does, and the Indians use them for that purpose.

**CANE** is also the name of a long measure, which differs according to the several countries where it is used.

At Naples, the cane is equal to 7 feet  $3\frac{1}{2}$  inches English

English measure: The cane of Tholouse and the upper Languedoc is equal to the varre of Arragon, and contains 5 feet 8 $\frac{1}{2}$  inches; at Montpellier, Provence, Dauphine, and the lower Languedoc, to 6 English feet 5 $\frac{1}{2}$  inches.

**CANEA**, a sea-port town on the north side of Candia, esteemed the second in the island. It is a pretty good harbour, but the fortifications are out of repair: E. long. 24°, N. lat. 35° 36'.

**CANEPHORÆ**, in Grecian antiquity, virgins who, when they became marriageable, presented certain baskets full of little curiosities to Diana, in order to get leave to depart out of her train, and change their state of life.

**CANEPHORIA**, in Grecian antiquity, a ceremony which made part of a feast celebrated by the Athenian virgins, on the eve of their marriage-day.

At Athens, the canephoria consisted in this; that the maid, conducted by her father and mother, went to the temple of Minerva, carrying with her a basket full of presents, to engage the goddess to make the marriage-state happy; or, as the scholiast of Theocritus has it, the basket was intended as a kind of honourable amends made to that goddess, the protectrix of virginity, for abandoning her party; or a ceremony to appease her wrath. Suidas calls it a festival in honour of Diana.

**CANEPHORIA** is also the name of a festival of Bacchus, celebrated particularly by the Athenians, on which the young maids carried golden baskets full of fruit, which baskets were covered, to conceal the mystery from the uninitiated.

**CANETO**, a fortified town of the duchy of Mantua, situated on the Oglio, about twelve miles south-west of Mantua: E. long. 10° 50', N. lat. 45°.

**CANG**, a gulf or sea, lying between China and Tartary, at the east end of the long wall.

**CANICULA**, in ichthyology, the trivial name of a species of *squalus*. See *SQUALUS*.

**CANICULA**, or **CANICULUS**, in astronomy. See *ASTRONOMY, Of fixed stars*.

It is also a name given to one of the stars of the constellation canis major, called the dog-star, and by the Greeks, *siurus*.

**CANICULAR days**, commonly called dog-days, a certain number of days preceding and ensuing the heliacal rising of canicula, or the dog-star, in the morning. The Ethiopians and Egyptians began their year at the rising of the dog-star, reckoning to its rise again the next year, which is called the *annus canarius*. The Romans supposed it to be the cause of the sultry weather usually felt in the dog-days; and therefore sacrificed a brown dog every year at its rising, to appease its wrath.

The dog-days begin towards the end of July, and end the beginning of September.

**CANINE**, whatever partakes of, or has any relation with the nature of a dog. Thus,

**CANINE teeth**, are two sharp-edged teeth in each jaw; one on each side, placed between the incisors and molares.

**CANIS**, or **DOG**, in zoology, a genus of quadrupeds,

belonging to the order of *feræ*. The characters of the dog are these: He has six fore-teeth in the upper jaw, those in the sides being longer than the intermediate ones, which are lobated; in the under jaw there are likewise six fore-teeth, those on the sides being lobated. He has six grinders in the upper, and seven in the lower jaw. The teeth called dog-teeth are four, one on each side, both in the lower and upper jaw; they are sharp-pointed, bent a little inward, and stand at a distance from any of the rest.

There are nine species of this genus, *viz.* 1. The familiar, or domestic dog, is distinguished from the other species, by having his tail bent to the left side; which mark is so singular, that perhaps the tail of no other quadruped is bent in this manner. Of this species there are a great number of varieties. Linnæus enumerates eleven, and Bouffon gives figures of no less than twenty-seven, *viz.* the molossus, or mastiff, which is about the size of a wolf, with the sides of the lips hanging down, and a full robust body. The large Danish dog, differs only from the former in being fuller in the body, and generally of a larger size. The grey-hound is likewise the same with the mastiff; but its make is more slender and delicate. Indeed the difference betwixt these three dogs, although perfectly distinguishable at first sight, is not greater than that betwixt a Dutchman, a Frenchman, and an Italian. The shepherd's dog, the wolf-dog, and what is commonly called the Siberian dog, to which may be joined the Lapland dog, the Canada dog, and, in general, all those which have strait ears and a pointed snout, are all one kind, differing only in thickness, the roughness or smoothness of their skin, the length of their legs, and tails. The hound, or beagle, the terrier, the braque, or short-tailed setting-dog, and the spaniel, may be considered as the same kind: they have the same form and the same instincts; and differ only in the length of their legs, and size of their ears, which in each of them are long, soft, and pendulous. The bull-dog, the small Danish dog, the Turkish dog, and the Iceland dog, may likewise be considered as the same kind, all the varieties in their appearance taking their rise merely from climate. For instance, the Turkish dog, which has no hair, is nothing else but the small Danish dog transported to a warm climate, which makes the hair fall off. A dog of any kind loses its hair in very warm climates. But this is not the only change which arises from difference of climate. In some countries the voice is changed; in others, dogs become altogether silent. In some climates, they lose the faculty of barking, and howl like wolves, or yelp like foxes. Warm climates even change their form and instincts: They turn ill-shaped, and their ears become strait and pointed. It is only in temperate climates that dogs preserve their natural courage, ardour, and sagacity.

In order to give an idea of the different kinds of dogs, in different climates, and of the varieties produced by commixtures, we shall give an explanation of Bouffon's genealogical tree, See Plate LXI. fig. 1. This tree is constructed in the form of a geographical chart, in which the situation of the different climates to which the parti-

cular dogs belong, is observed as accurately as the nature of the thing will admit.

The shepherd's dog is the stump of the tree. This dog, when transported to Lapland, or any very cold climate, assumes an ugly appearance, and its legs become short. But, in Britain, Russia, Siberia, &c. where the cold is not so rigorous, and the people are more civilized, he arrives at greater perfection, both in form and sagacity. The same shepherd's dog, when brought up in a country fully civilized, as Britain or France, loses his savage air, his strait ears, his thick long hair, and becomes what is called a bull-dog, a mastiff, a beagle, or hound. These changes, Bouffon attributes to the influence of the climate, the manners of the people, &c. The mastiff and the bull-dog have their ears still partly strait, or half-pendent, and resemble in their manners and sanguine disposition the dog from which they derive their origin. The beagle or hound preserves less of the appearance of its origin than the other two; its ears are long and entirely pendent; the softness, the tractability, the timidity of this dog, Bouffon considers as so many proofs of its great degeneracy, or rather of that perfection which it acquires by culture, and living among a civilized people.

The hound, the small spotted setting-dog, and the terrier, are all of the same family; for all the three kinds are often produced at the same litter, although the female hound had been covered only by one of these kinds.

When the hound is transported to Spain, or Barbary, where almost every animal has fine, long, downy hair, it is changed into a water hound, or spaniel. And the small and large spaniel, which differ only in the tail, when carried to Britain, are changed from a white to a black colour, and become what is called the large and small shagged dogs.

The mastiff, when carried to the north, is changed into the large Danish dog; and when transported to the south, it becomes a grey-hound. The large grey-hounds come from the Levant; those of a lesser size come from Italy; and the Italian grey-hounds, when brought to Britain, become what the French call *levrons*, that is, grey-hounds of the least size.

The great Danish dog, when carried to Ireland, the Ukrain, Tartary, &c. is changed into the Irish dog, which is the largest of all dogs.

The bull-dog, when carried from Britain to Denmark, becomes the small Danish dog; and this small Danish dog, when transported into a warm climate, loses its hair, and is changed into the Turkish dog.

All these races or families, with their varieties, are produced by the influence of climate, food, and education: The other kinds marked in the tree are not pure or distinct families, but are produced by the commixture of the other families. These mungrel dogs, with the particular parents which produce them, are marked out in the tree by dotted lines. For example,

The grey-hound and mastiff produce the mungrel grey-hound, which is likewise called the grey-hound with wolf's hair. The large Danish dog and the large spaniel produce the Calabrian dog; which is a beautiful dog, with long bushy hair, and of a larger size than the ma-

stiff. The spaniel and the small Danish dog produce the lion-dog, which is a very rare kind. It is needless to give more examples, as they can easily be traced from the dotted lines in the tree.

Having thus traced the varieties of the dog, and the probable sources of these varieties, we shall now give an account of his nature and instincts.

From the structure of the teeth, it might be concluded *à priori* that the dog is a carnivorous animal. He does not however eat indiscriminately every kind of animal substance. There are some birds, as the colymbus arcticus, which the water-dog will lay hold off with keenness, but will not bring out of the water, because its smell is exceedingly offensive to him. He will not eat the bones of a goose, crow, or hawk: But he devours even the putrid flesh of most other animals. He is possessed of such strong digestive powers, as to draw nourishment from the hardest bones. When flesh cannot be procured, he will eat fish, fruits, succulent herbs, and bread of all kinds. When oppressed with sickness, to which he is very subject, especially in the beginning of summer, in order to procure a puke, he eats the leaves of the quicken grass, the bearded wheat-grass, or the rough cock's-foot-grass, which gives him immediate relief. When he steals a piece of flesh, as conscious of the immorality of the action, he runs off with his tail hanging and bent in betwixt his feet.

His drink is water, which he takes in small quantities at a time, by licking with his tongue. He is in some measure obliged to lick in this manner, otherwise his nose would be immersed in the water.

His excrements are generally hard scybals, which, especially after eating bones, are white, and go by the name of *album græcum* among physicians. This *album græcum* was for a long time in great repute as a septic; but it is now entirely disregarded. He does not throw out his excrements promiscuously upon every thing that happens to be in the way, but upon stones, trunks of trees, or barren places. This is a wise institution of nature; for the excrements of a dog destroy almost every vegetable or animal substance. They are of such a putrid nature, that if a man's shoe touches them when recently expelled, that particular part will rot in a few days. He observes the same method in making his urine, which he throws out at a side. It is remarkable, that a dog will not pass a stone or a wall against which any other dog has pissed, without following his example, although a hundred should occur in a few minutes, in so much, that it is astonishing how such a quantity can be secreted in so short a time.

The dog is an animal not only of quick motion, but remarkable for travelling very long journeys. He can easily keep up with his master, either on foot or horseback, for a whole day. When fatigued, he does not sweat, but lolls out his tongue. Every kind of dog can swim; but the water-dog excels in that article.

The dog runs round when about to lie down, in order to discover the most proper situation. He lies generally on his breast, with his head turned to one side, and sometimes with his head above his two fore-feet. He sleeps little, and even that does not seem to be very quiet; for he often

This diagram illustrates the classification of various dog breeds into three main groups, each represented by a central hexagon. The breeds are shown in circles, and their relationships are indicated by solid and dotted lines.

- Shepherd Dog Group (Top Center):** Includes Icelandic Dog, Lapland Dog, Siberian Dog, Wolf Dog, and Shepherd Dog.
- Hound or Beagle Group (Middle):** Includes Terrier with crooked legs, Terrier, Braque of Bengal, Braque or small spotted dog, Hound or Beagle, Burgos, Water Hound, Boule, Small Spaniel, Maltese Dog or Lap-dog, and Calabrian Dog.
- Mastiff Group (Right):** Includes Albanian Dog, Large Danish Dog, Mastiff, Large Gray Hound, English Gray Hound, Italian Gray Hound, and Gray Hound Mungrel.

Other breeds shown include Small Spanish Dog, Bull Dog, Tuck Dog, Turkish Mungrel, Pug dog or small Bull-dog, Rocket, Artois Dog, Credin or flag dog, Pyramid, Lion Dog, and Strong Raced Dog. A compass rose is located in the bottom right corner.

often starts, and seems to hear with more acuteness in sleep than when awake. They have a tremulous motion in sleep, frequently move their legs, and bark, which is an indication of dreaming.

Dogs are possessed of the sensation of smelling in a high degree. They can trace their master by the smell of his feet in a church, or in the streets of a populous city. This sensation is not equally strong in every kind. The hound can trace game, or his master's steps, twenty-four hours afterwards. He barks more furiously the nearer he approaches the fowls, unless he be beat and trained to silence.

With regard to the propagation of dogs; the females admit the males before they are twelve months old. They remain in season ten, twelve, or even fifteen days, during which time they will admit a variety of males. They come in season generally twice in the year, and more frequently in the cold than in the hot months. The male discovers the condition of the female by the smell; but she seldom admits him the first six or seven days. One coitus will make her conceive a great number of young; but, when not restrained, she will admit several dogs every day: she seems to have no choice or predilection, except in favour of large dogs: From this circumstance, it sometimes happens, that a small female, who has admitted a mastiff, perishes in bringing forth her young. During the time of copulation, these animals cannot separate themselves, but remain united so long as the erection subsists. This is owing to the structure of the parts. The dog has not only a bone in his penis, but in the middle of the corpus cavernosum there is a large hollow, which is blown up in the time of erection to a considerable bulk. The female, on the other hand, has a larger clitoris than perhaps any other animal; besides a large firm protuberance rises in the time of copulation, and remains perhaps longer than that of the male, and prevents him from retiring till it subsides: Accordingly after the act of copulation is over, the male turns about in order to rest himself on his legs, and remains in that position till these parts turn flaccid. The female goes with young about nine weeks. They generally bring forth from six to twelve puppies. Those of a small size bring forth five, four, and sometimes but two. They continue to copulate and bring forth during life, which lasts generally about fourteen or fifteen years. The whelps are commonly blind, and cannot open their eyes till the tenth or twelfth day. In the fourth month, they lose some of their teeth, which are soon succeeded by others.

The dog has such a strong resemblance to the wolf and the fox, that he is commonly supposed to be the production of one or other of these animals tamed and civilized. Bouffon informs us, that he kept a young dog and a young wolf together till they were three years of age, without their discovering the least inclination to copulate. He made the same experiment upon a dog and a fox; but their antipathy was rather increased when the female was in season. From these experiments he concludes, that dogs, wolfs, and foxes, are perfectly distinct species of animals.

With regard to the natural disposition of the dog: In a savage state, he is fierce, cruel, and voracious; but, when civilized and accustomed to live with men,

he is possessed of every amiable quality. He seems to have no other desire than to please and protect his master. He is gentle, obedient, submissive, and faithful. These dispositions, joined to his almost unbounded sagacity, justly claim the esteem of mankind. Accordingly no animal is so much caressed or respected: He is so ductile, and so much formed to please, that he assumes the very air and temper of the family in which he resides.

An animal endowed with such uncommon qualities, must answer many useful purposes. His fidelity and vigilance are daily employed to protect our persons, our flocks, or our goods. The acuteness of his smell gains him employment in hunting; in some parts of Siberia, he is trained to draw carriages from one inn to another; and the negroes eat dogs flesh with great relish.

The dog is liable to many diseases, as the scab, madness, &c. and he seldom wants the tænia or tape-worm in his guts, especially if he drinks dirty water. See Plate LXI. and LXII.

2. The second species of this kind is the lupus or wolf, which is distinguished from the dog by having its tail turned inward. The wolf is larger and fiercer than a dog. His eyes sparkle, and there is a great degree of fury and wiliness in his looks. He draws up his claws when he walks, to prevent his tread from being heard. His neck is short, but admits of very quick motion to either side. His colour is generally blackish. Like most ferocious animals, he can bear hunger a very long time; but, at last, when the appetite for victuals becomes intolerable, he grows perfectly furious, and will attack men, horses, dogs, and cattle of all kinds; even the graves of the dead are not proof against his rapacity. This circumstance is finely described, in the following lines.

By wintry famine rous'd,——  
Cruel as death, and hungry as the grave!  
Burning for blood! bony, and ghast, and grim!  
Assembling wolves in raging troops descend;  
And, pouring o'er the country, bear along,  
Keen as the north-wind sweeps the glossy snow.  
All is their prize. They fasten on the bleed,  
Press him to earth, and pierce his mighty heart.  
Nor can the bull his awful front defend,  
Or shake the murdering savages away.  
Rapacious at the mother's throat they fly,  
And tear the screaming infant from her breast.  
The god-like face of Man avails him nought.  
Even beauty, force divine! at whose bright glance  
The generous lion stands in soften'd gaze,  
Here bleeds, a hapless undistinguish'd prey.  
But if, appris'd of the severe attack,  
The country be shut up, lur'd by the scent,  
On church-yards drear (inhuman to relate!)  
The disappointed prowlers fall, and dig  
The shrouded body from the grave; o'er which,  
Mix'd with soul shades, and frighted ghosts, they howl.

THOMSON'S WINTER.

The wolf is extremely suspicious, and, unless pressed with hunger, seldom ventures out of the woods. They make a howling noise in the night, and assemble together in troops in order to devour their prey. The wolf is a native of Europe, and frequents the woods of many parts.

parts of the continent to this day. This country, a few centuries ago, was much infested with them. So late as the year 1477, there is an act of parliament obliging all the gentlemen and tenants in the different shires of Scotland, to rise, properly armed, four times in the year, in order to destroy the wolves. But they are now so effectually rooted out, that not one of them has been seen wild, even in the highlands, for a century past. See Plate LXII. fig. 5.

2. The hyæna, has a strait jointed tail, with the hair of its neck erect, small naked ears, and four toes on each foot. It is about the size of a fow, and its head resembles that of a boar. The hairs on the back are about a span long, erect, and black at the points, and the eyes are near each other. The hyæna is a native of India and Africa. He digs holes in the earth like a fox, where he retires from danger. He is very fond of human flesh, which he digs out of church-yards in the night. When irritated, he lays hold of a weapon, or any thing that offends, and keeps it fast in his teeth, which makes him an easy prey to hunters.

4. The vulpes, or fox, has a strait tail, white at the point. His body is yellowish, or rather straw-coloured; his ears are small and erect; his lips are whitish, and his fore-feet are black. From the base of the tail, a strong scent is emitted, which to some people is very fragrant, and to others extremely disagreeable. The fox is a native of almost every quarter of the globe: He digs holes or dens in the earth; and is of such a wild and savage disposition, that it is impossible fully to tame him. He is esteemed to be the most crafty and cunning of all beasts of prey. His craftiness is principally discovered by the schemes he falls upon in order to catch lambs, geese, hens, and all kinds of small birds. When the females are in season, they make a disagreeable yelping noise in the night. He flies when he hears the explosion of a gun, or smells gun-powder. He is exceedingly fond of grapes, and does much mischief in vineyards. Various methods are daily employed to destroy foxes; they are hunted with dogs; iron-traps are often set at their holes; and their holes are sometimes smoked to make them run out, that they may the more readily fall into the snares, or be killed by dogs or fire-arms. But all the arts that have been employed are insufficient for the purpose of rooting him out of any country. They have so many passages in their dens, and often at a great distance, that they often make their escape. When hunted, they never run directly forward, but make a great many doublings and turnings; and when in danger of being taken, they emit such a smell from their posteriors, that the hunters can hardly endure it. See Plate LXII. fig. 4.

5. The alopec, or field-fox, is every way the same with the common fox, except in the point of the tail, which is black.

6. The lagopus, or white fox, with a strait tail, and the apex of different colours. The legs are very hairy. It inhabits the mountains of Lapland and Siberia.

7. The aureus, or jackall, is a native of the East Indies. There is no genuine description of this animal. They assemble in large troops in the night, in several parts of Asia, and make a hideous howling noise. When one calls, he is answered by numbers even at great distances; so that in a short time the whole woods resound with their noise. This noise rouses all the other wild

animals, as lions, tygers, &c. who take advantage of the general consternation, and devour the weaker animals. This circumstance has probably given rise to the notion of the jackall's being the lion's provider. They hide themselves in holes during the day, and go in quest of their prey in the night: They sometimes fall upon children, and devour them when no assistance is near.

8. The Mexicanus, has a smooth crooked tail. The body is ash-coloured, variegated with yellow spots. It is a native of Mexico, and is called the mountain-cat by Seba.

9. The thous, has a smooth, crooked tail. The upper part of his body is grey, and the belly is white. He is about the size of a large cat, and is found at Surinam.

CANIS, the DOG-FISH, a name given to several species of *Squalus*. See *SQUALUS*.

CANIS *major*, in astronomy, a constellation of the southern hemisphere.

CANIS *minor*, CANICULUS, or CANICULA, in astronomy, a constellation of the northern hemisphere.

CANKER, a disease incident to trees, proceeding chiefly from the nature of the soil. It makes the bark rot and fall. If the canker be in a bough, cut it off; in a large bough, at some distance from the tree; and in a small one, close to it: But for over-hot strong ground, the mold is to be cooled about the roots with pond mud, and cow dung.

CANNA, in botany, a genus of the monandria monogynia class. There are four species of this plant, all natives of the Indies.

CANNABIS, hemp, in botany, a genus of the diœcia pentandria class. The calix of the male is divided into five segments, and it has no corolla. The calix of the female consists of one leaf, open at the side; it has two styli; and the nut or capule consists of two valves. There is but one species, *viz.* the sativa, or common hemp, a native of India. For the method of cultivating and preparing hemp, see *FLAX*, and *HEMP*.

CANNACORUS, in botany. See *CANNA*.

CANNEL-COAL, a substance which has a long time, though with very little reason, been confounded, both by authors and druggists, with jet. It is dug up in many parts of England in great abundance, particularly in Lancashire, where it is burnt as common fuel. It is worked into toys and utensils of various kinds, under the name of jet. In medicine, it is said to be good in the colic; but the present practice takes no notice of it.

CANNON, in the military art, an engine or fire-arm for throwing iron, lead, or stone bullets, by force of gun-powder.

Cannons at first were called bombardæ, from the noise they made. They had likewise the name of culverin, basilisk, &c. from the beasts that were represented upon them; and the Spaniards, from devotion, gave them the name of saints; witness the twelve apostles which Charles V. ordered to be cast at Malaga, for his expedition to Tunis.

The metal of which cannons are composed, is either iron, or which is more usual, a mixture of copper, tin, and brass; the tin being added to the copper.

*A. Bell sculpt.*

per, to make the metal more dense and compact; so that the better and heavier the copper is, the less tin is required. Some to an hundred pounds of copper, add ten of tin, and eight of brass; others ten of tin, five of brass, and ten of lead. The sieur Bereau pretends, that when only pieces of metal are used, the founder ought to add to one hundred weight of that metal, twenty-five pounds of good copper, and five pounds of tin. Braudius describes a method of making cannon of leather; and it is certain the Swedes made use of such in the long war of the last century; but these burst too easily to have much effect. With regard to iron cannon, they are not capable of so much resistance as those of brass; but as they are less expensive, they are often used on board of ships, and also in several fortified places.

Cannons are distinguished by the diameters of the balls they carry. The rule for their length is, that it be such as that the whole charge of powder be on fire, before the ball quit the piece. If it be too long, the quantity of air to be drawn out before the ball, will give too much resistance to the impulse; and that impulse ceasing, the friction of the ball against the surface of the piece will take off from the motion.

In former days, cannon were made much longer than they are now; but experience has taught us, that a ball moves with a greater impetus through a less space than a greater: and accordingly it is found, that an iron ball of forty-eight pound weight goes farther from a short cannon, than another ball of ninety-six pound out of a longer piece; whereas, in other respects, it is certain, the larger the bore and ball, the greater the range.

It is found too, by experience, that of two cannons of equal bore, but different lengths, the longer requires a greater charge of powder than the shorter. The ordinary charge of a cannon is, for the weight of its gun-powder to be half that of its ball.

We shall here subjoin a table exhibiting the names of the several cannon, their length, their weight, and that of their ball.

Names of cannon.	weight of an iron ball.	weight of the cannon.	length of the cannon.
	lb. oz.	lb.	f. inch.
Cannon royal	48 0	8000	12 0
Demi cannon large	36 0	6000	12 0
Demi cannon ordinary	32 0	5600	12 0
Demi cannon least	30 0	5400	11 0
Culverin largest	20 0	4800	12 0
Culverin ordinary	17 5	4500	12 0
Culverin least	15 0	4000	11 0
Demi culverin ordinary	10 11	2700	11 0
Demi culverin least	9 0	2000	10 0
Saker ordinary	6 0	1500	10 0
Saker least	4 12	1400	8 0
Minion largest	3 12	1000	8 0
Minion ordinary	3 4	800	7 0
Falcon	2 8	750	6 0
Falconet	1 5	400	5 6
Rabinet	0 8	300	5 6
Base	0 5	200	4 6

Cannon are likewise distinguished according to the diameter of their mouth, or calibre. This calibre is divided, in consequence of an order from the king of France, into thirty-six parts, in order to determine by these parts the dimensions of the different moulds for cannon. We hope the reader, then, will not be dissatisfied to find an account of the dimensions of the several parts of cannon of five different calibres, as they are regulated by that order of the king of France, on Oct. 7, 1732, in the following table:

Pieces of cannon	of 24			of 16			of 12			of 8			of 4		
	feet.	inch.	lines.	feet.	inch.	lines.	feet.	inch.	lines.	feet.	inch.	lines.	feet.	inch.	lines.
Length of the bore	9	6		9	2		8	8		7	10		6	6	
Depth of the chamber	2	6			1	10									
Thickness of metal at breech		5	5		4	9		4	4		3	9		3	
Length of the cascabel		10	11		9	6		8	8		7	7		6	
Diameter of the trunions		5	5		4	9		4	4		3	10		3	
Projection of the trunions		5	5		4	9		4	4		3	10		3	
Calibre of the piece		5	8		4	11		4	6		3	11		3	2
Diameter of the ball		5	6		4	9		4	4		3	9		3	
Length of the whole piece	11			10	6		10			8	10		7	3	
Weight of the piece	5400			4200			3200			2100			1150 lb.		

**CANNON**, with letter-founders and printers, the name of the largest size of the letters they use.

**CANNULA**, in surgery, a tube made of different metals, principally of silver and lead, but sometimes of iron.

They are introduced into hollow ulcers, in order to facilitate a discharge of pus or any other substance; or into wounds, either accidental or artificial, of the large cavities, as the thorax or abdomen: they are used in the operation of branchotomy, and by some, after cutting for the stone, as a drain for the urine.

Other cannulas are used for introducing cauteries, either actual or potential, in hollow parts, in order to guard the parts adjacent to that to be cauterised, from injury. They are of various figures; some being oval, some round, and others crooked.

**CANOE**, a small boat, made of the trunk of a tree, bored hollow; and sometimes also of pieces of bark sewed together.

It is used by the natives of America to go a-fishing in the sea, or upon some other expedition, either by sea, or upon the rivers and lakes.

**CANON**, commonly called prebendary, a person who possesses a prebend, or revenue allotted for the performance of divine service in a cathedral or collegiate church. Originally, canons were only priests, or inferior ecclesiastics, who lived in community, residing near the cathedral church to assist the bishop, depending entirely on his will, supported by the revenues of his bishopric, and living in the same house as his domestics or counsellors, &c. By degrees these communities of priests, shaking off their dependence, formed separate bodies; in time they freed themselves from their rules, and at length ceased to live in a community. It is maintained, that the colleges of canons, which have been introduced into each cathedral, were not in the ancient church, but are of modern appointment.

In the Romish church, when a person is promoted to the office of a canon, he must be presented in a very ceremonious manner to the chapter, who assemble in the cathedral, in order to receive him: he kisses the altar thrice, after which he goes and takes his place in the choir; he afterwards makes his confession of faith aloud, and swears to observe the ordinances of the church and his holiness the pope: being thus solemnly installed, he is empowered to assist at the chapter, to chaunt the office of the choir, &c.

Canons are of various kinds, as,

**Cardinal-CANONS**, those attached, or, as the Latins call it, *incardinati*, to a church, as a priest is to a parish.

**Domiciliary-CANONS**, young canons, who, not being in orders, had no right in any particular chapters.

**Eschetaive-CANONS** were such as, without having any revenue or prebend, had the titles and dignities of canons, a voice in the chapter, and a place in the choir, till such time as a prebend should fall.

**Foreign CANONS**, such as did not officiate in the canonicis to which they belonged. To these were opposed monastical canons.

**Regular CANONS**, those who still live in community, and who, like religious, have, to the practice of their rules, added the solemn profession of vows.

**Tertiary CANON**, a person who had only the third part of the revenues of the canonicate.

**CANON**, in an ecclesiastical sense, a law, rule, or regulation of the policy and discipline of a church, made by councils either general, national, or provincial.

**CANONS of the apostles**, a collection of ecclesiastical laws, which, though very ancient, were not left us by the apostles. It is true, they were sometimes called apostolic canons; but this means no more than that they were made by bishops, who lived soon after the apostles, and were called apostolical men. They consist of regulations, which agree with the discipline of the second and third centuries: The Greeks generally count eighty-five, but the Latins receive only fifty, nor do they observe all these.

**CANON of mass**, in the Romish church, the name of a prayer which the priest reads low to himself, the people kneeling.

In this part of the mass, the priest particularly mentions some persons for whom he is going to offer the sacrifices, and prays to God for the redemption of their souls, the hopes of their salvation, &c.

**Paschal CANON**, a table of the moveable feasts, shewing the day of Easter, and the other feasts depending on it, for a cycle of nineteen years.

**CANON of scripture**, a catalogue or list of the inspired writings, or such books of the Bible as are called canonical; because they are in the number of those books which are looked upon as sacred, in opposition to those which are either not acknowledged as divine books, or are rejected as heretical and spurious, and are called apocryphal.

**CANON**, in monastic orders, a book wherein the religious of every convent have a fair transcript of the rules of their order, frequently read among them, as their local statutes.

**CANON** is also used for the catalogue of saints acknowledged and canonized in the Romish church.

**CANON**, in music, a short composition of two or more parts, in which one leads, and the other follows: Or it is a line of any length, shewing, by its divisions, how-musical intervals are distinguished, according to the ratios, or proportions, that the sounds terminating the intervals, bear one to another, when considered according to their degree of being acute or grave.

**CANON-LAW**, a collection of ecclesiastical laws, serving as the rule and measure of church-government.

The power of making laws was exercised by the church before the Roman empire became Christian. The canon-law that obtained throughout the West, till the twelfth century, was the collection of canons made by Dionysius Exiguus in 520, the capitularies of Charlemagne, and the decrees of the popes, from Siricius to Anastasius.

The canon-law, even when papal authority was at its height in England, was of no force when it was found to contradict the prerogative of the king, the laws,

laws, statutes, and customs of the realm, or the doctrine of the established church.

The ecclesiastical jurisdiction of the see of Rome in England, was founded on the canon-law; and this created quarrels between kings and several archbishops and prelates, who adhered to the papal usurpation.

Besides the foreign canons, there were several laws and constitutions made here for the government of the church; but all these received their force from the royal assent: And if, at any time, the ecclesiastical courts did, by their sentence, endeavour to enforce obedience to such canons, the courts at common law, upon complaints made, would grant prohibitions. The authority vested in the church of England of making canons, was ascertained by a statute of Henry VIII. commonly called the act of the clergy's submission; by which they acknowledged, that the convocation had been always assembled by the king's writ; so that though the power of making canons resided in the clergy met in convocation, their force was derived from the authority of the king's assenting to, and confirming them.

The old canons continued in force till the reign of James I. when the clergy being assembled in convocation, the king gave them leave to treat and consult upon canons: which they did, and presented them to the king, who gave them the royal assent: These were a collection out of the several preceding canons and injunctions. Some of these canons are now obsolete. In the reign of Charles I. several canons were passed by the clergy in convocation.

**CANONESS**, in the Romish church, a woman who enjoys a prebend, assigned, by the foundation, to maids, without their being obliged to renounce the world, or make any vows.

**CANONIZATION**, a ceremony in the Romish church, by which persons deceased are ranked in the catalogue of the saints. It succeeds beatification. See **BEATIFICATION**.

Before a beatified person is canonized, the qualifications of the candidate are strictly examined into, in some consistories held for that purpose; after which one of the consistorial advocates, in the presence of the pope and cardinals, makes the panegyric of the person who is to be proclaimed a saint, and gives a particular detail of his life and miracles: Which done, the holy father decrees his canonization, and appoints the day.

On the day of canonization, the pope officiates in white, and their eminences are dressed in the same colour. St Peter's church is hung with rich tapestry, upon which the arms of the pope, and of the prince or state requiring the canonization, are embroidered in gold and silver. An infinite number of lights blaze all round the church, which is crowded with pious souls, who wait with a devout impatience, till the new saint has made his public entry, as it were, into paradise, that they may offer up their petitions to him, without danger of being rejected.

The following maxim, with regard to canonization, is now observed, though it has not been followed a-

bove a century, *viz.* not to enter into the inquiries prior to canonization, till fifty years, at least, after the death of the person to be canonized. By the ceremony of canonization, it appears, that this rite of the modern Romans, has something in it very like the apothecis or dedication of the ancient Romans, and in all probability owes its rise to it; at least, several ceremonies of the same nature are conspicuous in both.

**CANONOR**, a town on the Malabar coast, in the Hither India: E. long. 75°, N. lat. 10°.

Here the Dutch have a fort and factory, which they took from the Portuguese in 1563.

**CANONRY**, the benefice filled by a canon. It differs from a prebend, in that the prebend may subsist without the canonicate; whereas the canonicate is inseparable from the prebend; again, the rights of suffrages, and other privileges, are annexed to the canonicate, and not to the prebend.

**CANOPUS**, in astronomy, a star of the first magnitude in the rudder of Argo, a constellation of the southern hemisphere. See **ASTRONOMY**, *Of the fixed stars*.

**CANTABRICA**, in botany, a synonyme of a species of convolvulus. See **CONVOLVULUS**.

**CANTALIVERS**, in architecture, pieces of wood framed into the front or other sides of a house, to suspend the mouldings and eyes over it.

**CANTAR**, or **CANTARO**, in commerce, a weight used in Italy, particularly at Leghorn, to weigh some sorts of merchandises.

There are three sorts of cantari, or quintals, one weighs 150 pounds, the other 151, and the third 160: The first serves to weigh alum and cheese, the second is for sugar, and the third for wool and codfish.

**CANTAR** is also a measure of capacity used at Cochin, and containing four rubis.

**CANTATA**, in music, a song or composition, intermixed with recitatives, airs, and different movements, chiefly intended for a single voice, with a thorough bass, though sometimes for other instruments.

The cantata when performed with judgment, has something in it very agreeable; the variety of the movement not clogging the ear, like other compositions. It was first used in Italy, then in France, whence it passed to us.

**CANTERBURY**, the capital city of Kent. fifty-five miles east of London, and sixteen north-west of Dover: E. long. 1° 15'. N. lat. 51° 10'.

It is a county of itself, and the see of an archbishop, who is primate and metropolitan of all England. It is a large, populous, and trading city; has a good silk manufactory, and sends two members to parliament.

**CANTERBURY-BELL**, in botany. See **CAMPANULA**.

**CANTHARIS**, in zoology, a genus of insects belonging to the order of insects coleoptera. The feelers of this genus are setaceous; the breast is margined, and shorter than the head; the elytra, or wing-cases, are flexile; and the sides of the belly are plaited and papillous. Linnæus enumerates 27 species of the cantharis, most of them to be found in different parts of

Eutæpe

Europe. The cantharis used in making blistering plasters, is ranked under a different genus, *viz.* the Meloe. See MELOE.

CANTICLES, a canonical book of the Old Testament. The Talmudists ascribe it to Hezekiah, but the learned are agreed that king Solomon was the author of it; and his name is prefixed to it in the title of the Hebrew text, and of the ancient Greek version.

CANTO, in music, the treble, or at least the higher part of a piece.

This word more properly signifies the first treble, unless the word *secundo*, for the second, or *ripieno*, for the treble of the grand chorus, be added.

CANTON, in geography, denotes a small country, or district, constituting a distinct government: such are the cantons of Switzerland.

CAN-TOON is also the name of a large, populous, and wealthy city and port-town of China, situated on the river Ta, about fifty miles from the Indian ocean: E. long. 112° 30', N. lat. 23° 25'.

It is a fortified place, within the walls of which no Christians are permitted to enter, notwithstanding their great trade thither; it being from thence that they import all manner of Chinese goods, as china-ware, tea, cabinets, raw and wrought silks, gold-dust, &c.

CANTONING, in the military art, is the allotting distinct and separate quarters to each regiment of an army; the town where they are quartered, being divided into so many cantons, or divisions, as there are regiments.

CANTRED, or CANTREF, signifies an hundred villages, being a British word, compounded of the adjective *cant*, i. e. hundred, and *tres*, a town or village. In Wales, some of the countries are divided into cantreds, as in England into hundreds.

CANVAS, in commerce, a very clear unbleached cloth of hemp, or flax, wove very regularly in little squares. It is used for working tapestry with the needle, by passing the threads of gold, silver, silk, or wool, through the intervals or squares.

CANVAS is also a coarse cloth of hemp, unbleached, somewhat clear, which serves to cover womens stays, also to stiffen mens cloaths, and to make some other of their wearing-apparel, &c.

CANVAS is also a very coarse cloth made of hemp, unbleached, serving to make towels, and answering other domestic purposes. It is also used to make sails for shipping, &c.

CANVAS is used among the French, for the model and first words, where an air or piece of music is composed, and given to a poet to regulate and finish.

CANATUS, in ornithology, the trivial name of a species of tringa. See TRINGA.

CANZONE, in music, signifies, in general, a song where some little figures are introduced: But it is sometimes used for a sort of Italian poem, usually pretty long, to which music may be composed in the style of a cantata. If this term be added to a piece of instrumental music, it signifies much the same as cantata: If placed in any part of a sonata, it implies the same meaning as *allegro*, and only denotes that

the part to which it is prefixed, is to be played or sung in a brisk and lively manner.

CANZONETTA, a diminutive of canzone, denoting a little short song: The canzonette neapolitane have two strains, each whereof is sung twice over, as the vau-devilles of the French: The canzonette siciliane are a species of jigg, the measure whereof is usually twelve eights, and six eights, and sometimes both, as rond-deaus.

CAP, a part of dress made to cover the head, much in the figure thereof.

The use of caps and hats is referred to the year 1449, the first seen in these parts of the world being at the entry of Charles VII. into Rouen: from that time they began to take place of the hoods, or chaperons, that had been used till then. When the cap was of velvet, they called it mortier; when of wool, simply bonnet. None but kings, princes, and knights, were allowed the use of the mortier. The cap was the head-dress of the clergy and graduates: Churchmen and members of universities, students in law, physic, &c. as well as graduates, wear square caps in most universities. Doctors are distinguished by peculiar caps, given them in assuming the doctorate. Pasquier says, that the giving the cap to students in the universities, was to denote that they had acquired full liberty, and were no longer subject to the rod of their superiors, in imitation of the ancient Romans, who gave a pileus or cap to their slaves, in the ceremony of making them free. The cap is also used as a mark of infamy in Italy. The Jews are distinguished by a yellow cap at Lucca, and by an orange one in France.

CAP of maintenance, one of the regalia, or ornaments of state belonging to the kings of England, before whom it was carried at the coronation, and other great solemnities. Caps of maintenance are also carried before the mayors of the several cities in England.

CAPE, in geography, an high land running out with a point, into the sea, as Cape-Nord, Cape-Horn, the Cape of Good-Hope, &c.

CAPE of Good-Hope. See GOOD-HOPE.

CAPE-coast-castle, the principal British fort and settlement on the gold-coast of Guinea, situated under the meridian of London, in 5° N. lat.

CAPELLA, in astronomy, a bright fixed star in the left shoulder of the constellation auriga.

CAPER, in botany. See CAPPARIS.

CAPERQUIN, a town of Ireland, in the county of Waterford, and province of Munster, situated on the river Blackwater: W. long. 7° 50', and N. lat. 52° 5'.

CAPHAR, a duty which the Turks raise on the Christians, who carry or send merchandises from Aleppo to Jerusalem, and other places in Syria.

This duty of caphar was first imposed by the Christians themselves, when they were in possession of the Holy land, for the maintenance of the troops, which were planted in difficult passes, to observe the Arabs, and prevent their incursions. It is still continued, and much increased by the Turks, under pretence of defending the Christians against the Arabs, with whom, never-

nevertheless, they keep a secret intelligence, favouring their excursions and plunders.

**CAPI-AGA**, or **CAPOU-AGASSI**, a Turkish officer, who is, as it were, grand-master of the seraglio.

He is the first in dignity and repute of all the white eunuchs, and is always near the Grand Signior's person. It is he who introduces ambassadors to audience; and all great affairs pass through his hands before they come to that of the prince.

**CAPIAS**, in law, a writ of two sorts, one before judgment in an action, and the other after: That before judgment is called *capias ad respondendum*, where an original is sued out, &c. to take the defendant, and make him answer the plaintiff; and that after judgment is the *capias ad satisfaciendum*, &c.

**CAPIGI**, in the Turkish affairs, the name of certain inferior officers belonging to the seraglio, to the number of five hundred, whose business is to assist the janizaries in guarding the first and second gate of that palace; whence also the name *capighi*, which signifies a gate.

**CAPILLAMENT**, in a general sense, signifies a hair, whence the word is applied to several things, which, on account of their length or their fineness, resemble hairs: As,

**CAPILLAMENTS of the nerves**, in anatomy, the fine fibres, or filaments, whereof the nerves are composed.

**CAPILLARY**, in a general sense, an appellation given to things on account of their extreme fineness, or resembling hair.

**CAPILLARY tubes**, in physics, little pipes whose canals are extremely narrow, their diameter being only a half, third, or fourth of a line. See **HYDROSTATICS**.

**CAPILLUS veneris**, in botany. See **ADIANTHUM**.

**CAPITAL**, in geography, denotes the principal city of a kingdom, province, or state.

**CAPITAL**, among merchants, traders, and bankers, signifies the sum of money which individuals bring to make up the common stock of a partnership.

**CAPITAL crime**, such a one as subjects the criminal to capital punishment, that is, the loss of life.

**CAPITAL**, in architecture, the uppermost part of a column or pilaster, serving as the head, or crowning, and placed immediately over the shaft, and under the entablature. See **ARCHITECTURE**.

**CAPIATANATE**, a province of the kingdom of Naples, situated on the gulf of Venice, and having the province of Molise on the north, and the Principate on the south.

**CAPITANIA**, in geography, an appellation given to the twelve governments established by the Portuguese in the Brasils.

**CAPITATION**, a tax or imposition raised on each person in consideration of his labour, industry, office, rank, &c. It is a very ancient kind of tribute. The Latins call it *tributum*, by which taxes on persons are distinguished from taxes on merchandise, which were called *vectigalia*.

Capitations are never practised among us but in exigencies of state. In France, the capitation was in-

VOL. II. Numb. 31.

3

roduced by Lewis XIV. in 1695, and is a tax very different from the *taille*, being levied from all persons whether they be subject to the *taille* or not. The clergy pay no capitation, but the princes of the blood are not exempted from it.

**CAPITOL**, in antiquity, a castle on the Mons Capitolinus at Rome, where there was a temple dedicated to Jupiter, in which the senate anciently assembled. The capitol consisted of three parts; a nave, sacred to Jupiter; and two wings, the one consecrated to Juno, and the other to Minerva: It was ascended to by stairs; the frontispiece and sides were surrounded with galleries, in which those who were honoured with triumphs entertained the senate at a magnificent banquet, after the sacrifices had been offered to the gods.

Both the inside and outside were enriched with infinite ornaments, the most distinguished of which was the statue of Jupiter, with his golden thunder-bolt, his sceptre, and crown. In the capitol also were a temple to Jupiter the guardian, and another to Juno, with the mint; and on the descent of the hill was the temple of Concord.

This beautiful edifice contained the most sacred deposits of religion, such as the *ancylia*, the books of the *sybils*, &c.

**CAPITOLINE games**, annual games instituted by Camillus, in honour of Jupiter Capitolinus, and in commemoration of the capitol's not being taken by the Gauls. Plutarch tells us, that a part of the ceremony consisted in the public crier's putting up the *Hetrurians* to sale by auction: They also took an old man, and, tying a golden bulla about his neck, exposed him to the public derision. Festus says, they also dressed him in a *prætexta*. There was another kind of *capitoline games*, instituted by Domitian, wherein there were rewards and crowns bestowed on the poets, champions, orators, historians, and musicians. These last *capitoline games* were celebrated every five years, and became so famous, that instead of calculating time by *lustra*, they began to count by *capitoline games*, as the Greeks did by *olympiads*. It appears, however, that this custom was not of long continuance.

**CAPITOUL**, an appellation given to the chief magistrates of Tholouse, on account of their meeting in a place called the Capitol: They are eight in number, are chosen annually, and have each the government of a *capitoulate*, or precinct, like the wards of London.

**CAPITULATION**, in military affairs, a treaty made between the garrison or inhabitants of a place besieged, and the besiegers, for the delivering up the place on certain conditions.

The most honourable and ordinary terms of capitulation are, to march out at the breach, with arms and baggage, drums beating, colours flying, a march lighted at both ends, and some pieces of cannon, waggons and convoys for their baggage, and for the sick and wounded.

**CAPITULATION**, in the German polity, a contract which the emperor makes with the electors, in the name of all the princes and states of the empire, before he is declared emperor, and which he ratifies before

†

H

fore

fore he is raised to that sovereign dignity. The principal points which the emperor undertakes to observe, are, 1. To defend the church and the empire. 2. To observe the fundamental laws of the empire. And, 3. To maintain and preserve the rights, privileges, and immunities of the electors, princes, and other states of the empire, specified in the capitulation. These articles and capitulations are presented to the emperor by the electors only, without the concurrence of the other states, who have complained from time to time of such proceedings; and in the time of the Westphalian treaty, in 1648, it was proposed to deliberate in the following diet, upon a way of making a perpetual capitulation; but the electors have always found means of eluding the execution of this article. In order however to give some satisfaction to their adversaries, they have inserted in the capitulations of the emperors, and in that of Francis I. in particular, a promise to use all their influence to bring the affair of a perpetual capitulation to a conclusion. Some German authors own, that this capitulation limits the emperor's power; but maintain that it does not weaken his sovereignty: Though the most part maintain, that he is not absolute, because he receives the empire under conditions which set bounds to an absolute authority.

**CAPNOIDES**, in botany, the trivial name of a species of fumaria. See **FUMARIA**.

**CAPON**, a cock-chicken, gelded as soon as left by the dam, or as soon as he begins to crow. They are of use either to lead chickens, ducklings, pheasants, &c. and defend them from the kites and buzzards; or to feed for the table, they being reckoned more delicate than either a cock or a hen.

**CAPPACIA**, a town of the hither principate, in the kingdom of Naples. It is a bishop's see, and situated about fifty-five miles south-east of the city of Naples: E. long. 15° 20', and N. lat. 40° 40'.

**CAPPARIS**, in botany, a genus of the polyandria monogynia class. The calix consists of four coriaceous leaves; the corolla has four petals; the stamina are long; and the capsule is fleshy within, unilocular, and supported by a pedunculus. There are ten species, none of which are natives of Britain.

**CAPRA**, or **GOAT**, a genus of quadrupeds belonging to the order of pecora. The horns are hollow, turned upwards, erect, and scabrous. There are eight fore-teeth in the under jaw, and none in the upper; and they have no dog-teeth. This genus consists of twelve species, viz.

1. The hircus, or common goat, with arched carinated horns, and a long beard. The goat of Angora is only a variety of this species; its hair is white, and hangs down to the feet; and the ears are plain and pendent. The common goat is a native of the eastern mountains. See Plate LXIII.

The goat is an animal of more sagacity than the sheep. Instead of having an antipathy at mankind, they voluntarily mingle with them, and are easily tamed. Even in uninhabited countries, they betray no savage dispositions. In the year 1698, an English vessel having put in to the island of Bonovista, two

negroes came aboard, and offered gratis to the captain as many goats as he pleased. The captain expressed his astonishment at this offer. But the negroes replied, that there were only twelve persons in the island; that the goats had multiplied to such a degree, that they were become extremely troublesome; and that, instead of having any difficulty in catching them, they followed the men where-ever they went, and were so obstinately officious, that they could not get quit of them upon any account whatever.

Goats are sensible of caresses, and capable of a considerable degree of friendship. They are stronger, more agile, and less timid than sheep. They have a lively, capricious, and wandering disposition; are fond of high and solitary places; and frequently sleep upon the very points of rocks. They are more easily supported than any other animal of the same size; for there is hardly an herb or the bark of a tree, which they will not eat with pleasure. Neither are they liable to so many diseases as sheep: They can bear heat and cold with less inconvenience. The actions and movements of animals depend more upon the force and variety of their sensations, than the structure of their bodies: The natural inconstancy or fancifulness of goats is accordingly expressed by the irregularity of their actions: They walk, stop short, run, jump, shew, and hide themselves, as it were by mere caprice, and without any other cause than what arises from the natural vivacity of their temper.

The buck will copulate when he is a year old, and the female when she is seven months. But as this is rather premature, they are generally restrained till they be eighteen months or two years. The buck is bald, beautiful, and vigorous; one is sufficient to serve 150 females. A buck for propagation should be large, handsome, and about two years of age; his neck should be short, and fleshy; his head slender; his ears pendent; his thighs thick; his limbs firm; his hair black, thick, and soft; and his beard should be long, and bushy. The females are generally in season from September to the end of November. The time of going with young is five months. They generally produce one kid, sometimes two, seldom three, and never more than four; and continue fruitful till they be seven years of age: But a buck is seldom kept after he is five.

Goat's flesh is not so good as mutton: The rank smell of the buck does not proceed from the flesh, but from the skin.

The food of this animal costs next to nothing, as it lives mostly upon such plants as are rejected by other cattle, and can support itself even upon the most barren mountains. But their produce is valuable. Cheese is made of their milk, which besides is reckoned good in consumptions, and other diseases. Their flesh, tallow, hair, and hides, are all useful and saleable commodities.

2. The ibex, has large knotty horns reclined upon its back, is of a yellowish colour, and its beard is black. This species is a native of Crete: and is likewise to be met with in the mountains of some of the northern parts of Europe.

3. The

CAPRA HIRCUS,  
*or Common Goat.*

CERVUS DAMA,  
*or Buck.*

CAPRIMULGUS,  
*or Goat Sucker.*

2. The *nambrica*, with reclined horns, about the length of the neck, pendent ears, and a beard. It is a native of India.

4. The *tupicapra*, or shamoy-goat, has erect and hooked horns. It inhabits the inaccessible mountains of Switzerland. The body is of a dusky red colour; but the front, top of the head, gullet, and inside of the ears are white; the under part of the tail is blackish; and the upper lip is a little divided. They seldom descend from the mountains but in hard winters, when they come down to feed upon the branches and barks of fir-trees, &c. On occasions of this kind, one of the herd always keeps watch to give notice to the rest of any approaching danger.

5. The *depressa*, is an American goat, with small depressed horns, bent inwards and lying upon the head. It is about the size of a kid; and the hair is long and pendulous.

6. The *reversa*, is likewise an American goat, with erect horns curved back at the points. It is about the size of a kid of a year old.

7. The *gazella*, is an Indian goat, with long, erect, cylindrical horns, annulated near the base.

8. The *cervicapra*, is likewise an Indian goat, with plaited, cylindrical horns. The hair near the horns is longer than in any other part of the body.

9. The *Bezoartica*, or Bezoar-goat, is bearded, and has cylindrical, arched, and wholly annulated horns. It is a native of Persia. The bezoar is found in one of the stomachs called *abomasus*. See *BEZOAR*.

10. The *dorcas*, or antelope, has cylindrical, annulated horns, bent backward, contorted, and arising from the front between they eyes. It is a native of Africa and Mexico.

11. The *tartarica*, has cylindrical, strait, annulated horns, diaphanous at the points. It has no beard, and is found in the northern parts of Asia.

12. The *ammon*, has semicircular, plain, white horns, and no beard. It is about the size of a ram, and is a native of Siberia.

**CAPRAIA**, an island on the coast of Tuscany, about thirty miles south-west of Leghorn: E. long.  $11^{\circ}$ , and N. lat.  $43^{\circ} 15'$ .

**CAPRARIA**, in botany, a genus of the didynamia angiospermia class. The calix is divided into five segments; the corolla is bell-shaped, and divided into five parts; the capsule has two valves, and contains many seeds. There are three species, none of them natives of Britain.

**CAPRAROLA**, a town of St Peter's patrimony in Italy, about twenty miles north of the city of Rome, and eight south of Viterbo: E. long.  $13^{\circ}$ , and N. lat.  $42^{\circ} 20'$ .—It is a bishop's see.

**CAPRI**, or **CAPREA**, a city and island at the entrance of the gulf of Naples, about twenty miles south of that city: E. long.  $14^{\circ} 50'$ , and N. lat.  $40^{\circ} 45'$ .

The island is only four miles long, and one broad; the city is a bishop's see, situated on a high rock, at the west end of the island.

**CAPRICORN**, in zoology. See *MORDELLA*.

**CAPRICORN beetle**. See *CERAMBYX*.

**CAPRICORN**, in astronomy, one of the twelve signs of the zodiac.

**Tropic of CAPRICORN**, a lesser circle of the sphere, which is parallel to the equinoctial, and at  $23^{\circ} 30'$  distance from it southwards.

**CAPRIFICATION**, a method used in the Levant, for ripening the fruit of the domestic fig-tree, by means of insects bred in that of the wild fig-tree.

It is said, that these figs will never come to maturity, unless wounded by the insects depositing their eggs. Possibly the reason of this effect, may be their lacerating the vessels of the fruit, and thereby deriving thither a greater quantity of nutritious juice.

Plumbs and pears, wounded in the same manner, are found to ripen soonest, and the pulp about the wound has a more exquisite taste than the rest.

**CAPRIFICUS**, in botany. See *FICUS*.

**CAPRIFOLIUM**, in botany. See *LONICERA*.

**CAPRIMULGUS**, **GOAT-SUCKER**, or **FERN-OWL**, in ornithology, a genus of birds belonging to the order of passerines. The beak is incurvated, small, tapering, and depressed at the base; the hairs at the mouth, which it opens very wide, are placed in a row. There are two species, viz. the *Europæus*, with the tubes of the nostrils hardly visible. It is a native of Europe, and feeds upon moths and nocturnal insects. This bird is said to suck goats in the night. See *Pl.* 63. 2. The *Americanus*, has the tubes of the nostrils very conspicuous. This is a night-bird, and is found in America.

**CAPRIOLES**, in the menage, leaps that a horse makes in the same place, without advancing, in such a manner, that when he is at the height of the leap, he jerks out with his hinder legs even and near. It is the most difficult of all the high menage. It differs from a croupade in this, that in a croupade the horse does not shew his shoes; and from a ballotade, because in this he does not jerk out. To make a horse work well at caprioles, he must be put between two pillars, and taught to raise first his fore-quarters, and then his hind-quarters, while his fore are yet in the air, for which end you must give the whip and the poinçon.

**CAPSICUM**, or **GUINEA-PEPPER**, a genus of the pentandria monogynia class. The corolla is rotated, and the berry wants juice. There are two species, both natives of the Indies. The seeds are used in sauces and pickles.

**CAPSQUARES**, in gunnery, strong plates of iron which come over the trunnions of a gun, and keep it in the carriage.

They are fastened by a hinge to the prize-plate, that they may lift up and down, and form a part of an arch in the middle to receive a third part of the thickness of the trunnions; for two thirds are let into the carriage, and the other end is fastened by two iron wedges, called the fore-locks and keys.

**CAPSTAN**, or **MAIN-CAPSTAN**, in a ship, a great piece of timber in the nature of a windlass, placed next behind the main-mast, its foot standing in a sleep on the lower deck, and its head between the upper decks; formed into several squares with holes in them. Its use

use is to weigh the anchors, to hoist up or strike down top-masts, to heave any weighty matter, or to strain any rope that requireth a main force.

*Jear* CAPSTAIN is placed between the main-mast and the mizen, and serves to strain any rope, heave up on the jear rope or upon the vial, or hold off by at the weighing of an anchor.

CAPSTAN-*birs*, the pieces of wood that are put into the capstan-holes, to heave up any thing of weight into the ship.

*Panel of a* CAPSTAN, a short piece of iron made fast to the deck, and resting upon the whelps, to keep the capstan from recoiling, which is of dangerous consequence.

*Whelps of a* CAPSTAN are short pieces of wood, made fast to it, to keep the cable from coming too nigh, in turning it about.

*Pawling the* CAPSTAN, is stopping it from turning by means of the pawl.

*Come up* CAPSTAN, or *launch out the* CAPSTAN, that is, slacken the cable which you heave by.

CAPSULE, in a general sense, denotes a receptacle, or cover in form of a bag.

CAPSULE, among botanists, a species of pericarpium, or seed-vessel, composed of several dry elastic valves, which usually burst open at the points, when their seeds are ripe: It differs from a pod, in being roundish and short. This kind of pericarpium sometimes contains one cell or cavity, sometimes more: In the first case it is called unilocular, as it is bilocular, trilocular, &c. when it contains two, three, &c. cells or cavities.

CAPSULÆ *atrabiliuriae*, called also *glandula renales*, and *renes succenturiati*. See p. 269.

CAPTAIN, a military officer, whereof there are various kinds, according to their commands.

CAPTAIN *of a troop or company*, an inferior officer, who commands a troop of horse, or company of foot, under a colonel. In the same sense we say, captain of dragoons, of grenadiers, of marines, of invalids, &c.

In the horse and foot guards, the captains have the rank of colonels.

CAPTAIN *general*, he who commands in chief.

CAPTAIN *lieutenant*, he who with the rank of captain, but the pay of lieutenant, commands a troop or company in the name and place of some other person who is dispensed with on account of his quality from performing the functions of his post.

Thus the colonel, being usually captain of the first company of his regiment; that company is commanded by his deputy, under the title of captain-lieutenant.

So in England, as well as in France, the king, queen, dauphin, princes, &c. have usually the title of captains of the guards, *gens d'armes*, &c. the real duty of which offices is performed by captain-lieutenants.

CAPTAIN *reformed*, one who, upon the reduction of the forces, has his commission and company suppressed; yet is continued captain, either as second to another, or without any post or command at all.

CAPTAIN *of militia*, he who commands a company of the militia, or trained bands. See MILITIA.

CAPTAIN *of a ship of war*, the commanding officer of a ship, galley, fire-ship, or the like. This officer ranks with a colonel in the land-service.

CAPTAIN *of a merchant ship*, he who has the direction of the ship, her crew, and lading, &c. In small ships and short voyages, he is more ordinarily called the master. In the mediterranean, he is called the patron.

The proprietor of the vessel appoints the captain or master, and he is to form the crew, and chuse and hire the pilots, mates, and seamen; though, when the proprietor and master reside on the same spot, they generally act in concert together.

CAPTAIN BASHAW, or CAPONDAN BASHAW, in the polity of the Turks, signifies the Turkish high admiral. He possesses the third office of the empire, and is invested with the same power at sea that the vizir has on shore. Soliman II. instituted this office in favour of the famous Barbarossa, with absolute authority over the officers of the marine and arsenal, whom he may punish, cashier, or put to death, as soon as he is without the Dardanelles. He commands in chief in all the maritime countries, cities, castles, &c. and, at Constantinople, is the first magistrate of police in the villages on the side of the Porte, and the canal of the Black-sea. The mark of his authority is a large Indian cane, which he carries in his hand, both in the arsenal and with the army.

The captain-bashaw enjoys two sorts of revenues; the one fixed, the other casual. The first arise from a capitation of the islands in the Archipelago, and certain governments in Natolia and Galipoli. The latter consist in the pay of the men who die during a campaign; in a fifth of all prizes made by the begs; in the profits accruing from the labour of the slaves, whom he hires as rowers to the grand signior; and in the contributions he exacts in all places where he passes.

CAPTION, in Scots law, a writ issuing under his majesty's signet, in his majesty's name, obtained at the instance of a creditor in a civil debt, commanding messengers at arms and other officers of the law to apprehend and imprison the person of the debtor until he pay the debt. See SCOTS LAW, title, *Sentences and their execution*.

CAPTIVITY, a punishment which God inflicted upon his people for their vices and infidelities. The first of these captivities is that of Egypt, from which Moses delivered them; after which, are reckoned six during the government of the judges; but the greatest and most remarkable, were those of Judah and Israel, which happened under the kings of each of these kingdoms. It is generally believed, that the ten tribes of Israel never came back again after their dispersion; and Josephus and St Jerom are of this opinion: nevertheless, when we examine the writings of the prophets, we find the return of Israel from captivity pointed out in a manner almost as clear as that of the tribes of Benjamin and Judah. See Hosea i. 10. xi. 12. Amos ix. 14. Isaiah xi. 13, 14. Ezekiel xxxvii. 16, &c.

The

The captivities of Judah are generally reckoned four; the fourth and last of which fell in the year of the world 3416, under Zedekiah; and from this period begins the seventy years captivity, foretold by Jeremiah.

Since the destruction of the temple by the Romans, the Hebrews boast, that they have always had their heads, or particular princes, whom they call princes of the captivity, in the east and west. The princes of the captivity in the east governed the Jews who dwelt at Babylon, in Chaldaea, Assyria, and Persia; and the prince of the captivity in the west governed those who dwelt in Judea, Egypt, Italy, and in other parts of the Roman empire. He who resided in Judæa, took up his abode commonly at Tiberias, and assumed the title of Rofchabboth, head of the fathers or patriarchs. He presided in assemblies, decided in cases of conscience, levied taxes for the expences of his visits, and had officers under him, who were dispatched through the provinces, for the execution of his orders. As to the princes of the captivity of Babylon, or the east, we know neither the original nor succession of them; it appears only, that they were not in being before the end of the second century.

**CAPTURE** signifies, particularly, prizes taken by privateers in time of war.

**CAPUA**, a city of the province of Lavoro, in the kingdom of Naples, situated on the river Volturno, about fifteen miles north-west of the city of Naples: E. long. 15°, and N. lat. 41° 20'.

It is the see of an archbishop.

**CAPUCHINS**, in the church of Rome. See **FRANCISCANS**.

**CAPUT mortuum**, in chemistry, that thick dry matter which remains after distillation of any thing, but of minerals especially.

**CAPY-BARA**, in zoology. See **SUS**.

**CARABINE**, a fire-arm, shorter than a musket, carrying a ball of twenty-four in the pound, borne by the light-horse, hanging at a belt over the left shoulder.

The barrel is two feet and a half long, and is sometimes furrowed spirally within, which is said to add to the range of the piece.

**CARABINEERS**, or **CARABINIERS**, regiments of light horse, carrying longer carabines than the rest, and used sometimes on foot.

**CARABUS**, in zoology, a genus of insects belonging to the order of insecta coleoptera. The feelers are bristly; the breast is shaped like a heart, and margined; and the elytra are likewise margined. There are 43 species of this genus, mostly distinguished by their colour.

**CARACATY**, a large country in the north of Asia, extending from the wall of China to the ancient Mogolistan.

**CARACOL**, in the menage. the half turn which a horseman makes, either to the right or left.

In the army, the horse always make a caracol after each discharge, in order to pass to the rear of the squadron.

VOL. II. No. 31.

†

I

thagna;

**CARACOL**, in architecture, denotes a stair-case in a helix or spiral form.

**CARACOLI**, a kind of metal, of which the Caribbees, or natives of the Lesser Antilles, make a sort of ornament in the form of a crescent, which they also call caracoli.

This metal comes from the main land; and the common opinion is, that it is a compound of silver, copper, and gold, something like the Corinthian brads among the ancients. These metals are so perfectly mixed and incorporated together, that the compound which results from them, it is said, has a colour that never alters, how long soever it remains in the sea, or under ground. It is something brittle, and they who work at it, are obliged to mix a large proportion of gold with it, to make the compound more tough and malleable.

**CARACT**, **CARAT**, or **CARRAT**, the name of that weight which expresses the degree of fineness that gold is of.

The mint-master, or custom, have fixed the purity of gold at 24 carats; though it is not possible so to purify and refine that metal, but it will want still about one fourth part of a carat in absolute purity and perfection. The carat is divided into  $\frac{1}{4}$ ,  $\frac{1}{8}$ ,  $\frac{1}{16}$ , and  $\frac{1}{32}$ . These degrees serve to distinguish the greater or lesser quantity of alloy therein contained; for instance, gold of 22 carats, is that which has two parts of silver, or of any other metal, and 22 of fine gold.

**CARACT** is also a certain weight which goldsmiths and jewelers use wherewith to weigh precious stones and pearls.

This carat weighs four grains, but something lighter than the grains of other weights. Each of these grains is subdivided into  $\frac{1}{4}$ ,  $\frac{1}{8}$ ,  $\frac{1}{16}$ ,  $\frac{1}{32}$ , &c.

**CARAGROUTH**, in commerce, a silver-coin of the empire, weighing nine drachms. It goes at Constantinople for 120 aspers. There are four sorts of them, which are all equally current, and of the same value.

**CARAGUATA**, in botany. See **TILLANDSIA**.

**CARAITES**, in the ecclesiastical history of the Jews, a religious sect among that people, who adhere closely to the text and letter of the scriptures, rejecting the rabbinical interpretations, and the cabbala. The Caraites pass for the most learned of the Jewish doctors; they are chiefly to be met with in Poland, Muscovy, and the east: they are but few in comparison of the bulk of the Jews, who are of the party of the rabbins: the latter have so great an aversion for the Caraites, that they will have no alliance, nor even conversation with them: they treat them as bastards; and if a carait would turn rabbinist, the other Jews would not receive him.

**CARAMANIA**, a province of Natolia, in Asia, situated on the Mediterranean sea, opposite to the island of Cyprus.

**CARAMANICO**, a large well-peopled town of the kingdom of Naples. in the hither Abruzzo.

**CARAMANTA**, the name of a province of South America, bordered on the north by the district of Carthagena;

thagena; on the east, by New Grenada; and on the south and west, by Popayan.

**CARAMANTA** is also the name of the capital of that province, situated in  $5^{\circ} 18' N.$  lat.

**CARANNA**, a resinous substance brought from New Spain in little masses rolled up in leaves of flags. It is rarely kept in the shops, and is rejected by the catalogue of the London college, though it is still retained in the Edinburgh.

**CARAPO**, in ichthyology, the trivial name of a species of gymnotus. See **GYMNOTUS**.

**CARAVAN**, or **CARAVANNE**, in the east, signifies a company or assembly of travellers and pilgrims, and more particularly of merchants, who, for their greater security, and in order to assist each other, march in a body through the deserts, and other dangerous places, which are infested with Arabs or robbers.

There is a chief, or aga, who commands the caravan, and is attended by a certain number of janizaries, or other militia, according to the countries from whence the caravans set out; which number of soldiers must be sufficient to defend them and conduct them with safety to the places for which they are designed, and on a day appointed. The caravan encamps every evening near such wells or brooks, as their guides are acquainted with; and there is a strict discipline observed upon this occasion, as in armies in time of war. Their beasts of burden are partly horses, but most commonly camels, who are capable of undergoing a very great fatigue.

**CARAVANSERA**, or **KARAVANSERA**, a place appointed for receiving and loading the caravans.

It is commonly a large square building, in the middle of which there is a very spacious court; and under the arches or piazzas that surround it there runs a bank, raised some feet above the ground, where the merchants, and those who travel with them in any capacity, take up their lodgings as well as they can; the beasts of burden being tied to the foot of the bank. Over the gates, that lead into the court, there are sometimes little rooms, which the keepers of the caravanferas let out at a very high price to such as have a mind to be private.

The caravanferas in the east are something in the nature of the inns in Europe, only that you meet with little accommodation either for man or beast, but are obliged to carry almost every thing with you: there is never a caravanfera without a well, or spring of water. These buildings are chiefly owing to the charity of the Mahometans; they are esteemed sacred dwellings, where it is not permitted to insult any person, or to pillage any of the effects that are deposited there. They even carry their precautions so far, as not to suffer any man who is not married to lodge there; because they are of opinion, that a man who has no wife is more dangerous than another.

**CARAVANSERASKIER**, the steward, or keeper of a caravanfera.

He keeps an account of all the merchandises that are sold upon trust, and demands the payments of the

sums due to the merchants for what has been sold in the caravanfera, on the seller's paying two *per cent*.

**CARAWAY**, in botany. See **CARUM**.

**CARBUNCLE**, in natural history, a very elegant gem, whose colour is deep red, with an admixture of scarlet.

This gem was known among the ancients by the name of anthrax. It is usually found pure and faultless, and is of the same degree of hardness with the sapphire: it is naturally of an angular figure, and is found adhering, by its base, to a heavy and ferruginous stone of the emery kind: its usual size is near a quarter of an inch in length, and two thirds of that in diameter in its thickest parts: when held up against the sun, it loses its deep tinge, and becomes exactly of the colour of a burning charcoal, whence the propriety of the name which the ancients gave it. It bears the fire unaltered, not parting with its colour, nor becoming at all the paler by it. It is only found in the East Indies, so far as is yet known, and there but very rarely.

**CARBUNCLE**, or **ANTHRAX**, in surgery, an inflammation which arises, in time of the plague, with a vesicle or blister almost like those produced by burning.

**CARBUNCLE**, in heraldry, a charge or bearing, consisting of eight radii, four whereof make a common cross, and the other four a saltier.

Some call these radii buttons, or staves, because round, and enriched with buttons, or pearly like pilgrims staves, and frequently tipped or terminated with flower-de-luces; others blazon them, royal sceptres, placed in saltier, pale and fesse.

**CARCHARIAS**, in ichthyology. See **SQUALUS**.

**CARCASSE**, or **CARCASS**, in the art of war, an iron-cask, or hollow capacity, about the bigness of a bomb, of an oval figure, made of ribs of iron, filled with combustible matters, as meal-powder, saltpetre, sulphur, broken glass, shavings of horns, turpentine, tallow, &c.; the design of it is to be thrown out of a mortar to set houses on fire, and do other execution. It has two or three apertures through which the fire is to blaze.

**CARCASSONE**, a town of Languedoc, in France, situated on the river Aude, about twenty-five miles west of Narbonne: E. long.  $2^{\circ}$ , and N. lat.  $43^{\circ} 20'$ . It is a bishop's see.

**CARCERES**, in the ancient Circensian games, were inclosures, in the circus, wherein the horses were restrained till the signal was given for starting, when, by an admirable contrivance, they all at once flew open.

**CARCINOMA**. See **CANKER**.

**CARD**, among artificers, an instrument consisting of a block of wood, beset with sharp teeth, serving to arrange the hairs of wool, flax, hemp, and the like: there are different kinds of them, as hand-cards, stock-cards, &c.

**CARDS**, among gamesters, little pieces of fine thin pasteboard of an oblong figure, of several sizes, but most commonly in England three inches and an half long, and two and an half broad, on which are painted several points and figures.

The

The moulds and blocks for making cards, are exactly like those that were used for the first books: they lay a sheet of wet or moist paper on the block, which is first slightly done over with a sort of ink made with lamp-black diluted in water, and mixed with some starch to give it a body. They afterwards rub it off with a round list. The court-cards are coloured by means of several patterns, styled *stanc-filles*. These consist of papers cut through with a pen-knife, and in these apertures they apply severally the various colours, as red, black, &c. These patterns are painted with oil-colours, that the brushes may not wear them out; and when the pattern is laid on the paste-board, they slightly pass over it a brush full of colour, which, leaving it within the openings, forms the face or figure of the card.

Cards, upon sufficient security, may be exported without payment of the stamp-duty; but for every pack sold without the label of the stamp-office, in England, there is a penalty of 10l.

**CARDAMINDUM**, in botany. See **TROPÆOLUM**.

**CARDAMINE**, **LADY'S SMOCK**, in botany, a genus of the tetradynamia siliquosa class. The pod opens with a spring, and the valves are revolute: The stigma is entire; and the calix gapes a little. There are fifteen species, seven of which are natives of Britain, viz. the bellidifolia, or daisy-leaved lady's-smock; the petræa, or mountain lady's-smock; the pratensis, or common lady's-smock; the amara, bitter cresses, or lady's-smock; the impatiens, or impatient lady's-smock; the parviflora, or small-flowered lady's-smock; and the hirsuta, or hairy lady's-smock.

**CARDAMOM**, in materia medica, the seeds of a species of animum. They are distinguished into the lesser and greater. The greater cardamom is a dried fruit or pod containing two rows of small triangular seeds of a warm aromatic flavour. The lesser is about half the size of the former, and the seeds are considerably stronger both in smell and taste. Hence this sort is the only one now used as a medicine. The seeds are warm, grateful, pungent, aromatic, and frequently employed as such in practice.

**CARDIAC**, an appellation given to such medicines as are supposed to preserve or increase the strength of the heart.

**CARDIACA**, in botany. See **LEONURUS**.

**CARDIALGIA**, the **HEART-BURN**, in medicine, a disorder of the stomach attended with anxiety, a nausea, and often a reaching or actual vomiting. See **MEDICINE**.

**CARDIFF**, a borough-town of Glamorganshire, in south Wales, situated on the river Tawe, about two miles south-east of Landaff: W. long. 3° 20', N. lat. 51° 30'. It sends only one member to parliament.

**CARDIGAN**, the capital of Cardiganshire, near the mouth of the river Tivy and the Irish channel, about thirty miles north of Pembroke: W. long. 4° 40', N. lat. 52° 15'. It gives the title of earl to the noble family of Brudenel, and sends only one member to parliament.

**CARDINAL**, in a general sense, an appellation given to things on account of their preeminence: thus we say, cardinal virtues, &c.

**CARDINAL SIGNS** in the zodiac, are Aries, Libra, Cancer, and Capricorn.

**CARDINAL**, more particularly signifies an ecclesiastical prince in the Romish church, being one who has a voice in the conclave at the election of a pope. The cardinals were originally nothing more than deacons, to whom was intrusted the care of distributing the alms to the poor of the several quarters of Rome; and as they held assemblies of the poor in certain churches of their several districts, they took the title of these churches. They began to be called cardinals in the year 300, during the pontificate of St Sylvest-er, by which appellation was meant the chief priests of a parish, and next in dignity to a bishop. This office grew more considerable afterwards, and by small degrees arrived at its present height, in which it is the reward of such as have served his holiness well, even princes thinking it no diminution of their honour to become members of the college of cardinals.

The cardinals compose the pope's council, and till the time of Urban VIII. were styled *most illustrious*; but by a decree of that pope in 1630, they had the title of *eminence* conferred upon them.

At the creation of a new cardinal, the pope performs the ceremony of shutting and opening his mouth, which is done in a private consistory. The shutting his mouth, implies the depriving him of the liberty of giving his opinion in congregations; and the opening his mouth, which is performed fifteen days after, signifies the taking off this restraint. However, if the pope happens to die during the time a cardinal's mouth is shut, he can neither give his voice in the election of a new pope, nor be himself advanced to that dignity.

The cardinals are divided into six classes or orders, consisting of six bishops, fifty priests, and fourteen deacons, making in all seventy; which constitute the sacred college. The number of cardinal-bishops has very seldom been changed, but that of priests and deacons have varied at different times.

The privileges of the cardinals are very great: They have an absolute power in the church during the vacancy of the holy see: They have a right to elect the new pope, and are the only persons on whom the choice can fall: Most of the grand offices in the court of Rome are filled by cardinals. The dress of a cardinal is a red soutanne, a rochet, a short purple mantle, and the red hat. When they are sent to the courts of princes, it is in quality of legates *a latere*; and when they are appointed governors of towns, their government is called by the name of legation.

**CARDINAL** is also a title given to some bishops, as those of Mentz and Milan, to the archbishop of Bourges; and the abbot of Vendome calls himself *cardinalis natus*.

**CARDINAL'S FLOWER**. See **RAPUNTUM**.

**CARDIROID**, in the higher geometry, an algebraical curve, so called from its resemblance to a heart.

**CARDIOS**.

**CARDIOSPERMUM**, in botany, a genus of the octandria trigynia class. The calix has four leaves; there are four petals; an unequal four-leaved nectarium; and there are three inflated capsules. There are two species, both natives of the Indies.

**CARDIUM**, in zoology, a genus of insects belonging to the order of vermes testacea. The shell consists of two equal valves, and the sides are equal. There are 21 species of this genus.

**CARDONNA**, a city of Catalonia, in Spain, situated on a river of the same name, about forty miles north-west of Barcelona: E. long.  $1^{\circ} 20'$ , N. lat.  $41^{\circ} 35'$ .

**CARDUEL**, a province of Georgia, in Asia, lying between the Caspian and Euxine seas, the capital whereof is Teflis. It belongs partly to the Turks, and partly to the Persians.

**CARDUELIS**, in ornithology, a synonyme of a species of fringilla. See **FRINGILLA**.

**CARDUUS**, in botany, a genus of the syngenesia polygamia æqualis class. The calix is ovated, and imbricated with spinous scales; and the receptacle is hairy. There are 26 species, ten of which are natives of Britain, viz. the lanceolatus, or spear-thistle; the nutans, or milk-thistle; the acanthoides, or welsted-thistle; the crispus, or thistle upon thistle; the palustris, or marsh-thistle; the dissectus, or English soft thistle; the helenioides, or melancholy thistle; the marianus, or milk-thistle; and the acaulos, or dwarf carline-thistle.

**CAREENING**, in the sea-language, the bringing a ship to lie down on one side, in order to trim and caulk the other side.

A ship is said to be brought to the careen, when the most of her lading being taken out, she is halled down on one side by a small vessel as low as necessary; and there kept by the weight of the ballast, ordnance, &c. as well as by ropes, lest her masts should be strained too much; in order that her sides and bottom may be trimmed, seams caulked, or any thing that is faulty under water mended. Hence when a ship lies on one side when she sails, she is said to sail on the careen.

**CARELIA**, in geography, a province of Finland, bounded by the province of Savolaxia on the north, and by the gulph of Finland on the south. It is subject to Russia.

**CARELSCROON**, a port-town of the province of Gothland, in Sweden, situated on the coast of the Baltic: E. long.  $15^{\circ}$ , and N. lat.  $56^{\circ} 20'$ .

It is an excellent harbour, where the Swedes lay up their royal navy.

**CARENTAN**, a town of Normandy, in France, situated at the mouth of a river of the same name: W. long.  $1^{\circ} 15'$ , and N. lat.  $49^{\circ} 20'$ .

**CARET**, among grammarians, a character marked thus  $\Delta$ , signifying that something is added on the margin, or interlined, which ought to have come in where the caret stands.

**CARETTA**, in zoology, the trivial name of a species of testudo. See **TESTUDO**.

**CAREX**, in botany, a genus of the monocæcia triandria class. The amenum of the male is imbricated; it has no corolla; and the calix consists of one leaf. The amenum of the female is likewise imbricated; the corolla is wanting; and the calix consists of one leaf; the nectarium is inflated and three-toothed; there are three stigmata; and the seeds are triangular and contained within the nectarium. There are 37 species, 26 of which are natives of Britain.

**CARGADORS**, a name which the Dutch give to those brokers, whose business is to find freight for ships outward bound, and to give notice to the merchants, who have commodities to send by sea, of the ships that are ready to sail, and of the places for which they are bound.

**CARGAPOL**, or **KARGAPOL**, the capital of a territory of the same name, in the province of Dwina, in Muscovy: E. long.  $36^{\circ}$ , and N. lat.  $63^{\circ}$ .

**CARGO** denotes all the merchandises and effects which are laden on board a ship.

**Super-CARGO**, a person employed by merchants to go a voyage, and oversee the cargo, and dispose of it to the best advantage.

**CARIAMA**, in ornithology, a synonyme of the palamedæa. See **PALAMEDÆA**.

**CARIBBE-ISLANDS**, a cluster of islands, situated in the Atlantic ocean, between  $59^{\circ}$  and  $63^{\circ}$  W. long. and between  $11^{\circ}$  and  $18^{\circ}$  N. lat. They belong partly to the British, and partly to the French, Dutch, &c.

**CARIBBIANA**, or **CARIBIANA**, the north east coast of Terra-firma, in south America, otherwise called New-Andalusia. See **ANDALUSIA**.

**CARICA**, in botany, a genus of the diœcia decandria class. The male has hardly any calix; the corolla is bell-shaped, and divided into five segments; the filaments are inserted into the tube of the corolla, and are alternately shorter. The calix of the female has five teeth; the corolla consists of five petals; there are five stigmata; and the berry is unilocular, and contains many seeds.

**CARICATURA**, in painting, denotes the concealment of real beauties, and the exaggeration of blemishes, but still so as to preserve a resemblance of the object.

**CARICOUS**, an epithet given to such tumours as resemble the figure of a fig. They are frequently found in the piles.

**CARIES**, in surgery, the corruption or mortification of a bone. See **SURGERY**.

**CARIGNAN**, a fortified town of Piedmont, situated on the river Po, about seven miles south of Turin: E. long.  $7^{\circ} 25'$ , and N. lat.  $44^{\circ} 30'$ .

**CARIGUE**, or **CARIGUEYA**, in zoology, a synonyme of a species of didelphis. See **DIDELPHIS**.

**CARINTHIA**, a duchy in the circle of Austria, in Germany, bounded by the archbishopric of Saltzburg on the north, and by Carniola and the dominions of Venice on the south. It is subject to the house of Austria.

**CARIONOLA**, a city of the province of Lavoro, in the

the kingdom of Naples, about twenty miles north of the city of Naples : E. long.  $15^{\circ}$ , and N. lat.  $41^{\circ} 20'$ . It is a bishop's see.

**CARIPI**, a kind of cavalry in the Turkish army.

The caripi, to the number of about one thousand, are not slaves, nor bred up in the seraglio, like the rest, but are generally Moors, or renegado Christians, who, having followed adventures, and being poor, and having their fortune to seek by their dexterity and courage, have arrived to the rank of horse-guards to the grand signior.

**CARISHBROOK-CASTLE**, a castle situated in the middle of the isle of Wight, where king Charles I. was imprisoned : W. long.  $1^{\circ} 30'$ , and N. lat.  $50^{\circ} 40'$ .

**CARKE** denotes the thirtieth part of a farplar of wool. See **SARPLAR**.

**CARLINA**, or **CARLINE THISTLE**, in botany, a genus of the syngenesia polygamia æqualis class. The calix is radiated, with long coloured scales. There are seven species, only one of which, viz. the vulgaris, is a native of Britain. The roots are said to be diaphoretic and alexipharmic.

**CARLINE**, or **CAROLINE**, a silver coin, current in the Neapolitan dominions, and worth about four-pence of our money.

**CARLINGFORD**, a port-town of Ireland, in the county of Lowth, and province of Leinster, about twenty-two miles north of Drogheda : W. long.  $6^{\circ} 23'$ , and N. lat.  $54^{\circ} 5'$ .

**CARLINGS**, or **CARLINES**, in a ship, two pieces of timber, lying fore and aft, along from beam to beam, whereon the ledges rest on which the planks of the ship are fastened. All the carlings have their ends let into the beams culvertail-wise : They are directly over the keel, and serve as a foundation for the whole body of the ship.

**CARLISLE**, the capital city of Cumberland, situated near the mouth of the river Eden, and the Solway frith : W. long.  $2^{\circ} 30'$ , and N. lat.  $54^{\circ} 45'$ .

It is a bishop's see.

**CARLOCK**, in commerce, a sort of ising-glass made with the sturgeon's bladder, imported from Archangel. The chief use of it is for clarifying wine ; but it is also used by dyers. The best carlock comes from Astracan, where a great quantity of sturgeon is caught.

**CARLOWITZ**, a town of Sclavonia, situated on the west side of the Danube, about thirty-five miles north-west of Belgrade : E. long.  $20^{\circ} 45'$ , and N. lat.  $45^{\circ} 25'$ .

**CARLSTADT**, the capital of Croatia, a frontier province of Christendom against the Turks : E. long.  $16^{\circ}$ , and N. lat.  $45^{\circ} 5'$ . It is subject to the house of Austria.

**CARLSTADT** is also the name of a town in the bishopric of Wurzburg, in the circle of Franconia in Germany, situated on the river Maine, about fourteen miles north of Wurzburg : E. long.  $9^{\circ} 50'$ , and N. lat.  $50^{\circ}$ .

**CARMAGNIOL**, a fortified town of Piedmont, situated on the river Po, about ten miles south of Turin : E. long.  $7^{\circ} 30'$ , and N. lat.  $44^{\circ} 45'$ .

VOL. II. No. 31.

3

**CARMELITES**, or **WHITE FRIERS**, are an order of our lady of Mount Carmel, making one of the four orders of mendicants. They pretend to derive their original from the prophets Elijah and Elisha. Their original rules contained sixteen articles, one of which confined them to their cells, and enjoined them to employ themselves day and night in prayer ; another prohibited the brethren having any property ; another enjoined fasting, from the feast of the exaltation of the holy cross till Easter, excepting on Sundays ; abstinence at all times from flesh, was enjoined by another article ; one obliged them to manual labour ; another imposed a strict silence on them, from vespers till the tierce the next day : However, these constitutions have been in some respects altered.

This order is so much increased, that it has at present thirty-eight provinces, besides the congregation of Mantua (in which there are fifty-four monasteries, under a vicar-general) and the congregation of bare-footed Carmelites in Italy and Spain, which have their peculiar generals.

If a monk of this order lie with a woman, he is prohibited saying mass for three or four years, is declared infamous, and obliged to discipline himself publicly once a week : If he is again guilty of the same offence, his penance is doubled : And if a third time, he is expelled to order.

**CARMENTALIA**, feasts celebrated by the Romans, in honour of the prophetess Carmenta, the mother of Evander.

They were solemnized twice in the month of January, viz. on the 11th and 15th.

**CARMINATIVES**, in pharmacy, medicines used in colics, or other flatulent disorders, to dispel the wind.

The four carminative flowers are those of camomile, melilot, motherwort, and dill ; besides, angelica, fennel, lovage, anise, caraway, coriander, cummin, &c. all agree in their carminative qualities, and are therefore used in compositions of that intention.

**CARMINE**, a powder of a very beautiful red colour, bordering upon purple, and used by painters in miniature ; though but rarely, because of its great price.

It is extracted from cochineal, by means of water, wherein chouan and antour have been infused ; some add rocou, but this gives it too much of the oval cast. Others make carmine with brasil-wood, fernambouc, and leaf-gold, beat in a mortar, and steeped in white-wine vinegar ; the scum arising from this mixture, upon boiling, when dried, makes carmine ; but this kind is vastly inferior to the former : There is another carmine, made of brasil-wood and fernambouc, by a different preparation.

**CARMONA**, a town of Andalusia in Spain, about seventeen miles east of Sevil : W. long.  $5^{\circ} 35'$ , N. lat.  $37^{\circ} 20'$ .

**CARNARVON**, a borough-town of Carnarvonshire, in north Wales, about five miles south-west of Bangor : W. long.  $4^{\circ} 25'$ , and N. lat.  $53^{\circ} 20'$ . It gives the title of earl to the noble family of Bridges ; and sends one member to parliament.

†

K

CARNA-

**CARNATION**, in botany. See **CARYOPHYLLUS**.

**CARNATION-colour**, among painters, is understood of all the parts of a picture, in general, which represent flesh, or which are naked and without drapery.

In colouring for flesh, there is so great a variety, that it is hard to lay down any general rules for instruction therein; neither are there any regarded by those who have acquired a skill this way: The various colouring for carnations, may be easily produced, by taking more or less red, blue, yellow, or bistre, whether for the first colouring, or for the finishing: The colour for women should be bluish, for children a little red, both fresh and gay; and for the men it should incline to yellow, especially if they are old.

**CARNELIAN**, in natural history, a precious stone, of which there are three kinds, distinguished by three colours, a red, a yellow, and a white. The red is very well known among us, and is found in roundish or oval masses, much like our common pebbles; and is generally met with between an inch and two or three inches in diameter: It is of a fine, compact, and close texture, of a glossy surface; and, in the several specimens, is of all the degrees of red, from the palest flesh-colour to the deepest blood-red. It is generally free from spots, clouds, or variegations; but sometimes it is veined very beautifully with an extremely pale red, or with white; the veins forming concentric circles, or other less regular figures, about a nucleus, in the manner of those of agates. The pieces of carnelian which are all of one colour, and perfectly free from veins, are those which our jewellers generally make use of for seals, though the variegated ones are much more beautiful. The carnelian is tolerably hard, and capable of a very good polish: It is not at all affected by acid menstruums: The fire divests it of a part of its colour, and leaves it of a pale red; and a strong and long continued heat will reduce it to a pale dirty gray.

The finest carnelians are those of the East Indies; but there are very beautiful ones found in the rivers of Silesia and Bohemia; and we have some not despicable ones in England.

Though the ancients have recommended the carnelian as astringent, and attributed a number of fanciful virtues to it, we know no other use of the stone, than the cutting seals on it, to which purpose it is excellently adapted, as being not too hard for cutting, and yet hard enough not to be liable to accidents, to take a good polish, and to separate easily from the wax.

**CARNERO**, in geography, a name given to that part of the gulf of Venice, which extends from the western coast of Istria to the island of Groffa and the coast of Morlachia.

**CARNERO** is likewise the name of the cape to the west of the mouth of the bay of Gibraltar.

**CARNIOLA**, a territory of Austria, in Germany, bounded by Carinthia and Stiria on the north, and by the dominions of Venice on the south.

**CARNIVAL**, or **CARNAVAL**, a time of rejoicing, a season of mirth, observed with great solemnity by the

Italians, particularly at Venice, holding from twelfth-day till lent.

Festivals, balls, operas, concerts of music, intrigues, marriages, &c. are chiefly held in carnival-time. The carnival begins at Venice the second holiday in Christmas: Then it is they begin to wear masks, and open their play-houses and gaming-houses; the Place of St Mark is filled with mountebanks, jack-puddings, pedlars, whores, and such like mob, who flock thither from all parts: There have been no less than seven sovereign princes, and thirty thousand foreigners here, to partake of these diversions.

**CAROB-tree**. See **CERATONIA**.

**CAROLINA**, a province of N. America, belonging to Great Britain: It is situated, comprehending Georgia, between 75° and 86° W. long. and between 31° and 36° N. lat. and bounded by Virginia on the north, by the Atlantic ocean on the east, by Spanish Florida on the south, and by the Apalachian mountains on the west; or rather extends westward, without any limits. It is divided into three distinct governments, *viz.* North and South Carolina, and Georgia.

**CAROLINE-books**, the name of four books, composed by order of Charlemagne, to refute the second council of Nice. These books are couched in very harsh and severe terms, containing one hundred and twenty heads of accusation against the council of Nice, and condemning the worship of images.

**CAROLSTAT**, a town of Gothland in Sweden, situated at the north end of the Wener-lake, about one hundred and forty miles west of Stockholm: E. long. 13° 30', and N. lat. 59° 40'.

**CAROLUS**, an ancient English broad piece of gold, struck under Charles I. its value has of late been at twenty-three shillings sterling, though at the time it was coined, it is said to have been rated at twenty shillings.

**CAROLUS**, a small copper coin, with a little silver mixed with it, struck under Charles VIII. of France.

The carolus was worth twelve deniers, when it ceased to be current.

Those which are still current in trade, in Lorrain, or in some neighbouring provinces, go under the name of French sols.

**CAROTID arteries**, in anatomy. See p. 226.

**CARP**, in ichthyology, the English name of a species of cyprinus. See **CYPRINUS**.

**CARPENTRY**, the art of cutting, framing, and joining large pieces of wood, for the uses of building. It is one of the arts subservient to architecture, and is divided into house-carpentry and ship-carpentry: The first is employed in raising roofing, flooring of houses, &c. and the second in the building of ships, barges, &c. The rules in carpentry are much the same with those of joinery; the only difference is, that carpentry is used in the larger coarser work, and joinery in the smaller and curious. See **JOINERY**.

**CARPET**, a sort of covering of stuff, or other materials, wrought with the needle or on a loom, which is part of the furniture of a house, and commonly spread over tables, or laid upon the floor.

Persian.

Persian and Turkey carpets are those most esteemed; though at Paris there is a manufactory after the manner of Persia, where they make them little inferior, not to say finer, than the true Persian carpets. They are velvety, and perfectly imitate the carpets which come from the Levant. There are also carpets of Germany, some of which are made of woollen stuffs, as serges, &c. and called square carpets: Others are made of wool also, but wrought with the needle, and pretty often embellished with silk; and lastly, there are carpets made of dog's hair. We have likewise carpets made in England, which are used either as floor-carpets, or to make chairs and other household furniture: It is true, we are not arrived at the like perfection in this manufactory with our neighbours the French; but may not this be owing to the want of the like public encouragement?

**CARPI**, a town of the Veronese in Italy, situated on the river Adige, twenty four miles south-east of Verona: E. long  $11^{\circ} 40'$ , and N. lat.  $45^{\circ} 10'$ .

**CARPINUS**, the *HORN-BEAN*, in botany, a genus of the monœcia polyandria class. The calix of the male is bell-shaped, and divided into five segments; it has no corolla; and the stamina are ten. The calix of the female has four teeth; there is no corolla; the styli are three; and the capsule has four valves, containing two seeds. There are but two species, both natives of America.

**CARPIO**, in ichthyology, the trivial name of a species of salmo and cyprinus. See *SALMO*, and *CYPRINUS*.

**CARPOBALSAM**, in the materia medica. the fruit of the tree which yields the true oriental balsam.

The carpopalsam is used in Egypt, according to Prosper Alpinus, in all the intentions for which the balsam itself is applied: But the only use the Europeans make of it is in venice-treacle and mithridate, and in these not a great deal; for cubebs and juniper-berries are generally substituted in its place.

**CARPOBOLUS**, in botany. See *LYCOPERDON*.

**CARPUS**, the *WRIST*, in anatomy. See p. 179, 180.

**CARR**, among the ancients, a kind of throne mounted on wheels, and used in triumphs and other solemn occasions.

**CARRIAGE**, a vehicle serving to convey persons, goods, merchandises, and other things from one place to another.

For the construction and mechanical principles of wheel-carriages, see *MECHANICS*.

**CARRIAGE of a cannon**, the frame or timber-work on which it is mounted, serving to point it for shooting, or to carry it from one place to another. It is made of two planks of wood, commonly one half the length of the gun, called the cheeks, and joined by three wooden transoms, strengthened with three bolts of iron. It is mounted on two wheels; but on a march has two fore-wheels, with limbers added. The principal parts of a Carriage are the cheeks, transoms, bolts, plates, train, bands, bridge, bed, hooks, trunion-holes, and capsquare.

**Block-CARRIAGE**, a cart made on purpose for carrying mortars and their beds from place to place.

**Truck-CARRIAGE**, two short planks of wood supported on two axle-trees, having four trucks of solid wood for carrying mortars or guns upon battery, where their own carriages cannot go. They are drawn by men.

**CARRICK**, the most southerly division of the shire of Air in Scotland.

**CARRICK on the Sure**, a town of Ireland, in the county of Tipperary, and province of Munster, about fourteen miles north-west of Waterford: W. long.  $7^{\circ} 24'$ , and N. lat.  $52^{\circ} 16'$ .

**CARRICK-FERGUS**, a town in the county of Antrim, and province of Ulster, in Ireland, about eighty-five miles north of Dublin: W. long.  $6^{\circ} 15'$ , and N. lat.  $54^{\circ} 45'$ .

**CARROT**, in botany. See *DAUCUS*.

**Candy-CARROT**. See *MYRRHIS*.

**Deadly-CARROT**. See *THAPSIA*.

**Mountain CARROT**. See *FOENICULUM*.

**CARROUSAL**, a course of hories and chariots, or a magnificent entertainment exhibited by princes on some public rejoicing. It consists in a cavalcade of several gentlemen richly dressed and equipped, after the manner of ancient cavaliers divided into squadrons, meeting in some public place, and practising juffs, tournaments, &c. The last carroufals were in the reign of Lewis XIV.

**CARS**, or *KARS*, a city of Turcomania, or the greater Armenia, situated on a river of the same name: E. long.  $44^{\circ}$ , and N. lat.  $41^{\circ} 30'$ . It is subject to the Turks.

**CARSE**, or *CARSE of Gowry*, the name of a district of Perthshire in Scotland, lying eastward of Perth, on the northern bank of the Tay.

**CART**, a land-carriage with two wheels, drawn commonly with horses, to carry heavy goods, &c. from one place to another. See *MECHANICS*.

**CARTAMA**, a town of Granada, in Spain, about ten miles north-west of Malaga: W. long.  $4^{\circ} 30'$ , and N. lat.  $36^{\circ} 40'$ .

**CARTEL**, an agreement made between two states for the exchange of their prisoners of war.

**CARTEL** signifies also a letter of defiance, or a challenge, to decide a controversy, either in a tournament, or in single combat. See *DUEL*.

**CARTERET**, a county of South Carolina, in North America.

**CARTESIANS**, a sect of philosophers, who adhere to the system of Des Cartes, and founded on the two following principles; the one metaphysical, the other physical: the metaphysical one is, *I think, therefore I am*; the physical principal is, *That nothing exists but substance*. Substance he makes of two kinds; the one a substance that thinks, the other a substance extended; whence actual thought and actual extension, are the essence of substance.

The essence of matter being thus fixed in extension, the Cartesians conclude, that there is no vacuum, nor any possibility thereof in nature, but that the world is absolutely full: mere space is precluded by this principle,

light, in regard, extension being implied in the idea of space, matter is so too.

Upon these principles, the Cartesians explain mechanically, and according to the laws of motion, how the world was formed, and whence the present appearances of nature do rise. They suppose, that matter was created of an indefinite extension, and divided into little square masses, full of angles; that the Creator impressed two motions on this matter; one whereby each part revolved round its centre, another whereby an assemblage, or system, turned round a common centre; whence arose as many different vortices as there were different masses of matter, thus moving round common centres.

The consequences of this hypothesis, according to the Cartesians, will be, that the parts of matter in each vortex could not revolve among each other, without having their angles gradually broken, and that this continual friction of parts and angles produced three elements; the first, an infinitely fine dust, formed of the angles broken off; the second, the spheres remaining, after all the angular irregularities are thus removed: these two make the matter of Des Cartes's first and second element; and those particles not yet rendered smooth and spherical, and which still retain some of their angles, make the third element.

Now, according to the laws of motion, the subtlest element must take up the centre of each system, being that which constitutes the sun, the fixed stars above, and the fire below; the second element, composed of spheres, makes the atmosphere, and all the matter between the earth and the fixed stars, in such a manner as that the largest spheres are always next the circumference of the vortex or system, and the smallest next its centre; the third element, or the hooked particles, is the matter that composes the earth, all terrestrial bodies, comets, spots in the sun, &c. Though both philosophers and divines have a just plea against this romantic system, yet it must be owned, that Des Cartes, by introducing geometry into physics, and accounting for natural phenomena by the laws of mechanics, did infinite service to philosophy.

**CARTHAGE**, or **NEW CARTHAGE**, the capital of Coslarica, a province of Mexico, in North America: W. long. 86°, and N. lat. 9° 44'.

**CARTHAGENA**, a large city, with one of the best harbours in Spain, situated in the province of Murcia, about twenty miles south of that city: W. long. 1° 5', and N. lat. 37° 40'. It is a bishop's see.

**NEW CARTHAGENA**, the capital of a province of the same name, in South America, situated on a kind of peninsula: W. long. 77°, and N. lat. 11°. It is one of the largest and best fortified towns in South America.

**CARTHAMUS**, or **BASTARD-SAFFRON**, in botany, a genus of the syngenesia polygamia æqualis class. The calix is ovated, and imbricated with foliaceous scales of an oval shape. There are nine species, none of them natives of Britain. The seeds are purgative; but operate slowly, and disorder the bowels.

**CARTHUSIANS**, a religious order, founded in the

year 1080, by one Bruno. Their rules are very severe. They are not to go out of their cells, except to church, without leave of their superior; nor speak to any person without leave. They must not keep any portion of their meat or drink till next day; their beds are of straw, covered with a felt; their cloathing two hair-cloths, two cowls, two pair of hose, and a cloke, all coarse. In the refectory, they are to keep their eyes on the dish, their hands on the table, their attention on the reader, and their hearts fixed on God. Women are not allowed to come into their churches.

**CARTHUSIAN-POWDER**, the same with kermes mineral. See **KERMES**.

**CARTILAGE**, in anatomy, a body approaching much to the nature of bones; but lubricous, flexible, and elastic.

**CARTMEL**, a market-town of Lancashire, about ten miles north-west of Lancaster: W. long. 2° 40', and N. lat. 54° 15'.

**CARTON**, or **CARTOON**, in painting, a design drawn on strong paper, to be afterwards calked through, and transferred on the fresh plaster of a wall to be painted in fresco.

Carton is also used for a design coloured, for working in mosaic, tapestry, &c. The cartons at Hampton-court are designs of Raphael Urbin, intended for tapestry.

**CARTOUCHE**, in architecture and sculpture, an ornament representing a scroll of paper. It is usually a flat member, with wavings, to represent some inscription, device, cypher, or ornament of armoury. They are, in architecture, much the same as modillions; only these are set under the cornice in wainscoting, and those under the cornice at the eaves of a house.

**CARTOUCHE**, in the military art, a case of wood, about three inches thick at the bottom, girt with marlin, holding about four hundred musket-balls, besides six or eight balls of iron, of a pound weight, to be fired out of a hobit, for the defence of a pass, &c.

A cartouche is sometimes made of a globular form, and filled with a ball of a pound weight; and sometimes it is made for the guns, being of ball of half or quarter pound weight, according to the nature of the gun, tied in form of a bunch of grapes, on a tompon of wood, and coated over. These were made in the room of partridge-shot.

**CARTRIDGE**, in the military art, a case of pasteboard or parchment, holding the exact charge of a fire-arm. Those for muskets, carbines, and pistols, hold both the powder and ball for the charge; and those of cannon and mortars are usually in cases of pasteboard or tin, sometimes of wood, half a foot long, adapted to the calibre of the piece.

**CARTRIDGE-BOX**, a case of wood or turned iron, covered with leather, holding a dozen musket-cartridges. It is wore upon a belt, and hangs a little lower than the right pocket-hole.

**CARVA**, in botany. See **LAURUS**.

**CARUI**, or **CARVI**, in botany. See **CARUM**.

**CARVING**. See **SCULPTURE**.

**CARUM**, **CARAWAY**, in botany, a genus of the pentandria

tandria digynia class. The fruit is oblong and striated; the involucre consists of but one leaf; and the petals are carinated and emarginated. There is but one species, *viz.* the caroi, a native of Britain. The seeds have an aromatic smell and pungent taste; and are frequently employed as a stomachic and carminative in flatulent cases.

**CARUNCULA**, in anatomy, a term denoting a little piece of flesh, and applied to several parts of the body, thus:

**CARUNCULÆ MYRTIFORMES**. See p. 276.

**CARUS**, in medicine, a sudden deprivation of sense and motion, affecting the whole body.

**CARWAR**, a town on the coast of Malabar, in the Hindia, sixty miles south of Goa: E. long. 73°, and N. lat. 15°. Here our East-India company have a factory, from whence they import pepper.

**CARYATIDES**, or **CARAITES**, in architecture. See p. 353.

**CARYOCATACTES**, in ornithology, the trivial name of a species of corvus. See **CORVUS**.

**CARYOCOSTINUM**, or **ELECTORIUM ET SCAMMONIO**, in pharmacy, is composed of the following ingredients: An ounce and a half of scammony; of cloves and ginger, each six drams; half a pound of honey; half a dram of essential oil of caraway-seeds; the spices must be ground together and mixed with the honey; then add the powdered scammony, and afterwards the oil. This electuary is a warm brisk purgative.

**CARYOPHYLLATA**, in botany. See **GEUM**.

**CARYOPHYLLUS**, the **PINK**, in botany. See **DIANTHUS**.

**CARYOPHYLLUS**, the **CLOVE-TREE**, in botany, a genus of the polyandria monogynia class. The corolla has four petals; the calix consists of four duplicated leaves; and the berry contains one seed. There is but one species, *viz.* the aromaticus, a native of the Molucca islands. The cloves are the flower-cups, have a strong agreeable aromatic smell, and a bitterish pungent taste. The essential oil of cloves is an ingredient in many of our official compositions.

**CARYOTA**, in botany, a genus of plants ranged under the palmæ bipennatifoliæ. The calix of the male is common; the corolla is divided into three parts; and the stamina are numerous. The calix and corolla of the male are the same with those of the female; there is but one pistillum; and the berry contains two seeds. There is but one species, *viz.* the urens, a native of India.

**CASAL**, the capital of the duchy of Montferrat, in Italy, situated on the river Po, forty-five miles east of Turin: E. long. 8° 35', and N. lat. 45°.

**CASAN**, or **KASAN**, a province of Russia, lying between the province of Moscow on the west, and Siberia on the east.

**CASCADE**, a steep fall of water from a higher into a lower place.

They are either natural, as that at Tivoli, &c. or artificial, as those of Versailles, &c. and either falling

with gentle descent, as those of Sceaux; or in form of a buffet, as at Trianon; or down steps, in form of a peiron, as at St Clou; or from bason to bason, &c.

**CASCAIS**, a town of Estremadura, in Portugal, situated at the mouth of the river Tagus, seventeen miles east of Lisbon: W. long. 10° 15', and N. lat. 38° 40'.

**CASCARILLA**, in botany. See **CINCHONA**.

**CASE**, among grammarians, implies the different inflexions or terminations of nouns, serving to express the different relations they bear to each other, and to the things they represent.

**CASE**, among printers, denotes a sloping frame, divided into several compartments, each containing a number of types or letters of the same kind. See **PRINTING**.

**CASE of crown-glass** contains usually twenty-four tables, each table being nearly circular, and about three feet six inches diameter.

**CASE of Newcastle glass** contains thirty-five tables; of Normandy glass twenty-five.

**CASE-HARDENING**, a method of preparing iron, so as to render its outer surface hard, and capable of resisting any edged tool.

This is a lesser degree of steel-making, and is practised by baking, calcination, or cementation in an oven or other close vessel, stratified with charcoal and powdered hoofs and horns of animals, so as to exclude the air. See **STEEL**.

**CASE-SHOT**, in the military art, musket-ball, stones, old iron, &c. put into cases, and shot out of great guns.

**CASERTA**, a city of the province of Lavoro, in the kingdom of Naples, about sixteen miles north of the city of Naples: E. long. 15° 5', and N. lat. 41° 10'. It is a bishop's see.

**CASH-BOOK**. See **BOOK-KEEPING**, p. 618.

**CASHELL**, or **CASHILL**, a city of the county of Tipperary, in Ireland, about eighty miles south-west of Dublin: W. long. 7° 40', and N. lat. 52° 16'. It is a bishop's see.

**CASHEW-NUT**, in botany. See **ANACARDIUM**.

**CASIA**, in botany. See **OSYRIA**.

**CASK**, a vessel of capacity, for preserving liquors of divers kinds; and also sometimes dry goods, as sugar, almonds, &c.

A cask of sugar is a barrel of that commodity, containing from eight to eleven hundred weight. A cask of almonds is about three hundred weight.

**CASPIAN-SEA**, a large sea, or lake of Asia, bounded by the province of Altracan on the north, and by part of Persia on the east, south, and west. It is upwards of four hundred miles long from south to north, and three hundred miles broad from east to west.

**CASSANDRA**, the same with the lyra, or harp-shell, a species of dolium.

**CASSANO**, a fortress, in the Milanese, in Italy, situated on the river Adda, about twelve miles north-east of Milan: E. long. 10°, and N. lat. 45° 20'.

**CASSEL**, the capital of the landgraviate of Hesse-cassel, † L in

- in the circle of the Upper Rhine, in Germany, situated on the river Fulde: E. long.  $2^{\circ} 20'$ , and N. lat.  $51^{\circ} 20'$ .
- CASSEL** is also the name of a town in French Flanders, about fifteen miles south of Dunkirk: E. long.  $2^{\circ} 30'$ , and N. lat.  $50^{\circ} 5'$ .
- CASSIA**, in botany, a genus of the decandria monogynia class. The calix consists of five leaves; the petals are five; and the antheræ are rostrated and barren; the pod is a legumen. There are 30 species, all natives of warm climates. The cassia fistula is a native of Egypt, and the East Indies. The fruit is a cylindrical pod, the pulp of which is a gentle laxative medicine.
- CASSIDA**, in botany. See **SCUTELLARIA**.
- CASSIDA**, in zoology, a genus of insects belonging to the order of coleoptera. The feelers are like threads, but thicker on the outside; the elytra are margined; and the head is hid under the thorax. There are 21 species of this insect, distinguished principally by differences in their colour.
- CASSIMERE**, the capital city of a province of the same name in the Hither India: E. long.  $75^{\circ}$ , and N. lat.  $35^{\circ}$ . It was once the capital of a kingdom, and is still sometimes the residence of the Mogul.
- CASSINE**, in botany, a genus of the pentandria trigynia class. The calix consists of five parts or segments; the petals are five, and the berry contains three seeds. There are only two species, both natives of Æthiopia.
- CASSIOPEIA**, in astronomy, a constellation of the northern hemisphere, situated opposite to the great bear, on the other side of the pole.
- CASSIS**, the **HELMET-SHELL**. See **MUREX**.
- CASSITERIA**, in the history of fossils, a genus of crystals, the figures of which are influenced by an admixture of some particles of tin.
- The cassiteria are of two kinds: the whitish pellucid cassiterion, and the brown cassiterion; the first is a tolerably bright and pellucid crystal, and seldom subject to the common blemishes of crystal: It is of a perfect and regular form, in the figure of a quadrilateral pyramid, and is found in Devonshire and Cornwall principally. The brown cassiterion is like the former in figure: It is of a very smooth and glossy surface, and is also found in great plenty in Devonshire and Cornwall.
- CASSOCK**, or **CASSULA**, a kind of robe or gown, wore over the rest of the habit, particularly by the clergy. The word cassock comes from the French *cas-que*, an horseman's coat.
- CASSOWARY**, in ornithology. See **STRUTHIO**.
- CASSUMBAZAR**, a town of India, in Asia, situated on the river Ganges, in the province of Bengal: E. long.  $37^{\circ}$ , and N. lat.  $24^{\circ}$ .
- CASUMUNAR**, in the materia medica, a root approaching to that of zedoary.
- It is cardiac and sudorific, and famous in nervous cases: It is also an ingredient in many compositions, and is prescribed in powders, bolusses, and infusions. Its dose is from five to fifteen grains.
- CASTANEA**, in botany. See **FAGUS**.
- CASTANOVITZ**, a town of Croatia, situated on the river Unna, which divides Christendom from Turkey: E. long.  $17^{\circ} 20'$ , and N. lat.  $45^{\circ} 40'$ . It is subject to the house of Austria.
- CASTEL-ARAGONESE**, a fortress of Sardinia, situated on the north-west coast of that island: E. long.  $8^{\circ} 45'$ , and N. lat.  $41^{\circ}$ .
- CASTEL-BAR**, a town of Ireland, in the county of Mayo, and province of Connaught, about thirty-eight miles north of Gallway: W. long.  $9^{\circ} 24'$ , N. lat.  $53^{\circ} 25'$ .
- CASTEL-BRANCHO**, a city of the province of Beira, in Portugal, about ninety five miles north-east of Lisbon: W. long.  $8^{\circ}$ , N. lat.  $39^{\circ} 35'$ .
- CASTEL DE VIDE**, a town of Alentejo, in Portugal, about twelve miles east of Portalegre, and thirty-five west of Alcantara: W. long.  $7^{\circ} 40'$ , N. lat.  $39^{\circ}$ .
- CASTELLA**, a town of the Mantuan, in Italy, about five miles north-east of the city of Mantua: E. long.  $11^{\circ} 15'$ , N. lat.  $45^{\circ} 30'$ .
- CASTELLAN**, the name of a dignity or charge in Poland: The castellans are senators of the kingdom, but senators only of the lower class, who, in diets, sit on low seats, behind the palatines, or great senators. They are a kind of lieutenants of provinces, and command a part of the palatinate under the palatine.
- CASTELLANY**, the territory belonging to any city or town, chiefly used in France and Flanders: Thus we say, the castellany of Lisle, Ypres, &c.
- CASTIGLIONE**, a fortified town in the duchy of Mantua, about twenty miles north-west of the city of Mantua: E. long.  $11^{\circ}$ , N. lat.  $45^{\circ} 15'$ .
- CASTILE**, the name of two inland provinces of Spain, situated almost in the middle of that kingdom: The most southerly one is called New Castile, and the other, towards the north, Old Castile; Madrid being the capital of the former, and Burges of the latter.
- CASTILLAN**, or **CASTILLANE**, a gold-coin, current in Spain, and worth fourteen rials and sixteen deniers.
- CASTILLAN** is also a weight used in Spain for weighing gold. It is the hundredth part of a pound Spanish weight.
- What they commonly call a weight of gold in Spain, is always understood of the castillan.
- CASTIL-LARA**, a town of the Mantuan, in Italy, situated six miles north-east of the city of Mantua: E. long.  $11^{\circ} 25'$ , N. lat.  $45^{\circ} 20'$ .
- CASTILLON**, a town of Perigort, in the province of Guienne, in France, situated on the river Dordogne, sixteen miles east of Bourdeaux: W. long.  $2^{\circ} 40'$ , N. lat.  $44^{\circ} 50'$ .
- CASTLE**, a fortress or place rendered defenceable, either by nature or art.
- A castle is a fort, or little citadel. See **CITADEL**.
- It frequently signifies with us the principal mansion of noblemen.
- In the time of Henry II. there were no less than 1115 castles in England, each of which contained a manor.
- CASTLE**, in the sea-language, is a part of the ship, of which there are two, the fore-castle, being the elevation.

tion at the prow, or the uppermost deck, towards the mizen, the place where the kitchens are. Hind-castle is the elevation which reigns on the stern, over the last deck, where the officers cabins and places of assembly are.

**CASTLE-CAREY**, a market town of Somersetshire, situated ten miles south-east of Wells: W. long.  $2^{\circ} 40'$ , N. lat.  $51^{\circ} 15'$ .

**CASTLE-RISING**, a borough-town of Norfolk situated near the sea coast, about thirty miles west of Norwich, and seven north of Lynn: E. long.  $40'$ , N. lat.  $52^{\circ} 46'$ . It sends two members to parliament.

**CASTLE-WORK**, service or labour done by inferior tenants, for the building and upholding of castles of defence, towards which some gave their personal assistance, and others paid their contributions. This was one of the three necessary charges to which all lands among our Saxon ancestors were expressly subject.

**CASTON**, a market-town of Norfolk, about eight miles north-west of Norwich: E. long.  $1^{\circ} 20'$ , N. lat.  $52^{\circ} 45'$ .

**CASTOR**, or **BEAVER**, in zoology, a genus of quadrupeds belonging to the order of glires. The fore-teeth of the upper jaw are truncated, and hollowed in a transverse angular direction. The tops of the fore-teeth of the lower-jaw lie in a transverse direction; and the tail is depressed. There are three species of castor, viz. 1. The fiber, with a plane ovated tail, is found on the banks of rivers in Europe, Asia, and America. It is from the inguinal glands of this animal that the castor is obtained; it is contained in cuds or pouches which resemble a dog's testicles.

Several writers have taken notice of the ingenuity of American beavers in making their houses, of which we shall here give some account. The first thing they do when they are about to build, is to assemble in companies, sometimes of two or three hundred together; then they chuse a place where plenty of provisions are to be had, and where all necessities are to be found proper for their use. Their houses are always in the water, and when they can find neither lake nor pond, they endeavour to supply that defect by stopping the current of a brook or small river, by means of a dam. To this end they first cut down trees in the following manner: Three or four beavers will go to work about a large tree, and by continually gnawing of it with their teeth, they at last throw it down, and so contrive matters that it always falls towards the water, that they may have the less way to carry it, when they have divided it into pieces. After they have done this, they take each piece by itself, and roll it towards the water, where they intend to place it.

These pieces are more or less thick and long, according to the nature and situation of the places where they are required. Sometimes they make use of the large trunks of trees, which they lay down flat; sometimes the dam only consists of branches as thick as one's thigh, which are supported by stakes interwoven with the branches of trees; and all the vacant places are filled up with a sort of clay, in such a manner, that no water can pass through them. They

prepare the clay with their paws or hands; and their tails serve instead of a cartilage, as well as a trowel to lay on their clay.

The foundation of the dams are generally ten or twelve feet thick, and they lessen gradually till they come to two or three. They always observe an exact proportion, inasmuch, that the most curious architects are not capable of performing their work more regularly. That side towards the current of the water is always sloping, but the other is perpendicular.

The construction of the houses is altogether as wonderful; for they are generally built upon piles in small lakes, which are formed by making of the dams. Sometimes they are on the bank of a river, or on the extremity of a point of land, which advances into the water. They are of a round or oval form, and the top of them is like a dome.

This description of one of their houses which was examined and measured, will perhaps give the reader more satisfaction than an account in general. It was about three parts surrounded with water, and the other part was joined to the land. It was round, with an oval dome at the top, and the height above the surface of the water, was eight feet. It was about forty feet in diameter, and one hundred and twenty in circumference, which perhaps may seem strange, because the proportion is geometrical; this however is fact, for it was measured several times. The part that joined to the bank was not made out of it, but was of the same materials with the rest.

The bottom of the house was of earth, or soil, with pieces of wood laid in it, above three inches in circumference; then a parcel of poplar sticks laid with one end in the house, and another slanting a long way under water; then a layer of earth again, and then poplar sticks, which were repeated to the height of eighteen inches. From thence to the top of the house there was a mixture of earth, stones, and sticks, curiously put together; and the whole was covered with sods, that had long grass growing thereon. The largest pieces of wood made use of near the top, were about three inches in diameter, and all the rest was still itself, not above two or three fingers thick.

The outermost part of this house did not stand farther out in the creek than the edge of the shore; but that which brought the water almost round the house were the trenches, which were made by taking out the earth; these were nine feet in the broadest part, and eighteen feet in length. The creek at the front of the house was six and thirty feet broad, and seemed to be pretty deep. The house was so contrived as to be very solid, for there was no breaking into it without an ax; and in the frosty season it was quite impenetrable. From this house there were several paths into the wood, through which they drew the sticks and trees, which they made use of for food or building.

The wall of the house was two feet thick, and it was covered with smooth clay on the inside in such a manner that it would not admit the least breath of air. Two thirds of the structure was out of the water; and in the upper part, each beaver had his particular

tical place, whereon leaves were strewed to lie upon.

There never was any fish seen in any of these houses, which are made like an oven in the inside, with a passage for these animals to go and bathe in the water. One of these will generally lodge about eight or ten beavers, though sometimes they have held thirty; but this is very uncommon.

These creatures are never surprised by the frost and snow; for they finish their work towards the end of September; and then they lay in provisions for the winter. In the summer-time they live upon fruits, and the barks and leaves of trees; and they likewise catch small fish, and particularly crabs or craw-fish. However, their winter-provision is the tender branches of trees, particularly poplar, of which they seem to be very fond. It is usually said, and upon pretty good authority, that these beavers make the walls of their houses of a thickness in proportion to the severity of the succeeding winter; which if true, these animals must be furnished with uncommon foresight.

When there are great floods caused by the melting of the snow, which damage the houses of the beavers, they then leave them, and shift for themselves as well as they can; however, the females return as soon as the waters are abated; but the males keep the field till July, when they assemble again to repair the damage that has been done by the flood, either to their houses or dams. When any of their houses are demolished by the hunters, they never repair them again, but build others quite new. Some authors have said, that the beavers make several rooms in their houses; but this upon examination has been found to be false.

In hunting the beavers, the savages sometimes shoot them, always getting on the contrary side of the wind; for they are very shy, quick in hearing, and of a very keen scent. This is generally done when the beavers are at work, or on shore feeding on poplar bark. If they hear any noise when at work, they immediately jump into the water, and continue there some time; and when they rise, it is at a distance from the place where they went in.

They sometimes are taken with traps: these are nothing but poplar sticks laid in a path near the water; which when the beaver begins to feed upon, they cause a large log of wood to fall upon their necks, which is put in motion by their moving of the sticks, and consequently requires an ingenious contrivance. The savages generally prefer this way of taking them, because it does not damage their skins.

In the winter-time they break the ice in two places at a distance from the house, the one behind the other. Then they take away the broken ice with a kind of a racket, the better to see where to place their stakes. They fasten their nets to these, which have large meshes, and sometimes are eighteen or twenty yards in length. When these are fixed, they proceed to demolish the house, and turn a dog therein; which terrifying the beaver, he immediately leaves it, and takes to the water; after which, he is soon entangled by the net.

Mr Lawton who was general surveyor of North Carolina, assures, that beavers are very plenty in that coun-

try. He confirms what has been said about their ingenuity in building of their dams and houses, and observes, that their food is chiefly the bark of trees and shrubs; such as that of the sassafras, ash, sweet gum, and several others. He adds, that if they are taken young, they will become very tame; but then they will do a great deal of mischief in the orchards, by breaking the trees. They will likewise block up the doors of the houses in the night, with the sticks and wood which they bring thither. He farther informs us, that it is certain death for them to eat any thing that is salt. The flesh is looked upon as very delicate food.

2. The *moschatus*, with a long, compressed, lanceolated tail, and palmated feet. It is the exotic water-rat of Clusius, and is a native of Russia.

3. The *zibethicus*, or musk-rat, with a long, compressed, and lanceolated tail, and the toes of the feet separate from each other. The follicles of the tail are said to banish moths and other insects from cloaths, &c. For this reason the inhabitants of Russia and Canada sew them into the folds of their cloaths, to keep off vermin and contagious diseases.

**CASTOR** is also the name of a market-town of Lincolnshire, twenty miles north-east of Lincoln: W. long. 12', and N. lat. 53° 30'.

**CASTOREA**, in botany. See **DURANTA**.

**CASTOREUM**, in the materia medica, a substance obtained from the inguinal glands of the castor. See **CASTOR**.

**CASTRATION**, in surgery, the operation of gelding.

It was prohibited by a decree of the senate of Rome under Hadrian; and the Cornelian law subjected the person who performed the operation, to the same penalties as the person on whom it was performed, although it was done with his consent.

Caltration is much in use in Asia and Turkey, where it is practised upon the slaves, to prevent any commerce with their women. In Italy, caltration is frequent from another motive, namely, to preserve the voice for singing. It is sometimes found necessary in chirurgical cases, as in a sarcocele and cancer of the testicles. For the method of performing this operation, see **SURGERY**.

**CASTRES**, a city of Languedoc, in France, about thirty-five miles east of Thoulouse: E. long. 2°, and N. lat. 43° 40'. It is a bishop's see.

**CASTRO**, the capital of the island of Chiloe, on the coast of Chili, in south America: W. long. 82°, S. lat. 43°.

**CASTRO** is also the capital of a duchy of the same name in the pope's territories, in Italy, situated on the confines of Tuscany: E. long. 12° 35', N. lat. 42° 30'.

**CASTRO** is likewise a town in the territory of Otranto, in the kingdom of Naples, about seven miles south of Otranto: E. long. 19° 25', N. lat. 40° 8'.

**CASTRO marino**, a town in the province of Algarva, in Portugal, situated near the mouth of the river Guadiana, on the confines of Andalusia: W. long. 8° 15'. N. lat. 37°.

**CASUALTIES** of *superiority*, in Scots law, those duties and emoluments which a superior has right to demand out of his vassal's estate, over and besides the constant yearly duties established by the *reddendo* of his charter, upon certain casual events. See **SCOTS LAW**, title, *Of the casualties due to the superior*.

**CASUS amissionis**, in Scots law. In actions of proving the tenor of obligations extinguishable by the debtor's retiring or cancelling them, it is necessary for the pursuer, before he is allowed a proof of the tenor, to condescend upon such a *casus amissionis*, or accident, by which the writing was destroyed, as shews it was lost while in the creditor's possession. See **SCOTS LAW**, title, *Actions*.

**CAT**, in zoology. See **FELIS**.

**CAT-mint**, in botany. See **MENTHA**.

**CAT**, or **CAT-head**, on shipboard, a short piece of timber in a ship, lying aloft right over the hawse, having at one end two shivers, wherein is reeved a rope, with a great iron-hook fastened to it, called

**CAT-hook**. Its use is to trice up the anchor, from the hawse to the top of the fore-castle.

**CAT-boles**, in a ship, are over the parts as right with the capstan as they can be: Their use is to heave the ship a-stern, upon occasion, by a cable, or hawse, called *stern-fast*. See **STERN-FAST**.

**CAT of the mountain**. See **FELIS**.

**CAT-silver**, in natural history. See **MICÆ**.

**CATACAUSTIC curves**, in the higher geometry, that species of caustic curves which are formed by reflexion. See **FLUXIONS**.

**CATACRHESES**, in rhetoric, a trope which borrows the name of one thing to express another. Thus Milton describing Raphael's descent from the empyreal heaven to paradise, says,

"Down thither prone in flight

"He speeds, and thro' the vast ethereal sky

"Sails between worlds and worlds."

**CATACOMB**, a grotto or subterraneous place for the burial of the dead.

The term is particularly used in Italy, for a vast assemblage of subterraneous sepulchres, three leagues from Rome, in the *via Appia*, supposed to be the sepulchres of the ancients. Others imagine these catacombs to be the cells wherein the primitive Christians hid themselves. Each catacomb is three feet broad, and eight or ten high, running in form of an alley or gallery, and communicating with one another.

**CATAGMATICS**, in pharmacy, remedies proper for curing a catagma or fracture.

**CATALEPSY**, in medicine. See **MEDICINE**.

**CATALONIA**, a province of Spain, bounded by the Pyrenean mountains which divide it from France, on the north; by the Mediterranean, on the east and south; and by the provinces of Aragon and Valencia, on the west.

**CATAMENIA**, in medicine. See **MENSES**.

**CATAMITE**, a boy kept for sodomitical practices.

**CATANANCHE**, in botany, a genus of plants belonging to the syngenesia polygamia æqualis class. The

VOL. II. No. 32.

3

†

M

and

receptacle is paleaceous; the calix is imbricated; and the pappus has an awn, with a kind of cetaceous calix. There are three species, none of which are natives of Britain.

**CATAPASM**, among ancient physicians, signifies any dry medicine reduced to powder, in order to be used by way of inspiration in the whole body, or any part of it.

**CATAPHONICS**, the science which considers the properties of reflected sounds.

**CATAPHORA**, in medicine, the same as coma. See **COMA**.

**CATAPHRACTA**, in antiquity, a kind of coat of mail, which covered the soldier from head to foot.

Hence, cataphracti were horsemen armed with the cataphracta, whose horses, as Sallust says, were covered with linen full of iron plates disposed like feathers.

**CATAPLASM**, an external topical medicine, prepared of ingredients of different virtues, according to the intention of the physician. Hence there are different sorts of cataplasms with respect to the matter of which they consist, as emollient, resolvent, discutient, suppurative, corroborative, anodyne, and antiseptic cataplasms. They are commonly applied hot, or lukewarm, rolled up in linen cloths, which by means of the oils which are added preserve heat for a considerable time; for which end also some, upon these, apply a swine's or ox's bladder, and sometimes on the top of all apply an earthen tile.

**CATAPULTA**, in antiquity, a military engine contrived for the throwing of arrows, darts, and stones, upon the enemy.

Some of these engines were of such force, that they would throw stones of an hundred weight. Josephus takes notice of the surprising effects of these engines, and says, that the stones thrown out of them beat down the battlements, knocked off the angles of the towers, and would level a whole file of men, from one end to the other, were the phalanx never so deep.

**CATARACT**, in hydrography, a precipice in the channel of a river, caused by rocks, or other obstacles, stopping the course of the stream, from whence the water falls with a greater noise and impetuosity: Such are the cataracts of the Nile, the Danube, Rhine, and the famous one of Niagara in America.

**CATARACT**, in medicine and surgery, a disorder of the humours in the eye, by which the pupilla, that ought to appear transparent and black, looks opaque, grey, blue, brown, &c. by which vision is variously impeded, or totally destroyed. See **MEDICINE**, and **SURGERY**.

**CATARO**, the capital of a territory of the same name, in the Venetian Dalmatia, about twenty five miles south-east of Ragusa: E. long. 19° 20', N. lat. 42° 25'.

**CATARACTES**, in ornithology, the trivial name of a species of larus. See **LARUS**.

**CATARRH**, in medicine, a distillation or defluxion from the head upon the mouth and aspera arteria,

and through them upon the lungs. See MEDICINE.

**CATASTASIS**, in poetry, the third part of the ancient drama, being that wherein the intrigue, or action, set forth in the epitalis, is supported and carried on, and heightened, till it be ripe for the unravelling in the catastrophe. Scaliger defines it, the full growth of the fable, while things are at a stand in that confusion to which the poet has brought them.

**CATASTROPHE**, in dramatic poetry, the fourth and last part of the ancient drama, or that immediately succeeding the catastasis: Or, according to others, the third only; the whole drama being divided into protasis, epitalis, and catastrophe; or, in the terms of Aristotle, prologue, epilogue, and exode. See EPIC and DRAMATIC compositions.

**CATCH-fly**, in botany. See LYNCHNIS

**CATCH-POLE**, a term used by way of reproach, for the bailiff's follower, or assistant.

**CATCH-word**, among printers, that placed at the bottom of each page, being always the first word of the following page.

**CATECHETIC**. Catechetical schools were buildings appointed for the office of the catechist, adjoining to the church, and called *catechumena*: Such was that in which Origen, and many other famous men, read catechetical lectures at Alexandria. See CATECHUMEN.

**CATECHISM**, the name of a small book, designed for instructing children in the principles of religion. The church of Rome, the church of England, the presbyterian church, &c. have all catechisms containing and enforcing their peculiar opinions.

**CATECHU**, in the materia medica, the name of a troch consisting of Japan earth and gum arabic, each two ounces, and of sugar of roses sixteen ounces, beat together, with a little water. It is recommended as a mild restraining, &c.

**CATECHUMEN**, a candidate for baptism, or one who prepares himself for the receiving thereof.

The catechumens, in church-history, were the lowest order of Christians in the primitive church. They had some title to the common name of Christian, being a degree above pagans and heretics, though not consummated by baptism. They were admitted to the state of catechumens, by the imposition of hands, and the sign of the cross. The children of believing parents were admitted catechumens, as soon as ever they were capable of instruction: But at what age those of heathen parents might be admitted, is not so clear. As to the time of their continuance in this state, there were no general rules fixed about it; but the practice varied according to the difference of times and places, and the readiness and proficiency of the catechumens themselves.

There were four orders or degrees of catechumens; the first, were those instructed privately without the church, and kept at a distance, for some time, from the privilege of entering the church, to make them the more eager and desirous of it. The next degree were the *audientes*, so called from their being admitted to hear sermons and the scriptures read in the church,

but were not allowed to partake of the prayers. The third sort of catechumens were the *genu flexentes*, so called, because they received imposition of hands kneeling. The fourth order was the *competentes & electi*, denoting the immediate candidates for baptism, or such as were appointed to be baptized the next approaching festival, before which, strict examination was made into their proficiency under the several stages of catechetical exercises.

After examination, they were exercised for twenty days together, and were obliged to fasting and confession: Some days before baptism they went veiled; and it was customary to touch their ears, saying, *Ephatha*, i. e. be opened; as also, to anoint their eyes with clay; both ceremonies being in imitation of our Saviour's practice, and intended to shadow out to the catechumens their condition both before and after their admission into the Christian church.

**CATEGORY**, in logic, a series or order of all the predicates or attributes contained under any genus:

The school-philosophers distribute all the objects of our thoughts and ideas into certain *genera* or classes, not so much, say they, to learn what they do not know, as to communicate a distinct notion of what they do know; and these classes the Greeks called categories, and the Latins predicaments.

Aristotle made ten categories, viz. quantity, quality, relation, action, passion, time, place, situation, and habit, which are usually expressed by the following technical distich:

*Arbor, sex, servos, ardore, refrigerat, usus,  
Ruri cras flabo, nec tunicatus ero.*

**CATENARIA**, in the higher geometry, the name of a curve line formed by a rope hanging freely from two points of suspension, whether the points be horizontal or not. See FLUXIONS.

**CATERGI**, the name of the public carriers in the grand Signior's dominions. In Europe, the merchant or traveller gives earnest to the carrier; but the catergi in Turkey give earnest to the merchant and others, as a security that they will certainly carry their goods, or not set out with them.

**CATERPILLAR**, in zoology, the name of all winged insects when in their reptile or worm-state. See NATURAL HISTORY, *Of insects*.

**CATESBÆA**, in botany, a genus of the tetrandria monogynia class. The corolla is long, monopetalous, and shaped like a tunnel; the stamina are within the faux; and the berry contains but one seed. There is but one species, viz. the spinosa, a native of Providence.

**CATHÆRETICS**, in pharmacy, medicines of a caustic nature, serving to eat off proud flesh.

**CATHARTICS**, in medicine, remedies which promote evacuation by stool.

**CATHEDRAL**, a church wherein is a bishop's see or seat.

**CATHETER**, in surgery, a fistulous instrument, usually made of silver, to be introduced into the bladder, in order to search for the stone, or discharge the urine when suppressed. See SURGERY.

**CATHETUS**, in geometry, a line or radius falling perpendicularly

pendicularly on another line or surface: thus the catheti of a right-angled triangle are the two sides that include the right angle.

**CATHETUS of incidence**, in catoptrics, a right line drawn from a point of the object, perpendicular to the reflecting line.

**CATHETUS of reflection**, or of the eye, a right line drawn from the eye, perpendicular to the reflecting line.

**CATHETUS of obliquation**, a right line drawn perpendicular to the speculum, in the point of incidence or reflection.

**CATHETUS**, in architecture, a perpendicular line, supposed to pass through the middle of a cylindrical body, as a baluster, column, &c.

**CATHNESS**, the most northerly county of Scotland, having the Caledonian ocean on the north, east, and south-east, and the shire of Sutherland on the south and west. Its capital is Wick.

**CATHOLIC**, in a general sense, denotes any thing that is universal or general.

**CATHOLIC CHURCH**. The rise of heresies induced the primitive Christian church to assume to itself the appellation of catholic, being a characteristic to distinguish it from all sects, who, though they had party-names, sometimes sheltered themselves under the name of Christians.

The Romish church distinguishes itself now by the name of catholic, in opposition to all those who have separated from her communion, and whom she considers as only heretics and schismatics, and herself only as the true and Christian church. In the strict sense of the word, there is no catholic church in being, that is, no universal Christian communion.

**CATHOLIC KING**, a title which hath been hereditary to the kings of Spain, ever since Alphonfus, who, having gained several victories over the Saracens, and re-established the Christian faith in Spain, was honoured with the title of Catholic. Some say it was in the time of Ferdinand and Isabella.

**CATHOLICON**, in pharmacy, a kind of soft purgative electuary, so called, as being supposed an universal purger of all humours.

**CATOCHE**, or **CATOCCHUS**, in medicine, a disease, by which the patient is rendered, in an instant, as immoveable as a statue, without either sense or motion, and continues in the same posture he was in at the moment he was seized. See **MEDICINE**.

**CATODON**, in ichthyology, the trivial name of a species of physeter. See **PHYSETER**.

**CATOPSIS**, in medicine. See **MYOPIA**.

**CATOPTRICS**, that part of optics that treats of reflex vision, and explains the laws and properties of reflection. See **OPTICS**.

**CATULUS**, in ichthyology. See **SQUALUS**.

**CATUS-PARDUS**, in zoology. See **FELIS**.

**CATUS ZIBETHICUS**. See **CASTOR**.

**CATZENELLBOGEN**, a city of Hesse, situated upon the Upper Rhine, in Germany, about sixteen miles north of Mentz: E. long.  $7^{\circ} 40'$ , N. lat.  $50^{\circ} 20'$ . It is the capital of a county of the same name.

**CAVALIER**, in fortification, an elevation of earth of different shapes, situated ordinarily in the gorge of a ballion, bordered with a parapet, and cut into more or less embrasures, according to the capacity of the cavalier.

Cavaliers are a double defence for the faces of the opposite ballion: they defend the ditch, break the besiegers galleries, command the traverses in dry moats, scowr the saillant angle of the counterscarpe where the besiegers have their counter-batteries, and infiltrate the enemies trenches, or oblige them to multiply their parallels: they are likewise very serviceable in defending the breach, and the retrenchments of the besieged, and can very much incommode the entrenchments which the enemy make, being lodged in the ballion.

**CAVALIER**, in the menage, one that understands horses, and is practised in the art of riding them.

**CAVALRY**, a body of soldiers that charge on horseback. They are divided into squadrons, and encamp on the wings of the army.

**CAVAN**, the capital of a county of the same name, in the province of Ulster, in Ireland, situated about sixty miles north-west of Dublin: W. long.  $7^{\circ} 35'$ , and N. lat.  $54^{\circ}$ .

**CAUCALIS**, in botany, a genus of the pentandria digynia class. The corolla is radiated; the fruit is hairy, and the involucre are entire. There are six species, three of which are natives of Britain, viz. the arvensis, or small corn-parley; the anthriscus, or hedge-parley; and the leptophylla, or fine-leaved bastard parley.

**CAUCASUS**, a vast ridge of mountains, running from the Lesser Asia through the north of Persia to the East Indies; these acquire different names in the several countries through which they pass.

**CAUDIVERBERA**, in zoology, the trivial name of a species of lacerta. See **LACERTA**.

**CAVEAR**, **CAVEER**, or **CAVIARY**, the spawn, or hard roes of sturgeon, made into small cakes, an inch thick, and of an hand's breadth, salted, and dried in the sun. This sort of food is in great repute throughout Muscovy, because of their three lents, which they keep with a superstitious exactness; wherefore the Italians settled at Muscovy, drive a very great trade in this commodity throughout that empire, because there is a prodigious quantity of sturgeon taken at the mouth of the Wolga and of the other rivers which fall into the Caspian sea. There is a pretty large quantity of this commodity consumed in Italy, and they are very well acquainted with it in France and England, where it is reckoned no despicable dish.

The French and Italians get the cavear from Archangel, but they seldom get it at the first hand, for they commonly buy it of the English and Dutch.

**CAVEAT**, in law, a kind of process in the spiritual courts, to stop the proving of a will, the granting letters of administration, &c. to the prejudice of another. It is also used to stop the institution of a clerk to a benefice.

**CAVEATING**, in fencing, is the shifting the sword from one side of that of your adversary to the other.

**CAVEDO**,

**CAVEDO**, in commerce, a Portuguese long measure, equal to  $27\frac{1}{8}$  English inches.

**CAVETTO**, in architecture, a hollow member, or round concave moulding, containing a quadrant of a circle, and having a quite contrary effect to that of a quarter round: it is used as an ornament in cornices.

**CAVEZON**, in the menage, a sort of nose-band, either of iron, leather, or wood, sometimes flat, and at other times hollow or twisted, clapt upon the nose of a horse, to wring it, and so forward the suppling and breaking of the horse.

**CAVIA-COBAYA**, a synonyme of the *mus porcellinus*, or Guinea-pig. See *Mus*.

**CAVILLON**, a town of Provence in France, situated on the river Durance, about fifteen miles south of Avignon: E. long.  $5^{\circ}$ , and N. lat.  $43^{\circ} 50'$ . It is a bishop's see, and subject to the pope.

**CAUKING**, or *CAULKING of a ship*, is driving oakum, or the like, into all the seams of the planks of a ship, to prevent leaking, and keep out the water.

**CAULKING-IRONS**, are iron chissels for that purpose. Some of these irons are broad, some round, and others grooved. After the seams are stopped with oakum, it is done over with a mixture of tallow, pitch, and tar, as low as the ship draws water.

**CAUL**, in anatomy. See p. 266. col. 2.

**CAULIFLOWERS**, in gardening, a much esteemed species of cabbage.

Cauliflowers have of late years been so much improved in Britain, as to exceed in goodness and magnitude any produced in most parts of Europe; and, by the skill of the gardener, are continued for several months together, but the most common season for them is in May, June, and July.

**CAULIS**, in botany. See p. 641. col. 2. and Plate LVII. fig. 148.

**CAUSALTY**, among metaphysicians, the action or power of a cause in producing its effect.

**CAUSALTY**, among miners, denotes the lighter, sulphureous, earthy parts of ores, carried off in the operation of washing.

This, in the mines, they throw in heaps upon banks, which, in six or seven years, they find it worth their while to work over again.

**CAUSE**, that from whence any thing proceeds, or by virtue of which any thing is done: it stands opposed to effect. We get the ideas of cause and effect from our observation of the vicissitude of things, while we perceive some qualities or substances begin to exist, and that they receive their existence from the due application and operation of other beings. That which produces, is the cause; and that which is produced, the effect: thus, fluidity in wax is the effect of a certain degree of heat, which we observe to be constantly produced by the application of such heat.

*First Cause*, that which acts of itself, and of its own proper power or virtue: God is the only first cause in this sense.

*Second Causes* are those which derive the power and faculty of action from a first cause.

*Efficient Causes* are the agents employed in the production of any thing.

*Material Causes*, the subjects whereon the agents work; or the materials whereof the thing is produced.

*Final Causes* are the motives inducing an agent to act; or the design and purpose for which the thing was done.

*Physical Cause*, that which produces a sensible corporeal effect; as the sun is the physical cause of light.

*Moral Cause*, that which produces a real effect, but in things immaterial; as repentance is the cause of forgiveness. A moral cause is also defined, that which determines us, though not necessarily, to do, or not to do, any thing; as advice, intreaties, commands, menaces, &c.

It is to be observed, that, in this sense, a moral cause is only applicable to a free intelligent agent: it is also observable, that the latter notion of a physical as well as a moral cause is the most just, clear, and distinct.

**CAUSE**, among civilians, the same with action. See *ACTION*.

**CAUSTICS**, in physic, an appellation given to medicines of so hot and fiery a nature, that, being applied, consume, and, as it were, burn the texture of the parts, like hot iron.

Caustics are generally divided into four sorts, the common stronger caustic, the common milder caustic, the antimonial caustic, and the lunar caustic.

The stronger caustic is prepared by boiling to a fourth part any quantity of the lees of almond-soap, adding lime that has been kept in a vessel pretty close stopp'd for several months; the lime is to be added till all the liquor is absorbed, and the whole reduced to a paste, which is to be kept in a vessel well stopp'd.

The common milder caustic is prepared by taking equal parts of soft soap and fresh quick-lime, and mixing them at the time of using.

The antimonial caustic is prepared thus: Take of antimony one pound, of corrosive sublimate two pounds; and being reduced separately into powder, mix them well, and distill them in a retort with a wide neck, in a gentle heat of sand; let what ascends into the neck of the retort be exposed to the air, that it may run into a liquor.

The method of preparing the lunar caustic is as follows: Dissolve pure silver by a sand-heat, in about twice its weight of aqua-fortis; then dry away the humidity with a gentle fire, afterwards melt it in a crucible, that it may be poured into proper moulds, carefully avoiding over-much heat, lest the matter should grow too thick.

**CAUSTIC CURVE**, in the higher geometry, a curve formed by the concurrence or coincidence of the rays of light reflected from some other curve.

**CAUSTIC GLASSES**. See *BURNING-GLASSES*.

**CAUSTICUM ANTIMONIALE**, in the London Dispensatory, the same with the oil of antimony.

**CAUSUS**, or *BURNING-FEVER*, a species of continual fever, accompanied with a remarkable inflammation of the blood.

**CAUTERIZATION**, the application of cauteries to any part of the body.

**CAUTERY**,

**CAUTERY**, in surgery, a medicine for burning, eating, or corroding any solid part of the body.

Cauteries are distinguished into two classes, actual and potential : by actual cauteries, are meant red hot instruments, usually of iron, and by potential cauteries are understood certain kinds of corroding medicines. See **MEDICINE**, and **SURGERY**.

**CAUTION**, in the civil and Scots law, denotes much the same with what, in the law of England, is called bail. See **BAIL**.

**CAUTIONER**, in Scots law, that person who becomes bound for another to the performance of any deed or obligation. As to the different kinds and effects of cautionry, see **SCOTS LAW**, title, *Obligations arising from consent*.

**CAXA**, a little coin made of lead, mixed with some scoria of copper, struck in China, but current chiefly at Bantam in the island of Java, and some of the neighbouring islands.

The caxas are of two kinds, great and small. Of the small, 300,000 are equal to fifty-six livres five sols French money; and of the great, 6000 are equal to four shillings and sixpence sterling.

**CAXAMALCA**, the name of a town and district of Peru, in South America, where there was a most sumptuous palace belonging to the Yncas, and a magnificent temple dedicated to the sun. It was at Caxamalca that Pizarro put to death Athualpha, their last king.

**CAY**, in zoology, a synonyme of the simia midas. See **SIMIA**.

**CAZEROM**, or **CAZERON**, a city of Persia, the capital of the province of Kurch Schabour, situated in 70° E. long. and 29° 15' N. lat.

**CAZIMIR**, a town of Poland, in the palatinate of Lublin.

**CEANOTHUS**, in botany, a genus of the pentandria monogynia class. The petals are vaulted; and the berry is dry, having three cells, containing each one seed. There are three species, none of them natives of Britain.

**CECROPIA**, in botany, a genus of the diœcia diandria class. The spathe of the male is caducous; the amenta are imbricated with helmet-shaped scales; and the corolla is wanting. The germina of the female are imbricated; it has but one stylus; the stigma is lacerated; and the berry contains but one seed. There is one species, viz. the peltata, a native of Jamaica.

**CEDAR**, in botany, the English name of a species of juniperus. See **JUNIPERUS**.

**CEDRELA**, in botany, a genus of the pentandria monogynia class. The calix is bell shaped, and divided into three segments; the corolla is shaped like a funnel, and has five petals inserted into the base of the receptacle; the capsule is lignous, and has five cells and five valves; the seeds are imbricated on the back part, and have membranaceous edges. There is but one species, viz. the odorata, a native of America.

**CEDRUS**, in botany. See **JUNIPERUS**, and **PINUS**.

**CELANDINE**, in botany. See **CHELIDONIUM**.

**CELASTRUS**, in botany, a genus of the pentandria monogynia class. The corolla consists of five open petals; the capsule is triangular, and has three cells; and the seeds have a calyptra. There are five species, none of them natives of Britain.

**CELERES**, in Roman antiquity, a regiment of bodyguards, belonging to the Roman kings, established by Romulus, and composed of 300 young men, chosen out of the most illustrious Roman families, and approved by the suffrages of the curiæ of the people, each of which furnished ten.

**CELERI**, in botany, the English name of the apium graveolens, or celery, which is cultivated in our gardens as a pot-herb.

**CELERITY**, in mechanics, the swiftness of any body in motion.

It is also defined to be an affection of motion, by which any moveable body runs through a given space in a given time. See **MECHANICS**.

**CELESTINS**, in church-history, a religious order of Christians, reformed from the Bernardins by pope Celestin V. Their rules are divided into three parts; the first, of the provincial chapters, and the elections of superiors; the second contains the regular observances; and the third, the visitation and correction of the monks.

The Celestins rise two hours after midnight to say matins: they eat no flesh at any time, except when they are sick: they fast every Wednesday and Friday to the feast of the exaltation of the holy cross; and from that feast to Easter, every day.

**CELIBACY**, the state of unmarried persons, to which, according to the doctrine, or at least the discipline, of the church of Rome, the clergy are obliged.

That celibacy has no pretence of divine or apostolical institution, seems no difficult point to prove: whence it is, at first, hard to conceive from what motive the court of Rome persisted so very obstinately to impose this institution on the clergy. But we are to observe, that this was a leading step to the execution of the project formed of making the clergy independent of princes, and rendering them a separate body, to be governed by their own laws. In effect, while priests had children, it was very difficult to prevent their dependence upon princes, whose favours have such an influence on private men; but having no family, they were more at liberty to adhere to the pope.

**CELOSIA**, in botany, a genus of the pentandria monogynia class. The calix has three leaves; the stamina are joined to the base of a plaited nectarium; and the capsule opens horizontally. There are eight species, none of them natives of Britain.

**CELSIA**, in botany, a genus of the didynamia angiospermia class. The calix is divided into five segments; the corolla is rotated; the filaments are barbed; and the capsule is bilocular. There is but one species, viz. the orientalis, a native of Greece.

**CELTIS**, in botany, a genus of the polygamia monœcia class. The calix of the hermaphrodite is divided into five segments; it has no corolla; there are five stamina,

stamina, and two styli; the drupa contains but one seed. The calix of the male is divided into six segments; it has no corolla; and the stamina are six. The species are three, none of them natives of Britain.

**CEMENT**, or **CÆMENT**. See **CÆMENT**.

**CEMENTATION**. See **CÆMENTATION**.

**CEMETERY**. See **COEMETERY**.

**CENADA**, a town of the Venetian territories in Italy, situated about thirty-two miles north of Padua: E. long.  $12^{\circ} 40'$ . and N. lat.  $46^{\circ} 5'$ .

**CENCHRAMIDEA**, in botany. See **CLUSIA**.

**CENCHRIS**; in zoology, a synonyme of the boa constrictor. See **BOA**.

**CENCHRUS**, in botany, a genus of the polygamia monœcia class. The involucre is lacinated, and incloses two flowers; the calix is a two flowered gluma, one of the flowers being a male, and the other a female. The corolla of the hermaphrodite is a blunt gluma; the stamina are three; and the stylus is bifid; there is but one seed. The corolla of the male is likewise an obtuse gluma; and there are three stamina. The species are six, none of them natives of Britain.

**CENCONTLAOLLI**, in ornithology. See **TURDUS**.

**CENOBITE**, or **COENOBITE**. See **COENOBITE**.

**CENOTAPH**, in antiquity, a monument erected in honour of the dead, but not containing any of their remains. Of these there were two sorts; one erected for such persons as had been honoured with funeral rites in another place; and the second sort, for those that had never obtained a just funeral.

The sign whereby honorary sepulchres were distinguished from others, was commonly the wreck of a ship, to denote the decease of the person in some foreign country.

**CENSER**, a sacred instrument made use of in the religious rites of the ancients. It was a vase, containing incense to be used in sacrificing to the gods. Censers were likewise in use among the Jews, as we find in 1 Kings vii. 50. The censer is also used in Romish churches.

**CENSOR**, in Roman antiquity, a magistrate, whose business it was to reform the manners, and to value the estates of the people.

There were two censors first created in the 311th year of Rome, upon the senate's observing that the consuls were generally so much taken up in military actions as to have no leisure to attend to private affairs. At first they were chosen out of the senate, but after the plebeians had got the consulate open to them, they soon arrived at the censorship.

After the censors were elected in the comitia centuriata, they proceeded to the capitol, where they took an oath not to manage either by favour or disaffection, but to act equitably and impartially through the whole course of their administration: and, notwithstanding their great authority, they were obliged to give an account of their management to the tribunes and *ediles curules*. In process of time, the dignity of this office dwindled very much; under the emperors it sunk to

nothing, as their majesties engrossed all the branches of that jurisdiction. The republic of Venice has at this day a censor of manners of their people, whose office lasts six months.

**CENSORS of books**, are a body of doctors or others established in divers countries, to examine all books before they go to the press, and to see they contain nothing contrary to faith and good manners.

At Paris, the faculty of theology claim this privilege, as granted to them by the pope; but in 1624, new commissions of four doctors were created, by letters-patent, the sole censors of all books, and answerable for every thing contained therein.

In England, we had formerly an officer of this kind, under the title of Licensor of the press; but, since the revolution, our press has been laid under no such restraint.

**CENSURE**, a judgment which condemns some book, person, or action, or more particularly a reprimand from a superior. Ecclesiastical censures, are penalties by which, for some remarkable misbehaviour, Christians are deprived of the communion of the church, or prohibited to execute the sacerdotal office.

**CENSUS**, in Roman antiquity, an authentic declaration made before the censors, by the several subjects of the empire, of their respective names and places of abode. This declaration was registered by the censors, and contained an enumeration, in writing, of all the estates, lands, and inheritances they possessed; their quantity, quality, place, wives, children, domestics, tenants, slaves.

The census was instituted by Servius Tullius, and was held every five years. It was of great service to the republic, because, by means of it, they discovered the number of citizens capable of bearing arms, and the money they could afford for the expence of a war. It went through all ranks of people, though under different names: that of the common people was called *census*; that of the knights, *census, recensio, recognitio*; that of the senators, *lectio, relectio*.

The census which intitled one to the dignity of a knight, was 400,000 sesterces: that of a senator, was double that sum.

In the Voconian law, census is used for a man, whose estate in the censor's books is valued at 100,000 sesterces.

**CENTAUR**, in ancient poetry, denotes a fabulous kind of animal, half man, half horse.

The Thesalians, who first taught the art of breaking horses, appearing on horseback to make only one body with the animal on which they rode, gave rise to the fiction of the hippocentaur.

**CENTAUREA**, in botany, a genus of the syngenesia polygamia frustranea class. The receptacle is bristly; the pappus is simple; the rays of the corolla are tunnel-shaped, long, and irregular. There are 61 species, five of which are natives of Britain, viz. the cyanus, or blue-bottle; the scabiosa, or great knapweed; the jacea, or common knapweed; the calcitrapa, or star-thistle; and the solstitialis, or St Barnaby's thistle.

**CENTAURY**.

**CENTAURY.** See **CHELIDONIUM**.

**CENTER of gravity**, in mechanics, that point about which all the parts of a body do, in any situation, exactly balance each other. See **MECHANICS**.

**CENTER of motion**, that point which remains at rest, while all the other parts of a body move about it. See **MECHANICS**.

**CENTESIMATION**, a milder kind of military punishment, in cases of desertion, mutiny, and the like, when only every hundredth man is executed.

**CENTIPES**, in zoology. See **SCOLOPENDRA**.

**CENTONARII**, in antiquity, certain officers of the Roman army, who provided tents and other stuff, called centones, made use of to quench the fire which the enemy's engines threw into the camp.

Their centonarii kept with the carpenters and other officers of the artillery.

**CENTRAL FORCES**, the powers which cause a moving body to tend towards, or recede from the centre of motion. See **MECHANICS**.

**CENTRAL RULE**, a rule discovered by Mr Thomas Baker, whereby to find the centre of a circle designed to cut the parabola in as many points, as an equation to be constructed hath real roots. Its principal use is in the construction of equations, and he has applied it with good success as far as biquadratics.

The central rule is chiefly founded on this property of the parabola, that if a line be inscribed in that curve perpendicular to any diameter, a rectangle formed of the segments of the inscript, is equal to the rectangle of the intercepted diameter and parameter of the axis.

The central rule has the advantage over Cartes and De Latere's methods of constructing equations, in that both these are subject to the trouble of preparing the equation, by taking away the second term.

**CENTRIFUGAL FORCE**, that force by which all bodies that move round any other body in a curve, endeavour to fly off from the axis of their motion in a tangent to the periphery of the curve, and that in every point of it. See **MECHANICS**.

**CENTRINA**, in ichthyology, the trivial name of a species of *squalus*. See **SQUALUS**.

**CENTRIPETAL FORCE**, that force by which a body is every where impelled, or any how tends towards some point as a centre. See **MECHANICS**.

**CENTRISCUS**, in ichthyology, a genus belonging to the order of amphibia nantes. The head gradually ends in a narrow snout; the aperture is broad and flat; the belly is carinated; and the belly-fins are united. There are two species, viz. 1. The *scutatus* has its back covered with a smooth bony shell, which ends in a sharp spine, under which is the tail; but the back-fins are between the tail and the spine. It is a native of the East Indies. 2. The *scolopax* has a rough scabrous body, and a strait extended tail. It has two belly-fins, with four rays in each, and has no teeth. It is found in the Mediterranean.

**CENTUMVIRI**, in Roman antiquity, judges appointed to decide common causes among the people: they were

chosen three out of each tribe; and though five more than an hundred, were nevertheless called centumviri, from the round number centum, an hundred.

**CENTUNCULUS**, in botany, a genus of the tetrandria monogynia class. The calix consists of four segments; the corolla has four divisions, and open; the stamina are short; and the capsule has but one cell. There is only one species, viz. the *minimus*, or bastard pimpernel, a native of Britain.

**CENTURION**, among the Romans, an officer in the infantry, who commanded a century, or an hundred men.

The centurions held the first rank in the first cohort of a legion, and two of them the place of the two first hastati or pike-men: the first among the principes was also a centurion.

The centurion primipilus was the chief of the centurions: he was not under the command of any tribune, as all the rest were; he had four centuries under his direction, and guarded the standard and the eagle of the legion.

**CENTURY**, in a general sense, any thing divided into or consisting of an hundred parts.

The Roman people, when they were assembled for the electing of magistrates, enacting of laws, or deliberating upon any public affair, were always divided into centuries, and voted by centuries, in order that their suffrages might be the more easily collected; whence these assemblies were called *comitia centuriata*. The Roman cohorts were also divided into centuries. See **CENTURION** and **COHORT**.

**CENTURY**, in chronology, the space of one hundred years.

This method of computing by centuries is generally observed in church-history, commencing from the time of our Saviour's incarnation; in which sense we say the first century, the second century, &c.

**CENTURIES of Magdeburg**, a famous ecclesiastical history, ranged into thirteen centuries, carried down to the year 1298, compiled by several hundred Protestants of Magdeburg, the chief of whom was Matthias Flacius Illyricus.

**CENTUSSIS**, in Roman antiquity, a coin containing an hundred asses.

**CEPA**, in botany, the trivial name of a species of *allium*. See **ALLIUM**.

**CEPÆA**, in botany. See **SEDUM**.

**CEPHALANTHUS**, in botany, a genus of the tetrandria monogynia class. It has no common calix; the proper calix is tunnel-shaped; the receptacle is globular, and naked; and the seeds are downy. There is but one species, viz. the *occidentalis*, a native of America.

**CEPHALIC**, in a general meaning, signifies any thing belonging to the head.

**CEPHALIC medicines** are remedies for disorders of the head.

**CEPHALIC vein**, in anatomy. See p. 241.

**CEPHALONIA**, the capital of an island of the same name, situated in the Mediterranean, near the coast of

- of Epirus, and subject to the Venetians: E. long. 21°, and N. lat. 38° 30'.
- CEPHALOPHARYNGÆI**, in anatomy. See p. 302.
- CEPHALUS**, in ichthyology, the trivial name of a species of mugil. See **MUGIL**.
- CEPHEUS**, in astronomy, a constellation of the northern hemisphere.
- CERHUS**, in ornithology, a synonyme of a species of **larus**. See **LARUS**.
- CERAM**, an island in the Indian ocean, between the Molucca islands on the north, and those of Amboyna and Banda on the south, lying between 126° and 129° E. long. and in 3° S. lat.
- It is about one hundred and fifty miles long, and sixty broad; and here the Dutch have a fortress, which keeps the natives in subjection.
- CERAMBYX**, in zoology, a genus of insects of the beetle kind, belonging to the order of insecta coleoptera. The antennæ are long and small; the breast is spinous or gibbous; and the elytra are linear. There are no less than 83 species enumerated by Linnæus, principally distinguished by the figure of the breast.
- CERASTES**, in zoology, the trivial name of a species of coluber; it is likewise the trivial name of a species of anguis. See **ANGUIS**, and **COLUBER**.
- CERASTIUM**, in botany, a genus of the decandria pentagynia class. The calix has five leaves; the petals are bifid; and the capsule is unilocular, and opens at the top. There are sixteen species, seven of which are natives of Britain, *viz.* the vulgatum, or narrow-leaved mouse-ear chickweed; the viscosum, or broad-leaved mouse-ear chickweed; the semidecandrium, or least mouse-ear chickweed; the arvense, or corn mouse-ear chickweed; the alpinum, or mountain mouse-ear chickweed; the tomentosum, or woolly mouse-ear chickweed; and the aquaticum, or marsh mouse-ear chickweed.
- CERASUS**, in botany, the trivial name of a species of **prunus**. See **PRUNUS**.
- CERATE**, in pharmacy, a kind of ointment applied to ulcerations, excoriations, &c. There are four kinds of cerate, *viz.* the *white cerate*, which is composed of a quarter of a pint of olive oil, four ounces of white wax, and half an ounce of spermaceti, liquified together and sharred till the cerate be cold. The *yellow cerate* is composed of half a pound of yellow basilicum ointment, and an ounce of yellow wax, melted together. The *ceratum epuloticum*, is composed of one pint of olive-oil, and of yellow wax and calamine prepared each half a pound. Liquify the wax with the oil, and, as soon as the mixture begins to grow stiff, sprinkle in the calamine, keeping them constantly stirring till the cerate is quite cold. The *mercurial cerate* is composed of yellow wax, hogs lard dried, each half a pound; three ounces of quicksilver; and one dram of simple balsam of sulphur. Melt the wax with the lard, then gradually add this mixture to the quicksilver and balsam of sulphur previously ground together.
- CERATION**, the name given by the ancients to the small seeds of the ceratonia, used by the Arabian physicians, as a weight to adjust the doses of medicines; as the grain weight with us took its rise from a grain of barley.
- CERATION**, or **CERATIUM**, was also a silver coin, equal to one third of an obolus.
- CERATOCARPUS**, in botany, a genus of the monœcia monandria class. The calix of the male is divided into two parts; it has no corolla; and the filament is long: The calix of the female consists of two leaves connected to the germen; it has no corolla; the styli are two; and the seeds are bicorned and compressed. There is but one species, *viz.* the arenarius, a native of Tartary.
- CERATOCEPHALOIDES**, in botany. See **VERBESINA**.
- CERATOCEPHALUS**, in botany. See **BIDENS**.
- CERATOIDES**, in botany. See **URTICA**.
- CERATONIA**, in botany, a genus of the polygamia polyœcia class. It is a native of Sicily, Crete, and other eastern countries.
- CERATOPHYLLUM**, in botany, a genus of the monœcia polyandria class. The calix of the male is divided into many segments; it has no corolla; and the stamina are from 16 to 20. The calix and corolla of the female are the same with those of the male; it has one pistil, no stylus, and one naked seed. There are two species, one of which, *viz.* the demersum or horned pondweed, is a native of Britain.
- CERATUM**, in pharmacy. See **CERATE**.
- CERBERA**, in botany, a genus of the pentandria monogynia class. The fruit is a drupa containing one seed. There are three species, all of them natives of the Indies.
- CERCELE**, in heraldry. A cross cercele is a cross which opening at the ends, turns round both ways, like a ram's horn. See **CROSS**.
- CERCIS**, in botany, a genus of the decandria monogynia class. The calix is five-toothed, and gibbous below; the corolla is papilionaceous, with a short vexillum under the wings; the capsule is a legumen. There are two species, none of them natives of Britain.
- CEREBELLUM**, in anatomy. See p. 286.
- CEREBRUM**, in anatomy. See p. 285.
- CEREMONY**, an assemblage of several actions, forms, and circumstances, serving to render a thing more magnificent and solemn; particularly used to denote the external rites of religious worship, the formalities of introducing ambassadors to audiences, &c.
- Master of the CEREMONIES*, an officer instituted by king James I. for the more honourable reception of ambassadors and strangers of quality: he wears about his neck a chain of gold, with a medal under the crown of Great Britain, having on one side an emblem of peace, with this motto, *beati pacifici*; and on the other, an emblem of war, with *dicu et mon droit*: his salary is three hundred pounds *per annum*.
- Assistant master of the CEREMONIES* is to execute the employment in all points, whensoever the master of the

the ceremonies is absent. His salary is one hundred and forty-one pounds thirteen shillings and fourpence *per annum*.

*Marshal of the CEREMONIES* is their officer, being subordinate to them both. His salary is one hundred pounds *per annum*.

**CEREUS**, in botany. See **CACTUS**.

**CERIGO**, or **CYTHÆA**, in geography, an island of the Archipelago, on the eastern coast of the Morea, and fifty miles north of the island of Candia. It is a mountainous country, between forty and fifty miles in circumference, and situated in E. long. 23° 40', and N. lat. 36°.

**CERINTHE**, in botany, a genus of the pentandria monogynia class. The limbus of the corolla is tubular and ventricose, opening at the faux; the seeds are often four, and sometimes two. There are only two species, none of them natives of Britain.

**CERINTHIAN**, in church-history, Christian heretics, followers of Cerinthus, who lived and published his heresy in the time of the apostles themselves. They did not allow that God was the author of the creatures, but said that the world was created by an inferior power: they attributed to this creator an only son, but born in time, and different from the world: they admitted several angels and inferior powers: they maintained that the law and the prophets came not from God, but from the angels; and that the God of the Jews was only an angel: they distinguished between Jesus and Christ; and said, that Jesus was a mere man, born, like other men, of Joseph and Mary; but that he excelled all other men in prudence and wisdom; that Jesus being baptized, the Christ of the supreme God, that is, the Holy Ghost, descended upon him; and that by the assistance of this Christ, Jesus performed his miracles. It was partly to refute this sect that St John wrote his gospel.

**CERINTHOIDES**, in botany. See **CERINTHE**.

**CEROPEGIA**, in botany, a genus of the pentandria monogynia class. The limbus of the corolla is connivent; and the seeds are plumose. There are two species, both natives of India.

**CERRUS**, in botany. See **ÆGILOPS**.

**CERTHIA**, in ornithology, a genus belonging to the order of picæ. The beak of this genus is arched, slender, sharp, and triangular; the tongue is sharp at the point; and the feet are of the walking kind, *i. e.* having the toes open and unconnected. There are 25 species, *viz.* 1. The familiaris, or creeper, is grey above and white underneath, with brown wings, and ten white spots on the ten prime feathers. It is a native of Europe, creeps up trees, lays about 20 eggs, and feeds upon caterpillars and the eggs of insects. 2. The muraria, or wall-creeper, is ash-coloured, with yellow spots on the wings. It frequents towers and old walls, in the holes of which it builds its nest. 3. The pusilla, is grey above, and white below; the eye-brows are white; the prime feathers of the wings are brown, and white on the outer edge. It is a native of India. 4. The capensis, is grey, with blackish wings, the outermost prime feathers of which are

edged with white: It is a native of the Cape of Good-Hope. 5. The olivacea, is olive-coloured above, and grey below, with the orbits of the eyes white. It is found in Madagascar. 6. The currucaia is likewise olive above, but yellowish below; and the prime wing-feathers are equal. It is a native of Ceylon. 7. The jugularis is greyish above, and yellowish below; the throat is of a violet colour; and the two outmost prime feathers of the wings are yellow at the points. It is found in the Philippine Isles. 8. The cærulea has a blue belt round the eyes; and the throat, and prime wing and tail feathers are black: The bill is very long. It is a native of Surinam. 9. The cayana is of a green shining colour above, and streaked with white below. It is a native of Cayenne. 10. The chalybeata is green and shining above; the breast is red, and on the fore-part of it there is an iron-coloured belt. 11. The afra is green above; the breast is red; the belly is white; and it has a short blue tail. The above two species are found at the Cape of Good-Hope. 12. The spiza is green, with the head and prime wing-feathers black. It is a native of Brasil. 13. The sperata is purple above, and red below; the head, throat, and tail, are violet. It is found in the Philippine Isles. 14. The senegalensis is of a blackish violet colour; the top of the head and throat are greenish, and the breast is red. It is a native of Senegal. 15. The gutturalis is greenish; the throat is a shining green, and the breast is purple. It is a native of Brasil. 16. The pinus is yellow below, and olive above; the wings are blue, with two white belts. It is a native of North America. 17. The cruenta is blackish above, and white below; the top of the head, the neck, and tail, are red. It is a native of Bengal. 18. The flaveola is black above, and yellow below; the eye-brows, and the tops of the outermost prime wing-feathers, are white. It is a native of America. 19. The pulchella has a green shining body, and a red breast; the two intermediate prime wing-feathers are very long. It is a native of Senegal. 20. The famosa has the two intermediate prime wing-feathers very long; the body is of a shining green; and the axillæ of the wings are yellow. It is found at the Cape of Good-Hope. 21. The philippina has the two intermediate wing-feathers very long, a greenish grey body, and yellowish underneath. It is a native of the Philippine Isles. 22. The violacea has the two intermediate prime wing-feathers very long, a shining violet-coloured body, and the breast and belly are yellow. 23. The zeylonica has a green head, an iron-coloured back, a yellow belly, and the throat and tail are azure. It is a native of Ceylon. 24. The cyanea is blue, with a black belt round the eyes; the shoulders, wings, and tail are black, and the feet are red. It is a native of Brasil and Cayenne. 25. The lotentia is blue, with a red belt over the breast. It is a native of Ceylon.

**CERTIORARI**, a writ which issues out of the chancery, directed to an inferior court, to call up the records of a cause there depending, in order that justice may be done. And this writ is obtained upon complaint, that

the party who seeks it has received hard usage, or is not like to have an impartial trial in the inferior court. A certiorari is made returnable either in the king's bench, common pleas, or in chancery.

It is not only issued out of the court of chancery, but likewise out of the king's bench, in which last mentioned court it lies where the king would be certified of a record. Indictments from inferior courts, and proceedings of the quarter-sessions of the peace, may also be removed into the king's bench by a certiorari; and here the very record must be returned, and not a transcript of it; though usually in chancery, if a certiorari be returnable there, it removes only a tenor of the record.

**CERTITUDE**, considered in the things or ideas which are the objects of our understanding, is a necessary agreement or disagreement of one part of our knowledge with another: as applied to the mind, it is the perception of such agreement or disagreement; or such a firm well-grounded assent, as excludes not only all manner of doubt, but all conceivable possibility of a mistake.

There are three sorts of certitude, or assurance, according to the different natures and circumstances of things.

1. A physical or natural certitude, which depends upon the evidence of sense; as that I see such or such a colour, or hear such or such a sound: no body questions the truth of this, where the organs, the medium, and the object are rightly disposed. 2. Mathematical certitude is that arising from mathematical evidence; such is, that the three angles of a triangle are equal to two right ones. 3. Moral certitude is that founded on moral evidence, and is frequently equivalent to a mathematical one; as that there was formerly such an emperor as Julius Cæsar, and that he wrote the Commentaries which pass under his name; because the historians of these times have recorded it, and no man has ever disproved it since: this affords a moral certitude, in common sense so great, that one would be thought a fool or a madman for denying it.

**CERVIA**, in geography, a city and port-town of Romania, in Italy, situated on the gulph of Venice, about ten miles south-east of Ravenna, and subject to the pope: E. long. 13°, and N. lat. 44° 30'.

**CERVICAL nerves**, in anatomy. See p. 251.

**CERVIX**, in anatomy. See p. 166.

**CERVIX of the uterus**. See p. 274.

**CERUMEN**, EAR-WAX. See p. 296.

**CERUSE**, or **CERUSS**, *white lead*, a sort of calx of lead, made by exposing plates of that metal to the vapour of vinegar.

The best way of preparing it is the following: A glass-ucurbit is to be cut off in such a manner as to leave it a very long mouth; an alembic head of glass is to be fitted to this; some vinegar is to be put into the body, and a number of thin plates of lead are to be placed in the head in such a manner that they may stand somewhat erect: when the head is fitted on, the body is to be set in a gentle sand-heat for twelve hours; then unluting the vessels, the receiver, which had been

fitted to the nose of the head, will contain a sweet and styptic liquor, nauseous and turbid, called the vinegar of lead, or the solution of lead; and the plates of lead, taken out of the head, will be found covered with a white dusty matter; this is cerus; and if the operation be repeated, the whole lead will be in fine reduced to this state of cerus.

Cerus is used externally either mixed in ointments, or by sprinkling it on old gleeting and watery ulcers, and in many diseases of the skin. If, when it is reduced into a fine powder, it is received in with the breath in inspiration, and carried down into the lungs, it causes terrible asthmas, that are almost incurable, and at last generally prove fatal: sad instances of the very pernicious effects of this metal are too often seen among those persons who work lead in any form, but particularly among the workers in white-lead.

The painters use it in great quantities, and, that it may be afforded cheap to them, it is generally adulterated with common whiting: the English and Dutch cerus are very bad in this respect: the Venetian ought always to be used by apothecaries.

**CERUSS of antimony**, a medicine prepared by distilling powdered regulus of antimony with spirit of nitre, till no more fumes arise; what remains in the retort being pulverised and washed, makes the cerus of antimony, which is esteemed a powerful diuretic.

**CERVUS**, or **DEER**, in zoology, a genus of quadrupeds belonging to the order of pecora. The horns are solid, brittle, covered with a hairy skin, and growing from the top; they likewise fall off, and are renewed annually. There are eight fore-teeth in the under jaw, and they have no dog-teeth. The species of this genus are seven, viz. 1. The camelopardalis, with simple or unbranched horns, and the fore-feet remarkably longer than the hind feet. This is an uncommon animal, few of them having ever been seen in Europe. It is a native of Æthiopia, and is very mild and gentle: The head is like that of a stag; its horns are blunt and about six inches long. The neck resembles that of a camel, but much longer, being sometimes seven feet in length. The body is small, covered with white hair, and spotted with red. He is eighteen feet in length from the tail to the top of the head; and when he holds up his head, it is sixteen feet from the ground. He feeds principally on the leaves of trees.

2. The alces, or elk, has palmated horns, without any proper stem, and a fleshy protuberance on the throat. This is the largest animal of the deer kind. At the fair of St Germain at Paris, in the year 1752, a female elk was exhibited as a show. It was caught in the year 1749, in a forest of Red Russia, belonging to a Khan of Tartary. The height was six feet seven inches, the length ten feet, and the thickness eight. The hair was long, like that of a wild boar. The skin is said to resist the force of a gun bullet. The elk is a very swift animal; and he feeds upon leaves of alder, birch, willow, &c. When tamed, he devours large quantities of hay or bread. This animal is found in the northern woods of Europe, Asia, and America.

3. The

3. The claphus, is a kind of elk, with cylindrical ramified horns, bent backwards. It is a native of the northern parts of Europe and Asia.

4. The tarandus, or rein-deer, is a native of Lapland, and the northern parts of Europe, Asia, and America. The horns are large, cylindrical, branched, and palmated at the tops. Two of the branches hang over the face. He is about the size of a buck, of a dirty whitish colour; the hairs of his skin are thick and strong. These animals are of great use to the Laplanders; they feed upon their flesh; they employ their sinews in sewing the boards of sledges together, and their milk affords them good cheese: They likewise make garments of their skins. The rein-deer are always employed in drawing sledges along the snowy mountains, where horses cannot travel. In a beaten track, they will drag a sledge twenty-five miles a day. When the animal is tired, his master looses him from the sledge, and he immediately scrapes the snow from the ground with his feet, and feeds upon a species of liver-wort, called rein-deer liver-wort, which is very plentiful in these countries. This is the only nourishment they require.

5. The dama, or buck and doe, a well known animal, kept tame in parks; the horns are branched, compressed, and palmated at the top. It is a native of Europe. Their flesh, which goes by the name of venison, is in high repute with the luxurious. See Plate LXIII.

6. The capreolus, has erect, cylindrical, branched horns, and forked at the top. It is called by some authors the Brazilian goat, and is a native of Europe and Asia.

7. The Guineensis, is of a greyish colour, and black underneath. It is a native of Guinea, and the size and figure of its horns have not been hitherto described with any precision.

**Cervus volans**, in zoology, a synonyme of a species of lucanus. See **LUCANUS**.

**CESARE**, among logicians, one of the modes of the second figure of syllogisms; the minor proposition of which is an universal affirmative, and the other two universal negatives: Thus,

**CE** No immoral books ought to be read:

**SA** But every obscene book is immoral:

**RE** Therefore no obscene book ought to be read.

**CESSIO bonorum**, in Scots law. The name of that action by which an insolvent debtor may apply for liberation from prison, upon making over his whole real and personal estate to his creditors. See **SCOTS LAW**, title, *Sentences and their execution*.

**CESTRUM**, in botany, a genus of the pentandria monogynia class. The corolla is tunnel-shaped; and the berry is unilocular. There are two species, both natives of America.

**GESTUS**, among ancient poets, a fine embroidered girdle said to be worn by Venus, to which Homer ascribes the faculty of charming and conciliating love.

**CETACEOUS**, an appellation given to fishes of the whale kind.

**GETE**, the name of Linnæus's seventh order of mammalia, comprehending the **MONODON**, **BALÆNA**,

**PHYSETER**, and **DELPHINUS**; see these articles. **CETERACH**, in botany, the trivial name of a species of asplenium. See **ASPENIUM**.

**CETTE**, a port-town of Languedoc, in France, situated on a bay of the Mediterranean, in E. long.  $5^{\circ} 16'$ , and N. lat.  $43^{\circ} 25'$ .

**CETUS**, in astronomy, a constellation of the southern hemisphere, comprehending twenty-two stars in Ptolemy's catalogue, twenty-one in Tycho's, and in the Britannic catalogue seventy-eight.

**CEUTA**, a city of the kingdom of Fez, in Africa, situated on the south side of the straits of Gibraltar, almost opposite to it: W. long.  $6^{\circ} 30'$ , and N. lat.  $35^{\circ} 50'$ . It is a strong fortress, in the possession of the Spaniards.

**CEYLON**, an island in the Indian ocean, situated between  $78^{\circ}$  and  $82^{\circ}$  E. long. and between  $6^{\circ}$  and  $10^{\circ}$  N. lat. It is about two hundred and fifty miles long, and two hundred broad. The Dutch, who are in possession of all the sea-coast, monopolize all the cinnamon produced in the island, the king being obliged to keep in the centre of the island, in his capital of Candy.

**CHABLAIS**, a country of Savoy, with the title of duchy.

**CHACO**, a large country of South America, situated between  $19^{\circ}$  and  $27^{\circ}$  S. lat.

**CHÆROPHYLLUM**, or **CHERVIL**, in botany, a genus of the pentandria digynia class. The involucre is concave and reflected; the petals are cordated; and the fruit is smooth and oblong. The species are seven, only two of which are natives of Britain, viz. the sylvestre, or wild cicely, or cow-weed; and the tumulum, or wild chervil. The leaves of the chervil are gently aperient and diuretic, and at the same time grateful to the palate and stomach.

**CHÆTODON**, in ichthyology, a genus of fishes belonging to the order of thoraci. The teeth are very numerous, thick, setaceous, and flexile: The rays of the gills are six. The back-fin and the fin at the anus are fleshy and squamous. There are twenty-three species, distinguished from each other principally by the figure of the tail, and the number of spines in the back-fin.

**CHAFF-FINCH**, in ornithology, the English name of a species of fringilla. See **FRINGILLA**.

**CHAGRE**, a fort at the mouth of a river of the same name, a little south of Porto Bello: W. long.  $82^{\circ}$ , and N. lat.  $9^{\circ} 50'$ .

**CHAIN**, a long piece of metal composed of several links or rings, engaged the one in the other. They are made of divers metals, some round, some flat, others square; some single, some double; and serve to so many uses, that it would be tedious to give a particular account of them all.

**CHAIN** is also a kind of measure in France, in the trade of wood for fuel: There are chains for wood by tale, for wood by the rope, for faggots, for cleft wood, and for round sticks. There are also chains measuring the sheaves of all sorts of corn, particularly with regard to the payment of tythes; for measuring pottles of hay,

hay, and for measuring horses. All these are divided into feet, inches, hands, &c. according to the use they are designed for.

**CHAIN-shot**, two bullets with a chain between them. They are used at sea to shoot down yards or masts, and to cut the shrouds or rigging of a ship.

**CHAIN**, in surveying, a measure of length, made of a certain number of links of iron-wire, serving to take the distance between two or more places.

Gunter's chain of 100 such links, each measuring  $7\frac{1}{2}$  inches, and consequently equal to 66 feet, or four poles. See **SURVEYING**.

**CHAISE**, a sort of light, open chariot, or calash. See **CHARIOT**.

**CHALAZA**, among naturalists, a white knotty sort of string at each end of an egg, formed of a plexus of the fibres of the membranes, whereby the yolk and white are connected together. See **EGG**.

**CHALCEDONY**, in natural history, a genus of semipellucid gems, of an even and regular not tabulated texture, of a semi-opaque crystalline basis, and variegated with different colours, dispersed in form of mists and clouds, and, if nicely examined, found to be owing to an admixture of various kinds of earths, but imperfectly blended in the mass, and often visible in distinct molecules.

Of this genus there are a great many species, as the bluish-white chalcedony; the brownish-black chalcedony, or smoky jasper or capnitis of the ancients; and the yellow and red chalcedony.

All the chalcedonies give fire readily with steel, and make no effervescence with aqua-fortis.

**CHALCIDES**, in zoology, the trivial name of a species lacerta. See **LACERTA**.

**CHALDEA**, or **BABYLONIA**, the ancient name of a country of Asia, now called Eyrac Arabic.

**CHALDEE**, or **CHALDAIC language**, that spoken by the Chaldeans, or people of Chaldea: It is a dialect of the Hebrew. See **HEBREW**.

**CHALDRON**, a dry English measure, consisting of thirty-six bushels, heaped up, according to the sealed bushel kept at Guild-hall, London: but on ship-board, twenty-one chaldron of coals are allowed to the score. The chaldron should weigh two thousand pounds.

**CHALK**, in natural-history, the English name of the white, dry marle, with a dusty surface, found in hard masses, and called by authors *creta*, and *terra creta*.

Chalk thrown into water, raises a great number of bubbles, with a hissing noise, and slowly diffuses itself into an impalpable powder. It ferments more strongly with acids than any other earth, and burns to lime.

As a medicine, chalk deserves, perhaps, the highest place among the alkaline absorbents; nor is it less useful in many of the ordinary affairs of life. Its use in cleaning various utensils is well known; and it is in no small repute as a manure, especially for cold sour lands; in which intention the soft unctuous chalk is most proper, as the dry, hard, and strong chalk is for lime. It is a great improver of lands, and will even change the very nature of them. However, it is most advisable to mix one load of chalk, with two or three

of dung, mud, or fresh mould, whereby it will become a lasting advantage to the ground: The common allowance is fourteen loads of chalk to every acre.

**Black CHALK**, among painters, denotes a kind of ochreous earth, of a close structure, and fine black colour, used in drawing upon blue paper.

**Red CHALK**, an indurated clayey ochre, common in the colour-shops, and much used by painters and artificers.

**CHALLONS on the Marne**, the capital of the Châlonois, in the province of Champaign in France, situated eighty-two miles east of Paris, and thirty south-east of Reims: E. long.  $4^{\circ} 35'$ , N. lat.  $48^{\circ} 55'$ . It is a bishop's see.

**CHALLONS on the Saon**, a city of Burgundy in France, thirty-two miles south of Dijon: E. long.  $5^{\circ}$ , N. lat.  $46^{\circ} 40'$ . It is the see of a bishop.

**CHALYBEAT**, in medicine, an appellation given to any liquid, as wine or water, impregnated with particles of iron or steel.

Dr Monro, professor of anatomy at Edinburgh, by pouring a tincture of galls into common water, and dissolving therein a small quantity of sal martis, adding some filings of iron, and oil of vitrol, procured a water exactly like the natural chalybeat water; and he is of opinion, that where these are not to be had, the artificial water may be made to answer all their intentions, according to its being more or less closely kept, or exposed in the air or heat, &c.

**CHAM**, or **KHAN**, a word of much the same import with *king* in English: It is the title of the sovereign princes of Tartary, and is likewise applied to the principal noblemen in Persia.

**CHAM**, in geography, a town of the Bavarian palatinate, situated on a river of the same name, about twenty-five miles north-east of Ratibon; E. long.  $13^{\circ}$ , N. lat.  $49^{\circ} 15'$ .

**CHAMA**, in zoology, a genus of shell-fish belonging to the order of vermes testacea. The shell is thick, and has two valves; it is an animal of the oyster kind. Linnæus enumerates 14 species, principally distinguished by the figure of their shells.

**CHAMÆBATOS**, in botany. See **RUBUS**.

**CHAMÆBUXUS**, in botany. See **POLYGALA**.

**CHAMÆCERASUS**, in botany. See **LONICERA**.

**CHAMÆCLEMA**, in botany. See **HEDERA**.

**CHAMÆCRISTA**, in botany. See **CASSIA**.

**CHAMÆDAPHNE**, in botany. See **KALMIA**.

**CHAMÆDRYS**, in botany. See **VERONICA**.

**CHAMÆLEA**, in botany. See **CENORUM**.

**CHAMÆLEON**, in zoology, the trivial name of a species of lacerta. See **LACERTA**.

**CHAMÆLINUM**, in botany. See **LINUM**.

**CHAMÆMILUM**, in botany. See **MATRICARIA**.

**CHAMÆNERION**, in botany. See **EPILŌBIUM**.

**CHAMÆPITYS**, in botany. See **TEUCRIUM**.

**CHAMÆRHODODENDROS**, in botany. See **AZALEA**.

**CHAMÆROPS**, or **HUMBLE PALM**, in botany, a genus ranged under the palmæ flabellifoliz of Linnæus. It is a native of Spain.

*Privy*

*Privy-Chamber.* Gentlemen of the privy-chamber, are servants of the king, who are to wait and attend on him and the queen at court, in their diversions, &c. Their number is forty-eight under the lord-chamberlain, twelve of whom are in quarterly waiting, and two of these lie in the privy-chamber.

In the absence of the lord-chamberlain, or vice-chamberlain, they execute the king's orders: at coronations, two of them personate the dukes of Aquitaine and Normandy: and six of them, appointed by the lord-chamberlain, attend ambassadors from crowned heads to their audiences, and in public entries. The gentlemen of the privy-chamber were instituted by Henry VII.

**CHAMBER**, in policy, the place where certain assemblies are held, also the assemblies themselves. Of these, some are established for the administration of justice, others for commercial affairs.

Of the first kind are, 1. Star-chamber, so called, because the roof was painted with stars; the authority, power, and jurisdiction of which are absolutely abolished by the statute 17 Car. I. 2. Imperial chamber of Spire, the supreme court of judicatory in the empire, erected by Maximilian I. This chamber has a right of judging by appeal, and is the last resort of all civil affairs of the states and subjects of the empire, in the same manner as the aulic council of Vienna. Nevertheless it is restrained in several cases; it takes no notice of matrimonial causes, these being left to the pope; nor of criminal causes, which either belong to particular princes or towns in their respective territories, or are cognizable by all the states of the empire in a diet. By the treaty of Osnaburg, in 1648, fifty assessors were appointed for this chamber, whereof twenty-four were to be Protestants, and twenty-six Catholics; besides five presidents, two of them Protestants, and the rest Catholics. 3. Chamber of accounts, a sovereign court in France, where accounts are rendered of all the king's revenues, inventories, and avowels thereof registered; oaths of fidelity taken, and other things relating to the finances transacted. There are nine in France, that of Paris is the chief; it registers proclamations, treaties of peace, naturalizations, titles of nobility, &c. All the members wear long black gowns of velvet, of sattin, or damask, according to their places. 4. Ecclesiastical chambers in France, which judge by appeal of differences about collecting the tithes. 5. Chamber of audience, or grand chamber, a jurisdiction in each parliament of France, the counsellors of which are called *jugeurs*, or judges, as those of the chamber of inquests are called *rapporteurs*, reporters of processes by writing. 6. Chamber of the edict, or miparty, a court established by virtue of the edict of pacification, in favour of those of the reformed religion. This chamber is now suppressed. 7. Apostolical chamber of Rome, that wherein affairs relating to the revenues of the church and the pope are transacted. This council consists of the cardinal-camerlingo, the governor of the rota, a treasurer, an auditor, a president, one advocate-general, a solicitor-general, a commissary

ry, and twelve clerks. 8. Chamber of London, an apartment in Guildhall, where the city-money is deposited.

Of the last sort are, 1. The chambers of commerce. 2. The chambers of assurance. And, 3. The royal or syndical chamber of booksellers in France.

The chamber of commerce is an assembly of merchants and traders, where the affairs relating to trade are treated of. There are several established in most of the chief cities of France; and in our own country, we have lately seen chambers of this kind erected for carrying on the British herring-fishery. Chamber of assurance in France, denotes a society of merchants and others for carrying on the business of insuring; but in Holland, it signifies a court of justice, where causes relating to insurances are tried. Chamber of booksellers in Paris, an assembly consisting of a syndic and assistants, elected by four delegates from the printers, and twelve from the bookellers, to visit the books imported from abroad, and to search the houses of sellers of marbled paper, printers, and dealers in printed paper for hangings, who are prohibited from keeping any letters proper for printing books. In the visitation of books, which ought to be performed by three persons at least from among the syndic and assistants, all libels against the honour of God and the welfare of the state, and all books printed either with or without the kingdom in breach of their regulations and privileges, are stopped, even with the merchandises that may happen to be in the bales with such libels, or other prohibited books. The days appointed for this chamber to meet, are Tuesdays and Fridays, at two o'clock in the afternoon.

**CHAMBERLAIN**, an officer charged with the management and direction of a chamber. See **CHAMBER**, in policy.

There are almost as many kinds of chamberlains as chambers, the principal whereof are as follows.

*Lord Chamberlain of Great Britain*, the sixth great officer of the crown; to whom belongs livery and lodging in the king's court; and there are certain fees due to him from each archbishop or bishop, when they perform their homage to the king; and from all peers at their creation, or doing their homage. At the coronation of every king, he is to have forty ells of crimson velvet for his own robes. This officer, on the coronation-day, is to bring the king his shirt, coif, and wearing cloaths; and after the king is dressed, he claims his bed, and all the furniture of his chamber for his fees: he also carries at the coronation, the coif, gloves, and linen to be used by the king on that occasion; also the sword and scabbard, the gold to be offered by the king, and the robe-royal and crown: he dresses and undresses the king on that day, waits on him before and after dinner, &c.

To this officer belongs the care of providing all things in the house of lords, in the time of parliament; to him also belongs the government of the palace of Westminster: he disposes likewise of the sword of state, to be carried before the king, to what lord he pleases.

**Lord CHAMBERLAIN** of the household, an officer who has the oversight and direction of all officers belonging to the king's chambers, except the precinct of the king's bed-chamber.

He has the oversight of the officers of the wardrobe at all his majesty's houses, and of the removing wardrobes, or of beds, tents, revels, music, comedians, hunting, messengers, &c. retained in the king's service. He moreover has the oversight and direction of the serjeants at arms, of all physicians, apothecaries, surgeons, barbers, the king's chaplain, &c. and administers the oath to all officers above stairs.

Other chamberlains, are those of the king's court of exchequer, of North Wales, of Chester, of the city of London, &c. in which cases this officer is generally the receiver of all rents and revenues belonging to the place whereof he is chamberlain.

In the exchequer there are two chamberlains, who keep a controulment of the pells of receipts and exitus, and have certain keys of the treasury, records, &c.

**CHAMBERLAIN** of London keeps the city-money, which is laid up in the chamber of London: he also presides over the affairs of masters and apprentices, and makes free of the city, &c.

His office lasts only a year, but the custom usually obtains to re-chuse the same person, unless charged with any misdemeanor in his office.

**CHAMBERRY**, the capital of the duchy of Savoy, in Italy, situated ninety miles north-west of Turin, and forty five south of Geneva: E. long. 5° 45', N. lat. 45° 40'.

**CHAMOIS**, or **CHAMOIS-GOAT**, in zoology. See **CAPRA**.

**CHAMPAIGN**, a province of France, bounded by Picardy on the north, by Lorrain on the east, by Burgundy on the south, and by the isle of France on the west. Its capital is Troyes.

**CHAMPAIN**, or *point CHAMPAIN*, in heraldry, a mark of dishonour in the coat of arms of him who kills a prisoner of war after he has cried quarter.

**CHAMPION**, a person who undertakes a combat in the place or quarrel of another; and sometimes the word is used for him who fights in his own cause.

It appears that champions, in the just sense of the word, were persons who fought instead of those that, by custom, were obliged to accept the duel, but had a just excuse for dispensing with it, as being too old, infirm, or being ecclesiastics, and the like. Such causes as could not be decided by the course of common law, were often tried by single combat; and he who had the good fortune to conquer, was always reputed to have justice on his side. Champions who fought for interest only, were held infamous; these hired themselves to the nobility, to fight for them in case of need, and did homage for their pension.

**CHAMPION** of the king, a person whose office it is, at the coronation of our kings, to ride armed into Westminster-hall, while the king is at dinner there, and, by the proclamation of a herald, make challenge to this

effect, viz. "That if any man shall deny the king's title to the crown, he is there ready to defend it in single combat, &c." Which done, the king drinks to him, and sends him a gilt cup, with a cover, full of wine, which the champion drinks, and has the cup for his fee.

**CHANCE**, in a general sense, a term applied to events not necessarily produced as the natural effects of any proper foreknown cause. For the doctrine of chance and its application to games, &c. see **GAMING**.

**CHANCE-medley**, in law, is the accidental killing of a man, not altogether without the killer's fault, though without any evil intention; and is where one is doing a lawful act, and a person is killed thereby: For, if the act be unlawful, it is felony.

**CHANCEL**, a particular part of the fabric of a Christian church; or that part of the choir between the altar and the balustrade that incloses it, where the minister is placed at the celebration of the communion.

**CHANCELLOR**, an officer supposed originally to have been a notary or scribe under the emperors, and named *cancellarius*, because he sat behind a lattice, called in Latin *cancellus*, to avoid being crowded by the people.

According to a late treatise, the chancellor originally presided over a political college of secretaries, for the writing of treaties, and other public business; and the court of equity, under the old constitution, was held before the king and his council, in the palace, where one supreme court for business of every kind was kept. At first the chancellor became a judge, to hear and determine petitions to the king, which were preferred to him; and in the end, as business increased, the people addressed their suit to the chancellor, and not to the king; and thus the chancellor's equitable power, by degrees, commenced by prescription.

**Lord high CHANCELLOR** of Great Britain, or *Lord keeper of the great seal*, is the highest honour of the long robe, being made so *per traditionem magni sigilli, per dominium regem*, and by taking the oaths: He is the first person of the realm next after the king, and princes of the blood, in all civil affairs; and is the chief administrator of justice, next the sovereign, being the judge of the court of chancery.

All other justices are tied to the strict rules of the law in their judgment: But the chancellor is invested with the king's absolute power, to moderate the written law, governing his judgment purely by the law of nature and conscience, and ordering all things according to equity and justice. In this respect Staundford says, the chancellor has two powers, one absolute, the other ordinary: Meaning, that although by his ordinary power, in some cases, he must observe the forms of proceedings, as other inferior judges; yet in his absolute power, he is not limited by the law, but by conscience and equity.

The lord chancellor not only keeps the king's great seal; but also all patents, commissions, warrants, &c. from the king, are, before they are signed, perused by him: He has the disposition of all ecclesiastical benefices

offices in the gift of the crown under 20l. a year, in the king's books; and he is speaker of the house of lords. See **PARLIAMENT**.

**CHANCELLOR of a cathedral**, an officer that hears lessons and lectures read in the church, either by himself or his vicar; to correct and set right the reader when he reads amiss; to inspect schools; to hear causes; apply the seal; write and dispatch the letters of the chapter; keep the books; take care that there be frequent preachings, both in the church and out of it; and assign the office of preaching to whom he pleases.

**CHANCELLOR of the dutchy of Lancaster**, an officer appointed chiefly to determine controversies between the king and his tenants of the dutchy-land, and otherwise to direct all the king's affairs belonging to that court. See **DUTCHY-COURT**.

**CHANCELLOR of the exchequer**, an officer who presides in that court, and takes care of the interest of the crown.

He is always in commission with the lord-treasurer, for the letting of crown-lands, &c. and has power, with others, to compound for forfeitures of lands, upon penal statutes: He has also great authority in managing the royal revenues, and in matters relating to the first-fruits.

**CHANCELLOR of the order of the garter, and other military orders**, is an officer who seals the commissions and mandates of the chapter and assembly of the knights, keeps the register of their proceedings, and delivers acts thereof under the seal of their order.

**CHANCELLOR of an university**, is he who seals the diplomas, or letters of degrees, provision, &c. given in the university.

The chancellor of Oxford is usually one of the prime nobility, chosen by the students themselves in convocation. He is their chief magistrate; his office is, *durante vita*, to govern the university, preserve and defend its rights and privileges, convoke assemblies, and do justice among the members under his jurisdiction.

Under the chancellor is the vice-chancellor, who is chosen annually, being nominated by the chancellor, and elected by the university in convocation: He is always the head of some college, and in holy orders. His proper office is to execute the chancellor's power, to govern the university according to her statutes, to see that officers and students do their duty, that courts be duly called, &c. When he enters upon his office, he chuses four pro-vice-chancellors out of the heads of the colleges, to execute his power in his absence.

The chancellor of Cambridge is also usually one of the prime nobility, and in most respects the same as that in Oxford; only he does not hold his office *durante vita*, but may be elected every three years. Under the chancellor there is a commissary, who holds a court of record for all privileged persons and scholars under the degree of master of arts, where all causes are tried and determined by the civil and statute law, and by the custom of the university.

The vice-chancellor of Cambridge is chosen annually, by the senate, out of two persons nominated by the heads of the several colleges and hall.

**CHANCEERY**, the grand court of equity and conscience, instituted to moderate the rigour of the other courts that are bound to the strict letter of the law.

The jurisdiction of this court is of two kinds, ordinary or legal, and extraordinary or absolute. The ordinary jurisdiction is that wherein the lord-chancellor, who is judge of this court, in his proceeding and judgment, is bound to observe the order and method of the common law; in such cases the proceedings, which were formerly in Latin, but now in English, are filed or enrolled in the petty-bag-office; and the extraordinary, or unlimited power, is that jurisdiction which the court exercises in cases of equity, wherein relief is to be had by bill and answer.

The ordinary court holds plea of recognizances acknowledged in the chancery, writs of *scire facias* for repeal of the king's letters-patent. &c. also of all personal actions by or against any officer of the court, and of several offences and causes by act of parliament; all original writs, commissions of bankrupts, of charitable uses, of idiots, lunacy, &c. are issued hence.

The extraordinary court gives relief for and against infants, notwithstanding their minority; for and against married women, notwithstanding their coverture. All frauds and deceits, for which there is no redress at common law; all breaches of trust, confidences and accidents, as to relieve obligors, mortgagors, &c. against penalties and forfeitures, where the intention was to pay the debt, are here remedied. But in all cases where the plaintiff can have his remedy at law, he ought not to be relieved in chancery; and a thing which may be tried by a jury, is not triable in this court.

The court of chancery will not retain a suit for any thing under ten pounds value, except in cases of charity, nor for lands. &c. under forty shillings *per ann.* In this court all patents, most sorts of commissions, deeds between parties touching lands and estates, treaties with foreign princes, &c. are sealed and enrolled. Out of it are issued writs to convene the parliament and convocation, proclamations and charters, &c. For the several officers belonging to the court of chancery, see the articles **MASTER of the rolls**, **MASTERS in chancery**, **CLERK**, &c.

**CHANDELIER**, in fortification, a kind of moveable parapet, consisting of a wooden frame, made of two upright stakes, about six feet high, with cross planks between them; serving to support fascines to cover the pioneers.

**CHANNEL**, in geography, an arm of the sea, or a narrow sea between two continents, or between a continent and an island. Such are the British channel, St George's channel, the channel of Constantinople, &c.

**CHANTILLY**, a village in France, about seven leagues from Paris, where there is a magnificent palace and fine forest belonging to the duke of Bourbon.

**CHANTOR** a singer in the choir of a cathedral. The word is almost grown obsolete, *chorister* or *singing-man* being commonly used instead of it. All great chapters

chapters have chantors and chaplains to assist the canons, and officiate in their absence.

**CHANTOR** is used by way of excellence for the precentor or master of the choir, which is one of the first dignities of the chapter. At St David's in Wales, where there is no dean, he is next in dignity to the bishop. The ancients called the chantor *primicerius cantorum*. To him belonged the direction of the deacons and other inferior officers.

Chantors in the temple of Jerusalem, were a number of Levites employed in singing the praises of God, and playing upon instruments before his altar. They had no habits distinct from the rest of the people; yet in the ceremony of removing the ark to Solomon's temple, the chantors appeared dressed in tunics of byssus or fine linen. 2 Chron. v. 12.

**CHANTRY**, or **CHAUNTRY**, a church or chapel, endowed with lands, &c. for the maintenance of one or more priests to say mass for the souls of the donors. Hence,

**CHANTRY-RENTS**, are rents still paid to the crown by the purchasers of those lands.

**CHAOS**, that confusion in which matter lay when newly produced out of nothing at the beginning of the world, before God, by his almighty word, had put it into the order and condition wherein it was after the six days creation.

**CHAOS**, in zoology, a genus of insects belonging to the order of vermes zoophyta. The body has no shell or covering, and is capable of reviving after being dead to appearance for a long time: It has no joints or external organs of sensation. There are five species, mostly obtained by infusions of different vegetables in water, and only discoverable by the microscope.

**CHAPEAU**, in heraldry, an ancient cap of dignity worn by dukes, being scarlet-coloured velvet on the outside, and lined with a fur. It is frequently borne above an helmet instead of a wreath, under gentlemen's crests.

**CHAPEL**, or **CHAPPEL**, a place of divine worship, served by an incumbent under the denomination of a chaplain.

**CHAPEL** is also a name given to a printer's work-house; in which sense they say, the laws of the chapel, the secrets of the chapel.

*Knights of the Chapel*, called also poor knights of Windsor, were instituted by Henry VIII. in his testament. Their number was at first thirteen, but has been since augmented to twenty-six. They assist in the funeral services of the kings of England: They are subject to the office of the canons of Windsor, and live on pensions assigned them by the order of the garter. They bear a blue or red cloak, with the arms of St George on the left shoulder.

**CHAPLET**, in the menage, a couple of stirrup leathers, mounted each of them with a stirrup, and joined at top in a sort of leather buckle, called the head of the chapelet, by which they are made fast to the pommel of the saddle, after being adjusted to the rider's length and bore. They are used both to avoid

the trouble of taking up or letting down the stirrups, every time that the gentleman mounts on a different horse and saddle, and to supply the place of the academy saddles, which have no stirrups to them.

**CHAPITERS**, in architecture, the same with capitals. **CHAPITERS**, in law, formerly signified a summary of such matters as were inquired of, or presented before justices in eyre, justices of alize or of the peace, in their sessions.

Chapiters, at this time, denote such articles as are delivered by the mouth of the justice in his charge to the inquest.

**CHAPLAIN**, an ecclesiastic who officiates in a chapel. See **CHAPEL**.

The king of Great Britain hath forty-eight chaplains in ordinary, usually eminent doctors in divinity, who wait four each month, preach in the chapel, read the service to the family, and to the king in his private oratory, and say grace in the absence of the clerk of the closet. Besides, there are twenty-four chaplains at Whitehall, fellows of Oxford or Cambridge, who preach in their turns, and are allowed 30*l.* *per annum* each. According to a statute of Henry VIII. the persons vested with a power of retaining chaplains, together with the number each is allowed to qualify, is as follows: An archbishop, eight; a duke or bishop, six; marquess or earl, five; viscount, four; baron, knight of the garter, or lord-chancellor, three; a dutchess, marchioness, countess, baroness, the treasurer and comptroller of the king's house, clerk of the closet, the king's secretary, dean of the chapel, almoner, and master of the rolls, each of them two; chief justice of the king's bench, and warden of the cinque-ports, each one. All these chaplains may purchase a licence or dispensation, and take two benefices with cure of souls. A chaplain must be retained by letters testimonial under hand and seal; for it is not sufficient that he serve as chaplain in the family.

**CHAPLAIN of the order of Malta**, otherwise called diaco, and clerk conventual, the second class of the order of Malta. The knights make the first rank.

**CHAPLET**, a string of beads used by the Roman Catholics, to count the number of their prayers. The invention of it is ascribed to Peter the hermit, who probably learned it of the Turks, as they owe it to the East-Indians.

Chaplets are sometimes called pater-nosters, and are made of coral, of diamonds, of wood, &c. The common chaplet contains fifty ave-marias, and five pater-nosters. There is also a chaplet of our Saviour, consisting of thirty-three beads, in honour of his thirty-three years living on earth, instituted by father Michael the Camaldulian.

**CHAPPE**, in heraldry, the dividing an escutcheon by lines drawn from the centre of the upper edge to the angles below, into three parts, the sections on the sides being of a different metal or colour from the rest.

**CHAPPEL in frith**, a market town of Derbyshire, about twenty-six miles north-west of Derby; W. long. 1° 50', N. lat. 53° 22'.

CHAPTER,

**CHAPTER**, in ecclesiastical polity, a society or community of clergymen belonging to the cathedrals and collegiate churches.

It was in the eighth century that the body of canons began to be called a chapter. The chapter of the canons of a cathedral were a standing council to the bishop, and, during the vacancy of the see, had the jurisdiction of the diocese. In the earlier ages, the bishop was head of the chapter; afterwards abbots and other dignitaries, as deans, provosts, treasurers, &c. were preferred to this distinction. The deans and chapters had the privilege of chusing the bishops in England; but Henry VIII. got this power vested in the crown: and as the same prince expelled the monks from the cathedrals, and placed secular canons in their room, those he thus regulated were called deans and chapters of the new foundation; such are Canterbury, Winchester, Ely, Carlisle, &c.

**CHAPTER**, in matters of literature, a division in a book for keeping the subject treated of more clear and distinct.

**CHARA**, in botany, a genus of the cryptogamia algæ class. The calix consists of two leaves; the antheræ are globular and sessile; there are three stigmata, and one round seed. The species are four, three of which are natives of Britain, *viz.* the tomentosa, or brittle chara; the vulgaris, or common chara; the hispida, or rough chara; and the flexilis, or smooth chara.

**CHARABON**, a sea-port town on the northern coast of the island of Java, in the Indian ocean, situated 130 miles east of Batavia; E. long. 108°, south lat. 6°.

**CHARACTER**, in a general sense, denotes any mark whatever, serving to represent either things or ideas: thus letters are characters, types, or marks of certain sounds; words, of ideas, &c.

Literal characters may be divided, with respect to the nations among whom they have been invented, into Greek characters, Roman characters, Hebrew characters, &c. The Latin character now used through all Europe was formed from the Greek, as the Greek was from the Phœnician; and the Phœnician, as well as the Chaldee, Syriac, and Arabic characters, were formed from the ancient Hebrew, which subsisted till the Babylonish captivity; for, after that event, the character of the Assyrians, which is the square Hebrew now in use, prevailed, the ancient being only found on some Hebrew medals, commonly called Samaritan medals. It was in 1091 that the Gothic characters, invented by Ulphilas, were abolished, and the Latin ones established in their room.

Medallists observe, that the Greek character, consisting only of majuscule letters, has preserved its uniformity on all medals, as low as the time of Gallienus; from that time it appears somewhat weaker and rounder: from the time of Constantine to Michael we find only Latin characters; and after Michael the Greek characters recommence; but from that time they begin to alter with the language, which was a mixture of Greek and Latin. The Latin medals preserve both their character and language as low as the translation of the seat of the empire to Constantinople: towards

VOL. II. No. 32.

3

the time of Decius the character began to lose its roundness and beauty; some time after, it retrieved, and subsisted tolerably till the time of Justin, when it degenerated gradually into the Gothic. The rounder, then, and better formed a character is upon a medal, the fairer pretence it has to antiquity.

**CHARACTER** is also used, in several of the arts, for a symbol, contrived for the more concise and immediate conveyance of the knowledge of things. For the

**CHARACTERS used in music.** See MUSIC.

**Numeral CHARACTERS** used to express numbers, are  
 either letters or figures. The Arabic character, call-  
 ed also the common one, because it is used almost  
 throughout Europe in all sorts of calculations, con-  
 sists of these ten digits, 1, 2, 3, 4, 5, 6, 7, 8, 9, 0.

The Roman numeral character consists of seven ma-  
 juscule letters of the Roman alphabet, viz. I, V, X,  
 L, C, D, M. The I denotes one, V five, X ten,  
 L fifty, C a hundred, D five hundred, and M a  
 thousand.

The I repeated twice makes two, II; thrice, three,  
 III; four is expressed thus IV, as I before V or X  
 takes an unit from the number expressed by these let-  
 ters. To express six, an I is added to a V, VI; for  
 seven, two, VII: and for eight, three, VIII: nine  
 is expressed by an I before X, thus IX.

The same remark may be made of the X before L  
 or C, except that the diminution is by tens; thus,  
 XL denotes forty, XC ninety, and LX sixty. The  
 C before D or M diminishes each by a hundred.

The number five hundred is sometimes expressed by  
 an I before a C inverted, thus, IC; and instead of  
 M, which signifies a thousand, an I is sometimes used  
 between two C's, the one direct, and the other in-  
 verted, thus CIO. The addition of C and O before  
 or after, raises CIO by tens, thus, CCIOO expresses  
 ten thousand, CCCIOOO, a hundred thousand.

The Romans also expressed any number of thou-  
 sands by a line drawn over any numeral less than a  
 thousand; thus, V denotes five thousand, LX sixty

thousand: so likewise M̄ is one million, MM̄ is two  
 millions, &c.

Some modern writers have admitted variations in  
 this method of notation; thus we find IIX expressing  
 eight, IICIX eighty-nine, Δ or V denoting ICIO,  
 and ∞ or ∞ standing for CIO; whence T̄ ten thou-  
 sand, ΨΨ twenty thousand.

The Greeks had three ways of expressing numbers:  
 first, every letter, according to its place in the alpha-  
 bet, denoted a number, from α, one, to ω, twenty-  
 four. 2. The alphabet was divided into eight units,  
 α one, β two, γ three, &c. into eight tens; ι ten,  
 κ twenty, λ thirty; &c. and eight hundreds, ρ one  
 hundred, σ two hundred, τ three hundred, &c. 3.  
 I stood for one, Π five, Δ ten, H a hundred, X a  
 thousand, M ten thousand; and when the letter Π in-  
 closed any of these, except I, it shewed the inclosed  
 letter to be five times its value; as ΠΔ fifty, ΠH five  
 hundred, ΠX five thousand, Πλ fifty thousand.

**French CHARACTERS**, used in the chamber of accounts,  
 and by persons concerned in the management of the  
 revenue, is, properly speaking, nothing else than the  
 Roman numerals, in letters that are not majuscule:  
 thus, instead of expressing fifty-six by LVI, they de-  
 note it by smaller characters lvj.

**CHARACTERS upon tomb-stones.**

S. V. Siste viator, i. e. Stop traveller.

M. S. Memoriz sacrum, i. e. Sacred to the memory.

D. M. Diis manibus.

I H S. Jesus.

X. P. a character found in the catacombs, about the  
 meaning of which authors are not agreed.

**CHARACTER**, in epic and dramatic poetry, that which  
 is peculiar in the manners of any person, and distin-  
 guishes him from all others. See EPIC, and drama-  
 tic compositions.

**CHARADRIUS**, in ornithology, a genus belonging to  
 the order of grallæ. The beak is cylindrical and  
 blunt; the nostrils are linear, and the feet have three  
 toes. There are 12 species, viz. 1. The hiaticula,  
 or sea-lark of Ray, has a black breast, a white streak  
 along the front; the top of the head is brown; and  
 the legs and beak are reddish. It is found on the  
 shores of Europe and America. 2. The alexandrinus,  
 or oriental dotterell, is of a brownish colour, with the  
 fore-head, collar, and belly white; the prime tail-  
 feathers on both sides are white; and the legs are  
 black. It is a native of Egypt, and is much valued  
 for its singing. It is about the size of a crow, and  
 lives upon mice, rats, &c. 3. The vociferus, or  
 noisy plover of Catesby, has black streaks on the breast,  
 neck, fore-head, and cheeks; and the feet are yel-  
 low. It is a native of North America. 4. The  
 ægyptius, has a black streak on the breast, white  
 eye-brows, the prime tail-feathers streaked with black  
 at the points, and bluish legs. It is found in the  
 plains of Egypt, and feeds on insects. 5. The mori-  
 nellus has an iron-coloured breast, a small white  
 streak on the breast and eye-brows, and black legs.  
 It is the dotterell of Ray, and a native of Europe.  
 6. The apricarius has a black belly; the body is  
 brown,

brown, and variegated with white and yellow spots; and the legs are ash-coloured. It is the spotted plover of Edwards, and a native of Canada. 7. The pluvialis, is black above, with green spots, white underneath, and the feet are ash-coloured. It is the green plover of Ray, and is a native of Europe. 8. The torquatus, has a black breast and a white front; the top of the head and the collar is black; and the beak and feet are bluish. It is a native of St Domingo. 9. The calidris, has black feet and a black bill; the rump is greyish; and the body is pure white below. It frequents the shores of Europe. 10. The œdicnemus, or stone curlew of Ray, is of a grey colour, with two of the prime wing-feathers black, but white in the middle; it has a sharp bill, and ash-coloured feet. It is a native of Britain. 11. The linnantopus, is white below, with a black back, and a long black bill; the feet are red and very long. It is the autumnal dotterell of English authors, and frequents the sea-shores of Europe. 12. Spinofus, armed dotterell, or lap wing, has a black breast, legs, and wings; it has a crest on the hinder part of the head. It is of the size of a pidgeon; the French call it dominicanus, from the resemblance it has to the dress of a dominican monk: It is a native of Egypt.

CHARANTIA, in botany See MOMORDICA.

CHARAX, in ichthyology. See SALMO.

CHARBON, in the menage, that little black spot or mark which remains after a large spot in the cavity of the corner teeth of a horse: about the seventh or eighth year, when the cavity fills up, the tooth being smooth and equal, it is said to be rased.

CHARCAS, the southern division of Peru, in South America, remarkable for the silver-mines of Potosi.

CHARCOAL, a kind of fuel, consisting of half burnt wood, much used by artificers of different professions; and that not only as fuel, but for polishing brass or copper plates, &c.

The best charcoal for common uses is that made of oak; but in the manufacture of gunpowder they commonly use charcoal made of alder.

CHARENTE, a river of France, which arising in the Limosin, runs westward by Angoulesme and Saintes, falling into the bay of Biscay, opposite to the isle of Oleron.

CHARENTON, the name of two towns in France, the one upon the Marmaude, in the Bourbonnois; the other in the isle of France, near the confluence of the Marne with the Seine, about three miles south-east of Paris: E. long. 2° 30', and N. lat. 48° 45'.

CHARGE, in heraldry, is applied to the figures represented on the escutcheon, by which the bearers are distinguished from one another; and it is to be observed, that too many charges are not so honourable as fewer.

CHARGE of lead denotes a quantity of thirty-six pigs. See PIG

CHARGE to enter heir, in Scots law, a writing passing under the signet, obtained at the instance of a creditor, either against the heir of his debtor, for fixing upon

him the debt as representing the debtor, which is called a general charge: Or, against the debtor himself, or his heir, for the purpose of vesting him in the right of any heritable subject to which he has made up no title, in order the creditor may attach that subject for payment of his debt, in the same manner as if his debtor or his heir were legally vested in it by service or otherwise. This last kind is called a special charge.

See SCOTS LAW, title, *Apprisings and adjudications*.

CHARGED, in heraldry, a shield carrying some impress or figure, is said to be charged therewith; so also when one bearing, or charge, has another figure added upon it, it is properly said to be charged.

CHARIOT, a half coach, having only a seat behind, with a stool, at most, before. See COACH.

The chariots of the ancients, chiefly used in war, were called by the several names *bigæ*, *trigæ*, &c. according to the number of horses applied to draw them. Every chariot carried two men, who were probably the warrior and the charioteer; and we read of several men of note and valour employed in driving the chariot. When the warriors came to encounter in close fight, they alighted out of the chariot, and fought on foot; but when they were weary, which often happened, by reason of their armour, they retired into their chariot, and thence annoyed their enemies with darts and missile weapons. These chariots were made so strong, that they lasted for several generations.

Besides this sort, we find frequent mention of the *currus falcati*, or those chariots armed with hooks, or scythes, with which whole ranks of soldiers were cut off together, if they had not the art of avoiding the danger; these were not only used by the Persians, Syrians, Egyptians, &c. but we find them among our British ancestors.

Triumphal CHARIOT was one of the principal ornaments of the Roman celebration of a victory.

The Roman triumphal chariot was generally made of ivory, round like a tower, or rather of a cylindrical figure; it was sometimes gilt at the top, and ornamented with crowns; and, to represent a victory more naturally, they used to stain it with blood. It was usually drawn by four white horses, but oftentimes by lions, elephants, tygers, bears, leopards, dogs, &c.

CHARISTIA, a festival of the ancient Romans, celebrated in the month of February, wherein the relations by blood and marriage met, in order to preserve a good correspondence; and that, if there happened to be any difference among them, it might be the more easily accommodated, by the good humour and mirth of the entertainment.

CHARITY, among divines, one of the three grand theological virtues, consisting in the love of God and of our neighbour, or the habit and disposition of loving God with all our heart, and our neighbour as ourselves.

CHARITY of St Hippolitus, a religious congregation founded, about the end of the XIVth century, by one Bernardin Alvarez, a Mexican, in honour of St Hippolitus

Hippolitus the martyr, patron of the city of Mexico; and approved by pope Gregory XIII.

CHARLEMONT, a town of the province of Namur, in the Austrian Netherlands, about eighteen miles south of Namur: E. long.  $4^{\circ} 40'$ , and N. lat.  $50^{\circ} 10'$ .

CHARLEMONT is also the name of a town of Ireland, situated on the river Blackwater, in the county of Armagh, and province of Ulster, about six miles south-east of Dungannon: W. long.  $6^{\circ} 50'$ , and N. lat.  $50^{\circ} 16'$ .

CHARLEROY, a strong town in the province of Namur, in the Austrian Netherlands, situated on the river Sambre, about nineteen miles west of Namur: E. long.  $4^{\circ} 20'$ , and N. lat.  $50^{\circ} 30'$ .

CHARLES'S CAPE, a promontory of Virginia, in North America, forming the northern head-land of the streight that enters the bay of Chesapeake.

CHARLES'S-FORT, a fortress in the county of Cork, and province of Munster in Ireland, situated at the mouth of Kinsale harbour: W. long.  $8^{\circ} 20'$ , and N. lat.  $51^{\circ} 21'$ .

CHARLES'S-TOWN, the capital of South Carolina, in North America, situated on a peninsula formed by Ashley and Cooper rivers, the former of which is navigable for ships twenty miles above the town: W. long.  $70^{\circ}$ , and N. lat.  $32^{\circ} 30'$ .

CHARLES'S WAIN, in astronomy, seven stars in the constellation called *ursa major*, or the great bear.

CHARLETON, an island at the bottom of Hudson's-bay, in North America, subject to Great Britain: W. long.  $80^{\circ}$ , and N. lat.  $52^{\circ} 30'$ .

CHARLOCK, the English name of the raphanus. See RAPHANUS.

CHARM, a term derived from the Latin *carmen*, a verse; and used to denote a magic power, or spell, by which, with the assistance of the devil, forcerers and witches were supposed to do wonderful things, far surpassing the power of nature.

CHARNEL, or CHARNEL-HOUSE, a kind of portico, or gallery, usually in or near a church-yard, over which were anciently laid the bones of the dead, after the flesh was wholly consumed.

Charnel-houses are now usually adjoining to the church.

CHARNUB, in botany. See CERATONIA.

CHART, or SEA-CHART, an hydrographical map, or a projection of some parts of the earth's superficies *in plano*, for the use of navigators. See NAVIGATION.

CHARTA-magna. See MAGNA charta.

CHARTER, in law, a written instrument or evidence of things acted between one person and another.

Charters of private persons, are deeds and instruments for the conveyance of lands, &c. Here the purchaser of land shall have all the charters and deeds, as incident to the same, and for the maintenance of his title. But this is understood where the feoffor is not bound to a general-warranty of the land.

CHARTER, in Scots law, that writing which contains the grant of a feudal subject to the vassal. See SCOTS LAW, tit. *Of the constitution of heritable rights*.

CHARTOPHYLAX, the name of an officer of the church of Constantinople, who attends at the door of the rails when the sacrament is administered, and gives notice to the priests to come to the holy table. He represents the patriarch upon the bench, tries all ecclesiastical causes, keeps all the marriage registers, assists at the consecration of bishops, and presents the bishop elect at the solemnity, and likewise all other subordinate clergy. This office resembles in some shape that of the bibliothecarius at Rome.

CHARTRES, a large city of France, in the province of Orleans, situated on the river Eure, about forty-two miles south-west of Paris: E. long.  $1^{\circ} 32'$ , N. lat.  $48^{\circ} 27'$ . It is a bishop's see.

CHARTREUSE, or CHARTREUSE-GRAND, a celebrated monastery, the capital of all the convents of the Carthusian monks, situated on a steep rock in the middle of a large forest of fir-trees, about seven miles north-east of Grenoble, in the province of Dauphine in France: E. long.  $5^{\circ} 5'$ , N. lat.  $45^{\circ} 20'$ . See CARTHUSIANS.

From this mother-convent, all the others of the same order take their name; among which was the Chartreuse of London, corruptly called the charter-house, now converted into an hospital, endowed with a revenue of 600 l. *per ann*.

Here are maintained eighty decayed gentlemen, not under fifty years of age: Also forty boys are educated and fitted either for the university or trades. Those sent to the university, have an exhibition of 20 l. a year for eight years; and have an immediate title to nine church-livings in the gift of the governors of the hospital, who are sixteen in number, all persons of the first distinction, and take their turns in the nomination of pensioners and scholars.

CHARYBDIS, a rock in the strait of Messina, between Italy and Sicily, much celebrated in the writings of ancient poets.

CHARYBDIS is also an appellation given by Dr Plot to certain openings in the bottom of the sea, whereby the water is conveyed to the origin or sources of springs, rivers, &c. such is Maelstrom, on the coast of Norway, supposed to be. See MAELSTROM.

CHASING of gold, silver, &c. See ENCHASING.

CHASTE-tree. See VITEX.

CHATELET, the name of certain courts of justice established in several cities in France. The grand chatelet at Paris, is the place where the presidial or ordinary court of justice of the provost of Paris is kept; consisting of a presidial, a civil chamber, a criminal chamber, and a chamber of policy. The little chatelet is an old fort, now serving as a prison.

CHATHAM, a port-town of Kent, adjoining to Rochester, situated on the river Medway, thirty miles south-east of London: E. long.  $40'$ , N. lat.  $51^{\circ} 20'$ .

It is the principal station of the royal navy, furnished with timber, rope-yards, and all manner of naval stores, sufficient for the building and fitting out the largest fleet.

CHATTEAU-CAMPRESIS, a town of the Cambresis, in the French Netherlands, situated on the river Selle,

Selle, thirteen miles south-east of Canbray, E. long.  $3^{\circ} 25'$ , N. lat.  $50^{\circ} 6'$ .

CHATTEAU DAUPHINE, a fortress situated on the frontiers of Piedmont, in the province of Dauphine, but yielded to the king of Sardinia: E. long.  $6^{\circ} 40'$ , N. lat.  $41^{\circ} 30'$ .

CHATELS, in law, all sorts of goods moveable and immoveable, except such as are in the nature of freehold.

CHATTIGAN, a port-town of India, in the province of Bengal, situated at the mouth of the most easterly branch of the Ganges, subject to the Mogul: E. long.  $91^{\circ}$ , N. lat.  $23^{\circ}$ .

CHATTILLON, a town of Burgundy in France, about sixteen miles south-west of Geneva: E. long.  $5^{\circ} 40'$ , N. lat.  $46^{\circ} 16'$ .

CHATTILLON is likewise the name of several other towns of France, situated upon the Indre, the Loing, the Loire, the Marne, the Saone, &c.

CHAUMONT, the name of two towns in France; the one situated in the isle of France, thirty miles north-west of Paris, E. long.  $2^{\circ}$ , N. lat.  $49^{\circ} 18'$ ; the other situated on the river Marne, in the province of Champaign, E. long.  $5^{\circ} 15'$ , N. lat.  $48^{\circ} 12'$ .

CHAUSE-TRAPE See CALTROP.

CHEADLE, a market-town of Staffordshire, ten miles north-east of Stafford: W. long.  $2^{\circ}$ , N. lat.  $53^{\circ}$ .

CHEASPEAK-BAY, a large frith or arm of the sea, which runs up about three hundred miles into the country between Virginia and Maryland, in North America: It is navigable almost all the way for large ships; being about twenty miles broad at the entrance between Charles-cape and Cape-Henry, and between twenty and thirty miles broad afterwards. See CHARLES-CAPE.

CHECAYA, in Turkish affairs, the second officer of the janizaries, who commands them under the aga, and is otherwise called *protogero*.

There is also a checaya of the treasury, stables, kitchen, &c. the word signifying as much as lieutenant, or the second in any office.

CHECK, or CHECK-ROLL, a roll or book, wherein is contained the names of such persons as are attendants and in pay to the king, or other great personages, as their household servants.

*Clerk of the CHECK*, in the king's household, has the check and controulment of the yeomen of the guard, and all the ushers belonging to the royal family, allowing their absence or defects in attendance, or diminishing their wages for the same, &c. He also, by himself or deputy, takes the view of those that are to watch in the court, and has the setting of the watch, &c.

*Clerk of the CHECK*, in the king's navy at Plymouth, is also the name of an officer invested with the like power.

CHECK, in falconry, a term used of a hawk when she forsakes her proper game, to lie at pyes, crows, rooks, or the like, that crosses her in her flight.

CHECKY, in heraldry, is when the shield, or a part thereof, as a bordure, &c. is chequered, or divided into chequers or squares, in the manner of a chess-board.

This is one of the most noble and most ancient figures used in armory; and a certain author saith, that it ought to be given to none but great warriors, in token of their bravery: For the chess-board represents a field of battle; and the pawns of men, placed on both sides, represent the soldiers of the two armies, which move, attack, advance, or retire, according to the will of the gamblers, who are the generals.

This figure is always composed of metal and colour: But some authors would have it reckoned among the several sorts of furs.

CHEEK, in anatomy, that part of the face situated below the eyes, on each side. See p. 305.

CHEESE, a sort of food, prepared of curdled milk, purged from the serum or whey, and afterwards dried for use.

Physicians condemn the too free use of cheese, by reason it loads the stomach when new, and heats and inflames when old.

Every country has its places noted for this commodity: Thus Chester and Gloucester-cheese are famous in England; and the Parmesan cheese is in no less repute abroad, especially in France. This sort of cheese is entirely made of sweet cow's milk: But at Rochfort in Languedoc, they make cheese of ewe's milk; and in other places, it is usual to add goat or ewe's milk, in a certain proportion, to that of cow's.

There is likewise a kind of medicated cheese, made by intimately mixing the expressed juice of certain herbs, as sage, baum, mint, &c. with the curd, before it is fashioned into a cheese. The 100 weight of cheese pays on importation, 1 s.  $3\frac{1}{8}$  d. and draws back, on exportation, 1 s.  $1\frac{1}{2}$  d. at the rate of 6 s. 8 d. The cheese of Ireland is prohibited to be imported.

CHEESE-RUNNET, in botany. See GALLIUM.

CHEGFORD, a market-town of Devonshire, about thirteen miles west of Exeter: W. long.  $4^{\circ}$ , N. lat.  $50^{\circ} 40'$ .

CHEIRANTHUS, in botany, a genus of the tetradynamia filiquosa class. The germen has teeth-like glands on each side; the calix is close, and consists of two small leaves, gibbous at the base; and the seeds are plain. There are thirteen species, only two of which are natives of Britain, viz. the cheiri, wall flower, or wild cheir; and the tricuspidatus, or sea stock-gillyflower. The leaves of the wall-flower are said to be cordial, anodyne, aperient, and emmenagogue; but are wholly neglected in practice.

CHEKAO, a kind of paste prepared by calcination and trituration from a hard stony substance, and afterwards washing the powder in large quantities of fair water.

The Chinese use the chekao in drawing the elegant figures we see in the wholly white china-ware, which they afterwards varnish in the common way. See CHINA-WARE.

CHEKAIM, a province of China, bounded by that of Nankin on the north, and by the ocean on the east.

CHELÆCANCORUM, in the materia medica. See CRAB'S CLAWS.

CHELIDONIUM, in botany, a genus of the polyanthia monogynia class. The corolla has four petals;

the calix consists of two leaves; and the pod is linear and unilocular. There are four species, three of which are natives of Britain, *viz.* the majas, or celandine; the glaucium, or yellow horned poppy; and the hybridum, or violet-coloured horned poppy. The leaves and root of the majas, or celandine, are stimulating, aperient, diuretic, and sudorific: It is peculiarly recommended in the slow kind of jaundice, where there are no symptoms of inflammation, and in dropsies.

**CHELIDONIUS lapis**, in natural-history, a stone said by the ancients to be found in the stomachs of young swallows, and greatly cried up for its virtues in the falling-sickness; but from their description, it appears to be only a species of lycodontes, or bufonitæ. See **LYCODONTES**, and **BUFONITÆ**.

**CHELM**, a town of Poland, capital of a palatinate of the same name: It is situated in the province of Red Russia, 110 miles south-east of Warsaw: E. long.  $23^{\circ} 30'$ , N. lat.  $51^{\circ} 25'$ .

**CHELMSFORD**, the county town of Essex, situated on the river Chelmer, twenty five miles north-east of London: E. long.  $30'$ , N. lat.  $51^{\circ} 40'$ . It sends two members to parliament.

**CHELONE**, in botany, a genus of the didynamia an-

giospermia class. The calix is divided into five parts; there are the rudiments of a fifth filament betwixt the two higher stamina; and the capsule is bilocular. There are three species, none of them natives of Britain.

**CHELSEA**, a fine village situated on the northern bank of the river Thames, a mile westward of Westminster, remarkable for a magnificent hospital of invalids and old decrepit soldiers; and a pleasure-house, called Ranelagh, to which a great deal of fine company resort in summer.

**CHELTENHAM**, or **CHILTHENHAM**, a market-town of Gloucestershire, seven miles north-east of Gloucester: W. long.  $2^{\circ} 10'$ , N. lat.  $51^{\circ} 50'$ . It is chiefly remarkable for its mineral waters, of the same kind with those of Scarborough. See **SCARBOROUGH**.

**CHEMISE**, in fortification, the wall with which a bastion, or any other bulwark of earth, is lined for its greater support and strength: Or it is the solidity of the wall from the talus to the stone-row.

**Fire-CHEMISE**, a piece of linen cloth, steeped in a composition of oil of petrol, camphor, and other combustible matters, used at sea, to set fire to an enemy's vessel.

## C H E M I S T R Y.

**T**HE object and chief end of chemistry is to separate the different substances that enter into the composition of bodies; to examine each of them apart; to discover their properties and relations; to decompose those very substances, if possible; to compare them together, and combine them with others; to reunite them again into one body, so as to reproduce the original compound with all its properties; or even to produce new compounds that never existed among the works of nature, from mixtures of other matters differently combined.

But this analysis, or decomposition, of bodies is finite; for we are unable to carry it beyond a certain limit. In whatever way we attempt to go further, we are always stopped by substances in which we can produce no change,

and which are incapable of being resolved into others.

To these substances we may give the title of *principles* or *elements*. Of this kind the principal are earth, water, air, and fire. For though there be reason to think, that these are not the first component parts, or the most simple elements, of matter; yet, as we know by experience, that our senses cannot possibly discover the principles of which they are themselves composed, it seems more reasonable to fix upon them, and consider them as simple homogeneous bodies, and the principles of the rest, than to tire our minds with vain conjectures about the parts or elements of which they may consist.

Before entering upon the examination of compound substances, it is necessary to consider the most simple ones, or the four first principles, with some attention.

### PART I. THEORY OF CHEMISTRY.

#### *Of the Principles of Bodies.*

##### *Of AIR.*

**AIR** is that fluid which we constantly breathe, and which encompasses the whole surface of the terrestrial globe. Being heavy, like other bodies, it penetrates in-

to all places that are not either absolutely inaccessible, or filled with some other body heavier than itself. Its principal property is, to be susceptible of condensation and rarefaction; so that the very same quantity of air may occupy a much greater, or a much smaller space, according to the different state it is in. Heat and cold are the most usual causes of its condensation and rarefaction: For if a certain quantity of air be heated, its bulk en-  
larges

larges in proportion to the degree of heat applied to it; the consequence whereof is, that the same space now contains fewer particles of air than it did before. Cold again produces just the contrary effect.

On this property which air has of being condensed and dilated by heat, its elasticity chiefly depends. For if air were forced by condensation into a less compass than it took up before, and then exposed to a very considerable degree of cold, it would remain quite inactive, without exerting such an effort as it usually makes against the depressing body. On the other hand, the elasticity of heated air arises only from hence, that being rarefied by the action of fire, it requires much more room than it occupied before.

Air enters into the composition of many substances, especially vegetable and animal bodies: For by analysing most of them such a considerable quantity thereof is extricated, that some naturalists have suspected it to be altogether destitute of elasticity when thus combined with the other principles in the composition of bodies. According to them, the efficacy of the elastic power of the air is so prodigious, and its force when compressed so excessive, that it is not possible the other component parts of bodies should be able to confine so much of it in that state of compression which it must needs undergo, if retaining its elasticity when pent up among them.

However that be, this elastic property of the air produces the most singular and important phenomena observable in the resolution and composition of bodies.

#### Of WATER.

WATER is a thing so well known, that it is almost needless to attempt giving a general idea of it here. Every one knows that it is a transparent, insipid substance, and usually fluid. We say it is usually so; for being exposed to a certain degree of cold, it becomes solid: Solidity therefore seems to be its most natural state.

Water exposed to the fire grows hot; but only to a limited degree, beyond which its heat never rises, be the force of fire applied to it ever so violent: It is known to have acquired this degree of heat by its boiling up with great tumult. Water cannot be made hotter, because it is volatile, and incapable of enduring the heat without being evaporated and entirely dissipated.

If such a violent and sudden heat be applied to water as will not allow it time to exhale gently in vapours, as when, for instance, a small quantity thereof is thrown upon a metal in fusion, it is dissipated at once with vast impetuosity, producing a most terrible and dangerous explosion. This surprising effect may be deduced from the instantaneous dilatation of the parts of the water itself, or rather of the air contained in it. Moreover, water enters into the texture of many bodies, both compound and secondary principles; but, like air, it seems to be excluded from the composition of all metals, and most minerals. For although an immense quantity of water exists in the bowels of the earth, moistening all its contents, it does not therefore follow, that it is one of the principles of minerals. It is only interposed between their parts; for they may be entirely robbed of it, with-

out any sort of decomposition: Indeed it is not capable of an intimate connection with them.

#### Of EARTH.

We observed, that the two principles above treated of are volatile; that is, the action of fire separates them from the bodies they help to compose. But earth is fixed, and, when absolutely pure, resists the utmost force of fire. So that, whatever remains of a body, after it hath been exposed to the power of the fiercest fire, must be considered as containing nearly all its earthy principle, and consisting chiefly thereof.

Earth therefore is a fixed principle which is permanent in the fire. There is reason to think it very difficult, if not impossible, to obtain the terrene principle wholly free from every other substance: For after our utmost endeavours to purify them, the earths we obtain from different compounds are found to have different properties, according to the different bodies from which they are procured; or else, if those earths be pure, we must allow them to be essentially different, seeing they have different properties.

Earth, in general, with regard to its properties, may be distributed into *fusible* and *unfusible*; that is, into earth that is capable of melting or becoming fluid in the fire, and earth that constantly remains in a solid form, never melting in the strongest degree of heat to which we can expose it.

The former is also called *vitrifiable*, and the latter *unvitrifiable* earth; because, when earth is melted by the force of fire, it becomes what we call *glass*, which is nothing but the parts of earth brought into nearer contact, and more closely united by the means of fusion. Perhaps the earth, which we look upon as incapable of vitrification, might be fused if we could apply to it a sufficient degree of heat. It is at least certain, that some earths, or stones, which separately resist the force of fire, so that they cannot be melted, become fusible when mixed together. Experience convinced Mr du Hamel, that lime-stone and slate are of this kind. It is however undoubtedly true, that one earth differs from another in its degree of fusibility: And this gives ground to believe, that there may be a species of earth absolutely unvitrifiable in its nature, which, being mixed in different proportions with fusible earths, renders them difficult to melt.

Whatever may be in this, as there are earths which we are absolutely unable to vitrify, that is a sufficient reason of our division of them. Unvitrifiable earths seem to be porous, for they imbibe water; whence they have also got the name of *absorbent earths*.

#### Of FIRE.

THE matter of the sun, or of light, the phlogiston, fire, the sulphureous principle, the inflammable matter, are all of them names by which the element of fire is usually denoted. But it should seem, that an accurate distinction hath not yet been made between the different states in which it exists; that is, between the phenomena

of

of fire actually existing as a principle in the composition of bodies, and those which it exhibits when existing separately and in its natural state: nor have proper distinct appellations been designed to it in those different circumstances. In the latter state we may properly give it the names of fire, matter of the sun, of light, and of heat; and may consider it as a substance composed of infinitely small particles, continually agitated by a most rapid motion, and of consequence essentially fluid.

This substance, of which the sun may be called the general reservoir, seems to flow incessantly from that source, diffusing itself over the world, and through all the bodies we know; but not as a principle, or essential part of them, since they may be deprived thereof, at least in a great measure, without suffering any decomposition. The greatest change produced on them, by its presence or its absence, is the rendering them fluid or solid: so that all other bodies may be deemed naturally solid; fire alone essentially fluid, and the principle of fluidity in others. This being presupposed, air itself might become solid, if it could be entirely deprived of the fire it contains; as bodies of most difficult fusion become fluid, when penetrated by a sufficient quantity of the particles of fire.

One of the chief properties of this pure fire is to penetrate easily into all bodies, and to diffuse itself among them with a sort of uniformity and equality: for if a heated body be contiguous to a cold one, the former communicates to the latter all its excess of heat, cooling in exact proportion as the other warms, till both come to have the very same degree of heat. Heat, however, is naturally communicable soonest to the upper parts of a body; and consequently, when a body cools, the under parts become soonest cold. It hath been observed, for instance, that the lower extremity of a heated body, freely suspended in the air, grows cold sooner than the upper; and that when a bar of iron is red-hot at one end, and cold at the other, the cold end is much sooner heated by placing the bar so that the hot end may be undermost, than when that end is turned uppermost. The levity of the matter of fire, and the vicinity of the earth, may possibly be the causes of this phenomenon.

Another property of fire is to dilate all bodies into which it penetrates. This hath already been shewn with regard to air and water; and it produces the same effect on earth.

Fire is the most powerful agent we can employ to decompose bodies; and the greatest degree of heat producible by man, is that excited by the rays of the sun collected in the focus of a large burning-glass.

#### *Of the PHLOGISTON.*

FROM what hath been said concerning the nature of fire, it is evidently impossible for us to fix and confine it in any body. Yet the phenomena attending the combustion of inflammable bodies shew that they really contain the matter of fire as a constituent principle. By what mechanism then is this fluid, so subtle, so active, so difficult to confine, so capable of penetrating into every other substance in nature, so fixed as to make a com-

ponent part of the most solid bodies? It is no easy matter to give a satisfactory answer to this question. But, without pretending to guess the cause of the phenomenon, let us rest contented with the certainty of the fact, the knowledge of which will undoubtedly procure us considerable advantages. Let us therefore examine the properties of fire thus fixed and become a principle of bodies. To this substance, in order to distinguish it from pure and unfix'd fire, the chemists have assigned the peculiar title of the *Phlogiston*, which is indeed no other than a Greek word for the inflammable matter; by which latter name, as well as by that of the sulphureous principle, it is also sometimes called. It differs from elementary fire in the following particulars. 1. When united to a body, it communicates to it neither heat nor light. 2. It produces no change in its state, whether of solidity or fluidity; so that a solid body does not become fluid by the accession of the phlogiston, and *vice versa*; the solid bodies to which it is joined being only rendered thereby more apt to be fused by the force of the culinary fire. 3. We can convey it from the body with which it is joined into another body, so that it shall enter into the composition thereof, and remain fixed in it.

On this occasion both these bodies, that which is deprived of the phlogiston and that which receives it, undergo very considerable alterations; and it is this last circumstance in particular that obliges us to distinguish the phlogiston from pure fire, and to consider it as the element of fire combined with some other substance, which serves it as a basis for constituting a kind of secondary principle. For if there were no difference between them, we should be able to introduce and fix pure fire itself where-ever we can introduce and fix the phlogiston: yet this is what we can by no means do, as will appear from experiments to be afterwards produced.

Hitherto chemists have never been able to obtain the phlogiston quite pure, and free from every other substance: for there are but two ways of separating it from a body of which it makes a part; to wit, either by applying some other body with which it may unite the moment it quits the former; or else by calcining and burning the compound from which you desire to sever it. In the former case, it is evident that we do not get the phlogiston by itself, because it only passes from one combination into another; and in the latter, it is entirely dissipated in the decomposition, so that no part of it can possibly be secured.

The inflammability of a body is an infallible sign that it contains a phlogiston; but from a body's not being inflammable, it cannot be inferred that it contains none; for experiments have demonstrated, that certain metals abound with it, which yet are by no means inflammable.

We have now delivered what is most necessary to be known concerning the principles of bodies in general. They have many other properties besides those above-mentioned; but we cannot properly take notice of them here, because they presuppose an acquaintance with some other things relating to bodies, of which we have hitherto said nothing, intending to treat of them in the sequel as occasion shall offer. We shall only observe in this place, that

that when animal and vegetable matters are burnt in such a manner as to hinder them from flaming, some part of the phlogiston contained in them unites intimately with their most fixed earthy parts, and with them forms a compound that can be consumed only by making it red-hot in the open air, where it sparkles and wastes away, without emitting any flame. This compound is called a *coal*. We shall inquire into the properties of this coal under the head of oils: at present it suffices that we know in general what it is, and that it readily communicates to other bodies the phlogiston it contains.

*A general View of the Affinities or elective Attractions that subsist between Bodies.*

BEFORE we can reduce compound bodies to the first principles above pointed out, we obtain, by analysing them, certain substances which are indeed more simple than the bodies they helped to compose, yet are themselves composed of our primary principles. They are therefore at one and the same time both principles and compounds; for which reason we shall call them by the name of secondary principles. Saline and oily matters chiefly constitute this class. But before we enter upon an examination of their properties, it is fit we lay before the reader a general view of what chemists understand by the relations or affinities of bodies; because it is necessary to know these, in order to a distinct conception of the different combinations we are to treat of.

All the experiments hitherto made concur in proving, that different bodies, whether principles or compounds, have such a mutual conformity, relation, affinity, or attraction, as disposes some of them to join and unite together, while they are incapable of contracting any union with others. This effect, whatever be its cause, will enable us to account for, and connect together, all the phenomena that chemistry produces. The nature of this universal affection of matter is laid down in the following propositions.

First, If one substance has any affinity or conformity with another, the two will unite together, and form one compound.

Secondly, All similar substances have an affinity with each other, and are consequently disposed to unite; as water with water, earth with earth, &c.

Thirdly, Substances that unite together lose some of their separate properties; and the compounds resulting from their union partake of the properties of those substances which serve as their principles.

Fourthly, The simpler any substances are, the more perceptible and considerable are their affinities: whence it follows, that the less bodies are compounded, the more difficult it is to analyse them; that is, to separate from each other the principles of which they consist.

Fifthly, If a body consist of two substances, and to this compound be presented a third substance that has no affinity at all with one of the two primary substances aforesaid, but has a greater affinity with the other than those two substances have with each other, there will ensue a decomposition, and a new union; that is, the third substance will separate the two compounding substances

from each other, coalesce with that which has an affinity with it, form therewith a new combination, and disengage the other, which will then be left at liberty, and such as it was before it had contracted any union.

Sixthly, It happens sometimes that when a third substance is presented to a body consisting of two substances, no decomposition follows; but the two compounding substances, without quitting each other, unite with the substance presented to them, and form a combination of three principles: and this happens when that third substance has an equal, or nearly equal, affinity with each of the compounding substances. The same thing may also happen even when the third substance hath no affinity but with one of the compounding substances only. To produce such an effect, it is sufficient that one of the two compounding substances have to the third body a relation equal, or nearly equal, to that which it has to the other compounding substance with which it is already combined. Hence it follows, that two substances, which, when apart from all others, are incapable of contracting any union, may be rendered capable of incorporating together in some measure, and becoming parts of the same compound, by combining with a third substance with which each of them has an equal affinity.

Seventhly, A body, which of itself cannot decompose a compound consisting of two substances, because they have a greater affinity with each other than it has with either of them, becomes nevertheless capable of separating the two by uniting with one of them, when it is itself combined with another body having a degree of affinity with that one sufficient to compensate its own want thereof. In that case there are two affinities, and thence ensues a double decomposition, and a double combination.

These fundamental truths, from which we shall deduce an explanation of all the phenomena in chemistry, will be confirmed and illustrated by applying them to the several cases, of which our design in this treatise obliges us to give a circumstantial account.

*Of Saline Substances in general.*

IF a particle of water be intimately united with a particle of earth, the result will be a new compound, which, according to our third proposition of affinities, will partake of the properties of earth and of water; and this combination principally forms what is called a *saline substance*. Consequently every saline substance must have an affinity with earth and with water, and be capable of uniting with both or either of them, whether they be separate or mixed together: and accordingly this property characterises all salts or saline substances in general.

Water being volatile, and earth fixed, salts in general are less volatile than the former, and less fixed than the latter; that is, fire, which cannot volatilize and carry off pure earth, is capable of rarefying and volatilizing a saline substance; but then this requires a greater degree of heat than is necessary for producing the same effects on pure water.

There are several sorts of salts, differing from one another in respect either of the quantity or the quality of the

earth in their composition; or, lastly, they differ on account of some additional principles, which not being combined with them in sufficient quantity to hinder their saline properties from appearing, permit them to retain the name of salts, though they render them very different from the simplest saline substances.

It is easy to infer from what has been said of salts in general, that some of them must be more, some less, fixed or volatile than others, and some more, some less, disposed to unite with water, with earth, or with particular sorts of earth, according to the nature or the proportion of their principles.

Before we proceed further, it is proper just to mention the principal reasons which induce us to think that every saline substance is actually a combination of earth and water, as we supposed at our entering on this subject. The first is, the conformity salts have with earth and water, or the properties they possess in common with both. Of these properties we shall treat fully, as occasion offers to consider them, in examining the several sorts of salts. The second is, that all salts may be actually resolved into earth and water by sundry processes; particularly by repeated dissolution in water, evaporation, desiccation, and calcination. Indeed the chemists have not yet been able to produce a saline substance by combining earth and water together. This favours a suspicion, that besides these two there is some other principle in the composition of salts which escapes our researches, because we cannot preserve it when we decompose them: but it is sufficient to our purpose, that water and earth are demonstrably amongst the real principles of saline substances, and that no experiment hath ever shewn us any other.

#### Of Acids.

THE simplest saline substance is that called an *acid*, on account of its taste, which is like that of verjuice, sorrel, vinegar, and other four things, which for the same reason are also called acids. By this peculiar taste are acids chiefly known. They have moreover the property of turning all the blue and violet colours of vegetables red, which distinguishes them from all other salts.

The form under which acids most commonly appear, is that of a transparent liquor; though solidity is rather their natural state. This is owing to their affinity with water; which is so great, that, when they contain but just as much of it as is necessary to constitute them salts, and consequently have a solid form, they rapidly unite therewith the moment they come into contact with it: and as the air is always loaded with moisture and aqueous vapours, its contact alone is sufficient to liquify them; because they unite with its humidity, imbibe it greedily, and by that means become fluid. We therefore say, they attract the moisture of the air. This change of a salt from a solid to a fluid state, by the sole contact of the air, is also called *deliquium*; so that when a salt changes in this manner from a solid into a fluid form, it is said to run *per deliquium*. Acids being the simplest species of saline bodies, their affinities with different substances are stronger than those of any other sort of salt with the same substances; which is agreeable to our fourth proposition concerning affinities.

Acids in general have a great affinity with earths: that with which they most readily unite is the unvitriifiable earth to which we gave the name of absorbent earth. They seem not to act at all upon vitriifiable earths, such as sand; nor yet upon some other kinds of earths, at least while they are in their natural state. Yet the nature of these earths may be in some measure changed, by making them red hot in the fire, and then quenching them suddenly in cold water: for by repeating this often they are brought nearer to the nature of absorbent earths, and rendered capable of uniting with acids.

When an acid liquor is mixed with an absorbent earth, for instance with chalk, these two substances instantly rush into union with so much impetuosity, that a great ebullition is immediately produced, attended with considerable hissing, heat, and vapours, which rise the very instant of their conjunction.

From the combination of an acid with an absorbent earth there arises a new compound, which some chemists have called *sal salsum*; because the acid by uniting with the earth loses its sour taste, and acquires another not unlike that of the common sea-salt used in our kitchens; yet varying according to the different sorts of acids and earths combined together. The acid at the same time loses its property of turning blue or violet vegetables red.

If we inquire what is become of its propensity to unite with water, we shall find that the earth, which of itself is not soluble in water, hath by its union with the acid acquired a facility of dissolving therein; so that our *sal salsum* is soluble in water. But, on the other hand, the acid hath, by its union with the earth, lost part of the affinity it had with water; so that if a *sal salsum* be dried, and freed of all superfluous humidity, it will remain in that dry solid form, instead of attracting the moisture of the air and running *per deliquium*, as the acid would do if it were pure and unmixed with earth.

Acids have likewise a great affinity with the phlogiston. When we come to treat of each acid in particular, we shall examine the combinations of each with the phlogiston: they differ so widely from one another, and many of them are so little known, that we cannot at present give any general idea of them.

#### Of Alkalis.

ALKALIS are saline combinations in which there is a greater proportion of earth than in acids. The principal arguments that may be adduced to prove this fact are these: First, if they be treated in the manner proposed above for analysing saline substances, we obtain from them a much greater quantity of earth than we do from acids. Secondly; by combining certain acids with certain earths we can produce alkalis; or at least such saline compounds as greatly resemble them. Our third and last argument is drawn from the properties of those alkalis which, when pure and unadulterated with any other principle, have less affinity with water than acids have, and are also more fixed, resisting the utmost force of fire. On this account it is that they have obtained the title of *fixed*, as well as to distinguish them from another species of alkali, to be considered hereafter, which is impure and volatile.

Though

Though fixed alkalis, when dry, sustain the utmost violence of fire without flying off in vapours, it is remarkable that, being boiled with water in an open vessel, considerable quantities of them rise with the steam; an effect which must be attributed to the great affinity between these two substances, by means whereof water communicates some part of its volatility to the fixed salt.

Alkalis freed of their superfluous humidity by calcination attract the moisture of the air, but not so strongly as acids: so that it is easier to procure and preserve them in a solid form.

They flow in the fire, and are then capable of uniting with vitrifiable earths, and of forming therewith true glass; which, however, will partake of their properties, if they be used in sufficient quantity.

As they melt more readily than vitrifiable earth, they facilitate its fusion; so that a weaker fire will reduce it to glass, when a fixed alkali is joined with it, than will melt it without that addition.

Alkalis are known by their taste, which is acrid and fiery; and by the properties they possess of turning blue or violet vegetables green; particularly syrup of violets.

Their affinity with acids is greater than that of absorbent earths; hence, if an alkali be presented to a combination of an acid with an absorbent earth, the earth will be separated from the acid by the alkali, and a new union between the acid and the alkali will take place. This is both an instance and a proof of our fifth proposition concerning affinities.

If a pure alkali be presented to a pure acid, they rush together with violence, and produce the same phenomena as were observed in the union of an absorbent earth with an acid, but in a greater and more remarkable degree.

Fixed alkalis may in general be divided into two sorts: one of these hath all the above recited properties; but the other possesses some that are peculiar to itself. We shall consider this latter sort more particularly under the head of sea-salt.

#### OF NEUTRAL SALTS.

THE acid and the alkali thus uniting, mutually rob each other of their characteristic properties; so that the compound resulting from their union produces no change in the blue colours of vegetables, and has a taste which is neither sour nor acrid, but saltish. A saline combination of this kind is for that reason named *sal falfum*, *sal medium*, or a *neutral salt*.

It must be observed, that in order to make these salts perfectly neutral, it is necessary that neither of the two saline principles of which they are compounded be predominant over the other; for in that case they will have the properties of the prevailing principle. The reason is this: neither of these saline substances can unite with the other but in a limited proportion beyond which there can be no further coalition between them. The action by which this perfect union is accomplished is termed *saturation*; and the instant when such proportions of the two saline substances are mixed together, that the one is incorporated with as much of the other as it can possibly take up, is called the *point of saturation*.

The point of saturation is known to be obtained, when, after repeated affusions of an acid in small quantities to an alkali, or an absorbent earth, we find those phenomena cease, which in such cases constantly attend the conflict of union, namely, ebullition, hissing, &c. and we may be assured the saturation is complete when the new compound hath neither an acid nor an acrid taste, nor in the least changes the blue colours of vegetables.

Neutral salts have not so great an affinity with water as either acids or alkalis have, because they are more compounded; for we observed before, that the affinities of the most compounded bodies are generally weaker than those of the most simple. In consequence hercof few natural salts, when dried, attract the moisture of the air; and those that do, attract it more slowly and in less quantity than either acids or alkalis do.

All neutral salts are soluble in water; but more or less readily, and in a greater or smaller quantity, according to the nature of their component principles.

Water made boiling hot dissolves a greater quantity of those salts which do not attract the moisture of the air, than when it is cold; and indeed it must be boiling hot to take up as much of them as it is capable of dissolving: but as for those which run in the air, the difference is imperceptible.

Some neutral salts have the property of shooting into crystals, and others have it not.

The nature of crystallization is this: Water cannot dissolve, nor keep in solution, more than a determinate quantity of any particular salt; when therefore such a quantity of water is evaporated from the solution of a salt capable of crystallization, that the remainder contains just as much salt as it can dissolve, then by continuing the evaporation the salt gradually recovers its solid form, and concretes into several little transparent masses called crystals. These crystals have regular figures, all differing from one another according to the species of salt of which they are formed. Different methods of evaporating saline solutions have different effects on the figure and regularity of the crystals; and each particular sort of salt requires a peculiar method of evaporation to make its crystals perfectly regular.

A solution of salt designed for crystallization is usually evaporated by means of fire to a pellicle: that is, till the salt begin to concrete; which is perceived by a kind of thin dark skin that gathers on the surface of the liquor, and is formed of the crystallized particles of salt. When this pellicle appears, the solution is suffered to cool, and the crystals form therein faster or slower according to the sort of salt in hand. If the evaporation be carried on briskly to perfect dryness, no crystals will be formed, and only an irregular mass of salt will be obtained.

The reasons why no crystals appear when the evaporation is hastily performed, and carried on to dryness, are, first, that the particles of salt, being always in motion while the solution is hot, have not time to exert their mutual affinities, and to unite together as crystallization requires: secondly, that a certain quantity of water enters into the very composition of crystals; which is therefore absolutely necessary to their formation, and in a greater

greater or smaller proportion according to the nature of the salt.

If these crystallized salts be exposed to the fire, they first part with that moisture which is not necessary to a saline concretion, and which they retained only by means of their crystallization: afterwards they begin to flow, but with different degrees of fusibility.

It must be observed, that certain salts melt as soon as they are exposed to the fire; namely, those which retain a great deal of water in crystallizing. But this fluor which they so readily acquire must be carefully distinguished from actual fusion; for it is owing only to their superfluous humidity, which heat renders capable of dissolving and liquifying them; so that when it is evaporated, the salt ceases to be fluid, and requires a much greater degree of fire to bring it into real fusion.

The neutral salts that do not crystallize may indeed be dried by evaporating the water which keeps them fluid; but by becoming solid they acquire no regular form; they again attract the moisture of the air, and are thereby melted into a liquor. These may be called *liquefcent salts*.

Most of the neutral salts, that consist of an acid joined with a fixed alkali, or with an absorbent earth, are themselves fixed and resist the force of fire; yet several of them, if they be dissolved in water, and the solution boiled and evaporated, lie off along with the steams.

### *Of the several Sorts of Saline Substances.*

#### *I. Of the UNIVERSAL, or VITRIOLIC ACID.*

THE universal acid is so called, because it is in fact the acid which is most universally diffused through all nature, in waters, in the atmosphere, and in the bowels of the earth. But it is seldom pure; being almost always combined with some other substance. That from which we obtain it, with most ease, and in the greatest quantity, is vitriol; and this is the reason why it is called the *vitriolic acid*; the name by which it is best known.

When the vitriolic acid contains but little phlegm, yet enough to give it a fluid form, it is called *oil of vitriol*; on account of a certain unctuousity belonging to it.

If the vitriolic acid contain much water, it is then called *spirit of vitriol*. When it does not contain enough to render it fluid, and so is in a solid form, it is named the *icy oil of vitriol*.

When oil of vitriol, highly concentrated, is mixed with water, they rush into union with such an impetuosity, that, the moment they touch each other, there arises a hissing noise, like that of red-hot iron plunged in cold water, together with a very considerable degree of heat proportioned to the degree in which the acid was concentrated.

If instead of mixing this concentrated acid with water, you only leave it exposed to the air for some time, it attracts the moisture thereof, and imbibes it most greedily. Both its bulk and its weight are increased by this accession; and if it be under an icy form, that is, if it be concentered, the phlegm thus acquired will soon resolve it into fluid.

The addition of water renders the vitriolic acid, and indeed all other acids, weaker in one sense; which is, that when they are very aqueous, they leave on the tongue a much fainter taste of acidity, and are less active in the solution of some particular bodies: But that occasions no change in the strength of their affinities, but in some cases rather enables them to dissolve several substances which, when well dephlegmated, they are not capable of attacking.

The vitriolic acid combined to the point of saturation with a particular absorbent earth, well known, forms a neutral salt that crystallizes. This salt is called *alum*, and the figure of its crystals is that of an octahedron or solid of eight sides. These octahedra are triangular pyramids, the angles of which are so cut off that four of the surfaces are hexagons, and the other four triangles.

There are several sorts of alum, which differ according to the earths combined with the vitriolic acid. Alum dissolves easily in water, and in crystallization retains a considerable quantity of it; which is the reason that being exposed to the fire it readily melts, swelling and puffing up as its superfluous moisture exhales. When that is quite evaporated, the remainder is called *burnt alum*, and is very difficult to fuse. The acid of the alum is partly dissipated by this calcination. Its taste is saltish, with a degree of roughness and astringency.

The vitriolic acid combined with certain earths forms a kind of neutral salt called *selenites*, which crystallizes in different forms according to the nature of its earth. There are numberless springs of water infected with dissolved selenites; but when this salt is once crystallized, it is exceeding difficult to dissolve it in water a second time. For that purpose a very great quantity of water is necessary, and moreover it must boil; for, as it cools, most of the dissolved selenites takes a solid form, and falls in a powder to the bottom of the vessel.

If an alkali be presented to the selenites, or to alum, these salts will be thereby decomposed; that is, the acid will quit the earths, and join the alkali, with which it hath a greater affinity. And from this conjunction of the vitriolic acid with a fixed alkali there results another sort of neutral salt, which is called *arcanum duplicatum*, *sal de duobus*, and *vitriolated tartar*, because one of the fixed alcalis most in use is called *salt of tartar*.

Vitriolated tartar is almost as hard to dissolve in water as the selenites. It shoots into eight-sided crystals, having the apices of the pyramids pretty obtuse. Its taste is saltish, inclining to bitter; and it decrepitates on burning coals. It requires a very great degree of fire to make it flow.

The vitriolic acid is capable of uniting with the phlogiston, or rather it has a greater affinity with it than with any other body: whence it follows, that all compounds of which it makes a part may be decomposed by means of the phlogiston.

From the conjunction of the vitriolic acid with the phlogiston arises a compound called *mineral sulphur*, because it is found perfectly formed in the bowels of the earth. It is also called *sulphur vivum*, or simply *sulphur*.

Sulphur

Sulphur is absolutely insoluble in water, and incapable of contracting any sort of union with it. It melts with a very moderate degree of heat, and sublimes in fine light downy tufts called *flowers of sulphur*. By being thus sublimed it suffers no decomposition, let the operation be repeated ever so often; so that sublimed sulphur, or *flower of sulphur*, hath exactly the same properties as sulphur that has never been sublimed.

If sulphur be exposed to a brisk heat in the open air, it takes fire, burns, and is wholly consumed. This deflagration of sulphur is the only means we have of decomposing it, in order to obtain its acid in purity. The phlogiston is destroyed by the flame, and the acid exhales in vapours; these vapours collected have all the properties of the vitriolic acid, and differ from it only as they still retain some portion of the phlogiston; which, however, soon quits them of its own accord, if the free access of the common air be not precluded.

The portion of phlogiston retained by the acid of sulphur is much more considerable when that mineral is burnt gradually and slowly: in that case the vapours which rise from it have such a penetrating odour, that they instantaneously suffocate any person who draws in a certain quantity of them with his breath. These vapours constitute what is called the *volatile spirit of sulphur*. There is reason to think this portion of phlogiston which the acid retains is combined therewith in a manner different from that in which these two are united in the sulphur itself; for nothing but actual burning is capable of separating the vitriolic acid and the phlogiston, which by their union form sulphur; whereas in the volatile spirit of sulphur they separate spontaneously when exposed to the open air; that is, the phlogiston flies off and leaves the acid, which then becomes in every respect similar to the vitriolic acid.

That the volatile spirit of sulphur is a compound, appears evidently from hence, that whenever the vitriolic acid touches any substance containing the phlogiston, provided that phlogiston be disengaged or opened to a certain degree, a volatile spirit of sulphur is infallibly and immediately generated. This spirit hath all the properties of acids, but considerably weakened, and of course less perceptible. It unites with absorbent earths or fixed alkalis; and with them forms neutral salts: but when combined therewith it may be separated from them by the vitriolic acid, and indeed by any of the mineral acids, because its affinities are weaker. Sulphur hath the property of uniting with absorbent earths, but not near so intimately as with fixed alkalis.

If equal parts of sulphur and an alkali be melted together, they incorporate with each other; and from their conjunction proceeds a compound of a most unpleasant smell, much like that of rotten eggs, and of a red colour nearly resembling that of an animal liver, which has occasioned it to bear the name of *hepar sulphuris*, or *liver of sulphur*.

In this composition the fixed alkali communicates to the sulphur the property of dissolving in water: and hence it comes that liver of sulphur may be made as well when the alkali is dissolved by water into a fluid, as when it is fused by the action of fire.

Sulphur has less affinity than any acid with the fixed alkalis: and therefore liver of sulphur may be decomposed by any acid whatever; which will unite with the fixed alkali, form therewith a neutral salt, and separate the sulphur.

If liver of sulphur be dissolved in water, and an acid poured thereon, the liquor, which was transparent before, instantly turns to an opaque white; because the sulphur, being forced to quit its union with the alkali, loses at the same time the property of dissolving in water, and appears again in its own opaque form. The liquor thus made white by the sulphur is called *milk of sulphur*.

If this liquor be suffered to stand still for some time, the particles of sulphur, now most minutely divided, gradually approach each other, unite, and fall insensibly to the bottom of the vessel; and then the liquor recovers its transparency. The sulphur thus deposited on the bottom of the vessel is called the *magistery* or *precipitate sulphur*. The names of magistery and precipitate are also given to all substances whatever that are separated from another by this method; which is the reason that we use the expression of precipitating one substance by another, to signify the separating one of them by means of the other.

### 3. Of the Nitrous Acid.

The nitrous acid combined with certain absorbent earths, such as chalk, marle, boles, forms neutral salts which do not crystallize; and which, after being dried, run in the air *per deliquium*.

All those neutral salts which consist of the nitrous acid joined to an earth, may be decomposed by a fixed alkali, with which the acid unites, and deserts the earth; and from this union of the nitrous acid with a fixed alkali results a new neutral salt, which is called *nitre*, or *salt-petre*. This latter name signifies the *salt of stone*; and in fact, nitre is extracted from the stones and plaster, in which it forms, by boiling them in water saturated with a fixed alkali.

Nitre shoots in long crystals adhering sideways to each other; it has a saltish taste, which produces a sensation of cold on the tongue.

This salt easily dissolves in water; which, when it boils, takes up still a greater quantity thereof.

It flows with a pretty moderate degree of heat, and continues fixed therein: but being urged by a brisk fire, and in the open air, it lets go some part of its acid, and indeed flies off itself in part.

The most remarkable property of nitre, and that which characterizes it, is its fulmination or explosion; the nature of which is as follows:

When nitre touches any substance containing a phlogiston, and actually ignited, that is, red hot, it bursts out into a flame, burns, and is decomposed with much noise.

In this deflagration the acid is dissipated, and totally separated from the alkali, which now remains by itself.

Indeed the acid, at least the greatest part of it, is by this means quite destroyed. The alkali which is left when nitre is decomposed by deflagration, is called in

general *fixed nitre*, and, more particularly, nitre fixed by such and such a substance as was used in the operation. But if nitre be deflagrated with an inflammable substance containing the vitriolic acid, as sulphur, for instance, the fixed salt produced by the deflagration is not a pure alkali but retains a good deal of the vitriolic acid, and, by combining therewith, hath now formed a neutral salt.

The reason why nitre flames, and is decomposed in the manner above mentioned, when it comes in contact with a phlogiston properly circumstanced, is, that the nitrous acid, having a greater affinity with the phlogiston than with the fixed alkali, naturally quits the latter to join with the former, and so produces a kind of sulphur, differing probably from the common sulphur, formed by the vitriolic acid, in that it is combustible to such a degree, as to take fire and be consumed in the very moment of its production; so that it is impossible to prevent its being thus destroyed, and consequently impossible to save it. In support of this opinion let it be considered, that the concurrence of the phlogiston is absolutely necessary to produce this deflagration, and that the matter of pure fire is altogether incapable of effecting it: for though nitre be exposed to the most violent degree of fire, even that in the focus of the most powerful burning-glass, it will not flame; nor will that effect ever happen till the nitre be brought into contact with a phlogiston properly so called, that is, the matter of fire existing as a principle of some body; and it is moreover necessary that this phlogiston be actually on fire, and agitated with the igneous motion, or else, that the nitre itself be red-hot, and so penetrated with fire as to kindle any inflammable matter that touches it.

This experiment, among others, helps to shew the distinction that ought to be made between pure elementary fire, and fire become a principle of bodies to which we have given the name of phlogiston.

Before we leave this subject, we shall observe, that nitre deflagrates only with such substances as contain the phlogiston in its simplest and purest form; such as charcoal, sulphur, and the metalline substances; and that, though it will not deflagrate without the addition of some combustible matter, it is nevertheless the only known body that will burn, and make other combustibles burn with it, in close vessels, without the admission of fresh air.

The nitrous acid hath not so great an affinity with earths and alkalis as the vitriolic acid hath; whence it follows, that the vitriolic acid decomposes all neutral salts arising from a combination of the nitrous acid with an earth or an alkali. The vitriolic acid expells the nitrous acid, unites with the substance which served it for a basis, and therewith forms a neutral salt, which is an alum, a selenites, or a vitriolated tartar, according to the nature of that basis.

The nitrous acid, when thus separated from its basis by the vitriolic acid, is named *spirit of nitre*, or *aqua fortis*. If it be dephlegmated, or contain but little superfluous water, it exhales in reddish vapours; these vapours being condensed and collected, form a liquor of a brownish yellow, that incessantly emits vapours of the same colour, and of a pungent disagreeable smell. These

characters have procured it the names of *smoking spirit of nitre*, and *yellow aqua fortis*. This property in the nitrous acid of exhaling in vapours, shews it to be less fixed than the vitriolic acid; for the latter, though ever so thoroughly dephlegmated, never yields any vapours, nor has it any smell.

### 3. Of the ACID of SEA-SALT.

THE acid of sea-salt is so called, because it is in fact obtained from such sea-salt as is used in our kitchens. It is not certainly known in what this acid differs from the vitriolic and the nitrous, with regard to its constituent parts.

When it is combined with absorbent earths, such as lime and chalk, it forms a neutral salt that does not crystallize; and, when dried, attracts the moisture of the air. If the absorbent earth be not fully saturated with the marine acid, the salt thereby formed has the properties of a fixed alkali: And this is what made us say, when we were on the subject of those salts, that they might be imitated by combining an earth with an acid. The marine acid, like the rest, hath not so great an affinity with earths as with fixed alkalis.

When it is combined with the latter, it forms a neutral salt which shoots into cubical crystals. This salt is inclined to grow moist in the air, and is consequently one of those which water dissolves in equal quantities, at least as to sense, whether it be boiling hot or quite cold. The affinity of this acid with alkalis and absorbent earths is not so great as that of the vitriolic and nitrous acids: Whence it follows, that, when combined therewith, it may be separated from them by either of those acids.

The acid of sea-salt, thus disengaged from the substance which served it for a basis, is called *spirit of salt*. When it contains but little phlegm, it is of a lemon colour, and continually emits many white, very dense, and very elastic vapours; on which account it is named the *smoking or volatile spirit of salt*. Its smell is not disagreeable, nor much unlike that of 'affron; but extremely quick and suffocating when it smokes.

The acid of sea-salt, like the other two, seems to have a greater affinity with the phlogiston, than with fixed alkalis. We are led to this opinion by a very curious operation, which gives ground to think, that sea-salt may be decomposed by the proper application of a substance containing the phlogiston.

From the marine acid, combined with a phlogiston, results a kind of sulphur, differing from the common sort in many respects; but particularly in this property, that it takes fire of itself upon being exposed to the open air. This combination is called *English phosphorus*, *phosphorus of urine*, because it is generally prepared from urine, or only *phosphorus*.

This combination of the marine acid with a phlogiston is not easily effected; because it requires a difficult operation in appropriated vessels. For these reasons it does not always succeed; and phosphorus is so scarce and dear, that hitherto chemists have not been able to make on it the experiments necessary to discover all its properties. If phosphorus be suffered to burn away in the air,

a small quantity of an acid liquor may be obtained from it, which seems to be spirit of salt, but either altered, or combined with some adventitious matter; for it has several properties that are not to be found in the pure marine acid; such as, leaving a fixed fusible substance behind it when exposed to a strong fire, and being easily combined with the phlogiston so as to reproduce a phosphorus.

Phosphorus resembles sulphur in several of its properties: It is soluble in oils; it melts with a gentle heat; it is very combustible; it burns without producing foot; and its flame is vivid and bluish.

From what has been said of the union of the acid of sea-salt with a fixed alkali, and of the neutral salt resulting therefrom, it may be concluded, that this neutral salt is no other than the common kitchen-salt. But it must be observed, that the fixed alkali, which is the natural basis of the common salt obtained from sea-water, is of a sort somewhat differing from fixed alkalis in general, and hath certain properties peculiar to itself. For,

1. The basis of sea-salt differs from other fixed alkalis in this, that it crystallizes like a neutral salt.

2. It does not grow moist in the air: On the contrary, when exposed to the air, it loses part of the water that united with it in crystallization, by which means its crystals lose their transparency, become as it were mealy, and fall into a fine flour.

3. When combined with the vitriolic acid to the point of saturation, it forms a neutral salt differing from vitriolated tartar, first, in the figure of its crystals which are oblong six-sided solids: secondly, in its quantity of water, which in crystallization unites therewith in a much greater proportion than with vitriolated tartar: whence it follows, that this salt dissolves in water more readily than vitriolated tartar; thirdly, in that it flows with a very moderate degree of heat, whereas vitriolated tartar requires a very fierce one.

If the acid of sea-salt be separated from its basis by means of the vitriolic acid, it is easy to see, that, when the operation is finished, the salt we have been speaking of must be the result. A famous chemist, named Glauber, was the first who extracted the spirit of salt in this manner, examined the neutral salt resulting from his process, and finding it to have some singular properties, called it his *sal mirabile*, or wonderful salt: On this account it is still called Glauber's *sal mirabile*, or *Glauber's salt*.

4. When the basis of the sea-salt is combined with the nitrous acid to the point of saturation, there results a neutral salt, or a sort of nitre, differing from the common nitre, first, in that it attracts the moisture of the air pretty strongly; and this makes it difficult to crystallize: secondly, in the figure of its crystals, which are parallelopipeds; and this has procured it the name of *quadrangular nitre*.

Common salt, or the neutral salt formed by combining the marine acid with this particular sort of fixed alkali, has a taste well known to every body. The figure of its crystals is exactly cubical. It grows moist in the air, and, when exposed to the fire, it bursts, before it melts, into

many little fragments, with a crackling noise; which is called the *decrepitation* of sea-salt.

That neutral salt mentioned above, which is formed by combining the marine acid with a common fixed alkali, and called *sal febrifugum sylvii*, hath also this property.

India furnishes us with a saline substance, known by the name of *borax*, which flows very easily, and then takes the form of glass. It is of great use in facilitating the fusion of metallic substances. It possesses some of the properties of fixed alkalis, which has induced certain chemists to represent it, through mistake, as a pure fixed alkali.

By mixing borax with the vitriolic acid, Mr Homberg obtained from it a salt, which sublimes in a certain degree of heat, whenever such a mixture is made. This salt has very singular properties; but its nature is not yet thoroughly understood. It dissolves in water with great difficulty; it is not volatile, though it rises by sublimation from the borax. According to Mr Roselle's observation, it rises then only by means of the water which carries it up; for when once made, it abides the fiercest fire, flows and vitrifies just as borax does, provided care be taken to free it previously from moisture by drying it properly. Mr Homberg called it *sedative salt*, on account of its medical effects. The sedative salt hath the appearance, and some of the properties, of a neutral salt; for it shoots into crystals, and does not change the colour of violets: but it acts the part of an acid with regard to alkalis, uniting with them to the point of saturation, and thereby forming a true neutral salt. It also acts, like the acid of vitriol, on all neutral salts; that is, it discharges the acid of such as have not the vitriolic acid in their composition.

Since Mr Homberg's time it hath been discovered, that a sedative salt may be made either with the nitrous or with the marine acid; and that sublimation is not necessary to extract it from the borax, but that it may be obtained by crystallization only. For this latter discovery we are indebted to Mr Geoffroy, as we are to Mr Lemery for the former.

Since that time M. Bayon d'Henouville, an able chemist, hath shewn that a sedative salt may be obtained by the means of vegetable acids; and hath lately demonstrated, that the sedative salt exists actually and perfectly in the borax, and that it is not produced by mixing acids with that saline substance, as it seems all the chemists before him imagined. This he proves convincingly from his analysis of borax, (which thereby appears to be nothing else but the sedative salt united with that fixed alkali which is the basis of sea-salt) and from his regenerating the same borax by uniting together that alkali and the sedative salt: a proof the most complete that can possibly be produced in natural philosophy, and equivalent to demonstration itself.

In order to finish what remains to be said upon the several sorts of saline substances, we should now speak of the acids obtained from vegetables and animals, and also of the volatile alkalis; but, seeing these saline substances differ from those of which we have already treated, only

as

as they are variously altered by the unions they have contracted with certain principles of vegetables and animals, of which nothing has been yet said, it is proper to defer being particular concerning them, till we have explained those principles.

### Of LIME.

Any substance whatever, that has been roasted a considerable time in a strong fire without melting, is commonly called a *calx*. Stones and metals are the principal subjects that have the property of being converted into *calces*. We shall treat of metalline *calces* in a subsequent chapter, and in this confine ourselves to the *calx* of *stone*, known by the name of *lime*.

In treating of earths in general, we observed that they may be divided into two principal kinds; one of which actually and properly flows when exposed to the action of fire, and turns to glass; whence it is called a *fusible* or *vitrifiable* earth; the other resists the utmost force of fire, and is therefore said to be an *unfusible* or *unvitrifiable* earth. The latter is also not uncommonly called *calcinable* earth; though sundry sorts of unfusible earths are incapable of acquiring by the action of fire all the qualities of *calcined* earth, or *lime* properly so called: such earths are particularly distinguished by the denomination of *refractory* earths.

As the different sorts of stones are nothing more than compounds of different earths, they have the same properties with the earths of which they are composed, and may, like them, be divided into fusible or vitrifiable; and unfusible or calcinable. The fusible stones are generally denoted by the name of *flints*; the calcinable stones, again, are the several sorts of marbles, cretaceous stones, those commonly called *free-stones*, &c. Some of which, as they make the best lime, are, by way of eminence, called *lime-stones*. Sea-shells also, and stones that abound with fossil shells, are capable of being burnt to lime.

All these substances being exposed for a longer or shorter time to the violent action of fire, are said to be *calcined*. By calcination they lose a considerable part of their weight, acquire a white colour, and become friable, though ever so solid before; as, for instance, the very hardest marbles. These substances, when thus calcined, take the name of *quick-lime*.

Water penetrates quick-lime, and rushes into it with vast activity. If a lump of newly calcined lime be thrown into water, it instantly excites almost as great a noise, ebullition, and smoke, as would be produced by a piece of red-hot iron; with such a degree of heat too, that, if the lime be in due proportion to the water, it will set fire to combustible bodies; as hath unfortunately happened to vessels laden with quick lime, on their springing a small leak.

As soon as quick-lime is put into water, it swells, and falls asunder into an infinite number of minute particles: in a word, it is in a manner dissolved by the water, which forms therewith a sort of white paste called *slacked lime*.

If the quantity of water be considerable enough for

the lime to form with it a white liquor, this liquor is called *lac calcis*; which, being left some time to settle, grows clear and transparent, the lime which was suspended therein and occasioned its opacity subsiding to the bottom of the vessel. Then there forms on the surface of the liquor a crystalline pellicle, somewhat opaque and dark coloured, which being skimmed off is reproduced from time to time. This matter is called *cremor calcis*.

Slacked lime gradually grows dry, and takes the form of a solid body, but full of cracks and destitute of firmness. The event is different when you mix it up, while yet a paste, with a certain quantity of uncalcined stony matter, such as sand for example: then it takes the name of *mortar*, and gradually acquires, as it grows drier and older, a hardness equal to that of the best stones. This is a very singular property of lime, nor is it easy to account for it; but it is a beneficial one, for every body knows the use of mortar in building.

Quick-lime attracts the moisture of the air in the same manner as concentrated acids and dry fixed alkalis, but not in such quantities as to render it fluid: it only falls into extremely small particles, takes the form of a fine powder, and the title of *lime slacked in the air*.

Lime once slacked, however dry it may afterwards appear, always retains a large portion of the water it had imbibed; which cannot be separated from it again but by means of a violent calcination. Being so recalcined it returns to be quick-lime, recovering all its properties.

Besides this great affinity of quick-lime with water, which discovers a saline character, it has several other saline properties, to be afterwards examined, much resembling those of fixed alkalis. In chemistry it acts very nearly as those salts do, and may be considered as holding the middle rank between a pure absorbent earth and a fixed alkali; and this hath induced many chemists to think that lime contains a true salt, to which all the properties it possesses in common with salts may be attributed.

But as the chemical examination of this subject hath long been neglected, the existence of a saline substance in lime hath been long doubtful. Mr du Fay was one of the first who obtained a salt from lime, by lixiviating it with a great deal of water, which he afterwards evaporated. But the quantity of salt he obtained by that means was very small; nor was it of an alkaline nature, as one would think it should have been, considering the properties of lime. Mr du Fay did not carry his experiments on this subject any further, probably for want of time; nor did he determine of what nature the salt was.

Mr Malouin had the curiosity to examine this salt of lime, and soon found that it was nothing else but what was above called *cremor calcis*. He found moreover, that, by mixing a fixed alkali with lime-water, a vitriolated tartar was formed; that, by mixing therewith an alkali like the basis of sea-salt, a Glauber's salt was produced; and, lastly, by combining lime with a substance abounding in phlogiston, he obtained a true sulphur. These very ingenious experiments prove to a demonstration, that the vitriolic acid constitutes the salt of lime; for, as hath been shewn, no other acid is capable of forming such combi-

combinations. On the other hand, Mr Malouin, having forced the vitriolic acid of this salt to combine with a phlogiston, found its basis to be earthy, and analogous to that of the selenites: whence he concluded, that the salt of lime is a true neutral salt, of the same kind as the selenites. Mr Malouin tells us he found several other salts in lime. But as none of them was a fixed alkali, and as all the saline properties of lime have an affinity with those of that kind of salt, there is great reason to think that all those salts are foreign to lime, and that their union with it is merely accidental.

Lime unites with all acids, and in conjunction with them exhibits various phenomena.

The vitriolic acid poured upon lime dissolves it with effervescence and heat. From this mixture there exhales a great quantity of vapours, in smell and colour perfectly like those of sea-salt; from which however they are found to be very different when collected into a liquor. From this combination of the vitriolic acid with lime arises a neutral salt, which ~~soon~~ <sup>soon</sup> into crystal, and is of the same kind with the selenitic salt obtained from lime by Mr Malouin.

The nitrous acid poured upon lime dissolves it in like manner with effervescence and heat: but the solution is transparent, and therein differs from the former, which is opaque. From this mixture there arises a neutral salt, which does not crystallize, and has withal the very singular property of being volatile, and rising wholly by distillation in a liquid form. This phenomenon is so much the more remarkable, as lime, the basis of this salt, is one of the most fixed bodies known in chemistry.

With the acid of sea-salt lime forms also a singular sort of salt, which greedily imbibes the moisture of the air. We shall have occasion to take further notice of it in another place.

Lime applied to fixed alkalis adds considerably to their caustic quality, and makes them more penetrating and active. An alkaline lixivium in which lime hath been boiled, being evaporated to dryness, forms a very caustic substance, which flows in the fire much more easily, attracts and retains moisture much more strongly, than fixed alkalis that have not been so treated. An alkali thus accuated by lime is called the *caustic stone*, or *potential cautery*, because it is employed by surgeons to produce eschars on the skin and cauterize it.

### *Of Metallic Substances in general.*

METALLIC substances are heavy, glittering, opaque, fusible bodies. They consist chiefly of a vitrifiable earth united with the phlogiston.

Several chemists insist on a third principle in these bodies, and have given it the name of *mercurial earth*; which, according to Becher and Stahl, is the very same that being combined with the vitriolic acid forms and characterises the acid of sea-salt. The existence of this principle hath not yet been demonstrated by any decisive experiment; but we shall shew that there are pretty strong reasons for admitting it.

We shall begin with mentioning the experiments which

prove metallic substances to consist of a vitrifiable earth united with the phlogiston. The first is this: if they be calcined in such a manner as to have no communication with any inflammable matter, they will be spoiled of all their properties, and reduced to an earth or calx, that has neither the splendour nor the ductility of a metal, and in a strong fire turns to an actual glass, instead of flowing like a metal.

The second is, that the calx or the glass resulting from a metal thus decomposed, recovers all its metalline properties by being fused in immediate contact with an inflammable substance, capable of restoring the phlogiston of which calcination had deprived it.

On this occasion we must observe, that chemists have not yet been able, by adding the phlogiston, to give the properties of metals to all sorts of vitrifiable earths indiscriminately, but to such only as originally made a part of some metallic body. For example, a compound cannot be made with the phlogiston and sand that shall have the least resemblance of a metal: and this is what seems to point out the reality of a third principle as necessary to form the metalline combination. This principle may probably remain united with the vitrifiable earth of a metallic substance, when reduced to a glass; whence it follows, that such vitrified metals require only the addition of a phlogiston to enable them to appear again in their pristine form.

It may be inferred from another experiment, that the calx and the glass of a metal are not its pure vitrifiable earth, properly so called: for by repeated or long continued calcinations, such a calx or glass may be rendered incapable of ever resuming the metalline form, in whatever manner the phlogiston be afterwards applied to it; so that by this means it is brought into the condition of a pure vitrifiable earth, absolutely free from any mixture.

When by adding the phlogiston to a metallic glass, we restore it to the form of a metal, we are said to *reduce*, *resuscitate*, or *revivify* that metal.

Metallic substances are of different kinds, and are divided into *metals* and *semi-metals*.

Those are called metals, which, besides their metalline splendor and appearance, are also malleable; that is, have the property of stretching under the hammer.

Those which have only the metalline splendor and appearance, without malleability, are called semi-metals.

Metals also are further subdivided into two sorts; *viz.* *perfect* and *imperfect* metals.

The perfect metals are those which suffer no damage or change whatever by the most violent and most lasting action of fire.

The imperfect metals are those which by the force of fire may be deprived of their phlogiston, and consequently of their metalline form.

When a moderate degree of fire only is employed to deprive a metal of its phlogiston, the metal is said to be *calcined*; and then it appears in the form of a powdered earth, which is called a *calx*; and this metalline calx being exposed to a more violent degree of fire, melts and turns to glass.

Metallic substances have an affinity with acids, but not equally with all; that is, every metallic substance is not capable of uniting and joining with every acid.

When an acid unites with a metallic substance, there commonly arises an ebullition, attended with a kind of hissing noise and fuming exhalations. By degrees, as the union becomes more perfect, the particles of the metal combining with the acid become invisible: this is termed *dissolution*; and when a metalline mass thus disappears in an acid, the metal is said to be *dissolved* by that acid. It is proper to observe, that acids act upon metalline substances, in one respect, just as they do upon alkalis and absorbent earths: for an acid cannot take up above such a certain proportion thereof as is sufficient to saturate it, to destroy several of its properties, and weaken others. For example, when an acid is combined with a metal to the point of saturation, it loses its taste, does not turn the blue colour of a vegetable red, and its affinity with water is considerably impaired. On the other hand, metalline substances, which, when pure, are incapable of uniting with water, by being joined with an acid, acquire the property of dissolving in water. These combinations of metalline substances with acids form different sorts of neutral salts; some of which have the property of shooting into crystals, while others have it not: most of them, when thoroughly dried, attract the moisture of the air.

The affinity which metalline substances have with acids is less than that which absorbent earths and fixed alkalis have with the same acids; so that all metalline salts may be decomposed by one of these substances, which will unite with the acid, and precipitate the metal.

Metalline substances thus separated from an acid solvent are called *magisteries*, and *precipitates* of metals. None of these precipitates, except those of the perfect metals, retain the metalline form: most of their phlogiston hath been destroyed by the solution and precipitation, and must be restored before they can recover their properties. In short, they are nearly in the same state with metalline substances deprived of their phlogiston by calcination; and accordingly such a precipitate is called a *calx*.

A metalline calx prepared in this manner loses a greater or a less portion of its phlogiston, the more or less effectually and thoroughly the metalline substance of which it made a part was dissolved by the acid.

Metallic substances have affinities with each other which differ according to their different kinds; but this is not universal, for some of them are incapable of any sort of union with some others.

It must be observed, that metallic substances will not unite, except they be both in a similar state; that is, both in a metalline form, or both in the form of a glass; for a metalline substance, retaining its phlogiston, cannot contract an union with any metallic glass, even its own.

### Of METALS.

THERE are six metals, of which two are perfect, and four imperfect. The perfect metals are gold and silver; the others are copper, tin, lead, and iron. Some chemists admit a seventh metal, viz. quick-silver; but, as it

is not malleable, it has been generally considered as a metallic body of a particular kind.

The ancient chemists, or rather the alchemists, who fancied a certain relation or analogy between metals and the heavenly bodies, bestowed on the seven metals, reckoning quick silver one of them, the names of the seven planets of the ancients, according to the affinity which they imagined they observed between those several bodies. Thus gold was called *Sol*, silver *Luna*, copper *Venus*, tin *Jupiter*, lead *Saturn*, iron *Mars*, and quick silver *Mercury*. Though these names were assigned for reasons merely chimerical, yet they still keep their ground; so that it is not uncommon to find the metals called by the names, and denoted by the characters, of the planets, in the writings even of the best chemists. Metals are the heaviest bodies known in nature.

### Of GOLD.

GOLD is the heaviest of all metals. The arts of wire drawing and gold-beating shew its wonderful ductility. The greatest violence of fire is not able to produce any alteration in it.

GOLD cannot be dissolved by any pure acid: but if the acid of nitre be mixed with the acid of sea-salt, there results a compound acid liquor, with which it has so great an affinity, that it is capable of being perfectly dissolved thereby. The chemists have called this solvent *aqua regis*, on account of its being the only acid that can dissolve gold, which they consider as the king of metals. The solution of gold is of a beautiful orange colour.

If gold dissolved in *aqua regis* be precipitated by an alkali or an absorbent earth, the precipitate gently dried, and then exposed to a certain degree of heat, is instantly dispersed into the air, with a most violent explosion and noise: gold thus precipitated is therefore called *aurum fulminans*. But if the precipitated gold be carefully washed in plenty of water, so as to clear it of all the adhering saline particles, it will not fulminate; but may be melted in a crucible without any additament, and will then appear in its usual form. The acid of vitriol being poured on *aurum fulminans* likewise deprives it of its fulminating quality.

GOLD does not begin to flow till it be red-hot like a live coal. Though it be the most malleable and most ductile of all metals, it has the singular property of losing its ductility more easily than any of them: even the fumes of charcoal are sufficient to deprive it thereof, if they come to contact with it while it is in fusion.

The malleability of this metal, and indeed of all the rest, is also considerably diminished by exposing it suddenly to cold when it is red hot; for example, by quenching it in water, or even barely exposing it to the cold air. The way to restore ductility to gold, when lost by its coming in contact with the vapour of coals, and in general to every other metal rendered less malleable by being suddenly cooled, is to heat it again, to keep them red hot a considerable time, and then to let them cool very slowly and gradually: this operation frequently repeated will by degrees much increase the malleability of a metal.

Pure sulphur hath no effect on gold; but being combined

bined with an alkali into a *hepar sulphuris*, it unites therewith very readily. Nay, so intimate is their union, that the gold by means thereof becomes soluble in water; and this new compound of gold and liver of sulphur, being dissolved in water, will pass through the pores of brown paper without suffering any decomposition; which does not happen, at least in such a manifest degree, to other metallic substances dissolved by liver of sulphur.

*Aurum fulminans* mixed and melted with flour of sulphur loses its fulminating quality: which arises from hence, that on this occasion the sulphur burns, and its acid, which is the same with the vitriolic, being thereby set at liberty, becomes capable of acting upon the gold as a vitriolic acid would; which, as was said above, deprives the gold of its fulminating quality.

### OF SILVER.

NEXT to gold, silver is the most perfect metal. Like gold, it resists the utmost violence of fire, even that in the focus of a burning-glass. However, it holds only the second place among metals; because it is lighter than gold by almost one half; is also somewhat less ductile; and lastly, because it is acted upon by a greater number of solvents.

Yet silver hath one advantage over gold, namely that of being a little harder; which makes it also more sonorous.

This metal, like gold, begins to flow when it is so thoroughly penetrated by the fire as to appear ignited like a live coal.

While this metal is in fusion, the immediate contact of the vapour of burning coals deprives it almost entirely of its malleability, in the same manner as we observed happens to gold: but both these metals easily recover that property by being melted with nitre.

The nitrous acid is the true solvent of silver, and being somewhat dephlegmated will very readily and easily take up a quantity of silver equal in weight to itself.

Silver thus combined with the nitrous acid forms a metallic salt which shoots into crystals, called by the name of *lunar crystals*, or *crystals of silver*.

These crystals are most violently caustic: applied to the skin, they quickly affect it much as a live coal would; they produce a blackish eschar, corroding and entirely destroying the parts they touch. Surgeons use them to eat away the proud fungous flesh of ulcers. As silver united with the nitrous acid hath the property of blackening all animal substances, a solution of this metallic salt is employed to die hair, or other animal matters, of a beautiful and durable black.

These crystals flow with a very moderate heat, and even before they grow red. Being thus melted, they form a blackish mass; and in this form they are used by surgeons, under the title of *lapis infernalis*, *infernal stone*, or *silver caustic*.

Silver is also dissolved by the vitriolic acid: but then the acid must be concentrated, and in quantity double the weight of the silver: nor will the solution succeed without a considerable degree of heat.

Spirit of salt and *aqua regis*, as well as the other a-

cids, are incapable of dissolving this metal, at least in the ordinary way.

Though silver be not soluble in the acid of sea-salt, nor easily in the acid of vitriol, as hath just been observed, it doth not follow, that it hath but a weak affinity with the latter, and none at all with the former: on the contrary, it appears from experiment, that it hath with these two acids a much greater affinity than with the acid of nitre: which is singular enough, considering the facility with which this last acid dissolves it.

The experiment which proves the fact is this. To a solution of silver in the nitrous acid add the acid either of vitriol or of sea-salt, and the silver will instantly quit its nitrous solvent to join with the superadded acid.

Silver thus united with the vitriolic or the marine acid is less soluble in water than when combined with the nitrous acid: and for this reason it is, that when either of these two acids is added to a solution of silver, the liquor immediately becomes white, and a precipitate is formed, which is no other than the silver united with the precipitating acid. If the precipitation be effected by the vitriolic acid, the precipitate will disappear upon adding a sufficient quantity of water, because there will then be water enough to dissolve it. But the case is not the same when the precipitation is made by the marine acid: for silver combined therewith is scarce soluble in water.

This precipitate of silver procured by means of the marine acid is very easily fused, and when fused changes to a substance in some measure transparent and flexible; which hath occasioned it to be called by the name of *luna cornea*. If it be proposed to decompose this *luna cornea*, that is, to separate the marine acid from the silver with which it is united, the *luna cornea* must be melted along with fatty and absorbent matters, with which the acid will unite, and leave the metal exceeding pure.

It must be observed, that if, instead of the marine acid, sea-salt in substance be added to a solution of silver in the nitrous acid, a precipitate is also produced, which by fusion appears to be a true *luna cornea*. The reason is, that the sea-salt is decomposed by the nitrous acid, which seizes its basis, as having a greater affinity therewith than its own acid hath; and this acid being consequently disengaged, and set at liberty unites with the silver, which, as has been shown, has greater affinity with it than with the nitrous acid. This is an instance of decomposition effected by means of one of those double affinities mentioned in the seventh proposition concerning affinities.

From what hath been already said it is clear, that all these combinations of silver with acids may be decomposed by absorbent earths and by fixed alkalis; it being a general law with regard to all metallic substances.

Silver, when separated by these means from the acids in which it was dissolved, requires nothing but simple fusion to restore it to its usual form; because it does not, any more than gold, lose its phlogiston by those solutions and precipitations.

Silver unites with sulphur in fusion. If this metal be only made red-hot in a crucible, and sulphur be then added,

ded, it immediately flows; the sulphur acting as a flux to it. Silver thus united with sulphur forms a mass that may be cut, is half malleable, and hath nearly the colour and consistence of lead. If this sulphurated silver be kept a long time in fusion, and in a great degree of heat, the sulphur flies off and leaves the silver pure. But if the sulphur be evaporated by a violent heat, it carries off with it part of the silver.

Silver unites and mixes perfectly with gold in fusion. The two metals thus mixed form a compound with properties partaking of both.

Metallurgists have hitherto sought in vain for a perfectly good and easy method of separating these two metals by the *dry way* only: (This term is used to signify all operations performed by fusion:) but they are conveniently enough parted by the *moist way*, that is, by acid solvents. This method is founded on the above-mentioned properties of gold and silver with respect to acids. It hath been shewn, that *aqua regis* only will dissolve gold; that silver, on the contrary, is not soluble by *aqua regis*, and that its proper solvent is the acid of nitre: Consequently, when gold and silver are mixed together, if the compound mass be put into *aqua fortis*, this acid will take up all the silver, without dissolving a particle of the gold, which will therefore remain pure; and by this means the desired separation is effected. This method, which is commonly made use of by goldsmiths and miners, is called the *parting assay*.

It is plain, that if *aqua regis* were employed instead of *aqua fortis*, the separation would be equally effected; and that the only difference between this process and the former would consist in this, that now the gold would be dissolved, and the silver remain pure. But the operation by *aqua fortis* is preferable; because *aqua regis* does take up a little silver, whereas *aqua fortis* hath not the least effect on gold.

It must be observed, that when gold and silver are mixed together in equal parts, they cannot be parted by the means of *aqua fortis*. To enable the *aqua fortis* to act duly on the silver, this metal must be, at least, in a triple proportion to the gold. If it be in a less proportion, you must either employ *aqua regis* to make the separation, or, if you prefer the use of *aqua fortis*, melt the metalline mass, and add as much silver as is necessary to make up the proportion above-mentioned: And hence this process is called *quartation*.

This effect, which is pretty singular, probably arises from hence, that when the gold exceeds, or even equals the silver in quantity, the parts of both being intimately united, the former are capable of coating over the latter, and covering them so as to defend them from the action of the *aqua fortis*; which is not the case when there is thrice as much silver as gold.

There is one thing more to be taken notice of with regard to this process; which is, that perfectly pure *aqua fortis* is rarely to be met with, for two reasons: First, it is difficult in making it wholly to prevent the rising of the medium employed to disengage the nitrous acid; that is, a little of the vitriolic acid will mix with the vapours of the *aqua fortis*: Secondly, unless the saltpetre be very well purified, it will always hold some small portion of

sea-salt, the acid of which, we know, is very readily set loose by the vitriolic acid, and consequently rises together with the vapours of the *aqua fortis*. It is easy to see, that *aqua fortis*, mixed either with the one or the other, is not proper for the parting process; because, as has just been said, the vitriolic and the marine acid equally precipitate silver dissolved in the nitrous acid; by which means, when they are united with that acid, they weaken its action upon the silver, and hinder the dissolution. Add, that *aqua fortis* adulterated with a mixture of spirit of salt becomes an *aqua regis*, and consequently is rendered capable of dissolving gold, in proportion as its action upon silver is diminished.

In order to remedy this inconvenience, and free *aqua fortis* from the vitriolic or marine acid with which it is tainted, silver must be dissolved therein: By degrees, as the metal dissolves, those heterogeneous acids lay hold of it, and precipitate with it in the form of a white powder, as we observed before. This precipitate being wholly fallen, the liquor grows clear; after which, if it be found capable of dissolving more silver, without turning milky, it may be depended on as a perfectly pure *aqua fortis*. Then filtre it, dissolve more silver in it, as long as it will take up any, and you will have a solution of silver in a very pure *aqua fortis*. By means of this solution may other *aqua fortis* be purified: For, pour a few drops thereof into a very impure *aqua fortis*, and immediately the vitriolic or marine acid, with which that *aqua fortis* is contaminated, will join the silver and fall therewith to the bottom. When the solution of silver prepared as above does not in the least affect the transparency of the *aqua fortis*, it is then very pure, and fit for the purposes of quartation.

This operation of purifying *aqua fortis* by a solution of silver is called the *precipitation of aqua fortis*; and *aqua fortis* thus purified is called *precipitated aqua fortis*.

When silver is dissolved in *aqua fortis* it may be separated therefrom, as has been shewn, by absorbent earths and fixed alkalis.

#### Of COPPER.

Of all the imperfect metals, copper comes the nearest to gold and silver. Its natural colour is a deep-red yellow. It resists a very violent degree of fire for a considerable time; but losing its phlogiston at last, it changes its metalline form for that of a calx, or a pure reddish earth. This calx is hardly, if at all, reducible to glass, without the addition of something to promote its fusion; all that the fiercest heat can do being only to render it soft. Copper, even while it retains its metalline form, and is very pure, requires a considerable degree of fire to melt it, and does not begin to flow till long after it is red-hot. When in fusion, it communicates a greenish colour to the flame of the coals.

This metal is inferior to silver in point of gravity; nor is its ductility so great, though it be pretty considerable: But, on the other hand, it exceeds that metal in hardness. It unites readily with gold and silver; nor does it greatly lessen their beauty when added to them in a small quantity: Nay, it even procures them some advantages;

vantages; such as making them harder, and less subject to lose their ductility. This may probably arise from hence, that the ductility of copper has the peculiarity of resisting most of those causes which rob the perfect metals of theirs.

The property which other metalline substances have in common with copper, of losing the phlogiston by calcining and then vitrifying, furnishes us with a method of separating them from gold and silver, when they are combined therewith. Nothing more is required than to expose the mass, compounded of the perfect metals and other metalline substances, to a degree of heat sufficient to calcine whatever is not either gold or silver. It is evident that by this means these two metals will be obtained as pure as is possible; for, as hath already been said, no metalline calx or glass is capable of uniting with metals possessed of their phlogiston. On this principle is formed the whole business of refining gold and silver.

When the perfect metals have no other alloy but copper, as this metal is not to be calcined or vitrified without great difficulty, which is increased by its union with the unvitrifiable metals, it is easy to see that it is almost impossible to separate them without adding something to facilitate the vitrification of the copper. Such metals as have the property of turning easily to glass are very fit for this purpose; and it is necessary to add a certain quantity thereof, when gold or silver is to be purified from the alloy of copper. We shall have occasion to be more particular on this subject when we come to treat of lead.

Copper is soluble in all the acids, to which it communicates a green colour, and sometimes a blue. Even the neutral salts, and water itself, act upon this metal. With regard to water indeed, as the procuring it absolutely pure and free from any saline mixture is next to an impossibility, it remains a question, whether the effect it produces on copper be not owing to certain saline particles contained in it. It is this great facility of being dissolved that renders copper so subject to rust; which is nothing else but some parts of its surface corroded by saline particles contained in the surrounding air and water.

The rust of copper is always green or blue, or of a colour between these two. Internally used it is very noxious, being a real poison, as are all the solutions of this metal made by any acid whatever. The blue colour, which copper constantly assumes, when corroded by any saline substance, is a sure sign by which it may be discovered where-ever it exists, even in a very small quantity.

Copper dissolved in the vitriolic acid forms a kind of metalline salt, which shoots into rhomboidal crystals of a most beautiful blue colour. These crystals are called *blue vitriol*, or *vitriol of copper*. They are sometimes found ready formed in the bowels of the earth; and may be artificially made by dissolving copper in the vitriolic acid; but the solution will not succeed unless the acid be well dephlegmated. The taste of this vitriol is saltish and astringent. It retains a considerable quantity of water in crystallizing, on which account it is easily rendered fluid by fire.

It must be observed, that when it is exposed to a cer-

tain degree of heat in order to free it of its humidity, a great part of its acid flies off at the same time: And hence it is that, after calcination, there remains only a kind of earth, or metalline calx, of a red colour, which contains but very little acid. This earth cannot be brought to flow but with the greatest difficulty.

A solution of copper in the nitrous acid forms a salt which does not crystallize, but, when dried, powerfully attracts the moisture of the air. The same thing happens when it is dissolved in the spirit of salt, or in *aqua regis*.

If the copper, thus dissolved by any of these acids, be precipitated by an earth or an alkali, it retains nearly the colour it had in the solution: But these precipitates are scarce any thing more than the earth of copper, or copper deprived of most of its phlogiston; so that if they were exposed to a violent fire, without any additament, a great part of them would be converted into an earth that could never be reduced to a metalline form. Therefore, when we intend to reduce these precipitates to copper, it is necessary to add a certain quantity of a substance capable of restoring to them the phlogiston they have lost.

The substance which hath been found fittest for such reductions is charcoal dust; because charcoal is nothing but a phlogiston closely combined with an earth, which renders it exceedingly fixed, and capable of resisting a violent force of fire. But as charcoal will not melt, and consequently is capable of preventing rather than forwarding the flux of a metalline calx or glass, which nevertheless is essentially necessary to complete the reduction, it hath been contrived to mix it, or any other substance containing the phlogiston, with such fixed alkalis as easily flow, and are fit to promote the flux of other bodies. These mixtures are called *reducing fluxes*; because the general name of fluxes is given to all salts, or mixtures of salts, which facilitate fusion.

If sulphur be applied to copper made perfectly red-hot, the metal immediately runs; and these two substances uniting, form a new compound much more fusible than pure copper.

This compound is destroyed by the sole force of fire, for two reasons: The first is, that, sulphur being volatile, the fire is capable of subliming a great part of it, especially when it is in a great proportion to the copper with which it is joined; the second is, that the portion of sulphur which remains, being more intimately united with the copper, though it be rendered less combustible by that union, is nevertheless burnt and consumed in time. Copper being combined with sulphur, and together with it exposed to the force of fire, is found to be partly changed into a blue vitriol; because the vitriolic acid, being disengaged by burning the sulphur, is by that means qualified to dissolve the copper. The affinity of copper with sulphur is greater than that of silver.

This metal, as well as the other imperfect metals and the semi-metals, being mingled with nitre and exposed to the fire, is decomposed and calcined much sooner than by itself; because the phlogiston which it contains occasions the delagration of the nitre, and consequently the two substances mutually decompose each other. There are certain metalline substances whose phlogiston is so abundant,

dant, and so weakly connected with their earth, that, when they are thus treated with nitre, there arises immediately a detonation, accompanied with flame, and as violent as if sulphur or charcoal dust had been employed; so that in a moment the metalline substance loses its phlogiston, and is calcined. The nitre, after these detonations, always assumes an alkaline character.

#### OF IRON.

IRON is lighter and less ductile than copper; but it is much harder, and of more difficult fusion.

It is the only body that has the property of being attracted by the magnet, which therefore serves to discover it where-ever it is. But it must be observed, that it hath this property only when in its metalline state, and loses it when converted to an earth or calx. Hence very few iron-ores are attracted by the loadstone; because, for the most part, they are only sorts of earths, which require a phlogiston to be added before they can be brought to the form of true iron.

When iron hath undergone no other preparation but the fusion which is necessary to smelt it from its ore, it is usually quite brittle, and flies to pieces under the hammer: Which arises in some measure from its containing a certain portion of unmetalline earth interposed between its parts. This we call *pig-iron*.

By melting this a second time it is rendered purer, and more free from heterogeneous matters: But still, as its proper parts are probably not brought sufficiently near, or closely enough united, till the iron hath undergone some further preparation besides that of fusion, it seldom hath any degree of malleability.

The way to give it this property is to make it just red-hot, and then hammer it for some time in all directions; to the end that its parts may be properly united, incorporated, and welded together, and that the heterogeneous matters which keep them asunder may be separated. Iron made by this means as malleable as possible, we call *bar-iron*, or *forged iron*.

Bar-iron is still harder to fuse than pig-iron: To make it flow requires the utmost force of fire.

Iron has the property of inbibing a greater quantity of phlogiston than is necessary to give it the metalline form. It may be made to take in this superabundant phlogiston two ways: The first is by fusing it again with matters that contain the phlogiston; the second is, by encompassing it with a quantity of such matters, charcoal-dust, for instance, and then exposing it so encompassed, for a certain time, to a degree of fire barely sufficient to keep it red-hot. This second method, whereby one substance is incorporated with another by means of fire, but without fusing either of them, is in general called *cementation*.

Iron thus impregnated with an additional quantity of phlogiston is called *steel*. The hardness of steel may be considerably augmented by *tempering* it; that is, by making it red-hot, and suddenly quenching it in some cold liquor. The hotter the metal, and the colder the liquor in which it is quenched, the harder will the steel be. By this means tools are made, such as files and *scers*, capable of cutting and dividing the hardest bo-

dies, as glass, pebbles, and iron itself. The colour of steel is darker than that of iron, and the facets which appear on breaking it are smaller. It is also less ductile and more brittle, especially when tempered.

As iron may be impregnated with an additional quantity of phlogiston, and thereby converted into steel, so may steel be again deprived of that superabundant phlogiston, and brought back to the condition of iron. This is effected by cementing it with poor earths, such as calcined bones and chalk. By the same operation steel may be *untempered*: nay, it will lose the hardness it had acquired by tempering, if it be but made red-hot, and left to cool gradually. As iron and steel differ only in the respects we have here taken notice of, their properties being in all other respects the same, what follows is equally applicable to both.

Iron being exposed to the action of fire for some time, especially when divided into small particles, such as filings, is calcined, and loses its phlogiston. By this means it turns to a kind of reddish yellow earth, which on account of its colour is called *crocus Martis*, or *saffron of Mars*.

This calx of iron has the singular property of flowing in the fire with somewhat less difficulty than iron itself; whereas every other metalline calx flows with less ease than the metal that produced it. It has moreover the remarkable property of uniting with the phlogiston, and of being reduced to iron without fusion; requiring for that purpose only to be made red-hot.

Iron may be incorporated with silver, and even with gold, by means of certain operations. Under the article of lead, we shall see how it may be separated from these metals.

The acids produce on it much the same effects as on copper: every one of them acts upon it. Certain neutral salts, alkalis, and even water itself, are capable of dissolving it; and hence it is also very subject to rust.

The vitriolic acid dissolves it with the greatest ease: but the circumstances which attend the dissolution thereof are different from those with which the same acid dissolves copper. For, 1. Whereas the vitriolic acid must be concentrated to dissolve copper, it must on the contrary be diluted with water to dissolve iron, which it will not touch when well dephlegmated. 2. The vapours which rise in this dissolution are inflammable; so that if it be made in a small-necked bottle, and the flame of a candle be applied to the mouth thereof, the vapours in the bottle take fire with such rapidity as to produce a considerable explosion.

This solution is of a beautiful green colour; and from this union of the vitriolic acid with iron, there results a neutral metalline salt, which has the property of shooting into crystals of a rhomboidal figure, and a green colour. These crystals are called *green vitriol*, and *vitriol of Mars*.

Green vitriol hath a saltish and astringent taste. As it retains a great deal of water in crystallizing it quickly flows by the action of fire: but this fluidity is owing to its water only, and is not a real fusion; for as soon as its moisture is evaporated, it resumes a solid form. Its green transparent colour is now changed into an opaque white:

white: and, if the calcination be continued, its acid also exhales, and is dissipated in vapours; and as it loses that, it turns gradually to a yellow colour, which comes so much the nearer to a red the longer the calcination is continued, or the higher the force of the fire is raised; which being driven to the utmost, what remains is of a very deep red. This remainder is nothing but the body of the iron, which, having lost its phlogiston, is now no more than an earth, nearly of the same nature with that which is left after calcining the metal itself.

Green vitriol dissolved in water spontaneously lets fall a yellowish earthy sediment. If this solution be defecated by filtration, it still continues to deposit some of the same substance, till the vitriol be wholly decomposed. This sediment is nothing but the earth of iron, which is then called *ochre*.

The nitrous acid dissolves iron with great ease. This solution is of a yellow colour, inclining more or less to a russet, or dark-brown, as it is more or less saturated with iron. Iron dissolved by this acid also falls spontaneously into a kind of calx, which is incapable of being dissolved a second time; for the nitrous acid will not act upon iron that has lost its phlogiston. This solution does not crystallize, and if evaporated to dryness attracts the moisture of the air.

Spirit of salt likewise dissolves iron, and this solution is green. The vapours which rise during the dissolution are inflammable, like those which ascend when this metal is attacked by the vitriolic acid. *Aqua regis* makes a solution of iron, which is of a yellow colour.

Iron hath a greater affinity than either silver or copper with the nitrous and vitriolic acids: so that if iron be presented to a solution of either, in one of these two acids, the dissolved metal will be precipitated; because the acid quits it for the iron, with which it has a greater affinity.

On this occasion it must be observed, that if a solution of copper in the vitriolic acid be precipitated by means of iron, the precipitate has the form and splendour of a metal, and does not require the addition of a phlogiston to reduce it to true copper; which is not the case, when the precipitation is effected by earths or alkaline salts.

The colour of this metalline precipitate hath deceived several persons, who being unacquainted with such phenomena, and with the nature of blue vitriol, imagined that iron was transmuted into copper, when they saw a bit of iron, laid in a solution of that vitriol, become, in form and external appearance, exactly like copper: whereas the surface only of the iron was crusted over with the particles of copper contained in the vitriol, which had gradually fallen upon, and adhered to the iron, as they were precipitated out of the solution.

Among the solvents of iron we mentioned fixed alkalis: and that they have such a power, is proved by the following phenomenon. If a large proportion of alkaline salts be suddenly mixed with a solution of iron in an acid, no precipitation ensues, and the liquor remains clear and pellucid; or if at first it look a little turbid, that appearance lasts but a moment, and the liquor presently recovers its transparency. The reason is, that quantity of alkali is more than sufficient to saturate all the acid of

the solution; and the superabundant portion thereof, meeting with the iron already finely divided by the acid, dissolves it with ease as fast as it falls, and so prevents its mudding in liquor. To evince that this is so in fact, let the alkali be applied in a quantity that is not sufficient, or but barely sufficient, to saturate the acid, and the iron will then precipitate like any other metal.

Water also acts upon iron; and therefore iron exposed to moisture grows rusty. If iron-slings be exposed to the dew, they turn wholly to a rust, which is called *crocus Martis aperiens*.

Iron exposed to the fire, together with nitre, makes it detonate pretty briskly, sets it in a flame, and decomposes it with rapidity.

This metal hath a greater affinity than any other metalline substance with sulphur; on which account, it is successfully used to precipitate, and separate all metalline substances combined with sulphur.

Sulphur uniting with iron communicates to it such a degree of fusibility, that if a mass of this metal, heated red-hot, be rubbed with a bit of sulphur, it incessantly runs into as perfect a fusion as a metal exposed to the focus of a large burning-glass.

#### OF TIN.

Tin is the lightest of all metals. Though it yields easily to the impression of hard bodies, it has but little ductility. Being bent backwards and forwards it makes a small crackling noise. It flows with a very moderate degree of fire, and long before it comes to be red-hot. When it is in fusion, its surface soon grows dusky, and there forms upon it a thin dark-coloured dusty pellicle, which is no other than a part of the tin that has lost its phlogiston, or a calx of tin. The metal thus calcined easily recovers its metalline form, on the addition of a phlogiston. If the calx of tin be urged by a strong fire it grows white, but the greatest violence of heat will not fuse it; which makes some chemists consider it as a calcinable or absorbent earth, rather than a vitrifiable one. Yet it turns to glass in some sort, when mixed with any other substance that vitrifies easily. However, it always produces an imperfect glass only, which is not at all transparent, but of an opaque white. The calx of tin thus vitrified is called *enamel*. Enamels are made of several colours by the addition of this or that metalline calx.

Tin unites easily with all the metals; but it destroys the ductility and malleability of every one of them, lead excepted. Nay, it possesses this property of making metals brittle, in such an eminent degree, that the very vapour of it, when in fusion, is capable of producing this effect. Moreover, which is very singular, the most ductile metals, even gold and silver, are those on which it works this change with the most ease, and in the greatest degree. It has also the property of making silver, mixed with it, flow over a very small fire.

It adheres to, and in some measure incorporates with, the surface of copper and of iron; whence arose the practice of coating over those metals with tin. Tin-plates are no other than thin plates of iron tinned over.

If to twenty parts of tin one part of copper be added,  
this

this alloy renders it much more solid, and the mixed mass continues tolerably ductile.

If, on the contrary, to one part of tin ten parts of copper be added, together with a little zinc, a femimetal to be considered hereafter, from this combination there results a metalline compound, which is hard, brittle, and very sonorous; so that it is used for casting bells: This composition is called *bronze* and *bell-metal*.

Tin hath an affinity with the vitriolic, nitrous, and marine acids. All of them attack and corrode it; yet none of them is able to dissolve it without great difficulty: So that if a clear solution thereof be desired, particular methods must be employed for that purpose; for the acids do but in a manner calcine it, and convert it to a kind of white calx or precipitate. The solvent which has the greatest power over it is *aqua regis*, which has even a greater affinity therewith than with gold itself; whence it follows, that gold dissolved in *aqua regis* may be precipitated by means of tin; but then the *aqua regis* must be weakened. Gold thus precipitated by tin is of a most beautiful colour, and is used for a red in enamelling and painting on porcelain, as also to give a red colour to artificial gems. If the *aqua regis* be not lowered, the precipitate will not have the purple colour.

Tin hath the property of giving a great lustre to all red colours in general; on which account it is used by the dyers for striking a beautiful scarlet, and tin-vessels are employed in making fine syrup of violets. Water does not act upon this metal, as it does upon iron and copper; for which reason it is not subject to rust: nevertheless, when it is exposed to the air, its surface soon loses its polish and splendor.

Tin mixed with nitre, and exposed to the fire, deflagrates with it, makes it detonate, and is immediately converted to a *refractory calx*; for so all substances are called which are incapable of fusion.

Tin readily unites with sulphur, and with it becomes a brittle and friable mass.

#### OF LEAD.

NEXT to gold and mercury, lead is the heaviest of all metalline substances, but in hardness is exceeded by every one of them. Of all metals also it melts the easiest, except tin. While it is in fusion there gathers incessantly on its surface, as on that of tin, a blackish, dusty pellicle, which is nothing but a calx of lead.

This calx further calcined by a moderate fire, the flame being reverberated on it, soon grows white. If the calcination be continued it becomes yellow, and at last of a beautiful red. In this state it is called *minium*, and is used as a pigment. *Minium* is not easily made, and the operation succeeds well in large manufactures only.

To convert lead into *litharge*, which is the metal in a manner half vitrified, you need only keep it melted by a pretty strong fire; for then, as its surface gradually calcines, it tends more and more to fusion and vitrification.

All these preparations of lead are greatly disposed to perfect fusion and vitrification, and for that purpose require but a moderate degree of fire; the calx or earth of

lead being of all metalline earths that which vitrifies the most easily.

Lead hath not only the property of turning into glass with the greatest facility, but it hath also that of promoting greatly the vitrification of all the other imperfect metals; and, when it is actually vitrified, procures the ready fusion of all earths and stones in general, even those which are refractory, that is, which could not be fused without its help.

Glass of lead, besides its great fusibility, hath also the singular property of being so subtle and active as to corrode and penetrate the crucibles in which it is melted, unless they be of an earth that is exceeding hard, compact, and withal very refractory: for glass of lead being one of the most powerful fluxes that we know, if the earth of the crucible in which it is melted be in the smallest degree fusible, it will be immediately vitrified; especially if there be any metallic matter in its composition.

The great activity of glass of lead may be weakened by joining it with other vitrifiable matters; but unless these be added in a very great proportion, it will still remain powerful enough to penetrate common earths, and carry off the matters combined with it.

On these properties of lead, and of the glass of lead, depends the whole business of refining gold and silver. It hath been shewn, that as these two metals are indestructible by fire, and the only ones which have that advantage, they may be separated from the imperfect metals, when mixed therewith, by exposing the compound to a degree of fire sufficiently strong to vitrify the latter; which when once converted into glass can no longer remain united with any metal that has its metalline form. But it is very difficult to procure this vitrification of the imperfect metals, when united with gold and silver; nay, it is in a manner impossible to vitrify them entirely, for two reasons: first, because most of them are naturally very difficult to vitrify: secondly, because the union they have contracted with the perfect metals defends them, in a manner, from the action of the fire, and that so much the more effectually as the proportion of the perfect metals is greater; which being indestructible, and in some sort coating over those with which they are alloyed, serve them as a preservative and impenetrable shield against the utmost violence of fire.

It is therefore clear, that a great deal of labour may be saved, and that gold and silver may be refined to a much greater degree of purity than can otherwise be obtained, if to a mixture of these metals with copper, for instance, or any other imperfect metal, be added a certain quantity of lead. For the lead, by its known property, will infallibly produce the desired vitrification; and as it likewise increases the proportion of the imperfect metals, and so lessens that of the perfect metals, in the mass, it evidently deprives the former of a part of their guard, and so effects a more complete vitrification. As the glass of lead hath the property of running through the crucible, and carrying with it the matters which it has vitrified, it follows, that when the vitrification of the imperfect metals is effected by its means, all those vitrified matters together penetrate the vessel containing the fused metalline mass, disappear, and leave only the gold and silver perfectly

perfectly pure, and freed, as far as is possible, from all admixture of heterogeneous parts.

The better to promote the separation of such parts, it is usual to employ in this process a particular sort of small crucibles, made of the ashes of calcined bones, which are exceedingly porous and easily pervaded. They are called *cupels*, on account of their figure, which is that of a wide-mouthed cup: and from hence the operation takes its name; for when we refine gold and silver in this manner, we are said to *cupel* those metals. It is easy to perceive, that the more lead is added, the more accurately will the gold and silver be refined; and that so much the more lead ought to be added as the perfect metals are alloyed with a greater proportion of the imperfect. This is the most severe trial to which a perfect metal can be put, and consequently any metal that stands it may be fairly considered as such.

In order to denote the fineness of gold, it is supposed to be divided into twenty-four parts called *carats*; and gold, which is quite pure and free from all alloy, is said to be twenty-four carats fine; that which contains  $\frac{1}{24}$  part of alloy is called gold of twenty-three carats; that which contains  $\frac{2}{24}$  of alloy is but twenty-two carats; and so on. Silver again is supposed to be divided into twelve parts only, which are called *penny-weights*; so that when absolutely pure it is said to be twelve penny-weights fine; when it contains  $\frac{1}{12}$  of alloy, it is then called eleven penny-weights fine; when it contains  $\frac{2}{12}$  of alloy, it is called ten penny-weights fine; and so on.

In treating of copper, we promised to shew under the article of lead how to separate it from iron. The process is founded on that property of lead which renders it incapable of mixing and uniting with iron, though it readily dissolves all other metalline substances. Therefore if you have a mass compounded of copper and iron, it must be fused with a certain quantity of lead, and then the copper, having a greater affinity with lead than with iron, will desert the latter and join the former, which being incapable of any union with iron, as was said, will wholly exclude it from the new compound. The next point is to separate the lead from the copper; which is done by exposing the mass compounded of these two metals to a degree of fire strong enough to deprive the lead of its metalline form, but too weak to have the same effect on the copper: and this may be done, since of all the imperfect metals lead is, next to tin, the easiest to be calcined, and copper, on the contrary, resists the greatest force of fire longest, without losing its metalline form. Now what we gain by this exchange, *viz.* by separating copper from iron, and uniting it with lead, consists in this, that as lead is calcined with less fire than iron, the copper is less exposed to be destroyed: for it must be observed, that, however moderate the fire be, it is hardly possible to prevent a certain quantity thereof from being calcined in the operation.

Lead melted with a third part of tin forms a compound, which being exposed to a fire capable of making it thoroughly red hot, swells, puffs up, seems in some sort to take fire, and is presently calcined. These two metals mixed together are much sooner calcined than either of them separately.

Both lead and tin are in some measure affected by water, and by a moist air; but they are both much less subject than iron or copper to be corroded by these solvents, and of course are much less liable to rust.

The vitriolic acid acts upon and dissolves lead much in the same manner as it doth silver.

The nitrous acid dissolves this metal with much ease, and in great quantities; and from this solution a small portion of mercury may be obtained.

When this solution of lead is diluted with a good deal of water, the lead precipitates in the form of a white powder; which happens because the acid is rendered too weak to keep the lead dissolved.

If this solution of lead be evaporated to a certain degree, it shoots into crystals formed like regular pyramids with square bases. These crystals are of a yellowish colour, and of a saccharine taste: they do not easily dissolve in water. This nitrous metalline salt has the singular property of detonating in a crucible, without any additament, or the contact of any other inflammable substance. This property it derives from the great quantity of phlogiston contained in, and but loosely connected with the lead, which is one of its principles.

If spirit of salt, or even sea-salt in substance, be added to a solution of lead in the nitrous acid, a white precipitate immediately falls; which is no other than the lead united with the marine acid. This precipitate is extremely like the precipitate of silver made in the same manner; and that being called *luna cornea*, hath occasioned this to be named *plumbum corneum*. Like the *luna cornea*, it is very fusible, and, being melted, hardens like it into a kind of horny substance: it is volatile, and may be reduced by means of inflammable matters combined with alkalis. But it differs from the *luna cornea* in this chiefly, that it dissolves easily in water; whereas the *luna cornea*, on the contrary, dissolves therein with great difficulty, and in a very small quantity.

As this precipitation of lead from its solution in spirit of nitre is procured by the marine acid, lead is thereby proved to have a greater affinity with the latter acid than with the former. Yet, if you attempt to dissolve lead directly by the acid of sea-salt, the solution is not so easily effected as by the spirit of nitre, and it is always imperfect; for it wants one of the conditions essential to every solution in a liquor, namely transparency.

If lead be boiled for a long time in a lixivium of fixed alkali, part of it will be dissolved.

Sulphur renders this metal refractory and scarce fusible; and the mass they form when united together is friable. Hence it appears that sulphur acts upon lead much in the same manner as upon tin; that is, it renders both these metals less fusible, which are naturally the most fusible of any, while it exceedingly facilitates the fusion of silver, copper, and iron, metals which of themselves flow with the greatest difficulty.

### Of QUICK-SILVER.

WE treat of quick-silver in a chapter apart, because this metallic substance cannot be classed with the metals properly so called, and yet has some properties which

will not allow us to confound it with the semi metals. The reason why quick-silver, by the chemists commonly called mercury, is not reputed a metal, is, that it wants one of the essential properties thereof, *viz.* malleability. When it is pure and unadulterated with any mixture, it is always fluid, and of course unmalleable. But as, on the other hand, it eminently possesses the opacity, the splendor, and above all the gravity of a metal, being, next to gold, the heaviest of all bodies, it may be considered as a true metal, differing from the rest no otherwise than by being constantly in fusion; which we may suppose arises from its aptness to flow with such a small degree of heat, that be there ever so little warmth on earth, there is still more than enough to keep mercury in fusion; which would become solid and malleable if it were possible to apply to it a degree of cold considerable enough for that purpose. These properties will not allow us to confound it with the semi-metals. Add, that we are not yet assured by any undoubted experiment that it can be wholly deprived of its phlogiston, as the imperfect metals may. Indeed we cannot apply the force of fire to it as could be wished: for it is so volatile, that it flies off and exhales in vapours with a much less degree of fire than is necessary to make it red-hot. The vapours of mercury thus raised by the action of fire, being collected and united in a certain quantity, appear to be no other than true mercury retaining every one of its properties; and no experiment hath ever been able to shew the least change thus produced in its nature.

If mercury be exposed to the greatest heat that it can bear without sublimation, and continued in it for several months, or even a whole year together, it turns to a red powder, which the chemists call *mercurius præcipitatus per se*. But to succeed in this operation, it is absolutely necessary that the heat be such as is above specified; for this metallic substance may remain exposed to a weaker heat for a considerable number of years, without undergoing any sensible alteration.

Some chemists fancied that by this operation they had fixed mercury, and changed its nature; but without any reason; for if the mercury thus seemingly transmuted be exposed to a somewhat stronger degree of fire, it sublimes and exhales in vapours as usual; and those vapours collected are nothing else but running mercury, which has recovered all its properties without the help of any additament.

Mercury has the property of dissolving all the metals, iron only excepted. But it is a condition absolutely necessary to the success of such dissolution, that the metallic substances be possessed of their phlogiston; for if they be calcined, mercury cannot touch them: and hence it follows, that mercury doth not unite with substances that are purely earthy. Such a combination of a metal with mercury is called an *amalgam*. Trituration alone is sufficient to effect it; however, a proper degree of heat also is of use.

Mercury amalgamated with a metal gives it a consistence more or less soft, and even fluid, according to the greater or smaller proportion of mercury employed. All amalgams are softened by heat, and hardened by cold.

Mercury is very volatile; vastly more so than the most

unfixed metals: moreover, the union it contracts with any metal is not sufficiently intimate to entitle the new compound resulting from that union to all the properties of the two substances united; at least with regard to their degree of fixity and volatility. From all which it follows, that the best and surest method of separating it from metals dissolved by it, is to expose the amalgam to a degree of heat sufficient to make all the quick-silver rise and evaporate; after which the metal remains in the form of a powder, and being fused recovers its malleability. If it be thought proper to save the quick-silver, the operation must be performed in close vessels, which will confine and collect the mercurial vapours. This operation is most frequently employed to separate gold and silver from the several sorts of earths and sands with which they are mixed in the ore; because these two metals, gold especially, are of sufficient value to compensate the loss of mercury, which is inevitable in this process: besides, as they very readily amalgamate with it, this way of separating them from every thing unmetallic is very commodious.

Mercury is dissolved by acids; but with circumstances peculiar to each particular acid.

The vitriolic acid concentrated and made boiling hot seizes on it, and presently reduces it to a kind of white powder, which turns yellow by the affusion of water, but does not dissolve in it: it is called *turbith mineral*. However, the vitriolic acid on this occasion unites with a great part of the mercury in such a manner that the compound is soluble in water. For if to the water which was used to wash the turbith a fixed alkali be added, there falls instantly a russet-coloured precipitate, which is no other than mercury separated from the vitriolic acid by the intervention of the alkali.

This dissolution of mercury by the vitriolic acid is accompanied with a very remarkable phenomenon; which is, that the acid contracts a strong smell of volatile spirit of sulphur: a notable proof that part of the phlogiston of the mercury hath united therewith. And yet, if the mercury be separated by means of a fixed alkali, it does not appear to have suffered any alteration. *Turbith mineral* is not so volatile as pure mercury.

The nitrous acid dissolves mercury with ease. The solution is limpid and transparent, and as it grows cold shoots into crystals, which are a nitrous mercurial salt.

If this solution be evaporated to dryness, the mercury remains impregnated with a little of the acid, under the form of a red powder, which hath obtained the names of *red precipitate*, and *arcanna corallinum*. This precipitate, as well as turbith, is less volatile than pure mercury.

If this solution of mercury be mixed with a solution of copper made likewise in the nitrous acid, and the mixture evaporated to dryness, there will remain a green powder called *green precipitate*. These precipitates are caustic and corrosive; and are used as such in surgery.

Though mercury be dissolved more easily and completely by the nitrous acid than by the vitriolic, yet it has a greater affinity with the latter than with the former; for if a vitriolic acid be poured into a solution of mercury in spirit of nitre, the mercury will quit the latter

ter

ter acid in which it was dissolved, and join the other which was added. The same thing happens when the marine acid is employed instead of the vitriolic.

Mercury combined with spirit of salt forms a singular body; a metalline salt which shoots into long crystals, pointed like daggers. This salt is volatile, and sublimes easily without decomposition. It is moreover the most violent of all the corrosives hitherto discovered by chemistry. It is called *corrosive sublimate*, because it must absolutely be sublimed to make the combination perfect. There are several ways of doing this: but the operation will never fail, if the mercury be rarefied into vapours and meet with the marine acid in a similar state.

Corrosive sublimate is dissolved by water, but in very small quantities only. It is decomposed by fixed alkalis, which precipitate the mercury in a reddish yellow powder, called, on account of its colour, *yellow precipitate*.

If corrosive sublimate be mixed with tin, and the compound distilled, a liquor comes over, which continually emits abundance of dense fumes, and from the name of its inventor is called the *smoking liquor of Libavius*. This liquor is no other than the tin combined with the marine acid of the corrosive sublimate, which therefore it hath actually decomposed: whence it follows, that this acid hath a greater affinity with tin than with mercury.

The marine acid in corrosive sublimate is not quite saturated with mercury; but is capable of taking up a much greater quantity thereof. For if corrosive sublimate be mixed with fresh mercury, and sublimed a second time, another compound will be produced containing much more mercury, and less acrimonious; for which reason it is named *sweet sublimate of mercury*, *mercurius dulcis*, *aquila alba*. This compound may be taken internally, and is purgative or emetic according to the dose administered. It may be rendered still more gentle by repeated sublimations, and then it takes the title of *panacea mercurialis*. No way hath hitherto been found to dissolve mercury in *aqua regis* without great difficulty, and even then it is but imperfectly dissolved.

Mercury unites easily and intimately with sulphur. If these two substances be only rubbed together in a gentle heat, or even without any heat, they will contract an union, though but an incomplete one. This combination takes the form of a black powder, which has procured it the name of *Æthiops mineral*.

If a more intimate and perfect union be desired, this compound must be exposed to a stronger heat; and then a red ponderous substance will be sublimed, appearing like a mass of shining needles: this is the combination desired, and is called *cinabar*. In this form chiefly is mercury found in the bowels of the earth. Cinabar finely levigated acquires a much brighter red colour, and is known to painters by the name of *vermilion*.

Cinabar rises wholly by sublimation, without suffering any decomposition; because the two substances of which it consists, *viz.* mercury and sulphur, are both volatile.

Though mercury unites and combines very well with sulphur, as hath been said, yet it hath less affinity with

that mineral than any other metal, gold only excepted: whence it follows, that any of the other metals will decompose cinabar, by uniting with its sulphur, and so setting the mercury at liberty to appear in its usual form. Mercury thus separated from sulphur, is esteemed the purest, and bears the name of *mercury revived from cinabar*.

Iron is generally used in this operation preferably to the other metals, because among them all it has the greatest affinity with sulphur, and is the only one that has none with mercury.

Cinabar may also be decomposed by means of fixed alkalis; the affinity of these salts with sulphur being generally greater than that of any metalline substance whatever.

## Of the SEMI-METALS.

### Of REGULUS of ANTIMONY.

REGULUS of antimony is a metallic substance of a pretty bright white colour. It has the splendor, opacity, and gravity of a metal; but it is quite unmalleable, and crumbles to dust, instead of yielding or stretching under the hammer; on which account it is classed with the semi-metals.

It begins to flow as soon as it is moderately red; but, like the other semi metals it cannot stand a violent degree of fire; being thereby dissipated into smoke and white vapours, which adhere to such cold bodies as they meet with, and so are collected into a kind of *farina* called *flowers of antimony*.

If regulus of antimony, instead of being exposed to a strong fire, be only heated so moderately that it shall not even melt, it will calcine, lose its phlogiston, and take the form of a greyish powder destitute of all splendor: this powder is called *calx of antimony*.

This calx is not volatile like the regulus, but will endure a very violent fire; and being exposed thereto will flow, and turn to a glass of the yellowish colour of a hyacinth.

It is to be observed, that the more the regulus is deprived of its phlogiston by continued calcination, the more refractory is the calx obtained from it. The glass therefore has also so much the less colour, and comes the nearer to common glass.

The calx and the glass of antimony will recover their metalline form, like every other calx and glass of a metal, if reduced by restoring to them their lost phlogiston. Yet, if the calcination be carried too far, their reduction will become much more difficult, and a much smaller quantity of regulus will be resuscitated.

Regulus of antimony is capable of dissolving the metals; but its affinities with them are various, and differ according to the following order. It affects iron the most powerfully, next copper, then tin, lead, and silver. It promotes the fusion of metals, but makes them all brittle and unmalleable.

It will not amalgamate with mercury; and though, by certain processes, particularly the addition of water and continued trituration, a sort of union between these two sub-

stances may be produced, yet it is but apparent and momentary; for being left to themselves, and undisturbed, they quickly disunite and separate.

The vitriolic acid, assisted by heat, and even by distillation, dissolves regulus of antimony. The nitrous acid likewise attacks it; but the solution can by no art be made clear and limpid; so that the regulus is only calcined, in a manner, by this acid.

The marine acid dissolves it well enough; but then it must be exceedingly concentrated, and applied in a peculiar manner, and especially by distillation. One of the best methods of procuring a perfect union between the acid of sea-salt and regulus of antimony, is to pulverize the latter, mix it with corrosive sublimate, and distil the whole. There rises in the operation a white matter, thick, and scarce fluid, which is no other than the regulus of antimony united and combined with the acid of sea-salt. This compound is extremely corrosive, and is called *butter of antimony*.

It is plain, that the corrosive sublimate is here decomposed; that the mercury is revived; and that the acid which was combined therewith hath quitted it to join the regulus of antimony, with which its affinity is greater. This butter of antimony, by repeated distillations, acquires a considerable degree of fluidity and limpidness.

If the acid of nitre be mixed with butter of antimony, and the whole distilled, there rises an acid liquor, or a sort of *aqua regis*, which still retains some of the dissolved regulus, and is called *bezoardic spirit of nitre*. After the distillation there remains a white matter, from which fresh spirit of nitre is again abstracted, and which being then washed with water, is called *bezoar mineral*. This bezoar mineral is neither so volatile, nor so caustic, as butter of antimony; because the nitrous acid hath not the property of volatilizing metallic substances, as the marine acid does, and because it remains much more intimately combined with the reguline part.

If butter of antimony be mixed with water, the liquor immediately becomes turbid and milky, and a precipitate falls, which is nothing but the metallic matter partly separated from its acid, which is too much weakened by the addition of water to keep it dissolved. Yet this precipitate still retains a good deal of acid; for which reason it continues to be a violent emetic, and in some degree corrosive. It hath therefore been very improperly called *mercurius vitæ*.

The proper solvent of regulus of antimony is *aqua regis*; by means whereof a clear and limpid solution of this semi-metal may be obtained.

Regulus of antimony mixed with nitre, and projected into a red-hot crucible, sets the nitre in a flame, and makes it detonate. As it produces this effect by means of its phlogiston, it must needs, at the same time, be calcined, and lose its metallic properties, which accordingly happens: and when the nitre is in a triple proportion to the regulus, the latter is so perfectly calcined as to leave only a white powder, which is fused with great difficulty, and then turns to a faintly coloured glass, not very different from common glass, and which is not reducible to a regulus by the addition of inflammable matter; at least it yields but a very small quantity thereof. If less nitre

be used, the calx is not so white; the glass it produces is more like a metalline glass, and is more easily reduced. The calx of the regulus thus prepared by nitre is called, on account of the medicinal virtue ascribed to it, *diaphoretic antimony*, or *diaphoretic mineral*.

Nitre always becomes an alkali by deflagration, and in the present case retains part of the calx, which it even renders soluble in water. This calx may be separated from the alkali, if an acid be employed to precipitate it; and then it is called *materia perlata*. This pearly matter is a calx of antimony, so completely deprived of its phlogiston as to be altogether incapable of reduction to a regulus.

Regulus of antimony readily joins and unites with sulphur, forming therewith a compound which has a very faint metallic splendor. This compound appears like a mass of long needles adhering together laterally; and under this form it is usually found in the ore, or at least when only separated by fusion from the stones and earthy matters with which the ore is mixed. It is called *crude antimony*.

Antimony flows with a moderate heat, and becomes even more fluid than other metallic substances. The action of fire dissipates or consumes the sulphur it contains, and its phlogiston also, so as to convert it into a calx and a glass, as it does the regulus.

*Aqua regis*, which we observed to be the proper solvent of the regulus, being poured on antimony, attacks and dissolves the reguline part, but touches not the sulphur; in consequence whereof it decomposes the antimony, and separates its sulphur from its regulus.

There are several other ways of effecting this decomposition, and obtaining the reguline part of antimony by itself: They consist either in destroying the sulphureous part of the antimony by combustion, or in melting the antimony with some substance which has a greater affinity than its reguline part with sulphur. Most metals are very fit for this latter purpose: For though the regulus has a considerable affinity with sulphur, yet all the metals, except gold and mercury, have a greater.

If therefore iron, copper, lead, silver, or tin, be melted with antimony, the metal employed will unite with the sulphur, and separate it from the regulus.

It must be observed, that, as these metals have some affinity with the regulus of antimony, the regulus will be joined in the operation by some of the metal employed as a precipitant, (so those substances are called which serve as the means of separating two bodies from each other;) and therefore the regulus procured in this manner will not be absolutely pure: On this account care is taken to distinguish each by adding the name of the metal employed in its precipitation; and thence come these titles, *martial regulus of antimony*, or only *martial regulus*, *regulus veneris*; and so of the rest.

Antimony is employed with advantage to separate gold from all other metals with which it may be alloyed. It has been shewn, that all the metals have a greater affinity, than the reguline part of antimony, with sulphur, gold only excepted; which is incapable of contracting any union therewith: And therefore, if a mass compounded of gold and several other metals be melted with anti-

antimony, every thing in that mass which is not gold will unite with the sulphur of the antimony. This union occasions two separations, to wit, that of the sulphur of the antimony from its reguline part, and that of the gold from the metals with which it was adulterated; and from the whole two new compounds arise; namely, a combination of the metals with the sulphur, which being lightest rises to the surface in fusion; and a metalline mass formed of the gold and the reguline part of the antimony united together, which being much the heaviest sinks to the bottom. There is no difficulty in parting the gold from the regulus of antimony with which it is alloyed: For the metalline mass need only be exposed to a degree of fire capable of dissipating into vapours all the semi-metal it contains; which being very volatile, the operation is much easier, and more expeditiously finished, than if the metals with which the gold was debased were to be vitrified on the cupel; without taking into the account that if silver were one of them, recourse must needs be had to the process of quartation after that of the cupel.

If equal parts of nitre and antimony be mixed together, and the mixture exposed to the action of fire, a violent detonation ensues; the nitre deflagrating consumes the sulphur of the antimony, and even a part of its phlogiston. After the detonation there remains a greyish matter which contains fixed nitre, vitriolated tartar, and the reguline part of the antimony in some measure deprived of its phlogiston, and half vitrified by the action of the fire, which is considerably increased by the deflagration. This matter is called *liver of antimony*.

If instead of equal parts of nitre and antimony, two parts of the former be used to one of the latter, then the reguline part loses much more of its phlogiston, and remains in the form of a yellowish powder.

Again, if three parts of nitre be taken to one of antimony, the regulus is thereby entirely robbed of its phlogiston, and converted to a white calx which bears the name of *diaphoretic antimony*, or *diaphoretic mineral*. The pearly matter may be precipitated by pouring an acid on the saline substances which here remain after the detonation, in the same manner as we shewed above was to be done with regard to the regulus.

In the last two operations, where the nitre is in a double or triple proportion to the antimony, the reguline part is found after the detonation to be converted into a calx, and not into a half vitrified matter, which we have seen is the effect when equal parts only of nitre and antimony are used. The reason of this difference is, that in these two cases the reguline part, being wholly, or almost wholly, deprived of its phlogiston, becomes, as was observed, more difficult to fuse, and consequently cannot begin to vitrify in the same degree of heat as that which hath not lost so much of its phlogiston. If, instead of performing the operation with equal parts of nitre and antimony alone, a portion of some substance which abounds with phlogiston be added, in that case the sulphur only of the antimony will be consumed, and the regulus will remain united with its phlogiston, and separated from its sulphur.

The regulus prepared in this manner is absolutely pure, because no metalline substance being employed, none can mix with it and adulterate it. It is called *regulus of antimony per se*, or only *regulus of antimony*.

It is true indeed, that in this operation, much of the reguline part unavoidably loses its phlogiston and is calcined, and consequently a much smaller quantity of regulus is obtained than when metalline precipitants are employed: But this loss is easily repaired, if it be thought proper, by restoring to the calcined part its lost phlogiston.

Antimony melted with two parts of fixed alkali yields no regulus, but is entirely dissolved by the salt, and forms with it a mass of a reddish yellow colour.

The reason why no precipitate is produced on this occasion is, that the alkali uniting with the sulphur of the antimony forms therewith the combination called *liver of sulphur*, which by its nature is qualified to keep the reguline part dissolved. This mass, formed by the union of the antimony with the alkali, is soluble in water. If any acid whatever be dropt into this solution, there falls a precipitate of a reddish yellow colour; because the acid unites with the alkali, and forces it to quit the matters with which it is combined. This precipitate is called *golden sulphur of antimony*.

As in the operation for preparing regulus of antimony *per se*, some of the nitre is, by the inflammable matters added thereto, turned to an alkali; this alkali seizes on part of the antimony, and therewith forms a compound like that just described. Hence it comes, that if the scoria formed in this process be dissolved in water, and an acid dropped into the solution, a true golden sulphur of antimony is thereby separated.

This union of antimony with an alkali may also be brought about by the humid way; that is, by making use of an alkali resolved into a liquor, and boiling the mineral in it. The alkaline liquor, in proportion as it acts upon the antimony, gradually becomes reddish and turbid. If left to settle and cool, when well saturated therewith, it gradually deposits the antimony it had taken up, which precipitates in the form of a red powder: And this precipitate is the celebrated remedy known by the name of *kermes mineral*. It is plain, that the kermes is nearly the same thing with the golden sulphur: Yet it differs from it in some respects; and especially in this, that being taken inwardly it operates much more gently than the golden sulphur, which is a violent emetic. Nitre, fixed by charcoal, and resolved into a liquor, is the only alkali employed in preparing the kermes.

It was shewn above, that regulus of antimony, mixed and distilled with corrosive sublimate, decomposes it, disengages the mercury, and joining itself to the marine acid forms therewith a new combination, called *butter of antimony*. If the same operation be performed with crude antimony instead of its regulus, the same effects are produced; but then the antimony itself is also decomposed; that is, the reguline part is separated from the sulphur, which being set free unites with the mercury, now also at liberty, and these two together form a true cinabar, called *cinabar of antimony*.

*Of BISMUTH.*

BISMUTH, known also by the name *tin-glass*, is a semi-metal, having almost the same appearance as regulus of antimony; yet it has a more dusky cast, inclining somewhat to red, and even presents some changeable streaks, especially after lying long in the air.

When exposed to the fire it melts long before it is red, and consequently with less heat than regulus of antimony, which does not flow, as was shewn above, till it begin to be red hot. It becomes volatile, like all the other semi-metals, when acted on by a violent fire: Being kept in fusion by a proper degree of heat it loses its phlogiston with its metallic form, and turns to powder or a calx; and that again is converted into glass by the continued action of fire. The calx and glass of bismuth may be reduced, like any other metallic calx, by restoring their phlogiston.

Bismuth mixes with all the metals in fusion, and even facilitates the fusion of such as do not otherwise flow readily. It whitens them by its union, and destroys their malleability.

It amalgamates with mercury, if they be rubbed together with the addition of water: Yet after some time these two metalline substances desert each other, and the bismuth appears again in the form of a powder. Hence it is plain that the union it contracts with mercury is not perfect; and yet it has the singular property of attenuating lead, and altering it in such a manner that it afterwards amalgamates with mercury much more perfectly, so as even to pass with it through shamoy leather without any separation. The bismuth employed in making this amalgama afterwards separates from it spontaneously, as usual; but the lead still continues united with the mercury, and always retains the property thus acquired.

The vitriolic acid does not dissolve bismuth: Its proper solvent is the nitrous acid, which dissolves it with violence, and abundance of fumes.

Bismuth dissolved in the nitrous acid is precipitated not only by alkalis, but even by the bare addition of water. This precipitate is extremely white, and known by the name of *magistery of bismuth*.

The acid of sea-salt and *aqua regis* likewise act upon bismuth, but with less violence.

This semi-metal does not sensibly defflagrate with nitre: yet it is quickly deprived of its phlogiston, and turned into a vitrifiable calx, when exposed with it to the action of fire.

It readily unites with sulphur in fusion, and forms therewith a compound which appears to consist of needles adhering laterally to each other.

It may be separated from the sulphur with which it is combined, by only exposing it to the fire, without any additament; for the sulphur is either consumed or sublimed, and leaves the bismuth behind.

*Of ZINC.*

ZINC to appearance differs but little from bismuth, and has even been confounded with it by several authors. Nevertheless, besides that it has something of a bluish cast, and is harder than bismuth, it differs from it essentially in its properties, as will presently be shewn.

These two metallic substances scarce resemble each other in any thing, but the qualities common to all semi-metals.

Zinc melts the moment it grows red in the fire, and then also begins to turn to a calx, which, like any other metallic calx, may be reduced by means of the phlogiston: But if the fire be considerably increased, it sublims, flames, and burns like an oily matter; which is a proof of the great quantity of phlogiston in its composition. At the same time abundance of flowers rise from it in the form of white flakes, flying about in the air like very light bodies; and into this form may the whole substance of the zinc be converted. Several names have been given to these flowers, such as *pompholix*, *philosophic wool*. They are supposed to be no other than the zinc itself deprived of its phlogiston; yet no body has hitherto been able to resuscitate them in the form of zinc, by restoring their phlogiston according to the methods used in the reduction of metals. Though they rise in the air with very great ease while the zinc is calcining, yet when once formed they are very fixed; for they withstand the utmost violence of fire, and are capable of being vitrified, especially if joined with a fixed alkali. They are soluble in acids.

Zinc unites with all metalline substances, except bismuth. It has this singular property, that being mixed with copper, even in a considerable quantity, such as a fourth part, it does not greatly lessen the ductility thereof, and at the same time communicates to it a very beautiful colour not unlike that of gold: On which account the composition is frequently made, and produces what is called *brass*. This metal melts much more easily than copper alone, because of the zinc with which it is alloyed. If it be exposed to a great degree of heat, the zinc which it contains takes fire, and sublims in white flowers, just as when it is pure.

It is to be observed, that brass is ductile only while it is cold, and not then unless the zinc used in making it was very pure; otherwise the composition will prove but *tombac*, or *prince's metal*, having very little malleability.

Zinc is very volatile, and carries off with it any metallic substance with which it is fused, making a kind of sublimate thereof. In the furnaces where they smelt ores containing zinc, the matter thus sublimed is called *cadmia fornacum*, to distinguish it from the native *cadmia* called also *calamine*, or *lapis calaminaris*; which, properly speaking, is an ore of zinc, containing a great deal of that semi-metal, together with some iron, and a stony substance. The name of *cadmia fornacum* is not appropriated solely to the metallic sublimate procured by means of zinc, but is given in general to all the metallic sublimate found in smelting-houses.

If a violent and sudden heat be applied to zinc, it sublims in its metalline form; there not being time for it to burn and be resolved into flowers.

This semi-metal is soluble in all the acids, but especially in spirit of nitre, which attacks and dissolves it with very great violence.

Zinc has a greater affinity than iron or copper with the vitriolic acid; and therefore it decomposes the green and blue vitriols, precipitating these two metals by

by uniting with the vitriolic acid, with which it forms a metallic salt or vitriol called *white vitriol*, or *vitriol of zinc*.

Nitre mixed with zinc, and projected into a red hot crucible, detonates with violence; and during the detonation there arises a great quantity of white flowers, like those which appear when it is declined by itself.

Sulphur has no power over zinc. Even liver of sulphur, which dissolves all other metallic substances, contracts no union with this semi-metal.

#### Of REGULUS of ARSENIC.

REGULUS of arsenic is the most volatile of all the semi-metals. A very moderate heat makes it wholly evaporate, and fly off in fumes; on which account it cannot be brought to fusion, nor can any considerable masses thereof be obtained. It has a metallic colour, somewhat resembling lead; but soon loses its splendor when exposed to the air.

It unites readily enough with metallic substances, having the same affinities with them as regulus of antimony hath. It makes them brittle, and unmanageable. It hath also the property of rendering them volatile, and greatly facilitates their scorification.

It very easily parts with its phlogiston and metallic form. When exposed to the fire it rises in a kind of shining crystalline calx, which on that account looks more like a saline matter than a metallic calx. To this calx or these flowers are given the names of *white arsenic*, *crystalline arsenic*, and most commonly plain *arsenic*.

Arsenic differs from every other metalline calx, first, in being volatile; whereas the calxes of all other metallic substances, not excepting those of the most volatile semi-metals, such as regulus of antimony and zinc, are exceedingly fixed; and secondly, in having a saline character, which is not found in any other metalline calx.

The saline character of arsenic appears, first, from its being soluble in water; secondly, from its corrosive quality, which makes it one of the most violent poisons: a quality from which the other metallic substances are free, when they are not combined with some saline matter. Regulus of antimony must however be excepted: but then the best chemists agree, that this semi-metal is either nearly of the same nature with arsenic, or contains a portion thereof in its composition: besides, its noxious qualities never discover themselves so plainly as when it is combined with some acid. Lastly, arsenic acts just like the vitriolic acid upon nitre; that is, it decomposes that neutral salt, by expelling its acid from its alkaline basis, of which it takes possession, and therewith forms a new saline compound.

This combination is a species of salt that is perfectly neutral. When the operation is performed in a close vessel, the salt shoots into crystals in the form of right-angled quadrangular prisms, terminated at each extremity by pyramids that are also quadrangular and right-angled; some of which, however, instead of ending in a point, are obtruse as if truncated. The consequence is different when the operation is performed in an open vessel; for

then nothing is obtained but an alkaline salt impregnated with arsenic, which cannot be crystallized.

The cause of this different effect is this: When the arsenic is once engaged in the alkaline basis of the nitre, it can never be separated from it by the utmost force of fire, so long as it is kept in a close vessel; whereas, if you expose it to the fire without that precaution, it readily separates from it.

This salt possesses many singular properties, the chief of which are these: First, it cannot be decomposed by the intervention of any acid, even the strongest acid of vitriol; and this, joined to its property of expelling the nitrous acid from its basis, shews that it has a very great affinity with fixed alkalis.

Secondly, this very salt, on which pure acids have no effect, is decomposed with the greatest ease by acids united with metallic substances. The reason of this phenomenon is curious, and furnishes us with an instance of what we advanced concerning double affinities.

If to a solution of any metallic substance whatever, made by any acid whatever, (except that of mercury by the marine acid, and that of gold by *aqua regis*,) a certain quantity of this salt dissolved in water be added, the metallic substance is instantaneously separated from the acid in which it was dissolved, and falls to the bottom of the liquor.

All metallic precipitates obtained in this manner are found to be a combination of the metal with arsenic; whence it necessarily follows that the neutral salt is by this means decomposed, its arsenical part uniting with the metallic substance, and its alkaline basis with the acid in which that substance was dissolved.

The affinities of these several bodies must be considered as operating on this occasion in the following manner: The acids which tend to decompose the neutral salt of arsenic, by virtue of their affinity with its alkaline basis, are not able to accomplish it, because this affinity is powerfully counteracted by that which the arsenic has with the same alkaline basis, and which is equal or even superior to theirs. But if these acids happen to be united with a substance which naturally has a very great affinity with the arsenical part of the neutral salt, then, the two parts of which this salt consists, being drawn different ways by two several affinities, tending to separate them from each other, the salt will undergo a decomposition, which could not have been effected without the help of this second affinity. Now, as metallic substances have a great affinity with arsenic, it is not surprising that the neutral salt of arsenic, which cannot be decomposed by a pure acid, should nevertheless yield to an acid combined with a metal. The decomposition of this salt, therefore, and the precipitation which of course it produces in metallic solutions, are brought about by the means of a double affinity; namely, that of the acid with the alkaline basis of the neutral salt, and that of the metal with the arsenical part of that salt.

Arsenic has not the same effect on sea-salt as on nitre, and cannot expel its acid: a very singular phenomenon, for which it is hard to assign a reason; for the nitrous acid

acid is known to have a greater affinity than the marine acid with alkalis, and even with the basis of sea-salt itself.

Yet arsenic may be combined with the basis of sea-salt, and a neutral salt thereby obtained, like that which results from the decomposition of nitre by arsenic: but for that purpose a quadrangular nitre must be first prepared, and arsenic applied thereto as to common nitre.

The salt produced by uniting arsenic with the basis of sea-salt very much resembles the neutral salt of arsenic above treated of, as well in the figure of its crystals as in its several properties.

Arsenic presents another singular phenomenon, both with the alkali of nitre and with that of sea-salt; which is, that if it be combined with these salts in a fluid state, it forms with them a saline compound, quite different from the neutral salts of arsenic which results from the decomposition of nitrous salts.

This saline compound, called *liver of arsenic*, takes up a much greater quantity of arsenic than is necessary for the perfect saturation of the alkali. It has the appearance of a glue, which is so much the thicker the more arsenic it contains. Its smell is disagreeable; it attracts the moisture of the air, and does not crystallize; it is easily decomposed by any acid whatever, which precipitates the arsenic and unites with the alkali. Lastly, the effects it produces on metallic solutions are different from those of our neutral arsenical salts.

Arsenic is easily reduced to a regulus. It need only be mixed with any matter containing the phlogiston, and by the help of a moderate heat a true regulus will sublime. This regulus is very volatile, and calcines with the greatest ease; which is the reason why it cannot be obtained but in small quantities; and also why, in order to obtain masses of it, some have thought of adding thereto some metal with which it has a great affinity, such as copper or iron; because, by joining with the metal, it is partly fixed and restrained from flying off. But it is plain the regulus obtained by this means is not pure, as it must partake considerably of the metal employed.

Arsenic readily unites with sulphur, and rises with it in a yellow compound called *orpiment*.

Sulphur cannot be separated from arsenic but by the intervention of two bodies only; to wit, a fixed alkali and mercury.

The property which mercury possesses of separating sulphur from arsenic is founded on this, that these two metallic substances are incapable of contracting any union; whereas, though most of the other metals and semi-metals have a greater affinity with sulphur than mercury hath, nevertheless they are all unable to decompose orpiment; because some of them have as great an affinity with arsenic as with sulphur; others have no affinity with either; and lastly, sulphur hath as great an affinity with arsenic as with any of them.

It must be observed, that, if fixed alkalis be employed to purify arsenic in this manner, no more must be used than is necessary to absorb the sulphur or the phlogiston, of which also it is their nature to deprive arsenic; for otherwise, as it has been shewn that arsenic readily unites

with alkalis, they would absorb a considerable quantity thereof.

### Of OIL in general.

OIL is an unctuous body, which burns and consumes with flame and smoke, and is not soluble in water. It consists of the phlogiston united with water by means of an acid. There is, moreover, in its composition a certain proportion of earth, more or less according to each several sort of oil.

The inflammability of oil evidently proves that it contains the phlogiston. That an acid is one of its constituent principles many experiments demonstrate, of which these are the chief: If certain oils be long triturated with an alkaline salt, and the alkali afterwards dissolved in water, crystals of a true neutral salt will be produced: some metals, and particularly copper, are corroded and rusted by oils, just as they are by acids: again, acid crystals are found in some oils that have been long kept. This acid in oil serves undoubtedly to unite its phlogiston with its water; because these two substances having no affinity with each other cannot be united without the intervention of such a medium as an acid, which has an affinity with both. As to the existence of water in oils, it appears plainly when they are decomposed by repeated distillations, especially after mixing them with absorbent earths. Lastly, when an oil is destroyed by burning, a certain quantity of earth is constantly left behind.

Oils exposed to the fire in close vessels pass over almost wholly from the containing vessel into any other applied to receive them. There remains, however, a small quantity of black matter, which is extremely fixed, and continues unalterable as long as it has no communication with the external air, be the force of the fire ever so violent. This matter is no other than part of the phlogiston of the oil united with its most fixed and grossest earth; and this is what we called *charcoal*, or plainly a *coal*.

### Of CHARCOAL.

WHEN oil happens to be united to much earth, as it is in vegetable and animal bodies, it leaves a considerable quantity of *coal* or charred matter.

This coal, exposed to the fire in the open air, burns and wastes, but without blazing like other combustible matters: there appears only a small bluish flame, but not the least smoke. Most commonly it only glows and sparkles, and so gradually falls into ashes, which are nothing but the earth of the body combined with an alkaline salt in burning. This alkaline salt may be separated from the earth, by lixiviating the ashes with water, which dissolves all the salt, and leaves the earth quite pure.

Charcoal is unalterable and indestructible by any other body but fire; whence it follows, that when it is not actually kindled and ignited, the most powerful agents, such as the acids, though ever so strong and concentrated, have not the least effect on it.

The case is otherwise when it is lighted, that is, when its phlogiston begins to separate from its earth; for then the pure acid of vitriol being joined therewith contracts

an instantaneous union with its phlogiston, and evaporates in a volatile sulphureous spirit. If the vitriolic acid, instead of being applied quite pure, be first clogged with some basis, especially an alkaline one, it quits that basis, enters into a more intimate union with the phlogiston of the burning coal, and so forms an actual sulphur, with which the alkali now unites and forms a hepar.

The pure acid sea-salt hath not been observed to act in the least upon charcoal, especially when it is not on fire. But when this acid is incorporated with an alkaline or metallic basis, and combined according to a peculiar process with burning charcoal, it in like manner quits its basis, unites with the phlogiston, and therewith forms a phosphorus.

Nor has the pure nitrous acid any effect on a charred coal, even when ignited: and so far is it from being able to kindle a cold one, that when poured on a live one, it extinguishes it like water. But when this acid is united with a basis, it quits it rapidly as soon as it touches a burning coal, and rushes violently into an union with the phlogiston thereof. From this union there probably arises, as we said before, a kind of sulphur or phosphorus, which is so inflammable as to be destroyed by the fire the very moment it is generated.

The acids of nitre and vitriol act upon oils; but very differently, according to the quantity of phlegm they contain. If they be awakened with much water, they have no effect at all upon oils: if they contain little water, or be dephlegmated to a certain degree, they dissolve them with heat, and with them form compounds of a thick consistence. Acids thus combined in a considerable proportion with oils render them soluble in water.

#### Of SOAP.

ALKALIS also have the same property. When an oil is combined with an acid, or an alkali, in such a manner that the compound resulting from their union is soluble in water; such a compound may in general be called *soap*. Soap itself hath the property of rendering fat bodies in some measure soluble in water; on which account it is very useful for scouring or cleansing any thing greasy.

Oily and saline substances, combined together, observe the same general rules as all other combinations; that is, they mutually communicate the properties belonging to each: thus oils, which naturally are not soluble in water, acquire by their union with saline matters the property of dissolving therein; and salts lose by their conjunction with oils part of their natural tendency to incorporate with water; so that while they serve to constitute soap, they do not, as before, attract the moisture of the air, &c. and in like manner, as they are not inflammable, they considerably lessen the inflammability of the oils combined with them.

Acid soaps are decomposed by alkalis, as alkaline soaps are by acids, according to the general rules of affinities.

The acids of nitre and vitriol, when highly concentrated, dissolve oils with such violence as to heat them, make them black, burn them, and even set them on fire. How sea-salt affects oils is not yet sufficiently ascertained.

All oils have the property of dissolving sulphur; which

is not at all surprising, seeing each of its component principles hath an affinity with oil.

It is also a property common to all oils to become more fluid, subtile, light, and limpid, the oftener they are distilled. On the contrary, by being incorporated with saline substances they acquire a greater consistence, and sometimes form compounds that are almost solid.

#### Of the several sorts of OILS.

OILS are distinguished by the substances from which they are drawn: and as oils are extracted from minerals, from vegetables, and from animals, there are of course mineral, vegetable, and animal oils.

#### Of MINERAL OILS.

IN the bowels of the earth we find but one sort of oil, called *petroleum*: Its smell is strong, and not disagreeable, and its colour sometimes more, sometimes less yellow. There are certain mineral substances which yield by distillation a great deal of oil very like petroleum. This sort of substance is called a *bitumen*, and is, indeed, nothing but an oil rendered consistent and solid by being combined with an acid; as appears from hence that, by uniting petroleum with the acid of vitriol, we can produce an artificial bitumen very like the native.

#### Of VEGETABLE OILS.

VEGETABLE substances yield a very great quantity and variety of oils; for there is not a plant, or part of a plant, that does not contain one or more sorts thereof, generally peculiar to itself, and different from all others.

By expression only, that is, by bruising and squeezing vegetable substances, particularly certain fruits and seeds, a sort of oil is obtained which has scarce any smell or taste. Oils of this sort are very mild and unctuous; and, because in this respect they resemble animal fat more than the rest do; they are called *fat oils*.

These oils, being exposed to the air for some time, sooner or later grow thick, acquire an acrid taste, and a strong disagreeable smell. Some of them congeal with the smallest degree of cold. This sort of oil is well adapted to dissolve those preparations of lead called *litharge* and *minium*, with which they form a thick tenacious substance, that is used for the basis of almost all plaisters. They also dissolve lead in its metalline form, but not so easily as the sorts of calx above-mentioned; probably because its body is not so much opened, nor its parts so divided.

By expression alone we also procure from certain vegetable substances another sort of oil, which is thin, limpid, volatile, of a pungent taste, and retains the smell of the vegetable that yielded it; on which account it is called an *essential oil*. Of this there are several sorts, differing from one another, like the fat oils, according to the subjects from which they are obtained.

We must observe, that it is very difficult, or rather in most cases impossible, to force from the greatest part of vegetables, by expression only, all the essential oil they contain.

contain. For this purpose, therefore, recourse must be had to fire: a gentle heat, not exceeding that of boiling water, will extract all the essential oils of a vegetable; and this is the most usual and most convenient way of procuring them.

The fat oils cannot be obtained by the same method: these being much less volatile than the essential oils, require a much greater degree of heat to raise them; which, nevertheless, they cannot bear without being much spoiled; and entirely changed in their nature, as shall presently be shewn. All oils, therefore, which rise with the heat of boiling water, and such alone, should be called essential oils.

Essential oils, in a longer or shorter time, according to the nature of each, lose the fragrant smell they had when newly distilled, and acquire another which is strong, rancid, and much less agreeable: They also lose their tenuity, becoming thick and viscid; and in this state they greatly resemble those substances abounding in oil which flow from certain trees, and which are called *balsams* or *resins*, according as they are less or more consistent.

Balsams and resins are not soluble in water. But there are other oily compounds which likewise run from trees; and, though not unlike resins, are however soluble in water. These are called *gums*; and their property of dissolving in water arises from their containing more water and more salt than resins have; or at least their saline parts are less clogged and more disengaged.

Balsams and resins distilled with the heat of boiling water yield great quantities of a limpid, subtile, odoriferous, and, in one word, essential oil. In the still there remains a substance thicker and more consistent than the balsam or resin was before distillation. The same thing happens to essential oils which by length of time have acquired a consistence, and are grown resinous. If they be redistilled, they recover their former tenuity, leaving behind them a remainder thicker and more resinous than they themselves were. This second distillation is called the *rectification* of an oil.

It must be observed, that an essential oil, combined with an acid strong enough to dissolve it, immediately becomes as thick and resinous, in consequence of this union, as if it had been long exposed to the air: which proves the consistence an oil acquires by long keeping to be owing to this, that its lightest and less acid parts being evaporated, the proportion of its acid to the remainder is so increased, that it produces therein the same change as an additional acid mixed with the oil would have wrought before the evaporation.

This also shews us, that balsams and resins are only essential oils combined with a great proportion of acid, and thereby thickened.

If vegetable substances, from which no more essential oil can be drawn by the heat of boiling water, be exposed to a stronger heat, they yield an additional quantity of oil; but it is thicker and heavier than the essential oil. These oils are black, and have a very disagreeable burnt smell which hath made them be called *fetid*, or *empyreumatic* oils. They are moreover very acrid.

It must be observed, that if a vegetable substance be exposed to a degree of heat greater than that of boiling

water, before the fat or the essential oil is extracted from it, an empyreumatic oil only will then be obtained; because both the fat and essential oils, when exposed to the force of fire, are thereby burnt, rendered acrid, acquire a smell of the fire, and, in a word, become truly empyreumatic. There is ground to think, that an empyreumatic oil is nothing else but an essential or fat oil burnt and spoiled by the fire, and that no other oil besides these two exists naturally in vegetables.

Empyreumatic oils, distilled and rectified several times by a gentle heat, acquire by every distillation a greater degree of tenuity, lightness, and limpidity. By this means also they lose something of their disagreeable odour; so that they gradually come nearer and nearer to the nature of essential oils: and if the rectifications be often enough repeated, ten or twelve times for instance, they become perfectly like those oils: except that their smell will never be so agreeable, nor like that of the substances from which they were obtained.

Fat oils may also be brought by the same means to resemble essential oils: but neither essential nor empyreumatic oils are capable of acquiring the properties of fat oils.

#### Of ANIMAL OILS.

DISTILLATION procures us considerable quantities of oil from all the parts of animal bodies, and especially from their fat. This oil at first is not very fluid, and is extremely fetid; but by many rectifications it gradually acquires a great degree of clearness and tenuity, and at the same time loses much of its disagreeable odour.

#### Of FERMENTATION in general.

By fermentation is meant an intestine motion, which, arising spontaneously among the insensible parts of a body, produces a new disposition and a different combination of those parts.

To excite a fermentation in a mixt body, it is necessary, first, that there be in the composition of that mixt a certain proportion of watery, saline, oily, and earthy parts; but this proportion is not yet sufficiently ascertained. Secondly, it is requisite that the body to be fermented be placed in a certain degree of temperate heat; for much cold obstructs fermentation, and too much heat decomposes bodies. Lastly, the concurrence of the air is also necessary to fermentation.

All vegetable and animal substances are susceptible of fermentation, because all of them contain in a due proportion the principles above specified. However, many of them want the proper quantity of water, and cannot ferment while they remain in such a state of driness. But it is easy to supply that defect.

With respect to minerals properly so called, they are not subject to any fermentation, at least that our senses can perceive.

There are three sorts of fermentation, distinguished from one another by their several productions. The first produces wines and spiritous liquors; for which reason it is called the *winous* or *spiritous fermentation*: The result of the second is an acid liquor; and therefore it is called

called the *acetous fermentation*: and the third generates an alkaline salt; which, however, differs from the alkaline salts hitherto treated of, in this respect chiefly, that, instead of being fixed, it is extremely volatile: This last sort takes the name of the *putrid* or *putrefactive fermentation*. We shall now consider these three sorts of fermentation and their effects a little more particularly.

These three sorts of fermentation may take place successively in the same subject; which proves them to be only three different degrees of fermentation, all proceeding from one and the same cause. These degrees of fermentation always follow the order in which we have here placed them.

### *Of the SPIRITUOUS, or VINOUS FERMENTATION.*

THE juices of almost all fruits, all saccharine vegetable matters, all farinaceous seeds and grains of every kind, being diluted with a sufficient quantity of water, are proper subjects of spirituous fermentation. If such liquors be exposed, in vessels slightly stopped, to a moderate degree of heat, they begin in some time to grow turbid; there arises insensibly a small commotion among their parts, attended with a hissing noise; this by little and little increases, till the grosser parts appear, like little seeds or grains, moving to and fro, agitated among themselves, and thrown up to the surface. At the same time some air-bubbles rise, and the liquor acquires a pungent, penetrating smell, occasioned by the very subtile vapours which exhale from it.

These vapours have never yet been collected, in order to examine their nature; and they are known only by their noxious effects. They are so actively pernicious, that if a man comes rashly into a close place, where large quantities of liquors are fermenting, he suddenly drops down and expires, as if he were knocked on the head.

When these several phenomena begin to go off, it is proper to stop the fermentation, if a very spirituous liquor be required: for if it be suffered to continue longer, the liquor will become acid, and from thence proceed to its last stage, that is, to putrefaction. This is done by stopping the containing vessels very close, and removing them into a cooler place. Then the impurities precipitate, and settling at the bottom leave the liquor clear and transparent: And now the palate discovers that the sweet saccharine taste it had before fermentation is changed to an agreeable pungency which is not acid.

Liquors thus fermented are in general called *wines*: For though in common life that word properly signifies the fermented juice of grapes only, and particular names are given to the fermented juices of other vegetable substances, as that obtained from apples, is called *cyder*; that made from malt is called *beer*; yet in chemistry it is of use to have one general term denoting every liquor that has undergone this first degree of fermentation.

By distillation we draw from wine an inflammable liquor, of a yellowish white colour, light, and of a penetrating pleasant smell. This liquor is the truly spirituous part of the wine, and the product of fermentation. That which comes off in the first distillation is commonly

loaded with much phlegm and some oily parts, from which it may be afterwards freed. In this state it goes by the name of *brandy*; but, when freed from these heterogeneous matters by repeated distillations, it becomes still clearer, lighter, more fragrant, and much more inflammable, and then is called *spirit of wine*, and *rectified spirit of wine*, or *ardent spirits*, if considerably purified. The properties which distinguish an ardent spirit from all other substances are, its being inflammable; its burning and consuming entirely, without the least appearance of smoke or fuliginosity; its containing no particles reducible to a coal, and its being perfectly miscible with water. Ardent spirits are lighter and more volatile than any of the principles of the mixtures from which they were produced, and consequently more so than the phlegm, the acid, and the oil of which they themselves consist. This arises from a particular disposition of these principles, which are in a singular manner attenuated by fermentation, and thereby rendered more susceptible of expansion and rarefaction.

Ardent spirits are supposed to be the natural solvents of oils and oily matters. But it is very remarkable, that they dissolve essential oils only, without touching the fat of animals, or the fat oils obtained from vegetables by expression; yet when these oils have once undergone the action of fire, they become soluble in spirit of wine, and even acquire a new degree of solubility every time they are distilled. It is not so with essential oils, which can never be rendered more soluble in ardent spirits than they are at first; and are so far from acquiring a new degree of solubility every time they are distilled, that on the contrary they even in some measure lose that property by repeated rectifications.

Spirit of wine doth not dissolve fixed alkalis; or at least it takes up but a very small quantity thereof; and hence ardent spirits may be freed from much of their phlegm by means of these salts thoroughly dried: For as they strongly imbibe moisture, and have even a greater affinity than ardent spirits with water, if a fixed alkali well exsiccated be mixed with spirit of wine that is not perfectly dephlegmated, the alkali immediately attracts its superfluous moisture, and is thereby resolved into a liquor, which on account of its gravity descends to the bottom of the vessel. The spirit of wine which swims a-top, is by this means as much dephlegmated, and as dry, as if it had been rectified by several distillations. As it takes up some alkaline particles in this operation, it is thereby qualified to dissolve oily matters with the greater facility. When rectified in this manner, it is called *tartarified spirit of wine*.

Yet spirit of wine, even when rectified to an alcohol, is not capable of dissolving all oily matters. Those named gums will by no means enter into any sort of union therewith; but it readily dissolves most of those which are known by the appellation of resins. When it has dissolved a certain proportion of resinous particles, it acquires a greater consistence, and forms what is called a *spirit varnish*, or a *drying varnish*, because it soon dries. This varnish is subject to be damaged by water. Many sorts thereof are prepared, different from each other according to the different resins employed, or the proportions

tions in which they are used. Most of these varnishes are transparent and colourless.

Such bitumens or resins as spirit of wine will not touch are dissolved in oils by means of fire, and then form another kind of varnish which water does not hurt. These varnishes are usually coloured, and require much longer time to dry than the spirit-varnishes: They are called *oil-varnishes*.

Spirit of wine hath a much greater affinity with water than with oily matters; and therefore if a solution of any oil or resin in spirit of wine be mixed with water, the liquor immediately grows turbid, and acquires a whitish milky colour, owing entirely to the oily parts being separated from the spirituous menstruum by the accession of water, and too finely divided to appear in their natural form. But if the liquor stands some time quiet, several of these particles unite together, and gradually acquire a bulk sufficient to render them very perceptible to the eye.

Acids have an affinity with spirit of wine, and may be combined with it. By this union they lose most of their acidity, and on that account are said to be *dulcified*.

One part of highly concentrated oil of vitriol being mixed with four parts of well dephlegmated spirit of wine, there arises immediately a considerable ebullition and effervescence, attended with great heat, and abundance of vapours, which smell pleasantly, but are hurtful to the lungs. At the same time is heard a hissing like that produced by a piece of red-hot iron plunged in water. Indeed it is proper to mix the liquors very gradually; for otherwise the vessels in which the operation is performed will be in great danger of breaking.

If two liquors thus mixed be distilled with a very gentle heat, there rises first a spirit of wine of a most penetrating and grateful odour: When about half thereof is come over, what follows has a quicker and more sulphureous smell, and is also more loaded with phlegm. When the liquor begins to boil a little, there comes off a phlegm which smells very strong of sulphur, and grows gradually more acid. On this phlegm floats a small quantity of a very light and very limpid oil. In the still there remains a thick, blackish substance, somewhat like a resin or bitumen. From this substance may be separated a good deal of a vitriolic but sulphureous acid. When that is extracted, there remains a black mass like a charred coal, which, being put into a crucible, and exposed to a violent heat, leaves a small portion of earth, very fixed, and even vitrifiable.

By rectifying the ardent spirit, which came over in distilling the above-mentioned mixture, a very singular liquor is obtained, which differs essentially both from oils and from ardent spirits, though in certain respects it resembles them both. This liquor is known in chemistry by the name of *æther*, and its chief properties are as follows.

Æther is lighter, more volatile, and more inflammable, than the most highly rectified spirit of wine. It quickly flies off when exposed to the air, and suddenly catches fire when any flame approaches it. It burns like spirit of wine without the least smoke, and consumes entirely without leaving the smallest appearance of a coal or

of ashes. It dissolves oils and oily matters with great ease and rapidity. These properties it has in common with an ardent spirit. But it resembles an oil, in that it is not miscible with water; and this makes it essentially different from spirit of wine, the nature of which is to be miscible with all aqueous liquors.

Another very singular property of æther is its great affinity with gold, exceeding even that of *aqua regis*. It does not indeed dissolve gold when in a mass, and in its metalline form: But if a small quantity of æther be added to a solution of gold in *aqua regis*, and the whole shaken together, the gold separates from the *aqua regis*, joins the æther, and remains dissolved therein.

The reason of all the phenomena above-mentioned, resulting from the mixture of spirit of wine with oil of vitriol, is founded on the great affinity between this acid and water. For if the vitriolic acid be weak, and as it were over-dosed with watery parts, neither oil nor æther can be obtained by means thereof: But when highly concentrated, it attracts the aqueous parts very powerfully; and therefore being mixed with spirit of wine, lays hold of most of the water contained in it, and even robs it of some portion of that which is essential to its nature, and necessary to constitute it spirit of wine: Whence it comes to pass, that a certain quantity of the oily particles in its composition being separated from the watery particles, and so brought nearer to each other, they unite and assume their natural form; and thus the oil that swims at top of the sulphureous phlegm is produced.

The vitriolic acid moreover thickens and even burns some of this oil; and hence comes the bituminous residuum left at the bottom of the still, which looks like the result of a vitriolic acid combined with common oil. Lastly, the vitriolic acid becomes sulphureous, as it always doth when united with oily matters, and also very aqueous, on account of the quantity of phlegm which it attracts from the spirit of wine.

Æther may be considered as a spirit of wine exceedingly dephlegmated, even to such a degree that its nature is thereby changed; so that the few aqueous particles left in it are not sufficient to dissolve the oily particles and keep them asunder; which therefore being now much nearer to one another than in common spirit of wine, the liquor hath lost its property of being miscible with water.

Spirit of nitre, well dephlegmated, and combined with spirit of wine, presents likewise some very singular appearances.

First, in the very instant of its mixture with spirit of wine, it produces a greater and more violent effervescence than the vitriolic acid occasions.

Secondly, this mixture, without the help of distillation, and only by stopping the bottle in which the liquors are contained, affords a sort of æther, produced probably by the vapours which ascend from, and swim atop of the mixture.

Thirdly, some authors pretend, that by distilling the mixture under consideration an oil is obtained greatly resembling that which rises from spirit of wine combined with vitriolic acid.

Fourthly, the two liquors we are speaking of, being intimately

intimately mixed by distillation, form a liquor slightly acid, used in medicine, and known by the name of *sweet* or *dulcified spirit of nitre*: a very proper name, seeing the nitrous acid, by uniting with the spirit of wine, actually loses almost all its acidity and corrosive quality.

Fifthly, when the distillation is finished, there remains in the bottom of the vessel a thick, blackish substance, nearly resembling that which is found after distilling oil of vitriol and spirit of wine.

Spirit of salt hath likewise been combined with spirit of wine; but it does not unite therewith so easily or so intimately as the two acids above mentioned. To mix them thoroughly, the spirit of salt must be highly concentrated, and smoking; and moreover the assistance of the still must be called in. Some authors pretend, that from this mixture also a small quantity of oil may be obtained; which probably happens when the liquors have the qualities above specified. The marine acid likewise, by uniting with spirit of wine, loses most of its acidity; on which account it is in like manner called *sweet* or *dulcified spirit of salt*. A thick residuum is also found here after distillation.

#### Of the ACETOUS FERMENTATION.

BESIDES an ardent spirit, wine affords a great deal of water, oil, earth, and a sort of acid which shall be considered presently. When the spirituous part is separated from these other matters, they undergo no further change. But if all the constituent parts of wine remain combined together, then, after some time, shorter or longer as the degree of heat in which the wine stands is greater or less, the fermentation begins afresh, or rather arrives at its second stage. The liquor once more grows turbid, a new intestine motion arises, and after some days it is found changed into an acid; which, however, is very different from those hitherto treated of. The liquor then takes the name of *vinegar*. The acetous fermentation differs from the spirituous, not only in its effect, but also in several of its concomitant circumstances. Moderate motion is of service to this, whereas it obstructs the spirituous; and it is attended with much more warmth than the spirituous. The vapours it produces are not noxious, like those of fermenting wine. Lastly, Vinegar deposits no tartar, even when the wine employed in this operation is quite new, and hath not had time to discharge its tartar: instead of tartar, vinegar deposits a viscid matter which is very apt to putrify.

#### Of VINEGAR.

IF wine, which has gone through this second stage of fermentation, be distilled, instead of an ardent spirit, only an acid liquor is obtained, which is called *distilled vinegar*.

This acid has the same properties as the mineral acids; that is, it unites with alkaline salts, absorbent earths, and metallic substances, and therewith forms neutral saline combinations.

Its affinity with these substances observes the same order as that observed by the mineral acids with regard to

the same substances; but in general it is weaker; that is, any mineral acid is capable of expelling the acid of vinegar out of all matters with which it is united.

Vinegar hath likewise a greater affinity than sulphur with alkalis: whence it follows, that it is capable of decomposing that combination of sulphur with an alkali called liver of sulphur, and of precipitating the sulphur it contains.

The acid of vinegar is always clogged with a certain proportion of oily parts, which greatly weaken it, and deprive it of much of its activity; and for this reason it is not near so strong as the mineral acids, which are not entangled with any oil. By distillation, indeed, it may be freed from this oil, and at the same time from the great quantity of water which in a manner suffocates it, and by that means may be brought much nearer to the nature of the mineral acids: but this attempt hath not yet been profecuted with the assiduity it deserves. Besides distillation, there is another way of freeing vinegar from a good deal of its phlegm; and that is, by exposing it to a hard frost, which readily congeals the watery part into ice, while the acid retains its fluidity.

Vinegar, saturated with a fixed alkali, forms a neutral oily salt, of a dark colour, which is semi-volatile, melts with a very gentle heat, flames when thrown upon burning coals, and dissolves in spirit of wine, of which, however, it requires six parts to complete the solution. This solution being evaporated to dryness leaves a matter in the form of leaves lying on each other; on which account it hath obtained the name of *terra foliata*. The same foliated matter will be obtained, though the salt be not previously dissolved in spirit of wine; but not so readily. This salt is also called *regenerated tartar*. Under the head of tartar we shall see the reason of these different appellations. Regenerated tartar is also in some degree capable of crystallizing: for this purpose a resolution thereof in water must be slowly evaporated to the consistence of a syrup, and then suffered to stand quiet in a cool place; by which means it will shoot into clusters of crystals, lying one upon another, not unlike the feathers on a quill.

With vinegar and several absorbent earths, such as calcined pearls, coral, shells of fish, &c. are also formed neutral saline compounds, each of which take the name of the particular earth employed in its composition.

Vinegar perfectly dissolves lead, and converts it to a neutral metallic salt, which shoots into crystals, and has a sweet saccharine taste. This compound is called *sugar of lead*, or *sal Saturni*.

If lead be exposed to the bare vapour of vinegar, it will be thereby corroded, calcined, and converted into a white matter much used in painting, and known by the name of *ceruse*, or, when it is finer than ordinary, *white-lead*.

Vinegar corrodes copper likewise, and converts it into a beautiful green rust, which also is used in painting, and distinguished by the name of *verdigris*. However, vinegar is not commonly employed to make verdigris: for this purpose they use wine, or the rape of wine, from which fire extricates an acid analogous to that of vinegar.

## OF TARTAR.

THIS substance is a saline compound, consisting of earthy, oily, and especially acid parts. It is found in the form of crusts, adhering to the inner sides of vessels in which wines have stood for some time, particularly acid wines, such as those of Germany.

Tartar derives its origin from the superabundant quantity of the acid contained in the juice of the grape. This superfluous acid, being more than is requisite to constitute the ardent spirit, unites with some of the oil and earth contained in the fermented liquor, and forms a kind of salt; which for some time continues suspended in that liquor, but, when the wine stands undisturbed in a cool place, is deposited, as hath been said, on the sides of the cask.

When it is purified, there appears on the surface of the liquor a sort of white crystalline pellicle, which is skimmed off as it forms. This matter is called *cream of tartar*. The same liquor which produces this cream, and in which the purified tartar is dissolved, being set to cool, yields a great number of white semi-transparent crystals, which are called *crystals of tartar*. The cream and the crystals of tartar are therefore no other than purified tartar, and differ from each other in their form only.

Though the crystals of tartar have every appearance of a neutral salt, yet they are far from being such; for they have all the properties of a true acid, which scarce differs from that of vinegar, except that it contains less water, and more earth and oil; to which it owes its solid form, as well as its property of not being soluble in water without much difficulty: for a very great quantity of water is requisite to keep the crystals of tartar in solution; and it must moreover be boiling hot; otherwise as soon as it cools most of the tartar dissolved in it separates from the liquor, and falls to the bottom in the form of a white powder.

Tartar is decomposed by calcination in the open fire. All its oily parts are consumed or dissipated in smoke, together with most of its acid. The other part of its acid, uniting intimately with its earth, forms a very strong and very pure fixed alkali, called *salt of tartar*.

It will be shewn in its proper place, that almost every vegetable matter, as well as tartar, leaves a fixed alkali in its ashes: yet tartar has these peculiar properties; first, it assumes an alkaline character even when burnt or calcined in close vessels, whereas other substances acquire it only by being burnt in the open air; secondly, the alkali of tartar is stronger and more saline than almost any that is obtained from other matters.

This alkali, when thoroughly calcined, powerfully attracts the moisture of the air, and melts into an unctuous alkaline liquor, improperly called *oil of tartar per deliquium*. This is the alkali generally used in making the *terra foliata*, mentioned under the head of vinegar; for which reason this combination is called *terra foliata tartari*.

Crystals of tartar combined with alkali of tartar produce a great effervescence while they are mixing, as all acids usually do; and if the combination be brought exactly up to the point of saturation, a perfectly neutral

salt is formed, which shoots into crystals, and easily dissolves in water; and this hath procured it the name of *soluble tartar*. It is also called the *vegetable salt*, as being obtained from vegetables only; and again *tartarified tartar*, because it consists of the acid and the alkali of tartar combined together.

Crystals of tartar combined with alkalis procured from the ashes of sea-weeds, such as soda, which alkalis resemble the basis of sea-salt, form likewise a neutral salt, which crystallizes well, and dissolves easily in water. This salt is another sort of soluble tartar. It is called *Saignette's salt*, from the inventor's name.

Tartar likewise dissolves the absorbent earths, as lime, chalk, &c. and with them forms neutral salts which are soluble in water. It even attacks metallic bodies, and when combined with them becomes soluble. A soluble tartar for medical use is prepared with crystals of tartar and iron: the metallic salt thereby produced hath the name of *chalybeated soluble tartar*. This salt attracts the moisture of the air, and is one of those which do not crystallize.

Crystallized tartar acts also upon several other metallic substances: for instance, it dissolves the regulus, liver, and glass of antimony, and thence acquires an emetic quality: It is then called *stibiated*, or *emetic tartar*. It likewise dissolves lead, and therewith forms a salt which, in the figure of its crystals, resembles tartarified tartar.

It is very extraordinary, that tartar, which of itself is not soluble in water, should be soluble therein when become a neutral salt by uniting either with alkalis or with absorbent earths, or even with metals. All the soluble tartars are easily decomposed by exposing them to a certain degree of heat. In distillation they yield the same principles which are obtained from tartar; and what remains fixed in the fire, after they are thoroughly burnt, is a compound of the alkali which tartar naturally produces, and of the alkaline or metallic substance with which it was converted into a neutral salt.

As crystal of tartar is the weakest of all acids, on account of the oily and earthy matters with which it is combined, soluble tartars are decomposed by all the acids; by any of which crystal of tartar may be separated from the substance that serves it for a basis and renders it a neutral salt.

## Of the Putrid Fermentation, or Putrefaction..

EVERY body which hath gone through the two stages of fermentation above described, that is, the spirituous and the acetous fermentation, being left to itself in a due degree of warmth, which varies according to the subject, advances to the last stage of fermentation; that is, to putrefaction.

When a body is in a putrefying state, it is easy to discover, by the vapours which rise from it, by the opacity which invades it, if a pellucid liquor, and frequently even by a greater degree of heat than is found in the two other sorts of fermentation, that an intestine motion is begun among its constituent parts, which lasts till the whole be entirely putrefied.

The effect of this intestine motion is to break the union,

union, and change the disposition, of the particles constituting the body in which it is excited, and to produce a new combination.

If we examine a substance that has undergone putrefaction, we shall soon perceive that it contains a principle which did not exist in it before. If this substance be distilled, there rises first, by means of a very gentle heat, a saline matter which is exceedingly volatile, and affects the organ of smelling briskly and disagreeably. Nor is the aid of distillation necessary to discover the presence of this product of putrefaction: it readily manifests itself in most substances where it exists, as any one may soon be convinced by observing the different smell of fresh and of putrefied urine; for the latter not only affects the nose, but even makes the eyes smart, and irritates them so as to draw tears from them in abundance.

This saline principle, which is the product of putrefaction, when separated from the other principles of the body which affords it, and collected by itself, appears either in the form of a liquor, or in that of a concrete salt, according to the different methods used to obtain it. In the former state it is called a *volatile urinous spirit*; and in the latter a *volatile urinous salt*. The qualification of urinous is given it, because a great deal thereof is generated in putrefied urine, to which it communicates its smell. It goes also by the general name of a *volatile alkali*, whether in a concrete or in a liquid form. The enumeration of its properties will shew why it is called an alkali.

Volatile alkalis, from whatever substance obtained, are all alike, and have all the same properties; differing only according to their degrees of purity. The volatile alkali, as well as the fixed, consists of a certain quantity of acid combined with, and entangled by a portion of the earth of the mixt body from which it was obtained; and on that account it has many properties like those of a fixed alkali. But there is moreover in its composition a considerable quantity of a fat or oily matter, of which there is none in a fixed alkali; and on this account again there is a great difference between them. Thus the volatility of the alkali produced by putrefaction, which is the principal difference between it and the other kind of alkali, whose nature it is to be fixed, must be attributed to the portion of oil which it contains: for there is a certain method of volatilizing fixed alkalis by means of a fatty substance.

Volatile alkalis have a great affinity with acids, unite therewith rapidly, and with ebullition, and form with them neutral salts, which shoot into crystals, but differ from one another according to the kind of acid employed in the combination.

The neutral salts which have a volatile alkali for their basis are in general called *ammoniacal salts*. That whose acid is the acid of sea-salt is called *sal ammoniac*. As this was the first known, it gave name to all the rest. Great quantities of this salt are made in Egypt, and thence brought to us. They sublime it from the foot of cow's dung, which is the fuel of that country, and contains sea-salt, together with a volatile alkali, or at least the materials proper for forming it; and consequently all

the ingredients that enter into the composition of *sal ammoniac*.

The neutral salts formed by combining the acids of nitre and of vitriol with a volatile alkali, are called, after their acids, *nitrous sal ammoniac*, and *vitriolic sal ammoniac*: The latter, from the name of its inventor, is also called Glauber's *secret sal ammoniac*.

A volatile alkali, then, has the same property as a fixed alkali with regard to acids; yet they differ in this, that the affinity of the former with acids is weaker than that of the latter: and hence it follows, that any *sal ammoniac* may be decomposed by a fixed alkali, which will lay hold of the acid, and discharge the volatile alkali.

A volatile alkali will decompose any neutral salt which has not a fixed alkali for its basis; that is, all such as consist of an acid combined with an absorbent earth or a metallic substance. By joining with the acids in which they are dissolved, it disengages the earths or metallic substances, takes their place, and, in conjunction with their acids, forms ammoniacal salts.

Hence it might be concluded, that, of all substances, next to the phlogiston and the fixed alkalis, volatile alkalis have the greatest affinity with acids in general. Yet there is some difficulty in this matter: for absorbent earths and several metallic substances are also capable of decomposing ammoniacal salts, discharging their volatile alkali, and forming new compounds by uniting with their acids. This might induce us to think that these substances have nearly the same affinity with acids.

But it is proper to observe, that a volatile alkali decomposes such neutral salts as have for their basis either an absorbent earth or a metallic substance, without the aid of fire; whereas absorbent earths or metallic substances will not decompose an ammoniacal salt, unless they be assisted by a certain degree of heat.

Now, as all these matters are extremely fixed, at least in comparison with a volatile alkali, they have the advantage of being able to resist the force of fire, and so of acting in conjunction therewith; and fire greatly promotes the natural action of substances upon one another: whereas the volatile alkali in the ammoniacal salt, being unable to abide the force of fire, is compelled to desert its acid; and that so much the more quickly, as its affinity therewith is considerably weakened by the presence of an earthy or metallic substance, both of which have a great affinity with acids.

These considerations oblige us to conclude, that volatile alkalis have a somewhat greater affinity, than absorbent earths and metallic substances, with acids.

Ammoniacal salts projected upon nitre in fusion make it detonate; and the nitrous sal ammoniac detonates by itself, without the addition of any inflammable matter. This singular effect evidently demonstrates the existence of an oily matter in volatile alkalis; for it is certain that nitre will never deslagrate without the concurrence and even the immediate contact of some combustible matter.

This oily substance is often found combined with volatile alkalis in such a large proportion as to disguise it in some measure, and render it exceeding foul. The salt may be freed from its superfluous oil by repeated sublimations;

tions; and particularly by subliming it from absorbent earths, which readily drink up oils. This is called the *rectification* of a volatile alkali. The salt, which before was of a yellowish or dirty colour, by being thus rectified, becomes very white, and acquires an odour more pungent and less fetid than it had at first, that is, when obtained by one single distillation from a putrid substance.

It is proper to observe, that the rectification of a volatile alkali must not be carried too far, or repeated too often; for by that means it may be entirely decomposed at length; and particularly if an absorbent earth, and especially chalk, be employed for that purpose, the salt may be converted into an oil, an earth, and water.

Volatile alkalis act upon several metallic substances, and particularly on copper; of which they make a most beautiful blue solution. On this property depends a pretty singular effect, which happens sometimes when we attempt by means of a volatile alkali to separate copper from an acid with which it is combined. Instead of seeing the liquor grow turbid, and the metal fall, both which generally happen when any alkali whatever is mixed with a metallic solution, we are surprised to observe the solution of copper, upon adding a volatile alkali, retain its limpidity, and let fall no precipitate; or at least if the liquor does grow turbid, it remains so but for a moment, and instantly recovers its transparency. This is occasioned by adding such a quantity of volatile alkali as is more than sufficient fully to saturate the acid of the solution, and considerable enough to dissolve all the copper as fast as it is separated from the acid. On this occasion the liquor requires a deeper blue than it had before; which arises from the property which volatile alkalis have of giving this metal, when combined with them, a fuller blue than any other solvent can: Hence we have a touchstone to discover copper where-ever it is; for, let the quantity of this metal, combined with other metals, be ever so small, a volatile alkali never fails to discover it, by making it appear of a blue colour.

Though a volatile alkali be constantly the result of putrefaction, yet it must not therefore be imagined, that none can be produced by any other means; on the contrary, most of those which contain the ingredients necessary to form it, yield no inconsiderable quantity thereof in distillation. Tartar, for example, which by being burnt in an open fire is converted, as was shewn, into a fixed alkali, yields a volatile alkali when it is decomposed in close vessels; that is, when it is distilled: Because, in this latter case, the oily part is not dissipated or burnt, as it is by calcination in a naked fire, but has time to unite with some of the earth and acid of the mixt, in such a manner as to form a true volatile alkali.

To prove that on this occasion, as well as on all others, where unputrefied bodies yield a volatile alkali, this salt is the product of the fire, we need only observe, that in these distillations it never rises till after some part of the phlegm of the acid, and even of the thick oil of the mixt, is come over; which never is the case when it is formed before-hand in the body which is the subject of the operation, as it is in those which have undergone putrefaction: For this salt, being much lighter and more

volatile than those other substances, rises of course before them in distillation.

### *A General View of Chemical Decomposition.*

THOUGH we have considered all the substances which enter into the composition of vegetables, animals, and minerals, whether as primary or as secondary principles, it will not be improper to shew in what order we obtain these principles from the several mixts; and especially from vegetables and animals, because they are much more complicated than minerals. This is called *analysing* a compound.

The method most commonly taken to decompose bodies is by applying to them successive degrees of heat, from the gentlest to the most violent, in appropriated vessels, so contrived as to collect what exhales from them. By this means the principles are gradually separated from each other; the most volatile rise first, and the rest follow in order, as they come to be acted on by the proper degree of heat: And this is called *distillation*.

But it being observed that fire, applied to the decomposition of bodies, most commonly alters their secondary principles very sensibly, by combining them in a different manner with each other, or even partly decomposing them, and reducing them to their primitive principles; other means have been used to separate those principles without the help of fire.

With this view the mixts to be decomposed are forcibly compressed, in order to squeeze out of them all such parts of their substance as they will by this means part with; or else those mixts are for a long time triturated, either along with water, which carries off all their saline and saponaceous contents; or with solvents, such as ardent spirits, capable of taking up every thing in them that is of an oily or resinous nature.

We shall here give a succinct account of the effects of these different methods, as applied to the principal substances among vegetables and animals, and likewise to some minerals.

### *The ANALYSIS of VEGETABLE SUBSTANCES.*

A vast many vegetable substances, such as kernels and seeds, yield by strong compression great quantities of mild, fat, unctuous oils, which are not soluble in ardent spirits: These are what we called *expressed oils*. They are also sometimes called *fat oils*, on account of their unctuousness, in which they exceed all other sorts of oil. As these oils are obtained without the aid of fire, it is certain that they existed in the mixt just as we see them, and that they are not in the least altered; which could not have been the case had they been obtained by distillation: For that never produces any oils but such as are acrid and soluble in spirit of wine.

Some vegetable matters, such as the rind of citrons, lemons, oranges, &c. also yield, only by being squeezed between the fingers, a great deal of oil. This spirits out in fine small jets, which being received upon any polished surface, such as a looking-glass, run together, and form a liquor that is a real oil.

But

But it must be carefully noted, that this sort of oil, though obtained by expression only, is nevertheless very different from the oils mentioned before to which the title of *expressed oils* peculiarly belongs: For this is far lighter and thinner; moreover, it retains the perfect odour of the fruit which yields it, and is soluble in spirit of wine; in a word, it is a true essential oil, but abounds so in the fruits which produce it, and is longed therein in such a manner, occupying a vast number of little cells provided in the peel for its reception, that a very slight pressure discharges it; which is not the case with many vegetables that contain an essential oil.

Succulent and green plants yield by compression a great deal of liquor or juice, which consists of most of the phlegm of the salts, and a small portion of the oil and earth of the plant. These juices, being set in a cool place for some time, deposit saline crystals, which are a combination of the acid of the plant with part of its oil and earth, wherein the acid is always predominant. These salts, as is evident from the description here given, bear a great resemblance to the tartar of wine treated of above. They are called *essential salts*; so that tartar might likewise be called the *essential salt of wine*.

Dried plants, and such as are of a ligneous, or acid nature, require to be long triturated with water, before they will yield their essential salts. Trituration with water is an excellent way to get out of them all their saline and saponaceous contents.

A vegetable matter that is very oily yields its essential salt with much difficulty, if at all; because the excessive quantity of oil entangles the salt so that it cannot extricate itself or shoot into crystals. Mr Gericke, in his *Principles of Chemistry*, says, That if part of the oil of a plant be extracted by spirit of wine, its essential salt may be afterwards obtained with more ease and in greater quantity.

Essential salts are among those substances which cannot be extracted from mixts by distillation; for the first impression of fire decomposes them.

Though the acid which predominates in the essential salts of plants be most commonly analogous to the vegetable acid, properly so called, that is, to the acid of vinegar and tartar, which is probably no other than the vitriolic acid disguised; yet it sometimes differs therefrom, and somewhat resembles the nitrous or the marine acid. This depends on the places where the plants grow which produce these salts: If they be submarine plants, their acid is a-kin to the acid of sea-salt; if, on the contrary, they grow upon walls, or in nitrous grounds, their acid is like that of nitre. Sometimes one and the same plant contains salts analogous to all the three mineral acids; which shews that the vegetable acids are no other than the mineral acids variously changed by circulating through plants.

Liquors containing the essential salts of plants being evaporated by a gentle heat to the consistence of honey, or even further, are called *extracts*. Hence it is plain, that an extract is nothing but the essential salt of a plant, combined with some particles of its oil and earth, that re-

mained suspended in the liquor, and are now incorporated by evaporation.

Extracts of plants are also prepared by boiling them long in water, and then evaporating some part of it. But these extracts are of inferior virtue; because the fire dissipates many of the oily and saline parts.

#### EMULSIONS.

Substances which abound much in oil, being bruised and triturated with water for some time, afford a liquor of an opaque dead-white colour like milk. This liquor consists of such juices as the water is capable of dissolving, together with a portion of the oil, which being naturally indissoluble in water, is only divided and dispersed in the liquor, the limpidity whereof is by that means destroyed. This sort of oily liquor, in which the oil is only divided, not dissolved, is called an *emulsion*. The oily particles in emulsions spontaneously separate from the water, when left at rest, and, uniting into greater masses, rise, on account of their lightness, to the surface of the liquor, which by that means recovers a degree of transparency.

If vegetables, abounding in essential oils and resins, be digested in spirit of wine, the menstruum takes up these oily matters, as being capable of dissolving them; and they may afterwards be easily separated from it by the affusion of water. The water, with which spirit of wine has a greater affinity than with oily matters, separates them by this means from their solvent, agreeable to the common laws of affinities.

Without the help of fire scarce any thing, besides the substances already mentioned, can be obtained from a plant: But by the means of distillation we are enabled to analyse them more completely. In prosecuting this method of extracting from a plant the several principles of which it consists, the following order is to be observed.

A plant being exposed to a very gentle heat, in a distilling vessel set in the *balneum marie*, yields a water which retains the perfect smell thereof. Some chemists, and particularly the illustrious Boerhaave, have called this liquor the *spiritus rectior*. The nature of this odoriferous part of plants is not yet thoroughly known; because it is so very volatile, that it is difficult to subject it to the experiments necessary for discovering all its properties.

If instead of distilling the plant in the *balneum marie*, it be distilled over a naked fire, with the precaution of putting a certain quantity of water into the distilling vessel along with it, to prevent its suffering a greater heat than that of boiling water, all the essential oil contained in that plant will rise together with that water, and with the same degree of heat.

On this occasion it must be observed, that no essential oil can be obtained from a plant after the *spiritus rectior* hath been drawn off; which gives ground to think that the volatility of these oils is owing to that spirit.

The heat of boiling water is also sufficient to separate from vegetable matters the fat oils which they contain: That, however, is to be done by the way of decoction

only, and not by distillation; because, though these oils will swim on water, yet they will not rise in vapours without a greater degree of heat,

When the essential oil is come over, if the plant be exposed to a naked fire, without the addition of water, and the heat be increased a little, a phlegm will rise that gradually grows acid; after which, if the heat be increased as occasion requires, there will come over a thicker and heavier oil; from some a volatile alkali; and last of all, a very thick, black, empyreumatic oil.

When nothing more rises with the strongest degree of heat, there remains of the plant a mere coal only, called the *caput mortuum*, or *terra damnata*. This coal when burnt falls into ashes, which being lixiviated with water give a fixed alkali.

It is observable, that in the distillation of plants which yield an acid and a volatile alkali, these two salts are often found quite distinct and separate in the same receiver; which seems very extraordinary, considering that they are naturally disposed to unite, and have a great affinity with one another. The reason of this phenomenon is, that they are both combined with much oil, which embarrasses them so that they cannot unite to form a neutral salt, as they would not fail to do were it not for that impediment.

All vegetables, except such as yield a great deal of volatile alkali, being burnt in an open fire, and so as to flame, leave in their ashes a large quantity of an acid, caustic, fixed alkali. But if care be taken to smother them, so as to prevent their flaming while they burn, by covering them with something that may continually beat down again what exhales, the salt obtained from their ashes will be much less acid and caustic; the cause whereof is, that some part of the acid and oil of the plant being detained in the burning, and stopped from being dissipated by the fire, combines with its alkali. These salts crystallize, and being much milder than the common fixed alkalis may be used in medicine, and taken internally. They are called *Tachenius's salts*, because invented by that chemist.

Marine plants yield a fixed alkali analogous to that of sea-salt. As for all other plants or vegetable substances, the fixed alkalis obtained from them, if rightly prepared and thoroughly calcined, are all perfectly alike, and of the same nature.

The last observation we have to make on the production of a fixed alkali is, that if the plant you intend to work upon be steeped or boiled in water before you burn it, a much smaller quantity of salt will be obtained from it; nay, it will yield none at all, if repeated boilings have robbed it entirely of those saline particles which must necessarily concur with its earth to form a fixed alkali.

#### *The Analysis of ANIMAL SUBSTANCES.*

SUCCULENT animal substances, such as new-killed flesh, yield by expression a juice or liquid, which is no other than the phlegm, replete with all the principles of the animal body except the earth, of which it contains but little. The hard or dry parts, such as the horns, bones, &c. yield a similar juice, by boiling them in water. These juices become thick, like a glue or jelly,

when their watery parts are evaporated; and in this state they are true extracts of animal matters. These juices afford no crystals of essential salt, like those obtained from vegetables, and shew no sign either of an acid or an alkali.

Great part of the oil which is in the flesh of animals may be easily separated without the help of fire; for it lies in a manner by itself: It is commonly in a concrete form, and is called *fat*. This oil somewhat resembles the fat oils of vegetables; for like them it is mild, unctuous, indissoluble in spirit of wine, and is subtilized and attenuated by the action of fire. But there is not in animals, as in vegetables, any light essential oil, which rises with the heat of boiling water; so that, properly speaking, animals contain but one sort of oil.

Few animal substances yield a perceptible acid. Ants and bees are almost the only ones from which any can be obtained; and indeed the quantity which they yield is very small, as the acid itself is extremely weak.

The reason thereof is, that as animals do not draw their nourishment immediately from the earth, but feed wholly either on vegetables or on the flesh of other animals, the mineral acids, which have already undergone a great change by the union contracted between them and the oily matters of the vegetable kingdom, enter into a closer union and combination with these oily parts while they are passing through the organs and strainers of animals; whereby their properties are destroyed, or at least so impaired that they are no longer sensible.

Animal matters yield in distillation, first, a phlegm, and then, on increasing the fire, a pretty clear oil, which gradually becomes thicker, blacker, more fetid, and empyreumatic. It is accompanied with a great deal of volatile alkali; and if the fire be raised and kept up till nothing more comes over, there will remain in the distilling vessel a coal like that of vegetables; except that when it is reduced to ashes, no fixed alkali, or at least very little, can be obtained from them, as from the ashes of vegetables. This arises from hence that, as we said before, the saline principle in animals being more intimately united with the oil than it is in plants, and being consequently more attenuated and subtilized, is too volatile to enter into the combination of a fixed alkali; on the contrary, it is more disposed to join in forming a volatile alkali, which on this occasion does not rise till after the oil, and therefore must certainly be the production of the fire.

The chyle, and the milk of animals which feed on plants, still retain some likeness to vegetables; because the principles of which these liquors are composed have not gone through all the changes which they must suffer before they enter into the animal combination.

Urine and sweat are excrementitious aqueous liquors, loaded chiefly with the saline particles which are of no service towards the nourishment of the animal, but pass through its strainers without receiving any alteration; such as the neutral salts which have a fixed alkali for their basis. and particularly the sea-salt which happens to be in the food of animals, whether it exist therein naturally, as it does in some plants, or whether the animals eat it to please their palates.

The

The saliva, the pancreatic juice, and especially the bile, are saponaceous liquors; that is, they consist of saline and oily particles combined together; so that being themselves dissolved in an aqueous liquor, they are capable of dissolving likewise the oily parts, and of rendering them miscible with water.

Lastly, The blood being the receptacle of all these liquors, partakes of the nature of each, more or less in proportion to the quantity thereof which it contains.

#### The ANALYSIS of MINERAL SUBSTANCES.

MINERALS differ greatly from vegetables, and from animals; they are not near so complex as those organized bodies, and their principles are much more simple; whence it follows, that these principles are much more closely connected, and that they cannot be separated without the help of fire; which not having on their parts the same action and the same power as on organized bodies, hath not the same ill effect on them; we mean the effect of changing their principles, or even destroying them entirely.

We do not here speak of pure, vitrifiable, or refractory earths; of mere metals and semi-metals; of pure acids; or even of their simplest combinations, such as sulphur, vitriol, alum, sea-salt: Of all these we have said enough.

We are now to treat of bodies that are more complex, and therefore more susceptible of decomposition. These bodies are compound masses or combinations of those above-mentioned; that is, metallic substances as they are found in the bowels of the earth, united with several sorts of sand, stones, earths, semi-metals, sulphur, &c. When the metallic matter is combined with other matters in such a proportion to the rest that it may be separated from them with advantage and profit, these compounds are called *ores*: when the case is otherwise, they are called *pyrites*, and *marcasites*; especially if sulphur or arsenic be predominant therein, which often happens.

In order to analyse an ore, and get out of it the metal it contains, the first step is to free it from a great deal of earth and stones which commonly adhere to it very slightly and superficially. This is effected by pounding the ore, and then washing it in water; to the bottom of which the metalline parts presently sink, as being the heaviest, while the small particles of earth and stone remain suspended some time longer.

Thus the metallic part is left combined with such matters only as are most intimately complicated with it. These substances are most commonly sulphur and arsenic. Now, as they are much more volatile than other mineral matters, they may be dissipated in vapours, or the sulphur may be consumed, by exposing the ore which contains them to a proper degree of heat. If the sulphur and arsenic be desired by themselves, the fumes thereof may be caught and collected in proper vessels and places. This operation is called *roasting* in ore.

The metal thus separated is now fit to be exposed to a greater force of fire, capable of melting it.

On this occasion the semi-metals and the imperfect metals require the addition of some matter abounding in phlogiston, particularly charcoal-dust; because these me-

tallic substances lose their phlogiston by the action of the fire, or of the fluxes joined with them, and therefore without this precaution would never acquire either the splendor or the ductility of a metal. By this means the metallic substance is more accurately separated from the earthy and stony parts, of which some portion always remains combined therewith till it is brought to fusion. For, as we observed before, a metallic glass or calx only will contract an union with such matters; a metal possessed of its phlogiston and metalline form being utterly incapable thereof.

We took notice of the cause of this separation above, where we shewed that a metal possessed of its phlogiston and metalline form will not remain intimately united with any calcined or vitrified matter, not even with its own calx or glass.

The metal therefore on this occasion gathers into a mass, and lies at the bottom of the vessel, as being most ponderous; while the heterogeneous matters float upon it in the form of a glass, or a semi-vitrification. These floating matters take the name of *scoriae*, and the metalline substance at bottom is called the *regulus*.

It frequently happens, that the metalline regulus thus precipitated, is itself a compound of several metals mixed together, which are afterwards to be separated.

It is proper to observe, before we quit this subject, that the rules here laid down for analysing ores are not absolutely general: For example, it is often advisable to roast the ore before you wash it; for by that means some ores are opened, attenuated, and made very friable, which would cost much trouble and expence, on account of their excessive hardness, if you should attempt to pound them without a previous torrefaction.

It is also frequently necessary to separate the ore from part only of its stone; sometimes to leave the whole; and sometimes to add more to it, before you smelt it. This depends on the quality of the stone, which always helps to promote fusion when it is in its own nature fusible and vitrifiable: It is then called the *flux* of the ore.

We shall now give a succinct account of the principal ores and mineral bodies, contenting ourselves with just pointing out the particulars of which they severally consist.

#### Of the PYRITES.

##### The Yellow Pyrites.

THE yellow pyrites is a mineral consisting of sulphur, iron, a unmetallic earth, and frequently a little copper: The sulphur, which is the only one of these principles that is volatile, may be separated from the rest by sublimation: It usually makes a fourth, and sometimes a third, of the whole weight of these pyrites. The other principles are separated from one another by fusion and reduction with the phlogiston, which, by metallizing the ferruginous and cupreous earths, parts them from the unmetallic earth: for this earth vitrifies, and cannot afterwards continue united with metallic matters possessed of their metalline form.

There is yet another way of decomposing the yellow pyrites, which is to let it lie till it effloresces, or begins

to

to shoot into flowers; which is nothing but a sort of slow accretion of the sulphur it contains. The sulphur being by this means decomposed, its acid unites with the ferruginous and cupreous parts of the pyrites, and therewith forms green and blue vitriols; which may be extracted by steeping in water the pyrites which has effloresced or been burnt, and then evaporating the lixivium to a pellicle; for by this means the vitriol will shoot into crystals. Sometimes the pyrites contains also an earth of the same nature with that of alum: A pyrites of this sort, after flowering, yields alum as well as vitriol.

#### *The White Pyrites.*

THE white pyrites contains much arsenic, a ferruginous earth, and an unmetallic earth. The arsenic being a volatile principle, may be separated by sublimation or distillation from the rest, which are fixed; and these again may be disjoined from each other by fusion and reduction, as was said in relation to the yellow pyrites.

#### *The Copper Pyrites.*

THE copper pyrites contains sulphur, copper, and an unmetallic earth. A great deal thereof likewise holds arsenic, and its colour approaches more or less to orange, yellow, or white, according to the quantity of arsenic in it. It may be decomposed by the same means as the yellow and white pyrites.

### OF ORES.

#### *Of Gold Ores.*

GOLD being constantly found in its metalline form, and never combined with sulphur and arsenic, its ores are not, properly speaking, ores; because the metal contained in them is not mineralized. The gold is only lodged between particles of stone, earth, or sand, from which it is easily separated by lotion, and by amalgamation with quick-silver. The gold thus found is seldom pure, but is frequently alloyed with more or less silver, from which it is to be separated by quartation.

It is also very common to find gold in most ores of other metals or semi-metals, and even in the pyrites; but the quantity contained therein is generally so small, that it would not pay the cost of extracting it. However, if any should incline to attempt it, merely out of curiosity, it would be necessary to begin with treating these ores in the manner proper for separating their metalline part; then to cupel the metalline regulus so obtained; and lastly, to refine it by quartation.

#### *Of Silver Ores.*

IT is no rare thing to find silver, as well as gold, in its metalline form, only lodged in sundry earths and stony matters, from which it may be separated in the same manner as gold. But the greatest quantities of this metal are usually dug out of the bowels of the earth in a truly mineral state; that is, combined with different substances, and particularly with sulphur and arsenic.

Several silver ores are distinguished by peculiar characteristics, and are accordingly denoted by particular

names. That which is called the *vitreous silver ore*, is scarce any thing else but a combination of silver and sulphur. Another is known by the name of the *horny silver ore*, because when in thin plates it is semi-transparent: In this ore the silver is mineralized by sulphur and a little arsenic. The *red silver ore* is of the colour which its name imports, sometimes more, sometimes less vivid; and is chiefly composed of silver, arsenic, and sulphur: It also contains a little iron.

These three ores are very rich in silver: the first contains nearly three-fourths of its weight, and the others about two-thirds of theirs.

There is a fourth, called the *white silver ore*, which though it be heavier, is not so rich in silver, because it contains much copper. Many other ores contain silver, yet are not, properly speaking, silver ores; because a much greater quantity of other metals than of silver is found in them.

When a silver ore is to be decomposed, in order to have the silver pure, or when silver is to be extracted out of any ore that contains it, the first thing to be done is to roast the ore in order to clear it of the volatile minerals: and as silver cannot be had pure without the operation of the cupel, which requires more or less lead to be joined with it, it is usual to mix with the torrefied silver ore a quantity of lead proportioned to that of the heterogeneous matters combined with the silver, and to melt the whole together. Part of the added lead vitrifies during the fusion, and at the same time converts some of the heterogeneous matter also into glass, with which it forms a scoria that rises to the surface of the matter. The other part of the lead, with which the silver is mixed, falls to the bottom in the form of a regulus, which must be cupelled in order to have the silver pure.

#### *Of Copper Ores.*

COPPER is much seldomer found in a metalline form, than gold or silver; it is commonly in a mineral state: it is mineralized by sulphur and arsenic: almost all its ores contain also more or less iron; sometimes a little silver or even gold, together with unmetallic earths and stones, as all ores do.

Most copper ores are of a beautiful green or blue, or else in shades blended of these two colours. The minerals called mountain green, and mountain blue, are true copper ores; not in the form of hard stones, like other ores, but crumbly and friable like earth.

Nevertheless there are several copper ores of different colours, as ash-coloured, whitish, and shaded with yellow or orange: which colours arise from the different proportions of arsenic, sulphur, and iron, which these ores contain.

In order to decompose a copper ore, and to extract the copper it contains, it is first of all to be freed from as many of its earthy, stony, sulphureous, and arsenical parts, as is possible, by roasting and washing; then what remains is to be mixed with a flux compounded of a fixed alkali and some inflammable matter; a little sea-salt is to be put over all, and the whole melted by a strong fire. The salts facilitate the fusion and scorification of the

the unmetallized matters, and therewith form a slag, which being the lightest rises to the surface. The metalline matters are collected below in the form of a shining regulus of copper; which however, is not usually fine copper, but requires to be purified.

In order to separate the copper from the unmetallized matters, it is absolutely necessary to melt its ore along with the inflammable substances abounding in phlogiston. For, as this metal is not possessed of its metalline form while it is in a mineral state, as it is destitute of the true quantity of phlogiston, and, though it were not, would lose it by the action of the fire, it would come to pass, that, if its ore were melted without the addition of any inflammable matter, the cupreous earth, or calx, would be scorified and confounded with the unmetallized matters; and as all metallic matters, except gold and silver, are subject to this inconvenience as well as copper, the addition of an inflammable substance, in fluxing all ores that contain them, is a general rule that ought constantly to be observed.

#### *Of Iron Ores.*

IRON is seldom found pure and malleable in the earth; yet it is much seldomer found in the mineral state, properly so called, than any of the other metals: for most iron ores are scarce any thing more than a ferruginous earth mixed in different proportions with unmetallized earths and stones. Some of them, however, contain also volatile minerals, such as sulphur and arsenic; and therefore it is necessary to roast the iron ores, like all others, before you attempt to extract the metal out of them. That being done, they are to be smelted with a flux consisting of fusible and inflammable matters, as the general rule directs.

Iron is the commonest of all metals; nay, it is so universally diffused through the earth, that it is difficult to find any stone, earth, or sand, that does not contain some of it; and therefore none of these are usually considered and treated as iron ores, except such as contain a great deal of that metal, and melt easily. The hematites, emery, yellow pyrites, calamine, all contain a pretty considerable quantity of iron; but nobody attempts to extract it from them, because they are very hard to melt.

Ferruginous earth being naturally of an orange colour, a stone or earth may be judged to contain iron, if either naturally or after roasting it appears to have any shade of yellow or red.

The singular property which iron has of being attracted by the magnet, and of being the only body, exclusive of all others, that is so, likewise affords us an easy method of discovering the presence of this metal among other matters, where it often exists in such a small quantity that it could not otherwise be found out. For this purpose the body in which iron is suspected to lurk, must be pulverised and torrefied with some inflammable matter; and then the powder thus roasted being touched with a magnet, or a magnetical bar, if it contains any particles of iron they will infallibly adhere to the magnet or bar.

#### *Of Tin Ores.*

TIN is never found in the earth pure and malleable,

VOL. II. No. 34.

3

but always in a mineral state, and always mineralized by arsenic. Tin ores are not sulphureous; whence it comes that though tin be the lightest of all metals, its ores are nevertheless heavier than those of other metals, as arsenic greatly exceeds sulphur in gravity. Some tin ores contain also a little iron. The ores of tin are to be washed, roasted, and smelted with a reducing flux, according to the general rules.

#### *Of Lead Ores.*

LEAD, like tin, is never found but in a mineral state. It is most commonly mineralized by sulphur; yet there are some lead ores which also contain arsenic.

Lead ores, as well as all others, must be roasted and smelted with a reducing flux: however, as it is difficult to free them from all their sulphur by torrefaction only, the reducing flux employed in their fusion may be made up with a quantity of iron filings, which being incapable of any union with lead, and having a much greater affinity than that metal with sulphur, will on this occasion be of great service by interposing between them.

#### *Of Quick-Silver Ores.*

RUNNING mercury is sometimes found in certain earths, or grey friable stones; but most commonly in a mineral state. It is always mineralized by sulphur, and by sulphur alone: so that cinabar is the only ore of quick-silver that we know of; and a very rich one it is, seeing it contains six or seven times as much mercury as sulphur.

Roasting can be of no use towards decomposing the ore of mercury, and separating its sulphur; because mercury being itself very volatile would be carried off by the fire together with the sulphur. In order therefore to part the two substances of which cinabar consists, recourse must necessarily be had to some third body, which will unite with one of them, and by that means separate it from the other. Now all the metals, except gold, having a greater affinity than mercury with sulphur, such a body is easily found: any metal but gold may be employed with success in this decomposition; but as iron hath a greater affinity with sulphur than any of the rest, and is, moreover, the only one that cannot unite with mercury, it must, on account of these two qualities, be preferred to all the rest.

Fixed alkalis are also well qualified to absorb the sulphur of cinabar. Cinabar must be decomposed in close vessels, and by the way of distillation; otherwise the mercury, as soon as it separates from the sulphur, will be dissipated in vapours and entirely lost.

In this operation it is needless to add either flux or phlogiston; because the cinabar is decomposed without melting, and the mercury, though in a mineral state, contains, like gold and silver, all the phlogiston requisite to secure its metalline properties.

#### *Of the Ores of Regulus of Antimony.*

REGULUS of antimony is always found in a mineral state: it is mineralized by sulphur: but sometimes, though rarely, it is also combined with a little arsenic.

When the ore of regulus of antimony is to be decomposed,

2 D

†

posed, the first thing to be done, is to expose it to a degree of heat too weak to melt its earthy and stony parts, but strong enough to fuse its reguline together with its sulphureous parts, which by this means are separated from the earth, and united into one mass, known by the name of Antimony.

It is plain, that this first operation, which is founded on the great fusibility of antimony, produces, with regard to the ore of regulus of antimony, the same effect that washing hath on other ores: so that after this first fusion nothing more is requisite to the obtaining of a pure regulus of antimony, but to separate it from its sulphur by roasting, and to melt it with some matter abounding in phlogiston, in the same manner as other metallic matters are treated. The term calcination is generally used to express this torrefaction of antimony, by means whereof the metallic earth of the regulus of antimony is separated from its sulphur.

As regulus of antimony hath, like mercury, much less affinity with sulphur than the other metals have, it follows that antimony may be decomposed by the same means as cinabar; but the regulus so obtained is adulterated with a portion of the additament made use of, which combines therewith.

#### *Of the Ores of Bismuth.*

THE ore of bismuth consists of the semi-metal mineralized by the arsenic, and of an unmetallic earth. It is very easy to decompose this ore, and to extract the bismuth it contains: for this purpose it need only be exposed to a moderate heat, whereby the arsenic will be dissipated in vapours, and the bismuth melted, which will then separate from the unmetallic earth. This earth, at least in several ores of bismuth, possesses the property of tinging all vitrifiable matters with which it is melted of a beautiful blue colour.

To decompose the ore of bismuth no flux or inflammable matter is used; because this semi-metal is possessed, even in its mineral state, of all the phlogiston requisite to maintain its metalline properties; and its great fusibility makes it unnecessary to melt the metallic earth contained in its ore.

#### *Of the Ores of Zinc.*

ZINC is not generally obtained from a particular ore of its own; but sublimes during the fusion of a mineral, or rather a confused mass of minerals, that contains this semi-metal together with iron, copper, lead, sulphur, arsenic, and, like all other ores, an unmetallic earth.

Nevertheless there is a substance which may be considered as the proper ore of zinc, because it contains a pretty large quantity of that semi-metal, a little iron, and an unmetallic earth. It is called calamine, or *lapis calaminaris*: but hitherto the art of procuring zinc directly from this mineral hath no where been practised. Calamine is commonly employed only to convert copper into brass or a yellow metal, by cementing it therewith. Indeed till lately no easy or practicable method of obtaining pure zinc from calamine was publicly known; for that semi-metal being volatile and very inflammable, its

ore cannot be fused like others. Mr Margraaf was the first who, by mixing powdered charcoal with calamine in close vessels, obtained a perfect zinc from it, by the means of distillation or sublimation.

#### *Of Arsenical Minerals.*

ARSENIC, as well as sulphur, is naturally combined with almost all ores, or minerals containing metallic substances. As it is very volatile, while the matters with which it is united are fixed, at least in comparison therewith, it is easily separated by sublimation.

The minerals that contain most arsenic are the white pyrites, orpiment, and cobalt. We have already considered the white pyrites: as to orpiment, it consists of sulphur and arsenic. Both these substances being very volatile, it is difficult to separate them by sublimation: yet, with proper management, and a due regulation of the fire, this separation may be effected; because sulphur sublimes a little more easily than arsenic. But it is more convenient, as well as more expeditious, to make use of some additament that hath a greater affinity with one of those substances than with the other. Fixed alkalis and mercury, both of which have more affinity with sulphur than with arsenic, may be very properly employed on this occasion. Cobalt is a mineral composed of arsenic, an unmetallic earth, and frequently bismuth: and as none of these are very volatile, except the arsenic, this may be easily separated from the rest by sublimation. The unmetallic earth which remains has, like that of the ore of bismuth, the property of giving a blue colour to any vitrifiable matters melted with it; whence it is conjectured, that cobalt and the ore of bismuth have a great resemblance, or are often blended with each other.

Besides the minerals already recited, there is found in the bowels of the earth another species of compound body, of which we have already taken notice; but which is supposed, with some degree of probability, to belong as much to the vegetable as to the mineral kingdom: we mean the bitumens; which the best observations oblige us to consider as vegetable oils, that by lying long in the earth have contracted an union with the mineral acids, and by that means acquired the thickness, consistence, and other properties observable in them.

By distillation they yield an oil, and an acid not unlike a mineral acid. Mr Bourdelin has even demonstrated, by a very artful and ingenious process, that amber contains a manifest acid of sea-salt.

#### *Explanation of the Table of Affinities or elective Attractions.*

WE have already explained what is meant by affinities, and have laid down the principal laws to which the relations of different bodies are subject. The late Mr Geoffroy, being convinced of the advantages which all who cultivate chemistry would receive from having constantly before their eyes a state of the best ascertained relations between the chief agents in chemistry, was the first who undertook to reduce them into order, and unite them all in one point of view, by means of a table. This table will be of considerable use to such as are beginning to study

study chemistry, in helping them to form a just idea of the relations which different substances have with one another; and the practical chemist will thereby be enabled to account for what passes in several of his operations, otherwise difficult to be understood, as well as to judge what may be expected to result from mixtures of different compounds. These reasons have induced us to insert it at the end of this elementary treatise, and to give a short explanation of it here; especially as it will serve at the same time for a recapitulation of the whole work, in which the several axioms of this table are dispersed. See Plate LXV.

The upper line of Mr Geoffroy's table comprehends several substances used in chemistry. Under each of those substances are ranged in distinct columns several matters compared with them, in the order of their relation to that first substance; so as that which is the nearest to it is that which hath the greatest affinity with it, or that which none of the substances standing below it can separate therefrom; but which, on the contrary, separates them all when they are combined with it, and expels them in order to join itself therewith. The same is to be understood of that which occupies the second place of affinity; that is, it has the same property with regard to all below it, yielding only to that which is above it: and so of all the rest.

At the top of the first column stands the character which denotes an acid in general. Immediately under this stands the mark of a fixed alkali, being placed there as the substance which has the greatest affinity with an acid. After the fixed alkali, appears the volatile alkali, whose affinity with acids yields only to the fixed alkali. Next come the absorbent earths; and, last of all, metallic substances. Hence it follows, that when a fixed alkali is united with an acid, it cannot be separated therefrom by any other substance; that a volatile alkali united with an acid cannot be separated from it by any thing but a fixed alkali; that an absorbent earth combined with an acid may be separated from it either by a fixed or by a volatile alkali; and lastly, that any metallic substance combined with an acid, may be separated from it by a fixed alkali, a volatile alkali, or an absorbent earth.

At the head of the second column stands the character of the marine acid, which signifies that the affinities of this acid are the subject of the column. Immediately below it is placed the mark of tin. As this is a metalline substance, and as the first column places metalline substances in the lowest degree of affinity with all acids, it is plain we must suppose fixed alkalis, volatile alkalis, and absorbent earths, to be placed here in order after the marine acids, and before tin. Tin, then, is of all metalline substances that which has the greatest affinity with the marine acid; and then follow regulus of antimony, copper, silver, mercury. Gold comes last of all; and there are no less than two vacant places above it. By this means it is in some sort excluded from the rank of substances that have an affinity with the marine acid. The reason thereof is, that this acid alone is not capable of dissolving gold and combining therewith, necessarily requiring for that purpose the aid of the nitrous acid, or at least of the phlogiston.

The third column exhibits the affinities of the nitrous acid, the character whereof stands at its head. Immediately below it is the sign of iron, as the metal which has the greatest affinity with this acid; and then follow other metals, each according to the degree of its relation, *viz.* copper, lead, mercury, and silver. In this column, as in the preceding one, we must suppose the substances, which in the first column stand above metallic substances, to be placed in their proper order before iron.

The fourth column is intended to represent the affinities of the vitriolic acid. The phlogiston stands uppermost. Below it the fixed alkalis, volatile alkalis, and absorbent earths, to shew that this is an exception to the first column. As to metalline substances, Mr Geoffroy has set down but three, being those with which the vitriolic acid has the most perceptible affinity: these metals, placed in the order of their affinities, are iron, copper, and silver.

The fifth column shews the affinities of absorbent earths. As these earths have no sensible affinity but with acids, this column contains only the characters of the acids ranked according to the degree of their strength, or affinity with the earths, *viz.* the vitriolic, the nitrous, and the marine acids. Underneath this last might be placed the acid of vinegar, or the vegetable acid.

The sixth column expresses the affinities of fixed alkalis with acids, which are the same with those of absorbent earths. Moreover, we find sulphur placed here below all the acids; because liver of sulphur, which is a combination of sulphur with a fixed alkali, is actually decomposed by any acid: for any acid precipitates the sulphur and unites with the alkali.

Immediately over the sulphur, or in the same square with it, might be set a mark denoting the volatile sulphureous spirit; because, like sulphur, it has less affinity than any other acid with fixed alkalis. Oils might also be ranked with sulphur, because they unite with fixed alkalis, and therewith form soaps which are decomposed by any acid whatever.

The seventh column points out the affinities of volatile alkalis, which are likewise the same as those of absorbent earths; and the vegetable acid might be placed here also under the marine acid.

The eighth column specifies the affinities of metallic substances with acids. The affinities of the acids, which with respect to fixed alkalis, volatile alkalis, and absorbent earths, succeed each other uniformly, do not appear in the same order here. The marine acid, instead of being placed below the vitriolic and nitrous acids, stands, on the contrary, at their head: because, in fact, this acid separates metalline substances from all the other acids with which they happen to be united, and, forcing these acids to quit possession, intrudes into their place. Nevertheless, this is not a general rule; for several metalline substances must be excepted, particularly iron and copper.

The ninth column declares the affinities of sulphur. Fixed alkalis, iron, copper, lead, silver, regulus of antimony, mercury, and gold, stand below it in the order of their affinities. With regard to gold, it must be observed, that it will not unite with pure sulphur; it suf-

fers.

fers itself to be dissolved only by the liver of sulphur, which is known to be a composition of sulphur and fixed alkali.

At the head of the tenth column appears mercury, and beneath it several metalline substances, in the order of their affinities with it. Those metalline substances are gold, silver, lead, copper, zinc, and *regulus* of antimony.

The eleventh column shews that lead has a greater affinity with silver than with copper.

The twelfth, that copper has a greater affinity with mercury than with calamine.

The thirteenth, that silver has a greater affinity with lead than with copper.

The fourteenth contains the affinities of iron. *Regulus* of antimony stands immediately underneath it, as being the metallic substance which has the greatest affinity with it. Silver, copper, and lead, are placed together in the next square below, because the degrees of affinity which those metals have with iron are not exactly determined.

The same is to be said of the fifteenth column: *Regulus* of antimony stands at its head; iron is immediately below it; and below the iron the same three metals occupy one square as before.

Lastly, The sixteenth column indicates that water has a greater affinity with spirit of wine than with salts. By this general expression must not be understood any saline substance whatever; but only the neutral salts, which spirit of wine frees from the water that kept them in solution. Fixed alkalis, on the contrary, as well as the mineral acids, have a greater affinity than spirit of wine with water; so that these saline substances, being well dephlegmated and mixed with spirit of wine, imbibe the water it contains and rectify it.

### *The Theory of Constructing the Vessels most commonly used in Chemistry.*

CHEMISTS cannot perform the operations of their art without the help of a considerable number of vessels, instruments, and furnaces, adapted to contain the bodies on which they intend to work, and to apply to them the several degrees of heat required by different processes.

Vessels intended for chemical operations should be able to bear, without breaking, the sudden application of great heat and great cold; be impenetrable to every thing, and unalterable by any solvent; unvitrifiable, and capable of enduring the most violent fire without melting: But hitherto no vessels have been found with all these qualities united.

They are made of sundry materials, namely, of metal, of glass, and of earth. Metalline vessels, especially those made of iron or copper, are apt to be corroded by almost every saline, oily, or even aqueous substance. For this reason, in order to render the use of them a little more extensive, they are tinned on the inside. But, notwithstanding this precaution, they are on many occasions not to be trusted; and should never be employed in any nice operations which require great accuracy; they are, moreover, incapable of resisting the force of fire.

Earthen vessels are of several sorts. Some, that are made of a refractory earth, are capable of being suddenly exposed to a strong fire without breaking, and even of sustaining a great degree of heat for a considerable time: But they generally suffer the vapours of the matters which they contain, as well as vitrified metals, to pass through them; especially the glass of lead, which easily penetrates them, and runs through their pores, as through a sieve. There are others made of an earth, that, when well baked, looks as if it were half vitrified: These being much less porous are capable of retaining the vapours of the matters which they contain, and even glass of lead in fusion; which is one of the severest trials a vessel can be put to: But then they are more brittle than the other sort.

Good glass-vessels should constantly be employed in preference to all others, whenever they can possibly be used: And that not only because they are no way injured by the most active solvents, nor suffer any part of what they contain to pass through, but also because their transparency allows the chemist to observe what passes within them; which is always both curious and useful. But it is pity, that vessels of this sort should not be able to endure a fierce fire without melting.

Distillation, as hath been already said, is an operation by which we separate from a body, by the help of a gradual heat, the several principles of which it consists.

There are three methods of distilling. The first is performed by applying the heat over the body whose principles are to be extracted. In this case, as the liquors when heated and converted into vapours constantly endeavour to fly from the centre of heat, they are forced to re-unite in the lower part of the vessel that contains the matter in distillation, and so passing through the pores or holes of that vessel, they fall into another cold vessel applied underneath to receive them. This way of distilling is, on this account, called distilling *per descensum*. It requires no other apparatus than two vessels figured like segments of hollow spheres, whereof that which is pierced with little holes, and intended to contain the matter to be distilled, ought to be much less than the other which is to contain the fire, and close its aperture exactly; the whole together being supported vertically upon a third vessel, which is to serve the purpose of a recipient, admitting into its mouth the convex bottom of the vessel containing the matter to be distilled, which must accurately fill it. This method of distilling is but little used.

The second method of distilling is performed by applying the heat underneath the matter to be decomposed. On this occasion the liquors being heated, rarefied, and converted into vapours, rise, and are condensed in a vessel contrived for that purpose, which we shall presently describe. This way of distilling is called distilling *per ascensum*, and is much used.

The vessel in which the distillation *per ascensum* is performed, we call an alembic. Plate LXIV. fig. 1.

There are several sorts thereof differing from one another both in the matter of which, and the manner in which, they are made.

Those

Those employed to draw the odoriferous waters and essential oils of plants are generally made of copper, and consist of several pieces. The first, which is designed to contain the plant, is formed nearly like a hollow cone, the vertex whereof is drawn out in the shape of a hollow cylinder or tube: This part is named the cucurbit, Plate LXIV. fig. 1. A; and its tube the neck of the alembic B. To the upper end of this tube another vessel is soldered: This is called the head C, and commonly has likewise the form of a cone, joined to the neck of the alembic by its base, round which on the inside is hollowed a small groove communicating with an orifice that opens at its most depending part. To this orifice is soldered a small pipe in a direction sloping downwards, which is called the nose, spout, or beak D of the alembic.

As soon as the matters contained in the alembic grow hot, vapours begin to arise from them, and ascending through the neck of the alembic into the head, are by the sides thereof stopped and condensed: From thence they trickle down in little streams to the groove, which conveys them to the spout; and by that they pass out of the alembic into a glass vessel or receiver G with a long neck, the end of the spout being introduced into that neck and luted thereto.

To facilitate the refrigeration and condensation of the vapours circulating in the head, all alembics of metal are moreover provided with another piece, which is a kind of large pan of the same metal, fitted and soldered round the head. This piece serves to keep cold water in, which incessantly cools the head, and therefore it is called the refrigeratory E. The water in the refrigeratory itself grows hot after some time, and must therefore be changed occasionally; the heated water being first drawn off by means of a cock fixed near the bottom of the refrigeratory. All copper alembics should be tinned on the inside for the reasons already given.

When saline spirits are to be distilled, alembics of metal must not be used; because the saline vapours would corrode them. In this case recourse must be had to alembics of glass. These consist of pieces only; namely, a cucurbit, whose superior orifice is admitted into, and exactly luted with its head, which is the second piece.

In general, as alembics require that the vapours of the matter to be distilled should rise to a considerable height, they ought to be used only when the most volatile principles are to be drawn from bodies: And the lighter and more volatile the substances to be separated by distillation are, the taller must the alembic be; because the most ponderous parts, being unable to rise above a certain height, fall back again into the cucurbit as soon as they arrive there, leaving the lighter to mount alone, whose volatility qualifies them to ascend into the head.

When a matter is to be distilled that requires a very tall alembic, and yet does not admit of a metalline vessel, the end will be best answered by a glass vessel of a round or oval shape, having a very long neck, with a small head fitted to its extremity. Such a vessel serves many purposes: It is sometimes employed as a receiver, and at other times as a digesting vessel; on which last occasion it goes under the name of a matrafs, fig. 3. When

one of these provided with a head, (fig. 3. C), is applied to the purpose of distilling, it forms a sort of alembic.

There are some alembics of glass, blown in such a manner by the workmen, that the body and head form but one continued piece. As these alembics do not stand in need of having their several pieces luted together, they are very useful on some occasions, when such exceeding subtle vapours rise as are capable of transpiring through lutes. The head must be open at the top, and provided with a short tube, through which by means of a funnel with a long pipe, the matter to be distilled may be introduced into the cucurbit. This is to be exactly closed with a glass stopple, the surface whereof must be made to fit the inside of the tube in every point, by rubbing those two pieces well together with emery.

Another sort of alembic hath also been invented, which may be used with advantage when cohobation is required; that is, when the liquor obtained by distillation is to be returned upon the matter in the cucurbit; and especially when it is intended that this cohobation shall be repeated a great number of times. The vessel we are speaking of is constructed exactly in the same manner as that last described; except that its beak, instead of being in a straight line as in the other alembics, forms a circular arch, and re-enters the cavity of the cucurbit, in order to convey back again the liquor collected in the head. This instrument hath commonly two beaks opposite to each other, both turned in this manner, and is called a *pelican*: It saves the artist the trouble of frequently unluting and reluting his vessels, as well as the loss of a great many vapours.

There are certain substances which in distillation afford matters in a concrete form, or rise wholly in the form of a very light powder, called *flowers*. When such substances are to be distilled, the cucurbit which contains them is covered with a head without a nose, which is named a *blind-head*.

When the flowers rise in great quantities and very high, a number of heads is employed to collect them; or rather a number of a kind of pots, consisting of a body only without any bottom, which fitting one into the other form a canal, that may be lengthened or shortened at pleasure, according as the flowers to be sublimed are more or less volatile. The last of the heads, which terminates the canal, is quite close at one end, and makes a true blind-head. These vessels are called *aludels*: they are usually of earthen or stone ware.

All the vessels above mentioned are fit only for distilling such light volatile matters as can be easily raised and brought over; such as phlegm, essential oils, fragrant waters, acid oily spirits, volatile alkalis, &c. But when the point is to procure, by distillation, principles that are much less volatile, and incapable of rising high, such as the thick fetid oils, the vitriolic, the nitrous, and the marine acids, &c. we are under a necessity of having recourse to other vessels, and another manner of distilling.

It is easy to imagine, that such a vessel must be much lower than the alembic. It is indeed no more than a hollow globe, whose upper part degenerates into a neck

or tube, that is bent into a horizontal position; for which reason this instrument is called a *retort*: It is always of one single piece.

The matter to be distilled is introduced into the body of the retort by means of a ladle with a long tubular shank. Then it is set in a furnace built purposely for this use, and so that the neck of the retort coming out of the furnace may, like the nose of the alembic, stand in a sloping position, to facilitate the egress of the liquors, which by its means are conveyed to a receiver, into which it is introduced, and with which it is luted. This way of distilling, in which the vapours seem rather to be driven out of the vessel horizontally and laterally, than raised up and sublimed, is for that reason called distillation *per latus*.

Retorts are, of all the instruments of distillation, those that must sustain the greatest heat, and resist the strongest solvents; and therefore they must not be made of metal. Some, however, which are made of iron may do well enough on certain occasions: The rest are either of glass or earth. Those of glass, for the reasons above given, are preferable to the other sort, in all cases where they are not to be exposed to such a force of fire as may melt them. The best glass, that which stands both heat and solvents best, is that in which there are fewest alkaline salts: Of this sort is the green German glass: The beautiful white crystal glass is far from being equally serviceable.

Retorts, as well as alembics, may be of different forms. For example, some matters are apt to swell and rise over the neck of the retort in substance without suffering any decomposition; when such matters are to be distilled in a retort, it is proper that the body of the vessel, instead of being globular, be drawn out into the form of a pear, so as nearly to resemble that of a cucurbit. In a retort of this kind, the distance between the bottom and the neck being much greater than in those whose bodies are spherical, the matters contained have much more room for expansion; so that the inconvenience here mentioned is thereby prevented. Retorts of this form are called English retorts: as they hold the middle place between alembics and common retorts, they may be used to distill such matters as have a mean degree of volatility between the greatest and the least.

It is moreover proper to have in a laboratory sundry retorts with necks of different diameters. Wide necks will be found the fittest for conveying thick matters, and such as readily become fixed; for instance, some very thick fetid oils, butter of antimony, &c. for as these matters acquire a consistence as soon as they are out of the reach of a certain degree of heat, they would soon choke up a narrow neck, and by stopping the vapours, which rise at the same time from the retort, might occasion the bursting of the vessels.

Some retorts are also made with an opening on their upper side, like that of tubulated glass alembics, which is to be closed in the same manner with a glass stopple. These retorts are also called *tubulated retorts*, and ought always to be used whenever it is necessary to introduce fresh matter into the retort during the operation; seeing it may be done by means of this invention, without un-

luting and reluting the vessels; which ought always to be avoided as much as possible.

One of the things that most perplexes the chemists is, the prodigious elasticity of many different vapours, which are frequently discharged with impetuosity during the distillation, and are even capable of bursting the vessels with explosion, and with danger to the artist. On such occasions it is absolutely necessary to give these vapours vent, as we shall direct in its proper place: But as that can never be done without losing a great many of them; as some of them in particular are so elastic, that scarce any at all would remain in the vessel; for instance, those of the spirit of nitre, and especially those of the smoking spirit of salt: the practice is to make use of very large receivers, of about eighteen or twenty inches diameter, that the vapours may have sufficient room to circulate in, and, by applying to the wide surface presented them by the extensive inside of such a large vessel, may be condensed into drops. These huge receivers are commonly in the form of hollow globes, and are called *ballons*.

To give these vapours still more room, ballons have been contrived with two open gullets in each, diametrically opposite to one another; whereof one admits the neck of the retort, and the other is received by one of the gullets of a second balloon of the same form, which is joined in like manner to a third, and so on. By this artifice the space may be enlarged at pleasure. These ballons with two necks are called *adapters*.

Operations on bodies that are absolutely fixed, as metals, stones, sand, &c. require only such vessels as are capable of containing those bodies and resisting the force of fire. These vessels are little hollow pots, of different dimensions, which are called crucibles. Crucibles can hardly be made of any thing but earth; they ought to have a cover of the same material fitted to shut them close. The best earth we know is that whereof those pots are made in which butter is brought from Bretagne: These pots themselves are exceeding good crucibles; and they are almost the only ones that are capable of holding glass of lead in fusion, without being penetrated by it.

For the roasting of ores, that is, freeing them by the help of fire from their sulphureous and arsenical parts, little cups made of the same material with crucibles are used; but they are made flat, shallow, and wider above than below, that these volatile matters may the more freely exhale. These vessels are called *tests*, or *scorifiers*: They are scarce used but in the docimastic art, that is, in making small assays of ores.

### *The Theory of constructing the Furnaces most commonly used in Chemistry.*

SKILL in conducting and applying fire properly, and determining its different degrees, is of very great consequence to the success of chemical operations.

As it is exceeding difficult to govern and moderate the action of fire, when the vessels in which any operation is performed are immediately exposed to it, chemists have contrived to convey heat to their vessels, in nice operations, through different mediums, which they place occasionally between those vessels and the fire.

Those

Those intermediate substances in which they plunge their vessels are called *baths*. They are either fluid or solid: The fluid baths are water, or its vapours. When the distilling vessel is set in water, the bath is called *balneum marie*, or the water-bath; and the greatest degree of heat of which it is susceptible is that of boiling water. When the vessel is exposed only to the vapours which exhale from water, this forms the vapour-bath: the heat of which is nearly the same with that of the *balneum marie*. These baths are useful for distilling essential oils, ardent spirits, sweet-scented waters; in a word, all such substances as cannot bear a greater heat without prejudice either to their odour, or to some of their other qualities.

Baths may also be made of any other fluids, such as oils, mercury, &c. which are capable of receiving and communicating much more heat; but they are very seldom used. When a more considerable degree of heat is required, a bath is prepared of any solid matter reduced to a fine powder, such as sand, ashes, filings of iron, &c. The heat of these baths may be pushed so far as to make the bottom of the vessel become faintly red. By plunging a thermometer into the bath, by the side of the vessel, it is easy to observe the precise degree of heat applied to the substance on which you are working. It is necessary that the thermometers employed on this occasion be constructed on good principles, and so contrived as to be easily compared with those of the most celebrated natural philosophers. Those of the illustrious Reaumur are most used and best known, so that it would not be amiss to give them the preference. When a greater heat is required than any of those baths can give, the vessels must be set immediately on live-coals, or in a flaming fire: this is called working with a naked fire; and in this case it is much more difficult than in the other to determine the degrees of heat.

There are several ways of applying a naked fire. When the heat or flame is reflected upon the upper part of the vessel which is exposed to the fire, this is called a reverberated heat. A melting heat is that which is strong enough to fuse most bodies. A forging heat is that of a fire which is forcibly excited by the constant blast of a pair of bellows, or more.

There is also another sort of fire which serves very commodiously for many operations, because it does not require to be fed or frequently mended: This is afforded by a lamp with one or more wicks, and may be called a lamp-heat. It is scarce ever employed but to heat baths, in operations which require a gentle and long continued warmth: if it hath any fault, it is that of growing gradually hotter.

All these different ways of applying fire require furnaces of different constructions: We shall therefore describe such as are of principal and most necessary use.

Furnaces must be divided into different parts or stories, each of which has its particular use and name.

The lower part of the furnace designed for receiving the ashes, and giving passage to the air, is called the ash-hole. The ash-hole is terminated above by a grate, the use of which is to support the coals and wood, which are to be burnt thereon: This part is called the fire-place.

The fire-place is in like manner terminated above by several iron bars, which lie quite across it from right to left, in lines parallel to each other: The use of these bars is to sustain the vessels in which the operations are to be performed. The space above these bars to the top of the furnace is the upper story, and may be called the laboratory of the furnace. Lastly, some furnaces are quite covered above, by means of a kind of vaulted roof called the dome.

Furnaces have moreover several apertures: one of these is at the ash-hole, which gives passage to the air, and through which the ashes that fall through the grate are raked out; this aperture is called the ash-hole door: another is at the fire-place, through which the fire is supplied with fuel, as occasion requires; this is called the mouth or door of the fire-place, or the stoke-hole: there is a third in the upper story, through which the neck of the vessel passes; and a fourth in the dome, for carrying off the fuliginosities of combustible matters, which is called the chimney.

To conclude, there are several other openings in the several parts of the furnace, the use whereof is to admit the air into those places, and also, as they can be easily shut, to incite or slacken the activity of the fire, and so to regulate it; which has procured them the title of *registers*. All the other openings of the furnace should be made to shut very close, the better to assist in governing the fire; by which means they likewise do the office of registers.

In order to our forming a just and general idea of the construction of furnaces, and of the disposition of the several apertures in them, with a view to increase or diminish the activity of the fire, it will be proper to lay down, as our ground-work, certain principles of natural philosophy, the truth of which is demonstrated by experience.

And first, every body knows that combustible matters will not burn or consume unless they have a free communication with the air; inasmuch that if they be deprived thereof, even when burning most rapidly, they will be extinguished at once: that consequently combustion is greatly promoted by the frequent accession of fresh air; and that a stream of air, directed so as to pass with impetuosity through burning fuel, excites the fire to the greatest possible activity.

Secondly, It is certain that the air which touches or comes near ignited bodies is heated, rarefied, and rendered lighter than the air about it; that is, further distant from the centre of heat: and consequently that this air so heated and become lighter is necessarily determined thereby to ascend and mount aloft, in order to make room for that which is less heated and not so light, which by its weight and elasticity tends to occupy the place quitted by the other. Another consequence hereof is, that if fire be kindled in a place inclosed every where but above and below, a current of air will be formed in that place, running in a direction from the bottom to the top; so that if any light bodies be applied to the opening below, they will be carried up towards the fire; but, on the contrary, if they be held at the opening above, they will be impelled by a force which will drive them up and carry them away from the fire.

Thirdly,

Thirdly, and lastly, it is a truth demonstrated in hydraulics, that the velocity of a given quantity of any fluid, determined to flow in any direction whatever, is so much the greater, the narrower the channel is to which that fluid is confined; and consequently that the velocity of a fluid will be increased by making it run from a wider through a narrower passage.

These principles being established, it is easy to apply them to the construction of furnaces. First, if a fire be kindled in the fire-place of a furnace, which is open on all sides, it burns nearly as if it were in the open air. It has with the surrounding air a free communication; so that fresh air is continually admitted to facilitate the entire combustion of the inflammable matters employed as fuel. But there being nothing to determine that air to pass with rapidity through the fire in this case, it does not at all augment the activity thereof, but suffers it to waste away quietly.

Secondly, If the ash-hole or dome of a furnace in which a fire is burning be shut quite close, then there is no longer any free communication between the air and the fire: if the ash-hole be shut, the air is debarred from having free access to the fire; if the dome be stoped, the egress of the air rarefied by the fire is prevented; and consequently the fire must in either case burn very faintly and slowly, gradually die away, and at last go quite out.

Thirdly, If all the openings of the furnace be wholly closed, it is evident that the fire will be very quickly extinguished.

Fourthly, If only the lateral openings of the fire-place be shut, leaving the ash-hole and upper part of the furnace open; it is plain that the air entering by the ash-hole will necessarily be determined to go out at top, and that consequently a current of air will be formed, which will pass through the fire, and make it burn briskly and vigorously.

Fifthly, If both the ash-hole and the upper story of the furnace be of some length, and form canals either cylindric or prismatic, then the air being kept in the same direction through a longer space, the course of its stream will be both stronger and better determined, and consequently the fire will be more animated by it.

Sixthly, and lastly, if the ash hole and the upper part of the furnace, instead of being cylindric or prismatic canals, have the form of truncated cones or pyramids, standing on their bases, and so ordered that the upper opening of the ash-hole adjoining to the fire-place may be wider than the base of the superior cone or pyramid; then the stream of air, being forced to pass incessantly from a larger channel through a smaller, must be considerably accelerated, and procure to the fire the greatest activity which it can receive from the make of a furnace.

The materials fittest for building furnaces are, 1. Bricks, joined together with potters clay mixed with sand, and moistened with water. 2. Potters clay mingled with potsherds, moistened with water, and baked in a violent fire. 3. Iron; of which all furnaces may be made; with this precaution, that the inside be provided with a great many prominent points, as fastenings for a coat of earth, with which the internal parts of the furnace

must necessarily be covered to defend it from the action of the fire.

The reverberating furnace is one of those that are most employed in chemistry: it is proper for distillations by the retort, and should be constructed in the following manner.

First, The use of the ash-hole being, as was said, to give passage to the air, and to receive the ashes, no bad consequence can attend its being made pretty high: It may have from twelve to twenty or twenty-four inches in height. Its aperture should be wide enough to admit billets of wood when a great fire is to be made.

Secondly, The ash-hole must be terminated at its upper part by an iron grate, the bars of which should be very substantial, that they may resist the action of the fire: this grate is the bottom of the fire-place, and destined to support the coals. In the lateral part of the fire-place, and nearly about the same height with the grate, there should be a hole of such a size that it may easily admit charcoal, as well as little tongs and shovels for managing the fire. This aperture or mouth of the fire-place should be perpendicularly over the mouth of the ash-hole.

Thirdly, from six to eight or ten inches high above the grate, over the ash-hole, little apertures must be made in the walls of the furnace, of eight or ten lines in diameter, an inch from one another, and those in one side must be diametrically opposite to those in the other. The use of these holes is to receive bars of iron for the retort to rest on; which should be, as was said, at different heights, in order to accommodate retorts of different sizes. At the upper extremity of this part of the furnace, which reaches from the iron bars to the top, the height whereof should be somewhat less than the width of the furnace, must be cut a semi-circular aperture for the neck of the retort to come through. This hole must by no means be over the doors of the fire-place and ash-hole; for then, as it gives passage to the neck of the retort, it must of course be opposite to the receiver, and in that case the receiver itself would stand over against those two apertures; which would be attended with this double inconvenience, that the receiver would not only grow very hot, but greatly embarrass the operator, whose free access to the fire-place and ash-hole would be thereby obstructed. It is proper therefore, that the semi-circular cut we are speaking of be so placed, that, when the greatest ballons are luted to the retort, they may leave an open passage to the fire-place or ash-hole.

Fourthly, in order cover in the laboratory of the reverberating furnace, there must be a roof made for it in the form of a cupola, or concave hemisphere, having the same diameter as the furnace. This dome should have a semi-circular cut in its rim answering to that above directed to be made in the upper extremity of the furnace, so that, when adjusted to each other, the two together may form a circular hole for the neck of the retort to pass through. At the top of this dome there must also be a circular hole of three or four inches diameter, carrying a short tapering funnel of the same diameter, and three inches high, which will serve for a chimney

chimney to carry off all fuliginosities, and accelerate the current of the air. This passage may be shut at pleasure with a flat cover. Moreover, as it is necessary that the dome should be taken off and put on with ease, it should have two ears or handles for that purpose: a portable or moveable furnace should also have a pair of handles fixed opposite to each other between the ash-hole and the fire place.

Sixthly and lastly, a conical canal must be provided of about three foot long, and sufficiently wide at its lower end to admit the funnel of the aperture at the top of the dome. This conical tube is to be applied to the dome when the fire is required to be extremely active: it tapers gradually from its base upwards, and breaks off as if truncated at top, where it should be about two inches wide.

Besides the apertures already mentioned as necessary to a reverberating furnace, there must also be many other smaller holes made in its ash-hole, fire-place, laboratory, and dome, which must all be so contrived as to be easily opened and shut with stopples of earth: these holes are the registers of the furnace, and serve to regulate the activity of the fire according to the principles before laid down.

When the action of the fire is required to be exactly uniform and very brisk, it is necessary to stop carefully with moist earth all the little chinks in the juncture of the dome with the furnace, between the neck of the retort and the circular hole through which it passes, and which it never fills exactly, and lastly the holes which receive the iron bars that sustain the retort.

It is proper to have in a laboratory several reverberating furnaces of different magnitudes; because they must be proportioned to the size of the retorts employed. The retort ought to fill the furnace, so as to leave only the distance of an inch between it and the inside of the furnace.

Yet when the retort is to be exposed to a most violent fire, and especially when it is required that the heat shall act with equal force on all parts of the furnace, and as strongly on its vault as on its bottom, a greater distance must be left between the retort and the inside of the furnace; for then the furnace may be filled with coals, even to the upper part of the dome. If moreover some pieces of wood be put into the ash-hole, the conical canal fitted on to the funnel of the dome, and all the apertures of the furnace exactly closed, except the ash-hole and the chimney, the greatest heat will then be excited that this furnace can produce.

The furnace now described may also be employed in many other chemical operations. If the dome be laid aside, an alembic may very well be placed therein: but then the space, which will be left between the body of the alembic and the top of the upper part of the furnace, must be carefully filled up with Windsor-loam moistened; for without that precaution the heat would soon reach the very head, which ought to be kept as cool as possible, in order to promote the condensation of the vapours.

On this occasion therefore it will be proper to leave no holes open in the fire-place, but the lateral ones; of

which also those over against the receiver must be stopped.

A pot or broad-brimmed earthen pan may be placed over this furnace, and being so fitted to it as to close the upper part thereof accurately, and filled with sand, may serve for a sand-heat to distill with.

The bars designed to support distilling vessels being taken out, a crucible may stand therein, and many operations be performed that do not require the utmost violence of fire. In a word, this furnace is one of the most commodious that can be, and more extensively useful than any other.

The melting furnace is designed for applying the greatest force of heat to the most fixed bodies, such as metals and earths. It is never employed in distilling: it is of no use but for calcination and fusion; and consequently need not admit any vessels but crucibles.

The ash-hole of this furnace differs from that of the reverberating furnace only in this, that it must be higher, in order to raise the fire-place to a level with the artist's hand; because in that all the operations of this furnace are performed. The ash-hole therefore must be about three foot high: and this height procures it moreover the advantage of a good draught of air. For the same reason, and in consequence of the principles we laid down, it should be so built that its width lessening insensibly from the bottom to the top, it may be narrower where it opens into the fire-place than any where below.

The ash-hole is terminated at its upper end, like that of the reverberating furnace, by a grate which serves for the bottom of the fire-place, and ought to be very substantial that it may resist the violence of the fire. The inside of this furnace is commonly an elliptic curve; because it is demonstrated by mathematicians, that surfaces having that curvature reflect the rays of the sun, or of fire, in such a manner, that, meeting in a point or a line, they produce there a violent heat. But to answer this purpose, those surfaces must be finely polished; an advantage hardly procureable to the internal surface of this furnace, which can be made of nothing but earth: besides, if it were possible to give it a polish, the violent action of the fire that must be employed in this furnace would presently destroy it. Yet the elliptical figure must not be entirely disregarded: for, if care be taken to keep the internal surface of the furnace as smooth as possible, it will certainly reflect the heat pretty strongly, and collect it about the center.

The fire-place of this furnace ought to have but four apertures.

First, that of the lower grate, which communicates with the ash-hole.

Secondly, a door in its fore-side, through which may be introduced coals, crucibles, and tongs for managing them: this aperture should be made to shut exactly with a plate of iron, having its inside coated with earth, and turning on two hinges fixed to the furnace.

Thirdly, over this door a hole slanting downwards towards the place where the crucible is to stand. The use of this hole is to give the operator an opportunity of examining

aming the condition of the matters contained in his crucible, without opening the door of the fire-place: this hole should be made to open and shut easily, by means of a stopple of earth.

Fourthly, a circular aperture of about three inches wide in the upper part or vault of the furnace, which should gradually lessen and terminate, like that of the dome of the reverberating furnace, in a short conical funnel of about three inches long, and fitted to enter the conical pipe before described, which is applied when the activity of the fire is to be increased.

When this furnace is to be used, and a crucible to be placed in it, care must be taken to set on the grate a cake of baked earth somewhat broader than the foot of the crucible. The use of this stand is to support the crucible, and raise it above the grate, for which purpose it should be two inches thick. Were it not for this precaution, the bottom of the crucible, which would stand immediately on the grate, could never be thoroughly heated, because it would be always exposed to the stream of cold air which enters by the ash-hole. Care should also be taken to heat this earthen bottom red-hot before it be placed in the furnace, in order to free it from any humidity, which might otherwise happen to be driven against the crucible during the operation, and occasion its breaking.

We omitted to take notice, in speaking of the ash hole, that, besides its door, it should have about the middle of its height a small hole, capable of receiving the nose of a good perpetual bellows, which is to be introduced into it and worked, after the door is exactly shut, when it is thought proper to excite the activity of the fire to the utmost violence.

The forge is only a mass of bricks of about three foot high, along whose upper surface is directed the nose or pipe of a pair of large perpetual bellows, so placed that the operator may easily blow the fire with one hand. The coals are laid on the hearth of the forge near the nose of the bellows; they are confined, if necessary, to prevent their being carried away by the wind of the bellows, within a space inclosed by bricks; and then by pulling the bellows the fire is continually kept up in its greatest activity. The forge is of use when there is occasion to apply a great degree of heat suddenly to any substance, or when it is necessary that the operator be at liberty to handle frequently the matters which he proposes to fuse or calcine.

The cupelling furnace is that in which gold and silver are purified, by the means of lead, from all alloy of other metallic substances. This furnace must give a heat strong enough to vitrify lead, and therewith all the alloy which the perfect metals may contain. This furnace is to be built in the following manner.

First, of thick iron-plates, or of some such composition of earth as we recommended for the construction of furnaces, must be formed a hollow quadrangular prism, whose sides may be about a foot broad, and from ten to eleven inches high; and extending from thence upwards may converge towards the top, so as to form a pyramid truncated at the height of seven or eight inches, and terminated by an aperture of the width of seven or eight

inches every way. The lower part of the prism is terminated and closed by a plate of the same materials of which the furnace is constructed.

Secondly, in the fore-side or front of this prism there is an opening of three or four inches in height by five or six inches in breadth: this opening, which should be very near the bottom, is the door of the ash-hole. Immediately over this opening is placed an iron grate, the bars of which are quadrangular prisms of half an inch square, laid parallel to each other, and about eight or nine inches asunder, and so disposed that two of their angles are laterally opposite, the two others looking one directly upwards, and the other downwards. As in this situation the bars of the grate present to the fire-place very oblique surfaces, the ashes and very small coals do not accumulate between them, or hinder the free entrance of the air from the ash-hole. This grate terminates the ash-hole at its upper part, and serves for the bottom of the fire-place.

Thirdly, three inches, or three and a half, above the grate, there is in the fore-side of the furnace another opening terminated by an arch for its upper part, which consequently has the figure of a semi-circle: it ought to be four inches wide at bottom, and three inches and an half high at its middle. This opening is the door of the fire-place; yet it is not intended for the same uses as the door of the fire-place in other furnaces: the purpose for which it is actually destined shall be explained when we come to shew how the furnace is to be used. An inch above the door of the fire-place, still in the fore-side of the furnace, are two holes of about an inch diameter, and at the distance of three inches and a half from each other, to which answer two other holes of the same size; made in the hinder part, directly opposite to these. There is, moreover, a fifth hole of the same width about an inch above the door of the fire-place. The design of all these holes shall be explained when we describe the manner in which these furnaces are to be used.

Fourthly, the fore-part of the furnace is bound by three iron braces, one of which is fixed just below the door of the ash-hole; the second occupies the whole space between the ash-hole door and the door of the fire-place, and has two holes in it, answering to those which we directed to be made in the furnace itself about this place; and the third is placed immediately over the door of the fire-place. These braces must extend from one corner of the front of the furnace to the other, and be fastened thereto with iron pins, in such a manner that their sides next to the doors may not lie quite close to the body of the furnace, but form a kind of grooves for the iron plates to slide in, that are designed to shut the two doors of the furnace when it is necessary. Each of these iron plates should have a handle, by which it may be conveniently moved; and to each door there should be two plates, which meeting each other, and joining exactly in the middle of the door-place, may shut it very close. Each of the two plates belonging to the door of the fire-place ought to have a hole in its upper part; one of these holes should be a slit of about two lines wide, and half an inch long; the other may be a semi-circular opening of one inch in height and two in breadth.

breadth. These holes should be placed so that neither of them may open into the fire-place when the two plates are joined together in the middle of the door to shut it close.

Fifthly, to terminate the furnace above, there must be a pyramid, formed of the same materials with the furnace, hollow, quadrangular, three inches high, on a base of seven inches, which base must exactly fit the upper opening of the furnace: the top of this pyramidal cover must end in a tube of three inches in diameter and two in height, which must be almost cylindrical, and yet a little inclining to the conical form. This tube serves, as in the furnaces already described, to carry the conical funnel, which is fitted to the upper part when a fire of extraordinary activity is wanted.

The furnace thus constructed is fit to serve all the purposes for which it is designed; yet, before it can be used, another piece must be provided, which, though it does not properly belong to the furnace, is nevertheless necessary in all the operations performed by it; and that is a piece contrived to contain the cupels, or other vessels which are to be exposed to the fire in this furnace. It is called a *muffle*, and is made in the following manner.

On an oblong square, of four inches in breadth, and six or seven in length, a concave semi-cylinder is erected, in the form of a vault, which makes a semi-circular canal, open at both ends. One of these is almost entirely closed, except that near the bottom two small semi-circular holes are left. In each of its sides likewise two such holes are made, and the other end is left quite open.

The muffle is intended to bear and communicate the fiercest heat; and therefore it must be made thin, and of an earth that will resist the violence of fire, such as that of which crucibles are made. The muffle being thus constructed, and then well baked, is fit for use.

When it is to be used, it must be put into the furnace by the upper opening, and set upon two iron bars, introduced through the holes made for that purpose below the door of the fire-place. The muffle must be placed on these bars in the fire-place, in such a manner that its open end shall stand next to and directly against the door of the fire-place, and may be joined to it with lute. Then the cupels are ranged in it, and the furnace is filled up, to the height of two or three inches above the muffle, with small coals not bigger than a walnut, to the end that they may lie close round the muffle, and procure it an equal heat on every side. The chief use of the muffle is to prevent the coals and ashes from falling into the cupels, which would be very prejudicial to the operations carrying on in them: for the lead would not vitrify as it ought, because the immediate contact of the coals would continually restore its phlogiston; or else the glass of lead, which ought to penetrate and pass through the cupels, would be rendered incapable of so doing; because the ashes mixing therewith would give it such a consistence and tenacity as would destroy that property, or at least considerably lessen it. The openings, therefore, which are left in the lower part of the muffle, should not be so high as to admit coals or ashes to get into the cupels; the use of them is to procure an easier passage for the heat and the air to those vessels. The muffle is left quite

open in its fore-part, that the operator may be at liberty to examine what passes in the cupels, to stir their contents, to remove them from one place to another, to convey new matters into them, &c. and also to promote the free access of the air, which must concur with the fire towards the evaporation necessary to the vitrification of lead; which air, if fresh were not often enough admitted, would be incapable of producing that effect; because it would soon be loaded with such a quantity of vapours that it could not take up any more.

The government of the fire in this furnace is founded on the general principles above laid down for all furnaces. Yet as there are some little differences, and as it is very essential to the success of the operations for which this furnace is intended, that the artist should be absolutely master of his degree of heat, we shall in few words shew how that may be raised or lowered.

When the furnace is filled with coals and kindled, if the door of the ash-hole be set wide open, and that of the fire place shut very close, the force of the fire is increased; and if, moreover, the pyramidal cover be put on the top, and the conical funnel added to it, the fire will become still more fierce.

Seeing the matters contained in this furnace are encompassed with fire on all sides, except in the fore part opposite to the door of the fire place, and as there are occasions which require that the force of the fire should be applied to this part also, an iron box, of the shape and size of the door, hath been contrived to answer that purpose. This box is filled with lighted coals, and applied immediately to the door-place, by which means the heat there is considerably augmented. This help may be made use of at the beginning of the operation, in order to accelerate it, and bring the heat sooner to the desired degree; or in case a very fierce heat be required; or at a time when the air being hot and moist will not make the fire burn with the necessary vigour.

The heat may be lessened, by removing the iron box, and shutting the door of the fire-place quite close. It may be still further and gradually diminished, by taking off the conical funnel from the top; by shutting the door of the fire-place with one of its plates only, that which has the least, or that which has the greatest aperture in it; by taking off the pyramidal cover; by shutting the ash-hole door wholly or in part; and lastly, by setting the door of the fire-place wide open: but, in this last case, the cold air penetrates into the cavity of the muffle, and refrigerates the cupels more than is almost ever necessary. If it be observed, during the operation, that the muffle grows cold in any particular part, it is a sign there is a vacuity left by the coals in that place: in this case an iron wire must be thrust into the furnace, through the hole which is over the door of the fire-place, and the coals stirred therewith, so as to make them fall into their places and fill up the vacant interstices.

It is proper to observe, that, besides what has been said concerning the ways of increasing the activity of the fire in the cupelling furnace, several other causes also may concur to procure to the matters contained in the muffle a greater degree of heat: for example, the smaller the muffle is, the wider and more numerous the holes in it are;

are; the nearer to its bottom, or further end, the cupels are placed, the more will the matters therein contained be affected with heat.

Besides the operations to be performed by the cupel, this furnace is very useful, and even necessary, for many chemical experiments; such, for instance, as those relating to fundry vitrifications and enamelling. As it is pretty low, the best way is to place it, when it is to be used, on a base of brick-work that may raise it to a level with the operator's hand.

A lamp-furnace is exceeding useful for all operations that require only a moderate, but long continued degree of heat. The furnace for working with a lamp heat is very simple: it consists only of a hollow cylinder, from fifteen to eighteen inches high, and five or six in diameter, having at its bottom an aperture large enough for a lamp to be introduced and withdrawn with ease. The lamp must have three or four wicks, to the end that by lighting more or fewer of them a greater or less degree of heat may be produced. The body of the furnace must moreover have several small holes in it, in order to supply the flame of the lamp with air enough to keep it alive.

On the top of this furnace stands a basin five or six inches deep, which ought to fill the cavity of the cylinder exactly, and to be supported at its circumference by a rim which may entirely cover and close the furnace: The use of this basin is to contain the sand through which the lamp-heat is usually conveyed.

Besides this, there must be a kind of cover or dome made of the same material with the furnace, and of the same diameter with the sand-bath, without any other opening than a hole, nearly circular, cut in its lower extremity. This dome is a sort of reverberatory, which serves to confine the heat and direct it towards the body of the retort; for it is used only when something is to be distilled in a vessel of this fashion; and then the hole at its bottom serves for a passage to the neck of the retort. This dome should have an ear or handle, for the convenience of putting it on and taking it off with ease.

#### *Of Lutes.*

CHEMICAL vessels, especially such as are made of glass, and the earthen vessels commonly called stoneware, are very subject to break when exposed to sudden heat or cold; whence it comes that they often crack when they begin to heat, and also when being very hot they happen to be cooled, either by fresh coals thrown into the furnace, or by the access of cold air. There is no way to prevent the former of these accidents, but by taking the pains to warm your vessel very slowly, and by almost insensible degrees. The second may be avoided by coating the body of the vessel with a paste or lute, which being dried will defend it against the attacks of cold.

The fittest stuff for coating vessels is a composition of fat earth, Windfor-loam, fine sand, filings of iron, or powdered glass, and chopped cow's hair, mixed and made into a paste with water. This lute serves also to defend glass vessels against the violence of the fire, and to prevent their melting easily.

In almost all distillations it is of great consequence,

as hath been said, that the neck of the distilling vessel be exactly joined with that of the receiver into which it is introduced, in order to prevent the vapours from escaping into the air and so being lost: And this junction is effected by means of a lute.

A few slips of paper, applied round the neck of the vessels with common lize, will be sufficient to keep in such vapours as are aqueous, or not very spirituous.

If the vapours are more acrid and more spirituous, recourse may be had to slips of bladder long steeped in water, which, containing a sort of natural glue, close the junctures of the vessels very well.

If it be required to confine vapours of a still more penetrating nature, it will be proper to employ a lute that quickly grows very hard; particularly a paste made with quick-lime and any sort of jelly, whether vegetable or animal; such as the white of an egg, stiff lize, &c. This is an excellent lute, and not easily penetrated. It is also used to stop any cracks or fractures that happen to glass vessels. But it is not capable of resisting the vapours of mineral acid spirits, especially when they are strong and smoking: For that purpose it is necessary to incorporate the other ingredients thoroughly with fat earth softened with water; and even then it frequently happens that this lute is penetrated by acid vapours, especially those of the spirit of salt, which of all others are confined with the greatest difficulty.

In such cases its place may be supplied with another, which is called fat lute, because it is actually worked up with fat liquors. This lute is composed of a very fine cretaceous earth, called tobacco-pipe clay, moistened with equal parts of the drying oil of lint-seed, and a varnish made of amber and gum copal. It must have the consistence of a stiff paste. When the joints of the vessels are closed up with this lute, they may, for greater security, be covered over with slips of linen smeared with the lute made of quick-lime and the white of an egg.

Chemical vessels are liable to be broken in an operation by other causes besides the sudden application of heat or cold. It frequently happens that the vapours of the matters, exposed to the action of fire, rush out with such impetuosity, and are so elastic, that finding no passage through the lute with which the joints of the vessels are closed, they burst the vessels themselves, sometimes with explosion and danger to the operator.

To prevent this inconvenience, it is necessary, that in every receiver there be a small hole, which being stopped only with a little lute may easily be opened and shut again as occasion requires. It serves for a vent-hole to let out the vapours, when the receiver begins to be too much crowded with them. Nothing but practice can teach the artist when it is requisite to open this vent. If he hits the proper time, the vapours commonly rush out with rapidity, and a considerable hissing noise; and the vent should be stopped again as soon as the hissing begins to grow faint. The lute employed to stop this small hole ought always to be kept so ductile, that by taking the figure of the hole exactly it may entirely stop it. Besides, if it should harden upon the glass, it would stick so fast, that it would be very difficult to remove it without breaking

ing

ing the vessel. This danger is easily avoided by making use of the fat lute, which continues pliant for a long time, when it is not exposed to an excessive heat.

This way of stopping the vent-hole of the receiver has yet another advantage: For if the hole be of a proper width, as a line and half, or two lines, in diameter, then when the vapours are accumulated in too great a quantity, and begin to make a great effort against the sides of the receiver, they push up the stopple, force it out, and make their way through the vent-hole: So that by this means the breaking of the vessels may always be certainly prevented. But great care must be taken that the vapours be not suffered to escape in this manner, except when absolute necessity requires it; for it is generally the very strongest and most subtle part of a liquor which is thus dissipated and lost.

Heat being the chief cause that puts the elasticity of the vapours in action, and prevents their condensing into a liquor, it is of great consequence in distillation that the receiver be kept as cool as possible. With this view a thick plank should be placed between the receiver and the body of the furnace, to intercept the heat of the latter, and prevent its reaching the former. As the vapours themselves rise very hot from the distilling vessel, they soon communicate their heat to the receiver, and especially to its upper part, against which they strike first. For this reason it is proper, that linen cloths dipt in very cold water be laid over the receiver, and frequently shifted. By this means the vapours will be considerably cooled, their elasticity weakened, and their condensation promoted.

By what hath been said in this first part, concerning the properties of the principal agents in chemistry, the construction of the most necessary vessels and furnaces, and the manner of using them, we are sufficiently prepared for proceeding directly to the operations, without being obliged to make frequent and long stops, in order to give the necessary explanations on those heads.

Nevertheless, we shall take every proper occasion to extend the theory here laid down, and to improve it by the addition of several particulars, which will find their places in our treatise of chemical operations.

## PART II. PRACTICE OF CHEMISTRY.

### Of the VITRIOLIC ACID.

#### To extract Vitriol from the Pyrites.

TAKE any quantity you please of iron pyrites; leave them for some time exposed to the air: They will crack, split, lose their brightness, and fall into powder. Put this powder into a glass cucurbit, and pour upon it twice

its weight of hot water; stir the whole with a stick, and the liquor will grow turbid. Pour it while it is yet warm into a glass funnel lined with brown filtering paper; and having placed your funnel over another glass cucurbit, let the liquor drain into it. Pour more hot water on the powdered pyrites, filter as before, and so go on, every time lessening the quantity of water, till that which comes off the pyrites appears to have no astringent vitriolic taste.

Put all these waters together into a glass vessel that widens upwards; set it on a sand bath, and heat the liquor till a considerable smoke arises; but take care not to make it boil. Continue the same degree of fire till the surface of the liquor begins to look dim, as if some dust had fallen into it; then cease evaporating, and remove the vessel into a cool place: In the space of four and twenty hours there will be formed therein a quantity of crystals, of a green colour and a rhomboidal figure: These are vitriol of Mars, or copperas. Decant the remaining liquor; add thereto twice its weight of water; filter, evaporate, and crystallize as before: repeat these operations till the liquor will yield no more crystals, and keep by themselves the crystals obtained at each crystallisation.

In large works for extracting vitriol from the pyrites, they proceed thus. They collect a great quantity of pyrites on a piece of ground exposed to the air, and pile them up in heaps of about three foot high. There they leave them exposed to the action of the air, sun, and rain, for three years together; taking care to turn them every six months, in order to facilitate the efflorescence of those which at first lay undermost. The rain-water which has washed those pyrites is conveyed by proper channels into a cistern; and when a sufficient quantity thereof is gathered, they evaporate it to a pellicle in large leaden boilers, having first put into it a quantity of iron, some part of which is dissolved by the liquor, because it contains a vitriolic acid that is not fully saturated therewith. When it is sufficiently evaporated, they draw it off into large leaden or wooden coolers, and there leave it to shoot into crystals. In these last vessels several sticks are placed, crossing each other in all manner of directions, in order to multiply the surfaces on which the crystals may fasten.

*To extract Sulphur from the Pyrites, and other sulphureous Minerals.*

REDUCE to a coarse powder any quantity of yellow pyrites, or other mineral containing sulphur. Put this powder into an earthen or glass retort, having a long wide neck, and so large a body that the matter may fill but two thirds of it. Set the retort in a sand-bath fixed over a reverberating furnace: Fit to it a receiver half full of water, and so placed that the nose of the retort may be about an inch under the water: Give a gradual fire, taking care you do not make it so strong as to melt the matter. Keep the retort moderately red for one hour, or an hour and half, and then let the vessels cool.

Almost all the sulphur, separated by this operation from its matrix, will be found at the extremity of the neck of the retort, being fixed there by the water. You may get it out either by melting it with such a gentle heat as will not set it on fire, or by breaking the neck of the retort.

*To extract Alum from aluminous Minerals.*

TAKE such minerals as are known or suspected to contain alum. Expose them to the air, that they may effloresce. If they remain there a year without any sensible

change, calcine them, and then leave them exposed to the air, till a bit thereof being put on the tongue imparts an astringent aluminous taste.

When your matters are thus prepared, put them into a leaden or glass vessel; pour upon them thrice their weight of hot water; boil the liquor; filter it; and repeat these operations till the earth be so edulcorated that the water which comes off it hath no taste. Mix all these solutions together, and let them stand four and twenty hours, that the gross and earthy parts may settle to the bottom; or else filter the liquor: then evaporate till it will bear a new-laid egg. Now let it cool, and stand quiet four and twenty hours: in that time some crystals will shoot, which are most commonly vitriolic; for alum is rarely obtained by the first crystallisation. Remove these vitriolic crystals: if any crystals of alum be found amongst them, these must be dissolved anew, and set to crystallise a second time in order to their purification; because they partake of the nature as well as of the colour of vitriol. By this method extract all the alum that the liquor will yield.

If you get no crystals of alum by this means, boil your liquor again, and add to it a twentieth part of its weight of a strong alkaline lixivium, or a third part of its weight of putrescent urine, or a small quantity of quick-lime. Experience and repeated trials must teach you which of these three substances is to be preferred, according to the particular nature of the mineral on which you are to operate. Keep your liquor boiling, and if there be any alum in it, there will appear a white precipitate; in that case let it cool and settle. When the white precipitate is entirely fallen, decant the clear, and leave the crystals of alum to shoot at leisure, till the liquor will yield no more; it will then be exceeding thick.

Alum is obtained from several sorts of minerals. In some parts of Italy, and in sundry other places, it effloresces naturally on the surface of the earth. There it is swept together with brooms, and thrown into pits full of water. This water is impregnated therewith till it can dissolve no more. Then it is filtered, and set to evaporate in large leaden vessels; and when it is sufficiently evaporated, and ready to shoot into crystals, it is drawn off into wooden coolers, and there left for the salt to crystallise.

In aluminous soils there are often found springs strongly impregnated with alum; so that to obtain it the water need only be evaporated.

In the country about Rome there is a very hard stone, which is hewn out of the quarry, just like other stones for building: this stone yields a great deal of alum. In order to extract it, the stones are calcined for twelve or fourteen hours; after which they are exposed to the air in heaps, and carefully watered three or four times a day for forty days together. In that time they begin to effloresce, and to throw out a reddish matter on their surface. Then they are boiled in water, which dissolves all the alum they contain, and being duly evaporated gives it back in crystals. This is the alum called Roman alum.

Several sorts of pyrites also yield a great deal of alum. The English have a stone of this kind, which in colour is very like a slate. This stone contains much sulphur, which

which they get rid of by roasting it. After this they steep the calcined stone in water, which dissolves the alum it contains, and to this solution they add a certain quantity of a lye made of the ashes of sea-weeds.

*To extract the Vitriolic Acid from Green Vitriol.*

TAKE any quantity of green vitriol: put it in an unglazed earthen vessel, and heat it gradually. Vapours will soon begin to rise. Increase the fire a little, and it will liquify by means of the water contained in it, and acquire what we called an *aqueous fluor*. Continue the calcination, and it will become less and less fluid, grow thick, and turn of a greyish colour. Now raise your fire, and keep it up till the salt recover its solidity, acquire an orange colour, and begin to grow red where it immediately touches the sides of the vessel. Then take it out and reduce it to powder.

Put the vitriol thus calcined and pulverised into a good earthen retort, of which one half at least must remain empty. Set the retort in a reverberatory furnace: Fit thereto a large glass receiver, and, having luted the joint well, give fire by degrees. You will soon see white clouds rise into the receiver, which will render it opaque and heat it. Continue the same degree of fire till these clouds disappear: They will be succeeded by a liquor which will trickle down the sides of the receiver in veins. Still keep up the fire to the same degree as long as these veins appear. When they begin to abate, encrease the fire, and push it to the utmost extremity: Upon this there will come over a black, thick liquor: It will even be found congealed, and prove the icy oil of vitriol, if care hath been taken to change the receiver, keep the vessels perfectly close, and give a sufficient degree of heat. Proceed thus till nothing more comes over, or at least very little. Let the vessels cool, unlute them, pour the contents of the receiver into a bottle, and seal it hermetically.

*To decompose Sulphur, and extract its Acid, by burning it.*

TAKE any quantity of the purest sulphur; fill therewith a crucible or other earthen dish; heat it till it melts; then set it on fire, and when its whole surface is lighted, place it under a large glass head, so that the flame of the sulphur do not touch either its sides or bottom; that the air have free access, in order to make the sulphur burn clear; that the head incline a little toward the side on which its beak is, that as the vapours condense therein the liquor may run off with ease. To the beak of this vessel fit a receiver: The fumes of the lighted sulphur will be condensed, and gather into drops in the head, out of which they will run into the receiver. There, when the sulphur has done burning, you will find an acid liquor, which is the spirit of sulphur.

*To concentrate the Vitriolic Acid.*

TAKE the vitriolic acid you intend to concentrate, that is, to dephlegmate and make stronger: Pour it into a good glass retort of such a size that your quantity of acid may but half fill it: Set this retort in the sand-bath of a reverberating furnace; fit it to a receiver;

lute it on, and give a gradual fire. There will come over into the receiver a clear liquor, the first drops of which will be but faintly acid: This is the most aqueous part.

When the drops begin to follow one another much more slowly, raise your fire, till the liquor begin to bubble a little in the middle. Keep it thus gently boiling, till one half or two thirds thereof be come over into the receiver. Then let your vessels cool; unlute them; what remains in the retort pour into a crystal bottle, and stop it exactly with a glass stopple rubbed with emery.

*To decompose vitriolated Tartar by means of the Phlogiston; or to compose Sulphur by combining the Vitriolic Acid with the Phlogiston.*

TAKE equal parts of vitriolated tartar, and very dry salt of tartar, separately reduced to powder; add an eighth part of their weight of charcoal dust; and mix the whole together very accurately. Throw this mixture into a red-hot crucible, placed in a furnace filled with burning coals. Cover it very close, and keep it very hot, till the mixture melt, which may be known by uncovering the crucible from time to time. There will then appear a bluish flame, accompanied with a pungent smell of sulphur.

Take the crucible out of the fire; dissolve its contents in hot water; filter the solution through brown paper supported by a glass funnel; drop into the filtered liquor by little and little any acid whatever. As you add the acid, the liquor will grow more and more turbid, and let fall a grey precipitate. Continue dropping in more acid till the liquor will yield no more precipitate. Filter it a second time to separate it from the precipitate: What remains on the filter is a true inflammable sulphur, which you may either melt or sublime into flowers.

### Of the NITROUS ACID.

*To extract nitre out of nitrous earths and stones. The purification of salt petre. Mother of nitre. Magnesia.*

TAKE any quantity of nitrous earths or stones; reduce them to powder; and therewith mix a third part of the ashes of green wood and quick-lime. Put this mixture into a barrel or vat, and pour on it hot water to about twice the weight of the whole mass. Let it stand thus for twenty four hours, stirring it from time to time with a stick. Then filter the liquor through brown paper, or pass it through a flannel bag, till it come clear: it will then have a yellowish colour. Boil this liquor, and evaporate till you perceive that a drop of it let fall on any cold body coagulates. Then stop the evaporation, and set your liquor in a cool place. In the space of four and twenty hours crystals will be formed in it, the figure of which is that of an hexagonal prism, having its opposite planes generally equal, and terminated at each extremity by a pyramid of the same number of sides. These crystals will be of a brownish colour, and deliquesce on a live coal.

Decant the liquor from these crystals; mix it with  
twice

twice its weight of hot water; evaporate and crystallise as before. Repeat the same operation till the liquor will yield no more crystals: it will then be very thick, and goes by the name of *mother of nitre*.

Earths and stones that have been impregnated with animal or vegetable juices susceptible of putrefaction, and have been long exposed to the air, but sheltered from the sun and rain, are those which yield the greatest quantity of nitre. But all sorts of earths and stones are not equally fit to produce it. None is ever found in flints or sands of a crystalline nature.

Some earths and stones abound so with nitre, that it effloresces spontaneously on their surface, in the form of a crystalline down. This nitre may be collected with brooms, and accordingly has the name of *salt-petre sweepings*. Some of this sort is brought from India.

The process by which our salt-petre makers extract nitre in quantities, out of rubbish and nitrous earths, is very nearly the same with that here set down: so that we shall not enter into a particular account of it. We shall only take notice of one thing, which it is of some consequence to know; namely, that there is no nitrous earth which does not contain sea-salt also. The greatest quantities of this salt are to be found in those earths which have been drenched with urine or other animal excrements. Now, as the rubbish of old houses in great cities is in this class, it comes to pass, that when the salt-petre workers evaporate a nitrous lixivium drawn from that rubbish, as soon as the evaporation is brought to a certain pitch, a great many little crystals of sea-salt form in the liquor, and fall to the bottom of the vessel.

The salt-petre workers in France call these saline particles *the grain*, and take great care to separate them from the liquor, (which as long as it continues hot keeps the salt-petre dissolved) before they set it to crystallise. This fact seems a little singular, considering that sea-salt dissolves in water more easily than salt-petre, and crystallises with more difficulty.

In order to discover the cause of this phenomenon, we must recollect, first, that water can keep but a determinate quantity of any salt in solution, and that if water fully saturated with a salt be evaporated, a quantity of salt will crystallise in proportion to the quantity of water evaporated. Secondly, that those salts which are the most soluble in water, particularly those which run in the air, will dissolve in cold and in boiling water equally; whereas much greater quantities of the other salts will dissolve in hot and boiling water than in cold water. These things being admitted, when we know that sea-salt is one of the first sort, and salt-petre of the second, the reason why sea-salt precipitates in the preparation of salt-petre appears at once. For,

When the solution of salt-petre and sea salt comes to be evaporated to such a degree that it contains as much sea-salt as it possibly can, this salt must begin to crystallise, and continue to do so gradually as the evaporation advances. But because at the same time it does not contain as much salt-petre as it can hold, seeing it is capable of dissolving a much greater quantity thereof when it is boiling hot than when it is cold, this last named salt will not crystallise so soon. If the evaporation were continued till the case

of the salt-petre came to be the same with that of the sea salt, then the salt-petre also would begin to crystallise gradually in proportion to the water evaporated, and the two salts would continue crystallising promiscuously together: but it is never carried so far; nor is it ever necessary; for as the water cools it becomes more and more incapable of holding in solution the same quantity of salt-petre as when it was boiling hot.

And then comes the very reverse, with regard to the crystallising of the two salts; for then the salt-petre shoots, and not the sea-salt. The reason of this fact also is founded on what has just been said. The sea-salt, of which cold water will dissolve as much as boiling water, and which owed its crystallising before only to the evaporation, now ceases to crystallise as soon as the evaporation ceases; while the salt-petre, which the water kept dissolved only because it was boiling hot, is forced to crystallise merely by the cooling of the water.

When the solution of salt-petre has yielded as many crystals of that salt as it can yield by cooling, it is again evaporated, and being then suffered to cool yields more crystals. And thus they continue evaporating and crystallising till the liquor will afford no more crystals. It is plain, that as the salt-petre crystallises, the proportion of sea-salt to the dissolving liquor increases; and as a certain quantity of water evaporates also during the time employed in crystallising the salt-petre, a quantity of sea-salt, proportioned to the water so evaporating, must crystallise in that time: and this is the reason why salt-petre is adulterated with a mixture of sea-salt. It likewise follows, that the last crystals of nitre, obtained from a solution of salt-petre and sea-salt, contain much more sea-salt than the first.

From all that has been said concerning the crystallisation of salt-petre and sea-salt, it is easy to deduce the proper way of purifying the former of these two salts from a mixture of the latter. For this purpose the salt-petre to be refined need only be dissolved in fair water. The proportion between the two salts in this second solution is very different from what it was in the former; for it contains no more sea-salt than what had crystallised along with the salt-petre under favour of the evaporation, the rest having been left dissolved in the liquor that refused to yield any more nitrous crystals.

As there is therefore a much greater quantity of salt-petre than of sea-salt in this second solution, it is easy to evaporate it to such a degree that a great deal of salt-petre shall crystallise, while much more of the water must necessarily be evaporated before any of the sea-salt will crystallise.

However, the salt-petre is not yet entirely freed from all mixture of sea-salt by this first purification; for the crystals obtained from this liquor, in which sea-salt is dissolved, are still incruited, and, as it were, infected therewith: hence it comes, that, to refine the salt-petre thoroughly, these crystallisations must be repeated four or five times.

The salt-petre men commonly content themselves with crystallising it thrice, and call the produce salt-petre of the first, second, or third shoot, according to the number of crystallisations it has undergone. But their best refined

refined salt-petre, even that of the third shooting, is not yet sufficiently pure for chemical experiments that require much accuracy: so that it must be further purified, but still by the same method.

The nitrous acid is not pure in the earths and stones from which it is extracted. It is combined partly with the very earth in which it is formed, and partly with the volatile alkali produced by the putrefaction of the vegetable or animal matters that concurred to its generation. A fixed alkali and quick-lime are added to the lixivium of a nitrous earth, in order to decompose the nitrous salts formed in that earth, and to separate the acid from the volatile alkali and the absorbent earth with which it is united: thence comes that copious sediment which appears in the lye at the beginning of the evaporation. These matters form with that acid a true nitre, much more capable than the original nitrous salts of crystallisation, detonation, and the other properties which are essential thereto. The basis of nitre is therefore a fixed alkali mixed with a little lime.

The mother of nitre, which will yield no more crystals, is brown and thick: by evaporation over a fire it is further inspissated, and becomes a dry, solid body; which however being left to itself soon gives, and runs into a liquor. This water still contains a good deal of nitre, sea-salt, and the acids of these salts united with an absorbent earth. It contains moreover a great deal of a fat, viscid matter, which prevents its crystallising.

All saline solutions in general, after having yielded a certain quantity of crystals, grow thick, and refuse to part with any more, though they still contain much salt. They are all called *mother-waters*, as well as that which hath yielded nitre. The mother-waters of different salts may prove the subjects of curious and useful enquiries.

If a fixed alkali be mixed with the mother of nitre, a copious white precipitate immediately falls, which being collected and dried is called *magnesia*. This precipitate is nothing but the absorbent earth that was united with the nitrous acid, together with a good deal of the lime that was added, and was also united with that acid, from which they are now separated by the fixed alkali, according to the usual laws of affinities or elective attractions.

The vitriolic acid poured upon mother of nitre causes many acid vapours to rise, which are a compound of the nitrous and marine acids, that is, an *aqua regia*. On this occasion also there falls a large quantity of a white powder, which is still called *magnesia*; yet it differs from the former in that it is not, like it, a pure absorbent earth, but combined with the vitriolic acid.

An *aqua regis* may also be drawn from nitrous earths by the force of fire only, without the help of any adjuvant.

*To decompose Nitre by means of the Phlogiston.*  
*Nitre fixed by Charcoal.* Clyffus of Nitre. Sal Polychrestum.

TAKE the purest salt-petre in powder; put it into a large crucible, which it may but half fill; set the crucible in a common furnace, and surround it with coals. When it is red hot the nitre will melt, and become as fluid as

water. Then throw into the crucible a small quantity of charcoal-dust: the nitre and the charcoal will immediately deflagrate with violence; and a great commotion will be raised, accompanied with a considerable hissing, and abundance of black smoke. As the charcoal wastes, the detonation will abate, and cease entirely as soon as the coal is quite consumed.

Then throw into the crucible the same quantity of charcoal-dust as before, and the same phenomena will be repeated. Let this coal also be consumed: then add more, and go on in the same manner till you can excite no further deflagration; always observing to let the burning coal be entirely consumed before you add any fresh. When no deflagration ensues, the matter contained in the crucible will have lost much of its fluidity.

Nitre will not take fire, unless the inflammable matter added to it be actually burning, or the nitre itself red hot, and so thoroughly ignited as immediately to kindle it. Therefore, if you would procure the detonation of nitre with charcoal, and make use of cold charcoal, as in the process, the nitre in the crucible must be red hot, and in perfect fusion: but you may also use live coals, and then the nitre need not be red-hot.

The matter remaining in the crucible after the operation, is a very strong fixed alkali. Being exposed to the air, it quickly extracts the moisture thereof, and runs into a liquor. It is called *alkalized nitre*, or to distinguish it from nitre alkalized by other inflammable matters, *nitre fixed by charcoal*.

The nitrous acid is not only dissipated during the deflagration of the nitre, but is even destroyed, and perfectly decomposed. The smoke that rises during the operation has not the least odour of an acid.

In order to collect the vapours discharged by the deflagration of nitre, fit to a tubulated earthen retort two or three large adapters: set the retort in a furnace; and under it make a fire sufficient to keep its bottom moderately red. Then take a small quantity, two or three pinches for example, of a mixture of three parts of nitre with one of charcoal-dust, and drop it into the retort through its tube, which must be uppermost, and immediately stopped close. A detonation instantly ensues, and the vapours that rise from the inflamed mixture of nitre and charcoal, passing out through the neck of the retort into the adapters, circulate therein for a while, and at last condense into a liquor.

When the detonation is over, and the vapours condensed, or nearly so, drop into the retort another equal quantity of the mixture; and repeat this till you find there is liquor enough in the recipients to be examined with ease and accuracy. This liquor is almost insipid, and shews no tokens of acidity; or at most but very slight ones. It is called *clyffus* of nitre.

Nitre is also decomposed and takes fire by the means of sulphur; but the circumstances and the result differ widely from those produced therewith by charcoal or any other inflammable body.

Nitre deflagrates with sulphur on account of the phlogiston which the latter contains. If one part of sulphur be mixed with two or three parts of nitre, and the mixture thrown by little and little into a red-hot crucible,

upon every projection there arises a detonation accompanied with a vivid flame.

The vapours discharged on this occasion have the mingled smell of a sulphureous spirit and spirit of nitre; and if they be collected by means of a tubulated retort, and such an apparatus of vessels as was used in the preceding experiment, the liquor contained in the recipients is found to be an actual mixture of the acid of sulphur, the sulphureous spirit, and the acid of nitre; the first being of greater quantity than the other two, and the second greater than the last.

Nor is the remainder after detonation a fixed alkali, as in the former experiments; but a neutral salt, consisting of the acid of sulphur combined with the alkali of nitre; a sort of vitriolated tartar, known in medicine by the name of *sal polychrestum*.

*To decompose Nitre by means of the Vitriolic Acid.*  
*The Smoking Spirit of Nitre.* *Sal de duobus.*  
*The Purification of Spirit of Nitre.*

TAKE equal parts of well purified nitre and green vitriol: dry the nitre thoroughly, and bruise it to a fine powder. Calcine the vitriol to redness: reduce it likewise to a very fine powder; and mingle these two substances well together. Put the mixture into an earthen long neck, or a good glass retort coated, of such a size that it may be but half full.

Set this vessel in a reverberating furnace covered with its dore; apply a large glass receiver, having a small hole in its body, stopped with a little lute. Let this receiver be accurately luted to the retort with the fat lute, and the joint covered with a slip of canvas smeared with lute made of quick-lime and the white of an egg. Heat the vessels very gradually. The receiver will soon be filled with very dense red vapours, and drops will begin to distill from the nose of the retort.

Continue the distillation, increasing the fire a little when you observe the drops to follow each other but slowly, so that above two thirds of a minute passes between them; and, in order to let out the redundant vapours, open the small hole in the receiver from time to time. Towards the end of the operation raise the fire so as to make the retort red. When you find that, even when the retort is red-hot, nothing more comes over, unlute the receiver, and without delay pour the liquor it contains into a crystal bottle, and close it with a crystal stopple rubbed in its neck with emery. This liquor will be of a reddish yellow colour, smoking exceedingly, and the bottle containing it will be constantly filled with red fumes like those observed in the receiver.

By the process here delivered, a very strong, perfectly dephlegmated, and vastly smoking spirit of nitre is obtained.

When the operation is over, you will find a red mass at the bottom of the retort, cast as it were in a mould. This is a neutral salt of the nature of vitriolated tartar, resulting from the union of the acid of the vitriol with the alkaline basis of the nitre.

The ferruginous basis of the vitriol, which is mixed with this salt, gives it the red colour. To separate it therefrom, you must pulverise it, dissolve it in boiling

water, and filter the solution several times through brown paper; because the ferruginous earth of the vitriol is so fine, that some of it will pass through the first time. When the solution is very clear, and deposits no sediment, let it be set to shoot, and it will yield crystals of vitriolated tartar; to which chemists have given the peculiar title of *sal de duobus*.

Nitre may also be decomposed, and its acid obtained, by the interposition of any of the other vitriols, alums, gypsums, boles, clays; in short, by means of any compound in which the vitriolic acid is found, provided it have not a fixed alkali for its basis.

The distillers of *aqua fortis*, who make large quantities at a time, and who use the least chargeable methods, do their business by the means of earths impregnated with the vitriolic acid; such as clays and boles. With these earths they accurately mix the nitre from which they intend to draw their spirit: this mixture they put into large oblong earthen pots, having a very short curved neck, which enters a recipient of the same matter and form. These vessels they place in two rows opposite to each other in long furnaces, and cover them over with bricks cemented with Windsor-loam, which serves for a reverberatory: then they light the fire in the furnace, making it at first very small, only to warm the vessels; after which they throw in wood, and raise the fire till the pots grow quite red-hot, in which degree they keep it up till the distillation is entirely finished.

Most experiments require the spirit of nitre to be absolutely pure; and if it be intended for such, it must be perfectly cleansed from the vitriolic taint.

This is easily effected by mixing your spirit with very pure nitre, and distilling it a second time. The vitriolic acid, with which this spirit of nitre is adulterated, coming in contact with a great quantity of undecomposed nitre, unites with its alkaline basis, and expels a proportionable quantity of the nitrous acid.

### Of the MARINE ACID.

*To extract Sea-salt from Sea-water, and from Brine-springs.* *Epsom Salt.*

FILTER the salt-water from which you intend to extract the salt; evaporate it by boiling, till you see on its surface a dark pellicle: this consists wholly of little crystals of salt just beginning to shoot: now slacken the fire, that the brine may evaporate more slowly, and without any agitation. The crystals, which at first were very small, will become larger, and form hollow truncated pyramids, the apices whereof will point downwards, and their bases be even with the surface of the liquor.

These pyramidal crystals are only collections of small cubical crystals concentered into this form. When they have acquired a certain magnitude they fall to the bottom of the liquor. When they come to be in such heaps as almost to reach the surface of the liquor, decant it from them, and continue the evaporation till no more crystals of sea-salt will shoot.

The acid of sea-salt is scarce ever found, either in sea-water or in the earth, otherwise than united with a fixed alkali.

alkali of a particular kind, which is its natural basis; and consequently it is in the form of a neutral salt. This salt is plentifully dissolved in the waters of the ocean, and when obtained therefrom bears the name of *sea-salt*. It is also found in the earth in vast crystalline masses, and is then called *sal-gem*; so that sea-salt and sal-gem are but one and the same sort of salt, differing very little from each other, except as to the places where they are found.

In the earth are also found springs and fountains, whose waters are strong brines, a great deal of sea-salt being dissolved in them. These springs either rise directly from the sea, or run through some mines of sal-gem, of which they take up a quantity in their passage.

As the same, or at least nearly the same quantity of sea-salt will continue dissolved in cold water as boiling water will take up, it cannot shoot, as nitre does, by the mere cooling of the water in which it is dissolved: it crystallises only by the means of evaporation, which continually lessens the proportion of the water to the salt; so that it is always capable of containing just so much the less sea-salt the more there is crystallised.

The brine should not boil after you perceive the pellicle of little crystals beginning to form on its surface; for the calmness of the liquor allows them to form more regularly, and become larger. Nor after this should the evaporation be hurried on too fast; for a saline crust would form on the liquor, which, by preventing the vapours from being carried off, would obstruct the crystallisation.

If the evaporation be continued after the liquor ceases to yield any crystals of sea-salt, other crystals will be obtained of an oblong four-sided form, which have a bitter taste, and are almost always moist. This sort of salt is known by the name of *Epsom salt*, which it owes to a salt spring in England, from the water of which it was first extracted. This salt, or rather saline compound, is a congeries of Glauber's salt and sea-salt, in a manner confounded together, and mixed with some of the mother of sea-salt, in which is contained a kind of bituminous matter. These two neutral salts, which constitute the Epsom salt, may be easily separated from each other, by means of crystallisation only. Epsom salt is purgative and bitter; and therefore named *sal cathartici cum amarum*, or bitter purging salts.

There are different methods used in great works for obtaining sea-salt out of water in which it is dissolved. The simplest and easiest is that practised in France, and in all those countries which are not colder. On the sea-shore they lay out a sort of broad shallow pits, pans, or rather ponds, which the sea fills with the tide of flood. When the ponds are thus filled, they stop their communication with the sea, and leave the water to evaporate by the heat of the sun; by which means all the salt contained in it necessarily crystallises. These pits are called *salt ponds*. Salt can be made in this way in the summer-time only, at least in France, and other countries of the same temperature; for during the winter, when the sun has less power, and rains are frequent, this method is not practicable.

For this reason, as it often rains in the province of

Normandy, the inhabitants take another way to extract salt from sea-water. The labourers employed for this purpose raise heaps of sand on the shore, so that the tide waters and drenches them when it flows, and leaves the sand dry when it ebbs. During the interval between two tides of flood the sun and the air easily carry off the moisture that was left, and so the sand remains impregnated with all the salt that was contained in the evaporated water. Thus they let it acquire as much salt as it can by several returns of flood, and then wash it out with fresh water, which they evaporate over a fire in leaden boilers.

To obtain the salt from brine-springs, the water need only be evaporated: but as several of these springs contain too little salt to pay the charges that would be incurred, if the evaporation were effected by the force of fire only, the manufacturers have fallen upon a less expensive method of getting rid of the greatest part of the water, and preparing the brine for crystallisation, in much less time, and with much less fire, than would otherwise have been necessary.

The method consists in making the water fall from a certain height on a great many small spars of wood, which divide it into particles like rain. This is performed under sheds open to all the winds, which pass freely through this artificial shower. By this means the water presents to the air a great extent of surface, being indeed reduced almost entirely to surface, and the evaporation is carried on with great ease and expedition. The water is raised by pumps to the height from which it is intended to fall.

*Experiments concerning the decomposition of Sea-salt, by means of the phlogiston. Kunckel's Phosphorus.*

"Of pure urine that has fermented five or six days take a quantity in proportion to the quantity of phosphorus you intend to make: it requires about one third part of a hoghead to make a dram of phosphorus. Evaporate it in iron pans, till it become clotted, hard, black, and nearly like chimney-soot; at which time it will be reduced to about a sixtieth part of its original weight before evaporation.

"When the urine is brought to this condition, put it in several portions into so many iron pots, under which you must keep a pretty brisk fire so as to make their bottoms red, and stir it incessantly till the volatile salt and the fetid oil be almost wholly dissipated, till the matter cease to emit any smoke, and till it smell like peach-blossoms. Then put out the fire, and pour on the matter, which will now be reduced to a powder, somewhat more than twice its weight of warm water. Stir it about in this water, and leave it to soak therein for twenty-four hours. Pour off the water by inclination; dry the drenched matter, and pulverise it. The previous calcination carries off from the matter about a third of its weight, and the lixiviation washes out half the remainder.

"With what remains thus calcined, washed, and dried, mix half its weight of gravel, or yellow freestone rasped, having sifted out and thrown away all the finest particles. River-sand is not proper on this occasion, because it flies in a hot fire. Then add to this mixture

mixture a sixteenth part of its weight of charcoal, made of beech, or of any other wood except oak, because that also flies. Moisten the whole with as much water as will bring it to a stiff paste, by working and kneading it with your hands: Now introduce it into your retort, taking care not to daub its neck. The retort must be of the best earth, and of such a size, that when your matter is in it, a full third thereof shall still be empty.

“ Place your retort, thus charged, in a reverberating furnace, so proportioned, that there may be an interval of two inches all round between the sides of the furnace and the bowl of the retort, even where it contracts to form the neck, which should stand inclined at an angle of sixty degrees. Stop all the apertures of the furnace, except the doors of the fire-place and ash-hole.

“ Fit on to the retort a large glass ballon two thirds full of water, and lute them together, as in distilling the smoking spirit of nitre. In the hinder part of this ballon, a little above the surface of the water, a small hole must be bored. This hole is to be stopped with a small peg of birch-wood, which must slip in and out very easily, and have a small knob to prevent its falling into the ballon. This peg is to be pulled out from time to time, that by applying the hand to the hole it may be known whether the air rarefied by the heat of the retort, issues out with too much or too little force.

“ If the air rushes out with too much rapidity, and with a hissing noise, the door of the ash-hole must be entirely shut, in order to slacken the fire. If it do not strike pretty smartly against the hand, that door must be opened wider, and large coals thrown into the fire-place to quicken the fire immediately.

“ The operation usually lasts four and twenty hours; and the following signs shew that it will succeed, provided the retort resist the fire.

“ You must begin the operation with putting some unlighted charcoal in the ash-hole, and a little lighted charcoal at the door thereof, in order to warm the retort very slowly. When the whole is kindled, push it into the ash hole, and close the door thereof with a tile. This moderate heat brings over the phlegm of the mixture. The same degree of heat must be kept up four hours, after which some coals may be laid on the grate of the fire-place, which the fire underneath will kindle by degrees. With this second heat brought nearer the retort, the ballon grows warm, and is filled with white vapours which have the smell of fetid oil. In four hours after, this vessel will grow cool and clear; and then you must open the door of the ash-hole one inch, throw fresh coals into the fire-place every three minutes, and every time shut the door of it, lest the cold air from without should strike against the bottom of the retort and crack it.

“ When the fire has been kept up to this degree for about two hours, the inside of the ballon begins to be netted over with a volatile salt of a singular nature, which cannot be driven up but by a very violent fire, and which smells pretty strong of peach-kernels. Care must be taken that this concrete salt do not stop the little hole in the ballon: for in that case it would burst, the retort being then red-hot, and the air exceedingly rarefied. The water in the ballon, being heated by the vicinity of

the furnace, exhales vapours which dissolve this sprigged salt, and the ballon clears up in half an hour after it has ceased rising.

“ In about three hours from the first appearance of this salt, the ballon is again filled with new vapours, which smell like sal ammoniac thrown upon burning coals. They condense on the sides of the receiver into a salt which is not branched like the former, but appears in long perpendicular streaks, which the vapours of the water do not dissolve. These white vapours are the fore-runners of the phosphorus; and a little before they cease to rise they lose their first smell of sal ammoniac, and acquire the odour of garlick.

“ As they ascend with great rapidity, the little hole must be frequently opened, to observe whether the hissing be not too strong; for in that case it would be necessary to shut the door of the ash-hole quite close. These white vapours continue two hours. When you find they cease rising, make a small passage through the dome, by opening some of its registers, that the flame may just begin to draw. Keep up the fire in this mean state till the first volatile phosphorus begin to appear.

“ This appears in about three hours after the white vapours first begin to rise. In order to discover it, pull out the little birchen peg once every minute, and rub it against some hot part of the furnace, where it will leave a trail of light, if there be any phosphorus upon it.

“ Soon after you observe this sign, there will issue out through the little hole of the ballon a stream of bluish light, which continues of a greater or shorter extent to the end of the operation. This stream or spout of light does not burn. If you hold your finger against it for twenty or thirty seconds, the light will adhere to it; and if you rub that finger over your hand, the light will besmear it, and render it luminous.

“ But from time to time this streamer darts out to the length of seven or eight inches, snapping and emitting sparks of fire; and then it burns all combustible bodies that come in its way. When you observe this, you must manage the fire very warily, and shut the door of the ash-hole quite close, yet without ceasing to throw coals into the fire-place every two minutes.

“ The volatile phosphorus continues two hours; after which the little spout of light contracts to the length of a line or two: And now is the time for pushing your fire to the utmost: Immediately set the door of the ash hole wide open, throw billets of wood into it, unstop all the registers of the reverberatory, supply the fire-place with large coals every minute: In short, for six or seven hours all the inside of the furnace must be kept of a white heat, so that the retort shall not be distinguishable.

“ In this fierce extremity of heat the true phosphorus distills like an oil, or like melted wax: One part thereof floats on the water in the recipient, the other falls to the bottom. At last the operation is known to be quite over when the upper part of the ballon, in which the volatile phosphorus appears condensed in a blackish film, begins to grow red: For this shews that the phosphorus is burnt where the red spot appears. You must now stop all the registers, and shut all the doors of the furnace, in order to smother the fire; and then close up the little hole in

in the ballon with fat lute or bees-wax. In this condition the whole must be left for two days; because the vessels must not be separated till they are perfectly cold, lest the phosphorus should take fire.

"As soon as the fire is out, the ballon, which is then in the dark, presents a most agreeable object: All the empty part thereof above the water seems filled with a beautiful blue light; which continues for seven or eight hours, or as long as the ballon keeps warm, never disappearing till it is cooled.

"When the furnace is quite cold, take out the vessels, and separate them from each other as neatly as possible. With a linen cloth wipe away all the black stuff you find in the mouth of the ballon; for if that filth should mix with the phosphorus, it would hinder it from being transparent when moulded. This must be done with great expedition: After which pour into the ballon two or three quarts of cold water, to accelerate the precipitation of the phosphorus that swims at top. Then agitate the water in the ballon, to rinse out all the phosphorus that may stick to the sides; pour out all the water thus shaken and turbid, into a very clean earthen pan, and let it stand till it grows clear. Then decant this first useless water, and on the blackish sediment left at the bottom of the pan pour some boiling water to melt the phosphorus; which thereupon unites with the fuliginous matter, or volatile phosphorus, that precipitated with it, both together forming a mass of the colour of slate. When this water in which you have melted the phosphorus is cool enough, take out the phosphorus, throw it into cold water, and therein break it into little bits in order to mould it.

"Then take a matras, having a long neck somewhat wider next the body than at its mouth: Cut off half the body, so as to make a funnel of the neck part, the smaller end of which must be stopped with a cork. The first mould being thus prepared, plunge it endwise, with its mouth uppermost, in a vessel full of boiling water, and fill it with that water. Into this funnel throw the little bits of your slate-like mass, which will melt again in this hot water, and fall so melted to the bottom of the tube. Stir this melted matter with an iron wire, to promote the separation of the phosphorus from the fuliginous matter with which it is fouled, and which, being less ponderous than the phosphorus, will gradually rise above it towards the upper part of the cylinder.

"Keep the water in the vessel as hot as at first, till on taking out the tube you see the phosphorus clean and transparent. Let the clear tube cool a little, and then set it in cold water, where the phosphorus will congeal as it cools. When it is perfectly congealed, pull out the cork, and with a small rod near as big as the tube, push the cylinder of phosphorus towards the mouth of the funnel, where the feculency lies. Cut off the black part of the cylinder, and keep it apart: For when you have got a quantity thereof, you may melt it over again in the same manner, and separate the clean phosphorus which it still contains. As to the rest of the cylinder which is clean and transparent, if you intend to mould it into smaller cylinders, you may cut it in slices, and melt it

again by the help of boiling water in glass tubes of smaller dimensions."

It is proper to observe, in the first place, that one of the most usual causes of miscarriage in this operation is a defect of the requisite qualities in the retort employed. It is absolutely necessary to have that vessel made of the best earth, and so well made that it shall be capable of resisting the utmost violence of fire, continued for a very long time.

We shall, in the second place, observe with M. Hellot, "that, before you set your retort in the furnace, it is proper to make an essay of your matter, to see if there be reason to hope for success. For this purpose put about an ounce thereof into a small crucible, and heat it till the vessel be red. The mixture, after having smoked, ought to chop and crack without puffing up, or even rising in the least. From these cracks will issue undulated flames, white and bluish, darting upwards with rapidity. This is the first volatile phosphorus, which occasions all the danger of the operation. When these first flashes are over, increase the heat of your matter by laying a large live coal upon the crucible. You will then see the second phosphorus, like a luminous, steady vapour, of a colour inclining to violet, covering the whole surface of the matter: It continues for a very long time, and diffuses a smell of garlick, which is the distinguishing odour of the phosphorus you are seeking.

"When this luminous vapour is entirely gone, pour the red hot matter out of the crucible upon an iron plate. If you do not find one drop of salt in fusion, but that, on the contrary, the whole falls readily into powder, it is a proof that your matter was sufficiently lixiviated, and that it contains no more fixed salt, or sea-salt, if you will, than is requisite. If you find on the plate a drop of salt coagulated, it shews that there is too much left in it, and that there is danger of your miscarrying in the operation because the redundant salt would corrode and eat through the retort. In this case your matter must be washed again, and then sufficiently dried."

The furnace must be so constructed, that within a narrow compass it may give a heat at least equal to that of a glass-house furnace, or rather greater, especially during the last seven or eight hours of the operation. M. Hellot, in his Memoir, gives an exact description of such a furnace.

"As certain accidents may happen in the course of the operation, some precautions are to be taken against them. For instance, if the ballon should break while the phosphorus is distilling, and any of it should fall on combustible bodies, it would set them on fire, and probably burn the laboratory, because it is not to be distinguished without the greatest difficulty. The furnace must therefore be erected under some vault, or upon a bed of brick-work, raised under some chimney that draws well: Nor must any furniture or utensil of wood be left near it. If a little flaming phosphorus should fall on a man's legs or hands, in less than three minutes it would burn its way to the very bone. In such a case nothing but urine will stop its progress.

"If the retort crack while the phosphorus is distilling, there

there is an unsuccessful end of your operation. It is easy to perceive this by the stink of garlick which you will smell about the furnace; and moreover, the flame that issues through the apertures of the reverberatory will be of a beautiful violet colour. The acid of sea-salt always gives this colour to the flame of such matters as are burnt along with it. But if the retort break before the phosphorus hath made its appearance, its contents may be saved by throwing a number of cold bricks into the fire-place, and upon them a little water to quench the fire at once." All these useful observations we owe also to M. Hellot.

The phosphorus here described was first discovered by a citizen of Hamburg named Brandt, who worked upon urine in search of the philosopher's stone. Afterwards two other skilful chemists, who knew nothing more of the process than that phosphorus was obtained from urine, or in general from the human body, likewise endeavoured to discover it; and each of them separately did actually make the discovery. These two chemists were Kunckel and Boyle.

The former perfected the discovery, and found out a method of making it in considerable quantities at a time; which occasioned it to be called *Kunckel's phosphorus*. The other, who was an English gentleman, had not time to bring his discovery to perfection, and contented himself with lodging a voucher of his having discovered it in the hands of the secretary of the Royal Society of London, who gave him a certificate thereof.

"Though Brandt, who had before this sold his secret to a chemist named Krafft, sold it afterwards to several other persons, and even at a very low rate: and though Mr Boyle published the process for making it; yet it is extremely probable that both of them kept in their own hands the master-key; I mean, *the particular management necessary to make the operation succeed*: For till Kunckel found it out, no other chemist ever made any considerable quantity thereof, except Mr Godfrey Hanwitz, an English chemist, to whom Mr Boyle revealed the whole mystery.

"And thus it came to pass, that, after Kunckel and Boyle died, M. Godfrey Hankwitz was the only chemist that could supply Europe therewith; on which account it is likewise very well known by the name of *English phosphorus*."

Almost all the chemists consider phosphorus as a substance consisting of the acid of sea-salt combined with the phlogiston, in the same manner as sulphur consists of the vitriolic acid combined with the phlogiston. This opinion is founded on the following principles.

First, urine abounds with sea-salt, and contains also a great deal of phlogiston: now these are the ingredients of which they conjecture phosphorus to be composed.

Secondly, phosphorus has many of the properties of sulphur; such as being soluble in oils; melting with a gentle heat; being very combustible; burning without any soot; giving a vivid and bluish flame; and lastly, leaving an acid liquor when burnt: sensible proofs that it differs from sulphur in nothing but the nature of its acid.

Thirdly, this acid of phosphorus, being mixed with a solution of silver in spirit of nitre, precipitates the silver; and this precipitate is a true *luna cornea*, which appears to be more volatile even than the common sort. This fact proves more incontestably that the acid of phosphorus is of the same nature with that of sea-salt.

Fourthly, M. Stahl observes, that if sea-salt be cast on live coals, they instantly burn with great activity; that they emit a vivid flame, and are much sooner consumed than if none of this salt had touched them; that sea-salt in substance, which will bear the violence of fire a considerable time when fused in a crucible, without sustaining any sensible diminution, yet evaporates very quickly, and is reduced to white flowers, by the immediate contact of burning coals; and lastly, that the flame which rises on this occasion is of a blue colour inclining to violet, especially if it be not thrown directly on the coals themselves, but kept in fusion amidst burning coals, in a crucible so placed that the vapour of the salt may join with the inflamed phlogiston as it rises from the coals.

These experiments of Mr Stahl's prove, that the phlogiston acts upon the acid of sea-salt, even while it is combined with its alkaline basis. The flame that appears on this occasion may be considered as an imperfect phosphorus: and indeed its colour is exactly like that of phosphorus.

All the facts above related evince, that the acid of phosphorus is akin to that of sea-salt; or rather, that it is the very same. But there are other facts which prove, that this acid undergoes some change at least, some peculiar preparation, before it enters into the composition of a true phosphorus; and that, when extricated therefrom by burning, it is not a pure acid of sea-salt, but is still adulterated with a mixture of some other substance, which makes it considerably different from that acid. For these observations we are obliged to M. Marggraff.

M. Marggraff hath also published a process for making phosphorus, and assures us, that by means thereof we may obtain in less time, with less heat, less trouble, and less expence, a greater quantity of phosphorus than by any other method. His operation is this:

He takes two pounds of sal ammoniac in powder, which he mixes accurately with four pounds of minium. This mixture he puts into a glass retort, and with a graduated fire draws off a very sharp, volatile, urinous spirit.

We observed in Part I. that some metallic substances have the property of decomposing sal ammoniac, and separating its volatile alkali. Minium, which is a calx of lead, is one of those metallic substances. In this experiment it decomposes the sal ammoniac, and separates its volatile alkali: what remains in the retort is a combination of the minium with the acid of sal ammoniac, which is well known to be the same with the marine acid; and consequently the residue of this operation is a sort of *plumbum corneum*.

The quantity thereof is four pounds eight ounces. Of this he mixes three pounds with nine or ten pounds of urine, that has stood putrefying for two months, evaporated to the consistence of honey. These he mixes

by

by little and little in an iron pan over the fire, stirring the mixture from time to time. Then he adds half a pound of charcoal dust, and evaporates the matter, kept continually stirring, till the whole be brought to a black powder. He next distills the mixture in a glass retort with degrees of fire, which he raises towards the end so as to make the retort red-hot, in order to expel all the urinous spirit, superfluous oil, and ammoniacal salt. The distillation being finished, there remains nothing in the retort but a very friable *caput mortuum*.

This remainder he pulverises again, and throws a pinch of it on live coals to discover whether or no the matter be rightly prepared for yielding phosphorus. If it be so, it presently emits an arsenical odour, and a blue undulating flame, which passes over the surface of the coals like a wave.

Being thus assured of the success of his operation, he puts one half of his matter, in three equal parts, into three small earthen German retorts, capable of holding about eighteen ounces of water a-piece. These three retorts, none of which is above three quarters full, he places together in one reverberatory furnace, built much like those we have described, except that it is so constructed as to hold the three retorts disposed in one line. To each retort he lutes a recipient something more than half full of water, ordering the whole in such a manner, that the noses of his retorts almost touch the surface of the water.

He begins the distillation with warming the retorts slowly, for about an hour, by a gentle heat. When that time is elapsed he raises the fire gradually, so that in half an hour more the coals begin to touch the bottoms of the retorts. He continues throwing coals into the furnace by little and little, till they rise half way the height of the retorts; and in this he employs another half hour. Lastly, in the next half hour he raises the coals above the bowels of the retorts.

Then the phosphorus begins to ascend in clouds: on this he instantly increases the heat of the fire as much as possible, filling the surface quite up with coals, and making the retorts very red. This degree of fire causes the phosphorus to distill in drops which fall to the bottom of the water. He keeps up this intense heat for an hour and half, at the end of which the operation is finished; so that it lasts but four hours and a half in all: In the same manner he distills the second moiety of his mixture in three other such retorts.

He purifies and moulds his phosphorus much in the same manner as M. Hellot does. From the quantity of ingredients above-mentioned, he obtains two ounces and a half fine crystalline moulded phosphorus.

The acid of phosphorus seems to be more fixed than any other: and therefore if you would separate it by burning from the phlogiston with which it is united, there is no occasion for such an apparatus of vessels as is employed for obtaining the spirit of sulphur. For this acid will remain at the bottom of the vessel in which you burn your phosphorus: indeed, if it be urged by the force of fire, its most subtiler part evaporates, and the remainder appears in the form of a vitrified matter.

This acid effervesces with fixed and volatile alkalis,

and therewith forms neutral salts; but very different from sea-salt, and from sal ammoniac. That which has a fixed alkali for its basis does not crackle when thrown on burning coals; but swells and vitrifies like borax. That which has a volatile alkali for its basis shoots into long pointed crystals; and, being urged by fire in a retort, lets go its volatile alkali, a vitrified matter remaining behind.

We shall conclude this article with an account of certain properties of phosphorus which have not yet been mentioned.

Phosphorus dissolves by lying exposed to the air. What water cannot effect, says M. Hellot, or at least requires eight or ten years to bring about, the moisture of the air accomplishes in ten or twelve days; whether it be that the phosphorus takes fire in the air, and the inflammable part evaporating, almost entirely, leaves the acid of the phosphorus naked, which like all other acids, when exceedingly concentrated, is very greedy of moisture; or else that the moisture of the air, being water divided into infinitely fine particles, is so subtiler as to find its way through the pores of the phosphorus, into which the grosser particles of common water can by no means insinuate themselves.

Phosphorus heated by the vicinity of fire, or by being any way rubbed, soon takes fire and burns fiercely. It is soluble in all oils, and in æther, giving to those liquors the property of appearing luminous, when the bottle containing the solution is opened. Being boiled in water, it likewise communicates thereto this luminous quality.

The late Mr Grosse observed, that phosphorus being dissolved in essential oils crystallises therein. These crystals take fire in the air, either when thrown into a dry vessel, or wrapt up in a piece of paper. If they be dipped in spirit of wine, and taken out immediately, they do not afterwards take fire in the air: they smoke a little, and for a very short time, but hardly waste at all. Though some of them were left in a spoon for a fortnight, they did not seem to have lost any thing of their bulk: but when the spoon was warmed a little they took fire, just like common phosphorus that had never been dissolved and crystallised in an essential oil.

M. Marggraff, having put a dram of phosphorus with an ounce of highly concentrated spirit of nitre into a glass retort, observed, that, without the help of fire, the acid dissolved the phosphorus; that part of the acid came over into the recipient which was luted to the retort; that at the same time the phosphorus took fire, burnt furiously, and burst the vessels with explosion. Nothing of this kind happens when any of the other acids, though concentrated, are applied to phosphorus.

*To decompose Sea salt by means of the Vitriolic Acid, Glauber's Salt. The Purification and Concentration of Spirit of Salt.*

Put the sea-salt from which you mean to extract the acid into an unglazed earthen pipkin, and set it amidst live coals. The salt will decrepitate, grow dry, and fall into a powder. Put this decrepitated salt into a tubulated glass retort, leaving two thirds thereof empty. Set the retort in a reverberating furnace; apply a receiver

ceiver like that used in distilling the smoking spirit of nitre, and lute it on in the same manner, or rather more exactly if possible. Then through the hole in the upper convexity of the retort pour a quantity of highly concentrated oil of vitriol, equal in weight to about a third part of your salt, and immediately shut the hole very close with a glass stopple, first rubbed therein with emery so as to fit it exactly.

As soon as the oil of vitriol touches the salt, the retort and receiver will be filled with abundance of white vapours; and soon after, without lighting any fire in the furnace, drops of a yellow liquor will distill from the nose of the retort. Let the distillation proceed in this manner without fire, as long as you perceive any drops come; afterwards kindle a very small fire under the retort, and continue distilling and raising the fire by very slow degrees, and with great caution, to the end of the distillation; which will be finished before you have occasion to make the retort red-hot. Unlute the vessels, and without delay pour the liquor, which is a very smoking spirit of salt, out of the receiver into a crystal bottle, like that directed for the smoking spirit of nitre.

When the operation is finished, we find a white, saline mass at the bottom of the retort as in a mould. If this mass be dissolved in water, and the solution crystallized, it yields a considerable quantity of sea-salt that hath not been decomposed, and a neutral salt consisting of the vitriolic acid united with the alkaline basis of that part which hath been decomposed. This neutral salt, which bears the name of *Glauber* its inventor, differs from vitriolated tartar, or the *Sal de duobus*, which remains after distilling the nitrous acid, especially in that it is more fusible, more soluble in water, and hath its crystals differently figured. But as in these two salts the acid is the same, the differences that appear between them must be attributed to the peculiar nature of the basis of sea-salt.

Spirit of salt drawn by the process above described is tainted with a small mixture of the vitriolic acid, carried up by the force of fire before it had time to combine with the alkali of the sea-salt; which happens likewise to the nitrous acid procured in the same manner. If you desire to have it pure, and absolutely free from the acid of vitriol, it must be distilled a second time from sea-salt, as the acid of nitre was before directed to be distilled again from fresh nitre, in order to purify it from any vitriolic taint.

*To decompose Sea-salt by means of the Nitrous Acid.*  
*Aqua regis. Quadrangular Nitre.*

**TAKE** dried sea-salt: bruise it to powder: put it into a glass retort, leaving one half of the vessel empty. Pour upon it a third of its weight of good spirit of nitre. Place your retort in the sand-bath of a reverberating furnace; put on the dome; lute to the retort a receiver having a small hole in it, and heat the vessels very slowly. There will come over into the receiver some vapours, and an acid liquor. Increase the fire gradually till nothing more rises. Then unlute the vessels, and pour the liquor out of the receiver into a crystal bottle, stopped like others containing acid spirits.

The nitrous acid hath a greater affinity than the marine acid with fixed alkalis. When therefore spirit of nitre and sea-salt are mixed together, the same consequences will follow as when the vitriolic acid is mixed with that salt; that is, the nitrous acid will, like the vitriolic, decompose it, by dislodging its acid from its alkaline basis, and assuming its place. But as the nitrous acid is considerably weaker, and much lighter, than the vitriolic acid, a good deal of it rises along with the acid of sea-salt during the operation. The liquor found in the receiver is therefore a true *aqua regis*.

If decrepitated salt, and a right smoking spirit of nitre, be employed in this process, the *aqua regis* obtained will be very strong.

The operation being finished, there is left in the retort a saline mass, containing sea-salt not decomposed, and a new species of nitre, which having for its basis the alkali of sea-salt, that is, an alkali of a peculiar nature, differs from the common nitre, 1. In the figure of its crystals; which are solids of four sides, formed like lozenges: 2. In that it crystallizes with more difficulty, retains more water in its crystals, attracts the moisture of the air, and dissolves in water with the same circumstances as sea salt.

### Of BORAX.

*To decompose Borax by the means of Acids, and to separate from it the Sedative Salt by Sublimation and by Crystallisation.*

**REDUCE** to a fine powder the borax from which you intend to extract the sedative salt. Put this powder into a wide-necked glass retort. Pour upon it an eighth part of its weight of common water, to moisten the powder; and then add concentrated oil of vitriol, to the weight of somewhat more than a fourth part of the weight of the borax. Set the retort in a reverberatory, make a moderate fire at first, and augment it gradually till the retort become red-hot.

A little phlegm will first come over, and then, with the last moisture that the heat expels, the sedative salt will rise; by which means some of it will be dissolved in this last phlegm, and pass therewith into the receiver; but most of it will adhere in the form of saline flowers to the fore-part of the neck of the retort, just where it is clear of the groove of the furnace. There they collect into a heap, which the succeeding flowers push insensibly forward till they slightly stop the passage. Those which rise after the neck is thus stopped stick to the after part of it which is hot, vitrify in some measure, and form a circle of fused salt. In this state the flowers of the sedative salt seem to issue out of the circle, as from their basis: They appear like very thin, light, shining scales, and must be brushed off with a feather.

At the bottom of the retort will be left a saline mass: Dissolve this in a sufficient quantity of hot water; filter the solution, in order to free it from a brown earth which it deposits; set the liquor to evaporate, and crystals of sedative salt will form in it.

Though borax is of great use in many chemical operations, especially in the fusion of metals, as we shall have

have occasion to see, yet, till of late years, chemists were quite ignorant of its nature, as they still are of its origin; concerning which we know nothing with certainty, but that it comes rough from the East Indies, and is purified by the Dutch.

### Of Operations on METALS.

#### Of GOLD.

*To separate Gold, by Amalgamation with Mercury, from the Earths and Stones with which it is found mixed.*

PULVERISE the earths and stones containing gold. Put the powder into a little wooden tray; dip this tray in water, gently shaking it and its contents. The water will grow muddy, by taking up the earthy parts of the ore. Continue washing it in this manner till the water cease to appear turbid. Upon the ore thus washed pour strong vinegar, having first dissolved therein, by the help of heat, about a tenth part of its weight of alum. The powder must be quite drenched and covered with this liquor, and so left to stand for twice twenty-four hours.

Decant the vinegar, and wash your powder with warm water, till the last that comes off hath no taste: then dry it, and put it into an iron mortar, with four times its weight of quick-silver: triturate the whole with a heavy wooden pestle, till all the powder be of a blackish colour: then pour in a little water, and continue rubbing for some time longer. More earthy and heterogeneous particles will be separated from the metalline parts by means of this water, which will look dirty: it must then be decanted, and more fair water added. Repeat this several times; then dry what remains in the mortar with a sponge, and by the help of a gentle heat; you will find it an amalgam of the mercury with the gold.

Put this amalgam into a chamoy bag: tie a knot on its neck, and squeeze it hard between your fingers, over some wide-mouthed vessel; there will issue through the pores of the leather numberless little jets of mercury, forming a sort of shower, that will collect into large globules in the vessel placed underneath. When you can force out no more mercury by this means, open the bag, and in it you will find the amalgam freed from the superfluous mercury; the gold retaining only about as much thereof as nearly equals itself in weight.

Put this amalgam into a glass retort: set this retort in the sand-bath of a reverberating furnace; cover it quite over with sand; apply a glass receiver half full of water, so that the nose of the retort may be under the water. The receiver need not be luted to the retort. Give a gradual heat, and raise the fire till drops of the sublimed mercury appear in the neck of the retort, and fall into the water with a hissing noise. If you hear any noise in the retort, slacken your fire a little. Lastly, when you observe, that, though you raise the fire still higher than before, nothing more will come over, take out your retort, break it, and there you will find the gold, which must be melted in a crucible with borax.

*To dissolve Gold in Aqua regis, and by that means to separate it from Silver.*

TAKE gold that is perfectly pure, or alloyed with

silver only. Reduce it to little thin plates, by hammering it on an anvil. If it be not sufficiently tough, Neal it till it be red in a moderate, clear fire, quite free from smoking coals, and then let it cool gradually, which will restore its ductility.

When the plates are thin enough, make them red-hot once more, and cut them into small bits with a pair of sheers. Put these bits into a tall, narrow-mouthed cucurbit, and pour on them twice their weight of good *aqua regis*, made of one part sal-ammoniac, or spirit of salt, and four parts spirit of nitre. Set the cucurbit in a sand-bath moderately heated, stopping its orifice slightly with a paper coffin, to prevent any dirt from falling in. The *aqua regis* will presently begin to smoke. Round the little bits of gold will be formed an infinite number of small bubbles, which will rise to the surface of the liquor. The gold will totally dissolve, if it be pure, and the solution will be of a beautiful yellow colour: if the gold be alloyed with a small quantity of silver, the latter will remain at the bottom of the vessel in the form of a white powder. If the gold be alloyed with much silver, when the gold is dissolved the silver will retain the form of the little metalline plates put into the vessel.

When the dissolution is completed, gently pour off the liquor into another low, wide-mouthed, glass cucurbit, taking care that none of the silver, which lies at the bottom in the form of a powder escape with the liquor. On this powder of silver pour as much fresh *aqua regis* as will cover it entirely; and repeat this till you are sure that nothing more can be taken up by it. Lastly, having decanted the *aqua regis* from the silver, wash the silver with a little spirit of salt weakened with water, and add this spirit of salt to the *aqua regis* in which your gold is dissolved. Then to the body containing these liquors fit a head and a receiver, and distill with a gentle heat, till the matter contained in the cucurbit becomes dry.

Mix together equal parts of common brimstone, and a very strong fixed alkali; for instance, nitre fixed by charcoal. Put them in a crucible, and melt the mixture, stirring it from time to time with a small rod. There is no occasion to make the fire very brisk, because the sulphur facilitates the fusion of the fixed alkali. Some sulphureous vapours will rise from the crucible: the two substances will mix intimately together, and form a reddish compound. Then throw into the crucible some little pieces of gold beat into thin plates, so that the whole do not exceed in weight one third part of the liver of sulphur: raise the fire a little. As soon as the liver of sulphur is perfectly melted, it will begin to dissolve the gold with ebullition; and will even emit some flashes of fire. In the space of a few minutes the gold will be entirely dissolved, especially if it was cut and slatted into small thin leaves.

The process here delivered is taken from M. Stahl. The design of his inquiries was to discover how Moses could burn the golden calf, which the Israelites had set up and worshipped while he was on the mount; how he could afterwards reduce that calf to powder, throw it into the water which the people used, and make all who had apostatized drink thereof, as related in the book of

Exodus; and he concludes, that Moses must have performed this operation by means of liver of sulphur.

*To separate Gold from all other metallic Substances by means of Antimony.*

HAVING put the gold you intend to purify into a crucible, set it in a melting furnace, cover it, and make the gold flow. When the metal is in fusion, cast upon it, by a little at a time, twice its weight of pure crude antimony in powder, and after each projection cover the crucible again immediately: this done keep the matter in fusion for a few minutes. When you perceive that the metallic mixture is perfectly melted, and that its surface begins to sparkle, pour it out into a hollow iron cone, previously heated, and smeared on the inside with tallow. Immediately strike with a hammer the floor on which the cone stands; and when all is cold, or at least sufficiently fixed, invert the cone and strike it: the whole metallic mass will fall out, and the under part thereof, which was at the point of the cone, will be a regulus more or less yellow as the gold was more or less pure. On striking the metallic mass, the regulus will freely part from the sulphureous crust at top.

Return this regulus into the crucible, and melt it. Less fire will do now than was required before. Add the same quantity of antimony, and proceed as at first. Repeat the same operation a third time, if your gold be very impure.

Then put your regulus into a good crucible, much larger than is necessary to hold it. Set your crucible in a melting furnace, and heat the matter but just enough to make it flow, with a smooth, brilliant surface. When you find it thus conditioned, point towards it the nose of a long-snouted pair of bellows, and therewith keep gently and constantly blowing. There will arise from the crucible a considerable smoke, which will abate greatly when you cease to blow, and increase as soon as you begin again. You must raise the fire gradually as you approach towards the end of the operation. If the surface of the metal lose its brilliant polish, and seem covered with a hard crust, it is a sign the fire is too weak; in which case it must be increased, till the surface recover its shining appearance. At last, when no more smoke rises, and the surface of the gold looks neat and greenish, cast on it, by little and little, some pulverized nitre, or a mixture of nitre and borax. The matter will swell up. Continue thus adding more nitre gradually, till no commotion is thereby produced in the crucible; and then let the whole cool. If you find, when the gold is cold, that it is not tough enough, melt it over again; when it begins to melt cast it in the same salts as before; and repeat this till it be perfectly ductile.

*To separate Silver from its Ore, by means of Scorification with Lead.*

BEAT to powder in an iron mortar the ore from which you mean to separate the silver, having first roasted it well in order to free it from all the sulphur and arsenic that it may contain. Weigh it exactly: then weigh out by itself eight times as much granulated lead. Put one half of this lead into a test, and spread it equally there-

on: upon this lead lay your ore, and cover it quite over with the remaining half of the lead.

Place the test thus loaded under the further end of the muffle in a cupelling furnace. Light your fire, and increase it by degrees. If you look through one of the apertures in the door of the furnace, you will perceive the ore, covered with calcined lead, swim upon the melted lead. Presently afterwards it will grow soft, melt, and be thrown towards the sides of the vessel, the surface of the lead appearing in the midst thereof bright and shining like a luminous disc: the lead will then begin to boil, and emit fumes. As soon as this happens, the fire must be a little checked, so that the ebullition of the lead may almost entirely cease for about a quarter of an hour. After this it must be excited to the degree it was at before, so that the lead may begin again to boil and smoke. Its shining surface will gradually lessen, and be covered with *scoria*. Stir the whole with an iron hook, and draw in towards the middle what you observe towards the sides of the vessel; to the end that, if any part of the ore should still remain undissolved by the lead, it may be mixed therewith.

When you perceive that the matter is in perfect fusion, that the greatest part of what sticks to the iron hook, when you dip it in the melted matter, separates from it again, and drops back into the vessel; and that the extremity of this instrument, when grown cold, appears varnished over with a thin, smooth, shining crust; you may look on these as marks that the business is done; and the more uniform and evenly the colour of the crust is, the more perfect may you judge the scorification to be.

Matters being brought to this pass, take the test with a pair of tongs from under the muffle, and pour its whole contents into an iron cone, first heated and greased with tallow. This whole operation lasts about three quarters of an hour. When all is cold, the blow of a hammer will part the regulus from the scoria; and as it is not possible, how perfect soever the scorification be, to avoid leaving a little lead containing silver in the scoria, it is proper to pulverise this scoria, and separate therefrom whatever extends under the hammer, in order to add it to the regulus.

*The refining of Silver by the Cupel.*

TAKING a cupel capable of containing one third more matter than you have to put into it: set it under the muffle of a furnace like that described in our theoretical elements, as peculiarly appropriated to this sort of operation. Fill the furnace with charcoal; light it; make the cupel red-hot, and keep it so till all its moisture be evaporated; that is, for about a good quarter of an hour, if the cupel be made wholly of the ashes of burnt-bones; and for a whole hour, if there be any washed wood-ash in its composition.

Reduce the regulus which remained after the preceding operation to little thin plates, flattening them with a small hammer, and separating them carefully from all the adherent scoria. Wrap these in a bit of paper, and with a small pair of tongs put them gently into the cupel. When the paper is consumed, the regulus will soon melt,

and

and the scoria, which will be gradually produced by the lead as it turns to litharge, will be driven to the sides of the cupel, and immediately absorbed thereby. At the same time the cupel will assume a yellow, brown, or blackish colour, according to the quantity and nature of the scoria imbibed by it.

When you see the matter in the cupel in a violent ebullition, and emitting much smoke, lower the fire by the methods formerly prescribed. Keep up such a degree of heat only that the smoke which ascends from the matter may not rise very high, and that you may be able to distinguish the colour which the cupel acquires from the scoria.

Increase the fire by degrees, as more and more litharge is formed and absorbed. If the regulus examined by this assay contain no silver, you will see it turn wholly into scoria, and at last disappear. When it contains silver, and the quantity of lead is much diminished, you will perceive little vivid irises, or beautiful rain-bow colours, shooting swiftly along its surface, and crossing each other in many different directions. At last, when all the lead is destroyed, the thin dark skin, that is continually protruded by the lead while it is turning into litharge, and which hitherto covered the silver, suddenly disappears; and, if at this moment the fire happen not to be strong enough to keep the silver in fusion, the surface of that metal will at once dart out a dazzling splendor; but, if the fire be strong enough to keep the silver in fusion, though freed from all mixture of lead, this change of colour, which is called its *fulguration*, will not be so perceptible, and the silver will appear like a bead of fire.

These phenomena shew that the operation is finished. But the cupel must still be left a minute or two under the muffle, and then drawn slowly out with the iron hook towards the door of the furnace. When the silver is so cooled as to be but moderately red, you may take the cupel from under the muffle with your little tongs, and in the middle of its cavity you will find an exceeding white bead of silver, the lower part whereof will be unequal, and full of little pits.

*To purify Silver by Nitre.*

**GRANULATE** the silver you intend to purify, or reduce it to thin plates; put it into a good crucible; add thereto a fourth part in weight of very dry pulverised nitre, mixed with half the weight of the nitre of calcined wine-lees, and about a sixth part of the same weight of common glass in powder. Cover this crucible with another crucible inverted; which must be of such a size that its mouth may enter a little way into that of the lower one, and have its bottom pierced with a hole of about two lines in diameter. Lute the two crucibles together with clay and Windsor-loam. When the lute is dry, place the crucibles in a melting furnace. Fill the furnace with charcoal, taking care however that they do not rise above the upper crucible.

Kindle the fire, and make your vessels of a middling red heat. When they are so, take up with the tongs a live coal, and hold it over the hole of the upper crucible. If you immediately perceive a vivid splendor round the

coal, and at the same time hear a gentle hissing noise, it is a sign that the fire is of a proper strength; and it must be kept up at the same degree till this phenomenon cease.

Then increase the fire to the degree requisite to keep pure silver in fusion; and immediately take your vessels out of the furnace. You will find the silver at the bottom of the lower crucible covered with a mass of alkaline scoria of a greenish colour. If the metal be not rendered perfectly pure and ductile by this operation, it must be repeated a second time.

*To dissolve Silver in Aqua Fortis, and thereby separate it from every other metalline Substance.*

**THE** silver you intend to dissolve being beaten into thin plates, put it into a glass cucurbit; pour on it twice its weight of good precipitated *aqua fortis*; cover the cucurbit with a paper, and set it on a sand-bath moderately heated. The *aqua fortis* will begin to dissolve the silver as soon as it comes to be a little warm. Red vapours will rise; and from the upper surfaces of the silver there will seem to issue streams of little bubbles, ascending to the top of the liquor, between which and the silver they will form, as it were, a number of fine chains: This is a sign that the dissolution proceeds duly, and that the degree of heat is such as it ought to be. If the liquor appear to boil and be agitated, a great many red vapours rising at the same time, it is a sign that the heat is too great, and should be lessened till it be reduced to the proper degree indicated above: having obtained that, keep it equally up till no more bubbles or red vapours appear.

If your silver be alloyed with gold, the gold will be found, when the dissolution is finished, at the bottom of the vessel in the form of a powder. The solution must now be decanted while it is yet warm: on the powder pour half as much fresh *aqua fortis* as before, and make it boil; again decant this second *aqua fortis*, and repeat the same a third time; then with fair water wash the remaining powder well: It will be of a brown colour inclining to red.

*To separate Silver from the Nitrous Acid by Distillation. Crystals of Silver. The Infernal Stone.*

**INTO** a large, low, glass body, put the solution of silver from which you intend to separate the silver by distillation. To this body fit a tubulated head provided with its stopple. Set this alembic in a sand-bath, so that the body may be almost covered with sand: apply a receiver, and distill with a moderate heat, so that the drops may succeed each other at the distance of some seconds. If the receiver grow very hot, check the fire. When red vapours begin to appear, pour into the alembic, through the hole in its head, a fresh quantity of your solution of silver, first made very hot. Continue distilling in this manner, and repeating the addition of fresh liquor, till all your solution be put into the alembic. When you have no more fresh solution to put in, and when, the phlegm being all come over, red vapours begin again to appear, convey into the alembic half a dram or a dram of tallow, and distill to driness; which being

being done, increase your fire so as to make the vessel containing the sand-bath red-hot. In the alembic you will find a calx of silver, which must be melted in a crucible with some soap and calcined wine-lees.

If the distillation be stopped when part of the phlegm is drawn off, and the liquor be then suffered to cool, many crystals will shoot therein, which are a neutral salt constituted of the nitrous acid and silver. If the distillation be carried further, and stopped when near its conclusion, the liquor being then suffered to cool will wholly coagulate into a blackish mass called the *infernal stone*.

*To separate Silver from the nitrous Acid by Precipitation.* Luna Cornea. Luna Cornea reduced.

INTO your solution of silver pour about a fourth part in weight of spirit of salt, solution of sea-salt, or solution of sal ammoniac. The liquor will instantly become turbid and milky. Add twice or thrice its weight of fair water, and let it stand some hours to settle. It will deposite a white powder. Decant the clear liquor, and on the precipitate pour fresh *aqua fortis*, or spirit of salt, and warm the whole on a sand bath with a gentle heat for some time. Pour off this second liquor, and boil your precipitate in pure water, shifting it several times, till the precipitate and the water be both quite insipid. Filter the whole, and dry the precipitate, which will be a *luna cornea*, and must be reduced in the following manner.

Smear the inside of a good crucible well with soap. Put your *luna cornea* into it; cover it with half its weight of salt of tartar, thoroughly dried and pulverised; press the whole hard down; pour thereon as much oil, or melted tallow, as the powder is capable of imbibing; set the crucible thus charged, and close covered, in a melting furnace, and, for the first quartet of an hour, kindle no more fire than is necessary to make the crucible moderately red; after that raise it so as to melt the silver and the salt, throwing into the crucible from time to time little bits of tallow. When it ceases to smoke, let the whole cool; or pour it into a hollow iron cone, warmed and tallowed.

*To dissolve Silver, and separate it from Gold, by Cementation.*

Mix thoroughly together fine brick-dust four parts, vitriol calcined to redness one part, and sea-salt or nitre one part. Moisten this powder with a little water. With this cement cover the bottom of a crucible half an inch thick; on this first bed lay a thin plate of the mass of gold and silver you intend to cement, and which you must previously take care to beat into such thin plates. Cover this plate with a second layer of cement, of the same thickness as the former; on this second bed lay another plate of your metal; cover it in like manner with cement; and so proceed till the crucible be filled to within half an inch of its brim. Fill up the remaining space with cement, and close the crucible with a cover, luted with a paste made of Windsor-loam and water: Set your crucible thus charged in a furnace, whose fire-place is deep enough to let it be entirely surrounded with coals, quite up to its mouth. Light some coals in the furnace,

taking care not to make the fire very brisk at first; increase it by degrees, but only so far as to make the crucible moderately red; keep up the fire in this degree for eighteen or twenty hours: Then let the fire go out; open the crucible when it is cold, and separate the cement from your plates of gold. Boil the gold repeatedly in fair water, till the water come off quite insipid.

### Of COPPER.

*To separate Copper from its Ore.*

BEAT your copper ore to a fine powder, having first freed it as accurately as possible, by washing and roasting, from all stony, earthy, sulphureous, and arsenical parts. Mix your ore thus pulverised with thrice its weight of the black flux; put the mixture into a crucible; cover it with common salt to the thickness of half an inch, and press the whole down with your finger. With all this the crucible must be but half full. Set it in a melting furnace; kindle the fire by degrees, and raise it insensibly till you hear the sea-salt crackle. When the decrepitation is over, make the crucible moderately red-hot for half a quarter of an hour. Then give a considerable degree of heat, exciting the fire with a pair of good perpetual bellows, so that the crucible may become very red hot, and be perfectly ignited. Keep the fire up to this degree for about a quarter of an hour; then take out the crucible, and with a hammer strike a few blows on the floor on which you set it. Break it when cold. If the operation hath been rightly and successfully performed, you will find at the bottom of the vessel a hard regulus, of a bright yellow colour, and semi-malleable; and over it a scoria of a yellowish brown colour, hard, and shining, from which you may separate the regulus with a hammer.

*To purify black Copper, and render it malleable.*

BREAK into small bits the black copper you intend to purify; mix therewith a third part in weight of granulated lead, and put the whole into a cupel set under the muffle in a cupelling furnace, and previously heated quite red. As soon as the metals are in the cupel raise the fire considerably, making use, if it be needful, of a pair of perpetual bellows, to melt the copper speedily. When it is thoroughly melted, lower the fire a little, and continue it just high enough to keep the metalline mass in perfect fusion. The melted matter will then boil, and throw up some scoria, which will be absorbed by the cupel.

When most of the lead is consumed, raise the fire again till the face of the copper become bright and shining, thereby shewing that all its alloy is separated. As soon as your copper comes to this state, cover it with charcoal dust conveyed into the cupel with an iron ladle: Then take the cupel out of the furnace, and let it cool.

*To deprive Copper of its Phlogiston by Calcination.*

PUT your copper in filings into a test, and set it under the muffle of a cupelling furnace; light the fire, and keep up such a degree of heat as may make the whole quite

quite red, but not enough to melt the copper. The surface of the copper will gradually lose its metalline splendor, and put on the appearance of a reddish earth. From time to time stir the filings with a little rod of copper or iron, and leave your metal exposed to the same degree of fire till it be always calcined.

*To resuscitate the Calx of Copper, and reduce it to Copper, by restoring its Phlogiston.*

Mix the calx of copper with thrice as much of the black flux; put the mixture into a good crucible, so as to fill two thirds thereof, and over it put a layer of sea-salt a finger thick. Cover the crucible, and set it in a melting furnace; heat it gradually, and keep it moderately red till the decrepitation of the sea-salt be over. Then raise the fire considerably by means of a good pair of perpetual bellows; satisfy yourself that the matter is in perfect fusion, by dipping into the crucible an iron wire; continue the fire in this degree for half a quarter of an hour. When the crucible is cold, you will find at its bottom a button of very fine copper, which will easily separate from the saline scoria at top.

*To dissolve Copper in the Mineral Acids.*

On a sand-bath, in a very gentle heat, set a matras containing some copper filings; pour on them twice their weight of oil of vitriol. That acid will presently attack the copper. Vapours will rise, and issue out of the neck of the matras. A vast number of bubbles will ascend from the surface of the metal to the top of the liquor, and the liquor will acquire a beautiful blue colour. When the copper is dissolved, put in a little and a little more, till you perceive the acid no longer acts upon it. Then decant the liquor, and let it stand quiet in a cool place. In a short time great numbers of beautiful blue crystals will shoot in it. These crystals are called *vitriol of copper*, or *blue vitriol*. They dissolve easily in water.

## Of I R O N.

*To separate Iron from its Ore.*

POUND into a coarse powder the martial stones or earths out of which you design to extract the iron: Roast this powder in a test under the muffle for some minutes, and let your fire be brisk. Then let it cool, beat it very fine, and roast it a second time, keeping it under the muffle till it emit no more smell.

Then mix with this powder a flux composed of three parts of nitre fixed with tartar, one part of fusile glass, and half a part of borax and charcoal-dust. The dose of this reducing flux must be thrice the weight of the ore.

Put this mixture into a good crucible; cover it with about half a finger thick of sea-salt; over the crucible put its cover, and lute it on with Windsor-loam made into a paste with water. Having thus prepared your crucible, set it in a melting furnace, which you must fill up with charcoal. Light the fire, and let it kindle by gentle degrees, till the crucible become red-hot. When the decrepitation of the sea-salt is over, raise your fire to

the highest by the blast of a pair of perpetual bellows, or rather several. Keep up this intense degree of heat for three quarters of an hour, or a whole hour, taking care that during all this time the furnace be kept constantly filling up with fresh coals as the former consume. Then take your crucible out of the furnace; strike the pavement on which you set it several times with a hammer, and let it stand to cool: Break it, and you will find therein a regulus of iron covered with slag.

In smelting-houses iron ore is fused amidst charcoal, the phlogiston of which combines with the martial earth, and gives it the metalline form. The iron thus melted runs down to the bottom of the furnace, from whence it is let out into large moulds, in which it takes the shape of oblong blocks, called *pigs* of iron. This iron is still very impure, and quite unmanageable. Its want of ductility after the first melting arises partly from hence, that, notwithstanding the previous roasting which the ore underwent, there still remains, after this first fusion, a considerable quantity of sulphur or arsenic combined with the metal.

A certain quantity of quick-lime, or of stones that will burn to lime, is frequently mixed with iron ore on putting it into the smelting furnace. The lime being an absorbent earth, very apt to unite with sulphur and arsenic, is of use to separate those minerals from the iron.

It is also of use to mix some such matters with the ore, when the stones or earths which naturally accompany it are very fusible; for, as the iron is of difficult fusion, it may happen that the earthy matters mixed with the iron shall melt as easily as the metal, or perhaps more easily. In such a case there is no separation of the earthy from the metalline part, both of which melt and precipitate together promiscuously: Now quick-lime, being extremely refractory, serves on this occasion to check the melting of those matters which are too fusible.

Yet quick-lime, notwithstanding its refractory quality, may sometimes be of use as a flux for iron: This is the case when the ore happens to be combined with substances which, being united with lime, render it fusible: Such are all arsenical matters, and even some earthy matters, which, being combined with quick-lime, make a fusible compound.

When the ore of an iron mine is found difficult to reduce, it is usually neglected even though it be rich; because iron being very common, people chuse to work those mines only whose ores are smelted with the most ease, and require the least consumption of wood.

Yet refractory ores are not to be altogether rejected, when another iron ore of a different quality is found near them. For it often happens, that two several iron ores, which being worked separately are very difficult to manage, and yield at last but bad iron, become very tractable, and yield excellent iron, when smelted together: And accordingly such mixtures are often made at iron-works.

The iron obtained from ores by the first fusion may be divided into two sorts. The one, when cold, resists the hammer, doth not easily break, and is in some measure extensible on the anvil; but if struck with a hammer, when red-hot, flies into many pieces: This sort of iron hath

always a mixture of sulphur in it. The other sort, on the contrary, is brittle when cold, but somewhat ductile when red-hot. This iron is not sulphurated, is naturally of a good quality, and its brittleness arises from its metalline parts not being sufficiently compacted together.

Iron abounds so much, and is so universally diffused through the earth, that it is difficult to find a body in which there is none at all: And this hath led several chemists into the error of thinking, that they had transmuted into iron several sorts of earths in which they suspected no iron, by combining them with an inflammable matter; whereas, in fact, all they did was to give the metalline form to a true martial earth which happened to be mixed with other earths.

*To render Pig-iron and brittle Iron malleable.*

INTO an earthen vessel widening upwards, put some charcoal-duft, and thereon lay the pig-iron which you propose to render ductile; cover it all over with a quantity of charcoal; excite the fire violently with a pair, or more, of perpetual bellows till the iron melt. If it do not readily flow and form a great deal of slag on its surface, add some flux, such as a very fusible sand.

When the matter is in fusion, keep stirring it from time to time, that all the parts thereof may be equally acted on by the air and the fire. On the surface of the melted iron *scoria* will be formed, which must be taken off as they appear. At the same time you will see a great many sparkles darted up from the surface of the metal, which will form a sort of fiery shower. By degrees, as the iron grows purer, the number of these sparkles diminishes, though they never vanish entirely. When but few sparkles appear, remove the coals which cover the iron, and let the slag run out of the vessel; whereupon the metal will grow solid in a moment. Take it out while it is still red-hot, and give it a few strokes with a hammer, to try if it be ductile. If it be not yet malleable, repeat the operation a second time, in the same manner as before. Lastly, when it is thus sufficiently purified by the fire, work it for a long time on the anvil, extending it different ways, and making it red-hot as often as there is occasion. Iron thus brought to the necessary degree of ductility, so as to yield to the hammer, and suffer itself to be extended every way, either hot or cold, without breaking to bits, or even cracking in the least, is very good and very pure. If it cannot be brought to this degree by the method here prescribed, it is a proof, that the ore from which this iron was extracted, ought to be mixed with other ores; but it frequently requires a great number of trials to obtain an exact knowledge of the quality and proportion of those other ores with which it is to be mixed.

*To convert Iron into Steel.*

TAKE small bars of the best iron; that is, of such as is malleable both hot and cold; set them on their ends in a cylindrical earthen vessel, whose depth is equal to the length of the bars, and in such a manner that they may be an inch distant from each other, and from the sides of the crucible. Fill the vessel with a cement compounded of two parts of charcoal, on part of bones burnt in a

close vessel till they become very black, and one half part of the ashes of green wood; having first pulverised and thoroughly mixed the whole together. Take care to lift up the iron bars a little, to the end that the cement may cover the bottom of the vessel, and so that there be about the depth of half an inch thereof under every bar: Cover the crucible and lute on the cover.

Set the crucible thus prepared in a furnace, so contrived, that the crucible may be surrounded with coals from top to bottom: For eight or ten hours keep up such a degree of fire that the vessel may be moderately red; after this take it out of the furnace; plunge your little iron bars into cold water, and you will find them converted into steel.

The principal difference between iron and steel consists in this, that the latter is combined with a greater quantity of phlogiston than the former.

It appears by this experiment, that, to make iron unite with an inflammable matter, it is necessary it should be in fusion; it is sufficient that it be so red-hot as to be opened and softened by the fire.

Every kind of charcoal is fit to be an ingredient in the composition of the cement employed to make steel, provided it contain no vitriolic acid. However, it hath been observed, that animal coals produce a speedier effect than others: for which reason it is proper to mix something of that kind with charcoal-duft, as above directed.

The following signs shew that the operation hath succeeded, and that the iron is changed into good steel.

This metal being quenched in cold water as proposed above, acquires such an extraordinary degree of hardness, that it will by no means yield to any impression of the file or hammer, and will sooner break in pieces than stretch upon the anvil. And here it is proper to observe, that the hardness of steel varies with the manner in which it is quenched. The general rule is, that the hotter the steel is when quenched, and the colder the water is in which you quench it, the harder it becomes. It may be deprived of the temper thus acquired, by making it red-hot, and letting it cool slowly; for it is thereby softened, rendered malleable, and the file will bite upon it. For this reason the artificers who work in steel begin with untempering it, that they may with more ease shape it into the tool they intend to make. They afterwards new-temper the tool when finished, and by this second temper the steel recovers the same degree of hardness it had acquired by the first temper.

The colour of steel is not so white as that of iron, but darker, and the grains, facets, or fibres, which appear on breaking it, are finer than those observed in iron.

If the bars of iron thus cemented, in order to convert them into steel, be too thick, or not kept long enough in cementation, they will not be turned into steel throughout their whole thickness: their surfaces only will be steel to a certain depth, and the centre will be mere iron; because the phlogiston will not have thoroughly penetrated them. On breaking a bar of this sort, the difference in colour and grain between the steel and the iron is very visible.

It is easy to deprive steel of the superabundant quantity of

of phlogiston which constitutes it steel, and thereby reduce it to iron. For this purpose it need only be kept red-hot for some time, observing that no matter approach it all the while that is capable of refunding to it the phlogiston which the fire carries off. The same end is still sooner obtained by cementing it with meagre hungry matters, capable of absorbing the phlogiston; such as bones calcined to whiteness, and cretaceous earths.

*The Calcination of Iron. Sundry Saffrons of Mars.*

TAKE filings of iron, what quantity you please; put them into a broad unglazed earthen vessel, set under the muffle of a cupelling furnace: make it red-hot; stir the filings frequently; and keep up the same degree of fire till the iron be wholly turned into a red powder.

Iron easily loses its phlogiston by the action of fire. The calx that remains after its calcination is exceeding red; which makes this be thought the natural colour of the earth of that metal. It hath accordingly been observed, that all the earths and stones, which either are naturally red, or acquire that colour by calcination, are ferruginous.

The yellowish red colour which every calx of iron hath, in whatever manner it be prepared, hath procured the name of *crocus*, or *saffron*, to every preparation of this kind. That made in the manner above directed is called in medicine *crocus martis astringens*.

The rust produced on the surface of iron, is a sort of calx of iron made by the way of dissolution. The moisture of the air acts upon the metal, dissolves it, and robs it of some of its phlogiston. This rust is called in medicine *crocus martis aperiens*; because it is thought that the saline parts, by means whereof the humidity dissolves the iron, remain united with the metal after its dissolution, and give it an aperitive virtue. The apothecaries prepare this sort of saffron of mars by exposing iron filings to the dew till they be turned entirely to rust; which is then called *saffron of mars by dew*.

Another saffron of mars is also prepared in a much shorter manner, by mixing filings of iron with pulverised sulphur, and moistening the mixture, which after some time ferments and grows hot. It is then set on the fire; the sulphur burns away, and the mass is kept stirring till it become a red matter. This saffron is nothing but iron dissolved by the acid of sulphur, which is known to be of the same nature with that of vitriol; and consequently this saffron of mars is no way different from vitriol calcined to redness.

*Iron dissolved by the mineral Acids.*

Put any mineral acid whatever into a matras with some water; set the matras on a sand-bath gently heated; drop into the vessel some filings of iron: the phenomena which usually accompany metalline dissolutions will immediately appear. Add more filings, till you observe the acid hath lost all sensible action upon them: then remove your matras from the sand-bath; you will find in it a solution of iron.

*Of Tin.*

*To extract Tin from its Ore.*

BREAK your tin ore into a coarse powder, and by washing carefully, separate from it all the heterogeneous matters and ores of a different kind that may be mixed therewith. Then dry it, and roast it in a strong degree of fire, till no more arsenical vapour rise from it. When the ore is roasted, reduce it to a fine powder, and mix it thoroughly with twice its weight of the black flux well dried, a fourth part of its weight of clean iron filings, together with as much borax and pitch: put the mixture into a crucible; over all put sea-salt to the thickness of four fingers, and cover the crucible close.

Set the crucible thus prepared in a melting furnace: apply at first a moderate and slow degree of fire, till the flame of the pitch, which will escape through the joint of the cover, disappear entirely. Then suddenly raise your fire, and urge it with rapidity to the degree necessary for melting the whole mixture. As soon as the whole is in fusion, take the crucible out of the furnace, and separate the regulus from the scoria.

All tin ores contain a considerable quantity of arsenic, and no sulphur at all, or at most very little. Hence, though tin be the lightest of all metals, its ore is nevertheless much heavier than any other; arsenic being much heavier than sulphur, of which the ores of every other kind always contain a pretty large proportion. This ore is moreover very hard, and is not brought to a fine powder with so much ease as the rest.

These properties of tin ore furnish us with the means of separating it easily by lotion, not only from earthy and stony parts, but even from the other ores which may be mixed with it. And this is of the greater advantage on two accounts, viz. because tin cannot endure, without the destruction of a great part thereof, the degree of fire necessary to scorify the refractory matters which accompany its ore; and again, because this metal unites so easily with iron and copper, the ores of which are pretty commonly blended with tin ore, that after the reduction it would be found adulterated with a mixture of these two metals, if they were not separated from it before the fusion.

Into an unvarnished earthen dish put the quantity of tin you intend to calcine; melt it, and keep stirring it from time to time. Its surface will be covered with a greyish white powder: Continue the calcination till all your tin be converted into such a powder, which is the calx of tin.

*The dissolution of Tin by Acids.*

Put into a glass vessel what quantity you please of fine tin cut into little bits. Pour on it thrice as much *aqua regis*, compounded of two parts *aqua fortis* weakened with an equal quantity of very pure water, and one part spirit of salt. An ebullition will arise, and the tin will be very rapidly dissolved; especially if the quantities of metal and of *aqua regis* be considerable.

*To extract Lead from its Ore.*

HAVING roasted your lead-ore, reduce it to a fine powder; mix it with twice its weight of the black flux, and one fourth of its weight of clean iron filings and borax; put the whole into a crucible capable of containing at least thrice as much; over all put sea-salt four fingers thick; cover the crucible; lute the juncture; dry the whole with a gentle heat, and set it in a melting furnace.

Make the crucible moderately red: you will hear the sea-salt decrepitate, and after the decrepitation a small hissing in the crucible. Keep up the same degree of fire till that be over.

Then throw in as many coals as are necessary to complete the operation entirely, and raise the fire suddenly, so as to bring the whole mixture into perfect fusion. Keep up this degree of fire for a quarter of an hour, which is time sufficient for the precipitation of the regulus.

When the operation is finished, which may be known by the quietness of the matter in the crucible, and by a bright vivid flame that will rise from it, take the crucible out of the furnace, and separate the regulus from the scoria.

*To separate Lead from Copper.*

WITH luting earth and charcoal-dust make a flat vessel, widening upwards, and large enough to contain your metalline mafs. Set it shelving downwards from the back towards the fore-part; and in the fore-part, at the bottom, make a little gutter communicating with another vessel of the same nature, placed near the former and a little lower. Let the mouth of the gutter withinside the upper vessel be narrowed, by means of a small iron plate fixed across it, while the loam is yet soft; so as to leave a very small aperture in the lower part of this canal sufficient to discharge the lead as it melts. Dry the whole by placing lighted coals round it.

When this apparatus is dry, put your mixed mafs of copper and lead into the upper vessel: both in that, and in the other vessel, light a very gentle fire of wood or charcoal, so as not to exceed the degree of heat necessary to melt lead. In such a degree of heat the lead contained in the mixed mafs will melt, and you will see it run out of the upper vessel into the lower; at the bottom of which it will unite into a regulus. When in this degree of heat no more lead flows, increase the fire a little, so as to make the vessel moderately red.

When no more will run, collect the lead contained in the lower vessel. Melt it over again in an iron ladle, with a degree of fire sufficient to make the ladle red; throw into it a little tallow or pitch, and while it burns keep stirring the metal, in order to reduce any part of it that may be calcined. Remove the pellicle or thin crust which will form on the surface; squeeze out all the lead it contains, and then put it to the mafs of copper left in the upper vessel. Check the fire, and in the same manner take off a second skin that will form on the surface of the lead. Lastly, when the metal is ready to fix, take off the skin that will then appear on it. The lead

remaining after this will be very pure, and free from all alloy of copper.

With regard to the copper itself, you will find it in the upper vessel covered with a thin coat of lead, and if the lead mixed with it was in the proportion of a fourth or a fifth part only, and the fire applied was gentle and slow, it will retain nearly the same form after the operation that the mixed mafs had before.

*The Calcination of Lead.*

TAKE what quantity of lead you please; melt it in one or more unglazed earthen pans: a dark grey powder will be found on its surface. Keep stirring the metal incessantly till it be wholly converted into such a powder, which is the *calx of lead*.

In the calcination of all metals, and particularly in this of lead, there appears a singular phenomenon which is not easily accounted for. It is this: though these matters lose a great deal of their substance, either by the dissipation of their phlogiston, or because some of the metal perhaps exhales in vapours, yet, when the calcination is over, their calxes are found to be encreased in weight, and this increase is very considerable. An hundred pounds of lead, for example, converted into minium, which is nothing but a calx of lead brought to a red colour by continuing the calcination, are found to gain ten pounds weight; so that for an hundred pounds of lead we have one hundred and ten pounds of minium: a prodigious and almost incredible augmentation, if it be considered that, far from adding any thing to the lead, we have on the contrary dissipated part of it.

*To prepare Glass of Lead.*

TAKE two parts of litharge, and one part of pure crystalline sand; mingle them together as exactly as possible, adding a little nitre and sea-salt: put this mixture into a crucible of the most solid and most compact earth. Shut the crucible with a cover that may perfectly close it.

Set the crucible thus prepared in a melting furnace; fill the furnace with coals; light the fire gradually, so that the whole may be slowly heated: Then raise the fire so as to make the crucible very red, and bring the matter it contains into fusion; keep it thus melted for a quarter of an hour.

Then take the crucible out of the furnace, and break it: In the bottom thereof you will most commonly find a small button of lead, and over it a transparent glass of a yellow colour nearly resembling that of amber. Separate this glass from the little button of metal, and from the saline matters which you will find above it.

*Lead dissolved by the Nitrous Acid.*

PUT into a matras some *aqua fortis* precipitated like that used to dissolve silver; weaken it by mixing therewith an equal quantity of common water; set the matras in a hot sand-bath; throw into it, little by little, small bits of lead, till you see that no more will dissolve. *Aqua fortis* thus lowered will dissolve about a fourth of its weight of lead.

There is gradually formed upon the lead, as it dissolves, first a grey powder, and afterwards a white crust, which

which at last hinder the solvent from acting on the remaining part of the metal; and therefore the liquor should be made to boil, and the vessel should be shaken to remove those impediments, by which means all the lead will be dissolved.

### Of MERCURY.

*To extract Mercury from its Ore, or to revivify it from Cinabar.*

PULVERIZE the cinabar from which you would extract the mercury; with this powder mix an equal part of clean iron filings; put the mixture into a retort of glass or iron, leaving at least one third part thereof empty. Set the retort thus prepared in a sand-bath, so that its body may be quite buried in the sand, and its neck decline considerably downwards: fit on a receiver half filled with water, and let the nose of the retort enter about half an inch into the water.

Heat the vessel so as to make the retort moderately red. The mercury will rise in vapours, which will condense into little drops, and fall into the water in the receiver. When you see that nothing more comes over with this degree of heat, increase it, in order to raise what mercury may still be left. When all the mercury is thus brought over, take off the receiver, pour out the water contained in it, and collect the mercury.

Mercury is never mineralized in the bowels of the earth by any thing but sulphur: with which it forms a compound of a brownish red colour, known by the name of *Cinabar*.

The oldest and richest mine of mercury is that of Almaden in Spain. It is a singular property of that mine, that though the mercury found in it is combined with sulphur, and in the form of cinabar, yet no additament is required to procure the separation of these two; the earthy and stony matter, with which the particles of the ore are incorporated, being itself an excellent absorbent of sulphur.

In the quick-silver works carried on at this mine they make no use of retorts. They place lumps of the ore on an iron grate, which stands immediately over the furnace. The furnaces which serve for this operation are closed at the top by a sort of dome, behind which stands the shaft of a chimney that communicates with the fire-place, and gives vent to the smoke. These furnaces have in their fore-side sixteen apertures, to each of which is luted an aludel in a horizontal position, communicating with a long row of other aludels placed likewise in an horizontal direction; which aludels so connected together form one long pipe or canal, the further end whereof opens into a chamber destined to receive and condense all the mercurial vapours. These rows of aludels are supported from end to end by a terrass, which runs from the body of the building, wherein the furnaces are erected, to that where the chambers are built that perform the office of receivers.

This a very ingenious contrivance, and saves much labour, expence, and trouble, that would be unavoidable if retorts were employed.

VOL. II. No. 35.

3

That part of the furnace which contains the lumps of ore, serves for the body of the retort; the row of aludels for its neck; and the little chambers in which these canals terminate are actual receivers. The terrass of communication, which reaches from the one building to the other, is formed of two inclined planes, the lower edges of which, meeting in the middle of the terrass, rise from thence insensibly; the one quite to the building where the furnaces are, and the other to that which forms the recipient chambers. By this means, when any mercury escapes through the joints of the aludels, it naturally runs down along these inclined planes, and so is collected in the middle of the terrass, where the inferior sides of the planes meeting together form a sort of canal, out of which it is easily taken up.

*To give Mercury, by the action of Fire, the appearance of a Metalline Calx.*

Put mercury into several little glass matrasses with long and narrow necks. Stop the matrasses with a little paper, to prevent any dirt from falling into them. Set them all in one sand-bath, so that they may be surrounded with sand as high as two thirds of their length. Apply the strongest degree of heat that mercury can bear without subliming: continue this heat without interruption, till all the mercury be turned to a red powder. The operation lasts about three months.

Mercury thus converted to a red powder is known in chemistry and medicine by the name of *mercury precipitated per se*.

*To dissolve Mercury in the Vitriolic Acid. Turbith mineral.*

Put mercury into a glass retort, and pour on it thrice its weight of good oil of vitriol. Set the retort in a sand-bath; fit on a recipient; warm the bath by degrees till the liquor just simmer. With this heat the mercury will begin to dissolve. Continue the fire in this degree till all the mercury be dissolved.

The vitriolic acid dissolves mercury pretty well: but for this purpose the acid must be very hot, or even boil; and then too it is a very long time before the dissolution is completed. We have directed the operation to be performed in a retort; because this solution is usually employed to make another preparation called *turbith mineral*, which requires that as much as possible of the acid solvent be abstracted by distillation. Having therefore dissolved your mercury in the vitriolic acid, if you will now prepare the turbith, you must, by continuing to heat the retort, drive over all the liquor into the receiver, and distill till nothing remains but a white powdery matter: then break the retort; pulverise its contents in a glass mortar, and thereon pour common water, which will immediately turn the white matter of a lemon-colour; wash this yellow matter in five or six warm waters, and it will be what is called in medicine *turbith mineral*; that is, a combination of the vitriolic acid with mercury, five or six grains whereof is a violent purgative, and also an emetic; qualities which it possesses in common

†

2 M

common

common with the vegetable turbit, whose name it hath therefore taken.

*To combine Mercury with sulphur. Æthiops Mineral.*

Mix a dram of sulphur with three drams of quick-silver, by triturating the whole in a glass mortar with a glass pestle. By degrees, as you triturate, the mercury will disappear, and the matter will acquire a black colour. Continue the triture till you cannot perceive the least particle of running mercury. The black matter you will then have in the mortar is known in medicine by the name of *æthiops mineral*. An *æthiops* may also be made by fire in the following manner.

In a shallow unglazed earthen pan melt one part of flowers of sulphur: add three parts of running mercury, making it fall into the pan in the form of small rain, by squeezing it through chamoy leather. Keep stirring the mixture with the shank of a tobacco-pipe all the while the mercury is falling: you will see the matter grow thick and acquire a black colour. When the whole is thoroughly mixed, set fire to it with a match, and let as much of the sulphur burn away as will flame.

*To sublime the combination of Mercury and Sulphur into Cinabar.*

GRIND to powder *æthiops mineral* prepared by fire. Put it into a cucurbit; fit thereto a head; place it in a sand-bath, and begin with applying such a degree of heat as is requisite to sublime sulphur. A black matter will rise, and adhere to the sides of the vessel. When nothing more will rise with this degree of heat, raise the fire so as to make the sand and the bottom of the cucurbit red; and then the remaining matter will sublime in the form of a brownish red mass, which is true *cinabar*.

*To dissolve Mercury in the Nitrous acid. Sundry Mercurial Precipitates.*

PUT into a matras the quantity of mercury you intend to dissolve: pour on it an equal quantity of good spirit of nitre, and set the matras in a sand-bath moderately heated. The mercury will dissolve with the phenomena that usually attend the dissolutions of metals in this acid. When the dissolution is completed, let the liquor cool. You will know that the acid is perfectly saturated, if there remain at the bottom of the vessel, notwithstanding the heat, a little globule of mercury that will not dissolve.

Mercury dissolves in the nitrous acid with much more facility, and in much greater quantity, than in the vitriolic; so that it is not necessary, on this occasion, to make the liquor boil. This solution when cold yields crystals, which are a nitrous mercurial salt. If you desire to have a clear limpid solution of mercury, you must employ an *aqua fortis* that is not tainted with vitriolic or marine acid: for, the affinity of these two acids with mercury being greater than that of the nitrous acid, they precipitate it in the form of a white powder, when they are mixed with the solvent.

Mercury thus precipitated in a white powder, out of a solution thereof in the spirit of nitre, is used in medi-

cine. To obtain this precipitate, which is known by the name of the *white precipitate*, sea salt, dissolved in water, together with a little sal ammoniac is used; and the precipitate is washed several times in pure water, without which precaution it would be corrosive, on account of the great quantity of the marine acid which it would contain.

The preparation known by the name of *red precipitate*, is also obtained from our solution of mercury in spirit of nitre. It is made by abstracting all the moisture of the solution, either by distillation in a retort, or by evaporation in a glass basin set on a sand-bath. When it begins to grow dry, it appears like a white ponderous mass. Then the fire is made strong enough to drive off almost all the nitrous acid, which, being now concentrated, rises in the form of red vapours. If these vapours be caught in a receiver, they condense into a liquor, which is a very strong and vastly smoking spirit of nitre.

By degrees, as the nitrous acid is forced up by the fire, the mercurial mass loses its white colour, and becomes first yellow, and at last very red. When it is become entirely of this last colour, the operation is finished. The red mass remaining is a mercury that contains but very little acid, in comparison of what it did while it was white: and indeed the first white mass is such a violent corrosive, that it cannot be used in medicine; whereas, when it is become red, it makes an excellent escharotic, which those who know how to use it properly apply with very great success, particularly to venereal ulcers.

*To combine Mercury with the Acid of Sea-salt. Corrosive Sublimate.*

EVAPORATE a solution of mercury in the nitrous acid till there remain only a white powder, as mentioned in our observations on the preceding process. With this powder mix as much green vitriol calcined to whiteness, and decrepitated sea-salt, as there was mercury in the solution. Triturate the whole carefully in a glass mortar. Put this mixture into a matras, so that two thirds thereof may remain empty, having first cut off the neck to half its length; or instead thereof you may use an apothecary's phial. Set your vessel in a sand-bath, and put sand round it as high as the contents reach. Apply a moderate fire at first, and raise it by slow degrees. Vapours will begin to ascend. Continue the fire in the same degree till they cease. Then stop the mouth of the vessel with paper, and increase the fire till the bottom of the sand-bath be red-hot. With this degree of heat a sublimate will rise, and adhere to the inside and upper part of the vessel, in the form of white, semi-transparent crystals. Keep up the fire to the same degree till nothing more sublimes. Then let the vessel cool; break it, and take out what is sublimed, which is *corrosive sublimate*.

*Sweet Sublimate.*

TAKE four parts of corrosive sublimate; pulverise it in a glass or marble mortar; add by little and little three parts of mercury revived from cinabar; triturate the whole carefully, till the mercury be perfectly killed, so that

that no globule thereof can be perceived. The matter will then be grey. Put this powder into an apothecary's phial, or into a matras, whose neck is not above four or five inches long, leaving two thirds thereof empty. Set the vessel in a sand-bath, and put sand round it to one third of its height. Apply a moderate fire at first; and afterwards raise it gradually till you perceive that the mixture sublimes. Keep it up to this degree till nothing more will rise, and then break the vessel. Reject, as useless, a small quantity of earth which you will find at the bottom; separate also what adheres to the neck of the vessel, and carefully collect the matter in the middle, which will be white. Pulverise it; sublime it a second time, in the same manner as before; and in the same manner separate the earthy matter left at the bottom of the vessel, and what you find sublimed into the neck. Pulverise, and sublime a third time, the white matter you last found in the middle. The white matter of this third sublimation is the *purest sublimate*, called also *aquila alba*.

#### *The Panacea of Mercury.*

PULVERISE some sweet sublimate, and sublime it in the same manner as you did thrice before. Repeat this nine times. After these sublimations it will make no impression on the tongue. Then pour on it aromatic spirit of wine, and set the whole in digestion for eight days. After that decant the spirit of wine, and dry what remains, which is the *panacea of mercury*.

#### OF ANTIMONY.

##### *To separate Antimony from its Ore by Fusion.*

HAVING drilled some small holes, of about two lines diameter, in the bottom of a crucible, put into it your antimonial ore broken into little bits, about the size of a hazel nut; lute on its cover; set the crucible thus prepared in the mouth of another crucible, and close the joints with lute.

At the distance of half a foot from this compound vessel place bricks all round, so as to form a furnace; the sides of which must rise as high as the brim of the uppermost crucible.

Let the bottom of this furnace be filled with ashes, up to the top of the lower crucible, and the rest of the furnace with lighted coals. Blow the fire, if it be necessary, with bellows, till the upper crucible become red. Keep it up in this degree for about a quarter of an hour. Then take your vessels out of the furnace, and you will find the antimony collected in the bottom of the lower crucible, having run through the holes of the upper one.

##### *The common Regulus of Antimony.*

REDUCE crude antimony to powder. Mix it with three fourths of its weight of white tartar, and half its weight of refined salt-petre, both pulverised. Into a large crucible, made red-hot in the fire, throw a spoonfull of your mixture, and cover it. There will be a very considerable detonation. When it is over, throw in a second spoonfull of your mixture, and cover the crucible

as before: this will produce a second detonation. Go on thus, till you have thrown in all your mixture.

When the whole has thus fulminated, increase the fire so as to bring the matter into fusion; that being done, take the crucible out of the furnace, and immediately pour its contents into an iron cone heated and greased with tallow. Strike the floor and the cone some gentle blows with a hammer, to make the regulus precipitate; and when the matter is fixed and cold, invert the cone, and turn it out. You will see it consist of two distinct substances; the uppermost of which is a saline scoria, and the undermost the reguline part. Strike this mass a blow with a hammer, in the place where these substances join, and you will by this means separate the scoria from the regulus; the latter of which will have the form of a metallic cone, on whose base you will observe the signature of a bright star.

##### *Regulus of Antimony precipitated by Metals.*

PUT one part of small iron nails into a crucible, and set it amidst burning coals, in a melting furnace. When the iron is thoroughly red-hot, and begins to grow white, add thereto little by little, and at several times, two parts of crude antimony in powder. The antimony will immediately flow and unite with the iron. When the antimony is entirely melted, add thereto, at several times, the fourth of its weight of pulverised nitre: a detonation will ensue, and the whole mixture will be in fusion.

After you have kept the matter in this condition for some minutes, pour it into an iron cone, first heated and tallowed. Strike the sides of the cone with a hammer, that the regulus may fall to the bottom; and, when all is cold, separate it from the scoria by a blow with a hammer. Melt this first regulus again in another crucible, adding a fourth part of its weight of crude antimony. Keep the crucible close shut, and give no more heat than is necessary to melt the matter. When it is in perfect fusion, add to it at several times, as you did before, the sixth part of its weight of pulverised nitre; and, in half a quarter of an hour after this, pour the whole into a cone as you did the first time.

Lastly, Melt your regulus over again a third or even a fourth time, always adding a little nitre, which will detonate as before. If after all these fusions you pour the regulus into an iron cone, you will find it very beautiful, and the star well formed: it will be covered with a semi-transparent, lemon-coloured scoria. This scoria is extremely acrid and caustic.

##### *The Calcination of Antimony.*

TAKE an unglazed earthen vessel, wider at top than at bottom; put into it two or three ounces of crude antimony finely pulverised. Set this vessel over a weak charcoal-fire, and increase the heat till you see the antimony begin to smoke a little. Continue the fire in this degree, and keep incessantly stirring the antimony with the shank of a tobacco-pipe all the while it is upon the fire.

The powder of antimony, which, before calcination, was of a brilliant colour inclining to black, will become dull,

dull, and look like an earth. When it comes to have this appearance, raise your fire till the vessel be red-hot, and keep it up in this degree till the matter cease entirely to smoke.

*Calx of Antimony reduced to a Regulus.*

Mix the calx of antimony, which you intend to reduce, with an equal quantity of black soap. This mixture will make a thin paste. Put it little by little into a crucible, previously made red-hot amidst live coals. Thus let the soap burn, till it cease to emit an oily smoke. Then cover the crucible; make the fire strong enough to melt the matter, and you will hear it effervesce and boil. When this noise is over, let the crucible cool, and then break it: you will find in it a beautiful scoria, marked with circles of several colours; and under that a button of regulus, which is not yet quite pure, and must be purified in the following manner.

Pound this regulus, and mix it with half its weight of an antimonial calx as perfectly desulphurated as possible. Put it into a crucible, and cover it: melt the whole, so that the surface of the melted matter may be smooth and uniform. Let the crucible cool, and then break it: you will find in it a beautiful button of very pure regulus, covered with a scoria, having the appearance of an opaque glass, or a kind of greyish enamel, moulded on the finely radiated surface of the regulus.

*Antimony calcined with Nitre. Liver of Antimony.*

PULVERISE and mix perfectly together equal parts of nitre and antimony: put the mixture into an iron mortar, and cover it with a tile, which however must not shut it quite close. With a live coal set fire to the matter in the mortar, and immediately withdraw it. The mixture will flame, with great detonation; which being over, and the mortar cooled, invert it, and strike its bottom to make all the matter fall out. Then, by a blow with a hammer, separate the scoria from the shining part, which is the *liver of antimony*.

*Another Calcination of Antimony with Nitre. Diaphoretic Antimony.*

Mix one part of antimony with three parts of nitre; project this mixture by spoonfulls into a crucible kept red hot in a furnace. Each projection will be attended with a detonation. Continue doing this till you have used all your mixture: then raise the fire, and keep it up for two hours; after which throw your matter into a pan full of hot water. Let it lie sleeping in water kept hot for a whole day. Then pour off the liquor: wash the white powder you find at bottom in warm water; and repeat the ablutions till the powder become insipid. Dry it, and you have *diaphoretic antimony*.

*Calx of Antimony vitrified.*

TAKE any quantity you please of calx of antimony, made without addition; put it into a good crucible, which set in a melting furnace: kindle the fire gradually, and leave the crucible uncovered at the beginning.

A quarter of an hour after the matter is red-hot, cover the crucible, and excite the fire vigorously till the

calx melt. You may know when it is thoroughly melted, by dipping into the crucible an iron wire, to the end of which a little knob of glass will adhere, if the matter be in perfect fusion. Keep it in fusion for a quarter of an hour, or rather longer if your crucible can bear it. Then take it out of the furnace, and immediately pour out the melted matter on a smooth stone, made very hot for the purpose: it will presently fix into a yellow glass.

*Kermes Mineral.*

BREAK any quantity you will of Hungarian antimony into little bits: put it into a good earthen coffee-pot: pour on it twice its weight of rain-water, and a fourth part of its weight of well filtered liquor of nitre fixed by charcoal. Boil the whole briskly for two hours, and then filter the liquor. As it cools it will acquire a red colour, grow turbid, and leave a red powder on the filter.

Return your antimony into the coffee-pot. Pour on it as much rain-water as before, and three fourths of the former quantity of the liquor of fixed nitre. Boil it again for two hours, and then filter the liquor. It will again deposit a red sediment. Return your antimony into the coffee pot: pour on it the same quantity of rain-water, and half the first quantity of the liquor of fixed nitre. Boil it again for two hours, and filter the liquor as formerly. Wash all these sediments with warm water, till they become insipid; then dry them, and you have the *kermes mineral*.

*Regulus of Antimony dissolved in the Mineral Acids.*

COMPOUND an *aqua regis* by mixing together four measures of spirit of nitre, and one measure of spirit of salt: on a sand-bath moderately heated place a matras, into which pour sixteen times as much of this *aqua regis* as you have regulus to dissolve. Break your regulus in little bits; and throw them successively one after another into the matras, observing not to add a new one till that put in before is entirely dissolved: continue this till your regulus be all used. By degrees, as the dissolution advances, the liquor will acquire a beautiful golden colour; which however will insensibly disappear, as the white fumes that continually ascend from it evaporate.

*Regulus of Antimony combined with the Acid of Sea-salt. Butter of Antimony. Cinabar of Antimony.*

PULVERISE and mix thoroughly six parts of regulus of antimony, and sixteen parts of corrosive sublimate. Put this mixture into a glass retort that hath a wide short neck, and let one half of its body at least be left empty. Set it in a reverberatory furnace, and having fitted a recipient thereto and luted the joint, make a very small fire at first to heat it slowly. Increase it afterwards by degrees, till you see a liquor ascend from the retort that grows thick as it cools. Keep up the fire to this degree as long as you see any of this matter come over.

When no more arises with this degree of fire, unlute your vessels, take off the receiver, and in its place substitute another filled with water. Then increase your fire by degrees till the retort be red-hot. Some running

ning mercury will fall into the water, which you may dry and keep for use; it being very pure.

Soon after mixing the regulus with the corrosive sublimate, the matter sometimes grows considerably hot: This is occasioned by the marine acid's beginning to act on the reguline part, and to desert its mercury.

The butter of antimony rises with a very moderate heat; because the acid of sea-salt hath the property of volatilizing, and carrying up along with it, the metallic substances with which it is combined: And for this reason a very gentle heat only is required at the beginning of the operation.

It is absolutely necessary that the neck of the retort be wide and short: for otherwise, if the butter of antimony should fix and be accumulated therein, it might stop up the passage entirely, and occasion the bursting of the vessels. By this operation we obtain eight parts and three quarters of fine butter of antimony, and ten parts of running mercury; there being left in the retort one part and a half of a rarefied matter, black, white, and red. This is probably the most earthy and most impure part of the regulus of antimony.

If crude antimony, instead of regulus of antimony, be mixed with corrosive sublimate, a butter of antimony will be obtained in the same manner; but, instead of having a running mercury after the butter, you will find a cinabar sublimed into the neck and upper concavity of the retort.

The reason of this difference is easily conceived: for, when the regulus is used, the mercury being deserted by its acid, finds no other substance to unite with, and so rises in the form of quick-silver; but when crude antimony is employed instead of its regulus, as the reguline part thereof cannot combine with the acid without quitting its sulphur, so this sulphur, being at liberty, unites with the mercury, which is so likewise, and therewith forms a cinabar; which from its origin is named *cinabar of antimony*.

*Butter of Antimony decomposed by means of Water only. The Pulvis Algaroth, or Mercurius Vitæ.*

MELT with a gentle heat as much butter of antimony as you please. When it is melted, pour it into a large quantity of warm water. The water will immediately grow turbid, but whitish, and let fall a great quantity of white powder. When all the precipitate is settled, decant the water: pour on fresh warm water; and having thus edulcorated it by several ablutions, dry it, and you have the *pulvis Algaroth, or mercurius vitæ*.

#### *Bezoar Mineral.*

MELT butter of antimony over warm ashes, and put it into a phial or matras. Gradually pour on it good spirit of nitre, till the matter be entirely dissolved. This usually requires as much spirit of nitre as there is butter of antimony. During the dissolution fumes will rise, which must be carefully avoided. Pour your solution, which will be clear and of a reddish colour, into a glass cucurbit, or a pan of stone-ware; set it in a sand-bath, and evaporate to dryness with a moderate heat. There will be left a white mass, weighing a fourth part less

than the whole quantity used, both of butter and the spirit of nitre. Let it cool, and again pour on it as much spirit of nitre as you used the first time. Place the vessel again in the sand-bath, and evaporate the moisture as before. You will have a white mass that hath neither gained nor lost in weight. On this pour, for the third time, the same quantity of spirit of nitre as you did the first time. Again evaporate the moisture to perfect dryness: then increase your fire, and calcine the matter for half an hour. You will have left a dry, friable, light, white matter, of an agreeable acid taste; which will fall into a coarse powder, and must be kept in a phial carefully stoppt. This is Bezoar mineral: it is neither caustic nor emetic, and has only a sudorific virtue. It obtained the name it bears, because, like the animal bezoar, it was imagined to have the property of resisting poison.

#### *Flowers of Antimony.*

TAKE an unglazed earthen pot, having an aperture in its side, with a stopple to shut it close. Set this pot in a furnace, the cavity whereof it may fit as exactly as possible; and fill up with lute the space, if any, left between the vessel and the furnace. Over this vessel fix three aludels with a blind-head at the top; and light a fire in the furnace under the pot.

When the bottom of the pot is thoroughly red, throw into the lateral aperture a small spoonful of powdered antimony. Stir the matter immediately with an iron spatula made a little bending, in order to spread it over the bottom of the vessel, and then stop the hole. The flowers will rise and adhere to the insides of the aludels. Keep up the fire so that the bottom of the pot may always continue red; and, when nothing more sublimes, put in a like quantity of antimony, and operate as before. In this manner go on subliming your antimony, till you have as many flowers as you want. Then let the fire go out; and when the vessels are cold, unlute them. You will find flowers adhering all round the insides of the aludels and the head, which you may collect with a feather.

#### *Regulus of Antimony converted into flowers.*

PULVERISE your regulus of antimony: put the powder into an unglazed earthen port: three or four fingers breadth above the powder, fit into the pot a little cover, made of the same earth and having a small hole in its middle, so that it may with ease be placed in the pot and taken out when there is occasion: cover the mouth of the pot with a common lid; set it in a furnace, and kindle a fire under it sufficient to make the bottom of the pot red and to melt the regulus. When it hath been thus kept in fusion for about an hour, let the fire go out and the whole cool. Then remove the two covers. You will find adhering to the surface of the regulus, which will be in a mass at the bottom of the pot, white flowers resembling snow, intermixed with beautiful, brilliant, silver coloured needles. Take them out, and you will find them make about one part in sixty-two of the whole regulus employed.

Put the covers again in their places, and proceed in the same manner as before: When the vessels are cold,

cold, you will find half as many more flowers as you got the first time.

Proceed thus till you have converted all your regulus into flowers. This will require a considerable number of sublimations, which, as you advance, will always yield you a greater portion of flowers; respect, however, being had to the quantity of regulus remaining in the pot.

### Of Bismuth.

#### *To extract Bismuth from its Ore.*

**B**REAK the ore of bismuth into small pieces, and therewith fill a crucible either of earth or iron. Set the crucible in a furnace, and light such a fire that the bits of ore may become moderately red. Stir the ore from time to time; and if you perceive it crackle and fly, keep the crucible covered. At the bottom you will find a button of bismuth.

#### *Bismuth dissolved by Acids. Magistery of Bismuth-Sympathetic Ink.*

**I**NTO a matras put bismuth broken into little bits: pour on it, by little and little, twice as much *aqua fortis*. This acid will attack the semi-metal briskly, and dissolve it entirely, with heat, effervescence, vapours, and puffing up. The solution will be clear and limpid.

If you would have a magistery of bismuth beautifully white, you must perform the dissolution with an *aqua fortis* that is not tainted with any mixture of the vitriolic acid; for this gives the precipitate a dirty white colour, inclining to grey.

Bismuth may also be precipitated by the means of fixed or volatile alkalis; but the precipitate is not of so fine a white as when procured by the means of pure water only.

A solution of bismuth prepared with the proper quantity of *aqua fortis*, that is, with two parts of the acid to one of the semi metal, coalesces into little crystals almost as soon as made.

*Aqua fortis* not only acts on bismuth when separated from its ore, and reduced to a regulus, but attacks it even in its ore, and likewise dissolves at the same time some portion of the ore itself. With this solution of the ore of bismuth Mr Hellot makes a very curious sympathetic ink, differing from all that were known before.

Mr Hellot prepares the liquor in the following manner: "He bruises the ore of bismuth to a coarse powder. On two ounces of this powder he pours a mixture of five ounces of common water with five ounces of *aqua fortis*. He does not heat the vessel till the first ebullitions are over. He then sets it in a gentle sand-heat, and lets it digest there till he sees no more air-bubbles rise. When none appear in this heat, he increases it so as to make the solvent boil slightly for a full quarter of an hour. It takes up a tincture nearly of the colour of brown beer. The ore that gives the *aqua fortis* this colour is the best. He then lets the solution cool, laying the matras on its side, that he may decant the liquor more conveniently when all is precipitated that is not taken up by the solvent.

"The second vessel, into which the liquor is first decanted, he also lays declining, that a new precipitation of the undissolved matters may be obtained; after which he pours the liquor into a third vessel. This liquor must not be filtered, if you would have the rest of the process succeed perfectly; because the *aqua fortis* would dissolve some of the paper, and that would spoil the colour of your liquor.

"When this solution, which Mr Hellot calls the *impregnation*, is thoroughly clarified by being decanted three or four times, he puts it into a glass basin with two ounces of very pure sea-salt. The fine white salt made by the sun succeeded best with Mr Hellot. If that cannot be had, common bay-salt purified by solution, filtration, and crystallisation, may be used instead of it. But as it is rare to meet with any of the sort that is not a little tainted with iron, the white bay salt is to be preferred. The glass basin he sets in a gentle sand-heat, and keeps it there till the mixture be reduced by evaporation to an almost dry saline mass.

"If you desire to save the *aqua regis*, the impregnation must be put into a retort, and distilled with the gentle heat of a sand-bath. But there is an inconvenience, as Mr Hellot observes, in employing a retort; which is, that, as the saline mass cannot be stirred while it coagulates in the retort, it is reduced to a compact cake of coloured salt, which presents but one single surface to the water in which it must be dissolved; so that the dissolution thereof takes up sometimes no less than five or six days. In the basin, on the contrary, the saline mass is easily brought to a granulated salt, by stirring it with a glass rod; and, when thus granulated, it has a great deal more surface; it dissolves more easily, and yields its tincture to water in four hours time. Indeed one is more exposed to the vapours of the solvent, which would be dangerous, if the operation were to be often performed, without proper precautions.

"When the basin, or little vessel containing the mixture of the impregnation and sea-salt, is heated, the liquor, which was of an orange-coloured red, becomes a crimson red; and, when all the phlegm of the solvent is evaporated, it acquires a beautiful emerald colour. By degrees it thickens, and turns of the colour of a mass of verdegris. It must then be carefully stirred with the glass rod, in order to granulate the salt, which must not be kept over the fire till it be perfectly dry: because you run a risk of losing irrecoverably the colour you are seeking. You may be sure you have lost it, if by too much heat the salt that was of a green colour turn to a dirty yellow. If it be once brought to this state, it will continue without changing when cold: but if care be taken to remove it from the fire while it is still green, you will see it gradually grow pale, and become of a beautiful rose-colour as it cools.

"Mr Hellot separates it from this vessel, and throws it into another containing distilled rain-water: and this second vessel he keeps in gentle digestion, till he observes that the powder which falls to the bottom is perfectly white. If, after three or four hours digesting, this powder still continues tinged with a rose colour, it is a proof that water enough was not added to dissolve all the salt.

salt impregnated with the tincture of the solution. In this case, the first tinged liquor must be poured off, and fresh water added in proportion to the quantity of tinged salt that is supposed to remain mixed with the precipitate.

“ When the ore is pure, and doth not contain a great deal of fusible stone, commonly called *flus*, or *quartz*, an ounce of it generally yields tincture enough for eight or nine ounces of water, and the liquor is of a beautiful colour, like that of the lilach or pipe-tree blossom. In order to prove the effect of this tincture, you must write with this lilach-coloured liquor on good well-gummed paper, that does not sink : or you may use it to shade the leaves of some tree or plant, having first drawn the outlines thereof lightly with China ink or with a black lead pencil. Let this coloured drawing, or writing, dry in a warm air. You will perceive no colour while it is cold; but, if it be gently warmed before the fire, you will see the writing, or the drawing, gradually acquire a blue or greenish blue colour, which is visible as long as the paper continues a little warm, and disappears entirely when it cools.”

The singularity of this sympathetic ink consists in its property of disappearing entirely, and becoming invisible, though it be not touched with any thing whatever : and this distinguishes it from all others ; which, when once rendered visible by the application of proper means, do not again disappear, or at least not without touching the strokes on the paper with some other liquor.

### Of Z I N C.

*To extract Zinc from its Ore, or from Calamine.*

TAKE eight parts of calamine reduced to a powder ; mix this powder accurately with one part of fine charcoal dust, previously calcined in a crucible to free it from all moisture : put this mixture into a stone retort coated with lute, leaving a third part of it empty : set your retort in a reverberatory furnace, capable of giving a very fierce heat. To the retort apply a receiver, with a little water in it. Kindle the fire, and raise it by degrees till the heat be strong enough to melt copper. With this degree of fire the zinc being metallised will separate from the mixture, and sublime into the neck of the retort, in the form of metallic drops. Break the retort when it is cold, and collect the zinc.

Most of the zinc we have comes from an ore of difficult fusion that is worked at Goslar, and yields, at one and the same time, lead, zinc, and another metallic matter called *cadmia fornacum*, which also contains much zinc.

The furnace used for smelting this ore is closed on its fore-side with thin plates or tables of stone, not above an inch thick. This stone is greyish, and bears a violent fire.

In this furnace the ore is melted amidst charcoal, by the help of bellows. Each melting takes twelve hours, during which time the zinc flowing with the lead is resolved into flowers and vapours, great part of which adheres to the sides of the furnace in the form of a very

hard crust of earth. The workmen take care to remove this crust from time to time ; for it would otherwise grow so thick at last, as to lessen the cavity of the furnace very considerably.

There adheres moreover to the fore-part of the furnace, which is formed, as we said before, of thin plates of stone, a metallic matter, which is the zinc, and is carefully collected at the end of each melting, by removing from this part all the live coals. A quantity of small-coal is laid unlighted at the bottom ; and on this small-coal, by striking the stone-plates gently with a hammer, the zinc is made to fall out of the other matter, known by the Latin name of *cadmia fornacum*, among which it appears fixed in a radiated form. To this other matter we may properly enough give the name of *furnace-calamine*. The zinc falls in the form of a melted metal, all on fire, and in a bright flame. It would soon be entirely burnt and reduced to flowers, if it were not extinguished, and easily cooled and fixed, by being hid under the unlighted small-coal placed below on purpose to receive it.

The zinc adheres to the fore-part of the furnace preferably to any other, because that being the thinnest, is therefore the coolest : and, in order further to promote its fixing on this part, they take care to keep the thin stone-plates cool during the operation, by throwing water on them.

Hence it appears that zinc is not extracted from its ore by fusion and the precipitation of a regulus, like other metallic substances. This is owing to the great volatility of our semi-metal, which cannot, without subliming, bear the degree of fire necessary to melt its ore. It is at the same time so combustible, that a great part of it rises in flowers which have not the metalline form.

*To sublime Zinc into Flowers.*

TAKE a very deep, large crucible : place this crucible in a furnace, so that it may stand inclining in an angle of forty-five degrees nearly. Throw some zinc into it, and kindle a fire in the furnace somewhat stronger than would be necessary to keep lead in fusion. The zinc will melt. Stir it with an iron wire, and there will appear on its surface a very bright white flame : two inches above this flame a thick smoke will be formed, and with this smoke exceeding white flowers will rise, and remain some time adhering to the sides of the crucible, in the form of a very fine light down. When the flame slackens, stir your melted matter again with the iron wire : you will see the flame renewed, and the flowers begin again to appear in greater abundance. Go on thus till you observe that the matter will not flame, nor any more flowers rise.

*To combine Zinc with Copper. Brast. Prince's Metal, &c.*

POUND one part and an half of calamine, and an equal quantity of charcoal : mingle these two powders together, and moisten them with a little water. Put this mixture into a large crucible, or some other earthen vessel that will bear a melting heat. Amongst and over this mixture put one part of very pure copper in thin plates, and then put fresh charcoal-dust over all : close the

the crucible; set it in a melting furnace; put coals all round it, and let them kindle gradually. Raise the fire so as to make the crucible very red hot. When you observe that the flame hath acquired a purple or bluish-green colour, uncover the crucible, and dip into it an iron wire, to examine whether or no the copper be in fusion under the charcoal dust. If you find it is, moderate the force of the fire a little, and let your crucible remain in the furnace for a few minutes. Then take it out and let it cool: you will find your copper of a gold colour, increased in weight a fourth, or perhaps a third part, and yet very malleable.

The *lapis calaminaris* is not the only substance with which copper may be converted into brass: all other ores containing zinc, the furnace-calamine that sublimes where such ores are worked, tutty, zinc in substance, may be substituted for it, and, like it, will make very fine brass; but, in order to succeed, sundry precautions are necessary.

This process is a sort of cementation; for the calamine doth not melt; only the zinc is converted into vapours, and then combines with the copper. On this the success of the operation partly depends, as it is the means of the copper's preserving its purity and malleability; because the other metallic substances that may be united with the ore of zinc, or with the zinc itself, not having the same volatility, cannot be reduced to vapours. If you are apprised that the calamine, or other ore of zinc used on this occasion, is contaminated with a mixture of any other metallic matter, you must mingle luting earth with the charcoal-dust and the matter containing the zinc; make it into a stiff paste with water; of this make a bed at the bottom of your crucible, and ram it hard down; lay the copper-plates thereon, cover them with charcoal-dust, and then proceed as before. By this means, when the copper melts, it cannot fall to the bottom of the crucible, nor mix with the ore; but is borne up by the mixture, and cannot combine with any thing but the zinc, that rises in vapours, and, passing through the lute, fixes in the copper.

*Lapis Calaminaris*, or other ore of zinc, may be also purified before it be used for making brass; especially if adulterated with lead ore, which is often the case. For this purpose the ore must be roasted in a fire strong enough to give a small degree of fusion to the leaden matter; which will thereby be reduced into larger, heavier, and tougher masses. The most subtile particles are dissipated in the torrefaction, together with some of the calamine. The calamine, on the contrary, is by roasting made more tender, lighter, and much more friable. When it is in this condition, put it into a washing tray or fan; dip the tray in a vessel full of water, and bruise the matter it contains. The water will carry off the lightest powder, which is the calamine, and leave nothing at the bottom of the tray but the heaviest substance; that is, the leaden matter, which is to be rejected as useless. The powder of the calamine will settle at the bottom of the vessel, where, after pouring off the water, it may be found, and used as above directed.

In this operation the charcoal-dust serves to prevent both the copper and the zinc from being calcined: and

for this reason, when you work on a great quantity of materials at once, it is not necessary to use so much charcoal dust, in proportion, as when you work but on a small quantity; because, the greater the mass of metal, the less easily will it calcine.

Though the copper melts in this operation, yet it is far from being necessary to apply such a strong fire as copper usually requires to melt it: for the accession of the zinc, on this occasion, communicates to it a great degree of fusibility. The increase of its weight is also owing to the quantity of zinc combined with it. Copper acquires still another advantage by its association with this semi-metal; for it remains longer in the fire without calcining.

Brass well prepared ought to be malleable when cold. But in whatever manner it be made, and whatever proportion of zinc there be in it, it is constantly found quite unmalleable when red-hot.

Brass melted in a crucible, with a fierce heat, takes fire almost like zinc, and from its surface many white flowers ascend, dancing about in flakes like the flowers of zinc. They are indeed the flowers of zinc, and the flame of brass urged by a strong fire is no other than the flame of the zinc that is united with the copper, and then burns. If brass be thus kept long in fusion, it will lose almost all the zinc it contains. It will also lose much of its weight, and its colour will be nearly that of copper. It is therefore necessary, towards performing this operation aright, to seize the moment when the copper is sufficiently impregnated with zinc, when it hath acquired the most weight and the finest colour, with the least detriment to its ductility, that is possible, and that instant to put out the fire; because, if the copper be left longer in fusion, it will only lose the zinc already united with it. Skill acquired by much practice, and an acquaintance with the particular calamine employed, are necessary to guide the artist surely through this operation; for there are very considerable differences between the sundry ores of zinc. Some of them contain lead, and in others there is iron. When these heterogeneous metals come to be mixed with the copper, they do indeed augment its weight, but they render it at the same time pale, and make it very harsh. Some calamines require to be roasted before they can be used for this purpose, and in the torrefaction emit vapours of a volatile alkali, succeeded by vapours of a sulphureous spirit: others exhale no vapours while roasting, and may be employed without any antecedent preparation. These different qualities must evidently produce great differences in the operation.

Brass may also be made, as prince's metal and other imitations of gold are actually made, by using zinc in substance, instead of the ores that contain it. But these compositions have not, when cold, the ductility of brass prepared with *lapis calaminaris*, because zinc is seldom pure, or free from a mixture of lead. Perhaps also the different manner in which the zinc unites with the copper may contribute to this variation.

To obviate this inconvenience, the zinc must be refined from all alloy of lead. The property of being indissoluble by sulphur, which this semi-metal possesses, points out

out a very practicable method of doing it. The zinc must be melted in a crucible, and stirred briskly with a strong iron wire, while tallow and mineral sulphur are alternately projected upon it; but so that the quantity of sulphur may greatly exceed that of the tallow. If the sulphur do not burn entirely away, but form a kind of scoria on the surface of the zinc, it is a sign that your semi-metal contains lead. In this case you must continue throwing in more sulphur, and keep stirring the zinc incessantly, till you perceive that the sulphur ceases to unite any more with a metallic substance, but burns freely on the surface of the zinc. The semi-metal is then refined; because the sulphur, which cannot dissolve it, unites very readily with the lead, or other metallic substance, contained in it.

If zinc thus refined be mixed with pure copper, in the proportion of a fourth or a third part, and the mixture be kept in fusion and constantly stirring for some time, the brass produced will be as ductile, when cold, as that made by cementation with the *lapis calaminaris*.

With regard to prince's metal, and other imitations of gold, they are made either with copper or brass recombined with more zinc. As it is necessary, for giving them a fine golden colour, to mix with them other proportions of zinc than that required to make brass only, they are generally much less ductile.

#### *Zinc dissolved in the Mineral Acids.*

WEAKEN concentrated oil of vitriol by mixing with it an equal quantity of water. Into a matras put the zinc you intend to dissolve, first broken to small pieces. Pour on it six times its weight of the vitriolic acid, lowered as above directed, and set the matras in a sand-bath gently heated. The zinc will dissolve entirely, without any sediment. The neutral metallic salt resulting from this dissolution shoots into crystals, which go by the name of *white vitriol*, or *vitriol of zinc*.

Zinc is dissolved by the nitrous and marine acids, much in the same manner as by the vitriolic; except that the marine acid does not touch a black, spongy, rarefied matter, which it separates from the zinc. M. Hellot found upon trial that this matter is not mercury, and that it cannot be reduced to a metallic substance.

A solution of zinc in the marine acid, being distilled to dryness, yields a sublimate on applying a violent heat to it.

All the acids dissolve with ease; not only zinc, but its flowers also; and that nearly in the same quantity, and with almost all the same phenomena.

### Of ARSENIC.

*To extract Arsenic from its Matrices. Zaffre or Smalt.*

POWDER some cobalt, white pyrites, or other arsenical matters. Put this powder into a retort with a short wide neck, leaving a full third thereof empty. Set your retort in a reverberating furnace; lute on a receiver; heat your vessel by degrees, and increase the fire till you see a powder sublime into the neck of the retort. Keep up the fire in this degree as long as the sublimation continues: when this begins to slacken, raise your fire,

and make it as strong as the vessels will bear. When nothing more ascends, let it go out. On unluting the vessels, you will find in the receiver a little arsenic in the form of a fine light *farina*. The neck of the retort will be full of white flowers, not quite so fine, some of which will appear like little crystals; and if a good deal of arsenic be sublimed, a ponderous matter, like a white, semi-transparent glass, will be found adhering to that part of the neck of the retort which is next its body.

When all the arsenic the cobalt will yield is thus separated, the earthy fixed matter left behind is mixed with divers fusible matters and vitrified, and produces a glass of beautiful blue colour. It is called *smalt*. This glass is to be prepared in the following manner.

Take four parts of fine fusible sand, an equal quantity of any fixed alkali perfectly depurated, and one part of cobalt from which the arsenic hath been sublimed by torrefaction. Pulverise these different substances very finely, and mix them thoroughly together; put the mixture into a good crucible, cover it, and set it in a melting furnace. Make a strong fire, and keep it up constantly in the same degree for some hours. Then dip an iron wire into the crucible; to the end of which a glassy matter will stick, in the form of threads, if the fusion and vitrification be perfect. In this case take the crucible out of the fire; cool it by throwing water on it, and then break it. You will find in it a glass, which will be of an exceeding deep blue, and almost black, if the operation hath succeeded. This glass, when reduced to a fine powder, acquires a much brighter and more lively blue colour.

If you find after the operation that the glass hath too little colour, the fusion must be repeated a second time, with twice or thrice the quantity of cobalt. If, on the contrary, the glass be too dark, less cobalt must be used.

In order to make the essay of a particular cobalt, with a view to know what quantity of blue glass it will yield, it is not necessary to perform the operation in the manner here set down; a great deal of time and trouble may be saved by melting one part of cobalt with two or three parts of borax. This salt is very fusible, and turns, when melted, into a substance which, for a time, possesses all the properties of glass. In this trial the glass of borax will be nearly of the same colour as the true glass, or smalt, made with the same cobalt.

The ores of bismuth, as well as cobalt, yield a matter that colours glass blue; nay, the smalt made with those ores is more beautiful than that procured from the ore of pure arsenic. Some cobalts yield both arsenic and bismuth. When such cobalts are used, it is common to find at the bottom of the crucible a little button of metallic matter, which is called *regulus of cobalt*. This regulus is a sort of bismuth, generally adulterated with a mixture of ferruginous and arsenical parts.

The heaviest and most fixed flowers of arsenic, procured from cobalt, have likewise the property of giving a blue colour to glass. But this colour is faint: it is owing to a portion of the colouring matter carried up along with the arsenic. These flowers may be made an ingredient in the composition of blue glass, not only because of the colouring principle they contain, but also because

† 2 O

they

they greatly promote fusion; arsenic being one of the most efficacious fluxes known.

In short, all those blue glasses, or smalts, contain a certain quantity of arsenic; for a portion of this semi-metal always remains united with the fixed matter of the cobalt, though roasted for a long time, and in a very hot fire. The portion of arsenic that is thus fixed vitrifies with the colouring matter, and enters into the composition of the smalt.

The blue glass made with the fixed part of cobalt hath several names, according to the condition in which it is.

When it hath undergone the first imperfect degree of fusion only, it is called *zaffre*. It takes the name of *smalt* when perfectly vitrified: and this again being pulverised is called *powder blue*; or, if finely levigated, *blue enamel*; because it is used in enamelling, as well as in painting earthen ware and porcelain.

*To separate Arsenic from Sulphur.*

**POWDER** the yellow or red arsenic which you intend to separate from its sulphur. Moisten this powder with a fixed alkali resolved into a liquor. Dry the mixture gently; put it into a very tall glass cucurbit, and fit on a blind-head. Set this cucurbit in a sand-bath; warm the vessels gently, and increase the fire by degrees, till you perceive that no more arsenic sublimes. The arsenic, which before was yellow and red, rises into the head partly on white flowers, and partly in a compact, white, semi-transparent matter, which looks as if it were vitrified. The sulphur combined with the fixed alkali remains at the bottom of the cucurbit.

*To give Arsenic the Metalline Form. Regulus of Arsenic.*

Take two parts of white arsenic in fine powder, one part of the black flux, half a part of borax, and as much clean iron filings. Rub the whole together, in order to mix them thoroughly. Put this mixture into a good crucible, and over it put sea salt three fingers thick. Cover the crucible; set it in a melting furnace; and begin with a gentle fire to heat the crucible equally.

When arsenical vapours begin to ascend from the crucible, raise the fire immediately so as to melt the mixture. Examine whether or no the matter be thoroughly melted, by introducing an iron wire into the crucible; and if the fusion be perfect, take the crucible out of the furnace. Let it cool; break it; and you will find in it a regulus of a white and livid metallic colour, very brittle, scarcely hard, but rather friable.

*To distil the Nitrous Acid by the Interposition of Arsenic. Blue Aqua Fortis.*

**PULVERISE** finely any quantity you please of refined salt-petre. Mix it accurately with an equal weight of white crystalline arsenic well pulverised, or else with very white and very fine flowers of arsenic. Put this mixture into a glass retort, leaving one half of it empty. Set your retort in a reverberating furnace; apply a receiver, having a small hole drilled in it, and containing a little

filtered rain-water; lute the receiver to the retort with stiff lute. Begin with putting two or three small live coals in the ash-hole of the furnace, and replace them with others when they are ready to go out. Go on thus warming your vessels by insensible degrees, and put no coals in the fire-place till the retort begin to be very warm. You will soon see the receiver filled with vapours of a dark red, inclining to a russet colour. With a big of lute stop the little hole of the receiver. The vapours will be condensed in the water of this vessel, and give it a very fine blue colour, that will grow deeper and deeper as the distillation advances. If your salt-petre was not very dry, some drops of acid will also come over, and falling from the nose of the retort mix with the water in the receiver. Continue your distillation, increasing the fire little by little as it advances, but exceeding slowly, till you see that when the retort is red-hot nothing more comes off; and then let your vessels cool.

When the vessels are cold, unlute the receiver, and as expeditiously as you can pour the blue *aqua fortis* it contains into a crystal bottle; which you must seal hermetically, because this colour disappears in a short time when the liquor takes air. You will find in the retort a white saline mass moulded in its bottom, and some flowers of arsenic sublimed to its upper cavity, and into its neck.

Pulverise the saline mass, and dissolve it in warm water. Filter the solution, in order to separate some arsenical parts that will be left on the filter. Let the filtered liquor evaporate of itself in the open air; when it is sufficiently evaporated, crystals will shoot in it representing quadrangular prisms terminated at each extremity by pyramids that are also quadrangular. These crystals will be in confused heaps at the bottom of the vessel: Over them will be other crystals in the form of needles; a saline vegetation creeping along the sides of the vessel; and the surface of the liquor will be obscured by a thin dusty pellicle.

*To alkalisate Nitre by Arsenic.*

**MELT** in a crucible the nitre you intend to alkalisate. When it is melted, and moderately red, project upon it two or three pinches of pulverised arsenic. A considerable effervescence and ebullition will immediately be produced in the crucible, attended with a noise like that which nitre makes when it detonates with an inflammable matter. At the same time a thick smoke will rise, which at first will smell like garlick, the odour peculiar to arsenic; it will also smell afterwards like spirit of nitre. When the effervescence in the crucible is over, throw again upon the nitre as much pulverised arsenic as you did the first time; and all the same phenomena will be repeated. Continue thus throwing in arsenic in small parcels, till it produce no more effervescence; taking care to stir the matter at every projection with an iron wire, the better to mix the whole together. Then increase your fire, and melt what remains. Keep it thus in fusion for a quarter of an hour, and then take the crucible out of the fire. It will contain a nitre alkalisated by arsenic.

of

## Of VEGETABLES.

*Of the Substances obtained from Vegetables by Expression only.**To express and depurate the Juice of a Plant, containing its Essential Salt. The Crystallisation of that Salt.*

BEFORE sun-rise, gather a good quantity of the plant, from which you design to express the juice, in order to obtain its salt. Wash it well in running water, to clear it of earth, insects, and other adventitious matters. Bruise it in a marble mortar; put it into a bag of new, strong, thick linen cloth; tie the bag tight, and commit it to a press. By pressing it strongly you will squeeze out a great quantity of green, thick juice, which will have the same taste as the plant. Dilute this juice with six times as much pure rain water, and filter it repeatedly through a woollen bag, till it pass clear and limpid. Evaporate the filtered juice with a gentle heat, till it be almost as thick as before it was mixed with water. Put this inspissated juice into a jar, or other vessel of earth or glass; on its surface pour olive oil to the depth of a line, and set it in a cellar. Seven or eight months after this pour off gently the liquor contained in the vessel, the inside of which you will find covered with a crystallised salt. Separate the crystals gently; wash them quickly with a little fair cold water, and dry them: this is the essential oil of the plant.

Every plant is not equally disposed to yield its essential salt by the method here proposed. Succulent vegetables only, whose juices are aqueous and not too viscid, are fit for this purpose. Such, for example, as sorrel, brook-lime, succory, fumitory, water-cresses, plantain, &c. An essential salt cannot be procured from those that yield thick, viscid, mucilaginous juices, such as the seeds of flea-wort, unless their juices be previously attenuated by fermentation, and that viscosity destroyed which obstructs the crystallisation of this salt.

Nor can the essential salt be obtained in any quantity from vegetable matters abounding in oil. Most kernels and seeds are of this sort: they all contain a great quantity of fat oil, which so entangles and clogs this salt, that the particles thereof cannot shoot away from the tenacious juices into crystals.

The same is to be said of dry aromatic plants; because they contain much essential oil, or resinous matters that produce the same effect. It is true, the essential salt itself contains a certain portion of oil; for it is no other than the acid of the plant incorporated and crystallised with part of its oil and of its earth: but then the oil must not be in too great a quantity; because it sheaths the acid, renders it clammy, as it were, and hinders it from extricating itself so as to be able to exert its qualities, and appear in the form of salt.

The juice of plants obtained by expression is very thick; because it contains many particles of the bruised plant that are unavoidably squeezed out along with it. In order to clear it of these superfluous parts it is proper to filter it: but as that would be difficult, on account of the

thickness of the juice, it must be thinned, by diluting it with a quantity of water, sufficient to give it the requisite degree of fluidity.

Instead of thus diluting the expressed juice, the plant may be ground with water before it is put into the press: it will by this means furnish a more fluid juice, that will easily pass through the filter. This method may be employed with success on dry plants, or such as are not very succulent. For this operation rain-water is to be preferred to any other; because it is the purest.

The juice of the plant, when diluted with the quantity of water sufficient to facilitate its filtration, is too aqueous to let the salt it contains unite into crystals: It must therefore be evaporated till it hath recovered a somewhat thicker consistence. The heat applied for that purpose must be gentle; lest the acid and oily parts that are to form the salt, be spoiled or dissipated, as they are not very fixed.

The oil poured on the liquor prevents its fermenting, putrefying, or growing mouldy, during the long space of time required for the crystallisation of the essential salt.

These salts are excellent medicines, being endued with the same virtues as the plants from which they were obtained.

*To draw the Oils out of Kernels, Seeds, and Fruits, by Expression.*

POUND in a marble mortar, or grind in a mill, the kernels, seeds, or fruits, out of which you intend to express the oil. If your matters be meagre, and grind to meal, suspend that meal in the steam of boiling water, in order to moisten it a little, and then dry it.

Tie up your matters thus prepared in a new, strong, thick canvas bag, and put it into a press, between two iron plates previously heated in boiling water: squeeze it strongly, and you will see the oil run in streams into the receiving vessel.

*To draw the Essential Oil of certain Fruits by Expression.*

TAKE the rind of a citron, lemon, orange, Bergamot-pear, or other fruit of that kind; cut it in slices, and doubling the slices squeeze them between your fingers over against a polished glass set upright, with its lower end in a vessel of earth or porcelain. Every time you squeeze the peel in a new ply, there will squirt out of it several fine jets of liquor, which, meeting with the surface of the glass, will be condensed into drops, and trickle down in small streams into the recipient. This liquor is the essential oil of the fruit.

*Of the Substances obtained from Vegetables by Trituration.**To make the Extracts of a Plant by Trituration.*

BRUISE the vegetable substance of which you intend to make the extracts; or, if it be hard and dry, grind it to a powder: put the matter thus prepared, together with seven or eight times as much rain-water, into an earthen vessel; and into this vessel fit a churning staff, so that

hat it may be continually whirled round with a rotatory motion, by means of a cord, a wheel, and a winch. Ply this machine for ten or twelve hours; and then filter the liquor through two linen cloths spread on a hair-sieve. Let your filtered liquor stand quiet for twelve hours more: Then pour it off by inclination from the sediment you will find at bottom; and filter it a second time through a flannel bag.

Pour fresh water, but in a smaller quantity, on the mass left after trituration with the machine. Triturate it again for four or five hours. Treat the liquor of this second triture just as you did that of the first, and mix them both together. Distribute all the liquor you now have among a sufficient number of shallow earthen plates, and evaporate it by a gentle heat, such as that of the sun, or of a vapour-bath, to the consistence of an extract, or even to dryness, as you think proper.

*To extract from Seeds and Kernels, by Trituration, the Matter of Emulsions.*

BLANCH the kernels of which you desire to make an emulsion; put them into a marble mortar; add a very little water; and pound them with a wooden pestle. Continue pounding and trituration till the matter become like a white paste. From time to time pour on it, by little and little, more fair water warmed, still continuing the trituration; by which means the paste will grow thinner. Go on thus till every particle of your kernels be crushed to pap. Then add, still rubbing the mixture, enough of water to make the whole an actual fluid; and you will have a liquor of a dead-white colour, resembling milk. Strain it through a clean linen cloth: it will leave on the filter some coarse parts, which must be returned to those left in the mortar. Again triturate and rub the remainder of the kernels, with the addition of water as before. This second liquor will not be so white nor so rich as the former: filter it in the same manner, and again grind with water the solid parts remaining. In this manner proceed, repeatedly rubbing and adding fresh water, till it appear no longer milky, but come off clear. The white milky waters thus obtained go by the name of an *emulsion*.

All the matters, from which a fat oil is obtainable by expression, produce emulsions when triturated with water.

An emulsion consists chiefly of two substances. One of these is mucilaginous, and soluble in water. This substance by itself would not give a milky appearance to the emulsion, which, with it alone, would be limpid. The other is a fat oil, which of itself is not soluble in water; but being divided by the means of trituration into very small globules, it is dispersed through the whole liquor, and suspended therein by the aid of the mucilaginous part. It is this oily part that gives the emulsion its dead-white milky colour; because it is not actually dissolved in the water, but only diffused through it.

If oil be mixed with water in a phial, and the mixture strongly shaken for some time, with a rapid and continued motion, the oil will be divided into a vast number of little globules, which intervening between the parts of the water will destroy its transparency, and give it a dead-

white colour, like that of our emulsion. But, as the oil is not so minutely divided by this means as by triturating the matters containing it; and again, there being no mucilage in this liquor, as there is in emulsions, the oil soon separates from the water when it is left at rest, re-unites into round globules, and these joining together rise to the surface of the liquor, which then recovers its transparency.

The case is not exactly the same with emulsions; but something like it happens to them also. If they be left to stand quiet in a long bottle, the liquor, which at first appeared homogeneous, separates into two manifestly different parts. The upper part retains its dead-white colour, but is thicker and more opaque; while the lower part becomes perfectly transparent. This is the beginning of an entire separation of the oily from the aqueous parts. The former, being the lighter, ascend and gain the upper part of the liquor; while the lower, being freed from that which obstructed its translucence, recovers its proper limpidity: but the oily parts do not re-unite into masses large enough to form one homogeneous whole, with the appearance and limpidness of oil; their being minutely divided and entangled in the mucilage impeding their natural tendency.

Emulsions first begin to spoil, as they grow old, not by turning rancid and acrimonious like the fat oils drawn by expression, but by turning sour; which is owing to the great quantity of mucilage they contain. As there is a fat oil in their composition, they have the same virtues with that sort of oil: but they are moreover incrassating, cooling, and emollient; qualities which render them extremely useful in acute and inflammatory disorders. They grow sour in a very short time, especially in the heat of summer; nay, they sometimes do so in two hours: and therefore they ought to be prepared from time to time as they are to be used.

The matter that is left when all the substance of the emulsion is extracted, and from which the water comes off clear and limpid, is scarce any thing but the earthy part of the seed or kernel that was triturated; which, however, still retains a portion of tenacious and gross oil, adhering to it so firmly as not to be separable by water.

The chyle and milk of animals resemble an emulsion in several respects, and particularly in their dead-white colour; which arises, in the same manner, from the very minute particles of oil contained in them, and distributed through an aqueous gelatinous fluid, but not dissolved therein. In general, whenever any oil of any kind happens to be lodged in this manner between the parts of an aqueous liquor, it always makes the whole of an opaque white: for oil will not mix with water, so as to produce a liquor that shall appear homogeneous and transparent, unless it be intimately dissolved in the water; which cannot be effected but by means of an union previously contracted between it and some sline matter; as is the case of mucilages, certain saponaceous matters, and some other combinations of which we shall have occasion to treat in the sequel.

The methods we have hitherto proposed, for extracting from vegetable substances all that they will yield without

without the assistance of fire, are not capable of analysing those substances accurately; since by expression and trituration we obtain only the liquid parts, impregnated indeed with almost all the principles of plants, which however are still combined with each other, and barely separated from the grossest earthy and oily parts. We must therefore necessarily have recourse to a more effectual expedient for carrying our analysis further. This expedient consists in making them undergo the action of fire, successively graduated, from the gentlest to the most violent heat.

But, before we enter on this analysis of vegetables, it is proper to describe the different operations that may be performed on oils, the only pure principle we have been able to obtain without the help of fire.

### *Of Operations on Fat Oils.*

*To attenuate Fat Oils, and change their Nature, by exposing them to the Action of Fire, and distilling them.*

Mix thoroughly three or four pounds of any fat oil whatever with twice its weight of lime slaked in the air. Put this mixture into a large earthen retort, leaving a third part of it empty. Set it in a reverberating furnace, and lute on a receiver. Heat the vessel with a very gentle fire. A little flame will rise first, and will soon be followed by an oil that will fall in drops from the nose of the retort. Continue the distillation very slowly, till you perceive the oil that comes over begin to be not quite so fluid as before, but rather a little thicker.

Then unlute your receiver, and put another in its place. Continue the distillation, increasing your fire by degrees. The oil that comes over will grow thicker and thicker, its fluidity will decrease, and it will acquire a dark-brown colour, which at last will become blackish. The oil will then be very thick. Push the operation till nothing more will come off, though the retort be red-hot. During the whole time this distillation lasts, there rises a good deal of water in company with the oil. Keep the second thick oil by itself.

Mix the oil that came over first in this operation with an equal part of fresh lime slaked in the air. Put the mixture into an earthen or glass retort, of a size so proportioned to the quantity, that a third part thereof may remain empty. Distill as before. The same phenomena will appear: a clear oil will first come over, and be succeeded by one a little thicker. Then shift your receiver, and distill off all the rest of the oil with an increased fire. The first oil obtained by this second distillation, will be clearer and thinner than that of the first distillation; and the second oil will not be so thick nor of so deep a colour as before.

Distill over again in the same manner the thin oil of this second distillation, and go on thus repeatedly distilling, till the first clear oil come over with a degree of heat not exceeding that of boiling water. Then, instead of mixing your oil with lime, put it with some water into a glass retort, or into a body with its head fitted on, and distill it, keeping the water just in a simmer. Your

oil will be more and more attenuated, and, after being thus distilled twice or thrice with water, will be so limpid, so thin, and so clear, that you will scarce be able to distinguish it from water itself.

### *To combine Fat Oils with Acids.*

Put any fat oil whatever into a glass basin, and set it in a sand-bath very moderately heated. Pour on this oil an equal quantity of concentrated oil of vitriol, which will immediately dissolve it with violence; a considerable ebullition and effervescence will arise, attended with great heat, and a prodigious quantity of black thick vapours, in which may be easily perceived the smell of burnt oil, together with that of a sulphureous acid. The mixture will become of a deep-red, black, and thick. Stir it with a small stick, till you observe that all is quiet.

### *To combine Fat Oils with Fixed Alkalis. Hard and Soft Soap. The Decomposition of Soap.*

TAKE a lixivium of Alicant kelp made more caustic by lime, as we shall shew when we come to speak of alkalis. Evaporate this lye till it be capable of bearing a new-laid egg. Divide it into two parts; and to one of these put just water enough to weaken it so that a new laid egg will not swim in it, but fall to the bottom. With the lye thus weakened, mix an equal quantity of fresh-drawn olive oil. Stir and agitate the mixture well till it become very white. Set it over a gentle fire, and continue stirring it incessantly, that the two ingredients of which it is compounded may gradually combine together, as part of the water evaporates. When you perceive they begin to unite, pour into the mixture thrice as much of the first strong lye as you took of olive oil. Continue the coction with a gentle fire, always stirring the matter, till it become so thick that a drop of it fixes, as it cools, into the consistence that soap ought to have. By dissolving a little of this soap in water, you will discover whether or no it contains more oil than ought to be in the composition. If it dissolve therein wholly and perfectly, without the appearance of the least little drop of oil floating on the water, it is a sign that it doth not contain too much oil. If, on the contrary, you perceive any of these little globules, you must pour into the vessel containing your matter a little more of the strong lye, to absorb the redundant oil. If there be too much of the alkali, it may be discovered by the taste. If the soap leave on your tongue the sensation of an alkaline salt, and produce an urinous savour, it is a sign that there is too much salt in proportion to the oil. In this case a little oil must be added to the mixture, to saturate the superabundant alkali. An excess in the quantity of alkali discovers itself likewise by the soap's growing moist in the air, on being exposed to it for some time.

Fixed alkalis, even when resolved into a liquor, that is, when loaded with much water, unite easily with fat oils, as appears from the experiment just recited, and require but a moderate heat to perfect that union. This combination may even be completely effected without the aid of fire, and by the heat of the sun only, provided sufficient time be allowed for that purpose. It only requires the mixture of the oil and alkali to be kept five or

six days in digestion, and stirred from time to time. A lixivium of pure alkali, not acuated by lime, may also be used to make soap: but it is observed, that the combination succeeds better, and that the alkali unites sooner and more perfectly with the oil, when it is sharpened by lime.

The oil is first mixed with a weaker and more aqueous lye, to the end that the combination may not take place too hastily, but that all the particles of the two substances to be compounded together may unite equally. But as soon as the alkali begins to dissolve the oil gradually and quietly, the dissolution may then be accelerated; and that is done by adding the remaining lye, which is stronger and less diluted than the other.

Soap made with olive oil is white, hard, and hath not a very disagreeable smell: but as that oil is dear, others, even the fat and oils of animals, are sometimes substituted for it. The soaps made with most of these other matters are neither so hard, nor so white, as that made of olive oil: they are called *soft soaps*.

Oils thus associated with fixed alkalis are by that means rendered soluble in water; because the alkaline salts, having a great affinity with water, communicate part thereof to the oils with which they are now incorporated. Yet the oil is not for all that rendered thoroughly miscible with water, or perfectly soluble therein; for the water in which soap is dissolved hath always a milky cast: now there is no other criterion of a perfect solution but transparency.

Alkalis also lose part of their affinity with water, by the union they thus contract with oils: for, when the combination is properly made, they no longer attract the moisture of the air, nor doth water dissolve them in such quantities as before. The composition of soap is plainly a saturation of an alkali with an oil; and, in order to make perfect soap, we are forced, as was said in the process, to grope, in a manner, by repeated trials, for this point of saturation; just as when we prepare a neutral salt by saturating an alkali with an acid. The union which the oil contracts with the alkali makes it lose, in part, the readiness with which it naturally takes fire; because the salt is not inflammable: the water also, which enters, in pretty considerable quantities, into the composition of soap, contributes a good deal to hinder the ascension of the oil.

Soap may be decomposed either by distilling it, or by mixing it with some substance that hath a greater affinity than oil with alkalis.

If we decompose it by distillation, a phlegm, or transparent spirit, of a somewhat yellowish colour, first comes over. This liquor is the aqueous part of the soap, quickened by a little of its alkali, which gives it an acid taste. It is followed by a red oil, which at first is pretty thin and limpid, but thickens as the distillation advances, grows black, and has a very disagreeable empyreumatic smell. This oil is soluble in spirit of wine.

When the distillation is finished, that is, when the retort being kept red-hot for some time will discharge no more, there is left in it a saline mass; which is the alkali of the soap, cruised over with some of the most fixed parts of the oil, that are charred to a coal. This salt

may be restored to the same degree of purity it had before its combination with the oil, by calcining it in a crucible with a naked fire, that may consume this burnt part of the oil, and reduce it to ashes.

It is plain, that the oil contained in soap is affected by distillation, much in the same manner as that which we mixed with lime and distilled.

Mr Geoffroy, by analysing soap with care, discovered that two ounces thereof contain ninety-six grains of salt of kelp, freed from all oil and moisture; or two drams and forty-eight grains of that salt, as it is used in manufacturing soap; that is, containing water enough to make it crystallise; one ounce three drams twenty grains of olive oil; and about two drams four grains of water.

As acids have a greater affinity than any other substance with alkalis, they may be very effectually employed to decompose soap.

If you propose to decompose soap by means thereof, you must first dissolve it in a sufficient quantity of water. Mr Geoffroy, who made this experiment likewise, dissolved two ounces thereof in about three gallons of warm water, and to the solution added oil of vitriol, which he let fall into it drop by drop. Every time a drop of acid falls into it, a *coagulum* is formed in the liquor. The vessel in which the solution is contained must then be shaken, that the acid may equally attack all the alkali diffused in it. When no new coagulation is produced by a drop of the acid, it is a sign you have added enough. The liquor then begins to grow clear: and if another quart of water be added, in order to facilitate the separation of the oily particles, you will see them rise and unite together on the surface of the liquor.

This is a pure, clear, true olive oil, hath its taste, its smell, and, like it, is fluid in warm weather, and becomes fixed by cold. Yet it differs in some respects from that which never hath been united with an alkali in order to form a soap; for it burns more vividly and more rapidly; and is soluble in spirit of wine. We shall account for these differences when we come to treat of ardent spirits.

Not only the vitriolic acid, but all others, even those obtained from vegetables, are capable of decomposing soap, and separating the oil from the alkali. In the liquor wherein soap is thus decomposed, is found a neutral salt, consisting of the acid made use of, united with the alkali of the soap. If the vitriolic acid be used, you will have a Glauber's salt; a quadrangular nitre, if the nitrous acid be used; and so of the rest.

The facility with which acids decompose soap is the reason that no water, but what is very pure, will dissolve it, or is fit to be used in washing with it.

Water that doth not dissolve soap well is usually called hard water. Such waters contain a certain quantity of saline matters, washed out of the earths through which they pass. The hardness of water is generally occasioned by selenitic particles.

The hardness of most well-waters is owing to a considerable quantity of selenitic gypsum with which the soil abounds. The selenites are neutral salts consisting of the vitriolic acid united with an earthy basis. If, therefore, soap be put into water in which a salt of this kind is dissolved,

solved, it is evident that the vitriolic acid in the selenites, having a greater affinity with the fixed alkali of the soap than with its own earthy basis, will quit the latter to unite with the former; and thus the soap will be decomposed instead of being dissolved. Accordingly we see, that, when we attempt to dissolve soap in our well-water, the surface of the liquor is in a short time covered with a fat oily pellicle. However, this decomposition of soap is not complete; at least but a small part of it is perfectly decomposed; because the great quantity of selenites, with which the water is impregnated, hinders the soap from mixing so thoroughly with it, as is requisite to produce a total decomposition thereof.

All mineral waters are likewise hard, with regard to soap; for, as most of them owe their virtues to the efflorescencies they have washed off, from pyrites that have grown hot and begun to be decomposed, they are impregnated with the saline matters produced by pyrites in that state; that is, with aluminous, vitriolic, and sulphureous substances, which have the same effect on soap as the selenites hath.

Mineral waters containing neutral salts only, such as sea-salt, Epsom salt, Glauber's salt, are nevertheless hard with regard to soap, though the acids of those salts, being united with fixed alkalis, are incapable of decomposing it. The reason is, that those neutral salts are more soluble in water than soap is; so much indeed as even to exclude it: because each of the two principles that compose them hath a very great affinity with water; whereas only one of the principles of soap, namely, its alkali, hath that affinity; the other, *viz.* the oily principle, having none at all. Thus water impregnated with an acid, or with any neutral salt, is hard with regard to soap, and incapable of dissolving it; and hence it follows, that soap is a sort of touchstone for trying the purity of water.

Wine dissolves soap; but imperfectly, because it contains an acid or tartarous part. Spirit of wine also dissolves it: but neither is this dissolution perfect; because it contains too little water: for its spirituous part can dissolve nothing but the oil of the soap; and the alkali is not at all, or at least in a very small quantity, soluble in this menstruum. The true solvent of soap is therefore a liquor that is partly spirituous, partly aqueous, and not acid.

Brandy has these qualities: and accordingly it is the solvent that unites best with soap, dissolves the greatest quantity, and makes the most limpid solution thereof. Yet even this solution hath something of a milky cast, occasioned by its not being entirely free from an acid, or the tartarous principle. This fault may be easily corrected, by mixing with it a little alkali to absorb the acid. A dram of crystallised salt of kelp mixed with three ounces and a half of good brandy, renders it capable of dissolving an ounce and two drams of good hard soap into a perfectly limpid liquor.

Some years ago it was discovered that soap might be used with great success in medicine, and that it possesses the property of dissolving the stony concretions that form in several parts of the body, particularly in the kidneys

and bladder. Soap is the basis of the composition known by the name of *Mrs Stephen's remedy*; and in this one ingredient its whole virtue resides.

From what hath been said on the nature of this compound, as well as on the cause and phenomena of its dissolution, it plainly appears to be of the last consequence, in administering it to a patient, that his constitution be considered, and a proper regimen ordered. All acids should be absolutely forbid him; as we know they hinder the soap from dissolving, and decompose it: and if the patient have any acidities in the first passages, matters capable of neutralising them should be prescribed him; as prepared crabs eyes, and other absorbents known in medicine: In such cases those with which the soap is compounded in *Mrs Stephen's remedy* may be of use.

#### *To combine Fat Oils with Sulphur.*

Put any fat oil whatever into an earthen vessel; add to it about a fourth part of its weight of flower of sulphur, and set the vessel in a furnace, with lighted coals under it. When the oil hath acquired a certain degree of heat, the sulphur will melt, and you will see it fall immediately to the bottom of the oil, in the form of a very red fluid. The two substances will remain thus separated, without mixing together, while the heat is no greater than is necessary to keep the sulphur in fusion. Increase it therefore; but slowly, and with circumspection, lest the matter take fire. When the oil begins to smoke, the two liquors will begin to mix and look turbid: at last they will unite so as to appear one homogeneous whole. If you keep up the heat, so that the mixture shall always continue smoking and ready to boil, you may add more sulphur, which will perfectly incorporate with it: and thus may a pretty considerable quantity thereof be introduced into this composition.

#### *To combine Fat Oils with Lead, and the Calxes of Lead. The Basis of Plasters. The Decomposition of this Combination.*

Into an earthen vessel put granulated lead, litharge, ceruse, or minium; and pour thereon twice its weight of any fat oil whatever. If you set the vessel over a brisk fire, the lead at bottom will melt before the oil begin to boil. When it boils, stir the matter with a stick: the lead, or the calx of lead, will gradually disappear, and at last be totally dissolved by the oil, to which it will give a very thick consistence.

Fat oils dissolve not only lead, but its calxes also: nay, they dissolve the latter more readily than lead in substance; probably because they are more divided. The result of a combination of these matters is a thick, tenacious mass, that grows in some degree hard in the cold, and soft by heat. This composition is known in pharmacy by the name of *plaster*. It is made up with several drugs into plasters, which partake of the virtues of those drugs; so that it is the basis of almost all plasters.

Lead itself is seldom used to make plasters: ceruse, litharge, or minium, are preferred to it; because these matters unite more readily with oils.

or

*Of the Substances obtained from Vegetables with a Degree of heat not exceeding that of boiling Water.*

*To obtain from Plants, by distilling them with the mean Degree of heat between freezing and boiling Water, a Liquor impregnated with their Principle of Odour.*

IN the morning, before sun-rise, gather the plant from which you design to extract its odoriferous water. Chuse the plant in its full vigour, perfectly sound, and free from all adventitious matters, except dew. Put this plant, without squeezing it, into the body of a tinned copper alembic, and set it in a water-bath. Fit on its head, and to the nose thereof lute a glass receiver with wet bladder.

Warm the bath to the mean degree between freezing and boiling water. You will see a liquor distill and fall drop by drop into the receiver. Continue the distillation with this degree of heat, till no more drops fall from the nose of the alembic. Then unlute the vessels; and if you have not as much liquor as you want, take out of the cucurbit the plant already distilled, and put a fresh one in its place. Distill as before, and go on thus till you have a sufficient quantity of odoriferous liquor. Put it into a bottle; stop it close; and set it in a cool place.

The liquor obtained from plants, with the degree of heat here prescribed, consists of the dew that was on the plant, and some of the phlegm of the plant itself, together with its odorous principle. Mr Boerhaave, who examined this odoriferous part of plants with great care, calls it the *spiritus r. flor.* The nature of this spirit is not yet thoroughly ascertained; because it is so very volatile, that it cannot easily be subjected to the experiments that are necessary to analyse it, and to discover all its properties. If the bottle containing the liquor, which may be considered as the vehicle of this spirit, be not exceeding carefully stopped, it flies quite off: so that in a few days nothing will be found but an insipid inodorous water.

Great part of the virtue of plants resides in this their principle of odour; and to it must be ascribed the most singular and the most wonderful effects we every day see produced by them. Every body knows that a great number of odorous plants affect, in a particular manner, by their scent only, the brain and the *genus nervosum*, of such especially whose nerves are very sensible, and susceptible of the slightest impression; such as hypochondriacal or melancholy men, and hysterical women. The smell of the tuberose, for instance, is capable of throwing such persons into fits, so as to make them drop down and swoon away. The smell of rue again, which is equally strong and penetrating, but of a different kind, is a specific remedy against the ill effects of the tuberose; and brings those persons to life again, with as quick and as surprising an efficacy as that by which they were reduced to a state not unlike death. This is Mr Boerhaave's observation.

The odorous exhalations of plants must be considered as a continual emanation of their *spiritus r. flor.*: but as growing plants are in a condition to repair, every instant, the losses they sustain by this means, as well as by transpiration, it is not surprising that they are not soon exhausted while they continue in vigour. Those, on the contrary, which we distill, having no such resource, are very soon entirely exhausted of this principle.

The separation of the *spiritus r. flor.* from plants requires but a very gentle heat, equally distant from the freezing point, and from the heat of boiling water. Accordingly the heat of the sun in summer is sufficient to dissipate it almost entirely. This shews why it is dangerous to stay long in fields, or woods, where many noxious plants grow. The virtues of plants residing chiefly in their exhalations, which the heat of the sun increases considerably, a sort of atmosphere is formed round them, and carried by the air and the wind to very great distances.

For the same reason the air of a country may be rendered salutary and medicinal, by the exhalations of wholesome plants growing therein. From the facility with which the odorous principle of plants evaporates, we learn what care ought to be taken in drying those intended for medical uses, so as to preserve their virtues. They must by no means be exposed to the sun, or laid in a warm place: a cool, dry place, into which the rays of the sun never penetrate, is the properest for drying plants with as little loss of their virtue as possible.

Though there is reason to believe that every vegetable matter hath a *spiritus r. flor.*, seeing each hath its particular scent, yet this principle is not very perceptible in any but those which have a very manifest odour: and accordingly it is extracted chiefly from aromatic plants, or the most odoriferous parts of plants.

*To extract the Fat Oils of Plants by the Decoction in boiling Water. Cacao-Butter.*

POUND or bruise in a marble mortar your vegetable substances abounding with the fat oil which you intend to extract by decoction: tie them up in a linen cloth: put this packet into a pan, with seven or eight times as much water, and make the water boil. The oil will be separated by the ebullition, and float on the surface of the water. Skim it off carefully with a ladle, and continue boiling till no more oil appear.

The heat of boiling water is capable of separating the fat oils from vegetable matters that contain any: but this is to be effected by actual decoction only, and not by distillation; because these oils will not rise in an alembic with the heat of boiling water. We are therefore necessitated to collect them from the surface of the water, as above directed.

The water used in this coction generally becomes milky, like an emulsion. Nevertheless this way of obtaining the fat oils is not generally practised; because the heat, to which they are exposed in the operation, occasions their being less mild than they generally are: but it is an excellent method, and indeed the only one that can be employed, for extracting from particular vegetables certain concrete oily matters, in the form of butter or wax; which

which matters are no other than fat oils in a fixed state. The cacao yields, by this means, a very mild butter; and in the same manner is a wax obtained from a certain shrub in America.

*To extract the Essential Oils of Plants by distillation with the heat of boiling water. Distilled waters.*

Put into a cucurbit the plant from which you design to extract the essential oil. Add as much water as will fill two thirds of your vessel, and dissolve therein half an ounce of sea-salt for every quart of water you use. To this body fit on an alembic head, and to the nose thereof lute a receiver with sized paper or wet bladder. Set it in a furnace, and let the whole digest together, in a very gentle warmth, for twenty-four hours.

This being done, light a wood-fire under your vessel, brisk enough to make the water in it boil immediately. Then slacken your fire, and leave it just strong enough to keep the water simmering. There will come over into the receiver a liquor of a whitish colour, somewhat milky; on the surface of which, or at the bottom, will be found an oil, which is the essential oil of the vegetable you put into the cucurbit. Continue your distillation with the same degree of heat, till you perceive the liquor come off clear, and unaccompanied with an oil.

When the distillation is finished, unlute the receiver; and, if the essential oil be of that sort that is lighter than water, fill the vessel up to the top with water. On this occasion a long-necked matras should be used for a receiver; that the oil which floats on the water may collect together in its neck, and rise up to its mouth. Then in the neck of this vessel put the end of a thread of cotton twine, so that the depending part without the vessel may be longer than that in the oil, and the extremity thereof hang within the mouth of a little phial, just big enough to contain your quantity of oil. The oil will rise along the yarn as in a siphon filter through it, and fall drop by drop into the little phial. When all the oil is thus come over, stop your little bottle very close, with a cork coated over with a mixture of wax and a little pitch.

If your oil be ponderous and of the sort that sinks in water, pour the whole contents of the receiver into a glass funnel, the pipe of which must terminate in a very small aperture that may be stopped with your fore-finger. All the oil will be collected in the lower part of the funnel: then remove your finger, and let the oil run out into a little bottle through another small funnel. When you see the water ready to come, stop the pipe of the funnel, and cork the bottle containing your oil.

*To extract the Essential Oils of Plants by Distillation per descensum.*

Reduce to a powder, or a paste, the vegetable substances from which you intend to extract the essential oil by the method proposed. Lay this matter about half an inch thick on a fine, close, linen cloth. If it be dry and hard, expose the cloth containing it to the steam of boiling water, till the matter become moist and soft. Then lay the cloth, with its contents, over the mouth

of a very tall cylindrical glass vessel, which is to do the office of a receiver in this distillation; and, by means of a piece of small pack-thread, fasten down the extremities of the cloth, by winding the thread several times over them and round the vessel; in such a manner, however, that the cloth be not tight, but may yield to a small weight, and sink about five or six lines deep into the vessel over which it is fastened. Set this recipient in a larger vessel, containing so much cold water as will reach half way up the cylindrical vessel, which, having little in it but air, must be ballasted with as much lead as will sink it to the bottom of the water.

On the cloth, containing the substance to be distilled, set a flat pan of iron or copper, about five or six lines deep, that may just fit the mouth of the glass vessel over which the cloth is fastened, so as to shut it quite close. Fill this pan with hot ashes, and on these lay some live coals. Soon after this you will see vapours descend from the cloth, which will fill the recipient, and drops of liquor will be formed on the under side of the cloth, from whence they will fall into the vessel. Keep up an equal gentle heat, till you perceive nothing more discharged. Then uncover the recipient: you will find in it two distinct liquors; one of which is the phlegm, and the other the essential oil of the substance distilled.

*Infusions, Decoctions, and Extracts of Plants.*

MAKE some water boiling-hot, and then take it off the fire. When it ceases to boil, pour it on the plant of which you desire to have the infusion; taking care there be enough of it to cover the plant entirely. Cover the vessel, and let your plant lie in the hot water for the space of half an hour, or longer if it be of a firm close texture. Then pour off the water by inclination: it will have partly acquired the colour, the smell, the taste, and the virtues of the plant. This liquor is called an infusion.

To make the decoction of a vegetable substance, put it into an earthen pan, or into a tinned copper vessel, with a quantity of water sufficient to bear being boiled for several hours without leaving any part of the plant dry. Boil your plant more or less according to its nature; and then pour off the water by inclination. This water is impregnated with several of the principles of the plant.

If the infusions and decoctions of plants be filtered, and evaporated in a gentle heat, they become extracts, that may be kept for whole years, especially if they be evaporated to a thick consistence; and better still if they be evaporated to dryness.

*Of Operations on Essential Oils.*

*The Rectification of Essential Oils.*

Put into a cucurbit the essential oil you propose to rectify. Set the cucurbit in a *balneum marie*; fit to it a head of tin, or of copper tinned, together with its refrigeratory; and lute on a receiver. Make the water in the bath boil, and keep up this degree of heat till nothing more will come over. When the distillation is finished,

nished, you will find in the receiver a rectified essential oil, which will be clearer, thinner, and better scented than before it was thus before re-distilled; and in the bottom of the cucurbit will be left a matter of a deeper colour, more tenacious, more resinous, and of a less grateful smell.

Essential oils, even the purest, the best prepared, and the thinnest, suffer great changes, and are much impaired by growing old: they gradually turn thick and resinous; their sweet, grateful scent is lost, and succeeded by a more disagreeable smell, somewhat like that of turpentine. The cause of these changes is, that their finest and most volatile part, that which contains most of the odorous principle, is dissipated and separated from that which contains least of it; which therefore grows thicker, and comes so much the nearer to the nature of a resin, as the quantity of acid, that was distributed through the whole oil before the dissipation of the more volatile part, is, after such dissipation, united and concentrated in the heaviest part; the acid in oils being much less volatile than the odorous part, to which alone they owe their levity.

Hence it appears what precautions are to be used for preserving essential oils as long as possible without spoiling. They must be kept in a bottle perfectly well stoppered, and always in a cool place, because heat quickly dissipates the volatile parts. Some authors direct the bottle to be kept under water.

*To fire Oils by combining them with highly concentrated Acids: instanced in Oil of Turpentine.*

Mix together in a glass equal parts of concentrated oil of vitriol, and highly smoking fresh-drawn spirit of nitre: pour this mixture at several times, but suddenly, on three parts of oil of turpentine, set for that purpose in a glass basin. By a part here must be understood a dram at least. A most violent commotion, accompanied with smoke, will immediately be raised in the liquors, and the whole will take fire in an instant, flame, and be consumed.

There is not in chemistry a phenomenon more extraordinary, and more surprising, than the firing of oils by mixing them with acids. It could never have been suspected, that a mixture of two cold liquors would produce a sudden, violent, bright, and lasting flame, like that we are at present considering.

*To combine Essential Oils with Mineral Sulphur. Balsam of Sulphur.*

Put into a matras one part of flowers of sulphur; pour on them six parts of the essential oil of turpentine, for instance; set the matras in a sand-bath, and heat it gradually till the oil boil. The sulphur, which at first lay at the bottom of the matras, will begin to melt, and appear to dissolve in the oil. When it hath boiled in this manner for about an hour, take the matras from the fire, and let the liquor cool. A great deal of the sulphur that was dissolved therein will separate from it as it cools, and fall to the bottom of the vessel in the form of needles, much like a salt shooting in water.

When the liquor is perfectly cold, decant it from the sulphur that lies at the bottom of the vessel: to that

sulphur put fresh oil of turpentine, and proceed as before: the sulphur will again disappear, and be dissolved in the oil; but when the mixture is cold you will find new crystals of sulphur deposited at the bottom. Decant once more this oil from the crystals, and pour on fresh oil to dissolve them: continue the same method, and you will find, that about sixteen parts of essential oil are required to keep one part of sulphur dissolved when cold. This combination is called *balsamum sulphuris terebinthinatum*, if made with oil of turpentine; *anisatum*, if with oil of anise-seeds; and so of others.

*To combine Essential Oils with fixed Alkalis. Starkey's Soap.*

Take salt of tartar, or any other alkali, thoroughly calcined. Heat it in a crucible till it be red, and in that condition throw it into a hot iron mortar: rub it quickly with a very hot iron pestle; and as soon as it is powdered, pour on it, little by little, nearly an equal quantity of oil of turpentine. The oil will enter into the salt, and unite intimately with it, so as to form a hard paste. Continue rubbing this composition with a pestle, in order to complete the union of the two substances; and, as your oil of turpentine disappears, add more, which will unite in the same manner, and give a softer consistence to the soapy mass. You may add still more oil, according to the consistence you intend to give your soap.

Starkey, the first chemist who found the means of making soap with an essential oil, and by whose name this kind of soap is therefore called, made use of a much more tedious method than that proposed in our process. He began with mixing a very small quantity of oil with his salt, and waited till all the oil united therewith of its own accord, so as to disappear entirely, before he added any more; and thus protracted his operation exceedingly, though in the main it was the same with ours. The method here proposed is more expeditious, and was invented by Dr Geoffroy.

Starkey's soap dissolves in water much as common soap does, without any separation of the oil: and by this mark it is known to be well made. It may also be decomposed, either by distillation, or by mixing it with an acid: and its decomposition, in either of these ways, is attended with nearly the same phenomena as the decomposition of common soap.

*Of the Substances obtained from Vegetables by means of a graduated Heat, from that of boiling Water, to the strongest that can be applied to them in close Vessels.*

*To analyse Vegetable Substances that yield neither a Fat nor an Essential Oil. Instanced in Guaiacum-wood.*

Take thin shavings of Guaiacum-wood, and put them into a glass or stone retort, leaving one half thereof empty. Set your retort in a reverberating furnace, and lute on a large glass receiver having a small hole drilled in it, such as is used for distilling the mineral acids. Put a  
live

live coal or two in the furnace, to warm the vessels gently and slowly.

With a degree of heat below that of boiling water, you will see drops of a clear inipid phlegm fall into the receiver. If you raise the fire a little, this water will come slightly acid, and begin to have a pungent smell. With a degree of fire somewhat stronger, a water will continue to rise which will be still more acid, smell stronger, and become yellowish. When the heat comes to exceed that of boiling water, the phlegm that rises will be very acid, high coloured, have a strong pungent smell, like that of matters long smoked with wood in a chimney, and will be accompanied with a red, light oil, that will float on the liquor in the receiver.

And now it is necessary, that the operation be carried on very cautiously, and vent frequently given to the rarefied air by opening the small hole in the receiver; such an incredible quantity thereof rushing out of the wood, with this degree of heat, as may burst the vessels to pieces, if not discharged from time to time.

When this red, light oil is come over, and the air ceases to rush out with impetuosity, raise your fire gradually, till the retort begin to redden. The receiver will be filled with dense vapours; and together with the watery liquor, which will then be extremely acid, there will rise a black, thick, ponderous oil, which will fall to the bottom of the receiver and lie under the liquor.

Then give the utmost degree of heat; that is, the greatest your furnace will allow, and your vessels bear. With this excessive heat a little more oil will rise, which will be very ponderous, as thick and black as pitch; and the vessels will continue full of vapours that will not condense.

At last, when you have kept the retort exceeding red for a long time in this extremity of heat, so that it begins to melt if it be of glass, and you perceive nothing more come over, let the fire go out and the vessel cool. Then take off your receiver: from the black oil at bottom decant the acid liquor with the red oil floating on it, and pour them both into a glass funnel, lined with brown filtering paper, and placed over a bottle. The acid liquor will pass through the filter into the bottle, and the oil will be left behind, which must be kept by itself in a separate bottle. Lastly, into another funnel, prepared as the former, pour the thick oil remaining with a little of the acid liquor at the bottom of the receiver. This liquor will filter off in the same manner, and thus be separated from the heavy oil.

In the retort you will find your Guaiacum shavings not in the least altered as to their figure, but light, friable, very black, scentless and tasteless, easily taking fire, and consuming without flame or smoke: in short you will find them charred to a perfect coal.

HITHERTO we have examined the substances that may be obtained from vegetables, either without the help of fire, or with a degree of heat not exceeding that of boiling water. The analysis of plants can be carried no further without a greater degree of heat: for, when the principle of odour and the essential oil of an aromatic

plant are wholly extracted by the preceding processes, if the distillation be afterward continued without increasing the heat, nothing more will be obtained but a little acid; which will soon cease, as a small part only of the quantity contained in the plant will be elevated; the rest being either too ponderous, or too much entangled with the other principles of the body, to rise with so small a degree of heat.

In order therefore to carry on the decomposition of a plant, from which you have, by the methods before proposed, extracted all the principles it is capable of yielding when so treated; or, in order to analyse a vegetable matter, which affords neither an expressed nor an essential oil, it must be distilled in a retort with a naked fire, as directed in the process, and be made to undergo all the degrees of heat successively, from that of boiling water to the highest that can be raised in a reverberating furnace.

A heat inferior to that of boiling water, with which we must begin in order to warm the vessel gradually, brings nothing over, but an insipid water, destitute of all acidity. By increasing it nearly to the degree of boiling water, the distilled water comes to be slightly acid.

When the heat is made a little stronger than that which is necessary for the elevation of an essential oil, the acidity of the water that comes off is much more considerable. It hath now both colour and smell, and there rises with it a red, light oil, that floats on the liquor in the receiver. This is not an essential oil; it hath none of the odour of the plant. Though so light as to float on water, yet it will not rise with the degree of heat that raises essential oils, even those that much surpass it in gravity, and will not swim on water as they do. This proves, that the ease or difficulty with which a particular degree of heat raises any substance in distillation doth not depend altogether on its gravity: its dilatibility, or the volatile nature of the matters with which it is so closely united as not to be separated from them by distillation, may probably contribute greatly to produce this effect.

It is very surprising, that a substance so hard, so compact, so dry in appearance, as Guaiacum-wood, should yield such a large quantity of water by distillation; and it is equally so, that it should discharge so much air, and with so much impetuosity, as nothing but experience could render credible.

It hath been remarked, that the heaviest and most compact woods yield the most air in distillation: and accordingly Guaiacum-wood, as exceeding almost all others in hardness and weight, discharges a vast quantity of air when analysed.

The thick, burnt, empyreumatic oil, that comes over last in this distillation, is heavier than water; on account, probably, of the great quantity of acid with which it is replete. The two kinds of oil obtained in this analysis may be rectified, by distilling them a second time, or rather several times; by which means they will become lighter and more fluid. In general, all thick, heavy oils constantly owe these qualities to an acid united with them; and it is by being freed from some of that acid in distillation, that they always acquire a greater

er degree of lightness and fluidity from that operation.

The analysis of a vegetable substance, shews what may be obtained from them when distilled in close vessels, with a graduated heat, from that of boiling water, to that which converts the mixt to a perfect coal; viz. phlegm, an acid, a light oil, much air, and a thick oil. But this analysis is far from being a complete one: it may be carried much farther, and made more perfect.

None of the principles obtained by this analysis are pure, simple, and thoroughly separated from the rest. They are still in some measure blended all together: their separation is but begun; and each requires a second and more accurate analysis, to reduce it to the greatest degree of purity of which it is capable. The oil and the acid chiefly merit so much pains.

A great deal of the acid of the plant remains, combined with the two sorts of oil here obtained; which we have reason to think differ no otherwise from one another; than as there is more or less acid united with each. The best way of freeing these oils from their redundant acid is to distill them frequently from alkalis and absorbents.

The acid is in the same circumstances nearly as the oil. The first that rises is mortified with much water, to which it owes a good deal of its volatility. That which comes over last is much more concentrated, and consequently heavier; yet it is still very aqueous. It might be freed in a great measure from this adventitious water, and so rendered much stronger; which would give us a better opportunity to discover its nature and properties, of which we know but very little.

Water is not the only heterogeneous substance that disguises the vegetable acid: a pretty considerable quantity of the oil of the plant is also combined with it, and contaminates its purity. The proof of this is, that when these acids are kept, in the same condition in which they first come over, for any length of time, in a glass vessel, they gradually deposit, on the bottom and sides of the vessel, an oily incrustation, which grows thicker and thicker the longer it stands; and, as this oily matter separates from it, the acid liquor appears less unctuous and saponaceous.

A very good way to separate this oil more effectually from the acid is to combine the whole with absorbents, and abstract the oil again by distillation. By this means a very sensible quantity of oil may be separated that was not perceived before.

The air, that is discharged with impetuosity in the operation, and must be let out, is loaded with many particles of acid and oil reduced to vapours, which it carries off; and by this means the quantity of the principles extracted from the mixt cannot be accurately determined: nor are the vapours, of which the vessels remain full after the operation, any other than particles of acid and oil, which the violence of the fire hath rarefied exceedingly, and which do not easily condense.

If we distill in this manner a vegetable aromatic substance, which of course contains an essential oil, provided it hath not been previously extracted by the appropriated process, this essential oil will rise first, as soon as the distilling vessel acquires the heat of boiling water: but its

scent will not be near so sweet or grateful, as if it were distilled in the manner before directed as properest for it. On the contrary, it will have an empyreumatic smell: because in this way it is impossible to avoid scorching, and half-burning some of the matter distilled; especially that part of it which touches the sides of the retort. Moreover, the very same equable degree of heat can hardly be kept up with a naked fire. The essential oil therefore, though it rises first, will not be pure, but contaminated with a mixture of the empyreumatic oil that first comes over, and will be confounded therewith.

Most vegetable substances, when distilled with a strong fire, yield the same principles with that which we have chosen for an instance. Entire plants of this kind, those from which the odorous principle; the essential oil, or the fat oil, hath been drawn, those of which extracts have been made by infusion or decoction, or the extracts themselves; all such matter being distilled yield a phlegm, an acid, a thin oil, air, and a thick oil; and the products of their several analyses differ from each other, only on account of the different quantity or proportion that each contains of the principles here enumerated.

But there are many other plants, which, besides these substances, yield also a considerable quantity of a volatile alkaline salt. This property is possessed chiefly by that tribe of plants which is distinguished by having cruciform flowers, among which there are some that, being analysed, greatly resemble animal-matters. We shall now analyse one of these; mustard-seed, for instance.

*To analyse a Vegetable Substance which yields the same Principles as are obtained from Animal-matters: instanced in Mustard-seed.*

With an apparatus like that of the preceding process, and with the same fire, distill mustard-seed. With a degree of heat, inferior to that of boiling water, there will come over a phlegm somewhat coloured, and impregnated with a volatile alkaline salt. With a degree of heat, greater than that of boiling water, the same kind of phlegm, impregnated with the same salt, will continue to come over; but it will be much higher coloured, and will be accompanied with a light oil. At this time a considerable quantity of air is discharged; with regard to which the same precautions must be taken as in distilling Guaiacum.

If the fire be gradually raised, there will come over a black thick oil, lighter however than water; and at the same time vapours will rise, and, condensing on the sides of the receiver, form into springs or ramifications. This is a volatile alkaline salt, in a concrete form, like that of animals, as we shall hereafter see. These vapours are much whiter than those of Guaiacum.

When you have thus drawn off, with a very strong fire, all the volatile alkali and thick-oil contained in the subject, there will be nothing left in the retort but a sort of coal, from which a small quantity of phosphorus may be obtained, provided the retort you employ for that purpose be good enough to stand a very violent heat.

Mustard-seed furnishes us with an instance of a vegetable, from which we obtain, by analysing it, the very same principles that animal-matters yield. Instead of

of getting an acid from it, we obtain only a volatile alkali.

We shall not here speak of the manner of separating and depurating the principles obtained by this process; but reserve it for the analysis of animals, which is absolutely the same. We shall content ourselves with observing, that the first volatile alkali, which rises at the beginning of the operation together with the phlegm, in a degree of heat below that of boiling water, differs from that which doth not come over till towards the end of the distillation, when the last thick oil ascends. The different times, and different degrees of heat, in which these two alkalis rise, shew that the former exists actually and perfectly in the plant; but that the latter is generated during the distillation, and is the product of the fire, which combines together the materials whereof it is composed.

Vegetables, that thus yield a volatile alkali with a heat less than that of boiling water, irritate the organ of smelling, affecting it with a sensation of acrimony; and the effluvia, which rise from them when bruised, make the eyes smart so as to draw tears from them in abundance. Several of these matters, being only bruised, effervesce with acids: effects producible only by a very volatile alkaline principle.

This is that alkali, the lightest of all the principles that can be extracted from bodies, which rises first in our distillation along with the phlegm, and with a degree of heat much inferior to that of boiling water. As the phlegm with which it rises is very copious, it is dissolved thereby; which is the reason it doth not appear in a concrete form. To this water it gives a slight yellowish tinge, because it is impure and oily. The saline alkaline properties of this liquor have procured it the title of a volatile spirit. This volatile alkali, which exists naturally and perfectly formed in mustard-seed, onions, garlick, cresses, and other such vegetables, constitutes a difference between them and animal substances, which contain only the materials requisite to form a volatile alkali, but none ready formed, unless they have undergone the putrid fermentation.

The second volatile alkali, which rises in our distillation, but not without a very strong degree of fire, and at the same time with the last thick oil, seems to be a production of the fire; for, if it were already formed in the mixt, as the other is, it would rise with the same heat, and at the same time, being equally volatile.

#### *Of the Substances obtained from Vegetables by Combustion.*

*To procure a fixed Caustic Alkaline Salt from a Vegetable Substance, by burning it in the open Air.*

**TAKE** any vegetable matter whatever; set it on fire, and let it burn in the open air till it be wholly reduced to ashes. On these ashes pour a quantity of boiling water sufficient to drench them thoroughly. Filter the liquor, in order to separate the earthy parts; and evaporate your lye to dryness, stirring it incessantly; and you will have a yellowish-white salt.

Put this salt in a crucible; set it in a melting furnace, and make a moderate fire, so as not to fuse the salt. It

VOL. II. No. 36.

3

will turn first of a blue-grey colour, afterwards of a blue-green, and at last reddish. Put on the dome of the furnace; fill it with coals; make your fire strong enough to melt the salt, and keep it in fusion for an hour, or an hour and half. Then pour it into a heated metal mortar; pound it while it is red-hot; put it as soon as possible into a glass bottle, first made very hot and dry, and shut it up close with a glass stopple rubbed with emery. By this means you will have the pure fixed alkali of the vegetable substance you burnt.

Burning a vegetable substance in the open air is a kind of violent and rapid analysis made by fire, which separates, resolves, and decomposes several of its principles.

When any wood or plant is laid on a quick fire, there ascends from it immediately an aqueous smoke, which consists of little more than phlegm; but this smoke soon becomes thicker and blacker; it is then pungent, draws tears from one's eyes, and excites a cough if drawn into the lungs with the breath. These effects arise from its being replete with the acid, and some of the oil, of the vegetable converted into vapours. Soon after this the smoke grows exceeding black and thick; it is now still more acrid, and the plant turns black. Its strongest acid and last thick oil are now discharged with impetuosity.

This rarefied oil being heated red-hot suddenly takes fire and flames. The vegetable burns and deflagrates rapidly, till all its oil is consumed. Then the flame ceases; and nothing remains but a coal, like that found in a retort after all the principles of a plant have been extracted by the force of fire. But this coal having a free communication with the air, which is absolutely necessary to keep a combustible burning, continues to burn, sparkles, and wastes till all its phlogiston is dissipated and destroyed. After this nothing remains but the earth and fixed salt of the vegetable; which, mixed together, form what we call the ashes. Water, which is the natural solvent of salts, takes up every thing of that kind that is contained in the ashes; so that by lixiviating them, as directed, all the salt is extracted, and nothing left but the pure earth of the mixt which is thus decomposed.

The phenomena observed in the burning of a vegetable substance, and the production thereby of a fixed alkali, seem to prove that this salt is the work of the fire; that it did not exist in the plant before it was burnt; that the plant only contained materials adapted to form this salt; and that this salt is no other than a combination of some of the acid, united with a portion of earth, by means of the igneous motion.

The alkali obtained from the ashes of burnt plants is not perfectly pure: it is contaminated with a small mixture of fatty matters, which were probably defended thereby against the action of the fire, and which render it somewhat saponaceous. In order to free it from this extraneous matter, and to render it very caustic, it must be calcined a long time in a crucible, but without melting it at first; because it is with this salt as with most metallic matters, which are sooner and more easily deprived of their phlogiston by being calcined without melting, provided they be comminuted into small particles, than when they are in fusion; all melted matters having but

†

8

a small surface exposed to the air, by the contact of which the evaporation of any thing whatever is exceedingly promoted.

*To procure the fixed Salt of a Plant, by burning it after the manner of Tachenius.*

INTO an iron pot put the plant whose salt you desire to obtain in the manner of Tachenius, and set it over a fire, strong enough to make its bottom red-hot; at the same time cover your plant with a plate of iron, that may lie immediately upon it in the pot. The plant will grow black, and smoke considerably; but will not flame, because it hath not a sufficient communication with the air. The black smoke only will escape through the interstice left between the side of the pot and the rim of the plate; which, for that purpose, should be made so as not to fit exactly into the pot. From time to time take up the iron plate, stir the plant, and cover it again immediately, to prevent its taking fire, or to smother it if it should happen to flame: go on thus till the black smoke cease.

Then take off the iron plate: the upper part of the half-burnt plant will take fire as soon as the air is admitted, consume gradually, and be reduced to a white ash. Stir your matter with an iron wire, that the undermost parts, which are still black, may be successively brought uppermost, take fire, and burn to white ashes.

Go on thus as long as you perceive the least blackness remaining. After this, leave your ashes some time longer on the fire; but stir them frequently, to the end that, if any black particles should still be left, they may be entirely consumed.

Your ashes being thus prepared, lixiviate them with seven times their quantity of water, made to simmer over the fire, and keep stirring it with an iron ladle. Then filter the liquor, and evaporate it to dryness in an iron pot, stirring it incessantly towards the end, lest the matter, when it grows stiff, should adhere too closely to the vessel. When all the humidity is evaporated, you will have a salt of a darkish colour and alkaline nature; which you may melt in a crucible, and mould into cakes. This is the fixed salt of plants, prepared in the manner of Tachenius.

*To render Fixed Alkalis very caustic by means of Lime. The Caustic Stone.*

TAKE a lump of newly burnt quick-lime, that hath not yet begun to slake in the air: put it into a stone pan, and cover it with twice its weight of the unwashed ashes of some plant that are full of the salt you design to render caustic. Pour on them a great quantity of hot water; let them steep in it five or six hours, and then boil them gently. Filter the liquor through a thick canvas bag, or through brown filtering paper supported by a linen cloth.

Evaporate the filtered liquor in a copper basin set over the fire; and there will remain a salt, which must be put into a crucible set in the fire. It will melt, and boil for some time; after which it will be still, and look like an oil, or melted fat. When it comes to this condition, pour it out on a very hot copper plate, and cut it into

oblong tapering slips, before it grow hard by cooling. Put these slips, while they are still hot, into a very dry glass bottle, and seal it hermetically. This is the *caustic stone*, or *common caustic*.

*The Analysis of Soot.*

TAKE wood-foot from a chimney under which no animal matter hath been dressed or burnt: put it into a glass retort set in a reverberating furnace; lute on a receiver, and begin to distill with a degree of heat somewhat less than that of boiling water. A considerable quantity of limpid phlegm will come over. Keep the fire in the same degree as long as any of this phlegm rises, but increase it when the drops begin to come flow; and then there will ascend a good deal of a milky water. When this water ceases to run, change the receiver, and increase your fire a little: a yellow volatile salt will rise, and stick to the sides of the receiver. The fire ought now to be very fierce, and, if so, will force up at the same time a very thick black oil. Let the vessels cool: you will find a saline matter risen into the neck of the retort, which could not pass over into the receiver: in the bottom of the retort will be a *caput mortuum*, or black charred substance, the upper part of which will be crufted over with a saline matter, like that in the neck of the retort.

As we are at present inquiring into the nature of vegetables only, it is evidently necessary that we chuse a foot produced by burning vegetables alone. Soot, though dry in appearance, contains nevertheless much humidity, as appears from this analysis; seeing there comes over at first a considerable quantity of phlegm, that doth not seem to be impregnated with any principle, except perhaps an extremely subtile, saline, and oily matter, that communicates to it a disagreeable smell, from which it cannot by any means be entirely freed.

The volatile alkali obtained from soot is, in a double respect, the product of the fire. In the first place, though it derives its origin wholly from wood, or other vegetables, which, when distilled in close vessels, yield no volatile alkali at all, yet it produces such a salt when analysed in the present manner: whence it must be inferred, that the principles of those vegetables are metamorphosed into a volatile alkali, by being burnt in the open air, and sublimed in the form of foot. Secondly, though soot, when analysed, yields a great deal of this salt, yet this salt doth not formally pre-exist therein; for it doth not rise till after the phlegm, nor without a very considerable degree of heat: therefore soot contains only the materials necessary to form this salt; therefore the perfect combination of this salt requires that the force of fire be applied a second time; therefore it is, as was said, doubly the product of the fire.

The saline matter which we find sublimed into the neck of the retort, and which also forms the cruft that covers the *caput mortuum* of the foot, appears by all chemical trials to be an ammoniacal salt; that is, a neutral salt, consisting of an acid and a volatile alkali. This ammoniacal salt rises only into the neck of the retort, and doth not come over into the receiver; because it is but semi-volatile. We shall treat more at large of the production

production of a volatile alkali, and of this ammoniacal salt, when we come to the analysis of animals, and the article of sal ammoniac.

*The Analysis of some particular Substances belonging to the Vegetable Kingdom.*

*Analysis of the natural Balsams : instanced in Turpentine.*

INTO a cucurbit put as much rain-water as will fill about a fourth part of its cavity, and pour into it the turpentine you intend to analyse. Cover the cucurbit with its head, and lute it on with slips of sized paper or wet bladder. Set your alembic in a sand-heat ; lute on a long-necked receiver ; and give a gradual fire till the water in the cucurbit boil. There will come over into the receiver a good deal of phlegm, which, by little and little, will become more and more acid ; and at the same time there will rise a great quantity of an æthereal oil, extremely light, fluid, and as limpid and colourless as water.

When you observe that no more oil comes off, unlute your vessels ; and in the receiver you will find an acidulated water, and the æthereal oil floating on it. These two liquors may be easily separated from each other, by means of a glass funnel.

In the cucurbit will be left some of the water you put in, together with the remainder of your turpentine ; which, when cold, instead of being fluid, as it was before distillation, will be solid, and of the consistence of a resin, and is then called *resin*.

Put this residuum into a glass retort, and distill it in a reverberatory with a naked fire, gradually increased according to the general rule for all distillations. At first, with a degree of heat a little greater than that of boiling water, you will see two liquors come over into the recipient ; one of which will be aqueous and acid, the other will be a transparent, limpid, yellowish oil, floating on the acid liquor.

Continue your distillation, increasing your fire from time to time, by slow degrees. These two liquors will continue to come off together ; and the nearer the operation draws to its end, the more acid will the aqueous liquor become, and the thicker and deeper coloured will the oil grow. At last the oil will be very thick, and of a deep reddish-yellow colour. When nothing more ascends, unlute your vessels : in the retort you will find only a very small quantity of a charred, light, friable substance.

All natural balsams, as well as turpentine, are oily, aromatic matters, which flow in great quantities from the trees containing them, either spontaneously, or thro' incisions made on purpose. As these matters have a strong scent, it is not surprising that they should greatly abound with essential oils. They may even be considered as essential oils, that naturally, and of their own accord, separate from the vegetables in which they exist.

Natural balsams, and essential oils grown thick with age, are exactly one and the same thing. Accordingly

we see that fire and distillation produce the same effects on both. The rectification of an essential oil, thickened by keeping, is nothing but a decomposition thereof, by separating, with the heat of boiling water, all those parts that are light enough to rise with that degree of heat, from what is so loaded with acid as to remain fixed therein.

The newer natural balsams are, the thinner they are, and the more essential oil do they yield ; and this essential oil, like all others, grows thick in time, and at last turns again to an actual balsam.

These balsams, by being long exposed to the heat of the sun, acquire such a consistence as to become solid. They then take another name, and are called *resins*. Resins yield much less essential oil when distilled, than balsams do. Hence it follows, that resins are to balsams, what balsams are to essential oils.

*The Analysis of Resins : instanced in Benjamin. The Flowers and Oil of Benjamin.*

INTO a pretty deep earthen pot, having a border or rim round its mouth, put the benjamin you intend to analyse. Cover the pot with a large conical cap of very thick white paper, and tie it on under the rim. Set your pot in a sand-bath, and warm it gently till the benjamin melt. Continue the heat in this degree for an hour and half. Then untie the paper cap and take it off, shaking it as little as possible. You will find all the inside of the cap covered with a great quantity of beautiful, white, shining flowers, in the form of little needles. Brush them off gently with a feather, put them into a bottle, and stop it close.

As soon as you take off the first cap, cover your pot immediately with a second like the former. In this manner go on till you perceive the flowers begin to grow yellowish ; and then it is proper to desist.

The matter left in the pot will be blackish and friable when cold. Pulverise it ; mix it with sand ; and distill it in a glass retort with a graduated heat. There will come over a light oil, of a fragrant scent, but in very small quantity ; a little of an acid liquor, and a great quantity of a red thick oil. There will be left in the retort a charred, spongy substance.

*Of the Nature and Properties of Camphor.*

WE do not propose to give an analysis of this singular body ; because hitherto there is no process known in chemistry by which it can be decomposed. We shall therefore content ourselves with reciting its principal properties, and making a few reflections on its nature.

Camphor is an oily concrete substance ; a kind of resin, brought to us from the island of Borneo, but chiefly from Japan. This substance resembles resins, in being inflammable, and burning much as they do ; it is not soluble in water, but dissolves entirely and perfectly in spirit of wine ; it is easily separated again from this menstruum, as all other oily matters are, by the addition of water ; it dissolves both in expressed and in distilled oils ; it hath a very strong aromatic smell. These are the chief

chief properties which camphor possesses in common with resins: but in other respects it differs totally from them; especially in the following particulars.

Camphor takes fire and flames with vastly more ease than any other resin. It is so very volatile, that it vanishes entirely in the air, without any other heat than that of the atmosphere. In distillation it rises entire, without any decomposition, or even the least alteration. It dissolves in concentrated mineral acids; but with circumstances very different from those that attend other oily or resinous substances. The dissolution is accompanied with no effervescence, no sensible heat; and consequently can produce no inflammation. Acids do not burn, blacken, or thicken it, as they do other oily matters; on the contrary, it becomes fluid, and runs with them into a liquor that looks like oil.

Camphor doth not, like other oily matters, acquire a disposition to dissolve in water by the union it contracts with acids; though its union with them seems to be more intimate than that of many oily matters with the same acids. On the contrary, if a combination of camphor and an acid be diluted with water, these two substances instantly separate from each other: the acid unites with the water, and the camphor, being entirely disengaged from it, swims on the surface of the liquor. Neither volatile alkalis, nor the most caustic fixed alkalis, can be brought into union with it; for it always eludes their power.

Notwithstanding these wide differences between camphor and all other oily and resinous substances, the rule, that acids thicken oils, seems to be so universal, and so constantly observed by nature, that we cannot help thinking this substance, like all the rest, is an oil thickened by an acid. But what oil? what acid? and how are they united? This is a subject for very curious inquiries.

With a yellow oil drawn from wine, and an acid vinous spirit, Mr Hellot made a kind of artificial camphor; a substance having the odour, savour, and inflammability of camphor; an imperfect camphor. True camphor hath the levity, the volatility, and the inflammability of æther. Can it be a substance of the same nature with æther, a kind of solid æther, an æther in a concrete form?

*The Analysis of Bitumens: instanced in Amber. The Volatile Salt and Oil of Amber.*

INTO a glass retort put some small bits of amber, so as to fill but two thirds of the vessel. Set your retort in a furnace covered with its dome; sit on a large glass receiver; and beginning with a very gentle heat, distill with degrees of fire. Some phlegm will first come off, which will gradually grow more acid, and be succeeded by a volatile salt, figured like fine needles, that will stick to the sides of the receiver.

Keep the fire up to this degree, in order to drive over all the salt. When you perceive that little or none rises, change the receiver, and increase your fire a little. A light, clear, limpid oil will ascend. As the distillation advances, this oil will grow higher coloured, less

limpid, and thicker; till at last it will be opaque, black, and have the consistence of turpentine.

When you perceive that, though the retort be red-hot, nothing more comes off, let the fire go out. You will have in the retort a black, light, spongy coal. If you have taken care to shift the receiver, from time to time, during the distillation of your oil, you will have sundry separate portions thereof, each of which will have a different degree of tenuity or thickness, according as it came over at the beginning, or towards the end of the distillation.

THE substance of which we have here given the analysis, together with all others of the same, that is, of the bituminous kind, is, by most chemists and naturalists, classed with minerals: and so far they are right, that we actually get these mixts, like other minerals, out of the bowels of the earth, and never procure them immediately from any vegetable or animal compound. Yet we have our reasons for acting otherwise, and for thinking that we could not, in this work, place them better, than immediately after those vegetable substances which we call *resins*.

Several motives determine us to proceed in this manner. The analysis of bitumens demonstrates, that, with regard to the principles of which they consist, they are totally different from every other kind of mineral; and that, on the contrary, they greatly resemble vegetable resins in almost every respect. In short, though they are not immediately procured from vegetables, there is the greatest reason for believing that they were originally of the vegetable kingdom, and that they are no other than resinous and oily parts of trees or plants, which by lying long in the earth, and there contracting an union with the mineral acids, have acquired the qualities that distinguish them from resins.

Mineralogists know very well that we find, every where in the earth, many vegetable substances, that have lain very long buried under it, and frequently at a considerable depth. It is not uncommon to find, under ground, vast beds of fossil trees, which seem to be the remains of immense forests: and bitumens, particularly amber, are often found among this subterraneous wood.

These considerations, joined to proofs drawn from their analysis, make this opinion more than probable: nor are we singular in maintaining it, as it is adopted by many able modern chemists.

The analysis of amber, above described, may serve as a general specimen of the decomposition of other bitumens: with this single difference, that amber is the only one among them which yields the volatile salt aforesaid; and this determined us to examine it preferably to any other. As for the rest, they all yield a phlegm, an acid liquor, and an oil; which is thin at first, but grows thicker and thicker as the distillation draws towards an end. It must be understood, however, that these acids and these oils may differ, according to the nature of the bitumens from which they are drawn; just as the phlegm, the acid, and the oil, resulting from the decomposition of resins, differ in quantity and quality, according to the nature of the resins from which they are procured.

The

The principal differences observed between resins and bitumens are these: the latter are less soluble in spirit of wine; have a peculiar scent, which cannot be accurately described, and of which the sense of smelling only can judge; and their acid is stronger and more fixed. This last property is one of the motives which induce us to think, that besides the vegetable acid, originally combined with the resinous or oily matter now become a bitumen, a certain quantity of mineral acid hath, in a course of time, been superadded to constitute this mixt. We shall presently see that the fact is certainly so, in the case of amber at least.

*The Analysis of Bees-wax.*

MELT the wax you intend to analyse, and mix with it as much fine sand as will make it into a stiff paste. Put this paste in little bits into a retort, and distil as usual, with a graduated fire, beginning with a very gentle heat. An acid phlegm will come over, and be followed by a liquor which at first will look like an oil, but will soon congeal in the receiver, and have the appearance of a butter or grease. Continue the distillation, increasing the fire by insensible degrees, till nothing more will come off. Then separate the butter from the acid phlegm in the receiver, mix it with fresh sand, and distil it again just as you did the wax before. Some acid phlegm will still come off, and an oil will ascend, which will not fix in the receiver, though it be still thick. Continue the distillation, with a fire so governed that the drops may succeed each other at the distance of six or seven seconds of time. Do not increase it, till you perceive the drops fall more slowly; and then increase it no more than is necessary to make the drops follow each other as above directed. When the distillation is finished, you will find in the receiver the oil come wholly over, and a little acid phlegm. Separate the oil from this liquor; and, if you desire to have it more fluid, redistil it a third time in the same manner.

*The Saccharine Juices of Plants analysed: instanced in Honey.*

PUT into a stone cucurbit the honey you intend to distil; set it in a moderate sand-heat, and evaporate the greatest part of its humidity, till you perceive the phlegm to be acid. Then take out the matter remaining in the cucurbit, put it into a retort, leaving a full third thereof empty, and distil in a reverberatory with degrees of fire. An acid amber-coloured liquor will come over. As the operation advances, this liquor will continually become deeper coloured and more acid, and at the same time a little black oil will ascend. When the distillation is over, you will find in the retort a pretty large charred mass, which being burnt in the open air, and lixiviated, affords a fixed alkali.

Sugar, manna, and the saccharine juices of fruits and plants, are of the same nature as honey, yield the same principles, and in the same proportions. All these substances must be considered as native soaps; because they consist of an oil rendered miscible with water, by means of a saline substance. They differ from the common artificial soaps in several respects; but chiefly in this, that

their saline part is an acid, whereas that of common soap is an alkali. The natural soaps are not for that reason the less perfect: on the contrary, they dissolve in water without destroying its transparency, and without giving it a milky colour; which proves, that acids are not less proper than alkalies, or rather that they are more proper additaments, for bringing oils into a saponaceous state.

*Gummy Substances analysed: instanced in Gum Arabic.*

DISTIL gum arabic in a retort with degrees of fire. A limpid, scentless, and tasteless phlegm will first come over; and then a russet coloured acid liquor, a little volatile alkali, and an oil, which will first be thin and afterwards grow thick. In the retort will be left a good deal of a charred substance, which, being burnt and lixiviated, will give a fixed alkali.

Gums have at first sight some resemblance of resins; which hath occasioned many resinous matters to be called gums, though very improperly: for they are two distinct sorts of substances, of natures absolutely different from each other. It hath been shewn, that resins have an aromatic odour; that they are indissoluble in water, and soluble in spirit of wine; that they are only an essential oil grown thick. Gums, on the contrary, have no odour, are soluble in water, indissoluble in spirit of wine, and, by being analysed as in the process, are converted almost wholly into a phlegm and an acid. The small portion of oil contained in them is so thoroughly united with their acid, that it dissolves perfectly in water, and the solution is clear and limpid. In this respect gums resemble honey, and the other vegetable juices analogous to it. They are all fluid originally; that is, when they begin to ooze out of their trees. At that time they perfectly resemble mucilages, or rather they are actual mucilages, which grow thick and hard in time by the evaporation of a great part of their moisture: just as resins are true oils, which, losing their most fluid parts by evaporation, at last become solid. Infusions or slight decoctions of mucilaginous plants, when evaporated to dryness, become actual gums.

Some trees abound both in oil and in mucilage: these two substances often mix and flow from the tree blended together. Thus they both grow dry and hard together in one mass, which of course is at the same time both gummy and resinous: and accordingly such mixts are named *gum resins*.

*Of Operations on FERMENTED VEGETABLE SUBSTANCES.*

*Of the Product of Spirituous Fermentation.*

*To make Wine of Vegetable Substances that are susceptible of Spirituous Fermentation.*

LET a liquor susceptible of, and prepared for, the spirituous fermentation, be put into a cask. Set this cask in a temperately warm cellar, and cover the bung hole with a bit of linen cloth only. In more or less time, according to the nature of the liquor to be fermented,

and to the degree of heat in the air, the liquor will begin to swell, and be rarefied. There will arise an intestine motion, attended with a small hissing and effervescence, throwing up bubbles to the surface, and discharging vapours; while the gross, viscous, and thick parts, being driven up by the fermenting motion, and rendered lighter by little bubbles of air adhering to them, will rise to the top, and there form a kind of soft spongy crust, which will cover the liquor all over. The fermenting motion still continuing, this crust will, from time to time, be lifted up and cracked by vapours making their escape through it; but those fissures will presently close again, till, the fermentation gradually going off, and at last entirely ceasing, the crust will fall in pieces to the bottom of the liquor, which will insensibly grow clear. Then stop the cask close with its bung, and set it in a cooler place.

Matters that are susceptible of the spirituous fermentation are seldom so perfectly prepared for it by nature as they require to be. If we except the juices that flow naturally from certain trees, but oftener from incisions made on purpose in them, all other substances require some previous preparation.

Boerhaave divides the substances that are fit for spirituous fermentation into five classes. In the first he places all the meally seeds, the legumens, and the kernels of almost all fruits. The second class includes the juices of all fruits that do not tend to putrefaction. In the third class stand the juices of all the parts of plants which tend rather to acidity than to putrefaction; and consequently those which yield much volatile alkali are to be excluded. The fourth class comprehends the juices or saps that spontaneously distil from several trees and plants, or flow from them when wounded. He forms his fifth and last class of the saponaceous, saccharine, and concrete or thick juices of vegetables. Resinous or purely gummy matters are excluded, as not being fermentable.

These five classes may be reduced into two; one comprehending all the juices, and another all the meally parts of vegetables that are susceptible of fermentation. The juices want nothing to fit them for fermentation, but to be expressed out of the substances containing them, and to be diluted with a sufficient quantity of water. If they be very thick, the best way is to add so much water as shall render the mixed liquor just capable of bearing a new-laid egg. With respect to farinaceous substances, as they are almost all either oily or mucilaginous, they require a little more management. The method of brewing malt liquors will furnish us with examples of such management. See BREWING.

Besides the preparations relating chiefly to malt-liquors, there are many other things to be observed relating to spirituous fermentation in general, and to all matters susceptible of that fermentation. For example; all grains and fruits designed for that fermentation must be perfectly ripe; for otherwise they will not ferment without difficulty, and will produce little or no inflammable spirit. Such matters as are too austere, too acrid, or astringent, are for the same reason unfit for spirituous fermentation; as well as those which abound too much in oil.

In order to make the fermentation succeed perfectly, so as to produce the best wine that the fermented liquor is capable of affording, it is necessary to let it stand quiet without stirring it, lest the crust that forms on its surface should be broken to little fragments, and mix with the liquor. This crust is a kind of cover, which hinders the spirituous parts from exhaling as fast as they are formed. The free access of the air is another condition necessary to fermentation: and for this reason the vessel that contains the fermenting liquor must not be close stopped; the bung-hole is only to be covered with a linen cloth, to hinder dirt and insects from falling into it. Nor must the bung-hole be too large, lest too much of the spirituous parts should escape and be lost.

Lastly, a just degree of warmth is one of the conditions most necessary for fermentation: for in very cold weather there is no fermentation at all; and too much heat precipitates it in such a manner that the whole liquor becomes turbid, and many fermenting and fermented particles are dissipated.

If, notwithstanding the exactest observance of every particular requisite to excite a successful fermentation, the liquor cannot, without difficulty, be brought to effervesce, which scarce ever happens but to malt-liquor, it may be accelerated by mixing therewith some matter that is very susceptible of fermentation, or actually fermenting. Such matters are called *ferments*. The crust that forms on the surface of fermenting liquors is a most efficacious ferment, and on that account very much used.

It sometimes happens, that there is occasion to check the fermentation excited in the liquor, before it ceases of itself. To effect this, such means must be used as are directly opposite to those mentioned above for promoting fermentation. The same end is obtained by mixing with the liquor a quantity of alkali, sufficient to absorb the acid contained therein: but this method is seldom made use of, because it spoils the liquor; which, after being thus treated, is incapable of any spirituous fermentation, but on the contrary will certainly putrefy.

Spirituous fermentation may also be stopped by mixing with the liquor a great quantity of some mineral acid. But this likewise alters its nature; because these acids, being fixed, always remain confounded therewith, and never separate from it.

The best method yet found out for checking this fermentation, without injury to the fermenting liquor, is to impregnate it with the fumes of burning sulphur. These fumes are known to be acid, and it is that quality in them which suspends the fermentation. But at the same time this acid is extremely volatile; so that it separates spontaneously from the liquor, after some time, and leaves it in a condition to continue its fermentation.

For this reason, when a wine is desired that shall be but half fermented, and shall partly retain the sweet taste it had in the state of *must*, (the proper name for the unfermented juice of the grape), it is put into casks in which sulphur hath been previously burnt, and the vapours thereof confined by stopping the bung-hole. These are called *matched wines*. If the same operation be performed on must, its fermentation will be absolutely prevented: it will retain all its saccharine taste, and is then called

called *stum*. As the sulphureous acid evaporates spontaneously, in no long space, it is necessary to fumigate matched wines or stums from time to time, when they are intended to be kept long without fermenting.

*To draw an Ardent Spirit from Substances that have undergone the Spirituous Fermentation. The Analysis of Wine.*

FILL a large copper cucurbit half full of wine. Fit on its head and refrigeratory. Lute on a receiver with wet bladder, and distill with a gentle fire; yet so that the drops which fall from the nose of the alembic may succeed one another pretty quick, and form a sort of small continued stream. Go on thus till you perceive that the liquor which comes over ceases to be inflammable; and then desist. You will find in the receiver a clear liquor, somewhat inclining to an amber-colour, of a pleasant quick smell, and which being thrown into the fire instantly flames. The quantity thereof will be nearly a fourth part of the wine you put into the alembic; and this is what is called *brandy*; that is, the ardent spirit of wine loaded with much phlegm.

In order to rectify it, and reduce it to spirit of wine, put it into a long-necked matras, capable of holding double the quantity. Fit a head to the matras, and lute on a receiver: place your matras over a pot half full of water: set this pot over a moderate fire; and with this vapour-bath distil your spirit, which will rise pure. Continue this degree of heat till nothing more will come over. You will find in the receiver a very clear colourless spirit of wine, of a quick but agreeable smell, which will catch fire at once by the bare contact of any flaming substance.

*To dephlegmate Spirit of Wine by the Means of Fixed Alkalis.*

INTO a glass cucurbit pour the spirit of wine you intend to dephlegmate, and add to it about a third part of its weight of fixed alkali, newly calcined, perfectly dry, heated, and pulverised. Shake the vessel, that the two matters may be mixed and blended together. The salt will gradually grow moist, and, if the spirit of wine be very aqueous, melt into a liquor, that will always lie at the bottom of the vessel, without uniting with the spirit of wine which will swim at top.

When you perceive that the alkali attracts no new moisture, and that no more of it melts, decant your spirit of wine from the liquor beneath it, and add to your spirit fresh salt thoroughly dried as before. This salt also will imbibe a little moisture; but it will not grow liquid, because the alkali, with which it was mixed before, hath left too little phlegm to melt this. Decant it from this salt as at first, and continue to mix and shake it in the same manner with fresh salt, till you observe that the salt remains as dry after as it was before mixing it with the spirit of wine. Then distil your spirit in a small alembic with a gentle heat, and you will have it as much dephlegmated as it can be.

*Spirit of Wine combined with different Substances.*

*To combine Spirit of Wine with the Vitriolic Acid. This Combination decomposed. Ether.*

INTO an English glass retort put two pounds of spirit of wine perfectly dephlegmated, and pour on it at once two pounds of highly concentrated oil of vitriol: shake the retort gently several times, in order to mix the two liquors. This will produce an ebullition, and considerable heat; vapours will ascend, with a pretty loud hissing noise, which will diffuse a very aromatic smell, and the mixture will be of a deeper or lighter red colour, according as the spirit of wine was more or less oily. Set the retort on a sand-bath made nearly as hot as the liquor; lute on a tubulated ballon, and distil the mixture with a fire strong enough to keep the liquor always boiling; a very aromatic spirit of wine will first come over into the ballon, after which the æther will rise. When about five or six ounces of it are come off, you will see in the upper concavity of the retort a vast number of little points in a veined form, which will appear fixed, and which are nevertheless so many little drops of æther, rolling over one another, and trickling down into the receiver. These little points continue to appear and succeed each other to the end of the operation. Keep up the same degree of fire, till upon opening the little hole in the ballon you perceive that the vapours, which instantly fill the receiver, have the suffocating smell of volatile spirit of sulphur.

Then unlute the ballon, pour the liquor it contains into a crystal bottle, and stop it close: there will be about eighteen ounces of it. Lute on your receiver again, and continue the distillation with a greater degree of fire. There will come over an aqueous, acid liquor, smelling strong of a sulphureous spirit, which is not inflammable. It will be accompanied with undulating vapours; which being condensed will form an oil, most commonly yellow, one part of which will float on the surface of the liquor, and another will sink to the bottom.

Towards the end of the distillation of this acid liquor, and of the yellow oil of which it is the vehicle, that part of the mixture, which is left in the retort and grown black, will begin to rise in froth. Then suppress your fire at once: stop the distillation, and change your receiver once more. When the vessels are grown pretty cool, finish your distillation with a lamp-heat kept up for twelve or fifteen days, which in all that time will raise but a very little sulphureous spirit. Then break your retort, in which you will find a black, solid mass, like a bitumen. It will have an acid taste, arising from a remainder of the acid imperfectly combined with oil.

This artificial bitumen may be freed from its redundant acid, by washing it in several waters. Then put it into a glass retort, and distil it with a strong reverberated fire. You will obtain a reddish oil that will swim on water, much like the oil obtained by distilling the natural bitumens.

bitumens. This oil also will be accompanied with an aqueous acid liquor. In the retort will be left a charred matter, which, being put into an ignited crucible in the fire, burns for some time, and, when well calcined, leaves a white earth.

The liquors that rise first in this distillation, and which we directed to be kept by themselves, are a mixture consisting, 1. of a highly dephlegmated spirit of wine, of a most fragrant smell; 2. of æther, which the spirit of wine wherewith it is united renders miscible with water; 3. of a portion of oil, which commonly rises with the æther towards the end of the operation; 4. and sometimes of a little sulphureous acid, if the receiver be not changed soon enough.

In order to separate the æther from these other substances, put the whole into an English retort, with a little oil of tartar *per deliquium* to absorb the sulphureous acid, and distil very slowly in a sand bath heated by a lamp, till near half the liquor be come over. Then cease distilling; put the liquor in the receiver into a phial with some water, and shake it; you will see it rise with rapidity to the upper part of the phial, and float on the surface of the water: this is the æther.

*Spirit of Wine combined with Spirit of Nitre.  
Sweet Spirit of Nitre.*

INTO an English retort of crystal glass put some highly rectified spirit of wine; and, by means of a glass funnel with a long pipe let fall into your spirit of wine a few drops of the smoking spirit of nitre. There will arise in the retort an effervescence attended with heat, red vapours, and a hissing noise like that of a live coal quenched in water. Shake the vessel a little, that the liquors may mix thoroughly, and that the heat may be equally communicated to the whole. Then add more spirit of nitre, but in a very small quantity, and with the same precautions as before. Continue thus adding spirit of nitre, by little and little at a time, till you have put into the retort a quantity equal to a third part of your spirit of wine. Let this mixture stand quiet, in a cool place, for ten or twelve hours; then set it to digest in a very gentle warmth for eight or ten days, having first luted on a receiver to the retort.

During this time a small quantity of liquor will come over into the receiver, which must be poured back into the retort. Then distill with a somewhat stronger degree of heat, but still very gently, till nothing be left in the retort but a thick matter. In the receiver you will find a spirituous liquor, of a quick grateful smell, which will excite a very smart sensation on the tongue, but without any corrosive acrimony. This is the *sweet spirit of nitre*.

*Spirit of Wine combined with the Acid of Sea salt.  
Dulcified Spirit of Salt.*

MIX together, little by little, in a glass retort, two parts of spirit of wine with one part of spirit of salt. Set this mixture to digest for a month in a gentle heat, and distill it, till nothing remain in the retort but a thick matter.

The acid of sea-salt is much less disposed to unite with

inflammable matters than the other two mineral acids; and therefore, though it be ever so highly concentrated, when mixed with spirit of wine, it never produces effervescence comparable to that which is produced by the spirit of nitre. Neither the proportion nor strength of the spirit of salt, requisite to prepare the sweet spirit of salt, are unanimously agreed upon by authors.\* Some direct equal parts of the two liquors; while others prescribe from two to four or five parts of spirit of wine to one part of spirit of salt. Some use only common spirit of salt; others require the smoking spirit distilled by means of spirit of vitriol. Lastly, some order the mixture to be distilled, after some days digestion; and others content themselves with barely digesting it. The whole depends on the degree of strength which the sweet spirit of salt is intended to have. This composition, as well as the sweet spirit of nitre, is esteemed in medicine to be very aperitive and diuretic.

When the mixture of spirit of salt and spirit of wine is distilled, there comes over but one liquor, which appears homogeneous. This is the *sweet spirit of salt*. The nature of the marine acid is not changed in this combination: the acid is only weakened and rendered more mild; but in other respects it retains its characteristic properties.

*Oils, or Oily matters, that are soluble in Spirit of Wine, separated from Vegetables, and dissolved by means of that Menstruum. Tinctures; Elixirs; Varnishes. Aromatic strong waters.*

PUT into a matras the substances from which you intend to extract a tincture, having first pounded them, or pulverised them if they are capable of it. Pour upon them spirit of wine to the depth of three fingers breadth. Cover the matras with a piece of wet bladder, and tie it on with packthread. Make a little hole in this bit of bladder with a pin, leaving it in the hole to keep it stopped. Set the matras in a sand-bath very gently heated. If the spirit of wine dissolve any part of the body, it will accordingly acquire a deeper or lighter colour. Continue the digestion till you perceive that the spirit of wine gains no more colour. From time to time pull out the pin, to give vent to the vapours, or rarefied air, which might otherwise burst the matras. Decant your spirit of wine, and keep it in a bottle well corked. Pour on some fresh spirit in its stead: digest as before; and go on in this manner, pouring on and off fresh spirit of wine, till the last come off colourless.

Spirit of wine impregnated with such parts of any vegetable substance as it is capable of dissolving, is commonly called a *tincture*. Several tinctures mixed together, or a tincture drawn from sundry vegetable substances at the same time, and in the same vessel, take the name of an *elixir*. Tinctures of elixirs impregnated with resinous matters only, are true *varnishes*. All these preparations are made in the same manner; to wit, as directed in our process. We shall only add here, that if the substances from which a tincture or elixir is to be made contain too much moisture, it is proper to free them from it by gentle desiccation; especially if you design that the tincture should be well impregnated with the oily and resinous

resinous parts: for their excess of moisture uniting with the spirit of wine would weaken it, and render it unable to act on those matters, which it cannot dissolve when it is aqueous.

If your tinctures or elixirs be not so strong or so saturated as you desire, you may by distillation abstract part of the spirit of wine which they contain, and by that means give them such a degree of thickness as you judge proper. But the spirit of wine thus drawn off constantly carries along with it a good deal of the aromatic principle. It is a truly *aromatic strong water*. This spirit of wine also carries up with it a portion of thin oil, which is so much the more considerable as the degree of heat employed is greater: and this is the reason why it becomes of a milky colour when mixed with water.

If you intend to make an aromatic strong water only, you need not previously extract a tincture from the vegetable substance with which you mean to prepare your water: you need only put it in a cucurbit, pour spirit of wine upon it, and distil with a gentle heat. By this means you will obtain a spirit of wine impregnated with all the odour of the plant.

#### Of TARTAR.

*Tartar analysed by distillation. The Spirit, Oil, and Alkaline Salt of Tartar.*

INTO a stone retort, or a glass one coated with lute, put some white tartar broken into small bits; observing that one half, or at least a full third, of the vessel be left empty. Set your retort in a reverberating furnace. Fit on a large balloon, having a small hole drilled in it; lute it exactly with fat lute, and secure the joint with a linen cloth smeared with lute made of quick-lime and the white of an egg. Apply at first an exceeding gentle heat, which will raise a limpid, sourish, pungent water, having but little smell, and a bitterish taste.

When this first phlegm ceases to come off, increase your fire a little, and make the degree of heat nearly equal to that of boiling water. A thin, limped oil will rise, accompanied with white vapours, and with a prodigious quantity of air, which will issue out with such impetuosity, that if you do not open the little hole in the receiver time enough to give it vent, it will burst the vessels with explosion. An acid liquor will rise at the same time. Continue the distillation, increasing the heat by insensible degrees, and frequently unstopping the little hole of the receiver, till the elastic vapours cease to issue, and the oil to distil.

Then raise your fire more boldly. The acid spirit will continue to rise, and will be accompanied with a black, fetid, empyreumatic, ponderous, and very thick oil. Urge the fire to the utmost extremity so that the retort may be of a perfect red heat. This violent fire will raise a little volatile alkali, besides a portion of oil as thick as pitch. When the distillation is finished, you will find in the retort a black, saline, charred matter, which grows hot when wetted, attracts the moisture of the air, runs *per deliquium*, and hath all the properties of a fixed alkali.

VOL. II. No. 37.

3

The mass, being exposed to a naked fire in the open air, burns, consumes, and is reduced to a white ash, which is a fiery, caustic, fixed alkali.

The lees of wine resemble tartar, in as much as they contain, and yield when analysed, the same principles; but they differ from it in this, that they contain, moreover, a greater quantity of earth, of phlegm, and a little ardent spirit, which are only mixed, but not united, with its tartarous acid.

*The Depuration of Tartar. Cream and Crystals of Tartar.*

REDUCE to a fine powder the tartar you intend to purify, and boil it in twenty five or thirty times as much water. Filter the boiling liquor through a flannel bag, and then gently evaporate some part of it: there will soon form on its surface a saline crust, which is the *cream of tartar*. Let your liquor cool, and there will adhere to the sides of the vessel a great quantity of a crystallised saline matter, which is *crystal of tartar*.

*Crystal of Tartar combined with several substances.*

*Crystal of Tartar combined with Absorbent Earths: Soluble Tartars.*

BOIL an absorbent earth, such as chalk, in a pan with water; and, when you perceive the earth thoroughly divided and equally distributed through the water, throw into the pan, from time to time, some pulverised crystal of tartar, which will excite a considerable effervescence. Continue these projections, till you observe no effervescence excited thereby. All the absorbent earth, which obscured the transparency of the water, and gave it an opaque white colour, will gradually disappear as the crystal of tartar combines with it; and when the combination is perfected, the liquor will be clear and limpid. Then filter it, and there will be left on the filter but a very small quantity of earth. Evaporate all the filtered liquor with a gentle heat; and then set it in a cool place to shoot. Crystals will form therein, having the figure of flat quadrangular prisms, with almost always one, sometimes two, of the angles of the prism shaved down, as it were; and then the surfaces at each end are oblique answering to those depressed angles. These crystals are a neutral salt which readily dissolves in water; a true *soluble tartar*.

*Crystal of Tartar combined with fixed Alkalies. The Vegetable Salt. Saignette's Salt. The decomposition of Soluble Tartars.*

IN eight parts of water dissolve one part of a very pure alkaline salt, perfectly freed from the phlogiston by calcination. Heat this lixivium in a stone pan set on a sand bath, and from time to time throw into it a little powdered cream or crystal of tartar. Each projection will excite a great effervescence, attended with many bubbles, which will rise to a considerable height one over the other. Stir the liquor when the effervescence ceases, and you will see it begin again.

†

2 T

When

When no effervescence appears upon stirring the liquor, add a little more cream of tartar, and the same phenomena will be renewed. Go on thus till you have obtained the point of perfect saturation.

Then filter your liquor. If the alkali you made use of was the salt of Soda, evaporate your liquor quickly to a pellicle, and there will shoot in it crystals of nine sides resembling a coffin; the bottom part thereof being concave, and streaked with a great many parallel lines; and this is *Suignette's salt*. If you have employed any other alkali but soda, or the basis of sea-salt, evaporate your liquor slowly to the consistence of a syrup: let it stand quiet, and there will form in it crystals having the figure of flatted parallelopipeds; and this is the *vegetable salt*, or *tartarified tartar*.

All soluble tartars are easily decomposed, by means of a certain degree of heat. They yield in distillation the same principles as tartar; and the alkali that remains when they are perfectly calcined, consists of that which the tartar naturally affords, and of the alkaline matter with which it was converted into a neutral salt.

*Crystal of Tartar combined with Iron. Chalybeated Tartar. Tincture of Steel with Tartar. Soluble Chalybeated Tartar.*

Mix four ounces of iron in filings with one pound of white tartar finely pulverised. Boil the mixture in about twelve times as much water as you took of tartar. When the saline part of the tartar is dissolved, filter the liquor boiling-hot through a flannel bag, and then set it in a cool place. In a very little time crystals of a ruflet colour will shoot therein. Decant the liquor from these crystals; evaporate it to a pellicle, and set it again to crystallise. Go on in this manner till it will shoot no more. Collect all the salt you have thus obtained, and keep it under the name of *chalybeated tartar*.

To make the tincture of steel with tartar, mix together six ounces of clean iron filings, and one pound of white tartar in powder. Put this mixture into a large iron kettle, and pour thereon as much rain-water as will moisten it. Make a paste of this matter, and leave it thus in a mass for twenty-four hours. Then pour on it twelve pounds of rain-water, and boil the whole for twelve hours at least, stirring the mixture frequently, and adding from time to time some hot water, to supply the place of what evaporates. When you have thus boiled the liquor, let it stand quiet for some time, and then pour it off from the sediment at bottom. Filter, and evaporate to the consistence of a syrup; and you have the *tincture of Mars with tartar*. The dispensaries generally order an ounce of rectified spirit of wine to be poured on this tincture, in order to preserve it, and to keep it from growing mouldy, as it is very apt to do.

*Soluble chalybeated tartar* is prepared by mixing four ounces of tartarified tartar with one pound of the tincture of Mars with tartar, and evaporating them together in an iron vessel to dryness; after which it is kept in a well stopped phial to prevent its growing moist in the air.

*Crystal of Tartar combined with the reguline part of Antimony. Stibiated or Emetic tartar.*

PULVERISE and mix together equal parts of the glass and of the liver of antimony. Put this mixture, with the same quantity of pulverised cream of tartar, into a vessel capable of containing as much water as will dissolve the cream of tartar. Boil the whole for twelve hours, from time to time adding warm water, to replace what is dissipated by evaporation. Having thus boiled your liquor, filter it while boiling hot; evaporate to dryness; and you will have a saline matter, which is *emetic tartar*.

*Of the Product of Acetous Fermentation.*

*Substances susceptible of the Acetous Fermentation turned into Vinegar.*

THE wine, the cyder, or the malt-liquor, you intend to convert into vinegar, being first thoroughly mixed with its lees, and with the tartar it may have deposited, put your liquor into a fat used before either for making or for holding vinegar. This vessel must not be quite full, and the external air must have access to the liquor contained in it. Set it where the air may have a degree of warmth answering nearly to the twentieth degree above 0 in Mr de Reaumur's thermometer. Stir the liquor from time to time. There will arise in it a new fermentative motion, accompanied with heat: its vinous odour will gradually change, and turn to a sour smell, which will become stronger and stronger till the fermentation be finished and cease of itself. Then stop your vessel close; the liquor it contains will be found converted into vinegar.

All substances that have undergone the spirituous fermentation are capable of being changed into an acid by passing through this second fermentation, or this second stage of fermentation. Spirituous liquors, such as wine, cyder, beer, being exposed to a hot air, grow sour in a very short time. Nay, these liquors, though kept with all possible care, in very close vessels, and in a cool place, degenerate at last, change their natures, and insensibly turn sour. Thus the product of spirituous fermentation naturally and spontaneously degenerates to an acid.

For this reason it is of great importance, in making wine, or any other vinous liquor, to stop the fermentation entirely, if you desire the wine should contain as much spirit as possible. It is even more advantageous to check the fermentation a little before it come to the height than afterwards: because the fermentation, tho' slackened and in appearance totally ceased, still continues in the vessels; but in a manner so much the less perceptible as it proceeds more slowly. Thus those liquors, in which the fermentation is not quite finished, but checked, continue for some time to gain more spirit; whereas, on the contrary, they degenerate and gradually turn sour, if you let the spirituous fermentation go on till it be entirely finished.

The production of the second fermentation, which we are now to consider, is an acid of so much the greater strength

strength; the stronger and more generous the spirituous liquor in which it is excited originally was. The strength of this acid, commonly called *vinegar*, depends likewise in a great measure on the methods used in fermenting the vinous liquor, in order to convert it into vinegar: for if it be fermented in broad, flat vessels, and left to grow four of itself, the spirituous parts will be dissipated, and the liquor be sour indeed, but vapid and effete.

The vinegar-makers, to increase the strength of their vinegar, use certain methods of which they make a mystery, keeping them very secret. However, Mr. Boerhaave gives us, from some authors, the following description of a process for making vinegar:

"Take two large oaken vats or hogsheds, and in each of these place a wooden grate or hurdle, at the distance of a foot from the bottom. Set the vessel upright, and on the grates place a moderately close layer of green twigs, or fresh cuttings of the vine. Then fill up the vessel with the foot-stalks of grapes, commonly called the *rape*, to within a foot of the top of the vessel, which must be left quite open.

"Having thus prepared the two vessels, pour into them the wine to be converted into vinegar, so as to fill one of them quite up, and the other but half full. Leave them thus for twenty-four hours, and then fill up the half-filled vessel with liquor from that which is quite full, and which will now in its turn be left only half full. Four and twenty hours afterwards repeat the same operation, and go on thus, keeping the vessels alternately full and half full during every twenty-four hours, till the vinegar be made. On the second or third day there will arise, in the half-filled vessel, a fermentative motion, accompanied with a sensible heat, which will gradually increase from day to day. On the contrary, the fermenting motion is almost imperceptible in the full vessel; and as the two vessels are alternately full and half full, the fermentation is by that means, in some measure, interrupted, and is only renewed every other day, in each vessel.

"When this motion appears to be entirely ceased, even in the half-filled vessel, it is a sign that the fermentation is finished; and therefore the vinegar is then to be put into common casks close stopped, and kept in a cool place.

"A greater or less degree of warmth accelerates or checks this, as well as the spirituous fermentation. In France it is finished in about fifteen days, during the summer; but if the heat of the air be very great, and exceed the twenty-fifth degree of Mr de Réaumur's thermometer, the half-filled vessel must be filled up every twelve hours; because if the fermentation be not so checked in that time, it will become so violent, and the liquor will be so heated, that many of the spirituous parts, on which the strength of the vinegar depends, will be dissipated; so that nothing will remain, after the fermentation, but a vapid wash, sour indeed, but effete. The better to prevent the dissipation of the spirituous parts, it is a proper and usual precaution to close the mouth of the half-filled vessel, in which the liquor ferments, with a cover made also of oak wood. As to the

full vessel, it is always left open, that the air may act freely on the liquor it contains: for it is not liable to the same inconveniences, because it ferments but very slowly."

The vine-cuttings and grape-stalks, which the vinegar-makers put into their vessels, serve to increase the strength of the liquor. These matters contain a very manifest and perceptible acid. They also serve as a ferment; that is, they dispose the wine to become eager more expeditiously and more vigorously. They are the better and the more efficacious for having been once used, because they are thereby thoroughly drenched with the fermented acid: and therefore the vinegar-makers lay them by for preparing other vinegar, after washing them nimbly in running water, in order to free them from a viscid oily matter which settles on them during the fermentation. This matter must by all means be removed; because it is disposed to grow mouldy and rot; so that it cannot but be prejudicial to any liquor in which you put it.

As the acetous fermentation differs from the spirituous in its production, so it doth in many circumstances attending it. 1. Motion and agitation are not prejudicial to the acetous fermentation, as they are to the spirituous; on the contrary, moderate stirring, provided it be not continued, is of service to it. 2. This fermentation is accompanied with remarkable heat; whereas the warmth of the spirituous fermentation is scarce sensible. 3. We do not believe there ever was an instance of the vapour that rises from a liquor in acetous fermentation proving noxious, and producing either disorders or sudden death, as the vapour of fermenting wine doth. 4. Vinegar deposits a viscid oily matter, as hath just been observed, very different from the lees and tartar of wine. Vinegar never deposits any tartar; even though new wine, that hath not yet deposited its tartar, should be used in making it.

#### *To concentrate vinegar by Frost.*

Expose to the air, in frosty weather, the vinegar you desire to concentrate. Icicles will form in it; but the whole liquor will not freeze. Take out those icicles and if you desire a further concentration of your vinegar by this method, the liquor which did not freeze the first time must be exposed to a stronger frost. More icicles will form therein, which must likewise be separated, and kept by themselves. The liquor which doth not freeze this second time will be a very strong concentrated vinegar.

#### *Vinegar analysed by Distillation.*

Into a glass or stone cucurbit put the vinegar to be distilled; fit to it a glass head; place your alembic in the sand-bath of a distilling furnace, and lute on a receiver. Apply a very gentle heat at first. A clear, limpid, light liquor will rise, and fall in distinct drops, like water, from the nose of the alembic.

Continue distilling this first liquor, till the vinegar contained in the cucurbit be diminished about a fourth part. Then shift your receiver, and increase the fire a little. A clear liquor will still come over, but heavier and more acid

acid than the former. Distil in this manner till you have drawn off into your second receiver two thirds of the liquor that was left in the cucurbit.

A thick matter will now remain at the bottom of the still: put it into a retort; lute on a receiver; set your retort in a reverberating furnace, and distil with degrees of fire. There will come over a limpid liquor, very acid and sharp, yet ponderous, and requiring a great degree of fire to raise it; on which account it makes the receiver very hot. It hath a strong empyreumatic smell. When the distillation begins to slacken, increase your fire. There will rise an oil of a fetid, quick smell. At last when nothing more will rise with the strongest fire, break the retort, and in it you will find a black charred matter: burn it, and from the ashes lixiviated with water you will obtain a fixed alkali.

*The Acid of Vinegar combined with different Substances.*

*The Acid of Vinegar combined with Alkaline Substances. Foliated Salt of Tartar, or regenerated Tartar. Decomposition of that Salt.*

INTO a glass cucurbit put some very pure and well dried salt of tartar; and pour on it some good distilled vinegar, by little and little at a time. An effervescence will arise. Pour on more vinegar, till you attain the point of saturation. Then fit a head to the cucurbit; set it in a sand bath; and, having luted on a receiver, distil with a gentle heat, and very slowly, till nothing remain but a dry matter. On this residuum drop a little of the same vinegar; and if any effervescence appears, add more vinegar till you attain the point of saturation, and distil again as before. If you observe no effervescence, the operation was rightly performed.

It is not easy to hit the exact point of saturation in preparing this neutral salt; because the oily parts, with which the acid of vinegar is loaded, hinder it from acting so briskly and readily as it would do, if it were as pure as the mineral acids: and for this reason it often happens, that, when we have nearly attained the point of saturation, the addition of an acid makes no sensible effervescence, though the alkali be not yet entirely saturated; which deceives the operator, and makes him conclude erroneously that he hath attained the true point of saturation.

But he easily perceives his mistake, when, after having separated from this saline compound all its superfluous moisture by distillation, he drops fresh vinegar upon it: for then the salts being more concentrated, and consequently more active, produce an effervescence, which would not have been sensible if this last portion of acid, instead of coming into immediate contact with the dried alkali, could not have mixed therewith till diffused through, and in a manner suffocated by that phlegm from which the acid of the vinegar before neutralised was gradually separated by its combining with the alkali; that phlegm keeping in solution both the neutral salt already formed, and the alkali not yet saturated. And for this reason it is necessary to try, after the first desiccation of

this salt, which is called *regenerated tartar*, whether or no the just point of saturation hath been attained.

From what hath been said, concerning the desiccation of this neutral salt, it is plain, that the use of it is only to free the salt from the great quantity of superfluous moisture wherein it is dissolved: which proves, that the acid of vinegar, like all other acids dissolved in much water, is separated from most of this redundant phlegm by being combined with a fixed alkali. And hence we must conclude, that the acid of vinegar, contained in regenerated tartar desiccated, is vastly stronger and more concentrated than it was before.

Though the acid of vinegar is freed, by combining with a fixed alkali, from a great quantity of superfluous phlegm, yet the oily parts with which it is entangled still cleave to it: these parts are not separated from it by its conversion into a neutral salt, but, without quitting it, combine also with the fixed alkali; and this gives regenerated tartar a saponaceous quality, and several other peculiar properties.

Regenerated tartar, when dried, is of a brown colour. It is semi-volatile; melts with a very gentle heat, and then resembles an unctuous liquor; which indicates its containing an oil: when cast upon live coals, it flames; and, when distilled with a strong heat, yields an actual oil; all which evidently proves the existence of that oil.

This salt is soluble in spirit of wine; a quality which it probably owes also to its oil. It requires about six parts of spirit of wine to dissolve it; and the dissolution succeeds very well in a matras, with the help of a gentle warmth. If the spirit of wine be abstracted from this solution, by distilling with a small fire, it remains at the bottom of the cucurbit, in the form of a dry substance composed of leaves lying one upon another; which hath procured it the name of *terra foliata tartari*, or *foliated salt of tartar*.

It is not absolutely necessary that regenerated tartar be dissolved in spirit of wine to make the foliated salt: for it may be procured in this form only by evaporating the water in which it is dissolved. But the operation succeeds better with spirit of wine; probably because the success thereof depends on using an exceeding gentle warmth: now spirit of wine evaporates with much less heat than water.

Regenerated tartar may also be crystallised. If you desire to have it in this form, combine the acid with the alkali to the point of saturation; evaporate the liquor slowly to the consistence of a syrup, and set it in a cool place; where it will shoot into clusters of crystals lying one upon another like feathers.

Vinegar perfectly dissolves absorbent matters also, and particularly those of the animal kingdom; such as corals, crabs eyes, pearls, &c. In order to a dissolution of such matters, you must pulverise them, put them into a matras, and pour on them spirit of vinegar to the depth of four fingers breadth: an effervescence will arise: when that is over, set the mixture to digest two or three days in a sand-bath; then decant the liquor, filter it, and evaporate it to dryness with a very gentle heat. The matter which remains is called *salt of coral, of pearls,*

of

of crabs-eyes, &c. according to the substances dissolved. If, instead of evaporating the liquor, a fixed alkali be mixed therewith, the absorbent matter, that was dissolved by the acid, will precipitate in the form of a white powder, which is called the *magistery of coral*, of pearls, &c.

*The Acid of Vinegar combined with copper. Verdegris. Crystals of Copper. This Combination decomposed. Spirit of Verdegris.*

INTO a large matras put verdegris in powder. Pour on it distilled vinegar to the depth of four fingers breadth. Set the matras in a moderate sand-heat, and leave the whole in digestion, shaking it from time to time. The vinegar will acquire a very deep blue-green colour. When the liquor is sufficiently coloured, pour it off by inclination. Put some fresh vinegar into the matras; digest as before; and decant the liquor again when it is sufficiently coloured. Proceed in this manner till the vinegar will extract no more colour. There will remain in the matras a considerable quantity of undissolved matter. The vinegar thus impregnated with verdegris is called *tincture of copper*.

Mix these several tinctures, and evaporate them with a gentle heat to a pellicle. Then set the liquor in a cool place: in the space of a few days a great many crystals of a most beautiful green colour will shoot therein, and stick to the sides of the vessel. Pour off the liquor from the crystals; evaporate it again to a pellicle, and set it by to crystallise. Continue these evaporations and crystallisations, till no more crystals will shoot in the liquor. These are called *crystals of copper*, and are used in painting. To this combination of the acid of vinegar with copper the painters and dealers have given them the title of *distilled verdegris*.

Verdegris is prepared at Montpellier. To make it they take very clean plates of copper, which they lay, one over another, with husks of grapes between, and after a certain time take them out. Their surfaces are then covered all over with a very beautiful green crust, which is *verdegris*. This verdegris is nothing but copper corroded by the acid of tartar, analogous to the acid of vinegar, which abounds in the wines of Languedoc, and especially in the rape, husks, and stones of grapes that have a very austere taste. Verdegris is a sort of rust of copper, or copper corroded and opened by the acid of wine, but not yet converted entirely into a neutral salt: for it is not soluble in water, nor does it crystallise. This arises from its not being united with a sufficient quantity of acid. The design of the operation here described is to furnish the verdegris with the quantity of acid requisite to make it a true metallic salt; for which purpose distilled vinegar is very fit.

Crystals of copper may be obtained, without employing verdegris, by making use of copper itself dissolved by the acid of vinegar, according to the method practised with respect to lead, as shall be shewn hereafter. But verdegris is generally used, because it dissolves soonest; it being a copper already half dissolved by an acid correspondent to that of vinegar.

Crystals of copper are decomposed by the action of

fire alone, without any additament; because the acid of vinegar adheres but loosely to copper. In order to decompose this salt, and extract its acid, it must be put into a retort, and distilled in a reverberatory furnace with degrees of fire. An insipid phlegm rises first, which is the water retained by the salt in crystallising. This phlegm is succeeded by an acid liquor, which rises in the form of white vapours that fill the receiver. Towards the end of the distillation the fire must be violently urged, in order to raise the strongest and most fixed acid. At last there remains in the retort a black matter, which is nothing but copper, that may be reduced by melting it in a crucible with one part of saltpetre and two parts of tartar. A similar acid, but more oily, and in a much smaller quantity, may be obtained from verdegris by distillation.

The acid, which in this distillation comes over after the first phlegm, is an exceeding strong and concentrated vinegar. It is known by the title of *spirit of verdegris*.

*The Acid of Vinegar combined with Lead. Ceruse. Salt or Sugar of Lead. This Combination decomposed.*

INTO the glass head of a cucurbit put thin plates of lead, and secure them so that they may not fall out when the head is put upon the cucurbit. Fit on this head to a wide-mouthed cucurbit containing some vinegar. Set it in a sand-bath; lute on a receiver, and distil with a gentle heat for ten or twelve hours. Then take off the head: in it you will find the leaden plates covered, and, in a manner, crusted over with a white matter. This being brushed off with a hare's foot is what we call *ceruse*. The leaden plates thus cleansed may be employed again for the same purpose, till they be wholly converted into ceruse by repeated distillations. During the operation there will come over into the receiver a liquor somewhat turbid and whitish. This is a distilled vinegar in which some lead is dissolved.

Reduce a quantity of ceruse into powder; put it into a matras; pour on it twelve or fifteen times as much distilled vinegar; set the matras in a sand-bath; leave the matter in digestion for a day, shaking it from time to time: then decant your liquor, and keep it apart. Pour fresh vinegar on what is left in the matras, and digest as before. Proceed thus till you have dissolved one half, or two thirds, of the ceruse.

Evaporate to a pellicle the liquors you poured off from the ceruse, and set them in a cool place. Greyish crystals will shoot therein. Decant the liquor from the crystals; evaporate it again to a pellicle, and set it by to crystallise. Proceed thus evaporating and crystallising, as long as any crystals will shoot. Dissolve your crystals in distilled vinegar, and evaporate the solution, which will then shoot into whiter and purer crystals. This is the *salt*, or *sugar of lead*.

Lead is easily dissolved by the acid of vinegar. If it be barely exposed to the vapour of that acid, its surface is corroded, and converted into a kind of calx or white rust, much used in painting, and known by the name of *ceruse*, or *white lead*. But this preparation of lead is not combined with a sufficient quantity of acid to convert

it into a salt : it is no more than lead divided and opened by the acid of vinegar ; a matter which is to lead what verdegis is to copper. And therefore if you desire to combine ceruse with the quantity of acid necessary to convert it into a true neutral salt, you must treat it in the same manner as we did verdegis in order to procure crystals of copper ; that is, you must dissolve it in distilled vinegar, as the process directs.

The salt of lead is not very white when it first shoots ; and for this reason it is dissolved again in distilled vinegar, and crystallised a second time. If salt of lead be repeatedly dissolved in distilled vinegar, and the liquor evaporated, it will grow thick ; but still cannot be defecated without great difficulty. If the same operation be oftener repeated, this quality will be thereby more and more increased ; till at last it will remain on the fire like an oil or melted wax : it coagulates as it cools, and then looks, at first sight, like a metallic mass, somewhat resembling silver. This matter runs with a very gentle heat, almost as easily as wax.

The salt of lead hath a saccharine taste, which hath procured it the name also of sugar of lead. For this reason, when wine begins to turn sour, the sure way to cure it of that disagreeable taste, is to substitute a sweet one which is not disagreeable to the taste, by mixing therewith ceruse, litharge, or some such preparation of lead ; for the acid of the wine dissolves the lead, and therewith forms a sugar of lead, which remains mixed with the wine, and hath a taste which, joined with that of the wine, is not unpleasant. But, as lead is one of the most dangerous poisons we know, this method ought never to be practised ; and whoever uses such a pernicious drug deserves to be most severely punished. Yet some thing very like this happens every day, and must needs have very bad consequences ; while there is nobody to blame, and those to whom the thing may prove fatal can have no mistrust of it.

Salt of lead may be decomposed by distillation without additament. In order to perform this, you must put the salt of lead into a glass or stone retort, leaving a full third thereof empty, and distil in a reverberating furnace with degrees of fire. A spirit rises, which fills the receiver with clouds. When nothing more will come over with a fire that makes the retort red-hot, let the vessels cool, and then unlute them. You will find in the receiver an austere liquor, which is inflammable ; or, at least, an inflammable spirit may be obtained from it, if about one half thereof be drawn off by distillation in a glass alembic. The retort in which the salt of lead was decomposed contains, at the end of the operation, a blackish matter : this is lead, which will resume its metallic form on being melted in a crucible ; because the acid by which it was dissolved, and from which it hath been separated, being of a very oily nature, hath left in it a sufficient quantity of phlogiston.

What is most remarkable in this decomposition of salt of lead, is the inflammable spirit which it yields, though the vinegar which entered into the composition of the salt seemed to contain none at all.

### *Of the Putrid Fermentation of Vegetable Substances.*

#### *The Putrefaction of Vegetables.*

FILL a hoghead with green plants, and tread them down a little ; or, if the vegetables be dry and hard substances, divide them into minute parts, and steep them a little in water to moisten them : then leave them, or the green plants, in the vessel, uncovered and exposed to the open air. By degrees a heat will arise in the center of the vessel, which will continue increasing daily, at last grow very strong, and be communicated to the whole mass. As long as the heat is moderate, the plants will retain their natural smell and taste. As the heat increases, both these will gradually alter, and at last become very disagreeable, much like those of putrid animal substances. The plants will then be tender as if they had been boiled ; or even be reduced to a kind of pap, more or less liquid according to the quantity of moisture they contained before.

Almost all vegetable matters are susceptible of putrefaction ; but some of them rot sooner, and others more slowly. As putrefaction is only a species of fermentation, the effect whereof is to change entirely the state of the acid, by combining it with a portion of the earth and oil of the mixt, which are so attenuated that from this union there results a new saline substance in which no acid is discernible ; which on the contrary hath the properties of an alkali, but rendered volatile ; it is plain, that, the nearer the acid of a plant set to putrefy is to this state, the sooner will the putrefaction of that plant be completed. Accordingly all plants that contain a volatile alkali ready formed, or from which it can be obtained by distillation, are the most disposed to putrefaction.

Those plants, in which the acid is very manifest and sensible, are less apt to putrefy ; because all their acid must undergo the change above specified. But vegetable matters, whose acid is entangled and clogged by several of their other principles, must be still longer elaborated before they can be reduced to the condition into which complete putrefaction brings all vegetables. The earthy and oily parts, in which the acids of these substances are sheathed, must be attenuated and divided by a previous fermentation, which, of those parts subtilised and united with the acid, forms an ardent spirit, wherein the acid is more perceptible than in the almost insipid or saccharine juices out of which it is produced. The acid contained in the ardent spirit must be still further disengaged, before it can enter into the combination of a volatile alkali : consequently the ardent spirit must undergo a sort of decomposition ; its acid must be rendered more sensible, and be brought to the same condition as the acid of plants in which it manifests all its properties.

Hence it appears that the spirituous and acetous fermentations are only preparatives which nature makes use of for bringing certain vegetable matters to putrefaction. These fermentations therefore must be considered as ad-

vanquished.

vances towards that putrefaction in which they terminate, or rather as the first stages of putrefaction itself.

*Putrefied Vegetable Substances analysed.*

Put the putrefied plants you mean to analyse into a glass cucurbit, and set it in a sand-bath. Fit to it a head; lute on a receiver; distil with a gentle fire, and a limpid fetid liquor will come over. Continue the distillation till the matter contained in the retort be almost dry.

Then unlute your vessels, and keep the liquor you find in the receiver by itself. Put the matter remaining in the cucurbit into a retort, and distil with a graduated heat. There will rise white vapours; a pretty considerable quantity of liquor nearly like that of the former distillation; a volatile salt in a concrete form; and a black oil, which towards the end will be very thick. In the retort there will remain a black charred matter, which being burnt in the open air will fall into ashes, from which no fixed alkali can be extracted.

By means of a funnel separate your oil from the aqueous liquor. Distil this liquor with a gentle heat. You will by this means obtain a volatile salt like that of animals; of which you may also get some, by the same means, from the liquor which came over in the first distillation.

This analysis shews the changes which putrefaction produces in vegetable matters. Scarce any of their principles are now to be discerned. They now yield no aromatic liquor; no essential oil; no acid; and consequently no essential salt, ardent spirit, or fixed alkali: in a word, whatever their natures were before putrefaction, they are all alike when they have once undergone this fermentative motion in its full extent. Nothing can then be obtained from them but phlegm, a volatile alkali, a fetid oil, and an insipid earth.

Almost all these changes are owing to the transmutation of the acid, which is depraved by putrefaction, and combined with a portion of the oil and subtilised earth of the mixt; so that the result of their union is a volatile alkali. Now, as the fixed alkali, found in the ashes of unputrefied plants, is only the most fixed part of their earth and of their acid, closely united together by the igneous motion, it is not surprising, that, when all the acid, with a part of the earth, is subtilised and volatilised by putrefaction, no fixed alkali can be found in the ashes of putrefied vegetables. The alteration which the acid suffers by the putrefactive motion is, in our opinion, the greatest it can undergo, without being entirely destroyed and decomposed, so as to be no longer a salt.

*Of Operations on ANIMAL SUBSTANCES.*

*Of MILK.*

*Milk separated into Butter, Curd, and Whey: instanced in Cow's-Milk.*

Put new cow's milk into a flat earthen pan, and set it in a temperate heat. In ten or twelve hours time there will gather on its surface a thick matter, of a somewhat

yellowish white: this is called *cream*. Gently skim off this cream with a spoon, letting the milk you take up with it run off. Put all this cream into another vessel, and keep it. The milk thus skimmed will not be quite so thick as before; nor will it be of such a dead white, but have a little bluish cast. If all the cream be not separated from it, more will gather on its surface after some time, which must be taken off as the former. In two or three days the skimmed milk will coagulate into a soft mass called *curd*, and then it tastes and smells sour.

Cut this curd across in several places. It will immediately discharge a large quantity of *serum*. Put the whole into a clean linen cloth; hang it up, and underneath it set a vessel to receive the serum as it drops. When the aqueous part hath done dripping, there will remain in the filter a white substance somewhat harder than the curdled milk. This substance is called *cheese*, and the *serum* separated from it is known by the name of *whey*.

The milk of animals that feed only on vegetables is, of all animal matters, the least removed from the vegetable nature. The truth of this will be demonstrated by the experiments we shall produce by and by, for the further analysis of milk.

Most chemists justly consider milk as of the same nature with chyle. Indeed there is great reason to think, that, except some small differences to be afterwards taken notice of, these two matters are nearly the same. They are both of a dead white colour, like that of an emulsion; which proves that, like emulsions, they consist of an oily matter divided, diffused and suspended, but not perfectly dissolved, in an aqueous liquor.

It is not surprising that these liquors should resemble emulsions; for they are produced in the same manner, and may very justly be called *animal emulsions*. For how are vegetable substances converted into chyle and milk in an animal body? They are bruised, divided, and triturated by mastication and digestion, as perfectly, at least, as the matters pounded in a mortar to make an emulsion; and must thereby undergo the same changes as those matters; that is, their oily parts, being attenuated by those motions, must be mixed with and lodged between the aqueous parts, but not dissolved therein; because they do not, in the bodies of animals, meet with saline matters, sufficiently disentangled and active, to unite intimately with them, and by that means render them soluble in water.

Nevertheless, chyle and milk, though produced in the same manner as emulsions, and very much resembling them, differ greatly from them in some respects; owing chiefly to the time they remain in the bodies of animals, their being heated while there, the elaborations they undergo therein, and the animal juices commixed with them.

New milk hath a mild agreeable taste, without any saline pungency; nor hath any chemical trial discovered in it either an acid or an alkali. Yet it is certain, that the juices of plants, out of which milk is formed, contain many saline matters, and especially acids: accordingly milk also contains the same; but the acids are so sheathed and combined, that they are not perceptible. The case is

is the same with all the other liquors intended to constitute part of an animal body: there is no perceptible acid in any of them.

Hence it may be inferred, that one of the principal changes which vegetables undergo, in order to their being converted into an animal substance, consists in this, that their acids are combined, entangled, and sheathed in such a manner, that they become imperceptible, and exert none of their properties.

Milk left to itself, without the help of distillation, or any additament whatever, undergoes a sort of decomposition. It runs into a kind of spontaneous analysis; which doth not indeed reduce it to its first principles, yet separates it into three distinct substances, as the process shews; namely, into cream, or the buttery fat part, into curd or cheese, and into serum or whey: which shews, that those three substances of which milk consists, are only mixed and blended together, but not intimately united.

The first parts, being the lightest, rise gradually to the surface of the liquor as they separate from the rest: and this forms the cream.

Cream, as skimmed from the surface of milk, is not however the pure buttery or fat part; it is still mixed with many particles of cheese and whey, which must be separated in order to reduce it into butter. The most simple, and at the same time the best method of effecting this, is daily practised by the country people. It consists in beating or churning the cream, in a vessel contrived for that purpose, with the flat side of a circular piece of wood, in the centre of which a staff is fixed. One would think that the motion, impressed on the cream by this instrument, should rather serve to blend more intimately the particles of butter, cheese, and whey, of which it consists, than to separate them from each other; as this motion seems perfectly adapted to divide and attenuate those particles. But, if we consider what passes on this occasion, we shall soon perceive that the motion by which butter is churned is nothing like triture: for churning is no other, properly speaking, than a continually repeated compression, the effect whereof is to squeeze out from amongst the buttery particles those of cheese and whey mixed therewith; by which means the particles of butter are brought into contact with each other; unite, and adhere together.

Milk, whether skimmed or no, grows sour of itself, and curdles in a few days. When it is newly curdled, the cheese and whey seem to be united, and to make but one mass: but these two matters separate spontaneously from each other, with the greatest ease, and in a very short time.

The acidity, which milk naturally contracts in the space of a few days, must be considered as the effect of a fermenting motion, which discovers in that liquor an acid that was not perceptible before. This, properly speaking, is an acetous fermentation, which milk passes through in its way to putrefaction; and it soon follows, especially if the milk be exposed to a hot air.

If, instead of leaving milk to grow sour and curdle of itself, an acid be mixed therewith, while it is yet sweet and newly milked, it immediately coagulates; which

gives reason to think, that its curdling naturally is the effect of the acid, which discovers itself therein as it grows stale.

The coagulation of milk may also be considerably accelerated, by setting it in a sand-bath gently heated; or by mixing therewith a little of what, in the language of the dairy, is called *runnet*; which is nothing but some curdled and half-digested milk taken from the stomach of a calf: or both these methods may be employed at once, which will produce the effect still more expeditiously.

It is not difficult to find out the cause of these effects. The runnet, which is milk already curdled and grown sour, is an actual ferment to sweet milk, disposing it to turn sour much more readily: for though milk, when thus hastily curdled by the runnet, hath not a manifestly acid taste, yet it is certain that this acid begins to exert itself. The proof thereof is, that, being exposed to the same degree of heat with milk equally new, that is not mixed with this ferment, it turns sour much sooner. As to the effect of heat in coagulating milk, there is nothing extraordinary in it: we know how much it promotes and accelerates all fermentative motion. The whole of this perfectly agrees with what we said before concerning fermentation.

Fixed alkalis also coagulate milk; but at the same time they separate the whey from the cheese, which floats on the liquor in cloats. They give the milk a russet colour inclining to red; which may arise from their attacking the fat part.

The separation of milk into butter, cheese, and whey, is a kind of imperfect analysis thereof, or rather the beginning of one. In order to render it complete, we must examine each of these substances separately, and find the principles of which they consist. This we shall endeavour to do in the following process.

#### *Butter analysed by Distillation.*

Into a glass retort put the quantity of fresh butter you intend to distil. Set the retort in a reverberatory; apply a receiver; and let your fire be very gentle at first. The butter will melt, and there will come over some drops of clear water, which will have the peculiar smell of fresh butter, and shew some tokens of acidity. If the fire be increased a little, the butter will seem to boil: a froth will gather on its surface, and the phlegm, still continuing to run, will gradually come to smell just like butter clarified in order to be preserved. Its acidity will be stronger and more manifest than that of the first drops that came over.

Soon after this, by increasing the fire a little more, there will rise an oil, having nearly the same degree of fluidity as fat oils; but it will grow thicker as the distillation advances, and at last will fix in the receiver when it cools. It will be accompanied with some drops of liquor, the acidity whereof will always increase, while its quantity decreases, as the distillation advances.

While this thick oil is distilling, the butter contained in the retort, which at first seemed to boil, will be calm and smooth, without the least appearance of ebullition; though the heat be then much greater than when it boiled. Continue the distillation, constantly increasing the fire

fire by degrees as you find it necessary for the elevation of the thick oil. This oil, or rather this kind of butter, will be at last of a russet colour. There will rise along with it some white vapours exceeding sharp and pungent.

When you observe that nothing more comes over, though the retort be quite red-hot, let the vessels cool, and unlute them. You will find in the receiver an aqueous acid liquor, a fluid oil, and a kind of fixed brown butter. Break the retort, and you will find therein a kind of charred matter; the surface of which, where it touched the glass, will be of a shining black, and have a fine polish.

The analysis of butter proves, that this substance, which is an oily matter in a concrete form, owes its consistence to the acid only, with which the oily part is combined: that is, it follows the general rule frequently mentioned above in treating of other oily compounds; the consistence whereof we shewed to be so much the firmer, the more acid they contain. The first portions of oil that come over in the distillation of butter are fluid, because a pretty considerable quantity of acid rose before them, which, being mixed with the phlegm, gives it the acidity we took notice of.

This oil, being freed from its acid, and by that means rendered fluid, rises first; because it is by the same means rendered lighter. The kind of butter that comes over afterwards, though it be fixed, is nevertheless far from having the same consistence as it had before distillation; because it loses much of its acid in the operation. This acid is what rises in the form of white vapours. These vapours are at least as pungent and irritating as the sulphureous acid or volatile alkalis: but their smell is different: it hath a resemblance, or rather is the same, with that which rises from butter when it is burnt and browned in an open vessel. But, when concentrated and collected in close vessels, as in the distillation of butter, they are vastly stronger: they irritate the throat so as to inflame it; they are exceeding sharp and pungent to the smell, and are so hurtful to the eyes that they quickly inflame them, as in an ophthalmia, and make them shed abundance of tears. The great volatility of this acid is entirely owing to a portion of the phlogiston of the butter with which it is still combined.

We took notice in the process, that butter seems to boil with a very moderate heat at the beginning of the distillation, and that in the course of the operation the ebullition ceases entirely, though the heat be then greatly increased; which is contrary to the general rule. The reason is, that butter, though a seemingly homogeneous mass, contains nevertheless some particles of cheese and whey. The particles of whey, being much the lightest, endeavour, on the first application of heat, to extricate themselves from amongst the particles of butter, and to rise in distillation. Thus they form the drops of acidulated phlegm which come over at first, and, in struggling to get free, lift up the buttery parts, or actually boil, which occasions the ebullition observable at the beginning of the process. When they are once separated, the melted butter remains calm and smooth, without boiling. If you want to make it boil, you must apply a much greater degree of heat; which you cannot do in close

vessels, without spoiling the whole operation: because the degree of heat necessary for that purpose would force up the butter in substance, which would rush over into the receiver, without any decomposition. Indeed if the vessels were luted, they would be in danger of bursting.

As to the caseous parts, which are mixed with fresh butter, they also separate at the beginning of the distillation when the butter is melted, and gather on its surface in a scum. These particles of cheese and whey, which are heterogeneous to butter, help to make it spoil the sooner. And for this reason, those who want to keep butter a long time, without the use of salt, melt it, and thereby evaporate the aqueous parts. The lightest portion of the particles of cheese rises to the surface, and is skimmed off; the rest remains at the bottom of the vessel, from which the butter is easily separated, by decanting it while it is yet fluid.

Butter may also be distilled, by incorporating it with some additament which will yield no principle itself, nor retain any of those of the butter. It may be distilled in this manner with the additament of fine sand: the operation succeeds very well, is sooner finished, and more easily conducted.

If you desire to convert the butter wholly into oil, you must take the fixed matter you find in the receiver, and distil it once more, or oftener, according to the degree of fluidity you want to give it. The case is the same with this matter as with all other thick oils, which, the oftener they are distilled, grow always the more fluid, because in every distillation they are separated from part of the acid, to which alone they owe their consistence.

#### *The Curd of Milk analysed by Distillation.*

INTO a glass retort put some new curd having first drained it thoroughly of all its whey, and even squeezed it in a linen cloth to express all its moisture. Distil it as you did butter. There will come over at first an acidulated phlegm, smelling like cheese or whey. As the distillation advances, the acidity of this phlegm will increase.

When it begins to run but very slowly, raise your fire. There will come over a yellow oil, somewhat empyreumatic. Continue the distillation, still increasing the fire by degrees as occasion requires. The oil and acid phlegm will continue to rise; the phlegm growing gradually more acid, and the oil deeper coloured and more empyreumatic. At last, when the retort is almost red-hot, there comes off a second black oil, of the consistence of turpentine, very empyreumatic, and so heavy as to sink in water. In the retort will be left a considerable quantity of charred matter.

Cheese-curd barely drained, till no more whey will drip from it, is not entirely freed thereof; and for this reason we directed it to be pressed in a linen cloth, before it be put into the retort to be distilled. Without this precaution, the remaining whey would rise in a considerable quantity on the first application of heat; and, instead of analysing the curd only, we should at the same time analyse the whey also. This is to be understood of green curd and new-made cheese; for, if it be suffered to grow

old, it will at length dry of itself: but then we should not obtain from it the same principles by distillation; as it corrupts and begins to grow putrid after some time, especially if it be not mixed with some seasoning to preserve it.

The first phlegm that rises in this distillation, as in that of butter, is a portion of the whey that was left in the cheese, notwithstanding its being well pressed. This phlegm grows gradually more acid, being the vehicle of the acids of the cheese, which are forced up along with it by the fire.

The acid obtained from this matter is less in quantity, and weaker, than that of butter: and accordingly the oil distilled from cheese is not fixed like that of butter. Yet it is remarkable that the last empyreumatic oil, which is as thick as turpentine, is heavier than water: a property which it probably derives from the quantity of acid it retains.

The quantity of charred matter, which remains in the retort after the distillation of cheese, is much greater than that left by butter: which proves that the former contains a much greater quantity of earth.

#### *Whey analysed.*

EVAPORATE two or three quarts of whey almost to dryness in a *balneum marie*; and distil the extract or residuum in a retort set in a reverberating furnace, with degrees of fire, according to the general rule. At first some phlegm will come over; then a lemon-coloured acid spirit; and afterwards a pretty thick oil. There will remain in the retort a charred matter, which being exposed to the air grows moist. Lixivate it with rain water, and evaporate the lixivium; it will yield you crystals of sea-salt. Dry the charred matter, and burn it in the open air with a strong fire, till it be reduced into ashes. A lixivium of these ashes will shew some tokens of a fixed alkali.

It will appear, on examining the three analyses of the substances whereof milk consists, that none of them yields a volatile alkali: which is worthy of notice; as it is the only animal matter from which such a salt cannot be obtained. It is true, the milk of animals that feed on vegetables may be considered as an intermediate liquor between vegetable and animal substances; as an imperfect animal-juice, which still retains much of the vegetable nature: and we actually find, that milk almost always hath, at least in part, the properties of those plants with which the animals that yield it are fed. Yet, as it cannot be formed in the body of the animal, without mixing with several of its juices that are entirely perfected, and become purely animal, it must appear strange that the analysis thereof should not afford the least vestige of that principle, which all other animal-matters yield in the greatest plenty.

The reason of this may be found in the use to which milk is destined. It is intended for the nourishment of animals of the same species with those in whose bodies it is produced. Consequently it ought as much as possible to resemble the juices of the food which is proper for those animals. Now, as animals that live only on

vegetables could not be properly nourished by animal matters, for which nature itself hath even given them an aversion, it is not surprising that the milk of such animals should be free from any mixture of such things as are unsuitable to the young ones whom it is designed to nourish. There is reason therefore to think, that nature hath disposed the organs in which the secretion of milk is performed, so as to separate it entirely from all the animal juices first mixed with it: and this is the principal difference between milk and chyle; the latter being necessarily blended with the saliva, the gastric and pancreatic juices, the bile and lymph, of the animals in which it is formed. Hence it may be concluded, that, if a quantity of chyle could be collected sufficient to enable us to analyse it, the analysis thereof would differ from that of milk, in this chiefly, that it would yield a great deal of volatile alkali, of which milk, as hath been said, yields none at all.

The same thing probably takes place in carnivorous animals. It is certain, that those animals chuse to eat the flesh of such others only as feed upon vegetables; and that nothing but extreme hunger, and the absolute want of more agreeable food, will force them to eat the flesh of other carnivorous animals. Wolves, which greedily devour sheep, goats, &c. seldom eat foxes, cats, polecats, &c. though these animals are not strong enough to resist them. Foxes, cats, and birds of prey, that make such terrible havoc among wild-fowl, and other sorts of game, do not devour one another. This being laid down, there is reason to think, that the milk of carnivorous animals is something of the nature of the flesh of those animals that feed on vegetables, and which they chuse to eat, and not of the nature of their own flesh; as the milk of animals that feed on vegetables is analogous to the juices of vegetables, and when analysed yields no volatile alkali, though every other part of their body does.

But whatever be the nature of milk, and of whatever ingredients it be formed, it always contains the three several substances above mentioned; namely, the fat, or buttery part, properly so called, the cheesy, and the ferrous part, the last of which we are now to examine. It is, properly speaking, the phlegm of the milk, and consists almost entirely of water. For this reason it is proper to lessen the quantity thereof considerably by evaporation, so that its other principles, being concentrated and brought nearer together, may become much more sensible. There is no danger of losing any essential part of the whey in the evaporation, if it be performed in the *balneum marie* with such a gentle heat as may carry off the aqueous parts only: this greatly shortens the analysis, which will be exceeding long and tedious if all the water be distilled off in close vessels.

As whey is chiefly the aqueous part of milk, as said above, it must contain all the principles thereof that are soluble in water; that is, its saline and saponaceous parts. And accordingly the analysis thereof shews that it contains an oil, rendered perfectly saponaceous by an acid; that is, made perfectly miscible with water. This quality of the oil contained in whey appears from the perfect transparency of that liquor, which we know is the

the mark of a complete dissolution. In the distillation of whey, the saponaceous matter contained therein is decomposed; the saline part rises first, as being the lightest; this is the acid taken notice of in the process; after which the oil, now separated from the principle which rendered it miscible with water, comes over in its natural form, and doth not afterwards mix with the aqueous part.

Besides the saponaceous matter, whey contains also another saline substance; namely, sea-salt: this is obtained by lixiviating the *caput mortuum* left in the retort, which, because of its fixedness, cannot rise with the other principles in distillation. To this salt it is owing that what remains in the retort after distillation grows moist in the air; for we know that sea-salt thoroughly dried hath this property.

The fixed alkaline salt, obtained from the *caput mortuum* burnt to ashes, proves that milk still retains something of the vegetable nature: for the following analysis will shew us that matters purely animal yield none at all.

#### *Of the Substances which compose an Animal Body.*

##### *Blood analysed. Instanced in Bullock's Blood.*

In a *balneum marie* evaporate all the moisture of the blood that the heat of boiling water will carry off. There will remain an almost dry matter. Put this dried blood into a glass retort, and distil with degrees of heat, till nothing more will come over, even when the retort is quite red-hot, and ready to melt. A brownish phlegm will rise at first: this will soon be impregnated with a little volatile alkali, and then will come over a yellow oil, a very pungent volatile spirit, a volatile salt in a concrete form, which will adhere to the sides of the receiver; and, at last, a black oil, as thick as pitch. There will be left in the retort a charred matter, which being burnt yields no fixed alkali.

Blood, which is carried by the circulation into all the parts of the animal body, and furnishes the matter of all the secretions, must be considered as a liquor consisting of almost all the fluids necessary to the animal machine: so that the analysis thereof is a sort of general though imperfect analysis of an animal.

Blood drawn from the body of an animal, and set by in a vessel, coagulates as it grows cold; and sometimes afterwards the *coagulum* discharges a yellowish *serum* or lymph; and in the midst thereof swims the red part, which continues curdled. These two substances, when analysed, yield nearly the same principles; and in that respect seem to differ little from each other. Though the serum of blood be naturally in a fluid form, yet it hath also a great tendency to coagulate; and a certain degree of heat applied to it, either by water or by a naked fire, will curdle it. Spirit of wine mixed with this liquor produces on it the same effect as heat.

Blood, while circulating in the body of a healthy animal, and when newly taken from it, hath a mild taste, which discovers nothing like either an acid or an alkali; nor doth it shew any sign of either the one or the other

in chemical trials. When tasted with attention, it betrays something like a savour of sea-salt; because it actually contains a little thereof, which is found in the charred matter left in the retort after the distillation, when carefully examined.

We shewed that milk also contains a little of this salt. It enters the bodies of animals with the food they eat; which contains more or less thereof according to its nature. It plainly suffers no alteration by undergoing the digestions, and passing through the strainers, of the animal body. The case is the same with the other neutral salts which have a fixed alkali for their basis: we find them unchanged in the juices of animals into whose bodies they have been introduced. They are incapable of combining, as acids do, with the oily parts; and so are dissolved by the aqueous fluids, of which nature makes use to free herself from those salts, and discharge them out of the body.

Blood, like all other animal-matters, is, properly speaking, susceptible of no fermentation but that of putrefaction. Yet it turns somewhat sour before it putrefies. This small degree of acetous fermentation is most sensible in flesh; and especially in the flesh of young animals, such as calves, lambs, chickens, &c.

The quantity of pure water, which blood, in its natural state, contains, is very considerable, and makes almost seven eighths thereof. If it be distilled, without being first dried, the operation will be much longer; because it will be necessary to draw off all this insipid phlegm with a gentle fire. There is no reason to apprehend that, by drying blood in open vessels as directed, any of its other principles will be carried off with its phlegm: for it contains no other substance that is volatile enough to rise with the warmth of a *balneum marie*. This may be proved by putting some undried blood into a glass cucurbit, fitting thereto a head and receiver, and distilling, in a *balneum marie*, all that the heat of the bath, not exceeding the heat of boiling water, will raise: for, when nothing more will come over, you will find in the receiver an insipid phlegm only, scarce differing from pure water, except in having a faint smell like that of blood; wherein it resembles all the phlegms that rise first in distillation, which always retain something of the smell of the matters from which they were drawn. That part of the blood, which remains in the cucurbit after this first distillation, being put into a retort, and distilled with a stronger fire, yields exactly the same principles, and in the same proportion, as blood dried in open vessels in the *balneum marie*: so that, if this phlegm of blood contains any principles, the quantity thereof is so small as to be scarce perceptible.

The volatile alkali that rises with the oil, when blood is distilled in a retort with a degree of heat greater than that of boiling water, is either the production of the fire, or arises from the decomposition of an ammoniacal salt of which it made a part. For we shall see, when we come to treat of this saline substance, that it is so extremely volatile as to exceed, in that respect, almost all other bodies that we know: and therefore if this volatile alkali pre-existed formerly in the blood, uncombined with any other matter capable, in some measure,

of

of fixing it, it would rise at first almost spontaneously, or at least on the first application of the gentlest heat. We have an instance of this in blood, or any other animal-matter, that is perfectly putrefied; which containing a volatile alkali, either formed or extricated by putrefaction, lets go this principle when distilled, even before the first phlegm: and, for this reason, when putrefied blood is to be analysed, it must by no means be dried, like fresh blood, before distillation; for all the volatile alkali would by that means be dissipated and lost at once.

Though blood and other animal-matters afford no fixed alkali, but, on the contrary, yield much volatile alkali, it doth not therefore follow that all the acid, which those substances contained before they were analysed, is employed in the production of a volatile alkali.

*Flesh analysed. Instanced in Beef.*

INTO an alembic or retort, placed in a sand-bath, put some lean beef, from which you have carefully separated all the fat. Distil till nothing more will rise. In this first distillation a phlegm will come over, weighing at least half the mass of the distilled flesh. In the retort you will find a matter almost dry, which you must afterwards distil with a naked fire in a reverberating furnace, taking the usual precautions. There will come over at first a little phlegm replete with volatile alkali; then a volatile alkali in a dry form, which will stick to the sides of the vessel; and also a thick oil. After the distillation there will be left in the retort a black, shining, light coal. Burn it to ashes in the open air, and lixiviate those ashes: the water of the lixivium will have no alkaline property, but will shew some tokens of its containing a little sea-salt.

The flesh of an animal, as appears from the process, yields much the same principles with its blood: and it cannot be otherwise; because it is formed altogether of materials furnished by the blood.

*Bones analysed. Instanced in Ox-Bones.*

CUT into pieces the bones of a leg of beef, carefully separating all the marrow. Put them into a retort, and distil them in a reverberating furnace as usual. A phlegm will come over first; then a volatile spirit, which will become stronger and stronger; afterwards a volatile salt in a dry form, with some oil; and, lastly, a black oil, with a little more volatile salt. There will be left in the retort a charred matter, from which a little sea-salt may be extracted. Reduce this charred matter to ashes, by burning it in the open air. These ashes will give some slight tokens of a fixed alkali.

The analysis of bones proves, that they consist of the same principles with flesh and blood; and the same may be said in general of all matters that are truly animal, that actually constitute any part of an animal.

*Animal Fat Analysed. Instanced in Mutton-Suet.*

PUT as much mutton-suet as you please into a glass retort, only taking care that the vessel be but half full; and distil with degrees of fire as usual. A phlegm smel-

ling of the suet will rise first, and soon grow very acid. After this some drops of oil will come over, and be followed by a matter like oil, in appearance, when it comes over; but it will fix in the receiver, and acquire a consistence somewhat softer than suet. This kind of butter of suet will continue to rise to the end of the distillation; and there will be left in the retort a small quantity of charred matter.

*Eggs analysed. Instanced in Pullet's Eggs.*

PUT some hens eggs in water, and boil them till they be hard. Then separate the yolks from the whites. Cut the whites into little bits; put them into a glass cucurbit; fit on a head and receiver; distil in a *balneum marie* with degrees of fire, raising it towards the end to the strongest heat which that bath can give; that is, to the heat of boiling water. There will come over an aqueous liquor, or insipid phlegm; the quantity whereof will be very considerable, seeing it will make about nine tenths of the whole mass of the whites of the eggs. Continue your distillation, and keep the water in the bath constantly boiling, till not a drop more of liquor will ascend from the alembic. Then unlute your vessels. In the cucurbit you will find your whites of eggs considerably shrunk in their bulk. They will look like little bits of brown glass, and be hard and brittle.

Put this residuum into a glass retort, and distil, as usual, in a reverberating furnace with degrees of heat. There will come over a volatile oily spirit, a yellow oil, a volatile salt in a dry form, and, at last, a black thick oil. There will be left in the retort a charred matter.

Reduce also into the smallest pieces you can the hard yolks of the eggs which you separated from the whites. Set them in a pan over a gentle fire: stir them with a stick till they turn a little brown, and discharge a substance like melted marrow. Then put them into a new, strong, canvas bag, and press them between two iron plates well heated; whereby you will obtain a considerable quantity of a yellow oil.

Let what remains in the bag be distilled in a retort set in a reverberating furnace: it will give you the same principles as you got from the whites.

Of the two perfectly distinct substances that constitute the egg, the yolk contains the embryo of the chick, and is destined to hatch it: the white is to serve for the nourishment of the chick when it is formed.

These two matters, though they contain the very same principles, yet differ considerably from each other; and chiefly in this, that their principles are not in the same proportions.

The white of an egg contains so much phlegm, that it seems to consist almost totally thereof. All the aqueous liquor, obtained by distilling it in the *balneum marie*, is, properly speaking, nothing but pure water; for no chemical trial can discover in it either an acid or a volatile alkali; or any very perceptible oily part. And yet it must contain some oil, because the liquor that rises last is a little bitterish to the taste, and smells somewhat of empyreuma. But the principles from which it derives these properties are in too small quantities to be distinctly perceived.

If, instead of distilling the hard white of an egg, with a view to draw off the great quantity of water it contains, you leave it some time in an air that is not too dry, the greatest part of its moisture separates spontaneously, and becomes very sensible. In all probability this is the effect of a beginning putrefaction, which attenuates this substance, and breaks its contexture. The liquor thus discharged by the white of an egg thoroughly dissolves the gum-resins, and particularly myrrh. If you desire to dissolve myrrh in this manner, cut a hard-boiled egg in halves; take out the yolk; put the powdered gum-resin into the cavity left by the yolk; join the two halves of the white; fasten them together with a thread, and hang them up in a cellar. In a few days time the myrrh will be dissolved by the moisture that issues from the white of the egg, and will drop into the vessel placed underneath to receive it. This liquor is improperly called *oil of myrrh per deliquium*.

All the properties of the whites of eggs, as well as the principles obtained by analysing them, are the same with those of the lymphatic part of the blood; so that there is a great resemblance between these two substances.

As to the yolk, it is plain from its analysis, that oil is the predominant principle thereof. If the yolk of an egg be mixed with water, the oil with which it is replete, and which is by nature very minutely divided, diffuses easily through the whole liquor, and remains suspended therein by means of its viscosity. The liquor at the same time becomes milk-white like an emulsion, and is in fact a true animal emulsion.

In order to obtain the oil of eggs by expression with the more ease, care must be taken to chuse eggs that are seven or eight days old; because they are then a little less viscous. Nevertheless their viscosity is still so great, that they will not easily yield their oil by expression: and therefore, in order to attenuate and destroy entirely this viscosity, they must be torrefied before they are put to be pressed.

The oil of eggs, like all other oily animal matters, seems analogous to the fat oils of vegetables. It hath all the properties that characterise those oils. Its colour is yellow, and it smells and tastes a little of the empyreuma, occasioned by torrefying the yolks. It is rendered somewhat less disagreeable by being exposed to the dew for thirty or forty nights, if care be taken to stir it often in the mean time.

To conclude: all the principles both in the yolk and the white of an egg are the same as those found in blood, flesh, and all other matters that are perfectly animal.

### *Of the Excrements of Animals.*

*Dung analysed. Instanced in human Excrements.  
Mr Homberg's Phosphorus.*

TAKE any quantity you please of human excrement, and distil it in a glass alembic set in the *balneum marie*. You will obtain an aqueous, clear, insipid liquor; which will nevertheless have a disagreeable odour. Having urged the distillation as far as is possible with the heat of

VOL. II. No. 37.

this bath, unlute your vessels, and you will find at the bottom of the cucurbit a dry matter, making about an eighth part only of what you put into it. Put this residuum into a glass retort, and distil in a reverberating furnace, with degrees of heat. You will obtain a volatile spirit, and a volatile salt, with a fetid oil; and a charred matter will be left in the retort.

This substance, consisting of matters subject to putrefaction, hath constantly a fetid smell, like that of all putrid matters; having been for some time confined in a warm, moist place, which we know promotes putrefaction, and even quickly produces it. Yet the analysis thereof proves that it is not putrefied, or at least not entirely so: for all putrefied matters contain a volatile alkali perfectly formed and extricated; and, as this principle rises with less heat than that of boiling water, it always comes over first in distillation. Now we have seen that, with the heat of boiling water, it parts with nothing but an insipid phlegm, containing no volatile alkali: a sure proof that the fecal matter is not completely putrefied.

One of the methods by which Mr Homberg endeavoured to obtain from excrement a clear oil, without any bad smell, was to separate its earthy and gross parts, by filtering it before he distilled it. "For this purpose he diluted excrement newly discharged with hot water, using a quart of water to an ounce of feces. Then he let the mixture stand to cool, and the gross parts falling to the bottom, he poured off the water by inclination. This liquor he filtered through brown paper, and evaporated to a pellicle over a gentle fire. There shot in it long crystals of four, five, and six sides, which Mr Homberg thinks may be called the essential salt of excrement. They resemble salt-petre, in some measure, and desagrate in the fire much like it; with this difference, that their flame is red, and they burn slowly; whereas the flame of salt-petre is white and very vivid: probably, says Mr Homberg, because there is too much of an oily matter in the one, and less in the other.

"Mr Homberg distilled this salt in a glass retort with degrees of fire, and at last with a very violent one. At first there came over an aqueous liquor, sharp and acid, which was followed by a brown fetid oil, smelling very strong of empyreuma. This distillation he attempted four several times; and each time the matter in the retort took fire, just when the oil began to come off."

The salt which Mr Homberg obtained from excrement is very remarkable. Its nitrous character is by no means ambiguous: its desagrating on live coals convinced Mr Homberg of its being a true nitre. But its constantly taking fire in the retort, as oft as distilled, is a sure proof that it is a nitrous salt: for nitre only hath the property of thus taking fire in close vessels, and making other combustible matters burn along with it.

The process, by which Mr Homberg at last obtained from excrement a clear oil without any bad smell, is curious, and worthy of a place here, on account of the views and occasions of reflection which it may open.

"Mr Homberg having tried in vain, by distilling excrement a great many different ways, to obtain from it such an oil as he wanted, resolved to employ fermentation,

†

2.Y tion,

tion, the effect whereof is to change the disposition of the principles of mixts. With this view he dried some excrement in the water-bath, and, having pulverised it, poured thereon six times its weight of phlegm that had been separated from it by distillation, and put the whole into a large glass cucurbit, covered with an inverted vessel that fitted exactly into it, and was close luted. This vessel he set in a *balneum marie* for six weeks, keeping up such a gentle heat as would not burn one's hand; after which he uncovered the cucurbit, and having fitted thereto a head and a receiver, distilled off all the aqueous moisture in the *balneum marie* with a very gentle heat. It had now lost almost all its bad smell, which was changed into a faint one. It came over somewhat turbid, whereas it was very clear when put into the cucurbit. Mr Homberg found this water to have a cosmetic virtue: he gave some of it to persons whose complexion, neck, and arms, were quite spoiled, being turned brown, dry, rough, and like a goose skin: they washed with it once a day, and, by continuing the use of this water, their skin became very soft and white.

"The dry matter left in the cucurbit after the first distillation, had not the least smell of feces: on the contrary, it had an agreeable aromatic odour; and the vessel in which Mr Homberg had digested it, being left open in a corner of his laboratory, acquired in time a strong smell of ambergris. It is surprising, as Mr Homberg justly observes, that digestion alone should change the abominable smell of excrement into an odour as agreeable as that of ambergris.

"This dry matter he powdered coarsely, and put two ounces thereof at once into a glass retort that would hold about a pound or a pound and a half of water. This he distilled in a sand-bath with a very gentle heat. A small quantity of an aqueous liquor came over first, and then an oil as colourless as spring-water. Mr Homberg continued the same gentle degree of heat till the drops began to come off a little redish; and then he changed the receiver, stopping that which contained the clear oil very close with a cork. Having carried on the distillation with a fire gradually augmented, there came over a considerable quantity of red oil; and there remained in the retort a charred matter which burnt very readily."

The clear oil, without any ill smell, which Mr Homberg obtained from the fecal matter by this process, was the very thing he was in search of, and which he had been assured would convert mercury into fine fixed silver; yet he ingenuously owns, that, whatever way he applied it, he could never produce any change in that metallic substance. We shall now proceed to the other discoveries made by Mr Homberg on this occasion.

In his attempt to obtain a clear oil from excrement, he distilled it with different additaments, and amongst the rest with vitriol and alum. He found that the matters left in the retort, when he made use of these salts, being exposed to the open air, took fire of themselves; that they kindled combustible matters; in a word, that they were a true phosphorus, of a species different from all then known. Pursuing these first hints, he sought and found the means of preparing this phosphorus by a way

much more expeditious, certain, and easy. His process is this.

"Take four ounces of feces newly excreted: mix therewith an equal weight of roch alum coarsely powdered: put the whole into a little iron pan that will hold about a quart of water, and set it over a gentle fire under a chimney. The mixture will melt, and become as liquid as water. Let it boil with a gentle fire, constantly stirring it, breaking it into little crumbs, and scraping off with a spatula whatever sticks to the bottom or sides of the pan, till it be perfectly dry. The pan must from time to time be removed from the fire, that it may not grow red hot; and the matter must be stirred, even while it is off the fire, to prevent too much of it from sticking to the pan. When the matter is perfectly dried, and in little clots, let it cool, and powder it in a metal mortar. Then put it again into the pan, set it over the fire and stir it continually. It will again grow a little moist, and adhere together in clots, which must be continually roasted and bruised till they be perfectly dry; after which they must be suffered to cool, and then be pulverised. This powder must be returned a third time to the pan, set on the fire, roasted, and perfectly dried: after which it must be reduced to a fine powder, and kept in a paper in a dry place. This is the first or preparatory operation.

"Take two or three drams of this powder. Put it into a little matras, the belly of which will hold an ounce, or an ounce and half of water, and having a neck about six or seven inches long. Order it so that your powder shall take up no more than about a third part of the matras. Stop the neck of the matras slightly with paper: then take a crucible four or five inches deep: in the bottom of the crucible put three or four spoonfulls of sand: set the matras on this sand, and in the middle of the crucible, so as not to touch its sides. Then fill up the crucible with sand, so that the belly of the matras may be quite buried therein. This done, place your crucible with the matras in the midst of a little earthen furnace, commonly called a *fove*, about eight or ten inches wide above, and six inches deep from the mouth to the grate. Round the crucible put lighted coals about half way up, and when it hath stood thus half an hour, fill up with coals to the very top of the crucible. Keep up this fire a full half hour longer, or till you see the inside of the matras begin to be red. Then increase your fire, by raising your coals above the crucible. Continue this strong heat for a full hour, and then let the fire go out.

"At the beginning of this operation dense fumes will rise out of the matras, through the stopple of paper. These fumes issue sometimes in such abundance as to push out the stopple; which you must then replace, and slacken the fire. The fumes cease when the inside of the matras begins to grow red: and then you may increase the fire without any fear of spoiling your operation.

"When the crucible is so cold that it may be safely taken out of the furnace with one's hand, you must gradually draw the matras out of the sand, that it may cool slowly, and then stop it close with a cork.

"If the matter at the bottom of the matras appear to

be

be in powder when shaken, it is a sign the operation hath succeeded: but if it be in a cake, and doth not fall into powder on shaking the matras, it shews that your matter was not sufficiently roasted and dried in the iron pan during the preparatory operation."

Mr Lemerî hath shewn, that excrement is not the only matter capable of producing this phosphorus with alum; but that, on the contrary, almost all animal and even vegetable matters are fit for this combination; that though Mr Homberg mixed alum in equal quantities only with the fecal matter, it may be used in a much greater proportion, and, in certain cases, will succeed the better; that, according to the nature of the substances to be worked on, the quantity of that salt may be more or less increased; and that whatever is added, more than the dose requisite for each matter, serves only to lessen the virtue of the phosphorus, or even destroys it entirely; that the degree of fire applied must be different according to the nature of those matters; and, lastly, that salts containing exactly the same acid with that of alum, or the acid of those salts separated from its basis and reduced into spirit, do not answer in the present operation: which shews, says Mr Lemerî, that many sulphureous matters may be substituted for excrement in this operation: but that there are no salts, or very few, if any, that will succeed in the place of alum.

This phosphorus, made either by Mr Homberg's or by Mr Lemerî's method, shines both by day and by night. Besides emitting light, it takes fire soon after it is exposed to the air, and kindles all combustible matters with which it comes in contact; and this without being rubbed or heated.

Mess. Homberg and Lemerî have given the most probable and the most natural explanation of the cause of the accension and other phenomena of this phosphorus. What they say amounts in short to what follows.

Alum is known to be a neutral salt, consisting of the vitriolic acid and a calcareous earth. When this salt is calcined with the fecal matter, or other substances abounding in oil, the volatile principles of these substances, such as their phlegm, their salts, and their oils, exhale in the same manner as if they were distilled; and there is nothing left in the matras, when those principles are dissipated, but a charred matter, like that which is found in retorts wherein such mixts have been decomposed by distillation.

This remainder therefore is nothing but a mixture of alum and charcoal. Now, as the acid of this salt, which is the vitriolic, hath a greater affinity with the phlogiston than with any other substance, it will quit its basis to unite with the phlogiston of the coal, and be converted by that union into a sulphur. And this is the very case, of which we have certain proofs in the operation for preparing this phosphorus; for when, after the volatile principles of the oily matter are drawn off, the fire is increased, in order to combine closely together the fixed parts that remain in the matras, that is, the alum and the charred matter, we perceive at the mouth of the matras a small blue sulphureous flame, and a pungent smell of burning sulphur. Nay, when the operation is finish-

ed, we find a real sulphur sticking in the neck of the matras; and, while the phosphorus is burning, it hath plainly a strong sulphureous smell. It is therefore certain, that this phosphorus contains an actual sulphur; that is, a matter disposed to take fire with the greatest ease. But though sulphur be very inflammable, it never takes fire of itself, without being either in contact with some matter that is actually ignited, or else being exposed to a considerable degree of heat. Let us see then what may be the cause of its accension, when it is a constituent part of this phosphorus.

We mentioned just now, that the acid of the alum quits its basis, in order to form a sulphur by combining with the phlogiston of the coal. This basis we know to be an earth capable of being converted into lime; and that it is actually converted into quick-lime by the calcination necessary to produce the phosphorus. We know that new made lime hath the property of uniting with water so readily, that it thereby contracts a very great degree of heat. Now when this phosphorus, which is partly constituted of the basis of the alum converted into quick-lime, is exposed to the air, the lime instantly attracts the moisture of which the air is always full, and by this means, probably, grows so hot as to fire the sulphur with which it is mixed. Perhaps also the acid of the alum is not totally changed into sulphur: some part thereof may be only half-disengaged from its basis, and in that condition be capable of attracting strongly the humidity of the air, of growing very hot likewise by imbibing the moisture, and so of contributing to the accension of the phosphorus.

There is also room to think that all the phlogiston of the charred matter is not employed in the production of sulphur in this phosphorus, but that some part of it remains in the state of a true coal. The black colour of the unkindled phosphorus, and the red sparkles it emits while burning, sufficiently prove this.

#### *Human Urine analysed.*

Put some human urine into a glass alembic; set it in a water bath, and distil till there remain only about a fortieth part of what you put in; or else evaporate the urine in a pan set in the *balneum marie* till it be reduced to the same quantity. With this heat nothing will exhale but an insipid phlegm, smelling however like urine. The residuum will, as the evaporation advances, become of a darker and darker ruffet, and at last acquire an almost black colour. Mingle this residuum with thrice its weight of sand, and distil it in a retort set in a reverberating furnace, with the usual precautions. At first there will come over a little more insipid phlegm like the former. When the matter is almost dry, a volatile spirit will rise. After this spirit, white vapours will appear on increasing the fire; a yellow oily liquor will come off, trickling down in veins; and together with this liquor a concrete volatile salt, which will stick to the sides of the receiver. At last there will come over a deep-coloured fetid oil. In the retort there will remain a saline earthy residuum, which being lixiviated will yield some sea-salt.

of

*Of the Volatile Alkali.**Volatile Alkalis rectified and depurated.*

Mix together the spirit, the volatile salt, the phlegm, and the oil, obtained from any substance whatever. Put the whole into a large wide-mouthed glass body, and thereto fit a head with a large beak. Set this alembic in a water-bath, lute on a receiver, and distil with a very gentle heat. There will ascend a spirit strongly impregnated with volatile alkali, and a volatile salt in a concrete form, which must be kept by itself. Then increase your heat to the degree of boiling water; whereupon there will rise a second volatile spirit, somewhat more ponderous than the former, with a light oil that will swim on its surface, and a little concrete volatile salt. Proceed till nothing more will rise with this degree of heat. Keep by itself what came over into the receiver. At the bottom of the cucurbit you will find a thick fetid oil.

Into such another distilling vessel put the spirit and salt that rose first in this distillation, and distil them in the *balneum marie* with a heat still gentler than before. A whiter, purer, volatile salt will sublime. Continue the distillation till an aqueous moisture rise, which will begin to dissolve the salt. At the bottom of the vessel will be left a phlegm, with a little oil floating on it. Keep your salt in a bottle well stopped.

*Volatile Alkalis combined with Acids. Sundry Ammoniacal Salts. Sal Ammoniac.*

On a volatile spirit or salt pour gradually any acid whatever. An effervescence will arise, and be more or less violent according to the nature of the acid. Go on adding more acid in the same manner, till no effervescence be thereby excited, or at least till it be very small. The liquor will now contain a semi-volatile neutral salt, called an *ammoniacal salt*; which may be obtained in a dry form by crystallising as usual, or by subliming it in close vessels; after the superfluous moisture hath been drawn off.

Volatile alkalies have the same properties with fixed alkalies, fixity only excepted: so that a volatile alkali must produce an effervescence when mixed with acids, and form therewith neutral salts, differing from each other in nothing but the nature of the acid in their composition.

It must be observed, that the point of saturation is very difficult to hit on this occasion; owing probably to the volatility of the alkali, which, being much lighter than the acid, tends always to possess the uppermost part of the mixture, while the acid sinks to the bottom: whence it comes to pass, that the lower part of the liquor is sometimes overcharged with acid, while the upper part is still very alkaline. But it is most eligible that the alkali should predominate in the mixture; because the excess of this principle easily flies off while the moisture is evaporating in order to the crystallisation or sublimation of the ammoniacal salt; which being only semi-volatile, resists the heat longer, and remains perfectly neutral.

If the vitriolic acid be combined with a volatile alkali, and the mixture distilled in a retort to draw off the su-

perfluous moisture, a liquor comes over into the receiver which smells strong of a sulphureous acid. Now, as the acid of vitriol never becomes sulphureous, but when it is combined with an inflammable matter, this experiment is one of those which demonstrate that volatile alkalies contain a very sensible quantity of inflammable matter. This same liquor tastes of an ammoniacal salt; which proves that it carries up with it some of the neutral salt contained in the mixture. The rest of this salt, which is called *Glauber's secret sal ammoniac*, or *vitriolic sal ammoniac*, sublimes into the neck of the retort. It is very pungent on the tongue; it crackles a little when thrown on a red-hot shovel, and then flies off in vapours.

The ammoniacal salt formed by the acid of nitre exhibits much the same phenomena; but it requires greater care in drying and subliming it, because it hath the property of detonating all alone, without the addition of any other inflammable matter: and it will infallibly do so, if too strong a fire be applied towards the end of the operation, when it begins to be very dry. This property of detonating by itself it derives from the inflammable matter contained in the volatile alkali which serves for its basis: and this is another demonstrative proof of the existence of such an inflammable matter in the volatile alkali. This salt is called *nitrous ammoniacal salt*.

With the vegetable acids, that of vinegar for instance, is formed an ammoniacal salt of a singular nature, and which can scarce be brought to a dry form.

A volatile alkali, combined to the point of saturation with the acid of sea-salt, forms another neutral salt, which takes a concrete form either by sublimation or crystallisation. The crystals of this salt are so very soft and fine, that a parcel of it looks like cotton or wool. This is the salt properly called *sal ammoniac*. It is of great use in chemistry and in manufactures; but that which is daily consumed in great quantities is not made in the manner above mentioned. It would come extremely dear, if we had no other way of procuring it, but by forming it thus with the acid of sea-salt and a volatile alkali. This salt, or at least the materials of which it is formed, may be found in the fuliginosities and soots of most animal, and of some vegetable substances. The greatest part of what we use comes from Egypt, where vast quantities thereof are made.

The method of preparing sal ammoniac in Egypt was not known among us till Messrs. Lemaire and Granger. Their memoirs inform us, that chimney-foot alone, without any additament, is the matter from which they obtain their sal ammoniac; that those chimneys under which nothing is burnt but cow's-dung, furnish the best foot. Six and twenty pounds of that foot yield usually six pounds of sal ammoniac.

"The operation takes up about fifty, or two and fifty hours. The vessels in which they put the foot are balloons of very thin glass, terminating in a neck of fifteen or sixteen lines long, and an inch in diameter: but they are not all of the same size. The least contain twelve pounds of foot, and the greatest fifty; but they fill them only three quarters full, in order to leave room for the sublimation of the salt.

"The furnace, in which they place these balloons, consists

 but experiments are yet wanting here.

NATURAL BODIES,  
 considered as the ob-  
 jects of CHEMISTRY,  
 may be divided into  
 the six following classes,  
 viz.

**ACIDS:** Vitriolic, Nitrous, Muriatic, Vegetable, of Urine, of Amber, as in the foregoing part of this table.

**ALKALIS:** Fixt, and Volatile, as above.

**OIL:** Essential, Emphyreumatic, and Fossile. By mixture; but their uses are not much known.

**SULPHUR.** *Balsam of Sulphur.* By solution in a boiling heat.

**COPPER.** Harder than silver alone. Used in small proportions as alloy in coins.

**IRON.** A hard whitish compound.

**MERCURY.** By amalgamation with silver-leaf, or calx of silver precipitated by copper, but not by salts. This is used for silverizing on other metals, in the same way as the amalgamum of gold.

**ZINC.** Hard, somewhat malleable, and of a white colour.

**ANTIMONY.** A brittle mass.

**BISMUTH.** A whitish semi-malleable body.

**ARSENIC.** Brittle; the silver being rendered in part volatile.

**PLATINA.** Pretty pure and malleable. Difficult of fusion; and in part separates when cold.

**COBALT.**

**CRYSTALLINE EARTHS,** and other vitreous matters. A fine yellow opaque glass. The finest yellow paint for porcelain is procured from a glass mixed with silver.

**ACIDS:** Vitriolic, Nitrous, Muriatic, Vegetable, of Urine, of Ants \*, as above.

**ALKALIS:** Fixt, and Volatile, as above.

**OILS:** Expressed \*, and Essential, as above.

**SULPHUR,** as above.

**GOLD and Silver,** as above.

**TIN.** A little harder than either of the metals, and easily fused: hence it is used as a solder for lead; and it forms the principal ingredients of pewter. If the fire is long continued, the tin floats on the surface.

**COPPER.** Brittle and granulated, like tempered iron or steel when broke. By throwing pieces of copper into melted lead. The union here is very slight.

**IRON.** An opaque brownish glass. By a great degree of heat if the iron has been previously reduced to the state of a calx; but never in its metallic state.

**MERCURY.** By amalgamation. Effected only in a melting heat, unless some bismuth has been previously united with the mercury.

**ZINC.** Hard and brittle. By pouring zinc on melted lead. If the zinc is first melted, and the lead injected upon it, it then deflagrates.

**ANTIMONY.**

**BISMUTH.** A grey-coloured semi-malleable body, easily fused; and thence used as a solder for lead or tin.

**ARSENIC.** A grey-coloured brittle mass; easily fused, and extremely volatile.

**PLATINA.** Of a leafy or fibrous texture, and purplish or blue colour, when exposed to the air. If a large proportion of platina is used, it separates in the cold.

**COBALT.** The nature of this compound is not known.

**NICKEL.** A brittle metallic body.

**CRYSTALLINE EARTHS.** A thin glass. By fusion in a moderate heat.

**ACIDS:** Vitriolic \*, Nitrous \*, Muriatic, Vegetable \*, of Urine, as above.

**ALKALIS:** Fixt, and Volatile, as above.

**OIL:** Expressed \*, as above.

**SULPHUR,** as above.

**GOLD, Silver, and Lead,** as above.

**COPPER.** A brittle mass. When the copper is in small proportions, it is firmer and harder than pure tin. This in right proportions with a little zinc, forms bell-metal.

**IRON.** A white brittle compound. By heating filings of iron red-hot, and pouring melted tin upon them. A metal resembling the finest silver is made of iron, tin, and a certain proportion of arsenic.

**MERCURY.** This amalgamum forms foils for mirrors; and forms the yellow pigment called *aurum mosaicum*. By being sublimed with sulphur and sal ammoniac.

**ZINC.** Hard and brittle. When the zinc is in small proportions, it forms a very fine kind of pewter.

**ANTIMONY.** *Regulus generis.* By elective attraction from copper and crude antimony.

**BISMUTH.** Bright, hard, and sonorous, when a small proportion of bismuth is used. This is very easily fused; and employed as a solder.

**ARSENIC.** A substance in external appearance resembling zinc.

**PLATINA.** A coarse hard metal which tarnishes in the air.

**COBALT.** By fusion.

**NICKEL.** A brittle metallic mass.

**CRYSTALLINE EARTHS,** or other vitreous matters. An opaque white vitreous mass, which forms the basis of white enamels.

**ACIDS:** Vitriolic, Nitrous, Muriatic, Vegetable, of Urine, of Amber, of Ants, as above.

**ALKALIS:** Fixt, and Volatile, as above.

**OIL:** Essential, as above.

METAL.

IRON. Harder and paler than copper. Easily fused.  
MERCURY \*. A curious amalgum. Soft at first, but afterward brittle. By triturating mercury with verdigris, common salt, vinegar, and water. Becomes commonly made by cementation with calamine. The larger the proportion of zinc, the paler, harder, and more brittle is the brass. Prince's metal, pinssbeck, and other metals resembling gold. By employing zinc in substance in small proportions. The best pinssbeck about 1-4th of zinc.  
ZINC. Spelter. A native substance, found in Cornwall, consisting of zinc and copper, and used as a folder.

SEMI-METALS.

ANTIMONY. By fusion.  
BISMUTH. A palish brittle mass. Somewhat resembling silver.  
ARSENIC. White copper. By pouring arsenic, fused with nitre, upon copper in fusion. If too large a proportion of arsenic is used, it makes the compound black and apt to tarnish.  
PLATINA. A white and hard compound, which does not tarnish so soon as pure copper, and admits of a fine polish.  
COBALT. White and brittle.  
NICKEL. White and brittle, and apt to tarnish.  
ACIDS: Vitriolic, Nitrous, Muriatic, Vegetable, of Urine, of Ants, as above.  
ALKALIS: Fixt \*, and Volatile, as above.  
SULPHUR, as above.  
METALS: Gold, Silver \*, Lead \*, Tin, and Copper, as above.  
ZINC. A white substance resembling silver.

IRON.

SEMI-METALS.

ANTIMONY. The magnetic quality of the iron is totally destroyed in this compound.  
BISMUTH. In a strong heat, this emiteth flames.  
ARSENIC. A whitish, hard, and brittle compound. By fusing with soap or tartar. A metal resembling fine steel is made by fusing cast iron with a little arsenic and glass.  
PLATINA. With cast iron it forms a compound remarkably hard, somewhat ductile, and fusible of a fine polish.  
COBALT. A compound remarkably ductile. By fusion in a moderate heat.  
NICKEL. A brittle mass.

VITRESCENT EARTHS.

A transparent glass. In general blackish; but sometimes yellow, green, or blue. The colour is influenced by the degree of heat as well as nature of the ingredients.  
ACIDS: Vitriolic, Nitrous, Muriatic, Vegetable \*, of Urine, as above.  
ALKALI: Fixt \*, as above.  
SULPHUR, as above.  
METALS: Gold, Silver \*, Lead \*, Tin, and Copper, as above.

MERCURY.

SEMI-METALS.

ZINC. An amalgum. Soft or hard, according to the proportions employed.  
ANTIMONY \*. By melting the regulus, and pouring it upon boiling mercury. By frequently distilling from this amalgum, the mercury is rendered much more pure, and is then called animated mercury.

SEMI-METALS.

BISMUTH. A silvizing for iron. By putting this amalgum upon iron, and evaporating the mercury. It has much the appearance of silver.  
PLATINA. The compound resulting from this mixture is not known.  
COBALT. By mixing first with nickel, and then adding mercury.

ACIDS: Vitriolic, Nitrous, Muriatic, Vegetable, of Urine, of Ants, as above.

OIL: Expressed \*, as above.  
SULPHUR \*, as above.  
METALS: Gold, Silver, Lead, Tin, Copper, and Iron, as above.

SEMI-METALS.

MERCURY, as above.  
ANTIMONY. This mixture is applied to no particular use.  
ARSENIC. A black and friable mass.  
PLATINA. A hard substance.

ACIDS: Vitriolic \*, Nitrous, Vegetable \*, and Urinous. With the phenomena, and by the means above described.

COBALT. The particular nature and properties of this mixt is not known.  
ALKALIS: Fixt and Volatile, as above.

SEMI-METALS.

SULPHUR, as above.  
METALS: Gold, Silver, Lead, Tin \*, Copper, and Iron, as above.

SEMI-METALS.

MERCURY, and Zinc, as above.  
BISMUTH. A mass resembling regulus of antimony.  
ARSENIC. The nature and qualities of this mixt are not known.  
PLATINA. A hard mass.

ACIDS: Vitriolic, Nitrous, Muriatic, Vegetable, of Urine, of Amber, as in the foregoing part of this table.

ALKALIS: Fixed, and Volatile, as above.

OILS: Essential, Emphyreumatic, and Fossile. By mixture; but their uses are not much known.

NICKEL. Ditto.

VITREOUS EARTHS. A thin penetrating glass; which is a powerful flux of metals.

ACIDS: Vitriolic, Nitrous, Muriatic, Vegetable, and urinous; with the phenomena, &c. above described.

ALKALIS: Fixed \*, and Volatile \*, as above.

SULPHUR, as above.

METALS: Gold, Silver, Lead, Tin, Copper, and Iron, as above.

MERCURY and ANTIMONY, as above.

ARSENIC. Nature not known.

SEMI-METALS. } PLATINA. This mixture changes its colour much on being exposed to the air.

COBALT \*. By mixing first with nickel or regulus of antimony, and then adding cobalt; but it cannot be united by itself.

BISMUTH.

consists of four walls built in a quadrangular form. The two front-walls are ten, and the sides nine foot long; but they are all five foot high, and ten inches thick. Within the quadrangle formed by these walls, three arches run lengthwise from end to end thereof, at the distance of ten inches asunder. The mouth of this furnace is in the middle of one of its fronts, and of an oval form; two foot four inches high, and sixteen inches wide.

"The ballons lie in the spaces between the arches of the furnace, which serve instead of a grate to support them. Four of them are usually placed in each interval; which makes sixteen for one furnace. They are set at the distance of about half a foot from each other, and secured in their places with brick and earth. But they leave about four inches on the upper part of the ballon uncovered, with a view to promote the sublimation, as they also do six inches of the inferior part, that the heat may the better act on the matters to be sublimed. Things being thus prepared, they first make a fire with straw, which they continue for an hour. Afterwards they throw in cow's-dung made up in square cakes like bricks. (The want of wood in this country is the reason that they generally make use of this fuel.) These cakes of dung add to the violence of the fire, which they continue in this manner for nineteen hours; after which they increase it considerably for fifteen hours more; and then they slacken it by little and little.

"When the matter contained in the vessels begins to grow hot, that is, after six or seven hours baking, it emits a very thick and ill-scented smoke, which continues for fifteen hours. Four hours after that, the sal ammoniac is observed to rise in white flowers, which adhere to the inside of the neck of the vessel; and those who have the direction of the operation take care from time to time to pass an iron rod into the neck of the ballon, in order to preserve a passage through the saline vault, for giving vent to some blueish vapours, which constantly issue out of the vessel during the whole operation."

From this history of the preparation of sal ammoniac it appears, that foot, and particularly the foot of animal matters, either contains abundance of this salt perfectly formed, and waiting only for sublimation to separate it therefrom, or at least that it contains the proper materials for forming it; and that during the operation, which is a kind of distillation of foot, these materials combine together and sublime.

We shewed, in our analysis of foot, that this substance yields by distillation a great deal of volatile alkali; and this is an ingredient which makes at least one half of sal ammoniac. As to the other principle of this salt, the marine acid, this also must needs exist in foot: but it is not so easy to conceive how it should come there.

It is very true that vegetable and animal substances, the only ones that produce foot in burning, contain some portion of sea-salt: but then this salt is very fixed, and seems unfit to rise with the acid, the oil, and the subtle earth, of which the volatile alkali is formed. Therefore we must suppose either that its elevation is procured by the force of the fire, aided by the volatility

of the matters that exhale in burning; or that, being decomposed by the violence of the combustion, its acid alone rises with the other principles above mentioned. The latter seems probable enough: for though in the common operations of chemistry the bare force of fire doth not seem sufficient to decompose sea-salt; yet the example of sea-plants, which, before burning, contain this salt in abundance, and whose ashes contain scarce any at all, but are replete with its fixed part, that is, with its alkaline basis, seems to prove, that, when this salt is intimately mixed with inflammable matters, it may be destroyed by burning; so that its acid shall desert its basis, and fly off with the foot.

Before the exact method of procuring sal ammoniac was known, it was generally imagined that the manufacturers mixed sea-salt, and even urine, with the foot; because these two substances contain the principles of which this salt consists. But, besides that the contrary now certainly appears from the above mentioned memoirs, it hath been shewn by Mr Duhamel, who hath published several memoirs and experiments concerning the composition and decomposition of sal ammoniac, from which we have partly taken what we have already said on this subject; it hath been shewn, in the first of these memoirs, that the addition of sea-salt to the foot, from which sal ammoniac is to be extracted, contributes nothing to its production, and cannot increase its quantity. That alone, therefore, which was originally contained in the matters that produced the foot, enters as a principle into the composition of sal ammoniac.

Sal ammoniac is sometimes found perfectly formed in the neighbourhood of volcanos. This salt is probably produced from the fuliginosities of vegetable or animal matters consumed by the fire of the volcano.

Sal ammoniac is often impure, because it carries up with it, in sublimation, some of the black charred matter which ought to be left at the bottom of the vessel; but it is easily purified. For this purpose you need only dissolve it in water, filter the solution, then evaporate and crystallize; by which means you will have a very white and very pure sal ammoniac. You may if you please, sublime it again in a cucurbit and blind head, with a fire not too brisk. Some of it will rise in the form of a light white powder, called *flowers of sal ammoniac*. These flowers are no other than true sal ammoniac, which hath suffered no decomposition; because the bare action of fire is not capable of separating the acid and the volatile alkali, of which this neutral salt consists. When you intend to decompose it, you must use the means to be mentioned hereafter.

Though sal Ammoniac be only semi-volatile, and requires a considerable heat to sublime it, yet it hath the property of carrying up with it matters that are very fixed and ponderous; such as metallic substances, and some kinds of earths. For medicinal uses we sublime therewith iron, lapis hæmatites, the copper in blue vitriol, &c. and then it takes different names, as *martial flowers of sal ammoniac*, *ens veneris*, and other such denominations, which it borrows from the matters sublimed with it.

*Sal Ammoniac decomposed by acids.*

INTO a large tubulated retort put a small quantity of sal ammoniac in powder: set your retort in a furnace, and lute on a large ballon, as in the distillation of the fuming acids of nitre and sea-salt. Through the hole in your retort pour a quantity of oil of vitriol or spirit of nitre equal in weight to your sal ammoniac. An effervescence will instantly follow. The mixture will swell, and discharge white vapours which will come over into the receiver. Stop the whole in the retort immediately, and let the first vapours pass over, together with some drops of liquor, which will distil without fire. Then put a few coals into the furnace, and continue the distillation with a very gentle heat; which however must be increased little by little till nothing more will come over. When the operation is finished, you will find in the receiver a spirit of salt if you made use of oil of vitriol or an *aqua regis*, if the spirit of nitre was employed: and in the retort will be left a saline mass, which will be either a glauher's secret sal ammoniac, or a nitrous sal ammoniac, according to the nature of the acid used to decompose the sal ammoniac.

*Sal ammoniac decomposed by fixed Alkalis. Volatile salt. The Febrifuge of Sylvius.*

INTO a glass alembic or retort put sal ammoniac and salt of tartar pulverised and mixed together in equal quantities. Set your vessel in a proper furnace, and immediately lute on a large receiver. A little volatile spirit will ascend; and a volatile alkali, in a concrete form, very white and beautiful will sublime into the head, and come over into the receiver, in quantity near two thirds or three fourths of the sal ammoniac used. Continue the distillation, increasing the fire by degrees till nothing more will sublime. Then unlute the vessels. Put up your volatile salt immediately into a wide mouthed bottle, and stop it close with a crystal stopple. At the bottom of the retort or cucurbit you will find a saline mass, which, being dissolved and crystallised, will form a salt nearly cubical, having the taste and other properties of sea-salt. This is the *sal febrifugum silvii*.

*Sal Ammoniac decomposed by absorbent Earths and Lime. Fixed Sal Ammoniac.*

LET one part of sal ammoniac and three parts of lime

slaked in the air be pulverised separately, and expeditiously mixed together. Put this mixture immediately into a glass retort, so large that half of it may remain empty. Apply thereto a capacious receiver, with a small hole in it to give vent to the vapours, if needful. Let your retort stand in the furnace about a quarter of an hour, without any fire under it. While it stands thus, a great quantity of invisible vapours will rise, condense into drops, and form liquor in the receiver. Then put two or three live coals in your furnace, and gradually increase the fire till no more liquor will rise. Now unlute your vessels, taking all possible care to avoid the vapours, and quickly pour the liquor out of the receiver into a bottle, which you must stop with a crystal stopple, rubbed with emery. There will remain, at the bottom of the retort, a white mass, consisting of the lime employed in the distillation, together with the acid of the sal ammoniac: this is called *fixed sal ammoniac*.

*Volatile Alkalis combined with oily matters. A Volatile Oily Aromatic salt.*

PULVERISE and mix together equal parts of sal ammoniac and salt of tartar: put the mixture into a glass or stone cucurbit: pour on it good spirit of wine till it rise half an inch above the matter. Mix the whole with a wooden spatula; apply a head and a receiver, and distil in a sand-bath, gently heated, for two or three hours. A volatile salt will rise into the head; and then the spirit of wine will distil into the receiver, carrying with it a portion of the volatile salt.

When nothing more will come over, let your vessels cool; then unlute them, separate the volatile salt, and weigh it directly. Return it into a glass cucurbit, and for every ounce thereof add a dram and a half of essential oil, drawn from one or more sorts of aromatic plants. Stir the whole with a wooden spatula, that the essence may incorporate thoroughly with the volatile salt. Cover the cucurbit with a head, fit on a receiver, and, having luted it exactly, distil in a sand-bath, as before, with a very gentle heat. All the volatile salt will rise, and stick to the head. Let the fire go out, and when the vessels are cooled take your salt out of the head. It will have an odour compounded of its own proper smell, and the smell of the essence with which it is combined. This is an *aromatic oily salt*. Put it into a bottle stopped close with a crystal stopple.

## A T A B L E.

**CHEMOSIS**, a disease of the eyes, proceeding from an inflammation, when the white of the eye swells above the black, and overtops it to such a degree, that there appears a sort of gap between them.

Others define it to be an elevation of the membrane which surrounds the eye, and is called the white; being an affection of the eye, like white flesh.

**CHENOPODIUM**, in botany, a genus of the pentandria digynia class. The calix consists of five leaves; it has no corolla; and there is but one lenticular seed. There are 18 species, 13 of which are natives of Britain, *viz.* the bonus henricus, common English mercury, or all-good; the urticum, or upright blite; the roburum, or sharp-leaved goose-foot; the murale, common goose-foot, or sow-bane; the hybridum, or maple-leaved blite; the album, or common orache; the viride, or green blite; the serotinum, or late-flowered blite; the glaucum, or oak-leaved blite; the vulvaria, or stinking orache; the polyspermum, round-leaved blite, or all seed; the maritimum, sea blite, or white glass-wort; and the fruticosum, shrub stone-crop, or glass-wort. The leaves of the vulvaria, or stinking orache, are said to be an excellent anti hysteric.

**CHEPELLO**, an island in the bay of Panama, and province of Darien, in South America, situated about three leagues from the city of Panama, which it supplies with provisions: W. long. 81°, N. lat. 9°.

**CHEPSTOW**, a market-town in Monmouthshire, situated on the river Wye, near its mouth, about ten miles south of Monmouth: W. long. 2° 40', N. lat. 51° 40'.

**CHEQ**, or **CHERIF**, the prince of Mecca, who is, as it were, high priest of the law, and sovereign pontiff of all the Mahometans, of whatever sect or country they be. See **CALIPH**.

The grand signior, sophies, moguls, Khans of Tartary, &c. send him yearly presents, especially tapestry to cover Mahomet's tomb withal, together with a sumptuous tent for himself, and vast sums of money to provide for all the pilgrims during the seventeen days of their devotion.

**CHERBURG**, a port-town of France, in the province of Normandy, situated on a bay of the English channel, opposite to Hampshire, in England: W. long. 1° 40', N. lat. 49° 45'.

**CHEREM**, in Jewish antiquity, the second and greater sort of excommunication among the Jews.

The cherem deprived the excommunicated person of almost all the advantages of civil society: he could have no commerce with any one, could neither buy nor sell, except such things as were absolutely necessary for life; nor resort to the schools, nor enter the synagogues; and no one was permitted to eat or drink with him.

The sentence of cherem was to be pronounced by ten persons, or at least in the presence of ten: but the excommunicated persons might be absolved by three judges, or even by one, provided he were a doctor of the law. The form of this excommunication was loaded with a multitude of curses and imprecations, taken from different parts of the scripture.

**CHERESOU**, the capital of Cardissas, in Asiatic Turkey, and the seat of the beglerbeg, or viceroys, of the province: E. long. 45°, N. lat. 36°.

**CHERLERIA**, in botany, a genus of the decandria trigynia class. The calix consists of five leaves; it has five petals less than the leaves of the calix, and five bind nectaria; the apothecæ are alternately barren: and the capsule has three cells and as many valves. There is but one species, *viz.* the sedoides, a native of Switzerland.

**CHERLESQUIOR**, in Turkish affairs, denotes a lieutenant-general of the Grand Signior's armies.

**CHERMES**, in zoology, a genus of insects belonging to the order of insecta hemiptera. The rostrum is situated on the breast; the feelers are longer than the breast; the four wings are deflected; the breast is gibbous; and the feet are of the jumping kind. There are 17 species, and the trivial names are taken from the plants which they frequent, as the chermes graminis, or grass-bug; the chermes ulmi, or elm-bug, &c.

**CHERRY-TREE**, in botany. See **PRUNUS**.

**CHERRY-ISLE**, in geography, an island situated in the north or frozen ocean, between Norway and Greenland: E. long. 20°, N. lat. 75°.

**CHERSO**, the capital of an island of the same name, in the gulf of Venice, and subject to the Venetians: E. long. 15°, N. lat. 45° 25'.

**CHERSONESUS**, among geographers, the same with a peninsula. See **PENINSULA**.

**CHERTSEY**, a market-town of Surry, about seven miles west of Kingston: W. long. 30', N. lat. 51° 25'.

**CHERUB**, or **CHERUBIN**, a celestial spirit, which in the hierarchy is placed next to the seraphim. See **HIERARCHY**.

The several descriptions which the scripture gives us of cherubins, differ from one another; but all agree in representing a figure composed of various creatures, as a man, an ox, an eagle, and a lion.

**CHERVIL**, in botany. See **CHEROPHYLLUM**.

**CHERWEL**, a river, which, arising in Northamptonshire, runs southwards by Banbury, and unites its waters with those of the Isis, near Oxford.

**CHESHAM**, a market-town of Buckinghamshire, about nine miles south-east of Aylesbury: W. long. 35', N. lat. 51° 36'.

**CHESHIRE**, a maritime county of England, bounded by Staffordshire on the east, and by the Irish sea on the west: its chief commodities are salt and cheese; the last of which is much esteemed all over Britain.

**CHESNUT-TREE**, in botany. See **FAGUS**.

**CHESS**, an ingenious game, performed with different pieces of wood, on a board divided into sixty-four squares or houses; in which chance has so small a share, that it may be doubted whether a person ever lost but by his own fault.

Each gamester has eight dignified pieces, *viz.* a king, a queen, two bishops, two knights, and two rooks; also eight pawns: all which, for distinction sake, are painted of two different colours, as white and black.

As

As to their disposition on the board; the white king is to be placed on the fourth black house from the corner of the board, in the first and lower rank; and the black king is to be placed on the fourth white house on the opposite or adversary's end of the board. The queens are to be placed next to the kings, on houses of their own colour. Next to the king and queen, on each hand, place the two bishops; next to them, the two knights; and last of all, on the corners of the board, the two rooks. As to the pawns, they are placed without distinction, on the second rank of the house, one before each of the dignified pieces.

Having thus disposed the men, the onset is commonly begun by the pawns, which march straight forward in their own file, one house at a time, except the first move, when it can advance two houses, but never moves backwards: the manner of their taking the adversary's men, is side-ways, in the next house forwards; where having captivated the enemy, they move forward as before. The rook goes forward or cross-ways through the whole file, and back again. The knight skips backward and forward to the next house, save one, of a different colour, with a sidling march, or a slope, and thus kills his enemies that fall in his way, or guards his friends that may be exposed on that side. The bishop walks always in the same colour of the field that he is placed in at first, forward and backward, aslope, or diagonally, as far as he tilts. The queen's walk is more universal, as she takes all the steps of the before-mentioned pieces, excepting that of the knight; and as to the king's motion, it is one house at a time, and that either forward, backward, sloping, or side-ways.

As to the value of the different pieces, next to the king is the queen, after her the rooks, then the bishops, and last of the dignified pieces comes the knight. The difference of the worth of pawns, is not so great as that of noblemen; only, it must be observed, that the king's bishop's pawn is the best in the field, and therefore the skilful gamester will be careful of him. It ought also to be observed, that whereas any man may be taken, when he falls within the reach of any of the adversary's pieces, it is otherwise with the king, who, in such a case, is only to be saluted with the word *check*, warning him of his danger, out of which it is absolutely necessary that he move; and, if it so happen that he cannot move without exposing himself to the like inconveniency, it is check-mate, and the game is lost.

**CHEST**, in commerce, a kind of measure, containing an uncertain quantity of several commodities.

A chest of sugar, *v. g.* contains from ten to fifteen hundred weight; a chest of glass, from two hundred to three hundred feet; of Castile soap, from two and an half to three hundred weight; of indigo, from one and an half to two hundred weight, five score to the hundred.

**CHEST**, or **THORAX**, in anatomy. See p. 277.

**CHESTER**, the capital city of Cheshire, situated sixteen miles south of Liverpool: W. long. 3°, N. lat.

53° 15'. It is a bishop's see, and gives the title of earl to the prince of Wales.

**NEW-CHESTER**, the capital of a county of the same name in Pennsylvania, in North America, situated on the river Delaware, south of Philadelphia: W. long. 74°, N. lat. 40° 15'. Its harbour is fine and capacious, admitting vessels of any burden.

**CHESTERFIELD**, a market-town of Derbyshire, fifteen miles north of Derby, W. long. 1° 25', N. lat. 53° 20'. It gives the title of earl to a branch of the noble family of Stanhope.

**CHEVALER**, in the menage, is said of a horse when in passing upon a walk or trot, his off fore-leg crosses or overlaps the near fore-leg every second motion.

**CHEVALIER**, in a general sense, signifies a knight, or horseman.

**CHEVAUX DE FRISE**, in fortification; a large joist, or piece of timber, about a foot in diameter, and ten or twelve in length, into the sides whereof are driven a great number of wooden pins, about six foot long, armed with iron points, and crossing one another. See **FORTIFICATION**.

**CHEVERON**, in heraldry. See **CHEVRON**.

**CHEVIL**. See **KEVIL**.

**CHEVIOT**, or **TIVIOI-HILLS**, run from north to south through Cumberland, and were formerly the borders or boundaries between England and Scotland, where many a bloody battle has been fought between the two nations, one of which is recorded in the ballad of Chevy-chase.

**CHEVISANCE**, in law, denotes an agreement or composition, as an end or order set down between a creditor and his debtor, &c.

In our statutes, this word is most commonly used for an unlawful bargain, or contract.

**CHEVRON**, or **CHEVERON**, in heraldry, one of the honourable ordinaries of a shield, representing two rafters of an house, joined together as they ought to stand; it was anciently the form of the priestesses' head attire: some say, it is a symbol of protection; others, of constancy; others, that it represents knights' spears, &c. It contains the fifth part of the field, and is figured as in Plate LV. fig. 3.

A chevron is said to be abased, when its point does not approach the head of the chief, nor reach farther than the middle of the coat; mutilated, when it does not touch the extremes of the coat; cloven, when the upper pieces are taken off, so that the pieces only touch at one of the angles; broken, when one branch is separated into two pieces; couched, when the point is turned towards one side of the escutcheon; divided, when the branches are of several metals, or when metal is opposed to colour; inverted, when the point is turned towards the point of the coat, and its branches towards the chief.

*Per* **CHEVRON**, in heraldry, is when the field is divided only by two single lines, rising from the two base points, and meeting in the point above, as the chevron does.

**CHEVRONED**,

**CHEVRONED**, is when the coat is filled with an equal number of chevrons, of colour and metal.

**CHEVRONEL**, a diminutive of chevron, and as such only containing half a chevron.

**CHEVRONNE**, or **CHEVRONNY**, signifies the dividing of the shield several times chevron-wise.

**CHEWING-BALLS**, a kind of balls made of asafœtida, liver of antimony, bay-wood, juniper-wood, and pellitory of Spain; which being dried in the sun, and wrapped in a linen-cloth, are tied to the bit of the bridle for the horse to chew: they create an appetite; and it is said, that balls of Venice treacle may be used in the same manner with good success.

**CHIAMPA**, the south division of Cochin-china, a country of the East-Indies.

**CHIAN earth**, in pharmacy, one of the medicinal earths of the ancients, the name of which is preserved in the catalogues of the materia medica, but of which nothing more than the name has been known for many ages in the shops.

It is a very dense and compact earth, and is sent hither in small flat pieces from the island of Chios, in which it is found in great plenty at this time. It stands recommended to us as an astringent. They tell us, it is the greatest of all cosmetics, and that it gives a whiteness and smoothness to the skin, and prevents wrinkles, beyond any of the other substances that have been celebrated for the same purposes.

**CHIAPA**, the capital of a province of the same name in Mexico, situated about 300 miles east of Acapulco: W. long. 98°, N. lat. 16° 30'.

**CHIARASCO**, a fortified town of Piedmont in Italy, situated on the river Tanaro, twenty miles south-east of Turin, and subject to the king of Sardinia: E. long. 7° 45', N. lat. 44° 40'.

**CHIARENZA**, a port-town of the north-west coast of the Morea, opposite to the island Zant, in the Mediterranean, and subject to the Turks: E. long. 21° 15', N. lat. 37° 35'.

**CHIARO-SCURO**, among painters, See **CLARO-OS-SCURO**.

**CHICHESTER**, the capital city of Sussex, situated fifty-two miles south-west of London, and twelve miles east of Portsmouth: W. long. 50', and N. lat. 50° 50'. It is a bishop's see, and sends two members to parliament.

*New* **CHICHESTER**, a port-town of Pensilvania, situated on the river Delaware, below Chester. See **CHESTER**.

**CHICK**, or **CHICKEN**, in zoology, denotes the young of the gallinaceous order of birds, especially the common hen. See **PHASIANUS**.

**CHICKEN-pox**. See **Small-Pox**, and **MEDICINE**.

**CHICK-wired**, in botany. See **ALSINE**.

**CHICKLING pea**, in botany, a name given to the lathyrus. See **LATHYRUS**.

**CHICUITO**, or **CUYO**, a province of South America, bounded by the province of La Plata on the north-east, and by Chili on the west.

**CHIDLEY**, or **CHIMLEY**, a market-town of Devonshire, about eighteen miles north-west of Exeter: W. long. 4°, N. lat. 51°.

VOL. II. No. 37.

3

**CHIEF**, a term signifying the head or principal part of a thing or person. Thus we say, the chief of a party, the chief of a family, &c.

**CHIEF**, in heraldry, is that which takes up all the upper part of the escutcheon from side to side, and represents a man's head. See **PLATE LXXV. fig. 4.**

It is to take up just the third part of the escutcheon, as all other honourable ordinaries do, especially if they are alone on the shield; but if there be several of them, they must be lessened in proportion to their number, and the same holds when they are cantoned, attended and bordered upon by some other figures; then the painter or engraver may be allowed to bring them into a smaller compass, to the end that all that is represented about the ordinaries may appear with some proportion and symmetry. Chiefs are very much varied, for they may be couvert, supported, crenellé, surmounted, abaissé, rempli, dentillé, engressé, canellé, danché, nebulé, fleurdelezée, fleuronné, vair, echequeté, lozangé, burellé, patté, fretté, giroiné, chaperonné, chappé, mantelé, emmanché, chaussé, veltu or revestu. See **COUVERT**, **SUPPORTED**, &c.

*In* **CHIEF**, imports something borne in the chief part or top of the escutcheon.

**CHIEF lord**, the feudal lord, or lord of an honour on whom others depend.

**CHIEF-justice of the king's bench and common pleas**. See **JUSTICE**.

**CHIEFTAIN**, denotes the captain, or chief, of any class, family, or body of men: thus, the chieftains, or chiefs, of the highland clans, were the principal noblemen or gentlemen of their respective clans.

**CHIERI**, a fortified town of Piedmont in Italy, situated eight miles east of Turin: E. long. 7° 45', N. lat. 44° 50'.

**CHILBLAINS**, in medicine. See **PERNIQ.**

**CHILD-bed.** } See **MIDWIFERY**.

**CHILD birth.** }

**CHILDERMAS-day**, or **INNOCENT'S-day**, an anniversary held by the church, on the 28th of December, in commemoration of the children at Bethlehem, massacred by order of Herod.

**CHILI**, a province of South America, bounded by Peru on the north, by the province of La Plata on the east, by Patagonia on the south, and by the Pacific ocean on the west; lying between 25° and 45° S. lat. and between 75° and 85° W. long. But some comprehend Patagonia in Chili, extending it to cape Horn, in 57° 30' S. lat.

**CHILIAD**, denotes a thousand of any things, ranged in several divisions, each whereof contains that number.

**CHILIARCHA**, or **CHILIARCHUS**, in antiquity, a military officer, who had the command of a thousand men.

**CHILIASTS**, in church-history. See **MILLENNARIANS**.

**CHILMINAR**, **CHELMINAR**, or **TCHELMINAR**, the most beautiful piece of architecture remaining of all antiquity; being the ruins of the famous palace of Persepolis, to which Alexander the Great, in a drunken fit, set fire, at the instigation of Thais the courtesan:

†

3 A

the

the word comes from the Persian *tebble minar*, that is to say, forty towers.

Don Garcias de Silva Figueroa, Pietro della Valle, Sir John Chardin, and Le Brun, have been very particular in describing these ruins.

There appear, say they, the remains of near four-score columns, the fragments of which are at least six feet high; but there are only nineteen can be called entire, with another detached from the rest, about an hundred and fifty paces: a rock of hard black marble serves as a foundation to the edifice: the first plan of the house is ascended to by ninety-five steps, all cut in the rock; the gate of the palace is about twenty feet wide, with the figure of an elephant on one side, and that of a rhinoceros on the other, thirty feet high, and both of polished marble: near these animals there are two columns, and not far from thence the figure of a pegasus. After passing this gate, are found fragments of magnificent columns in white marble, the smallest of which are fifteen cubits high, the largest eighteen, having forty flutings three full inches wide each; from whence we may judge of their thickness and other proportions. Near the gate is seen an inscription on a square piece of black marble, containing about twelve lines; the characters are of an extraordinary figure, resembling triangles, or pyramids: besides this, there are other inscriptions, the characters of which resemble the Hebrew, Chaldaic, or Syriac; others the Arabic or Persian; and others, in fine, the Greek characters. Dr Hyde, who hath explained the Greek inscription, by supplying some words that are effaced, observes, that the inscriptions are engraved very negligently, and perhaps by some soldiers; or, if they are the work of an engraver, he thinks that he was from Palmyra, and consequently that they are in the Phœnician tongue: he adds, that as they are in praise of Alexander, they were probably done in the time of that conqueror.

**CHILTERN**, a chain of chalky hills, running from east to west through Buckinghamshire.

**CHIMÆRA**, in geography, a port-town of Turkey in Europe, situated at the entrance of the gulph of Venice, in the province of Epirus, about thirty-two miles north of the city Corfu, near which are the mountains of Chimæra, which divide Epirus from Thessaly: E. long. 20° 40', and N. lat. 40° 20'.

**CHIMAY**, the name of a great lake, lying in the province of Acham, between the East-Indies and China.

**CHIMERA**, a fabulous monster, which the poets feign to have the head of a lion, the body of a goat, and the tail of a dragon; and add, that this odd beast was killed by Bellerophon. The foundation of the fable was, that in Lycia there was a burning mountain, or volcano, of this name; that the top of this mountain was seldom without lions, nor the middle, which had very good grass, without goats; that serpents bred at the bottom, which was marshy; and that Bellerophon rendered the mountain habitable.

By a chimera, among the philosophers, is understood a mere creature of the imagination, composed of

such contradictions and absurdities as cannot possibly any where exist but in thought.

**CHIMES of a clock**, a kind of a periodical music, produced at equal intervals of time, by means of a particular apparatus added to a clock.

**CHIMNEY**, in architecture, a particular part of a house, where the fire is made, having a tube or funnel to carry away the smoke. See **ARCHITECTURE**.

**CHINA**, including Chinese Tartary, a large empire, situated between 95° and 135° E. long. and between 21° and 55° N. lat. being accounted two thousand miles in length, and one thousand five hundred in breadth; it is bounded by Russian Tartary on the north, by the Pacific ocean on the east and south, and by Tonquin, Tibet, and the territories of Russia on the west. It is usually divided into sixteen provinces, which will be described in their alphabetical order. In these provinces there are computed to be one hundred and fifty-five capital cities, one thousand three hundred and twelve of the second rank, two thousand three hundred and fifty seven fortified towns, and upwards of ten millions of families, which may amount to about fifty millions of people.

The principal commodities of this country are silk, tea, China ware, Japan-ware, and gold dust; of all which the maritime states of Europe import great quantities, sending them silver in return.

**CHINA-root**, in pharmacy, a medicinal root, brought both from the East and West Indies, thence distinguished into oriental and occidental; it is the root of a species of smilax. See **SMILAX**.

**CHINA-ware**. See **PORCELAIN**.

**CHINCA**, a port-town of Peru, in South America, situated in an extensive valley, on a river of the same name, about sixty miles south of Lima: W. long. 76°, and S. lat. 13°.

**CHIN COUGH**, a convulsive kind of cough, which children are chiefly subject to. See **MEDICINE**.

**CHINESE**, in general, denotes any thing belonging to China. See **CHINA**.

It is observed by some, that the Chinese language has no analogy with any other language in the world: it only consists of three hundred and thirty words, which are all monosyllables, at least they are pronounced so short that there is no distinguishing above one syllable or sound in them; but the same word, as pronounced with stronger or weaker tone, has different significations; accordingly, when the language is accurately spoke, it makes a sort of music, which has a real melody, that constitutes the essence and distinguishing character of the Chinese tongue.

As to the Chinese characters, they are as singular as the language; the Chinese have not, like us, any alphabet, containing the elements, or, as it were, the principles of their words: instead of an alphabet they use a kind of hieroglyphics, whereof they have above eighty thousand.

As the Chinese pretend to an antiquity both with regard to their nation and arts, far beyond that of any other nation, it will not perhaps be unacceptable to give

give a short view of these pretensions, principally extracted from their own writers. But, when any thing is quoted from the Chinese history, it is absolutely necessary to attend, 1. To the times purely fabulous and mythological; 2. To the doubtful and uncertain times; and, 3. To the historical times, when the Chinese history, supported by indisputable monuments, begins to proceed on sure grounds.

1. Some ascribe to Tiene-hoang, a book in eight chapters, which contains the origin of letters. They add, that the characters used by the Sane hoang were natural, without any determinate form, that they were nothing but gold and precious stones.

Lieou-jou, author of Ouai-ki, says, that Tiene-hoang gave names to the ten *KANE*, and to the twelve *TCHI*, to determine the place of the year: this is meant of the cyclic characters.

*Tiene-hoang* signifies emperor of heaven. They call him also *Tiene ling*, the intelligent heaven; *Tsee jun*, the son who nourishes and adorns all things; and finally *Tchong-tiene-hoang-kune*, the supreme king of the middle heaven, &c. This Tiene-hoang succeeded Pouane-cou.

The Ouai-ki says, that Ti-hoang (emperor of the earth), the successor of Tiene-hoang, divided the day and the night, and appointed thirty days to make one moon. The book Tong li, quoted in Lopi, adds further, that this emperor fixed the winter-solstice to the eleventh moon. A proof that the Chinese year was originally very incorrect, and that the course of it was regulated only by that of the seasons, is, that for a long time, to express a year, they said a change of the leaves.

This Ti hoang, say they, was father of Tiene-hoang, and of Gine-hoang who follows.

They give Gine-hoang (sovereign of men) nine brothers, and pretend, that they divided the government among them. They were nine brothers (says Yuene-leoa-fane) who divided the earth among them, and built cities, which they surrounded with walls. It was under this prince (says Lopi), that there first began to be a distinction between the sovereign and the subject; they drank, they eat, and the two sexes united.

After these three emperors which we have just now named, they place the period named *Ou-long* (the five Long or dragons) composed of five different families. But they do not tell us their names, nor the duration of their reigns. In these times (says an author) men dwelt in the bottom of caves, or perched upon trees as it were in nests. This fact contradicts the invention of building cities, and surrounding them with walls, which they place under the reign of Gine-hoang; but we will meet with many such contradictions in the sequel.

They say nothing of the third Ki. Of the fourth, named *Ho-lo*, and composed of three families, they say, that the Ho-lo taught men to retire into the hollows of rocks. This is all they say of it. Neither do they say any thing of the fifth Ki, named *Lienc tong*, and composed of six families; of the sixth Ki, named *Su ming*, and composed of four families.

It is a folly to dwell upon the epocha of these six Ki;

nothing is more absurd. Lopi cites an author who generously gives them 1,100,750 years duration; Lopi says himself, that the five first Ki after Gine hoang make in all 50,000 years.

The seventh Ki is named *Sune-fei*, and comprehends twenty-two families. But they say nothing under all these reigns that has any relation to the arts or sciences. Only under the twenty-second and last, named *Tsee-che-chi*, they say, that it was not till then men ceased to dwell in caves. Is it not a palpable absurdity, that after so many ages, and under kings of whom they relate so many wonders, they had not yet found out the art of building huts to shelter them from the winds and rains!

The eighth Ki, named *Yne-ti*, contains thirteen families or dynasties. Tchine-fang-chi, the first of this period, reigned after Tsee-che-chi, and founded the first family. They say, that at the beginning men covered their bodies with leaves and herbs; serpents and beasts were very numerous; the waters which had overflowed, were not yet returned into their channels; and the misery of mankind was extreme. Tchine-fang taught men to prepare skins, to take off the hair with rollers of wood, and use them against the winds and frost which incommoded them very much. He taught them also to make a kind of web of their hair, to serve them as a covering to their heads against the rain. They obeyed him with joy; he called his subjects *people clothed with skins*; he reigned 350 years. To Tchine-fang-chi succeeded Chouchaue-chi, then Hai-kouei-chi, of whom they say nothing which has any relation to our subject.

The fourth prince, who also succeeded Hai-kouei-chi, was named *Hoene-tune*; he founded the fourth dynasty, (for each of these princes which we have just now mentioned, was the founder of a family or dynasty.) In the history of this king, Lopi quotes Lao-chene-tsee, who speaks thus:

"The ancient kings wore their hair dishevelled, without any ornament upon their heads. They had neither sceptre nor crown, and they governed their people in peace. Being of a beneficent disposition, they cherished all things, and put no person to death. Always giving, and never receiving any thing, their subjects, without dreading their power as masters, revered their virtue in their hearts. Then heaven and earth observed a most beautiful order, and every thing flourished in a surprising manner. The birds built their nests so low, that they might be reached with the hand; all the animal creation tamely submitted to the will of man. Then the just medium was observed, and harmony reigned over all. They did not reckon the year by the days. There was no distinction between within and without, between mine and thine. In this manner reigned Hoene-tune. But when mankind had degenerated from this happy state, birds and beasts, insects and serpents, all together, and as it were in concert, made war against them."

To this dynasty of Hoene-tune, succeeded that of Tong-hou-chi, containing seven kings which are not named. To this fifth dynasty succeeded the sixth, whose founder was Hoang-tane-chi.

The 7th, the dynasty of Ki-tong-chi \*.

The 8th, the dynasty of Ki-y-chi \*.

The

The 9th, the dynasty of Ki-kiu-chi \*.

The 10th, the dynasty of Hi-ouci-chi \*.

The 11th, the dynasty of Yeou-tsao-chi.

The 12th, the dynasty of Soui-gine.

The 13th and last, the dynasty of Yong-tching-chi.

Of these seven kings, or founders of dynasties, which remain to be considered to complete the number of dynasties included in this eighth period, nothing is said of those marked \* that has any relation to our subject.

As to Yeou-tsao-chi, founder of the eleventh dynasty, whose reign, say they, lasted more than 300 years, and whose family, they add, continued more than 100 generations during the space of 12 or 18,000 years: here is what we find recorded.

Hanc-tsee says, that, in the first ages of the world, animals multiplied very fast; and that men being but few, they could not subdue the beasts and serpents.

Yene-tsee says also, that the ancients, either perched on trees, or stretched in hollow caves, possessed the universe, (Tiene-hia, that is to say, China). These good kings (continues he) breathed nothing but charity without any shadow of hatred. They gave much, and took nothing. The people did not go to pay their court to them, but all the world submitted to their virtues.

Lopi and Ouai-ki say almost in the same words, that, in the most remote antiquity, men sheltered themselves in the hollows of rocks, that they dwelt in deserts, and lived in society with all the other creatures. They had no thought of doing any injury to the beasts, and the beasts did not think of hurting them. But in the succeeding ages they became too wise, which made the animals rebel; armed with claws, teeth, horns, and venom, they assaulted man, and man was not able to resist them. Yeou-tsao reigned then. He was the first who built houses of wood, in the form of birds nests; he persuaded men to retire into them to avoid the wild beasts. They did not know as yet how to cultivate the earth, they lived on herbs and fruits. They drank the blood of animals, they devoured their flesh quite raw, they swallowed the hair and the feathers. This is what they say of Yeou-tsao chi: after him comes Soui-gine, founder of the 12th dynasty.

Soui-gine chi is esteemed the inventor of fire.

On the summit of the mountain Pou-tcheou, says an author, are to be seen the walls of Justice. The sun and the moon cannot approach them; there is no difference of seasons there, nor vicissitudes of days and nights. This is the kingdom of light on the confines of Siouang mou. A faint (a great man) went to make a tour beyond the bounds of the sun and moon: he beheld a tree, and upon that tree a bird, who made fire come out of it by picking it. He was surprised at this; he took a branch of this tree, and from thence struck fire; from whence they called this great personage *Soui-gine*.

Other authors say also, that Soui-gine made fire with a certain kind of wood, and taught men to dress their viands. By this means all diseases, and all disorders of the stomach and bowels were prevented. In this he followed the direction of heaven, and from thence was named *Soui-gine*.

They say further, that, in the days of Soui-gine, there was much water upon the earth, and that this prince taught men the art of fishing. He must, of consequence, have invented nets or lines, which invention is after this ascribed to Fou-hi.

One Long-ma, or Dragon-horse, brought him a kind of table, and the tortoise letters. Soui-gine is the first to whom they apply this event, but the same thing will be said in the sequel of several others.

Soui-gine was the first who gave names to plants and animals; and these names (say they) were so expressive, that the nature of every thing was known by its name. He invented weights and measures for the regulation of commerce, which had been unknown before him.

Anciently (says an author) men married at fifty, and women at thirty years of age: Soui-gine shortened this period, and appointed that young men should marry at thirty, and girls at twenty.

Lastly, the Liki says, that it was Soui-gine who first taught men urbanity and politeness.

It now remains to speak of Yong tching-chi, the founder of the thirteenth and last dynasty of this period.

In his time, they used slender cords on which they tied various knots, and this served them instead of writing. But, after the invention of letters, how could they return again to the use of these cords, which is so limited and imperfect? This evidently implies a contradiction?

We come now to the ninth Ki or period, named *Chene-tong*. This ninth period will bring us down to the times of Fou hi. It comprehends twenty-one kings, whose names are as follow:

- |                            |                    |
|----------------------------|--------------------|
| 1. Sse hoang, or Tfan hie, | 12. Hiene-yuene,   |
| 2. Pe-hoang-chi,           | 13. He sou,        |
| 3. Tchong hoang-chi,       | 14. Kai-tiene,     |
| 4. Tai-ting-chi,           | 15. Tsune-liu chi, |
| 5. Kouene-liene,           | 16. Tcho jong,     |
| 6. Yene-chi,               | 17. Hao-yng,       |
| 7. Tai chi,                | 18. Yeou-tsao-chi, |
| 8. Tching hoei-chi,        | 19. Tchu-sang-chi, |
| 9. Li lou, or Hoei-chi,    | 20. Yne khang-chi, |
| 10. Sohoang chi,           | 21. Vou-hoai-chi.  |
| 11. Nuei-touane chi,       |                    |

Liu-pou ouei says plainly, that Sse-hoang made letters. This Sse-hoang, is called also *Tsang hie*. Some historians place him under Hoang-ti, whose minister they make him; while others make him a sovereign prince, and much anterior to Hoang-ti.

The first inventor of letters was Tsang-hie, then the king Vou-hoai made them be engraved on the coin, and Fou-hi used them in the public acts for the government of the empire. But observe, that these three emperors were even before Chini-nong; how can it be said then, that letters were not invented till under Hoang-ti? Such is the reasoning of Lopi, who was quite confounded with these fabulous times.

To this criticism it may be answered, You have told us, that letters had been invented in the reign of Soui-gine, the 12th king of the eighth period; how then can you pretend to give the honour of this invention to

Tsang-

T'ang-hie, who, according to your own testimony, did not flourish till the ninth period? However this may be, S'fee-hoan (say some romancers) knew to form letters the moment he was born. He was endowed with great wisdom, &c. After he had received the Ho-ton, he visited the south, went upon mount Yang-yu, and stepped on the bank of the river Lo. A divine tortoise carrying blue letters upon his shell, delivered them to him: then S'fee-hoan penetrated all the changes of heaven and earth; above he observed the various configurations of the stars; below he examined all the marks he had seen upon the tortoise; he viewed the plumage of birds, he took notice of the mountains, and of the rivers which flow from them, and of all this he composed letters. Some very learned Chinese think, that this was the ancient kind of writing named *Ko-tesu-chu*, which continued (say they) to the reign of the emperor Suene-ouang, that is, to the year 827 before J. C.

But Cong-yng-ta very well observes, that though the external figures of the letters have changed several times in some things, the six rules on which T'ang-hie formed them, have never suffered any change.

Then (continues Lopi) there was a difference between the sovereign and the subject, relation between the father and the son, distinction between the precious and the vile; laws appeared, rites and music reigned. Punishments were inflicted with vigour. Thus S'fee-hoan laid the foundations of good government, he appointed officers for each affair, the smallest did not escape him; and thus heaven and earth arrived at their full perfection.

They say nothing of the successor of S'fee-hoan which has any relation to our subject; but they say, that, under the reign of Tchong-hoang-chi, the third king of this period, they still used slender cords for writing.

From this prince we come at once to Hiene-yuene, the 12th in order of this period, because nothing is said of his predecessors.

We find a great many things under the reign of this prince, because he is the same with Hoang-ti, or at least they have confounded these two princes together.

They ascribe to Hiene-yuene the invention of cars. He joined two pieces of wood together, the one placed upright, and the other across, to the honour of the Most High. It is from this he is called *Hiens yuene*. The piece of wood placed across is called *hiene*, and that which is placed upright is called *yuene*. Hiene-yuene struck copper money, and made use of the balance to determine the weight of things. By this means he ruled the world in peace. *Ho* signifies merchandise in general. Formerly they wrote simply *hoa*, which signifies exchange. These merchandises (say they) consisted in metal, *kine*, in precious stones, *yu*, in ivory, *tchi*, in skins, *pi*, in coined money, *tsuene*, and in stuffs, *pou*, &c.

They then denominated money (as is done still) by the name of the reigning family. That of Hiene-yuene was one inch seven lines, and weighed twelve *tchu*, [the *tchu* is the 20th part of a *yo*, and a *yo* weighs 1200 little grains of millet]. They then engraved letters on their money (as is still done at present.) It is for this reason that *van-tsee*, letters, signifies also a piece of money, which is called likewise *kini*, and *tsuene*, and *tao*.

VOL. II. No. 38.

3

Tcho-jong (16th emperor of the 9th period) hearing, at Cane-tcheou, the singing of birds, composed a music of union, whose harmony penetrated every where, touched the intelligent spirit, and calmed the heart of man, in such a manner, that the external senses were sound, the humours in equilibrio, and the life very long. He called this music *T'jie-ouene*, that is to say, temperance, grace, and beauty.

But the design, and in some sort the only aim of the ancient music of the Chinese, according to their authors, was the harmony of the virtues, the moderation of the passions, elegance of manners, and, in a word, every thing that can contribute to the perfection of a good and wise government, &c. For they were persuaded that music was capable of working all these miracles. It is difficult for us to believe them in this, especially when we consider the music which is at present used among them. But we appeal to the Greeks, who related as astonishing effects from this agreeable invention, whilst the modern Greeks, like most part of the Orientals, have no music but a wretched and contemptible monotony.

The 17th king of the 9th period is named *Hao-yng*. In his time they cut down the branches of trees to kill beasts with. Men were few. Nothing but vast forests were every where to be seen, and these frightful woods were filled with wild beasts. How contradictory is this, and how incompatible with the times in which this prince is said to have reigned!

The 18th king of the 9th period is called *Yeu-t'fao-chi*. We have seen in the preceeding period, a prince of the same name. The Ouai-ki places this king at the beginning of the last ki, and gives him for successor Soui-gine. At this rate, nine entire periods, or ki, must have elapsed before men knew how to build huts, or had the use of fire. Lopi follows another method: he has ranged Yeou-t'fao-chi and Soui-gine in the preceeding period; and although the king we are now speaking of bears the same name; he speaks of him quite differently.

The 19th king of the 9th period is named *Tchu-siang-chi*.

They say, that he commanded S'fee-kouei to make a kind of guitar with five strings named *se*, to remedy the disorders of the universe, and preserve every thing that had life.

The 20th king of the 9th period is named *Yne-khang-chi*.

In his time, the waters did not flow, the rivers did not pursue their usual course, which occasioned a great number of diseases.

Yne-khang instituted the dances called *Ta-vou* (grand dances), with a view to preserve health: for, as Lopi says, when the body is not in motion, the humours have not a free course; matter is amassed in some part, from whence come diseases, which all proceed from some obstruction.

The Chinese also imagine, that a man's virtues may be known by his manner of touching the lute and drawing the bow, &c.

Thus the Chinese make dances as well as music have a reference to good government; and the Liki say, that

†

3 B

that

that we may judge of a reign by the dances which are used in it.

The 21st and last king of the 9th period is named *Vou-boai-chi*; but they relate nothing of this prince which is worthy of notice.

2. This is all that the fabulous times contain. If these times cannot enable us to fix the real epocha of various inventions, (as the Chinese are so full of contradictions about the time of these different discoveries), we see at least from them, that the origin of arts has been much the same among them as among other nations. We are now come down to Fou-hi, who is considered by the Chinese historians as the founder of their monarchy. What they say of this prince and his successors, has some more solidity in it than what we have hitherto seen.

### F O U H I.

The Ouai-ki, quoted in the Chinese annals, thus describes the manners of mankind in these days. "In the beginning, men differed nothing from other animals in their way of life. As they wandered up and down in the woods, and women were in common, it happened that children never knew their fathers, but only their mothers. They abandoned themselves to lust without shame, and had not the least idea of the laws of decency. They thought of nothing but sleeping and snoring, and then getting up and yawning. When hunger pressed them, they fought for something to eat; and when they were glutted, they threw the rest away. They eat the very feathers and hair of animals, and drank their blood. They clothed themselves with skins quite hairy. The emperor Fou-hi began by teaching them to make lines for catching fish, and snares for taking birds. It was for this, that this prince was named *Fou hi-chi*. He taught them further to feed domestic animals, and to fatten them for slaughter; for which they gave him the surname of *Poa-hi-chi*."

It seems evident, that the ancient Chinese had at first no other habitation than caves, the hollows of rocks, and natural dens. They were then infected with a kind of insect or reptile called *iang*; and when they met they asked one another, Are you troubled with *iangs*? To this day they make use of this expression, in asking after any person's health; *Couei-iang*? What disease have you? How do you do? *Vou-iang*. I am without *iang*; that is to say, I am hearty, in perfect health, without any ailment.

It would be superfluous to relate here, what the Chinese say, in their annals, of the invention of characters, and of *coua*, after what hath been said by F. Couplet and so many others on that subject. We shall only add, that the treatise *Hu-fee* bears, that, at the beginning nations were governed by means of certain knots which they made on slender cords: that afterwards the saint introduced writing in their place, to assist the mandarins in performing all their offices, and the people in examining their conduct; and that it was by the sym-

bol ——— *Kouai*, that he conducted himself in the execution of his work.

Lopi, whom we have so often quoted already, says, that Fou-hi extracted from the symbol of six lines every thing that concerned good government. For example,

Li gave him the hint of making lines for hunting

and fishing, and these lines were a new occasion of inventing stuffs for garments. Lopi adds, that it is a mistake to imagine, that, in the times of Fou-hi, they still used cords tied and knotted, and that books were not introduced till under Hoang-ti.

Fou-hi taught men to rear the six domestic animals, not only for food, but also for victims, in the sacrifices which they offered to *Chine*, and to *Ki*. They pretend that Fou-hi regulated the rites *Kiao-chene*.

Fou-hi also instituted marriage; before this the intercourse of the sexes was indiscriminate; he settled the ceremonies with which marriages were to be contracted, in order to render this great foundation of society respectable. He commanded the women to wear a different dress from that of the men, and prohibited a man's marrying a woman of the same name, whether a relation or not, a law which is actually still in force.

Fou-hi appointed several ministers and officers to assist him in the government of the empire.

One of these officers made the letters, another drew up the calendar, a third built the houses, a fourth practised medicine, a fifth cultivated the ground, a sixth was the master of the woods and waters.

They pretend that Fou-hi applied himself very much to astronomy. The Tcheou-pi-souane says, that he divided the heavens into degrees. Lopi takes notice, that properly the heavens have no degrees, but that this term is used with relation to the path of the sun in the course of a year.

The period of sixty years is reckoned due to Fou-hi. The Thiene-piene says plainly, that this prince made a calendar to fix the year, and that he is the author of *Kia-tse*. The Sane-fene says the same thing; and the Hane-li-tchi says, that Fou-hi made the first calendar by the *Kia-tse*; but the Chi-pene ascribes this to Hoang-ti. This is one of these contradictions so common in the Chinese historians.

The same Fou hi, they say, made arms, and ordained punishments. These arms were of wood, those of Chin-nong were of stone, and Tchi-yeou made some of metal.

Fou-hi drained off the waters, and surrounded the cities with walls. In the mean time, as Chin-nong is esteemed the first who made walls of stone, we must suppose that those raised by Fou-hi were only of earth or brick.

Fou-hi gave rules to music. Those who ascribe this fine art to Hoang-ti are deceived (or *vice versa*.) After Fou-hi had invented fishing, he made a song for the fishers. It was from his example that Chin-nong made one for the labourers.

Fou-hi took of the wood of Tong; he made it hollow; and of it made a *kine* (a lyre, or what you please to translate it) seven feet two inches long; the strings were of silk, to the number of 27; he commanded this instrument to be named *Lj*. Others say it had but 25 strings,

strings, others 10, and others only 5; (which of them shall we believe?) Besides, others make this instrument only three feet six inches six lines in length.

Fou hi made this instrument, say some, to ward off enchantments, and banish impurity of heart.

He took of the wood of *jung*, and made also a guitar of 36, or rather of 50 strings. This instrument served to adorn the person with virtues, and to regulate the heart, &c. Lastly, he made a third instrument of baked earth; after which, say they, ceremonies and music were in high esteem.

The money which Fou-hi introduced, was of copper; round within to imitate heaven, and square without to resemble the earth.

He himself made trial of many medicinal plants. (This is most commonly said of Chin-nong: but it is pretended, that Chin-nong finished what Fou-hi had begun.)

This is all we read of Fou-hi. Several contradictions will be remarked in most of these traditions, especially when we come to see in the sequel, that almost all these inventions are ascribed to the successors of Fou-hi. From hence may be judged what regard is due to the beginnings of the Chinese history.

We have still some reigns to examine, before we have done with the fabulous and uncertain times.

They say of Koung-koung, that he employed iron in making hangers and hatchets.

They ascribe to Niu-oua (who is the Eve of the Chinese) several instruments of music. The instruments *senq* and *hoang* served her, say they, to communicate with the eight winds. By means of *kouene*, or double fluter, she united all sounds into one, and made concord between the sun, moon, and stars. This is called *perfect harmony*. Niu-oua had a guitar (*je*) of five strings; she made another of 50 strings, whose sound was so affecting, that it could not be borne; wherefore she reduced these 50 strings to 25, to diminish its force.

The emperor Chin-nong is very famous among the Chinese, by the great discoveries which, they say, he made in medicine, agriculture, and even in the military art, since they believe, that, in the times of *Han*, they had a book of this prince on the military art.

A fondness for the marvellous has made some say, that, at three years of age, he knew every thing that concerned agriculture. The very name *Chin-nong*, in the Chinese language, signifies, *the spirit of husbandry*. Chin-nong took very hard wood, of which he made the coulter of the plough, and softer wood of which he made the handle. He taught men to cultivate the earth. They ascribe to him the invention of wine. He sowed the five kinds of grains on the south of Mount Ki, and taught the people to make them their food.

Chin-nong commanded that they should be diligent in gathering the fruits which the earth produced. He taught every thing relative to hemp, to the mulberry tree, and the art of making cloth and stuffs of silk. They owe also to Chin-nong the potters and the founders art; others, however, ascribe pottery to Hoang-ti, and the art of melting metals to Tchi-yeou.

Chin-nong invented fairs in the middle of the day. This was the origin of commerce and mutual exchange.

He made use of money to facilitate trade. He instituted festivals.

Chin-nong distinguished plants, determined their various properties, and applied them skilfully in the cure of diseases. They say, that, in one day, he made trial of 70 kinds of poisons, spoke of 400 diseases, and taught 365 remedies. This makes the subject of a book, intitled, *Pouen-tsao*, which they ascribe to him, and which contains four chapters. Others allege, and with reason, that this book is not ancient. They say, with as little truth, that Chin-nong made books engraved on square plates.

Chin-nong commanded Tsiou-ho-ki to commit to writing every thing relative to the colour of sick persons, and what concerned the pulse, to teach how to examine its motions if they were regular and harmonious, and, for this end, how to feel it from time to time, and acquaint the patient.

Chin-nong composed ballads or songs on the fertility of the country. He made a very beautiful lyre, and a guitar adorned with precious stones, to form the grand harmony, to bridle concupiscence, to elevate virtue to the intelligent spirit, and bring men back to the celestial verity.

Chin-nong ascended a car drawn by five dragons. He was the first that measured the figure of the earth, and determined the four seas. He found 900,000 lys is west, and 850,000 is north and south. He divided all this vast space into kingdoms.

Among the successors of Chin-nong they place Hoang-ti, and the rebel Tchi-yeou, whom they make the inventor of arms of iron, and several kinds of punishments. Tchi-yeou had the power of raising mists and darkness extremely thick. Hoang-ti knew not how to attack and overcome him. He accomplished it, however, by forming a car, on which he placed a figure whose arm of itself always turned to the south, in order to point out the four regions. Hoang-ti used the lance and buckler.

Tchi-yeou ordered sabres, lances, and cross-bows to be made. They ascribe to Hoang-ti the *kia-tse*, or cycle of 60 years; or at least Ta-nao, made it by his direction.

The Mandarin Tsang-kiai was charged to compose history. Yong-tcheng made a sphere which represented the celestial orbs, and discovered the polar star.

Li-cheou regulated numbers, and invented an instrument for computation, like to, or the same with that which is still in use in China and India; and of which Martini, in his *Decades*, and la Loubere, in his *voyage to Siam*, have given us the design and description.

Ling-lune, a native of Yuene yu, in the west of Tachia, (that is, Khorassan), took reeds in the valley of Hiai-ki; he cut two of an equal length, and blew into them: this gave occasion to the invention of bells. He adjusted twelve of these reeds to imitate the song of song-hoang, the royal bird, (one of the fabulous birds of the Chinese). He divided these reeds into twelve *lu*; six served to imitate the song of the male, and six that of the female. Finally, this man brought music to perfection, and explained the order and arrangement of different sounds. By means of these *lu-lu*, he governed the

the Kli of the Yne and of Yang, he determined the change of the four seasons, and gave calculations for astronomy, geometry, and arithmetic.

Yong yuene, by order of Hoang-ti, made twelve bells of copper, which corresponded to the moons, and served to adjust the five tones, and fix the seasons, &c. fables.

Hoang ti invented a kind of diadem or tiara, called *Allice*. He ordered a blue and yellow robe to be made for himself, in imitation of the colours of heaven and earth. Having viewed the bird *hoei*, and considered the variety of its colours, as well as those of the flowers, he made garments be dyed of different colours, to make a distinction between the great and small, the rich and poor.

Nin-fong and Tche-tsiang invented mortars for pounding rice; kettles or caldrons: they invented the art of building bridges, and of making shoes; they made coffins for the dead; and men reaped great advantages from all these inventions. Hoi invented the bow, Y-meou arrows; Khy-pe invented the drum, which made a noise like thunder, trumpets and horns, which imitated the voice of the dragon.

Kong kou and Hoa-hu, by order of the Emperor Hoang ti, hollowed a tree of which they made a ship; of the branches of the same tree they made oars; and by this means they were able to penetrate into places which seemed inaccessible, and where men had never been.

For the transportation of merchandize by land, they also invented chariots under this reign, and trained oxen and horses to draw them.

Hoang-ti also turned his thoughts to buildings, and gave models of them. He built a temple, called *Hokong*, in which he sacrificed to *Chang-ti*, or to the Supreme Being.

With a view to facilitate commerce, Hoang-ti struck money, called *kine-tao*, *knife of metal*, because it had the shape of the blade of a knife.

Hoang-ti having observed that men died before the time fixed by nature, of diseases which carried them off, he commanded Yu-fou, Ki-pe, and Lei-kong, three famous physicians of these times, to assist him to determine what remedies were proper for each disease.

Si-ling-chi, the chief consort of that emperor, contributed on her part to the good of the state, and taught the people the art of rearing silk-worms, of spinning their cots, and making stuffs of them.

The Ouai-ki takes notice, that Hoang-ti commanded China to be measured, and divided into provinces or tcheou. Each *tcheou* was composed of ten *che*, each *che* was composed of ten *tau*, and each *tau* contained ten *ye*, or ten cities. These ten *ye*, or cities, had each five *ly*, or streets, &c.

The empire of Hoang-ti, which, according to this historian, seems to have been considerable, extended on the east to the sea, on the west to Khong tong. It was bounded on the south by Kiang, and on the north by the country of Hoene-jo.

They say nothing that has any relation to the arts under the three princes who follow Hoang-ti; that is to

say, under the reigns of Chao-hao, who reigned 84 years; of Tchouene-hio, who reigned 78 years; and of Cao fine, who reigned 70 years. They observe only, that Chao-hao made them beat the watches with a drum: this supposes that they had then some instrument for marking the hours. The Se-ki adds, that this emperor levelled the highways, in order to render the mountains accessible, and that he cleared the channels of rivers. He made also a new kind of music, called *Ta yuene*, to unite men and genii, and reconcile high and low.

3. After having overcome the fatigue of so many fabulous traditions, we now come to the historical times. But before we enter upon them, it will not be improper to make some reflections which are absolutely necessary to shew how little regard is due to this sort of traditions. These reflections are thought to be so much the more important, as they will help to undeceive a great many people of the mistake they are in about the Chinese antiquities.

The Chinese monarchy begun by three princes, distinguished by the title of *Sane-hoang*, that is to say the *three Augusti*. These three Augusti, according to the most generally received opinion, are *Fou-hi*, *Ching-nong*, and *Hoang-ti*. The five emperors, successors of the Sane-hoang, are distinguished by the title of *Ou-ti*, that is to say, the *five emperors*. The five emperors are, *Chao-hao*, *Tchouene-hio*, *Tico*, *Yao*, and *Chune*. This division has been followed by Cong-ngane-coue, the great-grandson of Confucius, in the eighth generation, and one of the most celebrated writers of the dynasty of Hane. It has been adopted also by Hoang-fou-mi, and by most part of the best writers. The proofs of this opinion are taken partly from the book *Tcheou li*, an ancient record, or state of the empire, which many ascribe to the famous Tcheou-cong, minister and brother of Vou-vang, who was the founder of the imperial dynasty of Tcheou, eleven hundred and some odd years before the Christian æra; partly from the commentaries of Tso-kieou-mine on the Tchune-tsieou of Confucius's master. In these works, mention is made of the books, *Sane-fene*, and *Ou-tiene*, which, they say, are the histories of the three Hoang, and of the five Ti: now, the two first chapters of Chou-king, which contain an extract of the histories of Yao and of Chune, bore the title of *Tiene-yao* and *Tiene-Chune*; from whence it was concluded, that Yao and Chune were two of the five Ti; consequently Fou-hi, Ching-nong, and Hoang-ti, were what are called the three Hoang; and Chao-hao, Tchouene-hio, Tico, Yao, and Chune, were the five Ti.

These may perhaps be thought but feeble proofs to support an historical fact of this kind; but those who are of a contrary opinion, bring nothing to induce us to believe them, rather than Cong-ngane-coue and Hoang-fou-mi.

Hou-chouang-hou, in a preface before the *Tsiene-piene* of Kine-gine-chane confesses, that we find in the *Tcheou-li*, the existence of the book of three Hoang, and that of five Ti: but he adds, that we do not find there the names of these eight monarchs; that, under the Tsin, they spoke of *Tiene hoang*, of *Ti-hoang*, and of *Gine hoang*; that Cong-ngane-coue, in his preface to Chou-

Chou-king, gives Fou hi, Chine nong, Hoang-ti, for the three Hoang, and that he takes Chao-hao, Tchouene-hio, Tio, Yao, and Chune for the five Ti; but that we know not on what foundation he does this, since Confucius, in the Kia-yu, distinguishes by the title of *Ti*, all the kings after Fou hi. The same thing is proved by some passages of Tso-chi and of Liu-pou-ouei; from whence they conclude, that Fou-hi, Chine-nong, and Hoang ti are not the three Hoang, and that there are no other Hoang but heaven, earth, and man.

Tchine-huene retrenches Hoang-ti from the number of the Sane hoang, and puts in his place Niu-oua, whom he ranges between Fou-hi and Chine nong. Others strike out Niu-oua, and put Tcho-yong in the place of Hoang-ti. Niu-oua was the sister of Fou hi, and Fou-hi, they say, reigned 115 years. At what age must this princess have mounted the throne, for they make her succeed her brother?

The famous Se ma-tsiene, to whom the Chinese, from their high esteem of him, have given the name of *Tai sseng*, or *father of history*, will have Hoang-ti, Tchouene-hio, Cao-sine, Yao, and Chune to be the five Ti; and he gave these princes for their predecessors Soui-gine chi, Fou-hi, and Chine-nong, who, according to him, were the three Hoang. This opinion, since his time, has been embraced by several other writers, who depended upon his authority more than upon proofs which he could not produce.

Confucius says in his Kia yu, that the princes who had governed the empire began at Fou hi to take the name of *Ti* or Emperor. The same philosopher says further, in the treatise Hi-tsee, or commentary upon the Y-king, that anciently Fou hi governed China, that Chine nong succeeded him, that after them Hoang-ti, Yao, and Chune were seated on the throne. From so decisive a testimony, Hou-ou-sang, and several others with him, have not doubted, that these five princes named by Confucius were the Ou-ti, or five emperors. As to the Sane-hoang, they admitted Tiene-hoang chi, Ti-hoang chi, Gine-hoang chi, as three chiefs of the people who had governed the empire before Fou-hi.

As it is from Tao-ssé, that the several authors we have now quoted, have borrowed their idea of this chimerical division of the eight first Chinese emperors, into three Hoang and five Ti, it is necessary to relate what these religious think themselves. They have opinions peculiar to themselves about these first ages of the monarchy. They believe, that at the first there were three Augusti, Sane-hoang; then five emperors, Ou ti; next three kings, Sane-vang; and lastly, five Pa, Ou-pa; that is to say, five chiefs of Regulos.

This order so regularly observed of three and then five, which is repeated twice shews plainly, that all this has no foundation in truth, but that it is a system invented at pleasure. Wherefore Tou-chong-chu, who lived under the Hane, explained this in an allegorical manner. The three Hoang were, according to him, the three powers, (heaven, earth, and man); The five Ti were the five duties (the duties of king and subject, of father and children, of husband and wife, of elder and younger brothers, of friends); the three Vang were the three

lights, (sun, moon, and stars); finally, the five Pa were the five mountains, four of which are situated at the four cardinal points of the empire, and the fifth at the centre. Thus Tong-tchong-chu allegorized this pretended succession of kings. But Lopi, who relates this explanation, adds, it was not his own. This is a point of criticism of little importance to us; let them, if they please, ascribe it to some other than Tong-tchong-chu; we have still ground to say, that it came from some writer who lived in an age not far from that of Tong-tchong-chu. This is enough for our present purpose, since we see from hence the little regard they then paid to this division, which they considered as chimerical. It would be in vain to attempt to reconcile all these contradictions. All these imaginary reigns are in the manner of the Tao-ssé, who have darkened the origin of the Chinese monarchy by their fables and mythology. The ten Ki or periods are of their inventing; they gave them between two and three millions of years duration. But before these ten periods, they place three dynasties, viz. the dynasty of Thiene-hoang-chi, that of Ti hoang-chi, and finally, that of Gine-hoang-chi. If we attend to the signification of these names, they must be interpreted thus: the *Sovereign of heaven*, the *Sovereign of earth*, the *Sovereign of men*. We see from hence, that the allegorical explanation of Tong-tchong chu, which made the three Hoang signify the three powers, that is, heaven, earth, and man, is not without probability.

These three Hoang succeeded to Pouane-cou, otherwise Hoene tune, the chaos, the origin of the world, which several of the Tao ssé take for the first man, or the first king who governed China.

The dynasty of Thiene-hoang-chi had thirteen kings, who reigned, say they, 18,000 years; then came the dynasty of Ti-hoang-chi, whose kings, to the number of eleven, make up a like duration of 18,000 years. Finally, to Ti-hoang-chi succeeded the Gine-hoang-chi, whose dynasty, composed of nine kings, furnishes a space of 45,600 years. These three sums added, give us precisely 81,600 years. But if we add to these three dynasties, those which are comprehended in each of the ten Ki, and which amount, according to some calculations, to more than 230; we shall find that the pretensions of the Chinese very much exceed those of the Chaldeans and Egyptians. For if we believe the calculations of various authors, from Pouane-cou to the death of Confucius, which happened in the year 479 before J. C. there is elapsed 276,000 years, or 2,276,000, or 2,559,860, or even 3,276,000; or, finally, which is a great deal more, 96,961,740 years: for we find all these different calculations.

It is visible enough, that these extravagant numbers can be nothing else but astronomical periods, contrived to give the conjunction of the planets in certain constellations, or calculations which have some relation to the ideas of the Tao ssé, concerning the perpetual destructions and reproductions of worlds. In fact, some have endeavoured to make these numbers agree with the period of Tchao-cang-tsie, a famous philosopher in the days of Song, who had undertaken to determine the period of the duration of the world; for the system of the de-

struction and reproduction of worlds was very current, not only in the sect of Ju or of the learned, but also among the Bonzes, Ho-chang or the religious of Fo. and among the Tao-ssé or followers of Lao Kiune, that is to say, among the three great sects. who have the most influence in the empire. Tchao-cang tse established then a great period of 129 000 years, called *Tuene*, composed of twelve equal parts. called *hoei*, or *conjunctions*, which were each of 10,800 years. In the first conjunction, said he, heaven was formed by little and little, by the motion which the Tai ki, or the Supreme Being, impressed upon matter which was formerly at perfect rest. During the second conjunction, the earth was produced in the same manner. At the middle of the third conjunction, man and all other beings began to spring up, in the manner that plants and trees are produced in the islands, which afterwards preserve their several kinds by their seeds. At the middle of the eleventh conjunction, all things shall be destroyed, and the world shall fall back again into its primitive chaos; from whence it shall not arise till after the twelfth conjunction is expired.

It is not difficult at present to conceive, that the Tao-ssé had invented that prodigious number of reigns before Fou-hi, for no other reason, but to fill up that interval, which, according to them, had elapsed from the production of man, to the beginning of the Chinese monarchy, that is to say, to the reign of Fou hi. The same calculator determined the half of Yuene, or of his great period of 129,000 years, at the reign of Yao.

These Tao-ssé, as was said already, laid down these ten ages or ten Ki as an indisputable principle; each Ki comprehended several dynasties, whose duration they determined as they thought fit, and as their calculation required: but if they were at liberty to increase or diminish the duration of the ten Ki, it was not the same as to their number, which was in some sort a fundamental principle of their sect, from which they were not allowed to depart.

Some missionaries, to whom this doctrine of Tao-ssé was not unknown, imagined, that they discerned in these ten Ki, the ten generations before Noah. and as the writers cited by Lopi, and by Cong-ing-ta, say; that of these ten Ki, six were before Fou he, and four after him; these same missionaries have imagined, that Fou-hi was Enoch. It must be owned, in the mean time, that Tchine-huene and several others do not observe the same order; that they place Chine-noug in the ninth Ki, Hoang-ti in the tenth, &c. By this computation Hoang-ti would be Noah, and Fou-hi Methuselah, which contradicts their hypothesis.

The opinion which considers the ten Ki of the Chinese as the ten generations which preceded Noah, is very ingenious, and not improbable. Towards the end of the reign of Tcheou, about 300 years before the Christian æra, some Jews travelled into China, who might have made the writings of Moses known there, and, of consequence, the ten generations which preceded the deluge: besides, this knowledge was common to the Chaldeans, who might have penetrated into China before the Jews.

CHINEY, a city of the Austrian Netherlands, on the confines of the bishopric of Liege, about twelve miles south-east of Namur: E. long. 5°, N. lat. 50° 20'.

CHINON, a town of France in the province of the Orleanois, about twenty three miles south-west of Tours; E. long. 20', and N. lat. 47° 15'.

CHIO, CHIOS, XIO, or SCIO, an Asiatic island, lying near the coast of Ionia, in Natolia or Lesser Asia, about one hundred miles west of Smyrna. It is called by the Turks Sakisaduci, and is about one hundred miles in circumference; being chiefly inhabited by Christians of the Greek church, who are said to have three hundred churches in the island.

CHIO is also the capital of the above island, situated on the east coast: E. long. 27°, and N. lat. 38°.

CHIONANTHUS, or SNOW DROP TREE, in botany, a genus of the diandria-monogynia class. The calix divided into four oval segments; and the drupa contains but one seed. There are two species, viz. the virginica and zeylonica, both natives of the Indies.

CHIOZZO, or CHIOGGIO, a town on an island of the same name, in the gulph of Venice, by which there is a passage into the Lagunes situated about twelve miles south of the city of Venice.

CHIPPENHAM, a borough town in Wiltshire, about twenty two miles north west of Salisbury: W. long. 2° 12', and N. lat. 51° 25'. It sends two members to parliament.

CHIPPING, or MUCH-WICCOMB, a borough town of Buckinghamshire, about ten miles south of Aylesbury: W. long. 42', and N. lat. 51° 35'. It sends two members to parliament.

CHIROGRAPHY, a writing under one's own hand.

CHIROMANCY, a species of divination, drawn from the different lines and lineaments of a person's hand; by which means, it is pretended, the inclinations may be discovered.

CHIRONIA, in botany, a genus of the pentandria monogynia class. The corolla is rotated; the pistillum declines; the stamens are inserted into the tube of the corolla; the anthers are spiral; and the pericarpium is bilocular. There are eight species, none of them natives of Britain.

CHIRONOMY, in antiquity, the art of representing any past transaction by the gestures of the body, more especially by the motions of the hands: this made a part of liberal education; it had the approbation of Socrates, and was ranked by Plato among the political virtues.

CHIROTONY, among ecclesiastical writers, denotes the imposition of hands used in conferring priestly orders.

However, it is proper to remark, that chirotomy originally was a method of electing magistrates, by holding up the hands.

CHIRVAN, a province of Persia, lying on the western coast of the Caspian sea.

CHIRURGERY. See SURGERY.

CHISLEY-LAND, in agriculture, a soil of a middle nature between sandy and clayey land, with a large admixture of pebbles.

CHISSEL,

**CHISSEL**, an instrument much used in carpentry, masonry, joinery, sculpture, &c. and distinguished according to the breadth of the blade into half-inch chisels, quarter-inch chisels, &c. They have also different names according to the different uses to which they are applied; as, 1. The former, used by carpenters, &c. just after the work is scribed: it is struck with a mallet. 2. The paring-chisel, which is used in paring off the irregularities made by the former: this is pressed with the workman's shoulder. 3. The skew-former cleanses acute angles with the point of its narrow edge. 4. The mortice chisel, used in cutting deep square holes in wood, for mortices: it is narrow, but thick and strong, to endure hard blows. 5. Socket-chisels, having their shank made with a hollow socket at top, to receive a strong wooden sprig fitted into it with a shoulder. 6. Ripping chisel, having a blunt edge, with no basil, used in tearing two pieces of wood asunder. And, 7. the gouge. See **GOUGE**.

**CHITAU**, in the materia medica, a kind of lignum-aloes, of a reddish colour. See **LIGNUM-ALOES**.

**CHIVALRY**, in law, is a tenure of service, whereby the tenant is bound to perform some noble or military office to his lord; and is either regal, when held only of the king; or common, such as may be held of a common person as well as the king: the former is properly called *seignieury*, and the latter *escheage*.

A statute of Charles II. abolishes all tenures by chivalry, in capite, &c. and ordains that all tenures shall be construed to be free and common socage.

**CHIVES**, in botany. See **ANTHERÆ**.

**CHIUSI**, a city of Italy. in the dutchy of Tuscany, situated on the confines of the pope's territories, about thirty-five miles south-east of Sienna: E. long. 13°, and N. lat. 33°.

**CHLAMYS**, in antiquity, a military habit worn by the ancients over the tunic. It belonged to the patricians, and was the same in the time of war that the toga was in the time of peace. This sort of gown was called *picta*, from the rich embroidery with figures in Phrygian-work; and *purpurea*, because the ground-work was purple. The *chlamydes* of the emperors were all purple, adorned with a golden or embroidered border.

**CHLORIS**, in ornithology, the trivial name of a species of *Loxia*. See **LOXIA**.

**CHLOROSIS**, in medicine, a disease commonly called the green-sickness, incident to young girls. See **ME-DICINE**.

**CHOCOLATE**, in commerce, a kind of paste, or cake, prepared of certain ingredients, the basis of which is the cacao-nut.

The Indians, in their first making of chocolate, used to roast the cacao in earthen pots; and having afterwards cleared it of the husks, and bruised it between two stones, they made it into cakes with their hands. The Spaniards improved this method: when the cacao is properly roasted, and well cleaned, they pound it in a mortar, to reduce it into a coarse mass which they afterwards grind on a stone, till it be of the utmost fineness: the paste being sufficiently ground, is put quite

hot into tin moulds, in which it congeals in a very little time. The form of these moulds is arbitrary; the cylindrical ones, holding two or three pounds, are the most proper, because the bigger the cakes are, the longer they will keep. Observe, that these cakes are very liable to take any good or bad scent, and therefore they must be carefully wrapt up in paper, and kept in a dry place. Complaints are made, that the Spaniards mix with the cacao nuts too great a quantity of cloves and cinnamon, besides other drugs without number, as musk, ambergrise, &c. The grocers of Paris use few or none of these ingredients; they only chuse the best nuts, which are called *Caracca*, from the place from whence they are brought, and with these they mix a very small quantity of cinnamon, the freshest vanilla, and the finest sugar, but very seldom any cloves. Among us in England, the chocolate is made of the simple cacao, excepting that sometimes sugar, and sometimes vanilla is added.

Chocolate ready made, and cacao paste, are prohibited to be imported from any part beyond the seas. If made and sold in Great Britain, it pays inland-duty 1 s. 6 d. per lb. avoirdupoise: it must be inclosed in papers containing one pound each, and produced at the excise-office, to be stamped. Upon three days notice given to the officer of excise, private families may make chocolate for their own use, provided no less than half an hundred weight of nuts be made at one time.

**CHOENIX**, a dry measure, containing a forty-eighth part of a medimnus, or six bushels. Hence the celebrated proverb of Pythagoras, *Super chœnice ne jedas*.

**CHOIR**, that part of the church or cathedral where choiristers sing divine service: it is separated from the chancel, where the communion is celebrated; and also from the nave of the church, where the people are placed: the patron is said to be obliged to repair the choir of the church.

**CHOLEDOCHUS**, in anatomy. See Vol. i. p. 265.

**CHOLER**. See **BILE**.

**CHOLERA morbus**, in medicine. See **MEDICINE**.

**CHONDRILLA**, in botany, a genus of the syngenesia polygamia æqualis class. The calix is caliculated; the receptacle is naked; the pappus is simple, and furnished with a stipes; and the floscules are numerous. There is but one species, viz. the *jancœa*, a native of Germany.

**CHONDROPTERYGII**, in ichthyology, a term formerly applied to the order of fishes, now called *amphibia nantes* by Linnæus. See **AMPHIBIA**.

**CHOPIN**, or **CHOPINE**, a liquid measure, used both in Scotland and France, and equal to half their pint. See **PINT**, and **MEASURE**.

**CHORASSAN**, a province of Persia, on the north-east, adjoining to Ubec Tartary; this was the ancient *Bactria*, and the native country of the late Kouli Kan.

**CHORD**, in geometry, a right line drawn from one part of an arch of a circle to the other. Hence,

**CHORD of an arch** is a right line joining the extremes of that arch. See **TRIGONOMETRY**.

**CHORDS**,

**CHORDS**, or **CORDS**, in music, are strings, by the vibration of which the sensation of sound is excited, and by the divisions of which the several degrees of tune are determined.

**CHORD** is also used in music for the note or tone to be touched or sounded: in this sense the fifth is said to consist of five chords or sounds.

**CHORDAPSUS**, in medicine, a disease of the intestines, when to the touch they feel like stretched cords: it is the same with the ilac passion.

**CHORDEE**, in medicine and surgery, a symptom attending a gonorrhœa, consisting in a violent pain under the frenum, and along the duct of the urethra, during the erection of the penis, which is incurvated downwards. These erections are frequent and involuntary. See **MEDICINE**.

**CHOREUS**, in ancient poetry. See **TROCHEE**.

**CHORGES**, or **GORGES**, a town of Dauphiny, in France, about six miles east of Gap: E. long. 6°, and N. lat. 44° 36'.

**CHORIAMBUS**, in ancient poetry, a foot consisting of four syllables, whereof the first and last are long, and the two middle ones are short; or, which is the same thing, it is made up of a trochæus and iambus: such is the word *nōbilitās*.

**CHORION**, in anatomy, the exterior membrane which invests the fœtus in the uterus.

**CHOROBATA**, or **CHOROBATES**, a kind of water-level among the ancients, of the figure of the letter T, according to Vitruvius's description.

**CHOROGRAPHY**, the art of making a map of some country or province.

**CHORUS**, in dramatic poetry, one or more persons present on the stage during the representation, and supposed to be by-standers without any share in the action.

Tragedy in its origin was no more than a single chorus, who trod the stage alone, and without any actors, singing dithyrambics or hymns in honour of Bacchus. Thespis, to relieve the chorus, added an actor, who rehearsed the adventures of some of their heroes; and Æschylus, finding a single person too dry an entertainment, added a second, at the same time reducing the singing of the chorus, to make more room for the recitation. But when once tragedy began to be formed, the recitative, which at first was intended only as an accessory part to give the chorus a breathing time, became a principal part of the tragedy. At length, however, the chorus became inserted and incorporated into the action: sometimes it was to speak, and then their chief, whom they called coryphæus, spoke in behalf of the rest: the singing was performed by the whole company; so that when the coryphæus struck into a song, the chorus immediately joined him.

The chorus sometimes also joined the actors in the course of the representation, with their complaints and lamentations on account of any unhappy accidents that befel them: but the proper function, and that for which it seemed chiefly retained, was to shew the intervals of the acts: while the actors were behind the scenes, the chorus engaged the spectators; their songs

usually turned on what was exhibited, and were not to contain any thing but what was suited to the subject, and had a natural connection with it; so that the chorus concurred with the actors for advancing the action. In the modern tragedies the chorus is laid aside, and the fiddles supply its place. Mr Dacier looks on this retrenchment as of ill consequence, and thinks it robs tragedy of a great part of its lustre; he therefore judges it necessary to re-establish it, not only on account of the regularity of the piece, but also to correct, by prudent and virtuous reflections, any extravagancies that might fall from the mouths of the actors, when under any violent passion.

Mr Dacier observed also, that there was a chorus, or *grex*, in the ancient comedy; but this is suppressed in the new comedy, because it was used to reprove vices by attacking particular persons; as the chorus of the tragedy was laid aside to give the greater probability to those kind of intrigues which require secrecy.

**CHORUS**, in music, is when, at certain periods of a song, the whole company are to join the singer in repeating certain couplets, or verses.

**CHOTZIM**, a frontier-town of Moldavia, on the confines of Poland, situated on the river Niefter, and subject to the Turks: E. long. 27°, and N. lat. 48°.

**CHOUG**, a town of Syria, upon the road from Aleppo to Sayde, called by some travellers Shoggle.

**CHOUGH**, in ornithology. See **CORVUS**.

**CHREMnitz**, the principal of the nine-towns in Upper Hungary, situated about sixty-eight miles north-east of Presburg, and subject to the house of Austria: E. long. 19°, and N. lat. 48° 45'.

**CHREMPS**, in ichthyology. See **SPARUS**.

**CHRISM**, oil consecrated by the bishop, and used in the Romish and Greek churches in the administration of baptism, confirmation, ordination, and extreme unction.

**Order of CHRIST**, a military order, founded by Dionysius I. king of Portugal, to animate his nobles against the Moors.

The arms of this order are gules, a patriarchal cross, charged with another cross argent: they had their residence at first at Castromarin, afterwards they removed to the city of Thomar, as being nearer to the Moors of Andalusia and Estremadura.

**CHRIST** is also the name of a military order in Livonia, instituted in 1205, by Albert bishop of Riga. The end of this institution was to defend the new Christians, who were converted every day in Livonia, but were persecuted by the heathens. They wore on their cloaks a sword with a cross over it, whence they were also denominated brothers of the sword.

**CHRIST-BURGH**, a town of Poland, near the lake Drausen, and about three Polish miles from Marienburgh.

**CHRIST-CHURCH**, a borough town of Hampshire, thirty miles south-west of Winchester, near the sea-coast: W. long. 2°, N. lat. 50° 40'. It sends two members to parliament.

**CHRIST-thorn**, in botany. See **RHAMNUS**.

*Moß*

**Most CHRISTIAN king**, one of the titles of the king of France.

The French antiquaries trace the origin of this appellation up to Gregory the Great, who, writing a letter to Charles Martel, occasionally gave him that title, which his successors have since retained.

**CHRISTIAN religion**, that instituted by Jesus Christ. See RELIGION.

**CHRISTIANS**, those who profess to believe the Christian religion. See RELIGION.

**CHRISTIANS of St John**, a sect of Christians very numerous in Balsara and the neighbouring towns: they formerly inhabited along the river Jordan, where St John baptized, and it was from thence they had their name. They hold an anniversary feast of five days, during which they all go to the bishop, who baptizes them with the baptism of St John. Their baptism is also performed on rivers, and that only on Sundays; they have no notion of the third person in the Trinity, nor have they any canonical book, but abundance full of charms, &c. Their bishoprics descend by inheritance, as our estates do, though they have the ceremony of an election.

**CHRISTIANS of St Thomas**, a sort of Christians in a peninsula of India, on this side of the gulf: they inhabit chiefly at Cranganor, and the neighbouring country; these admit of no images, and receive only the cross, to which they pay a great veneration: they affirm, that the souls of the saints do not see God till after the day of judgment: they acknowledge but three sacraments, *viz.* baptism, orders, and the eucharist: they make no use of holy oils in the administration of baptism, but after the ceremony anoint the infant with an unction composed of oil and walnuts, without any benediction. In the eucharist, they consecrate with little cakes made of oil and salt, and instead of wine make use of water in which raisins have been infused.

**CHRISTIANA**, a town of Norway, in the province of Aggerhuys, situated on a bay of the sea, a hundred miles north of Gottenburgh: E. long.  $10^{\circ} 15'$ , N. lat.  $59^{\circ} 30'$ .

**CHRISTIANOPLE**, a port-town of Sweden, situated on the Baltic sea, in the territory of Bleking, and province South Gothland, about thirteen miles north-east of Carlskroon: E. long.  $15^{\circ} 40'$ , and N. lat.  $57^{\circ}$ .

**CHRISTIANSBURGH**, a Danish factory upon the gold-coast of Africa, near Acra.

**CHRISTIANSTADT**, a town of Sweden, situated on the river Helles, in the territory of Bleking, and province of South Gothland, forty-five miles west of Carlskroon: E. long.  $14^{\circ} 40'$ , N. lat.  $56^{\circ} 30'$ .

**CHRISTMAS**, a festival of the Christian church, observed on the 25th of December, in memory of the nativity of Jesus Christ.

**CHRISTOPHER-herb**, in botany. See **CHRISTOPHORIANA**.

**CHRISTOPHERS**, or **St CHRISTOPHERS**, one of the Caribbee islands, to which Columbus gave his Christian name: W. long.  $62^{\circ}$ , N. lat.  $71^{\circ} 30'$ .

It is about twenty miles long, and seven broad;  
VOL. II. No. 38.

and has a high mountain in the middle, from whence some rivulets run down. Its produce is chiefly sugar, cotton, ginger, and indigo. It is a British colony, and lies about sixty miles west of Antego.

**CHRISTOPHORIANA**, in botany. See **ACTEA**.

**CHROASTACES**, in natural history, a genus of pellucid gems, comprehending all those of variable colours, as viewed in different lights; of which kinds are the opal and the asteria, or oculus cati. See **OPAL**, and **ASTERIA**.

**CHROMA**, in music, a note or character of time, usually termed a quaver.

Chroma is also a graceful way of singing, or playing with quavers and trilloes.

**CHROMATIC**, in the ancient music, the second of the three kinds into which the consonant intervals were subdivided into their concinnous parts. The other two kinds are enharmonic and diatonic.

**CHROMATIC**, in painting, a term used to signify the colouring, which makes the third part in the art of painting.

**CHROMIS**, in ichthyology. See **SPARUS**.

**CHRONIC**, or **CHRONICAL**, among physicians, an appellation given to diseases that continue a long time, in contradistinction to those that soon terminate, and are called *acute*. See **MEDICINE**.

**CHRONICLE**, in matters of literature, a species or kind of history, disposed according to the order of time, and agreeing in most respects with annals. See **ANNALS**.

**Books of CHRONICLES**, in the canon of scripture, two sacred books, called by the Greeks *paralipomena*, that is, remains, additions, or supplements, as containing many circumstances omitted in the other historical books.

**CHRONOGRAM**, a species of false wit, consisting in this, that a certain date or epocha is expressed by numeral letters of one or more verses: such is that which makes the motto of a medal struck by Gustavus Adolphus, in 1632.

CHRISTVS DVX, ergo trIVMphVs.

**CHRONOLOGY**, the science or doctrine of time; in so far as it regards history, whether civil or ecclesiastical.

The business of chronology, is to ascertain and adjust the various epochas, æras, and other periods mentioned in history; so that the revolutions of empires and kingdoms, and other remarkable events, may be truly stated. For the principles of chronology, see **ASTRONOMY**, *Of the division of time*.

**CHRONOMETER**, in general, denotes any instrument or machine, used in measuring time; such are dials, clocks, watches, &c. See **CLOCK**, **DIAL**, &c.

**CHRONOSCOPE**, denotes much the same with chronometer. See the preceding article.

**CHROSTASIMA**, in natural history, a genus of pellucid gems, comprehending all those which appear of one simple and permanent colour in all lights: such are the diamond, carbuncle, ruby, garnet, amethyst, sapphire, beryl, emerald, and the topaz. See **DIAMOND**, **CARBUNCLE**, &c.

CHRY.

**CHRYSAETUS**, in ornithology. See **FALCO**.

**CHRYSALIS**, in natural history, a state of rest and seeming insensibility which butterflies, moths, and several other kinds of insects, must pass through before they arrive at their winged or most perfect state. See **NATURAL HISTORY**.

**CHRYSANTHEMOIDES**, in botany. See **OSTEOSPERMUM**.

**CHRYSANTHEMUM**, in botany, a genus of plants belonging to the syngenesia polygamia superflua class. The receptacle is naked, it has no pappus; the calix is hemispherical and imbricated; and the scales on the margin are membranaceous. There are nineteen species, two of which are natives of Britain, *viz.* the fegetum, or corn mary-gold; and the leucanthemum, or ox-eye daisy.

**CHRYSOBALANUS**, in botany, a genus of the icandria monogynia class. The corolla consists of five petals; the calix has five teeth; and the drupa contains a nut with five furrows. There is but one species, *viz.* the icaco, a native of America.

**CHRYSOBERYL**, a kind of beryl with a tincture of yellow. See **BERYL**.

**CHRYSOCOLLA**, in natural history, a species of green ochres. See **OGHRA**.

**CHRYSOCOMA**, in botany, a genus of plants belonging to the syngenesia polygamia æqualis class. The receptacle is naked; the pappus is simple; the calix is imbricated and hemispherical; and the stylus is hardly longer than the floccules. There are nine species, none of which are natives of Britain.

**CRYSOGONUM**, or **MOTH-MULLEIN**, in botany, a genus of plants belonging to the syngenesia polygamia necessaria class. The receptacle is paleaceous; the pappus is monophyllous, and three-toothed; the calix consists of five leaves; and the seeds are caliculated, and involved in four leaves. There is but one species, a native of Virginia.

**CHRYSLITE**, in natural history, a gem which the ancients knew under the name of the topaz; and the true chrysolite of the ancients, which had its name from its fine gold-yellow colour, is now universally called topaz by modern jewellers. See **TOPAZ**.

**CHRYSLITE-paste**, a kind of glass made in imitation of natural chrysolite, by mixing two ounces of prepared crystal, with ten ounces of red-lead, adding twelve grains of crocus martis made with vinegar; and then baking the whole for twenty-four hours, or longer, in a well luted cucurbit.

**CHRYSOMELA**, in zoology, a genus of insects, belonging to the order of coleoptera. The antennæ are shaped like bracelets, and thicker on the outside; and neither the breast nor the elytra are margined. There are no less than 122 species, principally distinguished by differences in their colour.

**CHRYSOPHYLLUM**, in botany, a genus of the pentandria monogynia class. The corolla is bell-shaped, and divided into ten segments, which alternately spread wider; and the berry contains ten seeds. There are but two species, both natives of America.

**CHRYSOPRASUS**, or **CHRYSOPRASUS**, the tenth

of the precious stones, mentioned in the Revelations, as forming the foundation of the heavenly Jerusalem.

The chrysoprasus is a species of prasius, of a pale but pure green colour, with an admixture of yellow.

**CHRYOSPLENIUM**, in botany, a genus of the decandria digynia class. The calix is divided into four or five coloured segments; it has no corolla; and the capsule has two beaks, and one cell containing many seeds. The species are two, *viz.* the alternifolium, or alternate-leaved golden saxifrage; and the oppositifolium, or common golden saxifrage; both natives of Britain.

**CRYSTAL**, or **CRYSTAL**. See **CRYSTAL**.

**CHUB**, or **CHUBB**, in ichthyology. See **CYPRINUS**.

**CHURCH**, has different significations, according to the different subjects to which it is applied. 1. It is understood of the collective body of Christians, or all those over the face of the whole earth who profess to believe in Christ, and acknowledge him to be the Saviour of mankind. This is what the ancient writers call the catholic or universal church. Sometimes the word church is considered in a more extensive sense, and divided into several branches; as the church militant, is the assembly of the faithful on earth; the church triumphant, that of the faithful already in glory; to which the Papists add the church patient, which, according to their doctrines, is that of the faithful in purgatory.

2. Church is applied to any particular congregation of Christians, who associate together and concur in the participation of all the institutions of Jesus Christ, with their proper pastors and ministers. Thus we read of the church of Antioch, the church of Alexandria, the church of Thessalonica, and the like.

3. Church denotes a particular sect of Christians distinguished by particular doctrines and ceremonies. In this sense, we speak of the Romish church, the Greek church, the reformed church, the church of England, &c.

The Latin or western church, comprehends all the churches of Italy, France, Spain, Africa, the north, and all other countries whither the Romans carried their language. G. Britain, part of the Netherlands, of Germany, and of the North, have been separated from hence ever since the time of Henry VIII. and constitute what we call the reformed church, and what the Romanists call the western schism.

The Greek or eastern church, comprehends the churches of all the countries anciently subject to the Greek or eastern empire, and through which their language was carried; that is, all the space extended from Greece to Mesopotamia and Persia, and thence into Egypt. This church has been divided from the Roman, ever since the time of the emperor Phocas.

The Gallican church, denotes the church of France, under the government and direction of their respective bishops and pastors. This church has always enjoyed certain franchises and immunities, not as grants from popes, but as derived to her from her first original, and which she has taken care never to relinquish. These liberties depend upon two maxims; the first, that the

pope

pope has no authority or right to command or order any thing either in general or in particular, in which the temporalities and civil rights of the kingdom are concerned; the second, that notwithstanding the pope's supremacy is owned in cases purely spiritual, yet, in France, his power is limited and regulated by the decrees and canons of ancient councils received in that realm.

4. The word church is used to signify the body of ecclesiastics, or the clergy, in contradistinction to the laity. See CLERGY.

5. Church is used for the place where a particular congregation or society of Christians assemble for the celebration of divine service. In this sense, churches are variously denominated, according to the rank, degree, discipline, &c. as metropolitan church, patriarchal church, cathedral church, parochial church, collegiate church, &c. See METROPOLIS, PATRIARCH, &c.

CHURCH-REVERES, the same with church-wardens.

CHURCH-STRETTON, a market-town of Shropshire, about twelve miles south of Shrewsbury: W. long.  $2^{\circ} 50'$ , N. lat.  $52^{\circ} 35'$ .

CHURCH-WARDENS, formerly called church-reeves, are officers chosen yearly, in Easter week, by the minister and parishoners of every parish, to look after the church, church-yard, church-revenues, &c. also to observe the behaviour of the parishoners in relation to such misdemeanors as appertain to the censure or jurisdiction of the ecclesiastical court.

They are to be chosen by the joint consent of the minister and his parishoners; and by custom, the minister may choose one, and the parishoners another; or, if there be a custom for it, the parishoners may elect both, though it is against the canon. They were sworn into their office by the archdeacon; and if he refuses to swear a church-warden, a mandamus may issue out to compel him: for as the church-wardens have a trust reposed in them by the parish, as temporal officers, the parishoners are the proper judges of their abilities to serve, and not the archdeacon who swears them.

The church wardens are a corporation. to sue, and be sued, for the goods of the church: they are to take care of the repairs of the church; and if they erect or add any thing new to the same, they must have the consent of the parishoners, or vestry; and if in the church, the license of the ordinary: they have, with consent of the minister, the placing of the parishoners in the seats of the body of the church, appointing gallery keepers, &c. reserving to the ordinary a power to correct the same. In London, the church-wardens have this authority in themselves: there also they are bound to fix fire-cocks, keep engines, &c. in their parishes, under the penalty of 10*l*.

Besides their ordinary power, the church-wardens have the care of the benefice during its vacancy: they are to join with the overseers of the poor in making rates for their relief, setting up trades for employing them, placing out poor apprentices, settling poor

persons, &c. It is their duty to collect the charity money upon briefs read in churches; they are to sign the certificates of those persons who receive the sacrament, to qualify them to bear offices, &c.

CHURCHING of women after child-birth, an office in the liturgy, containing a thanksgiving to be used by women after being delivered from the great pain and peril of child-birth.

CHURN-OWL, in ornithology. See CAPRIMULGUS.

CHURN-WORM, in zoology. See GRYLLOTALPA.

CHUSAN, or CHEUXAN, an island on the eastern coast of China, near the province of Chekiang: E. long.  $124^{\circ}$ , N. lat.  $30^{\circ} 40'$ .

CHUSISTAN, a province in the south-west part of Persia, bounded by the gulph of Persia on the south, and by the province of Eyraca Agem on the north.

CHUTON, CHUTTON, a market-town of Somersetshire, about seven miles north-east of Wells: W. long.  $2^{\circ} 36'$ , N. lat.  $51^{\circ} 25'$ .

CHYLE, in the animal economy, a milky fluid, secreted from the aliments by means of digestion.

The principles of the chyle seem to be sulphureous, mucilaginous, saline, and aqueous. It is a kind of natural emulsion, both with regard to the colour, the ingredients, and the manner of preparation. There is the difference between the artificial and natural emulsion, that the latter is far more pure, and is prepared with much greater apparatus, not by the sudden expression of part of the liquid, but by a gentle and successive percolation. The chyle is made sooner or later, according to the difference of the temperaments, strength, aliments and customs: therefore how many hours chylification requires, cannot be certainly determined. When the chyle enters the villous oscula of the lacteals, it is not a fluid extracted merely from the aliment and drink, but a mixture of fluids; that is, the saliva and thinner mucus of the mouth, and the two fluids of the œsophagus, one proceeding from the villous membrane of the tube itself, the other from its glands. To these may be added the glutinous fluid of the stomach, the pancreatic juice, the fluid of peyer's glands, which are very numerous in the small intestines. Hence the reason appears, why men may live upon bread and water, why the oriental nations use rice in the room of all kinds of pulse, and why acids, spirituous liquors, saline things, and many vegetable juices, herbs, roots, acrid and aromatic substances, are the least fit to generate chyle.

CHYLIFICATION, the formation of the chyle, or the act whereby the food is changed into chyle.

Chylification commences by comminuting the aliment in the mouth, mixing it with saliva, and chewing it with the teeth; by these means the food is reduced into a kind of pulp, which, being received into the stomach, mixes with the juices thereof; and thus diluted, begins to ferment or putrify, and, assuming a very different form from what it had before, grows either acid or rancid. Here it meets with a juice separated from the blood by the glands of that part; whose excretory ducts open into the cavity of the stomach.

**Stomach:** by the commixture of these liquors, whether of saliva or the juice of the stomach, a proper menstruum is composed, by which the parts of the aliment are still more and more divided by its insinuating into their pores, and acquire still a greater likeness to the animal fluids. The stomach, by means of its muscular fibres, contracting itself, does gradually discharge its contents by the pylorus into the duodenum; in which gut, after a small semicircular descent, it meets with the pancreatic juice and bile; both which joining it, renders some part of the aliment more fluid, by still disuniting the grosser part from the more pure, and here the chylification is made perfect. The bile which abounds with lixivial salts, and apt to entangle with the grosser parts of the concocted aliment, stimulates the guts, and cleanses their cavities of the mucous matter separated from the blood by the glands of the guts, and lodged in their cavities; which not only moistens the inside of the guts, but defends the mouth of the lacteal vessels from being injured by alien bodies which often pass that way.

The contents of the intestines move still on, by means of the peristaltic motion of the guts; whilst those thinner parts, fitted to the pores of the lacteal vessels, are absorbed by them: the thicker move still more slowly on, and by the many stops they continually meet with by the connivent valves, all the chyle or thin parts are at length entirely absorbed: the remains being merely excrementitious, are only fit to be protruded by stool.

In the passage through the small intestines, the finer part of the mass, which we call the chyle (as has been already observed) enters the orifices of the lacteal vessels of the first kind, wherewith the whole mesentery is intermixed, which either alone, or together with the meseraic veins, discharge themselves into the glands, at the basis of the mesentery.

Then the chyle is taken up by the lacteals of the second kind, and is conveyed into glands between the two tendons of the diaphragm, called Pecquet's reservoir; whence it is carried to the heart by the thoracic duct, and the subclavian vein: and here it first mixes with the blood, and in time becomes assimilated thereto.

**CHYLOSIS**, among physicians, the act of reducing the aliment in the stomach to chyle.

**CHYME**, or **CHYMUS**, in the common signification of the word, denotes every kind of humour which is intrastated by concoction, under which notion it comprehends all the humours fit or unfit for preserving and nourishing the body, whether good or bad. It frequently imports the finest part of the chyle, when separated from the feces, and contained in the lacteal and thoracic duct.

**CHYMISTRY**, or **CHEMISTRY**. See **CHEMISTRY**.  
**CHYMOLOGI**, an appellation given to such naturalists as have employed their time in investigating the properties of plants from their taste and smell.

**CHYMOSIS**, in medicine, the act of making or preparing chyme. See **CHYME**.

**CHYMOSIS** is also a distortion of the eye-lids, arising

from an inflammation; also an inflammation of the cornea tunica in the eye.

**CHALIS**, the name of the capital of a kingdom of that name in independent Tartary, situated on the road from Samarcand to China.

**CIBDELOPLACIA**, in natural history, a genus of spars debased by a very large admixture of earth: they are opaque, formed of thin crusts, covering vegetables and other bodies, by way of incrustations.

Of this genus we have the following species: 1. A greyish-white one, with a rough surface. 2. A whitish brown one: both these are friable. 3. A hard, pale-brown kind, which is the ostecolla of the shops. 4. The whitish-grey kind, with a smooth surface: this is the unicornu fossilis and ceratites of authors. 5. The whitish-brown coralloide kind.

**CIBDELOSTRACIA**, in natural history, terrene spars, destitute of all brightness and transparence, formed into thin plates, and usually found coating over the sides of fissures, and other cavities of stone, with congeries of them of great extent, and of plain or botroyide surfaces.

Of these there are usually reckoned seven kinds: the first is the hard, brownish-white cibdelostracium, found in Germany: the second is the hard, whitish cibdelostracium, with thin crusts. and a smoother surface, found also in the Harts-forest in Germany: the third is the hard, pale-brown cibdelostracium, with numerous very thin crusts, found in subterranean caverns in many parts of England as well as Germany: the fourth is the white, light, and friable cibdelostracium, found also in Germany, but very rarely in any part of England: the fifth is the light, hard, pale-brown cibdelostracium, with a smooth surface, found in almost all parts of the world: the sixth is the whitish, friable, crustaceous cibdelostracium, with a rougher surface, frequent in Germany and England; and the seventh is the brownish white, friable cibdelostracium, with a dusty surface, found in several parts of Ireland, as well as Germany.

**CICADIA**, in zoology, a genus of insects belonging to the order of hemiptera. The beak is inflected; the antennæ are setaceous; the four wings are membranaceous and deflected; and the feet, in most of the species, are of the jumping kind. The species are fifty-one. The larvæ of several of this genus evacuate great quantities of a frothy matter upon the branches and leaves of plants, in the midst of which they constantly reside.

**CICATRICULA**, among natural historians, denotes a small whitish speck in the yolk of an egg, supposed to be the first rudiments of the future chick.

**CICATRIX**, in surgery, a little seam or elevation of callous flesh rising on the skin, and remaining there after the healing of a wound or ulcer. It is commonly called a scar. See **SURGERY**.

**CICATRIZANTS**, in pharmacy, medicines which assist nature to form a cicatrix. Such are arminian bole, powder of tutty, dissecativum rubrum, &c.

Cicatrizants are otherwise called escharotics, epulotics, incarnatives, agglutinants, &c.

**CICELY**.

**CICELY.** See **MYRRHIS**.

**CICER**, or **CHICK-PEA**, in botany, a genus of the diallephia decandria class. The calix is divided into five segments, of the same length with the corolla, the four uppermost segments lying upon the vexillum; and the legumen or pod is turgid, rhomboidal, and contains two seeds. There is but one species, viz. the arietinum, a native of Spain.

**CICERBITA**, in botany. See **SONCHUS**.

**CICHORIUM**, or **SUCCORY**, in botany, a genus of the syngenesia polygamia æqualis class. The receptacle is paleaceous; the calix is caliculated; and the pappus has five teeth on its margin. The species are three, only one of which, viz. the intybus, or wild cichory, is a native of Britain. The leaves and root are detergent, aperient, and attenuating.

**CICINDELIA**, in zoology, a genus of insects belonging to the order of coleoptera. The antennæ are setaceous; the jaws are prominent, and furnished with teeth; the eyes are a little prominent; and the breast is roundish and margined. There are fourteen species.

**CICONIA**, in ornithology. See **ARDEA**.

**CICUTA**, in botany, a genus of the pentandria digynia class. The fruit is furrowed and ovated. The species are three, only one of which, viz. the virosa, or long-leaved water-hemlock, is a native of Britain.

**CICUTA** is also a synonyme of the conium. See **CONIUM**.

**CICUTARIA**, in botany, a synonyme of the æthusa, phellandrium, &c.

**CIDARIS**, in antiquity, the mitre used by the Jewish high-priests. The Rabbins say, that the bonnet used by priests in general was made of a piece of linen-cloth sixteen yards long, which covered their heads like a helmet or a turban: and they allow no other difference between the high-priest's bonnet, and that of other priests, than this, that one is flatter and more in the form of a turban; whereas that worn by ordinary priests, rose something more in a point.

**CIDARIS**, in conchyliology, the trivial name of a species of echinus. See **ECHINUS**.

**CIFALU**, or **CEFALEDI**, a port-town of Sicily, thirty-six miles east of Palermo: E. long. 13° 32', N. lat. 38° 30'.

**CILIA**, the **EYE-LASHES**, in anatomy. See Vol. I. p. 291.

**CILIARE**, or **LIGAMENTUM CILIARE**, in anatomy. See Vol. I. p. 290.

**CILIARIS**, in anatomy. See Vol. I. p. 291.

**CILIATED leaf**, among botanical writers, one surrounded all the way with parallel filaments, somewhat like the hairs of the eye-lids.

**CILICIUM**, in Hebrew antiquity, a sort of habit made of coarse stuff, formerly in use among the Jews in times of mourning and distress. It is the same with what the Septuagint and Hebrew versions call sack-cloth.

**CILLEY**, the capital of a territory of the same name in Stiria, and the circle of Austria in Germany: E. lon. 15° 35', N. lat. 46° 35'.

VOL. II. No. 38.

**CIMA**, or **SIMA**, in architecture, the same with **cymatium** or **ogee**. See **OGEE**.

**CIMEX**, or **BUG**, in zoology, a genus of insects belonging to the order of hemiptera. Linnæus enumerates no less than 121 species. The lectularius, or common house bug, is a well known insect. The methods of expelling them are various; as, oil of turpentine, the smoke of corn-mint, of narrow-leaved wild cress, of herb-robert, of the reddish agaric, of mustard, of Guiney pepper, of peats or turf, &c. But cleanliness is the only remedy against vermin of every kind.

**CIMOLIA terra**, in natural history, a species of white marle, which is ponderous and friable, and makes a considerable effervescence with aqua fortis.

**CINALOA**, a province of Mexico, in North America, lying on the Pacific Ocean, opposite to the south end of California.

**CINAN**, a city of China, the metropolis of the province of Zantung, situated in 37° N. lat. and 30' east of Pekin.

**CINCHONA**, in botany, a genus of the pentandria monogynia class. The corolla is bell-shaped; and the capsule is below the flower, and opens at the base. There is but one species, viz. the officinalis, a native of Peru. The Peruvian bark, which is the bark of this tree, is brought to us in pieces of different sizes, sometimes rolled up into short thick quills, and sometimes flat: the outside is brownish, and generally covered in part with a whitish moss; the inside is of a yellowish, reddish, or rusty iron colour. It has a lightly aromatic smell, somewhat musty, yet not disagreeable; a bitterish, astringent taste, which dwells long upon the tongue, accompanied with a degree of aromatic warmth. The small, thin, flat pieces are by some accounted the best; by others, the quill sort, with the roughest coat, especially if of a bright cinnamon colour on the inside; though the large flat pieces, whether rough or smooth, of a lighter or darker colour, are often of equal goodness. The best bark is that which is strongest in smell and taste: this likewise proves friable betwixt the teeth, and does not separate into fibres; it breaks, not shivery, but close and smooth.

The virtues of this bark, as a febrifuge, were discovered by the Indians about the year 1500: Europe did not become acquainted with it till 1649: nor was it received into general practice till several years after this; some ill consequences ensuing from its imprudent use, having brought it for a time into disrepute. At present, it is looked upon as the most effectual remedy in intermittent fevers of almost every kind, and safe in all ages and constitutions; provided it be judiciously and seasonably administered, and due regard be had to the circumstances of the disease. The modern practice, previous to the use of this medicine, usually gives an emetic at the beginning of a paroxysm: in some cases a cathartic, and in plethoric habits venesection, are premised: these render the bark not only more safe, but likewise more certain and speedy in its operation: where these evacuations are neglected, or not sufficiently plentiful, the disease, if of long

standing, scarce yields to the *cortex*; or if it appears at length subdued, yet the patient does not recover his strength, and soon suffers a relapse. The use of the bark is begun at the end of a paroxysm, and repeated, in the quantity of half a dram (more or less, according to the circumstances of the patient) every third or fourth hour during the intermission: where the fever is of the bilious kind, and accompanied with great heat, a little nitre is joined: in all cases, moderate exercise generally promotes its effect. At first, it usually loosens the belly, and sometimes operates as if a cathartic had been taken; and by this means supplies the omission of evacuations before its exhibition: if the purging continues, the medicine does not answer the purposes intended by it: in such case, a little opium is added, which effectually suppresses the flux: if after this the patient continues too collic, recourse is had to glysters. The looseness, however, ought not to be stopt too soon: on the contrary, where the bark does not itself produce this effect, it is necessary, as Dr Mead informs us, to join to it a little rhubarb, so as to occasion for a time two stools a day; by this means the disease is more effectually cured, and less subject to be followed by a dropsy, or ill habit of body: after a dram or two of rhubarb have been taken, it is to be discontinued, and the bark exhibited by itself. After the fever has been removed, the medicine is continued for some time longer, to prevent a relapse; and evacuations, unless absolutely necessary, abtained from. The disease is nevertheless seldom completely cured before some very considerable evacuation, either by stool, urine, or perspiration, ensues: if this does not succeed spontaneously, cathartics, diuretics, or diaphoretics, are given in conjunction with the bark; otherwise the patient continues weak, and without appetite, till either the disease returns, or changes into one of a different kind.

In symptomatic agues, hectic and purulent fevers, cacoehymic habits, and where the hypochondres are swelled and distended, this medicine is improper, and for the most part prejudicial. Its manifest astringency forbids its use in obstructions of the abdominal viscera, or suppression of any critical evacuation; until the obstruction is first removed, or the evacuation had its due course.

In acute, inflammatory, or malignant fevers, the bark does not seem to have any good effect. Nevertheless, in the decline of long nervous fevers, or after a remission, when from bad habit, old age, fatigue, or the like, the patient is extremely weak, and the pulse low, the *cortex* proves a medicine of excellent service; provided that there is no extravasation, that the vessels remain entire, and pus is not already formed.

Peruvian bark has likewise been found eminently serviceable in gangrenes and mortifications, proceeding either from an internal or external cause. In all the cases of this kind, where it proved successful, it occasioned a kind suppuration, which degenerated when the use of the medicine was discontinued, and again turned kindly upon resuming it. Some have been

hence induced to try the *cortex* in variolous cases, where either the pustules did not rightly suppurate, or petechiæ shewed a disposition to a gangrene; and here likewise it answered expectation: the empty vesicles filled with matter, watery sanies changed into thick white pus, the petechiæ became gradually of a pale colour, and at length disappeared, and the pox began to turn sooner than was expected.

The bark has been applied likewise, and not without success, to the cure of periodic head-achs, hysteric and hypochondriac fits, and other disorders, which have regular intermissions. By its astringency and aromatic quality, it strengthens the whole nervous system, and proves useful in weakness of the stomach, and sundry chronical disorders, proceeding from too great laxity of the fibres. In obstinate uterine fluxes, and old gleets, bark joined with chalybeates has notable effects.

The virtues of Peruvian bark reside chiefly in a resinous substance, and hence are extracted in perfection by rectified spirit. By strong coction in water, the resin is melted out, and mingled with the water; which whilst hot appears transparent, but in cooling grows turbid, and deposits great part of the resin to the bottom. Water elevates in distillation the aromatic part of the bark; pure spirit brings over nothing. Hence an aqueous extract proves not only less in quantity, but likewise inferior in quality to one made with rectified spirit. Proof-spirit extracts the virtues of this drug in tolerable perfection, in the cold; heat enables it to take up more than it can retain when cold. Spirit of sal ammoniac, prepared with fixt alkaline salts, gains very little from the *cortex*, either with or without heat: the spirit prepared with quicklime, and the dulcified spirit, in a few hours become strongly impregnated with its smell and taste.

The official preparations of bark are an extract resin, spirituous tincture, tincture in volatile spirit, and compound tincture. It is an ingredient also in the stomachic tincture.

The substances usually joined with bark in prescription seem calculated either to promote its efficacy, or merely for reducing it into the intended form; without much regard to its agreeableness, and the convenience of taking it: this is nevertheless a point of great consequence, as its taste, and the quantity which is necessary, make the patient too frequently loath it, before enough has been taken to produce the desired effect. If designed to be given in the solid form of a bolus, electuary, &c. it should be made up, not, as is customary, with syrups, but with mucilages: with the former, it sticks about the mouth and fauces, whence its taste remains for a considerable time; with the latter, it passes freely, scarce leaving any taste in the mouth. Aromatics do not prevent the taste of the bark from discovering itself; extract of liquorice very effectually conceals it. The extract of logwood also, joined to that of bark, and a proper quantity of mucilage, form a very elegant and agreeable composition.

CINCLUS, in ornithology. See TRINGA.

CINCTURE,

**CINCTURE**, or **CEINTURE**, in architecture, a ring, list, or orlo at the top and bottom of the shaft of a column, separating the shaft at one end from the base, and at the other from the capital. See **ARCHITECTURE**.

**CINERARIA**, in ornithology. See **MOTACILLA**.

**CINNABAR**, in natural history, is either native or factitious. The native cinnabar is an ore of quick-silver, moderately compact, very heavy, and of an elegant, striated red colour. In this ore the quick-silver is blended in different proportions with sulphur. It is so rich an ore, as to be no other than mercury impregnated with a small quantity of sulphur, just enough to reduce it to that state, being commonly more than six parts of mercury to one of sulphur; and even the poorest cinnabar yields one half mercury: it is of a very bright, glittering appearance, when fresh broken, and is usually found lodged in a bluish, indurated clay, though sometimes in a greenish talcy stone.

For the method of separating mercury from cinnabar, see **MERCURY**.

**Factitious CINNABAR**, a mixture of mercury and sulphur sublimed, and thus reduced into a fine red glebe. The best is of a high colour, and full of fibres, like needles.

The receipt for making it, according to the late college-dispensatory, is as follows. Take of purified quick-silver, twenty-five ounces; of sulphur, seven ounces; melt the sulphur, and stir the quick-silver into it while fluid; if it take fire, let it be immediately extinguished, by covering it with another vessel. When cold, let it be rubbed into a fine powder. Let this powder be put into a subliming vessel, and setting it over a gentle fire, raise it by degrees till the whole is sublimed into a red, striated, heavy mass, which perfectly resembles native cinnabar. This, as well as the native cinnabar, is excellent in epilepsies, and in all complaints of the head and nerves. But the factitious is rather to be preferred, as it doth not excite nausea, vomitings, and other disorders which arise from vitriolic and perhaps arsenical particles blended by nature among some of the masses of the native mineral.

Cinnabar is likewise used by painters as a colour, and is rendered more beautiful, by grinding it with gum-water and a little saffron.

**CINNAMON-TREE**, in botany. See **LAURUS**.

**CINNAMON-WATER** is made by distilling the bark first infused in spirit of wine, brandy, or white-wine.

**Clove-CINNAMON** is the bark of a tree growing in Brazil, which is often substituted for real cloves.

**White CINNAMON**, called also **Winter's bark**, is the bark of a tree frequent in the islands of St Domingo, Guadalupe, &c. of a sharp biting taste like pepper. Some use it instead of nutmeg; and in medicine it is esteemed a stomachic and antiscorbutic.

**CINOLOA**, or **CINALOA**, the capital of the province of Cinaloa, in North America, about thirty miles east of the bay of California: W. long. 113°, and N. lat. 25°. See **CINALOA**.

**CINQUEFOIL**, *quinqsfolium*, in botany. See **POTENTILLA**.

**CINQUE PORTS**, an appellation given to five port-towns, situated on the coast of Kent and Sussex, over-against France, and famous in English history.

The cinque ports are Hastings, Dover, Hithe, Romney, and Sandwich; which have had large privileges granted them, on account of their former great importance, being then not only the keys of the kingdom, but considerable for their maritime strength: thus, we are told, that they were obliged to provide eighty ships at their own charge for forty days, as often as the king should have occasion in his wars.

**CINQUE-PORT** is also a particular kind of fishing-net much used in standing water, so called on account of the five entrances into it.

**CINTRA**, a cape and mountain of Portugal, in the province of Estremadura, usually called the rock of Lisbon, situated on the north side of the entrance of the river Tagus: W. long. 10° 15', N. lat. 39°.

**CINYRA**, or **CINNOR**, in Jewish antiquity, generally translated cithara, lyra, &c. a musical instrument used before the flood, and invented by Jubah the son of Lamech.

**CION**, or **CYON**, among gardeners, denotes a young sprig, or sprout of a tree.

**CIPHER**, or **CYPHER**, one of the Arabic characters, or figures, used in computation, formed thus, 0. See **ARITHMETIC**.

**CIPHER** is also a kind of enigmatic character, composed of several letters interwoven, which are generally the initial letters of the persons names for whom the ciphers are intended.

**CIPHER** denotes likewise certain secret characters disguised and varied, used in writing letters that contain some secret, not to be understood but by those between whom the cipher is agreed on.

**CIPPUS**, in antiquity, a low column, with an inscription, erected on the high roads, or other places, to shew the way to travellers, to serve as a boundary, to mark the grave of a deceased person, &c.

**CIRCÆA**, or **ENCHANTERS NIGHTSHADE**, in botany, a genus of the diandria-monogynia class. The corolla consists of two petals; the corolla has likewise two leaves; and the capsule contains but one seed. The species are three, two of which are natives of Britain, viz. the luttiana, or enchanters-nightshade; and the alpina, or mountain enchanters-nightshade.

**CIRCASSIA**, a country situated between 40° and 50° E. long. and between 45° and 50° N. lat.

It is bounded by Russia on the north, by Astracan and the Caspian-sea on the east, by Georgia and Daghestan on the south, and by the river Don and the Palus Meotis on the west.

The Circassian Tartars form a kind of republic, but sometimes put themselves under the protection of Persia, and sometimes of Russia, or the Turks. They live mostly in tents, removing from place to place for the benefit of pasturage; and are chiefly remarkable for the beauty of their children, the seraglios of Turkey and

and Persia being usually supplied with boys and young virgins from this and the neighbouring country of Georgia.

**CIRCENSIAN GAMES**, a general term under which was comprehended all combats exhibited in the Roman circus, in imitation of the Olympic games in Greece. Most of the feasts of the Romans were accompanied with Circensian games; and the magistrates, and other officers of the republic, frequently presented the people with them, in order to procure their favour. The grand games were held five days, commencing on the 15th of September. There were six kinds of games exhibited: the first was wrestling, and fighting with swords, with staves, and with pikes; the second was racing; the third, leaping; the fourth, quoits, arrows, and cestus; all which were on foot; the fifth was horse-coursing: the sixth courses of chariots.

**CIRCIA**, in ornithology, a species of anas, called in english the summer-teal, and all over of a dusky yellowish brown, with black feet.

**CIRCINALIS**, in botany, a name used by some for *Adiantum*, maiden-hair. See **ADIANTUM**.

**CIRCLE**, in geometry, a plane figure comprehended by a single curve line, called its circumference, to which right lines drawn from a point in the middle, called the centre, are equal to each other. To find the area of a circle, see **PRACTICAL GEOMETRY**.

**CIRCLES of the sphere**. See **GEOGRAPHY** and **ASTRONOMY**.

**CIRCLES of latitude**. See **GEOGRAPHY**.

**CIRCLES of longitude**. See **GEOGRAPHY**.

**Horary CIRCLES**, in dialling, are the lines which shew the hours on dials, though these be not drawn circular, but nearly straight. See **DIALLING**.

**Horary CIRCLE**, on the globe. See **GEOGRAPHY**.

**Polar CIRCLE**. See **GEOGRAPHY**.

**CIRCLE**, in logic, or *logical CIRCLE*, is when the same terms are proved *in orbem* by the same terms; and the parts of the syllogism alternately by each other, both directly and indirectly.

**CIRCLES of the empire**, such provinces and principalities of the German empire as have a right to be present at diets. Maximilian I. divided the empire into six, and some years after into ten circles. This last division was confirmed by Charles V. The circles, as they stand in the Imperial Matricola, are as follows, Austria, Burgundy, the Lower Rhine, Bavaria, Upper Saxony, Franconia, Swabia, Upper Rhine, Westphalia, and the Lower Saxony.

**CIRCOLO MEZZO**, in the Italian music, denotes a diminution of four quavers or semiquavers, which represent a semicircle, proceeding by conjoint degrees.

**CIRCUIT**, in law, signifies a longer course of proceedings than is needful to recover the thing sued for.

**CIRCUIT**, also signifies the journey, or progress, which the judgestake twice every year, through the several counties of England and Wales, to hold courts and administer justice, where recourse cannot be had to the king's courts at Westminster: hence England is divided into six circuits, *viz.* the Home circuit, Norfolk circuit,

Midland circuit, Oxford circuit, Western circuit, and Northern circuit.

In Wales there are but two circuits, North and South Wales: two judges are assigned by the king's commission to every circuit.

**CIRCUIT court**, in Scots law, the judges of the supreme criminal court, or court of justiciary, are divided into three separate courts, consisting of two judges each; and the kingdom into as many districts. In certain boroughs of every district, each of these courts by rotation are obliged to hold two courts in the year, in spring and autumn; which are called circuit courts. See **SCOTS LAW**, *Of the supreme judges and courts of Scotland*.

**CIRCULAR**, in a general sense, any thing that is described or moved in a round, as the circumference of a circle, or surface of a globe.

**CIRCULAR NUMBERS**, called also spherical ones, according to some, are such whose powers terminate in the roots themselves.

Thus, for instance, 5 and 6, all whose powers do end in 5 and 6, as the square of 5 is 25, the square of 6 is 36, &c.

**CIRCULAR SAILING** is the method of sailing by the arch of a great circle. See **NAVIGATION**.

**CIRCULATION**, the act of moving round, or in a circle: thus we say, the circulation of the blood, &c.

**CIRCULATION of the blood**, the natural motion of the blood in a living animal, whereby that fluid is alternately carried from the heart into all parts of the body, by the arteries, from whence it is brought back to the heart again by the veins.

This motion is chiefly caused by the dilatation and contraction of this organ, and is the principle on which life depends; for when it ceases in any part, it dies; when it is diminished, the operations are weak; and, when it ceases totally, life is extinguished.

All the veins discharge themselves into the ventricles of the heart; from hence all the arteries arise: the blood expelled out of the right ventricle must be carried, through the pulmonary artery, into the lungs; from which it must be returned, by the pulmonary veins, to the left ventricle; from the left ventricle the blood, thus imported, is, by the constriction of that part, again expelled into the aorta, and by it distributed all over the rest of the body, and thence is returned again to the right ventricle by the cava, which completes the circulation.

This circulation becomes actually visible, with the assistance of a microscope, especially in fish, frogs, &c. wherein the inoculation, or union of the extremities of the arteries with those of the veins, together with the globules of the blood flowing from the one into the other, may be plainly seen.

The auricles of the heart being large hollow muscles, furnished with a double series of strong fibres, proceeding with a contrary direction to the opposite tendons, the one adhering to the right ventricle, the other to the sinus venosus; as also with innumerable

veins

veins and arteries; by the contractile force of these auricles, the blood will be vigorously expressed and driven into the right ventricle, which, upon this contraction, is rendered flaccid, empty, and disposed to admit it.

Now, if the right ventricle, thus full of blood, by the contraction of its fibres, press the blood towards the aperture again, the venous blood at the same time pouring in; will drive it back again into the cavity, and mix it more intimately, till, rising up against the parietes, it raise the valvulæ tricuspidæ, which are so connected to the fleshy columns extended on the opposite side, as that, when laid quite down, they cannot close the parietes of the right ventricle; these it thrusts towards the right auricle, till being there joined, they stop the passage very closely, and prevent any return.

By the same means, the same blood rises into the three semilunar valves, placed in the extremity of the other mouth, and lying open to the pulmonary artery; these it shuts close against the sides of the artery, and leaves a passage into the artery alone: the blood carried by this artery into the lungs, and distributed by its branches through the whole substance thereof, is first admitted into the extremities of the pulmonary vein, called arteria venosa; whence passing into four large vessels, which unite together, it is brought to the left sinus venosus, or trunk of the pulmonary vein, by the force of whose musculous structure it is driven into the left ventricle, which, on this occasion, is relaxed, and by that means prepared to receive it.

Hence, as before, it is driven into the left ventricle, which is relaxed by the same means; and by the valvulæ mitrales opening, admit it into the left ventricle, and hinder its flux into the pulmonary vein: from hence it is forced into the aorta, at whose orifice there are three semilunar valves, which also prevent a reflux, by closing the same.

The motion of the blood in living animals is attended with the following phenomena: 1. Both the venous sinuses are filled, and grow turgid at the same time. 2. Both auricles grow flaccid at the same time, and both are filled at the same time with blood, impelled by the contractile force of its correspondent muscular venous sinus. 3. Each ventricle contracts and empties itself of blood at the same time; and the two great arteries are filled and dilated at the same time. 4. As soon as the blood, by this contraction, is expelled, both ventricles being empty, the heart grows larger and broader. 5. Upon which the muscular fibres of both venous sinuses contract, and express the blood contained in them into the ventricle of the heart. 6. In the mean time the venous sinuses are again filled as before, and the auricles, &c. return into their former habitude. 7. This alteration continues till the animal begins to languish under the approach of death, at which time the auricles and venous sinuses make several palpitations, for one contraction of the ventricle.

In a fœtus, the apparatus for the circulation of the blood is somewhat different from that in adults. The septum, which separates the two auricles of the heart, is pierced through with an aperture, called the foramen

men ovale, and the trunk of the pulmonary artery, a little after it has left the heart, sends out a tube into the descending aorta, called the communicating canal. The fœtus being born, the foramen ovale closes by degrees, and the canal of communication dries up, and becomes a simple ligament.

As to the velocity of the circulating blood, and the time wherein the circulation is completed, several computations have been made. By Dr Keil's account, the blood is driven out of the heart into the aorta with a velocity which would carry it twenty-five feet in a minute: but this velocity is continually abated in the progress of the blood, in the numerous sections or branches of the arteries, so that before it arrive at the extremities of the body, its motion is greatly diminished. The space of time wherein the whole mass of blood ordinarily circulates, is variously determined. Some state it thus: Supposing the heart to make two thousand pulses in an hour, and that at every pulse there is expelled an ounce of blood; as the whole mass of blood is not ordinarily computed to exceed twenty-four pounds, it must be circulated seven or eight times over in the space of an hour.

The circulation of the blood was first discovered in England, in the year 1728, by Dr Harvey.

*CIRCULATION of the sap of vegetables.* See Vol. I. p. 45.

*CIRCULATION*, in chemistry, is an operation whereby the same vapour, raised by fire, falls back, to be returned and distilled several times.

*CIRCULATION of money.* See COMMERCE, and MONEY.

*CIRCULUS*, in chemistry, an iron instrument in form of a ring, which being heated red hot, and applied to the necks of retorts and other glass vessels, till they grow hot, a few drops of cold water thrown upon them, or a cold blast, will make the necks fly regularly and evenly off.

Another method of doing this, is to tie a thread, first dipt in oil of turpentine, round the place where you would have it break; and then setting fire to the thread, and afterwards sprinkling the place with cold water, the glass will crack exactly where the thread was tied.

*CIRCUMAJENTES MUSCULI*, or *OBLIQUI MUSCULI*, in anatomy. See Vol. I. p. 290.

*CIRCUMAMBIENT*, an appellation given to a thing that surrounds another on all sides; chiefly used in speaking of the air.

*CIRCUMCISION*, the act of cutting off the prepuce; a ceremony in the Jewish and Mahometan religions, wherein they cut off the foreskin of their males, who are to profess the one or the other law.

Among the Jews, the time for performing this rite was the eighth day, that is, six full days after the child was born: the law of Moses ordained nothing with respect to the person by whom, the instrument with which, or the manner how, the ceremony was to be performed; the instrument was generally a knife of stone. The child is usually circumcised at home, where the father, or godfather, holds him in his arms, while the operator

takes hold of the prepuce with one hand, and with the other cuts it off; a third person holds a porringer, with sand in it, to catch the blood; then the operator applies his mouth to the part, and having sucked the blood, spits it into a bowl of wine, and throws a styp-tic powder upon the wound. This ceremony was usually accompanied with great rejoicings and feasting, and it was at this time that the child was named in presence of the company. The Jews invented several superstitious customs at this ceremony, such as placing three stools, one for the circumcisor, the second for the person who holds the child, and the third for Elijah, who, they say, assists invisibly at the ceremony, &c.

The Jews distinguished their proselytes into two sorts, according as they became circumcised, or not: those who submitted to this rite were looked upon as children of Abraham, and obliged to keep the laws of Moses; the uncircumcised were only bound to observe the precepts of Noah, and were called *noachidæ*.

This ceremony, however, was not confined to the Jews: Herodotus and Philo Judæus observe, that it obtained also among the Egyptians and Ethiopians. Herodotus says, that the custom was very ancient among each people, so that there was no determining which of them borrowed it from the other. The same historian relates, that the inhabitants of Colchis also used circumcision; whence he concludes, that they were originally Egyptians.

The Turks never circumcise till the seventh or eighth year, as having no notion of its being necessary to salvation. The Persians circumcise their boys at thirteen, and their girls from nine to fifteen. Those of Madagascar cut the flesh at three several times; and the most zealous of the relations present, catches hold of the preputium, and swallows it.

Circumcision is practised on women by cutting off the foreskin of the clitoris, which bears a near resemblance and analogy to the preputium of the male penis. We are told that the Egyptian captive women were circumcised; and also the subjects of Prester John.

**CIRCUMCISION** is also the name of a feast, celebrated on the first of January, in commemoration of the circumcision of our Saviour.

**CIRCUMDUCTION**, in Scots law. When parties in a suit are allowed a proof of addigamus after the time limited by the judge for taking that proof is elapsed, either party may apply for circumduction of the time of proving: the effect of which is, that no proof can afterwards be brought, and the cause must be determined as it stood when circumduction was obtained. See *SCOTS LAW*, title *Pobation*.

**CIRCUMFERENCE**, in a general sense, denotes the line or lines bounding a plane figure. However, it is generally used in a more limited sense, for the curve line which bounds a circle, and otherwise called a periphery; the boundary of a right-lined figure being expressed by the term *perimeter*.

**CIRCUMFERENTOR**, an instrument used by surveyors, for taking angles. See *PRACTICAL GEOMETRY*.

**CIRCUMFLEX**, in grammar, one of the accents. See *ACCENT*.

**CIRCUMGYRATION**, denotes the whirling motion of any body round a center: such is that of the planets round the sun.

**CIRCUMLOCUTION**, a paraphractical method of expressing one's thoughts, or saying that in many words which might have been said in few.

**CIRCUMPOLAR stars**, an appellation given to those stars which by reason of their vicinity to the pole move round it without setting.

**CIRCUMSCRIBED**, in geometry, is said of a figure which is drawn round another figure, so that all its sides or planes touch the inscribed figure.

**CIRCUMSCRIPTION**, in natural philosophy, the termination, bounds, or limits of any natural body.

**CIRCUMSTANCE**, a particularity which, though not essential to any action, yet doth some way effect it.

**CIRCUMSTANTIBUS**, in law, a term used for supplying and making up the number of jurors (in case any impelled appear not, or appearing are challenged by any party) by adding to them so many of the persons present as will make up the number, in case they are properly qualified.

**CIRCUMVALLATION**, or *line of* **CIRCUMVALLATION**, in the art of war, is a trench bordered with a parapet, thrown up quite round the besieger's camp, by way of security against any army that may attempt to relieve the place, as well as to prevent desertion.

**CIRCUMVOLUTION**, in architecture, denotes the torus of the spiral line of the ionic volute.

**CIRCUS**, in antiquity, a great building of a round or oval figure, erected by the ancients, to exhibit shews to the people.

The Roman circus was a large oblong edifice, arched at one end, encompassed with porticoes, and furnished with two rows of seats, placed ascending over each other. In the middle was a kind of foot-bank, or eminence, with obelisks, statues, and posts at each end. This served them for the courses of their bigæ and quadrigæ.

Those that have measured the circus say, that it was 2187 feet long, and 960 broad; so that it was the greatest building in Rome: some say it would contain 150,000 people, others 260,000, or 300,000.

**CIRCUS**, in zoology, See *FALCO*.

**CIRENCESTER**, a borough-town of Gloucestershire, situated on the river Churn, fifteen miles south east of Gloucester: W. long. 2°, north lat. 51° 42'. It sends two members to parliament.

**CIRLUS**, in ornithology. See *EMBERIZA*.

**CIRRI**, among botanists, fine strings or thread like filaments, by which some plants fasten themselves to walls, trees, &c. such are those of ivy.

**CIRRI**, in ichthyology, certain oblong and soft appendages, not unlike little worms, hanging from the under jaws or mouths of some fishes: these cirri, commonly translated *beards*, afford marks to distinguish the different species of the fishes on which they are found.

**CIRSIUM**, in botany. See *SERRATULA*.

**CIRSOCELE**,

**CIRSOCELE**, a species of hernia. See **MEDICINE** and **SURGERY**.

**CISALPINE**, any thing on this side the Alps. Thus the Romans divided Gaul into cisalpine and transalpine.

**CISLEU**, in Hebrew chronology, the ninth month of their ecclesiastical, and the third of the civil year, answering nearly to our November.

**CISMAR**, a town of lower Saxony, in Germany, at a little distance from the Baltic sea.

**CISSAMPELOS**, in botany, a genus of the diœcia monadelphia class. The calix of the male has four leaves; the corolla is wanting; the nectarium is rotated; and the stamina are four connected together. The calix of the female consists of one ligulated roundish leaf; it has no corolla; the styli are three; and the fruit is a berry containing one seed. There are three species, all natives of America.

**CISSOID**, in geometry, a curve of the second order, first invented by Diocles, whence it is called the cissoid of Diocles. See **FLUXIONS**.

**CISSUS**, in botany, a genus of the tetrandria monogynia class. The berry contains but one seed, and is surrounded by the corolla and calix, which are both divided into four segments. The species are five, all natives of the Indies.

**CISTERCIANS**, in church history, a religious order founded in the eleventh century by St Robert, a benedictine. They became so powerful, that they governed almost all Europe, both in spirituals and temporals. Cardinal de Vitri describing their observances, says, they neither wore skins nor shirts; nor ever eat flesh, except in sickness; and abstained from fish, eggs, milk, and cheese: they lay upon straw-beds, in their tunics and cowls: they rose at midnight to prayers: they spent the day in labour, reading and prayer: and in all their exercises observed a continual silence. The habit of the Cistercian monks is a white robe, in the nature of a cassock, with a black scapulary and hood, and is girt with a wooden girdle. The nuns wear a white tunic, and a black scapulary and girdle.

**CISTERN**, denotes a subterraneous reservoir of rain-water; or a vessel serving as a receptacle for rain or other water, for the necessary uses of a family.

There are likewise lead-cisterns, jar-cisterns, &c. See **PLUMBERY** and **JAR**.

Authors mention a cistern of Constantinople, the vaults of which are supported by two rows of pillars, 212 in each row, each pillar being two feet in diameter. They are planted circularly, and in radii tending to that of the center.

**CISTUS**, in botany, a genus of the polyandria monogynia class. The corolla consists of five petals, and the calix of five leaves, two of them being less than the other two. The species are 37, and only five of them natives of Britain, viz. the guttulus, or annual cistus; the helianthemum, or dwarf cistus, or sun-flower; the surreianus, or narrow-leaved cistus; the polii-folius, or mountain dwarf cistus; and the hirsutus, or hoary dwarf cistus.

**CITADEL**, a place fortified with four, five, or six ba-

stions, built on a convenient ground near a city, that it may command it in case of a rebellion.

**CITATION**, in ecclesiastical courts, is the same with summons in civil courts. See **SUMMONS**.

**CITATION** is also a quotation of some law, authority, or passage of a book.

**CITHARA**, in antiquity, a musical instrument, the precise structure of which is not known; some think it resembled the Greek delta  $\Delta$ ; and others, the shape of a half moon. At first it had only three strings, but the number was at different times increased to eight, to nine, and lastly to twenty-four. It was used in entertainments and private houses, and played upon with a plectrum or quill, like the lyre.

**CITHAREXYLON**, in botany, a genus of the didynamia angiospermia class. The calix is bell-shaped, and has five teeth; the corolla is tunnel shaped; and the berry contains two seeds. There are two species, both natives of America.

**CITHARISTA**, or **CITHAROEDUS**, one who played on the cithara.

**CITILLE**, in zoology, the trivial name of a species of mus. See **MUS**.

**CITIZEN**, a native or inhabitant of a city, vested with the freedom and liberties of it.

A citizen of Rome was distinguished from a stranger, because he belonged to no certain commonwealth subject to the Romans. A citizen is either by birth or election; and sons may derive the right from their fathers. To make a good Roman citizen, it was necessary to be an inhabitant of Rome, to be enrolled in one of the tribes, and to be capable of dignities. Those to whom were granted the rights and privileges of Roman citizens, were only honorary citizens. It was not lawful to scourge a citizen of Rome.

**CITRINELLA**, in ornithology. See **EMBERIZA**.

**CITRINUS**, in natural history, a kind of sprig crystal, of a fine yellow colour, which being set in rings is often mistaken for a topaz.

**CITRON-TREE**, in botany. See **CITRUS**.

**CITRULLUS**, in botany. See **CUCURBITA**.

**CITRUS**, in botany, a genus of the polyadelphia icofandria class. The calix is divided into five segments; the petals are five, and oblong; and the fruit is a berry, consisting of nine cells. The species are three, viz. the medica, or lemon-tree, a native of Asia; the aurantium, or orange-tree, a native of the Indies; and the trifoliata, a native of Japan.

**CITTADELLA**, the capital of the island of Minorca, about twenty-three miles west of Port-mahon: E. long.  $3^{\circ} 30'$ , N. lat.  $40^{\circ}$ .

**CITTADELLAPIEVE**, a town of Italy, in the territories of the pope, near the lake of Perugia.

**CIVENCHEU**, a city of China, the second metropolis of the province of Fokien, in  $25^{\circ}$  N. lat. and  $2^{\circ} 9'$  east of Peking.

**CIVES**, the English name of a species of onion, growing in tufts, and seldom exceeding six inches in height: they never produce any bulbs, and are much used in sallads in spring.

**CIVET**, a soft unctuous matter produced in the manner of

of musk, in bags growing from the lower part of the belly of a civet-cat. See **CASTOR**.

**CIVET-CAT**, the English name of the animal which produces the civet. See **CASTOR**.

**CIVIC CROWN**, was a crown given by the ancient Romans to any soldier who had saved the life of a citizen in any engagement.

**CIVIDAD de las Palmas**, the capital of all the Canary islands, situated in the island of Canary.

**CIVIDAD-REAL**, a city of Spain, in the province of New Castile: it is the capital of La Mancha, situated on the river Guadiana, sixty miles south of Toledo: W. long.  $4^{\circ} 20'$ , N. lat.  $39^{\circ}$ .

**CIVIL**, in a general sense, something that regards the policy, public good, or peace of the citizens, or subjects of the state; in which sense we say, civil government, civil law, civil right, civil war, &c.

**CIVIL**, in a legal sense, is also applied to the ordinary procedure in an action, relating to some pecuniary matter or interest, in which sense it is opposed to criminal.

**CIVIL DEATH**, any thing that cuts off a man from civil society, as a condemnation to the galleys, perpetual banishment, condemnation to death, outlawry, and excommunication.

**CIVIL LAW**, is properly the peculiar law of each state, country, or city: but what we usually mean by the civil law, is a body of laws compiled out of the best Roman and Grecian laws, compiled from the laws of nature and nations, and, for the most part, received and observed throughout all the Roman dominions for above 1200 years. See **LAW**.

**CIVIL WAR**, a war between people of the same state, or the citizens of the same city.

**CIVIL YEAR** is the legal year, or annual account of time, which every government appoints to be used within its own dominions, and is so called in contradistinction to the natural year, which is measured exactly by the revolution of the heavenly bodies.

**CIVILIAN**, in general, denotes something belonging to the civil law; but more especially the doctors and professors thereof are called civilians.

**CIVITA-CASTELLANA**, a city of Italy, in St Peter's patrimony, situated near the river Tiber, twenty-five miles north of Rome: E. long.  $13^{\circ}$ , N. lat.  $42^{\circ} 15'$ .

**CIVITA VECCHIA**, a port-town and fortrefs of Italy, in St Peter's patrimony, situated on a bay of the Mediterranean, thirty miles north-west of Rome: E. long.  $12^{\circ} 30'$ , N. lat.  $42^{\circ}$ .

It is the station of the galleys belonging to the pope, who has lately declared it a free port.

**LACK**, among country-men. To clack wool, is to cut off the sheep's mark, which makes the weight less, and yields less custom to the king.

**LACKMANNAN**, the capital of Clackmannanshire, in Scotland, situated on the northern shore of the Forth, about twenty five miles north-west of Edinburgh: W. long.  $3^{\circ} 40'$ , N. lat.  $56^{\circ} 15'$ .

The county of Clackmannan is joined with that of

Kinross, which each in their turn chuse a member to represent them in parliament.

**CLAGENFURT**, or **CLAGENFORT**, the capital of Carinthia, in the circle of Austria in Germany, 120 miles south-west of Vienna: E. long.  $14^{\circ}$ , N. lat.  $47^{\circ}$ .

**CLAIM**, in law, a challenge of interest in any thing that is in possession of another.

**CLAKIS**, in ornithology, a synonyme of the *anas bernicla*. See **ANAS**.

**CLAMP** in a ship, denotes a piece of timber applied to a mast or yard, to prevent the wood from bursting; and also a thick plank lying fore and aft under the beams of the first orlop, or second deck, and is the same that the rising timbers are to the deck.

**CLAMP** is likewise the term for a pile of unburnt bricks built up for burning. These clamps are built much after the same manner as arches are built in kilns, viz. with a vacuity betwixt each brick's breadth for the fire to ascend by; but with this difference, that instead of arching, they truss over, or over-span; that is, the end of one brick is laid about half way over the end of another, and so till both sides meet within half a brick's length, and then a binding brick at the top finishes the arch.

**CLAMP-NAILS**, such nails as are used to fasten on clamps in the building or repairing of ships.

**CLAMPING**, in joinery, is the fitting a piece of board with the grain, to another piece of board cross the grain. Thus the ends of tables are commonly clamped, to prevent their warping.

**CLANDESTINA**, in botany. See **LATHRÆA**.

**CLANDESTINE**, any thing done without the knowledge of the parties concerned, or without the proper solemnities. Thus a marriage is said to be clandestine, when performed without the publication of bans, the consent of parents, &c.

**CLANGULA**, in ornithology. See **ANAS**.

**CLAP**, in medicine, the first stage of the venereal disease, more usually called a gonorrhœa. See **MEDICINE**.

**CLARAMONT-POWDER**, a kind of earth, called *Terra de Baira*, from the place where it is found: it is famous at Venice, for its efficacy in stopping hæmorrhages of all kinds, and in curing malignant fevers.

*Precept of CLARE CONSTAT*, in Scots law, the warrant of a superior for entering and infesting the heir of his former vassal, without the interposition of an inquest. See **SCOTS LAW**, title, *Succession in heritable Rights*.

**CLARE**, a market-town of Suffolk, thirteen miles south of Bury: E. long.  $35'$ , N. lat.  $52^{\circ} 15'$ . It gives the title of earl to the duke of Newcastle.

**CLARE** is also the capital of a county of the same name in the province of Connaught, in Ireland, situated about seventeen miles north-west of Limerick: W. long.  $9^{\circ}$ , N. lat.  $52^{\circ} 40'$ .

**CLARENCIEUX**, the second king at arms, so called from the duke of Clarence, to whom he first belonged; for Lionel third son to Edward III. having by his wife

wife the honour of Clare, in the county of Thomond, was afterwards declared duke of Clarence; which dukedom afterwards escheating to Edward IV. he made this earl a king at arms. His office is to marshal and dispose of the funerals of all the lower nobility, as baronets, knights, esquires, on the south side of the Trent; whence he is sometimes called Surroy, or South-roy, in contradistinction to Norroy.

**CLARENDON**, The constitutions of Clarendon, are certain ecclesiastical laws drawn up at Clarendon, near Salisbury. They were sixteen in number, all tending to restrain the power of the clergy, and readily assented to by all the bishops and barons, the archbishop Becket excepted, who opposed them at first, but was afterwards prevailed upon to sign them. The pope Alexander III. declared against and annulled most of them.

**CLARENZA**, the capital of a duchy of the same name in the Morea: it is a sea-port town, situated on the Mediterranean, twenty-six miles south of Petras: E. long.  $21^{\circ} 40'$ , N. lat.  $37^{\circ} 40'$ .

**CLARET**, a name given by the French to such of their red wines as are not of a deep or high colour. See **WINE**.

**CLARICHORD**, or **MANICHORD**, a musical instrument in form of a spinnet.

It has forty-nine or fifty stops, and seventy strings, which bear on five bridges, the first whereof is the highest, the rest diminishing in proportion. Some of the strings are in unison, their number being greater than that of the stops. There are several little mortises for passing the jacks, armed with brass hooks, which stop and raise the chords instead of the feather used in virginals and spinnets: but what distinguishes it most is, that the chords are covered with pieces of cloth, which render the sound sweeter, and deaden it so, that it cannot be heard at any considerable distance: whence it comes to be particularly in use among the nuns, who learn to play, and are unwilling to disturb the silence of the dormitory.

**CLARIFICATION**, in chemistry, the act of clearing and fining any fluid from all heterogeneous matter or feculencies. See **CHEMISTRY**.

**CLARION**, a kind of trumpet, whose tube is narrower, and its tone acuter and shriller than that of the common trumpet. It is said that the clarion, now used among the Moors and Portuguese, who borrowed it from the Moors, served anciently for a treble to several trumpets, which sounded tenor and bass.

**CLARION**, in heraldry, a bearing as represented in Plate LXV. fig. 5. he bears ruby, three clarions topaz, being the arms of the earl of Bath, by the name of Granville: Guillim is of opinion, that these three clarions are a kind of old-fashioned trumpets; but others say, that they rather resemble the rudder of a ship; others, a rest for a lance.

**CLARO-OBSCURO**, or **CLAIR OBSCURE**, in painting, the art of distributing to advantage the lights and shadows of a piece, both with regard to the easing of the eye, and the effect of the whole piece.

**CLARO-OBSCURO**, or **CHIARO-SCURO**, is also used to

signify a design consisting only of two colours, most usually black and white, but sometimes black and yellow; or it is a design washed only with one colour, the shadows being of a dusky brown colour, and the lights heightened up with white.

The word is also applied to two prints of two colours, taken off at twice, whereof there are volumes in the cabinets of the curious in prints.

**CLARY**, in botany. See **SALVIA**.

**CLARY-WATER**, a spirit drawn from an infusion of the herb clary in spirit of wine, being a very pleasant and excellent cordial.

**CLASMIUM**, in natural history, constitutes a distinct genus of gypsums by itself, being more soft, dull, and opaque, than other kinds: it neither gives fire with steel, nor ferments with aqua fortis; but calcines readily in the fire, and affords a very valuable plaster.

**CLASS**, an appellation given to the most general subdivisions of any thing: thus, animal is subdivided into the classes quadrupeds, birds, fishes, &c. which are again subdivided into serieses or orders; and these last into genera. See **NATURAL HISTORY**, and **BOTANY**.

**CLASS** is also used in schools, in a synonymous sense with form, for a number of boys all learning the same thing.

**CLASSIC**, or **CLASSICAL**, an epithet chiefly applied to authors read in the classes at schools.

This term seems to owe its origin to Tullius Servius, who, in order to make an estimate of every person's estate, divided the Roman people into six bands, which he called classes. The estate of the first class was not to be under 200 l. and these by way of eminence were called *classici*, *classici*: hence authors of the first rank came to be called classics, all the rest being said to be *infra classim*: thus Aristotle is a classic author in philosophy; Aquinas, in school-divinity, &c.

**CLATHRUS**, in botany, a genus of the cryptogamia fungi class. This fungus is roundish, and full of cancelli. The species are four, none of them natives of Britain.

**CLATTE**, in heraldry, an appellation given to irregular lines, not reducible to those commonly used. See **LINE**.

**CLAVARIA**, in botany, a genus of the cryptogamia fungi class. It is smooth and oblong. The species are eight, seven of which are natives of Britain, *viz.* the pistillaris, or simple clavaria; the ophioglossoides, or black clavaria; the digitata, or fingered clavaria; the hypoxylon, or flat clavaria; the coralloides, or yellow clavaria; the fastigiata, or sinking clavaria; and the muscoides, or pointed clavaria.

**CLAVES INSULÆ**, a term used in the isle of Man; where all weighty and ambiguous causes are referred to a jury of twelve, who are called *claves insule*, the keys of the island.

**CLAVICLES**, in anatomy. See Vol. I. p. 175.

**CLAVIS** properly signifies a key, and is sometimes used in English to denote an explanation of some obscure passages in any book or writing.

**CLAUSE**, in grammar, denotes a member of a period, or sentence.

**CLAUSE** signifies also an article, or particular stipulation in a contract, a charge or condition in a testament, &c.

**CLAUSENBURG**, a large city of Transilvania, situated on the river Samos, about fifty-five miles north-west of Hermanstadt: E. long.  $20^{\circ} 50'$ , N. lat.  $47^{\circ} 10'$ .

**CLAVUS**, in antiquity, an ornament upon the robes of the Roman senators and knights, which was more or less broad, according to the dignity of the person: hence the distinction of *tunica angust-clavia* and *lati-clavia*.

**CLAVUS**, in medicine and surgery, is used in several significations: 1. *Clavus hystericus*, is a shooting pain in the head, between the pericranium and cranium, which affects such as have the green-sickness. 2. *Clavus oculorum*, according to Celsus, is a callous tubercle on the white of the eye, taking its denomination from its figure. 3. *Clavus* imports indurated tubercles of the uterus. 4. *Clavus* imports a chirurgical instrument of gold, mentioned by Amatus Lusitanus, designed to be introduced into an exulcerated palate, for the better articulation of the voice. 5. *Clavus* is a callus or corn on the foot.

**CLAW**, among zoologists, denotes the sharp-pointed nails with which the feet of certain quadrupeds and birds are furnished.

*Crab's CLAWS*, in pharmacy, See **CRAB'S CLAWS**.

**CLAY**, in natural history, a genus of earths, the characters of which are these: they are firmly coherent, weighty, and compact; stiff, viscid, and ductile to a great degree, while moist; smooth to the touch, not easily breaking between the fingers, nor readily diffusible in water, and when mixed not readily subliming from it.

**CLAYTONIA**, in botany, a genus of the pentandria monogynia class. The calix consists of two valves; the corolla has five petals; the stigma is trifid; and the capsule has three valves, and contains three seeds. The species are two, none of them natives of Britain.

*Cape CLEAR*, a promontory in a little island on the south-west coast of Ireland.

**CLEAVERS**, in botany. See **GALLIUM**.

**CLEBURY**, a market-town of Shropshire, about 25 miles south-east of Shrewsbury: W. long.  $2^{\circ} 30'$ , and N. lat.  $52^{\circ} 27'$ .

**CLECHE**, in heraldry, a kind of cross, charged with another cross of the same figure, but of the colour of the field. See Plate LXV. fig. 6.

**CLEDGE**, among miners, denotes the upper stratum of fuller's earth.

**CLEF**, or **CLIFF**, in music, a mark set at the beginning of the lines of a song, which shews the tone or key in which the piece is to begin; or it is a letter marked on any line, which explains the rest.

**CLEIDOMASTOIDEUS**, in anatomy. See Vol. I. p. 215.

**CLEMA**, in antiquity, a twig of the vine, which served as the badge of a centurion's office.

**CLEMATIS**, in botany, a genus of the polyandria pu-

lygynia class. It has no calix; the petals are four; and the seeds are caudated. There are twelve species, none of them natives of Britain.

**CLEOME**, in botany, a genus of plants belonging to the tetradynamia siliquosa class. It has three nectariferous glands, one at each sinus of the calix, excepting the lowest; the siliqua or pod has two valves and one cell. There are fifteen species, none of them natives of Britain.

**CLEPSYDRA**, a water-clock, or instrument to measure time by the fall of a certain quantity of water.

**CLERGY**, a general name given to the body of ecclesiastics of the Christian church, in contradistinction to the laity.

The distinction of Christians into clergy and laity, was derived from the Jewish church, and adopted into the Christian by the apostles themselves: whenever any number of converts were made, as soon as they were capable of being formed into a congregation or church, a bishop or presbyter, with a deacon, were ordained to minister to them. Of the bishops, priests, and deacons, the clergy originally consisted; but in the third century, many inferior orders were appointed, as subservient to the office of deacon, such as sub-deacons, acolythists, readers, &c.

*Benefit of CLERGY*, is an ancient privilege, whereby one in orders claimed to be delivered to his ordinary, to purge himself of felony: this purgation was to be by his own oath, affirming his innocency, and the oath of twelve compurgators, as to their belief of it, before a jury of twelve clerks: if the clerk failed in his purgation, he was deprived of his character, whereby he became a mere layman; or he was to be kept in prison till a pardon was obtained: but if he purged himself, he was set at liberty.

**CLERK**, a word originally used to denote a learned man, or man of letters; whence the term became appropriated to church-men, who were from thence called clerks, or clergymen; the nobility and gentry being usually bred up to the exercise of arms, and none left but the ecclesiastics to cultivate the sciences.

**CLERK** is also applied to such as by their course of life, exercise their pens in any court or office, of which there are various kinds: thus,

*CLERK of the bills*, an officer in the court of king's bench, whose business it is to file all bail-pieces taken in that court, where he always attends.

*CLERK of the check*, an officer belonging to the king's court, so called, because he has the check and controulment of the yeomen that belong to the king, queen, or prince. He likewise, by himself or deputy, sets the watch in the court. There is also an officer in the navy of the same name, belonging to the king's yards.

*CLERK of the crown*, an officer, in the king's bench, who frames, reads, and records all indictments against offenders, there arraigned or indicted of any public crime. He is likewise termed clerk of the crown-office, in which capacity he exhibits informations by order of the court, for divers offences.

**CLERK**

**CLERK of the crown**, in chancery, an officer whose business it is constantly to attend the lord-chancellor, in person or by deputy, to write and prepare for the great seal special matters of state by commission, both ordinary and extraordinary, viz. commissions of lieutenancy, of justices of assize, oyer and terminer, goal-delivery, and of the peace; all general pardons, granted either at the king's coronation, or in parliament: the writs of parliament, with the names of the knights, citizens, and burghesses, are also returned into his office. He also makes out special pardons, and writs of execution on bonds of statute-staple forfeited.

**CLERK of the deliveries**, an officer of the tower, whose function is to take indentures for all stores and ammunition issued from thence.

**CLERK of the errors**, in the court of common pleas, an officer who transcribes and certifies into the king's bench, the tenor of the record of the action on which the writ of error, made out by the curfitor, is brought there to be determined. In the king's bench, the clerk of the errors transcribes and certifies the records of causes, by bill, in that court, into the exchequer. And the business of the clerk of the errors in the exchequer, is to transcribe the records certified thither out of the king's bench, and to prepare them for judgment in the exchequer-chamber.

**CLERK of the effoins**, in the court of common pleas, keeps the effoin-roll, or enters effoins: he also provides parchment, cuts it into rolls, marks the number on them, delivers out all the rolls to every officer, and receives them again when written. See **ESSOIN**.

**CLERK of the estreats**, an officer in the exchequer, who every term receives the estreats out of the lord-treasurer's remembrancer's office, and writes them out, to be levied for the crown.

**CLERK of the green-cloth**. See **GREEN-CLOTH**.

**CLERK of the hamper, or hanaper**, an officer in chancery, whose business is to receive all money due to the king for the seals of charters, letters patent, commissions, and writs; also the fees due to the officers for enrolling and examining them.

**CLERK-comptroller of the king's household**, an officer of the king's court, authorised to allow or disallow the charges of pursuivants, messengers of the green cloth, &c. to inspect and controul all defects of any of the inferior officers; and to sit in the counting-house with the lord-steward and other officers of the household, for regulating such matters.

**CLERK of the king's silver**, an officer of the common pleas, to whom every fine is brought, after it has passed the office of the custos brevium; and who enters the effect of writs of covenant, into a book kept for that purpose, according to which all the fines of that term are recorded in the rolls of the court.

**CLERK of the market**, an officer of the king's house, to whom is given the charge of the king's measures and weights, the standards of those that ought to be used all over England.

**CLERK of the nichils**, or *nihilis*, an officer of the exchequer, who makes a roll of all such sums as are nichilled by the sheriffs upon their estreats of green wax,

and delivers them in to the remembrancer of the treasury, to have execution done upon them for the king. See **NIHIL**.

**CLERK of the outlawries**, an officer of the common pleas, and deputy to the attorney-general, for making out all writs of *capias utlagatum*, after outlawry, to which there must be the king's attorney's name.

**CLERK of the paper-office**, an officer belonging to the king's bench, whose business is to make up the paper-books of special pleadings in that court.

**CLERK of the peace**, an officer belonging to the sessions of the peace, whose business is to read indictments, enrol the proceedings, and draw the process: he likewise certifies into the king's bench, transcripts of indictments, outlawries, attainders and convictions had before the justices of peace, within the time limited by statute, under a certain penalty. This office is in the gift of the *custos rotulorum*, and may be executed by deputy.

**CLERK of the pells**, an officer that belongs to the exchequer, whose business is to enter every teller's bill into a parchment roll called *pellis receptorum*, and to make another roll of payments called *pellis exituum*.

**CLERK of the petty bag**, an officer of the court of chancery, whereof there are three, the master of the rolls being the chief: their business is to record the return of all inquisitions out of every shire, to make out patents of customers, gaugers, comptrollers, &c. liberates upon extents of statutes-staple, *conge d'elires* for bishops, summons of the nobility, clergy, and burghesses to parliament, and commissions directed to knights and others, of every shire, for assessing subsidies and taxes.

**CLERK of the pipe**, an officer of the exchequer, who having the accounts of all debts due to the king delivered out of the remembrancer's office, charges them in a great roll folded up like a pipe. He writes out warrants to sheriffs, to levy the said debts on the goods and chattels of the debtors: and if they have no good, then he draws them down, to the treasurer's remembrancer, to write estreats against their lands.

**CLERK of the pleas**, an officer of the exchequer, in whose office all the officers of the court, having special privilege, ought to sue, or be sued, in any action. In this office also actions at law may be prosecuted by other persons, but the plaintiff ought to be tenant or debtor to the king, or some way accountable to him. The under clerks are attorneys in all suits.

**CLERKS of the privy-seal**, four officers that attend the lord privy-seal, for writing and making out all things that are sent by warrant from the signet to the privy-seal, and to be passed the great-seal; and likewise to make out privy-seals, upon special occasions of his majesty's affairs, as for loan of money, or the like.

**CLERK of the rolls**, an officer of the chancery, whose business is to make searches after, and copies of deeds, officers, &c.

**CLERK of the signet**, an officer continually attending upon his majesty's principal secretary, who has the custody of the privy-signet, as well for sealing the king's

king's private letters, as those grants which pass the king's hand by bill signed. There are four of these officers, who have their diet at the secretary's table.

**CLERK, or WRITER**, *to the signet*, in Scots law. See *SCOTS LAW*, title 3.

**Six CLERKS**, officers in chancery, next in degree below the twelve masters, whose business is to enrol commissions, pardons, patents, warrants, &c. which pass the great seal: they were anciently clerici, and forfeited their places if they married. These are also attorneys for parties in suits depending in the court of chancery.

**CLERK of the treasury**, an officer belonging to the court of common pleas, who has the charge of keeping the records of the court, makes out all records of *nisi prius*, and likewise all exemplifications of records being in the treasury. He has the fees due for all searches; and has under him an under-keeper, who always keeps one key of the treasury door.

**CLERK of the warrant**, an officer of the common pleas, whose business is to enter all warrants of attorney for plaintiffs and defendants in suit; and to enroll deeds of bargain and sale, that are acknowledged in court, or before a judge. His office is likewise to estreat into the exchequer all issues, fines, estreats, and amercements, which grow due to the crown in that court.

**CLERMONT**, a city and bishop's see of France, in the territory of Auvergne, and province of Lyonois, about seventy-five miles west of Lyons: E. long.  $3^{\circ} 20'$  and N. lat.  $45^{\circ} 42'$ .

**CLERODENDRUM**, in botany, a genus of the didynamia-angiospermia class. The calix is bell shaped, and divided into five segments; the tube of the corolla is filiform; the limb is divided into five equal parts; the stamina are very long; and the berry contains but one seed. The species are two, both natives of the Indies.

**CLEROMANCY**, a sort of divination performed by throwing lots, which were generally black and white beans, little clods of earth, or pebbles; also dice, or such like things, distinguished by certain characters. They cast the lots into a vessel, and having made supplication to the gods to direct them, drew them out, and, according to the characters, conjectured what should happen to them.

**CLETHRA**, in botany, a genus of the decandria monogynia class. The calix is divided into five segments; the petals are five; the stigma is trifid; and the capsule has three cells and three valves. There is but one species, viz. the *alnifolia*, a native of Carolina.

**CLEVES**, or **CLUF**, the capital of the dutchy of Cleve, in the circle of Westphalia, in Germany, situated near the western shore of the river Rhine: E. long.  $5^{\circ} 36'$ , and N. lat.  $51^{\circ} 40'$ . It is subject to the king of Prussia.

**CLEVELAND**, a district in the north-riding of York shire, from which the noble family of Fitzroy takes the title of duke.

**CLINT**, among the Romans, a citizen who put himself under the protection of some great man, who, in respect of that relation, was called patron.

This patron assisted his client with his protection, interest, and goods; and the client gave his vote for his patron, when he sought any office for himself or his friends. Clients owed respect to their patrons, as these owed them their protection.

The right of patronage was appointed by Romulus, to unite the rich and poor together in such a manner, as that one might live without contempt, and the other without envy; but the condition of a client, in course of time, became little else but a moderate slavery.

**CLIENT** is now used for a party in a lawsuit, who has turned over his cause into the hands of a counsellor or solicitor.

**CLIFFORTIA**, in botany, a genus of the diœcia polyandria class. The calix of the male consists of three leaves; it has no corolla; and the stamina are about thirty. The calix of the female consists likewise of three leaves; and the corolla is wanting; the styli are two; and the capsule is bilocular, and contains one seed. The species are four, all natives of Æthiopia.

**CLIMACTERIC**, among physicians, a critical year in a person's life, in which he is supposed to stand in great danger of death.

According to some, every seventh year is a climacteric; but others allow only those years produced by multiplying 7 by the odd number 3, 5, 7, and 9, to be climacterical. These years, they say, bring with them some remarkable change with respect to health, life, or fortune; the grand climacteric is the sixty-third year; but some, making two, add to this the eighty-first: the other remarkable climacterics are the seventh, twenty-first, thirty-fifth, forty-ninth, and fifty-sixth.

**CLIMATE**, in geography, a space upon the surface of the terrestrial globe, contained between two parallels, and so far distant from each other, that the longest day in one differs half an hour from the longest day in the other parallel. See *GEOGRAPHY*.

**CLIMAX**, or **GRADATION**, in rhetoric, a figure wherein the word or expression which ends the first member of a period begins the second, and so on; so that every member will make a distinct sentence, taking its rise from the next foregoing, till the argument and period be beautifully finished; as in the following gradation of Dr Tillotson. "After we have practised good actions a while, they become easy; and when they are easy, we begin to take pleasure in them; and when they please us, we do them frequently; and by frequency of acts, a thing grows into a habit; and confirmed habit is a second kind of nature; and so far as any thing is natural, so far it is necessary; and we can hardly do otherwise; nay, we do it many times, when we do not think of it."

**CLINCH**, in the sea-language, that part of a cable which is bended about the ring of the anchor, and then seized, or made fast.

**CLINCHING**, in the sea-language, a kind of slight caulking used at sea, in a prospect of foul weather, about the posts: it consists in driving a little oakum into their seams, to prevent the water's coming in at them.

**CLINIC**,

**CLINIC**, a term applied by the ancient church-historians, to those who received baptism on their death-bed.

**CLINIC medicine**, was particularly used for the method of visiting and treating sick persons in bed, for the more exact discovery of all the symptoms of their disease.

**CLINOIDES**, in anatomy. See Vol. I. p. 158.

**CLINOPODIUM**, in botany, a genus of the didynamia gymnospermia class. The involucre is hoary. The species are three, only one of which is a native of Britain, viz. the vulgare, or great wild basil.

**CLIO**, in zoology, a genus of insects belonging to the order of vermes mollusca; the body is oblong, and fitted for swimming; and it has two membranaceous wings placed opposite to each other. The species are three, principally distinguished by the shape of their vagina, and are all natives of the ocean.

**CLYPEUS**, in natural history, a name given to the flat depressed centronæ, from their resembling a shield. See **CENTRONIA**.

**CLITORIA**, in botany, a genus of the diadelphia decandria class. The vexillum is large, open, plaited, and covers the alæ. The species are five, all natives of the Indies.

**CLITORIS**, in anatomy. See Vol. I. p. 276.

**CLOACA**, in Roman antiquity, the common sewer, by which the filth of the city of Rome was carried away.

**CLOCK**, a kind of movement, or machine, serving to measure time.

The invention of clocks is attributed to Pacificus, archdeacon of Verona, who lived in the time of Lotharius: others ascribe it to Boetius, about the year 510: be that as it will, it is certain, that the art of making clocks, such as are now in use, was either first invented, or at least retrieved in Germany, about 230 years ago; and the invention of pendulum clocks, so late as the last age, is disputed between Huygens and Galileo. For the principles of *Clock and Watch Work*, see **WATCH**.

**CLOGHER**, a city and bishop's see of Ireland, in the county of Tyrone, and province of Ulster, situated twelve miles west of Armagh: W. long. 7° 30', and N. lat. 54° 16'.

**CLOISTER**, an habitation surrounded with walls, and inhabited by religious.

In a more general sense, it is used for a monastery of religious of either sex. In the first sense, it is the principal part of a regular monastery, being a square surrounded with walls or buildings. It is commonly placed between the church, the chapter-house, and refectory, underneath the dormitory.

**CLOSE**, in heraldry. When any bird is drawn in a coat of arms with its wings close down about it, (*i. e.* not displayed), and in a standing posture, they blazon it by this word *close*; but if it be flying, they call it *volant*. See **VOLANT**.

**CLOT-bird**. See **FRINGILLA**.

**CLOTH**, in commerce, a manufacture made of wool, wove in the loom.

Cloths are of divers qualities, fine or coarse. The goodness of cloth, according to some, consists in the following particulars. 1. That the wool be of a good quality, and well dressed. 2. It must be equally spun, carefully observing that the thread of the warp be finer and better twisted than that of the woof. 3. The cloth must be well wrought, and beaten on the loom, so as to be every where equally compact. 4. The wool must not be finer at one end of the piece than in the rest. 5. The lifts must be sufficiently strong, of the same length with the stuff, and must consist of good wool, hair, or ostrich-feathers; or, what is still better, of Danish dog's hair. 6. The cloth must be free from knots, and other imperfections. 7. It must be well scoured with fuller's earth, well fulled with the best white soap, and afterwards washed in clear water. 8. The hair or nap must be well drawn out with the teazel, without being too much opened. 9. It must be shorn close without making it thread-bare. 10. It must be well dried. 11. It must not be tenter-stretched, to force it to its just dimensions. 12. It must be pressed cold, not hot pressed, the latter being very injurious to woollen cloth.

*Manufacturing of white cloths which are intended for dying.*

The best wool for the manufacturing of cloths are those England and Spain, especially those of Lincolnshire and Segovia. To use those wools to the best advantage, they must be scoured, by putting them into a liquor somewhat more than lukewarm, composed of three parts fair water, and one of urine. After the wool has continued long enough in the liquor to soak, and dissolve the grease, it is drained and well washed in running water. When it feels dry, and has no smell but the natural one of the sheep, it is said to be duly scoured.

After this it is hung to dry in the shade, the heat of the sun making it harsh and inflexible: when dry, it is beat with rods upon hurdles of wood, or on cords, to cleanse it from dust, and the grosser filth; the more it is thus beat and cleansed, the softer it becomes, and the better for spinning. After beating, it must be well picked, to free it from the rest of the filth that had escaped the rods.

It is now in a proper condition to be oiled, and carded on large iron cards, placed slopewise. Olive oil is esteemed the best for this purpose: one fifth of which should be used for the wool intended for the woof, and a ninth for that designed for the warp. After the wool has been well oiled, it is given to the spinners, who first card it on the knee with small fine cards, and then spin it on the wheel, observing to make the thread of the warp smaller by one third than that of the woof, and much compacter twisted.

The thread thus spun, reeled, and made into skeins, that designed for the woof is wound on little tubes, pieces of paper, or rushes, so disposed, as that they may be easily put in the eye of the shuttle. That for the warp is wound on a kind of large wooden bobbins, to dispose it for warping. When warped, it is stiffened with size, the best of which is that made of shreds

of parchment, and when dry, is given to the weavers, who mount it on the loom.

The warp thus mounted, the weavers, who are two to each loom, one on each side, tread alternately on the treddle, first on the right step, and then on the left, which raises and lowers the threads of the warp equally; between which they throw transversely the shuttle from the one to the other: and every time that the shuttle is thus thrown, and a thread of the woof inserted within the warp, they strike it conjointly with the same frame, wherein is fastened the comb or reed, between whose teeth the threads of the warp are passed, repeating the stroke as often as is necessary.

The weavers having continued their work till the whole warp is filled with the woof, the cloth is finished; it is then taken off the loom by unrolling it from the beam whereon it had been rolled in proportion as it was wove; and now given to be cleansed of the knots, ends of threads, straws, and other filth, which is done with iron nippers.

In this condition it is carried to the fullery, to be scoured with urine, or a kind of potter's clay, well steeped in water, put along with the cloth in the trough wherein it is fulled. The cloth being again cleared from the earth or urine, is returned to the former hands to have the lesser filth, small straws, &c. taken off as before: then it is returned to the fuller to be beat and fulled with hot water, wherein a suitable quantity of soap has been dissolved; after fulling, it is taken out to be smoothed, or pulled by the lifts lengthwise, to take out the wrinkles, crevices, &c.

The smoothing is repeated every two hours, till the fulling be finished, and the cloth brought to its proper breadth: after which it is washed in clear water, to purge it of the soap, and given wet to the carders to raise the hair or nap on the right side with the thistle or weed. After this preparation the clothworker takes the cloth, and gives it its first cut or shearing; then the carders resume it, and after wetting, give it as many more courses with the teazle, as the quality of the stuff requires, always observing to begin against the grain of the hair, and to end with it; as also to begin with a smoother thistle, proceeding still with one sharper and sharper, as far as the sixth degree.

After these operations, the cloth being dried, is returned to the cloth worker, who sheers it a second time, and returns it to the carders, who repeat their operation as before, till the nap be well ranged on the surface of the cloth, from one end of the piece to the other.

The cloth thus wove, scoured, napped, and shorn, is sent to the dyer; when dyed, it is washed in fair water, and the worker takes it again wet as it is, lays the nap with a brush on the table, and hangs it on the tenters, where it is stretched both in length and breadth sufficiently to smooth it, set it square, and bring it to its proper dimensions, without straining it too much; observing to brush it afresh, the way of the nap, while a little moist, on the tenters.

When quite dry, the cloth is taken off the tenters, and brushed again on the table, to finish the laying of the nap; after which it is folded, and laid cold under a press, to make it perfectly smooth and even, and give it a gloss.

Lastly, the cloth being taken out of the press, and the papers, &c. for glossing it removed, it is in a condition for sale or use. With regard to the manufacture of mixt cloths, or those wherein the wools are first dyed, and then mixt, spun and wove of the colours intended, the process, except what relates to the colour, is mostly the same with that just represented.

**CLOUD**, a collection of vapours suspended in the atmosphere. See **PNEUMATICS**.

**CLOVE TREE**, in botany. See **CARYOPHYLLUS**.

**CLOVE**, a term used in weights of wool. Seven pounds make a clove.

In **Essex**, eight pounds of cheese and butter go to the clove.

**CLOVE JULY-FLOWER**. See **CARYOPHYLLUS**.

**CLOVER-GRASS**, in botany. See **TRIFOLIUM**.

**CLOYNE**, a city and bishop's see of Ireland, in the county of Cork, and province of Munster, about fifteen miles east of Cork: W. long. 8°, and N. lat. 51° 40'.

**CLUPEA**, or herring, in ichthyology, a genus belonging to the order of abdominales. The upper jaw is furnished with a serrated mystache; the branchiostegic membrane has eight rays; a scaly serrated line runs along the belly from the head to the tail; and the belly-fins have frequently nine rays. There are 11 species, viz.

1. The harengus, or common herring, has no spots, and the under jaw is longer than the upper one. A herring dies immediately after it is taken out of the water, whence the proverb arises, *As dead as a herring*. The flesh is every where in great esteem, being fat, soft, and delicate, especially if it is dressed as soon as caught; for then it is incomparably better than on the next day. There are vast quantities of these fish taken, salted, smoke-dried, and consumed all over Europe. They make a progress every year from the seas near the north of Scotland, into the British channel, coming in pursuit of worms and small fish, which at that time abound there. There is also plenty near Norway and Denmark, from whence they proceed annually as far as the coast of Normandy.

The herring-fishery is begun both by the English and Dutch towards the latter end of June; and the Dutch alone employ no less than one thousand ships therein, called busses, from forty-five to sixty ton each. The best time for catching herrings is from the latter end of September, to the latter end of October; and the nets they make use of, are about twenty five yards long, and five deep. They sometimes fasten so many of these nets together, as will take in a mile in compass. They judge where the herrings lie by the hovering and motion of the sea-birds, which continually pursue them, in expectation of prey. The fishermen row very gently along, letting the nets fall into the

sea,

sea, and taking their courses as near as they can against the tide; that so, when they draw their nets, they may have the assistance of the tide. As soon as any boat has got its load, it makes to the shore, and delivers its load to those that wash and gut them.

Herrings are put into a tub with salt or brine, where they lie for twenty-four hours, and are then taken out and put into wicker baskets and washed. After this, they are spitted on sharp wooden spits, and hang up in a chimney, built for that purpose, at such distances, that the smoke may have free access to them all. These places will hold ten or twelve thousand at a time; and they kindle billets on the floor in order to dry them. This done, they shut the doors, having before stopped up all the air-holes. This they repeat every quarter of an hour, inasmuch that a single salt of herrings requires five hundred billets to dry them. A last is ten barrels, and each barrel contains about one thousand herrings. When they are smoke-dried in this manner, they are called red herrings. Salt herrings, and pickled herrings, are cured after a different manner; the last of which were formerly best done by the Dutch; but now the Scotch and English are become their rivals in that trade. Herrings always swim in shoals, delighting to be near the shore. They spawn but once a year, that is about the beginning of November; a little before which, like most other fish, they are in highest season.

There are likewise herrings on the coast of North America, but they are not so plenty as in Europe; and they never go farther south than the rivers of Carolina. There are none near Spain, Portugal, in the Mediterranean, nor on the coast of Africa.

2. The sprattus has 13 rays in the back-fin. It is a native of the European seas, and has a great resemblance to the herring, only it is of a less size.

3. The alosa, has a forked snout, and black spots on the sides. It is found in the European seas.

4. The encrasicolus, or anchovy, has its upper jaw longer than the under one, and is found in the European seas. It is about three inches long, and is frequently used as a pickle.

5. The atherinoides has a shining line on each side, and small belly-fins. It is a native of Surinam.

6. The thrissa has 28 rays in the fin at the anus. It is found in the Indian ocean.

7. The sima has yellow fins, those of the belly being very small. The mouth is flat; the upper jaw is very short; the body is of a shining silver colour; and the fins are yellow. It is a native of Asia.

8. The sternicla has no belly-fins, and the body is broad. It is a native of Surinam.

9. The myltus is shaped like a sword, and the fins at the anus are united. It is found in the Indian ocean.

10. The tropica has a wedge-like tail, and a white, broad, compressed body; and the tail is wedge-shaped. It is found at Ascension island.

11. The sinensis is very like the common herring, but broader. It has no teeth, and is a native of China.

CLUSIA, in botany, a genus of the polygamia montecia class. The calix of the male consists of six leaves; the corolla has five petals; and the stamina are numerous. The calix and corolla of the female are the same as those of the male; the nectarium includes the germen and united antheræ; and the capsule has five cells, five valves, and a stuffed pulp. The species are four, all natives of America.

CLUSTIA, in botany, a genus of the diœcia gynandria class. The calix and corolla, both of the male and female, consist of five leaves; the styli are three; and the capsule has three cells and one seed.

CLYDE, a river in Scotland, which, arising in Annandale, runs north-west by Lanerk, Hamilton, and Glasgow, and falls into the Frith of Clyde, over-against the isle of Bute.

CLYMENUM, in botany. See LATHYRUS.

CLYPEOLA, in botany, a genus of the tetradynamia siliculosa class. The pod is emarginated, roundish, entire, compressed, and deciduous. The species are two, none of them natives of Britain.

CLYPEUS, or CLYPEUM, a shield or buckler. See SHIELD.

CLYSSUS, an extract prepared, not from one, but several bodies mixt together: and, among the moderns, the term is applied to several extracts procured from the same body, and then mixed together. Thus, if from wormwood we draw the water, spirit, oil, salt, and tincture, and according to the rules of art re-unite these into a mass compounded of them all, and containing the joint virtues of all, we have a clyffus of wormwood.

CLYSTER, is a liquid remedy, to be injected chiefly at the anus into the larger intestines. It is usually administered by the bladder of a hog, sheep, or ox, perforated at each end, and having at one of the apertures an ivory pipe fastened with pack-thread. But the French, and sometimes the Dutch, use a pewter syringe, by which the liquor may be drawn in with more ease and expedition than in the bladder, and likewise more forcibly expelled into the large intestines. This remedy should never be administered either too hot or too cold, but tepid; for either of the former will be injurious to the bowels.

Clysters are prepared of different ingredients, according to the different intentions proposed.

Clysters are sometimes used to nourish and support a patient who can swallow little or no aliment, by reason of some impediment in the organs of deglutition. In which case they may be made of broth, milk, ale, and decoctions of barley and oats with wine. The English introduced a new kind of clyster, made of the smoke of tobacco, which has been used by several other nations, and appears to be of considerable efficacy when other clysters prove ineffectual, and particularly in the iliac passion, in the *hernia incarcerata*, and for the recovery of drowned persons.

CNEORUM, in botany, a genus of the triandria monogynia class. The calix has three teeth; and the corolla has three equal petals. There is but one species, viz. the tricoccum, a native of Spain.

CNICUS,

**CNICUS**, or **SAFFRON FLOWER**, in botany, a genus of the *syngenesia polygamia aequalis* class. The calix is ovated, and imbricated with spinous branches; and the corolla are equal. The species are seven, none of them natives of Britain.

**COA**, in botany. See **HIPPOCRATEA**.

**COACH**, a commodious vehicle for travelling, so well known as to need no description. Their invention was owing to the French about the reign of Francis I.

**COAGULATION**, in a general sense, imports a certain change in the state of any liquor, by means of which, instead of retaining its fluidity, it becomes more or less consistent, according to the degree of coagulation.

**COAGULUM**, is the same with what in English we call runnet, or rather the curd formed thereby.

**COAL**, or **PIT-COAL**, in natural history. See **LITHANTHRAX**.

**Cannel-COAL**, in natural history. See **AMPELITES**.

**Small-COAL**, a sort of charcoal prepared from the spray and brush-wood stripped off from the branches of coppice-wood, sometimes bound in bavons for that purpose, and sometimes charred without binding, and then it is called coming it together.

**COALITION**, the re-union of the parts of a body before separated.

**COAT**, or **COAT OF ARMS**, in heraldry, a habit worn by the ancient knights over their arms both in war and tournaments, and still borne by heralds at arms. It was a kind of fur-coat, reaching as low as the navel, open at the sides with short sleeves, sometimes furred with ermine and hair, upon which were applied the armories of the knights embroidered in gold and silver, and enamelled with beaten tin-coloured black, green, red, and blue; whence the rule never to apply colour on colour, nor metal on metal. The coats of arms were frequently open, and diversified with bands and fillets of several colours, alternately placed, as we still see cloths scarleted, watered, &c. Hence they were called *devises*, as being divided and composed of several pieces sewed together; whence the words *false*, *pale*, *chevron*, *bend*, *cross*, *saltier*, *lozenge*, &c. which have since become honourable pieces, or ordinaries of the shield. See **CROSS**, **BEND**, **CHEVRON**, &c.

Coats of arms and banners were never allowed to be worn by any but knights and ancient nobles.

**COAT**, in anatomy. See **PART VI**.

**COAT OF MAIL**. See **MAIL**.

**COATI**, in zoology, a synonyme of a species of *viverra* and *ursus*. See **VIVERRA** and **URSUS**.

**COBALT**, in chemistry, a genus of fossils, of the order of the *aphurelata*: it is a dense, compact, and ponderous mineral, very bright and shining, and much resembling some of the antimonial ores. See **ANTI-MONY**, and **CHEMISTRY**, p. 139, 140, 141.

It is sometimes found of a deep bluish-black, very heavy and hard, and of a granulated structure, looking like a piece of pure iron where fresh broken: at other times it is found more compact, not granulated,

but resembling a mass of melted lead on the surface. These are the more ordinary appearances of cobalt, besides which there are other accidental varieties of it, being sometimes found of a florid red, or a red debased by mixtures of grey, black, or yellow; and in this state, it either forms an uniform mass, or a beautifully striated and ridged one.

From this mineral are produced the several kinds of arsenic, zaffre, and smalt. See **CHEMISTRY**, p. 145.

**COBELLA**, in zoology, the trivial name of a species of coluber. See **COLUBER**.

**COBITIS**, the loache, in ichthyology, a genus of fishes belonging to the order of abdominales. The eyes are in the upper part of the head. The branchiostegic membrane has from four to five rays; and the body is nearly of an equal thickness throughout. The species are five, *viz.* the anablops, with two cirri, a depressed head, and prominent eyes. It is found on the coasts of Surinam. 2. The barbatula, with six cirri, and a compressed smooth head. 3. The tænia, with six cirri, and a prickle below the eye. The above two are found in the fresh-waters of Europe. 4. The sofifilis, with eight cirri, and a prickle above the eye. It is a native of Europe. 5. The heteroclita, has no cirri; and the back-fin and that at the anus are full of white spots. It is a native Carolina.

**COBLENTZ**, a large city of Germany, in the archbishopric of Triers, and circle of the Lower Rhine, situated at the confluence of the Rhine and Moselle, fifty two miles north-east of Triers, and thirty-six south of Cologne: E. long. 7° 15', N. lat. 50° 30'.

**COBLON**, a port-town of the hither India, situated on Coromandel coast, twelve miles south of Fort St George: E. long. 80°, N. lat. 12. 50'.

**COBWEB**, in physiology, the fine net-work which spiders spin out of their own bowels, in order to catch their prey. See **ARANEA**.

**COCCEIRA** in botany. See **THEOBROMA**.

**COCCIFEROUS PLANTS**, the same with *bacciferous*. See **BACCIFEROUS**.

**COCCINELLA**, in zoology, a genus of insects, of the coleoptera order. The antennæ are fulclavated, and truncated; the polypi are shaped like a hart; the body is of a hemispherical figure; the breast and elytra are marginated; and the belly is plain. The species are forty-nine, mostly distinguishable by the number and colour of the spots on their wings, and the plants upon which they live.—The *coccinella cacti*, a native of the warmer parts of America, is the famous cochineal animal, so highly valued in every part of the world for the incomparable beauty of its red colour, which it equally communicates to wool, silk, linen, and cotton. It is bred on a plant known in Oaxaca in New Spain, and all those parts where it abounds, by the name of nopal, or nopalleca, the Indian fig-tree, which, except in the difference of the foliage, resembles the tunes, so common in the kingdom of Andalusia; the leaf of the tuna being broad, flat and prickly, and that of the nopal, oblong, with several eminences;

eminences; and instead of spines has a fine smooth membrane, of a permanent and lively green.

The method of planting the nopal is by making rows of holes about half a yard deep, and about two yards distant from one another. In each of these holes is placed one or two leaves of the nopal, in a flat position, and then covered with earth. This leaf soon after shoots up into a single stem, which during its growth divides into several branches, and these successively produce fresh leaves, the largest being nearest to the stem, which is full of knots, as are also the branches, and from these the leaves have their origin. The usual height of this plant is about three yards, which it seldom exceeds. The season when the nopal displays all its beauty and vigour, is like that of other plants, from the spring to the autumn, which at Oaxaca and other parts of North America is at the same time as in Spain. Its blossom is small, of a bright red, and in the shape of a bud; from the centre of which proceeds the tuna, a name given to its fruit; and as this increases the blossom fades, till at length it falls. When the tuna, or fig, is ripe, the outward skin becomes white; but the pulp is so fully impregnated with a deep red, that it tinges the urine of those who eat it of a blood colour, a circumstance attended with no small uneasiness to those who are unacquainted with this particular. Few fruits, however, are either more wholesome or pleasant.

The ground where the nopal is intended to be planted, must be carefully cleansed from all kinds of weeds, as they drain the soil of those juices which the nopal requires. Also after the cochineal is taken from the plant, which is never done till the insects are arrived at perfection, all the superfluous leaves are plucked off, that they may be succeeded by others the following year. For it must be observed, that the cochineal which are bred on young plants thrive much better, and are of a finer quality, than those produced on such as have stood some years.

The cochineal was formerly imagined to be a fruit or seed of some particular plant; an error which probably arose from an ignorance of the manner in which it is propagated; but at present every one is convinced of its being an insect, agreeably to its name, signifying a woodlouse, which generally breeds in damp places, especially in gardens. These insects, by rolling themselves up, form a little ball something less than a pea, and in some places are known by the name of Baquillas de San Anton, *i. e.* St Anthony's little cows: and such is the figure of the cochineal, except that it has not the faculty of rolling itself up; and its magnitude, when at its full growth, does not exceed that of a tick, common in dogs and other animals.

These insects breed and are nourished on the nopals, where their eggs are placed among the leaves; the juice of the plant, which is their sole nourishment, becomes converted into their substance; when, instead of being thin and watery, and, to all outward appearance, of little or no use, is rendered a most beautiful crimson colour. The plant is in May or June in its most vigorous state, and at this most favourable season the eggs

are deposited: and in the short space of two months from an animalcule, the insect grows up to the size above-mentioned; but its infant state is exposed to a variety of dangers; the violent blasts of the north wind sweep away the eggs from the foliage of the plant; and, what is equally fatal to their tender constitutions, showers, fogs, and frosts, often attack them, and destroy the leaves, leaving the careful cultivator this only resource, namely, that of making fires at certain distances, and filling the air with smoke, which frequently preserves them from the fatal effects of the inclemency of the weather.

The breeding of cochineal is also greatly obstructed by birds of different kinds, which are very fond of these insects; and the same danger is to be apprehended from the worms, *&c.* which are found among the plantations of nopals: so that unless constant care be taken to fright the birds away from the plantation, and to clear the ground of those various kinds of vermin, which multiply so fast in it, the owner will be greatly disappointed in his expectations.

When the insects are at their full growth, they are gathered and put into pots of earthen ware; but great attention is requisite to prevent them from getting out, as, in that case, great numbers of them would be lost; though there is no danger of it, where they are at liberty on the nopal leaves, those being their natural habitation; and where they enjoy a plenty of delicious food; for, though they often remove from one leaf to another, they never quit the plant; nor is it uncommon to see the leaves entirely covered with them, especially when they are arrived at maturity. When they have been confined some time in these pots, they are killed and put in bags. The Indians have three different methods of killing these insects, one by hot water, another by fire, and a third by the rays of the sun: and to these are owing the several gradations of the colour, which in some is dark, and in others bright; but all require a certain degree of heat. Those therefore who use hot water are very careful to give it the requisite heat, and that the quantity of water be proportioned to the number of insects. The method of killing the creatures by fire is to put them on shovels into an oven moderately heated for that intention; the fine quality of the cochineal depending on its not being over dried at the time of killing the insects: and it must be owned, that among the several ways made use of to destroy this valuable creature, that of the rays of the sun seems to bid fairest for performing it in the most perfect manner.

Besides the precaution requisite in killing the cochineal, in order to preserve its quality, it is equally necessary to know when it is in a proper state for being removed from the leaves of the nopal; but as experience only can teach the cultivator this necessary criterion, no fixed rule can be laid down. Accordingly in those provinces where the cultivation of these insects is chiefly carried on, those gathered by Indians of one village differ from those gathered in another; and even those gathered by one person in the same village, are often different from those gathered by another; every individual adhering to his own method.

The cochineal insect may, in some circumstances, be compared to the silk worm, particularly in the manner of depositing its eggs. The insects destined for this particular are taken at a proper time of their growth, and put into a box well closed, and lined with a coarse cloth that none of them be lost: and in this confinement they lay their eggs and die. The box is kept close shut till the time of placing the eggs on the nopal, when, if any motion is perceived, it is a sufficient indication that the animalcule has life, tho' the egg is so minute as hardly to be perceived; and this is the seed placed on the foliage of the nopal, and the quantity contained in the shell of a hen's egg is sufficient for covering a whole plant. It is remarkable that this insect does not, or at least in any visible manner, injure the plant, but extracts its nourishment from the most succulent juice, which it sucks by means of its proboscis through the fine teguments of the leaves.

The principal countries where the cochineal insects are bred, are Oaxaca, Flascala, Chulula, Nueva Galicia, and Chiapa, in the kingdom of New Spain; and Hambato, Loja, and Tucuman in Peru: but it is only in Oaxaca, that they are gathered in large quantities, and form a branch of commerce, the cultivation of these little creatures being there the chief employment of the Indians.

**COCCOTHAUSTES**, in ornithology, the trivial name of a species of loxia. See **LOXIA**.

**COCCULUS INDICUS**, the name of a poisonous berry, too frequently used by brewers in order to render their malt liquors intoxicating. It is the fruit of the *menispermum cocculus*. See **MENISPERMUM**.

**COCCUS**, in zoology, a genus belonging to the order of hemiptera. The rostrum proceeds from the breast; the belly is bristly behind; the wings of the male are erect; and the female has no wings. The species are twenty-two, denominated principally from the plants they frequent.

**COCCYGÆUS MUSCULUS**, in anatomy. See Vol. I. p. 220.

**COCCYX**, or **COCCYGIS OS**, in anatomy. See Vol. I. p. 171.

**COCHIN**, a port-town of India, on the Malabar-coast, about one hundred miles south of Calicut: W. long. 75°, and N. lat. 9° 30'. Here the Dutch have a factory, and a very strong fort.

**COCHIN CHINA**, a kingdom of India, situated between 104° and 109° E. long. and between 10° and 17° N. lat. being bounded by the kingdom of Tonquin on the north, by the Indian ocean on the east and south, and by the kingdom of Cambodia on the west: it is upwards of four hundred miles long, and one hundred and fifty broad, producing chiefly silk and rice.

**COCHINEAL**. See **COCCINELLA**.

**COCHLEA**, the SNAIL-SHELL, in zoology. See **LIMAX**.

**COCHLEA**, in anatomy. See Vol. I. p. 297.

**COCHLEARIA**, SCURVY-GRASS, in botany, a genus of the tetradynamia filiculosa class. The pod is emarginated, turgid, and scabrous; and the valves are ob-

tuse and gibbous. The species are eight, six of which are natives of Britain, viz. the officinalis, or common scurvy-grass, the leaves of which are famous for curing the scurvy; the groenlandica, or Goenland scurvy-grass; the anglica, or common sea scurvy-grass; the danica, or Danish scurvy-grass; the coronopus, or swine-creffes; and the armoracia, or horse-radish.

**COCHLITES**, in natural history, an appellation given to the petrified shells of the cochleæ, or snails.

**COCK**, in zoology, the English name of the males of gallinaceous birds, but more especially used for the common dunghill-cock. See **PHASIANUS**.

**COCK'S-COMB**, in botany. See **PHINANTHUS**.

**COCK-PIT**, a sort of theatre upon which game-cocks fight.

**COCK-PIT**, in a man of war, a place on the lower floor, or deck, abaft the main-captain, lying between the platform and the steward's room, where are partitions for the purser, surgeon, and his mates.

**COCK-SWAIN**, or **COXON**, an officer on board a man of war, who has the care of the barge and all things belonging to it, and must be also ready with his crew to man the boat on all occasions: he sits at the stern of the boat, and steers.

**COCKERMOUTH**, a borough-town of Cumberland, situated on the river Derwent, near the Irish sea, about twenty-five miles south-west of Carlisle: W. lon. 3° 10', and N. lat. 54° 35'. It sends two members to parliament.

**COCKET** is a seal belonging to the king's custom-house, or rather a scroll of parchment sealed and delivered by the officers of the customs to merchants, as a warrant that their merchandises are customed.

It is also used for the office where goods transported were first entered, and paid their custom, and had a cocket or certificate of discharge.

**COCOA**, or **CACAO**, in botany. See **THEOBROMA**.

**COCOI**, in ornithology. See **ARCTEA**.

**COCONATO**, a town of Italy in the province of Piedmont, about twenty miles east of Turin; it is said to be the birth-place of the famous Columbus, who discovered America: E. long. 8°, and N. lat. 44° 50'.

**COCTION**, a general term for all alterations made in bodies by the application of fire or heat.

**COD**, in ichthyology. See **GADUS**.

**COD** is also a term used, in some parts of the kingdom, for a pod. See **POD**.

**COD-CAPE**, in geography, a promontory on the coast of New England, near the entrance of Bolton harbour: W. long. 69° 50', and N. lat. 42°.

**CODDY-MODDY**, the English name of a species of larus. See **LARUS**.

**CODE**, a collection of the laws and constitutions of the Roman emperors, made by order of Justinian. See **LAW**.

**CODEX**, in antiquity, denotes a book or tablet, upon which the ancients wrote. It was of the bark of a tree, of ivory, of parchment, or of paper.

**CODIA**, among botanists, signifies the head of any plant, but more particularly a poppy head, whence its syrup is called diacodium.

**CODICIL**,

**CODICIL** is a writing by way of supplement to a will, when any thing is omitted which the testator would have added, or wants to be explained, altered, or recalled.

**CODLIN**, an apple useful in the kitchen, being proper for baking.

**CODLING**, an appellation given to the cod fish when young. See **GADUS**.

**COECUM**, in anatomy. See Vol. I. p. 260.

**COEFFICIENTS**, in algebra. See Vol. I. p. 80.

**COELESTIAL**, in general, denotes any thing belonging to the heavens: thus we say, celestial observations, the celestial globe, &c.

**COELIAC artery**, in anatomy. See Vol. I. p. 232.

**COELIAC passion**, in medicine, a kind of flux, or diarrhoea, wherein the aliments, either wholly changed, or only in part, pass off by stool. See **MEDICINE**.

**COELIAC vein**, in anatomy. See Vol. I. p. 245.

**COELOMA**, among physicians, a hollow ulcer seated in the cornea tunica of the eye.

**COENOBITE**, in church-history, a sort of monks in the primitive Christian church. They were so called from living in common; in which they differed from the anachorites, who retired from society.

**COENOBITE**, in a modern sense, is a religious who lives in a convent or community, under certain rules.

**COEUR**, in heraldry, a short line of partition in pale, in the centre of the escutcheon, which extends but a little way, much short of the top and bottom, being met by other lines, which form an irregular partition of the escutcheon. See Plate LXV. fig. 7.

**COEVORDEN**, a town of the province of Overijssel, strongly fortified by the famous Coehorn, on account of its situation, it being the key to the provinces of Groningen and Friesland.

**COFFEA**, the **COFFEE-TREE**, in botany, a genus of the pentandria monogynia class. The corolla is hypocrateriform; the stamina are above the tube; the berry is below the flower, and contains two seeds, which are arillated. The species are two, viz. the arabica, a native of Arabia and Æthiopia; and the occidentalis, a native of America. The berries of both species have much the same qualities. This fruit is used rather as food than as a medicine. The medical effects expected from it are, to assist digestion, promote the natural secretions, and to prevent or remove a disposition to sleep.

Coffee pays on importation 1*l.* 13*s.* 6*d.* the hundred weight; the drawback on exportation is 1*l.* 10*s.* 2*d.* Upon payment of the above duty, the coffee is to be put into warehouses; and upon delivery from thence, if to be consumed in Great Britain, is to pay for every hundred weight 8*l.* 8*s.* if of the British plantations in America, and 11*l.* 4*s.* if it comes from any other place.

**COFFERER of the king's household**, a principal officer in the court, next under the comptroller, who, in the counting-house, and elsewhere at other times, has a special charge and oversight of other officers of the house, for their good demeanor and charge in their offices, to all which he pays their wages.

**COGENDE**, a city of Tartary in Asia, situated in 74° E. long. and 41° N. lat. remarkable for its commerce in musk.

**COGGLE**. See **COGS**.

**COGGSHALL's sliding rule**. See **SLIDING RULE**.

**COGITATION**, a term used by some for the act of thinking.

**COGNATE**, in Scots law, any male relation through the mother.

**COGNATION**, in the civil law, a term for that line of consanguinity which is between males and females, both descended from the same father; as agnation is for the line of parentage between males only descended from the same stock.

**COGNI**, the capital of Caramania, in the lesser Asia, anciently called Iconium, about two hundred and fifty miles south-east of Constantinople: E. long. 33°, and N. lat. 38°.

**COGNITIONIS CAUSA**, in Scots law: When a creditor charges the heir of his debtor to enter, in order to constitute the debt against him, and the heir renounces the succession, the creditor can obtain no decreet of constitution of that debt against the heir; but only a decreet subjecting the *hereditas jacens*, or the estate which belonged to the debtor, to his diligence: and this is called a decreet *cognitionis causæ*. See **SCOTS LAW**, title, *Comprisings and adjudications*.

**COGNIZANCE**, in heraldry. See **CREST**.

**COGNIZANCE**, or **CONNUSANCE**, in law, has divers significations: sometimes it is an acknowledgment of a fine, or confession of something done; sometimes the hearing of a matter judicially, as to take cognizance of a cause; and sometimes a particular jurisdiction, as cognizance of pleas is an authority to call a cause or plea out of another court, which no person can do but the king, except he can shew a charter for it. This cognizance is a privilege granted to a city or town, to hold plea of all contracts, &c. within the liberty; and if any one is impleaded for such matters in the courts at Westminster, the mayor, &c. of such franchise may demand cognizance of the plea, and that it be determined before them.

**COGNIZANCE** is also used for a badge on a waterman's or serving-man's sleeve, which is commonly the giver's crest, whereby he is decerned to belong to this or that nobleman or gentleman.

**COGS**, or **COGGLES**, a kind of flat-bottomed boats used in rivers.

**COHABITATION**, denotes the state of a man and a woman who live together like husband and wife, without being legally married.

By the common law of Scotland, cohabitation for year and day, or a complete twelvemonth, is deemed equivalent to matrimony.

**CO-HEIR**, one who succeeds to a share of an inheritance, to be divided among several.

**COHESION**, in philosophy, that action by which the particles of the same body adhere together, as if they were but one. See **MECHANICS**.

**COHORT**, in Roman antiquity, the name of part of the

the Roman legion, comprehending about six hundred men. There were ten cohorts in a legion, the first of which exceeded all the rest, both in dignity and number of men. When the army was ranged in order of battle, the first cohort took up the right of the first line, the rest followed in their natural order, so that the third was in the centre of the first line of the legion, and the fifth on the left, the second between the first and third, and the fourth between the third and fifth: the five remaining cohorts formed a second line, in their natural order.

**COIF**, the badge of a serjeant at law, who is called serjeant of the coif, from the lawn-coif they wear under their caps when they are created serjeants.

The use of the coif was to cover the clerical tonsure. See **TONSURE**.

**COIL**. See **QUOIL**.

**COILON** in the ancient Grecian theatres, the same with the cavea of the Romans. See **CAVEA**.

**COILOPHYLLUM**, in botany. See **SARRACENA**.

**COIMBRA**, a large city of Portugal, in the province of Beira, situated on the river Mondego, about nine-fix miles north of Lisbon: W. long. 9°, and N. lat. 40° 20'.

**COIN** denotes all manner of the several stamps and species of money in any nation. See **MONEY**.

**COIN**, in architecture, a kind of dye cut diagonal-wise, after the manner of a flight of a stair case, serving at bottom to support columns in a level, and at top to correct the inclination of an entablature supporting a vault.

**COIN** is also used for a solid angle composed of two surfaces inclined towards each other, whether that angle be exterior, as the coin of a wall, a tree, &c. or interior, as the coin of a chamber or chimney. See **QUOIN**.

**COINAGE**, or **COINING**, the art of making money, as performed either by the hammer or mill.

Formerly the fabric of coins was different from what it is at present. They cut a large plate of metal into several little squares, the corners of which were cut off with sheers. After having shaped these pieces, so as to render them perfectly conformable, in point of weight, to the standard piece, they took each piece in hand again, to make it exactly round, by a gentle hammering. This was called a planchet, and was fit for immediate coining. Then engravers prepared, as they still do, a couple of steel masses in form of dyes, cut and terminated by a flat surface, rounded off at the edges. They engraved or stamped on it the hollow of a head, a cross, a scutcheon, or any other figure, according to the custom of the times, with a short legend. As one of these dyes was to remain dormant, and the other moveable, the former ended in a square prism, that it might be introduced into the square hole of the block, which, being fixed very fast, kept the dye as steady as any vice could have done. The planchet of metal was horizontally laid upon this inferior mass, to receive the stamp of it on one side, and that of the upper dye, wherewith it was covered, on the other. This moveable dye, having its round

engraved surface resting upon the planchet, had at its opposite extremity a flat square, and larger surface, upon which they gave several heavy blows, with a hammer of an enormous size, till the double stamp was sufficiently, in relievo, impressed on each side of the planchet. This being finished, was immediately succeeded by another, and they thus became a standard coin, which had the degree of fineness, the weight and mark, determined by the judgment of the inspectors, to make it good current money. The strong tempering which was and is still given to the two dyes, rendered them capable of bearing those repeated blows. Coining has been considerably improved and rendered expeditious, by several ingenious machines, and by a wise application of the surest physical experiments to the methods of fining, dyeing, and stamping the different metals.

The three finest instruments the mint-man uses, are the laminating engine, the machine for making the impressions on the edges of coins, and the mill.

After they have taken the laminæ, or plates of metal, out of the mould into which they are cast, they do not beat them on the anvil, as was formerly done, but they make them pass and repass between the several rollers of the laminating engine, which being gradually brought closer and closer to each other, presently give the lamina its uniform and exact thickness. Instead of dividing the lamina into small squares, they at once cut clean out of it as many planchets as it can contain, by means of a sharp steel trepan, of a roundish figure, hollow within, and of a proportionable diameter, to shape and cut off the piece at one and the same time. After these planchets have been prepared and weighed with standard pieces, filed or scraped to get off the superfluous part of the metal, and then boiled and made clean, they arrive, at last, at the machine, (Plate LXVI. fig. 1.), which marks them upon the edge; and finally, the mill, (fig. 2.) which, squeezing each of them singly between the two dyes, brought near each other with one blow, forces the two surfaces or fields of the piece to fill exactly all the vacancies of the two figures engraved hollow. The engine which serves to laminate lead, gives a sufficient notion of that which serves to flatten gold and silver laminæ between rollers of a lesser size. See **LAMINATING**.

The principal pieces of the machine, (fig. 1.), to stamp coins on the edge, are two steel laminæ, about a line thick. One half of the legend, or of the ring, is engraved on the thickness of one of the laminæ; and the other half on the thickness of the other; and these two laminæ are straight, although the planchet marked with them be circular.

When they stamp a planchet, they first put it between the laminæ in such a manner, as that these being each of them laid flat upon a copper-plate, which is fastened upon a very thick wooden table, and the planchet being likewise laid flat upon the same plate, the edge of the planchet may touch the two laminæ on each side, and in their thick part.

One of these laminæ is immoveable, and fastened with

with several screws; the other slides by means of a dented wheel, which takes into the teeth that are on the surface of the lamina. This sliding lamina makes the planchet turn in such a manner, that it remains stamped on the edge, when it has made one turn. Only crown and half-crown pieces can bear the impression of letters on the thickness of their edges.

The coining engine or mill is so handy (fig. 2.) that a single man may stamp twenty thousand planchets in one day: gold, silver, and copper planchets, are all of them coined with a mill, to which the coining squares, (fig. 3.), commonly called dyes, are fastened; that of the face under, in a square box garnished with male and female screws, to fix and keep it steady; and the other above, in a little box garnished with the same screws, to fasten the coining square. The planchet is laid flat on the square of the effigy, which is dormant; and they immediately pull the bar of the mill by its cords, which causes the screw set within it to turn. This enters into the female screw, which is in the body of the mill, and turns with so much strength, that by pushing the upper square upon that of the effigy, the planchet, violently pressed between both squares, receives the impression of both at one pull, and in the twinkling of an eye.

The planchet thus stamped and coined, goes through a final examination of the mint wardens, from whose hands it goes into the world.

*In the COINING of medals*, the process is the same, in effect, with that of money; the principal difference consisting in this, that money having but a small relief, receives its impression at a single stroke of the engine; whereas for medals, the height of their relief makes it necessary that the stroke be repeated several times: to this end the piece is taken out from between the dyes, heated, and returned again; which process in medallions and large medals, is repeated fifteen or twenty times before the full impression be given, care must be taken, every time the planchet is removed, to take off the superfluous metal stretched beyond the circumference with a file. Medallions, and medals of a high relief, are usually first cast in sand, by reason of the difficulty of stamping them in the press, where they are put only to perfect them; in regard the sand does not leave them clear, smooth, and accurate enough. Therefore we may see that medals receive their form and impression by degrees, whereas money receives them all at once.

*British COINAGE*, both by the beauty of the engraving, and by the invention of the impressions on the edges, that admirable expedient for preventing the alteration of the species, is carried to the utmost perfection.

It was only in the reign of king William III. that the hammer-money ceased to be current in England, where till then it was struck in that manner, as in other nations. Before the hammer species was called in, the English money was in a wretched condition, having been filed and clipped by natives as well as foreigners, inso much that it was scarce left of half the value: the retrieving this distressed state of the Eng-

Vol. II. No. 39.

lish money is looked upon as one of the glories of king William's reign.

The British coinage is now wholly performed in the Tower of London, where there is a corporation for it, under the title of the mint. Formerly there were here, as there are still in other countries, the rights of seignorage and brassage: but since the eighteenth year of king Charles the Second, there is nothing taken either for the king, or for the expences of coining; so that weight is returned for weight, to any person who carries their gold and silver to the Tower.

The species coined in Great Britain are esteemed contraband goods, and not to be exported. All foreign species are allowed to be sent out of the realm, as well as gold and silver in bars, ingots, dust, &c.

*Barbary COINAGE*, particularly that of Fez and Tunis, is under no proper regulations, as every goldsmith, Jew, or even private person, undertakes it at pleasure; which practice renders their money exceeding bad, and their commerce very unsafe.

*Muscovite COINAGE*. In Muscovy there is no other coin struck but silver, and that only in the cities of Muscow, Novogrod, Twer, and Pleskow, to which may be added Petersburg. The coinage of each of these cities is let out to farm, and makes part of the royal revenue.

*Persian COINAGE*. All the money made in Persia is struck with a hammer, as is that of the rest of Asia; and the same may be understood of America, and the coasts of Africa, and even Muscovy: the king's duty, in Persia, is seven and a half *per cent.* for all the monies coined, which are lately reduced to silver and copper, there being no gold coin there, except a kind of medals, at the accession of a new sopher.

*Spanish COINAGE* is esteemed one of the least perfect in Europe. It is settled at Seville and Segovia, the only cities where gold and silver are struck.

COIRE, or CHUR, the capital of the country of the Grisons, in Switzerland, situated on the river Rhine, fifty-three miles south of Constance: E. long. 9° 25', N. lat. 46° 40'.

COITION. See GENERATION.

COIX, or JOE'S TEARS, in botany, a genus of the monoecia triandria class. The calix of the male is a double-flowered glume, without any awn; the corolla is likewise a glume without an awn: the calix of the female is an open, oval, one-flowered glume; the stylus is bifid; and the seed is cartilaginous. There is but one species, *viz.* the latifolia, a native of Jamaica.

COKENHAUSEN, a fortress of Livonia, situated on the river Dwina, about thirty-two miles east of Riga: E. long. 25°, N. lat. 57°.

COLATURE. See FILTRATION.

COLCHESTER, a large borough-town of Essex, situated on the river Coln, twenty miles north-east of Chelmsford, on the road to Harwich: E. long. 1°, N. lat. 51° 55'. It sends two members to parliament.

COLCHICUM, or MEADOW SAFFRON, in botany, a

genus of the hexandria trigynia class. The corolla is divided into six segments, and the tube is radicated; it has three inflated cupules united together. The species are three, only one of which, viz the autumnale, or meadow-saffron, is a native of Britain.

**COLD**, in general, denotes the privation or absence of heat; and, consequently, those who suppose heat to consist in a brisk agitation of the component particles of the hot body, define cold to be such a faint motion of these parts, as is either altogether or nearly imperceptible to our organs of feeling: in which sense, cold is a mere term of relation between the cold body and the organs of sensation; and, in fact, the same body will be felt either hot or cold, according as the sensible organ is colder or hotter than it.

**COLD**, in medicine, is found to be productive of inflammatory disorders, as coughs, pleurisies, peripneumonies, rheumatic pains, consumptions, &c. See **MEDICINE**.

**COLDENIA**, in botany, a genus of the tetrandria tetragynia class. The calix has four leaves; the corolla is tunnel-shaped; the fruit consists of four seeds. There is but one species, a native of India.

**COLD-FINCH**. See **MOTACILLA**.

**COLDSHIRE-IRON**, that which is brittle when cold.

**COLE-FISH**. See **GADUS**.

**COLE-MOUSE**, in ornithology. See **PARUS**.

**COLEOPTERA**, the name of Linnæus's first order of insects. The insects belonging to this order have four wings; the upper pair, which serve as covers to the other two, are crustaceous, with a straight ridge or suture in the middle. See **NATURAL HISTORY**.

**COLE-SEED**, the seed of the *napus sativa*, or long-rooted, narrow-leaved rapa, called, in English, navew, and comprehended by Linnæus among the brassicas, or cabbage-kind. See **BRASSICA**.

This plant is cultivated to great advantage in many parts of England, on account of the nape-oil expressed from its seeds. It requires a rich and strong soil, especially in march or fenny lands, those newly recovered from the sea, or indeed any other land that is rank and fat, whether arable or pasture. The best seeds are brought from Holland, and should be sown about Midsummer, the very day that the land is plowed: a gallon will serve an acre.

Besides the oil already mentioned, it is likewise cultivated for winter-food to cattle, and is a very good preparative of land for barley or wheat.

**COLE-WORT**. See **BRASSICA**.

**COLIAS**, in ichthyology. See **SCOMBER**.

**COLIC**, in medicine, a severe pain in the lower venter, so called, because the disorder was formerly supposed to be seated in the colon. See **MEDICINE**.

**COLIC-SHELL**. See **SYPROEA**.

**COLIR**, an officer in China, who may properly be called an inspector, having an eye over what passes in every court or tribunal of the empire.

In order to render him impartial, he is kept independent, by having post for life. The power of the colirs is such, that they make even the princes of the blood tremble.

**COLISEUM**, in ancient architecture, an oval amphitheatre at Rome, built by Vespasian, wherein were statues set up, representing all the provinces of the empire: in the middle whereof stood that of Rome, holding a golden apple in her hand.

This structure was so large, that it would hold near 100,000 spectators.

**COLITES**, in natural history, a name given by some writers to a kind of pebble, found in the shape of the human penis and testis, and that either separately, or both together.

**COLLAR**, in Roman antiquity, a sort of chain put generally round the neck of slaves that had run away, after they were taken, with an inscription round it, intimating their being deserters, and requiring their being restored to their proper owners, &c.

**COLLAR**, in a more modern sense, an ornament consisting of a chain of gold, enamelled, frequently set with cyphers or other devices, with the badge of the order hanging at the bottom, wore by the knights of several military orders over their shoulders, on the mantle, and its figure drawn round their armories.

Thus, the collar of the order of the garter consists of S S, with roses enamelled red, within a garter enamelled blue, and the George at the bottom.

*Lord Mayor's COLLAR* is more usually called chain.

*Knights of the COLLAR*, a military order in the republic of Venice, called also the order of St Mark, or the medal.

It is the doge and the senate that confer this order; the knights bear no particular habit, only the collar, which the doge puts around their neck, with a medal, wherein is represented the winged lion of the republic.

*COLLAR of a draught horse*, a part of harness made of leather and canvas, and stuffed with straw or wool, to be put about the horse's neck.

**COLLORAGE**, a tax or fine laid for the collars of wine-drawing horses.

**COLLATERAL**, any thing, place, country, &c. situated by the side of another.

**COLLATERAL**, in genealogy, those relations which proceed from the same stock, but not in the same line of ascendants or descendants, but being, as it were, aside of each other.

Thus, uncles, aunts, nephews, nieces and cousins, are collaterals, or in the same collateral line: those in a higher degree, and nearer the common root, represent a kind of paternity with regard to those more remote.

**COLLATERAL succession**, in Scots law: When a defunct, for want of heirs descended of himself, is succeeded in his estate by a brother or sister, or their descendants, the estate is said to have gone to *collateral heirs*. See **SCOTS LAW**, title, *Succession in heretable rights*.

**COLLATION**, in the canon law, the giving or bestowing of a benefice on a clergyman by a bishop, who has it in his own gift or patronage.

**COLLATION**, in common law, the comparison or presentation of a copy to its original, to see whether or not it be conformable; or the report or act of the officer

ficer who made the comparison. A collated act is equivalent to its original, provided all the parties concerned were present at the collation.

**COLLATION**, in Scots law, that right which an heir has of throwing the whole heritable and moveable estates of the deceased into one mass, and sharing it equally with the others in the same degree of kindred, when he thinks such share will be more than the value of the heritage to which he had an exclusive title. See *SCOTS LAW*, title, *Succession in moveables*.

**COLLATION** is also vulgarly used for a repast between dinner and supper.

**COLLEAGUE**, a partner or associate in the same office or magistrature. See *ADJUNCT*.

**COLLECTS**, in an ecclesiastical sense, the short prayers into which the public devotions of the church are divided.

In the primitive church, the collects were repeated by the bishop alone, after the joint prayers of the deacon and congregation.

**COLLECTIVE**, among grammarians, a term applied to a noun expressing a multitude, though itself be only singular; as an army, company, troop, &c. called collective nouns.

**COLLECTOR**, in general, denotes a person who gets or brings together things formerly dispersed and separated. Hence,

**COLLECTOR**, in matters of civil polity, is a person appointed by the commissioners of any duty, the inhabitants of a parish, &c. to raise or gather any kind of tax.

**COLLECTOR**, among botanists, one who gets together as many plants as he can, without studying botany in a scientific manner.

**COLLEGATORY**, in the civil law, a person who has a legacy left him in common with one or more other persons.

**COLLEGE**, an assemblage of several bodies or societies, or of several persons into one society.

College, among the Romans, served indifferently for those employed in the offices of religion, of government, the liberal, and even mechanical arts and trades; so that, with them, the word signified what we call a corporation or company.

Each of these colleges had distinct meeting-places or halls; and likewise, in imitation of the state, a treasury and common chest, a register, and one to represent them upon public occasions, and acts of government. These colleges had the privilege of manumitting slaves, of being legates, and making by-laws for their own body, provided they did not clash with those of the government.

There are various colleges on foot among the moderns, founded on the model of those of the ancients. Such are the three colleges of the empire, *viz.*

**COLLEGE of electors, or their deputies**, assembled in the diet of Ratisbon.

**COLLEGE of princes**, the body of princes, or their deputies, at the diet of Ratisbon.

**COLLEGE of cities**, is, in like manner, the body of deputies which the imperial cities send to the diet.

**COLLEGE of cardinals**, or the *sacred COLLEGE*, a body composed of the three orders of cardinals. See *CARDINALS*.

**COLLEGE** is also used for a public place endowed with certain revenues, where the several parts of learning are taught.

An assemblage of several of these colleges constitute an university. The erection of colleges is part of the royal prerogative, and not to be done without the king's license. See *UNIVERSITY*.

**COLLEGE of civilians**, commonly called *Doctors-commons*, founded by Dr Harvey, dean of the arches, for the professors of the civil law residing in the city of London. The judges of the arches, admiralty, and prerogative court, with several other eminent civilians, commonly reside here.

To this college belong thirty-four proctors, who make themselves parties for their clients, manage their causes, give licenses for marriages, &c.

In the common hall of Doctors-commons are held several courts, under the jurisdiction of the civil law, particularly the high court of admiralty, the court of delegates, the arches court of Canterbury, and the prerogative court of Canterbury, whose terms for sitting are much like those at Westminster, every one of them holding several court-days; most of them fixed and known by preceding holidays, and the rest appointed at the judge's pleasure.

**COLLEGE of physicians**, a corporation of physicians in London, whose number, by charter, is not to exceed eighty. The chief of them are called fellows, and the next candidates, who fill up the places of fellows as they become vacant by death, or otherwise. Next to these are the honorary fellows; and lastly, the licentiates, that is, such as being found capable, upon examination, are allowed to practise physic.

This college has several great privileges granted by charter and acts of parliament. No man can practise physic in or within seven miles of London, without license of the college, under the penalty of 5*l*. Also, persons practising physic in other parts of England are to have letters testimonial from the president and three elects, unless they be graduate physicians of Oxford or Cambridge. Every member of the college is authorized to practise surgery in London or elsewhere; and that they may be able at all times to attend their patients, they are freed from all parish-offices.

The college is governed by a president, four censors, and twelve electors. The censors have, by charter, power to survey, govern, and arrest all physicians, or others, practising physic in or within seven miles of London; to fine, amerce, and imprison them at discretion; to search apothecaries shops, &c. in and about London; to see if their drugs, &c. be wholesome, and the compositions according to the form prescribed by the college in their dispensaries; and to burn, or otherwise destroy, those that are defective or decayed, and not fit for use.

In 1656, forty-two members of the college made a subscription, to set on foot a dispensary for the relief of the sick poor, who are advised gratis every day but Sunday.

Sunday, and medicines sold at the intrinsic value: since this they have erected two other dispensaries.

**COLLEGE of justice**, in Scots law, the supreme civil court of Scotland; otherwise called *Court of session*, or, of council and session. See **SCOTS LAW**, title, *Supreme judges and courts of Scotland*.

**Sion COLLEGE**, or the college of the London clergy, was formerly a religious house, next to a spittal or hospital; and now it is a composition of both, viz. a college for the clergy of London, who were incorporated in 1631, at the request of Dr White, under the name of the president and fellows of Sion-college; and an hospital of ten poor men, the first within the gates of the house, and the latter without.

This college consists of a president, two deans, and four assistants, who are annually chosen from among the rectors and vicars in London, subject to the visitation of the bishop. They have one of the finest libraries in England, built and stocked by Mr Simpson, chiefly for the clergy of the city, without excluding other students on certain terms; they have also a hall with chambers for the students, generally filled with the ministers of the neighbouring parishes.

**Gresham-COLLEGE**, or **COLLEGE of philosophy**, a college founded by Sir Thomas Gresham, who built the Royal-exchange; a moiety of the revenue whereof he gave in trust to the mayor and commonalty of London, and their successors for ever, and the other moiety to the company of mercers; the first to find four able persons to read in the college divinity, astronomy, music, and geometry; and the last, three or more able men to read rhetoric, civil law, and physic; a lecture upon each subject is to be read in term-time, every day, except Sundays, in Latin, in the forenoon, and the same in English in the afternoon; only the music-lecture is to be read alone in English. The lecturers have each 50 *l.* *per annum*, and a lodging in the college.

In this college formerly met the royal society, that noble academy, celebrated throughout the world for their improvements in natural knowledge. See **SOCIETY**.

**COLLEGE of heralds**, commonly called the *heralds office*, a corporation founded by charter of king Richard III. who granted them several privileges, as to be free from subsidies, tolls, offices, &c. They had a second charter from king Henry VI.; and a house built near Doctors-commons, by the earl of Derby, in the reign of king Henry VII. was given them by the duke of Norfolk, in the reign of queen Mary, which house is now rebuilt.

This college is subordinate to the earl-marshal of England. They are assistants to him in his court of chivalry, usually held in the common hall of the college, where they sit in their rich coats of his majesty's arms. See **HERALD**.

**COLLEGIATE churches**, those which though no bishop's see, yet have the retinue of the bishop, the canons and prebends. Such are, among us, Westminster, Windor, Rippon, Wolverhampton, Southwell, Manchester, &c. governed by deans and chapters.

**COLLET**, among jewelers, denotes the horizontal face or plane at the bottom of brilliants. See **BRILLIANT**.

**COLLET**, in glass-making, is that part of glass vessels which sticks to the iron instrument wherewith the metal was taken out of the melting-pot: these are afterwards used for making green glass.

**COLLETICS**, in pharmacy, denote much the same with agglutinants or vulneraries. See **VULNERARY**.

**COLLINSONIA**, in botany, a genus of the decandria monogynia class. The corolla is unequal, the inferior lip being multifid and capillary. It has but one seed. There is only one species, a native of Canada.

**COLLIQUAMENTUM**, in natural history, an extreme transparent fluid in an egg, observable after two or three days incubation, containing the first rudiments of the chick. It is included in one of its own proper membranes, distinct from the albumen. Harvey calls it the oculus.

**COLLIQUATION**, in chemistry, is applied to animal, vegetable, and mineral substances, tending towards fusion. See **FUSION**.

**COLLIQUATION**, in physic, a term applied to the blood, when it loses its crasis or balsamic texture; and to the solid parts, when they waste away, by means of the animal fluids flowing off through the several glands, and particularly those of the skin, faster than they ought: which occasions fluxes of many kinds, but mostly profuse, greasy, and clammy sweats.

**COLLIQUATIVE fever**, in physic, a fever attended with a diarrhoea, or profuse sweats.

**COLLISION**, the striking of one hard body against another; or the friction or percussion of bodies moving violently with different directions, and dashing against each other. See **MECHANICS**.

**COLLURIO**, in ornithology. See **LANIUS**.

**COLLUSION**, in law, a secret understanding between two parties, who plead or proceed fraudulently against each, to the prejudice of a third person.

**COLLUM**, the same with neck. See **NECK**, and **CERVIX**.

**COLLYRIUM**, in pharmacy, a topical remedy for a disorder of the eyes; designed to cool and repel hot, sharp humours.

They are generally of two kinds, the one liquid, and the other dry: liquid collyrias are composed of ophthalmic powders in waters, as rose water, plantain-water, or that of fennel, eye-bright, &c. wherein tully, white vitriol, or some other proper powder, is dissolved.

The dry collyrium is troches of rhais, sugar-candy, tully prepared, &c. blown into the eye.

**COLOCASIA**, in botany. See **ARUM**.

**COLOCYNTHIS**, in botany. See **CUCUMIS**.

**COLOGNE**, the capital of the circle of the Lower Rhine, in Germany, situated on the Rhine, about forty-five miles east of Mæstricht; E. long. 6° 40', N. lat. 50° 50'. It is one of the largest and most elegant cities of Germany, being the see of an archbishop, who is one of the electors of the empire, and has a yearly revenue of 120,000 *l.*

**COLOGNE-**

**COLOGNE-earth**, a kind of very light bastard ochre, of a deep brown colour.

**COLON**, in anatomy. See Vol. I. p. 261.

**COLON**, in grammar, a point or character marked thus, (:), shewing the preceding sentence to be perfect or entire; only that some remark, farther illustration, or other matter connected therewith, is subjoined.

**COLONEL**, in military matters, the commander in chief of a regiment, whether horse, foot, or dragoons.

A colonel may lay any officer of his regiment in arrest, but must acquaint the general with it; he is not allowed a guard, only a centry from the quarter-guard.

**COLONEL-lieutenant**, he who commands a regiment of guards, whereof the king, prince, or other person of the first eminence, is colonel. These colonel-lieutenants have always a colonel's commission, and are usually general officers.

**Lieutenant-COLONEL**, the second officer in a regiment, who is at the head of the captains, and commands in the absence of the colonel.

**COLONNA**, a town of Italy, in the Campagna of Rome, eighteen miles eastward of that city: E. long. 13° 15', N. lat. 42°.

**COLONNADE**, in architecture, a peristyle of a circular figure; or a series of columns disposed in a circle, and insulated within side.

**A polystile COLONNADE**, is that whose numbers of columns is too great to be taken in by the eye at a single view. Such is the colonnade of the palace of St Peter's at Rome, consisting of 284 columns of the Doric order, each above four foot and an half diameter, all in Tiburtine marble.

**COLONY**, a company of people transplanted into a remote province, in order to cultivate and inhabit it.

Colonies are of three sorts: the first are those that serve to ease and discharge the inhabitants of a country, where the people are become too numerous; the second are those established by victorious princes in the middle of vanquished nations, to keep them in awe and obedience; and the third sort are those established for the promotion of trade, called colonies of commerce; such are those established by European nations in several parts of Asia, Africa, and America.

**COLOPHONY**, in pharmacy, black resin, or turpentine, boiled in water, and afterwards dried; or, which is still better, the caput mortuum remaining after the distillation of the ethereal oil, being further urged by a more intense and long continued fire.

**COLOQUINTIDA**, in botany. See CUCUMIS.

**COLORATURA**, in music, denotes all manner of variations, trillos, diminutions, &c. serving to make song agreeable.

**COLOSSUS**, a statue of a gigantic, or enormous size.

The most famous of this kind was the colossus of Rhodes, made, in honour of Apollo, by Chares the disciple of Lysippus. It was eighty-six feet high, and its thumb so large, that few people could fathom it. This statue was placed across the mouth of the harbour at Rhodes, and the ships with full sails passed betwixt its legs.

VOL. II. No. 39.

**COLOSTRUM**, the first milk of any animal after bringing forth young, called beestings. It is remarkable that this milk is generally cathartic, and purges off the meconium; thus serving both as an aliment and medicine.

An emulsion prepared with turpentine, dissolved with the yolk of an egg, is sometimes called by this name.

**COLOUR**. See OPTICS.

**COLOUR**, in painting, is applied both to the drugs, and to the tints produced by those drugs variously mixed and applied.

The principal colours used by painters are red and white lead, or cerufs; yellow and red ochres: several kinds of earth, umbre, orpiment, lamp-black, burnt ivory, black lead, cinnabar or vermillion, gumboge, lacca, blue and green ashes, verdigris, bistre, bicce, smalt, carmine, ultra marine: each of which, with their uses, &c. are to be found under their proper articles.

Of these colours some are used tempered with gum-water, some ground with oil, others only in fresco, and others for miniature.

Painters reduce all the colours they use under these two classes, of dark and light colours: dark colours are black, and all others that are obscure and earthy, as umbre, bistre, &c.

Under light colours are comprehended white, and all that approach nearest to it.

Painters also distinguish colours into simple and mineral.

Under simple colours they rank all those which are extracted from vegetables, and which will not bear the fire; as the yellow, made of saffron, French berries, lacca, and other tinctures extracted from flowers, used by limners, illuminers, &c.

The mineral colours are those which being drawn from metals, &c. are able to bear the fire, and therefore used by enamellers. Changeable and permanent colours is another division, which, by some, is made of colours.

Changeable colours are such as depend on the situation of the objects with respect to the eye, as that of a pigeon's neck, taffeties, &c. the first however, being attentively viewed by the microscope, each fibre of the feathers appears composed of several little squares, alternately red and green, so that they are fixed colours.

**Local COLOURS**. See LOCAL.

**Water COLOURS**. See WATER.

**COLOUR**, in dying. There are, in the art of dying, five colours, called simple, primary, or mother colours, from the mixture of which all other colours are formed; these are blue, yellow, brown, red, and black. Of these colours, variously mixed and combined, they form the following colours, pansy, blue, and red; from the mixture of blue and scarlet are formed amaranth, violet, and pansy; from the same mixture of blue, crimson, and red, are formed the columbine, or dove-colour, purple-crimson, amaranth, pansy, and crimson-violet. See BOTANY, Vol. I. p. 633.

Here it is to be observed, that they give the name crimson to all colours made with cochineal.

**COLOUR**, in heraldry. The colours generally used in heraldry are red, blue, black, green, and purple, which the heralds call gules, azure, sable, vert or sinople, and purpure; tenne or tawny, and sanguine, are not so common: as to yellow and white, called *or* and *argent*, they are metals, not colours.

The metals and colours are sometimes expressed in blazon by the names of precious stones, and sometimes by those of planets or stars. See **BLAZONING**.

Oenomaus is said to have first invented the distinction of colours, to distinguish the gundillæ of combatants of the Circean games; the green for those who represented the earth, and blue for those who represented the sea.

**COLOURS**, in the military art, include the banners, flags, ensigns, &c. of all kinds, borne in the army or fleet. See **FLAG**, and **STANDARD**.

**Field-COLOUR**. See **FIELD**.

**COLOURS**, in the Latin and Greek churches, are used to distinguish several mysteries and feasts, celebrated therein.

Five colours only are regularly admitted into the Latin church; these are white, green, red, violet, and black: the white is for the mysteries of our Saviour, the feasts of the virgin, those of the angels, saints, and confessors; the red is for the mysteries and solemnities of the holy sacrament, the feasts of the apostles and martyrs; the green for the time between pentecost and advent, and from epiphany to septuagesima; the violet in advent and Christmas, in vigils, rogations, &c. and in votive masses in time of war; lastly, the black is for the dead, and the ceremonies thereto belonging.

In the Greek church, the use of colours is almost abolished, as well as among us: red was, in the Greek church, the colour for Christmas, and the dead, as black among us.

**To COLOUR strangers goods**, is when a freeman allows a foreigner to enter goods at the custom-house in his name.

**COLOURING**, among painters, the manner of applying and conducting the colours of a picture; or the mixtures of light and shadows, formed by the various colours employed in painting. See **PAINTING**.

**COLOURING of glass**. See **GLASS**.

**COLOURING of porcelain**. See **PORCELAIN**.

**COLT**, in zoology. See **EQUUS**.

**COLT-EVIL**, among farriers, a swelling of the yard and scrotum, incident both to stoned horses and geldings; for which, after washing the part with lukewarm vinegar, it is usual to anoint them with juice of rue, mixed with honey, and boiled in hog's grease, adding bay-leaves and the powder of fenugreek.

**COLT'S-FOOT**, in botany. See **TUSSILAGO**.

**COLTIE**, a term used by timber-merchants for a defect, or blemish, in some of the annular circles of a tree, whereby its value is much diminished.

**COLUBER**, in zoology, a genus of serpents belonging to the class of amphibia. The characters are these:

They have a number of scuta, or hard crusts, on the belly; and scutellæ, or scales, on the tail. Linnæus enumerates no less than 97 species under this genus, distinguished solely by the number of scuta and scutellæ. For the sake of brevity, we shall give the numbers in figures, the first denoting the number of scuta, and the second the number of scutellæ, thus, 40-22.

The first species is the viper, 118-22. This is the viper of the shops, the flesh of which has been much recommended in scrophulous, leprous, and other obstinate chronical disorders: but its virtues in these cases have been too much exaggerated: the flesh of the viper is however highly nutritive, and is therefore properly esteemed to be a good restorative: but, to answer any good purpose, even when given with this intention, it ought to be used liberally, and for a considerable time, as food. This animal is a native of Egypt. The body is very short, and of a pale colour, with brownish spots; and the head is gibbous, and covered with small scales. 2. The atropos, 131-22, is a native of America; the body is white, and the eyes are brown, with a white iris. 3. The lebeus, 110-50, is a native of Canada, and has many linear black rings. 4. The ammodites, 142-32, is about six inches long, and has an erect fleshy protuberance on its nose. It is a native of the East. 5. The berus, 146-39, or common British viper, is found in most countries in Europe: It is of a dusky blackish colour. 6. The chersea, 150-34, is a native of Sweden, and rather less than the asp. 7. The prester, 152-32, is found in the northern parts of Europe, and the whole body is black. 8. The aspis, 146-46, is a native of France, and is of a reddish colour, with dusky spots on the back. 9. Lebetinus, 155-46, is a native of Asia, and is of a cloudy colour, with red spots on the belly. 10. The severus, 170-42, is likewise a native of Asia, and is ash-coloured, with white belts. 11. The stolatus, 143-76, is a native of Asia, and is of a greyish colour, with two white fillets. 12. The lacteus, 203-32, is a native of the Indies; the colour is white, with black spots. 13. The naja, 193-60, is a native of the East Indies; and is the most poisonous of all serpents; they are eat by the ichneumon. 14. The atrox, 196-69, is a native of Asia; it is of a hoary colour; and the head is compressed and covered with small scales. 15. The niveus, 209-62, is white, without any spots. It is a native of Africa. 16. The corallinus, 195-82, is a native of Asia: It is greyish, with three brown fillets. 17. The diplas, 152-135, is a native of America: it is of a bluish colour, with the margins of the scales white. 18. The mysterizans, 192-167, is a native of America; the snout is stretched out, and triangular. Although this genus comprehends 97 species, the above 18 are all whose bite is supposed to be poisonous. The poison is contained in a little bag at the base of their long fangs. See **NATURAL HISTORY**.

The 19th species is the lutrix, 134-27; the back and belly are yellow; and the sides are bluish. It is a native of the Indies. 20. The calamarius, 140-22, is of a livid colour interspersed with dusky spots and

and lines, and is found in America. 21. The *simus*, 124-46, is a native of Carolina; the head is roundish, flat, and gibbous; the body is interspersed above with black and white; and the belly is black. 22. The *striatulus*, 126-45, is likewise a native of Carolina: the back is dusky and striated; and the belly is pale. 23. The *cerastes*, 150-29, is a native of Asia; the scales of the head are round and small: this is the horned viper of Hæfælsquift; but the horns are a mere imposition; the Arabians fix the spurs of a cock or other bird upon the head of the viper, in order to raise the admiration of travellers. 24. The *plicatilis*, 131-46, is of a livid colour, with dusky sides. 25. The *domicella*, 118-60, is a native of Asia; it is white, with black belts. 26. The *alidras*, 121-58, is a native of India, and is all white. 27. The *punctatus*, 136-43, is a native of Carolina: It is ash-coloured, variegated with yellow spots. 28. The *buccatus*, 107-72, is dusky-coloured, with white belts, and is a native of Asia. 29. The *angulatus*, 117-70, is a native of Asia, and of a greyish colour, with black fillets. 30. The *caruleus*, 165-24, is blueish, with white scales on one side: It is a native of America. 31. The *albus*, 170-20, is entirely white, and is a native of Asia. 32. The *typhlus*, 140-53, is a native of the Indies, and of a blueish colour. 33. The *fasciatus*, 128-67, is a native of Carolina; the scales are carinated, and the colour is blackish. 34. The *melanocephalus*, 140-62, is a native of America; the body is very smooth; the colour is dusky, and the head is black. 35. The *cobella*, 150-54, is very frequent in America: it is ash-coloured, interspersed with white lines. 36. The *reginæ*, 137-70, is a native of the Indies; the body is dusky, and the belly is black and white. 37. The *dollatus*, 164-43, is a native of Carolina; this is a small serpent; of a whitish colour, with black rings. 38. The *ordinatus*, 138-72, is likewise found in Carolina: It is blueish, and clouded with black spots. 39. The *Mexicanus*, 134-77, is a native of America. 40. The *aurora*, 179-37, is a native of America: it is livid, with a yellow back. 41. The *sipedon*, 144-73, is yellowish, and a native of North America. 42. The *maurus*, 152-66, is a native of Algiers: the body is yellowish above, and the belly is red. 43. The *vitatus*, 142-78, is a native of America; the edges of the scales are yellowish, and there is a white dentated fillet under the anus. 44. The *miliaris*, 162-59, is a native of the Indies: the body is yellow, with a white spot in each scale; and the belly is white. 45. The *æsculapii*, 180-43, is a native of the Indies: it has white and black belts. 46. The *rhombeatus*, 157-70, is a native of the Indies: the colour is blueish, with black spots. 47. The *cyaneus*, 119-110, is a native of America: it is of an azure colour, and the belly is green. 48. The *natrix*, 170-60, is a native of Europe: it is black, with a white spot on each side of the neck. 49. The *agilis*, 184-50, is a native of the Indies: it has yellow and white belts. 50. The *jaculatrix*, 163-77, is a native of Surinam. 51. The *aulicus*, 184-60, is a native of America, and is of a greyish colour, with white belts. 52. The *monilis*,

164-82, is a native of America; the body is annulated, with three white spots on the collar. 53. The *fulvius*, 218-31, is a native of Carolina: it has 22 black rings, and as many yellow, placed alternately. 54. The *pallidus*, 156-96, is a native of the Indies, and is of a pale colour, with grey and yellow spots. 55. The *lineatus*, 169-84, is a native of Asia: it is blueish, with four linear fillets. 56. The *padera*, 198-56, is a native of the Indies: it is white, with yellowish spots. 57. The *canus*, 188-70, is a native of the Indies: it is of a hoary colour, with yellowish belts. 58. The *getulus*, 215-44, is a native of Carolina: it is of a blackish blue colour, with yellow linear belts. 59. The *sibilans*, 160-100, is a native of Asia; and is blue, with black fillets, and a white belly. 60. The *laticaudatus*, 220-42, is a native of the Indies: it is ash-coloured, with yellow belts; and the tail is obtuse and compressed. 61. The *fistalis*, 150-114, is a native of Canada: the body is of a dirty yellow colour, with three blueish green fillets. 62. The *sibon*, 180-85, is a native of Africa: it is of a yellowish iron-colour, interspersed with white; and the belly is white, with yellow spots. 63. The *nebulatus*, 185-81, is a native of America: it is clouded with yellow and an ash colour, and the belly is variegated with yellow and white. 64. The *fuscus*, 149-117, is a native of Asia; it is yellow and ash-coloured, and there are yellow spots behind the eyes. 65. The *saturninus*, 147-120, is a native of the Indies: it is livid and coloured with an ash-colour, and the eyes are very large. 66. The *candidus*, 220-50, is a native of the Indies: it is white, with yellow belts. 67. The *scaber*, 228-44, is a native of the Indies: it is clouded with black and yellow, and the scales are carinated. 68. The *carinatus*, 157-115, is a native of the Indies: it is of a lead colour, and the edges of the scales are tipped with white; the belly is white, and the back is carinated. 69. The *ovivorus*, 203-73, is a native of America. 70. The *saurita*, 156-121, is a native of Carolina: it is of a greenish colour. 71. The *constrictor*, 186-92, is a native of North America: it is black and smooth; the belly is of a palish green; and the nape of the neck is white. This species is so bold, that it even attacks men, twisting about their legs, and breaking their bones: it runs very quickly; but its bite is not poisonous. 72. The *exoletus*, 147-132, is a native of the Indies. It is blueish and ash-coloured. 73. The *fitula*, 236-45, is a native of Egypt: It is greyish. 74. The *trifascialis*, 195-86, is a native of the Indies: It is of an azure colour. 75. The *guttatus*, 227-60, is a native of Carolina: It is of a livid colour, with red and black spots on the back. 76. The *lemniscatus*, 250-35, is a native of Asia: The body is very smooth, and variegated with white and black rings. 77. The *annulatus*, 190-96, is a native of America: It is white, with round yellow spots. 78. The *pelias*, 187-103, is a native of the Indies: It is yellow behind the eyes, and the rest is blackish. 79. The *tyria*, 210-83, is a native of Egypt: It is whitish, with yellow spots. 80. The *jugalus*, 195-102, is a native

of Egypt: It is black, with a red neck. 81. The pathia, 209-90, is a native of Africa: It is of a leaden colour. 82. The xilivus, 155-144, is a native of Carolina: It is blue, and very smooth; and the belly is of a pish green. 83. The molurus, 248-59, is a native of the Indies: This species is very like the boa; but the scuta and scales are larger. 84. The ahaculla, 165-150, is a native of Asia and America: It is of a yellowish green colour, and the tops of the scales are black; it has likewise a black belt across the eyes. 85. The petalarius, 212-102, is a native of the Indies: It is yellow, with white belts. 86. The hajc, 207-109, is a native of Egypt: This is a large serpent, with oblique red belts, and about one half of each scale white. 87. The filiformis, 165-158, is a native of the Indies: It is black, with a white belly; and the head is thicker than the body. 88. The pullatus, 217-108, is a native of Asia: It has red belts, with white spots. 89. The hippocrepis, 282-94, is a native of America: It is of a livid colour, with yellow spots. 90. The minervæ, 238-90, is a native of the Indies: It is of an azure colour, with a yellow fillet on the back. 91. The cinereus, 200-137, is a native of the Indies: It is of an ash-colour, with a white belly. 92. The viridissimus, 217-122, is a native of Surinam: It is of a fine green colour. 93. The mucosus, 200-140, is a native of the Indies: the head is blueish. 94. The domesticus, 245-94, frequents the dwelling-houses of Barbary: It greatly resembles the hippocrepis. 95. The cenchoa, 220-124, is a native of America: It is yellowish, with pale spots and white belts: The head is globular. 96. The cærulescens, 215-170, is a native of the Indies, and is of an azure colour. 97. The argus, is a native of Africa; but hitherto we have had no just description of it.—For the instincts, manner of living, &c. of serpents in general, see NATURAL HISTORY.

**COLUBRINUM LIGNUM, or SNAKE-WOOD.** See STRYCHNOS.

**COLUMBA, PIGEON**, in ornithology, a genus belonging to the order of passeræ. The characters of this genus are these: The bill is straight, and descends towards the point; the nostrils are oblong, and half covered with a soft tumid membrane; and the tongue is entire, *i. e.* not cloven. There are 40 species, *viz.* 1. The œnas, or domestic pigeon, is blueish, with a greenish shining neck; on the back, towards the tail, it is white, with a blackish streak on the point of the wings and tail. It is the stock-dove or wood-pigeon of Ray, and is a bird of Europe. The pigeon lays two eggs, and hatches them every month, for eight or nine months in the year, which, in the space of four years, amounts to about 18000 descendants. They always bill before copulation: Their method of feeding their young is curious; they first macerate pease or other grain for some time in their crop, and then vomit it up into the mouths of the young ones. The male and female sit upon their eggs by turns. 2. The hispanica, with white mealy wax on the bill. It is about double the size of the common pigeon. 3. The

dasytus, with rough feathered legs. 4. The gutturosa, or cropper, has a power of inflating its crop till it be as large as the animal's body. It is a native of Arabia Felix. 5. The cucullata has the feathers on the back-part of the head erect and reflected; and the bill is short. 6. The hispida, or rough pigeon, with the small feathers of the back and wings erected. It is a native of the East Indies. 7. The turbita, with the feathers on the breast bent backward, a short bill, and a plain vertex. 8. The laticauda, or broad-tailed pigeon, has an erect open tail consisting of many feathers. 9. The gyratrix turns itself round when flying: it is a little less than the common pigeon. 10. The galeata, with the head and prime feathers of the wings and tail of the same colour, and always different from the rest of the body. 11. The turcica, with red papillous wax. It is a bird of Arabia. 12. The tabellaria has naked eye-brows, and broad, white, fleshy wax on the bill. Although this bird be carried to a very great distance from home, it returns with vast speed; and hence the ancients employed it for the purpose of conveying back letters. 13. The montana has naked red orbits, a reddish body, and a yellow belly; the bill and feet are red. It is the mountain-partridge of Ray, and is a native of Jamaica. 14. The leucocephala, with the top of the head and the orbits red, and a blueish body. It is a native of North America. 15. The leucoptera, with naked blue orbits, and the prime wing-feathers white at the points, and the intermediate ones yellowish. It is the Indian turtle of Edwards, and is a native of Asia. 16. The guinea, with naked red orbits, a yellowish bill, triangular white spots on the wings, and the prime wing-feathers black at the points. It is a native of Africa. 17. The coronata has black orbits, a large erect crest on the head, and a blueish body. It is almost as large as a peacock, and is a native of Banda. 18. The striata, with hoary orbits, and the body variegated with black and ash-coloured belts. It is a native of the East Indies. 19. The palumbus, with the prime tail-feathers red behind, the prime wing-feathers edged with white, a white neck, and feathered legs. It is a native of Europe and Asia. 20. The cyanocephala, with a blue head, and a white belt below the eye. It is a native of America. 21. The madagascarensis, with feathered legs, a violet tail, a greenish blue body, and the beak and feet red. It is found in Madagascar. 22. The aenea, with feathered legs, greenish legs and bill, and a brass-coloured body. It is a native of the Molucca Isles. 23. The viridis, with a brass-coloured body, a violet belly, and red legs half covered with feathers. It is found at Ambona. 24. The martinica, with a violet body, a yellowish belly, and the prime wing-feathers red on the inside. It is found in Martinico. 25. The jamaicensis, with blueish prime tail-feathers terminated by a white line. It is found in Jamaica. 26. The senegalensis, with the three outmost prime tail-feathers white, and the neck spotted with black. It is found in Senegal. 27. The nicobarica has a white tail, a black body, blue prime wing-feathers, a greenish

ish shining back, and long feathers on the neck. It is found in the island of Nicombar near Pegu. 28. The *sinica* is yellowish, and belted with black; the belly is reddish, the wings yellow, the prime wing-feathers black, and a black bill. It is a native of China. 29. The *indica*, with a purple body, green shoulders, and the top of the head blueish. It is a native of the East Indies. 30. The *canadensis*, with the prime wing-feathers yellow at the points, and the prime tail-feathers ash-coloured. It is a native of Canada. 31. The *afra*, with the exterior prime tail-feathers white at the points, and violet spots on the wing-feathers. It is a native of Senegal. 32. The *turtur*, with the prime tail-feathers white, a greyish back, and a flesh-coloured breast. It is a native of India. 33. The *risoria* is clay-coloured above, and has a black crescent on the neck. It is a native of India. 34. The *postirina*, with a purple body, and a yellow bill and legs. It inhabits America within the tropics. 35. The *minuta* is the smallest of all pigeons, is of a dusky colour, with five steel-coloured spots on the wings, and the outmost prime tail-feathers white. It is a native of America. 36. The *migratoria* has a wedge-shaped tail, red naked orbits, and a reddish breast. This species is very frequent in North America: They live upon the seeds of the elm, oak, wheat, &c. and they winter in Carolina. 37. The *carolinensis* has a wedge-shaped tail, blue orbits, and a reddish belly. It is a native of America. 38. The *ambouensis* has a wedge-shaped tail, a reddish body, and a greenish neck. It is found at Amboina. 39. The *capensis* has a wedge-shaped tail, and the prime wing-feathers red on the interior side. It is found at the Cape of Good Hope. 40. The *marginata* has a wedge-shaped tail, a red breast, and the points of the prime tail-feathers black and edged with white.

**COLUMBINE**, in botany. See **AQUILEGIA**.

**Feathered COLUMBINE**. See **THALICTRUM**.

**COLUMBUS**, or *Congregation of St COLUMBUS*, a society of regular canons, who formerly had an hundred abbey or monasteries in the British islands.

**COLUMELLA**, in botany. See Vol. I. p. 637.

**COLUMN**, in architecture, a round pillar, made to support and adorn a building, and composed of a base, a shaft, and a capital. See **ARCHITECTURE**.

**COLUMN**, in the military art, a long deep file of troops or baggage.

The first and second lines of the army as they are encamped, make generally two columns on a march, filing off either from the right or left: sometimes the army marches in four, six, or eight columns, according as the ground will allow; and each column is led by a general officer.

**COLUMNEA**, in botany, a genus of the didynamia angiospermia class. The calix is divided into five segments; the upper labium of the corolla is vaulted and entire, and gibbous at the base; the antheræ are connected; and the capsule is bilocular. There is but one species, viz: the *scandens*, a native of Martinico.

**COLURES**, in astronomy and geography, two great

circles supposed to intersect each other at right angles in the poles of the world, and to pass through the solstitial and equinoctial points of the ecliptic. See **GEOGRAPHY**, and **ASTRONOMY**.

**COLURI**, a little island in the gulph of Engia, in the Archipelago, about seven miles south of Athens: of this island Ajax was sovereign: E. long 24°, N. lat. 38°.

**COLUTEA**, **BASTARD-SENA**, in botany, a genus of the diadelphia decandria class. The pod is inflated, and opens at the top; and the calix is bilabiate. The species are three, none of them natives of Britain.

**COLYMBUS**, the **DIVER**, in ornithology, a genus belonging to the order of anseres. The bill has no teeth, is subulated, straight, and sharp-pointed; the teeth are in the fauces or throat; the nostrils are linear, and at the base of the bill; and the legs are unfit for walking. There are eleven species, viz: 1. The *grylle*, with palmated and three-toed feet, a red body, and the covering feathers of the wings white. It flies very low, and is a native of Greenland. 2. The *troile*, with palmated three-toed feet, a black body, a white breast and belly, and the secondary prime feathers of the wings white at the points. It is found within the arctic circle. 3. The *septentrionalis*, with palmated four-toed feet, and an iron-coloured spot under the neck. It is a native of the northern lakes of Europe. They build their nests upon the shore without art, and lay a couple eggs: they run with great quickness upon the water; and presage storms by flying and crying with a miserable tone of voice. 4. The *arcticus*, with palmated four-toed feet, a hoary head, and a violet neck. It frequents the northern seas and lakes. 5. The *glacialis*, with palmated four-toed feet, and a violet head and neck. It inhabits the northern seas. 6. The *immer*, with palmated four-toed feet, the upper part of the body black and undulated with white, and a white belly. It inhabits the frozen seas. 7. The *crystallus*, with lobated feet, a red head, a black collar, and white secondary prime wing-feathers. It is a native of Europe. 8. The *auritus*, with lobated feet, a black head, and the ears are crested and of an iron colour. It frequents the lakes of Europe and America. 9. The *urinator*, with lobated feet, a smooth head, and white spots on the wings. It is a native of the southern parts of Europe. 10. The *dominicus*, with lobated feet, a smooth head, and the belly very much spotted. 11. The *padiceps*, with lobated feet and a yellowish body. It is a native of North America.

**COLYTEA**, in botany. See **CERCIS**.

**COMA**, or **COMA-VIGIL**, a preternatural propensity to sleep, when nevertheless the patient does not sleep, or, if he does, awakes immediately without any relief. See **MEDICINE**.

**COMA SOMNOLENTUM**, is when the patient continues in a profound sleep, and, when awaked, immediately relapses, without being able to keep open his eyes. See **MEDICINE**.

**COMARUM**, in botany, a genus of plants of the icosan-dria polygynia class. The calix is divided into ten segments; the petals are five, and less than the calix,

and the seeds are ovated, spongy, and persistent. There is but one species, *viz.* the palustre, a native of Europe.

**COMB**, an instrument to clean, untangle, and dress flax, wool, hair, &c.

Combs for wool are prohibited to be imported into Britain.

**COMA** is also the crest or red fleshy tuft growing upon a cock's head.

**Lady's COMB**, in botany. See **SCANDIX**.

**COMB-FISH**, in the history of shell-fish. See **OSTREA**.

**COMBAT**, in a general sense, denotes an engagement, or a difference decided by arms. See **BATTLE**.

**COMBAT**, in our ancient law, was a formal trial of some doubtful cause or quarrel by the swords or batons of two champions. This form of proceeding was very frequent not only in criminal but in civil causes; being built on a presumption, that God would never grant the victory but to him who had the best right. The last trial of this kind in England, was between Donald lord Ray, appellant, and David Ramsay, esq; defendant; when, after many formalities, the matter was referred to the king's pleasure.

**COMBATANT**, in heraldry, a term for two beasts, as lions, &c. borne in a coat of arms in a fighting posture, with their faces to each other.

**COMBINATION**, properly denotes an assemblage of several things two by two.

**COMBINATION**, in mathematics, is the variation or alteration of any number of quantities, letters, or the like, in all the different manners possible.

**COMEDY**. See **EPIC** and **DRAMATIC COMPOSITIONS**.

**COMET**, an opaque, spherical, and solid body like a planet, performing revolutions about the sun in elliptical orbits, which have the sun in one of the foci. See **ASTRONOMY**, p. 444.

**COMETARIUM**, a curious machine exhibiting an idea of the revolution of a comet about the sun. See Plate XLVIII. fig. 2.

**COMFREY**, in botany. See **SYMPHYTUM**.

**COMITIA**, in Roman antiquity, an assembly of the people, either in the comitium or campus martius, for the election of magistrates, or consulting on the important affairs of the republic.

There were certain days fixed for these assemblies, called *dies comitiales*, marked with a C in Julius Cæsar's calendar,

There were three kinds of comitia, *viz.* curiata, centuriata, and tributa, so distinguished from the manner wherein the people voted, and gave their suffrages, *viz.* by curiæ, or parishes, tribes, or centuries. The comitia curiata, owe their original to the division which Romulus made of the people into thirty curiæ, which answer in most respects to our parishes. The comitia centuriata were instituted by Servius Tullius. Comitial assemblies held for the election of consuls, were

called consular comitia. In like manner the other comitia were named from the officer to be created, whether a tribune, pontif, ædile, or the like. The power of calling these assemblies, belonged at first only to the kings: but on the establishment of the democracy, the same privilege was allowed to most of the chief magistrates, and sometimes to the pontiff.

**COMITIALIS MORBUS**, an appellation given to the epilepsy, by reason the comitia of ancient Rome were dissolved, if any person in the assembly happened to be taken with this distemper.

**COMITIUM**, in Roman antiquity, a large hall in the forum, where the comitia were ordinarily held.

**COMMA**, among grammarians, a point or character marked thus (,) serving to denote a short stop, and to divide the members of a period.

**COMMA**, in music, an interval equal to the difference of the tone major or minor, and expressed by the ratio 81 : 80.

**COMMELINA**, in botany, a genus of the triandria-monogynia class. The corolla is divided into six segments; it has three cross-like nectaria inserted by their proper filaments. The species are ten, none of them natives of Britain.

**COMMEMORATION**, in a general sense, the remembrance of any person or thing; or the doing any thing in honour of a person's memory, or in remembrance of any past event. Thus the eucharist is a commemoration of the sufferings of Jesus Christ.

**COMMENDAM**, in the ecclesiastical law, the trust or administration of the revenues of a benefice, given either to a layman, to hold, by way of *depositum*, for six months, in order to repairs, &c. or to an ecclesiastic, or beneficed person, to perform the pastoral duties thereof, till once the benefice is provided with a regular incumbent.

**COMMENSURABLE**, among geometricians, an appellation given to such quantities as are measured by one and the same common measure.

**COMMENSURABLE NUMBERS**, whether integers or fractions, are such as can be measured or divided by some other number, without any remainder: such are 12 and 18, as being measured by 6 or 3.

**COMMENSURABLE IN POWER**, is said of right lines, when their squares are measured by one and the same space or superficies.

**COMMENSURABLE SURDS**, those that being reduced to their least terms, become true figurative quantities of their kind; and are therefore as a rational quantity to a rational one.

**COMMENTARY**, or **COMMENT**, in matters of literature, an illustration of the difficult or obscure passages of an author.

**COMMENTARY**, or **COMMENTARIES**, likewise denotes a kind of history, or memoirs of certain transactions, wherein the author had a considerable hand: such are the commentaries of Cæsar.

COMMERCE.

## C O M M E R C E.

COMMERCE is an operation, by which the wealth, or work, either of individuals, or of societies, may be exchanged, by a set of men called merchants, for an equivalent, proper for supplying every want, without any interruption to industry, or any check upon consumption.

We shall begin by tracing commerce to its source, in order to reduce it to its first principles.

The most simple of all trade, is that which is carried on by bartering the necessary articles of subsistence. If we suppose the earth free to the first possessor, this person who cultivates it will first draw from it his food, and the surplus will be the object of barter: he will give this in exchange to any one who will supply his other wants. This naturally supposes both a surplus quantity of food produced by labour, and also free hands; for he who makes a trade of agriculture cannot supply himself with all other necessities, as well as food; and he who makes a trade of supplying the farmers with such necessities, in exchange for his surplus of food, cannot be employed in producing that food. The more the necessities of man increase, the more free hands are required to supply them; and the more free hands are required, the more surplus food must be produced by additional labour, to supply their demand.

This is the least complex kind of trade, and may be carried on to a greater or less extent, in different countries, according to the different degrees of the wants to be supplied. In a country where there is no money, nor any thing equivalent to it, the wants of mankind will be confined to few objects; to wit, the removing the inconveniencies of hunger, thirst, cold, heat, danger, and the like. A free man, who, by his industry, can procure all the comforts of a simple life, will enjoy his rest, and work no more: and, in general, all increase of work will cease, so soon as the demand for the purposes mentioned comes to be satisfied. There is a plain reason for this. When the free hands have procured, by their labour, what is withal to supply their wants, their ambition is satisfied: so soon as the husbandmen have produced the necessary surplus for relieving theirs, they work no more. Here then is a natural stop put to industry, consequently to bartering.

The next thing to be examined is, how bartering grows into trade, properly so called and understood, according to the definition given of it above; how trade comes to be extended among men; how manufactures, more ornamental than useful, come to be established; and how men come to submit to labour, in order to acquire what is not absolutely necessary for them.

This, in a free society, is chiefly owing to the introduction of money, and a taste for superfluities in those who possess it.

In ancient times, money was not wanting; but the

taste for superfluities not being in proportion to it, the specie was locked up. This was the case in Europe four hundred years ago. A new taste for superfluity has drawn, perhaps, more money into circulation, from our own treasures, than from the mines of the new world. The poor opinion we entertain of the riches of our forefathers, is founded upon the modern way of estimating wealth, by the quantity of coin in circulation, from which we conclude, that the greatest part of the specie now in our hands must have come from America.

It is more, therefore, through the taste of superfluity, than in consequence of the quantity of coin, that trade comes to be established; and it is only in consequence of trade that we see industry carry things in our days to so high a pitch of refinement and delicacy. Let us illustrate this, by comparing together the different operations of barter, sale, and commerce.

When reciprocal wants are supplied by barter, there is not the smallest occasion for money: this is the most simple of all combinations.

When wants are multiplied, bartering becomes more difficult; upon this money is introduced. This is the common price of all things: it is a proper equivalent in the hands of those who want, perfectly calculated to supply the occasions of those who, by industry, can relieve them. This operation of buying and selling is a little more complex than the former; but still we have here no idea of trade, because we have not introduced the merchant, by whose industry it is carried on.

Let this third person be brought into play, and the whole operation becomes clear. What before we called wants, is here represented by the consumer; what we called industry, by the manufacturer; what we called money, by the merchant. The merchant here represents the money, by substituting credit in its place; and as the money was invented to facilitate barter, so the merchant, with his credit, is a new refinement upon the use of money. This renders it still more effectual in performing the operations of buying and selling. This operation is trade: it relieves both parties of the whole trouble of transportation, and adjusting wants to wants, or wants to money; the merchant represents by turns both the consumer, the manufacturer, and the money. To the consumer he appears as the whole body of manufacturers; to the manufacturers as the whole body of consumers; and to the one and the other class his credit supplies the use of money. This is sufficient at present for an illustration. We now return to the simple operations of money in the hands of the two contracting parties, the buyer and the seller, in order to show how men come to submit to labour in order to acquire superfluities.

So soon as money is introduced into a country, it becomes an universal object of want to all the inhabitants.

The consequence is, that the free hands of the state, who

who before stopt working, because all their wants were provided for, having this new object of ambition before their eyes, endeavour, by refinements upon their labour, to remove the smaller inconveniences which result from a simplicity of manners. People, who formerly knew but one sort of clothing for all seasons, willingly part with a little money to procure for themselves different sorts of apparel properly adapted to summer and winter, which the ingenuity of manufacturers, and their desire of getting money, may have suggested to their invention.

Indeed these refinements seem more generally owing to the industry and invention of the manufacturers, (who by their ingenuity daily contrive means of softening or relieving inconveniences, which mankind seldom perceive to be such, till the way of removing them is contrived), than to the taste of luxury in the rich, who, to indulge their ease, engage the poor to become industrious.

Let any man make an experiment of this nature upon himself, by entering into the first shop. He will no where so quickly discover his wants as there. Every thing he sees appears either necessary, or at least highly convenient; and he begins to wonder how he could have been so long without that which the ingenuity of the workman alone had invented, in order that from the novelty it might excite his desire; for perhaps when it is bought, he will never once think of it more, nor ever apply it to the use for which it at first appeared so necessary.

Here then is a reason why mankind labour though not in want. They become desirous of possessing the very instruments of luxury, which their avarice or ambition prompted them to invent for the use of others.

What has been said represents trade in its infancy, or rather the materials with which that great fabric is built.

We have formed an idea of the wants of mankind multiplied even to luxury, and abundantly supplied by the employment of all the free hands set apart for that purpose. But if we suppose the workman himself disposing of his work, and purchasing with it food from the farmer, cloaths from the clothier; and, in general, seeking for the supply of every want from the hands of the person directly employed for the purpose of relieving it; this will not convey an idea of trade, according to our definition.

Trade and commerce are an abbreviation of this long process; a scheme invented and set on foot by merchants, from a principle of gain, supported and extended among men, from a principle of general utility to every individual, rich or poor, to every society, great or small.

Instead of a pin-maker exchanging his pins with fifty different persons, for whose labour he has occasion, he sells all to the merchant for money or for credit; and, as occasion offers, he purchases all his wants, either directly from those who supply them, or from other merchants who deal with manufacturers in the same way his merchant dealt with him.

Another advantage of trade is, that industrious people in one part of the country, may supply customers in another, though distant. They may establish themselves in the most commodious places for their respective busi-

ness, and help one another reciprocally, without making the distant parts of the country suffer for want of their labour. They are likewise exposed to no avocation from their work, by seeking for customers.

Trade produces many excellent advantages; it marks out to the manufacturers when their branch is under or over stocked with hands. If it is understocked, they will find more demand than they can answer: if it is overstocked, the sale will be slow.

Intelligent men, in every profession, will easily discover when these appearances are accidental, and when they proceed from the real principles of trade.

Posts, and correspondence by letters, are a consequence of trade; by the means of which merchants are regularly informed of every augmentation or diminution of industry in every branch, in every part of the country. From this knowledge they regulate the prices they offer; and as they are many, they serve as a check upon one another, from the principles of competition.

From the current prices the manufacturers are as well informed as if they kept the correspondence themselves: the statesman feels perfectly where hands are wanting, and young people destined to industry, obey, in a manner, the call of the public, and fall naturally in to supply the demand.

Two great assistances to merchants, especially in the infancy of trade, are public markets for collecting the work of small dealers, and large undertakings in the manufacturing way by private hands. By these means the merchants come at the knowledge of the quantity of work in the market, as on the other hand the manufacturers learn, by the sale of the goods, the extent of the demand for them. These two things being justly known, the price of goods is easily fixed.

Public sales serve to correct the small inconveniences which proceed from the operations of trade. A set of manufacturers got all together into one town, and entirely taken up with their industry, are thereby as well informed of the rate of the market as if every one of them carried thither his work, and upon the arrival of the merchant, who readily takes it off their hands, he has not the least advantage over them from his knowledge of the state of demand. This man both buys and sells in what is called wholesale; and from him retailers purchase, who distribute the goods to every consumer throughout the country. These last buy from wholesale merchants in every branch, that proportion of every kind of merchandise which is suitable to the demand of their borough, city, or province.

Thus all inconveniences are prevented, at some additional cost to the consumer, who must naturally reimburse the whole expence. The distance of the manufacturer, the obscurity of his dwelling, the caprice in selling his work, are quite removed; the retailer has all in his shop, and the public buys at a current price.

*How the Prices of Goods are determined by Trade.*

In the price of goods, two things must be considered as really existing, and quite different from one another;

to wit, the real value of the commodity, and the profit upon alienation.

I. The first thing to be known of any manufacture, when it comes to be sold, is, how much of it a person can perform in a day, a week, a month, according to the nature of the work, which may require more or less time to bring it to perfection. In making such estimates, regard is to be had only to what, upon an average, a workman of the country in general may perform, without supposing him the best or the worst in his profession, or having any peculiar advantage or disadvantage as to the place where he works.

Hence the reason why some people thrive by their industry, and others not; why some manufactures flourish in one place, and not in another.

II. The second thing to be known, is the value of the workman's subsistence, and necessary expence, both for supplying his personal wants, and providing the instruments belonging to his profession, which must be taken upon an average as above; except when the nature of the work requires the presence of the workman in the place of consumption: for although some trades, and almost every manufacture, may be carried on in places at a distance, and therefore may fall under one general regulation as to prices; yet others there are which, by their nature, require the presence of the workman in the place of consumption; and in that case the prices must be regulated by circumstances relative to every particular place.

III. The third and last thing to be known, is the value of the materials, that is, the first matter employed by the workman; and if the object of his industry be the manufacture of another, the same process of inquiry must be gone through with regard to the first, as with regard to the second: and thus the most complex manufactures may be at last reduced to the greatest simplicity.

These three articles being known, the price of manufacture is determined. It cannot be lower than the amount of all the three, that is, than the real value; whatever it is higher, is the manufacturer's profit. This will ever be in proportion to demand, and therefore will fluctuate according to circumstances.

Hence appears the necessity of a great demand, in order to promote flourishing manufactures.

By the extensive dealings of merchants, and their constant application to the study of the balance of work and demand, all the above circumstances are known to them, and are made known to the industrious, who regulate their living and expence according to their certain profit.

Employ a workman in a country where there is little trade or industry, he proportions his price always to the urgency of your want, or your capacity to pay; but seldom to his own labour. Employ another in a country of trade, he will not impose upon you, unless perhaps you be a stranger, which supposes your being ignorant of the value; but employ the same workman in a work not usual in the country, consequently not demanded, consequently not regulated as to the value, he will proportion his price as in the first supposition.

We may therefore conclude from what has been said, that in a country where trade has been established, manufactures must flourish, from the ready sale, the regula-

ted price of work, and the certain profit resulting from industry. Let us next inquire into the consequences of such a situation.

*How foreign Trade opens to an industrious People, and the Consequences of it to the Merchants who set it on foot.*

THE first consequence of the situation described in the preceding section is, that wants are easily supplied, for the adequate value of the thing wanted.

The next consequence is, the opening of foreign trade under its two denominations of passive and active. Strangers and people of distant countries, finding the difficulty of having their wants supplied at home, and the ease of having them supplied from this country, immediately have recourse to it. This is passive trade. The active is when merchants, who have executed this plan at home with success, begin to transport the labour of their countrymen into other regions, which either produce, or are capable of producing such articles of consumption, proper to be manufactured, as are most demanded at home; and consequently will meet with the readiest sale, and fetch the largest profits.

Here then is the opening of foreign trade, under its two denominations of active and passive.

What then are the consequences of this new commerce to our merchants, who have left their homes in quest of gain abroad?

The first is, that, arriving in any new country, they find themselves in the same situation, with regard to the inhabitants, as the workman in the country of no trade, with regard to those who employed him; that is, they proportion the price of their goods to the eagerness of acquiring, or the capacity of paying, in the inhabitants, but never to their real value.

The first profits then, upon this trade, must be very considerable; and the demand from such a country will be *high or low, great or small*, according to the spirit, not the real wants of the people: for these in all countries must first be supplied by the inhabitants themselves, before they cease to labour.

If the people of this not-trading country be abundantly furnished with commodities useful to the traders, they will easily part with them, at first, for the instruments of luxury and ease; but the great profit of the traders will insensibly increase the demand for the productions of their new correspondents; this will have the effect of producing a competition between themselves, and thereby of throwing the demand on their side. This is perpetually a disadvantage in traffic: the most unpolished nations in the world quickly perceive the effects of it; and are taught to profit by the discovery, in spite of the address of those who are the most expert in commerce.

The traders will therefore be very fond of falling upon every method and contrivance to inspire this people with a taste of refinement and delicacy. Abundance of fine presents, consisting of every instrument of luxury and superfluity, the best adapted to the genius of the people, will be given to the prince and leading men among them. Workmen will even be employed at home to study the

taste of the strangers, and to captivate their desires by every possible means. The more eager they are of presents, the more lavish the traders will be in bestowing and diversifying them. It is an animal put up to fatten, the more he eats the sooner he is fit for slaughter. When their taste for superfluity is fully formed, when the relish for their former simplicity is sophisticated, poisoned, and obliterated, then they are surely in the fetters of the traders, and the deeper they go, the less possibility there is of their getting out. The presents then will die away, having served their purpose; and if afterwards they are found to be continued, it will probably be to support the competition against other nations, who will incline to share of the profits.

If, on the contrary, this not-trading nation does not abound with commodities useful to the traders, these will make little account of trading with them, whatever their turn may be; but, if we suppose this country inhabited by a laborious people, who, having taken a taste for refinement from the traders, apply themselves to agriculture, in order to produce articles of subsistence, they will solicit the merchants to give them part of their manufactures in exchange for those; and this trade will undoubtedly have the effect of multiplying numbers in the trading nation. But if food cannot be furnished, nor any other branch of production found out to support the correspondence, the taste for refinement will soon die away, and trade will stop in this quarter.

Had it not been for the furs in those countries adjacent to Hudson's Bay, and in Canada, the Europeans never would have thought of supplying instruments of luxury to those nations; and if the inhabitants of those regions had not taken a taste for the instruments of luxury, furnished to them by the Europeans, they never would have become so indefatigable nor so dextrous hunters. At the same time we are not to suppose, that ever these Americans would have come to Europe in quest of our manufactures. It is therefore owing to our merchants, that these nations are become in any degree fond of refinement; and this taste, in all probability, will not soon exceed the proportion of the productions of their country. From these beginnings of foreign trade it is easy to trace its increase.

One step towards this, is the establishing correspondences in foreign countries; and these are more or less necessary in proportion as the country where they are established is more or less polished or acquainted with trade. They supply the want of posts, and point out to the merchants what proportion the productions of the country bear to the demand of the inhabitants for manufactures. This communicates an idea of commerce to the not-trading nation, and they insensibly begin to fix a determined value upon their own productions, which perhaps bore no determined value at all before.

Let us trace a little the progress of this refinement in the savages, in order to shew how it has the effect of throwing the demand upon the traders, and of creating a competition among them, for the productions of the new country.

Experience shews, that, in a new discovered country, merchants constantly find some article or other of its pro-

ductions, which turns out to a great account in commerce; and we see that the longer such a trade subsists, and the more the inhabitants take a taste for European manufactures, the more their own productions rise in their value, and the less profit is made by trading with them, even in cases where the trade is carried on by companies; which is a very wise institution for one reason, that it cuts off a competition between our merchants.

This is the best means of keeping prices low in favour of the nation; however it may work a contrary effect with respect to individuals who must buy from these monopolies.

When companies are not established, and when trade is open, our merchants, by their eagerness to profit by the new trade, betray the secrets of it, they enter into competition for the purchase of the foreign produce, and this raises prices, and favours the commerce of the most ignorant savages.

### *Consequences of the Introduction of a passive foreign Trade among a People who live in Simplicity and Idleness.*

WE now suppose the arrival of traders, all in one interest, with instruments of luxury and refinement, at a port in a country of great simplicity of manners, abundantly provided by nature with great advantages for commerce, and peopled by a nation capable of adopting a taste for superfluities.

The first thing the merchants do is, to expose their goods, and point out the advantages of many things, either agreeable or useful to mankind in general, such as wines, spirits, instruments of agriculture, arms, and ammunition for hunting, nets for fishing, manufactures for clothing, and the like. The advantages of these are presently perceived, and such commodities are eagerly sought after.

The natives on their side produce what they most esteem, generally something superfluous or ornamental. The traders, after examining all circumstances, determine the object of their demand, giving the least quantity possible in return for this superfluity, in order to impress the inhabitants with a high notion of the value of their own commodities; but as this parsimony may do more hurt than good to their interest, they are very generous in making presents, from the principles mentioned above.

When the exchange is completed, and the traders depart, regret is commonly mutual; the one and the other are sorry that the superfluities of the country fall short. A return is promised by the traders, and assurances are given by the natives of a better provision another time.

What are the first consequences of this revolution?

It is evident, that, in order to supply an equivalent for this new want, more hands must be set to work than formerly. And it is evident also, that this augmentation of industry will not essentially increase numbers: Why? Because the produce of the industry is, in this case, intended to be exported. But, if we can find out any additional consumption at home, even implied by  
this

this new trade, it will have the effect of augmenting numbers. An example will make this plain.

Let us suppose the superfluity of this country to be the skins of wild beasts, not proper for food; the manufacture sought for, brandy. The brandy is sold for furs. He who has furs, or he who can spare time to hunt for them, will drink brandy in proportion: but there is no reason to conclude from this simple operation, that one man more in the country must necessarily be fed, or that any augmentation of agriculture must of consequence ensue from this new traffic.

But let us throw in a circumstance which may apply an additional consumption at home, and then examine the consequences.

A poor creature who has no equivalent to offer for food, who is miserable, and ready to perish for want of subsistence, goes a hunting, and kills a wolf; he comes to a farmer with the skin, and says, You are well fed, but you have no brandy; if you will give me a loaf, I will give you this skin, which the strangers are so fond of, and they will give you brandy. But; says the farmer, I have no more bread than what is sufficient for my own family. As for that, replies the other, I will come and dig in your ground, and you and I will settle our account as to the small quantity I desire of you. The bargain is made; the poor fellow gets his loaf, and lives at least; perhaps he marries, and the farmer gets a dram. But had it not been for this dram, that is, this new want, which was purchased by the industry of this poor fellow, by what argument could he have induced the farmer to part with a loaf?

Here the sentiment of charity is excluded. This alone is a principle of multiplication; but as true it is, on the other hand, that could the poor fellow have got bread by begging, he would not probably have gone a-hunting.

Here then it appears, that the very dawning of trade, in the most unpolished countries, implies a multiplication. This is enough to point out the first step, and to connect the subject of our present inquiries with what has been already discussed in relation to other circumstances.

So soon as all the furs are disposed of, and a taste for superfluity is introduced, both the traders and the natives will be equally interested in the advancement of industry in this country. Many new objects of profit for the first will be discovered, which the proper employment of the inhabitants, in reaping the natural advantages of their soil and climate, will make effectual. The traders will therefore endeavour to set on foot many branches of industry among the savages, and the allurements of brandy, arms, and clothing; will animate these in the pursuit of them.

When once this revolution is brought about; when those who formerly lived in simplicity become industrious; manners put on a new face.

That is to say, we now find two trading nations instead of one, with this difference, however, that as hitherto we have supposed the merchants all in one interest, the compound demand, that is, the competition of the buyers, has been, and must still continue on the side of

the natives. This is a great prejudice to their interest; but as it is not supposed sufficient to check their industry, nor to restrain their consumption of the manufactures, let us here examine a little more particularly the consequences of the principle of demand in such a situation; for although we allow, that it can never change sides, yet it may admit of different modifications, and produce different effects, as we shall presently perceive.

The merchants we suppose all in one interest, consequently there can be no competition among them; consequently no check can be put upon their raising their prices, as long as the prices they demand are complied with. So soon as they are raised to the full extent of the abilities of the natives, or of their inclination to buy, the merchants have the choice of three things, which are all perfectly in their option; and the preference to be given to the one or the other, depends entirely upon themselves, and upon the circumstances we are going to point out.

First, they may support the *high* demand; that is, not lower their price; which will preserve a high estimation of the manufactures in the opinion of the inhabitants, and render the profits upon their trade the greatest possible. This part they may possibly take, if they perceive the natives doubling their diligence, in order to become able, in time, to purchase considerable cargoes at a high value; from which supposition is implied a strong disposition in the people to become luxurious, since nothing but want of ability prevents them from complying with the highest demand: but still another circumstance must concur, to engage the merchants not to lower their price. The great proportion of the goods they seek for in return, must be found in the hands of a few. This will be the case if slavery be established; for then there must be many poor, and few rich: and they are commonly the rich consumers who proportion the price they offer, rather to their desires, than to the value of the thing.

The second thing which may be done is, to open the door to a *great* demand; that is, to lower their prices. This will sink the value of the manufactures in the opinion of the inhabitants, and render profits less in proportion, although indeed, upon the voyage, the profits may be greater.

This part they will take, if they perceive the inhabitants do not incline to consume great quantities of the merchandize at a high value, either for want of abilities or inclination; and also, if the profits upon the trade depend upon a large consumption, as is the case in merchandize of a low value, and suited chiefly to the occasions of the lower sort. Such motives of expediency will be sufficient to make them neglect a *high* demand, and prefer a *great* one; and the more, when there is a likelihood that the consumption of low-priced goods in the beginning may beget a taste for others of a higher value, and thus extend in general the taste of superfluity.

A third part to be taken, is the least politic, and perhaps the most familiar. It is to profit by the competition between the buyers, and encourage the rising of demand as long as possible; when this comes to a stop, to make a kind of auction, by first bringing down the prices

to

to the level of the highest bidders, and so to descend by degrees, in proportion as demand sinks. Thus we may say with propriety, that demand commonly becomes *great*, in proportion as prices sink. By this operation, the traders will profit as much as possible, and sell off as much of their goods as the profits will permit.

But this plan, in a new discovered country, is not politic, as it both discovers a covetousness and a want of faith in the merchants, and also throws open the secrets of their trade to those who ought to be kept ignorant of them.

Let us next suppose, that the large profits of our merchants shall be discovered by others, who arrive at the same ports in a separate interest, and who enter into no combination which might prevent the natural effects of competition.

Let the state of demand among the natives be supposed the same as formerly, both as to *height* and *greatness*, in consequence of the operation of the different principles, which might have induced our merchants to follow one or other of the plans we have been describing; we must however still suppose, that they have been careful to preserve considerable profits upon every branch.

If we suppose the inhabitants to have increased in numbers, wealth, and taste for superfluity, since the last voyage, demand will be found rather on the rising hand. Upon the arrival of the merchants in competition with the former, both will offer to sale: but if both stand to the same prices, it is very natural to suppose, that the former dealers will obtain a preference; as, *ceteris paribus*, it is always an advantage to know and to be known. The last comers, therefore, have no other way left to counter-balance this advantage, but to lower their prices.

This is a new phenomenon: here the fall of prices is not voluntary as formerly; nor consented to from expediency; nor owing to a failure of demand, but to the influence of a new principle of commerce, to wit, a double competition, which we shall now examine.

### Of Double Competition.

When *competition* is much stronger on one side of the contract than on the other, it is called *simple*. This is the species of competition which is implied in the term *high demand*, or when it is said that *demand raises prices*.

*Double competition* is, when, in a certain degree, it takes place on both sides of the contract at once, or vibrates alternately from one to the other. This is what restrains prices to the adequate value of merchandize.

The great difficulty is to distinguish clearly between the principles of *demand*, and those of *competition*: here then follows the principal differences between the two, relatively to the effects they produce severally in the mercantile contract of buying and selling, which we here express shortly by the word *contract*.

*Simple demand* is what brings the quantity of a commodity to market. Many demand, who do not buy; many offer, who do not sell. This demand is called *great* or *small*; it is said to *increase*, to *augment*, to

*swell*; and is expressed by these and other synonymous terms, which mark an augmentation or diminution of quantity. In this species, two people never demand the same thing, but a part of the same thing, or things quite alike.

*Compound demand* is the principle which raises prices, and never can make them sink; because in this case more than one demands the very same thing. It is solely applicable to the buyers, in relation to the price they offer. This demand is called *high* or *low*, and is said to *rise*, to *fall*, to *mount*, to *sink*, and is expressed by these and other synonymous terms.

*Simple competition*, when between buyers, is the same as *compound* or *high demand*; but differs from it in so far, as this may equally take place among sellers, which *compound demand* cannot; and then it works a contrary effect: it makes prices *sink*, and is synonymous with *low demand*: it is this competition which overturns the balance of work and demand.

*Double competition* is what is understood to take place in almost every operation of trade; it is this which prevents their excessive rise of prices; it is this which prevents their excessive fall. While *double competition* prevails, the balance is perfect, trade and industry flourish.

The capital distinction, therefore, between the terms *demand* and *competition* is, that *demand* is constantly relative to the buyers; and when money is not the price, as in barter, then it is relative to that side upon which the greatest *competition* is found.

We therefore say, with regard to *prices*, demand is *high* or *low*. With regard to the *quantity of merchandize*, demand is *great* or *small*. With regard to *competition*, it is always called *great* or *small*, *strong* or *weak*.

*Competition* is, with equal propriety, applicable to both parties in the contract. A *competition* among buyers is a proper expression; a *competition* among sellers, who have the merchandize, is fully as easily understood, tho' it be not quite so striking, for reasons which an example will make plain.

You come to a fair, where you find a great variety of every kind of merchandize, in the possession of different merchants. These, by offering their goods to sale, constitute a tacit competition; every one of them wishes to sell in preference to another, and at the same time with the best advantage to himself.

The buyers begin, by cheapening at every shop. The first price asked marks the covetousness of the seller; the first price offered, the avarice of the buyer. From this operation competition begins to work its effects on both sides, and so becomes double. The principles which influence this operation are now to be deduced.

It is impossible to suppose the same degree of eagerness, either to buy or to sell, among several merchants; because the degree of eagerness is exactly in proportion to their view of profit; and as these must necessarily be influenced and regulated by different circumstances, that buyer, who has the best prospect of selling again with profit, obliges him, whose prospect is not so good, to content himself with less; and that seller, who has bought to the best advantage, obliges him, who has paid dearer

dearer for the merchandize, to moderate his desire of gain.

It is from these principles, that competition among buyers and sellers must take place. This is what confines the fluctuation of prices within limits which are compatible with the reasonable profits of both buyers and sellers; for we must constantly suppose the whole operation of buying and selling to be performed by merchants; the buyer cannot be supposed to give so high a price as that which he expects to receive, when he distributes to the consumers, nor can the seller be supposed to accept of a lower than that which he paid to the manufacturer. This competition is properly called double, because of the difficulty to determine upon which side it stands; the same merchant may have it in his favour upon certain articles, and against him upon others; it is continually in vibration, and the arrival of every post may less or more pull down the heavy scale.

In every transaction between merchants, the profit resulting from the sale must be exactly distinguished from the value of the merchandize. The first *may* vary, the last never *can*. It is this profit alone which can be influenced by competition; and it is for that reason we find such uniformity every where in the prices of goods of the same quality.

The competition between sellers does not appear so striking, as that between buyers; because he who offers to sale, appears only passive in the first operation; whereas the buyers present themselves one after another; they make a demand when the merchandize is refused to one at a certain price, a second either offers more, or does not offer all: but so soon as another seller finds his account in accepting the price the first had refused, then the first enters into competition, providing his profits will admit his lowering the first price, and thus competition takes place among the sellers, until the profits upon their trade prevent prices from falling lower.

In all markets this competition is varying, though insensibly, on many occasions; but in others, the vibrations are very perceptible. Sometimes it is found strongest on the side of the buyers; and in proportion as this grows, the competition between the sellers diminishes. When the competition between the former has raised prices to a certain standard, it comes to a stop; then the competition changes sides, and takes place among the sellers, eager to profit of the highest price. This makes prices fall, and according as they fall, the competition among the buyers diminishes. They still wait for the lowest period. At last it comes; and then perhaps some new circumstance, by giving the balance a kick, disappoints their hopes. If therefore it ever happens, that there is but one interest upon one side of the contract, as in the example in the former section, where we supposed the sellers united, you perceive, that the rise of the price, occasioned by the competition of the buyers, and even its coming to a stop, could not possibly have the effect of producing any competition on the other side; and therefore, if prices come afterwards to sink, the fall must have proceeded from the prudential considera-

tions of adapting the price to the faculties of those who, from the height of it, had withdrawn their demand.

From these principles of competition, the forestalling of markets is made a crime, because it diminishes the competition which ought to take place between different people, who have the same merchandize to offer to sale. The forestaller buys all up, with an intention to sell with more profit, as he has by that means taken other competitors out of the way, and appears with a single interest on one side of the contract, in the face of many competitors on the other. This person is punished by the state, because he has prevented the price of the merchandize from becoming justly proportioned to the real value; he has robbed the public, and enriched himself; and in the punishment he makes restitution. Here occur two questions to be resolved, for the sake of illustration.

Can competition among buyers possibly take place, when the provision made is more than sufficient to supply the quantity demanded? On the other hand, can competition take place among the sellers, when the quantity demanded exceeds the total provision made for it?

We think it may in both cases; because in the one and the other, there is a competition implied on one side of the contract, and the very nature of this competition implies a possibility of its coming on the other, provided separate interests be found upon both sides. But to be more particular:

1. Experience shews, that however justly the proportion between the demand and the supply may be determined in fact, it is still next to impossible to discover it exactly, and therefore the buyers can only regulate the prices they offer, by what they may reasonably expect to sell for again. The sellers, on the other hand, can only regulate the prices they expect, by what the merchandize has cost them when brought to market. We have already shewn, how, under such circumstances, the several interests of individuals affect each other, and make the balance vibrate.

2. The proportion between the supply and the demand is seldom other than *relative* among merchants, who are supposed to buy and sell, not from necessity, but from a view to profit. What we mean by *relative* is, that their demand is *great* or *small*, according to prices; there may be a great demand for grain at 35 s. *per* quarter, and no demand at all for it at 40 s.; that is, among merchants.

It is essential to attend to the smallest circumstance in matters of this kind. The circumstance we mean, is the difference we find in the effect of competition, when it takes place purely among merchants on both sides of the contract, and when it happens, that either the consumers mingle themselves with the merchant buyers, or the manufacturers, that is, the furnishers, mingle themselves with the merchant-sellers. This combination we shall illustrate, by the solution of another question, and then conclude with a few reflections upon the whole.

Can there be no case formed, where the competition upon one side may subsist, without a possibility of its taking

king place on the other, although there should be separate interests upon both?

The case is hardly supposable among merchants, who buy and sell with a view to profit; but it is absolutely supposable, and that is all, when the direct consumers are the buyers; when the circumstances of one of the parties is perfectly known; and when the competition is so strong upon one side, as to prevent a possibility of its becoming double, before the whole provision is sold off, or the demand satisfied. Let us have recourse to examples.

Grain arriving in a small quantity, at a port where the inhabitants are starving, produces so great a competition among the consumers, who are the buyers, that their necessity becomes evident; all the grain is generally bought up before prices can rise so high as to come to a stop; because nothing but want of money, that is, an impossibility of complying with the prices demanded by the merchants, can restrain them: but if you suppose, even here, that prices come naturally to a stop; or that, after some time, they fall lower, from prudential considerations; then there is a possibility of a competition taking place among the sellers, from the principles above deduced. If, on the contrary, the stop is not natural, but occasioned by the interposition of the magistrate, from humanity, or the like, there will be no competition, because then the principles of commerce are suspended; the sellers are restrained on one side, and they restrain the buyers on the other. Or rather, indeed, it is the magistrate, or compassion, who in a manner fixes the price, and performs the office of both buyer and seller.

A better example still may be found, in a competition among sellers; where it may be so strong, as to render a commodity in a manner of no value at all, as in the case of an uncommon and unexpected draught of fish, in a place of small consumption, when no preparations have been made for salting them. There can be then no competition among the buyers; because the market cannot last, and they find themselves entirely masters, to give what price they please, being sure the sellers must accept of it, or lose their merchandize. In the first example, humanity commonly stops the activity of the principle of competition; in the other it is stopped by a certain degree of fair dealing, which forbids the accepting of a merchandize for nothing.

In proportion therefore as the rising of prices can stop demand, or the sinking of prices can increase it, in the same proportion will competition prevent either the rise or the fall from being carried beyond a certain length: and if such a case can be put, where the rising of prices cannot stop demand, nor the lowering of prices augment it, in such cases double competition has no effect; because these circumstances unite the most separate interests of buyers and sellers in the mercantile contract; and when upon one side there is no separate interest, there can then be no competition.

From what has been said, we may form a judgment of the various degrees of competition. A book not worth a shilling, a fish of a few pounds weight, are often sold for considerable sums. The buyers here are not merchants. When an ambassador leaves a court in a

hurry, things are sold for less than the half of their value: he is no merchant, and his situation is known. When, at a public market, there are found consumers, who make their provision; or manufacturers, who dispose of their goods for present subsistence; the merchants, who are respectively upon the opposite side of the contract to these, profit of their competition; and those who are respectively upon the same side with them, stand by with patience, until they have finished their business. Then matters come to be carried on between merchant and merchant, and then profits may rise and fall, in the proportion of quantity to demand; that is to say, if the provision is less than the demand, the competition among the demanders, or the rise of the price, will be in the compound proportion of the falling short of the commodity, and of the prospect of selling again with profit. It is this combination which regulates the competition, and keeps it within bounds. It can affect but the profits upon the transaction; the intrinsic value of the commodity stands immovable: nothing is ever sold below the real value; nothing is ever bought for more than it may probably bring. We mean, in general. Whereas, so soon as consumers and needy manufacturers mingle in the operation, all proportion is lost. The competition between them is too strong for the merchants; the balance vibrates by jerks. In such markets merchants seldom appear: the principal objects there, are the fruits and productions of the earth, and articles of the first necessity for life, not manufactures strictly so called. A poor fellow often sells, to purchase bread to eat; not to pay what he did eat while he was employed in the work he disposes of. The consumer often measures the value of what he is about to purchase, by the weight of his purse, and his desire to consume.

### *Of what is called Expence, Profit, and Loss.*

THE term *expence*, when simply expressed, without any particular relation, is always understood to be relative to money. This kind is distinguished under the three heads of *private*, *public*, and *national*.

1. *Private expence* is, what a private person, or private society, lays out, either to provide articles of consumption, or something more permanent, which may be conducive to their ease, convenience, or advantage. Thus we say, a *large domestic expence*, relative to one who spends a great income. We say, a merchant has been at *great expence* for magazines, for living, for clerks, &c. but never that he has been at any in buying goods. In the same way a manufacturer may expend for building, machines, horses, and carriages, but never for the matter he manufactures. When a thing is bought, in order to be sold again, the sum employed is called *money advanced*; when it is bought not to be sold, it may be said to be *expended*.

2. *Public expence* is, the employment of that money, which has been contributed by individuals, for the current service of the state. The contribution, or gathering it together, represents the effects of many articles of *private expence*; the laying it out when collected, is *public expence*.

### 3. *National*

3. *National expence*, is what is expended out of the country: this is what diminishes national wealth. The principal distinction to be here attended to, is between *public expence*, or the laying out of public money, and *national expence*, which is the alienating the nation's wealth in favour of strangers. Thus the greatest *public expence* imaginable, may be no national expence; because the money may remain at home. On the other hand, the smallest *public*, or even *private expence*, may be a national expence; because the money may go abroad.

*Profit and loss* is divided into *positive, relative*, and *compound*. *Positive profit*, implies no loss to any body; it results from an augmentation of labour, industry, or ingenuity, and has the effect of swelling or augmenting the public good.

*Positive loss*, implies no profit to any body; it is what results from the cessation of the former, or of the effects resulting from it, and may be said to diminish the public good.

*Relative profit*, is what implies a loss to some body; it marks a vibration of the balance of wealth between parties, but implies no addition to the general stock.

*Relative loss*, is what, on the contrary, implies a profit to some body; it also marks a vibration of the balance, but takes nothing from the general stock.

The *compound* is easily understood; it is that species of profit and loss which is partly *relative*, and partly *positive*.

#### *The general Consequences resulting to a trading Nation, upon the opening of an active foreign Commerce.*

A NATION which remains passive in her commerce, is at the mercy of those who are active, and must be greatly favoured, indeed, by natural advantages, or by a constant flux of gold and silver from her mines, to be able to support a correspondence, not entirely hurtful to the augmentation of her wealth.

When we look upon the wide field which here opens to our view, we are perplexed with too great a variety of objects. In one part, we see a decent and comely beginning of industry; wealth flowing gently in, to recompense ingenuity; numbers both augmenting, and every one becoming daily more useful to another; agriculture proportionally extending itself; no violent revolutions; no exorbitant profits; no insolence among the rich; no excessive misery among the poor; multitudes employed in producing; great oeconomy upon consumption; and all the instruments of luxury, daily produced by the hands of the diligent, going out of the country for the service of strangers; not remaining at home for the gratification of sensuality. At last the augmentations come insensibly to a stop. Then these rivers of wealth, which were in brisk circulation through the whole world, and which returned to this trading nation as blood returns to the heart, only to be thrown out again by new pulsations, begin to be obstructed in their course; and flowing abroad more slowly than before, come to form stagnations at home. These, impatient of restraint, soon burst out into domestic circulation. Upon this cities swell in magni-

ficence of buildings; the face of the country is adorned with palaces, and becomes covered with groves; luxury shines triumphant in every part; inequality becomes more striking to the eye; and want and misery appear more deformed, from the contrast: even fortune grows more whimsical in her inconstancy; the beggar of the other day, now rides in his coach; and he who was born in a bed of state, is seen to die in a goal, or in an almshouse. Such are the effects of great domestic circulation.

The statesman looks about with amazement; he, who was wont to consider himself as the first man in the society in every respect, perceives himself, perhaps, eclipsed by the lustre of private wealth, which avoids his grasp when he attempts to seize it. This makes his government more complex and more difficult to be carried on; he must now avail himself of art and address, as well as of power and force. By the help of cajoling and intrigues, he gets a little into debt; this lays a foundation for public credit, which, growing by degrees, and in its progress assuming many new forms, becomes, from the most tender beginnings, a most formidable monster, striking terror into those who cherished it in its infancy. Upon this, as upon a triumphant war-horse, the statesman gets a-stride; he then appears formidable a-new; his head turns giddy; he is choaked with the dust he has raised; and at the moment he is ready to fall, to his utter astonishment and surprize, he finds a strong monied interest, of his own creating, which, instead of swallowing him up as he apprehended, flies to his support. Through this he gets the better of all opposition, he establishes taxes, multiplies them, mortgages his fund of subsistence; either becomes a bankrupt, and rises again from his ashes; or if he be less audacious, he stands trembling and tottering for a while on the brink of the political precipice. From one or the other of these perilous situations, he begins to discover an endless path, which, after a multitude of windings, still returns into itself, and continues an equal course through this vast labyrinth.

It is now full time to leave off rhapsody, and return to reasoning and cool inquiry, concerning the more immediate and more general effects and revolutions produced by the opening of a foreign trade in a nation of industry.

The first and most sensible alteration will be an increase of demand for manufacturers, because by supplying the wants of strangers, the number of consumers will now be considerably augmented. What again will follow upon this, must depend upon circumstances.

If this revolution in the state of demand should prove too violent, the consequence of it will be to *raise* demand; if it should prove gradual, it will *increase* it. This distinction is well understood, and the consequence appears just: for, if the supply do not increase in proportion to the demand; a competition will ensue among the demanders; which is the common effect of such sudden revolutions. If, on the other hand, a gentle increase of demand should be accompanied with a proportional supply, the whole industrious society will grow in vigour, and in wholesome stature, without being sensible

of any great advantage or inconvenience; the change of their circumstances will even be imperceptible.

The immediate effects of the violent revolution will, in this example, be flattering to some, and disagreeable to others. Wealth will be found daily to augment, from the rising of prices, in many branches of industry. This will encourage the industrious classes, and the idle consumers at home will complain. We have already dwelt abundantly long upon the effects resulting from this to the lower classes of the people, in providing them with a certain means of subsistence. Let us now examine in what respect even the higher classes will be made likewise to feel the good effects of this general change, although at first they may suffer a temporary inconvenience from it.

Farmers, as has been observed, will have a greater difficulty in finding servants, who, instead of labouring the ground, will chuse to turn themselves to manufactures. This we have considered in the light of purging the lands of superfluous mouths; but every consequence in this great chain of politics draws other consequences after it, and as they follow one another, things put on different faces, which affect classes differently. The purging of the land is but one of the first; here follows another.

The desertion of the lands employed in a trifling agriculture will at first, no doubt, embarrass the farmers; but in a little time every thing becomes balanced in a trading nation, because *here every industrious man must advance in prosperity, in spite of all general combinations of circumstances.*

In the case before us, the relative profits upon farming must soon become greater than formerly, because of this additional expence which must affect the whole class of farmers; consequently, this additional expence, instead of turning out to be a loss to either landlord or farmer, will, after some little time, turn out to the advantage of both: because the produce of the ground, being indispensably necessary to every body, must in every article increase in its value. Thus in a short time accounts will be nearly balanced on all hands; that is to say, the same proportion of wealth will, *ceteris paribus*, continue the same among the industrious. We say among the industrious; for those who are either idle, or even negligent, will be great losers.

A proprietor of land, inattentive to the causes of his farmer's additional expence, may very imprudently suffer his rents to fall, instead of assisting him on a proper occasion, in order to make them afterwards rise the higher.

Those who live upon a determined income in money, and who are nowise employed in traffic, nor in any scheme of industry, will, by the augmentation of prices, be found in worse circumstances than before.

In a trading nation every man must turn his talents to account, or he will undoubtedly be left behind in this universal emulation, in which the most industrious, the most ingenious, and the most frugal will constantly carry off the prize.

This consideration ought to be a spur to every body. The richest men in a trading nation have no security against poverty; we mean proportional poverty; for though

they diminish nothing of their income, yet, by not increasing it in proportion to others, they lose their rank in wealth, and from the first class in which they stood they will slide insensibly down to a lower.

There is one consequence of an additional beneficial trade, which raises demand and increases wealth; but if we suppose no proportional augmentation of supply, it will prove at best but an airy dream which lasts for a moment, and when the gilded scene is passed away; numberless are the inconveniences which are seen to follow.

We shall now point out the natural consequences of this augmentation of wealth drawn from foreign nations, when the statesman remains inattentive to increase the supply both of food and manufactures, in proportion to the augmentation of mouths, and of the demand for the produce of industry.

In such a situation profits will daily swell, and every scheme for reducing them within the bounds of moderation, will be looked upon as a hurtful and unpopular measure: be it so; but let us examine the consequences.

We have said, that the rise of demand for manufactures naturally increases the value of work: now we must add, that under such circumstances, the augmentation of riches, *in a country, either not capable of improvement as to the soil, or where precautions have not been taken for facilitating a multiplication of inhabitants, by the importation of subsistence,* will be productive of the most calamitous consequences.

On one side, this wealth will effectually diminish the mass of the food before produced; and on the other, will increase the number of useless consumers. The first of these circumstances will raise the demand for food; and the second will diminish the number of useful free hands, and consequently raise the price of manufactures: here are shortly the outlines of this progress.

The more rich and luxurious a people are, the more delicate they become in their manner of living; if they fed on bread formerly, they will now feed on meat; if they fed on meat, they will now feed on fowl. The same ground which feeds a hundred with bread, and a proportional quantity of animal food, will not maintain an equal number of delicate livers. Food must then become more scarce; demand for it rises; the rich are always the strongest in the market; they consume the food, and the poor are forced to starve. Here the wide door to modern distress opens; to wit, a hurtful competition for subsistence. Farther, when a people become rich, they think less of economy; a number of useless servants are hired, to become an additional dead weight on consumption; and when their starving countrymen cannot supply the extravagance of the rich to cheaply as other nations, they either import instruments of foreign luxury, or seek to enjoy them out of their own country, and thereby make restitution of their gains.

Is it not therefore evident, that if, before things come to this pass, additional subsistence be not provided by one method or other, the number of inhabitants must diminish; although riches may daily increase by a balance of additional matter, supposed to be brought into the country

in consequence of the hitherto beneficial foreign trade. This is not all. We say farther, that the beneficial trade will last for a time only. For the infallible consequence of the rise of prices at home will be, that those nations which at first consumed your manufactures, perceiving the gradual increase of their price, will begin to work for themselves; or finding out your rivals who can supply them cheaper, will open their doors to them. These again, perceiving the great advantages gained by your traders, will begin to supply the market; and since every thing must be cheaper in countries where we do not suppose the concurrence of all the circumstances mentioned above, these nations will supplant you, and be enriched in their turn.

Here comes a new revolution. Trade is come to a stop: what then becomes of all the hands which were formerly employed in supplying the foreign demands?

Were revolutions so sudden as we are obliged to represent them, all would go to wreck; in proportion as they happen by quicker or slower degrees, the inconveniencies are greater or smaller.

Prices, we have said, are made to rise by competition. If the competition of the strangers was what raised them, the distress upon the manufacturers will be in proportion to the suddenness of their deserting the market. If the competition was divided between the strangers and the home-consumers, the inconveniencies which ensue will be less; because the desertion of the strangers will be in some measure made up by an increase of home-consumption which will follow upon the fall of prices. And if, in the third case, the natives have been so imprudent, as not only to support a competition with the strangers, and thereby disgust them from coming any more to market, but even to continue the competition between themselves, the whole loss sustained by the revolution will be national. Wealth will cease to augment; but the inconveniencies, in place of being felt by the manufacturers, will only affect the state; those will continue in affluence, extolling the generosity of their countrymen, and despising the poverty of the strangers who had enriched them.

Domestic luxury will here prove an expedient for preserving from ruin the industrious part of a people, who in subsisting themselves had enriched their country. No change will follow in their condition; they will go on with a painful assiduity to labour, and if the consequences of it become now hurtful to one part of the state, they must at least be allowed to be essentially necessary for the support of the other.

But that luxury is no necessary concomitant of foreign trade, in a nation where the true principles of it are understood, will appear very plain, from a contrast we are now going to point out, in the example of a modern state, renowned for its commerce and frugality. The country is Holland.

A set of industrious and frugal people were assembled in a country by nature subject to many inconveniencies, the moving of which necessarily employed abundance of hands. Their situation upon the continent, the power of their former masters, and the ambition of their neighbours, obliged them to keep great bodies of troops.

These two articles added to the numbers of the community, without either enriching the state by their labour exported, or producing food for themselves or countrymen.

The scheme of a commonwealth was calculated to draw together the industrious; but it has been still more useful in subsisting them: the republican form of government being there greatly subdivided, vests authority sufficient in every part of it, to make suitable provision for their own subsistence; and the tie which unites them, regards only matters of public concern. Had the whole been governed by one sovereign, or by one council, this important matter never could have been effectuated.

It would be impossible for the most able minister that ever lived, to provide nourishment for a country so extended as France, or even as England, supposing these as fully peopled as Holland is: even although it should be admitted that a sufficient quantity of food might be found in other countries for their subsistence. The enterprise would be too great, abuses would multiply; the consequence would be, that the inhabitants would die for want. But in Holland the case is different, every little town takes care of its own inhabitants; and this care being the object of application and profit to so many persons, is accomplished with success.

When once it is laid down as a maxim in a country, that food must of necessity be got from abroad in order to feed the inhabitants at home, the corn-trade becomes considerable, and at the same time certain, regular, and permanent. This was the case in Holland: as the inhabitants were industrious, the necessary consequence has been, a very extraordinary multiplication; and at the same time such an abundance of grain, that, instead of being in want themselves, they often supply their neighbours. There are many examples of England's being supplied with grain from thence, and, which is still more extraordinary, from the re-exportation of the very produce of its own fruitful soil.

It is therefore evident, that the only way to support industry, is to provide a supply of subsistence, constantly proportional to the demand that may be made for it. This is a precaution indispensably necessary for preventing hurtful competition. This is the particular care of the Dutch: so long as it can be effectual, their state can fear no decline; but whenever they come to be distressed in the markets, upon which they depend for subsistence, they will sink into ruin. It is by mere dint of frugality, cheap and parsimonious living, that the navigation of this industrious people is supported. Constant employment, and an accumulation of almost imperceptible gains, fills their coffers with wealth, in spite of the large outgoings to which their own proper nourishment yearly forces them. The large profits upon industry in other countries, which are no proof of generosity, but a fatal effect of a scanty subsistence, is far from dazzling their eyes. They seldom are found in the list of competitors at any foreign port; if they have their cargo to dispose of, they wait with pleasure in their own vessels, consuming their own provisions, and at last accept of what others have left. It may be said, that many other circumstances concur in favour of the Dutch, besides the article of subsistence.

Without disputing this matter, it may be observed, that if a computation be made of the hands employed in providing subsistence, and of those who are severally taken up in supplying every other want, their numbers will be found nearly to balance one another in the most luxurious countries. From this we may conclude, that the article of food, among the lower classes, must bear a very high proportion to all the other articles of their consumption; and therefore a diminution upon the price of subsistence, must be of infinite consequence to manufacturers, who are obliged to buy it. From this consideration, let us judge of the consequence of such augmentations upon the price of grain as are familiar to us; 30 or 40 *per cent.* seems nothing. Now this augmentation operates upon two

thirds, at least, of the whole expence of a labouring man: let any one who lives in tolerable affluence make the application of this to himself, and examine how he would manage his affairs if, by accidents of rains or winds, his expences were to rise 30 *per cent.* without a possibility of restraining them; for this is unfortunately the case with all the lower classes. From whence it may be concluded, that the keeping food cheap, and still more the preserving it at all times at an equal standard, is the fountain of the wealth of Holland; and that any hurtful competition in this article must beget a disorder which will affect the whole of the manufacturers of a state.

## C O M

**COMMUNATORY**, an appellation given to whatever threatens punishment, or some penalty.

**COMMINUTION**, denotes the breaking, or rather grinding, a body to very small particles.

**COMMISSARY**, in the ecclesiastical law, an officer of the bishop, who exercises spiritual jurisdiction in places of a diocese so far from the episcopal see, that the chancellor cannot call the people to the bishop's principal consistory court, without giving them too much inconvenience.

**COMMISSARY-court**, in Scots law, a court originally constituted by the bishops for executing in their name an usurped jurisdiction, and was anciently called the *bishops court, curia Christianitatis, or consistorial court*. This court was new-modelled by Queen Mary at the Reformation, and continues till this day. See **SCOTS LAW**, title, *Ecclesiastical persons*.

**COMMISSARY**, in a military sense, is of three sorts.

**COMMISSARY-general of the musters**, an officer appointed to muster the army, as often as the general thinks proper, in order to know the strength of each regiment and company, to receive and inspect the muster-rolls, and to keep an exact state of the strength of the army.

**COMMISSARY-general of stores**, an officer in the artillery, who has the charge of all the stores, for which he is accountable to the office of ordnance.

**COMMISSARY-general of provisions**, an officer who has the inspection of the bread and provisions of the army.

**COMMISSION**, in common-law, the warrant or letters-patent which all persons exercising jurisdiction have to empower them to hear or determine any cause or suit: as, the commission of the judges, &c.

**COMMISSION of bankruptcy**, is the commission that issues from the lord chancellor, on a person's becoming a bankrupt within any of the statutes, directed to certain commissioners appointed to examine into it, and to secure the bankrupt's lands and effects for the satisfaction of his creditors.

**COMMISSION of lunacy** issues out of the court of chancery, to inquire whether a person represented to be a lunatic be so or not.

**COMMISSION**, in commerce. See **FACTORAGE**.

**COMMISSIONER**, a person authorised by commission,

letters-patent, or other lawful warrant, to examine any matters, or execute any public office, &c.

Besides those relating to judicial proceedings, there are

**COMMISSIONERS of the customs**. See **CUSTOMS**.

**COMMISSIONERS of excise**. See **EXCISE**.

**COMMISSIONERS of the navy**. See **NAVY**.

**Lords COMMISSIONERS of the treasury**. See **TREASURY** and **EXCHEQUER**.

**COMMITTEE**, one or more persons, to whom the consideration or ordering of a matter is referred, either by some court, or by the consent of parties, to whom it belongs.

**COMMITTEE of parliament**, a certain number of members appointed by the house, for the examination of a bill, making a report of an inquiry, process of the house, &c.

When a parliament is called, and the speaker and members have taken the oaths, there are committees appointed to sit on certain days, *viz.* the committee of privileges and elections, of religion, of trade, &c. which are standing committees.

Sometimes the whole house resolves itself into a committee; on which occasion each person has a right to speak and reply as often as he pleases, which is not the case when a house is not in a committee.

**COMMIXTION**, in Scots law, is a method of acquiring property, by mixing or blending together different substances belonging to different proprietors. If this commixtion was made without the consent of the different proprietors, and the materials cannot again be disjoined, it draws after it the property of the materials. See **SCOTS LAW**, title, *Division of rights*.

**COMMODATE**, in Scots law, is a gratuitous loan, wherein the property of the thing but continues with the lender, and only the use of it given to the borrower, who must restore the individual thing borrowed. See **SCOTS LAW**, title, *Obligations and contracts in general*.

**COMMODITY**, in a general sense, denotes all sorts of wares and merchandizes whatsoever that a person deals or trades in.

**Staple COMMODITIES**, such wares and merchandizes as are

are commonly and readily sold in a market, or exported abroad : being, for the most part, the proper produce or manufacture of the country.

**COMMODORE**, in maritime affairs, an officer of the British navy, commissioned by the lords of the admiralty, or by an admiral, to command a Squadron of men of war in chief.

**COMMON**, something that belongs to all alike, in contradistinction to proper, peculiar, &c.

**COMMON COUNCIL**. **COUNCIL**.

**COMMON LAW**, that body of rules received as law in England, before any statute was enacted in parliament to alter the same. See **LAW**.

**COMMON-PLACE BOOK**, is a register of what things occur, worthy to be noted, in the course of a man's thinking or study, so disposed, as that, among a number of subjects, any one may be easily found. The advantages of making a common-place book are many: it not only makes a man read with accuracy and attention, but induces him insensibly to think for himself, provided he considers it not so much as a register of sentiments that strike him in the course of reading, but as a register of his own thoughts upon various subjects. Many valuable thoughts occur even to men of no extraordinary genius. These, without the assistance of a common place-book, are generally lost

both to himself and others. There are various methods of arranging common-place books; that of Mr Locke is as good as any that have hitherto been contrived.

The first page of the book you intend to take down their *common-place* in, is to serve as a kind of index to the whole; and to contain references to every place or matter therein: in the commodious contrivance of which index, so as it may admit of a sufficient copia or variety of materials, without any confusion, all the secret of the method consists.

In order to this, the first page, as already mentioned, or, for more room, the two first pages that front each other, are to be divided, by parallel lines, into 25 equal parts; whereof, every fifth line to be distinguished, by its colour or other circumstance. These lines are to be cut perpendicularly by others, drawn from top to bottom; and in the several spaces thereof, the several letters of the alphabet, both capital and minuscule, are to be duly wrote.

The form of the lines and divisions, both horizontal and perpendicular, with the manner of writing the letters therein, will be conceived from the following specimen; wherein, what is to be done in the book for all the letters of the alphabet, is here shewn in the first four, *A, B, C, and D*.

A	a	C	a
	e		e
	i		i
	o		o
	u		u
B	a	D	a
	e 2. 3		e
	i		i
	o		o
	u		u

The index of the *common-place* book thus formed, matters are ready for the taking down any thing therein.

In order to this, consider to what head the thing you would enter is most naturally referred; and under which one would be led to look for such a thing: in this head, or word, regard is had to the initial letter, and the first vowel that follows it; which are the characteristic letters whereon all the use of the index depends.

Suppose, (*e. gr.*) I would enter down a passage that refers to the head *Beauty*; *B*, I consider, is the initial letter; and *e* the first vowel: then, looking upon the index for the partition *B*, and therein the line *e*, (which is the place for all words whose first letter is *B*, and first vowel *e*; as *Beauty*, *Benevolence*, *Bread*, *Breeding*, *Blemishes*,) and finding no numbers already down to direct me to any page of the book where words of this characteristic have been entered, I turn forward to the first blank page I find,

which, in a fresh book, as this is supposed to be, will be page 2, and here write what I have occasion for on the head *Beauty*; beginning the head in the margin, and indenting all the other subservient lines, that the head may stand out and shew itself: this done, I enter the page where it is wrote, *viz.* 2, in the index, in the space, *B e*; from which time, the class *B e* becomes wholly in possession of the 2d and 3d pages, which are assigned to letters of this characteristic.

Had I found any page or number already entered in the space *B e*, I must have turned to the page, and have wrote my matter in what room was left therein: so, if after entering the passage on *beauty*, I should have occasion for *benevolence*, or the like, finding the number 2 already possessed of the space of this characteristic, I begin the passage on *benevolence* in the remainder of the page, which not containing the whole, I carry it on to page 3, which is also for *B e*; and add the number 3 in the index.

**COMMON PLEAS** is one of the king's courts now held constantly

constantly in Westminster hall, but in former times was moveable.

All civil causes, as well real as personal, are, or were formerly, tried in this court, according to the strict law of the land. In personal and mixed actions it has a concurrent jurisdiction with the king's bench, but has no cognizance of pleas of the crown. The actions belonging to the court of common pleas come thither by original, as arrests and outlawries; or by privilege, or attachment for or against privileged persons; or out of inferior courts, not of record, by *pone*, *recordari*, *accedas ad curiam*, writ of false judgment, &c. The chief judge of this court is called lord chief justice of the common pleas, who is assisted by three other judges: the other officers of the court are the *custos breviarum*, who is the chief clerk; three prothonotaries, and their secondaries; the clerk of the warrants, clerk of the effoins, fourteen filazers, four exigentors, a clerk of the juries, the chirographer, the clerk of the king's sewer, clerk of the treasury, clerk of the seal, clerk of the outlawries, clerk of the enrolment of fines and recoveries, and clerk of the errors.

**COMMON**, in law, that soil, the use of which is common to this or that town or lordship. There is common of pasture for cattle, and also common of fishing, common of estovers, common of turbary, &c.

**COMMON PRAYER** is the liturgy in the church of England. Clergymen are to use the public form of prayers prescribed by the Book of Common Prayer; and refusing to do so, or using any other public prayers, are punishable by 1 Eliz. c. ii.

**COMMON**, in grammar, denotes the gender of nouns, which are equally applicable to both sexes: thus *patrens*, a parent, is of the common gender.

**COMMON**, in geometry, is applied to an angle, line, or the like, which belongs equally to two figures.

**COMMON DIVISOR**, a quantity or number which exactly divides two or more other quantities or numbers, without leaving any remainder.

**COMMONER**, or **GENTLEMAN COMMONER**, in the universities, a student entered in a certain rank.

**COMMONS**, or **HOUSE OF COMMONS** a denomination given to the lower house of parliament. See **PARLIAMENT**.

**COMMONS**, or **COMMONALTY**, likewise signifies the whole body of the people under the degree of a baron, whether knights, gentlemen, burgesses, yeomen, &c.

**Doctors Commons**, See **COLLEGE of civilians**.

**Proctor of the Commons**. See **PROCTOR**.

**COMMONTY**, in Scots law, sometimes signifies lands belonging to two or more common proprietors; sometimes a heath or muir though it should belong in property to one, if there has been a promiscuous possession upon it by pasturage; and the act 1695 mentions *commonties* belonging in property to the king and to royal boroughs. See title, *Obligations arising from consent*.

**COMMONWEALTH**. See **REPUBLIC**.

**COMMUNICATION**, in a general sense, the act of imparting something to another.

**COMMUNICATION** is also used for the connection of one

thing with another, or the passage from one place to another: thus a gallery is a communication between two apartments.

**COMMUNICATION of idioms**, in theology, the act of imparting the attributes of one of the natures in Jesus Christ to the other.

**COMMUNICATION of motion**, the act whereby a body at rest is put into motion by a moving body; or, it is the acceleration of motion in a body already moving. See **MECHANICS**.

**Lines of COMMUNICATION**, in military matters, trenches made to continue and preserve a safe correspondence between two forts or posts; or at a siege, between two approaches, that they may relieve one another.

**COMMUNION**, in matters of religion, the being united in doctrine and discipline; in which sense of the word, different churches are said to hold communion with each other.

In the primitive christian church, every bishop was obliged, after his ordination, to send circular letters to foreign churches, to signify that he was in communion with them. The three grand communions into which the Christian church is at present divided, is that of the church of Rome, the Greek church, and the Protestant church: but originally all Christians were in communion with each other, having one common faith and discipline.

**COMMUNION** is also used for the act of communicating in the sacrament of the eucharist, or the Lord's supper. See **RELIGION**.

**COMMUNION SERVICE**, in the liturgy of the church of England, the office for the administration of the holy sacrament, extracted from several ancient liturgies, as those of St Basil, St Ambrose, &c.

By the last rubric, part of this service is appointed to be read every Sunday and holyday, after the morning prayer, even though there be no communicants.

**COMMUNITY**, a society of men living in the same place, under the same laws, the same regulations, and the same customs.

**COMMUTATION**, in law, the change of a penalty or punishment from a greater to a less; as when death is commuted for banishment, &c.

**COMORIN**, or **CAPE COMORIN**, the most southerly promontory of the hither India, lying north-west of the island of Ceylon.

**COMPACT**, in physiology, is said of bodies which are of a close, dense, and heavy texture, with few pores, and very small.

**COMPANY**, in a commercial sense, is a society of merchants, mechanics, or other traders, joined together in one common interest.

When there are only two or three joined in this manner, it is called a partnership; the term *company* being restrained to societies consisting of a considerable number of members, associated together by a charter obtained from the prince.

The mechanics of all corporations, or towns incorporated, are thus erected into companies, which have charters of privileges and large immunities.

We

We shall here give some account of the principal companies of merchants, some of which trade with joint stocks, and all of them enjoy by charter many exclusive privileges: for however injurious these companies may, at this time of day, be reckoned to the nation in general, yet it is certain, that they were the original parents of all our foreign commerce: private traders upon their own bottom being discouraged from hazarding their fortunes in foreign countries, till the methods of traffic had been settled by joint-stock companies: and from this very principle it is, that we find several nations at present endeavouring to extend their trade by the same means. The most ancient trading company, in Britain, is the Hamburgh company, originally called merchants of the staple, and afterwards merchant-adventurers: they were incorporated by king Edward IV. from which time they traded with success till the reign of queen Elizabeth, who, for a farther encouragement of their industry, not only confirmed, but enlarged their privileges. However, it ought to be observed, that this trade is now open to private merchants, upon paying a very small sum to the company. The company of this kind, next incorporated, was that of the Russia-merchants; who having improved their trade and commerce in those remote parts, were incorporated by Edward VI. greatly encouraged by queen Mary, and had their confirmation, with an enlargement of their privileges, from Elizabeth. This company is not very considerable at present; the trade of those parts being mostly carried on by private merchants, on paying the sum of 5*l.* to the company.

The Eastland-company, formerly called merchants of Elbin, were incorporated by queen Elizabeth, and by her greatly encouraged; but, like the former company, it is now become inconsiderable, the trade of Norway and Sweden being laid open by act of parliament.

The Turkey, or Levant-company, was likewise incorporated by the same prince, and its charter confirmed and enlarged by king James I. who empowered them to trade to the Levant, or eastern parts of the Mediterranean; particularly to Smyrna, Aleppo, Alexandria, Grand-Cairo, and the other parts of the Turkish dominions. But this trade is now also laid open to private merchants, upon paying a small consideration.

The next in order is the East-India company, first incorporated in the year 1600, and empowered to trade to all countries lying eastward of the cape of Good Hope. Towards the end of king William's reign, an act of parliament passed, granting all private merchants, who should raise a certain sum for the supply of the government, the privilege of trading to these parts. Accordingly, a great many subscribed, and were called the new East-India-company; which soon found it necessary to unite with the old one, and trade with one joint stock: since which time, they have been styled the united East-India-company; and are at present in a flourishing condition, and in possession of many considerable forts and factories on the coast of

Malabar, the Coromandel-coast, the bay of Bengal, &c.

The royal African-company was first erected in the year 1661, with an exclusive privilege to trade from cape Blanc, on the coast of Africa, in 20° N. lat. as far as the cape of Good Hope. But this trade is now laid open by act of parliament.

The Eastland-company, the Greenland-company, the Hudson's-bay company, the South-sea-company, have likewise their several charters and privileges for trading to the places from which they take their denominations.

These are the principal trading company's belonging to the crown of Great Britain; and of a similar nature are the Dutch East and West India companies, the French East and West India companies, &c.

Concerning these companies, it may be proper to remark, that however necessary they might be in the infancy of trade, they are now looked upon by most men in the light of monopolies: hence it is, that their privileges have from time to time been lessened, in order to establish an absolutely free and general trade; and experience hath shewn, that the trade of the nation has advanced in proportion as monopolies have been laid aside. Indeed, to carry on trade with distant countries, where forces and forts are to be maintained, a company with a joint stock seems necessary; or, at least, certain duties ought to be paid by all who trade thither, towards defraying the said expenses: for not to speak of the East-India, Hudson's bay, &c. companies, the expence of maintaining whole forts must be very considerable, even the Turkey, Hamburgh, Muscovy, and Eastland companies, which do not trade with a joint stock, are nevertheless obliged to be at considerable charges, in making presents to the grand seignior and his ministers, maintaining consuls, &c. It would therefore be injustice that any should trade to the places within their charters, without paying the same duties towards the company's charge, as the present adventurers pay; but then there appears to be no reason why any of the king's subjects should be barred from trading to those places, or forced to pay a great fine for admission, that are willing to pay the company's duties, and submit to their regulations and orders in other respects.

On the whole, as all restrictions of trade are found to be hurtful, nothing can be more evident than that no company whatsoever, whether they trade in a joint stock, or only under regulation, can be for the public good, except it may be easy for all or any of his majesty's subjects to be admitted into all or any of the said companies, at any time, and for a very inconsiderable fine.

COMPANY, in military affairs, a small body of foot, commanded by a captain, who has under him a lieutenant and ensign.

The number of centinels or private soldiers in a company, may be from 50 to 80; and a battalion consists of thirteen such companies, one of which is always grenadiers, and posted on the right: next them stand the eldest company, and on the left the second company;

the youngest one being always posted in the centre.

Companies not incorporated into regiments are called irregulars, or independent companies.

*Artillery Company.* See ARTILLERY.

*COMPANY of ships.* a fleet of merchantmen, who make a charter party among themselves; the principal conditions whereof usually are, that certain vessels shall be acknowledged admiral, vice-admiral, and rear-admiral; that such and such signals shall be observed; that those which bear no guns, shall pay so much *per cent.* of their cargo; and in case they be attacked, that what damages are sustained, shall be reimbursed by the company in general. In the Mediterranean, such companies are called *conserves*.

*COMPARATIVE ANATOMY*, is that branch of anatomy which considers the secondary objects, or the bodies of other animals; serving for the more accurate distinctions of several parts, and supplying the defect of human subjects.

It is otherwise called the anatomy of beasts, and sometimes *zootomy*; and stands in contradistinction to human anatomy, or that branch of the art which considers the human body, the primary object of anatomy. See ANATOMY.

*COMPARATIVE DEGREE*, among grammarians, that between the positive and superlative degrees, expressing any particular quality above or beneath the level of another.

*COMPARISON*, in a general sense, the consideration of the relation between two persons or things, when opposed and set against each other, by which we judge of their agreement or difference.

Instruction is the principal, but not the only end of comparison. It may be employed with success in putting a subject in a strong point of view. A lively idea is formed of a man's courage by likening it to that of a lion; and eloquence is exalted in our imagination by comparing it to a river overflowing its bank, and involving all in its impetuous course. The same effect is produced by contrast: A man in prosperity becomes more sensible of his happiness, by comparing his condition with that of a person in want of bread. Thus comparison is subservient to poetry as well as to philosophy.

Comparisons serve two purposes: when addressed to the understanding, their purpose is to instruct; when to the heart, their purpose is to please. Various means contribute to the latter: first, the suggesting some unusual resemblance or contrast; second, the setting an object in the strongest light; third, the associating an object with others that are agreeable; fourth, the elevating an object; and, fifth, the depressing it. And that comparisons may give pleasure by these various means, will be made evident by examples, which shall be given, after premising some general observations.

Objects of different senses cannot be compared together; for such objects are totally separated from each other, and have no circumstance in common to admit either resemblance or contrast. Objects of hearing may be compared together, as also of taste, of

smell, and of touch: but the chief fund of comparison are objects of sight; because, in writing or speaking, things can only be compared in idea; and the ideas of sight are more distinct and lively than those of any other sense.

When a nation emerging out of barbarity begins to think of the fine arts, the beauties of language cannot long lie concealed; and when discovered, they are generally, by the force of novelty, carried beyond all bounds of moderation. Thus, in the earliest poems of every nation, we find metaphors and similes founded on the slightest and most distant resemblances, which, losing their grace with their novelty, wear gradually out of repute; and now, by the improvement of taste, no metaphor nor simile is admitted into any polite composition but of the most striking kind. To illustrate this observation, a specimen shall be given afterward of such metaphors as we have been describing: with respect to similes take the following specimen.

"Behold, thou art fair, my love: thy hair is as a  
"flock of goats that appear from Mount Gilead: thy  
"teeth are like a flock of sheep from the washing, e-  
"very one bearing twins: thy lips are like a thread  
"of scarlet: thy neck like the tower of David built  
"for an armoury, whereon hang a thousand shields of  
"mighty men: thy two breasts like two young roes  
"that are twins, which feed among the lilies: thy  
"eyes like the fish-pools in Heshbon, by the gate of  
"Bath-rabbin: thy nose like the tower of Lebanon,  
"looking toward Damascus." *Song of Solomon.*

"Thou art like snow on the heath; thy hair like  
"the mist of Cronia, when it curls on the rocks and  
"shines to the beam of the west: thy breasts are like  
"two smooth rocks seen from Branno of the streams:  
"thy arms like two white pillars in the hall of the  
"mighty Fingal." *Fingal.*

It has no good effect to compare things by way of simile that are of the same kind; nor to contrast things of different kinds.

A numerous brigade hasten'd: as when bands  
Of pioneers with spade and pick-ax arm'd,  
Forcun the royal camp to trench a field  
Or cast a rampart.

*Milton.*

The following is of things contrasted that are of different kinds.

*Queen.* What, is my Richard both in shape and  
mind

Transform'd and weak? Hath Bolingbroke depos'd  
Thine intellect? Hath he been in thy heart?  
The lion, dying, thrusteth forth his paw,  
And wounds the earth, if nothing else, with rage  
To be o'erpower'd: and wilt thou, pupil like,  
Take thy correction mildly, kiss the rod,  
And fawn on rage with base humility?

*Richard II. act 5. sc. 1.*

This comparison has scarce any force: a man and a lion are of different species, and therefore are proper subjects for a simile; but there is no such resemblance between them in general, as to produce any strong effect by contrasting particular attributes or circumstances.

A third general observation is, That abstract terms

can

can never be the subject of comparison, otherwise than by being personified. Shakespear compares adversity to a toad, and slander to the bite of a crocodile; but in such comparisons these abstract terms must be imagined sensible beings.

To have a just notion of comparisons, they must be distinguished into two kinds; one common and familiar, as where a man is compared to a lion in courage, or to a horse in speed; the other more distant and refined, where two things that have in themselves no resemblance or opposition, are compared with respect to their effects. There is no resemblance between a flower-plot and a cheerful song; and yet they may be compared with respect to their effects, the emotions they produce in the mind being extremely similar. There is as little resemblance between fraternal concord and precious ointment; and yet observe how successfully they are compared with respect to the impressions they make.

"Behold, how good and how pleasant it is for  
"brethren to dwell together in unity. It is like the  
"precious ointment upon the head, that ran down  
"upon Aaron's beard, and descended to the skirts of  
"his garment." *Psalms 133.*

For illustrating this sort of comparison, we shall add some more examples:

"Delightful is thy presence, O Fingal! it is like  
"the sun on Cromla, when the hunter mourns his  
"absence for a season, and sees him between the  
"clouds.

"Did not Ossian hear a voice? or is it the sound  
"of days that are no more? Often, like the even-  
"ing-sun, comes the memory of former times on my  
"soul.

"His countenance is settled from war; and is calm  
"as the evening-beam, that from the cloud of the  
"west looks on Cona's silent vale." *Fingal.*

We now proceed to illustrate by particular instances the different means by which comparisons, whether of the one sort or the other, can afford pleasure; and, in the order above established, we shall begin with such instances as are agreeable by suggesting some unusual resemblance or contrast.

Sweet are the uses of Adversity,  
Which, like the toad, ugly and venomous,  
Wears yet a precious jewel in her head.

*As you like it, act 2. sc. 1.*

See, how the Morning opes her golden gates,  
And takes her farewell of the glorious sun;  
How well resembles it the prime of youth,  
Trim'd like a yonker prancing to his love.

*Second Part Henry VI. act 2. sc. 3.*

Thus they their doubtful consultations dark  
Ended, rejoicing in their matchless chief:  
As when from mountain tops, the dusky clouds  
Ascending, while the North-wind sleeps, o'erspread  
Heav'n's cheerful face, the lowering element  
Scowls o'er the darken'd landscape, snow, and shower;  
If chance the radiant sun with farewell sweet  
Extends his evening-beam, the fields revive,

The birds their notes renew, and bleating herds  
Attest their joy, that hill and valley rings.

*Paradise Lost, book 2.*

None of the foregoing similes tend to illustrate the principal subject: and therefore the chief pleasure they afford must arise from suggesting resemblances that are not obvious: for undoubtedly a beautiful subject introduced to form the simile affords a separate pleasure, which is felt in the similes mentioned, particularly in that cited from Milton.

The next effect of a comparison in the order mentioned, is to place an object in a strong point of view; which effect is remarkable in the following similes.

As when two scales are charg'd with doubtful loads,  
From side to side the trembling balance nods,  
(While some laborious matron, just and poor,  
With nice exactness weighs her woolly store),  
Till pois'd aloft, the resting beam suspends  
Each equal weight; nor this nor that descends:  
So stood the war, till Hector's matchless might,  
With fates prevailing, turn'd the scale of fight.  
Fierce as a whirlwind up the wall he flies,  
And fires his host with loud repeated cries.

*Iliad, b. xii. 521.*

——— Out, out, brief candle!  
Life's but a walking shadow, a poor player,  
That struts and frets his hour upon the stage,  
And then is heard no more.

*Macbeth, act 5. sc. 5.*

O thou Goddess,  
Thou divine nature! how thyself thou blazon'st  
In these two princely boys! they are as gentle  
As zephyrs blowing below the violet,  
Not wagging his sweet head; and yet as rough,  
(Their royal blood inchas'd) as the rud'ft wind,  
That by the top doth take the mountain-pine,  
And make him stoop to th' vale.

*Cymbeline, act 4. sc. 4.*

"Why did not I pass away in secret, like the  
"flower of the rock that lifts its fair head unseen,  
"and strows its withered leaves on the blast?"

*Fingal.*

As words convey but a faint and obscure notion of great numbers, a poet, to give a lively notion of the object he describes with regard to number, does well to compare it to what is familiar and commonly known. Thus Homer compares the Grecian army in point of number to a swarm of bees: in another passage he compares it to that profusion of leaves and flowers which appear in the spring, or of insects in a summer's evening: and Milton,

——— As when the potent rod  
Of Amram's son in Egypt's evil day  
Wav'd round the coast, up call'd a pitchy cloud  
Of locusts, warping on the eastern wind,  
That o'er the realm of impious Pharaoh hung  
Like night, and darken'd all the land of Nile:  
So numberless were those bad angels seen,  
How'ring on wing under the cope of hell,  
Twixt upper, nether, and surrounding fires.

*Paradise Lost, book 1.*  
Such

Such comparisons have, by some writers, been condemned for the lowness of the images introduced: but surely without reason; for, with regard to numbers, they put the principal subject in a strong light.

Milton has a peculiar talent in embellishing the principal subject by associating it with others that are agreeable; which is the third end of a comparison. Similes of this kind have, beside, a separate effect: they diversify the narration by new images that are not strictly necessary to the comparison: they are short episodes, which, without drawing us from the principal subject, afford great delight by their beauty and variety.

He scarce had ceas'd, when the superior fiend  
Was moving toward the shore; his pond'rous shield,  
Ethereal temper, massy, large, and round,  
Behind him cast; the broad circumference  
Hung on his shoulders like the moon, whose orb  
Through optic glass the Tuscan artist views  
At ev'ning from the top of Fesole,  
Or in Valdarno, to descry new lands,  
Rivers, or mountains, in her spotted globe.

*Milton, b. 1.*

As when a vulture on Imaus bred,  
Whose snowy ridge the roving Tartar bounds,  
Dislodging from a region scarce of prey  
To gorge the flesh of lambs, or yearling kids,  
On hills where flocks are fed, flies toward the springs  
Of Ganges or Hydaspes, Indian streams,  
But in his way lights on the barren plains  
Of Sericana, where Chineses drive  
With sails and wind their cany waggons light:  
So on this windy sea of land, the fiend  
Walk'd up and down alone, bent on his prey.

*Milton, b. 3.*

Next of comparisons that aggrandise or elevate. These affect us more than any other sort: the reason of which will be evident from the following instances.

As when a flame the winding valley fills,  
And runs on crackling shrubs between the hills,  
Then o'er the stubble up the mountain flies,  
Fires the high woods, and blazes to the skies,  
This way and that, the spreading torrent roars;  
So sweeps the hero through the wasted shores.  
Around him wide, immense destruction pours,  
And earth is delug'd with the sanguine show'rs.

*Iliad xx. 569.*

Methinks, King Richard and myself should meet  
With no less terror than the elements  
Of fire and water, when their thund'ring shock,  
At meeting tears the cloudy cheeks of heaven.

*Richard II. act 3. sc. 5.*

"As rusheth a foamy stream from the dark shady  
"steep of Cromla, when thunder is rolling above,  
"and dark brown night rests on the hill: so fierce,  
"so vast, so terrible, rush forward the sons of Erin.  
"The chief, like a whale of Ocean followed by all  
"its billows, pours valour forth as a stream, rolling  
"its might along the shore."

*Fingal, b. 1.*

The last article mentioned, is that of lessening or depressing a hated or disagreeable object; which is effectually done by resembling it to any thing low or despicable.

Thus Milton, in his description of the rout of the rebel-angels, happily expresses their terror and dismay in the following simile:

As a herd -

Of goats or timorous flock together throng'd,  
Drove them before him thunder-struck, pursu'd  
With terrors and with furies to the bounds  
And crystal wall of heav'n, which op'ning wide,  
Rowl'd inward, and a spacious gap disclos'd  
Into the wasteful deep; the monitrous sight  
Strook them with horror backward, but far worse  
Urg'd them behind; headlong themselves they threw  
Down from the verge of Heav'n.

*Milton, b. 6.*

By this time the different purposes of comparison, and the various impressions it makes on the mind, are sufficiently illustrated by proper examples. This was an easy work. It is more difficult to lay down rules about the propriety or impropriety of comparisons; in what circumstances they may be introduced, and in what circumstances they are out of place. It is evident, that a comparison is not proper upon every occasion: a man in his cool and sedate moments, is not disposed to poetical flights, nor to sacrifice truth and reality to the delusive operations of the imagination: far less is he so disposed, when oppressed with care, or interested in some important transaction that occupies him totally. On the other hand, it is observable, that a man, when elevated or animated by any passion, is disposed to elevate or animate all his subjects: he avoids familiar names, exalts objects by circumlocution and metaphor, and gives even life and voluntary action to inanimate beings. In this warmth of mind, the highest poetical flights are indulged, and the boldest similes and metaphors relished. But without soaring so high, the mind is frequently in a tone to relish chaste and moderate ornament; such as comparisons that set the principal object in a strong point of view, or that embellish and diversify the narration. In general, when by any animating passion, whether pleasant or painful, an impulse is given to the imagination; we are in that condition disposed to every sort of figurative expression, and in particular to comparisons. This in a great measure is evident from the comparisons already mentioned; and shall be further illustrated by other instances. Love, for example, in its infancy, rousing the imagination, prompts the heart to display itself in figurative language, and in similes:

*Troilus.* Tell me, Apollo, for thy Daphne's love,  
What Cressid is, what Pandar, and what we?  
Her bed is India, there she lies, a pearl:  
Between our Ilium, and where she resides,  
Let it be call'd the wild and wandering flood;  
Ourself the merchant, and this sailing Pandar  
Our doubtful hope, our convoy, and our bark.

*Troilus and Cressida, act 1. sc. 1.*

Again:

Come, gentle Night; come, loving black-brow'd  
Night!

Give me my Romeo; and, when he shall die,  
Take him, and cut him out in little stars,  
And he will make the face of heav'n so fine,

That

That all the world shall be in love with Night,  
And pay no worship to the garish fun.

*Romeo and Juliet, act 3. sc. 4.*

But it will be a better illustration of the present head, to give examples where comparisons are improperly introduced. Similes are not the language of a man in his ordinary state of mind, dispatching his daily and usual work : for that reason, the following speech of a gardener to his servant, is extremely improper :

Go bind thou up yon dangling spricocks,  
Which, like unruly children, make their sire  
Stoop with oppression of their prodigal weight :  
Give some supportance to the bending twigs.  
Go thou, and, like an executioner,  
Cut off the heads of too-fast-growing sprays,  
That look too lofty in our commonwealth :  
All must be even in our government.

*Richard II. act 3. sc. 7.*

The fertility of Shakespear's vein betrays him frequently into this error.

Rooted grief, deep anguish, terror, remorse, despair, and all the severe dispiriting passions, are declared enemies, perhaps not to figurative language in general, but undoubtedly to the pomp and solemnity of comparison. Upon this account, the simile pronounced by young Rutland, under terror of death from an inveterate enemy, and praying mercy, is unnatural :

So looks the pent-up lion o'er the wretch  
That trembles under his devouring paws ;  
And so he walks insulting o'er his prey,  
And so he comes to rend his limbs asunder.  
Ah, gentle Clifford, kill me with thy sword,  
And not with such a cruel threat'ning look.

*Third part Henry VI. act 1. sc. 5.*

A man spent and dispirited after losing a battle, is not disposed to heighten or illustrate his discourse by similes.

*York.* With this we charg'd again ; but out ! alas,  
We bodg'd again ; as I have seen a swan  
With bootless labour swim against the tide,  
And spend her strength with over-matching waves.  
Ah ! hark, the fatal followers do pursue ;  
And I am faint and cannot fly their fury.  
The sands are number'd that make up my life ;  
Here must I stay, and here my life must end.

*Third part Henry VI. act 1. sc. 6.*

Similes thus unseasonably introduced, are finely ridiculed in the *Rehearsal*.

" *Bayes.* Now here she must make a simile.

" *Smith.* Where's the necessity of that, Mr Bayes ?

" *Bayes.* Because she's surprized ; that's a general rule ; you must ever make a simile when you are surprized ; 'tis a new way of writing."

A comparison is not always faultless even where it is properly introduced. A comparison, like other human productions, may fall short of its end ; of which defect instances are not rare even among good writers : and to complete the present subject, it will be necessary to make some observations upon such faulty comparisons. Nothing can be more erroneous than to institute a comparison too faint : a distant resemblance or contrast fa-

tigues the mind with its obscurity, instead of amusing it ; and tends not to fulfil any one end of a comparison. The following similes seem to labour under this defect.

*K. Rich.* Give me the crown.—Here, cousin, seize the crown,

Here, on this side, my hand ; on that side, thine.  
Now is this golden crown like a deep well,  
That owes two buckets, filling one another ;  
The emptier ever dancing in the air,  
The other down, unseen and full of water ;  
That bucket down, and full of tears, am I,  
Drinking my griefs, whilst you mount up on high.

*Richard II. act 4. sc. 3.*

*K. John.* Oh ! cousin, thou art come to set mine eye ;

The tackle of my heart is crack'd and burnt ;  
And all the shrouds wherewith my life should sail,  
Are turned to one thread, one little hair :  
My heart hath one poor string to stay it by,  
Which holds but till thy news be uttered.

*King John, act 5. sc. 10.*

*York.* My uncles both are slain in rescuing me :  
And all my followers to the eager foe  
Turn back, and fly like ships before the wind,  
Or lambs pursu'd by hunger-starved wolves.

*Third part Henry VI. act 1. sc. 6.*

The latter of the two similes is good : the former, because of the faintness of the resemblance, produces no good effect, and crowds the narration with an useless image.

In an epic poem, or in any elevated subject, a writer ought to avoid raising a simile upon a low image, which never fails to bring down the principal subject. In general, it is a rule, that a grand object ought never to be resembled to one that is diminutive, however delicate the resemblance may be : for it is the peculiar character of a grand object to fix the attention, and swell the mind ; in which state, it is disagreeable to contract the mind to a minute object, however elegant. The resembling an object to one that is greater, has, on the contrary, a good effect, by raising or swelling the mind : for one passes with satisfaction from a small to a great object ; but cannot be drawn down, without reluctance, from great to small. Hence the following similes are faulty.

Meanwhile the troops beneath Patroclus' care,  
Invade the Trojans, and commence the war.  
As wasps, provok'd by children in their play,  
Pour from their mansions by the broad highway,  
In swarms the guiltless traveller engage,  
Whet all their stings, and call forth all their rage ;  
All rise in arms, and with a general cry  
Assert their waxen domes and buzzing progeny :  
Thus from the tents the fervent legion swarms,  
So loud their clamours, and so keen their arms.

*Iliad, xvi. 312.*

So burns the vengeful hornet (foul all o'er)  
Repuls'd in vain, and thirfty still of gore ;  
(Hold son of air and heat) on angry wings  
Untam'd, untir'd, he turns, attacks, and stings.

Fir'd with like ardour, fierce Atreides flew,  
And sent his soul with ev'ry lance he threw.

*Iliad*, xvii. 642.

An error opposite to the former, is the introducing a resembling image, so elevated or great as to bear no proportion to the principal subject. Their remarkable disparity, being the most striking circumstance, seizes the mind, and never fails to depress the principal subject by contrast, instead of raising it by resemblance: and if the disparity be exceeding great, the simile takes on an air of burlesque; nothing being more ridiculous than to force an object out of its proper rank in nature, by equalling it with one greatly superior or greatly inferior. This will be evident from the following comparison.

Loud as a bull makes hill and valley ring,  
So roar'd the lock when it releas'd the spring.

*Odyssey*, xxi. 51.

Such a simile upon the simplest of all actions, that of opening a lock, is pure burlesque.

A writer of delicacy will avoid drawing his comparisons from any image that is nauseous, ugly, or remarkably disagreeable; for however strong the resemblance may be, more will be lost than gained by such comparison. Therefore we cannot help condemning, though with some reluctance, the following simile, or rather metaphor.

O thou fond many! with what loud applause  
Did'st thou beat heav'n with blessing Bolingbroke  
Before he was what thou would'st have him be?  
And now being trimm'd up in thine own desires,  
Thou, beastly feeder, art so full of him,  
That thou provok'st thyself to cast him up.  
And so, thou common dog, didst thou disgorge  
Thy glutton bosom of the royal Richard,  
And now thou would'st eat thy dead vomit up,  
And howl'st to find it.

*Second part Henry IV.* act 1. sc. 6.

The strongest objection that can lie against a comparison is, that it consists in words only, not in sense. Such false coin, or bastard wit, does extremely well in burlesque; but is far below the dignity of the epic, or of any serious composition:

The noble sister of Poplicola,  
The moon of Rome; chaste as the icicle  
That's curdled by the frost from purest snow,  
And hangs on Dian's temple.

*Coriolanus*, act 5. sc. 3.

There is evidently no resemblance between an icicle, and a woman, chaste or unchaste: but chastity is cold in a metaphorical sense, and an icicle is cold in a proper sense; and this verbal resemblance, in the hurry and glow of composing, has been thought a sufficient foundation for the simile. Such phantom similes are mere witticisms, which ought to have no quarter, except where purposefully introduced to provoke laughter. Lucian, in his dissertation upon history, talking of a certain author, makes the following comparison, which is verbal merely.

"This author's descriptions are so cold, that they  
"surpass the Caspian snow, and all the ice of the  
"north."

—But for their spirits and souls  
This word *rebellion* had froze them up  
As fish are in a pond.

*Second part Henry IV.* act 1. sc. 3.

Pope has several similes of the same stamp.  
And hence one master passion in the breast,  
Like Aaron's serpent swallows up the rest.

*Epist.* 2. l. 131.

And again, talking of this same ruling or master passion:  
Nature its mother, Habit is its nurse;  
Wit, spirit, faculties, but make it worse;  
Reason itself but gives it edge and pow'r;  
As heav'n's blest beam turns vinegar more sour.

*Ibid.* l. 145.

Where the subject is burlesque or ludicrous, such similes are far from being improper. Horace says pleasantly,

*Quamquam tu levior cortice.*

*L.* 3. *od.* 9.

And Shakespear,

In breaking oaths he's stronger than Hercules.

And this leads to observe, that besides the foregoing comparisons, which are all serious, there is a species, the end and purpose of which is to excite gaiety or mirth. Take the following examples.

Falstaff, speaking to his page:

"I do here walk before thee, like a sow that hath  
"overwhelmed all her litter but one."

*Second part Henry IV.* act 1. sc. 10.

"I think he is not a pick-purse, nor a horse steal-  
"er; but for his verity in love, I do think him as  
"concave as a cover'd goblet, or a worm-eaten nut."

*As you like it*, act 3. sc. 10.

This sword a dagger had his page,  
That was but little for his age;  
And therefore waited on him so,  
As dwarfs upon knights-errant do.

*Hudibras*, canto 1.

"Books, like men, their authors, have but one  
"way of coming into the world; but there are ten  
"thousand to go out of it, and return no more."

*Tale of a Tub.*

"The most accomplished way of using books at  
"present is, to serve them as some do lords, learn  
"their titles, and then brag of their acquaintance."

*Ibid.*

"He does not consider, that sincerity in love is as  
"much out of fashion as sweet snuff; no body takes  
"it now."

*Careless Husband.*

COMPARISON *of ideas*, that operation of the mind whereby it compares its ideas one with another, in regard of extent, degree, time, place, or any other circumstance, and is the ground of relations.

COMPARISON, in grammar, the inflection of the comparative degree.

COMPARTITION, in architecture, denotes the useful and graceful disposition of the whole ground-plot of an edifice, into rooms of office, and of reception or entertainment.

COMPARTMENT, in general, is a design composed of

of several different figures, disposed with symmetry, to adorn a parterre, a ceiling, &c.

A compartment of tiles, or bricks, is an arrangement of them, of different colours, and varnished, for the decoration of a building. Compartments, in gardening, are an assemblage of beds, plats, borders, walks, &c. disposed in the most advantageous manner that the ground will admit of. Compartments, in heraldry, are otherwise called partitions.

**COMPASS**, or *mariner's COMPASS*, an instrument whereby the ship's course is determined. See **NAVIGATION**.

*Azimuth COMPASS*. See **NAVIGATION**.

**COMPASS dials**, are small horizontal dials, fitted in brass or silver boxes, for the pocket, to shew the hour of the day, by the direction of a needle, that indicates how to place them right, by turning the dial about, till the cock or style stand directly over the needle, and point to the northward: but these can never be very exact, because of the variations of the needle itself. See **DIALING**.

**COMPASSES**, or *pair of COMPASSES*, a mathematical instrument for describing circles, measuring figures, &c.

The common compasses consist of two sharp-pointed branches, or legs, of iron, steel, brass, or other metal, joined at top by a rivet, whereon they move as on a centre.

The principal perfection of this, as of all other compasses, consists in the easy and uniform opening and shutting of their legs; one of which may be taken out, in order to make room for others.

There are now used compasses of various kinds and contrivances, accommodated to the various uses they are intended for.

**COMPEIGN**, a city of France, situated on the river Oyse, about forty-five miles north-east of Paris: E. long.  $3^{\circ}$ , N. lat.  $49^{\circ} 30'$ .

**COMPENDIUM**, in matters of literature, denotes much the same with epitome or abridgment. See **ABRIDGMENT**.

**COMPENSATION**, in a general sense, an action whereby any thing is admitted as an equivalent to another.

**COMPENSATION**. Where the same person is debtor and creditor to another, the mutual obligations, if they are for equal sums, are extinguished by compensation; if for unequal, the lesser obligation is extinguished, and the greater diminished, as far as the concurrence of debt and credit goes. See **SCOTS LAW**, title, *Extinction of obligations*.

**COMPETENCE**, or **COMPETENCY**, in law, the right or authority of a judge, for taking cognizance of any matter.

**COMPETITION**, in Scots law; In escheats, see title, *Casualties due to the superior*: In confirmations by the superior, in resignations, and in personal rights of lands, see title, *Of transmutation of rights by confirmation*: In inhibitions, in adjudications, amongst assignees, arresters, and pinders, see title, *Inhibitions, adjudications, assignations, arrestments, and*

*pindings*: Amongst creditors of a defunct, see title, *Succession in moveables*.

**COMPITALIA**, or **COMPITALITIA**, in Roman antiquity, feasts instituted by Servius Tullius in honour of the Lares. See **LARES**.

These feasts were observed on the 12th of January, and 6th of March.

**COMPLEMENT**, in geometry, is what remains of a quadrant of a circle, or of  $90^{\circ}$ , after any certain arch has been taken away from it. Thus, if the arch taken away be  $40^{\circ}$ , its complement is  $50$ : because  $50 + 40 = 90$ . The sine of the complement of an arch is called the co-sine, and that of the tangent the co-tangent, &c.

**COMPLEX**, in a more general sense, a term synonymous with compound; though, in strictness of speech, there is some difference. See **COMPOUND**.

**COMPLEX terms**, or *ideas*, in logic, are such as are compounded of several simple ones. See **TERM**, and **IDEA**.

**COMPLEXION**, among physicians, the temperament, habitude, and natural disposition of the body, but more often the colour of the face and skin.

**COMPLEXUS**, in anatomy. See Vol. I. p. 216.

**COMPLEXUS minor**, in anatomy. See Vol. I. p. 216.

**COMPLICATION**, in general, denotes the blending, or rather interweaving, of several different things together: thus a person afflicted with several disorders at the same time, is said to labour under a complication of diseases.

**COMPOUND**, **COMPOSE**, or **GOBONY**, in heraldry, is said of a bordure made up of angular parts, or chequers, of two different colours. See Plate LXV. fig. 13.

**COMPOSITE**, in general, denotes something compounded, or made up of several others united together. Thus,

**COMPOSITE numbers**, are such as can be measured exactly by a number exceeding unity; as 6 by 2 or 3, or 10 by 5, &c. so that 4 is the lowest composite number.

**COMPOSITE order**, in architecture. See Vol. I. p. 352.

**COMPOSITION**, in a general sense, the uniting or putting together several things, so as to form one whole, called a compound.

**COMPOSITION of ideas**, an act of the mind, whereby it unites several simple ideas into one conception or complex idea.

When we are provided with a sufficient stock of simple ideas, and have by habit and use rendered them familiar to our minds, they become the component parts of other ideas still more complicated, and form what we may call a second order of compound notions. This process may be continued to any degree of composition we please, mounting from one stage to another, and enlarging the number of combinations.

**COMPOSITION**, in grammar, the joining of two words together; or prefixing a particle to another word, to augment, diminish, or change its signification.

**COMPOSITION**, in logic, a method of reasoning, where-

by

by we proceed from some general self-evident truth, to other particular and singular ones.

In disposing and putting together our thoughts, there are two ways of proceeding, equally within our choice: for we may so propose the truths, relating to any part of knowledge, as they presented themselves to the mind, in the manner of investigation; carrying on the series of proofs in a reverse order, till they, at last, terminate in first principles: or beginning with these principles, we may take the contrary way, and from them deduce, by a direct train of reasoning, all the several propositions we want to establish.

This diversity, in the manner of arranging our thoughts, gives rise to the twofold division of method established among logicians; the one called analytic method, or the method of resolution, inasmuch as it traces things back to their source, and resolves knowledge into its first and original principles. This method stands in contradistinction to the method of composition; or, as it is otherwise called, the synthetic method: for here we proceed by gathering together the several scattered parts of knowledge, and combining them into one system, in such a manner, as that the understanding is enabled distinctly to follow truth through all the different stages of gradation.

COMPOSITION, in music, the art of disposing musical sounds into airs, songs, &c. either in one or more parts, to be sung by a voice, or played on instruments. See MUSIC, and SONG.

Under composition are comprehended the rules,  
1. Of melody, or the art of making a single part; that is, contriving and disposing the simple sounds, so as that their succession and progression may be agreeable to the ear. See MELODY.

2. Of harmony, or the art of disposing and concerting several single parts together, so as that they make one agreeable whole. See HARMONY.

COMPOSITION, in literature, the art of forming and arranging sentiments, and cloathing them with language suitable to the nature of the subject or discourse. We shall first give a few thoughts on original composition; and, 2dly, by way of example, unfold the nature of epic and dramatic compositions.

#### 1. On Original Composition.

The mind of a man of genius is a fertile and pleasant field; pleasant as *Elysium*, and fertile as *Tempe*; it enjoys a perpetual spring. Of that spring, *originals* are the fairest flowers: *imitations* are of quicker growth, but fainter bloom. *Imitations* are of two kinds; one of nature, one of authors: the first we call *originals*, and confine the term *imitation* to the second. We shall not enter into the curious inquiry of what is, or is not, strictly speaking, *original*, content with what all must allow, that some compositions are more so than others; and the more they are so, the better. *Originals* are, and ought to be, great favourites, for they are benefactors; they extend the republic of letters, and add a new province to its dominion: *imitators* only give us a sort of duplicates of what we had, possibly much better, before;

increasing the mere drug of books, while all that makes them valuable, *knowledge* and *genius*, are at a stand. The pen of an *original* writer, like Armida's wand, out of a barren waste calls a blooming spring: out of that blooming spring an *imitator* is a transplanter of laurels, which sometimes die on removal, always languish in a foreign soil.

But suppose an *imitator* to be most excellent (and such there are), yet still he but nobly builds on another's foundation; his debt is, at least, equal to his glory; which therefore, on the balance, cannot be very great. On the contrary, an *original*, though but indifferent (its *originality* being set aside), yet has something to boast; it is something to say with him in Horace,

*Meo sum pauper in ære;*

and to share ambition with no less than *Cæsar*, who declared he had rather be the first in a village, than the second at Rome.

Still farther: an *imitator* shares his crown, if he has one, with the chosen object of his imitation; an *original* enjoys an undivided applause. An *original* may be said to be of a *vegetable* nature; it rises spontaneously from the vital root of genius; it *grows*, it is not *made*: *imitations* are often a sort of *manufacture* wrought by those *mechanics*, *art* and *labour*, out of pre-existent materials not their own.

Again: we read *imitation* with somewhat of his languor who listens to a twice-told tale: our spirits rouse at an *original*; that is a perfect stranger, and all throng to learn what news from a foreign land: and though it comes, like an Indian prince, adorned with feathers only, having little of weight; yet of our attention it will rob the more solid, if not equally new: thus every telescope is lifted at a new-discovered star; it makes a hundred astronomers in a moment, and denies equal notice to the sun. But if an *original*, by being as excellent, as new; adds admiration to surprize, then are we at the writer's mercy; on the strong wing of his imagination, we are snatched from Britain to Italy, from climate to climate, from pleasure to pleasure; we have no home, no thought, of our own; till the magician drops his pen: and then falling down into ourselves, we awake to flat realities, lamenting the change, like the beggar who dreamt himself a prince.

It is with thoughts, as it is with words; and with both, as with men; they may grow old and die. Words tarnished, by passing through the mouths of the vulgar, are laid aside as inelegant and obsolete. So thoughts, when become too common, should lose their currency; and we should send new metal to the mint, that is, new meaning to the press. The division of tongues at Babel did not more effectually debar men from making themselves a name (as the scripture speaks) than the too great concurrence or union of tongues will do for ever. We may as well grow good by another's virtue, or fat by another's food, as famous by another's thought. The world will pay its debt of praise but once; and instead of applauding, explode a second demand, as a cheat.

If it is said, that most of the Latin classics, and all the Greek, except, perhaps, Homer, Pindar, and Anacreon,

creon, are in the number of *imitators*, yet receive our highest applause; our answer is, that they, though not *real*, are *accidental originals*; the works they imitated, few excepted, are lost: they, on their father's decease, enter as lawful heirs on their estates in fame: the fathers of our copyists are still in possession; and secured in it, in spite of Goths, and flames, by the perpetuating power of the press. Very late must a modern *imitator's* fame arrive, if it waits for their decease.

An *original* enters early on reputation: *fame*, fond of new glories, sounds her trumpet in triumph at its birth; and yet how few are awakened by it into the noble ambition of like attempts? Ambition is sometimes no vice in life; it is always a virtue in composition. High in the towering Alps is the fountain of the Po; high in fame, and in antiquity, is the fountain of an *imitator's* undertaking; but the river, and the imitation, humbly creep along the vale. So few are our *originals*, that, if all other books were to be burnt, the lettered world would resemble some metropolis in flames, where a few incombustible buildings, a fortress, temple, or tower, lift their heads, in melancholy grandeur, amid the mighty ruin. Compared with this conflagration, old Omar lighted up but a small bonfire, when he heated the baths of the barbarians, for eight months together, with the famed Alexandrian library's inextinguishable spoils, that no prophane book might obstruct the triumphant progress of his holy Alcoran round the globe.

But why are originals so few? not because the writer's harvest is over, the great reapers of antiquity having left nothing to be gleaned after them; nor because the human mind's teeming time is past, or because it is incapable of putting forth unprecedented births; but because illustrious examples *engross*, *prejudice*, and *intimidate*. They *engross* our attention, and so prevent a due inspection of ourselves; they *prejudice* our judgment in favour of their abilities, and so lessen the sense of our own; and they *intimidate* us with the splendor of their renown, and thus under diffidence bury our strength. Nature's impossibilities, and those of diffidence, lie wide asunder.

After all, the first ancients had not merit in being *originals*: they could not be *imitators*. Modern writers have a choice to make; and therefore have a merit in their power. They may soar in the regions of *liberty*, or move in the soft fetters of easy *imitation*; and *imitation* has as many plausible reasons to urge, as *pleasure* had to offer to Hercules. Hercules made the choice of an hero, and *so* became immortal.

Yet let not assertors of classic excellence imagine, that we deny the tribute it so well deserves. He that admires not ancient authors, betrays a secret he would conceal, and tells the world, that he does not understand them. Let us be as far from neglecting, as from copying, their admirable compositions: sacred be their rights, and inviolable their fame. Let our understanding feed on theirs; they afford the noblest nourishment: but let them nourish, and annihilate, our own. When we read, let our imagination kindle at their charms; when we write, let our judgment shut them out of our thoughts; treat even Homer himself, as his royal admirer was treated by the cynic; bid him stand aside, nor shade our

Vol. II. No. 40.

3

composition from the beams of our own genius; for nothing *original* can rise, nothing immortal, can ripen, in any other sun.

Must we, then, not imitate ancient authors? Imitate them, by all means; but imitate aright. He that imitates the divine Iliad, does not imitate Homer; but he who takes the same method, which Homer took, for arriving at a capacity of accomplishing a work so great. Tread in his steps to the sole fountain of immortality; drink where he drank, at the true *Helicon*, that is, at the breast of nature. Imitate; but imitate not the *composition*, but the *man*. For may not this paradox pass into a maxim? viz. "The less we copy the renowned ancients, we shall resemble them the more."

But possibly it may be replied, that we must either imitate Homer, or depart from nature. Not so: for suppose you was to change place, in time, with Homer; then, if you write naturally, you might as well charge Homer with an imitation of you. Can you be said to imitate Homer for writing *so*, as you would have written if Homer had never been? As far as a regard to nature, and sound sense, will permit a departure from your great predecessors; so far, ambitiously, depart from them; the farther from them in *similitude*, the nearer are you to them in *excellence*; you rise by it into an *original*; become a noble collateral, not an humble descendant from them. Let us build our compositions with the spirit, and in the taste of the ancients; but not with their materials: thus will they resemble the structures of Pericles at Athens, which Plutarch commends for having had an air of antiquity as soon as they were built. All eminence, and distinction, lies out of the beaten road; excursion, and deviation, are necessary to find it; and the more remote your path from the highway, the more reputable; if, like poor Gulliver, you fall not into a ditch, in your way to glory.

What glory to come near, what glory to reach, what glory (presumptuous thought!) to surpass our predecessors? And is that then in nature absolutely impossible? or is it not rather contrary to nature to fail in it? Nature herself sets the ladder, all wanting is our ambition to climb. For by the bounty of nature we are as strong as our predecessors; and by the favour of time (which is but another round in nature's scale) we stand on higher ground. As to the *first*, were they more than men? or are we less? Are not our minds cast in the same mould with those before the flood? The flood affected matter: mind escaped. As to the *second*; though we are moderns, the world is an ancient; more ancient far, than when they, whom we most admire, filled it with their fame. Have we not their beauties, as stars, to guide; their defects, as rocks, to be shunned; the judgment of ages on both, as a chart to conduct, and a sure helm to steer us in our passage to greater perfection than theirs? And shall we be slopt in our rival pretensions to fame by this just reproof?

*Stat contra, dicitque tibi tua pagina, Fur es.*

MART.

It is by a sort of noble contagion, from a general familiarity with their writings, and not by any particular sordid theft, that we can be the better for those who

†

3 S

went

went before us. Hope we, from plagiarism, any dominion in literature; as that Rome rose from a nest of thieves?

Rome was a powerful ally to many states; ancient authors are our powerful allies; but we must take heed, that they do not succour till they enslave, after the manner of Rome. Too formidable an idea of their superiority, like a spectre, would fright us out of a proper use of our wits; and dwarf our understanding, by making a giant of theirs. Too great awe for them lays genius under restraint, and denies it that free scope, that full elbow-room, which is requisite for striking its most masterly strokes. Genius is a master-workman, learning is but an instrument, and an instrument, though most valuable, yet not always indispensable. Heaven will not admit of a partner in the accomplishment of some favourite spirits; but rejecting all human means, assumes the whole glory to itself. Have not some, though not famed for erudition, *so* written, as almost to persuade us, that they shone brighter, and soared higher, for escaping the boasted aid of that proud ally?

Nor is it strange; for what, for the most part, mean we by genius, but the power of accomplishing great things without the means generally reputed necessary to that end? A *genius* differs from a *good understanding*, as a magician from a good architect; *that* raises his structure by means invisible; *this* by the skilful use of common tools. Hence genius has ever been supposed to partake of something divine.

Learning, destitute of this superior aid, is fond, and proud of what has cost it much pains; is a great lover of rules, and boaster of famed examples. As beauties less perfect, who owe half their charms to cautious art, learning inveighs against natural unstudied graces, and small harmless inaccuracies, and sets rigid bounds to that liberty to which genius often owes its supreme glory; but the no genius its frequent ruin. For unprescribed beauties, and unexampled excellence, which are characteristics of *genius*, lie without the pale of *learning's* authorities, and laws; which pale, genius must leap to come at them: but by that leap, if genius is wanting, we break our necks; we lose that little credit, which possibly we might have enjoyed before. For rules, like crutches, are a needful aid to the lame, though an impediment to the strong. A Homer casts them away; and, like his Achilles,

*Jura negat sibi nata, nihil non arrogat,*  
by native force of mind. There is something in poetry beyond prose-reason; there are mysteries in it not to be explained, but admired; which render mere prose-men infidels to their divinity. And here may be offered a second paradox: *viz.* "*Genius* often then deserves most to be praised, when it is most sure to be condemned; that is, when its excellence, from mounting high, to weak eyes is quite out of sight."

If we might speak farther of learning and genius, we would compare genius to virtue, and learning to riches. As riches are most wanted where there is least virtue; so learning where there is least genius. As virtue without much riches can give happiness; so genius without much learning can give renown. As it is said in Terence,

*pecuniam negligere interdum maximum est lucrum;*  
so to neglect of learning, genius sometimes owes its greater glory. Genius, therefore, leaves but the second place, among men of letters, to the learned. It is their merit, and ambition, to throw light on the works of genius, and point out its charms. We most justly reverence their informing radius for that favour; but we must much more admire the radiant stars pointed out by them.

A star of the first magnitude among the moderns was Shakespeare; among the ancients, Pindar; who, (as Voilius tells us) boasted of his no-learning, calling himself the eagle; for his flight above it. And such geni as these may, indeed, have much reliance on their own native powers. For genius may be compared to the natural strength of the body; learning to the superinduced countreiments of arms: if the first is equal to the proposed exploit, the latter rather encumbers, than assists; rather retards, than promotes, the victory. *Sacer nobis inest Deus*, says Seneca. With regard to the moral world, *conscience*, with regard to the intellectual, *genius*, is that god within. Genius can set us right in composition, without the rules of the learned; as conscience sets us right in life, without the laws of the land: *this*, singly, can make us good, as men: *that*, singly, as writers, can, sometimes, make us great.

As too great admirers of the fathers of the church have sometimes set up their authority against the true sense of scripture; so too great admirers of the classical fathers have sometimes set up their authority, or example, against reason.

*Neve minor, neu sit quinto productior actu fabula.*  
So says Horace, so says ancient example. But reason has not subscribed. We know but one book that can justify our implicit acquiescence in it: and (by the way) on that book a noble disdāin of undue deference to prior opinion has lately cast, and is still casting, a new and inestimable light.

But, superstition for our predecessors set aside, the classics are for ever our rightful and revered masters in *composition*; and our understandings bow before them. But when? When a master is wanted; which sometimes is not the case. Some are pupils of nature only, nor go farther to school. From such we reap often a double advantage; they not only rival the reputation of the great ancient authors, but also reduce the number of mean ones among the moderns. For when they enter on subjects which have been in former hands, such is their superiority, that, like a tenth wave, they overwhelm, and bury in oblivion all that went before: and thus not only enrich and adorn, but remove a load, and lessen the labour, of the letter'd world.

"But, it may be said, since *originals* can arise from genius only, and since genius is so very rare, it is scarce worth while to labour a point so much, from which we can reasonably expect so little." To show that genius is not so very rare as you imagine, we shall point out strong instances of it, in a far distant quarter from that mentioned above. The minds of the schoolmen were almost as much cloistered as their bodies; they had but little learning, and few books; yet may the most learned be struck  
with

with some astonishment at their so singular natural sagacity, and most exquisite edge of thought. Who would expect to find Pindar and Scotus, Shakespeare and Aquinas, of the same party? Both equally shew an *original*, unimpaired, energy: the *vigor igneus*, and *cælestis origo*, burns in both; and leaves us in doubt whether genius is more evident in the sublime flights and beauteous flowers of poetry, or in the profound penetrations, and marvelously keen and minute distinctions, called the thorns of the schools. There might have been more able consuls called from the plough, than ever arrived at that honour: many a genius, probably, there has been, which could neither write nor read. So that genius, that supreme lustre of literature, is less rare than is generally conceived.

By the praise of genius we detract not from learning; we detract not from the value of gold, by saying that diamond has greater still. He who disregards learning, shows that he wants its aid; and he that overvalues it, shows that its aid has done him harm. Over-valued indeed it cannot be, if genius as to *composition*, is valued more. Learning, we thank; genius, we revere; that gives us pleasure, this gives us rapture; that informs, this inspires; and is itself inspired; for genius is from heaven, learning from man: *this* sets us above the low, and illiterate; *that*, above the learned, and polite. Learning is borrowed knowledge; genius is knowledge innate, and quite our own. Therefore, as Bacon observes, it may take a nobler name, and be called wisdom; in which sense of wisdom, some are born wise.

Having put in a caveat against the most fatal of errors, from the too great indulgence of genius, return we now to that too great suppression of it, which is detrimental to composition; and endeavour to rescue the writer, as well as the man. We have said, that some are born wise; but they, like those that are born rich, by neglecting the cultivation and produce of their own possessions, and by running in debt, may be beggared at last; and lose their reputations, as younger brothers estates, not by being born with less abilities than the rich heir, but at too late an hour.

Many a great man has been lost to himself, and the public, purely because great ones were born before him. Hermias, in his collections on Homer's blindness, says, that Homer requesting the gods to grant him a sight of Achilles, that hero rose, but in armour so bright, that it struck Homer blind with the blaze. Let not the blaze of even Homer's muse darken us to the discernment of our own powers; which may possibly set us above the rank of *imitators*; who, though most excellent, and even immortal, (as some of them are), yet are still but *dii minorum gentium*, nor can expect the largest share of incense, the greatest profusion of praise, on their secondary altars.

But farther still: a spirit of *imitation* hath many ill effects; we shall confine ourselves to three. *First*, It deprives the liberal and politer arts of an advantage which the mechanic enjoy: in these, men are ever endeavouring to go beyond their predecessors; in the former, to follow them. And since copies surpass not their *originals*, as streams rise not higher than their spring, rarely so high; hence, while arts mechanic are in perpe-

tual progress and increase, the liberal are in retrogradation and decay. *These* resemble pyramids, are broad at bottom, but lessen exceedingly as they rise; *those* resemble rivers, which, from a small fountain-head, are spreading ever wider and wider, as they run. Hence it is evident, that different portions of understanding are not (as some imagine) allotted to different periods of time; for we see, in the same period, understanding rising in one set of artists, and declining in another. Therefore *nature* stands absolved, and our inferiority in composition must be charged on ourselves.

Nay, so far are we from complying with a necessity which nature lays us under, that, *secondly*, by a spirit of imitation we counteract nature, and thwart her design. She brings us into the world all *originals*. No two faces, no two minds, are just alike; but all bear nature's evident mark of separation on them. Born *originals*, how comes it to pass that we die *copies*? That meddling *ape imitation*, as soon as we come to years of *indiscretion*, (if we may so speak), snatches the pen, and blots out nature's mark of separation, cancels her kind intention, destroys all mental individuality; the letter'd world no longer consists of singulars, it is a medley, a mass; and a hundred books, at bottom, are but one. Why are monkeys such masters of mimicry? why receive they such a talent at imitation? Is it not as the Spartan slaves received a license for ebriety, that their betters might be ashamed of it?

The *third* fault to be found with a spirit of *imitation* is, that with great incongruity it makes us poor and proud: makes us think little, and write much; gives us huge folios, which are little better than more reputable cushions to promote our repose. Have not some sevenfold volumes put us in mind of Ovid's sevenfold channels of the Nile at the conflagration?

#### *Ostia septem*

*Pulverulenta vacant septem sine flumine valles.*

Such leaden labours are like Lycurgus's iron money, which was so much less in value than in bulk, that it required barns for strong boxes, and a yoke of oxen to draw five hundred pounds.

But notwithstanding these disadvantages of *imitation*, imitation must be the lot (and often an honourable lot it is) of most writers. If there is a famine of *invention* in the land, like Joseph's brethren, we must travel far for food; we must visit the remote and rich ancients: but an inventive genius may safely stay at home; that, like the widow's cruse, is divinely replenished from within, and affords us a miraculous delight. Whether our own genius be such or not, we diligently should inquire, that we may not go a-begging with gold in our purse. For there is a mine in man, which must be deeply dug ere we can conjecture its contents. Another often sees that in us, which we see not ourselves; and may there not be that in us which is unseen by both? That there may, chance often discovers, either by a luckily chosen theme, or a mighty premium, or an absolute necessity of exertion, or a noble stroke of emulation from another's glory; as that on Thucydides from hearing Herodotus repeat part of his history at the Olympic games. Had there been no Herodotus, there might have been no Thucydides, and the world's

world's admiration might have begun at Livy for excellence in that province of the pen. Demosthenes had the same stimulation on hearing Callistratus; or Tully might have been the first of consummate renown at the bar.

Quite clear of the dispute concerning ancient and modern learning, we speak not of performance, but powers. The modern powers are equal to those before them; modern performance in general is deplorably short. How great are the names just mentioned? Yet who will daily affirm, that as great may not rise up in some future, or even in the present age? Reasons there are why talents may not *appear*, none why they may not *exist*, as much in one period as another. An evocation of vegetable fruits depends on rain, air, and sun; an evocation of the fruits of genius no less depends on externals. What a marvellous crop bore it in Greece and Rome? And what a marvellous sunshine did it there enjoy? What encouragement from the nature of their governments, and the spirit of their people? Virgil and Horace owed their divine talents to Heaven; their immortal works to men; thank Mæcenas and Augustus for them. Had it not been for these, the genius of those poets had lain buried in their ashes. Athens expended on her theatre, painting, sculpture, and architecture, a tax levied for the support of a war. Cæsar dropt his papers when Tully spoke; and Philip trembled at the voice of Demosthenes. And has there arisen but one Tully, one Demosthenes in so long a course of years? The powerful eloquence of them both in one stream, should never bear us down into the melancholy persuasion, that several have not been born, though they have not emerged. The sun as much exists in a cloudy day, as in a clear; it is outward, accidental circumstances that with regard to genius either in nation, or age,

*Collectas fugat nubes, solemque reducit.* VIRG.

As great, perhaps greater than those mentioned (presumptuous as it may sound) may, possibly, arise; for, who hath fathomed the mind of man? Its bounds are as unknown, as those of the creation; since the birth of which, perhaps, not one has so far exerted, as not to leave his possibilities beyond his attainments, his powers beyond his exploits. Forming our judgments altogether by what *has* been done, without knowing, or at all inquiring, what possibly *might* have been done, we naturally enough fall into too mean an opinion of the human mind. If a sketch of the divine Iliad before Homer wrote, had been given to mankind, by some superior being, or otherwise, its execution would probably have appeared beyond the power of man. Now, to surpass it, we think impossible. As the first of these opinions would evidently have been a mistake, why may not the second be so too? Both are founded on the same bottom; on our ignorance of the possible dimensions of the mind of man.

Nor are we only ignorant of the dimensions of the human mind in general, but even of our own. That a man may be scarce less ignorant of his own powers, than an oyster of its pearl, or a rock of its diamond; that he may possess dormant, unsuspected abilities, till awakened by loud calls, or stung up by striking emergencies; is evident from the sudden eruption of some men out of perfect obscurity, into public admiration, on the strong

impulse of some animating occasion; not more to the world's great surprise, than their own. Few authors of distinction but have experienced something of this nature, at the first beamings of their yet unsuspected genius on their hitherto dark composition. The writer starts at it, as at a lucid meteor in the night; is much surprised; can scarce believe it true. During this happy confusion, it may be said to him, as to Eve at the lake,

*What there thou see'st, fair creature, is thyself.*

MILTON.

Genius, in this view, is like a dear friend in our company under disguise; who, while we are lamenting his absence, drops his mask, striking us at once with equal surprise and joy. This sensation, which we speak of in a writer, might favour, and so promote, the fable of poetic inspiration. A poet of a strong imagination, and stronger vanity, on feeling it, might naturally enough realise the world's mere compliment, and think himself truly inspired. Which is not improbable; for enthusiasm of all kinds do no less.

Since it is plain, that men may be strangers to their own abilities; and by thinking meanly of them without just cause, may possibly lose a name, perhaps a name immortal; we would find some means to prevent these evils. Whatever promotes virtue, promotes something more, and carries its good influence beyond the *moral* man: to prevent these evils we borrow two golden rules from *ethics*, which are no less golden in *composition*, than in life. 1. *Know thyself*; 2. *Reverence thyself*.

1st, *Know thyself*. Of ourselves it may be said, as Martial says of a bad neighbour,

*'Nil tam prope, proculque nobis.*

Therefore dive deep into thy bosom; learn the depth, extent, bias, and full sort of thy mind; contract full intimacy with the stranger within thee; excite and cherish every spark of intellectual light and heat, however smothered under former negligence, or scattered through the dull, dark mists of common thoughts; and collecting them into a body, let thy genius rise (if a genius thou hast) as the sun from chaos; and if we should then say, like an Indian, *Worship it*, (though too bold) yet should we say little more than the second rule enjoins, viz. *Reverence thyself*.

That is, let not great examples, or authorities, browbeat thy reason into too great a diffidence of thyself: thyself so reverence, as to prefer the native growth of thy own mind to the richest import from abroad; such borrowed riches make us poor. The man who thus reverences himself, will soon find the world's reverence to follow his own. His works will stand distinguished; his the sole property of them; which property alone can confer the noble title of an *author*; that is, of one who, to speak accurately, *thinks*, and *composes*; while other invaders of the press, how voluminous, and learned soever, with due respect be it spoken, only *read* and *write*.

This is the difference between those two luminaries in literature, the well-accomplished scholar, and the divinely-inspired enthusiast; the first is, as the bright morning star; the second, as the rising sun. The writer who neglects those two rules above will never stand alone; he makes

makes one of a group, and thinks in wretched unanimity with the throng. Incombered with the notions of others, and impoverished by their abundance, he conceives not the least embryo of new thought; opens not the least vista through the gloom of ordinary writers, into the bright walks of rare imagination, and singular design; while the true genius is crossing all public roads into fresh untrodden ground, he, up to the knees in antiquity, is treading the sacred footsteps of great examples, with the blind veneration of a bigot saluting the papal toe; comfortably hoping full absolution for the sins of his own understanding, from the powerful charm of touching his idol's infallibility.

Such meanness of mind, such prostration of our own powers, proceeds from too great admiration of others. Admiration has generally a degree of two very bad ingredients in it; of ignorance, and of fear; and does mischief in composition, and in life. Proud as the world is, there is more superiority in it given, than assumed: and its grandees of all kinds owe more of their elevation to the littleness of others minds, than to the greatness of their own. Were not prostrate spirits their voluntary pedestals, the figure they make among mankind would not stand so high. *Imitators and translators* are somewhat of the pedestal-kind, and sometimes rather raise their *original's* reputation, by showing him to be by them inimitable, than their own. Homer has been translated into most languages; Ælian tells us, that the Indians, (hopeful tutors!) have taught him to speak their tongue. What expect we from them? Not Homer's Achilles, but something, which, like Patroclus, assumes his name, and, at its peril, appears in his stead; nor expect we Homer's Ulysses gloriously bursting out of his cloud into royal grandeur, but an Ulysses under disguise, and a beggar to the last. Such is that inimitable father of poetry, and oracle of all the wise, whom Lycurgus transcribed; and for an annual public recital of whose works Solon enacted a law; that it is much to be feared, that his so numerous translations are but as the published testimonials of so many nations, and ages, that this author so divine is untranslated still.

But here,

*Cynthia aurem  
Vellit,*——

VIRG.

and demands justice for his favourite, and ours. Great things he has done; but he might have done greater. What a fall is it from Homer's numbers, free as air, lofty and harmonious as the spheres, into childish shackles, and tinkling sounds! But, in his fall, he is still great;——

*Nor appears  
Less than archangel ruin'd, and the excess  
Of glory obscur'd.*——

MILT.

Had Milton never wrote, Pope had been less to blame: but when in Milton's genius, Homer, as it were, personally rose to forbid Britons doing him that ignoble wrong; it is less pardonable, by that *effeminate* decoration, to put Achilles in petticoats a second time. How much nobler had it been, if his numbers had rolled on in full flow, through the various modulations of masculine melody, into those grandeurs of solemn sound, which are in-

VOL. II. No. 40.

3

dispensibly demanded by the native dignity of heroic song? How much nobler, if he had resisted the temptation, of that Gothic dæmon, which modern poetry tainting, became mortal? O how unlike the deathless, divine harmony of three great names (how justly joined!) of *Milton, Greece, and Rome?* His verse, but for his little speck of mortality, in its extreme parts, as his hero had in his heel; like him, had been invulnerable, and immortal. But, unfortunately, *that* was undipt in Helicon; as *this* in Styx. Harmony as well as eloquence is essential to poetry; and a murder of his music is putting half Homer to death. *Blank* is a term of diminution; what we mean by blank verse is, verse unfallen, uncurs'd; verse reclaimed, reenthroned in the true *language of the gods*; who never thundered, nor suffered their Homer to thunder in rhyme.

But supposing Pope's Iliad to have been perfect in its kind; yet it is a *translation* still; which differs as much from an *original*, as the moon from the sun.

But as nothing is more easy than to write originally wrong; originals are not here recommended, but under the strong guard of the first rule,—*Know thyself*. Lucian, who was an original, neglected not this rule, if we may judge by his reply to one who took some freedom with him. He was at first an apprentice to a statuary; and when he was reflected on as such, by being called *Prometheus*, he replied, "I am indeed the inventor of a new work, the model of which I owe to none; and, if I do not execute it well, I deserve to be torn by twelve vultures, instead of one."

Bacon says, "Men seek not to know their own stock, and abilities; but fancy their possessions to be greater, and their abilities less, than they really are." Which is in effect saying, "That we ought to exert more than we do; and that, on exertion, our probability of success is greater than we conceive."

Nor have we Bacon's opinion only, but his assistance too, in favour of originals. His mighty mind travelled round the intellectual world; and, with a more than eagle's eye, saw, and has pointed out, blank spaces, or dark spots in it, on which the human mind never shone: some of these have been enlightened since; some are benighted still.

Moreover, so boundless are the bold excursions of the human mind, that in the vast void beyond real existence, it can call forth shadowy beings, and unknown worlds, as numerous, as bright, and perhaps as lasting as the stars; such quite-original beauties we may call paradi-  
saical,

*Natas sine femine flores.*

OVID.

When such an ample area for renowned adventure in *original* attempts lies before us, shall we be as mere leaden pipes, conveying to the present age small streams of excellence from its grand reservoir in antiquity; and those too perhaps muddled in the pass? Originals shine like comets; have no peer in their path; are rivalled by none, and the gaze of all: all other compositions (if they shine at all) shine in clusters; like the stars in the galaxy; where, like bad neighbours, all suffer from all; each particular being diminished, and almost lost in the throng.

If thoughts of this nature prevailed; if ancients and moderns were no longer considered as masters and pupils,

†

3 T

but

but as hard-matched rivals for renown; then moderns, by the longevity of their labours, might one day become ancients themselves: and old time, that best weigher of merits, to keep his balance even, might have the golden weight of an Augustan age in both his scales: or rather, our scale might descend: and that of antiquity (as a modern match for it strongly speaks) might *kick the beam*.

Why condemned Maro his admirable epic to the flames? Was it not because his discerning eye saw some length of perfection beyond it? And what he saw, may not others reach? And who bid fairer than our countrymen for that glory? Something new may be expected from Britons particularly; who seem not to be more severed from the rest of mankind by the surrounding sea, than by the current in their veins; and of whom little more appears to be required, in order to give us originals, than a consistency of character, and making their compositions of a piece with their lives. May our genius shine; and proclaim us in that noble view!

—*minimè contentos nosse Britannos.* VIRG.

And so it does; for in polite composition, in natural and mathematical knowledge, we have great originals already: Bacon, Boyle, Newton, Shakespeare, Milton, have showed us, that all the winds cannot blow the British flag farther, than an original spirit can convey the British fame; their names go round the world; and what foreign genius strikes not as they pass? Why should not their posterity embark in the same bold bottom of new enterprise, and hope the same success? Hope it they may; or we must assert, either that those originals, which we already enjoy, were written by angels, or deny that we are men. As Simonides said to Pausanias, reason should say to the writer, "Remember thou art a man." And for man not to grasp at all which is laudable within his reach, is a dishonour to human nature, and a disobedience to the divine; for as Heaven does nothing in vain, its gift of talents implies an injunction of their use.

Johnson in the serious drama, is as much an imitator as Shakespeare is an original. He was very learned, as Sampson was very strong, to his own hurt. Blind to the nature of tragedy, he pulled down all antiquity on his head, and buried himself under it; we see nothing of Johnson, nor indeed of his admired (but also murdered) ancients; for what shone in the historian is a cloud on the poet; and Catiline might have been a good play if Sallust had never written.

Dryden, destitute of Shakespeare's genius, had almost as much learning as Johnson, and, for the buskin, quite as little taste. He was a stranger to the pathos, and, by numbers, expression, sentiment, and every other dramatic cheat, strove to make amends for it; as if a saint could make amends for the want of conscience; a soldier, for the want of valour; or a vestal, of modesty. The noble nature of tragedy disclaims an equivalent; like virtue, it demands the heart; and Dryden had none to give. Let epic poets *think*, the tragedian's point is rather to *feel*; such distant things are a tragedian and a poet, that the latter indulged, destroys the former. Look on Barnwell, and Essex, and see how as to these distant characters Dryden excels, and is excel-

led. But the strongest demonstration of his no-taste for the buskin, are his tragedies fringed with rhyme; which, in epic poetry, is a fore disease; in the tragic, absolute death. To Dryden's enormity, Pope's was a light offence. As lacemen are foes to mourning, these two authors, rich in rhyme, were no great friends to those solemn ornaments, which the noble nature of their works required.

Must rhyme then, it may be said, be banished? It is to be wished the nature of our language could bear its entire expulsion; but our lesser poetry stands in need of a toleration for it; it raises that, but sinks the great; as spangles adorn children, but expose men.

Among the brightest of the moderns, Mr Addison must take his place. Who does not approach his character with great respect? They who refuse to close with the public in his praise, refuse at their peril. But, if men will be fond of their own opinions, some hazard must be run. He had, what Dryden and Johnson wanted, a warm, and feeling heart; but, being of a grave and bashful nature, through a philosophic reserve, and a sort of moral prudery, he concealed it, where he should have let loose all his fire, and have showed the most tender sensibility of heart. At his celebrated Cato, few tears are shed, but Cato's own; which indeed are truly great, but unaffecting, except to the noble few who love their country better than themselves. The bulk of mankind want virtue enough to be touched by them. His strength of genius has reared up one glorious image, more lofty, and truly golden, than that in the plain of Dura, for cool admiration to gaze at, and warm patriotism (how rare!) to worship; while those two throbbing pulses of the drama, by which alone it is shown to live, *terror* and *pity*, neglected through the whole, leave our unmolested hearts at perfect peace. Thus the poet, like his hero, through mistaken excellence, and virtue overstrained, becomes a sort of suicide; and that which is most dramatic in the drama, dies. All his charms of poetry are but as funeral flowers which adorn, all his noble sentiments but as rich spices which embalm, the tragedy deceased.

Socrates frequented the plays of Euripides; and, what living Socrates would decline the theatre, at the representation of Cato? Tully's assassins found him in his litter, reading the *Mædea* of the Grecian poet, to prepare himself for death. Part of Cato might be read to the same end. In the weight and dignity of moral reflection, Addison resembles that poet, who was called the dramatic philosopher; and is himself, as he says of Cato, *ambitiously sententious*. But as to the singular talent so remarkable in Euripides, at melting down hearts into the tender streams of grief and pity, there the resemblance fails. His beauties sparkle, but do not warm; they sparkle as stars in a frosty night. There is, indeed, a constellation in his play; there is the philosopher, patriot, orator, and poet; but where is the tragedian? And, if that is wantings,

*Cur in theatrum Cato seveus venisti?* MART.

## 2. Of epic and dramatic Compositions.

Tragedy and the epic poem differ little in substantial:

iu

in both the same ends are proposed, *viz.* instruction and amusement; and in both the same means are employed, *viz.* imitation of human actions. They differ in the manner only of imitating: epic poetry deals in narration; tragedy represents its facts as passing in our sight: in the former, the poet introduces himself as an historian; in the latter, he presents his actors, and never himself.

This difference, regarding form only, may be thought slight: but the effects it occasions, are by no means so; for what we see, makes a stronger impression than what we learn from others. A narrative poem is a story told by another: facts and incidents passing upon the stage, come under our own observation; and are beside much enlivened by action and gesture, expressive of many sentiments beyond the reach of language.

A dramatic composition has another property, independent altogether of action; which is, that it makes a deeper impression than narration; in the former, persons express their own sentiments; in the latter, sentiments are related at second hand. For that reason, Aristotle, the father of critics, lays it down as a rule, That in an epic poem the author ought to take every opportunity to introduce his actors, and to confine the narrative part within the narrowest bounds. Homer understood perfectly the advantage of this method; and his poems are both of them in a great measure dramatic. Lucan runs to the opposite extreme; and is guilty of a still greater fault, in stuffing his *Pharsalia* with cold and languid reflections, the merit of which he assumes to himself, and deigns not to share with his personages.

Aristotle, from the nature of the fable, divides tragedy into simple and complex: but it is of greater moment, with respect to dramatic as well as epic poetry, to found a distinction upon the different ends attained by such compositions. A poem, whether dramatic or epic, that has nothing in view but to move the passions, and to exhibit pictures of virtue and vice, may be distinguished by the name of *pathetic*: but where a story is purposely contrived to illustrate some moral truth, by showing that disorderly passions naturally lead to external misfortunes, such composition may be denominated *moral*. Besides making a deeper impression than can be done by any moral discourse, it affords conviction equal to that of the most accurate reasoning. To be satisfied of this, we need but reflect, that the natural connection which vice hath with misery, and virtue with happiness, may be illustrated by stating a fact as well as by urging an argument. Let us assume, for example, the following moral truths: That discord among the chiefs renders ineffectual all common measures; and that the consequences of a slightly-founded quarrel, fostered by pride and arrogance, are not less fatal than those of the grossest injury: these truths may be inculcated, by the quarrel between Agamemnon and Achilles at the siege of Troy. In this view, probable circumstances must be invented, such as furnish an opportunity for the turbulent passions to exert themselves in action: at the same time, no accidental nor unaccountable event ought to be admitted; for the necessary or probable connection between vice and misery, is not learned from any events but what are naturally occasioned by the characters and passions of the persons re-

presented, acting in such and such circumstances. A real event of which we see not the cause, may be a lesson to us; because what hath happened may again happen: but this cannot be inferred from a story that is known to be a fiction.

Many are the good effects of such compositions. A pathetic composition, whether epic or dramatic, tends to a habit of virtue, by exciting us to do what is right, and restraining from what is wrong. Its frequent pictures of human woes produce, beside, two effects extremely salutary: they improve our sympathy, and at the same time fortify us in bearing our own misfortune. A moral composition must obviously produce the same good effects, because by being moral it doth not cease to be pathetic: it enjoys beside an excellence peculiar to itself; for it not only improves the heart, as above mentioned, but instructs the head by the moral it contains. For our part, we cannot imagine any entertainment more suited to a rational being, than a work thus happily illustrating some moral truth; where a number of persons of different characters are engaged in an important action, some retarding, others promoting, the great catastrophe; and where there is dignity of style as well as of matter. A work of this kind has our sympathy at command, and can put in motion the whole train of the social affections: our curiosity is by turns excited and gratified; and our delight is consummated at the close, upon finding, from the characters and situations exhibited at the commencement, that every incident down to the final catastrophe is natural, and that the whole in conjunction make a regular chain of causes and effects.

Considering that an epic and a dramatic poem are the same in substance, and have the same aim or end, one would readily imagine, that subjects proper for the one must be equally proper for the other. But considering their difference as to form, there will be found reason to correct that conjecture, at least in some degree. Many subjects may indeed be treated with equal advantage in either form; but the subjects are still more numerous for which they are not equally qualified; and there are subjects proper for the one and not at all for the other. To give some slight notion of the difference, as there is no room here for enlarging upon every article, we observe, that dialogue is the best qualified for expressing sentiments, and narrative for displaying facts. Heroism, magnanimity, undaunted courage, and the whole tribe of the elevated virtues, figure best in action: tender passions, and the whole tribe of sympathetic affections, figure best in sentiment: what we feel is the most remarkable in the latter; what we perform is the most remarkable in the former. It clearly follows, that tender passions are more peculiarly the province of tragedy, grand and heroic actions of epic poetry.

The subject best fitted for tragedy is a story where a man has himself been the cause of his misfortune. - But this man must neither be deeply guilty, nor altogether innocent: the misfortune must be occasioned by a fault incident to human nature, and therefore venial. Misfortunes of this kind call forth the social affections, and warmly interest the spectator. An accidental misfortune, if not extremely singular, doth not greatly move our

our pity: the person who suffers, being innocent, is freed from the greatest of all torments, that anguish of mind which is occasioned by remorse.

An atrocious criminal, on the other hand, who brings misfortunes upon himself, excites little pity, for a different reason: his remorse, it is true, aggravates his distress, and swells the first emotions of pity; but then our hatred of him as a criminal blending with pity, blunts its edge considerably. Misfortunes that are not innocent, nor highly criminal, partake the advantages of each extreme: they are attended with remorse to embitter the distress, which raises our pity to a great height; and the slight indignation we have at a venial fault, detracts not sensibly from our pity. For this reason, the happiest of all subjects for raising pity, is where a man of integrity falls into a great misfortune by doing an action that is innocent, but which by some singular means he conceives to be criminal: his remorse aggravates his distress; and our compassion, unrestrained by indignation, rises to its highest pitch. Pity comes thus to be the ruling passion of a pathetic tragedy; and by proper representation, may be raised to a height scarce exceeded by any thing felt in real life. A moral tragedy takes in a larger field; for, beside exercising our pity, it raises another passion, selfish indeed, but which deserves to be cherished equally with the social affections. The passion we have in view is fear or terror; for when a misfortune is the natural consequence of some wrong bias in the temper, every spectator who is conscious of such a wrong bias in his own temper, takes the alarm, and dreads his falling into the same misfortune: and it is by this emotion of fear or terror, frequently reiterated in a variety of moral tragedies, that the spectators are put upon their guard against the disorders of passion.

The commentators upon Aristotle, and other critics, have been much gravell'd about the account given of tragedy by this author: "That by means of pity and terror, it refines or purifies in us all sorts of passion." But no one who has a clear conception of the end and effects of a good tragedy, can have any difficulty about Aristotle's meaning: our pity is engaged for the persons represented; and our terror is upon our own account. Pity indeed is here made to stand for all the sympathetic emotions, because of these it is the capital. There can be no doubt, that our sympathetic emotions are refined or improved by daily exercise; and in what manner our other passions are refined by terror, we have just now said.

With respect to subjects of this kind, it may indeed be a doubtful question, whether the conclusion ought not always to be fortunate. Where a person of integrity is represented as suffering to the end under misfortunes purely accidental, we depart discontented, and with some obscure sense of injustice: for seldom is man so submissive to providence, as not to revolt against the tyranny and vexations of blind chance; he will be inclined to say, This ought not to be. We give for an example the *Romeo and Juliet* of Shakespeare, where the fatal catastrophe occasioned by Friar Laurence's coming to the monument a minute too late. We are vexed at the unlucky chance, and go away dissatisfied. Such impressions,

which ought not to be cherished, are a sufficient reason for excluding stories of that kind from the theatre. The misfortunes of a virtuous person, arising from necessary causes, or from a chain of unavoidable circumstances, will be considered in a different light: chance affords always a gloomy prospect, and in every instance gives an impression of anarchy and misrule: a regular chain, on the contrary, of causes and effects, directed by the general laws of nature, never fails to suggest the hand of Providence; to which we submit without resentment, being conscious that submission is our duty. For that reason, we are not disgusted with the distresses of Voltaire's *Mariamne*, though redoubled on her till the moment of her death, without the least fault or failing on her part: her misfortunes are owing to a cause extremely natural, and not unfrequent, the jealousy of a barbarous husband. The fate of *Desdemona* in the *Moor of Venice*, affects us in the same manner. We are not so easily reconciled to the fate of *Cordelia* in *King Lear*: the causes of her misfortune are by no means so evident, as to exclude the gloomy notion of chance. In short, a perfect character suffering under misfortunes, is qualified for being the subject of a pathetic tragedy, provided chance be excluded. Nor is a perfect character altogether inconsistent with a moral tragedy: it may successfully be introduced as an under-part, supposing the chief place to be filled with an imperfect character from which a moral can be drawn. This is the case of *Desdemona* and *Mariamne* just now mentioned; and it is the case of *Monimia* and *Belvidera*, in Otway's two tragedies, the *Orphan*, and *Venice Preserved*.

Fable operates on our passions, by representing its events as passing in our sight, and by deluding us into a conviction of reality. Hence, in epic and dramatic compositions, it is of importance to employ means of every sort that may promote the delusion, such as the borrowing from history some noted event, with the addition of circumstances that may answer the author's purpose: the principal facts are known to be true; and we are disposed to extend our belief to every circumstance. But in choosing a subject that makes a figure in history, greater precaution is necessary than where the whole is a fiction. In the latter case there is full scope for invention: the author is under no restraint other than that the characters and incidents be just copies of nature. But where the story is founded on truth, no circumstances must be added, but such as connect naturally with what are known to be true; history may be supplied, but must not be contradicted: further, the subject chosen must be distant in time, or at least in place; for the familiarity of persons and events nearly connected with us, ought by all means to be avoided. Familiarity ought more especially to be avoided in an epic poem, the peculiar character of which is dignity and elevation: modern manners make but a poor figure in such a poem.

After Voltaire, no writer, it is probable, will think of rearing an epic poem upon a recent event in the history of his own country. But an event of this kind is perhaps not altogether unqualified for tragedy: it was admitted in Greece; and Shakespeare has employed it successfully

cessfully in several of his pieces. One advantage it possesses above fiction, that of more readily engaging our belief, which tends above any other particular to raise our sympathy. The scene of comedy is generally laid at home: familiarity is no objection; and we are peculiarly sensible of the ridicule of our own manners.

After a proper subject is chosen, the dividing it into parts requires some art. The conclusion of a book in an epic poem, or of an act in a play, cannot be altogether arbitrary; nor be intended for so slight a purpose as to make the parts of equal length. The supposed pause at the end of every book, and the real pause at the end of every act, ought always to coincide with some pause in the action. In this respect, a dramatic or epic poem ought to resemble a sentence or period in language, divided into members that are distinguished from each other by proper pauses; or it ought to resemble a piece of music, having a full close at the end, preceded by imperfect closes that contribute to the melody. Every act in a dramatic poem ought therefore to close with some incident that makes a pause in the action; for otherwise there can be no pretext for interrupting the representation: it would be absurd to break off in the very heat of action; against which every one would exclaim: the absurdity still remains, though the action relents, if it be not actually suspended for some time. This rule is also applicable to an epic poem: though there, a deviation from the rule is less remarkable; because it is in the reader's power to hide the absurdity, by proceeding instantly to another book. The first book of the *Paradise Lost* ends without any regular close, perfect or imperfect: it breaks off abruptly, where Satan, seated on his throne, is prepared to make a speech to the convoked host of the fallen angels; and the second book begins with the speech. Milton seems to have copied the *Æneid*, of which the two first books are divided much in the same manner. Neither is there any proper pause at the end of the fifth book of the *Æneid*. There is no proper pause at the end of the seventh book of *Paradise Lost*, nor at the end of the eleventh.

This branch of the subject shall be closed with a general rule. That action being the fundamental part of every composition whether epic or dramatic, the sentiments and tone of language ought to be subservient to the action, so as in every respect to appear natural, and proper for the occasion. The application of this rule to our modern plays, would reduce the bulk of them to a skeleton.

After carrying on together epic and dramatic compositions, we proceed to handle them separately, and to mention circumstances peculiar to each, beginning with the epic kind. In a theatrical entertainment, which employs both the eye and the ear, it would be a gross absurdity to introduce upon the stage superior beings in a visible shape. There is not place for this objection in an epic poem; and Boileau, with many other critics, declares strongly for this sort of machinery in an epic poem. But waving authority, which is apt to impose upon the judgment, let us draw what light we can from reason. This matter is but indistinctly handled by critics: the poetical privilege of animating insensible objects for en-

livening a description, is very different from what is termed *machinery*, where deities, angels, devils, or other supernatural powers, are introduced as real personages, mixing in the action, and contributing to the catastrophe; and yet these two things are constantly jumbled together in the reasoning. The former is founded on a natural principle: but can the latter claim the same authority? so far from it, that nothing can be more unnatural. Its effects, at the same time, are deplorable. First, it gives an air of fiction to the whole; and prevents that impression of reality which is requisite to interest our affections, and to move our passions: this of itself is sufficient to explode machinery, whatever entertainment it may afford to readers of a fantastic taste or irregular imagination. And, next, were it possible, by disguising the fiction, to delude us into a notion of reality, an insuperable objection would still remain, which is, that the aim or end of an epic poem can never be attained in any perfection where machinery is introduced; for an evident reason, that virtuous emotions cannot be raised successfully but by the actions of those who are endued with passions and affections like our own, that is, by human actions: and as for moral instruction, it is clear, that none can be drawn from beings who act not upon the same principles with us. A fable in *Æsop's* manner is no objection to this reasoning: his lions, bulls, and goats, are truly men under disguise: they act and feel in every respect as human beings; and the moral we draw is founded on that supposition. Homer, it is true, introduces the gods into his fable: but he was authorized to take that liberty by the religion of his country; it being an article in the Grecian creed, that the gods often interpose visibly and bodily in human affairs. We must however observe, that Homer's deities do no honour to his poems: fictions that transgress the bounds of nature, seldom have a good effect: they may inflame the imagination for a moment, but will not be relished by any person of a correct taste. Let us add, that of whatever use such fictions may be to a mean genius, an able writer has much finer materials of Nature's production, for elevating his subject, and making it interesting.

The marvellous is indeed so much promoted by machinery, that it is not wonderful to find it embraced by the bulk of writers, and perhaps of readers. If indulged at all, it is generally indulged to excess. Homer introduces his deities with no greater ceremony than his mortals; and Virgil has still less moderation: a pilot spent with watching cannot fall asleep and drop into the sea by natural means: one bed cannot hold the two lovers, *Æneas* and *Dido*, without the immediate interposition of superior powers. The ridiculous in such fictions must appear, even through the thickest vail of gravity and solemnity.

Angels and devils serve equally with the Heathen deities, as materials for figurative language, perhaps better among Christians, because we believe in them, and not in the Heathen deities. But every one is sensible, as well as Boileau, that the invisible powers in our creed make a much worse figure as actors in a modern poem, than the invisible powers in the Heathen creed did in ancient times. The reason seems to be what follows. The Heathen deities, in the opinion of their votaries,

were beings elevated one step only above mankind, actuated by the same passions, and directed by the same motives; therefore not altogether improper to mix with men in an important action. In our creed, superior beings are placed at such a mighty distance from us, and are of a nature so different, that with no propriety can they appear with us upon the same stage: man is a creature so much inferior, that he loses all dignity when set in opposition.

There can be no doubt, that an historical poem admits the embellishment of allegory, as well as of metaphor, simile, or other figure. Moral truth, in particular, is finely illustrated in the allegorical manner: it amuses the fancy to find abstract terms, by a sort of magic, converted into active beings; and it is delightful to trace a general proposition in a pictured event. But allegorical beings should be confined within their own sphere, and never be admitted to mix in the principal action, nor to co-operate in retarding or advancing the catastrophe; which would have a still worse effect than invisible powers, and we are ready to assign the reason. The impression of real existence, essential to an epic poem, is inconsistent with that figurative existence which is essential to an allegory; and therefore no method can be more effectual to prevent the impression of reality, than to introduce allegorical beings co-operating with those whom we conceive to be really existing. The love-episode in the *Henriade*, insufferable by the discordant mixture of allegory with real life, is copied from that of Rinaldo and Armida in the *Jerusalemme liberata*, which hath no merit to intitle it to be copied. An allegorical object, such as Fame in the *Æneid*, and the Temple of Love in the *Henriade*, may find place in a description: but to introduce Discord as a real personage, imploring the assistance of Love as another real personage, to enervate the courage of the hero, is making these figurative beings act beyond their sphere, and creating a strange jumble of truth and fiction.

What is the true notion of an episode? or how is it to be distinguished from the principal action? Every incident that promotes or retards the catastrophe, must be a part of the principal action. This clears the nature of an episode; which may be defined, "An incident connected with the principal action, but contributing neither to advance nor retard it." The descent of *Æneas* into hell doth not advance nor retard the catastrophe; and therefore is an episode. The story of Nisus and Euryalus, producing an alteration in the affairs of the contending parties, is a part of the principal action. The family-scene in the sixth book of the *Iliad* is of the same nature: by Hector's retiring from the field of battle to visit his wife, the Grecians had liberty to breathe, and even to press upon the Trojans. Such being the nature of an episode, the unavoidable effect of it must be, to break in upon the unity of action; and therefore it ought never to be indulged, unless to unbend the mind after the fatigue of a long narration. This purpose of an episode demands the following conditions: it ought to be well connected with the principal action: it ought to be lively and interesting: it ought to be short: and a

time ought to be chosen when the principal action reels.

Next, upon the peculiarities of a dramatic poem. And the first we shall mention is a double plot; one of which must be of the nature of an episode in an epic poem; for it would distract the spectator, instead of entertaining him, if he were forced to attend, at the same time, to two capital plots equally interesting. And even supposing it an under-plot, of the nature of an episode, it seldom hath a good effect in tragedy, of which simplicity is a chief property; for an interesting subject that engages our warmest affections, occupies our whole attention, and leaves no room for any separate concern. Variety is more tolerable in comedy, which pretends only to amuse, without totally occupying the mind. But even here to make a double plot agreeable, is no slight effort of art: the under plot ought not to vary greatly in its tone from the principal; for discordant passions are unpleasant when jumbled together; which, by the way, is an insuperable objection to *tragi-comedy*. Upon this account, we blame the *Provoked Husband*: all the scenes that bring the family of the *Wrongheads* into action, being ludicrous and farcical, agree very ill with the principal scenes, displaying severe and bitter expostulations between lord Townly and his lady. The same objection touches not the double plot of the *Careless Husband*; the different subjects being sweetly connected, and having only so much variety as to resemble shades of colours harmoniously mixed. But this is not all. The under plot ought to be connected with that which is principal, so much at least as to employ the same persons: the under-plot ought to occupy the intervals or pauses of the principal action; and both ought to be concluded together. This is the case of the *Merry Wives of Windsor*.

Violent action ought never to be represented on the stage. While the dialogue runs on, a thousand particulars concur to delude us into an impression of reality, genuine sentiments, passionate language, and persuasive gesture: the spectator once engaged, is willing to be deceived, loses sight of himself, and without scruple enjoys the spectacle as a reality. From this absent state, he is roused by violent action: he wakes as from a pleasing dream, and gathering his senses about him, finds all to be a fiction.

The French critics join with Horace in excluding from the stage the shedding blood; but they have overlooked the most substantial objection, that above-mentioned, urging only that it is barbarous, and shocking to a polite audience. But the Greeks had no notion of such delicacy, or rather effeminacy; witness the murder of Clytemnestra by her son Orestes, passing behind the scene, as represented by Sophocles: her voice is heard calling out for mercy, bitter expostulations on his part, loud shrieks upon her being stabbed, and then a deep silence. We appeal to every person of feeling, whether this scene be not more horrible, than if the deed had been committed in sight of the spectators upon a sudden gust of passion. If Corneille, in representing the affair between Horatius and his sister upon which murder ensues behind the scene,

had

had no other view but to remove from the spectators a shocking action, he certainly was in a capital mistake: for murder in cold blood, which in some measure was the case as represented, is more shocking to a polite audience, even where the conclusive stab is not seen, than the same act performed in their presence, when it is occasioned by violent and unpremeditated passion, as suddenly repented of as committed. We heartily agree with Addison, that no part of this incident ought to have been represented, but reserved for a narrative, with every alleviating circumstance in favour of the hero. This is the only method to avoid the difficulties that unqualify this incident for representation, a deliberate murder on the one hand, and on the other a violent action performed on the stage, which must rouse the spectator from his dream of reality.

A few words upon the dialogue, which ought to be so conducted as to be a true representation of nature. Every single speech, short or long, ought to arise from what is said by the former speaker, and furnish matter for what comes after, till the end of the scene. In this view, the whole speeches, from first to last, represent so many links, all connected together in one regular chain. No author, ancient or modern, possesses the art of dialogue equal to Shakespeare. Dryden in this particular may justly be placed as his opposite: he frequently introduces three or four persons speaking upon the same subject, each throwing out his own sentiments separately, without regarding what is said by the rest; take for an example the first scene of *Aurengzebe*: sometimes he makes a number club in relating an event, not to a stranger, supposed ignorant of it, but to one another, for the sake merely of speaking: of which notable sort of dialogue, we have a specimen in the first scene of the first part of the *Conquest of Granada*. In the second part of the same tragedy, scene second, the king, *Abenamar*, and *Zulema*, make their separate observations, like so many soliloquies, upon the fluctuating temper of the mob: a dialogue so uncouth, puts one in mind of two shepherds in a pastoral, excited by a prize to pronounce verses alternately, each in praise of his own mistress.

The bandying sentiments in this manner, beside an unnatural air, has another bad effect: it stays the course of the action, because it is not productive of any consequence. In Congreve's comedies, the action is often suspended to make way for a play of wit.

No fault is more common among writers, than to prolong a speech after the impatience of the person to whom it is addressed ought to prompt him or her to break in. Consider only how the impatient actor is to behave in the mean time. To express his impatience in violent action without interrupting, would be unnatural; and yet to dissemble his impatience by appearing cool where he ought to be highly inflamed, would be no less unnatural.

Rhyme being unnatural and disgusting in dialogue, is happily banished from our theatre: the only wonder is, that it ever found admittance, especially among a people accustomed to the more manly freedom of Shakespeare's dialogue. By banishing rhyme, we have gained so much

as never once to dream that there can be any further improvement. And yet, however suitable blank verse may be to elevated characters and warm passions, it must appear improper and affected in the mouths of the lower sort. Why then should it be a rule, that every scene in tragedy must be in blank verse? Shakespeare, with great judgment, has followed a different rule; which is, to intermix prose with verse, and only to employ the latter where the importance or dignity of the subject requires it. Familiar thoughts and ordinary facts ought to be expressed in plain language; and if it appear not ridiculous to hear a footman deliver a simple message in blank verse, a vail must be drawn over the ridiculous appearance by the force of custom. In short, that variety of characters and of situations, which is the life of a play, requires not only a suitable variety in the sentiments, but also in the diction.

**COMPOSITION**, in painting, consists of two parts, invention and disposition; the first whereof is the choice of the objects which are to enter into the composition of the subject the painter intends to execute, and is either simply historical or allegorical.

**COMPOSITION**, in commerce, a contract between an insolvent debtor and his creditors, whereby the latter accept of a part of the debt in compensation for the whole, and give a general acquittance accordingly.

**COMPOSITION**, in printing, commonly termed composing, the arranging of several types, or letters, in the composing-stick, in order to form a line; and of several lines ranged in order in the galley, to make a page; and of several pages, to make a form. See **PRINTING**.

**COMPOST**, in husbandry and gardening, several sorts of soils, or earthy matter, mixed together, in order to make a manure, for assisting the natural earth in the work of vegetation, by way of amendment or improvement. See **AGRICULTURE**.

**COMPOSTELLA**, the capital of Galicia, in Spain, remarkable for the devotion paid there by pilgrims from all countries to the relics of St James.

**COMPOUND**, in a general sense, an appellation given to whatever is composed, or made up of different things: thus we say, a compound word, compound sound, compound taste, compound force, &c.

**COMPOUND-INTEREST**. See **INTEREST**.

**COMPOUND NUMBERS**, those which may be divided by some other number besides unity, without leaving any remainder: such are 18, 20, &c. the first being measured by the numbers 2, 6, or 9; and the second by the numbers 2, 4, 5, 10.

**COMPREHENSION**, in logic, the same with apprehension.

**COMPRESSION**, the act of pressing or squeezing some matter, so as to set its parts nearer to each other, and make it possess less space.

**COMPRINT**, among booksellers, signifies a surreptitious printing of another's copy, in order to gain thereby, which is expressly contrary to statute 14 Car. II.

**COMPROMISE**, a treaty, or contract, whereby two contending

- contending parties establish one or more arbitrators, to judge of and terminate their difference in an amicable way.
- COMPUNCTION**, in theology, an inward grief of mind, for having offended God.
- COMPUTATION**, in a general sense, the manner of estimating time, weights, measure, ~~monies~~, or quantities of any kind.
- CONARION**, or **CONOIDES**, a name for the pineal gland. See Vol. I. p. 286.
- CONATUS**, a term frequently used in philosophy and mathematics, defined by some to be a quantity of motion, not capable of being expressed by any time, or length; as the *conatus recedendi ab axe motus*, is the endeavour which a body, moved circularly, makes to recede, or fly off from the centre or axis of its motion. See **MECHANICS**.
- CONCATENATION**, a term chiefly used in speaking of the mutual dependence of second causes upon each other.
- CONCAVE**, an appellation used in speaking of the inner surface of hollow bodies, but more especially of spherical ones.
- CONCAVE GLASSES**, such as are ground hollow, and are usually of a spherical figure, though they may be of any other, as parabolical, &c. All objects seen through concave glasses, appear erect and diminished. See **OPTICS**.
- CONCENTRATION**, in general, signifies the bringing things nearer a center. Hence the particles of salt, in sea-water, are said to be concentrated; that is, brought nearer each other, by evaporating the watery part. See **CHEMISTRY**.
- CONCENTRIC**, in mathematics, something that has the same common center with another: it stands in opposition to excentric.
- CONCEPTION**, among physicians, &c. denotes the first formation of an embryo in the womb of its parent, who from that time becomes pregnant. See **GENERATION**.
- CONCEPTION**, in logic. See **APPREHENSION**.
- CONCEPTION**, in geography, a city of Chili, in South America, situated on the Pacific Ocean, in 79° W. long. and 37° S. lat.
- CONCEPTION** is also the capital of the province of Veragua, in Mexico, about 100 miles west of Porto Bello: W. long. 83°, and N. lat. 10°.
- CONCERT**, or **CONCERTO**, in music, a number or company of musicians, playing or singing the same piece of music or song at the same time. See **MUSIC**.
- CONCERTATO** intimates the piece of music to be composed in such a manner, as that all the parts may have their recitativos, be it for two, three, four, or more voices or instruments.
- CONCERTO GROSSI**, the grand chorus or a concert, or those places where all the several parts perform or play together.
- CONCHA**, in zoology, a synonyme of the **MYTILUS**, **SOLEN**, &c. See these articles.
- CONCHA**, in anatomy. See Vol. I. p. 297.
- CONCHOID**, in geometry, the name of a curve, given it by its inventor Nicomedes. See **FLUXIONS**.
- CONCHYLIA**, a general name for all kinds of petrified shells, as limpets, cochlea, nautili, conchæ, lepadæ, &c.
- CONCINNOUS intervals**, in music, are such as are fit for music, next to, and in combination with concords; being neither very agreeable, nor disagreeable in themselves, but having a good effect, as by their opposition they heighten the more essential principles of pleasure; or as by their mixture and combination with them, they produce a variety necessary to our being better pleased.
- CONCINNOUS system**, in music. A system is said to be concinuous, or divided concinuously, when its parts, considered as simple intervals, are concinuous; and are besides placed in such an order between the extremes, as that the succession of sounds, from one extreme to the other, may have an agreeable effect.
- CONCLAVE**, the place in which the cardinals of the Romish church meet, and are shut up, in order to the election of a pope.
- The conclave is a range of small cells, ten feet square, made of wainscot: these are numbered, and drawn for by lot. They stand in a line along the galleries and hall of the Vatican, with a small space between each. Every cell has the arms of the cardinal over it. The conclave is not fixed to any one determinate place, for the constitutions of the church allow the cardinals to make choice of such a place for the conclave as they think most convenient; yet it is generally held in the Vatican.
- The conclave is very strictly guarded by troops: neither the cardinals, nor any person shut up in the conclave, are spoke to, but at the hours allowed of, and then in Italian or Latin; even the provisions for the conclave are examined, that no letters be conveyed by that means from the ministers of foreign powers, or other persons who may have an interest in the election of the pontiff.
- CONCLAVE** is also used for the assembly, or meeting, of the cardinals shut up, for the election of a pope.
- CONCLUSION**, in logic, the consequence or judgment, drawn from what was asserted in the premises; or the previous judgments in reasoning, gained from combining the extreme ideas between themselves.
- CONCOCTION**, in medicine, the change which the food undergoes in the stomach, &c. to become chyle. See **CHYLE**.
- CONCOMITANT**, something that accompanies or goes along with another.
- CONCORD**, in grammar, that part of construction called syntax, in which the words of a sentence agree; that is, in which nouns are put in the same gender, number, and case; and verbs in the same number and person with nouns and pronouns.
- CONCORD**, in music, the relation of two sounds that are always agreeable to the ear, whether applied in succession or consonance. See **MUSIC**.
- CONCORDANCE**, a sort of dictionary of the Bible, explaining

explaining the words thereof in alphabetical order, with the several books, chapters, and verses quoted, in which they are contained.

**CONCORDIA**, in geography, a town of the dutchy of Mantua in Italy, about fifteen miles south east of the city of Mantua: E. long.  $11^{\circ} 20'$ , and N. lat.  $45^{\circ}$ .

**CONCRETE**, in the school-philosophy, an assemblage or compound.

**CONCRETE**, in natural philosophy and chemistry, signifies a body made up of different principles, or any mixed body: thus soap is a factitious concrete, or a body mixed together by art; and antimony is a natural concrete, or a mixed body, compounded in the bowels of the earth.

**CONCRETION**, the uniting together several small particles of a natural body into sensible masses, or concretes, whereby it becomes so and so figured and determined, and is endued with such and such properties.

**CONCRETION** is also the act whereby soft bodies are rendered hard; or an insensible motion of the particles of a fluid or a soft body, whereby they come to a consistence. It is indifferently used for induration, condensation, congelation, and coagulation.

**CONCUBINAGE**, denotes sometimes a criminal or prohibited commerce between the sexes; in which sense it comprehends adultery, incest, and simple fornication: but, in a more limited sense, it signifies the cohabitation of a man and a woman in the way of marriage, without having passed the ceremony thereof.

**CONCUBINE**, a woman whom a man takes to cohabit with in the manner of a wife, without being authorised thereto by a legal marriage.

**CONCUPISCENCE**, according to divines, an irregular appetite, or lust after carnal things, inherent in the nature of man ever since the fall.

**CONDAMIN**, in botany. See **CINCHONA**.

**CONDE**, a town of the French Netherlands, in the province of Hainault, situated on the river Scheld, about twelve miles west of Mons: E. long.  $3^{\circ} 40'$ , N. lat.  $50^{\circ} 35'$ .

**CONDENSATION**, the act whereby a body is rendered more dense, compact, and heavy.

**CONDENSER**, a pneumatic engine, or syringe, whereby an uncommon quantity of air may be crowded into a given space; so that sometimes ten atmospheres, or ten times as much air as there is at the same time, in the same space, without the engine, may be thrown in by means of it, and its egress prevented by valves properly disposed. See **PNEUMATICS**.

**CONDITION**, in the civil law, a clause of obligation stipulated as an article of a treaty or contract; or in a donation of testament, legacy, &c. in which last case a donee does not lose his donative, if it be charged with any dishonest or impossible conditions.

**CONDITIONALS**, something not absolute but subject to conditions.

**CONDOM**, the capital of the Condomois, in the province of Gascony, in France, about sixty miles south-east of Bourdeaux. It is a bishop's see, and situated in  $20'$  E. long. and  $44^{\circ} 5'$  N. lat.

**CONDORMIENTES**, in church history, religious sectaries, who hold their name from lying all together, men and women, young and old. They arose in the thirteenth century near Cologne, where they are said to have worshipped an image of Lucifer, and to have received answers and oracles from him.

**CONDUCTOR**, in surgery, an instrument which serves to conduct the knife in the operation of cutting for the stone, and in laying up sinuses and fistulas. See **SURGERY**.

**CONDUIT**, a canal or pipe for the conveyance of water, or other fluid.

There are several subterraneous conduits through which the waters pass that form springs. Artificial conduits for water are made of lead, stone, cast-iron, potter's earth, timber, &c.

**CONDYLOMA**, in medicine, a tubercle or callous eminence which arises in the folds of the anus, or rather a swelling or hardening of the wrinkles of that part.

**CONDYLUS**, a name given by anatomists to a knot in any of the joints, formed by the epiphysis of a bone.

**CONE**, in geometry, a solid figure, having a circle for its base, and its top terminated in a point or vertex. See **CONIC SECTIONS**.

**CONE of rays**, in optics, includes all the several rays which fall from any radiant point on the surface of a glass. See **OPTICS**.

**CONESSI**, a sort of bark of a tree which grows on the Coromandel coast in the East-Indies. It is recommended in a letter to Dr Monro, in the Medical Essays, as a specific in diarrhoeas. It is to be pounded into a fine powder, and made into an electuary with syrup of oranges; and the bark should be fresh, and the electuary new made every day, or second day, otherwise it loses its austere but grateful bitterness on the palate, and its proper effects on the intestines.

**CONFECTION**, in pharmacy, signifies in general any thing prepared with sugar: in particular, it imports something preserved, especially dry substances. It also signifies a liquid or soft electuary, of which there are various sorts directed in dispensaries.

**CONFECTS**, a denomination given to fruits, flowers, herbs, roots, &c. when boiled or prepared with sugar or honey, to dispose them to keep, and render them more agreeable to the taste.

**CONFERVA**, in botany, a genus of the cryptogamia algae class, consisting of oblong, capillary filaments; without any joints. There are twenty-one species.

**CONFESSION**, in a legal sense, an acknowledgment of some truth, though in prejudice of the person that makes the declaration.

**CONFESSION**, among divines, the verbal acknowledgment which a Christian makes of his sins.

Among the Jews it was a custom, on the annual feast of expiation, for the high-priest to make confession of sins to God in the name of the whole people: besides this general confession, the Jews were enjoined, if their sins were a breach of the first table of the law, to make confession of them to God; but violations offered the second table, were to be acknowledged to their brethren. The confessions of the primitive Christians

stians were all voluntary, and not imposed on them by any laws of the church; yet private confession was not only allowed, but encouraged.

The Romish church requires confession not only as a duty, but has advanced it to the dignity of a sacrament: this confession is made to the priest, and is private and auricular; and the priest is not to reveal them under pain of the highest punishment.

**CONFESSION of faith**, a list of the several articles of belief in any church.

**CONFESSIONAL**, or **CONFESSIONARY**, a place in churches, under the great altar, where the bodies of deceased saints, martyrs, and confessors, were deposited.

**CONFESSOR**, in the Romish church, a priest who is empowered to receive the confession of penitents, and to give them absolution.

**CONFIGURATION**, the outward figure which bounds bodies, and gives them their external appearance; being that which, in a great measure, constitutes the specific difference between bodies.

**CONFIRMATION by a superior**. See **SCOTS LAW**, title, *Transmission of rights by confirmation*.

**CONFIRMATION of a testament**. See **SCOTS LAW**, title, *Succession in moveables*.

**CONFIRMATION**, in theology, the ceremony of laying on of hands, for the conveyance of the Holy Ghost.

The antiquity of this ceremony is, by all ancient writers, carried as high as the apostles, and founded upon their example and practice. In the primitive church, it used to be given to Christians immediately after baptism, if the bishop happened to be present at the solemnity. Among the Greeks, and throughout the East, it still accompanies baptism: but the Romanists make it a distinct independent sacrament. Seven years is the stated time for confirmation: however, they are sometimes confirmed before, and sometimes after that age. The person to be confirmed has a god-father and god mother appointed him, as in baptism. The order of confirmation in the church of England, does not determine the precise age of the persons to be confirmed.

**CONFISCATION**, in law, the adjudication of goods or effects to the public treasury; as the bodies and effects of criminals, traitors, &c.

**CONFLAGRATION**, the general burning of a city, or other considerable place.

This word is commonly applied to that grand period or catastrophe of our world, when the face of nature is to be changed by fire, as formerly it was by water.

**CONFLUENT**, among physicians, &c. an appellation given to that kind of small-pox wherein the pustules run into each other. See **MEDICINE**.

**CONFORMATION**, the particular consistence and texture of the parts of any body, and their disposition to compose a whole.

**CONFORMATION**, in medicine, that make and construction of the human body, which is peculiar to every individual.

**CONFORMITY**, among schoolmen, the relation of agreement between one thing and another; as that be-

tween any thing and the division thereof, the object and the understanding, &c.

**CONFUSION**, in Scots law, is a method of extinguishing and suspending obligations. See **SCOTS LAW**, title, *Extinction of obligations*.

**CONGE' d'lire**, in ecclesiastical polity, the king's permission royal to a dean and chapter in the time of a vacancy, to chuse a bishop; or to an abbey, or priory, of his own foundation, to chuse their abbot or prior.

The king of England, as sovereign patron of all archbishoprics, bishoprics, and other ecclesiastical benefices, had of ancient time free appointment of all ecclesiastical dignities, whensoever they chanced to be void; investing them first *per baculum & annulum*, and afterwards by his letters patent; and in course of time he made the election over to others, under certain forms and limitations, as that they should at every vacation, before they chuse, demand the king's conge d'lire, and after the election crave his royal assent, &c.

**CONGE'**, in architecture, a mould in form of a quarter round or a cavetto, which serves to separate two members from one another, such as that which joins the shaft of the column to the cincture, called also apophyge.

**CONGES** are also rings or ferrels formerly used in the extremities of wooden pillars, to keep them from splitting, afterwards imitated in stone-work.

**CONGELATION**, freezing, or such a change produced by cold in a fluid body, that it quits its former state, and becomes congealed. See **FREEZING**.

**CONGER**, in zoology. See **MURÆNA**.

**CONGERIES**, a constellation or aggregate of several particles or bodies united into one mass.

**CONGIUS**, a liquid measure of the ancient Romans, containing the eighth part of the amphora, or the fourth of the urna, or six sextarii. The congius in English measure contains 2,070 676 solid inches; that is, seven pints, 4,942 solid inches.

**CONGLOBATE gland**, in anatomy. See Vol. I. p. 263.

**CONGLOMERATE gland**, in anatomy. See Vol. I. p. 265. *bottom*.

**CONGLUTINATION**, the gluing or fastening any two bodies together by the intromission of a third, whose parts are unctuous and tenacious, in the nature of glue. See **GLUE**.

**CONGO**, a large country on the western coast of Africa, between 10° and 20° E. long. and between the equator and 18° S. lat. comprehending the countries of Loango, Angola. and Benguella. It is bounded by the kingdom of Benin on the north; by Mataman, a part of Caffraria, on the south; and by the Atlantic ocean, on the west; and is sometimes called the lower Guinea.

**CONGREGATION**, an assembly of several ecclesiastics united, so as to constitute one body; as an assembly of cardinals, in the constitution of the pope's court, met for the dispatch of some particular business.

These assemblies, being sixteen in number, are distributed

distributed into several chambers, after the manner of our offices and courts: the first whereof is the pope's congregation, whose business it is to prepare the most difficult beneficiary matters to be afterward debated in the consistory: the second is the congregation of the holy office, or the inquisition: the third is the congregation *de propaganda fide*: the fourth is the congregation for explaining the council of Trent: the fifth is the congregation of the index, deputed to examine into pernicious and heretical books: the sixth is the congregation of immunities, established to obviate the difficulties that arise in the judgments of such suits as are carried on against churchmen: the seventh is the congregation of bishops and regulars: the eighth is the congregation for the examination of bishops, &c. It is also used for a company or society of religious, canonized out of any order, so as to make a subdivision of the order itself; as the congregation of Cluny, &c. among the Benedictines. It is likewise used for assemblies of pious persons, in manner of fraternities.

**CONGREGATIONALISTS**, in church-history, a sect of protestants who reject all church-government, except that of a single congregation.

**CONGRESS**, in political affairs, an assembly of commissioners, envoys, deputies, &c. from several courts meeting to concert matters for their common good.

**CONGRESS**, in a judicial sense, the trial made by appointment of a judge, before surgeons and matrons, in order to prove whether or no a man be impotent, before sentence is passed for the dissolution of a marriage, solicited upon such a complaint.

**CONGRUITY**, a suitableness or relation of agreement between things.

The terms *congruity* and *propriety* are not applicable to any single object: they imply a plurality, and obviously signify a particular relation between different objects. Thus we say currently, that a decent garb is suitable or proper for a judge, modest behaviour for a young woman, and a lofty style for an epic poem: and, on the other hand, that it is unsuitable or incongruous to see a little woman sunk in an overgrown farthingale, a coat richly embroidered covering coarse and dirty linen, a mean subject in an elevated style, an elevated subject in a mean style, a first minister darning his wife's stockings, or a reverend prelate in lawn sleeves dancing a hornpipe.

The perception we have of this relation, which seems peculiar to man, cannot proceed from any other cause, but from a *sense* of congruity or propriety; for, supposing us destitute of that sense, the terms would be to us unintelligible.

It is a matter of experience, that congruity or propriety, where-ever perceived, is agreeable; and that incongruity or impropriety, where-ever perceived, is disagreeable. The only difficulty is, to ascertain what are the particular objects that in conjunction suggest these relations; for there are many objects that do not: the sea, for example, viewed in conjunction with a picture, or a man viewed in conjunction with a mountain, suggest not either congruity or incongrui-

ty. It seems natural to infer, what will be found true by induction, that we never perceive congruity nor incongruity but among things that are connected together by some relation; such as a man and his actions, a principal and its accessories, a subject and its ornaments. We are indeed so framed by nature, as among things so connected, to require a certain suitableness or correspondence, termed *congruity* or *propriety*; and to be displeased when we find the opposite relation of *incongruity* or *impropriety*.

If things connected be the subject of congruity, it is reasonable beforehand to expect, that a degree of congruity should be required proportioned to the degree of the connection. And upon examination we find this to hold in fact: where the relation is intimate, as between a cause and its effect, a whole and its parts, we require the strictest congruity; but where the relation is slight, or accidental, as among things jumbled together in the same place, we require little or no congruity: the strictest propriety is required in behaviour and manner of living; because a man is connected with these by the relation of cause and effect: the relation between an edifice and the ground it stands upon, is of the most intimate kind, and therefore the situation of a great house ought to be lofty; its relation to neighbouring hills, rivers, plains, being that of propinquity only, demands but a small share of congruity: among members of the same club, the congruity ought to be considerable, as well as among things placed for show in the same niche: among passengers in a stage-coach, we require very little congruity; and less still at a public spectacle.

Congruity is so nearly allied to beauty, as commonly to be held a species of it; and yet they differ so essentially, as never to coincide: beauty, like colour, is placed upon a single subject; congruity upon a plurality: further, a thing beautiful in itself, may, with relation to other things, produce the strongest sense of incongruity.

Congruity and propriety are commonly reckoned synonymous terms; but they are distinguishable; and the precise meaning of each must be ascertained. Congruity is the genus, of which propriety is a species; for we call nothing *propriety*, but that congruity or suitableness, which ought to subsist between sensible beings and their thoughts, words, and actions.

In order to give a full view of these secondary relations, we shall trace them through some of the most considerable primary relations. The relation of a part to the whole, being extremely intimate, demands the utmost degree of congruity; even the slightest deviation is disgusting.

Examples of congruity and incongruity are furnished in plenty by the relation between a subject and its ornaments. A literary performance intended merely for amusement, is susceptible of much ornament, as well as a music room, or a play-house; for in gaiety, the mind hath a peculiar relish for show and decoration. The most gorgeous apparel, however improper in tragedy, is not unsuitable to opera actors: the truth is, an opera, in its present form, is a mighty fine thing; but as it deviates from nature in its capital circumstances, we look not for nature

nor.

nor propriety in those which are accessory. On the other hand, a serious and important subject admits not much ornament; nor a subject that of itself is extremely beautiful: and a subject that fills the mind with its loftiness and grandeur, appears best in a dress altogether plain.

To a person of a mean appearance, gorgeous apparel is unsuitable; which, besides the incongruity, has a bad effect; for by contrast it shows the meanness of appearance in the strongest light. Sweetness of look and manner, requires simplicity of dress joined with the greatest elegance. A stately and majestic air requires sumptuous apparel, which ought not to be gaudy, nor crowded with little ornaments. A woman of consummate beauty can bear to be highly adorned, and yet shows best in a plain dress:

For loveliness

Needs not the foreign aid of ornament,  
But is when unadorn'd, adorn'd the most.

*Thomson's Autumn*, 208.

Congruity regulates not only the quantity of ornament, but also the kind. The ornaments that embellish a dancing-room ought to be all of them gay. No picture is proper for a church, but what has religion for its subject. All the ornaments upon a shield ought to relate to war; and Virgil, with great judgment, confines the carvings upon the shield of Æneas to the military history of the Romans: but this beauty is overlooked by Homer; for the bulk of the sculpture upon the shield of Achilles, is of the arts of peace in general, and of joy and festivity in particular: the author of *Telemachus* betrays the same inattention, in describing the shield of that young hero.

In judging of propriety with regard to ornaments, we must attend, not only to the nature of the subject that is to be adorned, but also to the circumstances in which it is placed: the ornaments that are proper for a ball, will appear not altogether so decent at public worship; and the same person ought to dress differently for a marriage-feast and for a burial.

Nothing is more intimately related to a man, than his sentiments, words, and actions; and therefore we require here the strictest conformity. When we find what we thus require, we have a lively sense of propriety: when we find the contrary, our sense of impropriety is not less lively. Hence the universal distaste of affectation, which consists in making a shew of greater delicacy and refinement than is suited either to the character or circumstances of the person.

Congruity and propriety, where-ever perceived, appear agreeable; and every agreeable object produceth in the mind a pleasant emotion: incongruity and impropriety, on the other hand, are disagreeable; and of course produce painful emotions. These emotions, whether pleasant or painful, sometimes vanish without any consequence; but more frequently occasion other emotions, which we proceed to exemplify.

When any slight incongruity is perceived, in an accidental combination of persons or things, as of passengers in a stage-coach, or of individuals dining at an ordinary; the painful emotion of incongruity, after a momentary existence, vanisheth without producing any effect. But

this is not the case of propriety and impropriety: voluntary acts, whether words or deeds, are imputed to the author; when proper, we reward him with our esteem; when improper, we punish him with our contempt. Let us suppose, for example, a generous action suited to the character of the author, which raises in him and in every spectator the pleasant emotion of propriety: this emotion generates in the author both self-esteem and joy; the former when he considers his relation to the action, and the latter when he considers the good opinion that others will entertain of him: the same emotion of propriety produceth in the spectators esteem for the author of the action; and when they think of themselves, it also produceth, by means of contrast, an emotion of humility. To discover the effects of an unsuitable action, we must invert each of these circumstances: the painful emotion of impropriety generates in the author of the action both humility and shame; the former when he considers his relation to the action, and the latter when he considers what others will think of him; the same emotion of impropriety produceth in the spectators contempt for the author of the action; and it also produceth, by means of contrast, when they think of themselves, an emotion of self-esteem. Here then are many different emotions, derived from the same action considered in different views by different persons; a machine provided with many springs, and not a little complicated. Propriety of action, it would seem, is a chief favourite of nature, when such care and solicitude is bestowed upon it. It is not left to our own choice; but, like justice, is required at our hands; and, like justice, is enforced by natural rewards and punishments: a man cannot, with impunity, do any thing unbecoming or improper; he suffers the chastisement of contempt inflicted by others, and of shame inflicted by himself. An apparatus so complicated, and so singular, ought to rouse our attention: for nature doth nothing in vain; and we may conclude with great certainty, that this curious branch of the human constitution is intended for some valuable purpose.

A gross impropriety is punished with contempt and indignation, which are vented against the offender by corresponding external expressions: nor is even the slightest impropriety suffered to pass without some degree of contempt. But there are improprieties, of the slighter kind, that provoke laughter; of which we have examples without end, in the blunders and absurdities of our own species: such improprieties receive a different punishment, as will appear by what follows. The emotions of contempt and of laughter occasioned by an impropriety of this kind, uniting intimately in the mind of the spectator, are expressed externally by a peculiar sort of laugh, termed a *laugh of derision* or *scorn*. An impropriety that thus moves not only contempt but laughter, is distinguished by the epithet of *ridiculous*; and a laugh of derision or scorn is the punishment provided for it by nature. Nor ought it to escape observation, that we are so fond of inflicting this punishment, as sometimes to exert it even against creatures of an inferior species: witness a turkeycock swelling with pride, and strutting with displayed feathers; a ridiculous object, which in a gay mood is apt to provoke a laugh of derision.

We

We must not expect, that these different improprieties are separated by distinct boundaries : for of improprieties, from the slightest to the most gross, from the most risible to the most serious, there are degrees without end. Hence it is, that in viewing some unbecoming actions, too risible for anger, and too serious for derision, the spectator feels a sort of mixt emotion, partaking both of derision and of anger ; which accounts for an expression, common with respect to the impropriety of some actions, That we know not whether to laugh or be angry.

It cannot fail to be observed, that in the case of a risible impropriety, which is always slight, the contempt we have for the offender is extremely faint, though derision, its gratification, is extremely pleasant. This disproportion between a passion and its gratification, seems not conformable to the analogy of nature. In looking about for a solution, we must reflect upon what is laid down above, that an improper action not only moves our contempt for the author, but also, by means of contrast, swells the good opinion we have of ourselves. This contributes, more than any other article, to the pleasure we have in ridiculing follies and absurdities ; and accordingly, it is well known, that they who put the greatest value upon themselves are the most prone to laugh at others. Pride, which is a vivid passion, pleasant in itself, and not less so in its gratification, would singly be sufficient to account for the pleasure of ridicule, without borrowing any aid from contempt. Hence appears the reason of a noted observation, That we are the most disposed to ridicule the blunders and absurdities of others, when we are in high spirits ; for in high spirits, self-conceit displays itself with more than ordinary vigour.

With regard to the final causes of congruity and impropriety ; one, regarding congruity, is pretty obvious, that the sense of congruity, as one principle of the fine arts, contributes in a remarkable degree to our entertainment. Congruity, indeed, with respect to quantity, coincides with proportion : when the parts of a building are nicely adjusted to each other, it may be said indifferently, that it is agreeable by the congruity of its parts, or by the proportion of its parts. But propriety, which regards voluntary agents only, can never be the same with proportion : a very long nose is disproportioned, but cannot be termed *improper*. In some instances, it is true, impropriety coincides with disproportion in the same subject, but never in the same respect ; for example, a very little man buckled to a long toledo : considering the man and the sword with respect to size, we perceive a disproportion ; considering the sword as the choice of the man, we perceive an impropriety.

The sense of impropriety with respect to mistakes, blunders, and absurdities, is happily contrived for the good of mankind. In the spectators, it is productive of mirth and laughter, excellent recreation in an interval from business. But this is a trifle in respect of what follows. It is painful to be the subject of ridicule ; and to punish with ridicule the man who is guilty of an absurdity, tends to put him more upon his guard in time coming. Thus even the most innocent blunder is not committed with impunity ; because, were errors licensed where they

do no hurt, inattention would grow into a habit, and be the occasion of much hurt.

The final cause of propriety as to moral duties, is of all the most illustrious. To have a just notion of it, the moral duties that respect others must be distinguished from those that respect ourselves. Fidelity, gratitude, and the forbearing injury, are examples of the first sort ; temperance, modesty, firmness of mind, are examples of the other : the former are made duties by the sense of justice ; the latter by the sense of propriety. Here is a final cause of the sense of propriety, that must rouse our attention. It is undoubtedly the interest of every man, to suit his behaviour to the dignity of his nature, and to the station allotted him by Providence ; for such rational conduct contributes in every respect to happiness, by preserving health, by procuring plenty, by gaining the esteem of others, and, which of all is the greatest blessing, by gaining a justly-founded self-esteem. But in a matter so essential to our well-being, even self-interest is not relied on : the powerful authority of duty is superadded to the motive of interest. The God of nature, in all things essential to our happiness, hath observed one uniform method : to keep us steady in our conduct, he hath fortified us with natural laws and principles, which prevent many aberrations, that would daily happen were we totally surrendered to so fallible a guide as human reason. Propriety cannot rightly be considered in another light, than as the natural law that regulates our conduct with respect to ourselves ; as justice is the natural law that regulates our conduct with respect to others. We call propriety a law, not less than justice ; because both are equally rules of conduct that ought to be obeyed : propriety includes this obligation ; for to say an action is proper, is, in other words, to say, that it *ought* to be performed ; and to say it is improper, is, in other words, to say that it *ought* to be forborn. It is this very character of *ought* and *should* that makes justice a law to us ; and the same character is applicable to propriety, though perhaps more faintly than to justice : but the difference is in degree only, not in kind ; and we ought, without hesitation or reluctance, to submit equally to the government of both.

But it must, in the next place, be observed, that to the sense of propriety, as well as of justice, are annexed the sanctions of rewards and punishments ; which evidently prove the one to be a law as well as the other. The satisfaction a man hath in doing his duty, joined with the esteem and good will of others, is the reward that belongs to both equally. The punishments also, though not the same, are nearly allied ; and differ in degree more than in quality. Disobedience to the law of justice, is punished with remorse ; disobedience to the law of propriety, with shame, which is remorse in a lower degree. Every transgression of the law of justice raises indignation in the beholder ; and so doth every flagrant transgression of the law of propriety. Slighter improprieties receive a milder punishment : they are always rebuked with some degree of contempt, and frequently with derision. In general, it is true, that the rewards and punishments annexed to the sense of propriety, are

slighter in degree than those annexed to the sense of justice: which is wisely ordered, because duty to others is still more essential to society, than duty to ourselves; for society could not subsist a moment, were individuals not

protected from the headstrong and turbulent passion of their neighbours.

CONI, a strong town of Piedmont in Italy, situated upon the river Stura, thirty two miles south of Turin, in  $7^{\circ} 30'$  E. long. and  $44^{\circ} 25'$  N. lat.

## C O N I C S E C T I O N S.

**C**ONIC SECTIONS are curve lines formed by the intersections of a cone and plane.

If a cone be cut by a plane through the vertex, the section will be a triangle ABC, Plate LXVII fig. 1.

If a cone be cut by a plane parallel to its base, the section will be a circle. If it be cut by a plane DEF, fig. 1. in such a direction, that the side AC of a triangle passing through the vertex, and having its base BC perpendicular to EF, may be parallel to DP, the section is a parabola; if it be cut by a plane DR, fig. 2. meeting AC, the section is an ellipse; and if it be cut by a plane DMO, fig. 3. which would meet AC extended beyond A, it is an hyperbola.

If any line HG, fig. 1. be drawn in a parabola perpendicular to DP, the square of HG will be to the square of EP, as DG to DP; for let LHK be a section parallel to the base, and therefore a circle, the rectangle LGK, will be equal to the square of HG, and the rectangle BPC equal to the square of EP; therefore these squares will be to each other as their rectangles; that is, as BP to LG, that is DP to DG.

### *Description of Conic Sections on a Plane.*

#### P A R A B O L A.

"Let AB, fig. 4. be any right line, and C any point without it, and DKF a ruler, which let be placed in the same plane in which the right line and point are, in such a manner that one side of it, as DK, be applied to the right line AB, and the other side KF coincide with the point C; and at F, the extremity of the side KF, let be fixed one end of the thread FNC, whose length is equal to KF, and the other extremity of it at the point C, and let part of the thread, as FG, be brought close to the side KF by a small pin G; then let the square DKF be moved from B towards A, so that all the while its side DK be applied close to the line BA, and in the mean time the thread being extended will always be applied to the side KF, being stopt from going from it by means of the small pin; and by the motion of the small pin N there will be described a certain curve, which is called a *semi parabola*.

"And if the square be brought to its first given position, and in the same manner be moved along the line AB, from B towards H, the other semi-parabola will be described."

The line AB is called the directrix; C, the focus; any line perpendicular to AB, a diameter; the point where it meets the curve, its vertex; and four times the di-

stance of the vertex from the directrix, its latus rectum, or parameter.

#### E L L I P S E.

"If any two points, as A and B, fig. 5. be taken in any plane, and in them are fixed the extremities of a thread, whose length is greater than the distance between the points, and the thread extended by means of a small pin C, and if the pin be moved round from any point until it return to the place from whence it began to move, the thread being extended during the whole time of the revolution, the figure which the small pin by this revolution describes is called an *Ellipse*."

The points AB are called the foci; D, the centre; EF, the transverse axis; GH, the lesser axis; and any other line passing through D, a diameter.

#### H Y P E R B O L A.

"If to the point A, fig. 6. in any plane, one end of the rule AB be placed, in such a manner, that about that point, as a center, it may freely move; and if to the other end B, of the rule AB, be fixed the extremity of the thread BDC, whose length is smaller than the rule AB, and the other end of the thread being fixed in the point C, coinciding with the side of the rule AB, which is in the same plane with the given point A; and let part of the thread, as BD, be brought close to the side of the rule AB, by means of a small pin D; then let the rule be moved about the point A, from C towards T, the thread all the while being extended, and the remaining part coinciding with the side of the rule being stopt from going from it by means of the small pin, and by the motion of the small pin D, a certain figure is described which is called the *semi-hyperbola*."

The other semi-hyperbola is described in the same way, and the opposite HKF, by fixing the ruler to C, and the thread to A, and describing it in the same manner. A and C are called foci; the point G, which bisects AC, the center; KE, the transverse axis; a line drawn through the center meeting the hyperbolas, a transverse diameter; a line drawn through the center, perpendicular to the transverse axis, and cut off by the circle MN, whose center is E, and radius equal to CG, is called the second axis.

If a line be drawn through the vertex E, equal and parallel to the second axis GP and GO be joined, they are called asymptotes. Any line drawn through the center, not meeting the hyperbolas, and equal in length to the

part

part of a tangent parallel to it, and intercepted betwixt the asymptotes, is called a second diameter.

An ordinate to any section is a line bisected by a diameter and the abscissa, the part of the diameter cut off by the ordinate.

Conjugate diameters in the ellipse and hyperbola are such as mutually bisect lines parallel to the other; and a third proportional to two conjugate diameters is called the latus rectum of that diameter, which is the first in the proportion.

In the parabola, the lines drawn from any point to the focus are equal to perpendiculars to the directrix; being both equal to the part of the thread separated from the ruler.

In the ellipse, the two lines drawn from any point in the curve to the foci are equal to each other, being equal to the length of the thread; they are also equal to the transverse axis. In the hyperbola the difference of the lines drawn from any point to the foci is equal, being equal to the difference of the lengths of the ruler and thread, and is equal to the transverse axis.

From these fundamental properties all the others are derived.

The ellipse returns into itself. The parabola and hyperbola may be extended without limit.

Every line perpendicular to the directrix of a parabola meets it in one point, and falls afterwards within it; and every line drawn from the focus meets it in one point, and falls afterwards without it. And every line that passes through a parabola, not perpendicular to the directrix, will meet it again, but only once.

Every line passing through the center of an ellipse is bisected by it; the transverse axis is the greatest of all these lines; the lesser axis the least; and these nearer the transverse axis greater than those more remote.

In the hyperbola, every line passing through the center is bisected by the opposite hyperbola, and the transverse axis is the least of all these lines; also the second axis is the least of all the second diameters. Every line drawn from the center within the angle contained by the asymptotes, meets it once, and falls afterwards within it; and every line drawn through the center without that angle never meets it; and a line which cuts one of the asymptotes, and cuts the other extended beyond the center, will meet both the opposite hyperbolas in one point.

If a line  $GM$ , fig. 4. be drawn from a point in a parabola perpendicular to the axis, it will be an ordinate to the axis, and its square will be equal to the rectangle under the abscissa  $MI$  and latus rectum; for, because  $GMC$  is a right angle,  $GM^2$  is equal to the difference of  $GC^2$  and  $CM^2$ ; but  $GC$  is equal to  $GE$ , which is equal to  $MB$ ; therefore  $GM^2$  is equal to  $BM^2 - CM^2$ ; which, because  $CI$  and  $IB$  are equal, is (9 *Enc.* 2.) equal to four times the rectangle under  $MI$  and  $IB$ , or equal to the rectangle under  $MI$  and the latus rectum.

Hence it follows, that if different ordinates be drawn to the axis, their squares being each equal to the rectangle under the abscissa and latus rectum, will be to each other in the proportion of the abscissas, which is the same property as was shewn before to take place in the

parabola cut from the cone, and proves those curves to be the same.

This property is extended also to the ordinates of other diameters, whose squares are equal to the rectangle under the abscissas and parameters of their respective diameters.

In the ellipse, the square of the ordinate is to the rectangle under the segments of the diameter, as the square of the diameter parallel to the ordinate to the square of the diameter to which it is drawn, or as the first diameter to its latus rectum; that is,  $LK^2$  (fig. 5.) is to  $EKF$  as  $EF^2$  to  $GH^2$ .

In the hyperbola, the square of the ordinate is to the rectangle contained under the segments of the diameters betwixt its vertices, as the square of the diameter parallel to the ordinate to the square of the diameter to which it is drawn, or as the first diameter to its latus rectum; that is,  $SX^2$  is to  $EKK$  as  $MN^2$  to  $KE^2$ .

Or if an ordinate be drawn to a second diameter, its square will be to the sum of the squares of the second diameter, and of the line intercepted betwixt the ordinate and centre, in the same proportion; that is,  $RZ^2$  (fig. 6.) is to  $ZG^2$  added to  $GM^2$ , as  $KE^2$  to  $MN^2$ . These are the most important properties of the conic sections: and, by means of these, it is demonstrated, that the figures are the same described on a plane as cut from the cone; which we have demonstrated in the case of the parabola.

### Equations of the Conic Sections

ARE derived from the above properties. The equation of any curve, is an algebraic expression, which denotes the relation betwixt the ordinate and abscissa; the abscissa being equal to  $x$ , and the ordinate equal to  $y$ .

If  $p$  be the parameter of a parabola, then  $y^2 = px$ ; which is an equation for all parabolas.

If  $a$  be the diameter of an ellipse,  $p$  its parameter; then  $y^2 : ax - xx :: p : a$ ; and  $y^2 = \frac{p}{a} \times ax - xx$ ; an equation for all ellipses.

If  $a$  be a transverse diameter of a hyperbola,  $p$  its parameter; then  $y^2 : ax + xx :: p : a$ , and  $y^2 = \frac{p}{a} \times ax + xx$ .

If  $a$  be a second diameter of an hyperbola, then  $y^2 = aa + xx :: p : a$ ; and  $y^2 = \frac{p}{a} \times aa + xx$ ; which are equations for all hyperbolas.

As all these equations are expressed by the second powers of  $x$  and  $y$ , all conic sections are curves of the second order; and conversely, the locus of every quadratic equation is a conic section, and is a parabola, ellipse, or hyperbola, according as the form of the equation corresponds with the above ones, or with some other deduced from lines drawn in a different manner with respect to the section.

### General Properties of Conic Sections.

A TANGENT to a parabola bisects the angle contained by the lines drawn to the focus and directrix; in an ellipse

ellipse and hyperbola; it bisects the angle contained by the lines drawn to the foci.

In all the sections, lines parallel to the tangent are ordinates to the diameter passing through the point of contact; and in the ellipse and hyperbola, the diameters parallel to the tangent, and those passing through the points of contact, are mutually conjugate to each other. If an ordinate be drawn from a point to a diameter and a tangent from the same point which meets the diameter produced; in the parabola the part of the diameter betwixt the ordinate and tangent will be bisected in the vertex; and in the ellipse and hyperbola, the semi-diameter will be a mean proportion betwixt the segments of the diameter betwixt the center and ordinate, and betwixt the centre and tangent.

The parallelogram formed by tangents drawn through the vertices of any conjugate diameters, in the same ellipse or hyperbola, will be equal to each other.

### *Properties peculiar to the Hyperbola.*

As the hyperbola has some curious properties arising from its asymptotes, which appear at first view almost incredible, we shall briefly demonstrate them.

1. The hyperbola and its asymptotes never meet: if not, let them meet in  $S$ , fig. 6.; then by the property of the curve the rectangle  $KXE$  is to  $SX^2$  as  $GE^2$  to  $GM^2$  or  $EP^2$ ; that is, as  $GX^2$  to  $SX^2$ ; wherefore,  $KXE$  will be equal to the square of  $GX$ ; but the rectangle  $KXE$ , together with the square of  $GE$ , is also equal to the square of  $GX$ ; which is absurd.

2. If a line be drawn through a hyperbola parallel to its second axis, the rectangle, by the segments of that line, betwixt the point in the hyperbola and the asymptotes, will be equal to the square of the second axis.

For, if  $SZ$ , fig. 6. be drawn perpendicular to the second axis, by the property of the curve, the square of  $MG$ , that is, the square of  $PE$ , is to the square of  $GE$ , as the squares of  $ZG$  and the square of  $MG$  together, to the square of  $SZ$  or  $GX$ : and the squares of  $RX$  and  $GX$  are in the same proportion, because the triangles  $RXG$ ,  $PEG$  are equiangular; therefore the squares  $ZG$  and  $MG$  are equal to the square of  $RX$ ; from which taking the equal squares of  $SX$  and  $ZG$ , there remains the rectangle  $RSV$ , equal to the square of  $MG$ .

3. Hence, if right lines be drawn parallel to the second axis, cutting an hyperbola and its asymptotes, the rectangles contained betwixt the hyperbola and points where the lines cut the asymptotes will be equal to each other; for they are severally equal to the square of the second axis.

4. If from any points,  $d$  and  $S$ , in a hyperbola, there be drawn lines parallel to the asymptotes  $dS$  and  $Sb$ , the rectangle under  $dS$  and  $dS$  will be equal to the rectangle under  $QS$  and  $Sb$ ; also the parallelograms  $dS$ ,  $Gc$ , and  $SQGb$ , which are equiangular, and consequently proportional to the rectangles, are equal.

For draw  $YW$   $RV$  parallel to the second axis, the rectangle  $YdW$  is equal to the rectangle  $RSV$ ; wherefore,  $WD$  is to  $SV$  as  $RS$  is to  $dY$ . But because

the triangles  $RQS$ ,  $AYD$ , and  $GSV$   $c d W$ , are equiangular,  $Wd$  is to  $SV$  as  $cd$  to  $Sb$ , and  $RS$  is to  $dY$  as  $SQ$  to  $da$ ; wherefore,  $dc$  is to  $Sb$  as  $SQ$  to  $da$ : and the rectangle  $dc$ ,  $da$ , is equal to the rectangle  $QS$ ,  $Sb$ .

5. The asymptotes always approach nearer the hyperbola.

For, because the rectangle under  $SQ$  and  $Sb$ , or  $QG$ , is equal to the rectangle under  $da$  and  $dc$ , or  $AG$ , and  $QG$  is greater than  $aG$ ; therefore  $ad$  is greater than  $QS$ .

6. The asymptotes come nearer the hyperbola than any assignable distance.

Let  $X$  be any small line. Take any point, as  $d$ , in the hyperbola, and draw  $da$ ,  $dc$ , parallel to the asymptotes; and as  $X$  is to  $da$ , so let  $aG$  be to  $GQ$ . Draw  $QS$  parallel to  $ad$ , meeting the hyperbola in  $S$ , then  $QS$  will be equal to  $X$ . For the rectangle  $SQG$  will be equal to the rectangle  $daG$ ; and consequently  $SQ$  is to  $da$  as  $AG$  to  $GQ$ .

If any point be taken in the asymptote below  $Q$ , it can easily be shown that its distance is less than the line  $X$ .

### *Areas contained by Conic Sections.*

THE area of a parabola is equal to  $\frac{2}{3}$  the area of a circumscribed parallelogram.

The area of an ellipse is equal to the area of a circle whose diameter is a mean proportional betwixt its greater and lesser axes.

If two lines,  $ad$  and  $QS$ , be drawn parallel to one of the asymptotes of an hyperbola, the space  $aQSd$ , bounded by these parallel lines, the asymptotes and the hyperbola will be equal to the logarithm of  $aQ$ , whose module is  $ad$ , supposing  $aG$  equal to unity.

### *Curvature of Conic Sections.*

THE curvature of any conic section, at the vertices of its axis, is equal to the curvature of a circle whose diameter is equal to the parameter of its axis.

If a tangent be drawn from any other point of a conic section, the curvature of the section in that point will be equal to the curvature of a circle to which the same line is a tangent, and which cuts off from the diameter of the section, drawn through the point, a part equal to its parameter.

### *Uses of Conic Sections.*

ANY body, projected from the surface of the earth, describes a parabola, to which the direction wherein it is projected is a tangent; and the distance of the directrix is equal to the height from which a body must fall to acquire the velocity wherewith it is projected: hence the properties of the parabola are the foundation of gunnery.

All bodies acted on by a central force, which decreases as the square of the distances increases, and impressed with any projectile motion, making any angle with the direction of the central force, must describe conic sections, having the central force in one of the foci, and will

will describe parabolas, ellipses, and hyperbolas, according to the proportion betwixt the central and projectile force. This is proved by direct demonstration.

The great principle of gravitation acts in this manner; and all the heavenly bodies describe conic sections having the sun in one of the foci; the orbits of the planets are ellipses, whose transverse and lesser diameters are nearly equal; it is uncertain whether the comets describe ellipses with very unequal axes, and so return after a great number of years; or whether they describe parabolas and hyperbolas, in which case they will never return.

*Uses of Conic Sections in the Solution of Geometrical Problems.*

MANY problems can be solved by conic sections that cannot be solved by right lines and circles. The following theorems, which follow from the simpler properties of the sections, will give a specimen of this.

A point equally distant from a given point and a given line, is situated in a given parabola.

A point, the sum of whose distances from two given points is given, is situated in a given ellipse.

A point, the difference of whose distances from two given points is given, is situated in a given hyperbola.

C O N

CONICHTHYODONTES, or PLECTRONITÆ, in natural history, one of the three names the fossil teeth of fishes are known by.

CONIFEROUS TREES, such as bear hard, dry seed-vessels, of a conical figure, consisting of several woody parts, being mostly scaly, adhering closely together, and separating when ripe.

Of this sort is the cedar of Lebanon, fir, &c.

CONINGSECK, the capital of a county of the same name, in the circle of Swabia, in Germany, about twenty miles north of Constance: E. long  $9^{\circ} 23'$ , N. lat.  $47^{\circ} 50'$ .

CONJOINT DEGREES, in music, two notes which follow each other immediately in the order of the scale, as *ut* and *re*.

CONJOINT TETRACHORDS, two tetrachords, or fourths, where the same chord is the highest of one, and the lowest of the other.

CONISSALÆ, in natural history, a class of fossils, naturally and essentially compounded, not inflammable, nor soluble in water, found in detached masses, and formed of crystalline matter debased by earth.

Of this class there are two orders, and of each of these only one genus. Conissalæ of the first order are found in form of a naturally regular and uniform powder, all the genuine particles of which are nearly of one determinate shape, appearing regularly concreted, and not fragments of others once larger. Conissalæ of the second order are found in form of a rude, irregular, and shapeless powder, the particles of which are never of any determinate particular figure, but seem broken fragments of some once larger masses.

To the former genus belong the different kinds of sand; and to the latter, the saburæ, or grits.

CONJUGATE DIAMETER, or *axis of an ellipse*, the shortest of the two diameters, or that bisecting the transverse axis.

CONJUGATE HYPERBOLAS. See CONICSECTIONS.

CONJUGATION, in grammar, a regular distribution of the several inflexions of verbs in their different voices, moods, tenses, numbers and persons, so as to distinguish them from one another.

The Latins have four conjugations, distinguished by the terminations of the infinitive *äre*, *ere*, *ire*, and *ire*.

C O N

The English have scarce any natural inflexions, deriving all their variations from additional particles, pronouns, &c. whence there is scarce any such thing as strict conjugations in that language.

CONIUM, in botany, a genus of the pentandria digynia class of plants. The fruit is globular, crenated on each side, and has five striæ or streaks. There are three species, only one of which, *viz.* the conium maculatum, or hemlock, is a native of Britain. Within these few years past Dr Stork published a treatise recommending the extract of hemlock to be given internally, in several doses, as a kind of specific for cancers, the king's-evil, and all kinds of schirrous tumours. On the faith of this single physician, the whole medical practitioners in Europe dosed their patients who laboured under diseases of the above kinds with hemlock, which is unquestionably a rank poison, if taken to any extent. After two or three years practice, it was at length discovered that the hemlock was not possessed of those extraordinary virtues which Dr Stork had attributed to it; and of course its reputation began to sink, and now, like many other great medicines, has had its day, and is gradually wearing out of practice.

CONJUNCT rights. See SCOTS LAW, title, *Succession in heritable rights*.

CONJUNCT, or CONFIDENT persons. See SCOTS LAW, title, *Actions*.

CONJUNCTION, in astronomy, the meeting of two stars or planets, in the same degree of the zodiac.

CONJUNCTION, in grammar, an undeclinable word, or particle, which serves to join words and sentences together, and thereby shews their relation or dependence one upon another.

CONJUNCTIVA, in anatomy. See Vol. I. p. 291.

CONNAUGHT, the most westerly province of Ireland.

CONNARUS, in botany, a genus of the monodelphia decandria class. It has but one stylus; the stigma is simple; and the capsule has two valves, and contains one seed. There is but one species, *viz.* the monocarpus, a native of India.

CONNECTICUT, a British colony of North America, bounded by the Massachuset colony on the north-east; by the sea, on the south; and by New York, on the west;

west; being about 100 miles in length, and 80 in breadth.

**CONNECTION**, or **CONNEXION**, the relation or dependence of one thing upon another.

**CONNECTION**, or **CONTINUITY**, in the drama, consists in the joining of the several scenes together.

The connection is said to be observed, when the scenes of an act succeed one another immediately, and are so joined as that the stage is never left empty.

**CONNOISSEUR**, a French word much used of late in English, to signify a person well versed in any thing: whence it is used for a critic, or a person who is a thorough judge of any subject.

**CONNOR**, a city of Ireland, in the county of Antrim, and province of Ulster, situated about six miles north of Antrim, in 6° 30' W. long. and 54° 50' N. lat.

**CONOCARPODENDRON**, in botany. See **PROTEA**.

**CONOCARPUS**, the **BUTTON-TREE**, in botany, a genus of the pentandria monogynia class. The corolla consists of four petals; the seeds are naked, solitary, and below the flower; and the flowers are aggregated. There are three species, all natives of the Indies.

**CONOID**, in geometry, a solid body, generated by the revolution of a conic section about its axis. See **CONIC SECTIONS**.

**CONOIDES**, in anatomy, a gland found in the third ventricle of the brain, called *pinealis*, from its resemblance to a pine-apple.

**CONQUEST**. See **SCOTS LAW**, title, *Succession in heritable rights*.

**CONSANGUINITY**, the relation subsisting between persons of the same blood, or who are sprung from the same root.

**CONSANGUINITY** and **AFFINITY**, degrees of, forbidden in marriage; see **SCOTS LAW**, title, *Marriage*. Consanguinity or affinity, an objection against a judge; see title, *Jurisdiction and judges*: Against a witness; see title, *Probation*.

**CONSCIENCE**, a secret testimony of the soul, whereby it gives its approbation to things that are naturally good, and condemns those that are evil. See **MORALS**.

**CONSCRIPT**, in Roman antiquity, an appellation given to the senators of Rome, who were called conscript-fathers on account of their names being entered all in one register.

**CONSECRATION**, the act of devoting any thing to the service and worship of God.

In England, churches have been always consecrated with particular ceremonies, the form of which was left to the discretion of the bishop.

**CONSENT**, in a general sense, denotes much the same with assent. See **ASSENT**.

**CONSENT of parts**, in the animal œconomy. See **SYMPATHY**.

**CONSEQUENCE**, in logic, the conclusion, or what results from reason or argument.

**CONSERVATOR**, an officer ordained for the security and preservation of the privileges of some cities and

communities. having a commission to judge of and determine the differences among them.

**CONSERVATORY**, a term sometimes used for a green house, or ice-house.

**CONSERVE**, in pharmacy, a form of medicine, contrived to preserve the flowers, herbs, roots, pills, or fruits, of several simples, as near as possible to what they are when fresh gathered.

Conserve are made by beating up the thing to be preserved, with sugar, *viz.* a triple quantity thereof to those that are most moist, and a double quantity to those that are least so.

**CONSIGNATION** of money. See **SCOTS LAW**, title, *Obligations and contracts in general*: Of redemption-money; see title, *Redeemable rights*.

**CONSISTENCE**, in physics, that state of a body wherein its component particles are so connected or entangled among themselves, as not to separate or recede from each other. It differs from continuity in this, that it implies a regard to motion or rest, which continuity does not, it being sufficient to denominate a thing continuous that its parts are contiguous to each other.

**CONSISTORIAL**, or **COMMISSARY COURT**. See **SCOTS LAW**, title, *Ecclesiastical persons*.

**CONSISTORY**, at Rome, is an ecclesiastical assembly held in the presence of the pope, for the reception of princes or their ambassadors, for the canonization of saints, for the promotion of cardinals, and other important affairs.

**CONSOLE**, in architecture, an ornament cut upon the key of an arch, which has a projecture, and, on occasion; serves to support little corniches, figures, bulls, and vases. See **ARCHITECTURE**.

**CONSOLIDA**, in botany. See **AJUGA**.

**CONSOLIDATION**, in medicine, the action of uniting broken bones, or the lips of wounds, by means of conglutinating medicines.

**CONSONANCE**, in music, is ordinarily used in the same sense with concord, *viz.* for the union or agreement of two sounds produced at the same time, the one grave and the other acute; which mingling in the air in a certain proportion, occasion an accord agreeable to the ear. See **MUSIC**.

**CONSONANT**, a letter that cannot be sounded without some single or double vowel before or after it, as b, c, d, &c.

**CONSPIRACY**, in law, signifies an agreement between two or more, falsely to indict, or procure to be indicted, an innocent person, of felony.

**CONSPIRATORS** are, by statute, defined to be such as bind themselves by oath, covenant, or other alliance, to assist one another falsely and maliciously to indict persons, or falsely to maintain pleas.

Conspirators in treason are those that plot against the king and the government.

**CONSTABLE**, Lord High Constable, an ancient officer of the crowns both of England and France, whose authority was so very extensive, that the office has been laid aside in both kingdoms, except upon particular occasions,

cations, such as the king's coronation. The constable of France had his person privileged, and, during the king's minority, was named next to the princes of the blood. The army obeyed him next the king: he managed all that belonged to war, either for punishment of delinquents, distribution of booty, surrender of places, &c. The jurisdiction and functions of this office are now in the marshals of France.

The function of the constable of England consisted in the care of the common peace of the land, in deeds of arms and matters of war. By a law of Richard II. the constable of England has the determination of things concerning wars and blazonry of arms, which cannot be discussed by the common law. The first constable was created by the Conqueror: the office continued hereditary till the thirteenth of Henry VIII. when it was laid aside, as being so powerful as to become troublesome to the king. We have also constables denominated from particular places, as constable of the Tower, of Dover castle, of Windsor castle, of the castle of Caernarvon, and many other of the castles of Wales, whose office is the same with that of the castellani, or governors of castles.

**CONSTABLE of Scotland.** See SCOTS LAW, title, *Of inferior judges*.

**CONSTABLES to justices of the peace,** in Scots law, are the proper officers for executing their orders. They have powers to suppress tumults, and to apprehend delinquents and those who can give no good account of themselves, and carry them to the next justice.

**CONSTANCE,** a city of Swabia, in Germany, situated on the western shore of a lake to which it gives name, in  $9^{\circ} 12'$  E. lon. and  $47^{\circ} 37'$  N. lat.

It is the see of a bishop, who is a prince of the German empire.

**CONSTANTINA,** the capital of a province of the same name, in the kingdom of Algiers, in Africa: E. long.  $7^{\circ}$ , and N. lat.  $35^{\circ} 30'$ .

**CONSTANTINOPLE,** the metropolis of the Turkish empire, called by the Turks themselves Stamboul, and by many Europeans the Port, being one of the best harbours in Europe: E. long.  $29^{\circ} 15'$ , and N. lat.  $41^{\circ} 30'$ .

It is built on the western shore of the Bosphorus, in the form of a triangle; the seraglio, or palace, occupying that angle which runs out between the Propontis and harbour; and underneath the palace are the gardens, which extend to the water-side.

**CONSTELLATION,** in astronomy. See Vol. I. p. 486.

**CONSTIPATION,** in medicine, a hardness of the belly, with great costiveness.

**CONSTITUENT PART,** in physiology, an essential part in the composition of any thing, differing little from what is otherwise called element or principle.

**CONSTITUTION,** in matters of policy, signifies the form of government established in any country or kingdom.

**CONSTITUTION** also denotes an ordinance, decision, regulation, or law, made by authority of any superior, ecclesiastical or civil.

**Apostolical CONSTITUTIONS,** a collection of regulations attributed to the apostles, and supposed to have been collected by St Clement, whose name they likewise bear.

It is the general opinion, however, that they are spurious, and that St Clement had no hand in them. They appeared first in the IVth age, but have been much changed and corrupted since that time. They are divided into eight books, consisting of a great number of rules and precepts, relating to the duties of Christians, and particularly the ceremonies and discipline of the church. Mr Whiston, in opposition to the general opinion, asserts them to be a part of the sacred writings, dictated by the apostles in their meetings, and wrote down from their own mouth by St Clement, and intended as a supplement to the New Testament, or rather as a system of Christian faith and polity. The reason why the Constitutions are suspected by the orthodox, and, perhaps, the reason also why their genuineness is defended by Mr Whiston, is, that they seem to favour Arianism.

**CONSTITUTION,** in a physical sense, signifies the particular temperature of the body.

**CONSTRUCTOR,** an appellation given to several muscles on account of their constringing or closing some of the orifices of the body. See ANATOMY.

**CONSTRUCTION of equations,** in Algebra. See ALGEBRA.

**CONSTRUCTION,** in grammar, the connecting the words of a sentence according to the rules of the language.

**CONSUALIA,** in Roman antiquity, a festival instituted by Romulus, who, at the time of the rape of the Sabine virgins, found an altar under ground dedicated to the god Confus, that is, Neptune. They were introduced with a magnificent cavalcade; and during the celebration, the horses and asses were crowned with flowers, and a mule was sacrificed to that god.

**CONSUBSTANTIATION,** a tenet of the Lutheran church with regard to the manner of the change made in the bread and wine in the eucharist.

The divines of that profession maintain, that after consecration, the body and blood of our Saviour are substantially present, together with the substance of the bread and wine, which is called consubstantiation, or impanation.

**CONSUL,** the chief magistrate of the Roman commonwealth. They were two in number, chosen every year in the Campus Martius, by the people assembled in the comitia centuriata. In the first times of the commonwealth, no man could pretend to this dignity, but such as were of a patrician family; but afterwards the people obtained, that one of the consuls should be chosen from among them. A consul was commonly chosen at forty-three years of age, but this was not always observed: besides, it was requisite he should have exercised other offices, as that of quaestor, aedile, and praetor: and yet this condition was no better observed than the first; for Pompey had never been praetor nor quaestor when he obtained the consulship. Their authority and power was of very great extent, so long as the commonwealth subsisted. They were

the

the head of the senate: they commanded the armies, and were supreme judges of the differences between the citizens; but as they had made some abuse of this power, it was allowed by the Valerian law for the party aggrieved to appeal from their tribunal to the people, especially in cases where the life of a citizen was concerned. Under the emperors, consul was little more than an honourable title, and at last it became absolutely extinct in the time of Justinian. From the establishment of the republic to the consulate of Basil, that is, from the year of Rome 244, to the year of Rome 1294, the years are accounted by the consuls; but after that period, the time was computed by the years of the emperors reigns and the indictions.

**CONSUL**, at present, is an officer established by virtue of a commission from the king and other princes, in all foreign countries of any considerable trade, to facilitate and dispatch business, and protect the merchants of the nation. The consuls are to keep up a correspondence with the ministers of England residing in the courts whereon their consulate depends. They are to support the commerce and the interest of the nation; to dispose of the sums given and the presents made to the lords and principals of places, to obtain their protection, and prevent the insults of the natives on the merchants of the nation.

**CONSUMMATION**, the end or completion of the work. Thus we say, the consummation of all things, meaning the world.

**CONSUMPTION**, in medicine, a word of very extensive signification, implies all disorders that bring any decay or waste upon the constitution; but is most used for the phthisis pulmonalis. See **MEDICINE**.

**CONTACT**, is when one line, plane, or body, is made to touch another, and the parts that do thus touch, are called the points or places of contact.

**CONTAGION**, in phisic, the communicating a disease from one body to another. In some diseases it is only effected by an immediate contact or touch, as the venom of the pox; in others, it is conveyed by infected cloaths, as the itch; and in others, it is transmitted through the air at a considerable distance, by means of steams or effluvia expiring from the sick, as in the plague and other pestilential disorders, in which case the air is said to be contagious.

**CONTEMPLATION**, an act of the mind, whereby it applies itself to consider and reflect upon the works of God, nature, &c.

**CONTEMPORARY**, a person or thing that existed in the same age with another. Thus, Socrates, Plato, and Arislophanes, were contemporaries.

**CONTENT**, in geometry, the area or quantity of matter or space included in certain bounds. See **GEOMETRY**.

**CONTESSA**, a port-town of Turkey, in Europe, in the province of Macedonia, situated on a bay of the Archipelago, about 200 miles west of Constantinople: E. long. 25°, and N. lat. 41°.

**CONTEXT**, among divines and critics, that part of scripture or of a writing that precedes and follows the text.

**CONTI**, a town of Picardy in France, about fifteen miles south-west of Aniens: E. long. 2° 20', N. lat. 49° 40'.

**CONTIGUITY**, in geometry, is when the surface of one body touches that of another.

**CONTINENT**, in general, an appellation given to things continued without interruption; in which sense we say, continent fever, &c.

**CONTINENT**, in geography, a great extent of land not interrupted by seas, in contradistinction to island and peninsula, &c. See **GEOGRAPHY**.

**CONTINGENT**, something casual or unusual. Hence future contingent, denotes a conditional event which may or may not happen, according as circumstances fall out.

**CONTINGENTS** are sometimes used by mathematicians in the same sense as tangent. See **TANGENT**.

**CONTINUED proportion**, in arithmetic, is that where the consequent of the first ratio is the same with the antecedent of the second; as 4 : 8 :: 8 : 16, in contradistinction to discrete proportion.

**CONTINUITY**, is defined by some schoolmen the immediate cohesion of parts in the same quantum; by others, a mode of body, whereby its extremities become one; and by others, a state of body resulting from the mutual implication of its parts. There are two kinds of continuity, mathematical and physical. The first is merely imaginary, since it supposes real or physical parts where there are none.

Physical continuity is that state of two or more particles, in which their parts are so mutually implicated as to constitute one uninterrupted quantity or continuum.

**CONTINUO**, in music, signifies the thorough bass, as basso continuo is the continual or thorough bass, which is sometimes marked in music books by the letters B. C.

**CONTORSION**, in medicine, has many significations.

1. It denotes the iliac passion.
2. An incomplete dislocation, when a bone is in part, but not entirely, forced from its articulation.
3. A dislocation of the vertebrae of the back side-ways, or a crookedness of these vertebrae.
- And, 4. A disorder of the head, in which it is drawn towards one side, either by a spasmodic contraction of the muscles on the same side, or a palsy of the antagonist muscles on the other.

**CONTOUR**, in painting, the out-line, or that which defines a figure.

A great part of the skill of the painter lies in managing the contours well. Contour, with the Italian painters, signifies the lineaments of the face.

**CONTOURNE**, in heraldry, is used when a beast is represented standing or running with its face to the sinister side of the escutcheon, they being always supposed to look to the right, if not otherwise expressed.

**CONTOURNIATED**, a term among antiquaries applied to medals, the edges of which appear as if turned in a lath. This sort of work seems to have had its origin in Greece, and to have been designed to perpetuate the memories of great men, particularly those who had bore away the prize at the solemn games. Such are

are those remaining of Homer, Solon, Euclid, Pythagoras, Socrates, and several athletes.

**CONTRABAND**, in commerce, a prohibited commodity, or merchandise bought or sold, imported or exported, in prejudice to the laws and ordinances of a state, or the public prohibitions of the sovereign. Contraband goods are not only liable to confiscation themselves, but also subject all other allowed merchandise found with them in the same box, bale or parcel, together with the horses, waggons, &c. which conduct them. There are contrabands likewise, which, besides the forfeiture of the goods, are attended with several penalties and disabilities.

**CONTRACT**, in a general sense, a mutual consent of two or more parties, who voluntarily promise and oblige themselves to do something, pay a certain sum, or the like. All donations, exchanges, leases, &c. are so many different contracts.

**CONTRACTILE force**, that property or power inherent in certain bodies, whereby, when extended, they are enabled to draw themselves up again to their former dimensions.

**CONTRACTION**, in grammar, is the reducing of two syllables into one, as *can't* for *cannot*, *should'st* for *shoulddest*, &c.

**CONTRACTION**, in physics, the diminishing the extent or dimensions of a body, or the causing its parts to approach nearer to each other, in which sense it stands opposed to dilatation or expansion.

**CONTRA-FISSURE**, in surgery, a kind of fracture, or fissure, in the cranium, which sometimes happens on the side opposite to that which received the blow; or, at least, at some distance from it. See **SURGERY**.

**CONTRARIETY**, an opposition between two things, which imports their being contrary to one another; and consists in this, that one of the terms implies a negation of the other, either mediately or immediately; so that contrariety may be said to be the contrast, or opposition of two things, one of which imports the absence of the other, as love and hatred.

**CONTRARY**, a positive opposite, which, subsisting by turns in the same subject with its opposite, is as remote from it as possible, expells it, and is mutually expelled by it. Blackness and whiteness, cold and heat, are such contraries.

**CONTRAST**. See **RESEMBLANCE**.

**CONTRATE-wheel**, in watch-work, that next to the crown, the teeth and hoop whereof lie contrary to those of the other wheels, from whence it takes its name. See **WATCH-MAKING**.

**CONTRAVALLATION**, or *the line CONTRAVALLATION*, in fortification, a trench guarded with a parapet, and usually cut round about a place by the besiegers, to secure themselves on that side, and to stop the sallies of the garrison. See **FORTIFICATION**.

**CONTRAVENTION**, in law, a man's failing to discharge his word, obligation, duty, or the laws or customs of the place.

**CONTRAYERVA**, in botany. See **DORSTENIA**.

**CONTRE**, in heraldry, an appellation given to several bearings, on account of their cutting the shield con-

trary and opposite ways: thus we meet with contre-bend, contre-chevron, contre-pale, &c. when there are two ordinaries of the same nature opposite to each other, so as colour may be opposed to metal, and metal to colour. See **COUNTER**.

**CONTRITION**, in theology, a sorrow for our sins, resulting from the reflexion of having offended God, from the sole consideration of his goodness, without any regard to the punishment due to the trespass, and attended with a sincere resolution of reforming them.

**CONTROL** is properly a double register kept of acts, issues, &c. of the officers or commissioners in the revenue, army, &c. in order to perceive the true state thereof, and to certify the truth, and the due keeping of the acts subject to the entegisterment.

**CONTROLLER**, an officer appointed to control or oversee the accounts of other officers, and, on occasion, to certify whether or no things have been controlled or examined.

In Britain we have several officers of this name, as controller of the king's house, controller of the navy, controller of the customs, controller of the mint, &c.

**CONTROLLER of the hanaper**, an officer that attends the lord chancellor daily, in term and in seal-time, to take all things sealed in leathern bags from the clerks of the hanaper, and to make the number and effect thereof, and enter them in a book, with all the duties belonging to the king and other officers for the same, and so charge the clerk of the hanaper with them.

**CONTROLLER of the pipe**, an officer of the exchequer, that makes out a summons twice every year, to levy the farms and debts of the pipe. See **PIPE**, and **EX-CHEQUER**.

**CONTROLLERS of the pells**, two officers of the exchequer, who are the chamberlain's clerks, and keep a control of the pell of receipts, and goings out.

**CONTUSION**, in medicine and surgery, any hurt of the body that is inflicted by a blunt instrument. See **SURGERY**.

**CONVALLARIA**, or *LILLY of the VALLEY*, in botany, a genus of the hexandria monogynia class. The corolla is divided into six segments; and the berry is spotted, and has three cells. The species are eight, three of which are natives of Britain, viz. the majalis, or may-lily; the multiflora, or Solomon's-seal; and the polygonatum, or sweet-smelling Solomon's-seal.

**CONVENT**, in church-history. See **MONASTERY**.

**CONVENTICLE**, a private assembly or meeting, for the exercise of religion. The word was first attributed as an appellation of reproach to the religious assemblies of Wickliffe, in this nation, in the reigns of Edward III. and Richard II. There were several statutes made in former reigns, for the suppression of conventicles; but, by 1 William and Mary, it is ordered, that dissenters may assemble for the performance of religious worship, provided their doors be not locked, barred, or bolted.

**CONVENTION**, a treaty, contract, or agreement between two or more parties.

**CONVENTION** is also a name given to an extraordinary assembly of parliament, or the estates of the realm, held

- without the king's writ; as was the convention of estates, who, upon the retreat of king James II. came to a conclusion that he had abdicated the throne, and that the right of succession devolved to king William and queen Mary; whereupon their assembly expired as a convention, and was converted into a parliament.
- CONVERGING**, or **CONVERGENT lines**, in geometry, are such as continually approach nearer one another, or whose distances become still less and less. These are opposed to divergent lines, the distances of which become continually greater: those lines which converge one way, diverge the other.
- CONVERGING rays**, in optics, those rays that, issuing from divers points of an object, incline towards another, till, at last, they meet and cross, and then become diverging rays. See **OPTICS**.
- CONVERSE**, in mathematics. One proposition is called the converse of another, when, after a conclusion is drawn from something supposed in the converse proposition, that conclusion is supposed; and then, that which in the other was supposed, is now drawn as a conclusion from it: thus, when two sides of a triangle are equal, the angles under these sides are equal; and, on the converse, if these angles are equal, the two sides are equal.
- CONVERSION**, in a moral sense, implies a repentance for a temper and conduct unworthy our nature, and unbecoming our obligations to its Author, and a resolution to act a wiser and a better part for the future.
- CONVERSION**, in war, a military motion whereby the front of a battalion is turned where the flank was, in case the battalion is attacked in the flank.
- CONVERSION of equations**, in algebra. See Vol. I. p. 104.
- CONVEX**, an appellation given to the exterior surface of gibbous or globular bodies, in opposition to the hollow inner surface of such bodies, which is called concave: thus we say, a convex frieze, lens, mirror, superficies, &c.
- CONVEXITY**, that configuration or shape of a body, on account of which it is denominated convex.
- CONVEYANCE**, in law, a deed or instrument that passes land, &c. from one person to another.
- CONVICT**, in common law, a person that is found guilty of an offence by the verdict of a jury.
- CONVICTION**, in theology, expresses the first degree of repentance, wherein the sinner becomes sensible of his guilt, of the evil nature of sin, and of the danger of his own ways.
- CONVOCAION**, an assembly of the clergy of England, by their representatives, to consult of ecclesiastical matters. It is held during the session of parliament, and consists of an upper and a lower house. In the upper sit the bishops, and in the lower the inferior clergy, who are represented by their proctors, consisting of all the deans and archdeacons, of one proctor for every chapter, and two for the clergy of every diocese, in all one hundred and forty-three divines, viz. twenty-two deans, fifty-three archdeacons, twenty-four prebendaries, and forty-four proctors of the diocesan clergy. The lower house chooses its prolocutor, whose business it is to take care that the members attend, to collect their debates and votes, and to carry their resolutions to the upper house. The convocation is summoned by the king's writ, directed to the archbishop of each province, requiring him to summon all bishops, deans, archdeacons, &c.
- The power of the convocation is limited by a statute of Henry VIII. They are not to make any canons or ecclesiastical laws, without the king's licence; nor, when permitted to make any, can they put them in execution, but under several restrictions. They have the examining and censuring all heretical and schismatical books and persons, &c. but there lies an appeal to the king in chancery, or to his delegates. The clergy in convocation, and their servants, have the same privileges as members of parliament.
- CONVOLUTION**, a winding motion, proper to the trunks of some plants, as the convolvulus, or bind-weed; the clasps of vines, bryony, &c.
- CONVOLVULUS**, or **BIND-WEED**, in botany, a genus of the pentandria monogynia class. The corolla is bell-shaped, and plaited; it has two stigmata; and the capsule is bilocular, each cell containing two seeds. There are forty-three species, only three of which are natives of Britain, viz. the arvensis, or small bind-weed; the sepium, or great bind-weed; and the soldanella, or sea bind-weed.
- CONVOY**, in marine affairs, one or more ships of war, employed to accompany and protect merchant ships, and prevent their being insulted by pirates, or the enemies of the state in time of war.
- CONVOY**, in military matters, a body of men that guard any supply of men, money, ammunition, or provisions, conveyed by land into a town, army, or the like, in time of war.
- CONVULSION**, in medicine, a preternatural and violent contraction of the membranous and muscular parts of the body. See **MEDICINE**.
- CONWAY**, a market-town of Carnarvonshire in North Wales, situated near the mouth of a river of the same name, fifteen miles west of St Asaph: W. long. 3° 50', and N. lat. 53° 20'.
- CONYZA**, or **FLEA-BANE**, in botany, a genus of the syngenesia polygamia superflua class. The receptacle is naked; the pappus is simple; the calix is roundish and imbricated; and the rays of the corolla are divided into three segments. There are nineteen species, only one of which is a native of Britain, viz. the squarrosa, or plowman's spikenard.
- CONZA**, a town of the kingdom of Naples in Italy, situated on the farther Principate, on the river Offanto, fifty miles south-east of the city of Naples: E. long. 16°, N. lat. 41°. It is the see of an archbishop.
- COOPER**, in geography, the name of a river in Carolina in North America.
- COOPER**, on board a ship, he that looks to the casks, and all other vessels for beer, water, or any other liquor. He has a mate under him.
- CO-ORDINATE**, something of equal order, rank, or degree with another. See **ORDER**.

COPAIBA

**COPAIBA**, or *balsam of COPAIBA*, a liquid resinous juice, flowing from incisions made in the trunk of the fera, a large tree which grows in the Spanish West Indies, and is used as a corroborating and detergent medicine.

**COPAL**, in the materia medica, a resin obtained from several sorts of large trees in New Spain. It is brought to us in irregular lumps; but it has never come into use as a medicine, and is rarely to be met with in the shops.

**COPENHAGEN**, the capital of the kingdom of Denmark, situated on the eastern shore of the island of Zealand, upon a fine bay of the Baltic sea, not far from the strait called the Sound: E. long. 13°, and N. lat. 55° 30'.

**COPERNICAN**, in general, something belonging to Copernicus. Hence,

**COPERNICAN system** or *hypothesis*, that system of the world, wherein the sun is supposed to rest in the centre, and the planets, with the earth, to move in ellipses round him. See Vol. I. p. 434.

**COPERNICUS**, the name of an astronomical instrument, invented by Mr Whiston, to exhibit the motion and phenomena of the planets, both primary and secondary. It is built upon the Copernican system, and for that reason called by his name.

**COPHTS**, **COPHTI**, or **COPTS**, a name given to such of the Christians of Egypt as are of the sect of Jacobites.

The Cophts have a patriarch, who is styled the patriarch of Alexandria, having eleven or twelve bishops under him, but no archbishop. The rest of the clergy, whether secular or regular, are of the order of St Anthony, St Paul, and St Macarius, each of whom have their monasteries. The Cophts have seven sacraments, viz. baptism, the eucharist, confirmation, ordination, faith, fasting, and prayer.

**COPHTIC**, or **COPTIC language**, is that spoke by the Cophts, being the ancient language of the Egyptians, intermixed with the Greek, and the characters of it being those of the Greek.

The ancient Coptic is now a dead language, to be met with no where but in books, and those only translations of the scriptures, and of ecclesiastical offices, or others that have a relation thereto; the language now used over all the country being that of the Arabic.

**COPPEL**, **COPPEL**, or **CUPPEL**, a chemical vessel made of earth, pretty thick, and of the form of a platter or dish.

**COPPELLING**, or **CUPPELLING**, in chemistry, is the putting metallic substances into a coppel, or covered vessel, made of bone ashes, and set in a naked fire, to try what gold or silver they will afford. See p. 114.

**COPPER** constitutes a distinct genus of metals, being next to iron in specific gravity, but lighter than gold, silver, or lead. See p. 80.

**COPPERAS**, a name given to the factitious green vitriol. See **CHEMISTRY**.

The English copperas is made at Deptford, in the following manner, from pyritæ. See **PYRITÆ**.

A heap of these stones, two or three foot thick, is laid in a bed well rammed; where being turned once in six months, in five or six years, by the action of the air and rain, they begin to dissolve, and yield a liquor which is received in pits, and thence conveyed into a cistern, in a boiling-house. The liquor at length being pumped out of the cistern into a leaden boiler, and a quantity of iron added thereto, in two or three days the boiling is compleated; care having been taken all along to supply it with fresh quantities of iron, and to restore the boiling, whenever it seems to abate. When boiled sufficiently, it is drawn off into a cooler, with sticks across, where it is left 14 or 15 days to shoot. The uses of copperas are numerous. It is the chief ingredient in the dyeing of wool, cloths, and hats, black; in making ink; in tanning and dressing leather, &c. and from hence is prepared oil of vitriol, and a kind of Spanish brown for painters. In medicine it is rarely prescribed under the name of copperas, but it is a true salt of iron, and often prescribed under that name, and used instead of the genuine preparation; our chemists in general giving themselves no further trouble about the making of that salt, than to dissolve and purify the common copperas, and shoot it again into crystals.

**COPPICE**, or **COPSE**, a little wood, consisting of under-woods, or such as may be raised either by sowing or planting.

**COPULATION**, the act of generation, or the congress of the male and female, otherwise called coition. See **GENERATION**.

**COPY-HOLD**, a tenure for which a tenant has nothing to shew but the copy of the rolls made by the steward of the lords court.

It is called a base tenure, because the tenant holds the land at the will of the lord. However, it is not simply at the will of the lord, but according to the custom of the manor by which such estate is defendible, and the tenants heirs may inherit it; and a copyholder, so long as he does his services, and does not break the custom, cannot be ejected by the lord; and if he be, he shall have trespass against him.

**COPY-HOLDER**, one who is admitted tenant of lands or tenements within a manor, which time out of mind, by use and custom of the manor, have been demisable and demised to such as will take them in fee simple or fee-tail, for life, years, or at will, according to the custom of the manor by copy of court-roll; but is generally where the tenant has such estate either in fee or for three lives.

**COQUIMBO**, a port-town of Chili, in South America, situated at the mouth of a river of the same name, which discharges itself into the pacific ocean: W. long 75° 10', and N. lat. 30°.

**COR CAROLI**, in astronomy, an extraneostellated star in the northern hemisphere, situated between the coma berenices, and ursa major, so called by Dr Halley in honour of king Charles.

**COR HYDRÆ**, a fixed star of the first magnitude, in the constellation of hydra.

Cor.

**COR LEONIS**, or **REGULUS**, in astronomy, a fixed star of the first magnitude in the constellation leo.

**CORACO-BRACHIALIS**, in anatomy. See Vol. I. p. 196.

**CORACOIDES**, in anatomy. See Vol. I. p. 177.

**CORACOMANTES**, in antiquity, persons who foretold events from their observations on crows.

**CORACO-RADIALIS**, in anatomy. See Vol. I. p. 197.

**CORALLINA**, or **CORAL**, in zoology, a genus belonging to the order of vermes zoophyta. The trunk is radicated, jointed, and calcareous. The species are eight, distinguished by the form of their branches, and are found in the ocean adhering to stones, bones, shells, &c. The corals were formerly believed to be vegetable substances hardened by the air; but are generally believed to be composed of a congeries of animals, which are even endued with the faculty of moving spontaneously. Linnæus's order of zoophyta is composed of animals of this kind; as the spongia, fertularia, &c. See **NATURAL HISTORY**.

**CORALLODENDRON**, in botany. See **ERYTHRINA**.

**CORAL fishery**. Red coral is found in the Mediterranean, on the shores of Provence, from Cape de la Couronne to that of St Tropez; about the isles of Majorca and Minorca; on the south of Sicily; on the coasts of Africa; and, lastly, in the Ethiopic ocean, about cape Negro. The divers say, that the little branches are found only in the caverns whose situation is parallel to the earth's surface, and open to the south. The manner of fishing being nearly the same wherever coral is found, it will suffice to instance the method used at the bastion of France, under the direction of the company established at Marseilles for that fishery. Seven or eight men go in a boat commanded by the patron or proprietor, and when the net is thrown by the caster, the rest work the vessel, and help to draw the net in. The net is composed of two rafters of wood tied cross-wise, with leads fixed to them: to these they fasten a quantity of hemp twisted loosely round, and intermingled with some large netting. This instrument is let down where they think there is coral, and pulled up again, when the coral is strongly intangled in the hemp and netting. For this purpose, six boats are sometimes required; and if in hauling in, the rope happens to break, the fishermen run the hazard of being lost. Before the fishers go to see, they agree for the price of the coral, which is sometimes more, sometimes less a pound; and they engage, on pain of corporal punishment, that neither they nor their crew shall embezzle any, but deliver the whole to the proprietors. When the fishery is ended, which amounts one year with another to twenty-five quintals for each boat, it is divided into thirteen parts, of which the proprietor hath four, the casters two, and the other six men one each; the thirteenth belongs to the company for payment of the boat furnished them.

**CORAN**, or **ALCORAN**. See **ALCORAN**.

**CORAX**, in ornithology, the trivial name of a species of corvus. See **CORVUS**.

**CORBAN**, a scripture term of an offering which had life, in opposition to the minchab which had no life.

**CORBAN** is also a ceremony which the Mahometans perform at the foot of mount Ararat, in Arabia, near Mecca. It consists in killing a great number of sheep, and distributing them among the poor.

**CORBEILS**, in fortification. See **BASKET**.

**CORBEL**, in architecture, a representation of a basket, sometimes seen on the heads of the caryatides.

**CORBY**, a town of Germany, thirty miles east of Paderborn, in Westphalia: East long. 9° 20', N. lat. 51° 40'.

**CORCHORUS**, **JEWS-SALLAD**, in botany, a genus of the polyandria monogynia class. The corolla consists of five petals; the calix is deciduous, and consists of five leaves; and the capsule has many cells and valves. The species are six, none of them natives of Britain.

**CORD of wood**, a certain quantity of wood for burning, so called because formerly measured with a cord. The dimensions of a statute cord of wood are eight feet long, four feet high, and four feet broad.

**CORD-WOOD**, is new wood, and such as, when brought by water, comes on board a vessel, in opposition to that which is floated.

**CORDAGE**, a term used, in general, for all sorts of cord, whether small, middling, or great. See **ROPE**.

**CORDATED**, an appellation frequently given by naturalists to things somewhat resembling a heart.

**CORDED**, in heraldry. A cross corded some authors take for a cross wound or wrenched about with cords. See **CABLED-CROSS**.

Others, with more probability, take it for a cross made of two pieces of cord.

**CORDELERAS**, mountains of south America, otherwise called Andes. See **ANDES**.

**CORDELIER**, in church-history, a Franciscan or religious of the order of St Francis.

**CORDIA**, in botany, a genus of the pentandria monogynia class. The corolla is tunnel-shaped, and has but one petal; the stylus is dichotomous; and the fruit is a bilocular drupa. The species are five, none of them natives of Britain.

**CORDIAL**, in medicine, whatever raises the spirits, and gives them a sudden strength and cheerfulness, as wine, spirits, the effluvia of flowers, fruit, and many other substances.

**CORDON**, in fortification, a row of stones, made round on the outside, and set between the wall of the fortrefs which lies alope, and the parapet which stands perpendicular, after such a manner, that this difference may not be offensive to the eye: whence the cordons serve only as an ornament, ranging round about the place, being only used in fortification of stone-work. For in those made with earth, the void space is filled up with pointed stakes.

**CORDOUA**, **CORDOVA**, a city of Andalusia, in Spain, situated

- situated on the river Guadalquivir, seventy-two miles north-east of Seville, and seventy-five north of Malaga: W. long.  $4^{\circ} 45'$ , and N. lat.  $37^{\circ} 45'$ .
- COREA**, an island or peninsula on the north-east coast of China, between  $36^{\circ}$  and  $42^{\circ}$  N. lat.
- CORDWAINERS** a term whereby shoemakers are denominated in statutes. By a statute of Jac. I. the master and wardens of the cordwainers company, &c. are to appoint searchers and triers of leather; and no leather is to be sold before searched, sealed, &c.
- CORDYLINA**, in botany. See **YUCCA**.
- CORDYLUS**, the trivial name of a species of **Lacerta**. See **LACERTA**.
- COREGONUS**, in ichthyology, a synonyme of a species of **Salmo**. See **SALMO**.
- COREIA**, in antiquity, a festival in honour of Proserpine.
- COREOPSIS**, in botany, a genus of the syngenesia polygamia frustranea class. The receptacle is paleaceous, the pappus has two double horns; the calix is erect, and consists of many leaves. There are eleven species, none of them natives of Britain.
- CORFE-CASTLE**, a borough-town of Dorsetshire, about twelve miles east of Dorchester, near the sea: W. long.  $2^{\circ} 10'$ , and N. lat.  $50^{\circ} 36'$ . It sends two members to Parliament.
- CORFU**, an island subject to the Venetians, situated in the Mediterranean, near the entrance of the gulph of Venice.
- CORFU** is also the capital of the above island: E. long.  $20^{\circ} 40'$ , and N. lat.  $39^{\circ} 40'$ .
- CORIA**, a city of Estremadura, in Spain, thirty-five miles north of Alcantara: W. long.  $6^{\circ} 40'$ , and N. lat.  $39^{\circ} 55'$ . It is a bishop's see.
- CORIANDRUM**, in botany, a genus of the pentandria digynia class. The corolla is radiated; the involucre universal consists of one leaf, and the partiale is dimidiated; and the fruit is spherical. The species are two, only one of which, viz. the fativum, or coriander, is a native of Britain. The seeds are used as a stomachic.
- CORIARIA**, MYRTLE-SUMACH, in botany, a genus of the diœcia decandria class. The calix of both male and female consists of five leaves, and the corolla of each has five petals. The antheræ are divided into two parts: The female has five styli, and five seeds. The species are two, none of them natives of Britain.
- CORINDUM**, in botany. See **CARDIOSPERMUM**.
- CORINTH**, a city of European Turkey, situated near the isthmus into the Morea, about fifty miles west of Athens, in  $23^{\circ}$  E. long. and  $37^{\circ} 30'$  N. lat.
- CORINTHIAN ORDER**, in architecture. See Vol. I. p. 352.
- CORIS**, in botany, a genus of the pentandria monogynia class. The corolla has but one irregular leaf; the calix is prickly, and the capsule has five valves. There is but one species, a native of Montpellier.
- CORISPERMUM**, in botany, a genus of the monandria digynia class of plants, whose corolla consists of
- Vol. II. No. 41.

two compressed, crooked, pointed petals, equal in size, and placed opposite one another: its fruit is a roundish capsule, compressed, bilocular, and having a furrowed edge; the seeds are of an oblong figure, and stand single. There are two species, none of them natives of Britain.

**CORK**, or **CORK-TREE**, in botany. See **QUERCUS**.  
**CORK**, or **CORKING of a saddle**, the pieces to which the bolsters are made fast; so called as having formerly been made of cork.

**CORK**, in geography, the capital of a county of the same name, in Ireland, and province of Munster, situated on the river Lee, about fifty miles south of Limerick: W. long.  $8^{\circ} 25'$ , and N. lat.  $51^{\circ} 40'$ .

**CORMANDEL-COAST**, comprehends the eastern coast of the hither India, bounded by Golconda on the north, the bay of Bengal on the east, Madura on the south, and Bishnagar on the west: it lies between  $10^{\circ}$  and  $20^{\circ}$  N. lat.

**CORMORANT**, in ornithology. See **TANTALUS**.

**CORN**, in country affairs, the grain or seeds of plants, separated from the spica, or ear, and used for making bread.

There are several species of corn, such as wheat, rye and barley, millet and rice, oats, maize and lentils, pease, and a number of other kinds, each of which has its usefulness and propriety. Corn is very different from fruits, with respect to the manner of its preservation; and is capable of being preserved in public granaries, for pressing occasions, and of being kept for several centuries.

The first method is to let it remain in the spike; the only expedient for conveying it to the islands and provinces of America. The inhabitants of those countries save it in the ear, and raise it to maturity by that precaution: but this method of preserving it, is attended with several inconveniencies among us; corn is apt to rot or sprout, if any the least moisture is in the heap; the rats likewise infest it, and our want of straw also obliges us to separate the grain from the ear. The second is to turn and winnow it frequently; or to pour it through a trough or mill-hopper, from one floor to another; being thus moved and aired every fifteen days, for the first six months, it will require less labour for the future, if lodged in a dry place: but if, through neglect, mixes should be allowed to slide into the heap, they will soon reduce the corn to a heap of dust: this must be avoided by moving the corn anew, and rubbing the places adjacent with oils and herbs, whose strong odour may chase them away; for which garlic and dwarf-elder are very effectual: they may likewise be exposed to the open sun; which immediately kills them. When the corn has been preserved from all impurities for the space of two years, and has exhaled all its fires, it may be kept for fifty or even a hundred years, by lodging it in pits, covered with strong planks, closely joined together: but the safer way is to cover the heap with quick-lime, which should be dissolved by sprinkling it over with a small quantity of water; this causes the grains to shoot to

† 4 B the

the depth of two or three fingers, and incloses them with an incrustation, through which neither air nor insects can penetrate.

Corn not exceeding the under mentioned prices have the following bounties *per* quarter, *viz.*

	Price <i>per</i> qr.	Bounty <i>per</i> qr.
	l. s. d.	s. d.
Wheat	2 8	5 0
Rye	1 12	3 6
Barley and Malt	1 4	2 6
Oat-meal	0 15	2 6

In France corn of the growth of the kingdom is reckoned a contraband commodity.

CORN-MILL, a water-engine for grinding of corn. See MECHANICS.

CORN, in medicine and surgery, a hard tubercle like a flat wart, growing in several parts of the feet, especially upon the joints of the toes. See MEDICINE.

CORNACHINE-powder, the same with what is sometimes called the earl of Warwick's powder, and *pulvis de tribus*. It is prepared thus: Take four ounces of scammony; calcined hartshorn prepared, three ounces; grind them together into a powder. It is given as a purge.

CORNAGE, an ancient tenure, the service whereof was to blow a horn when any invasion of the Scots was perceived.

This tenure was very frequent in the northern counties near the Piets wall.

CORNEA *tunica*, in anatomy. See Vol. I. p. 289.

CORNEL-trees, in botany. See CORNUS.

CORNELIAN. See CARNELIAN.

CORNER, in a general sense, the same with angle. See ANGLE.

CORNET, in the military art of the ancients, an instrument much in the nature of a trumpet, which when it only sounded, the ensigns were to march alone, without the soldiers; whereas, when the trumpet only sounded, the soldiers were to move without the ensigns. The cornets and buccinæ sounded the charge and retreat, and the cornets and trumpets sounded during the course of the battle.

CORNET, in the military art of the moderns, the third commission-officer in a troop of horse or dragoons.

This is a very honourable post: he commands in the lieutenant's absence; his principal duty being to carry the standard, near the middle of the first rank of the squadron.

CORNEUS, the name by which Linnæus calls a kind of tin-ore, found in black columns, with irregular sides, and terminating in prisms.

CORNICHE, CORNISH, or CORNICE, in architecture. See ARCHITECTURE.

CORNICHE is also used, in general, for all little projections in masonry or joinery, even where there are no columns, as the corniche of a chimney, beaufet, &c.

CORNICHE-ring, of a piece of ordnance, is that next from the muzzle-ring, backward.

CORNICULARIUS, in Roman antiquity, an officer of

the army, appointed to assist the military tribune in quality of lieutenant.

CORNIX, in ornithology, the trivial name of a species of *corvus*. See CORVUS.

CORNU. See HORN.

CORNU ammonis, in natural history, fossil shells, called also serpent-stones, or snake-stones.

They are found of all sizes, from the breadth of a sixpence, to more than two feet in diameter; some of them rounded, others greatly compressed, and lodged in different strata of stones and clays; some again are smooth, and others ridged in different manners, their striæ and ridges being either straight, irregularly crooked, or undulated.

CORNU cervi. See HARTSHORN.

CORNUCOPIA, or HORN OF PLENTY, among painters, &c. is represented under the figure of a large horn, out of which issue fruits, flowers, &c. Upon medals the cornucopia is given to all deities, geni, and heroes, to mark the felicity and abundance of all the wealth procured by the goodness of the former, or the care and valour of the latter.

CORNUCOPÆ, in botany, a genus of the triandria digynia class. The involucre consists of one tunnel-shaped crenated leaf, containing many flowers; and the calices are double-valved. There is but one species, *viz.* the cuculiatum, a native of Sinyria.

CORNUS, or CORNEL-TREE, in botany, a genus of the tetrandria monogynia class. The involucre consists mostly of four leaves; the petals are four, and above the fruit, which is a bilocular gluma. There are five species, none of them natives of Britain.

CORNUTIA, in botany, a genus of the didynamia angiospermia class. The calix has five teeth; the stamina are longer than the corolla; the stylus is very long; and the berry contains but one seed.

CORNWAL, the most westerly county of England, which gives the title of duke to the prince of Wales. It sends forty-four members to parliament.

COROLLA, among botanists, the most conspicuous part of a flower, surrounding the organs of generation, and composed of one or more flower-leaves, most commonly called petals, to distinguish them from the leaves of the plant; according as there is one, two, or three of these petals, the corolla is said to be monopetalous, dipetalous, tripetalous, &c.

COROLLARY is a consequence drawn from something already advanced or demonstrated.

COROLLULA, a term used by botanists, to express the little partial flowers, which together make up the compound ones.

CORONA, among anatomists, denotes that edge of the glans penis where the preputium begins. See ANATOMY.

CORONA, among botanists. See PAPPUS.

CORONA borealis, the NORTHERN CROWN, in astronomy. See Vol. I. p. 486.

CORONA imperialis, in zoology, a synonyme of a species of *conus*. See CONUS.

CORONA imperialis, in botany. See FRITILLARIA.

CORONA

**CORONA** *solis*, in botany. See **HELIANTHUS**.

**CORONÆ** *jur.* See **JUS**.

**CORONAL**, in anatomy. See Vol. I. p. 152.

**CORONALE** *os*, in anatomy, the same with the *os frontis*. See Vol. I. p. 152.

**CORONARIA**, in botany. See **AGROSTEMA**.

**CORONARY** *vessels*, in anatomy. See **ANATOMY**, Part III. and IV.

**CORONEOLA**, in botany. See **LYSIMACHIA**.

**CORONER**, an ancient officer of this kingdom, so called because he is wholly employed for the king and crown.

The office of coroners especially concerns the pleas of the crown; and they are conservators of the peace in the county where elected, being usually two for each county. Their authority is judicial and ministerial: judicial, where a person comes to a violent death; to take and enter appeals of murder, pronounce judgment on outlawries, &c. and to inquire into the lands, goods, and escape of murders, treasure trove, wreck of the sea, deodands, &c. The ministerial power is when coroners execute the king's writs, on exception taken to the sheriff, as being party in a suit, of kin to either of the parties, or on the default of the sheriff, &c. The authority of the coroner does not terminate on the demise of the king, as that of judges, &c. does, who act by the king's commission. On default of sheriffs, coroners are to impanel juries, and to return issues on juries not appearing, &c.

**CORONET**. See **CROWN**.

**CORONET**, or **CRONET** *of a horse*, the lowest part of the postern, which runs round the coffin, and is distinguished by the hair joining and covering the upper part of the hoof.

**CORONILLA**, in botany, a genus of the diadelphia decandria class. The calix is bilabiate, and the vexillum is hardly longer than the alæ. There are 11 species, none of them natives of Britain.

**CORONOPUS**, in botany. See **PLANTAGO**.

**CORPORA** *cavernosa*, in anatomy. See Vol. I. p. 272.

**CORPORA** *olivaria*, in anatomy. See Vol. I. p. 287.

**CORPORA** *pyramidalia*, in anatomy. See Vol. I. p. 287.

**CORPORA** *friata*, in anatomy. See Vol. I. p. 286.

**CORPORAL**, an inferior officer under a serjeant, in a company of foot, who has charge over one of the divisions, places and relieves sentinels, and keeps good order in the corps de garde: he also receives the word from the inferior rounds, which passes by his corps de garde. This officer carries a fusée, and is commonly an old soldier: there are generally three corporals in each company.

**CORPORAL** *of a ship*, an officer who has the charge of setting and relieving the watches and centries, and who sees that the soldiers and sailors keep their arms neat and clean: he teaches them how to use their arms, and has a mate under him.

**CORPORATION**, a body politic, or incorporate, so called, because the persons or members are joined into one body, and are qualified to take and grant, &c.

Corporations are either spiritual or temporal: spiritual, as bishops, deans, archdeacons, parsons, vicars, &c. Temporal, as mayor, commonalty, bailiff, burgesses, &c. And some corporations are of a mixed nature, composed of spiritual and temporal persons, such as heads of colleges and hospitals, &c. All corporations are said to be ecclesiastical or lay: ecclesiastical are either regular, as abbeys, priories, chapters, &c. or secular, as bishoprics, deaneries, archdeacons, &c. lay, as those of cities, towns, companies, or communities of commerce, &c.

**CORPOREAL**, those qualities which denominate a body. See **QUALITY**, **BODY**, and **INCORPOREAL**.

**CORPULENCY**, in medicine, the state of a person too much loaded with flesh or fat.

**CORPUS** *callosum*, in anatomy. See Vol. I. p. 285.

**CORPUS** *cavernosum*, in anatomy. See Vol. I. p. 272.

**CORPUS** *reticulare*. See **RETICULARE**.

**CORPUS Christi**, a festival of the church, kept on the next Thursday after Trinity-sunday, instituted in honour of the eucharist; to which also one of the colleges in Oxford is dedicated.

**CORPUSCLE**, in physics, a minute particle, or physical atom, being such as a natural body is made up of. By this word is not meant the elementary particles, nor the hypostatical principles of chemists; but such particles, whether of a simple or compound nature, whose parts will not be dissolved nor dissipated by ordinary degrees of heat.

**CORPUSCULAR philosophy**, that way of philosophizing which endeavours to explain things, and to account for the phenomena of nature by the motion, figure, rest, position, &c. of the corpuscles, or the minute particles of matter.

Mr Boyle sums up the chief principles of the corpuscular hypothesis, which now flourishes under the mechanical philosophy, in these particulars:

1. They suppose that there is but one catholic or universal matter, which is an extended, impenetrable, and divisible substance, common to all bodies, and capable of all forms.
2. That this matter, in order to form the vast variety of natural bodies, must have motion in some or all its assignable parts; and that this motion was given to matter by God the Creator of all things, and has all manner of directions and tendencies.
3. Matter must also be actually divided into parts, and each of these primitive particles, fragments, or atoms of matter, must have its proper magnitude or size, as also its peculiar figure or shape.
4. They suppose also, that these differently sized and shaped particles may have as different orders and positions, whereof great variety may arise in the composition of bodies.

**CORRECTION**, in printing, the pointing out or discovering the faults in a printed sheet, in order to be amended by the compositor before it be printed off. See **PRINTING**.

**CORRECTOR**, in general, denotes something that mends the faults or bad qualities of others.

**CORRECTOR** *of the staple*, a clerk belonging to the staple, whose business is to write down and record the bargains that merchants make there.

**CORRECTOR**,

**CORRECTOR**, in medicine and pharmacy, an ingredient in a compoſition, which guards againſt or abates the force of another.

**CORRELATIVE**, ſomething oppoſed to another in a certain relation. Thus, father and ſon are correlatives. Light and darkneſs, motion and reſt, are correlative and oppoſite terms.

**CORRIGIOLA**, in botany. See **ILLECEBRUM**.

**CORROBORANTS**, or **CORROBORATIVE medicines**. See **STRENGTHENERS**.

**CORROSION**, in a general ſenſe, the action of gnawing away, by degrees, the continuity of the parts of bodies.

**CORROSION**, in chemistry, an action of bodies, by means of proper menſtrums, that produces new combinations, and a change of their form, without converting them to fluidity. See **CHEMISTRY**.

**CORRUGATOR**, in anatomy. See Vol. I. p. 291.

**CORROSIVES**, in ſurgery, are medicines which corrode whatever part of the body they are applied to: ſuch are burnt alum, white precipitate of mercury, white vitriol, red precipitate of mercury, butter of antimony, lapis infernalis, &c.

**CORRUPTION**, the deſtruction, extinction, or, at leaſt, ceaſation for a time, of the proper mode of exiſtence of any natural body. See **PUTREFACTION**.

**CORRUPTION of blood**, in law, an infection accruing to a man's ſtate, attainted of felony and treaſon, and to his iſſue; for as he loſes all to the prince, &c. his iſſue cannot be heirs to him, or to any other anceſtor by him: and if he were noble, his heirs are rendered ignoble.

**CORSA**, in architecture. See **PLAT-band**.

**CORSAIR**, a pirate, or perſon who ſcours the ſea for plunder, with an armed veſſel, without commiſſion from any prince or power. A corſair differs from a privateer, in that the latter acts under a commiſſion, and only attacks the veſſels of thoſe at war with the ſtate whence he had his commiſſion.

**CORSELET**, a little cuirafs; or, according to others, an armour or coat made to cover the whole body, anciently worn by the pike-men, uſually placed in the front and flanks of the battle, for the better reſiſting the enemy's aſſaults, and guarding the ſoldiers placed behind them.

**CORSICA**, an iſland in the Mediterranean, between 8° and 10° E. long. and between 41° and 43° N. lat. about one hundred miles ſouth of Genoa, and ſubject to that republic; though the natives for many years diſputed their right. This iſland is now in the hands of the French, after a glorious ſtruggle for liberty under general Paoli.

**CORTEX**, or **CORTEX Peruvianus**. See **CINCHONA**.

**CORTEX cerebri**. See Vol. p. 285.

**CORTONA**, a city of Tuſcany, in Italy, about thirty-five miles ſouth-eaſt of Sienna: E. long. 13°, and N. lat. 43° 15'.

**CORTUSA**, in botany, a genus of the pentandria monogynia claſs. The corolla is rotated, with an open

limbus; and the caſpule has two valves. There are two ſpecies, none of them natives of Britain.

**CORUNNA**, or **GROYNE**, a port-town of Galicia in Spain, ſituated on a fine bay of the Atlantic ocean, about thirty-two miles north of Compoſtella: W. long. 9°, and N. lat. 43°.

**CORUS**, in Jewiſh antiquity. See **HOMER**.

**CORUS**, in our old writers, denotes eight buſhels, or a quarter.

**CORUS** is alſo a wind, ſo called by the Jews, riſing in the ſummer in the weſt; and is that at preſent called the north eaſt-wind.

**CORUSCATION**, a glittering, or gleam of light iſſuing from any thing. It is chiefly uſed for a flaſh of lightning darting from the clouds in time of thunder.

**CORVUS**, the **RAVEN**, or **CROW-kind**, in ornithology, a genus of birds, of the order of picæ, the diſtinguiſhing characteristics of which are theſe: The beak is convex and cultrated; the noſtrils are covered with brittle feathers; the tongue is forked and cartilaginous; and the feet are of the walking kind. The ſpecies are nineteen, viz. 1. The hottentottus, is of a greeniſh black colour, with long myſtaches, and an equal tail. It is found at the Cape of Good Hope. 2. The corax, or raven of Engliſh authors, is black, with a blueiſh back, and a roundiſh tail. It is a native of Europe, and feeds upon carcion: it is much given to theft, and may be taught to utter articulate ſounds.

3. The corone, or carcion-crow, is of a black blueiſh colour, with the prime wing-feathers ſharp, and a round tail: it lives upon carcion and fruits, and is a native of Europe. 4. The frugilegus, or rook, is black, with an aſh-coloured forehead, and a roundiſh tail. The rooks aſſemble in flocks, and infeſt the corn-fields: many of them ſleep together in the ſame tree, by which means they are eaſily taken. 5. The cornix, or roylton-crow, is aſh-coloured, with the throat, wings, and tail black. It feeds upon worms, ſnails, frogs, caterpillars, &c. 6. The monedula, or jack-daw, is of a duſky colour, with a hoary hind-head; and the wings, tail, and forehead black. It is a native of Europe. They flock together in winter, ſleep, and build their neſts in old turrets and walls.

7. The glandularius, or jay, has blueiſh wings, with tranſverſe black and white lines; and the body is variegated with an iron-colour. It is a native of Europe, and feeds upon nuts, corn, and ſometimes ſmall birds. 8. The criſtatus, or blue-creſted jay, has the covert feathers of the wings marked with tranſverſe black lines, a blueiſh body, and a black collar. It is a native of North America. 9. The cayanus, is of a violet colour above, and white below, with a black front and throat, and the point of the tail white: the feathers of the hind head are erect and rigid. It is a native of Cayenne. 10. The caryocatactes, is brown, and ſpotted with white; the wings and tail are black; the prime tail-feathers are white at the points, but the intermediate ones have a worn appearance. It is a native of Europe, and feeds upon nuts. 11. The baliacallus is of a greeniſh black colour, with a forked tail.

It

It is found on the Philippine isles. 12. The *afer*, is of a violet blackish colour, and has a wedge-like tail. It is a native of Africa. 13. The *pica*, or magpye, is variegated with black and white, and its tail is shaped like a wedge. They build their nests in trees in a very artificial manner; the outside consists of thorns both above and below, leaving only a hole for their entrance. They lay five or six eggs, which are pale and spotted: they feed upon small birds, &c. and carefully lay up superfluous food till they become hungry again. They may be learned to talk pretty distinctly. 14. The *senegaleus*, is of a blackish violet colour, with black legs, and a wedge-shaped tail. It is a native of Senegal. 15. The *brachyurus*, is green below, with yellow lines on the head, and white spots on the wings. It is found in the Molucca isles. 16. The *canadensis*, is of a dusky colour, with a yellow forehead, and white below: it has a roundish tail, and is a native of Canada. 17. The *pyrrhocorax*, is blackish, with a yellow beak, and black legs. 18. The *graculus*, is of a blackish violet colour, with a yellow back and legs. 19. The *eremita*, is greenish, with a yellowish head, a small crest on the back part of the head, and a red beak and legs. The three last are natives of Switzerland.

**CORVUS**, the RAVEN, in astronomy. See Vol. I. p. 487.

**CORVUS**, in Roman antiquity, a military engine, or rather gallery, moveable at pleasure by means of pulleys, chiefly used in boarding the enemy's ships; to cover the men.

**CORYBANTES**, in antiquity, priests of the goddess Cybele, who, inspired with a sacred fury, danced up and down, tossing their heads, and beating on cymbals or brazen drums. They inhabited mount Ida, in the island of Crete, where they nourished the infant Jupiter, keeping a continual rattling with their cymbals, that his father Saturn, who had resolved to devour all his male offspring, might not hear the child's cries.

**CORYBANTICA**, in Grecian antiquity, a festival kept in honour of the Corybantes.

**CORYCOMACHIA**, among the ancients, was a sort of exercise in which they pushed forwards a ball, suspended from the ceiling, and at its return either caught it with their hands, or suffered it to meet their body. Oribasius informs us it was recommended for extenuating too gross bodies.

**CORYDALIS**, in botany. See **FUMARIA**.

**CORYLUS**, the HAZEL, in botany, a genus of the monoecia polyandria class. The calix of the male consists of one trifid leaf, and contains but one flower; it has no corolla, but eight stamens: the calix of the female consists of two lacerated leaves; it has no corolla; the styli are two; and the nut is oval. There are two species, *viz.* the *avellana*, a native of Britain; and the *colurna*, a native of Bizantium.

**CORYMBIUM**, in botany, a genus of plants belonging to the syngenesia monogynia class. The calix consists of two leaves shaped like a prism, and containing one flower; the corolla has but one regular petal; and

VOL. II. No. 42.

3

†

the fruit contains one downy seed. There is but one species, a native of Africa.

**CORYMBUS**, in botany. See Vol. I. p. 637.

**CORYPHA**, in botany, a genus belonging to the order of palmæ flabellifoliæ. The corolla consists of three petals; it has six stamens, and one pistillum; and the fruit is a drupa containing one seed. There is but one species, a native of India.

**CORYPHÆNA**, in ichthyology, a genus belonging to the order of thoracici. The head is declined and truncated; the branchiostegic membrane has six rays; and the back fin runs the whole length of the back. There are twelve species, most of them found in foreign seas.

**CORYZA**, in medicine, a catarrh of the nose. See **CATARRH**.

**CORZOLA**, or **CURSCOLA**, an island in the gulf of Venice, divided from Ragusa in Dalmatia, by a narrow strait: E. long. 18°, and N. lat. 42° 35'.

**COS**, the WHET-STONE, in natural history, a genus of vitrescent stones, consisting of fragments of an indeterminate figure, sub-opaque, and granulated.

Of this genus there are several species, some consisting of rougher, and others of smoother, or even of altogether impalpable particles; and used not only for whet-stones, but also for mill-stones, and other the like purposes.

**CO-SECANT**, in geometry, the secant of an arch which is the complement of another to 90°. See **GEOMETRY**.

**COSENZA**, the capital of the hither Calabria, in the kingdom of Naples: E. long. 16° 35', N. lat. 39° 15'. It is an archbishop's see.

**CO-SINE**, in trigonometry, the sine of an arch, which is the complement of another to 90°. See **GEOMETRY**.

**COSMETIC**, in physic, any medicine or preparation which renders the skin soft and white, or helps to beautify and improve the complexion; as lip-salves, cold creams, cerusa, &c.

**COSMICAL**, a term in astronomy, expressing one of the poetical risings of a star: thus a star is said to rise cosmically, when it rises with the sun, or with that point of the ecliptic in which the sun is at that time: and the cosmical setting is when a star sets in the west at the same time that the sun rises in the east.

**COSMOGRAPHY**, a description of the several parts of the visible world; or the art of delineating the several bodies according to their magnitudes, motions, relations, &c.

Cosmography consists of two parts, astronomy and geography. See **ASTRONOMY**, and **GEOGRAPHY**.

**COSSACKS**, people inhabiting the banks of the rivers Neiper and Don, near the Black-sea and frontiers of Turkey. Their country is commonly called the Ukraine, and is mostly subject to Russia.

**COSSET**, among farmers, a colt, calf, lamb, &c. brought up by hand, without the dam.

**COSTAL**, an appellation given by anatomists to several parts belonging to the sides: thus we meet with costal muscles, vertebræ, &c.

4. C

COSTA-

**COSTA-RICA**, a province of Mexico, bounded by the North sea on the north-east, and by the Pacific ocean on the south-west. Its chief town is New-Carthage.

**COSTARUM depressores**, in anatomy. See Vol. I. p. 215.

**COSTIVENESS**, in medicine, a preternatural detention of the fæces, with an unusual dryness and hardness thereof, and thence a suppression of their evacuation. See **MEDICINE**.

**COSTMARY**, the English name of a species of tanzy. See **TANACETUM**.

**COSTRANGULA**, in botany. See **SCROPHULARIA**.

**COSTUME**, a term among painters: thus a painter must observe the costume; that is, he must make every person and thing sustain its proper character, and not only observe the story, but the circumstances, the scene of action, the country or place, and make the habits, arms, manners, proportions, and the like, to correspond.

**COSTUS**, in botany, a genus of the monandria monogynia class. The interior part of the corolla is inflated and ringent; the inferior lip being trifid. There is but one species, viz. the arabicus, a native of both the Indies. The root of the costus is said to attenuate acid humours, and to promote expectoration, perspiration, and urine; but is now rarely to be met with in the shops.

**CO-TANGENT**, the tangent of an arch, which is the complement of another to 90°. See **GEOMETRY**.

**COTURNIX**, in ornithology. See **TETRAO**.

**COTICE**, or **COTISE**, in heraldry, is the fourth part of the bend; and with us seldom if ever borne but in couples, with a bend between them. See **BEND**.

The bend thus bordered, is said to be cotised; as, he bears sable, on a bend cotised argent, three cinquefoils. See Plate LXV. fig. 11.

**COTINUS**, in botany, the trivial name of a species of rhus. See **RHUS**.

**COTONASTER**, in botany. See **CRATÆGUS**.

**COTRONA**, a town of the further Calabria, in the kingdom of Naples, situated on the Mediterranean, about fifteen miles south-east of St Severino: E. long. 17° 40', and N. lat. 38° 50'. It is the see of a bishop.

**COTTON**, in commerce, a soft downy substance found on the bombax, or cotton tree. See **BOMBAX**.

Cotton is separated from the seeds of the plant by a mill, and then spun and prepared for all sorts of fine works, as stockings, waistcoats, quilts, tapettry, curtains, &c. With it they likewise make muslin, and sometimes it is mixed with wool, sometimes with silk, and even with gold itself.

The finest sort comes from Bengal and the coast of Coromandel.

Cotton makes a very considerable article in commerce, and is distinguished into cotton-wool, and cotton thread. The first is brought mostly from Cyprus, St John d'Acre, and Smyrna: the most esteemed is white, long, and soft. Those who buy it in bales should see that it has not been wet, moisture being very prejudicial to it. The price of the finest is usually

from six to seven piallers the quintal of forty four ocos.

Of cotton thread, that of Damas, called cotton d'ounce, and that of Jerusalem, called bazas, are the most esteemed; as also that of the Antilles islands. It is to be chosen white, fine, very dry, and evenly spun. The other cotton-threads are the half bazas, the rames, the beledin, and gonzezel; the payas and montafiri, the geneguins, the baquins, the josselassars, of which there are two sorts. Those of India, known by the name of Tutucorin, Java, Bengal, and Surat, are of four or five sorts, distinguished by the letters A, B, C, &c. They are sold in bags, with a deduction of one pound and a half on each of those of Tutucorin, which are the dearest, and two pounds on each bag of the other sorts. For those of Fielesbas, Smyrna, Aleppo, and Jerusalem, the deduction at Amsterdam is eight in the hundred for the tare, and two in the hundred for weight, and on the value one per cent. for prompt payment.

Cotton of Siam, is a kind of silky cotton in the Antilles, so called because the grain was brought from Siam. It is of an extraordinary fineness, even surpassing silk in softness. They make hose of it there preferable to silk ones, for their lustre and beauty. They sell from ten to twelve and fifteen crowns a pair, but there are very few made, unless for curiosity.

*The manner of picking Cotton, as practised in the Antilles.* The bags are made of coarse cloth, of which they take three ells and a half each: the breadth is one ell three inches. When the bag has been well soaked in water, they hang it up, extending the mouth of it to cross pieces of timber nailed to posts fixed in the ground seven or eight feet high. He who packs it goes into the bag, which is six feet nine inches deep, or thereabouts, and presses down the cotton, which another hands him, with hands and feet; observing to tread it equally every where, and putting in but little at a time. The best time of packing is in rainy moist weather, provided the cotton be under cover. The bag should contain from 300 to 320 pounds. The tare abated in the Antilles is three in the hundred. Cotton being a production applicable to a great variety of manufactures, it cannot be too much cultivated in our own plantations that will admit of it.

Cotton wool, not of the British plantations, pays on importation  $\frac{3}{8}$ d. the pound, and draws back on exportation  $\frac{67}{100}$ d.

East Indies, pays  $2\frac{87}{100}$ d. and draws back  $2\frac{58}{100}$ d.

Cotton yarn the pound of the East Indies pays  $4\frac{1}{2}$ d. and draws back  $4\frac{3}{4}$ d.

*Lavender Cotton.* See **SANTOLINA**.

*Philophtic Cotton*, a name given to the flowers of zinc, on account of their white colour, and resemblance to cotton.

*Cotton weed.* See **GNAPHALIUM**.

**COTTUS**, in ichthyology, a genus belonging to the order of thoracici. The head is broader than the body, and the gill-membrane has six rays. There are six

fix species, viz. the cataphractus, quadricornis, grunniens, scaber, scorpius, and gobio.

**COTULA**, in botany, a genus of the syngentia polygamia superflua class. The receptacle is naked; the pappus is marginated; and the corollulæ of the disk are divided into four segments; the species are six, none of them natives of Britain.

**COTULA**, or **COTYLA**, in antiquity, a liquid measure among the Greeks, equal to the hemina of the Romans, containing half a sextary, or four acetabula: hence it appears that it contained ten ounces of wine, and nine of oil.

**COTURNIX**, in ornithology. See **TETRAO**.

**COTYLEDON**, in botany, a genus of the decandria pentagynia class. The calix is divided into five segments; the corolla consists of one petal; there are five nectariferous scales at the base of the germen; and it has five capsules. The species are eight, only one of which is a native of Britain, viz. the umbilicus, or navel-wort.

**COTYLEDONES**, in anatomy, are certain glandular bodies, adhering to the chorion of some animals.

**COUGH**, in medicine. See **MEDICINE**.

**COUGH**, in painting, a term used for each lay or impression of colour, either in oil or water, wherewith the painter covers his canvas, wall, wainscot, or other matter to be painted.

**COUGH-GRASS**, in botany. See **TRITICUM**.

**COUCHANT**, in heraldry, is understood of a lion, or other beast, when lying down, but with his head raised, which distinguishes the posture of couchant from dormant, wherein he is supposed quite stretched out and asleep. See Plate LXV. fig. 9.

**COUCHE**, in heraldry, denotes any thing lying along: thus, chevron couché, is a chevron lying sideways, with the two ends on each side of the shield, which should properly rest on the base.

**COVERING of a cataract**, in surgery. See **SURGERY**.

**COVENANT**, a contract or agreement, made between two or more persons, to perform something.

**COVENTRY**, a city and bishop's see in Warwickshire, situated 80 miles north west of London, and 10 miles north of Warwick: W. long.  $1^{\circ} 26'$ , and N. lat.  $52^{\circ} 25'$ .

**COVENTRY-BELLS**, in botany. See **CAMPANULA**.

**COVERDEN**, a town of the united provinces, situated in that of Overijssel, near the confines of Westphalia: E. long.  $6^{\circ} 45'$ , and N. lat.  $52^{\circ} 50'$ .

**CO-VERSED SINE**, in geometry, the remaining part of the diameter of a circle, after the versed sine is taken from it. See **GEOMETRY**.

**COVERT WAY**, or **CORRIDOR**, in fortification, a space of ground, level with the field on the edge of the ditch, three or four fathoms broad, ranging quite round the half moons, and other works toward the country. It has a parapet raised on a level, together with its banquetts and glacis. See **FORTIFICATION**.

**COVERTURE**, in law, is applied to the state and condition of a married woman, who is under the power of her husband, and therefore called *femme couverte*.

**COVING**, in building, is when houses are built projecting over the ground plot, and the turned projecture arched with timber, lathed and plaistered.

**COULTER**, in husbandry, an iron-instrument, fixed in the beam of a plough, and serving to cut the edge of each furrow. See **AGRICULTURE**.

**COUNCIL**, or **COUNSEL**, in a general sense, an assembly of divers considerable persons to concert measures relating to the state.

**Aulic COUNCIL**. See **AULIC**.

**Cabinet COUNCIL**. See **PRIVY-COUNCIL**.

**Common COUNCIL**, in the city of London, is a court wherein are made all bye-laws which bind the citizens. It consists, like the parliament, of two houses; an upper, composed of the lord mayor and aldermen; and a lower, of a number of common-council men, chosen by the several wards, as representatives of the body of the citizens.

**Privy COUNCIL**, the *primum mobile* of the civil government of Great Britain, bearing part of that great weight in the government which otherwise would be too heavy upon the king.

It is composed of eminent persons, the number of whom is at the sovereign's pleasure, who are bound by oath to advise the king to the best of their judgment, with all the fidelity and secrecy that becomes their station. The king may declare to, or conceal from, his privy-council whatever he thinks fit; and has a select council out of their number, commonly called the *cabinet council*, with whom his majesty determines such matters as are most important, and requires the utmost secrecy.

Privy-counsellors, though but gentlemen, have precedence of all the knights and younger sons of barons and viscounts, and are styled right honourable.

**COUNCIL of war**, an assembly of the principal officers of an army or fleet, occasionally called by the general or admiral to concert measures for their conduct with regard to sieges, retreats, engagements, &c.

**COUNCIL**, in church history, an assembly of prelates and doctors, met for the regulating matters relating to the doctrine or discipline of the church.

**National COUNCIL**, is an assembly of prelates of a nation under their primate or patriarch.

**Oecumenical or general COUNCIL**, is an assembly which represents the whole body of the universal church. The Romanists reckon eighteen of them; Bullinger, in his treatise de Conciliis, six; Dr Prideaux, seven; and bishop Beveridge has increased the number to eight, which, he says, are all the general councils which have ever been held since the time of the first Christian emperor. They are as follows: 1. The council of Nice, held in the reign of Constantine the Great, on account of the heresy of Arius. 2. The council of Constantinople, called under the reign and by the command of Theodosius the Great, for much the same end that the former council was summoned. 3. The council of Ephesus, convened by Theodosius the younger, at the suit of Nestorius. 4. The council of Calcedon, held in the reign of Marcianus, which approved of the Eutychian heresy. 5. The second council of Constantinople, assembled by the emperor Justinian.

Justinian.

Justinian, condemned the three chapters taken out of the book of Theodorus of Mopsuestia, having first decided that it was lawful to anathematize the dead. Some authors tell us, that they likewise condemned the several errors of Origen about the Trinity, the plurality of worlds, and pre-existence of souls. 6. The third council of Constantinople, held by the command of Constantine Pogonatus the emperor, in which they received the definitions of the five first general councils, and particularly that against Origen and Theodorus of Mopsuestia. 7. The second Nicene council. 8. The fourth council of Constantinople, assembled when Lewis II. was emperor of the west. The regulations which they made are contained in twenty-seven canons, the heads of which are set down by M. du Pin, to whom the reader is referred.

**COUNSELLOR**, in general, a person who advises another: thus we say, a counsellor at law, a privy counsellor, &c.

**COUNSELLOR at law**, a person retained by a client to plead his cause in a public court of judicature.

**COUNT**, a nobleman who possesses a domain erected into a county. The dignity is a medium between that of a duke and a baron.

Counts were originally lords of the court, or of the emperor's retinue, and had their name comites *a comitendo*.

**COUNT-WHEEL**, in the striking part of a clock, a wheel which moves round once in twelve or twenty-four hours. It is sometimes called the locking wheel.

**COUNTER**, a term which enters into the composition of diverse words of our language, and generally implies opposition; but when applied to deeds, means an exact copy kept of the contrary party, and sometimes signed by both parties.

**COUNTER ALLEY**, in gardening. See **ALLEY**.

**COUNTER APPROACHES**, in fortification, lines and trenches made by the besieged in order to attack the works of the besiegers, or to hinder their approaches.

**COUNTER BARRY**, or **CONTRE BARRE**, in heraldry, is the same as our bendy sinister *per* bend counter-changed. See **BARRY**.

**COUNTER BATTERY**, is a battery raised to play upon another to dismount the guns.

**COUNTER-CHANGED**, in heraldry, is when any field or charge is divided or parted by any line or lines of partition, consisting all interchangeably of the same tinctures. See plate LXV. fig. 12.

**COUNTER-CHARGE**, a reciprocal charge or recrimination brought against an accuser.

**COUNTER-CHEVRONED**, a shield chevrony, parted by one or more partition lines.

**COUNTER-COMPOSED**, in heraldry, is when the figure is compounded of two panes, as in Plate LXV. fig. 13.

**COUNTER-DRAWING**, in painting, is the copying a design, or painting, by means of a fine linen-cloth, an oiled paper, or other transparent matter, where the strokes appearing through are followed with a pencil, with or without colour. Sometimes it is done on glass, and with frames or nets divided into squares

with silk or with thread, and also by means of instruments invented for the purpose, as the parallclo-gram.

**COUNTER-ERMINE**, in heraldry, is the contrary of ermine, being a black field with white spots. See Plate LXV. fig. 14.

**COUNTERFEITS**, in law, are persons that obtain any money or goods by counterfeit letters or false tokens, who being convicted before justices of assize or of the peace, &c. are to suffer such punishment as shall be thought fit to be inflicted under death, as imprisonment, pillory, &c.

**COUNTER-FACED**, or **CONTER-FACE**, in heraldry, is the same that we call barry *per* pale counterchanged; but then the number of panes into which the field is divided is always specified. See **BARRY**.

**COUNTER-FOIL**, or **COUNTER-STOCK**, in the exchequer, that part of a tally which is kept by an officer of the court.

**COUNTER-FORTS**, spurs or buttresses serving as props to a wall subject to bulge or be thrown down.

**COUNTER-FUGUE**, in music, is when the fugues go contrary to one another. See **FUGUE**.

**COUNTER GUARD**, in fortification, is a work raised before the point of a bastion, consisting of two long faces parallel to the faces of the bastion, making a salient angle: they are sometimes of other shapes, or otherwise situated.

**COUNTER-LIGHT**, or **CONTER-JOUR**, a light opposite to any thing, which makes it appear to disadvantage. A single counter-light is sufficient to take away all the beauty of a fine painting.

**COUNTER-march**, in military affairs, a change of the face or wings of a battalion, by which means those that were in the front come to be in the rear.

It also signifies returning, or marching back again.

**COUNTER-MINE**, in war, a well and gallery drove and sunk till it meet the enemy's mine, to prevent its effect.

**COUNTER-PALED**, *contre pale*, in heraldry, is when the escutcheon is divided into twelve pales parted *per fesse*, the two colours being counter-changed; so that the upper are of one colour, and the lower of another.

**COUNTER-PART**, in music, denotes one part to be applied to another. Thus the bass is said to be a counter-part to the treble.

**COUNTER-PASSANT**, is when two lions are in a coat of arms, and the one seems to go quite the contrary way from the other.

**COUNTER-POINT**, in music, the art of composing harmony, or of disposing several parts in such a manner as to make an agreeable whole or a concert.

**COUNTER POINTED**, *contre pointé*, in heraldry, is when two chevrons in one escutcheon meet in the points, the one rising as usual from the base, and the other inverted falling from the chief; so that they are counter to one another in the points. They may also be counter-pointed when they are founded upon the sides of the shield, and the points meet that way, called counter-pointed in fesse.

**COUNTER-**

**COUNTER-POTENT**, *contre-potencé*, in heraldry, is reckoned a fur as well as vair and ermine, but composed of such pieces as represent the tops of crutches, called in French *pot-nces*, and in old English *potents*.

**COUNTER-PROOF**, in rolling-press printing, a print taken off from another fresh printed; which by being passed through the press, gives the figure of the former, but inverted. To counter-prove, is also to pass a design in black lead, or red chalk, through the press, after having moistened with a sponge both that and the paper on which the counter-proof is to be taken.

**COUNTER-QUARTERED**, *contre-écartelé*, in heraldry, denotes the escutcheon, after being quartered, to have each quarter again divided into two.

**COUNTER-SALIENT**, is when two beasts are borne in a coat leaping from each other directly the contrary way.

**COUNTER-SCARP**, in fortification, is properly the exterior talus or slope of the ditch; but it is often taken for the covered way and the glacis. In this sense we say, the enemy have lodged themselves on the counter-scarp.

*Angle of the COUNTER-SCARP*, is that made by the two sides of the counter-scarp meeting before the middle of the curtain.

**COUNTER-SIGNING**, the signing the writing of a superior in quality of secretary. Thus charters are signed by the king, and counter-signed by a secretary of state or lord chancellor.

**COUNTER-SWALLOW-TAIL**, in fortification, an outwork in form of a single tenaille, wider at the gorge than the head.

**COUNTER-TENOR**, called by the French *haut-contre*, one of the middle parts of music opposite to the tenor. See **TENOR**.

**COUNTER-TIME**, in the menage, is the defence or resistance of a horse that interrupts his cadence, and the measure of his menage, occasioned either by a bad horseman, or by the malice of the horse.

**COUNTER** is also the name of a counting-board in a shop, and of a piece of metal with a stamp on it, used in playing at cards.

*Counter of a horse*, that part of a horse's forehead which lies between the shoulders and under the neck.

**COUNTERS in a ship**, are two. 1. The hollow arching from the gallery to the lower part of the straight piece of the stern, is called the upper counter. 2. The lower counter is between the transom and the lower part of the gallery.

**COUNTER** is also the name of two prisons in the city of London, *viz.* the Poultry and Woodstreet.

**COUNTING**. See **ACCOUNTING**.

**COUNTY**, in geography, originally signified the territory of a count or earl, but now it is used in the same sense with shire. See **SHIRE**.

**COUNTY-COURT**, a court of justice, held every month in each county, by the sheriff or his deputy.

**COUPED**, in heraldry, is used to express the head, or any limb, of an animal, cut off from the trunk, smooth; distinguishing it from that which is called *e-*

railed, that is, forcibly torn off, and therefore is ragged and uneven.

**COUPED** is also used to signify such crosses, bars, bends, chevrons, &c. as do not touch the sides of the escutcheons, but are, as it were, cut off from them.

**COUPER**, the name of two towns of Scotland, the one situated about twelve miles north-east of Perth, in the shire of Angus, W. long. 3°, and N. lat. 56°. 30'; and the other in the county of Fife, about ten miles west of St Andrews: W. long. 2° 40', and N. lat. 56° 20'.

**COUPLE-CLOSS**, in heraldry, the fourth part of a chevron, never borne but in pairs, except there be a chevron between them, faith Guillim, though Bloom gives an instance to the contrary.

**COUPLET**, a division of a hymn, ode, song, &c. wherein an equal number, or equal measure of verses is found in each part; which divisions, in odes, are called strophes.

**COURBARIL**, in botany. See **HYMENÆA**.

**COURIER**, a messenger sent post, or express, to carry dispatches.

**COURLAND**, a dutchy situated between 21° and 26° of E. long. and between 56° 30', and 57° 30' N. lat. It is bounded by the river Dwina, which divides it from Livonia, on the north; by Lithuania, on the east; by Samogitia, on the south; and by the Baltic sea on the west; being 130 miles long, and 30 broad.

**COURSING**, among sportsmen, is of three sorts, *viz.* at the deer, at the hare, and at the fox. These coursings are with greyhounds; for the deer there are two sorts of coursings, the one with the paddock, the other either in the forest or purlieu. See **PADDOCK**, &c.

In coursing the hare, the best way is to find one fitting, and when she is first started, to give her ground, or law, which is generally twelve-score yards. In coursing a fox, you are to stand close, and on a clear wind.

**COURT**, in a law sense, the place where judges distribute justice, or exercise jurisdiction: also the assembly of judges, jury, &c. in that place.

Courts are divided into superior and inferior, and into courts of record and base courts: again, courts are either such as are held in the king's name, as all the ordinary courts; or where the precepts are issued in the name of the judge, as the admiral's court.

The superior courts are those of the king's-bench, the common-pleas, the exchequer, and the court of chancery. See **KING'S-BENCH**, **COMMON-PLEAS**, **EXCHEQUER**, and **CHANCERY**.

A court of record is that which has a power to hold plea, according to the course of the common law, of real, personal, and mixt actions; where the debt or damage is forty shillings, or above, as the court of King's-Bench, &c.

*Court of admiralty*. See **ADMIRALTY**.

*Court of arches*. See **ARCHES**.

**COURT-BARON**, a court that every lord of a manor has within his own precincts. This court must be held

by prescription, and is of two kinds, *viz.* by common law, and by custom: the former is where the barons or freeholders, being suitors, are the judges; the other is that where the lord, or his steward, is the judge.

**COURT of chivalry, or the marshal's COURT**, that whereof the judges are the lord high constable, and the earl marshal of England.

This court is the fountain of martial law; and the earl marshal is not only one of the judges, but is to see execution done.

**COURT of conscience**, a court in the cities of London, Westminster, and some other places, that determines matters in all cases where the debt or damage is under forty shillings.

**COURT of delegates**, a court where delegates are appointed by the king's commission, under the great seal, upon an appeal to him from the sentence of an archbishop, &c. in ecclesiastical causes; or of the court of admiralty, in any marine cause.

**COURT of husting**, a court of record held at Guildhall, for the city of London, before the lord mayor and aldermen, sheriffs and recorder, where all pleas, real, personal, and mixt, are determined; where all lands, tenements, &c. within the said city, or its bounds, are pleadable in two hustings; the one called the hustings of plea of lands, and the other the hustings of common pleas. The court of hustings is the highest court within the city, in which writs of exigent may be taken out, and outlawries awarded, wherein judgment is given by the recorder.

There are also other courts called wardmotes, or meeting of the wards; and courts of holymote, or assemblies of the guilds and fraternities.

**COURT-LEET**, a court ordained for the punishment of offences under high treason against the crown.

**COURT-MARTIAL**, a court appointed for the punishing offences in officers, soldiers, and sailors, the powers of which are regulated by the mutiny-bill.

**COURT of requests**, was a court of equity, of the same nature with the chancery, but inferior to it.

**COURTESY**, or **CURTSEY of England**, a certain tenure whereby a man marrying an heiress seized of lands of fee simple, or fee tail general, or seized as heir of the tail special, and getteth a child by her that cometh alive into the world, though both it and his wife die forthwith; yet, if she were in possession, he shall keep the land during his life, and is called *tenant per legem Angliæ*, or tenant by the courtesy of England; because this privilege is not allowed in any country except Scotland, where it is called *curialitas Scotiæ*.

**COURTISAN**, a woman who prostitutes herself for hire, especially to people of superior rank.

**COURTRAY**, a town of the Austrian Netherlands, situated on the river Lys, about twenty-three miles south-west of Ghent, and fourteen east of Ypres: E. long. 3° 10', and N. lat. 50° 48'.

**COUSIN**, a term of relation between the children of brothers and sisters, who in the first generation are called cousin-germans, in the second generation second cousins, &c. If sprung from the relations of the

father's side, they are denominated paternal cousins; if on the mother's, maternal.

**COUSU**, in heraldry, signifies a piece of another colour or metal placed on the ordinary, as if it were sewed on, as the word imports. This is generally of colour upon colour, or metal upon metal, contrary to the general rule of heraldry.

**COVERT**, in heraldry, denotes something like a piece of hanging, or a pavillion falling over the top of a chief or other ordinary, so as not to hide, but only to be a covering to it.

**COW**, in zoology. See **BOS**.

**Sea-Cow**, in zoology. See **TRICHECUS**.

**COW-ITCH**, in botany. See **PHASEOLUS**.

**COW'S-LIP**, in botany. See **PRIMULA**.

**COW'S-LIP of Jerusalem**. See **PULMONARIA**.

**COWARD**, in heraldry, a term given to a lion-borne in an escutcheon with his tail doubled or turned in between his legs.

**COWES**, a town and harbour on the northern coast of the isle of Wight, situated about eight miles south of Plymouth: W. long. 1° 25', and N. lat. 50° 45'.

**COWL**, or **COUL**, a habit worn by the Bernardines and Benedictines, of which there are two kinds; one white, very large, worn in ceremonies; the other black, worn on ordinary occasions, in the streets, &c.

**Friar's COWL**, in botany. See **ARISARUM**.

**COXWOLD**, a market-town in the north riding of Yorkshire, about fourteen miles north of the city of York: W. long. 50', and N. lat. 54° 20'.

**COZUMEL**, an island near the western coast of Yucatan, where Cortez landed and refreshed his troops, before entering upon the conquest of Mexico: W. long. 89°, and N. lat. 13°.

**CRAB**, in zoology. See **CANCER**.

**CRAB'S CLAWS**, in the materia medica, are the tips of the claws of the common crab broken off at the verge of the black part, so much of the extremity of the claws only being allowed to be used in medicine as is tinged with this colour. The blackness, however, is only superficial; they are of a greyish white within, and when levigated furnish a tolerable white powder.

Crab's claws are of the number of the alkaline absorbents, but they are superior to the generality of them in some degree, as they are found on a chemical analysis to contain a volatile urinous salt.

**CRAB'S EYES**, in pharmacy, are a strong concretion in the head of the cray-fish. They are rounded on one side, and depressed and sinuated on the other, considerably heavy, moderately hard, and without smell. We have them from Holland, Muscovy, Poland, Denmark, Sweden, and many other places.

Crab's eyes are much used both in the shop-medicines and extemporaneous prescriptions, being accounted not only absorbent and drying, but also discutient and diuretic.

**CRAB**, an engine of wood, with three claws, placed on the ground like a capstan, and used at launching or heaving ships into the dock.

**CRABRO**,

**CRABRO**, in zoology. See **TENTHREDO**.

**CRACOA**, in botany. See **VICIA**.

**CRACKER**, in ornithology. See **ANAS**.

**CRACOW**, by some accounted the capital city of Poland, is situated in the province of little Poland, and palatinate of Cracow, in a fine plain near the banks of the Vistula. It has an university, and is the see of a bishop, and the seat of the supreme courts of justice: it stands about 140 miles south-west of Warsaw, in 19° 30' of E. long. and 50° N. lat.

**CRADLE**, a well known machine in which infants are rocked to sleep.

It denotes also that part of the stock of a cross bow where the bullet is put.

**CRADLE**, in surgery, a case in which a broken leg is laid after being set.

**CRADLE**, among shipwrights, a timber frame made along the outside of a ship by the bilge, for the convenience of launching her with ease and safety.

**CRAFT**, in the sea-language, signifies all manner of nets, lines, hooks, &c. used in fishing. Hence all such little vessels as ketches, boats, and smacks, &c. used in the fishing trade, are called small craft.

**CRAIL**, or **CAREIL**, a parliament town of Scotland, situated on the sea-coast of the county of Fife, about seven miles south-east of St Andrews: W. long. 2° 20' and N. lat. 56° 17'.

**CRAMBE**, *wild sea-cabbage*, in botany, a genus of the tetradynamia siliquosa class. The four long filaments are forked at the points, and the antheræ are fixed upon one of them; the berry is dry, globular, and deciduous. The species are three, only one of which, *viz.* the maritima, or sea-colewort, is a native of Britain.

**CRAMP**, in medicine, a convulsive contraction of a muscular part of the body.

**CRAMP FISH**. See **TORPEDO**.

**CRAMP IRON**, or **CRAMPS**, a piece of iron bent at each end, which serves to fasten together pieces of wood, stones, or other things.

**CRAMPER**, in ichthyology. See **CYPRINUS**.

**CRAMPONÉ'E**, in heraldry, an epithet given to a cross which has at each end a cramp or square piece coming from it; that from the arm in chief towards the sinister angle, that from the arm on that side downwards, that from the arm in base towards the dexter side, and that from the dexter arm upwards. See Plate LXVI. fig. 5.

**CRANAGE**, the liberty of using a crane at a wharf, and also the money paid for drawing up wares out of a ship, &c. with a crane.

**CRANE**, in ornithology. See **ARDEA**.

**CRANE**, in mechanics, a machine used in building and commerce for raising large stones and other weights. See **MECHANICS**.

**CRANE'S BILL**, among surgeons, a kind of forceps, so called from its figure.

**CRANE'S BILL**, in botany. See **GERANIUM**.

**CRANE-FLY**, in zoology. See **TIPULA**.

**CRANGANOR**, a Dutch factory on the Malabar-coast,

in the hither India, about thirty miles north of Cochin: E. long. 75° 5', and N. lat. 10°.

**CRANIOLARIA**, in botany, a genus of the didynamia angiospermia class. The perianthium consists of four leaves, and the spathe of one; and the tube of the corolla is very long. There are two species, none of them natives of Britain.

**CRANIUM**, in anatomy. See Vol. I. p. 151.

**CRANNY**, in glass-making, an iron-instrument, where-with the necks of glasses are formed.

**CRAPE**, in commerce, a kind of stuff, made in the manner of gauze, with raw silk, gummed and twisted on the mill.

**CRAPULA**, among physicians. See **SURFEIT**.

**CRISIS**, among physicians, is used to signify such a due mixture of qualities in a human body, as constitutes a state of health.

**CRASSAMENTUM**, in physic, the thick red or fibrous part of the blood, otherwise called cruor, in contradistinction to the serum or aqueous part.

**CRASSULA**, in botany, a genus of the pentandria pentagynia class. The calix consists of five leaves, and the corolla of five petals; there are five nectariferous glands at the base of the germen; and it has five capsules. There are 17 species, none of them natives of Britain.

**CRATÆGUS**, in botany, a genus of the icofandria digynia class. The calix has five segments, and the corolla five petals; the berry is below the flower, and contains two seeds. There are nine species, three of which are natives of Britain, *viz.* the aria, or white bean-tree; the torminalis, service-tree, or sorb; and the oxyacantha, white-thorn, or hawthorn.

**CRATCHES**, in the menage, a swelling on the pastern, under the fet lock, and sometimes under the hoof; for which reason it is distinguished into the sinew cratches, which affect the sinew, and those upon the coronet, called quitter-bones.

**CRATER**, in astronomy. See Vol. I. p. 487.

**CRATEVA**, in botany, a genus of the polyandria monogynia class.

**CRATO**, a town of Aentejo, in Portugal, situated about seven miles south of Portalegre: W. long. 8° 2' and N. lat. 38° 50'.

**CRAVEN**, in geography, a division of the west riding of Yorkshire, situated on the river Aire.

**CRAX**, in ornithology, a genus of birds, belonging to the order of gallinæ. The base of the beak of each mandible is covered with wax; and the feathers of the head are curled. There are five species, *viz.* 1. The alecator, or Indian hen of Sloane, is about the size of a common hen: It is black, with a white belly. A yellow wax covers about one half of each mandible: The tongue is entire; the temples are bare, and black; the tail is roundish, and consists of 14 prime feathers; and it has no spur. It is found in the warm parts of America. 2. The rubra, or Peruvian hen, is red, with a blueish head: It is a native of Peru. 3. The mitu, or Brazilian pheasant, is black, with a dusky belly, and red wax: It is a native of Guinea and Bra- zil.

zill. 4. The globicera, has a yellow protuberance between the nostrils, and is of a blueish black colour: It is likewise a native of Brazil. 5. The pauxi, or Mexican pheasant of Brissonius, is of a blueish colour, with blue wax, and the tip of the tail and belly white: It is a native of Mexico.

**CRAYON**, a name for all coloured stones, earths, or other minerals used in designing or painting in pastel. Crayons may be made of any colour, and adapted for the faces of men, women, landscapes, clouds, sunbeams, buildings, and shadows, in the following manner: Take plaster of Paris, or alabaster calcined, and of the colour of which you intend to make your crayons, a sufficient quantity: grind them first asunder, and then together, and with a little water make them into a paste: then roll them with your hand upon the grinding stone into long pieces, and let them dry moderately in the air: when they are to be used, scrape them to a point like a common pencil.

**CREAM**, the fat part of the milk that swims upon the surface.

**CREAM of tartar**. See **CHEMISTRY**.

**CREAT**, in the menage, an usher to a riding-master; or, a gentleman bred in the academy, with intent to make himself capable of teaching the art of riding the great horse.

**CREATION**, the producing something out of nothing, which strictly and properly is the effect of the power of God alone, all other creations being only transformations, or change of shape.

**CREDENTIALS**, letters of recommendation, and power, especially such as are given to ambassadors, or public ministers, by the prince or state that sends them to foreign courts.

**CREDIBILITY**, a species of evidence, less indeed than absolute certainty or demonstration, but greater than mere possibility: it is nearly allied to probability, and seems to be a mean between possibility and demonstration.

**CREDIT**, in commerce, a mutual trust or loan of merchandize, or money, on the reputation of the probity and sufficiency of a dealer. See **COMMERCE**.

**CREDITON**, a market-town in Devonshire, considerable for a good woolen manufactory: it is situated about nine miles north-west of Exeter, in  $3^{\circ} 50' W.$  long. and  $50^{\circ} 50' N.$  lat.

**CREDITOR**, a person to whom any sum of money is due, either by obligation, promise, or otherwise.

**CREED**, a brief summary of the articles of a Christian's belief.

The most ancient form of creeds is that which goes under the name of the apostolic creed; besides this, there are several other ancient forms and scattered remains of creeds to be met with in the primitive records of the church. The first is a form of apostolical doctrine, collected by Origen; the second is a fragment of a creed preserved by Tertullian; the third remains of a creed, is in the works of Cyprian; the fourth, a creed composed by Gregory Thaumaturgus, for the use of his own church; the fifth, the creed of Lucian the martyr; the sixth, the creed of the apo-

stolical constitutions. Besides these scattered remains of the ancient creeds, there are extant some perfect forms, as those of Jerusalem, Cæsarea, Antioch, &c.

The most universal creeds are, the apostolical, the Athanasian, and the Nicene creeds.

**CREEK**, the part of a haven where any thing is landed from the sea.

**CREEPER**, in ornithology. See **CERTHIA**.

**CREMA**, a city and bishop's see of Italy, capital of a district of the Milanese, called from it Cremasco: it stands almost in the middle between Milan and Mantua, in  $10^{\circ} 15' E.$  long. and  $45^{\circ} 20' N.$  lat.

**CREMASTER**, in anatomy. See Vol. I. p. 272.

**CREMONA**, a city of Italy, and capital of a district of the Milanese, called from it the Cremonese, is situated forty-five miles south-east of Milan, in  $10^{\circ} 30' E.$  long. and  $45^{\circ} N.$  lat.

**CRENATED**, in botany. See Vol. I. p. 640.

**CRENCLES**, in a ship, small ropes, spliced into the bolt-ropes of the sails of the main-mast and fore-mast. They are fastened to the bow-line bridles; and are also to hold by, when a bonnet is shaken off.

**CRENELLE**, or **IMBATTLED**, in heraldry, is used when any honourable ordinary is drawn, like the battlements on a wall to defend men from the enemies shot. See Plate LXVI. fig. 6.

**CRENOPHYLAX**, in antiquity, a magistrate at Athens, who had the inspection of fountains.

**CRUPANCE**, in the menage, a chop, or crutch, in a horse's leg, given by the sponges of the shoes of one of the hinder feet crossing and striking against the other hinder foot. This crutch degenerates into an ulcer.

**CREPIS**, in botany, a genus of the Syngenesia polygamia æqualis class. The receptacle is naked; the calix is calculated, with deciduous scales; and the pappus is plumose, and furnished with a stipes. The species are fourteen, three of which are natives of Britain, viz. the testarum, or smooth succory hawk-weed; the biennis, or rough succory hawk-weed; and the scetida, or stinking hawk-weed.

**CREPUNDIA**, in antiquity, a term used to express such things as were exposed along with children, as rings, jewels, &c. serving as tokens whereby they afterwards might be known.

**CRESCENT**, the new moon, which, as it begins to recede from the sun, shews a little rim of light, terminating in points, called horns, that are still encreasing, till it is in opposition to the sun, at which time it is full moon, or quite round.

**CRESCENT**, in heraldry, a bearing in form of a new moon. See Plate LXV. fig. 10.

It is used either as an honourable bearing, or as the difference to distinguish between elder and younger families; this being generally assigned to the second son, and those that descend from him. The figure of the crescent is the Turkish symbol, with its points looking towards the top of the chief, which is its most ordinary representation, called crescent montant. Crescents are said to be adossed, when their backs are turned towards each other; a crescent is said to be inverted, when

when its points look towards the bottom; turned crescents have their points looking to the dexter side of the shield; cornuted crescents, to the sinister side; and affronted crescents, contrary to the adossed, have their points turned to each other.

**CRESCENT**, a term among farriers. Thus a horse is said to have crescents when that part of the coffin-bone, which is most advanced, falls down and presses the sole outwards, and the middle of her hoof above shrinks, and becomes flat, by reason of the hollowness beneath it.

**CRESCENTIA**, in botany, a genus of the didynamia angiospermia class. The calix is split into two equal parts; the corolla is gibbous; and the berry is unilocular, and contains many seeds. There is but one species, a native of Jamaica.

**CRESS**, or **CRASSES**, in botany. See **SISYMBRIUM**. *Indian Cress*. See **TROPEOLUM**.

**CRESSY**, a port-town of Picardy in France, about forty-four miles south of Calais, and twenty-seven north-west of Abbeville, remarkable on account of the victory obtained there over the French, by Edward III. of England, in the year 1346: E. long. 2°, N. lat. 50° 20'.

**CREST**, in armoury, the top-part of the armour, for the head, mounting over the helmet, in manner of a comb, or tuft of a cock, deriving its name from *crissa*, a cock's comb.

The crest was for the most part made of feathers, or the hair of horses tails or mains. The soldiers took great pride in adorning them.

**CREST**, in heraldry, the uppermost part of an armoury, or that part of the cask or helmet next to the mantle. Guillim says, the crest, or cognizance, claims the highest place, being seated on the most eminent part of the helmet; yet so as to admit of an interposition of some escrol, wreath, chapeau, crown, &c.

The crest is esteemed a greater mark of nobility than the armory; being borne at tournaments, to which none were admitted till such time as they had given proof of their nobility: sometimes it serves to distinguish the several branches of a family; and it has served, on occasion, as a distinguishing badge of factions: sometimes the crest is taken for the device; but more usually is formed of some piece of the arms. Families that exchange arms do not change their crest.

**CREST**, among carvers, an imagery, or carved work, to adorn the head or top of any thing, like our modern corniche.

**CREST-fallen**, a fault of an horse, when the upper part of his neck, called the crest, hangs to one side: this they cure by placing it upright, clipping away the spare skin, and applying plasters to keep it in a proper position.

**CRESTED**, something furnished with a crest. See **CREST**.

**CRETA**, or **CHALK**, in natural history. See **CHALK**.

**CREUX**, a French term used among artists, and literally signifies a hollow cavity or pit, out of which something has been scooped or dug: whence it is used

to signify that kind of sculpture, where the lines and figures are cut and formed within the face or plan of the plate or matter engraved; and thus it stands in opposition to *relievo*, where the lines and figures are embossed, and rise prominent above the face of the matter engraved on.

**CREW**, the company of sailors belonging to a ship, boat, or other vessel.

**CREX**, in ornithology. See **RALLUS**.

**CRIBBAGE**, a game at cards, to be learnt only by practice.

**CRIBRATION**, in pharmacy, the passing any substance through a sieve, or search, in order to separate the finer particles from the grosser.

**CRIBROSUM** *os*, in anatomy, called also *os ethmoides*. See Vol. I. p. 157.

**CRICETUS**, in zoology. See **MUS**.

**CRICK**, among farriers, is when a horse cannot turn his neck any manner of way, but holds it fore right, insomuch that he cannot take his meat from the ground without great pain.

**CRICKET**, in zoology. See **GRYLLOUS**.

*Mole CRICKET*. See **GRYLLOTALPA**.

**CRICKLADE**, a borough-town of Wiltshire, situated on the river Isis, about twenty-six miles south-west of Oxford: W. long. 1° 55', and N. lat. 51° 35'.

**CRICO-ARYTANOIDÆUS**, in anatomy. See Vol. I. p. 300.

**CRICOIDES**, in anatomy. See Vol. I. p. 300.

**CRICO-THYROIDÆUS**, in anatomy. See Vol. I. p. 300.

**CRIM**, or **CRIM-TARTARY**, a peninsula in the Black sea, between 33° and 37° E. long. and between 44° and 46° N. lat. It is joined to Little Tartary by a narrow isthmus.

**CRIME**, the transgression of a law, either natural or divine, civil or ecclesiastic.

**CRIMSON**, one of the seven red colours of the dyers. See **DYING**.

**CRINONES**, among physicians, small worms that breed in the skin, called also *dracunculi*.

**CRINUM**, in botany, a genus of the hexandria monogynia class. The corolla is tunnel-shaped, and consists of one leaf, divided into six segments; and the perianth is at the bottom of the corolla. There are four species, none of them natives of Britain.

**CRISIS**, in medicine, is used in different senses, both by the ancient and modern physicians. With some it means frequently no more than the excretion of any noxious substance from the body. Others take the word for a secretion of the noxious humours made in a fever. Others use it for the critical motion itself; and Galen defines a crisis in fevers, a sudden and instantaneous change, either for the better or the worse, productive of recovery or death.

**CRISTÆ**, in surgery, a term for certain excrescences about the anus and pudenda. See Vol. I. p. 157.

**CRISTA GALLI**, in anatomy. See Vol. I. p. 157.

**CRISTA GALLI**, or **COCK'S COMB**. See **RHINANTHUS**.

**CRISTA PAVONIS**, in botany. See **POINCIANA**.

**CRITERIUM**, a standard by which propositions and opinions are compared, in order to discover their truth or falsehood.

**CRITHE**, in surgery, commonly called the sty, is a tubercle that grows in different parts of the eye lids.

**CRITHMUM**, in botany, a genus of the pentandria digynia class. The fruit is oval and compressed. There are two species, one of which, viz. the maritimum, or sampire, is a native of Britain; the leaves are said to be stomachic, aperient, and diuretic.

**CRITICAL** *days* and *symptoms*, among physicians, are certain days and symptoms in the course of acute diseases, which indicate the patient's state, and determine him either to recover or grow worse. See **MEDICINE**.

**CRITICISM**, the art of judging with propriety concerning any object or combination of objects. But, in a more limited sense, the science of criticism is confined to the fine arts. The principles of the fine arts are best unfolded by studying the sensitive part of our nature, and by learning what objects are naturally agreeable, and what are naturally disagreeable. The man who aspires to be a critic in these arts, must pierce still deeper: he must clearly perceive what objects are lofty, what low, what are proper or improper, what are manly, and what are mean or trivial. Hence a foundation for judging of taste, and for reasoning upon it: where it is conformable to principles, we can pronounce with certainty, that it is correct; otherwise, that it is incorrect, and perhaps whimsical. Thus the fine arts, like morals, become a rational science; and, like morals, may be cultivated to a high degree of refinement.

Manifold are the advantages of criticism, when thus studied as a rational science. In the first place, a thorough acquaintance with the principles of the fine arts, redoubles the entertainment these arts afford. To the man who resigns himself entirely to sentiment or feeling, without interposing any sort of judgment, poetry, music, painting, are mere pastime; in the prime of life, indeed, they are delightful, being supported by the force of novelty, and the heat of imagination; but they lose their relish gradually with their novelty; and are generally neglected in the maturity of life, which disposes to more serious and more important occupations. To those who deal in criticism as a regular science, governed by just principles, and giving scope to judgment as well as to fancy, the fine arts are a favourite entertainment; and in old age maintain that relish which they produce in the morning of life.

In the next place, a philosophical inquiry into the principles of the fine arts, inures the reflecting mind to the most enticing sort of logic: the practice of reasoning upon subjects so agreeable tends to a habit; and a habit strengthening the reasoning faculties, prepares the mind for entering into subjects more difficult and abstract. To have, in this respect, a just conception of the importance of criticism, we need but reflect upon the common method of education; which, after some years spent in acquiring languages, hurries

us, without the least preparatory discipline, into the most profound philosophy: a more effectual method to alienate the tender mind from abstract science, is beyond the reach of invention; and accordingly, with respect to such speculations, the bulk of our youth contract a sort of hobgoblin terror, which is seldom, if ever subdued. Those who apply to the arts, are trained in a very different manner: they are led, step by step, from the easier parts of the operation, to what are more difficult; and are not permitted to make a new motion, till they be perfected in those which regularly precede it. The science of criticism appears then to be a middle link, connecting the different parts of education into a regular chain. This science furnisheth an inviting opportunity to exercise the judgment: we delight to reason upon subjects that are equally pleasant and familiar; we proceed gradually from the simpler to the more involved cases; and in a due course of discipline, custom, which improves all our faculties, bestows acuteness upon those of reason, sufficient to unravel all the intricacies of philosophy.

Nor ought it to be overlooked, that the reasonings employed upon the fine arts are of the same kind with those which regulate our conduct. Mathematical and metaphysical reasonings have no tendency to improve social intercourse; nor are they applicable to the common affairs of life: but a just taste in the fine arts, derived from rational principles, furnishes elegant subjects for conversation, and prepares us finely for acting in the social state with dignity and propriety.

The science of rational criticism tends to improve the heart not less than the understanding. It tends, in the first place, to moderate the selfish affections: by sweetening and harmonizing the temper, it is a strong antidote to the turbulence of passion and violence of pursuit: it procures to a man so much mental enjoyment, that in order to be occupied, he is not tempted in youth to precipitate into hunting, gaming, drinking; nor in middle-age, to deliver himself over to ambition; nor in old-age, to avarice. Pride and envy, two gulfy passions, find in the constitution no enemy more formidable than a delicate and discerning taste: the man upon whom nature and culture have bestowed this blessing, feels great delight in the virtuous dispositions and actions of others: he loves to cherish them, and to publish them to the world: faults and failings, it is true, are to him not less obvious; but these he avails, or removes out of sight, because they give him pain. On the other hand, a man void of taste, upon whom the most striking beauties make but a faint impression, has no joy but in gratifying his pride or envy by the discovery of errors and blemishes. In a word, there may be other passions, which, for a season, disturb the peace of society more than those mentioned; but no other passion is so unwearied an antagonist to the sweets of social intercourse: those passions, tending assiduously to their gratification, put a man perpetually in opposition to others; and dispose him more to relish bad than good qualities, even in a companion. How different that disposition of mind, where every virtue

virtue in a companion or neighbour, is, by refinement of taste, set in its strongest light; and defects or blemishes, natural to all, are suppressed, or kept out of view!

In the next place, delicacy of taste tends not less to invigorate the social affections, than to moderate those that are selfish. To be convinced of this tendency, we need only reflect, that delicacy of taste necessarily heightens our sensibility of pain and pleasure, and of course our sympathy, which is the capital branch of every social passion. Sympathy in particular invites a communication of joys and sorrows, hopes and fears: such exercise, soothing and satisfactory in itself, is necessarily productive of mutual good-will and affection.

One other advantage of rational criticism is referred to the last place, being of all the most important; which is, that it is a great support to morality. No occupation attaches a man more to his duty than that of cultivating a taste in the fine arts: a just relish of what is beautiful, proper, elegant, and ornamental, in writing or painting, in architecture or gardening, is a fine preparation for the same just relish of these qualities in character and behaviour. To the man who has acquired a taste so acute and accomplished, every action wrong or improper, must be highly disgustful: if, in any instance, the overbearing power of passion sway him from his duty, he returns to it upon the first reflection, with redoubled resolution never to be swayed a second time: he has now an additional motive to virtue, a conviction derived from experience, that happiness depends on regularity and order, and that a disregard to justice or propriety never fails to be punished with shame and remorse.

For the rules of criticism, applicable to the fine arts, and derived from human nature, see ARCHITECTURE, BEAUTY, CONGRUITY, COMPARISON, GRANDEUR, &c.

**CROATIA**, a frontier province of Germany, bounded by Sclavonia on the north and east, by Bosnia on the south, and by Carniola on the west. It is subject to the house of Austria.

**CROCCEUS**, or **HOAMEO**, a large river of China, which, after a course of two thousand miles, falls into the bay of Nankin: it is sometimes called the Yellow river, on account of the slime of this colour with which its waters are tinged.

**CROCINUM**, among physicians, denotes the oil of saffron, said to be of a heating quality, and to procure sleep.

**CROCODES**, an appellation given to pastils or troches, whereof crocus, or saffron, is the principal ingredient.

**CROCODILE**, in zoology. See **LACERTA**.

**CROCUS**, or **SAFFRON**, in botany, a genus of the triandria monogynia class. The corolla is divided into six equal parts; and it has three erect stigmata. There is but one species, a native of Britain. The antheræ, or cloves, picked off and pressed together into cakes, goes by the name of saffron, which is an elegant and

useful aromatic, and is deservedly accounted one of the highest cordials.

**CROCUS**, in chemistry, denotes any metal calcined to a red or deep yellow colour. See **CHEMISTRY**.

**CROCUS METALLORUM**, an emetic preparation of antimony and nitre. See **CHEMISTRY**.

**CROFT**, a little close adjoining to a dwelling-house, and enclosed for pasture or arable land, or any other particular use.

**CROISADE**, **CRUSADE**, or **CRUZADO**, a name given to the expeditions of the Christians against the infidels, for the conquest of Palestine; so called, because those who engaged in the undertaking wore a cross on their cloaths, and bore one on their standard.

This expedition was also called the holy war, to which people flocked in great numbers out of pure devotion, the pope's bulls and the preaching of the priests of those days making it a point of conscience. The several nations engaged in the holy war were distinguished by the different colours of their crosses: the English wore white, the French red, the Flemish green, the Germans black, and the Italians yellow. From this enterprise several orders of knighthood took their rise. They reckon eight croisades for the conquest of the holy land; the first begun in the year 1095, at the solicitation of the Greek emperor and the patriarch of Jerusalem.

**CROISES**, or **CROIZES**, in English antiquity, pilgrims bound for the holy land, or such as had been there; so called from a badge they wore in imitation of a cross. The knights of St John of Jerusalem, created for the defence and protection of pilgrims, were particularly called croisets.

**CROISIERS**, a religious order founded in honour of the invention or discovery of the cross by the empress Helena.

They are dispersed in several parts of Europe, particularly in the Low Countries, France, and Bohemia, those in Italy being at present suppressed. These religious follow the rule of St Augustine. They had in England the name of crouched friars.

**CROMARTY**, the capital of the shire of Cromarty, in Scotland, with an excellent and safe harbour capable of containing the greatest fleets: W. long. 3° 40', and N. lat. 57° 54'.

**CRONENBURG**, a fortress of Denmark, situated in the island of Zealand, at the entrance of the Sound, where the Danes take toll of ships bound for the Baltic: E. long. 12° 5', and N. lat. 56°.

**CRONSLOT**, or **CROWN-CASTLE**, a castle and harbour in a little island of the same name, at the mouth of the river Neva, and entrance of the gulf of Finland, in Russia, about twelve miles west of Peterburgh: E. long. 30°, and N. lat. 60°. Here is a station for the Russian men of war, and a yard for building and refitting them.

**CRONSTAT**, a town of Transylvania, situated near the frontiers of Moldavia, about fifty miles north-east of Hermanstat, and subject to the house of Austria: E. long. 25°, and N. lat. 47°.

**CROPPER**,

**CROPPER**, in ornithology. See **COLUMBA**.

**CROSIER**, or **CROZIER**, a shepherd's crook; a symbol of pastoral authority, consisting of a gold or silver staff, crooked at the top, carried occasionally before bishops and abbots, and held in the hand when they give the solemn benedictions. The custom of bearing a pastoral staff before bishops is very ancient. Regular abbots are allowed to officiate with a mitre and crosier. Among the Greeks none but a patriarch had a right to the crosier.

**CROSIER**, in astronomy, four stars in the southern hemisphere, in the form of a cross, serving those who sail in south latitudes to find the antarctic pole.

**CROSLET**, in heraldry, is when a cross is crossed again at a small distance from each of the ends. Upton says it is not so often borne by itself in arms, as other crosses are, but often in diminutives, that is, in small crosslets scattered about the field. See Plate LXVI. fig. 7.

**CROSS**, in antiquity, a species of punishment, or rather the instrument wherewith it was inflicted, consisting of two pieces of wood crossing each other.

This punishment was only inflicted on malefactors and slaves, and thence called *servile supplicium*. The most usual method was to nail the criminal's hands and feet to this machine, in an erect posture; though there are instances of criminals so nailed with their head downward.

*Invention of the Cross*, a festival observed on May 3, by the Latin church, in memory of the empress Helena's (the mother of Constantine) finding the true cross of Christ on mount Calvary, where she caused erect a church for the preservation of it.

*Exaltation of the Cross*, a grand festival solemnized on September 14, in commemoration of Heraclius's restoring to mount Calvary the true cross, that had been carried off by Cosroes king of Persia, upon taking the city of Jerusalem.

*Order of the Cross*, an order of ladies instituted in 1668, by the empress Eleanora de Gonzagua, wife of the emperor Leopold, on occasion of the miraculous recovery of a little golden cross, wherein were inclosed two pieces of the true cross, out of the ashes of a part of the palace that had been burnt down: though the fire burnt the case wherein it was enclosed, and melted the crystal, it appears that the wood had not received the least damage.

**CROSS**, in heraldry, an ordinary composed of fourfold lines, whereof two are perpendicular, and the other two transverse; for so we must conceive of them, though they are not drawn throughout, but meet, by couples, in four right angles, near about the fesse-point of the escutcheon. The content of a cross is not always the same; for when it is not charged, it has only the fifth part of the field; but if it be charged, then it must contain the third part thereof.

This bearing was bestowed on such as had performed, or at least undertaken some service for Christ and the Christian profession; and is therefore held by several authors the most honourable charge in all heraldry. What brought it into such frequent use was

the ancient expeditions into the holy land, the cross being the ensigns of that war.

In these wars, the Scots carried St Andrew's cross; the French, a cross argent; the English, a cross or; the Germans, sable; the Italians, azure; the Spaniards, gules.

**CROSS BAR-SHOT**, a bullet with an iron-bar passing through it, and standing six or eight inches out at both sides: it is used at sea, for destroying the enemy's rigging.

**CROSS BILL**, in ornithology. See **LOXIA**.

**CROSS-WORT**, in botany. See **VALANTIA**.

**CROSSELET**, a little or diminutive cross, used in heraldry, where the shield is frequently seen covered with crosslets; also fesses and other honourable ordinaries, charged or accompanied with crosslets. Crosses frequently terminate in crosslets. See Plate LXVI. fig. 7.

**CROTALARIA**, in botany, a genus of the diadelphia decandria class. The pod is swollen, inflated, and pedicellated. There are eleven species, none of them natives of Britain.

**CROTALOPHORUS**, in zoology. See **CROTALUS**.

**CROTALUS**, or **RATTLE-SNAKE**, in zoology, a genus belonging to the order of amphibia serpentes, the characters of which are these: The belly is furnished with scuta, and the tail has both scuta and scales; but the principal characteristic of this genus, is the rattle at the end of the tail. The rattles consist of several articulated crustaceous, or rather horny bags, which make a considerable rattling noise when the creature moves, and serves to warn people of their approach. There are five species, and the bite of every one of them is so highly poisonous, that it generally kills in a short time. 1. The horridus, or American rattle-snake, has 167 scuta, and 23 scutellæ. It is generally of an orange, tawny, or blackish colour on the back, and the belly is ash coloured: they are from four to six inches in length; some are as thick as a man's leg: Dr Tyfon dissected one which was four feet five inches long, and the body six and a half inches in diameter. They devour birds, squirrels, hares, &c. 2. The miliaris has 13 scuta, and 31 scutellæ. It is ash-coloured, interspersed with black spots, and is a native of Carolina. 3. The dryinas has 165 scuta, and 30 scutellæ. It is whitish, with a few yellow spots, and is a native of America. 4. The durissus has 172 scuta, and 21 scutellæ. It is variegated with white and yellow colours, and is likewise found in America. 5. The mutus has 217 scuta, and 34 scutellæ. It has a chain of rhomboidal black spots on the back, a black line behind the eyes, and is a native of Surinam.

**CROTCHET**, in music, one of the notes or characters of time, marked thus ♯, equal to half a minim, and double of a quaver.

**CROTCHETS** are also marks or characters, serving to inclose a word or sentence which is distinguished from the rest, being generally in this form [ ], or this ( ).

**CROTON**, in botany, a genus of plants of the monoechia polyandria class. The calix of the male is cylindrical,

drical, and has five teeth; the corolla has five petals; and the stamina are from 10 to 15. The calix of the female consists of many leaves; it has no corolla; but has three bifid styli; and the capsule has three cells, and contains one seed. There are 21 species, none of them natives of Britain.

**CROTOY**, a town of France, situated in the province of Picardy, at the mouth of the river Somme: E. long. 1° 30', and N. lat. 50° 15'.

**CROUP** *of a horse*. in the menage, the extremity of the reins above the hips.

**CROUPADE**, in the menage, a leap, in which the horse pulls up his hind legs, as if he drew them up to his belly.

**CROW**, or **CARRION-CROW**, in ornithology. See **CORVUS**.

*Keyfion* **CROW**. See **CORVUS**.

**Crow**, in mechanics, a kind of iron lever, with a claw at one end, and a sharp point at the other; used for heaving or purchasing great weights.

**Crow's BILL**, among surgeons, a kind of forceps, for drawing bullets and other foreign bodies out of wounds.

**Crow-FLOWERS**, in botany. See **LYCHNIS**.

**Crow's FEET**, in the military art, machines of iron, having four points, each about three or four inches long, so made, that whatever way they fall, there is still a point up: they are thrown upon breaches, or in passes where the enemy's cavalry are to march, proving very troublesome by running into the horse's feet and laming them.

**Crow's FEET**, in a ship, small lines or ropes, sometimes eight or ten, reeved through the deadmens eyes; and scarce of any other use than to make a shew of small rigging. They are usually placed at the bottom of the back-stays of the fore-top-mast, mizen-top-mast, and gallant-top-mast.

**Crow's FOOT**, in botany. See **RANUNCULUS**.

**CROWLAND**, a market-town of Lincolnshire: W. long. 10°, and N. lat. 52° 40'.

**CROWN**, an ornament worn on the head by kings, sovereign princes, and noblemen, as a mark of their dignity.

In scripture there is frequent mention of crowns, and the use of them seems to have been very common among the Hebrews. The high priest wore a crown, which was a fillet of gold placed upon the forehead, and tied with a ribbon of hyacinth colour, or azure blue. It seems also as if private priests, and even common Israelites, wore also a sort of crown, since God commands Ezekiel not to take off his crown, nor assume the marks of one in mourning. This crown was no more than a ribbon or fillet, with which the Jews and several people in the east girt their heads. And indeed the first crowns were no more than a bandelet drawn round the head, and tied behind, as we still see it represented on medals round the heads of Jupiter, the Ptolemies, and kings of Syria. Afterwards they consisted of two bandelets: by degrees they took branches of trees of divers kinds; at length they added flowers, inasmuch that Claudius Saturni-

nus says, there was not any plant whereof crowns had not been made. The woods and groves were searched to find different crowns for the several deities; and they were used not only on the statues and images of the gods, by the priests in sacrificing, and by kings and emperors, but also on altars, temples, doors of houses, sacred vessels, victims, ships, &c.

The Roman emperors had four kinds of crowns, still seen on medals, *viz.* a crown of laurel, a radial or radiating crown, a crown adorned with pearls and precious stones, and the fourth a kind of bonnet or cap, something like the mortar.

The Romans had also various kinds of crowns, which they distributed as rewards of military achievements; as, 1. The oval crown, made of myrtle, and bestowed upon generals, who were entitled to the honours of the lesser triumph, called ovation. 2. The naval or rostral crown, composed of a circle of gold, with ornaments representing beaks of ships, and given to the captain who first grappled, or the soldier who first boarded, an enemy's ship. 3. The crown called in Latin *vallis*, or *castrensis*, a circle of gold raised with jewels or palisades; the reward of him who first forced the enemy's entrenchments. 4. The mural crown, a circle of cold indented and embattled; given to him who first mounted the wall of a besieged place, and there lodged a standard. 5. The civic crown, made of the branch of a green oak, and given him who had saved the life of a citizen. 6. The triumphal crown, consisting at first of wreaths of laurel, but afterwards made of gold; proper to such generals as had the honour of a triumph. 7. The crown called obsidionalis, or *graminea*, made of grass growing on the place; the reward of a general who had delivered a Roman army from a siege. 8. The crown of laurel, given by the Greeks to their athletes; and by the Romans to those who had negotiated or confirmed a peace with an enemy: this was the least honourable of all. We meet also with the *corona aurea*, often bestowed on soldiers, without any other additional term; the radial crown, given to princes at their translation among the gods; athletic crowns, and crowns of laurel, destined to crown victims at the public games, poets, orators, &c. All these crowns were marks of nobility to the wearers; and upon competitions with rivals for rank and dignities, often determined the preference in their favour. See Plate LXVI. fig. 8. n°. 1. 2. 3. &c.

*The Imperial Crown* is a bonnet or tiara, with a semi-circle of gold, supporting a globe with a cross at top. See Plate LXVI. fig. 9. n°. 1.

*The British Crown* is adorned with four crosses, between which there are four fleurs de lis: it is covered with four diadems, which meet at a little globe supporting a cross. *Ibid.* n°. 2.

*The French Crown*, is a circle of eight fleurs de lis, encompassed with six diadems, bearing at top a double fleurs de lis, which is the crest of France. *Ibid.* n°. 3.

*The Spanish Crown* is adorned with large indented leaves, and covered with diadems terminating in a globe, surmounted with a cross. *Ibid.* n°. 4.

The crowns of almost all other kings are adorned with large leaves, bordered with four, six, or eight diadems, with a globe and cross at top.

*The Papal Crown* is composed of a tiara, and a triple crown encompassing it, with two pendants like the bishop's mitres. These crowns represent the pretended triple capacity of the pope, as high priest, supreme judge, and sole legislator of Christians. *Ibid.* n<sup>o</sup>. 5.

*An electoral Crown*, or coronet, is a scarlet cap turned up with ermine, and closed with a semicircle of gold, all covered with pearls, with a globe at top, surmounted with a golden cross. *Ibid.* n<sup>o</sup>. 6.

*Crowns of British princes of the blood*. 1. The prince of Wales's crown consists alternately of crosses and fleurs de lis, with one arch, in the middle of which is a ball and cross, as in the royal diadem. 2. That of all the younger sons and brothers of the king, consists likewise of crosses and fleurs de lis alternately, but without any arch, or being surmounted with a globe and cross at top. 3. That of the other princes of the blood consists alternately of crosses and leaves, like those in the coronet of dukes, &c. *Ibid.* fig. 10. n<sup>o</sup>. 1. 2. 3.

*Crowns of noblemen* are, a duke's, composed of leaves of smilage, or parsley: that of a marquis, of flowers and pearls placed alternately: an earl's has no flowers about the circle, like the duke and marquis, but only points rising, and a pearl on every one of them: a viscount has neither flowers nor points raised above the circle, like the other superior degrees, but only pearls placed on the circle itself without any limited number: a baron's has only six pearls on the golden border, not raised, to distinguish him from the earl's; and the number of them limited, to shew he is inferior to the viscount. *Ibid.* fig. 11. n<sup>o</sup>. 1. 2. &c.

*Crown*, in commerce, a general name for coins both foreign and domestic, which are of, or very near, the value of five shillings sterling.

*Crown office*, an office belonging to the king's Bench court, of which the king's coroner or attorney is commonly master. In this office, the attorney general and clerk of the crown severally exhibit informations for crimes and misdemeanors at common law, as in the case of batteries, conspiracies, libelling, &c. on which the offender is liable to pay a fine to the king.

*Crown-glass*, denotes the finest sort of window-glass. See GLASS.

*Crown-wheel of a watch*, the upper wheel next the balance, which by its motion drives the balance, and in royal pendulums is called the swing-wheel.

*Crown imperial*, in botany. See FRITILLARIA.

*Croydon*, a market-town in Surrey, about ten miles south of London.

*Crucial incision*, in surgery, an incision made in form of a cross.

*Crucianella*, in botany, a genus of the tetrandria monogynia class. The corolla consists of one funnel-shaped petal, with a filiform tube; the calix has three leaves; and the seeds are two, situate between the

calix and corolla. The species are five, none of them natives of Britain.

*CRUCIATA*, in botany. See VALENTIA.

*CRUCIBLE*, a chemical vessel made of earth, and so tempered and backed as to endure the greatest fire. They are used to melt metals, and to flux minerals, ores, &c.

The figure of a crucible is commonly that of an obtuse conoid, with its base at the top, and obtuse apex at the bottom; whence this conical figure may be varied, till it comes to the hollow segment of a sphere.

The crucibles most generally used are those of Hesse and Austria.

*CRUCIFIX*, a cross upon which the body of Christ is fastened in effigy, used by the Roman-catholics to excite in their minds a strong idea of our Saviour's passion.

They esteem it an essential circumstance of the religious worship performed at the altar; and on Good Friday they perform the ceremony of adoring it, which is done in these words, *O crux ave, spes unica; Hail, thou cross, our only hope*. The officiating priest uncovers the crucifix, elevates it with both his hands, and says, *Ecce lignum crucis: Behold the wood of the cross*. The people answer, *in quo salus mundi pendit; on which the Saviour of the world suffered death*. Then the whole congregation bow with great reverence, and devoutly kiss the holy wood.

*CRUCIFIXION*, a capital punishment by nailing the criminal to a cross. See CROSS.

*CRUCIFORM*, in general, something disposed cross-wise; but more especially used by botanists, for flowers consisting of four petals disposed in the form of a cross.

*CRUDE*, an epithet given to something that has not passed the fire, or had a proper degree of coction.

*CRUDITY*, among physicians, is applied to undigested substances in the stomach; to humours in the body which are unconcocted, and not prepared for expulsion; and to the excrements.

*CRUISE*, in the sea-language, signifies to sail back and fore within a certain space of the sea, as well to annoy the enemy, as to protect our own trading vessels.

*CRUMENTATA*, among zoologists, animals furnished with a pouch, or bag, wherein to receive their young in time of danger.

*CRUOR*, sometimes signifies the blood in general; sometimes only the venous blood; and sometimes extravasated, or coagulated blood.

*CRUPPER*, in the menage, the buttocks of a horse, the rump; also a thong of leather put under a horse's tail, and drawn up by thongs to the buckle behind the saddle, so as to keep him from casting the saddle forwards on his neck.

*CRURA CLITORIDIS*, in anatomy. See Vol. I. p. 276.

*CRURA MEDULLÆ OBLONGATÆ*. See Vol. I. p. 287.

*CRURÆUS*, or *CRUREUS MUSCULUS*, in anatomy. See Vol. I. p. 207.

*CRURAL*, in anatomy, an epithet given to the artery which conveys the blood to the crura, or legs, and to the

the vein by which this blood returns towards the heart. See ANATOMY, Part III. IV.

CRUS, in anatomy, all that part of the body contained between the buttocks and the toes. See ANATOMY, Part I.

CRUSCA, an Italian term signifying bran, is in use amongst us to denote that celebrated academy called *della crusca*, established at Florence, for purifying and perfecting the Tuscan language.

CRUSTA VILLOSA, in anatomy. See Vol. I. p. 258.

CRUSTA LACTEA, in medicine, the same with *achor*, being scabby eruptions with which the heads of children are often troubled. See MEDICINE.

CRUSTACEOUS, an appellation given to animals covered with shells made up of several pieces, in contradistinction to those consisting of a single piece.

CRUX, or St CROIX, one of the Caribbee-islands, situated about sixty miles south east of Porto-Rico, and subject to France: W. long.  $64^{\circ}$ , and N. lat.  $17^{\circ} 30'$ .

CRUSADO, in commerce, a Portuguese coin, struck under Alphonfus V. about the year 1457, at the time when pope Calixtus sent thither the bull for a croisade against the infidels.

This coin has a cross on one side, and the arms of Portugal on the other.

CRYMODES, among physicians, a kind of fever attended with a shivering cold and inflammation of the internal parts of the body.

CRYPTOGAMIA, in botany. See the *Scheme*, p. 635. and Plate LIII. fig. 24. also p. 636.

CRYPTOGRAPHY, the art of writing in cipher, or with sympathetic ink. See CIPHER and INK.

CRYSTAL, the name of a very large class of fossils; hard, pellucid, and naturally colourless; of regularly angular figures, composed of simple, not filamentous plates; not flexible nor elastic, giving fire with steel; not fermenting in acid menstrua, and calcining in a strong fire.

The orders of pure crystal are three; the first is perfect columnar crystals, with double pyramids, composed of eighteen planes, in an hexangular column, terminated by an hexangular pyramid at each end: the second order is that of perfect crystals, with double pyramids, without a column, composed either of twelve or of sixteen planes, in two hexangular pyramids, joined closely, base to base, without the intervention of any column: the third order is that of imperfect crystals, with single pyramids, composed either of twelve or ten planes, in an hexangular or pentangular column, affixed irregularly, at one end, to some solid body, and terminated, at the other, by an hexangular or pentangular pyramid.

These are all the general forms into which crystal, when pure, is found concentered: but under these there are almost infinite varieties in the number of angles, and the length, thickness, and other accidents of the columns and pyramids.

When crystal is blended with metalline particles at the time of its formation, it assumes a variety of figures wholly different from these, constituting a fourth order, under the name of metalline crystals: when that

metal is lead, the crystal assumes the form of a cube; when it is tin, of a quadrilateral pyramid, with a broad base; when iron, the crystal is found concentered in rhomboidal crystals: these crystals are very common about mines; but the common spars, which are liable to be influenced in the same manner by the metals, and to appear in the very same form, are to be carefully distinguished from them. There is one very easy test for this purpose, which is, that all spars are subject to be dissolved by aqua fortis, and effervesce violently only on its touching it: but it has no such effects on crystal.

The pebble crystal is common enough in all parts of the world; but that which is formed of hexangular columns, affixed to a solid base at one end, and terminated by a hexangular column at the other, is infinitely more so: this is what we call sprig or rock crystal, and is the species described by most authors under the name of crystal of the shops, or that kept for medicinal use.

It is to be chosen the clearest, purest, and most transparent that can be had: it should be proved to be no spar, by means of aquafortis, or by drawing a point of it along a pane of glass, which it cuts in the manner of a diamond. It is found in vast abundance in many parts of England and Ireland; and in Germany it is yet more frequent. It is found about Bristol of amethystine tinge; in Silesia and Bohemia it is stained to the colour of the ruby, sapphire, emerald, and topaz, in which case jewellers make great advantage of it, selling it under the name of accidental sapphire, &c.

CRYSTAL is also used for a facitious body, cast in glass-houses, called crystal-glass; being, in fact, no more than glass carried, in the composition and manufacture, to a greater perfection than the common glass.

The best kind of glass-crystal is that called Venice crystal, made at Moran, near Venice. See GLASS.

CRYSTALS, in chemistry, salts or other matters shot, or congealed, in the manner of crystal. See CHEMISTRY.

CRYSTALLINE HUMOUR, in anatomy. See Vol. I. p. 289.

CRYSTALLIZATION, in chemistry. See CHEMISTRY.

CRYSTALLOMANCY, in antiquity, a kind of divination, performed by means of a mirror, wherein the figures of the things required are said to have been represented.

CUB, a bear's whelp. Among hunters, a fox and martens of the first year, are called cubs. See URSUS.

CUBA, an island of North America, situated in the Atlantic ocean, between  $74^{\circ}$  and  $87^{\circ}$  of W. long. and between  $20^{\circ}$  and  $23^{\circ}$  N. lat. being eight hundred miles and upwards in length from east to west, and generally about seventy miles broad. It lies about fifty miles west of Hispaniola, and seventy-five north of Jamaica.

CUBAGUA, an American island, situated between the island of Margareta and Terra Firma, and subject to Spain: W. long.  $64^{\circ}$ , and N. lat.  $10^{\circ} 15'$ .

CUBE,

**CUBE**, in geometry, a solid body, consisting of six equal square sides. See **GEOMETRY**.

**CUBEBS**, in the materia medica, a small dried fruit, resembling a grain of pepper, but often somewhat longer, brought into Europe from the island of Java. In aromatic warmth and pungency, they are far inferior to pepper.

**CUBIC**, or **CUBICAL EQUATION**, in algebra. See **ALGEBRA**.

**CUBIT**, in the mensuration of the ancients, a long measure, equal to the length of a man's arm, from the elbow to the tip of the fingers.

Dr Arbuthnot makes the English cubit equal to 18 inches; the Roman cubit equal to 1 foot 5, 406 inches; and the cubit of the scripture equal to 1 foot, 9, 888 inches.

**CUCKOW**, in ornithology. See **CUCULUS**.

**CUCKOW-SPIT**, the same with froth-spit. See **FROTH-SPIT**.

**CUCKOW-SPIT-INSECT**. See **CICADA**.

**CUCUBALUS**, in botany, a genus of the decandria trigynia class. The calix is inflated; the corolla has five petals with unguis; and the capsule has three cells. There are 13 species, five of which are natives of Britain, viz. the bacciferus, or berry-bearing chickweed; the beken, or white corn campion; the viscosus, or Dover campion; the elites, or Spanish catchfly; and the acaulis, or moss campion.

**CUCULUS**, the Cuckow, in ornithology, a genus belonging to the order of picæ. The bill is somewhat cylindrical; the edges of the nostrils are a little prominent; the tongue is arrow-shaped, plain, and not divided, and the toes are of the climbing kind, *i. e.* two before and two behind. It is about the size of a pigeon. The cuckow is a migrating bird; it comes to Britain about the end of April, hatches its young, and disappears about St John's day. The cuckow neither builds a nest, nor sits upon its eggs; but takes possession of a nest built by small birds of the sparrow kind, in which it generally lays but one egg, which is hatched by the small bird along with its own eggs; during the time of hatching, the cuckow sits upon hedges or trees, and almost constantly sings. If the cuckow's egg be first hatched, she immediately throws out and destroys the eggs of the small bird; but if the small bird's eggs be first hatched, the cuckow allows the young to live till its own egg is hatched, and then destroys the young belonging to the small bird. The small bird feeds and brings up the young cuckow with as much care and attention as if it were its own, till it be able to procure its own food, when, some say, it ungratefully kills and eats its nurse. The cuckow feeds upon caterpillars and small birds; but is never transformed into a hawk, as is vulgarly supposed. It is a native of Europe. Linnæus enumerates no less than 22 species, which inhabit different parts of the globe, and are chiefly distinguished by the shape of the tail and variations in colour.

**CUCUMBER**, in botany. See **CUCUMIS**.

**CUCUMIS**, or **CUCUMBER**, in botany, a genus of the monoecia syngenesia class. The calix of the male has

five teeth; the corolla is divided into five segments; and the filaments are three: The calix and corolla of the female are the same with those of the male; the pistillum is trifid; and the seeds of the apple are short and slender. There are 11 species, none of them natives of Britain.

**CUCURBIT**, in chemistry. See **CHEMISTRY**, Vol. II. p. 109.

**CUCURBITA**, the **GOURD**, in botany, a genus of the monoecia syngenesia class. The calix has five teeth; the corolla is divided into five segments; and the filaments are three: The calix and corolla of the female are the same with those of the male; the pistillum is quinquelid; and the seeds of the apple are turned at the edges. The species are five, none of them natives of Britain.

**CUD** sometimes means the inside of the throat in beasts, and sometimes the food that they keep there and chew over again: from whence, *to chew the cud*, signifies, to ponder, think, or ruminate upon a thing.

**CUDWEED**, in botany. See **GNAPHALIUM**.

**CUENCA**, a city and bishop's see of New Castile, in Spain, about eighty-five miles east of Madrid: W. long. 2° 40', and N. lat. 40° 12'.

**CUIRASSIÈ**, a piece of defensive armour, made of iron plate, well hammered, serving to cover the body, from the neck to the girdle, both before and behind. Whence,

**CUIRASSIERS**, cavalry armed with cuirasses, as most of the Germans are: the French have a regiment of cuirassiers; but we have had none in the British army since the revolution.

**CULDEES**, in church-history, a sort of monkish priests, formerly inhabiting Scotland and Ireland. Being remarkable for the religious exercises of preaching and praying, they were called, by way of eminence, *cultores Dei*; from whence is derived the word culdees. They made choice of one of their own fraternity to be their spiritual head, who was afterwards called the Scots bishop.

**CULEUS**, in Roman antiquity, the largest measure of capacity for things liquid, containing twenty amphoræ, or forty urnæ. It contained one hundred forty-three gallons, three pints, English wine-measure; and was 11.095 solid inches.

**CULEX**, in zoology, a genus of insects belonging to the order of diptera: The mouth is armed with setaceous prickles inclosed in a flexile sheath. There are seven species, principally distinguished by their colour.

**CULIACAN**, the capital of a province of the same name in Mexico, opposite to the southern end of California: W. long. 113°, and N. lat. 24°.

**CULIAGE**, a barbarous and immoral practice, whereby the lords of manors anciently assumed a right to the first night of their vassals' brides.

**CULLEN**, a parliament town in Scotland, situated on the sea-coast of Banfshire: W. long. 2° 12', and N. lat. 57° 38'.

**CULM**, or **CULMUS**, among botanists. See Vol. I. p. 641.

**CULMI-**

**CULMINATION**, in astronomy, the passage of any heavenly body over the meridian, or its greatest altitude for that day.

**CULMORE**, a town of Ireland, in the county of Londonderry, and province of Ulster, about five miles north of Londonderry: W. long.  $7^{\circ} 40'$ , and N. lat.  $55^{\circ}$ .

**CULMUS**. See **CULM**.

**CULPRIT**, a formal reply of a proper officer in court, in behalf of the king, after a criminal has pleaded not guilty, affirming him to be guilty, without which the issue to be tried is not joined.

The term culprit is a contraction of the Latin *culpabilis*, and the French *prêt*; importing that he is ready to prove the criminal guilty.

**CULROSS**, a parliament town of Scotland, situated on the river Forth, about twenty three miles north-west of Edinburgh: W. long.  $3^{\circ} 34'$ , and N. lat.  $56^{\circ} 8'$ .

**CULVERIN**, in the military art, a large cannon, or piece of artillery; for the kinds, weight, and proportions of which, see **CANNON**.

**CULVERTAILED**, among ship-wrights, signifies the fastening, or letting, of one timber into another, so that they cannot slip out, as the carlings into the beams of a ship.

**CUMBERLAND**, one of the most northerly counties of England, separated from Scotland by the frith and river of Solway. It gives the title of duke to his royal highness William duke of Cumberland, &c.

**CUMINOIDES**, in botany. See **LAGOECIA**.

**CUMINUM**, in botany, a genus of the pentandria digynia class. The fruit is oval and striated; it has four umbellulæ, and the involucre consists of four segments. There is but one species, a native of Egypt. The seeds are carminative and stomachic.

**CUNEIFORM**, in general, an appellation given to whatever resembles a wedge.

**CUNEIFORM BONE**, in anatomy. See Vol. I. p. 180.

**CUNEUS**, the wedge, in mechanics. See **MECHANICS**.

**CUNICULUS**, in zoology. See **LEPUS**.

**CUNILA**, in botany, a genus of the diandria monogynia class; of which there are three species, none of them natives of Britain.

**CUNNINGHAM**, one of the four bailiwicks of Scotland, and one of the three into which the shire of Ayr is subdivided. It lies north-east of Kyle. Its chief town is Irwin.

**CUP**, among botanists, the same with calyx. See **CALYX**.

**CUPANIA**, in botany, a genus of the pentandria monogynia class. The calyx consists of three leaves; the stylus is trifid; the capsule has three valves; and the seeds are six. There is but one species, a native of America.

**CUPOLA**, in architecture, a spherical vault; or the round top of the dome of a church, in form of a cup inverted.

**CUPPEL**, or **COPEL**, in chemistry. See **COPEL**.

**CUPPING**, in surgery, the operation of applying cup-

ping-glasses for the discharge of blood, and other humours, by the skin. See **SURGERY**.

**CUPRESSUS**, the **CYPRESS-TREE**, a genus of the monœcia monodelphia class. The calyx of the male is a scale of the amentum; it has no corolla; and the antheræ have no filaments: The calyx of the female is a strobilus, and the squama contains a single flower; it has no corolla; the stylus is a concave point; and the nut is angular. The species are four, none of them natives of Britain.

**CUPRUM**, or **COPPER**. See **CHEMISTRY**, Vol. II. p. 80.

**CURASSOW**, or **CURACAO**, one of the lesser Antilla-islands, subject to the Dutch, and situated in  $68^{\circ} 35'$  W. long. and  $12^{\circ} 30'$  N. lat.

**CURATE**, properly signifies the parson or vicar of a parish, who has the charge or cure of the parishioners souls. See **CURE**.

**CURATE**, also signifies a person substituted by the incumbent, to serve his cure in his stead.

**CURATOR**, among civilians, a person regularly appointed to manage the affairs of minors, or persons mad, deaf, dumb, &c. See **LAW**.

**CURB**, in the menage, a chain of iron, made fast to the upper part of the branches of the bridle, in a hole called the eye, and running over the horse's beard. It consists of these three parts; the hook, fixed to the eye of the branch; the chain of SS's, or links; and the two rings, or mailes. Large curbs, provided they be round, are always most gentle: but care is to be taken, that it rest in its proper place, a little above the beard, otherwise the bit-mouth will not have the effect that may be expected from it.

English watering bits have no curbs; the Turkish bits, called genettes, have a ring that serves instead of a curb. See **GENETTES**.

**CURCULIO**, in zoology, a genus of insects belonging to the order of coleoptera. The feelers are subclavated, and rest upon the snout, which is prominent and horny. There are no less than ninety-five species, principally distinguished by their colour.

**CURCUMA**, or **TURMERIC**, in botany, a genus of the monandria monogynia class. It has four barren stamina, and only the fifth is fertile. There are two species, both natives of India. See Vol. I. p. 633.

**CURDISTAN**, a province of Persia, having Turcomania, or Armenia, on the north, and Eyraca-Arabia, or Chaldea, on the south.

**CURDLING**, the coagulating any fluid body, especially milk.

It is said, that at Florence they curdle their milk for the making of cheese with artichoke-flowers, instead of the rennet used among us for that purpose.

**CURFEW**, or **COURFEW**, a signal given in cities taken in war, &c. to the inhabitants to go to bed. Pasquin says, it was so called, as being intended to advertise the people to secure themselves from the robberies and debaucheries of the night.

The most eminent curfew in England was that established by William the Conqueror, who appointed,

under severe penalties, that, at the ringing of a bell at eight o'clock in the evening, every one should put out their lights and fires, and go to bed: whence, to this day, a bell rung about that time is called a curfew-bell.

**CURIA**, in Roman antiquity, a certain division, or portion of a tribe. Romulus divided the people into thirty curiæ, or wards, whereof there were ten in every tribe, that each might keep the ceremonies of their feasts and sacrifices in the temple, or holy place, appointed for every curia. The priest of the curia was called curio.

**CURIA**, in the English law, generally signifies a court; and has been taken for the customary tenants, who do their suit and service at the court of the lord. See **COURT**.

**CURING**, a term used for the preserving fish, flesh, and other animal substances, by means of certain additions of things, to prevent putrefaction. One great method of doing this, is by smoking the bodies with the smoke of wood, or rubbing them with salt, nitre, &c.

**CURLEW**, in ornithology. See **SCOLOPAX**.

**CURNOCK**, a measure of corn, containing four bushels, or half a quarter.

**CURRANS**, or **CURRENTS**, the fruit of a species of grossularia. See **GROSSULARIA**.

The white and red sort are mostly used; for the black, and chiefly the leaves, upon first coming out, are in use to flavour English spirits, and counterfeit French brandy. Currants greatly assuage drought, cool and fortify the stomach, and help digestion.

**CURRENTS** also signify a smaller kind of grapes brought principally from Zant and Cephalonia. They are gathered off the bushes, and laid to dry in the sun, and so put up in large butts. They are opening and pectoral, but are more used in the kitchen, than in medicine.

Currants, the hundred weight pay on exportation 1 l. 2 s. 1  $\frac{1}{2}$  d. and draw back on exportation 1 l. os. 7  $\frac{1}{2}$  d. If imported in Venetian ships, they pay the 112 lb. 1 l. 3 s. 7  $\frac{1}{2}$  d. and draw back 1 l. 1 s. 8  $\frac{1}{2}$  d. In other foreign bottoms they pay 1 l. 7 s. 4  $\frac{1}{2}$  d. and draw back 1 l. 5 s. 6  $\frac{1}{2}$  d.

**CURRENT**, in hydrography, a stream or flux of water in any direction. In the sea, they are either natural, occasioned by the diurnal motion of the earth round its axis, or accidental, caused by the waters being driven against promontories, or into gulfs and streights, where, wanting room to spread, they are driven back, and thus disturb the ordinary flux of the sea. Dr Halley makes it highly probable that in the Downs, there are under-currents, by which as much water is carried out as is brought in by the upper-currents.

**CURRENTS**, in navigation, are certain settings of the stream, by which ships are compelled to alter their course or velocity, or both, and submit to the motion impressed upon them by the current. See **NAVIGATION**.

**CURRIERS**, those who dress and colour leather after it comes from the tan yard. See **TANNING**.

**CURRUCU**, in ornithology. See **MOTACILLA**.

**CURRYING**, the method of preparing leather with oil, tallow, &c. See **TANNING**.

**CURTATE** *distance*, in astronomy, the distance of a planet from the sun to that point where a perpendicular let fall from the planet meets with the ecliptic.

**CURTATION**, in astronomy, is the interval between a planet's distance from the sun, and the curtate distance.

**CURTIN**, **CURTAIN**, or **COURTIN**, in fortification, is that part of the rampart of a place which is betwixt the flanks of two bastions, bordered with a parapet five feet high, behind which the soldiers stand to fire upon the covered way and into the moat.

**CURVATOR** *coccygis*, in anatomy. See Vol. I. p. 220.

**CURVATURE** of a line, is the peculiar manner of its bending or flexure by which it becomes a curve of such and such peculiar properties.

**CURVE**, in geometry, a line which running on continually in all directions, may be cut by one right line in more points than one. See **CONIC SECTIONS**, and **FLUCTIONS**.

**CURVET**, or **CORVET**, in the menage, an air in which the horse's legs are raised higher than in the demi-volt; being a kind of leap up, and a little forwards, wherein the horse raises both his fore-legs at once, equally advanced, (when he is going straight forward, and not in a circle), and as his fore-legs are falling, he immediately raises his hind-legs, equally advanced, and not one before the other: so that all his four legs are in the air at once; and as he sets them down, he marks but twice with them.

**CURVILINEAR**, or **CURVILINEAL**, is said of figures bounded by curves, or crooked lines.

**CURVIROSTRA**, in ornithology. See **LOXIA**.

**CURULE** chair, in Roman antiquity, a chair adorned with ivory, wherein the great magistrates of Rome had a right to sit and be carried.

The curule magistrates were the ædiles, the prætors, censors, and consuls. This chair was fitted in a kind of chariot, whence it had its name. The senators who had borne the offices of ædiles, prætors, &c. were carried to the senate-house in this chair, as were also those who triumphed, and such as went to administer justice, &c. See **ÆDILES**, &c.

**CURZOLA**, an island in the gulf of Venice, upon the coast of Dalmatia, about twelve miles from the island of Lessina.

**CUSCO**, the capital city of Peru, during the reigns of the Incas: it is still a fine city, and the see of a bishop, and stands about 350 miles east of Lima, in 70° W. long. and 13° S. lat.

**CUSCUTA**, or **DODDER**, a genus of the tetrandria digynia class. The calix consists of four segments; the corolla has but one petal; and the capsule is bilocular. There are two species, one of which is a native of Britain, viz. the Europæa, dodder, hell-weed, or devil's guts.

**CUSPIDATED**, in botany, are such plants whose leaves are pointed like a spear.

**CUSTOM**,

**CUSTOM**, a very comprehensive term, denoting the manners, ceremonies and fashions of a people, which having turned into a habit, and passed into use, obtains the force of laws; in which sense it implies such usages, as, though voluntary at first, are yet, by practice, become necessary.

Custom is hence, both by lawyers and civilians, defined *lex non scripta*, a law, or right, not written, established by long usage, and the consent of our ancestors: in which sense it stands opposed to the *lex scripta*, or the written law.

**CUSTOMS**, in commerce, the tribute or toll, paid by merchants to the king, for goods exported or imported: they are otherwise called duties. See **DUTY**.

**CUSTOM HOUSE**, an office established by the king's authority in the maritime cities, or port-towns, for the receipt and management of the customs and duties of importation and exportation, imposed on merchandises, and regulated by books of rates.

**CUSTOS brevium**, the principal clerk belonging to the court of common pleas, whose business it is to receive and keep all the writs made returnable in that court, filing every return by itself; and, at the end of each term, to receive of the prothonotaries all the records of the nisi prius, called the postestas.

**CUSTOS rotulorum**, an officer who has the custody of the rolls and records of the sessions of peace, and also of the commission of the peace itself.

He usually is some person of quality, and always a justice of the peace, of the quorum, in the county where he is appointed.

**CUSTOS spiritualium**, he that exercises the spiritual jurisdiction of a diocese, during the vacancy of any see, which, by the canon law, belongs to the dean and chapter; but at present, in England, to the archbishop of the province, by prescription.

**CUSTOS temporalium** was the person to whom a vacant see or abbey was given by the king, as supreme lord. His office was, as steward of the goods and profits, to give an account to the escheator, who did the like to the exchequer.

**CUTAMBULI**, certain worms, either under the skin, or upon it, which, by their creeping, cause an uneasy sensation. It is also applied to wandering scorbutic pains.

**CUT-A-FEATHER**, in the sea language. If a ship has too broad a bow, it is common to say, *she will not cut a feather*; that is, she will not pass through the water so swift, as to make it foam or froth.

**CUTANEOUS**, in general, an appellation given to whatever belongs to the cutis or skin.

**CUTICLE**, in anatomy. See Vol. I. p. 285.

**CUTICULAR**, the same with cutaneous.

**CUTIS**, the SKIN, in anatomy. See Vol. I. p. 254.

**CUTTER of the tallies**, an officer of the exchequer, whose business is to provide wood for the tallies, to cut or notch the sum paid upon them; and then to call them into court, to be written upon. See **TALLY**.

**CUTTLE-FISH**. See **SEPIA**.

**CUZT**, the most eastern province of the kingdom of Fez, in Africa.

**CYANUS**, in botany. See **CENTAURIA**.

**CYATHUS**, in Roman antiquity, a liquid measure, containing four ligulas, or half a pint English wine-measure, being 469½ solid inches.

**CYCLAMEN**, or **SOW-BREAD**, in botany, a genus of the pentandria monogynia class. The corolla is rotated and reflected; the tube is very short, with a prominent faux; and the berry is covered with a capsule. There are two species, none of them natives of Britain. The root is a powerful aperient and abstergent.

**CYCLE**. See Vol. I. p. 491.

**CYCLE of the moon**. See Vol. I. p. 491.

**CYCLE of the Roman indiction**. See Vol. I. p. 491.

**CYCLISCUS**, in surgery, an instrument in the form of a half moon, used in scraping the skull, in case of fractures of that part.

**CYCLOID**, a curve on which the doctrine of pendulums and time-measuring instruments in a great measure depend; Mr Huygens demonstrated, that from whatever point or height a heavy body, oscillating on a fixed centre, begins to descend, while it continues to move in a cycloid, the time of its falls or oscillations will be equal to each other. It is likewise demonstrable, that it is the curve of quickest descent, *i. e.* a body falling in it, from any given point above, to another not exactly under it, will come to this point in a less time than in any other curve passing through those two points.

**CYCLOMETRY**, a term sometimes used for the mensuration of circles.

**CYCLOPÆDIA**, or **ENCYCLOPÆDIA**, denotes the circle or compass of arts and sciences. A cyclopædia, say the authors of the French Encyclopædia, ought to explain, as much as possible, the order and connection of human knowledge. See **DICTIONARY**.

**CYCLOPTERUS**, the **LUMP-FISH**, in ichthyology, a genus belonging to the order of amphibian nantes. The head is obtuse, and furnished with saw-teeth; there are four rays in the gills; and the belly-fins are connected together in an orbicular form. There are three species.

**CYDER**, an excellent drink made of the juice of apples. It conduces greatly to the goodness of the cyder, to let the apples lie a week or two in heaps, before they are pressed. After straining the liquor through a sieve, let it stand a day or two in an open tun, covered only with a cloth, or boards to keep out the dust, that the more gross parts may subside. Then draw it off in pails into vessels, wherein it is intended to be kept, observing to leave an eighth part of them empty. Set these vessels in your coldest cellars, with the bung open, or covered only with a loose cover, both that the volatile steams may have free vent, and that the must may be kept cool, otherwise it is apt to ferment too much. Having fermented in this manner for fifteen or twenty days, the vessel may be stopped up close; and, in two or three months time, the cyder will be fit for drinking. But if you expect cyder in perfection, so as to flower in the glass, it must be guided as they call it, and drawn off into bottles, after it has been a short time in the cask: this is done by pouring into each vessel

fel a pint of the infusion of sixty or seventy grains of the most transparent ising-glass, or fish-glue, in a little white-wine and river or rain water, stirred well together, after being strained through a linen cloth. When this viscous substance is put into the cask, it spreads itself over the surface like a net, and carries all the dregs to the bottom with it.

Ginger added to cyder, not only corrects its windiness, but makes it more brisk; and a few drops of currant-juice, besides tinging, adds a pleasant quickness to it. Honey, or sugar, mixed with some spices, and added to flat cyder, will very much revive it.

Some commend boiling of cyder-juice, which should be done as soon as it is pressed, scumming it continually, and observing to let it boil no longer than till it acquires the colour of small beer: when cold, put it into a cask, leaving a small vent; and when it begins to bubble up out of the vent, bottle it for use.

CYDONIA, in botany. See CRATEVA.

CYGNUS, in ornithology. See ANAS.

CYGNUS, in astronomy. See Vol. I. p. 486.

CYLINDER, in geometry, a solid body, supposed to be generated by the rotation of a parallelogram.

*Rolling, or loaded* CYLINDER. See MECHANICS.

CYLINDROID, in geometry, a solid body, approaching to the figure of a cylinder, but differing from it in some respect, as having the bases elliptical, but parallel and equal.

CYLINDRUS, in natural history. See VOLUTA.

CYMA, in botany, the tender stalks which herbs send forth in the beginning of the spring, particularly those of the cabbage-kind.

CYMATIUM, in architecture, a member or moulding, of the cornice, the profile of which is waved, that is, concave at top, and convex at bottom. See ARCHITECTURE.

CYMBAL, a musical instrument in use among the ancients. The cymbal was round, made of brass, like our kettle-drums, and, as some think, in their form, but smaller, and of different use.

CYMBALARIA, in botany. See ANTIRRHINUM.

CYMBARIA, in botany, a genus of the didynamia angiospermia class of plants. The calix is divided into many parts; and the capsule is unilocular. There is but one species.

CYNÆDUS, in ichthyology. See SPARUS.

CYNANCHE, among physicians, denotes an inflammation of the larynx.

CYNANCHUM, in botany, a genus of the pentandria digynia class. The nectarium is cylindrical, and has five teeth. There are five species, none of them natives of Britain.

CYNANTHROPIA, in medicine, the distemper occasioned by the bite of a mad dog. See MEDICINE.

CYNAPIUM, in botany. See ETHUSA.

CYNARA, the ARTICHOKE, in botany, a genus of the syngenesia polygamia æqualis class. The calix is dilated and imbricated, with fleshy scales sharp at the points. There are four species, none of them natives of Britain. The use of the artichoke as a food is well known.

CYNICS, a sect of ancient philosophers, who valued themselves upon their contempt of riches and state, arts and sciences, and every thing, in short, except virtue or morality.

The cynic philosophers owe their origin and institution to Antisthenes of Athens, a disciple of Socrates, who, being asked of what use his philosophy had been to him, replied, "It enables me to live with myself." Diogenes was the most famous of his disciples, in whose life the system of this philosophy appears in its greatest perfection: he led a most wretched life, a tub having served him for a lodging, which he rolled before him where ever he went; yet he was, nevertheless, not the more humble on account of his ragged cloak, bag, and tub; for, one day, entering Plato's house, at a time that there was a splendid entertainment there for several persons of distinction, he jumped up upon a very rich couch, in all his dirt, saying, "I trample on the pride of Plato." "Yes (replied Plato,) but with great pride, Diogenes." He had the utmost contempt for all the human race, for he walked the streets of Athens, at noon-day, with a lighted lantern in his hand, telling the people, "He was in search of a man." Amongst many excellent maxims of morality, he held some very pernicious opinions; for he used to say, that the uninterrupted good fortune of Harpalus, who generally passed for a thief and a robber, was a testimony against the gods. He regarded chastity and modesty as weaknesses; hence Laertius observes of him, that he did every thing openly, whether it belonged to Ceres or Venus, though he adds that Diogenes only ran to an excess of impudence to put others out of conceit with it: but impudence was the characteristic of these philosophers, who argued, that what was right to be done, might be done at all times, and in all places. The chief principle of this sect, in common with the stoics, was, that we should follow nature; but they differed from the stoics in their explanation of that maxim, the cynics being of opinion that a man followed nature, that gratified his natural motions and appetites; while the stoics understood right reason, by the word nature.

CYNIC SPASM, a kind of convulsion, wherein the patient imitates the howlings of dogs.

CYNIPS, in zoology, a genus of insects belonging to the order of hymenoptera. The mouth consists of two jaws, without any proboscis; and the sting in the tail is spiral, and generally hid. There are nineteen species, distinguished by their colour, and the plants they inhabit.

CYNOCEPHALUS, in zoology, the trivial name of a species of simia. See SIMIA.

CYNOGLOSSUM, in botany, a genus of the pentandria monogynia class. The corolla is tunnel-shaped; the seeds are depressed, and the stylus is fixed to the interior side of them. There are eight species, only one of which is a native of Britain, viz. the officinale, or hound's-tongue; the root is said to be pectoral and narcotic.

CYNOMETRA, in botany, a genus of the decandria monogynia class. The calix consists of four segments, the

the opposite ones being broader; and the legumen is fleshy, lunated, and contains but one seed. There are two species, both natives of India.

**CYNOMORIUM**, in botany, a genus of the monoecia monandria class. The calix of the female is an imbricated amentum, and neither male nor female has a corolla; the female has one stylus, and one round seed. There is but one species, a native of Jamaica.

**CYNOSURUS**, in botany, a genus of the triandria digynia class. The calix is a double valve, and includes many flowers. There are ten species, four of which are natives of Britain, *viz.* the cristatus, or crested dog-tail grass; the echinatus, or rough dog-tail grass; the cæruleus, or blue dog-tail grass; and the paniceus, or bearded dog-tail grass.

**CYPERUS**, in botany, a genus of the triandria monogynia class. The gluma is paleaceous and imbricated; it has no corolla, and but one naked seed. There are twenty species, only one of which is a native of Britain, *viz.* the longus, sweet cyperus, or English galangale; the root is carninative and attenuant.

**CYPHOMA**, **CYPHOS**, or **CYPHOSIS**, an incurvation of the spine, forming a crookedness in the back.

**CYPRÆA**, in zoology, a genus of insects belonging to the order of vermes testacea. It is an animal of the limax or snail-kind; the shell is one involuted, subovated, obtuse, smooth valve. The aperture on each side is linear, longitudinal, and toothed. There are forty-four species, distinguished by the form of their shells.

**CYPRESS**. See **CUPRESSUS**.

**CYPRINUS**, in ichthyology, a genus of fishes belonging to the order of abdominales. The mouth is toothless; there are three rays in the gills; the body is smooth, and white; and the belly-fins have frequently nine rays. There are thirty-one species, principally distinguished by the number of rays in the vent-fin.

**CYPRIPEDIUM**, in botany, a genus of the gynandria diandria class. The nectarium is ventricose, inflated, and hollow. There are two species, one of them, *viz.* the calceolus, or ladies-slipper, a native of Britain.

**CYPRUS**, an island situated in the most easterly part of the Levant, or Mediterranean sea, between 33° and

36° E. long. and between 34° and 30° N. lat.

**Knight of CYPRUS**, an order instituted by Guy de Lusignan, titular king of Jerusalem, to whom Richard I. of England, after conquering this island, made over his right.

**CYRENAICS**, a sect of ancient philosophers, so called from their founder, Aristippus of Cyrene, a disciple of Socrates.

The great principle of their doctrine was, that the supreme good of man in this life is pleasure; whereby they not only meant a privation of pain, and a tranquillity of mind, but an assemblage of all mental and sensual pleasures, particularly the last.

**CYST**, the bag, or tunic, including all incysted tumors, as the scirrhus, atheroma, steotoma, meliceris, &c.

**CYSTIC**, a name given to two arteries and two veins. See Vol. I. p. 245.

**CYSTIC DUCT**. See Vol. I. p. 265.

**CYTISUS**, in botany, a genus of the diadelphia decandria class. The calix is bilabiate; and the legumen is attenuated at the base. There are eleven species, none of them natives of Britain.

**CZACKATHURN**, a town of Germany, in the duchy of Stiria, and circle of Austria, situated near the conflux of the rivers Muer and Save, about fifty miles south-east of Gratz: E. long. 17°, and N. lat. 46° 50'.

**CZAR**, a title of honour assumed by the great dukes, or, as they are now styled, emperors of Russia.

Beckman makes no doubt but they took this title, by corruption, from Cæsar, emperor; and accordingly they bear an eagle, as the symbol of their empire, and the word CÆSAR in their arms.

**CZASLAW**, a town of Bohemia, about thirty-five miles south-east of Prague: E. long. 15° 8', and N. lat. 49° 50'.

**CZERNIGOF**, the capital of the province of Czernigof, in Russia, near the frontiers of Poland: E. long. 31°, 30', and N. lat. 52° 30'.

**CZONGRODT**, a town of Hungary, situated on the river Thieffe, about thirty miles north of Segedin: E. long. 20° 45', and N. lat. 46° 36'.

\*\*\*\*\*

### D A C

**DAB**, in ichthyology, the English name of a species of pleuronectes. See **PLEURONECTES**.

**DACA**, a city of the province of Bengal, in the East-Indies, situated on a branch of the river Ganges: E. long. 89° and N. lat. 23° 30'.

**DA CAPO**, in music, signifies from the head or beginning; intimating, that the air is to be begun again, and ended with the first part.

**DACE**, the English name of a species of cyprinus. See **CYPRINUS**.

VOL. II. No. 42.

3

†

### D A C

**DACOLITHUS**, in ichthyology. See **COBITIS**.

**DACTYL**, in poetry, a metrical foot consisting of a long and two short syllables, as *carmina, evident, excellence*.

The dactyl and spondee are the only feet or measures used in hexameter verses. See **HEXAMETER**.

**DACTYLIS**, in botany, a genus of the triandria digynia class of plants. The calix consists of two obtuse valves, the one being somewhat larger than the other. The species are two, *viz.* the cynosuroides,

4 H

or

- or smooth cock's-foot grafs; and the glomeratus, or rough cock's-foot grafs; both natives of Britain.
- DACTYLUS**, in zoology. See **PHOLAS**.
- DADUCHI**, in antiquity, priests of the goddesses Ceres, so called, because at the feasts and sacrifices of that goddess, they ran about the temple, carrying a lighted torch, which they delivered from hand to hand, till it had passed through them all. This they did in memory of Ceres's searching for her daughter Proserpine, by the light of a torch, which she kindled in mount *Ætna*.
- DÆMON**, a name given by the ancients to certain spirits, or genii, which appeared to men, either to do them service, or to hurt them. The Platonists distinguish between gods, dæmons, and heroes. The gods are those whom Cicero calls *Dii majorum gentium*. The dæmons are those whom we call angels. Christians, by the word dæmon, understand only evil spirits, or devils.
- DÆMONIAC**, a word applied to a person supposed to be possessed with an evil spirit, or dæmon. See **DÆMON**.
- DÆMONIACS**, in church-history, a branch of the anabaptists, whose distinguishing tenet is, that the devils shall be saved at the end of the world.
- DAGO**, or **DAGERWORT**, the capital of an island of the same name in the Baltic, near the coast of Livonia, subject to Russia: E. long.  $21^{\circ} 30'$ , and N. lat.  $58^{\circ} 45'$ .
- DAHGESTAN**, a country of Asia, bounded by Circassia on the north, by the Caspian sea on the East, by Chirvein a province of Persia on the south, and by Georgia on the west. Its chief towns are Tarku and Derbent, both situated on the Caspian sea.
- DAHOME**, a kingdom of Africa, on the Guinea coast.
- DAISY**. See **BELLIS**.
- Great DAISY*. See **LEUCANTHEMUM**.
- Ox-eye DAISY*. See **BUPHTHALMUM**.
- DALEA**, in botany. See **PSORALEA**.
- DALEBURGH**, the capital of the province of Dalia, in Sweden, situated on the western side of the Wener-lake, fifty miles north-east of Gottenburg; E. long.  $13^{\circ}$ , and N. lat.  $59^{\circ}$ .
- DALECARLIA**, a province of Sweden, abounding with iron and copper mines.
- DALECHAMPIA**, in botany, a genus of the monoechia monodelphia class. It has no corolla either in the male or female; and the seeds are roundish and solitary. There is but one species, *viz.* the scandens, a native of America.
- DALKEITH**, a town of Scotland, in the county of Lothian, six miles south-east of Edinburgh: W. long.  $2^{\circ} 40'$ , and N. lat.  $55^{\circ} 50'$ .
- DALIA**, a province of Sweden, bounded on the north by Dalecarlia, on the east by Wermeland and the Wener-lake, on the south by Gothland, and on the west by Norway.
- DALMATIA**, a frontier province of Europe, mostly subject to the Turks, but some towns on the sea-coast to the Venetians: it is bounded by Bosnia on the north, by Servia on the east, by Albania on the south, and by Morlachia and the gulph of Venice on the west.
- DAMA**, in zoology. See **CERVUS**.
- DAMAGE**, in law, is generally understood of a hurt, or hindrance attending a person's estate.
- DAMALA**, a sea-port town of the Morea in Greece, at the entry of the gulph of Engæa.
- DAMAN**, a port-town of the hither India, in the province of Guzurat or Cambay, situated on the west coast, about eighty miles south of Surat, in  $72^{\circ} 20'$  E. long. and  $20^{\circ}$  N. lat. It is subject to the Portuguese.
- DAMASCUS**, or **SCHAM**, the capital city of the south part of Syria, situated ninety miles north-east of Jerusalem, in a pleasant, extensive, and fruitful plain; E. long.  $37^{\circ} 20'$ , and N. lat.  $33^{\circ} 15'$ .
- DAMASK**, a silk-stuff, with a raised pattern, so as that the right side of the damask is that which hath the flowers raised or fattened.
- DAMASKEENING**, or **DAMASKING**, the art or operation of beautifying iron, steel, &c. by making incisions therein, and filling them up with gold and silver wire; chiefly used for adorning sword-blades, guards and grips, locks of pistols, &c.
- DAMASONIUM**, in botany. See **ALISONA**.
- DAMBEA**, the capital of Abyssinia, or Ethiopia, situated at the head of a lake, to which it gives name: E. long.  $34^{\circ}$ , and N. lat.  $15^{\circ}$ .
- DAMELOPRE**, a kind of bilander, used in Holland for conveying merchandize from one canal to another; being very commodious for passing under the bridges.
- DAMIANISTS**, in church-history, a branch of the ancient acephali-severitæ. They agreed with the catholics in admitting the IVth council, but disowned any distinctions of persons in the Godhead; and professed one single nature, incapable of any difference; and yet they called God, the Father, Son, and Holy Ghost.
- DAMIETTA**, a port-town of Egypt, situated on the eastern mouth of the river Nile, four miles from the sea, and 100 miles north of Grand Cairo; E. long.  $32^{\circ}$ , and N. lat.  $31^{\circ}$ .
- DAMNATA TERRA**, among chemists, the same with caput mortuum. See **CAPUT**.
- DAMPS**, in natural history, noxious steams and exhalations, frequently found in mines, pits, wells, and other subterraneous places. See **PNEUMATICS**.
- DAMSEL**, from the French *damoisel*, or *damoiseau*, an appellation anciently given to all young people of either sex, that were of noble or genteel extraction, as the sons and daughters of princes, knights, and barons: thus we read of Damsel Pepin, Damsel Louïse Gros, Damsel Richard prince of Wales.
- From the sons of kings this appellation first passed to those of great lords and barons, and at length to those of gentlemen, who were not yet knights.
- At present, damsel is applied to all maids or girls, not yet married, provided they be not of the vulgar.
- DANAE**, in antiquity, a coin somewhat more than an obolus, used to be put into the mouths of the dead, to pay their passage over the river Acheron.
- DANCE**,

**DANCE**, an agreeable motion of the body, adjusted by art to the measures or tune of instruments, or of the voice.

Athenæus concludes, that in the early ages of antiquity, they accounted dancing an exercise becoming persons of honour and wisdom; and that, as such, it had been esteemed by the greatest men in all ages. Thus, Homer calls Merion a fine dancer; and says, that the graceful mein and great agility which he had acquired by that exercise, distinguished him above the rest in the armies of either Greeks or Trojans. Dancing was in very great esteem among the Greeks, even the Lacedæmonians encouraged it: but, at Rome, we find the custom was quite otherwise; for there, to use the words of Cicero, no man dances unless he is mad or drunk: Cicero reproaches Gabinus with having danced: and we read, that Domitian excluded several members from the senate for having danced.

Dancing in general, was by the ancients divided into cubittic, spherittic, and orchestric: the cubittic dance was performed with certain wrestlings and contortions of the body; the spherittic with a sort of ball, or bowl play; but the orchestric was most usual, and what indeed was dancing properly so called.

Dancing is usually an effect and indication of joy; though Mr Pallesprat assures us, that there are nations in South America, who dance to shew their sorrow. It has been in use among all nations, civilized and barbarous; though held in esteem among some, and in contempt among others. It has often been, and still is, sometimes made an act of religion. Thus David danced before the ark to honour God, and express his excess of joy for its return into Zion. Among the pagans it made a part of the worship paid to the gods, it being usual to dance round the altars and statues; and at Rome, the *falii*, who were priests of Mars, danced through the streets in honour of that God. The poets made the gods themselves dance. The Christians are not free from this superstition; for in popish countries certain festivals, particularly those of the sacrament, and passion of our Lord, are celebrated with dancing.

**DANCETTE**, in heraldry, is when the outline of any bordure, or ordinary, is indented very largely, the largeness of the indentures being the only thing that distinguishes it from indented.

**DANDELION**, in botany. See **LEONTODON**.

**DANEGELT**, a tax or tribute on every hide of land, imposed on our ancestors the Saxons by the Danes, on their frequent invasions, as the arbitrary terms of peace and departure.

**DARNAMAS**, the name of the best sort of cotton that comes from Smyrna, so called from a plain near that city.

**DANTELE**, in heraldry. See **DANCETTE**.

**DANTIA**, in botany. See **ISNARDIA**.

**DANTZICK**, the capital of regal Prussia, in the kingdom of Poland, situated on the western shore of the river Wesel, or Vistula, which a little below falls into the Baltic sea: E. long. 19°, and N. lat. 54°. It

is an excellent harbour, and has the best foreign trade within the Baltic.

**DANUBE**, one of the largest rivers in Europe, which, taking its rise in the Black Forest in Swabia, runs eastward through Bavaria, Austria, Hungary, and Turkey in Europe; discharging itself by several channels into the Pontus Euxinus, or Black Sea.

**DAPHNE**, in botany, a genus of the *ostandria monogynia* class. It has no calix; the corolla consists of four segments; and the berry contains but one seed. There are 11 species, two of which are natives of Britain, *viz.* the laureola, or spurge laurel; and the mezezeum, or spurge olive. The laureola is a strong cathartic.

**DAPPLE BAY**, in the menage: when bay horses have marks of a dark bay, they are called dapple-bays.

**DAPPLE-BLACK**; when a black horse has got spots or marks, more black or shining than the rest of his skin, he is called a dapple-black.

**DARAPTI**, among logicians, one of the modes of syllogisms of the third figure, whose premises are universal affirmatives, and the conclusion is a particular affirmative: thus,

DAR- Every body is divisible;

AP- Every body is a substance;

TI, Therefore, some substance is divisible.

**DARBY**, the capital of Darbyshire, situated on the river Darwent: W. long. 1° 25', and N. lat. 53°.

**DARDANELLS**, two castles at the entrance of the Hellespont, where all ships going to Constantinople are examined: E. long. 27°, and N. lat. 40° 5'.

**DARIEN**, a province of Terra Firma, in South America, being the narrow isthmus which joins North and South America.

**DARII**, in logic, one of the modes of syllogism of the first figure, wherein the major proposition is an universal affirmative, and the minor and conclusion particular affirmatives: thus,

DA- Every thing that is moved, is moved by another;

RI- Some body is moved;

I, Therefore, some body is moved by another.

**DARKING**, a market-town of Surrey, situated ten miles east of Guildford: W. long. 20°, and N. lat. 51° 18'.

**DARLINGTON**, a market-town of the county of Durham, situated twenty miles south of the city of Durham: W. long. 1° 15', and N. lat. 54° 30'.

**DARMSTAT**, the capital of Hesse-Darmstadt, in the circle of the upper Rhine in Germany, situated on a river of the same name, fourteen miles south of Frankfurt, and thirteen south-east of Mentz: E. long. 8° 25', and N. lat. 49° 45'.

**DARNEL**, in botany. See **LOLIUM**.

**DARTFORD**, a market-town of Kent, in the Dover road, fourteen miles south-east of London: E. long. 16', and N. lat. 51° 25'.

**DARTMOUTH**, a borough and port town of Devonshire, situated on the English channel, twenty-six miles south-

fourth of Exeter, which sends two members to parliament: W. long.  $4^{\circ}$ , and N. lat.  $50^{\circ} 25'$ .

**DARWENT**, a river, which, rising in the Peak of Derbyshire, runs from north to south through that county, and falls into the Trent.

**DASYPUS**, the **ARMADILLO**, in zoology, a genus of quadrupeds belonging to the order of bruta. The *dasypus* has neither fore-teeth nor dog-teeth; it is covered with a hard boney shell, intersected with distinct moveable zones or belts: This shell covers the head, the neck, the back, the flanks, and extends even to the extremity of the tail; the only parts to which it does not extend, are the throat, the breast, and the belly, which are covered with a whitish skin of a coarse grain, resembling that of a hen after the feathers are pulled off. The shell does not consist of one entire piece, like that of the tortoise, but is divided into separate belts connected to each other by membranes, which enable the animal to move it, and even to roll itself up like a hedge-hog. The number of these belts does not depend on the age of the animal, as some have imagined, but is uniformly the same at all times, and serves to distinguish the different species. All the species of this animal were originally natives of America: they were entirely unknown to the ancients; and modern travellers mention them as peculiar to Mexico, Brasil, and the southern parts of America; though some indeed have confounded them with two species of manis, or shell-lizard, which are found in the East Indies: Others report that they are natives of Africa, because some of them have been transported from Brasil to the coast of Guinea, where a few have since been propagated: but they were never heard of in Europe, Asia, or Africa, till after the discovery of America.—They are all endowed with the faculty of extending and contracting their bodies, and of rolling themselves up like a ball, but not into so complete a sphere as the hedge-hog. They are very inoffensive animals, excepting when they get into gardens, where they devour the melons, potatoes, and other roots. They walk quickly; but can hardly be said to run or leap; so that they seldom escape the pursuit either of men or dogs. But nature has not left them altogether defenceless. They dig deep holes in the earth; and seldom go very far from their subterraneous habitations: Upon any alarm, they immediately go into their holes; but, when at too great a distance, they require but a few moments to make one. The hunters can hardly catch them by the tail before they sink their body in the ground, where they stick so close, that the tail frequently comes away and leaves the body in the earth; which obliges the hunters, when they want to take them alive and immutated, to dilate the sides of the hole. When they are taken, and find that there is no resource, they instantly roll themselves up, and will not extend their bodies, unless they are held near a fire. When in deep holes, there is no other method of making them come out, but by forcing in smoke or water. They keep in their holes through the day, and seldom go abroad in quest of subsistence but in the night. The hunters usually chase them with small dogs, which easily come up with them. When

the dogs are near, the creatures instantly roll themselves up, and in this condition the hunters carry them off. However, if they be near a precipice, they often escape both the dogs and hunters: they roll themselves up, and tumble down like a ball, without breaking their shell, or receiving any injury. The *dasypus* is a very fruitful animal; the female generally brings forth four young ones every month; which is the reason why the species is so numerous, notwithstanding they are so much sought after on account of the sweetness of their flesh. The Indians likewise make baskets, boxes, &c. of the shells which cover their heads.

Linnæus enumerates six species of *dasypus*, principally distinguished by the number of their moveable belts.

1. The *novemcinctus*, or *dasypus*, with nine moveable belts, (see Plate LXVIII. fig. 1.) The head is long and narrow; the muzzle extends a good way beyond the under lip; the mouth is large; the eyes are small, and placed on the sides of the head; the ears are long, and placed near each other; the tail is long and conical, and terminates in a sharp point. It has five toes on the hind-feet, and only four on the fore-feet; the claws are long, and of a yellowish colour. The length of the body, from the point of the muzzle, to the origin of the tail, is about eleven inches; and the length of the tail, about nine and a half.

2. The *unicinctus*, or *dasypus*, with eighteen moveable belts: the other species have two large immovable pieces of shell, one on the shoulders, and another on the buttocks: this species has but one, which is on the shoulders, from that to the tail consisting entirely of moveable belts. The length of the body, from the point of the muzzle, to the origin of the tail, is about nine inches, and the tail about five.

3. The *tricinctus*, or *dasypus*, with three moveable belts. The head is oblong, and covered with an entire piece of shell; the ears are short and roundish; it has five toes on all the feet, and the two middle claws of the fore-feet are remarkably larger than the rest; the tail is short, being about two inches in length; and the body is about one foot long.

4. The *quadrincinctus*, or *dasypus*, with four moveable belts: Linnæus is mistaken with regard to the trivial name and specific character of this animal; it ought to be called the *sexcinctus*, or *dasypus*, with six moveable belts; for, according to Brissonius, Bouffon, and most other natural historians, none of the species of this genus have four moveable belts. It has five toes on every foot.

5. The *septemcinctus*, or *dasypus*, with seven moveable belts: Here Linnæus is in another error of the same kind; for this animal has eight moveable belts. It has four toes on the fore-feet, and five on the hind-feet.

6. The *dasypus* with 12 moveable belts. This is the largest species, being about two feet in length.

**DATA**, among mathematicians, a term for such things or quantities as are given or known, in order to find other things thereby that are unknown. Euclid uses the word *data* (of which he hath a particular tract) for

for such spaces, lines, and angles as are given in magnitude, or to which we can assign others equal.

**DATE**, in law, is the description of the day, month, year of our Lord, and year of the reign of the king, in which a deed or other writing was made.

**DATE**, the fruit of the phoenix, or great palm-tree. See **PHOENIX**.

**DATISI**, in logic, a mode of syllogisms in the third figure, wherein the major is an universal affirmative, and the minor and conclusion particular affirmative propositions. For example,

DA- All who serve God are kings;

TI- Some who serve God are poor;

SI- Therefore, some who are poor are kings.

**DATIVE**, among grammarians, the third case in the declension of nouns, expressing the relation of a thing to whose profit or loss some other thing is referred. It is called dative, because usually governed by a verb, implying something to be given to some person. In English, the dative is expressed by the signs *to* or *for*.

**DATURA**, the **THORN-APPLE**, in botany, a genus of the pentandria monogynia class. The corolla is plaited and tunnel-shaped; the calix is tubulous, angular, and deciduous; and the capsule consists of four valves. There are six species, all natives of warm climates. The thorn-apple is a narcotic poison: It has lately been recommended in cases of madness by Dr Stork, but without answering any useful purpose.

**DAUCUS**, the **CARROT**, in botany, a genus of plants belonging to the pentandria digynia class. The corollæ are subradiated, and all hermaphrodite; and the seeds are rough and hairy. There are five species, only one of which, *viz.* the carota, wild-carrot, or bird's-nest, is a native of Britain. The seeds are said to be diuretic and carminative.

**DAVENTRY**, a market town of Northamptonshire, situated about ten miles north of Northampton: W. long.  $1^{\circ} 15'$ , and N. lat.  $52^{\circ} 12'$ .

**DAVIDISTS**, in church-history, a sect of Christian heretics in the XVIth century; so called from David George, their leader, who began by giving out that he was the Messiah, and was sent into the world in order to people the kingdom of heaven, which was quite empty of inhabitants, for want of virtuous and good men: he rejected marriage, and denied the resurrection.

**DAVIDS**, or **ST DAVID'S**, a city and bishop's see of Pembrokehire, situated near the Irish channel, about twenty miles north west of Pembroke: W. long.  $5^{\circ} 20'$ , and N. lat.  $52^{\circ}$ .

**ST DAVID'S** is also the name of a town and fort situated on the coast of Coromandel, in the hither India, about eighty miles south of Fort St George: E. long.  $79^{\circ} 40'$ , and N. lat.  $11^{\circ} 45'$ .

**DAVIS'S STRAITS** run north-west from Cape Farewell, in  $60^{\circ}$  N. lat. to Baffin's bay, in  $80^{\circ}$  N. lat. separating Greenland from North America.

**DAVIT**, in a ship, that short piece of timber with a notch at one end, wherein, by a strap, hangs the fish-block.

The use of this block is to help up the fluke of the  
Vol. II. No. 43.

3

†

anchor, and to fasten it at the ship's bow or loof. The davit is shiftable from one side of the ship to the other, as there is occasion.

**DAUPHIN**, a title given to the eldest son of France, and heir presumptive of the crown, on account of the province of Dauphiny, which, in 1343, was given to Philip of Valois, on this condition, by Humbert dauphin of the Viennois.

**DAUPHIN-FORT**, a fort built by the French, on the eastern coast of the island of Madagascar, E. long.  $48^{\circ}$ , and S. lat.  $24^{\circ}$ .

**DAUPHINE**, or **DAUPHINY**, a province of France, bounded by Burgundy on the north, by Piedmont on the east, by Provence on the south, and by the river Rhone, which separates it from Languedoc and the Lyonois, on the west.

**DAY**. See Vol. I. p. 491.

**DAYS of grace**, are those granted by the court at the prayer of the defendant, or plaintiff, in whose delay it is.

**DAYS of grace**, in commerce, are a customary number of days allowed for the payment of a bill of exchange, &c. after the same becomes due.

Three days of grace are allowed in Britain; ten in France and Dantzic; eight at Naples; six at Venice, Amsterdam, Rotterdam, and Antwerp; four at Frankfurt; five at Leipzig; twelve at Hamburg; six in Portugal; fourteen in Spain; thirty in Genoa, &c.

**DAY'S MAN**, in the north of England, an arbitrator or person chosen to determine an affair in dispute.

**INTERCALARY DAYS**. See Vol. I. p. 489.

**DEACON**, one of the three sacred orders of the Christian church.

As to the office of deacons, the most common and ordinary was to be attendant on the bishops and presbyters in the service of the altar, to take care of the holy table and all the ornaments and utensils belonging to it; and, in the next place, to receive the offerings of the people, and to present them to the priest; at the same time reciting the names of those that offered. In some churches, though not in all, the deacons read the gospel both before and at the communion-service; but their most peculiar office was to assist the bishop and presbyters in the administration of the eucharist, at which their business was to distribute the elements to the people who were present, and carry them to those who were absent. That they were never allowed to consecrate them at the altar, appears from the testimonies of Hilary, Jerom, and the author of the constitutions. They were permitted, however, to administer solely the sacrament of baptism in some cases. Another part of the office of deacons, was to be a sort of monitors and directors to the people in the exercise of their public devotions in the church; for which purpose they made use of certain known forms of words, to give notice when each part of the service began. Whence they are sometimes called [*eirkerukes*,] the the holy cryers of the church.

Deacons had, by licence and authority from the bishop, a power to preach, to reconcile penitents and grant them absolution, and to represent their bishops

4 I

in

in general councils. Their office out of the church was to take care of the necessitous, such as orphans, widows, prisoners, and all the poor and sick who had any title to be maintained out of the public revenues of the church; to inquire into the morals and conversation of the people, and to make their report thereof to the bishop. Whence, on account of the variety of business, it was usual to have several deacons in the same church.

In the Romish church, it is the deacons office to incense the officiating priest or prelate; to lay the corporal on the altar; to receive the paten or cup from the subdeacon, and present them to the person officiating; to incense the choir; to receive the pax from the officiating prelate, and carry it to the subdeacon; and at the pontifical mass, when the bishop gives the blessing, to put the mitre on his head, and to take off the archbishop's pall, and lay it on the altar. In England, the form of ordaining deacons, declares that it is their office to assist the priest in the distribution of the holy communion; in which, agreeably to the practice of the ancient church, they are confined to the administering the wine to the communicants. A deacon, with us, is not capable of any ecclesiastical promotion, yet he may be a chaplain to a family, curate to a beneficed clergyman, or lecturer to a parish church. He may be ordained at twenty-three years of age, *anno currente*; but it is expressly provided, that the bishop shall not ordain the same person a priest and deacon in the same day. Deacons, according to St Paul, should be chaste, sincere, and blameless; neither great drinkers, nor given to filthy lucre; they should hold the mystery of the faith in a pure conscience, and should be well approved before they are admitted to the ministry.

**DEACONESS**, a female deacon, an order of women, who had their distinct offices and services in the primitive church. This office appears as ancient as the apostolical age; for St Paul calls Phebe a servant of the church of Cenchrea. The original word is [*diakonos*], answerable to the Latin word *ministra*. Tertullian calls them *viduæ*, widows, because they were commonly chosen out of the widows of the church; and, for the same reason, Epiphanius, when the council of Laodicea, calls them [*presbutidas*], elderly women, because none but such were ordinarily taken into this office. For, indeed, by some ancient laws, these four qualifications were required in every one that was to be admitted into this order. 1. That she should be a widow. 2. That she should be a widow that had born children. 3. A widow that was but once married. 4. One of a considerable age, forty, fifty, or sixty years old. Though all these rules admitted of exceptions. Concerning their ordination, whether it was always performed by imposition of hands, the learned are much divided in their sentiments. Baronius and Valsinius think they were not, and make no other account of them than as mere lay-persons. But the author of the constitutions, speaking of their ordination, requires the bishop to use imposition of hands, with a form of prayer which is there recited. We

are not, however, to imagine, that this ordination gave them any power to execute any part of the sacerdotal office. They were only to perform some inferior services of the church, and those chiefly relating to the women for whose sakes they were ordained. One part of their office was to assist the minister at the baptizing of women, to undress them for immersion, and to dress them again, that the whole ceremony might be performed with all the decency becoming so sacred an action. Another part of their office was to be private catechists to the women-catechumens who were preparing for baptism. They were likewise to visit and attend women that were sick and in distress; to minister to the martyrs and confessors in prison; to attend the women's gate in the church; and, lastly, to assign all women their places in the church, regulate their behaviour, and preside over the rest of the widows, whence in some canons they are styled [*prokathemenai*] governesses. This order, which since the tenth or twelfth century has been wholly laid aside, was not abolished every where at once, but continued in the Greek church longer than in the Latin, and in some of the Latin churches longer than in others.

**DEAD-MAN'S HEAD**, in geography, a cape or promontory near Tregony in Cornwall, between St Mawes and Fowey.

**DEAD-MEN'S EYES**, in the sea-language, a kind of blocks with many holes in them, but no streevers, whereby the shrouds are fastened to the chains: the crow feet reeve also through these holes; and, in some ships, the main-stays are set tight in them; but then they have only one hole, through which the lanyards are passed several times.

**DEAD-NETTLE**. See **LAMUM**.

**DEAD-RECKONING**, in navigation, the calculation made of a ship's place by means of the compass and log; the first serving to point out the course she sails on, and the other the distance run. See **NAVIGATION**.

**DEAD'S PART**, in Scots law, that proportion of the funds of a marriage, which, upon the dissolution of it, goes to the executor of the deceased husband or wife, as the defunct or dead's part. See **SCOTS LAW**, title 28.

**DEAD-SEA**, in geography, a lake of Judea, into which the river Jordan discharges itself; being about seventy miles long, and twenty broad.

**DEAD-TOPS**, a disease incident to young trees, and cured by cutting off the dead parts close to the next good twig or shoot, and claying them over as in grafting.

**DEAD-WATER**, at sea, the eddy-water just astern of a ship, so called, because it does not pass away so swift as the water running by her sides does. They say that a ship makes much dead-water, when she has a great eddy following her stern.

**DEADLY CARROT**. See **THAPSIA**.

**DEADLY NIGHTSHADE**. See **ATROPA**.

**DEADS**, among miners, denotes the earth or other fusile substances which inclose the ore on every side. Hence, *breaking up the deads*, is the removing these substances for the convenience of carrying on their work.

**DEAFNESS**,

**DEAFNESS**, the state of a person who either wants the sense of hearing, or has it greatly impaired. See **DUMBS**.

**DEAL**, a thin kind of fir-planks, of great use in carpentry: they are formed by sawing the trunk of a tree into a great many longitudinal divisions, of more or less thickness, according to the purposes they are intended to serve.

Deals are rendered much harder, by throwing them into salt water as soon as they are sawed, keeping them there three or four days, and afterwards drying them in the air or sun; but neither this nor any other method yet known, will preserve them from shrinking.

Deals called Burgendorp deals, the hundred containing six score, pay on importation 3 l. 8 s. 8  $\frac{1}{2}$  d. and draw back 3 l. 3 s. the rate 12 l. Meabro deals, six score, pay 1 l. 2 s. 10  $\frac{1}{2}$  d. and draw back 1 l. 1 s. the rate 4 l. Norway deals, six score, pay 1 l. 8 s. 7  $\frac{1}{2}$  d. and draw back 1 l. 6 s. 3 d. the rate 5 l. Spruce deals, six score, pay 4 l. 5 s. 10  $\frac{1}{2}$  d. and draw back 3 l. 18 s. 9 d. the rate 15 l. Deals from Russia, and all other countries not particularly rated, exceeding twenty foot in length, pay 4 l. 5 s. 10  $\frac{1}{2}$  d. and draw back 3 l. 18 s. 9 d. the rate 15 l. Deals from Sweden, or any other country, of twenty feet in length or under, not otherwise rated, the 120, pay 1 l. 8 s. 7  $\frac{1}{2}$  d. and draw back 1 l. 6 s. 3 d. the rate 5 l.

**DEAL**, in geography, a port-town of the county of Kent, between which and the Goodwin-sands, the shipping usually rides in the Downs, in going out or coming home: it is about sixty-seven miles eastward of London: E. long. 1° 30', and N. lat. 51° 16'.

**DEAN**, an ecclesiastical dignity in cathedral and collegiate churches, and head of the chapter.

**DEAN and CHAPTER**, are the bishop's council to assist him in the affairs of religion, and to assent to every grant which the bishop shall make to bind his successors. As a deanry is a spiritual dignity, a man cannot be a dean and prebendary of the same church.

**DEAN of guild**, in Scots law, a magistrate of a royal borough, who has the cognizance of mercantile causes, and the inspection of buildings within borough. See **SCOTS LAW**, title 4.

**DEATH** is generally considered as the separation of the soul and body; in which sense it stands opposed to life, which consists in the union thereof.

**The law of DEATH-BED**, in Scots law, the privilege which that law allows to an heir of reducing all deeds respecting the heretable estate of his predecessor, granted by him while on death-bed, in prejudice of the lawful heir. All deeds are liable to reduction *ex capite testis*, that are granted by a person within sixty days of his death, if he had then contracted the disease of which he died, and had not afterwards recovered, so as to have gone to kirk or market unsupported. See **SCOTS LAW**, title 27.

**DEBENHAM**, a market-town of Suffolk, about twenty miles east of Bury: E. long. 1° 20', and N. lat. 52° 20'.

**DEBENTURE**, a term of trade used at the custom-house for a kind of certificate signed by the officers of

the customs, which intitles a merchant exporting goods to the receipt of a bounty or draw-back. All merchandises that are designed to be taken on board for that voyage being entered and shipped, and the ship being regularly cleared out, and sailed out of port on her intended voyage, debentures may be made out from the exporter's entries, in order to obtain the drawbacks, allowances, bounties, or premiums; which debentures for foreign goods are to be paid within one month after demand. And in making out these debentures, it must be observed, that every piece of vellum, parchment, or paper, containing any debenture for drawing back customs or duties, must, before writing, be stamped, and pay a duty of 3 d.

The forms of debentures vary, according to the merchandise exported. In the execution of debentures for tobacco, it must be particularly observed, 1. That debentures for the same quantity, may be made in one or more parchments. 2. That the exporter's oath must be printed, specifying whether he acts for himself or by commission. If exported to any other foreign ports than Ireland, the word *Ireland* must be added to the oath after Great Britain. 4. That as no tobacco may be consumed on board ships of war in Europe, but what has paid full duties, and been manufactured in Great Britain, no drawback is to be allowed for tobacco exported in any man of war. 5. That the eight pounds *per* hoghead of 350 pounds, or more, allowed for draught at importation, must not be deducted on exportation. 6. That debentures for tobacco exported to Ireland, must not be paid till a certificate be produced, testifying the landing thereof. 7. That no persons may swear to the exportation, but such as are permitted to swear to debentures for other goods. In debentures for all other foreign goods, no person may be admitted to swear to the exportation, but the true exporter, either as a proprietor, or who being employed by commission, is concerned in the direction of the voyage. All kinds of debentures before delivered or paid to the exporters, are entered into a separate book kept for that purpose by the collector and comptroller of the customs.

**DEBITA fundi**, in Scots Law. A debt is said to be a *debitum fundi*, when it is recoverable either by a personal action against the debtor himself, or by a real action against his lands.

**DEBITA fructuum**, in Scots law. Funds are *debita fructuum* not *fundi*; so are not recoverable out of the lands themselves, but out of the fruits of the lands out of which they are payable. See **SCOTS LAW**, title 17.

**DEBILITY**, among physicians, a relaxation of the solids, occasioning oftentimes weaknesses and faintings.

**DEBRECHEN**, a town of Upper Hungary, about seventy-seven miles east of Buda: E. long. 21° 10' N. lat. 47° 45'.

**DEBRUIZED**, in heraldry, a term peculiar to the English, by which is intimated the grievous restraint of any animal, debarred of its natural freedom, by any of the ordinaries being laid over it.

**DEBT**, in law, any thing due to another, whether it be money,

money, goods, or services; or the action brought for recovering the same.

**DEBTOR**, a person who owes any thing to another; in contradistinction to creditor, which is he to whom the debt is owing.

**DEBTOR**, in merchants accounts. See **BOOK-KEEPING**.

**DECAGON**, in geometry, a plane figure with ten sides and ten angles.

**DECALOGUE**, the ten precepts or commandments delivered by God to Moses, after engraving them on two tables of stone.

The Jews, by way of excellence, call these commandments the *ten words*, from whence they had afterwards the name of decalogue: but it is to be observed, that they joined the first and second into one, and divided the last into two: they understand that against stealing, to relate to the stealing of men, or kidnapping; alledging, that the stealing one anothers goods or property, is forbidden in the last commandment.

The emperor Julian objected to the decalogue, that the precepts it contained (those only excepted which concern the worship of false gods, and the observation of the sabbath) were already so familiar to all nations, and so universally received, that they were unworthy, for that very reason, to be delivered, by so great a legislator, to so peculiar a people. The church of Rome has struck the second commandment quite out of the decalogue, and to make their number complete, hath split the tenth into two. The reason of which may be easily conceived.

**DECAN**, a province of the Hither India, bounded by the province of Cambaya, or Guzerat, on the north; by Golconda and Berar, on the east; by Visapour, on the south; and by the Indian ocean on the west.

**DECANDRIA**, in the Linnæan system of botany. See **BOTANY**, the *Scheme*, p. 635. and Plate LIII. fig. 10.

**DECANTATION**, among chemists, &c. the gently pouring off a liquor from its fæces, by inclining the lip or canthus of the vessel; whence the name.

**DECANUS**, in Roman antiquity, an officer who presided over other ten officers, and was head of the *contubernium*, or serjeant of a file of soldiers.

**DECAPROTI**, *decemprimi*, in Roman antiquity, officers for gathering the tributes and taxes.

The decaproti were also obliged to pay for the dead, or to answer to the emperor for the quota parts of such as died, out of their own estates.

**DECASTYLE**, in the ancient architecture, a building with an ordnance of ten columns in front, as the temple of Jupiter Olympius was.

**DECEIT**, in law, a subtle trick, or device, to which may be added all manner of craft and collusion, or underhand practice, used to defraud another, by any means whatever.

**DECEMBER**, the last month of the year, consisting of thirty-one days, and so called as being the tenth month in the Roman year, which commenced with March.

**DECEMPEDA**, in antiquity, a rule or rod divided into ten feet, each of which was subdivided into inches, and these into digits, used in measuring of land, and

by architects, in giving the proper dimensions and proportions to the parts of their buildings.

**DECEMVIRI**, in Roman antiquity, ten magistrates chosen annually at Rome, to govern the commonwealth instead of consuls, with an absolute power to draw up and make laws for the people.

One of the decemviri had all the ensigns and honours of the function, and the rest had the like in their turn, during the year of their decemvirate. In them was vested all the legislative authority ever enjoyed by the kings, or, after them, by the consuls. It was the decemviri drew up the laws of the Twelve Tables, thence called *leges decemvirales*, which were the whole of the Roman law, for a considerable time.

**DECENNALIA**, ancient Roman festivals celebrated by the emperors, every tenth year of their reign, with sacrifices, games, and largesses for the people. The emperor Augustus first instituted these solemnities, in which he was imitated by his successors.

**DECIDUOUS**, an appellation chiefly used in respect of plants: thus, the calix or cup of a flower is said to be deciduous, when it falls along with the flower-petals; and, on the contrary, it is called permanent, when it remains after they are fallen. Again, deciduous leaves are those which fall in autumn, in contradistinction to those of the ever-greens, which remain all the winter.

**DECIL**, in astronomy, an aspect or position of two planets, when they are distant from each other a tenth part of the zodiac.

**DECIMAL ARITHMETIC**, the art of computing by decimal fractions.

**DECIMAL FRACTION**, in arithmetic. See Vol. I. p. 395.

**DECIMATION**, a punishment inflicted by the Romans, on such soldiers as quitted their post, or behaved themselves cowardly in the field. The names of all the guilty were put into an urn or helmet, and as many were drawn out as made the tenth part of the whole number, and these were put to the sword, and the others saved.

**DECIPHERING**, the art of finding the alphabet of a cypher. See **CYPHER**.

Every language has, besides the form of its characters, something peculiar in the place, order, combination, frequency, and number of the letters; to all which particular regard is to be had in deciphering. In all languages, however, the following rules ought to be observed: 1. One word is to be compared with another, that their resemblance and difference may be known. 2. No word can be without a vowel. 3. A word of one letter is always a vowel, or a consonant with an apostrophe. 4. The vowels recur much more frequently than the consonants. 5. Double vowels may be at the beginning of a word, but not double consonants. 6. Double characters at the beginning of a word are always vowels. 7. Short words of two or three letters have two or three, or one or two consonants. 8. The vowels are therefore most easily learned from the short words which are to be first considered by the decipherer. 9. If double characters are preceded by a single letter, the letter is a vowel. 10. In languages abounding with diphthongs

one

one vowel is of ten joined with another. 11. The letter that precedes or follows double consonants is, if a consonant, always one of the liquids, *l, m, n, r*. 12. If two different characters occur, of which the latter is often conjoined with various letters, and the former is never found either by itself, or followed by any other letter, those two are *qu*. 13. These letters *qu* are always followed by a vowel. 14. One vowel recurs more frequently than another, as do the consonants, according to the language, &c.

**DECISE**, a town of the Orleanois, in France, situated on the river Loire, about fifteen miles south-east of Nevers: E. lon.  $3^{\circ} 32'$ , and N. lat.  $46^{\circ} 40'$

**DECK** of a ship is a planked floor from stem to stern, upon which the guns lie, and where the men walk to and fro.

Great ships have three decks, first, second, and third, beginning to count from the lowermost.

Half deck reaches from the main-mast to the stem of the ship.

Quarter-deck is that aloft the steerage, reaching to the round house.

Flush deck is that which lies even in a right-line fore and aft, from stem to stern. A rope-deck is that made of cordages, interwoven and stretched over a vessel, through which it is easy to annoy an enemy who comes to board her. They are little used but by small vessels, to defend them against privateers.

**DECKENDORF**, a town of Bavaria, in Germany, situated on the Danube, about thirty-seven miles south-east of Ratisbon: E. long.  $13^{\circ}$ , and N. lat.  $48^{\circ} 45'$ .

**DECLAMATION**, a speech made in public, in the tone and manner of an oration, uniting the expression of action to the propriety of pronunciation, in order to give the sentiment its full impression upon the mind.

**DECLARATORY action**, in Scots law, is that by which a pursuer only craves, that some right or privilege shall be declared to belong to him, without demanding the payment or performance of any thing from the defender. See *SCOTS LAW*, title, 30.

**DECLENSION**, in grammar, an inflexion of nouns according to their divers cases, as nominative, genitive, dative, &c. It is a different thing in the modern languages, which have not properly any cases, from what it is in the ancient Greek and Latin. With respect to languages, when the nouns admit of changes, either in the beginning, the middle, or ending; declension is properly the expression of all those changes in a certain order, and by certain degrees called cases. With regard to languages, where the nouns do not admit of changes in the same number, declension is the expression of the different states a noun is in, and the different relations it has; which difference of relations is marked by particles, and called articles, as *a, the, of, to, from, by, &c.*

**DECLINATION**, in astronomy, the distance of any celestial object from the equinoctial, either northward or southward. It is either true or apparent, according

as the real or apparent place of the object is considered. See *ASTRONOMY*.

**DECLINATION of a wall or plane for dials**. See *DIALLING*.

**DECLINATOR**, or **DECLINATORY**, an instrument contrived for taking the declinations, inclinations, and reclinations of planes.

**DECLINATURE of judges**, in Scots law, declining the jurisdiction of a judge, or refusing to acquiesce in his judgment from any legal obligation to the judge himself, the incompetency of his jurisdiction to the nature of the action, or upon the privilege of the objector or decliner. See *SCOTS LAW*, title 2.

**DECLIVITY** denotes the reverse of acclivity. See *ACCLIVITY*.

**DECOCTION**, in pharmacy, the boiling simples, or other drugs, in order to extract their virtues for some medicinal purpose. The general subjects of decoction are animals and vegetables, and sometimes minerals, as antimony and quicksilver. The liquors which serve to boil them, are water, wine, vinegar, milk, and whey.

**DECOMPOSITION**, in chemistry, the reduction of a body into its principles or component parts. See *CHEMISTRY*.

**DECORATION**, in architecture, is used for whatever adorns a building, either withoutside or within.

**DECORUM**, in architecture, is the suitableness of a building, and the several parts and ornaments thereof, to the station and occasion.

**DECOUPLE**, in heraldry, the same as uncoupled: thus a chevron decouplé, is a chevron wanting so much of it towards the point, that the two ends stand at a distance from one another, being parted and uncoupled.

**DECOURS**, in heraldry. See *DECREMENT*.

**DECOY**, a place made for catching wild-fowl. Hence, **DECOY-DUCK** is a duck that flies abroad, and lights into company with wild ones, which by her allurements she draws into the decoy.

**DECREE**, an order made by a superior power, for the regulation of an inferior.

**DECREE**, in the civil law, is a determination that the emperor pronounces upon hearing a particular cause between plaintiff and defendant.

**DECREE**, or **DECREET**, in Scots law, the decisive sentence or judgment of a court of law.

**DECREET-ARBITRAL**, in Scots law, the sentence or judgment of one to whom parties voluntarily submit the determination of any question betwixt them. See *SCOTS LAW*, title 32.

**DECREMENT**, in heraldry, signifies the wane of the moon from the full to the new. The moon in this state is called moon decreescent, or in decours; and when borne in coat-armour, faces to the left side of the escutcheon, as she does to the right side when in the increment. See *CRESCENT*.

**DECREPITATION**, in chemistry, the act of catching salt over the fire, till it cease to crackle. See *CHEMISTRY*.

It is also applied to the crackling of the salts during the operation.

**DECRETAL**, in the canon-law, a letter of a pope, determining some point or question in the ecclesiastical law. The decretals compose the second part of canon law. The first genuine one acknowledged by all the learned as such, is the letter of pope Siricius, written in the year 385, to Himerus bishop of Tarragona in Spain, concerning some disorders which had crept into the churches of Spain.

**DECUMANI DENTES**, in heraldry. See **DANCETTE**.

**DECUPLE PROPORTION**, that of ten to one.

**DECURIO**, in Roman antiquity, a commander of ten men in the army, or the chief of a decury.

**DECURRENT LEAF**. See **BOTANY**, p. 641.

**DECURY**, ten persons ranged under one chief, or leader, called the decurio.

The Roman cavalry was divided into decuries, which were subdivisions of a century, each century containing ten decuries.

**DECUSSATION**, a term in geometry, optics, and anatomy, signifying the crossing of any two lines, rays, or nerves, when they meet in a point, and then go on separately from one another.

**DECUSSORIUM**, a surgeon's instrument, which, by pressing gently on the dura mater, causes an evacuation of the pus collected between the cranium and the before mentioned membrane, through the perforation made by the trepan.

**DEDDINGTON**, a market town of Oxfordshire, about fifteen miles north of Oxford: W. long.  $1^{\circ} 20'$ , and N. lat.  $51^{\circ} 55'$ .

**DEDHAM**, a market-town in Essex, about thirty-five miles north-east of Chelmsford: E. long.  $1^{\circ} 10'$ , and N. lat.  $52^{\circ} 5'$ .

**DEDICATION**, a solemn devoting or setting apart any person or thing to the service of God and the purposes of religion.

*Fest of DEDICATION*, an anniversary festival among the Jews, in memory of Judas Maccabæus, who repaired and dedicated anew the temple and altar, which had been plundered and profaned by Antiochus Epiphanes. It was observed on the twenty-fifth of Cisleu, and continued eight days.

**DEE**, the name of several rivers, as that on which Chester stands, that whereon Aberdeen stands, &c.

**DEED**, in Scots laws, any settlement, disposition, contract, or other legal writing.

**DEED**, an instrument written on paper or parchment, comprehending some contract, bargain or agreement between the parties thereto, in relation to the matter therein contained.

**DEEMSTERS**, or **DEMSTERS**. All controversies in the Isle of Man are decided without process, writings, or any charges, by certain judges, chosen yearly from among themselves, called deemsters; there being two of them for each division of the island: they sit judges in all courts, either for life or property; and with the advice of twenty-four keys, declare what is law, in uncommon emergencies.

**DEEPING**, a market-town of Lincolnshire, about thirty-

five miles south of Lincoln: W. long.  $20^{\circ}$ , and N. lat.  $52^{\circ} 35'$ .

**DEER**, in zoology. See **CERVUS**.

**DEFAMATION**, the speaking slanderous words of another; for which the slanderer is punishable, according to the nature of his offence, either by action upon the case at common law, or by statute, or in the ecclesiastical court.

**DEFAULT**, in law, is generally taken for non-appearance in court, at a day assigned; but imports any omission of that which we ought to do, for which judgment may be given against the defaulter.

**DEFEASANCE**. See **DEFEISANCE**.

**DEFECATE**, or **DEFÆCATE**, in chemistry, a term applied to a body freed and purged from fæces and impurities.

**DEFEISANCE**, in law, a condition relating to some certain deed, which being performed, the deed is defeated and rendered void, as if it had never been made.

**DEFENCE**, in fortification, all sorts of works that cover and defend the opposite posts, as flanks, casemats, parapets, and faussebrays. See **FORTIFICATION**.

*Line of DEFENCE*, a supposed line drawn from the angle of the curtain, or from any other part in the curtain, to the flanked angle of the opposite bastion. See **FORTIFICATION**.

**DEFENDER of the faith**, a peculiar title, belonging to the king of Great Britain, as Catholic does to the king of Spain, Christian to the king of France, &c.

This title was first given by pope Leo X. to king Henry VIII. for writing against Luther.

**DEFERENT**, in anatomy, a term applied to certain vessels in the body, that serve for the conveyance of humours from one part to another. See **ANATOMY**.

**DEFERENT**, in the Ptolemaic astronomy, a circle invented to account for the eccentricity, perigee, and apogee of the planets.

**DEFERENTIA VASA**. See Vol. I. p. 273.

**DEFILE**, in fortification, a strait narrow passage, thro' which a company of horse or foot can pass only in file, by making a small front.

**DEFINITE**, in grammar, is applied to an article that has a precise determinate signification; such as the article *the* in English, *le* and *la* in French, &c. which fix and ascertain the noun they belong to, to some particular, as *the king*, *le roy*; whereas in the quality of *king*, *de roy*, the articles *of* and *de* mark nothing precise, and are therefore indefinite.

**DEFINITION**, an idea of any science, subject, &c. conveyed in a few words.

**DEFINITIVE**, a term applied to whatever terminates a process, question, &c. in opposition to provisional and interlocutory.

**DEFLAGRATION**, in chemistry, the kindling or setting fire to a salt or mineral, &c. either alone, or mixed for that purpose with a sulphureous one in order to purify it. See **CHEMISTRY**.

*DEFLECTION of the rays of light*. See **OPTICS**.

**DEFLUXION**, in medicine, the falling of humours from a superior to an inferior part of the body.

**DEFORCEMENT**,

**DEFORCEMENT**, in Scots law, the opposing or resisting the officers of the law in the execution of their office. See *SCOTS LAW*, titles 25 and 33.

**DEFORMITY**, the want of that uniformity necessary to constitute the beauty of an object. See *BEAUTY*.

**DEGENERATION**, or **DEGENERATING**, in general, denotes the growing worse, or losing some valuable qualities whereof a thing was formerly possessed.

**DEGLUTITION**, in medicine, the act of swallowing the food, performed by means of the tongue driving the aliment into the œsophagus, which, by the contraction of the sphincter, protrudes the contents downwards.

**DEGRADATION**, the act of depriving a person for ever of a dignity or degree of honour, and taking away the title, badge, and privileges of it.

**DEGRADATION**, in painting, expresses the lessening the appearance of distant objects in a landscape, in the same manner as they would appear to an eye placed at that distance from them.

**DEGRADED CROSS**, in heraldry, a cross divided into steps at each end, diminishing as they ascend towards the centre, called by the French *perronnée*. See Plate LXVIII. fig. 6.

**DEGREE**, in geometry, a division of a circle, including a three hundred and sixtieth part of its circumference. See *ASTRONOMY*, and *GEOGRAPHY*.

**DEGREE of latitude**. See *GEOGRAPHY*.

**DEGREE of longitude**. See *GEOGRAPHY*.

**DEGREES**, in music, are the little intervals whereof the concords or harmonical intervals are composed.

**DEGREE**, in universities, denotes a quality conferred on the students or members thereof as a testimony of their proficiency in the arts or sciences, and intitling them to certain privileges.

**DEJECTION**, in medicine, the act of ejecting or evacuating the excrements. It is also applied to the excrements themselves thus evacuated, in which sense it is of the same import with stool.

**DEIFICATION**, in antiquity. See *APOTHEOSIS*.

**DEISM**, the system of religion acknowledged by the deists.

**DEISTS**, in the modern sense of the word, are those persons in Christian countries, who, acknowledging all the obligations and duties of natural religion, disbelieve the Christian scheme, or revealed religion. They are so called from their belief in God alone, in opposition to Christians. The learned Dr Clarke taking the denomination in the most extensive signification, distinguishes deists into four sorts. 1. Such as pretend to believe the existence of an eternal, infinite, independent, intelligent Being; and who teach, that this supreme Being made the world, though they fancy he does not at all concern himself in the management of it. 2. Those who believe not only the being, but also the providence of God with respect to the natural world; but who, not allowing any difference between moral good and evil, deny that God takes any notice of the morally good or evil actions of men; these things depending, as they imagine, on the arbitrary constitutions of human laws. 3. Those who having right apprehensions concerning the natural attributes of

God, and his all governing providence, and some notion of his moral perfections also; yet, being prejudiced against the notion of the immortality of the human soul, believe that men perish entirely at death, and that one generation shall perpetually succeed another, without any future restoration or renovation of things. 4. Such as believe the existence of a supreme Being, together with his providence in the government of the world, as also the obligations of natural religion; but so far only as these things are discoverable by the light of nature alone, without believing any divine revelation. These last are the only true deists; but as the principles of these men would naturally lead them to embrace the Christian revelation, the learned author concludes there is now no consistent scheme of deism in the world.

**DEITY**, a term frequently used in a synonymous sense with God.

**DELEGATES**, commissioners appointed by the king under the great seal to hear and determine appeals from the ecclesiastical court.

**DELEGATION**, a commission extraordinary given by a judge to take cognizance of and determine some cause which ordinarily does not come before him.

**DELEGATION**, in Scots law, a method of extinguishing obligations by the creditor's discharging his former debtor upon another becoming bound in his place.

**DELETERIOUS**, an appellation given to things of a destructive or poisonous nature. See *POISON*.

**DELF**, in heraldry, is by some supposed to represent a square rod or turf, and to be so called from delving, or digging. A delf tenne is due to him that revokes his own challenge, or any way goes from his word; and to such this is given as an abatement to the honour of their arms, and is always placed in the middle of the escutcheon. However, if two or more delfs are found in an escutcheon, they are not then to be looked upon as signs of an abatement, but of honour. Also, if it be of metal, or charged upon, it then becomes a charge of perfect bearing.

**DELFT**, a city of the United Netherlands, in the province of Holland, eight miles north-east of Rotterdam, and thirty south-west of Amsterdam: E. long. 4° 5', and N. lat. 52° 6'.

**DELIA**, in antiquity, feasts celebrated by the Athenians in honour of Apollo, surnamed Delius.

**DELIA** was also a quinquennial festival in the island of Delos, instituted by Theseus at his return from Crete, in honour of Venus, whose statue, given him by Ariadne, he erected on that place, having by her assistance met with success in his expedition.

**DELIBAMENTA**, in antiquity, a libation to the infernal gods, always offered by pouring downwards. See *LIBATION*.

*Jus DELIBERANDI*, in Scots law, an apparent heir is allowed a year after his predecessor's death, called *annus deliberandi*, to deliberate whether he will enter and represent him or not, during which time he cannot be pursued for the debts of his predecessor. See *SCOTS LAW*, title 27.

**DELIBERATIVE**,

**DELIBERATIVE**, an appellation given to a kind or branch of rhetoric, employed in proving a thing, or convincing an assembly thereof, in order to persuade them to put it in execution.

To have a deliberative voice in the assembly, is when a person has a right to give his advice and his vote therein. In councils, the bishops have deliberative voices; those beneath them have only consultative voices.

**DELICT**, in Scots law, signifies such small offences or breaches of the peace as are punishable only by fine or short imprisonment. See **SCOTS LAW**, title 33.

**DELIMA**, in botany, a genus of the polyandria monogynia class. It has no corolla; the calix consists of five leaves; and the berry contains two seeds. There is but one species, a native of Ceylon.

**DELINEATION**. See **DESIGNING**.

**DELINQUENT**, a guilty person, or one who has committed some fault or offence, for which he is punishable.

**DELIQUIUM**, or **ANIMI DELIQUIUM**. See **LIPOTHYMIA**.

**DELIQUIUM**, in chemistry, signifies the solution of any body, when exposed to a cool and damp place, by the humidity it attracts from the air.

**DELIRIUM**, in medicine, the production of ideas not answerable to external causes, from an internal indisposition of the brain. See **MEDICINE**.

**DELIVERY**, or **CHILD-BIRTH**. See **MIDWIFERY**.

**DELLY**, the capital of a province of the same name, and at present of all the Hither India: E. long. 79°, and N. lat. 28.

**DELOS**, the principal of the Cyclades islands, in the Archipelago: E. long. 25° 50', and N. lat. 37° 26'.

**DELPHINIUM**, or **LARK'S-SPUR**, in botany, a genus of the polyandria trigynia class. It has no calix; the corolla consists of five petals; and the nectarium is bifid, and horned behind. There are seven species, only one of which, viz. the consolida, or wild lark's-spur, is a native of Britain.

**DELPHINUS**, or **DOLPHIN**, in ichthyology, a genus belonging to the order of cete; the characters of which are these: they have teeth in each jaw; and a fistula or pipe in the head. There are three species, viz. 1. The phocæna, with a conical body, a broad back, and an obtuse snout. The colour of the back is a blackish blue, and the belly is white. The fistula, or pipe, through which they breathe and spout up the water, is betwixt the eyes: it has forty-six teeth in each jaw: it is found in the Baltic and different parts of the European ocean. The skin is smooth and soft. The external orifice of the fistula resembles the letter C: it has two strong pectoral fins, and a cartilaginous fin on the back. The tail is bifid. The penis of the male is not covered with a præputium, it lies concealed within the body, but is easily protruded when occasion requires. In the female, the cervix of the vulva is about nine inches long, and situate betwixt the navel and anus. They copulate in the summer; bring forth one at a birth; they nourish their

young with milk; and they live about thirty years. They live several days out of the water, provided they be not wounded. See **PLATE I.XVIII.** fig. 2. It is about four feet long, and two and a half thick. 2. The delphus, or dolphin of the ancients, is of an oblong cylindrical shape, and the snout is sharp and tapering; the teeth are subulated. It likewise frequents the European ocean. 3. The orca, or lesser whale of Ray, has the upper part of the snout waved, and broad serrated teeth. The inferior jaw is much longer than the superior one.

**DELPHINUS**, in astronomy, a constellation of the northern hemisphere. See **ASTRONOMY**.

**DELSBERG**, or **DESBERG**, a town of Switzerland, about seventeen miles south-west of Basle.

**DELTOIDES**, in anatomy. See **VOL. I.** p. 195.

**DELUGE**, an inundation or overflowing of the earth, either wholly or in part, by water.

We have several deluges recorded in history, as that of Ogyges, which overflowed almost all Attica; and that of Deucalion, which drowned all Thessaly in Greece: but the most memorable was that called the universal deluge, or Noah's flood, which overflowed and destroyed the whole earth, and out of which only Noah, and those with him in the ark, escaped. See **ARK**.

Many attempts have been made to account for the deluge by means of natural causes: but these attempts have only tended to discredit philosophy, and to render their authors ridiculous.

**DEMAIN**, or **DEMESNE**, in its common acceptation, is used for the lands round a manor-house, occupied by the lord.

**DEMAIN**, or **DEMESNE**, in law, is commonly understood to be the lord's chief manor-place, with the lands thereto belonging, which he and his ancestors have time out of mind kept in their own manual occupation.

**DEMEMBRE'**, in heraldry, is said of dismembered animals, or those with their limbs cut off.

**DEMEMBRATION**, in Scots law, signifies either the crime of depriving another of any member of his body, or the punishment of a crime by cutting off any member of the criminal's body. See **SCOTS LAW**, title 33.

**DEMER**, a river in the Austrian Netherlands, on which the city of Mechlin stands.

**DEMESNE**. See **DEMAIN**.

**DEMETRIA**, a festival celebrated by the Greeks in honour of Ceres, wherein it was usual for the devotees to lash themselves.

**DEMETRIOWITZ**, a city of the dutchy of Smolensko, in the Russian empire, situated upon the river Ugra, in 37° E. long. and 52° 30' N. lat.

**DEMI**, a word used in composition with other words to signify half.

**DEMI-CULVERIN**, a piece of ordnance usually 4½ inches bore, 2700 pound weight, ten feet long, and carrying point blank 175 paces.

**DEMI-CULVERIN of the least size**, is 4½ inches bore,

*Fig. 1.* DASYPUS or ARMADILLO

Plate LXVIII.

*Fig. 2*

DELPHINUS or DOLPHIN

*Fig. 5.*  
DRACO or FLYING DRAGON

8.  
DOUBLE FICHE

*Fig. 3.*  
DIDELPHIS or OPOSSUM

*Fig. 4.* DIODON

*A. Bell Sc.<sup>t</sup>*

10 feet long, and 2000 pounds weight. It carries a ball of 4 inches diameter, and of 9 pounds weight, and its level range is 174 paces.

**DEMI-CULVERIN** of the largest sort, is  $4\frac{1}{2}$  inches bore,  $10\frac{1}{2}$  feet long, and weighs 3000 pounds weight. It carries a ball  $4\frac{1}{2}$  inches diameter, weighing 12 pounds 11 ounces, point blank 178 paces.

**DEMI-GORGE**, in fortification, is that part of the polygon which remains after the flank is raised, and goes from the curtain to the angle of the polygon. It is half of the vacant space or entrance into a bastion.

**DEMI-QUAVER**, a note in music, two of which are equal to a quaver.

**DEMI-SEMI-QUAVER**, in music, the shortest note, two of them being equal to a semi-quaver.

**DEMOCRACY**, the same with a popular government, wherein the supreme power is lodged in the hands of the people: such were Rome and Athens of old; but as to our modern republics, Basil only excepted, their government comes nearer to aristocracy than democracy.

**DEMONSTRABLE**, a term used in the schools, to signify that a thing may be clearly proved. Thus it is demonstrable that the three angles of a triangle are equal to two right ones.

**DEMONSTRATION**, in logic, a series of syllogisms, all whose premises are either definitions, self-evident truths, or propositions already established. See **LOGIC**.

**DEMONSTRATIVE**, in grammar, a term given to such pronouns as serve to indicate or point out a thing. Of this number are *hic*, *hæc*, *hoc*, among the Latins; and *this*, *that*, *these*, *those*, in English.

**DEMULCENTS**, among physicians, medicines good against acrimonious humours. Such are the roots of marsh-mallows, of white lilies, of liquorice, and of viper grass, the five emollient herbs, &c.

**DEMURRAGE**, in commerce, an allowance made to the master of a ship by the merchants, for staying in a port longer than the time first appointed for his departure.

**DEMURRER**, in law, a stop put to any action upon some point of difficulty which must be determined by the court, before any further proceedings can be had in the suit.

**DEN**, a syllable which added to the names of places shews them to be situated in valleys or near woods, as Tenterden.

**DENARIUS**, in Roman antiquity, the chief silver coin among the Romans, worth in our money about sevenpence three farthings. As a weight, it was the seventh part of a Roman ounce.

**DENARIUS** is also used in our law-books for an English penny.

**DENBY**, the capital of Denbyshire, in North Wales: W. long.  $3^{\circ} 30'$ , and N. lat.  $53^{\circ} 15'$ . It sends only one member to parliament.

**DENDERMOND**, a fortified town of Flanders, situated at the confluence of the rivers Scheld and Dender, twelve miles east of Ghent: E. long.  $3^{\circ} 50'$ , and N. lat.  $51^{\circ} 10'$ .

**DENDRACHATES**, in natural history, the name used by the ancients for an extremely elegant and beautiful species of agate, the ground of which is whitish, variegated with veins of a brighter white. These veins are beautifully disposed in a number of various figures, but generally in many concentric irregular circles, drawn round one or more points. It is common also, in various parts of this stone, to find very beautiful delineations of trees, mosses, sea-plants, and the like, so elegantly expressed, that many have erroneously taken them for real plants included in the substance of the stone; whence the name dendrachates.

**DENDRANATOMY**, a term used by some for a description of the various parts of trees, as root, trunk, branch, bark, wood, pith, flower, fruit, &c. See **AGRICULTURE**, Part I.

**DENDROPHORIA**, in antiquity, the carrying of boughs or branches of trees, a religious ceremony so called, because certain priests called from thence dendrophori, tree-bearers, marched in procession, carrying the branches of trees in their hands in honour of some god, as Bacchus, Cerele, Sylvanus, &c. The college of the dendrophori is often mentioned in ancient marbles; and we frequently see in basso relievos the bacchanals represented as men carrying little shrubs or branches of trees.

**DENEB**, an Arabic term signifying tail, used by astronomers to denote several fixed stars. Thus deneb eleet, signifies the bright star in the lion's tail. Deneb adigege, that in the swan's tail, &c.

**DENIER**, a small French copper-coin, of which twelve make a sol.

There were two kinds of deniers, the one tournois, the other paris, whereof the latter was worth a fourth part more than the former.

**DENIZEN**, in law, an alien made a subject by the king's letters patent, otherwise called donatison, because his legitimation proceeds *ex donatione regis*, from the king's gift.

**DENMARK**, a kingdom situated between  $8^{\circ}$  and  $13^{\circ}$  of E. long. and between  $54^{\circ}$  and  $58^{\circ}$  of N. lat.: it comprehends the peninsula of Jutland, and the islands of Zeland, Funen, &c. To the king of Denmark likewise belong Norway, Iceland, and the dutchy of Holstein.

**DENNIS**, or St DENNIS, a town of France four miles north of Paris, where the kings of France are interred.

**DENOMINATOR**, in arithmetic, a term used in speaking of fractions. See **ARITHMETICK**, p. 387.

**DENS CANIS**, or DOG'S-TOOTH, in botany. See **ERYTHRONIUM**.

**DENS LEONIS**. See **LEONTODON**.

**DENSITY** of bodies, is that property directly opposite to rarity, whereby they contain such a quantity of matter under such a bulk.

Accordingly, a body is said to have double or triple the density of another body, when their bulk being equal, the quantity of matter is in the one double or triple the quantity of matter in the other.

**DENSITY** of the air. See **PNEUMATICS**.

**DENTALIUM**, in natural history, a shell-fish belonging to the order of *vermes testacea*. The shell consists of one tubulous strait valve, open at both ends. There are eight species, distinguished by the angles, striæ, &c. of their shells.

**DENTARIA**, or **TOOTHWORT**, in botany, a genus of the *tetradynamia siliquosa* class. The siliqua or pod bursts open by elastic valves; the stigma is emarginated; and the calix is connivent. There are three species, only one of which, *viz.* the *bulbifera*, or coralwort, is a native of Britain.

**DENTATED LEAF**. See **BOTANY**, p. 640.

**DENTEX**, in ichthyology. See **SPARUS**.

**DENTILES**, or **DENTILS**, in architecture, an ornament in corniches bearing some resemblance to teeth, particularly used in the *Ionian* and *Corinthian* orders. See **ARCHITECTURE**, p. 352.

**DENTIFRICE**, in medicine, a remedy for rubbing the teeth, and purging them from sordes; and for cleansing and absterging the gums, when replete with humours. There are dentifrices of various kinds and forms; some in form of a powder composed of corals, pumice-stone, salt, allum, egg-shells, crabs-claws, hartshorn, &c. others in form of an electuary, consisting of the same powders mixt up with honey; others are in form of a liquor drawn by distillations from drying herbs, and astringent medicines, &c.

**DENTILLARIA**. See **PLUMBAGO**.

**DENTISCALPRA**, in surgery, an instrument for scouring yellow, livid, or black teeth; to which being applied, near the gums, it scrapes off the foul morbid crust.

**DENTITION**, the breeding or cutting the teeth in children. See **MEDICINE**.

**DENUNCIATION**, a solemn publication or promulgation of any thing.

All vessels of enemies are lawful prizes, after denunciation or proclamation of war. The design of the denunciation of excommunicated persons, is that the sentence may be the more fully executed by the person's being more known.

**DENUNCIATION at the horn**, in Scots law, is that form by which a debtor, after the expiry of a charge to make payment upon letters of horning, is denounced rebel to the king for disobedience. No caption for apprehending and imprisoning the debtor can be obtained upon an expired charge of horning till he is first denounced rebel, and the horning with the executions of charge and denunciation registered. As to the other legal effects of denunciation, see **SCOTS LAW**, title 12.

**DEOBRUENTS**, in pharmacy, such medicines as open obstructions. See **DETERGENT**.

**DEODAND**, in our customs, implies a thing devoted or consecrated to God, for the pacification of his wrath, in case of any misfortune; as a person's coming to a violent end, without the fault of any reasonable creature; as if a horse should strike his keeper, and so kill him. In this case, the horse is to be a deodand; that is, he is to be sold, and the price distributed to the poor, as an expiation of that dreadful event.

**DEPONENT**, in Latin grammar, a term applied to verbs which have active significations, but passive terminations or conjugations, and want one of their participles passive.

**DEPONENT**, in the law of Scotland, a person who makes a deposition. See **DEPOSITION**.

**DEPOPULATION**, the act of diminishing the number of people in any country, whether by war or bad politics.

**DEPORTATION**, a sort of banishment used by the Romans, whereby some island or other place was allotted to a criminal for the place of his abode, with a prohibition not to stir out of the same on pain of death.

**DEPOSIT**, among civilians, something that is committed to the custody of a person, to be kept without any reward, and to be returned again on demand.

**DEPOSITARY**, in law, a person intrusted as keeper or guardian of a deposit.

**DEPOSITION**, in Scots law, is a contract by which one commits the custody or possession of any thing to another, to be kept for behoof of the owner, and returned on demand, or at any period specified in the contract. The owner is called the depositor, and the person to whose custody the thing is committed the depositary. See **SCOTS LAW**, title 20.

**DEPOSITION**, in law, the testimony given in court by a witness upon oath.

**DEPRECATION**, in rhetoric, a figure whereby the orator invokes the aid and assistance of some one; or prays for some great evil or punishment to befall him who speaks falsely, either himself or his adversary.

**DEPRECATORY**, or **DEPRECATIVE**, in theology, a term applied to the manner of performing some ceremonies in the form of prayer.

The form of absolution is deprecative in the Greek church, being conceived in these terms, *May God absolve you*: whereas it is in the declarative form in the Latin church, and in some of the reformed churches, *I absolve you*.

**DEPRESSION of the pole**. See **ASTRONOMY**, and **GEOGRAPHY**.

**DEPRESSOR**, or **DEPRIMENS**, in anatomy, a name applied to several muscles, because they depress the parts they are fastened to.

**DEPRIVATION**, in the canon-law, the deposing a bishop, parson, vicar, &c. from his office and preferment.

**DEPTFORD**, a town three miles east of London, on the southern banks of the Thames; chiefly considerable for its fine docks for building ships, and the king's yard.

**DEPURATION**. See **CLARIFICATION**.

**DEPURATORY FEVER**, a name given by Sydenham to a fever which prevailed much in the years 1661, 1662, 1663, and 1664. He called it depuratory, because he observed, that nature regulated all the symptoms in such a manner, as to fit the febrile matter, prepared by proper concoction, for expulsion in a certain time, either by a copious sweat, or a freer perspiration.

**DEPUTATION**, a mission of select persons out of a company

company or body, to a prince or assembly, to treat of matters in their name.

**DEPUTY**, a person sent upon some business, by some community.

**DEPUTY** is also one that exercises an office in another's right; and the forfeiture or misdemeanor of such deputy shall cause the person whom he represents to lose his office.

**DEPUTATUS**, among the ancients, a name applied to persons employed in making of armour: and likewise to brisk active people, whose business was to take care of the wounded in engagements, and carry them off the field.

**DERBENT**, a city of Dagistan, on the western coast of the Caspian sea: E. long.  $51^{\circ}$ , and  $41^{\circ} 15'$  N. lat.

**DEREHAM**, a market-town of Norfolk, about fifteen miles west of Norwich: E. long.  $1^{\circ}$ , and N. lat.  $52^{\circ} 40'$ .

**DERIVATIVE**, in grammar, a word which is derived from another called its primitive. See **PRIMITIVE**.

Thus, *manhood* is derived from *man*, *deity* from *Deus*, and *lawyer* from *law*.

**DERMESTES**, in zoology, a genus of insects belonging to the order of coleoptera. The antennæ are clavated, with three of the joints thicker than the rest; the breast is convex; and the head is inflexed below the breast. There are thirty species, distinguished by their colour, &c.

**DERNIER RESSORT**. See **RESSORT**.

**DEROGATORY**, a clause importing derogation. A derogatory clause in a testament, is a certain sentence, cipher, or secret character, which the testator inserts in his will, and of which he reserves the knowledge to himself alone, adding a condition, that no will he may make hereafter is to be reckoned valid, if this derogatory clause is not inserted expressly, and word for word. It is a precaution invented by lawyers against latter-wills extorted by violence, or obtained by suggestion.

**DERPT**, a town of Livonia, situated on the river Eimbec: E. long.  $28^{\circ} 10'$ , and N. lat.  $58^{\circ} 10'$ .

**DERVIS**, a name given to all Mahomedan monks, though of various orders. The most noted among them are the Bektaschi, the Mevelevi, the Kadri, and the Seyah. The Bektaschi, who are allowed to marry and live in cities and towns, are obliged, by the rules of their order, to visit remote lands, and to salute every one they meet with *gazel*, or love-songs, and with *esma*, or the invocation of the names of God, and humbly to wish him prosperity, which they do by repeating the word *eivallah*, a solemn exclamation of the wrestlers, by which the conquered yields the palm to the conqueror. The Mevelevi, so called from Mevelava their founder, are used to turn round for two or three hours together, with such swiftness that you cannot see their faces; they are great lovers of music: in their monasteries they profess great humility and poverty, and when visited make no distinction of persons; they first bring their guests coffee to drink; and if the

ways have been dirty, they wash their feet and sandals. The Kadri, with a peculiar superstition, emaciate their bodies; they go quite naked, except their thighs, and often join hands and dance, sometimes a whole day, repeating with great vehemence, *bu! bu! bu!* (one of the names of God) till, like madmen, they fall on the ground, foaming at the mouth, and running down with sweat: the prime vizir Kupruli Achmed Pasha, thinking this sect unbecoming the Mahomedan religion, ordered it to be suppressed; but, after his death, it revived, and is at present more numerous than ever, especially at Constantinople. The Seyah are wanderers, and though they have monasteries, yet they often spend their whole life in travelling; when they are sent out, their superiors impose upon them such a quantity of money or provisions, forbidding them to come back till they have procured it, and sent it to the monastery; wherefore when a Seyah comes into a town, he cries aloud in the market-place, *Ya allah senden*, &c. *O God! give me, I pray, five thousand crowns, or a thousand measures of rice*. Many of these dervises travel over the whole Mahomedan world, entertaining the people where-ever they come, with agreeable relations of all the curiosities they have met with. There are dervises in Egypt, who live with their families, and exercise their trades, of which kind are the dancing dervises at Damascus. They are all distinguished among themselves by the different forms and colours of their habits; those of Persia wear blue; the solitaires and wanderers wear only rags of different colours; others carry on their heads a plume made of the feathers of a cock; and those of Egypt wear an octagonal badge of a greenish white alabaster at their girdles, and a high stiff cap, without any thing round it.

**DERWENT**, a river, which, taking its rise in the north riding of Yorkshire, runs south, and falls into the Ouse.

**DERWENT-WATER**, a river of Gumberland, which falls into the Irish sea below Cocker-mouth.

**DESART**, a large extent of country entirely barren, and producing nothing. In this sense some are sandy deserts, as those of Lop, Xamo, Arabia, and several others in Asia; in Africa, those of Lybia and Zara: others are stony, as the desert of Pharan in Arabia Petrea.

*The* **DESART**, absolutely so called, is that part of Arabia, south of the Holy Land, where the children of Israel wandered forty years.

**DESCANT**, in music, the art of composing in several parts. See **MUSIC**.

**DESCENDENTS**, in Scots law. The issue of a common parent *in infinitum* are called his descendents.

**DESCENSION**, in astronomy, is either right or oblique.

*Right* **DESCENSION** is an arch of the equinoctial, intercepted between the next equinoctial point and the intersection of the meridian, passing through the centre of the object, at its setting, in a right sphere.

*Oblique* **DESCENSION**, an arch of the equinoctial, intercepted

tercepted between the next equinoctial point and the horizon, passing through the centre of the object, at its setting, in an oblique sphere.

**DESCENT**, in general, is the tendency of a body from a higher to a lower place; thus all bodies, unless otherwise determined by a force superior to their gravity, descend towards the centre of the earth. See **MECHANICS**.

**DESCENT**, or **DISCENT**, in law, an order or method whereby lands or tenements are derived to any man from his ancestors.

**DESCENT**, in genealogy, the order of succession of descendants in a line or family; or their distance from a common progenitor: thus we say, one descent, two descents, &c.

**DESCENT**, in heraldry, is used to express the coming down of any thing from above; as, a lion en descent, is a lion with his head towards the base points, and his heels towards one of the corners of the chief, as if he were leaping down from some high place.

**DESCRIPTION**, is such a strong and beautiful representation of a thing, as gives the reader a distinct view and satisfactory notion of it. See **NARRATION** and *Description*.

**DESEADA**, or **DESIDERADA**, one of the Caribbee-islands, subject to France, lying eastward of **Guadeloupe**. See **CARIBBEE**.

**DESERTER**, in a military sense, a soldier who, by running away from his regiment or company, abandons the service.

A deserter is, by the articles of war, punishable by death, and, after conviction, is hanged at the head of the regiment he formerly belonged to, with his crime writ on his breast.

**DESSERTION**, in Scots Law, when one of the married persons deserts or forsakes the other. Wilful desertion for four years together is a ground of divorce. See **SCOTS LAW**, title 6.

**DESHACHE**, in heraldry, is where a beast has its limbs separated from its body, so that they still remain on the escutcheon, with only a small separation from their natural places.

**DESIDERATUM** is used to signify the desirable perfections in any art or science: thus, it is a desideratum with the blacksmith, to render iron fusible by a gentle heat, and yet preserve it hard enough for ordinary uses; with the glassman, and looking-glass maker, to render glass malleable; with the clock-maker, to bring pendulums to be useful where there are irregular motions, &c.

**DESIGN**, in a general sense, the plan, order, representation, or construction of a building, book, painting, &c.

**DESIGN**, in the manufactories, expresses the figures wherewith the workman enriches his stuff, or silk, and which he copies after some painter, or eminent draughtsman, as in diaper, damask, and other flowered silk and tapestry, and the like.

In undertaking of such kinds of figured stuffs, it is necessary, says **Monf. Savary**, that, before the first stroke of the shuttle, the whole design be represented

on the threads of the warp; we do not mean in colours, but with an infinite number of little pack-threads, which, being disposed so as to raise the threads of the warp, let the workmen see, from time to time, what kind of silk is to be put in the eye of the shuttle for woof. This method of preparing the work is called reading the design, and reading the figure, which is performed in the following manner: a paper is provided, considerably broader than the stuff, and of a length proportionate to what is intended to be represented thereon. This they divide lengthwise, by as many black lines as there are intended threads in the warp; and cross these lines, by others drawn breadthwise, which, with the former, make little equal squares: on the paper thus squared, the draughtsman designs his figures, and heightens them with colours, as he sees fit. When the design is finished, a workman reads it, while another lays it on the simblot.

To read the design, is to tell the person who manages the loom, the number of squares, or threads, comprised in the space he is reading, intimating at the same time, whether it is ground or figure. To put what is read on the simblot, is to fasten little strings to the several packthreads, which are to raise the threads named; and thus they continue to do till the whole design is read.

Every piece being composed of several repetitions of the same design, when the whole design is drawn, the drawer, to re-begin the design afresh, has nothing to do but to raise the little strings, with slip-knots, to the top of the simblot, which he had let down to the bottom: this he is to repeat as often as is necessary till the whole be manufactured.

The ribbon-weavers have likewise a design, but far more simple than that now described. It is drawn on paper with lines and squares, representing the threads of the warp and woof. But instead of lines, whereof the figures of the former consist, these are constituted of points only, or dots, placed in certain of the little squares, formed by the intersection of the lines. These points mark the threads of the warp that are to be raised, and the spaces left blank denote the threads that are to keep their situation: the rest is managed as in the former.

**DESIGN** is also used, in painting, for the first idea of a large work, drawn roughly, and in little, with an intention to be executed and finished in large.

Design, in painting, is the simple contour, or outlines of the figures intended to be represented, or the lines that terminate and circumscribe them: such design is sometimes drawn in crayons, or ink, without any shadows at all; sometimes it is hatched, that is, the shadows are expressed by sensible outlines, usually drawn across each other with the pen, crayon, or graver. Sometimes, again, the shadows are done with the crayon rubbed so as that there do not appear any lines: at other times, the grains or strokes of the crayon appear, as not being rubbed: sometimes the design is washed, that is, the shadows are done with a pencil in Indian ink, or some other liquor; and sometimes

times the design is coloured, that is, colours are laid on much like those intended for the grand work.

The essential requisites of a design are correctness, good taste, elegance, character, diversity, expression, and perspective. Correctness depends on the justness of the proportions, and knowledge of anatomy. Taste is a certain manner of correctness peculiar to one's self, derived either from nature, masters, or studies, or all of them united. Elegance gives a delicacy that not only strikes persons of judgment, but communicates an agreeableness that pleases universally. The character is what is peculiar to each thing, wherein there must be diversity, inasmuch that every thing has its peculiar character to distinguish it. The expression is the representation of an object, according to the circumstances it is supposed to be in. Perspective is the representation of the parts of a painting or a figure, according to the situation they are in with regard to the point of sight. The design or draught, is a part of the greatest import and extent in painting. It is acquired chiefly by genius and application, rules being of less avail here than in any other branches of the art, as colouring, &c. The principal rules that regard design are, that novices accustom themselves to copy good originals at first sight; not to use squares in drawing, lest they stint and confine their judgment; to design well from life, before they practise perspective; to learn to adjust the size of their figures to the visual angle, and the distance of the eye from the model or object; to mark out all the parts of their design before they begin to shade; to make their contours in great pieces, without taking notice of the little muscles, and other breaks; to make themselves masters of the rules of perspective; to observe the perpendicular, parallel, and distance of every stroke; to compare and oppose the parts that meet and traverse the perpendicular, so as to form a kind of square in the mind, which is the great and almost the only rule of designing justly; to have a regard not only to the model, but to the parts already designed, there being no such thing as designing with strict justness, but by comparing and proportioning every part to the first. All the other rules relate to perspective. See PERSPECTIVE.

**DESION**, the Macedonian name of the month called by the Athenians *anthestherion*.

**DESISE**, a town of France, situated on the river Loire, fifteen miles south-east of Nevers: E. long.  $3^{\circ} 32'$ , N. lat.  $46^{\circ} 48'$ .

**DESPOTICAL**, in general, denotes any thing that is uncontrouled and absolute; but is particularly used for an arbitrary government, where the power of the prince is unlimited, and his will a law to his subjects: such are those of Turkey, Persia, and most of the eastern governments; and even those of Europe, if we except the republics, our own, and the Swedish government.

**DESPOUILLE**, in heraldry, the whole case, skin, or slough of a beast, with the head, feet, tail, and all appurtenances, so that being filled and stuffed it looks like the entire creature.

**DESSAW**, a city of upper Saxony, in Germany, situated on the river Elbe, sixty miles north-west of Dres-

VOL. II. No. 43.

3 †

den, and subject to the prince of Anhalt Dessau: E. long.  $12^{\circ} 40'$ , N. lat.  $51^{\circ} 50'$ .

**DESSERT**, or **DESART**, a service of fruits and sweetmeats, usually served up last to table.

**DESSICCATIVE**, or **DESICCATIVE**, in pharmacy, an epithet applied to such topical medicines as dry up the humours flowing to a wound or ulcer.

**DESTINIES**, in mythology. See **PARCÆ**.

**DESTINY**, among philosophers and divines. See **FATE**.

**DESTRUCTION**, in general, an alteration of any thing from its natural state to one contrary to nature; whereby it is deemed the same with corruption. See **CORRUPTION**.

A chemical destruction, or corruption, is nothing but a resolution of the whole naturally mixed body into its parts.

**DESUDATION**, in medicine, a profuse and inordinate sweat, succeeded by an eruption of pustules, called *sudamina*, or heat pimples.

**DETACHMENT**, in military affairs, a certain number of soldiers drawn out from several regiments or companies equally, to be employed as the general thinks proper, whether on an attack, at a siege, or in parties to scour the country.

**DETERGENTS**, in pharmacy, such medicines as are not only softening and adhesive, but also, by a peculiar activity, conjoined with a suitable configuration of parts, are apt to abrade and carry along with them such particles as they lay hold on in their passage.

**DETERIORATION**, the impairing or rendering a thing worse: it is just the reverse of melioration. See **MELIORATION**.

**DETERMINATION**, in mechanics, signifies much the same with the tendency or direction of a body in motion. See **MECHANICS**.

**DETERMINATION**, among school-divines, is an act of divine power, limiting the agency of second causes, in every instance, to what the Deity predestinated concerning them. See **PREDESTINATION**.

**DETERSIVES**, in pharmacy. See **DETERGENTS**.

**DETHMOLD**, a town of Westphalia, in Germany, fifteen miles north of Paderborn: E. long.  $8^{\circ} 35'$ , N. lat.  $52^{\circ}$ .

**DETINUE**, in law, a writ or action that lies against one who has got goods or other things delivered to him to keep, and afterwards refuses to deliver them.

**DETONATION**, in chemistry, the noise and explosion which any substance makes upon the application of fire to it. It is also called *fulmination*. See **CHEMISTRY**.

**DETRANCHE**, in heraldry, a line bendwise, proceeding always from the dexter side, but not from the very angle, diagonally athwart the shield.

**DETTINGEN**, a village of Germany, about nine miles east of Hanau, in the circle of the upper Rhine: E. long.  $8^{\circ} 45'$ , and N. lat.  $50^{\circ} 8'$ .

**DEVA**, a port-town of Spain, situated on the bay of Biscay, forty miles east of Bilbao: W. long.  $2^{\circ} 10'$ , and N. lat.  $43^{\circ} 20'$ .

**DEVENTER**, a city of the united Provinces, and province of Overijssel, about eight miles north of Zutphen: E. long.  $6^{\circ}$ , and N. lat.  $52^{\circ} 20'$ .

**DEVICE**, among painters. See **DEVISE**.

4 M

DEVII.

**DEVIL**, an evil angel, one of those celestial spirits cast down from heaven for pretending to equal himself with God. The Ethiopians paint the devil white, to be even with the Europeans who paint him black. There is no mention of the word devil in the Old Testament, but only of the word Satan and Belial: nor do we meet with it in any heathen authors, in the sense it is taken among Christians, that is, as a creature revolted from God. Their theology went no farther than to evil genii, or dæmons.

Some of the American idolaters have a notion of two collateral independent beings, one of whom is good, and the other evil; which last they imagine has the direction and superintendence of this earth, for which reason they chiefly worship him: whence those that give us an account of the religion of these savages give out, with some impropriety, that they worship the devil. The Chaldeans, in like manner, believed both a good principle and an evil one, which last they imagined was an enemy to mankind.

Isaiah, speaking, according to some commentators, of the fall of the devil, calls him Lucifer, from his former elevation and state of glory: but others explain this passage of Isaiah in reference to the king of Babylon, who had been precipitated from his throne and glory. The Arabians call Lucifer, Eblis, which some think is only a diminutive or corruption of the word Diabolus.

**DEVIL-IN-A-BUSH**, in botany. See **NIGELLA**.

**DEVIL'S BIT**. See **SCABIOSA**.

**DEVINCTION**, in antiquity, a kind of love-charm, described by Virgil in his eighth eclogue: it consisted in tying certain knots, and repeating a formula of words.

**DEVISE**, or **DEVICE**, in heraldry, painting, and sculpture, any emblem used to represent a certain family, person, action, or quality; with a suitable motto, applied in a figurative sense. See **MOTTO**.

**DEVISE**, in law, the act whereby a person bequeaths his lands or tenements to another by his last will and testament.

**DEVISES**, a borough town in Wiltshire, eighteen miles north-west of Salisbury: W. long.  $2^{\circ} 6'$ , and N. lat.  $51^{\circ} 25'$ . It sends two members to parliament.

**DEUNX**, in Roman antiquity, eleven ounces, or  $\frac{1}{12}$  parts of the libra. See **LIBRA**.

**DEVOLUTION**, in law, a right acquired by succession from one to another.

**DEVONSHIRE**, a county in the west of England, bounded by the Bristol channel, on the north; by Somersetshire and Dorsetshire, on the east; by the English channel, on the south; and by Cornwall, on the west. From this county the noble family of Cavendish take the title of duke.

**DEVOTION**, a sincere ardent worship of the deity. See **PRAYER**, **ADORATION**, **WORSHIP**, &c.

**DEUTERONOMY**, a canonical book of the Old Testament, and the last of the pentateuch of Moses. See **BIBLE**.

**DEUTEROPOTMI**, in Grecian antiquity, a designation given to such of the Athenians as had been thought dead, and, after the celebration of the funeral rites, unexpectedly recovered. It was unlawful for the deu-

teropotmi to enter into the temple of the Eumenides, or to be admitted to the holy rites, till after they were purified, by being let through the lap of a woman's gown, that they might seem to be new born.

**DEUTEROSIS**, the Greek name by which the Jews called their Mischnah, or second law. See **MISCHNAH**.

**DEUX PONTES**, a city of Germany, in the palatinate of the Rhine, sixty miles north-east of Nancy: E. long.  $7^{\circ} 15'$ , and N. lat.  $49^{\circ} 25'$ .

**DEW**, a dense moist vapour, falling on the earth in form of a misting rain, while the sun is below the horizon. See **PNEUMATICS**.

**DEW-BORN**, in country affairs, a distemper in cattle, being a swelling in the body, as much as the skin can hold, so that some beasts are in danger of bursting. This distemper proceeds from the greediness of a beast to feed, when put into a rank pasture: but commonly when the grass is full of water. In this case the beast should be stirred up and down, and made to purge well: but the proper cure is bleeding in the tail; then take a grated nutmeg, with an egg, and breaking the top of the shell, put out so much of the white as you may have room to slip the nutmeg into the shell; mix them together, and then let shell and all be put down the beast's throat; that done, walk him up and down, and he will soon mend.

**DEXTANS**, in Roman antiquity, ten ounces, or  $\frac{1}{12}$  of their libra. See **LIBRA**.

**DEXTER**, in heraldry, an appellation given to whatever belongs to the right side of a shield, or coat of arms: thus we say, bend-dexter, dexter point, &c. See **BEND**, **POINT**, &c.

**DEXTROCHERE**, or **DESTROCHERE**, in heraldry, is applied to the right arm painted in a shield, sometimes naked, sometimes clothed, or adorned with a bracelet; and sometimes armed, or holding some moveable, or member used in the arms.

**DEY**, in matters of government, the sovereign prince of Algiers, answering to the bay of Tunis. See **BEY**.

**DEYNSE**, a town of Flanders, nine miles south west of Ghent: E. long.  $3^{\circ} 30'$ , N. lat.  $51^{\circ}$ .

**DIABETES**, in physic, an excessive discharge of urine, which comes away crude, and exceeds the quantity of liquids drank. See **MEDICINE**.

**DIABOLUS**. See **DEVIL**.

**DIABOLUS MARINUS**. See **RAIA**.

**DIABOLUS METELLORUM**, a title given by chemists to jupiter or tin, because, when incorporated with other metals, it renders them incapable of reduction, or at least very difficult to undergo that operation.

**DIABROSIS**, in medicine. See **ANABROSIS**.

**DIACARYON**, in pharmacy. See **DIANUCUM**.

**DIACAUSTIC CURVE**, a species of the caustic curves formed by refraction.

**DIACHYLON**, in pharmacy, an emollient digestive plaister, composed of mucilages or viscid juices drawn from certain plants.

**DIACODIUM**, in pharmacy, a syrup prepared from poppy heads. It is also called the syrupus de meconio. As it is of consequence that all the circumstances in the directions

directions for compounding this medicine, be exactly followed, we here give the method of preparing it from the London Dispensatory. Take of the heads of dried white poppies without their seeds, three pounds and a half; of water, six gallons. Slice the heads, and boil them in the water, often stirring them that they may not burn, till about a third only of the liquor is left, which will be almost all imbibed by the poppy heads: then take all from the fire, and press the liquor strongly out from the heads; in the next place, boil the liquor by itself, to about two quarts, and strain it while hot, first through a sieve, and then through a thin flannel: set it by for a night, that what fæces have passed the strainers, may subside; next morning pour off the clear liquor, and boil it with six pounds of double refined sugar, till the whole comes to the weight of nine pounds, or a little more, that it may become a syrup of a just consistence. This syrup partakes of all the virtues of the poppy.

**DIACOUSTICS**, called also **DIAPHONICS**, the consideration of the properties of refracted sound, as it passes through different mediums.

**DIADELPHIA**, in the Linnæan system of botany. See Vol. I. p. 635.

**DIADEM**, in antiquity, a head-band, or fillet, worn by kings as a badge of their royalty. It was made of silk, thread, or wool, and tied round the temples and forehead, the ends being tied behind, and let fall on the neck. It was usually white, and quite plain, though sometimes embroidered with gold, and set with pearls and precious stones. In latter times, it came to be twilted round crowns, laurels, &c. and even appears to have been worn on divers parts of the body. See **CROWN**.

**DIADÉM**, in heraldry, is applied to certain circles, or rims, serving to inclose the crowns of sovereign princes, and to bear the globe and cross, or the flower de luces for their crest. The crowns of sovereigns are bound, some with a greater, and some with a less number of diadems. The bandage about the heads of moors on shields is also called diadem, in blazoning.

**DIÆRESIS**, in surgery, an operation serving to divide and separate the part when the continuity is a hindrance to the cure.

**DIÆRESIS**, in medicine, is the consuming of the vessels of an animal body, when from some corroding cause certain passages are made, which naturally ought not to have been; or certain natural passages are dilated beyond their ordinary dimensions, so that the humours which ought to have been contained in the vessels extravasate or run out.

**DIÆRESIS**, in grammar, the division of one syllable into two, which is usually noted by two points over a letter, as *aulai* instead of *aulæ*, *disfolvenda* for *disfolvenda*.

**DIÆTETÆ**, in Grecian antiquity, a kind of judges, of which there were two sorts, the *cleroti* and *diallaacterii*. The former were public arbitrators, chosen by lot to determine all causes exceeding ten drachms, within their own tribe, and from their sentence an appeal lay to the superior courts.

The *diallaacterii*, on the contrary, were private arbitrators from whose sentence there lay no appeal, and accordingly they always took an oath to administer justice without partiality.

**DIAGLYPHICE**, the art of cutting or engraving figures on metals, such as seals, intaglias, matrices of letters, &c. or coins for medals.

**DIAGNOSTIC**, in medicine, a term given to those signs which indicate the present state of a disease, its nature and cause.

**DIAGONAL**, in geometry, a right line drawn across a quadrilateral figure, from one angle to another, by some called the diameter, and by others the diametral of the figure. See **GEOMETRY**.

**DIAGRAM**, in geometry, a scheme for explaining and demonstrating the properties of any figure, whether triangle, square, circle, &c. See **GEOMETRY**.

**DIAGRAM**, among ancient musicians. See **SCALE**.

**DIAHEXAPLA**, or **DIAHEXAPTE**, among farriers, a compound medicine, so called from its containing six ingredients, *viz.* birthwort and gentian roots, juniper-berries, bay-berries, myrrh, and ivory shavings. It is commended for colds, consumptions, purpines, and many other disorders in horses.

**DIAL**. A dial is a plane, upon which lines are described in such a manner, that the shadow of a wire, or of the upper edge of another plane, erected perpendicularly on the former, may shew the true time of the day.

The edge of the plane by which the time of the day is found, is called the stile of the dial, which must be parallel to the earth's axis; and the line on which the said plane is erected, is called the substile.

The angle included between the subtile and stile, is called the elevation, or height of the stile.

Those dials whose planes are parallel to the plane of the horizon, are called horizontal dials; and those dials whose planes are perpendicular to the plane of the horizon, are called vertical, or erect dials.

Those erect dials, whose planes directly front the north or south, are called direct north or south dials; and all other erect dials are called decliners, because their planes are turned away from the north or south.

Those dials whose planes are neither parallel nor perpendicular to the plane of the horizon, are called inclining, or reclining dials, according as their planes make acute or obtuse angles with the horizon; and if their planes are also turned aside from facing the south or north, they are called declining-inclining, or declining-reclining dials.

The intersection of the plane of the dial, with that of the meridian, passing through the stile, is called the meridian of the dial, or the hour-line of XII.

Those meridians, whose planes pass through the stile, and make angles of 15, 30, 45, 60, 75, and 90 degrees with the meridian of the place (which marks the hour-line of XII.) are called hour circles; and their intersections with the plane of the dial are called hour-lines.

In all declining dials, the substile makes an angle with

with the hour-line of XII; and this angle is called the distance of the substile from the meridian.

The declining plane's difference of longitude, is the angle formed at the intersection of the stile and plane of the dial, by two meridians; one of which passes through the hour-line of XII. and the other through the substile.

This much being premised concerning dials in general, we shall now proceed to explain the different methods of their construction.

If the whole earth  $aPcp$ , (Plate LXIX. fig. 1.) were it transparent, and hollow, like a sphere of glass, and had its equator divided into 24 equal parts by so many meridian semicircles,  $a, b, c, d, e, f, g$ , &c. one of which is the geographical meridian of any given place, as London (which is supposed to be at the point  $a$ ;) and if the hours of XII were marked at the equator, both upon that meridian and the opposite one, and all the rest of the hours in order on the rest of the meridians, those meridians would be the hour-circles of London: then, if the sphere had an opaque axis, as  $PEp$ , terminating in the poles  $P$  and  $p$ , the shadow of the axis would fall upon every particular meridian and hour, when the sun came to the plane of the opposite meridian, and would consequently shew the time at London, and at all other places on the meridian of London.

If this sphere was cut through the middle by a solid plane  $ABCD$ , in the rational horizon of London, one half of the axis  $EP$  would be above the plane, and the other half below it; and if straight lines were drawn from the centre of the plane, to those points where its circumference is cut by the hour-circles of the sphere, those lines would be the hour-lines of a horizontal dial for London: for the shadow of the axis would fall upon each particular hour-line of the dial, when it fell upon the like hour-circle of the sphere.

If the plane which cuts the sphere be upright, as  $AFCG$ , fig. 2. touching the given place (London) at  $F$ , and directly facing the meridian of London, it will then become the plane of an erect direct south dial: and if right lines be drawn from its center  $E$ , to those points of its circumference where the hour-circles of the sphere cut it, these will be the hour-lines of a vertical or direct south dial for London, to which the hours are to be set as in the figure (contrary to those on a horizontal dial), and the lower half  $EP$  of the axis will cast a shadow on the hour of the day in this dial, at the same time that it would fall upon the like hour-circle of the sphere, if the dial-plane was not in the way.

If the plane (still facing the meridian) be made to incline, or recline, any given number of degrees, the hour-circles of the sphere will still cut the edge of the plane in those points to which the hour-lines must be drawn straight from the center; and the axis of the sphere will cast a shadow on these lines at the respective hours. The like will still hold, if the plane be made to decline by any given number of degrees from the meridian toward the east or west: provided the declination be less than 90 degrees, or the reclination be less than the co-latitude of the place: and the axis of the sphere will be a gnomon, or stile, for the dial. But it cannot be a gnomon, when

the declination is quite 90 degrees, nor when the reclination is equal to the co-latitude; because in these two cases, the axis has no elevation above the plane of the dial.

And thus it appears, that the plane of every dial represents the plane of some great circle upon the earth; and the gnomon the earth's axis, whether it be a small wire, as in the above figures, or the edge of a thin plate, as in the common horizontal dials.

The whole earth, as to its bulk, is but a point, if compared to its distance from the sun: and therefore, if a small sphere of glass be placed upon any part of the earth's surface, so that its axis be parallel to the axis of the earth, and the sphere have such lines upon it, and such planes within it, as above described; it will shew the hours of the day as truly as if it were placed at the earth's center, and the shell of the earth were as transparent as glass.

But because it is impossible to have a hollow sphere of glass perfectly true, blown round a solid plane; or if it was, we could not get at the plane within the glass to set it in any given position; we make use of a wire-sphere to explain the principles of dialing, by joining 24 semicircles together at the poles, and putting a thin flat plate of brass within it.

A common globe, of 12 inches diameter, has generally 24 meridian semicircles drawn upon it. If such a globe be elevated to the latitude of any given place, and turned about until one of these meridians cut the horizon in the north point, where the hour of XII is supposed to be marked, the rest of the meridians will cut the horizon at the respective distances of all the other hours from XII. Then if these points of distance be marked on the horizon, and the globe be taken out of the horizon, and a flat board or plate be put into its place, even with the surface of the horizon; and if straight lines be drawn from the center of the board, to those points of distance on the horizon which were cut by the 24 meridian semicircles, these lines will be the hour-lines of a horizontal dial for that latitude, the edge of whose gnomon must be in the very same situation that the axis of the globe was, before it was taken out of the horizon: that is, the gnomon must make an angle with the plain of the dial, equal to the latitude of the place for which the dial is made.

If the pole of the globe be elevated to the co-latitude of the given place, and any meridian be brought to the north point of the horizon, the rest of the meridians will cut the horizon in the respective distances of all the hours from XII, for a direct south dial, whose gnomon must be an angle with the plane of the dial, equal to the co-latitude of the place; and the hours must be set the contrary way on this dial to what they are on the horizontal.

But if your globe have more than 24 meridian semicircles upon it, you must take the following method for making *horizontal* and *south dials*.

Elevate the pole to the latitude of your place, and turn the globe until any particular meridian (suppose the first) comes to the north point of the horizon, and the opposite meridian will cut the horizon in the south. Then, set the hour-index to the uppermost XII on its circle;

*Fig. 3.*

*Fig. 4.*

*Fig. 5.*

*Fig. 6.*

*J. Bell's design.*

circle; which done, turn the globe westward until 15 degrees of the equator pass under the brazen meridian, and then the hour-index will be at I (for the sun moves 15 degrees every hour) and the first meridian will cut the horizon in the number of degrees from the north point, that I is distant from XII. Turn on, until other 15 degrees of the equator pass under the brazen meridian, and the hour-index will then be at II, and the first meridian will cut the horizon in the number of degrees that II is distant from XII: and so, by making 15 degrees of the equator pass under the brazen meridian for every hour, the first meridian of the globe will cut the horizon in the distances of all the hours from XII to VI, which is distant just 90 degrees; and then you need go no farther, for the distances of XI, X, IX, VIII, VII, and VI, in the forenoon, are the same from XII, as the distances of I, II, III, IIII, V, and VI, in the afternoon: and these hour-lines continued through the center, will give the opposite hour-lines on the other half of the dial.

Thus, to make a horizontal dial for the latitude of London, which is  $51\frac{1}{2}$  degrees north, elevate the north pole of the globe  $51\frac{1}{2}$  degrees above the north point of the horizon, and then turn the globe, until the first meridian (which is that of London on the English terrestrial globe) cuts the north point of the horizon, and set the hour-index to XII at noon.

Then turning the globe westward until the index points successively to I, II, III, IIII, V, and VI, in the afternoon, or until 15, 30, 45, 60, 75, and 90 degrees of the equator pass under the brazen meridian, you will find that the first meridian of the globe cuts the horizon in the following numbers of degrees from the north towards the east, *viz.*  $11\frac{3}{4}$ ,  $24\frac{1}{2}$ ,  $38\frac{1}{2}$ ,  $53\frac{1}{2}$ ,  $71\frac{1}{2}$ , and 90; which are the respective distances of the above hours from XII upon the plane of the horizon.

To transfer these, and the rest of the hours, to a horizontal plane, draw the parallel right lines  $a c$  and  $d b$ , (Plate LXIX. fig. 3.) upon that plane, as far from each other as is equal to the intended thickness of the gnomon or stile of the dial, and the space included between them will be the meridian or twelve o'clock line on the dial. Cross this meridian at right angles with the six o'clock line  $g h$ , and setting one foot of your compasses in the intersection  $a$ , as a center, describe the quadrant  $g e$  with any convenient radius or opening of the compasses; then, setting one foot in the intersection  $b$ , as a center, with the same radius describe the quadrant  $f h$ , and divide each quadrant into 90 equal parts or degrees, as in the figure.

Because the hour-lines are less distant from each other about noon, than in any other part of the dial, it is best to have the centers of these quadrants at a little distance from the center of the dial-plane, on the side opposite to XII, in order to enlarge the hour-distances thereabouts, under the same angles on the plane. Thus, the center of the plane is at  $C$ , but the centers of the quadrants are at  $a$  and  $b$ .

Lay a ruler over the point  $b$  (and keeping it there for the center of all the afternoon hours in the quadrant  $f h$ ) draw the hour-line of I through  $11\frac{3}{4}$  degrees in the quadrant; the hour-line of II, through  $24\frac{1}{2}$  degrees; of

III, through  $38\frac{1}{2}$  degrees; IIII, through  $53\frac{1}{2}$ ; and V, through  $71\frac{1}{2}$ ; and because the sun rises about four in the morning, on the longest days at London, continue the hour-lines of IIII and V in the afternoon through the center  $b$  to the opposite side of the dial.—This done, lay the ruler to the center  $a$  of the quadrant  $e g$ , and through the like divisions or degrees of that quadrant, *viz.*  $11\frac{3}{4}$ ,  $24\frac{1}{2}$ ,  $38\frac{1}{2}$ ,  $53\frac{1}{2}$ , and  $71\frac{1}{2}$ , draw the forenoon hour-lines of XI, X, IX, VIII, and VII; and because the sun sets not before eight in the evening on the longest days, continue the hour-lines of VII and VIII in the forenoon, through the center  $a$ , to VII and VIII in the afternoon; and all the hour lines will be finished on this dial; to which the hours may be set, as in the figure.

Lastly, through  $51\frac{1}{2}$  degrees of either quadrant, and from its center, draw the right line  $a g$  for the hypotenuse or axis of the gnomon  $a g i$ ; and from  $g$ , let fall the perpendicular  $g i$ , upon the meridian line  $a i$ , and there will be a triangle made, whose sides are  $a g$ ,  $g i$ , and  $i a$ . If a plate similar to this triangle be made as thick as the distance between the lines  $a c$  and  $b d$ , and set upright between them, touching at  $a$  and  $b$ , its hypotenuse  $a g$  will be parallel to the axis of the world, when the dial is truly set; and will cast a shadow on the hour of the day.

N. B. The trouble of dividing the two quadrants may be saved, if you have a scale with a line of chords upon it, such as that on the top of Plate LXX.: for if you extend the compasses from 0 to 60 degrees of the line of chords, and with that extent, as a radius, describe the two quadrants upon their respective centers, the above distances may be taken with the compasses upon the line, and set off upon the quadrants.

To make an erect direct south dial, Plate LXIX. fig. 4. Elevate the pole to the co-latitude of your place, and proceed in all respects as above taught for the horizontal dial, from VI in the morning to VI in the afternoon, and the hours must be reversed, as in the figure; and the hypotenuse  $a g$  of the gnomon  $a g f$ , must make an angle with the dial-plane equal to the co-latitude of the place. As the sun can shine no longer on this dial than from six in the morning until six in the evening, there is no occasion for having any more than twelve hours upon it.

To make an erect dial, declining from the south towards the east or west. Elevate the pole to the latitude of your place, and screw the quadrant of altitude to the zenith. Then, if your dial declines towards the east (which we shall suppose it to do at present) count in the horizon the degrees of declination, from the east point towards the north, and bring the lower end of the quadrant to that degree of declination at which the reckoning ends. This done, bring any particular meridian of your globe (as suppose the first meridian) directly under the graduated edge of the upper part of the brazen meridian, and set the hour index to XII at noon. Then, keeping the quadrant of altitude at the degree of declination in the horizon, turn the globe eastward on its axis, and observe the degrees cut by the first meridian in the quadrant of altitude (counted from the zenith) as the hour index comes

to XI, X, IX, &c. in the forenoon, or as 15, 30, 45, &c. degrees of the equator pass under the brazen meridian at these hours respectively; and the degrees then cut in the quadrant by the first meridian, are the respective distances of the forenoon hours from XII on the plane of the dial.—Then, for the afternoon hours, turn the quadrant of altitude round the zenith until it comes to the degree in the horizon opposite to that where it was placed before: namely, as far from the west point of the horizon towards the south, as it was set at first from the east point towards the north; and turn the globe westward on its axis, until the first meridian comes to the brazen meridian again, and the hour-index to XII: then, continue to turn the globe westward, and as the index points to the afternoon hours I, II, III, &c. or as 15, 30, 45, &c. degrees of the equator pass under the brazen meridian, the first meridian will cut the quadrant of altitude in the respective number of degrees from the zenith that each of these hours is from XII on the dial.—And note, that when the first meridian goes off the quadrant at the horizon in the forenoon, the hour-index shews the time when the sun will come upon this dial: and when it goes off the quadrant in the afternoon, the index will point to the time when the sun goes off the dial.

Having thus found all the hour-distances from XII, lay them down upon your dial plane, either by dividing a semicircle into two quadrants of 90 degrees each (beginning at the hour-line of XII) or by the line of chords, as above directed.

In all declining dials, the line on which the stile or gnomon stands (commonly called the *substile-line*) makes an angle with the twelve o'clock line, and falls among the forenoon hour-lines, if the dial declines towards the east; and among the afternoon hour-lines, when the dial declines towards the west; that is, to the left hand from the twelve o'clock line in the former case, and to the right hand from it in the latter.

To find the distance of the substile from the twelve o'clock line; if your dial declines from the south toward the east, count the degrees of that declination in the horizon from the east point toward the north, and bring the lower end of the quadrant of altitude to that degree of declination where the reckoning ends: then, turn the globe until the first meridian cuts the horizon in the like number of degrees, counted from the south point toward the east; and the quadrant and first meridian will then cross one another at right angles, and the number of degrees of the quadrant, which are intercepted between the first meridian and the zenith, is equal to the distance of the substile line from the twelve o'clock line; and the number of degrees of the first meridian, which are intercepted between the quadrant and the north pole, is equal to the elevation of the stile above the plane of the dial.

If the dial declines westward from the south, count that declination from the east point of the horizon towards the south, and bring the quadrant of altitude to the degree in the horizon at which the reckoning ends; both for finding the forenoon hours, and distance of the substile from the meridian: and for the afternoon hours, bring the quadrant to the opposite degree in the horizon, namely, as far from the west towards the north, and then proceed in all respects as above.

Thus, we have finished our declining dial; and in so doing, we made four dials, *viz.*

1. A north dial, declining eastward by the same number of degrees. 2. A north dial, declining the same number west. 3. A south dial, declining east. And, 4. a south dial declining west. Only, placing the proper number of hours, and the stile or gnomon respectively, upon each plane. For (as above mentioned) in the south-west plane, the substilar-line falls among the afternoon hours; and in the south-east, of the same declination, among the forenoon hours, at equal distances from XII. and so, in all the morning hours on the west decliner, will be like the afternoon hours on the east decliner: the south-east decliner will produce the north-west decliner; and the south-west decliner, the north east decliner, by only extending the hour-lines, stile and substile, quite through the center: the axis of the stile (or edge that casts the shadow on the hour of the day) being in all dials whatever parallel to the axis of the world, and consequently pointing towards the north pole of the heaven in north latitudes, and toward the south pole in south latitudes.

But because every one who would like to make a dial, may perhaps not be provided with a globe to assist him, and may probably not understand the method of doing it by logarithmic calculation; we shall shew how to perform it by the plain dialling lines, or scale of latitudes and hours; such as those on the top of Plate LXX. and which may be had on scales commonly sold by the mathematical instrument makers.

This is the easiest of all mechanical methods, and by much the best, when the lines are truly divided: and not only the half hours and quarters may be laid down by all of them, but every fifth minute by most, and every single minute by those where the line of hours is a foot in length.

Having drawn your double meridian line *ab, cd*, (Plate LXIX. fig. 5.) on the plane intended for a horizontal dial, and crossed it at right angles by the six o'clock line *fe* (as in fig. 31.) take the latitude of your place with the compasses, in the scale of latitudes, and set that extent from *c* to *e*, and from *a* to *f*, on the six o'clock line: then, taking the whole six hours between the points of the compasses in the scale of hours, with that extent set one foot in the point *c*, and let the other foot fall where it will upon the meridian line *cd*, as at *d*. Do the same from *f* to *b*, and draw the right lines *ed* and *fb*, each of which will be equal in length to the whole scale of hours. This done, setting one foot of the compasses in the beginning of the scale at XII, and extending the other to each hour on the scale, lay off these extents from *d* to *e* for the afternoon hours, and from *b* to *f* for those of the forenoon: this will divide the lines *de* and *bf* in the same manner as the hour-scale is divided at 1, 2, 3, 4, and 6; on which the quarters may also be laid down, if required. Then, laying a ruler on the point *c*, draw the first five hours in the afternoon, from that point, through the dots at the numeral figures 1, 2, 3, 4, 5, on the line *de*; and continue the lines of IIII and V through the center *c* to the other side of the dial, for the like hours of the morning: which done, lay the ruler on the point *a*, and draw the last five hours in the forenoon through the dots 5, 4, 3, 2, 1.

2, 1, on the line  $fb$ ; continuing the hour-lines of VII and VIII through the center  $a$  to the other side of the dial, for the like hours of the evening; and set the hours to their respective lines, as in the figure. Lastly, make the gnomon the same way as taught above for the horizontal dial, and the whole will be finished.

To make an erect south dial, take the co-latitude of your place from the scale of latitudes, and then proceed in all respects for the hour-lines, as in the horizontal dial; only reverting the hours, as in fig. 4. and making the angle of the stile's height equal to the co-latitude.

But lest the young dialist should have neither globe nor wooden scale, we shall now shew him how he may make a dial without any of these helps. Only, if he has not a line of chords, he must divide a quadrant into 90 equal parts or degrees for taking the proper angle of the stile's elevation; which is easily done.
