The cannons double fortified have full one diameter of their bore in thickness of metal at their touch-hole, and  $\frac{1}{2}$  at their trunnions, and  $\frac{1}{3}$  at their muzzle. The lessened cannons have, at their touch-hole, but  $\frac{1}{2}$  or  $\frac{1}{3}$  of the diameter of their bore in thickness of metal, and  $\frac{1}{4}$  at their trunnions, and  $\frac{1}{5}$  at their muzzle. The ordinary fortified cannons, have  $\frac{1}{3}$  at the touch hole,  $\frac{1}{4}$  at the trunnions, and  $\frac{1}{5}$  at the muzzle. All the double fortified culverines, and all lesser pieces of that kind, have one diameter and  $\frac{1}{4}$  at the touch-hole,  $\frac{1}{3}$  at the trunnions, and  $\frac{1}{5}$  at the muzzle. And all the ordinary fortified culverines, are fortified every way as the double fortified cannons; and the lessened culverines, as the ordinary cannons in all points.

With regard to bullets, or balls, wherewith cannons are loaded, they are of various kinds, viz. 1. Red-hot bullets, intended to set fire to places, where combustible matters are found. The bullet is made red-hot, by digging a place in the earth, and lighting in it a great quantity of charcoal, or sea coal, and placing over it a strong iron grate. When the fire is well lighted, the bullets are placed on the grate, where, in a very short time, they grow red hot; they are taken out with tongs, or iron ladles for the purpose, and carried into the piece; having before put some clay over the powder the cannon is loaded with, lest it should be set on fire by the red hot bullet: then the piece is fired. Where-ever the bullet passes, and meets with combustible matters, it sets them on fire. But when a trench is before the battery of red-hot bullets, hay is rammed over the powder; because, if it was clay, the pieces of it would wound and kill the workmen.

Red-hot bullets are never fired but with eight or four pounders. For if they were of a stronger caliber, the bullets could not be served easily.

2. Hollow bullets are shells made cylindrical, with an aperture and fusee at one end, which giving fire to the inside, when in the ground, it bursts, and has the same effect with a mine.

3. Chain

3. Chain-bullets consist of two balls joined by a chain, three or four foot a part.

4. Branch bullets are two balls joined by a bar of iron, five or six inches a-part.

5. Two-headed bullets, called also angels, being two halves of a bullet, joined by a bar or chain: these are chiefly used at sea, for cutting of cords, cables, sails, &c.

As bullets, as well as the pieces of ordnance, are of different caliber, which caliber, in a piece of ordnance, is the diameter of the mouth thereof; and in a bullet, its circumference; there are means found to proportion these two calibers to one another, *viz.* with an instrument called a caliber-rule, wherein a right line is so divided, as that the first part being equal to the diameter of an iron or leaden ball of one pound weight, the other parts are to the first, as the diameters of balls of two, three, four, &c. pounds, are to the diameter of one ball of one pound.

The caliber consists of two thin pieces of brass, six inches long, joined by a rivet, so as to move quite round each other: the head, or one end of the piece, is cut circular, and one half of its circumference divided into every second degree. On the other half are divisions from one to ten; each again subdivided into four: the use of which divisions and subdivisions, is when the diameter of a bullet, &c. not exceeding ten inches, is taken, the diameter of the semicircle will, among the divisions, give the length of the diameter, taken between the points of the calibers, in inches and fourth parts.

The degrees on the head serve to take the quantity of an angle, the method of which is obvious. If the angle be inward, apply the outward edges to the planes that form the angle; the degree cut by the diameter of the semicircle, shews the quantity of the angle sought. For an outward angle, open the branches till the points be outward, and applying the straight edges to the planes that form the angle, the degrees cut by the diameter of the semicircle shew the angle required; reckoning from 180 towards the right hand.

On one branch of the calibers, on the same side, are, first, six inches; and each of these subdivided into ten parts. Secondly, a scale of unequal divisions, beginning at two, and ending at ten, each subdivided into four parts. Thirdly, two other scales of lines, shewing, when the diameter of the bore of a piece is taken with the points of the calibers outwards, the name of the piece, whether of the iron or brass, *i. e.* the weight of the bullet it carries, or that it is such or such a pounder, from one to forty-two pounds.

On the other branch of the calibers, on the same side, is a line of cords to about three inches radius; and a line of lines on both branches, as on the sector; with a table of the names of the several pieces of ordnance. On the same face is a hand graved, and a right line drawn from the finger towards the centre of the river, shewing, by its cutting certain divisions made on the circle, the weight of an iron shot, when the diameter is taken by the points of the calibers. Lastly, on the circle or head, on the same side, are graved several geometrical figures, inscribed in each other, with numbers; as a cube, whose side is sup-

posed one foot; a pyramid on the same base or altitude, and the proportions of their weight, &c. a sphere inscribed in a cube; a cylinder, cone, circle, square, &c.

The outside of the caliber serves to take the diameter of the mouth of the piece; and the inside, called the heel, that of the bullet.

There is another method of taking the caliber of the pieces, which is to have a rule very well divided, on which are graved the calibers both of the pieces and bullets. That rule must be applied on the mouth of the piece, and the caliber is presently found.

Sometimes, in lieu of bullets, the pieces are charged with cartouches, which are cases loaded with musket-balls, nails, chains, and pieces of old iron; sometimes, also, with small cannon-balls. See Plate XCVIII.

There are cartouches made in form of grapes, which are musket-balls joined together with pitch, and disposed on a small board, in a pyramidal form round a wooden stick, which arises from the middle of the board. (*ibid.*)

The cartouches made of tin are the best, because they carry further.

There are also cartouches made in form of pine-apples, whose figure is pyramidal. Their base is equal to the caliber of a bullet, proposed for the piece they are to be fired with; their height is of a caliber and a half; they are dipped in tar, and afterwards rolled on musket-balls, and when well covered with those balls, dipped again in the same tar, after which they may be used, thrusting the biggest foremost into the piece. These pine-apples are very good at sea, because, besides that the musket-balls flying about wound a great number of people, the bullet which is at the bottom of the cartouch does also much execution.

There are several sorts of carriages for ordnance, *viz.* ballard carriages, with low wheels, and high wheels. Sea-carriages, made in imitation of those for ship-guns: and carriages for field-pieces, of which there are two kinds.

The carriages must be proportioned to the pieces mounted on them.—The ordinary proportion is, for the carriage to have  $1\frac{1}{2}$  of the length of the gun; the wheels to be half the length of the piece in height; four times the diameter or caliber, gives the depth of the planks the fore end, in the middle  $3\frac{1}{2}$ .

The piece thus mounted on its carriage, several instruments are employed. some to prepare the piece to be loaded, some to load it, others to point it, and others to cleanse it, &c. Those instruments have each their proper name, which are as follows:

The lantern or ladle (*ibid.*) which serves to carry the powder into the piece, and which consists of two parts. *viz.* of a wooden box, appropriated to the caliber of the piece for which it is intended, and of a caliber and a half in length with its vent; and of a piece of copper nailed to the box, at the height of a half caliber.

This lantern must have three calibers and a half in length, and two calibers in breadth, being rounded at the end to load the ordinary pieces.

The rammer, (*ibid.*) which is a round piece of wood, commonly called a box, fastened to a stick twelve foot long,

long, for the pieces from twelve to thirty three pounds; and ten for the eight and four pounders; which serve to drive home the powder and ball to the breech.

The sponge, (*ibid.*) which is a long staff or rammer, with a piece of sheep or lamb skin wound about its end, to serve for scouring the cannon when discharged, before it be charged with fresh powder; to prevent any spark of fire from remaining in her, which would endanger the life of him who should load her again.

Wad-screw, (*ibid.*) which are two points of iron turned serpent-wise, to extract the wad out of the pieces, when one wants to unload them, or the dirt which had chanced to enter into it.

The botefeux, (*ibid.*) which are sticks two or three feet long, and an inch thick, split at one end, to hold an end of the match twisted round it, to fire the cannon.

The priming iron, (*ibid.*) which is a pointed iron rod, to clear the touch-hole of the pieces of powder or dirt; and also to pierce the cartridge, that it may sooner take fire.

The primer, (*ibid.*) which must contain a pound of powder at least, to prime the pieces.

The quoins of mire, which are pieces of wood with a notch on the side to put the fingers on, to draw them back or push them forward, when the gunner points his piece. They are placed on the sole of the carriage.

Leaden plates, which are used to cover the touch-hole, when the piece is charged, lest some dirt should enter it and stop it.

Before you charge the piece, sponge it well, to clean it of all filth and dirt within-side; then the proper weight of gunpowder, which powder drive in and ram down; taking care that the powder be not bruised in ramming, which weakens its effect; run over it a little quantity of paper, hay, or the like; and then throw in the ball.

To point, level, or direct the piece, so as to play against any certain point, is done by the help of a quadrant with a plummet; which quadrant consists of two branches made of brass or wood; one about a foot long, eight lines broad, and one line in thickness; the other four inches long, and the same thickness and breadth as the former. Between these branches is a quadrant, divided into 90 degrees, beginning from the shorter branch, and furnished with thread and plummet.

Place the longest branch of this instrument in the cannon's mouth, and elevate or lower it till the thread cuts the degree necessary to hit the proposed object. Which done, prime the cannon, and then set fire to it.

To point a cannon well, so as to do the execution proposed, we must know the path of a bullet, or the line it describes, from the mouth of the piece to the point where it lodges, which path is commonly called range.

If the piece be laid in a line parallel to the horizon, it is called the right or level range; and if it be mounted to 45 degrees, the ball is said to have the utmost range, and so proportionably; all others between 00 degrees and 45, being called intermediate ranges.

A shot made when the muzzle of a cannon is raised above the horizontal line, and is not designed to shoot directly or point blank, is called random-shot.

The utmost random of any piece is about ten times as

far as the bullet will go point blank; and the bullet will go farthest when the piece is mounted to about 45 degrees above the level range.

Mr Norton observes, that

	Pieces. Level.	Pieces. Utmost Random.

A 24 pounder may very well fire 90 or 100 shots, every day in summer; at 60 or 75 in winter. In case of necessity, it may fire more. And some French officers of artillery assure, that they have caused such a piece to fire every day 150 shots in a siege.

A 16 and a 12 pounder fire a little more, because they are easier served. There have even been some occasions, where 200 shots have been fired from these pieces, in the space of nine hours, and 138 in the space of five.

To range pieces in a battery, take care to reconnoitre well the ground where it is to be placed, and the road to convey it, in the right time, the cannon and the munitions.

The pieces must be armed, each with two lanterns, or ladles, a rammer, a sponge, and two priming-irons. The battery must also be provided with carriages, and other implements, necessary to remount the pieces which the enemy should chance to dismount.

To serve expeditiously and safely a piece in battery, it is necessary to have to each a sack of leather, large enough to contain about twenty pounds of powder to charge the lanterns or ladles, without carrying them to the magazine; and to avoid thereby making those trains of powder in bringing back the lantern from the magazine, and the accidents which frequently happen thereby.

A battery of 3 pieces must have 30 gabions, because six are employed on each of the two sides or epaulements, which make twelve, and nine for each of the two merlons.

There ought to be two gunners and six soldiers to each piece, and four officers of artillery.

The gunner, posted on the right of the piece, must take care to have always a pouch full of powder, and two priming-irons; his office is to prime the piece, and load

it

it with powder. That on the left fetches the powder from the little magazine, and fills the lantern or ladle which his comrade holds; after which, he minds that the match be very well lighted, and ready to set fire to the piece at the first command of the officer.

There must be three soldiers on the right, and three on the left of the piece. The two first to take care to ram and sponge the piece, each on his side. The rammer and sponge must be placed on the left, and the lantern or ladle on the right. After having rammed well the wad put over the powder, and that put over the bullet, they then take each a handspike, which they pass between the foremost spokes of the wheel, the ends whereof will pass under the head of the carriage, to make the wheel turn round, leaning on the other end of the handspike, towards the embrasure.

It is the office of the second soldier on the right, to provide wad, and to put it into the piece, as well over the powder as over the bullet; and that of his comrade on the left, to provide 50 bullets, and every time the piece is to be charged, to fetch one of them and put it into the piece, after the powder has been rammed. Then they both take each an handspike, which they pass under the hind part of the wheel, to push it in battery.

The officer of artillery must take care to have the piece diligently served.

In the night he must employ the gunners and soldiers, who shall relieve those who have served 24 hours to repair the embrasures.

If there be no water near the battery, care must be taken to have a cask filled with it, to dip the sponges in it, and cool the pieces, every ten or twelve rounds.

The MORTAR is a short piece of ordnance, thick and wide, proper for throwing bombs, carcasses, shells, stones, &c.

There are chiefly two kinds of mortars: the one hung or mounted on a carriage with low wheels, after the manner of guns, called *pendent* or *hanging mortars*; the other fixed on an immoveable base, called *standing mortars*. (*ibid.*)

At the head of the bore, or chase of the mortar, is the chamber for the charge of the powder. This is usually made cylindrical, all but the base which they make hemispherical: though some of the later engineers prefer hemispherical chambers; as the surface of those being less, under equal capacities, make less resistance to the gun-powder.

The thickness of the mortar about the chamber, is to be much greater than about the chase, by reason the gun-powder makes a much greater effort about the chamber than elsewhere. The diameter of the chamber to be much less than that of the bore; by reason bombs, shells, &c. are much lighter than the bullets of equal diameters, and consequently less powder suffices.

The first mortar piece used for throwing stones, weighs commonly 1000 lb. and whose utmost range is 150 fathoms, loaded with two pounds of powder; it has 15 inches of diameter at its mouth, and 2 foot 7 inches in height.

The depth of its bore or chase is 1 foot 7 inches, and the depth of its chamber, without including the entrance

where the rampion is placed, 8 inches. The tourillons have 5 inches of diameter,

The chamber must enter an inch into the tourillons; the thickness of the metal about the chamber, 3 inches; the thickness of the belly, 2 inches; and the length of the chase, 1 inch and  $\frac{1}{2}$ ; about each ring, 1 inch and  $\frac{1}{2}$ .

Mortars, for throwing bombs, are of several kinds.

There are some in the ancient manner, of 6, 7, 8, 9, 10, 11, 12, and 18 inches diameter at their mouth, and which contain in their chambers 3, 4, 5, 6, and 12 pounds of powder.

The chamber where the powder is put is cylindrical, and a little rounded at bottom.

Those of new invention have a concave chamber. And of these there are some which have 12 inches and  $\frac{1}{2}$  at the mouth, and contain in their chambers 18 pounds of powder; others 12, and others 8.

The proportions of mortars are as follow: The mortar which throws a bomb of 19 inches 10 lines of diameter, has the bore 27 $\frac{1}{2}$  inches long, and 18 inches 4 lines of diameter: it has in thickness between the bourelet, and its small reinforced ring, 3 $\frac{1}{2}$  inches; its small reinforced ring, is 3 $\frac{1}{2}$  inches thick; its great one, 4 inches; the entrance of its chamber has 5 $\frac{1}{2}$  inches of diameter; the chamber, in form of a pear, is 13 inches long, and 7 $\frac{1}{2}$  inches of diameter at its greatest breadth; and also 7 $\frac{1}{2}$  thick, and contains 12 pounds of powder.

The tourillons of the mortar have 32 inches in length from one end to the other, and 9 of diameter. The mortar has in height 4 foot 4 inches.

The bomb has 17 inches 10 lines of diameter, is 2 inches thick every where, except the bottom, which has 2 inches 10 lines. The aperture of the touch-hole is of 20 lines within and without.

The bomb contains 48 lb. of powder, and weighs 490 lb. and a little more.

The bore of the concave mortar, whose chamber contains 18 pounds of powder, has 12 $\frac{1}{2}$  inches of diameter, and is 18 $\frac{1}{2}$  inches long. It has in thickness between the bourelet, and its reinforced ring, 3 $\frac{1}{2}$  inches; and its reinforced ring is 4 $\frac{1}{2}$  inches thick. Its chamber has 9 inches 7 lines of diameter at its greatest width: the higher part thereof has 6 inches of diameter, and 4 inches in height; and its lower part 2 $\frac{1}{2}$  inches. The thickness of the metal round the chamber is of 26 inches 9 lines. The tourillons have, from one end to the other, 8 inches of diameter. The mortar has in height 3 feet 5 inches 4 lines. It throws a bomb of 11 inches 8 lines diameter, which is 1 inch 4 lines thick every where, except at its cullet, which has 1 inch 8 lines. The aperture of its touch-hole is 16 lines inside and outside. The bomb contains 15 pounds of powder, and weighs 130 pounds, or thereabout.

The bore or chase of the concave mortar, whose chamber contains 12 pounds of powder, has 12 inches 6 lines of diameter, and 17 inches 6 lines in length. Its thickness between the bourelet and its reinforced ring, is of 2 $\frac{1}{2}$  inches. Its reinforced ring is 3 inches thick. Its chamber has of diameter, at its greatest width, 9 inches 6 lines. The portion of that chamber a-top has 5 inches 4 lines of diameter, and 2 inches at bottom. The thick-

ends of the metal round the chamber is 6 inches. The tourillons are, from one end to the other, 30 inches long, and 7 inches of diameter; and the mortar is in all 3 foot 2 inches high.

It throws a bomb 11 inches 8 lines of diameter, which is 1 inch 4 lines thick every where, except at its cullot, which has 1 inch 8 lines.

The aperture of its touch-hole outside and inside, is 16 lines.

The bomb contains 15 pounds of powder, and weighs 130.

The mortar, which has a concave chamber containing 8 pounds of powder, must throw a bomb of 11 inches 8 lines. Its diameter is of  $12\frac{1}{2}$  inches; its bore 18 inches long; its thickness at the chase  $2\frac{1}{2}$  inches; its reinforced ring 6 inches long, and 3 inches thick; its concave chamber 8 inches 8 lines long, and 7 inches in diameter; the thickness of the metal round it 5 inches; its tourillons 3 inches long from one end to the other, and 7 inches in diameter. The concave chamber contains 8 pounds of powder, and throws a bomb as above.

The ordinary mortar, which throws a bomb of 11 inches 8 lines, has a bore of 12 inches diameter, and 18 long; its thickness at the neck 2 inches; at its reinforced ring  $2\frac{1}{2}$  inches; its chamber  $9\frac{1}{2}$  inches in length, its diameter of  $5\frac{1}{2}$  inches, the thickness of the metal round the chamber 7 inches, which chamber contains 6 pounds of powder; the tourillons have in length, from one end to the other, 28 inches, and 8 inches of diameter.

The mortar, which throws a bomb of 8 inches, has the bore 12 inches long, and 8 inches 4 lines in diameter; its thickness 1 inch 4 lines at the chase; its reinforced rings 4 inches 8 lines long, and 1 inch 8 lines thick; its chamber 6 inches long, and 2 inches 8 lines of diameter; its tourillons 18 inches 8 lines in length, and 4 inches 8 lines of diameter. The bomb of 8 inches of diameter is 10 lines thick every where, except at the cullot, which is 13, and its touch-hole 1 inch of diameter inside and outside. The chamber contains 4 pounds of powder, and the bomb weighs 40 pounds.

The bore of the mortar, which is to throw a bomb of 6 inches, is of  $6\frac{1}{2}$  inches of diameter, and 9 inches long; its thickness at the chase 1 inch; its reinforced ring  $1\frac{1}{2}$  inch thick, and  $3\frac{1}{2}$  inches long; its chamber  $4\frac{1}{2}$  inches long, and 2 inches of diameter; the thickness of the metal 2 inches, and from the bottom of the chamber to behind the recoil of the mortar 4 inches thick.

Common mortars are very good for the bombardment of a place, when they can be carried near the place; throwing the bomb to 45 degrees of elevation, and to 700 fathoms distance: the chamber is charged with 5 or 6 pounds of powder, which is the greatest charge, and carries farther: the nearer a place a mortar is mounted, the less powder is wanted for its charge. The mortars, with a concave chamber of the same diameter, *i. e.* of 12 and  $12\frac{1}{2}$  inches, pointed at 45 degrees, are proper to bombard places afar off; they carry their bombs from 1200 to 1800 fathoms. Those whose chamber contains 8 pounds of powder, throw the bomb to 1200 fathoms, and weigh 2000 lb. Those of 12 pounds of powder will

carry their bombs to 1400 fathoms, and weigh 2500 lb. Those of 18 pounds of powder will carry to 1800 fathoms, and weigh 5000 lb.

The carriage for a mortar of 12 inches of diameter must be 6 foot long, the flasks 12 inches long and 10 thick. The trunnions are placed in the middle of the carriage.

The carriage of 18 must be 4-foot long; and the flasks 11 inches high, and 6 thick.

To mount the mortars of new invention, they use carriages of cast iron.

In Germany, to mount mortars from 8 to 9 inches, and carry them into the field, and execute them horizontally as a piece of cannon, they make use of a piece of wood 8 feet 2 inches long, with a hole in the middle to lodge the body of the mortar and its trunnions as far as their half diameter, and mounted on two wheels four feet high, to which they join a vantrain proportioned to it, and made like those which serve to the carriages of cannons.

Having mounted the mortar on its carriage, the next thing is to caliber the bomb, by means of a great caliber, the two branches whereof embrace the whole circumference of the bomb: these two branches are brought on a rule where the different calibers are marked, among which that of the bomb is found.

A bomb is a hollow iron ball, or shell, filled with gun-powder, and furnished with a vent for a fusée or wooden tube filled with combustible matter to be thrown out from a mortar. The method of preparing a bomb is as follows: A hollow iron globe is cast pretty thick, having a round aperture by which it may be filled and lighted; and circular ansæ for the commodiously putting it into the mortar. To prove whether it be staunch, after heating it red hot on the coals, it is exposed to the air so as it may cool gently; for, since fire dilates iron, if there be any hidden chinks or perforations, they will thus be opened and enlarged, and the rather because of the spring of the included air continually acting from within. This done, the cavity of the globe is filled with hot water, and the aperture well stopped, and the outer surface washed with cold water and soap; so that if there be the smallest leak, the air, rarified by the heat, will now perspire and form bubbles on the surface.

If no defect be found in the bomb, its cavity is filled, by means of a funnel, with whole gun-powder; a little space or liberty is left, that when a fusée or wooden tube, of the figure of a truncated cone, is driven through the aperture, (with a wooden mallet, not an iron one, for fear of accident), and fastened with a cement made of quick-lime, ashes, brick-duft, and steel filings worked together in a glutinous water, or of four parts of pitch, two of colophony, one of turpentine, and one of wax; the powder may not be bruised. This tube is filled with a combustible matter, made of two ounces of nitre, one of sulphur, and three of gun-powder-duft well rammed.

This fusée set on fire, burns slowly till it reaches the gun powder, which goes off at once, bursting the shell to pieces with incredible violence. Special care, however, must be taken, that the fusée be so proportioned, as that

that the gun-powder do not take fire ere the shell arrives at the destined place; to prevent which, the fusee is frequently wound round with a wet clammy thread.

The mortar mounted on its carriage, and the bomb ready, let us place our piece in battery, which battery must consist,—1. Of an epaulment to shelter the mortars from the fire of the enemy. 2. Of platforms on which the mortars are placed. 3. Of small magazines of powder. 4. Of a boyau which leads to the great magazine. 5. Of ways which lead from the battery to the magazine of bomba. 6. Of a great ditch before the epaulment. 7. Of a berm or retraite.

The platforms for mortars of 12 inches must have 9 feet in length, and 6 in breadth.—The lambourds for common mortars must be four inches thick; those of a concave chamber of 8 lb. of powder, 5 inches; those of 12 lb. 6 inches; those of 18 lb. 7 inches, or thereabouts. Their length is at discretion, provided there be enough to make the platforms 9 feet long.—The fore-part of the platform will be situated at two foot distance from the epaulment of the battery.—The bombardiers, to shelter themselves in their battery, and not be seen from the town besieged, raised an epaulment of 7 foot or more high; which epaulment has no embrasures.

To serve expeditiously a mortar in battery are required,—five strong handspikes; a dame or rammer, of the caliber of the conic chamber, to ram the wad and the earth; a wooden knife a foot long, to place the earth round the bomb; an iron scraper two foot long, one end whereof must be 4 inches broad and roundwise, to clean the bore and the chamber of the mortar; and the other end made in form of a spoon to clean the little chamber; a kind of brancard to carry the bomb, a shovel, and pick ax.

The officer who is to mind the service of the mortar must have a quadrant to give the degrees of elevation.

Five bombardiers, or others, are employed in that service; the first must take care to fetch the powder to charge the chamber of the mortar, putting his priming-iron in the touch-hole before he charges the chamber; and never going to fetch the powder before he has asked his officer at what quantity of powder he designs to charge, because more or less powder is wanted, according to the distance where it is fired; the same will take care to ram the wad and earth, which another soldier shall put in the chamber.

That on the right will put again two shovels full of earth in the bottom of the bore, which should be likewise very well rammed down.

This done, the rammer or dame is returned into its place, against the epaulment on the right of the mortar: he takes an handspike in the same place to post himself behind the carriage of the mortar, in order to help to push it into battery: having laid down his handspike, he takes out his priming-iron, and primes the touch-hole with fine powder.

The second soldier on the right and left, will have by that time brought the bomb ready loaded, to be placed

in the mortar, which must be received in the mortar by the first soldier, and placed very strait in the bore or chafe of the mortar.

The first, on the right, shall furnish him with earth to put round the bomb, which he must take care to ram close with the knife given him by the second on the left.

This done, each shall take a handspike, which the two first, on the right and left, shall put under the pegs of retreat of the fore part, and the two behind under those of the hind-part; and they together shall push the mortar in battery.

Afterwards the officer shall point or direct the mortar.

During that time the first soldier shall take care to prime the touch hole of the mortar, without ramming the powder; and the last on the right, shall have the match ready to set fire on the fusee of the bomb on the right, while the first shall be ready with his on the left, to set fire to the touch-hole of the mortar; which he ought not to do till he sees the fusee well lighted.

The foremost soldiers will have their handspikes ready to raise the mortar upright, as soon as it has discharged; while the hindmost on the left shall, with the scraper, clean the bore and chamber of the mortar.

The magazine of powder for the service of the battery, shall be situated 15 or 20 paces behind, and covered with boards, and earth over it.—The loaded bombs are on the side of the said magazine, at five or six paces distance.

The officer who commands the service of the mortar, must take care to discover, as much as possible, with the eye, the distance of the place where he intends to throw his bomb, giving the mortar the degrees of elevation, according to the judgment he has formed of the distance. Having thrown the first bomb, he must diminish or increase the degrees of elevation, according to the place upon which it shall fall. Several make use of tables to discover the different distances according to the differences of the elevations of the mortar, especially the degrees of the quadrant from 1 to 45.

M. Blondel has wrote a large treatise on that subject, where he pretends to give a demonstration to throw bombs with great exactness.

They say then, (says M Blondel, speaking of bombardiers), that the mortar chafes more or less, according as it is more or less charged with powder; and that a mortar, for example, of 12 inches caliber, charged in its chamber with 2 lb. of powder, gives every degree 48 feet difference in the random, and for the greatest extent under the elevation of 45 degrees, 2160 feet.

The same mortar will give every degree 50 foot difference, if it be charged with  $2\frac{1}{2}$  of the same goodness, and 2700 foot for the greatest random.

Lastly, it will give 72 foot difference every degree, if the charge be of 3 lb. of the same powder; and at the elevation of 45 degrees, which, they say, is the greatest random, it will throw the bomb at the distance of 3240 feet.

On this foundation they have made the following tables.

TABLES

## TABLES for Mortars of 12 inches of Caliber.

## TABLES for Mortars of 8 inches Caliber.

First Table at two pounds of powder.

Degrees	Randoms	Degrees	Randoms
5	240 Feet	28	1344 Feet
10	480	29	1392
11	528	30	1440

40	3280		

Granadoes are charged like the bombs, and are very much like them, except that they have no *ansa*.

A granado is a hollow ball, or shell of iron, brass, or even glass, or potters earth, filled with gun powder, and fitted with a fusee to give it fire. (*ibid.*)

Of these there are two kinds; the one large for ditches, or fosses, called sometimes bombs, whose caliber is the same with that of the bullets of 33 lb. and which weigh 16 lb. of 24, and which weigh 12 lb. of 16, which weigh 8 lb.

These granadoes are rolled from the ramparts, or other works, into the ditch, or on a breach, and do much execution.

The other are hand-granadoes, of the bigness or caliber of a bullet of 4 lb. and weigh only 2 lb. containing 4 or 5 ounces of powder, or thereabout.

These serve to throw with the hand into the trenches, or retrenchments, in the middle of a troop or company, and they infallibly lame or kill.

Care is taken, as much as possible, that they be well emptied, shaved, and of brittle iron. Their aperture or orifice must have six lines, or thereabout.

Small lanterns or ladles of copper, and small rammers, are used to charge the granadoes.

As to the proportions of granadoes, those of the caliber of

of a bullet of 33, have 6 inches of diameter, and something more; they are 8 lines thick, and weigh 16 lb.

Those of the caliber of 24 have 5 inches 5 lines diameter, are 6 lines thick, and weigh 12 lb.

Those of the caliber of 16 have 4 inches 9 lines of diameter, are 5 lines thick, and weigh 8 lb.

Those which weigh 6 lb. have 3 inches 5 lines diameter, and 5 lines in thickness.

Those of 5 lb. weight have 3 inches 2½ lines diameter, and 5 lines in thickness.

Those which weigh 3 lb. have 2 inches 8 lines diameter, and are 4½ lines thick.

Those of 2 lb. weight, have 2 inches 4 lines diameter, and 4 lines in thickness.

Those of 1 lb. weight have 1 inch 10 lines diameter, and are 3 lines thick.

Those of ½ have 1 inch 8 lines diameter, and are 3 lines thick.

Those of ¼ have 1 inch 6 lines diameter, and are 3 lines thick.

Those of a ⅓ have 1 inch 2 lines diameter, and are 2½ lines thick.

All these granadoes must be thicker at bottom than any where else.

These different sorts of granadoes have also different sorts of fuses.

Those of the caliber of 33 24 16 12 8 4  
are at the biggest end, of 12 lin. 11 10½ 10 9½ 8½

The diameter of the }  
orifices, } 4 4 3 3 3 2

The fuses are in }  
length, in all, of } 5½ inch. 5 4 4 3½ 2½

And as the large granadoes, which are made to throw into the fosses, or ditches, or with small mortars, they must have fuses of different lengths; these are for small mortars; those for ditches must be shorter.

The Germans cover over the fusee with paper or parchment, tied with a thread round the fusee.

In France they use a composition of black pitch, mixed with a little tallow, with which they rub over the fusee, when fixed to the granado.

The fusee must burn so long, and no longer, as is the time of the motion of the bomb or granado, from the mouth of the mortar, &c. to the place where it is to fall, which time is about 27 seconds; so that the fusee must be contrived, either from the nature of the composition, or the length of the pipe which contains it, to burn just that time.

At Paris they charge the fusees for the bombs and granadoes with a composition made with powder-dust and charcoal, very well pounded, and sifted very fine, putting two ounces of charcoal on each pound of powder, and make several proofs, to know if the composition be not too quick.

There are several other compositions to charge the fusees for bombs or granadoes.

The first is of 4 lb. of powder, 2 lb. of saltpetre, and 1 lb. of sulphur.

The second is of 5 lb. of powder, 2 lb. of saltpetre, and 1 pound of sulphur.

VOL. II. No. 58.

2

The third, which is the best, is of 3 lb. of powder, 2 lb. of saltpetre, and 1 lb. of sulphur.

The fourth is of 3 lb. of powder, 2 lb. of saltpetre, and ½ lb. of sulphur.

The fusees must be charged even, *i. e.* they must burn without spitting.

The fusee of the hand-granado, which is of the caliber of 4, must be 2 inches 2 lines long, 9 lines of diameter, and 6 lines at the small end: the orifice of the fusee 2½ lines.

As soon as the fusee is placed to the granado, the head thereof must be sauced in melted pitch, and afterwards dipped in water, which hinders the composition from spoiling, and the wood from rotting.

The PETARD. (*ibid.*) is the next piece of artillery which deserves our attention, and is a kind of engine of metal, somewhat in shape of a high-crowned hat, serving to break down gates, barricades, draw-bridges, or the like works; which are intended to be surprized. It is very short, narrow at the breach, and wide at the muzzle, made of copper mixed with a little brass, or of lead with tin.

The petards are not always of the same height and bigness: they are commonly 10 inches high, 7 inches of diameter at-top, and 10 inches at bottom. They weigh commonly 40, 45, and 50 pounds.

The madrier, on which the petard is placed, and where it is tied with iron circles, is of two feet for its greatest width, and of 18 inches on the sides, and no thicker than a common madrier. Under the madrier are two iron bars passed cross-ways, with a hook, which serves to fix the petard.

To charge a petard 15 inches high, and 6 or 7 inches of caliber or diameter at the bore, the inside must be first very well cleaned and heated, so that the hand may bear the heat; then take the best powder that may be found, throw over it some spirit of wine, and expose it to the sun, or put it in a frying-pan; and when it is well dried, 5 or 6 lb. of this powder is put into the petard, which reaches within three fingers of the mouth: the vacancies are filled with tow, and stopped with a wooden tampion; the mouth being strongly bound up with cloth tied very tight with ropes; then it is fixed on the madrier, that has a cavity cut in it to receive the mouth of the petard, and fastened down with ropes.

Some, instead of gun powder for the charge, use one of the following compositions, *viz.* gun-powder seven pounds, mercury sublimate one ounce, camphor eight ounces; or gun-powder six pounds, mercury sublimate three ounces, and sulphur three; or gun-powder six, beaten glass ½ an ounce, and camphor ½.

Before any of these pieces are appropriated for service, it is necessary they have each undergo a particular trial of its soundness, which is called a proof, to be made by or before one authorized for the purpose, called the *proof-master*.

To make a proof of the piece, a proper place is chosen, which is to be terminated by a mount of earth very thick to receive the bullets fired against it, that none of them may run through it. The piece is laid on the ground, supported

†

8 F

supported

supported only in the middle by a block of wood. It is fired three times : the first with powder of the weight of the bullet, and the two others with  $\frac{1}{2}$  of the weight ; after which a little more powder is put in to finge the piece ; and after this water, which is impressed with a sponge, putting the finger on the touch-hole, to discover if there be any cracks ; which done, they are examined with the cat, which is a piece of iron with three grasps, disposed in the form of a triangle, and of the caliber of the piece ; then it is visited with a wax candle, but it is of very little service in the small pieces, because if they be a little long, the smoke extinguishes it immediately.

The proof of mortars is made in this manner : Where there are carriages of cast iron, the mortar is placed on one of those carriages. Under that carriage is made a platform of madriers 5 or 6 inches thick ; the mortar is charged with the best powder, and with as much of it as its chamber can contain, observing to leave no vacuity at the neck of the mortar, but what is necessary to put a little wad over the powder, and which is rammed with the end of an handspike, to keep the powder together as much as possible. A large green turf, with earth two fingers deep, is put over the wad, which must have width enough to fill up the bottom of the mortar. This turf and earth are very well rammed down, then the bomb is placed over it as upright as possible, leaving a small place round it, which is to be filled with clay as tight as possible, pressing it between the mortar and the bomb with a pointed stick ; and as it is not necessary to spend much powder in these sort of proofs, the bomb must be filled with as much earth as it would contain powder.

For want of carriages of cast iron, holes are dug in the earth where the mortars are buried as far as the touch-hole ; and in order that the mortars thus buried may find more resistance, and make a greater effort, large pieces of wood in form of joists are put under the mortar, chusing always the hardest ground, to resist better the recoil of the mortar.

A fusée for granadoes is put on the touch-hole of each mortar, that the gunner may have time to retire, in case the mortar was to burst in the proof ; which is also practised in the proof of the pieces.

This proof is made three times, without increasing or diminishing any thing.

Besides the large pieces mentioned throughout this treatise, invented for the destruction of mankind, there are others called small guns, viz. muskets of ramparts, common muskets, fusils, carabines, musketoons, and pistols.

A musket, or musquet, is a fire-arm borne on the shoulder, and used in war, formerly fired by the application of a lighted match, but at present with a flint and lock.

The common muskets are of the caliber of 20 leaden balls to the pound, and receive balls from 22 to 24 : its length is fixed to 3 feet 8 inches from the muzzle to the touch-pan.

A fusil, or fire-lock, has the same length and caliber ; and serves at present instead of a musket.

A carabine is a small sort of fire-arm, shorter than a fusil, and carrying a ball of 24 in the pound, borne by the light horse, hanging at a belt over the left shoulder.

The carabine is a kind of medium between the pistol and the musket ; and bears a near affinity to the arquebuss, only that its bore is smaller. It was formerly made with a match-lock, but of late only with a flint-lock.

The musketoon is of the same length of the carabine, the barrel polished, and clean within.

The musketoon carries five ounces of iron, or seven and a half of lead, with an equal quantity of powder.

The barrel of a pistol is generally 14 inches long.

As to the invention of cannon and gun powder, we are certain that they are discoveries of a modern date : but there is no depending upon the various accounts given of them by authors. All that can be said with certainty is, that there is mention made of gun-powder in the register of the chamber of accounts in France, in the year of Christ 1338 ; that Alphonse XI. king of Castile, besieged the Moors with iron mortars, in the year of Christ 1343 ; and that our King Edward, in 1346, first carried those thundering machines of war and death into France, where he availed himself of five or six pieces of cannon at the battle of Cressy.

Before the invention of these instruments of war, the ancients made use of the aries, or battering-ram, the catapultæ, the ballista, scorpion, and testudo. See *RAM, &c.*

For the mathematical principles of Gunnery, see *PROJECTILES.*

**GUN-POWDER**, a composition of saltpetre, sulphur, and charcoal, mixed together, and usually granulated ; which easily takes fire, and, when fired, rarifies, or expands, with great vehemence, by means of its elastic force.

It is to this powder we owe all the action and effect of guns, ordnance, &c. so that the modern military art, fortification, &c. in a great measure depend thereon.

*Method of making GUN POWDER.* Dr Shaw's recipe for this purpose is as follows. Take four ounces of refined saltpetre, an ounce of brimstone, and six drams of small coal : reduce these to a fine powder, and continue beating them for some time in a stone mortar, with a wooden pestle, wetting the mixture between whiles with water, so as to form the whole into an uniform paste, which is reduced to grains, by passing it through a wire sieve fit for the purpose ; and in this form being carefully dried, it becomes the common gun-powder.

For greater quantities, mills are usually provided, by means of which more work may be performed in one day, than a man can do in a hundred.

The nitre or saltpetre is refined thus : dissolve four pounds of rough nitre as it comes to us from the Indies, by boiling it in as much water as will commodiously suffice for that purpose : then let it shoot for two or three days in a covered vessel of earth, with sticks laid across for the crystals to adhere to. These crystals being taken out, are drained and dried in the open air.

In order to reduce this salt to powder, they dissolve

a large quantity of it in as small a proportion of water as possible; then keep it constantly stirring over the fire, till the water exhales, and a white dry powder is left behind.

In order to purify the brimstone employed, they dissolve it with a very gentle heat; then scum and pass it through a double strainer. If the brimstone should happen to take fire in the melting, they have an iron cover that fits on close to the melting vessel, and damps the flame. The brimstone is judged to be sufficiently refined if it melts, without yielding any fetid odour, between two hot iron plates, into a kind of red substance.

The coal for the making of gun powder is either that of willow, or hazel, well charred in the usual manner, and reduced to powder. And thus the ingredients are prepared for making this commodity: but as these ingredients require to be intimately mixed, and as there would be danger of their firing if beat in a dry form, the method is to keep them continually moist, either with water, urine, or a solution of sal ammoniac: they continue thus stamping them together for twenty four hours, after which the mass is fit for corning and drying in the sun, or otherwise, so as sedulously to prevent its firing.

*Rationale of GUN-POWDER.* The explosive force of gun-powder is now a thing commonly known, but the physical reason thereof may not perhaps be hitherto sufficiently understood. In order to explain it, Dr Shaw proposes the following observations: 1. That saltpetre of itself is not inflammable; and though it melts in the fire, and grows red hot, yet does not explode, unless it comes in contact with the coals. 2. That brimstone easily melts at the fire, and easily catches flame. 3. That powdered charcoal readily takes fire, even from the sparks yielded by a flint and steel. 4. That if nitre be mixed with powdered charcoal, and brought in contact with the fire, it burns and flames. 5. That if sulphur be mixed with powdered charcoal, and applied to the fire, part of the sulphur burns slowly away, but not much of the charcoal; and, 6. That if a lighted coal be applied to a mixture of nitre and sulphur, the sulphur presently takes fire with some degree of explosion; leaving part of the nitre behind, as we see in making the sal prunellæ, and sal polychrestum.

These experiments duly considered, adds the doctor, may give us the chemical cause of the strange explosive force of gun-powder. For each grain of this powder consisting of a certain proportion of sulphur, nitre, and coal, the coal presently takes fire, upon contact of the smallest spark: at which time both the sulphur and the nitre immediately melt, and by means of the coal interposed between them, burst into flame; which, spreading from grain to grain, propagates the same effect almost instantaneously: whence the whole mass of powder comes to be fired: and as nitre contains both a large proportion of air and water, which are now violently rarified by the heat, a kind of fiery explosive blast is thus produced. wherein the nitre seems, by its aqueous and aerial parts, to act as bellows to the other inflammable bodies, sulphur and coal, to blow them

into a flame, and carry off their whole substance in smoke and vapour.

*Different kinds of GUN-POWDER.* The three ingredients of gun-powder are mixed in various proportions according as the powder is intended for muskets, great guns, or mortars; though these proportions seem not to be perfectly adjusted or settled by competent experience.

Semienowitz, for mortars, directs an hundred pounds of saltpetre, twenty-five of sulphur, and as many of charcoal; for great guns, an hundred pounds of saltpetre, fifteen pound of sulphur, and eighteen pound of charcoal; for muskets and pistols, an hundred pound of saltpetre, eight pound of sulphur, and ten pound of charcoal. Miethius extols the proportion of one pound of saltpetre to three ounces of charcoal, and two, or two and a quarter of sulphur; than which, he affirms, no gun-powder can possibly be stronger. He adds, that the usual practice of making the gun-powder weaker for mortars than guns, is without any foundation, and renders the expence needlessly much greater: for whereas to load a large mortar, twenty-four pound of common powder is required, and consequently, to load it ten times, two hundred and forty pound, he shews, by calculation, that the same effect would be had by one hundred and fifty pound of the strong powder.

To increase the strength of powder, Dr Shaw thinks it proper to make the grains considerably large, and to have it well sifted from the small dust. We see that gun-powder, reduced to dust, has little explosive force; but when the grains are large, the flame of one grain has a ready passage to another, so that the whole parcel may thus take fire nearly at the same time, otherwise much force may be lost, or many of the grains go away as shot unfired.

It should also seem that there are other ways of increasing the strength of powder, particularly by the mixture of salt of tartar; but perhaps, adds the last-mentioned author, it were improper to divulge any thing of this kind, as gun-powder seems already sufficiently destructive.

*Method of trying and examining GUN-POWDER.* There are two general methods of examining gun-powder; one with regard to its purity, the other with regard to its strength. Its purity is known by laying two or three little heaps near each other upon white paper, and firing one of them: for if this takes fire readily, and the smoke rises upright, without leaving any dross or sculent matter behind, and without burning the paper, or firing the other heaps, it is esteemed a sign that the sulphur and nitre were well purified, that the coal was good, and that the three ingredients were thoroughly incorporated together: but if the other heaps also take fire at the same time, it is presumed, that either common salt was mixed with the nitre, or that the coal was not well ground, or the whole mass not well beat, and mixed together; and if either the nitre or sulphur be not well purified, the paper will be black or spotted.

In order to try the strength of gun-powder, there are two kinds of instruments in use; but neither of them

them appear more exact than the common method of trying to what distance a certain weight of powder will throw a ball from a musket.

There has been much talk of a white powder, which, if it answered the character given it, might be a dangerous composition; for they pretend that this white powder will throw a ball as far as the black, yet without making a report; but none of the white powder we have seen, says Dr Shaw, answers to this character; being, as we apprehend, commonly made either with touchwood or camphor, instead of coal.

*Observations on the force of GUN-POWDER.* Gun-powder, fired either in vacuum, or in air, produces, by its explosion, a permanent elastic fluid. For if a red-hot iron be included in a receiver, after being exhausted, and gun powder be let fall on the iron, the powder will take fire, and the mercurial gage will suddenly descend upon the explosion; and though it immediately ascends again, yet it will never rise to the height it first stood at, but will continue depressed by a space proportioned to the quantity of gun powder which was let fall on the iron.

The same production likewise takes place, when gun powder is fired in the air: for if a small quantity of powder be placed in the upper part of a glass tube, and the lower part of the tube be immersed in water, and the water be made to rise so near the top, that only a small portion of air is left in that part where the gun-powder is placed; if in this situation the communication of the upper part of the tube with the external air be closed, and the powder be fired, which will easily be done by a burning-glass, the water will in this experiment descend upon the explosion as the quicksilver did in the last; and will always continue depressed below the place at which it stood before the explosion; and the quantity of this depression will be greater, if the quantity of powder be increased, or the diameter of the tube be diminished. From whence it is proved, that as well in air as in a vacuum, the explosion of fired powder produces a permanent elastic fluid. It also appears from experiment, that the elasticity or pressure of the fluid produced by the firing of gun powder, is *ceteris paribus*, directly as its density. This follows from hence, that if in the same receiver a double quantity of powder be let fall, the mercury will subside twice as much as in the firing of a single quantity.

To determine the elasticity and quantity of this elastic fluid, produced from the explosion of a given quantity of gun powder, Mr Robins premises, that the elasticity of this fluid increases by heat, and diminishes by cold, in the same manner as that of the air; and that the density of this fluid, and consequently its weight, is the same with the weight of an equal bulk of air having the same elasticity, and the same temperature.

From these principles, and from his experiments, (for a detail of which we must refer the reader to his *New Principles of Gunnery*, in Scholium to prop. II.) he concludes, that the fluid produced by the firing of gun-powder will be  $\frac{1}{20}$  of the weight of the gun pow-

der, and the ratio of the respective bulks of the powder, and the fluid produced from it, will be in round numbers 1 to 244.

Hence we are certain, that any quantity of powder fired in any confined space, which it adequately fills, exerts, at the instant of its explosion, against the sides of the vessels containing it, and the bodies it impels before it, a force at least 244 times greater than the elasticity of common air; or, which is the same thing, than the pressure of the atmosphere; and this without considering the great addition which this force will receive from the violent degree of heat with which it is endued at that time, the quantity of which augmentation is the next head of Mr Robins's enquiry. He determines that the elasticity of the air is augmented when heated to the extremest heat of red hot iron, in the proportion of 796 to 1947; and supposing that the flame of fired gun-powder is not less hot than red hot iron, and the elasticity of the air, and consequently of the fluid, generated by the explosion, being augmented by the extremity of this heat in the ratio of 796 to 1947, it follows, that if 244 be augmented in this ratio, the resulting number, which is 9997, will determine how many times the elasticity of the flame of fired powder exceeds the elasticity of common air, supposing it to be confined in the same space which the powder filled before it was fired.

Hence then, the absolute quantity of the pressure exerted by gun-powder at the moment of its explosion may be assigned: for since the fluid then generated has an elasticity of 9997, or, in round numbers, 1000 times greater than common air; and since common air, by its elasticity, exerts a pressure on any given surface equal to the weight of the incumbent atmosphere with which it is in *equilibrium*, the pressure exerted by fired powder, before it has dilated itself, is 1000 times greater than the pressure of the atmosphere; and consequently the quantity of this force on a surface of an inch square amounts to above six tun weight, which force however diminishes as the fluid dilates itself. The variations of the density of the atmosphere does not any way alter the action of powder by any experiment that can be made. But the moisture of the air has a very great influence on the force of it: for that quantity which in a dry season would communicate to a bullet a velocity of 1700 feet in one second, will not in damp weather communicate a velocity of more than 12 or 1300 feet in a second, or even less, if the powder be bad and negligently kept.

The velocity of expansion of the flame of gun-powder, when fired in a piece of artillery, without either bullet, or any other body before it, is prodigious. By the experiments of Mr Robins, it seems this velocity cannot be much less than 7000 feet in a second. This, however, must be understood of the most active part of the flame. For, as was observed before, the elastic fluid, in which the activity of gun-powder consists, is only  $\frac{1}{20}$  of the substance of the powder, the remaining  $\frac{19}{20}$  will in the explosion be mixed with the elastic part, and will by its weight retard

tard the activity of the explosion; and yet they will be so completely united, as to move with uncommon motion; but the unelastic part will be less accelerated than the rest, and some of it will not even be carried out of the barrel, as appears by the considerable quantity of unctuous matter, which adheres to the inside of all fire-arms, after they have been used. These inequalities in the expansive motion of the flame render it impracticable to determine its velocity, otherwise than from experiments.

**To recover damaged GUN POWDER.** The method of the powder-merchants is, to put part of the powder on a sail-cloth, to which they add an equal weight of what is really good; and with a shovel mingle it well together, dry it in the sun, and barrel it up, keeping it in a dry and proper place. Others again, if it be very bad, restore it by moistening it with vinegar, water, urine, or brandy: then they beat it fine, scarce it, and to every pound of powder add an ounce, an ounce and a half, or two ounces, according as it is decayed, of melted salt-petre. Afterwards, these ingredients are to be moistened and mixed well, so that nothing can be discerned in the composition, which may be known by cutting the mass; and then they granulate it as aforesaid. In case the powder be in a manner quite spoiled, the only way is to extract the salt-petre with water, according to the usual manner, by boiling, filtrating, evaporating, and crystallizing; and then with fresh sulphur and charcoal to make it up a-new again. In regard to the medical virtues of gun-powder, Boerhaave informs us, that the flame of it affords a very healthy fume in the height of the plague: because the explosive acid vapour of nitre and sulphur corrects the air; and that the same vapour, if received in a small close pent up place, kills insects.

It is enacted by 5 and 11 of Geo. I. and 5 Geo. II. c. 20. that gun-powder be carried to any place in a covered carriage; the barrels being close jointed; or in cases and bags of leather, &c. And persons keeping more than 200 pounds weight of gun-powder at one time, within the cities of London and Westminster, or the suburbs, &c. are liable to forfeitures if it be not removed; and justices of peace may issue warrants to search for, seize, and remove the same.

The invention of gun-powder is ascribed by Polydore Virgil to a chemist, who having accidentally put some of the ingredients in this composition in a mortar, and covered it over with a stone, it happened to take fire, and blew up the stone. Thuret says, the person here spoken of was a monk of Friburg, named Constantine Anlzen; but Belleforet and others hold it to be Bartholdus Schwartz, or the black; at least it is affirmed, that he first taught the use of it to the Venetians, in the year 1380, during the war with the Genoese. But what contradicts this account, and shews gun-powder to be of an older date, is, that Peter Mexia, in his *Varix Lectiones*, relates, that Alphonsus XI king of Castile, used mortars against the Moors in a siege in 1343. Durance adds, that there is mention made of this powder in the registers of the chambers of accounts in France, as early as the year

1338; and frier Bacon, our countryman, mentions the composition in express terms, in his treatise *De nullitate magix*, published at Oxford, in the year 1216.

**GUN-SHOT-WOUNDS.** See **SURGERY.**

**GUNTSBERG**, a town of Germany in the circle of Swabia, situated on the east side of the Danube: E. long.  $10^{\circ} 15'$ . N. lat.  $48^{\circ} 35'$ .

**GUNTER'S LINE**, a logarithmic line, usually graduated upon scales, sectors, &c.

It is also called the line of lines, and line of numbers; being only the logarithms graduated upon a ruler, which therefore serves to solve problems instrumentally in the same manner as logarithms do arithmetically. It is usually divided into an hundred parts, every tenth whereof is numbered, beginning with 1, and ending with 10; so that, if the first great division, marked 1, stand for one tenth of any integer, the next division, marked 2, will stand for two tenths; 3, three tenths, and so on; and the intermediate divisions will, in like manner, represent 100th parts of the same integer. If each of the great divisions represent 10 integers, then will the lesser divisions stand for integers; and if the greater divisions be supposed each 100, the subdivisions will be each 10.

**Use of GUNTER'S LINE.** 1. *To find the product of two numbers.* From 1 extend the compasses to the multiplier; and the same extent, applied the same way from the multiplicand, will reach to the product. Thus if the product of 4 and 8 be required, extend the compasses from 1 to 4, and that extent laid from 8 the same way, will reach to 32, their product. 2. *To divide one number by another.* The extent from the divisor to unity, will reach from the dividend to the quotient: thus, to divide 36 by 4, extend the compasses from 4 to 1, and the same extent will reach from 36 to 9, the quotient sought. 3. *To three given numbers, to find a fourth proportional.* Suppose the numbers 6, 8, 9; extend the compasses from 6 to 8, and this extent, laid from 9 the same way, will reach to 12, the fourth proportional required. 4. *To find a mean proportional between any two given numbers.* Suppose 8 and 32; extend the compasses from 8, in the left hand part of the line, to 32 in the right; then bisecting this distance, its half will reach from 8 forward, or from 32 backward, to 16, the mean proportional sought. 5. *To extract the square root of any number.* Suppose 25; bisect the distance between 1 on the scale and the point representing 25; then the half of this distance, set off from 1, will give the point representing the root 5. In the same manner, the cube root, or that of any higher power, may be found by dividing the distance on the line, between 1 and the given number, into as many equal parts as the index of the power expresses; then one of those parts, set from 1, will find the point representing the root required.

**GUNTER'S QUADRANT.** one made of wood, brass, &c. containing a kind of stereographic projection of the sphere, on the plane of the equinoctial; the eye being supposed placed in one of the poles.

**GUNTER'S SCALE**, called by navigators simply the *gunter*, is a large plain scale, generally two foot long, and about an inch and a half broad, with artificial lines delineated on it, of great use in solving questions in trigonometry, navigation, &c.

**GUN-WALE**, or **GUNNEL**, is the uppermost wale of a ship, or that piece of timber which reaches on either side from the quarter-deck to the fore-castle, being the uppermost bend which finishes the upper works of the hull, in that part in which are put the stanchions which support the wale-trees.

**GURIEL**, a subdivision of Georgia in Asia, situated on the eastern coast of the Euxine sea.

**GURK**, a city of Carinthia, in Germany: E. long. 14°, N. lat. 47° 20'.

**GURNARD**, in ichthyology. See **TRIGLA**.

**GUSSET**, in heraldry, is formed by a line drawn from the dexter or sinister chief points, and falling down perpendicularly to the extreme base. See Plate XCVII. fig. 8.

The gusset is an abatement of honour, denoting an effeminate person.

**GUSTROW**, a town of Germany, in the dutchy of Mecklenburg: E. long. 12° 15', N. lat. 54°.

**GUTS**. See **ANATOMY**, p. 257.

**GUTSKROW**, a city of Germany in the circle of Upper Saxony, and province of Swedish Pomerania: E. long. 13° 40', N. lat. 54°.

**GUTTÆ**, in architecture, are ornaments in the form of little cones, used in the plafond of the Doric cornice, or on the architrave underneath the triglyphs, representing a sort of drops or bells. See **ARCHITECTURE**.

**GUTTA SERENA**, a disease in which the patient, without any apparent fault in the eye, is entirely deprived of sight. See **MEDICINE**.

**GUTTERS**, in architecture, a kind of canals in the roofs of houses, serving to receive and carry off the rain.

**GUTTURAL**, a term applied to letters or sounds pronounced or formed as it were in the throat.

**GUTTY**, in heraldry, a term used when any thing is charged or sprinkled with drops. In blazoning, the colour of the drops is to be named; as, gutty of sable, of gules, &c.

**GUY**, in a ship, is any rope used for keeping off things from bearing or falling against the ship's side when they are hoisting in.

That rope which at one end is made fast to the fore-mast, and seized to a single block at the pendant of the garnet, is called the *guy* of the garnet.

**GUZES**, in heraldry, roundles of a sanguine or murrey colour. These, from their bloody hue, are by some supposed to represent wounds.

**GYMNASIARCH**, in antiquity, the director of the gymnasium. He had two deputies under him; the one called *xyltarch*, who presided over the *athletæ*, and had the oversight of the wrestling; the other *gymnastes*, who had the direction of all the other exercises.

**GYMNASIUM**, in Grecian antiquity, a place fitted for performing exercises.

Gymnasia, according to Potter, were first used at Lacedæmon, but were afterwards very common in all the parts of Greece, and imitated, very much augmented, and improved at Rome. They were not single edifices, but a knot of buildings united, being so capacious as to hold many thousands of people at once; and having room enough for philosophers, rhetoricians, and the professors of all other sciences, to read their lectures; and wrestlers, dancers, and all others who would, to exercise at the same time without the least disturbance or interruption. They consisted of a great many parts, the chief of which were, the porticos, elæstheilium, palaestra, conister-um, &c.

Athens had several gymnasia, of which the lyceum, academia, and cynosarges, were those of most note.

The lyceum was situated on the banks of the river Ilissus, and received its name from Apollo, to whom it was dedicated.

The lyceum was the place where Aristotle taught philosophy, walking there every day till the hour of anointing; whence he and his followers got the name of peripatetics.

The academy was part of the ceramicus without the city, where Plato lectured. See **ACADEMY**.

**GYMNASTICS**, the art of performing the several bodily exercises, as wrestling, running, fencing, dancing, &c.

**GYMNOPYRUS**, in natural history, a name given by Dr Hill to the pyritæ of a simple internal structure, and not covered with a crust.

Of these there are only two species: 1. A green variously shaped kind. 2. A botryoide kind.

The first species is the most common of all the pyritæ, and appears under a great diversity of shapes. It is very hard and heavy, very readily gives fire with steel, but will not at all ferment with aquafortis. The second species is very elegant and beautiful, and its usual colour is a very agreeable pale green; but what most distinguishes it from all other pyritæ is, that its surface is always beautifully elevated into tubercles of various sizes, resembling a cluster of grapes.

**GYMNOSOPHISTS**, a sect of philosophers who clothed themselves no farther than modesty required. There was some of these sages in Africa; but the most celebrated clan of them was in India. The African gymnosophists dwelt upon a mountain in Ethiopia, near the Nile, without the accommodation either of house or cell. They did not form themselves into societies like those of India, but each had his private retirement, where he studied and performed his devotions by himself. If any person had killed another by chance, he applied to these sages for absolution, and submitted to whatever penances they enjoined. They observed an extraordinary frugality, and lived only upon the fruits of the earth. Lucan ascribes to these gymnosophists several new discoveries in astronomy.

As to the Indian gymnosophists, they dwelt in the woods, where they lived upon the wild products of the earth, and never drank wine, nor married. Some of them practised physic, and travelled from one place to another: these were particularly famous for their remedies.

remedies against barrenness. Some of them, likewise, pretended to practise magic, and to foretell future events.

In general, the gymnosophists were wise and learned men: their maxims and discourses, recorded by historians, do not in the least favour of a barbarous education, but are plainly the result of great sense and deep thought. They keep up the dignity of their character to so high a degree, that it was never their custom to wait upon any body, not even upon princes themselves; for which reason Alexander, who would not condescend to visit them in person, sent some of his courtiers to them in order to satisfy his curiosity. Their way of educating their disciples is very remarkable: every day, at dinner, they examined them how they had spent the morning; and every one was obliged to shew, that he had discharged some good office, practised some virtue, or improved in some part of learning: if nothing of this appeared, he was sent back without his dinner. They held a transmigration of souls; and it is probable that Pythagoras borrowed his doctrine from them.

**GYMNOSPERMIA**, in botany. See **BOTANY**, p. 636.

**GYMNOTUS**, in ichthyology, a genus of fishes belonging to the order of apodes. They have two tentacula at the upper lip; the eyes are covered with the common skin; there are five rays in the membrane of the gills; the body is compressed, and carinated on the belly with a fin. There are five species.

**GYNÆCEUM**, among the ancients, the apartment of the women, a separate room in the inner part of the house where they employed themselves in spinning, weaving, and needle-work.

**GYNÆOCRACY**, denotes the government of women, or a state where women are capable of the supreme command. Such are Britain and Spain.

**GYNANDRIA**, in botany. See **BOTANY**, p. 635.

**GYPSIES**. See **EGYPTIANS**.

**GYPSUM**, or **PLASTER-STONE**, in natural history, a genus of fossils, naturally and essentially simple, not inflammable nor soluble in water, and composed of flat small particles, which form bright, glossy, and in some degree transparent masses, not flexible or elastic, not giving fire with steel, nor fermenting with, or being soluble in, acid menstrua, and very easily calcined in the fire.

Of these gypsums, some are harder, others softer, and are of several colours; as, white, grey, red, green, &c. sometimes distinct, and sometimes variously blended together.

The texture of all the gypsums being ultimately the same, it may be sufficient to observe, that their origin is plainly from particles of a determinate nature and substance, and of a certain and invariable figure, an oblong, flat, and irregularly angular one. These we sometimes see, as indeed is most natural to them, disposed without order or regularity, into loose, complex, friable masses; at others, they are getting out of their native order, and emulating the structure of other classes of bodies, of which they are indeed properly the basis, and appearing somewhat in the figure of the fibraræ; and at other times, of the foliaceous composite flakes of the selenitæ: the species which have these structures, are truly varying from the gypsums into those bodies they emulate; for the fibraræ are only a peculiar arrangement of these very particles, and the selenitæ only more broad flakes of the same, like those of the foliaceous talcs.

The gypsums are much used in plaster, for stuccoing rooms, and casting busts and statues.

**GYRFALCON**. See **FALCO**.

**GYSHORN**, a town of germany, in the dutchy of Lunenburg, situated on the river Aller, forty-five miles north-east of Hanover: E. long. 10° 45', and N. lat. 52° 50'.

## H

### H A B

**HABAT**, the north-west province of the empire of Morocco, situated on the streights of Gibraltar.

**HABAKKUK**, or the prophecy of Habakkuk, a canonical book of the Old Testament.

There is no mention made in scripture, either of the time when this prophet lived, or of the parents from whom he was descended; but according to the authors of the lives of the prophets, he was of the tribe of Simeon, and a native of Bethzacar.

**HABEAS CORPUS**, in law, is a writ of two kinds; the one being the great writ of the English liberty, which lies where a person is indicted for any crime or trespass before justices of the peace, or in a court of any franchise, and on being imprisoned has offered sufficient bail, which has been refused, though the

### H A B

case be bailable; in which case he may have this writ out of the king's bench, in order to remove himself thither, to answer the cause at the bar of that court.

The practice in this case is, first to procure a certiorari out of the court of chancery, directed to all the justices for removing the indictment into the king's bench; and upon that to obtain this writ, directed to the sheriff, for causing the body of the party to be brought at a certain day.

The other kind of habeas corpus is used for bringing the body of a person into court, who is committed to any goal or prison, either in civil or criminal causes; which writ will remove the person and cause from one court and prison to another.

No habeas corpus, or other writ, to remove a cause from

from out of an inferior court, can be allowed, if the same be not delivered to the judge of the court, before the jury who are to try the cause have appeared, and before any of them are sworn, 43 Eliz. c. 5.

The habeas corpus act, 31 Car. II. c. 2. has ordained, that a person may have a habeas corpus from any judge, on complaint made and view of the warrant of commitment, (except such person is committed for treason or felony expressed in the warrant, or some other offence that is not bailable) which habeas corpus must be made returnable immediately; and on producing a certificate of the cause of commitment, the prisoner is to be discharged on bail given to appear in the court of king's bench the next term, or next assizes, &c. Persons committed, for either treason or felony, expressly mentioned in the warrant, upon a motion made in open court, in the first week of the term, or day of sessions, &c. after commitment, are to be brought to trial; and if they are not indicted the next term or sessions after commitment, on a motion made the last day of that term, they shall be let out upon bail, except it appear on oath, that the king's witnesses are not ready; and in case they are not indicted or tried the second term after commitment, they shall be discharged.

Judges denying a habeas corpus, shall forfeit 500 l. and if an officer refuse to obey it, or to deliver a true copy of the commitment-warrant, he forfeits 100 l. for the first offence.

**HABIT**, in philosophy, an aptitude or disposition either of mind or body, acquired by a frequent repetition of the same act.

**HABIT**, in medicine, denotes the settled constitution of the body, or the habitude of any thing else, as the structure or composition of a body, or the parts thereof.

**HABIT** is also used for a dress or garb, or the composition of garments, wherewith a person is covered; in which sense we say, the habit of an ecclesiastic, of a religious, &c. a military habit, &c.

**HABITE AND REPUTE**, in Scots law, the common opinion of the people, among whom a person lives, with respect to any circumstance relating to him.

**HABITUAL**, something grown to a habit by long use. See **HABIT**.

**HABITUDE**, among schoolmen, the respect or relation one thing bears to another. See **RELATION**.

**HACHA**, a town of terra firma, in South America, situated on the north sea, at the mouth of the river Hacha. in W. long. 72°. N. lat. 11° 0'.

**HACKNEY**, a village on the north-east side of London, with a handsome church, three meeting-houses, and seventeen almshouses.

**HADDINGTON**, a parliament-town in Scotland, about thirteen miles east of Edinburgh.

**HADDOCK**, the English name of a well known fish of the gadus kind. See **GADUS**.

**HADRAMUT**, a city of Arabia Felix, the capital of the province of Hadramut, situated in E. long. 50° 30', N. lat. 16°, three hundred and sixty miles north-east of Mecho.

**HÆMAGOGOS**, among physicians, a compound medicine consisting of fetid and aromatic simples, mixed with black heliobore; and prescribed in order to promote the menstrual and hæmorrhoidal fluxes, as also to bring away the lochia.

**HÆMANTHUS**, in botany, a genus of the hexandria monogynia class. The involucre is large, and consists of six leaves; the corolla is above the fruit, and divided into six parts; and the berry has three cells. There are four species, none of them natives of Britain.

**HÆMATITES**, or **BLOOD-STONE**, in natural history, an extremely rich and fine iron.

It is very ponderous, and is either of a pale red, a deeper red, or a bluish colour; usually of a very glossy surface; and when broken, of a fine and regularly striated texture; the striz converging toward the centre of the body; and the masses thereof naturally breaking into fragments of a broad base and pointed end; appearing something pyramidal. The hæmatites is various in its degrees of purity and hardness, as well as in its figure: the finest and most pure is of a botryoid surface; the whole superficies rising into larger or smaller roundish tubercles: sometimes the hæmatites is of a coarse texture, and a laxer structure, in which state it is known to many by the name schistus.

**HÆMATOPUS**, the **SEA-PYX**, in ornithology, a genus belonging to the order of grallæ. The beak is compressed with an equal wedge-shaped point; the nostrils are linear; and the feet have three toes without nails. There is but one species, viz. the astrægus, a native of Europe and America. It feeds upon shell-fish near the sea-shores.

**HÆMATOXYLUM**, **CAMPECHE-WOOD**, in botany, a genus of the decandria monogynia class. The calix is divided into five parts; the petals are five; the capsule is lanceolated, and contains one cell with two boat-shaped valves. There is but one species, viz. the campechianum, campechy or logwood, a native of America, near Carthage. It is usually brought home in large logs, very hard, of a red colour, and an astringent sweet taste. It has been long used by the dyers, but not till very late as a medicine: an extracted decoction of it are said to be serviceable in diarrhoeas.

**HÆMOPTOSIS**, **HÆMPTYSIS**, or **HÆMOPROS**, in medicine, a spitting of blood. See **MEDICINE**.

**HÆMORRHAGE**, in medicine, a flux of blood from any part of the body. See **MEDICINE**.

**HÆMORRHOIDAL**, an appellation given by anatomists to the arteries and veins going to the intestinum rectum. See **ANATOMY**, Part III. and IV.

**HÆMORRHOIDS**, or **PILES**, in medicine, an hæmorrhage, or flux of blood from the hæmorrhoidal vessels. See **MEDICINE**.

**HAERLEM**, a populous city of the United Provinces, in the province of Holland, situated near the lake which from this town is called Haerlem-Meer; four miles east of the ocean, and twelve west of Amsterdam: E. long. 4° 20'. N. lat. 52° 30'.

**HAGAI**, a canonical book of the Old Testament, so called

called from the prophet of that name, who, in all probability was born at Babylon, from whence he returned with Zerubbabel.

**HAGENAU**, a fortified town of Germany, in the Landgraviate of Alsace: E. long.  $7^{\circ} 40'$ , N. lat.  $48^{\circ} 45'$ .

**HAGUE**, a town of the United Provinces, in the province of Holland, situated two miles east of the sea, and fourteen north-west of Rotterdam. This is one of the finest towns in Europe; but though it enjoys all the privileges of a city of Holland, except that of sending representatives to the state, yet, as it has no walls, it is only esteemed a village. Here every city of the United provinces has a house for their respective deputies, and here the states of the province of Holland assemble, and all public affairs are transacted.

**HAIL**, in physiology, an aqueous concretion, in form of white or pellucid spherules, descending out of the atmosphere.

Hail is evidently no other than drops of rain congealed into ice. This happens when in their passage thro' the inferior air, they meet with nitrous particles, which are known to contribute greatly to freezing. Their magnitude is owing to a fresh accession of matter as they pass along. Hence we see the reason why hail is so frequent in summer, because at that time greater quantities of nitre are exhaled from the earth, and float up and down the air. See **RAIN** and **FROST**.

**HAIMSUCKEN**, in Scots law, the assaulting or beating a man in his own house. See **SCOTS LAW**, title 33.

**HAIR**, slender, oblong, and flexible filaments, growing out of the pores of animals, and serving most of them as a covering. See **ANATOMY**, p. 256.

**HAKE**, in ichthyology. See **GADUS**.

**HALBERSTAT**, a city of Germany, in the circle of Upper Saxony, the capital of the duchy of the same name; subject to the king of Prussia, E. long.  $11^{\circ} 6'$ , N. lat.  $51^{\circ} 55'$ .

**HALCRYPTIUM**, a name given by Dr Hill to the salt suspended in a fluid form, and in very small quantities in mineral waters, scarce discernable by the taste, and with much difficulty separable from them.

**HALCYON**, in ornithology, a name given by the ancients to the alcedo, or kingfisher. See **ALCEDO**.

**HALCYON DAYS**, in antiquity, a name given to seven days before and as many after the winter-solstice; by reason the halycon, invited by the calmness of the weather, laid its eggs in nests-build in the rocks, close by the brink of the sea, at this season.

**HALE**, in the sea-language, signifies pull; as, to hale up, is to pull up; to hale in or out, is to pull in or out. To over-hale a rope, is to hale it too stiff, or to hale it the contrary way.

**Keel-HALE**. See **DUCKING**.

**HALEM**, a town of the Austrian Netherlands, in the province of Brabant, twenty-five miles west of Maestricht: E. long.  $5^{\circ} 5'$ , N. lat.  $51^{\circ} 5'$ .

**HALESWORTH**, a market town of Suffolk, thirty-five miles east of Bury: E. long.  $1^{\circ} 40'$ , N. lat.  $52^{\circ} 30'$ .

**HALF-BLOOD**, in law, is where a man marries a se-

cond wife, the first being dead, and by the first venter has a son, and by his second venter has likewise a son, the two brothers, in this case, are but of half blood.

**HALF-MERK**, a noble, or 6 s. 8 d.

**HALF-MOON**, in fortification, an outwork composed of two faces, forming a salient angle, whose gorge is in form of a crescent, or half moon; whence the name. See **FORTIFICATION**.

**HALIÆTUS**, in ornithology. See **FALCO**.

**HALIOTIS**, the **EAR-SHELL**, a genus of insects belonging to the order of Vermes testacea. This is an animal of the snail-kind, with an open shell resembling an ear. There are seven species, distinguished by the figure of their shells.

**HALL**, in geography, a town of Germany, in the circle of Austria, and county of Tyrol, situated six miles north-east of Inspruck: E. long.  $11^{\circ} 28'$ , N. lat.  $47^{\circ} 15'$ .

**HALL** is also a town of the Austrian Netherlands in the province of Brabant, seven miles south of Brussels: E. long.  $4^{\circ} 10'$ , N. lat.  $50^{\circ} 50'$ .

**HALL** is also a city of Germany, in the circle of Upper Saxony, in the capity of a duchy situated on the river Sala, subject to the king of Prussia: E. long.  $12^{\circ} 5'$ , N. lat.  $51^{\circ} 35'$ .

**HALL** is also a town of Germany, in the circle of Swabia, twenty miles east of Hailbron; being an imperial city, or sovereign state: E. long.  $9^{\circ} 45'$ , N. lat.  $49^{\circ} 20'$ .

**HALLAGE**, a fee or toll paid for cloth brought to be sold in Blackwell-hall, London.

**HALLAMASS**. See **ALL-SAINTS**.

**HALLELUJA**, a word signifying, praise the Lord.

The singing halleluja was a sort of invitational, or call to each other, to praise the Lord.

St Austin says, that in some churches, it was sung only on Easter-day, and the fifty days of Pentecost; but that even in those churches where it was most in use, it was never used in the time of lent.

**HALLEN**, a town of the Austrian Netherlands, in the province of Brabant: E. long.  $5^{\circ}$ , N. lat.  $50^{\circ} 55'$ .

**HALLEIN**, a town of Germany, in the archbishopric of Saltzburg: E. long.  $13^{\circ} 6'$ , N. lat.  $47^{\circ} 36'$ .

**HALLER**, a town in the Netherlands, in the province of Brabant: E. long.  $5^{\circ}$ , N. lat.  $50^{\circ} 40'$ .

**HALLERIA**, in botany a genus of the didynamia angiospermia class. The calix has three segments, and the corolla four, the filaments are longer than the corolla; and the berry has two cells. There is but one species, a native of Æthiopia.

**HALLIFAX**, a large market town in the west riding of of Yorkshire, thirty-four miles south-west of York: W. long.  $1^{\circ} 40'$ , N. lat.  $53^{\circ} 45'$ .

**HALMSTAT**, a port-town of Gothland in Sweden, eighty miles south of Gottenberg: E. long.  $13^{\circ} 5'$ , N. lat.  $56^{\circ} 45'$ .

**HALO**, a meteor in the form of a luminous ring or circle, of various colours, appearing round the bodies of the sun, moon, or stars.

Concerning the production of halos, Sir Isaac Newton intimates, that they are formed by the light

which comes through the drops of rain, by two refractions, without any reflection; but how this may be, is not easy to conceive.

**HALTWESEL**, a market-town of Northumberland, thirty-two miles west of Newcastle: W. long.  $2^{\circ}$ , N. lat.  $55^{\circ}$ .

**HAM**, in anatomy, the part behind the knee.

**HAM**, in geography, a city in Germany, in the circle of Westphalia, and the capital of the county of Mark, subject to Prussia: E. long.  $7^{\circ} 15'$ , N. lat.  $51^{\circ} 35'$ .

**HAMA**, or **APAMEA**. See **APAMEA**.

**HAMADAN**, a city of Persia, in the province of Eyrac Agem, 200 miles north-west of Isfahan; E. long.  $47^{\circ} 35'$ , N. lat.  $35^{\circ}$ .

**HAMADRYADS**, in heathen theology, certain rural deities; being nymphs of the woods, whose fate depended upon certain trees, together with which they were supposed both to be born and to die.

**HAMAMELIS**, in botany, a genus of the tetrandria digynia class. The involucre consists of three leaves, and the proper calix of four; the petals are four; and the nut has two cells. There is but one species, a native of Virginia.

**HAMAXOBIANS**, *hamaxobii*, an ancient people of European Sarmatia, so called from their living together in chariots or waggons, for the conveniency of shifting the place of their abode at pleasure.

**HAMBURGH**, a large city and well fortified port-town of Germany, in the circle of Lower Saxony, and duchy of Holstein, situated on the north side of the river Elb, partly on islands, and partly on the continent. It is an imperial city, or sovereign state, governed by its own magistrates, and subject only to the general laws of the empire. Merchants from all parts of Europe resort to it, from whence their goods are sent into the heart of the empire: E. long.  $9^{\circ} 40'$ , N. lat.  $54^{\circ}$ .

**HAMCHEU**, the capital of the province of Chekiam, in China, situated on the river Cienton, 160 miles south-east of Nanking: E. long.  $120^{\circ}$ , N. lat.  $30^{\circ}$ .

**HAMELIN**, a town of Germany, in the circle of lower Saxony, and duchy of Brunswic, subject to the elector of Hanover: E. long.  $9^{\circ} 12'$ , N. lat.  $52^{\circ} 15'$ .

**HAMILTON**, a town of Scotland, in the county of Clydesdale, situated on the river Clyde, eleven miles south-east of Glasgow: W. long.  $3^{\circ} 50'$ , N. lat.  $55^{\circ} 40'$ .

**HAMLE**, the name of the eleventh month of the Ethiopian year, beginning on the 25th of June, old style.

**HAMMONT**, a town of Germany, in the circle of Westphalia, and bishopric of Liege, situated near the confines of Brabant: E. long.  $5^{\circ} 32'$ , N. lat.  $51^{\circ} 20'$ .

**HAMPSHIRE**, an English country, bounded by Berkshire, on the north; by Surry and Suffex, on the east; by the English channel, on the south; and by Wiltshire and Dorsetshire, on the west. It comprehends the isle of Wight. Its chief towns are Winchester, Southampton, and Portsmouth.

**New HAMPSHIRE**, a province of New England, in North America, bounded by Nova Scotia, on the

north; by the Atlantic ocean, on the east; by the province of Massachusetts bay, on the south; and by New York, on the west: subject to Great Britain.

**HAMPSTEAD**, a pleasant village in Middlesex, four miles north of London.

**HAMPTON**, a market-town of Gloucestershire, twelve miles south of Gloucester: W. long.  $2^{\circ} 15'$ , N. lat.  $51^{\circ} 38'$ .

**HAMPTON-COURT**, a town in Middlesex, situated on the north side of the Thames, twelve miles west of London, and two west of Kingstons; in which is the finest palace belonging to the king of Britain.

**HANAU**, the capital of a county of the same name in Germany, is pleasantly situated on the river Kunts, thirteen miles east of Frankfort, and twelve north-west of Aschaffenburg: E. long.  $8^{\circ} 45'$ , N. lat.  $50^{\circ} 12'$ .

**HAND**, in anatomy. See **ANATOMY**, Part I. II. &c.

**HAND**, in the manege, a measure of four inches, or of a clinched fist, by which the height of a horse is computed.

**HAND-BREADTH**, a measure of three inches.

**HANDS**, in heraldry, are borne in coat-armour dexter and sinister, that is, right and left, expanded or open. These are the most necessary parts of the human body, as they serve to express all sorts of actions, and even our very thoughts and designs; thus, joining of hands is an universal token of friendship, and clapping of hands a general mark of applause.

**HANOVER**, a city of Germany, in the circle of Lower Saxony, and dukedom of Brunswic, situated on the river Leina, thirty-six miles west of Brunswic: it is the capital of his Britannic majesty's German dominions, situated in E. long.  $9^{\circ} 45'$ , N. lat.  $52^{\circ} 32'$ .

**HANSE**, or **HANS**, a company of merchants united for the promotion and advantage of trade.

**HANSE-TOWNS**, port-towns of Germany of which Lubeck and Hamburg were the chief. They were formerly all of them imperial cities, confederated for their mutual defence, and the protection of their trade.

**HAPPINESS**, among philosophers, consists in the prosecution or enjoyment of some good.

**HARBINGER**, an officer of the king's household, having four yeomen under him, who ride a day's journey before the court, when it travels, to provide lodgings, &c.

**HARBOROUGH**, a town of Leicester shire, thirteen miles south-east of Leicester: W. long.  $1^{\circ}$ , N. lat.  $52^{\circ} 26'$ .

**HARBOUR**, a place where ships may ride safe at anchor, chiefly used in speaking of those secured by a boom and chain, and furnished with a mole.

**HARBURGH**, a port town of Germany, in the circle of Lower Saxony, and duchy of Lunenburg, situated on the river Elbe, opposite to Hamburg: E. long.  $9^{\circ} 30'$ , N. lat.  $53^{\circ} 57'$ .

**HARCOURT**, a town of France, in the province of Normandy, twenty-three miles south-west of Rouen.

**HARDENING**, the giving a greater degree of hardness to bodies than they had before.

There are several ways of hardening iron and steel, as by hammering them, quenching them when hot in cold water, &c. **CHEMISTRY**, p. 124.

**HARDERWICK**,

**HARDERWICK**, a town of Guelderland, in the United Netherlands, twenty-three miles north-west of Zutphen: E. long.  $5^{\circ} 30'$ . N. lat.  $52^{\circ} 35'$ .

**HARDNESS**, in physiology, that quality in bodies whereby their parts cohere firmly together, so as not to give way to any external impulse, nor yield inwards, without breaking.

In this sense hardness coincides with what on other occasions we call firmness, in opposition to softness and fluidity.

**HARE**, in zoology. See **LEPUS**.

**HARE-LIP**, in surgery. See **SURGERY**.

**HARENGUS**. See **CRUPEA**.

**HARFLEUR**, a port-town of France, in the province of Normandy, situated near the mouth of the Seyne, four miles west of Havre de Grace: E. long.  $15^{\circ}$  N. lat.  $49^{\circ} 30'$ .

**HARIOT**, or **HARIOT**, in law, a due belonging to a lord at the death of his tenant, consisting of the best beast, either horse, ox, or cow, which he had at the time of his death; and in some manors, the best goods, piece of plate, &c. are called hariots.

**HARLEBECK**, a town of the Austrian Netherlands, in the province of Flanders, situated on the river Lys, six miles north-east of Courtray: E. long.  $3^{\circ} 15'$ , N. lat.  $50^{\circ} 50'$ .

**HARLEQUIN**, a buffoon or merry andrew; but is now used for a person of extraordinary agility, dressed in party-coloured cloaths, the principal character in a pantomime entertainment. See **PANTOMIME**.

**HARLESTON**, a market-town of Norfolk, situated on the river Waveney, fourteen miles south of Norwich: E. long.  $1^{\circ} 25'$ , N. lat.  $52^{\circ} 35'$ .

**HARLINGEN**, a port-town of the United Netherlands, in the province of West Friesland, situated on the German sea: E. long.  $5^{\circ} 20'$ , N. lat.  $53^{\circ} 15'$ .

**HARLOW**, a market-town of Essex, situated fifteen miles west of Chelmsford: E. long.  $6'$ , N. lat.  $51^{\circ} 45'$ .

**HARMONICAL**, something belong to harmony. See **HARMONY**.

**HARMONICAL COMPOSITION**, in a general sense, includes both harmony and melody, *i. e.* of music or songs, both in a single part, and in several parts.

**HARMONICAL SERIES**, a series of many numbers in continual harmonical proportion. Thus, if there are four or more numbers, of which every three immediate terms are harmonical, the whole will make an harmonical series: such is  $30 : 20 : 15 : 12 : 10$ . Or, if every four terms immediately next each other are harmonical, it is also a continual harmonical series, but of another species, as  $3, 4, 6, 9, 18, 36$ , &c.

**HARMONICAL SOUNDS**, an appellation given, by Mr Sauveur, to such sounds as always make a determinate number of vibrations, in the time that one of the fundamentals, to which they are referred, makes one vibration.

Harmonical sounds are produced by the parts of chords, &c. which vibrate a certain number of times, while the whole chord vibrates once.

The relations of sounds had only been considered in the series of numbers,  $1 : 2, 2 : 3, 3 : 4, 4 : 5$ , &c. which produced the intervals called octave, fifth, fourth, third, &c. Mr Sauveur first considered them in the natural series,  $1, 2, 3, 4, 5$ , &c. and examined the relations of sounds arising therefrom. The result is, that the first interval,  $1 : 2$ , is an octave; the second,  $1 : 3$ , a twelfth; the third,  $1 : 4$ , a fifteenth, or double octave; the fourth,  $1 : 5$ , a seventeenth; the fifth,  $1 : 6$ , a nineteenth, &c.

This new consideration of the relations of sounds is more natural than the old one; and is, in effect, all the music that nature makes without the assistance of art.

**HARMONICS**, that part of music which considered the differences and proportions of sounds, with respect to acute and grave; in contradistinction to rhythmica and metrica.

**HARMONY**, in music, the agreeable result or union of several musical sounds heard at one and the same time; or the mixture of divers sounds, which together have an effect agreeable to the ear.

**HARMONY of the spheres**, or **Celestial HARMONY**, a sort of music much talked of by many of the ancient philosophers and fathers, supposed to be produced by the sweetly tuned motions of the stars and planets. This harmony they attributed to the various proportionate impressions of the heavenly globes upon one another, acting at proper intervals. It is impossible, according to them, that such prodigious large bodies, moving with so much rapidity, should be silent; on the contrary, the atmosphere continually impelled by them, must yield a set of sounds proportionate to the impression it receives; consequently, as they do not all run the same circuit, nor with one and the same velocity, the different tones arising from the diversity of motions, directed by the hand of the Almighty, must form an admirable symphony, or concert.

They therefore supposed, that the moon, as being the lowest of the planets, corresponded to *mi*; mercury, to *fa*; venus, to *sol*; the sun, to *la*; mars, to *fi*; jupiter, to *ut*; saturn, to *re*; and the orb of the fixed stars, as being the highest of all, to *mi*, or the octave.

**HARP**, a musical instrument of the string-kind, of a triangular figure, held upright between the legs of the person who plays upon it.

**HARPIES**, among the ancient poets, fabulous impure monsters, said to be the daughters of Neptune and Earth. Virgil mentions three of them, Aello, Ocypete, and Celæno; they are described to be fowls, with the face of a virgin, bears ears, their bodies like vultures, and hands like their crooked talons.

**HARPINEER**, or **HARPONEER**, the person who manages the harping-iron.

**HARPSICORD**, the most harmonious of all the musical instruments of the string-kind. It is played on after the manner of the organ, and is furnished with a set, and sometimes with two sets of keys; the touching or striking of these keys moves a kind of little jacks, which

which also move a double row of chords or strings, of brass or iron, stretched over four bridges on the table of the instrument.

**HARQUEBUSS**, a piece of fire-arms, of the length of a mulket, usually cocked with a wheel. It carried a ball that weighed one ounce seven eighths.

There was also a larger sort, called the great harquebuss, used for the defence of strong places, which carried a ball of about three ounces and a half: but they are now but little used, except in some old castles, and by the French in some of their garrisons.

**HARRIER**, a kind of hound, endowed with an admirable gift of smelling, and very bold in the pursuit of his game.

**HARROW**, in agriculture. See **AGRICULTURE**, p. 58.

**HART**, a stag, or male deer, in the sixth year. See **CERVUS**.

**HART'S HORNS**, in pharmacy, the whole horns of the common male deer, as separated from the head, without farther preparation.

The chemical analysis of hart's-horn is sufficiently known: it yields a water highly impregnated with a volatile salt, which is called spirit of hart's-horn, with a fetid oil, and a volatile salt by the common distillation in a retort.

The salt of hart's horn is a great sudorific, and is given in fevers of many kinds with great success; the spirit has the same, and all the other virtues of volatile alkalis, and is used to bring people out of faintings by its pungency, on holding it under their nose, and at the same time pouring some drops of it in water down the person's throat.

**HART-WORT**, in botany. See **TORDYLLIUM**.

**HARTFORD**, the capital of Hertfordshire, situated twenty-one miles north of London: W. long. 7°, and N. lat. 51° 45'.

**HARTFORD** is also a town of New England, in the province of Connecticut, situated 50 miles west of Boston: W. long. 71° 15', and N. lat. 42°.

**HARTLAND**, a market-town of Devon, situated near the Bristol channel; it gives name to a cape, called Hartland-point, at the entrance of the Bristol channel: W. long. 4° 45', and N. lat. 51° 9'.

**HARTLEPOOL**, a port-town of the county of Durham, situated on the German ocean; fourteen miles south-east of Durham: W. long. 55°, and N. lat. 54° 40'.

**HARVEST**, the time or season that the corn is ripe, and fit to be reaped and taken into barns.

**HARWICH**, a borough and port-town of Essex, sixty-two miles north-east of London: E. long. 1° 25', N. lat. 52° 5'. It sends two members to parliament.

**HASLEM**, an island of Denmark, in the Categate-sea, north of the island of Zealand.

**HASLEMERE**, a borough-town of Surry, thirty eight miles south-west of London, and ten miles south-west of Guildford. It sends two members to parliament.

**HASSELT**, a town of Westphalia, in Germany, fifteen miles north-west of Mædtricht.

**HASSIDEANS**, or **ASSIDEANS**, an appellation given

to those Jews who resorted to Mattathias, to fight for the law of God, and the liberties of their country.

**HASSOCK**, a bals made of rushes, to kneel or rest the feet upon in churches.

**HASP** and **STAPLE**, in Scots law, the symbol commonly used in burgage tenements for entering and infesting an heir, by delivering into his hands the hasp and staple of the door. See **SCOTS LAW**, title 27.

**HASTA**, among medallists, a kind of javelin, not shod or headed with iron; or rather an ancient sort of sceptre, longer than ordinary, occasionally given to all the gods.

**HASTATED LEAF**. See **BOTANY**, p. 639.

**HASTINGS**, a borough-town of Suffex, situated on the coast of the English channel, fifty miles south-east of London: E. long. 36°, and N. lat. 50° 50'.

**HAT**, a covering for the head, worn by the men in most parts of Europe. Those most in esteem are made of the pure hair of the castor or beaver; for they are also made of the hair or wool of divers other animals, and that by much the same process.

*Method of making HATS.* To make the beaver-hats, they tear off the long and short hair from the skin, with knives suitable to the occasion: after which they proportion the quantity of the several sorts of beaver-hair, by mixing one third of the dry castor to two thirds of old-coat, which is a term for a skin that has been worn some time by the Indians of America; who catch and sell them to the Europeans. The hair, so mixed, is carded and weighed out into parcels, according to the size and thickness of the hat intended. The stuff is now laid on the hurdle, with an instrument called a bow, resembling that of a violin, but larger; whose string being worked with a small bow-stick, and made to play on the furs, they fly, and mix themselves together, the dust and filth at the same time passing through the chinks. Instead of a bow, some hat-makers use a scarce of hair, through which they pass the stuff. Thus hats are formed of an oval figure, ending with an acute angle at the top: with what stuff remains, they strengthen them where slenderest, yet designedly make them thicker in the brim near the crown, than towards the circumference, or in the crown itself. They next harden the stuff, so managed, into more compact flakes, by pressing down a hardened leather upon it. This done, they are carried to the bason, upon which laying one of the hardened hats, they sprinkle it over with water, and mould it; and the heat of the fire, with the water and pressing, imbody the stuff into a slight hairy sort of felt; after which, turning up the edges all round over the mould, they lay it by, and proceed with another; which being in like manner reduced to the same consistence and form, they are both joined together, so as to make them meet in an angle at top, making only one conical cap. The next process is to remove the hat to a trough, resembling a mill-hopper, which is a copper kettle filled with water and grounds, kept hot for the purpose; and, after being dipped in the kettle, the hat is laid on the sloping side, called the plank. Here they proceed to work it, by rolling and unrolling it again

again and again, one part after another, first with the hand, and afterwards with a small wooden roller, taking care to dip it from time to time, till at length, by thus fulling and thickening it four or five hours, it is brought to the dimensions intended. In this violent labour, the workmen usually guard their hands with thick leather, which they call gloves. The hat thus wrought into the form of a conical cap, is reduced into proper shape on a block of the size of the intended crown, by tying it round with a string, called a commander; after which, with a bent iron, called a stamper, they gradually beat down the commander all round, till it has reached the bottom of the block, and what remains at the bottom below the string forms the brim. In this station it is set to dry, and afterwards singed, by holding it over the blaze of a fire, made of straw, or shavings: it is then rubbed with pumice-stone, to take off the coarser nap; then rubbed over with seal skin, to lay the nap still finer; and, lastly, carded with a fine card, to raise the fine cotton, with which the hat is to appear when finished: then fitting it to the block, they tie it, cut round the edges, and deliver it to the dyers. (See DYEING.) The dye being completed, the hat is dried by being hung in the roof of a stove heated with a charcoal-fire; and, when dry, it is stiffened with melted glue, or rather gum-senega, which is smeared over the hat with a brush, and rubbed in with the hand. Then, having spread a cloth over the steaming bason, which is a little fire-place raised about three feet high, with an iron plate laid over it, exactly covering the fire, the hat is laid upon the cloth, with the brim downwards, the cloth being first sprinkled with water, to raise a strong steam, to force in the stiffening. When it is moderately hot, the workman strikes gently on the brim, with the flat of his hand, to make the joinings incorporate and bind so as not to appear, turning it from time to time, and at last setting it on the crown. And when it has been sufficiently steamed and dried, it is put again on the block, brushed, ironed, well smoothed, and fitted for lining.

Hats make a considerable article in commerce: England supplies Spain, Portugal, Italy, and Germany, with extraordinary quantities of them; and as our manufacturers have the reputation of making the best hats in Europe, their importation is prohibited.

**HATS** are also made for womens wear, of chips, straw, or cane, by platting, and sewing the plats together; beginning with the centre of the crown, and working round till the whole is finished. Hats for the same purpose are also wove and made of horse-hair, silk, &c.

**HATCHEL**, or **HITCHEL**, a tool with which flax and hemp are combed into fine hairs. It consists of long iron pins, or teeth, regularly set in a piece of board.

**HATCHES**, in a ship, a kind of trap-doors between the main-mast and fore-mast, through which all goods of bulk are let down into the hold.

**HATCH WAY**, the place where the hatches are. Thus, to lay a thing in the hatch way, is to put it so, that the hatches cannot be come at, or opened.

**HATCHING**, the maturing fecundated eggs, whether

by the incubation and warmth of the parent-bird, or by artificial heat, so as to produce young chickens alive.

The art of hatching chickens by means of ovens has long been practised in Egypt; but it is there only known to the inhabitants of a single village named Berme, and to those that live at a small distance from it. Towards the beginning of autumn they scatter themselves all over the country, where each person among them is ready to undertake the management of an oven, each of which is of a different size, but in general they are capable of containing from forty to fourscore thousand eggs. The number of these ovens placed up and down the country is about three hundred and eighty-six, and they usually keep them working for about six months: as therefore each brood takes up in an oven, as under a hen, only twenty-one days, it is easy in every one of them to hatch eight different broods of chickens. Every Bermean is under the obligation of delivering to the person who intrusts him with an oven, only two thirds of as many chickens as there have been eggs put under his care; and he is a gainer by this bargain, as more than two thirds of the eggs usually produce chickens. In order to make a calculation of the number of chickens yearly so hatched in Egypt, it has been supposed, that only two thirds of the eggs are hatched, and that each brood consists of at least thirty thousand chickens; and thus it would appear, that the ovens of Egypt give life yearly to at least ninety-two millions six hundred and forty thousand of these animals.

This useful and advantageous method of hatching eggs has been lately discovered in France, by the ingenious Mr Reaumur, who, by a number of experiments, has reduced the art to certain principles. He found by experience that the heat necessary for this purpose is nearly the same with that marked 32 on his thermometer, or that marked 96 on Fahrenheit's. This degree of heat is nearly that of the skin of the hen, and, what is remarkable, of the skin of all other domestic fowls, and probably of all other kinds of birds. The degree of heat which brings about the development of the cygnet, the gosling, and the turkey-pout, is the same as that which fits for hatching the canary-songster, and, in all probability, the smallest humming bird: the difference is only in the time during which this heat ought to be communicated to the eggs of different birds: it will bring the canary bird to perfection in eleven or twelve days, while the turkey-pout will require twenty-seven or twenty-eight.

After many experiments, Mr Reaumur found that stoves heated by means of a baker's oven, succeeded better than those made hot by layers of dung: and the furnaces of glass-houses, and those of the melters of metals, by means of pipes, to convey heat into a room, might, no doubt, be made to answer the same purpose. As to the form of the stoves, no great nicety is required; a chamber over an oven will do very well; nothing more will be necessary but to ascertain the degree of heat, which may be done by melting a lump of butter, of the size of a walnut, with half as much tal-

low, and putting it into a phial; this will serve to indicate the heat with sufficient exactness, for when it is too great, this mixture will become as liquid as oil, and when the heat is too small, it will remain fixed in a lump; but it will flow like a thick syrup, upon inclining the bottle, if the stove be of a right temper: great attention therefore should be given to keep the heat always at this degree, by letting in fresh air, if it be too great, or shutting the stove more close, if it be too small; and that all the eggs in the stove may equally share the irregularities of the heat, it will be necessary to shift them from the sides to the centre; thereby imitating the hens, who are frequently seen to make use of their bills, to push to the outer parts those eggs that were nearest to the middle of their nests, and to bring into the middle such as lay nearest the sides.

Mr Reaumur has invented a sort of low boxes, without bottoms, and lined with furs. These, which he calls artificial parents, not only shelter the chickens from the injuries of the air, but afford a kindly warmth, so that they presently take the benefit of their shelter as readily as they would have done under the wings of a hen. After hatching, it will be necessary to keep the chickens, for some time, in a room artfully heated and furnished with these boxes; but afterwards they may be safely exposed to the air in the court yard, in which it may not be amiss to place one of these artificial parents to shelter them if there should be occasion for it.

As to the manner of feeding the young brood, they are generally a whole day after being hatched, before they take any food at all; and then a few crumbs of bread may be given them for a day or two, after which they will begin to pick up insects and grubs for themselves.

But to save the trouble of attending them, capons may be taught to watch them in the same manner as hens do. Mr Reaumur assures us, that he has seen above two hundred chickens at once, all led about and defended only by three or four such capons. Nay, cocks may be taught to perform the same office, which they, as well as the capons, will continue to do all their lives after.

**HATFIELD**, a market-town of Hertfordshire, situated twenty miles north west of London.

**HATHERLY**, a market-town of Devonshire, twenty miles north west of Exeter.

**HATTEM**, a town of Gelderland, one of the United Provinces: E. long 6°, N. lat. 52° 30'.

**HATTOCK**, a shock of corn containing twelve sheaves: others make it only three sheaves laid together.

**HATUAN**, a town of Upper Hungary, fifteen miles north east of Buda: E. long. 19° 35', and N. lat. 47° 48'.

**HAVANNA**, a port-town of the island of Cuba, in America, situated at the entrance of the gulph of Mexico: subject to Spain: W. long. 84°, and N. lat. 23°.

**HAVANT**, a market town of Hampshire, six miles north-east of Portsmouth.

**HAVEL**, a river of Brandenburg, in Germany, which

receives the river Spree, near Berlin, and discharges itself into the Elbe, a little below Havelburg.

**HAVELBURG**, a town of Germany, in the circle of Upper Saxony, and marquise of Brandenburg, subject to the king of Prussia: E. long. 12° 44', and N. lat. 53°.

**HAVEN**, a sea-port or harbour. See **HARBOUR**.

**HAVERFORD-WEST**, a borough-town of Pembroke-shire, in south Wales, situated twelve miles south east of St David's. It sends only one member to parliament.

**HAUNCH**, or **HANCH**, the hip, or that part of the body between the last ribs and the thigh.

**HAVRE DE GRACE**, is a port-town of France, in the province of Normandy, situated on the English channel, at the mouth of the river Seyne: E. long. 10', and N. lat. 49° 30'.

**HAUTBOY**, a musical instrument of the wind kind, shaped much like the flute, only that it spreads and widens towards the bottom, and is sounded through a reed. The treble is two feet long; the tenor goes a fifth lower, when blown open: it has only eight holes; but the bass, which is five feet long, has eleven.

**HAW**, a sort of berry, the fruit of several species of *mespilus*, thence denominated haw-thorns. See **MESPILUS**.

**HAW**, among farriers, an excrescence resembling a gristle, growing under the nether eye-lid and eye of a horse, which, if not timely removed, will put it quite out. See **FARRIERY**.

**HAWK**. See **FALCO**.

**HAWKING**, the exercise of taking wild-fowl by means of hawks.

**HAWSER**, in the sea-language, a large rope, or a kind of small cable, serving for various uses a-board a ship, as to fasten the main and fore shrouds, to warp a ship as she lies at anchor, and wind her up to it by a capstan, &c. The hawser of a man of war may serve for a cable to the sheet-anchor of a small ship.

**HAWSES**, in a ship, are two large holes under the bow, through which the cables run when she lies at anchor.

**HAY**, any kind of grass, cut and dried, for the food of cattle.

The time of mowing grass for hay, must be regulated according to its growth and ripeness; nothing being more prejudicial to the crop than mowing it too soon, because the sap is not then fully come out of the root, and when made into hay, it shrinks away to nothing. It must not, however, be let stand too long, till it have shed its seeds. When the tops of the grass look brown, and begin to bend down, and the red honey-suckle flowers begin to wither, you may conclude it ripe for mowing.

*St Foix* HAY. See **AGRICULTURE**, p. 65.

**HAY**, in geography, a market-town in Brecknockshire, south Wales, thirteen miles north-east of Brecknock.

**HAYNAULT**, a province of the Netherlands, bounded by Brabant and Flanders, on the north; by Namur and

and Liege, on the east; by the Cambresis, Picardy, and Champaign, on the south; and by Artois, and another part of Flanders, on the west: the north part is subject to the house of Austria, and the south part to France. Its capital is Mons.

**HAYWARD**, the person who keeps the common herd or cattle of a town.

**HAZARD**, a game on dice, without tables, is very properly so called; since it speedily makes a man, or undoes him.

It is played with only two dice; and as many may play at it as can stand round the largest round table.

Two things are chiefly to be observed, *viz.* main and chance; the latter belonging to the caster, and the former, or main, to the other gamesters. There can be no main thrown above nine, nor under five; so that five, six, seven, eight, and nine, are the only mains flung at hazard. Chances and nicks are from four to ten: thus four is a chance to nine, five to eight, six to seven, seven to six, eight to five; and nine and ten a chance to five, six, seven, and eight: in short, four, five, six, seven, eight, nine, and ten, are chances to any main, if any of these nick it not. Now nicks are either when the chance is the same with the main, as five and five, or the like; or six and twelve, seven and eleven, eight and twelve. Here observe, that twelve is out to nine, seven, and five; eleven is out to nine, eight, six, and five: and ames-ace and duce-ace, are out to all mains whatever.

**HAZLE**, in botany. See **CORYLUS**.

**HAZLE-EARTH**, or **HAZLEY EARTH**, a kind of red loam, which is said to be an excellent mixture with other sorts of earth; uniting what is too loose, cooling what is too hot, and gently entertaining the moisture.

**HEAD**, in anatomy. See **ANATOMY**, Part I. II &c.

**HEAD-ACH**, a most troublesome sensation in the head, produced by various causes, and attended with different symptoms, according to its different degrees, and the place where it is seated. See **MEDICINE**.

**Dragon's HEAD**, in astronomy, &c. is the ascending node of the moon, or other planet.

**HEADFORD**, a town of Galway, in Ireland, twelve miles north of the city of Galway.

**HEALTH** is a right disposition of the body, and of all its parts; consisting in a due temperature, a right conformation, just connection, and ready and free exercise of the several vital functions.

**HEAM**, in beasts, is the same with the secundines, or after-birth in women.

**HEARING**, the sense whereby we perceive sounds.

The organ of hearing is the ear, and particularly the auditory nerve and membrane. See **ANATOMY**, p. 295.

This membrane, in the various degrees of tension and relaxation, adapts itself to the several natures and states of sonorous bodies; becoming tense for the reception of acute sounds, and relaxed for the admission of grave sounds. In short, it is rendered tense and relaxed in a thousand different degrees, according to the various degrees of acuteness or gravity in sounds.

Sound, then, is in effect nothing out a certain mo-

dulation of the air, which being collected by the external ear, passes through the meatus auditorius, and beats upon the membrane of the tympanum, which moves the bones in the tympanum: these move the internal air, which finally communicates the motion to the auditory nerve, in the labyrinth and cochlea; and according as the vibrations are quick or slow, the sound is either acute or grave.

It deserves observation, that though the air be the usual matter of sounds; so that if a bell be hung in vacuo, it will not be heard at all; yet most other bodies, properly disposed, will do its office, only some more faintly than others. Thus a sound may be heard through water, or even through earth, of which there are various instances.

As the sight is assisted by spectacles, or other glasses; so the hearing is enlivened and rendered quick, by means of acoustic instruments; which are of various figures, but for the most part bear some resemblance to a trumpet, diverging and growing wider towards the external mouth.

**HEARSE**, among sportsmen, a hind of the second year of her age.

**HEART**, in anatomy. See **ANATOMY**, p. 278.

**Force of the HEART**. Several ingenious persons have, from time to time, attempted to make estimates of the force of the blood in the heart and arteries; who have as widely differed from each other, as they have from the truth, for want of a sufficient number of data to argue upon. This set the truly ingenious Dr Hales upon making proper experiments, in order to ascertain the force of the blood in the veins and arteries of several animals.

If, according to Dr Keil's estimate, the left ventricle of a man's heart throw out in each systole an ounce or 1.638 cubic inches of blood, and the area of the orifice of the aorta be  $\approx 0.4187$ : then dividing the former by this, the quotient 3.9 is the length of the cylinder of blood, which is formed in passing through the aorta in each systole of the ventricle; and in the seventy-five pulses of a minute, a cylinder of 292.5 inches in length will pass: this is at the rate of 1462 feet in an hour. But the systole of the heart being performed in one third of this time, the velocity of the blood in that instant will be thrice as much, *viz.* at the rate of 4386 feet in an hour, or 73 feet in a minute. And if the ventricle throws out one ounce in a pulse, then in the seventy-five pulses of a minute, the quantity of blood will be equal to 4.4 lb 11 oz. and, in thirty-four minutes, a quantity equal to a middle-sized man, *viz.* 158 lb. will pass through the heart. But if, with Dr Harvey and Dr Lower, we suppose two ounces of blood, that is, 3.276 cubic inches, to be thrown out at each systole of the ventricle, then the velocity of the blood in entering the orifice of the aorta, will be double the former, *viz.* at the rate of 146 feet in a minute, and a quantity of blood equal to the weight of a man's body will pass in half the time, *viz.* 17 minutes.

If we suppose, what is probable, that the blood will rise  $7\frac{1}{2}$  feet high in a tube fixed to the carotide artery

tery of a man, and that the inward area of the left ventricle of his heart is equal to fifteen square inches; these multiplied into  $7\frac{1}{2}$  feet, give 1350 cubic inches of blood, which presses on that ventricle, when it first begins to contract, a weight equal to 15.5 pounds.

What the doctor thus calculates, from supposition, with regard to mankind, he actually experimented upon horses, dogs, fallow-deer, &c. by fixing tubes, in

orifices opened in their veins and arteries; by observing the several heights, to which the blood rose in these tubes, as they lay on the ground; and by measuring the capacities of the ventricles of the heart, and orifices of the arteries. And, that the reader may the more readily compare the said estimates together, he has given a table of them, ranged in the following order.

The several animals.	Weight of each.	Height of the blood in the tube from the jugular vein.	Height of the blood in tubes fixed to arteries.	Capacity of the left ventricle of the heart.	Area of the orifice of the aorta.	Velocity of the blood in the aorta.	Quantities of blood equal to the weight of the animal, in what time.	How much in a minute.	Weight of the blood sustained by the left ventricle contracting.	N <sup>o</sup> of pulses in a minute.	Area of transverse section of descending aorta.	Area of the transverse section of ascending aorta.
	Pounds. Ounces.	Inches.	Feet Inches.	Cubic inches.	Square inches.	Feet and inches in a minute.	Minutes.	Pounds.	Pounds.		Square inches.	Square inches.

**HEAT**, in physiology, one of the secondary qualities of bodies, produced by fire, and opposed to cold.

Under the article fire, we considered the sun as the principal source of heat upon the earth's surface, and the confines of the earth and atmosphere: without this, all the bodies upon our globe would doubtless grow rigid, lifeless, and fixed. It is this that stirs within them, as the main spring of their actions. Hence vegetation and animalization are evidently promoted; and hence the ocean and the atmosphere continue in a fluid state.

Heat in us is properly a sensation, excited by the action of fire; or it is the effect of fire on our organs of feeling. Hence it follows, that what we call heat is a particular idea or modification of our own mind, and not any thing existing in that form in the body that occasions it. Heat, says Mr Locke, is no more in the fire that burns the finger, than pain is in the needle that pricks it. In effect, heat in the body that

gives it, is only motion; and in the mind, only a particular idea.

Heat in the hot body, according to 'S Gravesande, is an agitation of the parts of the body, made by means of the fire contained in it: by such an agitation a motion is produced in our bodies, which excites the idea of heat in our mind; so that heat in respect of us is nothing but that idea, and in the hot body nothing but motion. If such motion expel the fire in right lines, it gives us the idea of light; if in a various and irregular motion, only heat.

Heat, with respect to our sensations, or the effect produced on us by a hot body, is estimated by its relation to the organ of feeling; no object appearing to be hot, unless its heat exceed that of our body. Whence the same thing to different persons, or at different times to the same person, shall appear both hot and cold. The degree of heat is measured by the expansion of the air, or spirit in the thermometer.

It

It has been justly observed, by some of our modern philosophers, that actual or absolute heat, is to sensible or relative heat, the same as motion is to velocity: for absolute heat is nothing but the whole motion of all the parts of the ignited body; and sensible or relative heat, respects only the comparative velocity of the parts. Thus, equal bulks of mercury and water set in a sand-heat, where the heat of the fire may be uniformly communicated to both, will acquire in equal times equal-degrees of absolute heat: but the relative heat of the water, or that which is sensible to the finger, will be near 14 times as great as that of the mercury, because the water, having 14 times a less quantity of matter, will admit of velocity so much in proportion greater.

Again, if mercury and water have the same relative or sensible heat, that is, if both are heated in such a manner as to cause an equal ascent in the thermometer, then a quantity of mercury will heat 14 times as much water as the same quantity of water will do; or it will make the same quantity of cold water 14 times hotter than the same quantity of hot water can. All which is easy to be shewn by experiment, and abundantly proves, that heat and fire are wholly owing to the velocity of the parts of the heated or ardent body: on which theory the various phenomena of heat, cold, fire, burning, &c. are rationally accounted for. For, first, we are to consider, that cold and heat are only comparative terms, or that the same thing may either be too hot, or too cold, according to the relative idea or standard-degree. Thus, ice or snow is said to be cold with respect to the finger, but ice or snow is warm if compared to a freezing mixture; so that if (as we commonly do) we make the hand or any part of the body the standard of heat or cold, or the term of comparison; then it is evident, 1. If the parts of any body, applied to the hand, have the same velocity as the parts of the hand, such a body we naturally pronounce is neither hot nor cold. 2. If the particles of the body have a greater velocity than those of the hand, we pronounce it warm, if the excess be small; but hot, if it be great. 3. If the velocity of the parts of the body applied be less than that in the hand, the sensation then is what we call cold, which also may be in various degrees. 4. Hence it is plain, there can be no such thing as absolute cold, but where the particles of matter are absolutely quiescent or at rest. 5. Hence also, there can be no such thing as absolute heat, because no degree of velocity can be assigned but a greater is still assignable, till we come to infinity, where we are quite lost, as having no idea of infinite velocity or heat.

From this theory of heat and cold we may conclude, that there is no body in nature whose parts are not in motion, in some degree, since we have yet been able to discover no ultimate degree or limit of cold; and if any such thing were to be found in nature, it is likely that it would be as impossible to bear or endure the test, as any extreme degree of heat; both heat and cold naturally tending to destroy the animated part, or test, in the extreme degrees: cold, by destroying

the vital motion, and fixing the part rigid and inflexible; but heat, by putting the parts into too great an agitation, causing a greater velocity of the fluids, and dissipation and a force of tension in the solids beyond what the natural state of the body can bear; and therefore it will inevitably destroy it.

HEAT, in the animal œconomy, known by the several names of natural heat, vital heat, innate heat, and animal heat, is commonly supposed to be that generated by the attrition of the parts of the blood, occasioned by its circulatory motion, especially in the arteries.

To what organs or operations, the heat of the human body, and other animal bodies, is owing, is hitherto extremely doubtful. The opinions that at present prevail are, 1. That the heat of animal-bodies is owing to the attrition betwixt the arteries and the blood. 2. That the lungs are the fountain of this heat. 3. That the attrition of the parts of the solids on one another produce it. 4. That it is owing to the mechanical attrition of the particles of our fluids. To which opinions Dr Stevenfon of Edinburgh added a 5th, viz. That whole process by which our aliment and juices are constantly undergoing some alteration.

The reasonings in favour of these several opinions may be seen at large, as laid down by the above-mentioned author in an essay on the cause of animal-heat, in the Medical Essays, vol. vi. The chief arguments in favour of the first opinion, are, that if an artery is tied, or cut, the part to which it goes turns cold; and on the ceasing of the pulsation of the arteries, cold and death follow. An increase of heat attends a brisk circulation, and a languid circulation is accompanied with a small heat. One who burns in a fever, or is hot with exercise, has a full and frequent pulse. In cold faintings, chlorosis, &c. the pulse is small and slow. To these they add, that the thermometer shews the arterial blood to be a little hotter than that of the veins.

This is accounted for from the conical figure of the arteries, from their fluxes and branches into exquisitely small capillaries; whence the resistance, and consequently the attrition, must be great, from the number, strength, and elasticity of their coats, from the propelling power of the heart, and their strong resistance. From all these it is inferred, that the particles of blood perpetually getting new motions, directions, and rotations, are attenuated, condensed, have their angles grinded off, and are made homogeneous: hence, it is said, follows the fluidity, red colour, and heat of the mass, which is here perfected.

The second opinion is, that the lungs are the fountain of heat in the human body. All that has been said for the blood's being heated in the arteries is advanced to prove this hypothesis, with considerable additions, viz. that in the lungs the blood-vessels every where attend, divide, and subdivide, along with the ramifications of the wind-pipe; and as these are perpetually changing their situation and form, becoming longer or shorter, making more acute or more obtuse angles,

angles, so must the concomitant blood-vessels every moment make new angles, and give the blood new directions; that at last it enters into an exquisitely fine net-work, spreads every where on the vastly thin air-vesicles, where these air-bladders are perpetually changing their angles, points of contact, their form, volume, interstices, and so forth. From these and the elasticity of the air, and weight of the atmosphere, the blood is said to be churned, pressed backward and forward, broken and kneaded together, dissolved and condensed, made red and hot in respiration.

The third opinion is, that the cause of the animal heat is owing to the action of the solid parts upon one another. The reason in support of this opinion, is, that the heart and arteries move most; thence that it is natural to think, that the heat should be owing to this motion.

The fourth opinion is, the mechanical attrition of the particles of the fluids upon one another. Dr Stevenson observes, that those who support this hypothesis, must not only suppose that mechanical attrition begets heat, but begets itself without diminution; that they must not only shew what sets this attrition agoing, but what maintains it, because all mechanical force perpetually decreases in a resisting medium; in short, that they must shew the possibility of a perpetuum mobile, the impossibility of which they themselves demonstrate.

The fifth opinion is, what Dr Stevenson calls the animal process, or that process by which our aliment and fluids are perpetually undergoing some alteration. This process, according to that writer, may be one *sui generis*, somewhat of a middle nature betwixt fermentation and putrefaction; and he thinks it comes so near to the latter, that he chuses to call it by that name. In putrefaction, which is a most powerful dissolvent of bodies, the intestine action of their minute particles creates, collects, or some way or other is the cause or means of heat. The doctor thinks it probable that this process is constantly carried on in all our juices, especially where there is blood; and this is chiefly in the veins, so that the blood is both the fountain of heat and the first spring and motion.

The late Dr Mortimer, in the *Philos. Trans.* n<sup>o</sup> 476. gives it as his opinion, that the heat of animals is explicable from the phosphorus and air they contain. Phosphorus exists, at least in a dormant state, in animal fluids; and it is also known, that they all contain air: it is therefore only necessary to bring the phosphoreal and aerial particles into contact, and heat must of consequence be generated.

**HEATH**, in botany. See **ERICA**.

**Berry-bearing HEATH**. See **EMPETRUM**.

**HEATHENS**, in matters of religion. See **PAGANS**.

**HEAVEN**, literally signifies the expanse of the firmament, surrounding our earth, and extended every way to an immense distance.

The Hebrews acknowledged three heavens: the first the aerial heaven, in which the birds fly, the winds blow, and the showers are formed; the second, the firmament in which the stars are placed; the third,

the heaven of heavens, the residence of the Almighty, and the abode of saints and angels.

Heaven is considered by Christian divines and philosophers, as a place in some remote part of infinite space, in which the omnipresent Deity is said to afford a nearer and more immediate view of himself, and a more sensible manifestation of his glory, than in the other parts of the universe. This is often called the empyrean, from that splendor with which it is supposed to be invested; and of this place the inspired writers give us the most noble and magnificent descriptions.

The pagans considered heaven as the residence only of the celestial gods, into which no mortals were admitted after death, unless they were deified. As for the souls of good men, they were consigned to the *elysian fields*. See **ELYSIAN FIELDS**.

**HEBDOMARY**, a solemnity of the ancient Greeks, in honour of Apollo, in which the Athenians sung hymns in honour of that god, and carried in their hands branches of laurel. The word signifies the seventh day, this solemnity being observed on the seventh day of every lunar month.

**HEBENSTRETIA**, in botany, a genus of the didynamia angiospermia class. The calix is bilabiate; the corolla has but one labium, consisting of four segments; and the capsule contains two seeds. There are two species, both natives of Ethiopia.

**HEBRAISM**, an idiom or manner of speaking peculiar to the Hebrew language. See the next article.

**HEBREW**, or **HEBREW LANGUAGE**, that spoken by the ancient Jews, and wherein the Old Testament is wrote.

This appears to be the most ancient of all the languages in the world, at least we know of none older: and some learned men are of opinion, that this is the language in which God spoke to Adam in Paradise.

The books of the Old Testament are the only pieces to be found, in all antiquity, written in pure Hebrew; and the language of many of these is extremely sublime; it appears perfectly regular, and particularly so in its conjugations; indeed, properly speaking it has but one conjugation, but this is varied in each seven or eight different ways, which has the effect of so many different conjugations, and affords a great variety of expressions to represent by a single word the different modifications of a verb, and many ideas which in the modern and in many of the ancient and learned languages cannot be expressed without a periphrasis.

The primitive words, which are called roots, have seldom more than three letters or two syllables.

In this language there are twenty-two letters, only five of which are usually reckoned vowels, which are the same with ours, *viz.* *a, e, i, o, u*; but then each vowel is divided into two, a long and a short, the sound of the former being somewhat grave and long, and that of the latter short and acute: it must however be remarked, that the two last vowels have sounds that differ in other respects besides quantity, and a greater or less elevation. To these ten or twelve vowels may be added others called semi-vowels, which serve to connect the consonants, and to make the easier transitions from

from one another. The number of accents to this language are, indeed, prodigious : of these there are near forty, the use of some of which, notwithstanding all the inquiries of the learned, are not yet perfectly known. We know, in general, that they serve to distinguish the sentences like the points called commas, semicolons, &c. in our language ; to determine the quantity of the syllables, and to mark the tone with which they are to be spoken or sung. It is no wonder then, that there are more accents in the Hebrew than in other languages, since they perform the office of three different things, which in other languages are called by different names.

**HEBREWS**, or *Epistle to the Hebrews*, a canonical book of the New Testament.

Though St Paul did not prefix his name to this epistle, the concurrent testimony of the best authors ancient and modern afford such evidence of his being the author of it, that the objections to the contrary are of little or no weight.

The Hebrews, to whom this epistle was wrote, were the believing Jews of Palestine ; and its design was to convince them, and by their means all the Jewish converts wheresoever dispersed, of the insufficiency and abolishment of the ceremonial and ritual law.

**HEBRIDES**, islands on the west of Scotland, of which Sky, Mull, Isla, and Arran are some of the largest.

**HECATOMB**, among the ancient pagans, was the sacrifice of an hundred bulls or oxen ; or, in a less confined sense, an hundred animals of any sort.

**HECATOMBÆON**, in ancient chronology, the first month of the Athenian year, consisting of thirty days, and answering to the latter part of our June.

**HECK**, an engine to take fish. A salmon heck is a grate for catching that sort of fish.

**HECTIC FEVER**. See **MEDICINE**.

**HEDERA**, in botany, a genus of the pentandria monogynia class. The corolla consists of five oblong petals, and the berry contains five seeds. There are two species ; one of them, *viz.* the helix, is a native of Britain.

**HEDERA TERRESTRIS**. See **GLECHOMA**.

**HEDGES**, in agriculture, are either planted to make fences round inclosures, or to divide the several parts of a garden. When they are designed as outward fences, they are planted either with haw thorn, crabs, or black-thorn ; but those hedges which are planted in gardens, either to surround wilderness-quarters, or to screen the other parts of a garden from sight, are planted according to the fancy of the owner, some preferring ever-greens, in which case the holly is best ; next the yew, then the laurel, laurustinus, phillyria, &c. others prefer the beech, the hornbeam, and the elm.

**HEDMORA**, a city of Sweden, in the province of Westmania, situated on the river Dalcarlia, fifty miles north-west of Upsal : E. long. 15° 55', and N. lat. 60° 16'.

**HEDYOTIS**, in botany, a genus of the tetrandria monogynia class. The calix consists of one funnel shaped petal ; and the capsule has two cells, and many seeds. There are three species, all natives of Ceylon.

**HEDYSARUM**, in botany, a genus of the diadelphia decandria class. The corolla is transversely carinated ; and the pod is jointed, each joint containing one seed. There are 46 species, only one of which is a native of Britain, *viz.* the St Foin, or cocks-head.

**HEEL**, in anatomy. See **ANATOMY**, p. 185.

**HEEL**, in the sea language. If a ship leans on one side, whether she be a-ground or a-float, then it is said she heels a starboard, or a-port ; or that she heels off-wards, or to the shore ; that is, inclines more to one side than to another.

**HEELER**, or *Bloody heel-cock*, a fighting cock that strikes or wounds much with his spurs.

The masters know such a cock, even while a chicken, by the striking of his two heels together in his going.

**HEGIRA**, in chronology, a celebrated epocha among the Mahometans.

The event which gave rise to this epocha was the flight of Mahomet from Mecca, with his new profelytes, to avoid the persecution of the Coraischites ; who, being then most powerful in the city, could not bear that Mahomet should abolish idolatry, and establish his new religion. This flight happened in the fourteenth year after Mahomet had commenced prophet : he retired to Medina, which he made the place of his residence.

**HEIDELBURG**, a city of Germany, in the circle of the lower Rhine, the capital of the Palatinate, situated on the river Neckar : E. long. 8° 40', and N. lat. 49° 20'.

**HEILA**, a port-town of regal Prussia, in the kingdom of Poland, situated on the point of a peninsula in the Baltic sea, twelve miles north of Dantzick : E. long. 19°, N. lat. 54° 30'.

**HEINUSE**, among hunters, a roe-buck of the fourth year.

**HEIR**, in Scots law, a generic term applicable to those who are intitled by law to take the possession of any subject which belonged to a person deceased.—For the different kinds of heirs, &c. see **LAW**, tit. 27. & 28.

**HEIRSHIP moveables**, in Scots law, the best of certain kinds of moveables, which the heir of line is intitled to take, besides the heretable estate. See **LAW**, tit. 27.

**HEIR-APPARENT**, is a person so called in the lifetime of his ancestor, at whose death he is heir at law.

**HEIRESS**, a female heir to one who has an estate in lands, &c. Stealing an heiress, and marrying her against her will, was declared felony by 3 Hen. VII.

**HELENA**, or *St HELENA*, an island in the Atlantic ocean, situated 1200 miles west of the coast of Africa, and 1800 east of the coast of South America : W. long. 6° 30', S. lat. 16°.

**HELENIUM**, in botany, a genus of the syngenesia polygamia superflua class. The receptacle is naked ; the calix is simple, and consists of many leaves ; and the corollule of the radius are semitrid. There is but one species, a native of Austria.

**HELIÆA**,

**HELIAEA**, in Grecian antiquity, was the greatest and most frequented court in Athens for the trial of civil affairs. The judges who sat in it were at least fifty, but the more usual number was either two or five hundred. When causes of great moment were to be tried, it was customary to call in the judges of the other courts: sometimes a thousand were called in, and then two courts are said to have been joined; sometimes fifteen hundred or two thousand were called in, and then three or four courts met together.

They had cognizance of civil affairs of the greatest weight and importance, and were not permitted to give judgment till they had taken a solemn oath to do it with impartiality, and to give sentence according to the laws, &c.

**HELIACAL**, in astronomy, a term applied to the rising or setting of the stars; or, more strictly speaking, to their emersion out of, and immersion into, the rays and superior splendor of the sun.

A star is said to rise heliacally, when after having been in conjunction with the sun, and on that account invisible, it comes to be at such a distance from him, as to be seen in the morning before sun-rising; the sun, by his apparent motion, receding from the star towards the east: on the contrary, the heliacal setting is when the sun approaches so near a star, as to hide it with his beams, which prevent the fainter light of the star from being perceived; so that the terms apparition and occultation would be more proper than rising and setting.

**HELIANTHEMUM**, in botany, see the article **CISTUS**.

**HELIANTHUS**, the *Great sun-flower*, in botany, a genus of the syngenesia polygamia frustranea class. The receptacle is paleaceous and plane; the pappus consists of two leaves; and the calix is imbricated and squarrous. There are twelve species, none of them natives of Britain.

**HELIASTES**, in antiquity, one of the judges of the court heliaea. See **HELIAEA**.

**HELICTERES**, the *screw-tree*, in botany, a genus of the gynandria decandria class. It has five styli; the calix consists of one oblique leaf; the petals are five; the nectarium consists of five small leaves; and it has five twisted capsules. There are four species, none of them natives of Britain.

**HELIOCARPUS**, in botany, a genus of the dodecandria digynia class. The calix consists of four leaves; the petals are four; the styli are simple; and the capsule consists of two compressed cells, radiated on each side. There is but one species, a native of America.

**HELIOCENTRIC latitude of a planet**, the inclination of a line drawn between the centre of the sun and the center of a planet, to the plane of the ecliptic.

**HELIOCENTRIC place of a planet**, in astronomy, the place of the ecliptic wherein the planet would appear to a spectator placed at the centre of the sun.

**HELIOCOMETES**, a phenomenon sometimes observed about sun setting; being a large luminous tail, or column of light, proceeding from the body of the sun,

and dragging after it, not unlike the tail of a comet; whence the name.

**HELIOSCOPE**, in optics, a sort of telescope, peculiarly fitted for viewing the sun without hurting the eyes.

**HELIOSTATA**, in optics, an instrument invented by the late learned Dr S Gravelande; who gave it this name, from its fixing, as it were, the rays of the sun in an horizontal direction across the dark chamber all the while it is in use.

**HELIX**, in anatomy. See **ANATOMY**, p. 298.

**HELIX**, in zoology, a genus belonging to the order of vermes testacea. It is an animal of the snail-kind; the shell consists of one spiral, brittle, and almost diaphanous valve; and the aperture is narrow. There are 60 species, principally distinguished by the figure of their shells.

**HELL**, the place of divine punishment after death.

As all religions have supposed a future state of existence after this life; so all have their hell or place of torment, in which the wicked are supposed to be punished. The hell of the ancient heathens was divided into two mansions; the one called elysium, on the right hand; pleasant and delightful, appointed for the souls of good men; the other called tartara, on the left, a region of misery and torment, appointed for the wicked. The latter only was hell, in the present restrained sense of the word. See **ELYSIUM**.

The philosophers were of opinion, that the infernal regions were at an equal distance from all the parts of the earth; nevertheless it was the opinion of some, that there were certain passages which led thither, as the river Lethe near the Syrtis, and the Acherusian cave in Epirus. At Hermione it was thought, that there was a very short way to hell; for which reason the people of that country never put the fare into the mouths of the dead to pay their passage.

The Jews placed hell in the centre of the earth, and believed it to be situated under waters and mountains. According to them, there are three passages leading to it: the first is in the wilderness, and by that Korah, Dathan and Abiram descended into hell; the second is in the sea, because Jonah, who was thrown into the sea, cried to God out of the belly of hell; the third is in Jerusalem, because it is said the fire of the Lord is in Zion, and his furnace is in Jerusalem. They likewise acknowledged seven degrees of pain in hell, because they find this place called by seven different names in scripture. Though they believed that infidels, and persons eminently wicked, will continue for ever in hell; yet they maintained, that every Jew who is not infected with some heresy, and has not acted contrary to the points mentioned by the rabbins, will not be punished therein for any other crimes above a year at most.

The Mahometans believe the eternity of rewards and punishments in another life. In the Koran it is said, that hell has seven gates, the first for the Mussulmans, the second for the Christians, the third for the Jews, the fourth for the Sabians, the fifth for the Magians, the

the sixth for the pagans, and the seventh for the hypocrites of all religions.

Among Christians, there are two controverted questions in regard to hell; the one concerns locality, the other the duration of its torments. The locality of hell, and the reality of its fire, began first to be controverted by Origen. That father, interpreting the scripture account metaphorically, makes hell to consist not in external punishments, but in a consciousness or sense of guilt, and a remembrance of past pleasures. Among the moderns, Mr Whiston advanced a new hypothesis. According to him, the comets are so many hells appointed in their orbits alternately to carry the damned into the confines of the sun, there to be scorched by its violent heat, and then to return with them beyond the orb of Saturn, there to starve them in these cold and dismal regions. Another modern author, not satisfied with any hypothesis hitherto advanced, assigns the sun to be the local hell. As to the second question, *viz.* the duration of hell-torments, we have Origen again at the head of those who deny that they are eternal; it being that father's opinion, that not only men, but devils, after a due course of punishment suitable to their respective crimes, shall be pardoned and restored to heaven. The chief principle upon which Origen built his opinion, was the nature of punishment, which he took to be emendatory, applied only as physic for the recovery of the patient's health. The chief objection to the eternity of hell torments among modern writers, is the disproportion between temporary crimes and eternal punishments. Those who maintain the affirmative, ground their opinions on scripture accounts, which represent the pains of hell under the figure of a worm which never dies, and a fire which is not quenched; as also upon the words, "These shall go away into everlasting punishment, but the righteous into life eternal."

**HELLEBORUS**, **HELLEBORE**, in botany, a genus of the polyandria polygynia class. It has no calix; the petals are five or more; the nectarium is tubular and bilabiate; and the capsule contains many seeds. There are five species, two of them natives of Britain, *viz.* the *fætidus*, or great bastard black hellebore; and the *viridis*, or wild black hellebore. The hellebore, when taken in large quantities, is poisonous; but the root, in small doses, is supposed to attenuate the humours, and to promote urinary and uterine discharges.

**HELLENISM**, in matters of language, a phrase in the idiom, genius, or construction of the Greek tongue.

This word is only used when speaking of the authors who, writing in a different language, express themselves in a phraseology peculiar to the Greek.

**HELLENISTIC**, or **HELLENISTIC LANGUAGE**, that used by the Grecian Jews who lived in Egypt and other parts where the Greek tongue prevailed. In this language it is said the Septuagint was written, and also the books of the New Testament; and that it was thus denominated to shew that it was Greek filled with Hebraisms and Syriacisms.

**HELLESPONT**, the entrance of the streights which divides Asia from Europe, and passes from the Archi-

pelago to Constantinople. It is now called the Dardanelles, and is about two miles wide.

**HELM** of a ship, is a piece of timber fastened into the rudder, which comes forward into the steerage, or place where the person at the helm steers the ship, by holding the whipstaff in his hand, which is joined to the helm. They begin however to be left off, steerwheels being used in their room.

There are several terms in the sea-language relating to the helm; as, *bear up the helm*; that is, let the ship go more large before the wind. *Helm a mid ship*, or *right the helm*; that is, keep it even with the middle of the ship. *Port the helm*, put it over the left side of the ship. *Starboard the helm*, put it on the right side of the ship.

**HELMET**, an ancient defensive armour worn by horsemen both in war and in tournaments. It covered both the head and face, only leaving an aperture in the front secured by bars, which was called the visor.

**HELMINTHOLITHUS**, in natural history, a name given by Linnæus to petrified bodies resembling worms.

Of these he reckons four genera. 1. Petrified lithophyta, found in the mountains of Sweden. 2. Petrified shells. 3. Petrified zoophytes. 4. Petrified reptiles.

**HELMONT**, a town of the Netherlands, in the province of Dutch Brabant, situated on the river Aa: E. long. 5° 40', N. lat. 51° 30'.

**HELMSTAT**, a town of Germany, in the circle of Lower Saxony, and dukedom of Brunswic: E. long. 11° 15', N. lat. 52° 20'.

**HELOTS**, in Grecian antiquity, the inhabitants of Helos, a town of Laconia, conquered by the Spartans; who made them all prisoners of war, and reduced them into the condition of slaves.

The freemen of Sparta were forbidden the exercise of any mean or mechanical employment, and therefore the whole care of supplying the city with necessaries devolved upon the Helots.

**HELSINGFORD** a port town of Sweden, situated on the gulph of Finland, in 24° 6' E. long. and 60° 8' N. lat.

**HELSINGIA**, a province of Sweden, bounded by the Bothnic gulph on the east, and by Dalecarlia on the west.

**HELSINGIC CHARACTER**, a peculiar kind of character, found inscribed on stones in the province of Helsingia: the Runic and Helsingic characters may be easily transformed into each other.

**HELSTON**, a borough of Cornwall, nine miles south-west of Falmouth: it sends two members to parliament.

**HELVOETSLUYS**, a port-town of the united Netherlands, situated in the island of Voorn, in the province of Holland, five miles south of the Briel: it is one of the best harbours in Holland, and that to which the English packet always goes.

**HEMEROBIOUS**, in zoology, a genus of insects of the neuroptera order, the characters of which are these: The mouth is furnished with two teeth; the palpi are four; the wings are destitute, but not plaited; and

the antennæ are bristly and longer than the breast. There are 15 species, principally distinguished by their colours.

**HEMEROCALLIS**, DAY-LILLY, in botany, a genus of the hexandria-monogynia class. The corolla is bell-shaped, with a cylindrical tube; and the stamina are declinated. There are two species, none of them natives of Britain.

**HEMI**, a word used in the composition of divers terms, signifying the same with semi, or demi, viz. one half.

**HEMINA**, in Roman antiquity, a liquid measure which, according to Arbuthnot, was equal to half a wine-pint english measure; its contents being 2,818 solid inches.

**HEMIONITIS**, in botany, a genus of the cryptogamia silices class. The parts of fructification lie in decussating lines. There are three species, none of them natives of Britain.

**HEMIPLEGIA**, or **HEMIPLEXIA**, among physicians, a palsy of one half of the body.

**HEMISPHERE**, in geometry, the half of a globe or sphere, when it is supposed to be cut through its centre in the plane of one of its great circles.

**HEMISPHERE** is also used to denote a projection of half the terrestrial globe, or half the celestial sphere, on a plane, and frequently called planisphere.

**HEMISTICH**, in poetry, denotes half a verse, or a verse not completed.

**HEMITRITÆUS**, among physicians, a kind of intermitting fever, being a semiteretian. See **MEDICINE**.

**HEMLOCK**, in botany. See **CICUTA**.

**HEMP**, in botany. See **CANNABIS**.

The raising and dressing of hemp scarcely differs from the raising and dressing of flax, but in the following particulars.

Hemp requires a light, free, dry, dusty, and even a sandy warm soil; which if not naturally rich, must be made so by manure. New broke up ground does not answer for hemp, producing it thin and poor upon the stalk. Hemp does well to follow beans. The ground should be ploughed and harrowed three or four times, a fortnight or three weeks intervening between each time. In some parts of Lincoln and Holland the soil is naturally so free and rich, that it will produce hemp constantly year after year without manure. The leaves which fall off the stalk help to manure the ground. It is frequently sown with a view to clear the ground of weeds; which it does most affectually, growing fast, and soon checking every weed but mugwort, which is picked out with a fork.

It is sown about the first of May; so thin, that about four pecks are sufficient for an English acre; and the ground must then be covered as much as possible to preserve the seed from the birds, who are very fond of it.

The *taper-topped* stalk which does not bear the pods, is called the *female*, though in fact it is the *male*, scattering from its bloom a small dust, which impregnates the pods of the *bushy-topped*; which last is commonly, though improperly, called the male or carle hemp.

When hemp is the object of the farmer more than

a crop of seed, the whole should be pulled when the stalk begins to grow yellow, and the earth remaining about the roots should be beat off to prevent more growth: but if the seed is wanted in its greatest perfection, the stalks bearing the pods must be pulled before the upmost pod begins to open; the earth should not be beat off from the roots; it should be stooked in sheaves upon the field, to dry and win as corn; and the top of these stooks should be covered with undergrowth, or the like, to preserve the seed from the birds.

Hemp is sooner watered than flax, and the canals must be deeper.

In keeping the seed, care must be taken to preserve it from rats, mice, and such like vermin, who are all fond of it.

It is dressed as coarse flax, but is sooner dressed; and its greater length requires more care, and renders it more troublesome in the handling, especially in the skutching of it by the water lint-mills with horizontal skutchers, when it must be folded double. What is too coarse and strong in the stalk for the hand or foot machines, may be broke and peeled by the hand.

See **FLAX**.

**HEMPSTEAD**, a market-town of Hartfordshire, twenty-four miles north-west of London.

**HEN**, in ornithology. See **PHASIANUS**.

**HEN-BANE**. See **HYOSCIAMUS**.

**HENDECAGON**, in geometry, a figure that hath eleven sides and as many angles.

**HENLEY**, a market-town of Oxfordshire, situated on the river Thames, twenty miles south-east of Oxford, and thirty-two west of London.

**HENNEBURG**, a town of Germany, in the circle of Franconia, and the capital of the county of Henneburgh: E. long 10° 27', and N. lat. 50° 46'.

**HENOTICON**, in church-history, a decree or edict of the emperor Zeno, made at Constantinople, in the year 482, by which he pretended to reconcile all parties under one faith. It is generally agreed that Peter, patriarch of Alexandria, and Acacius, patriarch of Constantinople, were the authors of this decree, and that their design was to compliment the emperor with a right of prescribing regulations in matters of faith. The emperor, by this decree, arrogated to himself the right of being head of the church. Pope Simplicius, however, in the year 483, condemned the henoticon, and cited Acacius, the chief promoter of it, to appear before him at Rome; but it was not entirely suppressed till the year 518.

**HENRICO**, a county of the colony of Virginia, in North America.

**HENRY**, or **CAPE-HENRY**, the south cape of Virginia, at the entrance of Chesapeake-bay: W. long. 74° 50', N. lat. 37°.

**HEPARSULPHURIS**, or **LIVER OF SULPHUR**. See **CHEMISTRY**.

**HEPATIC**, in medicine and anatomy, any thing belonging to the liver.

**HEPATICA**, in botany. See **ANEMONE**.

**HEPATITIS**, in medicine. See **MEDICINE**.

**HEPATUS**.

**HEPATUS**, in ichthyology. See **LABRUS**.

**HEPHÆSTIA**, in Grecian antiquity, an Athenian festival, in honour of Vulcan, the chief ceremony of which was a race with torches.

**HEPSETUS**, in ichthyology. See **ESOX**.

**HEPTACHORD**, in the ancient poetry, signified verses that were sung or played on seven chords, that is, on seven different notes. In this sense it was applied to the lyre, when it had but seven strings.

**HEPTAGON**, in geometry, a figure consisting of seven sides and as many angles.

**HEPTANDRIA**, in botany. See **BOTANY**, p. 635.

**HEPTANGULAR**, in geometry, an appellation given to figures which have seven angles.

**HEPTARCHY**, a government of seven persons: also a state or country divided into seven kingdoms, and governed by seven independent princes; in which sense it is particularly applied to the government of South Britain when divided amongst the Saxons.

**HEPTATEUCH**, the seven first books of the Old Testament, containing the pentateuch, or five books of Moses, and the books of Joshua and Judges.

**HEPHTHEMIMERIS**, in ancient poetry, a verse consisting of three feet and a half, or seven half feet. It likewise denotes a cæsure after the third foot of a verse.

**HERACLEA**, a port-town of Romania, in European Turkey, situated on the Propontis, sixty miles south-west of Constantinople; it was once a great city: E. long. 28°, and N. lat. 41°.

**HERACLEONITES**, a sect of christians, the followers of Heracleon, who refined upon the gnostic divinity, and maintained that the world was not the immediate production of the Son of God, but that he was only the occasional cause of its being created by the demiurgus. The Heracleonites denied the authority of the prophecies of the Old Testament, maintaining that they were mere random sounds in the air; and that St. John the Baptist was the only true voice that directed to the Messiah.

**HERACLEUM**, in botany, a genus of the pentandria digynia class, the general flower of which is difform and radiated; the single flowers of the disc consist each of five equal petals, but those of the radius consist of five unequal petals: the fruit is elliptic, compressed, and striated on each side in the middle, and contains two oval compressed seeds. There are five species, one of which, viz. the sphondylium, or cow-parpaip, is a native of Britain.

**HERACLIDÆ**, or *Return of the Heracleidæ into Peloponnesus*, in chronology, a famous epocha, that constitutes the beginning of profane history; all the time preceding that period being accounted fabulous.

This return happened in the year of the world 2862, an hundred years after they were expelled, and eighty after the destruction of Troy.

**HERALD**, an officer at arms, whose business it is to declare war, to proclaim peace, to marshal all the solemnities at the coronation, christening, marriage, and funeral of princes, to blazon and examine coats of arms, &c.

Heralds were formerly held in much greater esteem than they are at present, and were created and christened by the king, who pouring a gold-cup of wine on their head, gave them the herald-name; but this is now done by the earl-marshal. They could not arrive at the dignity of herald without having been seven years *poursuivant*; nor could they quit the office of herald, but to be made king at arms.

**HERALDRY**, is the art of armory and blazoning; or, the knowledge of what relates to the bearing of arms, and the laws and regulations thereof.

*Arms*, or *Armories*, are marks of dignity and honour, regularly composed of certain figures and colours, given or authorized by sovereigns, and borne in banners, shields, coats, &c. for the distinction of persons, families, and states, and passing by descent to posterity.

They are called *arms*, in regard they are borne principally on the buckler, cuirasse, banners, and other apparatus of war; and *coats of arms*, *coat-armour*, &c. because anciently embroidered on a cloak or habit, worn by the ancient knights over their arms, both in war and at tournaments, and still borne by the heralds at arms.

It was a kind of surcoat, reaching only as low as the navel, open at the sides, with short sleeves; sometimes furred with *ermine* and *vair*, wherein were applied the *armories* of the knight, embroidered with gold and silver, and enamelled with beaten tin, coloured *black*, *green*, *red*, and *blue*; whence the rule never to apply colour on colour, nor metal on metal.

The *coats of arms* were frequently open, and diversified with bands and fillets of several colours, alternately placed, as we still see cloths scarleted, watered, &c. Hence they were also called *devices* or *divises*; and being divided, or composed of several pieces sewed together, whence the words *fesse*, *pale*, *chevron*, *bend*, *cross*, *salter*, *lozenge*, &c. See these articles.

The surcoat being embroidered with *gold* and *silver*, was the occasion that those two metals have been since placed in the coats of arms, under their *French* name of *or* and *argent*; and their being coloured *black*, *green*, *red*, and *blue*, that those different colours have also been introduced in them: therefore,

There are two metals in *Heraldry*, viz. *or* and *argent*; and seven colours, which are, *gules*, *azure*, *sable*, *vert*, *purpure*, *tenne*, and *sanguine*. See these and all the other terms belonging to heraldry as they occur in the order of the alphabet.

**HERAT**, a city of Persia, in the province of Chorassan: E. long. 61°, and N. lat. 34° 30'.

**HERB**, in pharmacy, an appellation given to the stalks and leaves of plants, especially such as are fleshy and succulent, and die away every year; but is also frequently used to denote the leaves alone.

**HERBAL**, a book that treats of the classes, genera, species, and virtues of plants. See **BOTANY**.

**HERBIVOROUS ANIMALS**, those which feed only on vegetables.

**HERBOURG**, a town in the circle of the upper Rhine, and territory of Nassau: E. lon. 8° 15', and N. lat. 50° 36'.

**HERCINIAN**,

**HERCINIAN FOREST**, a forest which anciently extended the whole length of Germany and Bohemia, some remains of which are still in being, *viz.* the Black Forest, Odenwald near Heidelberg, Stigewald in Wurtzburg, and Bamberg, and Hartswald in Brunf-wic.

**HERCOLE**, a port-town of Tuscany, on the coast called Stato del Presidii: E. lon.  $12^{\circ}$ , and N. lat.  $42^{\circ} 25'$ .

**HERCULES**, in astronomy. See **ASTRONOMY**. p. 436.

**HERCULES-PILLARS**, in antiquity, a name given to mount Calpe in Spain, near Gibraltar, on the European side of the streights, and mount Avila on the African side.

**HEREDITAMENTS**, whatever immoveable things a person may have to himself and his heirs by way of inheritance; and which, if not otherwise bequeathed, descend to him who is next heir, and not to the executor, as chattels do.

**HEREDITARY**, an appellation given to whatever belongs to a family by right of succession, from heir to heir.

**HEREDITAS JACENS**, in Scots law. An estate is said to be *in hereditate jacente*, after the proprietor's death, till the heir's entry.

**HEREFORD**, the principal city of Herefordshire, situated on the river Wye, twenty-four miles north-west of Gloucester, and one hundred and twenty west of London: W. lon.  $2^{\circ} 42'$ , and N. lat.  $52^{\circ} 6'$ .

It sends two members to parliament.

**HERESY**, the crime of obstinately persisting in opinions that are contrary to the fundamentals of religion.

**HERETABLE RIGHTS**, in Scots law, all rights affecting lands, houses, &c. or any immoveable subject. See **LAW**, tit. 9.

**HERETAGE**, in Scots law, lands, houses, or any immoveable subject, in contradistinction to moveables or moveable subjects. See **LAW**, tit. 9. It also sometimes signifies such immoveable property as a person succeeds to as heir to another, in contradistinction to that which he himself purchases or acquires in any other manner, called *conquest*. See **LAW**, tit. 27.

**HERETIC**, a general name for all such persons, under any religion, but especially the Christian, as profess or teach religious opinions contrary to the established faith, or to what is made the standard of orthodoxy.

**HERLING**, a market-town of Norfolk, twenty miles south-west of Norwich.

**HERMÆ**, among antiquarians, statues of the god Mercury, made of marble, and sometimes of brass, without arms or feet, and set up by the Greeks and Romans in the cross ways.

**HERMÆA**, in antiquity, ancient Greek festivals, in honour of the god Hermes or Mercury.

**HERMANIA**, in botany, a genus of the monadelphia pentandria class. It has but one stylus; the capsule has five cells; and the petals are semitubular at the base. There are nine species, none of them natives of Britain.

**HERMANASTAT**, the capital city of Transilvania, sub-

ject to the house of Austria: E. lon.  $24^{\circ}$ , N. lat.  $46^{\circ} 32'$ .

**HERMAPHRODITE**, a person of both sexes, or who has the parts of generation both of male and female.

It is now generally allowed, that there is no such thing as a true hermaphrodite; most, if not all those who pass for such, being mere women, whose clitoris is grown to an enormous size, and the labia pudendi become unusually tumid.

Among the insect-class of animals, indeed, hermaphrodites are very frequent: such as worms, snails, leeches, &c.

**HERMAPHRODITE FLOWERS**, among botanists. See **BOTANY**.

**HERMATHENA**, among antiquarians; a statue representing Mercury and Minerva both in one.

**HERMES**. See **HERMÆ**.

**HERMETIC**, or **HERMETICAL**, an appellation given to whatever belongs to chemistry, from Hermes Trismegistus, who is supposed to have been its inventor.

**HERMETICAL PHILOSOPHY**, that which undertakes to solve the various phenomena of nature, from the chemical principles salt, sulphur, and mercury.

**HERMETICAL SEAL**, among chemists, a method of stopping glass-vessels, used in chemical operations, so closely, that the most subtil spirit cannot escape through them.

It is commonly done by heating the neck of the vessel in a flame, till ready to melt, and then twisting it closely together with a pair of pincers. Or, vessels may be hermetically sealed, by stopping them with a glass plug, well luted; or, by covering the vessel with another ovum philosophicum.

**HERMIT**, a devout person retired into solitude to be more at leisure for contemplation, and to disencumber himself from the affairs of the world.

**HERMON**, a mountain on the east of Syria and Palestine, in Asia.

**HERNANDIA**, in botany, a genus of the monœcia triandria class. The calix of the male has three segments, and the corolla three petals. The calix of the female is entire and truncated; the corolla consists of six petals; and the drupa is hollow, with an open mouth, and a loose kernel. There are two species, both natives of the Indies.

**HERNGRUNT**, a town of Upper Hungary, situated north of Buda, near the Carpathian mountains: E. lon.  $19^{\circ} 20'$  lat.  $48^{\circ} 47'$ .

**HERNIA**, in medicine. See **MEDICINE** and **SURGERY**.

**HERNIARIA**, RUPTURE WORT, in botany, a genus of the pentandria digynia class. The calix consists of five segments; it has no corolla; and the capsule contains one seed. There are four species, three of them natives of Britain, *viz.* the glabra, or smooth rupture-wort; the hirsuta, or rough rupture wort; and the lenticulata, or sea rupture wort. The leaves may be used as a mild restraining; but have no title to their former reputation of curing ruptures.

**HERO**, in the ancient mythology, a great and illustrious person, of a mortal nature, though supposed by the populace

lace to partake of immortality; and, after his death, placed among the number of the gods.

**HEROIC POEM**, that which describes some extraordinary enterprize; being the same with epic poem. See **COMPOSITION**.

**HEROIC VERSE**, that wherein heroic poems are usually composed; or it is that proper for such poems. In the Greek and Latin, hexameter verses are usually denominated heroic verses, as being alone used by Homer, Virgil, &c.

**HERON**, in ornithology. See **ARDEA**.

**HERPES**, in medicine, a bilious pustule, which breaking out in different manners upon the skin, accordingly receives different denominations. See **MEDICINE**.

**HERRING**, in ichthyology. See **CLUPEA**.

**HERSILLON**, in the art of war, is a strong plank or beam, about ten or twelve feet long, stuck full of spikes on both sides, and used to incommode the march of the infantry or cavalry.

**HESPER**, an appellation given to the planet Venus, when she sets after the sun.

**HESPERIDES**, in antiquity, the daughters of Hesperus, brother of Atlas, who kept a garden full of golden apples, guarded by a dragon: but Hercules having laid the dragon asleep stole away the apples.

**HESPERIS**, **DAME'S VIOLET**, in botany, a genus of the tetradynamia filiquosa class. The petals are obliquely bent; there is a gland betwixt the short stamina; and the stigma is forked at the base, and connivent at top. There are seven species, only one of which, viz. the marroonalis, or unfavoury dame's violet, is a native of Britain.

**HESSE-CASSEL** landgraviate, including Wetteravia, is a circle of the Upper Rhine, bounded by Westphalia and Brunswic on the north, by Franconia and Saxony on the east, by the river Maine on the south, and by another part of Westphalia and the electorate of Mentz and Triers on the west: it is subject to the king of Sweden.

**HESSE-DARMSTAT**, is bounded by the river Maine, which divides it from Hesse-Cassel, on the north, by the same river on the east, and by the Palatinate on the south and west.

**HETEROCLITE**, among grammarians, one of the three variations in irregular nouns, and defined by Mr Rudiman, a noun that varies in declension; as, *hoc vas, vasis: hac vasa, vasorum*.

**HETERODOX**, in polemical theology, any thing contrary to the faith and doctrines of a church.

**HETERODOMUS VECTIS**, in mechanics, a lever, wherein the fulcrum, or point of suspension, is placed between the power and the weight. See **MECHANICS**.

**HETEROGENEITY**, in physiology, that quality or property of bodies which denominates a thing heterogeneous. See the next article.

**HETEROGENOUS**, or **HETEROGENEAL**, something that consists of parts of dissimilar kinds, in opposition to homogenous.

**HETEROSCI**, in geography, a term of relation, denoting such inhabitants of the earth as have their shadows

falling but one way, as those who live between the tropics and polar circles, whose shadows at noon in north latitude are always to the northward, and in south latitude to the southward.

**HEUCHERA**, in botany, a genus of the pentandria digynia class. The petals are five; and the capsule has a double beak, and two cells. There is but one species, a native of Virginia.

**HEXACHORD**, in ancient music, a concord called by the moderns a sixth.

**HEXAGON**, in geometry, a figure of six sides and angles; and if these sides and angles be equal, it is called a regular hexagon. See **GEOMETRY**.

**HEXAHEDRON**, in geometry, one of the five Platonic bodies, or regular solids; being the same with a cube.

**HEXAMETER**, *carmen hexametrum*, in ancient poetry, a kind of verse consisting of six feet; the first four of which may be indifferently either spondees or dactyls, the fifth is generally a dactyl, and the sixth always a spondee. Such is the following verse of Horace:

1 2 3 4 5 6  
*Aut prolesse uolunt, aut delictare potest.*

**HEXANDRIA**, in botany. See **BOTANY**, p. 635.

**HEXASTYLE**, in architecture, a building with six columns in front.

**HEXHAM**, a market-town of Northumberland, sixteen miles west of Newcastle.

**HEYDON**, a borough town in Yorkshire, thirty-seven miles south-east of York, and six miles west of Hull. It sends two members to parliament.

**HEYTSBURY**, a borough town of Wiltshire, fourteen miles north-west of Salisbury, sends two members to parliament.

**HIATICULA**, in ornithology. See **CHARADRIUS**.

**HIATUS**, properly signifies an opening, chasm, or gap; but it is particularly applied to those verses, where one word ends with a vowel, and the following word begins with one, and thereby occasions the mouth to be more open, and the sound to be very harsh.

The term hiatus is also used in speaking of manuscripts, to denote their defects, of the parts that have been lost or effaced.

**HIBISCUS**, in botany, a genus of the monadelphia polyandria class. The calix is double; the exterior one consists of many leaves; the capsule has five cells, and contains many seeds. There are twenty-five species, none of them natives of Britain.

**HICCUP**, or **HICCUGH**, in medicine, a spasmodic affection of the stomach and diaphragm, arising from any thing that irritates and vellicates their nervous coats. See **MEDICINE**.

**HIDE**, the skin of beasts, but particularly applied to those of large cattle, as bullocks, cows, horses, &c.

Hides are either raw or green, just as taken off the carcase; salted or seasoned with salt, alum, and saltpetre, to prevent their spoiling; or curried and tanned. See **TANNING**.

**HIDE of land**, was such a quantity of land as might be plowed with one plough within the compass of a year, or so much as would maintain a family; some  
† 8 M call

call it sixty, some eighty, and some an hundred acres.

**HIDE-BOUND.** See **FARRIERY**, p. 563.

**HIERACHIUM**, **HAWKWEED**, in botany, genus of the syngenesia polygamia æqualis class. The receptacle is naked; the calix is oval and imbricated; and the pappus is simple and sessile. There are 28 species, 8 of them natives of Britain. The leaves of the pilosella, or common creeping mouse-ear, are recommended as astringents.

**HIERACITES**, in church-history, Christian heretics in the third century, so called from their leader Hierax, a philosopher of Egypt; who taught that Melchisedek was the Holy Ghost, denied the resurrection, and condemned marriage.

**HIERARCHY**, among divines, denotes the subordination of angels.

Some of the rabbins reckon four, others ten, orders or ranks of angels; and give them different names, according to their different degrees of power and knowledge.

**HIERARCHY** likewise denotes the subordination of the clergy, ecclesiastical polity, or the constitution and government of the Christian church considered as a society.

**HIEROGLYPHICS**, in antiquity, mystical characters, or symbols, in use among the Egyptians, and that as well in their writings as inscriptions; being the figures of various animals, the parts of human bodies, and mechanical instruments.

But besides the hieroglyphics in common use among the people, the priests had certain mystical characters, in which they wrapped up and concealed their doctrines from the vulgar. It is said, that these something resembled the Chinese characters, and that they were the invention of Hermes. Sir John Marsham conjectures, that the use of these hieroglyphical figures of animals introduced the strange worship paid them by that nation: for as these figures were made choice of, according to the respective qualities of each animal, to express the qualities and dignity of the persons represented by them, who were generally their gods, princes and great men, and being placed in their temples, as the images of their deities; hence they came to pay a superstitious veneration to the animals themselves.

The meaning of a few of these hieroglyphics, has been preserved by ancient writers. Thus we are told they represented the supreme Deity by a serpent with the head of a hawk. The hawk itself was the hieroglyphic of Osiris; the river-horse, of Typhon; the dog, of Mercury; the cat, of the moon, or Diana; the beetle, of a courageous warrior; a new-born child, of the rising sun; and the like.

**HIEROGRAMMATISTS**, *i. e.* holy registers, were an order of priests among the ancient Egyptians, who presided over learning and religion.

They had the care of the hieroglyphics, and were the expositors of religious doctrines and opinions. They were looked upon as a kind of prophets, and it is pretended that one of them predicted to an Egyptian king, that an Israelite, (meaning Moses) eminent for his

qualifications and achievements, would lessen and depress the Egyptian monarchy.

**HIEROMANCY**, in antiquity, that part of divination which predicted future events from observing the various things offered in sacrifice. See **DIVINATION** and **SACRIFICE**.

**HEROMNEMON**, the name of an officer in the Greek church, whose principal function it was to stand behind the patriarch at the sacraments and other ceremonies of the church, and to shew him the prayers, psalms, &c. in the order in which they were to be rehearsed.

**HIEROPHANTES**, in Grecian antiquity, the name by which the Athenians called those priests and priestesses who were appointed by the state to have the supervisory of things sacred, and to take care of the sacrifices.

**HIEROPHYLAX**, an officer in the Greek church, who was guardian or keeper of the holy utensils, vestments, &c. answering to our sacrista or vestry-keeper.

**HIGH WAY**, a free passage for the king's subjects, on which account it is called the king's high-way, tho' the freehold of the soil belong to the owner of the land. Those ways that lead from one town to another, and such as are drift or cart-ways, and are for all travellers in great roads, or that communicate with them, are high-ways only; and as to their reparation, are under the care of surveyors.

**HIGHAM-FERRERS**, a borough town of Northamptonshire, twelve miles north-east of Northampton: it sends two members to parliament.

**HIGHNESS**, at title given to princes. Before king James I. the kings of England had no other title but that of highness; which was also the case of the kings of Spain before Charles V.

At present all the sons of crowned heads are styled royal highness, as the electors of Germany are electoral highness.

**HIGHWORTH**, or **HIGWORTH**, a market-town of Wiltshire, situated thirty miles north of Salisbury.

**HILARIA**, an ancient Roman festival, observed on the eighth of the calends of April, or the twenty-fifth day of March, in honour of the goddess Cybele. It was so called from the various expressions of joy and mirth on this occasion.

**HILARODI**, in the ancient music and poetry, a sort of poets among the Greeks, who went about singing little gay poems or songs, somewhat graver than the Ionic pieces, accompanied with some instrument. From the streets they were at length introduced into tragedy, as the magodi were into comedy. They appeared dressed in white, and were crowned with gold. At first they wore shoes, but afterwards they assumed the crepida, being only a sole tied over with a strap.

**HILARY-TERM.** See **TERM**.

**HILDESHEIM**, the capital of a bishopric, surrounded by the territories of Brunswic, and subject to its own bishop: E. long. 10°, N. lat. 52° 17'.

**HILUM**, among botanists, denotes the eye of a bean.

**HIN**, a hebrew measure of capacity for things liquid, containing the sixth part of an ephah, or one gallon two pints, or 2.533 solid inches, English measure.

**HINO**,

**HIND**, a female stag in the third year of its age. See **CERVUS**.

**HINDON**, a borough town of Wiltshire, situated fourteen miles west of Salisbury: it sends two members to parliament.

**HINDOWN**, or **HENDOWN**, the capital of the country of the Hindowns, in the hither India: E. long  $76^{\circ} 30'$ , N. lat.  $27^{\circ}$ .

**HINE**, or **HIND**, a husbandman's servant. Thus the person who oversees the rest, is called the master hine.

**HIPPOBOSCA**, or **HORSE-FLY**, in zoology, a genus of insects belonging to the order of diptera. The beak consists of two valves, is cylindrical, obtuse, and hanging; and the feet have several claws. There are four species, distinguished by their wings, &c. The equina is extremely troublesome to horses.

**HIPPOCAMPUS**, in ichthyology. See **SYNGNATHUS**.

**HIPPOCENTAUR**, in antiquity, a fabulous animal, half man half horse.

What gave rise to the fable of Hippocentaurs, was this. The Thessalians are said to have been the first inventors of the art of breaking horses; and being first seen on horseback, they seemed to make but one body with the horses; whence the origin of the fable.

**HIPPOCREPIS**, **COMMON HORSE SHOE VETCH**, in botany, a genus of the diadelphia decandria class. The pod is compressed and crooked. There are three species, only one of which, viz. the comosa, or tufted horse shoe vetch, is a native of Britain.

**HIPPODROME**, in antiquity, the course where horse-races were performed.

**HIPPOGLOSSUS**, in ichthyology, See **PLEURONECTES**.

**HIPPOMANES** signifies the expressed juice of the tithymallus; as also a juice distilling from the genitals of a mare, in the time of her covering: some again take it for the secundines of a mare; and, lastly, it signifies a fleshy substance adhering to the forehead of a colt newly foaled, which some imagine to have a virtue of procuring love, and promoting the birth.

**HIPPOPHAE**, in botany, a genus of the diœcia tetrandria class. The calix of the male has two segments; and the corolla is wanting. The calix of the female consists of two segments; it has no corolla; but one stylus; and the berry contains many seeds. There are three species, only one of which, viz. the rhamnoides, fallow-thorn, or sea buck-thorn, is a native of Britain.

**HIPPOTAMUS**, the **RIVER-HORSE**, a genus of quadrupeds, belonging to the order of belluæ; the characters of which are these: It has 6 foreteeth in the upper jaw, disposed in pairs at a distance from each other; and four prominent foreteeth in the under jaw, the intermediate ones being longest: the dog-teeth are solitary and obliquely truncated; and the feet are hoofed on the edges.

There is but one species of hippopotamus, viz. the amphibius, or river-horse. The history of this quadruped, though next to the elephant in magnitude, is far from being sufficiently delineated. The best description hitherto given of him is that of

Frederic Zerenghi, an Italian surgeon, published in the year 1603. Zerenghi killed two of them (a male and a female) on the banks of the Nile, preserved their skins, and brought them to Rome. Every skin took 400 pounds of salt in curing. He says, the skin of the hippopotamus is about an inch thick, extremely hard, impenetrable by a common musket-ball; and there are only a few short white hairs scattered very thin over it. The teeth are not protruded out of the mouth, as is commonly believed; for, when the mouth is shut, although the teeth be extremely large, they are entirely covered by the lips. The dimensions of the female, of which Zerenghi gives a figure, are as follow: From the point of the muzzle to the origin of the tail, between 11 and 12 feet; the circumference of the body about 10 feet; the height of the body,  $4\frac{1}{2}$  feet; the circumference of the leg, near the shoulder, 2 feet 9 inches, lower down 1 foot  $9\frac{1}{2}$  inches; the height of the legs about  $1\frac{1}{2}$  foot; the length of the feet from the extremity of the claws,  $4\frac{1}{2}$  inches; the claws are nearly of an equal length and breadth, and are somewhat more than two inches; each toe is furnished with a claw, and each foot with four toes. The tail is about one foot long, more than a foot in circumference near the origin, and about 3 inches near the point. The tail is not round, but flattish. The head, from the extremity of the lips to the neck, is about 2 feet 4 inches, and the circumference 5 feet 8 inches. The ears are about 3 inches long, and nearly as broad; they are a little pointed, and covered in the interior side with short white hair. The mouth, when open, is about  $1\frac{1}{2}$  foot wide, and furnished with 44 teeth of different figures. Their teeth are of such a hard substance, that they give fire with steel. These dimensions are taken from a female hippopotamus; but the male is generally about one third larger.

With such powerful arms, and such a prodigious strength of body, the hippopotamus might render himself formidable to every other animal. But he is naturally of a mild disposition; and besides, his body is so heavy, and his motions so slow, that he cannot overtake any other quadruped. He swims swifter than he runs, and preys upon fishes. He dives in the water, and can stay very long under. He has no membrane betwixt his toes, as the castor or the otter; and he only swims easily in consequence of the great bulk of his belly, which makes him nearly of an equal specific gravity with the water. Moreover, he often keeps himself at the bottom, and walks upon the channel with the same freedom as upon dry land. Besides preying upon fishes, crocodiles, &c. he frequently goes out of the water and feeds upon sugar-canes, rushes, millet, rice, roots, &c. These he devours in large quantities, and often does great damage in the cultivated field. But as he is more timid on land than in the water, he is easily drove away. His legs are so short, that he cannot escape by flight when at a distance from the river. He generally flies when approached by people in boats; but, if they wound him, he returns with fury, attacks the boats with his teeth, and frequently oversets them.

This animal seems to be confined principally to the rivers

- rivers of Africa. The male and female generally go together, and the female is said to produce but one at a birth.
- HIPPURIS**, in botany, a genus of the monandria monogynia class. It has neither calix nor corolla; the stigma is simple; and there is but one seed. There is only one species, *viz.* the *vulgaris*, a native of Britain.
- HIPPURIS**, in ichthyology. See *CORYPHÆNA*.
- HIRCANIA**, in geography, the provinces of Persia in Asia, which lie on the southern shore of the Caspian sea.
- HIRCHFELD**, a city of Germany, in the circle of the upper Rhine, and landgraviate of Hesse Cassel, situated on the river Fuld, in E. long.  $9^{\circ} 32'$ , N. lat.  $50^{\circ} 47'$ .
- HIRTELLA**, in botany, a genus of the triandria monogynia class. The calix is divided into five parts; the petals are five, and equal; the filaments are spiral, and the stylus is lateral. There is but one species, a native of Brazil.
- HIRUDO**, the *LEECH*, in zoology, a genus belonging to the order of vermes intestina. The body is flat, jointed, and moves either forward or backward. There are nine species, principally distinguished by that colour. This well known animal is used for bleeding children, &c. When they once fix, they seldom quit till they are glutted with blood. Salt makes them quit their hold, and throw up the blood.
- HIRUNDO**, in ornithology, a genus of birds, of the order of passerres. The bill is small, crooked, subulated, bent a little inward, and depressed at the base. There are 12 species, principally distinguished by their colour. This includes the common swallow, martin, &c.
- HISPANIOLA**, an island of America, in the Atlantic ocean, situated between  $67^{\circ}$  and  $74^{\circ}$  of W. long. and between  $18^{\circ}$  and  $20^{\circ}$  N. lat. being about 420 miles long from east to west, and 120 in breadth. It is frequently called St. Domingo, from the capital thereof.
- HISTORIOGRAPHER**, a professed historian, or writer of history.
- HISTORY**, a description or recital of things as they are, or have been, in a continued orderly narration of the principal facts and circumstances thereof.
- History, with regard to its subject, is divided into the history of Nature, (See *NAT. HIST.*) and the history of Actions. The history of Actions is a continued relation of a series of memorable events.
- HISTRIO**, in the ancient drama, signified an actor or comedian, but more especially a pantomime, who exhibited his part by gestures and dancing.
- HITCHING**, a market-town in Hartfordshire, fourteen miles north-west of Hartford, and thirty-two north-west of London.
- HITHE**, one of the Cinque Ports in the county of Kent, situated on the English channel, six miles west of Dover.
- HIVE**, in country affairs, a convenient receptacle for bees. See *APIS*.
- HIVING of Bees**. See *APIS*.
- HOACHE** in natural history, a kind of earth approaching to the nature of chalk, but harder, and feeling like soap; whence some think, that it is either the same with our soap rock of Cornwall, or very like it. The Chinese dissolve it in water, till the liquor is of the consistence of cream, and then varnish their china-ware with it.
- HOAR-HOUND**, in botany. See *MARUBIUM*.
- HOARSENESS**, in medicine, a diminution of the voice, commonly attended with a preternatural asperity or roughness thereof.
- HOBBY**, in ornithology. See *FALCO*.
- HOE** in country-affairs, a tool made like a cooper's adz, to cut upwards in gardens, field, &c. This tool is commonly called the hand-hoe. See *AGRICULTURE*.
- HOG**, in zoology. See *SUS*.
- HOGSHEAD**, in commerce, a measure of capacity, containing sixty-three gallons.
- HOGUE**, a town and cape on the north-west point of Normandy in France, near which admiral Rook burnt the French admiral's ship called the *Rising-sun*, with twelve more large men of war: W. lon.  $2^{\circ}$ , and N. lat.  $49^{\circ} 50'$ .
- HOHIO**, a river of North America; which rising in the Apalachian mountains, near the confines of Carolina and Virginia, runs south west, and falls into the river Mississippi.
- HOKE-DAY**, the Tuesday after easter-week; which was the day on which the English conquered and expelled the Danes: this was therefore kept as a day of rejoicing; and a duty, called hoke-tuesday money, was paid to the landlord, for giving his tenants and bondmen leave to celebrate it.
- HOLCUS**, in botany, a genus of the polygamia monœcia class. The calix of the hermaphrodite is a double-flowered glume; the corolla is a glume with an awn; and there are three stamina, two styli, and one feed. The calix of the male is a double-valved glume; it has no corolla, but three stamina. There are ten species, only two of them natives of Britain, *viz.* the *lanatus*, or meadow soft-grass; and the *mollis*, or creeping soft-grass.
- HOLDERNESS**, a peninsula in the east riding of Yorkshire, which has the German ocean on the east, and the river Humber on the south.
- HOLDING**, in Scots law, the tenor or terms upon which a proprietor of lands holds or enjoys them of his superior.—See *BLENCH*, *BURGAGE*, *FEE*, *WARD*.
- HOLLAND**, one of the United Provinces. It is about one hundred miles long from north to south, and scarce thirty miles broad: but enjoys the greatest trade of any province in the world, and in point of strength and riches is equal to the other six united provinces. It is situated one hundred miles east of England, and is bounded on the north and west by the German sea, on the east by the Zuider sea, and on the south by the provinces of Zealand and Utrecht.
- HOLLAND** is also the name of the south-east division of Lincolnshire.
- HOLLAND**, in commerce, a fine and close kind of linen,

linen, so called from its being first manufactured in Holland.

**HOLLY**, in botany. See **ILEX**.

*Sea-HOLLY*. See **ERYNGIUM**.

**HOLOCAUST**, a burnt-offering, or sacrifice, wholly consumed by fire: of this kind was the daily sacrifice in the Jewish church. This was done by way of acknowledgment, that the person offering and all that belonged to him, were the effects of the divine bounty.

**HOLOGRAPH**, among civilians, a will wholly written by the hand of the testator.

**HOLSTEIN**, a duchy of Germany, in the circle of lower Saxony, one hundred miles long, and fifty broad. It is bounded by Sleswic or south Jutland on the north, by the Baltic sea and the duchy of Sax-Lawenburg on the east, by the river Elbe on the south, and by the German sea on the west.

**HOLY-GHOST**, one of the Persons of the Holy Trinity.

*Order of the HOLY GHOST*, the principal military order in France, instituted by Henry III. in 1569. It consists of an hundred knights, who are to make proof of their nobility for three descents. The king is the grand-master, or sovereign; and as such, takes an oath on his coronation-day, to maintain the dignity of the order.

**HOLY-DAYS**. See **FESTIVAL**.

**HOLY-HEAD**, a cape and town in the isle of Anglesea, situated in the Irish channel: W. long.  $4^{\circ} 45'$ , and N. lat.  $53^{\circ} 26'$ .

**HOLY-ISLAND**, an island in the German sea, six miles south of Berwick upon Tweed: W. long.  $1^{\circ} 42'$ , and N. lat.  $55^{\circ} 45'$ .

**HOLY-WELL**, a town of north Wales, in Flintshire, ten miles east of St. Asaph.

**HOMAGE**, in law, is the submission, loyalty, and service which a tenant promised to his lord, when he was first admitted to the land which he held of the lord in fee: also that owing to a king, or to any superior.

**HOMBERG**, a town of Germany, in the circle of the upper Rhine, and landgraviate of Hesse, situated ten miles north of Francfort: E. long.  $8^{\circ} 24'$ , N. lat.  $50^{\circ} 20'$ .

**HOMBERG** is also a town of Germany, in the palatinate of the Rhine, and dukedom of Deuxponts: E. long.  $7^{\circ} 6'$ , and N. lat.  $49^{\circ} 20'$ .

**HOMER**. See **OMER**.

**HOMICIDE**, signifies in general the taking away of any person's life. See **SCOTS LAW**, tit. 33.

**HOMILY**, in ecclesiastical writers, a sermon, or discourse, upon some point of religion, delivered in a plain manner, so as to be easily understood by the common people.

**HOMO**, *MAN*, is ranked by Linnæus under the order of primates, and characterised by having four parallel foreteeth both in the upper and lower jaw, and two mammae on the breast. The species, according to this author, are two, *viz.* the homo sapiens, and the homo troglodytes. He subdivides the homo sapiens into five varieties, *viz.* the American, the European, the Asiatic, the African, and what he calls the monstrous. The troglodytes, or orang outang, is a native of Aethiopia, Java, and Amboina. His body is white; he

walks erect; and is about one half the ordinary human size. He generally lives about 25 years. He conceals himself in caves during the day, and searches for his prey in the night. He is said to be exceedingly sagacious, but is not endowed with the faculty of speech.

**HOMOLOGOUS**, in geometry, an appellation given to the corresponding sides and angles of similar figures, as being proportional to each other.

**HONAN**, a province of China, bounded by those of Xanli and Pekin on the north, by Xantong and Nankin on the east, by Suchuen on the south, and by Xensi on the west; lying between  $33^{\circ}$  and  $37^{\circ}$  north latitude. Its capital is Caitum.

**HONDURAS**, a province of Mexico, in North America; which including the country of the Moskitos-Indians, is situated between  $85^{\circ}$  and  $94^{\circ}$  W. long. and between  $12^{\circ}$  and  $16^{\circ}$  N. lat.

**HONE**, a fine kind of whetstone, used for setting razors, pen-knives, and the like.

**HONEY**, is, in general, a thick, viscons, and more or less fluid substance, of a whitish or yellowish colour, sweet to the taste, soluble in water, becoming vinous in fermentation, inflammable, liquable by a gentle heat, and of a fragrant smell. See **APIS**.

**HONFLEUR**, a port-town of France, in the province of Normandy, situated on the south side of the river Seyne, near the English channel: E. long.  $15'$ , and N. lat.  $49^{\circ} 24'$ .

**HONITON**, a borough-town of Devonshire, twelve miles east of Exeter. It sends two members to parliament.

**HONOUR**, a testimony of esteem or submission, expressed by words, actions, and an exterior behaviour, by which we make known the veneration and respect we entertain for any one on account of his dignity or merit. The word honour is also used in general for the esteem due to virtue, glory, and reputation. It is also used for virtue and probity themselves, and for an exactness in performing whatever we have promised; and in this last sense we use the term, *a man of honour*. But honour is more particularly applied to two different kinds of virtue, bravery in men, and chastity in women.

*Maid of Honour*, are six young ladies in the household of the queen and princess-royal; the salary of those of a queen are 300 l. per ann. each, and those of the princess dowager of Wales, 200 l.

**HONOUR-POINT**, in heraldry, is that next above the centre of the escutcheon, dividing the upper part into two equal portions.

**HOOF**, the horny substance that covers the feet of divers animals, as oxen, horses, sheep, &c.

**HOOKS** are a necessary sort of utensils, and used for various purposes.

**HOOKER**, in naval architecture, a vessel much used by the Dutch, built like a pink, but rigged and masted like a hoy.

Hookers will lie nearer a wind than vessels with cross sails can do. They are from fifty to two hundred tons burden, and with a few hands will sail to the East Indies.

† 8 N

HOP,

HOP, in botany. See HUMULUS.

New land is found to succeed better with hops than old; and on this principle they are very cautious in their plantations in Kent, and look forward for the after-produce. When they make a new hop-ground, they plant it with apple-trees at a large distance asunder, and with cherry-trees between; by this means, when the hops have grown ten years, which they judge as much as they will do well, they place their account in the cherry-trees, which bear large crops; these they gather for about thirty years, and then they cut them up, and depend upon their apple-trees only, which they find very large and strong by that time.

The dry stalks of hops should be burnt on the ground in winter, covering them with a little fresh earth as they burn. This makes together an excellent compost, to make the hills of. The land must be dug or plowed well, and laid very even, and then the places for the hills marked out by a line, and a stick put in every place where one is to be. A thousand hills may be made in an acre of ground, and six or seven plants set on every hill. From six to nine feet should be allowed between every hill, and the grounds in the hills should be better and richer than the common earth. Some plant hops in March and April, but the most experienced people prefer the month of October, because they will then strike firm roots, and be strong and vigorous against spring. The largest plants are to be chosen; and it is best to procure them from some rich ground, where the hills have been laid high; they should be about eight or ten inches long, and have three or four joints or buds a-piece; the holes for planting them are to be dug eight or ten inches deep, and about a foot over; and in each of these holes four plants are to be set, one in each corner: they may be covered an inch deep over the top, if planted in October; but in spring, when they have shot from the joints, then they must not be buried: after this, the ground must be carefully kept clear of weeds.

*Dressing of Hops.* This is preparing the ground in winter and spring for the making a good summer-crop. In doing this, the hills upon which the plants stand must be all pulled down, and undermined on every side, till the spade comes near the principal root; then shake off or remove with the hand the loose mould from the upper or loose roots, that you may see where the new roots grow out of the old sets. The old sets are to be carefully preserved, but the other roots may be cut away. Whatever time the hills are pulled down, the roots must not be cut till March. When the young hops are dressed for the first time, all the roots are to be cut away that grew the year before, and the sets are to be cut off within one inch of the same; and every year after, they must be cut as close as may be to the old roots; but to a weak hop, some of the shoots are to be left at the dressing. Those roots of the plant which grow downwards, are never to be injured, but only those which run horizontally are to be cut. The old roots and the young ones may be easily distinguished, in that the old ones are always red, and the young white. If there are by accident any wild hops got a-

mong the rest, the places where they grow are to be marked with sticks, or otherwise, at the time of their being gathered; and after this, at the time of dressing the ground, that whole hill is to be destroyed, and a new one made with new plants in the room of it. When the roots are cut and dressed, the rich compost is to be put to them; and the hills must not be made too high at first, lest they hinder the young shoots.

*Gathering and drying of Hops.* Hops blow in the latter end of July, in the beginning of August they bell; and they are sometimes ripe at the beginning of September, sometimes later. When they begin to change colour, are easily pulled to pieces, and their seeds look brown within them, they are ripe; and they are then to be gathered as quick as possible, for the least blast of wind will hurt them at this time.

The manner of gathering hops, is to take down four hills standing together in the midst of the garden, and to cut the roots even with the ground, then lay the ground level; and when it is swept clean, it makes a floor, on which the hops may be laid and picked. The hop-plants are first unwound from the poles, and then the people sit round and pick off the hops into baskets.

Care should be taken to dry the hops as fast as they are picked, for in lying undried they are apt to heat and change colour very quickly. If the quantity picked be so large, that the kiln in which they are to be dried is over-stocked, they must be spread thin upon a floor, and they will keep two or three days in that manner without any harm. Indeed, where the quantity is but small, there is no need to have recourse to the kiln at all, for they will dry much better than any other way, by being laid thin upon a floor, and often turned. The drying of hops is the most material part of their manufacture; for if they be ill dried, they lose all their agreeable flavour; and great caution should be used, that they be all equally dried.

*Bagging of Hops,* a term used by the farmers, who cultivate hops, for the last thing they have to do with them, in order to bring them to market; that is, the putting them up in large bags of coarse cloth, for carriage. When the hops have been picked and dried in the oost, or tin-floor, they are so brittle that they would break to pieces and be spoiled if they were immediately to be put up; they are therefore to lie together three weeks, or thereabouts, that they may become tough: if they are covered from the air by blankets in the heap, they may be bagged much sooner than if left open.

The manner of bagging them is this; a hole is made in an upper-floor, so large that a man may easily go up and down it; then a hoop is fitted to the mouth of the bag, and so firmly sewed on, that it cannot be torn off; the bag is then let down through the hole, and the hoop remaining above, stops it from being pulled quite through, being larger than the hole: a few hops are to be first thrown into the bag, and a person below is to take up a parcel of these in each corner of the bag, tying it with a packthread; this makes a sort of tassel, by which the bags are afterwards the easier managed and

and turned about. When this is done, one man must go down into the bag, and, while another calls in the hops, he must tread them down equally every way with his feet; when the bag is in this manner filled, it is to be ripped from the hoop, and sewed up, leaving two tassels at the corners, as at the bottom. A bag of hops thus prepared, may be kept for several years in a dry place.

The tops of this plant, being of a cooling quality, are eaten, when boiled, as an emollient. A decoction of hop-flowers is also accounted an antidote against poison, and cures the itch, as well as the syrup thereof, and is esteemed excellent in choleric and pestilential fevers. The heads and tendrils are good in the scurvy and most cutaneous diseases. Juleps and apozems are also prepared with hops for hypochondriacal and hysterical affections, and to promote the menses: but the chief use of this plant consists in preserving beer and other malt-liquors (in which the flower of this plant is a principal ingredient) from turning sour, and rendering it wholesome and grateful to the taste, &c.

**HORD**, in geography, is used for a company of wandering people, which have no settled habitation, but stroll about, dwelling in waggons, or under tents, to be ready to shift as soon as the herbage, fruit, and the present province is eaten bare: such are several tribes of the Tartars, particularly those who inhabit beyond the Wolga, in the kingdom of Astracan and Bulgaria.

**HORDEUM**, **BARLEY**, in botany, a genus of the triandria digynia class. The involucre consists of six leaves, and contains three flowers. There are eight species, only one of which, *viz.* the murinum, or wall-barley-grass, is a native of Britain. The native place of the vulgare, or common barley cultivated in our fields, is not known. For the culture, &c. of common barley, see **AGRICULTURE**, p. 61.

**HORDICALIA**, or **HORNICIDIA**, in antiquity, a religious feast held among the Romans, wherein they sacrificed cattle big with young. This feast fell on April 15. on which day they sacrificed thirty cows with calf to the goddess Tellus, of the Earth; part of them were sacrificed in the temple of Jupiter. The calves taken out of their bellies were burnt to ashes at first by the

pontifices, afterwards by the eldest of the vestal virgins. **HOREHOUND**, **BALLOTA**, **STACHYS**, in botany. See **MARUBIUM**.

**HORIZON**, in astronomy and geography, that great circle which divides the heavens and the earth into two equal parts, or hemispheres, distinguishing the upper from the lower. See **ASTRONOMY** and **GEOGRAPHY**.

**HORIZONTAL**, something relating to the horizon; or that is taken in, or on a level with the horizon: thus we say, an horizontal plane, &c.

**HORMINUM**, **CLARY**, in botany, a genus of the didynamia gymnospermia class. The calix is bell-shaped, with four nearly equal segments, and a fifth larger and emarginated; and the upper labium of the corolla is concave. There are two species, none of them natives of Britain.

**HORN**, a hard substance growing on the heads of divers animals, particularly the cloven-footed quadrupeds; and serving them both as weapons of offence and defence.

**HORN-BEAM**, in botany. See **CARPINUS**.

**HORN-WORK**, in fortification, an out-work composed of two demi-bastions, joined by a curtain. See **FORTIFICATION**.

**HORNET**, in zoology. See **APIS**.

**HORNING**, in Scots law, a writing issuing from the signet, in his Majesty's name, at the instance of a creditor against his debtor, commanding him to pay or perform within a certain time. See **DENUNCIATION**, —and **LAW**, tit. 12. §. 13. 14.

**HORNSEY**, a market-town of the east riding of Yorkshire, thirty-five miles east of York.

**HOROGRAPHY**. See **DIALLING**.

**HOROLOGIUM**, a general name for instruments to measure the hours, as a watch, clock, dial, &c. See **WATCH**.

**HOROSCOPE**, in astrology, is the degree of the ascendent, or the star that rises above the horizon at a certain moment, which is observed in order to predict some future event, as the success of a design, the fortune of a person who was at that instant born, &c.

**HORSE**, in zoology. See **EQUUS**.

## H O R S E M A N S H I P;

Or, The Art of Riding, and of Training and Managing HORSES.

*The method of preparing horses to be mounted.*

**T**HOUGH all horses are generally bought at an age when they have already been backed, they should be begun and prepared for the rider with the same care, gentleness and caution, as if they had never been handled or backed, in order to prevent accidents, which might else arise from skittishness or other causes: and as it is proper that they should be taught the figure of the ground

they are to go upon, when they are at first mounted, they should be previously trotted in a *longe* on circles, without any one upon them.

The manner of doing this is as follows: Put an easy *cavesson* upon the horse's nose, and make him go forwards round you, standing quiet and holding the *longe*; and let another man, if you find it necessary, follow him with a whip. All this must be done very gently, and but a little at a time: for more horses are spoiled by over-much work, than by any other treatment whatever; and that by

by very contrary effects; for sometimes it drives them into vice, madness and despair, and often stupifies and totally dispirits them.

The first obedience required in a horse is going forwards: Till he performs this duty freely, never even think of making him rein back, which would inevitably make him rellive: As soon as he goes forwards readily, stop and carefs him. You must remember in this, and likewise in every other exercise, to use him to go equally well to the right and left; and when he obeys, carefs him and dismiss him immediately. If a horse, that is very young, takes fright and stands still, lead on another horse before him, which probably will induce him instantly to follow. Put a snaffle in his mouth; and when he goes freely, saddle him, girting him at first very loose. Let the cord, which you hold, be long and loose; but not so much, so as to endanger the horse's entangling his legs in it. It must be observed, that small circles, in the beginning, would constrain the horse too much, and put him upon defending himself. No bend must be required at first: never suffer him to gallop false; but whenever he attempts it, stop him without delay, and then set him off afresh. If he gallops of his own accord, and true, permit him to continue it; but if he does it not voluntarily, do not demand it of him at first. Should he fly and jump, shake the cord gently upon his nose without jerking it, and he will fall into his trot again. If he stands still, plunges or rears, let the man who holds the whip, make a noise with it; but never touch him, till it be absolutely necessary to make him go on. When you change hands, stop and carefs him, and entice him by fair means to come up to you: For by presenting yourself, as some do, on a sudden before horses, and frightening them to the other side, you run a great risk of giving them a shynefs. If he keeps his head too low, shake the *cavesson* to make him raise it: And in whatever the horse does, whether he walks, trots, or gallops, let it be a constant rule, that the motion be determined and really such as is intended, without the least shuffling, pacing, or any other irregular gait.

*The method of placing the rider and rendering him firm on horseback, with some occasional instructions for riders and the horses.*

It is necessary that the greatest attention, and the same gentleness, that is used in teaching the horses, be observed likewise in teaching the rider, especially at the beginning. Every method and art must be practised to create and preserve, both in man and horse, all possible feeling and sensibility, contrary to the usage of most riding masters, who seem industriously to labour at abolishing these principles both in one and the other. As so many essential points depend upon the manner in which a man is at first placed on horseback, it ought to be considered and attended to with the strictest care and exactness.

The absurdity of putting a man, who perhaps has never before been upon a horse, on a rough trotting horse, on which he is obliged to stick with all the force of his arms and legs, is too obvious to need mentioning. This rough

work, all at once, is plainly as detrimental at first, as it is excellent afterwards in proper time. No man can be either well, or firmly seated on horseback, unless he be master of the balance of his body, quite unconstrained, with a full possession of himself, and at his ease; none of which requisites can he enjoy, if his attention be otherwise engaged; as it must wholly be in a raw, unsuppled, and unprepared lad, who is put at once upon a rough horse: in such a distressful state he is forced to keep himself on at any rate, by holding to the bridle, (at the expence of the sensibility both of his own hand, and the horse's mouth,) and by clinging with his legs, in danger of his life, and to the certain depravation of a right feeling in the horse.

The first time a man is put on horseback, it ought to be upon a very gentle one. He never should be made to trot, till he is quite easy in the walk; nor gallop, till he is able to trot properly. The same must be observed in regard to horses: they should never be made to trot, till they are obedient, and their mouths are well formed on a walk; nor be made to gallop, till the same be effected on a trot. When he is arrived at such a degree of firmness in his seat, the more he trots, and the more he rides rough horses, the better. This is not only the best method, but also the easiest and the shortest: by it, a man is soon made sufficiently an horseman for a soldier; but by the other detestable methods, that are commonly used, a man, instead of improving, contracts all sorts of bad habits, and rides worse and worse every day; the horse too becomes daily more and more unfit for use. In proceeding according to the manner proposed, a man is rendered firm and easy upon the horse, both his own and the horse's sensibility is preserved, and each in a situation fit to receive and practise all lessons effectually.

Among the various methods that are used of placing people on horseback, few are directed by reason. Before you let the man mount, teach him to know, and always to examine, if the curb be well placed, (that is, when the horse has a bit in his mouth, which at first he should not; but only a snaffle, till the rider is firm in his seat, and the horse also somewhat taught;) and likewise if the nose-band be properly tight; the throat band loose, and the mouth-piece neither too high nor too low in the horse's mouth, but rightly put so as not to wrinkle the skin, nor to hang lax; the girths drawn moderately, but not too tight; and the crupper and the breast plate properly adjusted. A very good and careful hand may venture on a bit at first, and succeed with it full as well, as by beginning with a snaffle alone: on colts, indeed, it is better, in all schools whatsoever, to avoid any pressure on the bars just at first, which a curb, though ever so delicately used, must in some degree occasion. When the bridle, &c. have been well looked to, let the man approach the horse gently near the shoulder; then taking the reins and an handful of the mane in his left hand, let him put his foot softly in the left stirrup, by pulling it towards him, least he touch the horse with his toe, then raising himself up, let him rest a moment on it with his body upright, but not stiff: and after that passing his right leg clear over the saddle without rubbing against anything, let him seat himself gently down. He must be

be cautious not to take the reins too short, for fear of making the horse rear, run, or fall back, or throw up his head; but let him hold them of an equal length, neither tight nor slack, and with the little finger betwixt them. It is fit that horses should be accustomed to stand still to be mounted, and not to stir till the rider pleases. All soldiers should be instructed to mount and dismount equally well on both sides, which may be of very great use in times of hurry and confusion. Then place the man in his saddle, with his body rather back, and his head held up with ease, without stiffness; seated neither forwards, nor very backwards, with the breast pushed out a little, and the lower part of the body likewise a little forwards; the thighs and legs turned in without constraint, and the feet in a straight line, neither turned in nor out: By this position, the natural weight of the thighs has a proper and sufficient pressure of itself, and the legs are in readiness to act, when called upon: they must hang down easy and naturally, and be so placed, as not to be wriggling about, touching and tickling the horse's sides, but always near them in case they should be wanted, as well as the heels.

The body must be carefully kept easy and firm, and without any rocking, when in motion; which is a bad habit very easily contracted, especially in galloping. The left elbow must be gently leant against the body, a little forwards; unless it be so rested, the hand cannot be steady, but will be always checking, and consequently have pernicious effects on the horse's mouth: and the hand ought to be of equal height with the elbow; if it were lower, it would constrain and confine the motion of the horse's shoulders; but, as the mouths of horses are different, the place of the hand also must occasionally differ: a leaning, low, heavy for hand requires a high hand; and a horse that pokes out his nose, a low one. The right hand arm must be placed in symmetry with the left; only let the right hand be a little forward or backward, higher or lower as occasions may require, in order that both hands may be free: both arms must be a little bent at the elbow, to prevent stiffness.

A soldier's right hand should be kept unemployed in riding; it carries the sword, which is a sufficient business for it.

There remains one farther observation, that ought not to be omitted, about the hand, that it must be kept clear of the body; *i. e.* about two inches and half forwards from it, with the nails turned opposite to the belly, and the wrist a little rounded with ease; a position not less graceful than ready for slackening, tightening, and moving the reins from on side to the other, as may be found necessary.

When the men are well placed, the more rough trotting they have without stirrups, the better; but with a strict care always, that their position be preserved very exactly. In all cases, great care must be taken to hinder their clinging with their legs: In short, no sticking by hands or legs is ever to be allowed of at any time. If the motion of the horse be too rough, slacken it, till the rider grows by degrees more firm: and when he is quite firm and easy on his horse in every kind of motion, stir-

rups may be given him; but he must never leave off trotting often without any.

The stirrups must be neither short nor long; but of such a length, that when the rider, being well placed, puts his feet into them, (about one third of the length of each foot from the point of it,) the points may be between two and three inches higher than the heels. The rider must not bear upon his stirrups, but only let the natural weight of his legs rest on them: For if he bear upon them, he would be raised above and out of his saddle; which should never be, except in charging sword in hand, with the body inclined forwards at the very instant of attacking. Spurs may be given, as soon as the rider is grown familiar with stirrups, or even long before, if his legs are well placed.

A hand should always be firm, but delicate: a horse's mouth should never be surprised by any sudden transition of it, either from slack to tight, or from tight to slack. Every thing in horsemanship must be effected by degrees, but at the same time with spirit and resolution. That hand which, by giving and taking properly, gains its point with the least force, is the best; and the horse's mouth, under this same hand's directions, will also consequently be the best, supposing equal advantages in both from nature. This principle of gentleness should be observed upon all occasions in every branch of horsemanship. Sometimes the right hand may be necessary, upon some troublesome horses, to assist the left; but the seldomer this is done, the better; especially in a soldier, who has a sword to carry, and to make use of.

The snaffle must on all occasions be uppermost; that is to say the reins of it must be above those of the bridle, whether the snaffle or the bit be used separately, or whether they be both used together. When the rider knows enough, and the horse is sufficiently prepared and settled to begin any work towards suppling, one rein must be shortened according to the side worked to; but it must never be so much shortened, as to make the whole strength rest on that rein alone; for, not to mention that the work would be false and bad, one side of the horse's mouth would by that means be always deadened; whereas on the contrary, it should always be kept fresh by its own play, and by the help of the opposite rein's acting delicately in a somewhat smaller degree of tension; the joint effect of which produces in a horse's mouth the proper, gentle and easy degree of *appui* or bearing.

A coward and a madman make alike bad riders, and are both alike discovered and confounded by the superior sense of the creature they are mounted upon, who is equally spoiled by both, though in very different ways. The coward, by suffering the animal to have his own way, not only confirms him in his bad habits, but creates new ones in him: and the madman, by false and violent motions and corrections, drives the horse, through despair, into every bad and vicious trick that rage can suggest.

It is very requisite in horsemanship, that the hand and legs should act in correspondence with each other in every thing; the latter always subservient and assistant to the former. Upon circles, in walking, trotting, or galloping, the outward leg is the only one to be used, and that only for a moment at a time, in order to set off the horse

true,

Arue, or put him right, if he be false; and as soon as that is done, it must be taken away again immediately: but if the horse be lazy, or otherwise retains himself, both legs must be used, and pressed to his sides at the same time together. The less the legs are used in general, the better. Very delicate good riders, with horses they have dressed themselves, will scarcely ever want their help. By the term *outward* is understood the side which is more remote from the centre; and by *inward* is meant the side next to the centre. In reining back, the rider should be careful not to use his legs, unless the horse backeth on his shoulders; in which case they must be both applied gently at the same time, and correspond with the hand. If the horse refuse to back at all, the riders legs must be gently approached, till the horse lifts up a leg, as if to go forwards; at which time, when that leg is in the air, the rein of the same side with that leg, which is lifted up, will easily bring that same leg backwards, and accordingly oblige the horse to back: but if the horse offers to rear, the legs must be instantly removed away. The inward rein must be the tighter on circles, so that the horse may bend and look inwards; and the outward one crossed over a little towards it; and both held in the left hand.

Let the man and horse begin on very slow motions, that they may have time to understand, and reflect on what is taught them; and in proportion as the effects of the reins are better comprehended, and the manner of working becomes more familiar, the quickness of motion must be increased. Every rider must learn to feel, without the help of the eye, when a horse goes false, and remedy the fault accordingly: this is an intelligence, which nothing but practice, application and attention can give, in the beginning on slow motions. A horse may not only gallop false, but also trot and walk false. If a horse gallops false, that is to say, if going to the right, he leads with the left leg; or if going to the left, he leads with the right; or in case he is disunited, *i. e.* if he leads with the opposite leg behind to that which he leads with before; stop him immediately, and put him off again properly: the method of effecting this, is by approaching your outward leg and putting your hand outwards, still keeping the inward rein the shorter, and the horse's head inwards, if possible; and if he should still resist, then bend and pull his head outwards also, but replace it again, bent properly inwards, the moment he goes off true. A horse is said to be disunited to the right, when going to the right, and consequently leading with the right leg before, he leads with the left behind; and is said to be disunited to the left, when going to the left, and consequently leading with the left leg before, he leads with the right behind. A horse may at the same time be both false and disunited; in correcting both which faults, the same method must be used. He is both false and disunited to the right, when in going to the right he leads with the left leg before, and the right behind; notwithstanding that hinder leg be with propriety more forward under his belly than the left, because the horse is working to the right: and he is false and disunited to the left, when in going to the left he leads with the right leg before, and the left behind; notwithstanding,

as above, that hinder leg be with propriety more forward under his belly than the right, because the horse is working to the left.

In teaching men a right seat on horseback, the greatest attention must be given to prevent stiffness, and sticking by force in any manner upon any occasion: stiffness disgraces every right work; and sticking serves only to throw a man (when displaced) a great distance from his horse by the spring he must go off with: whereas by a proper equilibrating position of the body, and by the natural weight only of the thighs, he cannot but be firm, and secure in his seat.

As the men become more firm, and the horses more supple, it is proper to make the circles less, but not too much so, for fear of throwing the horses forwards upon their shoulders.

Some horses, when first the bit is put into their mouths, if great care be not taken, will put their heads very low. With such horses, raise your right hand with the *bridoon* in it, and play at the same time with the bit in the left hand, giving and taking.

On circles, the rider must lean his body inwards; unless great attention be given to make him do it, he will be perpetually losing his seat outwards. It is scarce possible for him to be displaced if he leans his body properly inwards.

*The method of suppling horses with men upon them, by the EPAULE en dedans, &c. with and without a longe, on circles and on straight lines.*

WHEN a horse is well prepared and settled in all his motions, and the rider firm, it will be proper then to proceed on towards a farther suppling and teaching of both.

In setting out upon this new work, begin by bringing the horse's head a little more inwards than before, pulling the inward rein gently to you by degrees. When this is done, try to gain a little on the shoulders, by keeping the inward rein the shorter, as before, and the outward one crossed over towards the inward one. The intention of these operations is this; the inward rein serves to bring in the head, and procures the bend; whilst the outward one, that is a little crossed, tends to make that bend perpendicular, and as it should be, that is to say, to reduce the nose and the forehead to be in a perpendicular line with each other: it also serves, if put forwards, as well as also crossed, to put the horse forwards, if found necessary, which is often requisite, many horses being apt in this and other works rather to lose their ground backwards than otherwise, when they should rather advance: if the nose were drawn in towards the breast beyond the perpendicular, it would confine the motion of the shoulders, and have other bad effects. All other bends, besides what are above specified, are false. The outward rein, being crossed, not in a forward sense, but rather a little backwards, serves also to prevent the outward shoulder from getting too forwards, and makes it approach the inward one; which facilitates the inward leg's crossing over the outward one; which is the motion that so admirably supples the shoulders. Care must be taken, that the inward leg pass over the outward one,

one, without touching it; this inward leg's crossing over must be helped also by the inward rein, which you must cross towards and over the outward rein every time the outward leg comes to the ground, in order to lift and help the inward leg over it: at any other time, but just when the outward leg comes to the ground, it would be wrong to cross the inward rein, or to attempt to lift up the inward leg by it; nay, it would be demanding an absolute impossibility, and lugging about the reins and horse to no purpose; because in this case, a very great part of the horse's weight resting then upon that leg, would render such an attempt, not only fruitless, but also prejudicial to the sensibility of the mouth, and probably oblige him to defend himself: and moreover, it would put the horse under a necessity of straddling before, and also of leading with the wrong leg, without being productive of any suppling motion whatsoever.

When the horse is thus far familiarly accustomed to what you have required of him, then proceed to effect by degrees the same crossing in his hinder legs. By bringing in the fore-legs more, you will of course engage the hinder ones in the same work: if they resist, the rider must bring both reins more inwards; and, if necessary, put back also, and approach his inward leg to the horse; and if the horse throws out his croup too far, the rider must bring both reins outwards, and if absolutely necessary, he must also make use of his outward leg, in order to replace the horse properly; observing that the croup should always be considerably behind the shoulders, which in all actions must go first; and the moment that the horse obeys, the rider must put his hand and leg again into their usual position.

Nothing is more ungraceful in itself, more detrimental to a man's seat, or more destructive of the sensibility of a horse's sides, than a continual wriggling unsettledness in a horseman's legs, which prevents the horse from ever going a moment together true, steady, or determined.

A horse should never be turned, without first moving a step forwards; and when it is doing, the rider must not lift up his elbow, and displace himself; a motion only of the hand from the one side to the other being sufficient for that purpose. It must also be a constant rule never to suffer a horse to be stopped, mounted or dismounted, but when he is well placed. The slower the motions are, when a man or horse is taught any thing, the better.

At first, the figures worked upon must be great, and afterwards made less by degrees, according to the improvement which the man and horse make; and the cadenced pace also, which they work in, must be accordingly augmented. The changes from one side to the other, must be in a bold determined trot, and at first quite straight forwards, without demanding any side motion on two paces, which is very necessary to require afterwards, when the horse is sufficiently suppled. By two paces is meant, when the fore-parts and hinder-parts do not follow, but describe two different lines.

In the beginning, a *longe* is useful on circles, and also on straight lines, to help both the rider and the horse; but afterwards, when they are grown more intelligent, they should go alone. At the end of the lesson, rein back; and then put the horse, by a little at a time, for-

wards, by approaching both legs gently to his sides, and playing with the bridle: if he rears, push him out immediately into a full trot. Shaking the *cavesson* on the horse's nose, and also putting one's self before him and rather near to him, will generally make him back, though he otherwise refuse to do it: and moreover a slight use and approaching of the rider's legs, will sometimes be necessary in backing, in order to prevent the horse from doing it too much upon his shoulders; but the pressure of the legs ought to be very small, and taken quite away the moment that he puts himself enough upon his haunches. If the horse does not back upon a straight line properly, the rider must not be permitted to have recourse immediately to his leg, and so distort himself by it, but first try, if crossing over his hand and reins to which ever side may be necessary, will not be alone sufficient; which most frequently it will; if not, then employ the leg.

After a horse is well prepared and settled, and goes freely on in all his several paces, he ought to be in all his works kept, to a proper degree, upon his haunches, with his hinder legs well placed under him; whereby he will be always pleasant to himself and his rider, will be light in hand, and ready to execute whatever may be demanded of him, with facility, vigour, and quickness.

The common method that is used, of forcing a horse sideways, is a most glaring absurdity, and very hurtful to the animal in its consequences; for instead of suppling him, it obliges him to stiffen and defend himself, and often makes a creature, that is naturally benevolent, restless, frightened and vicious.

For horses, who have very long and high fore-hands, and who poke out their noses, a running snaffle is of excellent use; but for such as bore and keep their heads low, a common one is preferable; though any horse's head indeed may be kept up also with a running one, by the rider's keeping his hands very high and forwards: but whenever either is used alone without a bridle upon horses that carry their heads low and that bore, it must be sawed about from one side to the other.

This lesson of the *epaul en dedans*, should be taught to such people as are likely to become useful in helping to teach men and to break horses; and the more of such that can be found, the better: none others should ever be suffered upon any occasion to let their horses look any way besides the way they are going. But all horses whatever, as likewise all men, who are designed for the teaching others, must go thoroughly and perfectly through this excellent lesson, under the directions of intelligent instructors, and often practise it too afterwards, and when that is done, proceed to, and be finished by the lessons of the head and tail to the wall.

#### *Of the head to the wall, and of the croup to the wall.*

THIS lesson should be practised immediately after that of the *epaule en dedans*, in order to place the horse properly the way he goes, &c. The difference between the head to the wall, and the croup to the wall, consists in this: in the former, the fore parts are more remote from the centre, and go over more ground; in the latter, the hinder-parts are more remote from the center, and consequently

requently go over more ground : in both, as likewise in all other lessons, the shoulders must go first. In riding-houses, the head to the wall is the easier lesson of the two at first, the line to be worked upon being marked by the wall, not far from his head.

The motion of the legs to the right, is the same as that of the *epaule en dedans* to the left, and so *vice versa*; but the head is always bent and turned differently : in the *epaule en dedans*, the horse looks the contrary way to that which he goes ; in this he looks the way he is going.

In the beginning, very little bend must be required ; too much at once would astonish the horse and make him defend himself : it is to be augmented by degrees. If the horse absolutely refuses to obey, it is a sign, that either he or his rider has not been sufficiently prepared by previous lessons. It may happen, that weakness or a hurt in some part of the body, or sometimes temper, though seldom, may be the cause of the horse's defending himself : it is the rider's business to find out from whence the obstacle arises ; and if he finds it to be from the first mentioned cause, the previous lessons must be resumed again for some time ; if from the second, proper remedies must be applied ; and if from the last cause, when all fair means that can be tried have failed, proper corrections with coolness and judgment must be used.

In practising this lesson to the right, bend the horse to the right with the right rein ; helping the left leg over the right (at the time when the right leg is just come to the ground,) with the left rein crossed towards the right, and keeping the right shoulder back with the right rein towards your body, in order to facilitate the left legs crossing over the right ; and so likewise *vice versa* to the left, each rein helping the other by their properly mixed effects. In working to the right, the rider's left leg helps the hinder parts on to the right, and his right leg stops them, if they get too forwards ; and so *vice versa* to the left ; but neither ought to be used, till the hand being employed in a proper manner has failed, or finds that a greater force is necessary to bring what is required about than it can effect alone ; for the legs should not only be corresponding with, but also subservient to the hand ; and all unnecessary aids, as well as all force, ought always to be avoided, as much as possible.

In the execution of all lessons, the equillibre of the rider's body is of great use to the horse : it ought always to go with and accompany every motion of the animal ; when to the right, to the right ; and when to the left, to the left.

Upon all horses, in every lesson and action, it must be observed, that there is no horse but has his own peculiar appui or degree of bearing, and also a sensibility of mouth, as likewise a rate of his own, which it is absolutely necessary for the rider to discover and make himself acquainted with. A bad rider always takes off at least the delicacy of both, if not absolutely destroys it. The horse will inform his rider when he has got his proper bearing in the mouth, by playing pleasantly and steadily with his bit, and by the spray about his chaps. A delicate and good hand will not only always preserve a light appui, or bearing, in its sensibility ; but also of a heavy one, whether naturally so or acquired, make a light one. The

lighter this appui can be made, the better ; provided that the rider's hand corresponds with it ; if it does not, the more the horse is properly prepared, so much the worse : Instances of this inconvenience of the best of appuis, when the rider is not equally taught with the horse, may be seen every day in some gentlemen, who try to get their horses bitted as they call it, without being suitably prepared themselves for riding them : the consequence of which is, that they ride in danger of breaking their necks ; till at length after much hauling about, and by the joint insensibility and ignorance of themselves and their grooms, the poor animals gradually become mere senseless, unfeeling posts ; and thereby grow, what they call, settled. When the proper appui is found, and made of course as light as possible, it must not be kept duly fixed without any variation, but be played with ; otherwise one equally continued tension of reins would render both the rider's hand and the horse's mouth very dull. The slightest, and frequent giving and taking, is therefore necessary to keep both perfect.

Whatever pace or degree of quickness you work in, (be it ever so fast, or ever so slow,) it must be cadenced ; time is as necessary for an horseman as for a musician.

This lesson of the head and of the tail to the wall, must be taught every soldier : scarce any manœuvre can be well performed without it. In closing and opening of files, it is almost every moment wanted.

#### *The method of teaching horses to stand fire, noises, alarms, fights, &c.*

In order to make horses stand fire, the sound of drums, and all sorts of different noises, you must use them to it by degrees in the stable at feeding-time ; and instead of being frightened at it, they will soon come to like it as a signal for eating.

With regard to such horses as are afraid of burning objects, begin by keeping them still at a certain distance from some lighted straw : caress the horse ; and in proportion as his fright diminishes, approach gradually the burning straw very gently, and increase the size of it. By this means he will very quickly be brought to be so familiar with it, as to walk undaunted even through it.

As to horses that are apt to lie down in the water, if animating them, and attacking them vigorously, should fail of the desired effect, then break a straw bottle full of water upon their heads, and let the water run into their ears, which is a thing they apprehend very much.

All troop-horses must be taught to stand quiet and still when they are shot off from, to stop the moment you present, and not to move after firing, till they are required to do it ; this lesson ought especially to be observed in light-troops ; in short, the horses must be taught to be so cool and undisturbed, as to suffer the rider to act upon him with the same freedom as if he was on foot. Patience, coolness, and temper, are the only means requisite for accomplishing this end. Begin by walking the horse gently, then stop and keep him from stirring for some time, so as to accustom him by degrees not to have the least idea of moving without orders : if he does, then back him ; and

and when you stop him, and he is quite still, leave the reins quite loose.

To use a horse to fire-arms, first put a pistol or carbine in the manger with his feed ; then use him to the sound of the lock and the pan ; after which, when you are upon him, shew the piece to him, presenting it forwards, sometimes on one side, sometimes on the other : when he is thus far reconciled, proceed to flash in the pan ; after which, put a small charge into the piece, and so continue augmenting it by degrees to the quantity which is commonly used : if he seems uneasy, walk him forwards a few steps slowly ; and then stop, back and caress him. Horses are often also disquieted and unsteady at the clasp, and drawing, and returning of swords, all which they must be familiarized to by little and little, by frequency and gentleness.

It is very expedient for all cavalry in general, but particularly for light cavalry, that their horses should be very ready and expert in leaping over ditches, hedges, gates, &c. The leaps, of whatever sort they are, which the horses are brought to in the beginning, ought to be very small ones ; the riders must keep their bodies back, raise their hands a little in order to help the foreparts of the horse up, and be very attentive to their equilibrium. It is best to begin at a low bar covered with furze, which pricking the horse's legs, if he does not raise himself sufficiently, prevents his contracting a sluggish and dangerous habit of touching, as he goes over, which any thing yielding and not pricking would give him a custom of doing. Let the ditches you first bring horses to, be narrow ; and in this, as in every thing else, let the increase be made by degrees. Accustom them to come up to every thing which they are to leap over, and to stand coolly at it for some time ; and then to raise themselves gently up in order to form to themselves an idea of the distance. When they leap well standing, then use them to walk gently up to the leap, and to go over it without first halting at it ; and after that practice is familiar to them, repeat the like in a gentle trot, and so by degrees faster and faster, till at length it is as familiar to them to leap flying on a full gallop, as any other way : all which is to be acquired with great facility by calm and soft means without any hurry.

As horses are naturally apt to be frightened at the sight and smell of dead horses, it is advisable to habituate them to walk over, and leap over carcases of dead horses : and as they are particularly terrified at this sight, the greater gentleness ought consequently to be used.

Horses should also be accustomed to swim, which often may be necessary upon service ; and if the men and horses both are not used to it, both may be frequently liable to perish in the water. A very small portion of strength is sufficient to guide a horse, any where indeed, but particularly in the water, where they must be permitted to have their heads, and be no ways constrained in any shape.

The unreasonable rage in Britain of cutting off all extremities from horses, is in all cases a very pernicious custom. It is particularly so in regard to a troop-horse's tail. It is almost incredible, how much they suffer at the picket for want of it : constantly fretting, and sweating,

VOL. II. No. 60.

1

kicking about and laming one another, tormented, and stung off their meat, miserable, and helpless ; whilst other horses, with their tails on, brush off all flies, are cool and at their ease, and mend daily, whilst the docked ones grow every hour more and more out of condition.

*The method of reining back,—and of moving forwards immediately after,—of piafing,—of pillars, &c.*

NEVER finish your work by reining back with horses that have any disposition towards retaining themselves ; but always move them forwards and a little upon the haunches also after it, before you dismount, (unless they retain themselves very much indeed, in which case nothing at all must be demanded from the haunches.) This lesson of reining back, and piafing, is excellent to conclude with, and puts an horse well and properly on the haunches : It may be done, according as horses are more or less supplied, either going forwards, backing, or in the same place : if it is done well advancing, or at most on the same spot, it is full sufficient for a soldier's horse : For to piafe in backing, is rather too much to be expected in the hurry, which cannot but attend such numbers both of men and horses as must be taught together in regiments. This lesson must never be attempted at all, till horses are very well supplied, and somewhat accustomed to be put together ; otherwise it will have very bad consequences, and create restiveness. If they refuse to back, and stand motionless, the rider's legs must be approached with the greatest gentleness to the horse's sides ; at the same time as the hand is acting on the reins to sollicit the the horse's backing. This seldom fails of procuring the desired effect, by raising one of the horse's fore-legs, which being in the air, has no weight upon it, and is consequently very easily brought backwards by a small degree of tension in the reins. When this lesson is well performed, it is very noble, and useful, and has a pleasing air ; it is an excellent one to begin teaching scholars with.

The lesson is particularly serviceable in the pillars, for placing scholars well at first. Very few regimental riding-houses have pillars, and it is fortunate they have not ; for though, when properly made use of with skill, they are one of the greatest and best discoveries in horsemanship ; they must be allowed to be very dangerous and pernicious, when they are not under the direction of a very knowing person.

*The method of curing restivenesses, vices, defences, starting, &c.*

WHENEVER a horse makes resistance, one ought, before a remedy or correction is thought of, to examine very minutely all the tackle about him, if any thing hurts or tickles him, whether he has any natural or accidental weakness, or in short any the least impediment in any part. For want of this precaution, many fatal disasters happen : the poor dumb animal is frequently accused falsely of being restive and vicious ; is used ill without reason, and, being forced into despair, is in a manner obliged to act accordingly, be his temper and inclination ever so

8 P

well

well disposed. It is very seldom the case, that a horse is really and by nature vicious; but if such be found, he will despise all caresses, and then chastisements become necessary.

Correction, according as you use it, throws a horse into more or less violent action, which, if he be weak, he cannot support: but a vicious strong horse is to be considered in a very different light, being able both to undergo and consequently to profit by all lessons; and is far preferable to the best natured weak one upon earth. Patience and science are never-failing means to reclaim such a horse: in whatsoever manner he defends himself, bring him back frequently with gentleness (not however without having given him proper chastisement, if necessary,) to the lesson which he seems most averse to. Horses are by degrees made obedient, through the hope of recompence and the fear of punishment: how to mix these two motives judiciously together, is a very difficult matter; it requires much thought and practice; and not only a good head, but a good heart likewise. The coolest, and best natured rider, will always succeed best. By a dextrous use of the incitements above mentioned, you will gradually bring the horse to temper and obedience; mere force and want of skill and coolness, would only tend to confirm him in bad tricks. If he be impatient or choleric, never strike him, unless he absolutely refuses to go forwards; which you must resolutely oblige him to do, and which will be of itself a correction, by preventing his having time to meditate, and put in execution any defence by retaining himself. Resistance in horses, you must consider, is sometimes a mark of strength and vigour, and proceeds from spirits, as well as sometimes from vice and weakness. Weakness frequently drives horses into viciousness, when any thing wherein strength is necessary is demanded from them; nay, it inevitably must: great care therefore should always be taken to distinguish from which of these two causes any remedy or punishment is thought of. It may sometimes be a bad sign, when horses do not at all defend themselves, and proceed from a sluggish disposition, a want of spirit, and of a proper sensibility. Whenever one is so fortunate as to meet with a horse of just the right spirit, activity, delicacy of feeling, with strength and good-nature, he cannot be cherished too much; for such a one is a rare and inestimable jewel, and, if properly treated, will in a manner do every thing of himself. Horses are oftener spoiled by having too much done to them, and by attempts to dress them in too great an hurry, than by any other treatment.

If after a horse has been well supplied, and there are no impediments, either natural or accidental, if he still persists to defend himself, chastisements then become necessary: but whenever this is the case, they must not be frequent, but always firm, though always as little violent as possible: for they are both dangerous and very prejudicial, when frequently or slightly played with; and still more so, when used too violently.

It is impossible, in general, to be too circumspect in lessons of all kinds, in aids, chastisements, or caresses. Some have quicker parts, and more cunning, than others. Many will imperceptibly gain a little every day on their

rider. Various, in short, are their dispositions and capacities. It is the rider's business to find out their different qualities, and to make them sensible how much he loves them, and desires to be loved by them; but at the same time that he does not fear them, and will be master.

Plunging is a very common defence among restive and vicious horses: if they do it in the same place, or backing, they must, by the rider's legs and spurs firmly applied, be obliged to go forwards, and their heads kept up high. But if they do it flying forwards, keep them back, and ride them gently and very slow for a good while together. Of all bad tempers and qualities in horses, those which are occasioned by harsh treatment and ignorant riders, are the worst.

Rearing is a bad vice, and, in weak horses especially, a very dangerous one. Whilst the horse is up, the rider must yield his hand, and when the horse is descending, he must vigorously determine him forwards: if this be done at any other time but whilst the horse is coming down, it may add a spring to his rearing, and make him fall backwards. With a good hand on them, horses seldom persist in this vice; for they are themselves naturally much afraid of falling backwards. If this method fails, you must make the horse kick up behind, by getting somebody on foot to strike him behind with a whip; or, if that will not effect it, by pricking him with a goad.

Starting often proceeds from a defect in the sight; which therefore must be carefully looked into. Whatever the horse is afraid of, bring him up to it gently; if you caress him every step he advances, he will go quite up to it by degrees, and soon grow familiar with all sorts of objects. Nothing but great gentleness can correct this fault: for if you inflict punishment, the apprehension of chastisement becomes prevalent, and causes more starting than the fear of the object. If you let him go by the object, without bringing him up to it, you increase the fault, and confirm him in his fear: the consequence of which is, he takes his rider perhaps a quite contrary way from what he was going, becomes his master, and puts himself and the person upon him every moment in great danger.

With such horses as are to a very great degree fearful of any objects, make a quiet horse, by going before them, gradually entice them to approach nearer and nearer to the thing they are afraid of. If the horse, thus alarmed, be undisciplined and head-strong, he will probably run away with his rider; and if so, his head must be kept up high, and the snaffle sawed backwards and forwards from right to left, taking up and yielding the reins of it, as also the reins of the bit: but this latter must not be sawed backwards and forwards, like the snaffle, but only taken up, and yielded properly. No man ever yet did, or ever will stop a horse, or gain any point over him, by main force, or by pulling a dead weight against him.

#### *Remarks and hints on Shoeing.*

As feet differ, so should shoes accordingly. The only system of farriers, is to shoe in general with excessive heavy and

and clumsy ill-shaped shoes, and very many nails, to the total destruction of the foot. The cramps they annex, tend to destroy the bullet; and the shoes made in the shape of a walnut-shell prevent the horse's walking upon the firm basis which God has given him for that end, and thereby oblige him to stumble and fall. They totally pare away also, and lay bare the inside of the animal's foot with their detestable butteris, and afterwards put on very long shoes, whereby the foot is hindered from having any pressure at all upon the heels, which pressure otherwise might still perchance, notwithstanding their dreadful cutting, keep the heels properly open, and the foot in good order. The frog should never be cut out; but as it will sometimes become ragged, it must be cleaned every now and then, and the ragged pieces cut off with a knife. In one kind of foot indeed a considerable cutting away must be allowed of, but not of the frog; we mean that very high feet must be cut down to a proper height; because if they were not, the frog, though not cut, would still be so far above the ground, as not to have any bearing on it, whereby the great tendon must inevitably be damaged, and consequently the horse would go lame.

The weight of shoes must greatly depend on the quality and hardness of the iron. If the iron be very good, it will not bend; and in this case, the shoes cannot possibly be made too light: care however must be taken, that they be of a thickness so as not to bend; for bending would force out the nails, and ruin the hoof. That part of the shoe which is next the horse's heel, must be narrower than any other, (as is seen in the draught, plate 101. fig. 4.) that stones may be thereby prevented from getting under it, and sticking there; which otherwise would be the case; because the iron, when it advances inwardly beyond the bearing of the foot, forms a cavity, wherein stones being lodged would remain, and, by pressing against the foot, lame the horse. The part of the shoe, which the horse walks upon, should be quite flat, and the inside of it likewise; only just space enough being left next the foot, to put in a picker, (which ought to be used every time the horse comes into the stable,) and also to prevent the shoe's pressing upon the sole. Four nails on each side hold better than a greater number, and keep the hoof in a far better state. The toe of the horse must be cut short, and nearly square. (the angles only just rounded off,) nor must any nails be driven there; this method prevents much stumbling, especially in descents, and serves, by throwing nourishment to the heels, to strengthen them; on them the horse should in some measure walk, and the shoe be made of a proper length accordingly; by this means, narrow heels are prevented, and many other good effects produced. Many people drive a nail at the toe, but it is an absurd practice. Leaving room to drive one there causes the foot to be of an improper length; and moreover that part of the hoof is naturally so brittle, that even when it is kept well greased, the nail there seldom stays in, but tears out and

damages the hoof. That the directions for shoeing a proper length may be the more clear and intelligible, we have annexed (plate 101.) a draught of a foot shod a proper length standing on a plain surface, and with it a draught of the right kind of shoe.

In wet, spongy, and soft ground, where the foot sinks in, the pressure upon the heels is of course greater, than on hard ground; and so indeed it should be upon all accounts. The hinder feet must be treated in the same manner as the fore-ones; and the shoes the same: except in hilly and slippery countries, they may not improperly be turned up a little behind: but turning up the fore-shoes is of no service, and is certain ruin to the fore-legs, especially to the bullets. In descending hills, cramps are apt to throw horses down, by stopping the fore-legs, out of their proper basis and natural bearing when the hinder ones are rapidly pressed; which unavoidably must be the case, and consequently cannot but push the horse upon his nose. With them on a plain surface, a horse's foot is always thrown forwards on the toe, out of its proper bearing, which is very liable to make the horse stumble. The notion of their utility in going up hills is a false one. In ascending, the toe is the first part of the foot, which bears on, takes hold of the ground, and whether the horse draws or carries; and consequently the business is done before the part where the cramps are comes to the ground. Ice nails are preferable to any thing to prevent slipping, as also to help horses up hill, the most forward ones taking hold of the ground early, considerably before the heels touch the ground: they must be so made, as to be, when driven in, scarce half inch above the shoe, and also have four sides ending at the top in a point. They are of great service to prevent slipping on all kinds of places, and by means of them a horse is not thrown out of his proper basis. They must be made of very good iron. If they are not, the heads of them will be perpetually breaking off. From the race-horse to the cart-horse, the same system of shoeing should be observed. The size, thickness, and weight of them only should differ. The shoe of a race-horse must of course be lighter than that of a saddle horse; that of a saddle horse lighter than that of a coach or bāt horse; and these last more so than a cart, waggon, or artillery horse. At present all shoes in general are too heavy; if the iron is good, shoes need not be so thick as they are now generally made. The utmost severity ought to be insisted upon all those who clap shoes on hot: This unpardonable laziness of farriers in making feet thus fit shoes, instead of shoes fitting feet, dries up the hoof, and utterly destroys them. Frequent removals of shoes are detrimental and tear the foot, but sometimes they are very necessary: this is an inconvenience which half-shoes are liable to; for the end of the shoe, being very short, is apt to work soon into the foot, and consequently must often be moved.

For the *Natural History and Treatment of the Diseases of Horses*, see EQUUS, and FARRIER.

## H O R

**HORSHAM**, a market-town and borough of Suffex, situated twenty miles north west of Lewia, in W. long.

## H O R

22', N. lat. 51° 10'. It sends two members to parliament.

**HORTAGILERS**,

**HORTAGILERS**, in the grand seignior's court, upholsterers, or tapestry-hangers. The grand seignior has constantly four hundred in his retinue when he is in the camp: these go always a day's journey before him, to fix upon a proper place for his tent, which they prepare first; and afterwards those of the officers, according to their rank.

**HORTULANUS**, in ornithology. See **EMBERIZA**.

**HORTUS SICCUS**, a **DRY-GARDEN**, an appellation given to a collection of specimens of plants, carefully dried and preserved.

Take a specimen of a plant in flower, and with it one of its bottom-leaves, if it have any; bruise the stalk, if too rigid; slit it, if too thick; spread out the leaves and flowers on paper; cover the whole with more paper, and lay a weight over all. At the end of eighteen hours take out the plants, now perfectly flattened; lay them on a bed of dry common sand; sift over them more dry sand, to the depth of two inches, and thus let them lie about three weeks: the less succulent dry much sooner, but they take no harm afterwards. If the floor of a garret be covered in spring with sand two inches deep, leaving space for walking to the several parts, it will receive the collection of a whole summer, the covering of sand being sifted over every parcel as laid in. They need no farther care, from the time of laying them, till they are taken up to be stuck on paper. The cement used is a solution of gum-arabic in water.

Plants may be dried very well without sand, by only putting them frequently into fresh quires of paper, or a few by only pressing them between the leaves of a book; but the sand-method preserves the colour best, and is done with least trouble.

**HOSANNA**, a Hebrew word, signifying *Save now*, or *Save, we beseech thee*; from the frequent use of which, during the feast of tabernacles, the whole solemnity got the appellation of *Hosanna Rabbi*.

**HOSEA**, a canonical book of the Old Testament, so called from the prophet of that name, its author, who was the son of Beri, and the first of the lesser prophets. He lived in the kingdom of Samaria, and delivered his prophecies under the reign of Jeroboam II. and his successors, kings of Israel; and under the reigns of Uzziah, Jotham, Ahaz, and Hezekiah, kings of Judah. His principal design is to publish the gross idolatries of the people of Israel and Judah, to denounce the divine vengeance against them, and to foretell the captivity in Assyria.

**HOST**, denotes either a person who entertains another, or the person so entertained; but it is now generally used in the first of these senses.

**Host**, in the church of Rome, a name given to the elements used in the eucharist, or rather to the consecrated wafer; which they pretend to offer up every day, a new host or sacrifice, for the sins of mankind.

They pay adoration to the host, upon a false presumption that the elements are no longer bread and wine, but transubstantiated into the real body and blood of Christ. See **TRANSUBSTANTIATION**.

**HOSTAGE**, a person given up to an enemy as a security for the performance of the articles of a treaty.

**HOT-BEDS**, in gardening, beds made with fresh horse-dung, or tanner's bark, and covered with glasses to defend them from cold winds.

**HOTTONIA**, **WATER-VIOLET**, in botany, a genus of the pentandria monogynia class. The corolla is shaped like a jug; the stamina are fixed to the tube of the corolla; and the capsule has but one cell. There are two species, none of them natives of Britain.

**HOVINGHAM**, a market-town of the east riding of Yorkshire, seventeen miles north-east of York.

**HOULSWORTHY**, a market-town of Devonshire, thirty-eight miles north-west of Exeter.

**HOUND**. See **CANIS**.

**HOURL**, in chronology, an aliquot part of a natural day, usually a 24th, sometimes a 12th. See **ASTRONOMY**, **DIALING**, **GEOGRAPHY**.

**HOUSE**, a habitation, or place built with conveniences for dwelling in. See **ARCHITECTURE**.

**HOUS**, in astrology, denotes the twelfth part of the heavens.

**HOUSTONIA**, in botany, a genus of the tetrandria-monogynia class. The corolla consists of one bell-shaped petal; and the seeds are two, and furrowed. There are two species, none of them natives of Britain.

**HOY**, in naval architecture, a small vessel, fitted only with one mast.

**HOYE**, a town of Westphalia, capital of a county of the same name, and subject to the elector of Hanover: E. long. 9°, N. lat. 53° 5'.

**HUDSON'S BAY**, a large mediterranean sea of north America, situated between 51° and 63° of N. lat. and of unequal breadth from 130 to 35 leagues.

**HUDSON'S STRAIGHTS**, giving entrance into Hudson's bay, lie between 65° and 75° of W. lon.

**HUDSON'S RIVER**, rises near the lake Champlain, in Canada, and falls into the Atlantic, a little below the city of New-York.

**HUE AND CRY**, in law, the pursuit of a person who has committed felony on the highway.

**HUEGLY**, a large town in the East Indies, situated on an island in the most westerly branch of the river Ganges, in the province of Bengal: E. long. 87° N. lat. 25°.

**HUETTE**, a city of Spain, in the province of New Castile, sixty-seven miles east of Madrid: W. lon. 2° 45', N. lat. 40° 35'.

**HUGUENOTS**, a name given by way of contempt to the Calvinists of France.

The name had its rise in the year 1560; but authors are not agreed as to its origin. The most plausible opinion, however, is that of Pasquier, who observes, that at Tours, the place where they were first thus denominated, the people had a notion, that an apparition or hobgoblin, called king Hugon, strolled about the streets in the night-time; from whence as those of the reformed religion met chiefly in the night to pray, &c. they called them Huguenots, that is, the disciples of king Hugon.

**HULKS**,

**HULKS**, large vessels used in setting the masts of ships.

**HULL**, in the sea-language, is the main body of a ship, without either masts, yards, sails, or rigging. Thus to strike a hull in a storm is to take in her sails, and to lash the helm on the lee-side of the ship; and to hull, or lie a-hull, is said of a ship whose sails are thus taken in, and helm lashed a lee.

**HULL**, in geography, a strong sea port town in the east riding of Yorkshire, situated on the river Hull, near the mouth of the Humber, thirty-two miles south-east of York.

**HULPEN**, a town of the Austrian Netherlands, in the province of Brabant, situated nine miles south east of Brussels: E. long.  $4^{\circ} 22'$ . N. lat.  $50^{\circ} 42'$ .

**HUMAN**, in general, is an appellation given to whatever relates to mankind: thus we say, the human soul, human body, human laws, &c.

**HUMANITY**, the peculiar nature of man, whereby he is distinguished from all other beings.

**HUMANITIES**, in the plural, signify grammar, rhetoric, and poetry, known by the name of *literæ humaniores*; for teaching of which, there are professors in the universities of Scotland, called humanists.

**HUMBER**, a river formed by the Trent, the Ouse, and several other streams united. It divides Yorkshire from Lincolnshire, and falls into the German Sea at Holderness.

**HUMBLE BEE**. See *Apis*.

**HUMERUS**, in anatomy See *ANAT.* p. 176.

*Luxation of the HUMERUS* See *SURGERY*.

**HUMIDITY**, that quality in bodies whereby they are capable of wetting other bodies. This differs very much from fluidity, and seems to be merely a relative thing, depending upon the congruity of the component particles of the liquor to the pores of such particular bodies, as it is capable of adhering to, penetrating a little into, or wetting. Thus, for instance, quicksilver is not a moist thing with regard to our hands or clothes, but may be called so in reference to gold, tin, or lead, to whose surfaces it will perfectly adhere, and render them soft and moist.

**HUMMING-BIRD**. See *TROCHILUS*.

**HUMOUR**, in a general sense, denotes much the same with liquid or fluid. See *FLUID*.

**HUMOUR**. See *WIT*.

**HUMULUS** in botany, a genus of the triæcia pentandria class. The calix of the male is divided into five parts, and it has no corolla. The calix of the female consists of one entire leaf opening at one side; the corolla is wanting; it has two styli; and the nut has two valves, and is inclosed within the calix. There is but one species, viz. the lupulus, or hop, a native of Britain. See *HOP*.

**HUNDRED**, *hundredum*, or *centuria*, a part or division of a county, which was anciently so called from its containing an hundred families, or from its furnishing an hundred able men for the king's wars. After king Alfred's dividing this kingdom into counties, and giving the government of each county to a sheriff, these counties were divided into hundreds, of which the constable was the chief officer. The grants of hundreds

were at first made by the king to particular persons but they are not now held by grant or prescription; their jurisdiction being devolved to the county court; a few of them only excepted, that have been by privilege annexed to the crown, or granted to some great subjects, and still remain in the nature of a franchise.

**HUNGARY**, a kingdom bounded by the Carpathian mountains, which divide it from Poland, on the north; by Transilvania and Walachia on the east; by the river Drave, which separates it from Sclavonia, on the south; and by Austria and Moravia on the west. It is one continued plain of 300 miles long, and is situated between  $16^{\circ}$  and  $23^{\circ}$  of E. lon. and between  $45^{\circ}$  and  $49^{\circ}$  of N. lat. It is now subject to the empress queen.

**HUNGARY WATER**, a distilled-water, so denominated from a queen of Hungary, for whose use it was first prepared

Quincy gives the following directions for making it. Take of fresh gathered flowers of rosemary, two pounds; rectified spirits of wine, two quarts; put them together, and distil them immediately in balneo.

Or, Take of fresh tops of rosemary, one pound and a half; proof spirit, one gallon; and distil in balneo till five pints are obtained

**HUNGER**, an uneasy sensation, which creates an appetite or desire of food.

Hunger is by some attributed to a sharp acrimonious humour, which vellicates the coats of the stomach; others, who deny the existence of any such liquor, attribute it to the attrition or rubbing of the coats of the stomach; and others, again, account for it from the acidity of the blood.

**HUNGERFORD**, a market-town of Berkshire, situated on the river Kennet, twenty-four miles west of Reading.

**HUNNINGHEN**, a town of Germany, in the langravate of Alsace, situated on the Rhine, three miles north of Basil: E. long.  $7^{\circ} 35'$ , N. lat.  $47^{\circ} 37'$ .

**HUNNOBY**, a market-town in the east riding of Yorkshire, situated thirty four miles north east of York.

**HUNTING** the exercise or diversion of pursuing four-footed beasts of game.

Four-footed beasts are hunted in the fields, woods, and thickets, and that both with guns and greyhounds.

Birds, on the contrary, are either shot in the air, or taken with nets and other devices, which exercise is called fowling; or they are pursued and taken by birds of prey, which is called hawking.

The pursuing of four-footed beasts, as badgers, deer, does, roebucks, foxes, hares, &c. properly termed hunting, is a noble exercise, serving not only to recreate the mind, but to strengthen the body, whet the stomach, and cheer the spirits.

**HUNTINGDON**, the capital of Huntingdonshire, situated on the river Ouse, fifty six miles north of London: W. lon.  $15'$ , and N. lat.  $52^{\circ} 23'$ .

It sends two members to parliament.

**HUQUAM**, a province of China, bounded by Honan

on the north, and by Quamsi and Canton on the south; lying between 25° and 30° of north latitude.

**HURA**, the **SAND BOX TREE**, in botany, a genus of the monoecia monadelphica class. The male has no calix; the corolla consists of four petals; it has eight stamens, and four glandular bearded nectaria; the calix and corolla of the female are the same as in the male; the stylus is filiform; the stigma is peltate; the capsule has four valves, and but one seed. There is only one species, a native of Mexico.

**HURDLES**, in fortification, twigs of willows or osiers interwoven close together, sustained by long stakes, and usually laden with earth.

**HURDLES**, in husbandry, certain frames, made either of split timber, or of hazel-rods, watted together, to serve for gates in inclosures, or to make sheep-folds, &c.

**HURDS**, or **HORDS**, of flax, or hemp, the coarser parts separated in the drellings from the tear or fine stuff. See **FLAX**.

**HURLE-BONE**, in a horse, a bone near the middle of the buttock, very apt to go out of its sockets with a hurt or strain.

**HURON**, a vast lake of North America, situated between 84° and 89° W. long. and between 43° and 46° N. lat. from whence the country contiguous to it is called the country of the Hurons, whose language is spoken over a great extent in the southern parts of north America.

**HURRICANE**, a furious storm of wind, owing to a contrariety of winds. See **WIND** and **WHIRLWIND**.

Hurricanes are frequent in the West-indies, where they make terrible ravages, by rooting up trees, destroying houses and shipping, and the like.

**HUSBAND**, a man joined or contracted with a woman in marriage.

**HUSBANDRY**. See **AGRICULTURE**.

**HUSK**, the same with what botanists call the calix, or cup of a flower. See **BOTANY**, p. 636, &c.

**HUSO** in ichthyology. See **ACCIPENSER**.

**HUSSARS**, a kind of irregular cavalry armed with the sabre and bayonet, are retained in the service of most princes or the continent.

They are very resolute partisans, and better in an invasion or hasty expedition than in a set battle.

**HUSSITES**, the disciples of John Huss, a Bohemian, and curate of the chapel of Bethlehem at Prague; who, about the year 1414, embraced and defended the opinions of Wickliff of England, for which he was cited before the council of Constance, and, refusing to renounce his supposed errors, he was condemned to be burnt alive, which sentence was accordingly executed upon him at Constance.

It is evident in what the pretended heresy of John Huss and Jerom of Prague, who suffered with him, consisted, from the answer they made to the council, when they were admonished to conform to the sentiments of the church: They were lovers, they said, of the holy gospel, and true disciples of Christ; that the church of Rome, and all other churches of the world, were widely departed from the apostolical tradition;

that the clergy ran after pleasures and riches, larded it over the people, affected the highest seats at entertainments, bred horses and dogs; and the revenues of the church, which belonged to the poor members of Christ, were consumed in vanity and wantonness; and that the priests were ignorant of the commandments of God, or, if they did know them, paid but little regard to them. The followers of Huss were also called Calixtins, Taberites, and Bohemian brethren.

**HUSTINGS**, a court held in Guildhall before the lord-mayor and aldermen of London, and reckoned the supreme court of the city. Here deeds may be enrolled, recoveries passed, out-lawries sued out, and replevins and writs of error determined. In this court also is the election of aldermen, of the four members of parliament for the city, &c.

This court is very ancient, as appears by the laws of Edward the Confessor.

Some other cities have likewise had a court bearing the same name, as Winchester, York, &c.

**HUSUM**, a port-town of Sleswic or south Jutland, situated on the German sea; subject to the duke of Holstein Gottorp: E. long. 8° 30', N. lat. 54° 40'.

**HUTHERFIELD**, a market-town in the west riding of Yorkshire: W. long. 1° 34', N. lat. 53° 37'.

**HUY**, a strong town in the bishopric of Liege, situated on the Maes, sixteen miles north-east of Namur: E. long. 5° 15', N. lat. 50° 35'.

**HYACINTH**, in botany. See **HYACINTHUS**.

**HYACINTH**, in natural history, a genus of pellucid gems, whose colour is red with an admixture of yellow.

The hyacinth, though less striking to the eye than any other red gems, is not without its beauty in the finest specimens. It is found of various sizes, from that of a pin's head to the third of an inch in diameter. Like common crystal, it is sometimes found columnar, and sometimes in a pebble-form; and is always hardest and brightest in the larger masses.

Its colour is a dull or deadish red, with an admixture of yellow in it; and this mixed colour is found in all the variety of tints that a prevalence of the red or of the yellow in different degrees is capable of giving it.

Our jewelers allow all those gems to be hyacinths or jacinths, that are of a due hardness with this mixed colour; and as they are of very different beauty and value in their several degrees and mixture of colours, they divide them into four kinds; three of which they call hyacinths, but the fourth, very improperly, a ruby. 1. When the stone is in its most perfect state, and of a pure and bright flame-colour, neither the red nor the yellow prevailing, in this state they call it hyacintha la belle. 2. When it has an over proportion of the red, and that of a dusky colour than the fine high red in the former, and the yellow that appears in a faint degree in it is not a fine, bright, and clear, but a dusky brownish-yellow, then they call it the taffron hyacinth. 3. Such stones as are of a dead whitish yellow, with a very small proportion of red in them, they call amber-hyacinths. And, 4. When the

the stone is of a fine deep red, blended with a dusky and very deep yellow, they call it a rubacelle. But though the over-proportion of a strong red in this gem has made people refer it to the class of rubies, its evident mixture of yellow shews that it truly belongs to the hyacinths.

The hyacinth la belle is found both in the East and West Indies. The oriental are the harder but the American are often equal to them in colour. The rubacelle is found only in the East Indies, and is generally brought over among the rubies, but it is of little value: the other varieties are found in Silesia and Bohemia.

**HYACINTHUS**, in botany, a genus of the hexandria monogynia class. The corolla is bell shaped; and there are three melliferous pores in the germen. There are 13 species, only one of which, viz. the non-scriptus, English hyacinth, or hare bells, is a native of Britain.

**HYADES**, in astronomy, seven stars in the bull's head, famous among the poets for the bringing of rain. See **ASTRONOMY**, p. 487.

**HYATIDES**, in medicine, little transparent vesicles or bladders, full of water, sometimes found solitary, and sometimes in clusters, upon the liver, and various other parts, especially in hydropical constitutions.

**HYDATOSCOPIA**, called also hydromancy, a kind of divination or method of foretelling future events by means of water.

**HYDNUM**, in botany, a genus of the cryptogamia fungi class: it is an horizontal fungus, echinated or beset with sharp-pointed fibres on its under part. There are four species, only one of which, viz. the imbricatum, or common hydnum, is a native of Britain.

**HYDRA**, in astronomy. See **ASTRONOMY**, p. 487.

**HYDRAGOGUES**, among physicians, remedies which evacuate a large quantity of water in dropsies.

Quincy observes, that the strongest cathartics chiefly answer to the character of hydragogues, in that by their forcibly shaking and vellicating the bowels and their appendages, they squeeze out water enough to make the stools appear little else.

The principal hydragogues, in the common opinion, are the juices of elder, of the root of iris, of soldanella, mechoacan, jalop, &c.

**HYDRANGÆA**, in botany, a genus of the decandria digynia class. The capsule has two cells, and a double beak. There is but one species, a native of Virginia.

**HYDRAULICS**, the science of the motion of fluids, and the construction of all kinds of instruments and machines relating thereto.

As the construction of hydraulic engines depends upon the knowledge of the general laws of fluids it will be better to give the description of them under the article hydrostatics. See **HYDROSTATICS**.

**HYDRENTEROCELE**, in surgery, a species of hernia wherein the intestines descend into the scrotum, together with a quantity of water.

**HYDROCELE**, in surgery, denotes any hernia arising from water; but is particularly used for such a one of the scrotum which sometimes grows to the size of one's

head, without pain, but exceeding troublesome to the patient. See **SURGERY**.

**HYDROCEPHALUS**, in surgery, a preternatural distention of the head, to an uncommon size, by a stagnation and extravasation of the lymph, which, when collected within side of the bones of the cranium, the hydrocephalus is then termed internal; as it is external, when retained betwixt the common integuments and the cranium. See **SURGERY**.

**HYDROCHARIS**, the LITTLE WATER-LILY, in botany, a genus of the diœcia decandria class. The spathe of the male consists of two leaves, the calix of three segments, and the corolla of three petals. The calix of the female consists of three segments, and the corolla of three petals; it has six styli; and the capsule has six cells and many seeds. There is but one species, viz. the morsus ranæ, or frog bit, a native of Britain.

**HYDROCORAX**, in ornithology. See **BUCEROS**.

**HYDROCOTYLE**, in botany, a genus of the pentandria digynia class. The umbella is simple; the involucre consists of four leaves; the petals are entire, and the seeds are roundish and compressed. There are five species, only one of them, viz. the vulgaris, march penny wort, or white rot, is a native of Britain.

**HYDROGRAPHY**, the art of measuring and describing the sea, rivers, lakes, and canals.

With regard to the sea, it gives an account of its tides, counter tides, soundings, bays, gulphs, creeks, &c. as also of the rocks, shelves, sands, shallows, promontories, harbours, the distance and bearing of one port from another, with every thing that is remarkable, whether out at sea, or on the coast.

**HYDROMANCY**, a method of divination by water, practised by the ancients in this manner. They filled a cup or bowl of water: then fastening a ring to a piece of thread tied to their finger, held it over the water, and repeated a certain form of words, desiring to be satisfied with regard to their inquiry; and if the question was answered in the affirmative, the ring would strike the sides of the bowl of its own accord.

Another kind of hydromancy was to look upon the water in which the figure of several demons used to appear. This expedient Numa is said to have made use of, to settle the ceremonies of religion.

This way of divination is said to have been used first by the Persians, and afterwards approved by Pythagoras.

**HYDROMEL**, among physicians, water impregnated with honey, either before or after fermentation.

Vinous hydromel, commonly called mead, is said to be good for the gravel. See the article **MEAD**.

**HYDROMETER**, an instrument to measure the gravity, density, velocity, force, &c. of water and other fluids. See **HYDROSTATICS**.

**HYDROTACE**, in botany. See **LEMNA**.

**HYDROMPHOLUS**, in medicine and surgery, a tumour in the navel, arising from a collection of water.

**HYDROPHANÆ**, in natural history, a genus of semipellucid gems, composed of crystal and earth; the latter ingredient being in large proportion, and mixed imperfectly

imperfectly, as in the chalcedony; and giving a general cloudiness or mistiness to the stone, but of so imperfect and irregular an admixture, as not to be capable of so good a polish as the chalcedony; and appearing of a dusky and foul surface, till thrown into water, in which they become lucid, and in some degree transparent, either in part or totally; also changing their colour, which returns to them on being taken out of the water.

To this genus belong the oculus beli of authors, or whitish-grey hydrophines, variegated with yellow, and with a black central nucleus; and the oculus mundi, or lapis mutabilis, which is likewise a whitish-grey kind without veins.

**HYDROPHOBIA**, an aversion or dread of water; a

terrible symptom of the rabies canina. See **MEDICINE**. **HYDROPHYLLUM**, in botany, a genus of the pentandria monogynia class. The corolla is bell-shaped; the stigma is bifid; and the capsule is roundish with two valves. There are two species, none of them natives of Britain.

**HYDROPS**, in medicine. See **MEDICINE**.

**HYDROSCOPE**, an instrument anciently used for the measuring of time

The hydroscope was a kind of water-clock, consisting of a cylindrical tub, conical at bottom: the cylinder was graduated, or marked out with divisions, to which the top of the water becoming successively contiguous, as it trickled out at the vertex of the cone, pointed out the hour.

## H Y D R O S T A T I C S.

**T**HE science of **HYDROSTATICS** treats of the nature of gravity, pressure, and motion of fluids in general; and of weighing solids in them.

A fluid is a body that yields to the least pressure or difference of pressures. Its particles are so exceedingly small, that they cannot be discerned by the best of microscopes; they are hard, since no fluid, except air or steam, can be pressed into a less space than it naturally possesses; and they are round and smooth, since they are so easily moved among one another.

All bodies, both fluid and solid, press downwards by the force of gravity: but fluids have this wonderful property, that their pressure upwards and sidewise is equal to their pressure downwards; and this is always in proportion to their perpendicular height, without any regard to their quantity: for, as each particle is quite free to move, it will move towards that part or side on which the pressure is least. And hence, no particle or quantity of a fluid can be at rest, till it is every way equally pressed.

(Plate XCIX. fig. 2.) To shew by experiment that fluids press upward as well as downward, let AB be a long upright tube filled with water near to its top; and CD a small tube open at both ends, and immersed into the water in the large one: if the immersion be quick, you will see the water rise in the small tube to the same height that it stands in the great one, or until the surfaces of the water in both are on the same level: which shews that the water is pressed upward into the small tube by the weight of what is in the great one; otherwise it could never rise therein, contrary to its natural gravity; unless the diameter of the bore were so small, that the attraction of the tube would raise the water; which will never happen, if the tube be as wide as that in a common barometer. And as the water rises no higher in the small tube than till its surface be on a level with the surface of the water in the great one, this shews that the pressure is not in proportion to the quantity of water in the great tube, but in proportion to its perpendicular

height therein: for there is much more water in the great tube all around the small one, than what is raised to the same height in the small one, as it stands in the great.

Take out the small tube, and let the water run out of it; then it will be filled with air. Stop its upper end with the cork C, and it will be full of air all below the cork: this done, plunge it again to the bottom of the water in the great tube, and you will see the water rise up in it to the height E; which shews that the air is a body, otherwise it could not hinder the water from rising up to the same height as it did before, namely, to A; and in so doing it drove the air out at the top; but now the air is confined by the cork C: and it also shews that the air is a compressible body; for if it were not so, a drop of water could not enter into the tube.

The pressure of fluids being equal in all directions, it follows, that the sides of a vessel are as much pressed by a fluid in it, all around in any given ring of points, as the fluid below that ring is pressed by the weight of all that stands above it. Hence the pressure upon every point in the sides, immediately above the bottom, is equal to the pressure upon every point of the bottom. To shew this by experiment, let a hole be made at E (fig. 3.) in the side of the tube AB close by the bottom; and another hole of the same size in the bottom, at C; then pour water into the tube, keeping it full as long as you chuse the holes should run, and have two two basons ready to receive the water that runs through the two holes, until you think there is enough in each bason; and you will find, by measuring the quantities, that they are equal; which shews that the water run with equal speed through both holes; which it could not have done, if it had not been equally pressed through them both: for if a hole of the same size be made in the side of the tube, as about f, and if all three are permitted to run together, you will find that the quantity run through the hole at f is much less than what has run in the same time through either of the holes C or e.

*Fig. 1.*

*Whitell & Sulp.*

In the same figure, let the tube be re-curved from the bottom at C into the shape DE, and the hole at C be stopp'd with a cork. Then pour water into the tube to any height, as Ag, and it will spout up in a jet EFG, nearly as high as it is kept in the tube AB, by continuing to pour in as much there as runs through the hole E; which will be the case whilst the surface Ag keeps at the same height. And if a little ball of cork G be laid upon the top of the jet, it will be supported thereby, and dance upon it. The reason why the jet rises not quite so high as the surface of the water Ag, is owing to the resistance it meets with in the open air: for if a tube, either great or small, was screwed upon the pipe at E, the water would rise in it until the surfaces of the water in both tubes were on the same level; as will be shewn by the next experiment.

### The hydrostatic paradox.

ANY quantity of a fluid, how small soever, may be made to balance and support any quantity, how great soever. This is deservedly termed *the hydrostatical paradox*, which we shall first shew by an experiment, and then account for it upon the principle above-mentioned, namely, that *the pressure of fluids is directly as their perpendicular height, without any regard to their quantity.*

Let a small glass tube DCG, (fig. 4.) open at both ends, and bended at B, be joined to the end of a great one AI at cd, where the great one is also open; so that these tubes in their openings may freely communicate with each other. Then pour water through a small-necked funnel into the small tube at H; this water will run through the joining of the tubes at cd, and rise up into the great tube: and if you continue pouring until the surface of the water comes to any part, as A, in the great tube, and then leave off, you will see that the surface of the water in the small tube will be just as high at D; so that the perpendicular altitude of the water will be the same in both tubes, however small the one be in proportion to the other. This shews, that the small column DCG balances and supports the great column Acd; which it could not do if their pressures were not equal against one another in the recurved bottom at B.—If the small tube be made longer, and inclined in the situation GEF, the surface of the water in it will stand at F, on the same level with the surface A in the great tube; that is, the water will have the same perpendicular height in both tubes, although the column in the small tube is longer than that in the great one; the former being oblique, and the latter perpendicular.

Since then the pressure of fluids is directly as their perpendicular heights, without any regard to their quantities, it appears that whatever the figure or size of vessels be, if they are of equal heights, and if the areas of their bottoms are equal, the pressures of equal heights of water are equal upon the bottoms of these vessels; even though the one should hold a thousand or ten thousand times as much water as would fill the other. To confirm this part of the hydrostatical paradox by an experiment, let two vessels be prepared of equal heights, but very unequal contents, such as AB in fig. 5. and AB in fig. 6.

VOL. II. No. 60.

Let each vessel be open at both ends, and their bottoms Dd Dd be of equal widths. Let a brass bottom CC be exactly fitted to each vessel, not to go into it, but for it to stand upon; and let a piece of wet leather be put between each vessel and its brass bottom, for the sake of closeness. Join each bottom to its vessel by a hinge D, so that it may open like the lid of a box; and let each bottom be kept up to its vessel by equal weights E and E, hung to lines which go over the pulleys F and F (whose blocks are fixed to the sides of the vessels at f) and the lines tied to hooks at d and d, fixed in the brass bottoms opposite to the hinges D and D. Things being thus prepared and fitted, hold the vessel AB (fig. 5.) upright in your hands over a basin on a table, and cause water to be poured into the vessel slowly, till the pressure of the water bears down its bottom at the side d, and raises the weight E; and then part of the water will run out at d. Mark the height at which the surface H of the water stood in the vessel, when the bottom began to give way at d; and then, holding up the other vessel AB (fig. 4.) in the same manner, cause water to be poured into it at H; and you will see that when the water rises to A in this vessel, just as high as it did in the former, its bottom will also give way at d, and it will lose part of the water.

The natural reason of this surprising phenomenon is, that since all parts of a fluid at equal depths below the surface are equally pressed in all manner of directions, the water immediately below the fixed part Bf (fig. 4) will be pressed as much upward against its lower surface within the vessel, by the action of the column Ag, as it would be by a column of the same height, and of any diameter whatever; (as was evident by the experiment with the tube, fig. 3.) and therefore, since action and reaction are equal and contrary to each other, the water immediately below the surface Bf will be pressed as much downward by it, as if it was immediately touched and pressed by a column of the height gA, and of the diameter Bf; and therefore, the water in the cavity BDdf will be pressed as much downward upon its bottom CC, as the bottom of the other vessel (fig. 5.) is pressed by all the water above it.

To illustrate this a little farther, let a hole be made at f (fig. 5.) in the fixed top Bf, and let a tube G be put into it; then, if water be poured into the tube A, it will (after filling the cavity Bd) rise up into the tube G, until it comes to a level with that in the tube A; which is manifestly owing to the pressure of the water in the tube A, upon that in the cavity of the vessel below it. Consequently, that part of the top Bf, in which the hole is now made, would, if corked up, be pressed upward with a force equal to the weight of all the water which is supported in the tube G: and the same thing would hold at g, if a hole were made there. And so if the whole cover or top Bf were full of holes, and had tubes as high as the middle one Ag put into them, the water in each tube would rise to the same height as it is kept into the tube A, by pouring more into it, to make up the deficiency that it sustains by supplying the others, until they were all full: and then the water in the tube A would support equal heights of water in all the rest of the

The tubes, Or, if all the tubes except A, or any other one, were taken away, and a large tube equal in diameter to the whole top Bf were placed upon it, and cemented to it; and then if water were poured into the tube that was left in either of the holes, it would ascend through all the rest of the holes, until it filled the large tube to the same height that it stands in the small one, after a sufficient quantity had been poured into it: which shews, that the top Bf was pressed upward by the water under it, and before any hole was made in it, with a force equal to that wherewith it is now pressed downward by the weight of all the water above it in the great tube. And therefore, the reaction of the fixed top Bf must be as great, in pressing the water downward upon the bottom CC, as the whole pressure of the water in the great tube would have been, if the top had been taken away, and the water in that tube left to press directly upon the water in the cavity BDiff.

*The hydrostatic bellows.*

PERHAPS the best machine in the world for demonstrating the upward pressure of fluids, is the hydrostatic bellows A (fig. 7.) which consists of two thick oval boards, each about 16 inches broad, and 18 inches long, covered with leather, to open and shut like a common bellows, but without valves; only a pipe B, about three feet high, is fixed into the bellows at c. Let some water be poured into the pipe at c, which will run into the bellows, and separate the boards a little. Then lay three weights b, c, d, each weighing 100 pounds, upon the upper board; and pour more water into the pipe B, which will run into the bellows, and raise up the board with all the weights upon it; and if the pipe be kept full, until the weights are raised as high as the leather which covers the bellows will allow them, the water will remain in the pipe, and support all the weights, even though it should weigh no more than a quarter of a pound, and they 300 pounds: for will all their force be able to cause them to descend and force the water out at the top of the pipe.

The reason of this will be made evident, by considering what has been already said of the result of the pressure of fluids of equal heights without any regard to their quantity. For, if a hole be made in the upper board, and a tube be put into it, the water will rise in the tube to the same height that it does in the pipe; and would rise as high (by supplying the pipe) in as many tubes as the board could contain holes. Now, suppose only one hole to be made in any part of the board, of an equal diameter with the bore of the pipe B; and that the pipe holds just a quarter of a pound of water; if a person claps his finger upon the hole, and the pipe be filled with water, he will find his finger to be pressed upward with a force equal to a quarter of a pound. And as the same pressure is equal upon all equal parts of the board, each part, whose area is equal to the area of the whole, will be pressed upward with a force equal to that of a quarter of a pound: the sum of all which pressures against the under side of an oval board 16 inches broad, and 18 inches long, will amount to 300 pounds; and therefore so much weight will be raised up and supported by a quarter of a pound of water in the pipe.

Hence, if a man stands upon the upper board, and blows into the bellows through the pipe B, he will raise himself upward upon the board: and the smaller the bore of the pipe is, the easier he will be able to raise himself. And then, by clapping his finger upon the top of the pipe, he can support himself as long as he pleases; provided the bellows be air-tight, so as not to lose what is blown into it.

Upon this principle of the upward pressure of fluids, a piece of lead may be made to swim in water, by immersing it to a proper depth, and keeping the water from getting above it. Let CD (fig. 8.) be a glass tube, open at both ends, and EFG a flat piece of lead, exactly fitted to the lower end of the tube, not to go within it, but for it to stand upon; with a wet leather between the lead and tube to make close work. Let this leaden bottom be half an inch thick, and held close to the tube by pulling the packthread IHL upward at L with one hand, whilst the tube is held in the other by the upper end C. In this situation, let the tube be immersed in water in the glass vessel AB, to the depth of six inches below the surface of the water at K; and then, the leaden bottom EFG will be plunged to the depth of somewhat more than eleven times its own thickness: holding the tube at that depth, you may let go the thread at L; and the lead will not fall from the tube, but will be kept to it by the upward pressure of the water below it, occasioned by the height of the water at K above the level of the lead. For as lead is 11.33 times as heavy as its bulk of water, and is in this experiment immersed to a depth somewhat more than 11.33 times its thickness, and no water getting into the tube between it and the lead, the column of water EabcG below the lead is pressed upward against it by the water KDEGL all around the tube; which water being a little more than 11.33 times as high as the lead is thick, is sufficient to balance and support the lead at the depth KE. If a little water be poured into the tube upon the lead, it will increase the weight upon the column of water under the lead, and cause the lead to fall from the tube to the bottom of the glass vessel, where it will lie in the situation bd. Or, if the tube be raised a little in the water, the lead will fall by its own weight, which will then be too great for the pressure of the water around the tube upon the column of water below it.

Let two pieces of wood be plained quite flat, so as no water may get in between them when they are put together: let one of the pieces, as bd, be cemented to the bottom of the vessel AB (fig. 8.) and the other piece be laid flat and close upon it, and held down to it by a stick, whilst water is poured into the vessel: then remove the stick, and the upper piece of wood will not rise from the lower one: for, as the upper one is pressed down both by its own weight and the weight of all the water over it, whilst the contrary pressure of the water is kept off by the wood under it, it will lie as still as a stone would do in its place. But if it be raised ever so little at any edge, some water will then get under it; which being acted upon by the water above, will immediately press it upward; and as it is lighter than its bulk of water, it will rise, and float upon the surface of the water.

All fluids weigh just as much in their own element as they

they do in open air. To prove this by experiment, let as much shot be put into a phial, as, when corked, will make it sink in water: and being thus charged, let it be weighed, first in air, and then in water, and the weights in both both cases wrote down. Then, as the phial hangs suspended in water, and counterpoised, pull out the cork, that water may run into it, and it will descend, and pull down that end of the beam. This done, put as much weight into the opposite scale as will restore the equipoise; which weight will be found to answer exactly to the additional weight of the phial when it is again weighed in air, with the water in it.

The velocity with which water spouts out at a hole in the side or bottom of a vessel, is as the square root of the depth or distance of the hole below the surface of the water. For, in order to make double the quantity of a fluid run through one hole as through another of the same size, it will require four times the pressure of the other, and therefore must be four times the depth of the other below the surface of the water: and for the same reason, three times the quantity running in an equal time through the same sort of hole, must run with three times the velocity, which will require nine times the pressure; and consequently must be nine times as deep below the surface of the fluid: and so on.—To prove this by an experiment, let two pipes, as C and g (fig. 9.) of equal sized bores, be fixed into the side of the vessel AB; the pipe g being four times as deep below the surface of the water at b in the vessel as the pipe C is: and whilst these pipes run, let water be constantly poured into the vessel, to keep the surface still at the same height. Then, if a cup that holds a pint be so placed as to receive the water that spouts from the pipe C, and at the same moment a cup that holds a quart be so placed as to receive the water that spouts from the pipe g, both cups will be filled at the same time by their respective pipes.

The horizontal distance, to which a fluid will spout from a horizontal pipe, in any part of the side of an upright vessel below the surface of the fluid, is equal to twice the length of a perpendicular to the side of the vessel, drawn from the mouth of the pipe to a semicircle described upon the altitude of the fluid: and therefore, the fluid will spout to the greatest distance possible from a pipe whose mouth is at the centre of the semicircle; because a perpendicular to its diameter (supposed parallel to the side of the vessel) drawn from that point, is the longest that can possibly be drawn from any part of the diameter to the circumference of the semicircle. Thus, if the vessel AB (fig. 9.) be full of water, the horizontal pipe D be in the middle of its side, and the semicircle  $Nedcb$  be described upon D as a centre, with the radius or semidiameter  $D_2N$ , or  $D_2h$ , the perpendicular  $Dd$  to the diameter  $NDh$  is the longest that can be drawn from any part of the diameter to the circumference  $Nedcb$ . And if the vessel be kept full, the jet G will spout from the pipe D, to the horizontal distance NM, which is double the length of the perpendicular  $Dd$ . If two other pipes as C and E, be fixed into the side of the vessel at equal distances above and below the pipe D, the perpendiculars  $Cc$  and  $Ee$ , from these pipe to the semicircle, will be equal; and the jets F and H spouting from them will

each go to the horizontal distance NK; which is double the length of the equal perpendiculars  $Cc$  or  $Dd$ .

Fluids by their pressure may be conveyed over hills and valleys in bended pipes, to any height not greater than the level of the springs from whence they flow. But when they are designed to be raised higher than the springs, forcing engines must be used; which shall be described when we come to treat of pumps.

A *syphon*, generally used for decanting liquors, is a bended pipe, whose legs are of unequal lengths; and the shortest leg must always be put into the liquor intended to be decanted, that the perpendicular altitude of the column of liquor in the other leg may be longer than the column in the immersed leg, especially above the surface of the water. For, if both columns were equally high in that respect, the atmosphere, which presses as much upward as downward, and therefore acts as much upward against the column in the leg that hangs without the vessel, as it acts downward upon the surface of the liquor in the vessel, would hinder the running of the liquor through the syphon, even though it were brought over the bended part by suction. So that there is nothing left to cause the motion of the liquor, but the superior weight of the column in the longer leg, on account of its having the greater perpendicular height.

Let D (fig. 10.) be a cup filled with water to C, and ABC a syphon, whose shorter leg BCF is immersed in the water from C to F. If the end of the other leg were no lower than the line AC, which is level with the surface of the water, the syphon would not run, even though the air should be drawn out of it at the mouth A. For although the suction would draw some water at first, yet the water would stop at the moment the suction ceased; because the air would act as much upward against the water at A, as it acted downward for it by pressing on the surface at C. But if the leg AB comes down to G, and the air be drawn out at G by suction, the water will immediately follow, and continue to run, until the surface of the water in the cup comes down to F; because, till then, the perpendicular height of the column BAG will be greater than that of the column CB; and consequently, its weight will be greater, until the surface comes down to F; and then the syphon will stop, though the leg CF should reach to the bottom of the cup. For which reason, the leg that hangs without the cup is always made long enough to reach below the level of its bottom; as from  $d$  to E: and then, when the syphon is emptied of air by suction at E, the water immediately follows, and by its continuity brings away the whole from the cup; just as pulling one end of a thread will make the whole cleave follow.

If the perpendicular height of a syphon, from the surface of the water to its bended top at B, be more than 33 feet, it will draw no water, even though the other leg were much longer, and the syphon quite emptied of air, because the weight of a column of water 33 feet high is equal to the weight of as thick a column of air, reaching from the surface of the earth to the top of the atmosphere; so that there will then be an equilibrium; and consequently, though there would be weight enough of air upon the surface C to make the water ascend in the leg

leg CB almost to the height B, if the syphon were emptied of air, yet the weight would not be sufficient to force the water over the bend; and therefore, it could never be brought into the leg BAC.

#### *Tantalus's cup.*

Let a hole be made quite through the bottom of the cup A (fig. 11.) and the longer leg of the bended syphon BCED be cemented into the hole, so that the end D of the shorter leg DE may almost touch the bottom of the cup within. Then, if water be poured into this cup, it will rise in the shorter leg by its upward pressure, extruding the air all the way before it through the longer leg: and when the cup is filled above the bend of the syphon at F, the pressure of the water in the cup will force it over the bend of the syphon: and it will descend in the longer leg CBG, and run through the bottom, until the cup be emptied.

This is generally called *Tantalus's cup*, and the legs of the syphon in it are almost close together; and a little hollow statue, or figure of a man, is sometimes put over the syphon to conceal it; the bend E being with the neck of the figure as high as the chin. So that poor thirsty *Tantalus* stands up to the chin in water, imagining it will rise a little higher, and he may drink; but instead of that, when the water comes up to his chin, it immediately begins to descend; and so, as he cannot stoop to follow it, he is left as much pained with thirst as ever.

#### *The fountain at command.*

The device called *the fountain at command* acts upon the same principle with the syphon in the cup. Let two vessels A and B (Plate C. fig. 1.) be joined together by the pipe C which opens into them both. Let A be open at top, B close both at top and bottom (save only a small hole at *b* to let the air get out of the vessel B) and A be of such a size as to hold about six times as much water as B. Let a syphon DEF be soldered to the vessel B, so that the part DE may be within the vessel, and F without it; the end D almost touching the bottom of the vessel, and the end F below the level of D: the vessel B hanging at A by the pipe C (soldered into both) and the whole supported by the pillars G and H upon the stand I. The bore of the pipe must be considerably less than the bore of the syphon.

The whole being thus constructed, let the vessel A be filled with water, which will run through the pipe C, and fill the vessel B. When B is filled above the top of the syphon at E, the water will run through the syphon, and be discharged at F. But since the bore of the syphon is larger than the bore of the pipe, the syphon will run faster than the pipe, and will soon empty the vessel B; upon which the water will cease from running through the syphon at F, until the pipe C re-fills the vessel B, and then it will begin to run as before. And thus the syphon will continue to run and stop alternately, until all the water in the vessel A has run through the pipe C.—So that after a few trials, one may easily guess about what time the syphon will stop, and when it will be-

gin to run: and then to amuse others, he may call out *stop*, or *run*, accordingly.

Upon this principle, we may easily account for *intermitting* or *reciprocating springs*. Let AA (fig. 2.) be part of a hill, within which there is a cavity BB; and from this cavity a vein or channel running in the direction BCDE. The rain that falls upon the side of the hill will sink and strain through the small pores and crannies G, G, G, G; and fill the cavity H with water. When the water rises to the level HHC, the vein BCDE will be filled to C, and the water will run through CDF as through a syphon; which running will continue until the cavity be emptied, and then it will stop until the cavity be filled again.

#### *The common pump.*

The *common sucking pump*, with which we draw water out of wells, is an engine both pneumatic and hydraulic. It consists of a pipe open at both ends, in which is a moveable piston, bucket, or sucker, as big as the bore of the pipe in that part wherein it works; and is leathered round, so as to fit the bore exactly; and may be moved up and down, without suffering any air to come between it and the pipe or pump-barrel.

We shall explain the construction both of this and the forcing pump by pictures of glass models, in which both the action of the pistons and motion of the valves are seen.

Hold the model DCBL (fig. 3.) upright in the vessel of water K, the water being deep enough to rise at least as high as from A to L. The valve *a* on the moveable bucket G, and the valve *b* on the fixed box H, (which box quite fills the bore of the pipe or barrel at H) will each lie close, by its own weight, upon the hole in the bucket and box, until the engine begins to work. The valves are made of brass, and covered underneath with leather for closing the holes the more exactly: and the bucket G is raised and depressed alternately by the handle E and rod D *d*, the bucket being supposed at B before the working begins.

Take hold of the handle E, and thereby draw up the bucket from B to C, which will make room for the air in the pump all the way below the bucket to dilate itself, by which its spring is weakened, and then its force is not equivalent to the weight or pressure of the outward air upon the water in the vessel K: and therefore, at the first stroke, the outward air will press up the water through the notched foot A, into the lower pipe, about as far as *e*: this will condense the rarefied air in the pipe between *e* and C to the same state it was in before; and then, as its spring within the pipe is equal to the force or pressure of the outward air, the water will rise no higher by the first stroke; and the valve *b*, which was raised a little by the dilation of the air in the pipe, will fall, and stop the hole in the box H; and the surface of the water will stand at *e*. Then, depress the piston or bucket from C to B, and as the air in the part B cannot get back again through the valve *b*, it will (as the bucket descends) raise the valve *a*, and so make its way through the upper part of the barrel *d* into the open air. But upon raising the

bucket *G* a second time, the air between it and the water in the lower pipe at *e* will be again left at liberty to fill a larger space; and so its spring being again weakened, the pressure of the outward air on the water in the vessel *K* will force more water up into the lower pipe from *e* to *f*; and when the bucket is at its greatest height *C*, the lower valve *b* will fall, and stop the hole in the box *H* as before. At the next stroke of the bucket or piston, the water will rise through the box *H* towards *B*, and then the valve *b*, which was raised by it, will fall when the bucket *G* is at its greatest height. Upon depressing the bucket again, the water cannot be pushed back through the valve *b*, which keeps close upon the hole whilst the piston descends. And upon raising the piston again, the outward pressure of the air will force the water up thro' *H*, where it will raise the valve, and follow the bucket to *C*. Upon the next depression of the bucket *G*, it will go down into the water in the barrel *B*; and as the water cannot be driven back through the now close valve *b*, it will raise the valve *a* as the bucket descends, and will be lifted up by the bucket when it is next raised. And now, the whole space below the bucket being full, the water above it cannot sink when it is next depressed; but upon its depression, the valve *a* will rise to let the bucket go down; and when it is quite down, the valve *a* will fall by its weight, and stop the hole in the bucket. When the bucket is next raised, all the water above it will be lifted up, and begin to run off by the pipe *F*. And thus, by raising and depressing the bucket alternately, there is still more water raised by it; which getting above the pipe *F*, into the wide top *I*, will supply the pipe, and make it run with a continued stream.

So, at every time the bucket is raised, the valve *b* rises, and the valve *a* falls; and at every time the bucket is depressed, the valve *b* falls, and *a* rises.

As it is the pressure of the air or atmosphere which causes the water to rise and follow the piston or bucket *G* as it is drawn up; and since a column of water 33 feet high is of equal weight with as thick a column of the atmosphere from the earth to the very top of the air; therefore, the perpendicular height of the piston or bucket from the surface of the water in the well must always be less than 33 feet; otherwise the water will never get above the bucket. But, when the height is less, the pressure of the atmosphere will be greater than the weight of the water in the pump, and will therefore raise it above the bucket; and when the water has once got above the bucket, it may be lifted thereby to any height, if the rod *D* be made long enough, and a sufficient degree of strength be employed, to raise it with the weight of the water above the bucket; without ever lengthening the stroke.

The force required to work a pump, will be as the height to which the water is raised, and as the square of the diameter of the pump-bore, in that part where the piston works. So that, if two pumps be of equal heights, and one of them be twice as wide in the bore as the other, the widest will raise four times as much water as the narrowest; and will therefore require four times as much strength to work it.

The wideness or narrowness of the pump, in any other part besides that in which the piston works, does not

make the pump either more or less difficult to work; except what difference may arise from the friction of the bore, which is always greater in a narrow bore than in a wide one, because of the greater velocity of the water.

The pump-rod is never raised directly by such a handle as *E* at the top, but by means of a lever, whose longer arm (at the end of which the power is applied) generally exceeds the length of the shorter arm five or six times; and, by that means, gives five or six times as much advantage to the power. Upon these principles, it will be easy to find the dimensions of a pump that shall work with a given force, and draw water from any given depth. But, as these calculations have been generally neglected by pump-makers (either for want of skill or industry) the following table was calculated by the late ingenious Mr Booth for their benefit. In this calculation, he supposed the handle of the pump to be a lever increasing the power five times; and had often found that a man can work a pump four inches diameter, and 30 feet high above the bucket, and discharge 27½ gallons of water (English wine measure) in a minute. Now, if it be required to find the diameter of a pump, that shall raise water with the same ease from any other height above the bucket; look for that height in the first column, and over against it in the second you have the diameter or width of the pump; and in the third, you find the quantity of water which a man of ordinary strength can discharge in a minute.

Height of the pump above the bucket. Feet.	Diameter of the bore where the bucket works. Inches. 100 parts.	Water discharged in a minute, English wine-measure. Gallons. Pints.

*The forcing-pump.*

THE *forcing pump* raises water through the box *H* (fig. 4) in the same manner as the sucking-pump does, when the plunger or piston *g* is lifted up by the rod *D*. But this plunger has no hole through it, to let the water in the barrel

barrel BC get above it when it is depressed to B, and the valve *b* (which rose by the ascent of the water through the box H when the plunger *g* was drawn up) falls down and stops the hole in H, the moment that the plunger is raised to its greatest height. Therefore, as the water between the plunger *g* and box H can neither get through the plunger upon its descent, nor back again into the lower part of the pump Le, but has a free passage by the cavity around H into the pipe MM, which opens into the air-vessel KK at P; the water is forced through the pipe MM by the descent of the plunger, and driven into the air-vessel; and in running up through the pipe at P, it opens the valve *a*; which shuts at the moment the plunger begins to be raised, because the action of the water against the under side of the valve then ceases.

The water, being thus forced into the air-vessel KK by repeated strokes of the plunger, gets above the lower end of the pipe GHI, and then begins to condense the air in the vessel KK. For, as the pipe GH is fixed airtight into the vessel below F, and the air has no way to get out of the vessel but through the mouth of the pipe at I, and cannot get out when the mouth I is covered with water, and is more and more condensed as the water rises upon the pipe, the air then begins to act forcibly by its spring against the surface of the water, at H: and this action drives the water up through the pipe IH GF, from whence it spouts in a jet S to a great height; and is supplied by alternately raising and depressing of the plunger *g*, which constantly forces the water that it raises through the valve H, along the pipe MM, into the air-vessel KK.

The higher that the surface of the water H is raised in the air-vessel, the less space will the air be condensed into, which before filled that vessel; and therefore the force of its spring will be so much the stronger upon the water, and will drive it with the greater force through the pipe at F: and as the spring of the air continues whilst the plunger *g* is rising, the stream or jet S will be uniform, as long as the action of the plunger continues: and when the valve *b* opens, to let the water follow the plunger upward, the valve *a* shuts, to hinder the water, which is forced into the air-vessel, from running back by the pipe MM into the barrel of the pump.

If there was no air-vessel to this engine, the pipe GHI would be joined to the pipe MMN at P; and then the jet S would stop every time the plunger is raised, and run only when the plunger is depressed.

Mr Newsham's water-engine, for extinguishing fire, consists of two forcing pumps, which alternately drive water into a close vessel of air; and by forcing the water into that vessel, the air in it is thereby condensed, and compresses the water so strongly, that it rushes out with great impetuosity and force through a pipe that comes down into it; and makes a continued uniform stream by the condensation of the air upon its surface in the vessel.

By means of forcing pumps, water may be raised to any height above the level of a river or spring; and machines may be contrived to work these pumps, either by a running stream, a fall of water, or by horses. An instance in each sort will be sufficient to shew the method.

First, by a running stream, or a fall of water. Let AA (fig. 5.) be a wheel turned by the fall of water BB; and have any number of cranks (suppose six) as C, D, E, F, G, H, on its axis, according to the strength of the fall of water, and the height to which the water is intended to be raised by the engine. As the wheel turns round, these cranks move the levers *c, d, e, f, g, h*, up and down, by the iron rods *i, k, l, m, n, o*; which alternately raise and depress the pistons by the other iron rods *p, q, r, s, t, u, w, x, y*, in twelve pumps; nine whereof, as L, M, N, O, P, Q, R, S, T, appear in the plate; the other three being hid behind the work at V. And as pipes may go from all these pumps, to convey the water (drawn up by them to a small height) into a close cistern, from which the main pipe proceeds, the water will be forced into this cistern by the descent of the pistons. And as each pipe, going from its respective pump into the cistern, has a valve at its end in the cistern, these valves will hinder the return of the water by the pipes; and therefore, when the cistern is once full, each piston upon its descent will force the water (conveyed into the cistern by a former stroke) up the main pipe, to the height the engine was intended to raise it: which height depends upon the quantity raised, and the power that turns the wheel. When the power upon the wheel is lessened by any defect of the quantity of water turning it, a proportionable number of the pumps may be laid aside, by disengaging their rods from the vibrating levers.

This figure is a representation of the engine erected at Blenheim for the Duke of Marlborough, by the late ingenious Mr Aldersca. The water-wheel is  $7\frac{1}{2}$  feet in diameter, according to Mr Switzer's account in his *Hydraulics*.

When such a machine is placed in a stream that runs upon a small declivity, the motion of the levers and action of the pumps will be but slow; since the wheel must go once round for each stroke of the pumps. But, when there is a large body of slow running water, a cog or spur-wheel may be placed upon each side of the water-wheel AA, upon its axis, to turn a trundle upon each side; the cranks being upon the axis of the trundle. And by proportioning the cog-wheels to the trundles, the motion of the pumps may be made quicker, according to the quantity and strength of the water upon the first wheel; which may be as great as the workman pleases, according to the length and breadth of the float-boards or wings of the wheel. In this manner, the engine for raising water at London-Bridge is constructed; in which the water-wheel is 20 feet diameter, and the floats 14 feet long.

#### *A quadruple pump-mill for raising water.*

THE engine is represented in Plate 99. fig. 1. In which ABCD is a wheel, turned by water according to the order of the letters. On the horizontal axis are four small wheels, toothed almost half round; and the parts of their edges on which there are no teeth are cut down so as to be even with the bottoms of the teeth where they stand.

The teeth of these four wheels take alternately into the

the teeth of four racks, which hang by two chains over the pullies *Q* and *L*; and to the lower ends of these racks there are four iron rods fixed, which go down into the four forcing pumps, *S*, *R*, *M*, and *N*. And, as the wheels turn, the racks and pump-rods are alternately moved up and down.

Thus, suppose the wheel *G* has pulled down the rack *I*, and drawn up the rack *K* by the chain: as the last tooth of *G* just leaves the uppermost tooth of *I*, the first tooth of *H* is ready to take into the lowermost tooth of the rack *K*, and pull it down as far as the teeth go; and then the rack *I* is pulled upward through the whole space of its teeth, and the wheel *G* is ready to take hold of it, and pull it down again, and so draw up the other — In the same manner, the wheels *E* and *F* work the racks *O* and *P*.

These four wheels are fixed on the axle of the great wheel in such a manner, with respect to the positions of their teeth, that whilst they continue turning round, there is never one instant of time in which one or other of the pump rods is not going down and forcing the water. So that, in this engine, there is no occasion for having a general air-vessel to all the pumps, to procure a constant stream of water flowing from the upper end of the main pipe.

From each of these pumps, near the lowest end, in the water, there goes off a pipe, with a valve on its farthest end from the pump; and these ends of the pipes all enter one close box, into which they deliver the water: and into this box, the lower end of the main conduct pipe is fixed. So that, as the water is forced or pushed into the box, it is also pushed up the main pipe to the height that it is intended to be raised,

#### *A pump-engine to go by horses.*

WHERE a stream or fall of water cannot be had, and gentlemen want to have water raised, and brought to their houses from a rivulet or spring; this may be effected by a horse engine, working three forcing-pumps which stand in a reservoir filled by the spring or rivulet: the pistons being moved up and down in the pumps by means of a triple crank *ABC*, which, as it is turned round by the trundle *G* (Plate 100. fig. 6.) raises and depresses the rods *D*, *E*, *F*. if the wheel has three times as many cogs as the trundle has staves or rounds, the trundle and cranks will make three revolutions for every one of the wheel: and as each crank will fetch a stroke in the time it goes round, the three cranks will make nine strokes for every turn of the great wheel.

The cranks should be made of cast iron, because they will not bend; and they should each make an angle of 120 with both of the others, as at *a*, *b*, *c*; which is (as it were) a view of their radii, in looking endwise at the axis: and then there will be always one or other of them going downward, which will push the water forward with a continued stream into the main pipe. For, when *b* is almost at its lowest situation, and is therefore just beginning to lose its action upon the piston which it moves, *c* is beginning to move downward, which will by its piston continue the propelling force upon the water: and when

*c* is come down to the position of *b*, *a* will be in the position of *c*.

The more perpendicularly the piston rods move up and down in the pumps, the freer and better will their strokes be: but a little deviation from the perpendicular will not be material. Therefore, when the pump-rods *D*, *E*, and *F* go down into a deep well, they may be moved directly by the cranks, as is done in a very good horse-engine of this sort at the late Sir James Creed's at Greenwich, which forces up water about 64 feet from a well under ground, to a reservoir on the top of his house. But when the cranks are only at a small height above the pumps, the pistons must be moved by vibrating levers, as in the above engine at Blenheim: and the longer the levers are, the nearer will the strokes be to a perpendicular.

Let us suppose, that in such an engine as Sir James Creed's, the great wheel is twelve feet diameter, the trundle four feet, and the radius or length of each crank nine inches, working a piston in its pump. Let there be three pumps in all, and the bore of each pump be four inches diameter. Then, if the great wheel has three times as many cogs as the trundle has staves, the trundle and cranks will go three times round for each revolution of the horses and wheel, and the three cranks will make nine strokes of the pumps in that time, each stroke being 18 inches (or double the length of the crank) in a four-inch bore. Let the diameter of the horse-wheel be 18 feet, and the perpendicular height to which the water is raised above the surface of the well be 64 feet.

If the horses go at the rate of two miles an hour (which is very moderate walking) they will turn the great wheel 187 times round in an hour.

In each turn of the wheel the pistons make nine strokes in the pumps, which amount to 1683 in an hour.

Each stroke raises a column of water 18 inches long, and four inches thick, in the pump barrels; which column, upon the descent of the piston, is forced into the main pipe, whose perpendicular altitude above the surface of the well is 64 feet.

Now, since a column of water 18 inches long, and four inches thick, contains 226.18 cubic inches, this number multiplied by 1683 (the strokes in an hour) gives 380661 for the number of cubic inches of water raised in an hour.

A gallon, in wine-measure, contains 231 cubic inches, by which divide 380661, and it quotes 1468 in round numbers, for the number of gallons raised in an hour; which, divided by 63, gives 26½ hogsheds — If the horses go faster, the quantity raised will be so much the greater.

In this calculation it is supposed that no water is wasted by the engine. But as no forcing engine can be supposed to lose less than a fifth part of the calculated quantity of water, between the pistons and barrels, and by the opening and shutting of the valves, the horses ought to walk almost 2½ miles per hour to fetch up this loss.

A column of water four inches thick, and 64 feet high, weighs 349½ pounds averdupoise, or 424½ pounds troy; and this weight, together with the friction of the engine, is the resistance that must be overcome by the strength of the horses.

The

The horse tackle should be so contrived, that the horses may rather push on than drag the levers after them. For if they draw, in going round the walk, the outside leather-straps will rub against their sides and hams; which will hinder them from drawing at right angles to the levers, and so make them pull at a disadvantage. But if they push the levers before their breasts, instead of dragging them, they can always walk at right angles to these levers.

It is no ways material what the diameter of the main or conduct pipe be: for the whole resistance of the water therein, against the horses, will be according to the height to which it is raised, and the diameter of that part of the pump in which the piston works; as we have already observed. So that by the same pump, an equal quantity of water may be raised in (and consequently made to run from) a pipe of a foot diameter, with the same ease as in a pipe of five or six inches; or rather with more ease, because its velocity in a large pipe will be less than in a small one, and therefore its friction against the sides of the pipe will be less also.

And the force required to raise water depends not upon the length of the pipe, but upon the perpendicular height to which it is raised therein above the level of the spring. So that the same force, which would raise water to the height AB (fig. 7.) in the upright pipe *AiklmnopqB*, will raise it to the same height or level *BIH* in the oblique pipe *AEFGH*. For the pressure of the water at the end *A* of the latter, is no more than its pressure against the end *A* of the former.

The weight or pressure of water at the lower end of a pipe, is always as the sine of the angle to which the pipe is elevated above the level parallel to the horizon. For, although the water in the upright pipe *AB* would require a force applied immediately to the lower end *A*, equal to the weight of all the water in it, to support the water, and a little more to drive it up and out of the pipe; yet if that pipe be inclined from its upright position to an angle of 80 degrees (as in *A 80*), the force required to

support or to raise the same cylinder of water will then be as much less as the sine *80 b* is less than the radius *AB*; or as the sine of 80 degrees is less than the sine of 90. And so, decreasing as the sign of the angle of elevation lessens, until it arrives at its level *AC* or place of rest, where the force of the water is nothing at either end of the pipe. For, although the absolute weight of the water is the same in all positions, yet its pressure at the lower end decreases, as the sine of the angle of elevation decreases; as will appear plainly by a farther consideration of the figure.

Let two pipes, *AB* and *BC*, of equal lengths and bores, join each other at *A*; and let the pipe *AB* be divided into 100 equal parts, as the scale *S* is; whose length is equal to the length of the pipe.—Upon this length, as a radius, describe the quadrant *BCD*, and divide it into 90 equal parts or degrees.

Let the pipe *AC* be elevated to 10 degrees upon the quadrant, and then filled with water; then, part of the water that is in it will rise in the pipe *AB*, and if it be kept full of water, it will raise the water in the pipe *AB* from *A* to *i*; that is, to a level *i 10* with the mouth of the pipe at 10: and the upright line *a 10*, equal to *Ai*, will be the sine of 10 degrees elevation; which being measured upon the scale *S*, will be about 17.4 of such parts as the pipe contains 100 in length: and therefore, the force or pressure of the water at *A*, in the pipe *A 10*, will be to the force or pressure at *A* in the pipe *AB* as 17.3 to 100.

Let the same pipe be elevated to 20 degrees in the quadrant, and if it be kept full of water, part of that water will run into the pipe *AB*, and rise therein to the height *At*, which is equal to the length of the upright line *b 20*, or to the sine of 20 degrees elevation; which, being measured upon the scale *S*, will be 34.2 of such parts as the pipe contains 100 in length; and therefore the pressure of the water at *A*, in the full pipe *A 20*, will be to its pressure, if that pipe were raised to the perpendicular situation *AB*, as 34.2 to 100.

Elevate

Elevate the pipe to the position A 30 on the quadrant ; and if it be supplied with water, the water will rise from it into the pipe AB; to the height A/, or to the same level with the mouth of the pipe at 30. The sine of this elevation, or of the angle of 30 degrees, is  $e$  30; which is just equal to half the length of the pipe, or to 50 of such parts of the scale as the length of the pipe contains 100. Therefore, the pressure of the water at A, in a pipe elevated 30 degrees above the horizontal level, will be equal to one half of what it would be, if the same pipe stood upright in the situation AB.

And thus, by elevating the pipe to 40, 50, 60, 70, and 80 degrees on the quadrant, the sines of these elevations will be  $d$  40,  $e$  50,  $f$  60,  $g$  70, and  $h$  80; which will be equal to the heights Aw, An, Ao, Ap, and Aq; and these heights measured upon the scale S will be 64.3, 76.6, 86.6, 94.0, and 98.5; which express the pressures at A in all these elevations, considering the pressure in the upright pipe AB as 100.

Because it may be of use to have the lengths of all the sines of a quadrant from 0 degrees to 90, we have given the foregoing table, shewing the length of the sine of every degree in such parts as the whole pipe (equal to the radius of the quadrant) contains 1000. Then the sines will be integral or whole parts in length. But if you suppose the length of the pipe to be divided only into 100 equal parts, the last figure of each part or sine must be cut off as a decimal; and then those which remain at the left hand of this separation will be integral or whole parts.

Thus, if the radius of the quadrant (supposed to be equal to the length of the pipe AC) be divided into 1000 equal parts, and the elevation be 45 degrees, the sine of that elevation will be equal to 707 of these parts; but if the radius be divided into 100 equal parts, the same sine will be only 70.7 or  $70\frac{7}{10}$  of these parts. For, as 1000 is to 707, so is 100 to 70.7.

As it is of great importance to all engine-makers, to know what quantity and weight of water will be contained in an upright round pipe of a given diameter and height, so as, by knowing what weight is to be raised, they may proportion their engines to the force which they can afford to work them; we shall subjoin tables shewing the number of cubic inches of water contained in an upright pipe of a round bore, of any diameter from one inch to six and a half; and of any height from one foot to two hundred: together with the weight of the said number of cubic inches, both in troy and avoirdupoise ounces. The number of cubic inches divided by 231, will reduce the water to gallons in wine-measure; and divided by 382, will reduce it to the measure of ale-gallons. Also, the troy ounces divided by 12, will reduce the weight to troy pounds: and the avoirdupoise ounces divided by 16, will reduce the weight to avoirdupoise pounds.

And here we must repeat it again, that the weight or pressure of the water acting against the power that works the engine must always be estimated according to the perpendicular height to which it is to be raised, without any regard to the length of the conduct pipe, when it has an oblique position; and as if the diameter of that

pipe were just equal to the diameter of that part of the pump in which the piston works. Thus by the tables on the two following pages, the pressure of the water against an engine whose pump is of a  $4\frac{1}{2}$  inch bore, and the perpendicular height of the water in the conduct pipe is 80 feet, will be equal to 8057.5 troy ounces, and to 8848.2 avoirdupoise ounces; which makes 671.4 troy pounds, and 553 avoirdupoise.

EXAMPLE. Required the number of cubic inches, and the weight of the water, in an upright pipe 278 feet high, and  $1\frac{1}{2}$  inch diameter?

Feet.	Cubic inches.	Troy oz.	Avoir. oz.
200	4241.1	2238.2	2457.8
70	1484.1	783.3	860.2
8	169.6	89.5	98.3
Ans. 278	5895.1	3111.0	3416.3

Here the nearest single decimal figure is only taken into the account; and the whole, being reduced by division, amounts to  $25\frac{1}{2}$  wine-gallons in measure, to  $259\frac{1}{2}$  pounds troy, and  $213\frac{1}{2}$  pounds avoirdupoise.

These tables were at first calculated to six decimal places for the sake of exactness; but in transcribing them there are no more than two decimal figures taken into the account, and sometimes but one; because there is no necessity for computing to hundredth parts of an inch or of an ounce in practice.

### The fire engine.

THE fire-engine comes next in order to be explained: but as it would be difficult, even by the best plates, to give a particular description of its several parts, so as to make the whole intelligible, we shall only explain the principles upon which it is constructed.

1. Whatever weight of water is to be raised, the pump-rod must be loaded with weights sufficient for that purpose, if it be done by a forcing pump, as is generally the case: and the power of the engine must be sufficient for the weight of the rod, in order to bring it up.

2. It is known, that the atmosphere presses upon the surface of the earth with a force equal to 15 pounds upon every square inch.

3. When water is heated to a certain degree, the particles thereof repel one another, and constitute an elastic fluid, which is generally called steam or vapour.

4. Hot steam is very elastic; and when it is cooled by any means, particularly by its being mixed with cold water, its elasticity is destroyed immediately, and it is reduced to water again.

5. If a vessel be filled with hot steam, and then closed so as to keep out the external air and all other fluids; when that steam is by any means condensed, cooled, or reduced to water, that water will fall to the bottom of the vessel; and the cavity of the vessel will be almost a perfect vacuum.

6. Whenever a vacuum is made in any vessel, the air by its weight will endeavour to rush into the vessel, or

to drive in any other body that will give way to its pressure; as may be easily seen by a common syringe. For, if you stop the bottom of a syringe, and then draw up the piston, if it be so tight as to drive out all the air before it, and leave a vacuum within the syringe, the piston being let go will be driven down with a great force.

7. The force with which the piston is drove down, when there is a vacuum under it, will be as the square of the diameter of the bore in the syringe. That is to say, it will be driven down with four times as much force in a syringe of a two-inch bore, as in a syringe of one inch: for the areas of circles are always as the squares of their diameters.

8. The pressure of the atmosphere being to 15 pounds upon every square inch, it will be equal to about 12 pounds upon every circular inch. So that if the bore of the syringe be round, and one inch in diameter, the piston will be pressed down into it by a force nearly equal to 12 pounds: but if the bore be two inches diameter, the piston will be pressed down with four times that force.

And hence it is easy to find with what force the atmosphere presses upon any given number either of square or circular inches.

These being the principles upon which this engine is constructed, we shall next describe the chief working parts of it: which are, 1. A boiler. 2. A cylinder and piston. 3. A beam or lever.

The boiler is a large vessel made of iron or copper; and commonly so big as to contain about 2000 gallons.

The cylinder is about 40 inches diameter, bored so smooth, and its leathered piston fitting so close, that little or no water can get between the piston and sides of the cylinder.

Things being thus prepared, the cylinder is placed upright, and the shank of the piston is fixed to one end of the beam, which turns on a centre like a common balance.

The boiler is placed under the cylinder, with a communication between them, which can be opened and shut occasionally.

The boiler is filled about half full of water, and a strong fire is made under it: then, if the communication between the boiler and the cylinder be opened, the cylinder will be filled with hot steam: which would drive the piston quite out at the top of it. But there is a contrivance by which the piston, when it is near the top of the cylinder, shuts the communication at the top of the boiler within.

This is no sooner shut, than another is opened, by which a little cold water is thrown upwards in a jet into the cylinder, which mixing with the hot steam, condenses it immediately; by which means a vacuum is made in the cylinder, and the piston is pressed down by the weight of the atmosphere; and so lifts up the loaded pump-rod at the other end of the beam.

If the cylinder be 42 inches in diameter, the piston will be pressed down with a force greater than 20000 pounds, and will consequently lift up that weight at the opposite end of the beam : and as the pump-rod with its plunger is fixed to that end, if the bore where the plunger works were 10 inches diameter, the water would be forced up through a pipe of 180 yards perpendicular height.

But, as the parts of this engine have a good deal of friction, and must work with a considerable velocity, and there is no such thing as making a perfect vacuum in the cylinder, it is found that no more than 8 pounds of pressure must be allowed for, on every circular inch of the piston in the cylinder, that it may make about 16 strokes in a minute, about 6 feet each.

Where the boiler is very large, the piston will make between 20 and 25 strokes in a minute, and each stroke 7 or 8 feet ; which, in a pump of 9 inches bore, will raise upwards of 300 hogheads of water in an hour.

It is found by experience, that a cylinder 40 inches diameter will work a pump 10 inches diameter and

100 yards long : and hence we can find the diameter and length of a pump that can be worked by any other cylinder.

For the convenience of those who would make use of this engine for raising water, we shall subjoin part of a table calculated by Mr. Beighton, shewing how any given quantity of water may be raised in an hour, from 48 to 440 hogheads ; at any given depth, from 15 to 100 yards ; the machine working at the rate of 16 strokes *per* minute, and each stroke being 6 feet long.

One example of the use of this table, will make the whole plain. Suppose it were required to draw 150 hogheads *per* hour, at 90 yards depth ; in the second column from the right hand, I find the nearest number, *viz.* 149 hogheads 40 gallons ; against which, on the right hand, I find the diameter of the bore of the pump must be 7 inches ; and in the same collateral line, under the given depth 90, I find 27 inches, the diameter of the cylinder fit for that purpose.—And so for any other.

A Table shewing the Power of the Engine for raising Water by Fire ;  
Calculated to the Measure of Ale-gallons, at 282 cubic Inches *per* Gallon.

#### The Persian wheel.

WATER may be raised by means of a stream AB (Plate 100. fig. 8.) turning a wheel CDE, according to the order of the letters, with buckets *a, a, a, &c.* hung upon the wheel by strong pins *b, b, b, b, &c.* fixed in the side of the rim : but the wheel must be made as high as the water is intended to be raised above the level of that part of the stream in which the wheel is placed. As the wheel turns, the buckets on the right hand go down into

the water, and are thereby filled ; and go up full on the left hand, until they come to the top at K ; where they strike against the end *n* of the fixed trough M, and are thereby overset, and empty the water into the trough ; from which it may be conveyed in pipes to the place which it is designed for : and as each bucket gets over the trough, it falls into a perpendicular position again, and goes down empty, until it comes to the water at A, where it is filled as before. On each bucket is a spring *r*, which going over the top or crown of the bar *m* (fixed to the trough M) raises the bottom of the bucket above the level of

Fig. 7.

Fig. 5.

*Fig. 1.*

Fig. 2.

Fig. 6.

Fig. 3. Fig. 4.

*Fig. 8*

of its mouth, and so causes it to empty all its water into the trough.

Sometimes this wheel is made to raise water no higher than its axis; and then, instead of buckets hung upon it, its spokes C, d, e, f, g, h are made of a bent form, and hollow within; these hollows opening into the holes C, D, E, F, in the outside of the wheel, and also into those at O in the box N upon the axis. So that, as the holes C, D, &c. dip into the water, it runs into them; and as the wheel turns, the water rises in the hollow spokes, e, d, &c. and runs out in a stream P from the holes at O, and falls into the trough Q, from whence it is conveyed by pipes. And this is a very easy way of raising water, because the engine requires neither men nor horses to turn it.

### *Of the specific gravities of bodies.*

THE art of weighing different bodies in water, and thereby finding their specific gravities, or weights, bulk for bulk, was invented by Archimedes.

The specific gravities of bodies are as their weights, bulk for bulk: thus a body is said to have two or three times the specific gravity of another, when it contains two or three times as much matter in the same space.

A body immersed in a fluid will sink to the bottom, if it be heavier than its bulk of the fluid. If it be suspended therein, it will lose as much of what it weighed in air, as its bulk of the fluid weighs. Hence, all bodies of equal bulk, which would sink in fluids, lose equal weights when suspended therein. And unequal bodies lose in proportion to their bulks.

### *The hydrostatic balance.*

THE *hydrostatic balance* differs very little from a common balance that is nicely made: only it has a hook at the bottom of each scale, on which small weights may be hung by horse hairs, or by silk threads. So that a body, suspended by the hair or thread, may be immersed in water without wetting the scale from which it hangs.

If the body thus suspended under the scale, at one end of the balance, be first counterpoised in air by weights in the opposite scale, and then immersed in water, the equilibrium will be immediately destroyed. Then, if as much weight be put into the scale from which the body hangs as will restore the equilibrium (without altering the weights in the opposite scale) that weight which restores the equilibrium will be equal to the weight of a quantity of water as big as the immersed body. And if the weight of the body in air be divided by what it loses in water, the quotient will shew how much that body is heavier than its bulk of water. Thus, if a guinea suspended in air be counterbalanced by 129 grains in the opposite scale of the balance; and then upon its being immersed in water, it becomes so much lighter as to require  $7\frac{1}{2}$  grains put into the scale over it, to restore the equilibrium; it shews that a quantity of water of equal bulk with the guinea, weighs  $7\frac{1}{2}$  grains, or 7.25; by which divide 129 (the weight of the guinea in air) and the quotient will be 17.793; which shews that the guinea is

17.793 times as heavy as its bulk of bulk of water. And thus any piece of gold may be tried, by weighing it first in air, and then in water; and if, upon dividing the weight in air by the loss in water, the quotient comes out to be 17.793, the gold is good; if the quotient be 18, or between 18 and 19, the gold is very fine; but if it be less than  $17\frac{1}{2}$ , the gold is too much alloyed, by being mixed with some other metal.

If silver be tried in this manner, and found to be 11 times as heavy as water, it is very fine; if it be  $10\frac{1}{2}$  times as heavy, it is standard; but if it be of any less weight compared with water, it is mixed with some lighter metal, such as tin.

By this method the specific gravities of all bodies that will sink in water may be found. But as to those which are lighter than water, as most sorts of wood are, the following method may be taken, to shew how much lighter they are than their respective bulks of water.

Let an upright stud be fixed into a thick flat piece of brass, and in this stud let a small lever, whose arms are equally long, turn upon a fine pin as an axis. Let the thread which hangs from the scale of the balance be tied to one end of the lever, and a thread from the body to be weighed tied to the other end. This done, put the brass and lever into a vessel: then pour water into the vessel, and the body will rise and float upon it, and draw down the end of the balance from which it hangs: then, put as much weight in the opposite scale as will raise that end of the balance, so as to pull the body down into the water by means of the lever; and this weight in the scale will shew how much the body is lighter than its bulk of water.

There are some things which cannot be weighed in this manner, such as quicksilver, fragments of diamonds, &c. because they cannot be suspended in threads; and must therefore be put into a glass bucket, hanging by a thread from the hook of one scale, and counterpoised by weights put into the opposite scale. Thus, suppose you want to know the specific gravity of quicksilver, with respect to that of water; let the empty bucket be first counterpoised in air, and then the quicksilver put into it and weighed. Write down the weight of the bucket, and also of the quicksilver; which done, empty the bucket, and let it be immersed in water as it hangs by the thread, and counterpoised therein by weights in the opposite scale: then, pour the quicksilver into the bucket in the water, which will cause it to preponderate; and put as much weight into the opposite scale as will restore the balance to an equipoise; and this weight will be the weight of a quantity of water equal in bulk to the quicksilver. Lastly, divide the weight of the quicksilver in air, by the weight of its bulk of water, and the quotient will shew how much the quicksilver is heavier than its bulk of water.

If a piece of brass, glass, lead, or silver be immersed and suspended in different sorts of fluids, its different losses of weight therein will shew how much it is heavier than its bulk of the fluid; the fluid being lightest, in which the immersed body loses least of its aerial weight. A solid bubble of glass is generally used for finding the specific gravities of fluids.

Hence we have an easy method of finding the specific gravities both of solids and fluids, with regard to the re-

specific bulks of common pump water, which is generally made a standard for comparing all the others by.

In constructing tables of specific gravities with accuracy, the gravity of water must be represented by unity or 1.000, where three cyphers are added, to give room for expressing the ratios of other gravities in decimal parts, as in the following table.

Take away the decimal point from the numbers in the right hand column, or (which is the same) multiply them by 1000, and they will shew how many ounces avoirdupoise are contained in a cubic foot of each body.

*How to find out the quantity of adulteration in metals.*

THE use of the table of specific gravities will best appear by an example. Suppose a body to be compounded of gold and silver, and it is required to find the quantity of each metal in the compound.

First find the specific gravity of the compound, by weighing it in air and in water, and dividing its aerial weight by what it loses thereof in water, the quotient will shew its specific gravity, or how many times it is heavier than its bulk of water. Then, subtract the specific gravity of silver (found in the table) from that of the compound, and the specific gravity of the compound from that of gold; the first remainder shews the bulk of gold, and the latter the bulk of silver, in the whole compound: and if these remainders be multiplied by the respective specific gravities, the products will shew the proportion of weights of each metal in the body. Example.

Suppose the specific gravity of the compounded body to be 13; that of standard silver (by the table) is 10.5, and that of gold 19.63: therefore 10.5 from 13, remains 2.5, the proportional bulk of the gold; and 13 from 19.63, remains 6.63, the proportional bulk of silver in the compound. Then, the first remainder 2.5, multiplied by 19.63, the specific gravity of gold, produces 49.075 for the proportional weight of gold; and the last remainder 6.63 multiplied by 10.5, the specific gravity of silver, produces 69.615 for the proportional weight of silver in the whole body. So that, for every 49.07 ounces or pounds of gold, there are 69.6 pounds or ounces of silver in the body.

Hence it is easy to know whether any suspected metal be genuine, or alloyed, or counterfeit; by finding how much it is heavier than its bulk of water, and comparing the same with the table: if they agree, the metal is good; if they differ, it is alloyed or counterfeited.

*How to try spirituous liquors.*

A CUBICAL inch of good brandy, rum, or other proof spirits, weighs 235.7 grains; therefore, if a true inch cube of any metal weighs 235.7 grains less in spirits than in air, it shews the spirits are proof. If it loses less of its aerial weight in spirits, they are above proof: if it loses more, they are under. For, the better the spirits are, they are the lighter; and the worse, the heavier.

The hydrometer is one of the most useful instruments of the philosophic kind; for though the hydrostatical balance be the most general instrument for finding the

specific gravities of all sorts of bodies, yet the hydrometer is best suited to find those of fluids in particular, both as to ease and expedition.

This instrument should be made of copper, since ivory imbibes spirituous liquors, and thereby alters its gravity; and glass is apt to break. The most simple kind, used for finding the strength of spirits, consists of a copper-ball Bb Plate 101. (fig. 1. n° 1.) with a brass wire, AB,  $\frac{1}{2}$  of an inch thick, soldered into it. The upper part of this wire being filed flat on one side, is marked proof at m, because it sinks exactly to this mark in proof-spirits. There are other two marks at A and B, to shew whether the liquor be  $\frac{1}{10}$  above or below proof, according as the hydrometer sinks to A or emerges to B, when a brass-weight as C or K has been screwed on at the bottom c. There are also weights to be screwed on, for shewing the specific gravities of fluids quite to common water. The round part of the wire above the ball, may be marked so as to represent river water when it sinks to R W,

(*ibid.* n° 2.) the weight which fits the instrument for river-water being screwed on at c: also when put into spring-water, mineral-water, sea-water, and water of salt-springs, it will emerge or rise gradually to the marks SP, MI, SE, SA; and, on the contrary, when put into Bristol-water, rain-water, port-wine, and mountain-wine, it will successively sink to the marks, br, ra, po, mo.

Another kind, which serves to distinguish the specific differences of fluids to great nicety, consists of a large hollow ball B. (*ibid.* n° 3) with a smaller ball b under it, partly filled with quick silver or small shot, and screwed on to the lower part of the former, in order to render it but little specifically lighter than water: it has also a small short neck at C, into which is screwed the graduated brass-wire AC, which by its weight causes the body of the instrument to descend in the fluid, with part of the stem.

When this instrument is swimming in the liquor, contained in the jar ILMK, the part of the fluid displaced

placed by it will be equal in bulk to the part of the instrument under water, and equal in weight to that of the whole instrument. Suppose the weight of the whole were 4000 grains, then it is evident we can by this means compare together the different bulks of 4000 grains of various sorts of fluids. For if the weight *A* be such as shall cause the aræometer to sink in rain-water, till its surface comes to the middle point of the stem 20; and if, after this, it be immersed in common spring water, and the surface is observed to stand  $\frac{1}{10}$  of an inch below the middle point 20; it is evident that the same weight of each water differs in bulk only by the magnitude of  $\frac{1}{10}$  of an inch in the stem.

Now suppose the stem were ten inches long, and weighed 100 grains, then every tenth of an inch would be one grain weight; and since the stem is of brass, and brass is about eight times heavier than water, the same bulk of water will be equal to  $\frac{1}{8}$  of a grain; and consequently to the  $\frac{1}{8}$  of  $\frac{1}{1000}$  part, that is, a 3200th part of the whole bulk, which is a degree of exactness as great as can be desired. Yet the instrument is capable of still greater exactness, by making the stem or neck consist of a flat thin slip of brass, instead of one that is round or cylindrical: by this means we increase the surface, which is the most requisite thing; and diminish the solidity, by which the instrument is rendered more exact.

In order to adapt this instrument to all sorts of uses, there ought to be two different stems to screw on and off in a small hole at *a*. One stem should be such a nice thin slip of brass, or rather of steel, like a watch-spring set straight, as we have just mentioned, on one side of which ought to be the several marks or divisions to which it will sink in various sorts of waters, as rain-water, river-water, spring water, sea-water, salt spring-water, &c. And on the other side you mark the division to which it sinks in various lighter fluids, as hot bath-water, Bristol water, Lincomb water, Cheltenham water, port-wine, mountain, madeira, and various other sorts of wine. But in this case the weight *A* on the top must be a little less than before, when it was used for the heavier waters.

But, in case of trying the strength of spirituous liquors, a common cylindric stem will do best, because of its strength and steadiness; and this ought to be so contrived, that, when immersed in what is called proof-spirit, the surface of the spirit may be upon the middle point 20; which is easily done by duly adjusting the small weight *A* on the top, and making the stem of such a length, that, when immersed in water, it may just cover the ball, and rise to *a*; but, when immersed in pure spirit, it may arise to the top at *A*; then by dividing the upper and lower parts *a* 20, *A* 20, into ten equal parts each, when the instrument is immersed in any sort of spirituous liquor, it will immediately shew how much it is above or below proof.

This proof-spirit consists of half water and half alcohol or pure spirit; that is, such as when poured upon gunpowder, and set on fire, will burn all away, and permit the powder to take fire, which it will, and

flash as in the open air. But if the spirit be not so highly rectified, there will remain some phlegm or water, which will make the powder wet, and unfit to take fire. This proof-spirit of any kind weighs seven pounds twelve ounces per gallon.

The common method of shaking the spirits in a vial, and, by raising a crown of bubbles, to judge by the manner of their rising or breaking away whether the spirit be proof or near it, is very precarious, and capable of great fallacy. There is no way so easy, quick, certain, and philosophical, as this by the aræometer, which will demonstrate infallibly the difference of bulks, and consequently specific gravities, in equal weights of spirits, to the 30, 40, or 50 thousandth part of the whole, which is a degree of accuracy beyond which nothing can be desired.

All bodies expand with heat, and contract with cold; but some more and some less than others: and therefore the specific gravities of bodies are not precisely the same in summer as in winter. It has been found, that a cubic inch of good brandy is 10 grains heavier in winter than in summer; as much spirit of nitre. 20 grains; vinegar 6 grains, and spring water 3. Hence it is most profitable to buy spirits in winter, and sell them in summer, since they are always bought and sold by measure. It has been found, that 32 gallons of spirits in winter will make 33 in summer.

The expansion of all fluids is proportionable to the degree of heat; that is, with a double or triple heat a fluid will expand two or three times as much.

Upon these principles depends the construction of the thermometer, in which the globe or bulb, and part of the tube, are filled with a fluid, which, when joined to the barometer, is spirits of wine tinged, that it may be the more easily seen in the tube. But when thermometers are made by themselves, quicksilver is generally used.

In the thermometer, a scale is fitted to the tube, to shew the expansion of the quicksilver, and consequently the degree of heat. And, as *Fahrenheit's* scale is most in esteem at present, we shall explain the construction and graduation of thermometers according to that scale.

First, let the globe or bulb, and part of the tube, be filled with a fluid; then immerse the bulb in water just freezing, or snow just thawing; and even with that part in the scale where the fluid then stands in the tube, place the number 32, to denote the freezing point: then put the bulb under your armpit, when your body is of a moderate degree of heat, so that it may acquire the same degree of heat with your skin; and when the fluid has risen as far as it can by that heat, there place the number 97: then divide the space between these numbers into 65 equal parts, and continue those divisions both above 97 and below 32, and number them accordingly.

This may be done in any part of the world; for it is found that the freezing point is always the same in all places, and the heat of the human body differs but very little: so that the thermometers made in this manner will

will agree with one another: and the heat of several bodies will be shewn by them, and expressed by the number upon the scale, thus.

Air, in severe cold weather, in our climate, from 15 to 25. Air in winter, from 26 to 42. Air in spring and autumn, from 43 to 53. Air at midsummer, from 65 to 68. Extreme heat of the summer sun, from 86 to 100. Butter just melting, 95. Alcohol boils with 174 or 175. Brandy with 190. Water 212. Oil of turpentine 550. Tin melts with 408, and lead with 540. Milk freezes about 30, vinegar 28, and blood 27.

A body specifically lighter than a fluid will swim upon its surface, in such a manner, that a quantity of the fluid equal in bulk with the immersed part of the body, will be as heavy as the whole body. Hence, the lighter a fluid is, the deeper a body will sink in it; upon which depends the construction of the hydrometer or water-poise.

From this we can easily find the weight of a ship, or any other body that swims in water. For, if we multiply the number of cubic feet which are under the surface, by 62 5, the number of pounds in one foot of fresh water; or by 63, the number of pounds in a foot of salt water; the product will be the weight of the ship, and all that is in it. For, since it is the weight of the ship that displaces the water, it must continue to sink until it has removed

as much water as is equal to it in weight; and therefore the part immersed must be equal in bulk to such a portion of the water as is equal to the weight of the whole ship.

To prove this by experiment, let a ball of some light wood, such as fir or pear-tree, be put into water contained in a glass vessel; and let the vessel be put into a scale at one end of a balance, and counterpoised by weights in the opposite scale: then, marking the height of the water in the vessel, take out the ball; and fill up the vessel with water to the same height that it stood at when the ball was in it; and the same weight will counterpoise it as before.

From the vessel's being filled up to the same height: at which the water stood when the ball was in it, it is evident that the quantity poured in is equal in magnitude to the immersed part of the ball; and from the same weight counterpoising, it is plain that the water poured in is equal in weight to the whole ball.

In troy weight, 24 grains make a pennyweight, 20 pennyweight make an ounce, and 12 ounces a pound. In avoirdupoise weight, 16 drams make an ounce, and 16 ounces a pound. The troy pound contains 5760 grains, and the avoirdupoise pound 7000: and hence, the avoirdupoise dram weighs 27.34375 grains, and the avoirdupoise ounce 437.5.

## H Y P

**HYGROMETER**, a machine, or instrument whereby to measure the degrees of driness, or moisture of the air, or rather of the atmosphere.

There are divers sorts of hygrometers; for whatever body either swells or shrinks, by dryness or moisture, is capable of being formed into an hygrometer. Such are woods of most kinds particularly ash, deal, poplar, &c. Such also is catgut, the beard of a wild oat, &c.

**HYMEN**, in anatomy. See **ANATOMY**, p. 277.

**HYMENÆA**, in botany, a genus of the decandria monogynia class. The calix consists of five segments, and the corolla of five petals; and the pod is filled with a farinaceous pulp. There is but one species, a native of America.

**HYMENÆAL**, something belong to marriage, so called from hymen.

**HYMN**, a religious song. The hymns sung in the christian church, as distinguished from the psalms, are pieces of poetry composed by pious but not inspired authors.

**HYOIDES**, in anatomy. See **ANATOMY**, p. 166.

**HYOSCYAMUS**, **HEN-BANE**, in botany, a genus of the pentandria monogynia class. The corolla is obtuse and funnel shaped; the stamina are inclined; and the capsule is operculated, and consists of two cells. There are six species, only one of which, viz. the niger, or common hen-bane, is a native of Britain. The leaves, &c. of this plant are highly narcotic and poisonous, and now disregarded in practice.

**HYOTHYROIDES**, in anatomy. See **ANATOMY**, p. 300.

VOL. II. No. 61.

## H Y P

**HYPANTE**, or **HYPERPANTE**, a name given by the Greeks to the feast of the presentation of Jesus in the temple.

This word, which signifies lowly or humble meeting, was given to this feast, from the meeting of old Simon and Anna the prophetess in the temple, when Jesus was brought thither.

**HYPECUM**, *wild cumin*, in botany, a genus of the tetrandria digynia class. The calix consists of two leaves, and the corolla of four petals, the two outermost of which are broader, and divided into three segments. There are four species, none of them natives of Britain.

**HYPERBATON**, in grammar, a figurative construction inverting the natural and proper order of words and sentences.

**HYPERBOLA**. See **CONIC SECTIONS**.

**HYPERBOLE**, in rhetoric, a figure, whereby the truth and reality of things are excessively either enlarged or diminished.

An object uncommon with respect to size, either very great of its kind or very little, strikes us with surprise; and this emotion forces upon the mind a momentary conviction that the object is greater or less than it is in reality: the same effect, precisely, attends figurative grandeur or littleness; and hence the hyperbole, which expresses this momentary conviction. A writer, taking advantage of this natural delusion, enriches his description greatly by the hyperbole: and the reader, even in his coolest moments, relishes this figure, being sensible that it is the operation of nature upon a warm fancy.

It cannot have escaped observation, that a writer is generally more successful in magnifying by a hyperbole than in diminishing. The reason is, that a minute object contracts the mind, and fetters its powers of imagination; but that the mind, dilated and inflamed with a grand object, moulds objects for its gratification with great facility. Longinus, with respect to a diminishing hyperbole, cites the following ludicrous thought from a comic poet: "He was owner of a bit of ground not larger than a Lacedæmonian letter." But, for the reason now given, the hyperbole has by far the greater force in magnifying objects; of which take the following examples:

For all the land which thou see'st, to thee will I give it, and to thy seed for ever. And I will make thy seed as the dust of the earth: so that if a man can number the dust of the earth, then shall thy seed also be numbered. *Genesis* xiii. 15. 16.

*Illa vel intactæ segetis per summa volaret  
Gramina: nec teneras cursu læsisset aristas.*  
*Æneid.* vii. 808.

—————Atque imo barathri ter gurgite vastos  
Sorbet in abruptum fluctus, rursusque sub auras  
Erigit alternos, et sidera verberat unda.  
*Æneid.* iii. 421.

—————Horrificis juxta tonat *Ætna* ruinis,  
Interdumque atram prorumpit ad æthera nubem,  
Turbine fumantem piceo et candente favilla:  
Attollitque globos flammæ, et sidera lambit.  
*Æneid.* iii. 571.

#### Speaking of Polyphemus,

—————Ipse arduus, altaque pulsat  
Sidera. *Æneid.* iii. 619.

—————When he speaks,  
The air, a charter'd libertine, is still.  
*Henry V.* act 1. sc. 1.

Now shield with shield, with helmet helmet clos'd,  
To armour armour, lance to lance oppos'd,  
Host against host with shadowy squadrons drew,  
The sounding darts in iron tempests flew,  
Victors and vanquish'd join promiscuous cries,  
And shrilling shouts and dying groans arise;  
With streaming blood the slipp'ry fields are dy'd,  
And slaughter'd heroes swell the dreadful tide.  
*Iliad* iv. 508.

Quintilian is sensible that this figure is natural: "For," says he, "not contented with truth, we naturally incline to augment or diminish beyond it; and for that reason the hyperbole is familiar even among the vulgar and illiterate:" and he adds, very justly, "That the hyperbole is then proper, when the subject of itself exceeds the common measure." From these premises, one would not expect the following inference, the only reason he can find for justifying this figure of speech, "Conceditur enim amplius dicere, quia dici quantum est, non potest: meliusque ultra quam citra stat oratio." (We are indulged to say more than enough,

because we cannot say enough; and it is better to be above than under.) In the name of wonder, why this slight and childish reasoning, when immediately before he had observed, that the hyperbole is founded on human nature? we could not resist this personal stroke of criticism; intended not against our author, for no human creature is exempt from error, but against the blind veneration that is paid to the ancient classic writers, without distinguishing their blemishes from their beauties.

Having examined the nature of this figure, and the principle on which it is erected; let us proceed to the rules by which it ought to be governed. And, in the first place, it is a capital fault, to introduce an hyperbole in the description of an ordinary object or event; for in such a case, it is altogether unnatural, being destitute of surprise, its only foundation. Take the following instance, where the subject is extremely familiar, viz. swimming to gain the shore after a shipwreck,

I saw him beat the surges under him,  
And ride upon their backs; he trod the water;  
Whose enmity he flung aside, and breast'd  
The surge most swollen that met him: his bold head  
'Bove the contentious waves he kept, and oar'd  
Himself with his good arms, in lusty strokes  
To th' shore, that o'er his wave-borne basis bow'd,  
As stooping to relieve him. *Tempest*, act 2. sc. 1.

In the next place, it may be gathered from what is said, that an hyperbole can never suit the tone of any dispiriting passion: sorrow in particular will never prompt such a figure; and for that reason the following hyperboles must be condemned as unnatural:

*K. Rich.* Aumerle, thou weep'st, my tender-hearted cousin!

We'll make foul weather with despised tears;  
Our sighs, and they, shall lodge the summer-corn,  
And make a dearth in this revolting land.

*Richard II.* act 3. sc. 6.

Draw them to Tyber's bank, and weep your tears  
Into the channel, till the lowest stream  
Do kiss the most exalted shores of all.

*Julius Caesar*, act 1. sc. 1.

Thirdly, a writer, if he wish to succeed, ought always to have the reader in his eye: he ought in particular never to venture a bold thought or expression, till the reader be warmed and prepared. For this reason, an hyperbole in the beginning of a work can never be in its place. Example:

Iam pauca aratro jugera regie  
Moles relinquent. *Horat. Carm. lib. 2. ode 15.*

In the fourth place, the nicest point of all, is to ascertain the natural limits of an hyperbole, beyond which being overstrained it has a bad effect. Longinus, (chap. iii.) with great propriety of thought, enters a caveat against an hyperbole of this kind: he compares it to a bowstring, which relaxes by overstraining, and produceth an effect directly opposite to what is intended. To ascertain any precise boundary, would be difficult,

if

not impracticable. We shall therefore only give a specimen of what may be reckoned overstrained hyperboles. No fault is more common among writers of inferior rank ; and instances are found even among those of the finest taste ; witness the following hyperbole, too bold even for an Hotspur.

Hotspur, talking of Mortimer :

In single opposition hand to hand,  
He did confound the best part of an hour  
In changing hardiment with great Glendower.  
Three times they breath'd, and three times did they  
drink,  
Upon agreement, of swift Severn's flood ;  
Who then affrighted with their bloody looks,  
Ran fearfully among the trembling reeds,  
And hid his crisp'd head in the hollow bank,  
Blood-stained with these valiant combatants.

*First Part Henry IV. act 1. sc. 4.*

Speaking of Henry V.

England ne'er had a King until his time :  
Virtue he had, deserving to command :  
His brandish'd sword did blind men with its beams :  
His arms spread wider than a dragon's wings :  
His sparkling eyes, replete with awful fire,  
More dazzled, and drove back his enemies,  
Than mid-day sun fierce bent against their faces.  
What should I say ? his deeds exceed all speech :  
He never lifted up his hand, but conquer'd.

*First Part Henry VI. act 1. sc. 1.*

Lastly, An hyperbole, after it is introduced with all advantages, ought to be comprehended within the fewest words possible : as it cannot be relished but in the hurry and swelling of the mind, a leisurely view dissolves the charm, and discovers the description to be extravagant at least, and perhaps also ridiculous. This fault is palpable in a sonnet which passeth for one of the most complete in the French language : Phillis, in a long and florid description, is made as far to outshine the sun as he outshines the stars :

Le silence regnoit sur la terre et sur l'onde,  
L'air devenoit serain et l'Olimp vermeil,  
Et l'amoureux Zephir affranchi du someil.  
Ressuscitoit les fleurs d'une haleine seconde.

L'Aurore deployoit l'or de sa tresse blonde,  
Et semoit de rubis le chemin du soleil ;  
Enfin ce Dieu venoit au plus grand appareil  
Qu'il soit jamais venu pour éclairer le monde :

Quand la jeune Philis au visage riant,  
Sortant de son palais plus clair que l'orient,  
Fit voir une lumiere et plus vive et plus belle.

Sacre flambeau du jour, n'en soiez point jaloux,  
Vous parutes alors aussi peu devant elle,  
Que les feux de la nuit avoient fait devant vous.

*Malleuille.*

There is in Chaucer a thought expressed in a single line,

which sets a young beauty in a more advantageous light than the whole of this much laboured poem :

Up rose the sun, and up rose Emelie.

HYPERCATALECTIC, in the Greek and Latin poetry, is applied to a verse, which has one or two syllables too much, or beyond the regular and just measure : as,

*Musa sorores sunt Minerva.*

Also,

*Musa sorores Palladis lugent.*

HYPERICUM, *St John's wort*, a genus of the polyadelphia polyandria class. The calix consists of five segments, and the corolla of five petals : and the filaments are numerous, and bound in five bundles. There are twenty-nine species, eight of them natives of Britain.

HYPERSARCOSIS, in medicine and surgery, an excess of flesh, or rather a fleshy excrescence, such as those generally arising upon the lips of wounds, &c.

HYPHEN, an accent or character, in grammar, implying that two words are to be joined, or connected into one compound word, and marked thus - ; as, pre established, five-leaved, &c.

Hypens also serve to connect the syllables of such words as are divided by the end of the line.

HYPNOTIC, in the materia medica, such medicines as any way produce sleep, whether called narcotics, hypnotics, opiates, or soporifics.

HYPNUM, in botany, a genus of the cryptogamia musci class. There are forty-two species, all natives of Britain.

HYPOCAUSTUM, among the Greeks and Romans, a subterraneous place, wherein was a furnace to heat the baths.

Another sort of hypocaustum was a kind of kiln, to heat their winter-parlours.

Among the moderns, it is that place where the fire is kept that warms a stove or hot-house.

HYPOCHAERIS, in botany a genus of the syngenesia polygamia æqualis class. The receptacle is paleaceous ; the calix is imbricated ; and the pappus is plumose. There are four species, two of them natives of Britain, viz. the radicata, or long-rooted hawkweed ; and the maculata, or spotted hawkweed.

HYPOCHONDRIA, in anatomy. See ANATOMY, p. 256.

HYPOCHONDRIAC PASSION. See MEDICINE.

HYPOCYSTIS, in pharmacy, an inspissated juice, obtained from the sessile asarum, much resembling the true Egyptian acacia.

They gather the fruit, while unripe ; and express the juice, which they evaporate over a very gentle fire, to the consistence of an extract, and then form into cakes, and expose them to the sun to dry.

Hypocyst is an astringent, and that of considerable power ; it is good against diarrhoeas and hæmorrhages of all kinds, and may be used in repellent gargarisms in the manner of the acacia ; but it is very rarely met with genuine in our shops, the german acacia being usually sold under its name.

**HYPOGASTRIC**, an appellation given to the internal branch of the iliac artery.

**HYPOGASTRICUM**, in anatomy. See **ANATOMY**, p. 256.

**HYPOPHYLLOCARPODENDRON**, in botany. See **LEUCODENDRON**.

**HYPOPYON**, in medicine, a collection of purulent matter under the cornea of the eye.

**HYPOSTASIS**, among divines, signifies a person or substance; chiefly used in speaking of the persons of the Trinity.

**HYPOTHEC**, in Scotslaw, a right of security established by law to creditors upon the goods and effects of their debtors, for payment of certain debts. See **LAW**, tit. 20. § 13.

**HYPOTHENAR**, in anatomy. See **ANATOMY**, p. 200.

**HYPOTHENUSE**, in geometry, the longest side of a right-angled triangle, or it is that side which subtends the right angle.

**HYPOTHESIS**, in general, denotes something supposed to be true, or taken for granted, in order to prove or illustrate a point in question.

Hypotheses, however elegant and artful, ought to be first proved by repeated observations and constant experience, before they are received as truths.

**HYSSOPUS**, in botany, a genus of the didynamia gynodioecia class. The inferior lip of the corolla has a small crenated segment; and the stamina are erect and distant. There are three species, none of them natives of Britain. The leaves are said to be good in asthma, coughs, and other disorders of the lungs.

**HYSTERIC**, or **HYSTERIC PASSION**. See **MEDICINE**.

**HYSTERON PROTERON**, in grammar and rhetoric, a species of the hyperbaton, wherein the proper order of construction is so inverted, as that the part of any sentence which should naturally come first is placed last; as in this of Terence, *valet & vivit*, for *vivit & valet*; and in the following of Virgil, *moriamur & in media arma ruamus*, for *in media arma ruamus & moriamur*.

**HYSTEROPHORUS**. See **PARTHENIUM**.

**HYSTRIX**, in zoology, a genus of quadrupeds belonging to the order of glires, the characters of which are these: They have two fore-teeth, obliquely divided, both in the upper and under jaw, besides eight grinders; and the body is covered with quills or prickles. (See Plate CI. fig. 5.) There are four species. viz.

1. The *cristata*, or crested porcupine, has four toes on the fore-feet, five toes on the hind-feet, a crested head, a short tail, and the upper lip is divided like that of a hare. The length of the body is about two feet, and the height about two feet and a half. The porcupine is covered with prickles, some of them nine or ten inches long, and about  $\frac{1}{2}$  of an inch thick. Like the hedge-hog, he rolls himself up in a globular form, in which position he is proof against the attacks of the most rapacious animals. The prickles are exceedingly sharp, and each of them has five large black and as many white rings, which succeed one another alter-

nately from the root to the point. These quills the animal can erect or let down at pleasure; when irritated, he beats the ground with his hind-feet, erects his quills, shakes his tail, and makes a considerable rattling noise with his quills.

Most authors have asserted that the porcupine, when irritated, darts his quills to a considerable distance against the enemy, and that he will kill very large animals by this means. But Mr Buffon, and some other late historians, assure that the animal possesses no such power. Mr Buffon frequently irritated the porcupine, but never saw any thing like this darting of his quills. He says indeed, that when the creature was much agitated with passion, some of the quills which adhered but slightly to the skin, would fall off, particularly from the tail; and this circumstance, he imagines, has given rise to the mistake.

The porcupine, though originally a native of Africa and the Indies, can live and multiply in the more temperate climates of Spain and Italy. Pliny, and every other natural historian since the days of Aristotle, tells us that the porcupine, like the bear, conceals itself during the winter, and that they bring forth their young in 80 days. But these circumstances remain to this day uncertain. It is remarkable, that although this animal be very common in Italy, no person has ever given us a tolerable history of it. We only know in general, that the porcupine, in a domestic state, is not a fierce or ill-natured animal; that with his fore-teeth, which are strong and sharp, he can cut through a strong board; that he eats bread, fruits, roots, &c. that he does considerable damage when he gets into a garden; that he grows fat, like most animals, about the end of summer; and that his flesh is not bad food.

2. The *prehensilis*, or cuandu, has four toes on the fore-feet, five on the hind-feet, and a long tail. It is considerably less than the former species, being only 17 inches long from the point of the muzzle to the origin of the tail, which is nine inches long; the legs and feet are covered with long brownish hair; the rest of the body is covered with quills interperfed with long hairs; the quills are about five inches long and about  $\frac{1}{2}$  of an inch in diameter. He feeds upon birds and small animal. He sleeps in the day like the hedgehog, and searches for his food in the night. He climbs trees, and supports himself by twisting his tail round the branches. He is generally found in the high grounds of America from Brazil to Louisiana and the southern parts of Canada. His flesh is esteemed very good eating.

3. The *dorsata*, has four toes on the fore-feet, five on the hind-feet, and has quills only on the back, which are short, and almost hid among the long hair. He is about two feet long. He is a native of Hudson's bay. The savages eat his flesh, and make use of his skin as a fur after taking off the prickles.

4. The *macroura*, has five toes both on the hind and fore feet; his tail is very long, and the prickles are elevated. He is a native of Asia the East Indies.

JACCA,

## I.

J A G

J A M

**JACCA**, a city and bishop's see of Arragon, in Spain, sixty miles north of Saragossa: W. lon. 50', and N. lat. 42° 50'.

**JACEA**. See **CENTAURIA**.

**JACK**, in mechanics, a well-known instrument of common use for raising very great weights of any kind.

The common kitchen-jack is a compound engine where the weight is the power applied to overcome the friction of the parts, and the weight with which the spit is charged; and a steady and uniform motion is obtained by means of the fly.

**JACK-FLAG**, in a ship, that hoisted up at the sprit sail top-mast head. See **FLAG**.

**JACK-DAW**, in ornithology. See **CORVUS**.

**JACKALL**, in zoology. See **CANIS**.

**JACOBÆA**, in botany. See **SENECIO**.

**JACOBITES**, a term of reproach bestowed on the persons, who, vindicating the doctrines of passive obedience and non-resistance with respect to the arbitrary proceedings of princes, disallow of the late revolution, and assert the supposed rights and adhere to the interests of the late abdicated king James and his family.

**JACOBITES**, in church-history, a sect of Christians in Syria and Mesopotamia; so called either from Jacob, a Syrian, who lived in the reign of the emperor Mauricius; or from one Jacob, a monk, who flourished in the year 550.

The Jacobites are of two sects, some following the rites of the Latin church, and others continuing separated from the church of Rome. There is also at present a division among the latter, who have two rival patriarchs, one of whom resides at Caramit, and the other at Derzapharan. As to their belief, they hold but one nature in Jesus Christ; with respect to purgatory and prayers for the dead, they are of the same opinion as the Greeks and other eastern Christians: they consecrate unleavened bread at the eucharist, and are against confession, believing that it is not of divine institution.

**JACOBUS**, an ancient gold coin worth twenty-five shillings.

**JAFFA**, anciently called **JOPPA**, is a port-town of Palestine in Asiatic Turkey, situated thirty miles north-west of Jerusalem: E. lon. 36°, N. lat. 32° 20'.

**JAFNAPATAN**, a port-town at the north end of the island of Ceylon, in the East Indies; subject to the Dutch: E. lon. 79°, N. lat. 10°.

**JAGENDORF**, a city of Silesia, twelve miles north-west of Tropaw: E. lon. 17° 6' N. lat. 50° 8'.

**St. JAGO**, the chief of the Cape Verd islands, in Africa, 300 miles west of Cape Verd; subject to Portugal: W. lon. 24°, N. lat. 15°.

**St. JAGO**, the capital of the island of Cuba, 100 miles north-west of Jamaica: W. lon. 76°, 30', N. lat. 20°.

VOL. II. Numb. 61.

2

**St. JAGO**, the capital of the province of Chili, in South America, situated six miles west of the mountains of Andes, and eighteen east of the Pacific ocean: W. lon. 77°, S. lat. 34°.

**JAGO DE LA VEGA**, or Spanish town, the capital of Jamaica, situated at the south-east part of the island, about seven miles north-west of Port Passage and the bay of Port Royal: E. lon. 76° 50', N. lat. 18° 20'.

**JALAP**, in botany. See **MIRABILIS**.

**JAMAICA**, an island of America, situated in the Atlantic ocean, between 76° and 79° of west longitude, and between 17° and 18° odd minutes north latitude, near 5000 miles south-west of England, 100 miles south of the island of Cuba, and 350 miles north of Terra Firma. The island lies east and west, and is about 140 miles long, and 60 broad. The wind sets on the shore almost all the day in every part of the island, and off the shore in the night; it sometimes hails, but the people there never see frost or snow. The produce of the island is chiefly sugar; but there are plantations of coffee, of the cocoa or chocolate tree, of indigo, tobacco, pepper, cotton, woods for dying, and the mahogany and machineel wood, ginger, medicinal drugs and gums. The common diseases of the country are fevers, fluxes, and the dry gripes.

**JAMANA**, the chief town of a province of Arabia, also of the same name: E. lon. 47° 15', N. lat. 25°.

**JAMBA**, a city of the hither India, and the capital of the province of the same name, situated 220 miles north-east of Delli: E. lon. 82°, N. lat. 31°.

**JAMBOLIFERA**, in botany, a genus of the octandria monogynia class. The calix has four teeth, and the corolla four funnel-shaped petals; and the stigma is simple. There is but one species, a native of India,

**IAMBUS**, in ancient poetry, a simple foot consisting of a short and a long syllable, as *pis*.

**JAMBY**, a town on the east side of the island of Sumatra, in the East Indies, situated in 101° E. lon. and in 1° 30' S. lat.

**JAMES**, or *knights of St James*, a military order in Spain, first instituted about the year 1170, by Ferdinand II. king of Leon and Galicia. The greatest dignity belonging to this order is grand master, which has been united to the crown of Spain. The knights are obliged to make proof of their descent from families that have been noble for four generations, on both sides; they must also make it appear that their said ancestors have neither been Jews, Saracens, nor Heretics; nor have ever been called into question by the inquisition. The novices are obliged to serve six months in the galleys, and to live a month in a monastery; they observe the rules of St Austin, making no vows but of poverty, obedience, and conjugal fidelity.

**St. James's DAY**, a festival of the Christian church, observed

† 8 Y

served

served on the 25th of July, in honour of St James the greater, son of Zebedee.

*Epistle of St James*, a canonical book of the New Testament, being the first of the catholic or general epistles; which are so called, as not being written to one, but to several Christian churches.

**JAMES TOWN**, once the capital of Virginia in America, and of James-country, situated in a peninsula on the north side of James, or Pauhatan river, in W. lon.  $76^{\circ} 30'$ , N. lat.  $37^{\circ} 30'$ .

**JANEIRO**, a province of Brazil, in south America, situated between  $44^{\circ}$  and  $49^{\circ}$  of W. lon. and between the tropic of capricorn and  $22^{\circ}$  of S. lat.

**JANICAW**, or **JANOWITZ**, a town of Bohemia, situated forty-five miles south-east of Prague.

**JANIZARIES**, an order of the Turkish infantry, reputed the grand signior's guards, and the main strength of the Ottoman army.

**JANSENISTS**, in church-history, a sect of the Roman-catholics in France, who followed the opinions of Jansenius, bishop of Ypres, and doctor of divinity of the universities of Louvain and Douay, in relation to grace and predestination.

In the year 1640, the two universities just mentioned, and particularly father Molina and father Leonard Celsus, thought fit to condemn the opinions of the Jesuits on grace and free-will. This having set the controversy on foot, Jansenius opposed to the doctrine of the Jesuits the sentiments of St Augustine, and wrote a treatise on grace, which he entitled *Augustinus*. This treatise was attacked by the Jesuits, who accused Jansenius of maintaining dangerous and heretical opinions; and afterwards in 1642, obtained of pope Urban VIII. a formal condemnation of the treatise wrote by Jansenius: when the partisans of Jansenius gave out that this bull was spurious, and composed by a person entirely devoted to the Jesuits. After the death of Urban VIII. the affair of Jansenism began to be more warmly controverted, and gave birth to an infinite number of polemical writings concerning grace; and what occasioned some mirth, was the titles which each party gave to their writings: one writer published, *The torch of St Augustine*, another found snuffers for St Augustine's torch, and father Veron formed a gag for the Jansenists, &c. In the year 1650, sixty eight bishops of France subscribed a letter to pope innocent X to obtain an enquiry into, and condemnation of the five following propositions, extracted from Jansenius's *Augustinus*: I. Some of God's commandments are impossible to be observed by the righteous, even though they endeavour with all their power to accomplish them. II. In the state of corrupted nature, we are incapable of resisting inward grace. III. Merit and demerit in a state of corrupted nature, does not depend on a liberty which excludes necessity, but on a liberty which excludes constraint. IV. The semipelagians admitted the necessity of an inward preventing grace for the performance of each particular act, even for the beginning of faith: but they were heretics in maintaining that this grace was of such a nature, that the will of man was able either to resist

or obey it. It is semipelagianism to say, that Jesus Christ died, or shed his blood, for all mankind in general.

In the year 1652, the pope appointed a congregation for examining into the dispute in relation to grace. In this congregation Jansenius was condemned, and the bull of condemnation, published in May 1653, filled all the pulpits in Paris with violent outcries and alarms against the heresy of the Jansenists. In the year 1656, pope Alexander VII. issued out another bull, in which he condemned the five propositions of Jansenius. However, the Jansenists affirm, that these propositions are not to be found in this book; but that some of his enemies having caused them to be printed on a sheet, inserted them in the book, and thereby deceived the pope. At last Clement the XI. put an end to the dispute by his constitution of July the 17. 1705; in which, after having recited the constitutions of his predecessors in relation to this affair, he declares, "That in order to pay a proper obedience to the papal constitutions concerning the present question, it is necessary to receive them with a respectful silence." The clergy of Paris, the same year, approved and accepted this bull, and none dared to oppose it.

This is the famous bull *Unigenitus*, so called from its beginning with the words *Unigenitus Dei Filius*, &c. which has occasioned so much confusion in France.

**JANUARY**, in chronology, the first month of the year, so called from Janus, one of the ancient Roman deities painted with two faces; one whereof was supposed to look towards the new year, and the other towards the old.

**JAPAN**, or *islands of JAPAN*, are situated between  $130^{\circ}$  and  $144^{\circ}$  of E. lon. and between  $30^{\circ}$  and  $40^{\circ}$  N. lat.

**JAPANNING**, the art of varnishing and drawing figures on wood, &c. in the manner as is done by the natives of Japan.

The method of preparing woods for japanning is as follows. 1. Take plasterer's size, dissolve it over the fire, and mix it with whiting finely powdered till it is of a good body, but not too thick. 2. By means of a strong brush, lay your work over with the former mixture; and letting it dry very well, repeat this till the wood is perfectly plain, or the pores and crevices sufficiently filled up; and when it is thoroughly dry, rub the work over with a wet rag till it is rendered as smooth as possible: this work is called water-plaining. 3. After this, wash over the work with the thickest of seed-lac varnish till it is very smooth, letting it stand to dry between every washing. 4. In a day or two's time, you may varnish it over with black, or whatever other colour you design; and when it is dry, finish it by polishing. See the article **VARNISH**.

After the same manner carved figures are to be primed; also frames, cabinets, stands, tea-tables, &c. saying that these are not to be polished, and therefore do not require so great a body of varnish: but for the tops of tables, boxes, sides of cabinets, &c. when the wood is ordinary and rough grained, as deal oak, &c. you may use common joiners glue dissolved in water

water till it is fine and thin, into which put the finest saw-dust, till it is indifferently thick: then with a brush lay your wooden-work over with it, and when it is dry, repeat it so often till all the roughness and grain of the wood is sufficiently hidden; and two or three days after let it be scraped with a scraper, as pear-tree and olive-wood are done to make it as smooth as possible: then varnish it as before directed. This, if well done, might not come behind any other work either for beauty or durability; but, however, those woods that are firm and close grained are chiefly to be chosen.

Method of taking off japan patterns. 1. Having laid your ground, whether black, or of any other colour, and rendered it fit for drawing; and having your draught or design before you on paper, either drawn or printed, do as follows. 2. Rub this draught or print all over the back side with whiting or fine chalk, wiping off all that whiting which lies loose upon the paper; then laying this paper upon the table, or piece of varnished-work, with the whited side next it upon the very place where you would have that figure made, with a needle not sharp-pointed, fixed in a wooden handle, and called a tracing-pencil, go over and trace as much of the drawing as you think proper: thus by means of the whiting, you will have the gross form of the draught, and such other lines as will be a direction to you how to perform what you would have done. 3. Having done this, if you draw in gold-size, use fine chinnabar mixed with gum-water; and with a small pencil dipt into it, go over all the lines made by the chalk: this will hold it so as not to come off. 4. If you work your metals or colours in gum-water, then trace over your design with gum-water mixt with gold or brass dust; by either of these ways when it is dry and finished, viz. either in gum-water or gold size, you may compleat and finish your work.

Method of jappanning wood. The wood being prepared as before directed, it is jappanned with black, as follows. 1. Take of the thickest lac-varnish, six ounces; and lamp black, enough to colour it: with this wash over your piece three times, letting it dry thoroughly between each time: again, with the same varnish, wash it over three other several times, letting it dry as before, and rush it smooth between each washing. 2. Then take the following: Of thickest seed-lac varnish, six ounces; and venice turpentine, one ounce: wash over your work with it six times, letting it stand twelve hours between the three first and the three last varnishes. 3. Your work being thus far done, take the following japan-varnish: Of the finest seed lac varnish, six ounces; of lamp black, a sufficient quantity; mix them, and with that let your work be washed twelve times, standing twelve hours betwixt the first six and the last six washings. 4. Then letting it stand to dry for six or seven days, polish it with tripoli and a rag, as before directed: but in polishing you must work at it only till it is almost smooth; and then let it stand by for two days: afterwards polish it again, almost enough; then let it stand for six days, after which finish the polishing of it; finally, clear it up with oil and lamp-black, by which means you will have a good black japan scarce at all inferior to the true japan.

For a white japan. 1. Lay the ground with ising-

glass size mixed with as much whiting scraped into it as will make it of a proper thickness; with this whiten your work once over, and being thoroughly dry, do it over again; and in like manner repeat it the third time; after which let it stand for twelve hours, covering it from dust; rush it with Dutch rushing as near the grain of the wood as is proper. 2. Then taking first ising-glass size, and flake white, so much as will make the size of a fair body, mix them well together, and with this go over your work three several times, letting it dry between each time, and rush it as before. 3. Then take white starch boiled in fair water, till it is somewhat thick, wash over the whole work twice with it, blood-warm; letting it dry as before. 4. Letting it stand for a day or two, it being first washed with rectified spirit of wine, to clear it from the dust, dip a pure clean pencil into the finest white varnish, and do over the work six or seven times; and if this be well done, it will give a finer gloss than if it were polished: if it be not well done, polishing will be necessary, for which reason you must give it five or six varnishes more. In polishing you must make use of the finest tripoli; and instead of lamp-black and oil, must use putty and oil, and conclude with white starch mixed with oil.

Common red japan. 1. Take ising-glass size, fine vermilion, a sufficient quantity, as much as is proper; with the former mixture do your work over four times: first warming it by the fire, letting it dry each time, and rushing it as before. 2. This being done, wash it over eight times with ordinary seed lac varnish, and let it by for twelve hours: then rush it again, but slightly, to make it look smooth. 3. And, lastly, for an exquisite outward covering, wash it ten times with the best lac-seed varnish; let it lie seven days to dry, and then polish it with tripoli, and clear it up with oil and lamp black.

A deeper red japan may be made by mixing fine sanguis draconis, in powder, with the varnish, and a pale red japan may be had by mixing too much white lead with it, as to make it of whatever degree of paleness you please.

Blue japan. 1. Take gum-water what quantity you please, and a sufficient quantity of white lead; grind them well upon a marble; take ising glass size what quantity you please, and the finest and best smalt a sufficient quantity; mix them well together; then add to them of the white lead, ground as before, so much as will give it a sufficient body; mix all together to the consistence of a paint. 2. Do your work over with this mixture three or four times, till you perceive the blue to lie with a good and fair body, letting it dry thoroughly between each time: if your blue is too pale, put more smalt among your size, without any white lead, and so *vice versa*. 3. Then rush it smooth, and go over it again with a stronger blue; and when it is dry, wash it three times with the clearest ising glass size alone, and let it stand for two days to dry, covering it. 4. Warm your work gently at the fire, and with a pencil varnish it over with the finest white varnish, repeating it seven or eight times, letting it stand to dry two days as before. After which repeat again the washes seven or eight times in like manner. 5. Let it now stand for a week, and then polish it as before, and clear it up with lamp black and oil.

Chefnut.

**Chesnut-coloured japan.** Take indian red, grind it with ising-glass size upon a porphyry-stone, till they are as soft and as fine as butter; then mix a little white lead, which grind strongly; and, lastly, lamp-black, in due proportion.

**A tortoise-shell japan.** First lay a white ground, as before directed; then with proper colours, as vermilion, auripigment, &c. duly mixed with turpentine-varnish, streak and cloud or shadow the white ground with any irregular fancy at pleasure, in imitation of tortoise-shell: then let it stand to dry, and striking it here and there with reddish-yellow varnish, mixed with a little cinnabar, cloud the work up and down, touching it up also with varnish mixed with lamp or ivory black. Having done this, varnish it five or six times over with the finest white varnish, letting it dry between every washing.

**Japanning with gold size.** The size being laid over that part only which you intend to gild, as already directed, let it remain there till it is so dry, that when you put your finger on it, it be glutinous and clammy, but not so moist that the particles should come off with your fingers. It is in this temper that the gold is to be applied: then take a piece of washing leather, or the like, and wrapping it round your fore finger, dip it in the gold dust, and rub it where your gold size is laid; for it will stick no where but on the size; and if any gold-dust lies about your work, brush it away with a fine clean varnishing brush. Then, with your pencil, draw that part with gold size also which is designed for your copper, and letting it dry as in the former case, cover it over with copper dust in the same manner. Having done this, lay your silver-size; and when it is dry, as before, lay on your silver-dust, as in the two former. But it is to be observed, that the metalline colours are to be laid successively one after another, letting each be covered and thoroughly dry before you enter upon a distinct colour. After all these, the other colours which are not metalline are to be laid on with gum-water, reserving the rock, &c. for the last part of the work. Let your size be of a due consistence, neither too thick nor too thin, that it may run smooth and clean. See **SIZE**.

**Japanning metals with gum-water.** Take gum water, put it into a mussel-shell; with which mix so much of your metal or colour as may give it a proper consistence, so that it may run fine and smooth: having prepared and well mixed your metals and colours, lay on your design; your gum-water being thoroughly dried, you are to run it over with fine seed-lac varnish, and afterwards polish and clear it.

**Laying speckles or strewings on japan-work.** To do this, either on outside or inside boxes, drawers, &c. mix your speckles with ordinary lac-varnish, so much as may make it fit to work, but not so thick as for colour, and mix them well with a proper brush. Warm the work to be done gently by the fire, and with a pencil wash it over with the former mixture; and when it is dry, repeat it again, and so often till your speckles lie as thick and even as you desire. When it is thoroughly dry, go over and beautify the work three or four times with seed-lac varnish mixed with turpentine, and so let it dry, and the work is finished, except you have a mind to polish it.

But if you polish it, you must wash it eight or ten times over with the best seed-lac varnish, letting it stand to dry every time; and afterwards polish it, as before directed. All sorts of coloured speckles may be thus used, except those of silver; the laying on of which requires the best and finest of the lac-varnish, or the best white varnish, which must make it fit for polishing; but if you have not a mind to polish it, fewer washes of the varnish will be sufficient.

Japanned and laquered ware of the East indies, pay duty for every 100 l. gross value at the sale 38 l. on importation, and the drawback is 35 l. 12s. 6d. on exportation.

**JASMINUM**, in botany, a genus of the diandria monogynia class. The corolla consists of five segments, the berry is trilocular; and the seed is arillated. There are six species, none of them natives of Britain.

**JASPER**, in natural history, a genus of scrupi, of a complex irregular structure, of great variety of colours, and emulating the appearance of the finer marbles, or semipellucid gems.

The great characteristic of jaspers is, that they all readily strike fire with steel, and make not the least effervescence with aquafortis.

Jaspers, though commonly reckoned among the precious stones, ought undoubtedly to be ranged among the scrupi; being only opaque crystalline masses, variously debased with an earthy admixture: and to this last ingredient it is that they owe all their variety of colours, as white, green, red, brown, and bluish.

The several kinds of nephritic stone, and the lapis divinus or jade, are all genuine jaspers; but the hard, bright, green jasper of the East Indies, seems to be the true kind. It is found in masses of various sizes and shapes; but the more usual standard as to size, is between four and six inches in diameter; but there are masses of it found of a foot or more in diameter, and others no larger than a horse bean. It is generally simple and unmixed; but if it be variegated at all, it is always with white; and this is disposed not in streaks or veins, but in clouds. It is capable of a very fine polish; and when the white clouds are well disposed, is very beautiful; and, in pieces not too thick, is tolerably pellucid, when held up against the light.

**JASPONYX**, in natural history, the purest horn-coloured onyx, with beautiful green zones, which are composed of the genuine matter of the finest jaspers. See **JASPER** and **ONYX**.

**JASQUES**, a port-town of Persia, situated on the gulph of Ormus: E. long. 58°, N. lat. 25°.

**JATROPHA**, the **CASSADA PLANT**, in botany, a genus of the monœcia monadelphia class. The male has no calix; the corolla consists of one funnel-shaped petal; and the stamina are ten. The female has no calix; the corolla consists of five petals; the styli are three, and bifid; the capsule has three cells, and contains but one seed. There are seven species, none of them natives of Britain.

**JAVA**, an island of the East Indies, situated between 102° and 113° of E. longitude, and between 5° and 8°

8° of south latitude; being about 700 miles long from east to west, and one hundred broad.

**JAVELIN**, in antiquity, a sort of spear, five feet and an half long; the shaft of which was of wood, with a steel point.

Every soldier, in the Roman armies, had seven of these; which were very light and slender.

**JAUNDICE**, in medicine. See **MEDICINE**.

**JAW**, in anatomy. See **ANATOMY**, p. 159.

**JAWER**, a city of Silesia, capital of the duchy of Jawer, situated in 16° 12' E. long, and 51° 8' N. lat.

**JAZY**, a city of European Turkey, capital of Moldavia, situated on the river Pruth, in E. long. 28° 40', N. lat. 47° 15'.

**IBERIS**, in botany, a genus of the tetradynamia sili-culosa class. The corolla is irregular, the two out-most petals being largest; and the pod is emarginated, and contains many seeds. There are twelve species, only one of which, viz. the medicaulis or rock-creffe, is a native of Britain.

**IBEX**, in zoology. See **CAPRA**.

**IBIS**, in ornithology. See **TANTALUS**.

**ICE**, in physiology, a solid, transparent, and brittle body, formed of some fluid, particularly water, by means of cold. See **FROST** and **FREEZING**.

The younger Lemery observes, that ice is only a re-establishment of the parts of water in their natural state; that the mere absence of fire is sufficient to account for this re-establishment; and that the fluidity of water is a real fusion, like that of metals exposed to the fire; differing only in this, that a greater quantity of fire is necessary to the one than the other. Gallileo was the first that observed ice to be lighter than the water which composed it: and hence it happens, that ice floats upon water, its specific gravity being to that of water as eight to nine. This rarefaction of ice is owing to the air-bubbles produced in the water by freezing; and being considerably large in proportion to the water frozen, render the body so much specifically lighter: and these air-bubbles growing large, acquire a great expansive power, so as to burst the containing vessels, though ever so strong.

**ICE-HOUSE**, a building contrived to preserve ice for the use of a family in the summer-season.

Ice-houses are more generally used in warm countries than with us; particularly in Italy, where the meanest person who rents a house, has his vault or cellar for ice.

As to the situation, it ought to be placed upon a dry spot of ground; because where-ever there is moisture, the ice will melt: therefore in all strong lands which retain the wet, too much pains cannot be taken to make drains all round them. The place should also be elevated, and as much exposed to the sun and air as possible.

As to the figure of the building, that may be according to the fancy of the owner; but a circular form is most proper for the well in which the ice is to be preserved, which should be of a size and depth proportionable to the quantity to be kept; for it is proper to have it large enough to contain ice for two years consumption,

Vol. II. No. 61.

†

1

so that if a mild winter should happen, in which little or no ice is to be had, there may be a stock to supply the want. At the bottom of the well, there should be a space of about two feet deep, left to receive any moisture that may drain from the ice; over this space should be placed a strong wooden grate, and from thence a small drain should be laid under ground, to carry off the wet. The sides of the well should be built with brick or stone, at least two bricks thick; for the thicker it is, the less danger there will be of the well being affected by any external cause. When the well is brought up within three feet of the surface, there should be another outer-arch or wall begun, which should be carried up to the height of the top of the intended arch of the well; and if there be a second arch turned over this wall, it will add to the goodness of the house: the roof must be high enough above the inner arch to admit of a door-way to get out the ice. If the building is to be covered with slates or tiles, reeds should be laid considerably thick under them, to keep out the sun and external air; and if these reeds are laid the thickness of six or eight inches, and plastered over with lime and hair, there will be no danger of the heat getting through them. The external wall may be built in what form the proprietor pleases; and as these ice-houses are placed in gardens, they are sometimes so contrived as to have an handsome alcove-seat in front, with a small door behind it, through which a person might enter to take out the ice; and a large door on the other side, fronting the north, with a porch wide enough for a small cart to back, in order to shoor down the ice near the mouth of the well, which need not be more than two feet diameter, and a stone so contrived as to shut it up in the exactest manner: all the vacant space above and between this and the large door should be filled up with barley-straw. The building thus finished, should have time to dry before the ice is put into it.

It is to be observed, that upon the wooden grate, at the bottom of the well, there should be laid some small faggots; and if upon these a layer of reeds is placed smooth for the ice to lie upon, it will be better than straw, which is commonly used. As to the choice of the ice, the thinner it is, the easier it may be broken to powder; for the smaller it is broken, the better it will unite when put into the well. In putting it in, care must be taken to ram it as close as possible; and also to allow a vacancy of two inches, all round, next the side of the well, to give passage to any moisture occasioned by the melting of some of the ice. When the ice is put into the well, if a little salt-petre be mixed with it at every ten inches or a foot in thickness, it will cause it to unite more closely into a solid mass.

**ICHNEUMON**, in zoology. See **VIVERRA**:

**ICHNEUMON** is also the name of a genus of flies, of the hymenoptera order. It has no tongue; the antennæ have above thirty joints; the abdomen, in most of the species, is petiolated; and it has a sting in the tail inclosed in a double-valved cylindrical sheath. There

8 Z

are

are seventy-seven species, principally distinguished by their colour.

**ICHTNOGRAPHY**, in perspective, the view of any thing cut off by a plain parallel to the horizon, just at the base of it.

Among painters, it signifies a description of images, or of ancient statues of marble and copper, of busts and semi-busts, of paintings in fresco, mosaic works, and ancient pieces of miniature.

**ICHOGLANS**, the grand signior's pages serving in the seraglio.

Those are the children of Christian parents, either taken in war, purchased, or presents from the viceroys and governors of distant provinces: they are the most sprightly, beautiful and well-made that can be met with; and are always reviewed and approved of by the grand signior himself, before they are admitted into the seraglios of Pera, Constantinople, or Adrianople, being the three colleges where they are educated, or fitted for employments, according to the opinion the court entertains of them.

**ICHOR**, properly signifies a thin watery humour, like serum: but is sometimes also used for a thicker kind, flowing from ulcers, called also sanies.

**ICHTHYOCOLLA**, **ISINGLASS**, a preparation from the fish known by the name of huso. See **ACCIPENSER**.

This is a tough and firm substance, of a whitish colour, and in some degree transparent; it is light, moderately hard, very flexible, and of scarce any smell, and very little taste. We usually receive it in twisted pieces of an oblong and rounded figure, and bent in the shape of a horse-shoe: this our druggists usually beat and pull to pieces, and sell it in thin shreds like skins, which easily dissolve: besides this kind of round isinglass, we meet with some in small thin square cakes, white and very transparent; these are the finest of all. But isinglass, of whatever shape, is to be chosen clean, whitish, and pellucid.

The method of preparing the ichthyocolla is this: they cut off all the fins of the huso, close to the flesh, and take out the bladder, stomach, and intestines; they wash these very clean, and then cut them in pieces, and throwing them into a large quantity of water, they let them steep four and twenty hours, and after this they kindle a fire under the vessel, and keep the liquor just boiling till the greater part of the matters are dissolved; they then stir the whole briskly about; then strain it through flannels, and set the liquor by to cool. When there is a large quantity of fat usually formed upon it, which is carefully skimmed off, and the clear liquor is poured off from the grosser parts which subside, it is put over the fire again, and gently evaporated and skimmed afresh all the time, till by trials they find, that on letting a spoonful of it cool it will harden into the consistence of glue. Great care is taken to keep the fire very gentle, to prevent burning towards the end of this evaporation. They then pour it out upon a large, smooth, wooden table; and as it cools, form it into the masses we meet with it in, by cutting and rolling it up.

The greatest quantity of isinglass is made in Russia. We have it principally from Holland, the Dutch contracting for the most of it before it is made.

It is an excellent agglutinant and strengthener; and is often prescribed in jellies and broth, but rarely enters any compositions of the regular medicinal form. It is the most efficacious as well as the most safe and innocent of all the ingredients used for cleaning wines, upon which account the wine-coopers use a much greater quantity of it than the apothecaries.

A very valuable glue is also made of this drug, which is a proper form to keep it for the wine-coopers use.

**ICHTHYOLOGY**, the science of fishes, or that branch of zoology which treats of fishes. See **NATURAL HISTORY**.

**ICHTHYPERIA**, in natural history, a name given by Dr Hill to the bony palates and mouths of fishes, usually met with either fossil, in single pieces, or in fragments. They are of the same substance with the bufontæ; and are of very various figures, some broad and short, others longer and slender; some very gibbose, and others plainly arched. They are likewise of various sizes, from the tenth of an inch to two inches in length, and an inch in breadth.

**ICOSAHEDRON**, in geometry, a regular solid, consisting of twenty triangular pyramids, whose vertexes meet in the centre of a sphere, supposed to circumscribe it; and therefore, have their height and bases equal. wherefore the solidity of one of those pyramids multiplied by 20, the number of bases, gives the solid content of the icosahedron.

**ICOSANDRIA**, in the Linnæan system of botany. See **BOTANY**, p. 635.

**IDA**, a mountain in the island of Candia or Crete; also another in Natolia, or lesser Asia, celebrated by the poets for the judgment of Paris on the beauty of the three goddesses, Minerva, Juno, and Venus, to the last of whom he gave the preference.

**IDEA**, the reflex perception of objects, after the original perception or impression has been felt by the mind. See **METAPHYSICS**.

**IDENTITY**, denotes that by which a thing is itself, and not any thing else; in which sense, identity differs from similitude as well as diversity. See **METAPHYSICS**.

**IDES**, in the ancient Roman calendar, were eight days in each month; the first of which fell on the 15th of March, May, July, and October; and on the 13th day of the other months.

They were reckoned backwards, in the manner already explained under the article **CALENDOS**.

Thus they called the 14th day of March, May, July, and October; and the 12th of the other months, the *pridie idus*, or the day before the ides; the next preceding day, they called the *tertio idus*; and so on, reckoning always backwards, till they come to the nones. See **NONES**. This method of reckoning time is still retained in the chancery of Rome, and in the calendar of the breviary.

**IDIOM**, among grammarians, properly signifies the peculiar

cular genius of each language, but it is often used in a synonymous sense with dialect.

**IDIOPATHY**, in physic, a disorder peculiar to a certain part of the body, and not arising from any preceding disease; in which sense, it is opposed to sympathetic. Thus, an epilepsy is idiopathic, when it happens merely through some fault in the brain; and sympathetic, when it is the consequence of some other disorder.

**IDIOSYNCRASY**; among physicians, denotes a peculiar temperament of body, whereby it is rendered more liable to certain disorders than persons of a different constitution usually are.

**IDIOT**, a person that is born a natural fool.

**IDOLATRY**, or the worship of idols, may be distinguished into two sorts. By the first, men adore the works of God, the sun, the moon, the stars, angels, dæmons, men and animals: by the second, men worship the work of their own hands, as statues, pictures, and the like: and to these may be added a third, that by which men have worshipped the true God under sensible figures and representations. This indeed may have been the case with respect to each of the above kinds of idolatry; and thus the Israelites adored God under the figure of a calf.

The stars were the first objects of idolatrous worship; and on account of their beauty, their influence on the productions of the earth, and the regularity of their motions, particularly the sun and moon, which are considered as the most glorious and resplendent images of the Deity: afterwards, as their sentiments became more corrupted, they began to form images, and to entertain the opinion, that by virtue of consecration, the gods were called down to inhabit or dwell in their statues. Hence Arnobius takes occasion to rally the pagans for guarding so carefully the statues of their gods, who, if they were really present in their images, might save their worshippers the trouble of securing them from thieves and robbers.

As to the adoration which the ancient pagans paid to the statues of their gods, it is certain, that the wiser and more sensible heathens considered them only as simple representations or figures designed to recal to their minds the memory of their gods. This was the opinion of Varro and Seneca: and the same sentiment is clearly laid down in Plato, who maintains, that images are inanimate, and that all the honour paid to them has respect to the gods whom they represent. But as to the vulgar, they were stupid enough to believe the statues themselves to be gods, and to pay divine worship to stocks and stones.

Soon after the flood, idolatry seems to have been the prevailing religion of all the world; for where-ever we cast our eyes at the time of Abraham, we scarcely see any thing but false worship and idolatry. And it appears from scripture, that Abraham's forefathers, and even Abraham himself, were for a time idolaters.

The Hebrews were indeed expressly forbidden to make any representation of God; they were not so much as to look upon an idol: and from the time of the Maccabees to the destruction of Jerusalem, the Jews extended this precept to the making the figure

of any man: by the law of Moses, they were obliged to destroy all the images they found, and were forbidden to apply any of the gold or silver to their own use, that no one might receive the least profit from any thing belonging to an idol. Of this the Jews, after they had smarted for their idolatry, were so sensible, that they thought it unlawful to use any vessel that had been employed in sacrificing to a false god, to warm themselves with the wood of a grove, after it was cut down, or to shelter themselves under its shade.

But the preaching of the Christian religion, wherever it prevailed, entirely rooted out idolatry; as did also that of Mahomet, which is built on the worship of one God. It must not, however, be forgotten, that the protestant Christians charge those of the church of Rome with paying an idolatrous kind of worship to the pictures or images of saints and martyrs: before these, they burn lamps and wax-candles; before these, they burn incense, and kneeling offer up their vows and petitions: they, like the pagans, believe that the saint to whom the image is dedicated, presides in a particular manner about its shrine, and works miracles by the intervention of its image; and that if the image was destroyed or taken away, the saint would no longer perform any miracle in that place.

**IDYLLION**, in ancient poetry, is only a diminutive of the word [*eidōs*,] and properly signifies any poem of moderate extent, without considering the subject. But as the collection of Theocritus's poems were called idyllia, and the pastoral pieces being by far the best in that collection, the term idyllion seems to be now appropriated to pastoral pieces.

**JEALOUSY**, in general, denotes the fear of a rival; but is more especially understood of the suspicion which married people entertain of each other's fidelity and affection.

**JEDBURGH**, the capital of Tiviotdale or Roxburgh, in Scotland, thirty-six miles south-east of Edinburgh: W. long. 2° 15', N. lat. 55° 25'.

**JEDDO**, the capital city of Japan Proper, situated on the east side of the island: E. long. 141° N. lat. 36°.

The splendor of the royal palace and public buildings of this city, in the opinion of those Europeans who have seen it, is no where to be equalled. The emperor's palace and gardens, which are in the middle of the city, are five miles in circumference. All the houses are built upon one floor, and the rooms are only divided by folding screens.

**JEER**, or **JEER-ROPE**, in a ship, is a large rop reeved through double or treble blocks, lashed at the mast-head and on the yard, in order to hoist or lower the yards.

**JEHOVAH**, one of the scripture names of God, signifying the Being who is self-existent and gives existence to others.

So great a veneration had the Jews for this name, that they left off the custom of pronouncing it, whereby its true pronunciation was forgotten. They call it tetragrammaton, or the name with four letters; and believe, that whoever knows the true pronunciation of it cannot fail to be heard by God.

JEJU-

**JEJUNUM**; in anatomy. See **ANATOMY**, p. 260.  
**JEMPTERLAND**, a province of Sweden, bounded by Angermania on the north, by Medelpadia on the east, by Helsingia on the south, and by Norway on the west.

**JENA**, a city of Germany, in the circle of Upper Saxony, and the landgraviate of Thuringia: E. lon.  $11^{\circ} 44'$ , N. lat.  $51^{\circ}$ .

**JENKOPING**, a city of Sweden, in the province of Gothland, situated ninety miles south-east of Gottenburg: E. long.  $14^{\circ} 30'$ , N.  $57^{\circ} 30'$ .

**JEREMIAH**, *The prophecy of*, a canonical book of the Old Testament. This divine writer was of the race of the priests, the son of Hilkiah of Anathoth, in the tribe of Benjamin. He was called to the prophetic office when very young, about the thirteenth of Josiah, and continued in the discharge of it about forty years. He was not carried captive to Babylon with the other Jews, but remained in Judea to lament the desolation of his country. He was afterwards a prisoner in Egypt with his disciple Baruch, where it is supposed he died in a very advanced age. Some of the Christian fathers tell us, he was stoned to death by the Jews, for preaching against their idolatry; and some say, he was put to death by Pharaoh Hophra, because of his prophecy against him. Part of the prophecy of Jeremiah relates to the time after the captivity of Israel, and before that of Judah, from the first chapter to the forty-fourth; and part of it was in the time of the latter captivity, from the forty-fourth chapter to the end. The prophet lays open the sins of Judah with great freedom and boldness, and reminds them of the severe judgments, which had befallen the ten tribes for the same offences. He passionately laments their misfortune, and recommends a speedy reformation to them. Afterwards he predicts the grievous calamities that were approaching, particularly the seventy years captivity in Chaldaea. He likewise foretells their deliverance and happy return, and the recompence which Babylon, Moab, and other enemies of the Jews should meet with in due time. There are likewise several intimations in this prophecy concerning the kingdom of the Messiah; also several remarkable visions, and types, and historical passages relating to those times. The fifty-second chapter does not belong to the prophecy of Jeremiah, which probably was added by Ezra, and contains a narrative of the taking of Jerusalem, and of what happened during the captivity of the Jews, to the death of Jechonias. St. Jerom has observed upon this prophet, that his style is more easy than that of Isaiah and Hosea; that he retains something of the rusticity of the village where he was born; but that he is very learned and majestic, and equal to those two prophets in the sense of his prophecy.

**JERSEY**, an island in the English channel, fifteen miles west of the coast of Normandy, and eighty miles south of Portland in Dorsetshire: W. long.  $2^{\circ} 20'$ , N. lat.  $49^{\circ} 20'$ .

**New Jersey**, a province in North America, which may be bounded on the north by a line drawn from

the river Delaware to Hudson's river, which divides it from New-York; by the Atlantic Ocean, on the east; by the same ocean on the south; and by Delaware bay and river, which separates it from Pennsylvania, on the west. It lies between  $74^{\circ}$  and  $76^{\circ}$  of W. long. and between  $39^{\circ}$  and  $41^{\circ}$  of N. lat. and is about 140 miles in length, and 60 in breadth. It is subject to Britain.

**JERUSALEM**, the capital city of Judea, or Palestine, in Asiatic Turkey, situated thirty miles east of the Levant, or Mediterranean sea, and ninety miles south of Damascus: E. long.  $36^{\circ}$ , N. lat.  $32^{\circ}$ .

It stands on a high rock, with steep ascents on every side, except on the north; and is surrounded with a deep valley, which is again encompassed with hills. The city is at present three miles in circumference, and has a little altered its situation: for mount Calvary, which was formerly without the walls, stands now in the middle of the city; and mount Sion, which stood near the centre, is now without the walls.

**JESI**, a city of Italy, in the province of Ancona, and territory of the pope: E. long.  $14^{\circ} 40'$ , N. lat.  $43^{\circ} 45'$ .

**JESSELMERE**, the capital of the province of the same name in the East Indies, subject to the Mogul: E. long.  $73^{\circ} 20'$ , N. lat.  $27^{\circ}$ .

**JESSO**, or **YEDSO**, a country of Asia, which lies north of Japan, and is said to extend north-east to the continent of America: E. long.  $140^{\circ}$ , N. lat.  $40^{\circ}$ .

**JESUAT**, a province of India, bounded by Patan on the north, and by Bengal on the south; subject to the Mogul.

**JESUITES**, or the society of Jesus, a famous religious order in the Romish church, founded by Ignatius Loyola, a native of Guipuscoa in Spain, who in the year 1538 assembled ten of his companions at Rome, principally chosen out of the university of Paris, and made a proposal to them to form a new order; when, after many deliberations, it was agreed to add to the three ordinary vows of chastity, poverty, and obedience, a fourth; which was, to go into all countries whither the pope should please to send them, in order to make converts to the Romish church. Two years after, pope Paul III. gave them a bull, by which he approved this new order, giving them a power to make such statutes as they should judge convenient: on which, Ignatius was created general of the order; which in a short time spread over all the countries of the world, to which Ignatius sent his companions, while he staid at Rome, from whence he governed the whole society.

The entire society is composed of four sorts of members; novices, scholars, spiritual and temporal coadjutors, and professed members. The novices continue so two years; after which they are admitted to make the three simple vows, of chastity, poverty, and obedience, in the presence of their superiors: the scholars add some spiritual exercises to their studies. The spiritual coadjutors assist the professed members, and also make the three simple vows: the temporal coadjutors,

or

or lay-brothers, take care of the temporal affairs of the society; and the professed members, which compose the body of the society, besides the three simple vows, add a special vow of obedience to the head of the church in every thing relating to missions among idolaters and heretics. They have professed houses for their professed members and their coadjutors; colleges, in which the sciences are taught to strangers; and seminaries, in which the young Jesuits go through a course of philosophy and theology. They are governed by a general, who has four assistants, and who appoints rectors, superiors of houses, provincials, visitors, and commissaries. The discipline of these houses, and especially of the colleges, was regulated by Ignatius himself. On account of the gross doctrines and bad practices of the Jesuits, the order, within these few years, has been suppressed in most Roman-catholic countries; the members banished, and their goods confiscated.

**JET**, in natural history, a solid, dry, opaque, inflammable substance, found in large detached masses, of a fine and regular structure, having a grain like that of wood, splitting more easily horizontally than in any other direction, very light, moderately hard, not fusible, but readily inflammable, and burning a long time with a fine greenish flame.

It is of a fine deep black colour, very glossy and shining, except upon its surface, where it has been fouled by accident. When examined by the microscope, it is found to be composed of a number of parallel plates, very thin, and laid closely upon one another. It is not soluble in, nor makes any effervescence with acids. It should be chosen of the deepest black, of a moderate hardness, very light, and such as will split most evenly in an horizontal direction; this being its great characteristic, by which it is distinguished from the cannel coal, which breaks equally easy any way.

Jet is of great use to perfumers, and is sometimes prescribed in medicine. Dioscorides tells us, that it is an excellent emollient and discutient, and recommends a fumigation of it for diseases of the womb; and among the eastern nations, it is still in high repute as a cordial, a strengthener, and prolonger of life.

Every pound of jet pays on importation a duty of 7 $\frac{1}{2}$ d. and draws back 6 $\frac{1}{2}$ d. on exportation.

**JET D'EAU**, a French term, frequently also used with us, for a fountain that casts up water to a considerable height in the air.

**JEWEL**, any precious stone, or ornament beset with them. See the articles **DIAMOND**, **RUBY**, &c.

**JEWS**, those who profess obedience to the laws and religion of Moses.

When a modern Jew builds an house, he must leave part of it unfurnished, in remembrance that the temple and Jerusalem now lie desolate. They lay great stress upon frequent washings. They abstain from meats prohibited by the Levitical law; for which reason, whatever they eat must be dressed by Jews, and after a manner peculiar to themselves. Every Jew is obli-

VOL. II. No. 61.

1

ged to marry, and a man who lives to twenty unmarried, is accounted as actually living in sin.

The Jews, it is said, were formerly at the disposal of the chief lord where they lived, and likewise all their goods. A Jew may be a witness by our law, being sworn on the Old Testament, and taking the oaths to the government.

For a farther account of the Jew, see the articles **CARAITES**, **CIRCUMCISION**, **LEVITES**, **PASSOVER**, **PHARISEES**, **RABBINS**, **SADDUCEES**, **SANHEDRIM**, **SYNAGOGUE**, **TALMUD**, &c.

**JEW'S EARS**, in botany, See **TRENELLA**.

**IGLAW**, a town of Germany, in the province of Moravia, situated on the river Igla, on the frontiers of Bohemia; subject to the house of Austria: E. long. 35° 7', N. lat. 49° 16'.

**IGNAVUS**, in zoology. See **BRADYPUS**.

**IGNIS**. See **FIRE**.

**IGNIS-FATUUS**. See **WILL-with-a-wisp**.

**IGNITION**, in chemistry, the heating metals red-hot, without melting them.

**IGNORANCE**, the privation or absence of knowledge.

The causes of ignorance, according to Locke, are chiefly these three. 1. Want of ideas. 2. Want of a discoverable connection between the ideas we have. 3. Want of tracing and examining our ideas. See **METAPHYSICS**.

**IGUANA**, in zoology. See **LACERTA**.

**IHOR**, the capital of the province of Ihor, in Malacca, near the south cape of the further peninsula of India, subject to the Dutch: E. lon. 103°, N. lat. 3°.

**ILCHESTER**, a borough-town of Somersetshire, fourteen miles south of Wells. It sends two members to parliament.

**ILEX**, the **HOLM-OAK**, or **EVER-GREEN OAK**, in botany, a genus of the tetrandria-tetragynia class. The calix has four teeth; the corolla is rotated; it has no stylus; and the berry contains four seeds. There are five species, none of them natives of Britain. The kermes of the shops adheres and is gathered off the branches of the *ilex aquifolium*. The kermes is a round grain about the bulk of a pea. These grains appear full of small reddish ovula, or animalcules, of which they are the nidus. The kermes is a grateful mild refringent and corroborant.

**ILHEOS**, or **RIO DE ILHEOS**, a province of Brazil in south America, subject to Portugal. It is bounded by the bay of All-saints on the north, and by the Atlantic ocean on the east.

**ILIAC PASSION**, in medicine. See **MEDICINE**.

**ILIACUS MUSCULUS**, in anatomy. See **ANATOMY**, p. 204.

**ILIAD**, the name of an ancient epic poem, the first and finest of those composed by Homer.

The poet's design in the *iliad* was to shew the Greeks, who were divided into several little states, how much it was their interest to preserve a harmony and good understanding among themselves: for which end, he sets before them the calamities that befel their ancestors from the wrath of Achilles, and his misunder-

9 A

†

standing

standing with Agamemnon; and the advantages that afterwards accrued to them from their union. The Iliad is divided into twenty-four books, or rhapsodies, which are marked with the letters of the alphabet.

**ILIUM**, in anatomy. See *ANAT.* p. 260.

**ILLENOIS**, the inhabitants of a country contiguous to the illenois-lake, in Canada, in north-America, which is situated between  $88^{\circ}$  and  $93^{\circ}$  of W. lon. and between  $41^{\circ}$  and  $46^{\circ}$  of N. lat.

**ILLER**, a river of Germany, which rising in the mountains of Tyrol, runs north through Swabia, and falls into the Danube at Ulm.

**ILMEN**, a lake in the province of Great Novogrod, in Russia, in  $34^{\circ}$  E. lon. and  $58^{\circ}$  N. lat.

**ILMINSTER**, a market-town of Somersetshire, twenty-four miles south-west of Wells.

**IMAGE**, in a religious sense, is an artificial representation or similitude of some person or thing, used either by way of decoration and ornament, or as an object of religious worship and veneration; in which last sense, it is used indifferently with the word idol.

**IMAGINATION**, a power or faculty of the mind, whereby it conceives and forms ideas of things communicated to it by the outward organs of sense. See *METAPHYSICS*.

**IMAN**, a name applied by the Mahometans to him who is head of the congregations in their mosques; and, by way of eminence, to him who has the supreme authority both in respect to spirituals and temporals.

**IMBECILLITY**, a languid, infirm state of body; which, being greatly impaired, is not able to perform its usual exercises and functions.

**IMBIBING**, the action of a dry porous body, that absorbs or takes up a moist or fluid one: thus, sugar imbibes water; a sponge, the moisture of the air, &c.

**IMBRICATED**, among botanists. See *BOTANY*, p. 641.

**IMENSTAT**, a town of Germany, in the circle of Swabia; situated in E. lon.  $10^{\circ} 8'$  N. lat.  $47^{\circ} 26'$ .

**IMITATION**, the acts of doing or striving to copy after, or become like to, another person or thing.

Du Bos observes, that the principal merit of poems and pictures consists in the imitation of such objects as would have excited real passions; and that the passions which these imitations give rise to, are only superficial, and not so strong as that of the object imitated, and are therefore soon effaced. He also maintains, that the imitation of tragic objects in poems and pictures, afford most pleasure: we listen, therefore, with pleasure to those unhappy men who make a recital of their misfortunes by means of a painter's pencil, or of a poet's verses; but, as Diogenes Laertius observes, it would afflict us extremely, were we to hear them bewailing their sad disasters in person.

**IMMACULATE**, something without stain, chiefly applied to the conception of the holy virgin.

**IMMATERIAL**, something devoid of matter, or that is pure spirit: thus God, angels, and the human soul, are immaterial beings.

**IMMEDIATE**, whatever is capable of producing an ef-

fect without the intervention of external means; thus we say, an immediate cause, in opposition to a mediate or remote one.

**IMMENSITY**, an unlimited extension, or which no finite and determinate space, repeated ever so often, can equal.

**IMMERSION**, that act by which any thing is plunged into water or other fluid.

It is used in chemistry for a species of calcination, when any body is immersed in a fluid to be corroded; or it is a species of lotion, as when a substance is plunged into any fluid in order to deprive it of a bad quality, or communicate to it a good one.

**IMMERSION**, in astronomy, is when a star or planet is so near the sun with regard to our observations, that we cannot see it; being, as it were, enveloped and hid in the rays of that luminary. It also denotes the beginning of an eclipse of the moon, or that moment when the moon begins to be darkened, and to enter into the shadow of the earth.

**IMMORTAL**, that which will last to all eternity, as having in it no principle of alteration or corruption: thus God and the human soul are immortal.

**IMMUNITY**, a privilege or exemption from some office, duty, or imposition, as an exemption from tolls, &c.

Immunity is more particularly understood of the liberties granted to cities and communities.

**IMPALED**, in heraldry; when the coats of a man and his wife who is not an heiress are borne in the same escutcheon, they must be marshalled in pale; the husband's on the right side, and the wife's on the left: and this the heralds call baron and feme, two coats impaled.

If a man has had two wives, he may impale his coat in the middle between theirs; and if he has had more than two, they are to be marshalled on each side of his in their proper order.

**IMPALPABLE**, that whose parts are so extremely minute that they cannot be distinguished by the senses, particularly by that of feeling.

**IMPANATION**, a term used by divines, to signify the opinion of the Lutherans with regard to the eucharist, who believe that the species of bread and wine remain together with the body of our Saviour after consecration.

**IMPANNELLING**, in law, signifies the writing down or entering into a parchment, list or schedule, the names of a jury summoned by the sheriff to appear for such public services as juries are employed in.

**IMPARLANCE**, in law, a petition in court for a day to consider or advise what answer the defendant shall make to the plaintiff's action; and is the continuance of the cause till another day, or a longer time given by the court.

**IMPASTATION**, the mixture of various materials of different colours and consistencies, baked or bound together with some cement, and hardened either by the air or by fire.

**IMPATIENS**, in botany, a genus of the syngenesia monogynia class. The calix consists of two leaves, and the

the corolla of five irregular petals; and the capsule has five valves. There are seven species, only one of which, *viz.* the noli-me-tangere, or touch-me-not, is a native of Britain.

**IMPEACHMENT**, an accusation and prosecution for treason and other crimes and misdemeanors.

**IMPENETRABILITY**, in philosophy, that property of body, whereby it cannot be pierced by another: thus, a body, which so fills a space as to exclude all others, is said to be impenetrable.

**IMPERATIVE**, one of the moods of a verb, used when we would command, intreat, or advise: thus, *go, read, take pity, be advised*, are imperatives in our language.

**IMPERATOR**, in Roman antiquity, a title of honour conferred on victorious generals, by their armies, and afterwards confirmed by the senate.

**IMPERATORIA**, **MASTER-WORT**, in botany, a genus of the pentandria digynia class. The fruit is roundish, compressed, and gibbous in the middle. There is but one species, a native of Switzerland. The root of this plant, though an excellent aromatic, has only place in the plague water of the Edinburgh pharmacopœia.

**IMPERFECT**, something that is defective, or that wants some of the properties found in other beings of the same kind.

**IMPERIAL**, something belonging to an emperor or empire, as imperial crown, imperial chamber, imperial cities, imperial diet, &c.

**IMPERSONAL VERB**, in grammar, a verb to which the nominative of any certain person cannot be prefixed; or, as others define it, a verb destitute of the two first and primary persons, as *deceit, oportet*, &c.

**IMPERVIOUS**, a thing not to be pervaded nor passed thro', either by reason of the closeness of its pores, or the particular configuration of its parts.

**IMPETUS**, in mechanics, the force with which one body impels or strikes another. See **MECHANICS**.

**IMPLICATION**, in law, is where something is implied, that is not expressed by the parties themselves in their deeds, contracts, and agreements.

**IMPORTATION**, in commerce, the bringing merchandise into a kingdom from foreign countries; in contradistinction to exportation. See **EXPORTATION**.

We shall here give some of the principal laws relating to the importation of goods into this kingdom. Goods imported without entry, or paying customs, are forfeited; and the lord-treasurer, the barons of the exchequer, or chief magistrates of the place where the offence was committed, or next adjoining to it, may grant a warrant to any person, who, with the assistance of a constable, may break open doors, chests, &c. and take thence any prohibited or unaccustomed goods; but this is to be done within one month after the offence was committed. But if false information is given, the person wrongfully accused, may recover costs and damages.

No ship or vessel arriving from beyond sea is to be above three days in sailing from Gravesend to the place of discharge on the river Thames, unless hindered by contrary winds or other impediment. And no ship bound

for the port of London is to touch or stay at any place adjoining to any shore, between Gravesend and Cheltenham. True entries are to be made of all such ships lading, upon oath of the master or purser for that voyage; also where she took in her lading, where she was built, how manned, who were the owners, and who the master during the voyage. In all out-ports, ships are to come directly to the place of unloading, and make true entries as aforesaid, upon penalty of the forfeiture of 100 l.

After any ship is cleared, and the watchmen and tidemen discharged from their attendance, if there be found on board any concealed goods that have not paid the duty inwards, the master, or other person taking charge of the ship, shall forfeit 100 l.

Porters, carmen, watermen, &c. assisting in landing unaccustomed goods, shall, on conviction, for the first offence, be committed to the next jail till they find security for their good behaviour; and for their second offence, they are to be committed to prison for two months, without bail or mainprize, or till they are discharged by the court of exchequer, or each of them pay 5 l. to the sheriff of the county.

No merchant-denizen shall cover a stranger's goods, but shall, by himself or agent, sign one of his bills of every entry, with the mark, number, and contents of every parcel of goods, without which no entry shall pass. And no children of aliens under the age of twenty one years, shall have entry made in their names, nor be permitted to trade.

Merchants, trading into the port of London, shall have free liberty to lade and unlade their goods at any of the lawful quays between the Tower and London-bridge, from sun-rising to sun-setting, from September 10, to March 10; and between six o'clock in the morning and six in the evening, from March 10, to September 10; giving notice thereof to the respective officers, appointed to attend the lading and unlading of goods. \* And such officers as shall refuse to be present shall forfeit 5 l. for every default.

To prevent combination between importers, and seizers of goods unlawfully imported or exported, none shall seize them but the officers of the customs, or such as shall be authorized so to do by the lord treasurer, undertreasurer, or a special commission from his majesty, under the great privy seal.

If any seizer of prohibited or unaccustomed goods does not make due prosecution thereof, it is lawful for the custom-house officers, or others deputed thereto, to make seizure of such goods, and they shall be, in law, adjudged the first true informers and seizers, and have the benefit thereof, notwithstanding any law and statute to the contrary.

All foreign goods permitted to be landed by bills at sight, bills at view or suffrance, shall be landed at the most convenient quays and wharfs, as the officers of the customs shall direct; and there, or at the king's storehouse of the respective ports, shall be measured, weighed, numbered, &c. by the officers appointed, who shall perfect the entry, and subscribe their names to it, and the next day make their report to the customhouse, collector, or

or comptroller; or in default thereof, shall forfeit 100 l.

Any merchant who shall import goods, shall have liberty to break bulk in any lawful port or quay, the master or purser first making oath of the true contents of the ship's lading. No English merchant shall put on shore in Scotland or Ireland, any merchandize of the growth or produce of any of his majesty's plantations, unless the same have been first landed in England, Wales, or Berwick, and paid the duties with which they are chargeable, under the penalty of forfeiting the ship and goods, three fourths to the king, and one fourth to the informer, or he that shall sue for the same: but if a ship be disabled, or driven into any port of Ireland, and unable to proceed on her voyage, her goods may be put on shore, under the hands of the principal officers of the customs there residing, till the goods can be put on board some other vessel, to be transported to some part of England or Wales.

Natives of England or Ireland may import into England, directly from Ireland, any hemp, flax, thread, yarn and linen, of the growth and manufacture of Ireland, custom-free; the chief officer so importing bringing a certificate from the chief office in Ireland, expressing the particulars of the goods, with the names and places of abode of the exporters thence, and of such as have sworn that the said goods are, bona fide, of the growth and manufacture of that kingdom, and who they are consigned to in England; and the chief officer shall make oath, that the said goods are the same that are on board, by virtue of that certificate.

**IMPOST**, in law, signifies in general a tribute or custom, but is more particularly applied to signify that tax which the crown receives for merchandizes imported into any port or haven.

**IMPOSTS**, in architecture, the capitals of pillars, or pilasters, which support arches.

**IMPOSTHUME**, in surgery, &c. See **ABSCESS**.

**IMPOTENCE**, or **IMPOTENCY**, in general, denotes want of strength, power, or means to perform any thing.

Divines and philosophers distinguish two sorts of impotency; natural, and moral. The first is a want of some physical principle, necessary to an action; or where a being is absolutely defective, or not free and at liberty to act: the second only imports a great difficulty, as a strong habit to the contrary, a violent passion, or the like.

Impotency is, more particularly, used for a natural inability to coition. Impotence with respect to men, is the same as sterility in women; that is, an inability of propagating the species. There are many causes of impotence; as, a natural defect in the organs of generation, which seldom admits of a cure: accidents, or diseases; and in such cases the impotence may, or may not be remedied, according as these are curable or otherwise.

**IMPREGNATION**, the getting a female with-child. See **PREGNANCY**.

The term impregnation is also used, in pharmacy; for communicating the virtues of one medicine to ano-

ther, whether by mixture, coction, digestion, &c.

**IMPRESSION** is applied to the species of objects, which are supposed to make some mark or impression on the senses, the mind, and the memory.

The peripatetics assert, that bodies emit species resembling them, which are conveyed to the common sensorium, and they are rendered intelligible by the active intellect; and when thus spiritualized, are called expressions, or express species, as being expressed from the others.

**IMPRESSION** also denotes the edition of a book, regarding the mechanical part only; whereas edition, besides this, takes in the care of the editor, who corrected or augmented the copy, adding notes, &c. to render the work more useful.

**IMPROBATION**, in Scots law, the name of that action brought for setting any deed or writing aside upon the head of forgery. See **LAW**, tit. 33.

**IMPROPRIATION**, a parsonage or ecclesiastical living, the profits of which are in the hands of a layman; in which sense, it stands distinguished from appropriation, which is where the profits of a benefice are in the hands of a bishop, college, &c. though these terms are now often used promiscuously.

**IMPULSE**, in mechanics. See **MECHANICS**.

**IMPURITY**, in the law of Moses, is any legal defilement. Of these there were several sorts; some were voluntary, as the touching a dead body, or any animal that died of itself, or any creature that was esteemed unclean; or the touching things holy, by one who was not clean, or was not a priest; the touching one who had a leprosy, one who had a gonorrhœa, or who was polluted by a dead carcase, &c. Sometimes these impurities were involuntary, as when any one inadvertently touched bones, or a sepulchre, or any thing polluted; or fell into such diseases as pollute, as the leprosy, &c.

**IMPUTATION**, in general, the charging something to the account of one, which belonged to another: thus, the assertors of original sin maintain, that Adam's sin is imputed to all his posterity.

In the same sense, the righteousness and merits of Christ are imputed to true believers.

**INACCESSIBLE**, something that cannot be come at, or approached, by reason of intervening obstacles, as a river, rock, &c. It is chiefly used in speaking of heights and distances. See **GEOMETRY**.

**INALIENABLE**, that which cannot be legally alienated or made over to another: thus the dominions of the king, the revenues of the church, the estates of a minor, &c. are inalienable, otherwise than with a reserve of the right of redemption.

**INANIMATE**, a body that has either lost its soul, or that is not of a nature capable of having any.

**INANITION**, among physicians, denotes the state of the stomach when empty, in opposition to repletion.

**INARCHING**, in gardening, is a method of grafting, commonly called grafting by approach, and is used when the stock intended to graft on, and the tree from which the graft is to be taken, stand so near, or can

can be brought so near, that they may be joined together.

**INAUGURATION**, the coronation of an emperor or king, or the consecration of a prelate: so called from the ceremonies used by the Romans, when they were received into the college of augurs.

**INCA**, or **YUCA**, a name given by the natives of Peru to their kings and the princes of the blood. Pedro de Cieça, in his Chronicle of Peru, gives the origin of the incas, and says, that that country was, for a long time, the theatre of all manner of crimes, of war, dissention, and the most dreadful disorders, till at last two brothers appeared, one of whom was called Mangocapa; of this person, the Peruvians relate many wonderful stories. He built the city of Cusco, made laws, established order and harmony by his wise regulations; and he and his descendants took the name of inca, which signifies king or great lord. These incas became so powerful, that they rendered themselves masters of all the country from Pasco to Chili, and from the river Maule on the south, to the river Augasmago on the north; these two rivers forming the bounds of their empire, which extended above thirteen hundred leagues in length. This they enjoyed till the divisions between inca Guascar and Atabalipa; which the Spaniards laying hold of, made themselves masters of the country, and destroyed the empire of the incas.

**INCAMERATION**, a term used in the chancery of Rome, for the uniting of lands, revenues, or other rights, to the pope's domain.

**INCANTATION**, denotes certain ceremonies, accompanied with a formula of words, and supposed to be capable of raising devils, spirits, &c. See **CHARM**, &c.

**INCAPACITY**, in the canon-law, is of two kinds: 1. The want of a dispensation for age in a minor, for legitimation in a bastard, and the like: this renders the provision of a benefice void in its original. 2. Crimes and heinous offences, which annul provisions at first valid.

**INCARNATION**, in theology, the act whereby the second person of the holy Trinity assumed the human nature, viz. a true body and reasonable soul, in order to accomplish the redemption of fallen mankind.

**INCARNATIVES**, in surgery, medicines which assist nature in filling up wounds or ulcers with flesh; or rather remove the obstructions thereto.

**INCENSE**, or **FRANK-INCENSE**, in the materia medica, &c. a dry resinous substance, known among authors by the names thus and olibanum.

Incense is a rich perfume, with which the ancient pagans, and the Roman Catholics still, perfume their temples, altars, &c.

The burning of incense made part of the daily service of the ancient Jewish church. The priests drew lots to know who should offer it; the destined person took a large silver dish, in which was a censer full of incense; and being accompanied by another priest, carrying some live coals from the altar, went into the temple. There, in order to give notice to the people, they struck upon an instrument of brass placed between

VOL. II. No. 61.

1

the temple and the altar; and being returned to the altar, he who brought the fire left it there, and went away. Then the offerer of incense having said a prayer or two, waited the signal, which was the burning of the holocaust; immediately upon which he set fire to the incense, the whole multitude continuing all the time in prayer. The quantity of incense offered each day, was half a pound in the morning, and as much at night.

One reason of this continual burning of incense might be, that the multitude of victims that were continually offered up, would have made the temple smell like a slaughter-house, and consequently have inspired the comers rather with disgust and aversion, than awe and reverence, had it not been overpowered by the agreeable fragrance of those perfumes.

**INCEST**, the crime of venereal commerce between persons who are related in a degree wherein marriage is prohibited by the law of the country.

**INCH**, a well known measure of length; being the twelfth part of a foot, and equal to three barley-corns in length.

**INCIDENCE**, denotes the direction in which one body strikes on another. See **OPTICS** and **MECHANICS**.

**INCIDENT DILIGENCE**, in Scots law, a warrant granted by a lord ordinary in the court of session, for citing witnesses for proving any point, or for production of any writing necessary for preparing the cause for a final determination, or before it goes to a general proof.

**INCISIVE**, an appellation given to whatever cuts or divides: thus, the fore-teeth are called dentes incisivi, or cutters; and medicines of an attenuating nature, incisives, or incisive medicines.

**INCLE**, a kind of tape made of linen yarn.

**INCLINATION**, is a word frequently used by mathematicians, and signifies the mutual approach, tendency, or leaning of two lines or two planes towards each other, so as to make an angle.

**INCLINED PLANE**, in mechanics, one that makes an oblique angle with the horizon. See **MECHANICS**.

**INCLOSURE**, in husbandry, the fence or hedge made to inclose lands.

**INCOGNITO**, or **INCOG**, is applied to a person that is in any place where he would not be known: but it is more particularly applied to princes, or great men, who enter towns, or walk the streets, without their ordinary train or the usual marks of their distinction and quality.

**INCOMBUSTIBLE**, something that cannot be burnt, or consumed by fire. See **ASBESTUS**.

**INCOMMENSURABLE**, a term in geometry, used where two lines, when compared to each other, have no common measure, how small soever, that will exactly measure them both. And in general, two quantities are said to be incommensurable, when no third quantity can be found that is an aliquot part of both.

**INCOMMENSURABLE NUMBERS** are such as have no common divisor that will divide them both equally.

**INCOMPATIBLE**, that which cannot subsist with another, without destroying it: thus cold and heat are

†

9 B

incom-

incompatible in the same subject, the strongest overcoming and expelling the weakest.

**INCORPORATION**, in pharmacy, is much the same as impastation, being a reduction of dry substances to the consistence of a paste, by the admixture of some fluid; thus pills, boles, troches, and plasters are made by incorporation. Another incorporation is, when things of different consistences, are by digestion reduced to one common consistence.

**INCORPOREAL**, a thing, or substance, which has no body; as God, angels, and the soul of man.

**INCORRUPTIBLE**, that which cannot be corrupted.

**INCRASSATING**, in pharmacy, &c. the rendering fluids thicker by the mixture of other substances less fluid, or by the evaporation of the thinner parts.

**INCUBATION**, the action of a hen, or other fowl brooding on her eggs.

**INCUBUS**, or **NIGHT-MARE**, in medicine. See **MEDICINE**.

**INCUMBENT**, a clerk, or minister who is resident on his benefice: he is called incumbent, because he does, or at least ought, to bend his whole study to discharge the cure of his church.

**INCURVATION** of the rays of light, their bending out of a rectilinear straight course, occasioned by refraction. See **OPTICS**.

**INCUS**, in anatomy. See **ANATOMY**, p. 296.

**INDEFINITE**, that which has no certain bounds, or to which the human mind cannot affix any.

**INDEFINITE**, in grammar, is understood of nouns, pronouns, verbs, participles, articles, &c. which are left in an uncertain indeterminate sense, and not fixed to any particular time, thing, or other circumstance.

**INDELIBLE**, something that cannot be cancelled, or effaced.

**INDEMNITY**, in law, the saving harmless; or, a writing to secure one from all damage and danger that may ensue from any act.

**INDENTED**, in heraldry, is when the out-line of an ordinary is notched like the teeth of a saw. See **PLATE CII. fig. 1.**

**INDEPENDENTS**, a sect of Protestants in Britain and Holland, so called from their independency on other churches, and their maintaining that each church or congregation has sufficient power to act and perform every thing relating to religious government within itself, and is no way subject or accountable to other churches or their deputies.

They therefore disallow parochial and provincial subordination, and form all their congregations upon a scheme of co-ordinancy. But though they do not think it necessary to assemble synods; yet if any be held, they look on their resolutions as prudential councils, but not as decisions to which they are obliged to conform.

**INDETERMINATE**, in general, an appellation given to whatever is not certain, fixed, and limited; in which sense, it is the same with indefinite.

**INDEX**, in arithmetic and algebra, shews to what power any quantity is involved, and is otherwise called exponent.

**INDIA PROPER**, or **HITHER INDIA**, a large peninsula in Asia, bounded on the north by **Uzbek Tartary**, and **Thibet**; on the east, by another part of **Thibet**, the kingdom of **Asem**, **Ava**, and **Pegu**; on the south, by the bay of **Bengal**, and the Indian ocean; and by the same ocean and **Persia** on the west: situated between  $66^{\circ}$  and  $92^{\circ}$  of east longitude, and between  $7^{\circ}$  and  $40^{\circ}$  of north latitude; being about 2000 miles in length from north to south, and 1500 miles in breadth from east to west where broadest; though the southern part of the peninsula is not 300 miles broad. All the country within these limits is either subject or tributary to the great **Mogul**. It is frequently called **Indostan**, a name supposed to be derived from the river **Indus**, on its western frontiers: it is also called the **Mogulistan**, from the imperial family now upon the throne, who trace their pedigree from **Tamerlane** a **Mogul Tartar**.

The produce of this country, and what the Europeans import from thence, is chiefly chints, callicocs, muslins, some silk, pepper, and diamonds, which are purchased by most nations with silver; but the Dutch frequently barter spices for them, which makes the India trade doubly advantageous to them.

**INDIA**, beyond the **Ganges**, is a country bounded by **Thibet** and **Boutan** on the north; by **China**, **Tonquin**, and **Cochin-China** on the east; by the Indian ocean on the south; and by the hither India, the bay of **Bengal**, and the straits of **Malacca**, on the west: it is situated between  $92^{\circ}$  and  $104^{\circ}$  of east longitude, and between the equator and 30 degrees of north latitude: being near 2000 miles in length from north to south, but of a very unequal breadth; in which limits are comprehended the kingdoms of **Asem**, **Ava**, **Pegu**, **Laos**, **Siam**, **Cambodia**, and **Malacca**, governed by as many Indian princes; only the Dutch have usurped the dominion of **Malacca**. In this country there are a vast number of elephants, and consequently a great deal of ivory; our merchants also meet with gold and precious stones, canes, opium, and such other articles as are usually found within the tropics.

**INDIAN BERRY**. See **COCCULUS**.

**INDICATION**, in physic, whatever serves to direct the physician how to act.

**INDICATIVE**, in grammar, the first mood, or manner, of conjugating a verb, by which we simply affirm, deny, or ask something; as, *amant*, they love; *non amant*, they do not love; *amantne*, do they love?

**INDICTION**, in chronology, a cycle of fifteen years.

**INDICTMENT**, in Scots law, the name of the summons or libel upon which criminals are cited before the court of Justiciary to stand trial.

**INDIES**, East and West. See **INDIA** and **AMERICA**.

**INDIGESTION**, in medicine, a crudity, or want of due coction, either in the food, an humour of the body, or an excrement.

**INDIGETES**, a name which the ancients gave to some of their gods.

**INDIGO**, in botany. See **INDIGOFERA**.

**INDIGOFERA**, in botany, a genus of the diadelphia decandria class. The calix is plain; the superior margins

gins of the alæ are connivent, and of the same shape with the vexillum; and the pod is strait. There are six species, all of them natives of the Indies. The tinctoria, anil, or indigo, grows about two feet high, with roundish leaves.

As to the indigo blue, it is a secular, or settling, made by means of water and oil olive out of the leaves of the anil, or indigo plant; there is a difference between that made by the leaves only, and that which is made of the leaves and small branches. The choicest of the former sort is that which bears the surname of Serquisse, from a village of that name some leagues from Surat in the East-Indies. It is made also about Biana and Coffa near Agra; and also in the kingdom of Golconda. In making the secular of anil, in order to make indigo of it, they cut the herb with a sickle, when the leaves begin to fall upon touching them; and after they have stripped them from the branches, they put them into a sufficient quantity of water in a vessel called the steeping vat; and let them infuse there thirty or thirty-five hours; after which they turn the cock, in order to let the water run off, which is become of a green colour inclining towards blue, into a vessel of the nature of a churn, where it is worked by means of a roller or turner of wood, the ends of which are pointed and faced with iron: this they work till the water abounds with a lather; then they cast into it a little oil of olive, that is, one pound into such a quantity of the liquor as will yield seventy pounds of indigo, such as is saleable; and as soon as the said oil is thrown in, the lather separates into two parts, so that you may observe a quantity curdled as milk is when ready to break; then they cease working, and let it stand to settle; which when it has done some time, they open the pipe or cock of the vessel, in order to let the water clear off, that the secular which is subside may remain behind at the bottom of the vessel like the lees of wine. Then taking it out, they put it into straining bags of cloth, to separate what water was left; after which they convey it into chests or boxes that are shallow, to dry it; and being dried, it is what we call indigo.

Chuse the indigo of Serquisse in flat cakes, of a moderate thickness, neither too soft nor too hard, of a deep violet colour, light, and such as swims on water, and when broken has no white spots in it; and lastly, such as is copperish or reddish on being rubbed with one's nail, and has the least dust and broken pieces in it.

The other sort of indigo is also the secular made from the anil; and differs nothing from the former, but as it is made of the whole plant, stalk and leaf; the best of which kind is that which bears the name Guatimala, that comes from the West Indies. In chusing this indigo, it should be as near the other kind as can be; but the surest proof of its goodness is its burning upon the fire like wax, and leaving only a little ashes behind. The second sort of indigo is that of St Domingo, differing nothing from the Guatimala, only that it is not of so lively a colour; the third is the Jamaica indigo; the fourth is that of the Leeward

islands; all which are better or worse, according as they are more or less neat and pure.

The use of the indigo is for the the dyer and land-resses, serving the last to put among their linen. The painters use it to grind with white for painting in blue; for if it is used alone and neat, it turns black; ground with yellow, it makes a green: some confectioners and apothecaries preposterously use this to colour sugars with which to make conferves and syrup of violets, by adding some orice.

**INDIVIDUAL**, in logic, a particular being of any species, or that which cannot be divided into two or more beings equal or alike.

The usual division in logic is made unto genera or genus's, those genera into species, and those species into individuals.

**INDIVISIBLE**, among metaphysicians. A thing is said to be absolutely indivisible, that is a simple being, and consists of no parts into which it may be divided. Thus God is indivisible in all respects, as is also the human mind, not having extension or other properties of body.

**INDIVISIBLES**, in geometry, the elements or principles into which any body or figure may be ultimately resolved; which elements are supposed infinitely small: thus a line may be said to consist of points, a surface of parallel lines, and a solid of parallel and similar surfaces.

**INDORSEMENT**, in law, any thing written on the back of a deed, as a receipt for money received.

There is likewise an indorsement, by way of assignment, on bills of exchange and notes of hand; which is done by writing a person's name on the back thereof. See **BILL**.

**INDUCTION**, in law, is putting a clerk or clergyman in possession of a benefice or living to which he is collated, or presented.

**INDULGENCES**, in the Romish church, are a remission of the punishment due to sins, granted by the church, and supposed to save the sinner from Purgatory. Clement VI. in his decretal, which is generally received by the church of Rome, declares, that our Saviour has left an infinite treasure of merits, arising from his own sufferings, besides those of the blessed virgin and the saints; and that the pastors and guides of the church, and more especially the popes, who are the sovereign disposers of this treasure, have authority to apply it to the living by virtue of the keys, and to the dead by way of suffrage, to discharge them from their respective proportions of punishment, by taking just so much merit out of this general treasure as they conceive the debt requires, and offering it to God.

The power of granting indulgences has been greatly abused in the church of Rome. It was one of the chief things which the council of Constance laid to the charge of John XXIII. in 1415, that he impowered his legates to absolve penitents from all sorts of crimes, upon the payment of sums proportionable to their guilt. Pope Leo X. in order to carry on the magnificent structure of St. Peter's at Rome, published indulgences, and a plenary remission to all such as should contribute money

money towards it. Finding the project take, he gave his sister, the princess of Cibo, the benefit of the indulgences of Saxony and the neighbouring parts, and farmed out those of other countries to the highest bidders, who, to make the best of their bargains, procured the ablest preachers to cry up the value of the ware. "Happy times for sinners! says a modern writer, "their crimes were rated, and the remission of them "set up by auction. The apostolic chancery taxed "sins at a pretty reasonable rate. It cost but ninety "livres and a few ducats, for crimes which people on "this side the Alps punished with death."

It was this great abuse of indulgences that contributed not a little to the first reformation of religion in Germany, where Martin Luther began first to declaim against the preachers of indulgences, and afterwards against indulgences themselves: but since that time the popes have been more sparing in the exercise of this power: however, they still carry on a great trade with them to the Indies, where they are purchased at two rials a-piece, and sometimes more.

The pope likewise grants indulgences to persons at the point of death; that is, he grants them, by a brief, power to chuse what confessor they please, who is authorized thereby to absolve them from all their sins in general.

**INDULT**, in the church of Rome, the power of presenting to benefices granted to certain persons by the pope. Of this kind is the indult of kings and sovereign princes in the Romish communion, and that of the parliament of Paris granted by several popes. By the concordat for the abolition of the pragmatic sanction, made between Francis I. and Leo X. in 1516, the French king has the power of nominating to bishoprics, and other consistorial benefices, within his realm. At the same time, by a particular bull, the pope granted him the privilege of nominating to the churches of Britany and Provence. In 1648 pope Alexander VIII. and in 1668 Clement IX. granted the king an indult for the bishoprics of Metz, Toul, and Verdun, which had been yielded to him by the treaty of Munster; and in 1668 the same pope Clement IX. granted him an indult for the benefices in the counties of Roussillon, Artois, and the Netherlands. The cardinals likewise have an indult granted them by agreement between pope Paul IV. and the sacred college in 1555, which is always confirmed by the popes at the time of their election. By this treaty the cardinals have the free disposal of all the benefices depending on them, and are empowered likewise to bestow a benefice in commendam.

**INDULTO**, a duty, tax, or custom, paid to the king of Spain for all such commodities as are imported from the West Indies in the galleons.

**INDUS**, a large river of Asia, which rises in the mountains which separate Tartary from India, and discharges itself into the India ocean.

**INERTIA of matter**, in philosophy, is defined by Sir Isaac Newton to be a passive principle by which bodies persist in their motion or rest, receive motion in pro-

portion to the force impressing it, and resist as much as they are resisted. It is also defined by the same author to be a power implanted in all matter, whereby it resists any change endeavoured to be made in its state. See **MECHANICS**.

**INFALLIBLE**, something that cannot err, or be deceived.

One of the great controversies between the Protestants and Papists, is the infallibility which the latter attribute to the pope; though, in fact, they themselves are not agreed on that head, some placing this pretended infallibility in the pope and a general council.

**INFAMY**, in law, is a term which extends to forgery, perjury, gross cheats, &c. by which a person is rendered incapable of being a witness or juror, even tho' he is pardoned for his crimes.

**INFANT**, denotes a young child. See **MIDWIFERY**, and **MEDICINE**.

**INFANTE**, and **INFANTA**, all the sons and daughters of the kings of Spain and Portugal, except the eldest; the princes being called *infantes*, and the princesses *infantas*.

**INFANTRY**, in military affairs, denotes the whole body of foot-soldiers.

**INFECTION**, among physicians. See **CONTAGION**.

**INFESTMENT**, in Scots law, the solemnity of the delivery of an heretable subject to the purchaser. See **LAW**, tit. 10.

**INFINITE**, that which has neither beginning nor end: in which sense God alone is infinite.

Infinite is also used to signify that which has had a beginning, but will have no end, as angels and human souls. This makes what the schoolmen call *infinitum a parte post*; as, on the contrary, by *infinitum a parte ante*, they mean that which has an end but had no beginning.

**INFINITE QUANTITIES**. The very idea of magnitudes infinitely great, or such as exceed any assignable quantities, does include a negation of limits: yet if we nearly examine this notion, we shall find that such magnitudes are not equal among themselves, but that there are really, besides infinite length and infinite area, three several sort of infinite solidity; all of which are *quantitates sui generis*, and that those of each species are in given proportions.

Infinite length, or a line infinitely long, is to be considered either as beginning at a point, and so infinitely extended one way, or else both ways from the same point; in which case the one, which is a beginning infinity, is the one half of the whole, which is the sum of the beginning and ceasing infinity; or, as may be said, of infinity *a parte ante* and *a parte post*, which is analogous to eternity in time and duration, in which there is always as much to follow as is past, from any point or moment of time; nor doth the addition or subduction of finite length, or space of time, alter the case either in infinity or eternity, since both the one or the other cannot be any part of the whole.

**INFINITESIMALS**, among mathematicians, are defined to be infinitely small quantities.

In

In the method of infinitesimals, the element, by which any quantity increases or decreases, is supposed to be infinitely small, and is generally expressed by two or more terms, some of which are infinitely less than the rest, which being neglected as of no importance, the remaining terms form what is called the difference of the proposed quantity. The terms that are neglected in this manner, as infinitely less than the other terms of the element, are the very same which arise in consequence of the acceleration, or retardation, of the generating motion, during the infinitely small time in which the element is generated; so that the remaining terms express the elements that would have been produced in that time, if the generating motion had continued uniform: therefore those differences are accurately in the same ratio to each other as the generating motions or fluxions. And hence, though in this method infinitesimal parts of the elements are neglected, the conclusions are accurately true without even an infinitely small error, and agree precisely with those that are deduced by the method by fluxions. See **FLUXIONS**.

**INFIRMARY**, a kind of hospital, where the weak and sickly are properly taken care of.

**INFLAMMABILITY**, that property of bodies which disposes them to kindle, or catch fire. See **FIRE**.

**INFLAMMATION**. See **MEDICINE** and **SURGERY**.

**INFLECTION**, or *Point of INFLECTION*, in the higher geometry, is a point where a curve begins to bend a contrary way.

**INFLECTION**, in grammar, the variation of nouns and verbs, by declension and conjugation.

**INFLUENCE**, a quality supposed to flow from the heavenly bodies, either with their light or heat; to which astrologers idly ascribe all sublunary events.

**INFORMATION**, in law, is nearly the same in the crown-office, as what in other courts is called a declaration. It is sometimes brought by the king, or his attorney general, or the clerk of the crown-office; and at other times by a private person, who informs or sues, as well for the king as himself, upon the breach of some popular statute, in which a penalty is given to the party that will sue for it.

**INFRACTION**, a term chiefly used to signify the violation of a treaty.

**INFRA-SCAPULARIS**, in anatomy. See **ANATOMY**, p. 196.

**INFRA-SPINATUS**, in anatomy. See **ANATOMY**, p. 195.

**INFULA**, in antiquity, a broad kind of fillet, made of white wool, which the priests used to tie round their heads.

**INFUNDIBULIFORM**, in botany, an appellation given to such monopetalous or one-leaved flowers, as resemble a funnel in shape, or which have a narrow tube at one end, and gradually widen towards the limb or mouth.

**INFUSION**, in pharmacy, a method of obtaining the virtues of plants, roots, &c. by steeping them in a hot or cold liquid.

Hot infusions are made by pouring boiling water, or  
Vol. II. Numb. 62.

any other menstruum, on the drugs whose virtues we would extract: thus, in order to obtain the common infusion of senna, take the leaves of senna, an ounce and a half; of crystals of tartar, three drams; of the lesser cardamom seeds husked, two drams: boil the crystals of tartar in a pint of water, till they are dissolved; then pour the water, while boiling hot, upon the senna and the rest; and when the liquor is cold, strain it off.

**INGELSHEIM**, a town of Germany, in the palatinate of the Rhine, eight miles south-west of Mentz, E. long. 7° 40', N. lat. 50°

**INGLUVIES**, the crop or craw of granivorous birds, serving for the immediate reception of the food, where it is macerated for some time, before it is transmitted to the true stomach.

**INGOLSTAT**, a town of Germany, in the circle of Bavaria, situated on the river Danube, thirty miles west of Ratibon: E. long. 11° 30', and N. lat. 48° 45'.

**INGOT**, a mass of gold or silver, melted down and cast in a mould, but not coined or wrought.

**INGRAFTING**, in gardening. See **GARDENING**.

**INGRESS**, in astronomy, signifies the sun's entering the first scruple of one of the four cardinal signs, especially Aries.

**INGRIA**, a province of Russia, bounded by the lake Ladoga, the river Nieva, and the gulph of Finland on the north, by Novogorod on the east and south, and by Livonia on the west.

**INGROSSER**, one who buys up great quantities of any commodity, before it comes to market, in order to raise the price.

**INGUEN**, in anatomy, the same with what is otherwise called groin, or pubes.

**INHERITANCE**, a perpetual right or interest in lands, invested in a person and his heirs.

**INHIBITION**, in Scots law, a diligence obtained at the suit of a creditor against his debtor, prohibiting him from selling or contracting debts upon his estate to the creditor's prejudice. See **LAW**, tit. 18.

**INHUMATION**, in chemistry, a method of digesting substances by burying the vessel in which they are contained in horse-dung or earth.

**INJECTION**, the forcibly throwing certain liquid medicines into the body, by means of a syringe, tube, clyster-pipe, or the like.

*Anatomical INJECTION*, the filling the vessels with some coloured substance, in order to make their figures and ramifications visible.

For this purpose, a fine red injection is prepared thus: pour a pint of oil of turpentine on three ounces of vermilion, stir them well together, and then strain all through a fine linen cloth. If a green injection is wanted, distilled verdigrease may be used instead of the vermilion.

A coarse injection may be made of one pound of tallow, five ounces of white-wax, three ounces of oil of olives, melted together, and adding two ounces of venice-turpentine; and when this is dissolved, three ounces of vermilion or verdigrease are to be thoroughly mixed with the other ingredients, and the whole strained through a linen cloth.

**INJURY**, any wrong done to a man's person, reputation, or goods.

**INK**, a black liquor generally made of an infusion of galls, copperas, and a little gum arabic.

To make a very good ink for writing: take three ounces of good galls, reduced to powder; which infuse in three pints of river or rain-water, setting it in the sun or a gentle heat, for two days; then take common copperas, or green vitriol, three ounces; powder it, put it into the infusion, and set it in the sun for two days more; lastly, shake it well, and add an ounce of good gum arabic.

To make the London powder-ink: take ten ounces of the clearest nut-galls, which reduce to a fine powder; then add two ounces of white copperas, four ounces of Roman vitriol, and of gum arabic or sandarach an ounce; pound and sift them very fine. This powder, though whitish itself, will, when put into water, turn it to a good black ink: an ounce of the powder serves to make a pint of ink.

To make a shining ink: take gum arabic and Roman vitriol, of each an ounce; galls well bruised, a pound; put them into rape-vinegar, or vinegar made of clear small beer; set them in a warm place, stir them often till the liquor becomes black, and then add to a gallon of this preparation an ounce of ivory-black, and a quarter of a pint of seed-lac varnish.

To make a shining Japan or China ink: take an ounce of lamp-black, and clarify it in an earthen pipkin to take out the dross; two drams of indigo; half a dram of peach black; one dram of black endive, burnt; reduce them to a very fine powder, and then take a moiety of fig-leaf-water, another part of milk, and a very little gum arabic; and mixing all the ingredients well together, make them up for use.

**Printing Ink** is made by boiling or burning linseed-oil till it is pretty thick, adding a little rosin to it while hot, and then mixing this varnish with lamp-black.

**INK** is also an appellation given to any coloured liquor, used in the same manner as the atramentum or black ink; as red, green, blue, yellow, &c. inks.

Red ink is made thus: take wine-vinegar a pint; raspings of brazil, one ounce; alum, half an ounce; boil them gently, and add five drams of gum arabic: dissolve the gum, strain the ingredients, and keep the liquid for use.

Green ink is made by boiling verdigrease with argol in fair water, and adding a little gum arabic.

Blue ink is made by grinding indigo with honey and the white of eggs, and making it fluid with water.

Yellow ink is made by an infusion of saffron in water, with a little alum and gum arabic.

**Sympathetic Ink**, a liquor with which a person may write, without the letters appearing, till some means be taken to render them legible.

Of this kind are the glutinous juices of plants, or any other thick and viscid fluids, provided they have no remarkable colours themselves; for being written on white paper, nothing will appear, till some fine powder of any coloured earth is thrown over the paper, whereby the letters become legible: the reason of this is

evident, as the powder sticks only to the letters formed by the invisible but viscid liquor.

Another sort of sympathetic inks are made of infusions, the matter of which easily burns to a charcoal: thus if a scruple of sal armoniac be dissolved in two ounces of fair water, letters written therewith will be invisible till held before the fire; for the sal armoniac being burnt to a charcoal, by a heat not strong enough to scorch the paper, the letters are thereby rendered visible.

Another sort of sympathetic ink is made of a solution of lead in vinegar, and a lixivium of lime and orpiment; for if a letter be written with the former, nothing will appear: but to conceal the affair still more, some different subject may be written above it, with a black ink made of burnt cork and gum-water; then, if a piece of cotton, wetted with the said lixivium, be rubbed over the paper, the sentence that was visible will disappear, and the invisible one before written with the solution of lead will be seen in its place very black and strong.

**INN**, a place appointed for the entertainment and relief of travellers.

**Inns of Court**, are colleges in London, for the study of the laws of England, with all conveniencies for the lodging and entertainment of the professors and students.

The four principal inns of court are the Inner-temple, Middle-temple, Lincoln's inn, and Gray's inn; the other inns are the two serjeant's inns; and the others, which are less considerable, are Clifford's inn, Symond's inn, Clement's inn, Lion's inn, Furnival's inn, Staple's inn, Thavie's inn, Barnard's inn, and New-inn. These are mostly taken up by attorneys, solicitors, &c. but they belong to the inns of court, who send yearly some of their barristers to read to them.

**INN**, in geography, a large river which rises in a mountain of the Alps, in the country of the Grisons, runs north-east through Tyrol and Bavaria, and discharges itself into the Danube.

**INNATE IDEAS**, those supposed to be stamped on the mind from the first moment of its existence, and which it constantly brings into the world with it: a doctrine, which Mr. Locke has abundantly refuted.

**INNERKEITHING**, a port-town of Scotland, in the county of Fife, situated on the north shore of the frith of Forth, ten miles north-west of Edinburgh.

**INNISKILLING**, a strong town of Ireland, in the province of Ulster, and county of Fermanagh: W. long. 7° 50', and N. lat. 54° 20'.

**INNOCENTS DAY**, a festival of the Christian church, observed on December 28, in memory of the massacre of the innocent children by the command of Herod king of Judea; who being alarmed at hearing that an infant was born king of the Jews, and imagining that his own kingdom was in danger, sent orders to have all the children slain that were in Bethlehem and the adjacent country.

The Greek church in their calendar, and the Abyssinians of Ethiopia in their offices, commemorate fourteen thousand infants on this occasion.

INNOMI-

**INNOMINATA OSSA**, in anatomy. See **ANATOMY**, p. 171.

**INOCULATION**, in medicine, the art of transplanting a distemper from one subject to another, by incision, particularly used for engrafting the small pox. See **MEDICINE**.

**INOSCULATION**, in anatomy. See **ANASTOMOSIS**.

**INQUEST**, in Scots law, the same with jury.

**INQUISITION**, in the church of Rome, a tribunal in several Roman catholic countries, erected by the popes for the examination and punishment of heretics.

This court was founded in the twelfth century by father Dominic and his followers, who were sent by pope Innocent III. with orders to excite the catholic princes and people to extirpate heretics, to search into their number and quality, and to transmit a faithful account thereof to Rome. Hence they were called inquisitors; and this gave birth to the formidable tribunal of the inquisition, which was received in all Italy, and the dominions of Spain, except the kingdom of Naples and the Low Countries.

This diabolical tribunal takes cognizance of heresy, Judaism, Mahometanism, Sodomy, and polygamy; and the people stand in so much fear of it, that parents deliver up their children, husbands their wives, and masters their servants, to its officers, without daring in the least to murmur. The prisoners are kept for a long time, till they themselves turn their own accusers, and declare the cause of their imprisonment; for they are neither told their crime, nor confronted with witnesses. As soon as they are imprisoned, their friends go into mourning, and speak of them as dead, not daring to solicit their pardon, lest they should be brought in as accomplices. When there is no shadow of proof against the pretended criminal, he is discharged, after suffering the most cruel tortures, a tedious and dreadful imprisonment, and the loss of the greatest part of his effects. The sentence against the prisoners is pronounced publicly, and with extraordinary solemnity. In Portugal they erect a theatre capable of holding three thousand persons, in which they place a rich altar, and raise seats on each side in the form of an amphitheatre. There the prisoners are placed, and over-against them is a high chair, whither they are called, one by one, to hear their doom, from one of the inquisitors.

These unhappy people know what they are to suffer, by the cloaths they wear that day. Those who appear in their own cloaths, are discharged upon payment of a fine: those who have a *santo benito*, or trait yellow coat without sleeves, charged with St. Andrew's crosses, have their lives, but forfeit all their effects: those who have the resemblance of flames, made of red serge, sewed upon their *santo benito*, without any crosses, are pardoned, but threatened to be burnt if ever they relapse: but those who, besides these flames, have on their *santo benito* their own picture, surrounded with figures of devils, are condemned to expire in the flames. The inquisitors, who are ecclesiastics, do not pronounce the sentence of death; but form and

read an act, in which they say, that the criminal being convicted of such a crime, by his own confession, is with much reluctance delivered to the secular power to be punished according to his demerits: and this writing they give to the seven judges, who attend at the right side of the altar, who immediately pass sentence. For the conclusion of this horrid scene, see *ACT of faith*.

**INSCRIBED**, in geometry. A figure is said to be inscribed in another, when all its angles touch the side or planes of the other figure.

**INSCRIPTION**, a title or writing carved, engraved, or affixed to any thing, to give a more distinct knowledge of it, or to transmit some important truth to posterity.

The inscriptions mentioned by Herodotus and Diodorus Siculus, sufficiently shew that this was the first method of conveying instruction to mankind, and transmitting the knowledge of history and sciences to posterity: thus the ancients engraved upon pillars both the principles of sciences, and the history of the world. Pisistratus carved precepts of husbandry on pillars of stone; and the treaties of confederacy between the Romans and Jews, were engraved on plates of brass. Hence, antiquarians have been very curious in examining the inscriptions on ancient ruins, coins, medals, &c.

**INSECTS**, in zoology, a numerous class of animals. See **NATURAL HISTORY**.

**INSERTION**, in anatomy, the close conjunction of the vessels, tendons, fibres, and membranes of the body with some other parts.

**INSIPID**, an appellation given to things without taste.

**INSOLATION**, in chemistry, the suffering matters to stand and digest in the heat of the sun, instead of that of a furnace.

**INSOLVENT**, a term applied to persons unable to pay their debts.

**INSPIRATION**, among divines, implies the conveying of certain extraordinary and supernatural notices or motions into the soul.

**INSPISSATING**, in pharmacy, an operation whereby a liquor is brought to a thicker consistence, by evaporating the thicker parts.

**INSBRUCK**, a city of Germany, in the circle of Austria, capital of the county of Tyrol, situated on the river Inn, in E. long. 11° 26', N. lat. 47° 12'.

**INSTALLMENT**, the installing or establishing a person in some dignity.

**INSTANT**, such a part of duration wherein we perceive no succession; or it is that which takes up the time only of one idea in our minds.

**INSTAURATION**, the re-establishment or restoration of a religion, a church, or the like, to its former state.

**INSTEP**, in the manege, is that part of a horse's hind leg which reaches from the ham to the pastern-joint.

**INSTINCT**, an appellation given to the sagacity and natural inclinations of brutes, which supplies the place of reason in mankind.

INSTI-

**INSTITUTES**, in literary history, a book containing the elements of the Roman law, and constitutes the last part of the civil-law.

The Institutes are divided into four books, and contain an abridgment of the whole body of the civil law; being designed for the use of students.

**INSTITUTE**, in Scots law. When by disposition, or deed of entail, a number of persons are called to the succession of an estate one after another, the person first named is called the institute, and the others substitutes. See *LAW*, tit. 27.

**INSTITUTION**, in general, signifies the establishing or founding something.

In the canon and common law, it signifies the investing a clerk with the spiritualities of a rectory, &c. which is done by the bishop, who uses the formula, "I institute you rector of such a church, with cure of souls, and receive your care and mine."

**INSTRUMENT**, in general, whatever is subservient to a cause in producing any effect.

A common case of mathematical instruments contains several compasses, a sector, scale, drawing-pen, and protractor.

**Notarial INSTRUMENT**, in Scots law, any fact certified in writing, under the hand of a notary-public. See *LAW*, tit 21.

**INSULATED**, in architecture, an appellation given to such columns as stand alone, or free from any contiguous wall, &c. like an island in the sea; whence the name.

**INSURANCE**, in law and commerce, a contract or agreement whereby one or more persons, called insurers, assurers, &c. oblige themselves to answer for the loss of a ship, house, goods, &c. in consideration of a premium paid by the proprietors of the things insured.

Insurances are of various kinds, as on ships or parts of ships, on merchandize singly, and on ships and goods jointly: and these are again branched out to run either for a time stipulated, or to one single port, or out and home, with liberty to touch at the different places mentioned in the policy. Insurances may likewise be made on goods sent by land, or by hoys, &c. on rivers; and this is frequently done, more especially on jewels, and other things of great value.

The principal offices for the insurance of ships and merchandize in London, are the Royal-exchange assurance, and the London assurance, both of which are established by act of parliament. These offices also insure houses and other buildings, goods, wares, and merchandize, from loss or damage by fire; and the former of them also assure lives.

The Royal-exchange insurance, on a brick or stone building, insures any sum not exceeding 200*l.* at 5*s.* *per ann.* and any larger sum not exceeding 1000*l.* after the rate of 2*s.* 6*d.* *per cent. per ann.* Above 1000*l.* and not exceeding 2000*l.* at 3*s.* *per cent.* Above 2000*l.* and not exceeding 3000*l.* at 4*s.* *per cent.* On goods and merchandize, the property of the assured, within any brick or stone building, or on the goods and building together, this office insures any sum not exceeding 300*l.* for 7*s.* 6*d.* *per ann.* and

larger sums after the rates above-mentioned: but timber or plaster-buildings, or goods or merchandize therein, pay 8*s.* *per ann.* for 200*l.* and after the rate of 4*s.* *per cent.* for any greater sum not exceeding 1000*l.* and 5*s.* *per cent.* for all insurances above 1000*l.* and not exceeding 2000*l.* On a timber or plaster-building with goods and merchandize together, any sum, not exceeding 300*l.* may be insured for 12*s.* *per ann.* and larger sums at the above rates. The goods belonging to hazardous trades, as distillers, chemists, apothecaries, colour-men, tallow-chandlers, oilmen, innholders, &c. deposited in brick houses, pay 8*s.* *per ann.* for insuring 200*l.* and after the rate of 4*s.* *per cent.* for any greater sum not exceeding 1000*l.*; and above 1000*l.* and not exceeding 2000*l.* 5*s.* *per cent.* but when the houses and goods are put together, the price of insurance is 4*s.* *per cent. per ann.* without any other charge except the policies.

The Friendly Society insurance, has some very extraordinary regulations; the principal of which is, that every one of the assured becomes a member of the society; and when any loss happens, contributes in proportion to the sum he has insured, to make good the damage; on which account he pays only 1*s.* 4*d.* *per cent. per ann.* premium, and 6*s.* 8*d.* *per cent.* as a caution; but what is unexpended of the 6*s.* 8*d.* is returned to the party insured at the end of seven years.

We have also insurances for lives, in virtue of which, when the person insured dies, a sum of money becomes payable to the person on whose behalf the policy of insurance was granted. The principal insurance-office of this kind, is that of the Amicable Society for a perpetual assurance, kept in Serjeant's inn, Fleet-street, London.

In this office, after paying the charges of the policy, and 10*s.* entrance-money, each person pays 5*l.* *per annum*, by quarterly payments; and from these payments the dividends, which usually amount to 100*l.* and upwards, are to arise. All persons admitted are to be between the ages of twelve and forty five, and in a good state of health. Any person is allowed to have two or three insurances or numbers on the same life, whereby such person will be intitled to a claim on each number so insured; and every claimant is empowered to put in a new life, in the room of one deceased, within twelve calendar months next after the end of the current year. By becoming members of this society, clergymen, physicians, lawyers, tradesmen, and all whose income ceases at the time of their death, may, in all probability, leave to their families a claim of not less than 100*l.* for every 5*l.* annually paid in.

**INTAGLIOS**, precious stones on which are engraved the heads of great men, inscriptions, and the like; such as we frequently see set in rings, seals, &c.

**INTEGER**, in arithmetic, a whole number, in contradistinction to a fraction.

**INTERCALARY**, an appellation given to the odd day inserted in leap year; which was so called from *cal-, calare*, to proclaim, it being proclaimed by the priests with a loud voice.

**INTER-**

**INTERCOLUMNIATION**, in architecture, denotes the space between two columns, which is always to be proportioned to the height and bulk of the columns. See **ARCHITECTURE**.

**INTERCOSTAL**, in anatomy, an appellation given to such muscles, nerves, arterics and veins as lie between the ribs. See **ANATOMY**, Part II.

**INTERDICT**, an ecclesiastical censure, by which the church of Rome forbids the performance of divine service in a kingdom, province, town, &c.

**INTERDICTION**, in Scots law, a legal restraint laid upon weak or profuse persons from signing any deed to their own prejudice, without the consent of curators or interdictors. See **SCOTS LAW**, tit. 7.

**INTEREST**, is the premium or money paid for the loan or use of money; and is distinguished into two kinds, simple and compound.

Simple interest is that which is paid for the principal, or sum lent, at a certain rate or allowance made by law, or agreement of parties, whereby so much as 5*l.* or 6*l.* or any other sum, is paid for 100*l.* lent out for one year; and more or less proportionally for greater or lesser sums, and for more or less time. For example, if it is 5*l.* to 100*l.* for one year, it is 2*l.* 10*s.* for half a year, and 10*l.* for two years: also 10*l.* for one year of 200*l.* and 5*l.* for half a year; and so on, for other sums and times. Thus, as the law, or agreement of parties, fixes a certain ratio, or, as we call it, rate of interest, which is so much on the 100*l.* for one year: from this we can easily find the proportional interest on 1*l.* for one year, being plainly the  $\frac{1}{100}$  part of the interest of 100*l.* so if this is 5*l.* that is .05*l.* if this is 6*l.* that is .06*l.* and if this is 5*l.* 10*s.* or 5 5*l.* that is .055*l.* Wherefore, if we understand the rate of interest to be the interest of 1*l.* for one year, the more common questions about simple interest will relate to these four things, *viz.* any principal sum, its interest, the time in which it gives that interest, and the rate, or interest of 1*l.* for one year; according to which, that principal, interest, and time, are adjusted to one another.

From which we have four problems; in the rules whereof we suppose the principal and interest expressed in the denomination of pounds, by reducing what is less than 1*l.* to a decimal of 1*l.* and the time to be expressed in years, and decimal parts of one year.

**Prob. I.** Having any principal, sum, and time, with the rates of interest given, to find the interest of that sum for that time and rate.

**Rule:** Multiply the principal rate, and time, continually into one another; the product is the interest sought.

Observe, if we express the principal by *p*, the interest by *n*, the time by *t*, and the rate by *r*, then this rule is thus represented,  $n = tpr$ .

**Example:** The rate of interest being .05*l.* what is the interest of 85*l.* for 4 years and 3 quarters, or 4.75 years?

**Answer.** 20*l.* 3*s.* 9*d.* = 20.1875*l.* =  $85 \times 4.75 \times .05$ .

05.

Which is thus performed:

$$\begin{array}{r} 85 = p \\ 4.75 = t \\ \hline 425 \\ 595 \\ 340 \\ \hline 403.75 \\ .05 = r \\ \hline \end{array}$$

20.1875 pounds.

Which decimal is reduced by multiplying it by 20, 12, and 4: thus,

$$\begin{array}{r} .1875 \\ 20 \\ \hline 3.7500 \text{ shillings} \\ 12 \\ \hline 15000 \\ 7500 \\ \hline 9.0000 \text{ pence} \end{array}$$

**Prob. II.** Having the rate, principal and interest, to find the time.

**Rule:** Divide the interest by the product of the rate and principal, the quote is the time: thus,  $t = \frac{n}{rp}$ .

**Example:** The rate .05*l.* principal 85*l.* interest 20*l.* 3*s.* 9*d.* or 20.1875*l.* the time is 4.75 years, or 4  $\frac{3}{4}$  years. Thus,  $4.75 = \frac{20.1875}{85 \times .05}$ , or  $\frac{20.1875}{4.25}$ .

**Demonstration:** This rule is deduced from the former; thus, since  $n = tpr$ , then dividing both sides by *rp*, it is  $\frac{n}{rp} = t$ .

**Prob. III.** Having the principal, interest, and time, to find the rate.

**Rule:** Divide the interest by the product of principal and time, the quote is the rate: thus,  $r = \frac{n}{tp}$ .

**Example:**  $n = 20.1875$  *l.*  $t = 4.75$  years,  $p = 85$  *l.* then is  $r = .05$  *l.* =  $\frac{20.1875}{4.75 \times 85}$ , or  $\frac{20.1875}{403.75}$ .

**Demonstration:** Since  $n = tpr$ , divide both by *tp*; it is  $\frac{n}{tp} = r$ .

**Prob. IV.** Having the rate, time and interest, to find the principal.

**Rule:** Divide the interest by the product of rate and time, the quote is the principal; thus,  $p = \frac{n}{tr}$ .

**Example:**  $n = 20.1875$  *l.*  $t = 4.75$  years,  $r = .05$  *l.* then is  $p = 85$  *l.* =  $\frac{20.1875}{4.75 \times .05}$ , or  $\frac{20.1875}{.2375}$ .

**Demonstration:** Since  $n = tpr$ , divide both sides by *tr*, the quote is  $\frac{n}{tr} = p$ .

**Scholium:** If the interest of any sum for any time is added to the principal, this total or sum is called the amount, (*viz.* of the principal and its interest for that time.) And then from these four things, *viz.* the amount, which we call *a*, the principal, the time, and

and rate, arise four problems; for having any three of these, the fourth may always be found. Thus,

Prob. V. Having the principal, time, and rate, to find the amount.

Rule: Find the interest by prob. I. add it to the principal, the sum is the amount.

Thus, by prob. I. the interest is  $ptr$ : therefore the amount is  $a = ptr + p$ . The reason is evident.

Note: Because  $ptr = rt \times p$ , and  $p = 1 \times p$ ; therefore  $rt + 1 = rt + 1 \times p = 1$ . And so the rule may be expressed thus; To the product of the rate and time add unity, and multiply the sum by the principal, the product is the amount.

Example: What is the amount of 246 l. principal in 2 years and  $\frac{1}{2}$ , or 2.5 years, the rate of interest being .05 l? Answer  $246 l. + 30.75 l. = 276 l. 15 s.$  for the interest is  $246 \times .05 \times 2.5 = 30.75 l.$  Or thus;  $.05 \times 2.5 = .125 l.$  to which add 1, it is  $1 + .125 l.$  which multiplied by 276, produces 276.75 l.

Prob. VI. Given the principal, amount, and time, to find the rate.

Rule: Take the difference betwixt the principal and amount, and divide it by the product of the time and principal, the quote is the rate: thus,  $r = \frac{a - p}{tp}$ .

Example: Suppose  $a = 276.75 l.$   $p = 246$ ,  $t = 2.5$  years; then is  $r = .05 l. = \frac{276.75 - 246}{2.5 \times 246} = \frac{30.75}{615}$ .

Demonstration: Since by prob. V.  $a = ptr + p$ , take  $p$  from both sides, it is  $a - p = ptr$ ; then divide both by  $tp$ , it is  $\frac{a - p}{tp} = r$ .

Prob. VII. Given the amount, principal, and rate, to find the time.

Rule: Take the difference of the amount and principal, and divide it by the product of the principal and rate, the quote is the time: thus  $t = \frac{a - p}{rp}$ .

Example: Suppose  $a = 276.75 l.$   $p = 246 l.$   $r = .05$ ; then is  $t = 2.5$  years  $= \frac{276.75 l. - 246}{246 \times .05} = \frac{30.75}{12.3}$ .

Demonstration: In the last problem,  $a - p$  was equal to  $trp$ ; and dividing both by  $rp$ , it is  $\frac{a - p}{rp} = t$ .

Prob. VIII. Given the amount, rate, and time, to find the principal.

Rule: Add 1 to the product of the rate and time, and by that sum divide the amount, the quote is the principal: thus,  $p = \frac{a}{rt + 1}$ .

Example:  $a = 276.75 l.$   $r = .05 l.$   $t = 2.5$  years; then is  $p = 246 = \frac{276.75}{2.5 \times .05 + 1} = \frac{276.75}{1.125}$ .

Demonstration: By prob. V. it is  $a = rt + 1 \times p$ ; therefore dividing both sides by  $rt + 1$ , it is  $\frac{a}{rt + 1} = p$ .

Compound INTEREST, is that which is paid for any principal sum, and the simple interest due upon it for any

time, accumulated into one principal sum. Example: if 100 l. is lent out for one year at 6 l. and if at the end of that year the 6 l. due of interest be added to the principal, and the sum 106 l. be considered as a new principal bearing interest for the next year (or whatever less time it remains unpaid) this is called compound interest, because there is interest upon interest, which may go on by adding this second year's interest of 106 l. to the principal 106 l. and making the whole a principal for the next year.

Now, although it be not lawful to let out money at compound interest, yet in purchasing of annuities or pensions, &c. and taking leases in reversion, it is very usual to allow compound interest to the purchaser for his ready money; and therefore, it is very necessary to understand it.

Let therefore, as before,  $p$  = the principal put to interest;  $t$  = the time of its continuance;  $a$  = the amount of the principal and interest;  $R$  = the amount of 1 l. and its interest for one year, at any given rate, which may be thus found.

Viz.  $100 : 106 :: 1 : 1.06$  = the amount of 1 l. at 6 per cent. Or  $100 : 105 :: 1 : 1.05$  = the amount of 1 l. at 5 per cent. And so on, for any other assigned rate of interest.

Then if

$R$  = amount of 1 l. for 1 year, at any rate.

$R^2$  = amount of 1 l. for 2 years.

$R^3$  = amount of 1 l. for 3 years.

$R^4$  = amount of 1 l. for 4 years.

$R^5$  = amount of 1 l. for 5 years.

Here  $t = 5$ . For  $1 : R :: R : RR :: RR : RRR :: RRR : R^4 : R^4 : R^5 : \&c.$  in a geometrical progression continued; that is, as 1 l. is to the amount of 1 l. at 1 year's end: so is that amount: to the amount of 1 l. at 2 years end, &c. Whence it is plain, that compound interest is grounded upon a series of terms, increasing in geometrical proportion continued; wherein  $t$  (viz. the number of years) does always assign the index of the last and highest term, viz. the power of  $R$ , which is  $R^t$ .

Again, as  $1 : R^t :: p : pR^t = a$  the amount of  $p$  for the time, that  $R^t$  = the amount of 1 l. That is, as 1 l. is to the amount of 1 l. for any given time: so is any proposed principal, or sum: to its amount for the same time.

From what has been said, we presume, the reason of the followings theorems will be very easily understood.

Theorem I.  $pR^t = a$ , as above.

From hence the two following theorems are easily deduced.

Theorem II.  $\frac{a}{R^t} = p$ .

Theorem III.  $\frac{a}{p} = R^t$ .

By these three theorems, all questions about compound interest may be truly resolved by the pen only, viz. without tables: though not so readily as by the help of tables calculated on purpose.

Example

**Example I.** What will 256l. 10s. amount to in 7 years, at 5 *per cent. per annum*, compound interest?

Here is given  $p=256\ 5$ ,  $t=7$ , and  $R=1.05$ , which being involved until its index  $=t$  (*viz.* 7) will become  $R^7=1.40710$ . Then  $1.40710 \times 256.5 = 360.92115 = a = 360\text{l. } 18\text{s. } 5\text{d.}$  which is the answer required.

**Example II.** What principal or sum of money must be put out to raise a stock of 360l. 18s. 5d. in seven years, at 5 *per cent. per annum*, compound interest.

Here is given  $a=360.92115$ ,  $R=1.05$  and  $t=7$  to find  $p$  by theorem II. Thus  $R^7=1.40710$  ( $360.92115 = a$ )  $256.5 = p$ . That is,  $p=256\text{l. } 10\text{s.}$  which is the sum or principal required.

**Example III.** In what time will 256l. 10s. raise a stock of (or amount to) 360l. 18s. 5d. allowing 5 *per cent. per annum*, compound interest?

Here is given  $p=256\ 5$ ,  $a=360.92115$ ,  $R=1.05$ .

To find  $t$  by theorem III.  $R^t = \frac{a}{p} = \frac{360.92115}{256} = 1.40710$ . which being continually divided by  $R=1.05$  until nothing remain, the number of those divisions will be  $=7=t$ .

Thus  $1.05$   $1.40710$  ( $1.3400$ , and  $1.05$ ) ( $1.3400$ )  $1.2762$ , and  $1.05$  ( $1.2762$ )  $1.2155$ , and so on until it becomes  $1.05$   $1.05$  ( $1$ . which will be at the seventh division.

Therefore it will be  $t=7$ , the number of years required by the question.

**INTERJECTION**, in grammar, an indeclinable part of speech, signifying some passion or emotion of the mind. See GRAMMAR.

**INTERIM**, a name given to a formulary, or kind of confession of the articles of faith, obtruded upon the Protestants after Luther's death by the emperor Charles V. when he had defeated their forces; so called because it was only to take place in the interim (mean time) till a general council should have decided all points in dispute between the Protestants and Romanists. It retained most of the doctrines and ceremonies of the Romanists, excepting that of marriage, which was allowed to priests, and communion to the laity under both kinds. Most of the Protestants rejected it. There were two other interims, one of Leipsic, the other of Franconia.

**INTERLOCUTOR**, in Scots law. The sentence or judgment of a court of law, is commonly called an interlocutor before decree is extracted.

**INTERLOPERS**, are properly those who, without due authority, hinder the trade of a company or corporation lawfully established, by dealing in the same way.

**INTERLUDE**, an entertainment exhibited on the theatre between the acts of a play, to amuse the spectators while the actors take breath and shift their dresses, or to give time of changing the scenes and decorations.

**INTERMITTENT**, or **INTERMITTING FEVERS**, such fevers as go off and soon return again, in opposition to those which are continual. See MEDICINE.

**INTEROSSEUS**, in anatomy. See ANATOMY, p. 202.

**INTERPOLATION**, among critics, denotes a spurious passage inserted into the writings of some ancient author.

**INTERREGNUM**, the time during which the throne is vacant in elective kingdoms; for in such as are hereditary, like ours, there is no such thing as an interregnum.

**INTERREX**, the magistrate who governs during an interregnum.

**INTERMENT**. See BURIAL.

**INTERROGATION**, or *Point of INTERROGATION*, in grammar, a character of this form (?) serving to denote a question.

**INTERVAL**, in music, the difference between two sounds, in respect of acute and grave; or, that imaginary space terminated by two sounds, differing in acuteness or gravity.

**INTESTATE**, in law, a person that dies without making a will.

**INTESTINES**, in anatomy. See ANATOMY, p. 259.

**INTESTINAL**, something belonging to or seated in the intestines.

**INTRIGUE**, or **INTRIGUE**, an assemblage of events or circumstances, occurring in an affair, and perplexing the persons concerned in it.

In this sense, it is used to signify the nodus or plot of a play or romance; or that point wherein the principal characters are most embarrassed, through the artifice and opposition of certain persons, or the unfortunate falling out of certain accidents and circumstances.

**INTRINSIC**, a term applied to the inner, real, and genuine values, properties, &c. of any thing, in opposition to their extrinsic or apparent values, &c.

**INTRUSION**, in Scots law. See EJECTION.

**INTUITION**, among logicians, the act whereby the mind perceives the agreement or disagreement of two ideas, immediately by themselves, without the intervention of any other; in which case, the mind perceives the truth as the eye doth the light, only by being directed towards it.

**INVECTED**, in heraldry, denotes a thing fluted or furrowed.

Invected is just the reverse of ingrailed, in which the points are turned outward to the field; whereas in invected they are turned inward to the ordinary, and the small semicircles outward to the field. See PLATE CII fig. 2.

**INVECTIVE**, in rhetoric, differs from reproof, as the latter proceeds from a friend, and is intended for the good of the person reproofed; whereas the invective is the work of an enemy, and entirely designed to vex and give uneasiness to the person against whom it is directed.

**INVENTION**, denotes the act of finding any thing new, or even the thing thus found.

**INVERARY**, a parliament town of Scotland, in the county of Argyll, of which it is the capital, situated in Lochfin, forty five miles north-west of Glasgow: W. long.  $5^{\circ}$ , N. lat.  $56^{\circ} 25'$ .

**INVERNESS**, a parliament and port-town of Scotland, the capital of the county of Inverness, situated at the mouth of the river Ness: W. long.  $4^{\circ}$  N. lat.  $57^{\circ} 45'$ .

INVERUR,

**INVERSE**, is applied to a manner of working the rule of three. See **ARITHMETICK**, p. 383.

**INVERURY**, a parliament-town of Scotland, in the county of Aberdeen, situated on the river Don, ten miles west of Aberdeen.

**INVESTIGATION**, properly denotes the searching or finding any thing out by the tracks or prints of the feet; whence mathematicians, schoolmen, and grammarians, come to use the term in their respective researches.

**INVESTITURE**, in Scots law, the writings which constitute a proper feudal right. See **LAW**, tit. 10.

**INULA**, in botany, a genus of the syngenesia polygamia superflua class. The receptacle is naked; the pappus is simple; and the antheræ terminate at the base in two bristles. There are 22 species, 4 of them natives of Britain, *viz.* the helenium, or elecampane; the dysenterica, or middle flea-bane; the pulicaria, or small flea-bane; and the erithmoides, or golden sampire. The root of the elecampane is said to excite urine, and loosen the belly.

**INVOCATION**, in theology, the act of adoring God, and especially of addressing him in prayer for his assistance and protection.

**INVOICE**, an account in writing of the particulars of merchandize, with their value, custom, charges, &c. transmitted by one merchant to another in a distant country. See **BOOK-KEEPING**, p. 618.

**INVOLUCRUM**, among botanists. See **BOTANY**, p. 637.

**INVOLUTION**, in algebra. See **ALGEBRA**, p. 84.

**JOACHIMITES**, in church-history, the disciples of Joachim a cistercian monk, who was an abbot of Flora in Calabria, and a great pretender to inspiration.

The Joachimites were particularly fond of certain ternaries: the Father, they said, operated from the beginning till the coming of the Son; the Son, from that time to theirs, which was the year 1260; and from that time the Holy Spirit was to operate in his turn. They also divided every thing relating to men, to doctrine, and the manner of living, into three classes, according to the three persons in the Trinity.

**JOANNA**, one of the islands of Comoro, situated between the north-west part of Madagascar and Zanguebar, in Africa: E. long. 45°, S. lat. 12°.

**JOB**, or *Book of Job*, a canonical book of the Old Testament, containing a narrative of a series of misfortunes which happened to a man whose name was Job, as a trial of his virtue and patience; together with the conferences he had with his cruel friends, on the subject of his misfortunes, and the manner in which he was restored to ease and happiness. This book is filled with those noble, bold, and figurative expressions, which constitute the very soul of poetry.

Many of the Jewish rabbins pretend that this relation is altogether a fiction: others think it a simple narrative of a matter of fact, just as it happened: while a third sort of critics acknowledge, that the groundwork of the story is true, but that it is wrote in a poetical strain, and decorated with peculiar circumstances, to render the narration more profitable and entertaining.

The time is not set down in which Job lived. Some

have thought that he was much ancients than Moses, because the law is never cited by Job or his friends, and because it is related that Job himself offered sacrifices. Some imagine that this book was wrote by himself; others say, that Job wrote it originally in Syriac or Arabic, and that Moses translated it into Hebrew: but the rabbins generally pronounce Moses to be the author of it, and many Christian writers are of the same opinion.

**JOBBER**, in law, a person that buys and sells cattle for others. Hence stock jobbers are persons who buy and sell stocks for other persons.

**IOGUIS**, among the East-Indians, a kind of hermits, who generally stand under trees, or near their pagods. Some of them go stark naked, holding their arms across over their heads, and continue in that posture all their lives: others lie on the ground, with one leg higher than the other, and their arms raised above their head; and these wretched penitents insensibly lose the use of their arms and legs: some confine themselves in cages, set on the top of a thick stake, fixed in the ground; and these cages are so small, that they put the penitent to prodigious torture: some holding a sabre in one hand, and a kind of shield in the other, go up a kind of crane, where hooking themselves to an iron, which runs a considerable way into their backs, they spring forward into the air, flourishing their sabres, and launching out into extravagant praises of their idols: and others plunge into the Ganges, in hopes of being devoured by a crocodile, fancying that by this means they shall obtain the happiness of the next life.

These miserable wretches are considered by the Indians as perfect models of piety and holiness: they are followed by persons of both sexes, who make a vow of devoting themselves to their service, and are wholly employed in soothing their voluntary sufferings by offering them alms and refreshments. They call the pious to their devotions by ringing a little bell; and when they hold their spiritual conversations, they sit close in a ring, and set up a banner, made of several pieces of stuff, fastened at the end of a stick.

**JOHN**, or *Gospel of St. John*, a canonical book of the New Testament, containing a recital of the life, actions, doctrine, and death of our Saviour Jesus Christ, written by St. John the apostle and evangelist.

St. John wrote his Gospel at Ephesus, after his return from the isle of Patmos, at the desire of the Christians of Asia. St. Jerom says, he would not undertake it, but on condition they shall appoint a public fast, to implore the assistance of God; and that the fast being ended, St. John, filled with the Holy Ghost, broke out into these words, "In the beginning was the word," &c. The ancients assign two reasons for this undertaking: the first is, because, in the other three gospels, there was wanting the history of the beginning of Jesus Christ's preaching, till the imprisonment of John the Baptist; which, therefore, he applied himself particularly to relate. The second reason was, in order to remove the errors of the Gnostics, Ebionites, and other sects.

St

**St. JOHN'S DAY**, the name of two Christian festivals, one observed on June 24, kept in commemoration of the wonderful circumstances attending the birth of St. John the Baptist; and the other on Dec. 27, in honour of St. John the Evangelist.

**St. JOHN'S WORT.** See **HYPERICUM**.

**St. JOHN'S**, in geography, one of the Philippine islands, situated in 126° E. lon. and 7° N. lat.

**St. JOHN'S**, is also an island in the bay of St. Lawrence, situated north of New Scotland: W. lon. 65°, N. lat. 43°.

**JOINERY**, the art of working in wood, or of fitting various pieces of timber together.

It is called by the French *menuiserie*, *q. d.* small work, to distinguish it from carpentry, which is employed about large and less curious works.

**JOINT**, in general, denotes the juncture of two or more things.

The joints of the human body are called by anatomists articulations. See **ANATOMY**, p. 148.

**JOINTURE**, in law, generally signifies a settlement of lands and tenements, made on a woman in consideration of marriage.

**JOINVILLE**, a town of Champaign, in France, situated on the river Marne: E. lon. 5° 15', and N. lat. 48° 27'.

**JOISTS**, or **JOYSTS**, in architecture, those pieces of timber framed into the girders and summers, on which the boards of the floor are laid.

**JONAH**, or *Prophecy of JONAH*, a canonical book of the Old Testament; in which it is related, that Jonah was ordered to go and prophecy the destruction of the Ninevites; but that disobediently attempting a voyage another way, he was discovered by the rising of a sudden tempest, and cast into the sea; where he was swallowed up by a whale, which, having lodged him three days and three nights in his belly, disgorged him upon the shore; whereupon being sensible of his past danger and surprising deliverance, he betook himself to the journey and embassy to which he was appointed; and arriving at Nineveh, the metropolis of Assyria, he, according to his commission, boldly laid open to the inhabitants their sins and miscarriages, and proclaimed their sudden overthrow; upon which the whole city, by prayer and fasting, and a speedy repentance, happily averted the divine vengeance, and escaped the threatened ruin.

**IONIA**, anciently was a province of the Lesser Asia, or Natolia, bounded by Etolia on the north, Lydia on the east, Caria on the south, and the Archipelago on the west.

**IONIC ORDER.** See **ARCHITECTURE**, p. 352.

**IONIC DIALECT**, in grammar, a manner of speaking peculiar to the people of Ionia.

**IONIC SECT** was the first of the ancient sects of philosophers; the others were the Italic and Eleatic. The founder of this sect was Thales, who, being a native of Miletus in Ionia, occasioned his followers to assume the appellation of Ionic: Thales was succeeded by Anaximander, and he by Anaximenes, both of Miletus; Anaxagoras Clazomenius succeeded them, and

Vol. II. Numb. 62.

2

removed his school from Asia to Athens, where Socrates was his scholar. It was the distinguishing tenet of this sect, that water was the principle of all natural things.

**JONK**, or **JONQUE**, in naval affairs, is a kind of small ship, very common in the East Indies: these vessels are about the bigness of our fly-boats; and differ in the form of their building, according to the different methods of naval architecture used by the nations to which they belong. Their sails are frequently made of mats, and their anchors are made of wood.

**JOSHUA**, a canonical book of the Old Testament, containing a history of the wars and transactions of the person whose name it bears. This book may be divided into three parts; the first of which is a history of the conquest of the land of Canaan; the second, which begins at the twelfth chapter, is a description of that country, and the division of it among the tribes; and the third, comprised in the two last chapters, contains the renewal of the covenant he caused the Israelites to make, and the death of their victorious leader and governor. The whole comprehends a term of seventeen, or, according to others, of twenty-seven years.

**JOURNAL**, or **DAY-BOOK**. See **BOOK KEEPING**, p. 583.

**JOURNAL**, at sea. See **NAVIGATION**.

**JOURNAL** is also a name common for weekly essays, news-papers, &c. as the Gray's Inn Journal, the Westminster Journal, the Edinburgh Weekly Journal, &c.

**JOURNEYMAN**, properly one who works by the day only; but it is now used for any one who works under a master, either by the day, the year, or the piece.

**IPECACUANHA**, in the materia medica, a West-indian root, of which there are two kinds, distinguished by their colour, and brought from different places, but both possessing the same virtues, though in a different degree. The one is grey, and brought from Peru; the other is brown, and is brought from the Brazils: and these are indifferently sent into Europe under the general name of ipecacuanha.

These two sorts have been by some supposed to be the roots of two different plants: but this is a mistake; the only difference is, that one grows in a different place, and in a richer and moister soil, and is better supplied with juices than the other.

Ipecacuanha is an excellent, mild, and safe emetic; it is also a noble restraining; and, given in doses too small to vomit, is the greatest of all remedies for a dysentery. Small doses of ipecacuanha, are an excellent remedy in diarrhoeas of a more simple kind; and in the fluxus albus we hardly know a better medicine.

**I POMÆA**, in botany, a genus of the pentandria monogynia class. The corolla is funnel shaped; the stylus is globular; and the capsule has three cells. There are eighteen species, none of them natives of Britain.

**IPSWICH**, a borough and port town of Suffolk, situated on the river Orwell, twenty-four miles south east of Bury.

It sends two members to parliament.

† 9 E

IRELAND,

**IRELAND**, an island of the Atlantic ocean, subject to Great Britain, situated between  $5^{\circ}$  and  $10^{\circ}$  W. long. and between  $51^{\circ}$  and  $56^{\circ}$  N. lat. being bounded by the Northern ocean on the north, by St. George's channel, which divides it from Great Britain, on the east, and by the Atlantic and Western ocean on the south and west. This country is two hundred and fifty miles long, and one hundred and fifty broad; distant from Holyhead in north Wales fifty miles, and from Galloway in Scotland fifteen miles. It is divided into four large provinces, *viz.* Ulster on the north, Leinster on the east, Munster on the south, and Connaught on the west.

**IRIS**, the RAINBOW. See OPTICS.

**IRIS**, in anatomy. See ANATOMY, p. 289.

**IRIS**, the FLOWER-DE LUCE, in botany, a genus of the triandria monogynia class. The corolla consists of six divisions, alternately reflected: the stigmata have the appearance of petals. There are twenty-two species, only two of which are natives of Britain. *viz.* the pseudacorus, or yellow flower-de-luce; and the foetidissima, or stinking gladdon. The root is cathartic, and recommended in dropsies.

**IRON**. See CHEMISTRY, p. 82.

**IRON-SICK**, in the sea-language, is said of a ship or boat, when her bolts or nails are so eaten with rust, and so worn away, that they occasion hollows in the planks, whereby the vessel is rendered leaky.

**IRON-WORM**, in botany. See SIDERITIS.

**IRONY**, in rhetoric, is when a person speaks contrary to his thoughts, in order to add force to his discourse; whence Quintilian calls it *diversiloquium*.

**IROQUOIS**, the name of five nations in North America, in alliance with the British colonies. They are bounded by Canada on the north, by the British plantations of New-York and Pennsylvania on the east and south, and by the lake Ontario on the west.

**IRRADIATION**, the act of emitting subtile effluvia, like the rays of the sun, every way.

**IRTIS**, a great river, which runs from north to south through Russia, falls into the river Oby, and makes part of the boundary between Asia and Europe.

**IRWIN**, a port-town of Scotland, in the bailiwick of Cunningham, situated at the mouth of the river Irwin, on the frith of Clyde: W. long.  $4^{\circ} 40'$ , N. lat.  $55^{\circ} 35'$ .

**ISABELLA**, a fortress of the Austrian Netherlands, situated on the west side of the river Schield, opposite to Antwerp: in E. long.  $4^{\circ} 10'$ , N. lat.  $51^{\circ} 15'$ .

**ISAIAH**, or *Prophecy of ISAIAH*, a canonical book of the Old Testament. Isaiah is the first of the four greater prophets, the other three being Jeremiah, Ezekiel, and Daniel. This prophet was of royal blood, his father Amos being brother to Azariah king of Judah. The style of this prophet is noble, sublime and florid. Grotius calls him the Demosthenes of the Hebrews. He had the advantage, above the other prophets, of improving his diction by conversing with men of the greatest parts and elocution; and this added a sublimity, force, and majesty to what he said. He impartially reprov'd the vices of the age in which he

lived, and openly displayed the judgments of God that were hanging over the Jewish nation: at the same time denouncing vengeance on the Assyrians, Egyptians, Ethiopians, Moabites, Edomites, Syrians, and Arabians, who were instrumental in inflicting those judgments. He foretold the deliverance of the Jews from their captivity in Babylon, by the hands of Cyrus king of Persia, an hundred years before it came to pass; but the most remarkable of his predictions are those concerning the Messiah, in which he not only foretold his coming in the flesh, but all the great and memorable circumstances of his life and death.

**ISATIS**, in botany, a genus of the tetradynamia filiquosa class. The pod is lanceolated, has two valves, and contains but one seed. There are four species, only one of which, *viz.* the tinctoria, or woad, is a native of Britain. It is used by the dyers. See BOTANY, p. 634.

**ISCHÆMUM**, *SCHOENANTH*, in botany, a genus of the polygamia monœcia class. The calix of the hermaphrodite is a glume containing two flowers; the corolla consists of two valves; it has three stamina, two styli, and one seed. The calix, & c. of the male are the same with those of the hermaphrodite. There are two species, both natives of the East Indies.

**ISCHIUM**, in anatomy. See ANAT. p. 172.

**ISCHURY**, in medicine, a disease consisting in an entire suppression of urine. See MEDICINE.

**ISENACH**, a town of Germany in the circle of Upper Saxony, situated in E. long.  $10^{\circ} 12'$ , N. lat.  $51^{\circ}$ .

**ISENARTS**, a town of Germany, in the circle of Austria, and dukedom of Stiria, situated thirty five miles north-west of Gratz.

**ISERNIA**, a town of Naples, in the province of Molise, situated in E. long.  $15^{\circ} 15'$ , N. lat.  $41^{\circ} 36'$ .

**ISH**, in Scots law, signifies *expiry*: thus we say, The ish of a lease. It signifies also *to go out*: thus we say, Free ish and entry from and to any place.

**ISIA**, feasts and sacrifices anciently solemnised in honour of the goddess Isis.

The Isia were full of abominable impurities, and for that reason those who were initiated were obliged to take an oath of secrecy: they held for nine days successively; but were so abominable, that the senate abolished them at Rome, under the consulship of Piso and Gabinius.

**ISINGLASS**. See ICHTHYOCOLLA.

**ISLAND**, a tract of dry land, encompassed with water; in which sense it stands contradistinguished from continent, or terra firma.

**ISLE DE DIEU**, an island in the bay of Biscay, on the coast of France, situated fourteen miles west of the coast of Poitou.

**ISLE of France**, a province of that kingdom, in which the capital city of Paris is situated, being bounded by Picardy on the north, by Champain on the east, by Orleans on the south, and by Normandy on the west.

**ISNARDIA**, in botany, a genus of the tetrandria monogynia class. It has no corolla; the calix consists of four divisions; and the capsul has four cells. There is but one species, a native of France.

**ISNY**,

**ISNY**, a free imperial city of Germany, in the circle of Swabia, situated in E. long.  $10^{\circ}$ , N. lat.  $47^{\circ} 36'$ .

**ISOCHRONAL**, is applied to such vibrations of a pendulum, as are performed in the same space of time as all the vibrations or swings of the same pendulum are, whether the arches it describes be longer or shorter.

**ISOCHRONAL LINE**, that in which a heavy body is supposed to descend without any acceleration.

**ISOLA**, a port town and bishop's see of the hither Calabria, fifteen miles south of St Severino.

**ISOPERIMETRICAL FIGURES**, in geometry, are such as have equal perimeters or circumferences.

**ISOPYRUM**, in botany, a genus of the polyandria polygynia class. It has no calix; the petals are five or more; the nectarium is bilabiated, and tubular; and the capsule contains many seeds. There are three species, none of them natives of Britain.

**ISOCELES TRIANGLE**, in geometry, one that has two equal sides.

**ISPAHAN**, or **SPAHAHN**, the capital city of Eyrac Agem, and of all Persia: it is of an oval form, and twelve miles in circumference: E. lon.  $50^{\circ}$ , N. lat.  $32^{\circ} 30'$ .

**ISPIDA**, in ornithology. See **ALCEDO**.

**ISSUES**, in surgery, are little ulcers made designedly by the surgeon in various parts of the body, and kept open by the patient, for the preservation or recovery of his health. See **SURGERY**.

**ISTHMA**, or **ISTHMIAN GAMES**, one of the four solemn games which were celebrated every fifth year in Greece; so called from the Corinthian isthmus, where they were kept.

**ISTHMUS**, in geography, a narrow neck of land, that joins two continents, or joins a peninsula to the terra firma, and separates two seas,

**ISTRIA**, a peninsula in the north part of the gulph of Venice, bounded by Carniola on the north; and on the south, east, and west, by the sea.

**ITALIAN**, the language spoken in Italy.

**ITALY**, a country situated between seven and nineteen degrees east long. and between thirty-eight and forty-seven degrees north latitude, bounded by Switzerland, and the Alps, which separate it from Germany, on the north; by the gulph of Venice, on the east; by the Mediterranean sea, on the south; and by the same sea and the Alps, which separate it from France, on the west; and if we include Savoy, which lies indeed on the west side of the Alps, between Italy and France, we must extend it a degree farther west: this is usually described, however, with Italy, as it is contiguous to Piedmont, and has the same sovereign, being a province of the king of Sardinia's dominions. Italy is said to resemble a boot, and is in length from north-west to south-east 600 miles; the breadth is very unequal; in the north, which may be called the top of the boot, it is about 400 miles broad from east to west; in the calf of the leg, or middle, it is about 120 miles broad; and towards the south, about the instep, eighty miles broad; and comprehends the following countries or subdivisions. 1. In the north are

the duchies of Savoy, Piedmont, and Montferrat; the territories of Genoa; the duchies of Milan, Mantua, Parma, Modena, and the territories of Venice. 2. In the middle of Italy, are the duchy of Tuscany, the pope's dominions, and the state of Lucca. 3. And in the south is the kingdom of Naples.

**ITCH**, a cutaneous disease, arising from a corruption of a serous lymphatic matter, sometimes attended with mild, sometimes with more obstinate and dangerous symptoms. See **MEDICINE**.

**JUBILEE**, a time of public and solemn festivity among the ancient Hebrews.

This was kept every fiftieth year: it began about autumnal equinox, and was proclaimed by the sound of trumpet throughout all the country. At this time all slaves were released, all debts annihilated, and all lands, houses, wives, and children, however alienated, were restored to their first owners. During this whole year all kind of agriculture was forbidden, and the poor had the benefit of the harvest, vintage, and other productions of the earth, in the same manner as in the sabbatic or seventh year. As this was designed to put the Israelites in mind of their Egyptian servitude, and to prevent their imposing the like upon their brethren, it was not observed by the Gentile profelytes.

The Christians, in imitation of the Jews, have likewise established jubilees, which began in the time of pope Boniface VIII. in the year 1300, and are now practised every twenty-five years; but these relate only to the pretended forgiveness of sins, and the indulgences granted by the church of Rome; together with the privilege of performing a thousand frolics in masquerade.

**JUCATAN**, or **YUCATAN**, a peninsula of Mexico, situated between  $89^{\circ}$  and  $94^{\circ}$  W. long. and between  $16^{\circ}$  and  $21^{\circ}$  N. lat.

**JUDAISM**, the religious doctrines and rites of the Jews. See **JEWS**.

**JUDE**, or *the general epistle of JUDE*, a canonical book of the New Testament, written against the heretics, who, by their disorderly lives and impious doctrines, corrupted the faith and good morals of the Christians. St Jude draws them in lively colours, as men given up to their passions, full of vanity, conducting themselves by worldly wisdom, and not by the spirit of God.

**JUDEA**. See **PALESTINE**.

**JUDENBURGH**, a city of Stiria, in Germany: E. long.  $15^{\circ}$ , N. lat.  $47^{\circ} 22'$ .

**JUDGE**, a chief magistrate of the law, appointed to hear causes, to explain the laws, and to pass sentence.

**Book of JUDGES**, a canonical book of the Old Testament, so called from its relating the state of the Israelites under the administration of many illustrious persons who were called judges, from their being both the civil and military governors of the people, and who were raised up by God upon special occasions, after the death of Joshua, till the time of their making a king. In the time of this peculiar polity, there were several remarkable occurrences, which are recorded in this book. It acquaints us with the gross impiety of a new generation which sprung up after the death of Joshua,

shua, and gives us a short view of the dispensations of heaven towards this people, sometimes relieving and delivering them, and at others severely chastising them by the hands of their enemies.

**JUDGMENT**, among logicians, a faculty or rather act of the human soul, whereby it compares its ideas, and perceives their agreement or disagreement.

**JUDGEMENT**, in law, the sentence of the judges upon a suit, &c.

**JUDOIGNE**, a town of the Austrian Netherlands, in the province of Brabant, situated on the river Gheet, thirteen miles south-east of Louvain, and sixteen north of Namur.

**IVES**, or **St. Ives**, a borough and port-town of Cornwall, situated on the Irish channel: it sends two members to parliament: W. long. 6°, N. lat. 50° 18'.

**JUGERUM**, in Roman antiquity, a square of 120 Roman feet; its proportion to the English acre being as 10000 to 16097.

**JUGULAR**, in anatomy, an appellation given to two veins of the neck, which arise from the subclavians. See **ANATOMY**, part IV.

**IVICA**, or **YVICA**, the capital of an island of the same name, fifty miles east of Valencia in Spain: E. long. 1°, N. lat. 39°.

**JUICE**, denotes the sap of vegetables, or the liquors of animals.

**JUJUBES**, in the materia medica, the name of a fruit of the pulpy kind, produced on a tree which Linnæus makes a species of rhamnus. See **RHAMNUS**.

The jujubes have been made a general ingredient in pectoral decoctions; but they are now seldom used on these occasions, and are scarce at all heard of in prescription, or to be met with in our shops.

**JULEP**, in pharmacy, a medicine composed of some proper liquor, and a syrup or sugar of extemporaneous preparation, without decoction, designed for the concoction or alteration of the humours, or restoring the strength.

**JULIAN**, or **St. JULIAN**, a harbour on the coast of Patagonia, in South America, where ships bound to the south seas usually touch: W. long. 74°, N. lat. 48° 15'.

**JULIAN PERIOD**, in chronology. See **ASTRONOMY**, p. 489.

**JULIERS**, the capital of the duchy of the same name, situated on the river Roer, twenty miles west of Cologne, and as many east of Maastricht: E. long. 6°, N. lat. 50° 55'.

**JULPHA**, or **Old JULPHA**, once the capital of Armenia, but now in ruins, the inhabitants being transplanted to a town within a mile of Ispahan, called New Julpha, and there they carry on a foreign trade with all countries in Asia. The situation of Old Julpha was in E. long. 46°, N. lat. 39°.

**JULY**, in chronology, the seventh month of the year, so called in honour of Julius Cæsar; before whose time it was known by the name of quintilis, as being the fifth month of the old Roman year.

**JUNCUS**, the **RUSH**, in botany, a genus of the hexan-

dria monogynia class. The calix has six leaves; it has no corolla; and the berry is dry, and contains but one seed. There are 19 species, twelve of them natives of Britain.

**JUNGERMANNIA**, a genus of the cryptogamia algæ class. Of which there are 29 species, all natives of Britain.

**JUNIPERUS**, in botany, a genus of the diœcia monadelphica class. The male has no corolla, but has three stamina; the calix of the female consists of three parts; it has three petals, and three styli; and the berry contains three seeds. There are nine species, only one of which, viz. the communis or common juniper, is a native of Britain. The berries are used as carminatives and stomachics.

**JUNK**, in the sea-language, old cables cut into short pieces, and given to boatswains for making swabs, plats, and nippers; as also to the ship carpenters, and to poor people, to be picked into oakum, for caulking ships, &c.

**JUNTO**, in matters of government, denotes a select council for taking cognizance of affairs of great consequence, which require secrecy.

In Spain and Portugal, it signifies much the same with convention, assembly, or board among us: thus we meet with the junto of the three estates, of commerce, of tobacco, &c. See **BOARD**, &c.

**IVORY**, in natural history, &c. a hard, solid and firm substance, of a white colour, and capable of a very good polish. It is the tusk of the elephant, (See **ELEPHAS**,) and is hollow from the base to a certain height, the cavity being filled up with a compact medullary substance, seeming to have a great number of glands in it. It is observed, that the Ceylon ivory, and that of the island of Achem, do not become yellow in the wearing, as all other ivory does; for this reason the teeth of these places bear a larger price than those of the coast of Guinea.

**JUPITER**, in astronomy. See **ASTRONOMY**, p. 441.

**JUREA**, or **JURA**, a strong city in Italy, in the province of Piedmont, situated on the river Doria, subject to the king of Sardinia: E. long. 7°, 36'; N. lat. 45°, 22'.

**JURISPRUDENCE**, the science of what is just or unjust; or the knowledge of laws, rights, customs, statutes, &c. necessary for the administration of justice.

**JURY-MAST**, whatever is set up in room of a mast that has been lost in a storm or in an engagement, and to which a lesser yard, ropes, and sails, are fixed.

**JUS DELIBERANDI**, in Scots law, that right which an heir has, by law, of deliberating for a certain time whether he will represent his predecessor. See **LAW**, tit. 27.

**JUS DEVOLUTUM**, in Scots law, the right of the church, of presenting a minister to a vacant parish, in case the patron shall neglect to use that right within the time limited by law. See **LAW**, tit. 5.

**JUS MARITI**, in Scots law, the right the husband acquires to his wife's moveable estate, in virtue of the marriage. See **LAW**, tit. 6.

**JUS RELICTÆ**, in Scots law, the right the wife has in the

the goods in communion, in case of the previous decease of the husband. See *LAW*, tit. 28.

**JUS PREVENTIONIS**, in Scots law, the preferable right of jurisdiction acquired by a court, in any cause to which other courts are equally competent, by having exercised the first act of jurisdiction. See *LAW*, tit. 2.

**JUST**, a sportive combat on horseback, man against man, armed with lances.

The difference between jousts and tournaments, according to Du Cange, consists in this, that the latter is a genus of which the former is only a species. Tournaments included all kinds of military sports and engagements, which were made out of gallantry and diversion. Jousts were those particular combats, where the parties were near each other, and engaged with lance and sword.

**JUSTICE**, in a moral sense, is one of the four cardinal virtues; which gives every person his due.

**JUSTICE**, in a legal sense, a person deputed by the king to administer justice to his subjects, whose authority arises from his deputation, and not by right of magistracy.

**JUSTICE-SEAT**, is the highest forest-court, always held before the lord chief justice in eyre of the forest; in which court fines are set for offences, and judgments given.

**JUSTICIA**, in botany, a genus of the diandria monogynia class. The corolla is ringent; and the capsule has two cells. There are 19 species, none of them natives of Britain.

**JUSTICIAR**, in the old English laws, an officer instituted by William the Conqueror, as the chief officer of state, who principally determined in all cases civil and criminal. He was called in Latin *Capitalis Justiciarius totius Angliæ*.—For **JUSTICIAR** in Scotland, see *LAW*, tit. 3. § 13.

**JUSTICIARY**, or *Court of JUSTICIARY*, in Scotland. See *LAW*, tit. 3. § 10.

**JUTES**, the ancient inhabitants of Jutland, in Denmark.

**JUTLAND**, a peninsula of Denmark, anciently called the Cimbric Chersonese, situated between 8° and 11° of E. long. and between 55° and 58° of N. lat. bounded by the Categate sea, which separates it from Norway, on the north; by the same sea, which divides it from the Danish islands and Sweden, on the east; by Holstein, on the south; and by the German ocean, on the west. It is divided into north and south Jutland; the south being usually called Sleswic. The whole is about 180 miles in length, and 90 in breadth.

**IVY**, in botany. See *HEDERA*.

**IXIA**, in botany, a genus of the triandria monogynia class. The corolla consists of six open equal petals; and it has three erect stigmata. There are ten species, none of them natives of Britain.

**IXORA**, in botany, a genus of the tetrandria monogynia class. The corolla consists of one long funnel-shaped petal; and the berry contains four seeds. There are three species, none of them natives of Britain.

## K.

### K E D

**KÆMPFERIA**, in botany, a genus of the monandria monogynia class. The corolla consists of six segments, three of them being large and open. There are two species, both natives of India. The root of this plant is the galangal, which was formerly used in bitter infusions, but is now neglected in practice.

**KAKENHAUSEN**, a city of Livonia, subject to Russia: E. long. 26°, N. lat. 57°.

**KALI**, in botany. See *SALSOLA*.

**KALLO**, a town of upper Hungary, situated in a lake twenty miles south east of Tockay.

**KAOLIN**, one of the substances whereof china-ware is made; being no other than a kind of talc reduced to powder, and made into a paste with water.

**KAUSBEUREN**, an imperial city of Germany, thirty-two miles south of Augsburg: E. long. 10° 45', N. lat. 47° 50'.

**KEBLA**, an appellation given by the Mahometans to that part of the world where the temple of Mecca is situated, towards which they are obliged to turn themselves when they pray.

**KEDGING**, in the sea-language, is when a ship is

VOL. II. No. 62.

2

### K E E

brought up or down in a narrow river by means of the tide, the wind being contrary. To do this, they use to set their fore-course, or fore-top sail and mizzen, that so they may flat her about; and if she happens to come too near the shore, they let fall a kedge-anchor, with a hawser fastened to it from the ship, in order to turn her head about; which work is called kedging.

**KEEL**, the lowest piece of timber in a ship, running her whole length from the lower part of her stem to the lower part of her stern-post. Into it are all the lower futtocks fastened; and under part of it, a false keel is often used.

**KEELSON**, a principal timber in a ship, fayed within-side cross all the floor timbers; and being adjusted to the keel with suitable scarfs, it serves to strengthen the bottom of the ship.

**KEEPER of the great seal**, is a lord by his office, is styled lord keeper of the great seal of Great-Britain, and is always one of the privy council. All grants, charters and commissions of the king under the great seal, pass through the hands of the lord-keeper; for without that seal, many of those grants, &c. would be

†

2 F

be

be of no force; the king being, in the interpretation of the law, a corporation, and therefore passes nothing but by the great seal, which is also said to be the public faith of the kingdom, being in the highest esteem and reputation.

Whenever there is a lord-keeper, he is invested with the same place, authority, preeminence, jurisdiction, or execution of laws, as the lord chancellor of Great-Britain is vested with.

The lord-keeper is constituted by the delivery of the great seal, &c.

**KEEPER of the privy seal**, is also a lord by his office, through whose hands all grants, pardons, &c. pass before they come to the great seal, and even some things pass this officer's hands which do not pass the great seal at all. This officer is also one of the privy council, yet was anciently called clerk of the privy seal. His duty is to put the seal to no grant, &c. without a proper warrant; nor with warrant where it is against law, or inconvenient, but shall first acquaint the king therewith.

**KEISER WAERT**, a strong town of Germany in the circle of Westphalia and duchy of Berg, situated on the Rhine, twenty-five miles north of Cologne, E. lon.  $6^{\circ} 8'$ , N. lat.  $51^{\circ} 20'$ .

**KELLINGTON**, a borough-town of Cornwall, thirteen miles south of Launceston, which sends two members to parliament.

**KELP**, a fixed salt, or particular species of pot-ash, procured by burning a species of *salicofa*. See *SALICOSA*.

**KELSO**, a town of Scotland, in the shire of Mers, or Roxburgh, situated on the north side the Tweed, twenty miles south-west of Berwick.

**KEMPTEN**, a city of Germany, in the circle of Swabia, situated on the river Iser: E. lon.  $10^{\circ} 7'$ , N. lat.  $47^{\circ} 38'$ .

**KENDAL**, a market-town of Westmoreland, twenty-two miles south-west of Appleby.

**KENKS**, in the sea language, doublings in a rope or cable, when banded in and out, so that it does not run easy; or when any rope makes turns or twists, and does not run free in the block, then it is said to make kenks.

**KENNING to a TERCE**, in Scots law, the dividing or setting off that part of the husband's estate to his relief which he is entitled to liferent after his death. See *TERCE*.

**KENSINGTON**, a pleasant village in the county of Middlesex, two miles west of London; where is a royal palace, with large and fine gardens.

**KENT**, a county bounded by the river Thames on the north, by the ocean on the east, by Sussex and the Straits of Dover on the south, and by Surrey on the west.

**KERMAN**, the capital of the province of Kerman, or Carimania, in Persia: E. lon.  $56^{\circ} 30'$ , N. lat.  $30^{\circ}$ .

**KERMES** in botany. See *LEX*.

**KERMES MINERAL**. See *CHEMISTRY*, p. 140.

**KERRY**, a county of Ireland, in the province of Munster, bounded by the river Shannon, which divides it from Clare, on the north; by Limeric and Cork, on

the east; by another part of Cork, on the south; and by the Atlantic Ocean, on the west.

**KESSEL**, a town of Upper Guelderland, in the quarter of Roermonde, situated on the river Meuse: E. lon.  $6^{\circ}$ , N. lat.  $51^{\circ} 25'$ .

**KESTRIL**, in ornithology. See *FALCO*.

**KETMIA**, in botany. See *HIBISCUS*.

**KETTERING**, a market-town of Northamptonshire, ten miles north-east of Northampton.

**KETCH**, in naval architecture, a vessel with two masts. See *SHIP*.

**KEVEL**, in ship-building, a piece of plank sayed against the quickwork on the quarter-deck, in the shape of a semicircle; about which the running rigging is belaid.

**KEXHOLME**, the capital of the province of the same name in Finland, situated on the lake Ladoga, eighty miles north of Petersburg: E. lon.  $30^{\circ}$ , N. lat.  $61^{\circ} 30'$ .

**KEY**, a well known instrument for opening and shutting the locks of doors, chests, buroes, and the like.

**KEY**, in music, a certain fundamental note, or tone, to which the whole piece, be it in concerto, sonata, cantata, &c. is accommodated, and with which it usually begins, but always ends.

**KEY-STONE** of an arch, or vault, that placed at the top or vertex of an arch, to bind the two ~~swags~~ together.

**KIAM**, a great river of China, which, taking its rise near the west frontier, crosses the whole kingdom eastward, and falls into the bay or gulph of Nanking, a little below that city.

**KIAMSI**, a province of China, bounded by that of Nanking on the north, and by that of Canton on the south.

**KIDDERMINSTER**, a market-town twelve miles north of Worcester.

**KIDNEYS**, in anatomy. See *ANATOMY*, p. 268.

**KIGGELARIA**, in botany, a genus of the dioecia decandria class. The calix of both male and female consists of five segments, and the corolla of five petals; the antheræ of the male are perforated at the apex: The female has five styli; the capsule has five valves, one cell, and many seeds. There is but one species, a native of Ethiopia.

**KIDDARE**, the capital of a county of the same name, in Ireland, twenty-seven miles south-west of Dublin.

**KILDERKIN**, a liquid measure, containing two firkins.

**KILKENNY**, a county of Ireland, in the province of Leinster, bounded by Queen's County, on the north; by the county of Wexford, on the east; by Waterford, on the south; and by the county of Tipperary, on the west. It is also the name of the capital of that county; and is situated in W. lon.  $7^{\circ} 15'$ , N. lat.  $52^{\circ} 20'$ .

**KIMBOLTON**, a market-town of Huntingdonshire, nine miles south-west of Huntingdon.

**KING**, in the general acceptation of the word, is a person who has a supreme authority, with the power of levying taxes, making laws, and enforcing an obedience to them: but in Britain, which is a limited monarchy.

monarchy, the power of the king is greatly restrained ; which is so far from diminishing his honour, that it adds a glory to his crown ; for while other kings are absolute monarchs over innumerable multitudes of slaves, the king of England has the distinguished glory of governing a free people, the least of whom is protected by the laws : he has great prerogatives, and a boundless power in doing good ; and is at the same time only restrained from acting inconsistently with his own happiness, and that of his people. He has all the ensigns of royalty, and all the marks of sovereignty ; but while he has the power of making treaties, of sending and receiving ambassadors, of conferring titles of honour, creating privy counsellors, officers of state, and judges, and may raise men and arms both for sea and land, he cannot force his subjects to maintain them, or raise one tax by his sole authority : he has the privilege of coining money, but he cannot force the meanest subject to part with his property : he can pardon a criminal ; but he cannot put a subject to death, till he is condemned by his peers : he may at his pleasure call, continue, prorogue, and dissolve parliaments, and without his royal assent no bill in parliament can pass into a law ; yet he can neither act contrary to law, nor make new laws by his sole authority ; on the contrary, he may even be sued and cast in his own courts.

At his coronation, he takes an oath to govern his people according to the statutes agreed on in parliament, to cause law and justice in mercy to be executed in all his judgments ; to maintain, as much as in him lies, the laws of God, the true profession of the gospel, and the protestant reformed religion by law established. But tho' he may mitigate the rigour of the law, and forgive offenders, he cannot pardon murder, where an appeal is brought by the subject ; nor any other crime, when the offender is impeached by the house of commons. He may lay an embargo on shipping, but then it ought to be for the public good, and not for the private advantage of any particular traders. Writs, processes, commissions, &c. are in his name ; and he has a power not only to make courts, but to create universities, colleges, and boroughs ; to incorporate a city or town, and to grant franchises to such corporations ; but they must not, under colour thereof, set up a monopoly. He is esteemed the head of the church in that part of his dominions called England. But notwithstanding these and other prerogatives, the king can take what he has a right to only by due course of law. In short, he has a principal share in the legislative power, and the whole executive power is lodged in him ; he is supposed present in all his courts, he can do no wrong, and, according to the laws of England, he never dies.

**KING'S BENCH**, a court in which the king was formerly accustomed to sit in person, and on that account was moved with the king's household. This was originally the only court in Westminster-hall, and from this it is thought that the courts of common pleas and exchequer were derived. As the king in person is still presumed in law to sit in this court, though only represented by his judges, it is said to have supreme

authority ; and the proceedings in it are supposed to be *coram nobis*, that is, before the king. This court consists of a lord chief justice and three other justices or judges, who are invested with a sovereign jurisdiction over all matters, whether of a criminal or public nature. All crimes against the public good, though they do not injure any particular person, are under the cognizance of this court ; and no private subject can suffer any unlawful violence or injury against his person, liberty, or possessions, but a proper remedy is afforded him here ; not only for satisfaction of damages sustained, but for the punishment of the offender : and wherever this court meets with an offence contrary to the first principles of justice, it may punish it. It frequently proceeds on indictments found before other courts, and removed by *certiorari* into this. Persons illegally committed to prison, though by the king and counsel, or either of the houses of parliament, may be bailed in it ; and in some cases, even upon legal commitments. Writs of *mandamus* are issued by this court, for the restoring of officers in corporations, &c. unjustly turned out, and freemen wrongfully disfranchised.

The court of king's bench is now divided into a crown-side and plea-side, the one determining criminal, and the other civil causes : in the first it determines criminal matters of all kinds, where the king is plaintiff ; such as treasons, felonies, murders, rapes, robberies, riots, breaches of the peace, and all other causes that are prosecuted by indictment, information, &c. On the plea-side, it determines all personal actions commenced by bill or writ ; as actions of debt, upon the case, detinue, trover, ejectment, trespass, waste, &c. against any person in the custody of the marshal of the court, as every person sued here is supposed to be by law.

The officers of this court on the crown-side are the clerk and secondary of the crown ; and on the side of the pleas there are two chief clerks or prothonotaries, and their secondary and deputy, the *custos breviarum*, two clerks of the papers, the clerk of the declarations, the signer and sealer of bills, the clerk of the rules, clerk of the errors, and clerk of the bills ; to which may be added the filazers, the marshal of the court, and the crier.

**Books of KINGS**, two canonical books of the Old Testament, so called because they contain the history of the kings of Israel and Judah, from the beginning of the reign of Solomon, down to the Babylonish captivity, for the space of near six hundred years.

It is probable that these books were composed by Ezra, who extracted them out of the public records, which were kept of what passed in that nation.

**KING'S COUNTY**, a county of Ireland, in the province of Leinster, bounded by West meath on the north, by the county of Kildare on the east, by Queen's county and Tipperary on the south, and by the river Shannon, which separates it from Galway, on the west.

**KING'S-EVIL**. See **MEDICINE**.

**KING'S FISHER**, in ornithology. See **ALCEDO**.

**KINGHORN**, a town of Scotland, on the coast of Fife, nine miles north of Edinburgh.

**KINGSTON**,

**KINGSTON**, a market-town of Surry, situated on the river Thames, twelve miles west of London.

**KINGSTON**, a port-town of Jamaica, situated on the north side of the bay of Port royal: W. long. 77°, N. lat. 17° 32'.

**KINROSS**, a town of Scotland, in the shire of Fife, situated on the lake of Loch Leven, twenty miles north of Edinburgh.

**KINSALE**, a port-town of Ireland, in the county of Cork and province of Munster, situated on the river Bandon, fourteen miles south of the city of Cork: W. long. 8° 20', and N. lat. 51° 32'.

**KIOF**, or **KIOW**, the capital of the Russian Ukraine, on the frontiers of Poland: E. long. 30° 30', and N. lat. 51°.

**KIRK**, a Saxon term, signifying the same with church.

**KIRK-OSWALD**, a market town of Cumberland, twelve miles south of Carlisle.

**KIRK-SESSIONS**, an inferior church judicatory in Scotland, consisting of the ministers, elders, and deacons of a parish.

It regulates matters relating to public worship, catechising, visitations, &c. and judges in cases of fornication and lesser scandals.

**KIRKALDY**, a town of Fifeshire, in Scotland, ten miles north of Edinburgh.

**KIRKHAM**, a market town of Lancashire, sixteen miles south of Lancaster.

**KIRKUDBRIGHT**, a parliament-town of Scotland, which ranks with Dumfries, Annan, &c. situated on a bay of the Irish sea, sixty miles west of Carlisle: W. long. 4° 5', and N. lat. 54° 38'.

**KIRKWALL**, the capital of the Orkney-islands, and situated in that of Pomona, is a parliament-town, which classes with Dingwall, Tain, &c. W. long. 25°, and N. lat. 59° 45'.

**KITCHEN-GARDEN**, a piece of ground laid out for the cultivation of fruit, herbs, pulse, and other vegetables used in the kitchen. See **GARDENING**.

**KITE**. See **FALCO**.

**KNARESBOROUGH**, a borough-town in the north riding of Yorkshire, fifteen miles north of York. It sends two members to parliament.

**KNAVE**, in old law-books, an appellation given to a manservant, or even to a male child.

**KNAVESHIP**, in Scots law, one of the names of the small-duties payable in thirlage to the miller's servants, called sequels. See **SCOTS LAW**, tit. 16.

**KNAUTIA**, in botany, a genus of the tetrandria monogynia class. The common calix is oblong, simple, and contains five flowers; the proper calix is simple, and above the fruit; the corollulæ are irregular; and the receptacle is naked. There are two species, none of them natives of Britain.

**KNEE**, in anatomy, the articulation of the thigh and leg-bones. See **ANATOMY**, part I. &c.

**KNEE**, in a ship, a crooked piece of timber, bent like a knee, used to bind the beams and futtocks together, by being bolted fast into them both. These are used about all the decks.

**Carling-KNEES**, in a ship, those timbers which extend from the sides to the hatch-way, and bear up the deck on both sides.

**KNIFE**, a well-known instrument, made for cutting.

All sorts of knives are prohibited to be imported.

**KNIGHT**, among the Romans, a person of the second degree of nobility, following immediately that of the senators.

Part of the ceremony whereby this honour was conferred, was the giving of an horse; for each had an horse at the public charge, and received the stipend of a horseman, to serve in the wars.

When the knights were taken in among the senators, they resigned the privilege of having an horse kept for them at the charge of the public: then it became necessary, in order to be a knight, that they should have a certain revenue, that their poverty might not disgrace the order; and when they failed of the prescribed revenue, they were expunged out of the list of knights, and thrust down among the Plebeians. Ten thousand crowns is computed to have been the revenue required.

The knights at length grew so very powerful, that they became a balance between the power of the senate and people: they neglected the exercises of war, and betook themselves principally to civil employments in Rome.

**KNIGHT**, in a modern sense, properly signifies a person, who, for his virtue and martial prowess, is by the king raised above the rank of gentlemen, into an higher class of dignity and honour.

Knighthood was formerly the first degree of honour in the army, and usually conferred with a great deal of ceremony on those who had distinguished themselves by some notable exploit in arms: the ceremonies at their creation have been various; the principal was a box on the ear, and a stroke with a sword on the shoulder; they put on him a shoulder-belt, and a gilt sword, spurs, and other military accoutrements; after which being armed as a knight, he was led to the church in great pomp. Camden describes the manner of making a knight-bachelor among us, which is the lowest, though the most ancient order of knighthood, to be thus: the person kneeling, was gently struck on the shoulder by the prince, and accosted in these words, "Rise, or be a knight, in the name of God."

**KNIGHT** is also understood of a person admitted into any order, either purely military, or military and religious, instituted by some king or prince, with certain marks and tokens of honour and distinction, as the knights of the garter, knights of the thistle, knights of Malta, the knights of the Holy Ghost, &c.

**KNIGHTS-ERRANT**, a pretended order of chivalry, much talked of in old romances, being a kind of heroes that travelled the world in search of adventures, redressing wrongs, rescuing damsels, and taking all occasions of signalizing their prowess. This romantic bravery of the old knights was heretofore the chimera of the Spaniards.

**KNIGHTS of the shire**, or **KNIGHTS of parliament**, in the

the British polity, are knights or gentlemen of estate, who are elected, on the king's writ, by the freeholders of every county, to represent them in parliament.

The qualifications of a knight of the shire in England, is to be possessed of 600*l.* *per. ann.* in a freehold estate; and in Scotland 400*l.* Scots valued rent, or 40. shillings of old extent. Their expences during their sitting, were, by a statute of Hen. VIII. to be defrayed by the county; but this is now scarce ever required.

**KNIGHT-MARSHAL**, an officer in the king's household, who has jurisdiction and cognizance of any transgression within the king's household and verge; as also of contracts made there, whereof one of the house is party.

**KNIGHTS**, in a ship, two thick short pieces of wood, commonly carved like a man's head, having four shivers in each, three for the halyards, and one for the top-ropes to run in: one of them stands fast bolted on the beams abaft the foremast, and is therefore called the fore-knight; and the other, standing abaft the main mast, is called the main knight.

**KNOWLEDGE**, is defined, by Mr Locke, to be the

perception of the connection and agreement, or disagreement and repugnancy, of our ideas.

**KONIGSBURG**, a city of Poland, the capital of ducal Prussia, and of the king of Prussia's Polish dominions, situated on the river Pregel, near a bay of the Baltic sea, seventy miles north-east of Dantzick: E. long. 21°, and N. lat. 54° 40'.

**KORAN**, or **ALCORAN**. See **MAHOMETANISM**.

**KOS**, in Jewish antiquity, a measure of capacity, containing about four cubic inches: this was the cup of blessing, out of which they drank when they gave thanks after solemn meals, like that of the passover.

**KUR**, the ancient Cyrus, a river of Persia, which rises in the mountains of Georgia, and running south-east by Teflis, unites its streams with the river Arras (the ancient Arraxes) and falls into the Caspian sea, south of Baku.

**KUTUCHTA**, among the Calmuc Tartars, the name of their high-priest, or sovereign pontiff; formerly only the deputy of the delai-lama, or high-priest of the Tartars, but at present independent on him.

\*\*\*\*\*

## L.

### L A B

**L** A, in music, the syllable by which Guido denotes the last sound of each hexachord: if it begins in C, it answers to our A; if in G, to E; and if in F, to D.

**LABARUM**, in Roman antiquity, the standard borne before the Roman emperors; being a rich purple streamer, supported by a spear.

**LABDANUM**, or **LADANUM**, a resin of the softer kind, though of too firm a consistence to be ranked among the fluid ones.

There are two kinds of it kept in the shops; one usually imported in bladders, to preserve it in its genuine soft consistence, and to prevent the evaporation of its finer parts; another in rolls, much inferior to the former in purity and virtue.

Labdanum should be chosen soft and moist, of a strong smell, pure, very inflammable, and diffusing a fragrant smell while burning. It is a resinous juice which exudes from a tree of the cistus-kind.

In medicine it is used externally, to attenuate and discuss tumours; internally, it is more rarely used, but it is greatly extolled by some against catarrhs, and in dysenteries.

**LABEL**, in heraldry, a fillet usually placed in the middle along the chief of the coat, without touching its extremities. Its breadth ought to be a ninth part of the chief. It is adorned with pendants; and when there are above three of these, the number must be specified in blazoning.

This is a kind of addition to the arms of a second

VOL. II. Numb. 62.

2

### L A B

brother, to distinguish him from the first, and is esteemed the most honourable of all differences. See **PLATE CII**.

**LABIAL LETTERS**, those pronounced chiefly by means of the lips.

**LABIATED FLOWERS**, monopetalous flowers, consisting of a narrow tube, with a wide mouth, divided into two or more.

**LABIAU**, a port-town of Prussia, situated on a bay of the Baltic sea, twenty miles north-east of Königsburg: E. long. 22° 15', N. lat. 55°.

**LABORATORY** or **ELABORATORY**, the chemists work-house, or the place where they perform their operations; where the furnaces are built, their vessels kept, &c. and in general, the term laboratory, is applied to any place where physical experiments in pharmacy, chemistry, pyrotechny, &c. are performed. See **CHEMISTRY**, p. 108, &c.

**LABOUR**, in general, denotes a close application to work or business. Among seamen a ship is said to be in labour, when she rolls and tumbles very much, either a hull, under sail, or at anchor.—It is also spoke of a woman in travail or child birth. See **MIDWIFERY**.

**LABOURER**, generally signifies one that does the most slavish and less artful part of a laborious work, as that of husbandry, masonry, &c.

**LABRADOR**, also called New-Britain, and Eskimaux, is a country in North America, bounded by Hudson's Straits and the Atlantic Ocean, on the north; by the same ocean, on the east; by the river of St. Lawrence

and

† 9 C

and Canada, on the south; and by Hudson's bay, on the west: situated between  $59^{\circ}$  and  $79^{\circ}$  of W. long. and between  $50^{\circ}$  and  $64^{\circ}$  of N. lat.

**LABRUS**, in ichthyology, a genus of fishes belonging to the order of thoracici, the characters of which are these. The teeth are sharp, and the lips are simple and very thick; there are six bony rays in the membrane of the gills, and the opercula are scaly. The rays of the back fin are furnished with a thread-like ramentum behind; the breast fins are sharp-pointed; and the lateral line is straight. There are forty-one species of labrus, distinguished by the shape of the tail, fins, colour, &c.

**LABURNUM**, in botany. See **CYTISUS**.

**LABYRINTH**, in anatomy. See **ANATOMY**, p. 297.

**LAC**, MILK, among physicians, &c. See **MILK**.

**LACCA**, or **LAC**, in natural history, improperly called gum-lac, a sort of wax of a red colour, collected in the East-Indies by certain insects, and deposited on sticks flattened for that purpose in the earth. It is brought over, either adhering to the sticks, or in small transparent grains, or in semi-transparent flat cakes: the first is called stick lac, the second seed lac, and the third shell lac. On breaking a piece of stick lac, it appears composed of regular cells like the honey-comb, with small corpuscles of a deep red colour lodged in them: these are the young insects, and to these the lac owes its tincture, for when freed from them its colour is very dilute. The shell and seed lacs, which do not exhibit any insects or cellular appearance upon breaking, are supposed to be artificial preparations of the other: the seed sort is said to be the stick lac bruised and robbed of its more soluble parts; and the shell to be the seed lac, melted and formed into cakes. The stick lac therefore is the genuine sort, and ought alone to be employed for medicinal purposes. This concrete is of great esteem in Germany and other countries, for laxity and sponginess of the gums, proceeding from cold; or a scorbutic habit: for this use the lac is boiled in water, with the addition of a little alum, which promotes its solution: or a tincture is made from it with rectified spirit. This tincture is recommended also internally in the fluor albus, and in rheumatic and scorbutic disorders: it has a grateful smell, and a not unpleasant, bitterish, astringent taste: in the Edinburgh pharmacopœia, a tincture is directed to be made with spirit of scurvy grass. The principal use of lac among us is in certain mechanic arts as a colouring drug, and for making sealing wax.

**LACE**, in commerce, a work composed of many threads of gold, silver or silk, interwoven the one with the other, and worked upon a pillow with spindles, according to the pattern designed. The open work being formed with pins, which are placed and displaced as the spindles are moved.

The importation of gold and silver lace is prohibited.

**Bone LACE**, a lace made of fine linen thread or silk, much in the same manner as that of gold and silver. The pattern of the lace is fixed upon a large round pillow, and pins being stuck into the holes or openings in the pattern, the threads are interwoven by means of a

number of bobbins made of bone or ivory, each of which contains a small quantity of fine thread, in such a manner as to make the lace exactly resemble the pattern. There are several towns in England, and particularly in Buckinghamshire, that carry on this manufacture; but vast quantities of the finest laces have been imported from Flanders.

**LACEDEMON**, the ancient name of Mithra. See **MISITHRA**.

**LACERTA**, the lizard, in zoology, a genus of amphibious animals belonging to the order of reptilia, the characters of which are these: The body is naked, with four feet, and a tail. There are 49 species, viz.

1. The crocodylus, or crocodile, has a compressed jagged tail, five toes on the fore-feet, and four on the hind-feet. This is the largest animal of the lizard kind. One that was dissected at Siam, an account of which was sent to the Royal Academy at Paris, was eighteen feet and a half long, of which the tail was no less than five feet and a half, and the head and neck above two and a half. He was four feet and nine inches in circumference where thickest.

The hinder legs, including the thigh and the paw, were two feet and two inches long; the paws, from the joint to the extremity of the longest claws, were above nine inches. They were divided into four toes; of which three were armed with large claws, the longest of which was an inch and a half, and seven lines and a half broad at the root. The fourth toe was without a nail, and of a conical figure; but was covered with a thick skin like shagreen leather. These toes were united with membranes like those of ducks, but much thicker.

The fore-legs had the same parts and conformation as the arms of a man, both within and without; but they were somewhat shorter than those behind. The hands had five fingers, the two last of which had no nails, and were of a conical figure, like the fourth toe on the hind paws. The head was long, and had a little rising at the top; but the rest was flat, and especially towards the extremity of the jaws. It was covered with a skin, which adhered firmly to the skull and to the jaws. The skull was rough and unequal in several places; and about the middle of the forehead there were two bony crests, about two inches high. They were not quite parallel, but separated from each other in proportion as they mounted upwards.

The eye was very small in proportion to the rest of the body, and was so placed within its orbit, that the outward part, when shut, was only a little above an inch in length, and run parallel to the opening of the jaws.

The nose was placed in the middle of the upper jaw, near an inch from its extremity, and was perfectly round and flat, being two inches in diameter, of a black, soft, spongy substance, not unlike the nose of a dog. The nostrils were in the form of a Greek capital  $\Sigma$ , and there were two caruncles which filled and closed them very exactly, and which opened as often as he breathed through the nose. The jaws seemed to shut one within another by means of several apophyses, which

LABEL

*A. Bell & Sons*

which proceeded from above downwards, and from below upwards, there being cavities in the opposite jaw to receive them. They had twenty-seven dog-teeth in the upper jaw, and fifteen in the lower, with several void spaces between them. They were thick at the bottom, and sharp at the point; being all of different sizes, except ten large hooked ones, six of which were in the lower jaw, and four in the upper. The mouth was fifteen inches in length, and eight and a half in breadth where broadest; and the distance of the two jaws, when opened as wide as they could be, was fifteen inches and a half. The skull, between the two crests, was proof against a musket ball, for it only rendered the part a little white that it struck against.

The colour of the body was of a dark brown on the upper part, and of a whitish citron below, with large spots of both colours on the sides. From the shoulders to the extremity of the tail he was covered with large scales of a square form, disposed like parallel girdles, and were fifty-two in number; but those near the tail were not so thick as the rest. In the middle of each girdle there were four protuberances, which became higher as they approached the end of the tail, and composed four rows, of which the two in the middle were lower than the remaining two, forming three channels, which grew deeper the nearer they came to the tail, and were confounded with each other about two feet from its extremity.

The skin was defended with a sort of armour, which, however, was not proof against a musket ball, contrary to what has been commonly said. However, it must be acknowledged, that the attitude in which it was placed might contribute not a little thereto; for probably, if the ball had struck obliquely against the shell, it would have flown off. Those parts of the girdles underneath the belly were of a whitish colour, and were made up of scales of divers shapes. They were about one sixth of an inch in thickness, and were not so hard as those on the back.

This creature lays eggs of the size of those of a goose, to the number of sixty; which she covers over with sand, and leaves to be hatched by the heat of the sun. They are to be met with in the rivers Nile, Niger, and Ganges, besides most other large rivers in the southern parts of Asia, Africa, and America.

The crocodile is very destructive to the lower people of Upper Egypt, often devouring women who come to the river to fetch water, and children playing on the shore or swimming in the river.

2. The *caudiverbera*, has a depressed pinnatifid tail, and palmated feet. It is larger than the common green lizard, is found in Peru, and has got its name from its beating the ground with its tail. 3. The *dracæra*, has a long tail dentated above, a smooth body, and equal toes. It is a native of America. 4. The *superciliosa*, has a carinated tail, and the scales on the back and eye-brows are ciliated. It is a native of the Indies. 5. The *scuata*, has a subcompressed tail, and a dentated future on the back. It is a native of Asia. 6. The *monitor*, has a carinated tail, and white eye-like spots on the body. It is a native of the

Indies. 7. The *principalis*, has a carinated tail, a crest on the throat, and a smooth back. It is found in south America. 8. The *bicarinata*, has a compressed tail with a double carina, and a quadruple carina on the back. It is a native of the Indies. 9. The *cordylus* has a short verticillated tail, and dentated scales. It is found in Africa and Asia. 10. The *stellio*, has a verticillated tail, and dentated scales. It is a native of Africa. 11. The *mauritanica*, has a short verticillated tail smooth at the apex. It is found in Mauritania. 12. The *azurea*, has a short verticillated tail, and sharp pointed scales. It is a native of Africa. 13. The *turcica*, has a verticillated tail, and a rough grey body. It is a native of the East Indies. 14. The *ameiva*, has a long verticillated tail, 30 scutæ on the belly, and a plaited collar. It is a native of America. 15. The *agilis*, has a pretty long verticillated tail, with sharp scales, and a collar formed by scales. This is the common green lizard, and is a native both of Europe and India. 16. The *algira*, has a pretty long verticillated tail, and a yellow line on each side of the body. It is found in Mauritania. 17. The *seps* has a long verticillated tail, with a reflected lateral future, and square scales. It is a native of warm climates. 18. The *sex-lineata*, has a long verticillated tail, and six white lines on the back. It is a native of Carolina. 19. The *angulata*, has a long hexagonal tail, and sharp carinated scales. It is a native of America.

20. The *chamæleon*, has a crooked cylindrical tail.

The head of a large *chamæleon* is almost two inches long, and from thence to the beginning of the tail it is four inches and a half. The tail is five inches long, and the feet two and a half. The thickness of the body is different at different seasons; for sometimes from the back to the belly it is two inches, and sometimes but one; for he can blow himself up and contract himself at pleasure. This swelling and contraction is not only of the back and belly, but of the legs and tail.

These different motions are not like those of other animals, which proceed from a dilatation of the breast in breathing, and which rises and falls successively; but they are very irregular, as in tortoises, and frogs. The *chamæleon* has continued as it were blown up for two hours together, and then he would grow less and less insensibly; for the dilatation was always more quick and visible than the contraction. In this last state he appeared extremely lean, and the spine of the back was sharp, and all his ribs might be told; likewise the tendons of the arms and legs might be seen very distinctly.

The skin is very cold to the touch; and, notwithstanding he seems so lean, there is no feeling the beating of the heart. The surface of the skin is unequal, and has a grain not unlike flageen, but very soft, because each eminence is as smooth as if it was polished. Some of these are as large as a middling pin's head on the arms, legs, belly, and tail, but on the shoulders and head they are of an oval figure, and a little larger. Those under the throat are ranged in the form of a chap-

let,

let, from the lower lip to the breast. Some on the head and back are amassed together in clusters, with spaces between them, on which are almost imperceptible spots of a pale red and yellow colour; as well as the ground of the skin itself; which plainly appears between these clusters. This ground changes colour when the animal is dead, becoming of a greyish brown, and the small spots are whitish.

The colour of all these eminences, when the *chamæleon* is at rest in a shady place, is of a bluish grey, except on the claws, where it is white with a little yellow; and the spaces between the clusters is of a pale red and yellow, as was before observed. But when he is in the sun, all parts of the body which are affected with the light, become of a greyish brown, or rather of a tawny. That part of the skin which the sun does not shine on, changes into several brighter colours, which form spots of the size of half one's finger. Some of these descend from the spine half way on the back; and others appear on the sides, arms, and tail. They are all of an isabella colour, from a mixture of a pale yellow and of a bright red, which is the colour of the ground of the skin.

The head of a *chamæleon* is not unlike that of a fish, it being joined to the breast by a very short neck, covered on each side with cartilaginous membranes resembling the gills of fishes. There is a crest directly on the top of the head, and two others on each side above the eyes, and between these there are two cavities near the top of the head. The muzzle is blunt, and not much unlike that of a frog; at the end there is a hole on each side for the nostrils, but there are no ears, nor any sign of any.

The jaws are furnished with teeth, or rather with a bone in the form of teeth, which he makes little or no use of, because he lives upon swallowing flies and other insects, without chewing them. The form, structure, and motion of the eyes, have something very particular; for they are very large, being almost half an inch in diameter. They are of a globous figure; which may be easily seen, because they stand out of the head. They have a single eye-lid like a cap, with a hole in the middle, through which the sight of the eye appears, which is of a shining brown, and round it there is a little circle of a gold colour. This eye-lid has a grain like shagreen, as well as the other parts of the skin; and when the rest of the body changes colour, and assumes spots of different shapes, those on the lid always keep the same form, though they are tinged with the same colour as the skin. But the most extraordinary thing relating to the eyes is, that this animal often moves one when the other is entirely at rest; nay, sometimes one eye will seem to look directly forward, and the other backward; and one will look up to the sky when the other regards the earth.

That part of the body which is called the trunk, and comprehends the thorax and the belly, in a *chamæleon* is almost all thorax with little or no belly. The four feet are all of a length; and the only difference between them is, that those before are turned

backwards, and those behind forwards. There are five toes on each paw, which have a greater resemblance to hands than feet. They are all divided into two, which gives the appearance of two hands to each arm, and two feet to each leg; and though one of these parts have three toes, and the other but two, yet they seem to be all of the same size. These toes lie together under the same skin as in a mitten; however, their shape might be seen through the skin. With these paws the *chamæleon* can lay hold of the small branches of trees in the same manner as a parrot. When he is about to perch, he parts his toes different from birds, because he puts two behind and two before. The claws are little, crooked, very sharp, and of a pale yellow, proceeding but half way out of the skin, while the other half is hid beneath it. His walk is slower than that of a tortoise, and he seems to move along with an affectation of gravity. He seems to seek for a proper place to set his feet upon; and when he climbs up trees, he does not trust to his feet like squirrels, but endeavours to find out clefts in the bark, that he may get a surer hold.

His tail is like that of a viper when it is puffed up and round, for otherwise the bones may be seen in the same manner as on the back. He always wraps his tail round the branches of trees, and it serves him as it were instead of a fifth hand.

He is a native of Africa and Asia.

21. The gecko, has a cylindrical tail, concave ears, and a warty body. It is the Indian salamander of Bontius. "This animal is very frequent in Cairo, (says Hasselquist) both in the houses and without them. The poison of this animal is very singular, as it exhales from the lobuli of the toes. The animal seeks all places and things impregnated with sea salt, and passing over them several times leaves this very noxious poison behind it. In July 1750, I saw two women and a girl, in Cairo, at the point of death, from eating cheese new salted, bought in the market, and on which this animal had dropt its poison. Once at Cairo, I had an opportunity of observing how acrid the exhalations of the toes of this animal are, as it ran over the hand of a man who endeavoured to catch it; there immediately rose little pustules over all those parts the animal had touched; these were red, inflamed, and smarted a little, greatly resembling those occasioned by the stinging of nettles. It emits an odd sound, especially in the night, from its throat, not unlike that of a frog." 22. The *scincus*, has a cylindrical tail, compressed at the point, and blunt marginated toes. This animal is found in Arabia Petrea near the Red Sea, and in Upper Egypt near the Nile. It is much used by the inhabitants of the East as an aphrodisiacum, but not at this time by the Europeans. The flesh of the animal is given in powder, with some stimulating vehicle; broth made of the recent flesh, is likewise used by the Arabs. It is brought from Upper Egypt and Arabia to Alexandria, whence it is carried to Venice and Marseilles, and from thence to all the apothecaries shops of Europe. It has been an error, common to almost all authors, to imagine the *scincus* to be a fish. 23. The *orbicularis*, has a cylindrical

tail, and a roundish belly. It is a native of Mexico.

24. The *quinque-lineata*, has a cylindrical tail, and five white lines on the back. It is found in Carolina.

25. The *balistifus*, has a long cylindrical tail, a radiated fin on the back, and a crest on the hind part of the head. It is a native of South America.

26. The *ignava*, has a long cylindrical tail, a toothed ridge on the back, and a crest on the throat. It is a native of the Indies.

27. The *calotes*, has a long cylindrical tail, with the fore-part of the back and hind part of the head toothed. It is a native of Ceylon.

28. The *agama*, has a long cylindrical tail, with prickles on the neck and hind part of the head. It is a native of America.

29. The *umbra*, has a long cylindrical tail, a callous crest on the nape of the neck, and a streaked back. It is a native of southern climates.

30. The *plica*, has a long cylindrical tail, a callous crest on the hind head, and a warty neck. It is a native of the Indies.

31. The *narmorata*, has a long cylindrical tail, a smooth back, and a small toothed crest on the throat. It is a native of Spain.

32. The *bullaris*, has a long cylindrical tail, and a bladder on the throat, which it blows up when enraged. It is a native of Jamaica.

33. The *strumosa*, has a long cylindrical tail, and a gibbous breast. It is found in South America.

34. The *tequisein*, has a long cylindrical tail, and a plaited future on the side. It is a native of the Indies.

35. The *aurata*, has a cylindrical tail, and round shining scales like gold. It is found in the islands of Cyprus and Jersey.

36. The *nilotica*, has a long tail with a triangular edge, and four lines of scales on the back. It is a native of Egypt.

37. The *punctata*, has a long cylindrical tail, two yellow lines on the back, and is interspersed with black points. It is found in Asia.

38. The *lemniscata*, has a long cylindrical tail, and 8 white lines on the back. It is found in Guinea.

39. The *fasciata*, has a blue cylindrical tail, and five yellow lines on the back. It is a native of Carolina.

40. The *chalcides*, has a long cylindrical tail, and very short legs, with five toes on the feet. It is a native of Europe and Africa.

41. The *vulgaris*, has a cylindrical tail, four toes on the fore feet, and two dusky coloured lines on the back. It is a native of Europe.

42. The *aquatica*, has a tail somewhat cylindrical, and four toes on the fore-feet. It lives in the fresh waters, pools, &c. of Europe.

43. The *palustris*, has a lanceolated tail, and four toes on the fore-feet. It inhabits the stagnant waters of Europe.

44. The *punctata*, has a cylindrical tail, four toes on the fore-feet, and longitudinal rows of white spots on the back. It is a native of Carolina.

45. The *quatuor-lineata*, has a long cylindrical tail, four toes on the fore-feet, and four yellow lines on the back. It is a native of North America.

46. The *salamandra*, has a short cylindrical tail, four toes on the fore-feet, and a naked porous body. This animal is vulgarly said to live in fire; but it is found to be a mistake. It is found in the southern countries of Europe.

47. The *angina*, has a very long verticillated tail, extremely rigid at the point. It is found at the Cape of Good hope.

**LACHINÆA**, in botany, a genus of the *oëlandria monogynia* class. It has no calix; the corolla is divided into four segments; the limbus is unequal; and the fruit, which is a kind of berry, contains but one seed.

There are two species, both natives of warm climates.

**LACHRYMAL**, in anatomy, an appellation given to several parts of the eye. See **ANATOMY**, p. 289.

**LACHRYMATORY**, in antiquity, a vessel wherein were collected the tears of a deceased person's friends, and preserved along with the ashes and urn.

**LACTEAL VESSELS**, in anatomy. See **ANAT.** p. 263.

**LACTIFEROUS**, an appellation given to plants abounding with a milky juice, as the sow-thistle, and the like.

**LACTUCA**, LETTUCE, in botany. See **LETTUCE**.

**LACUNÆ**, in anatomy. See **ANATOMY**, p. 275, 276.

**LACUNAR**, in architecture, an arched roof or ceiling, more especially the planking or flooring above porticos and piazzas.

**LADENBURG**, a town of Germany, situated on the river Neckar, eighty miles north-west of Heidelberg.

**LADRONE ISLANDS**, are situated in the Pacific Ocean, between 12° and 28° of N. lat. and about 140° E. long.

**LADY'S BEDSTRAW**. See **GALLIUM**.

**LADY'S MANTLE**. See **ALCHIMILLA**.

**LADY'S SMOCK**. See **CARDAMINE**.

**LADY'S SLIPPER**. See **CYPRIPEDIUM**.

**LADY'S TRACES**. See **OPHYRS**.

**LADY DAY**, in law, the 25th of March, being the annunciation of the holy virgin. See **ANNUNCIATION**.

**LAGOECIA**, ROUND-HEADED CUMMIN, in botany, a genus of the *pentandria monogynia* class. It has both an universal and partial involucre; the petals are bifid; and the seed is solitary. There is but one species, a native of Crete.

**LAGOPUS**, in ornithology. See **TETRAO**.

**LAGOS**, a port-town of Portugal, in the province of Algarva: W. long. 9° 27', N. lat. 36° 45'.

**LAGURUS**, in botany, a genus of the *triandria digynia* class. The calix has a double valve, with a villous aun, and the exterior petal has two auns at the end. There are two species, none of them natives of Britain.

**LAHOLM**, a port-town of Gothland, in Sweden, sixty miles north of Copenhagen.

**LAHOR**, the capital of a province of the same name in the hither India: E. long 75° and N. lat. 33°.

**LAKE**, a collection of waters contained in some cavity in an inland place, of a large extent, surrounded with land, and having no communication with the ocean.

**LAMA**, the sovereign pontiff, or rather god of the Asiatic Tartars, inhabiting the country of Barantola. The lama is not only adored by the inhabitants of the country, but also by the kings of Tartary, who send him rich presents, and go in pilgrimage to pay him adoration, calling him *lama congu*, i. e. god the everlasting father of heaven. He is never to be seen but in a secret place of his palace, amidst a great number of lamps, sitting cross-legged upon a cushion, and adorned

all over with gold and precious stones; where, at a distance, they prostrate themselves before him, it not being lawful for any to kiss even his feet. He is called the great lama, or lama of lamas, that is, priest of priests. And to persuade the people that he is immortal, the inferior priests, when he dies, substitute another in his stead, and so continue the cheat from generation to generation. These priests persuade the people, that the lama was raised from death many hundred years ago, that he has lived ever since, and will continue to live for ever.

**LAMB**, in zoology, the young of the sheep kind. See **Ovis**.

**LAMBOIDES**, in anatomy. See **ANATOMY**, p. 152.

**LAMELLÆ**, in natural history, denotes very thin plates, such as the scales of fishes are composed of.

**LAMENTATIONS**, a canonical book of the Old Testament, written by the prophet Jeremiah. The two first chapters of this book are employed in describing the calamities of the siege of Jerusalem. In the third, the author deplores the persecutions he himself had suffered. The fourth turns upon the desolation of the city and temple, and the misfortune of Zedekiah. The fifth chapter is a prayer for the Jews in their dispersion and captivity; and at the end of all, he speaks of the cruelty of the Edomites, who had insulted Jerusalem in her misery. The first four chapters of the lamentations are an abecdy, every verse or couplet beginning with one of the letters of the Hebrew alphabet, in the alphabetical order.

**LAMINÆ**, in physiology, the thin plates whereof many substances consist.

**LAMIUM**, **DEAD-NETTLE**, in botany, a genus of the didynamia gyniopermia class. The superior labium is entire and vaulted; the inferior one consists of two lobes; in the margin of the faux on each side there is a remarkable tooth. There are eight species, three of them natives of Britain, viz. the album, or white dead-nettle; the rubrum, or red dead nettle; and the amplexicaule, or great henbit.

**LAMMAS-DAY**, a festival celebrated on the first of August by the Romish church, in memory of St. Peter's imprisonment.

**LAMP**, a vessel containing oil, with a lighted wick.

Dr. St. Clair, in Phil. Trans. n° 245, gives the description of an improvement upon the common lamp. He proposes that it should be made two or three inches deep, with a pipe coming from the bottom almost as high as the top of the vessel: let it be filled so high with water as to cover the hole of the pipe at the bottom, that the oil may not get in at the pipe, and so be lost. Then let the oil be poured in, so as to fill the vessel almost brim full, which must have a cover pierced with as many holes as there are wicks designed. When the vessel is thus filled, and the wicks are lighted, if water falls in by drops at the pipe, it will always keep the oil at the same height, or very near; the weight of the water being to that of the oil as 20 to 19, which in two or three inches makes no great difference. If the water runs faster than the oil wastes, it will only run over at the top of the pipe, and what

does not run over will come under the oil, and keep it at the same height.

**LAMPAS**, in fardery. See **FARRIERY**, p. 557.

**LAMPREY**. See **PETROMYZON**.

**LAMPSACUS**, a port-town of the lesser Asia, at the entrance of the Propontis, opposite to Gallipoli, situated eighty miles south-west of Constantinople: E. long. 28°, N. lat. 40° 12'.

**LANCASTER**, the county-town of Lancashire: W. long. 2° 44', N. lat. 54°. It sends two members to parliament.

**LANCEOLATED LEAF**. See **BOTANY**, p. 639.

**LANCEET**, a surgical instrument, sharp pointed, and two-edged, chiefly used for opening veins in the operation of phlebotomy, or bleeding; also for laying open abscesses, tumors, &c.

**LANCHANG**, the capital of the kingdom of Laos, in the further India: E. long. 101°, N. lat. 20°.

**LAND**, in a limited sense, denotes arable ground. See **AGRICULTURE**.

**LAND**, in the sea language, makes part of several compound terms; thus *land laid*, or to lay the land, is just to lose sight of it. *Land-locked*, is when land lies all round the ship, so that no point of the compass is open to the sea; if she is at anchor in such a place, she is said to ride land-locked, and is therefore concluded to ride safe from the violence of winds and tides. *Land mark*, any mountain, rock, steeple, tree, &c. that may serve to make the land known at sea. *Land is shut in*, a term used to signify that another point of land hinders the sight of that the ship came from. *Land to*, or the ship *lies land to*; that is, she is so far from shore that it can only be just discerned. *Land turn*, is a wind that in almost all hot countries blows at certain times from the shore in the night. *To set the land*, that is, to see by the compass how it bears.

**LANDAFF**, a city and bishop's see of Glamorganshire, in south Wales, twenty-six miles north west of Bristol: W. long. 3° 20', N. lat. 51° 33'.

**LANDAU**, a city of Germany, in the circle of the Upper Rhine, and landgraviate of Alsace, situated fifteen miles south-west of Spire: E. long. 8°, N. lat. 49° 12'.

**LANDEN**, a small town of the Austrian Netherlands, in the province of Brabant, eighteen miles south-east of Louvain, and twenty miles north of Namur.

**LANDGRAVE**, the German name for a count or earl, that has the government of a province, country, or large tract of land.

**LANDGRAVIATE**, or **LANDGRAVATE**, the office, authority, jurisdiction, or territory of a landgrave.

**LANDRECY**, a town of the French Netherlands, in the province of Hainault: E. long. 5° 25', N. lat. 50° 5'.

**LANDSCROON**, a port-town of Sweden, in the province of Gothland, and territory of Schonen, situated on the Baltic sea, within the Sound: E. long. 14° 20', N. lat. 55° 42'.

**LANDSHUT**, a city of Germany, and the capital of Lower Pavia, situated fifty miles north-east of Munich: E. long. 12° 6', N. lat. 48° 30'.

**LANDSLIP**,

**LANDSHIP**, or **LANDSCAPE**, in painting, the view or prospect of a country, extended as far as the eye will reach.

Landships are esteemed one of the lowest branches of painting, representing some rural scene, as hills, valleys, rivers, country houses, &c. where human figures are only introduced as accidents.

**LANDSPERG**, the name of two towns in Germany; one situated on the river Warta, thirty-two miles north-east of Frankfort upon the Oder; and the other in Bavaria, twenty-three miles south of Augsburg.

**LANERK**, a parliament town of Scotland, situated on the river Clyde, twenty miles south-east of Glasgow.

**LANGREL SHOT**, at sea, that consisting of two bars of iron, joined by a chain or shackle, and having half a ball of iron fixed on each end; by means of which apparatus, it does great execution among the enemy's rigging.

**LANGRES**, a great city of Champagne, the bishop of which is one of the twelve peers of France: E. long.  $5^{\circ} 22'$ , and N. lat.  $48^{\circ}$ .

**LANGUAGE**, in the most general meaning of the word, signifies any sound uttered by an animal, by which it expresses any of its passions, sensations, or affections; but it is more particularly understood to denote those various modifications of the human voice, by which the several sensations and ideas of one man are communicated to another.

Nature has endowed every animal with powers sufficient to communicate to others of the same species some of its sensations and desires. The organs of most animals are so formed, as readily to perceive and understand (as far as is necessary for their particular species of existence) the voice of those of their own kind; by means of which they assemble together, for the defence or preservation of the species. But as they rise higher in the order of intellectual powers, the powers of expression likewise increase. However, the voice alone, even when endowed with a great extent of modulation, is incapable of conveying all that variety of emotions and sensations, which on many occasions are necessary to be communicated. In all these cases, motion and gesture are called in to supply the defects of the voice. The amorous pigeon does not trust solely to his plaintive cooing, in order to soften the rigour of his reluctant mate, but adds to it the most submissive and expressive gestures; and the faithful dog, finding his voice alone insufficient to express his joy at meeting with his master, is obliged to have recourse to a variety of endearing actions. But man—the most distinguished of all the animal creation,—although endowed with a power of voice and expression of countenance and gesture eminently superior to all the creatures of God—finds that all these united are not sufficient to express the infinite variety of ideas with which his mind is stored: for although these may powerfully express the passions and stronger feelings of the mind; yet as they are incapable of expressing the several progressive steps of perception by which his *reason* ascends

from one degree of knowledge to another, he has been obliged to discover, by means of his reasoning faculty, a method of expressing with certainty, and communicating with the utmost facility, every perception of his mind.—With this view, having observed, that besides the power of uttering simple sounds, and the several variations of these into acute or grave, open or shrill, &c. by which his stronger feelings were naturally expressed, he was likewise endowed with a power of stopping or interrupting these sounds, by certain closings of the lips with one another, and of the tongue with the palate, &c. he has taken advantage of these circumstances, and formed unto himself a language capable of expressing every perception of the mind; for by affixing at all times the same idea to any one sound or combination of sounds thus modified and joined together, he is enabled at any time to excite in the mind of any other person an idea similar to that in his own mind, provided the other person has been previously so far instructed as to know the particular modification of sound which has been agreed upon as the *symbol* of that idea.—Thus man is endowed with two different species of language: one consisting of tones and gestures; which as it is natural to man considered as a distinct species of animals, and necessary for the preservation and well-being of the whole, is universally understood by all mankind: thus laughter and mirth universally express cheerfulness of mind; while tears, in every part of the globe, discover a heart overflowing with tender sensations; and the humble tone of supplication, or the acute accent of pain, are equally understood by the Hurons of America, and by the more refined inhabitants of Europe. The other species of language, as it is entirely artificial, and derives its power from particular compact, (for before any thing can be recognized as the symbol of an idea, several persons must first agree that such an idea must always be denoted by this symbol,) must be different in different parts of the globe; and every distinct form which it may assume, from the different genius of every society who originally formed a particular language for themselves, will be altogether unintelligible to every other body of men, but those belonging to the same society where that language was originally invented, or those who have been at pains to acquire a knowledge of it by means of study.

It is unnecessary for us here to draw any parallel between the nature of these two different species of language; it being sufficiently evident, that the artificial language does not debar the use of the tones and gestures of the natural, but tends to ascertain the meaning of these with greater precision, and consequently to give them greater power. Man must therefore reap many advantages from the use of artificial language, which he could not have enjoyed without it. It is equally plain, that the one, being natural and inspired, must remain nearly the same, without making any progress to perfection; whereas the other, being entirely the invention of man, must have been exceedingly rude and imperfect at first, and must have arrived by slow degrees at greater and greater perfection, as the reasoning faculties acquired vigour and acuteness. It must likewise be subject to perpetual changes, from that variety of incidents which affect all sensible things:

and

and these changes must always correspond with the change of circumstances in the people who make use of that particular language : for when any particular set of ideas become prevalent among any society of men, words must be adopted to express them ; and from these the language must assume its character. Hence the reason why the language of all barbarous and uncivilized people is rude and uncultivated ; while those nations which have improved their reasoning faculties, and made some progress in the polite arts, have been no less distinguished by the superiority of their language than by their pre-eminence in other respects.—The language of a brave and martial people is bold and nervous, although perhaps rude and uncultivated ; while the language of those nations in which luxury and effeminacy prevail, is flowing and harmonious, but devoid of force and energy of expression.

It may be considered as a general rule, that the language of any nation is an exact index of the state of their minds. But as man is naturally an imitative animal, and in matters of this kind never has recourse to invention but through necessity ; if by some accident any part of a nation should be separated from that community to which they belonged, after a language had been invented, they would retain the same general sounds and *idiom* of language with those from whom they were separated ; although in process of time these two people, by living in countries of a dissimilar nature, or being engaged in different occupations, and leading a different manner of life, might in time lose all knowledge of one another, assume a different national character and opposite dispositions of mind, and form each of them a distinct language to themselves, totally different in genius and style, though agreeing with one another in the fundamental sounds and general *idiom* : so that if this particular *idiom*, formed before their separation, should happen to be more peculiarly adapted to the genius of one of these people than the other, that particular people whose natural genius and style of language was not in concord with the *idiom* which they had adopted, would labour under an inconvenience on this account which they never would be able entirely to overcome ; and this inconvenience would prevent their language from attaining such a degree of perfection, as the genius of the people would otherwise naturally have led them to. Thus languages have been originally formed ; and thus that happy concord of circumstances which have concurred to raise some languages to that height of perfection which they have attained may be easily accounted for, while many ineffectual efforts have been made to raise other languages to the same degree of excellence.

We shall not here enter upon any fruitless inquiries, with a view to discover if only one language was originally formed, or if any language that we are acquainted with has a greater claim to that much envied pre-eminence than others. We have seen, that the discovery of language is entirely within our reach, and evidently the invention of man ; and therefore that the invention of different languages by different societies, is extremely probable. But these different societies, in process of time, beheld to intermix by war or commerce, and their different languages would likewise become mixed.

Hence during the succession of many ages, while the principles of language were not understood, many different languages must have been formed, while others may have sunk into oblivion, especially in those early ages before the invention of letters, which alone could preserve their memory. In vain, therefore, would we endeavour to discover the state of those nations or languages of which we have but obscure traces in history. Indeed we have no reason to lament our loss in this particular ; for supposing such a discovery could be made, we could derive little advantage from it. The antiquity of a language does not imply any degree of excellence : some nations have made more progress in improving their mental faculties, and refining their language, in a few years, than others have done in many ages. We shall therefore leave this subject, and proceed to make some remarks on the advantages or defects of some of those *idioms* of language with which we are most intimately acquainted, as this may perhaps lead us to some discoveries of real utility to ourselves.

As the words *IDIOM* and *GENIUS* of a language are often confounded, it will be necessary to inform the reader, that by *IDIOM* we would here be understood to mean *that general mode of arranging words into sentences which prevails in any particular language* ; and by the *GENIUS* of a language we mean to express *the particular set of ideas which the words of any language, either from their formation or multiplicity, are most naturally apt to excite in the mind of any one who hears it properly uttered*. Thus although the *English*, *French*, *Italian*, and *Spanish* languages, nearly agree in the same general *IDIOM* ; yet the particular *GENIUS* of each is remarkably different : The *English* is naturally bold nervous, and strongly articulated ; the *French* is weaker, and more flowing ; the *Italian* more soothing and harmonious ; and the *Spanish* more grave, sonorous, and stately. Now, when we examine the several languages which have been most esteemed in Europe, we find that there are only two distinct *IDIOMS* among them which are essentially distinguished from one another ; and all these languages are divided between these two *idioms*, following sometimes the one, and sometimes the other, either wholly or in part. The languages which may be said to adhere to the first *IDIOM*, are those which in their construction follow the order of nature ; that is, express their ideas in the natural order in which they occur to the mind ; the subject which occasions the action appearing first ; then the action, accompanied with its several modifications ; and, last of all, the object to which it has reference.—These may be properly called *ANALOGOUS* languages ; and of this kind are the *English*, *French*, and most of the modern languages in Europe.—The languages which may be referred to the other *IDIOM*, are those which follow no other order in their construction than what the taste or fancy of the composer may suggest ; sometimes making the object, sometimes the action, and sometimes the modification of the action, to precede or follow the other parts. The confusion which this might occasion is avoided by the particular manner of *arranging* their words, by which they are made to refer to the others with which they ought to be connected, in what-

ever part of the sentence they occur, the mind being left at liberty to connect the several parts with one another after the whole sentence is concluded. And as the words may be here transposed at pleasure, those languages may be called *TRANSPOSITIVE* languages. To this class we must, in an especial manner, refer the *Latin* and *Greek* languages.—As each of these *IDIOMS* has several advantages and defects peculiar to itself, we shall endeavour to point out the most considerable of them, in order to ascertain with greater precision the particular character and excellence of some of those languages now principally spoken or studied in Europe.

The partiality which our forefathers, at the revival of letters in Europe, naturally entertained for the Greek and Roman languages, made them look upon every distinguishing peculiarity belonging to them, as *one* of the *many* causes of the amazing superiority which these languages evidently enjoyed above every other at that time spoken in Europe.—This blind deference still continues to be paid to them, as our minds are early prepossessed with these ideas, and as we are taught in our earliest infancy to believe, that to entertain the least idea of our own language being equal to the Greek or Latin in any particular whatever, would be a certain mark of ignorance or want of taste.—Their rights, therefore, like those of the church in former ages, remain still to be examined; and we, without exerting our reason to discover truth from falsehood, tamely sit down satisfied with the idea of their undoubted pre-eminence in every respect.—But if we look around us for a moment, and observe the many excellent productions which are to be met with in almost every language of Europe, we must be satisfied, that *even these* are now possessed of *some* powers which might afford at least a presumption, that, if they were cultivated with a proper degree of attention, they might, in *some respects*, be made to rival, if not to excel, those beautiful and justly admired remains of antiquity.—Without endeavouring to derogate from their merit, let us, with the cool eye of philosophic reasoning, endeavour to bring before the sacred tribunal of Truth some of those opinions which have been most generally received upon this subject, and rest the determination of the cause on her impartial decision.

The learned reader well knows, that the several changes which take place in the arrangement of the words in every *TRANSPOSITIVE* language could not be admitted without occasioning great confusion, unless certain classes of words were endowed with particular variations, by means of which they might be made to refer to the other words with which they ought naturally to be connected.—From this cause proceeds the necessity of several variations of *verbs*, *nouns*, and *adjectives*; which are not in the least essential or necessary in the *ANALOGOUS* languages, as we have pretty fully explained under the article *GRAMMAR*, to which we refer for satisfaction on this head. We shall in this place consider, whether these variations are an advantage or a disadvantage to language.

As it is generally supposed, that every language whose verbs admit of *inflection*, is on that account much more perfect than one where they are varied by *auxiliaries*; we shall, in the first place, examine this with some degree

of attention; and that what is said on this head may be the more intelligible, we shall give examples from the Latin and English languages. We make choice of these languages, because the Latin is more purely *transpositive* than the Greek, and the English admits of less *inflection* than any other language that we are acquainted with.

If any preference be due to a language from the one or the other method of *conjugating* verbs, it must in a great measure be owing to one or more of these three causes:—Either it must admit of a greater variety of sounds, and consequently more room for harmonious diversity of tones in the language;—or a greater freedom of expression is allowed in uttering any simple idea, by the one admitting of a greater variety in the arrangement of the words which are necessary to express that idea than the other does;—or, lastly, a greater precision and accuracy in fixing the meaning of the person who uses the language, arise from the use of one of these forms above the other!—for, 'as every other circumstance which may serve to give a diversity to language, such as the general and most prevalent sounds, the frequent repetition of any one particular letter, and a variety of other circumstances of that nature, which may serve to debase a particular language, are not influenced in the least by the different methods of varying the verbs, they cannot be here considered. We shall therefore proceed to make a comparison of the advantages or disadvantages which may accrue to a language by inflecting their verbs, with regard to each of these particulars.

The *first* particular that we have to examine, is, Whether the one method of expressing the variations of a verb admits of a greater variety of sounds.—In this respect the *Latin* seems, at first view, to have a great advantage over the *English*: for the word *amo*, *amabam*, *amaveram*, *amavero*, *amem*, &c. seem to be more different from one another than the English translations of these, *I love*, *I did love*, *I had loved*, *I shall have loved*, *I may love*, &c. for, although the syllable *am* is repeated in every one of the first, yet as the last syllable usually strikes the ear with greater force, and leaves a greater impression than the first, it is very probable that many will think the frequent repetition of the word *LOVE* will, in the last instance, appear more striking to the ear than the other: we will therefore allow this its full weight, and grant that there is as great, or even a greater difference between the sounds of the different *tenses* of a Latin verb, than there is between the words that are equivalent to them in English.—But as we here consider the variety of sounds of the language in general, before any just conclusion can be drawn, we must not only compare the different parts of the same verb, but also compare the different verbs with one another in each of these languages.—And here, at first view, we perceive a most striking distinction in favours of the *analogous* language over the *inflected*: for as it would be impossible to form a particular set of inflections different from one another for each particular verb, all those languages which have adopted this method have been obliged to reduce their verbs into a small number of classes; all the words of each of which classes, commonly called *conjugations*, have the several variations of the *modes*, *tenses*, and *persons*, expressed

expressed exactly in the same manner, which must of necessity introduce a similarity of sounds into the language in general, much greater than where every particular verb always retains its own distinguishing sound.—To be convinced of this, we need only repeat any number of verbs in Latin and English, and observe one which side the preference with respect to variety of sounds must fall.

Pono,	<i>I put.</i>	Moveo,	<i>I move.</i>
Dono,	<i>I give.</i>	Doleo,	<i>I ail.</i>
Cano,	<i>I sing.</i>	Lugeo,	<i>I mourn.</i>
Sono,	<i>I sound.</i>	Obeo,	<i>I die.</i>
Orno,	<i>I adorn.</i>	Gaudeo,	<i>I rejoice.</i>
Pugno,	<i>I fight.</i>	Incipio,	<i>I begin.</i>
Lego,	<i>I read.</i>	Facio,	<i>I make.</i>
Scribo,	<i>I write.</i>	Fodio,	<i>I dig.</i>
Puto,	<i>I think.</i>	Odio,	<i>I hate.</i>
Vivo,	<i>I live.</i>	Rideo,	<i>I laugh.</i>
Ambulo,	<i>I walk.</i>	Impleo,	<i>I fill.</i>
Loqueo,	<i>I speak.</i>	Abstineo,	<i>I forbear.</i>

The similarity of sounds is here so obvious in the Latin as to be perceived at the first glance: nor can we be surprised to find it so, when we consider, that all their regular verbs, amounting to four thousand or upwards, must all be reduced to four conjugations, and even these differing but little from one another, which must of necessity produce the sameness of sounds which we here perceive; whereas every language that follows the natural order, like the English, instead of these small number of uniform terminations, have almost as many distinct sounds as original verbs in their language.

But if, instead of the present of the indicative mood, we should take almost any other tense of the Latin verb, the similarity of sounds would be still more perceptible, as many of these tenses have the same termination in all the four conjugations, particularly in the imperfect of the indicative, as below.

Pona bam;	<i>I did put,</i>	<i>I put.</i>
Dona bam;	<i>I did give,</i>	<i>I gave.</i>
Cane bam;	<i>I did sing,</i>	<i>I sung.</i>
Sona bam;	<i>I did sound,</i>	<i>I sounded.</i>
Orna bam;	<i>I did adorn,</i>	<i>I adorned.</i>
Pugna bam;	<i>I did fight,</i>	<i>I fought.</i>
Lege bam;	<i>I did read,</i>	<i>I read.</i>
Scribe bam;	<i>I did write,</i>	<i>I wrote.</i>
Putā bam;	<i>I did think,</i>	<i>I thought.</i>
Vive bam;	<i>I did live,</i>	<i>I lived.</i>
Ambula bam;	<i>I did walk,</i>	<i>I walked.</i>
Loque bam;	<i>I did speak,</i>	<i>I spoke.</i>
Move bam;	<i>I did move,</i>	<i>I moved.</i>
Dole bam;	<i>I did ail,</i>	<i>I ailed.</i>
Luge bam;	<i>I did mourn,</i>	<i>I mourned.</i>

Obie bam;	<i>I did die,</i>	<i>I died.</i>
Gaudie bam;	<i>I did rejoice,</i>	<i>I rejoiced.</i>
Incipie bam;	<i>I did begin,</i>	<i>I began.</i>
Facie bam;	<i>I did make,</i>	<i>I made.</i>
Fodie bam;	<i>I did dig,</i>	<i>I dug.</i>
Odie bam;	<i>I did hate,</i>	<i>I hated.</i>
Ride bam;	<i>I did laugh,</i>	<i>I laughed.</i>
Imple bam;	<i>I did fill,</i>	<i>I filled.</i>
Abstinie bam;	<i>I did forbear,</i>	<i>I forbore.</i>

It is unnecessary to make any remarks on the Latin words in this example: but in the English translation we have carefully marked, in the first column, the words without any inflection; and, in the second, have put down the same meaning by an inflection of our verb; which we have been enabled to do, from a peculiar excellency in our own language unknown to any other, either ancient or modern.—Were it necessary to pursue this subject farther, we might observe, that the *perfect* tense in all the conjugations ends universally in *I*, the *pluperfect* in *eram*, the *future* in *am* or *bo*; in the subjunctive mood, the *imperfect* universally in *essem*, the *perfect* in *erim*, and the *pluperfect* in *issem* and *ero*: and as a still greater sameness is observable in the different variations for the persons in these tenses, seeing the first person plural in all tenses ends in *mus*, and the second person in *tis*, with little variation in the other persons; it is evident, that, in respect of diversity of sounds, this method of conjugating verbs by *inflection*, is greatly inferior to the more natural method of expressing the various connections and relations of the verbal attributive by different words, usually called *auxiliaries*.

The second particular by which the different methods of marking the relation of the verbal attributive can affect language, arises from the variety of expressions, which either of these may admit of in uttering the same sentiment.—In this respect likewise the method of conjugating by inflection seems to be deficient. Thus the present of the indicative mood in Latin can at most be expressed only in two ways, *viz.* *scribo*, and *ego scribo*; which ought perhaps in strictness to be admitted only as one: whereas, in English, we can vary it in four different ways, *viz.* *1st*, *I write*; *2dly*, *I do write*; *3dly*, *write I do*; *4thly*, *write do I*\*. And if we consider the further variation which these receive in power as well as in sound, by having the accent placed on the different words; instead of four, we will find eleven different variations: thus, *1st*, *I write*, with the emphasis upon the *I*;—*2dly*, *I write*, with the emphasis upon the word *write*. Let any one pronounce these with the different accent necessary, and he will be immediately satisfied that they are not only distinct from each other with respect to meaning, but also with

regard

\* We are sufficiently aware, that the last variation cannot in strictness be considered as good language; although many examples of this manner of using it in serious compositions, both in poetry and prose, might be easily produced from the best authors in the English language.—But however unjustifiable it may be to use it in serious composition; yet, when judiciously employed in works of humour, this and other forced expressions of the like nature produce a fine effect, by giving a burlesque air to the language, and beautifully contrasting it to the purer diction of solid reasoning. The sagacious Shakespeare has, on many occasions, shewed how successfully these may be employed in composition, particularly in drawing the character of *ancient Pistol*, in *Henry V.* Without this liberty, Butler would have found greater difficulty in drawing the inimitable character of *Hudibras*.—Let this apology suffice for our having inserted this and other variations of the same kind; which, although they may be often improper for serious composition, have still their use in language.

regard to sound; and the same must be understood of all the other parts of this example.

- |                        |                                 |
|------------------------|---------------------------------|
| 3. I <i>do</i> write,  | 8. <i>W</i> rites I <i>do</i> , |
| 4. I <i>DO</i> write,  | 9. WRITE <i>do</i> I,           |
| 5. I <i>do</i> WRITE,  | 10. Write <i>do</i> I,          |
| 6. WRITE I <i>do</i> , | 11. <i>W</i> rite <i>do</i> I.  |
| 7. Write I <i>do</i> . |                                 |

None of the Latin tenses admit of more variations than the two above mentioned: nor do almost any of the English admit of fewer than in the above example; and several of these phrases, which must be considered as exact translations of some of the tenses of the Latin verb, admit of many more. Thus the imperfect of the subjunctive mood, which in Latin admits of the above two variations, admits in English of the following:

- |                                       |                                       |
|---------------------------------------|---------------------------------------|
| 1. I <i>might</i> have wrote.         | 4. <i>W</i> rote <i>might</i> have I. |
| 2. <i>W</i> rote I <i>might</i> have. | 5. I wrote <i>might</i> have.         |
| 3. Have wrote I <i>might</i> .        | 6. Have wrote <i>might</i> I.         |

And if we likewise consider the variations which may be produced by a variation of the emphasis, they will be as under.

- |                                       |                                        |
|---------------------------------------|----------------------------------------|
| 1. I <i>might</i> have wrote.         | 13. WROTE <i>might</i> have I.         |
| 2. I MIGHT have wrote.                | 14. <i>W</i> rote MIGHT have I.        |
| 3. I <i>might</i> HAVE wrote.         | 15. <i>W</i> rote <i>might</i> HAVE I. |
| 4. I <i>might</i> have WROTE.         | 16. <i>W</i> rote <i>might</i> have I. |
| 5. WROTE I <i>might</i> have.         | 17. I wrote <i>might</i> have.         |
| 6. <i>W</i> rote I <i>might</i> have. | 18. I WROTE <i>might</i> have.         |
| 7. <i>W</i> rote I MIGHT have.        | 19. I wrote MIGHT have.                |
| 8. <i>W</i> rote I <i>might</i> HAVE. | 20. I wrote <i>might</i> HAVE.         |
| 9. HAVE wrote I <i>might</i> .        | 21. HAVE wrote <i>might</i> I.         |
| 10. HAVE WROTE I <i>might</i> .       | 22. HAVE WROTE <i>might</i> I.         |
| 11. HAVE wrote I <i>might</i> .       | 23. HAVE wrote MIGHT I.                |
| 12. HAVE wrote I MIGHT.               | 24. HAVE wrote <i>might</i> I.         |

In all twenty four variations, instead of two.—If we likewise consider, that the Latins were obliged to employ the same word, not only to express “I *might* have wrote” but also “I *could*, I *would*, or I *should* have wrote,” each of which would admit of the same variations as the word *might*, we have in all *ninety six* different expressions in English for the same phrase which in Latin admits only of two, unless they have recourse to other forced turns of expression, which the defects of their verbs in this particular has compelled them to invent.

But, if it should be objected, that the last circumstance we have taken notice of as a defect, can only be considered as a defect of the Latin language, and is not to be attributed to the *inflection* of their verbs, seeing they might have had a particular tense for each of these different words *might*, *could*, *would*, and *should*; we answer, that, even admitting this excuse as valid, the superiority of the analogous language, as such, still remains in this respect as twelve to one.—Yet even this conclusion is greater than ought to have been made: For as the difficulty of forming a sufficient variety of words for all the different modifications which a verb may be made to undergo is too great for any rude people to be able to overcome; we find, that every nation which has adopted this mode of inflection, not excepting the Greeks themselves, has been obliged to remain satisfied with fewer

words than would have been necessary even to effect this purpose, and make the same word serve a double, treble, or even quadruple office, as in the Latin tense which gave rise to these observations: So that however in physical necessity this may not be chargeable upon this particular mode of construction, yet in moral certainty this must always be the case; and therefore we may safely conclude, that the mode of varying verbs by *inflection* affords less variety in the arrangement of the words of the particular phrases, than the method of varying them by the help of auxiliaries.

But if there should still remain any shadow of doubt in the mind of the reader, whether the method of varying the verbs by *inflection*, is inferior to that by *auxiliaries*, with regard to diversity of sounds, or variety of expression; there cannot be the least doubt, but that, with respect to precision, distinctness, and accuracy in expressing any idea, the latter enjoys a superiority beyond all comparison.—Thus the Latin verb *Amo*, may be Englished either by the words *I love*, or *I do love*, and the emphasis placed upon any of the words that the circumstances may require; by means of which, the meaning is pointed out with a force and energy which it is altogether impossible to produce by the use of any single word. The following line from Shakspeare's *Othello* may serve as an example;

—Excellent wretch!

Perdition catch my soul, but I do love thee:

In which the strong emphasis upon the word *no*, gives it a force and energy which conveys, in an irresistible manner, a most perfect knowledge of the situation of the mind of the speaker at the time.—That the whole energy of the expression depends upon this seemingly insignificant word, we may be at once satisfied of, by keeping it away in this manner;

—Excellent wretch!

Perdition catch my soul, but I love thee.

How poor—how tame—how insignificant is this, when compared with the other! Here nothing remains but a tame assertion, ushered in with a pompous exclamation which could not here be introduced with any degree of propriety. Whereas, in the way that Shakspeare has left it to us, it has a forcible power which nothing can surpass; for, overpowered with the irresistible force of Desdemona's charms, this strong exclamation is forced from the soul of Othello in spite of himself. Surprised at this tender emotion which brings to his mind all those amiable qualities for which he had so much esteemed her, and at the same time fully impressed with the firm persuasion of her guilt, he bursts out into that seemingly inconsistent exclamation—*Excellent wretch!* And then he adds in the warmth of his surprise,—thinking it a thing most astonishing that any warmth of affection should still remain in his breast, he even confirms it with an oath.—“*Perdition catch my soul, but I do love thee.*”—“In spite of all the falsehoods with which I know thou hast deceived me—in spite of all the crimes of which I know thee guilty—in spite of all these reasons for which I ought to hate thee—in spite of myself,—still I find that I love,—yes, I do love thee.” We look upon it as a thing altogether impossible to trans-

lose the energy of this expression into any language whose verbs are regularly inflected.

In the same manner we might go through all the other tenses, and shew that the same superiority is to be found in each—Thus in the *perfect tense* of the Latins, instead of the simple *AMAVI*, we say, *I HAVE LOVED*; and by the liberty we have of putting the emphasis upon any of the words which compose this phrase, we can in the most accurate manner fix the precise idea which we mean to excite: for if we say *I have loved*, with the emphasis upon the word *I*, it at once points out the person as the principal object in that phrase, and makes us naturally look for a contrast in some other person, and the other parts of the phrase become subordinate to it;—“*HE has loved thee much, but I have loved thee infinitely more*”—The Latins too, as they were not prohibited from joining the pronoun with their verb, were also acquainted with this excellence, which Virgil has beautifully used in this verse:

———*Nos patriam fugimus ;*  
*Tu, Tytere, lentis in umbra, &c.*

But we are not only enabled thus to distinguish the person in as powerful a manner as the Latins, but can also with the same facility point out any of the other circumstances as principals; for if we say, with the emphasis upon the word *Have*, “*I HAVE loved*,” it as naturally points out the time as the principal object, and makes us look for a contrast in that peculiarity, *I HAVE*: “*I have loved indeed;—my imagination has been led astray—my reason has been perverted:—but, now that time has opened my eyes, I can smile at those imaginary distresses which once perplexed me.*”—In the same manner we can put the emphasis upon the other word of the phrase *loved*,—“*I have LOVED*.”—Here the passion is exhibited as the principal circumstance; and as this can never be excited without some object, we naturally wish to know the object of that passion—“*Who! what have you loved?*” are the natural questions we would put in his case. “*I have LOVED —Eliza.*”—In this manner we are, on all occasions, enabled to express, with the utmost precision, that particular idea which we would wish to excite, so as to give an energy and perspicuity to the language, which can never be attained by those languages whose verbs are conjugated by inflection; and if to this we add the inconvenience which all inflected languages are subjected to, by having too small a number of tenses, so as to be compelled to make one word on many occasions supply the place of two, three, or even four, the balance is turned still more in our favours.—Thus, in Latin, the same word *AMABO* stands for *shall* or *will* love, so that the reader is left to guess from the context which of the two meanings it was most likely the writer had in view.—In the same manner, *may* or *can* love are expressed by the same word *AMEM*; as is also *might*, *could*, *would*, or *should* love, by the single word *AMAREM*, as we have already observed; so that the reader is left to guess which of these four meanings the writer intended to express; which occasions a perplexity very different from that clear precision which our language allows of, by not only pointing out the different words, but also by allowing us to put the emphasis upon

any of them we please, which superadds energy and force to the precision it would have had without that of assistance.

Upon the whole, therefore, after the most candid examination, we must conclude, that the method of conjugating verbs by *inflection* is inferior to that which is performed by the help of *auxiliaries*;—because it does not afford such a diversity of sounds,—nor allow such variety in the arrangement of expression for the same thought,—nor give so much distinction and precision in the meaning.—It is, however, attended with one considerable advantage above the other method: for as the words of which it is formed are necessarily of greater length, and more sonorous, than in the analogous languages, it admits of a more flowing harmony of expression; for the number of monosyllables in this last greatly checks that pompous dignity which naturally results from longer words. Whether this single advantage is sufficient to counterbalance all the other defects with which it is attended, is left to the judgment of the reader to determine:—but we may remark, before we quit the subject, that even this excellence is attended with some peculiar inconveniences, which shall be more particularly pointed out in the sequel.

But perhaps it might still be objected, that the comparison we have made above, although it may be fair, and the conclusion just with regard to the Latin and English languages; yet it does not appear clear, that on that account the method of conjugating verbs by *inflection* is inferior to that by *auxiliaries*: for although it be allowed, that the Latin language is defective in point of tenses; yet if a language were formed which had a sufficient number of inflected tenses to answer every purpose; if it had, for instance, a word properly formed for every variation of each tense; one for *I love*, another for *I do love*; one for *I shall*, another for *I will love*; one for *I might*, another for *I could*, and *would*, and *should* love; and so on through all the other tenses; that this language would not be liable to the objections we have brought against the inflection of verbs; and that of course, the objections we have brought are only valid against those languages which have followed that mode and executed it imperfectly.—We answer, that although this would in some measure remedy the evil, yet it would not remove it entirely. For in the first place, unless every verb, or a very small number of verbs, was conjugated in one way, having the sound of the words in each tense, and divisions of tenses, as we may say, different from all the other conjugations,—it would always occasion a sameness of sounds which would in some measure prevent that variety of sounds so proper for a language. And even if this could be effected, it would not give such a latitude to the expression as auxiliaries allow: for although there should be two words, one for *I might*, and another for *I could* love; yet as these are single words, they cannot be varied; whereas, by auxiliaries, either of these can be varied twenty-four different ways, as has been shewn above.—In the last place, no single word can ever express all that variety of meaning which we can do by the help of our auxiliaries and the emphasis. *I have loved*, if expressed by any one word, could only denote at all times one distinct meaning; so that, to give it

it the power of ours, there behoved to be three distinct words at least. However, if all this was done;—that is, if there was a distinct conjugation formed for every forty or fifty verbs;—if each of the tenses was properly formed, and all of them different from every other tense as well as every other verb; and these all carried through each of the different persons, so as to be all different from one another;—and if likewise there was a distinct word to mark each of the separate meanings which the same tense could be made to assume by means of the emphasis;—and if all this infinite variety of words could be formed in a distinct manner, different from each other and harmonious;—this language would have powers greater than any that could be formed by auxiliaries, if it were possible for the human powers to acquire such a degree of knowledge as to be able to employ it with facility. But how could this be attained, since upwards of ten thousand words would be necessary to form the variations of any one verb, and a hundred times that number would not include the knowledge of the verbs alone of such a language \*?—How much, therefore, ought we to admire the simple perspicuity of our language, which enables us, by the proper application of ten or twelve seemingly trifling words, the meaning and use of which can be attained with the utmost ease, to express all that could be expressed by this unwieldy apparatus? What can equal the simplicity or the power of the one method, but the well known powers of the twenty-four letters, the knowledge of which can be obtained with so much ease—and their power knows no limits?—or what can be compared to the fancied perfection of the other, but the transcript of it which the Chinese seem to have formed in their unintelligible language?

Having thus considered pretty fully the advantages and defects of each of these two methods of varying verbs, we cannot help feeling a secret wish arise in our mind, that there had been a people sagacious enough to have united the powers of the one method with those of the other;—nor can we help being surprised, that, among the changes which took place in the several languages of Europe after the downfall of the Roman monarchy, some of them did not accidentally stumble on the method of doing it.—From many concurring circumstances, it seems probable, that the greatest part, if not all the Gothic nations that over-ran Italy at that time, had their verbs varied by the help of auxiliaries; and many of the modern European languages which have sprung from them, have so far borrowed from the Latin, as to have some of the tenses of their verbs inflected: yet the English alone have in any instance combined the joint powers of the two: which could only be done by forming inflections for the different tenses in the same manner as the Latins, and at the same time retaining the original method of varying them by auxiliaries; by which means either the one or the other method could have been employed as occasion required.—We have luckily two tenses formed in that way; the

acquainted

*present* of the indicative, and the *past*. In almost all our verbs these can be declined either with or without auxiliaries. Thus the present, without an auxiliary, is, *I love, I write, I speak*; with an auxiliary, *I do write, I do love, I do speak*. In the same manner, the past tense, by inflection, is, *I loved, I wrote, I spoke*; by auxiliaries, *I did love, I did speak, I did write*. Every author, who knows any thing of the power of the English language, knows the use which may be made of this distinction. What a pity is it that we should have stopt short so soon? how blind was it in so many other nations to imitate the defects, without making a proper use of that beautiful language which is now numbered among the dead?

After the verbs, the next most considerable variation we find between the *Analogous* and *transpositive* languages, is in the nouns; the latter varying the different cases of these by *inflection*; whereas the former express all the different variations of them by the help of other words prefixed, called *prepositions*. Now, if we consider the advantages or disadvantages of either of these methods under the same heads as we have done the verbs, we will find, that with regard to the first particular, *viz.* variety of sounds, almost the same remarks may be made as upon the verbs;—for if we compare any particular noun by itself, the variety of sound appears much greater between the different cases in the *Transpositive*, than between the translation of these in the *Analogous* language. Thus, *REX, REGIS, REGI, REGEM, &c.* are more distinct from one another in point of sound, than the translation of these, *a king, of a king, to a king, a king, &c.* But if we proceed one step further, and consider the variety which is produced in the language *in general*, by the one or the other of these methods, the case is entirely reversed. For as it would have been impossible to form distinct variations, different from one another, for each case of every noun, they have been obliged to reduce all their nouns into a few general classes, called *declensions*, and endowed all of those included under each class with the same termination in every case; which produces a like similarity of sound with what we already observed was occasioned to the verbs from the same cause; whereas in the analogous languages, as there is no necessity for any constraint, there is almost as great a variety of sounds as there are of nouns. The Latins have only five different declensions, so that all the great number of words of this general order must be reduced to the very small diversity of sounds which these few classes admit of; and even the sounds of these few classes are not so much diversified as they ought to have been, as many of the different *cases* in the different *declensions* have exactly the same sounds, as we shall have occasion to remark more fully hereafter.—We might here produce examples to shew the great *similarity* of sounds between different nouns in the Latin language, and *variety* in the English, in the same way as we did of the verbs: but as every reader, in the least

\* This assertion may perhaps appear to many very much exaggerated: but if any should think so, we only beg the favour that he will set himself to mark all the variation of tenses, mode, person, and number, which an English verb can be made to assume, varying each of these in every way that it will admit, both as to the diversity of expressions, and the emphasis; he will soon be convinced that we have here said nothing more than enough.

acquainted with these two languages, can satisfy himself in this particular, without any further trouble than by marking down any number of Latin nouns, with their translations in English; we thought it unnecessary to dwell longer on this particular.

But if the inflection of nouns is a disadvantage to a language in point of diversity of sounds, it is very much the reverse with regard to the variety it allows in the arranging the words of the phrase. Here, indeed, the Transpositive language shines forth in all its glory, and the Analogous must yield the palm without the smallest dispute. For as the *nominative case* (or that noun which is the cause of that energy expressed by the verb) is different from the *accusative* (or that noun upon which the energy expressed by the verb is exerted) these may be placed in any situation that the writer shall think proper, without occasioning the smallest confusion: whereas in the analogous languages, as these two different states of the noun are expressed by the same word, they cannot be distinguished but by their position alone; so that the noun which is the efficient cause must always precede the verb, and that which is the active subject must follow; which greatly cramps the harmonious flow of composition.—Thus the Latins, without the smallest perplexity in the meaning, could say either *Brutum amavit Cassius*, or *Cassius amavit Brutum*, or *Brutum Cassius amavit*, or *Cassius Brutum amavit*. As the termination of the word *Cassius* always points out, that it is in the *nominative case*, and therefore that he is the person from whom the energy proceeds; and in the same manner, as the termination of the word *Brutum* points out that it is in the *accusative case*, and consequently that he is the object upon which the energy is exerted; the meaning continues still distinct and clear, notwithstanding of all these several variations: whereas in the English language, we could only say *Cassius loved Brutus*, or, by a more forced phraseology, *Cassius Brutus loved*: Were we to reverse the case, as in the Latin, the meaning also would be reversed; for if we say *Brutus loved Cassius*, it is evident, that, instead of being the person beloved, as before, *Brutus* now becomes the person from whom the energy proceeds, and *Cassius* becomes the object beloved.—In this respect, therefore, the analogous languages are greatly inferior to the transpositive; and indeed it is from this single circumstance alone that they derive their chief excellence.

But although it thus appears evident, that any language, which has a particular variation of its nouns to distinguish the *accusative* from the *nominative case*, has an advantage over those languages which have none; yet it does not appear that any other of their *cases* adds to the variety, but rather the reverse: for, in Latin, we can only say *Amor Dei*; in English the same phrase may be rendered, either,—*the love of God*,—*of God the love*,—or, by a more forced arrangement, *God the love of*. And as these oblique cases, as the Latins called them, except the accusative, are clearly distinguished from one another, and from the nominative, by the preposition which accompanies them, we are not confined to any particular arrangement with regard to these as with the accusative, but may place them in what

order we please, as in Milton's elegant invocation at the beginning of *Paradise Lost*:—

Oh man's first disobedience, and the fruit  
Of that forbidden tree, whose mortal taste  
Brought death into the world, and all our wo,  
With loss of Eden, till one greater Man  
Restore us, and regain the blissful seat,  
Sing, heavenly muse.

In this sentence the transposition is almost as great as the Latin language would admit of, and the meaning as distinct as if Milton had begun with the plain language of prose, thus,—“Heavenly muse, sing of man's first disobedience,” &c.

Before we leave this head, we may remark, that the little attention which seems to have been paid to this peculiar advantage derived from the use of an accusative case different from the nominative, is somewhat surprising.—The Latins, who had more occasion to attend to this with care than any other nation, have in many cases overlooked it, as is evident from the many instances we meet with in their language where this is not distinguished. For the nominative and accusative are the same in the singular number of all those of the first declension ending in *e*; as is likewise the case with those in *um* of the second, in *s* of the third, and in *u* of the fourth. In the plural number, there is no distinction between these two cases in those of the second declension ending in *um*, nor in all those of the third, fourth, and fifth, of every termination, the number of which is very considerable. So that their language reaps no advantage in this respect from almost one half of their nouns. Nor have any of the modern languages in Europe, however much they may have borrowed from the ancient languages in other respects, attempted to copy from them in this particular; from which perhaps more advantage would have been gained, than from copying all the other supposed excellencies of their language.—But to return to our subject.

It remains that we consider, whether the inflection of nouns gives any advantage over the method of defining them by prepositions, in point of distinctness and precision of meaning.—But in this respect too the analogous language must come off victorious.—Indeed this is the particular in which their greatest excellence consists; nor was it, we believe, ever disputed, but that, in point of accuracy and precision, this method must excel all others, however it may be defective in other respects.—We observed under this head, when speaking of verbs, that it might perhaps be possible to form a language by inflection which should be capable of as great accuracy as in the more simple order of auxiliaries: but this would have been such an infinite labour, that it was not to be expected that ever human powers would have been able to accomplish it. More easy would it have been to have formed the several inflections of the nouns so different from one another, as to have rendered it impossible ever to mistake the meaning. Yet even this has not been attempted. And as we find that those languages which have adopted the method of inflecting their verbs are more imperfect in point of precision than the other, so the same may be said of inflecting the nouns: for, not to mention the energy which

which the analogous languages acquire by putting the accent upon the noun, or its preposition (when in an oblique case), according as the subject may require, to express which variation of meaning no particular variety of words have been invented in any inflected language, they are not even complete in other respects.—The Latin, in particular, is in many cases defective, the same termination being employed in many instances for different cases of the same noun.—Thus the genitive and dative singular, and nominative and vocative plural, of the first declension, are all exactly alike, and can only be distinguished from one another by the formation of the sentences;—as are also the nominative, vocative and ablative singular, and the dative and ablative plural. In the second, the genitive singular, and nominative and vocative plural, are the same; as are also the dative and ablative singular, and dative and ablative plural; except those in *um*, whose nominative, accusative, and vocative singular, and nominative, accusative and vocative plural, are alike. The other three declensions agree in as many of their cases as these do; which evidently tends to perplex the meaning, unless the hearer is particularly attentive to, and well acquainted with, the particular construction of the other parts of the sentence; all of which is totally removed, and the clearest certainty exhibited, at once, by the help of prepositions in the analogous languages.

It will hardly be necessary to enter into such a minute examination of the advantages or disadvantages attending the variation of *adjectives*: as it will appear evident, from what has been already said, that the endowing them with terminations similar to, and corresponding with the nouns, must tend still more and more to increase the similarity of sounds in any language, than any of those particulars we have already taken notice of; and were it not for the liberty which they have, in transpositive languages, of separating the adjective from the noun, this must have occasioned such a jingle of similar sounds as behoved to have been most disgusting to the ear: but as it would have been impossible in many cases, in those languages where the verbs and nouns are inflected, to have pronounced the words which ought to have followed each other, unless their adjectives could have been separated from the nouns; therefore, to remedy this inconvenience, they were forced to devise this unnatural method of inflecting them also; by which means it is easy to recognize to what noun any adjective has a reference, in whatever part of the sentence it may be placed.—In these languages, therefore, this inflection, both as to gender, number, and case, becomes absolutely necessary; and, by the diversity which it admitted in the arranging the words of the several phrases, might counterbalance the jingle of similar sounds which it introduced into the language.—But what shall we say of those European nations, who, although possessed of a language in every respect different from the transpositive idiom, have nevertheless adopted the variations of their adjectives in the fullest sense? for here they have nothing to counterbalance this disagreeable jingle of similar sounds, so destructive of all real harmony.—In the days of monkish ignorance, when this custom was probably introduced, the clashing of words with one another might be esteemed an ornament; but now that mankind

have attained a higher sense of harmony and propriety, we in Britain may felicitate ourselves to find, that our language has escaped this mark of barbarity, which so many others are now subjected to.

Having thus examined the most striking particulars in which the transpositive and analogous languages differ, and endeavoured to show the general tendency of every one of the particulars separately, it would not be fair to dismiss the subject without considering each of these as a whole, and pointing out their general tendency in that light: for we all know, that it often happens in human inventions, that every part which composes a whole, taken separately, may appear extremely fine; and yet, when all these parts are put together, they may not agree, but produce a jarring and confusion very different from what we might have expected. We therefore imagine a few remarks upon the genius of each of these two distinct idioms of language considered as a whole will not be deemed useless.

Although all languages agree in this respect, that they are the means of conveying the ideas of one man to another; yet as there are an infinite variety of ways in which we might wish to convey these ideas, sometimes by the easy and familiar mode of conversation, and at other times by more solemn addresses to the understanding, by pompous declamation, &c. it may so happen, that the genius of one language may be more properly adapted to the one of these than the other, while another language may excel in the opposite particular. This is exactly the case in the two general idioms of which we now treat.—Every particular in a *transpositive* language, is peculiarly calculated for that solemn dignity which is necessary for pompous orations. Long sounding words, formed by the inflection of the different parts of speech,—flowing periods, in which the attention is kept awake by the harmony of the sounds, and an expectation of that word which is to unravel the whole,—if composed by a skilful artist, are admirably suited to that solemn dignity and awful grace which constitute the essence of a public harangue. On the contrary, in private conversation, where the mind wishes to unbend itself with ease, these become so many clogs which encumber and perplex. At these moments we wish to transmute our thoughts with ease and facility—we are tired with every unnecessary syllable—and wish to be freed of the trouble of attention as much as may be. Like our state-robcs, we would wish to lay aside our pompous language, and enjoy ourselves at home with freedom and ease. Here the solemnity and windings of the *transpositive* language are burdensome; while the facility with which a sentiment can be expressed in the *analogous* language is the thing that we wish to acquire.—In this humble, though most engaging sphere, the analogous language moves unrivalled;—in this it wishes to indulge, and never tires. But it in vain attempts to rival the *transpositive* in dignity and pomp: The number of monosyllables interrupt the flow of harmony; and altho' they may give a greater variety of sounds, yet they do not naturally possess that dignified gravity which suits the other language. This, then, must be considered as the striking particular in the genius of these two different idioms, which marks their characters.

If

If we consider the effects which these two different characters of language must naturally produce upon the people who employ them, we will soon perceive, that the genius of the *analogous* language is much more favourable for the most engaging purposes of life, the civilizing the human mind by mutual intercourse of thought, *than the transpositive*. For as it is chiefly by the use of speech that man is raised above the brute creation ;—as it is by this means he improves every faculty of his mind, and, to the observations which he may himself have made, has the additional advantage of the experience of those with whom he may converse, as well as the knowledge which the human race have acquired by accumulated experience of all preceding ages ;—as it is by the enlivening glow of conversation that kindred souls catch fire from one another, that thought produces thought, and each improves upon the other, till they soar beyond the bounds which human reason, if left alone, could ever have aspired to ;—we must surely consider that language as the most beneficial to society, which most effectually removes these bars that obstruct its progress. Now, the genius of the *analogous* languages is so easy, so simple and plain, as to be within the reach of every one who is born in the kingdom where it is used, to speak it with facility ; even the rudest among the vulgar can hardly fall into any grammatical errors : whereas, in the *transpositive* languages, so many rules are necessary to be attended to, and so much variation is produced in the meaning by the slightest variations in the sound, that it requires a study far above the reach of the illiterate mechanic ever to attain. So that, how perfect soever the language may be when spoken with purity, the bulk of the nation must ever labour under the inconvenience of rudeness and inaccuracy of speech, and all the evils which this naturally produces.—Accordingly we find, that in Rome, a man, even in the highest rank, received as much honour, and was as much distinguished among his equals, for being able to converse with ease, as a modern author would be for writing in an easy and elegant style ; and Cæsar among his contemporaries was as much esteemed for his superiority in speaking the language in ordinary conversation with ease and elegance, as for his powers of oratory, his skill in arms, or his excellence in literary composition. It is needless to point out the many inconveniences that this behoved to produce in a state. It is sufficient to observe, that it naturally tends to introduce a vast distinction between the different orders of men ; to set an impenetrable barrier between those born in a high and those born in a low station ; to keep the latter in ignorance and barbarity, while it elevates the former to such a height as must subject the other to be easily led by every popular demagogue.—How far the history of the nations who have followed this *IDIOM* of language confirms this observation, every one is left to judge for himself.

Having thus considered *LANGUAGE* in general, and pointed out the genius and tendency of the two most distinguished *IDIOMS* which have prevailed ; we shall close these remarks with a few observations upon the particular nature and genius of those languages which are now chiefly studied or spoken in Europe.

Of all the nations whose memory history has trans-

mitted to us, none have been so eminently distinguished for their literary accomplishments, as well as acquaintance with the polite arts, as the Greeks ; nor are we as yet acquainted with a language possessed of so many advantages, with so few defects, as that which they used, and which continues still to be known by their name.—The necessary connection between the progress of knowledge and the improvement of language has been already explained ; so that it will not be surprising to find their progress in the one keep pace with that of the other : but it will be of utility to point out some advantages which that distinguished people possessed, which other nations, perhaps not less distinguished for talents or taste, have not enjoyed, which has contributed to render their language the most universally admired in ancient as well as in modern times.

As it is probable, that many different societies of men, in the early ages of antiquity, may have found themselves in such circumstances as to be obliged to invent a language to themselves ; each would naturally adopt those sounds into their language which chance might suggest, or were most agreeable to their perception of harmony, or most consonant to the disposition of mind of the original inventors ; in the same manner as we see that each composer of music has a particular species of sounds of which he is fonder than any other, which will predominate through all his compositions, and give them a certain characteristic tone by which they may be distinguished from that of other composers :—So the language of each particular set of people would have originally a certain characteristic tone of harmony, which would distinguish it from all others ; and behoved to be more or less perfect, according to the greater or less degree of that delicate sense of harmony, distinguished by the name of *taste*, which these original inventors were possessed of. These sounds, then, being once established by custom, would become familiar to the ear of the descendants of these particular tribes : new words would be invented as knowledge increased ; but these behoved to be modulated so as to be agreeable to the general tenor of their language, from the necessity of making it consonant as well to the organs of hearing as the organs of speech.—Hence it happens, that the characteristic tones of a language are preserved much longer without variation than any other particular relating to it ; and if it change at all, the change must be slow and imperceptible. Knowledge after this may increase ;—taste may be improved ;—it may be perceived that the language is not copious enough to express the ideas, or harmonious enough to please the ear of the composer ;—he may readily invent words to supply the deficiency in that respect ; but the sounds in a great measure remain without the reach of his power, and he must rest satisfied with these, such as they are, without attempting innovations.—Happy therefore, in this respect, must we deem those nations, whose earliest ancestors have been so fortunate as to adopt no unharmonious sounds into their language, whereby they are freed from one bar to the cultivating those refined pleasures which proceed from the use of a delicate taste, which others may perhaps never be able to surmount :—and in this respect no nation was ever so eminently distinguished as the

the Greeks ; which no doubt contributed its share to promote that general elegance and harmony of proportion which prevailed in all their arts. The original sounds and fundamental tones of that language are the most harmonious, and the most agreeable to the ear, of any that have hitherto been invented ; infomuch, that from this principle alone the sound of their language is agreeable to every nation who have heard it, even when the meaning of the words are not understood ; whereas almost all other languages, till they are understood, appear, to an ear which has not been accustomed to them, jarring and discordant. This is the fundamental excellence of that justly admired language ; nor have the people failed to improve this to the utmost of their power, by many aids of their own invention.—The Greek language is of the *transpositive* kind : but a people so lively, so acute, and so loquacious, could ill bear the ceremonious restraint which that mode of language naturally subjected them to ; and have therefore, by various methods, freed it in a great measure from the stiffness which that produced. In inflecting their nouns and verbs, they sometimes prefix a syllable, and sometimes add one ; which, besides the variety that it gives to the sounds of the language, adds greatly to the distinctness, and admits of a more natural arrangement of the words than in the Latin, and of consequence renders it much fitter for the easiness of private conversation : and indeed, the genius of the people so far prevailed over the *idiom* of the language, as to render it, in the age of its greatest perfection, capable of almost as much ease, and requiring almost as little transposition of words, as those languages which have been called analogous. But as those nations who spoke this language were all governed by popular assemblies, and as no authority could be obtained among them but by a skill in rhetoric and the powers of persuasion ; it became necessary for every one, who wished to acquire power or consideration in the state, to improve himself in the knowledge of that language, in the use of which alone he could expect honours or reputation. Hence it happened, that while the vivacity of the people rendered it easy, the great men studiously improved every excellence that it could reap from its powers as a *transpositive* language ; so that, when brought to its utmost perfection by the amazing genius of the great Demosthenes, it attained a power altogether unknown to any other language.—Thus happily circumstanced, the Greek language arrived at that envied pre-eminence which it still justly retains. From the progress of arts and sciences ; from the gaiety and inventive genius of the people ; from the number of free states into which Greece was divided, each of which invented words of its own, all of which contributed to the general stock ; and from the natural commutation which took place between these states, which excited in the strongest degree the talents of the people ; it acquired a copiousness unknown to any ancient language, and excelled by few of the moderns.—In point of harmony of numbers, it is altogether unrivalled ; and on account of the ease as well as dignity which it admitted of from the causes assigned above, it admits of perfection in a greater number of particular kinds of composition than any other language ever known.—The irresistible force and overwhelming impetuosity of

*Demosthenes* seems not more natural to the genius of the language ; than the more flowery charms of Plato's calm and harmonious cadences, or the unadorned simplicity of Xenophon ; nor does the majestic pomp of Homer seem to be more naturally adapted to the genius of the language, than the more humble strains of Theocritus, or the laughing festivity of Anacreon : Equally adapted to all purposes, when we peruse any of these authors, we would imagine the language was most happily adapted for his particular style alone. The same powers it likewise in a great measure possessed for conversation ; and the dialogue seems not more natural for the dignity of Sophocles or Euripides, than for the more easy tenderness of Menander, or buffoonery of Aristophanes.—With all these advantages, however, it must be acknowledged, that it did not possess that unexceptionable clearness of meaning, which some analogous languages enjoy, or that characteristic force which the accent has power to give it, were not these defects counterbalanced by other causes which we shall afterwards point out.

The Romans, a people of fierce and warlike dispositions, for many ages during the infancy of their republic, more intent on pursuing conquests and military glory, than in making improvements in literature or the fine arts, bestowed little attention to their language. Of a disposition less social and more phlegmatic than the Greeks, they gave themselves no trouble about rendering their language fit for conversation ; and it remained strong and nervous, but, like their ideas, was limited and confined. More disposed to command respect by the power of their arms than by the force of persuasion, they despised the more effeminate powers of speech : so that, before the Punic wars, their language was perhaps more reserved and uncourtly than any other at that time known.—But after their rival Carthage was destroyed, and they had no longer that powerful curb upon their ambition ; when riches flowed in upon them by the multiplicity of that conquests ;—luxury began to prevail, the stern austerity of their manners to relax, and selfish ambition to take place of that disinterested love for their country so eminently conspicuous among all orders of men before that period.—Popularity began then to be courted : ambitious men, finding themselves not possessed of that merit which insured them success with the virtuous senate, amused the mob with artful and seditious harangues ; and by making them believe that they were possessed of all power, and had their sacred rights encroached upon by the senate, led them about at their pleasure, and got themselves exalted to honours and riches by these insidious arts. It was then the Romans first began to perceive the use to which a command of language could be put.—Ambitious men then studied it with care, to be able to accomplish their ends ; while the more virtuous were obliged to acquire a skill in this, that they might be able to repel the attacks of their adversaries.—Thus it happened, that in a short time that people, from having entirely neglected, began to study their language with the greatest assiduity ; and as Greece happened to be subjected to the Roman yoke about that time, and a friendly intercourse was established between these two countries, this greatly conpired to nourish in the

minds of the Romans a taste for that art of which they had lately become so much enamoured. Greece had, long before this period, been corrupted by luxury; their taste for the fine arts had degenerated into unnecessary refinement; and all their patriotism consisted in popular harangues and unmeaning declamation. Oratory was then studied as a refined art; and all the subtleties of it were taught by rule, with as great care as the gladiators were afterwards trained up in Rome. But while they were thus idly trying who should be the lord of their own people, the nerves of government were relaxed, and they became an easy prey to every invading power. In this situation they became the *subjects*, under the title of the *allies*, of Rome, and introduced among them the same taste for haranging which prevailed among themselves. Well acquainted as they were with the powers of their own language, they set themselves with unwearied assiduity to polish and improve that of their new masters: but with all their assiduity and pains they never were able to make it arrive at that perfection which their own language had acquired; and in the Augustan age, when it had arrived at the summit of its glory, Cicero bitterly complains of its want of copiousness in many particulars.

But as it was the desire of all who studied this language with care, to make it capable of that stately dignity and pomp necessary for public harangues; they followed the genius of the language in this particular, and in a great measure neglected those lesser delicacies which form the pleasure of domestic enjoyment; so that, while it acquired more copiousness, more harmony, and precision, it remained stiff and inflexible for conversation; nor could the minute distinction of nice grammatical rules be ever brought down to the apprehension of the vulgar; so that the language spoken among the lower class of people remained rude and unpolished even till the end of the monarchy. The Huns who over run Italy, incapable of acquiring any knowledge of such a difficult and abstruse language, never adopted it; and the native inhabitants being made acquainted with a language more natural and easily acquired, quickly adopted that idiom of speech introduced by their conquerors, although they still retained many of those words which the confined nature of the barbarian language made necessary to allow them, to express their ideas.—And thus it was that the language of Rome, that proud mistress of the world, from an original defect in its formation, although it had been carried to a perfection in other respects far superior to any northern language at that time, easily gave way to them, and in a few ages the knowledge of it was lost among mankind: while, on the contrary, the more easy nature of the Greek language has still been able to keep some slight footing in the world, although the nations in which it has been spoken have been subjected to the yoke of foreign dominion for upwards of two thousand years, and their country has been twice ravaged by barbarous nations, and more cruelly depressed than ever the Romans were.

From the view which we have already given of the Latin language, it appears evident, that its idiom was more strictly transpositive than any other language yet known, and was attended with all the defects to which that idiom

is naturally subjected: nor could it boast of such favourable alleviating circumstances as: the Greek, the prevailing sounds of the Latin being far less harmonious to the ear; and although the formation of the words are such as to admit of full and distinct sounds, and so modulated as to lay no restraint upon the voice of the speaker; yet, to a person unacquainted with the language, they do not convey that enchanting harmony so remarkable in the Greek language. The Latin is stately and solemn, it does not excite disgust; but at the same time it does not charm the ear, so as to make it listen with pleased attention. To one acquainted with the language indeed, the nervous boldness of the thoughts, the harmonious rounding of the periods, the full solemn swelling of the sounds, so distinguishable in the most eminent writers in that language which have been preserved to us, all conspire to make it pleasing and agreeable.—In these admired works we meet with all its beauties, without perceiving any of its defects; and we naturally admire, as perfect, a language which is capable of producing such excellent works.—Yet with all these seeming excellencies, this language is less copious, and more limited in its style of composition, than many modern languages far less capable of precision and accuracy than almost any of these, and infinitely behind them all in point of easiness in conversation. But these points have been so fully proved already, as to require no further illustration.—Of the compositions in that language which have been preserved to us, the *orations* of Cicero are best adapted to the genius of the language, and we there see it in its utmost perfection. In the *philosophical works* of that great author we perceive some of its defects; and it requires all the powers of that great man, to render his *epistles* agreeable, as these have the genius of the language to struggle with.—Next to oratory, history agrees with the genius of this language; and Cæsar, in his *Commentaries*, has exhibited the language in its purest elegance, without the aid of pomp or foreign ornament.—Among the Poets, Virgil has best adapted his works to his language. The flowing harmony and pomp of it is well adapted for the epic strain, and the correct delicacy of his taste rendered him perfectly equal to the task. But Horace is the only poet whose force of genius was able to overcome the bars which the language threw in his way, and succeed in lyric poetry. Were it not for the brilliancy of the thoughts, and acuteness of remarks, which so eminently distinguish this author's compositions, his odes would long ere now have sunk into utter oblivion.—But so conscious have all the Roman poets been of the unsuitness of their language for easy dialogue; that almost none of them, after Plautus and Terence, have attempted any dramatic compositions in that language.—Nor have we any reason to regret that they neglected this branch of poetry, as it is probable, if they had ever become fond of these, they would have been obliged to have adopted so many unnatural contrivances, to render them agreeable, as would have prevented us (who of course would have considered ourselves as bound to follow them) from making that progress in the drama which so particularly distinguishes the productions of modern times.

The modern *Italian* language, from an inattention quite common in literary subjects, has been usually called a

child

child of the Latin language, and is commonly believed to be the Latin a little debased by the mixture of the barbarous language of those people who conquered Italy. The truth is, it is directly the reverse: for this language, in its general idiom, and fundamental principles, is evidently of the analogous kind, first introduced by these fierce invaders, although it has borrowed many of its words, and some of its modes of phraseology, from the Latin, with which they were so intimately blended that this could scarcely be avoided; and it has been from remarking this slight connection so obvious at first sight, that superficial observers have been led to draw this general conclusion, so contrary to fact.

When Italy was over-run with the Lombards, and the empire destroyed by these northern invaders, they, as conquerors, continued to speak their own native language. Fierce and illiterate, they would not stoop to the servility of studying a language so clogged with rules, and difficult of attainment, as the Latin behoved to be to a people altogether unacquainted with nice grammatical distinctions: while the Romans of necessity were obliged to study the language of their conquerors, as well to obtain some relief of their grievances by prayers and supplications, as to destroy that odious distinction which subsisted between the conquerors and conquered while they continued as distinct people. As the language of their new masters, although rude and confined, was natural in its order, and easy to be acquired, the Latins would soon attain a competent skill in it: and as they bore such a proportion to the whole number of people, the whole language behoved to partake somewhat of the general sound of the former: for, in spite of all their efforts to the contrary, the organs of speech could not at once be made to acquire a perfect power of uttering any unaccustomed sounds; and as the language of the barbarians behoved to be much less copious than the Latin, whenever they found themselves at a loss for a word, they would naturally adopt those which most readily presented themselves from their new subjects. Thus a language in time was formed, somewhat resembling the Latin, both in the general tenor of the sounds, and in the meaning of many words: and as the barbarians gave themselves little trouble about language, and in some cases perhaps hardly knew the general analogy of their own language, it is not surprising if their new subjects should find themselves sometimes at a loss on that account, or if, in these situations, they followed, on some occasions, the analogy suggested to them by their own: which accounts for the strange degree of mixture of heterogeneous grammatical analogy we meet with in the Italian as well as Spanish and French languages.—The Idiom of all the Gothic languages is purely analogous; and in all probability, before their mixture with the Latins and other people in their provinces, the several grammatical parts of speech followed the plain simple idea which that supposes; the verbs and nouns were all probably varied by auxiliaries, and their adjectives retained their simple unalterable state:—but by their mixture with the Latins, this simple form has been in many cases altered; their verbs became in some cases inflected; but their nouns in all these languages still retained their original form; although they have varied

their adjectives, and foolishly clogged their nouns with gender, according to the Latin idioms. From this heterogeneous, and fortuitous (as we may say, because injudicious) mixture of parts, results a language possessing almost all the defects of each of the languages of which it is composed; with few of the excellencies of either: for it has neither the ease and precision of the *analogous*, nor the pomp and boldness of the *transpositive* languages; at the same time that it is clogged with almost as many rules, and liable to as great abuses.

These observations are equally applicable to the French and Spanish, as to the Italian language.—With regard to this last in particular, we may observe, that as the natural inhabitants of Italy, before the last invasion of the barbarians, were sunk and enervated by luxury and that depression of mind and genius which anarchy always produces; they had become fond of feasting and entertainments, and the enjoyment of sensual pleasures constituted their highest delight; and their language partook of the same debility as their body.—The barbarians too—unaccustomed to the seductions of pleasure—soon fell from their original boldness and intrepidity,—and, like Hannibal's troops of old, were enervated by the sensual gratifications into which a nation of conquerors unaccustomed to the restraint of government freely indulged.—The softness of the air—the fertility of the climate—the unaccustomed flow of riches which they at once acquired,—together with the voluptuous manner of their conquered subjects,—all conspired to enervate their minds, and render them soft and effeminate.—No wonder then, if a language new-moulded should at this juncture partake of the genius of the people who formed it; and instead of participating of the martial boldness and ferocity of either of their ancestors, should be softened and enfeebled by every device which an effeminate people could invent.—The strong consonants which terminated the words, and gave them life and boldness, being thought too harsh for the delicate ears of these sons of sloth, were banished their language;—while sonorous vowels, which could be protracted to any length in music, were substituted in their stead.—Thus the Italian language is formed flowing and harmonious, but destitute of those nerves which constitute the strength and vigour of a language: at the same time, the sounds are neither enough diversified, nor in themselves of such an agreeable tone, as to afford great pleasure without the aid of musical notes;—and the small pleasure which this affords is still lessened by the little variety of measure which the great similarity of the termination of words occasions.—Hence it happens, that this language is fitted for excelling in fewer branches of literature than almost any other:—and although we have excellent historians, and more than ordinary poets, in this language; yet they labour under great inconveniences from the language in which they write,—as it wants nerves and stateliness for the former,—and sufficient variety of modulation for the latter.—It is, more particularly on this account, altogether unfit for an epic poem:—and although attempts have been made in this way by two men, whose genius, if not fettered by the language, might have been crowned with success; yet these, notwithstanding the same that  
with

with some they may have acquired, must, in point of poetic harmony, be deemed defective by every impartial person. Nor is it possible that a language which hardly admits of poetry without rhyme, can ever be capable of producing a perfect poem of great length; and the stanza to which their poets have ever confined themselves, must always produce the most disagreeable effect in a poem where unrestrained pomp or pathos are necessary qualifications. The only species of poetry in which the Italian language can claim a superior excellence, is the tender tone of elegy: and here it remains unrivalled and alone:—the plaintive melody of the sounds, and smooth flow of the language, seem perfectly adapted to express that soothing melancholy which this species of poetry requires.—On this account, the plaintive stanzas of the *Pasfor Fido* of *Guarini* have justly gained to that poem an universal applause; although, unless on this account alone, it is perhaps inferior to almost every other poem of the kind which ever appeared.—We must observe with surprise, that the Italians, who have fettered every other species of poetry with the severest shackles of rhyme, have in this species shewed an example of the most unrestrained freedom; the happy effects of which ought to have taught all Europe the powerful charms attending it: yet with amazement we perceive, that scarce an attempt to imitate them has been made by any poet in Europe except by Milton in his *Lycidas*; no dramatic poet, even in Britain, having ever adopted the unrestrained harmony of numbers to be met with in this and many other of their best dramatic compositions.

Of all the languages which sprung up from the mixture of the Latins with the northern people on the destruction of the Roman empire, none of them approach so near to the genius of the Latin as the Spanish does. For as the Spaniards have been always remarkable for their military prowess and dignity of mind, their language is naturally adapted to express ideas of that kind. Sonorous and solemn, it admits nearly of as much dignity as the Latin. For conversation, it is the most elegant and courteous language in Europe.—The humane and generous order of chivalry was first invented and kept its footing longest in this nation; and although it run at last into such a ridiculous excess as deservedly made it fall into universal disrepute, yet it left such a strong tincture of romantic heroism upon the minds of all ranks of people, as made them jealous of their glory, and strongly emulous of cultivating that heroic politeness, which they considered as the highest perfection they could attain. Every man disdained to flatter, or to yield up any point of honour which he possessed: at the same time, he rigorously exacted from others all that was his due. These circumstances have given rise to a great many terms of respect, and courteous condescension, without meanness or flattery, which give their dialogue a respectful politeness and elegance unknown to any other European language. This is the reason why the characters so finely drawn by Cervantes in *Don Quixote* are still unknown to all but those who understand the language in which he wrote.—Nothing can be more unlike the gentle meekness and humane heroism of the knight, or the native simplicity, warmth of affection, and respectful loquacity of the squire,—than

the inconsistent follies of the one, or the impertinent forwardness and disrespectful petulance of the other, as they are exhibited in every English translation.—Nor is it possible to represent so much familiarity, united with such becoming condescension in the one, and unfeigned deference in the other, in any other European language, as is necessary to paint these two admirable characters.

Although this language, from the solemn dignity and majestic elegance of its structure, is perhaps better qualified than any other modern one for the sublime strains of epic poetry; yet as the poets of this nation have all along imitated the Italians by a most servile subjection to rhyme, they never have produced one poem of this sort, which in point of poetry of style deserves to be transmitted to posterity. And in any other species of poetry but this, or the higher tragedy, is it not naturally fitted to excel. But although the drama and other polite branches of literature were early cultivated in this country, and made considerable progress in it, before the thirst of gain debased their souls, or the desire of universal dominion made them forfeit that liberty which they once so much prized; since they became enervated by an overbearing pride, and their minds enslaved by superstition; all the polite arts have been neglected: so that, while other European nations have been advancing in knowledge, and improving their language, they have remained in a state of torpid inactivity; and their language has not arrived at that perfection which its nature would admit, or the acute genius of the people would have made us naturally expect.

It will perhaps, by some, be thought an unpardonable insult, if we do not allow the French the preference of all modern languages in many respects. But so far must we pay a deference to truth, as to be obliged to rank it among the poorest languages in Europe.—Every other language has some sounds which can be uttered clearly by the voice: even the Italian, although it wants energy, still possesses distinctness of articulation. But the French is almost incapable of either of these beauties; for in that language the vowels are so much curtailed in the pronunciation, and the words run into one another in such a manner, as of necessity to produce an indistinctness which renders it incapable of measure or harmony. From this cause, it is in a great measure incapable of poetic modulation, and rhyme has been obliged to be substituted in its stead; so that this poorest of all contrivances which has ever yet been invented to distinguish poetry from prose, admitted into all the modern languages when ignorance prevailed over Europe; has still kept some footing in the greatest part of these, rather through a deference for established customs, than from any necessity.—Yet as the French language admits of so little poetic modulation, rhyme is in some measure necessary to it; and therefore they have adopted, and dignified this poor deviation from prose with the name of Poetry; and, by their blind attachment to this art, have neglected to improve so much as they might have done the small powers for harmony that their language is possessed of; and, by being long accustomed to this false taste, have become fond of it to such a ridiculous excess, as to have all their tragedies,—nay even their comedies, in rhyme. While the poet is obliged to enervate his language, and check the flow of composition, for the

the sake of linking his lines together, the judicious actor finds more difficulty in destroying the appearance of that measure, and preventing the clinking of the rhimes, than in all the rest of his task.—After this we will not be surprised to find Voltaire attempt an epic poem in this species of poetry; although the more judicious Fénélon in his *Telemaque* had shewn to his countrymen the only species of poetry which their language could admit of for any poem which aspired to the dignity of the epic strain.—Madam Despoulières, in her *Idyllie*, has shewn the utmost extent of harmony to which their language can attain in smaller poems:—indeed in the tenderness of an elegy, or the gaiety of a song, it may succeed; but it is so destitute of force and energy, that it can never be able to reach the Pindaric, or even perhaps the Lyric strain,—as the ineffectual efforts even of the harmonious Rousseau, in his translation of the Psalms of David of this stamp, may fully convince us.

With regard to its power in other species of composition, the sententious rapidity of Voltaire, and the more nervous dignity of Rousseau, afford us no small presumption, that, in a skilful hand, it might acquire so much force, as to transmit to futurity historical facts in a style not altogether unworthy of the subject.—In attempts at pathetic declamation, the superior abilities of the composer may perhaps on some occasions excite a great idea, but this is ever cramped by the genius of the language: and altho' no nation in Europe can boast of so many orations where this grandeur is attempted; yet perhaps there are few who cannot produce more perfect, although not more laboured, compositions of this kind.

But notwithstanding the French language labours under all these inconveniences;—although it can neither equal the dignity or genuine politeness of the Spanish, the nervous boldness of the English, nor the melting softness of the Italian;—although it is destitute of poetic harmony, and so much cramped in sound as to be absolutely unfit for almost every species of musical composition\*;—yet the sprightly genius of that volatile people has been able to surmount all these difficulties, and render it the language most generally esteemed, and most universally spoken, of any in Europe: for this people, naturally gay and loquacious, and fond to excess of those superficial accomplishments which engage the attention of the fair sex, have invented such an infinity of words capable of expressing vague and unmeaning compliment, now dignified by the name of *politeness*, that, in this strain, one who uses the French can never be at a loss;

VOL. II. Numb. 63.

2

and as it is easy to converse *more*, and really say *less*, in this than any other language, a man of very moderate talents may distinguish himself much more by using this than any other that has ever yet been invented.—On this account, it is peculiarly well adapted for that species of conversation which must ever take place in those general and promiscuous companies, where many persons of both sexes are met together for the purposes of relaxation or amusement; and must of course be naturally admitted into the courts of princes, and assemblies of great personages; who, having fewer equals with whom they can associate, are more under a necessity of conversing with strangers, in whose company the tender stimulus of friendship does not so naturally expand the heart to mutual trust or unrestrained confidence. In these circumstances, as the heart remaineth disengaged, conversation must necessarily flag; and mankind in this situation will gladly adopt that language in which they can converse most easily without being deeply interested.—One these accounts the French now is, and probably will continue to be reckoned the most polite language in Europe, and therefore the most generally studied and known: nor should we envy them this distinction, if our countrymen would not weaken and enervate their own manly language, by adopting too many of their unmeaning phrases.

The English is perhaps possessed of a greater degree of excellence, blended with a greater number of defects, than any of the languages that we have hitherto mentioned.—As the people of great Britain are a bold, daring, and impetuous race of men; subject to strong passions, and, from the absolute freedom and independence which reigns among all ranks of people throughout this happy isle, little solicitous about controuling these passions;—our language takes its strongest characteristic distinction from the genius of the people; and, being bold, daring, and abrupt, is admirably well adapted to express those great emotions which spring up in an intrepid mind at the prospect of interesting events. Peculiarly happy too in the full and open sound of the vowels, which forms the characteristic *tone* of the language, and in the strong use of the aspirate H in almost all those words which are used as exclamations, or marks of strong emotions upon interesting occasions, that particular class of words called *interjections* have, in our language, more of that fulness and unrestrained freedom of tones, in which their chief power consists, and are pushed forth from the inmost recesses of the soul in a more forcible and unrestrained manner, than any other language whatever. Hence it is

more

\* An author of great discernment, and well acquainted with the French language, has lately made the same remark; and as the loftiness of his genius often prevents him from bringing down his illustrations to the level of ordinary comprehension, he has on this, and many other occasions, been unjustly accused of being fond of paradoxes.—But as music never produces its full effect but when the tones it assumes are in unison with the idea that the words naturally excite, it of necessity follows, that if the words of any language do not admit of that fulness of sound, or of that species of tones, which the passion or affection that may be described by the words would naturally require to excite the same idea in the mind of one who was unacquainted with the language, it will be impossible for the music to produce its full effect, as it will be cramped and confined by the sound of the words;—and as the French language does not admit of those full and open sounds which are necessary for pathetic expression in music, it must of course be unfit for musical composition.—It is true indeed, that in modern times, in which so little attention is bestowed on the simple and sublime charms of pathetic expression, and a fantastical tingling of unmeaning sounds is called music—where the sense of the words are lost in figures, quavers, and unnecessary repetition of particular syllables,—all languages are nearly equally fitted for it; and among these the French: nor is it to be doubted, that, in the easy gaiety of a song, this language can properly enough admit of all the musical expression which that species of composition may require.

more peculiarly adapted for the great and interesting scenes of the *Drama* than any language that has yet appeared in the globe.—Nor has any other nation ever arrived at that perfection which the English may justly claim in that respect; for however faulty our dramatic compositions may be in some of the critical niceties which relate to this art,—in nervous force of diction, and in the natural expression of those great emotions which constitute its soul and energy, we claim, without dispute, an unrivalled superiority.—Our language too, from the great intercourse that we have had with almost all the nations of the globe by means of our extensive commerce, and from the eminent degree of perfection which we have attained in all the arts and sciences, has acquired a copiousness beyond what any other modern nation can lay claim to; and even the most partial favourers of the Greek language are forced to acknowledge, that in this respect it must give place to the English. Nor is it less happy in that facility of construction which renders it more peculiarly adapted to the genius of a free people, than any other form of language.—Of an *idiom* purely analogous, it has deviated less from the genius of that *idiom*, and possesses more of the characteristic advantages attending it, than any other language that now exists: for, while *others*, perhaps by their more intimate connection with the Romans, have adopted some of their transpositions, and clogged their language with unnecessary fetters, *we* have preserved ourselves free from the contagion, and still retain the primitive simplicity of our language. Our *verbs* are all varied by auxiliaries (except in the instance we have already given, which is so much in our favours); our *nouns* remain free from the perplexing embarrassment of *genders*, and our pronouns mark this distinction where necessary with the most perfect accuracy; our *articles* also are of course freed from this unnatural encumbrance, and our *adjectives* preserve their natural freedom and independence. From these causes, our language follows an order of construction so natural and easy, and the rules of *syntax* are so few and obvious, as to be within the reach of the most ordinary capacity. So that from this, and the great clearness and distinctness of meaning which this mode of construction necessarily is accompanied with, it is much better adapted for the familiar intercourse of private society, and liable to fewer errors in using it, than any other language yet known; and on this account we may boast, that in no nation of Europe do the lower class of people speak their language with so much accuracy, or have their minds so much enlightened by knowledge, as those of great Britain.—What then shall we say of the discernment of those grammarians, who are every day echoing back to one another complaints of the poverty of our language on account of the few and simple rules which it requires in *syntax*? As justly might we complain of an invention in mechanics, which, by means of one or two simple movements, obvious to an ordinary capacity, little liable to accidents, and easily put in order by the rudest hand, should possess the whole powers of a complex machine, which had required an infinite apparatus of wheels and contrary movements, the knowledge of which could only be acquired, or the various accidents to which it was exposed by using it be

repaired, by the powers of an ingenious artist, as complain of this characteristic excellence of our language as a defect.

But if we thus enjoy in an eminent degree the advantages attending an *analogous* language; we likewise feel in a considerable measure the defects to which it is exposed; as the number of monosyllables with which it always must be embarrassed, notwithstanding the great improvements which have been made in our language since the revival of letters in Europe, prevents in some degree that swelling fulness of sound which so powerfully contributes to harmonious dignity and graceful cadences in literary compositions.—And as the genius of the people of Britain has always been more disposed to the rougher arts of command, than the softer insinuations of persuasion, no pains have been taken to correct these natural defects of our language; but on the contrary, by an inattention of which we have hardly a parallel in the history of any civilized nation, we meet with many instances, even within this last century, of the harmony of sound being sacrificed to that brevity so desirable in conversation, as many elegant words have been curtailed, and harmonious syllables suppressed, to substitute in their stead others, shorter indeed, but more barbarous and uncouth.—Nay, so little attention have our forefathers bestowed upon the harmony of sounds in our language, that one would be tempted to think, on looking back to its primitive state, that they had on some occasions studiously debased it.—Our language, at its first formation, seems to have laboured under a capital defect in point of sound, as such a number of S's enter into the formation of our words, and such a number of letters and combinations of other letters assume a similar sound, as to give a general hiss through the whole tenor of our language, which must be exceedingly disagreeable to every unprejudiced ear. We would therefore have naturally expected, that at the revival of letters, when our forefathers became acquainted with the harmonious languages of Greece and Rome, they would have acquired a more correct taste, and endeavoured, if possible, to have diminished the prevalence of this disgusting sound. But so far have they been from thinking of this, that they have multiplied this letter exceedingly. The plurals of almost all our nouns were originally formed by adding the harmonious syllable *en* to the singular, which has given place to the letter *s*; and instead of *housen* formerly, we now say *houses*. In like manner, many of the variations of our verbs were formed by the syllable *eth*, which we have likewise changed into the same disagreeable letter; so that, instead of *loveth*, *moveth*, *writeth*, *walketh*, &c. we have changed them into the more modern form of *loves*, *moves*, *writes*, *walks*, &c.—Our very auxiliary verbs have suffered the same change; and instead of *bath* and *doth*, we now make use of *has* and *does*. From these causes, notwithstanding the great improvements which have been made in language, within these few centuries, in other respects; yet, with regard to the pleasantness of sound alone, it was perhaps much more perfect in the days of Chaucer than at present: and although custom may have rendered these sounds so familiar to our ear, as not to affect us much; yet to an unprejudiced person, unacquainted with our language, we

have

have not the smallest doubt, but the language of *Bacon* or *Sydney* would appear more harmonious than that of *Robertson* or *Hume*.—This is indeed the fundamental defect of our language, and loudly calls for reformation.

But notwithstanding this great and radical defect in our language with regard to pleasingness of sounds, which must be so strongly perceived by every one who is unacquainted with the meaning of our words; yet to those who understand the language, the exceeding copiousness which it allows in the choice of words proper for the occasion, and the nervous force which it derives from the accent, with the perspicuity and graceful elegance the emphasis bestows upon it, makes this defect be totally overlooked; and we could produce such numerous works of prose which excel in almost every different style of composition as would be tiresome to enumerate; and every reader of taste and discernment will be able to recollect a sufficient number of writings which excel in point of style, between the graceful and becoming gravity so conspicuous in all the works of the author of the *Whole Duty of Man*, and the animated and nervous diction of *Robertson* in his history of *Charles the fifth*,—the more flowery style of *Shaftsbury*, or the Attic simplicity and elegance of *Addison*. But although we can equal, if not surpass, every modern language in works of prose, it is in its poetical powers that our language shines forth with the greatest lustre.—The brevity to which we must here necessarily confine ourselves, prevents us from entering into a minute examination of the poetical powers of our own, compared with other languages; otherwise it would be easy to shew, that every other modern language labours under great restraints in this respect which ours is freed from;—that our language admits of a greater variety of poetic movements, and diversity of cadence, than any of the admired languages of antiquity,—that it distinguishes with the greatest accuracy between accent and quantity, and is possessed of every other poetic excellence which their languages were capable of: so that we are possessed of all the sources of harmony which they could boast; and, besides all these, have one superadded, which is the cause of greater variety and more forcible expression in numbers than all the rest; that is, the unlimited power given to the emphasis over quantity and cadence; by means whereof, a necessary union between sound and sense, numbers and meaning, in versification, unknown to the ancients, has been brought about, which gives our language in this respect a superiority over all those justly admired languages.—But as we cannot here further pursue this subject, we shall only observe, that these great and distinguishing excellencies far more than counterbalance the inconveniences that we have already mentioned; and although, in mere pleasantness of sounds, or harmonious flow of syllables, our language may be inferior to the Greek, the Latin, Italian, and Spanish; yet in point of manly dignity, graceful variety, intuitive distinctness, nervous energy of expression, unconstrained freedom and harmony of poetic numbers, it will yield the palm to none.—Our immortal *Milton*, slowly rising, in graceful majesty stands up as equal, if not superior in these respects to any poet, in any other language, that ever yet existed;—while *Thomson*, with more humble

aim, in melody more smooth and flowing, softens the soul to harmony and peace:—the plaintive moan of *Hammond* calls forth the tender tear and sympathetic sigh; while *Gray's* more soothing melancholy fixes the sober mind to silent contemplation:—more tender still than these, the amiable *Shenston* comes; and from his Doric reed, still free from courtly affectation, flows a strain so pure, so simple, and of such tender harmony, as even Arcadian shepherds would be proud to own. But far before the rest, the daring *Shakespeare* steps forth conspicuous, clothed in native dignity; and, pressing forward with unremitting ardour, boldly lays claim to both dramatic crowns, held out to him by *Thalia* and *Melpomene*:—his rivals, far behind, look up, and envy him for these unfading glories; and the astonished nations round, with distant awe, behold and tremble at his daring flight.—Thus the language, equally obedient to all, bends with ease under their hands, whatever form they would have it assume; and, like the yielding wax, readily receives, and faithfully transmits to posterity, those impressions which they have stamped upon it.

Such are the principal outlines of the language of Great Britain, such are its beauties, and such its most capital defects; a language more peculiarly circumstanced than any that has ever yet appeared.—It is the language of a great and powerful nation, whose fleets surround the globe, and whose merchants are in every port; a people admired, or revered by all the world;—and yet it is less known in every foreign country, than any other language in Europe.—In it are written more perfect treatises on every art and science, than are to be found in any other language;—yet it is less sought after or esteemed by the literati in any part of the globe, than almost any of these. Its superior powers for every purpose of language are sufficiently obvious from the models of perfection, in almost every particular, which can be produced in it;—yet it is neglected, despised, and vilified by the people who use it; and many of those authors who owe almost the whole of their fame to the excellence of the language in which they wrote, look upon that very language with the highest contempt.—Neglected and despised, it has been trodden under foot as a thing altogether unworthy of cultivation or attention. Yet in spite of all these inconveniences, in spite of the many wounds it has thus received, it still holds up its head, and preserves evident marks of that comeliness and vigour which are its characteristic distinction. Like a healthy oak planted in rich and fertile soil, it has sprung up with vigour: and although neglected, and suffered to be over-run with weeds; although exposed to every blast, and unprotected from every violence; it still beareth up under all these inconveniences, and shoots up with a robust healthiness and wild luxuriance of growth. Should this plant, so sound and vigorous, be now cleared from those weeds with which it has been so much encumbered;—should every obstacle which now buries it under thick shades, and hides it from the view of every passenger, be cleared away;—should the soil be cultivated with care, and a strong fence be placed around it, to prevent the idle or the wicked from breaking or distorting its branches;—who can tell with what additional vigour it would flourish, or what amazing magnitude and perfection

tion

tion it might at last attain!—How would the astonished world behold, with reverential awe, the majestic gracefulness of that object which they so lately despised!

[N. B. Some unavoidable circumstances which attended the printing of the preceding article, have occasioned several mistakes in it, of which the following deserve immediate notice.]

**LANGUED**, in heraldry, expresses such animals whose tongue appearing out of the mouth, is borne of a different colour from that of the body.

**LANGUEDOC**, a province of France, bounded by Lioinois, on the north; by the river Rhone, which divides it from Dauphine and Provence, on the east; by the Mediterranean and the the Pyrenees, on the south; and by Guienne and Gascony, on the west.

**LANGUOR**, among physicians, signifies great weakness and loss of strength, attended with a dejection of mind; so that the patients can scarce walk, or even stand upright, but are apt to faint away.

**LANIGEROUS**, an appellation given to whatever bears wool.

**LANIUS**, the BUTCHER-BIRD, in ornithology, a genus belonging to the order of accipitres; the characters of which are these: The beak is somewhat strait, with a tooth on each side towards the apex, and naked at the base; and the tongue is lacerated. There are twenty six species, distinguished by the shape of the tail, and colour.

**LANNIERS**, or **LANNIARDS**, in a ship, are small ropes reeved into the dead-man's eyes of all shrouds, either to slacken them or set them taught: the stays of all masts are also set taught by lanniers.

**LANTANA**, in botany, a genus of the didynamia angiospermia class. The calix consists of four obsolete teeth; and the drupa has two cells. There are seven species, none of them natives of Britain.

**LANUGO**, the soft down of plants, like that growing on the fruit of the peach-tree.

**LANZO**, a town of Italy, in the territory of Piedmont, situated fifteen miles north of Turin.

**LAODICEA**, an ancient city of the lesser Asia, situated east of Ephesus, now in ruins.

**LAON**, a city of France, in the province of the Isle of France, situated in E. long. 3° 45', lat. 49° 37'.

**LAOS**, a country of the farther India in Asia, bounded by China on the north; by Tonquin, on the east; by Siam and Cambodia, on the south; and Ava and Pegu, on the west.

**LAPATHUM**, in botany. See **RUMEX**.

**LAPIDARY**, an artificer, who cuts precious stones.

The art of cutting precious stones is of great antiquity. The French, though they fell into it but lately, have notwithstanding carried this art to a very great perfection, but not in any degree superior to the English.

There are various machines employed in the cutting of precious stones, according to their quality: the diamond, which is extremely hard, is cut on a wheel of soft steel, turned by a mill, with diamond-dust, tempered with olive-oil, which also serves to polish it.

The description of the diamond-cutter's wheel or mill, as represented in Plate CIII. fig. 7. is as follows: *a* is the pincers; *b*, the screw of the pincers; *c*, the shell that carries the mastic and the diamond; *d*, the mastic that softens the diamond at the end of the shell; *e*, the diamond presented to the wheel, to be cut facetwise; *f*, the iron-wheel turning on its pivot; *g*, iron-pegs, to fix and keep the pincers steady; *h*, small pigs of lead of different weights, wherewith the pincers are loaded at pleasure to keep them steady; *i*, a wooden wheel; *k*, the axis of the wheel. It is bended and makes an elbow under the wheel, to receive the impulsion of a bar that does the office of a turning handle; *l*, the sole, or square piece of steel, wherein the pivot of the tree or axis moves; *m*, the turning handle, that sets the wheel a-going by means of the elbow of its axis; the elbow of the piercer wherewith a hog-head is broached, will give an idea of this kind of motion; *n*, the cat-gut string, that goes round both the iron and the wooden wheels. If the wooden wheel is twenty times larger than the iron-one, the latter shall make twenty turns upon the diamond, whilst the large wheel makes but one round its axis; and whilst the boy gives, without any resistance, a hundred impulsions to the turning handle, the diamond experiences a thousand times the friction of the whole grinding wheel.

The diamond-cutter follows the work with his eyes, without taking any other share in it than that of changing the place of the diamond to bite on a new surface; and of timely thrown upon it, with a few drops of oil, the minute particles of the diamonds first ground one against the other, to begin the cutting of them.

The oriental ruby, sapphire, and topaz, are cut on a copper-wheel with diamond dust, tempered with olive-oil, and are polished on another copper-wheel with tripoli and water. The hyacinth, emerald, amethyst, garnets, agats, and other stones, not of an equal degree of hardness with the other, are cut on a leaden wheel with smalt and water, and polished on a tin-wheel with tripoli. The turquois of the old and new rock, girasol and opal, are cut and polished on a wooden wheel with tripoli also.

The lapidaries of Paris have been a corporation since the year 1290. It is governed by four jurats, who superintend their rights and privileges, visit the master-workmen, take care of the master-piece of workmanship, bind apprentices, and administer the freedom.

**LAPIS**, in general, is used to denote a stone of any kind.

**LAPLAND**, the most northerly part of Europe, divided

ded into Norwegian Lapland, Swedish Lapland, and Russian Lapland: it lies between  $10^{\circ}$  and  $35^{\circ}$  of E. long. and between  $65$  and  $72^{\circ}$  of N. lat.

**LAPWING**, in ornithology. See **FRINGA**.

**LARQUEUS**, in surgery, a kind of ligature, so contrived, that when stretched by any weight, or the like, it draws up close. Its use is to extend broken or dis-jointed bones, to keep them in their places when they are set, and to bind the parts close together.

**LAR-BOARD**, among seamen, the left-hand side of the ship, when you stand with your face towards the head.

**LARCENY**, in law, a felonius carrying away another person's goods; and this, according to the value of the thing stolen, is either grand, or petit larceny; the first being stealing effects above the value of 1 s. and the last such as are either of that value, or under it.

**LAREDO**, a port-town of Spain, in the province of Biscay, situated on the coast of Biscay: W. lon.  $3^{\circ} 40'$ , N. lat.  $43^{\circ} 30'$ .

**LARES**, certain inferior deities among the ancient Romans, who were the guardians of houses; they were also sometimes taken for the guardians of streets and ways, and Tibullus makes them the guardians of the fields. According to Ovid, they were the sons of Mercury and Lara, whose tongue was cut out by Jupiter, because she revealed his adulteries to Juno; and not contented with this, he delivered her to Mercury, with orders to conduct her to hell; but he falling in love with her by the way, had twins by her, who from their mother were called lares.

These domestic deities were sometimes represented under the figure of a dog, the symbol of fidelity; because dogs have the same function as the lares, which is to guard the house. At other times their images were covered with the skin of a dog, and had the figure of that domestic animal standing by them. The principal sacrifices to the lares, were incense, fruit, and a hog.

**LARIX**. See **PINUS**.

**LARK**, in ornithology. See **ALAUDA**.

**LARUS**, the **GULL**, in ornithology, a genus belonging to the order of anseres, the characters of which are these: The bill is strait, cultrated, a little crooked at the point, and without teeth; the inferior mandible is gibbous below the apex, the nostrils are linear, a little broader before, and situate in the middle of the back. There are 11 species, principally distinguished by their colour.

**LARYNX**, in anatomy. See **ANAT.** p. 300.

**LASERPITIUM**, **LASER-WORT**, a genus of the pentandria digynia class. The fruit is oblong, with eight membranaceous angles. There are nine species, none of them natives of Britain.

**LASSITUDE**, or **WEARINESS**, in medicine, a morbid sensation, that comes on spontaneously, without any previous motion, exercise, or labour. This is a frequent symptom in acute distempers: it arises either from an increase of bulk, a diminution of proper evacuation, or too great a consumption of the fluids necessary to maintain the spring of the solids, or from a vitiated secretion of that juice.

VOL. II. No. 63.

1

**LAST**, in general, signifies the burden or load of a ship.

It signifies also a certain measure of fish, corn, wool, leather, &c. A last of codfish, white herrings, meal, and ashes for soap, is twelve barrels; of corn or rapeseed, ten quarters; of gun powder, twenty-four barrels; of red-herrings, twenty cades; of hides, twelve dozen; of leather, twenty dickers; of pitch and tar, fourteen barrels; of wool, twelve sacks; of stock-fish, one thousand; of flax or feathers, 1700 lb.

**LASTAGE**, or **LESTAGE**, a duty exacted in some fairs and markets, for carrying things bought whether one will. It signifies also the ballast or lading of a ship; and sometimes is used for garbage, rubbish, or such like filth.

**LATERAN COUNCILS**, those councils held in the basilica of the Latin church at Rome. See **COUNCIL**.

There have been five councils held in this place.

*viz.* in the years 1123, 1139, 1179, 1215, and 1513.

**LATH**, in building, a long, thin and narrow slip of wood, nailed to the rafters of a roof or ceiling, in order to sustain the covering.

**LATHE**, in turning, a well-known engine used in turning wood, ivory, and other materials.

**LATHRÆA**, in botany, a genus of the didynamia angiospermia class. The calix consists of four segments; and the capsule has but one cell. There are four species, only one of which, *viz.* the squamaria, or toothwort, is a native of Britain.

**LATHYRUS**, in botany, a genus of the diadelphia decandria class. The stylus is plain, villous above, and broader below; and the two superior laciniae of the calix are shorter than the others. There are 21 species, seven of them natives of Britain; *viz.* the pissolia or crimson grass-vetch; the yellow vetchling; the hirsutus, or rough-codded chickling-vetch; the latifolius, or broad-leaved pease-everlasting; the sylvestris, or narrow-leaved pease-everlasting; the palustris, or marsh chickling-vetch; and the pratensis, or common yellow vetchling.

**LATIN**, a dead language, first spoken in Latium, and afterwards at Rome; and still used in the Romish church, and among many of the learned. See **LANGUAGE**.

**LATISSIMUS**, in anatomy. See **ANAT.** p. 195.

**LATITUDE**. See **GEOGRAPHY**, and **ASTRONOMY**.

**LATITUDINARIAN**, a person of moderation with regard to religious opinions, who believes there is a latitude in the road to heaven, which may admit people of different persuasions.

**LATTEN**, denotes iron-plates tinned over, of which tea-canisters are made.

**LAVANDULA**, **LAVENDER**, in botany, a genus of the didynamia-gymnospermia class. The calix is oval, subdentated, and supported by a bractea; and the stamina are within the tube. There are four species, none of them natives of Britain.

**LAVATERA**, in botany, a genus of the monadelphia polyandria class. The calix is double, the exterior one being divided into three segments; and there are many capsules, containing each a number of seeds. There are nine species, only one of which, *viz.* the

†

9 N

arboresc,

arborca, or sea-tree mallow, is a native of Britain.

**LAUBACH**, a city of Germany, in the circle of Austria, and the capital of the duchy of Carinthia: E. lon.  $14^{\circ} 40'$ , and N. lat.  $46^{\circ} 28'$ .

**LAUDANUM**. See **OPIMUM**.

**LAUDER**, a borough town of Scotland, in the shire of Mers, situated twenty-two miles south-east of Edinburgh.

**LAVENDER**. See **LAVENDULA**.

**LAUGHTER**, an affection peculiar to mankind, occasioned by something that tickles the fancy.

In laughter, the eye-brows are raised about the middle, and drawn down next the nose; the eyes are almost shut; the mouth opens, and shews the teeth, the corners of the mouth being drawn back and raised up; the cheeks seem puffed up, and almost hide the eyes; the face is usually red, and nostrils open, and the eyes wet.

**LAUNCESTON**, the county-town of Cornwall, thirty-six miles west of Exeter; W. lon.  $4^{\circ} 40'$ , N. lat.  $50^{\circ} 45'$ .

It sends two members to parliament.

**LAUNCH**, in the sea language, signifies to put out: as, *launch the ship*, that is, put her out of the dock: *launch ast*, or *forward*, speaking of things that are stowed in the hold, is, put them more forward: *launch, ho!* is a term used when a yard is hoisted high enough, and signifies, *hoist no more*.

**LAURA**, in church-history, a name given to a collection of little cells, at some distance from each other, in which the hermits, in ancient times, lived together in a wilderness.

These hermits did not live in community, but each monk provided for himself in his distinct cell. The most celebrated lauras mentioned in ecclesiastical history, were in Palestine; as the Laura of St Euthymus, at four or five leagues distance from Jerusalem; the laura of St Saba, near the brook Cedron; the laura of the Towers, near the river Jordan, &c.

**LAURENTIALIA**, in Roman antiquity, a festival celebrated in honour of Acca Laurentia, Romulus's nurse.

**LAURUS**, in botany, a genus of the enneandria monogynia class. It has no calix; the corolla consists of six petals; the nectarium consists of three glands, with two bristles surrounding the germen; and the drupa contains but one seed. There are eleven species, among which are the cinnamonum, or cinnamon-tree; the camphora, or camphor-tree, (see **CAMPHOR**;) and the sassafras, or sassafras-tree.

The bark of the cinnamon-tree is light, thin, and of a reddish colour, rolled up in long quills or canes; of a fragrant delightful smell, and an aromatic sweet

pungent taste, with some degree of astringency. It is generally mixed with the casia bark: this last is easily distinguishable by its breaking over smooth, whilst cinnamon splinters; and by its slimy mucilaginous taste; without any thing of the roughness of the true cinnamon. Cinnamon is a very elegant and useful aromatic, more grateful both to the palate and stomach than most other substances of this class: by its astringent quality it likewise corroborates the viscera, and proves of great service in several kinds of alvine fluxes and immoderate discharges from the uterus. An essential oil, a simple and spirituous distilled water, and a tincture of it, are kept in the shops: it is likewise employed as a spicy ingredient in a great number of compositions.

The root of the sassafras-tree is brought to us in long straight pieces, very light, and of a spongy texture, covered with a rough fungous bark; outwardly of an ash colour, inwardly of the colour of rusty iron. It has a fragrant smell, and a sweetish aromatic subacid taste: the bark tastes much stronger than any other part; and the small twigs stronger than the large pieces. As to the virtues of this root, it is a warm aperient and corroborant; and frequently employed, with good success, for purifying and sweetening the blood and juices. For these purposes, infusions made from the rasped root or bark may be drank as tea. In some constitutions, these liquors, by their fragrance, are apt, on first taking them, to affect the head: in such cases, they may be advantageously freed from their flavour by boiling; a decoction of sassafras, boiled down to the consistence of an extract, proves simply bitterish and subastringent. Hoffman assures us, that he has frequently given this extract to the quantity of a scruple at a time, with remarkable success, for strengthening the tone of the viscera in cachexies; as also in the decline of intermittent fevers, and in hypochondriacal spasms. Sassafras yields in distillation an extremely fragrant oil, of a penetrating pungent taste, so ponderous (notwithstanding the lightness of the drug itself) as to sink in water. Rectified spirit extracts the whole taste and smell of sassafras: and elevates nothing in evaporation: hence the spirituous extract proves the most elegant and efficacious preparations, as containing the virtue of the root entire.

The only official preparation of sassafras is the essential oil. The sassafras itself is an ingredient in the decoction of the woods and the compound lime waters, and the oil in the elixir guaiacum.

**LAUSANNE**, a city of Switzerland, in the canton of Bern, situated on the north side of the lake of Geneva: E. lon.  $6^{\circ} 31'$ , and N. lat.  $46^{\circ} 33'$ .

## W.

**LAW** may be defined, "The command of the sovereign power, containing a common rule of life for the subjects." It is divided into the law of nature, the law of nations, and civil or municipal law.

1. The law of nature is that which God has prescribed to all men, by the internal dictate of reason alone. It is discovered by a just consideration of the agreeableness or disagreeableness of human actions to the nature of man; and

and comprehends all the duties we owe either to the Supreme Being, to ourselves, or to our neighbour; as reverence to God, self defence, temperance, honour to our parents, benevolence to all, a strict adherence to our engagements, gratitude, &c. The law of nature, where it either commands or forbids, is immutable, and cannot be controlled by any human authority; but where that law does no more than confer a right, without obliging us to use it, the supreme power may divest us thereof, in whole or in part.

2. The law of nations is also the result of reason, and has God for its author; but it supposes mankind formed into several bodies politic, or states; and comprises all the duties which one state owes to another. These must of necessity be similar to the duties arising between individuals, since both are dictated by reason; so that what is the law of nature when applied to men considered simply as such, is indeed the law of nations when applied to kingdoms or states. From this source proceeded the rights of war, the security of ambassadors, the obligations arising from treaties, &c. The particular usages of nations in their mutual correspondence

which are not necessarily founded in reason, are no part of the law of nations in its proper sense: for they are arbitrary, and derive their sole authority from compact, either express or presumed; and may therefore, without violating the law of nature, be altered. For this reason, they ought to be thrown into the class of positive laws, whose obligation lasts no longer than the agreement upon which it is founded. Of this sort, are the ceremonial used in receiving and entertaining ambassadors, the privileges indulged to some of their servants, the rules observed in cartels for exchanging prisoners of war, &c.

3. Civil or municipal law, is that which every sovereign kingdom or state has appropriated to itself. The appellation of municipal was originally confined to the laws of *municipia*, or dependent states; but it came by degrees to signify all civil laws without distinction. No sovereign state can subsist without a supreme power, or a right of commanding in the last resort; the supreme power of one age cannot therefore be fettered by any enactment of a former age, otherwise it would cease to be supreme. Hence the law last in date derogates from prior laws.

## PRINCIPLES OF THE LAW OF SCOTLAND.

### Title I. *General Observations.*

1. THE municipal law of Scotland, as of most other countries, consists partly of statutory or written law, which has the express authority of the legislative power; partly of customary or unwritten law, which derives force from its presumed or tacit consent.

2. Under our statutory or written law is comprehended, (1.) Our acts of parliament: not only those which were made in the reign of James I. of Scotland, and from thence down to our union with England in 1707, but such of the British statutes enacted since the union as concern this part of the united kingdom.

3. The remains of our ancient written law were published by Sir John Skene clerk-register, in the beginning of the last century, by licence of parliament. The books of *Regiam Majestatem*, to which the whole collection owes its title, seem to be a system of Scots law, written by a private lawyer at the command of David I.; and though no express confirmation of that treatise by the legislature appears, yet it is admitted to have been the ancient law of our kingdom by express statutes. The borough-laws, which were also enacted by the same king David, and the statutes of William, Alexander II. David II. and the three Roberts, are universally allowed to be genuine. Our parliaments have once and again appointed commissions to revise and amend the *Regiam Majestatem*, and the other ancient books of our law, and to make their report: but, as no report appears to have been made, nor consequently any ratification by parliament, none of these remains are received, as of proper authority, in our courts; yet they are of excellent use in proving and illustrating our most ancient customs.

4. Our written law comprehends, (2.) The acts of sederunt, which are ordinances for regulating the forms of

proceeding before the court of session in the administration of justice, made by the judges, who have a delegated power from the legislature for that purpose. Some of these acts dip upon matter of right, which declare what the judges apprehend to be the law of Scotland, and what they are to observe afterwards as a rule of judgment.

5. The civil or Roman and canon laws, though they are not perhaps to be deemed proper parts of our written law, have undoubtedly had the greatest influence in Scotland. The powers exercised by our sovereigns and judges have been justified upon no other ground, than that they were conformable to the civil or canon laws; and a special statute was judged necessary, upon the reformation, to rescind such of their constitutions as were repugnant to the Protestant doctrine. From that period, the canon law has been little respected, except in questions of tithes, patronages, and some few more articles of ecclesiastical right: But the Roman continues to have great authority in all cases where it is not derogated from by statute or custom, and where the genius of our law suffers us to apply it.

6. Our unwritten or customary law, is that which, without being expressly enacted by statute, derives its force from the tacit consent of king and people; which consent is presumed from the ancient custom of the community. Custom, as it is equally founded in the will of the lawgiver with written law, has therefore the same effects: Hence, as one statute may be explained by another, so a statute may be explained or repealed by the uniform practice of the community, and even go into disuse by a posterior contrary custom. But this power of custom to derogate from prior statutes, is generally confined by lawyers to statutes concerning private right, and does not extend to those which regard public policy.

7. An

7. An uniform tract of the judgments or decisions of the court of session, is commonly considered as part of our customary law; and without doubt, where a particular custom is thereby fixed or proved, such custom of itself constitutes law: But decisions, though they bind the parties litigating, have not, in their own nature, the authority of law in similar cases; yet, where they continue uniform, great weight is justly laid on them. Neither can the judgments of the house of peers of Great Britain reach farther than to the parties in the appeal, since in these the peers act as judges, not as lawgivers.

8. Though the laws of nature are sufficiently published by the internal suggestion of natural light, civil laws cannot be considered as a rule for the conduct of life, till they are notified to those whose conduct they are to regulate. The *Scots* acts of parliament were, by our most ancient custom, proclaimed in all the different shires, boroughs, and baron-courts of the kingdom. But after our statutes came to be printed, that custom was gradually neglected; and at last, the publication of our laws, at the market-cross of Edinburgh, was declared sufficient; and they became obligatory forty days thereafter. *British* statutes are deemed sufficiently notified, without formal promulgation; either because the printing is truly a publication, or because every subject is, by a maxim of the English law, party to them, as being present in parliament, either by himself or his representative. After a law is published, no pretence of ignorance can excuse the breach of it.

9. As laws are given for the rule of our conduct, they can regulate future cases only; for past actions, being out of our power, can admit of no rule. Declaratory laws form no exception to this; for a statute, where it is declaratory of a former law, does no more than interpret its meaning; and it is included in the notion of interpretation, that it must draw back to the date of the law interpreted.

10. By the rules of interpreting statute-law received in Scotland, an argument may be used from the title to the act itself, *a rubro ad nigrum*; at least, where the rubric has been either originally framed, or afterwards adopted by the legislature. The preamble or narrative, which recites the inconveniences that had arisen from the former law, and the causes inducing the enactment, may also lead a judge to the general meaning of the statute. But the chief weight is to be laid on the statutory words.

11. Laws, being directed to the unlearned as well as the learned, ought to be construed in their most obvious meaning, and not explained away by subtle distinctions; and no law is to suffer a figurative interpretation, where the proper sense of the words is as commodious, and equally fitted to the subject of the statute. Laws ought to be explained so as to exclude absurdities, and in the sense which appears most agreeable to former laws, to the intention of the lawgiver, and to the general frame and structure of the constitution. In prohibitory laws, where the right of acting is taken from a person, solely for the private advantage of another, the consent of him, in whose behalf the law was made, shall support the act done in breach of it; but the consent of parties immediately interested has no effect in matters which regard

the public utility of a state. Where the words of a statute are capable but of one meaning, the statute must be observed, however hard it may bear on particular persons. Nevertheless, as no human system of laws can comprehend all possible cases, more may be sometimes meant by the lawgiver than is expressed; and hence certain statutes, where extension is not plainly excluded, may be extended beyond the letter, to similar and omitted cases: others are to be confined to the statutory words.

12. A strict interpretation is to be applied, 1. To correctory statutes, which repeal or restrict former laws, and to statutes which enact heavy penalties, or restrain the natural liberties of mankind. 2. Laws, made on occasion of present exigencies in a state, ought not to be drawn to similar cases, after the pressure is over. 3. Where statutes establish certain solemnities as requisite to deeds, such solemnities are not suppliable by equivalents; for solemnities lose their nature, when they are not performed specifically. 4. A statute, which enumerates special cases, is, with difficulty, to be extended to cases not expressed; but, where a law does not descend to particulars, there is greater reason to extend it to similar cases. 5. Statutes, which carry a dispensation or privilege to particular persons or societies, suffer a strict interpretation; because they derogate from the general law, and imply a burden upon the rest of the community. But at no rate can a privilege be explained to the prejudice of those in whose behalf it was granted. As the only foundation of customary law is usage, which consists in fact, such law can go no farther than the particular usage has gone.

13. All statutes, concerning matters specially favoured by law, receive an ample interpretation; as laws for the encouragement of commerce, or of any useful public undertaking, for making effectual the wills of dying persons, for restraining fraud, for the security of creditors, &c. A statute, though its subject-matter should not be a favourite of the law, may be extended to similar cases, which did not exist when the statute was made; and for which, therefore, it was not in the lawgiver's power to provide.

14. Every statute, however unfavourable, must receive the interpretation necessary to give it effect: And, on the other hand, in the extension of favourable laws, scope must not be given to the imagination, in discovering remote resemblances; the extension must be limited to the cases immediately similar. Where there is ground to conclude that the legislature has omitted a case out of the statute purposely, the statute cannot be extended to that case, let it be ever so similar to the cases expressed.

## Tit. 2. Of Jurisdiction and Judges in general.

1. THE object of law are persons, things, and actions: among persons, judges, who are invested with jurisdiction, deserve the first consideration. Jurisdiction is a power conferred upon a judge or magistrate, to take cognizance of, and decide causes according to law, and to carry his sentences into execution. That tract of ground, or district, within which a judge has the right of jurisdiction,

is called his territory: and every act of jurisdiction, exercised by a judge without his territory, either by pronouncing sentence, or carrying it into execution, is null.

2. The supreme power, which has the right of enacting laws, falls naturally to have the right of erecting courts, and appointing judges, who may apply these laws to particular cases: But, in Scotland, this right has been always intrusted with the Crown, as having the executive power of the state.

3. Jurisdiction is either supreme, inferior, or mixed. That jurisdiction is supreme, from which there lies no appeal to a higher court. Inferior courts are those whose sentences are subject to the review of the supreme courts, and whose jurisdiction is confined to a particular territory. Mixed jurisdiction participates of the nature both of the supreme and inferior: thus, the judge of the high court of Admiralty, and the commissaries of Edinburgh, have an universal jurisdiction over Scotland, and they can review the decrees of inferior admirals and commissaries; but since their own decrees are subject to the review of the courts of Session or Justiciary, they are, in that respect, inferior courts.

4. Jurisdiction is either civil or criminal: by the first, questions of private right are decided; by the other, crimes are punished. But, in all jurisdiction, though merely civil, there is a power inherent in the judge to punish, either corporally, or by a pecuniary fine, those who offend during the proceedings of the court, or who shall afterwards obstruct the execution of the sentence.

5. Jurisdiction is either privative or cumulative. Privative jurisdiction, is that which belongs only to one court, to the exclusion of all others. Cumulative, otherwise called concurrent, is that which may be exercised by any one of two or more courts, in the same cause. In civil cumulative jurisdiction, the private pursuer has the right of election before which of the courts he shall sue; but as, in criminal questions which are prosecuted by a public officer of court, a collision of jurisdiction might happen, through each of the judges claiming the exercise of their right, that judge, by whose warrant the delinquent is first cited or apprehended, (which is the first step of jurisdiction), acquires thereby (*jure præventionis*) the exclusive right of judging in the cause.

6. All rights of jurisdiction, being originally granted in consideration of the fitness of the grantee, were therefore personal, and died with himself. But, upon the introduction of the feudal system, certain jurisdictions were annexed to lands, and descended to heirs, as well as the lands to which they were annexed; but now all heritable jurisdictions, except those of admiralty and a small pittance reserved to barons, are either abolished, or resumed and annexed to the crown.

7. Jurisdiction is either proper or delegated. Proper jurisdiction, is that which belongs to a judge or magistrate himself, in virtue of his office. Delegated, is that which is communicated by the judge to another who acts in his name, called a depute or deputy. Where a deputy appoints one under him, he is called a substitute. No grant of jurisdiction, which is an office requiring personal qualifications, can be delegated by the grantee to another, without an express power in the grant.

8. Civil jurisdiction is founded, 1. *Ratione domicilii*, if the defender has his domicile within the judge's territory. A domicile is the dwelling place where a person lives with an intention to remain; and custom has fixed it as a rule, that residence for forty days founds jurisdiction. If one has no fixed dwelling-place, *e. g.* a soldier, or a travelling-merchant, a personal citation against him within the territory is sufficient to found the judge's jurisdiction over him, even in civil questions. As the defender is not obliged to appear before a court to which he is not subject, the pursuer must follow the defender's domicile.

9. It is founded, 2. *Ratione rei sitæ*, if the subject in question lie within the territory. If that subject be immoveable, the judge, whose jurisdiction is founded in this way, is the sole judge competent, excluding the judge of the domicile.

10. Where one, who has not his domicile within the territory, is to be sued before an inferior court *ratione rei sitæ*, the court of session must be applied to, whose jurisdiction is universal, and who, of course, grants letters of supplement to cite the defender to appear before the inferior judge. Where the party to be sued resides in another kingdom, and has an estate in this, the court of session is the only proper court, as the *commune forum* to all persons residing abroad; and the defender, if his estate be heritable, is considered as lawfully summoned to that court, by a citation at the market-cross of Edinburgh, and pier and shore of Leith: but where a stranger, not a native of Scotland, has only a moveable estate in this kingdom, he is deemed to be so little subject to the jurisdiction of our courts, that action cannot be brought against him till his effects be first attached by an arrestment *jurisdictionis fundandæ causa*, *Harc.* 487, which is laid on by a warrant issuing from the supreme courts of session, or admiralty, or from that within whose territory the subject is situated, at the suit of the creditor.

11. A judge may, in special cases, arrest or secure the persons of such as have neither domicile nor estate within his territory, even for civil debts. Thus, on the border between Scotland and England, warrants are granted of course by the judge-ordinary of either side, against those who have their domicile upon the opposite side, for arresting their persons, till they give caution *judicio fisci*: and even the persons of citizens or natives may be so secured, where there is just reason to suspect that they are *in meditatione fugæ*, *i. e.* that they intend suddenly to withdraw from the kingdom; upon which suspicion, the creditor who applies for the warrant must make oath. An inhabitant of a borough-royal, who has furnished one who lives without the borough in meat, cloaths, or other merchandize, and who has no security for it but his own compt-book, may arrest his debtor, till he give security *judicio fisci*.

12. A judge may be declined, *i. e.* his jurisdiction disowned judicially, 1. *Ratione causæ*, from his incompetency to the special cause brought before him. 2. *Ratione suspecti judicis*; where either the judge himself, or his near kinsman, has an interest in the suit. No judge can vote in the cause of his father, brother, or son, either by consanguinity or affinity; nor in the cause of his uncle or nephew by consanguinity. 3. *Ratione pri-*  
vilegi;

*viilegii*; where the party is by privilege exempted from their jurisdiction.

13. Prorogated jurisdiction (*jurisdictio in consentientes*) is that which is, by the consent of parties, conferred upon a judge, who, without such consent, would be incompetent. Where a judge is incompetent, every step he takes must be null, till his jurisdiction be made competent by the parties actual submission to it. It is otherwise where the judge is competent, but may be declined by the party upon privilege.

14. In order to prorogation, the judge must have jurisdiction, such as may be prorogated. Hence, prorogation cannot be admitted where the judge's jurisdiction is excluded by statute. Yet where the cause is of the same nature with those to which the judge is competent, though law may have confined his jurisdiction within a certain sum, parties may prorogate it above that sum unless where prorogation is prohibited. Prorogation is not admitted in the king's causes; for the interest of the Crown cannot be hurt by the negligence of its officers.

15. All judges must at their admission swear, 1. The oath of allegiance, and subscribe the assurance; 2. The oath of abjuration; 3. The oath of supremacy; lastly, The oath *de fidelis administratione*.

16. A party who has either properly declined the jurisdiction of the judge before whom he had been cited, or who thinks himself aggrieved by any proceedings in the cause, may, before decree, apply to the court of session to issue letters of advocacy for calling the action from before the inferior court to themselves. The grounds therefore, upon which a party may pray for letters of advocacy, are incompetency and iniquity. Under incompetency, is comprehended not only defect of jurisdiction, but all the grounds of declining a jurisdiction, in itself competent, arising either from suspicion of the judge, or privilege in the parties. A judge is said to commit iniquity, when he either delays justice, or pronounces sentence, in the exercise of his jurisdiction, contrary to law.

17. That the court of session may not waste their time in trifles, no cause for a sum below twelve pound Sterling can be advocated to the court of session from the inferior judge competent: but if an inferior judge shall proceed upon a cause to which he is incompetent, the cause may be carried from him by advocacy, let the subject be ever so inconsiderable.

### Tit. 3. Of the supreme Judges and Courts of Scotland.

1. THE King, who is the fountain of jurisdiction, might by our constitution have judged in all causes, either in his own person, or by those whom he was pleased to vest with jurisdiction.

2. The parliament of Scotland, as our court of the last resort, had the right of reviewing the sentences of all our supreme courts.

3. By the treaty of union, 1707, the parliaments of Scotland and England are united into one parliament of Great Britain. From this period, the British house of Peers, as coming in place of the Scots parliament, is become our court of the last resort, to which appeals lie

from all the supreme courts of Scotland: But that court has no original jurisdiction in civil matters, in which they judge only upon appeal. By art. 22. of that treaty, the Scots share of the representation in the house of Peers is fixed to sixteen Scots peers elective; and in the house of Commons, to forty-five commoners, of which thirty are elected by the freeholders of counties, and fifteen by the royal boroughs. The Scots privy council was also thereupon abolished, and sunk into that of Great Britain, which for the future is declared to have no other powers than the English privy council had at the time of the union.

### COURT OF SESSION.

4. A court was erected in 1425, consisting of certain persons to be named by the king, out of the three estates of parliament, which was vested with the jurisdiction formerly lodged in the privy council, and got the name of the Session, because it was ordained to hold annually a certain number of sessions at the places to be specially appointed by the king. This court had a jurisdiction, cumulative with the judge ordinary, in spuilzies, and other possessory actions, and in debts; but they had no cognizance in questions of property of heritable subjects. No appeal lay from its judgments to the parliament. The judges of this court served by rotation, and were changed from time to time, after having sat forty days; and became so negligent in the administration of justice, that it was at last thought necessary to transfer the jurisdiction of this court to a council to be named by the king, called the daily council.

5. The present model of the court of session, or college of justice, was formed in the reign of James V. The judges thereof, who are vested with an universal civil jurisdiction, consisted originally of seven churchmen; seven laymen, and a president, whom it behoved to be a prelate; but spiritual judges were in 1584 partly, and in 1640 totally prohibited. The judges of session have been always received by warrants from the crown. Anciently his Majesty seems to have transferred to the court itself the right of chusing their own president; and in a *sedes-rant* recorded June 26. 1593, the king condescended to present to the lords, upon every vacancy in the bench, a list of three persons, out of which they were to chuse one. But his Majesty soon resumed the exercise of both rights, which continued with the Crown till the usurpation; when it was ordained, that the king should name the judges of the session, by the advice of parliament. After the restoration, the nomination was again declared to be solely in the Sovereign.

6. Though judges may, in the general case, be named at the age of twenty-one years, the lords of session must be at least twenty-five. No person can be named lord of session, who has not served as an advocate or principal clerk of session for five years, or as a writer to the signet for ten: and in the case of a writer to the signet, he must undergo the ordinary trials upon the Roman law, and be found qualified two years before he can be named. Upon a vacancy in the bench, the king presents the successor by a letter addressed to the lords, wherein he requires them to try and admit the person presented. The powers given them to reject the person presented upon trial are

2450

taken away, and a bare liberty to remonstrate substituted in its place.

7. Besides the fifteen ordinary judges, the king was allowed to name three or four lords of his great council, who might sit and vote with them. These extraordinary lords were suppressed in the reign of Geo. I.

8. Though the jurisdiction of the session be properly limited to civil causes, the judges have always sustained themselves as competent to the crime of falsehood. Where the falsehood deserves death or demembration, they, after finding the crime proved, remit the criminal to the court of justiciary. Special statute has given to the court of session jurisdiction in contraventions of law-burrows, de-forcements, and breach of arrestment; and they have been in use to judge in battery *pendente lite*, and in usury.

9. In certain civil causes, the jurisdiction of the session is exclusive of all inferior jurisdictions; as in declarators of property, and other competitions of heritable rights, provings of the tenor, *cessiones honorum*, restitution of minors, reductions of decrees or of writings, sales of the estates of minors or bankrupts, &c. In a second class of causes, their jurisdiction can be only exercised in the way of review, after the cause is brought from the inferior court; as in maritime and consistorial causes, which must be pursued in the first instance before the admiral or commissary; and in actions below twelve pounds Sterling, which must be commenced before the judge-ordinary. In all civil actions, which fall under neither of these classes, the jurisdiction of the session is concurrent, even in the first instance, with that of the judge-ordinary. The session may proceed as a court of equity by the rules of conscience, in abating the rigour of law, and giving aid in proper cases to such as in a court of law can have no remedy: and this power is inherent in the supreme court of every country, where separate courts are not established for law and for equity.

#### COURT OF JUSTICIARY.

10. The supreme criminal judge was styled the Justiciar; and he had anciently an universal civil jurisdiction, even in matters of heritage. He was obliged to hold two justice courts or ayres yearly at Edinburgh or Peebles, where all the free-holders of the kingdom were obliged to attend. Besides this universal court, special justice-ayres were held in the different shires of the kingdom twice in the year. These last having gone into disuse, eight deputies were appointed, two for every quarter of the kingdom, who should make their circuits over the whole in April and October.

11. The office of deputies was suppressed in 1672; and five lords of session were added, as commissioners of Justiciary, to the justice-general and justice clerk. The justice-general, if present, is constant president of the court, and in his absence the justice-clerk. The kingdom is divided into three districts, and two of the judges are appointed to hold circuits in certain boroughs of each district twice in the year; one judge may proceed to business in the absence of his colleague.

12. By an old statute, the crimes of robbery, rape, murder, and wilful fire-raising, (the four pleas of the

Crown), are said to be reserved to the King's court of Justiciary; but the only crime in which, *de praxi*, the jurisdiction of Justiciary became at last exclusive of all inferior criminal jurisdiction, was that of high treason. The court of Justiciary, when sitting at Edinburgh, has a power of advocating causes from all inferior criminal judges, and of suspending their sentences.

13. The circuit-court can also judge in all criminal causes which do not infer death or demembration, upon appeal from any inferior court within their district; and has a supreme civil jurisdiction, by way of appeal, in all causes not exceeding twelve pounds Sterling, in which their decrees are not subject to review; but no appeal is to lie to the circuit, till the cause be finally determined in the inferior court.

#### COURT OF EXCHEQUER.

14. The court of Exchequer, as the King's chamberlain-court, judged in all questions of the revenue. In pursuance of the treaty of Union, that court was abolished, and a new court erected, consisting of the Lord High Treasurer of Great Britain, and a chief Baron, with four other Barons of Exchequer; which Barons are to be made of serjeants at law, English barristers, or Scots advocates of five years standing. This court has a privative jurisdiction conferred upon it, as to the duties of customs, excise, or other revenues appertaining to the King or Prince of Scotland, and as to all honours and estates that may accrue to the crown; in which matters, they are to judge by the forms of proceeding used in the English court of Exchequer, under the following limitations; that no debt due to the Crown shall affect the debtor's real estate in any other manner than such estate may be affected by the laws of Scotland, and that the validity of the Crown's titles to any honours or lands shall continue to be tried by the court of Session. The Barons have the powers of the Scots court transferred to them, of passing the accounts of sheriffs, or other officers who have the execution of writs issuing from, or returnable to the court of Exchequer, and of receiving resignations, and passing signatures of charters, gifts of casualties, &c. But though all these must pass in Exchequer, it is the court of Session only who can judge of their preference after they are completed.

#### ADMIRAL COURT.

15. The jurisdiction of the Admiral in maritime causes was of old concurrent with that of the Session. The High-admiral is declared the King's Justice-General upon the seas, on fresh water within flood mark, and in all harbours and creeks. His civil jurisdiction extends to all maritime causes, and so comprehends questions of charter parties, freights, salvages, bottomries, &c. He exercises this supreme jurisdiction by a delegate, the judge of the high-court of admiralty; and he may also name inferior deputies, whose jurisdiction is limited to particular districts, and whose sentences are subject to the review of the high court. In causes which are declared to fall under the Admiral's cognizance, his jurisdiction is now sole; in so much that the Session itself, though they may review his decrees by suspension or reduction, cannot

not carry a maritime question from him by advocacy. The Admiral has acquired, by usage, a jurisdiction in mercantile causes, even where they are not strictly maritime, cumulative with that of the judge-ordinary.

16. All our supreme courts have seals or signets, proper to their several jurisdictions. The courts of Session and Justiciary used formerly the same signet, which was called the King's, because the writs issuing from thence run in the King's name; and though the Justiciary got at last a separate signet for itself, yet that of the Session still retains the appellation of the *King's Signet*. In this office are sealed summonses for citation, letters of executorial diligence, or for staying or prohibiting of diligence, and generally whatever passes by the warrant of the Session, and is to be executed by the officers of the court. All these must, before sealing, be signed by the writers or clerks of the signet: But letters of diligence, where they are granted in a depending process, merely for probation, though they pass by the signet, must be subscribed by a clerk of Session. The clerks of the signet also prepare and subscribe all signatures of charters, or other royal grants, which pass in Exchequer.

#### Tit. 4. *Of the inferior Judges and Courts of Scotland.*

##### SHERIFF.

SHERIFF, from *reeve*, governor, and *sheer*, to cut or divide, is the judge ordinary constituted by the Crown over a particular division or county. The Sheriff's jurisdiction, both civil and criminal, was, in ancient times, nearly as ample within his own territory as that of the supreme courts of Session and Justiciary was over the whole kingdom.

2. His civil jurisdiction now extends to all actions upon contracts, or other personal obligations, forthcomings, poindings of the ground, mails and duties, and to all possessory actions, as removing, ejectons, spuilzies, &c. to all briefs issuing from the chancery, as of inquest, terce, division, tutory, &c. and even to adjudications of land-estates, when proceeding on the renunciation of the apparent heir. His present criminal jurisdiction extends to certain capital crimes, as theft, and even murder, though it be one of the pleas of the Crown; and he is competent to most questions of public police, and has a cumulative jurisdiction with justices of the peace in all riots and breaches of the peace.

3. Sheriffs have ministerial power, in virtue of which, they return juries, in order to the trial of causes that require juries. The writs for electing members of parliament have been, since the union, directed to the Sheriffs, who, after they are executed, return them to the crown-office from whence they issued. They also execute writs issuing from the court of Exchequer; and in general, take care of all estates, duties, or casualties that fall to the Crown within their territory, for which they must account to the Exchequer.

##### LORD OF REGALTY.

4. A Lord of Regality was a magistrate, who had a

grant of lands from the Sovereign, with royal jurisdiction annexed thereto. His civil jurisdiction was equal to that of a Sheriff; his criminal extended to the four pleas of the crown. He had a right to repledge or reclaim all criminals, subject to his jurisdiction, from any other competent court, though it were the Justiciary itself, to his own. He had also right, according to the most common opinion, to the single escheat of all denounced persons residing within his jurisdiction, even though such privilege had not been expressed in the grant of regality.

##### STEWART.

5. The Stewart was the magistrate appointed by the King over such regality lands as happened to fall to the Crown by forfeiture, &c. and therefore the Stewart's jurisdiction was equal to that of a regality. The two Stewartries of Kircudbright, and of Orkney and Zetland, make shires or counties by themselves, and send each a representative to parliament.

##### BAILIE.

6. Where lands, not erected into a regality, fell into the King's hands, he appointed a Bailie over them, whose jurisdiction was equal to that of a Sheriff.

7. By the late jurisdiction act 20. Geo. II. all heritable regalities and baileries, and all such heritable sheriffships and Stewartries as were only parts of a shire, are dissolved; and the powers formerly vested in them are made to devolve upon such of the King's courts as these powers would have belonged to if the jurisdictions dissolved had never been granted. All sheriffships and Stewartries that were no part of a shire, where they had been granted, either heritably or for life, are resumed and annexed to the crown. No High Sheriff or Stewart can hereafter judge personally in any cause. One Sheriff or Stewart-depute is to be appointed by the King in every shire, who must be an advocate of three years standing; and after a certain term not yet expired, all commissions to these deputies are to be granted for life.

##### PRINCE OF SCOTLAND.

8. The appanage, or patrimony, of the Prince of Scotland, has been long erected into a regality-jurisdiction, called the Principality. It is personal to the King's eldest son, upon whose death or succession it returns to the Crown. The prince has, or may have, his own chancery, from which his writs issue, and may name his own chamberlain and other officers for receiving and managing his revenue. The vassals of the Prince are intitled to elect, or to be elected members of Parliament for counties, equally with those who hold of the Crown.

##### JUSTICES OF THE PEACE.

9. Justices of the Peace are magistrates named by the Sovereign over the several counties of the kingdom, for the special purpose of preserving the public peace. Anciently their power reached little farther than to bind over disorderly persons for their appearance before the Privy Council or Justiciary; afterwards they were authorized to judge in breaches of the peace, and in most of the laws concerning public policy. They may compel workmen or labourers to serve for a reasonable fee, and they

they can condemn masters in the wages due to their servants. They have power to judge in questions of highways, and to call out the tenants with their cotiers and servants to perform six days work yearly for upholding them.

10. Since the Union, our justices of the peace, over and above the powers committed to them by the laws of Scotland, are authorised to exercise whatever belonged to the office of an English justice of the peace, in relation to the public peace. From that time, the Scots and the English commissions have run in the same style, which contain powers to inquire into, and judge in all capital crimes, witchcrafts, felonies, and several others specially enumerated, with this limitation subjoined, *of which justices of the peace may lawfully inquire*. Two justices can constitute a court. Special statute has given the cognisance of several matters of excise to the justices, in which their sentences are final.

#### BOROUGHES.

11. A borough is a body-corporate, made up of the inhabitants of a certain tract of ground erected by the Sovereign, with jurisdiction annexed to it. Boroughs are erected, either to be holden of the Sovereign himself, which is the general case of royal boroughs; or of the superior of the lands erected, as boroughs of regality and barony. Boroughs-royal have power, by their charters, to chuse annually certain office-bearers or magistrates; and in boroughs of regality and barony, the nomination of magistrates is, by their charter, lodged sometimes in the inhabitants, sometimes in the superior. Bailies of boroughs have jurisdiction in matters of debt, services, and questions of possession betwixt the inhabitants. Their criminal jurisdiction extends to petty riots, and reckless fire-raising. The Dean of Guild is that magistrate of a royal borough who is head of the merchant-company: he has the cognisance of mercantile causes within borough, and the inspection of buildings, that they incroach neither on private property, nor on the public streets; and he may direct insufficient houses to be pulled down. His jurisdiction has no dependance on the court of the borough, or bailie-court.

#### BARONS.

12. A Baron, in the large sense of that word, is one who holds his lands immediately of the Crown; and, as such, had, by our ancient constitution, right to a seat in parliament, however small his freehold might have been. The lesser Barons were exempted from the burden of attending the service of parliament. This exemption grew insensibly into an utter disability in all the lesser Barons from sitting in parliament, without election by the county; though no statute is to be found expressly excluding them.

13. To constitute a Baron in the strict law-sense, his lands must have been erected, or at least confirmed by the King, *in liberam baroniam*: and such Baron had a certain jurisdiction, both civil and criminal, which he might have exercised, either in his own person, or by his bailie.

14. By the late jurisdiction-act, the civil jurisdiction

of a Baron is reduced to the power of recovering, from his vassals and tenants, the rents of his lands, and of condemning them in mill-services; and of judging in causes where the debt and damages do not exceed 40 s. Sterling. His criminal jurisdiction is, by the same statute, limited to assaults, batteries, and other smaller offences, which may be punished by a fine not exceeding 20 s. Sterling, or by setting the offender in the stocks in the day-time not above three hours; the fine to be levied by poinding, or one month's imprisonment. The jurisdiction formerly competent to proprietors of mines, and coal or salt works, over their workmen, is reserved; and also that which was competent to proprietors who had the right of fairs or markets, for correcting the disorders that might happen during their continuance; provided they shall exercise no jurisdiction inferring the loss of life or dememoration.

#### CONSTABULARIES.

15. The High Constable of Scotland had no fixed territorial jurisdiction, but followed the court; and had, jointly with the Marischal, the cognisance of all crimes committed within two leagues of it. All other constabularies were dependant on him: These had castles, and sometimes boroughs subject to their jurisdiction, as Dundee, Montrose, &c. and amongst other powers, now little known, they had the right of exercising criminal jurisdiction within their respective territories during the continuance of fairs. By the late jurisdiction-act, all jurisdictions of constabulary are dissolved, except that of High Constable.

#### LYON KING OF ARMS.

16. The office of the Lyon King of Arms was chiefly ministerial, to denounce war, proclaim peace, carry public messages, &c. But he has also a right of jurisdiction, whereby he can punish all who usurp arms contrary to the law of arms, and deprive or suspend messengers, heralds, or pursuivants, (who are officers named by himself;) but he has no cognisance of the damage arising to the private party through the messenger's fault. Messengers are subservient to the supreme courts of session and judicatory; and their proper business is to execute all the King's letters either in civil or criminal causes.

17. Our judges had, for a long time, no other salaries or appointments than what arose from the sentences they pronounced. Our criminal judges applied to their own use the fines or issues of their several courts; and regalties had a right to the single escheat of all persons denounced, who resided within their jurisdiction; and our civil judges got a certain proportion of the sum contained in the decree pronounced. But these were all prohibited upon regular salaries being settled upon our judges.

#### Tit. 5. Of Ecclesiastical Persons.

THE Pope, or bishop of Rome, was long acknowledged, over the western part of Christendom, for the head of the Christian church. The papal jurisdiction was abolished in Scotland *anno* 1560. The King was, by act 1669, declared to have supreme authority over all

persons, and in all causes ecclesiastical; but this act was repealed by 1690, as inconsistent with Presbyterian church-government, which was then upon the point of being established.

2. Before the reformation from Popery, the clergy was divided into secular and regular. The secular had a particular tract of ground given them in charge, within which they exercised the pastoral office of bishop, presbyter, or other church officer. The regular clergy had no cure of souls, but were tied down to residence in their abbeys, priories, or other monasteries: And they got the name of regular, from the rules of mortification to which they were bound, according to the institution of their several orders. Upon the vacancy of any benefice, whether secular or regular, Commendators were frequently appointed to levy the fruits, as factors or stewards during the vacancy. The Pope alone could give the higher benefices; *in commendam*; and at last, from the plenitude of his power, he came to name commendators for life, and without any obligation to account. After the reformation, several abbeys and priories were given by James VI. *in perpetuam commendam*, to laics.

3. Upon abolishing the Pope's authority, the regular clergy was totally suppressed; and, in place of all the different degrees which distinguished the secular clergy, we had at first only parochial Presbyters or Ministers, and superintendants, who had the oversight of the church within a certain district: Soon thereafter the church-government became episcopal, by Archbishops, Bishops, &c. and after some intermediate turns, is now Presbyterian by kirk-sessions, presbyteries, synods, and general assemblies.

4. Prelate, in our statutes, signifies a Bishop, Abbot, or other dignified clergyman, who in virtue of his office had a seat in parliament. Every Bishop had his Chapter, which consisted of a certain number of the ministers of the diocese, by whose assistance he managed the affairs of the church within that district. The nomination of Bishops to vacant sees has been in the crown since 1540, though under the appearance of continuing the ancient right of election, which was in the Chapter. The confirmation by the Crown under the great seal, of the Chapter's election, confirmed a right to the spirituality of the benefice; and a second grant, upon the consecration of the Bishop-elect, gave a title to the temporality; but this second grant fell soon into disuse.

5. He who founded or endowed a church was intitled to the right of patronage thereof, or *advocatio ecclesie*; whereby, among other privileges, he might present a churchman to the cure, in case of a vacancy. The presentee, after he was received into the church, had a right to the benefice *proprio jure*; and if the church was parochial, he was called a parson. The Pope claimed the right of patronage of every kirk, to which no third party could shew a special title; and since the reformation, the Crown, as coming in place of the Pope, is considered as universal patron: where no right of patronage appears in a subject. Where two churches are united, which had different patrons, each patron presents by turns.

6. Gentlemen of estates frequently founded colleges or

collegiate churches, the head of which got the name of Provost, under whom were certain Prebendaries or Canons, who had their several stalls in the church, where they sung masses. Others of lesser fortunes founded chaplains, within the precincts of a parochial church; or altarges, which were donations granted for the singing of masses for deceased friends at particular altars in a church. Though all these were suppressed upon the reformation, their founders continued patrons of the endowments; out of which they were allowed to provide bursars, to be educated in any of the universities.

7. Where a fund is gifted for the establishment of a second minister in a parish where the cure is thought too heavy for one, the patronage of such benefice does not belong to the donor, but to him who was patron of the church, unless either where the donor has reserved to himself the right of patronage in the donation, or where he and his successors have been in the constant use of presenting the second minister, without challenge from the patron. The right of presenting incumbents was by 1690, c. 23. taken from patrons, and vested in the heritors and elders of the parish, upon payment to be made by the heritors to the patron of 600 merks; but it was again restored to patrons, 10. An. c. 12. with the exception of the presentations sold in pursuance of the former act.

8. Patrons were not simply administrators of the church; for they held the fruits of the vacant benefice as their own, for some time after the reformation. But that right is now no more than a trust in the patron, who must apply them to pious uses within the parish, at the sight of the heritors, yearly as they fall due. If he fail, he loses his right of administering the vacant stipend for that and the next vacancy. The king, who is exempted from this rule, may apply the vacant stipend of his churches to any pious use, though not within the parish. If one should be ordained to a church, in opposition to the presentee, the patron, whose civil right cannot be affected by any sentence of a church-court, may retain the stipend as vacant. Patrons are to this day intitled to a seat and burial-place in the churches of which they are patrons; and to the right of all the tithes of the parish not heritably disposed.

9. That kirks may not continue too long vacant, the patron must present to the presbytery, (formerly to the Bishop), a fit person for supplying the cure, within six months from his knowledge of the vacancy, otherwise the right of presentation accrues to the presbytery *jure devoluto*. Upon presentation by the patron, the Bishop collated or conferred the benefice upon the presentee by a writing, in which he appointed certain ministers of the diocese to induce or institute him into the church; which induction completed his right, and was performed by their placing him in the pulpit, and delivering him the bible and the keys of the church. The bishop collated to the churches of which himself was patron, *pleno jure*, or without presentation; which he also did in menial churches, whose patronages were sunk, by the churches being appropriated to him, as part of his patrimony. Since the revolution, a judicial act of admission by the presbytery, proceeding either upon a presentation, or up-

on a call from the heritors and elders, or upon their own *ius devolutum*, compleats the minister's right to the benefice.

10. Soon after the reformation, the Popish churchmen were prevailed upon to resign in the sovereign's hands, a third of their benefices, which was appropriated, in the first place, for the subsistence of the reformed clergy. To make this fund effectual, particular localities were assigned in every benefice, to the extent of a third, called the assumption of thirds; and for the farther support of ministers. Queen Mary made a grant in their favour of all the small benefices not exceeding 300 merks. Bishops, by the act which restored them to the whole of their benefices, were obliged to maintain the ministers within their dioceses, out of the thirds; and in like manner, the laic titulars, who got grants of the teinds, became bound, by their acceptance thereof, to provide the kirks within their erections in competent stipends.

11. But all these expedients for the maintenance of the clergy having proved ineffectual, a commission of parliament was appointed in the reign of James VI. for planting kirks, and modifying stipends to ministers out of the teinds; and afterwards several other commissions were appointed, with the more ample powers of dividing large parishes, erecting new ones, &c. all of which were, in 1707, transferred to the court of Session, with this limitation, that no parish should be disjoined, nor new church erected, nor old one removed to a new place, without the consent of three fourths of the heritors, computing the votes, not by their numbers, but by the valuation of their rents within the parish. The Judges of Session, when sitting in that court, are considered as a commission of Parliament, and have their proper clerks, macers, and other officers of court, as such.

12. The lowest stipend that could be modified to a minister by the first commission was 500 merks, or five chalders of victual, unless where the whole teinds of the parish did not extend so far: And the highest was 1000 merks, or ten chalders. The parliament 1633 raised the *minimum* to eight chalders of victual, and proportionably in silver; but as neither the commission appointed by that act, nor any of the subsequent ones, was limited as to the *maximum*, the commissioners have been in use to augment stipends considerably above the old *maximum*, where there is sufficiency of free teinds, and the cure is burdensome, or living expensive.

13. Where a certain quantity of stipend is modified to a minister out of the teinds of a parish, without proportioning that stipend among the several heritors, the decree is called a *decree of modification*: But where the commissioners also fix the particular proportions payable by each heritor, it is a decree of *modification and locality*. Where a stipend is only modified, it is secured on the whole teinds of the parish, so that the minister can insist against any one heritor to the full extent of his teinds: such heritor being always entitled to relief against the rest, for what he shall have paid above his just share: But where the stipend is also localised, each heritor is liable in no more than his own proportion.

14. Few of the reformed ministers were, at first, provided with dwelling houses: most of the Popish clergy

having, upon the first appearance of the reformation, let their manse in feu, or in long tacks: Ministers therefore got a right, by 1563. to as much of these manse as would serve them, notwithstanding such feus or tacks. Where there was no parson's nor vicar's manse, one was to be built by the heritors, at the sight of the bishop, (now the Presbytery,) the charge not exceeding L. 1000 Scots, nor below 500 merks. Under a manse are comprehended stable, barn, and byre, with a garden; for all which, it is usual to allow half an acre of ground.

15. Every incumbent is intitled at his entry to have his manse put into good condition; for which purpose, the presbytery may appoint a visitation by tradesmen, and order estimates to be laid before them of the sums necessary for the repairing, which they may proportion among the heritors according to their valuations. The presbytery, after the manse is made sufficient, ought, upon application of the heritors, to declare it a free manse, which lays the incumbent under an obligation to uphold it in good condition during his incumbency; otherwise, he or his executors shall be liable in damages: But they are not bound to make up the loss arising from the necessary decay of the building by the waste of time.

16. All ministers, where there is any landward or country-parish, are, over and above their stipend, intitled to a glebe, which comprehends four acres of arable land, or sixteen fowms of pasture-ground where there is no arable land, (a fowm is what will graze ten sheep or one cow), and is to be designed or marked by the bishop or presbytery out of such kirk-lands within the parish as lie nearest to the kirk, and, in default of kirk-lands, out of temporal lands.

17. A right of relief is competent to the heritors, whose lands are set off for the manse or glebe, against the other heritors of the parish. Manses and glebes, being once regularly designed, cannot be seized or sold by the incumbent in prejudice of his successors, which is in practice extended even to the case where such alienation evidently appears profitable to the benefice.

18. Ministers, besides their glebe, are intitled to grafs for a horse and two cows. And, if the lands out of which the grafs may be designed, either lie at a distance, or are not fit for pasture, the heritors are to pay to the minister L. 20 Scots yearly as an equivalent. Ministers have also freedom of baggage, pasturage, fowel, seal, divot, loaning, and free fish and entry, according to use and wont: What these privileges are, must be determined by the local custom of the several parishes.

19. The legal terms at which stipends become due to ministers are Whitfunday and Michaelmas. If the incumbent be admitted to his church before Whitfunday, till which term the corns are not presumed to be fully sown, he has right to that whole year's stipend; and, if he is received after Whitfunday, and before Michaelmas, he is intitled to the half of that year; because, tho' the corns were sown before his entry, he was admitted before the term at which they are presumed to be reaped. By the same reason, if he dies or is transported before Whitfunday, he has right to no part of that year; if before Michaelmas, to the half; and if not till after Michaelmas, to the whole.

20. After

20. After the minister's death, his executors have right to the annat; which, in the sense of the canon law, was a right reserved to the Pope, of the first year's fruits of every benefice. Upon a threatened invasion from England *anno* 1547, the annat was given by our Parliament, notwithstanding this right in the Pope, to the executors of such churchmen as should fall in battle in defence of their country: But the word annat or ann, as it is now understood, is the right which law gives to the executors of ministers, of half a year's benefice, over and above what was due to the minister himself for his incumbency.

21. The executors of a minister need make up no title to the ann by confirmation: Neither is the right assignable by the minister, or affectable with his debts; for it never belonged to him, but is a mere gratuity given by law to those whom it is presumed the deceased could not sufficiently provide; and law has given it expressly to *executors*: And if it were to be governed by the rules of succession in executory, the widow, in case of no children, would get one half, the other would go to the next of kin; and where there are children, she would be intitled to a third, and the other two thirds would fall equally among the children. But the court of Session, probably led by the general practice, have in this last case divided the ann into two equal parts, of which one goes to the widow, and the other among the children *in capita*.

22. From the great confidence that was, in the first ages of Christianity, reposed in churchmen, dying persons frequently committed to them the care of their estates, and of their orphan children: but these were simply rights of trust, not of jurisdiction. The clergy soon had the address to establish to themselves a proper jurisdiction, not confined to points of ecclesiastical right, but extending to questions that had no concern with the church. They judged, not only in tithes, patronages, testaments, breach of vow, scandal, &c.; but in questions of marriage and divorce, because marriage was a sacrament; in tochers, because these were given in consideration of marriage; in all questions where an oath intervened, on pretence that oaths were a part of religious worship, &c. As churchmen came, by the means of this extensive jurisdiction, to be diverted from their proper functions, they committed the exercise of it to their officials or commissaries: Hence the Commissary-court was called the Bishops court, and *Curia Christianitatis*; it is also styled the Consistorial Court, from *Consistory*, a name first given to the court of appeals of the Roman Emperors and afterwards to the courts of judicature held by churchmen.

23. At the reformation, all episcopal jurisdiction, exercised under the authority of the Bishop of Rome, was abolished. As the course of justice in consistorial causes was thereby stopped, Q. Mary besides naming a Commissary for every diocese, did, by a special grant, establish a new Commissary-court at Edinburgh, consisting of four judges or commissaries. This court is vested with a double jurisdiction; one diocesan, which is exercised in the special territory contained in the grant, *viz* the counties of Edinburgh, Haddington, Linlithgow, Peebles, and a part part of Stirling-shire; and another universal, by which the judges confirm the testaments of all

who die in foreign parts, and may reduce the decrees of all inferior Commissaries, provided the reduction be pursued within a year after the decree: Bishops, upon their re-establishment in the reign of James VI. were restored to the right of naming their several Commissaries.

24. As the clergy in times of Popery assumed a jurisdiction independent of the civil power or any secular court, their sentences could be reviewed only by the Pope, or judges delegated by him; so that, with regard to the courts of Scotland, their jurisdiction was supreme. But by an act 1560, the appeals from our Bishops courts, that were then depending before the Roman consistories, were ordained to be decided by the court of Session: And by a posterior act 1609, the Session is declared the King's great Consistory, with power to review all sentences pronounced by the Commissaries. Nevertheless, since that court had no inherent jurisdiction in consistorial causes, prior to this statute; and since the statute gives them a power of judging only by way of advocacy, they have not, to this day, any proper consistorial jurisdiction in the first instance: neither do they pronounce sentence, in any consistorial cause brought from the Commissaries, but remit it back to them with instructions. By the practice immediately subsequent to the act before quoted, they did not admit advocations from the inferior Commissaries, till the cause was brought before the Commissaries of Edinburgh; but that practice is now in disuse.

25. The Commissaries retain to this day an exclusive power of judging in declarators of marriage, and of the nullity of marriage; in actions of divorce and of non-adherence, of adultery, bastardy, and confirmation of testaments: because all these matters are still considered to be properly consistorial. Inferior Commissaries are not competent to questions of divorce, under which are comprehended questions of bastardy and adherence, when they have a connection with the lawfulness of marriage, or with adultery.

26. Commissaries have now no power to pronounce decrees in absence for any sum above L. 40 Scots, except in causes properly consistorial: but they may authenticate tutorial and curatorial inventories; and all bonds, contracts, &c. which contain a clause for registration in the books of any judge competent, and protests on bills, may be registred in their books.

#### Tit. 6. Of Marriage.

Persons, when considered in a private capacity, are chiefly distinguished by their mutual relations; as husband and wife, tutor and minor, father and child, master and servant. The relation of husband and wife is constituted by marriage; which is the conjunction of man and wife, vowing to live inseparably till death.

2. Marriage is truly a contract, and so requires the consent of parties. Idiots, therefore, and furious persons cannot marry. As no person is presumed capable of consent within the years of pupillarity, which, by our law, lasts till the age of fourteen in males, and twelve in females; marriage cannot be contracted by pupils; but if the married pair should cohabit after puberty, such acquiescence

acquiescence gives force to the marriage. Marriage is fully perfected by consent; which, without consummation, founds all the conjugal rights and duties. The consent requisite to marriage must be *de presenti*. A promise of marriage, (*stipulatio sponsalitia*), may be resiled from, as long as matters are entire; but if any thing be done by one of the parties, whereby a prejudice arises from the non-performance, the party resiling is liable in damages to the other. The canonists, and after them our courts of justice, explain a *copula* subsequent to a promise of marriage into actual marriage.

3. It is not necessary, that marriage should be celebrated by a clergyman. The consent of parties may be declared before any magistrate, or simply before witnesses: And though no formal consent should appear, marriage is presumed from the cohabitation, or living together at bed and board, of a man and woman who are generally reputed husband and wife. One's acknowledgment of his marriage to the midwife whom he called to his wife, and to the minister who baptized his child, was found sufficient presumptive evidence of marriage, without the aid, either of cohabitation, or of *habite et repute*. The father's consent was, by the Roman law, essential to the marriage of children *in familia*: But, by our law, children may enter into marriage, without the knowledge; and even against the remonstrances of a father.

4. Marriage is forbidden within certain degrees of blood. By the law of Moses, *Levit. c. 18.* which is made ours, seconds in blood, and all remoter degrees, may lawfully marry. By seconds in blood, are meant first cousins. Marriage in the direct line is forbidden *in infinitum*; as it is also in the collateral line, in the special case where one of the parties is *loco parentis* to the other, as grand-uncle, great grand-uncle, &c. with respect to his grand-niece, &c. The same degrees that are prohibited in consanguinity, are prohibited in affinity; which is the tie rising from marriage, betwixt one of the married pair and the blood-relations of the other. Marriage also, where either of the parties is naturally unfit for generation, or stands already married to a third person, is *ipso jure* null.

5. To prevent bigamy and incestuous marriages, the church has introduced proclamation of banns; which is the ceremony of publishing the names and designations of those who intend to intermarry, in the churches where the bride and bridegroom reside, after the congregation is assembled for divine service; that all persons who know any objection to the marriage, may offer it. When the order of the church is observed, the marriage is called regular; when otherwise, clandestine.

6. By marriage, a society is created between the married pair, which draws after it a mutual communication of their civil interests, in as far as is necessary for maintaining it. As the society lasts only for the joint lives of the *socii*; therefore rights that have the nature of a perpetuity, which our law styles heritable, are not brought under the partnership or communion of goods; as a land-estate, or bonds bearing a yearly interest: It is only moveable subjects, or the fruits produced by heritable sub-

jects during the marriage, that become common to man and wife.

7. The husband, as the head of the wife, has the sole right of managing the goods in communion, which is called *jus mariti*. This right is so absolute, that it bears but little resemblance to a right of administering a common subject; for the husband can, in virtue thereof, sell, or even gift at pleasure, the whole goods falling under communion; and his creditors may affect them for the payment of his proper debts: So that the *jus mariti* carries all the characters of an assignation by the wife to the husband, of her moveable estate. It arises *ipso jure* from the marriage; and therefore needs no other constitution. But a stranger may convey an estate to a wife, so as it shall not be subject to the husband's administration; or the husband himself may, in the marriage-contract, renounce his *jus mariti* in all or any part of his wife's moveable estate.

8. From this right are excepted paraphernal goods, which, as the word is understood in our law, comprehends the wife's wearing apparel, and the ornaments proper to her person, as necklaces, ear-rings, breast or arm jewels, buckles, &c. These are neither alienable by the husband, nor affectable by his creditors. Things of promiscuous use to husband and wife, as plate, medals, &c. may become paraphernal, by the husband's giving them to the wife, at or before marriage; but they are paraphernal only in regard to that husband who gave them as such, and are esteemed common moveables, if the wife, whose *paraphernalia* they were, be afterwards married to a second husband; unless he shall in the same manner appropriate them to her.

9. The right of the husband to the wife's moveable estate, is burdened with the moveable debts contracted by her before marriage: And as his right is universal, so is his burden; for it reaches to her whole moveable debts, though they should far exceed her moveable estate. Yet the husband is not considered as the true debtor in his wife's debts. In all actions for payment, she is the proper defender: the husband is only cited for his interest, that is, as curator to her, and administrator of the society-goods. As soon therefore as the marriage is dissolved, and the society-goods thereby suffer a division, the husband is no farther concerned in the share belonging to his deceased wife; and consequently is no longer liable to pay her debts, which must be recovered from her representatives, or her separate state.

10. This obligation upon the husband is perpetuated against him. 1. Where his proper estate, real or personal, has been affected, during the marriage, by complete legal diligence; in which case, the husband must, by the common rules of law, relieve his property from the burden with which it stands charged: But the utmost diligence against his person, is not sufficient to perpetuate the obligation; nor even incomplete diligence against his estate. 2. The husband continues liable, even after the wife's death, in so far as he is *lucratus* or profited by her estate. As he was at no time the proper debtor in his wife's moveable debts; therefore, though he should be *lucratus*, he is, after the dissolution, only liable for them

them *subsidiariis*, i. e. if her own separate estate is not sufficient to pay them off.

11. Where the wife is debtor in that sort of debt, which, if it had been due to her, would have excluded the *jus mariti*, e. g. in bonds bearing interest, the husband is liable only for the bygone interests, and those that may grow upon the debt during the marriage; because his obligations for her debts must be commensurated to the interest he has in her estate. It is the husband alone who is liable in personal diligence for his wife's debts, while the marriage subsists: The wife, who is the proper debtor, is free from all personal execution upon them while she is *vestita viro*.

12. The husband by marriage becomes the perpetual curator of the wife. From this right it arises, 1. That no suit can proceed against the wife, till the husband be cited for his interest. 2. All deeds, done by a wife without the husband's consent, are null; neither can she sue in any action without the husband's concurrence. Where the husband refuses, or by reason of forfeiture, &c. cannot concur; or where the action is to be brought against the husband himself, for performing his part of the marriage articles; the judge will authorise her to sue in her own name. The effects arising from this curatorial power discover themselves even before marriage, upon the publication of banns; after which the bride, being no longer *sui juris*, can contract no debt, nor do any deed, either to the prejudice of her future husband, nor even to her own.

13. If the husband should either withdraw from his wife, or turn her out of doors; or if, continuing in family with her, he should by severe treatment endanger her life; the Commissaries will authorise a separation *a mensa et toro*, and give a separate alimony to the wife, suitable to her husband's estate, from the time of such separation, until either a reconciliation or a sentence of divorce.

14. Certain obligations of the wife are valid, notwithstanding her being *sub cura mariti*; *ex. gr.* obligations arising from delict; for wives have no privilege to commit crimes. But if the punishment resolves into a pecuniary mulct, the execution of it must, from her incapacity to fulfil, be suspended till the dissolution of the marriage, unless the wife has a separate estate exempted from the *jus mariti*.

15. Obligations arising from contract, affect either the person or the estate. The law has been so careful to protect wives, while *sub cura mariti*, that all personal obligations granted by a wife, though with the husband's consent, as bonds, bills, &c. are null; with the following exceptions: 1. Where the wife gets a separate *peculium* or stock, either from her father or a stranger, for her own or her children's alimony, she may grant personal obligations in relation to such stock; and by stronger reason, personal obligations granted by a wife are good, when her person is actually withdrawn from her husband's power, by a judicial separation. 2. A wife's personal obligation, granted in the form of a deed *inter vivos*, is valid, if it is not to take effect till her death. 3. Where the wife is by the husband *præposita negotiis*, entrusted with the management, either of a particular branch of business, or of his whole affairs, all the contracts she en-

ters into in the exercise of her *præpositura*, are effectual, even though they be not reduced to writing, but should arise merely *ex re*, from furnishings made to her: But such obligations have no force against the wife; it is the husband only, by whose commission she acts, who is thereby obliged.

16. A wife, while she remains in family with her husband, is considered as *præposita negotiis domesticis*; and consequently may provide things proper for the family, for the price whereof the husband is liable, though they should be misapplied, or though the husband should have given her money to provide them elsewhere. A husband, who suspects that his wife may hurt his fortune by high living, may use the remedy of inhibition against her; by which all persons are interpellated from contracting with her, or giving her credit. After the completing of this diligence, whereby the *præpositura* falls, the wife cannot bind the husband, unless for such reasonable furnishings as he cannot instruct that he provided her with *alimunde*. As every man, and consequently every husband, has a right to remove his managers at pleasure, inhibition may pass at the suit of the husband against the wife, though he should not offer to justify that measure by an actual proof of the extravagance or profuseness of her temper.

17. As to rights granted by the wife affecting her estate; she has no moveable estate, except her *paraphernalia*; and these she may alien or impignorate, with consent of the husband. She can, without the husband, bequeath by testament her share of the goods in communion; but she cannot dispose of them *inter vivos*. A wife can lawfully oblige herself, in relation to her heritable estate, with consent of her husband; for though her person is in some sense sunk by the marriage, she continues capable of holding a real estate; and in such obligations, her estate is considered, and not her person. A husband, though he be curator to his wife, can, by his acceptance or intervention, authorise rights granted by her in his own favour; for a husband's curatory is not intended only for the wife's advantage, but is considered as a mutual benefit to both.

18. All donations, whether by the wife to the husband, or by the husband to the wife, are revocable by the donor; but if the donor dies without revocation, the right becomes absolute. Where the donation is not pure, it is not subject to revocation: Thus, a grant made by the husband, in consequence of the natural obligation that lies upon him to provide for his wife, is not revocable, unless in so far as it exceeds the measure of a rational settlement; neither are remuneratory grants revocable, where mutual grants are made in consideration of each other, except where an onerous cause is simulated, or where what is given *hinc inde* bears no proportion to each other. All voluntary contracts of separation, by which the wife is provided in an yearly alimony, are effectual as to the time past, but revocable either by the husband or wife.

19. As wives are in the strongest degree subject to the influence of their husbands, third parties, in whose favours they had made grants, were frequently vexed with actions of reduction, as if the grant had been extorted from the wife, through the force or fear of the husband.

husband. To secure the grantees against this danger, ratifications were introduced, whereby the wife, appearing before a judge, declares upon oath, her husband not present, that she was not induced to grant the deed *ex vi putatus*. A wife's ratification is not absolutely necessary for securing the grantee: Law indeed allows the wife to bring reduction of any deed she has not ratified, upon the head of force or fear; of which, if she brings sufficient evidence, the deed will be set aside; but if she fails in the proof, it will remain effectual to the receiver.

20. Marriage, like other contracts, might, by the Roman law, be dissolved by the contrary consent of parties; but, by the law of Scotland, it cannot be dissolved till death, except by divorce, proceeding either upon the head of adultery, or of wilful desertion.

21. Marriage is dissolved by death, either within year and day from its being contracted, or after year and day. If it is dissolved within year and day, all rights granted in consideration of the marriage (unless guarded against in the contract) become void, and things return to the same condition in which they stood before the marriage; with this restriction, that the husband is considered as a *bona fide* possessor, in relation to what he has consumed upon the faith of his right; but he is liable to repay the tocher, without any deduction in consideration of his family expence during the marriage. If things cannot be restored on both sides, equity hinders the restoring of one party, and not the other.

22. Upon the dissolution of a marriage, after year and day, the surviving husband becomes the irrevocable proprietor of the tocher and the wife, where she survives, is intitled to her jointure, or to her legal provisions. She has also right to mournings, suitable to the husband's quality; and to alimony from the day of his death till the term at which her liferent provision, either legal or conventional, commences. If a living child be procreated of the marriage, the marriage has the same effect as if it had subsisted beyond the year. A day is adjoined to the year, *in majorem evidentiam*, that it may clearly appear that the year itself is elapsed; and therefore, the running of any part of the day, after the year, has the same effect as if the whole were elapsed. The legal right of courtesy competent to the surviving husband is explained below, Tit. xvi. 28.

23. Divorce is such a separation of married persons, during their lives, as looses them from the nuptial tie, and leaves them at freedom to intermarry with others. But neither adultery, nor wilful desertion, are grounds which must necessarily dissolve marriage: they are only handles, which the injured party may take hold of, to be free. Cohabitation, therefore, by the injured party, after being in the knowledge of the acts of adultery, implies a passing from the injury; and no divorce can proceed, which is carried on by collusion betwixt the parties, lest, contrary to the first institution of marriage, they might disengage themselves by their own consent: and though after divorce, the guilty person, as well as the innocent, may contract second marriages; yet in the case of divorce upon adultery, marriage is by special statute prohibited betwixt the two adulterers.

24. Where either party has deserted from the other

for four years together, that other may sue for adherence. If this has no effect, the church is to proceed, first by admonition, then by excommunication; all which previous steps are declared to be a sufficient ground for pursuing a divorce. *De praxi*, the Commissaries pronounce sentence in the adherence, after one year's desertion; but four years must intervene between the first desertion and the decree of divorce.

25. The legal effects of divorce on the head of desertion are, that the offending husband shall restore the tocher, and forfeit to the wife all her provisions, legal and conventional; and on the other hand, the offending wife shall forfeit to the husband her tocher, and all the rights that would have belonged to her, in the case of her survivance. This was also esteemed the rule in divorces upon adultery. But by a decision of the court of Session 1762, founded on a tract of ancient decisions recovered from the records, the offending husband was allowed to retain the tocher.

#### Tit. 7. Of Minors, and their Tutors and Curators.

1. THE stages of life principally distinguished in law are, *pupillarity*, *puberty* or *minority*, and *majority*. A child is under pupillarity, from the birth till fourteen years of age, if a male, and till twelve, if a female. Minority begins where pupillarity ends, and continues till majority, which, by the law of Scotland, is the age of twenty-one years complete, both in males and females: But minority, in a large sense, includes all under age, whether pupils, or *puberes*. Because pupils cannot in any degree act for themselves, and minors seldom with discretion, pupils are put by law under the power of tutors, and minors may put themselves under the direction of curators. Tutorship is a power and faculty to govern the person, and administer the estate of a pupil. Tutors are either nominate, of law, or clative.

2. A tutor nominate is he who is named by a father, in his testament or other writing, to a lawful child. Such tutor is not obliged to give caution for the faithful discharge of his office; because his fidelity is presumed to have been sufficiently known to the father.

3. If there be no nomination by the father, or if the tutors nominate do not accept, or if the nomination falls by death or otherwise, there is place for a tutor of law. This sort of tutory devolves upon the next agnate; by which we understand he who is nearest related by the father, though females intervene.

4. Where there are two or more agnates equally near to the pupil, he who is intitled to the pupil's legal succession falls to be preferred to the others. But as the law suspects, that he may not be over careful to preserve a life which stands in the way of his own interest, this sort of tutor is excluded from the custody of the pupil's person, which is commonly committed to the mother, while a widow, until the pupil be seven years old; and, in default of the mother, to the next cognate, *i. e.* the nearest relation by the mother. The tutor of law must be at least twenty-five years of age. He is served or declared by a jury of sworn men, who are called upon a brief issuing

ing from the Chancery, which is directed to any judge having jurisdiction. He must give security before he enters upon the management.

5. If no tutor of law demands the office, any person, even a stranger, may apply for a tutory-dative. But because a tutor in law ought to be allowed a competent time to deliberate whether he will serve or not, no tutory-dative can be given till the elapsing of a year from the time at which the tutor of law had first a right to serve. It is the king alone, as the father of his country, who gives tutors-dative, by his court of exchequer; and no gift of tutory can pass in exchequer, without the citation or consent of the next of kin to the pupil, both by the father and mother, nor till the tutor give security, recorded in the books of exchequer. There is no room for a tutor of law, or tutor-dative, while a tutor nominate can be hoped for: and tutors of law, or dative, even after they have begun to act, may be excluded by the tutor nominate, as soon as he offers to accept, unless he has expressly renounced the office. If a pupil be without tutors of any kind, the court of Session will, at the suit of any kinsman, name a factor (steward) for the management of the pupil's estate.

6. After the years of pupillarity are over, the minor is considered as capable of acting by himself, if he has confidence enough of his own capacity and prudence. The only two cases in which curators are imposed upon minors are, first, where they are named by the father, in a state of health. 2. Where the father is himself alive; for a father is *ipso jure*, without any service, administrator, that is, both tutor and curator of law to his children, in relation to whatever estate may fall to them during their minority. This right in the father does not extend to grand-children, nor to such even of his immediate children as are forisfamiliated. Neither has it place in subjects which are left by a stranger to the minor, exclusive of the father's administration. If the minor chuses to be under the direction of curators, he must raise and execute a summons, citing at least two of his next of kin, to appear before his own judge-ordinary, upon nine days warning. At the day and place of appearance, he offers to the judge a list of those whom he intends for his curators: such of them as resolve to undertake the office, must sign their acceptance, and give caution; upon which an act of curatory is extracted.

7. These curators are styled *ad negotia*, to distinguish them from another sort called curators *ad lites*, who are authorised by the judge to concur with a pupil or minor in actions of law, either where he is without tutors and curators, or where his tutors or curators are parties to the suit. This sort is not obliged to give caution, because they have no intermeddling with the minor's estate: they are appointed for a special purpose; and when that is over, their office is at an end. Women are capable of being tutors and curators, under the following restrictions; 1. The office of a female tutor or curator falls by her marriage, even though the nomination should provide otherwise; 2. No woman can be tutor of law. Pupils are declared incapable of tutory or curatory. Where the minor has more tutors and curators than one, who are called in the nomination to the joint management,

they must all concur in every act of administration: where a certain number is named for a quorum, that number must concur: where any one is named *sine quo non*, no act is valid without that one's special concurrence. But if they are named without any of these limitations, the concurrence of the majority of the nominees then alive is sufficient.

8. In this, tutory differs from curatory, that as pupils are incapable of consent, they have no person capable of acting; which defect the tutor supplies: but a minor *pupus* can act for himself. Hence, the tutor subscribes alone all deeds of administration: but in curatory, it is the minor who subscribes as the proper party; the curator does no more than consent. Hence also, the persons of pupils are under the power, either of their tutors or of their nearest cognates; but the minor, after pupillarity, has the disposal of his own person, and may reside where he pleases. In most other particulars, the nature, the powers, and the duties of the two offices coincide. Both tutors and curators must, previous to their administration, make a judicial inventory, subscribed by them and the next of kin, before the minor's judge-ordinary, of his whole estate, personal and real; of which, one subscribed duplicate is to be kept by the tutors or curators themselves; another, by the next of kin on the father's side; and a third, by the next of kin on the mother's. If any estate belonging to the minor shall afterwards come to their knowledge, they must add it to the inventory within two months after their attaining possession thereof. Should they neglect this, the minor's debtors are not obliged to make payment to them; they may be removed from their offices as suspected, and they are intitled to no allowance for the sums disbursed by them in the minor's affairs, except the expence laid out upon the minor's entertainment, upon his lands and houses, and upon completing his titles.

9. Tutors and curators cannot grant leases of the minor's lands, to endure longer than their own office; nor under the former rental, without either a warrant from the court of Session, or some apparent necessity.

10. They have power to sell the minor's moveables; but cannot sell their pupil's land estate, without the authority of a judge. But the alienation of heritage by a minor, with consent of his curators, is valid.

11. Tutors and curators cannot, contrary to the nature of their trust, authorise the minor to do any deed for their own benefit; nor can they acquire any debt affecting the minor's estate: and, where a tutor or curator makes such acquisition, in his own name, for a less sum than the right is intitled to draw, the benefit thereof accrues to the minor.

12. By the Roman law, tutory and curatory, being *munera publica*, might be forced upon every one who had not a relevant ground of excuse; but, with us, the persons named to these offices may either accept or decline: and where a father, in *liege justice*, names certain persons both as tutors and curators to his children, though they have acted as tutors, they may decline the office of curatory. Tutors and curators having once accepted, are liable *in diligence*, that is, are accountable for the consequences of their neglect in any part of their duty.

duty from the time of their acceptance. They are accountable *singuli in solidum*, i. e. every one of them is answerable, not only for his own diligence, but for that of his co-tutors; and any one may be sued without citing the rest: But he who is condemned in the whole, has action of relief against his co-tutors.

13. From this obligation to diligence, we may except, 1. Fathers or administrators in law, who, from the presumption that they act to the best of their power for their children, are liable only for actual intromissions. 2. Tutors and curators named by the father, with the special provisos, that they shall be liable barely for intromissions, not for omissions; and that each of them shall be liable only for himself, and not *in solidum* for the co-tutors: But this power of exemption from diligence, is limited to the estate descending from the father himself. Tutors or curators are not intitled to any salary or allowance for pains, unless a salary has been expressly contained in the testator's nomination; for their office is presumed gratuitous.

14. Though no person is obliged to accept the office of tutor or curator, yet having once accepted, he cannot throw it up or renounce it, without sufficient cause; but, if he should be guilty of misapplying the minor's money, or fail in any other part of his duty, he may be removed at the suit of the minor's next in kin, or by a co-tutor, or co-curator: Where the misconduct proceeds merely from indolence, or inattention, the court, in place of removing the tutor, either join a curator with him, or, if he be a tutor-nominate, they oblige him to give caution for his past and future management.

15. The offices of tutory and curatory expire by the pupil's attaining the age of puberty, or the minor's attaining the age of twenty-one years complete; and by the death either of the minor, or of his tutor or curator.

16. Deeds either by pupils, or by minors having curators without their consent, are null; but they oblige the granters, in as far as relates to sums profitably applied to their use. A minor under curators can indeed make a testament by himself; but whatever is executed in the form of a deed *inter vivos*, requires the curator's consent. Deeds by a minor who has no curators, are as effectual as if he had curators, and signed them with their consent; he may even alien his heritage, without the interposition of a judge.

17. Minors may be restored against all deeds granted in their minority, that are hurtful to them. Deeds, in themselves void, need not the remedy of restitution; but where hurtful deeds are granted by a tutor in his pupil's affairs, or by a minor who has no curators, as these deeds subsist in law, restitution is necessary: And even where a minor, having curators, executes a deed hurtful to himself with their consent, he has not only action against the curators, but he has the benefit of restitution against the deed itself. The minor cannot be restored, if he does not raise and execute a summons for reducing the deed, *ex capite minorænnitatis et læsionis*, before he be twenty-five years old. These four years, between the age of twenty-one and twenty five, called *quadriennium utile*, are indulged to the minor, that he may have a

reasonable time, from that period, when he is first presumed to have the perfect use of his reason, to consider with himself what deeds done in his minority have been truly prejudicial to him.

18. Questions of restitution are proper to the court of Session. Two things must be proved by the minor, in order to the reduction of the deed; 1. That he was minor when it was signed; 2. That he is hurt or lesed by the deed. This lesion must not proceed merely from accident; for the privilege of restitution was not intended to exempt minors from the common misfortunes of life; it must be owing to the imprudence or negligence of the minor, or his curator.

19. A minor cannot be restored against his own delict or fraud. 2. Restitution is excluded, if the minor, at any time after majority, has approved of the deed, either by a formal ratification, or tacitly by payment of interest, or by other acts inferring approbation. 3. A minor, who has taken himself to business, as a merchant shopkeeper, &c cannot be restored against any deed granted by him, in the course of that business, especially if he was *proximus majorennitati* at signing the deed. 4. According to the more common opinion, a minor cannot be restored in a question against a minor, unless some gross unfairness shall be qualified in the bargain.

20. The privilege of restitution does not always die with the minor himself. 1. If a minor succeeds to a minor, the time allowed for restitution is governed by the minority of the heir, not of the ancestor. 2. If a minor succeeds to a major, who was not full twenty-five, the privilege continues with the heir during his minority; but he cannot avail himself of the *anni utiles*, except in so far as they were unexpired at the ancestor's death. 3. If a major succeeds to a minor, he has only the *quadriennium utile* after the minor's death; and if he succeeds to a major dying within the *quadriennium*, no more of it can be profitable to him than what remained when the ancestor died.

21. No minor can be compelled to state himself as a defender, in any action, whereby his heritable estate flowing from ascendants may be evicted from him, by one pretending a preferable right.

22. This privilege is intended merely to save minors from the necessity of disputing upon questions of preference; it does not therefore take place, 1. Where the action is pursued on the father's falsehood or delict. 2. Upon his obligation to convey heritage. 3. On his liquid bond for a sum of money, though such action should have the effect to carry off the minor's estate by adjudication. 4. Nor in actions pursued by the minor's superior, upon feudal casualties. 5. This privilege cannot be pleaded in bar of an action which had been first brought against the father, and is only continued against the minor; nor where the father was not in the peaceable possession of the heritable subject at his death. Before the minor can plead it, he must be served heir to his father. The persons of pupils are protected from imprisonment on civil debts.

23. Curators are given, not only to minors, but in general to every one who, either through defect of judgment, or unsuitness of disposition, is incapable of

rightly managing his own affairs. Of the first sort, are idiots and furious persons. Idiots, or *fatui*, are entirely deprived of the faculty of reason. The distemper of the furious person does not consist in the defect of reason, but in an overheated imagination, which obstructs the application of reason to the purposes of life. Curators may be also granted to lunatics, and even to persons dumb and deaf, though they are of sound judgment, where it appears that they cannot exert it in the management of business. Every person, who is come of age, and is capable of acting rationally, has a natural right to conduct his own affairs. The only regular way, therefore, of appointing this sort of curators, is by a jury summoned upon a brief from the chancery; which is not, like the brief of common tutory, directed to any judge-ordinary, but to the judge of the special territory where the person alleged to be fatuous or furious resides; that if he is truly of sound judgment, he may have an opportunity to oppose it: And, for this reason, he ought to be made a party to the brief. The curatory of idiots and furious persons belongs to the nearest agnate; but a father is preferred to the curatory of his fatuous son, and the husband to that of his fatuous wife, before the agnate.

24. A clause is inserted in the brief, for inquiring how long the fatuous or furious person has been in that condition; and the verdict to be pronounced by the inquest, is declared a sufficient ground, without farther evidence, for reducing all deeds granted after the period at which it appeared by the proof that the fatuity or furiosity began. But, as fatuous and furious persons are, by their very state, incapable of being obliged, all deeds done by them may be declared void, upon proper evidence of their fatuity at the time of signing, though they should never have been cognosed idiots by an inquest.

25. We have some few instances of the Sovereign's giving curators to idiots, where the next agnate did not claim; but such gifts are truly deviations from our law, since they pass without an inquiry into the state of the person upon whom the curatory is imposed. Hence the curator of law to an idiot, serving *quandocunque*, is preferred as soon as he offers himself, before the curator-dative. This sort of curatory does not determine by the lucid intervals of the person *sub cura*; but it expires by his death, or perfect return to a sound judgment; which last ought regularly to be declared by the sentence of a judge.

26. Persons, let them be ever so profuse, or liable to be imposed upon, if they have the exercise of reason, can effectually oblige themselves, till they are fettered by law. Interdiction is a legal restraint laid upon such persons from signing any deed to their own prejudice, without the consent of their curators or interdictors.

27. There could be no interdiction, by our ancient practice, without a previous inquiry into the person's condition. But as there were few who could bear the shame that attends judicial interdiction, however necessary the restraint might have been, voluntary interdiction has received the countenance of law; which is generally executed in the form of a bond, whereby the grantor obliges himself to do no deed that may affect his estate, without the consent of certain friends therein mentioned. Though

the reasons inductive of the bond should be but gently touched in the recital, the interdiction stands good. Voluntary interdiction, though it be imposed by the sole act of the person interdicted, cannot be recalled at his pleasure: But it may be taken off, 1. By a sentence of the court of Session, declaring, either that there was, from the beginning, no sufficient ground for the restraint; or that the party is, since the date of the bond, become *rei suæ providus*. 2. It falls, even without the authority of the Lords, by the joint act of the person interdicted, and his interdictors, concurring to take it off. 3. Where the bond of interdiction requires a certain number as a quorum, the restraint ceases, if the interdictors shall be by death reduced to a lesser number.

28. Judicial interdiction is imposed by a sentence of the court of Session. It commonly proceeds on an action brought by a near kinsmen to the party; and sometimes from the *nobile officium* of the court, when they perceive, during the pendency of a suit, that any of the litigants is, from the facility of his temper, subject to imposition. This sort must be taken off by the authority of the same court that imposed it.

29. An interdiction need not be served against the person interdicted; but it must be executed, or published by a messenger, at the market-cross of the jurisdiction where he resides, by publicly reading the interdiction there, after three cyesses made for convocating the lieges. A copy of this execution must be affixed to the cross; and thereafter, the interdiction, with its execution, must be registered in the books, both of the jurisdiction where the person interdicted resides, and where his lands lie, or in the general register of the session, within forty days from the publication. An interdiction, before it is registered, has no effect against third parties, though they should be in the private knowledge of it; but it operates against the interdictors themselves, as soon as it is delivered to them.

30. An interdiction, duly registered, has this effect, that all deeds, done thereafter, by the person interdicted, without the consent of his interdictors, affecting his heritable estate, are subject to reduction. Registration, in the general register, secures all his lands from alienation, where-ever they lie; but where the interdiction is recorded in the register of a particular shire, it covers no lands, except those situated in that shire. But persons interdicted have full power to dispose of their moveables, not only by testament, but by present deeds of alienation: And creditors, in personal bonds granted after interdiction, may use all execution against their debtor's person and moveable estate; such bonds being only subject to reduction, in so far as diligence against the heritable estate may proceed upon them.

31. All onerous or rational deeds granted by the person interdicted, are as effectual, even without the consent of the interdictor, as if the grantor had been laid under no restraint; but he cannot alter the succession of his heritable estate, by any settlement, let it be ever so rational. No deed, granted with consent of the interdictors, is reducible, though the strongest lesion or prejudice to the grantor should appear: The only remedy competent, in such case, is an action by the grantor against his interdic-

tors.

tors, for making up to him what he has lost through their undue consent. It is no part of the duty of interdictors, to receive sums, or manage any estate; they are given merely *ad auctoritatem praestandam*, to interpose their authority to reasonable deeds; and so are accountable for nothing but their fraud or fault, in consenting to deeds hurtful to the person under their care.

32. The law concerning the state of children falls next to be explained. Children are either born in wedlock, or out of it. All children, born in lawful marriage or wedlock, are presumed to be begotten by the person to whom the mother is married; and consequently to be lawful children. This presumption is so strongly founded, that it cannot be defeated but by direct evidence that the mother's husband could not be the father of the child. *e.g.* where he is impotent, or was absent from the wife till within six lunar months of the birth. The canonists indeed maintain, that the concurring testimony of the husband and wife that the child was not procreated by the husband, is sufficient to elide this legal presumption for legitimacy: but it is an agreed point, that no regard is to be paid to such testimony, if it be made after they have owned the child to be theirs. A father has the absolute right of disposing of his children's person, of directing their education, and of moderate chastisement; and even after they become *puberes*, he may compel them to live in family with him, and to contribute their labour and industry, while they continue there, towards his service. A child who gets a separate stock from the father for carrying on any trade or employment, even though he should continue in the father's house, may be said to be emancipated or *forisfamiliated*, in so far as concerns that stock; for the profits arising from it are his own. *Forisfamiliation*, when taken in this sense, is also inferred by the child's marriage, or by his living in a separate house, with his father's permission or goodwill. Children, after their full age of twenty-one years, become, according to the general opinion, their own masters; and from that period are bound to the father only by the natural ties of duty, affection, and gratitude. The mutual obligations between parents and children to maintain each other, are explained afterwards, Tit. 20.

33. Children, born out of wedlock, are styled natural children, or bastards. Bastards may be legitimated or made lawful, either, 1. By the subsequent intermarriage of the mother of the child with the father. And this sort of legitimation, intitles the child to all the rights of lawful children. The subsequent marriage, which produces legitimation, is considered by the law to have been entered into when the child legitimated was begotten; and hence, if he be a male he excludes, by his right of primogeniture, the sons procreated after the marriage, from the succession of the father's heritage, though these sons were lawful children from the birth. Hence also, those children only can be thus legitimated, who are begotten of a woman whom the father might at that period have lawfully married. 2. Bastards are legitimated by letters of legitimation from the sovereign. See Tit. 29.

34. As to the power of masters over their servants: All servants now enjoy the same rights and privileges with other subjects, unless in so far as they are tied down by

their engagements of service. Servants are either necessary or voluntary. Necessary are those whom law obliges to work without wages, of whom immediately. Voluntary servants engage without compulsion, either for mere subsistence, or also for wages. Those who earn their bread in this way, if they should stand off from engaging, may be compelled to it by the Justices of the peace, who have power to fix the rate of their wages.

35. Colliers, coal-bearers, and salters, and other persons necessary to collieries and saltworks, as they are particularly described by act 1661, are tied down to perpetual service at the works to which they have once entered. Upon a sale of the works, the right of their service is transferred to the new proprietor. All persons are prohibited to receive them into their service, without a testimonial from their last master; and if they desert to another work, and are redemanded within a year thereafter, he who has received them is obliged to return them within twenty-four hours, under a penalty. But though the proprietor should neglect to require the deserter within the year, he does not, by that short prescription, lose his property in him. Colliers, &c. where the colliery to which they are allotted, is either given up, or not sufficient for their maintenance, may lawfully engage with others; but if that work shall be again set a going, the proprietor may reclaim them back to it.

36. The poor make the lowest class or order of persons. Indigent children may be compelled to serve any of the king's subjects without wages, till their age of thirty years. Vagrants and sturdy beggars may be also compelled to serve any manufacturer. And because few persons were willing to receive them into their service, public work-houses are ordained to be built for setting them to work. The poor who cannot work, must be maintained by the parishes in which they were born; and where the place of their nativity is not known, that burden falls upon the parishes where they have had their most common resort, for the three years immediately preceding their being apprehended, or their applying for the public charity. Where the contributions collected at the churches to which they belong, are not sufficient for their maintenance, they are to receive badges from the minister and kirk session, in virtue of which they may ask alms at the dwelling houses of the inhabitants of the parish.

#### Tit. 8. *Of the Division of Rights, and the several ways by which a Right may be acquired.*

THE things or subjects to which persons have right, are the second object of law. The right of enjoying and disposing of a subject at one's pleasure, is called property. Proprietors are restrained by law from using their property enviously to their neighbour's prejudice. Every state or sovereign has a power over private property, called, by some lawyers, *dominium eminens*, in virtue of which, the proprietor may be compelled to sell his property for an adequate price, where an evident utility on the part of the public demands it.

2. Certain things are by nature itself incapable of appropriation, as the air, the light, the ocean, &c.; none of

of which can be brought under the power of any one person, though their use be common to all: Others are by law exempted from private commerce, in respect of the uses to which they are destined. Of this last kind are, 1. *Res publicæ*, as navigable rivers, highways, bridges, &c.: the right of these is vested in the King, chiefly for the benefit of his people, and they are called *regalia*. 2. *Res universitatis*, things which belong in property to a particular corporation or society, and whose use is common to every individual in it; but both property and use are subject to the regulations of the society; as town-houses, corporation-halls, market-places, church yards, &c. The lands or other revenue belonging to a corporation do not fall under this class, but are *juris privati*.

3. Property may be acquired, either by occupation or accession; and transferred by tradition or prescription: But prescription, being also a way of losing property, falls to be explained under a separate title. OCCUPATION, or occupancy, is the appropriating of things which have no owner, by apprehending them, or seizing their possession. This was the original method of acquiring property, and continued, under certain restrictions, the doctrine of the Roman law, *Quod nullius est, sit occupantis*; but it can have no room in the feudal plan, by which the King is looked on as the original proprietor of all the lands within his dominions.

4. Even in that sort of moveable goods which are presumed to have once had an owner, this rule obtains by the law of Scotland, *Quod nullius est, sit domini regis*. Thus, the right of treasures hid under ground, is not acquired by occupation, but accrues to the King. Thus also, where one finds strayed cattle or other moveables, which have been lost by the former owner, the finder acquires no right in them, but must give public notice thereof; and if within year and day after such notice, the proprietor does not claim his goods, they fall to the King, Sheriff, or other person, to whom the King has made a grant of such escheats.

5. In that sort of moveables which never had an owner, as wild beasts, fowls, fishes, or pearls found on the shore, the original law takes place, that he who first apprehends, becomes proprietor; in so much, that though the right of hunting, fowling, and fishing, be restrained by statute, under certain penalties, yet all game, even what is caught in contravention of the law, becomes the property of the catcher, unless where the confiscation thereof is made part of the penalty: But whales thrown in or killed on our coasts, belong neither to those who kill them, nor to the proprietor of the grounds on which they are cast, but to the King, providing they are so large as that they cannot be drawn by a wane with six oxen.

6. ACCESSION is that way of acquiring property, by which, in two things which have a connection with, or dependence on one another, the property of the principal thing draws after it the property of its accessory. Thus the owner of a cow becomes the owner of the calf; a house belongs to the owner of the ground on which it stands, though built with materials belonging to, and at the charge of another. The Romans excepted from this rule the case of paintings drawn on another man's board

or canvas, in consideration of the excellency of the art; which exception our practice has for a like reason extended to similar cases.

7. Under accession is comprehended SPECIFICATION; by which is meant, a person's making a new species or subject, from materials belonging to another. Where the new species can be again reduced to the matter of which it was made, law considers the former mass as still existing; and therefore, the new species, as an accessory to the former subject, belongs to the proprietor of that subject: But where the thing made cannot be so reduced, as in the case of wine, which cannot be again turned into grapes, there is no place for the *fiat juris*; and therefore the workmanship draws after it the property of the materials.

8. Though the new species should be produced from the COMMIXTION or confusion of different substances belonging to different proprietors, the same rule holds; but where the mixture is made by the common consent of the owners, such consent makes the whole a common property, according to the shares that each proprietor had formerly in the several subjects. Where things of the same sort are mixed without the consent of the proprietors, which cannot again be separated. *e. g.* two hogsheds of wine, the whole likewise becomes a common property; but in the after-division, regard ought to be had to the different quality of the wines: If the things so mixed admit of a separation, *e. g.* two flocks of sheep, the property continues distinct.

9. Property is carried from one to another by TRADITION; which is the delivery of possession by the proprietor, with an intention to transfer the property to the receiver. Two things are therefore requisite, in order to the transmitting of property in this way: 1. The intention or consent of the former owner to transfer it on some proper title of alienation, as sale, exchange, gift, &c. 2. The actual delivery in pursuance of that intention. The first is called the *causa*, the other the *modus transferendi domini*: Which last is so necessary to the acquiring of property, that he who gets the last right, with the first tradition, is preferred, according to the rule, *Traditionibus, non nudis pactis, transferuntur rerum dominia*.

10. Tradition is either real, where the *ipsa corpora* of moveables are put into the hands of the receiver; or symbolical, which is used where the thing is incapable of real delivery, or even when actual delivery is only inconvenient. Where the possession or custody of the subject has been before with him to whom the property is to be transferred, there is no room for tradition.

11. Possession, which is essential both to the acquisition and enjoyment of property, is defined, the detention of a thing, with a design or *animus* in the detainer of holding it as his own. It cannot be acquired by the sole act of the mind, without real detention; but, being once acquired, it may be continued *solo animo*. Possession is either natural, or civil. Natural possession is, when one possesses by himself: Thus, we possess lands by cultivating them and reaping their fruits, houses by inhabiting them, moveables by detaining them in our hands. Civil possession is our holding the thing, either by the sole act

of the mind, or by the hands of another who holds it in our name : Thus, the owner of a thing lent possesses it by the borrower ; the proprietor of lands, by his tacksmen, trustee, or steward, &c. The same subject cannot be possessed entirely, or *in solidum*, by two different persons at one and the same time ; and therefore possession by an act of the mind ceases, as soon as the natural possession is so taken up by another, that the former possessor is not suffered to re-enter. Yet two persons may, in the judgment of law, possess the same subject, at the same time, on different rights : thus, in the case of a pledge, the creditor possesses it in his own name, in virtue of the right of impignoration ; while the proprietor is considered as possessing, in and through the creditor, in so far as is necessary for supporting his right of property. The same doctrine holds in liferenters, tacksmen, and, generally, in every case where there are rights affecting a subject, distinct from the property.

12. A *bona fide* possessor is he, who, though he is not really proprietor of the subject, yet believes himself proprietor on probable grounds. A *mala fide* possessor knows, or is presumed to know, that what he possesses is the property of another. A possessor *bona fide* acquired right, by the Roman law, to the fruits of the subject possessed, that had been reaped and consumed by himself, while he believed the subject his own. By our customs, perception alone, without consumption, secures the possessor : Nay, if he has sown the ground, while his *bona fides* continued, he is intitled to reap the crop, *propter curam et culturam*. But this doctrine does not reach to civil fruits, *e. g.* the interest of money, which the *bona fide* receiver must restore, together with the principal, to the owner.

13. *Bona fides* necessarily ceaseth by the *conscientia rei aliena* in the possessor, whether such consciousness should proceed from legal interpellation, or private knowledge. *Mala fides* is sometimes induced, by the true owner's bringing his action against the possessor, sometimes not till litiscontestation, and, in cases uncommonly favourable, not till sentence be pronounced against the possessor.

14. The property of moveable subjects is presumed by the bare effect of possession, until the contrary be proved ; but possession of an immoveable subject, though for a century of years together, if there is no seisin, does not create even a presumptive right to it : *Nulla fides, nulla terra*. Such subject is considered as caducuary, and so accrues to the sovereign. Where the property of a subject is contested, the lawful possessor is intitled to continue his possession, till the point of right be discussed ; and, if he has lost it by force or stealth, the judge will, upon summary application, immediately restore it to him.

15. Where a possessor has several rights in his person, affecting the subject possessed, the general rule is, that he may ascribe his possession to which of them he pleases ; but one cannot ascribe his possession to a title other than that on which it commenced, in prejudice of him from whom his title flowed.

#### Tit. 9. Of heritable and moveable Rights.

For the better understanding the doctrine of this title,  
VOL. II. No. 64. 2 †

it must be known, that by the law of Scotland, and indeed of most nations of Europe, since the introduction of feus, where ever there are two or more in the same degree of consanguinity to one who dies intestate, and who are not all females, such rights belonging to the deceased as are either properly feudal, or have any resemblance to feudal rights, descend wholly to one of them, who is considered as his proper heir ; the others, who have the name of next of kin or executors, must be contented with that portion of the estate which is of a more perishable nature. Hence has arisen the division of rights to be explained under this title : the subjects descending to the heir, are styled heritable ; and those that fall to the next of kin, moveable.

2. All rights of, or affecting lands, under which are comprehended houses, mills, fishings, teinds ; and all rights of subjects that are  *fundo anexa*, whether completed by seisin or not, are heritable *ex sua natura*. On the other hand, every thing that moves itself, or can be moved, and in general whatever is not united to land, is moveable : as household-furniture, corns, cattle, cash, arrears of rent and of interest, even though they should be due on a right of annualrent : For though the arrears last mentioned are secured on land, yet being presently payable, they are considered as cash.

3. Debts, (*nomina debitorum*), when due by bill, promissory note, or account, are moveable. When constituted by bond, they do not all fall under any one head ; but are divided into heritable and moveable, by the following rules. All debts constituted by bond bearing an obligation to interest the creditor in any heritable subject in security of the principal sum and annualrent, or annualrent only, are heritable ; for they not only carry a yearly profit, but are secured upon land.

4. Bonds merely personal, though bearing a clause of interest, are moveable as to succession ; i. e. they go not to the heir, but to the next of kin or executors : but they are heritable with respect to the fisk, and to the rights of husband and wife ; that is, though, by the general rule, moveable rights fall under the communion of goods consequent upon marriage, and the moveables of denounced persons fall to the crown or fisk, by single escheat, yet such bonds do neither, but are heritable in both respects.

5. Bonds taken payable to heirs and assignees, secluding executors, are heritable in all respects, from the destination of the creditor. But a bond, which is made payable to heirs, without mention of executors, descends, not to the proper heir in heritage, though heirs are mentioned in the bond, but to the executor ; for the word *heir*, which is a generic term, points out him who is to succeed by law in the right ; and the executor, being the heir *in mobilibus*, is considered as the person to whom such bond is taken payable. But where a bond is taken to heirs-male, or to a series of heirs, one after another, such bond is heritable, because its destination necessarily excludes executors.

6. Subjects originally moveable become heritable :  
1. By the proprietor's destination. Thus, a jewel, or any other moveable subject, may be provided to the heir, from the right competent to every proprietor to settle his property on whom he pleases. 2. Moveable rights

rights may become heritable, by the supervening of an heritable security: Thus, a sum due by a personal bond becomes heritable, by the creditor's accepting an heritable right for securing it, or by adjudging upon it,

7. Heritable rights do not become moveable by accessory moveable securities, the heritable right being in such case the *jus nobilior*, which draws the other after it.

8. Certain subjects partake, in different respects, of the nature both of heritable and moveable. Personal bonds are moveable in respect of succession, but heritable as to the fisk, and husband and wife. All bonds, whether merely personal, or even heritable, on which no seisin has followed, may be affected at the suit of creditors, either by adjudication, which is a diligence proper to heritance; or by arrestment, which is peculiar to moveables. Bonds including executors, though they descend to the creditor's heir, are payable by the debtor's executors, without relief against the heir; since the debtor's succession cannot be affected by the destination of the creditor.

9. All questions, whether a right be heritable or moveable, must be determined according to the condition of the subject at the time of the ancestor's death. If it was heritable at that period, it must belong to the heir; if moveable, it must fall to the executor, without regard to any alterations that may have affected the subject in the intermediate period between the ancestor's death and the competition.

#### Tit. 10. *Of the Constitution of heritable Rights by Charter and Seisin.*

HERITABLE rights are governed by the feudal law, which owed its origin, or at least its first improvements, to the Longobards; whose kings, upon having penetrated into Italy, the better to preserve their conquests, made grants to their principal commanders of great part of the conquered provinces, to be again subdivided by them among the lower officers, under the conditions of fidelity and military service.

2. The feudal constitutions and usages were first reduced into writing, about the year 1150, by two lawyers of Milan, under the title of *Consuetudines Feudorum*. None of the German Emperors appear to have expressly confirmed this collection by their authority; but it is generally agreed, that it had their tacit approbation, and was considered as the customary feudal law of all the countries subject to the empire. No other country has ever acknowledged these books for their law; but each state has formed to itself such a system of feudal rules, as best agreed with the genius of its own constitution. In feudal questions, therefore, we are governed, in the first place, by our own statutes and customs; where these fail us, we have regard to the practice of neighbouring countries, if the genius of their law appears to be the same with ours; and should the question still remain doubtful, we may have recourse to those written books of the feus, as to the original plan on which all feudal systems have proceeded.

3. This military grant got the name, first of *beneficium*, and afterwards of *feudum*; and was defined a gratuitous right to the property of lands, made under the conditions

of fealty and military service, to be performed to the grantor by the receiver; the radical right of the lands still remaining in the grantor. Under lands, in this definition, are comprehended all rights or subjects so connected with land, that they are deemed a part thereof; as houses, mills, fishings, jurisdictions, patronages, &c. Though feus in their original nature were gratuitous, they soon became the subject of commerce; services of a civil or religious kind were frequently substituted in place of military; and now, of a long time, services of every kind have been entirely dispensed with, in certain feudal tenures. He who makes the grant is called the superior, and he who receives it the vassal. The subject of the grant is commonly called the feu; though that word is at other times, in our law, used to signify one particular tenure. See Tit. 11. The interest retained by the superior in the feu is styled *dominium directum*, or the superiority; and the interest acquired by the vassal, *dominium utile*, or the property. The word *fee* is promiscuously applied to both.

4. Allodial goods are opposed to feus; by which are understood, goods enjoyed by the owner, independent of a superior. All moveable goods are allodial; lands only are so, when they are given without the condition of fealty or homage. By the feudal system, the sovereign, who is the fountain of feudal rights, reserves to himself the superiority of all the lands of which he makes the grant; so that, with us, no lands are allodial, except those of the King's own property, the superiorities which the King reserves in the property-lands of his subjects, and manes and glebes, the right of which is completed by the presbytery's designation, without any feudal grant.

5. Every person who is in the right of an immoveable subject, provided he has the free administration of his estate, and is not debarred by statute, or by the nature of his right, may dispose of it to another. Nay, a vassal, though he has only the *dominium utile*, can subfeu his property to a subvassal by a subaltern right, and thereby raise a new *dominium directum* in himself, subordinate to that which is in his superior; and so *in infinitum*. The vassal who thus subfeus, is called the subvassal's immediate superior, and the vassal's superior is the subvassal's mediate superior.

6. All persons who are not disabled by law, may acquire and enjoy feudal rights. Papists cannot purchase a land estate by any voluntary deed. Aliens, who owe allegiance to a foreign prince, cannot hold a feudal right without naturalization; and therefore, where such privilege was intended to be given to favoured nations or persons, statutes of naturalization were necessary, either general, or special; or at least, letters of naturalization by the sovereign.

7. Every heritable subject, capable of commerce, may be granted in feu. From this general rule is excepted, 1. The annexed property of the Crown, which is not alienable without a previous dissolution in parliament. 2. Tailzied lands, which are devised under condition that they shall not be aliened. 3. An estate *in hereditate jacente* cannot be effectually aliened by the heir-apparent (*i. e.* not entered); but such alienation becomes

becomes effectual upon his entry, the supervening right accruing in that case to the purchaser; which is a rule applicable to the alienation of all subjects not belonging to the vendor at the time of the sale.

8. The feudal right, or, as it is called, investiture, is constituted by charter and feisin. By the charter, we understand that writing which contains the grant of the feudal subject to the vassal, whether it be executed in the proper form of a charter, or of a disposition. Charters by subject-superiors are gramed, either, 1. *A me de superiore meo*: when they are to be holden, not of the granter himself, but of his superior. This sort is called a public holding, because vassals were in ancient times publicly received in the superior's court before the *pares curie* or co-vassals. Or, 2. *De me*, where the lands are to be holden of the granter. These were called sometimes base rights, from *bas*, lower: and sometimes private, because, before the establishment of our records, they were easily concealed from third parties; the nature of all which will be more fully explained, Tit. 14. An original charter is that by which the fee is first granted: A charter by progress is a renewed disposition of that fee to the heir or assignee of the vassal. All doubtful clauses in charters by progress ought to be construed agreeably to the original grant; and all clauses in the original charter are understood to be implied in the charters by progress, if there be no express alteration.

9. The first clause in an original charter, which follows immediately after the name and designation of the granter, is the narrative or recital, which expresses the causes inductive of the grant. If the grant be made for a valuable consideration, it is said to be onerous; if for love and favour, gratuitous. In the dispositive clause of a charter, the subjects made over are described either by special boundaries or march-stones; (which is called a bounding charter), or by such other characters as may sufficiently distinguish them. A charter regularly carries right to no subjects but what are contained in this clause, though they should be mentioned in some other clause of the charter.

10. The clause of *tenendas* (from its first words, *tenendas prædictas terras*) expresses the particular tenure by which the lands are to be holden. The clause of *reddendo* (from the words, *reddendo inde annuatim*) specifies the particular duty or service which the vassal is to pay or perform to the superior.

11. The clause of warrandice is that by which the granter obliges himself that the right conveyed shall be effectual to the receiver. Warrandice is either personal or real. Personal warrandice, where the granter is only bound personally, is either, 1. Simple, that he shall grant no deed in prejudice of the right; and this sort, which is confined to future deeds, is implied even in donations. 2. Warrandice from fact and deed, by which the granter warrants that the right neither has been, nor shall be hurt by any fact of his. Or, 3. Absolute warrandice *contra omnes mortales*, whereby the right is warranted against all legal defects in it, which may carry it off from the receiver, either wholly or in part. Where a sale of lands proceeds upon an onerous cause, the granter is liable in absolute warrandice, though no warran-

dice be expressed; but in assignments to debts or decrees, no higher warrandice than from fact and deed is implied.

12. Gratuitous grants by the Crown imply no warrandice; and though warrandice should be expressed, the clause is ineffectual, from a presumption, that it has crept in by the negligence of the Crown's officers. But where the Crown makes a grant, not *jure coronæ*, but for an adequate price, the sovereign is in the same case with his subjects.

13. Absolute warrandice, in case of eviction, affords an action to the grantee, against the granter, for making up to him all that he shall have suffered through the defect of the right; and not simply for his indemnification, by the granter's repayment of the price to him. But as warrandice is penal, and consequently *stricti juris*, it is not easily presumed, nor is it incurred from every light servitude that may affect the subject, far less does it extend to burdens which may affect the subject posterior to the grant, nor to those imposed by public statute, whether before or after, unless specially warranted against.

14. Real warrandice is either, 1. Express, whereby, in security of the lands principally conveyed, other lands, called warrandice-lands, are also made over, to which the receiver may have recourse in case the principal lands be evicted. Or, 2. Tacit, which is constituted by the exchange or excambion of one piece of ground with another; for, if the lands exchanged are carried off from either of the parties, the law itself, without any paction, gives that party immediate recourse upon his own first lands, given in exchange for the lands evicted.

15. The chapter concludes with a precept of feisin, which is the command of the superior granter of the right to his bailie, for giving feisin or possession to the vassal, or his attorney, by delivering to him the proper symbols. Any person, whose name may be inserted in the blank, left in the precept for that purpose, can execute the precept as bailie; and whoever has the precept of feisin in his hands, is presumed to have a power of attorney from the vassal for receiving possession in his name.

16. A feisin is the instrument or attestation of a notary, that possession was actually given by the superior or his bailie, to the vassal or his attorney; which is considered as so necessary a solemnity, as not to be suppliable, either by a proof of natural possession, or even of the special fact that the vassal was duly entered to the possession by the superior's bailie.

17. The symbols, by which the delivery of possession is expressed, are, for lands, earth and stone; for rights of annualrent payable forth of land, it is also earth and stone, with the addition of a penny money; for parsonage teinds, a sheaf of corn; for jurisdictions, the book of the court; for patronages, a psalm book, and the keys of the church; for fishings, net and coble; for mills, clap and happer, &c. The feisin must be taken upon the ground of the lands, except where there is a special dispensation in the charter from the Crown.

18. All feisins must be registered within sixty days after their date, either in the general register of feisins at Edinburgh, or in the register of the particular shire appointed by the act 1617; which, it must be observed, is not, in every case, the shire within which the lands lie. Bur-

gage:

gage feifins are ordained to be registered in the books of the borough.

19. Unregistered feifins are ineffectual againft third parties, but they are valid againft the granters and their heirs. Seifins regularly recorded, are preferable, not according to their own dates, but the dates of their registration.

20. Seifin neceffarily fupposes a fuperior by whom it is given; the right therefore which the fovereign, who acknowledges no fuperior, has over the whole lands of Scotland, is conftituted, *jure coronæ*, without feifin. In feveral parcels of land, that lie contiguous to one another, one feifin ferves for all, unlefs the right of the feveral parcels be either holden of different fuperiors, or derived from different authors, or enjoyed by different tenures under the fame fuperior. In difcontiguous lands, a feparate feifin muft be taken on every parcel, unlefs the fovereign has united them into one tenandry, by a charter of union; in which cafe, if there is no fpecial place expreffed, a feifin taken on any part of the united lands will ferve for the whole, even though they be fituated in different faires. The only effect of union is, to give the difcontiguous lands the fame quality as if they had been contiguous, or naturally united; union, therefore, does not take off the neceffity of feparate feifins, in lands holden by different tenures, or the rights of which flow from different fuperiors, thefe being incapable of natural union.

21. The privilege of barony carries a higher right than union does, and confequently includes union in it as the leffer degree. This right of barony can neither be given, nor transmitted, unlefs by the Crown; but the quality of fimple union, being once conferred on lands by the fovereign, may be communicated by the vaffal to a fubvaffal. Though part of the lands united or erected into a barony, be fold by the vaffal to be holden *a me*, the whole union is not thereby diffolved: what remains unfold retains the quality.

22. A charter, not perfected by feifin, is a right merely perfonal, which does not transfer the property. (fee Tit. xx. 1.) and a feifin of itfelf bears no faith, without its warrant: It is the charter and feifin joined together that conftitutes the feudal right, and fecures the receiver againft the effect of all pofferior feifins, even though the charters on which they proceed fhould be prior to his.

23. No quality which is designed as a lien or real burden on a feudal right, can be effectual againft fingular fucceffors, if it be not inserted in the investiture. If the creditors in the burden are not particularly mentioned, the burden is not real; for no perpetual unknown incumbrance can be created upon lands. Where the right itfelf is granted with the burden of the fum therein mentioned, or where it is declared void, if the fum be not paid againft a day certain, the burden is real; but where the receiver is fimplly obliged by his acceptance to make payment, the clause is effectual only againft him and his heirs.

#### Tit. 11. Of the feveral kinds of Holding.

FEUDAL fubjects are chiefly diftinguifhed by their dif-

ferent manners of holding, which were either ward, blanch, feu, or burgage. Ward-holding, which is now abolifhed by 20. Geo. II. c. 50. was that which was granted for military fervice. Its proper *reddendo* was, *services*, or *services ufed and wont*; by which laft was meant the performance of fervice whenever the fuperior's occafions required it. As all feudal rights were originally held by this tenure, ward-holding was *in dubio*. Hence, though the *reddendo* had contained fome fpecial fervice, or yearly duty, the holding was prefumed ward, if another holding was not particularly expreffed.

2. Feu holding is that whereby the vaffal is obliged to pay to the fuperior a yearly rent in money or grain, and fometimes alfo in *services* proper to a farm as ploughing, reaping, carriages for the fuperior's ufe, &c. *nomine feudi firme*. This kind of tenure was introduced for the encouragement of agriculture the improvement of which was confiderably obftruded by the vaffal's obligation to military fervice. It appears to have been a tenure known in Scotland as far back as *leges burgorum*.

3. Blanch-holding is that whereby the vaffal is to pay to the fuperior an elufory yearly duty, as a penny money, a rofe, a pair of gilt furs, &c. merely in acknowledgment of the fuperiority, *nomine albæ firme*. This duty, where it is a thing of yearly growth, if it be not demanded within the year, cannot be exacted thereafter; and where the words, *fi petatur tantum*, are fubjoined to the *reddendo*, they imply a releafe to the vaffal, whatever the quality of the duty may be, if it is not asked within the year.

4. Burgage holding is that, by which boroughs-royal hold of the fovereign the lands which are contained in their charters of erection. This, in the opinion of *Craig*, does not conftitute a feparate tenure, but is a fpecies of ward-holding; with this fpeciality, that the vaffal is not a private perfon, but a community: And indeed, watching and warding, which is the ufual fervice contained in the *reddendo* of fuch charters, might be properly enough faid, fome centuries ago, to have been of the military kind. As the royal borough is the King's vaffal, all burgage-holders hold immediately of the Crown: The magiftrates therefore, when they receive the refignations of the particular burgeffes, and give feifin to them, act, not as fuperiors, but as the King's bailies fpecially authorized thereto.

5. Feudal fubjects, granted to churches, monafteries, or other focieties for religious or charitable ufes, are faid to be mortified, or granted *ad manum mortuam*; either becaufe all casualties muft neceffarily be loft to the fuperior, where the vaffal is a corporation, which never dies: or becaufe the property of thefe fubjects is granted to a dead hand, which cannot transfer it to another. In lands mortified in times of Popery to the church, whether granted to prelates for the behoof of the church, or *in puram elemofynam*; the only fervices preftable by the vaffal were prayers, and finging of mafies for the fouls of the deceased, which approaches nearer to blanch-holding than ward. The purpofes of fuch grants having been, upon the reformation, declared fuperftitious, the lands mortified were annexed to the Crown: But mortifications

to universities, hospitals, &c. were not affected by that annexation; and lands may, at this day, be mortgaged to any lawful purpose, either by blanch or by feu holding.

### Tit. 12. Of the Casualties due to the Superior.

THE right of the superior continues unimpaired, notwithstanding the feudal grant, unless in so far as the *dominium utile*, or property, is conveyed to his vassal. The superiority carries a right to the services and annual duties contained in the *reddendo* of the vassal's charter. The duty payable by the vassal is a *debitum fundi*; *i. e.* it is recoverable, not only by a personal action against himself, but by a real action against the lands.

2. Besides the constant fixed rights of superiority, there are others, which, because they depend upon uncertain events, are called casualties.

3. The casualties proper to a ward holding, while that tenure subsisted, were ward, recognition, and marriage, which it is now unnecessary to explain, as by the late statutes 20 and 25 Geo. II. for abolishing ward-holdings, the tenure of the lands holden ward of the Crown or Prince is turned into *blanch*, for payment of one penny Scots yearly, *si petatur tantum*; and the tenure of those holden of subjects, into *feu*, for payment of such yearly feu-duty in money, victual, or cattle, in place of all services, as shall be fixed by the court of Session. And accordingly that court, by act of sederunt Feb. 8. 1749, laid down rules for ascertaining the extent of these feu-duties.

4. The only casualty, or rather forfeiture, proper to feu-holdings, is the loss or tinsel of the feu-right, by the neglect of payment of the feu-duty for two full years. Yet where there is no conventional irritancy in the feu-right, the vassal is allowed to purge the legal irritancy at the bar; that is, he may prevent the forfeiture, by making payment before sentence: but where the legal irritancy is fortified by a conventional, he is not allowed to purge, unless where he can give a good reason for the delay of payment.

5. The casualties common to all holdings are, non-entry, relief, dissent-efcheat, disclamation, and purpresture. NON-ENTRY is that casualty which arises to the superior out of the rents of the feudal subject, through the heir's neglecting to renew the investiture after his ancestor's death. The superior is intitled to this casualty, not only where the heir has not obtained himself infeft, but where his retour is set aside upon nullities. The heir, from the death of the ancestor, till he be cited by the superior in a process of general declarator of non-entry, loses only the retoured duties of his lands, (see next parag.); and he forfeits these, though his delay should not argue any contempt of the superior, because the casualty is considered to fall, as a condition implied in the feudal right, and not as a penalty of transgression: But, where the delay proceeds not from the heir, but from the superior, nothing is forfeited.

6. For understanding the nature of retoured duties, it must be known, that there was anciently a general valuation of all the lands in Scotland, designed both for re-

gulating the proportion of public subsidies, and for ascertaining the quantity of non-entry and relief-duties payable to the superior; which appears, by a contract betwixt K. R. Bruce and his subjects *anno* 1327, preserved in the library of the faculty of advocates, to have been settled at least as far back as the reign of Alexander III. This valuation became in the course of time, by the improvement of agriculture, and perhaps also by the heightening of the nominal value of our money, from the reign of Robert I. downwards to that of James III. much too low a standard for the superior's casualties: Wherefore, in all services of heirs, the inquest came at last to take proof likewise of the present value of the lands contained in the brief (*quantum nunc valent*) in order to fix these casualties. The first was called the old, and the other the new extent. Though both extents were ordained to be specified in all retours made to the Chancery upon briefs of inquest; yet by the appellation of retoured duties in a question concerning casualties, the new extent is always understood. The old extent continued the rule for levying public subsidies, till a tax was imposed by new proportions, by several acts made during the usurpation. By two acts of Cromwell's parliament, held at Westminster 1656, imposing taxations on Scotland, the rates laid upon the several counties are precisely fixed. The subsidy granted by the act of convention 1667, was levied on the several counties, nearly in the same proportions that were fixed by the usurper in 1656; and the sums to which each county was subjected were subdivided among the individual land-holders in that county, according to the valuations already settled, or that should be settled by the commission appointed to carry that act into execution. The rent fixed by these valuations is commonly called the valued rent; according to which the land tax, and most of the other public burdens, have been levied since that time.

7. In feu-holdings, the feu-duty is retoured as the rent, because the feu-duty is presumed to be, and truly was at first, the rent. The superior therefore of a feu-holding gets no non-entry, before citation in the general declarator; for he would have been intitled to the yearly feu-duty, though the fee had been full, *i. e.* though there had been a vassal infeft in the lands. The superior of teinds gets the fifth part of the retoured duty as non-entry, because the law considers teinds to be worth a fifth part of the rent. In rights of annualrent which are holden of the granter, the annualrent becomes his debtor's vassal; and the annualrent contained in the right is retoured to the blanch or other duty contained in the right before declarator.

8. It is because the retoured duty is the presumed rent, that the non-entry is governed by it. If therefore no retour of the lands in non-entry can be produced, nor any evidence brought of the retoured duty, the superior is intitled to the real, or at least to the valued rent, even before citation. In lands formerly holden ward of the King, the heir, in place of the retoured duties, is subjected only to the annual payment of one *per cent.* of the valued rent.

9. The heir, after he is cited by the superior in the action of general declarator, is subjected to the full rents

till his entry, because his neglect is less excusable after citation. The decree of declarator, proceeding on this action, intitles the superior to the possession, and gives him right to the rents, downward from the citation. As this sort of non-entry is properly penal, our law has always restricted it to the retoured duties, if the heir had a probable excuse for not entering.

10. Non entry does not obtain in burgage-holdings, because the incorporation of inhabitants holds the whole incorporated subjects of the King; and there can be no non-entry due in lands granted to communities, because there the vassal never dies: This covers the right of particulars from non-entry; for if non-entry be excluded with regard to the whole, it cannot obtain with regard to any part. It is also excluded, as to a third of the lands, by the terce, during the widow's life; and as to the whole of them, by the courtesy, during the life of the husband. But it is not excluded by a precept of feisin granted to the heir, till feisin be taken thereon.

11. *RELIEF* is that casualty which intitles the superior to an acknowledgment or consideration from the heir, for receiving him as vassal. It is called relief, because, by the entry of the heir, his fee is relieved out of the hands of the superior. It is not due in feu-holdings flowing from subjects, unless where it is expressed in the charter by a special clause for doubling the feu-duty at the entry of an heir; but in feu rights, holden of the crown, it is due, though there should be no such clause in the charter. The superior can recover this casualty, either by a pointing of the ground, as a *debitum fundi*, or by a personal action against the heir. In blanch and feu-holdings, where this casualty is expressly stipulated, a year's blanch or feu-duty is due in name of relief, beside the current year's duty payable in name of blanch or feu farm.

12. *ESCHEAT* (from *escheoir*, to happen or fall) is that forfeiture which falls through a person's being denounced rebel. It is either single or liferent. Single escheat, though it does not accrue to the superior, must be explained in this place, because of its coincidence with life-tenent.

13. After a debt is constituted, either by a formal decree, or by registration of the ground of debt, which to the special effect of execution, is in law accounted a decree; the creditor may obtain letters of horning, issuing from the signet, commanding messengers to charge the debtor to pay or perform his obligation, within a day certain. Where horning proceeds on a formal decree of the Session, the time indulged by law to the debtor is fifteen days; if upon a decree of the commission of teinds or admiral, it is ten; and upon the decrees of all inferior judges, fifteen days. Where it proceeds on a registered obligation, which specifies the number of days, that number must be the rule; and, if no precise number be mentioned, the charge must be given on fifteen days, which is the term of law, unless where special statute interposes; as in bills, upon which the debtor may be charged on six days.

14. The messenger must execute these letters (and indeed all summonses) against the debtor, either personally, or at his dwelling house; and, if he get not access to

the house, he must strike six knocks at the gate, and thereafter affix to it a copy of his execution. If payment be not made within the days mentioned in the horning, the messenger, after proclaiming three o'yeas at the market-cross of the head borough, of the debtor's domicile, and reading the letters there, blows three blasts with a horn, by which the debtor is understood to be proclaimed rebel to the King for contempt of his authority; after which, he must affix a copy of the execution to the market-cross: This is called the publication of the diligence, or a denunciation at the horn. Where the debtor is not in Scotland, he must be charged on sixty days, and denounced at the market cross of Edinburgh, and pier and shore of Leith.

15. Denunciation, if registered within fifteen days, either in the Sheriff's books, or in the general register, drew after it the rebel's single escheat, i. e. the forfeiture of his moveables to the Crown. Persons denounced rebels have not a *persona standi in judicio*; they can neither sue nor defend in any action. But this incapacity, being unfavourable, is personal to the rebel, and cannot be pleaded against his assignee.

16. Persons cited to the court of Justiciary may be also denounced rebels, either for appearing there with too great a number of attendants; or, if they fail to appear, they are declared fugitives from the law. Single escheat falls without denunciation, upon sentence of death pronounced in any criminal trial; and by special statute, upon one's being convicted of certain crimes, though not capital; as perjury, bigamy, deforcement, breach of arrestment, and usury. By the late act abolishing wardholdings, the casualties both of single and liferent escheat are discharged, when proceeding upon denunciation for civil debts; but they still continue, when they arise from criminal causes. All moveables belonging to the rebel at the time of his rebellion, (whether proceeding upon denunciation, or sentence in a criminal trial), and all that shall be afterwards acquired by him until relaxation, fall under single escheat. Bonds bearing interest, because they continue heritable *quoad fiscum*, fall not under it, nor such fruits of heritable subjects as become due after the term next ensuing the rebellion, these being reserved for the liferent escheat.

17. The King never retains the right of escheat to himself, but makes it over to a donatory, whose gift is not perfected, till, upon an action of general declarator, it be declared that the rebel's escheat has fallen to the crown by his denunciation, and that the right of it is now transferred to the pursuer by the gift in his favour: Every creditor therefore of the rebel, whose debt was contracted before rebellion, and who has used diligence before declarator, is preferable to the donatory. But the escheat cannot be affected by any debt contracted, nor by any voluntary deed of the rebel after rebellion.

18. The rebel, if he either pays the debt charged for, or suspends the diligence, may procure letters of relaxation from the horn, which, if published in the same place, and registered fifteen days thereafter in the same register with the denunciation, have the effect to restore him to his former state; but they have no retrospect, as to the moveables

moveables already fallen under escheat, without a special clause for that purpose.

19. The rebel, if he continues unrelaxed for year and day after rebellion, is construed to be civilly dead: And therefore, where he holds any feudal right, his superiors, as being without a vassal, are entitled, each of them, to the rents of such of the lands belonging to the rebel as holds of himself, during all the days of the rebel's natural life, by the casualty of *LIFERENT-ESCHEAT*; except where the denunciation proceeds upon treason or proper rebellion, in which case the liferent falls to the King.

20. It is that estate only, to which the rebel has a proper right of liferent in his own person, that falls under his liferent escheat.

21. Though neither the superior nor his donatory can enter into possession in consequence of this casualty, till decree of declarator; yet that decree, being truly declaratory, has a retrospect, and does not so properly confer a new right, as declare the right formerly constituted to the superior, by the civil death of his vassal. Hence, all charters or heritable bonds, though granted prior to the rebellion, and all adjudications, though led upon debts contracted before that period, are ineffectual against the liferent escheat, unless seisin be taken thereon within year and day after the granter's rebellion.

22. Here, as in single escheat, no debt contracted after rebellion can hurt the donatory, nor any voluntary right granted after that period, though in security or satisfaction of prior debts.

23. *DISCLAMATION* is that casualty whereby a vassal forfeits his whole feu to his superior, if he disowns or disclaims him without ground, as to any part of it. *PURPRESTURE* draws likewise a forfeiture of the whole feu after it, and is incurred by the vassal's incroaching upon any part of his superior's property, or attempting, by building, inclosing, or otherwise, to make it his own. In both these feudal delinquencies, the least colour of excuse saves the vassal.

24. All grants from the crown, whether charters, gifts of casualties, or others, proceed on signatures which pass the signet. When the King resided in Scotland, all signatures were superscribed by him; but, on the accession of James VI. to the crown of England, a cachet or seal was made, having the King's name engraved on it, in pursuance of an act of the Privy Council, April 4. 1603, with which all signatures were to be afterwards sealed, that the Lords of exchequer were impowered to pass; and these powers are transferred to the court of Exchequer, which was established in Scotland after the union of the two kingdoms in 1707. Grants of higher consequence, as remissions of crimes, gifts proceeding upon forfeiture, and charters of *msodamus*, must have the King's sign-manual for their warrant.

25. If lands holding of the Crown were to be conveyed, the charter passed, before the union of the kingdoms in 1707, by the great seal of Scotland; and now by a seal substituted in place thereof. Grants of church dignities, during episcopacy, passed also by the great seal; and the commissions to all the principal officers of the Crown, as Justice Clerk, King's Advocate, Solicitor, &c.

do so at this day. All rights which subjects may transmit by simple assignation, the King transmits by the privy seal; as gifts of moveables, or of casualties that require no seisin. The quarter seal, otherwise called the testimonial of the great seal, is appended to gifts of tutory, commissions of brieves issuing from the chancery, and letters of presentation to lands holding of a subject, proceeding upon forfeiture, bastardy, or *ultimus heres*.

26. Seals are to royal grants, what subscription is to rights derived from subjects, and give them authority: They serve also as a check to gifts procured (*subreptione vel obreptione*) by concealing the truth, or expressing a falsehood; for, where this appears, the gift may be stopped before passing the seals, though the signature should have been signed by the King. All rights passing under the great or privy seal must be registered in the registers of the great or privy seal *respectivé*, before appending the seal.

### Tit. 13. Of the Right which the Vassal acquires by getting the Feu.

UNDER the *dominium utile* which the vassal acquires by the feudal right, is comprehended the property of whatever is considered as part of the lands, whether of houses, woods, inclosures, &c. above ground; or of coal, limestone, minerals, &c. under ground. Mills have, by the generality of our lawyers, been deemed a separate tenement, and so not carried by a charter or disposition, without either a special clause conveying mills, or the erection of the lands into a barony. Yet it is certain, that, if a proprietor builds a mill on his own lands, it will be carried by his entail, or by a retour, without mentioning it, although the lands are not erected into a barony. If the lands disposed be alstricted, or thirled to another mill, the purchaser is not allowed to build a new corn-mill on his property, even though he should offer security that it shall not hurt the thirle; which is introduced for preventing daily temptations to fraud.

2. Proprietors are prohibited to build dove-cotes, unless their yearly rent, lying within two miles thereof, extend to ten chalders of victual. A purchaser of lands, with a dove-cote, is not obliged to pull it down, though he should not be qualified to build one; but, if it becomes ruinous, he cannot rebuild it. The right of brewing, though not expressed in the grant, is implied in the nature of property; as are also the rights of fishing, fowling, and hunting, in so far as they are not restrained by statute.

3. There are certain rights naturally consequent on property, which are deemed to be reserved by the crown as *regalia*: unless they be specially conveyed: Gold and silver mines are of this sort: The first universally; and the other, where three half-pennies of silver can be extracted from the pound of lead, by act 1424. (three half-pennies at that time was equal to about two shillings five pennies of our present Scots money.) These were by our ancient law annexed to the Crown; but they are now dissolved from it; and every proprietor is intitled to a grant of the mines within his own lands, with the burden of delivering to the crown a tenth of what shall be brought up.

4. Salmon-

4. Salmon-fishing is likewise a right understood to be reserved by the Crown, if it be not expressly granted; but forty years possession thereof, where the lands are either erected into a barony, or granted with the general clause of fishings, establish as the full right of the salmon fishing in the vassal. A charter of lands, within which any of the king's forests lie, does not carry the property of such forest to the vassal.

5. All the subjects, which were by the Roman law accounted *res publicæ*, as rivers, high ways, ports, &c. are, since the introduction of feus, held to be *inter regalia*, or *in patrimonio principis*; and hence incroachment upon a highway is said to infer purpresture. No person has the right of a free port without a special grant, which implies a power in the grantee to levy anchorage and shore-dues, and an obligation upon him to uphold the port in good condition. In this class of things, our forefathers reckoned fortalices, or small places of strength, originally built for the defence of the country, either against foreign invasions, or civil commotions; but these now pass with the lands in every charter.

6. The vassal acquires right by his grant, not only to the lands specially contained in the charter, but to those that have been possessed forty years as pertinent thereof. But, 1. If the lands in the grant are marked out by special limits, the vassal is circumscribed by the tenor of his own right, which excludes every subject without these limits from being pertinent of the lands. 2. A right possessed under an express investment is preferable, *ceteris paribus*, to one possessed only as pertinent. 3. Where neither party is invest *per expressum*, the mutual promiscuous possession by both, of a subject as pertinent, resolves into a commonalty of the subject possessed: But if one of the parties has exercised all the acts of property of which the subject was capable, while the possession of the other was confined to pasturage only, or to casting seal and divot, the first is to be deemed sole proprietor, and the other to have merely a right of servitude.

7. As barony is a *nomen universitatis*, and unites the several parts contained in it into one individual right, the general conveyance of a barony carries with it all the different tenements of which it consists, though they should not be specially enumerated, (and this holds, even without erection into a barony, in lands that have been united under a special name.) Hence likewise, the possession by the vassal of the smallest part of the barony lands preserves to him the right of the whole.

8. The vassal is intitled, in consequence of his property, to levy the rents of his own lands, and to recover them from his tenants by an action for rent before his own court; and from all other possors and intruders, by an action of mails and duties before the Sheriff. He can also remove from his lands, tenants who have no leases, and he can grant tacks or leases to others. A tack is a contract of location, whereby the use of land or any other immoveable subject, is set to the lessee or tacksmen for a certain yearly rent, either in money, the fruits of the ground, or services. It ought to be reduced into writing, as it is a right concerning lands; tacks therefore, that are given verbally, to endure for term of years, are good against neither party, for more

than one year. An obligation to grant a tack is as effectual against the granter, as a formal tack. A liferenter, having a temporary property in the fruits, may grant tacks to endure for the term of his own liferent.

9. The tacksmen's right is limited to the fruits which spring up annually from the subject set, either naturally, or by the industry of the tacksmen; he is not therefore intitled to any of the growing timber above ground, and far less to the minerals, coal, clay, &c. under ground, the use of which consumes the substance. Tacks are, like other contracts, personal rights in their own nature, and consequently ineffectual against singular successors in the lands; but, for the encouragement of agriculture, they were, by act 1449, declared effectual to the tacksmen for the full time of their endurance, into whose hands soever the lands might come.

10. To give a written tack the benefit of this statute, it must mention the special tack-duty payable to the proprietor, which though small, if it be not elusory, secures the tacksmen; and it must be followed by possession, which supplies the want of a seisin. If a tack does not express the term of entry, the entry will commence at the next term after its date, agreeable to the rule, *Quod parè debetur, præsentis die debetur*. If it does not mention the ish, i. e. the term at which it is to determine, it is good for one year only; but, if the intention of parties to continue it for more than one year, should appear from any clause in the tack, it is sustained for two years as the *minimum*. Tacks granted to perpetuity, or with an indefinite ish, have not the benefit of the statute. Tacks of houses within borough do not fall within this act.

11. Tacks necessarily imply a *delectus persona*, a choice by the setter of a proper person for his tenant. Hence the conveyance of a tack, which is not granted to assignees, is ineffectual without the landlord's consent. A right of tack, though it be heritable, falls under the *jur mariti*, because it cannot be separated from the labouring cattle and implements of tillage, which are moveable subjects. A tack therefore granted to a single woman without the liberty of assignig, falls by her marriage, because the marriage, which is a legal conveyance thereof to the husband, cannot be annulled. This implied exclusion of assignees, is however limited to voluntary, and does not extend to necessary assignments, as an adjudication of a tack by the tacksmen's creditor; but a tack, expressly excluding assignees, cannot be carried even by adjudication. But tacksmen may sublet, unless subtenants are expressly excluded; and liferent tacks, because they import a higher degree of right in the tacksmen, than tacks for a definite term, may be assigned, unless assignees be specially excluded.

12. If neither the setter nor tacksmen shall properly discover their intention to have the tack dissolved at the term fixed for its expiration, they are understood, or presumed, to have entered into a new tack upon the same terms with the former, which is called *tacit relocation*; and continues till the landlord warns the tenant to remove, or the tenant renounces his tack to the landlord: This obtains also in the case of moveable tenants, who possess from year to year without written tacks.

13. In tacks of land the setter is commonly bound to put

put all the houses and office houses, necessary for the farm, in good condition at the tenant's entry; and the tenant must keep them and leave them so at his removal. But in tacks of houses, the fetter must not only deliver to the tenant the subject set, in tenantable repair at his entry, but uphold it in that repair during the whole years of the tack.

14. If the inclemency of the weather, inundation, or calamity of war, should have brought upon the crop an extraordinary damage (*plus quam tolerabile*), the landlord had, by the Roman law, no claim for any part of the tack-duty: If the damage was more moderate, he might exact the full rent. It is nowhere defined, what degree of sterility or devastation makes a loss not to be borne; but the general rule of the Roman law seems to be made ours. Tenants are obliged to pay no public burdens, to which they are not expressly bound by their tacks, except mill-services.

15. Tacks may be evacuated during their currency, 1. In the same manner as feu-rights, by the tacksmen's running in arrear of his tack-duty for two years together. This irritancy may be prevented by the tenant's making payment at the bar before sentence. 2. Where the tenant either runs in arrear of one year's rent, or leaves his farm uncultivated at the usual season; in which case he may be ordained to give security for the arrears, and for the rent of the five following crops, if the tack shall subsist so long; otherwise, to remove, as if the tack were at an end. 3. Tacks may be evacuated at any time, by the mutual consent of parties.

16. The landlord, when he intends to remove a tenant whose tack is expiring, or who possesses without a tack, must, upon a precept signed by himself, warn the tenant forty days preceding the term of Whitsunday, at or immediately preceding the 1st, personally, or at his dwelling house, to remove at that term, with his family and effects. This precept must be also executed on the ground of the lands, and thereafter read in the parish church where the lands lie, after the morning service, and affixed to the most patent door thereof. Whitsunday, though it be a moveable feast, is, in questions of removing, fixed to the 15th of May. In warnings from tenements within borough, it is sufficient that the tenant be warned forty days before the 1st of the tack, whether it be Whitsunday or Martinmas; and in these the ceremony of knocking the door is sustained as warning, when proceeding upon a verbal order from the proprietor.

17. This process of warning was precisely necessary for founding an action of removing against tenants, till act of sederunt of the court of Session, Dec. 14. 1756, which leaves it in the option of the proprietor, either to use the former method, or to bring his action of removing before the judge ordinary; which, if it be called forty days before the said term of Whitsunday, shall be held as equal to a warning. Where the tenant is bound, by an express clause of his tack, to remove at the 1st without warning, such obligation is, by the said act, declared to be a sufficient warrant for letters of horning, upon which, if the landlord charge his tenant forty days before the said Whitsunday, the judge is authorised to eject him within six days after the term of removing expressed in the tack.

18. Actions of removing might, even before this act of sederunt, have been pursued without any previous warning, 1. Against vicious possessors, *i. e.* persons who had seized the possession by force, or who, without any legal title, had intruded into it, after the last possessor had given it up. 2. Against possessors who had a naked tolerance. 3. Against tenants who had run in arrear of rent, during the currency of their tacks. 4. Again such as had sold their lands, and yet continued to possess after the term of the purchaser's entry. Upon the same ground, warning was not required, in removings against possessors of liferented lands, after the death of the liferenter who died in the natural possession: But if he possessed by tenants, these tenants could not be disturbed in their possessions till the next Whitsunday, that they might have time to look out for other farms; but they might be compelled to remove at that term, by an action of removing, without warning.

19. A landlord's title in a removing, let it be ever so lame, cannot be brought under question by a tenant whose tack flows immediately from him; but, if he is to insist against tenants not his own, his right must be perfected by infestment, unless it be such as requires no infestment, as *terce*, &c.

20. The defender, in a removing, must, before offering any defence which is not instantly verified, give security to pay to the fetter the violent profits, if they should be awarded against him. These are so called, because the law considers the tenant's possession after the warning as violent. They are estimated, in tenements within borough, to double the rent; and in lands, to the highest profits the pursuer could have made of them, by possessing them either by a tenant, or by himself.

21. If the action of removing shall be passed from, or if the landlord shall, after using warning, accept of rent from the tenant, for any term subsequent to that of the removal, he is presumed to have changed his mind, and tacit relocation takes place. All actions of removing against the principal or original tacksmen, and decrees thereupon, if the order be used, which is set forth *supra*, § 17. are, by the act of sederunt 1755, declared to be effectual again the assignees to the tack, or subtenants.

22. The landlord has, in security of his tack-duty, over and above the tenant's personal obligation, a tacit pledge or hypothec, not only in the fruits, but in the cattle pasturing on the ground. The corn, and other fruits, are hypothecated for the rent of that year whereof they are the crop; for which they remain affected, though the landlord should not use his right for years together.

23. The whole cattle on the ground, considered as a quantity, are hypothecated for a year's rent, one after another successively. The landlord may apply this hypothec payment of the past year's rent, at any time within three months from the last conventional term of payment, after which it ceases for that year. As the tenant may increase the subject of this hypothec, by purchasing oxen, sheep, &c. so he can impair it, by selling part of his stock; but if the landlord suspects the tenant's management, he may, by sequestration or poinding, make his right, which was before general upon the whole stock, special upon every individual. A superior has also a hypo-

pothec for his feu-duty, of the same kind with that just explained.

24. In tacks of houses, breweries, shops, and other tenements, which have no natural fruits, the furniture and other goods brought into the subject set are hypothecated to the landlord for one year's rent. But the tenant may by sale impair this hypothec, as he might that of cattle in rural tenements; and indeed, in the particular case of a shop, the tenant rents it for no other purpose, than as a place of sale.

**Tit. 14. Of the Transmission of Rights, by Confirmation and Resignation.**

A VASSAL may transmit his feu either to universal successors, as heirs; or to singular successors, *i. e.* those who acquire by gift, purchase, or other singular title. This last sort of transmission is either voluntary, by disposition; or necessary, by adjudication.

2. By the first feudal rules, no superior could be compelled to receive any vassal in the lands, other than the heir expressed in the investiture; for the superior alone had the power of ascertaining to what order of heirs the fee granted by himself was to descend. But this right of refusal in the superior did not take place, 1. In the case of creditors appraisers or adjudgers, whom superiors were obliged to receive upon payment of a year's rent. 2. In the case of purchasers of bankrupt estates, who were put on the same footing with adjudgers. The Crown refuses no voluntary donee, on his paying a composition to the exchequer of a sixth part of the valued rent. Now superiors are directed to enter all singular successors (except incorporations) who shall have got from the vassal a disposition, containing procuratory of resignation; they always receiving the fees or casualties that law entitles them to on a vassal's entry, *i. e.* a year's rent.

3. Base rights, *i. e.* dispositions to be holden of the disposer, are transmissions only of the property, the superiority remaining as formerly. As this kind of right might, before establishing the registers, have been kept quite concealed from all but the granter and receiver, a public right was preferable to it, unless clothed with possession: But as this distinction was no longer necessary after the establishment of the records, all infeftments are declared preferable, according to the dates of their several registrations; without respect to the former distinction of base and public, or of being clothed and not clothed with possession.

4. Public rights, *i. e.* dispositions to be holden of the granter's superior, may be perfected either by confirmation or resignation; and therefore, they generally contain both precept of feisin and procuratory of resignation. When the receiver is to complete his right in the first way, he takes feisin upon the precept; but such feisin is ineffectual without the superior's confirmation; for the donee cannot be deemed a vassal, till the superior receive him as such, or confirm the holding. By the usual style in the transmission of lands, the disposition contains an obligation and precept of infeftment, both *a me* and *de me*, in the option of the donee; upon which, if feisin is taken indefinitely, it is construed in favour of

the donee to be a base infeftment, because a public right is null without confirmation: But, if the receiver shall afterwards obtain the superior's confirmation, it is considered as if it had been from the beginning a public right.

5. Where two several public rights of the same subject are confirmed by the superior, their preference is governed by the dates of the confirmations, not of the infeftments confirmed; because it is the confirmation which compleats a public right.

6. Though a public right becomes, by the superior's confirmation, valid from its date; yet if any mid impediment intervene betwixt that period and the confirmation, to hinder the two from being conjoined, *e. g.* if the granter of a public right should afterwards grant a base right to another, upon which feisin is taken before the superior's confirmation of the first, the confirmation will have effect only from its own date; and consequently the base right first compleated, will carry the *property* of the lands preferable to the public one.

7. Resignation is that form of law, by which a vassal surrenders his feu to his superior; and it is either *ad perpetuam remanentiam*, or *in favorem*. In resignations *ad remanentiam*, where the feu is resigned, to the effect that it may remain with the superior, the superior, who before had the superiority, acquires, by the resignation, the property also of the lands resigned: and as his infeftment in the lands still subsisted, notwithstanding the right by which he had given his vassal the property; therefore, upon the vassal's resignation, the superior's right of property revives, and is consolidated with the superiority, without the necessity of a new infeftment; but the instrument of resignation must be recorded.

8. Resignations *in favorem* are made, not with an intention that the property resigned should remain with the superior, but that it should be again given by him, in favour either of the resigner himself, or of a third party; consequently the fee remains in the resigner, till the person in whose favour resignation is made gets his right from the superior perfected by feisin. And because resignations *in favorem*, are but incomplete personal deeds, our law has made no provision for recording them. Hence, the first feisin on a second resignation is preferable to the last feisin upon the first resignation; but the superior, accepting a second resignation, whereupon a prior feisin may be taken in prejudice of the first resignation, is liable in damages.

9. By our former decisions, one who was vested with a personal right of lands, *i. e.* a right not compleated by feisin, effectually divested himself by disposing it to another; after which, no right remained in the disposer, which could be carried by a second disposition, because a personal right is no more than a *jus obligationis*, which may be transferred by any deed sufficiently expressing the will of the granter. But this doctrine, at the same time that it rendered the security of the records extremely uncertain, was not truly applicable to such rights as required feisin to complete them; and therefore it now obtains, that the granter even of a personal right of lands, is not so divested by conveying the right to one person, but that he may effectually make it over afterwards to another;

mother; and the preference between the two does not depend on the dates of the dispositions, but on the priority of the seisin following upon them.

### Tit. 15. Of redeemable Rights.

An heritable right is said to be redeemable, when it contains a right of reversion, or return, in favour of the person from whom the right flows. Reversions are either legal, which arise from the law itself, as in adjudications, which law declares to be redeemable within a certain term after their date; or conventional, which are constituted by the agreement of parties, as in wadsets, rights of annualrent, and rights in security. A wadset (from wad or pledge) is a right, by which lands, or other heritable subjects, are impignorated by the proprietor to his creditor, in security of his debt; and, like other heritable rights, is perfected by seisin. The debtor, who grants the wadset, and has the right of reversion, is called the reverser; and the creditor, receiver of the wadset, is called the wadsetter.

Wadsets, by the present practice, are commonly made out in the form of mutual contracts, in which one party sells the land, and the other grants the right of reversion. When the right of reversion is thus incorporated in the body of the wadset, it is effectual without registration; because the singular successor in the wadset is, in that case, sufficiently certified of the reversion, though it be not registered, by looking into his own right, which bears it *in gremio*. But where the right of reversion is granted in a separate writing, it is ineffectual against the singular successor of the wadsetter, unless it be registered in the register of seisin within 60 days after the date of the seisin upon the wadset.

3. Rights of reversion are generally esteemed *stricti juris*; yet they go to heirs; though heirs should not be mentioned, unless there be some clause in the right, discovering the intention of parties, that the reversion should be personal to the reverser himself. In like manner, though the right should not express a power to redeem from the wadsetter's heir, as well as from himself, redemption will be competent against the heir. All our lawyers have affirmed, that reversions cannot be assigned, unless they are taken to assignees; but from the favour of legal diligence, they may be adjudged.

4. Reversions commonly leave the reverser at liberty to redeem the lands *quandocunque*, without restriction in point of time; but a clause is adjoined to some reversions, that if the debt be not paid against a determinate day, the right of reversion shall be irritated, and the lands shall become the irredeemable property of the wadsetter. Nevertheless, the irritancy being penal, as in wadsets, the sum lent falls always short of the value of the lands, and the right of redemption is by indulgence continued to the reverser, even after the term has expired, while the irritancy is not declared. But the reverser, if he does not take the benefit of this indulgence, within forty years after the lapse of the term, is cut out of it by prescription.

5. If the reverser would redeem his lands, he must use an order of redemption against the wadsetter: the first

step of which is premonition (or notice given under form of instrument) to the wadsetter, to appear at the time and place appointed by the reverser, then and there to receive payment of his debt, and thereupon to renounce his right of wadset. In the voluntary redemption of a right of wadset holden base, a renunciation duly registered re-establishes the reverser in the full right of the lands. Where the wadset was granted to be holden of the granter's superior, the superior must receive the reverser, on payment of a year's rent, if he produce a disposition from the wadsetter, containing procuratory of resignation. If, at executing the wadset, the superior has granted letters of regrefs, *i. e.* an obligation again to enter the reverser upon redemption of the lands, he will be obliged to receive him, without payment of the year's rent. But letters of regrefs will not have this effect against singular successors in the superiority, if they are not registered in the register of reversions. All wadsets that remain personal rights, are extinguished by simple discharges, though they should not be recorded.

6. If the wadsetter either does not appear at the time and place appointed, or refuses the redemption-money, the reverser must consign it under form of instrument, in the hands of the person thereto appointed in the right of reversion; or, if no person be named, in the hands of the clerk to the bills, a clerk of session, or any responsible person. An instrument of consignment, with the consignatory's receipt of the money consigned, compleats the order of redemption; stops the farther currency of interest against the reverser, and founds him in an action for declaring the order to be formal, and the lands to be redeemed in consequence of it.

7. After decree of declarator is obtained, by which the lands are declared to return to the debtor, the consigned money, which comes in place of the lands, becomes the wadsetter's, who therefore can charge the consignatory upon letters of horning to deliver it up to him; but, because the reverser may, at any time before decree, pass from his order, as one may do from any other step of diligence, the consigned sums continue to belong to the reverser, and the wadsetter's interest in the wadset continues heritable till that period.

8. If the wadsetter chuses to have his money rather than the lands, he must require from the reverser, under form of instrument, the sums due by the wadset, in terms of the right. The wadset sums continue heritable, notwithstanding requisition, which may be passed from by the wadsetter even after the reverser has consigned the redemption money in consequence thereof.

9. Wadsets are either proper or improper. A proper wadset is that whereby it is agreed, that the use of the land shall go for the use of the money; so that the wadsetter takes his hazard of the rents, and enjoys them without accounting, in satisfaction, or *in solutum* of his interest.

10. In an improper wadset, the reverser, if the rent should fall short of the interest, is taken bound to make up the deficiency; if it amounts to more, the wadsetter is obliged to impute the excrescence towards extinction of the capital: And, as soon as the whole sums, principal and interest, are extinguished by the wadsetter's possession,

session, he may be compelled to renounce, or divest himself in favour of the reverser.

11. If the wadsetter be intitled by his right to enjoy the rents without accounting, and if at the same time the reverser be subjected to the hazard of their deficiency, such contract is justly declared usurious; and also in all proper wadsets wherein any unreasonable advantage has been taken of the debtor, the wadsetter must, during the not requisition of the sum lent, either quit his possession to the debtor, upon his giving security to pay the interest, or subject himself to account for the surplus-rents, as in improper wadsets.

12. Infeftments of annualrent, the nature of which has been explained, are also redeemable rights. A right of annualrent does not carry the property of the lands, but it creates a real *nexus* or burden upon the property, for payment of the interest or annualrent contained in the right; and consequently, the bygone interests due upon it are *debita fundi*. The annualrenter may therefore either insist in a real action for obtaining letters of poinding the ground, or sue the tenant in a personal action towards the payment of his past interest: And in a competition for those rents, the annualrenter's preference will not depend on his having used a poinding of the ground, for his right was complicated by the feisin; and the power of poinding the ground, arising from that antecedent right, is *mere facultatis*, and need not be exercised, if payment can be otherwise got. As it is only the interest of the sum lent which is a burden upon the lands, the annualrenter, if he wants his principal sum, cannot recover it either by poinding or by a personal action against the debtor's tenants, but must demand it from the debtor himself, on his personal obligation in the bond, either by requisition, or by a charge upon letters of horning, according as the right is drawn.

13. Rights of annualrent, being servitudes upon the property, and consequently consistent with the right of property in the debtor, may be extinguished without requisition.

14. Infeftments in security are another kind of redeemable rights (now frequently used in place of rights of annualrent) by which the receivers are infeft in the lands themselves, and not simply in an annualrent forth of them, for security of the principal sums, interest, and penalty, contained in the rights. If an infeftment in security be granted to a creditor, he may thereupon enter into the immediate possession of the lands or annualrent for his payment. They are extinguished as rights of annualrent.

15. All rights of annualrent, rights in security, and generally whatever constitutes a real burden on the fee, may be the ground of an adjudication, which is preferable to all adjudications, or other diligences, intervening between the date of the right and of the adjudication deduced on it; not only for the principal sum contained in the right, but also for the whole past interest contained in the adjudication. This preference arises from the nature of real debts, or *debita fundi*; but in order to obtain it for the interest of the interest accumulated in the adjudication, such adjudication must proceed on a process of poinding the ground.

## Tit. 16. Of Servitudes.

SERVITUDE is a burden affecting lands, or other heritable subjects, whereby the proprietor is either restrained from the full use of what is his own, or is obliged to suffer another to do something upon it. Servitudes are either natural, legal, or conventional. Nature itself may be said to constitute a servitude upon inferior tenements, whereby they must receive the water that falls from those that stand on higher ground. Legal servitudes are established by statute or custom, from considerations of public policy; among which may be numbered the restraints laid upon the proprietors of tenements within the city of Edinburgh. There is as great a variety of conventional servitudes, as there are ways by which the exercise of property may be restrained by passion in favour of another.

2. Conventional servitudes are constituted, either by grant, where the will of the party burdened is expressed in writing, or by prescription, where his consent is presumed from his acquiescence in the burden for 40 years. A servitude constituted by writing, or grant, is not effectual against the grantor's singular successors, unless the grantee has been in the use or exercise of his right: But they are valid against the grantor and his heirs, even without use. In servitudes that may be acquired by prescription, forty years exercise of the right is sufficient, without any title in writing, other than a charter and feisin of the lands, to which the servitude is claimed to be due.

3. Servitudes constituted by grant are not effectual, in a question with the superior of the tenement burdened with the servitude, unless his consent be adhibited: for a superior cannot be hurt by his vassal's deed: But, where the servitude is acquired by prescription, the consent of the superior, whose right afforded him a good title to interrupt, is implied. A servitude by grant, though followed only by a partial possession, must be governed, as to its extent, by the tenor of the grant; but a servitude by prescription is limited by the measure or degree of the use had by him who prescribes: agreeably to the maxim, *tantum præscriptum quantum possessum*.

4. Servitudes are either predial or personal. Predial servitudes are burdens imposed upon one tenement, in favour of another tenement. That to which the servitude is due is called the dominant, and that which owes it is called the servient tenement. No person can have right to a predial servitude, if he is not proprietor of some dominant tenement that may have benefit by it; for that right is annexed to a tenement, and so cannot pass from one person to another, unless some tenement goes along with it.

5. Predial servitudes are divided into rural servitudes, or of lands; and urban servitudes, or of houses. The rural servitudes of the Romans were *iter*, *clivus*, *via*, *aquæductus*, *aquæhausus*, and *jus pascendi pecoris*. Similar servitudes may be constituted with us, of a foot-road, horse road, cart-road, dams, and aqueducts, watering of cattle, and pasturage. The right of a highway is not a servitude constituted in favour of a particular tenement, but is a right common to all travellers. The care of

of high-ways, bridges, and ferries, is committed to the sheriffs, justices of peace, and commissioners of supply in each shire.

6. Common pasturage, or the right of feeding one's cattle upon the property of another, is sometimes constituted by a general clause of pasturage in a charter or disposition, without mentioning the lands burdened; in which case, the right comprehends whatever had been formerly appropriated to the lands disposed out of the grantor's own property, and likewise all pasturage due to them out of other lands. When a right of pasturage is given to several neighbouring proprietors, on a moor or common belonging to the grantor, indefinite as to the number of cattle to be pastured, the extent of their several rights is to be proportioned according to the number that each of them can fodder in winter upon his own dominant tenement.

7. The chief servitudes of houses among the Romans were those of support, *viz. tigni immittendi*, and *oneris ferendi*. The first was the right of fixing in our neighbour's wall a joist or beam from our house: The second was that of resting the weight of one's house upon his neighbour's wall.

8. With us, where different floors or stories of the same house belong to different persons, as is frequent in the city of Edinburgh, the property of the house cannot be said to be entirely divided; the roof remains a common roof to the whole, and the area on which the house stands supports the whole; so that there is a communication of property, in consequence of which the proprietor of the ground floor must, without the constitution of any servitude, uphold it for the support of the upper, and the owner of the highest story must uphold that as a cover to the lower. Where the highest floor is divided into garrets among the several proprietors, each proprietor is obliged, according to this rule, to uphold that part of the roof which covers his own garret.

9. No proprietor can build, so as to throw the rain-water falling from his own house, immediately upon his neighbour's ground, without a special servitude, which is called of *stillicide*: but, if it falls within his own property, though at the smallest distance from the march, the owner of the inferior tenement must receive it.

10. The servitudes *altius non tollendi*, *et non officiendi luminibus vel prospectui*, restrain proprietors from raising their houses beyond a certain height, or from making any building whatsoever that may hurt the light or prospect of the dominant tenement. These servitudes cannot be constituted by prescription alone; for, though a proprietor should have built his house ever so low, or should not have built at all upon his grounds for forty years together, he is presumed to have done so for his own convenience or profit; and therefore cannot be barred from afterwards building a house on his property, or raising it to what height he pleases, unless he be tied down by his own consent.

11. We have two predial servitudes to which the Romans were strangers, *viz.* that of *sewel* or *seal* and *divot*, and of *thirlage*. The first is a right, by which the owner of the dominant tenement may turn up peats, turfs, seals, or divots, from the ground of the servient, and carry

them off either for *sewel*, or *thatch*, or the other uses of his own tenement.

12. *THIRLAGE* is that servitude, by which lands are *astricted*, or *thirled*, to a particular mill, and the possessors bound to grind their grain there, for payment of certain *multures* and *sequels*, as the agreed price of grinding. In this servitude, the mill is the dominant tenement, and the lands *astricted* (which are called also the *thirle* or *sucken*) the servient. *Multure* is the quantity of grain or meal payable to the proprietor of the mill, or to the *multure* his *tacksmen*. The *sequels* are the small quantities given to the servants, under the name of *knave*ship, *bannock*, and *lock* or *gowpen*. The quantities paid to the mill by the lands not *astricted*, are generally proportioned to the value of the labour, and are called *out-town* or *in-sucken multures*; but those paid by the *thirle* are ordinarily higher, and are called *in-town* or *in-sucken multures*.

13. *Thirlage* may be constituted by a landholder, when, in the disposition of certain lands, he *astricts* them to his own mill; or when, in the disposition of a mill, he *astricts* his own lands to the mill disposed, or when, in letting his lands, he makes it a condition in the *tacks*. The grant of a mill with the general clause of *multures*, without specifying the lands *astricted*, conveys the *thirlage* of all the lands formerly *astricted* to that mill, whether they were the property of the grantor, or of a third party.

14. A less formal constitution serves to *astrict* barony-lands to the mill of the barony, than is necessary in any other *thirlage*; which perhaps proceeds from the effects of the union between the two. Hence, if a baron makes over the mill of a barony, *cum multuris*, or *cum astrictis multuris*, it infers an *astriction* of the barony-lands to the mill conveyed, even of such as had been before sold to another for a certain duty *pro omni alio onere*. But if, prior to the baron's conveyance of his mill *cum multuris*, he had sold any part of the barony-lands to another *cum multuris*, the first purchaser's lands are not *astricted* by the posterior grant; for a right of lands with the *multures*, implies a freedom of these lands from *thirlage*.

15. *Thirlage* is either, 1. Of *grindable* corns; or, 2. Of *all* growing corns; or, 3. Of the *investa et illata*, *i. e.* of all the grain brought within the *thirle*, though of another growth. Where the *thirlage* is of *grindable* grain, it is in practice restricted to the corns which the tenants have occasion to grind, either for the support of their families, or for other uses; the surplus may be carried out of the *thirle* unmanufactured, without being liable in *multure*. Where it is of the *grana crescentia*, the whole grain growing upon the *thirle* is *astricted*, with the exceptions, 1. Of seed and horse-corn, which are destined to uses inconsistent with grinding; and, 2. Of the farm-duties due to the landlord, if they are deliverable in grain not grinded. But, if the rent be payable in meal, flour, or malt, the grain of which these are made must be manufactured in the dominant mill.

16. The *thirlage* of *investa et illata* is seldom constituted but against the inhabitants of a borough or village, that they shall grind all the unmanufactured grain they import thither at the dominant mill. *Multure*, therefore, cannot be exacted in a *thirlage* of *investa et illata*, for

flour or oat-meal brought into the servient tenement, unless the importer had brought it in grain, and grinded it at another mill. The same grain that owes multure, as *granum crescens*, to the mill in whose thirle it grew, if it shall be afterwards brought within a borough where the *inveſta et illata* are thirled, muſt pay a ſecond multure to the proprietor of that dominant tenement; but, where the right of theſe two thirlages is in the ſame proprietor, he cannot exact both. Where lands are thirled of general terms, without expreſſing the particular nature in the ſervitude, the lighteſt thirlage is preſumed, from the favour of liberty; but in the aſtriction of a borough or village, where there is no growing grain which can be the ſubject of thirlage, the aſtriction of *inveſta et illata* muſt be neceſſarily underſtood.

17. Thirlage, in the general caſe, cannot be eſtabliſhed by preſcription alone, for *iis quæ ſunt mera facultatis non præſcribitur*; but where one has paid for forty years together the heavy inſucken multures, the ſlighteſt title in writing will ſubject his lands. Thirlage may be, contrary to the common rule, conſtituted by preſcription alone, 1. Where one pays to a mill a certain ſum, or quantity of grain yearly, in name of multure, whether he grinds at it or not (called dry multure.) 2. In mills of the King's property; which is conſtituted *jure coronæ*, without titles in writing; and, where he derives right from another, his titles are more liable to be loſt. This is extended in practice to mills belonging to church-lands, where thirty years poſſeſſion is deemed equivalent to a title in writing, from a preſumption that their rights were deſtroyed at the reformation. Though thirlage itſelf cannot be conſtituted by mere poſſeſſion, the proportion of multure payable to the dominant tenement may be ſo fixed.

18. The poſſeſſors of the lands aſtricted, are bound to uphold the mill, repair the dam-dykes and aqueduſts, and bring home the millſtones. Theſe ſervices, though not expreſſed in the conſtitution, are implied.

19. Servitudes, being reſtraints upon property, are *ſtricti juris*: They are not therefore preſumed, if the acts upon which they are claimed can be explained conſiſtently with freedom; and, when ſervitudes are conſtituted, they ought to be uſed in the way leaſt burdensome to the ſervient tenement. Hence, one who has a ſervitude of peats upon his neighbour's moſs, is not at liberty to extend it for the uſe of any manufacture which may require an extraordinary expence of ſewel; but muſt confine it to the natural uſes of the dominant tenement.

20. Servitudes are extinguiſhed, 1. *Confuſione*, when the ſame perſon comes to be proprietor of the dominant and ſervient tenements; for *res ſua nemini ſervit*, and the uſe the proprietor thereafter makes of the ſervient tenement is not *jure ſervitutis*, but is an act of property. 2. By the perſiſhing, either of the dominant or ſervient tenement. 3. Servitudes are loſt *non utendo*, by the dominant tenement neglecting to uſe the right for forty years; which is conſidered as a dereliſtion of it, though he, who has the ſervient tenement, ſhould have made no interruption, by doing acts contrary to the ſervitude.

21. Perſonal ſervitudes are thoſe by which the proper-

ty of a ſubject is burdened, in favour, not of a tenement, but of a perſon. The only perſonal ſervitude known in our law, is uſufruct or life-rent; which is a right to uſe and enjoy a thing during life, the ſubſtance of it being preſerved. A life-rent cannot therefore be conſtituted upon things which perſiſh in the uſe; and though it may upon ſubjects which gradually wear out by time, as houſehold-furniture, &c. yet, with us, it is generally applied to heritable ſubjects. He, whoſe property is burdened, is uſually called the ſiar.

22. Life-rents are divided into conventional and legal. Conventional life-rents are either ſimple, or by reſervation. A ſimple life-rent, or by a ſeparate conſtitution, is that which is granted by the proprietor in favour of another: And this ſort, contrary to the nature of predial ſervitudes, requires ſeiſin in order to affect ſingular ſucceſſors; for a life-rent of lands is, in ſtrict ſpeech, not a ſervitude, but a right reſembling property, which conſtitutes the life-renter vaſſal for life; and ſingular ſucceſſors have no way of diſcovering a life-rent-right, which perhaps is not yet commenced, but by the records; whereas, in predial ſervitudes, the conſtant uſe of the dominant tenement makes them public. The proper right of life-rent is intransmiſſible, *offibus uſufructuarii inheret*: When the profits of the life-rented ſubject are tranſmitted to another, the right becomes merely perſonal, for it intitles the aſſignee to the rent, not during his own life, but his cedent's, and is therefore carried by ſimple aſſignation, without ſeiſin.

23. A life-rent by reſervation, is that which a proprietor reſerves to himſelf in the ſame writing by which he conveys the fee to another. It requires no ſeiſin; for the granter's former ſeiſin, which virtually included the life-rent, ſtill ſubſiſts as to the life-rent which is expreſſly reſerved. In conjunct infeſtments taken to huſband and wife, the wife's right of conjunct fee reſolves, in the general caſe, into a life-rent.

24. Life-rents by law, are the terce and the courteſy. The terce (*tertia*) is a life-rent competent by law to widows, who have not accepted of ſpecial provisions, in the third of the heritable ſubjects, in which their huſbands died infeſt; and takes place only where the marriage has ſubſiſted for year and day, or where a child has been born alive of it.

25. The terce is not limited to lands, but extends to teinds, and to ſervitudes and other burdens affecting lands; thus, the widow is intitled, in the right of her terce, to a life-rent of the third of the ſums ſecured, either by rights of annualrent, or by rights in ſecurity. In improper wadſets, the terce is a third of the ſum lent: In thoſe that are proper, it is a third of the wadſet-lands; or in caſe of redemption, a third of the redemption money. Neither rights of reverſion, ſuperiority, nor patronage, fall under the terce; for none of theſe have fixed profits, and ſo are not proper ſubjects for the widow's ſubſiſtence; nor tacks, becauſe they are not feudal rights. Burgage-tenements are alſo excluded from it, the reaſon of which is not ſo obvious. Since the huſband's ſeiſin is both the meaſure and ſecurity of the terce, ſuch debts or diligences alone, as exclude the huſband's ſeiſin, can prevail over it.

26. Where a terce is due out of lands burdened with

a prior terce still subsisting, the second tercer has only right to a third of the two thirds that remain unaffected by the first terce. But upon the death of the first widow, whereby the lands are disburdened of her terce, the lesser terce becomes enlarged, as if the first had never existed. A widow, who has accepted of a special provision from her husband, is thereby excluded from the terce, unless such provision shall contain a clause that she shall have right to both.

27. The widow has no title of possession, and so cannot receive the rents in virtue of her terce, till she be served to it; and in order to this, she must obtain a brief out of the chancery, directed to the Sheriff, who calls an inquest, to take proof that she was wife to the deceased; and that the deceased died intestate in the subjects contained in the brief. The service or sentence of the jury, finding these points proved, does, without the necessity of a return to the chancery, intitle the wife to enter into the possession; but she can only possess with the heir *pro indiviso*, and so cannot remove tenants, till the sheriff kens her to her terce, or divides the lands between her and the heir. In this division, after determining by lot or kaval, whether to begin by the sun or the shade, *i. e.* by the east or the west, the sheriff sets off the two first acres for the heir, and the third for the widow. Sometimes the division is executed, by giving one entire farm to the widow, and two of equal value to the heir. The widow's right is not properly constituted by this service; it was constituted before, by the husband's seisin, and fixed by his death; the service only declares it, and so intitles her to the third part of the rents *retro* to her husband's death, preferable to any rights that may have affected the lands in the intermediate period between that and her own service. The relief, if she was reputed to be lawful wife to the deceased, must be served, notwithstanding any objections by the heir against the marriage, which may be afterwards tried by the commissary.

28. Courtesy is a liferent given by law, to the surviving husband, of all his wife's heritage in which she died intestate, if there was a child of the marriage born alive. A marriage, though of the longest continuance, gives no right to the courtesy, if there was no issue of it. The child born of the marriage must be the mother's heir: If she had a child of a former marriage, who is to succeed to her estate, the husband has no right to the courtesy while such child is alive: so that the courtesy is due to the husband, rather as father to an heir, than as husband to an heiress. Heritage is here opposed to conquest, and so is to be understood only of the heritable rights to which the wife succeeded as heir to her ancestors, excluding what she herself had acquired by singular titles.

29. Because the husband enjoys the liferent of his wife's whole heritage, on a lucrative title, he is considered as her temporary representative, and so is liable in payment of all the yearly burdens chargeable on the subject, and of the current interest of all her debts, real and personal, to the value of the yearly rent he enjoys by the courtesy. The courtesy needs no solemnity to its constitution: That right, which the husband had to the rents of his wife's estate, during the marriage, *jure mariti*, is continued with him after her death, under the name of

courtesy, by an act of the law itself. As in the terce, the husband's seisin is the ground and measure of the wife's right; so in the courtesy, the wife's seisin is the foundation of the husband's; and the two rights are, in all other respects, of the same nature; if it is not that the courtesy extends to burgage-holdings, and to superiorities.

30. All liferenters must use their right *salva rei substantia*: Whatever therefore is part of the fee itself, cannot be encroached on by the liferenter, *e. g.* woods or growing timber, even for the necessary uses of the liferented tenement. But, where a coppice or *silva cadua* has been divided into hags, one of which was in use to be cut annually by the proprietor, the liferenter may continue the former yearly cuttings; because these are considered as the annual fruits the subject was intended to yield, and so the proper subject of a liferent.

31. Liferenters are bound to keep the subject liferented in proper repair. They are also burdened with the alimony of the heir, where he has not enough for maintaining himself. The bare right of apparenancy founds the action against the liferenter. It is a burden personal to the liferenter himself, and cannot be thrown upon his adjudging creditors, as coming in his place by their diligences. Liferenters are also subjected to the payment of the yearly cesses, stipends, &c. falling due during their right, and to all other burdens that attend the subject liferented.

32. Liferent is extinguished by the liferenter's death. That part of the rents which the liferenter had a proper right to, before his death, falls to his executors; the rest, as never having been *in bonis* of the deceased, goes to the fiar. Martinmas and Whitsunday are, by our custom, the legal terms of the payment of rent: Consequently, if a liferenter of lands survives the term of Whitsunday, his executors are intitled to the half of that year's rent, because it was due the term before his death; and if he survives the Martinmas, they have right to the whole. If the liferenter, being in the natural possession, and having first sowed the ground, should die, even before the Whitsunday, his executors are intitled to the whole crop, in respect that both seed and industry were his. In a liferent of money constituted by a moveable bond, the executors have a right to the interest, down to the very day of the liferenter's death, where no terms are mentioned for the payment thereof; but in the case of an heritable bond, or of a money liferent secured on land, the interests of liferenter and fiar (or of heir and executor, for the same rules serve to fix the interests of both) are both governed by the legal terms of land-rent, without regard to the conventional.

### Tit. 17. Of Teinds.

1. TEINDS, or tithes, are that liquid proportion of our rents or goods, which is due to churchmen, for performing divine service, or exercising the other spiritual functions proper to their several offices. Most of the canonists affirm, that the precise proportion of a tenth, not only of the fruits of the ground, but of what is acquired by personal industry, is due to the Christian clergy, of divine right, which they therefore call the proper patrimony.

trimony of the church; though it is certain that tithes, in their infancy, were given, not to the clergy alone, but to lay-monks who were called *pauperes*, and to other indigent persons. Charles the Great was the first secular Prince who acknowledged this right in the church. It appears to have been received with us, as far back as David I.

2. The person employed by a cathedral church or monastery to serve the cure in any church annexed, was called a vicar, because he held the church, not in his own right, but in the right or *vice* of his employers; and so was removeable at pleasure, and had no share of the benefice, other than what they thought fit to allow him: But, in the course of time, the appellation of vicar was limited to those who were made perpetual, and who got a stated share of the benefice for their incumbency; from whence arose the distinction of benefices into parsonages and vicarages.

3. Parsonage-teinds are the teinds of corn; and they are so called because they are due to the parson or other titular of the benefice. Vicarage-teinds are the small teinds of calves, lint, hemp, eggs, &c. which were commonly given by the titular to the vicar who served the cure in his place. The first sort was universally due, unless in the case of their infeudation to laics, or of a pontifical exemption; but, by the customs of almost all Christendom, the lesser teinds were not demanded where they had not been in use to be paid. By the practice of Scotland, the teinds of animals, or of things produced from animals, as lambs, wool, calves, are due though not accustomed to be paid; but roots, herbs, &c. are not tithable, unless use of payment be proved: neither are personal teinds, *i. e.* the tenth of what one acquires by his own industry, acknowledged by our law; yet they have been found due, when supported by 40 years possession.

4. The parson who was entitled to the teind of corns, made his right effectual either by accepting of a certain number of teind-bolls yearly from the proprietor, in satisfaction of it; or more frequently, by drawing or separating upon the field his own tenth part of the corns, after they were reaped, from the stock or the remaining nine tenths of the crop, and carrying it off to his own granaries; which is called drawn teind.

5. After the reformation, James VI. considered himself as proprietor of all the church-lands; partly because the purposes for which they had been granted were declared superstitious; and partly, in consequence of the resignations which he, and *Q. Mary* his mother, had procured from the beneficiaries: and even as to the teinds, tho' our reformed clergy also claimed them as the patrimony of the church, our sovereign did not submit to that doctrine farther than extended to a competent provision for ministers. He therefore erected or secularised several abbeys and priories into temporal lordships; the grantees of which were called sometimes lords of erection, and sometimes titulars, as having by their grants the same title to the erected benefices, that the monasteries had formerly.

6. As the Crown's revenue suffered greatly by these erections, the temporality of all church-benefices (*i. e.*

church lands) was, by 1587, *c.* 29. annexed to the crown. That statute excepts from the annexation such benefices as were established before the reformation in laymen, whose rights the legislature had no intention to weaken. Notwithstanding this statute, his Majesty continued to make farther erections, which were declared null by 1592, *c.* 119. with an exception of such as had been made in favour of lords of parliament, since the general act of annexation in 1587.

7. K. Charles I. soon after his succession, raised a reduction of all these erections, whether granted before or after the act of annexation, upon the grounds mentioned at length by Mr Forbes in his treatise of tithes, p. 159. At last the whole matter was referred to the King himself by four several submissions or compromises, in which the parties on one side were the titulars and their tacksmen, the bishops with the inferior clergy, and the royal boroughs, for the interest they had in the teinds that were gifted for the provision of ministers, schools, or hospitals within their boroughs; and, on the other part, the proprietors who wanted to have the leading of their own teinds. The submission by the titulars contained a surrender into his Majesty's hands of the superiorities of their several erections.

8. Upon each of these submissions his Majesty pronounced separate decrees arbitral, dated Sept. 2. 1629, which are subjoined to the acts of parliament of his reign. He made it lawful for proprietors to sue the titulars for a valuation, and if they thought fit for a sale also, of their teinds, before the commissioners named or to be named for that purpose. The rate of teind, when it was possessed by the proprietor jointly with the flock, for payment of a certain duty to the titular; and so did not admit a separate valuation, was fixed at a fifth part of the constant yearly rent, which was accounted a reasonable *surrogatum*, in place of a tenth of the increase. Where it was drawn by the titular, and consequently might be valued separately from the flock, it was to be valued as its extent should be ascertained upon a proof before the commissioners; but in this last valuation, the King directed the fifth part to be deducted from the proved teind, in favour of the proprietor, which was therefore called the King's case. The proprietor suing for a valuation gets the leading of his own teinds as soon as his suit commences; providing he does not allow protestation to be extracted against him for not insisting.

9. Where the proprietor insisted also for a sale of his teinds, the titular was obliged to sell them at nine years purchase of the valued teind-duty. If the pursuer had a tack of his own teinds, not yet expired; or if the defender was only tacksmen of the teinds, and so could not give the pursuer an heritable right; an abatement of the price was to be granted accordingly by the commissioners.

10. There is no provision in the decrees arbitral, for selling the teinds granted for the sustentation of ministers, universities, schools or hospitals; because these were to continue, as a perpetual fund, for the maintenance of the persons or societies to whom they were appropriated; and they are expressly declared not subject to sale, by 1690, *c.* 30.—1693, *c.* 23. By the last of these acts, it is also provided

vided, that the teinds belonging to bishops, which had then fallen to the crown, upon the abolishing of episcopacy, should not be subject to sale as long as they remained with the Crown not disposed of; nor those which the proprietor, who had right both to stock and teind, reserved to himself, in a sale or feu of the lands. But, though none of these teinds can be sold, they may be valued.

11. The King by the decrees arbitral, declared his own right to the superiorities of erection which had been resigned to him by the submission, reserving to the titulars the feu-duties thereof, until payment by himself to them of one thousand merks Scots for every chaldier of feu-victual, and for each hundred merks of feu-duty, which right of redeeming the feu-duties was afterwards renounced by the Crown. If the church-vassal should consent to hold his lands of the titular, he cannot thereafter recur to the Crown as his immediate superior.

12. In explaining what the constant rent is, by which the teind must be valued, the following rules are observed. The rent drawn by the proprietor, from the sale of subjects, that are more properly parts of the land than of the fruits, *e. g.* quarries, minerals, mosses, &c. is to be deducted from the rental of the lands; and also the rent of supernumerary houses, over and above what is necessary for agriculture; and the additional rent that may be paid by the tenant, in consideration of the proprietor's undertaking any burden that law imposes on the tenant, *e. g.* upholding the tenant's houses, because none of these articles are paid properly on account of the fruits. Orchards must also be deducted, and mill-rent, because the profits of a mill arise from industry; and the corns manufactured there suffer a valuation, as rent payable by the tenant; and therefore ought not to be valued a second time against the titular as mill-rent. The yearly expence of culture ought not to be deducted; for no rent can be produced without it: But, if an improvement of rent is made at an uncommon expence, *e. g.* by draining a lake, the proprietor is allowed a reasonable abatement on that account.

13. Notwithstanding the several ways of misapplying parochial teinds in the times of popery, some few benefices remained entire in the hands of the parsons. The ministers planted in these, after the reformation, continued to have the full right to them, as proper beneficiaries; but a power was afterwards granted to the patron, to redeem the whole teind from such beneficiaries, upon their getting a competent stipend modified to them; which teind so redeemed, the patron is obliged to sell to the proprietor, at six years purchase.

14. Some teinds are more directly subject to an allocation for the minister's stipend, than others. The teinds, in the hands of the lay titular, fall first to be allocated, who, since he is not capable to serve the cure in his own person, ought to provide one who can; and if the titular, in place of drawing the teind, has set it in tack, the tack-duty is allocated: This sort is called free teind. Where the tack duty, which is the titular's interest in the teinds, falls short, the tack itself is burdened, or, in other words, the surplus teind over and above the tack-duty: But, in this case, the commissioners are empowered to recompense

Vol. II. Numb. 65.

2

the tackfman, by prorogating his tack for such a number of years as they shall judge equitable. Where this likewise proves deficient, the allocation falls on the teinds, heritably conveyed by the titular, unless he has warranted his grant against future augmentations; in which case, the teinds of the lands belonging in property to the titular himself must be allocated in the first place.

15. Where there is sufficiency of free teinds in a parish, the titular may allocate any of them he shall think fit for the minister's stipend, since they are all his own; unless there has been a previous decree of locality: And this holds, though the stipend should have been paid immemorably out of the teinds of certain particular lands. This right was frequently abused by titulars, who, as soon as a proprietor had brought an action of sale of his teinds, allocated the pursuer's full teind for the stipend, whereby such action became ineffectual: It was therefore provided, that after citation in a sale of teinds it shall not be in the titular's power to allocate the pursuer's teinds solely, but only in proportion with the other teinds in the parish.

16. Ministers glebes are declared free from the payment of teind. Lands *cum decimis inclusis* are also exempted from teind. But in order to exempt lands from payment of teind, it is necessary that the proprietor prove his right thereto, *cum decimis inclusis*, as far back as the above act of annexation 1587.

17. Teinds are *debita fructuum*, not *fundi*. The action therefore for bygone teinds is only personal, against those who have intermeddled, unless where the titular is infest in the lands, in security of the valued teind-duty. Where a tenant is, by his tack, bound to pay a joint duty to his landlord for stock and teind, without distinguishing the rent of each, his defence of a *bona fide* payment of the whole to the landlord has been sustained in a suit at the instance of a laic titular, but repelled where a churchman was pursuer. In both cases the proprietor who receives such rent is liable as intermeddler.

18. In tacks of teinds, as of lands, there is place for tacit relocation; to stop the effect of which, the titular must obtain and execute an inhibition of teinds against the tackfman, which differs much from inhibition of lands (explained under the next title), and is intended merely to interpel or inhibit the tackfman from farther intermeddling. This diligence of inhibition may also be used at the suit of the titular, against any other possessor of the teinds; and if the tackfman or possessor shall intermeddle after the inhibition is executed, he is liable in a spuilzie.

19. Lands and teinds pass by different titles: A disposition of lands therefore, though granted by one who has also right to the teind, will not carry the teind, unless it shall appear from special circumstances that a sale of both was designed by the parties. In lands *cum decimis inclusis*, where the teinds are consolidated with the stock, the right of both must necessarily go together in all cases.

#### Tit. 18. Of Inhibitions.

THE constitution and transmission of feudal rights being  
† 9 Y explained,

explained, and the Surdens with which they are chargeable, it remains to be considered, how these rights may be affected at the suit of creditors, by legal diligence. Diligences are certain forms of law, whereby a creditor endeavours to make good his payment, either by affecting the person of his debtor, or by securing the subjects belonging to him from alienation, or by carrying the property of these subjects to himself. They are either real or personal. Real diligence is that which is proper to heritable or real rights; personal, is that by which the person of the debtor may be secured, or his personal estate affected. Of the first sort we have two, *viz.* Inhibition and Adjudication.

2. Inhibition is a personal prohibition, which passes by letters under the signet, prohibiting the party inhibited to contract any debt, or do any deed, by which any part of his lands may be aliened or carried off, in prejudice of the creditor inhibiting. It must be executed against the debtor, personally, or at his dwelling house, as summonses, and thereafter published and registred in the same manner with interdictions, (see Tit. vii. 30.)

3. Inhibition may proceed, either upon a liquid obligation, or even on an action commenced by a creditor for making good a claim not yet sustained by the judge; which last is called inhibition upon a depending action. The summons, which constitutes the dependence, must be executed against the debtor before the letters of inhibition pass the signet; for no suit can be said to depend against one, till he be cited in it as a defender: But the effect of such inhibition is suspended, till decree be obtained in the action against the debtor; and in the same manner, inhibitions on conditional debts have no effect, till the condition be purified. Inhibitions are not granted, without a trial of the cause, when they proceed on conditional debts. And though, in other cases, inhibitions now pass of course, the Lords are in use to stay, or recal them, either on the debtor's shewing cause why the diligence should not proceed, or even *ex officio* where the ground of the diligence is doubtful.

4. Though inhibitions, by their uniform style, disable the debtor from selling his moveable as well as his heritable estate, their effect has been long limited to heritage, from the interruption that such an embargo upon moveables must have given to commerce; so that debts contracted after inhibition may be the foundation of diligence, against the debtor's person and moveable estate. An inhibition secures the inhibitor against the alienation, not only of the lands that belonged to his debtor when he was inhibited, but of those that he shall afterwards acquire; but no inhibition can extend to such after-purchases as lie in a jurisdiction where the inhibition was not registred; for it could not have extended to these, tho' they had been made prior to the inhibition.

5. This diligence only strikes against the voluntary debts or deeds of the inhibited person: It does not restrain him from granting necessary deeds, *i. e.* such as he was obliged to grant anterior to the inhibition, since he might have been compelled to grant these before the inhibitor had acquired any right by his diligence. By this rule, a wadsetter or annualrenter might, after being inhibited, have effectually renounced his right to the reverser on

payment, because law could have compelled him to it; but to secure inhibitors against the effect of such alienations, it is declared by act of sederunt of the court of Session, Feb. 19. 1680, that, after intimation of the inhibition to the reverser, no renunciation or grant of redemption shall be sustained, except upon declarator of redemption brought by him, to which the inhibitor must be made a party.

6. An inhibition is a diligence simply prohibitory, so that the debt, on which it proceeds, continues personal after the diligence; and consequently, the inhibitor, in a question with anterior creditors whose debts are not struck at by the inhibition, is only preferable from the period at which his debt is made real by adjudication: And where debts are contracted on heritable security, though posterior to the inhibition, the inhibitor's debt, being personal, cannot be ranked with them; he only draws back from the creditors ranked the sums contained in his diligence. The heir of the person inhibited is not restrained from alienation, by the diligence used against his ancestor; for the prohibition is personal, affecting only the debtor against whom the diligence is used.

7. Inhibitions do not, of themselves, make void the posterior debts or deeds of the person inhibited; they only afford a title to the user of the diligence to set them aside, if he finds them hurtful to him: And even where a debt is actually reduced *ex capite inhibitionis*, such reduction, being founded solely in the inhibitor's interest, is profitable to him alone, and cannot alter the natural preference of the other creditors.

8. Inhibitions may be reduced, upon legal nullities, arising either from the ground of debt, or the form of diligence. When payment is made by the debtor to the inhibitor, the inhibition is said to be purged. Any creditor, whose debt is struck at by the inhibition, may, upon making payment to the inhibitor, compel him to assign the debt and diligence in his favour, that he may make good his payment the more effectually against the common debtor.

#### Tit. 19. Of Comprisings, Adjudications, and Judicial Sales.

HERITABLE rights may be carried from the debtor to the creditor, either by the diligence of apprising (now adjudication), or by a judicial sale carried on before the court of Session. Apprising, or comprising, was the sentence of a sheriff, or of a messenger who was specially constituted sheriff for that purpose, by which the heritable rights belonging to the debtor were sold for payment of the debt due to the apprifer; so that apprisings were, by their original constitution, proper sales of the debtor's lands, to any purchaser who offered. If no purchaser could be found, the sheriff was to apprise or tax the value of the lands by an inquest, (whence came the name of apprising), and to make over to the creditor lands to the value of the debt.

2. That creditors may have access to affect the estate of their deceased debtor, though the heir should stand off from entering, it is made lawful (by 1540, c. 106.) for any creditor to charge the heir of his debtor to enter to his ancestor,

year

year and day being past after the ancestor's death, within forty days after the charge; and, if the heir fails, the creditor may proceed to apprise his debtor's lands, as if the heir had been entered. Custom has so explained this statute, that the creditor may charge the heir, immediately after the death of his ancestor, provided letters of apprising be not raised till after the expiry both of the year and of the forty days next ensuing the year, within which the heir is charged to enter. But this statute relates only to such charges on which apprising is to be led against the ancestor's lands; for, in those which are to be barely the foundation of a common summons or process against the heir, action will be sustained if the year be elapsed from the ancestor's death before the execution of the summons, though the forty days should not be also expired. Though the statute authorises such charges against majors only, practice has also extended it against minors, and the rule is extended to the case where the heir is the debtor. One must, in this matter, distinguish between a general and a special charge. A general charge serves only to fix the representation of the heir who is charged, so as to make the debt his, which was formerly his ancestor's: But a special charge makes up for the want of a service, explained Tit. xxvii. 25. and states the heir, *fictione juris*, in the right of the subjects to which he is charged to enter. Where therefore the heir is the debtor, a general charge for fixing the representation against him is unnecessary. Since the only concern of the creditor is, that his debtor make up titles to the ancestor's estate, which is done by a special charge: But where the deceased was the debtor, the creditor must first charge his heir to enter in general, that it may be known whether he is to represent the debtor; if he does not enter within forty days, the debt may be fixed against him by a decree of constitution, on which he must be charged to enter heir in special, upon forty days more; and these must be elapsed before the creditor can proceed to apprise.

3. Apprisings in course of time underwent several changes in their form and effect, till at length, by act 1672, c. 19. adjudications were substituted in their place, which directed to proceed against debtors by way of action before the court of Session. By that statute, such part of the debtor's lands is to be adjudged as is equivalent to the principal sum and interest of the debt, with the composition due to the superior and expences of infestment; and a fifth part more in respect the creditor is obliged to take land for his money. The debtor must deliver to the creditor a valid right of the lands to be adjudged, or transumps thereof, renounce the possession in his favour, and ratify the decree of adjudication: And law considers the rent of the lands as precisely commensurated to the interest of the debt; so that the adjudger lies under no obligation to account for the surplus rents. In this, which is called a special adjudication, the legal or time within which the debtor may redeem, is declared to be five years; and the creditor attaining possession upon it can use no farther execution against the debtor, unless the lands be evicted from him.

4. Where the debtor does not produce a sufficient right to the lands, or is not willing to renounce the pos-

session, and ratify the decree, (which is the case that has most frequently happened), the statute makes it lawful for the creditor to adjudge all right belonging to the debtor in the same manner, and under the same reversion of ten years, as he could, by the former laws, have appraised it. In this last kind, which is called a general adjudication, the creditor must limit his claim to the principal sum, interest, and penalty, without demanding a fifth part more. But no general adjudication can be insisted on, without libelling in the summons the other alternative of a special adjudication; for special adjudications are introduced by the statute in the place of apprisings; and it is only where the debtor refuses to comply with the terms thereof that the creditor can lead a general adjudication.

5. Abbreviates are ordained to be made of all adjudications, which must be recorded within sixty days after the date of the decree. In every other respect, general adjudications have the same effects that apprisings had; adjudgers in possession are accountable for the surplus rents; a citation in adjudications renders the subject litigious; superiors are obliged to enter adjudgers; the legal of adjudications does not expire during the debtor's minority, &c. Only it may be observed, that though apprisings could not proceed before the term of payment, yet where the debtor is *vergens ad inopiam*, the court *ex nobili officio* admit adjudication for the debt before it be payable. But this sort being founded solely in equity, subsists merely as a security, and cannot carry the property to the creditor by any length of time.

6. There are two kinds of adjudication, which took place at the same time with apprisings, and still obtain; viz. adjudications on a decree *cognitionis causa*, otherwise called *contra hereditatem jacentem*, and adjudications in implement. Where the debtor's apparent heir, who is charged to enter, formally renounces the succession, the creditor may obtain a decree *cognitionis causa*; in which, though the heir renouncing is cited for the sake of form, no sentence condemnatory can be pronounced against him, in respect of his renunciation; the only effect of it is to subject the *hereditas jacentis* to the creditor's diligence.

7. Adjudications *contra hereditatem jacentem*, carry not only the lands themselves that belonged to the deceased, but the rents thereof fallen due since his death; for these, as an accessory to the estate belonging to the deceased, would have descended to the heir if he had entered, which rule is applied to all adjudications led on a special charge. This sort of adjudication is declared redeemable within seven years, by any co-adjudging creditor, either of the deceased debtor, or of the heir renouncing: The heir himself, who renounces, cannot be restored against his renunciation, nor consequently redeem, if he be not a minor. But even a major may redeem indirectly, by granting a simulate bond to a confident person; the adjudication upon which, when conveyed to himself, is a good title to redeem all other adjudications against the lands belonging to his ancestor.

8. Adjudications in implement are deduced against those who have granted deeds without procuratory of resignation or precept of seisin, and refuse to divest themselves;

to the end that the subject conveyed may be effectually vested in the grantee. These adjudications may be also directed against the heir of the grantor, upon a charge to enter. Here there is no place for a legal reversion; for, as the adjudication is led for completing the right of a special subject, it must carry that subject as irredeemably as if the right had been voluntarily completed.

9. All adjudications led within year and day of that one which has been made first effectual by seisin (where seisin is necessary) or exact diligence for obtaining seisin, are preferable *pari passu*. The year and day runs from the date of the adjudication, and not of the seisin or diligence for obtaining it. After the days of that period, they are preferable according to their dates. All the co adjudgers within the year are preferable *pari passu* as if one adjudication had been led for all their debts. This makes the seisin or diligence on the first adjudication a common right to the rest, who must therefore be refund to the owner of that diligence his whole expence laid out in carrying on and completing it. And though that first adjudication should be redeemed, the diligence upon it still subsists as to the rest. This *pari passu* preference, however, does not destroy the legal preference of adjudications led on *debita fundi*. See Tit. xv. 15. Nor does it take place in adjudications in implement.

10. Before treating of judicial sales of bankrupts estates, the nature of sequestration may be shortly explained, which is a diligence that generally ushers in actions of sale. Sequestration of lands is a judicial act of the court of Session, whereby the management of an estate is put into the hands of a factor or steward named by the court, who gives security, and is to be accountable for the rents to all having interest. This diligence is competent, either where the right of the lands is doubtful, if it be applied for before either of the competitors has attained possession; or where the estate is heavily charged with the debts: But, as it is an unfavourable diligence, it is not admitted, unless that measure shall appear necessary for the security of creditors. Subjects, not brought before the court by the diligence of creditors, cannot fall under sequestration; for it is the competition of creditors which alone founds the jurisdiction of the court to take the disputed subject into their possession.

11. The court of Session who decrees the sequestration has the nomination of the factor, in which they are directed by the recommendation of the creditors. A factor appointed by the Session, though the proprietor had not been seised in the lands, has a power to remove tenants. Judicial factors must, within six months after extracting their factory, make up a rental of the estate, and a list of the arrears due by tenants, to be put into the hands of the clerk of the process, as a charge against themselves, and a note of such alterations in the rental as may afterwards happen; and must also deliver to the clerk annually a scheme of their accounts, charge and discharge, under heavy penalties. They are, by the nature of their office, bound to the same degree of diligence that a prudent man adhibits in his own affairs; they are accountable for the interest of the rents, which they either have, or by diligence might have recovered, from a year after their falling due. As it is much in the power of those factors to

take advantage of the necessities of creditors, by purchasing their debts at an undervalue, all such purchases made either by the factor himself, or to his behoof, are declared equivalent to an acquittance or extinction of the debt. No factor can warrantably pay to any creditor, without an order of the court of Session; for he is, by the tenor of his commission, directed to pay the rents to those who shall be found to have best right to them. Judicial factors are intitled to a salary, which is generally stated at five *per cent.* of their intromissions; but it is seldom ascertained till their office expires, or till their accounting; that the court may modify a greater or smaller salary, or none, in proportion to the factor's integrity and diligence. Many cases occur, where the court of Session, without sequestration, name a factor to preserve the rents from perishing; *e. g.* where an heir is deliberating whether to enter, where a minor is without tutors, where a succession opens to a person residing abroad; in all which cases, the factor is subjected to the rules laid down in act of sederunt, Feb. 13. 1730. \*

12. The word *bankrupt* is sometimes applied to persons whose funds are not sufficient for their debts; and sometimes, not to the debtor, but to his estate. The court of Session are empowered, at the suit of any real creditor, to try the value of a bankrupt's estate, and sell it for the payment of his debts.

13. No process of sale, at the suit of a creditor, can proceed without a proof of the debtor's bankruptcy, or at least that his lands are so charged with debts, that no prudent persons will buy from him; and therefore the summons of sale must comprehend the debtor's whole estate. The debtor, or his apparent heir, and all the real creditors in possession, must be made parties to the suit; but it is sufficient if the other creditors be called by an edictal citation. The summons of sale contains a conclusion of ranking or preference of the bankrupt's creditors. In this ranking, first and second terms are assigned to the whole creditors for exhibiting in court (or producing) their rights and diligences; and the decree of certification proceeding thereupon, against the writings not produced, has the same effect in favour of the creditors who have produced their rights, as if that decree had proceeded upon an action of reduction-improbation. See Tit. xxx. 5. The ranking of these creditors must be concluded by an extracted decree, before the actual sale. The irredeemable property of the lands is adjudged by the court to the highest offerer at the sale. The creditors receiving payment must grant to the purchaser absolute warrandice, to the extent of the sum received by them; and the lands purchased are declared disburdened of all debts or deeds of the bankrupt, or his ancestors, either on payment of the price by the purchaser to the creditors according to their preference, or on consignation of it, in case of their refusal, in the hands of the magistrates of Edinburgh: The only remedy provided to such creditors as judge themselves hurt by the sale of division of the price, even though they should be minors, is an action for recovering their share of the price against the creditors who have received it.

14. The expence of these processes is disbursed by the factor out of the rents in his hands; by which the whole

whole burden of such expence falls upon the posterior creditors.

15. Apparent heirs are intitled to bring actions of sale of the estates belonging to their ancestors, whether bankrupt or not; the expence of which ought to fall upon the pursuer, if there is any excrescence of the price, after payment of the creditors.

16. As processes of ranking and sale are designed for the common interest of all the creditors, no diligence carried on or completed during their pendency ought to give any preference in the competition; *pendente lite, nihil innovandum*.

17. It is a rule in all real diligences, that where a creditor is preferable on several different subjects, he cannot use his preference arbitrarily, by favouring one creditor more than another; but must allocate his universal or catholic debt proportionally against all the subjects or parties whom it affects. If it is material to such creditor to draw his whole payment out of any one fund, he may apply his debt so as may best secure himself; but that inequality will be rectified, as to the posterior creditors, who had likewise, by their rights and diligences, affected the subjects out of which he drew his payment, by obliging him to assign in their favour his right upon the separate subjects which he did not use in the ranking; by which they may recur against these separate subjects for the shares which the debt preferred might have drawn out of them. As the obligation to assign is founded merely in equity, the catholic creditor cannot be compelled to it; if his assigning shall weaken the preference of any separate debt vested in himself, affecting the special subject sought to be assigned. But if a creditor upon a special subject shall acquire from another a catholic right, or a catholic creditor shall purchase a debt affecting a special subject, with a view of creating to the special debt a higher degree of preference than was naturally due to it, by an arbitrary application of the catholic debt, equity cannot protect him from assigning in favour of the creditor excluded by such application, especially if, prior to the purchase, the subject had become litigious by the process of ranking; for transmissions ought not to hurt creditors who are no parties to them, nor to give the purchaser any new right, which was not formerly in himself or his cedent.

#### Tit. 20. Of Obligations and Contracts in general.

THE law of heritable rights being explained, moveable rights fall next to be considered, the doctrine of which depends chiefly on the nature of Obligations. An obligation is a legal tie, by which one is bound to pay or perform something to another. Every obligation on the person obliged, implies an opposite right in the creditor, so that what is a burden in regard to the one is right with respect to the other; and all rights founded on obligation are called personal. There is this essential difference between a real and a personal right, that a *jus in re*, whether of property, or of an inferior kind as servitude, entitles the person vested with it to possess the subject as his own; or if he is not in possession, to demand it from the possessors; whereas the creditor in a personal right

has only *jus ad rem*, or a right to compel the debtor to fulfil his obligation; without any right in the subject itself, which the debtor is bound to transfer to him. One cannot oblige himself, but by a present act of the will. A bare resolution therefore, or purpose to be obliged; is alterable at pleasure.

2. Obligations are either, first, merely natural, where one person is bound to another by the law of nature, but cannot be compelled by any civil action to the performance. Thus, though deeds granted by a minor having curators, without their consent, are null, yet the minor is naturally obliged to perform such deeds; and parents are naturally obliged to provide their children in reasonable patrimonies. Natural obligations intitle the creditor to retain what he has got in virtue thereof, without being subjected to restore it. 2. Obligations are merely civil, which may be sued upon by an action; but are elided by an exception in equity; this is the case of obligations granted through force or fear, &c. 3. Proper or full obligations, are those which are supported both by equity and the civil sanction.

3. Obligations may be also divided into, 1. Pure, to which neither day nor condition is adjoined. These may be exacted immediately. 2. Obligations (*ex die*), which have a day adjoined to their performance. In these, *dies statim credit, sed non venit*; a proper debt arises from the date of the obligation, because it is certain that the day will exist; but the execution is suspended, till the lapse of that day. 3. Conditional obligations; in which there is no proper debt (*dies non credit*) till the condition be purified, because it is possible the condition may exist; and which therefore are said to create only the hope of a debt; but the granter, even of these, has no right to rescind. An obligation, to which a day is adjoined that possibly may never exist, implies a condition; *dies incertus pro conditione habetur*. Thus, in the case of a provision to a child, payable when he attains to the age of fourteen, if the child dies before that age, the provision falls.

4. Obligations, when considered with regard to their cause, were divided by the Romans, into those arising from contract, quasi contract, delict, and quasi-delict: But there are certain obligations, even full and proper ones, which cannot be derived from any of these sources, and to which Lord Stair gives the name of obdiential. Such as the obligation on parents to aliment or maintain their children; which arises singly from the relation of parent and child, and may be enforced by the civil magistrature. Under parents are comprehended the mother, grandfather, and grandmother, in their proper order. This obligation on parents extends to the providing of their issue in all the necessaries of life, and giving them suitable education. It ceases, when the children can earn a livelihood by their own industry; but the obligation on parents to maintain their indigent children, and reciprocally on children to maintain their indigent parents, is perpetual. This obligation is, on the father's death, transferred to the eldest son, the heir of the family; who, as representing the father, must aliment his younger brothers and sisters: The brothers are only intitled to alimony, till their age of twenty-one, after which they are presumed able to do for themselves; but the obligation

to maintain the sisters continues till their marriage. In persons of lower rank, the obligation to alimēt the sisters ceases after they are capable of subsisting by any service or employment.

5. All obligations, arising from the natural duty of restitution, fall under this class: Thus, things given upon the view of a certain event, must be restored, if that event does not afterwards exist: Thus also, things given *ob turpem causam*, where the turpitude is in the receiver and not in the giver, must be restored. And on the same principle, one upon whose ground a house is built or repaired by another, is obliged, without any covenant, to restore the expence laid out upon it, in so far as it has been profitable to him.

6. A contract is the voluntary agreement of two or more persons, whereby something is to be given or performed upon one part, for a valuable consideration, either present or future, on the other part. Consent, which is implied in agreement, is excluded, 1. By error in the essentials of the contract, for in such case, the party does not properly contract, but errs or is deceived; Add this may be also applied to contracts which take their rise from fraud or imposition. 2. Consent is excluded by such a degree of restraint upon any of the contracting parties, as extorts the agreement; for where violence or threatening are used against a person, his will has really no part in the contract.

7. Loan or *mutuum* is that contract which obliges a person, who has borrowed any fungible subject from another, to restore to him as much of the same kind, and of equal goodness. Whatever receives its estimation in number, weight, or measure, is a fungible, as corn, wine, current coin, &c. The only proper subjects of this contract are things which cannot be used, without either their extinction or alienation; hence, the property of the thing lent is necessarily transferred by delivery to the borrower, who consequently must run all the hazards, either of its deterioration or its perishing, according to the rule, *res perit suo domino*. Where the borrower neglects to restore, at the time and place agreed on, the estimation of the thing lent must be made according to its price at that time and in that place; because it would have been worth so much to the lender, if the obligation had been duly performed. If there is no place nor time stipulated for, the value is to be stated according to the price that the commodity gave when and where it was demanded. In the loan of money, the value put on it by public authority, and not its intrinsic worth, is to be considered. This contract is obligatory only on one part; for the lender is subjected to no obligation: The only action therefore that it produces, is pointed against the borrower, that he may restore as much in quantity and quality as he borrowed, together with the damage the lender may have suffered through default of due performance.

8. Commodate is a species of loan, gratuitous on the part of the lender, where the thing lent may be used, without either its perishing or its alienation. Hence, in this sort of loan, the property continues with the lender: the only right the borrower acquires in the subject is its use, after which he must restore the individual thing that

he borrowed: Consequently, if the subject perishes, it perishes to the lender, unless it has perished by the borrower's fault. What degree of fault or negligence makes either of the contracting parties liable to the other in damages, is comprehended under the following rules. Where the contract gives a mutual benefit to both parties, each contracter is bound to admit a middle sort of diligence, such as a man of ordinary prudence uses in his affairs. Where only one of the parties has benefit by the contract, that party must use exact diligence; and the other who has no advantage by it is accountable only for dolo, or for gross omissions which the law construes to be dolo. Where one employs less care on the subject of any contract which implies an exuberant trust, than he is known to employ in his own affairs, it is considered as dolo.

9. By these rules, the borrower in the contract of commodate must be exactly careful of the thing lent, and restore it at the time fixed by the contract, or after that use is made of it for which it was lent: If he puts it to any other use, or neglects to restore it at the time covenanted, and if the thing perishes thereafter, even by mere accident, he is bound to pay the value. On the other part, the lender is obliged to restore to the borrower such of the expences disbursed by him on that subject, as arose from any uncommon accident, but not those that naturally attend the use of it. Where a thing is lent gratuitously, without specifying any time of redelivery, it constitutes the contract of *precarium*, which is revokable at the lender's pleasure, and, being entered into from a personal regard to the borrower, ceases by his death.

10. Depositum is a contract, by which one who has the custody of a thing committed to him (the depositary), is obliged to restore it to the depositor. If a reward is bargained for by the depositary for his care, it resolves into the contract of location. As this contract is gratuitous, the depositary is only answerable for the consequences of gross neglect; but after the deposit is redemanded, he is accountable even for casual misfortune. He is intitled to a full indemnification for the losses he has sustained by the contract, and to the recovery of all sums expended by him on the subject.

11. An obligation arises without formal paction, barely by a traveller's entering into an inn, ship, or stable, and there depositing his goods, or putting up his horses; whereby the innkeeper, shipmaster, or stabler, is accountable, not only for his own facts and those of his servants, (which is an obligation implied in the very exercise of these employments), but of the other guests or passengers; and, indeed, in every case, unless where the goods have been lost *damno fatali*, or carried off by pirates or house-breakers. Not only the masters of ships but their employers, are liable each of them for the share that he has in the ship; but by the present custom of trading nations, the goods brought into a ship must have been delivered to the master or mate, or entered into the ship-books. Carriers fall within the intendment of this law; and practice has extended it to vintners within borough. The extent of the damage sustained by the party may be proved by his own oath *in litem*.

12. Sequestration, whether voluntarily consented to by the parties, or authorised by the judge, is a kind of deposit;

deposit; but as the office of sequestree, to whose care the subject in dispute is committed, is not considered as gratuitous, he cannot throw it up at pleasure, as a common depositary may do; and he is liable in the middle degree of diligence. Confignation of money is also a deposit. It may be made, either where the debt is called in question by the debtor, as in suspensions; or where the creditor refuses to receive his money, as in wadsets, &c. The risk of the configned money lies on the configner, where he ought to have made payment, and not confignation, or has configned only a part; or has chosen for confignatory, a person neither named by the parties nor of good credit. The charger, or other creditor, runs the risk, if he has charged for sums not due, or has without good reason refused payment, by which refusal the confignation became necessary. It is the office of a confignatory, to keep the money in safe custody, till it be called for: If therefore he puts it out at interest, he must run the hazard of the debtor's insolvency; but, for the same reason, though he should draw interest for it, he is liable in none to the configner.

13. Pledge, when opposed to wadset, is a contract, by which a debtor puts into the hands of his creditor a special moveable subject in security of the debt, to be redelivered on payment. Where a security is established by law to the creditor, upon a subject which continues in the debtor's possession, it has the special name of an hypothec. Tradesmen and ship-carpenters have an hypothec on the house or ship repaired, for the materials and other charges of reparation; but not for the expence of building a new ship. Owners of ships have an hypothec on the cargo for the freight, heritors on the fruits of the ground, and landlords on the *investa et illata*, for their rents. Writers also, and agents, have a right of hypothec, or more properly of retention, in their constituent's writings, for their claim of pains and disbursements. A creditor cannot, for his own payment, sell the subject impignorated, without applying to the judge-ordinary for a warrant to put it up to public sale or roup; and to this application the debtor ought to be made a party.

#### Tit. 21. Of Obligations by Word or Writ.

THE appellation of *verbal* may be applied to all obligations to the constitution of which writing is not essential, which includes both real and consensual contracts; but as these are explained under separate titles, obligations by word, in the sense of this rubric, must be restricted, either to promises, or to such verbal agreements as have no special name to distinguish them. Agreement implies the intervention of two different parties, who come under mutual obligations to one another. Where nothing is to be given or performed but on one part, it is properly called a promise, which, as it is gratuitous, does not require the acceptance of him to whom the promise is made. An offer, which must be distinguished from a promise, implies something to be done by the other party; and consequently is not binding on the offerer, till it be accepted, with its limitations or conditions, by him to whom the offer is made; after which, it becomes a proper agreement.

2. Writing must necessarily intervene in all obligations and bargains concerning heritable subjects, though they should be only temporary; as tacks, which, when they are verbal, last but for one year. In these no verbal agreement is binding, though it should be referred to the oath of the party; for, till writing is adhibited, law gives both parties a right to refile, as from an unfinished bargain; which is called *locus penitentiae*. If, upon a verbal bargain of lands, part of the price shall be paid by him who was to purchase, the *interventus rei*, the actual payment of money, creates a valid obligation, and gives a beginning to the contract of sale: And in general, where ever matters are no longer entire, the right to refile seems to be excluded. An agreement, whereby a real right is passed from, or restricted, called *pactum liberatorium*, may be perfected verbally; for freedom is favourable, and the purpose of such agreement is rather to dissolve than to create an obligation. Writing is also essential to bargains made under condition that they shall be reduced into writing; for in such cases, it is *pari contractus*, that, till writing be adhibited, both parties shall have liberty to withdraw. In the same manner, verbal or nuncupative testaments are rejected by our law; but verbal legacies are sustained, where they do not exceed *L. 100 Scots*.

3. Anciently, when writing was little used, deeds were executed by the party appending his seal to them; in presence of witnesses. For preventing frauds that might happen by appending seals to false deeds, the subscription also of the granter was afterwards required, and, if he could not write, that of a notary. As it might be of dangerous consequence, to give full force to the subscription of the parties by initials, which is more easily counterfeited; our practice, in order to sustain such subscription, seems to require a proof, not only that the granter used to subscribe in that way, but that *de facto* he had subscribed the deed in question; at least, such proof is required, if the instrumentary witnesses be still alive.

4. As a further check, it was afterwards provided that all writings carrying any heritable right, and other deeds of importance, be subscribed by the principal parties, if they can subscribe; otherwise, by two notaries, before four witnesses specially designed. The subsequent practice extended this requisite of the designation of the witnesses to the case where the parties themselves subscribed. Custom has construed obligations for sums exceeding *L. 100 Scots*, to be obligations of importance: In a divisible obligation, *ex. gr.* for a sum of money, though exceeding *L. 100*, the subscription of one notary is sufficient, if the creditor restricts his claim to *L. 100*: But, in an obligation indivisible, *e. g.* for the performance of a fact, if it be not subscribed in terms of the statute, it is void. When notaries thus attest a deed, the attestation or docquet must specially express that the granter gave them a mandate to sign; nor is it sufficient that this be mentioned in the body of the writing.

5. In every deed, the name of him who writes it, with his dwelling place or other mark of distinction, must be inserted. The witnesses must both subscribe as witnesses, and their names and designations be inserted in the body of the deed: And all subscribing witnesses must know the granter, and either see him subscribe, or hear him

him acknowledge his subscription; otherwise they are declared punishable as accessory to forgery. Deeds, decrees, and other securities, consisting of more than one sheet, may be written by way of book, in place of the former custom of pasting together the several sheets, and signing the joinings on the margin; provided each page be signed by the grantor, and marked by its number; and the testing clause express the number of pages.

6. Instruments of seisin are valid, if subscribed by one notary, before a reasonable number of witnesses; which is extended by practice to instruments of resignation. Two witnesses are deemed a reasonable number to every deed that can be executed by one notary. It is not necessary, that the witnesses to a notarial instrument, or execution, see the notary or messenger sign; for they are called as witnesses to the transaction which is attested, and not to the subscription of the person attesting.

7. A new requisite has been added to certain deeds since the union, for the benefit of the revenue: They must be executed on stamped paper, or parchment, paying a certain duty to the crown. Charters, instruments of resignation, seisin, and retours of lands holden of a subject, are charged with 2 s. 3 d. of duty: Bonds, tacks, contracts, and other personal obligations, paid at first 6 d. to which a farther duty of 1 s. has been since added. Bail bonds, bills, testaments, discharges, or acquittances of rent or of interest and judicial deeds, as notarial instruments, bonds of cautionry in suspensions, &c. are excepted.

8. The grantor's name and designation are essential, not properly as solemnities, but because no writing can have effect without them. Bonds were, by our ancient practice, frequently executed without filling up the creditor's name; and they passed from hand to hand, like notes payable to the bearer: But as there was no method for the creditor of a person possessed of these to secure them for his payment, all writings taken blank in the creditor's name are declared null, as covers to fraud; with the exception of indorsements of bills of exchange.

9. Certain privileged writings do not require the ordinary solemnities. 1. Holograph deeds (written by the grantor himself) are effectual without witnesses. The date of no holograph writing, except a bill of exchange, (see next paragr.) can be proved by the grantor's own assertion, in prejudice either of his heir or his creditors, but must be supported by other adminicles. 2. Testaments, if executed where men of skill in business cannot be had, are valid though they should not be quite formal: and let the subject of a testament be ever so valuable, one notary signing for the testator, before two witnesses, is in practice sufficient. Clergymen were frequently notaries before the reformation; and, though they were afterwards prohibited to act as notaries, the case of testaments is excepted; so that these are supported by the attestation of one minister, with two witnesses. 3. Discharges to tenants are sustained without witnesses, from their presumed rusticity, or ignorance in business. 4. Missive letters *in re mercatoria*, commissions, and fitted accounts in the course of trade, and bills of exchange, though they are not holograph, are, from the favour of commerce, sustained without the ordinary solemnities.

10. A bill of exchange is an obligation in the form of a mandate, whereby the drawer or mandant desires him to whom it is directed, to pay a certain sum, at the day and place therein mentioned, to a third party. Bills of exchange are drawn by a person in one country to his correspondent in another; and they have that name, because it is the exchange, or the value of money in one place compared with its value in another, that generally determines the precise extent of the sum contained in the draught. The creditor in the bill is sometimes called the possessor, or *porteur*. As parties to bills are of different countries, questions concerning them ought to be determined by the received custom of trading nations, unless where special statute interposes. For this reason, bills of exchange, though their form admits not of witnesses, yet prove their own dates, in questions either with the heir, or creditors of the debtor; but this doctrine is not extended to inland bills payable to the drawer himself.

11. A bill is valid, without the designation, either of the drawer, or of the person to whom it is made payable: It is enough, that the drawer's subscription appears to be truly his; and one's being possessor of a bill marks him out to be the creditor, if he bears the name given in the bill to the creditor: Nay, though the person drawn on should not be designed, his acceptance presumes that it was he whom the drawer had in his eye. Bills drawn blank, in the creditor's name, fall under the statutory nullity; for though indorsements of bills are excepted from it, bills themselves are not. Not only the person drawn upon must sign his acceptance, but the drawer must sign his draught, before any obligation can be formed against the acceptor: Yet it is sufficient in practice, that the drawer signs, before the bill be produced in judgment; though it should be after the death both of the creditor and acceptor. A creditor in a bill may transmit it to another by indorsement, though the bill should not bear *to his order*; by the same rule that other rights are transmissible by assignation, though they do not bear *to assignees*.

12. The drawer, by signing his draught, becomes liable for the value to the creditor in the bill, in case the person drawn upon either does not accept, or after acceptance does not pay; for he is presumed to have received value from the creditor at giving him the draught, though it should not bear *for value received*: But, if the drawer was debtor to the creditor in the bill before the draught, the bill is presumed to be given towards payment of the debt, unless it expressly bears *for value*. The person drawn upon, if he refuse to accept, while he has the drawer's money in his hands, is liable to him in damages. As a bill presumes value from the creditor, indorsement presumes value from the indorsee; who therefore, if he cannot obtain payment from the acceptor, has recourse against the indorser, unless the bill be indorsed in these words, *without recourse*.

13. Payment of a bill, by the acceptor, acquits both the drawer and him at the hands of the creditor; but it intitles the acceptor, if he was not the drawer's debtor, to an action of recourse against him; and, if he was, to

a ground of compensation. Where the bill does not bear value in the hands of the person drawn upon, it is presumed that he is not the drawer's debtor, and consequently he has recourse against the drawer, *ex mandato*.

14. Bills, when indorsed, are considered as so many bags of money delivered to the onerous indorsee; which therefore carry right to the contents, free of all burdens that do not appear on the bills themselves. Hence, a receipt or discharge, by the original creditor, if granted on a separate paper, does not exempt the acceptor from second payment to the indorsee; hence also, no ground of compensation competent to the acceptor against the original creditor can be pleaded against the indorsee: But, if the debtor shall prove, by the oath of the indorsee, that he paid not the full value for the indorsation, the indorsee is justly considered as but a name; and therefore all exceptions, receivable against the original creditor, will be sustained against him.

15. Bills must be negotiated by the possessor, against the person drawn upon, within a precise time, in order to preserve recourse against the drawer. In bills payable so many days after sight, the creditor has a discretionary power of fixing the payment somewhat sooner or later, as his occasions shall require. Bills payable on a day certain, need not be presented for acceptance till the day of payment, because that day can neither be prolonged nor shortened by the time of acceptance. For the same reason, the acceptance of bills, payable on a precise day, need not be dated: But, where a bill is drawn payable so many days after sight, it must; because there the term of payment depends on the date of the acceptance.

16. Though bills are, in strict law, due the very day on which they are made payable, and may therefore be protested on the day thereafter; yet there are three days immediately following the day of payment, called days of grace, within any of which the creditor may protest the bill: But if he delay protesting till the day after the last day of grace, he loses his recourse. Where a bill is protested, either for not acceptance, or not payment, the dishonour must be notified to the drawer or indorser, within three posts at farthest. This strictness of negotiation is confined to such bills as may be protested by the possessor upon the third day of grace: Where therefore bills are indorsed after the days of grace are expired, the indorsee is left more at liberty, and does not lose his recourse, though he should not take a formal protest for not payment, if, within a reasonable time, he shall give the indorser notice of the acceptor's refusing to pay. Not only does the possessor, who neglects strict negotiation, lose his recourse against the drawer, where the person drawn upon becomes afterwards bankrupt, but though he should continue solvent; for he may, in that case, recover payment from the debtor, and so is not to be indulged in an unnecessary process against the drawer, which he has tacitly renounced by his negligence. Recourse is preserved against the drawer, though the bill should not be duly negotiated, if the person drawn upon was not his debtor; for there the drawer can qualify no prejudice by the neglect of diligence, and he ought not to have drawn on one who owed him nothing.

VOL. II. Numb. 65,

2

17. The privileges superadded to bills by statute are, that tho', by their form, they can have no clause of registration, yet, if duly protested, they are registrable within six months after their date in case of not acceptance, or in six months after the term of payment in the case of not payment; which registration is made the foundation of summary diligence, either against the drawer or indorser in the case of not acceptance, or against the acceptor in case of not payment. This is extended to inland bills, *i. e.* bills both drawn and made payable in Scotland. After acceptance, summary diligence lies against no other than the acceptor; the drawer and indorser must be pursued by an ordinary action. It is only the principal sum in the bill, and interest, that can be charged for summarily: The exchange, when it is not included in the draught, the re-exchange incurred by suffering the bill to be protested and returned; and the expense of diligence, must all be recovered by an ordinary action; because these are not liquid debts, and so must be previously constituted.

18. Bills, when drawn payable at any considerable distance of time after date, are denied the privileges of bills; for bills are intended for currency, and not to lie as a security in the creditor's hands. Bills are not valid which appear *ex facie* to be donations. No extrinsic stipulation ought to be contained in a bill which deviates from the proper nature of bills; hence, a bill to which a penalty is adjoined, or with a clause of interest from the date, is null. Inland precepts drawn, not for money the medium of trade, but for fungibles, are null, as wanting writer's name and witnesses. It is not an agreed point whether promissory notes, without writer and witnesses, unless holograph, are probative. This however is certain, that they at no rate intitle to the privileges of bills.

19. As for the solemnities essential to deeds signed in a foreign country, when they come to receive execution in Scotland, it is a general rule, that no laws can be of authority beyond the dominions of the lawgiver. Hence, in strictness, no deed, though perfected according to the law of the place where it is signed, can have effect in another country where different solemnities are required to a deed of that sort. But this rigour is so softened *ex comitate*, by the common consent of nations, that all personal obligations granted according to the law of that country where they are signed, are effectual every where, which obtains even in obligations to convey heritage. Conveyances themselves, of heritable subjects, must be perfected according to the law of the country where the heritage lies, and from which it cannot be removed.

20. A writing, while the grantor keeps it under his own power or his doer's, has no force; it becomes obligatory, only after it is delivered to the grantee himself, or found in the hands of a third person. As to which last, the following rules are observed. A deed found in the hands of one, who is doer both for the grantor and grantee, is presumed to have been put in his hands as doer for the grantee. The presumption is also for delivery, if the deed appears in the hands of one who is a stranger to both. Where a deed is deposited in the hands of a third person, the terms of depositation may be proved by the oath of the depositary, unless where they are reduced

†. 10 A

reduced

reduced into writing. A deed appearing in the custody of the grantee himself, is considered as his absolute right; in so much that the grantor is not allowed to prove that it was granted in trust, otherwise than by a written declaration signed by the trustee, or by his oath.

21. The following deeds are effectual without delivery, 1. Writings containing a clause dispensing with the delivery: These are of the nature of revocable deeds, where the death of the grantor is equivalent to delivery, because after death there can be no revocation. 2. Deeds in favour of children, even natural ones; for parents are the proper custodians or keepers of their children's writings. From a similar reason, postnuptial settlements by the husband to the wife need no delivery. 3. Rights which are not to take effect till the grantor's death, or even where he reserves an interest to himself during his life; for it is presumed he holds the custody of these, merely to secure to himself such reserved interest. 4. Deeds that the grantor lay under an antecedent natural obligation to execute, *e. g.* rights granted to a cautioner for his relief. 5. Mutual obligations, *e. g.* contracts; for every such deed, the moment it is executed, is a common evidence to all the parties contracters. Lastly, the publication of a writing by registration, is equivalent to delivery.

*Tit. 22. Of Obligations and Contracts arising from Consent, and of accessory Obligations.*

CONTRACTS consensual, *i. e.* which might, by the Roman law, be perfected by sole consent, without the intervention either of things or of writing, are sale, permutation, location, society, and mandate. Where the subject of any of these contracts is heritable, writing is necessary.

2. Sale is a contract, by which one becomes obliged to give something to another, in consideration of a certain price in current money to be paid for it. Things consisting merely in hope, may be the subject of this contract, as the draught of a net. Commodities, where their importation or use is absolutely prohibited, cannot be the subject of sale; and even in run goods, no action lies against the vender for not delivery, if the buyer knew the goods were run.

3. Though this contract may be perfected before delivery of the subject, the property remains till then with the vender. See Tit. viii. 9. Yet till delivery, the hazard of its deterioration falls on the purchaser, because he has all the profits arising from it, after the sale. On the other hand, the subject itself perishes to the vender; 1. If it should perish through his fault, or after his undue delay to deliver it. 2. If a subject is sold as a fungible, and not as an individual, or *corpus*, *e. g.* a quantity of farm-wheat, sold without distinguishing the parcel to be delivered from the rest of the farm. 3. The *periculum* lies on the vender till delivery, if he be obliged by a special article in the contract to deliver the subject at a certain place.

4. Location is that contract, where an hire is stipulated for the use of things, or for the service of persons. He who lets his work or the use of his property to hire, is

the locator or lessor; and the other, the conductor or lessee. In the location of things, the lessor is obliged to deliver the subject, fitted to the use it was let for; and the lessee must preserve it carefully, put it to no other use, and, after that is over, restore it. Where a workman or artificer lets his labour, and if the work is either not performed according to contract, or if it be insufficient, even from mere unskilfulness, he is liable to his employer in damages, for he ought not, as an artificer, to have undertaken a work to which he was not equal. A servant hired for a certain term, is intitled to his full wages, though from sickness or other accident he should be disabled for a part of his time; but, if he die before the term, his wages are only due for the time he actually served. If a master dies, or without good reason turns off, before the term, a servant who eats in his house, the servant is intitled to his full wages, and to his maintenance till that term: And, on the other part, a servant who without ground deserts his service, forfeits his wages and maintenance, and is liable to his master in damages.

5. Society or copartnership is a contract, whereby the several partners agree, concerning the communication of loss and gain arising from the subject of the contract. It is formed by the reciprocal choice that the partners make of one another; and so is not constituted in the case of co-heirs, or of several legatees in the same subject. A copartnership may be so constituted, that one of the partners shall, either from his sole right of property in the subject, or from his superior skill, be intitled to a certain share of the profits, without being subjected to any part of the loss; but a society, where one partner is to bear a certain proportion of loss, without being intitled to any share of the profits, is justly reprobated. All the partners are intitled to shares of profit and loss proportioned to their several stocks, where it is not otherwise covenanted.

6. As partners are united, from a *delectus personæ*, in a kind of brotherhood, no partner can, without a special power contained in the contract, transfer any part of his share to another. All the partners are bound *in solidum* by the obligation of any one of them, if he subscribe by the *firm* or social name of the company; unless it be a deed that falls not under the common course of administration. The company-effects are the company property of the society subjected to its debts; so that no partner can claim a division thereof, even after the society is dissolved, till these are paid: And, consequently, no creditor of a partner can, by diligence, carry to himself the property of any part of the common stock, in prejudice of a company-creditor: but he may, by arrestment, secure his debtor's share in the company's hands, to be made forthcoming to him at the close of the copartnership, in so far as it is not exhausted by the company debts.

7. Society being founded in the mutual confidence among the *socii*, is dissolved, not only by the renunciation, but by the death of any one of them, if it be not otherwise specially covenanted. A partner, who renounces upon unfair views, or at a critical time, when his withdrawing may be fatal to the society, loses his partners from all their engagements to him, while he is bound to them for all the profits he shall make by his withdrawing,

ing, and for the loss arising thereby to the company. Not only natural, but civil death, *e. g.* arising from a sentence inflicting capital punishment, makes one incapable to perform the duties of a partner, and consequently dissolves the society. In both cases, of death and renunciation, the remaining partners may continue the copartnership, either expressly, by entering into a new contract; or tacitly, by carrying on their trade as formerly. Public trading companies are now every day constituted, with rules very different from those which either obtained in the Roman law, or at this day obtain in private societies. The proprietors or partners in these, though they may transfer their shares, cannot renounce; nor does their death dissolve the company, but the share of the deceased descends to his representative.

8. A joint trade is not a copartnership, but a momentary contract, where two or more persons agree to contribute a sum, to be employed in a particular course of trade, the produce whereof is to be divided among the adventurers, according to their several shares, after the voyage is finished. If, in a joint trade, that partner who is intrusted with the money for purchasing the goods, should, in place of paying them in cash, buy them upon credit, the furnisher who followed his faith alone in the sale, has no recourse against the other adventurers; he can only recover from them what of the buyer's share is yet in their hands. Where any one of the adventurers, in a joint trade, becomes bankrupt, the others are preferable to his creditors, upon the common stock, as long as it continues undivided, for their relief of all the engagements entered into by them on account of the adventure.

9. Mandate is a contract, by which one employs another to manage any business for him; and by the Roman law, it must have been gratuitous. It may be constituted tacitly, by one's suffering another to act in a certain branch of his affairs, for a tract of time together, without challenge. The mandatory is at liberty not to accept of the mandate; and, as his powers are solely founded in the mandant's commission, he must, if he undertakes it, strictly adhere to the directions given him: Nor is it a good defence, that the method he followed was more rational; for in that his employer was the proper judge. Where no special rules are prescribed, the mandatory, if he acts prudently, is secure, whatever the success may be; and he can sue for the recovery of all the expences reasonably disbursed by him in the execution of his office.

10. Mandates may be general, containing a power of administering the mandant's whole affairs; but no mandate implies a power of disposing gratuitously of the constituent's property; nor even of selling his heritage for an adequate price: But a general mandatory may sell such of the moveables as must otherwise perish. No mandatory can, without special powers, transact doubtful claims belonging to his constituent, or refer them to arbiters.

11. Mandates expire, 1. By the revocation of the employer, though only tacit, as if he should name another mandatory for the same business. 2. By the renunciation of the mandatory; even after he has executed

part of his commission, if his office be gratuitous. 3. By the death, either of the mandant or mandatory: But if matters are not entire, the mandate continues in force, notwithstanding such revocation, renunciation, or death. Procuratories of resignation, and precepts of seisin, are made out in the form of mandates; but, because they are granted for the sole benefit of the mandatory, all of them, excepting precepts of *clare constat*, are declared to continue after the death either of the granter or grantee. Deeds which contain a clause or mandate for registration, are for the same reason made registrable after the death of either.

12. The favour of commerce has introduced a tacit mandate, by which masters of ships are empowered to contract in name of their exercitors or employers, for repairs, ship-provisions, and whatever else may be necessary for the ship or crew; so as to oblige, not themselves only, but their employers. Whoever has the actual charge of the ship is deemed the master, though he should have no commission from the exercitors, or should be substituted by the master in the direction of the ship without their knowledge. Exercitors are liable, whether the master has paid his own money to a merchant for necessities, or has borrowed money to purchase them. The furnisher or lender must prove that the ship needed repairs, provisions, &c. to such an extent; but he is under no necessity to prove the application of the money or materials to the ship's use. If there are several exercitors, they are liable *singuli in solidum*. In the same manner the undertaker of any branch of trade, manufacture, or other land-negotiation, is bound by the contracts of the institors whom he sets over it, in so far as relates to the subject of the *præpositura*.

13. Contracts and obligations, in themselves imperfect, receive strength, by the contractor or his heirs doing any act thereafter which imports an approbation of them, and consequently supplies the want of an original legal consent. This is called homologation; and it takes place even in deeds intrinsically null, whether the nullity arises from the want of statutory solemnities, or from the incapacity of the granter. It cannot be inferred, 1. By the act of a person who was not in the knowledge of the original deed; for one cannot approve what he is ignorant of. 2. Homologation has no place where the act or deed which is pleaded as such can be ascribed to any other cause; for an intention to come under an obligation is not presumed.

14. Quali-contracts are formed without explicit consent, by one of the parties doing something that by its nature either obliges him to the other party, or the other party to him. Under this class may be reckoned tutory, &c. the entry of an heir, *negotiorum gestio, indebiti solutio*, communion of goods between two or more common proprietors, and *mercium jactus levande navis causa*. *Negotiorum gestio* forms those obligations which arise from the management of a person's affairs in his absence, by another, without a mandate. As such manager acts without authority from the proprietor, he ought to be liable in exact diligence, unless he has from friendship interposed in affairs which admitted no delay; and he is accountable for his intromissions with interest. On the other

other part, he is intitled to the recovery of his necessary disbursements on the subject, and to be relieved of the obligations in which he may have bound himself in consequence of the management.

15. *Indebiti solutio*, or the payment to one of what is not due to him, if made through any mistake, either of fact, or even of law, sounds him who made the payment in an action against the receiver for repayment (*condictio indebiti*.) This action does not lie, 1. If the sum paid was due *ex æquitate*, or by a natural obligation; for the obligation to restore is founded solely in equity. 2. If he who made the payment knew that nothing was due; for *qui consulto dat quod non debebat, præsumitur donare*.

16. Where two or more persons become common proprietors of the same subject, either by legacy, gift or purchase, without the view of co-partnership, an obligation is thereby created among the proprietors to communicate the profit and loss arising from the subject, while it remains common: And the subject may be divided at the suit of any having interest. This division, where the question is among the common proprietors, is according to the valuation of their respective properties: But, where the question is between the proprietors and those having servitudes upon the property, the superficies is only divided, without prejudice to the property. Commonities belonging to the King, or to royal boroughs, are not divisible. Lands lying runrig, and belonging to different proprietors, may be divided, with the exception of borough and incorporated acres; the execution of which is committed to the judge-ordinary, or justices of the peace.

17. The throwing of goods overboard, for lightening a ship in a storm, creates an obligation, whereby the owners of the ship and goods saved are obliged to contribute for the relief of those whose goods were thrown overboard, that so all may bear a proportional loss of the goods ejected for the common safety. In this contribution, the ship's provisions suffer no estimation. A master who has cut his mast, or parted with his anchor, to save the ship, is intitled to this relief; but if he has lost them by the storm, the loss falls only on the ship and freight. If the ejection does not save the ship, the goods preserved from shipwreck are not liable in contribution. Ejection may be lawfully made, if the master and a third part of the mariners judge that measure necessary, though the owner of the goods should oppose it: And the goods ejected are to be valued at the price that the goods of the same sort which are saved shall be afterwards sold for.

18. There are certain obligations, which cannot subsist by themselves, but are accessions to, or make a part of other obligations. Of this sort are fidejussion, and the obligation to pay interest. Cautionry, or fidejussion, is that obligation by which one becomes engaged as security for another, that he shall either pay a sum, or perform a deed.

19. A cautioner for a sum of money may be bound, either simply as cautioner for the principal debtor, or conjunctly and severally for and with the principal debtor. The first has, by our customs, the *beneficium ordinis*, or of discussion; by which the creditor is obliged to discuss the proper debtor, before he can insist for payment against

the cautioner. Where one is bound as full debtor with and for the principal, or conjunctly and severally with him, the two obligants are bound equally in the same obligation, each *in solidum*; and consequently, the cautioner, though he is but an accessory, may be sued for the whole, without either discussing, or even citing the principal debtor. Cautioners for performance of facts by another, or for the faithful discharge of an office, *e. g.* for factors, tutors, &c. cannot by the nature of their engagement be bound conjunctly and severally with the principal obligant, because the fact to which the principal is bound cannot possibly be performed by any other. In such engagements, therefore, the failure must be previously constituted against the proper debtor, before action can be brought against the cautioner, for making up the loss of the party suffering.

20. The cautioner, who binds himself at the desire of the principal debtor, has an *actio mandati*, or of relief against him, for recovering the principal and interest paid by himself to the creditor, and for necessary damages; which action lies *de jure*, though the creditor should not assign to him on payment. As relief against the debtor is implied in fidejussory obligations, the cautioner, where such relief is cut off, is no longer bound: Hence, the defence of prescription frees the cautioner, as well as the principal debtor.

21. But, 1. Where the cautionry is interposed to an obligation merely natural, the relief is restricted to the sums that have really turned to the debtor's profit. 2. A cautioner who pays without citing the debtor, loses his relief, in so far as the debtor had a relevant defence against the debt, in whole or in part. Relief is not competent to the cautioner, till he either pays the debt, or is distressed for it; except, 1. Where the debtor is expressly bound to deliver to the cautioner his obligation cancelled, against a day certain, and has failed; or, 2. Where the debtor is *vergens ad inopiam*; in which case the cautioner may, by proper diligence, secure the debtor's funds for his own relief, even before payment or distress.

22. A right of relief is competent *de jure* to the cautioner who pays against his co-cautioners, unless where the cautioner appears to have renounced it. In consequence of this implied relief, a creditor, if he shall grant a discharge to any one of the cautioners, must, in demanding the debt from the others, deduct that part, as to which he has cut off their relief by that discharge. Where a cautioner in a bond signs a bond of corroboration, as a principal obligant with the proper debtor, and with them a new cautioner, the cautioner in the new bond is intitled to a total relief against the first cautioner, at whose desire he is presumed to be bound.

23. Cautionry is also judicial, as in a suspension. It is sufficient to loose the cautioner, that when he became bound, the suspender had good reason to suspend, *e. g.* if the charger had at that period no title, or had not then performed his part, though these grounds of suspension should be afterwards taken off. In all maritime causes, where the parties are frequently foreigners, the defender must give caution *judicis fidei et judicatum solvi*: Such cautioner gets free by the death of the defender before sentence;

sentence; but he continues bound, though the cause should be carried from the admiral to the court of session. This sort of caution is only to be exacted in causes strictly maritime.

24. It happens frequently, that a creditor takes two or more obligants bound to him, all as principal debtors, without sivejussion. Where they are so bound, for the performance of facts that are in themselves indivisible, they are liable each for the whole, or *singuli in solidum*. But, if the obligation be for a sum of money, they are only liable *pro rata*; unless, 1. Where they are in express words bound conjunctly and severally; or, 2. In the case of bills or promissory notes. One of several obligants of this sort, who pays the whole debt, or fulfils the obligation, is intitled to a proportional relief against the rest; in such manner, that the loss must, in every case, fall equally upon all the solvent obligants.

25. Obligations for sums of money are frequently accompanied with an obligation for the annual rent or interest thereof. Interest (*usura*) is the profit due, by the debtor of a sum of money, to the creditor, for the use of it. The canon law considered the taking of interest as unlawful: The law of Moses allowed it to be exacted from strangers; and all the reformed nations of Europe have found it necessary, after the example of the Romans, to authorise it at certain rates fixed by statute. Soon after the reformation, our legal interest was fixed at the rate of ten *per cent. per annum*; from which time, it has been gradually reduced, till at last, by 12. *Ann. stat.* 2. c. 16. it was brought to five *per cent.* and has continued at that rate ever since.

26. Interest is due, either by law, or by paction. It is due by law, either from the force of statute, under which may be included acts of federunt, or from the nature of the transaction. Bills of exchange, and inland bills, though they should not be protested, carry interest from their date in case of not acceptance; or from the day of their falling due, in case of acceptance and not payment. Where a bill is accepted, which bears no term of payment, or which is payable on demand, no interest is due till demand be made of the sum, the legal voucher of which is a notorial protest. Interest is due by a debtor after denunciation, for all the sums contained in the diligence, even for that part which is made up of interest. Sums paid by cautioners on distress, carry interest, not only as to the principal sum in the obligation, but as to the interest paid by the cautioner. Factors named by the court of Session are liable for interest by a special act of federunt; see Tit. xix. 10.

27. It arises *ex lege*, or from the nature of the transaction, that a purchaser in a sale is liable in interest for the price of the lands bought from the term of his entry, though the price should be arrested in his hands, or tho' the seller should not be able to deliver to him a sufficient progress or title to the lands; for no purchaser can in equity enjoy the fruits of the lands, while at the same time he retains the interest of the price: But lawful confiscation of the price made by a purchaser, upon the refusal of the persons having right to receive it, stops the currency of interest. Where one intermeddles with money belonging to another which carries interest, he ought to re-

VOL. II. No. 65.

2

store it *cum omni obventione et causa*, and is therefore liable in the interest of it, as being truly an accessory of the subject itself. It is also from the nature of the transaction, that interest is in certain cases allowed to merchants or others in name of damages.

28. Interest is due by express paction, where there is a clause in a bond or obligation, by which money is made to carry interest. An obligation is not lawful, where it is agreed on, that the yearly interest of the sum lent, if it should not be paid punctually as it falls due, shall be accumulated into a principal sum bearing interest; but an obligation may be lawfully granted, not only for the sum truly lent, but for the interest to the day at which the obligation is made payable, whereby the intermediate interest is accumulated into a principal sum, from the term of payment. Interest may be also due by implied paction: Thus, where interest upon a debt is by a letter promised for time past. Such promise implies a paction for interest as long as the debt remains unpaid; thus also, the use of payment of interest presumes a paction, and when interest is expressed for one term, it is presumed to be bargained for till payment.

29. The subject matter of all obligations consists either of things, or of facts. Things exempted from commerce cannot be the subject of obligation. See Tit. viii. 2. et seq. One cannot be obliged to the performance of a fact naturally impossible; nor of a fact in itself immoral, for that is also in the judgment of law impossible. Since impossible obligations are null, no penalty or damage can be incurred for non-performance; but it is otherwise, if the fact be in itself possible, though not in the debtor's power; in which case the rule obtains, *locum facti impossibilis subit damnum et interesse*.

30. An obligation, to which a condition is adjusted, either naturally or morally impossible, is in the general case null; for the parties are presumed not to have been serious. But such obligation is valid, and the condition thereof held *pro non scripta*, 1. In testaments; 2. In obligations, to the performance of which the grantor lies under a natural tie, as in bonds of provision to a child. Where an obligation is granted under a condition, lawful but unfavourable, e. g. that the creditor shall not marry without the consent of certain friends, no more weight is given to the condition than the judge thinks reasonable. A condition, which is in some degree in the power of the creditor himself, is held as fulfilled, if he has done all he could to fulfil it. Implement or performance cannot be demanded in a mutual contract, by that party who himself declines, or cannot fulfil the counterpart.

31. Donation, so long as the subject is not delivered to the donee, may be justly ranked among obligations; and it is that obligation which arises from the mere good will and liberality of the grantor. Donations imply no warrandice, but from the future facts of the donor. They are hardly revokable by our law for ingratitude, though it should be of the grossest kind: Those betwixt man and wife are revokable by the donor, even after the death of the donee; but remuneratory grants, not being truly donations, cannot be so revoked. That special sort of donation, which is constituted verbally, is called a promise. The Roman law intitled all donors to the *beneficium*

† 10 B

beneficium

*neficium competentis*, in virtue of which they might retain such part of the donation as was necessary for their own subsistence. Our law allows this benefit to fathers, with respect to the provisions granted to their children, and to grandfathers, which is a natural consequence of children's obligation to aliment their indigent parents; but to no collateral relation, not even to brothers.

32. Donations, made in contemplation of death, or *mortis causa*, are of the nature of legacies, and like them revokable: Consequently, not being effectual in the granter's life, they cannot compete with any of his creditors; not even with those whose debts were contracted after the donation. They are understood to be given from a personal regard to the donee, and therefore fall by his predecease. No deed, after delivery, is to be presumed a *donatio mortis causa*; for revocation is excluded by delivery.

33. Deeds are not presumed, *in dubio*, to be donations. Hence, a deed by a debtor to his creditor, if donation be not expressed, is presumed to be granted in security or satisfaction of the debt; but bonds of provision to children are, from the presumption of paternal affection, construed to be intended as an additional patrimony: Yet a tocher, given to a daughter in her marriage-contract, is presumed to be in satisfaction of all former bonds and debts; because marriage contracts usually contain the whole provisions in favour of the bride. One who alimments a person that is come of age, without an express paction for board, is presumed to have entertained him as a friend, unless in the case of those who earn their living by the entertainment or board of strangers. But alimony given to minors, who cannot bargain for themselves, is not accounted a donation; except either where it is presumed, from the near relation of the person alimmenting, that it was given *ex pietate*; or where the minor had a father or curators, with whom a bargain might have been made.

#### Tit. 23. Of the Dissolution or Extinction of Obligations.

OBLIGATIONS may be dissolved by performance or implement, consent, compensation, novation, and confusion. 1. By specific performance: Thus, an obligation for a sum of money is extinguished by payment. The creditor is not obliged to accept of payment by parts, unless where the sum is payable by different divisions. If a debtor in two or more separate bonds to the same creditor, made an indefinite payment, without ascribing it, at the time, to any one of the obligations, the payment is applied, 1. To interest, or to sums not bearing interest. 2. To the sums that are least secured, if the debtor thereby incurs no rigorous penalty. But, 3. If this application be penal on the debtor, *e. g.* by suffering the legal of an adjudication to expire, the payment will be so applied to as to save the debtor from that forfeiture. Where one of the debts is secured by a cautioner, the other not, the application is to be so made, *ceteris paribus*, that both creditor and cautioner may have equal justice done to them.

2. Payment made by the debtor upon a mistake in fact,

to one whom he believed, upon probable grounds, to have the right of receiving payment, extinguishes the obligation. But payment made to one, to whom the law denies the power of receiving it, has not this effect; as if a debtor, seized by letters of caption, should make payment to the messenger; for *ignorantia juris neminem excusat*. In all debts, the debtor, if he be not interpellated, may safely pay before the term, except in tack-duties or feu-duties; the payment whereof, before the terms at which they are made payable, is construed to be collusive, in a question with a creditor of the landlord or superior. Payment is *in dubio* presumed, by the voucher of the debt being in the hands of the debtor; *chirographum, apud debitorem repertum, presumitur solutum*.

3. Obligations are extinguishable by the consent of the creditor, who, without full implement, or even any implement, may renounce the right constituted in his own favour. Though a discharge or acquittance, granted by one whom the debtor *bona fide* took for the creditor, but who was not, extinguishes the obligation, if the satisfaction made by the debtor was real; yet where it is imaginary, the discharge will not screen him from paying to the true creditor the debt that he had made no prior satisfaction for. In all debts which are constituted by writing, the extinction, whether it be by specific performance, or bare consent, must be proved, either by the oath of the creditor, or by a discharge in writing; and the same solemnities which law requires in the obligation, are necessary in the discharge: But, where payment is made, not by the debtor himself, but by the creditor's intromission with the rents of the debtor's estate, or by delivery to him of goods in name of the debtor, such delivery or intromission, being *facti*, may be proved by witnesses, though the debt should have been not only constituted by writing, but made real on the debtor's lands by adjudication.

4. A discharge, though it should be general, of all that the granter can demand, extends not to debts of an uncommon kind, which are not presumed to have been under the granter's eye. This doctrine applies also to general assignations. In annual payments, as of rents, feu-duties, interest, &c. three consecutive discharges by the creditor, of the yearly or termly duties, presume the payment of all preceedings. Two discharges by the ancestor, and the third by the heir, do not infer this presumption, if the heir was ignorant of the ancestor's discharges. And discharges by an administrator, as a factor, tutor, &c. presume only the payment of all preceeding duties incurred during his administration. This presumption arises from repeating the discharges thrice successively; and so does not hold in the case of two discharges, though they should include the duties of three or more terms.

5. Where the same person is both creditor and debtor to another, the mutual obligations, if they are for equal sums, are extinguished by compensation; if for unequal, still the lesser obligation is extinguished, and the greater diminished, as far as the concurrence of debt and credit goes. To found compensation, 1. Each of the parties must be debtor and creditor at the same time. 2. Each of

of them must be debtor and creditor in his own right.

3. The mutual debts must be of the same quality: Hence, a sum of money cannot be compensated with a quantity of corns; because, till the prices are fixed, at which the corns are to be converted into money, the two debts are incommensurable. Lastly, compensation cannot be admitted, where the mutual debts are not clearly ascertained, either by a written obligation, the sentence of a judge, or the oath of the party. Where this requires but a short discussion, sentence for the pursuer is delayed for some time, *ex equitate*, that the defender may make good his ground of compensation. Where a debt for fungibles is ascertained in money, by the sentence of a judge, the compensation can have no effect farther back than the liquidation, because, before sentence, the debts were incommensurable: But, where a debt for a sum of money is, in the course of a suit, constituted by the oath of the debtor, the compensation, after it is admitted by the judge, operates, *retro*, in so far as concerns the currency of interest, to the time that, by the parties acknowledgment, the debt became due; for, in this case, the debtor's oath is not what creates the debt, or makes it liquid; it only declares that such a liquid sum was truly due before. Compensation cannot be offered after decree, either by way of suspension or reduction; unless it has been formerly pleaded, and unjustly repelled. Decrees in absence are excepted.

6. The right of retention, which bears a near resemblance to compensation, is chiefly competent, where the mutual debts, not being liquid, cannot be the ground of compensation; and it is sometimes admitted *ex equitate*, in liquid debts, where compensation is excluded by statute: Thus, though compensation cannot be pleaded after decree, either against a creditor or his assignee; yet, if the original creditor should become bankrupt, the debtor, even after decree, may retain against the assignee, till he gives security for satisfying the debtor's claim against the cedent. This right is frequently founded in the expence disbursed or work employed on the subject retained, and so arises from the mutual obligations incumbent on the parties. But retention may be sustained, though the debt due to him who claims it does not arise from the nature of the obligation by which he is debtor: Thus, a factor on a land estate may retain the sums levied by him in consequence of his factory, not only till he be paid of the disbursements made on occasion of such estate, but also till he be discharged from the separate engagements he may have entered into on his constituent's account.

7. Obligations are dissolved by novation, whereby one obligation is changed into another, without changing either the debtor or creditor. The first obligation being thereby extinguished, the cautioners in it are loosed, and all its consequences discharged; so that the debtor remains bound only by the last. As a creditor to whom a right is once constituted, ought not to lose it by implication, novation is not easily presumed, and the new obligation is construed to be merely corroborative of the old; but, where the second obligation expressly bears to be *satisfaction* of the first, these words must necessarily be explained into novation. Where the creditor accepts of

a new debtor, in place of the former who is discharged, this method of extinction is called delegation.

8. Obligations are extinguished *confusione*, where the debt and credit meet in the same person, either by succession or singular title, *e. g.* when the debtor succeeds to the creditor, or the creditor to the debtor, or a stranger to both, for one cannot be debtor to himself. If the succession, from which the *confusio* arises, happens afterwards to be divided, so as the debtor and creditor come again to be different persons; the *confusio* does not produce an extinction, but only a temporary suspension of the debt.

#### Tit. 24. Of Assignations.

HERITABLE rights, when they are clothed with investment, are transmitted by disposition, which is a writing containing procuratory of resignation and precept of seisin; but those which either require no seisin, or on which seisin has actually followed, are transmissible by simple assignation. He who grants the assignation, is called the cedent; and he who receives it, the assignee or assignee: If the assignee conveys his right to a third person, it is called a translation; and if he assigns it back to the cedent, a retrocession. Certain rights are, from the uses to which they are destined, incapable of transmission, as alimentary rights: Others cannot be assigned by the person invested in them, without special powers given to him, as tacks, reversions: The transmission of a third sort, is not presumed to be intended, without an express conveyance; as of paraphernal goods, which are so proper to the wife, that a general assignation by her to her husband, of all that did or should belong to her at her decease, does not comprehend them. A life interest is, by its nature, incapable of a proper transmission; but its profits may be assigned, while it subsists.

2. Assignations must not only be delivered to the assignee, but intimated by him to the debtor. Intimations are considered as so necessary for completing the conveyance, that in a competition between two assignations, the last, if first intimated; is preferred.

3. Though, regularly, intimation to the debtor is made by an instrument, taken in the hands of a notary, by the assignee or his procurator; yet the law admits equipollencies, where the notice of the assignment given to the debtor is equally strong. Thus, a charge upon letters of horning at the assignee's instance, or a suit brought by him against the debtor, supplies the want of intimation; these being judicial acts, which expose the conveyance to the eyes both of the judge and of the debtor; or the debtor's promise of payment by writing to the assignee, because that is in effect a corroborating of the original debt. The assignee's possession of the right, by entering into payments of the rents or interest, is also equal to an intimation; for it imports, not only notice to the debtor, but his actual compliance: But the debtor's private knowledge of the assignment is not sustained as intimation.

4. Certain conveyances need no intimation. 1. Indorsements of bills of exchange; for these are not to be fettered with forms, introduced by the laws of particular states. 2. Bank-notes are fully conveyed by the bare delivery

delivery of them; for as they are payable to the bearer, their property must pass with their possession. 3. Adjudication, which is a judicial conveyance, and marriage, which is a legal one, carry the full right of the subjects thereby conveyed, without intimation: nevertheless, as there is nothing in these conveyances which can of themselves put the debtor *in mala fide*, he is therefore *in tuto* to pay to the wife, or to the original creditor in the debt adjudged, till the marriage or adjudication be notified to him. Assignments of moveable subjects, though they be intimated, if they are made *retenta possessione*, (the cedent retaining the possession), cannot hurt the cedent's creditors; for such rights are presumed, in all questions with creditors, to be collusive, and granted in trust for the cedent himself.

5. An assignation carries to the assignee the whole right of the subject conveyed, as it was in the cedent; and consequently, he may use diligence, either in his cedent's name while he is alive, or in his own.

6. After an assignation is intimated, the debtor cannot prove payment, or compensation, by the oath of the cedent, who has no longer any interest in the debt; unless the matter has been made litigious by an action commenced prior to the intimation: But the debtor may refer to the oath of the assignee, who is in the right of the debt, that the assignment was gratuitous, or in trust for the cedent; either of which being proved, the oath of the cedent will affect the assignee. If the assignation be in part onerous, and in part gratuitous, the cedent's oath is good against the assignee, only in so far as his right is gratuitous. All defences competent against the original creditor in a moveable debt, which can be proved otherwise than by his oath, continue relevant against even an onerous assignee; whose right can be no better than that of his author, and must therefore remain affected with all the burdens which attended it in the author's person.

### Tit. 25. Of Arrestments and Poidings.

THE diligences, whereby a creditor may affect his debtor's moveable subjects, are arrestment and poiding. By arrestment is sometimes meant the securing of a criminal's person till trial; but as it is understood in the rubric of this title, it is the order of a judge, by which he who is debtor in a moveable obligation to the arrester's debtor, is prohibited to make payment or delivery till the debt due to the arrester be paid or secured. The arrester's debtor is usually called the common debtor; because, where there are two or more competing creditors, he is debtor to all of them. The person in whose hands the diligence is used, is styled the arrestee.

2. Arrestment may be laid on by the authority either of the supreme court, or of an inferior judge. In the first case, it proceeds either upon special letters of arrestment, or on a warrant contained in letters of horning; and it must be executed by a messenger. The warrants granted by inferior judges are called precepts of arrestment, and they are executed by the officer proper to the court. Where the debtor to the common debtor is a pupil, arrestment is properly used in the hands of the tutor, as the pupil's administrator: This doctrine may perhaps extend

to other general administrators, as commissioner, &c. But arrestment, used in the hands of a factor or steward, cannot found an action of forthcoming without calling the constituent. Where the debtor to the common debtor is a corporation, arrestment must be used in the hands of the directors or treasurer, who represent the whole body. Arrestment, when it is used in the hands of the debtor himself, is inept; for that diligence is intended only as a restraint upon third parties.

3. All debts, in which one is personally bound, though they should be heritably secured, are grounds upon which the creditor may arrest the moveable estate belonging to his debtor. Arrestment may proceed on a debt, the term of payment whereof is not yet come, in case the debtor be *vergens ad inopiam*. If a debt be not yet constituted by decree or registration, the creditor may raise and execute a summons against his debtor for payment, on which pending action arrestment may be used, in the same manner as inhibition, which is called arrestment upon a dependence. If one's ground of credit be for the performance of a fact, or if his depending process be merely declaratory, without a conclusion of payment or delivery, such claims are not admitted to be sufficient grounds for arrestment.

4. Moveable debts are the proper subject of arrestment; under which are comprehended conditional debts, and even depending claims. For lessening the expence of diligence to creditors, all bonds which have not been made properly heritable by feisin are declared arrestable. But this does not extend to adjudications, wadsets, or other personal rights of lands, which are not properly debts. Certain moveable debts are not arrestable. 1. Debts due by bill, which pass from hand to hand as bags of money. 2. Future debts; for though inhibition extends to *adquirenda* as well as *adquisita*, yet arrestment is limited, by its warrant, to the debt due at the time of serving it against the arrestee. Hence, an arrestment of rents or interest carries only those that have already either fallen due, or at least become current. Claims, depending on the issue of a suit, are not considered as future debts; for the sentence, when pronounced, has a retrospect to the period at which the claim was first founded. The like doctrine holds in conditional debts. 3. Alimentary debts are not arrestable; for these are granted on personal considerations, and so are not communicable to creditors; but the past interest due upon such debt may be arrested by the person who has furnished the alimony. One cannot secure his own effects to himself for his maintenance, so as they shall not be affectable by his creditors. Salaries annexed to offices granted by the king, and particularly those granted to the judges of the Session, and the fees of servants, are considered as alimentary funds; but the surplus fee, over and above what is necessary for the servant's personal uses, may be arrested.

5. If, in contempt of the arrestment, the arrestee shall make payment of the sum, or deliver the goods arrested, to the common debtor, he is not only liable criminally for breach of arrestment, but he must pay the debt again to the arrester. Arrestment is not merely prohibitory, as inhibitions are; but is a step of diligence which founds the user in a subsequent action, whereby the property of the

the subject arrested may be adjudged to him: It therefore does not, by our later practice, fall by the death of the arrestee, but continues to subsist, as a foundation for an action of forthcoming against his heir, while the subject arrested remains *in medio*. Far less is arrestment lost, either by the death of the arrester, or of the common debtor.

6. Where arrestment proceeds on a depending action, it may be loosed by the common debtor's giving security to the arrester for his debt, in the event it shall be found due. Arrestment founded on decrees, or on registered obligations, which in the judgment of law are decrees, cannot be loosed, but upon payment or consignation; except, 1. Where the term of payment of the debt is not yet come, or the condition has not yet existed. 2. Where the arrestment has proceeded on a registered contract, in which the debts or mutual obligations are not liquid. 3. Where the decree is suspended, or turned into a libel; for, till the suspension be discussed, or the pending action concluded, it cannot be known whether any debt be truly due. A loosing takes off the *nexus*, which had been laid on the subject arrested; so that the arrestee may thereafter pay safely to his creditor, and the cautioner is substituted in place of the arrestment, for the arrester's security: Yet the arrester may, while the subject continues with the arrestee, pursue him in a forthcoming, notwithstanding the loosing.

7. Arrestment is only an inchoated or begun diligence; to perfect it, there must be an action brought by the arrester against the arrestee, to make the debt or subject arrested forthcoming. In this action, the common debtor must be called for his interest, that he may have an opportunity of excepting to the lawfulness or extent of the debt, on which the diligence proceeded. Before a forthcoming can be pursued, the debt due by the common debtor to the arrester, must be liquidated; for the arrester can be no further intitled to the subject arrested than to the extent of the debt due to him by the common debtor. Where the subject arrested is a sum of money, it is, by the decree of forthcoming, directed to be paid to the pursuer towards satisfying his debt; where goods are arrested, the judge ordains them to be exposed sale, and the price to be delivered to the pursuer. So that in either case, decrees of forthcoming are judicial assignations to the arrester of the subject arrested.

8. In all competitions, regard is had to the dates, not of the grounds of debt, but of the diligences proceeding upon them. In the competition of arrestments, the preference is governed by their dates, according to the priority even of hours, where it appears with any certainty which is the first. But, as arrestment is but a begun diligence, therefore if a prior arrester shall neglect to insist in an action of forthcoming for such a time as may be reasonably construed into a desertion of his begun diligence, he loses his preference. But, as dereliction of diligence is not easily presumed, the distance of above two years, between the first arrestment and the decree of forthcoming, was found not to make such a *mora* as to intitle the posterior arrester to a preference. This rule of preference, according to the dates of the several arrestments, holds, by our present practice, whether they have pro-

ceeded on a decree, or on a dependence; on debts not yet payable, or on debts already payable; provided the pendency shall have been closed, or the debt have become payable, before the issue of the competition.

9. In the competition of arrestments with assignations, an assignation by the common debtor, intimated before arrestment, is preferable to the arrestment. If the assignation is granted before arrestment, but not intimated till after it, the arrester is preferred.

10. Poining is that diligence affecting moveable subjects, by which their property is carried directly to the creditor. No poining can proceed, till a charge be given to the debtor to pay or perform, and the days thereof be expired, except poinings against vassals for their feu-duties, and poinings against tenants for rent, proceeding upon the landlord's own decree; in which the ancient custom of poining without a previous charge continues. A debtor's goods may be poined by one creditor, though they have been arrested before by another; for arrestment being but an imperfect diligence, leaves the right of the subject still in the debtor, and so cannot hinder any creditor from using a more perfect diligence, which has the effect of carrying the property directly to himself.

11. No cattle pertaining to the plough, nor instruments of tillage, can be poined in the time of labouring or tilling the ground, unless where the debtor has no other goods. By labouring time is understood, that time, in which that tenant, whose goods are to be poined, is ploughing, though he should have been earlier or later than his neighbours; but summer-fallowing does not fall under this rule.

12. In the execution of poining, the debtor's goods must be apprifed, first on the ground of the lands where they are laid hold on, and a second time at the market-cross of the jurisdiction, by the stated apprifers thereof; or, if there are none, by persons named by the messenger or other officer employed in the diligence. Next, the messenger must, after public intimation by three oyeses, declare the value of the goods according to the second apprifement, and require the debtor to make payment of the debt, including interest and expences. If payment shall be offered to the creditor, or in his absence to his lawful attorney; or if, in case of refusal by them, consignation of the debt shall be made in the hands of the judge-ordinary or his clerk, the goods must be left with the debtor; if not, the messenger ought to adjudge and deliver them over, at the apprifed value, to the user of the diligence towards his payment: And the debtor is intitled to a copy of the warrant and executions, as a voucher that the debt is discharged in whole or in part by the goods poined.

13. Ministers may point for their stipends, upon one apprifement on the ground of the lands; and landlords were always in use to point so, for their rents. Apprifement of the goods at the market-cross of the next royal borough, or even of the next head-borough of stewartry or regality, though these jurisdictions be abolished, is declared as sufficient as if they were carried to the head-borough of the shire. Poining, whether it be considered as a sentence, or as the execution of a sentence, must be

proceeded in between sun-rising and sun-setting; or at least it must be finished before the going off of daylight. The powers of the officer employed in the execution of poindings, are not clearly defined by custom, in the case of a third party claiming the property of the goods to be poinded. This is certain, that he may take the oath of the claimant, upon the verity of his claim; and if from thence it shall appear that the claimant's title is collusive, he ought to proceed in the diligence; but, if there remains the least doubt, his safest course is to deliver the goods to the claimant, and to express in his execution the reasons why poinding did not proceed.

14. Any person who stops a poinding *via facti*, on groundless pretences, is liable, both criminally, in the pains of deforcement, (see Tit. xxxiii. 15.) and civilly, in the value of the goods which might have been poinded by the creditor.

#### Tit. 26. Of Prescriptions.

PREScription, which is a method, both of establishing and of extinguishing property, is either positive or negative. Positive prescription is generally defined, as the Roman *usucapio*, the acquisition of property (it should rather be, when applied to our law, the securing it against all further challenge) by the possessor's continuing his possession for the time which law has declared sufficient for that purpose: Negative, is the loss or amission of a right, by neglecting to follow it forth, or use it, during the whole time limited by law. The doctrine of prescription, which is, by some writers, condemned as contrary to justice, has been introduced, that the claims of negligent creditors might not subsist for ever, that property might be at last fixed, and forgeries discouraged, which the difficulty of detecting must have made exceeding frequent, if no length of time had limited the legal effect of writings.

2. Positive prescription was first introduced into our law by 1617, c. 12. which enacts, that whoever shall have possessed his lands, annualrents, or other heritages, peaceably, in virtue of infeftments, for forty years continually after their dates, shall not thereafter be disquieted in his right by any person pretending a better title. Under *heritages* are comprehended every right that is *fundo annexum*, and capable of continual possession. Continued possession, if proved as far back as the memory of man, presumes possession upwards to the date of the infeftment. The whole course of possession must by the act be founded on seifins, and consequently no part thereof on the bare right of apparenay; but forty years possession, without seifin, is sufficient in the prescription of such heritable rights as do not require seifin. The possession must also be without any *lawful* interruption, *i. e.* it must neither be interrupted *via facti*, nor *via juris*. The prescription of subjects not expressed in the infeftment as part and pertinent of another subject specially expressed, has been explained, Tit. xiii. 6.

3. The act requires, that the possessor produce, as his title of prescription, a charter of the lands, preceeding the forty years possession, with the seifin following on it: and where there is no charter extant, seifins, one or more

standing together for forty years, and proceeding either on retours, or precepts of *clare constat*. This has given rise to a reasonable distinction observed in practice, between the prescription of a singular successor, and of an heir. Singular successors must produce for their title of prescription, not only a seifin, but its warrant, as a charter, disposition, &c. either in their own person, or in that of their author: But the production by an heir of seifins, one or more, standing together for forty years, and proceeding on retours or precepts of *clare constat*, is sufficient. The heir is not obliged to produce the retours or precepts on which his seifins proceed, nor is the singular successor obliged to produce the ground of his charter; so that if the title of prescription produced be a fair deed, and a sufficient title of property, the possessor is secure by the act, which admits no ground of challenge, but falsehood. A special statute, for establishing the positive prescription in moveable rights, was not necessary; for, since a title in writing is not requisite for the acquiring of these, the negative prescription, by which all right of action for recovering their property is cut off, effectually secures the possessor.

4. The negative prescription of obligations, by the lapse of forty years, was introduced into our law long before the positive, by 1469, c. 29.—1474, c. 55. This prescription is now amplified by the foresaid act 1617, which has extended it to all actions competent upon heritable bonds, reversions, and others whatsoever; unless where the reversions are either incorporated in the body of the wadset right, or registred in the register of reversions: And reversions so incorporated, or registred, are not only exempted from the negative prescription, but they are an effectual bar against any person from pleading the positive.

5. A shorter negative prescription is introduced by statute, in certain rights and debts. Actions of spuilzie, ejection, and others of that nature, must be pursued within three years after the commission of the fact on which the action is founded. As in spuilzes and ejections, the pursuer was intitled, *in odium* of violence, to a proof by his own oath *in litem*, and to the violent profits against the defender, the statute meant only to limit these special privileges by a three years prescription, without cutting off the right of action, where the claim is restricted to simple restitution. Under the general words, and others of that nature, are comprehended all actions where the pursuer is admitted to prove his libel by his own oath *in litem*.

6. Servants fees, house-rents, mens ordinaries, (*i. e.* money due for board,) and merchants accounts, fall under the triennial prescription, by 1579, c. 83. There is also a general clause subjoined to this statute, of other the like debts, which includes alimentary debts, wages due to workmen, and accounts due to writers, agents, or procurators. These debts may by this act, be proved after the three years, either by the writing or oath of the debtor; so that they prescribe only as to the mean of proof by witnesses; but after the three years, it behoves the creditor to refer to the debtor's oath, not only the constitution, but the subsistence of the debt. In the prescription of house-rents, servants fees, and alimony, each term's

term's rent, fee, or alimony, runs a separate course of prescription; so that in an action for these, the claim will be restricted to the arrears incurred within the three years immediately before the citation: But, in accounts, prescription does not begin till the last article; for a single article cannot be called an account. Actions of removing must also be pursued within three years after the warning. Reductions of erroneous retours, prescribe, if not pursued within twenty years.

7. Ministers stipends and multures prescribe in five years after they are due; and arrears of rent, five years after the tenant's removing from the lands. As the prescription of mails and duties was introduced in favour of poor tenants, that they might not suffer by neglecting to preserve their discharges, a proprietor of lands subject to a liferent, who had obtained a lease of all the liferented lands from the liferenter, is not intitled to plead it, nor a tacksmen of one's whole estate, who had by the lease a power of removing tenants. Bargains concerning moveables, or sums of money which are proveable by witnesses, prescribe in five years after the bargain. Under these are included sales, locations, and all other consensual contracts, to the constitution of which writing is not necessary. But all the above mentioned debts, may, after the five years, be proved, either by the oath or the writing of the debtor; of which above, § 6. A quinquennial prescription is established in arrestments, whether on decrees or depending actions: The first prescribe in five years after using the arrestment, and the last in five years after sentence is pronounced on the depending action.

8. No person binding for or with another, either as cautioner or co-principal, in a bond or contract for a sum of money, continues bound after seven years from the date of the bond, provided he has either a clause of relief in the bond, or a separate bond of relief, intimated to the creditor, at his receiving the bond. But all diligence used within the seven years against the cautioner, shall stand good. As this is a public law, intended to prevent the bad consequences of rash engagements, its benefit cannot, before the lapse of the seven years, be renounced by the cautioner. As it is correctory, it is strictly interpreted: Thus, bonds bearing a mutual clause of relief *pro rata*, fall not under it; nor bonds of corroboration, nor obligations, where the condition is not purified, or the term of payment not come within the seven years; because no diligence can be used on these. The statute excludes all cautionries for the faithful discharge of offices; these not being obligations in a bond or contract for sums of money. And practice has denied the benefit of it to all judicial cautioners, as cautioners in a suspension. Actions of count and reckoning, competent either to minors against their tutors or curators, or *vice versa*, prescribe in ten years after the majority or death of the minor.

9. Holograph bonds, missive letters, and books of account, not attested by witnesses, prescribe in twenty years, unless the creditor shall thereafter prove the verity of the subscription by the debtor's oath. It is therefore sufficient to save from the effect of this prescription, that the constitution of the debt be proved by the party's oath,

after the twenty years; whereas in stipends, merchants accounts, &c. not only the constitution, but the subsistence of the debt, must be proved by writing or the debtor's oath, after the term of prescription. Some lawyers extend this prescription of holograph writings to all obligations for sums not exceeding £ 100 Scots, which are not attested by witnesses; because though these are in practice sustained, yet they ought not to have the same duration with deeds attested by witnesses. Though in the short prescriptions of debts, the right of action is forever lost, if not exercised within the time limited; yet where action was brought on any of those debts, before the prescription was run, it subsisted, like any other right, for forty years. As this defeated the purpose of the acts establishing these prescriptions, all processes upon warnings, spuilzies, ejections, or arrestments, or for payment of the debts contained in act 1669, c. 9. are by the said act, joined with 1685, c. 14. declared to prescribe in five years, if not wakened within that time; see Tit. 30.

10. Certain obligations are lost by the lapse of less than forty years, without the aid of statute, where the nature of the obligation, and the circumstances of parties, justify it: Thus, bills which are not intended for lasting securities, produce no action, where the creditor has been long silent, unless the subsistence of the debt be proved by the debtor's oath; but the precise time is not fixed by practice. Thus also, a receipt for bills granted by a writer to his employer, not insisted upon for twenty-three years, was found not productive of an action. The prescriptions of the restitution of minors, of the benefit of inventory, &c. are explained in their proper places.

11. In the positive prescription, as established by the act 1617, the continued possession for forty years, proceeding upon a title of property not chargeable with falsehood, secures the possessor against all other grounds of challenge, and so presumes *bona fides*, *presumptione juris et de jure*. In the long negative prescription, *bona fides* in the debtor is not required: The creditor's neglecting to insist for so long a time, is construed as an abandoning of his debt, and so is equivalent to a discharge. Hence, though the subsistence of the debt should be referred to the debtor's own oath, after the forty years, he is not liable.

12. Prescription runs *de momento in momentum*: The whole time defined by law must be completed, before a right can be either acquired or lost by it; so that interruption, made on the last day of the fortieth year, breaks its course. The positive prescription runs against the Sovereign himself, even as to his annexed property, but it is generally thought he cannot suffer by the negative: He is secured against the negligence of his officers, in the management of processes, by express statute, 1600, c. 14. The negative, as well as the positive prescription, runs against the church, though churchmen have but a temporary interest in their benefices. But because the rights of beneficiaries to their stipends are liable to accidents, through the frequent change of incumbents, thirteen years possession does, by a rule of the Roman chancery which we have adopted, found a presumptive title in the beneficiary: But this is not properly prescription; for if by titles recovered, perhaps out of the incumbent's own hands,

lands, it shall appear that he has possessed tithes, or other subjects, to a greater extent than he ought, his possession will be restricted accordingly. This right must not be confounded with that established in favour of churchmen, which is confined to church lands and rents, and constitutes a proper prescription, upon a possession of thirty years.

13. The clause in the act 1617, saving minors from prescription, is extended to the positive, as well as to the negative prescription; but the exception of minority is not admitted in the case of hospitals for children, where there is a continual succession of minors, that being a *casus insolitus*. Minors are expressly excepted in several of the short prescriptions, as 1579, c. 81.—1669, c. 9; but where law leaves them in the common case, they must be subject to the common rules.

14. Prescription does not run *contra non valentem agere*, against one who is barred, by some legal incapacity, from pursuing; for in such case, neither negligence nor dereliction can be imputed to him. This rule is, by a favourable interpretation, extended to wives who *ex reverentia maritali* forbear to pursue actions competent to them against their husbands. On the same ground, prescription runs only from the time that the debt or right could be sued upon. Thus, inhibition prescribes only from the publishing of the deed granted to the inhibitor's prejudice; and in the prescription of removings, the years are computed only from the term at which the defender is warned to remove. Neither can prescription run against persons who are already in possession, and so can gain nothing by a pursuit. Thus, where a person, who has two adjudications affecting the same lands, is in possession upon one of them, prescription cannot run against the other during such possession.

15. Certain rights are incapable of prescription: 1. Things that law has exempted from commerce. 2. *Res mera facultatis*, e. g. a faculty to charge a subject with debts, to revoke, &c. cannot be lost by prescription, for faculties may, by their nature, be exercised at any time: Hence, a proprietor's right of using any act of property on his own grounds, cannot be lost by the greatest length of time. 3. Exceptions competent to a person for eluding an action, cannot prescribe, unless the exception is founded on a right productive of an action, e. g. compensation; such right must be insisted on, within the years of prescription. 4. Obligations of yearly pensions or payments, though no demand has been made on them for forty years, do not suffer a total prescription, but still subsist as to the arrears fallen due within that period; because prescription cannot run against an obligation, till it be payable, and each year's pension or payment is considered as a separate debt.

16. No right can be lost *non utendo* by one, unless the effect of that prescription be to establish it in another. Hence the rule arises, *juri sanguinis nunquam præscribitur*. Hence also, a proprietor of land cannot lose his property by the negative prescription, unless he who objects it can himself plead the positive. On the same ground, a superior's right of feu-duties cannot be lost *non utendo*; because being inherent in the superiority, it is truly a right of lands that cannot suffer the negative

prescription, except in favour of one who can plead the positive; which the vassal cannot do, being destitute of a title. This rule applies also to parsonage tithes, which are an inherent burden upon all lands not specially exempted; and from which therefore the person liable cannot prescribe an immunity, by bare non-payment: But such vicarage tithes as are only due where they are established by usage, may be lost by prescription. In all these cases, though the radical right cannot suffer the negative prescription, the bygone duties, not demanded within the forty years, are lost to the proprietor, superior, or titular.

17. Prescription may be interrupted by any deed, whereby the proprietor or creditor uses his right or ground of debt. In all interruptions, notice must be given to the possessor of the subject, or the debtor, that the proprietor or creditor intends to sue upon his right. All writings whereby the debtor himself acknowledges the debt, and all processes for payment brought or diligences used against him upon his obligation, by horning, inhibition, arrestment, &c. must be effectual to interrupt prescription.

18. Interruptions, by citation upon libelled summonses, where they are not used by a minor, prescribe, if not renewed every seven years: But where the appearance of parties, or any judicial act has followed thereupon, it is no longer a bare citation, but an action which subsists for forty years. Citations for interrupting the prescription of real rights must be given by messengers; and the summonses, on which such citations proceed, must pass the signet upon a bill, and be registered within sixty days after the execution, in a particular register appointed for that purpose: And where interruption of real rights is made *via facti*, an instrument must be taken upon it, and recorded in the said register; otherwise it can have no effect against singular successors.

19. Interruption has the effect to cut off the course of prescription, so that the person prescribing can avail himself of no part of the former time, but must begin a new course, commencing from the date of the interruption. Minority therefore is no proper interruption; for it neither breaks the course of prescription, nor is it a document or evidence taken by the minor on his right: It is a personal privilege competent to him, by which the operation of the prescription is indeed suspended during the years of minority, which are therefore discounted from it; but it continues to run after majority, and the years before and after the minority may be conjoined to complete it. The same doctrine applies to the privilege arising from one's incapacity to act.

20. Diligence used upon a debt, against any one of two or more co-obligants, preserves the debt itself, and so interrupts prescription against all of them; except in the special case of cautioners, who are not affected by any diligence used against the principal debtor. In the same manner, a right of annualrent, constituted upon two separate tenements, is preserved as to both from the negative prescription, by diligence used against either of them. But whether such diligence has also the effect to hinder the possessor of the other tenement by singular titles from the benefit of the positive prescription, may be doubted.

TIT.

Tit. 27. *Of Succession in Heritable Rights.*

SINGULAR successors are those who succeed to a person yet alive, in a special subject by singular titles; but succession, in its proper sense, is a method of transmitting rights from the dead to the living. Heritable rights descend by succession to the heir properly so called; moveable rights, to the executors, who are sometimes said to be heirs in moveables. Succession is either by special destination, which descends to those named by the proprietor himself; or legal, which devolves upon the persons whom the law marks out for successors, from a presumption, that the proprietor would have named them, had he made a destination. The first is in all cases preferred to the other, as presumption must yield to truth.

2. In the succession of heritage, the heirs at law are otherwise called heirs general, heirs whatsoever, or heirs of line; and they succeed by the right of blood, in the following order. First, descendants sons are preferred to daughters, and the eldest son to all the younger. Where there are daughters only, they succeed equally, and are called heirs-portioners. Failing immediate descendants, grand-children succeed; and in default of them, great-grand-children; and so on *in infinitum*; preferring, as in the former case, males to females, and the eldest male to the younger.

3. Next after descendants, collaterals succeed; among whom the brothers *german* of the deceased have the first place. But as, in no case, the legal succession of heritage is, by the law of Scotland, divided into parts, unless where it descends to females; the immediate younger brother of the deceased excludes the rest, according to the rule, *heritage descends*. Where the deceased is himself the youngest, the succession goes to the immediate elder brother, as being the least deviation from this rule. If there are no brothers *german*, the sisters *german* succeed equally; then brothers *consanguinean*, in the same order as brothers *german*; and failing them, sisters *consanguinean* equally. Next, the father succeeds. After him, his brothers and sisters, according to the rules already explained; then the grand-father; failing him, his brothers and sisters; and so upwards, as far back as propinquity can be proved. Though children succeed to their mother, a mother cannot to her child; nor is there any succession by our law through the mother of the deceased; in so much that one brother *uterine*, *i. e.* by the mother only, cannot succeed to another, even in that estate which flowed originally from their common mother.

4. In heritage there is a right of representation, by which one succeeds, not from any title in himself, but in the place of, and as representing some of his deceased ascendants. Thus, where one leaves a younger son, and a grandchild by his eldest, the grandchild, though farther removed in degree from the deceased than his uncle, excludes him, as coming in place of his father the eldest son. Hence arises the distinction between succession *in capita*, where the division is made into as many equal parts as there are *capita* or heirs, which is the case of heirs portioners; and succession *in stirpes*, where the re-

motors heirs draw no more among them than the share belonging to their ascendant or *stirps*, whom they represent; an example of which may be figured in the case of one who leaves behind him a daughter alive, and two granddaughters by a daughter deceased. In which case the two granddaughters would succeed equally to that half which would have belonged to their mother had she been alive.

5. In the succession of heirs portioners, indivisible rights, *e. g.* titles of dignity, fall to the eldest sister. A single right of superiority goes also to the eldest; for it hardly admits a division, and the condition of the vassal ought not to be made worse by multiplying superiors upon him. Where there are more such rights, the eldest may perhaps have her election of the best, but the younger sisters are entitled to a recompence, in so far as the divisions are unequal; at least, where the superiorities yield a constant yearly rent. The principal seat of the family falls to the eldest, with the garden and orchard belonging to it, without recompence to the younger sisters; but all other houses are divided amongst them, together with the lands on which they are built, as parts and pertinents of these lands.

6. Those heritable rights, to which the deceased did himself succeed as heir to his father or other ancestor, get sometimes the name of heritage in a strict sense, in opposition to the *scuda nova*, or feus of conquest, which he had acquired by singular titles, and which descend, not to his heir of line, but of conquest. This distinction obtains only, where two or more brothers or uncles, or their issue, are next in succession; in which case the immediate younger brother, as heir of line, succeeds to the proper heritage, because that descends; whereas the conquest ascends to the immediate elder brother. It has no place in female succession, which the law divides equally among the heirs-portioners. Where the deceased was the younger brother, the immediate elder brother is heir both of line and of conquest. An estate, disposed by a father to his eldest son, is not conquest in the son's person, but heritage; because the son would have succeeded to it, though there had been no disposition. The heir of conquest succeeds to all rights affecting land, which require seisin to perfect them. But teinds go to the heir of line; because they are merely a burden on the fruits, not on the land. Tacks do not fall under conquest, because they are complete rights without seisin; nor personal bonds taken to heirs excluding executors.

7. The heir of line is entitled to the succession, not only of subjects properly heritable, but to that sort of moveables called *heirship*, which is the best of certain kinds. This doctrine has been probably introduced, that the heir might not have an house and estate to succeed to, quite dismantled by the executor. In that sort which goes by pairs or dozens, the best pair or dozen is the heirship. There is no heirship in fungibles, or things estimated by quantity, as grain, hay, current money &c. To intitle an heir to this privilege, the deceased must have been either, 1. A Prelate: 2. A Baron, *i. e.* one who stood in fealty at his death in lands, though not erected into a barony; or even in a right of annualrent: Or, 3. A burgher; not an honorary one, but a trading burgher of a royal borough, or at least one intitled to enter bur-

gers, in the right of his ancestor. Neither the heir of conquest, nor of tailzie, has right to heirship-moveables.

8. As to succession by destination, no proprietor can settle any heritable estate, in the proper form of a testament; not even bonds including executors, though these are not heritable *ex sua natura*: But, where a testament is in part drawn up in the style of a deed *inter vivos*, such part of it may contain a settlement of heritage, though executors should be named in the testamentary part. The common method of settling the succession of heritage is by disposition, contract of marriage, or simple procuratory of resignation: And, though a disposition settling heritage should have neither precept nor procuratory, it founds an action against the heir of line to complete his titles to the estate; and thereafter divest himself in favour of the disponent. The appellation of tailzie, or entail, is chiefly used in the case of a land estate, which is settled on a long series of heirs, substituted one after another. The person first called in the tailzie, is the institute; the rest, the heirs of tailzie, or the substitutes.

9. Tailzies, when considered in relation to their several degrees of force, are either, 1. Simple destinations: 2. Tailzies with prohibitory clauses. 3. Tailzies with prohibitory, resolutive, and irritant clauses. That is a simple destination, where the persons called to the succession are substituted one after another, without any restraint laid on the exercise of their property. The heirs, therefore, succeeding to such estate, are absolute fiars, and consequently may alter the destination at pleasure.

10. In tailzies with clauses prohibitory, *e. g.* declaring that it shall not be lawful to the heirs to contract debts or alien the lands in prejudice of the succession, none of the heirs can alien gratuitously. But the members of entail may contract debts which will be effectual to the creditors, or may dispose of the estate for onerous causes. In both these sorts, the maker himself may alter the tailzie; except, 1. Where it has been granted for an onerous cause, as in mutual tailzies; or, 2. Where the maker is expressly disabled, as well as the institute or the heirs.

11. Where a tailzie is guarded with irritant and resolutive clauses, the estate entailed cannot be carried off by the debt, or deed, of any of the heirs succeeding thereto, in prejudice of the substitutes. It was long doubted, whether such tailzies ought to be effectual, even where the superior's consent was adhibited; because they sunk the property of estates, and created a perpetuity of liferents. They were first explicitly authorised by 1685, *c.* 22.

By this statute, the entail must be registered in a special register established for that purpose; and the irritant and resolutive clauses must be inserted, not only in the procuratories, precepts, and seissins, by which the tailzies are first constituted, but in all the after-conveyances thereof; otherwise they can have no force against singular successors. But a tailzie, even without these requisites, is effectual against the heir of the granter, or against the institute who accepts of it.

12. An heir of entail has full power over the entailed estate, except in so far as he is expressly fettered; and as entails are an unfavourable restraint upon property, and a frequent snare to trading people, they are *strictissimi*

*juris*; so that no prohibition or irritancies are to be inserted by implication.

13. An heir, who counteracts the directions of the tailzie, by aliening any part of the estate, charging it with debt, &c. is said to contravene. It is not the simple contracting of debt that infers contravention; the lands entailed must be actually adjudged upon the debt contracted. An heir may, where he is not expressly barred, settle rational provisions on his wife and children, without incurring contravention.

14. When the heirs of the last person specially called in a tailzie come to succeed, the irritancies have no longer any person in favour of whom they can operate; and consequently, the fee, which was before tailzied, becomes simple and unlimited in the person of such heirs. The King may purchase lands within Scotland, notwithstanding the strictest entail; and where the lands are in the hands of minors or fatuous persons, his Majesty may purchase them from the curators or guardians. And heirs of entail may sell to their vassals the superiorities belonging to the entailed estate; but in all these cases, the price is to be settled in the same manner that the lands or superiorities sold were settled before the sale.

15. Rights, not only of land estates, but of bonds, are sometimes granted to two or more persons in conjunct fee. Where a right is so granted to two strangers, without any special clause adjoined to it, each of them has an equal interest in the fee, and the part of the deceased descends to his own heir. If the right be taken to the two jointly, and *the longest liver* and their heirs, the several shares of the conjunct fiars are affectable by their creditors during their lives; but, on the death of any one of them, the survivor has the fee of the whole, in so far as the share of the predeceased remains free, after payment of his debts. Where the right is taken to the two in conjunct fee, and to the heirs of one of them, he to whose heirs the right is taken, is the only fiar; the right of the other resolves into a simple liferent: Yet where a father takes a right to himself and his son jointly, and to the son's heirs, such right being gratuitous is not understood to strip the father of the fee, unless a contrary intention shall plainly appear from the tenor of the right.

16. Where a right is taken to a husband and wife, in conjunct fee and liferent, the husband, as the *persona dignior*, is the only fiar: The wife's right resolves into a liferent, unless it be presumable, from special circumstances, that the fee was intended to be in the wife. Where a right of moveables is taken to husband and wife, the heirs of both succeed equally, according to the natural meaning of the words.

17. Heirs of provision are those who succeed to any subject, in virtue of a provision in the investiture, or other deed of settlement. This appellation is given most commonly to heirs of a marriage. These are more favourably regarded than heirs by simple destination, who have only the hope of succession; for heirs of a marriage, because their provisions are constituted by an onerous contract, cannot be disappointed of them by any gratuitous deed of the father. Nevertheless, as their right is only a right of succession, which is not designed to restrain the father,

father from granting onerous or rational deeds, he continues to have the full power of selling the subject, or charging it with debts, unless a proper right of credit be given to the heir by the marriage-contract, e. g. if the father should oblige himself to invest the heir in the lands, or make payment of the sum provided against a day certain, or when the child attains a certain age, &c. for such rights, when perfected by investment, or secured by diligence, are effectual against all the posterior deeds of the father, even onerous.

18. Though all provisions to children, by a marriage-contract conceived in the ordinary form, being merely rights of succession, are postponed to every onerous debt of the granter, even to those contracted posterior to the provisions; yet where a father executes a bond of provision to a child actually existing, whether such child be the heir of a marriage or not, a proper debt is thereby created, which, though it be without doubt gratuitous, is not only effectual against the father himself and his heirs, but is not reducible at the instance even of his prior onerous creditors, if he was solvent at the time of granting it. A father may, notwithstanding a first marriage-contract, settle a jointure on a second wife, or provide the children of a second marriage; for such settlements are deemed onerous; but where they are exorbitant, they will be restricted to what is rational: And in all such settlements, where the provisions of the first marriage-contract are incoached upon, the heirs of that marriage have recourse against the father, in case he should afterwards acquire a separate estate, which may enable him to fulfil both obligations.

19. Where heritable rights are provided to the heirs of a marriage, they fall to the eldest son, for he is the heir at law in heritage. Where a sum of money is so provided, the word *heir* is applied to the subject of the provision, and so marks out the executor, who is the heir in moveables. When an heritable right is provided to the *bairns* (or issue) of a marriage, it is divided equally among the children, if no division be made by the father; for such destination cuts off the exclusive right of the legal heir. No provision granted to bairns, gives a special right of credit to any one child, as long as the father lives: The right is granted *familiæ*; so that the whole must indeed go to one or other of them; but the father has a power inherent in him, to divide it among them, in such proportions as he thinks best; yet so as none of them may be entirely excluded, except in extraordinary cases.

20. A clause of return is that, by which a sum in a bond or other right, is, in a certain event, limited to return to the granter himself, or his heirs. When a right is granted for onerous causes, the creditor may defeat the clause of return, even gratuitously. But, where the sum in the right flows from the granter, or where there is any other reasonable cause for the provision of return in his favour, the receiver cannot disappoint it gratuitously. Yet since he is heir, the sum may be either assigned by him for an onerous cause, or affected by his creditors.

21. An heir is, in the judgment of law, *eadem persona cum defuncto*, and so represents the deceased universally, not only in his rights, but in his debts: In the

first view, he is said to be heir *active*; in the second *passive*. From this general rule are excepted, heirs substituted in a special bond, and even substituted in a disposition *crimen honorum*, to take effect at the granter's death; for such substitutes are considered as singular successors, and their right as an universal legacy, which does not subject the legatee *ultra valorem*.

22. Before an heir can have an active title to his ancestor's rights, he must be entered by service and retour. He who is intitled to enter heir, is, before his actual entry, called apparent heir. The bare right of apparenancy carries certain privileges with it. An apparent heir may defend his ancestor's titles against any third party who brings them under challenge. Tenants may safely pay him their rents; and after they have once acknowledged him by payment, he may compel them to continue it; and the rents not uplifted by the apparent heir belong to his executors, upon his death.

23. As an heir is, by his entry, subjected universally to his ancestor's debts, apparent heirs have therefore a year (*annus deliberandi*) allowed to them from the ancestor's decease, to deliberate whether they will enter or not; till the expiring of which, though they may be charged by creditors to enter, they cannot be sued in any process founded upon such charge. Though declaratory actions, and others which contain no personal conclusion, may be pursued against the apparent heir, without a previous charge; action does not lie even upon these, within the year, if the heir cannot make the proper defences without incurring a passive title. But judicial sales, commenced against an ancestor, may be continued upon a citation of the heir, without waiting the year of deliberating. This *annus deliberandi* is computed, in the case of a posthumous heir, from the birth of such heir. An apparent heir, who by immixing with the estate of his ancestor, is as much subjected to his debts as if he had entered, can have no longer a right to deliberate whether he will enter or not.

24. All services proceed on brieves from the chancery, which are called brieves of inquest, and have been long known in Scotland. The judge, to whom the brief is directed, is required to try the matter by an inquest of fifteen sworn men. The inquest, if they find the claim verified, must declare the claimant heir to the deceased, by a verdict or service, which the judge must attest, and return the brief, with the service proceeding on it, to the chancery.

25. The service of heirs is either general or special. A general service vests the heir in the right of all heritable subjects, which either do not require seisin, or which have not been perfected by seisin in the person of the ancestor. A special service, followed by seisin, vests the heir in the right of the special subjects in which the ancestor died seised.

26. If an heir, doubtful whether the estate of his ancestor be sufficient for clearing his debts, shall at any time within the *annus deliberandi*, exhibit upon oath a full inventory of all his ancestor's heritable subjects, to the clerk of the shire where the lands lie; or, if there is no heritage requiring seisin, to the clerk of the shire where he died; and if, after the same is subscribed by the the-

riff or sheriff depute, the clerk, and himself, and registered in the sheriff's books, the extract thereof shall be registered within forty days after expiry of the *annus deliberandi* in the general register appointed for that purpose, his subsequent entry will subject him no farther than to the value of such inventory. If the inventory be given up and registered within the time prescribed, the heir may serve on it, even after the year.

27. Creditors are not obliged to acquiesce in the value of the estate given up by the heir; but, if they be real creditors, may bring the estate to a public sale, in order to discover its true value; since an estate is always worth what can be got for it. An heir by inventory, as he is, in effect, a trustee for the creditors, must account for that value to which the estate may have been improved since the death of the ancestor, and he must communicate to all the creditors the sales he has got in transacting with any one of them.

28. Practice has introduced an anomalous sort of entry, without the interposition of an inquest, by the sole consent of the superior, who, if he be satisfied that the person applying to him is the next heir, grants him a precept (called of *clare constat*, from the first words of its recital), commanding his bailie to infect him in the subjects that belonged to his ancestor. These precepts are, no doubt, effectual against the superior who grants them, and his heirs; and they may, when followed by seisin, afford a title of prescription: But as no person can be declared an heir by private authority, they cannot bar the true heir from entering after twenty years, as a legal entry would have done. Of the same nature is the entry by hasp and staple, commonly used in burgage tenements of houses; by which the bailie, without calling an inquest, cognosces or declares a person heir, upon evidence brought before himself; and, at the same time, infects him in the subject, by the symbol of the hasp and staple of the door. Charges given by creditors to apparent heirs to enter, stand in the place of an actual entry, so as to support the creditor's diligence.

29. A general service cannot include a special one; since it has no relation to any special subject, and carries only that class of rights on which seisin has not proceeded; but a special service implies a general one of the same kind or character, and consequently carries even such rights as have not been perfected by seisin. Service is not required to establish the heir's right in titles of honour, or offices of the highest dignity; for these descend *jure sanguinis*.

30. An heir, by immixing with his ancestor's estate without entry, subjects himself to his debts, as if he had entered; or, in our law-phrases, incurs a passive title. The only passive title by which an apparent heir becomes liable universally for all his ancestor's debts, is *gestio pro herede*, or his behaving as none but an heir has right to do. Behaviour as heir is inferred, from the apparent heir's intromission, after the death of the ancestor, with any part of the lands or other heritable subjects belonging to the deceased, to which he himself might have completed an active title by entry.

31. This passive title is excluded, if the heir's intromission be by order of law; or if it be founded on singu-

lar titles, and not as heir to the deceased. But an apparent heir's purchasing any right to his ancestor's estate, otherwise than at public roup (auction), or his possessing it in virtue of rights settled in the person of any near relation of the ancestor, to whom he himself may succeed as heir, otherwise than upon purchase by public sale, is deemed behaviour as heir.

32. Behaviour as heir is also excluded, where the intromission is small, unless an intention to defraud the ancestor's creditors be presumable from the circumstances attending it. Neither is behaviour inferred against the apparent heir, from the payment of his ancestor's debt, which is a voluntary act, and profitable to the creditors: nor by his taking out of briefs to serve: for one may alter his purpose, while it is not completed: nor by his assuming the titles of honour belonging to his ancestor, or exercising an honorary office hereditary in the family; for these are rights annexed to the blood, which may be used without proper representation. But the exercising an heritable office of profit, which may pass by voluntary conveyance, and consequently is adjudgeable, may reasonably be thought to infer a passive title. Lastly, as passive titles have been introduced, merely for the security of creditors; therefore, where questions concerning behaviour arise among the different orders of heirs, they are liable to one another no farther than *in valorem* of their several intromissions.

33. Another passive title in heritage, may be incurred by the apparent heir's accepting a gratuitous right from the ancestor, to any part of that estate to which he himself might have succeeded as heir; and it is called *præceptio hereditatis*, because it is a taking of the succession by the heir before it opens to him by the death of his ancestor. If the right be onerous, there is no passive title: If the consideration paid for it does not amount to its full value, the creditors of the deceased may reduce it, in so far as it is gratuitous, but still it infers no passive title.

34. The heir incurring this passive title is no farther liable, than if he had, at the time of his acceptance, entered heir to the granter, and so subjected himself to the debts that were then chargeable against him; but with the posterior debts he has nothing to do, not even with those contracted between the date of the right, and the infestment taken upon it, and he is therefore called *successor titulo lucrativo post contractum debitum*.

35. Neither of these passive titles takes place, unless the subject intermeddled with or disposed, be such as the intromitter or receiver would succeed to as heir. In this also, these two passive titles agree, that the intromission in both must be after the death of the ancestor; for there can be no *termini habiles* of a passive title, while the ancestor is alive. But in the following respect they differ: *Gestio pro herede*, being a vicious passive title founded upon a quasi delict, cannot be objected against the delinquent's heir, if process has not been litiscontested while the delinquent himself was alive; whereas the *successor titulo lucrativo* is, by the acceptance of the disposition, understood to have entered into a tacit contract with the granter's creditors, by which he undertakes the burden of their debts; and all actions founded on contract are transmissible against heirs.

36. An apparent heir, who is cited by the ancestor's creditor in a process for payment, if he offers any peremptory defence against the debt, incurs a passive title; for he can have no interest to object against it, but in the character of heir. In the same manner, the heir's not renouncing upon a charge to enter heir, infers it: But the effect of both these is limited to the special debt pursued for, or charged upon. This passive title, which is inferred from the heir's not renouncing, has no effect till decree pass against him; and even a renunciation offered after decree, if the decree be in absence, will intitle the heir to a suspension of all diligence against his person and estate, competent upon his ancestor's debts.

37. By the principles of the feudal law, an heir, when he is to complete his titles by special service, must necessarily pass over his immediate ancestor, *e. g.* his father, if he was not infest; and serve heir to that ancestor who was last vest and seised in the right, and in whose *hereditas jacens* the right must remain, till a title be connected thereto from him. As this bore hard upon creditors, who might think themselves secure in contracting with a person whom they saw for some time in the possession of an estate, and from thence conclude that it was legally vested in him; it is therefore provided, that every person, passing over his immediate ancestor who had been three years in possession, and serving heir to one more remote, shall be liable for the debts and deeds of the person interjected, to the value of the estate to which he is served. This being correctory of the feudal maxims, has been strictly interpreted, so as not to extend to the gratuitous deeds of the person interjected, nor to the case where the interjected person was a naked fief, and possessed only civilly through the liferenter.

38. Our law, from its jealousy of the weakness of mankind while under sickness, and of the importunity of friends on that occasion, has declared that all deeds affecting heritage, if they be granted by a person on death-bed, (*i. e.* after contracting that sickness which ends in death), to the damage of the heir, are ineffectual, except where the debts of the grantor have laid him under a necessity to alien his lands. As this law of deathbed is founded solely in the privilege of the heir, deathbed-deeds, when consented to by the heir, are not reducible. The term properly opposed to death bed is *liege poussie*, by which is understood a state of health; and it gets that name, because persons in health have the *legitima potestas*, or lawful power of disposing of their property at pleasure.

39. The two extremes being proved, of the grantor's sickness immediately before signing, and of his death following it, though at the greatest distance of time, did, by our former law, found a presumption that the deed was granted on death bed, which could not have been elided, but by a positive proof of the grantor's convalescence; but now the allegation of death bed is also excluded, by his having lived sixty days after signing the deed. The legal evidence of convalescence is the grantor's having been, after the date of the deed, at kirk OR market unsupported; for a proof of either will secure the deed from challenge. The going to kirk or market must

be performed, when people are met together in the church or churchyard for any public meeting, civil or ecclesiastical, or in the market place at the time of public market. No other proof of convalescence is receiveable, because at kirk and market there are always present unsuspected witnesses, which we can hardly be sure of in any other case.

40. The privilege of setting aside deeds *ex capite lecti*, is competent to all heirs, not to heirs of line only, but of conquest, tailzie, or provision; not only to the immediate, but to remoter heirs, as soon as the succession opens to them. But, where it is consented to or ratified by the immediate heir, it is secured against all challenge even from the remoter. Yet the immediate heir cannot, by any antecedent writing, renounce his right of reduction, and thereby give strength to deeds that may be afterwards granted *in lecto* to his hurt; for no private renunciation can authorise a person to act contrary to a public law; and such renunciation is presumed to be extorted through the fear of exheredation. If the heir should not use this privilege of reduction, his creditor may, by adjudication, transfer it to himself, or he may without adjudication, reduce the deed, libelling upon his interest as creditor to the heir: But the grantor's creditors have no right to this privilege, in regard that the law of death-bed was introduced, not in behalf of the grantor himself, but of his heir.

41. The law of death-bed strikes against dispositions of every subject to which the heir would have succeeded, or from which he would have had any benefit, had it not been so disposed. Deathbed-deeds granted in consequence of a full or proper obligation in *liege poussie*, are not subject to reduction; but, where the antecedent obligation is merely natural, they are reducible. By stronger reason, the deceased cannot, by a deed merely voluntary, alter the nature of his estate on death bed to the prejudice of his heir, so as from heritable to make it moveable; but if he should, in *liege poussie*, exclude his apparent heir, by an irrevocable deed containing reserved faculties, the heir cannot be heard to quarrel the exercise of these faculties on death-bed.

42. In a competition between the creditors of the deceased and of the heir, our law has justly preferred the creditors of the deceased, as every man's estate ought to be liable, in the first place, for his own debt. But this preference is, by the statute, limited to the case where the creditors of the deceased have used diligence against their debtor's estate, within three years from his death; and therefore the heir's creditors may, after that period, affect it for their own payment. All dispositions by an heir, of the ancestor's estate, within a year after his death, are null, in so far as they are hurtful to the creditors of the ancestor. This takes place, though these creditors should have used no diligence, and even where the dispositions are granted after the year: It is thought they are ineffectual against the creditors of the deceased who have used diligence within the three years.

#### Tit. 28. Of Succession in Moveables.

In the succession of moveable rights, it is an universal rule,

10 E

2

rule,

rule, that the next in degree to the deceased (or next of kin) succeeds to the whole; and if there are two or more equally near, all of them succeed by equal parts, without that prerogative, which takes place in heritage, of the eldest son over the younger, or of males over females. Neither does the right of representation, explained Tit. xxvii. 4. obtain in the succession of moveables, except in the single case of a competition between the full blood and the half blood: for a niece by the full blood will be preferred before a brother by the half blood, though she is by one degree more remote from the deceased than her uncle. Where the estate of a person deceased consists partly of heritage, and partly of moveables, the heir in the heritage has no share of the moveables, if there are others as near in degree to the deceased as himself: But where the heir, in such case, finds it his interest to renounce his exclusive claim to the heritage, and betake himself to his right as one of the next of kin, he may collate or communicate the heritage with the others, who in their turn must collate the moveables with him; so that the whole is thrown into one mass, and divided equally among all of them. This doctrine holds, not only in the line of descendants, but of collaterals; for it was introduced, that the heir might in no case be worse than the other next of kin.

2. One may settle his moveable estate upon whom he pleases, excluding the legal successor, by a testament; which is a written declaration of what a person wills to be done with his moveable estate after his death. No testamentary deed is effectual, till the death of the testator; who may therefore revoke it at pleasure, or make a new one, by which the first loses its force; and hence testaments are called, last or latter wills. Testaments, in their strict acceptation, must contain a nomination of executors, *i. e.* of persons appointed to administer the succession according to the will of the deceased: Yet nothing hinders one from making a settlement of moveables, in favour of an universal legatee, though he should not have appointed executors; and on the other part, a testament where executors are appointed, is valid, though the person who is to have the right of succession should not be named. In this last case, if the executor nominated be a stranger, *i. e.* one who has no legal interest in the moveable estate, he is merely a trustee, accountable to the next of kin; but he may retain a third of the dead's part (explained § 6.) for his trouble in executing the testament: in payment of which, legacies, if any be left to him, must be imputed. The heir, if he be named executor, has right to the third as a stranger; but if one be named who has an interest in the legal succession, he has no allowance, unless such interest be less than a third. Nuncupative or verbal testaments are not, by the law of Scotland, effectual for supporting the nomination of an executor, let the subject of the succession be ever so small: But verbal legacies, not exceeding £ 100 Scots, are sustained; and even where they are granted for more, they are ineffectual only as to the excess.

3. A legacy is a donation by the deceased, to be paid by the executor to the legatee. It may be granted, either in the testament, or in a separate writing. Legacies are not due till the grantor's death; and consequently they

can transmit no right to the executors of the legatee, in the event that the grantor survives him.

4. Legacies, where they are general, *i. e.* of a certain sum of money indefinitely, give the legatee no right in any one debt or subject; he can only insist in a personal action against the executor, for payment out of the testator's effects. A special legacy, *i. e.* of a particular debt due to the deceased, or of a particular subject belonging to him, is of the nature of an assignation, by which the property of the special debt or subject vests, upon the testator's death, in the legatee, who can therefore directly sue the debtor or possessor: Yet as no legacy can be claimed till the debts are paid, the executor must be cited in such process, that it may be known, whether there are free effects sufficient for answering the legacy. Where there is not enough for payment of all the legacies, each of the general legatees must suffer a proportional abatement: But a special legatee gets his legacy entire, though there should be nothing over for payment of the rest; and on the contrary, he has no claim, if the debt or subject bequeathed should perish, whatever the extent of the free executry may be.

5. Minors, after puberty, can test without their curators, wives without their husbands, and persons interdicted without their interdictors: but bastards cannot test, except in the cases afterwards set forth, Tit. xxix. 3. As a certain share of the goods, falling under the communion that is consequent on marriage, belongs, upon the husband's decease, to his widow, *jure relicte*, and a certain share to the children, called the legitime, portion-natural, or bairns part of gear; one who has a wife or children, though he be the absolute administrator of all these goods during his life, and consequently may alien them by a deed *inter vivos* in *liege prussie*, even gratuitously, if no fraudulent intention to disappoint the wife or children shall appear, yet cannot impair their shares gratuitously on deathbed; nor can he dispose of his moveables to their prejudice by testament, though it should be made in *liege prussie*; since testaments do not operate till the death of the testator, at which period the division of the goods in communion have their full effect in favour of the widow and children.

6. If a person deceased leaves a widow, but no child, his testament, or, in other words, the goods in communion, divide in two; one half goes to the widow, the other is the dead's part, *i. e.* the absolute property of the deceased, on which he can test, and which falls to his next of kin, if he dies intestate. Where he leaves children, one or more, but no widow, the children get one half as their legitime; the other half is the dead's part, which falls also to the children, if the father has not tested upon it. If he leaves both widow and children, the division is tripartite; the wife takes one third by herself; another falls, as legitime, to the children equally among them, or even to an only child, though he should succeed to the heritage; the remaining third is the dead's part. Where the wife predeceases without children, one half is retained by the husband, the other falls to her next of kin: Where she leaves children, the division ought also to be tripartite, by the common rules of society, since no legitime is truly due on a mother's death;

yet

yet it is in practice tripartite ; two thirds remain with the surviving father, as if one third were due to him *proprio nomine*, and another as administrator of the legitime for his children ; the remaining third, being the wife's share, goes to her children, whether of that or any former marriage, for they are all equally her next of kin.

7. Before a testament can be divided, the debts owing by the deceased are to be deducted ; for all executry must be free. As the husband has the full power of burdening the goods in communion, his debts affect the whole, and so lessen the legitime and the share of the relict, as well as the dead's part. His funeral charges, and the mournings and alimony due to the widow, are considered as his proper debts : but the legacies, or other gratuitous rights, granted by him on deathbed, affect only the dead's part. Bonds bearing interest, due by the deceased, cannot diminish the relict's share, because such bonds, when due to the deceased, do not increase it. The funeral charges of the wife predeceasing, fall wholly on her executors who have right to her share. Where the deceased leaves no family, neither husband, wife, nor child, the testament suffers no division, but all is the dead's part.

8. The whole issue of the husband, not only by that marriage which was dissolved by his death, but by any former marriage, has an equal interest in the legitime ; otherwise the children of the first marriage would be cut out, as they could not claim the legitime during their father's life. But no legitime is due, 1. Upon the death of a mother. 2. Neither is it due to grandchildren, upon the death of a grandfather. Nor, 3. To children forisfamiliarized, *i. e.* to such as, by having renounced the legitime, are no longer considered as *in familia*, and so are excluded from any farther share of the moveable estate than they have already received.

9. As the right of legitime is strongly founded in nature, the renunciation of it is not to be inferred by implication. Renunciation by a child of his claim of legitime has the same effect as his death, in favour of the other children intitled thereto ; and consequently the share of the renouncer divides among the rest ; but he does not thereby lose his right to the dead's part, if he does not also renounce his share in the father's executry. Nay, his renunciation of the legitime, where he is the only younger child, has the effect to convert the whole subject thereof into dead's part, which will therefore fall to the renouncer himself as next of kin, if the heir be not willing to collate the heritage with him.

10. For preserving an equality among all the children, who continue intitled to the legitime, we have adopted the Roman doctrine of *collatio bonorum* ; whereby the child, who has got a provision from his father, is obliged to collate it with the others, and impute it towards his own share of the legitime ; but if, from the deed of provision, the father shall appear to have intended it as a *præcipuum* to the child, collation is excluded. A child is not bound to collate an heritable subject provided to him, because the legitime is not impaired by such provision. As this collation takes place only in questions among children who are intitled to the legitime, the relict is not bound to collate donations given her by her husband, in order to increase the legitime ; and on the other

part, the children are not obliged to collate their provisions, in order to increase her share.

11. As an heir in heritage must complete his titles by entry, so an executor is not vested in the right of the moveable estate of the deceased without confirmation. Confirmation is a sentence of the Commissary or Bishop's court, empowering an executor, one or more, upon making inventory of the moveables pertaining to the deceased, to recover, possess, and administer them, either in behalf of themselves, or of others interested therein. Testaments must be confirmed in the commissariat where the deceased had his principal dwelling house at his death. If he had no fixed residence, or died in a foreign country, the confirmation must be at *Edinburgh*, as the *commune forum* ; but if he went abroad with an intention to return, the commissariat within which he resided, before he left Scotland, is the only proper court.

12. Confirmation proceeds upon an edict, which is affixed on the door of the parish-church where the deceased dwelt, and serves to intimate to all concerned the day of confirmation, which must be nine days at least after publishing the edict. In a competition for the office of executor, the Commissary prefers, *primo loco*, the person named to it by the deceased himself, whose nomination he ratifies or confirms, without any previous decerniture ; this is called the confirmation of a testament-testamentary. In default of an executor named by the deceased, universal disponents are by the present practice preferred ; after them, the next of kin ; then the relict ; then creditors ; and lastly, special legatees. All these must be decerned executors, by a sentence called a decree-dative ; and if afterwards they incline to confirm, the Commissary authorizes them to administer, upon their making inventory, and giving security to make the subject thereof forthcoming to all having interest ; which is called the confirmation of a testament dative.

13. A creditor, whose debtor's testament is already confirmed, may sue the executor, who holds the office for all concerned, to make payment of his debt. Where there is no confirmation, he himself may apply for the office, and confirm as executor creditor ; which intitles him to sue for, and receive the subject confirmed, for his own payment : And where one applies for a confirmation, as executor creditor, every co-creditor may apply to be conjoined with him in the office. As this kind of confirmation is simply a form of diligence, creditors are exempted from the necessity of confirming more than the amount of their debts.

14. A creditor, whose debt has not been constituted, or his claim not closed by decree, during the life of his debtor, has no title to demand directly the office of executor *qua* creditor ; but he may charge the next of kin who stands off, to confirm, who must either renounce within twenty days after the charge, or be liable for the debt ; and if the next of kin renounces, the pursuer may constitute his debt, and obtain a decree *cognitionis causa*, against the *hereditas jacens* of the moveables, upon which he may confirm as executor creditor to the deceased. Where one is creditor, not to the deceased, but to his next of kin who stands off from confirming, he may affect the moveables of the deceased, by obtaining himself decerned

decerned executor-ative to the deceased, as if he were creditor to him, and not to his next of kin.

15. Where an executor has either omitted to give up any of the effects belonging to the deceased in inventory, or has estimated them below their just value, there is place for a new confirmation, *ad omiffa, vel male appretiatâ*, at the suit of any having interest; and if it appears that he has not omitted or undervalued any subject *doloſe*, the Commissary will ordain the subjects omitted, or the difference between the estimations in the principal testament and the true values, to be added thereto; but if *doloſe* shall be presumed, the whole subject of the testament *ad omiffa vel male appretiatâ*, will be carried to him who confirms it, to the exclusion of the executor in the principal testament.

16. The legitime and relict's share, because they are rights arising *ex lege*, operate *ipſo jure*, upon the father's death, in favour of the relict and children; and consequently pass from them, though they should die before confirmation, to their next of kin: Whereas the dead's part, which falls to the children or other next of kin in the way of succession, remains, if they should die before confirming, *in bonis* of the first deceased; and so does not descend to their next of kin, but may be confirmed by the person who, at the time of confirmation, is the next of kin to the first deceased. Special assignments, though neither intimated, nor made public, during the life of the granter, carry to the assignee the full right of the subjects assigned, without confirmation. Special legacies are really assignments, and so fall under this rule. The next of kin, by the bare possession of the *ipſa corpora* of moveables, acquires the property thereof without confirmation, and transmits it to his executors.

17. The confirmation of any one subject by the next of kin, as it proves his right of blood, has been adjudged to carry the whole executry out of the testament of the deceased, even what was omitted, and to transmit all to his own executors. The confirmation of a stranger, who is executor nominated, as it is merely a trust for the next of kin, has the effect to establish the right of the next of kin to the subjects confirmed, in the same manner as if himself had confirmed them.

18. Executry, though it carries a certain degree of representation of the deceased, is properly an office: Executors therefore are not subjected to the debts due by the deceased, beyond the value of the inventory; but, at the same time, they are liable in diligence for making the inventory effectual to all having interest. An executor-creditor who confirms more than his debt amounts to, is liable in diligence for what he confirms. Executors are not liable in interest, even upon such bonds recovered by them as carried interest to the deceased, because their office obliges them to retain the sums they have made effectual, in order to a distribution thereof among all having interest. This holds though they should again lend out the money upon interest, as they do it at their own risk.

19. There are certain debts of the deceased called privileged debts, which were always preferable to every other. Under that name are comprehended, medicines furnished to the deceased on death-bed, physicians fees during that period, funeral charges, and the rent of his house, and

his servant's wages for the year or term current at his death. These the executors are in safety to pay on demand. All the other creditors, who either obtain themselves confirmed, or who cite the executor already confirmed, within six months after their debtor's death, are preferred, *pâri paffu*, with those who have done more timely diligence; and therefore no executor can either retain for his own debt, or pay a testamentary debt, so as to exclude any creditor, who shall use diligence within the six months, from the benefit of the *pâri paffu* preference; neither can a decree for payment of debt be obtained, in that period, against an executor, because, till that term be elapsed, it cannot be known how many creditors may be intitled to the fund in his hands. If no diligence be used within the six months, the executor may retain for his own debt, and pay the residue *primò venienti*. Such creditors of the deceased as have used diligence within a year after their debtor's death, are preferable on the subject of his testament to the creditors of his next of kin.

20. The only passive title in moveables is vitious intromission, which may be defined an unwarrantable intermeddling with the moveable estate of a person deceased, without the order of law. This is not confined, as the passive titles in heritage are, to the persons interested in the succession, but strikes against all intromitters whatever. Where an executor confirmed, intromits with more than he has confirmed, he incurs a passive title, fraud being in the common case presumed from his not giving up in inventory the full subject intermeddled with. Vitious intromission is also presumed, where the repositories of a dying person are not sealed up, as soon as he becomes incapable of sense, by his nearest relations; or, if he dies in a house not his own, they must be sealed by the master of such house and the keys delivered to the Judge-ordinary, to be kept by him, for the benefit of all having interest.

21. The passive title of vitious intromission does not take place where there is any probable title or circumstance that takes off the presumption of fraud. In consequence of this rule, necessary intromission, or *custodie causa*, by the wife or children, who only continue the possession of the deceased, in order to preserve his goods for the benefit of all concerned, incurs no passive title. And upon the same principle, an intromitter, by confirming himself executor, and thereby subjecting himself to account, before action be brought against him on the passive titles, purges the vitiosity of his prior intromission: And where the intromitter is one who is interested in the succession, *e. g.* next of kin, his confirmation, at any time within a year from the death of the deceased, will exclude the passive title, notwithstanding a prior citation. As this passive title was intended only for the security of creditors, it cannot be sued upon by legatees; and since it arises *ex delicto*, it cannot be pleaded against the heir of the intromitter. As in delicts, any one of many delinquents may be subjected to the whole punishment, so any one of many intromitters may be sued *in ſolidum* for the pursuer's debt, without calling the rest; but the intromitter who pays, has an action of relief against the others for their share of it. If the intromitters are sued jointly,

jointly, they are liable, not *pro rata* of their several intromissions, but *pro virili*.

28. The whole of a debtor's estate is subjected to the payment of his debts; and therefore, both his heirs and executors are liable for them, in a question with creditors; but as succession is by law divided into the heritable and the moveable estate, each of these ought, in a question between the several successors, to bear the burdens which naturally affect it. Action of relief is accordingly competent to the heir who has paid a moveable debt, against the executor; and *vice versa*. This relief is not cut off by the deceased's having disposed either his land-estate or his moveables, with the burden of his *whole* debts; for such burden is not to be construed as an alteration of the legal succession, but merely as a farther security to creditors, unless the contrary shall be presumed from the special style of the disposition.

### Tit. 29. Of last Heirs and Bastards.

By our ancient practice, feudal grants taken to the vassal, and to a special order of heirs, without settling the last termination upon *heirs whatsoever*, returned to the superior, upon failure of the special heirs therein contained, but now that feus are become patrimonial rights, the superior is, by the general opinion, held to be fully divested by such grant, and the right descends to the vassal's heirs at law. And even where a vassal dies, without leaving any heir who can prove the remotest propinquity to him, it is not the superior, as the old law stood, but the King, who succeeds as last heir, both in the heritable and moveable estate of the deceased, in consequence of the rule, *Quod nullius est, cedit domino Regi*.

2. If the lands, to which the King succeeds, be holden immediately of himself, the property is consolidated with the superiority, as if resignation had been made in the Sovereign's hands. If they are holden of a subject, the King, who cannot be vassal to his own subject, names a donatory; who, to complete his title, must obtain decree of declarator; and thereafter he is presented to the superior, by letters of presentation from the King under the quarter-seal, in which the superior is charged to enter the donatory. The whole estate of the deceased is, in this case, subjected to his debts, and to the widow's legal provisions. Neither the King nor his donatory is liable beyond the value of the succession. A person who has no heir to succeed to him, cannot alien his heritage *in leffo*, to the prejudice of the King, who is intitled to set aside such deed, in the character of *ultimus heres*.

3. A bastard can have no legal heirs, except those of his own body; since there is no succession but by the father, and a bastard has no certain father. The King therefore succeeds to him, failing his lawful issue, as last heir. Though the bastard, as absolute proprietor of his own estate, can dispose of his heritage in *liege poustie*, and of his moveables by any deed *inter vivos*; yet he is disabled, *ex defectu natalium*, from bequeathing by testament, without letters of legitimation from the Sovereign. If the bastard has lawful children, he may test, without such letters, and name tutors and curators to his issue.

VOL. II. No. 66.

2

Letters of legitimation, let their clauses be ever so strong, cannot enable the bastard to succeed to his natural father, to the exclusion of lawful heirs.

4. The legal rights of succession, being founded in marriage, can be claimed only by those who are born in lawful marriage; the issue therefore of an unlawful marriage are incapable of succession. A bastard is excluded, 1. From his father's succession; because law knows no father, who is not marked out by marriage. 2. From all heritable succession, whether by the father or mother; because he cannot be pronounced lawful heir by the inquest, in terms of the brief; and, 3. From the moveable succession of his mother; for, though the mother be known, the bastard is not her lawful child, and legitimacy is implied in all succession conferred by law. A bastard, though he cannot succeed *jure sanguinis*, may succeed by destination, where he is specially called to the succession by an entail or testament.

5. Certain persons, though born in lawful marriage, are incapable of succession. Aliens are, from their allegiance to a foreign prince, incapable of succeeding in *feudal rights*, without naturalization. Children born in a foreign state, whose fathers were natural born subjects, and not attainted, are held to be natural born subjects. Persons educated in, or professing the Popish religion, if they shall neglect, upon their attaining the age of fifteen, to renounce its doctrines by a signed declaration, cannot succeed in *heritage*; but must give place to the next Protestant heir, who will hold the estate irredeemably, if the Popish heir does not, within ten years after incurring the irritancy, sign the *formula* prescribed by the statute 1700, c. 3.

### Tit. 30. Of Actions.

HITHERTO of *persons* and *rights*, the two first objects of law; *actions* are its third object, whereby persons make their rights effectual. An action may be defined, a demand regularly made and insisted in, before the judge competent, for the attaining or recovering of a right; and it suffers several divisions, according to the different natures of the rights pursued upon.

2. Actions are either real or personal. A real action, is that which arises from a right in the thing itself, and which therefore may be directed against all possessors of that thing: Thus, an action for the recovery, even of a moveable subject, when founded on a *jus in re*, is in the proper acceptation real; but real actions are, in vulgar speech, confined to such as are directed against heritable subjects. A personal action is founded only on an obligation undertaken for the performance of some fact, or the delivery of some subject; and therefore can be carried on against no other than the person obliged, or his heirs.

3. Actions are either ordinary or rescissory. All actions are, in the sense of this division, ordinary, which are not rescissory. Rescissory actions are divided, 1. Into actions of proper improbation. 2. Actions of reduction improbation. 3. Actions of simple reduction. Proper improbations, which are brought for declaring writings false or forged, are treated of below, Tit. 33. Reduction.

†

10 F

Reduction improbation is an action, whereby a person who may be hurt or affected by a writing, insists for producing or exhibiting it in court, in order to have it set aside, or its effect ascertained, under the certification that the writing, if not produced, shall be declared false and forged. This certification is a fiction of law, introduced that the production of writings may be the more effectually forced, and therefore it operates only in favour of the pursuer. Because the summons in this action proceeds on alleged grounds of falsehood, his Majesty's Advocate, who is the public prosecutor of crimes, must concur in it.

4. As the certification in this process draws after it so heavy consequences, two terms are assigned to the defenders for production. After the second term is elapsed, intimation must be made judicially to the defender, to satisfy the production within ten days; and till these are expired, no certification can be pronounced. Certification cannot pass against deeds recorded in the books of Session, if the defender shall, before the second term, offer a condescendence of the dates of their registration, unless falsehood be objected; in which case, the original must be brought from the record to the court. But an extract from the inferior court is no bar to certification; the principal writing must be laid before the court of Session on a proper warrant.

5. In an action of simple reduction the certification is only temporary, declaring the writings called for, null, until they be produced; so that they recover their full force after production, even against the pursuer himself; for which reason, that process is now seldom used. Because its certification is not so severe as in reduction-improbation, there is but on term assigned to the defender for producing the deeds called for.

6. The most usual grounds of reductions of writings are, the want of the requisite solemnities; that the granter was minor, or interdicted, or inhibited; or that he signed the deed on death bed, or was compelled or frightened into it, or was circumvented; or that he granted it in prejudice of his lawful creditors.

7. In reductions on the head of force, or fear, or fraud and circumvention, the pursuer must libel the particular circumstances from which his allegation is to be proved. Reduction is not competent upon every degree of force or fear; it must be such as would shake a man of constancy and resolution. Neither is it competent, on that fear which arises from the just authority of husbands or parents over their wives or children, nor upon the fear arising from the regular execution of lawful diligence by caption, provided the deeds granted under that fear relate to the ground of debt contained in the diligence; but if they have no relation to that debt, they are reducible *ex metu*.

8. Alienations granted by debtors after contracting of lawful debts, in favour of conjunct or confident persons, without just and necessary causes, and without a just price really paid, are null. One is deemed a prior creditor, whose ground of debt existed before the right granted by the debtor; though the written voucher of the debt should bear a date posterior to it. Persons are accounted conjuncts, whose relation to the granter is so

near, as to bar them from judging in his cause. Confident persons are those who appear to be in the granter's confidence, by being employed in his affairs, or about his person: as a doer, steward, or domestic servant.

9. Rights, though gratuitous, are not reducible, if the granter had, at the date thereof, a sufficient fund for the payment of his creditors. Provisions to children are, in the judgment of law, gratuitous; so that their effect, in a question with creditors, depends on the solvency of the granter: But settlements to wives, either in marriage contracts, or even after marriage, are onerous, in so far as they are rational; and consequently are not reducible, even though the granter was insolvent. This rule holds also in rational tochers contracted to husbands: But it must, in all cases, be qualified with this limitation, *if the insolvency of the granter was not publicly known*; for if it was, fraud is presumed in the receiver of the right, by contracting with the bankrupt.

10. The receiver of the deed, if he be a conjunct or confident person, must abstruse or support the onerous cause of his right, not merely by his own oath, but by some circumstances or adminicles. But where a right is granted to a stranger, the narrative of it expressing an onerous cause, is sufficient *per se* to secure it against reduction.

11. All voluntary payments or rights made by a bankrupt to one creditor, to disappoint the more timeous diligence of another, are reducible at the instance of that creditor who has used the prior diligence. A creditor, though his diligence be but begun by citation, may insist in a reduction of all posterior voluntary rights granted to his prejudice; but the creditor who neglects to complete his begun diligence within a reasonable time, is not intitled to reduce any right granted by the debtor, after the time that the diligence is considered as abandoned.

12. A prohibited alienation, when conveyed by the receiver to another who is not privy to the fraud, subsists in the person of the *bona fide* purchaser. In the case of moveable rights, this nullity is receivable by exception; but it must be declared by reduction, where the right is heritable.

13. By act 1696, c. 5. all alienations by a bankrupt, within sixty days before his bankruptcy, to one creditor in preference to another, are reducible, at the instance even of such co-creditors as had not used the least step of diligence. A bankrupt is there described by the following characters; diligence used against him by horning and caption; and insolvency, joined either with imprisonment, retiring to the sanctuary, absconding, or forcibly defending himself from diligence. It is sufficient that a caption is raised against the debtor, though it be not executed, provided he has retired to shun it. It is provided, that all heritable bonds or rights on which *seisin* may follow, shall be reckoned, in a question with the granter's other creditors upon this act, to be of the date of the *seisin* following thereon. But this act was found to relate only to securities for former debts, and not to *nova debita*.

14. Actions are divided into *rei persequutione*, and *personale*. By the first, the pursuer insists barely to recover the subject that is his, or the debt due to him; and it is included s

includes the damage sustained; for one is as truly a sufferer in his patrimonial interest by that damage, as by the loss of the subject itself. In penal actions, which always arise *ex delicto*, something is also demanded by way of penalty.

15. Actions of spuilzie, ejection, and intrusion, are penal. An action of spuilzie is competent to one dispossessed of a moveable subject violently, or without order of law, against the person dispossessing; not only for being restored to the possession of the subject, if extant, or for the value, if it be destroyed, but also for the violent profits, in case the action be brought within three years from the spoliation. Ejection and intrusion are, in heritable subjects, what spuilzie is in moveables. The difference between the two first is, that in ejection, violence is used; whereas the intruder enters into the void possession, without either a title from the proprietor, or the warrant of a judge. The actions arising from all the three are of the same general nature.

16. The action of contravention of law-borrows is also penal. It proceeds on letters of law-borrows, (from *borgh* a cautioner), which contain a warrant to charge the party complained upon, that he may give security, not to hurt the complainer in his person, family, or estate. These letters do not require the previous citation of the party complained upon, because the caution which the law requires is only for doing what is every man's duty; but, before the letters are executed against him, the complainer must make oath that he dreads bodily harm from him. The penalty of contravention is ascertained to a special sum, according to the offender's quality; the half to be applied to the silk, and the half to the complainer. Contravention is not incurred by the uttering of reproachful words, where they are not accompanied, either with acts of violence, or at least a real injury; and as the action is penal, it is elided by any probable ground of excuse.

17. Penalties are the consequences of delict, or transgression; and as no heir ought to be accountable for the delict of his ancestor, farther than the injured person has really suffered by it, penal actions die with the delinquent, and are not transmissible against heirs. Yet the action, if it has been commenced, and litiscontested in the delinquent's lifetime, may be continued against the heir, though the delinquent should die during the dependence. Some actions are *rei persecutoria* on the part of the pursuer, when he insists for simple restitution; which yet may be penal in respect of the defender; e.g. the action on the passive title of vitious intromission, by which the pursuer frequently recovers the debt due to him by the deceased, though it should exceed the value of the goods intermeddled with by the defenders.

18. The most celebrated division of actions in our law, is into *petitory*, *possessory*, and *declaratory*. *Petitory* actions are those, where something is demanded from the defender, in consequence of a right of property, or of credit in the pursuer: Thus, actions for restitution of moveables, actions of pointing, or forthcoming, and indeed all personal actions upon contracts or quasi contracts, are petitory. *Possessory* actions are those which are founded, either upon possession alone, as spuilzies; or

upon possession joined with another title, as removings; and they are competent either for getting into possession, for holding it, or for recovering it; analogous to the interdicts of the Roman law, *quorum bonorum, uti possidetis*, and *unde vi*.

16. An action of molestation is a possessory action, competent to the proprietor of a land-estate, against those who disturb his possession. It is chiefly used in questions of commonry, or of controverted marches. Where a declarator of property is conjoined with a process of molestation, the session alone is competent to the action. Actions on brieves of perambulation, have the same tendency with molestations, viz. the settling of marches between conterminous lands.

20. The action of mails and duties is sometimes petitory, and sometimes possessory. In either case, it is directed against the tenants and natural possessors of land-estates, for payment to the pursuer of the rents remaining due by them for past crops, and of the full rent for the future. It is competent, not only to a proprietor whose right is perfected by seisin, but to a simple disponee, for a disposition of lands includes a right to the mails and duties; and consequently to an adjudger, for an adjudication is a judicial disposition. In the petitory action, the pursuer, since he founds upon right, not possession, must make the proprietor, from whom the tenants derive their right, party to the suit; and he must support his claim by titles of property or diligences, preferable to those in the person of his competitor. In the possessory, the pursuer, who libels that he, his ancestors or authors, have been seven years in possession, and that therefore he has the benefit of a possessory judgment, need produce no other title than a seisin, which is a title sufficient to make the possession of heritage lawful; and it is enough, if he calls the natural possessors, though he should neglect the proprietor. A possessory judgment founded on seven years possession, in consequence either of a seisin or a tack, has this effect, that though one should claim under a title preferable to that of the possessor, he cannot compete with him in the possession, till in a formal process of reduction he shall obtain the possessor's title declared void.

21. A *declaratory* action is that, in which some right is craved to be declared in favour of the pursuer, but nothing sought to be paid or performed by the defender, such as declarators of marriage, of irritancy, of expiry of the legal reversion, &c. Under this class may be also comprehended rescissory actions, which, without any personal conclusion against the defender, tend simply to set aside the rights or writings libelled, in consequence of which a contrary right or immunity arises to the pursuer. Decrees upon action that are properly declaratory confer no new right; they only declare what was the pursuer's right before, and so have a retrospect to the period at which that right first commenced. Declarators, because they have no personal conclusion against the defender, may be pursued against an apparent heir without a previous charge given him to enter to his ancestor; unless where special circumstances require a charge.

22. An action for proving the tenor, whereby a writing, which is destroyed or amissing, is endeavored to be revived, is in effect declaratory. In obligations that are extinguishable

extinguishable barely by the debtor's retiring or cancelling them, the pursuer, before a proof of the tenor is admitted, must condescend on such a *casus amissionis*, or accident by which the writing was destroyed, as shews it was lost when in the creditor's possession; otherwise bonds that have been cancelled by the debtor on payment, might be reared up as still subsisting against him: But in writings which require contrary deeds to extinguish their effect, as assignations, dispositions, charters, &c. it is sufficient to libel that they were lost, even *casu fortuito*.

23. Regularly, no deed can be revived by this action, without some adminicle in writing, referring to that which is libelled; for no written obligation ought to be raised up barely on the testimony of witnesses. If these adminicles afford sufficient conviction, that the deed libelled did once exist, the tenor is admitted to be proved by witnesses, who must depose, either that they were present at signing the deed, or that they afterwards saw it duly subscribed. Where the relative writings contain all the substantial clauses of that which is lost, the tenor is sometimes sustained without witnesses. In a writing which is libelled to have contained uncommon clauses, all these must appear by the adminicles. Actions of proving the tenor are, on account of their importance, appropriated to the court of Session; and, by the old form, the testimony of the witnesses could not be received, but in presence of all the judges.

24. The action of double or multiple poiding may be also reckoned declaratory. It is competent to a debtor, who is distressed, or threatened with distress, by two or more persons claiming right to the debt, and who therefore brings the several claimants into the field, in order to debate and settle their several preferences, that so he may pay securely to him whose right shall be found preferable. This action is daily pursued by an arrestee, in the case of several arrestments used in his hands for the same debt; or by tenants in the case of several adjudgers, all of whom claim right to the same rents. In these competitions, any of the competitors may bring an action of multiple poiding in name of the tenants, or other debtors, without their consent, or even though they should disclaim the process; since the law has introduced it as the proper remedy for getting such competitions determined: And while the subject in controversy continues *in medio*, any third person who conceives he has a right to it, may, though he should not be cited as a defender, produce his titles, as if he were an original party to the suit, and will be admitted for his interest in the competition.

25. Certain actions may be called accessory, because they are merely preparatory or subservient to other actions. Thus, exhibitions *ad deliberandum*, at the instance of an heir against the creditors or custodiers of his ancestor's writings, are intended only to pave the way for future processes. An action of transference is also of this sort, whereby an action, during the pendency of which the defender happens to die, is craved to be transferred against his representative, in the same condition in which it stood formerly. Upon the pursuer's death, his heir may insist in the cause against the defender, upon producing, either a retour or a confirmed testament, ac-

cording as the subject is heritable or moveable. Transferences being but incidental to other actions, can be pronounced by that inferior judge alone before whom the principal cause depended; but, where the representatives of the deceased live in another territory, it is the supreme court which must transfer. Obligations may be now regiltred summarily after the creditor's death; which before was not admitted, without a separate process of regiltration, to which the granter was necessarily to be made a party.

26. A process of wakening is likewise accessory. An action is said to sleep, when it lies over, not insisted in for a year, in which case its effect is suspended; but even then it may, at any time within the years of prescription, be revived or wakened by a summons, in which the pursuer recites the last step of the process, and concludes that it may be again carried on as if it had not been discontinued. An action that stands upon any of the inner-house rolls cannot sleep; nor an action in which decree is pronounced, because it has got its full completion: Consequently the decree may be extracted after the year, without the necessity of a wakening.

27. An action of transumpt falls under the same class. It is competent to those, who have a partial interest in writings that are not in their own custody, against the possessors thereof, for exhibiting them, that they may be transumed for their behoof. Though the ordinary title in this process be an obligation by the defender to grant transumps to the pursuer, it is sufficient if the pursuer can show that he has an interest in the writings; but, in this case, he must transume them on his own charges. Actions of transumpt may be pursued before any judge-ordinary. After the writings to be transumed are exhibited, full duplicates are made out, collated, and signed, by one of the clerks of court, which are called transumps, and are as effectual as an extract from the register.

28. Actions proceeded anciently upon brieves issuing from the chancery, directed to the justiciary or judge-ordinary, who tried the matter by a jury, upon whose verdict judgment was pronounced: And to this day, we retain certain brieves, as of *inquest*, *terce*, *idealty*, *tutory*, *perambulation*, and perhaps two or three others: But summonses were, immediately upon the institution of the College of Justice, introduced in the place of brieves. A summons, when applied to actions pursued before the session, is a writ in the King's name, issuing from his signet upon the pursuer's complaint, authorising messengers to cite the defender to appear before the court, and make his defences; with certification if he fail to appear, that decree will be pronounced against him in terms of the certification of the summons.

29. The days indulged by law to a defender, between his citation and appearance, to prepare for his defence, are called *inducie legales*. If he is within the kingdom, twenty one and six days, for the first and second diets of appearance, must be allowed him for that purpose; and if out of it, sixty and fifteen. Defenders residing in Orkney or Zetland must be cited on forty days. In certain summonses which are privileged, the *inducie* are shortened: Spuilzies and ejections proceed on fifteen days; wakenings

wakenings and transferences, being but incidental, on six; see the list of privileged summonses, in act of sederunt June 29. 1672. A summons must be executed, *i. e.* served against the defender, so as the last diet of appearance may be within a year after the date of the summons; and it must be called within a year after that diet, otherwise it falls for ever. Offence against the authority of the court, acts of malversation in office by any member of the college of justice, and acts of violence and oppression committed during the dependence of a suit by any of the parties, may be tried without a summons, by a summary complaint.

30. Where an action is in part penal, *e. g.* a removing, spuilzie, &c. a pursuer who restricts his demand to, and obtains decree merely for restitution, cannot thereafter bring a new process for the violent profits. Yet the same fact may be the foundation both of a criminal and civil action, because these two are intended for different purposes; the one for satisfying the public justice, the other for indemnifying the private party: And though the defender should be absolved in the criminal trial, for want of evidence, the party injured may bring an action *ad civilem effectum*, in which he is intitled to refer the libel to the defender's oath.

31. One libel or summons may contain different conclusions on the same ground of right, rescissory, declaratory, petitory, &c. if they be not repugnant to each other: Nay, though different sums be due to one, upon distinct grounds of debt, or even by different debtors, the creditor may insist against them all in the same summons.

32. Defences are pleas offered by a defender for eliding an action. They are either dilatory, which do not enter into the cause itself, and so can only procure an absolution from the *lis pendens*: Or peremptory, which entirely cut off the pursuer's right of action. The first, because they relate to the forms of proceeding, must be offered *in limine judicii*, and all of them at once. But peremptory defences may be proponed at any time before sentence.

33. A cause, after the parties had litigated it before the judge, was said by the Romans to be litiscontested. By litiscontestation a judicial contract is understood to be entered into by the litigants, by which the action is perpetuated against heirs, even when it arises *ex delicto*. By our law, litiscontestation is not formed till an act is extracted, admitting the libel or defences to proof.

### Tit. 31. Of Probation.

ALL allegations by parties to a suit, must be supported by proper proof. Probation is either by writing, by the party's own oath, or by witnesses. In the case of allegations, which may be proved by either of the three ways, a proof is said to be admitted *prout de jure*; because in such case, all the legal methods of probation are competent to the party: If the proof he brings by writing be lame, he may have recourse either to witnesses or to his adversary's oath: but, if he should first take himself to the proof by oath, he cannot thereafter use any other probation, for the reason assigned § 3. and, on

VOL. II. Numb. 66.

2

the contrary, a pursuer, who has brought a proof by witnesses, on an extracted act, is not allowed to recur to the oath of the defender. Single combat, as a sort of appeal to Providence, was, by our ancient law, admitted as evidence, in matters both civil and criminal. It was afterwards restricted to the case of such capital crimes where no other proof could be had; some traces of this blind method of trial remained even in the reign of J. VI. who, by 1600. c. 12. might authorise duels on weighty occasions.

2. As obligations or deeds signed by the party himself, or his ancestors or authors, must be, of all evidence, the least liable to exception; therefore every debt or allegation may be proved by proper evidence in writing. The solemnities essential to probative deeds have been already explained, Tit. xxi. 3. *et seq.* Books of account kept by merchants, tradesmen, and other dealers in business, though not subscribed, are probative against him who keeps them; and, in case of furnishings by a shop-keeper, such books, if they are regularly kept by him, supported by the testimony of a single witness, afford a *semiplena probatio* in his favour, which becomes full evidence by his own oath in supplement. Notorial instruments and executions by messengers bear full evidence, that the solemnities therein set forth were used, not to be invalidated otherwise than by a proof of falsehood; but they do not prove any other extrinsic facts therein averred, against third parties.

3. Regularly, no person's right can be proved by his own oath, nor taken away by that of his adversary; because these are the bare averments of parties in their own favour. But, where the matter in issue is referred by one of the parties to the oath of the other, such oath, though made in favour of the deponent himself, is decisive of the point; because the reference is a virtual contract between the litigants, by which they are understood to put the issue of the cause upon what shall be deposed: And this contract is so strictly regarded, that the party who refers to the oath of the other cannot afterwards, in a civil action, plead upon any deed against the party deposing, inconsistent with his oath. To obviate the snares that may be laid for perjury, he, to whose oath of verity a point is referred, may refuse to depose, till his adversary swear that he can bring no other evidence in proof of his allegation.

4. A defender, though he cannot be compelled to swear to facts in a libel properly criminal; yet may, in trespasses where the conclusion is limited to a fine, or to damages. In general, an oath of party cannot either hurt or benefit third parties; being, as to them, *res inter alios acta*.

5. An oath upon reference, is sometimes qualified by special limitations restricting it. The qualities which are admitted by the judge as part of the oath, are called intrinsic; those which the judge rejects or separates from the oath, extrinsic. Where the quality makes a part of the allegation which is relevantly referred to oath, it is intrinsic. Thus, because a merchant, suing for furnishings after the three years, must, in order to make a relevancy, offer to prove by the defender's oath, not only the delivery of the goods, but that the price is still due; there-

†

10 G

fore

fore, though the defender should acknowledge upon oath his having received the goods, yet, if he adds, that he paid the price, this last part, being a denial that the debt subsists, is intrinsic, since it is truly the point referred to oath. Where the quality does not import an extinction of the debt, but barely a counter-claim, or *mutua petitio*, against the pursuer, it is held as extrinsic, and must be proved *aliunde*. Neither can a defender who in his oath admits the constitution of a debt, get off by objecting the quality of payment, where the payment ought by its nature to be vouched by written evidence.

6 Oaths of verity are sometimes deferred by the judge to either party, *ex officio*; which because they are not founded on any implied contract between the litigants, are not finally decisive, but may be traversed on proper evidence afterwards produced. These oaths are commonly put by the judge for supplying a lame or imperfect proof, and are therefore called oaths in supplement. See § 2.

7. To prevent groundless allegations, oaths of calumny have been introduced, by which either party may demand his adversary's oath, that he believes the fact contained in his libel or defences to be just and true. As this is an oath, not of verity, but only of opinion, the party who puts it to his adversary, does not renounce other probation; and therefore no party is bound to give an oath of calumny, on recent facts of his own, for such oath is really an oath of verity. These oaths have not been so frequent since the act of federunt, Feb. 1. 1715, whereby any party, against whom a fact shall be alledged, is obliged, without making oath, to confess or deny it; and in case of calumnious denial, is subjected to the expence that the other party has thereby incurred.

8. In all oaths, whether of verity or calumny, the citation carries, or at least implies, a certification, that if the party does not appear at the day assigned for deposing, he shall be held *pro confesso*; from a presumption of his consciousness, that the fact upon which he declines to swear makes against him; but no party can be held *pro confesso*, if he be in the kingdom, without a previous personal citation used against him. Though an oath which resolves into a *non memini*, cannot be said to prove any point; yet where one so deposes upon a recent fact, to which he himself was privy, his oath is considered as a dissembling of the truth, and he is held *pro confesso*, as if he had refused to swear.

9. An oath *in litem*, is that which the judge defers to a pursuer, for ascertaining either the quantity or the value of goods which have been taken from him by the defender without order of law, or the extent of his damages. An oath *in litem*, as it is the affirmation of a party in his own behalf, is only allowed where there is proof that the other party has been engaged in some illegal act, or where the public policy has made it necessary, see Tit. xx. 11. This oath, as to the quantities, is not admitted, where there is a concurring testimony of witnesses brought in proof of it. When it is put as to the value of goods, it is only an oath of credulity; and therefore it has always been subject to the modification of the court.

10. The law of Scotland rejects the testimony of witnesses, 1. In payment of any sum above L. 100 Scots, all

which must be proved either *scripto vel juramento*. 2. In all gratuitous promises, though for the smallest sums. 3. In all contracts, where writing is either essential to their constitution, (see Tit. xxi. 2) or where it is usually admitted, as in the borrowing of money. And it is a general rule, subject to the restrictions mentioned in the next §, that no debt or right, once constituted by writing, can be taken away by witnesses.

11. On the other part, probation by witnesses is admitted to the extent of L. 100 Scots, in payments, nuncupative legacies, and verbal agreements which contain mutual obligations. And it is received to the highest extent, 1. In all bargains which have known engagements naturally arising from them, concerning moveable goods. 2. In facts performed in satisfaction, even of a written obligation, where such obligation binds the party precisely to the performance of them. 3. In facts which with difficulty admit of a proof by writing, even though the effect of such proof should be the extinction of a written obligation, especially if the facts import fraud or violence; thus, a bond is reducible *ex dolo*, on a proof by witnesses. Lastly, all intromission by a creditor with the rents of his debtor's estate payable in grain, may be proved by witnesses; and even intromission with the silver-rent, where the creditor has entered into the total possession of the debtor's lands.

12. No person, whose near relation to another bars him from being a judge in his cause, can be admitted as a witness for him; but he may, against him, except a wife or child, who cannot be compelled to give testimony against the husband or parent, *ob reverentiam personæ, et metum perjurii*. Though the witness, whose propinquity to one of the parties is objected to, be as nearly related to the other, the objection stands good.

13. The testimony of infamous persons is rejected; *i. e.* persons who have been guilty of crimes that law declares to infer infamy, or who have been declared infamous by the sentence of a judge; but *infamia facti* does not disqualify a witness. Pupils are inhabile witnesses; being, in the judgment of law, incapable of the impressions of an oath. The testimony of women is seldom admitted, where other witnesses can be had. And in general witnesses otherwise exceptionable may, where there is a penury of witnesses arising from the nature or circumstances of the fact, be received *cum nota*; that is, their testimony, though not quite free from suspicion, is to be conjoined with the other evidence; and to have such weight given it as the judge shall think it deserves.

14. All witnesses, before they are examined in the cause, are purged of partial counsel; that is, they must declare, that they have no interest in the suit, nor have given advice how to conduct it; that they have got neither bribe nor promise, nor have been instructed how to depose; and that they bear no enmity to either of the parties. These, because they are the points put to a witness before his making oath, are called *initialia testimonii*. Where a party can bring present proof of a witness's partial counsel, in any of the above particulars, he ought to offer it before the witness be sworn; but, because such objection, if it cannot be instantly verified, will be no bar to the examination, law allows the party in that case to proceed.

protest for *reprobator*, before the witness is examined; *i. e.* that he may be afterwards allowed to bring evidence of his enmity, or other inhability. Reprobator is competent even after sentence, where protestation is duly entered; but in that case, the party inflicting must consign *L. 100 Scots*, which he forfeits if he succumb. This action must have the concurrence of the King's Advocate, because the conclusion of it imports perjury; and for this reason, the witness must be made a party to it.

15. The interlocutory sentence or warrant, by which parties are authorized to bring their proof, is either by way of act, or of incident diligence. In an act, the Lord Ordinary who pronounces it, is no longer judge in the process; but in an incident diligence, which is commonly granted upon special points, that do not exhaust the cause, the Lord ordinary continues judge. If a witness does not appear at the day fixed by the warrant of citation, a second warrant is granted of the nature of a caption, containing a command to messengers to apprehend and bring him before the court. Where the party to whom a proof is granted, brings none within the term allowed by the warrant, an interlocutor is pronounced, circumducing the term, and precluding him from bringing evidence thereafter. Where evidence is brought, if it be upon an act, the Lord Ordinary on the acts, after the term for proving is elapsed, declares the proof concluded, and thereupon a state of the case is prepared by the Ordinary on concluded causes, which must be judged by the whole Lords; but if the proof be taken upon an incident diligence, the import of it may be determined by the Lord Ordinary in the cause.

16. Where facts do not admit a direct proof, presumptions are received as evidence which, in many cases, make as convincing a proof as the direct. Presumptions are consequences deduced from facts known or proved, which infer the certainty, or at least a strong probability, of another fact to be proved. This kind of probation is therefore called artificial, because it requires a reasoning to infer the truth of the point in question, from the facts that already appear in proof. Presumptions are either, 1. *juris et de jure*; 2. *juris*; or 3. *hominis* or *judicis*. The first sort obtains, where statute or custom establishes the truth of any point upon a presumption; and it is so strong, that it rejects all proof that may be brought to elide it in special cases. Thus, the testimony of a witness, who forwardly offers himself without being cited, is, from a presumption of his partiality, rejected, let his character be ever so fair; and thus also, a minor, because he is by law presumed incapable of conducting his own affairs, is, upon that presumption, disabled from acting without the consent of his curators, though he should be known to behave with the greatest prudence. Many such presumptions are fixed by statute.

17. *Præsumptiones juris* are those, which our law books or decisions have established, without founding any particular consequence upon them, or statuting *super præsumpto*. Most of this kind are not proper presumptions inferred from positive facts, but are founded merely on the want of a contrary proof; thus, the legal presumptions for freedom, for life, for innocence, &c. are in effect so many negative propositions, that servitude, death, and

guilt, are not to be presumed, without evidence brought by him who makes the allegation. All of them, whether they be of this sort, or proper presumptions, as they are only conjectures formed from what commonly happens, may be elided, not only by direct evidence, but by other conjectures, affording a stronger degree of probability to the contrary. *Præsumptiones hominis* or *judicis*, are those which arise daily from the circumstances of particular cases; the strength of which is to be weighed by the judge.

18. A *factio juris* differs from a presumption. Things are presumed, which are likely to be true; but a fiction or law assumes for truth what is either certainly false, or, at least, is as probably false as true. Thus, an heir is feigned or considered in law as the same person with his ancestor. Fictions of law must, in their effects, be always limited to the special purposes of equity, for which they were introduced; see an example, Tit. xxx. 3.

### Tit. 32. Of Sentences and their Execution.

PROPERTY would be most uncertain, if debateable points might, after receiving a definitive judgment, be brought again in question, at the pleasure of either of the parties: Every state has therefore affixed the character of final to certain sentences or decrees, which in the Roman law are called *res judicata*, and which exclude all review or rehearing.

2. Decrees of the court of Session, are either *in foro contradictorio*, where both parties have litigated the cause, or in absence of the defender. Decrees of the Session *in foro* cannot, in the general case, be again brought under the review of the court, either on points which the parties neglected to plead before sentence (which we call competent and omitted), or upon points pleaded and found insufficient (proposed and repelled.) But decrees, though *in foro*, are reversible by the court, where either they labour under essential nullities; *e. g.* where they are *ultra petita*, or not conformable to their grounds and warrants, or founded on an error in calcul, &c.; or where the party against whom the decree is obtained has thereafter recovered evidence sufficient to overturn it, of which he knew not before.

3. As parties might formerly reclaim against the sentences of the session, at any time before extracting the decree, no judgment was final till extract; but now, a sentence of the inner-house, either not reclaimed against within six sederunt-days after its date, or adhered to upon a reclaiming bill, though it cannot receive execution till extract, makes the judgment final as to the court of Session. And, by an order of the house of Lords, March 24. 1725, no appeal is to be received by them from sentences of the Session after five years from extracting the sentence; unless the person entitled to such appeal be minor, clothed with a husband, *non compos mentis*, imprisoned, or out of the kingdom. Sentences pronounced by the Lord Ordinary have the same effect, if not reclaimed against, as if they were pronounced in presence; and all petitions against the interlocutor of an Ordinary must be preferred within eight sederunt days after signing such interlocutor.

4. Decrees, in absence of the defender, have not the force of *res judicate* as to him; for where the defender does not appear, he cannot be said to have subjected himself by the judicial contract which is implied in litifcontestation: A party therefore may be restored against these, upon paying to the other his costs in recovering them. The sentences of inferior courts may be reviewed by the court of Session, before decree, by advocacy, and after decree, by suspension or reduction; which two last are also the methods of calling in question such decrees of the Session itself as can again be brought under the review of the court.

5. Reduction is the proper remedy, either where the decree has already received full execution by payment, or where it decrees nothing to be paid or performed, but simply declares a right in favour of the pursuer. Suspension is that form of law by which the effect of a sentence condemnatory, that has not yet received execution, is stayed or postponed, till the cause be again considered. The first step towards suspension is a bill preferred to the Lord Ordinary on the bills. This bill, when the desire of it is granted, is a warrant for issuing letters of suspension which pass the signet; but, if the presenter of the bill shall not, within fourteen days after passing it, expedite the letters, execution may proceed on the sentence. Suspensions of decrees *in foro* cannot pass, but by the whole Lords in time of session, and by three in vacation time; but other decrees may be suspended by any one of the judges.

6. As suspension has the effect of staying the execution of the creditor's legal diligence, it cannot, in the general case, pass without caution given by the suspender to pay the debt, in the event it shall be found due. Where the suspender cannot, from his low or suspected circumstances, procure unquestionable security, the Lords admit juratory caution, *i. e.* such as the suspender swears is the best he can offer; but the reasons of suspension are, in that case, to be considered with particular accuracy at passing the bill. Decrees in favour of the clergy, of universities, hospitals, or parish school masters, for their stipends, rents, or salaries, cannot be suspended, but upon production of discharges, or on consignation of the sums charged for. A charger, who thinks himself secure without a cautioner, and wants dispatch, may, where a suspension of his diligence is sought, apply to the court to get the reasons of suspension summarily discussed on the bill.

7. Though he, in whose favour the decree suspended is pronounced, be always called the charger, yet a decree may be suspended before a charge be given on it. Nay, suspension is competent even where there is no decree, for putting a stop to any illegal act whatsoever: Thus, a building, or the exercise of a power which one assumes unwarrantably, is a proper subject of suspension. Letters of suspension are considered merely as a prohibitory diligence; so that the suspender, if he would turn provoker, must bring an action of reduction. If upon discussing the letters of suspension, the reasons shall be sustained, a decree is pronounced, suspending the letters of diligence on which the charge was given *simpliciter*; which is called a decree of suspension, and takes off the effect of the decree sus-

pending. If the reasons of suspension be repelled, the court find the letters of diligence orderly proceeded, *i. e.* regularly carried on; and they ordain them to be put to farther execution.

8. Decrees are carried into execution, by diligence, either against the person, or against the estate of the debtor. The first step of personal execution is by letters of horning, which pass, by warrant of the court of Session, on the decrees of magistrates of boroughs, sheriffs, admirals, and commissaries. If the debtor does not obey the will of the letters of horning within the days of the charge, the charger, after denouncing him rebel, and registering the horning, may apply for letters of caption, which contain a command, not only to messengers, but to magistrates, to apprehend and imprison the debtor. All messengers and magistrates, who refuse their assistance in executing the caption, are liable *subsidiarie* for the debt; and such subsidiary action is supported by the execution of the messenger employed by the creditor, expressing that they were charged to concur, and would not. Letters of caption contain an express warrant to the messenger, in case he cannot get access, to break open all doors, and other lock fast places.

9. Law secures peers, married women, and pupils, against personal execution by caption upon civil debts. No caption can be executed against a debtor within the precincts of the King's palace of Holyroodhouse: But this privilege of sanctuary afforded no security to criminals, as that did which was, by the canon law, conferred on churches and religious houses. Where the personal presence of a debtor, under caption, is necessary in any of our supreme courts, the judges are empowered to grant him a protection, for such time as may be sufficient for his coming and going, not exceeding a month.

10. After a debtor is imprisoned, he ought not to be indulged the benefit of the air, not even under a guard; for creditors have an interest, that their debtors be kept under close confinement, that, by the *squalor carceris*, they may be brought to pay their debt: And any magistrate or jailor, who shall suffer the prisoner to go abroad, without a proper attestation, upon oath, of the dangerous state of his health, is liable *subsidiarie* for the debt. Magistrates are in like manner liable, if they shall suffer a prisoner to escape, through the insufficiency of their prison: But, if he shall escape under night, by the use of instruments, or by open force, or by any other accident which cannot be imputed to the magistrates or jailor, they are not chargeable with the debt; provided they shall have, immediately after his escape, made all possible search for him. Regularly, no prisoner for debt upon letters of caption, though he should have made payment, could be released without letters of suspension, containing a charge to the jailor to set him at liberty; because the creditor's discharge could not take off the penalty incurred by the debtor for contempt of the King's authority: But to save unnecessary expence to debtors in small debts, jailors are empowered to let go prisoners where the debt does not exceed 200 marks *Scots*, upon production of a discharge, in which the creditor consents to his release.

11. Our law, from a consideration of compassion, allows insolvent debtors to apply for a release from prison, upon a *cessio bonorum*, i. e. upon their making over to the creditors all their estate, real and personal. This must be insisted for, by way of action, to which all the creditors of the prisoner ought to be made parties. The prisoner must, in this action, which is cognisable only by the court of Session, exhibit a particular inventory of his estate, and make oath that he has no other estate than is therein contained, and that he has made no conveyance of any part of it, since his imprisonment, to the hurt of his creditors. He must also make oath, whether he has granted any disposition of his effects before his imprisonment, and condescend on the persons to whom, and on the cause of granting it; that the court may judge, whether, by any collusive practice, he has forfeited his claim to liberty.

12. A fraudulent bankrupt is not allowed this privilege; nor a criminal who is liable in an assythment or indemnification to the party injured or his executors, though the crime itself should be extinguished by a pardon. A disposition granted on a *cessio bonorum* is merely in farther security to the creditors, not in satisfaction or *in solutum* of the debts. If therefore, the debtor shall acquire any estate after his release, such estate may be attached by his creditors, as if there had been no *cessio*, except in so far as is necessary for his subsistence. Debtors, who are set free on a *cessio bonorum*, are obliged to wear a habit proper to dyvours or bankrupts. The Lords are prohibited to dispense with this mark of ignominy, unless, in the summons and process of *cessio*, it be libelled, sustained, and proved, that the bankruptcy proceeds from misfortune. And bankrupts are condemned to submit to the habit, even where no suspicion of fraud lies against them, if they have been dealers in an illicit trade.

13. Where a prisoner for debt declares upon oath, before the magistrate of the jurisdiction, that he has not wherewith to maintain himself, the magistrate may set him at liberty, if the creditor, in consequence of whose diligence he was imprisoned, does not aliment him within ten days after intimation made for that purpose. But the magistrate may, in such case, detain him in prison, if he chuses to bear the burden of the aliment; rather than release him. The statute authorising this release, which is usually called the act of grace, is limited to the case of prisoners for civil debts.

14. Decrees are executed against the moveable estate of the debtor by arrestment or pouding; and against his heritable estate, by inhibition, or adjudication. If one be condemned, in a removing or other process, to quit the possession of lands, and refuses, notwithstanding a charge, letters of ejection are granted of course, ordaining the sheriff to eject him; and to enter the obtainer of the decree into possession. Where one opposes by violence the execution of a decree, or of any lawful diligence, which the civil magistrate is not able to do himself and his officers to make good, the execution is enforced *manu militari*.

15. A decree-arbitral, which is a sentence proceeding on a submission to arbiters, has some affinity with a ju-

dicial sentence, though in most respects the two differ. A submission is a contract entered into, by two or more parties who have disputable rights or claims, whereby they refer their differences to the final determination of an arbiter or arbiters, and oblige themselves to acquiesce in what shall be decided. Where the day within which the arbiters are to decide, is left blank in the submission, practice has limited the arbiters power of deciding to a year. As this has proceeded from the ordinary words of style, empowering the arbiters to determine betwixt and the day of next to come; therefore, where a submission is indefinite, without specifying any time, like all other contracts or obligations, it subsists for forty years. Submissions, like mandates, expire by the death of any of the parties-submitters before sentence. As arbiters are not vested with jurisdiction, they cannot compel witnesses to make oath before them, or havers of writings to exhibit them; but this defect is supplied by the court of Session, who, at the suit of the arbiters, or of either of the parties, will grant warrant for citing witnesses, or for the exhibition of writings. For the same reason, the power of arbiters is barely to decide; the execution of the decree belongs to the judge. Where the submitters consent to the registration of the decree-arbitral, performance may be enforced by summary diligence.

16. The power of arbiters is wholly derived from the consent of parties. Hence, where their powers are limited to a certain day, they cannot pronounce sentence after that day. Nor can they subject parties to a penalty higher than that which they have agreed to in the submission. And where a submission is limited to special claims, sentence pronounced on subjects not specified in the submission is null, as being *ultra vires compromissi*.

17. But, on the other part, as submissions are designed for a most favourable purpose, the amicable composing of differences, the powers thereby conferred on arbiters receive an ample interpretation. Decrees-arbitral are not reducible upon any ground, except corruption, bribery, or falsehood.

#### Tit. 26. Of Crimes.

THE word *crime*, in its most general sense, includes every breach, either of the law of God, or of our country; in a more restricted meaning, it signifies such transgressions of law as are punishable by courts of justice. Crimes were, by the Roman law, divided into public and private. Public crimes were those that were expressly declared such by some law or constitution, and which, on account of their more atrocious nature and hurtful consequences, might be prosecuted by any member of the community. Private crimes could be pursued only by the party injured, and were generally punished by a pecuniary fine to be applied to his use. By the law of Scotland, no private party, except the person injured, or his next of kin, can accuse criminally: but the King's Advocate, who in this question represents the community, has a right to prosecute all crimes in *vindictam publicam*, though the party injured should refuse to concur. Smaller offences, as petty riots, injuries, &c. which do not demand

mand the public vengeance, pass generally by the appellation of delicts, and are punished either by fine or imprisonment.

2. The essence of a crime is, that there be an intention in the actor to commit it; for an action in which the will of the agent has no part, is not a proper object either of rewards or punishments: Hence arises the rule, *crimen dolo contrahitur*. Simple negligence does not therefore constitute a proper crime. Yet where it is extremely gross, it may be punished arbitrarily. Far less can we reckon in the number of crimes, those committed by an idiot or furious person: But lesser degrees of fatuity, which only darken reason, will not afford a total defence, though they may save from the *pœna ordinaria*. Actions committed in drunkenness are not to be considered as involuntary, seeing the drunkenness itself, which was the first cause of the action, is both voluntary and criminal.

3. On the same principle, such as are in a state of infancy, or in the confines of it, are incapable of a criminal action, dole not being incident to that age; but the precise age at which a person becomes capable of dole, being fixed neither by nature nor by statute, is by our practice to be gathered by the judge, as he best can, from the understanding and manners of the person accused. Where the guilt of a crime arises chiefly from statute, the actor, if he is under puberty, can hardly be found guilty; but, where nature itself points out its deformity, he may, if he is *proximus pubertati*, be more easily presumed capable of committing it: Yet, even in that case, he will not be punished *pœna ordinaria*.

4. One may be guilty of a crime, not only by perpetrating it himself, but by being accessory to a crime committed by another; which last is by civilians styled *ope et consilio*, and, in our law-phrases, art and part. A person may be guilty, art and part, either by giving advice or counsel to commit the crime; or, 2. By giving warrant or mandate to commit it; or, 3. By actually assisting the criminal in the execution. It is generally agreed by doctors, that, in the more atrocious crimes, the adviser is equally punishable with the criminal; and that, in the slightest, the circumstances arising from the adviser's lesser age, the jocular or careless manner of giving advice, &c. may be received as pleas for softening the punishment. One who gives mandate to commit a crime, as he is the first spring of action, seems more guilty than the person employed as the instrument in executing it; yet the actor cannot excuse himself under the pretence of orders which he ought not to have obeyed.

5. Assistance may be given to the committer of a crime, not only in the actual execution, but previous to it, by furnishing him, intentionally, with poison, arms, or the other means of perpetrating it. That sort of assistance which is not given till after the criminal act, and which is commonly called abetting, though it be of itself criminal, does not infer art and part of the principal crime; as if one should favour the escape of a criminal knowing him to be such, or conceal him from justice.

6. Those crimes that are, in their consequences, most hurtful to society, are punished capitally, or by death; others escape with a lesser punishment, sometimes fixed by statute, and sometimes arbitrary, *i. e.* left to the dis-

cretion of the judge, who may exercise his jurisdiction, either by fine, imprisonment, or a corporal punishment. Where the punishment is left, by law, to the discretion of the judge, he can in no case extend it to death. The single escheat of the criminal falls on conviction, in all capital trials, though the sentence should not express it.

7. Certain crimes are committed more immediately against God himself; others, against the state; and a third kind, against particular persons. The chief crime in the first class, cognisable by temporal courts, is *blasphemy*, under which may be included atheism. This crime consists in the denying or vilifying the Deity, by speech or writing. All who curse God or any of the persons of the blessed Trinity, are to suffer death, even for a single act; and those who deny him, if they persist in their denial. The denial of a providence, or of the authority of the holy Scriptures, is punishable capitally for the third offence.

8. No prosecution can now be carried on for witchcraft or conjuration. But all who undertake, from their skill in any occult science, to tell fortunes, or discover stolen goods, are to suffer imprisonment for a year, stand in the pillory four times in that year, and find surety for their future good behaviour.

9. Some crimes against the state are levelled directly against the supreme power, and strike at the constitution itself: others discover such a contempt of law, as tends to baffle authority, or slacken the reins of government. *Treason, crimen majestatis*, is that crime which is aimed against the majesty of the state; and can be committed only by those who are subjects of that state either by birth or residence. Soon after the union of the two kingdoms in 1707. the laws of treason, then in force in England, were made ours by 7. *An. c.* 21. both with regard to the facts constituting that crime, to the forms of trial, the corruption of blood, and all the penalties and forfeitures consequent on it.

10. It is high treason, by the law of England, to imagine the death of the King, Queen-consort, or of the heir apparent of the crown; to levy war against the King, or adhere to his enemies; to counterfeit the King's coin, or his great or privy seal; to kill the chancellor, treasurer, or any of the twelve judges of England, while they are doing their offices; which last article is by the forenamed act 7. *An.* applied to Scotland, in the case of slaying any judge of the Session or of Justiciary sitting in judgment. Those who wash, clip, or lighten the proper money of the realm, who advisedly affirm by writing or printing, that the Pretender has any right to the crown, that the King and Parliament cannot limit the succession to it, or who hold correspondence with the Pretender or any person employed by him, are also guilty of treason.

11. The forms of proceeding in the trial of treason, whether against Peers or Commoners, are set forth in a small treatise, published by order of the house of Lords in 1709, subjoined to a collection of statutes concerning treason. By the conviction upon this trial, the whole estate of the traitor forfeits to the crown. His blood is also corrupted, so that, on the death of an ancestor, he cannot inherit;

herit; and the estate which he cannot take, falls to the immediate superior as escheat, *ob defectum hereditatis*, without distinguishing whether the lands hold of the crown, or of a subject. No attainer for treason shall, after the death of the Pretender and all his sons, hurt the right of any person, other than that of the offender, during his natural life; The rights of creditors and other third parties in the case of forfeiture on treason, must be determined by the law of England.

12. *Misprision of treason*, from *Meprendre*, is the overlooking or concealing of treason. It is inferred by one's bare knowledge of the crime, and not discovering it to a magistrate or other person intrusted by his office to take examinations; though he should not in the least degree assent to it. The fore-said act 7. *An.* makes the English law of misprision ours. Its punishment is, by the law of England, perpetual imprisonment, together with the forfeiture of the offender's moveables, and of the profits of his heritable estate, during his life; that is, in the style of our law, his single and liferent escheat.

13. The crime of *sedition* consists in the raising commotions or disturbances in the state. It is either verbal or real. Verbal sedition, or leasing making, is inferred from the uttering of words tending to create discord between the King and his people. It is punished either by imprisonment, fine, or banishment, at the discretion of the judge. Real sedition is generally committed, by convoking together any considerable number of people, without lawful authority, under the pretence of redressing some public grievance, to the disturbing of the public peace. Those who are convicted of this crime are punished by the confiscation of their goods; and their lives are at the King's will. If any persons, to the number of twelve, shall assemble, and being required by a magistrate or constable to disperse, shall nevertheless continue together for an hour after such command, the persons disobeying shall suffer death and the confiscation of moveables.

14. Judges, who, wilfully or through corruption, use their authority as a cover to injustice or oppression, are punished with the loss of honour, fame, and dignity. Under this head, may be classed *theftbote* (from *bote*, compensation), which is the taking a consideration in money or goods from a thief to exempt him from punishment, or connive at his escape from justice. A sheriff or other judge, guilty of this crime, forfeits his life and goods. And even a private person, who takes theftbote, suffers as the principal thief. The buying of disputed claims, concerning which there is a pending process, by any judge or member either of the Session, or of an inferior court, is punished by the loss of the delinquent's office, and all the privileges thereto belonging.

15. Deference is the opposition given, or resistance made, to messengers or other officers, while they are employed in executing the law. The court of Session is competent to this crime. It is punishable with the confiscation of moveables, the one half to the King, and the other to the creditor at whose suit the diligence was used. Armed persons, to the number of three or more, assisting in the illegal running, landing, or exporting of prohibited or uncustomed goods, or any who shall resist, wound,

or maim any officer of the revenue in the execution of office, are punishable with death and the confiscation of moveables.

16. *Breach of arrestment*, (see Tit. xxv. 5.) is a crime of the same nature with deformance, as it imports a contempt of the law and of our judges. It subjects to an arbitrary corporal punishment, and the escheat of moveables; with a preference to the creditor for his debt, and for such farther sum as shall be modified to him by the judge. Under this head of crimes against good government and police, may be reckoned the *forestalling of markets*; that is, the buying of goods intended for a public market, before they are carried there; which for the third criminal act, infers the escheat of moveables; as also slaying salmon in forbidden time, destroying plough-graith in time of tillage, slaying or houghing horses or cows in time of harvest, and destroying or spoiling growing timber; as to the punishment of which, see statutes 1503, c. 72,—1587, c. 82, and 1698, c. 16—1. *Geo. I. St. 2. c. 48.*

17. Crimes against particular persons may be directed, either against life, limb, liberty, chastity, goods, or reputation. *Murder* is the wilful taking away of a person's life, without a necessary cause. Our law makes no distinction between premeditated and sudden homicide; both are punished capitally. Casual homicide, where the actor is in some degree blameable, and homicide in self-defence, where the just bounds of defence have been exceeded, are punished arbitrarily; but the slaughter of night-thieves, house-breakers, assistants in masterful depredations, or rebels denounced for capital crimes, may be committed with impunity. The crime of *dismemberment*, or the cutting off of a member, is joined with that of murder; but in practice, its punishment has been restricted to the escheat of moveables, and an assything or indemnification to the party. *Mutilation*, or the disabling of a member, is punished at the discretion of the judge.

18. *Self-murder* is as highly criminal as the killing our neighbour; and for this reason, our law has, contrary to the rule, *crimina morte extinguuntur*, allowed a proof of the crime, after the offender's death, that his single escheat might fall to the King or his donatory. To this end, an action must be brought, not before the Justiciary, but the Session, because it is only intended *ad civilem effectum*, for proving and declaring the self-murder; and the next of kin to the deceased must be made a party to it.

19. The punishment of parricide, or of the murder of a parent, is not confined, by our law, to the criminal himself. All his posterity in the right line are declared incapable of inheriting; and the succession devolves on the next collateral heir. Even the cursing or beating of a parent infers death, if the person guilty be above sixteen years; and an arbitrary punishment, if he be under it. A presumptive or statutory murder is constituted by 1690, c. 21. by which any woman who shall conceal her pregnancy, during its whole course, and shall not call for, or make use of help in the birth, is to be reputed the murderer, if the child be dead, or amissing. This act was intended to discourage the unnatural practice of wo-

men

men making away with their children begotten in fornication to avoid church-censures.

20. *Duelling*, is the crime of fighting in single combat, on previous challenges given and received. Fighting in a duel, without licence from the King, is punishable by death; and whatever person, principal or second, shall give a challenge to fight a duel, or shall accept a challenge, or otherwise engage therein, is punished by banishment and escheat of moveables, though no actual fighting should ensue.

21. *Himsucken*, (from *haim*, home, and *socken*, to seek or pursue,) is the assaulting or beating of a person in his own house. The punishment of this crime is no where defined, except in the books of the Majesty, which make it the same as that of a rape; and it is, like rape, capital by our practice. The assault must be made in the proper house of the person assaulted, where he lies and rises daily and nightly, so that neither a public house, nor even a private, where one is only transiently, falls within the law.

22. Any party to a law-suit, who shall slay, wound, or otherwise invade his adversary, at any period of time between executing the summons and the compleat execution of the decree, or shall be accessory to such invasion, shall lose his cause. The sentence pronounced on this trial, against him who has committed the battery, is not subject to reduction, either on the head of minority, or any other ground whatever: And if the person prosecuted for this crime shall be denounced for not appearing, his liferent, as well as single escheat, falls upon the denunciation.

23. The crime of *wrongous imprisonment* is inferred, by granting warrants of commitment in order to trial, proceeding on informations not subscribed, or without expressing the cause of commitment; by receiving or detaining prisoners on such warrants; by refusing to a prisoner a copy of the warrant of commitment; by detaining him in close confinement, above eight days after his commitment; by not releasing him on bail, where the crime is bailable; and by transporting persons out of the kingdom, without either their own consent, or a lawful sentence. The persons guilty of a wrongous imprisonment, are punished by a pecuniary mulct, from L. 6000 down to L. 400 *Scots*, according to the rank of the person detained; and the judge or other person guilty, is over and above subjected to pay to the person detained a certain sum *per diem*, proportioned to his rank, and is declared incapable of public trust. All these penalties may be insisted for by a summary action before the session, and are subject to no modification.

24. *Adultery*, is the crime by which the marriage-bed is polluted. This crime could, neither by the Roman nor Jewish law, be committed, but where the guilty woman was the wife of another: By ours, it is adultery, if either the man or woman be married. We distinguish between simple adultery, and that which is notorious or manifest. Open and manifest adulterers, who continue incorrigible, notwithstanding the censures of the church, are punished capitally. This crime is distinguished by one or other of the following characters; where there is issue procreated between the adulterers; or where they

keep bed and company together notoriously; or where they give scandal to the church, and are, upon their obstinate refusing to listen to their admonitions, excommunicated. The punishment of simple adultery, not being defined by statute, is left to the discretion of the judge; but custom has made the falling of the single escheat one of its penalties.

25. *Bigamy*, is a person's entering into the engagements of a second marriage, in violation of a former marriage vow still subsisting. Bigamy, on the part of the man, has been tolerated in many states, before the establishment of Christianity, even by the Jews themselves; but it is prohibited by the precepts of the gospel, and it is punished by our law, whether on the part of the man, or of the woman, with the pains of perjury.

26. *Incest*, is committed by persons who stand within the degrees of kindred forbidden in *Lev. xviii.* and is punished capitally. The same degrees are prohibited in affinity, as in consanguinity, *Lev. xviii. 13. et seq.* As this crime is repugnant to nature, all children, whether lawful or natural, stand on an equal footing: *Civilis ratio civilia jura corrumpere potest, non vero naturalia.* It is difficult indeed to bring a legal proof of a relation merely natural, on the side of the father; but the mother may be certainly known without marriage.

26. There is no explicate statute making rape, or the ravishing of women, capital; but it is plainly supposed in act 16 12, c. 4. by which the ravisher is exempted from the pains of death, only in the case of the woman's subsequent consent, or her declaration that she went off with him of her own free-will; and even then, he is to suffer an arbitrary punishment, either by imprisonment, confiscation of goods, or a pecuniary fine.

28. *Theft* is defined, a fraudulent intermeddling with the property of another, with a view of making gain. Our ancient law proportioned the punishment of the theft to the value of the goods stolen; heightening it gradually, from a slight corporal punishment to a capital, if the value amounted to thirty-two pennies Scots, which in the reign of David I. was the price of two sheep. In several later acts, it is taken for granted, that this crime is capital. But where the thing stolen is of small value, we consider it, not as theft, but as pickery, which is punished either corporally or by banishment. The breaking of orchards, and the stealing of green wood, is punished by a fine, which rises as the crime is repeated.

29. Theft may be aggravated into a capital crime, though the value of the thing stolen be trifling; as theft twice repeated, or committed in the night, or by landed men; or of things set apart for sacred uses. The receivers and concealers of stolen goods, knowing them to be such, suffer as thieves. Those who barely harbour the person of the criminal within forty-eight hours either before or after committing the crime, are punished as partakers of the theft. Such as sell goods belonging to thieves or lawless persons who dare not themselves come to market, are punished with banishment and the escheat of moveables.

30. Theft attended with violence, is called *robbery*; and in our old statutes, *rief* or *stouthrief*, under which class may be included *forning*, or the taking of meat and drink by force, without paying for it, *Stouthrief* came

at

at last to be committed so audaciously, by bands of men associated together, that it was thought necessary to vest all our freeholders with a power of holding courts upon forners and rievvers, and condemning them to death. Nay, all were capitally punished, who, to secure their lands from depredation, paid to the rievvers a yearly contribution, which got the name of *black mail*. An act also passed, commanding to banishment a band of forners, who were originally from *Egypt*, called *Gypsies*, and adjudging to death all that should be reputed *Egyptians*, if found thereafter within the kingdom. Robbery committed on the seas, is called *piracy*, and is punished capitally by the high admiral. Several of the facts which constitute this crime are set forth in a British statute, 8. *Geo. I. c. 24.*

31. *Falseness*, in a large sense, is the fraudulent imitation or suppression of truth, to the damage of another. The latest statute against this crime, punishes it by confiscation of moveables. That particular species of falseness, which consists in the falsifying of writings, passes by the name of *forgery*. Our practice has now of a long time, agreeably to the Roman law, made this crime capital; unless the forgery be of executions, or other writings of smaller moment; in which case, it is punished arbitrarily.

32. The writing must not only be fabricated, but put to use or founded on, in order to infer this crime. And though it be strictly criminal, yet the trial of it is proper to the court of Session; but where improbation is moved against a deed by way of exception, the inferior judge, before whom the action lies, is competent to it *ad civilem effectum*. When it is pleaded as an exception, our practice, to discourage affected delays, obliges the defender, who moves it, to consign L. 40 Scots; which he forfeits, if his plea shall appear calumnious.

33. Where a person, found guilty of forgery by the court of Session, is by them remitted to the Justiciary, an indictment is there exhibited against him, and a jury sworn, before whom the decree of Session is produced, in place of all other evidence of the crime, in respect of which the jury find the pannel guilty; so that that decree, being pronounced by a competent court, is held as full proof, or, in the style of the bar, as *probatio probata*.

34. *Perjury*, which is the judicial affirmation of a falsehood on oath, really constitutes the *crimen falsi*; for he who is guilty of it does, in the most solemn manner, substitute falsehood in the place of truth. To constitute this crime, the violation of truth must be deliberately intended by the swearer; and therefore reasonable allowances ought to be given to forgetfulness or misapprehension, according to his age, health, and other circumstances. The breach of a promissory oath does not infer this crime; for he who promises on oath, may sincerely intend performance when he swears, and so cannot be said to call on God to attest a falsehood. Though an oath, however false, if made upon reference in a civil question, concludes the cause, the person perjured is liable to a criminal trial; for the effect of the reference can go no farther than the private right of the parties.

35. Notwithstanding the mischievous consequences of perjury to society, it is not punished capitally, but by confiscation of moveables, imprisonment for a year, and

infamy. The court of Session is competent to perjury *incidenter*, when in any examination upon oath, taken in a cause depending before them, a person appears to have sworn falsely; but in the common case, that trial is proper to the Justiciary. *Subornation of perjury* consists in tampering with persons who are to swear in judgment, by directing them how they are to depose; and it is punished with the pains of perjury.

36. The crime of *Stellionate*, from *stellis*, includes every fraud which is not distinguished by a special name; but is chiefly applied to conveyances of the same numerical right, granted by the proprietor to different disponees. The punishment of stellionate must necessarily be arbitrary, to adapt it to the various natures and different aggravations of the fraudulent acts. The persons guilty of that kind of it, which consists in granting double conveyances, are by our law declared infamous, and their lives and goods at the King's mercy. The cognizance of *fraudulent bankruptcy* is appropriated to the court of Session, who may inflict any punishment on the offender, that appears proportioned to his guilt, death excepted.

37. The crime of *usury*, before the reformation, consisted in the taking of *any* interest for the use of money; and now in taking an higher rate of interest than is authorized by law. It is divided into *usura manifesta*, or direct; and *velata*, or covered. One may be guilty of the first kind, either where he covenants with the debtor for more than the lawful interest on the loan-money; or where one receives the interest of a sum before it is due, since thereby he takes a consideration for the use of money before the debtor has really got the use of it. Where a debt is clogged with an uncertain condition, by which the creditor runs the hazard of losing his sum, he may covenant for an higher interest than the legal, without the crime of usury; for there, the interest is not given merely in consideration of the use of the money, but of the danger undertaken by the creditor.

38. Covered usury, is that which is committed under the mask, not of a loan, but of some other contract; *e. g.* a sale, or an improper wadset. And in general, all obligations entered into with an intention of getting more than the legal interest for the use of money, however they may be disguised, are usurious. As a farther guard against this crime, the taking more than the legal interest for the forbearance of payment of money, merchandise, or other commodities, by way of loan, exchange, or other contrivance whatever; or the taking a bribe for the loan of money, or for delaying its payment when lent, is declared usury. Where usury is proved, the usurious obligation is not only declared void, but the creditor, if he has received any unlawful profits, forfeits the treble value of the sums or goods lent. Usury, when it is to be pursued criminally, must be tried by the Justiciary; but where the libel concludes only for voiding the debt or restitution, the session is the proper court.

39. *Injury*, in its proper acceptation, is the reproaching or affronting our neighbour. Injuries are either verbal or real. A verbal injury, when directed against a private person, consists in the uttering contumelious words, which tend to expose our neighbour's character by making him little or ridiculous. It does not seem that the twitting

ting one with natural defects, without any sarcastical reflections, though it be inhuman, falls under this description, as these imply no real reproach in the just opinion of mankind. Where the injurious expressions have a tendency to blacken one's moral character, or fix some particular guilt upon him, and are deliberately repeated in different companies, or handed about in whispers to confidants, it then grows up to the crime of slander: and where a person's moral character is thus attacked, the *animus injuriandi* is commonly inferred from the injurious words themselves, unless special circumstances be offered to take off the presumption; *ex. gr.* that the words were uttered in judgment in one's own defence, or by way of information to a magistrate, and had some foundation in fact. Though the cognizance of slander is proper to the commissaries, who, as the *judices Christianitatis*, are the only judges of scandal; yet for some time past, bare verbal injuries have been tried by other criminal judges, and even by the Session. It is punished either by a fine, proportioned to the condition of the persons injuring and injured, and the circumstances of time and place; or if the injury import scandal, by publicly acknowledging the offence; and frequently the two are conjoined. The calling one a bankrupt is not, in strict speech, a verbal injury, as it does not affect the person's moral character; yet as it may hurt his credit in the way of business, it founds him in an action of damages, which must be brought before the judge-ordinary. A real injury is inflicted by any fact by which a person's honour or dignity is affected; as striking one with a cane, or even aiming a blow without striking; spitting in one's face; assuming a coat of arms, or any other mark of distinction proper to another, &c. The composing and publishing defamatory libels may be reckoned of this kind. Real injuries are tried by the judge-ordinary, and punished, either by fine or imprisonment, according to the demerit of the offenders.

40. After having shortly explained the several crimes punishable by our law, this treatise may be concluded, with a few observations on criminal jurisdiction, the forms of trial, and the methods by which crimes may be extinguished. Criminal jurisdiction is founded, 1. *Ratione domicilii*, if the defender dwells within the territory of the judge. Vagabonds, who have no certain domicile, may be tried where-ever they are apprehended. 2. *Ratione delicti*, if the crime was committed within the territory. Treason is triable, by the English law, in any county that the King should appoint; and by a temporary act now expired, treason committed in certain Scots counties, was made triable by the court of Justiciary, where-ever it should sit.

41. No criminal trial can proceed, unless the person accused is capable of making his defence. Absents therefore cannot be tried; nor fatuous nor furious persons, *durante furore*, even for crimes committed, while they were in their senses. For a like reason, minors who had no curators could not, by the Roman law, be tried criminally; but our practice considers every person who is capable of dole, to be also sufficiently qualified for making his defence in a criminal trial.

42. No person can be imprisoned in order to stand trial

for any crime, without a warrant in writing expressing the cause, and proceeding upon a subscribed information, unless in the case of indignities done to judges, riots, and the other offences specially mentioned in 1701, c. 6. Every prisoner committed in order to trial, if the crime of which he is accused be not capital, is entitled to be released upon bail, the extent of which is to be modified by the judge, not exceeding 12000 merks Scots for a Nobleman, 6000 for a landed gentleman, 2000 for any other gentleman or burghers, and 600 for any other inferior person. That persons who, either from the nature of the crime with which they are charged, or from their low circumstances, cannot procure bail, may not lie for ever in prison untried, it is lawful to every such prisoner, to apply to the criminal judge, that his trial may be brought on. The judge must, within twenty-four hours after such application, issue letters directed to messengers, for intimating to the prosecutor to fix a diet for the prisoner's trial, within sixty days after the intimation, under the pain of wrongous imprisonment: And if the prosecutor does not insist within that time, or if the trial is not finished in forty days more, when carried on before the Justiciary, or in thirty, when before any other judge; the prisoner is, upon a second application, setting forth that the legal time is elapsed, entitled to his freedom, under the same penalty.

43. Upon one's committing any of the grosser crimes, it is usual for a justice of the peace, sheriff, or other judge, to take a precognition of the facts, *i. e.* to examine those who were present at the criminal act, upon the special circumstances attending it, in order to know whether there is ground for a trial, and to serve as a direction to the prosecutor, how to set forth the facts in the libel; but the persons examined may insist to have their declarations cancelled, before they give testimony at the trial. Justices of the peace, sheriffs, and magistrates of boroughs, are also authorized to receive informations, concerning crimes to be tried in the circuit-courts; which informations are to be transmitted to the justice clerk forty days before the sitting of the respective courts. To discourage groundless criminal trials, all prosecutors, where the defender was absolved, were condemned by statute, in costs, as they should be modified by the judge, and besides were subjected to a small fine to be divided between the sisk and the defender: And where the King's advocate was the only pursuer, his informer was made liable. This sufficiently warrants the present practice of condemning vexatious prosecutors in a pecuniary mulct, though far exceeding the statutory sum.

44. The forms of law upon criminal accusations, differ much from those observed in civil actions, if we except the case of such crimes as the court of Session is competent to, and of lesser offences tried before inferior courts. The trial of crimes proceeds, either upon indictment, which is sometimes used, when the person to be tried is in prison; or by criminal letters issuing from the signet of the Justiciary. In either case the defender must be served with a full copy of the indictment or letters, and with a list of the witnesses to be brought against him, and of the persons who are to pass on the inquest, and fifteen free days must intervene, between his being

so served, and the day of appearance. When the trial proceeds upon criminal letters, the private prosecutor must give security, at raising the letters, that he will report them duly executed to the Justiciary, in terms of 1535, c. 35; and the defender, if he be not already in prison, is, by the letters, required to give caution, within a certain number of days after his citation, for his appearance upon the day fixed for his trial: And if he gives none within the days of the charge he may be denounced rebel, which infers the forfeiture of his moveables.

45. That part of the indictment, or of the criminal letters, which contains the ground of the charge against the defender, and the nature or degree of the punishment he ought to suffer, is called the libel. All libels must be special, setting forth the particular facts inferring the guilt, and the particular place where these facts were done. The time of committing the crime may be libelled in more general terms, with an alternative as to the month, or day of the month: but as it is not practicable in most cases, to libel upon the precise circumstances of accession that may appear in proof, libels against accessories are sufficient, if they mentioned, in general, that the persons prosecuted are guilty art and part.

46. The defender, in a criminal trial, may raise letters of exculpation, for citing witnesses in proof of his defences against the libel, or of his objections against any of the jury or witnesses; which must be executed, to the same day of appearance, with that of the indictment or criminal letters.

47. The diets of appearance, in the court of Justiciary, are peremptory; the criminal letters must be called on the very day to which the defender is cited; and hence, if no accuser appears, their effect is lost, *instantia perit*, and new letters must be raised. If the libel or any of the executions, shall to the prosecutor appear informal, or if he be dissident of the proof, from the absconding of a necessary witness, the court will, upon a motion made by him, desert the diet *pro loco et tempore*; after which new letters become also necessary. A defender, who does not appear on the day to which he is cited, is declared fugitive; in consequence of which, his single escheat falls. The defender, after his appearance in court, is called the pannel.

48. The two things to be chiefly regarded in a criminal libel, are, 1. The relevancy of the facts *i. e.* their sufficiency to infer the conclusion; 2. Their truth. The consideration of the first belongs to the judge of the court; that of the other, to the jury or assize. If the facts libelled be found irrelevant, the pannel is dismissed from the bar; if relevant, the court remits the proof thereof to be determined by the jury; which must consist of 15 men picked out by the court from a greater number not exceeding 45, who have been all summoned, and given in list to the defender at serving him with a copy of the libel.

49. Crimes cannot, like debts, be referred to the defender's oath; for no person is compellable to swear against himself, where his life, limb, liberty, or estate is concerned, nor even in crimes which infer infamy; because one's good name is, in right estimation, as valuable as his life. There is one exception however to this rule in trying the crime of usury, which may be proved by the usurer's own

oath, notwithstanding the rule, *nemo tenetur jurare in suam turpitudinem*. Crimes therefore are in the general case proveable only by the defender's free confession, or by writing, or by witnesses. No extrajudicial confession, unless it is adhered to by the pannel in judgment, can be admitted as evidence.

50. All objections relevant against a witness in civil cases, are also relevant in criminal. No witness is admitted, who may gain or lose by the event of the trial. *Socii criminis*, or associates in the same crime, are not admitted against one another, except either in crimes against the state, as treason: in occult crimes, where other witnesses cannot be had, as forgery; or in thefts or depredations committed in the Highlands. The testimony of the private party injured may be received against the pannel, where the King's Advocate is the only prosecutor, if, from the nature of the crime, there must needs be a penury of witnesses, as in rape, robbery, &c.

51. After all the witnesses have been examined in court, the jury are shut up in a room by themselves, where they must continue, excluded from all correspondence, till their verdict or judgment be subscribed by the foreman (or chancellor), and clerk; and according to this verdict, the court pronounces sentence, either absolving or condemning. It is necessary, by the law of Scotland, that a jury should be unanimous in finding a person guilty; the narrowest majority is as sufficient against the pannel, as for him. Juries cannot be punished on account of an erroneous verdict, either for or against the pannel.

52. Though the proper business of a jury be to inquire into the truth of the facts found relevant by the court, for which reason they are sometimes called the inquest; yet, in many cases, they judge also in matters of law or relevancy. Thus, though an objection against a witness should be repelled by the court, the jury are under no necessity to give more credit to his testimony than they think just: And in all trials of art and part, where special facts are not libelled, the jury, if they return a general verdict, are indeed judges, not only of the truth, but of the relevancy of the facts that are sworn to by the witnesses. A general verdict, is that which finds, in general terms, that the pannel is guilty or not guilty, or that the libel or defences are proved or not proved. In a special verdict, the jury finds certain facts proved, the import of which is to be afterwards considered by the court.

53. Criminal judges must now suspend for some time the execution of such sentences as affect life or limb, that so condemned criminals, whose cases deserve favour, may have access to apply to the king for mercy. No sentence of any court of judicature, south of the river Forth, importing either death or demerabration, can be executed in less than thirty days; and, if north of it, in less than forty days, after the date of the sentence. But corporal punishments, less than death or dismembering, *e. g.* whipping, pillory, &c. may be inflicted eight days after sentence on this side Forth, and twelve days after sentence beyond it.

54. Crimes are extinguished, 1. By the death of the criminal; both because a dead person can make no defence, so that his trial is truly a judging upon the hearing of

of one side ; and because, though his guilt should be ever so notorious, he is after death carried beyond the reach of human penalties : Such trials therefore can have no effect, but to punish the innocent heir, contrary to that most equitable rule, *culpa tenet suos auctores*. 2. Crimes may be extinguished by a remission from the Sovereign. But a remission, though it secures the delinquent from the public resentment, the exercise of which belongs to the Crown, cannot cut off the party injured from his claim of damages, over which the Crown has no prerogative. Whoever therefore founds on a remission, is liable in damages to the private prosecutor, in the same manner, as if he had been tried and found guilty. Even general acts of indemnity passed in parliament, though they secure against such penalties as law inflicts upon the criminal, merely *per modum pæne*, yet do not against the payment of any pecuniary fine, which is given by statute to the party injured, nor against the demand of any claim competent to him in name of damages.

55. Lesser injuries, which cannot be properly said to affect the public peace, may be extinguished, either by the private party's expressly forgiving them, or by his being reconciled to the offender, after receiving the injury. Hence arises the rule, *disimulatione tollitur injuria*. But where the offence is of a higher nature, the party injured, though he may pass from the prosecution, in so far as his private interest is concerned, cannot preclude the King's Advocate, or Procurator-fiscal, from insisting *ad vindictam publicam*.

56. Crimes are also extinguished by prescription,

which operates by the mere lapse of time, without any act, either of the Sovereign or of the private sufferer. Crimes prescribe in twenty years ; but in particular crimes, the prescription is limited by statute to a shorter time. No person can be prosecuted upon the act against wrongous imprisonment, after three years. High treason, committed within his Majesty's dominions, suffers likewise a triennial prescription, if indictment be not found against the traitor within that time. All actions, brought upon any penal statute made or to be made, where the penalty is appropriated to the Crown, expire in two years after committing the offence ; and where the penalty goes to the Crown or other persecutor, the prosecutor must sue within one year, and the Crown within two years after the year ended. Certain crimes are, without the aid of any statute, extinguished by a shorter prescription than twenty years. By our old law, in the cases of rape, robbery, and hame-sucken, the party injured was not heard, after a silence of twenty four hours ; from a presumption, that persons could not be so grossly injured, without immediately complaining : And it is probable, that a prosecution for these crimes, if delayed for any considerable time, would be cast even at this day, or at least the punishment restricted. Lesser injuries suffer also a short prescription ; law *presuming* forgiveness, from the nature of the offence, and the silence of the party. The particular space of time sufficient to establish this presumption must be determined by the judge, according to circumstances.

## L A Y

**LAWBURROWS**, in Scots Law. See **LAW**, Tit xxx. 16.

**LAWLESS COURT**, a court said to be held annually on King's hill, at Rochford, in Essex, on the Wednesday morning after Michaelmas-day, at cock-crowing, where they whisper, and have no candle nor any pen and ink, but only a coal. Persons who owe suit, or service, and do not appear, forfeit double their rent every hour they are missing.

This servile attendance, Camden informs us, was imposed on the tenants for conspiring at the like unreasonable time to raise a commotion. The court belongs to the honour of Raleigh, and to the earl of Warwick ; and is called lawless, from its being held at an unlawful hour.

**LAWN**, a spacious plain in a park, or adjoining to a noble seat.

**LAWSONIA**, in botany, a genus of the ostandria monogynia class. The calix consists of four segments, and the corolla of four petals ; the stamina are disposed in pairs ; and there are four capsules containing a great many seeds. There are two species, both natives of India.

**LAWYER** signifies a counsellor, or one that is learned or skilled in the law.

**LAY-BROTHERS**, among the Romanists, those pious, but illiterate persons, who devote themselves, in some convent, to the service of the religious. They wear a different habit from that of the religious, but never

## L A Z

enter into the choir, nor are present at the chapters ; nor do they make any other vow, except of constancy and obedience. In nunneries, there are also lay-sisters.

**LAY-MAN**, one who follows a secular employment, or has not entered into holy orders.

**LAYERS**, in gardening, are tender shoots, or twigs of trees, laid or buried in the ground ; till having struck root, they are separated from the parent-tree, and become distinct plants.

**LAZAR-HOUSE**, or **LAZARETTO**, a public-building, in the nature of an hospital, to receive the poor and those afflicted with contagious distempers. In some places, lazarettos are appointed for the performance of quarantine ; in which case, those are obliged to be confined in them who are suspected to have come from places infected with the plague.

**LAZARITES**, or *Fathers of St LAZARUS*, a religious congregation of regular clerks, instituted in France in the seventeenth century, by M. Vincent. They take their name from a house in the suburbs of Paris, where they have a seminary, called the seminary of good children. The vows they make are simple ; and, upon occasion, may be dispensed with.

**LAZULI**, or *Lapis LAZULI*, in natural history, one of the ores of copper, the basis of which is a crystalline matter, coloured with that elegant blue which copper gives to all alkaline liquors.

The

The lip's lazuli is found in many parts of the world ; but that of Asia and Africa is much superior both in beauty and real value to the Bohemian and German kind, which is too often sold in its place.

Its great use, beside the polishing as a gem, is the making the fine blue used in painting called ultramarine, which is obtained from it by calcination.

**LEAD.** See **CHEMISTRY**, p. 81, 186.

**LEAF, folium**, in the natural history of plants. See **BOTANY**, sect. 2.

**LEAF**, in clocks and watches, an appellation given to the notches of their pinions. See **WATCH**.

**LEAGUE**, a measure of length, containing more or less geometrical paces, according to the different usages and customs of countries. A league at sea, where it is chiefly used by us, being a land-measure mostly peculiar to the French and Germans, contains three thousand geometrical paces, or three English miles.

**LEAGUE** also denotes an alliance or confederacy between princes and states for their mutual aid, either in attacking some common enemy, or in defending themselves.

**LEAK**, among seamen, is a hole in the ship through which the water comes in. To spring a leak, is said of a ship that begins to leak. To stop a leak, is to fill it with a plug wrapt in oakum and well tarred, or putting in a tarpawling clout to keep the water out; or nailing a-piece of sheet-lead upon the place.

**LEAKAGE**, the state of a vessel that leaks, or lets water or other liquid ounce in or out.

**LEAKAGE**, in commerce, is an allowance of 12 per cent. in the customs, allowed to importers of wines for the waste and damage it is supposed to have received in the passage: an allowance of two barrels in twenty-two is also made to the brewers of ale and beer, by the excise-office.

**LEAOTUNG**, the most northerly part of China, in Asia.

**LEAP**, in music, is when the song does not proceed by conjoint degrees, as when between each note there is an interval of a third, fourth, fifth, &c.

**LEAP-YEAR.** See **ASTRONOMY**, p. 489.

**LEARMOUTH**, a market-town of Northumberland, situated forty-eight miles north-west of Newcastle, and twelve south-west of Berwick.

**LEASING-MAKING**, in Scots law, the uttering of words tending to excite discord between the King and his people; also called verbal sedition.

**LEATHER**, the skin of several sorts of beasts dressed and prepared for the use of the various manufacturers, whose business it is to make them up. See **TANNING**.

#### *Colouring of LEATHER.*

*To colour white leather.* Hang the skins in chalk or lime-water, till they are grown supple, that the hair or wool may be stripped off; stretch them on tenters, or by means of lines, and smooth them over: then brush them over with alum-water very warm, and colour them with the colour you would have them, and dry them in the sun, or in some warm house, and they will be useful on sundry occasions, without any further trouble.

VOL. II. Num b. 67.

2

*To colour black leather the German way.* Take of the bark of the elder two pounds, of the filings or rust of iron the same quantity; put them into two gallons of rain-water, and stop them up close in a cask or vessel, and let them stand for the space of two months: then add to that the liquid part of a pound of nut-galls, beaten to powder, and a quarter of a pound of copperas, heating them over the fire, and suffering them to stand 24 hours after; and then use the liquor with a brush till the skin has taken a fine black.

*To colour leather a fair red.* First rub the leather well in alum-water, or alum it; boil stale urine, scum it till half of it is wasted: then put in an ounce of the finest lake, the like quantity of brazil in powder, one ounce of alum, and half an ounce of sal-armoniac; mix them well, and keep them stirring over a gentle fire about two hours; and so use the liquid part, to colour or tinge the skins.

*To colour leather of a curious French yellow.* Take one part of chalk, and another of wood-ashes, and make of them a good lye; then strain out the fine liquor, and set it in a vessel over the fire, and put into it turmeric in powder, and a little saffron; and let it simmer, till it becomes pretty thick; then set it a cooling, to be used as occasion requires.

*To make white leather blue.* Take a quart of elder-berries, strain out the juice, and boil it with an ounce of powder of alum, and half an ounce of indigo, or smalt-blue, and brush over the leather with a fine brush dipped in it three times, suffering it to dry between whiles, and the business will be effected.

*To colour Spanish leather, &c.* Take that which the Dutch call pomplemelch, warm it, and rub the leather with it; then take of Venice tot appelen; and having pounded it small, put a quantity of water to it, and let it soften over a gentle fire; then press out the water, and rub or wash out the skin in it; repeating the same several times; and after that, take the finest shoemakers black, and rub the skin over with it, having in the melting added a little vitriol or copperas; and letting it dry, take goose or hog's grease, and with a woollen cloth rub the skin over for a good while, where there is a good fire to supple it, and afterwards rub it over with your hands, till it disappear; or instead of grease, you may use linseed or train-oil, and so in case of any other colour, according to the colours you design.

#### *Dying of LEATHER.*

*A reddish colour.* First wash the skins in water, and wring them out well, and afterwards wet them with a solution of tartar and bay-salt in fair water, and wring them out again; then to the former dissolution add ashes of crab-shells, and rub the skins very well with this: afterwards, wash them in common water, and wring them out; then wash them with tincture of madder in the solution of tartar and alum and the crab-shell ashes: and if they prove not red enough after all, wash them with the tincture of brazil.

*A pure yellow.* Take of fine aloes two ounces, of linseed-oil four pounds; dissolve or melt them; then strain the liquor, and besmear the skins with it, and letting dry varnish them over.

10 K

†

24

*An orange.* Boil fustic-berries in alum water: but for a deep orange, use turmeric-root.

*Blue.* Boil elder-berries, or dwarf elder, in water; then smear or wash the skins with it; wring them out; then boil the berries as before in a solution of alum water, and wet the skins in the same water once or twice; dry them, and they will be very blue.

*A pure sky colour.* For each skin take indigo one ounce; put it into boiling water, let it stand one night; then warm it a little, and with a brush-pencil besmear the skin twice over.

*Purple.* Dissolve rock-alum in warm water, wet the skins with it, dry them; then boil rasped brazil well in water; let it stand to cool: do this three times, and afterwards rub the dye over the skins with your hand; and when they are dry, polish them.

*Green.* Take sap-green and alum-water, of each a sufficient quantity; mix and boil them a little; if you would have the colour darker, add a little indigo.

*Processes for dying LEATHER Red and Yellow, as practised in Turkey; with directions for preparing and tanning the skins, as communicated by Mr Philippo, a native of Armenia, who received from the Society for the Encouragement of Arts, &c. one hundred pounds, and also the gold medal of the Society, as a reward for discovering this secret.*

1. *First preparation of the Skins, both for Red and Yellow Leather, by dressing them in lime.* Let the skins, dried with the hair on, be first laid to soak in clean water for three days; let them then be broken over the flesh side, put into fresh water for two days longer, and afterwards hung up to drain half an hour. Let them now be broken again on the flesh side, limed in cold lime on the same side, and doubled together with the grain side outward. In this state they must be hung up within doors over a frame for five or six days, till the hair be loose; which must be then taken off, and the skins returned into the lime-pit, for about three weeks. Take them out, and let them be well worked flesh and grain, every sixth or seventh day during that time: after which, let them be washed ten times in clear water, changing the water at each washing. They are next to be prepared in drench, as below mentioned.

2. *Second preparation of the Skins for both the Red and Yellow Dyes by drenching.* After squeezing the water out of the skins, put them into a mixture of bran and water, warm as new milk, in the following proportions, viz. about three pounds of bran for five skins, and water sufficient to make the mixture moderately fluid, which will be about a gallon to each pound of bran. In this drench let the skins lie three days; at the end of which time they must be well worked, and afterwards returned into the drench two days longer. They must then be taken out and rubbed between the hands; the water squeezed

from them, and the bran scraped off clear from both sides of the skins. After this they must be again washed ten times in clear water, and the water squeezed out of them.

Thus far the preparatory process of all the skins, whether intended to be dyed red or yellow, is the same; but afterwards those which are to be dyed red, must be treated as follows.

3. *Preparation in honey and bran of the skins that are to be dyed red.* Mix one pound of honey with three pints of luke-warm water, and stir them together till the honey is dissolved. Then add two double handfuls of bran; and taking four skins (for which the above quantity of the mixture will be sufficient) work them well in it one after another. Afterwards fold up each skin separately into a round form, with the flesh side inwards, and lay them in an earthen pan, or other proper vessel; if in the summer, by the side of each other; but in the winter, on the top of each other. Place the vessel in a sloping position, so that such part of the fluid as may spontaneously drain from the skins, may drain from them. An acid fermentation will then rise in the liquor, and the skins will swell considerably. In this state they must continue for seven or eight days; but the moisture that drains from them, must be poured off, once or twice a day, as occasion may require. After this a further preparation in salt is necessary; and which must be performed in the following manner.

4. *Preparation in salt, of the skins to be dyed red.* After the skins have been fermented in the honey and bran, as above mentioned, let them be taken out of that mixture on the eighth or ninth day, and well rubbed with dry common sea-salt, in the proportion of about half a pound to each skin; the salt must be well rubbed and worked with them. This will make them contract again, and part with a further considerable quantity of moisture; which must be squeezed out by drawing each skin separately through the hands. They must next be scraped clean on both sides from the bran, superfluous salt, and moisture that may adhere to them. After which, dry salt must be strewed over the grain side, and well rubbed in with the hand. They are then to be doubled with the flesh side outwards, lengthways from neck to tail, and a little more dry salt must be thinly strewed over the flesh side, and rubbed in: for the two last operations about a pound and a half of salt will be sufficient for each skin. They must then be put, thus folded on each other, between two clean boards, placed sloping, breadthways; and a heavy weight laid on the upper board, in order gradually to press out what moisture they will thus part with. In this state of pressure, they must be continued two days or longer, till it is convenient to dye them, for which they will then be duly prepared.

5. *Preparation of the Red Dye, in a proper proportion for four skins.* Put eight gallons of water into a copper, with seven ounces of shenan\*, tied up in a linen bag.

Light

\* Shenan is a drug much used by dyers in the East; and may easily be procured at any of the ports of Syria and Africa, in the Levant. It is the Eastern-jointed cali, called by botanists *felicornia*; and grows in great plenty in those and other parts of the East. There is a lesser species of the *felicornia* on our coast, which, from its great affinity with the Lichen, might be presumed to have the same qualities. On some trials, however, it has not appeared to answer the intention.

Light a fire under a copper, and when the water has boiled about a quarter of an hour, take out the bag of shenan, and put into the boiling fluid or lixivium, 1st, two drams of alum; 2dly, two drams of pomegranate bark; 3dly, three quarters of an ounce of turmeric; 4thly, three ounces of cochineal; 5thly, two ounces of loaf sugar. Let the whole mixture boil about six minutes, then cover the fire, and take out a quart of liquor, putting it into a flat earthen pan; and when it is as cold as new milk, take one skin, folded lengthways, the grain side outwards, and dip it in the liquor, rubbing it gently with the hands. Then taking out the skin, hang it up to drain, and throw away the superfluous dye. Proceed in the same manner with the remaining three skins; repeating the operation on each skin separately, eight times, squeezing the skins by drawing them through the hands before each fresh dipping. Lay them now on one side of a large pan, set sloping, to drain off as much of the moisture as will run from them without pressure, for about two hours, or till they are cold; then tan them as below directed.

6. *Tanning the Red Skins.* Powder four ounces of the best white galls in a marble mortar, sifting it through a fine sieve. Mix the powder with about three quarts of water, and work the skins well in this mixture for half an hour or more, folding up the skins four fold. Let them lie in this tan twenty-four hours; when they must be worked again as before; then taken out, scraped clean on both sides from the first galls, and put into a like quantity of fresh galls and water. In this fresh mixture they must be again well worked for three quarters of an hour; then folded up as before, and left in the fresh tan for three days. On the fourth day they must be taken out, washed clean from the galls, in seven or eight fresh quantities of water, and then hung up to dry.

7. *Manner of dressing the skins after they are tanned.* When the skins have been treated as above, and are very near dry, they should be scraped with the proper instrument or scraper on the flesh side, to reduce them to a proper degree of thickness. They are then to be laid on a smooth board, and glazed by rubbing them with a smooth glass. After which they must be oiled, by rubbing them with olive oil, by means of a linen rag, in the proportion of one ounce and an half of oil for four skins; then they are to be grained on a graining board, lengthways, breadthways, and cornerways, or from corner to corner.

8. *Preparation with Galls, for the Skins to be dyed yellow.* After the four skins are taken out of the drench of bran, and clean washed as before directed in the second article, they must be very well worked, half an hour or more, in a mixture of a pound and a half of the best white galls, finely powdered, with two quarts of clean water. The skins are then to be separately doubled

lengthways; rolled up with the flesh side outwards, laid in the mixture, and close pressed down on each other, in which state they must continue two whole days. On the third day let them be again worked in the tan; and afterwards scraped clean from the galls, with an ivory or brass instrument (for no iron must touch them.) They must then be put into a fresh tan, made of two pounds of galls finely powdered, with about three quarts of water, and well worked therein fifteen times. After this they must be doubled, rolled up as before, and laid in the second tan for three days. On the third day a quarter of a pound of white sea-salt must be worked into each skin; and the skins doubled up as before, and returned into the tan, till the day following, when they are to be taken out, and well washed six times in cold water; and four times in water lukewarm. The water must be then well squeezed out, by laying the skins under pressure, for a bout half an hour, between two boards, with a weight of about two or three hundred pounds laid upon the uppermost board, when they will be ready for the dye.

9. *Preparation of the Yellow Dye, in the proper proportion for four skins.* Mix six ounces of calliari gehira\*, or dgehira, or the berries of the eastern rhamnus, with the same quantity of alum, and pound them together till they be fine, in a marble or brass mortar, with a brass pestle. Then dividing the materials thus powdered, into three equal parts of four ounces each, put one of those three parts into about a pint and a half of water, in a china or earthen vessel; and stir the mixture together. Let the fluid stand to cool, till it will not scald the hand. Then spreading one of the skins flat on a table, in a warm room, with the grain side uppermost, pour a fourth part of the tinging liquor, prepared as above directed, over the upper or grain side, spreading it equally over the skin with the hand, and rubbing it well in. Afterwards do the like with the other three skins, for which the mixture first made will be sufficient.

This operation must be repeated twice more on each skin separately, with the remaining eight ounces of the powder of the berries, and alum, with the abovementioned due proportions of hot water, put to them as before directed.

The skins, when dyed, are to be hung up on a wooden frame, without being folded, with the grain side outwards, about three quarters of an hour to drain, when they must be carried to a river or stream of running water, and well washed therein six times or more. After this, they must be put under pressure for about an hour, till the water be well squeezed out; afterwards the skins must be hung up to dry in a warm room.

This being done, the skins are to be dressed and grained as before directed for those dyed red; except the oiling, which must be omitted.

*Gilding*

tion of the shenan; but it will be prudent to pursue the examination of this further, as some unknown circumstances in the collecting, or using the English sebecornia might occasion the miscarriage. But be this as it may, the Eastern shenan may, at all events, be easily procured in any quantity, at a very trifling expence, by any of the captains of Turkey ships, at Aleppo, Smyrna, &c.

\* The calliari gehira is the berries of an Eastern rhamnus, or buckthorn tree, and may be had at Aleppo, and other parts of the Levant, at a small price. The common Avignon, or yellow berries, may be substituted, but not with so good an effect; the calliari gehira being a stronger and brighter yellow dye, both for this use, and also that of coloring paper hangings, &c.

*Gilding of LEATHER.* Take glair of the whites of eggs, or gum water, and with a brush rub over the leather with either of them; then lay on the gold or silver, and letting them dry, burnish them. See the articles *GILDING* and *BURNISHING*.

*To dress or cover leather with silver or gold.* Take brown red, grind or move it on a stone with a muller, adding water and chalk; and when the latter is dissolved, rub, or lightly dab the leather over with it, till it looks a little whitish; and then lay on the leaf, silver or gold, before the leather is quite dry, laying the leaves a little over each other, that there may not be the least part uncovered; and when they have well closed with the leather, and are sufficiently dried on, and hardened, rub them over with an ivory polisher, or the fore-tooth of a horse.

**LEAVEN**, a piece of sour dough, used to ferment and render light a much larger quantity of dough or paste.

**LECHEA**, in botany, a genus of the triandria trigynia class. The calix consists of three leaves, and the corolla of three linear petals; and the capsules are three, with three valves, and one seed. There are two species, both natives of Canada.

**LECTICA**, in Roman antiquity, a vehicle in which people were carried in a reclining posture.

**LECTISTERNIUM**, a religious feast or banquet of the ancient Romans. In times of public danger or calamity, or of thanksgiving for some happy event, the republic ordered solemn feasts to be made for the gods; and this solemnity was called *lectisternium*, because on this occasion they spread tables, and placed beds around them, on which their heavenly guests were to lie and eat.

**LECTURERS**, in England, are an order of preachers in parish-churches, distinct from the rector or vicar. They are chosen by the vestry, or chief inhabitants of the parish, and are usually the afternoon preachers.

**LEDBURY**, a market-town of Herefordshire, thirteen miles east of Hereford.

**LEDGER**, the principal book wherein merchants enter their accounts. See *BOOK-KEEPING*.

**LEDUM**, the *MARSH-CISTUS*, in botany, a genus of the decandria monogynia class. The calix consists of five segments, and the corolla of five plain petals; and the capsule has five cells, opening at the base. There is but one species, a native of the northern parts of Europe.

**LEE**, in the sea language, a word of various significations; though it is generally understood to mean the part opposite to the wind. Thus *lee shore*, is that shore against which the wind blows. *Lee-latch*, or have a care of the lee-latch, is, take care that the ship do not go to the leeward, or too near the shore. *A lee the helm*, put it to the leeward side of the ship. *To lie by the lee*, or to come up to the lee, is to bring the ship so, that all her sails may lie flat against her masts and throats, and that the wind may come right upon her broad side.

**LEE-WAY**, is the angle that the rhumbline, upon which the ship endeavours to sail, makes with the rhumb upon which she really sails. See *NAVIGATION*.

**LEECH**, in zoology. See *HIRUDO*.

**LEEDS**, a large market town, in the west riding of Yorkshire, situated on the river Aire, twenty-miles south-west of York; it has a very great woollen trade.

**LEEK**. See *ALLIUM*.

**LEERDAM**, a town in the province of Holland, seventeen miles north east of Dort: E. long. 5°, N. lat. 51° 50'.

**LEERWICK**, a town of Scotland, in Mainland, one of the islands of Shetland, in the county of Orkney: W. long. 30', N. lat. 61° 20'.

**LEES**, are the more gross and ponderous parts of liquors, which, being separated by fermentation, fall to the bottom.

**LEET**, a little court held within a manor, and called the king's court, on account that its authority to punish offences originally belonged to the Crown, from whence it is derived to inferior persons.

**LEEWARD**, at sea, the side opposite to that on which the wind blows.

**LEEWARD-ISLANDS**, in America, a name given to the Caribbees.

**LEG**, in anatomy. See *ANATOMY*, Part I. and II. &c.

**LEGACY**, in Scots law, a donation by one person to another, to be paid by the giver's executor after his death. See *LAW*, Tit. xxviii. 3.

**LEGATEE**, in Scots law, the person to whom a legacy is provided.

**LEGATE**, a cardinal or bishop, whom the pope sends as his ambassador to sovereign princes.

**LEGATUS**, in roman antiquity, a military officer who commanded as deputy of the chief general.

**LEGEND**, any idle or ridiculous story told by the Romanists concerning their saints, and other persons, in order to support the credit of their religion.

The legend was originally a book used in the old Romish churches, containing the lessons to be read at divine service; hence the lives of the saints and martyrs came to be called legends, because chapters were read out of them at matins, and in the refectories of religious houses. Among these the golden legend, which is a collection of the lives of the saints, was received by the church with great applause, which it maintained for two hundred years; though it is so full of ridiculous and romantic stories, that the Romanists themselves are now ashamed of it.

**LEGER-LINE**, in music, one added to the staff of five lines, when the ascending or descending notes run very high or low: there are sometimes many of these lines both above and below the staff, to the number of four or five.

**LEGGIARDO**, or *LEGGIARDAMENTE*, in music, signifies to play or sing in a lively, brisk, and gay manner.

**LEGHORN**, or *LIVORNO*, a port town of Italy, in the duchy of Tuscany, situated on the Tuscan sea, forty miles west of Florence: E. long. 11°, N. lat. 43° 30'.

**LEGION**, in Roman antiquity, a body of foot which consisted of ten cohorts.

The exact number contained in a legion, was fixed by Romulus at three thousand; though Plutarch as-

scribes

fires us, that after the reception of the Sabines into Rome, he encreased it to six thousand. The common number afterwards, in the first times of the free state, was four thousand; but in the war with Hannibal, it arose to five thousand; and after this it is probable that it sunk again to four thousand, or four thousand two hundred, which was the number in the time of Polybius.

**LEGISLATOR**, a law giver, or person who establishes the polity and laws of a state. Such was Moies, among the Jews; Lycurgus, among the Lacedæmonians, &c.

**LEGITIMATION**, an act whereby illegitimate children are rendered legitimate.

**LEGITIME**, in Scots law, that share of the moveable effects belonging to a husband and wife; which upon the husband's death falls to the children. See *LAW*, Tit. xxviii. §

**LEGUME**. See *BOTANY*, p. 637.

**LEGUMINOUS**, an appellation given to all plants whose fruit is a legume

**LEICESTER**, the county-town of Leicestershire. It sends two members to parliament. W. long.  $1^{\circ} 5'$ , and N. lat.  $52^{\circ} 40'$ .

**LEININGEN**, a town of Germany, seventeen miles south of Worms.

**LEINSTER**, a province of Ireland, the capital of which is Dublin.

**LEIPSIC**, a rich and populous city of Germany, in the circle of Upper Saxony and province of Misnia: E. long.  $12^{\circ} 40'$ , N. lat.  $51^{\circ} 20'$ .

**LEITH**, a port-town of Scotland, about two miles north of Edinburgh.

**LEMBURG**, *LEOPOLIS*, a city of Poland, and capital of the province of Red Russia: E. long.  $24^{\circ}$ , N. lat.  $49^{\circ}$ .

**LEMMA**, in mathematics, a proposition which serves previously to prepare the way for the more easy apprehension of the demonstration of some theorem, or construction of some problem.

**LEMNA**, in botany, a genus of the monœcia diandria class. The calix of both male and female consists of one leaf; neither of them have any corolla; the female has one stylus, and the capsule consists of one cell. There are four species, three of which are natives of Britain, viz. the trifolca, or ivy-leaved duck's-meal; the minor, or least duck's-meal; and the polyrhiza, or greater duck's-meal.

**LEMNOS**, an island of the Archipelago, situated forty-miles south-west of the entrance of the Hellespont; E. lon.  $26^{\circ}$ , N. lat.  $29^{\circ}$ .

**LEMON**, in botany. See *CITRUS*.

**LEMONADE**, a liquor prepared of water, sugar, and lemon or citron juice: it is very cooling and grateful.

**LEMUR**, in zoology, a genus of quadrupeds belonging to the order of primates, the characters of which are these: There are four fore teeth in the upper jaw, the intermediate ones being remote; and six long, compressed, parallel teeth in the under jaw; the dog teeth are solitary, and the grinders are somewhat labiated. There are five species, viz.

VOL. II. No. 67.

1. The *tardigradus*, is a small animal, about eight inches long; and is found in Ceylon. The head is roundish, with a prominent nose; the legs are long and thick; and the feet resemble those of a monkey; the eyes are round, and near each other; the ears are long, and situate very low on the head. The hair on the top of the head, the ears, the neck, the shoulders, the back, the sides, and the outer parts of the thighs and legs, are of a reddish ash-colour; there is a white line betwixt the ears; the under jaw, the throat, the breast, and the belly, are mixed with white and an ash colour. It has no tail. This animal is of a very singular construction. It is perhaps longer in proportion to its thickness than any other quadruped: But its natural history is but imperfectly known.

2. The *mongoz*, is of a greyish colour above, and white below; his body is about a foot and a half in length; and the tail is as long as the body. This animal is very troublesome when kept in a domestic state. He takes every opportunity of escaping, and flies to the woods in quest of fruits, and it is very difficult to catch him. He bites in a cruel manner those with whom he is least acquainted. He has a great aversion to cold and moisture. He lives upon bread and fruits. His motions are brisk and lively. He is a native of Madagascar.

3. The *macaco* has a long tail, with about 30 alternate rings of black and white, and a barbed collar. He is about a foot and four inches long, and the tail is longer than the body. His general figure very much resembles that of a monkey, excepting the head, which is somewhat triangular. The *macaco* is a beautiful and elegant animal. Although his figure resembles the monkey, his dispositions and manners are very different. He is gentle and inoffensive in a domestic state. In a natural state, he is fond of society: In the island of Madagascar, troops of 30 or 40 of them are generally found together in the woods.

4. The *catta* has likewise a long tail, with black and whiterings. This is a very gentle animal; it lives upon fruits and roots; its motion is slow; and it makes a placid murmuring noise like a cat. It is likewise a native of Madagascar.

5. The *volans*, resembles a bat, being furnished with a strong membrane, like that animal, by which it is enabled to fly. It is a native of Asia; but its history is not sufficiently known.

**LEMURIA**, a festival of the ancient Romans, solemnized on the ninth of May, to pacify the manes of the dead, who were the lemures or phantoms that came in the night to torment the living.

**LENA**, a great river of Siberia running north from N. lat.  $55^{\circ}$  to  $72^{\circ}$ .

**LENÆA**, in antiquity, a festival of Bacchus, surnamed *Lenæus* from a vine-press. Besides the usual ceremonies at feasts sacred to this god, it was remarkable for poetical contentions, and tragedies acted at this time.

**LENS**, in dioptrics, properly signifies a small roundish glass, of the figure of a lentil; but is extended to any optic glass, not very thick, which either collects the rays of light into a point, in their passage through it,

10 L

†

or

- or disperses them further apart, according to the laws of refraction. See *OPTICS*.
- LENT**, a solemn time of fasting in the Christian church, observed as a time of humiliation before Easter, the great festival of our Saviour's resurrection.
- Those of the Romish church, and some of the Protestant communion, maintain, that it was always a fast of forty days, and, as such, of apostolical institution. Others think it was only of ecclesiastical institution, and that it was variously observed in different churches, and grew by degrees from a fast of forty hours, to a fast of forty days. This is the sentiment of Morton, bishop Taylor, du Maulin, Daille, and others.
- LENTISCUS**, in botany. See *PISTACIA*.
- LEO**, in zoology. See *FELIS*.
- LEO**, in astronomy. See *ASTRONOMY*, p. 467.
- St LEO**, a town and bishop's see of Italy, twenty miles north-west of Urbino.
- LEON**, the capital of the province of Leon, in Spain, situated on the river Esia: W. long.  $6^{\circ} 5'$ , N. lat.  $43^{\circ}$ .
- LEON** is also the capital of the province of Nicaragua, in Mexico, situated at the west end of the Lake Nicaragua: W. long.  $91^{\circ}$ , N. lat.  $11^{\circ} 30'$ .
- St LEONARD**, a town of France, in the province of Guignes, and territory of Limousin: E. long.  $1^{\circ} 45'$ , N. lat.  $45^{\circ} 50'$ .
- St. LEONHART**, a town of Germany, in the circle of Austria, and duchy of Carinthia: E. long.  $15^{\circ}$ , N. lat.  $47^{\circ}$ .
- LEONTICE**, in botany, a genus of the hexandria monogynia class. The corolla consists of six petals, and the nectarium of six leaves inserted into the unguis of the corolla, and having an open limb; and the calix has six deciduous leaves. There are four species, none of them natives of Britain.
- LEONTINI**, a town of Sicily, twenty miles north-west of Syracuse.
- LEONTODON**, in botany, a genus of the syngenesia polygamia æqualis class. The receptacle is naked; the calix is caliculated; the pappus is simple; and the floiculi are in a simple series. There are nine species, three of them natives of Britain, viz. the taraxacum, or dandelion; the hispidum, or rough dandelion; and the autumnale, or yellow devil's-bit. The root of the taraxacum is esteemed a good cathartic.
- LEONURUS**, **LION'S TAIL**, in botany, a genus of the didynamia gymnosperma class. The antheræ are interspersed with shining glands. There are five species, only one of them, viz. the cardiaca, or mother-wort, is a native of Britain.
- LEOPARD**. See *FELIS*.
- LEOPARD'S BANE**, in botany. See *DORONICUM*.
- LEPANTO**, a port-town of European Turkey, eighty miles west of the isthmus of Corinth; whence the gulph of Lepanto takes its name.
- LEPASTRUM**, in natural history, a genus of selenitæ, composed of plates disposed in the form of a radiated star.
- LEPIDIDIUM**, in botany, a genus of the tetradinamia filiculosa class. The pod is emarginated, cordated,

- and contains many seeds. There are 17 species, three of them natives of Britain, viz. the latifolium, or dittander: the rudérale, narrow-leaved wild cress, or dittander; and the petræum, or mountain dittander.
- LEPIDOPTERA**, in zoology, an order of insects, with four wings, which are covered with imbricated squamulæ. See *NATURAL HISTORY*.
- LEPIUM**, in natural history, a genus of fossils of the harder gypsum, composed of very small particles, and of a less glittering hue.
- There is only one species of this genus, being one of the least valuable and most impure of the class of gypsums. It is of an extremely rude, irregular, coarse and unequal structure; a little soft to the touch, of a very dull appearance, and of different degrees of a greyish white. It is burnt in plaister for the coarser works; it calcines very slowly and unequally, and makes but a very coarse and ordinary plaister.
- LEPROSY**, a foul cutaneous disease, appearing in dry, white, thin, scurfy scabs, either on the whole body, or only some part of it, and usually attended with a violent itching and other pains. See *MEDICINE*.
- LEPTODECORHOMBES**, in natural history, a genus of fossils of the order of the selenitæ; consisting of ten planes, each so nearly equal to that opposite to it as very much to approach to a decahedral parallelopiped, though never truly or regularly so.
- Of this genus there are only five known species. 1. A thin, fine, pellucid, and slender streaked one, with transverse striæ, found in considerable quantities in the strata of clay in most parts of England, particularly near Heddington in Oxfordshire. 2. A thin, dull-looking opaque, and slender streaked one, more scarce than the former, and found principally in Leicestershire and Staffordshire. 3. A thin fine streaked one, with longitudinal striæ, found in the clay-pits at Richmond, and generally lying at great depths. This has often on its top and bottom a very elegant smaller rhomboide, described by four regular lines. 4. A rough kind, with thick transverse striæ, and a scabrous surface, very common in Leicestershire and Yorkshire. And, 5. a very short kind, with thick plates, common in the clay-pits of Northamptonshire and Yorkshire.
- LEPTOPOLYINGLIMI**, in Natural History, a genus of fossil shells, distinguished by a number of minute teeth at the cardo; whereof we find great numbers at Harwick cliff, and in the marle-pits of Suffex.
- LEPTURA**, in zoology, a genus of insects belonging to the order of coleoptera, the characters of which are these:—The feelers are bristly; the elytra are attenuated towards the apex; and the thorax is somewhat cylindrical. There are 25 species, principally distinguished by their colour.
- LEPUS**, in zoology, a genus of quadrupeds belonging to the order of glires. The characters are these: they have two sore teeth in each jaw; those in the upper jaw are double, the interior ones being smallest. There are four species, viz.
1. The timidus, or hare, has a short tail; the points of the ears are black; the upper-lip is divided up to the

the nostrils; the length of the body is generally about a foot and a half; and the colour of the hair is reddish, interspersed with white. The hare is naturally a timid animal. He sleeps in his form, or seat, during the day, and feeds, copulates, &c. in the night. In a moon-light evening, a number of them are sometimes seen sporting together, leaping and pursuing each other: But the least motion, the falling of a leaf, alarms them; and then they all run off separately, each taking a different route. They are extremely swift in their motion, which is a kind of gallop, or a succession of quick leaps. When pursued, they always take to the higher grounds: as their fore-feet are much shorter than the hind ones, they run with more ease up-hill than down hill. The hare is endowed with all those instincts which are necessary for his own preservation. In winter he chuses a form exposed to the south, and in summer to the north. He conceals himself among vegetables of the same colour with himself. Mr Fouilloux says, that he observed a hare, as soon as he heard the sound of the horn, or the noise of the dogs, although at a mile's distance, rise from her seat, swim across a rivulet, then lie down among the rushes, and by this means evade the scent of the dogs. After being chased for a couple of hours, a hare will sometimes push another from his form, and lie down in it himself. When hard pressed, the hare will mingle with a flock of sheep, run up an old wall and conceal himself among the grass on the top of it, or cross a river several times at small distances. He never runs against the wind, or straight forward; but constantly doubles about, in order to make the dogs lose their scent.

It is remarkable, that the hare, although ever so frequently pursued by the dogs, seldom leaves the place where she was brought forth, or even the form in which she usually sits. It is common to find them in the same place next day, after being long and keenly chased the day before. The females are more gross than the males, and have less strength and agility; they are likewise more timid, and never allow the dogs to approach so near their form before rising as the males. They likewise practise more arts, and double more frequently, than the males.

The hare is diffused almost over every climate; and, notwithstanding they are every where hunted, their species never diminishes. They are in a condition of propagating the first year of their lives; the females go with young about 30 days, and produce four or five at a time; and as soon as they have brought forth, they again admit the embraces of the male; so that they may be said to be always pregnant. The eyes of the young are open at birth; the mother suckles them about 20 days, after which they separate from her and procure their own food. The young never go far from the place where they were brought forth; but still they live solitary, and make forms about thirty paces distant from each other: Thus, if a young hare be found any where, you may almost be certain of finding several others within a very small distance. The hare is not so savage as his manners would indicate. He is gentle, and susceptible of a kind of education. He is pretty easily tamed, and will even show a kind of attachment to the people of the house: But still this attachment is not so strong or lasting as to engage

him to become altogether domestic; for although taken when very young, and brought up in the house, he no sooner arrives at a certain age, than he takes the first opportunity of recovering his liberty and flying to the fields. The hare lives about seven or eight years. He feeds upon grass, and other vegetables. His flesh is excellent food. See Plate CIII. fig. 2.

2. The cuniculus, or rabbit, has a very short tail, and naked ears. The rabbit, though it has a great resemblance to the hare, is very different in his manners; and they have such a rooted antipathy to one another, that no art can engage them to have any sexual intercourse. The fecundity of the rabbit is still greater than that of the hare; they multiply so prodigiously in some countries, that the product of the fields is hardly sufficient to maintain them. They devour herbage of all kinds, roots, grain, fruits, &c. They are in a condition for producing at the age of six months; like the hare, the female is almost constantly in season; she goes with young about 30 days, and brings forth from four to eight at a litter. A few days before littering, she digs a new hole in the earth, not in a straight line, but in a zigzag form; the bottom of the hole she enlarges every way; she then pulls off a great quantity of hair from her belly, of which she makes a kind of bed for her young. During the two first days after birth, she never leaves them, but when pressed with hunger, and then she eats quickly and returns: In this manner she suckles and attends her young for six weeks. All this time, both the hole and the young are concealed from the male; sometimes when the female goes out, in order to deceive the male, she fills up the mouth of the hole with earth mixed with her own urine. But when the young ones begin to come to the mouth of the hole, and to eat such herbs as the mother brings to them, the father seems to know them; he takes them betwixt his paws, smooths their hair, and caresses them with great fondness. The rabbit is supposed not to be a native of the northern parts of Europe, but to have been originally brought from Greece and Spain. The rabbit lives about seven years, and his flesh is good. Their colour is various, some of them being red, others white, but the most general colour is grey. See Plate CIII. fig. 3.

3. The capensis, has a tail about the length of his head and red legs. It is a native of the Cape of Good Hope.

4. The brasiliensis has no tail. It is found in South America.

LEPUS, in astronomy. See ASTRONOMY, p. 487.

LERIA, a city and bishop's see of Portugal: W. long. 9° 15', and N. lat. 39° 30'.

LERIDA, a city and bishop's see of Catalonia in Spain: E. long. 5', N. lat. 41° 20'.

LERINS, two islands on the coast of Provence, five or six miles south of Antibes, called St. Margaret and St. Honorat.

LERNEA, the SEA-HARE, in zoology, a sea-insect of the order of the gymnarthria, the body of which is of an oblong cylindric figure, and is perforated in the forehead; the tentacula resemble ears. See GYMNARTHRIA.

I.E.

**LE ROY LE VEUT**, the king's assent to public bills. See the articles **BILL**, **STATUTE**, and **PARLIAMENT**.

**LESBOS**, or **METEIN**, an island of the Archipelago, sixty miles north-west of Smyrna. Its chief town is Castro.

**LESCAR**, a city and bishop's see of France, forty miles east of Bayonne.

**LESCARD**, a borough-town of Cornwall, fifteen miles west of Launceston, which sends two members to parliament.

**LESSINES**, a town of the Austrian Netherlands, fourteen miles north of Mons.

**LESSONS**, among ecclesiastical writers, portions of the Holy Scriptures, read in Christian churches, at the time of divine service.

**LESTWITHIEL**, a borough-town of Cornwall, twenty-three miles south-west of Launceston, which sends two members to parliament.

**LETHARGY**, in medicine. See **MEDICINE**.

**LETHE**, in the ancient mythology, one of the rivers of hell, signifying oblivion or forgetfulness; its waters having, according to poetical fiction, the peculiar quality of making those who drank of them forget every thing that was past.

**LETRIM**, or **LEITRIM**, a county of Ireland, in the province of Connaught; bounded by Fermanagh on the north, by Cavan on the east, by Roscommon on the south, and by Sligo on the west.

**LETTER**, a character used to express one of the simple sounds of the voice; and as the different simple sounds are expressed by different letters, these, by being differently compounded, become the visible signs or characters of all the modulations and mixtures of sounds used to express our ideas in a regular language.

**LETTER of attorney**, in law, is a writing by which one person authorises another to do some lawful act in his stead; as, to give scisin of lands, to receive debts, sue a third person, &c.

The nature of this instrument is to transfer to the person to whom it is given, the whole power of the maker, to enable him to accomplish the act intended to be performed. It is either general or special; and sometimes it is made revocable, which is when a bare authority is only given; and sometimes it is irrevocable, as where debts, &c. are assigned from one person to another. It is generally held, that the power granted to the attorney must be strictly pursued; and that where it is made to three persons, two cannot execute it. In most cases, the power given by a letter of attorney determines upon the death of the person who gave it. No letter of attorney made by any seaman, &c. in any ship of war, or having letters of marque, or by their executors, &c. in order to empower any person to receive any share of prizes, or bounty-money, shall be valid, unless the same be made revocable, and for the use of such seamen, and be signed and executed before, and attested by, the captain and one other of the signing officers of the ship, or the mayor or chief magistrate of some corporation.

**LETTER of mart**, or **marque**, a letter granted to one

of the king's subjects, under the privy seal, empowering him to make reprisals for what was formerly taken from him by the subjects of another state contrary to the law of mart. See the article **MARQUE**.

**LETTERS-PATENT**, are writings sealed with the great seal; so called, because they are open, with the seal affixed to them. These are granted to authorise a man to do or enjoy what of himself he could not do.

**LETTUCE**, in botany. See **LACTUCA**.

**LEVANT**, a name given to the east part of the Mediterranean sea, bounded by Natolia or the lesser Asia on the north, by Syria and Palestine on the east, by Egypt and Barca on the south, and by the island of Candia and the other part of the Mediterranean on the west.

**LEVATOR**, in anatomy, a name given to several muscles. See **ANATOMY**, Part II.

**LEUCADENDRON**, in botany, a genus of the tetrandria monogynia class. The stamens have two petals, one of them being divided into segments; the receptacle is somewhat hairy; it has no proper calix; and the antheræ are joined together. There are 15 species, none of them natives of Britain.

**LEUCOIUM**, the **GREAT SNOW-DROP**, in botany, a genus of the hexandria monogynia class. The corolla is bell-shaped, and divided into six segments; and the stigma is simple. There are three species, none of them natives of Britain.

**LEUCOMA**, in surgery, a distemper of the eye, otherwise called albugo. See **ALBUGO** and **MEDICINE**.

**LEUCOPHLEGMATIA**, in medicine, a kind of dropsy, otherwise called anasarca. See **ANASARCA** and **MEDICINE**.

**LEVEL**, an instrument wherewith to draw a line parallel to the horizon, by means of which the true level, or the difference of ascent or descent between several places, may be found for conveying water, draining fens, &c.

There are several instruments of different contrivance and matter, invented for the perfection of levelling all of which, for the practice, may be reduced to those that follow

**Air LEVEL**, that which shews the line of level by means of a bubble or air inclosed with some liquor in a glass-tube of an indeterminate length and thickness, whose two ends are hermetically sealed. When the bubble fixes itself at a certain mark, made exactly in the middle of the tube, the plane or ruler wherein it is fixed is level. When it is not level, the bubble will rise to one end. This glass-tube may be set in another of brass, having an aperture in the middle, whence the bubble of air may be observed. The liquor wherewith the tube is filled, is oil of tartar, or aqua secunda; those not being liable to freeze as common water, nor to rarefaction and condensation, as spirit of wine is. There is one of these instruments with sights, being an improvement upon that last described, which, by the addition of more apparatus, becomes more commodious and exact. It consists of an air level, (see Plate CIV. fig. 1.) n° 1. about eight inches long, and seven or eight lines in diameter, set in a brass-tube.

2. with

Fig. 1. LEVELS

Fig. 2. LEVELING

Fig. 3. LOGARITHMS

Fig. 4. MANIS or Scaly Lizard

2, with an aperture in the middle, C. The tubes are carried in a strong straight ruler, a foot long; at whose ends are fixed two sights, 3, 3, exactly perpendicular to the tubes, and of an equal height, having a square hole, formed by two fillets of brass crossing each other at right angles; in the middle whereof is drilled a very little hole, through which a point on a level with the instrument is descried. The brass-tube is fastened on the ruler by means of two screws, one whereof, marked 4, serves to raise or depress the tube at pleasure, for bringing it towards a level. The top of the ball and socket is rivetted to a little ruler that springs, one end whereof is fastened with screws to the great ruler, and at the other end has a screw, 5, serving to raise and depress the instrument when nearly level.

This instrument, however, is yet less commodious than the following one; because though the holes be ever so small, yet they will still take in too great a space to determine the point of level precisely.

This instrument consists of an air level, with telescope sights: this level (*ibid.* n° 2.) is like the last, with this difference, that instead of plain sights, it carries a telescope to determine exactly a point of level at a good distance. The telescope is a little brass-tube, about fifteen inches long, fastened on the same ruler as the level. At the end of the tube of the telescope, marked 1, enters the little tube 1, carrying the eye-glass and an hair horizontally placed in the focus of the object-glass, 2; which little tube may be drawn out, or pushed into the great one, for adjusting the telescope to different sights: at the other end of the telescope is placed the object-glass. The screw 3, is for raising or lowering the little fork, for carrying the hair, and making it agree with the bubble of air, when the instrument is level; and the screw 4, is for making the bubble of air, D or E, agree with the telescope: the whole is fitted to a ball and socket. M. Huygens is said to be the first inventor of this level, which has this advantage, that it may be inverted by turning the ruler and telescope half round; and if then the hair cut the same point that it did before, the operation is just.

It may be observed, that one may add a telescope to any kind of level, by applying it upon or parallel to the base or ruler, when there is occasion to take the level of remote objects.

Dr Desaguliers contrived an instrument, by which the difference of level of two places, which could not be taken in less than four or five days with the best telescope-levels, may be taken in as few hours. The instrument is as follows: to the ball C (*ibid.* n° 3.) is joined a recurve tube B A, with a very fine bore, and a small bubble at top, A, whose upper part is open. It is evident from the make of this instrument, that if it be inclined in carrying, no prejudice will be done to the liquor, which will always be right both in the ball and tube when the instrument is set upright. If the air at C, be so expanded with heat, as to drive the liquor to the top of the tube, the cavity A will receive the liquor, which will come down again and settle at D, or near it, according to the level of the place where the instrument is, as soon as the air at C returns to the same temperament as to heat and cold. To preserve the same

degree of heat, when the different observations are made, the machine is fixed in a tin vessel E F, filled with water up to *g h*, above the ball, and a very sensible thermometer has also its ball under water, than one may observe the liquor at D, in each experiment, when the thermometer stands at the same height as before. The water is poured out when the instrument is carried, which one may do conveniently by means of the wooden frame, which is set upright by the three screws S, S, S, *ibid.* n° 4. and a line and plummet P P, n° 5. At the back part of the wooden frame, from the piece at top K, hangs the plummet P, over a brass point at N; M *m* are brackets, to make the upright board K N continue at right angles with the horizontal one at N. N° 6, represents a front view of the machine, supposing the fore part of the tin-vessel transparent; and here the brass-socket of the recurve tube, into which the ball is screwed, has two wings at I I, fixed to the bottom, that the ball may not break the tube by its endeavour to emerge when the water is poured in as high as *g h*.

After the Dr had contrived this machine, he considered, that as the tube is of a very small bore, if the liquor should rise into the ball at A, n° 3 in carrying the instrument from one place to another, some of it would adhere to the sides or the ball A, and upon its descent in making the experiment, so much might be left behind, that the liquor would not be high enough at D, to shew the difference of the level: therefore, to prevent that inconvenience, he contrived a blank screw, to shut up the hole at A, as soon as one experiment is made, that in carrying the machine, the air in A may balance that in C, so that the liquor shall not run up and down the tube, whatever degree of heat and cold may act upon the instrument, in going from one place to another. Now, because one experiment may be made in the morning, the water may be so cold, that when a second experiment is made at noon the water cannot be brought to the same degree of cold it had in the morning; therefore, in making the first experiment, warm water must be mixed with the cold, and when the water has stood some time before it comes to be as cold as it is likely to be at the warmest part of that day, observe and set down the degree of the thermometer at which the spirit stands, and likewise the degree of the water in the barometer at D; then screw on the cap at A, pour out the water, and carry the instrument to the place whose level you would know; then pour in your water, and when the thermometer is come to the same degree as before, open the screw at top, and observe the liquor in the barometer.

The doctor's scale for the barometer is ten inches long, and divided into tenths; so that such an instrument will serve for any heights not exceeding ten feet, each tenth of an inch answering to a foot in height.

The Dr made no allowance for the decrease of density in the air, because he did not propose this machine for measuring mountains, (though with a proper allowance for the decreasing density of the air, it will do very well), but for heights that want to be known in gardens, plantations, and the conveyance of water, where an experiment that answers two or three feet in a distance of twenty miles, will render this a very useful instrument.

**Artillery Foot-LEVEL** is in form of a square, having its two legs or branches of an equal length; at a juncture whereof is a little hole, whence hangs a thread and plummet playing on a perpendicular line in the middle of a quadrant. It is divided into twice 45 degrees from the middle, *ibid* n° 7.

This instrument may be used on other occasions, by placing the ends of its two branches on a plane; for when the thread plays perpendicularly over the middle division of the quadrant, that plane is assuredly level. To use it in gunnery, place the two ends on the piece of artillery, which you may raise to any proposed height, by means of the plummet, whose thread will give the degree above the level.

**Carpenters and Paviser's LEVEL**, consists of a long ruler, in the middle whereof is fitted, at right angles, another somewhat bigger, at the top of which is fastened a line, which, when it hangs over a fiducial line at right angles with the base, shews that the said base is horizontal. Sometimes this level is all of one board. *Ibid*. n° 8.

**Gunner's LEVEL**, for levelling cannons and mortars, consists of a triangular brass-plate, about four inches high, *ibid*. 9. at the bottom of which is a portion of a circle, divided into 45 degrees; which number is sufficient for the highest elevation of cannons and mortars, and for giving shot the greatest range: on the center of this segment of a circle is screwed a piece of brass, by means of which it may be fixed or screwed at pleasure; the end of this piece of brass is made so as to serve for a plummet and index, in order to shew the different degrees of elevation of pieces of artillery. This instrument has also a brass-foot, to set upon cannons or mortars, so as, when those pieces are horizontal, the instrument will be perpendicular. The foot of this instrument is to be placed on the piece to be elevated, in such a manner, as that the point of the plummet may fall on the proper degree: this is what they call levelling the piece.

**Mason's LEVEL**, is composed of three rules, so joined as to form an isocles-rectangle, somewhat like a roman A; at the vertex whereof is fastened a thread, from which hangs a plummet, that passes over a fiducial line, marked in the middle of the base, when the thing to which the level is applied is horizontal; but declines from the mark, when the thing is lower on one side than on the other.

**Plumb, or Pendulum-LEVEL**, that which shews the horizontal lines by means of another line perpendicular to that described by a plummet or pendulum. This instrument, *ibid*. n° 10. consists of two legs or branches, joined together at right angles, whereof that which carries the thread and plummet is about a foot and a half long; the thread is hung towards the top of the branch, at the point 2. The middle of the branch where the thread passes is hollow, so that it may hang free every where: but towards the bottom, where there is a little blade of silver, whereon is drawn a line perpendicular to the telescope, the said cavity is covered by two pieces of brass, making as it were a kind of case, lest the wind should agitate the thread; for which reason

the silver blade is covered with a glass G, to the end that it may be seen when the thread and plummet play upon the perpendicular: the telescope is fastened to the other branch of the instrument, and is about two feet long: having an hair placed horizontally across the focus of the object-glass, which determines the point of the level. The telescope must be fitted at right angles to the perpendicular. It has a ball and socket, by which it is fastened to the foot, and was invented by M. Picard.

**Reflecting LEVEL**, that made by means of a pretty long surface of water representing the same object inverted which we see erected by the eye, so that the point where these two objects appear to meet is a level with the place where the surface of the water is found. This is the invention of M. Marriotte.

There is another reflecting level consisting of a mirror of steel, or the like, well polished, and placed a little before the object-glass of a telescope, suspended perpendicularly. This mirror must make an angle of 45° with the telescope, in which case the perpendicular line of the said telescope is converted into a horizontal line, which is the same with the line of level. This is the invention of M. Cassini.

**Water LEVEL**, that which shews the horizontal line by means of a surface of water or other liquor, founded on this principle, that water always places itself level. See the article FLUID.

The most simple is made of a long wooden trough, or canal, whose sides are parallel to the base, so that being equally filled with water, its surface shews the line of level. This is the chorobates of the ancients. See CHOROBATA.

It is also made with two cups fitted to the two ends of a pipe, three or four feet long, about an inch in diameter, by means whereof the water communicates from the one to the other cup; and this pipe being moveable on its stand by means of a ball and socket, when the two cups become equally full of water, their two surfaces mark the line of level.

This instrument, instead of cups, may also be made with two short cylinders of glass three or four inches long, fastened to each extreme of the pipe with wax or mastic. Into the pipe is poured some common or coloured water, which shews itself through the cylinders, by means whereof the line of level is determined; the height of the water, with respect to the center of the earth, being always the same in both cylinders: this level, though very simple, is yet very commodious for levelling small distances.

**LEVEL of Mr Huygens's invention**, consists of a telescope a, *ibid*. n° 11. in form of a cylinder, going through a ferril, in which it is fastened by the middle. This ferril has two flat branches b b, one above, and the other below; at the ends whereof are fastened little moving pieces, which carry two rings, by one of which the telescope is suspended to an hook at the end of the screw 3, and by the other a pretty heavy weight is suspended, in order to keep the telescope in equilibrio. This weight hangs in the box 5, which is almost filled with linseed oil, oil of walnuts, or other matter that

that will not easily coagulate, for more aptly settling the balance of the weight and telescope. The instrument carries two telescopes close and very parallel to each other; the eye glass of the one being against the object-glass of the other, that one may see each way without turning the level. In the focus of the object-glass of each telescope must a little hair be strained horizontally, to be raised and lowered as occasion requires by a little screw. If the tube of the telescope be not found level when suspended, a ferril or ring, 4, is put on it, and is to be slid along till it fixes to a level. The hook on which the instrument is hung, is fixed to a flat wooden cross; at the ends of each arm whereof there is a hook serving to keep the telescope from too much agitation in using or carriage. To the said flat cross is applied another hollow one, that serves as a case for the instrument; but the two ends are left open, that the telescope may be secured from the weather, and always in a condition to be used. The foot of this instrument is a round brass plate, to which are fastened three brass ferile, moveable by means of joints wherein are put slaves, and on this foot is placed the box.

N<sup>o</sup> 12. marked I, is a balance-level; which being suspended by the ring, the two sights, when in equilibrio, will be horizontal, or in a level.

**LEVELLING**, the art of finding a line parallel to the horizon at one or more stations, in order to determine the height of one place with regard to another. See the preceding article.

A truly level surface is a segment of a spherical surface, which is concentric to the globe of the earth. A true line of level is an arch of a great circle, which is imagined to be described upon a truly level surface. The apparent level is a straight line drawn tangent to an arch or line of true level. Every point of the apparent level, except the point of contact, is higher than the true level: thus let EAG (Plate CIV. fig. 2. n<sup>o</sup> 1.) be an arch of a great circle drawn upon the earth; to a person who stands upon the earth at A, the line HD is the apparent level parallel to his rational horizon RR; but this line, the farther it is extended from his station A, the farther it recedes from the center; for BC is longer than AC; and DC is longer than BC, &c. The common methods of levelling are sufficient for laying pavements of walks, for conveying water to small distances, for placing horizontal dials, or astronomical instruments; but in levelling the bottoms of canals which are to convey water to the distance of many miles, the difference between the apparent and true level must be taken into the account: thus let IAL (ibid. n<sup>o</sup> 2.) be an arch of a great circle upon the earth: let it be required to cut a canal whose bottom shall be a true level from A to B, of the length of 5078 feet: the common method is to place the levelling instrument in the bottom of the canal at A, and looking through the sights placed horizontally at a stick set up perpendicular at B, to make a mark where the visual ray or point of the apparent level points at E, and then to sink the bottom of the canal at B as much below E as A is below D. But this will not

give the true level: for according to Cassini's calculation, at the distance of 5078 feet the apparent level is seven inches above the true; and therefore, to make a true level, B must be sunk seven inches lower than the apparent level directs; so that if A be four feet below D, B must be four feet seven inches below the mark E. We have here mentioned the error which will arise from placing the level at one end of the line to be levelled, and shewn how to correct it; but in most cases it is better to take a station in the middle of the line to be levelled: thus, if the points H and B are to be levelled, place the instrument in the middle at A, and setting up sticks perpendicular at H and B, make marks upon each stick where the apparent level points, as E and F; those points are level: and if you sink H as much below F, as B is below E, HAB will be a true level.

The operation of levelling is as follows: suppose the height of the point A, (ibid. n<sup>o</sup> 3.) on the top of a mountain above that of the point B, and at the foot thereof, be required. Place the level about the middle distance between the two points as in D, and staffs in A and B; and let there be persons instructed with signals for raising and lowering, on the said staffs, little marks of pasteboard or other matter, the level being placed horizontally by the bubble, &c. Look towards the staff AE, and cause the mark to be raised to be lowered till the middle, upper edge, or other most conspicuous part, appear in the visual ray. Then measuring exactly the perpendicular height of the point E above the point A, which suppose six feet four inches; set that down in your book: then turn the level horizontally about, that the eye-glass of the telescope may be still next the eye when you look the other way; if you have only plain sights, the instrument need not be turned; and cause the person at the staff B, to raise or lower his mark, till some conspicuous part of it fall in the visual ray, as at C: then measure the perpendicular height of C above B, which suppose sixteen feet six inches: set this also down in the book above the other number of the first observation; subtract the one from the other, the remainder will be ten feet two inches, which is the difference of the level between A and B, or the height of the point A above the point B.

If the point D, where the instrument is fixed, be in the middle between the two points A and B, there will be no necessity for reducing the apparent level to the true level; the visual ray in that case being raised equally above the true level. If it be further required to know whether there be a sufficient descent for conveying water from the spring A (ibid. n<sup>o</sup> 4.) to the point B. Here, in regard the distance from A to B is considerable, it is required that several operations be made. Having then chosen a proper place for the first station, as at I. set up a staff in the point A, near the spring, with a proper mark to slide up and down the staff, as L, and measure the distance from A to I, which suppose two thousand yards. Then the level being adjusted in the point I. let the mark L be raised and lowered till such time as you spy some conspicuous part of it through the telescope or sights of the level, and measure the height AL, which suppose thirteen feet five inches. But in regard the distance AI is two thousand yards, you must have recourse to.

to your table for a reduction, subtracting eleven inches, which will leave the height of AL twelve feet six inches, and this note down in your book. Now turn the level horizontally about, so that the eye-glass of the telescope may be towards A, and fixing up another staff at H, cause the mark G to be moved up and down till you spy some conspicuous part through the telescope or sights. Measure the height HG, which suppose seven yards one foot two inches. Measure likewise the distance of the points IH, which suppose one thousand three hundred yards; for which distance four inches eight lines must be subtracted from the height HG, which consequently will only leave seven yards nine inches four lines, to be taken down in your book. This done, remove the level forwards to some other eminence, as E, whence the staff H may be viewed; as also another staff at D, near the place whither the water is to be conveyed. The level being again adjusted in the point E, look back to the staff H; and managing the mark as before, the visual ray will give the point F. Measure the height HF, which suppose eleven feet six inches. Measure likewise the distance HE, which suppose a thousand yards, for which there is two inches nine lines of abatement; which being taken from the height HF, there will remain eleven feet three inches three lines; which enter in your book. Lastly, turning the level to look at the next staff D, the visual ray will give the point D. Measure the height of D from the ground, which suppose eight feet three inches. Measure also the distance from the station E to B, which suppose nine hundred yards, for which distance there are two inches three lines of abatement; which being taken from the height BD, there will remain eight feet nine lines; which enter as before.

For the manner of entering down observations in your book, observe, that when a proper place or station for the level between the two points has been pitched upon, write down the two heights observed at that station in two different columns, viz. under the first column, those observed in looking through the telescope when the eye was from the spring, or towards the point, which we may call back sights; and under the second column, those observed when the eye was next the spring, which we call foresights. Having summed up the heights of each column separately, subtract the lesser from the greater, the remainder will be the difference of the level between the points A and B. If the distance of the two points be required, add all the distances measured together; and dividing the difference of height by the yards of the distances, for each two hundred yards you will have a descent of about two inches nine lines.

Dr. Halley suggests a new method of levelling, performed wholly by means of the barometer, in which the mercury is found to be suspended to so much the less height, as the place is farther remote from the center of the earth; whence the different heights of the mercury in two places give the difference of level. This method has been put in practice by some of the French academy.

**LEVELLING STAVES**, instruments used in levelling, serving to carry the marks to be observed, and at the same time to measure the heights of those marks from the ground. They usually consist each of two long wooden rulers, made to slide over one another, and divide into feet, inches, &c.

**LEVER**, or **LEAVER**, in mechanics. See **MECHANICS**.

**LEVERET**, among sportsmen, denotes a hare in the first year of her age.

**LEVIGATION**, in pharmacy and chemistry, the reducing hard and ponderous bodies to an impalpable powder, by grinding them on a porphyry, or the like.

**LEVITE**, in a general sense, means all the descendants of Levi, among whom were the Jewish priests themselves, who being descended from Aaron, were likewise of the race of Levi: but it is more particularly used for an order of officers in that church, who were employed in performing the manual service of the temple, such as in fetching wood, water, and other things necessary for the sacrifices, and in singing and playing upon instruments of music.

**LEVITICUS**, a canonical book of the Old Testament, so called from its containing the laws and regulations relating to the priests, Levites, and sacrifices.

**LEVITY**, in physiology, the privation or want of weight in any body, when compared with another that is heavier than it, in which sense it stands opposed to gravity.

**LEVY**, in law, signifies to gather or collect, as to levy money: and to levy a fine of lands, is the passing a fine.

**LEWARDEN**, a city of the United Provinces, the capital of west Friesland: E. long.  $5^{\circ} 35'$ , N. lat.  $53^{\circ} 20'$ .

**LEWES**, a borough-town of Sussex, forty miles south of London, which sends two members to parliament.

**LEWIS**, the most northerly of any of the western islands of Scotland, lying in  $8^{\circ}$  odd minutes W. long. and between  $58^{\circ}$  and  $59^{\circ}$  odd minutes N. lat.

**LEXICON**, the same as dictionary, but chiefly used in speaking of Greek dictionaries. See **DICTIONARY**.

**LEYDEN**, a city of Holland, in which there is a famous university, situated twenty miles south of Amsterdam.

**LEYTE**, one of the Philippine islands, separated from the island Philippina by a narrow channel: E. long.  $123^{\circ}$ , N. lat.  $11^{\circ}$ .

**LIBANUS**, a range of mountains in Asiatic Turkey, between Syria and Palestine, which extend from Sidon on the Levant, eastward beyond Damascus.

**LIBATION**, a religious ceremony among the ancient pagans, which consisted in an effusion of liquors poured on the head of the victims prepared for sacrifice.

**LIBAW**, a port-town of Poland, in the duchy of Courland, situated on a bay of the Baltic: E. long.  $21^{\circ}$ , N. lat.  $56^{\circ} 40'$ .

**LIBELLULA**, in the history of insects, a genus of four-winged flies, called in English dragon-flies, or adder-flies; the characters of which are these: The mouth is furnished with jaws; the feelers are shorter than the

is

breast; and the tail of the male terminates in a kind of hooked forceps. There are 21 species, chiefly distinguished by their colour.

**LIBER**, among botanists, denotes the rind or inner bark of trees.

**LIBERIA**, in Roman antiquity, a festival observed on the sixteenth of the calends of April, at which time the youth laid aside their juvenile habit for the toga virilis, or habit peculiar to grown men.

**LIBERTUS**, in Roman antiquity, a person who from being a slave had obtained his freedom.

The difference between the *liberti* and *libertini* was this: the *liberti* were such as had been actually made free themselves, and the *libertini* were the children of such persons.

**LIBERTY**, in general, denotes a state of freedom, in contradistinction to slavery.

According to Cicero, liberty is the power of living as a man pleases, or without being controlled by another.

In a legal sense, liberty signifies some privilege that is held by charter or prescription.

**LIBRA**, the **BALANCE**, in astronomy. See **ASTRONOMY**, p. 487.

**LIBRA**, in Roman antiquity, a pound weight; also a coin, equal in value to twenty denarii.

**LIBRARY**, an edifice or apartment destined for holding a considerable number of books placed regularly on shelves; or, the books themselves lodged in it.

The first who erected a library at Athens was the tyrant Pisistratus, which was transported by Xerxes into Persia, and afterwards brought back by Seleucus Nicator to Athens. Plutarch says, that under Eumenes there was a library at Pergamus that contained 200,000 books. That of Ptolemy Philadelphus, according to A. Gellius, contained 700,000, which were all burnt by Cæsar's soldiers. Constantine and his successors erected a magnificent one at Constantinople, which in the eighth century contained 300,000 volumes; and among the rest, one in which the *Iliad* and *Odyssey* were written in letters of gold, on the guts of a serpent: but this library was burnt by order of Leo Isaurus. The most celebrated libraries of ancient Rome, were the Ulpian and the Palatine, and in modern Rome that of the Vatican. The foundation of the Vatican library was laid by pope Nicholas, in the year 1450; it was afterwards destroyed in the sacking of Rome by the constable of Bourbon, and restored by pope Sixtus V. and has been considerably enriched with the ruins of that of Heidelberg, plundered by count Tilly in 1682. One of the most complete libraries in Europe, is that erected by Cosmo de Medicis; though it is now exceeded by that of the French king, which was begun by Francis I. augmented by cardinal Richelieu, and completed by M. Colbert. The emperor's library at Vienna, according to Lambecius, consists of 80,000 volumes, and 15,940 curious medals. The Bodleian library at Oxford exceeds that of any university in Europe, and even those of any of the sovereigns of Europe, except the emperor's and the French king's, which are each of them older by a hundred years. It was

Vol. II. Numb. 67.

2

first opened in 1602, and has since been increased by a great number of benefactors: indeed the Medicean library, that of Bessarion at Venice, and those just mentioned, exceed it in Greek manuscripts; but it outdoes them all in Oriental manuscripts; and as to printed books, Ambrosian at Milan, and that of Wolfenbützel, are two of the most famous, and yet both are inferior to the Bodleian. The Cotton library consists wholly of manuscripts, particularly of such as relate to the history and antiquities of Britain; which, as they are now bound, make about 1000 volumes.

In Edinburgh there is a good library belonging to the university, well furnished with books; which are kept in good order, and cloistered up with wire-doors, that none but the keeper can open, and are now lent out only upon consignment of the price; a method much more commodious than the multitude of chaigs used in other libraries. There is also a noble library of books and manuscripts belonging to the faculty of Advocates. See **ADVOCATE**.

**LIBRATION**, in astronomy, an apparent irregularity of the moon's motion, whereby she seems to librate about her axis, sometimes from the east to the west, and now and then from the west to the east. See **ASTRONOMY**.

**LIBYA**, in ancient geography, a large extent of Africa, lying south-west of Egypt.

**LICENCE**, in law, an authority given to a person to do some lawful act.

**LICENTiate**, one who has obtained the degree of a licence.

The greatest number of the officers of justice in Spain, are distinguished by no other title but that of licentiate. In order to pass licentiate in common law, civil law, and physic, they must have studied seven years; and in divinity, ten. Among us, a licentiate usually means a physician who has a licence to practise, granted by the college of physicians.

**LICHEN**, **LIVER-WORT**, in botany, a genus of the cryptogamia algæ class. The receptacle is roundish, plain, and shining; and the farina is dispersed upon the leaves. There are 85 species, all natives of Britain.

**LICTORS**, in Roman antiquity, the serjeants or bea- dles who carried the fasces before the supreme magistrates: it was also a part of their office to be the public executioners in beheading, scourging, &c.

**LIDDESDALE**, a county of Scotland, bounded by Tiviotdale, on the north; Cumberland, on the south-east; and Annandale, on the south-west.

**LIEGE**, in law, a term sometimes used for liege lord, or one who owns no superior.

**LIEGE ROUSTIE**, in Scots law, is opposed to death bed; and signifies a person's enjoying that state of health, in which only he can dispose of his property at pleasure. See law, Tit. xxvii. 28.

**LIEGE**, in geography, the capital of the bishopric of the same name in Germany, situated on the river Maes, twelve miles south of Maestricht; E. long. 5° 36', N. lat. 50° 40'.

**LIENTERY**, is a flux of the belly, in which, whatever

†

10 N

is

is taken in is discharged by stool as it is swallowed, or very little altered either in colour or substance. See **MEDICINE**.

**LIEUTENANT**, an officer who supplies the place and discharges the office of a superior in his absence. Of these, some are civil, as the lords-lieutenants of kingdoms, and the lord-lieutenants of counties; and others are military, as the lieutenant general, lieutenant-general of the artillery, lieutenant colonel, lieutenant of the artillery of the tower, lieutenants of horse, foot, ships of war, &c.

**Lord LIEUTENANT of Ireland**, is properly a viceroy, and has all the state and grandeur of a king of England, except being served upon the knee. He has the power of making war and peace, of bestowing all the offices under the government, of dubbing knights, and of pardoning all crimes except high treason; he also calls and prorogues the parliament, but no bill can pass without the royal assent. He is assisted in his government by a privy-council; and, on his leaving the kingdom, he appoints the lords of the regency, who govern in his absence.

**Lords LIEUTENANTS of counties**, are officers, who, upon any invasion or rebellion, have power to raise the militia, and to give commissions to colonels and other officers, to arm and form them into regiments, troops and companies. Under the lords lieutenants, are deputy-lieutenants, who have the same power; these are chosen by the lords-lieutenants out of the principal gentlemen of each county, and presented to the king for his approbation.

**LIEUTENANT-GENERAL**, is an officer next in rank to the general: in battle, he commands one of the wings; in a march, a detachment, or a flying camp; also a quarter, at a siege, or one of the attacks, when it is his day of duty.

**LIFE**, is peculiarly used to denote the animated state of living creatures, or the time that the union of their soul and body lasts.

**LIFERENT**, in Scots law. When the use or enjoyment of a subject is given to a person during his life, it is said to belong to him in liferent. See **LAW**, Tit. xvi. 21.

**LIGAMENT**, in anatomy, a strong compact substance, serving to join two bones together. See **ANATOMY**.

**LIGATURE**, in surgery, is a chord, band, or string; or the binding any part of the body with a chord, band, fillet, &c. whether of leather, linnen, &c.

Ligatures are used to extend and replace bones that are broken or dislocated; to tie the patients down in lithotomy and amputations; to tie upon the veins in phlebotomy, or the arteries in amputations, or in large wounds; to secure the splints that are applied to fractures; to tie up the processes of the peritonæum, with the spermatic vessels in castration; and, lastly, in taking off warts or other excrescences by ligature.

**LIGHT**, in physiology, certain subtle particles of matter, capable of exciting in us the sensation of colours. See **OPTICS**.

**LIGHTENING**, the bursting of fire from a cloud or the earth. See **ELECTRICITY**.

**LIGHTER**, in naval architecture, a large kind of boat used in the river of Thames for carrying heavy goods, as coals, timber, &c.

**LIGNICENSIS terra**, in the materia medica, the name of a fine yellow hole, dug in many parts of Germany, particularly about Emeric in the circle of Westphalia, and used in cordial and astringent compositions.

**LIGULATED**, among botanists, an appellation given to such floscules as have a straight end turned downwards, with three indentures, but not divided into segments.

**LIGUSTICUM**, **LOVAGE**, in botany, a genus of the pentandria digynia class. The fruit is oblong, with five furrows on each side. There are six species, two of them natives of Britain, viz. the scotticum, or Scottish sea-parsley; and the cornubiense, or Cornwall saxifrage.

**LIGUSTRUM**, **PRIVET**, in botany, a genus of trees belonging to the diandria monogynia class. The corolla consists of four segments; and the berry has four seeds. There is but one species, viz. the vulgare or privet, a native of Britain.

**LILIADEOUS**, an appellation given to such flowers as resemble that of the lily.

**LILIUM**, in botany, a genus of the hexandria monogynia class. The corolla is bell-shaped, and consists of six petals, with a longitudinal nectariferous line; and the valves of the capsule are connected with a lattice-work of hair. There are nine species, none of them natives of Britain. The root of the white lily is reckoned emollient and suppurative.

**LIMA**, a province of Peru, in South America; the capital of which, called also Lima, was almost entirely destroyed by an earthquake in 1746: W. long. 76°, and S. lat. 12° 30'.

**LIMAX**, in zoology, a genus of insects belonging to the order of vermes mollusca; the characters of which are these: The body is oblong, fitted for crawling, with a kind of muscular coat on the upper part; and the belly is plain: they have a roundish hole in the side, near the neck, which serves the purposes of genitals, and for voiding their excrements: they have likewise four tentacula or horns, situate above the mouth, which they extend or retract at pleasure. There are eight species, distinguished entirely by their colour, as the black snail; the white snail; the reddish snail; the ash-coloured snail; &c. Snails are said to be hermaphrodites, and mutually impregnate each other.

**LIMB**, in a general sense, denotes the border or edge of a thing: thus, we say, the limb of a quadrant, of the sun, of a leaf, &c.

**LIMB**, in anatomy, an appellation given to the extremities of the body, as the arms and legs.

**LIMB**, *limbus*, in the church of Rome, is used in two different senses. 1. The limb of the patriarchs is said to be the place where the patriarchs waited the redemption of mankind: in this place, they suppose our Saviour's soul continued from the time of his death to his resurrection. 2. The limb of infants, dying without baptism; a place supposed to be distinct both from heaven and hell; since, say they, children dying innocent of any actual sin do not deserve hell, and by reason of their original sin cannot be admitted into heaven.

**LIMBURG**,

**LIMBURG**, the capital of a dutchy of the same name, in the Austrian Netherlands, twenty miles south-east of Liege : E. long.  $6^{\circ} 5'$ , and N. lat.  $50^{\circ} 37'$ .

**LIME**. See **CHEMISTRY**, p. 76.

**LIMERIC**, the capital of a county of the same name in Ireland, situated on the river Shannon, fifty two miles north of Cork : W. long.  $8^{\circ} 30'$ , N. lat.  $52^{\circ} 35'$ .

**LIMINGTON**, or **LEMINGTON**, a borough-town of Hampshire, twelve miles south-west of Southampton. It sends two members to parliament.

**LIMIT**, in a restrained sense, is used by mathematicians for a determinate quantity to which a variable one continually approaches ; in which sense, the circle may be said to be the limit of its circumscribed and inscribed polygons. In algebra, the term limits is applied to two quantities, one of which is greater, and the other less, than another quantity and in this sense it is used, in speaking of the limits of equations, whereby their solution is much facilitated. See **ALGEBRA**.

**LIMNING**, the art of painting in water-colours, in contradistinction to painting, which is done in oil-colours. See **PAINTING**.

Limning is by far more ancient than painting in oil ; this last being first invented by John Van Eyck, a Flemish painter, in 1410.

In limning, all colours are proper enough, except the white, made of lime, which is only used in fresco. The azure and ultramarine must always be mixt with size or gum : but there are always applied two lays of hot size, before the size colours are laid on : the colours are all ground in water, each by itself, and, as they are required in working, are diluted with size water.

When the piece is finished, they go over it with the white of an egg, well beaten ; and then with varnish, if required.

To limn or draw a face in colours : having all the materials in readiness, lay the prepared colour on the card even and thin, free from hairs and spots, over the place where the picture is to be. The ground being laid, and the party placed in a due position, begin the work ; which is to be done at three sittings. At the first, you are only to dead-colour the face, which will require about two hours. At the second sitting, go over the work more curiously, adding its particular graces or deformities. At the third sitting, finish the whole ; carefully remarking whatever may conduce to render the piece perfect, as the cast of the eyes, moles, scars, gestures, and the like.

**LIMODORUM**, in botany, a genus of the gynandria diandria class. The nectarium consists of one concave, pedicellated leaf, situate with the undermost petal. There is but one species, a native of North America.

**LIMON**. See **CITRUS**.

**LIMOSELLA**, in botany, a genus of the didynamia angiospermia class. The calix consists of five segments, and the corolla of five equal divisions ; the stamina are approximate in pairs ; and the capsule has one cell and two valves, containing many seeds.

**LIMPET**. See **PATELLA**.

**LINARIA**, in ornithology. See **FRINGILLA**.

**LINCOLN**, the capital city of the county of Lincoln :

W. long.  $27'$ , N. lat.  $53^{\circ} 16'$ . It sends two members to parliament.

**LINE**, in geometry, a quantity extended in length only, without any breadth or thickness. It is formed by the flux or motion of a point. See **FLUXIONS**, and **GEOMETRY**.

**LINE**, in the art of war, is understood of the disposition of an army, ranged in order of battle, with the front extended as far as may be, that it may not be flanked.

**LINE of battle**, is also understood of the disposition of a fleet on the day of the engagement, on which occasion the vessels are usually drawn up as much as possible in a straight line, as well to gain and keep the advantage of the wind, as to run the same board.

**Ship of the LINE**, a vessel large enough to be drawn up in the line, and to have a place in a sea-fight.

**LINE**, in genealogy, a series or succession of relations in various degrees, all descending from the same common father.

**LINE** also denotes a French measure, containing the twelfth part of an inch, or the hundred and forty-fourth part of a foot. Geometricians conceive the line subdivided into six points. The French line answers to the English barley corn.

**LINEs**, in heraldry, the figures used in armories, to divide the shield into different parts, and to compose different figures. These lines, according to their different forms and names, give denomination to the pieces or figures which they form, except the straight or plain lines.

**LINEA ALBA**, in anatomy. See **ANATOMY**, p. 192.

**LINEAMENT**, among painters, is used for the out-lines of a face.

**LINEAR NUMBERS**, in mathematics, such as have relation to length only ; such is a number which represents one side of a plane figure. If the plane figure be a square, the linear number is called a root.

**LINEAR PROBLEM**, that which may be solved geometrically by the intersection of two right lines. This is called a simple problem, and is capable but of one solution.

**LINEN**. See **LINEN**.

**LING**, in ichthyology. See **GADUS**.

**LINGEN**, a town of Germany, in the circle of Westphalia, capital of a county of the same name, situated on the river Ems, forty five miles north of Munster.

**LINGUATULA**, in ichthyology. See **PLEURONECTES**.

**LINIMENT**, in pharmacy, a composition of a consistence somewhat thinner than an unguent, and thicker than an oil, used for anointing different parts of the body in various intentions.

The materials proper for composing of a liniment, are oils, fats, balsams, and whatever enters the composition of unguents and plasters.

**LINLITHGOW**, a town of Scotland, in the county of Lothian, capital of the county of Linlithgow, situated sixteen miles west of Edinburgh.

**LINNÆA**, in botany, a genus of the didynamia angiospermia class. The calix is double ; the corolla is bell-shaped ; and the berry is dry, and contains two seeds.

seeds. There is but one species, a native of Sweden. LINNEN, in commerce, a well-known kind of cloth, chiefly made of flax. See FLAX.

In order to succeed in the linnen-manufacture, one set of people should be confined to the plowing and preparing the soil, sowing and covering the seed, to the weeding, pulling, rippling, taking care of the new seed, and watering and grassing the flax, till it is lodged at home: others should be concerned in the drying, breaking, scutching, and heckling the flax, to fit it for the spinners; and others in spinning and reeling it, to fit it for the weaver; others should be concerned in taking due care of the weaving, bleaching, beetling, and finishing the cloth for the market. It is reasonable to believe, that if these several branches of the manufacture were carried on by distinct dealers in Scotland and Ireland, where our home-made linnens are manufactured, the several parts would be better executed, and the whole would be afforded cheaper, and with greater profit.

LINNET, in ornithology. See FRINGILLA.

LINSEED, the seed of the plant linum. Linseed bruised and steeped in water, gives it very soon a thick mucilaginous nature, and communicates much of its emollient virtues to it.

LINT. See LINNEN and FLAX.

LINTEL, in architecture, a piece of stone or timber that lies horizontally over door-posts and window-jambs, as well to bear the thickness of the wall over it, as to bind the sides of the wall together.

LINTON, a market-town of Cambridgeshire, situated ten miles south-east of Cambridge.

LINTS, or LINTZ, a beautiful city, capital of Upper Austria, with a strong citadel.

LINUM, FLAX, in botany, a genus of the pentandria pentagynia class. The calix consists of five leaves, and the corolla of five petals; the capsule has five valves, and ten cells; and the seeds are solitary. There are 22 species, five of them natives of Britain, viz. the usitatissimum, or common flax; the perenne, or blue flax; the tenuifolium, or narrow-leaved wild flax; the catharticum, or purging flax; and the radiola, least rupture-wort, or all-seed. See FLAX.

LION, in zoology. See FELIS.

LIONCELLES, in heraldry, a term used for several lions borne in the same coat of arms.

LIP, in anatomy. See ANATOMY, p. 305.

*Hare-Lip*, a disorder, in which the upper lip is in a manner slit or divided, so as to resemble the upper lip of a hare, whence the name. See SURGERY.

LIPOTHYMIA, FAINTING, in medicine, may arise from several causes, as too violent exercises, suppression of the menses or other accustomed evacuations, &c. See MEDICINE.

LIPPIA, in botany, a genus of the didynamia angiospermia class. The calix consists of four roundish, erect, and membranaceous teeth; the capsule is straight, has two valves, one cell, and two seeds. There are two species, none of them natives of Britain.

LIQUIDAMBER, in botany, a genus of the monœcia polyandria class. The calix has four leaves; it has

no corolla, but numerous filaments: the calix of the male consists of four leaves in the form of a globe; it has no corolla, but a couple of styli; and the capsules, which are numerous, are round, with a double valve, and contains many seeds. There are two species, both natives of America. This tree yields a fragrant resin, called liquidamber, which resolves and opens obstructions.

LIQUOR, a name signifying any fluid substance.

LIQUORICE. See GLYCRRHIZA.

LIRIODENDRUM, the TULIP-TREE, in botany, a genus of the polyandria polygynia class. The calix consists of three leaves, and the corolla of nine petals; and the seeds are imbricated upon a strobilus. There are two species, none of them natives of Britain.

LISBON, the capital of Portugal, situated on the north bank of the Tagus, about ten miles from its mouth, and eighty miles west of the frontiers of Spain: W. long. 9° 25', N. lat. 38° 25'. It is about six miles long, winding with the river, from whence it rises with an easy ascent, and is computed to contain about 30,000 houses, 200,000 inhabitants, forty parish-churches, and forty convents of both sexes.

LISIEUX, a large city and bishop's see of France, in the province of Normandy: E. long. 16', and N. lat. 40° 14'.

LISLE, or RYSEL, a large and populous city, the capital of French Flanders, situated on the river Deule, twelve miles west of Tournay: E. long. 3°, and N. lat. 50° 42'.

LIST, in commerce, the bordure of cloth, or of stuff; serving not only to shew their quality, but to preserve them from being torn in the operations of fulling, dying, &c.

List is used on various occasions; but chiefly by gardeners for securing their wall-trees.

LITANY, a solemn form of supplication to God, in which the priest utters some things fit to be prayed for, and the people join in their intercession, saying, *We beseech thee to hear us, good Lord, &c.*

LITCHFIELD, a city of Staffordshire, one hundred miles north-west of London, and twelve south-east of Stafford. This city and Coventry have one bishop between them; it sends two members to parliament.

LITERATI, in general, denotes men of learning; but is more particularly used by the Chinese for such persons as are able to read and write their language.

LITHANTHRAX, PIT-COAL, in natural history, a genus of fossils, defined to be solid, dry, opaque, inflammable substances, found in large strata, splitting horizontally more easily than in any other direction, of a glossy hue, soft and friable, not fusible, but easily inflammable, and leaving a large residuum of ashes.

Of this genus there are three species: 1. The hard, dusky, black coal, known by the name of Scotch coal. 2. The hard, glossy, black coal, known by the same name. 3. The friable, glossy, black coal, called Newcastle coal, as being chiefly dug about that town.

LITHARGE, is properly a recement of lead, or lead vitrified, either alone, or with a mixture of copper. See CHEMISTRY, p. 84.

LITHIDIA,

**LITHIDIA**, in natural history, the name of a large class of fossils, including the flint and pebble kinds.

The lithidia are defined to be stones of a debased crystalline matter, covered by, and surrounded with, an opaque crust, and frequently of great beauty, and considerable brightness within, though of but a slight degree of transparency, approaching to the nature of the semi pellucid gems, and like them found in not very large masses.

**LITHOGINESIA**, a term used by some authors for the formation of stones. See **STONE**.

**LITHOMARGA**, *Ston-marle*, a name given by some authors to a sparry substance highly debased by earth, which is found in great plenty in the caves of the Hart's forest in Germany, and used there.

**LITHONTRIPTICS**, medicines which either break, or are supposed to have the virtue of breaking, stones in the urinary passages. See **MEDICINE**.

**LITHOPHYTA**, the name of Linnæus's third order of vermes. See **NATURAL HISTORY**.

**LITHOSPERMUM**, *Gromwell*, in botany, a genus of the pentandria monogynia class. The corolla is funnel-shaped, with a naked perforated faux; and the calix consists of five segments. There are six species, three of them natives of Britain; viz. the officinale, or gromwell; the purpureo-cæruleum, or lesser creeping gromwell; and the arvense, or bastard alkanet. The seeds of the officinale are accounted diuretic.

**LITHOSTROTION**, in natural history, a name of a species of fossil coral, composed of a great number of long and slender columns, sometimes round, sometimes angular, joined nicely to one another, and of a starry or radiated surface at their tops. These are found in considerable quantities in the northern and western parts of this kingdom, sometimes in single, sometimes in complex specimens.

**LITHOTOMY**, in surgery, cutting for the stone. See **SURGERY**.

**LITHOZUGIA**, in natural history, a genus of fossils, composed of a simple stony matter, making a kind of cement, and holding firmly together small pebbles &c. embodied in it.

**LITHUANIA**, a province of Poland, bounded by Samogitia, Livonia, and part of Russia, on the north; by another part of Russia, on the east; by Volhinia and Polesia, on the south; and by Prussia and Polachia, on the west.

**LITISCONTESTATION**, in Scots law. See **LAW**, Tit. xxx. 33.

**LITURGY**, a name given to those set forms of prayer which have been generally used in the Christian church. Of these there are not a few ascribed to the apostles and fathers, but they are almost universally allowed to be spurious.

**LITUUS**, in Roman antiquity, a short straight rod, only bending a little at one end, used by the augurs. See **AUGUR**.

**LIVADIA**, the capital of a province of European Turkey, the ancient Achaia, situated on the north side of the gulph of Lepanto: E. long. 23° 15', N. lat. 27° 30'.

**LIVER**, in anatomy. See **ANATOMY**, p. 264.

**LIVERWORT**, in botany. See **LICHEN**.

**LIVERPOOL**, or **LEVERPOOL**, a port town of Lancashire, fifteen miles north of Chester, which sends two members to parliament.

**LIVERYMEN** of London are a number of men chosen from among the freemen of each company. Out of this body the common council, sheriff, and other superior officers for the government of the city are elected, and they alone have the privilege of giving their votes for members of parliament; from which the rest of the citizens are excluded.

**LIVONIA**, a province of Russia, 160 miles long, and 120 broad; bounded by the gulph of Finland, on the north; by Ingria and great Novogorod, on the east; by Lithuania and Courland, on the south; and by the Baltic, on the west: its chief towns are Narva, Revel, and Riga.

**LIVONICA TERRA**, a kind of fine bole used in the shops of Germany and Italy. These earths are both dug out of the same pit, in the place from whence they have their name, and in some other parts of the world. They are generally brought to us made up into little cakes, and sealed with the impression of a church and an escutcheon with two cross keys. In Spain and Portugal they are much used, sometimes singly, sometimes mixed together, and are good in fevers and in fluxes of all kinds.

**LIVRE**, a French money of account, containing twenty sols.

**LIXIVIOUS**, an appellation given to salts obtained from burnt vegetables by lotion.

**LIXIVIUM**, in pharmacy, &c. a ley, obtained by pouring some liquor upon the ashes of plants; which is more or less powerful, as it has imbibed the fixed salts contained in the ashes.

**LIZZARD**, in zoology. See **LACERTA**.

**LIZZARD**, in geography, a cape, or promontory of Cornwall, fifteen miles south of Falmouth: W. long. 5° 47', N. lat. 49° 50'.

**LOACH**, in ichthyology. See **COBITIS**.

**LOADSTONE**. See **MAGNET**.

**LOAMS**, in natural history, are defined to be earths composed of dissimilar particles, hard, stiff, dense, and hard and rough to the touch; not easily ductile while moist, readily diffusible in water, and composed of sand and a tough viscid clay. Of these loams, some are whitish, and others brown or yellow.

**LOBE**, in anatomy, any fleshy protuberant part, as the lobes of the lungs, lobes of the ears, &c.

**LOBELIA**, in botany, a genus of the syngenesia monogynia class. The calix consists of five segments, and the corolla of one irregular petal; and the capsule has two and sometimes three cells. There are 26 species, only one of them a native of Britain, viz. the dortinnanna, or water gladiale.

**LOCAL**, in law, something fixed to the freehold, or tied to a certain place: thus real actions are local, since they must be brought in the country where they lie: and local customs are those peculiar to certain countries and places.

**LOCAL MEDICINES**, those destined to act upon particular parts; such are fomentations, epithems, velicatories, &c.

**Decree of LOCALITY**, in Scots law, a decree proportioning a minister's stipend among the different persons liable in payment of it. See **LAW**, Tit. v. 13.

**LOCATELLUS's BALSAM**, in pharmacy, a celebrated balsam, the preparation whereof is directed in the Edinburgh dispensatory thus: Take of yellow-wax, one pound; oil olive, a pint and a half; Venice turpentine, a pound and a half; balsam of Peru, two ounces; dragon's blood, one ounce: melt the wax in the oil over a gentle fire; then add the turpentine; and having taken them from the fire, mix in the balsam of Peru and dragon's blood, keeping them continually stirring till grown cold.

This balsam is used in internal bruises and hæmorrhages, erosions of the intestines, ulcerations of the lungs, dysenteries, and in some coughs and asthmas.

**LOCHIA**, in medicine, a flux from the uterus, consequent to delivery. See **MIDWIFERY**.

**LOCHMABEN**, a town of Scotland, fifteen miles east of Dumfries.

**LOCK**, a well-known instrument used for fastening doors, chests, &c. generally opened by a key.

**LOCKMAN**, an officer in the isle of Man, who executes the orders of the government, much like our under sheriff.

**LOCRIDA**, a town of Turkey in Europe, seventy miles south-east of Durazzo: E. long.  $21^{\circ}$ , N. lat.  $41^{\circ}$ .

**LOCUS GEOMETRICUS**, denotes a line, by which a local or indeterminate problem is solved.

A locus is a line, any point of which may equally solve an indeterminate problem. Thus, if a right line suffice for the construction of the equation, it is called *locus ad rectum*; if a circle, *locus ad circulum*; if a parabola, *locus ad parabolam*; if an ellipsis, *locus ad ellipsin*; and so of the rest of the conic sections.

**LOCULAMENT**, among botanists, denotes a cell, or partition, in a seed pod, for the seed of a plant.

**LOCUST**, in zoology. See **GRYLLUS**.

**LODGMENT**, in military affairs, is a work raised with earth, gabions, fascines, wool-packs, or mantelets, to cover the besiegers from the enemies fire, and to prevent their losing a place which they have gained, and are resolved, if possible, to keep.

**LOEFLINGIA**, in botany, a genus of the triandria monogynia class. The calix consists of five leaves, and the corolla of five small petals; and the capsule has one cell, and three valves. There is but one species, a native of Spain.

**LOESELIA**, in botany, a genus of the didynamia angiospermia class. The calix consists of four segments; and the capsule has three cells. There is but one species, a native of America.

**LOG**, in naval affairs, is a flat piece of wood, shaped somewhat like a flounder, with a piece of lead fastened to its bottom, which makes it stand or swim upright in the water. See **PLATE CIII.** fig. 4.

**LOGARITHMIC CURVE**. If on the line AN (**PLATE CIII.** fig. 5.) both ways indefinitely extended, be ta-

ken, AC, CE, EG, GI, IL, on the right hand; and also Ag, gP, &c. on the left, all equal to one another: and if at the points Pg, A, C, E, G, I, L, be erected to the right line AN, the perpendiculars PS, g d, AB, CD, EF, GH, IK, LM, which let be continually proportional, and represent numbers, viz. AB, 1; CD, 10; EF, 100, &c. then shall we have two progressions of lines, arithmetical and geometrical: for the lines AC, AE, AG, &c. are in arithmetical progression, or as 1, 2, 3, 4, 5, &c. and so represent the logarithms to which the geometrical lines AB, CD, EF, &c. do correspond. For since AG is triple of the first line AC, the number GH shall be in the third place from unity, if CD be in the first: so likewise shall LM be in the fifth place, since AL = 5 AC. If the extremities of the proportionals S, d, B, D, F, &c. be joined by right lines, the figures SBML will become a polygon, consisting of more or less sides, according as there are more or less terms in the progression.

If the parts AC, CE, EG, &c. be bisected in the points, c, e, g, i, l, and there be again raised the perpendiculars cd, ef, gb, ik, lm, which are mean proportionals between AB, CD; CD, EF, &c. then there will arise a new series of proportionals, whose terms, beginning from that which immediately follows unity, are double of those in the first series, and the difference of the terms is become less, and approach nearer to a ratio of equality than before. Likewise, in this new series, the right lines AL, Ae, express the distances of the terms LM, cd, from unity, viz. since AL is ten times greater than Ae, LM shall be the tenth term of the series from unity; and because Ae is three times greater than Ac, ef will be the third term of the series if cd be the first, and there shall be two mean proportionals between AB and ef, and between AB and LM there will be nine mean proportionals. And if the extremities of the lines Bd, Df, Fb, &c. be joined by right lines, there will be a new polygon made, consisting of more but shorter sides than the last.

If, in this manner, mean proportionals be continually placed between every two terms, the number of terms at last will be made so great, as also the number of the sides of the polygon, as to be greater than any given number, or to be infinite; and every side of the polygon so lessened, as to become less than any given right line; and consequently the polygon will be changed into a curve-lined figure; for any curve lined figure may be conceived as a polygon, whose sides are infinitely small and infinite in number. A curve described after this manner, is called logarithmical.

It is manifest from this description of the logarithmic curve, that all numbers at equal distances are continually proportional. It is also plain, that if there be four numbers, AB, CD, IK, LM, such that the distance between the first and second be equal to the distance between the third and the fourth, let the distance from the second to the third be what it will, these numbers will be proportional. For because the distances AC, IL, are equal, AB shall be to the increment Ds, as IK is to the increment MT. Wherefore,

fore, by composition,  $AB : DC :: IK : ML$ . And, contrariwise, if four numbers be proportional, the distance between the first and second shall be equal to the distance between the third and fourth.

The distance between any two numbers, is called the logarithm of the ratio of those numbers; and, indeed, doth not measure the ratio itself, but the number of terms in a given series of geometrical proportionals, proceeding from one number to another, and defines the number of equal ratios by the composition whereof the ratio of numbers is known.

**LOGARITHMS**, are the indexes or exponents (mostly whole numbers and decimal fractions, consisting of seven places of figures at least) of the powers or roots (chiefly broken) of a given number; yet such indexes or exponents, that the several powers or roots they express, are the natural numbers, 1, 2, 3, 4, 5, &c. to 10 or 100000, &c. (as, if the given number be 10, and its index be assumed 1 0000000, then the 0.0000000 root of 10, which is 1, will be the logarithm of 1; the 0.301036 root of 10, which is 2, will be the logarithm of 2; the 0.477121 root of 10, which is 3, will be the logarithm of 3; the 1.612060 root of 10, the logarithm of 4; the 1.041393 power of 10 the logarithm of 11; the 1.079181 power of 10 the logarithm of 12, &c.) being chiefly contrived for ease and expedition in performing of arithmetical operations in large numbers, and in trigonometrical calculations; but they have likewise been found of extensive service in the higher geometry, particularly in the method of fluxions. They are generally founded on this consideration, that if there be any row of geometrical proportional numbers, as 1, 2, 4, 8, 16, 32, 64, 128, 256, &c. or 1, 10, 100, 1000, 10000, &c. and as many arithmetical progressional numbers adapted to them, or set over them, beginning with 0,

thus,  $\left\{ \begin{array}{l} 0, 1, 2, 3, 4, 5, 6, 7, \text{ \&c.} \\ 1, 2, 4, 8, 16, 32, 64, 128, \text{ \&c.} \end{array} \right\}$   
or,  $\left\{ \begin{array}{l} 0, 1, 2, 3, 4, \text{ \&c.} \\ 1, 10, 100, 1000, 10000, \text{ \&c.} \end{array} \right\}$

then will the sum of any two of these arithmetical progressions, added together, be that arithmetical progression which answers to or stands over the geometrical progression, which is the product of the two geometrical progressions over which the two assumed arithmetical progressions stand: again, if those arithmetical progressions be subtracted from each other, the remainder will be the arithmetical progression standing over that geometrical progression which is the quotient of the division of the two geometrical progressions belonging to the two first assumed arithmetical progressions; and the double, triple, &c. of any one of the arithmetical progressions, will be the arithmetical progression standing over the square, cube, &c. of that geometrical progression which the assumed arithmetical progression stands over, as well as the  $\frac{1}{2}$ ,  $\frac{1}{3}$ , &c. of that arithmetical progression will be the geometrical progression answering to the square root, cube root, &c. of the arithmetical progression over it; and from hence arises the following common, though lame and imperfect definition of logarithms; viz.

“That they are so many arithmetical progressions, answering to the same number of geometrical ones.” Whereas, if any one looks into the tables of logarithms, he will find, that these do not all run on in an arithmetical progression, nor the numbers they answer to in a geometrical one; these last being themselves arithmetical progressions. Dr Wallis, in his history of algebra, calls logarithms the indexes of the ratios of numbers to one another. Dr Halley, in the philosophical transactions, n<sup>o</sup> 216, says, they are the exponents of the ratios of unity to numbers. So also Mr Cotes, in his Harmonia Mensurarum, says, they are the numerical measures of ratios. But all these definitions convey but a very confused notion of logarithms. Mr Maclaurin, in his Treatise of Fluxions, has explained the natural and genesis of logarithms agreeably to the notion of their first inventor lord Napier. Logarithms then, and the quantities to which they correspond, may be supposed to be generated by the motion of a point; and if this point moves over equal spaces in equal times, the line described by it increases equally.

Again a line decreases proportionably, when the point that moves over it describes such parts in equal times as are always in the same constant ratio to the lines from which they are subducted, or to the distances of that point, at the beginning of those lines, from a given term in that line. In like manner, a line may increase proportionably, if in equal times the moving point describes spaces proportional to its distances from a certain term at the beginning of each time. Thus, in the first case, let  $ac$  (Plate CIV. fig. 3.) be to  $ao$ ,  $cd$  to  $co$ ,  $de$  to  $do$ ,  $ef$  to  $eo$ ,  $fg$  to  $fo$ , always in the same ratio of  $QR$  to  $QS$ ; and suppose the point  $P$  sets out from  $a$ , describing  $ac$ ,  $cd$ ,  $de$ ,  $ef$ ,  $fg$ , in equal parts of the time; and let the space described by  $P$  in any given time be always in the same ratio to the distance of  $P$  from  $o$  at the beginning of that time; then will the right line  $ao$  decrease proportionably.

In like manner, the line  $oa$ , (*ibid.* n<sup>o</sup> 3.) increases proportionably, if the point  $p$ , in equal times, describes the spaces  $ac$ ,  $cd$ ,  $de$ ,  $fg$ , &c. so that  $ac$  is to  $ao$ ,  $cd$  to  $co$ ,  $de$  to  $do$ , &c. in a constant ratio. If we now suppose a point  $P$  describing the line  $AG$  (*ibid.* n<sup>o</sup> 4.) with an uniform motion, while the point  $p$  describes a line increasing or decreasing proportionably, the line  $AP$ , described by  $P$ , with this uniform motion, in the same time that  $oa$ , by increasing or decreasing proportionably, becomes equal to  $op$ , is the logarithm of  $op$ . Thus  $AC$ ,  $AD$ ,  $AE$ , &c. are the logarithms of  $oc$ ,  $od$ ,  $oe$ , &c. respectively; and  $oa$  is the quantity whose logarithm is supposed equal to nothing.

We have here abstracted from numbers, that the doctrine may be the more general; but it is plain, that if  $AC$ ,  $AD$ ,  $AE$ , &c. be supposed, 1, 2, 3, &c. in an arithmetic progression;  $oc$ ,  $od$ ,  $oe$ , &c. will be in geometric progression and that the logarithm of  $oa$ , which may be taken for unity, is nothing.

Lord Napier, in his first scheme of logarithms, supposes, that while  $op$  increases or decreases proportionably, the uniform motion of the point  $P$ , by which the logarithm of  $op$  is generated, is equal to the velocity of  $p$  at  $a$ ; that is, at the term of time when the logarithms begin to be generated.

But since the way above hinted at, for finding the logarithms of the prime numbers is so intolerably laborious and troublesome, the more skilful mathematicians that came after the first inventors, employing their thoughts about abbreviating this method, had a vastly more easy and short way offered to them from the contemplation and mensuration of hyperbolic spaces contained between the portions of an asymptote, right lines perpendicular to it, and the curve of the hyperbola: for if ECN (Plate CIII. fig. 6. n° 1.) be an hyperbola, and AD, AQ the asymptotes, and AB, AP, AQ, &c. taken upon one of them, be represented by numbers, and the ordinates BC, PM, QN, &c. be drawn from the several points B, P, Q, &c. to the curve, then will the quadrilinear spaces BCMP, PMNQ, &c. viz. their numerical measures be the logarithms of the quotients of the division of AB by AP, AP by AQ, &c. since when AB, AP, AQ, &c. are continual proportionals, the said spaces are equal, as is demonstrated by several writers concerning conic sections. See H YPERBOLA.

Having said that these hyperbolic spaces, numerically expressed, may be taken for logarithms, we shall next give a specimen, from the great Sir Isaac Newton, of the method how to measure these spaces, and consequently of the construction of logarithms.

Let CA (*ibid.* n° 2.) = AF be = 1, and AB = Ab = x; then will  $\frac{1}{1+x}$  be = BD, and  $\frac{1}{1-x}$  = bD; and putting these expressions into serieses, it will be  $\frac{1}{1+x} = 1 - x + x^2 - x^3 + x^4 - x^5$ , &c. and  $\frac{1}{1-x} = 1 + x + x^2 + x^3 + x^4 + x^5$ , &c.

and  $\frac{x}{1+x} = x - xx + x^2x - x^3x + x^4x - x^5x$ , &c. and  $\frac{x}{1-x} = x + xx + x^2x + x^3x + x^4x + x^5x$ , &c. and taking the fluents, we shall have the area AFDB =  $x - \frac{xx}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \frac{x^5}{5}$ , &c. and the area AFdb, =  $x + \frac{xx}{2} + \frac{x^3}{3} + \frac{x^4}{4} + \frac{x^5}{5}$ , &c. and the sum bDDB =  $2x + \frac{2x^2}{3} + \frac{2x^3}{4} + \frac{2x^4}{5} + \frac{2x^5}{6}$ , &c.

Now if AB or ab be  $\frac{1}{10} = x$ , Cb being = 0.9, and CB = 1.1, by putting this value of x in the equations above, we shall have the area bDDB = 0.2006706954621511 for the terms of the series will stand as you see in this table,

0.2000000000000000	= first	} Term of the series.
6666666666666666	= second	
4000000000000000	= third	
285714286	= fourth	
2222222	= fifth	
18182	= sixth	
154	= seventh	
1	= eighth	

0.2006706954621511

If the parts Ad and AD of this area be added separately, and the lesser DA be taken from the greater dA, we shall have Ad - AD =  $x^2 + \frac{x^4}{2} + \frac{x^6}{3} + \frac{x^8}{4}$ , &c. =

VOL. II. Num. 67.

2

= 0.0100503358535014, for the terms reduced to decimals will stand thus:

0.0100000000000000	= first	} Term of the series.
5000000000000000	= second	
3333333333	= third	
250000000	= fourth	
200000	= fifth	
1667	= sixth	
14	= seventh	

0.0100503358535014.

Now if this difference of the areas be added to, and subtracted from their sum before found, half the aggregate, viz. 0.1053605156578263 will be the greater area Ad, and half the remainder, viz. 0.0953101798043249, will be the lesser area AD.

By the same tables, these areas AD and Ad, will be obtained also when AB = Ab are supposed to be  $\frac{1}{10}$  or CB = 1.01, and Cb = 0.99, if the numbers are but duly transferred to lower places, as

0.0200000000000000	= first	} Term of the series.
6666666666	= second	
400000	= third	
28	= fourth	

Sum = 0.0200006667066694 = area bD.

0.0001000000000000	= first	} Term of the series.
50000000	= second	
3333	= third	

0.0001000050003333 = area Ad - AD.

Half the aggregate 0.0100503358535014 = Ad, and half the remainder, viz. 0.0099503308531681 = AD.

And so putting AB = Ab =  $\frac{1}{100}$ , or CB = 1.001 and Cb = 0.999, there will be obtained Ad = 0.00100050003335835, and AD = 0.00099950013330835.

After the same manner, if AB = Ab, be = 0.2, or 0.02, or 0.002, these areas will arise.

Ad = 0.2231435513142097, and  
AD = 0.1823215576939546, or  
Ad = 0.0202027073175194, and  
AD = 0.1098026272961797, or  
Ad = 0.002002, and AD = 0.001.

From these areas thus found, others may be easily had

from addition and subtraction only. For since  $\frac{1.2}{0.8} \times \frac{1.2}{0.9} = 2$ , the sum of the areas belonging to the ratios  $\frac{1.2}{0.8}$  and  $\frac{1.2}{0.9}$  (that is, insisting upon the parts of the absciss 1.2, 0.8; and 1.2, 0.9) viz.

0.405465, &c. and  $\begin{cases} AD = 0.18232, & \text{&c.} \\ Ad = 0.10536, & \text{&c.} \end{cases}$

Sum = 0.28768, &c.

added thus,  $\begin{cases} 0.40546, & \text{&c.} \\ 0.28768, & \text{&c.} \end{cases}$

Total = 0.69314, &c. = the area of AFHG,   
 † 10 P † when

when CG is =2. Also, since  $\frac{1.2}{0.8} \times 2 = 3$ , the sum 1.0986122, &c. of the areas belonging to  $\frac{1.2}{0.8}$ , and 2, will be the area of AFGH, when CG=3. Again, since  $\frac{2 \times 2}{0.8} = 5$ , and  $2 \times 5 = 10$ ; by adding  $Ad = 0.2231$ , &c.  $AD = 0.1823$ , &c. and  $Ad = 0.1053$ , &c. together, their sum is 0.5108, &c. and this added to 1.0986, &c. the area of AFGH, when CG=3. You will have 1.6093379124341004 = AFGH, when CG is 5; and adding that of 2 to this, gives 2.3025850929940457 = AFGH, when CG is equal to 10; and since  $10 \times 10 = 100$ ; and  $10 \times 100 = 1000$ ; and  $\sqrt{5 \times 10 \times 0.98} = 7$ , and  $10 \times 1.1 = 11$ , and  $\frac{1000 \times 1.091}{7 \times 11} = 13$ , and  $\frac{1000 \times 0.998}{2} = 499$ ; it is plain that the area AFGH may be found by the composition of the areas found before, when CG=100, 1000, or any other of the numbers above mentioned; and all these areas are the hyperbolic logarithms of those several numbers.

Having thus obtained the hyperbolic logarithms of the numbers 10, 0.98, 0.99, 1.01, 1.02; if the logarithms of the four last of them be divided by the hyperbolic logarithm 2.302585, &c. of 10, and the index 2, be added; or, which is the same thing, if it be multiplied by its reciprocal 0.4342944819032518, the value of the subtangent of the logarithmic curve, to which Briggs's logarithms are adapted, we shall have the true tabular logarithms of 98, 99, 100, 101, 102. These are to be interpolated by ten intervals, and then we shall have the logarithms of all the numbers between 980 and 1020; and all between 980 and 1000, being again interpolated by ten intervals, the table will be as it were constructed. Then from these we are to get the logarithms of all the prime numbers, and their multiples less than 100, which may be done by

addition and subtraction only: for  $\sqrt[10]{84 \times 1020} = 2$ ;

$$\sqrt[4]{8 \times 9963} = 3; \frac{10}{2} = 5; \sqrt{\frac{98}{2}} = 7; \frac{99}{9} = 11; \frac{1001}{7 \times 11} = 13;$$

$$\frac{102}{6} = 17; \frac{988}{4 \times 13} = 19; \frac{9936}{16 \times 27} = 23; \frac{986}{2 \times 17} = 29; \frac{992}{32}$$

$$= 31; \frac{999}{27} = 37; \frac{984}{24} = 41; \frac{989}{23} = 43; \frac{987}{21} = 47;$$

$$\frac{9911}{11 \times 17} = 53; \frac{9971}{13 \times 13} = 59; \frac{9882}{2 \times 81} = 61; \frac{9949}{3 \times 49} = 67;$$

$$\frac{994}{14} = 71; \frac{9928}{8 \times 17} = 73; \frac{9954}{7 \times 18} = 79; \frac{996}{12} = 83; \frac{9968}{7 \times 16}$$

$$= 89; \frac{9894}{6 \times 17} = 97; \text{ and thus having the logarithms}$$

of all the numbers less than 100, you have nothing to do but interpolate the several times, through ten intervals.

Now the void places may be filled up by the following theorem. Let  $n$  be a number, whose logarithm is wanted; let  $x$  be the difference between that and the two nearest numbers, equally distant on each side, whose logarithms are already found; and let  $d$  be half the differ-

ence of their logarithms: then the required logarithm of the number  $n$ , will be had by adding  $d + \frac{dx}{2n} + \frac{dx^3}{12n^3}$ , &c. to the logarithm of the lesser number; for if the numbers are represented by  $Cp$ ,  $CG$ ,  $CP$ , (*ibid.* n<sup>o</sup> 2.) and the ordinates  $p$ ,  $PQ$ , be raised; if  $n$  be wrote for  $CG$ , and  $x$  for  $GP$ , or  $Gp$ , the area  $pQP$ , or  $\frac{2x}{n} + \frac{x^3}{2n^3}$

+  $\frac{x^3}{3n^3}$ , &c. will be to the area  $pHG$ , as the difference between the logarithms of the extreme numbers, or  $2d$ , is to the difference between the logarithms of the lesser, and of the middle one; which, therefore, will be

$$\frac{dx}{n} + \frac{dx^2}{2n} + \frac{dx^3}{3n^3}, \text{ &c.} = d + \frac{dx}{2n} + \frac{dx^3}{12n^3}, \text{ &c.}$$

$$\frac{x}{n} + \frac{x^3}{3n} + \frac{x^3}{5n}, \text{ &c.}$$

The two first terms  $d + \frac{dx}{2n}$  of this series, being sufficient for the construction of a canon of logarithms, even to 14 places of figures, provided the number, whose logarithm is to be found, be less than 1000; which cannot be very troublesome, because  $x$  is either 1 or 2: yet it is not necessary to interpolate all the places by help of this rule, since the logarithms of numbers, which are produced by the multiplication or division of the number last found, may be obtained by the numbers whose logarithms were had before, by the addition or subtraction of their logarithms. Moreover, by the difference of their logarithms, and by their second and third differences, if necessary, the void places may be supplied more expeditiously; the rule afore-going being to be applied only where the continuation of some full places is wanted, in order to obtain these differences.

By the same method rules may be found for the interpolation of logarithms, when of three numbers the logarithm of the lesser and of the middle number are given, or of the middle number and the greater; and this although the numbers should not be in arithmetical progression. Also by pursuing the steps of this method, rules may be easily discovered for the construction of artificial sines and tangents, without the help of the natural tables. Thus far the great Newton, who says, in one of his letters to Mr Leibnitz, that he was so much delighted with the construction of logarithms, at his first setting out in those studies, that he was ashamed to tell to how many places of figures he had carried them at that time: and this was before the year 1666; because, he says, the plague made him lay aside those studies, and think of other things.

Dr. Keil, in his Treatise of Logarithms, at the end of his Commandine's Euclid, gives a series, by means of which may be found easily and expeditiously the logarithms of large numbers. Thus, let  $z$  be an odd number, whose logarithm is sought: then shall the numbers  $z-1$  and  $z+1$  be even, and accordingly their logarithms, and the difference of the logarithms will be had, which let be called  $y$ . Therefore, also the logarithm of a number, which is a geometrical mean between  $z-1$  and  $z+1$ , will

will be given, *viz.* equal to half the sum of the logarithms.

Now the series  $x \times \frac{1}{4z} + \frac{1}{24z^3} + \frac{181}{15120z^5} + \frac{25200z^7}{13}$ , &c. shall be equal to the logarithm of the ratio, which the geometrical mean between the numbers  $z-1$  and  $z+1$ , has to the arithmetical mean, *viz.* to the number  $z$ . If the number exceeds 1000, the first term of the series, *viz.*

$\frac{2}{4z}$ , is sufficient for producing the logarithm to 13 or 14 places of figures, and the second term will give the logarithm to 20 places of figures. But if  $z$  be greater than

0.00000000542813; and if the logarithm of the geometrical mean, *viz.*

4.301051709302416 be added to the quotient, the sum will be

4.301051709845230 = the logarithm of 20001

Wherefore it is manifest that to have the logarithm to 14 places of figures, there is no necessity of continuing out the quotient beyond 6 places of figures. But if you have a mind to have the logarithm to 10 places of figures only, the two first figures are enough. And if the logarithms of the numbers above 20000 are to be found by this way, the labour of doing them will mostly consist in setting down the numbers. This series is easily deduced from the consideration of the hyperbolic spaces aforesaid. The first figure of every logarithm towards the left hand, which is separated from the rest by a point, is called the index of that logarithm; because it points out the highest or remotest place of that number from the place of unity in the infinite scale of proportionals towards the left hand: thus, if the index of the logarithm be 1, it shews that its highest place towards the left hand is the tenth place from unity; and therefore all logarithms which have 1 for their index, will be found between the tenth and hundredth place, in the order of numbers. And for the same reason all logarithms which have 2 for their index, will be found between the hundredth and thousandth place, in the order of numbers, &c. Whence universally the index or characteristic of any logarithm is always less by one than the number of figures in whole numbers, which answer to the given logarithm; and, in decimals, the index is negative.

As all systems of logarithms whatever, are composed of similar quantities, it will be easy to form, from any system of logarithms, another system in any given ratio; and consequently to reduce one table of logarithms into another of any given form. For as any one logarithm in the given form, is to its correspondent logarithm in another form; so is any other logarithm in the given form, to its correspondent logarithm in the required form; and hence we may reduce the logarithms of lord Napier into the form of Briggs's, and contrariwise. For as 2.302585092, &c. lord Napier's logarithm of 10, is to 1.0900000000, Mr Briggs's logarithm of 10; so is any other logarithm in lord Napier's form, to the correspondent tabular logarithm in Mr Briggs's form; and because the two first numbers constantly remain the same; if lord Napier's logarithm of any one number be divided by 2.302585, &c. or multiplied by 4342944, &c. the ratio of 1.0000, &c. to 2.30258, &c. as is found by dividing 1.00000, &c. by 2.30258, &c. the quotient in the former, and the product in the latter, will give the correspondent logarithm

10000. the first term will exhibit the logarithm to 18 places of figures; and so this series is of great use in filling up the chiliads omitted by Mr Briggs. For example, it is required to find the logarithm of 20001; the logarithm of 20000 is the same as the logarithm of 2, with the index 4 prefixed to it; and the difference of the logarithms of 20000 and 20001, is the same as the difference of the logarithms of the numbers 10000 and 10001, *viz.* 0.0000434272, &c. And if this differ-

ence be divided by  $4z$ , or 80004, the quotient  $\frac{2}{4z}$  shall be

in Briggs's form, and the contrary. And, after the same manner, the ratio of natural logarithms to that of Briggs's, will be found = 868538963806.

#### *The use and application of LOGARITHMS.*

It is evident, from what has been said of the construction of logarithms, that addition of logarithms must be the same thing as multiplication in common arithmetick; and subtraction in logarithms the same as division: therefore, in multiplication by logarithms, add the logarithms of the multiplicand and multiplier together, their sum is the logarithm of the product.

	num.	logarithms.
Example. Multiplicand	8.5	0.1294189
Multiplier	10	1.0000000
Product	85	1.9294189

And in division, subtract the logarithm of the divisor from the logarithm of the dividend, the remainder is the logarithm of the quotient.

	num.	logarithms.
Example. Dividend	9712 8	3.9873444
Divisor	456	2.6589648
Quotient	21.3	1.3283796

#### *To find the complement of a LOGARITHM.*

Begin at the left hand, and write down what each figure wants of 9, only what the last significant figure wants of 10; so the complement of the logarithm of 456, *viz.* 2.6589648, is 7.3410352.

In the rule of three. Add the logarithms of the second and third terms together, and from the sum subtract the logarithm of the first, the remainder is the logarithm of the fourth. Or, instead of subtracting a logarithm, add its complement, and the result will be the same.

#### *To raise powers by LOGARITHMS.*

Multiply the logarithm of the number given, by the index of the power required, the product will be the logarithm of the power sought.

Example. Let the cube of 32 be required by logarithms. The logarithm of 32 = 1.5051500, which multiplied by 3, is 4.5154500, the logarithm of 32768, the cube of 32. But in raising powers, *viz.* squaring, cubing,

bing, &c. of any decimal fraction by logarithms, it must be observed, that the first significant figure of the power be put so many places below the place of units, as the index of its logarithm wants of 10, 100, &c. multiplied by the index of the power.

*To extract the roots of powers by LOGARITHMS.*

Divide the logarithm of the number by the index of the power, the quotient is the logarithm of the root sought.

Logarithm of 106 = 2.0253058  
Logarithm of 100 = 2.0000000

Divide by 4) 0.0253058 (0.0063264.75

Logarithm of the least term 100 added	2.0000000
Logarithm of the first mean 101.4673846	2.0063264.75
Logarithm of the second mean 102.9563014	2.0126529.5
Logarithm of the third mean 104.4670483	2.0189794.25
Logarithm of the greatest term 106	2.0253059.

## L O G I C.

**L**OGIC, the art of thinking and reasoning justly; or, it may be defined the science or history of the human mind, inasmuch as it traces the progress of our knowledge from our first and most simple through all their different combinations, conceptions, and all those numerous deductions that result from variously comparing them one with another.

The precise business of logic, therefore, is to explain the nature of the human mind, and the proper manner of conducting its several powers, in order to the attainment of truth and knowledge. It lays open those errors and mistakes we are apt, through inattention, to run into; and teaches us how to distinguish between truth, and

*To find mean proportionals between any two numbers.*

Subtract the logarithm of the least term from the logarithm of the greatest, and divide the remainder by a number more by one than the number of means desired; then add the quotient to the logarithm of the least term (or subtract it from the logarithm of the greatest) continually, and it will give the logarithms of all the mean proportionals required.

Example. Let three mean proportionals be sought, between 106 and 100.

what only carries the appearance of it. By this means we grow acquainted with the nature and force of the understanding; see what things lie within its reach; where we may attain certainty and demonstration; and when we must be contented with probability.

This science is generally divided into four parts, *viz. Perception, Judgment, Reasoning, and Method.* This division comprehends the whole history of the sensations and operations of the human mind. But we must refer the reader for the first part, *viz. Perception, and Ideas, to METAPHYSICS*, where it will be more conveniently and fully treated, and confine ourselves in this place to the three last, *viz. Judgment, Reasoning, and Method.*

### PART I. Of JUDGMENT.

THE mind being furnished with ideas, its next step in the way to knowledge is, the comparing these ideas together, in order to judge of their agreement or disagreement. In this joint view of our ideas, if the relation is such, as to be immediately discoverable by the bare inspection of the mind; the judgments thence obtained are called *intuitive*; for in this case, a mere attention to the ideas compared, suffices to let us see, how far they are connected or disjointed. Thus, *that the whole is greater than any of its parts*, is an intuitive judgment, nothing more being required to convince us of its truth, than an attention to the ideas of *whole* and *part*. And this too is the reason, why we call the act of the mind forming these judgments, *intuition*; as it is indeed no more, than an immediate perception of the agreement or disagreement of any two ideas.

But it is to be observed, that our knowledge of this

kind respects only our ideas, and the relations between them; and therefore can serve only as a foundation to such reasonings as are employed in investigating these relations. Now many of our judgments are conversant about facts, and the real existence of things, which cannot be traced by the bare contemplation of our ideas. It does not follow, because I have the idea of a circle in my mind, that therefore a figure answering to that idea, has a real existence in nature. I can form to myself the notion of a centaur, or golden mountain, but never imagine on that account, that either of them exist. What then are the grounds of our judgment in relation to facts? *Experience* and *testimony*. By *experience* we are informed of the existence of the several objects which surround us, and operate upon our senses. *Testimony* is of a wider extent, and reaches not only to objects beyond the present sphere of our observation, but also to facts and

and transactions, which being now past, and having no longer any existence, could not without this conveyance, have fallen under our cognizance.

Here then we have three foundations of human judgment, from which the whole system of our knowledge may with ease and advantage be derived. First, *intuition*, which respects our ideas themselves, and their relations, and is the foundation of that species of reasoning, which we call *demonstration*. For whatever is deduced from our intuitive perceptions, by a clear and connective series of proofs, is said to be demonstrated, and produces absolute certainty in the mind. Hence the knowledge obtained in this manner, is what we properly term *science*; because in every step of the procedure, it carries its own evidence along with it, and leaves no room for doubt or hesitation. And, what is highly worthy of notice, as the truths of this class express the relations between our ideas, and the same relations must ever and invariably subsist between the same ideas, our deductions in the way of science, constitute what we call eternal, necessary, and immutable truths. If it be true that the whole is equal to all its parts, it must be so unchangeably; because the relation of equality being attached to the ideas themselves, must ever intervene where the same ideas are compared. Of this nature are all the truths of natural religion, morality, and mathematicks, and in general, whatever may be gathered from the bare view and consideration of our ideas.

The second ground of human judgment is *experience*; from which we infer the existence of those objects that surround us, and fall under the immediate notice of our senses. When we see the sun, or cast our eyes towards a building, we not only have ideas of these objects within ourselves, but ascribe to them a real existence out of the mind. It is also by the information of the senses, that we judge of the qualities of bodies; as when we say that snow is white, fire hot, or steel hard. For as we are wholly unacquainted with the internal structure and constitution of the bodies that produce these sensations in us, and are unable to trace any connection between that structure and the sensations themselves, it is evident, that we build our judgments altogether upon observation, ascribing to bodies such qualities, as are answerable to the perceptions they excite in us. But this is not the only advantage derived from experience; for we are likewise indebted to it for all our knowledge regarding the co-existence of sensible qualities in objects, and the operations of bodies one upon another. Ivory, for instance, is hard and elastic; this we know by experience, and indeed by that alone. For being altogether strangers to the true nature both of elasticity and hardness, we cannot by the bare contemplation of our ideas determine, how far the one necessarily implies the other, or whether there may not be a repugnance between them. But when we observe them to exist both in the same object, we are then assured from experience, that they are not incompatible; and when we also find that a stone is hard and not elastic, and that air though elastic is not hard, we also conclude upon the same foundation, that the ideas are not necessarily conjoined; but may exist separately in different objects. In like manner with regard

to the operations of bodies one upon another; it is evident, that our knowledge this way, is all derived from observation. *Aqua regia* dissolves gold, as has been found by frequent trial, nor is there any other way of arriving at the discovery. Naturalists may tell us if they please, that the parts of *aqua regia* are of a texture apt to insinuate between the corpuscles of gold, and thereby loosen and shake them asunder. If this is a true account of the matter, we believe it will notwithstanding be allowed, that our conjecture in regard to the conformation of these bodies is deduced from the experiment, and not the experiment from the conjecture. It was not from any previous knowledge of the intimate structure of *aqua regia* and gold, and the aptness of their parts to act or be acted upon, that we came by the conclusion above mentioned. The internal constitution of bodies is in a manner wholly unknown to us, and could we even surmount this difficulty, yet as the separation of the parts of gold, implies something like an active force in the *menstruum*, and we are unable to conceive how it comes to be possessed of this activity; the effect must be owned to be altogether beyond our comprehension. But when repeated trials had once confirmed it, inasmuch that it was admitted as an established truth in natural knowledge, it was then easy for men, to spin out theories of their own invention, and contrive such a structure of parts, both for gold and *aqua regia*, as would best serve to explain the phenomenon, upon the principles of that system of philosophy they had adopted.

From what has been said it is evident, that as intuition is the foundation of what we call *scientific* knowledge, so is experience of *natural*. For this last, being wholly taken up with objects of sense, or those bodies that constitute the natural world; and their properties, as far as we can discover them, being to be traced only by a long and painful series of observations, it is apparent, that in order to improve this branch of knowledge, we must betake ourselves to the method of trial and experiment.

But though experience is what we may term the immediate foundation of natural knowledge, yet with respect to particular persons, its influence is very narrow and confined. The bodies that surround us are numerous, many of them lie at a great distance, and some quite beyond our reach. Life too is short, and so crowded with cares, that but little time is left for any single man to employ himself in unfolding the mysteries of nature. Hence it is necessary to admit many things upon the testimony of others, which by this means becomes the foundation of a great part of our knowledge of body. No man doubts of the power of *aqua regia* to dissolve gold, though perhaps he never himself made the experiment. In these therefore and such like cases, we judge of the facts and operations of nature, upon the mere ground of testimony. However, as we can always have recourse to experience, where any doubt or scruple arises, this is justly considered as the true foundation of natural philosophy; being indeed the ultimate support upon which our assent rests, and whereto we appeal, when the highest degree of evidence is required.

But there are many facts that will not allow of an appeal to the senses, and in this case testimony is the true

and only foundation of our judgments. All human actions of whatever kind, when considered as already past, are of the nature here described; because having now no longer any existence, both the facts themselves, and the circumstances attending them, can be known only from the relations of such as had sufficient opportunities of arriving at the truth. *Testimony* therefore is justly accounted a third ground of human judgment; and as from the other two we have deduced *scientific* and *natural* knowledge, so may we from this derive *historical*; by which we mean, not merely a knowledge of the civil transactions of states and kingdoms, but of all facts whatsoever, where testimony is the ultimate foundation of our belief.

#### *Of affirmative and negative propositions.*

WHILE the comparing of our ideas, is considered merely as an act of the mind, assembling them together, and joining or disjoining them according to the result of its preceptions, we call it *judgment*; but when our judgments are put into words, they then bear the name of *propositions*. A proposition therefore is a sentence expressing some judgment of the mind, whereby two or more ideas are affirmed to agree or disagree. Now as our judgments include at least two ideas, one of which is affirmed or denied of the other, so must a proposition have terms answering to these ideas. The idea of which we affirm or deny, and of course the term expressing that idea, is called the *subject* of the proposition. The idea affirmed or denied, as also the term answering it is called the *predicate*. Thus in the proposition, *God is omnipotent*: *God* is the subject, it being of him that we affirm omnipotence; and *omnipotent* is the predicate, because we affirm the idea expressed by that word to belong to God.

But as in propositions, ideas are either joined or disjoined; it is not enough to have terms expressing those ideas, unless we have also some words to denote their agreement or disagreement. That word in a proposition which connects two ideas together, is called the *copula*; and if a negative particle be annexed, we thereby understand that the ideas are disjoined. The *substantive verb*, is commonly made use of for the copula, as in the above-mentioned proposition, *God is omnipotent*; where *is* represents the copula, and signifies the agreement of the ideas of *God* and *omnipotence*. But if we mean to separate two ideas: then, besides the substantive verb, we must also use some particle of negation, to express this repugnance. The proposition, *Man is not perfect*; may serve as an example of this kind, where the notion of *perfection*, being removed from the idea of *man*, the negative particle *not* is inserted after the copula, to signify the disagreement between the subject and predicate.

Every proposition necessarily consists of these three parts, but then it is not alike needful that they be all severally expressed in words; because the copula is often included in the term of the predicate, as when we say, *He sits*; which imports the same as *he is sitting*. In the *Latin* language, a single word has often the force of a whole sentence. Thus, *ambulat* is the same as *ille est ambulans*; *amo*, as *ego sum amans*, and so in innumerable other instances; by which it appears, that we are not so much to regard the number of words in a sentence,

as the ideas they represent, and the manner in which they are put together. For where ever two ideas are joined or disjoined in an expression, though of but a single word it is evident that we have a subject, predicate, and copula, and of consequence a complete proposition.

When the mind joins two ideas, we call it an *affirmative* judgment; when it separates them, a *negative*; and as any two ideas compared together, must necessarily either agree or not agree, it is evident, that all our judgments fall under these two divisions. Hence likewise, the propositions expressing these judgments, are all either affirmative or negative.

Hence we see the reason of the rule commonly laid down by logicians; that in all negative propositions, the negation ought to affect the copula. For as the copula, when placed by itself, between the subject and the predicate, manifestly binds them together; it is evident, that in order to render a proposition negative, the particle of negation must enter it in such manner, as to destroy this union. In a word, then only are two ideas disjoined in a proposition, when the negative particle may be so referred to the copula, as to break the affirmation included in it, and undo that connection it would otherwise establish. When we say, for instance, *No man is perfect*; take away the negation, and the copula of itself plainly unites the ideas in the proposition. On the contrary, in this sentence; *The man who departs not from an upright behaviour, is beloved of God*; the predicate *beloved of God*, is evidently affirmed of the subject *an upright man*; so that notwithstanding the negative particle, the proposition is still affirmative. The reason is plain; the negation here affects not the copula, but making properly a part of the subject, serves with other terms in the sentence, to form one complex idea, of which the predicate *beloved of God*, is directly affirmed.

#### *Of universal and particular propositions.*

THE next considerable division of proposition, is into *universal* and *particular*. Our ideas, are all singular as they enter the mind, and represent individual objects. But as by abstraction we can render them universal, so as to comprehend a whole class of things, and sometimes several classes at once; hence the terms expressing these ideas, must be in like manner universal. (See *METAPHYSICS*.) If therefore we suppose any general term to become the subject of a proposition, it is evident, that whatever is affirmed of the abstract idea belonging to that term, may be affirmed of all the individuals to which that idea extends. Thus when we say, *Men are mortal*; we consider mortality, not as confined to one or any number of particular men, but as what may be affirmed without restriction of the whole species. By this means the proposition becomes as general as the idea which makes the subject of it, and indeed derives its universality entirely from that idea, being more or less so, according as this may be extended to more or fewer individuals. But these general terms sometimes enter a proposition in their full latitude, as in the example given above; and sometimes appear with a mark of limitation. In this last case we are given to understand, that the predicate agrees not to the whole universal idea, but only to a part of it; as in the proposition,

proposition, *some men are wise*: for here wisdom is not affirmed of every particular man, but restrained to a few of the human species.

Now from this different appearance of the general idea, that constitutes the subject of any judgment, arises the division of propositions into *universal* and *particular*. An *universal* proposition is that wherein the subject is some general term, taken in its full latitude, inasmuch that the predicate agrees to all the individuals comprehended under it, if it denotes a proper species; and to all the several species, and their individuals, if it marks an idea of a higher order. The words *all*, *every*, *no*, *none*, &c. are the proper signs of this universality; and as they seldom fail to accompany general truths, so they are the most obvious criterion whereby to distinguish them. *All animals have a power of beginning motion*. This is an universal proposition; as we know from the word *all*, prefixed to the subject *animal*, which denotes that it must be taken in its full extent. Hence the power of beginning motion, may be affirmed of all the several species of animals.

A *particular* proposition has in like manner some general term for its subject, but with a mark of limitation added, to denote, that the predicate agrees only to some of the individuals comprehended under a species, or to one or more of the species belonging to any genus, and not to the whole universal idea. Thus, *some stones are heavier than iron*; *some men have an uncommon share of prudence*. In the last of these propositions, the subject *some men*, implies only a certain number of individuals, comprehended under a single species. In the former, where the subject is a genus, that extends to a great variety of distinct classes, *some stones* may not only imply any number of particular stones, but also several whole species of stones; inasmuch as there may be not a few, with the property there described. Hence we see, that a proposition does not cease to be particular, by the predicate's agreeing to a whole species, unless that species singly and distinctly considered, makes also the subject of which we affirm or deny.

There is still one species of propositions that remains to be described; and which the more deserve our notice, as it is not yet agreed among logicians to which of the two classes mentioned above they ought to be referred, I mean *singular* propositions; or those where the subject is an individual. Of this nature are the following: *Sir Isaac Newton was the inventor of fluxions*; *This book contains many useful truths*. What occasions some difficulty, as to the proper rank of these propositions, is, that the subject being taken according to the whole of its extension, they sometimes have the same effect in reasoning, as universals. But if it be considered, that they are in truth the most limited kind of particular propositions, and that no proposition can with any propriety be called universal, but where the subject is some universal idea; we shall not be long in determining to which class they ought to be referred. When we say, *Some books contain useful truths*; the proposition is particular, because the general term appears with a mark of restriction. If therefore we say, *This book contains useful truths*; it is evident that the proposition must be still more particular, as the limit-

tation implied in the word *this* is of a more confined nature than in the former case.

We see therefore, that all propositions are either *affirmative* or *negative*; nor is it less evident, that in both cases they may be *universal* or *particular*. Hence arises that celebrated fourfold division of them, into *universal*, *affirmative*, and *universal negative*; *particular affirmative*, and *particular negative*; which comprehends indeed all their varieties. The use of this method of distinguishing them will appear more fully afterwards, when we come to treat of reasoning and syllogism.

#### *Of absolute and conditional propositions.*

THE objects about which we are chiefly conversant in this world, are all of a nature liable to change. What may be affirmed of them at one time, cannot often at another; and it makes no small part of our knowledge, to distinguish rightly these variations, and trace the reasons upon which they depend. For it is observable, that amidst all the vicissitudes of nature, some things remain constant and invariable; nor are even the changes, to which we see others liable, effected, but in consequence of uniform and steady laws, which when known, are sufficient to direct us in our judgments about them. Hence philosophers, in distinguishing the objects of our perception into various classes, have been very careful to note, that some properties belong essentially to the general idea, so as not to be separable from it, but by destroying its very nature; while others are only accidental, and may be affirmed or denied of it in different circumstances. Thus, solidity, a yellow colour, and great weight, are considered as essential qualities of gold; but whether it shall exist as an uniform conjoined mass, is not alike necessary. We see that, by a proper menstruum, it may be reduced to a fine powder; and that intense heat will bring it into a state of fusion.

From this diversity in the several qualities of things, arises a considerable difference as to the manner of our judging about them. For all such properties as are inseparable from objects, when considered as belonging to any genus or species, are affirmed absolutely and without reserve of that general idea. Thus we say, *Gold is very weighty*, *a stone is hard*, *animals have a power of self-motion*. But in the case of mutable or accidental qualities, as they depend upon some other consideration, distinct from the general idea; that also must be taken into the account, in order to form an accurate judgment. Should we affirm, for instance, of some stones, that they are very susceptible of a rolling motion; the proposition while it remains in the general form, cannot with any advantage be introduced into our reasonings. An aptness to receive that mode of motion, flows from the figure of the stone; which, as it may vary infinitely, our judgment then only becomes applicable and determinate, when the particular figure, of which volubility is a consequence, is also taken into the account. Let us then bring in this other consideration, and the proposition will run as follows: *Stones of a spherical form, are easily put into a rolling motion*. Here we see the condition upon which the predicate is affirmed, and therefore know in what particular cases the proposition may be applied.

This:

This consideration of propositions, respecting the manner in which the predicate is affirmed of the subject, gives rise to the division of them into *absolute* and *conditional*. *Absolute* propositions are those, wherein we affirm some property inseparable from the idea of the subject, and which therefore belongs to it in all possible cases; as, *God is infinitely wise*. *Virtue tends to the ultimate happiness of man*. But where the predicate is not necessarily connected with the idea of the subject, unless upon some consideration distinct from that idea, there the proposition is called *conditional*. The reason of the name is taken from the supposition annexed, which is of the nature of a condition, and may be expressed as such. Thus, *If a stone is exposed to the rays of the sun, it will contract some degree of heat*. *If a river runs in a very declining channel, its rapidity will constantly increase*.

There is not any thing of greater importance in philosophy, than a due attention to this division of propositions. If we are careful never to affirm things absolutely, but where the ideas are inseparably conjoined; and if in our other judgments, we distinctly mark the conditions which determine the predicate to belong to the subject, we shall be the less liable to mistake in applying general truths to the particular concerns of human life. It is owing to the exact observance of this rule, that mathematicians have been so happy in their discoveries, and that what they demonstrate of magnitude in general, may be applied with ease in all obvious occurrences.

The truth is, particular propositions are then known to be true, when we can trace their connection with universals; and it is accordingly the great business of science, to find out general truths, that may be applied with safety in all obvious instances. Now the great advantage arising from determining with care the conditions upon which one idea may be affirmed or denied of another, is this; that thereby particular propositions really become universal, may be introduced with certainty into our reasonings, and serve as standards to conduct and regulate our judgments. To illustrate this by a familiar instance. If we say, *Some water acts very forcibly*; the proposition is particular: And as the conditions on which this forcible action depends, are not mentioned, it is as yet uncertain in what cases it may be applied. Let us then supply these conditions, and the proposition will run thus: *Water conveyed in sufficient quantity, along a steep descent, acts very forcibly*. Here we have an universal judgment, inasmuch as the predicate *forcible action*, may be ascribed to all water under the circumstances mentioned. Nor is it less evident, that the proposition in this new form is of easy application; and in fact we find, that men do apply it, in instances where the forcible action of water is required; as in corn-mills, and many other works of art.

#### *Of simple and compound propositions.*

HITHERTO we have treated of propositions, where only two ideas are compared together. These are in the general called *simple*; because having but one subject and one predicate, they are the effect of a simple judgment, that admits of no subdivision. But if several ideas offer themselves to our thoughts at once, whereby we are led

to affirm the same thing of different objects, or different things of the same object; the propositions expressing these judgments are called *compound*: because they may be resolved into as many others as there are subjects or predicates in the whole complex determination of the mind. Thus: *God is infinitely wise, and infinitely powerful*. Here there are two predicates, *infinite wisdom*, and *infinite power*, both affirmed of the same subject; and accordingly, the proposition may be resolved into two others, affirming these predicates severally, in like manner in the proposition, *neither kings nor people are exempt from death*; the predicate is denied of both subjects, and may therefore be separated from them, in distinct propositions. Nor is it less evident, that if a complex judgment consists of several subjects and predicates, it may be resolved into as many simple propositions as are the number of different ideas compared together. *Riches and honours are apt to elate the mind, and increase the number of our desires*. In this judgment, there are two subjects and two predicates, and it is at the same time apparent, that it may be resolved into four distinct propositions. *Riches are apt to elate the mind*. *Honours are apt to elate the mind*. *Riches are apt to increase the number of our desires*. And so of honours.

Logicians have divided these compound propositions into a great many different classes; but not with a due regard to their proper definition. Thus, *conditionals*, *causals*, *relatives*, &c. are mentioned as so many distinct species of this kind, though in fact they are no more than simple propositions. To give an instance of a conditional: *If a stone is exposed to the rays of the sun, it will contract some degree of heat*. Here we have but one subject and one predicate; for the complex expression, *a stone exposed to the rays of the sun*, constitutes the proper subject of this proposition, and is no more than one determinate idea. The same thing happens in causals. *Rehoboam was unhappy because he followed evil counsel*. There is here an appearance of two propositions, arising from the complexity of the expression; but when we come to consider the matter more nearly, it is evident, that we have but a single subject and predicate. *The pursuit of evil counsel brought misery upon Rehoboam*. It is not enough therefore, to render a proposition compound, that the subject and predicate are complex notions, requiring sometimes a whole sentence to express them: For in this case, the comparison is still confined to two ideas, and constitutes what we call a simple judgment. But where there are several subjects, or predicates, or both, as the affirmation or negation may be alike extended to them all, the proposition expressing such a judgment, is truly a collection of as many simple ones as there are different ideas compared. Confining ourselves therefore to this more strict and just notion of compound propositions, they are all reducible to two kinds, *viz. copulatives and disjunctives*.

A *copulative* proposition is, where the subjects and predicates are so linked together, that they may be all severally affirmed or denied one of another. Of this nature are the examples of compound propositions given above. *Riches and honours are apt to elate the mind, and increase the number of our desires*. *Neither kings nor people are exempt from death*. In the first of these, the

two

two predicates may be affirmed severally of each subject, whence we have four distinct propositions. The other furnishes an example of the negative kind, where the same predicate being disjoined from both subjects, may be also denied of them in separate propositions.

The other species of compound propositions are those called disjunctives; in which, comparing several predicates with the same subject, we affirm that one of them necessarily belongs to it, but leave the particular predicate undetermined. If any one, for example, says, *This world either exists of itself, or is the work of some all-wise and powerful cause*; it is evident, that one of the two predicates must belong to the world; but as the proposition determines not which, it is therefore of the kind we call *disjunctive*. Such too are the following. *The sun either moves round the earth, or is the centre about which the earth revolves. Friendship finds men equal, or makes them so.* It is the nature of all propositions of this class, supposing them to be exact in point of form, that upon determining the particular predicate, the rest are of course to be removed; or if all the predicates but one are removed, that one necessarily takes place. Thus in the example given above; if we allow the world to be the work of some wise and powerful cause, we of course deny it to be self-existent; or if we deny it to be self-existent, we must necessarily admit that it was produced by some wise and powerful cause. Now this particular manner of linking the predicates together, so that the establishing of one displaces all the rest, or the excluding all but one necessarily establishes that one, cannot otherwise be effected than by means of *disjunctive* particles. And hence it is, that propositions of this class take their name from these particles, which make so necessary a part of them, and indeed constitute their very nature considered as a distinct species.

*Of the division of propositions into self-evident and demonstrable.*

WHEN any proposition is offered to the view of the mind, if the terms in which it is expressed are understood; upon comparing the ideas together, the agreement or disagreement asserted is either immediately perceived, or found to lie beyond the present reach of the understanding. In the first case, the proposition is said to be *self-evident*, and admits not of any proof, because a bare attention to the ideas themselves produces full conviction and certainty; nor is it possible to call in any thing more evident, by way of confirmation. But where the connection or repugnance comes not so readily under the inspection of the mind, there we must have recourse to reasoning; and if by a clear series of proofs we can make out the truth proposed, inasmuch that self-evidence shall accompany every step of the procedure, we are then able to demonstrate what we assert, and the proposition itself is said to be *demonstrable*. When we affirm, for instance, *that it is impossible for the same thing to be and not to be*; whoever understands the terms made use of, perceives at first glance the truth of what is asserted; nor can he by any efforts bring himself to believe the contrary. The proposition therefore is *self-evident*, and such that it is impossible by reasoning to make it plainer; because there is no truth more obvious, or better known, from which

as a consequence it may be deduced. But if we say, *This world had a beginning*; the assertion is indeed equally true, but shines not forth with the same degree of evidence. We find a great difficulty in conceiving how the world could be made out of nothing; and are not brought to a free and full consent, until by reasoning we arrive at a clear view of the absurdity involved in the contrary supposition. Hence this proposition is of the kind we call *demonstrable*, in as much as its truth is not immediately perceived by the mind, but yet may be made appear by means of others more known and obvious, whence it follows as an unavoidable consequence.

From what has been said it appears, that reasoning is employed only about demonstrable propositions, and that our intuitive and self-evident perceptions are the ultimate foundation on which it rests.

Self-evident propositions furnish the first principles of reasoning; and it is certain, that if in our researches we employ only such principles as have this character of self-evidence, and apply them according to the rules to be afterwards explained, we shall be in no danger of error in advancing from one discovery to another. For this we may appeal to the writings of the mathematicians, which being conducted by the express model here mentioned, are an incontestable proof of the firmness and stability of human knowledge, when built upon so sure a foundation. For not only have the propositions of this science stood the test of ages; but are found attended with that invincible evidence, as forces the assent of all who duly consider the proofs upon which they are established.

First then it is to be observed, that they have been very careful in ascertaining their ideas, and fixing the signification of their terms. For this purpose they begin with *definitions*, in which the meaning of their words is so distinctly explained, that they cannot fail to excite in the mind the very same ideas as are annexed to them by the writer. And indeed the clearness and irresistible evidence of mathematical knowledge is owing to nothing so much as this care in laying the foundation. Where the relation between any two ideas is accurately and justly traced, it will not be difficult for another to comprehend that relation, if, in setting himself to discover it, he brings the very same ideas into comparison. But if, on the contrary, he affixes to his words ideas different from those that were in the mind of him who first advanced the demonstration; it is evident, that, as the same ideas are not compared, the same relation cannot subsist, inasmuch that a proposition will be rejected as false, which, had the terms been rightly understood, must have appeared unexceptionably true. A square, for instance, is a figure bounded by four equal right lines, joined together at right angles. Here the nature of the angles makes no less a part of the idea, than the equality of the sides; and many properties demonstrated of the square flow entirely from its being a rectangular figure. If therefore we suppose a man, who has formed a partial notion of a square, comprehending only the equality of its sides without regard to the angles, reading some demonstration that implies also this latter consideration; it is plain he would reject it as not universally true, in as much as it could not be applied where the sides were joined to-

gether

gether at unequal angles. For this last figure, answering still to his idea of a square, would be yet found without the property assigned to it in the proposition. But if he comes afterwards to correct his notion, and render his idea complete, he will then readily own the truth and justness of the demonstration.

We see therefore, that nothing contributes so much to the improvement and certainty of human knowledge, as the having determinate ideas, and keeping them steady and invariable in all our discourses and reasonings about them. And on this account it is, that mathematicians always begin by defining their terms, and distinctly unfolding the notions they are intended to express. Hence such as apply themselves to these studies, having exactly the same views of things, and bringing always the very same ideas into comparison, readily discern the relations between them.

When they have taken this first step, and made known the ideas whose relations they intend to investigate; their next care is, to lay down some self evident truths, which may serve as a foundation for their future reasonings. And here indeed they proceed with remarkable circumspection, admitting no principles but what flow immediately from their definitions, and necessarily force themselves upon the mind. Thus a *circle* is a figure formed by a right line, moving round some fixed point in the same plane. The fixed point round which the line is supposed to move, and where one of its extremities terminates, is called the *centre* of the circle. The other extremity, which is conceived to be carried round, until it returns to the point whence it first set out, describes a curve running into itself, and termed the *circumference*. All right lines drawn from the centre to the circumference, are called *radii*. From these definitions compared, geometers derive this self-evident truth, *That the radii of the same circle are all equal one to another.*

We now observe, that, in all propositions, we either affirm or deny some property of the idea that constitutes the subject of our judgment, or we maintain that something may be done or effected. The first sort are called *speculative* propositions, as in the example mentioned above, *the radii of the same circle are all equal one to another.* The others are called *practical*, for a reason too obvious to be mentioned; thus, *that a right line may be drawn from one point to another*, is a practical proposition, inasmuch as it expresses that something may be done.

From this twofold consideration of propositions arises the twofold division of mathematical principles into *axioms* and *postulates*. By an *axiom* they understand any self-evident *speculative* truth: as, *that the whole is greater than its parts; that things equal to one and the same things are equal to one another.* But a self-evident *practical* proposition is what they call a *postulate*. Such are those of *Euclid*; *That a finite right line may be continued directly forwards: That a circle may be described about*

*any centre with any distance.* And as, in an *axiom*, the agreement or disagreement between the subject and predicate must come under the immediate inspection of the mind; so, in a *postulate*, not only the possibility of the thing asserted must be evident at first view, but also the manner in which it may be effected. For where this manner is not of itself apparent, the proposition comes under the notion of the demonstrable kind, and is treated as such by geometrical writers. Thus, *to draw a right line from one point to another*, is assumed by *Euclid* as a *postulate*, because the manner of doing it is so obvious as to require no previous teaching. But then it is not equally evident, *how we are to construct an equilateral triangle.* For this reason he advances it as a demonstrable proposition, lays down rules for the exact performance, and at the same time proves, that if these rules are followed, the figure will be justly described.

This leads us to take notice, that as *self-evident truths* are distinguished into different kinds, according as they are speculative or practical; so is it also with *demonstrable* propositions. A demonstrable speculative proposition, is by mathematicians called a *theorem*. Such is the 47th proposition of the first book of the *Elements*, viz. *that in every right-angled triangle, the square described upon the side subtending the right-angle is equal to both the squares described upon the sides containing the right-angle.* On the other hand, a demonstrable practical proposition, is called a *problem*; as where *Euclid* teaches us *to describe a square upon a given right-line.*

It may not be amiss to add, that besides the four kinds of propositions already mentioned, mathematicians have also a fifth, known by the name of *corollaries*. These are usually subjoined to *theorems*, or *problems*, and differ from them only in this; that they flow from what is there demonstrated, in so obvious a manner, as to discover their dependence upon the proposition whence they are deduced, almost as soon as proposed. Thus *Euclid* having demonstrated, *that in every right-lined triangle all the three angles taken together are equal to two right angles*; adds by way of corollary, *that all the three angles of any one triangle taken together are equal to all the three angles of any other triangle taken together*: which is evident at first sight; because in all cases they are equal to two right ones, and things equal to one and the same thing are equal to one another.

The scholia of mathematicians are indifferently annexed to definitions, propositions, or corollaries; and answer the same purposes as annotations upon a classic author. For in them occasion is taken to explain whatever may appear intricate and obscure in a train of reasoning; to answer objections; to teach the application and uses of propositions; to lay open the original and history of the several discoveries made in the science; and in a word, to acquaint us with all such particulars as deserve to be known, whether considered as points of curiosity or profit.

## PART II. OF REASONING.

It often happens, in comparing ideas together, that their agreement or disagreement cannot be discerned at first

view, especially if they are of such a nature as not to admit of an exact application one to another. When, for instance,

instance, we compare two figures of a different make, in order to judge of their equality or inequality, it is plain, that by barely considering the figures themselves we cannot arrive at an exact determination; because, by reason of their disagreeing forms, it is impossible so to put them together, as that their several parts shall mutually coincide. Here then it becomes necessary to look out for some third idea, that will admit of such an application as the present case requires; wherein if we succeed, all difficulties vanish, and the relation we are in quest of may be traced with ease. Thus right-lined figures are all reducible to squares, by means of which we can measure their areas, and determine exactly their agreement or disagreement in point of magnitude.

But how can any third idea serve to discover a relation between two others, by being compared severally with these others? for such a comparison enables us to see how far the ideas with which this third is compared are connected or disjoined between themselves. In the example mentioned above, of two right-lined figures, if we compare each of them with some square whose area is known, and find the one exactly equal to it, and the other less by a square-inch, we immediately conclude, that the area of the first figure is a square inch greater than that of the second. This manner of determining the relation between any two ideas, by the intervention of some third with which they may be compared, is that which we call *reasoning*. The great art lies, in finding out such intermediate ideas, as, when compared with the others in the question, will furnish evident and known truths, because it is only by means of them that we arrive at the knowledge of what is hidden and remote.

Hence it appears, that every act of reasoning necessarily includes three distinct judgments; two wherein the ideas whose relation we want to discover are severally compared with the middle idea, and a third wherein they are themselves connected or disjoined according to the result of that comparison. Now, as, in the first part of logic, our judgments, when put into words, were called propositions; so here, in the second part, the expressions of our reasonings are termed *sylogisms*. And hence it follows, that as every act of reasoning implies three several judgments, so every syllogism must include three distinct propositions. When a reasoning is thus put into words, and appears in form of a syllogism, the intermediate idea made use of to discover the agreement or disagreement we search for is called the *middle term*; and the two ideas themselves, with which this third is compared, go by the name of the *extremes*.

But as these things are best illustrated by examples; let us, for instance, set ourselves to inquire, *whether men are accountable for their actions*. As the relation between the ideas of *man* and *accountableness*, comes not within the immediate view of the mind, our first care must be, to find out some third idea, that will enable us the more easily to discover and trace it. A very small measure of reflection is sufficient to inform us, that no creature can be accountable for his actions, unless we suppose him capable of distinguishing the good from the bad. Nor is this alone sufficient. For what would it avail him to know good from bad actions, if he had no freedom of choice, nor could avoid the one and pursue

the other? hence it becomes necessary to take in both considerations in the present case. It is at the same time equally apparent, that where-ever there is this ability of distinguishing good from bad actions, and of pursuing the one and avoiding the other, there also a creature is accountable. We have then got a third idea, with which *accountableness* is inseparably connected, viz. *reason and liberty*; which are here to be considered as making up one complex conception. Let us now take this middle idea, and compare it with the other term in the question, viz. *man*; and we all know by experience, that it may be affirmed of him. Having thus, by means of the intermediate idea, formed two several judgments, viz. *that man is possessed of reason and liberty*; and *that reason and liberty imply accountableness*; a third obviously and necessarily follows, viz. *that man is accountable for his actions*. Here then we have a complete act of reasoning, in which there are three distinct judgments; two that may be styled previous, in as much as they lead to the other, and arise from comparing the middle idea with the two ideas in the question: the third is a consequence of these previous acts, and flows from combining the extreme ideas between themselves. If now we put this reasoning into words, it exhibits what logicians term a syllogism, and runs this:

*Every creature possessed of reason and liberty is accountable for his actions.*

*Man is a creature possessed of reason and liberty.*

*Therefore man is accountable for his actions.*

In this syllogism there are three several propositions, expressing the three judgments implied in the act of reasoning, and so disposed as to represent distinctly what passes within the mind in tracing the more distant relations of its ideas. The two first propositions answer the two previous judgments in reasoning, and are called the *premises*, because they are placed before the other. The third is termed the *conclusion*, as being gained in consequence of what was asserted in the premises. The terms expressing the two ideas whose relation we inquire after, as here *man* and *accountableness*, are in general called the *extremes*; and the intermediate idea, by means of which the relation is traced, viz. *a creature possessed of reason and liberty*, takes the name of the *middle term*. Hence it follows, that by the *premises* of a syllogism we are always to understand the two propositions where the middle term is severally compared with the *extremes*; for these constitute the previous judgments, whence the truth we are in quest of is by reasoning deduced. The *conclusion* is that other proposition, in which the *extremes* themselves are joined or separated, agreeably to what appears upon the above comparison.

The conclusion is made up of the extreme terms of the syllogism; and the extreme, which serves as the predicate of the conclusion, goes by the name of the *major term*; the other extreme, which makes the subject in the same proposition, is called the *minor term*. From this distinction of the extremes, arises also a distinction between the premises, where these extremes are severally compared with the middle term. That proposition which compares the greater extreme, or the predicate of the conclusion, with the middle term, is called the *major proposition*.

*proposition*; the other, wherein the same middle term is compared with the subject of the conclusion, or lesser extreme, is called the *minor proposition*. All this is obvious from the syllogism already given, where the conclusion is, *Man is accountable for his actions*. For here the predicate, *accountable for his actions*, being connected with the middle term in the first of the two premisses, *every creature possessed of reason and liberty is accountable for his actions*, gives what we call the *major proposition*. In the second of the premisses, *Man is a creature possessed of reason and liberty*, we find the lesser extreme, or subject of the conclusion, *viz. man*, connected with the same middle term, whence it is known to be the *minor proposition*. When a syllogism is proposed in due form, the major proposition is always placed first, the minor next, and the conclusion last.

These things premised, we may in the general define reasoning to be an act or operation of the mind, deducing some unknown proposition from other previous ones that are evident and known. These previous propositions, in a simple act of reasoning, are only two in number; and it is always required that they be of themselves apparent to the understanding, inasmuch that we assent to and perceive the truth of them as soon as proposed. In the syllogism given above, the premisses are supposed to be self-evident truths, otherwise the conclusion could not be inferred by a single act of reasoning. If, for instance, in the major, *every creature possessed of reason and liberty is accountable for his actions*, the connection between the subject and predicate could not be perceived by a bare attention to the ideas themselves; it is evident, that this proposition would no less require a proof than the conclusion deduced from it. In this case a new middle term must be sought for, to trace the connection here supposed; and this of course furnishes another syllogism, by which having established the proposition in question, we are then, and not before, at liberty to use it in any succeeding train of reasoning. And should it so happen, that in this second essay there was still some previous proposition whose truth did not appear at first sight, we must then have recourse to a third syllogism in order to lay open that truth to the mind; because, so long as the premisses remain uncertain, the conclusion built upon them must be so too. When by conducting our thoughts in this manner, we at last arrive at some syllogism, where the previous propositions are intuitive truths; the mind then rests in full security, as perceiving that the several conclusions it has passed through stand upon the immovable foundation of self-evidence, and when traced to their source terminate in it.

We see therefore, that in order to infer a conclusion by a single act of reasoning, the premisses must be intuitive propositions. Where they are not, previous syllogisms are required; in which case reasoning becomes a complicated act, taking in a variety of successive steps. This frequently happens in tracing the more remote relations of our ideas, where many middle terms being called in, the conclusion cannot be made out, but in consequence of a series of syllogisms following one another in a train. But although in this concatenation of propositions, those that form the premisses of the last syllogism are often

considerably removed from self-evidence; yet if we trace the reasoning backwards, we shall find them the conclusions of previous syllogisms, whose premisses approach nearer and nearer to intuition, in proportion as we advance, and are found at last to terminate in it. And if, after having thus unravelled a demonstration, we take it the contrary way; and observe how the mind, setting out with intuitive perceptions, couples them together to form a conclusion; how, by introducing this conclusion into another syllogism, it still advances one step farther; and so proceeds, making every new discovery subservient to its future progress; we shall then perceive clearly, that reasoning, in the highest exercise of that faculty, is no more than an orderly combination of those simple acts which we have already so full explained.

Thus we see, that reasoning, beginning with first principles, rises gradually from one judgment to another, and connects them in such a manner, that every stage of the progression brings intuitive certainty along with it. And now at length we may clearly understand the definition given above of this distinguishing faculty of the human mind. Reason is the ability of deducing unknown truths from principles or propositions that are already known. This evidently appears by the foregoing account, where we see, that no proposition is admitted into a syllogism, to serve as one of the previous judgments on which the conclusion rests, unless it is itself a known and established truth, whose connection with self-evident principles has been already traced.

*Of the several kinds of reasoning; and first of that by which we determine the genera and species of things.*

ALL the aims of human reason may be reduced to these two: 1. To rank things under those universal ideas to which they truly belong; and, 2. To ascribe to them their several attributes and properties in consequence of that distribution.

One great aim of human reason is, to determine the genera and species of things. Now, as in universal propositions we affirm some property of a genus or species, it is plain, that we cannot apply this property to particular objects, till we have first determined whether they are comprehended under that general idea of which the property is affirmed. Thus there are certain properties belonging to all *even* numbers, which nevertheless cannot be applied to any particular number, until we have first discovered it to be of the species expressed by that general name. Hence reasoning begins with referring things to their several divisions and classes in the scale of our ideas; and as these divisions are all distinguished by peculiar names, we hereby learn to apply the terms expressing general conceptions to such particular objects as come under our immediate observation.

Now, in order to arrive at these conclusions by which the several objects of perception are brought under general names, two things are manifestly necessary. First, that we take a view of the idea itself denoted by that general name, and carefully attend to the distinguishing marks which serve to characterize it. Secondly, that we compare this idea with the object under consideration, observing diligently wherein they agree or differ. If

the

the idea is found to correspond with the particular object, we then without hesitation apply the general name; but if no such correspondence intervenes, the conclusion must necessarily take a contrary turn. Let us, for instance, take the number *eight*, and consider by what steps we are led to pronounce it an *even* number. First then we call to mind the idea signified by the expression *an even number*, viz. that it is a number divisible into two equal parts. We then compare this idea with the number *eight*, and, finding them manifestly to agree, see at once the necessity of admitting the conclusion. These several judgments therefore, transferred into language, and reduced to the form of a syllogism, appear thus:

*Every number that may be divided into two equal parts is an EVEN number.*

*The number EIGHT may be divided into two equal parts.*

*Therefore the number EIGHT is an EVEN number.*

Here it may be observed, that where the general idea to which particular objects are referred is very familiar to the mind, this reference, and the application of the general name, seem to be made without any apparatus of reasoning. When we see a horse in the fields, or a dog in the street, we readily apply the name of the species; habit, and a familiar acquaintance with the general idea, suggesting it instantaneously to the mind. We are not however to imagine on this account, that the understanding departs from the usual rules of just thinking. A frequent repetition of acts begets a habit; and habits are attended with a certain promptness of execution that prevents our observing the several steps and gradations by which any course of action is accomplished. But in other instances, where we judge not by pre-contracted habits, as when the general idea is very complex, or less familiar to the mind; we always proceed according to the form of reasoning established above. A goldsmith, for instance, who is in doubt as to any piece of metal, whether it be of the species called *gold*; first examines its properties, and then comparing them with the general idea signified by that name, if he finds a perfect correspondence, no longer hesitates under what class of metals to rank it.

But the great importance of this branch of reasoning, and the necessity of care and circumspection in referring particular objects to general ideas, is still farther evident from the practice of the mathematicians. Every one who has read *Euclid* knows, that he frequently requires us to draw lines through certain points, and according to such and such directions. The figures thence resulting are often squares, parallelograms, or rectangles. Yet *Euclid* never supposes this from their bare appearance, but always demonstrates it upon the strictest principles of geometry. Nor is the method he takes in any thing different from that described above. Thus, for instance, having defined a square to be a figure bounded by four equal sides, joined together at right angles; when such a figure arises in any construction previous to the demonstration of a proposition, he yet never calls it by that name, until he has shewn that its sides are equal, and all its angles right ones. Now this is apparently the same form of reasoning we have before exhibited, in proving *eight* to be an even number.

VOL. II. N° 69.

†

Having thus explained the rules by which we are to conduct ourselves in ranking particular objects under general ideas, and shewn their conformity to the practice and manner of the mathematicians; it remains only to observe, that the true way of rendering this part of knowledge both easy and certain, is, by habituating ourselves to clear and determinate ideas, and keeping them steadily annexed to their respective names. For as all our aim is, to apply general words aright; if these words stand for invariable ideas, that are perfectly known to the mind, and can be readily distinguished upon occasion, there will be little danger of mistake or error in our reasonings. Let us suppose, that by examining any object, and carrying our attention successively from one part to another, we have acquainted ourselves with the several particulars observable in it. If among these we find such as constitute some general idea, framed and settled beforehand by the understanding, and distinguished by a particular name; the resemblance, thus known and perceived, necessarily determines the species of the object, and thereby gives it a right to the name by which that species is called. Thus four equal sides, joined together at right angles, made up the notion of a square. As this is a fixed and invariable idea, without which the general name cannot be applied we never call any particular figure a *square*, until it appears to have these several conditions; and contrarily, where-ever a figure is found with these conditions, it necessarily takes the name of a *square*. The same will be found to hold in all our other reasonings of this kind; where nothing can create any difficulty but the want of settled ideas. If, for instance, we have not determined within ourselves the precise notion denoted by the word *manslaughter*; it will be impossible for us to decide, whether any particular action ought to bear that name: because however nicely we examine the action itself, yet being strangers to the general idea with which it is to be compared, we are utterly unable to judge of their agreement or disagreement. But if we take care to remove this obstacle, and distinctly trace the two ideas under consideration, all difficulties vanish, and the resolution becomes both easy and certain.

Thus we see, of what importance it is, towards the improvement and certainty of human knowledge, that we accustom ourselves to clear and determinate ideas, and a steady application of words.

*Of Reasoning, as it regards the powers and properties of things, and the relations of our general ideas.*

WE come now to the second great end which men have in view in their reasonings, namely, The discovering and ascribing to things their several attributes and properties. And here it will be necessary to distinguish between reasoning as it regards the sciences, and as it concerns common life. In the sciences, our reason is employed chiefly about universal truths, it being by them alone that the bounds of human knowledge are enlarged. Hence the division of things into various classes, called otherwise genera and species. For these universal ideas, being set up as the representatives of many particular things, whatever is affirmed of them may be also affirmed of all the individuals to which they belong. *Murder*, for instance,

10 S 2.

is,

is a general idea, representing a certain species of human actions. Reason tells us that the punishment due to it is *death*. Hence every particular action coming under the notion of *murder*, has the punishment of *death* allotted to it. Here then we apply the general truth to some obvious instance, and this is what properly constitutes the reasoning of common life. For men, in their ordinary transactions and intercourse one with another, have for the most part to do only with particular objects. Our friends and relations, their characters and behaviour, the constitution of the several bodies that surround us, and the uses to which they may be applied, are what chiefly engage our attention. In all these we reason about particular things; and the whole result of our reasoning is, the applying the general truths of the sciences to the ordinary transactions of human life. When we see a viper, we avoid it. Where-ever we have occasion for the forcible action of water, to move a body that makes considerable resistance, we take care to convey it in such a manner that it shall fall upon the object with impetuosity. Now all this happens in consequence of our familiar and ready application of these two general truths. *The bite of a viper is mortal. Water falling upon a body with impetuosity, acts very forcibly towards setting it in motion.* In like manner, if we set ourselves to consider any particular character, in order to determine the share of praise or dispraise that belongs to it, our great concern is, to ascertain exactly the proportion of virtue and vice. The reason is obvious. A just determination in all cases of this kind depends entirely upon an application of these general maxims of morality: *Virtuous actions deserve praise. Vicious actions deserve blame.*

Hence it appears, that reasoning, as it regards common life, is no more than the ascribing the general properties of things to those several objects with which we are more immediately concerned, according as they are found to be that particular division or class to which the properties belong. The steps then by which we proceed are manifestly these. First, we refer the object under consideration to some general idea or class of things. We then recollect the several attributes of that general idea. And lastly, ascribe all those attributes to the present object. Thus, in considering the character of *Sempronius*, if we find it to be of the kind called *virtuous*; when we at the same time reflect, that a *virtuous* character is deserving of esteem, it naturally and obviously follows that *Sempronius* is so too. These thoughts put into a *syllogism*, in order to exhibit the form of reasoning here required, run thus.

*Every virtuous man is worthy of esteem.*

*Sempronius is a virtuous man.*

*Therefore Sempronius is worthy of esteem.*

By this *syllogism* it appears, that before we affirm any thing of a particular object, that object must be referred to some general idea. *Sempronius* is pronounced worthy of esteem, only in consequence of his being a virtuous man. Hence we see the necessary connection of the various parts of reasoning, and the dependence they have one upon another. The determining the genera and species of things is, as we have said, one exercise of human reason; and here we find, that this exercise is the first in order, and previous to the other, which consists in ascribing to

them their powers, properties, and relations. But when we have taken this previous step, and brought particular objects under general names; as the properties we ascribe to them are no other than those of the general idea, it is plain, that in order to a successful progress in this part of knowledge, we must thoroughly acquaint ourselves with the several relations and attributes of these our general ideas. When this is done, the other part will be easy, and require scarce any labour of thought, as being no more than an application of the general form of reasoning represented in the foregoing *syllogism*. Now as we have already sufficiently shewn how we are to proceed in determining the genera and species of things, all that is farther wanting towards a due explanation of it is, to offer some considerations as to the manner of investigating the general relations of our ideas. This is the highest exercise of the powers of the understanding, and that by means whereof we arrive at the discovery of universal truths, inasmuch that our deductions in this way constitute that particular species of reasoning which we have before said regards principally the sciences.

But that we may conduct our thoughts with some order and method, we shall begin with observing, that the relations of our general ideas are of two kinds. Either such as immediately discover themselves, upon comparing the ideas one with another; or such as, being more remote and distant, require art and contrivance to bring them into view. The relations of the first kind furnish us with intuitive and self-evident truths; those of the second are traced by reasoning and a due application of intermediate ideas. It is of this last kind that we are to speak here, having dispatched what was necessary with regard to the other in the former part. As therefore, in tracing the more distant relations of things, we must always have recourse to intervening ideas, and are more or less successful in our researches, according to our acquaintance with these ideas, and ability of applying them it is evident, that to make a good reasoner, two things are principally required. *First*, an extensive knowledge of those intermediate ideas, by means of which things may be compared one with another. *Secondly*, the skill and talent of applying them happily, in all particular instances that come under consideration.

In order to our successful progress in reasoning, we must have an extensive knowledge of those intermediate ideas by means of which things may be compared one with another. For as it is not every idea that will answer the purpose of our inquiries, but such only as are peculiarly related to the objects about which we reason, so as, by a comparison with them, to furnish evident and known truths; nothing is more apparent, than that the greater variety of conceptions we can call into view, the more likely we are to find some among them that will help us to the truths here required. And indeed it is found to hold in experience, that in proportion as we enlarge our views of things, and grow acquainted with a multitude of different objects, the reasoning faculty gathers strength. For by extending our sphere of knowledge, the mind acquires a certain force and penetration, as being accustomed to examine the several appearances of its ideas, and observe what light they cast one upon another.

This

This is the reason, why, in order to excel remarkably in any one branch of learning, it is necessary to have at least a general acquaintance with the whole circle of arts and sciences. The truth is, all the various divisions of human knowledge are very nearly related among themselves, and in innumerable instances serve to illustrate and set off each other. And altho' it is not to be denied, that, by an obstinate application to one branch of study, a man may make considerable progress and acquire some degree of eminence in it; yet his views will be always narrow and contracted, and he will want that masterly discernment, which not only enables us to pursue our discoveries with ease, but also, in laying them open to others, to spread a certain brightness around them. But when our reasoning regards a particular science, it is farther necessary, that we more nearly acquaint ourselves with whatever relates to that science. A general knowledge is a good preparation, and enables us to proceed with ease and expedition, in whatever branch of learning we apply to. But then in the minute and intricate questions of any science we are by no means qualified to reason with advantage, until we have perfectly mastered the science to which they belong.

We come now to the second thing required, in order to a successful progress in reasoning, namely, the skill and talent of applying intermediate ideas happily in all particular instances that come under consideration. Use and exercise are the best instructors in the present case. And therefore the true way to acquire this talent is, by being much conversant in those sciences where the art of reasoning is allowed to reign in the greatest perfection. Hence it was that the ancients, who so well understood the manner of forming the mind, always began with *mathematicks*, as the foundation of their philosophical studies. Here the understanding is by degrees habituated to truth, contracts insensibly a certain fondness for it, and learns never to yield its assent to any proposition, but where the evidence is sufficient to produce full conviction. For this reason *Plato* has called mathematical demonstrations the *catharticks* or purgatives of the soul, as being the proper means to cleanse it from error, and restore that natural exercise of its faculties, in which just thinking consists.

If therefore we would form our minds to a habit of reasoning closely and in train, we cannot take any more certain method, than the exercising ourselves in mathematical demonstrations, so as to contract a kind of familiarity with them. Not that we look upon it as necessary that all men should be deep mathematicians, but that, having got the way of reasoning which that study necessarily brings the mind to, they may be able to transfer it to other parts of knowledge, as they shall have occasion.

But although the study of *mathematicks* be of all others the most useful to form the mind, and give it an early relish of truth, yet ought not other parts of philosophy to be neglected. For there also we meet with many opportunities of exercising the powers of the understanding: and the variety of subjects naturally leads us to observe all those different turns of thinking that are peculiarly adapted to the several ideas we examine and

the truths we search after. For this purpose, besides the study of *mathematicks*, we ought to apply ourselves diligently to the reading of such authors as have distinguished themselves for strength of reasoning, and a just and accurate manner of thinking. For it is observable, that a mind exercised and seasoned to truth, seldom rests satisfied in a bare contemplation of the arguments offered by others, but will be frequently essaying its own strength, and pursuing its discoveries upon the plan it is most accustomed to. Thus we insensibly contract a habit of tracing truth from one stage to another, and of investigating those general relations and properties, which we afterwards ascribe to particular things, according as we find them comprehended under the abstract ideas to which the properties belong.

#### *Of the forms of Syllogisms.*

HITHERTO we have contented ourselves with a general notion of syllogisms, and of the parts of which they consist. It is now time to enter a little more particularly into the subject, to examine their various forms, and lay open the rules of argumentation proper to each. In the syllogisms mentioned in, we may observe, that the *middle term* is the subject of the *major* proposition, and the predicate of the *minor*. This disposition, though the most natural and obvious, is not however necessary; it frequently happening, that the *middle term* is the subject in both the premisses, or the predicate in both; and sometimes directly contrary, the predicate in the *major*, and the subject in the *minor*. Hence the distinction of syllogisms into various kinds, called *figures* by logicians. For *figure*, according to their use of the word, is nothing else but the order and disposition of the *middle term* in any syllogism. And as this disposition is fourfold, so the figures of syllogisms thence arising are four in number. When the *middle term* is the subject of the *major* proposition, and the predicate of the *minor*, we have what is called the *first figure*. If, on the other hand, it is the predicate of both the premisses, the syllogism is said to be in the *second figure*. Again, in the *third figure*, the *middle term* is the subject of the two premisses. And lastly, by making it the predicate of the *major*, and subject of the *minor*, we obtain syllogisms in the *fourth figure*.

But besides this fourfold distinction of syllogisms, there is also a farther subdivision of them in every figure, arising from the *quantity* and *quality*, as they are called, of the propositions. By *quantity* we mean the consideration of propositions as universal or particular; by *quality*, as affirmative or negative. Now as, in all the several dispositions of the *middle term*, the proposition of which a syllogism consists may be either universal or particular, affirmative or negative; the due determination of these, and so putting them together as the laws of argumentation require, constitute what logicians call the *moods* of syllogisms. Of these *moods* there are a determinate number to every figure, including all the possible ways in which propositions differing in *quantity* or *quality* can be combined, according to any disposition of the *middle term*, in order to arrive at a just conclusion.

The division of syllogisms according to mood and figure,

gure, respects those especially which are known by the name of plain simple syllogisms; that is, which are bounded to three propositions, all simple, and where the extremes and middle term are connected according to the rules laid down above. But as the mind is not tied down to any one precise form of reasoning, but sometimes makes use of more, sometimes of fewer premisses, and often takes in compound and conditional propositions, it may not be amiss to take notice of the different forms derived from this source, and explain the rule by which the mind conducts itself in the use of them.

When, in any syllogism, the *major* is a conditional proposition, the syllogism itself is termed *conditional*. Thus:

*If there is a God, he ought to be worshipped.*

*But there is a God:*

*Therefore he ought to be worshipped.*

In this example, the *major* is conditional, and therefore the syllogism itself is also of the kind called by that name. All conditional propositions are made up of two distinct parts: one expressing the condition upon which the predicate agrees or disagrees with the subject, as in this now before us, *if there is a God*; the other joining or disjoining the said predicate and subject, as here, *he ought to be worshipped*. The first of these parts, or that which implies the condition, is called the *antecedent*; the second, where we join or disjoin the predicate and subject, has the name of the *consequent*.

In all propositions of this kind, supposing them to be exact in point of form, the relation between the antecedent and consequent must ever be true and real; that is, the antecedent must always contain some certain and genuine condition, which necessarily implies the consequent; for otherwise the proposition itself will be false, and therefore ought not to be admitted into our reasonings. Hence it follows, that when any conditional proposition is assumed, if we admit the antecedent of that proposition, we must at the same time necessarily admit the consequent; but if we reject the consequent, we are in like manner bound to reject also the antecedent. For as the antecedent always expresses some condition, which necessarily implies the truth of the consequent; by admitting the antecedent we allow of that condition, and therefore ought also to admit the consequent. In like manner if it appears that the consequent ought to be rejected, the antecedent evidently must be so too; because the admitting of the antecedent would necessarily imply the admission also of the consequent.

There are two ways of arguing in *hypothetical* syllogisms, which lead to a certain and unavoidable conclusion. For as the *major* is always a conditional proposition, consisting of an antecedent and a consequent; if the *minor* admits the antecedent, it is plain that the conclusion must admit the consequent. This is called arguing from the admission of the antecedent to the admission of the consequent, and constitutes that mood or species of *hypothetical* syllogisms which is distinguished in the schools by the name of the *modus ponens*, in as much as by it the whole conditional proposition both antecedent and consequent is established. Thus:

*If God is infinitely wise, and acts with perfect freedom, he does nothing but what is best.*

*But God is infinitely wise, and acts with perfect freedom:*

*Therefore he does nothing but what is best.*

Here the antecedent or first part of the conditional proposition is established in the *minor*, and the consequent or second part in the conclusion; whence the syllogism itself is an example of the *modus ponens*. But if we, on the contrary, suppose, that the *minor* rejects the consequent; then it is apparent, that the conclusion must also reject the antecedent. In this case we are said to argue from the removal of the consequent to the removal of the antecedent, and the particular mood or species of syllogisms thence arising is called by logicians the *modus tollens*; because in it both antecedent and consequent are rejected or taken away, as appears by the following example.

*If God were not a being of infinite goodness, neither would he consult the happiness of his creatures.*

*But God does consult the happiness of his creatures; Therefore he is a being of infinite goodness.*

These two species take in the whole class of *conditional* syllogisms, and include all the possible ways of arguing that lead to a legitimate conclusion; because we cannot here proceed by a contrary process of reasoning, that is, from the removal of the antecedent to the removal of the consequent, or from the establishing of the consequent to the establishing of the antecedent. For although the antecedent always expresses some real condition, which once admitted necessarily implies the consequent, yet it does not follow that there is therefore no other condition; and if so, then, after removing the antecedent, the consequent may still hold, because of some other determination that enters it. When we say: *If a stone is exposed some time to the rays of the sun, it will contract a certain degree of heat*; the proposition is certainly true; and admitting the antecedent, we must also admit the consequent. But as there are other ways by which a stone may gather heat, it will not follow, from the ceasing of the before-mentioned condition, that therefore the consequent cannot take place. In other words, we cannot argue: *But the stone has not been exposed to the rays of the sun; therefore neither has it any degree of heat*; in as much as there a great many other ways by which heat might have been communicated to it. And if we cannot argue from the removal of the antecedent to the removal of the consequent, no more can we from the admission of the consequent to the admission of the antecedent; because as the consequent may flow from a great variety of different suppositions, the allowing of it does not determine the precise supposition, but only that some one of them must take place. Thus, in the foregoing proposition, *If a stone is exposed some time to the rays of the sun, it will contract a certain degree of heat*; admitting the consequent, viz. *that it has contracted a certain degree of heat*, we are not therefore bound to admit the antecedent, *that it has been some time exposed to the rays of the sun*, because there are many other causes whence that heat may have proceeded. These two ways of arguing, therefore, hold not in conditional syllogisms.

As from the *major's* being a conditional proposition, we obtain the species of conditional syllogisms; so where it

is

is a disjunctive proposition, the syllogism to which it belongs is also called *disjunctive*, as in the following example :

*The world is either self-existent, or the work of some finite, or of some infinite being.*

*But it is not self-existent, nor the work of a finite being.*

*Therefore it is the work of an infinite being.*

Now a disjunctive proposition is that where, of several predicates, we affirm one necessarily to belong to the subject, to the exclusion of all the rest, but leave that particular one undetermined. Hence it follows, that as soon as we determine the particular predicate, all the rest are of course to be rejected; or if we reject all the predicates but one, that one necessarily takes place. When therefore, in a *disjunctive* syllogism, the several predicates are enumerated in the *major*; if the *minor* establishes any one of these predicates, the conclusion ought to remove all the rest; or if, in the *minor*, all the predicates but one are removed, the conclusion must necessarily establish that one. Thus, in the *disjunctive* syllogism given above, the *major* affirms one of three predicates to belong to the earth, viz. *self-existence*, or that it is *the work of a finite* or that it is *the work of an infinite being*. Two of these predicates are removed in the *minor*, viz. *self-existence*, and *the work of a finite being*. Hence the conclusion necessarily ascribes to it the third predicate, and affirms that it is *the work of an infinite being*. If now we give the syllogism another turn, inasmuch that the *minor* may establish one of the predicates, by affirming the earth to be *the production of an infinite being*; then the conclusion must remove the other two, asserting it to be neither *self-existent*, nor *the work of a finite being*. These are the forms of reasoning in this species of syllogisms, the justness of which appears at first sight; and that there can be no other, is evident from the very nature of a disjunctive proposition.

In the several kinds of syllogisms hitherto mentioned, the parts are complete, that is, the three propositions of which they consist are represented in form. But it often happens, that some one of the premises is not only an evident truth, but also familiar and in the minds of all men; in which case it is usually omitted, whereby we have an imperfect syllogism, that seems to be made up of only two propositions. Should we, for instance, argue in this manner;

*Every man is mortal;*

*Therefore every king is mortal:*

the syllogism appears to be imperfect, as consisting but of two propositions. Yet it is really complete, only the *minor* [*Every king is a man*] is omitted, and left to the reader to supply, as being a proposition so familiar and evident, that it cannot escape him.

These seemingly imperfect syllogisms are called *enthymemes*, and occur very frequently in reasoning, especially where it makes a part of common conversation. Nay, there is a particular elegance in them; because, not displaying the argument in all its parts, they leave somewhat to the exercise and invention of the mind. By this means we are put upon exerting ourselves, and seem to share in the discovery of what is proposed to us. Now this is the great secret of fine writing, so to frame and put together our thoughts, as to give full play to the reader's imagination.

tion, and draw him insensibly into our very views and course of reasoning. This gives a pleasure not unlike to that which the author himself feels in composing. It besides shortens discourse, and adds a certain force and liveliness to our arguments, when the words in which they are conveyed favour the natural quickness of the mind in its operations, and a single expression is left to exhibit a whole train of thoughts.

But there is another species of reasoning with two propositions, which seems to be complete in itself, and where we admit the conclusion without supposing any tacit or suppressed judgment in the mind from which it follows syllogistically. This happens between propositions where the connection is such that the admission of the one necessarily and at the first sight implies the admission also of the other. For if it so falls out, that the proposition on which the other depends is self-evident, we content ourselves with barely affirming it, and infer that other by a direct conclusion. Thus, by admitting an universal proposition, we are forced also to admit of all the particular propositions comprehended under it, this being the very condition that constitutes a proposition universal. If then that universal proposition chances to be self-evident, the particular ones follow of course, without any farther train of reasoning. Whoever allows, for instance, *that things equal to one and the same things are equal to one another*, must at the same time allow, *that two triangles, each equal to a square whose side is three inches, are also equal between themselves*. This argument therefore,

*Things equal to one and the same thing are equal to one another;*

*Therefore these two triangles, each equal to the square of a line of three inches, are equal between themselves,*

is complete in its kind, and contains all that is necessary towards a just and legitimate conclusion. For the first or universal proposition is self-evident; and therefore requires no farther proof. And as the truth of the particular is inseparably connected with that of the universal, it follows from it by an obvious and unavoidable consequence.

Now in all cases of this kind, where propositions are deduced one from another, on account of a known and evident connection, we are said to reason by *immediate consequence*. Such a coherence of propositions, manifest at first sight, and forcing itself upon the mind, frequently occurs in reasoning. Logicians have explained at some length the several suppositions upon which it takes place, and allow of all *immediate consequences* that follow in conformity to them. It is however observable, that these arguments, though seemingly complete, because the conclusion follows necessarily from the single proposition that goes before, may yet be considered as real *enthymemes*, whose *major*, which is a conditional proposition, is wanting. The syllogism but just mentioned, when represented according to this view, will run as follows:

*If things equal to one and the same thing are equal to one another; these two triangles, each equal to a square whose side is three inches, are also equal between themselves.*

*But things equal to one and the same thing, are equal to one another;*

*Therefore also these triangles, &c. are equal between themselves.*

This observation will be found to hold in all *immediate consequences* whatsoever, inasmuch that they are in fact no more than *enthymemes* of hypothetical syllogisms. But then it is particular to them, that the ground on which the conclusion rests, namely, its coherence with the *minor*, is of itself apparent, and seen immediately to flow from the rules and reasons of logic.

The next species of reasoning we shall take notice of is what is known by the name of a *sorites*. This is a way of arguing, in which a great number of propositions are so linked together, that the predicate of one becomes continually the subject of the next following until at last a conclusion is formed, by bringing together the subject of the first proposition, and the predicate of the last. Of this kind is the following argument.

*God is omnipotent.*

*An omnipotent being can do every thing possible.*

*He that can do every thing possible, can do whatever involves not a contradiction.*

*Therefore God can do whatever involves not a contradiction.*

This particular combination of propositions, may be continued to any length we please, without in the least weakening the ground upon which the conclusion rests. The reason is, because the *sorites* itself may be resolved into as many simple syllogisms as there are middle terms in it; where this is found universally to hold, that when such a resolution is made, and the syllogisms are placed in train, the conclusion of the last in the series is also the conclusion of the *sorites*. This kind of argument therefore, as it serves to unite several syllogisms into one, must stand upon the same foundation with the syllogisms of which it consists, and is indeed, properly speaking, no other than a compendious way of reasoning syllogistically.

What is here said of plain simple propositions, may be as well applied to those that are conditional; that is, any number of them may be so joined together in a series, that the consequent of one shall become continually the antecedent of the next following; in which case, by establishing the antecedent of the first proposition, we establish the consequent of the last, or, by removing the last consequent, remove also the first antecedent. This way of reasoning is exemplified in the following argument.

*If we love any person, all emotions of hatred towards him cease.*

*If all emotions of hatred towards a person cease, we cannot rejoice in his misfortunes.*

*If we rejoice not in his misfortunes, we certainly wish him no injury.*

*Therefore if we love a person, we wish him no injury.*

It is evident that this *sorites*, as well as the last, may be resolved into a series of distinct syllogisms; with this only difference, that here the syllogisms are all conditional.

We come now to that kind of argument which logicians called *induction*; in order to the right understand-

ing of which, it will be necessary to observe, that our general ideas are for the most part capable of various subdivisions. Thus the idea of the lowest species may be subdivided into its several individuals, the idea of any genus into the different species it comprehends, and so of the rest. If then we suppose this distribution to be duly made, and so as to take in the whole extent of the idea to which it belongs; then it is plain, that all the subdivisions or parts of any idea together constitute that whole idea. Thus the several individuals of any species taken together constitute the whole species, and all the various species comprehended under any genus make up the whole genus. This being allowed, whatever may be affirmed of all the several subdivisions and classes of any idea, ought to be affirmed of the whole general idea to which these subdivisions belong. What may be affirmed of all the individuals of any species, may be affirmed of the whole species, and what may be affirmed of all the species of any genus may be also affirmed of the whole genus; because all the individuals taken together are the same with the species, and all the species taken together the same with the genus.

This way of arguing, where we infer universally concerning any idea what we had before affirmed or denied separately of all its several subdivisions and parts, is called reasoning *by induction*. Thus if we suppose the whole tribe of animals, subdivided into men, beasts, birds, insects, and fishes, and then reason concerning them after this manner: *All men have a power of beginning motion; all beasts, birds, and insects, have a power of beginning motion; all fishes have a power of beginning motion; therefore all animals have a power of beginning motion*: the argument is an *induction*. When the subdivisions are just, so as to take in the whole general idea, and the enumeration is perfect, that is, extends to all and every of the inferior classes or parts; there the *induction* is complete, and the manner of reasoning by *induction* is apparently conclusive.

The last species of syllogisms we shall take notice of, is that commonly distinguished by the name of a *dilemma*. A *dilemma* is an arguement, by which we endeavour to prove the absurdity or falsehood of some assertion. In order to this we assume a conditional proposition, the antecedent of which is the assertion to be disproved, and the consequent a disjunctive proposition, enumerating all the possible suppositions upon which that assertion can take place. If then it appears, that all the several suppositions ought to be rejected, it is plain that the antecedent or assertion itself must be so too. When therefore such a proposition as that before-mentioned is made the *major* of any syllogism; if the *minor* rejects all the suppositions contained in the consequent, it follows necessarily, that the conclusion ought to reject the antecedent, which, as we have said, is the very assertion to be disproved. This particular way of arguing is that which logicians call a *dilemma*; and from the account here given of it, it appears, that we may in the general define it to be a *hypothetical syllogism, where the consequent of the major is a disjunctive proposition, which is wholly taken away or removed in the minor*. Of this kind is the following:

*If God did not create the world perfect in its kind: it*

*must either proceed from want of inclination, or from want of power.*

*But it could not proceed either from want of inclination, or from want of power :*

*Therefore he created the world perfect in its kind ; or, which is the same thing, It is absurd to say that he did not create the world perfect in its kind.*

The nature then of a *dilemma* is universally this. The *major* is a conditional proposition, whose consequent contains all the several suppositions upon which the antecedent can take place. As therefore these suppositions are wholly removed in the *minor*, it is evident that the antecedent must be so too ; inasmuch that we here always argue from the removal of the consequent to the removal of the antecedent. That is, a *dilemma* is an argument in the *modus tollens* of hypothetical syllogisms, as logicians speak. Hence it is plain, that if the antecedent of the *major* is an affirmative proposition, the conclusion of the *dilemma* will be negative ; but if it is a negative proposition, the conclusion will be affirmative.

#### *Of Demonstration.*

HAVING dispatched what seemed necessary with regard to the forms of syllogisms, we shall now explain their use and application in reasoning. We have seen, that in all the different appearances they put on, we still arrive at a just and legitimate conclusion : now it often happens, that the conclusion of one syllogism becomes a previous proposition in another, by which means great numbers of them are sometimes linked together in a series, and truths are made to follow one another in train. And as in such a concatenation of syllogisms, all the various ways of reasoning that are truly conclusive may be with safety introduced ; hence it is plain, that in deducing any truth from its first principles, especially where it lies at a considerable distance from them, we are at liberty to combine all the several kinds of arguments above explained, according as they are found best to suit the end and purpose of our inquiries. When a proposition is thus, by means of syllogisms, collected from others more evident and known, it is said to be *proved* ; so that we may in the general define the *proof of the proposition* to be a syllogism, or series of syllogisms, collecting that proposition from known and evident truths. But more particularly, if the syllogisms of which the proof consists admit of no premisses but definitions, self-evident truths, and propositions already established, then is the argument so constituted called a *demonstration* ; whereby it appears, that demonstrations are ultimately founded on definitions and self-evident propositions.

All syllogisms whatsoever, whether compound, multi-form, or defective, are reducible to plain simple syllogisms in some one of the four figures. But this is not all. Syllogisms of the first figure in particular, admit of all possible conclusions : that is, any proposition whatsoever, whether an universal affirmative, or universal negative, a particular affirmative, or particular negative, which fourfold division embraces all their varieties ; any one of these may be inferred, by virtue of some syllogism in the first figure. By this means the syllogisms of all the other figures are reducible also to syllogisms of the first

figure, and may be considered as standing on the same foundation with them. We cannot here demonstrate and explain the manner of this reduction. It is enough to take notice, that the thing is universally known and allowed among logicians, to whose writings we refer such as desire farther satisfaction in this matter. This then being laid down, it is plain, that any demonstration whatsoever may be considered as composed of a series of syllogisms, all in the first figure. For since all the syllogisms that enter the demonstration are reducible to syllogisms of some one of the four figures, and since the syllogisms of all the other figures are farther reducible to syllogisms of the first figure, it is evident, that the whole demonstration may be resolved into a series of these last syllogisms. Let us now, if possible, discover the ground upon which the conclusion rests, in syllogisms of the first figure ; because, by so doing, we shall come at an universal principle of certainty, whence the evidence of all demonstrations in all their parts may be ultimately derived.

The rules then of the first figure are these. The *middle term* is the subject of the *major* proposition, and the predicate of the *minor*. The *major* is always an universal proposition, and the *minor* always affirmative. Let us now see what effect these rules will have in reasoning. The *major* is an universal proposition, of which the *middle term* is the subject, and the *predicate of the conclusion* the predicate. Hence it appears, that in the *major*, the *predicate of the conclusion* is always affirmed or denied universally of the *middle term*. Again, the *minor* is an affirmative proposition, whereof the *subject of the conclusion* is the subject, and the *middle term* the predicate. Here then the *middle term* is affirmed of the *subject of the conclusion* ; that is, the *subject of the conclusion* is affirmed to be comprehended under, or to make a part of the *middle term*. Thus then we see what is done in the *premisses* of a syllogism of the first figure. The *predicate of the conclusion* is universally affirmed or denied of some idea. The *subject of the conclusion* is affirmed to be or to make a part of that idea. Hence it naturally and unavoidably follows, that the *predicate of the conclusion* ought to be affirmed or denied of the subject. To illustrate this by an example, we shall resume one of the former syllogisms.

*Every creature possessed of reason and liberty is accountable for his actions.*

*Man is a creature possessed of reason and liberty.*

*Therefore man is accountable for his actions.*

Here, in the first proposition, the predicate of the conclusion, *accountableness*, is affirmed of all creatures that have *reason and liberty*. Again, in the second proposition, *man*, the subject of the conclusion, is affirmed to be or to make a part of the class of creatures. Hence the conclusion necessarily and unavoidably follows, *viz. that man is accountable for his actions* ; because if reason and liberty be that which constitutes a creature *accountable*, and *man* has reason and liberty, it is plain he has that which constitutes him *accountable*. In like manner, where the *major* is a negative proposition, or denies the *predicate of the conclusion* universally of the *middle term*, as the *minor* always asserts the *subject of the conclusion*, to be or make a part of that *middle term*, it is no less evident, that the *predicate of the*

*the.*

the conclusion ought in this case to be denied of the subject. So that the ground of reasoning in all syllogisms of the first figure is manifestly this. *Whatever may be affirmed universally of any idea, may be affirmed of every or any number of particulars comprehended under that idea.* And again: *Whatever may be denied universally of any idea, may be in like manner denied of every or any number of its individuals.* These two propositions are called by logicians the *dictum de omni*, and *dictum de nullo*, and are indeed the great principles of syllogistic reasoning, inasmuch as all conclusions whatsoever either rest immediately upon them, or upon propositions deduced from them. But what adds greatly to their value is, that they are really self-evident truths, and such as we cannot gainsay without running into an express contradiction. To affirm, for instance, that *no man is perfect*, and yet argue that *some men are perfect*; or to say that *all men are mortal*, and yet that *some men are not mortal*, is to assert a thing to be and not to be at the same time.

And now we may affirm, that in all syllogisms of the first figure, if the *premises* are true, the *conclusion* must needs be true. If it be true that the *predicate of the conclusion*, whether affirmative or negative, agrees universally to some idea, and if it be also true that the *subject of the conclusion* is a part of or comprehended under that idea, then it necessarily follows, that the *predicate of the conclusion* agrees also to the *subject*. For to assert the contrary, would be to run counter to some one of the two principles before established; that is, it would be to maintain an evident contradiction. And thus we are come at last to the point we have been all along endeavouring to establish, namely, That every proposition which can be demonstrated is necessarily true. For as every demonstration may be resolved into a series of syllogisms all in the first figure, and as, in any one of these syllogisms, if the premises are true, the conclusion must be so too; it evidently follows, that if all the several premises are true, all the several conclusions are so, and consequently the conclusion also of the last syllogism, which is always the proposition to be demonstrated. Now that all the premises of a demonstration are true, will easily appear from the very nature and definition of that form of reasoning. A demonstration is a series of syllogisms, all whose premises are either definitions, self-evident truths, or propositions already established. Definitions are identical propositions, wherein we connect the description of an idea with the name by which we chuse to have that idea called; and therefore as to their truth there can be no dispute. Self-evident propositions appear true of themselves, and leave no doubt or uncertainty in the mind. Propositions before established are no other than conclusions gained by one or more steps from definitions and self-evident principles, that is, from true premises, and therefore must needs be true. Whence all the previous propositions of a demonstration being manifestly true, the last conclusion or proposition to be demonstrated must be so too. So that demonstration not only leads to certain truth, but we have here also a clear view of the ground and foundation of that certainty. For as, in demonstrating, we may be said to do nothing more than combine a series of syllogisms together, all

resting on the same bottom; it is plain, that one uniform ground of certainty runs through the whole, and that the conclusions are every where built upon some one of the two principles before established as the foundation of all our reasoning. These two principles are easily reduced into one, and may be expressed thus. *Whatever predicate, whether affirmative or negative, agrees universally to any idea, the same must needs agree to every or any number of individuals comprehended under that idea.* And thus we have reduced the certainty of demonstration to one simple and universal principle, which carries its own evidence along with it, and which is indeed the ultimate foundation of all syllogistic reasoning.

Demonstration therefore serving as an infallible guide to truth, and standing on so sure and unalterable a basis, we may now venture to assert, that the rules of logic furnish a sufficient *criterion* for the distinguishing between truth and falsehood. For since every proposition that can be demonstrated is necessarily true, he is able to distinguish truth from falsehood, who can with certainty judge when a proposition is truly demonstrated. Now a demonstration is nothing more than a concatenation of syllogisms, all whose premises are definitions, self-evident truths, or propositions previously established. To judge therefore of the validity of a demonstration, we must be able to distinguish, whether the definitions that enter it are genuine; and truly descriptive of the ideas they are meant to exhibit; whether the propositions assumed without proof as intuitive truths have really that self-evidence to which they lay claim; whether the syllogisms are drawn up in due form, and agreeable to the laws of argumentation; in fine, whether they are combined together in a just and orderly manner, so that no demonstrable propositions serve any where as premises, unless they are conclusions of previous syllogisms. Now it is the business of logic, in explaining the several operations of the mind, fully to instruct us in all these points. It teaches the nature and end of definitions, and lays down the rules by which they ought to be framed. It unfolds the several species of propositions, and distinguishes the self-evident from the demonstrable. It delineates also the different forms of syllogisms, and explains the laws of argumentation proper to each. In fine, it describes the manner of combining syllogisms, so as that they may form a train of reasoning, and lead to the successive discovery of truth. The precepts of logic therefore, as they enable us to judge with certainty when a proposition is duly demonstrated, furnish a sure *criterion* for the distinguishing between truth and falsehood.

But perhaps it may be objected, that demonstration is a thing very rare and uncommon, as being the prerogative of but a few sciences, and therefore the *criterion* here given can be of no great use. But where ever, by the bare contemplation of our ideas, truth is discoverable, there also demonstration may be attained. Now that is an abundantly sufficient *criterion*, which enables us to judge with certainty in all cases where the knowledge of truth comes within our reach; for with discoveries, that lie beyond the limits of the human mind, we have properly no business. When a proposition is demonstrated, we are certain of its truth. When, on the contrary, our

ideas

ideas are such as have no visible connection nor repugnance, and therefore furnish not the proper means of tracing their agreement or disagreement, there we are sure that scientific knowledge is not attainable. But where there is some foundation of reasoning, which yet amounts not to the full evidence of demonstration, there the precepts of logic, by teaching us to determine aright of the degree of proof, and of what is still wanting to render it full and complete, enable us to make a due estimate of the measures of probability, and to proportion our assent to the grounds on which the proposition stands. And this is all we can possibly arrive at, or even so much as hope for, in the exercise of faculties so imperfect and limited as ours.

We conclude it may not be improper to take notice of the distinction of demonstration into *direct* and *indirect*. A *direct demonstration* is, when beginning with definitions, self-evident propositions, or known and allowed truths, we form a train of syllogisms, and combine them in an orderly manner, continuing the series through a variety of successive steps, until at last we arrive at a syllogism, whose conclusion is the proposition to be demonstrated. Proofs of this kind leave no doubt or uncertainty behind them, because all the several premisses being true, the conclusions must be so too, and of course the very last conclusion or proposition to be proved. The other species of demonstration is the *indirect*, or, as it is sometimes called, the *apagogical*. The manner of proceeding here is, by assuming a proposition which directly contradicts that we mean to demonstrate, and thence by a continued train of reasoning, in the way of a direct demonstration, deducing some absurdity or manifest untruth. For hereupon we conclude that the proposition assumed was false, and thence again, by an immediate consequence, that the proposition to be demonstrated is true. Thus *Euclid*, in his third book, being to demonstrate, *that circles which touch one another inwardly have not the same centre*; assumes the direct contrary to this, *viz. that they have the same centre*, and thence by an evident train of reasoning proves *that a part is equal to the whole*. That supposition therefore, leading to this absurdity, he concludes to be false, *viz. that circles touching one another inwardly have the same centre*, and thence again immediately infers *that they have not the same centre*.

Now because this manner of demonstration is accounted by some not altogether so clear and satisfactory, we shall therefore endeavour here to shew, that it equally with the other leads to truth and certainty. Two propositions are said to be *contradictory* one of another, when that which is asserted to be in the one is asserted not to be in the other. Thus the propositions, *circles that touch one another inwardly have the same centre*, and *circles that touch one another inwardly have not the same centre*, are *contradictories*; because the second asserts the direct contrary of what is asserted in the first. Now in all contradictory propositions this holds universally, that one of them is necessarily true, and the other necessarily false. For if it be true, that circles which touch one another inwardly have not the same centre, it is unavoidably false that they have the same centre. On the other hand, if it be false that they have the same centre,

it is necessarily true that they have not the same centre. Since therefore it is impossible for them to be both true or both false at the same time, it unavoidably follows, that one is necessarily true, and the other necessarily false. This then being allowed, if any two contradictory propositions are assumed, and one of them can by a clear train of reasoning be demonstrated to be false, it necessarily follows that the other is true. For as the one is necessarily true, and the other necessarily false, when we come to discover which is the false proposition, we thereby also know the other to be true.

Now this is precisely the manner of an indirect demonstration. For there we assume a proposition, which directly contradicts that we mean to demonstrate, and having by a continued series of proofs shewn it to be false, thence infer that its contradictory, or the proposition to be demonstrated, is true. As therefore this last conclusion is certain and unavoidable, let us next inquire, after what manner we come to be satisfied of the falsehood of the assumed proposition, that so no possible doubt may remain as to the force and validity of demonstrations of this kind. The manner then is plainly this. Beginning with the assumed proposition, we, by the help of definitions, self-evident truths, or propositions already established, continue a series of reasoning in the way of a direct demonstration, until at length we arrive at some absurdity or known falsehood. Thus *Euclid*, from the supposition that circles touching one another inwardly have the same centre, deduces *that a part is equal to the whole*. Since therefore, by a due and orderly process of reasoning, we come at last to a false conclusion, it is manifest that all the premisses cannot be true. For were all the premisses true, the last conclusion must be so too. Now as to all the other premisses made use of in the course of reasoning, they are manifest and known truths by supposition, as being either definitions, self evident propositions, or truths previously established. The assumed proposition is that only as to which any doubt or uncertainty remains. That alone therefore can be false, and indeed, from what has been already shewn, must unavoidably be so. And thus we see, that, in indirect demonstrations, two contradictory propositions being laid down, one of which is demonstrated to be false, the other, which is always the proposition to be proved, must necessarily be true; so that here, as well as in the direct way of proof, we arrive at a clear and satisfactory knowledge of truth.

This is universally the method of reasoning in all apagogical or indirect demonstrations; but if any proposition is assumed, from which in a direct train of reasoning we can deduce its contradictory, the proposition so assumed is false, and the contradictory one true. For if we suppose the assumed proposition to be true, then, since all the other premisses that enter the demonstration are also true, we shall have a series of reasoning, consisting wholly of true premisses; whence the last conclusion or contradictory of the assumed proposition must be true likewise. So that by this means we should have two contradictory propositions both true at the same time, which is manifestly impossible. The assumed proposition therefore, whence this absurdity flows, must necessarily be false, and consequently its contradictory, which is

here the proposition deduced from it, must be true. If then any proposition is proposed to be demonstrated, and we assume the contradictory of that proposition, and thence directly infer the proposition to be demonstrated, by this very means we know that the proposition so inferred is true. For since from an assumed proposition we have deduced its contradictory, we are thereby certain that the assumed proposition is false; and if so, then its contradictory, or that deduced from it, which in this case is the same with the proposition to be demonstrated, must be true.

We have a curious instance of this in the twelfth proposition of the ninth book of the elements. Euclid there proposes to demonstrate, *that in any series of numbers, rising from unity in geometrical progression, all the prime numbers that measure the last term in the series will also measure the next after unity.* In order to this, he assumes the contradictory of the proposition to be demonstrated, namely; *that some prime number measuring the last term in the series, does not measure the next after unity;* and thence, by a continued train of reasoning, proves, that it actually does measure it. Hereupon he concludes the assumed proposition to be false, and that which is deduced from it, or its contradictory, which is the very proposition he proposes to demonstrate, to be true. Now

that this is a just and conclusive way of reasoning, is abundantly manifest from what we have so clearly illustrated above.

Having thus sufficiently evinced the certainty of demonstration in all its branches, and shewn the rules by which we ought to proceed, in order to arrive at a just conclusion, according to the various ways of arguing made use of; it is needless to enter upon a particular consideration of those several species of false reasoning, which logicians distinguish by the name of *sophisms*. He that thoroughly understands the form and structure of a good argument, will of himself readily discern every deviation from it. And although *sophisms* have been divided into many classes, which are all called by sounding names, that therefore carry in them much appearance of learning; yet are the errors themselves so very palpable and obvious, that it is lost labour to write for a man capable of being misled by them. Here therefore we chuse to conclude this second part of logic, and shall in the next part give some account of *method*, which though inseparable from reasoning, is nevertheless always considered by logicians as a distinct operation of the mind; because its influence is not confined to the mere exercise of the reasoning faculty, but extends in some degree to all the transactions of the understanding.

### PART III. Of METHOD.

#### *Of method in general, and the division of it into analytic and synthetic.*

WE have now done with the two first operations of the mind, whose office it is to search after truth, and enlarge the bounds of human knowledge. There is yet a third, which regards the disposal and arrangement of our thoughts, when we endeavour so to put them together that their mutual connection and dependence may be clearly seen. This is what logicians call *method*, and place always the last in order in explaining the powers of the understanding; because it necessarily supposes a previous exercise of our other faculties, and some progress made in knowledge, before we can exert it in any extensive degree.

In this view it is plain, that we must be before-hand well acquainted with the truths we are to combine together; otherwise how could we discern their several connections and relations, or so dispose of them as their mutual dependence may require? But it often happens, that the understanding is employed, not in the arrangement and composition of known truths, but in the search and discovery of such as are unknown. And here the manner of proceeding is very different. We assemble at once our whole stock of knowledge relating to any subject; and, after a general survey of things, begin with examining them separately and by parts. Hence it comes to pass, that whereas, at our first setting out, we were acquainted only with some of the grand strokes and outlines of truth, by thus pursuing her through her several windings and recesses we gradually discover those more inward and finer touches whence she derives all her strength, symmetry, and beauty. And here it is, that when, by a narrow scrutiny into things, we have unravelled any part of know-

ledge, and traced it to its first and original principles, in so much that the whole frame and contexture of it lies open to the view of the mind; here it is, that taking it the contrary way, and beginning with these principles, we can so adjust and put together the parts, as the order and method of science requires.

But as these things are best understood when illustrated by examples: let us suppose any machine, for instance a watch, presented to us, whose structure and composition we are as yet unacquainted with, but want if possible to discover. The manner of proceeding in this case is, by taking the whole to pieces, and examining the parts separately one after another. When by such a scrutiny we have thoroughly informed ourselves of the frame and contexture of each, we then compare them together, in order to judge of their mutual action and influence. By this means we gradually trace out the inward make and composition of the whole, and come at length to discern, how parts of such a form, and so put together, as we found in unravelling and taking them asunder, constitute that particular machine called a watch, and contribute to all the several motions and phenomena observable in it. This discovery being made, we can take things the contrary way, and, beginning with the parts, so dispose and connect them, as their several uses and structures require, until at length we arrive at the whole itself, from the unravelling of which these parts related.

And as it is in tracing and examining the works of art, so is it in a great measure in unfolding any part of human knowledge. For the relations and mutual habitudes of things do not always immediately appear upon comparing them one with another. Hence we have recourse to intermediate ideas, and by means of them are furnished

with those previous propositions, that lead to the conclusion we are in quest of. And if it so happen, that the previous propositions themselves are not sufficiently evident, we endeavour by new middle terms to ascertain their truth, still tracing things backward in a continued series, until at length we arrive at some syllogism where the premises are first and self-evident principles. This done, we become perfectly satisfied as to the truth of all the conclusions we have passed through, in as much as they are now seen to stand upon the firm and immoveable foundation of our intuitive perceptions. And as we arrived at this certainty by tracing things backward to the original principles whence they flow, so may we at any time renew it by a direct contrary process, if, beginning with these principles, we carry the train of our thoughts forward, until they lead us by a connected chain of proofs to the very last conclusion of the series.

Hence it appears, that in disposing and putting together our thoughts, either for our own use, that the discoveries we have made may at all times lie open to the review of the mind, or where we mean to communicate and unfold these discoveries to others, there are two ways of proceeding equally within our choice. For we may so propose the truths relating to any part of knowledge, as they presented themselves to the mind in the manner of investigation, carrying on the series of proofs in a reverse order, until they at last terminate in first principles: or, beginning with these principles, we may take the contrary way, and from them deduce, by a direct train of reasoning, all the several propositions we want to establish. This diversity in the manner of arranging our thoughts gives rise to the twofold division of method established among logicians. For method, according to their use of the word, is nothing else but the order and disposition of our thoughts relating to any subject. When truths are so proposed and put together, as they were or might have been discovered, this is called the *analytick method*, or the *method of resolution*; in as much as it traces things backward to their source, and *resolves* knowledge into its first and original principles. When, on the other hand, they are deduced from these principles, and connected according to their mutual dependence, inasmuch that the truths first in order tend always to the demonstration of those that follow,

this constitutes what we call the *synthetick method*, or *method of composition*; for here we proceed by gathering together the several scattered parts of knowledge, and combining them into one whole system, in such manner, that the understanding is enabled distinctly to follow truth through all her different stages and gradations.

There is this farther to be taken notice of, in relation to these two species of method; that the first has also obtained the name of the *method of invention*, because it observes the order in which our thoughts succeed one another in the *invention* or discovery of truth. The other again is often denominated the *method of doctrine* or *instruction*; in as much as, in laying our thoughts before others, we generally chuse to proceed in the *synthetick* manner, deducing them from their first principles. For we are to observe, that although there is great pleasure in pursuing truth in the method of investigation, because it places us in the condition of the inventor, and shews the particular train and process of thinking by which he arrived at his discoveries; yet is it not so well accommodated to the purposes of evidence and conviction. For at our first setting out, we are commonly unable to divine where the analysis will lead us, inasmuch that our researches are for some time little better than a mere groping the dark. And even after light begins to break in upon us, we are still obliged to many reviews, and a frequent comparison of the several steps of the investigation among themselves. Nay, when we have unravelled the whole, and reached the very foundation on which our discoveries stand, all our certainty in regard to their truth will be found in a great measure to arise from that connection we are now able to discern between them and first principles taken in the order of composition. But in the synthetick manner of disposing our thoughts, the case is quite different. For as we here begin with intuitive truths, and advance by regular deductions from them, every step of the procedure brings evidence and conviction along with it; so that in our progress from one part of knowledge to another, we have always a clear perception of the ground on which our assent rests. In communicating therefore our discoveries to others, this method is apparently to be chosen, as it wonderfully improves and enlightens the understanding, and leads to an immediate perception of truth.

## L O L

**LOHOCH**, or **ЛОХ**, in pharmacy, a composition of a middle consistence between a soft electuary and a syrup, principally used in disorders of the lungs.

There are several kinds of lohochs, denominated from the principal ingredient that enters into their composition. The common lohoch is made thus: take of fresh-drawn oil of sweet almonds, and of pectoral or balsamic syrup, one ounce; white-sugar, two drams: mix, and make them into a lohoch.

**LOINS**, in anatomy, the two lateral parts of the umbilical region of the abdomen. See **ANATOMY**.

**LOIRE**, the largest river in France, rises in the mountains of the Cevennes, and, after running a course of about five hundred miles, falls into the bay of Biscay.

**LOLIUM**, **DARNEL**, in botany, a genus of the triandria

## L O N

digynia class. The involucre consists of one leaf; it has no calix; and the stipula consists of many flowers. There are three species, two of them natives of Britain, viz. the perenne, or perennial darnel-grass; and the temulentum, or annual darnel-grass.

**LOMBARDY**, a kingdom which comprehended almost all Italy. It was erected by the Longobards, or Lombards, a German nation, about the year 598, and lasted till Charlemain put an end to it about the year 760.

**LOMOND**, a lake in the county of Lenox, in Scotland, which runs almost the whole length of the county.

**LONCHITIS**, **SPLEEN-WORT**, in botany, a genus of the cryptogamia filicum class of plants, the fructifications of which are arranged into lunulated series, and disposed separately under the sinuses of the leaves.

There.

There are four species, none of them natives of Britain.

**LONDON**, the metropolis of Great Britain, where the first meridian is fixed on the British maps, lies in  $51^{\circ} 32' N.$  lat. on the river Thames, and the greatest part on the north-side of that river. The form of London, including Westminster and Southwark, comes pretty near an oblong square, five miles in length, if measured in a direct line from Hyde-Park to the end of Limehouse, and six miles if we follow the windings of the streets; the greatest breadth is two miles and a half, and the circumference of the whole sixteen or seventeen miles, but it is not easy to measure it exactly, on account of its irregular form. The principal streets are generally level, exceeding well built, and extended to a very great length; these are inhabited by tradesmen, whose houses and shops make a much better figure than those of any tradesmen in Europe. People of distinction usually reside in elegant squares, of which there are great numbers at the west end of the town near the court. What mostly contributes to the riches and glory of this city, is the port, whither several thousand ships of burden annually resort from all countries, and where the greatest fleets never fail to meet with wealthy merchants ready to take off the richest cargoes. The number of persons in the whole place are computed to be about eight hundred thousand.

**LONDONDERRY**, a city of Ireland, in the province of Ulster, and county of Londonderry, situated on the river Mourne, near its mouth, in  $W. \text{ long. } 7^{\circ} 40', N. \text{ lat. } 54^{\circ} 52'.$

**LONG**, an epithet given to whatever exceeds the usual standard of length; thus, we say a long-boat, long accent, &c.

**LONGÆVITY**, length of life.

Lord Bacon observes, that the succession of ages, and of the generation of men, seems no way to shorten the length of human life, since the age of man, down from Moses's time to the present, has stood at about eighty years, without gradually declining, as one might have expected. The greatest instances of longævity in these our islands, are that of old Parr, who lived almost 153 years; of Jenkins, of Yorkshire, who lived 169 years; or of the countess Desmond, or Mr Eccleston, both of Ireland, who each exceeded 140 years.

**LONGFORD**, a county of Ireland, in the province of Leinster, bounded by the county of Letrim and Cavan on the north, by Meath on the east and south, and by Roscommon on the west.

**LONG-ISLAND**, an island belonging to New-York in North America, lying between  $71^{\circ}$  and  $74^{\circ} W.$  long. and in  $41^{\circ} 30' N.$  lat.

**LONGIMETRY**, the art of measuring lengths, both accessible and inaccessible. See **GEOMETRY**.

**LONGINICO**, a town of the Morea, in Europe, situated on the river Alpheus, fifty miles south of Lepanto: being the ancient Olympia, where Hercules instituted the Olympic games.

**LONGISSIMUS DORSI**, in anatomy. See **ANATOMY**, p. 218.

**LONGITUDE of a star**, in astronomy, an arch of the ecliptic, intercepted between the beginning of aries, and the point of the ecliptic cut by the star's circle of longitude.

**LONGITUDE of a place**. See **GEOGRAPHY**.

In the philosophical transactions, n<sup>o</sup> 1, we have an account of a successful experiment in finding the longitude at sea, made with two pendulum-watches by major Holmes, in a voyage from the coast of Guinea homewards. This and some other successes encouraged Monsieur Huygens so far, that, after he had improved the structure of these watches, he published an account at large for the shewing how and in what manner these watches are to be used in finding the longitude at sea, with directions for adjusting of them and keeping a journal by them; which account the curious reader may see at large in the Philosophical transactions, n<sup>o</sup> 47.

The chief objection against pendulum-clocks and watches, is the effects that heat and cold have upon the spring and pendulum, which make the spring in watches draw stronger at some times than at other times, and causes the pendulum to lengthen and shorten, according as the weather is hotter or colder; but these effects are so regular, that without doubt they may be accounted for.

But the most ingenious and successful machines for this purpose have been invented by Mr. John Harrison, who, at different times, contrived three different time-pieces for determining the longitude at sea.

The first of Mr. Harrison's machines was tried in May 1736, when it was put on board a man of war; and by its exact measure of time, in its return from Lisbon, corrected an error of almost a degree and an half in the computations of the reckoning of a ship. In 1739, Mr. Harrison finished his second machine, which, from various experiments made upon it, was sufficiently regular and exact for finding the longitude of a ship within the nearest limits proposed by parliament. Upon the success of this, Mr. Harrison, in 1741, undertook still a more advantageous machine, which he finished in 1758, when he applied to the commissioners of longitude for orders to make a trial of that instrument to some part in the West Indies, as directed by the statutes for the discovery of the longitude at sea. In consequence of this application, Mr. Harrison received orders for his son to proceed from Portsmouth to Jamaica, in one of his majesty's ships of war, with his third instrument, in November 1761; and the commissioners having directed that every requisite step and precaution should be taken, for making, with care, the proper experiments, and ascertaining their accuracy, not only going to Jamaica, but in the return, it appears, from the calculations made from the experiments in going to Jamaica, that the difference between the longitude, as found by the time-piece, and calculated by the observations of the transit of mercury in 1743 at Jamaica and London, is five seconds of time, which at Jamaica is little more than a geographical mile.

During the voyage, Mr. Harrison's time-piece corrected the ship's reckoning, which sometimes erred about a degree and a half: and in going from Madeira

to Jamaica, it also corrected the errors of the log, and shewed the longitude so exactly, that the ship made the island of Descada, and all the other islands, until they arrived at Jamaica, as foretold by the time-piece. At the arrival at Jamaica, the observations for finding the time were made by equal altitudes; and the longitude shewn by the time-piece, being within 5" of time of the longitude shewn by the most accurate observations of mercury in its transit over the sun in the year 1743, and with which all the observations at London and Paris agreeing within 23", amounts to a demonstration, that Mr. Harrison has performed all that is required by the statute of the 12th of queen Anne, to entitle him to the greatest reward mentioned in that act. In returning from Jamaica, the weather was very tempestuous, so that the time piece was forced to be placed on the counter, to avoid being perpetually exposed to the sea water; there it suffered continual violent agitations, which, though they necessarily retarded its motion, yet did not occasion any such considerable error, as would have made Mr. Harrison's right to the greatest reward questionable, had it depended on this voyage only; for the time-keeper, in its going and return, lost only 1' 54" and  $\frac{1}{2}$ ; which, in the latitude of Portsmouth, amounts to about eighteen geographical miles or minutes of a great circle, whereas the act required only that it should come within the distance of thirty geographical miles or minutes of a great circle.

**LONGITUDINAL**, in general, denotes something placed lengthwise; thus some of the fibres of the vessels in the human body are placed longitudinally, others transversely or across.

**LONGUEVILLE**, a town of Normandy in France, twenty miles north of Rouen: E. long. 1° 10'. N. lat. 49° 50'.

**LONICERA**, in botany, a genus of the pentandria monogynia class. The corolla consists of one irregular petal: and the berry of two cells containing many seeds. There are 13 species, only one of which, viz. the periclymenum, or common honey-suckle, is a native of Britain.

**LOOF**, in the sea language, is a term used in various senses: thus, the loof of a ship is that part of her aloft, which lies just before the chest tree; hence the guns which lie there are called loof-pieces: keep your loof, signifies, keep the ship near to the wind; to loof into a harbour, is to sail into it close by the wind; loof up, is to keep nearer the wind; to spring the loof, is when a ship that was going large before the wind, is brought close by the wind.

**LOOKING-GLASSES**, are nothing but plain mirrors of glass; which being impervious to the light, reflect the images of things placed before them; for the theory whereof, see **OPTICS**.

**LOOM**, a frame composed of a variety of parts, used in all the branches of weaving. See **WEAVING**.

**LOOSING** of arrestment, in Scots law. See **LAW**, Tit. xxv. 6.

**LOPIIUS**, in zoology, a genus of the branchiostegious order of fishes, whose head is in size equal to all the rest of the body: the head and body are both of a de-

pressed form: there are a number of fleshy pinnules or appendages surrounding the whole body of the fish. There are three species.

**LORANTHUS**, in botany, a genus of the hexandria monogynia class. The margin of the calix is entire; the corolla consists of six segments folded backwards; and the berry contains one seed. There are five species, none of them natives of Britain.

**LORD**, a title of honour, given to those who are noble, either by birth or creation; in this sense it amounts to much the same as peer of the realm, or lord of Parliament. This title is, by courtesy, also given to all the sons of dukes and marquises, and to the eldest sons of earls; and it is also a title of honour bestowed on those who are honourable by their employments, as lord advocate, lord chamberlain, lord chancellor, &c.

**LORETTO**, a city of Italy, in the marquise of Ancona, in the pope's territories, 145 miles east of Rome. This place is famous for the chamber of the blessed Virgin, which, according to the Roman catholic tradition, was brought by angels from Palestine to Dalmatia, and from thence transported over into Italy, and fixed at Loretto.

**LORN**, the north part of Argyleshire in Scotland, bounded by Lochabar on the north, by Broadalbin on the east, by the rest of Argyleshire on the south, and by the sea on the west.

**LORRAIN**, a duchy formerly belonging to the circle of the Upper Rhine in Germany, but now united to the crown of France. It is bounded by the duchy of Luxemburg on the north; by Alsatia, the duchy of Deux ponts, and the palatinate of the Rhine, on the east; by the county of Burgundy, on the south; and by Champaign, on the west.

**LOTHIAN**, a county of Scotland, bounded by the frith of Forth on the north; by the German sea, on the east; by Clydesdale, Tweeddale, and Merse, on the south; and by Stirling, on the west. The capital of this county is Edinburgh.

**LOTION** is, strictly speaking, such washing as concerns beautifying the skin, by cleansing it of those deformities which a disordered blood sometimes throws upon it, or rather are made by a preternatural secretion: for according to Quincy, generally those disordered of the skin, commonly accounted signs of a foul blood, are, from those salts which are natural in the best constitution, thrown off by the cutaneous glands, which ought to be washed away through the kidney; so that instead of those insignificant and ridiculous tribes of sweeteners, which in this case are frequently used, promoting the urinary discharge, or rectifying that of the skin by proper washes, frictions, or ointments, or both together, is the only way to get rid of such disorders.

**LOTTERY**, a kind of public game at hazard, frequent in Britain, France, and Holland, in order to raise money for the service of the state; being appointed with us by the authority of parliament, and managed by commissioners appointed by the lords of the treasury for that purpose. It consists of several numbers of blanks and prizes, which are drawn out of wheels, one

- of which contains the numbers, and the other the corresponding blanks or prizes.
- LOTUS**, in botany, a genus of the diadelphia decandria class. The legumen is cylindrical; the wings are connivent above; and the calix is tubular. There are 17 species, only one of which, *viz.* the corniculata, or birds-foot trefoil, is a native of Britain.
- LOVAGE**, in botany. See **LIGUSTICUM**.
- LOVE APPLE**. See **SOLANUM**.
- LOUIS**, or *Knights of St. Louis*, the name of a military order in France, instituted by Louis XIV. in 1693. Their collars are of a flame colour, and pass from left to right; the king is their grand master. There are in it eight great crosses, and twenty four commanders; the number of knights is not limited. At the time of their institution, the king charged his revenue with a fund of three hundred thousand livres for the pensions of the commanders and knights.
- LOUISIANA**, or *New France*, a country of north America, bounded by the river and lake of Illinois on the north, North Carolina on the east, and the gulph of Mexico on the south.
- LOUSE**, in zoology. See **PEDICULUS**.
- LOUTH**, a county of Ireland, in the province of Leinster, bounded by Monaghan and Armagh on the north, by the Irish Channel on the east, by East Meath on the south; and by Cavan on the west.
- LOUVAIN**, a city of the Austrian Netherlands, in the province of Brabant, situated on the river Dyle, fifteen miles north-east of Brussels.
- LOWERING**, among distillers, a term used to express the debasing the strength of any spiritous liquors, by mixing water with it.
- LOXIA**, in zoology, the name of a genus of birds of the order of the passerines; the distinguishing characters of which are, that the tongue is plain, equal and whole; the beak large, thick, and short, and crooked and convex both ways. There are 48 species, principally distinguished by their colour.
- LOZENGE**, in heraldry, a rhombus, or figure of equal sides, but unequal angles, resembling a quarry of glass in our old windows, placed erect, point ways. It is in this figure that all unmarried gentlewomen and widows bear their coats of arms, because, as some say, it was the figure of the Amazonian shield; or, as others, because it is the ancient figure of the spindle. Plate CIII. fig. 8. represents an ordinary of lozenges.
- The lozenge differs from the fusil, in that the latter is narrower in the middle, and not so sharp at the ends.
- LUBEC**, a city and port-town of Germany, in the circle of Lower Saxony, and duchy of Holstein, situated ten miles south-west of the Baltic sea: E. long. 10° 35', N. lat. 54° 20'.
- LUBEN**, a town of Germany, in the circle of Upper Saxony, and marquisate of Lusatia: E. long. 14° 25', N. lat. 52°.
- LUBLIN**, a city of Poland, in the palatinate of the same name: E. long. 22° 15', N. lat. 51° 30'.
- LUBOW**, a town of Poland, in the palatinate of Cracow: E. long. 20° 30', N. lat. 49° 30'.
- LUC**, a town of Provence, in France, twenty-three miles north-east of Toulon.
- LUCAR**, or *St. LUCAR*, a port-town of Spain, in the province of Andalusia: W. long. 6° 38', N. lat. 36° 42'. *St. LUCAR* is also a town of Andalusia, in Spain: W. long. 8° 12', N. lat. 37° 20'.
- St. LUCAR* is also the name of another town of Spain, fifteen miles west of Seville.
- LUCARNO**, a town of the duchy of Milan, situated on the lake of Maggiore, but subject to Switzerland.
- LUGCA**, the capital of the republic of the same name in Italy, situated twelve miles east of the Tuscan sea: E. long. 11° 20', N. lat. 43° 45'.
- LUCERN**, the capital of the canton of the same name in Switzerland, situated on the lake Lucern, to which it gives its name: E. long. 8° 12', N. lat. 47°.
- LUCERNE**, in botany. See **MEDICAGO**. For the culture of lucerne, see **AGRICULTURE**. p. 65.
- LUCIA ISLANDS**, one of the Caribbee islands in America, situated seventy miles north-west of Barbadoes, being twenty-two miles long, and eleven broad.
- St. LUCIA*, one of the Cape Verd islands in Africa, lying in W. long. 25°, N. lat. 16° 30'.
- LUCIOPERCA**, in ichthyology. See **PERCA**.
- LUCIUS**, in ichthyology. See **ESOX**.
- LUCONIA**, or *MANILLA*, the chief of the Philippine islands, situated between 117° and 123° E. long. and between 12° and 19° of N. lat.
- LUDLOW**, a borough of Shropshire, situated on the river Corve; eighteen miles south of Shrewsbury. It sends two members to parliament.
- LUDWIGIA**, in botany, a genus of the tetrandria monogynia class. The corolla consists of four petals, and the calix of four segments; the capsule has four sides and four cells, with many seeds. There are two species, none of them natives of Britain.
- LUES**, among physicians, is, in general, used for a disease of any kind; but, in a more particular sense, is restrained to contagious and pestilential diseases: thus, the lues gallica, or venerea, signifies the venereal disease. See **MEDICINE**.
- LUGGERSHAL**, a borough-town, ten miles north of Salisbury. It sends two members to parliament.
- LUGO**, a city and bishop's see of Spain, sixty miles east of Compostella: W. long. 7° 50', and N. lat. 43° 5'.
- LUKE**, or *gospel of St. LUKE*, a canonical book of the New Testament.
- Some think it was properly St. Paul's gospel, and that when that apostle speaks of his gospel, he means what is called St. Luke's. Irenaeus says, that St. Luke digested into writing what St. Paul preached to the Gentiles; and Gregory Nazianzen tells us, that St. Luke wrote with the assistance of St. Paul.
- St. LUKE the evangelist's day*, a festival in the Christian church, observed on the 18th of October.
- LULA LAPMARK**, a province of Sweden, bounded on the north by that of Torne; on the east, by the Bothnic gulph; on the south, by Pithia-lapmark; and on the west, by Norway.

LUMBAGO,

**LUMBAGO**, in medicine, denotes a pain about the loins, as that preceding fevers, agues, and the rheumatism.

**LUMBARIS**, a name given to the arteries and veins which spread over the loins. See **ANATOMY**.

**LUMBRICAL**, a name given to four muscles of the fingers, and to as many of the toes. See **ANATOMY**, part II.

**LUMBRICUS**, the **EARTH-WORM**, in zoology, a genus of insects belonging to the order of vermes intestina. The body is cylindrical, annulated, with an elevated belt near the middle. There is but one species of this animal. It lives under ground, and feeds upon the seeds and roots of plants. It comes above ground in the night, or during rain, for the purpose of copulation. For the effects of these animals in the human body, and the method of expelling them, see **MEDICINE**.

**LUMME**, in ornithology. See **COLYMBUS**.

**LUMP-FISH**. See **CYCLOPTERUS**.

**LUNA**, in astronomy, the moon. See **ASTRONOMY**.

**LUNAR**, something belonging to the moon; thus we say, lunar month, lunar year, &c.

**LUNARIA**, **HONESTY**, in botany, a genus of the tetradynamia siliculosa class. The silicula, or pod, is entire, elliptical, and compressed; with plain, equal, parallel valves. There are two species, none of them natives of Britain.

**LUNATIC**, a person affected with lunacy. See **MEDICINE**.

**LUND**, or **LUNDEW**, a city of Sweden, in the province of Gothland, the capital of the territory of Schonon, situated thirty miles east of Copenhagen.

**LUNDY**, a little island in the mouth of the Bristol-channel: W. long.  $4^{\circ} 50'$ , N. lat.  $51^{\circ} 25'$ .

**LUNENBURG**, the capital of the duchy of the same name, thirty miles south-east of Hamburg: E. long.  $10^{\circ} 20'$ , N. lat.  $53^{\circ} 35'$ .

**LUNGS**. See **ANATOMY**, p. 280.

**LUNG-WORT**, in botany. See **PULMONARIA**.

**LUNISOLAR YEAR**, in chronology, the space of 532 common years; found by multiplying the cycle of the sun by that of the moon.

**LUNULA**, in geometry, a plane figure like a crescent or half moon.

**LUPERCALIA**, a festival of the ancient Romans in honour of the god Pan, observed on the 15th of February, and so called from luperci, the priests of that fabulous deity.

**LUPINUS**, in botany a genus of the diadelphia decandria class. The calix consists of two lips; five of the antheræ are oblong, and the other five round; and the pod is coreaceous. There are seven species, none of them natives of Britain.

**LUPULUS**, in botany, &c. See **HUMULUS**.

**LUPUS**, in zoology. See **CANIS**.

**LUPUS MARINUS**. See **ANARRICHAS**.

**LUPUS**, in astronomy. See **ASTRONOMY**, p. 487.

**LURE**, in falconry, a device of leather, in the form of a bird, with two wings stuck with feathers, and baited with a piece of fish; wherewith to reclaim or call back a hawk, when at a considerable distance.

**LUSATIA**, a marquisate of Upper Saxony, bounded by Brandenburg, on the north; by Silesia, on the east; by Bohemia, on the south; and by the duchy of Saxony, on the west: it is subject to the king of Poland.

**LUSTRATION**, in antiquity, sacrifices or ceremonies by which the ancients purified their cities, fields, armies, or people, defiled by any crime or impurity.

Some of these lustrations were public, others private. There were three species or manners of performing lustration, viz. by fire and sulphur, by water, and by air; which last was done by fanning and agitating the air round the thing to be purified. Some of these lustrations were necessary, that is, could not be dispensed with, as lustrations of houses in time of a plague, or upon the death of any person; others again were done out of choice, and at pleasure. The public lustrations at Rome were celebrated every fifth year, in which they led a victim thrice round the place to be purified, and in the mean time burnt a great quantity of perfumes.

**LUSTRE**, the gloss or brightness appearing on any thing, particularly on manufactures of silk, wool, or stuff. It is likewise used to denote the composition or manner of giving that gloss.

The lustre of silks is given them by washing in soap, then clear water, and dipping them in alum water cold. To give stuffs a beautiful lustre, for every eight pounds of stuff allow a quarter of a pound of linseed; boil it half an hour, and then strain it through a cloth, and let it stand till it is turned almost to a jelly: afterwards put an ounce and a half of gum to dissolve twenty four hours; then mix the liquor, and put the cloth into this mixture; take it out, dry it in the shade, and press it. If once doing is not sufficient, repeat the operation. Curriers give a lustre to black leather first with juice of bar-berries, then with gum arabic, ale, vinegar, and flanders-glue, boiled together. For coloured leather, they use the white of an egg beaten in water. Moroccos have their lustre from juice of bar-berries and lemon or orange. For hats, the lustre is frequently given with common water, sometimes a little black dye is added: the same lustre serves for furs, except that for very black furs they sometimes prepare a lustre of galls, copperas, Roman alum, ox's marrow, and other ingredients.

**LUSTRUM**, in Roman antiquity, a general muster and review of all the citizens and their goods, which was performed by the censors every fifth year, who afterwards made a solemn lustration. See **LUSTRATION**.

**LUTE**, or **LUTING**, among chemists. See **CHEMISTRY**, p. 116.

**LUTE**, is also a musical instrument with strings.

The lute consists of four parts, viz. the table; the body or belly, which has nine or ten sides; the neck, which has nine or ten stops or divisions, marked with strings; and the head, or cross, where the screw for raising and lowering the strings to a proper pitch of tone are fixed. In the middle of the table there is a rose or passage for the sound; there is also a bridge that the strings are fastened to, and a piece of ivory between

between the head and the neck to which the other extremities of the strings are fitted. In playing, the strings are struck with the right hand, and with the left the stops are pressed. The lutes of Bologna are esteemed the best, on account of the wood, which is said to have an uncommon disposition for producing a sweet sound.

**LUTHERANS**, the Christians who follow the opinions of Martin Luther, one of the principal reformers of the church in the sixteenth century.

This sect took its rise from the distaste taken at the indulgences which were granted in 1517, by pope Leo X. to those who contributed towards finishing St. Peter's church at Rome. John Stupitze, vicar general of the Augustines in Germany, was the first who took occasion to declare against these abuses, for which purpose he made use of Martin Luther, the most learned of all the Augustines. Luther was a native of Eisleben, in the county of Mansfield in Saxony, and taught divinity at the university of Wirtemberg; he mounted the pulpit, and declaimed vehemently against the abuse of indulgences, and even fixed ninety-five propositions upon the church doors of Wirtemberg, in order to their being considered and examined in a public conference: against these John Tetzel, a Dominican, published a hundred and six positions at Francfort upon the Oder; and by virtue of his office of inquisitor, ordered those of Luther to be burnt; when his adherents, to revenge the affront, publicly burnt at Wirtemberg those of Tetzel. Thus war was declared between the Dominicans and Augustines, and soon after between the Roman catholic and the Lutheran party. In 1520, Luther sent his book *De Libertate Christiana*, to the pope; in which he grounds justification upon faith alone, without the assistance of good works; and asserts, that Christian liberty rescues us from the bondage of human traditions, and particularly the slavery of papal impositions; and afterwards, in a remonstrance written in high Dutch, he proceeded to deny the authority of the church of Rome. He was the same year excommunicated by the pope; upon which Luther causing a large fire to be made without the walls of Wirtemberg, threw the pope's bull into it with his own hands, together with the decretals, extravagants, and clementines; and this example was followed by his disciples in other towns. The next year the emperor Charles V. ordered his books to be burnt, and put him under the ban of the empire as a heretic and schismatic; and about this time king Henry VIII. of England wrote against him in defence of the seven sacraments, to which Luther wrote a reply.

The elector of Saxony, who had for some time kept him concealed in his castle of Wetsburg, now gave him leave to reform the churches of Wirtemberg as he thought fit; when this reformer proposed, that the bishops, abbots, and monks, should be expelled; that all the lands and revenues of the bishoprics, abbeyes, and monasteries, should escheat to the respective princes; and that all the convents of mendicant friars should be turned into public schools and hospitals: this year, Luther had the satisfaction to see a league contracted

between Gustavus king of Sweden, and Frederick king of Denmark, who both agreed to establish Lutheranism in their dominions: and now Luther's persuasion, which from the Upper Saxony had spread into the northern provinces, began to be perfectly settled in the duchies of Lunenburgh, Brunswick, Mecklenburgh, and Pomerania, and in the archbishoprics of Magdeburgh and Bremen; in the towns of Hamburg, Wismar, Rostock, and along the Baltic as far as Livonia and Prussia. Luther maintained the doctrine of consubstantiation; and at a general diet at Ratibon for reconciling both parties, the divines could agree to no more than five or six articles concerning justification, free-will, original sin, baptism, good works, and episcopacy.

**LUTHERN**, in architecture, a kind of window over the cornice, in the roof of a building; standing perpendicularly over the naked of a wall, and serving to illuminate the upper story.

Lutherns are of various forms, as square, semi-circular, round, called bulls-eyes, flat arches, &c.

**LUTON**, a market town, fourteen miles south of Bedford.

**LUTRA**, in zoology. See **MUSTELA**.

**LUXATION**, in surgery, is when any bone is moved out of its place, or articulation, so as to impede or destroy its proper motion or office. See **SURGERY**.

**LUXEMBURG**, the capital of the duchy of the same name, situated an hundred miles south east of Brussels, is a small but strong fortress: E. long. 6° 8', N. lat. 49° 45'.

**LYBIA**, a name anciently given to all the coast of Barbary, especially that part lying westward of Egypt.

**LYCEUM**, in Grecian antiquity, an academy situated upon the banks of the Ilissus at Athens. It was composed of porticoes and walks, where Aristotle taught philosophy; walking there constantly every day till the hour of anointing, whence he and his followers were called peripatetics.

**LYCHNIS**, in botany, a genus of the decandria pentagynia class. The calix consists of one oblong smooth leaf, and the corolla of five unguiculated petals, with a bifid limbus; and the capsule has three cells. There are seven species, three of them natives of Britain, viz. the flos cuculi, meadow pinks, or cuckow-flower; the viscaria, or red German catchfly; and the dioica, or white campion.

**LYCIUM**, in botany, a genus of the petandria monogynia class. The corolla is tubular, the faux being shut up by the beard of the filaments; and the berry has two cells. There are three species, none of them natives of Britain.

**LYCODONTES**, in natural history, the petrified teeth of the lupus-piscis, or wolf-fish, frequently found fossil. They are of different shapes; but the most common kind rise into a semiorbicular form, and are hollow within, somewhat resembling an acorn-cup: this hollow is found sometimes empty, and sometimes filled with the stratum in which it is immersed. Many of them have an outer circle, of a different colour from the rest.

**LYCO-**

**LYCOPERDON**, in botany, a genus of the cryptogamia fungi class: It is roundish, and replete with farinaceous seeds. There are ten species, six of them natives of Britain, *viz.* the tuber, or solid puff-ball; the certinum, or branny puff-ball; the bovista, or common puff-ball; the stellatum, or star puff-ball; the fornicatum, or turret puff-ball; and the pedunculatum, or stalked puff-ball.

**LYCOPodium**, in botany, a genus of the cryptogamia musci class. The anthera is double-valved, and sessile; the calyptra is wanting. There are 24 species, of which six are natives of Britain, *viz.* the clavatum, or common club-moss; the inundatum, or marsh club-moss; the annotinum, or Welsh club-moss; the alpinum, or mountain club-moss; the selago, or firr club-moss; and the selaginoides, or prickly club-moss.

**LYCOPSIS**, in botany, a genus of the pentandria monogynia class. The tube of the corolla is incurved. There are seven species, only one of which, *viz.* the arvensis, or small wild buglass, is a native of Britain.

**LYCOPUS**, in botany, a genus of the diandria monogynia class. The corolla consists of four segments, one of them emarginated; the stamina are distant; and there are four seeds. There are two species; only one of them, *viz.* the europæus, or water-horehound, is a native of Britain.

**LYDIA**, an ancient province of lesser Asia, in which was the city of Philadelphia.

**LYGEUM**, in botany, a genus of the triandria monogynia class. The spatha consists of one leaf; there are two corollæ above the same germen; and the nut has two cells. There is but one species, a native of Spain.

**LYING-IN WOMEN.** See MIDWIFERY.

**LYME**, a borough and port-town of Dorsetshire, E. long. 3° 5', and N. lat. 50° 44'.

It sends two members to parliament.

**LYMPH**, a fine fluid, separated in the body from the mass of blood, and contained in peculiar vessels.

Dr Keil says, that the lymph being chemically examined, will be found to contain a great deal of volatile, but no fixed salt, some phlegm, some sulphur, and a little earth. The use of the lymph, he observes, may be gathered from the consideration of the parts into which it discharges itself: that which comes from the head, neck and arms, is thrown into the jugular and subclavian veins; all the lymphatics which the parts

in the cavity of the thorax send out, empty themselves into the thoracic duct; and the lymph from all the rest of the body, flows to the receptacle of the chyle; so that there can be no doubt but its chief use is to dilute and perfect the chyle before it mixes with the blood. See ANATOMY, Part III.

**LYMPHATICS**, in anatomy. See ANATOMY, p. 308.

**LYNN-REGIS**, a port-town of Norfolk, situated at the mouth of the river Ouse, on a bay of the German sea, thirty-two miles west of Norwich.

It sends two members to parliament.

**LYNX**, in zoology. See FELIS.

**LYONS**, the capital of the Lyonois, a province of France, bounded by Orleanois and Burgundy on the north, by la Bresse and Dauphine on the east, by Languedoc and Guienne on the south, and by another part of Guienne and Orleanois on the west. This city lies upon the confluence of the rivers Rhone and Soan, in E. lon. 4° 55', and N. lat. 5° 50'. Next to Paris, it is esteemed the place of greatest trade in France.

**LYRA**, in ichthyology. See CALLYONIMUS.

**LYRE**, a musical instrument of the string-kind, much used by the ancients.

**LYRE**, in astronomy. See ASTRONOMY, p. 486.

**LYRIC**, in general, signifies something sung or played on the lyre: but it is more particularly applied to the ancient odes and stanzas, answering to our airs and songs, and may be played on instruments. This species of poetry was originally employed in celebrating the praises of gods and heroes, though it was afterwards introduced into feasts and public diversions.

**LYSIMACHIA**, in botany, a genus of the pentandria monogynia class. The calix is rotated; and the capsule is roundish, with a sharp point, and contains ten valves. There are eleven species, five of them natives of Britain, *viz.* the vulgaris, or yellow willow-herb; the thirsiflora, or tufted loose-strife; the nemorum, or yellow pimpernell of the woods; the nummularia, or money-wort; and the tenella, or purple money-wort.

**LYTHRUM**, in botany, a genus of the dodecandria monogynia class. The calix consists of twelve segments, and the corolla of six petals inserted into the calix; and the capsule has two cells, and many seeds. There are ten species, two of them natives of Britain, *viz.* the salicaria, or purple spiked loose-strife; and the hyssopifolia, or small hedge-hyssop.

# E R R A T A.

- End of the article CATASTROPHE. For *See* EPIC and DRAMATIC compositions, read, *See* COMPOSITION.
- CHEVRON. Read Plate LXV.
- CIRCUMDUCTION. For *addigamus*, read *alledge-ances*;—and for *Pobation*, read *Probation*.
- DECLINATURE of judges. For *legal obligation*, read *legal objection*.
- Page 424. column 2. line 39. For *fig. 31.* read *fig. 3.*
- P. 425. col. 1. In paragr. 4. there should have been a reference to *fig. 6.*—N. B. In any Treatise, or long article, illustrated by plates, when a figure is referred to without repeating the N° of the plate, let it be understood that the plate last mentioned is meant.
- P. 426. col. 1. l. 35. For *fig. 9.* read *fig. 3.*—N. B. Fol. 425 & 426 are, by oversight, twice repeated.
- P. 429. col. 1. l. 41. For *Fig. 5.* read *Fig. 3.*
- P. 437. col. 2. l. 12. For *gait*, read *gate*.
- DIODON. Omitted the reference to the figure, viz. Plate LXVIII. fig. 4.
- DIPONDIUS. For *two sparrows*, read *five sparrows*.
- DRACO. Omitted to refer to Plate LXVIII. fig. 5.
- ECHENEIS. Omitted to refer to Plate LXXIV. fig. 4.
- P. 477. col. 1. l. 43. For *Plate LXXV.* read *Plate LXXIV.*
- P. 616 col. 1. l. ult. Read *Plate LXXX.* fig. 3.
- P. 684 col. 1. By mistake Florida is placed under the Spanish empire, and Canada under that of France; whereas they were both ceded to Britain by the late treaty of peace.
- GIRONNE. For *fig. 5.* read *fig. 4.*
- GORE. For *fig. 4.* read *fig. 5.*
- P. 729. col. 2. l. 28. For *as to language*, read *as essential to language*.
- P. 731. col. 2. l. penult. For *remain changed*, read *remain unchanged*.
- P. 735. col. 1. l. 43. For *to write*, read *to unite*.
- P. 742. col. 1. l. 26. For *was it not.* read *it was not.*
- GRYLLUS. For *fig. 3, 4, 5* read *fig. 4, 5, 6.*
- GULES. For *Plate CI.* fig. 6 read *Plate XCVII.* fig. 7.
- P. 805. col. 2. l. 29. For *fig. 4* read *fig. 5.*
- INTERLOCUTOR. For *extracted*, read *extracted*.
- P. 863. col. 1. l. 40. For "*increase. However, the voice,*" &c. read "*increase; and the voice,*" &c.
- P. 864. col. 1. Instead of l. 17, 18, 19. read thus: "But although it may be considered as a general rule, " that the language of any nation is a very exact index of the state of their mind, yet it admits of some particular exceptions; for as man," &c.
- Ibid.* l. 9. *Delete the words in time.*
- Ibid.* col. 2. Instead of l. 11, 12. read thus:—"little advantage from it, as the antiquity of a language does not necessarily imply any degree of excellence, " seeing we all know that some nations," &c.
- P. 865. col. 2. l. 34. For *word*, read *words*.
- P. 866. col. 1. l. 6. For *one*, read *on*;—and in l. 24. *delete the word all.*
- Ibid.* col. 2. l. 22. For "*and the pluperfect in ISSEM*" "*and ERO,*" read "*the pluperfect in ISSEM, and the future in ERO.*"
- Ibid.* col. 1. and 2. Delete *Loqueo, Odio, Loque-bam, Odie-bam,* with the English words accompanying them;—and for *Faceo, Pona bam, Obie-bam, Gaudie bam, and Abstine bam,* read *Facio, Pone bam, Obi bam, Gaude-bam, and Abstine bam.*
- P. 868. For "*Tu, Tytere, lentis in umbra,*" &c. read "*Tu, Tityre, lentus in umbra,*" &c.
- Ibid.* col. 1. l. 28. For *contrast*, read *contrast*;—l. 37. for *posson*, read *passion*;—and delete the syllable *con* at the beginning of l. 45.
- P. 869. col. 2. l. 7. from the bottom. For *as they ought to have*, read *as they might have*.
- P. 870 col. 2. lines 22, 23, 24, 25, and 26. read thus: "For all their nouns in *um* of the second declension, " in *e* of the third, and in *u* of the fourth, have each " their nominative and accusative singular alike. Nor " in the plural number is there any distinction between " these two cases," &c.
- Ibid.* col. 2. l. 19. from the bottom. For *language*, read *languages*.
- P. 872. col. 1. l. 13. For *by accumulated*, read *by the accumulated*;—and l. 25. for *any grammatical errors*, read *any considerable grammatical errors*.
- P. 873. col. 1. l. 10. from the bottom: for *commutation*, read *communication*;—col. 2. l. 5. for *more naturally adapted to the genius of the language*, read *more agreeable to the genius of the language in which Es wrote*;—and col. 2. l. 38. for *that*, read *their*.
- P. 874 col. 2. l. 23. For *languages far less capable*, read *languages, far less capable*.—*Ibid.* l. penult. for *quite*, read *too*.
- P. 875. col. 2. l. 24. For *into*, read *in*.

P. 875.

# E R R A T A.

- P. 875. col. 2. l. 31. For *new-moulded* should at this juncture partake, read *new-moulded at this juncture should partake*.
- P. 876. col. 1. l. 15. For *stanzas*, read *scenes*;—col. 2. l. 7. for *is it possible*, read, *is it as we imagine, possible*;—and l. 16. for *is it*, read *it is*.
- P. 877. col. 1. l. 10. Read *Matam Deshouliers*.
- P. 883. col. 2. l. 7. from the bottom, read thus: "Hence, as one statute may be explained or repealed "by another," &c.—and in l. 6. delete the words *or repealed*.
- P. 885. col. 1. l. 13. from the bottom. For *enexed*, read *annexed*.
- P. 887. col. 1. l. 11. from the bottom. For 1972, read 1672.
- P. 889. col. 1. l. 16. For *give*, read *given*.
- P. 890. col. 1. l. 43. For *confirmed*, read *conferred*.
- P. 895. col. 1. l. 31. For "of the tocher and the wife," &c. read, "of the tocher; and the wife," &c.
- P. 904. col. 2. l. 8, 9. For "ward-holding was in dubio," read "ward-holding was in dubio presumed."
- P. 905. col. 2. l. 32. For *commission*, read *commissioners*.
- P. 908. col. 1. l. 5. For *establisb* as the full right, read *establisbes the full right*.
- P. 909. col. 2. l. 8. For *again*, read *against*;—l. 9, 10. for *hypothec p. yment*, read *hypothec for payment*;—and in l. 41. for 1755, read 1756.
- P. 914. col. 1. l. 2. For *brought*, read *bought*;—l. 10. for *of general terms*, read *in general terms*;—and l. 11. for *in the servitude*, read *of the servitude*.
- P. 916. col. 2. l. 17. For p. 159, read p. 259.
- P. 920. col. 1. l. 18. Delete the word *be*;—and in col. 2. l. 6. from the bottom, for *of division*, read *or division*.
- P. 921. col. 2. l. 26. For *statem*, read *statim*;—and in l. 31. for *may exist*, read *may never exist*.
- P. 931. col. 2. l. 18. For *seisin has actually followed*, read *seisin has not actually followed*.
- P. 947. col. 2. l. 11. from the bottom. For *action*, read *actions*.
- P. 951. col. 2. l. 13. For *or law*, read *of law*.
- P. 953. col. 2. For *Tit. 26*, read *Tit. 33*;—and in l. 5. from the bottom, for *bin*, read *kin*.
- P. 958. col. 2. l. 12. from the bottom. For *forms of law*, read *forms of trial*.
- The page following 958 is numbered 949 instead of 959. In col. 2. l. 25. of said page, for *It is necessary*, read *It is not necessary*.
- LOGIC. Read lines 3d. 4th. and 5th. of the first paragraph thus: "Inasmuch as it traces the progress of our knowledge from our first and most simple conceptions through all their different combinations, "and all those numerous deductions," &c."
