Preface

From the time when we started collaborating as a team in the 1960s, we envisaged not a grammar but a series of grammars. In 1972, there appeared the first volume in this series, *A Grammar of Contemporary English (GCE)*. This was followed soon afterwards by two shorter works, *A Communicative Grammar of English (CGE)* and *A University Grammar of English (UGE)*, published in the United States with the title *A Concise Grammar of Contemporary English*. These two were in part an abridgment of *GCE*, but what is more significant is that they were deliberately different both from the parent book and from each other. This is particularly obvious in the case of *CGE*, which looks at the whole grammar of the language from a semantic and communicative viewpoint. It is less obviously true of *UGE*, which follows the chapter divisions and in most cases the chapter titles of *GCE*, though in fact the abridgment was accompanied by a good deal of fresh thinking and radical revision.

With *A Comprehensive Grammar of the English Language*, we attempt something much more ambitious: a culmination of our joint work, which results in a grammar that is considerably larger and richer than *GCE* and hence superordinate to it. Yet, as with our other volumes since *GCE*, it is also a grammar that incorporates our own further research on grammatical structure as well as the research of scholars world-wide who have contributed to the description of English and to developments in linguistic theory.

It scarcely needs to be said that we take full collective responsibility for the contents of this book. But what does indeed need to be said is that it has been immeasurably improved as a result of the generous assistance that we have received, not least from our own students. We have benefited too from the perceptive attention that *GCE*, *UGE*, and *CGE* have received from reviewers throughout the world. But in addition to these scholars and writers, in addition also to the numerous scholars that we acknowledged in earlier prefaces, a further willing band of linguists put themselves generously at our disposal in giving detailed attention to earlier drafts of what has become *A Comprehensive Grammar of the English Language*.

Some few have even undertaken the heavy task of giving a detailed critique of the entire book in such an earlier draft. For their searching work to this degree, we are especially indebted to John Algeo, R A Close, and Robert de Beaugrande, who between them produced hundreds of pages of invaluable comments. But we are grateful also to W N Francis and Bengt Jacobsson, who gave comparably generous and skilled attention to large parts of the book.

Many other scholars have helped us with one or more individual chapters or with specific problems in the description of grammar. We list their names, but this can in no way convey our degree of gratitude or indicate the intellectual effort from which we have benefited: V Adams, B Altenberg, E Andersson, W-D Bald, D L Bolinger, J Coates, R Cureton, L Haegeman, R Ilsen, S Johansson, H Kakehi (and his Kobe students), H Kinoshita, T

Lavelle, B Lott, C F Meyer, T Nevalainen, W J Pepicello, G Stein, J Taglicht, J Thompson, G Tottie, T Waida, K Wales. The fact that some of these friends are among the most eminent experts in the world on American, British, and other varieties of English has contributed beyond measure to the confidence with which we assign such descriptive labels as 'AmE' and 'BrE'.

Finally, we take great pleasure in making clear that David Crystal's role has extended far beyond what is indicated on the title page. He has not merely provided the detailed index which will make 'information retrieval' possible; in addition, in the course of this onerous and highly specialized task, he has contributed pervasively to the correction of error, the standardization of terminology, and the improvement of presentation.

But this Preface would be sadly incomplete if we did not also record our gratitude to the grant-giving bodies whose financial help (over and above the support we have received from University College London, Lund University, the University of Lancaster, and the University of Wisconsin) has made our research and writing possible: the Leverhulme Trust, the Gulbenkian Foundation, the Social Science Research Council, the British Academy, the Knut and Alice Wallenberg Foundation, the Bank of Sweden Tercentenary Foundation, and our publishers, the Longman Group.

The English language today

The importance of English

- 1.1 English is generally acknowledged to be the world's most important language. It is perhaps worth glancing briefly at the basis for that evaluation. There are, after all, thousands of different languages in the world, and each will seem uniquely important to those who speak it as their native language, the language they acquired at their mother's knee. But there are more objective standards of relative importance.

One criterion is the number of speakers of the language. A second is the extent to which a language is geographically dispersed: in how many continents and countries is it used or is a knowledge of it necessary? A third is its functional load: how extensive is the range of purposes for which it is used? In particular, to what extent is it the medium for highly valued cultural manifestations such as a science or a literature? A fourth is the economic and political influence of the native speakers of the language.

- 1.2 If we restrict the first criterion to native speakers of the language, the number of speakers of English is more than 300 million, and English ranks well below Chinese (which has over three times that number of speakers). The second criterion, the geographical dispersal of the language, invites comparison with (for example) Hebrew, Latin, and Arabic as languages used in major world religions, though only Arabic has a substantial number of speakers. But the spread of English over most of the world as an international language is a unique phenomenon in the world's history: about 1500 million people – over a third of the world's population – live in countries where English has some official status or is one of the native languages, if not the dominant native language. By the third criterion, the great literatures of the Orient spring to mind, not to mention the languages of Tolstoy, Goethe, Cervantes, and Racine. But in addition to being the language of the still more distinguished Shakespeare, English leads as the primary medium for twentieth-century science and technology. The fourth criterion invokes Japanese, Russian, and German, for example, as languages of powerful, productive, and influential nations. But English is the language of the United States, whose gross domestic product in 1980 was more than double that of its nearest competitor, Japan.

No claim has here been made for the importance of English on the grounds of its quality as a language (the size of its vocabulary, its relative lack of inflections, the alleged flexibility of its syntax). The choice of an international language, or lingua franca, is never based on linguistic or aesthetic criteria but always on political, economic, and demographic ones.

The use of English

- 1.3 English is the world's most widely used language. A distinction is often made that depends on how the language is learned: as a *native* language (or *mother tongue*), acquired when the speaker is a young child (generally in the home), or as a *nonnative* language, acquired at some subsequent period. Overlapping with this distinction is that between its use as a *first* language, the primary

language of the speaker, and as an *additional* language. In some countries (particularly of course where it is the dominant native language), English is used principally for internal purposes as an *intranational* language, for speakers to communicate with other speakers of the same country; in others it serves chiefly as an *international* language, the medium of communication with speakers from other countries.

One well-established categorization makes a three-way distinction between a *native* language, a *second* language, and a *foreign* language. As a foreign language English is used for international communication, but as a second language it is used chiefly for intranational purposes. We can distinguish five types of function for which English characteristically serves as a medium when it is a second language: (1) *instrumental*, for formal education; (2) *regulative*, for government administration and the law courts; (3) *communicative*, for interpersonal communication between individuals speaking different native languages; (4) *occupational*, both intranationally and internationally for commerce and for science and technology; (5) *creative*, for nontechnical writings, such as fiction and political works.

Note [a] A bilingual child may have more than one native language, and a bilingual adult may be equally proficient in more than one first language. In some countries, English is one of two or more languages, and as a foreign language too it may be one of several that are known.

[b] Although one's native language is usually also one's first language, it need not be. People may migrate to a country where a language different from their native tongue is spoken. If they become proficient in the new language and use it extensively, that nonnative language may become their first language, displacing the native tongue. Such displacement has occurred, for example, among Pakistanis in the United Kingdom and among Vietnamese in the United States.

[c] Second-language writers in Southeast Asia and in East and West Africa are making important contributions to English literature. Their writings may incorporate features characteristic of their second-language variety, including rhetorical and stylistic features, but they are generally addressed to, and read by, an international English readership.

Native and second language

- 1.4 English is spoken as a *native* language by more than 300 million people, most of them living in North America, the British Isles, Australia, New Zealand, the Caribbean, and South Africa. In several of these countries, English is not the sole language: the Quebec province of Canada is French-speaking, most South Africans speak Afrikaans or Bantu languages, and many Irish and Welsh people speak Celtic languages. But those whose native language is not English will have English as their *second* language for certain governmental, commercial, social, or educational activities within their own country.

English is also a second language in many countries where only a small proportion of the people have English as their native language. In about twenty-five countries English has been legally designated as an official language: in about ten (such as Nigeria) it is the sole official language, and in some fifteen others (such as India) it shares that status with one or more other languages. Most of these countries are former British territories. Despite the association of the English language with the former colonial rulers, it has been retained for pragmatic reasons: where no one native language is generally acceptable, English is a *neutral* language that is politically acceptable, at least at the national level, for administrative and legal

functions; and as an international language for science and technology it is desirable for higher education. English is an official language in countries of such divergent backgrounds as India, Nigeria, and Liberia, while in numerous other countries (Burma, Thailand, South Korea, and some Middle Eastern countries) it is used for higher education. In Sri Lanka, English at one time lost its official status, while retaining its social, cultural, and economic importance, but it has been reestablished as an official language; indeed, as a result of the increase in secondary education more people today learn English there than at any time during the colonial period. It has been estimated that English is a second language for well over 300 million people: the number of second-language speakers may soon exceed the number of native speakers, if it has not done so already.

Note The significance of English for higher education in second language countries is reflected in statistics for book publishing and literacy in 1981/82 in India. India emerged as the world's third largest publisher of books in English and forty-one per cent of titles produced there were in English, although only 2.3 per cent of the population were literate in English. But that tiny percentage represented 15 million people.

Foreign language

- 1.5 By *foreign* language we mean a language used by persons for communication across frontiers or with others who are not from their country: listening to broadcasts, reading books or newspapers, engaging in commerce or travel, for example. No language is more widely studied or used as a foreign language than English. The desire to learn it is at the present time immense and apparently insatiable. American organizations such as the United States Information Agency (USIA) and the Voice of America have played a notable role in recent years, in close and amicable liaison with the British Council, which provides support for English teaching both in the Commonwealth and in other countries throughout the world. The BBC (British Broadcasting Corporation), like the USIA, has notable radio and television facilities devoted to this purpose. Other English-speaking countries such as Australia also assume heavy responsibilities for teaching English as a foreign language.

We shall look more closely in the next sections at the kind and degree of demand, but meantime the reasons for the demand have surely become clear. To put it bluntly, English is a top requirement of those seeking good jobs, and is often the language in which much of the business of good jobs is conducted. It is needed for access to at least half of the world's scientific literature, and the most important scientific journals are in English. It is thus intimately associated with technological and economic development and it is the principal language of international aid. The great manufacturing countries Germany and Japan use English as their principal advertising and sales medium; it is the language of automation and computer technology. Not only is it the universal language of international aviation, shipping, and sport, it is to a considerable degree the universal language of literacy and public communication. It is the major language of diplomacy, and is the most frequently used language both in the debates in the United Nations and in the general conduct of UN business.

Note [a] Some measure of the number and importance of publications in English is provided by the number of translations of English books. In 1977 out of a world total of 50 047 translations of books, 19 577 were from English. The nearest competitors were Russian (6771) and French (6054).

[b] The pervasive influence of English has induced language academics or other language-planning agencies in some countries to attempt to control the range of its functions and to prevent the acceptance of Englishisms (English loan words and loan translations) into their national languages, at least in official writing.

The demand for English

The teaching of English

- 1.6 The role of chief foreign language that French occupied for two centuries from about 1700 has been assumed by English – except of course in the English-speaking countries themselves, where French or (in the United States) Spanish is the foreign language most widely studied. Although patriotism obliges international organizations to devote far more resources to translation and interpreter services than reason would dictate, no senior post would be offered to a candidate deficient in English. The general equivalent of the nineteenth-century European ‘finishing school’ in French is perhaps the English-medium school organized through the state education system, and such institutions seem to be even more numerous in the Soviet Union and other East European countries than in countries to the West. There are also innumerable commercial institutions that teach English at all levels and to all ages, both in non-English-speaking countries and in English-speaking countries. Most language learning, of course, takes place in the ordinary schools of the state educational system.

The extent to which English is studied at the school level is shown in one analysis of the educational statistics for 112 countries where English is not a native language, but is either a foreign language or a second language. The study estimates that over 46 million primary school students and over 71 million secondary school students were in English classes in the early 1970s. These figures represent over 15 per cent of the primary school population and over 76 per cent of the secondary school population for those countries. It is significant that English was the medium of instruction for 30 per cent of the primary school students and for nearly 16 per cent of the secondary school students. Estimated figures would have been far higher if statistics for all non-English-speaking countries had been included. (A notable exclusion from the study was the People's Republic of China.) Since the secondary school population is increasing at a rapid rate in the developing countries, we can expect that the number of English learners at the secondary level has increased very considerably since the early 1970s.

Outside the primary and secondary schools, there are large numbers of students in institutions of higher and further education who are learning English for a variety of purposes: as the medium of the literature and culture of English-speaking countries; for access to scholarly and technological publications; to qualify as English teachers, translators, or interpreters; to improve their chances of employment or promotion in such areas as the tourist trade, international commerce, or international programmes for economic or military aid. In countries where it is a second language, English

is commonly used as the medium for higher education, at least for scientific and technological subjects, even when it is not so used at the primary or secondary levels.

Many students come from abroad for their higher and further education to English-speaking countries, where English is of course the medium for their studies. In 1979, there were 286 340 foreign students enrolled at the post-secondary level of education in the United States, 56 877 in the United Kingdom, and 32 148 in Canada (where some will have studied in French-speaking institutions), apart from smaller numbers in other English-speaking countries. The country with the next highest figure after the United States was France, which had 112 042 foreign students in the same year.

School models of English

- 1.7 In countries where English is predominantly the native language, the form of written English taught in the schools is normally the STANDARD variety (cf 1.23), the variety associated with the educated users of the language in that country. However, it is now less usual than in the past for teachers to attempt to make the local spoken variety conform with some educated spoken norm.

In countries where English is a nonnative language, the major models for both writing and speech have generally been the standard varieties of British and American English. The choice between them has depended on various factors: whether the country was formerly a British or a US colony; its proximity to Britain or the United States; which of the two had most influenced its economic, cultural, or scientific development; and current commercial or political relations. In some countries both American and British standard varieties are taught, sometimes in different institutions, sometimes in the same institution.

The situation has been changing in those countries where English is a second language, used extensively for intranational purposes in the absence of a commonly accepted national language. In countries such as India and Nigeria indigenous educated varieties are becoming institutionalized and are acquiring social acceptability. In the meantime, teachers in those countries are uncertain, or vary, about the norms to which their teaching should be geared: to those of the evolving local standard or to those of some external standard. Such uncertainties are analogous to the uncertainties among teachers in native-English countries over divided usages or prescriptive norms that differ from their own usage (cf 1.17).

Where English is a foreign language, we may expect the American and British standard varieties to continue to be the major models, competing increasingly with the standard varieties of other countries such as Australia, in regions that are within the sphere of influence of those countries.

Note Countries where English is a foreign language may develop, to some extent, independent prescriptive norms that are enshrined in handbooks and textbooks and that are reflected in examination questions.

The international character of English

- 1.8 English is preeminently the most international of languages. Though the name of the language may at once remind us of England, or we may associate

the language with the United States, one of the world's superpowers, English carries less implication of political or cultural specificity than any other living tongue (Spanish and French being also notable in this respect). At one and the same time, English serves the daily purposes of republics such as the United States and South Africa, sharply different in size, population, climate, economy, and national philosophy; and it serves an ancient realm such as the United Kingdom, as well as her widely scattered Commonwealth partners, themselves as different from each other as they are from Britain herself.

But the cultural neutrality of English must not be pressed too far. The literal or metaphorical use of such expressions as *case law* throughout the English-speaking world reflects a common heritage in the legal system; and allusions to or quotations from Shakespeare, the Authorized (or King James) Version of the Bible, Gray's *Elegy*, Mark Twain, a sea shanty, a Negro spiritual, or a pop song – wittingly or not – testify similarly to a shared culture. *The Continent* can have its British meaning of 'continental Europe' in the United States and even in Australia and New Zealand. At other times, English equally reflects the independent and distinct culture of one or other of the English-speaking communities. When an Australian speaks of *fossicking* something out ['searching for something'], the metaphor looks back to the desperate activity of reworking the diggings of someone else in the hope of finding gold that had been overlooked. When an American speaks of *not getting to first base* ['not achieving even initial success'], the metaphor concerns an equally culture-specific activity – the game of baseball. And when an Englishman says that something is *not cricket* ['unfair'], the allusion is also to a game that is by no means universal in the English-speaking countries.

The future of English

- 1.9 Predictions – often gloomy – have been made about the future of English. It is worth considering the bases for such predictions with respect to the various uses of English.

A single international language has long been thought to be the ideal for international communication. Artificially-constructed languages have never acquired sufficiently large numbers of adherents, although in principle such languages have the obvious advantage that they put all learners on the same footing (all are nonnative speakers), thereby not giving an advantage to speakers of any particular language. During the last few decades English has come closest to being the single international language, having achieved a greater world spread than any other language in recorded history. Yet in recent years doubts have arisen whether it will ever reach the ideal of the single international language or, indeed, whether its use as an international language will continue at the present level.

One reason for the doubts has been the fear that national varieties of English are rapidly growing further apart and will finally separate into mutually incomprehensible languages. Fears have also been expressed that justifiable sensitivity to the child's right to use his native dialect (regional, socioeconomic, or ethnic) within a national variety might lead to the abandonment of a national standard dialect and hence to the further

disintegration of English. The diversity in English is greatest in countries where English is a second language and therefore has to be taught. Since in those countries students are usually taught by teachers who are themselves not native speakers of English and who have inevitably acquired the language to varying degrees of adequacy, it is not surprising that the standards of achievement are variable and subject to change. Some express concern about the excessive internal variability and the ill-acquired control of the language in such situations. Some fear the divisive effect of the emerging institutionalized varieties, which no longer look to native varieties for standards of acceptability.

- 1.10 While fears for the disintegration of English cannot be dismissed summarily, powerful forces are operating to preserve the unity of the language. Despite considerable dialectal differences within each national variety, the education systems have preserved the essential similarity of the national standards. The traditional spelling system generally ignores both the changes in pronunciation over time and the variations in pronunciation through space; despite its notorious vagaries, it is a unifying force in world English. Many factors are conducive to making differences in national varieties familiar and comprehensible: there is the influence of newspapers, magazines, and books on the written medium and of radio, television, and film on the spoken medium. Teachers and students can be made sensitive to, and tolerant of, language variation, and national examination systems can be made flexible enough to take account of variation. Despite a growing tolerance of nonstandard variation in speech, standard forms remain the norm for written English.

The future of English as an international language has also been said to rest on the practicability of teaching the language, especially on a mass scale, to the level required for international usefulness, given the enormous expenditures required for the purpose. It is possible that as developing countries become richer they will be able to increase their expenditure on the teaching of English and raise the levels of teacher and student proficiency. At all events, programmes have been devised to restrict the goals of language learning, thereby allowing a more realistic deployment of educational resources, as in the Teaching of English for Specific Purposes, for example for business or scientific communication. Following earlier attempts (such as 'Basic English') that were largely lexical, a proposal has also recently been made for constructing a simplified form of English (termed 'Nuclear English') that would contain a subset of the features of natural English; for example, modal auxiliaries such as *can* and *may* would be replaced by such paraphrases as *be able to* and *be allowed to*. The simplified form would be intelligible to speakers of any major national variety and could be expanded for specific purposes, for example for international maritime communication.

The long-range continuance of English as a second language is also questionable in some countries. The eagerness for rapid technological advancement conflicts with the demands for the establishment of authentic links with past native traditions: objections to an official status for English and calls for its replacement by native languages are expressions of national pride and independence. Since a good command of English is usually restricted to an elite, we may expect political resentment against a minority

second language that brings benefits to those proficient in it. English is likely to be retained as an official language as long as no specific native language is politically acceptable to all, but we can expect that in at least some countries indigenous languages will become sufficiently dominant to acquire sole official status and eventually to displace English. In such cases English will gradually become recognized as a foreign language. However, irrespective of the degree of world influence exercised by the English-speaking countries themselves, English is likely to be retained generally as the medium for higher education as long as the major English-speaking countries retain their economic and political status.

Standards of English

- 1.11 Complaints by native speakers that English is deteriorating or being corrupted reflect in the main a conservative resistance to change. Some language changes result in the loss of distinctions, but if a distinction is needed the loss will be compensated for. For example, in some regional varieties the distinction between the singular and plural meanings of *you* has been retained by the use of such expressions as *you-all* or *you guys* for the plural meanings (cf 6.12 Notes [a, b]). The introduction of specific new words or expressions (such as *prioritize* or *interface*) sometimes provokes violent indignation, often conveyed in ethical terms. Usually the objections to the innovations (or supposed innovations) reflect objections to their typical users. Some of the complaints relate to variants that are in divided usage among speakers of the standard variety; for example, *graduated from* and *was graduated from* in American English, or *different from* and *different to* in British English. In yet other instances the forms are clearly recognized as unacceptable in the standard variety (such as the multiple negative in *I don't want no money from no one*; cf 10.63 Note), though they may be acceptable in some nonstandard varieties. Relatively few points are at issue. They do not justify generalizations about the state of the language as a whole.

Some native speakers claim that the *use* of the language is deteriorating. One charge is ethical: people are said to be abusing the language, more so than in the past, with intent to conceal, mislead, or deceive, generally through euphemism or obscure language. Usually, the accusation is directed principally against politicians, bureaucrats, and advertisers, but the abuse is felt to have an adverse effect on the language as such. Certainly, the contemporary mass media facilitate the rapid and widespread dissemination of such language abuses. The other charge is aesthetic or functional: people are said to be using the language less elegantly or less efficiently than in the recent past, a charge that is commonly directed against young people. The charge may or may not have some justification, but in any case is impossible to substantiate. Many variables inhibit the feasibility of making valid and reliable comparisons with earlier periods: for example, the phenomenal growth of the literate population and of the use of the written language.

Note On standard and nonstandard English, cf 1.22. On varieties of standard English, cf 1.23ff.

Grammar and the study of language

Types of linguistic organization

Sounds and spellings

- 1.12 We claim that on the one hand there is a single English language (the grammar of which is the concern of this book), and that on the other hand there are recognizable varieties. Since these varieties can have reflexes in any of the types of organization that the linguist distinguishes, this is the point at which we should outline the types, one of which is grammar. When people speak, they emit a stream of sounds. We hear the sounds not as indefinitely variable in acoustic quality (however much they may be so in actual physical fact). Rather, we hear them as each corresponding to one of the very small set of sound units (in English, /p/, /l/, /n/, /t/, /ð/, /s/ . . .) which can combine in certain ways and not in others. For example, in English we have *spin* but not **psin*. (On the use of the asterisk and similar symbols, see 1.42.) We similarly observe patterns of stress and pitch. The rules for the organization of sound units (or phonemes) are studied in the branch of linguistics known as PHONOLOGY, while the physical properties of sounds and their manner of articulation are studied in PHONETICS.

The other major method of linguistic communication is by writing; and for English as for many other languages an alphabetic writing system has been developed, the symbols related in the main to the individual sounds used in the language. Here again there is a closely structured organization which regards certain differences in shape as irrelevant and others (for example capitals versus lower case, ascenders to the left or right of a circle, eg: *b* versus *d*) as significant. The study of ORTHOGRAPHY (or more inclusively, GRAPHOLOGY or GRAPHEMICS) thus parallels the study of phonology in several ways. Despite the notorious oddities of English spelling, there are general principles: eg combinations of letters that English permits (*tch*, *qu*, *ss*, *oo*) and others that are disallowed (**pfx*, **go*) or have only restricted distribution (final *v* or *j* occurs only exceptionally as in *Raj*, *spiv*).

Lexicology, grammar, semantics, pragmatics

- 1.13 Just as the small set of arabic numerals can be combined to express in writing any natural numbers we like, however vast, so the small set of sounds and letters can be combined to express in speech and writing respectively an indefinitely large number of WORDS. These linguistic units enable people to refer to every object, action, and quality that members of a society wish to distinguish: in English, *door*, *soap*, *indignation*, *find*, *stupefy*, *good*, *uncontrollable*, and so on to a total exceeding the half million words listed in unabridged dictionaries. These units have a meaning and a structure (sometimes an obviously composite structure as in cases like *uncontrollable*) which relate them not only to the world outside language but to other words within the language (*happy* to *happiness*, *unhappy*, etc; *good* to *bad*, *kind*, etc; *door* to *room*, *key*, etc). The study of words is the business of LEXICOLOGY, but the regularities in their formation are similar in kind to the regularities of grammar and are closely connected to them (cf App I.1ff). It is GRAMMAR

that is our primary concern in this book. Words must be combined into larger units, and grammar encompasses the complex set of rules specifying such combination. Meaning relations in the language system are the business of SEMANTICS, the study of meaning, and semantics therefore has relevance equally within lexicology and within grammar. Finally, the meaning of linguistic expressions when uttered within particular types of situation is dealt with in PRAGMATICS, which is concerned with the communicative force of linguistic utterances. Two terms are employed for the interconnection of grammar and the uses of grammar: TEXT LINGUISTICS and DISCOURSE ANALYSIS. All types of organization (but notably lexicology and grammar) enter into the structure of TEXTS, which constitute spoken and written discourse (cf Chapter 19).

The meanings of 'grammar'

Syntax and inflections

- 1.14 The word 'grammar' has various meanings, and since grammar is the subject matter of this book we should explore the most common meanings of the word. We shall be using 'grammar' to include both SYNTAX and that aspect of MORPHOLOGY (the internal structure of words) that deals with INFLECTIONS (or ACCIDENCE). The fact that the past tense of *buy* is *bought* [inflection] and the fact that the interrogative form of *He bought it* is *Did he buy it?* [syntax] are therefore both equally the province of grammar. There is nothing technical about our usage in this respect: it corresponds to one of the common lay uses of the word in the English-speaking world. A teacher may comment:

John uses good grammar but his spelling is awful.

The comment shows that spelling is excluded from grammar; and if John wrote *interloper* where the context demanded *interpreter*, the teacher would say that he had used the wrong word, not that he had made a mistake in grammar. But in the education systems of the English-speaking countries, it is possible also to use the term 'grammar' loosely so as to include both spelling and lexicology.

There is a further use of 'grammar' that derives from a period in which the teaching of Latin and Greek was widespread. Since the aspect of Latin grammar on which teaching has traditionally concentrated is the paradigms (or model sets) of inflections, it made sense for the learner to say:

Latin has a good deal of grammar, but English has hardly any.

This meaning of 'grammar' has continued to be used by lay native speakers. In effect, grammar is identified with inflections, so that nonspecialists may still speak of 'grammar and syntax', tacitly excluding the latter from the former.

Note The term *grammar school* (used in several English-speaking countries, though not always with reference to the same type of school) reflects the historical fact that certain schools concentrated at one time on the teaching of Latin and Greek. One sometimes comes upon the lay supposition that such schools do or should make a special effort to teach *English grammar*.

Rules and the native speaker

- 1.15 Nor have we completed the inventory of meanings. The same native speaker, turning his attention from Latin, may comment:

French has a well-defined grammar, but in English we're free to speak as we like.

To begin with, it is clear that the speaker cannot now be intending to restrict 'grammar' to inflections: rather the converse; it would seem to be used as a virtual synonym of 'syntax'.

Secondly, the native speaker's comment probably owes a good deal to the fact that he does not feel the rules of his own language – rules that he has acquired unconsciously – to be at all constraining; and if ever he happens to be called on to explain one such rule to a foreigner he has very great difficulty. By contrast, the grammatical rules he learns for a foreign language seem much more rigid and they also seem clearer because they have been actually spelled out to him in the learning process.

But another important point is revealed in this sentence. The distinction refers to 'grammar' not as the observed patterns in the use of French but as a codification of rules compiled by the French (especially by the Académie Française) to show the French themselves how their language should be used. This is not grammar 'immanent' in a language (as our previous uses were, however much they differed in the types of pattern they referred to), but grammar as codified by grammarians: the Academy Grammar. There is no such Academy for the English language and so (our naive native speaker imagines) the English speaker has more 'freedom' in his usage.

The codification of rules

- 1.16 The 'codification' sense of grammar is readily identified with the specific codification by a specific grammarian:

Jespersen wrote a good grammar, and so did Kruisinga.

And this sense naturally leads to the concrete use as in:

Did you bring your grammars?

Naturally, too, the codification may refer to grammar in any of the senses already mentioned. The codification will also vary, however, according to the linguistic theory embraced by the authors, their idea of the nature of grammar rather than their statement of the grammar of a particular language:

Chomsky developed a transformational grammar that differed considerably from earlier grammars.

In the usage of many leading linguists, this last sense of grammar has returned to the catholicity that it had in the Greek tradition more than 2000 years ago, covering the whole field of language structure. Thus, in the framework of formal linguistics, some grammarians speak of 'the grammar' as embracing rules not only for syntax but for phonological, lexical, and semantic specification as well.

Note Accidents of intellectual history in the nineteenth century result in the fact that an old-fashioned

Old High German grammar (or an Old English grammar) may well contain only inflections together with a detailed explanation of how the phonological system emerged.

Prescriptive grammar

- 1.17 Finally we come to the use of 'grammar' in statements such as:

It's bad grammar to end a sentence with a preposition.

Here the term refers to a way of speaking or writing that is to be either preferred or avoided. Such statements pertain to **PRESCRIPTIVE GRAMMAR**, a set of regulations that are based on what is evaluated as correct or incorrect in the standard varieties. Since we do not have an Academy of the English Language, there is no one set of regulations that could be considered 'authoritative'. Instead, evaluations are made by self-appointed authorities who, reflecting varying judgments of acceptability and appropriateness, often disagree.

Authorities on **USAGE**, in this restricted sense, primarily deal with **DISPUTED** usage, a relatively small number of syntactic and lexical items that are controversial within the standard varieties. Their objections may persuade some to avoid certain usages, at least in their formal writing. Over the last two centuries prescriptive rules have accumulated into a general prescriptive tradition for formal writing that is embodied (with some variation) in school textbooks and student reference handbooks, and in usage guides for the general public.

As an occasional consequence of prescriptive pressures, some speakers have mistakenly extended particular prescriptive rules in an attempt to avoid mistakes. A classic instance of such **HYPERCORRECTION** is the use of *whom* as subject (cf 6.35 Note [a]). Others are the pseudo-subjunctive *were* as in *I wonder if he were here* and the use of the subjective pronoun *I* in the phrase *between you and I*.

Our primary concern in this book is to describe the grammar of English. But we occasionally refer to the prescriptive tradition not only because it may lead to hypercorrection but also because it may affect attitudes towards particular uses that may in turn influence the preferences of some native speakers, at least in formal or more considered styles. It may lead some, for example, to replace their usual *was* by subjunctive *were* in *If I was strong enough, I would help you*, or to replace *who* by *whom* in *the teacher who I most admired*.

Grammar and other types of organization

- 1.18 Progress towards a more explicit type of grammatical description is inevitably slow and the whole field of grammar is likely to remain an area of interesting controversy. While theoretical problems are not the concern of this book, our treatment cannot be neutral on the issues that enliven current discussion. For example, we would not wish to assert the total independence of grammar from phonology on the one hand and lexicology or semantics on the other as was implied in the deliberate oversimplification of 1.12f. Phonology is seen to have a bearing on grammar even in small points such as the association of initial /ð/ with demonstrativeness and conjunctions (*this, then, though*, etc, cf 2.37). More important are the phonological conditions for the *-s* and *-ed*

inflections in verbs and nouns (cf 3.5f, 5.80). It is seen to bear on lexicology, for example, in the fact that some nouns and verbs differ only in the position of the stress (cf App I.56):

That is an 'insult.
They may in'sult me.

But most obviously the interdependence of phonology and grammar is shown in focus processes (cf the connection between intonation and linear presentation: 18.2ff, 19.25f), and in the fact that by merely altering the phonology one can distinguish sets of sentences like those quoted in App II.21.

The interrelations of grammar, lexicology, and semantics are manifested in the semantic restrictions (cf 10.51) that permit [1] and [2], but not [1a] and [2a]:

Fear replaced indecision.	[1]
*John replaced indecision.	[1a]
John hated indecision.	[2]
*Fear hated indecision.	[2a]

The borderline between grammar and semantics is unclear, and linguists will draw the line variously. We shall not give guidance on such constraints in this book.

Similarly, the borderline between grammar and pragmatics (and even more so between semantics and pragmatics) is unclear. Although we shall have occasion to refer to the kinds of intended speech behaviour (such as request and invitation) that may be conveyed through certain sentence types (cf particularly Chapter 11), we shall not attempt a comprehensive account. But we shall attempt to give every indication of the meaning of the constructions we discuss.

Our general principle will be to regard grammar as accounting for constructions where greatest generalization is possible, assigning to lexicology (and hence beyond the scope of this book) constructions on which least generalization can be formulated. In applying this principle we will necessarily make arbitrary decisions along the gradient from greatest to least generalization.

Varieties of English

Types of variation

- 1.19 Having indicated how we may speak of different types of linguistic organization such as phonology, lexicology, and grammar, we may now return to the point we had reached at the beginning of 1.12. What are the varieties of English whose differing properties are realized through the several types of linguistic organization?

Formulating a theoretical basis on which the varieties of any language can be described, interrelated, and studied is one of the prime concerns of the

branch of language study called SOCIOLINGUISTICS. This discipline is far from having achieved complete answers, and all attempts are in some degree oversimplifications.

We shall first consider five major types of variation. Any use of language necessarily involves variation within all five types, although for purposes of analysis we may abstract individual varieties (a related set of variation within one type).

- (a) region (1.20f)
- (b) social group (1.22ff)
- (c) field of discourse (1.28)
- (d) medium (1.29f)
- (e) attitude (1.31ff)

The first two types of variation relate primarily to the language user. People use a regional variety because they live in a region or have once lived in that region. Similarly, people use a social variety because of their affiliation with a social group. These varieties are relatively permanent for the language user. At the same time, we should be aware that many people can communicate in more than one regional or social variety and can therefore (consciously or unconsciously) switch varieties according to the situation. And of course people move to other regions or change their social affiliations, and may then adopt a new regional or social variety.

The last three types of variation relate to language use. People select the varieties according to the situation and the purpose of the communication. The field of discourse relates to the activity in which they are engaged; the medium may be spoken or written, generally depending on the proximity of the participants in the communication; and the attitude expressed through language is conditioned by the relationship of the participants in the particular situation. A COMMON CORE or nucleus is present in all the varieties so that, however esoteric a variety may be, it has running through it a set of grammatical and other characteristics that are present in all the others. It is this fact that justifies the application of the name 'English' to all the varieties.

Note We have conspicuously omitted variation in time, since this book is solely concerned with the grammar of present-day English. Variation in the contemporary language, however, reflects in part historical change in progress. At any one period, older variants may coexist with newer variants, and some of the newer variants may eventually become the sole forms.

Regional variation

- 1.20** Varieties according to region have a well-established label both in popular and technical use: DIALECTS. Geographical dispersion is in fact the classic basis for linguistic variation, and in the course of time, with poor communications and relative remoteness, such dispersion results in dialects becoming so distinct that we regard them as different languages. This latter stage was long ago reached with the Germanic dialects that are now Dutch, English, German, Swedish, etc, but it has not been reached (and may not necessarily ever be reached, given the modern ease and range of communication) with the dialects of English that have resulted from the regional separation of communities within the British Isles and (since the voyages of exploration and settlement in Shakespeare's time) elsewhere in the world.

Regional variation seems to be realized predominantly in phonology. That is, we generally recognize a different dialect from a speaker's pronunciation or accent before we notice that the vocabulary (or LEXICON) is also distinctive. Grammatical variation tends to be less extensive and certainly less obtrusive. But all types of linguistic organization can readily enough be involved. A Lancashire man may be recognized by a Yorkshireman because he pronounces an /r/ after vowels as in *stir* or *hurt*. A *middy* is an Australian measure for beer – but it refers to a considerably bigger measure in Sydney than it does in Perth. Instead of *I saw it*, a New Englander might say *I see it*, a Pennsylvanian *I seen it*, and a Virginian either *I seen it* or *I seed it*, if they were speaking the rural nonstandard dialect of their locality, and the same forms characterize certain dialects within Britain too.

Note [a] The attitude of native speakers of one dialect towards the dialects of other native speakers varies greatly, but, in general, dialects of rural and agricultural communities are regarded as more pleasant than dialects of large urban communities such as New York or Birmingham. This is connected, of course, with social attitudes and the association of city dialects with variation according to education and social standing (cf 1.22) rather than according to region.
[b] Dialectologists and sociolinguists often use the term 'dialect' for social varieties.

- 1.21** It is pointless to ask how many dialects of English there are: there are indefinitely many, depending on how detailed we wish to be in our observations. But they are of course more obviously numerous in long-settled Britain than in areas more recently settled by Europeans, such as North America or, still more recently, Australia and New Zealand. The degree of generality in our observation depends crucially upon our standpoint as well as upon our experience. An Englishman will hear an American Southerner primarily as an American, and only as a Southerner in addition if further subclassification is called for and if his experience of American English dialects enables him to make it. To an American the same speaker will be heard first as a Southerner and then (subject to similar conditions) as, say, a Virginian, and then perhaps as a Piedmont Virginian. One might suggest some broad dialectal divisions which are rather generally recognized. Within North America, most people would be able to distinguish Canadian, Northern, Midland, and Southern varieties of English. Within the British Isles, Irish, Scots, Northern, Midland, Welsh, Southwestern, and London varieties would be recognized with similar generality. Some of these – the English of Ireland and Scotland for example – would be recognized as such by many Americans and Australians too, while in Britain many people could make subdivisions: Ulster and Southern might be distinguished within Irish English, for example, and Yorkshire picked out as an important subdivision of Northern speech. British people can also, of course, distinguish North Americans from all others (though not usually Canadians from Americans), South Africans from Australians and New Zealanders (though mistakes are frequent), but not usually Australians from New Zealanders.

Social variation

- 1.22** Within each of the dialects there is considerable variation in speech according to education, socioeconomic group, and ethnic group. Some differences correlate with age and sex. Much (if not most) of the variation does not

involve categorical distinctions; rather it is a matter of the frequency with which certain linguistic features are found in the groups.

There is an important polarity between uneducated and educated speech in which the former can be identified with the nonstandard regional dialect most completely and the latter moves away from regional usage to a form of English that cuts across regional boundaries. To revert to an example given in a previous section, an outsider (who was not a skilled dialectologist) might not readily find a New Englander who said *see* for *saw*, a Pennsylvanian who said *seen*, and a Virginian who said *seed*. These are forms that tend to be replaced by *saw* with schooling, and in speaking to a stranger a dialect speaker would tend to use 'school' forms. On the other hand, there is no simple equation of regional and uneducated English. Just as educated English, *I saw*, cuts across regional boundaries, so do many features of uneducated use: a prominent example is the double negative as in *I don't want no cake*, which has been outlawed from all educated English by the prescriptive grammar tradition for over two hundred years but which continues to thrive as an emphatic form in uneducated speech wherever English is spoken.

Educated English naturally tends to be given the additional prestige of government agencies, the professions, the political parties, the press, the law court, and the pulpit – any institution which must attempt to address itself to a public beyond the smallest dialectal community. It is codified in dictionaries, grammars, and guides to usage, and it is taught in the school system at all levels. It is almost exclusively the language of printed matter. Because educated English is thus accorded implicit social and political sanction, it comes to be referred to as STANDARD ENGLISH, and provided we remember that this does not mean an English that has been formally standardized by official action, as weights and measures are standardized, the term is useful and appropriate. In contrast with standard English, forms that are especially associated with uneducated (rather than dialectal) use are generally called NONSTANDARD.

Note 'Substandard' is sometimes used in place of 'nonstandard', but less commonly now than in the past.

Standard English

- 1.23 The degree of acceptance of a single standard of English throughout the world, across a multiplicity of political and social systems, is a truly remarkable phenomenon: the more so since the extent of the uniformity involved has, if anything, increased in the present century. Uniformity is greatest in orthography, which is from most viewpoints the least important type of linguistic organization. Although printing houses in all English-speaking countries retain a tiny element of individual decision (eg: *realize/realise, judgment/judgement*), there is basically a single spelling and punctuation system throughout: with two minor subsystems. The one is the subsystem with British orientation (used in most English-speaking countries other than the United States), with distinctive forms in only a small class of words, *colour, centre, levelled*, etc. The other is the American subsystem, *color, center, leveled*, etc. Canadian spelling draws on both systems and is

open to considerable variation. Learned or formal publications, such as academic journals and school textbooks, prefer British spellings, while popular publications, such as newspapers, prefer American spelling. Individuals may use both variants according to situation, but sometimes randomly. One difference between the American and British subsystems of punctuation is that the general American practice is to put a period or comma inside closing quotation marks, which are usually double in American usage for the primary set: *The sign said "No smoking."* A further orthographic point may cause Anglo-American misunderstanding: the numerical form of dates. In British (and European) practice 2/10/85 means '2 October 1985', but in American practice it means 'February 10, 1985' (cf 6.66).

In grammar and vocabulary, standard English presents somewhat less of a monolithic character, but even so the world-wide agreement is extraordinary and – as has been suggested earlier – seems actually to be increasing under the impact of closer world communication and the spread of identical material and nonmaterial culture. The uniformity is especially close in neutral or formal styles of written English on subject matter not of obviously localized interest: in such circumstances one can frequently go on for page after page without encountering a feature which would identify the English as belonging to one of the national standards (cf 1.28ff).

National standards of English

British and American English

- 1.24 What we are calling national standards should be seen as distinct from the standard English which we have been discussing and which we should think of as being supranational, embracing what is common to all. Again, as with orthography, there are two national standards that are overwhelmingly predominant both in the number of distinctive usages and in the degree to which these distinctions are institutionalized: American English <AmE> and British English <BrE>. Grammatical differences are few and the most conspicuous are known to many users of both national standards: the fact that AmE has two past participles for *get* and BrE only one (cf 3.18), for example, and that in BrE either a singular or a plural verb may be used with a singular collective noun:

The government $\left\{ \begin{array}{l} \text{is} \\ \text{are} \end{array} \right\}$ in favour of economic sanctions.

whereas in AmE a singular verb is required here. Some are less familiar, but are unlikely to hamper communication. For example, AmE may use the simple past in informal style in contexts where BrE normally requires the present perfective (cf 4.20 Note), as in:

Sue just $\left\{ \begin{array}{l} \text{finished} \\ \text{has finished} \end{array} \right\}$ her homework.

And BrE tends to use the construction with *should* where AmE generally uses the present subjunctive (cf 14.24):

I insisted that he $\left\{ \begin{array}{l} \text{should take} \\ \text{take} \end{array} \right\}$ the documents with him.

Lexical examples are far more numerous, but many of these are familiar to users of both standards: for example, *railway* <BrE>, *railroad* <AmE>; *tin* <BrE>, *can* <AmE>; *petrol* <BrE>, *gas(oline)* <AmE>. Some items may confuse most speakers of the other standard because they are unfamiliar, at least in the relevant meaning: *boot* <BrE>, *trunk* <AmE>; *rubber* <BrE>, *eraser* <AmE>; *drawing pin* <BrE>, *thumbtack* <AmE>. *Public school* in AmE is a school maintained by public funds, but in BrE it applies to certain fee-paying schools. *Cider* (unless further specified, as in *hard cider*) is usually nonalcoholic in AmE, but (unless further specified as *sweet cider*) it is alcoholic in BrE. *School* in *I'm going to school* includes colleges and universities in AmE, but excludes them in BrE. Floors are numbered from ground level in AmE, so that *first floor* is generally level with the ground, but in BrE it is above the *ground floor*. In some instances an item that is normal in one standard is used in the other in restricted contexts: BrE *shop* (AmE *store*) is used in AmE for a small and specialized store, eg: *barber shop*, *shoe-repair shop*, and sometimes for a high-class establishment or one that has pretensions to be so considered, eg: *clothing shop/store*, *jewelry shop/store*; BrE *chips* (esp AmE *french fries*) now occurs in AmE, as a recent borrowing from BrE, in the combination *fish and chips*.

More recent innovations in either area tend to spread rapidly to the other. Thus while radio sets have had *valves* in BrE but *tubes* in AmE, television sets have *tubes* in both, and *transistors* and computer *software* are likewise used in both standards. Mass communication neutralizes differences; the pop music culture, in particular, uses a 'mid-Atlantic' dialect that levels differences even in pronunciation.

The United States and Britain have been separate political entities for two centuries; for generations, thousands of books have been appearing annually; there is a long tradition of publishing descriptions of both AmE and BrE. These are important factors in establishing and institutionalizing the two national standards, and in the relative absence of such conditions other national standards are both less distinct (being more open to the influence of either AmE or BrE) and less institutionalized.

One attitudinal phenomenon in the United States is of sociolinguistic interest. In affirming the students' right to their own varieties of language, many American educationalists have declared that Standard American English is a myth, some asserting the independent status (for example) of Black English. At the same time they have acknowledged the existence of a written standard dialect, sometimes termed 'Edited American English'.

Scotland, Ireland, Canada

- 1.25 Scots, with ancient national and educational institutions, is perhaps nearest to the self-confident independence of BrE and AmE, though the differences in grammar and vocabulary are rather few. There is the preposition *outwith* ['except'] and some other grammatical features, and such lexical items as *advocate* in the sense 'practising lawyer' or *bailie* ['municipal magistrate'] and several others which, like this last, refer to Scottish affairs. Orthography is identical with BrE, though *burgh* corresponds closely to 'borough' in meaning and might almost be regarded as a spelling variant. On the other hand, the

'Lallans' Scots, which has some currency for literary purposes, has a highly independent set of lexical, grammatical, phonological, and orthographical conventions, all of which make it seem more like a separate language than a regional dialect.

Hiberno-English, or Irish English, may also be considered as a national standard, for though we lack descriptions of this longstanding variety of English it is consciously and explicitly regarded as independent of BrE by educational and broadcasting services. The proximity of Great Britain, the easy movement of population, the pervasive influence of AmE, and like factors mean however that there is little room for the assertion and development of a separate grammar and vocabulary.

Canadian English is in a similar position in relation to AmE. Close economic, social, and intellectual links along a 4000-mile frontier have naturally caused the larger community to have an enormous influence on the smaller, not least in language. Though in many respects (*zed* instead of *zee*, for example, as the name of the letter 'z'), Canadian English follows British rather than United States practice, and has a modest area of independent lexical use, eg: *pogey* ['welfare payment'], *riding* ['parliamentary constituency'], *muskeg* ['kind of bog']; in many other respects it has approximated to AmE, and in the absence of strong institutionalizing forces it would continue in this direction. However, counteracting this tendency in language as in other matters is the tendency for Canadians to resist the influence of their powerful neighbour in their assertion of an independent national identity.

South Africa, Australia, New Zealand

- 1.26 South Africa, Australia, and New Zealand are in a very different position, remote from the direct day-to-day impact of either BrE or AmE. While in orthography and grammar the South African English in educated use is virtually identical with BrE, rather considerable differences in vocabulary have developed, largely under the influence of the other official language of the country, Afrikaans; for example, *veld* ['open country'], *kopje* or *koppie* ['hillock'], *dorp* ['village']. Because of the remoteness from Britain or America, few of these words have spread: an exception is *trek* ['journey'].

New Zealand English is more like BrE than any other non-European variety, though it has adopted quite a number of words from the indigenous Maoris (for example *whare* ['hut'] and of course *kiwi* and other names for fauna and flora) and over the past half century has come under the powerful influence of Australia and to a considerable extent of the United States.

Australian English is undoubtedly the dominant form of English in the Antipodes and by reason of Australia's increased wealth, population, and influence in world affairs, this national standard (though still by no means fully institutionalized) is exerting an influence in the northern hemisphere, particularly in Britain. Much of what is distinctive in Australian English is confined to familiar use. This is especially so of grammatical features like adverbial *but* or the use of the feminine pronoun both anaphorically for an inanimate noun (*job* . . . *her*) and also impersonally and nonreferentially for 'things in general':

The job's still not done; I'll finish her this arvo, but. ['... it this afternoon, however.']

A: Are you feeling better?

B: Too right, mate; she'll be jake. ['Absolutely ...; everything will be fine.']

But there are many lexical items that are to be regarded as fully standard: not merely the special fauna and flora (such as *kangaroo*, *gumtree*, *wattle*), but special Australian uses of familiar words (for example *paddock* as a general word for 'field', *crook* ['ill'], *station* ['sheep farm'], *banker* ['river full to its banks'], *washer* ['face cloth']) and special Australian words (for example *bowyang* ['a trouser strap'], *waddy* ['a bludgeon']).

Pronunciation and standard English

- 1.27 The list in 1.25f does not exhaust the regional or national variants that approximate to the status of a standard. Beside the widespread Creole in the Caribbean, for example, there is the increasing recognition that the language of government and other agencies observes an indigenous standard that can be referred to as Caribbean English. Nor have we discussed the emerging standards in countries where English is spoken as a second language (cf 1.34). However, all the variants are remarkable primarily in the tiny extent to which even the most firmly established, BrE and AmE, differ from each other in vocabulary, grammar, and orthography. We have been careful, however, not to mention pronunciation in this connection. Pronunciation is a special case for several reasons. In the first place, it is the type of linguistic organization which distinguishes one national standard from another most immediately and completely and which links in a most obvious way the national standards to the regional varieties. Secondly (with an important exception to be noted), it is the least institutionalized aspect of standard English, in the sense that, provided our grammar and lexical items conform to the appropriate national standard, it matters less that our pronunciation follows closely our individual regional pattern. This is doubtless because pronunciation is essentially gradient, a matter of 'more or less' rather than the discrete 'this or that' features of grammar and lexicon. Thirdly, norms of pronunciation are subject less to educational and national constraints than to social ones: this means, in effect, that some regional accents are less acceptable than others (cf 1.20 Note [a]).

But there is an exception, noted above, to the generalization that regional pronunciation can be used without stigma. In BrE, one type of pronunciation comes close to enjoying the status of 'standard': it is the accent associated with the older schools and universities of England, 'Received Pronunciation' or 'RP'. Because this has traditionally been transmitted through a private education system based upon boarding schools insulated from the locality in which they happen to be situated, it is nonregional, and this – together with the obvious prestige that the social importance of its speakers has conferred on it – has been one of its strengths as a widely-favoured spoken form of the language. But RP no longer has the unique authority it had in the first half of the twentieth century. It is now only one among several accents commonly used on the BBC and takes its place along with others which carry the unmistakable mark of regional origin – not least, an Australian or North

American or Caribbean origin. Thus the rule that a specific type of pronunciation is relatively unimportant seems to be in the process of losing the notable exception that RP has constituted. Nevertheless, RP remains the standard for teaching the British variety of English as a foreign language, as can be easily seen from dictionaries and textbooks intended for countries that teach British English.

RP also shares a distinction with a variety of Midland American pronunciation known as 'network English'. BBC newsreaders are virtually all RP speakers, just as newsreaders on the national radio and television networks in the United States all speak with the 'network English' pronunciation.

In this book we do not attempt to represent the range of variation in pronunciation associated with different national standards. We do, however, record the major differences (using the system of symbols listed on page viii) between RP and network English.

Note The extreme variation that is tolerated in the pronunciation of English in various countries puts a great responsibility upon the largely uniform orthography (cf 1.23) in preserving the mutual comprehensibility of English throughout the world. A 'phonetic' spelling would probably allow existing differences to become greater whereas – through 'spelling pronunciation' with increased literacy – our conventional orthography not merely checks the divisiveness of pronunciation change but actually reduces it.

Varieties according to field of discourse

- 1.28 The field of discourse is the type of activity engaged in through language. A speaker of English has a repertoire of varieties according to field and switches to the appropriate one as occasion requires. The number of varieties that speakers command depends upon their profession, training, and interests.

Typically the switch involves nothing more than turning to the particular set of lexical items habitually used for handling the field in question. Thus, in connection with repairing a machine: *nut*, *bolt*, *wrench*, *thread*, *lever*, *finger-tight*, *balance*, *adjust*, *bearing*, *axle*, *pinion*, *split-pin*, and the like. But there are grammatical correlates to field variety as well. To take a simple example, the imperatives in cooking recipes: *Pour the liquid into a bowl*, not *You should* or *You might care to*, still less *The cook should* ... Or the omission of direct objects that is common in instructional language in general: *Bake at 450°*; *Open (the box at) this end*; *Keep (this bottle) away from children*. More complex grammatical correlates are to be found in the language of technical and scientific description: the passive is common and clauses are often 'nominalized' (cf 17.15ff); thus not usually:

You can rectify this fault if you insert a wedge ...

but rather:

Rectification of this fault is achieved by insertion of a wedge ...

More radical grammatical differences are found in the language of legal documents:

Provided that such payment as aforesaid shall be a condition precedent to the exercise of the option herein specified ...

and in newspaper headlines:

Development Plan for Harlem Fought

The type of language required by choice of field is broadly independent from the variables (dialect, national standard) already discussed. Some obvious contingent constraints are however emerging: the use of a specific variety of one class frequently presupposes the use of a specific variety of another. The use of a well-formed legal sentence, for example, presupposes an educated variety of English.

We shall have occasion in this book to refer to variations in grammar according to the field of discourse with self-explanatory labels. Literature is of course a long-established field, but LITERARY English extends to other fields, for example nontechnical essays on humanistic topics and biographies. Some fields have certain characteristics in common; for example, LEGAL and RELIGIOUS English have numerous forms peculiar to their respective fields, but both may include usages that are otherwise ARCHAIC, though there is a trend away from such archaism in these fields. Poetry too has traditionally used archaic features. Indeed, poetry may deviate from the norms of the language in other respects, particularly in word order. Literary English is sometimes described as poetic if it displays features that are rare in prose.

As with dialects (cf 1.21), there are indefinitely many fields depending on how detailed we wish our discussion to be. LEARNED (or scholarly) language covers a wide range of subject matter (psychology, literary criticism, history, physics, medicine), each of which could be regarded as a separate field, though we shall need to distinguish only the field of SCIENTIFIC discourse. Applications of technology are reflected in INSTRUCTIONAL writing, itself included within TECHNICAL language. But instructional language may range from cooking recipes to instructions for playing games. When learned or technical language is used too obtrusively or (to all appearances) unnecessarily, it is often pejoratively referred to as JARGON.

Jargon may include obtrusive language from other discourse fields, for example JOURNALISTIC and (in particular) BUREAUCRATIC writing. Journalism in its widest sense includes reporting on radio and television, each of which may be distinguished from newspaper reporting. Some features of newspapers call for special consideration, in particular headlines, the language of newspaper headlines.

We have by no means exhausted the fields that have developed their own linguistic expression. Among others we refer to, we may mention advertising and business.

Note Varieties according to field of discourse are sometimes called REGISTERS, though this term is applied in different ways.

Varieties according to medium

- 1.29 The only varieties according to medium that we need to consider are those conditioned by speaking and writing respectively. Since speech is the primary or natural medium for linguistic communication, it is reasonable to focus on the differences imposed on language when it has to be expressed in a graphic

(and normally visual) medium instead. Most of these differences arise from two sources. One is situational: the use of a written medium normally presumes the absence of the person(s) to whom the piece of language is addressed. This imposes the necessity of a far greater explicitness: the careful and precise completion of a sentence, rather than the casual expression supported by gesture and terminating when speakers are assured by word or look that their hearers have understood. As a corollary, since the written sentence can be read and reread, slowly and critically (whereas the spoken sentence is evanescent), writers tend to anticipate criticism by writing more concisely as well as more carefully and elegantly than they may choose to speak.

The second source of difference is that many of the devices we use to transmit language by speech (stress, rhythm, intonation, tempo, for example) are impossible to represent with the relatively limited repertoire of conventional orthography. They are difficult enough to represent even with a special prosodic notation (cf App II). As a consequence writers often have to reformulate their sentences to convey fully and successfully what they want to express within the orthographic system. Thus instead of the spoken sentence with a particular intonation nucleus on *John* (cf App II.11*ff*), one might have to rephrase the sentence in writing to convey the intended focus:

JÖHN didn't do it.

It was not in fact John that did it.

The advantages are not all on one side, however; the written medium has the valuable distinctions of paragraphs, italics, quotation marks, etc, which have no clear analogue in speech.

- 1.30 As with varieties according to field, we are here dealing with two varieties that are in principle at the disposal of any users of English as occasion may demand, irrespective of the variety of English they use as a result of region and education. But again there are contingent constraints: we do not expect speakers with little formal education to compose in written English with the facility that educated speakers acquire. This indeed is what a great deal of education is about.

There are contingent constraints of another kind. Some field varieties of English (legal statutes especially) are difficult to compose except in writing and difficult to understand except by reading. Other varieties are comparably restricted to speech: a radio commentary on a football match will be phrased very differently from a newspaper report of the same game.

Varieties according to attitude

- 1.31 Varieties according to attitude constitute, like field and medium varieties, a range of English any section of which is in principle available at will to any individual speaker of English, irrespective of the regional variant or national standard he may habitually use. This present class of varieties is often called 'stylistic', but 'style' like 'register' is a term which is used with several different meanings. We are here concerned with the choice of linguistic form that proceeds from our attitude to the hearer (or reader), to the topic, and to

the purpose of our communication. We recognize a gradient in attitude between FORMAL (relatively stiff, cold, polite, impersonal) on the one hand and INFORMAL (relatively relaxed, warm, rude, friendly) on the other. The corresponding linguistic contrasts involve both grammar and vocabulary. For example:

Overtime emoluments are not available for employees who are non-resident . . .

Staff members who don't live in can't get paid overtime . . .

While many sentences like the foregoing can be rated 'more formal' or 'more informal' in relation to each other, it is useful to pursue the notion of the common core (cf 1.19) here, so that we can acknowledge a median or unmarked variety of English, bearing no obvious colouring that has been induced by attitude. For example:

This student's work is now much better and seems likely to go on improving.

On each side of this NEUTRAL (and normal) English, we may usefully distinguish sentences containing features that are markedly formal or informal. In the present work, we shall for the most part confine ourselves to this three-term distinction, leaving the middle one unlabelled and specifying only usages that are relatively formal or informal. It should be realized that the neutral term often covers items in one or the other extreme as well. For example, contractions such as *didn't* are appropriate in both informal and neutral English; they are excluded from formal English.

- 1.32 Mastery of such a range of attitudinal varieties seems a normal achievement for educated adults, but it is an acquisition that is not inevitable or even easy for either the native or the foreign learner of a language. It appears to require maturity, tact, sensitivity, and adaptability – personality features which enable the individual to observe and imitate what others do, and to search the language's resources to find an expression to suit his attitude. Young native speakers at the age of five or six have, broadly speaking, one form of English that is made to serve all purposes, whether they are talking to their mother, their pets, their friends, or an aged neighbour. And although this invariant language can cause parents twinges of embarrassment, it is generally recognized that it is a limitation that the child will grow out of.

Foreign learners are in a somewhat similar position. Until their skill in the language is really very advanced, it is attitudinally invariant, though the particular variety is much less predictable than that of the native child. If much of their practice in English has been obtained through textbooks specializing in commercial training, their habitual variety will be very different from that of the learner who has done vacation work helping on a farm. More usually, either an invariant literary (sometimes even an archaic) flavour or an invariant excessively informal flavour occurs in the speech of foreign students. But, in any case, just as the native child's youth inhibits criticism, so the foreign student's accent informs listeners that there are respectable reasons for occasional inappropriateness in the language variety.

- 1.33 The three-way contrast of formal–neutral–informal is not of course adequate to describe the full range of linguistic varieties that are evoked by differences of attitude. We should add at least one category at each end of the scale. On the one hand, we need to account for the extremely distant, rigid (or 'frozen') variety of English sometimes found in written instructions. For example:

Distinguished patrons are requested to ascend to the second floor.

But we must account also for the intimate, casual, or hearty – often slangy – language used between very close friends (especially of a similar age) or members of a family, or used when speakers feel for any other reason that they do not need to bother about what the listener (or reader) thinks of their choice of language. We might thus match the foregoing example with:

(Get) upstairs, you lot!

We now have a potential five-term distinction:

very formal – FORMAL – neutral – INFORMAL – very informal

As we said above (1.31), we chiefly employ the labels 'formal' and 'informal', leaving unmarked the 'neutral' normal style; but we sometimes designate language as 'very formal' or 'very informal', occasionally replacing 'very informal' by 'casual' or 'familiar' as appropriate. The term COLLOQUIAL is also used for the very informal range, but particularly for the spoken language. A further term, SLANG, is needed to denote the frequently vivid or playful lexical usage typical of casual discourse, usually indicating membership in a particular social group.

One final point on attitude varieties. As with the English dictated by field and medium, there are contingency constraints in the normal selection of attitudinal variety. Just as statute drafting (field) normally presupposes writing (medium), so also it presupposes a particular attitude variety: in this case 'very formal'. Similarly it would be hard to imagine an appropriate football commentary on the radio being other than informal, or a radio commentary on the funeral of a head of state being other than formal, though both are in the same medium (speech).

Varieties according to interference

- 1.34 A very different type of variation applies to speakers of English as a second language or foreign language. The variation is caused by interference from another language. The Frenchman who says *I am here since Thursday* is imposing a French grammatical usage on English; the Russian who says *There are four assistants in our chair of mathematics* is imposing a Russian lexico-semantic usage on the English word 'chair'. Most obviously, we always tend to impose our native phonological pattern on any foreign language we learn. The practised linguist is able to detect the language background of students, and this has obvious implications for language teaching in that students can be helped with the problems that give them the greatest difficulty.

At the opposite extreme are interference varieties that are so widespread in a community and of such long standing that they may be thought stable and adequate enough to be institutionalized and hence to be regarded as

varieties of English in their own right rather than stages on the way to a more native-like English. There is active debate on these issues in India, Pakistan, and several African countries, where efficient and fairly stable varieties of English are prominent in educated use at the highest political and professional level and are beginning to acquire the status of national standards. The new cultural settings for the use of English have produced considerable changes: different notions of appropriate style and rhetoric, and an influx of loan words, changes of meanings, and new expressions.

We can also recognize regional supranational varieties such as South Asian English (the English of the Indian subcontinent), East African English, and West African English, and these in turn may share characteristics. For example, in African English, and to some extent in South Asian English, *yes* is commonly used in a negative reply that confirms the speaker's assumption in a negative question:

A: Isn't she in bed?

B: Yes (, she isn't).

African and South Asian English very frequently use *isn't it?* as a universal tag, *They're late, isn't it?*, and often omit articles required in the major standard varieties, *They gave us hard time*.

Creole and pidgin

- 1.35 At an extreme of a different kind, there are the interference varieties known as creole and pidgin. It is a matter of debate, and to some extent politics, whether these should be regarded as falling within the orbit of the English language. Since, however, the expressions 'creole English' and 'pidgin English' are in common occurrence, we should say something about them, although they will not be described in this book. They have traditionally been used chiefly by the less prosperous and privileged sections of a community but have also been stable over several generations.

Pidgin is technically distinguished from creole by being essentially a second language used to replace a native language for restricted public (especially commercial) purposes rather than to conduct family affairs and talk to one's children. On the other hand, a creole is a native language. It is usually more varied than a pidgin, but it tends to be restricted to local, practical, and family matters. Political, educational, and sociolinguistic thought vacillates as to whether such creolized forms of English (as in Sierra Leone or the Caribbean) should be given official status or not. Would creole speakers benefit from the self-assurance this might give, or (since the elite in their society would still learn a more international English in addition) would the danger be that this would tend to perpetuate their underprivileged status? Here is a sample of Jamaican Creole in an orthography that already suggests partial institutionalization:

Hin sed den, 'Ma, a we in lib?' Hie sie, 'Mi no nuo, mi pikini, bot duon luk fi hin niem hahd, ohr eni wie in a di wohld an yu kal di niem, hin hie unu.' Hin sed, 'Wel Ma, mi want im hie mi a nuo mi.' 'Lahd nuo, masa! Duo no kal di niem, hin wi kom kil yu.' Hin sie, 'Wel Ma, hin wi haf fi kil mi.' (see Note [a])

Creole is normally the principal or sole language of its speakers, being transmitted from parent to child like any other native language. Moreover, for all its evidence of interference from other languages, a creolized form of English is usually more like ordinary English than a pidgin English is, and it gives less impression of being merely a drastic reduction of ordinary English.

Here are samples of Hawaiian Pidgin that are typical of three ethnic groups: Korean (a), Filipino (b), and Japanese (c):

- (a) Aena tu macha churen, samawl churen. Haus mani pei. Mai churen go sakul, teiki haus mani pei, aeswai koria kim neim wan moa taim mi meri. (see Note [b])
- (b) Ai go tel, 'Ae, mi no mo hapai klos oni diskain klos, da ispital-kain klos. Oni hia yu kaen hanapa, wahini-kain.' 'Orait, pau hana time, po klak, siks klak hi kam, hi go hapai yu klos.' (see Note [c])
- (c) Samtaim gud rod get, samtaim, olsem ben get, enguru get, no? Olsem hyumen life, awl, enikain, stawmu get, nais dei get. Olsem, enibadi, mi olsem, smawl-taim. (see Note [d])

The definitions we have given may suggest an unjustified dichotomy between creoles and pidgins, and may also suggest that they are stable autonomous language systems. We should rather consider creoles and pidgins as not discrete stages in a changing process. On the one hand, through repidginization a creole comes to be used as a second language by neighbouring peoples who have little contact with the European language on which the creole is based. On the other hand, through decreolization a creole tends to merge with the European language when the creole speakers and the European language speakers are in frequent contact. Moreover, both creoles and pidgins may admit a very large amount of variation. A pidgin in its early stages of development, such as the English-based Hawaiian Pidgin, is highly unstable; we similarly find considerable instability in a repidginized creole, as in the second language use of the English-based Krio. When a creole is undergoing decreolization, as with the English-based Guyanese Creole, it can best be analysed as a continuum of varieties on a scale of least to most different from the European language. By contrast, Tok Pisin, which began as pidgin English in Papua New Guinea, has become highly institutionalized through use in education, government, and the media, and may already have some currency as a native language.

- Note [a] He said then, 'Ma, and where does he live?' She says, 'I don't know, my child, but don't look hard for his name, or anywhere in all the world that you call the name, he will hear you.' He said, 'Well, Ma, I want him to hear me and know me.' 'Lord, no, master! Do not call the name, he will come and kill you.' He says, 'Well ma, he will have to kill me.'
- [b] And I had too many children, small children. I had to pay for the house. My children were going to school, I had to take rent money to pay for them, that's why I married a second time a Korean named Kim.
- [c] I said, 'Hey, I've no clothes to wear but those clothes, hospital clothes. You can only fasten them here, they're like women's clothes.' 'All right, after work, at four, six o'clock he'll come, he'll bring your clothes.'
- [d] Sometimes there's a good road, sometimes, there's things like bends, angles, right? Human life is just the same, there's all sorts of things, storms, nice days. It's like that for everyone, for me too, when I was young.

Relationships among variety types

- 1.36 Varieties within each type of variation may be viewed in principle as independent from each other. Users of English may retain recognizable features of any regional variety in their use of a national standard; within that standard, they can discourse in English that is appropriate to their particular occupation or hobbies; they can handle these topics in English appropriate to either speech or writing; in either medium, they can adjust their discourse on any of the topics according to the respect, friendliness, or intimacy they feel for their hearers or readers. And all of this would apply equally if they are proficient in English as a foreign or second language and their use of English is affected by interference from their native tongue.

At the same time, the variation is to a large extent interdependent. We have drawn attention to several contingent constraints (for example, in 1.28), and we now consider the types of interdependence as they affect the varieties system as a whole.

Regional variation has been explicitly connected with the educational varieties: a person educated in Ohio will adopt standard AmE, not BrE. Similarly, for speakers of an interference variety: someone learning English in Europe or India is likely to approach a standard with BrE orientation; in Mexico or the Philippines, with an AmE orientation.

- 1.37 Next are varieties relating to fields of discourse. Certain fields of activity (farming and shipbuilding, for example) are associated with specific regions; clearly, it is in the dialect of these regions that the language of daily discourse on such activities is fully developed. In other fields (medicine, nuclear physics, philosophy) we expect to find little use of nonstandard English or of regionally distinctive English. On the other hand, we expect AmE to predominate in discussions of baseball and BrE in discussions of cricket.

Since writing is an educated art, we normally expect the educated English of one or other national standard in this medium. Indeed, when we occasionally try to represent uneducated English in writing, we realize acutely how narrowly geared to standard English are our graphic conventions. For the same reason there are subjects (for example, coaching a football team) that can scarcely be handled in writing and others (for example, legal statutes) that can scarcely be handled in speech.

Attitudinal varieties have a great deal of independence in relation to other varieties: it is possible to be formal or informal on biochemistry or politics in AmE or BrE, for example. But informal or casual language across an 'authority gap' or 'seniority gap' (a student talking to an archbishop) presents difficulties, and on certain topics (funerals) it would be considered distasteful. And very formal language when the subject is courtship or football would seem comic.

- 1.38 Finally, the interference varieties. At the extremes of creole and pidgin there is especial interdependence between the form of the language and its functions. Indeed, pidgins tend to be restricted to a few practical matters, though we have noted the expansion of functions in Tok Pisin (cf 1.35).

As to English taught at an advanced level as a second or foreign language, it is to be hoped that enough proficiency is achieved to allow the users the

flexibility they need in handling (let us say) public administration, a learned profession such as medicine with its supporting medical journals, and informal conversation. Students are likely to be handicapped if they are taught English at the formal or informal levels only, or the spoken or written language only, or are restricted to the English necessary for a particular occupation ('English for engineers', for example).

Variation within a variety

- 1.39 We need to make two final points about variation in the use of English. First, the various conditioning factors (region, medium, attitude, for example) each constitute a continuum rather than a discrete category.

Secondly, we may not be able to account always for the choice of one rather than another linguistic form; we sometimes find *DIVIDED USAGE*, a choice between variants, the conditions for which cannot be attributed to the variety distinctions discussed in this chapter.

For example, we can say (or write) one or the other of each of these pairs:

He stayed a week. ~ He stayed for a week.

I consider her my friend. ~ I consider her as my friend.

I don't know whether I can be there. ~ I don't know if I can be there.

Neither member of such pairs is necessarily linked to any of the varieties that we have specified. Attempts have been made to find a basis for at least some of this seemingly random variation (often called 'free variation'). For example, it has been claimed that certain language varieties (termed 'randomly distributed dialects') define groups of speakers who are not associated regionally or sociologically, the groups being characterized by linguistic features that are related systematically.

- 1.40 It may help to see variation in terms of the relationships depicted in Fig 1.40, where both the verticals represent a 'more-or-less' opposition. The upper pole of the first vertical corresponds to the features of greatest uniformity, such as the invariable past tense of *bring* in the educated variety of English, or the many features characterizing the main stable common core

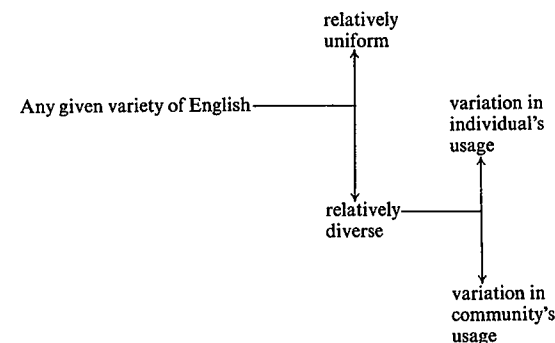

Fig 1.40 Variation within a variety

of the language, such as the position of the article in a noun phrase. The lower pole of the first vertical corresponds to the area of fluctuation illustrated in 1.39. The second vertical represents the situation in which, on the one hand, an individual may indulge in such a fluctuation (*I wonder whether* one moment and *I wonder if* a little later), and on the other hand, there may be fluctuation within the community as a whole (one member appearing to have a preference for *He didn't dare ask* and another a preference for *He didn't dare to ask*). This appears to be a natural state of affairs in language. Language change is constantly occurring in all languages and in all varieties of language with the result that older and newer variants always coexist; and some members of a society will be temperamentally disposed to use the new (perhaps by their youth) while others are comparably inclined to the old (perhaps by their age). But many will not be consistent either in their choice or in their temperamental disposition. Perhaps English may give rise to such fluctuation more than some other languages because of its patently mixed nature: a basic Germanic wordstock, stress pattern, word-formation, inflection, and syntax overlaid with a classical and Romance wordstock, stress pattern (*cf App II.4*), word-formation (*cf App I.28f*) – and even inflection and syntax.

Attitudes to variation

- 1.41 At various places in this chapter we have had occasion to refer to language attitudes; for example, the official acceptance of English as a neutral second language (1.4) and the views on the present state of the language expressed by native speakers (1.11). As we have indicated in 1.1, the current preeminence of English as an international language reflects its practical values, not some assumed aesthetic or linguistic qualities. The growing local acceptance of second-language educated varieties as standards derives from demands for national autonomy, an autonomy that was achieved long ago by transplanted varieties in native English-speaking countries, notably the United States of America. Increasing tolerance (by no means universal) for second-language varieties and for local nonstandard varieties reflects views that each speech community has a right to its own language and that no variety is intrinsically superior.

Standard varieties continue to enjoy general prestige. They are more differentiated, especially lexically, entering into a wider range of functions and situational domains. The prestige of these varieties and their official maintenance ensure, at least for the written medium, a neutral comprehensible language within particular English-speaking countries and (to a major extent) internationally.

Certain regional or social varieties are generally held in higher esteem than others because they are associated with more prestigious groups. Justification for the higher esteem is sometimes sought in claims that they are more logical or closer to some pristine state of the language. For similar reasons, some language features are more highly regarded than their variants. Language attitudes and language behaviour do not necessarily coincide. Despite their acceptance of commonly-held evaluations, many continue using stigmatized varieties or variants because they feel more comfortable with what they are used to, or because they want to retain their membership of a particular

speech community. Those who are competent to do so may adjust their variety to suit their audience, particularly in the spoken medium, and are likely to monitor their language in the direction of standard varieties in the written medium, especially in formal style. On the other hand, some may retain stigmatized varieties or variants because they reject the evaluations of others.

Acceptability and frequency

- 1.42 The metaphor of the common core points to a distinction that applies to two other aspects of our description of English grammar. We distinguish between the central and the marginal also for acceptability and frequency.

Acceptability is a concept that does not apply exclusively to grammar. Native speakers may find a particular sentence unacceptable because (for example) they consider it logically absurd or because they cannot find a plausible context for its use or because it sounds clumsy or impolite. However, we are concerned only with the acceptability of forms or constructions on the grounds of their morphology or syntax.

In general, our examples are fully acceptable if they are left unmarked. But we sometimes contrast acceptable and unacceptable examples, marking the latter by placing an asterisk '*' before them. If they are tending to unacceptability but are not fully unacceptable, we put a query '?' before the asterisk. A query alone signifies that native speakers are unsure about the particular language feature. If native speakers differ in their reactions, we put the asterisk or query in parentheses. Our assessment of native speaker evaluations reflect in part our own research: elicitation experiments with informants in the United States and Britain.

Assessments by native speakers of relative acceptability largely correlate with their assessments of relative frequency; we have conducted experiments to elicit frequency judgments too. But we have also drawn on our research and that of others into the frequencies of language phenomena in several important corpora, preeminently:

- (a) the corpus of the Survey of English Usage (SEU), covering spoken as well as written texts of British English
- (b) the Brown University corpus, comprising samples of American printed English
- (c) the parallel Lancaster-Oslo/Bergen corpus (LOB), comprising samples of British printed English

We leave unmarked those features of the language that occur frequently, drawing attention just to those that occur extremely frequently or only rarely.

Our approach in this book is to focus on the common core that is shared by standard British English and standard American English. We leave unmarked any features that the two standard varieties have in common, marking as <BrE> or <AmE> only the points at which they differ. But usually we find it necessary to say <esp(ecially) BrE> or <esp(ecially) AmE>, for it is

rare for a feature to be found exclusively in one variety. Similarly we do not mark features that are neutral with respect to medium and attitude. We distinguish where necessary spoken and written language, generally using 'speaker' and 'hearer' as unmarked forms for the participants in an act of communication, but drawing on the combinations 'speaker/writer' and 'hearer/reader' when we wish to emphasize that what is said applies across the media. We also frequently need to label features according to variation in attitude, drawing attention to those that are formal or informal.

In this book we offer a descriptive presentation of English morphology and syntax with a minimum of formalism. We make a direct connection between morphological and syntactic forms and their meaning, conducting excursions into lexicology, semantics, and pragmatics where these impinge closely on our grammatical description.

Note The terms 'grammatical' and 'ungrammatical' are commonly used by nonspecialists as synonyms of 'acceptable' and 'unacceptable'. We have avoided using the former terms in this book because of the various meanings which they have even among linguists.

Bibliographical note

On international varieties of English see Bailey and Görlach (1982); Kachru (1982); Quirk (1972), Chapters 1-7. Major works on regional varieties (including general bibliographies, dictionaries, and some accounts of social variation) are listed at the end of Bailey and Görlach (1982). Two series of books are in progress: *Varieties of English Around the World*, published by John Benjamins (Amsterdam and Philadelphia), and *English in the International Context*, published by Pergamon (Oxford). The journal *English World-Wide* is devoted to scholarly articles on English varieties world-wide.

On the international use of English, see Fishman et al (1977) and the data in the Statistical Yearbooks published by UNESCO and the United Nations.

On 'Nuclear English', see Quirk (1982), 37-53.

On variation in British and American English see Beaugrande (1983); Crystal and Davy (1969); Ferguson and Heath (1981), Parts I and IV; Hughes and Trudgill (1979); Joos (1962); Labov (1972); McDavid (1963). On random variation, see Carden (1973).

On creoles and pidgins see Valdman (1977). The samples of Hawaiian Pidgin came from Bickerton and Odo (1976).

On acceptability in general, see Greenbaum (1977b). On the relationship between syntactic frequency and acceptability, see Greenbaum (1976c). Evaluations of language attitudes and use appear in Bolinger (1980a); Daniels (1983); Greenbaum (1985); Michaels and Ricks (1980); Quirk (1982), esp Chapters 1, 2 and 4.

For a survey of attitudes to specific usage problems in British English, see Mittins et al (1970). The treatment of usage problems by American dictionaries and guides to usage is evaluated in Cresswell (1975). Opinions expressed in the leading American guides to usages are summarized in Copperud (1980). Popular guides to usage include Fowler (1965) and Partridge (1973) for British usage, and Bernstein (1965) and Follett (1966) for American usage.

This chapter and its relation to later chapters

The plan of this grammar

- 2.1** Grammar is a complex system, the parts of which cannot be properly explained in abstraction from the whole. In this sense, all parts of a grammar are mutually defining, and there is no simple linear path we can take in explaining one part in terms of another. The method of presentation adopted in this book will be to order the description of English grammar so that features which are simpler (in the sense that their explanation presupposes less) come before those which are more complex (in the sense that their explanation presupposes more).

Our mode of progression can be best described as cyclic, rather than linear. In this way, a topic dealt with earlier in a cursory way can be taken up later for more extended treatment. There are three cycles: (a) Chapter 2; (b) Chapters 3 to 11; (c) Chapters 12 to 19.

The present chapter, which constitutes the first cycle, presents a general outline of English grammar and of its major concepts and categories, with particular reference to the simple sentence.

The second cycle, Chapters 3 to 11, is concerned with the basic constituents which make up the simple sentence. Thus Chapters 3 and 4 present the grammar and semantics of the verb phrase, and Chapters 5 and 6 the basic constituents of the noun phrase, in particular determiners, nouns, and pronouns. Chapter 7 deals with adjectives and adverbs, Chapter 8 with adverbials, and Chapter 9 with prepositions and prepositional phrases. In the light of these detailed studies, Chapters 10 and 11 then re-examine the simple sentence in all its structural variety.

The third cycle treats matters which involve more complex sentence structure. Chapters 12 and 13 move beyond the simple sentence, dealing with substitution, ellipsis, and coordination: three operations which may be carried out on simple sentences in order to produce structures of greater or less complexity. Chapters 14 and 15 introduce a further factor of complexity – the subordination of one clause to another – thereby leading to a more general study of the complex sentence. Chapter 16 follows up Chapters 3 and 4 in giving further attention to the verb phrase, with special reference to verb classification, together with issues relating to phrasal and prepositional verbs, and to verb and adjective complementation. Similarly, Chapter 17 resumes the topic of Chapters 5 and 6, exploring the full complexity of the noun phrase in terms of structures separately examined in earlier chapters. Chapter 18 also involves a knowledge of the whole grammar as described in preceding chapters, but this time with a view to presenting the various ways in which individual parts of a sentence can be arranged for focus, emphasis, and thematic presentation. Finally, Chapter 19 considers the ways in which sentence grammar relates to the formation of texts, including those comprising extended discourse in speech or writing.

The three Appendices summarize aspects of English which, though strictly peripheral to grammar, nevertheless impinge on it at many points, necessitating frequent reference in the body of the book to the topics concerned. They are word-formation (Appendix I); stress, rhythm, and intonation (Appendix II); and punctuation (Appendix III).

Each of the chapters and appendices ends with a bibliographical note giving guidance on further reading relevant to the material just presented. We concentrate in these notes on references to recent and germinal contributions, particularly in learned monographs and articles. We assume, normally without further recommendation, that the reader will consult the major grammarians of the past, whose works are of course cited in the general Bibliography at the end of this book: for example, the compendious studies by Curme, Jespersen, Kruisinga, Poutsma, Sweet, Visser, and others; to which (as well as to the bibliography by Scheurweghs and Vorlat) all succeeding grammarians are heavily indebted.

Note Word-formation is sometimes considered a part of grammar. See 1.14ff for a discussion of various uses of the term 'grammar', and the meaning of 'grammar' assumed in this book.

The purpose of this chapter

- 2.2** This chapter outlines the structure of the English sentence in such a way as to provide, as it were, a small-scale map of the territory to be explored in some detail in the main body of the book. As with all small-scale maps, most of the details have to be ignored, and complicated contours have to be smoothed out and simplified. But in compensation, it is intended that the details included in the chapter are more important for English grammar than those which are omitted. In particular, the chapter aims (a) to provide a general introduction to English grammar; and (b) to introduce important concepts and categories to which it will be necessary to make frequent reference in the larger-scale expositions of Chapters 3 to 19.

Parts of the sentence

Grammatical units

- 2.3** In order to state general rules about the construction of sentences, it is constantly necessary to refer to units smaller than the sentence itself: units such as those which are commonly referred to by the terms **CLAUSE**, **PHRASE**, **WORD**, and **MORPHEME** (cf 2.7). The relation between one unit and another unit of which it is a part is **CONSTITUENCY**. We may thus say that in [1], *the evenings*, *have turned*, *very cold*, and *just recently* are **CONSTITUENTS** of the whole sentence:

[The evenings][have turned][very cold][just recently]. [1]

One way of indicating constituency is by bracketing, as in [1]; another is by a tree diagram:

Fig 2.3a

Clearly the constituents of Fig 2.3a themselves contain units, namely the individual words of which they are composed; therefore, a fuller tree diagram would be:

Fig 2.3b

This again may be presented more economically, if less clearly, in terms of bracketing:

[[The][evenings]][[have][turned]][[very][cold]][[just][recently]]. [1a]

Furthermore, the words themselves in some cases consist of two or more units of smaller size: *evening* + *s*, *turn* + *ed*, *recent* + *ly*:

Fig 2.3c

A tree diagram is more informative if it labels the constituents as instances of particular units or classes of units; Fig 2.3b, for example, may be reconstituted as follows:

Fig 2.3d

Three 'sizes' of unit have here been distinguished: clause, phrase, and word. A further level would distinguish morphemes (*evening*, *-s*, *recent*, *-ly*) as constituents of words (cf 2.7). The terms for different phrases (noun phrase, adjective phrase, etc) obviously reflect the character of the words which are the main constituents of these units.

Constituents

- 2.4** Figure 2.3d shows constituents simply as the smaller parts into which a unit can be divided. We may extend this part-whole relation to include units which are only indirectly part of a larger unit: thus in Fig 2.3d not only [the

evenings], but indirectly also [*the*] and [*evenings*], *evening* and *-s* are constituents of the whole clause. But it is useful to reserve the term IMMEDIATE CONSTITUENT for those units which are the parts into which another unit is immediately divisible: thus the verb phrase [*have turned*] is an immediate constituent of the whole clause, and the auxiliary [*have*] and the main verb [*turned*] are immediate constituents of the verb phrase [*have turned*].

More important, in one respect constituency does not correspond to our ordinary understanding of the part-whole relationship. One unit may be a UNITARY CONSTITUENT of another unit; *ie*, it may be the only 'part' into which another unit can be analysed. (UNITARY CONSTITUENCY may thus be distinguished from MULTIPLE CONSTITUENCY, where a unit is divided into two or more immediate constituents.) Traditional grammar has acknowledged this concept of unitary constituency in certain respects. For example, it has been normal to say that a SENTENCE may consist of a single clause, as in Fig 2.3d. Such sentences are called SIMPLE SENTENCES, and are distinguished from COMPLEX or COMPOUND SENTENCES, which include two or more clauses. (For further discussion of these distinctions, cf 10.1, 14.2f.) Thus while example [1] is a simple sentence, exhaustively analysed into a single clause, [1b] is a compound sentence:

The evenings have turned very cold just recently, but the
afternoons have been quite warm.

[1b]

It has also been normal to say that a word may consist of just one morpheme, or of more than one: *night*, for example, consists of a STEM alone, while *nights* consists of the same stem followed by the inflectional SUFFIX *-s*.

On the other hand, the term PHRASE has traditionally been applied to a unit consisting of more than one word, and this has meant some inconsistency in the interpretation of grammatical constituency. Avoiding this inconsistency, many modern grammarians have used the term 'phrase' to refer to a constituent consisting either of *one* word or of *more than one* word, and this usage will be followed in this book. In the following sentence, therefore, all the bracketed segments are phrases:

[The evenings] [have turned] [cold] [recently].

[1c]

Note [a] An analogy with chemistry is suggested: a phrase, like other grammatical units, is rather like a molecule, which may consist of a single atom, or of a combination of atoms bound together within a larger structure.

[b] Ideally, it would be convenient to make a terminological distinction between 'simple' units which have one constituent and 'complex' units or 'compound' units which have more than one. Unfortunately, however, this terminological convention might cause confusion, since grammatical tradition has preempted the terms 'complex' and 'compound' for purposes not entirely consistent with it. For example, the distinction between simple and compound sentences is different from the distinction between simple and compound nouns. Our use of the terms 'complex' and 'compound' will be made clear in later chapters; cf 10.1, 14.2f, and App I.57.

[c] Linguists differ on what are the immediate constituents of a clause. The above description represents the basis of our system of clause analysis, to be further developed in 2.13ff.

[d] Some linguists use the term 'sentence' for a clause which is part of a sentence.

Chain and choice relationships

- 2.5 The principle which allows both unitary and multiple constituents of a grammatical unit goes against the commonsense understanding of 'parts' and 'wholes', and therefore needs some justification. The justification lies in a distinction between CHAIN (*ie* syntagmatic) and CHOICE (*ie* paradigmatic) relationships among linguistic constituents. The chain relationship is an 'and' relationship, whereas the choice relationship is an 'or' relationship. Thus if two units *X* and *Y* occur one after the other in a larger unit, they are in a chain relationship, *X* + *Y*. But if *X* and *Y* can be substituted for one another in a larger unit, they are in a choice relationship, *X*/*Y*. (Substitution here means 'commutability', *ie* acceptable replacement in terms of the structure of the sentence, not necessarily in terms of meaning.) In examining a single sentence, we can observe only the chain relationships, and indeed, if we were interested only in chain relationships, we might be satisfied simply to represent a sentence as a sequence of morphemes as follows:

The + evening + s + have + turn + ed + very + cold + just
+ recent + ly.

Note It is worth observing, in passing, that choice relationships are made explicit in certain types of appositional self-correcting constructions; *eg*: *They were constantly quarrelling – well, arguing, anyway* (cf 17.80).

- 2.6 When, however, we consider what are the possibilities of English grammar (for example, what does and what does not make a grammatical sentence in English), we have to investigate choice relationships. Describing English grammar involves stating what choices exist in the construction of English sentences, and what the relations are between these choices. It is on this basis that it is necessary to distinguish units of different 'sizes', and to recognize the choices which exist at different levels of constituency. From here, consideration of examples like [1] and [2] leads to the recognition of unitary constituents:

(a)	(b)	(c)	(d)	
{ The weather }	{ has been }	{ very cold }	{ just recently }	[1]
{ It }	{ was }	{ cold }	{ recently }	[2]

(Braces {}, as well as the oblique stroke (or slash) /, are used in this grammar to indicate choice relations.)

In each of the structural positions (a–d) either a single word or a combination of words may be used. In this sense we may say that *the weather/it, very cold/cold*, etc in [1] and [2] are COMMUTABLE. We may also say that by virtue of this commutability, *very* and *just* in [1] are OPTIONAL constituents of the phrases in which they occur, and such optionality is indicated, in this grammar, by the use of parentheses ():

The weather has been (very) cold (just) recently. [3]

A typical English sentence will in fact contain a mixture of simple and complex units:

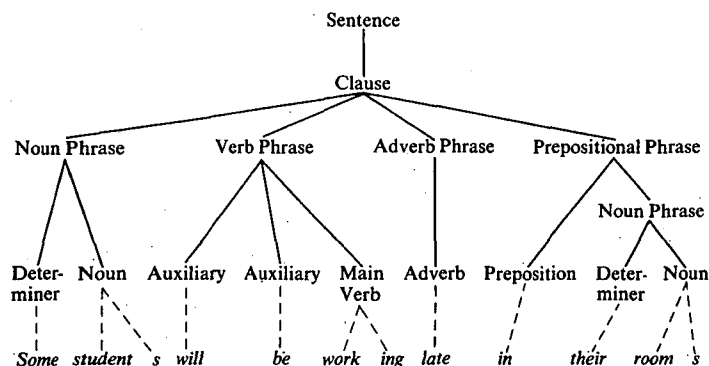

Fig 2.6

The occurrence of unitary constituents means that there is nothing contradictory in describing the same linguistic item on one occasion as a unit of one kind, and on another occasion as a unit of a different kind. For example, *late* in Fig 2.6 may be equally correctly described as an adverb phrase, as an adverb, or as a stem morpheme. When we say '*late* is an *X*', where *X* is the name for some grammatical unit or category, this identification means, more precisely, that *late* is a REALIZATION (or 'specimen') of *X*, and this does not rule out the possibility of its being at the same time a realization of some other unit or category *Y*. For this reason, any grammatical statement of the form '*i* is an *X*' (where *i* is an item, say a word or a sequence of words) is likely to be incomplete; but this form of words is so convenient that in spite of its incompleteness, we shall use it in this grammar when no confusion can arise.

The most extreme case of such multiple realization is that of a one-morpheme sentence such as the imperative *Hurry!* Here we may describe the same item as a sentence, a clause, a phrase, a word, or a morpheme.

The grammatical hierarchy

- 2.7 The existence of unitary constituents also leads to a superficial difficulty in talking of units of different 'size' or 'length'. As a particular unit may consist of one, or more than one, unit of a different kind, it follows that we cannot say, in a literal commonsense way, that 'a phrase is longer than a word', or 'a clause is larger than a phrase'. But at the same time, there is a hierarchical ranking of units in terms of their POTENTIAL size. Thus, although a given phrase (say *late* in Fig 2.6) may be no larger than a word, the choice category to which it belongs, that of adverb phrases, may have other realizations much longer than a single word, including such phrases as *quite late*, *quite late enough*, *very much later than I expected*. In this sense, units of grammar may be placed in a hierarchy of POTENTIAL SIZE or EXTENSIBILITY as follows:

HIGHEST UNIT: SENTENCES, which consist of one or more
CLAUSES, which consist of one or more

PHRASES, which consist of one or more
WORDS, which consist of one or more

LOWEST UNIT: MORPHEMES

By MORPHEME we understand a minimum unit of form and meaning which may be a whole word (*forget*), an inflection such as *-s* (*forget + s*) or a word-formation affix such as *un-*, *-ful* (*un + forget + ful*). On the sentence as the highest grammatical unit, cf 2.11.

In this hierarchy, the WORD is a unit of particular importance because it is the unit which primarily relates the grammar of a language to its lexicon (cf 2.34). Consequently the relation between words and their component morphemes is somewhat different from that which obtains between other units and their immediate constituents. The combination of morphemes in words is constrained not only by grammatical but by lexical considerations (cf App I.1ff), and the discrete segmentation of words into sequences of morphemes is not always possible – consider, for example, the relation between *crisis* and *crises*, between *sane* and *sanity*, or between *sing* and *sung*. It is because of these and other differences that grammar is generally divided (cf 1.14) into morphology (dealing with the internal form of words in so far as this is a grammatical matter; cf 2.35) and syntax (dealing with the way in which words are combined to form sentences).

Embedding

- 2.8 The above hierarchy still represents an oversimplified view of the relation between units. In Fig 2.6 it can be observed that one kind of phrase, the prepositional phrase *in their rooms*, contains as a constituent another phrase, the noun phrase *their rooms*. This is an example of the phenomenon of EMBEDDING which accounts for the indefinite extensibility of certain units of grammar. Both the noun phrase and the prepositional phrase may be immediate constituents of a clause, as are *some students* and *in their rooms* in the sentence of Fig 2.6:

Some students will be working late in their rooms.

Both units likewise can consist of more than one word (prepositional phrases, indeed, must normally consist of at least two words). There is therefore no reason to describe one unit as more extensible than the other; they are both, as phrases, placed at the same position in the hierarchy. But each unit can be a constituent of the other:

Fig 2.8

This means that, by repeated embedding, both a noun phrase and a prepositional phrase can be indefinitely extended:

NOUN PHRASE: some students [at [the college [on [the other side [of [the park [at [the north end [of . . .]]]]]]]]]

PREPOSITIONAL PHRASE: on [the top floor [of [a house [in [the corner [of [the old square [behind [the church . . .]]]]]]]]]

In practice, of course, phrases of this degree of complexity rarely occur; but it is important to recognize that however long such a phrase may be, there is always the possibility of making it longer by further embedding. Moreover, the indefinite length of noun phrases and prepositional phrases does not affect their position in the grammatical hierarchy, since however long a phrase may be, the clause which contains it will always be (potentially) longer:

I have been talking to *some students at the college on the other side of the park at the north end of . . .*

They live on *the top floor of a house in the corner of the old square behind the church . . .*

Embedding, as we have illustrated it so far, can be defined as the occurrence of one unit as a constituent of another unit at the same rank in the grammatical hierarchy. (As we shall see in 2.9, the embedded unit need not be an *immediate* constituent of the equivalent unit in which it is embedded.)

Subordination

- 2.9 Another kind of embedding occurs when one clause is made a constituent of another clause: the case normally described as **SUBORDINATION**. The two clauses in [1] and [2] constitute simple sentences, but it is also possible to combine them into a single (complex) sentence, by subordinating one to the other, as in [3]:

The weather has been remarkably warm. [1]

We returned from Italy last week. [2]

The weather has been remarkably warm since we returned from Italy last week. [3]

Clauses which are embedded in other clauses (eg: *since we returned from Italy last week* in [3]) are **SUBORDINATE** clauses, and they are often introduced by a subordinating **CONJUNCTION** (*since* in [3]). The subordinate clause in [3] is parallel in its function to the adverb phrase *just recently* in Fig 2.3d, and is indeed termed an 'adverbial clause' (cf 15.17ff). On the other hand, it is itself divisible into phrases in a way which makes it parallel to the whole clause in Fig 2.3d. The relation between the two clauses of [3] is one of 'part to whole', as is illustrated by the abbreviated tree diagram, Fig 2.9a, opposite.

Subordination of clauses is not confined to clauses which are immediate constituents of other clauses. There are also clauses (especially those termed **relative clauses**; cf 17.9ff) which are constituents of phrases, and which therefore are only indirectly embedded within a larger clause, cf Fig 2.9b opposite.

Once again, embedding gives rise to the theoretical possibility of grammatical units having indefinite length. The familiar nursery chant *The*

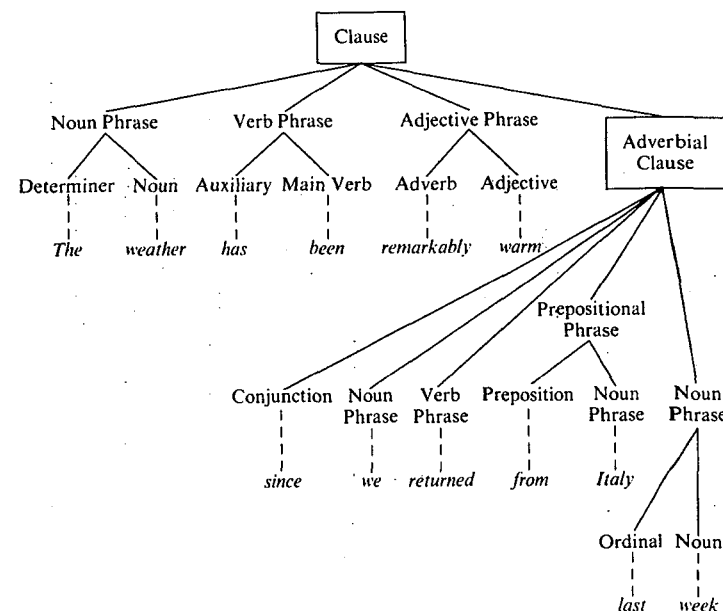

Fig 2.9a

Note Morphemes and unitary constituents (eg the Noun constituent above *Italy*) have not been included in this diagram.

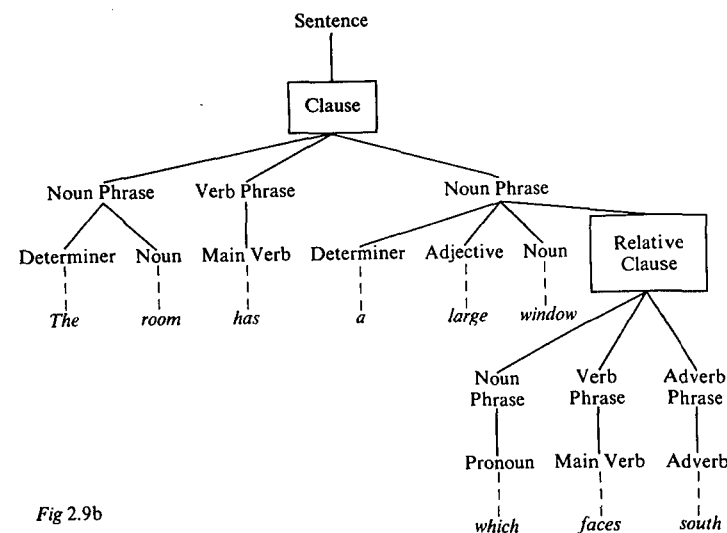

Fig 2.9b

House That Jack Built shows how repeated subordination of one relative clause to another leads to the construction of sentences of ever-increasing length:

This is the house [that Jack built].

This is the malt [that lay in the house [that Jack built]].

This is the rat [that ate the malt [that lay in the house [that Jack built]]].

This is the cat [that killed the rat [that ate the malt [that lay in the house [that Jack built]]]].

etc

Coordination

- 2.10 The principle of indefinite extensibility is also present in grammar in another respect: two or more units of the same status on the grammatical hierarchy may constitute a single unit of the same kind. This type of construction is termed COORDINATION, and, like subordination, is typically signalled by a link-word termed a conjunction: in this case a COORDINATING conjunction. The most common coordinating conjunctions are *and*, *or*, and *but*:

COORDINATION OF CLAUSES:

[[It was Christmas Day,] and [the snow lay thick on the ground]]. [1]

COORDINATION OF PREPOSITIONAL PHRASES:

You can go [[by air] or [by rail]]. [2]

COORDINATION OF NOUNS:

His [[son] and [daughter]] live in Buenos Aires. [3]

In these examples, the coordinated units are respectively clauses, phrases, and words. Coordination has many variations and complications which cannot be illustrated here (*cf* Chapter 13), but its essential principle is that units and structures may be duplicated without affecting their position in the grammatical hierarchy. Thus appropriate tree diagrams for [2] and [3] show the bifurcation of one unit into two linked units of equal status:

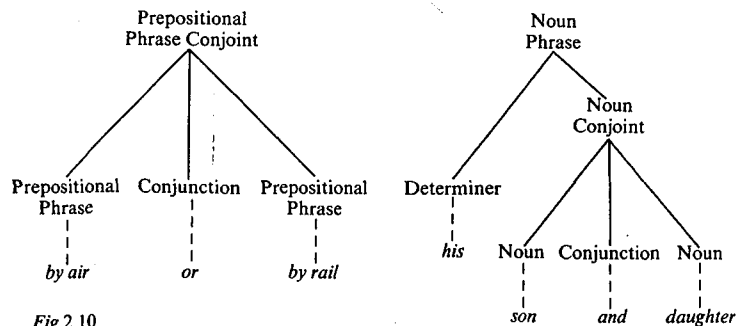

Fig 2.10

The constituent which contains the coordinated units as its immediate constituents is here labelled a 'conjoint' item, to mark its internal composition, but it is otherwise equivalent in its status to each of its coordinated constituents, or CONJOINS (*son*, *daughter*, etc).

These examples show the most common case, where the conjoint contains only two coordinated units; but the number of coordinated constituents is open-ended. We may compare the phrase *his son and daughter* in [3] with the treble coordination of *his wife, son, and daughter* (noting that the coordinating conjunction normally occurs before only the last conjoint), or with the more extended coordination of:

The colours of the rainbow are *blue, green, yellow, orange, red, indigo, and violet*.

or with the theoretical extremity of an infinitely long coordination:

The positive integers are *one, two, three, four, five, six, seven, ...*

Note Conjoints are called 'conjuncts' by some grammarians, but in this grammar we use the latter term for linking adverbials (*cf* 8.134*ff*).

Sentences

- 2.11 It is usually assumed that the SENTENCE is the highest-ranking unit of grammar, and hence that the purpose of a grammatical description of English is to define, by means of whatever descriptive apparatus may be necessary (rules, categories, etc), what counts as a grammatical sentence in English. In this way, the terms 'grammar' and 'sentence' are mutually defining. In the past, grammarians have aimed to define 'sentence' as a prerequisite to defining 'grammar', or to define 'grammar' as a means of defining 'sentence'. But both approaches will be avoided here: indeed, neither of these terms can be given a clear-cut definition. The sentence is an indeterminate unit in the sense that it is often difficult to decide, particularly in spoken language, where one sentence ends and another begins (*cf* 19.29*ff*). The term 'grammar' is indeterminate in the sense that 'What counts as a grammatical English sentence?' is not always a question which permits a decisive answer; and this is not only because of the difficulty of segmenting a discourse into sentences but because questions of grammatical acceptability inevitably become involved with questions of meaning, with questions of good or bad style, with questions of lexical acceptability, with questions of acceptability in context, etc. To give a realistic presentation of English grammar, we therefore have to abandon neat boundaries, and to accept that grammar is a linguistic 'core' round which other aspects of linguistic organization and usage are integrated. Our intention, therefore, is to take a broad interpretation of grammar, which will enable us to give an account of other factors, especially meaning, which impinge on the discussion of grammatical rules and categories.

The CLAUSE, particularly the independent clause (*cf* 14.2), is in many ways a more clearly-defined unit than the sentence. It is for this reason that we shall concentrate, in this and the following nine chapters, on the SIMPLE SENTENCE (*ie* the sentence consisting of a single independent clause) as the most central part of grammar. We shall use the term MULTIPLE SENTENCE (subsuming complex and compound sentences) (*cf* 14.1*ff*) for all sentences which consist of more than one clause, either through subordination or

through coordination. Thus the limits of the English sentence are defined, in practice, wherever grammatical relations (such as those of subordination and coordination) cannot be established between clauses. Such relations, and their limits, are explored in later chapters, particularly Chapters 13, 14, and 19.

Form and function

- 2.12 We have indicated how grammatical categories may be identified through relationships of choice (or substitution) between constituents. In the simple cases of examples 2.6 [1] and [2], repeated here as [1] and [2], we recognized four positions in the clause where different kinds of phrase can occur:

{ The weather }	{ has been }	{ very cold }	{ just recently }	[1]
{ It }	{ was }	{ cold }	{ recently }	[2]

But to describe more fully how clauses are composed of phrases, it is necessary to take account of other factors, *eg* whether a constituent may vary its position (MOBILITY), and whether a constituent can be omitted (OPTIONALITY). In both these respects, the adverb phrases of [1] and [2] are different from the other phrases:

The weather has been very cold <i>just recently</i> .	[1]
<i>Just recently</i> , the weather has been very cold.	[1a]
The weather has been very cold.	[1b]

Another observation about the adverb phrase is that it may be replaced by a different kind of constituent, which is similarly optional and mobile. For example, a noun phrase such as *this month* or a prepositional phrase such as *during the past week* may be a substitute for *just recently* in [1] and [1a]:

The weather has been very cold { <i>just recently</i> .	[1]
{ <i>this month</i> .	[1c]
{ <i>during the past week</i> .	[1d]

On the other hand, we obviously cannot always replace a noun phrase by an adverb phrase or by a prepositional phrase:

<i>This month</i> has been very cold.	[3]
* <i>Just recently</i> has been very cold.	[4]
* <i>During the past week</i> has been very cold.	[5]

That is, noun phrases are in a 'choice' relation to other kinds of phrase on some occasions, but not on others.

In order to state more complicated facts of constituency such as these, it is important to distinguish two ways of classifying constituents. We may classify a unit either on the basis of its FORM (*eg* its internal structure, as a noun phrase, or as a verb phrase), or on the basis of its FUNCTION (*eg* as a subject or an object of a clause). By function is meant a unit's 'privilege of occurrence', in terms of its position, mobility, optionality, etc, in the unit of

which it is a constituent. Two units which have the same privilege of occurrence may be said to be FUNCTIONALLY EQUIVALENT. Thus the final phrases of [1], [1c], and [1d], although they belong to different formal categories (adverb phrase, noun phrase, prepositional phrase), may be said to belong to the same functional category of ADVERBIAL. Such categories define ELEMENTS OF STRUCTURE in the higher unit, which in this case is a clause. An adverbial, generally speaking, is distinguished from other elements by its variable position (for example, initial, medial, or final in the clause), by its optionality, and by the fact that the number of adverbials which can occur in a clause is not fixed.

The advantage of distinguishing functional from formal categories is that generalizations of two kinds can be made: those about a unit's status as a constituent of a higher unit, and those about its internal structure in terms of smaller or lower units. In some cases (*eg* prepositions; *cf* 2.29) the distinction is unimportant, but in other cases it is important and indeed necessary. For example, it is important to distinguish those prepositional phrases which act as adverbials from those which act as parts of noun phrases. It is also important to distinguish *adverbials* (a functional category) from *adverb phrases* (a formal category, whose members frequently function as adverbials). Here, as elsewhere, we trust that the advantage of using traditional and widely-understood terms outweighs any danger of confusion.

Note A FORMAL classification takes account of how a unit is composed of smaller units or components, including, in the case of words, stems and affixes. Since English often lacks formal indicators of word class, we often identify words by their function rather than their form.

Clause structure

Central and peripheral elements of the clause

- 2.13 The form-function distinction is particularly important in the case of clause structure, which we shall now discuss in some detail as the most familiar and important illustration of functional classification. To describe the constituency of clauses, we need to distinguish the following elements of clause structure:

SUBJECT (S), VERB (V), OBJECT (O), COMPLEMENT (C), and ADVERBIAL (A).

These are exemplified in the following simple declarative sentences:

Someone [S] was laughing [V] loudly [A] in the next room [A].	[1]
My mother [S] usually [A] enjoys [V] parties [O] very much [A].	[2]
In 1945 [A] the country [S] became [V] totally independent [C].	[3]
I [S] have been [V] in the garden [A] all the time [A] since lunch [A].	[4]
Mary [S] gave [V] the visitor [O] a glass of milk [O].	[5]
Most people [S] consider [V] these books [O] rather expensive [C], actually [A].	[6]
You [S] must put [V] all the toys [O] upstairs [A] immediately [A].	[7]

At the simplest level, we may make the following generalizations about

clause structures from these examples. The verb element (V) is the most 'central' element, and in all the examples above it is preceded by the subject (S). Following the verb there may be one or two objects (O), or a complement (C), which follows the object if one is present. The most peripheral element is the adverbial, which can occur either initially (in front of the subject, as in [3]), or finally (after the verb, and after the object or complement if one is present, as in [1], [4], and [6]). Many adverbials, however, may also occur medially, as in [2]. A clause may contain a varied number of final adverbials; eg none [5], one [2], two [7], three [4]. These observations are summarized in the simplified formula:

(A) S (A) V (O) (O) (C) (A . . .)

(As elsewhere, parentheses signal elements which may or may not be present in any given clause.) As a first approximation, this indicates something of the variability of clause structures in declarative clauses, although it will need later modification (cf Notes [a] and [b]).

The distinction between 'centre' and 'periphery' is relative rather than absolute. The verb element is the most 'central' element in that (i) its position is normally medial rather than initial or final; (ii) it is normally obligatory; (iii) it cannot normally be moved to a different position in the clause; and (iv) it helps to determine what other elements must occur (cf 2.16ff). For the opposite reasons, adverbials are the most peripheral elements: (i) their position is most frequently final; (ii) they are usually optional; (iii) they are mostly mobile; and (iv) they do not determine what other elements occur. They may be regarded, from a structural point of view, largely as 'optional extras', which may be added at will, so that it is not possible to give an exact limit to the number of adverbials a clause may contain. The other elements, subject, object, and complement, are in various degrees more peripheral than the verb, and less peripheral than the adverbial.

Note [a] Although in [1-7] the subject is apparently just as indispensable to clause structure as the verb, it will be noted that in imperative and nonfinite clauses the subject is usually optional (cf 2.57, 11.24f, 14.6ff). There is also a category of clauses in which the verb is omitted (verbless clauses; cf 14.9), but this is a less significant category than those of imperative and nonfinite clauses.

[b] The above generalizations will, of course, be subject to modification when we consider a wider range of clauses, particularly subordinate and nondeclarative clauses. For example, elements other than adverbials have a limited mobility; on movement of subjects, cf 2.48; of verbs, 18.8f; of objects and complements, 18.20, 18.37, 18.38.

[c] It is unfortunate that traditionally the word *verb* does service both for a clause element, and for the class of word which occurs as a constituent of that element. For example, in the former sense *must put* in [7] is a verb, and in the latter sense, *must* and *put* are verbs individually (cf 2.27). The term 'predicator' has been sometimes used to replace 'verb' in the sense of 'verb element', but for lack of a familiar alternative, we shall continue to use *verb* in both senses, distinguishing between verbs as elements and verbs as words where there is some risk of confusion. In yet another sense (cf 2.35) *verb* designates a basic verb form, or LEXICAL ITEM, which is manifested in different morphemes or morpheme combinations; eg: *have*, *having*, and *had* are all forms of the lexical item HAVE. (A similar polysemy applies to other word classes, particularly nouns).

A 'fixed word-order language'

2.14 To illustrate the mobility of adverbials in contrast with other elements, we

may observe that in example [2] *usually* can be moved to initial or final position:

My mother <i>usually</i> enjoys parties very much. [S A V O A]	[2]
<i>Usually</i> my mother enjoys parties very much. [A S V O A]	[2a]
My mother enjoys parties very much, <i>usually</i> . [S V O A A]	[2b]

However, the other elements cannot be similarly moved from their S V O sequence:

*Usually enjoys parties my mother very much. [A V O S A]
 *Enjoys usually my mother parties very much. [V A S O A]
 *My mother parties usually enjoys very much. [S O A V A]

The fact that these orders, and many others of the same elements, do not readily occur, helps to explain why English is commonly described as a 'fixed word-order language'. In practice, discussion of word order in languages tends to revolve around the ordering of phrases which are clause elements, and it is notable, for instance, that in English the positions of subject, verb, and object are relatively fixed. In declarative clauses, they occur regularly in the order S V O, unless there are particular conditions (for example, the initial placing of the object pronoun in relative clauses) which lead to a disturbance of this order. Further conditions allow variations of this declarative order (for example, *Parties my mother usually enjoys very much* is a possible, though less usual, variant of [2]); these will be discussed in 2.59 and 18.20.

It is enough to state here that English does indeed have strict limitations on the ordering of clause elements, but that the more peripheral an element is, the more freedom of position it has. After V, S is the least mobile element, followed by O and C. Later we shall give attention to the various factors which lead to the displacement of an element from its regular position (cf esp 2.59, 11.5, 11.14, and 18.19ff).

Note [a] In [2], the restriction on movement even extends to the adverbial *very much*, which in comparison with other members of the adverbial category is relatively immobile:

*Very much my mother usually enjoys parties. [A S A V O] [2c]

[b] In terms of the present grammatical hierarchy (cf 2.7) the term *word order* ought to apply strictly to the ordering of words within phrases, rather than of phrases within clauses. This is not the normal interpretation of the expression, but it may be incidentally noted that in this more restricted sense, English has an even greater fixity of word order. Note, for example, beside [2a-2c], the still greater dislocation in:

*Mother my usually enjoys parties much very.

Adverbials

2.15 It is worth pointing out that different degrees of centrality can be observed not only in different elements of clause structure, but also in different sub-categories of the same element. Thus the adverbial category has been described as the most peripheral, but it is in fact a heterogeneous category, within which there are relatively central and relatively peripheral types of adverbial. In examples 2.13 [1-7], most of the adverbials are both mobile and optional: it is possible, for example, to omit the adverbial *usually* in [2] (*My mother enjoys parties very much*) as well as to change its position (as in

examples 2.14 [2a] and [2b]). But there are, as we have just seen in [2c], some adverbials which cannot readily be moved from their position in a given clause, and there are even adverbials which are obligatory, such as the place adverbials *in the garden* in example 2.13 [4] and *upstairs* in 2.13 [7]:

- I have been *in the garden* all the time since lunch. [4]
 You must put all the toys *upstairs* immediately. [7]

Contrast:

- *I have been all the time since lunch. [4a]
 *You must put all the toys immediately. [7a]

Because they are essential to the 'completion' of the meaning of the verb, such elements are classified by some grammarians as complements (*cf* 2.17f, 10.11). Our position, however, is that adverbials represent a spectrum of types, the most central of which, because of their obligatoriness and relative immobility, resemble complements. In provisional support of this analysis, note that *in the garden* and *upstairs* are equivalent to adverbials in meaning, *eg* in answering the question *Where?*, even though they are similar to complements in acting as an obligatory element following the verb BE.

At the other end of the spectrum, there are elements which are frequently called SENTENCE ADVERBIALS, because they tend to qualify, by their meaning, a whole sentence or clause, rather than just part of a clause (such as a verb, or a verb and object):

- To my regret*, he refused the offer of help. [8]
 He was, *however*, very interested in my other proposals. [9]

In Chapter 8, these adverbials are subdivided into DISJUNCTS (those which, like *to my regret* in [8], comment on the form or content of the clause) and CONJUNCTS (those which, like *however* in [9], have a connective function). Such sentence adverbials are distinguished from ADJUNCTS and SUBJUNCTS, adverbials which are more closely integrated with the rest of the clause, and which include such familiar categories as adverbials of manner, place, time, and degree (*cf* 8.39, 8.51, 8.79, 8.104).

Characteristic of disjuncts and conjuncts are such markers of peripherality as separation from the rest of the clause by intonation boundaries in speech (*cf* App II.11ff) or by commas in writing (*cf* App III.17f). The distinctions between these four major types of adverbial are significant enough to deserve careful analysis in a later chapter (8.24ff), and yet it must be concluded that there is no clear division between the more central and more peripheral adverbials. Here we anticipate a problem which will be confronted at the end of this chapter (2.60): that of the partial INDETERMINACY of grammatical categories.

Note Sentence [4a] is grammatical if *been* is interpreted as an auxiliary verb followed by ellipsis of the main verb, as in (*cf* 12.62):

- A: You should have been waiting here when the taxi arrived.
 B: I have been (waiting) all the time since lunch.

Clause types

2.16 By eliminating *optional* adverbials from the clause structures illustrated in 2.13, we arrive at a classification of the essential core of each clause structure. Of the obligatory elements, the main verb is the one that wholly or largely determines what form the rest of the structure will take. From examples [1–7] the following seven CLAUSE TYPES emerge:

Table 2.16 Clause types

	S(subject)	V(erb)	O(bject(s))	C(omplement)	A(dverbial)	
Type SV	Someone	was laughing				[1a]
Type SVO	My mother	enjoys	parties			[2a]
Type SVC	The country	became		totally independent		[3a]
Type SVA	I	have been			in the garden	[4a]
Type SVOO	Mary	gave	the visitor	a glass of milk		[5a]
Type SVOC	Most people	consider	these books	rather expensive		[6a]
Type SVOA	You	must put	all the toys		upstairs	[7a]

This set of patterns is the most general classification that can be usefully applied to the whole range of English clauses whether main or subordinate. Each clause type is associated with a set of verbs, as will be shown in detail in 16.18–66.

The seven fall naturally into three main types. There are:

- a two-element pattern: SV
 three three-element patterns: $SV + \begin{Bmatrix} O \\ C \\ A \end{Bmatrix}$
 three four-element patterns: $SVO + \begin{Bmatrix} O \\ C \\ A \end{Bmatrix}$

Cutting across this threefold classification are three main verb classes:

INTRANSITIVE VERBS (*eg*: *laugh* in [1a]), are followed by no obligatory element, and occur in type SV.

TRANSITIVE VERBS (*eg*: *enjoy* in [2a], *give* in [5a], *consider* in [6a], *put* in [7a]) are followed by an OBJECT (*cf* 2.17), and occur in types SVO, SVOO, SVOC, and SVOA respectively.

COPULAR VERBS (eg: *become* in [3a], *be* in [4a]) are followed by a SUBJECT COMPLEMENT (cf 2.17) or an ADVERBIAL, and occur in types *SVC* and *SVA*.

In a general sense, the term TRANSITIVE is often applied to all verbs which require an object, including those of clause types *SVOO*, *SVOC*, and *SVOA*. It is, however, convenient to make a further classification of the verbs in these patterns:

The term 'verb' primarily refers not to the whole V element, but to the main verb (cf 2.29) of the verb phrase: in [7a], for example, it is the main verb *put* (or more strictly, the lexical item *PUT*; cf 2.35–36) which determines that an object and an adverbial must follow the verb element.

Note The term COPULA refers to the verb *BE*, and COPULAR verbs are those verbs (including *BE* and *BECOME*) which are functionally equivalent to the copula (cf 16.21ff). They are variously called 'copulative', 'equative', 'intensive', or 'linking' verbs.

Objects and complements

2.17 Before considering the verb further, however, it is important to notice differences between the various elements which have been labelled 'object' and 'complement'. The following distinctions will be made:

An object such as *parties* in [2a] (*My mother enjoys parties*) clearly has a different semantic role in the clause from an object such as *the visitor* in [5a] (*Mary gave the visitor a glass of milk*), and this has been traditionally recognized by applying the term DIRECT OBJECT to the former, and INDIRECT OBJECT to the latter. Leaving the semantic distinction until 10.7, 10.18ff, we give priority here to the distributional fact that whenever there are two objects (in type *SVOO*), the former is normally the indirect object, and the latter the direct object. But although it is more central with regard to position (cf 2.13), in other respects the indirect object is more peripheral than the direct object: it is more likely to be optional, and may generally be paraphrased by a prepositional phrase functioning as adverbial (cf 2.23).

Similarly, we must distinguish between the type of complement found in the *SVC* pattern; ie: *totally independent* in:

The country became totally independent. [3a]

and the type of complement found in the *SVOC* pattern; ie: *rather expensive* in:

Most people consider these books rather expensive. [6a]

The distinction is effectively made by noting that in [3a] the country is understood to have become a *totally independent country*, while in [6a] the books are understood to be considered *rather expensive books*. In other words, in *SVC* clauses the complement applies some attribute or definition to the subject, whereas in *SVOC* clauses it applies an attribute or definition to the object. This distinction is usually denoted by the terms SUBJECT COMPLEMENT and OBJECT COMPLEMENT respectively. In these cases, the complement is an adjective phrase, but elsewhere, where the complement is a noun phrase, the same kind of distinction holds:

Type *SVC*: The country became a *separate nation*.

Type *SVOC*: Most people considered Picasso a *genius*.

In the *SVC* sentence, a *separate nation* is understood to be a definition of the subject, *the country*, while in the *SVOC* sentence, a *genius* is understood to be a definition of the object, *Picasso*.

Note [a] In place of 'subject complement', the term 'predicative noun' or 'predicative adjective' is sometimes used. Other alternatives are 'predicative nominal' and 'predicative adjectival', the choice between 'nominal' and 'adjectival' being determined by whether this element is a noun phrase or an adjective phrase.

[b] Also, some writers make use of a very broad sense of 'complement', subsuming complements, objects, and obligatory adverbials in the present grammar.

Obligatory adverbials

2.18 There is a parallel between complements and obligatory adverbials (cf 2.15). Obligatory adverbials are largely restricted to what in a broad sense we may term SPACE ADJUNCTS (cf 8.3, 8.39ff). Just as complements can be divided into subject complements and object complements, so can obligatory space adjuncts be divided into those occurring in the *SVA* pattern, in which a location is attributed to the referent of the subject, and those occurring in the *SVOA* pattern, in which a location is attributed to the referent of the object. The parallel may be brought out as follows:

- | | |
|---|-----|
| { He [S] stayed [V] very quiet [C_s]. | [1] |
| { He [S] stayed [V] in bed [A_s]. | [2] |
| { They [S] kept [V] him [O] very quiet [C_o]. | [3] |
| { They [S] kept [V] him [O] in bed [A_o]. | [4] |

The symbols A_s and A_o here indicate a subject-related adjunct and an object-related adjunct respectively. The parallel between the two sets of clause types is also evident in the verb classes, and we acknowledge this by calling the verb in both [1] and [2] COPULAR (since it is equivalent in function to the copula *BE*) and calling the verb in both [3] and [4] COMPLEX TRANSITIVE (cf 2.16).

Space adjuncts occurring in the *SVA* and *SVOA* patterns include not only those indicating position, such as *in bed* or *at the office*, but also those indicating direction, such as *down* in *She put the glass down* (cf 10.10, 16.24). By extension, they may also include adverbials which specify 'temporal location', as in:

The next meeting will be *on the 5th February*.

and by a more abstract and metaphorical interpretation of 'space' (cf 9.32):

The road [S] is [V] *under construction* [A_s].

We [S] kept [V] him [O] *off cigarettes* [A_o].

But there are still some obligatory adverbials to which a locational metaphor cannot be applied. Examples are the manner adjunct *kindly* in [5], and the prepositional phrase *without a job* in [6]:

They [S] treated [V] her [O] *kindly* [A]. [5]

He [S] is [V] *without a job* [A]. [6]

At the same time, the close relationship of the prepositional phrase in [6] to a subject complement is evident in its semantic equivalence to the adjective *unemployed*.

Note As the above examples suggest, the distinction between complement and adverbial is by no means clear-cut, and there are strong arguments for classifying prepositional phrases such as *without a job* in [6] as complements. For further discussion, cf 10.11. Another difficulty, in determining the function in a clause of some prepositional phrases, is that which arises over the status of prepositional verbs such as *consist of* (cf 16.5ff).

Clause elements subclassified

2.19 Table 2.19 Verb classes in relation to clause types

Type <i>SV</i>	S Prices	V (intransitive) rose			[1]
Type <i>SVO</i>	S Elizabeth	V (monotransitive) enjoys	O _d classical music		[2]
Type <i>SVC</i>	S Your face	V (copular) seems	C _s familiar		[3]
Type <i>SVA</i>	S My sister	V (copular) lives	A _s next door		[4]
Type <i>SVOO</i>	S We all	V (ditransitive) wish	O _i you	O _d a happy birthday	[5]
Type <i>SVOC</i>	S The president	V (complex transitive) declared	O _d the meeting	C _o open	[6]
Type <i>SVOA</i>	S The doorman	V (complex transitive) showed	O _d the guests	A _o into the drawing room	[7]

A_o object-related adverbial C_o object complement O_d direct object
A_s subject-related adverbial C_s subject complement O_i indirect object

We have now found it necessary not only to distinguish functional categories such as subject, verb, and object in the structure of the clause, but also to

subclassify these into more specific categories, such as transitive verb, direct object, and subject complement. Such subclassification is typical of both formal and functional distinctions in grammar. Only through these finer distinctions can an adequate account be given of what combinations of constituents enter into the structure of the English clause. To clarify the terminology and its use, let us return to the seven clause types in Table 2.16, and specify the structures more precisely (again omitting optional adverbials) by means of subcategories of V, O, C, and A, in Table 2.19 opposite. The abbreviations used are those which will be current throughout this book (new examples are added for further illustration). Further variations on these clause types, including some exceptional patterns, are discussed in 16.18ff.

Systematic correspondences

2.20 The study of grammatical structure is aided by observing systematic CORRESPONDENCES between one structure and another. Such correspondences are sometimes described in terms of transformational rules, but we shall not make use of such theoretical formulations in this book. Instead, we shall use demonstrable correspondences as an informal way of showing similarities and contrasts between structures. They are important in explaining the relation between grammatical choice and meaning, and also in providing criteria for classification.

A systematic correspondence may be broadly defined as a relation or mapping between two structures X and Y, such that if the same lexical content occurs in X and in Y, there is a constant meaning relation between the two structures. (In using the term 'lexical content', we allow for the possibility that X and Y may contain different, though related, lexical items, such as *wise* and *wisely*.) This relation is often one of semantic equivalence, or paraphrase. In 2.21–24, we give three important examples of systematic correspondence, and show how they help in the identification of clause elements. Further types of correspondence will be examined in 2.45ff.

The symbol ~ is used in this book to represent such correspondences. Lack of systematic correspondence is symbolized by ~.

We take the seven basic clause types of [1–7] as the point of departure for our description, but do not regard correspondences as unidirectional.

Active and passive structures

2.21 Clauses containing a noun phrase as object are distinguished by the fact that they are usually matched by passive clauses, in which the object noun phrase now appears as subject (V_{pass} = passive verb phrase), cf Table 2.21 on the next page. As type SVOO clauses have two objects, they can often have two passive forms – one in which the indirect object becomes the subject, and another in which the direct object becomes subject. Further discussion of the active-passive relationship is found in 3.63ff.

As the formulae show, this correspondence permits us to convert clauses of types with an object into equivalent types without objects (or, in the case of SVOO, with only one object). Thus the passive of *They considered him a genius* [SVOC] is closely parallel in meaning to the SVC pattern, except for the passive verb phrase:

He was considered a genius. [S V_{pass} C_s]
 cf He seemed a genius. [S V C_s]

In all passive clause types, the agent *by*-phrase (cf 3.65ff, 9.50), which incorporates a noun phrase equivalent to the subject of the corresponding active clause, has the structural status of an optional adverbial (it is marked (A) in Table 2.21). Even when the agent *by*-phrase is absent, however, there is an implication of its presence at the level of meaning. In this sense, the agent *by*-phrase acts as complementation (cf 2.32) of the passive verb. Thus *He was considered a genius* carries the implication '... by someone or other'.

Table 2.21 Relations between active and passive clause types

Type SVO	
S V O _d ~ S V _{pass} (A)	A number of people saw the accident ~ The accident was seen (by a number of people)
Type SVOO	
S V O _i O _d ~ { S V _{pass} O _d (A) S V _{pass} O _i (A)	My father gave me this watch { (1) ~ I was given this watch (by my father) (2) ~ This watch was given (to) me (by my father)
Type SVOC	
S V O _d C _o ~ S V _{pass} C _s (A)	Queen Victoria considered him a genius ~ He was considered a genius (by Queen Victoria)
Type SVOA	
S V O _d A _o ~ S V _{pass} A _s (A)	An intruder must have placed the ladder there ~ The ladder must have been placed there (by an intruder)

Note [a] There are some exceptions (eg the verbs *have*, *cost*, *resemble*; cf 10.14, 16.27) to the passive equivalence with type SVO; eg:

John had the book ~ *The book was had by John.

[b] The second passive corresponding to type SVOO in Table 2.21 above is unidiomatic in AmE. More acceptable, in both AmE and BrE, is the related SVOA ~ SVA passive with a prepositional phrase (cf 2.23); eg:

Some flowers had been brought *him*.
 is less natural than:

Some flowers had been brought *for him*.

With some verbs the former type seems quite unacceptable (cf 16.55ff):

*Some fish had been caught/bought/cooked *us*.

Copular and complex transitive structures

2.22 Another correspondence often obtains between an SVOC clause and a clause with an infinitive or *that*-clause (cf 16.50f):

I considered *her beautiful*. ~ { I considered *her to be beautiful*.
 I considered *that she was beautiful*.

This correspondence indicates that the O and C of an SVOC clause are in the same relation to one another as the S and C of an SVC clause: *She was beautiful* (cf 16.43ff). This relation is expressed, wherever it is made explicit at all, by a copular verb, and we may therefore call it, for further reference, a COPULAR relationship. Copular relationships are important in other aspects of grammar apart from clause structure. They correspond, for example, to relations of apposition (cf 17.65ff) and many relations of modification (cf 2.31–33).

Further, we may extend the concept of 'copular relationship' to the relation between subject and adverbial in SVA clauses and the relation between object and adverbial in SVOA clauses (cf 10.10, 16.24, 16.48).

Indirect objects and prepositional phrases

2.23 There is a further correspondence by which SVOO clauses can be converted into SVOA clauses by the substitution of a prepositional phrase following the direct object for the indirect object preceding it:

She sent *Jim* a card ~ She sent a card *to Jim*.

She left *Jim* a card ~ She left a card *for Jim*.

To and *for*, indicating a recipient (cf 9.46), are the prepositions chiefly used, but others, such as *with* and *of*, are occasionally found (cf 16.57).

Note [a] There are however, some recipient *to*- and *for*-phrases which cannot be made into indirect objects: *He suggested the idea to Bill*; *She described her home to us*; etc. A borderline case is *?He explained me his plan*, which is acceptable to some speakers, but not to others.
 [b] We later (16.56ff) consider an alternative analysis in which the *to*-phrases and the *for*-phrases illustrated above are described as *prepositional objects*, and are regarded as grammatically equivalent to indirect objects.

The characterization of clause elements

2.24 For a fuller appreciation of the clause patterns outlined in 2.16, we need to know, of course, on what grounds the elements subject, verb, object, complement, and adverbial are identified. The identification of the verb element in general presents no problem, as this element can be realized only by a verb phrase (cf 2.27). For the other elements, it is necessary to use a variety of criteria. Although clause elements are functional categories (cf 2.12), their definitions are based on formal as well as on functional criteria. Thus it is an important part of the definition of both subjects and objects that they normally consist of noun phrases; it is an important part of the definition of complements that they are normally noun phrases or adjective phrases; and it is an important part of the definition of adverbials that they may be adverb phrases, prepositional phrases, or noun phrases. It is unnecessary to go into these definitions any further in this chapter, as they are elaborated systematically in 10.5ff.

Phrases

Phrases as clause elements

- 2.25 The constituents which function as elements of clause structure are either phrases or subordinate clauses (cf 2.9), and our next stage is to outline briefly how the phrases, in their turn, are constituted. The five formal categories of phrase we have mentioned in 2.24 are verb phrases, noun phrases, adjective phrases, adverb phrases, and prepositional phrases. In the following diagram, the upward-pointing arrows show how these phrase types (when not embedded in other structures) can function as clause elements:

Fig 2.25 Phrases as clause elements

The broken arrows on the right indicate that adverb phrases and prepositional phrases can exceptionally function as subjects (cf 9.1 Note [a] and 10.15), and that prepositional phrases can exceptionally function as complements (cf 10.11).

- Note [a] Figure 2.25 naturally omits reference to embedded phrases (cf 2.8), eg to prepositional phrases functioning as constituents of noun phrases.
 [b] Phrases such as *the poor* and *the young* are only apparent exceptions to Fig 2.25: we shall argue (cf 7.23ff), that although they have an adjective as their main word (or head), such phrases are noun phrases.
 [c] Only a limited range of adverbials can be realized as noun phrases (cf 8.39, 8.52).

General structural characteristics of phrases

- 2.26 Each phrase is named after a class of word which has a primary, and indeed obligatory function within it. This function, however, varies in different types of phrases, and we may usefully investigate it in terms of the distinction between optional and obligatory elements. One kind of construction is illustrated by prepositional phrases, which contain two normally obligatory elements: the preposition and the prepositional complement (cf 9.1). Another kind of construction is illustrated by adjective phrases, which have one obligatory element (an adjective), optionally preceded or followed by other elements. These two constructions will be called **NONHEADED** and **HEADED** respectively:

Fig 2.26

Thus in the sentence *I went to London*, neither *to* nor *London* could be omitted: **I went to*, **I went London*. But in the sentence *This is very important indeed*, the modifiers *very* and *indeed* can be omitted: *This is important*; while *important* is obligatory: **This is very indeed*. The obligatory element of a headed construction is called its **HEAD**; it may function in a manner equivalent to the whole construction of which it is a part. Adverb phrases resemble adjective phrases in that they have a head (an adverb) to which optional elements may be added; eg: (*rather*) *slowly*. But the two most important categories of phrase, verb phrases and noun phrases, do not entirely fit into either category: for them, the headed/nonheaded distinction is inadequate.

- Note Technical terms for headed and nonheaded are 'endocentric' and 'exocentric'.

Verb phrases and noun phrases

- 2.27 The verb phrase and the noun phrase can be considered the most important phrasal categories for functional reasons. We note from Fig 2.25 that the verb phrase operates as the V element in a clause, ie as the most 'central' and indispensable part of the clause (cf 2.13). The noun phrase is important more because of its multiplicity of function: Fig 2.25 shows that a noun phrase can function as any of the clause constituents except V. A declarative sentence, indeed, normally contains a verb phrase and at least one noun phrase.

Verb phrases are headed to the extent that they are composed of two kinds of element, auxiliaries and main verbs, such that every unreduced verb phrase (cf 2.51) contains a main verb, but not necessarily an auxiliary. However, a nonfinite (3.53ff) main verb cannot normally stand on its own in independent clauses; the auxiliaries *can*, *have*, and *been* may not, therefore, be omitted in:

Jack *can* play the trombone. Our team *has been* beaten.

The relations between auxiliaries and main verbs are more complex than can be explained by the simple headed/nonheaded distinction; further consideration of this question will be given in 3.55.

Similar remarks apply to noun phrases. A noun phrase is headed to the extent that it has a central constituent or head, to which other elements can be optionally added. But if we change the plural noun phrase in [1] into a singular one in [2], the head can no longer stand alone:

- The room contains { (some) (beautiful) (Flemish) vases. [1]
 { a (beautiful) (Flemish) vase. [2]

For a large class of noun phrases, in fact, a **DETERMINATIVE** element such as *a* in [2] is obligatory. In another respect, too, noun phrases do not behave like headed constructions: members of one class of words, that of personal pronouns (*I*, *him*, *her*, etc), although they act as heads of noun phrases (in the sense that *I* can function alone as subject, *him* as object, etc), cannot normally have optional elements, such as articles and adjectives, added to them. Thus in some noun phrases the head must be accompanied, and in other noun phrases it cannot (normally) be accompanied, by another element. Such observations make it clear that phrases, like clauses, cannot be described by a single structural formula, and that various subclassifications have to be made of phrases and of the elements they contain.

Summary of phrase structures

- 2.28 In spite of the inevitable oversimplification, we give now a brief tabular summary of the main elements of each phrase class. Rather than label all elements with functional labels (as we did with S, V, O, C, and A), we shall merely illustrate certain general types of syntactic function within phrases. These types will receive further comment in 2.29–33.

VERB PHRASES (*cf* 3.52*ff*) consist of a main verb which either stands alone as the entire verb phrase, or is preceded by up to four verbs in an auxiliary function:

Table 2.28a Verb phrase

auxiliary/auxiliaries				main verb
The ship			was	sank
			has been	sinking
			must have been	sunk
			may have been	sinking
			being	sunk

<rare; *cf* Note>

NOUN PHRASES (*cf* 5.1*ff*, 17.1*ff*) consist of a head, which is typically a noun, and of elements which (either obligatorily or optionally) determine the head and (optionally) modify the head, or complement another element in the phrase:

Table 2.28b Noun phrase

	determinative	premodification	head	postmodification	
					complementation
I remember	Alice's		him		
	that		Peter		
			wedding		
	girl			with the red hair	
				in the country last year	
	all those	fine warm	days		
	a	better	story		than that
	the	best	trip		that I ever had
	a	good	trip	that I once had	

ADJECTIVE PHRASES (*cf* 7.20*ff*) consist of an adjective as head, optionally preceded and followed by modifying elements:

Table 2.28c Adjective phrase

	premodification	head	postmodification	
				complementation
The weather was	too	pleasant		
		hot		to be enjoyable
	incredibly	cold		
		pleasant	enough	

Sometimes an obligatory or optional complementation (*cf* 2.32, 16.69) is added.

ADVERB PHRASES (*cf* 7.46*ff*) are similar to adjective phrases in their structure, except that they have an adverb, instead of an adjective, as their head:

Table 2.28d Adverb phrase

	premodification	head	postmodification	
				complementation
I spoke to him		yesterday		
	quite	often		
	very	severely	indeed	
	as	clearly		as I could

PREPOSITIONAL PHRASES (*cf* 9.1*ff*) consist of a preposition followed by a prepositional complement, which is normally a noun phrase:

Table 2.28e Prepositional phrase

	preposition	prepositional complement
I met her	for	lunch
	at	the corner of the street
	on	Saturday morning
	by	a strange coincidence

It is true of adjective and adverb phrases, as of noun phrases, that one-word elements tend to precede the head, whereas multi-word elements tend to follow it. But there are exceptions: *eg* the adverbs *indeed* and *enough* postmodify their head.

Note The verb phrase construction of *may have been being sunk* is so rare that an extended example is called for. The following dialogue could well occur during an interview for an appointment:

A: Has a candidate named Petersen been interviewed yet?

B: He wasn't in the waiting room two minutes ago. He may have been being interviewed then.

Form and function in phrase structure

- 2.29 We shall find it necessary to observe the distinction between form and function within phrases, as within clauses. It is true that there is a strong association between certain word classes and certain elements within the phrase. For example, in noun phrases the head is typically a noun, and the determinative function is typically performed by members of a relatively small class of words called, appropriately enough, DETERMINERS (*the, a, no, every, etc.*). On the other hand, there is rarely a one-to-one match between formal and functional classifications. The head of a noun phrase may be a pronoun (as we have seen), or an adjective: *the poor, the unemployed, etc.* Similarly, the determinative function can be performed not only by a determiner, but by a genitive construction: *John's new bicycle, etc.* (cf 5.121). In such cases, we need to make terminological distinctions between form and function, so that we can say, for example, that an adjective (formal term) can function either as modifier or as head (functional terms) in a noun phrase. It will be noted that a noun can be a premodifier as well as a head: contrast *the poor city* with *the city poor*.

In other cases, however, there is a one-to-one match, and it would be superfluous to introduce two terms for what is effectively the same category. A preposition nearly always functions as the 'preposed' element of a prepositional phrase, and no other word class shares this function. It might be equally claimed that there is no need to distinguish form from function in the verb phrase: that auxiliary verb and main verb will satisfy both requirements. But even here, we shall find good grounds for distinguishing 'auxiliary' and 'main', as functional terms, from the terms which define classes of verb word. Of these, there are three: MODAL verbs (*may, will, could, etc.*) always function as auxiliaries; FULL verbs (*give, work, try, etc.*) always function as main verbs; and PRIMARY verbs (the three most important verbs in the language: *be, have, and do*) can function either as auxiliaries or as main verbs.

There are three other terms designating broad functions which may be performed by various types of constituents, and we shall now explain their meaning. They are DETERMINATION, MODIFICATION, and COMPLEMENTATION.

Determination

- 2.30 This term may be used for the function of words and (sometimes) phrases which, in general, determine what *kind of reference* a noun phrase has: for example, whether it is definite (like *the*) or indefinite (like *a/an*), partitive (like *some*) or universal (like *all*). Semantically, all noun phrases are determined in some way or other; eg all noun phrases are either definite or indefinite in meaning. But some heads are by their very nature self-determining: proper nouns and personal pronouns, for example, are inherently definite, and in this sense incorporate their own determiner. In

such cases, then, a noun phrase will not generally contain a separate word with a determinative function. When the head is a common noun, on the other hand, determination as a syntactic function is normal, if not obligatory: we cannot, for instance, omit the determiners *the* and *a* in *The driver was a man*.

Note It will be clear from the above that we treat the definite and indefinite articles as members of the larger class of determiners. There appears to be an exception to the generalization that common nouns are determined in the case of plural and noncount nouns like *women* and *water* respectively; but we shall prefer to say (cf 5.2) that the apparent absence of an article signals the presence of the ZERO article.

Modification

- 2.31 Modification, in contrast, is a largely optional function performed, for instance, by adjectives in the noun phrase, and by intensifying adverbs in the adverb phrase. Premodifiers precede the head, and postmodifiers follow it; in noun phrases, premodifiers follow determinatives. Semantically, modifiers add 'descriptive' information to the head, often restricting the reference of the head. Thus *a green table* has a more specific meaning than *a table*, and *very tall* has a more specific meaning than *tall* (cf however, 17.3ff for the distinction between restrictive and nonrestrictive modification). In this respect, modifiers in phrases parallel adverbials in the clause – a similarity brought out by:

He arrived (unexpectedly) (in Warsaw) yesterday. [1]
 ~ his (unexpected) arrival (in Warsaw) yesterday. [2]

In the clause [1] the parenthesized elements are adverbials, whereas in the noun phrase [2] the parenthesized elements are modifiers.

Note [a] The particular correspondence between [1] and [2], whereby a clause-related meaning takes on the grammatical form of a noun phrase, is discussed under the heading of NOMINALIZATION (cf 17.51ff).
 [b] The parallel between [1] and [2] also helps to explain a traditional characterization of adverbs as modifiers of verbs (a tradition enshrined in the term *adverb* itself). But as we shall see in Chapter 8, adverbs cannot be regarded in this light.

Complementation

- 2.32 We reserve the term COMPLEMENTATION (as distinct from *complement*) for the function of a part of a phrase or clause which follows a word, and completes the specification of a meaning relationship which that word implies. As such, complementation may be either obligatory or optional on the syntactic level. Complementation also overlaps with other functions, such as adverbials and modifiers.

We have already encountered complementation in clause structure: the clause types listed in Table 2.16 (SVO, SVA, SVOA, etc.) were characterized by differences in the complementation (in terms of O, C, or A) required to complete the meaning of the verb. Thus the terms 'monotransitive' (as applied to the verb *deceive*) or 'ditransitive' (as applied to the verb *allow*) identify their complementations as O and O O respectively. In a similar way, certain adjectives require complementation by a postmodifier:

VERB COMPLEMENTATION

He deceived *his father*. BUT *He deceived.
 He allowed me *a respite*. BUT *He allowed me.

ADJECTIVE COMPLEMENTATION

All sales are subject *to tax*. BUT *All sales are subject.
 Mr Gould is likely *to resign*. BUT *Mr Gould is likely.

The verb *deceive* and the adjective *subject* are similar to the extent that their meaning requires not only a subject ('X') but some other element ('Y'): 'X deceives Y', 'X is subject to Y'. The meaning of a clause will be incomplete unless the 'Y' is specified. In other cases, the complementation is optional:

VERB COMPLEMENTATION: Joan was eating (*her lunch*). [1]
 ADJECTIVE COMPLEMENTATION: The boat was ready (*for departure*). [2]

The function of the optional elements here is still one of complementation because even when they are omitted, it is still implied that Joan was *eating something*, and that the boat was *ready for something*. In this connection, we may notice a contrast even between such semantically similar adjectives as *glad* and *cheerful*, in that the first implies that the emotion has a specific source, whereas the second does not. Thus *glad* will be typically followed by a complementing phrase or clause (*eg: glad about your prize, glad that you came*), and will occur without such complementation only if the context supplies the information which the clause fails to specify. On the other hand, *cheerful* may freely occur as both modifier and head in a way which is not possible with *glad*:

We always found him *cheerful*. BUT ?We always found him *glad*.
 He was a *cheerful* person. BUT *He was a *glad* person.

Note Although we describe the complementation in [1] as 'optional', there is reason to claim that *her lunch* in *Joan was eating her lunch* is not optional in a strictly syntactic sense of the word. If, as we argue in 10.4, verbs like *eat* are dually classified as both transitive and intransitive, then the omission of the object involves a change in the classification of the verb element (*cf* App I.54).

Modification and complementation

2.33 Although complementing elements may be optional, such elements differ semantically from other optional elements (*eg* most modifiers) in that the omission of complementation, as in *The boat was ready* (2.32 [2]), implies that some element of meaning in a preceding word is 'unsatisfied', and therefore has to be provided through context. It must be admitted, however, that this criterion is not always clear-cut, since the need for semantic 'satisfaction' is a matter of degree.

Another difference between complementation and modification is a syntactic one. Whereas the modifying function always relates to the head of a phrase, the complementing function may relate to a premodifier which is separated from its complementation by the head:

Greek is a *more difficult language than French*. [1]
 She was *too ill to travel*. [2]

In [1], the phrase *than French* complements the comparative adverb *more*

rather than the head noun *language*; and in [2], *to travel* complements the adverb *too*, rather than the head adjective *ill*. To see this, we note that the omission of the relevant modifier results in an unacceptable sentence:

*Greek is a *difficult language than French*.
 *She was *ill to travel*.
 (But *cf: She is (rather) young to drive a car*; 16.76.)

It is clear, then, that there is not a straight choice between optional and obligatory elements of phrases. Determination, modification, and complementation all depend on the presence of some other element (usually the head) in the phrase. Heads are obligatory and modifiers are generally optional, but determination and complementation are functions whose conditions of occurrence cannot be defined so simply (*cf* 5.10ff, 16.18ff).

Note For completeness, it should be mentioned that modifiers may themselves contain modifiers (*cf* 17.118ff). For example, in *far more difficult*, *far* modifies *more*, and *far more* modifies *difficult*. Hence the unacceptability of **far difficult*.

Word classes

2.34 In dealing with phrases, we have already had occasion to refer to many of the general WORD CLASSES traditionally called 'parts of speech'. Members of the Indo-European group of languages have been analysed in terms of such categories since classical antiquity. It may be helpful now to list and exemplify the word classes that have been introduced:

- (a) CLOSED CLASSES (*cf* 2.39)
 - preposition – *of, at, in, without, in spite of*
 - pronoun – *he, they, anybody, one, which*
 - determiner – *the, a, that, every, some*
 - conjunction – *and, that, when, although*
 - modal verb – *can, must, will, could*
 - primary verb – *be, have, do*
- (b) OPEN CLASSES (*cf* 2.40)
 - noun – *John, room, answer, play*
 - adjective – *happy, steady, new, large, round*
 - full verb – *search, grow, play*
 - adverb – *steadily, completely, really*

To these may be added two lesser categories (*cf* 2.42):

- (c) numerals – *one, two, three; first, second, third*
 and the marginal and anomalous class of
- (d) interjections – *oh, ah, ugh, phew*
 and, finally, a small number of words of unique function (*eg* the negative

particle *not* and the infinitive marker *to*) which do not easily fit into any of these classes.

Even so short a list of examples raises several important questions, to which we now turn.

Lexical items and grammatical words

- 2.35 First, we should notice that the examples are listed as *words* in their 'dictionary form', and not as they often appear in sentences when they function as constituents of phrases (but cf Note [a] on invariable words): thus the singular noun *room* is listed and not the plural noun *rooms*; the simple adjective *happy* and not the comparative adjective *happier*; the infinitive (or uninflected) verb *hope* and not the past form *hoped*; the subjective pronoun form *he* and not the objective form *him*. We cite these words in what may be called their BASE form (cf App I.2ff), *ie* the form to which, in regular cases, inflectional suffixes are added to make inflected forms (*rooms*, *happier*, etc). But such a manner of speaking reveals that we are using the term 'word' in two different senses. The ambiguity is more fully evident in:

'The word *works* occurs in the sentence *He works at home*.' [1]

'The word *WORK* occurs in the sentence *He works at home*.' [2]

Both sentences are acceptable in normal usage, but the ambiguity they show can be avoided if we adopt the term LEXICAL ITEM (cf App I.1) to replace 'word' in [2]. That is, a lexical item is a word as it occurs in a dictionary, where *work*, *works*, *working*, *worked* will all be counted as different grammatical forms, or variants, of the word *WORK*. We shall use a graphic convention (SMALL CAPITALS), where necessary (and particularly in Chapter 3), to distinguish lexical items from grammatical word-forms (*ie* words as units which are constituents of phrases). We shall not, however, in general distinguish lexical items by a separate terminology: following normal practice, class labels such as *verb*, *noun*, and *adjective* will be used to refer to words in both senses.

Like the distinction between forms and functions, that between words as forms and words as lexical items does not have to be made in all cases. Only certain parts of speech have inflections (*ie* endings or modifications which change one word-form into another): notably nouns (*answer*, *answers*), verbs (*give*, *gives*, *gave*, *giving*, *given*), pronouns (*they*, *them*, *their*, *theirs*), and adjectives (*large*, *larger*, *largest*). Moreover, not all words in these categories have more than one form. Other word classes, with a few exceptions (cf Note [a]), are invariable. In citing invariable words, we shall always use italics rather than small capitals.

Note [a] Apart from nouns, verbs, pronouns, and adjectives, a few adverbs (*soon*, *sooner*, *soonest*, etc) and determiners (*few*, *fewer*, *fewest*, etc) have inflected forms. Other parts of speech are invariable.

[b] On 'stem', as distinct from 'base', cf App I.2.

[c] When a grammatical or semantic distinction is realized morphologically by a contrast between the presence and the absence of an inflection, the word-form with the inflection is termed MARKED, and the form without it UNMARKED. Thus the plural forms of regular nouns, in contrast to their singular forms, are marked by the -s ending. The unmarked form is also frequently the term which is more neutral or general in use or meaning: the present tense, as

opposed to the past, is thus not only unmarked in having (except in the third person singular) no inflection, but also in being able to refer to time in a general sense, including past, present, and future time (cf 4.3). From this concept, it is common to extend the use of 'marked' and 'unmarked' (as we do in this book) more generally to grammatical contrasts which are formally or semantically unequal in this way. It can be said, for example, that the progressive aspect (*eg: is living*) is marked in relation to the nonprogressive (*eg: lives*) both because it is realized by the additional syntactic MARKING of the BE + *Ving* construction (cf 3.54) and also because it is semantically more restricted than the nonprogressive. Further examples of a marked/unmarked distinction are mentioned in 3.58, 5.112, 6.10, and 7.88.

- 2.36 From even the few examples given in 2.34, it can be seen that a lexical item may consist of a sequence of more than one orthographic word (cf 2.37). This is especially common in the case of complex prepositions (cf 9.10ff) such as *in spite of*, *because of*, *away from*, and multi-word verbs (cf 16.2ff) such as *look at*, *set up*, and *stand out* (compare the related adjective *outstanding*, again one lexical item, but this time one word also). Equally, however, we can sometimes look upon a lexical item as being downgraded to become less than a word: for example, the adverbs *out* and *up* in *outstanding* and *upset* or (from this viewpoint) the noun *spite* and the prepositions *in* and *of* in *in spite of*.

The treatment of the subjective form (*I*, *he*, *she*, etc) of personal pronouns as the base or 'dictionary' form is conventional, but is not so clearly motivated as in the case of other word classes. We may note even here, however, a tendency to select the subjective form in derivational compounds: for example, *she-wolf* and *he-man* rather than **her-wolf* and **him-man*.

Morphological, phonological, and orthographic form

- 2.37 Secondly, some of the examples in 2.34 appear as more than one word class (*play* as a noun and verb, *that* as a demonstrative and conjunction) and more of them could have been given additional entries in this way (*round* can be a noun, verb, adjective, adverb, and preposition). In such cases we can say that the same MORPHOLOGICAL FORM is a realization of more than one lexical item. This is a highly important feature of English, and further attention will be drawn to it in App I.43ff. A morphological form may be simple (consisting of a stem only, as in the case of *play*) or complex (consisting of more than one morpheme, like *playful*). The morphological form of a word may therefore be defined as its composition in terms of morphemes (cf 2.7), *ie* stems and affixes.

While such morphological correspondences across parts of speech should be noted, we should also give attention to morphological characteristics which distinguish one part of speech from another, notably the occurrence of particular derivational affixes (cf App I.20ff) which mark a word as a member of a particular class. The suffix *-ness*, for example, marks an item as a noun (*kindness*, *happiness*, etc), while the suffix *-less* marks an item as an adjective (*helpless*, *careless*, etc). Such indicators enable a speaker of English to recognize implicitly the word class of an item, even if he has not met that item before, purely on the basis of its form.

When the need arises, therefore, we shall be able to distinguish a lexical item not only from the grammatical forms which it takes in various syntactic settings, but from the morphological forms which it may share entirely or in part with other lexical items of the same word class or of other word classes.

Thus the adjective LONG has precisely the same morphological forms as the adverb LONG (*long ~ longer ~ longest*); whereas the adjective GOOD shares the forms of the adverb WELL only in part: *ie* the comparative (*better*) and superlative (*best*) forms.

This morphological convergence may also occur at the level of grammatical forms, either between forms of different lexical items (eg: *meeting* as a singular noun and *meeting* as a verb participle) or between forms of the same lexical item (*worked* as a realization of both the past tense and the -ed participle forms of WORK). The latter is an example of the NEUTRALIZATION of inflectional forms which are distinct for other verbs (cf 3.2ff, 3.11ff) such as GIVE (*gave, given*).

For the sake of completeness, it should be added that a word also has a PHONOLOGICAL and an ORTHOGRAPHIC form, and that similarities and contrasts in pronunciation and spelling are not necessarily to be associated with those on the levels of lexicology and grammar. There is, for example, an important similarity between all words beginning /ð/ (*the, that, then*, for example), and likewise between many of those beginning *wh-* (*which, when*, for example): basically, the former are relater or indicator words, and the latter interrogative or relative words (cf 2.44f). But we should hesitate to attempt a morphological account of these similarities; rather, they are correspondences of pronunciation and spelling which reflect grammatical correspondences in the history of the language. Similarly, the variant spelling and pronunciation of the indefinite article *a/an* is not a case of inflectional variation, but of variation determined by phonology (*viz* by whether the following word begins with a consonant or not).

Homonyms and homomorphs

- 2.38 Words which share the same phonological or orthographic 'shape', but are morphologically unrelated, are termed HOMONYMS: for example, *rose* [noun] is a homonym of *rose* [past tense verb]. There is no standard term for words which also share the same morphological form (eg: *red* as a noun and *red* as an adjective, *meeting* as a noun and *meeting* as a verb), but it seems appropriate to adopt the term HOMOMORPH for this purpose. These and related distinctions such as 'homophone' and 'homograph' (cf Note) are explained in Fig 2.38 opposite.

To the set of equivalence relations between words, this diagram adds, for completeness, the relation of synonymy, or sameness of meaning. Strictly, synonymy (and its opposite, antonymy) holds between word senses, rather than between words. For example, *hard* is a synonym of *difficult* only in one sense; in another sense (that in which it contrasts with *soft*) it is not. Of the three major kinds of equivalence in Fig 2.38, homonymy is phonological and/or graphic, and synonymy is semantic. Only homomorphy is of primary concern to grammar.

Note There has been considerable disagreement and confusion over the use of the term 'homonym', which has often been extended to apply to cases we have referred to as homomorphs. Similarly, 'homonym' has often been used ambiguously, according to whether it denotes identity of pronunciation, of spelling, or of both. These distinctions can be made, where required, by the use of the terms HOMOPHONE and HOMOGRAPH. In practice, the distinction between homonymy and homomorphy is not always easy to draw. We judge *red* [noun] and *red* [adjective] to be

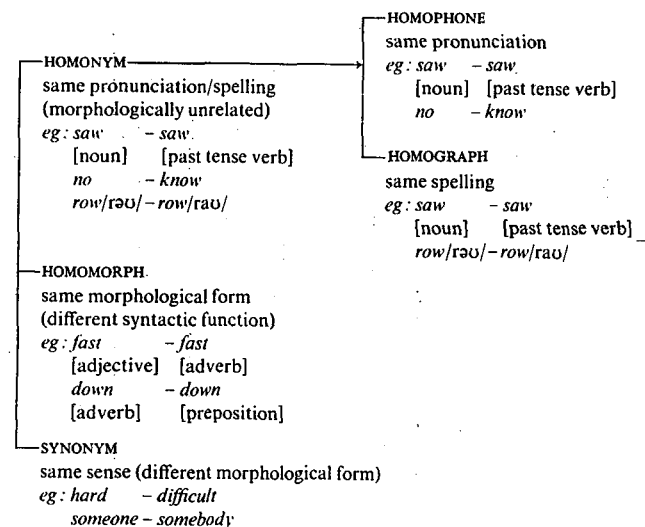

Fig 2.38 Types of equivalence between words

homomorphs only on the grounds that they share the same stem morpheme, and this in turn rests on the judgment that the two words are related through processes of word-formation, in a semantically systematic way (cf esp CONVERSION, App I.43ff). Thus to call two words such as *hard* [adjective] and *hard* [adverb] 'homomorphs' is to acknowledge their affinity in meaning. With other words (eg: *leave* [noun] and *leave* [verb]) this connection is less clear. Our use of 'homomorph' is also ambiguous (but harmlessly so) according to whether this relation of morphological identity exists between words *qua* grammatical forms (eg between *hidden* as an adjective and *hidden* as a verb participle) or between words *qua* lexical items (eg between WORK as a noun, comprising the word forms *work* and *works*, and WORK as a verb, comprising the forms *work*, *works*, *working*, and *worked*). And if we apply the term 'homomorphs' to WORK [noun] and WORK [verb], we must also apply it, where the occasion arises, to different secondary word classes (cf 2.41): eg WORK as an intransitive verb (as in *This watch doesn't work*) and WORK as a monotransitive verb (as in *She worked wonders*). By acknowledging in these ways the various senses in which words may be linguistically 'the same' or 'different', we do not imply any subordination of semantic to formal criteria, but merely recognize that grammatical and semantic criteria may be independent of one another. The conventional practices of lexicography, whereby different grammatical homomorphs are grouped under the same 'headword', should not necessarily be regarded, for grammatical purposes, as definitive.

Closed-class items

- 2.39 Thirdly, the parts of speech in 2.34 were listed in two main groups, (a) and (b), and this introduces a distinction of great significance. Set (a) comprises what are called CLOSED-CLASS items. That is, the sets of items are 'closed' in the sense that they are only exceptionally extended by the creation of additional members: a moment's reflection is enough for us to realize how rarely in a language we invent or adopt a new or additional pronoun. It requires no great effort to list all or most of the members of a closed class

(even though one may not be sure that one has made an exhaustive inventory of its more peripheral members).

A semantic corollary of this is that closed-class members are mutually exclusive and mutually defining in meaning: it is less easy to state the meaning of an individual item than to define it in relation to the rest of the class. The meaning of closed-class items also tends to be closely bound up with that of the construction of which they are a part, as is reflected in alternative names sometimes given to them – 'function words', 'grammatical words', and 'structure words'. These terms also stress their function in the grammatical sense, as structural markers: thus a determiner typically signals the beginning of a noun phrase, a preposition the beginning of a prepositional phrase, a conjunction the beginning of a clause.

Open-class items

- 2.40 By contrast, set (b) in 2.34 comprises OPEN CLASSES. Items belonging to such a class have broadly the same grammatical properties and structural possibilities as its other members, but the class is 'open' in that it is indefinitely extendable. New items are constantly being created, and no one could make an inventory of all the nouns (for example) in English, and be confident that it was complete. This inevitably affects the way in which we attempt to define any item in an open class: while it would be valuable to relate the meaning of *room* to other nouns with which it has a semantic affinity (*chamber, hall, house*, etc) one could not define it as 'not house, not box, not plate, not indigestion, ...' as one might define a closed-class item like *this* as 'not that'.

Of course, in any one phrase or sentence the decision to select a particular word at one place in the structure imposes great constraints on what can be selected at another. But in an arrangement like the following there is in principle a sharp difference between the number of possibilities in columns (i), (iii), and (iv) ('closed') and the number in (ii), (v), and (vi) ('open'):

	(i)	(ii)	(iii)	(iv)	(v)	(vi)
(John)	may	sit	by	the	fountain	sadly
	will	stare	at	this	tree	happily
	must	read	from	that	book	frequently
	⋮	hurry	along	⋮	window	⋮
		⋮	on		path	
			⋮			

The distinction between 'open' and 'closed' word classes must be treated with caution, however. On the one hand, we must not exaggerate the ease with which we create new words (*cf* App I.13f), and on the other we must not exaggerate the extent to which word classes in set (a) are 'closed': new prepositions (usually of the complex type 'preposition + noun + preposition' like *by way of*) continue to arise (*cf* 9.10ff).

The taxonomy of word classes

- 2.41 There is a yet more important caveat. Although they have deceptively specific labels, the word classes tend in fact to be rather heterogeneous, if not problematic categories. There is nothing sacrosanct about the traditional parts-of-speech classification, and we have indeed deviated from tradition to some extent in our list in 2.34. Thus the traditional category of article (*the* and *a/an*) has been subsumed under the larger heading of determiners (including, for instance, the demonstratives *this* and *that*); the traditional category of verb, on the other hand, has been divided into three categories, two closed (primary and modal verbs) and one open (full verbs). Both these adjustments are well-motivated for modern English. They do, however, raise questions about the justification for this or that classification.

The term 'word classes' (or more particularly the traditional term 'parts of speech') has been normally understood to refer to the most *general* categories to which lexical items can be appropriately assigned. There are, however, well-established subclassifications within these categories: nouns are subclassified into SECONDARY WORD CLASSES as common nouns, proper nouns, etc, and verbs as transitive verbs, intransitive verbs etc. But there is scope for considerable disagreement on the point at which we stop grouping subcategories into larger categories. The class of adverbs is notoriously heterogeneous, and may be separated into an open class consisting of adverbs with an adjectival base (especially those, like *completely*, which have an *-ly* suffix), and a closed class including adverbs such as *here, there, now*, etc. This closed class, however, will still be heterogeneous. An even better case can be made for splitting the conjunction class into subordinators (*cf* 14.11ff), which link a subordinate clause to a superordinate clause, and coordinators (*cf* 13.5ff), which link coordinate constructions. In the opposite direction, there are arguments, despite the clear criteria which separate modal, primary, and full verbs in modern English, for bringing these together, in the traditional way, within a global class of verbs. Indeed, the use of the term 'verb' itself in reference to these three categories reflects their overlap in terms of morphology, function, and meaning (*cf* 3.1ff).

Such arguments, however, have more to do with the labelling of categories than with the question of how we can best explain the grammatical behaviour of items on the basis of their various degrees of similarity and contrast. It is to this more substantial question that we shall address ourselves in the following chapters.

Additional classes

- 2.42 Some mention must be finally made of two categories, numerals and interjections, which are yoked together here only by virtue of the difficulty of classifying them as either closed or open classes.

(a) NUMERALS

Numerals, whether the cardinal numerals, *one, two, three, ...* or the ordinal numerals *first, second, third, ...*, must be placed somewhere between open-class and closed-class items: they resemble the former in that they make up a very large class – indeed, a class of infinite membership; but they resemble the latter in that the semantic relations among them are mutually exclusive

More generally, however, *pronoun* is a misnomer on two counts. First, a pronoun tends to be a surrogate for a whole noun phrase rather than a noun:

The man invited the little Swedish girl because he liked her. [2]

Secondly, the relationship which often obtains between a pronoun and its ANTECEDENT (an element to which it in some sense 'cross-refers') is not one which can be explained by the simple act of replacement. Notice, for example, that the following alternatives are by no means equivalent in meaning:

Many students did better than *many students* expected. [3]

Many students did better than *they* expected. [3a]

In [3a], *many students* and *they* are normally taken to refer to the same group of people. In [3], *many students* and *many students* are normally taken to refer to different groups. Hence it would be misleading to say that *they* 'replaces' *many students* in [3a]. It is none the less useful to apply a general term PRO-FORM to words and word-sequences which are essentially devices for recapitulating or anticipating the content of a neighbouring expression, often with the effect of reducing grammatical complexity.

Such devices are not limited to pronouns: the word *such* which begins this very paragraph may be described as a pro-modifier, and under appropriate circumstances there are also pro-forms for place, time, and other adverbials:

Mary is *in London* and John is *there* too.

Mary arrived *on Tuesday* and John arrived *then* too.

The police searched the big room *carefully*, but the small room less *so*.

In older English and still sometimes in very formal English, we find *thus* or *so* used more generally than in ordinary modern English as pro-forms for adverbials:

He often behaved *prudently*, but he did not always behave $\left\{ \begin{array}{l} \text{thus.} \\ \text{so.} \end{array} \right.$ [4]

But *so* has a more important function in modern usage, namely to substitute – along with the 'pro-verb' DO – for a main verb and whatever follows it in the clause (cf 2.51):

She hoped that they would *clean the house carefully* before her arrival, but unfortunately they didn't *do so*. [5]

DO can also act as a pro-form on its own, as is shown in:

A: I *warned her* about it.

B: Yes, I *did*, too. [6]

It will be observed that the use of pro-forms greatly facilitates sentence connection, as in [6], and the combining of sentences to form more complex sentences, whether by coordination, as in [4] and [5], or by subordination, as in [2]. We shall examine the various pro-forms and their uses in 12.8ff.

Note The items *do* and *thing*, although they belong to the classes of verb and noun respectively, have

semantic functions similar to pro-forms, in conveying a broad and undifferentiated meaning:

How do you *do* your laundry?

There's an important *thing* I'd like to discuss with you.

Wh-words

2.45 In pro-forms, we have identified a set of items which cuts across the standard classification of words into 'parts of speech'. This is true also for another set of items, the *wh*-words, including *what*, *which*, *who*, and *when* (cf Note). Indeed, *wh*-words may be regarded as a special set of pro-forms. To highlight both the similarity and the contrast between other pro-forms and *wh*-words, we may suggest that whereas other pro-forms have a general meaning roughly statable as 'We know what this item means/refers to, so I need not state it in full', the *wh*-words have a meaning something like 'It has not been known before what this item refers to, and so it needs to be stated in full'. This informal statement will account for the use of interrogative *wh*-words in questions:

WH-WORD	(FULL FORM)	OTHER PRO-FORM
Where is Mary?	Mary is <i>in London</i> .	John is <i>there</i> too.

But the paraphrase for *wh*-words is broad enough to help explain also their use in subordinate clauses such as:

The place *where* Mary lives is London.

I wonder *where* Mary lives.

Where Mary lives, the traffic is very noisy.

Initial position in the clause is a general characteristic of *wh*-words whether their role is interrogative (cf 6.36ff), relative (cf 6.32ff, 17.13ff), or subordinating (cf 14.12ff). Through the use of *wh*-words we can ask for the identification of the subject, object, complement, or an adverbial of a sentence. Thus in relation to a sentence consisting of S V O C A, like [1], we have:

- | | |
|--|-----|
| They [S] make [V] him [O] the chairman [C] every year [A]. | [1] |
| Who makes him the chairman every year? [<i>wh</i> -word as S] | [2] |
| Who(m) do they make the chairman every year? [<i>wh</i> -word as O] | [3] |
| What do they make him every year? [<i>wh</i> -word as C] | [4] |
| When do they make him the chairman? [<i>wh</i> -word as A] | [5] |

It will be noticed from these examples that the *wh*-word assumes first position in the clause whatever the normal position of the corresponding element in declarative clauses such as [1], and that this shift of order is accompanied by other changes of structure in the last three examples, involving the placement of *do* in front of the subject – a topic to which we shall shortly return (2.49f). Our present point, however, is that what the *wh*-words have in common is independent of their word-class classification. Whereas *who*, *whom*, and *what* above are pronouns in their syntactic function, *when* in [5] is a time adverb, and further exemplification shows *wh*-words functioning as determiners (*Which cup is yours?*), as adjectives (*How do you feel?*), and as modifying adverbs (*How old are you?*).

Note The *wh*-words include not only *which, when, why, where*, etc but also, less obviously, a few items pronounced with initial /h/, some having the *wh*- in spelling (*who, whose, whom*), and one not (*how*). We are therefore using the term '*wh*-word' as a convenient mnemonic title for a group of words, most of which begin with the letters *wh*-, and which share certain grammatical properties.

Variations on the basic sentence patterns

Sentence processes

- 2.46 Having outlined the constituency of English simple sentences by working down the grammatical hierarchy from clauses through phrases to words, we may now resume consideration of systematic correspondences, some of which were illustrated in 2.20*ff*. Let us return to the simple declarative sentence seen as a whole, and consider what modifications of its basic constituency must be allowed for if we are to account for questions, negative sentences, and other types of simple sentence which go beyond the structures we have outlined. It is a widely accepted principle, which we acknowledge through this form of presentation, that the simple declarative sentence is in a sense the canonical form of sentence, in terms of which other types of sentence, including both those which are more complex ('complex' and 'compound' sentences) and those which are more simple ('reduced' sentences), may be explained by reference to such operations as conjunction, insertion, inversion, substitution, and transposition. Such operations can be called 'sentence processes', and to the extent that the relation between one structure and another can be more naturally elucidated by such means, we shall feel free to use the concept of process, as well as the concepts of pattern and structure, in describing systematic correspondences.

First, a terminological point. Terms such as DECLARATIVE, INTERROGATIVE, IMPERATIVE, and EXCLAMATIVE can be used (either as adjectives or nouns) in referring to grammatical categories, and will be applied, at this stage, to types of clause or types of simple sentence. The terms STATEMENT, QUESTION, DIRECTIVE, and EXCLAMATION on the other hand, will be applied to the logical or semantic status of an utterance – what it means, and what it is used for – and for our purposes will be regarded as defining categories of sentence (*cf*, however, the discussion of indirect speech in 14.30*ff*). Since we confine our attention here to simple sentences, the distinctions between these two sets of terms will not become important until later chapters (esp Chapter 10).

Note More careful consideration of the relation between grammar, semantics, and pragmatics will require further distinctions of terminology. Thus we may distinguish SENTENCE (a grammatically autonomous unit) from UTTERANCE (a unit which is autonomous in terms of its pragmatic or communicative function). Further, there is commonly a need to separate what a locution *is*, in terms of its logical status (eg 'statement') from what it *does* in terms of its force as a speech act (eg ASSERTION; *cf* 11.3). Similarly, a directive (viewed as a general semantic type) may have various communicative functions: not only giving orders (*Come here*), but making offers (*Have some chocolate*), etc (*cf* 11.29).

Subject and predicate

- 2.47 Simple sentences are traditionally divided into two major parts, a SUBJECT and a PREDICATE. This means that in terms of clause elements (*cf* 2.13), the

subject (S) is distinguished from the other elements (V and combinations of O, C, and A) which follow it:

SUBJECT	PREDICATE
Julie	buys her vegetables in the market.
The train	arrived late today.
Tigers	are carnivorous.

This division, however, has more to do with the statement as a logical category than with the structural facts of grammar. Thus the subject is often described as the constituent defining the topic of the sentence – that which the sentence is 'about' and which it presupposes as its point of departure; whereas the predicate is that which is asserted about the subject. In general, we shall find little need to refer to the predicate as a separate structural unit in the description of English grammar.

Note One significant property of the predicate, however, is that it is the part of the clause which is typically affected by clause negation (*cf* 10.64*f*). Further, a predicate may be omitted through ellipsis (*cf* 12.61), or may be replaced by a pro-form (*cf* 2.44, 2.51, 12.21*ff*).

Operator and predication

- 2.48 A more important division, in accounting for the relation between different sentence types, is that between OPERATOR and PREDICATION as two subdivisions of the predicate. Not all simple statements have an operator, but when it occurs, it is normally the word which directly follows the subject. Provisionally defined as the *first or only auxiliary* (but *cf* 2.49), it has a crucial role in the formation of questions:

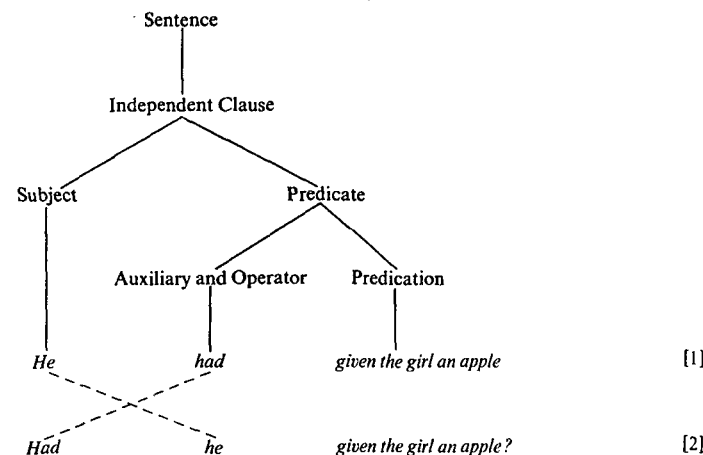

Fig 2.48a

By reversing the order of subject and operator, we can change the statement [1] into the *yes-no* question [2]. The operator has a similar role in the formation of most *wh*-questions. Compare, for example:

Who(m)	John	is	inviting somebody to dinner.	[3]
	is	John	inviting to dinner?	[4]
Where	The gold	has	been hidden somewhere.	[5]
	has	the gold	been hidden?	[6]

Fig 2.48b

Negation, also, makes crucial use of the operator: to make a positive statement negative, we insert *not* after the operator, or else add to the operator the informal enclitic *-n't* (cf 3.22f):

I	shall	not	be working this afternoon.	[7]
We	had	not	given the girl an apple.	[8]

Fig 2.48c

In all these and other ways, then, the operator, or first auxiliary, performs an 'operational' function in relating a positive declarative structure to another major structure in the language. That it is the first auxiliary, rather than a subsequent auxiliary, that takes on this role is clear from sentences like [6] and [7], where the second auxiliary (*been* and *be* respectively) is unaffected, being part of the predication:

Note In two ways, the role of the operator requires a reassessment of the account of clause structure given in 2.13–24. First, the operator is a single word which has a direct function in a clause; second, the division of a clause into subject, operator, and predication cuts across its division into S, V, O, C, and A, so that we entertain two alternative constituent analyses of the same structure. On these points, cf 2.55 and 2.61.

DO, BE, and HAVE as operators

- 2.49 The definition of operator as first auxiliary raises the question of what happens if the corresponding positive declarative has no auxiliary, and therefore no operator (cf 2.27). In such cases, in the corresponding interrogative and negative structures, the verb *DO* is introduced as a 'dummy' auxiliary to perform the function of operator (cf 3.37). This construction of *DO-SUPPORT*, which we have already seen in the *wh*-questions in 2.45 [3–5], is further exemplified in:

DECLARATIVE	INTERROGATIVE OR NEGATIVE	
They often <i>go</i> abroad.	~ <i>Do</i> they often <i>go</i> abroad?	[1]
Her father <i>works</i> in a factory.	~ Where <i>does</i> her father <i>work</i> ?	[2]
We <i>received</i> your letter.	~ We <i>did</i> not <i>receive</i> your letter.	[3]

Notice that *DO* as operator occurs in the variant forms of *do*, *does*, and *did*: as a finite verb (cf 3.2, 3.52), it realizes distinctions of number, person, and tense. Elsewhere however, *DO* may also, like *BE* and *HAVE*, function as a main

verb: compare the positive sentence *He did it* with the negative *He did not do it*, where the two functions cooccur.

Unlike *DO*, *BE* functions as an operator even when it constitutes the whole verb phrase, and is thus a main verb:

<i>Is</i> everything ready?	(~ Everything <i>is</i> ready)	[4]
<i>Was</i> Titian a painter?	(~ Titian <i>was</i> a painter)	[5]
<i>Are</i> these books for sale?	(~ These books <i>are</i> for sale)	[6]

Thus in the questions [4–6], *is*, *was*, and *are*, which are here main verbs, are placed in front of the subject. The main verb *HAVE*, on the other hand, tends to resemble the main verb *DO* in not functioning as operator (*Do you have a box of matches?*), although there is also a traditional usage (chiefly BrE) in which it does so: *Have you a box of matches?* (cf 3.34f, 3.48). These usages are exceptions to our earlier definition of the operator as 'first auxiliary'.

Questions and negation

- 2.50 We can now venture process rules for forming questions and negative sentences in English, given that we know how to form simple statements:

- YES-NO QUESTIONS:** Place the operator before the subject.
- WH-QUESTIONS:** First, identify the *wh*-element, which is a phrase containing or consisting of the *wh*-word. Then:
 - If the *wh*-element is the subject, make no change in the statement order.
 - If the *wh*-element is some other element (eg O, C, A), place it before the subject, and place the operator between the *wh*-element and the subject.
- NEGATION:** Place *not* or *-n't* after the operator (cf 3.22f).
- In (a), (b), and (c), if there is no operator in the corresponding statement, introduce the operator *DO*.

The following examples may be compared with the statement *Someone (has) borrowed my pencil*:

- Have you borrowed my pencil? [*yes-no* question]
- Who has borrowed my pencil?
 - Why have you borrowed my pencil?
 } [*wh-question*]
- I haven't borrowed your pencil. [negation]
- Did you borrow my pencil?
 Why did you borrow my pencil?
 I didn't borrow your pencil.

Predications and pro-forms

- 2.51 The predication, like the operator, is a constituent of some importance in the English clause. One indication of this is the readiness with which two predications can be joined by coordination (cf 13.53):

You should *eat regularly* and *take more exercise*.
 Someone has *broken into the house* and *stolen the money*.

English also has a composite pro-form *do so* which substitutes for a predicate or a predication (cf 12.23ff):

She hoped that he would *search the room carefully*,

{ and he { *searched the room carefully.* [1]

{ but he didn't { *search the room carefully.* [2]

Again, for sentences such as [1] and [2] there is the further alternative of omitting the predication altogether; the operator, left 'stranded' by this omission, thus shows its capability of standing as an independent unit:

She hoped that he would search the room carefully, { and he *did.*
but he *didn't.*

The composite pro-form *do so* should be distinguished from the empty auxiliary *DO* used in *DO*-support. Like other auxiliaries, *DO* may constitute a residual operator in cases where the contents of the predication are implied and do not need to be expressed. We see a parallel, in this connection, between [3] and [4-6]:

A: *Do they pay you for the work?*

B: { *Yes, they do.* [3]
{ *No, they don't.*

A: *Will they pay you for the work?*

B: { *Yes, they will.* [4]
{ *No, they won't.*

A: *Are they paying you for the work?*

B: { *Yes, they are.* [5]
{ *No, they aren't.*

A: *Have they been paying you for the work?*

B: { *Yes, they have.* [6]
{ *No, they haven't.*

Ellipsis

- 2.52 The above response forms [3-6] illustrate another grammatical process, that of ELLIPSIS (cf 12.31ff), whereby elements of a sentence which are predictable from context can be omitted. Ellipsis obviously resembles the substitution of pro-forms in its abbreviatory function, and both processes will be considered in this grammar under the common heading of REDUCTION (cf 12.1ff) as means of avoiding redundancy of expression. There is thus a choice between unreduced forms, pro-forms, and ellipsis, as can be seen in the following equivalent answers to [5]:

Yes, they ARE { paying me for the work. [UNREDUCED]
{ doing so. [PRO-FORM]
[ELLIPSIS]

(On the position and function of the intonation nucleus on *are*, cf 18.15f, 2.56 Note.) Reduction is a particularly clear illustration of the advantage of explaining grammatical phenomena in terms of process: without postulating or 'reconstructing' an unreduced form, we should find it difficult to explain the meaning and grammatical status of reduced forms.

Note A more careful analysis will later require the recognition that one predication may be embedded in another (cf 3.21). This is already suggested by the optional presence of *been* in a reduced answer to [6]:

Yes, they have (been (paying me for the work)).

Here both the inner brackets and the outer brackets delimit an omissible predication. Thus there can be more than one predication in a clause, either by embedding, as in:

You must [have [been [working too hard]]].

or by coordination, as in:

You must [[eat regularly] and [get more exercise]].

One of the consequences of this use of the term 'predication' is that a predication may, unlike those predications exemplified in 2.48, be preceded by more than one auxiliary, of which only the first is to be considered an operator. Therefore in the following example, the coordinated elements are predications:

Someone must have [[broken into the house] and [stolen the money]].

Nonassertive forms

- 2.53 It is already clear that there is a close connection between questions and negation: both constructions involve an operator, and the question-and-answer sequences in 2.51 [3-6] show how a *yes-no* question elicits from its addressee a choice between a positive and negative statement. The term *YES-NO QUESTION* itself reinforces this point.

Yes-no questions are also related to negation through their association with a set of words which we may call NONASSERTIVE FORMS (cf 6.59ff): *any*, *anybody*, *anywhere*, *yet*, etc. These in turn contrast with corresponding ASSERTIVE FORMS (*some*, *somebody*, *somewhere*, *already*, etc) which are associated with positive statements:

Have you found *any* mistakes *yet*? [1]

Yes, I have found *some* *already*. [2]

No, I haven't found *any* *yet*. [3]

The contrast between assertiveness and nonassertiveness is basically a logical one: whereas a sentence like [2] asserts the truth of some proposition, the question [1] and the negative statement [3] do not claim the truth of the corresponding positive statement. We may thus represent the relations between [1-3] by the following diagram:

Fig 2.53 Nonassertive territory

The arrows represent relations between question and (unreduced) answer, and the area enclosed by the broken line ----- may be termed 'nonassertive territory'. However, the paradigm of [1-3] is not complete, in a grammatical sense, until we add a fourth category, that of the negative question:

Haven't you found *any* mistakes *yet*? [4]

This cannot be easily fitted into Fig 2.53, for there is a fundamental asymmetry between the relation of positive to negative statements, and that of positive to negative *yes-no* questions. Logically, negative *yes-no* questions are equivalent to positive ones, in that they elicit equivalent *yes* and *no* answers: they differ from the latter only in indicating that the corresponding negative statement has been implied (cf 11.7).

Note Whereas it is frequently impossible for a positive statement to contain nonassertive forms (**I have any ideas*), it is by no means unusual for assertive forms to occur in questions and negative clauses: *Do(n't) you have some ideas*? Our use of the term 'nonassertive territory' does not exclude, and indeed anticipates, a more delicate stage of analysis (cf 10.61f) at which we acknowledge that assertive forms can give an assertive 'bias' to constructions which are predominantly nonassertive.

Negative forms

2.54 The addition of negative questions therefore invites a reanalysis of Fig 2.53 as follows:

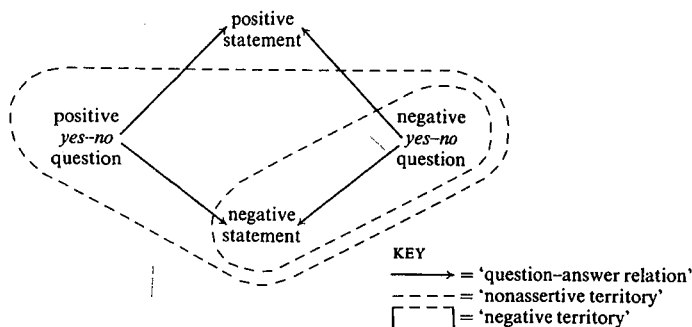

Fig 2.54 Nonassertive and negative territory

The justification for including a 'negative territory' within the larger 'nonassertive territory' lies in the existence of another set of words, the NEGATIVE FORMS, which mark a clause as negative even if the word *not* (-n't) does not occur in it (cf 6.62, 10.58f):

I saw *nobody*. [1]

[= I didn't see *anybody*.]

Have you *never* been to London? [2]

[= Haven't you *ever* been to London?]

We therefore have three parallel sets of words, as in the following:

ASSERTIVE FORMS: *some somebody something sometimes*

NONASSERTIVE FORMS: *any anybody anything ever*

NEGATIVE FORMS: *no nobody nothing never*

In [1] and [2] the negative forms are seen as equivalent in meaning to *not*, followed, not necessarily immediately, by a nonassertive form (eg: *never* = *not ... ever*); but since a negative clause normally contains only one mark of its negative status (cf 10.63), it is quite natural for a negative form to be followed by one or more nonassertive forms in the same clause or sentence:

John *never* invites *any* students to his parties.

No one *ever* gives her *any* encouragement.

It is this which justifies grammatically the treatment of negation as carrying the implication of nonassertion.

Note Like *wh*-words (cf 2.45), both nonassertive and negative forms tend to show a family likeness in their morphological form. But just as *wh*-words do not always begin with the spelling *wh*-, so nonassertive forms do not always begin with *any*-, nor negative forms with *no*-. Among exceptions are the negative words *few* and *rarely* (cf 10.59), and the nonassertive words *ever* and *yet* (cf 10.60).

Scope

2.55 In accounting for sentence processes, we have found it necessary to refer to a number of special classes of word – pro-forms (including *wh*-words), assertive forms, nonassertive forms, negative forms, operators – which intersect with the primary word-class categories. These classes may be described as having a *logical* function rather than a *structural* function in the sense of 2.12. In fact, all of them except operators are distributed across a range of word classes, and can have a number of different functions in clause structure; eg as S, O, C, A. Moreover, their contribution to the meaning of the sentence can stretch well beyond the particular phrase in which they occur. Their position, too, may bring particular significance: for example, a *wh*-word or an operator at the beginning of a sentence will mark the whole of what follows it as a question.

SCOPE is the general term that we shall use to describe the semantic 'influence' which such words have on neighbouring parts of a sentence. It deserves attention because of its close connection with the ordering of elements. The position of a negative form, for instance, is generally significant in defining whatever follows it as nonassertive:

Some people *never* send *any* Christmas cards.

In such a sentence, we may say that *any*, because it follows *never*, is within the scope of negation (cf 10.64) while *some* is not. It would therefore not be possible to reverse the positions of the assertive and nonassertive words:

**Any* people *never* send *some* Christmas cards.

This sentence may, however, be contrasted with an allowable sentence in which *any* people follows a negative:

I don't know *any* people who *never* send Christmas cards.

In a similar way, the operator or *wh*-element which normally begins a question indicates that what follows is within the scope of interrogation. It is this which accounts in part for the difference of meaning between:

- Does he *seriously* believe that? [1]
Seriously, does he believe that? [2]

or between:

- Why doesn't he *also* take the children abroad? [3]
Also, why doesn't he take the children abroad? [4]

In [2] and [4] the adverb must be interpreted as a sentence adverbial (*cf* 2.15) which, because of its initial position, is not part of the matter being questioned.

Focus

- 2.56 The position of *also* in [3] above brings to notice another phenomenon of 'semantic influence'. We shall call certain adverbs, such as *also*, *only*, and *even*, FOCUSING SUBJUNCTS (*cf* 8.116*ff*), because they have the peculiarity of extending the application of their meaning to units of varying size and position. Thus [3] in different contexts could mean:

- 'Why doesn't *he* (in addition to his wife) take the children abroad?' [5]
 'Why doesn't he take *the children* (in addition to his wife) abroad?' [6]
 'Why doesn't he take the children *abroad* (in addition to taking them to places in this country)?' [7]
 'Why doesn't he *take the children abroad* (in addition to, say, giving them presents)?' [8]

The italicized parts of these paraphrases identify the different focused elements which give rise to the ambiguities.

The ambiguities, however, are more apparent on paper than in speech. This is one aspect of grammar for which intonation plays a critical role, since the various meanings of [3] can be largely distinguished by different positions of the nucleus (*cf* App II.11). For example:

- Why doesn't he *also* take the children abroad? [5a]
 Why doesn't he *also* take the *children* abroad? [6a]
 Why doesn't he *also* take the children *abroad*? [7a], [8a]

The term FOCUS, in fact, will be more generally applied to the varying placement of the nucleus so as to mark which parts of an utterance are meant to represent new or contrastive information (*cf* 18.8*ff*). The interaction between information focus in this sense, and scope in the sense of 2.55 is a somewhat difficult area of grammar (*cf* esp 10.65) which nevertheless has some obvious communicative effects. The nucleus can, for example, narrow down the negative or interrogative force of a sentence by giving contrastive prominence to a particular item:

I don't drink *instant* coffee.

carries the implication 'I drink some coffee, but not . . .', and similarly:

Have you read *all* her novels?

carries the implication 'I know you've read *some* of her novels, but what I want to know is . . .'.

Enough has been said to suggest that a full understanding of interrogation, negation, and other processes cannot be reached without a study of the phenomena of scope and focus. These illustrate particularly clearly the need for grammar to take account of other aspects of language, especially the semantic contrasts which are realized through grammar, and the phonological contrasts through which grammar itself is realized.

Note It is not surprising that the special grammatical functions of operators, *wh*-words, and negative words are associated with special meanings when the focus is placed on these items:

We *HAVE* been working hard. (*cf* focus on the operator; 18.15*f*).

WHEN are you leaving? (*cf* echo questions; 11.33*ff*).

I was *NOT* telling lies. (*cf* denial negation; 10.65 Note [a]).

These are all, in a way, SECOND-INSTANCE SENTENCES, *ie* sentences about other sentences rather than sentences about the world outside language. Focus on the operator can involve the introduction of DO-support, showing that DO as operator can be found even in unreduced declarative sentences:

I *DO* believe you.

Other structural variations

Directives and exclamations

- 2.57 We finally take brief notice of grammatical processes other than those connected with questions and negation.

Apart from statements and questions, a classification of sentences in terms of communicative function (*cf* 2.46) must include DIRECTIVES (*cf* 11.24*ff*) and EXCLAMATIONS (*cf* 11.31*f*). The former, in their typical form, contain no subject or operator: they consist simply of a predication with an imperative verb, *ie* a verb in its base form:

Be quiet!

Search the room carefully!

Make yourself a cup of tea.

This is understandable; since an imperative normally refers to some future action which the hearer is urged to perform, its subject is semantically predictable, and therefore dispensable, while the verb phrase is required to make no distinctions of tense, number, and person. Imperatives can, however, be negative, and for this *do* is introduced as an imperative marker (*cf* 11.28):

Don't hurry!

Don't be frightened!

Don't wait for me.

Exclamatives, as a formal category, resemble *wh*-questions in beginning with a *wh*-word (*what* or *how*), but differ from them in generally retaining the regular declarative order of subject and verb:

What beautiful clothes she wears!

How well Philip plays the piano!

(Compare the *wh*-questions *What clothes does she wear?* and *How well does Philip play the piano?*) The exclamatory force of *what* and *how* resides in their function as an intensifying determiner and adverb respectively: the element in which they occur must be overtly or implicitly subject to modifications of degree (cf 7.42, 7.87ff). Like directives, therefore, they are grammatically restricted; but their restrictions are of a different kind.

For example they resemble *wh*-questions rather than directives in their general unsusceptibility to negation:

- ?How well Philip doesn't play the piano! [1]
?What beautiful clothes she doesn't wear! [2]

To explain this tendency we may again appeal to the notion of scope – the rest of the sentence being included in the scope of the initial intensifying phrase. Since negative states of affairs cannot be treated as matters of degree, negative exclamations are unusual.

Note Thus [1] can be given only an irregular or humorous interpretation such as 'I find Philip's behaviour perfectly delightful in that he, unlike so many other people I know, does not play the piano'.

Pragmatic considerations

2.58 The peculiarities of directives and exclamations have much to do with their pragmatic roles as utterances which relate specifically to the hearer's and the speaker's participation in the act of communication: a directive is 'hearer-oriented', whereas an exclamation is 'speaker-oriented'.

If we define PRAGMATICS as a study of language in relation to the communicative functions it may be used to perform, then there is a certain division of labour between grammar and pragmatics whereby the more the context contributes to the communicative force of an utterance, the less need there is for the utterance to be grammatically explicit. In this sense, directives and exclamations are towards the pragmatic end of the scale. They can take many forms other than the structures above, and are often reducible to formulaic utterances which make very limited use of grammatical structure: *Out with it! What a day! Perfect!* etc (cf 11.38ff). To the extent that the situation limits the need for full articulation of meaning, sentence grammar becomes otiose. Here again, attention must be given to the interaction between grammar and other factors in the totality of linguistic communication.

Note The contribution of grammar to the communicative process reaches its minimum in utterances which are merely interjections: *Ouch! Hush!* ([ʃ:ɪ]) etc. It is worth noting that these quasi-linguistic noises very frequently have either an exclamatory or an imperative force (cf 11.55). On the other hand, we must acknowledge that statements and questions, too, can occur as interjections or in markedly reduced forms: *Uh-huh, Yes, No, Eh?, Right?, Ready?*, etc.

Grammatical highlighting

2.59 Still thinking of grammar in a communicative context, we notice that many variations of grammatical structure relate to the speaker's or writer's need to present the message in a form readily adapted to the addressee's requirements as interpreter. Reduction (cf 2.52) and information focus (cf 2.56), in

particular, enable users of language to suppress those elements of meaning which are informationally predictable, and to highlight those which are informationally important. In Chapter 18 we shall explore how such considerations interact with processes which involve varying the position of elements in the sentence.

The so-called CLEFT SENTENCE (cf 18.25ff), for example, is a grammatical device similar to, and associated with, information focus: it enables the user to select (within limits) which element of the sentence will be highlighted. The cleft sentence is divided into two main parts: an initial focal element, followed by a 'background' structure which resembles a relative clause. For the simple sentence [1] the alternative cleft sentences [2–4] are available:

- Julie buys her vegetables in the market. [1]
It's *Julie* that/who buys her vegetables in the market. [2]
It's *her vegetables* that Julie buys in the market. [3]
It's *in the market* that Julie buys her vegetables. [4]

A less complex device with a similar function is FRONTING: the initial placing of an element such as an object or an adverbial (cf 18.20):

- Her vegetables* Julie buys in the market.
In the market Julie buys her vegetables.

The opposite device of postponing a normally nonfinal element to final position is shown by the EXTRAPOSITION of a subject clause (cf 18.33), as in [6]:

- What you say* doesn't matter. [5]
~ It doesn't matter *what you say*. [6]

The final position gives the element in question a different kind of prominence, which we shall discuss under the headings of end-focus and end-weight (cf 18.3f, 18.9).

The role of the anticipatory pronoun *it* in [6] is essentially a structural one in the sense that it carries virtually no information in itself, but merely supplies the structural requirement for an initial subject. (Its semantic function, in so far as it has one, is merely to signal that the content of the subject is expressed in a later position in the same sentence.) A somewhat parallel role is performed by the introductory word *there* in EXISTENTIAL sentences (cf 18.44ff), as in [8]:

- Someone* was knocking at the door. [7]
~ *There was someone* knocking at the door. [8]

The effect of the prelude *there was* in [8] is to postpone to a more 'focused' position the indefinite pronoun *someone*, which, because it ushers in new information, can only uneasily fill the unfocused position of subject (cf 2.55, 2.56).

We have merely hinted at the communicative value of these apparently unneeded constructions, and at the stylistic considerations which may lead users of English to select them. But they enable us to stress once again that the study of grammatical process, in all its variety and apparent arbitrariness, compels us to place grammar in its broader context of uses and users of language.

Gradience and multiple analysis

Gradience

- 2.60 Grammar is to some extent an indeterminate system. Categories and structures, for example, often do not have neat boundaries. Grammarians are tempted to overlook such uncertainties, or to pretend that they do not exist. Our guiding principle in this grammar, however, will be to acknowledge them, and where appropriate to explore them through the study of GRADIENCE. A gradient is a scale which relates two categories of description (for example two word classes) in terms of degrees of similarity and contrast. At the ends of the scale are items which belong clearly to one category or to another; intermediate positions on the scale are taken by 'in-between' cases – items which fail, in different degrees, to satisfy the criteria for one or the other category. At various points in the preceding survey we have hinted at gradience; in the contrast between central and peripheral elements of the clause (2.13), between adjuncts, subjuncts, disjuncts, and conjuncts (2.15), between complements and adverbials (2.17f), between modification and complementation (2.33).

The simplest cases of gradience to identify are those relating to word classes. We shall see, for example, in 13.18f that there is a scale relating coordinating and subordinating conjunctions, such that *and* and *if* represent clear cases of each category, whereas *for* is in an intermediate position:

COORDINATING

SUBORDINATING

and ← *for* → *if*

Nevertheless, *for* is closer to *if* in its syntactic behaviour than to *and* (cf 13.18f), and can reasonably be classed as a peripheral subordinator.

Multiple analysis

- 2.61 Another kind of indeterminacy is revealed through what may be called MULTIPLE ANALYSIS. It is one thing to analyse a sentence into a multiplicity of smaller units through progressive subdivision, as shown in the tree diagrams of 2.3–9; it is quite another thing to propose that two or more different analyses, each resulting in a different constituent structure, can be applied to the same sentence. There are occasions, however, when such alternative analyses seem to be needed, on the grounds that some of the generalizations that have to be made require one analysis, and some require another. It is for this reason that we have presented, in this chapter, two ways of analysing a clause: one analysis in terms of the elements S, V, O, C, and A, and the other in terms of subject and predicate, the predicate being subdivided into operator and predication (cf 2.48 Note). In other cases, there appears to be a gradient between two analyses, such that sentences may vary in the degree to which one analysis is more appropriate than another.

An important example of multiple analysis is that required for prepositional verbs such as *look at* and *approve of* (cf 16.13ff). In the terms of the present chapter, we regard the preposition as introducing a prepositional phrase which functions as an adverbial:

[They] [don't approve] [of noisy parties].

But there are also good reasons, such as the possibility of the (rather awkward) passive *Noisy parties are not approved of*, for an alternative analysis in which *noisy parties* is treated as an object of the multi-word verb *approve of*:

[They] [don't approve of] [noisy parties].

Such alternative analyses are further discussed in 16.5.

Conclusion

- 2.62 Both the complexities and indeterminacies of grammar place the prospect of writing a complete and definitive grammatical description of English beyond reasonable expectation. Given inevitable limitations, what we aim to achieve here is a description which combines breadth of coverage and depth of detail, and in which observation of particularities goes hand in hand with the search for general and systematic explanations.

Bibliographical note

For the general application of various models or theories to English grammar, see Akmajian and Heny (1975); Bloomfield (1933); Brown and Miller (1982); Dik (1978); Fillmore (1977b); Huddleston (1976b, 1984); Hudson (1976a); Newmeyer (1980); Pike and Pike (1977); Radford (1982); Stockwell et al (1973).

Descriptive and reference grammars of English include Curme (1931); Jespersen (1909–1949, 1933); Kruisinga (1931–32); Poutsma (1926–29); Quirk et al (1972); Svartvik and Sager (1980); Sweet (1891–98); Visser (1963–73); Zandvoort (1975).

On aspects of English sentence structure, see Crystal (1980); Firbas (1974); Greenbaum (1980); Halliday (1963); Huddleston (1965, 1971); Hudson (1971); Young (1980).

On elements of structure and their syntactic and semantic relations (both in English and in other languages), see Abraham (1978); Allerton (1980); Jacobson (1964); Li (1975, 1976); Mathesius (1975); Matthews (1980).

Studies relevant to the boundaries of grammar include the following: (a) relating to semantics and pragmatics: Austin (1962); Bolinger (1977a); Givón (1979); Searle (1969, 1979); (b) relating to lexical structures: Halliday (1966); Schopf (1969), esp Ch 3.

On topics related to gradience and multiple analysis, see Bolinger (1961a, 1961b); Givón (1984); Lakoff (1982); Mohan (1977); Quirk (1965); Ross (1973).

Among other works relevant to the general analysis of grammatical concepts and categories are Allerton (1979); Ellegård (1978); Gleason (1965), esp Pt 2; Greenbaum (1973a, 1977a); Hockett (1968); Lehmann (1978); Lyons (1966, 1977 esp Vol 2); Matthews (1974, 1981); Robins (1980, esp Chs 5 and 6); Sørensen (1958).

Bibliographical note	171
----------------------	-----

Major verb classes

- 3.1 The function of the V element in English clause structure, as outlined in 2.13–24, is realized by the VERB PHRASE, which consists of one or more verb constituents, eg:

<i>She left yesterday.</i>	<i>She won't leave tomorrow.</i>
<i>Has she not left yet?</i>	<i>She will leave tomorrow.</i>
<i>Did she leave yesterday?</i>	<i>She might be leaving next week.</i>

Verbs, as a class of words, can be divided into three major categories, according to their function within the verb phrase; we distinguish the open class of FULL VERBS (or lexical verbs) such as LEAVE (cf 3.2ff) from the closed classes of PRIMARY VERBS (BE, HAVE, and DO; cf 3.31ff) and of MODAL AUXILIARY VERBS (*will, might, etc*; cf 3.39). Of these three classes, the full verbs can act only as main verbs (cf 2.28), the modal auxiliaries can act only as auxiliary verbs, and the primary verbs can act either as main verbs or as auxiliary verbs.

- Note [a] Some verbs (variously termed marginal modals, semi-auxiliaries, catenative verbs, etc) have a status intermediate between that of main verbs and that of auxiliary verbs. (These are discussed in 3.40–3.51.)
- [b] SMALL CAPITALS are generally used in this chapter in citing a verb as a lexical item (cf 2.35) instead of as a grammatical form. We will cite the modal auxiliaries, however, in *italics*, since it is often more appropriate to regard *can* and *could* (for example) as invariable words, than as forms of the same lexical item (cf 4.49ff, where special uses of the past modal forms *could, might, would, and should* are discussed).

Full verbs

The morphology of regular verbs

Verb forms and the verb phrase

- 3.2 Regular full verbs, eg CALL, have four morphological forms. Irregular full verbs vary in this respect; a verb like SPEAK has five, whereas CUT has only three forms (note, however, that the primary verb BE (cf 3.32) has as many as eight forms).

	REGULAR VERBS		IRREGULAR VERBS		
(1) BASE FORM	<i>call</i>	<i>want</i>	<i>speak</i>	<i>cut</i>	<i>win</i>
(2) -S FORM	<i>calls</i>	<i>wants</i>	<i>speaks</i>	<i>cuts</i>	<i>wins</i>
(3) -ING PARTICIPLE	<i>calling</i>	<i>wanting</i>	<i>speaking</i>	<i>cutting</i>	<i>winning</i>
(4) PAST FORM	<i>called</i>	<i>wanted</i>	<i>spoke</i>	<i>cut</i>	<i>won</i>
(5) -ED PARTICIPLE	<i>called</i>	<i>wanted</i>	<i>spoken</i>	<i>cut</i>	<i>won</i>

These verb forms have different functions in finite and nonfinite verb phrases (cf 3.52ff). On this basis, the -s form and the past form are called FINITE, whereas the -ing participle and the -ed participle are called NONFINITE. The

BASE form (the form which has no inflection) is sometimes finite, and sometimes nonfinite (see below). In a finite verb phrase (the kind of verb phrase which normally occurs in simple sentences), only the first verb word (in bold face below) is finite:

*She **calls** him every day.*
*She **is calling** him now.*
*She **has called** twice today.*

and the subsequent verbs, if any, are nonfinite. In a nonfinite verb phrase, on the other hand, all verbs are nonfinite; eg:

Calling early, she found him at home.
Called early, he ate a quick breakfast.
Having been called early, he felt sleepy all day.

The difference between finite and nonfinite phrases is discussed in greater detail in 3.52ff. Here we confine our attention to the syntactic deployment of the verb forms of which verb phrases are composed:

- (1) The BASE FORM (*call, speak, cut, etc*) occurs as (a) a FINITE form in:
 - (i) the present tense in all persons and numbers except 3rd person singular (which has the -s form): *I/you/we/they call regularly.* (cf 3.54, 4.3ff)
 - (ii) the imperative: *Call at once!* (cf 3.54, 11.24ff)
 - (iii) the present subjunctive: *They demanded that she call and see them.* (cf 3.59–61)
 It also occurs as (b) a NONFINITE form in:
 - (i) the bare infinitive: *He may call tonight.*
 - (ii) the to-infinitive: *We want her to call.* (cf 3.53, 14.6ff)
- (2) The -S FORM (*calls, speaks, cuts, etc*) occurs as a FINITE form in: 3rd person singular present tense: *He/She calls every day.*
- (3) The -ING PARTICIPLE (*calling, speaking, cutting, etc*) occurs as a NONFINITE form in:
 - (i) the progressive aspect following BE: *He's calling her now.* (cf 4.25ff)
 - (ii) -ing participle clauses: *Calling early, I found her at home.* (cf 3.53, 14.6ff)
- (4) The PAST FORM (*called, spoke, cut, etc*) occurs as a FINITE form in the past tense: *Someone called yesterday.* (cf 4.11ff)
- (5) The -ED PARTICIPLE (*called, spoken, cut, etc*) occurs as a NONFINITE form in:
 - (i) the perfective aspect following HAVE: *He has called twice today.* (cf 4.18ff)
 - (ii) the passive voice following BE: *Her brother is called John.* (cf 3.63ff)
 - (iii) -ed participle clauses: *Called early, he ate a quick breakfast.* (cf 3.53, 14.6ff)

As will become clearer when we discuss the structure of the verb phrase (3.52ff), the nonfinite forms of the verb occur not only in nonfinite verb phrases, but also in noninitial positions in finite verb phrases.

- Note The *-ing* participle is sometimes called the 'present participle', and the *-ed* participle is sometimes called the 'past participle' or, with transitive verbs, the 'passive participle'. Since these terms are potentially misleading, we prefer to use terms which are descriptive only of morphological form. Note, however, that the *-ed* participle owes its name to the form this participle takes in regular verbs; some irregular verbs (eg: *taken*) have a more distinctive ending in *-en*, and some grammarians for this reason have preferred the term '*-en* participle'.

The morphology of regular full verbs

- 3.3 Morphologically, full verbs are considered under two heads: REGULAR verbs (such as CALL) and IRREGULAR verbs (such as DRINK). In both types, the *-s* form and the *-ing* participle form are almost invariably predictable from the base. Irregular verbs differ from the regular verbs, however, in that the past form and the *-ed* participle of irregular verbs cannot be predicted by general rule from the base.

- 3.4 Regular full verbs have only four different forms:

BASE	<i>call</i>	<i>like</i>	<i>try</i>
<i>-ing</i> PARTICIPLE	<i>calling</i>	<i>liking</i>	<i>trying</i>
<i>-s</i> FORM	<i>calls</i>	<i>likes</i>	<i>tries</i>
PAST FORM or <i>-ed</i> PARTICIPLE	<i>called</i>	<i>liked</i>	<i>tried</i>

These verbs are called regular because if we know the base form (ie the dictionary entry form; cf 2.35) of such a verb, we can predict all its other forms by rule. This is a very powerful generalization, since the vast majority of English verbs belong to the regular class. Furthermore, new verbs that are coined or borrowed from other languages adopt this pattern; eg: *xerox* ~ *xeroxing* ~ *xeroxes* ~ *xeroxed*. As the past form and the *-ed* participle form are identical for all regular verbs, it will be convenient to refer to them both as the *-ed* form, distinguishing where necessary between the *V-ed₁* (past tense) and *V-ed₂* (*-ed* participle) forms.

- Note [a] The process of assimilating foreign words to the regular pattern is more marked in verbs than in nouns, where foreign plurals are often kept in English, sometimes with an alternative native ending (cf 5.82ff): *antenna* ~ *antennae/antennas*.

[b] Some archaic 2nd person and 3rd person singular present-tense verb forms survive in very restricted use: chiefly in traditional liturgical language. The 2nd person forms with *thou* as subject (cf 6.12 Note [c]) end in *-est* /ɪst/, /est/, whereas the even rarer 3rd person forms end in *-eth* /eθ/, /eθ/:

(thou)	<i>callest</i>	<i>givest</i>	<i>hearest</i>
(he/she)	<i>calleth</i>	<i>giveth</i>	<i>heareth</i>

Contracted nonsyllabic endings *-st* and *-th* occur with the primary verbs HAVE and DO: *hast*, *hath*; *dost* /dɒst/, *doth* /dɒθ/. (Similar forms *saist*, *saith* /seθ/ occur with the verb SAY, which also, however, has the regular forms *sayest* and *sayeth*.) The primary verb BE, here as elsewhere, is highly irregular: it has no *-st* or *-th* forms, but it has the archaic 2nd person form *art* and an analogous past tense form *wert*: *thou art/wert*. Other verbs have *-(e)st* 'thou-forms' in the past tense: *hadst*, *didst*, *gavest*, *camest*, etc. The spelling of the *-est* forms of *see* and *lie* is irregular: *seest* /si:st/, *liest* /laɪst/.

All the modal auxiliaries except those ending in *-t* have special 'thou-forms': *will* ~ *wilt*, *shall* ~ *shalt*, *can* ~ *canst*, *may* ~ *mayst*, *would* ~ *wouldst*, *should* ~ *shouldst*, *could* ~ *couldst*.

The *-ing* participle and the *-s* form

- 3.5 The *-ing* form of both regular and irregular verbs is formed by adding *-ing* /ɪŋ/ to the base:

walk ~ *walking* *agree* ~ *agreeing* *push* ~ *pushing*
sing ~ *singing* *pass* ~ *passing* *weep* ~ *weeping*

(On the spelling of the *-ing* participle, cf 3.7ff.) The *-s* form of both regular and irregular verbs (sometimes spelled *-es*; cf 3.9) is also predictable from the base. It has three pronunciations /ɪz/, /z/, and /s/, which occur under the following phonological conditions:

- (a) /ɪz/ after bases ending in voiced or voiceless sibilants; eg:

Table 3.5a

BASE	<i>-s</i> FORM	BASE	<i>-s</i> FORM
/-s/ <i>pass</i>	~ <i>passes</i> /-sɪz/	/-dʒ/ <i>budge</i>	~ <i>budges</i> /-dʒɪz/
/-z/ <i>buzz</i>	~ <i>buzzes</i> /-zɪz/	/-/ <i>push</i>	~ <i>pushes</i> /-ʃɪz/
/-tʃ/ <i>catch</i>	~ <i>catches</i> /-tʃɪz/	/-ʒ/ <i>camouflage</i>	~ <i>camouflages</i> /-ʒɪz/

For these cases, the *-s* form always ends in *-es*.

- (b) /z/ after bases ending in voiced sounds other than sibilants, including vowels; eg:

Table 3.5b

/-l/ <i>call</i>	~ <i>calls</i> /-lɪz/	/-b/ <i>rob</i>	~ <i>robs</i> /-bɪz/
/-i:/ <i>flee</i>	~ <i>flees</i> /-i:z/	/-aɪ/ <i>try</i>	~ <i>tries</i> /-aɪz/

- (c) /s/ after bases ending in voiceless sounds other than sibilants, eg:

Table 3.5c

/-t/ <i>cut</i>	~ <i>cuts</i> /-ts/	/-k/ <i>lock</i>	~ <i>locks</i> /-ks/
/-p/ <i>hop</i>	~ <i>hops</i> /-ps/	/-f/ <i>cough</i>	~ <i>coughs</i> /-fs/

The rules on the spelling *-es* (*go/goes*), the changing of *-y* to *-i* (*try/tries*), etc are the same as for the regular plural of nouns (cf 5.81).

- Note [a] Apart from the three primary verbs BE, HAVE, and DO (cf 3.31ff), the only verbs which have an irregular *-s* form are *say* /seɪ/ ~ *says* /sez/, and derivatives of DO, eg: *outdo* /-du:/ ~ *outdoes* /-dʌz/; *overdo* /-du:/ ~ *overdoes* /-dʌz/. In the *-s* form, SAY is irregular in pronunciation, but not in spelling. GAINSAY, historically a derivative of SAY, may have a regular or an irregular pronunciation in the *-s* form: *gainsays* /-seɪz/ or /-sez/.

[b] In some varieties of English (eg South African English and many varieties of AmE) the pronunciation of the syllabic ending of the *-s* form is /əz/ rather than /ɪz/. Similarly, the syllabic *-ed* form (cf 3.6) is pronounced in such varieties as /əd/ rather than /ɪd/.

[c] A common (especially nonstandard) pronunciation of the *-ing* inflection is /ɪn/, conventionally spelt *-in'*; eg: *gettin'* /'getɪn/.

[d] The verb *lightning* ~ *lightnings* ~ *lightning* ~ *lightninged* is a sole exception to the rule for forming the *-ing* participle. Since the base form of the verb already ends in an *-ing* suffix, no further *-ing* is added: *It is lightning/*lightninging*. The *-ing* participle of this verb is avoided probably because of the awkwardness of this irregularity.

The past form and the -ed participle

- 3.6 Like the -s form, the past and the -ed participle forms (both termed the -ed form) of regular verbs have three pronunciations:

- (a) /ɪd/ after bases ending in /d/ and /t/, eg:

pad ~ *padded* /-ɪd/ *pat* ~ *patted* /-ɪd/

- (b) /d/ after bases ending in voiced sounds other than /d/, including vowels, eg:

buzz ~ *buzzed* /-zɪd/ *budge* ~ *budged* /-dʒɪd/

call ~ *called* /-ld/ *tow* ~ *towed* /-əʊd/

- (c) /t/ after bases ending in voiceless sounds other than /t/, eg:

pass ~ *passed* /-st/ *pack* ~ *packed* /-kt/

Note Some exceptions to the second rule above are verbs like *dwelt* ~ *dwelled*/*dwelt*, which (esp in BrE) may end in /t/ rather than /d/. The devoicing may also be reflected in an irregular spelling: *dwelt*. These verbs are classed as irregular verbs (cf 3.13).

The spelling of regular verb inflections

- 3.7 The rules in 3.5 – 6 apply to pronunciation, but certain additional rules have to be stated to account for the spellings of verbs with regular verb inflections. First, however, we note the general spelling rules:

The -s form is written -s: *look* ~ *looks*

The -ing form is written -ing: *look* ~ *looking*

The -ed form is written -ed: *look* ~ *looked*

These rules apply except where one of the following additional changes applies: doubling of the final consonant of the base (cf 3.8); deletion or addition of a final -e (cf 3.9); substitution of -i- for a final -y or vice versa (cf 3.10).

These additional rules are necessary in order to account for such apparent anomalies as are illustrated in the following distinctions:

{ *die* ~ *dying* ~ *died*
 dye ~ *dyeing* ~ *dyed*

{ *sing* ~ *singing* ~ *sang/sung* (cf 3.19)
 singe ~ *singeing* ~ *singed*

{ *stop* ~ *stopping* ~ *stopped*
 stoop ~ *stooping* ~ *stooped*

{ *bar* ~ *barring* ~ *barred*
 bare ~ *baring* ~ *bared*

{ *hop* ~ *hopping* ~ *hopped*
 hope ~ *hoping* ~ *hoped*

{ *star* ~ *starring* ~ *starred*
 stare ~ *staring* ~ *stared*

As we see above, final -e can be preserved to avoid confusion in pairs like *dying* and *dyeing* (cf 3.9).

Doubling of consonant before -ing and -ed

- 3.8 A single consonant letter at the end of the base is doubled before -ing and -ed when the preceding vowel is stressed and spelt with a single letter:

bar ~ *'barring* ~ *barred*

beg ~ *'begging* ~ *begged*

oc'cur ~ *oc'curring* ~ *oc'curred*
per'mit ~ *per'mitting* ~ *per'mitted*
pa'trol ~ *pa'trolling* ~ *pa'trolled*

There is normally no doubling when the preceding vowel is unstressed (*enter* ~ *'entering* ~ *'entered*, *visit* ~ *'visiting* ~ *'visited*) or is written with two letters (*dread* ~ *dreading* ~ *dreaded*).

With some final consonants, however, doubling occurs even when the preceding vowel is unstressed. In the following cases (a – c), doubling is normal in BrE, whereas it is an alternative and less favoured practice in AmE:

- (a) Verbs ending in an unstressed vowel followed by -l:

'travel	{ 'travelling	'travelled	<BrE and AmE>
	{ 'traveling	'traveled	<AmE only>

Similarly: *'cancel*, *'counsel*, *'dial*, *'model*, *'signal*, etc.

- (b) Verbs ending in an unstressed vowel followed by -m(me):

'program(me)	'programming	'programmed	<BrE and AmE>
'program	'programing	'programed	<AmE only>

- (c) Some verbs ending in an unstressed vowel followed by -p:

'worship	{ 'worshipping	'worshipped	<BrE and AmE>
	{ 'worshipping	'worshiped	<AmE only>

The verbs *handicap* and *kidnap* also follow the pattern of *worship*. But most verbs ending in -p after an unstressed vowel have no doubling either in BrE or in AmE: *de'velop* ~ *de'veloping* ~ *de'veloped*, *'gallop* ~ *'galloping* ~ *'galloped*, *'gossip* ~ *'gossiping* ~ *'gossiped*, etc.

- (d) Verbs ending in an unstressed vowel followed by -g:

'humbug	'humbugging	'humbugged
---------	-------------	------------

But note <AmE> *'catalog* ~ *'cataloging* ~ *'cataloged*.

- (e) In verbs ending with vowel + -c, the doubling of the final consonant is spelt -ck-:

'panic	'panicking	'panicked
'traffic	'trafficking	'trafficked

Similarly *'frolic*, *'bivouac*, etc.

- (f) In certain verbs whose base ends in a vowel followed by -s, there is variation between -s- and -ss- when the verb suffix is added:

'bias	'biasing/'biassing	'biased/'biassed
'bus	'busing/'bussing	'bused/'bussed
'focus	'focusing/'focussing	'focused/'focussed

Note [a] With verbs like *PLAY* (~ *playing* ~ *played*) and *ROW* (~ *rowing* ~ *rowed*) there is no doubling, because the -y and -w do not count as consonants in these words, but as part of the spelling of the diphthong (-ay-, -ow-). (On *LAY*, *PAY*, cf 3.10.)

[b] There is, on the other hand, doubling in words such as EQUIP (~ *e'quipping* ~ *e'quipped*) and ACQUIT (~ *ac'quitting* ~ *ac'quitted*), because the *u* here counts as part of the consonantal spelling -qu-, rather than as a vowel.

[c] The letter -x is never doubled, since it represents the two consonant sounds /ks/: *fix* ~ *fixing* ~ *fixed*, etc.

[d] Final silent consonants are not doubled: *crochet* /-eɪ/ ~ *crocheting* ~ *crocheted*; *hurrah* /-ɑ:/ ~ *hurrahing* ~ *hurrahed*.

[e] The rules given here for doubling are in general followed also in the addition of derivational suffixes (App 1.32ff) beginning with a vowel.

[f] The spellings **catalogged* ~ **catalogging* do not occur (see (d) above), since the BrE spellings for AmE CATALOG are *catalogue* ~ *cataloguing* ~ *catalogued*.

[g] A rare exception to (e) above is *arc* ~ *arc(k)ing* ~ *arc(k)ed*, for which the spelling without *k* is also possible.

[h] The verb BENEFIT sometimes (esp in AmE) has forms with irregular consonant doubling (*benefitting* ~ *'benefitted*) alongside the regular *benefiting* ~ *benefited*.

Deletion of and addition of -e

- 3.9 If the base ends in a mute (unpronounced) -e, this -e is regularly dropped before the -ing and -ed inflections:

create ~ *creating* ~ *created* *shave* ~ *shaving* ~ *shaved*
bake ~ *baking* ~ *baked* *type* ~ *typing* ~ *typed*

Verbs with monosyllabic bases in -ye, -oe, and -nge, pronounced /ndʒ/, are exceptions to this rule: they do not lose the -e before -ing, but they do lose it before -ed:

dye ~ *dyeing* ~ *dyed* *singe* ~ *singeing* ~ *singed*
hoe ~ *hoeing* ~ *hoed* *tinge* ~ *tingeing* ~ *tinged*

Impinging and *infringing*, on the other hand, are regular. The final -e is also lost before -ed by verbs ending in -ie or -ee: *tie* ~ *tied*, *die* ~ *died*, *agree* ~ *agreed*.

Before the -s ending, on the other hand, an -e is added in the following cases:

- (a) After the following letters, representing sibilant consonants:

-s *pass* ~ *passes* -ch *watch* ~ *watches*
 -z *buzz* ~ *buzzes* -sh *wash* ~ *washes*
 -x *coax* ~ *coaxes*

- (b) after -o in GO (~ *goes*), DO (~ *does* /dʌz/), ECHO (~ *echoes*), VETO (~ *veto*es).

Compare the spelling of regular -s plurals (cf 5.81).

Note [a] The loss of -e in *age* ~ *ag(e)ing* is optional.

[b] Where -ch represents a consonant other than the sibilant or affricate /tʃ/, the -e is omitted: *stomachs*.

Treatment of -y

- 3.10 In bases ending in a consonant followed by -y, the following changes take place:

- (a) -y changes to -ie- before -s: *carry* ~ *carries*, *try* ~ *tries*
 (b) -y changes to -i before -ed: *carry* ~ *carried*, *try* ~ *tried*

Similarly *dry*, *deny*, *fancy*, etc.

The -y- remains, however, where it follows a vowel letter: *stay* ~ *stayed*, *alloy* ~ *alloys*, etc; or where it precedes -ing: *carry* ~ *carrying*, *stay* ~ *staying*, etc. Two exceptions to these rules are: *pay* ~ *paid*, and *lay* ~ *laid*, in which the *y* changes to *i* after -a-. (On a third exception, *say* ~ *said*, cf 3.15.)

A different spelling change occurs in verbs whose bases end in -ie: DIE, LIE, TIE, VIE. In these cases, the -ie changes to -y- before -ing is added: *die* ~ *dying*, *lie* ~ *lying*, *tie* ~ *tying*, *vie* ~ *vying*.

Note [a] In verbs whose bases end in a vowel other than -y or mute -e, the addition of inflections involves no further change of spelling: *boo* ~ *boos* ~ *booing* ~ *boomed*, *ski* ~ *skis* ~ *skiing* ~ *skied*, etc.

[b] LIE is a regular verb in the sense 'tell untruths'; on the irregular verb *lie* ~ *lay* ~ *lain*, cf 3.16.

[c] Like PAY and LAY are their derivatives REPAY (~ *repaid*), MISLAY (~ *misaid*), WAYLAY (~ *waylaid*), and RELAY (~ *relaid*). There is another verb 'RELAY, however, which is derived from the noun 'relay and which has the regularly spelt -ed form *relayed*: thus *The floor was relaid*, but *The news was relayed far and wide*.

The morphology of irregular full verbs

- 3.11 Irregular full verbs are like regular verbs in that their -s forms and their -ing forms are predictable from the base (cf 3.2f). But they differ from regular verbs in that either the past inflection, or the -ed participle inflection, or both of these, are irregular. More precisely the major differences are:

- (a) Irregular verbs either do not have the regular -ed inflection, or else have a variant of that inflection in which the /d/ is devoiced to /t/ (eg: *burn* ~ *burnt*, which occurs alongside the regular *burned*).
- (b) Irregular verbs typically, but not invariably, have variation in their base vowel. The explanation of this phenomenon, called GRADATION or ABLAUT, is historical, and it is characteristic of Indo-European languages in general: *choose* ~ *chose* ~ *chosen*, *write* ~ *wrote* ~ *written*.
- (c) Irregular verbs have a varying number of distinct forms. Since the -s form and the -ing form are predictable for regular and irregular verbs alike, the only forms that need be listed for irregular verbs are the base form (V), the past (V-ed₁), and the -ed participle (V-ed₂). These are traditionally known as the PRINCIPAL PARTS of the verb. Most irregular verbs have, like regular verbs, only one common form for the past and the -ed participle; but there is considerable variation in this respect, as the table shows:

	V	V-ed ₁	V-ed ₂
all three forms alike:	<i>cut</i>	<i>cut</i>	<i>cut</i>
V-ed ₁ = V-ed ₂ :	<i>meet</i>	<i>met</i>	<i>met</i>
V = V-ed ₁ :	<i>beat</i>	<i>beat</i>	<i>beaten</i>
V = V-ed ₂ :	<i>come</i>	<i>came</i>	<i>come</i>
all three forms different:	<i>speak</i>	<i>spoke</i>	<i>spoken</i>

Note Where irregular verbs have regular inflections (as is normal in the -s and -ing forms), they follow the spelling rules for regular verbs (cf 3.7-10).

Irregular verb classes

3.12 The 250 or so irregular English verbs can be classified on the basis of criteria derived from the above similarities and differences. Since it is impractical to account for both pronunciation and spelling together, only pronunciation will be considered in setting up classes of irregular verbs, and for that matter in deciding whether a verb is irregular or not. The criteria of classification to be used are the following:

- (a) Suffixation in *V-ed₁* and/or *V-ed₂*, including not only the alveolar suffixes *-ed/-t* as in *dreamed/dreamt*, but also, for *V-ed₂*, nasal suffixes as in *shaken, torn*.
- (b) *V-ed* identity: ie *V-ed₁ = V-ed₂*, as in *met ~ met*.
- (c) Vowel identity, ie the various principal parts show no difference of base vowel.

Table 3.12 shows how these three criteria divide irregular full verbs into seven classes:

Table 3.12 Irregular verb classes

CLASS	USE OF SUFFIX	V-ed IDENTITY	VOWEL IDENTITY	Example		
				V	V-ed ₁	V-ed ₂
1	+	+	+	<i>burn</i>	<i>burned/burnt</i>	<i>burned/burnt</i>
2	+	±	+	<i>saw</i>	<i>sawed</i>	<i>sawed/sawn</i>
3	+	+	—	<i>bring</i>	<i>brought</i>	<i>brought</i>
4	+	—	—	<i>break</i>	<i>broke</i>	<i>broken</i>
5	—	+	+	<i>cut</i>	<i>cut</i>	<i>cut</i>
6	—	+	—	<i>strike</i>	<i>struck</i>	<i>struck</i>
7	—	—	—	<i>swim</i>	<i>swam</i>	<i>swum</i>

Class 1 has three pluses, which indicate that a verb like *burn* is very close to a regular verb. The only irregularity is that each verb has, or at least allows as a variant, a *V-ed* form with an irregular final consonant or consonant cluster; eg: *burned* has an irregular variant *burnt* /-nt/ with a voiceless suffix after a voiced sound (cf 3.6).

Class 2 has a past suffix in *-ed* and two alternative *-ed* participle suffixes, one alveolar (*sawed*) and the other nasal (*sawn*). All verbs have vowel identity, although some verbs also have alternative forms with vowel gradation.

Class 3 has no vowel identity; eg: *bring ~ brought*. Many of the verbs in Classes 1 and 3 manifest some differences between BrE and AmE. For instance, in a subclass of Class 1 which will be distinguished as Class 1A, AmE shows a stronger preference than BrE for the regular /d/ variants of *burned/burnt*, etc. But the frequency of each form varies from verb to verb, and there is no one-to-one correspondence between a spelling in *-t* and a pronunciation in /t/. Class 3 shows a similar pattern of preference for variant *-ed* forms such as *dreamed/dreamt* /dri:md/, /dremt/.

Class 4 has three different principal parts, usually with a nasal *V-ed₂* suffix (*break ~ broke ~ broken*).

Class 5 has the same form for all principal parts (*cut ~ cut ~ cut*).

Class 6 has identity between *V-ed₁* and *V-ed₂*, has no suffix, but does have a change of the base vowel (*strike ~ struck ~ struck*).

Class 7 is the most irregular major class of full verbs: *V-ed₁* and *V-ed₂* are different; there is no suffix, but there is change of the base vowel (*swim ~ swam ~ swum*). Particularly irregular is the exceptional verb *go ~ went ~ gone*, which has an entirely unconnected *V-ed₁* form, *went*. The substitution of a different form in this way is termed SUPPLETION (cf: *was/were* as the past forms of BE, 3.32).

Although we will not further define the difference among the verbs of each class, for mnemonic reasons the verbs in the lists below will be grouped into subclasses as (A), (B), (C), etc. Parentheses, for example '*dwelled*' are used for less common forms, and decidedly uncommon verbs or verb forms are marked '<rare>'. '(R)' denotes the existence of a regular variant.

Note The following list contains most of the irregular verbs in present-day English, including those which are relatively rare, but is not meant to be exhaustive, particularly with regard to derivative verbs. For example, it does not include very unusual or archaic forms such as *girt* (a rare past form of *gird*); nor does it include less common derivatives such as *reled*. Some irregular *-ed* participle forms survive only in special contexts, especially in adjectival use (for example *sunken* in a *sunken road*; or *shaven* in a *recently shaven chin*). We do not note such forms where they are not used as verbs and where the verb from which they are derived is otherwise regular. Where the verb occurs in the list of irregular verbs for another reason, exceptional nonverbal forms are noted for comparison.

Irregular verbs listed in class order**Class 1****3.13 Characteristics:**

The suffix is used but voicing is variable (contrast *spent* with *made*). *V-ed₁* and *V-ed₂* are identical (*burned/burnt ~ burned/burnt*) and there is vowel identity in all parts (*build ~ built ~ built*).

	V	V-ed	COMMENTS
1A	<i>burn</i>	{ <i>burnt</i> <i>burned</i>	(R)
	<i>dwel</i>	{ <i>dwelt</i> (<i>dwelled</i>)	(R)
	<i>earn</i>	<i>earned</i>	(R) (cf Note [b])
	<i>learn</i>	{ <i>learnt</i> <i>learned</i>	(R) Adj: <i>learned</i> /-ɪd/ ['scholarly']
	<i>smell</i>	{ <i>smelt</i> <i>smelled</i>	(R)
	<i>spell</i>	{ <i>spelt</i> <i>spelled</i>	(R) Also MISPELL

V	V-ed	COMMENTS
spill	{ spilt spilled	(R)
spoil	{ spoilt spoiled	(R)
1B bend	bent	Also UNBEND. Adj: 'on <i>bended</i> knee'
build	built	Also REBUILD
lend	lent	
rend	rent	<Rare; in restricted use>
sēnd	sent	
spend	spent	Also MISSPEND
1C have	had	Primary verb: cf 3.33; -s form: <i>has</i> /hæz/
make	made	Also REMAKE, UNMAKE

Note [a] For Class 1A verbs, the irregular -t spelling is generally rare in AmE. In BrE, the -t spelling is of varying frequency, but the /t/ pronunciation is widely current.

[b] EARN belongs marginally to Class 1A, since a pronunciation in /t/ has some BrE currency.

[c] There is a tendency to associate -t forms in Class 1A more with V-ed₂ than with V-ed₁, and with V-ed₁ when there is least implication of duration:

He *spelt*/has *spelt* it like this on only one occasion.

Contrast: *It smelled* delicious.

[d] The variation between /d/ and /t/ in Classes 1 and 3 applies to verbal uses but not to adjectival uses, for which /t/ is favoured. Both BrE and AmE have, for example, *burnt* toast, *burnt* umber. Even so, /d/ may occur attributively where the meaning emphasizes the process rather than the result of the process: *burnt* wood means 'wood which looks burnt', but *burned* wood might mean a quantity of wood which has been burned as fuel.

Class 2

3.14 Characteristics:

V-ed₂ has two suffixes, one alveolar which is R and identical with V-ed₁ (*mowed*), the other nasal (*mown*). There is no change of the base vowel for V-ed₁ (*saw* ~ *sawed*).

V	V-ed ₁	V-ed ₂	COMMENTS
hew	hewed	{ hewn hewed	(R)
mow /əʊ/	mowed	{ mown mowed	(R) Adj use: 'a <i>new-mown</i> lawn'
saw	sawed	{ sawn sawed	(R) <esp BrE>
sew /əʊ/	sewed	{ sewn sewed	(R)

V	V-ed ₁	V-ed ₂	COMMENTS
shear	sheared	{ shorn sheared	(R)
show	showed	{ shown (showed)	(R) } Sometimes spelled <i>shew</i> , <i>shewed</i> , <i>shewn</i>
sow /əʊ/	sowed	{ sown sowed	(R)
strew /u:/	strewed	{ strewn strewed	(R)
swell	swelled	{ swollen swelled	(R) Adj use: 'a <i>swollen</i> ankle/head' Adj use: 'a <i>swelled</i> head' [metaphorical suggestion of conceit]

Note [a] As an adjective, *swollen* is generally accepted in both literal and metaphorical uses. *Swelled* head is metaphorical (esp AmE).

[b] To the Class 2 list may be added *prove* ~ *proved* ~ *proved/proven* and *shave* ~ *shaved* ~ *shaved/shaven*. Although these verbs are usually regular, the -ed participle ending in -en is quite common for *prove* and not unusual for *shave*. These -en forms are more current in AmE than in BrE. *Proven* also occurs in the Scottish legal phrase *not proven*.

Class 3

3.15 Characteristics:

The suffix is used but voicing is variable (contrast *meant*, *told*). V-ed₁ and V-ed₂ are identical (*left* ~ *left*), and there is change of base vowel (*think* ~ *thought*).

V	V-ed	COMMENTS
3A /i:/ ~ /e/		
bereave	{ bereft bereaved	(R) <Rare; restricted use> Adj: 'bereft of hope'; V-ed ₂ <i>bereaved</i> usually = 'deprived of a close relative by death'
cleave	{ cleft cleaved	(R) Adj: <i>cleft</i> palate; also V-ed ₁ = <i>clove</i> , V-ed ₂ = <i>cloven</i> . Adj: <i>cloven</i> hoof
creep	crept	
deal	dealt /e/	Also MISDEAL
dream	{ dreamt /e/ dreamed	(R) <esp BrE> <esp AmE>
feel	felt	
flee	fled	
keep	kept	
kneel	{ knelt kneeled	(R) <esp AmE>
lean	{ leant /e/ leaned	(R) <esp BrE> <esp AmE>
leap	{ leapt /e/ leaped	(R) <esp AmE>
leave	left	

V	V-ed	COMMENTS
mean sleep sweep weep	meant /e/ slept swept wept	Also OVERSLEEP
3B: ~ /ɔ:/		
beseech bring buy /aɪ/ catch seek teach think	{ besought beseeched brought bought caught sought taught thought } (R)	<Rare; in restricted use> Also RETHINK
3C: /u:/ ~ /ɒ/		
lose	lost	
3D: /e/ ~ /əʊ/		
sell tell	sold told	Also FORETELL, RETELL
3E: /ɪə/ ~ /ɜ:/		
hear	heard	Also MISHEAR
3F: /eɪ/ ~ /e/		
say	said	But -s form: <i>says</i> /e/. On GAINSAY, cf 3.5 Note [a].

Class 4

3.16 Characteristics:

V-ed₁ and V-ed₂ differ and, in practically all cases, the latter has a nasal suffix (*break* ~ *broke* ~ *broken*). There is no base vowel identity. There is a range of base vowel changes and the verbs have been ordered according to vowel patterning.

V	V-ed ₁	V-ed ₂	COMMENTS
4A: V-ed ₁ and V-ed ₂ have the same vowel.			
4Aa: V-ed = /əʊ/			
break /eɪ/	broke	broken	Adj: 'I'm broke' ['without money'] <informal>
choose /u:/	chose	chosen	
freeze /i:/	froze	frozen	Also UNFREEZE, DEEPFREEZE (also R)
speak	spoke	spoken	
steal	stole	stolen	

V	V-ed ₁	V-ed ₂	COMMENTS
(a)wake(n)	(a)woke	(a)woken	cf R (A)WAKEN. But there is some tendency to produce blends of the regular and irregular verbs, as in 'You <i>waked</i> me too early.'
weave	{ wove weaved (R)	{ woven weaved (R)	
4Ab: /eə/ ~ /ɜ:/			
bear	bore	borne	'She has <i>borne</i> six children' (but: 'She was <i>born</i> in 1955'); also FORBEAR, OVERBEAR
swear tear wear	swore tore wore	sworn torn worn	Also FORSWEAR
4Ac: /aɪ/ ~ /ɪ/			
bite	bit	bitten	V-ed ₂ sometimes = <i>bit</i>
chide <rare>	chid	{ chidden chid hidden (hid)	Also R <i>chided</i>
hide	hid		
4Ad: /e/ ~ /ɒ/			
forget	forgot	forgotten	Sometimes <esp AmE> V-ed ₂ = <i>forgot</i> ; also BEGET, with <i>begat</i> as an <archaic and scriptural> alternative to <i>begot</i> (V-ed ₁). See also GET, Class 6F, 3.18.
tread	trod	{ trodden (trod)	
4Ae: /aɪ/ ~ /eɪ/			
lie	lay	lain	['be horizontal']. Contrast LIE = 'tell a lie' (R). Sometimes confused with LAY 'put' (~ <i>laid</i> ~ <i>laid</i>)
4B: V and V-ed ₂ , but not V-ed ₁ , have the same vowel			
4Ba: V/V-ed ₂ = /əʊ/			
blow	blew	blown	
grow	grew	grown	Also OUTGROW
know	knew	known	
throw	threw	thrown	Also OVERTHROW
4Bb: V/V-ed ₂ = /eɪ/			
forsake	forsook	forsaken	<restricted use>
shake	shook	shaken	
take	took	taken	Also BETAKE <restricted use>, MISTAKE, OVERTAKE, PARTAKE, UNDERTAKE

V	V-ed ₁	V-ed ₂	COMMENTS
4Bc: V/V-ed ₂ = /ɪ/			
forbid	{ forbade /eɪ or æ/ forbidden forbad /æ/ (forbid)	(forbid)	cf BID, Class 5
give	gave	given	Also FORGIVE, MISGIVE
4Bd: V/V-ed ₂ = /ɔ:/			
draw	drew	drawn	Also WITHDRAW
4Be: V/V-ed ₂ = /ɔ:/			
fall	fell	fallen	Also BEFALL <restricted use>
4Bf: V/V-ed ₂ = /i:/			
eat	ate { BrE /e/ AmE /eɪ/ }	eaten	Also OVEREAT
4Bg: V/V-ed ₂ = /i:/			
see	saw	seen	Also FORESEE, OVERSEE
4Bh: V/V-ed ₂ = /eɪ/			
slay	slew	slain	<restricted use, esp in BrE>
4C: all three parts have different vowels			
4Ca: /aɪ/ ~ /əʊ/ ~ /ɪ/			
drive	drove	driven	Also OVERRIDE Also ARISE, which is <rare> except when metaphorical: 'The question arose ...'
ride	rode	ridden	
rise	rose	risen	
smite	smote	smitten	<Archaic> except when metaphorical in V-ed ₂ , eg: 'smitten with her charms'
stride	strode	{ strid stridden strode }	Both <i>strid</i> and <i>stridden</i> are <rare>; also BESTRIDE
strive	{ strove strived (R)	{ striven strived (R)	Also REWRITE, UNDERWRITE
write	wrote	written	
4Cb: /aɪ/ ~ /u:/ ~ /əʊ/			
fly	flew	flown	cf: <i>flee</i> ~ <i>fled</i> ~ <i>fled</i> (Class 3A)
4Cc: /u:/ ~ /ɪ/ ~ /ʌ/			
do	did	done	The -s form <i>does</i> has the irregular pronunciation /dʌz/. Also OUTDO, OVERDO, REDO, UNDO, etc (cf 3.36)

V	V-ed ₁	V-ed ₂	COMMENTS
4D: all three parts have the same vowel			
4D: /i:/			
beat	beat	beaten	<i>beat</i> is sometimes used as V-ed ₂ , esp in AmE
4E: V-ed ₁ and V-ed ₂ have different vowels in special alternative forms			
4E: /aɪ/			
dive	{ dived (R) (dove)	dived (R)	V-ed ₁ <i>dove</i> is AmE only; the verb is R in standard BrE and often in AmE
shrive	{ shrived (R) shrove	{ shrived (R) shriven	<Rare>
thrive	{ thrived (R) (throve)	{ thrived (R) (thriven)	Normally R; <i>thriven</i> is <archaic>

Note *Glide* is a regular verb in present-day English, but there are occasional occurrences of the archaic irregular past form *glode*.

Class 5

3.17 Characteristics:

All three parts V, V-ed₁, and V-ed₂ are identical. No suffix or change of the base vowel (*bet* ~ *bet* ~ *bet*).

V/V-ed	COMMENTS
bet	BrE also R: <i>betted</i>
bid	'make an offer (to buy)' etc. (But in the sense of 'say a greeting' or 'give an order', the forms <i>bid</i> ~ <i>bad(e)</i> ~ <i>bidden</i> may also be used in rather archaic style: 'Do as you are <i>bid</i> (den).') Also OUTBID, UNDERBID.
burst	Also nonstandard BUST, with alternative R V-ed form <i>busted</i>
cast	Also BROADCAST, FORECAST, MISCAT, OVERCAST, RECAST, TELECAST (sometimes also R)
cost	COST = 'estimate the cost of' is R
cut	
fit	R <in BrE>
hit	
hurt	
knit	Usually R: <i>knitted</i>
let	
put /u/	But PUT(T) /pʌt/ in golf is R: <i>putted</i>
quit	Also R: <i>quitted</i>
rid	Also R: <i>riddled</i>
set	Also BESET, RESET, UPSET, OFFSET, INSET
shed	Also R <rare> = 'put in a shed'
shit	<Not in polite use>; V-ed ₁ sometimes <i>shat</i>
shut	
slit	
split	
spread /e/	

V/V-ed	COMMENTS
sweat /ɛ/	Also R: <i>sweated</i>
thrust	
wed	Also R: <i>wedded</i>
wet	Also R: <i>wetted</i>

Note The regular verb SHRED sometimes occurs with the Class 5 forms *shred ~ shred ~ shred*.

Class 6

3.18 Characteristics:

No suffix; V-ed₁ and V-ed₂ are identical; change of base vowel (*win ~ won ~ won*).

V	V-ed	COMMENTS
6A: Mainly /i:/ ~ /e/		
bleed	bled	
breed	bred	
feed	fed	Also OVERFEED, etc
hold	held	Also BEHOLD (in restricted use), UPHOLD, WITHHOLD, etc
lead /i:/	led	Also MISLEAD
meet	met	
read /i:/	read /e/	Also REREAD, etc
speed	sped	Also R: <i>speeded</i> , esp of mechanisms, and always R in the phrasal verb <i>SPEED up</i>
6B: Mainly /ɪ/ ~ /ʌ/		
cling	clung	
dig	dug	
fling	flung	
hang	hung	Also OVERHANG. But HANG is also R in the sense 'put to death by hanging'
sling	slung	
slink	slunk	
spin	spun	V-ed ₁ = <i>span</i> is (archaic)
stick	stuck	
sting	stung	
strike	struck	Literal use; in metaphorical, adjectival use V-ed ₂ also <i>stricken</i> : ' <i>stricken (struck)</i> by terror'
string	strung	Also RESTRING, HAMSTRING
swing	swung	
win	won	
wring	wrung	
6C: /aɪ/ ~ /aʊ/		
bind	bound	Also REBIND, UNBIND; Adj: 'one's <i>bounden</i> duty'
find	found	
grind	ground	
wind	wound	= 'turn round'; also REWIND, UNWIND; WIND/wind/ = 'smell the presence of' etc is always R

V	V-ed	COMMENTS
6D: /aɪ/ ~ /ɪ/		
light	lit	Also R: <i>lighted</i> ; ALIGHT and HIGHLIGHT are only R. Adj: 'a <i>lighted</i> candle'
slide	slid	
6E: /ɪ/ ~ /æ/		
sit	sat	
spit	spat	V-ed also = <i>spit</i> (esp AmE); SPIT = 'fix with a spit' is R
6F: ~ /ɒ/		
get	got	AmE also has <i>gotten</i> for V-ed ₂ in certain senses of the word, eg 'acquire', 'cause', 'come'; thus AmE makes a distinction between <i>We've gotten tickets</i> = 'acquired' and <i>We've got tickets</i> = 'we possess'. On the related verbs FORGET and BEGET, cf Class 4Ad (3.16).
shine	shone	$\left\{ \begin{array}{l} /ʃɒn/ \\ \langle \text{BrE} \rangle \\ /ʃəʊn/ \\ \langle \text{AmE} \rangle \end{array} \right\}$ Also R when = 'polish' (esp AmE); also OUTSHINE
shoe /u:/	shod	Also R: <i>shoed</i>
shoot	shot	Also OVERSHOOT
6G: /aɪ/ ~ /ɔ:/		
fight	fought	Also OUTFIGHT
6H: /æ/ ~ /ʊ/		
stand	stood	Also (MIS)UNDERSTAND, WITHSTAND, etc
6I: /aɪ/ ~ /əʊ/		
abide	abode	restricted use when = 'stay'; R when ABIDE by = 'obey', eg: 'He <i>abided</i> by our decision'.
6J: /i:/ ~ /əʊ/		
heave	hove	Usually R: <i>heaved</i>

Note In AmE, the normally regular verb PLEAD has an alternative Class 6A past form *pled*.

Class 7

3.19 Characteristics:

No suffix; V-*ed*₁ and V-*ed*₂ are different; change of base vowel (*began* ~ *begun*).

V	V- <i>ed</i> ₁	V- <i>ed</i> ₂	COMMENTS
7A: /ɪ/ ~ /æ/ ~ /ʌ/			
begin	began	begun	
drink	drank	drunk	cf Adj uses: 'He was <i>drunk</i> ' but ' <i>drunken</i> driving'
ring	{rang (rung)}	rung	Also R: <i>ringed</i> in the sense 'put a ring around'
shrink	{shrank (shrunk)}	shrunk	Adj: <i>shrunk</i>
sing	{sang (sung)}	sung	
sink	{sank (sunk)}	sunk	Adj: <i>sunken</i>
spring	sprang	sprung	V- <i>ed</i> ₁ also <i>sprung</i> in AmE
stink	{stank (stunk)}	stunk	Has impolite connotations
swim	{swam (swum)}	swum	
7B			
come	came	come	Also BECOME, OVERCOME
run	ran	run	Also OUTFRAN, OVERRUN, RERUN
7C			
go	went	gone	Also UNDERGO, FOR(E)GO (cf Note [b])

Note [a] In Class 7A, although the gradation series /ɪ/ ~ /æ/ ~ /ʌ/ is the one generally accepted as standard, V-*ed*₁ forms in /ʌ/ are commonly used (esp in AmE) and accepted. V-*ed*₂ forms in /æ/ also have some currency.

[b] On *been* in place of *gone*, cf 4.22 Note [b].

Irregular verbs (including derivatives) in alphabetical order

3.20 Since irregular verbs, if one includes prefixed and compound derivatives, make up to some extent an open and productive class, this list makes no claim to completeness. As before, rarer forms are enclosed in parentheses. Verbs in square brackets are those which are generally regular, but which have irregular spelling or irregular forms of limited currency.

In the right-hand column, reference is given to the typological classification above, which also includes relevant details of usage (AmE, BrE, archaic, pronunciation, etc).

Base (V)	Past tense (V- <i>ed</i> ₁)	- <i>ed</i> participle (V- <i>ed</i> ₂)	Reference
abide	abode, abided,	abode, abided	6I
arise	arose	arisen	4Ca
awake	awoke, awaked	awoken, awaked	4Aa
be	was, were	been	(cf 3.32)
bear	bore	borne	4Ab

Verbs in auxiliary function

3.21 In contrast to full verbs, the verbs we will consider in the next sections are capable of functioning as AUXILIARY or 'helping' verbs (*cf* 2.27f). These are the PRIMARY VERBS BE, HAVE, and DO, and the MODAL VERBS *can*, *may*, *will*, *shall*, *could*, *might*, *would*, *should*, and *must*. Since they can function only as auxiliaries, the modal verbs will generally be referred to as MODAL AUXILIARIES.

The auxiliaries make different contributions to the verb phrase (*cf* 3.55f). Of the three primary verbs, DO is only a semantically empty syntactic component in sentence processes such as negation and interrogation (*cf* DO-support; 3.37), whereas BE contributes to aspect and voice, and HAVE contributes to aspect. The modal auxiliaries are so called because of their contribution of meanings in the area known as MODALITY (including such concepts as volition, probability, and obligation); but such verbs have a broader semantic role than this label suggests (*cf* 4.49ff).

Although auxiliaries have different functions in the verb phrase, they have one important syntactic function in common, *viz* their ability to act as OPERATOR when they occur as the first verb of a finite verb phrase (*cf* 2.48); as such they are used, for example, in the formation of *yes-no* questions:

Is he asking any questions?
Has he been asking any questions?
Was he asked any questions?
Will he be asked any questions?
Has he asked any questions?
Does he ask any questions?

Here the operator, or first auxiliary of the verb phrase, is isolated from the rest of the predicate no matter how complex the verb phrase is. Since BE and (sometimes, esp in BrE) HAVE also have this function as main verbs, the term operator will also be used for them in sentences like:

Is she a tall girl? *Has he any money?* <BrE>

(The variant constructions with HAVE are discussed in 3.33–35.) The complex verb phrase of *He might have been being questioned by the police* is thus analysed, within this sentence, as shown in Fig 3.21:

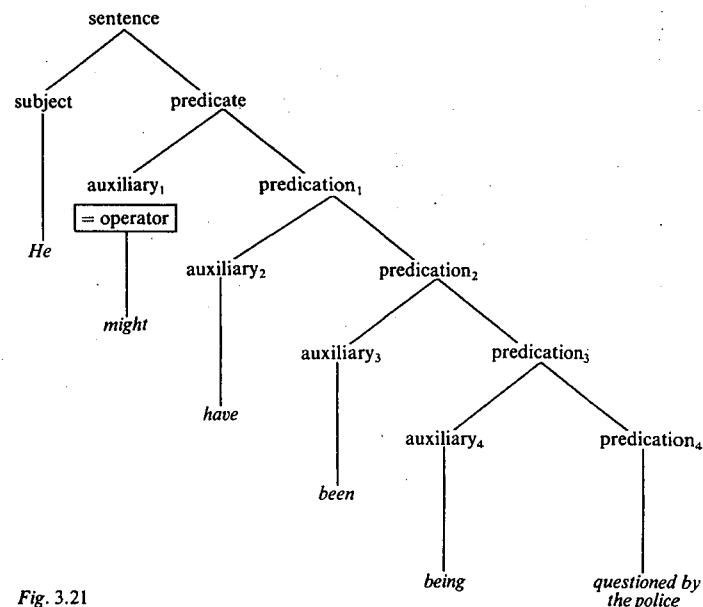

Fig. 3.21

(On the use of the terms predicate and predication in this diagram, *cf* 2.47–48.)

Many of the criteria for the syntactic function of auxiliaries have to do with their status as operators, and therefore apply also to BE and HAVE as main verbs. These are listed in (a), (c), (d), (e) below. Of the remaining criteria, (b) is morphological, (f) and (g) are syntactic and have to do with the ordering of elements in the verb phrase, and (h) is semantic.

Criteria for auxiliary verbs

(a) Operator in negation with *not*

3.22 In forming negative finite clauses, the first auxiliary is placed before the negative word *not*. Contrast:

She *can* do it. She *cannot* do it.
 She *saw* the play. *She *saw not* the play.

As the example shows, full verbs like SEE are distinguished from auxiliary verbs by their inability to form negation in this way.

Note [a] Whereas current English has no negative sentence such as **She saw not the play* (but *cf* Note [b]) we do have an acceptable negative sentence of the form:

He decided *not* to see the play.
I like *not* working on Fridays.

In these cases, however, negation is associated with the second, nonfinite verb phrases, *to see* and *working*, rather than with the initial finite verb phrases, *decided* and *like* (cf 14.7). This is obvious from the following paraphrases:

He decided that he would not see the play.

I like it not working on Fridays.

which are not synonymous with:

He did not decide that he would see the play.

I don't like it working on Fridays.

In these examples, the distinction between negation in the superordinate clause and negation in the nonfinite clause is clear; but in other cases, the semantic difference may be small or nonexistent (cf catenative verbs 3.49; transferred negation 14.36):

She seemed not to mind. = She didn't seem to mind.

Even here, however, the syntactic difference between the two constructions is indicated by the inability of the first negative to be contracted: **She seemn't to mind* (cf 3.23).

[b] Whereas **She saw not the play* was rejected above, *She saw not the play but the opera* is acceptable. The reason for this is that the negative word *not* goes with the noun phrase *the play* rather than with the verb (cf 13.42); i.e. the sentence can be paraphrased:

It was not the play but the opera that she saw.

A related example of the use of *not* after a full verb is the following quotation from President John F. Kennedy's Inaugural Address:

Ask not what your country can do for you; ask what you can do for your country.

This case is parallel to the preceding one, in that there is a contrastive parallelism between the two objects of the verb *ask*, the first of which is rejected by *not*: ... *not what your country can do for you* ... (but) *what you can do for your country*. The scope of *not* here therefore includes the interrogative clause, but excludes the main verb. This example also has an air of studied archaism (cf Note [c]).

[c] In archaic or facetiously archaic usage we can still meet negative constructions in which *not* follows a full verb and not an operator:

Whether they succeeded I *know not*. ['I do not know']

I *care not* who knows it. ['I do not care ...']

If I *mistake not*, you were at Yale? ['If I am not in error ...']

[d] *Not* also follows a full verb when it acts as a pro-form for a clause (cf 12.28):

Jean may be late, but I *hope not*. [... hope that she won't be late]

[e] Negation in subjunctive and nonfinite verb phrases does not involve the occurrence of an operator (cf 3.58, 14.6).

(b) Negative and verb contractions

- 3.23 The negative word *not* following an operator can in most cases be contracted and attached, as an enclitic particle, to the auxiliary. The resulting negative auxiliary is spelled with a final *-n't*: *isn't*, *hadn't*, *didn't*, *won't*, *couldn't*, etc. The pronunciation of the contracted auxiliary and its conditions of use are given below in later sections (3.32ff, 3.39). Every auxiliary except the *am* form of BE has a contracted negative form (but cf 3.32 Note [c]), but two of these, *mayn't* and *shan't*, are now virtually nonexistent in AmE, while in BrE *shan't* is becoming rare and *mayn't* even more so.

In addition, many operators have contracted nonnegative forms:

BE: *am* ~ 'm; *is* ~ 's; *are* ~ 're;
HAVE: *have* ~ 've; *has* ~ 's; *had* ~ 'd;
modals: *will* ~ 'll; *would* ~ 'd.

Notice that the contractions 's and 'd are ambiguous, the former representing *is* or *has* (or, occasionally, *does*; cf 3.36 Note), and the latter *had* or *would*. Further information on individual contractions is given in 3.33, 3.36, 3.39.

The above verb contractions were called nonnegative because they cannot combine with negative contractions to form doubly-contracted forms:

- (i) *She is not* studying. (ii) *She isn't* studying.
(iii) *She's not* studying. (iv) **She'sn't* studying.

There are, however, two constructions (ii) and (iii) corresponding to the uncontracted negative construction in (i). In the first contracted construction (ii), the contracted negative is attached to the uncontracted operator; in the second contracted form, the contracted operator is attached to the subject, the *not* being uncontracted. Generally speaking, the variant (ii) with contracted negation is more common than the variant (iii) with contracted verb and full negation. There are, however, exceptions to this generalization in Scotland and in Northern England, where forms such as 'll *not* seem to be preferred to forms such as *won't*.

Contractions are phonologically reduced or simplified forms which are institutionalized in both speech and writing. As such, they are to be distinguished from cases of PHONOLOGICAL REDUCTION only (eg the reduction of /ɑ:/ to /ə/ in the pronunciation of *are*). A contracted form can undergo additional phonological reduction, and this is very commonly the case with the negative contractions, where the final /nt/ is reduced to /n/; eg: *haven't* /hævn/, *isn't* /ɪzn/.

Contracted forms, being enclitic to a preceding word, naturally do not occur initially, eg where the operator comes at the beginning of the clause, with inversion (cf 3.24). Further, being unstressed, they do not occur where the operator is the only verb in the verb phrase, and precedes an ellipsis (cf 3.26). These two circumstances are illustrated in:

- { *Will* you be in tonight?
**ll* you be in tonight?
No, but I *will* tomorrow night.
**No*, but I *ll* tomorrow night.

In other positions, the contraction is favoured in informal style. The choice between uncontracted *is* /ɪz/ and contracted 's /z/ in spoken English has been found to be conditioned by the following variables, listed in order of importance:

First, there is significant correlation of /z/ with a preceding pronoun, or with the preceding words *there* and *here*, eg:

It's raining. There's a car in the garage. Here's my bus.

whereas the uncontracted form is associated with a preceding noun, eg:

The car *is* in the garage.

Second, but less important, /z/ is typical of informal and /ɪz/ of formal contexts.

Third, there is some tendency for the contracted form to be more common when functioning as an auxiliary than as a main verb.

When these three factors of preference are combined the choice of form is more predictable, ie /ɪz/ is most likely when it is a main verb and follows a

noun in a formal context (eg: *Radiation is dangerous*), whereas /z/ is most likely when it is an auxiliary and follows a pronoun in an informal context (eg: *It's getting dark*). A similar pattern of choice is to be expected with other verb contractions.

- Note [a] Although phonological reduction may result in pronunciations similar to those of orthodox contractions, such reductions are not represented in writing if they occur outside the normal conditions for contraction. For example, although the auxiliary at the beginning of *Have you eaten?* may be reduced, in speech, to /v/ (as in /vju: 'itn/), this will not be written in standard orthography **Ve you eaten?*
[b] On the alternative constructions *usedn't to* and *didn't use(d) to*, cf 3.44.

(c) Inversion of subject and operator

- 3.24 Auxiliaries, as operators, admit inversion; ie the subject noun phrase and the auxiliary (the first auxiliary if there are two or more) change places, especially in interrogative clauses. Compare:

She will come. ~ Will she come?
She plans to come. ~ *Plans she to come?

As with *not*-negation (cf 3.22) main verbs here require the use of *DO* (cf 3.37):
Does she plan to come?

Inversion of subject and operator occurs not only in interrogatives but also in sentences with introductory negatives or semi-negatives (cf 18.24):

At no time *was* the entrance *left* unguarded.

- Note [a] In addition to subject-operator inversion, there is also inversion of subject and main verb, as in *Down came the rain* (cf 18.23).
[b] Subject-operator inversion is usual not only with *yes-no* questions, but with *wh*-questions. There are, however, one or two formulaic *wh*-questions in which the subject and main verb are inverted:
How goes it? [a greeting: 'How are you doing?']
How came you to miss the train? ['How did you come to...?']
What say you, Peter? ['What is your opinion?']
Where stands the Administration?
There tends to be a tone of archaism or mock-archaism in such questions.
[c] On *Used she to come?* and *Did she use(d) to come?* cf 3.44.

(d) Emphatic positive

- 3.25 Auxiliaries as operators can carry nuclear stress to mark a finite clause as positive rather than negative:

Won't you try again? Yes, I **WILL** try again. [1]
You must speak to the teacher. I **HAVE** spoken to her. [2]

The function of this **EMPHATIC POSITIVE** use of the operator is to deny a negative which has been stated or implied. On the use of *DO* here in assertive contexts, cf 3.37, 18.16:

You **DID** speak to her? ['I thought you didn't']
You should listen to your mother. But I **DO** listen to her.

Sometimes the emphatic operator has no contrastive meaning, but is used purely for emotive force (cf 18.56):

I **AM** glad! I **DO** wish you would listen. You **HAVE** done well.

(e) Operator in reduced clauses

- 3.26 The reply to a question such as:

Won't you try again? Can you drive a car?

may be as indicated in [1] above:

Yes, I **WILL** try again. No, I **CAN'T** drive a car.

On the other hand, a more likely reply would be the elliptical construction:

Yes, I **WILL**. No, I **CAN'T**.

Auxiliaries can function as operators in a range of such reduced constructions (cf 12.21f, 12.60), where the main verb is omitted either by ellipsis or by pro-form substitution, and the clause is understood to repeat the content of an earlier clause. The nature of this type of operator function has been captured by various labels such as 'code' or 'stranding'.

Here we mention four types of reduced clause containing an operator without a main verb, of which the first two are the most important. *DO* is used as an 'empty' operator where the clause has no other auxiliary.

- (i) *SO/NEITHER/NOR* + OPERATOR (cf 12.29)

Positive:

Ann will stay and so *will* BÀrbara.
Bill stayed and so *did* HÈnry.

Negative:

Ann won't stay and *neither* will BÀrbara.
Bill didn't stay, *nor* did HÈnry.

- (ii) OPERATOR + *TOO/EITHER* (cf 12.59)

Positive:

Ann will stay late and Barbara *will* TÒo.
Bill broke his promise, and Henry *did* TÒo.

Negative:

Ann won't eat much and Barbara *won't* ÈITHER.
Bill didn't break his promise, and Henry *didn't* ÈITHER.

- (iii) PREDICATION FRONTING (cf 18.20)

Ann **SÀID** she would be late, and late she *WÀS*.
Bill **SÀID** he would win the match, and win the match he *DID*.

- (iv) RELATIVIZED PREDICATION (cf 6.34 Note [b])

Ann said she would be late, which she *WÀS*.
Bill said he would win the match, which he *DID*.

In these examples, the second auxiliary (unless it is *DO*) is the same as the first; but there are also reduced constructions in which the two auxiliaries may differ (cf 12.59, 19.45 Note):

Ann hoped that we *would* stay, but unfortunately we *couldn't*.
You *should* take a break whenever you *can*.

(f) Pre-adverb position

- 3.27 Frequency subjuncts, like *always* or *never*, and disjuncts, like *certainly* or *probably*, typically, but not necessarily, follow auxiliaries as operators, whereas they precede main verbs. Compare:

She $\left\{ \begin{array}{l} \text{never} \\ \text{probably} \end{array} \right\}$ believed his story.

She would $\left\{ \begin{array}{l} \text{never} \\ \text{probably} \end{array} \right\}$ believe that story.

If there is more than one auxiliary, the adverb will still generally occur after the first, *ie* after the operator:

She would *probably never* have believed his story.

The position of an adverb, however, is often variable within the verb phrase (*cf* 8.14ff). Compare:

She $\left\{ \begin{array}{l} \text{would probably never have} \\ \text{probably never would have} \\ \text{would probably have never} \end{array} \right\}$ believed that story.

The most important point is that such adverbs could not occur immediately after the main verb except where the main verb is BE (and therefore an operator):

*She believed *never/probably* his story.

(*Cf*: She was *never/probably* a taxpayer.)

(g) Quantifier position

- 3.28 Quantifiers like *all*, *both*, and *each* which modify the subject of the clause may occur after the operator as an alternative, in many instances, to the predeterminer position (*cf* 5.15f):

All the boys will be there. ~ The boys will *all* be there.

Both my parents are working. ~ My parents are *both* working.

These quantifiers do not, however, occur after a main verb in the same type of construction:

All our team played well. ~ *Our team played *all* well.

Each of us owns a bicycle. ~ *We own *each* a bicycle.

But if the quantifier is placed before the main verb, these sentences become acceptable:

Our team *all* played well. We *each* own a bicycle.

Note *All*, *both*, and *each* sometimes occur between subject and operator, but this is exceptional, and less acceptable than the post-operator position:

?We both were working late. ~ We were both working late.

(h) Independence of subject

- 3.29 Compared with most main verbs, auxiliaries are semantically independent of the subject. This is reflected in at least three ways.

First, there is a lack of semantic restrictions (*cf* 10.51) between the subject and the auxiliary verb. Contrast:

The man } ought to be here at five.
The bus }

The man } hopes to be here at five.
*The bus }

Second, there is the possibility of construction with existential *there*:

There *used* } to be a school on the island.
*There *hoped* }

Third, if other conditions are met for the active-passive correspondence (*eg* if the verb is transitive, *cf* 3.67ff), auxiliaries usually admit the change from one voice to the other without change of meaning:

Thousands of people will meet the president.

= The president will be met by thousands of people.

Compare the situation in which a full verb occurs as first (finite) verb:

Thousands of people hope to meet the president.

≠ The president hopes to be met by thousands of people.

These criteria for independence are, however, not infallible. For example, in some contexts some auxiliaries fail the active-passive test (*cf* 3.72), and there are also some verbs which by other criteria are not auxiliaries, but which pass this test. These verbs will be considered later (3.47ff) under the headings of semi-auxiliary and catenative verbs.

Additional features of modal auxiliary verbs

- 3.30 The criteria (a–h) discussed so far help to define auxiliaries as a functional class, but it must be remembered that all of them except (h) apply to operators in general, and therefore apply also to BE and (sometimes) HAVE as main verbs. Now we add the following morphological and syntactic criteria which apply specifically to modal auxiliary verbs, as distinct from the primary verbs BE, HAVE, and DO.

(j) Construction with the bare infinitive

Modal auxiliaries are normally followed by the infinitive, which is bare (*ie* the base form of the verb alone) except with *used* (*cf* 3.44) and (usually) *ought* (*cf* 3.43), verbs which for this reason, as well as for others, are somewhat marginal to the class of modals. Compare:

You *will* be asked questions. BUT: You *ought to* comb your hair.

They *might* have stolen it. BUT: He *used to* read for hours.

(On the marginal modal auxiliaries *dare* and *need*, *cf* 3.42.)

(k) Finite functions only

Modal auxiliaries can only occur as the first (operator) element of the verb phrase. They cannot occur in nonfinite functions, *ie* as infinitives or

participles, and as a consequence of this can occur only as first verb in the verb phrase:

MODAL VERB	PRIMARY VERB	FULL VERB
*to may	to have	to eat
*(is) maying	(is) being	(is) eating
*(has) mayed	(has) been	(has) eaten

The primary verbs have the full range of nonfinite forms, but not all of these forms can be used in auxiliary function. For BE, all three nonfinite forms can be auxiliaries: *be*, *being*, *been*; HAVE has no *-ed* participle in auxiliary function, but only *have* and *having*. 'Dummy' auxiliary DO, like the modal auxiliaries, can only occur as an operator, and the nonfinite forms of DO, (*to*) *do*, *doing*, and *done*, are constructed only as main verbs.

(l) No 3rd person inflection

Modal auxiliaries are not inflected in the 3rd person singular of the present tense; *ie*, they have no *-s* form:

You *must* } write. BUT: You *like* } to write.
She *must* } She *likes* }

In contrast, the primary verbs do have an *-s* form, but it is irregular (*cf* 3.31*ff*).

(m) Abnormal time reference

Not only the present forms, but the past forms of the modal auxiliaries can be used to refer to present and future time (often with hypothetical or tentative meaning):

I think he *may/might* retire next May.
Will/would you phone him tomorrow?

Contrast:

*I think he *retired* next May.
**Did* you phone him tomorrow?

Also modal auxiliaries which do not have a distinct past form (*eg*: *must*, *need*, *ought*) can be used to refer to the past in indirect speech:

I told him he *must* be home early. ['... had to be ...']

Note [a] The use of past forms to refer to present and future time is also possible with full verbs, but only in some special constructions: *eg* in hypothetical *if*-clauses (*cf* 14.23, 15.35*f*):

If you *phoned* ['were to phone'] me tomorrow, I could help you straight away.

[b] In dialectal use (*eg* Scots English, Tyneside English, and Southern AmE), there are varieties of popular speech in which one modal auxiliary can follow another: *He might could come* ['He might be able to come'] etc.

The primary verbs BE, HAVE, and DO

3.31 Having discussed auxiliary verb criteria, we can now consider the special morphological and syntactic characteristics of verbs which can function as auxiliaries: first the primary, and second the modal verbs.

Semantically, the primary verbs as auxiliaries share an association with the basic grammatical verb categories of tense, aspect, and voice (*cf* 3.63, 4.2, 4.17). In this they are broadly distinguished from the modal verbs, which are associated mainly with the expression of modal meanings such as possibility, obligation, and volition (*cf* 4.42*ff*). But first, we examine these primary verbs from a formal point of view.

BE

3.32 The verb BE is a main verb (with a copular function; *cf* 2.16) in:

Ann *is* a happy girl. *Is* that building a hotel?

But BE also has two auxiliary functions: as an aspect auxiliary (Type C, 3.55):

Ann *is* learning Spanish.
The weather *has been* improving.

and as a passive auxiliary (Type D, 3.55):

Ann *was* awarded a prize.
Our team *has never been* beaten.

BE is unique in having a full set of both finite and nonfinite forms in auxiliary function; it is also unique among English verbs in having as many as eight different forms, *cf* Table 3.32 on the next page. In the nonnegative column of Table 3.32 the unstressed pronunciations (with vowel reduction) are given after the stressed pronunciation, where they differ.

Note [a] BE is the only verb in English to have a special form for the 1st person singular of the present (*am*) and two distinct forms of the past tense (*was*, *were*). In the subjunctive, however (*cf* 3.58*ff*), the form *was* does not occur.

[b] *Ain't* is a nonstandard contraction commonly used (esp in AmE) in place of *am not*, *is not*, *are not*, *has not*, and *have not*.

[c] There is no completely natural informal contraction of *am I not* (parallel to *isn't she* for *is she not*) in negative sentences. (On the position of *not* in negative questions, *cf* 11.7.) *Aren't I* is widely used, especially in BrE, whereas *ain't I*, usually considered nonstandard, is somewhat more current in AmE than in BrE. *Ain't I* is mainly Scottish and Irish.

[d] The following BrE example (of marginal acceptability) shows that it is possible for *aren't* to act as a contracted form of *am not* even in declarative contexts:

HE *WASN'T* and I probably *aren't* NORMALLY.

Here the substitution of *aren't* seems to have resulted from a desire for parallelism with the preceding occurrence of *wasn't*.

[e] Phonologically, the contracted *'s* ending /s/ or /z/ cannot occur after a sibilant consonant. Hence *Your place is over there* cannot become in writing **Your place's over there*. Compare the conditions for the pronunciation of the *-s* form of regular verbs (*cf* 3.5), and contrast the contraction following a nonsibilant:

Your { place *is* /pleɪsɪz/ } over there.
 seat *'s* /si:ts/ }

Other conditions on the use of the contraction *'s* in place of *is* are discussed in 3.23.

Table 3.32 Forms of BE

	NONNEGATIVE	UNCONTRACTED NEGATIVE	CONTRACTED NEGATIVE (cf Note)
base	be /bi:/, /bɪ/		
present			
1st person singular present	am /æm/, /əm/ 'm /m/	am not, 'm not	(aren't)
3rd person singular present	is /ɪz/ 's /z/, /s/	is not, 's not	isn't /'ɪzn̩t/
2nd person present, 1st and 3rd person plural present	are /ɑ:/ 're /ə/	are not 're not	aren't /ɑ:'nt/
past			
1st and 3rd person singular past	was /wɒz/, /w(ə)z/	was not	wasn't /'wɒzn̩t/
2nd person past 1st and 3rd person plural past	were /wɜ:/, /wə/	were not	weren't /wɜ:'nt/
-ing form	being /'bi:ɪŋ/	not being	
-ed participle	been /bi:n/, /bm/	not been	

NOTE The final /t/ of the negative contraction is commonly not sounded.

HAVE

- 3.33 HAVE functions both as an auxiliary and as a main verb. As an auxiliary for perfective aspect (cf 4.18ff), HAVE combines with an -ed participle to form complex verb phrases:

I *have* finished.
What *has* she bought?
They may *have* been eaten.

As a main verb, it normally takes a direct object, and has various meanings such as possession: *I have no money*; *They had two children*; etc (cf 3.34). The different forms of HAVE are shown in Table 3.33 opposite.

In negative constructions we have the following three variants:

I *have not* seen her. (typical of written discourse)
I *haven't* seen her. }
I've *not* seen her. (typical of spoken discourse)

Of the contracted forms, the *haven't* type is generally more common than the *'ve not* type. As an -ed participle, *had* is restricted to use as a main verb, as in

Have you had lunch?, or to use in the HAVE *to* construction, as in *They have had to sell their car*.

Note Phonologically, the 'd contraction cannot occur after /t/ or /d/: if we encounter the written form 'd in such contexts (eg: *It'd been damaged*), this must be understood to represent the syllabic reduced form /əd/. Compare a similar restriction in 3.32 Note [e].

Table 3.33 Forms of HAVE

	NONNEGATIVE	UNCONTRACTED NEGATIVE	CONTRACTED NEGATIVE (cf Note)
base	have /hæv/, /(h)əv/ 've /v/	have not 've not	haven't /'hævnt/
-s form	has /hæz/, /(h)əz/ 's /z/, /s/	has not 's not	hasn't /'hæzn̩t/
past	had /hæd/, /(h)əd/ 'd /d/	had not 'd not	hadn't /'hædn̩t/
-ing form	having /'hævɪŋ/	not having	
-ed participle	had /hæd/, /(h)əd/		

NOTE The final /t/ of the negative contraction is commonly not sounded.

HAVE as main verb

- 3.34 When used as a main verb with stative meaning (cf 4.4), HAVE shows syntactic variation in that it not only combines with DO-support in forming constructions with an operator (cf 3.37):

We *don't have* any money. Do you *have* a lighter?

but also acts as an operator itself in constructions such as:

We *haven't* any money. *Have* you a lighter?

This latter construction, although it is the traditional construction in BrE, is now somewhat uncommon, particularly in the past tense: *?Had she any news?*

There is also the informal HAVE *got* construction (cf 3.45), which although perfective in form is nonperfective in meaning, and is frequently preferred (esp in BrE) as an alternative to stative HAVE:

John *has* courage. = John *has got* courage.

It is particularly common in negative and interrogative clauses. To express some stative senses we can thus have three alternatives:

Possession: { (a) We *haven't*
(b) We *haven't got*
(c) We *don't have* } any butter.

Relationship: { (a) *Have* you
(b) *Have* you *got*
(c) *Do* you *have* } any brothers? { (a) No, I *haven't*.
(b) No, I *haven't*.
(c) No, I *don't*. }

Health: $\left\{ \begin{array}{l} \text{(a) I haven't} \\ \text{(b) I haven't got} \\ \text{(c) I don't have} \end{array} \right\}$ a headache any longer.

Of these alternatives, (a) is esp BrE <more formal>; (b) is esp BrE <informal>; (c) is AmE (and also common in BrE nowadays).

- Note [a] A further alternative for expressing negation is of course a negative determiner or pronoun: *We have no butter* (cf 5.13, 6.62).
 [b] On HAVE to compared with HAVE got to, cf 3.48.
 [c] In informal English *has got*, *have got*, and *had got* may be reduced to *'s got*, *'ve got*, and *'d got*. In very informal English, *'ve got* may be further reduced to *got*:
 What you *got* there? I *got* something nice for you.
 In its written form, this omission of the auxiliary is nonstandard.

- 3.35 In dynamic senses (cf 4.4) such as 'receive', 'take', 'experience', and in idioms with an eventive object (eg: *have breakfast* = 'eat breakfast'), HAVE (in both AmE and BrE) normally has DO-support, and HAVE *got* is not possible:

A: *Does she have* coffee with her breakfast?
 B: Yes, she *does*.
 A: *Did you have* any difficulty getting here?
 B: No, I *didn't*.
 A: *Did you have* a good time in Japan?
 B: Yes, we certainly *did*.

Other dynamic uses include HAVE in a causative sense followed by an -ed participle, or in a similar sense followed by a bare infinitive:

A: *Did they have* the house painted?
 B: No, they *didn't*.
 A: *Did they have* you paint the house?
 B: Yes, they *did*.

- Note [a] Note the following contrast between stative and dynamic meaning:
Had she got her baby at the clinic? ['Was her baby at the clinic with her?']
Did she have her baby at the clinic? ['Did she give birth to her baby at the clinic?']
 Especially in AmE, the second sentence could have both of these meanings.
 [b] Since HAVE with the DO construction is typically dynamic, in the present tense it tends to single out a habitual interpretation (cf 4.6). Compare:
Do you have bad headaches? [normally habitual: 'as a rule']
Have you got a bad headache? [nonhabitual: 'now, at this moment']
Have you got bad headaches? [This could only be addressed to more than one person in a nonhabitual sense.]

DO

- 3.36 DO, like BE and HAVE, can be both an auxiliary and a main verb. As an auxiliary, DO has no nonfinite forms, but only present and past forms, cf Table 3.36 opposite.

- Note Occasionally *does* is contracted in informal style to *'s* /s/; eg: *What's it matter?* A more drastic kind of phonological reduction is indicated by the following (nonstandard) orthographic rendering of informal speech:
Whyncha do it yourself? ['Why don't you ...?']

Table 3.36 Forms of DO

	NONNEGATIVE	UNCONTRACTED NEGATIVE	CONTRACTED NEGATIVE (cf Note)
base	<i>do</i> /du:/, /dʊ/, /də/	<i>do not</i>	<i>don't</i> /dəʊnt/
-s form	<i>does</i> /dəz/, /dɒz/	<i>does not</i>	<i>doesn't</i> /dəznt/
past	<i>did</i> /dɪd/	<i>did not</i>	<i>didn't</i> /dɪdnt/
-ing form (main verb only)	<i>doing</i> /ˈduːɪŋ/		
-ed participle (main verb only)	<i>done</i> /dʌn/		

NOTE The final /t/ of the negative contraction is commonly not sounded.

DO-SUPPORT

- 3.37 The term DO-SUPPORT (or 'DO-periphrasis') applies to the use of DO as an 'empty' or 'dummy' operator (cf 2.49) in conditions where the construction requires an operator, but where there is no semantic reason for any other operator to be present. All uses of DO as an auxiliary come under this heading. The main ones are:

(a) In indicative clauses (cf 3.52) negated by *not*, where the verb is simple present or simple past:

She *doesn't* want to stay.
 I *didn't* like mathematics at school.

Negative imperative clauses introduced by *Do not* or *Don't* may, with some reservation (cf 11.30, Note [a]), be placed in the same category.

(b) In questions and other constructions involving subject-operator inversion, where the verb is in the simple present or past tense:

Did he stay late? What *do* they say? *Does* it matter?

This category includes tag questions (cf 11.8ff) and other reduced questions where the dummy operator is not accompanied by a main verb:

He knows how to drive a car, *doesn't* he?
 They *didn't* make any mistakes, *did* they?
 I don't like him, *do* you?

It also includes inversion after an initial negative element:

Never *did* he think the book would be finished so soon.

(c) In emphatic constructions where the verb is simple present or simple past (cf emphatic positive constructions, 3.25):

They *do* want you to come.
 Michael *did* say he would be here at nine, *didn't* he?

Here we may also include the 'persuasive imperative' introduced by *do*:

"Do sit down! "Do be quiet.

A: May I sit here? B: Yes, by all means DO.

(See, however, 11.30 Note [a] on the dubious status of DO as operator in this construction.)

(d) In reduced clauses, where DO acts as a dummy operator preceding ellipsis of a predication (12.60):

Mary reads books faster than I *do*. [*do* = 'read books']

Did you watch the game on television? No, but my brother *did*.

['... watch the game on television']

Note [a] There is no DO-support for negation in nonfinite clauses, where *not* precedes a full verb as main verb:

Not liking mathematics, he gave it up.

Not to go to the exhibition would be a pity.

There is also normally no DO-support for subjunctive verbs (cf 3.58):

It is important that this mission *not fail*.

[b] Negative words other than *not* do not require DO-support:

No one liked him.

They never/seldom go out.

[c] Nor is there any DO-support in questions without inversion, *ie* questions with the normal S V O/C/A order (cf 11.12, 11.15): *He said that? Who came first?*

[d] Auxiliaries have no DO-support, since they themselves perform the function of operators (cf 3.21). Thus DO does not precede other auxiliaries: **She does must come*. There is a rare exception, however, where *Do* or *Don't* precedes auxiliary BE in imperatives (cf 11.30 Note [a]): *Don't be drinking wine when he calls; Don't be frightened by that noise*.

[e] In some legal documents in archaic style, the auxiliary DO construction is used merely as an alternative to the simple present or past tense:

I, the undersigned, being of sound mind, *do* this day hereby *bequeath*...

do as main verb

3.38 When used as a main verb, DO has the full range of forms, including the *-ing* participle *doing* and the *-ed* participle *done*:

What have you been *doing* today? I haven't *done* much, I'm afraid.

As a main verb, DO can combine with a pronoun object to act as a pro-predication referring to some unspecified action or actions. The pronoun object may be personal (*it*), demonstrative (*this/that*), interrogative (*what*), or indefinite (*nothing/anything*, etc):

I have been meaning to mend that radio, but I haven't *done it* yet.

(cf 12.25)

A: I'm throwing these books away. B: Why are you *doing THAT*?

A: *What* have they been *doing* to the road? B: Widening it.

A: *What* have you *done* with my pen? B: I've put it in the desk.

A: *What* did you *do* on holiday? B: We didn't *do anything*.

I didn't know *what* to *do*, so I *did nothing*.

See also the use of DO in pseudo-cleft sentences (18.29). DO is also used intransitively as a pro-predication (cf 12.22):

She didn't earn so much as she might have (*done*). <esp BrE>

Apart from these uses as a pro-form, the main verb DO has a wide range of uses as a general-purpose agentive transitive verb, especially in informal speech:

Let's *do* the dishes – you wash and I'll dry. [1]

Who *does* your car? Fred Archer – and he *does* my neighbour's too. [2]

She's *done* some really good essays – and she always hands them in on time. [3]

DO in such sentences is often replaceable by a verb of more exact meaning; *eg* in [2] SERVICE or MAINTAIN, and in [3] WRITE. The meaning is narrowed down by the nature of the object: *eg* in *Will you do the potatoes?*, DO could mean 'peel' or 'cook', but scarcely 'polish', a meaning it might have in *Have you done the silver?*

Note There is also a resultative use of *done* meaning 'cooked': *Is the meat done?*

Modal auxiliaries

3.39 The criteria for identifying modal auxiliaries have been discussed in 3.22ff, and especially 3.30. Not all verbs respond to all criteria, however, and it is useful to make a distinction between central and marginal modals. We will discuss the marginal modals and other verbs of intermediate status in 3.40ff, and we will discuss the meanings of the modal auxiliaries later (4.49ff).

All that needs to be said about the form of the central modals is stated in Table 3.39 and the accompanying Notes. The Table gives the contracted

Table 3.39 Forms of the modal auxiliary verbs

NONNEGATIVE	UNCONTRACTED NEGATIVE	CONTRACTED NEGATIVE
<i>can</i> /kæn, kən/	<i>cannot</i> , (<i>can not</i> : cf Note [b])	<i>can't</i> /kɑ:nt/ <BrE>, /kænt/ <AmE>
<i>could</i> /kʊd, kəd/	<i>could not</i>	<i>couldn't</i> /'kʊdnt/
<i>may</i> /meɪ/	<i>may not</i>	(<i>mayn't</i> /meɪnt/ cf 3.23)
<i>might</i> /maɪt/	<i>might not</i>	<i>mightn't</i> /'maɪnt/
<i>shall</i> /ʃæl, ʃ(ə)/	<i>shall not</i>	(<i>shan't</i> /ʃɑ:nt/ <BrE> cf 3.23)
<i>should</i> /ʃʊd, ʃ(ə)d/	<i>should not</i>	<i>shouldn't</i> /'ʃʊdnt/, /'ʃədn't/
<i>will</i> /wɪl/	<i>will not</i>	<i>won't</i> /wəʊnt/
<i>'ll</i> /(ə)/	<i>'ll not</i>	(cf Note [c])
<i>would</i> /wʊd/	<i>would not</i>	<i>wouldn't</i> /'wʊdnt/
<i>'d</i> /(ə)d/	<i>'d not</i>	(cf Note [c])
<i>must</i> /mʌst, məst/	<i>must not</i>	<i>mustn't</i> /'mʌstnt/

(Unstressed pronunciations with vowel reduction are placed after the stressed pronunciations. Rare forms are placed in parentheses.)

negative form, and also the pronunciation of both stressed and unstressed forms.

Semantic aspects of the negation of modal auxiliaries are examined in 10.67f.

Note [a] The words braced together can for some purposes be regarded as present and past forms of the same verb. But for other purposes, they behave as independent verbs (cf 4.59).

[b] The spelling of *can not* as two words is unusual: it occurs where main verb negation (cf 10.67f) is intended, or where special emphasis on or separation of the negative word is required; eg:

Can you not interrupt, please.

Can I not help you?

He says we *can* manage when we *can* certainly *not*.

[c] There are obviously no contracted forms of 'll and 'd since they are themselves contractions. These forms are braced with *will* and *would* because 'll and 'd can always be expanded to *will* and *would* (except, of course, when 'd = *had*, cf 3.33).

[d] Regarding the frequency of the modal auxiliaries, the following findings, based on studies of the SEU, Brown and LOB corpora, are of significant interest:

(a) The frequency of individual modals varies greatly from *will* (four times per thousand in spoken BrE) to *shall* (three times per ten thousand words in written English). The marginal modals *ought to*, *need*, and *dare* are in their turn strikingly less frequent than *shall*.

(b) The modals as a whole are much more frequent in spoken than in written English.

(c) *Will*, *can*, and their past forms *would* and *could* are notably more frequent than other modals.

(d) Among less frequent modals, *should*, *shall*, and *ought to* are even less frequent in AmE than in BrE.

Verbs of intermediate function

3.40 In the following sections we examine verbs whose status is in some degree intermediate between auxiliaries and main verbs. These form a set of categories which may be roughly placed on a gradient between modal auxiliaries at one end, and full verbs, such as *hope*, which take a nonfinite clause as object, at the other. The extremes of the scale may therefore be represented by *I can go* and *I hope to go*, cf Fig 3.40a opposite.

The structural implication of this scale is that the construction (a) *I can go* contains one verb phrase, whereas the construction (f) *I hope to go* contains a finite verb phrase followed by a nonfinite one. This distinction will be further discussed in 3.57. Semantic aspects of the scale may also be noted (cf 4.66); many of the intermediate verbs, particularly those at the higher end of the scale, have meanings associated with aspect, tense, and modality: meanings which are primarily expressed through auxiliary verb constructions. Our principal task, however, is to distinguish these classes by formal criteria, while making any semantic observations that may be useful.

The criteria which will provide the framework for this analysis are those which were used in identifying the class of auxiliaries in 3.22ff. There are eight criteria for auxiliaries, and four criteria which more narrowly apply to the central modal auxiliaries. They are summarized in Table 3.40b opposite, together with illustratively contrasting examples.

(one verb phrase)	(a) CENTRAL MODALS	<i>can, could, may, might, shall, should, will/'ll, would/'d, must</i> (cf 3.39)
	(b) MARGINAL MODALS	<i>dare, need, ought to, used to</i> (cf 3.41ff)
	(c) MODAL IDIOMS	<i>had better, would rather/sooner, BE to, HAVE got to, etc</i> (cf 3.45f)
	(d) SEMI-AUXILIARIES	<i>HAVE to, BE about to, BE able to, BE bound to, BE going to, BE obliged to, BE supposed to, BE willing to, etc</i> (cf 3.47f)
	(e) CATENATIVES	<i>APPEAR to, HAPPEN to, SEEM to, GET + -ed participle, KEEP + -ing participle, etc</i> (cf 3.49)
(two verb phrases)	(f) MAIN VERB + nonfinite clause	<i>HOPE + to-infinitive, BEGIN + -ing participle, etc</i> (cf 16.38f)

Fig. 3.40a The auxiliary verb – main verb scale

Table 3.40b Criteria for auxiliary verbs

AUXILIARY CRITERIA (Op = operator)	AUXILIARY	MAIN VERB
(a) Op in negation	He <i>cannot</i> go.	*He <i>hopes not</i> to go. (cf Note)
(b) Negative contraction	<i>can't</i>	* <i>hopen't</i>
(c) Op in inversion	<i>Can</i> we go?	* <i>Hope</i> we to go?
(d) Emphatic positive	*Yes, I <i>DO can</i> come.	Yes, I <i>DO hope</i> to come.
(e) Op in reduced clause	I can come if you <i>can</i> .	*I hope to come if you <i>hope</i> .
(f) Position of adverb	We <i>can always</i> go early.	We <i>always hope</i> to go early.
(g) Postposition of quantifier	{ They <i>can all</i> come. ?They <i>all can</i> come.	{ ?They <i>hope all</i> to come. They <i>all hope</i> to come.
(h) Independence of subject	{ Ann can do it. ~ It can be done by Ann.	{ He <i>hopes</i> to do it. *It <i>hopes</i> to be done by him.
MODAL AUXILIARY CRITERIA	MODAL AUXILIARY	MAIN VERB
(j) Bare infinitive	I <i>can go</i> .	*I <i>hope go</i> .
(k) No nonfinite forms	*to <i>can</i> /* <i>canning</i> /* <i>canned</i>	to <i>hope</i> /hoping/hoped
(l) No -s form	*She <i>cans</i> come.	She <i>hopes</i> to come.
(m) Abnormal time reference	You <i>could</i> leave this evening. [not past time]	You <i>hoped</i> to leave this evening. [past time]

NOTE *He hopes not to go* is acceptable in the sense 'He hopes that he will not go'; but this is then a case of the negation of *to go*, not of *hopes* (cf 3.22 Note [a]).

Marginal modals: *dare*, *need*, *ought to*, and *used to*

- 3.41 Given that in the above table modal auxiliaries are positive for all criteria, where main verbs like *hope* are negative, the marginal modals are verbs which closely resemble the central modal auxiliaries. It can be argued, indeed, for *dare* and *need* that these are proper modals, but that for each there is also a homomorphic verb (DARE, NEED) constructed as a main verb (cf, however, 3.42 Note [b]). *Ought*, too, may be treated as a central modal if speakers construct it with the bare infinitive (cf 3.43 Note [a]).

dare* and *need

- 3.42 *Dare* and *need* can be constructed either as main verbs (with *to*-infinitive and with inflected *-s*, *-ing* and past forms), or, under restricted conditions, as modal auxiliaries (with the bare infinitive and without the inflected forms).

Table 3.42

	MODAL AUXILIARY CONSTRUCTION	MAIN VERB CONSTRUCTION
Positive	—	He <i>needed/dared</i> to escape.
Negative	He <i>needn't/daren't</i> escape.	He <i>doesn't need/dare</i> to escape.
Interrogative	<i>Need/Dare</i> we escape?	<i>Do we need/dare</i> to escape?
Negative-interrogative	$\left\{ \begin{array}{l} \text{Needn't he escape} \\ \text{after all?} \\ \text{Dare he not escape?} \end{array} \right.$	$\left\{ \begin{array}{l} \text{Doesn't he need to escape} \\ \text{after all?} \\ \text{Doesn't he dare to escape?} \end{array} \right.$

The modal construction is restricted to nonassertive contexts (cf 2.53), *ie* mainly negative and interrogative sentences, whereas the main verb construction can almost always be used, and is in fact more common. The auxiliary construction with *dare* and *need* is rarer in AmE than in BrE, where it is also quite rare.

As a modal, *dare* exhibits abnormal time reference (cf 3.30) in that it can be used, without inflection, for past as well as present time:

The king was so hot-tempered that no one *dare* tell him the bad news.

The main verb form *dared* (*to*) might also occur here.

- Note [a] 'Nonassertive contexts' are not confined to negative and interrogative clauses: they also include clauses containing semi-negative words such as *hardly* and *only*. The following examples illustrate sentences with negative import, but lacking *not*-negation:

No one dare predict the results. Standards are *lower than* they need be.

For further illustrations and discussion of this topic, cf 10.61.

- [b] Blends between the auxiliary construction and the main verb construction occur and seem to be widely acceptable (more so in the case of *dare* than in that of *need*):

They *do not dare* ask for more. *Do they dare* ask for more?

These two examples combine the DO-support of the main verb construction with the bare infinitive of the auxiliary construction. On the hypothesis that there are two different verbs (the main verb DARE and the auxiliary verb *dare*), one would expect these to be ungrammatical; but they are not. The past tense form *dared* without DO-support may be regarded as another example of a blend, since the *-ed* past inflection is not characteristic of modal verbs:

They *dared not* carry out their threat.

Blends with *need* are usually of the type with *-s* inflection and bare infinitive: ?*One needs only reflect for a second*...

- [c] *Dare* occurs (with nuclear stress) in the following idiomatic constructions expressing a threatening rebuke:

How *DARE* you do such a thing? Don't you *DARE* speak to me like that.

The latter example, with DO-support and a bare infinitive *speak*, is another example of a blend.

- [d] In another formulaic construction, *I dare say* followed by a *that*-clause, the two verbs are often written as a single word *daresay*:

I daresay she is right. ['I wouldn't be surprised if...']

The normal sense of *dare* is lost here.

- [e] As main verbs, DARE and NEED can enter into a number of different constructions (cf 16.26, 16.39, 16.50). Thus, NEED can take a direct object:

You *need* a haircut.

As is to be expected, NEED and DARE as main verbs have to be replaced by DO in reduced clause constructions:

She *needs* to practise and so do I. They *didn't dare* to attack us, *did* they?

- [f] As a modal auxiliary, *need* has no tense contrast. To express past time, however, we can place *need* before the perfective aspect (cf 4.18ff): *You need not have done it*. This is then approximately equivalent to the past tense of NEED as a main verb: *You did not need to do it*. But the NEED to construction does not have the counterfactual implication of the *need have*... construction. For instance, in the following the counterfactual meaning is inappropriate, and we could not therefore replace *did not need to say* by *need not have said*:

Anne was too nervous to reply, but fortunately she *did not need to say* anything.

- [g] As an auxiliary, *dare* usually fails the independence of subject criterion (h) in 3.29. There is no semantic equivalence between the active *The boy daren't contact her* and the passive *She daren't be contacted by the boy*. One meets, however, exceptions such as *This is a problem which dare not be overlooked*.

- [h] Further to Note [b] above, results of elicitation experiments indicate a higher acceptance rate for blends with AmE than with BrE speakers. This can be interpreted in two opposite ways: we can argue either that blends are more common in AmE, or that *dare* and *need* are such unusual verbs in AmE in these constructions, that speakers do not react critically to blends, but rather display passive acceptance of them. The latter interpretation (which has also been advanced for blends with another marginal auxiliary, *ought to*, cf 3.43) is supported by frequently introduced lexical changes such as the following:

Submitted sentence:	<i>Needn't</i> he go?
Proposed lexical changes:	$\left\{ \begin{array}{l} \text{Doesn't he have to go?} \\ \text{Does he have to go?} \\ \text{Shouldn't he go? etc} \end{array} \right.$

ought to

- 3.43 *Ought to* /ɔ:t tu:/, /ɔ:t (t)ə/, has the uncontracted negative *ought not to* and the contracted negative *oughtn't to*. It normally has the *to*-infinitive (although occasionally in familiar style the bare infinitive occurs in nonassertive contexts):

You *ought to* stop smoking.

You *oughtn't to* smoke so much.

Ought you *to* smoke so much?

The *to* is also optional following *ought* in ellipsis: *Yes, I think I ought (to)*. On the meaning of *ought to*, cf 4.56.

- Note [a] Elicitation tests on young people have shown that, for both AmE and BrE, in nonassertive contexts the *to*-less *ought* construction is widely acceptable, and for some speakers even preferable to the construction with *to* in nonassertive contexts; eg:

They *ought not* (*to*) do that sort of thing. *Ought* we (*to*) have done it?
Oughtn't we (*to*) send for the police?

In assertive contexts, however, the *to*-less form is unacceptable:

We $\left\{ \begin{array}{l} \text{ought to} \\ \text{*ought} \end{array} \right\}$ give him another chance.

[b] Treating *ought* as a main verb with DO-support, which is usually described as a dialectal usage, proved to be the least popular alternative in a test with BrE teenage informants:

They *didn't ought* to do that sort of thing.

Did we *ought* to have done it?

However, the existence of this construction, even if it is not part of standard English, is an indicator of the marginal status of *ought to* which, like the other marginal modals, shows some tendency to pattern as a main verb. More generally, such results reflect change and uncertainty in the use of certain modals which, from a historical viewpoint, are in decline.

used to

- 3.44 *Used to* denotes a habit or a state that existed in the past (cf 4.15), and is therefore semantically not so much a modal auxiliary as an auxiliary of tense and aspect. In formal terms, however, it fits the marginal modal category.

It always takes the *to*-infinitive and only occurs in the past tense:

She *used to* attend regularly. ['was in the habit of attending ...']

I *used to* be interested in bird-watching. ['I was formerly ...']

It is typically pronounced /'ju:stʊ:/ or /'ju:stʊ/ before vowels or before an ellipsis, and /'ju:stə/ before consonants.

Used to occurs both as an operator and with DO-support. In the latter case the spellings *use to* and *used to* both occur, reflecting speakers' uncertainty of the status of this verb: an uncertainty, that is, as to whether it is to be treated as an invariable form, like a modal auxiliary, or as a form with an infinitive, like a full verb. The pronunciation of the verb does not allow discrimination between these possibilities. In the negative, the operator construction, which avoids this dilemma, is preferred by many in BrE:

$\left\{ \begin{array}{l} \text{He usen't to smoke.} \\ \text{He used not to smoke.} \end{array} \right\}$ <BrE>

$\left\{ \begin{array}{l} \text{He didn't use to smoke.} \\ \text{He didn't used to smoke.} \end{array} \right\}$ <BrE and AmE>

The construction *did ... use to* is preferred to other constructions in both AmE and BrE. The spelling *did ... used to*, however, is often regarded as nonstandard. The interrogative operator construction *used (he)* is rare even in BrE. Tag questions also normally have DO-support; compare:

Did he use to smoke? He used to smoke, didn't he?

Note [a] *Used to* + infinitive should be distinguished from *used to* + noun phrase or *-ing* participle clause:

She is *used to* $\left\{ \begin{array}{l} \text{life in the country.} \\ \text{living in the country.} \end{array} \right\}$

In this latter construction, although it has the same pronunciation as the marginal modal, *used to* is in fact a participial adjective followed by the preposition *to* ['accustomed to ...'] (cf 16.69 Note [a]).

[b] A perfective form of *used to*, *had used to*, is occasionally attested.

[c] There is a tendency for speakers to avoid the problem of negating *used to* by employing the negative adverb *never*: *I never used to watch television.*

Modal idioms: *had better*, etc

- 3.45 This category contains the following four multi-word verbs, as well as some less common verbal constructions:

had better would rather HAVE got to BE to

They all begin with an auxiliary verb, and are followed by an infinitive (sometimes preceded by *to*):

We $\left\{ \begin{array}{l} \text{had} \\ \text{'d} \end{array} \right\}$ better leave soon. Yes, we $\left\{ \begin{array}{l} \text{had.} \\ \text{'d better.} \end{array} \right\}$ [1]

I *d rather* not say anything. [2]

They've *got to* leave immediately. [3]

The conference *is to* take place in Athens. [4]

None of these idiomatic verbs has nonfinite forms; they cannot therefore follow other verbs in the verb phrase:

*I *will have got to* leave soon.

*The conference *has been to* take place in Athens.

In this respect they are not like main verbs. They are not, however, entirely like auxiliaries, since they do not behave as operators. It is normally the first word alone which acts as operator in (for example) negative and interrogative sentences:

Hadn't we better lock the door?

Would you rather eat in a hotel?

We *haven't got to* pay already, have we?

I *wasn't to* know that you were waiting.

However, *had better* and *would rather* have two kinds of negation. First, there is a negation in which *not* follows the whole expression:

I *d rather not* stay here alone.

You *d better not* lock the door.

A second type of negation, in which *not* follows the first word, is typically used in 'second instance' contexts (especially in negative questions) where an earlier statement or assumption is being challenged:

A: *Wouldn't you rather* live in the country?

B: No, I *would not*. I *d rather* live here.

The two kinds of negation are sometimes associated with different meanings, the former being an instance of predication negation (cf 10.69):

Had we better not go? ['Would it be advisable if we didn't go?']

Hadn't we better go? ['I think we had better go; don't you agree?']

The contracted verb form followed by *not* is unacceptable with these two idioms:

*I *d not rather* leave. *You *d not better* resign.

Would rather differs from central modals and marginal modals in that it is

incapable of showing active-passive synonymy:

I'd *rather rent* the cottage. *The cottage *would rather be rented* by me.

On the other hand, HAVE *got to* and BE *to* are more like main verbs in that they have an -s form and normal present/past tense contrast:

The committee $\begin{cases} \text{is to meet today.} \\ \text{was to meet yesterday.} \end{cases}$

She $\begin{cases} \text{has got to leave by tomorrow.} \\ \text{had got to leave by the next day. (BrE)} \end{cases}$

The past tense construction *had got to*, however, does not occur in AmE, and is rare in BrE, especially in questions.

Note [a] In addition to the four modal idioms illustrated above, the following sentences illustrate less common idioms which might be placed in the same category:

I *would sooner* leave the decision to you.

I *would (just) as soon* eat at home.

We *may/might (just) as well* pay at once. (cf 4.53 Note [e])

You *had best* forget this incident.

[b] Sometimes (particularly in AmE) the uncontracted form of 'd *rather* is realized as *had rather* instead of *would rather*. Very occasionally the uncontracted form *should rather* is also encountered. These variations, and similar variations with *would sooner*, etc have presumably arisen because of the ambiguity of the contraction 'd.

[c] *Would rather* and *would sooner* express preference ['... would prefer to ...'] and may therefore be followed by a comparative construction beginning with *than*:

I'd *rather/sooner* live in the country *than* in the city.

[d] It is a sign of the 'in-between' status of modal idioms that either the whole idiom or just the first word of the idiom may be 'stranded' before ellipsis of the predication, as in [1] above, where the reply *Yes, we'd better* is an alternative to *Yes, we had*. (A third alternative is *Yes, we better had*.) With *would rather*, however, the *would* alone is usually stranded

A: *Would you rather* buy this one?

B: Yes, I $\begin{cases} \text{would.} \\ \text{?would rather.} \end{cases}$

[e] In informal speech, the first word of HAVE *got to* and *had better* is often completely elided, so that the pronunciation of the whole idiom is reduced to /'gɒtə/, /'betə/, thus making it resemble a single modal auxiliary. This reduction is represented in very informal written style (eg in fictional dialogue) by the omission of 've, 'd, etc, and sometimes by the nonstandard spelling *gotta*:

You $\begin{cases} \text{got to} \\ \text{gotta} \end{cases}$ be careful these days. They *better* go home.

[f] HAVE *got to* is not to be confused with the perfective of the catenative verb GET *to*. The latter has, in AmE, the distinctive form HAVE *gotten to* (cf 3.18):

We've *gotten to* watch more TV this year than last. (AmE)

The meanings of the modal idioms

3.46 All four of the modal idioms discussed above have meanings classifiable as 'modal'.

(a) *Had better* has a meaning of 'advisability', similar to the obligational meaning of *ought to* and *should* (cf 4.56).

(b) *Would rather* has the volitional meaning 'would prefer to'.

(c) HAVE *got to* has meanings of 'obligation' and 'logical necessity' (cf: *must* 4.54). From the semantic point of view, it is best considered a variant of

the semi-auxiliary HAVE *to*. The respects in which its meaning differs from that of HAVE *to* are considered in 3.48 and 4.54f.

(d) BE *to* is an idiom expressing futurity, with varied connotations of 'compulsion', 'plan', 'destiny', etc, according to context. In the past, *was to* and *were to* express futurity from the standpoint of past time orientation; in conditional clauses, the subjunctive *were to* expresses hypothetical future meaning (cf 15.36). The meaning of BE *to* is further discussed in 4.47f.

Note [a] BE *to* must not be confused with an apparently identical construction in which the copula BE is followed by a nominal or adverbial infinitive clause (cf 15.10f, 15.48):

The committee is to find a solution. [1]

The problem is to find a solution. [2]

Whereas [1] illustrates the modal idiom BE *to*, in [2], *to find a solution* is a nominal infinitive clause acting as complement of *is* (cf: *The problem is how to find a solution*).

[b] The future meaning of BE *to* is particularly emphasized when it is accompanied by *still* or *yet*:

The most severe weather is *yet/still* to come.

The implication here is negative: 'has not yet come'. Compare a similar use of HAVE *to*, 3.48.

Semi-auxiliaries: *be going to*, etc

3.47 The semi-auxiliaries consist of a set of verb idioms which express modal or aspectual meaning and which are introduced by one of the primary verbs HAVE and BE; eg:

<i>be able to</i>	<i>be bound to</i>	<i>be likely to</i>	<i>be supposed to</i>
<i>be about to</i>	<i>be due to</i>	<i>be meant to</i>	<i>be willing to</i>
<i>be apt to</i>	<i>be going to</i>	<i>be obliged to</i>	<i>have to</i>

The boundaries of this category are not clear: they might be extended, for example, to include the negative *be unable to*, *be unwilling to*, etc (cf Note [a]).

We will first of all deal with the semi-auxiliaries introduced by BE.

All these constructions satisfy the first seven criteria for auxiliary verbs (cf 3.22ff), in the sense that, for example, *be going to* has *be* as an operator in negation and inversion, rather than having DO-support:

- { Ada *isn't* going to win.
- { *Ada *doesn't be* going to win.
- { *Is* Ada going to win?
- { *Does Ada *be* going to win?

However, this follows from the fact that the first word of the semi-auxiliary construction is the primary verb *be*. To be strictly comparable to an auxiliary in its entirety, *be going to* would have to form its negation by adding *not* to the second or third word: **is goingn't to* or **is going ton't*. It is therefore only by special interpretation of the operator criteria (a-e) that these semi-auxiliaries can be described as auxiliary-like. They do, however, resemble auxiliaries in permitting synonymous passives and *there*-constructions in accordance with the criterion of subject-independence (cf 3.29):

Brazil *is going to* win the World Cup.

~ The World Cup *is going to* be won by Brazil.

Several home teams *are going to* be beaten tomorrow.

~ There *are going to* be several home teams beaten tomorrow.

Moreover, such constructions as *be going to* and *be bound to* belie their appearance in not allowing contrasts of aspect and voice. There is, for example, no nonprogressive construction corresponding to *be going to*:

*Several home teams *go to* be beaten tomorrow.

And there is no active equivalent of the superficially passive *be bound to*:

He *was bound to* be a failure. ~ *Someone *bound* him to be a failure.

This is further evidence of a resemblance to auxiliaries rather than to main verb constructions.

These constructions are, however, in one respect much closer to main verbs than are the modal idioms. They have nonfinite forms such as *been going to* and *to be bound to*, and can therefore occur in combination with preceding auxiliaries:

James *will be obliged to* resign.

We *have always been willing to* help.

Two or more semi-auxiliaries may indeed occur in sequence:

Someone *is going to have to* complain.

No one *is likely to be able to* recognize her.

Although there are restrictions on this kind of combination (cf 3.57), the occurrence of nonfinite semi-auxiliaries means that these idioms can fill slots in a modal verb paradigm where modal auxiliaries of equivalent meaning cannot occur:

We haven't { *could
been able to } solve the problem. [*can* = 'ability']

To { *can
be allowed to } speak freely is a human right. [*can* = 'permission']

Other equivalences of this kind are between *must* and *have to* (cf 3.48), and between *will* and *be willing to*.

Note [a] There is a gradience between a semi-auxiliary such as *be bound to* and an occurrence of the copula *BE* followed by an adjectival or participial construction such as *happy to* or *compelled to*. One criterion of importance here is the ability of what follows *BE* to stand at the beginning of a supplementary clause (cf 15.60ff):

Compelled to take stern measures, the administration lost popularity. [1]

?*Bound to* take stern measures, the administration lost popularity. [2]

By this criterion, the combinations *able to* and *willing to* are less clearly independent than their negatives *unable to* and *unwilling to*:

Unable/Unwilling to resist, Matilda agreed to betray her country. [3]

?*Able/Willing to* resist, Matilda declined to betray her country. [4]

Of these parallel sentences, [1] and [3] are clearly acceptable, whereas [2] and [4] are more marginal. But acceptability judgments tend to vary in this area.

[b] As semi-auxiliaries, *be meant to* and *be supposed to* have meanings similar to those of *ought to* (cf 4.56, 4.66) and are not to be confused with homomorphic passive constructions. In the case

of *be supposed to*, the semi-auxiliary is marked by a special pronunciation /... s(ə)'pəʊstə/ or /... s(ə)'pəʊstə/ (cf the special pronunciation of *used to*; 3.44).

have to

3.48 *Have to* is the only semi-auxiliary beginning with *HAVE* rather than *BE*, but its inclusion in this category is partly justified by its occurrence in the full range of nonfinite forms, a respect in which it differs from the semantically parallel *have got to* (cf 4.55):

I *may have to* leave early. (*I *may have got to* leave early.)

People *are having to* boil their drinking water during this emergency.

The administration *has had to* make unpopular decisions.

As these examples show, *have to* can occur in modal, perfective, and progressive constructions. It would be impossible to substitute *have got to* for *have to* in these cases.

In meaning, *have to* is similar to *must* (cf 4.54), and can stand in for *must* in past constructions where *must* cannot occur:

These days you *must* work hard if you want to succeed. } [*have to* =
In those days you *had to* work hard if you wanted } 'obligation']
to succeed.

There *must* be some solution to the problem. } [*have to* =
There *had to* be some solution to the problem. } 'logical necessity']

Have to patterns either as a main verb or as an auxiliary with respect to operator constructions:

Do we *have to* get up early tomorrow? <AmE and BrE>

Have we to get up early tomorrow? <BrE – somewhat old-fashioned>

In this, it resembles other uses of *HAVE* as a main verb (cf 3.34). DO-support, however, is the only construction in AmE and the dominant one in BrE (cf Note [c]).

Although *have got to* has the same meanings of 'obligation' and 'logical necessity' as are expressed by *have to*, *have got to* tends not to have habitual meaning, and when combined with a verb of dynamic meaning, tends to refer to the future. There is thus a potential difference between:

Jim's *got to* check the temperature every 12 hours. [1]

Jim *has to* check the temperature every 12 hours. [2]

Whereas [1] is likely to have the force of a directive, stipulating what Jim's duties will be in the future, [2] is more likely to indicate a habitual action ['This is what Jim's present duties consist of'].

Note [a] Both *have to* and *have got to* occur with epistemic meaning like that of *must* (cf 4.54) in sentences such as:

Someone { *has to*
has got to } be telling lies. You { *have to*
we got to } be joking.

This has until recently been regarded as an AmE usage, but is now also current in BrE.

[b] In other contexts *have to* and *have got to* express a stronger meaning of 'logical necessity' which cannot be matched by the use of *must*:

There *has (got) to be* a first time for everything.

[c] Studies in BrE usage show that over 85 per cent of instances of *have to* in negative and interrogative clauses are constructed with DO. Elicitation tests have further indicated that negative constructions without DO (of the kind *I hadn't to walk more than a mile*) are less acceptable than interrogative constructions without DO (such as *Has he to answer the letter this week?*).

Catenative verb constructions

- 3.49 The term CATENATIVE will in practice be used to denote verbs in such constructions as *appear to*, *come to*, *fail to*, *get to*, *happen to*, *manage to*, *seem to*, *tend to*, and *turn out to* followed by the infinitive:

Sam $\left\{ \begin{array}{l} \text{appeared} \\ \text{came} \\ \text{failed} \\ \text{?got} \\ \text{seemed} \end{array} \right\}$ to realize the importance of the problem. [1]

Such constructions have meanings related to aspect or modality, but are nearer to main verb constructions than are semi-auxiliaries, patterning entirely like main verbs in taking DO-support:

Sam *didn't* $\left\{ \begin{array}{l} \text{appear} \\ \text{come} \end{array} \right\}$ to realize the importance of the problem. [2]

Most of them do, however, resemble auxiliary constructions in satisfying the 'independence of subject' criterion (cf 3.29). Thus [1] has the corresponding passive [3]:

The importance of the problem $\left\{ \begin{array}{l} \text{appeared} \\ \text{came} \\ \text{?failed} \\ \text{*got} \\ \text{seemed} \end{array} \right\}$ to be realized by Sam. [3]

This criterion, however, applies somewhat marginally to agentive verbs like *fail* and *manage*, and does not apply at all to *get*.

Unlike main verb constructions such as *expect (to)*, *want (to)*, and *attempt (to)*, catenative constructions are in no way syntactically related to transitive verb constructions in which the verb is followed by a direct object or prepositional object (cf 16.26ff, 16.38). Compare:

John $\left\{ \begin{array}{l} \text{appeared} \\ \text{attempted} \end{array} \right\}$ to attack the burglar. [4]
[5]

But:

John $\left\{ \begin{array}{l} \text{*appeared} \\ \text{attempted} \end{array} \right\}$ an attack on the burglar. [6]
[7]

We may also include among catenative verbs certain verbs which resemble the auxiliary BE in combining either with the *-ing* participle in progressive constructions, or with the *-ed* participle in passive constructions:

The girl $\left\{ \begin{array}{l} \text{started out} \\ \text{kept (on)} \\ \text{went on} \end{array} \right\}$ working.

Our team *got beaten* by the visitors.

(In BrE, *carried on* can be used as equivalent to *went on*.) These, again, should be distinguished from similar looking constructions in which a main verb is followed by a nominal *-ing* participle clause (eg: *The girl liked working*; cf 16.39) or by a participial adjective, as in the pseudo-passive (cf 3.77): *Our team looked beaten*.

Note [a] The term 'catenative' alludes to the ability of these verbs to be concatenated in sequences of nonfinite constructions, as in *Our team seems to manage to keep on getting beaten*. This propensity for forming chain-like structures is not, however, confined to catenative verbs, but is also characteristic of semi-auxiliaries and main verbs followed by nonfinite clauses as objects: Hence such improbable, but structurally possible sequences as:

We are going to have to enjoy seeming to like listening to his music.

[b] Some catenative verbs, like some semi-auxiliaries, are closely related to constructions with anticipatory *it* (cf 16.34, 16.72):

He seems to be rich. ~ It seems that he is rich.

She turned out to love horses. ~ It turned out that she loved horses.

Joan is likely to resign. ~ It is likely that Joan will resign.

Some further aspects of the gradience between modals and main verbs

- 3.50 Although they do not enter into the list of modal auxiliary criteria stated in 3.30ff, the following may be mentioned as additional characteristics of modal auxiliaries:

- (a) They are either invariable, like *must*, or close to invariable, like *would*, which, although historically it is the past tense form of *will*, is from the standpoint of present-day English in many respects an independent form. Thus modals might without too much simplification be regarded as 'modal particles' which have lost their historical connection with the inflectional paradigm of verbs.
- (b) From the semantic point of view, modal auxiliaries are often specialized towards the expression of certain speech acts; eg giving advice (*ought to*, *should*), making promises or threats (*will*), giving orders (*must*, *can*), etc (cf 4.49ff). In this respect, they give an utterance a force somewhat similar to that of a performative (cf 4.7) such as *I beg you . . .*, *I promise you . . .*, etc.

These characteristics of modals are also shared in various degrees by modal idioms, semi-auxiliaries, etc. For example, *had better* and *have got to* are more closely associated with speech acts such as giving advice and orders than is the semi-auxiliary *have to*, which is capable of undergoing variation of tense and aspect.

- 3.51 Adding points (a) and (b) together, we may go so far as to see in modals a tendency to develop into 'pragmatic particles'. This tendency is seen in its purest form in a construction such as *May you be happy!* (cf 3.60), where the

modal *may* is placed at the beginning of the sentence, and marks it as an expression of wish. On a similar footing, *let* (cf 11.26) in sentences such as *Let them come here* or *Let the world take notice* may be regarded as a pragmatic particle of imperative or optative mood. In other respects, however, *let* is totally unlike auxiliary verbs. In being followed by a pronoun in the objective case (*Let them . . .*, *Let us . . .*, etc) it assimilates to the pattern of complex transitive verbs. Clearly, in terms of its syntactic affinities, it is a main verb rather than an auxiliary.

Another example of a verb which is syntactically a main verb, although it behaves rather like a pragmatic particle, is the verb *want* when followed by *to* + infinitive in utterances such as:

- You *want to* be careful with that saw. [1]
I *want to* tell you how much we enjoyed last night. [2]

In [1], *You want to* expresses a warning or a piece of advice; in [2] *I want to* introduces an expression of wish, which, in effect, tones down a performative verb. This pragmatic device is particularly conventionalized in informal usage, where it is pronounced /'wɒnə/. (Especially in AmE, a nonstandard spelling *wanna* is also current.) What makes *want to* in [1] particularly similar to a pragmatic particle is the impossibility of obtaining an equivalent meaning when the sentence is changed into the past tense or into the progressive aspect:

- ?You *are wanting to* be careful with that saw. [3]
You *wanted to* be careful with that saw. [4]

Sentences [3] and [4] no longer have a particular advice-giving function, and have to be interpreted simply as statements about the wishes of the hearer.

Note [a] On the other hand, the negative of *want to can* (in informal use) have a specialized advice-giving function even when combined with the progressive of the following verb:

Come on: you *don't want to* keep them all waiting.
You *don't want to* be sitting around doing nothing.

[b] A better candidate than *let* for quasi-modal status, in informal English, is the 1st person imperative marker *let's* regarded simply as an unanalysed particle pronounced /lets/ (cf 11.26). Here the relation to a transitive construction is no longer evident, and there is an interesting resemblance to marginal modals in the ability of *let's* to form a negation either by the postposition of *not*, or by DO-support:

Let's not be late for the game.
Don't let's be late for the game. (esp BrE)

On *let's don't* (AmE), cf 11.28 (iv).

The particle-like status of *let's* is also supported by the existence, in familiar AmE, of the pleonastic variant *let's us . . .*, and of the construction *let's you . . .*, in which the addition of the 2nd person pronoun indicates that 's is no longer associated with *us*.

The structure of verb phrases

Finite verb phrases

- 3.52 We have seen that in one respect the structure of the verb phrase may be described in terms of auxiliaries and main verbs, the main verb normally being the sole verb in cases where the verb phrase consists of one verb only. In another way, the structure may be represented in terms of finite and nonfinite verb words. On this basis, a finite verb phrase is a verb phrase in which the first or only word is a finite verb, the rest of the verb phrase (if any) consisting of nonfinite verbs; on the other hand, a nonfinite verb phrase contains nonfinite verb forms only.

Using the description of finite and nonfinite verb forms in 3.2, we can now distinguish finite from nonfinite verb phrases as follows:

- (a) Finite verb phrases can occur as the verb phrase of independent clauses (cf 14.6ff).
(b) Finite verb phrases have tense contrast, *ie* the distinction between present and past tenses (cf 4.3ff, 4.11ff):

He *is* a journalist now.
He *worked* as a travel agent last summer.

- (c) There is person concord and number concord (cf 10.34ff) between the subject of a clause and the finite verb phrase. Concord is particularly clear with the present tense of BE:

I *am* } here. He/She/It *is* } here.
You *are* } We/They *are* }

But with most full verbs overt concord is restricted to a contrast between the 3rd person singular and other persons or plural number:

He/She/Jim *reads* } the paper every morning.
I/We/You/They *read* }

With modal auxiliaries there is no overt concord at all (cf 3.30):

I/You/She/We/They *can* play the cello.

- (d) Finite verb phrases contain, as their first or only word, a finite verb form (as described in 3.2) which may be either an operator (cf 3.21) or a simple present or past form. DO-support (cf 3.37) is used in forming (for example) negative and interrogative constructions.
(e) Finite verb phrases have mood, which indicates the factual, nonfactual, or counterfactual status of the predication. In contrast to the 'unmarked' INDICATIVE mood, we distinguish the 'marked' moods IMPERATIVE (used to express commands and other directive speech acts; cf 11.24ff), and SUBJUNCTIVE (used to express a wish, recommendation, etc; cf 3.58ff). Both the imperative and the present subjunctive consist of the base form of the verb:

Please *come* here and *attend* to me.

The Council requires that every member *attend* at least one meeting per year.

The five criteria listed above lead to inconsistency, in that subjunctive and imperative verb phrases are according to criteria (a) and (e) finite, whereas according to criterion (c) they are nonfinite. This inconsistency is not, however, disturbing, but reflects the fact that the finite/nonfinite distinction may be better represented as a scale of 'FINITENESS' ranging from the indicative (or 'most finite') mood, on the one hand, to the infinitive (or 'least finite') verb phrase, on the other. The imperative and subjunctive have in some respects more in common with the infinitive (a nonfinite form which like them consists of the base form, and typically expresses nonfactual meaning). There is, indeed, a tradition of regarding the infinitive as a mood of the verb. On this basis, the gradience of 'finiteness' may be represented as follows (the symbols '+', '-', etc referring to the satisfaction or nonsatisfaction of each of the criteria listed above):

	(a)	(b)	(c)	(d)	(e)	
INDICATIVE	+	+	+	+	+	} (Finite)
SUBJUNCTIVE	+	?	—	—	+	
IMPERATIVE	+	—	—	?	+	
<hr/>						
INFINITIVE	—	—	—	—	—	(Nonfinite)

Fig. 3.52 A scale of finiteness

On the query in column (b), see the discussion of the *were*-subjunctive in 3.62. The query in column (d) reflects uncertainty as to whether DO-support occurs in imperative constructions (cf 3.58 on the position of *not* in the subjunctive construction, and 11.30 Note [a] on *do* with the imperative).

For the sake of clarity, we will continue to make a clear-cut distinction between finite verbs (including those in the indicative, imperative, and subjunctive moods) and nonfinite verbs (including the infinitive).

A clause with a finite verb phrase as its V element is called a 'finite verb clause' or, more tersely, a 'finite clause'. Similarly, a clause with a nonfinite verb as its V element is called a 'nonfinite (verb) clause' (cf 14.5ff).

Note Verbs introduced by modal auxiliaries are normally classified as indicative, but it is worth pointing out that not only semantically, but syntactically, they resemble imperatives and subjunctives. They lack person and number contrast and also (to some extent) tense contrast. It follows from the lack of person and number contrast that they have no overt concord with the subject.

Nonfinite verb phrases

- 3.53 The infinitive ((*to*) *call*), the *-ing* participle (*calling*), and the *-ed* participle (*called*) are the nonfinite forms of the verb. Hence any phrase in which one of these verb forms is the first or only word (disregarding the infinitive marker *to*) is a nonfinite verb phrase. Such phrases do not normally occur as the verb phrase of an independent clause. Compare:

FINITE VERB PHRASES

He *smokes*.
Mary *is having* a smoke.
He *must smoke* 40 a day.
You *have been smoking* all day.

NONFINITE VERB PHRASES

To smoke like that must be dangerous.
I regret having started *to smoke*.
The cigars *smoked* here tend to be expensive.
That was the last cigarette *to have been smoked* by me.

Simple and complex verb phrases

- 3.54 The finite verb phrase is SIMPLE when it consists of only one word, which may be present, past (cf 3.2), imperative (cf 11.24), or subjunctive (cf 3.58):

He *works* hard. He *worked* hard. *Work* harder!
It is important that he *work* hard.

Except in the 3rd person singular, the present tense of all verbs apart from BE is realized by the base form of the verb: *I/you/they work hard*.

The verb phrase is COMPLEX when it consists of two or more words, as in:

John *has worked* hard. John *should be working* hard.
Don't let's upset her. They *may have been sold*.

There are four basic types of construction in a complex verb phrase:

Type A (MODAL) consists of a modal auxiliary + the base of a verb: *eg: must examine*.

Type B (PERFECTIVE) consists of the auxiliary HAVE + the *-ed* participle of a verb: *eg: has examined*. (Traditionally the term PERFECT has been frequently used instead of PERFECTIVE.)

Type C (PROGRESSIVE) consists of the auxiliary BE + the *-ing* participle of a verb: *eg: is examining*.

Type D (PASSIVE) consists of the auxiliary BE + the *-ed* participle of a verb: *eg: is examined*.

These four basic constructions also enter into combination with each other:

AB: *may have examined*
AC: *may be examining*
AD: *may be examined*
BC: *has been examining*
BD: *has been examined*
CD: *is being examined*
ABC: *may have been examining*
ABD: *may have been examined*
ACD: *may be being examined*
BCD: *has been being examined*
ABCD: *may have been being examined*

In these strings the different constructions are 'telescoped' into one another. This means that combinations of the basic types A, B, etc form structures in which the nonfinite verb of the first construction also functions as the

auxiliary of the second, and so forth. For example, ABD (*may have been examined*) has the following structure, where *have* is shared by A and B, and *been* is shared by B and D:

Fig. 3.54

Note *Beware* is used only in the imperative and in complex verb phrases with modal auxiliaries which have a quasi-imperative force:

Beware (of) the dog.

You must *beware* (of) what you say to her.

Simple and complex finite verb phrases

- 3.55 The order in which the four constructions can form combinations is indicated by the alphabetical symbols A, B, C, D, which label them. A cannot follow B, B cannot follow C or D, etc, but gaps are allowed: AC, AD, ACD, BD, etc. Figure 3.55 gives a graphic representation of how the finite indicative verb phrase (simple or complex) is built up in a left-to-right progression.

Fig. 3.55 The structure of the finite verb phrase

First comes the selection of the present or past tense of the finite verb, then the selection of none, one, two, three, or four of the complex phrase constructions as indicated by the direction of the arrows. On the whole, the more complex the verb phrase pattern is, the less commonly it occurs. Those complex phrases containing the combination CD (progressive + passive) are particularly uncommon (cf 3.73), but are undoubtedly acceptable as compared with sequences such as BCC (**have been being examining*) or CBD (**is having been examined*) which are not grammatical at all.

Note The rare ABCD pattern is illustrated in 2.28 Note.

Simple and complex nonfinite verb phrases

- 3.56 Unlike finite verb phrases, nonfinite verb phrases have no tense or mood distinctions (subject to the remarks on the gradience of finiteness in 3.52), and cannot occur in construction with a subject of a main clause. Contrast:

FINITE: He *was doing* it easily.

NONFINITE: *He *doing* it easily.

Since modal auxiliaries have no nonfinite forms (cf 3.30), they cannot occur in nonfinite verb phrases, and therefore the modal construction Type A is not available within such phrases. But the aspect and voice auxiliaries HAVE (Type B) and BE (Types C and D) suffer from no such restriction. If we relate the structure of the nonfinite verb phrase to that of the finite verb phrase, we can tabulate the eight possible combinations as in Table 3.56a:

Table 3.56a Nonfinite verb phrases

	INFINITIVES	PARTICIPLES
simple	<i>to examine</i>	<i>examining</i>
complex	B <i>to have examined</i>	<i>having examined</i>
	C <i>to be examining</i>	[<i>being</i>] <i>examining</i>
	D <i>to be examined</i>	[<i>being</i>] <i>examined</i>
	BC <i>to have been examining</i>	<i>having been examining</i>
	BD <i>to have been examined</i>	<i>having been examined</i>
	CD <i>to be being examined</i>	[<i>being</i>] <i>being examined</i>
	BCD <i>to have been being examined</i>	<i>having been being examined</i>
	<rare>	<rare>

Looking at the right-hand side of the Table, we may interpret the square brackets as follows. Whenever a phrase should theoretically begin with the auxiliary *being*, this participle is omitted. In this way, the -ed participle phrase *examined* is regarded as a special variant of the -ing participle phrase, viz the representative of the passive construction D. There does indeed occur a further construction *being examined*, but this is the one which combines progressive with passive meaning (CD), as in the contrast between:

the suspects *examined* by the police [not progressive]

the suspects *being examined* by the police [progressive]

(On progressive meaning in nonfinite phrases, cf 4.67.) Another result of the rule which omits the initial auxiliary *being* is that there are two types of nonfinite -ing participle phrase containing a main verb only (*examining*): one of these is progressive, and expresses the meaning characteristic of the progressive (cf 4.25), whereas the other is not. Contrast:

Smoking cigarettes is dangerous. [not progressive]

They caught him *smoking* cigarettes. [progressive: 'while he was smoking']

As with finite verb phrases, the combination CD is rare, and BCD is of marginal acceptability.

Note [a] The combination *being examining*, for phrase type C, is not quite impossible, as occasional examples such as the following have been attested in spontaneous conversation:

You can probably get an extension on the grounds of *being teaching*.

Being teaching here manages to draw particular attention to the progressive meaning 'on the grounds of being in the course of teaching', which the aspectually ambiguous *on the grounds of teaching* would fail to do.

[b] It may be helpful to illustrate various kinds of complex nonfinite verb phrase by means of the following sentences:

Table 3.56b

INFINITIVES	PARTICIPLES
We're glad <i>to have invited</i> you.	<i>Having invited</i> you, I expected you to come.
I'd like <i>to be working</i> .	<i>Being working</i> (cf Note [a])
I'd hate <i>to be questioned</i> about it.	When <i>questioned</i> , he denied everything.
I'm glad <i>to have been working</i> .	<i>Having been working</i> all day, I'm very tired.
He's said <i>to have been invited</i> .	<i>Having been invited</i> , he should have come.
I expected <i>to be being interviewed</i> then.	I saw her <i>being interviewed</i> .

Gradience between one and two verb phrases

3.57 In a single complex finite verb phrase, as already discussed, the order of constructions is limited to ABCD, and a similar restriction of nonfinite verb phrases to the order BCD has also been noted. If, however, a nonfinite verb phrase follows a finite one, as in certain types of verb complementation (cf 16.36ff), it is possible for the same construction to be repeated in each phrase:

We *had hoped* *to have finished* by then. [perfective + perfective]

I *am hoping* *to be seeing* her tomorrow. [progressive + progressive]

Moreover, it is possible for two constructions to occur outside their normal 'alphabetical' order so long as one construction occurs in a different verb phrase from the other:

I *was hoping* *to have finished* by then. (C + B)

Jackson *was believed* *to have been killed*. (D + BD)

In practice, however, most of the more complex possibilities, such as ABC + BCD, rarely if ever occur:

?They *must have been expecting* *to have been being paid* well.

The question arises as to what structures are possible when a semi-auxiliary or a catenative verb occurs in the string of verbs. For instance, should *will have to help* in *The children will have to help us* be analysed as one verb phrase, or as two? There is no clear answer to this question, since the gradient relating auxiliary to main verb functions implies a comparable gradient between a single verb phrase analysis and a multiple verb phrase analysis.

With semi-auxiliaries it is possible to repeat the same construction in such examples as:

Sarah and I *are going to be leaving* tonight. [1]

The walls *were supposed to be repainted*. [2]

But (as noted in 3.47) *are going to* in [1] is not truly progressive, and *were supposed to* in [2] is not truly passive, because these constructions do not contrast (in the relevant sense) with a nonprogressive and an active construction respectively. In other cases where the same construction is repeated, the meaning of the construction does not require this repetition:

If you'd done that, we *would have had to have arrested* you. [3]

Such verb sequences as *would have had to have arrested*, with its vacuous repetition of the past time meaning of the perfective construction, are not uncommon, but are felt to be 'illogical' or pleonastic, because their meaning is no different from that of the same sequence without the repetition: ... *we would have had to arrest you*. The occurrence of such constructions, however, may be a mark of the intermediate status of semi-auxiliaries, which allow some syntactic duplication of constructions, but do not appear to allow for semantic duplications. It is reasonable to suggest that in [3] *would have had to have arrested* consists syntactically of two verb phrases *would have had* and *to have arrested*, but semantically of only one.

The subjunctive mood

3.58 The subjunctive in modern English is generally an optional and stylistically somewhat marked variant of other constructions, but it is not so unimportant as is sometimes suggested. There are two forms of the subjunctive, traditionally called the present and past subjunctive, although the use of these forms relates more to mood than to tense.

Terms for the two major categories of the present subjunctive are the MANDATIVE and the FORMULAIC subjunctive (cf 3.59f). These are realized, like the imperative, by the base form of the verb. Consequently, where the clause has a plural subject, there is normally no difference between the indicative and subjunctive forms. Except with BE, where the subjunctive form *be* is distinct from the indicative forms *am*, *is*, and *are*, the subjunctive is distinctive only in the third person singular:

I insist that we *reconsider* the Council's decisions. [indicative or subjunctive] [1]

I insist that the Council *reconsider* its decisions. [subjunctive] [2]

I insist that the Council's decision(s) *be* reconsidered. [subjunctive] [3]

The past subjunctive is conveniently called the WERE-SUBJUNCTIVE, since it survives as a distinguishable form only in the past tense of the verb BE.

Whereas the indicative form shows a contrast between *was* (1st and 3rd person singular) and *were* (plural and 2nd person singular), the subjunctive is invariably *were*, and hence is a form distinct from the indicative only in the 1st and 3rd persons singular:

If I/he/she *was* leaving, you would have heard about it. [indicative]

If I/he/she *were* leaving, you would have heard about it. [subjunctive]

Like the imperative verb phrase (cf 11.24ff), the subjunctive verb phrase allows few morphological or syntactic variations. As [3] above shows, a passive subjunctive is a possibility for the mandative subjunctive, as well as for the formulaic and *were*-subjunctive:

God *be praised*! <restricted use>

It would be odd if she *were awarded* the first prize.

With all verbs except BE, the verb phrase is made negative by placing *not* before the subjunctive form. In the case of *be*, *not* may be placed either before or after the verb, whereas with *were* it follows it:

It is essential that this mission *not fail*. [4]
[Contrast the indicative variant '... *does not fail* ...'; cf 16.72.]

The Senate has decreed that such students $\left\{ \begin{array}{l} \textit{be not} \\ \textit{not be} \end{array} \right\}$ exempted from college dues.

If I $\left\{ \begin{array}{l} \textit{weren't} \\ \textit{were not} \end{array} \right\}$ your best friend, you would regret that remark.

Uses of the subjunctive

The mandative subjunctive

- 3.59 This, the most common use of the subjunctive, occurs in subordinate *that*-clauses, and consists of the base form of the verb only. Thus there is a lack of the regular concord of the indicative mood between subject and finite verb, and there is no backshifting of tense (cf 14.33f); *ie* the present and past variants are formally indistinguishable:

The committee $\left\{ \begin{array}{l} \textit{proposes} \\ \textit{proposed} \end{array} \right\}$ (that) Mr Day *be* elected.

I demand(ed) that the committee *reconsider* its decision.

His sole requirement *is/was* that the system *work*.

The mandative subjunctive is productive in that it can be used with any verb in a *that*-clause when the superordinate clause satisfies the requisite semantic condition, *viz* that the *that*-clause be introduced by an expression of demand, recommendation, proposal, resolution, intention, etc. This expression takes the form of a verb, an adjective, or a noun:

$\left. \begin{array}{l} \textit{They recommend} \\ \textit{It is appropriate} \\ \textit{We were faced with the demand} \end{array} \right\}$ that this tax *be* abolished.

The following are among those expressions which commonly introduce a *that*-clause containing the mandative subjunctive:

VERBS: *decide, insist, move, order, prefer, request*

ADJECTIVES: *advisable, desirable, fitting, imperative*

NOUNS: *decision, decree, order, requirement, resolution*

Fuller lists of examples are given in 16.32, 16.72.

The mandative subjunctive is more characteristic of AmE than of BrE, where it is formal and rather legalistic in style. There are indications, however, that it is reestablishing itself in BrE, probably as a result of AmE influence. In 16.32 we present the patterns of preference in BrE and in AmE regarding the choice between the mandative subjunctive, putative *should*, and the indicative, in sentences such as:

The employees have demanded that the manager

$\left\{ \begin{array}{l} \textit{resign.} \\ \textit{should resign.} \\ \textit{resigns.} \end{array} \right\}$ <esp AmE>
<esp BrE>

Note [a] As example [2] suggests, the absence of DO-support, as well as the absence of an -s inflection, is a criterion distinguishing the present subjunctive from the present indicative:

$\left\{ \begin{array}{l} \textit{Our decision is that the school remain closed. [subjunctive]} \\ \textit{Our decision is that the school remains closed. [indicative]} \\ \textit{They insisted that we not eat meat. [subjunctive]} \\ \textit{They insisted that we do not eat meat. [indicative]} \end{array} \right\}$ [1]
[1a]
[2]
[2a]

Thus the subjunctive can be marked as distinct from the indicative with either a singular subject, as in [1], or a plural subject, as in [2]. This makes it reasonable to say that where the base form can be analysed either as an indicative or as a subjunctive, there is a neutralization of the two moods:

Our decision is that the schools *remain* closed. [1b]

Such a view cannot be entertained, however, with the *were*-subjunctive (cf 3.62).

[b] The use of the subjunctive after *insist* depends on meaning. When this verb introduces an indirect statement, the indicative is used, but when it introduces an indirect directive, the subjunctive is more likely:

She *insists* that he *is* guilty of fraud. [3]

We *insist* that he *be* admitted to hospital immediately. [4]

[c] In addition to *should* and the indicative, there are other alternatives to the mandative subjunctive, notably (with some verbs) the object with infinitive construction (cf 16.63):

$\left\{ \begin{array}{l} \textit{We ask that the Government be circumspect.} \\ \textit{We ask the Government to be circumspect.} \end{array} \right\}$ [5]

[6]

[d] There is a tendency in BrE to choose the subjunctive more especially when the finite verb is BE (eg in the passive voice), as in [4] and [5] above.

The formulaic subjunctive

- 3.60 Like the mandative subjunctive, the FORMULAIC SUBJUNCTIVE consists of the base form of the verb. It is used in certain set expressions chiefly in independent clauses:

Come what may, we will go ahead with our plan.

God *save* the Queen! ['May God save the Queen']

Suffice it to say that we won. ['Let it suffice ...']

Heaven *forbid* that I should let my own parents suffer.

Be it noted that this offer was made in good faith. <formal, rather archaic>

Be that as it may, we have nothing to lose.

The force which the subjunctive conveys here, that of an expression of will, may also be conveyed by *let* or *may* (cf 3.51). The formulaic subjunctive tends to be formal and rather old-fashioned in style.

Other uses of the present subjunctive

- 3.61 Other contexts in which the present subjunctive can be used in subordinate clauses are noted in relevant sections of Chapters 14 and 15. They include:

- (a) Clauses of condition and concession (cf 14.24):

(*Even*) if that *be* the official view, it cannot be accepted. <formal>

- (b) Clauses of condition or negative purpose introduced by *lest* or *for fear that* (cf 15.48):

The President must reject this proposal, *lest* it cause strife and violence. <formal>

This *lest* construction is restricted to very formal usage in BrE, but is more current in AmE.

The *were*-subjunctive

- 3.62 The *were*-subjunctive (or past subjunctive) is hypothetical or unreal in meaning, being used in adverbial clauses introduced by such conjunctions as *if*, *as if*, *as though*, *though*, and in nominal clauses after verbs like *wish* and *suppose* (cf 14.24, 16.33). This subjunctive is limited to the one form *were*, and thus breaks the concord rule of the indicative verb *BE* in the 1st and 3rd person singular of the past tense. The indicative form *was* is substituted in less formal style:

If I were/was rich, I would buy you anything you wanted.

Tim always speaks quietly on the phone, *as though he were/was* telling a secret.

I *wish the journey were/was* over.

Just *suppose everyone were/was* to give up smoking and drinking.

The *were*-subjunctive may be regarded as a fossilized inflection: it is nowadays a less usual alternative to the hypothetical past indicative (cf 4.16). Examples of hypothetical *were* with a 2nd person or plural subject (*eg: you were ... , they were ...*) are therefore to be viewed as indicative, rather than as a neutralization of indicative and subjunctive.

Note [a] In the fixed phrase *as it were* ['so to speak'], however, *were* cannot be replaced by *was*; it is also normal in standard English to use *were* in the fixed phrase *If I were you*.

[b] As it is commonly supposed that the *were*-subjunctive always refers to circumstances contrary to fact, it is worth noting the occasional occurrence of a hypercorrect 'pseudo-subjunctive' *were* in contexts where the past time meaning of *was* seems to give the required interpretation:

The pilot appeared to deviate from his flight path to minimize the danger to people living in the town; but if this *were* his intention, he failed to communicate it to the control tower.

A similar anomalous use of *were* occasionally occurs in indirect questions:

It was difficult to tell whether the language *were* Semitic or Indo-European.

Active and passive voice

- 3.63 The term **VOICE** is used to describe the last major verb category to be considered in this chapter: that which distinguishes an active verb phrase (*eg: ate*) from a passive one (*eg: was eaten*). We have left this topic to the end of the chapter for two reasons: first, the passive construction, when it occurs, appears in final position in the verb phrase (cf Type D, 3.55), and second, voice is a category which, as we saw in 2.21, concerns not only verb phrases, but other constituents in the clause, and therefore points to connections between this chapter and sections in later chapters (esp 16.26ff, 18.32) where the contrast between active and passive must be reconsidered in a larger context.

Voice defined

- 3.64 Voice is a grammatical category which makes it possible to view the action of a sentence in either of two ways, without change in the facts reported:

The butler *murdered* the detective. [ACTIVE] [1]
 ~ The detective *was murdered* by the butler. [PASSIVE] [2]

As we see from [1] and [2], the active-passive relation involves two grammatical levels: the verb phrase, and the clause. In the former, a passive verb phrase (*ie* one containing a construction of Type D) contrasts with an active verb phrase, which is simply defined as one which does not contain that construction. For example:

Table 3.64

	ACTIVE	PASSIVE
present:	<i>kisses</i>	~ <i>is kissed</i>
past:	<i>kissed</i>	~ <i>was kissed</i>
modal:	<i>may kiss</i>	~ <i>may be kissed</i>
perfective:	<i>has kissed</i>	~ <i>has been kissed</i>
progressive:	<i>is kissing</i>	~ <i>is being kissed</i>
modal + perfective:	<i>may have kissed</i>	~ <i>may have been kissed</i>
modal + progressive:	<i>may be kissing</i>	~ <i>may be being kissed</i>
perfective + progressive:	<i>has been kissing</i>	~ <i>has been being kissed</i>
modal + perfective + progressive:	<i>may have been kissing</i>	~ <i>may have been being kissed</i>

In the verb phrase, the difference between the two voice categories is that the passive adds a form of the auxiliary *BE* followed by the past participle (*-ed* participle) of the main verb.

The active-passive correspondence

- 3.65 In addition, at the clause level, changing from the active to the passive involves rearrangement of two clause elements, and one addition (cf 2.21). (a) The active subject becomes the passive AGENT; (b) the active object becomes the passive subject; and (c) the preposition *by* is introduced before the agent. The prepositional phrase (AGENT *BY*-PHRASE) of passive sentences

is generally an optional element (but *cf* 3.71). The active-passive correspondence for a monotransitive verb (*cf* 2.16) with an object (typically a noun phrase) can be seen diagrammatically as in *Fig. 3.65*:

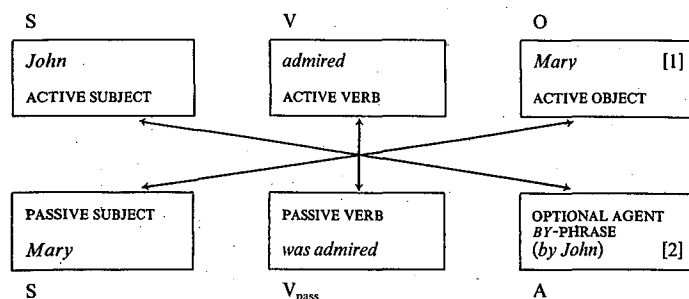

Fig. 3.65 The active-passive correspondence

Alternatively, the active-passive correspondence can be expressed by this formula:

noun phrase₁ + active verb phrase + noun phrase₂
 ~ noun phrase₂ + passive verb phrase + (*by* noun phrase₁)

The terms 'subject' and 'object' in *Fig. 3.65* are used here, as in 2.13 and 10.7, to refer to elements with a particular structural function in the clause: *eg* the subject has concord with the verb phrase, and contains a subjective rather than objective case pronoun. Thus certain changes apart from those represented in [1] and [2] may have to take place in changing a sentence from active to passive (*cf* 3.70):

The men *respect* her. [3]
 ~ *She is* respected by the men. [4]

But although the corresponding active and passive sentences appear to be radically different, the relations of meaning between their elements remain the same: for example, [1] has the same truth value as [2], and [3] has the same truth value as [4]. In *John helped Mary* and *Mary was helped by John*, *John* is in both cases the 'performer of the action', even though structurally, *John* has a very different position and function in each.

Note [a] Corresponding active and passive sentences do not, however, always have the same truth value (*cf* 3.72).

[b] We distinguish terminologically the agent, as defined above (and in grammatical tradition), from the agentive, which is a semantic role (*cf* 10.19) often assumed by the subject of an active sentence or by the agent of a passive sentence (*cf* 9.50).

The passive auxiliaries: *be* and *get*

3.66 The passive auxiliary is normally *be*. Its only serious contender is *get*, which however is not, by most syntactic criteria, an auxiliary at all (*cf* 3.22ff).

Moreover, *get* tends to be limited to constructions without an expressed animate agent:

The cat *got run over* (by a bus). James *got beaten* last night.

Get with an animate agent is not, however, unknown:

James *got caught* (by the police).

The *get*-passive is avoided in formal style, and even in informal English it is far less frequent than the *be*-passive. Further examples are:

The house is *getting rebuilt*. [1]
 Such criticisms will *get treated* with the contempt they deserve. [2]
 This story eventually *got translated* into English. [3]

Get is much more common as a 'resulting copula' (*cf* 16.21ff) in sentences like *My mother is getting old*, and it may be best analysed as such in sentences which look superficially like passives, but which could not be expanded by an agent (*cf* 3.77):

We are *getting bogged down* in all sorts of problems. <informal> [4]
 I have to *get dressed* before eight o'clock. [= 'dress'] [5]
 I don't want to *get mixed up* with the police again. <informal> [6]
 Your argument *gets a bit confused* here. [7]

Similarly *get bored*, *get tired*, *get (very) excited*, *get lost*, etc. *Get* is a dynamic conclusive verb (*cf* 4.33ff), and the participles in these sentences are stative (*eg*: *dressed* means 'in a state of wearing clothes', as in *Jane is already dressed*). Hence the meaning of such sentences is predictable if they are regarded as *SVC* sentences with *get* as main verb and the participle (with its modifiers if any) as complement, as suggested by this exchange:

A: I [S] 'm [V] completely confused [C].
 B: Yes, I [S] 'm getting [V] confused [C], as well [A].

It is important, therefore, to draw a distinction between the passive sentences [1–3] and the copular sentences [4–7], which we may call *PSEUDO-PASSIVE* (*cf* 3.77). At the same time, there is an affinity between these sentence types, and this is evident when we consider the meaning of the *get*-passive, which, like the copular *get*, puts the emphasis on the subject rather than the agent, and on what happens to the subject as a result of the event. Compare *He got taught a lesson* ['it served him right'] with:

He { *was* / *?got* } *taught* a lesson on the subjunctive (by our new teacher).

It is presumably because of the emphasis which *get* places on the subject referent's condition (usually an unfavourable condition) that the agent is less usual with a *get*-passive. This same emphasis may account in part for the fact that the *get*-passive often reflects an unfavourable attitude towards the action:

How did that window *get opened*?

typically implies 'It should have been left shut!'

Note [a] The *ger*-passive provides a convenient way of avoiding the passive with *be* in cases where there is a potential confusion between the normal passive interpretation and that of the 'statal passive' (cf 3.77). Thus the ambiguity between stative and dynamic meaning in *The chair was broken* is eliminated in *The chair got broken*.

[b] The idiomatic expression *get started* is anomalous, in that *start* cannot be treated as a transitive verb in this context:

How soon can we *get started* on the swimming pool?

This idiom appears to be closely related to the causative use of *get*, eg in:

How soon can we *get* $\left\{ \begin{array}{l} \text{work} \\ \text{ourselves} \end{array} \right\}$ started on the pool? (cf 16.54)

Compare a similar pseudo-passive construction with *be* (cf 3.77 Note [a]).

[c] Apart from *get*, verbs in pseudo-passive sentences include *become*, *grow*, and *seem* (cf 16.21, 16.23).

Voice constraints

- 3.67 Although it is a general rule that transitive verb sentences can be either active or passive, there are a number of exceptions where the active (transitive) and passive sentences are not in systematic correspondence. We will distinguish five kinds of 'voice constraint' associated respectively with the verb (3.68f), the object (3.70), the agent (3.71), meaning (3.72), and frequency of use (3.73).

Verb constraints

- 3.68 (a) ACTIVE ONLY

There are greater restrictions on verbs occurring in the passive than on verbs occurring in the active. In addition to copular and intransitive verbs, which having no object cannot take the passive, some transitive verbs, called 'middle' verbs, do not occur at least in some senses in the passive (cf 10.14); for example:

They *have* a nice house.

He *lacks* confidence.

The auditorium *holds* 5000 people.

The dress *becomes* her.

John *resembles* his father.

Will this *suit* you?

All these belong to the stative class of verbs of 'being' and 'having' (cf 4.31). But other stative verbs, such as those of volition or attitude, can easily occur in the passive. Contrast:

The coat does not fit you. ~ *You are not fitted by the coat.

The police want him. ~ He is wanted by the police.

- (b) PASSIVE ONLY

Conversely, with some verbs and verb constructions only the passive is possible (cf 16.50):

John was $\left\{ \begin{array}{l} \text{said} \\ \text{reputed} \end{array} \right\}$ to be a good teacher.

~ *They $\left\{ \begin{array}{l} \text{said} \\ \text{reputed} \end{array} \right\}$ him to be a good teacher.

Other examples are *be born* (with an irregular past participle), and *be drowned* (in cases where no agent is implied):

He was born in Tübingen. ~ ?His mother bore him in Tübingen.

The wanted man fell into the water and was drowned. ~ ... and someone drowned him.

Prepositional verbs

- 3.69 In English, prepositional verbs (cf 16.5ff) can often occur in the passive, but not so freely as in the active. These prepositional verbs are verbal idioms consisting of a lexical verb followed by a preposition, such as *look at*. Compare the following sentences, in which [1a] and [2a] contain prepositional verbs, whereas [1b] and [2b] contain the same words in nonidiomatic use:

The engineers *went* very carefully *into* $\left\{ \begin{array}{l} \text{the problem.} \\ \text{the tunnel.} \end{array} \right\}$ [1a] [1b]

~ $\left\{ \begin{array}{l} \text{The problem} \\ \text{?*The tunnel} \end{array} \right\}$ was very carefully *gone into* by the engineers.

They eventually *arrived at* $\left\{ \begin{array}{l} \text{the expected result.} \\ \text{the splendid stadium.} \end{array} \right\}$ [2a] [2b]

~ $\left\{ \begin{array}{l} \text{The expected result} \\ \text{?*The splendid stadium} \end{array} \right\}$ was eventually *arrived at*.

In these sentences it is clear that the difference in acceptability can be stated in terms of concrete/abstract passive subjects. It is only in the abstract, figurative use that *go into*, *arrive at*, *look into*, and many other expressions accept the passive.

With some ingenuity, however, one may construct contexts where such verbal expressions will occur in the passive even where they are not used abstractly and idiomatically, especially in a coordinate construction:

This private drawer of mine has been *gone into* and rummaged so many times that it is totally disarranged.

Thus the distinction between prepositional verbs and nonidiomatic combinations of verb and preposition does not entirely determine the possibility of a passive. Rather, there is a scale of 'cohesion' between verb and preposition, which will be analysed later, in 16.12ff, when we come to examine prepositional verbs in more detail.

Object constraints

- 3.70 Transitive verbs can be followed either by phrasal or by clausal objects (cf 15.3ff, 16.30ff). With clauses as objects, however, the passive transformation is to a greater or lesser degree restricted in use:

- (A) Noun phrase as object:

John loved *Mary*. ~ *Mary* was loved (by John).

- (B) Clause as object:

- (i) Finite clause:

John thought (*that*) *she was attractive*.

~ ?**That she was attractive* was thought (by John).

- (ii) Nonfinite clause:

- (a) infinitive:

John hoped *to meet her*. ~ **To meet her* was hoped (by John).

(b) participle:

John enjoyed *seeing her*.

~ *? *Seeing her* was enjoyed (by John).

The passive often becomes acceptable, however, particularly when the object is a finite clause, if the clausal object is extraposed and replaced by the anticipatory pronoun *it* (cf 16.34, 16.72f, 16.83, 18.33):

It was thought that *she was attractive*.

?*It* was hoped to *meet her*.

or if the subject of the object clause is made the subject of a passive superordinate clause (cf 16.50f, 18.36), as in:

She was thought to *be attractive*.

The construction with anticipatory *it* never occurs with participle clauses as subject, and is only sometimes acceptable with infinitive clauses (cf 16.38):

It was desired to *have the report delivered here*.

(Even then, the acceptability of this construction may be criticized on grounds of style.)

Coreference between a subject and a noun phrase object blocks the passive correspondence. This constraint occurs with (a) reflexive pronouns, (b) reciprocal pronouns, and (c) possessive pronouns when coreferential to the subject:

(a) John could see { Paul
himself } in the mirror.

~ { Paul
*Himself } could be seen in the mirror.

(b) We could hardly see *each other* in the fog.

~ **Each other* could hardly be seen in the fog.

(c) The woman shook { my hand.
her head.

~ { My hand
?*Her head } was shaken by the woman.

Note [a] The passive of the sentence with a reciprocal pronoun can be made acceptable if the pronoun is split into two parts as follows:

Each could hardly be seen by the other. (cf 6.31)

[b] Since reflexive and reciprocal pronouns are objective case replacements, we would in any case not expect them to take subject position in a passive sentence, or for that matter in any other sentence (cf 3.65).

[c] The passive is not possible for many idioms in which the verb and the object form a close unit:

The ship set sail. ~ *Sail was set.

We changed buses. ~ *Buses were changed.

Agent constraints

3.71 Unlike the active subject, the agent *by*-phrase is generally optional. In fact approximately four out of five English passive sentences have no expressed

agent. This omission occurs especially when the agent is irrelevant or unknown, as in:

The Prime Minister has often *been criticized* recently.

or where the agent is left out as redundant:

Jack fought Michael last night, and Jack *was beaten*.

An agent phrase *by Michael* would clearly not be necessary or even fully acceptable in this context.

Since the agent phrase is usually left unexpressed, the identity of the agent may be irrecoverable, and it may be impossible to postulate a unique active clause corresponding to the passive one:

Order *had been restored* without bloodshed.

~ { Colonel Laval (?)
The administration (?) } *had restored* order without bloodshed.
The army (?)

Note In some sentences, the agent is not optional; eg:

{ The music *was followed* by a short interval. [1]

*The music *was followed*. [2]

{ The rebels *were actuated* by both religious and political motives. [3]

*The rebels *were actuated*. [4]

However, the nonoccurrence of the agentless sentences [2] and [4] may be due not so much to grammatical or lexical restriction, as to the fact that without the agent, the sentence becomes informationally vacuous. (In this connection, [2] may be contrasted with *We're being followed*.)

Meaning constraints

3.72 We cannot assume that matching active and passive sentences always have the same propositional meaning. The difference of order brought about by changing an active sentence into the passive or vice versa may well make a difference not only in emphasis (cf 18.3ff, 18.11ff), but also to the scope of negatives and quantifiers (cf 2.54f):

Every schoolboy *knows* one joke at least. [1]

~ One joke at least *is known* by every schoolboy. [2]

The most likely interpretation of [1] is quite different from the most likely interpretation of [2]: whereas [1] favours the reading 'Each schoolboy knows at least some joke or other', [2] favours the reading 'There is one particular joke which is known to every schoolboy'.

Moreover, a shift of modal meaning may accompany a shift of voice in verb phrases containing modal auxiliaries (cf 4.52):

John cannot do it.

~ It cannot be done (by John).

In the active, *can* here will normally be interpreted as expressing ability, whereas in the passive it is interpreted as expressing possibility. Even when it might be argued that *can* retains the same meaning of ability in both active and passive, a shift of meaning is detectable:

John can't be taught. ['It's impossible to teach him'] OR 'He is unable to learn']

~ She can't teach John. ['She is unable to teach John']

Examples with other modal auxiliaries are:

- | | |
|---|--|
| { | Every one of them must be reprimanded. |
| | ['Every one of them is to blame'] |
| | ~ You must reprimand every one of them. |
| | ['It's your duty to do so'] |
| { | Why wouldn't Miranda ride the grey mare? |
| | ['Why did Miranda refuse?'] |
| | ~ Why wouldn't the grey mare be ridden by Miranda? |
| | ['Why did the mare refuse?'] |

Note [a] The shift from active to passive may change the meaning not only of a modal construction, but also of the perfective aspect:

Winston Churchill has twice visited Harvard. [3]

Harvard has twice been visited by Winston Churchill. [4]

It has been claimed that the active sentence [3] can only be appropriately used in the lifetime of Churchill, since the subject of the sentence determines the interpretability of the perfective in terms of a period of time leading up to the present (cf 4.20). The passive sentence [4], according to this claim, could appropriately be said now, after Churchill's death, since Harvard University is still in existence. However, speakers have differing intuitions on this matter.

[b] Some difference between the meaning of an active sentence and its passive counterpart has also been noted in examples such as [5] and [6], where both subject and object of the active sentence are generic (cf 5.52ff):

Beavers build dams. ~ ?Dams are built by beavers. [5]

Excessive drinking causes high blood pressure. ~ ?High blood pressure is caused by excessive drinking. [6]

This difference, which is a difference of preferred interpretation only, arises from the fact that in subject position, a generic phrase tends to be interpreted universally, while in object or agent position, this universal meaning disappears. Thus the subject *beavers* in [5] is likely to mean approximately 'all beavers', while *dams* is likely to have a similarly generic meaning in the passive counterpart.

Frequency constraints

3.73 To the structural and semantic restrictions mentioned in the preceding sections, we may add 'frequency constraints'. There is a notable difference in the frequency with which the active and passive voices are used. The active is generally by far the more common, but there is considerable variation among individual text types. The passive has been found to be as much as ten times as frequent in one text as in another. The major stylistic factor determining frequency seems to be related to the distinction between informative and imaginative prose, rather than to a difference between spoken and written English. The passive is generally more commonly used in informative than in imaginative writing, and is notably more frequent in the objective, impersonal style of scientific articles and news reporting.

As might be expected, the passive becomes very much rarer in combinations with other complex verb constructions (eg Types AD, BD, CD, ACD in 3.54). This rarity is extreme in the combinations BCD or ABCD ('perfective progressive passive' and 'modal perfective progressive passive'), perhaps in part because of an avoidance of the awkwardness of the *be being* sequence:

The Conservatives *won* the election. [1]

~ The election *was won* by the Conservatives. [2]

But:

The Conservatives *have not been winning* seats lately. [3]

~ (?)Seats *have not been being won* by the Conservatives lately. [4]

<rare>

As the passive paraphrase of [3], [4] offers no particular difficulties of interpretation. But it is likely to be replaced in actual use by the simpler construction *Seats have not been won by the Conservatives lately*, from which it differs little in meaning (cf 4.38, 4.40 Note [a]).

The passive gradient

3.74 The purely formal definition of the passive, viz that the clause contains the construction *be* (or *get*) + *-ed* participle, is very broad, and would include, for example, all the following sentences:

This violin *was made* by my father. [1]

This conclusion *is hardly justified* by the results. [2]

Coal *has been replaced* by oil. [3]

This difficulty *can be avoided* in several ways. [4]

We *are encouraged* to go on with the project. [5]

Leonard *was interested* in linguistics. [6]

The building *is already demolished*. [7]

The modern world *is getting* ['becoming'] *more highly industrialized and mechanized*. [8]

But taking account of the verb's function and meaning, we prefer to consider only those above the broken line as passive. Those below the line, [5–8], do not have a clear correspondence with an active verb phrase or active clause, and are increasingly remote from the 'ideal' passive of [1], which can be placed in direct correspondence with a unique active counterpart. The variety of relationships displayed by [1–8] may well be regarded as points on a gradient or scale running from [1] to a sentence such as [9], which is clearly to be analysed as having an adjectival complement following a copular verb:

My uncle { *was*
 got
 seemed } (very) tired. [9]

The possibility of inserting *very* confirms the adjectival status of *tired*.

Central passives

3.75 Examples [1–4] can be called 'central' or 'true' passives. Sentences [1] and [2] have a direct active-passive relation. The difference between the two is that the former has a personal, and the latter a nonpersonal agent (cf 9.50):

~ My father *made* this violin. [1a]

~ The results *hardly justify* this conclusion. [2a]

Sentence [3] brings some unclarity about the nature of the active counterpart. There are two possible active counterparts, depending on the interpretation of the *by*-phrase:

- ~ Oil has replaced coal. [3a']
 ~ (People in many countries) have replaced coal by oil. [3a'']

(The supplied active subject, here and below, is given in parentheses.)

In the former case, the *by*-phrase has been interpreted as an agent phrase corresponding to the active subject, but in the latter case, the *by*-phrase has been given an instrumental interpretation (*by* = *with*). Similarly ambiguous expressions are *be confronted by/with* and *be impressed by/with*.

Sentence [4] exemplifies the most common type of passive, that which has no expressed agent ('agentless passive'), and so leaves the subject of the active counterpart undetermined.

Semi-passives

- 3.76 Sentences [5] and [6] represent a 'mixed' or semi-passive class whose members have both verbal and adjectival properties (*cf* 7.15ff). They are verb-like in having active analogues:

- { We are encouraged to go on with the project. [5]
 { ~ (The results) encourage us to go on with the project. [5a]
 { Leonard was interested in linguistics. [6]
 { ~ Linguistics interested Leonard. [6a]

On the other hand, their adjectival properties include the possibility of:

- (a) coordinating the participle with an adjective;
 (b) modifying the participle with *quite*, *rather*, *more*, etc;
 (c) replacing *be* by a lexical copular verb such as *feel* or *seem*:

We *feel* rather encouraged and content . . .

Leonard *seemed* very interested in and keen on linguistics.

To these we may add the fact that [5] and [6] are stative rather than dynamic. This in itself does not exclude a passive analysis, for there are stative passives as well as dynamic passives, as is already illustrated by [2]: *This conclusion is hardly justified by the results*. It does, however, tilt the scales in favour of an adjectival analysis, since all participial adjectives have a stative meaning, whereas corresponding verbs usually do not.

In such adjectival uses of the past participle, it is rare to have a *by*-phrase expressing the agent, but blends such as the following do occur:

I feel rather let down *by his indifference*.
 She seems extremely elated *by her success*.

Even *-ed* adjectives which have no corresponding active infinitive or finite verb forms may occasionally have agent *by*-phrases:

We were *unimpressed* by his attempts.
 ~ { *His attempts *unimpressed* us.
 { His attempts did not impress us.

Evidently the ability to take an agent *by*-phrase cannot be regarded as diagnostic of the passive construction. (If further confirmation is needed, it will be found in noun phrases where the agent *by*-phrase occurs as postmodifier: *poems by Wordsworth*.)

There are, in fact, several prepositions which can introduce agent-like phrases; notably *about*, *at*, *over*, *to*, and *with* (*cf* 9.49ff, 16.69):

- We were all worried *about the complication*. [10]
 ~ The complication worried us all. [10a]
 I was a bit surprised *at her behaviour*. [11]
 ~ Her behaviour surprised me a bit. [11a]
 You won't be bothered *with me* any more. [12]
 ~ I won't bother you any more. [12a]
 This edition was not known *to earlier scholars*. [13]
 ~ Earlier scholars did not know (of) this edition. [13a]

But just as a *by*-phrase (as noted in 3.75) may cooccur, in an instrumental function, with an active subject, so these agent-like phrases may sometimes cooccur with an active subject, and so be interpreted ambiguously when in the passive:

Leonard was interested *in linguistics*.
 ~ (Someone) interested Leonard *in linguistics*.

There is thus no strong reason to treat such prepositional phrases, whether introduced by *by* or some other preposition, as diagnostic of the passive voice.

Note [a] Semi-passive constructions such as those of [10–13] can have a clause as complementation (*cf* 16.71):

I was surprised *that the food was so good*. [14]

In such cases, the clausal complementation can also be seen as analogous to an agent; *cf*:

~ *That the food was so good* surprised me. [14a]

[b] *Be known (to)* differs from other examples of the semi-passive in lacking the causative feature of *be worried (about)*, *be surprised (at)*, etc, and in not taking modifiers like *quite* and *rather*:

I was rather surprised at her methods.

but:

*Her methods are rather known to me.

(On the other hand, the *be known (to)* construction can be intensified by *well*; but the sequence *well known* can be hyphenated, and is perhaps a compound here.)

Pseudo-passives

- 3.77 Finally, [7] and [8] have neither an active transform nor a possibility of agent addition:

- The building is already demolished. [7]
 The modern world is getting more highly industrialized and mechanized. [8]

Such examples may be called 'pseudo-passives', since it is chiefly only their superficial form of verb + *-ed* participle that recommends them for consideration as passives. In terms of meaning, the active sentence corresponding to [7] is not [7a'], but [7a'']:

- ?*(Someone) already demolishes the building. [7a']
 (Someone) has already demolished the building. [7a'']

That is, *is demolished* denotes a resultant state: it refers, like the perfective, to a state resulting from the demolition, rather than to the act of demolition itself. Such a construction has been termed a 'statal passive'. In this connection, we note that an ambiguity is evident particularly in the past tense:

In 1972, the Democrats were defeated.

On the dynamic (central passive) reading, this means 'Someone defeated the Democrats'; on the statal (copular) reading, it means 'The Democrats were in a state of having been defeated'. The first reading can be singled out by adding the agent phrase:

In 1972, the Democrats were defeated by the Republicans.

The first (passive) reading can also be picked out if we change the verb to the progressive aspect:

In 1972, the Democrats were being defeated.

Neither of these tests apply to the statal passive construction because it is essentially copular, the verb *be* in this case being the copula rather than the passive auxiliary.

Similarly, the participles in [8] have adjectival values: compare *industrialized* with *industrial* and *mechanized* with *mechanical*, and note that these *-ed* words can be used adjectivally in phrases like *the industrialized world*. Moreover, no 'performer' can be conceived of: an *industrialized world* is simply a world that has reached a state of industrialization. Once we come to examples like this, we are firmly in the territory of *be* as a copula replaceable by other copular verbs such as *become*, *feel*, *seem*, *remain*, etc.: *She became enraged, I felt cheated*, etc. Here the *-ed* word is a complement, and therefore adjectival.

- Note [a] There is a pseudo-passive construction with intransitive verbs of motion or completion in which the participle is active rather than passive in meaning:

Why *are* all those cars *stopped* at the corner?

By the time she got there, her friend *was gone*.

I'll soon *be finished* with this job.

With most intransitive verbs, this construction has been superseded by the perfective construction, which is almost synonymous. Compare *Mary has come* with the archaic *Mary is come*. The somewhat melodramatic imperative *Be gone* may be written as a single word *Begone*, and is sometimes, like *Beware* (cf 3.54 Note), treated as an infinitive: *I told them to begone from my sight*.

- [b] A similar pseudo-passive is used with verbs of posture:

Grandfather *was sat* in the rocking chair.

I've *been stood* here for about ten minutes.

In this case, the construction is largely synonymous with, though less common than, the progressive construction: *was sitting*, *'ve been standing*, etc.

- [c] The 'notional passive' with an intransitive active verb, as in *The clock winds up at the back* ['can be wound up'] is discussed under word-formation (App 1.54).

Summary

- 3.78 Summarizing the passive gradient as exemplified in 3.74, we may set up the following classes:

I Central passives

- (a) With expressed agents: [1], [2], [3]
 (b) Without expressed agents: [4]

II Semi-passives: [5], [6]

III Pseudo-passives

- (a) With 'current' copular verbs *be*, *feel*, *look*, etc.: [7]
 (b) With 'resulting' copular verbs *get*, *become*, *grow*, etc.: [8]
 (cf 16.21–23 for the terms 'current' and 'resulting')

Introduction

- 4.1 In this chapter we examine the semantics of the verb phrase, and in particular of the finite verb phrase. We turn our attention to the meanings associated with tense, aspect, and the modal auxiliaries, having already dealt with the morphology and syntax of these categories in 3.52–7. The chapter will conclude with some observations on the meanings of verbs on the gradient between auxiliaries and main verbs, and of nonfinite verb phrases.

It is unfortunate that the terminology used in discussing the verb phrase often tempts us to confuse distinctions of grammatical form with distinctions of meaning. This applies to terms such as 'aspect', 'perfective', 'progressive', and 'modality', which, as names for grammatical categories, also reflect their typical meanings. But preeminently it applies to the terms 'present' and 'past' used in referring to tenses of the verb. The English present tense, for instance, usually, but by no means always, signifies present time (cf 4.5–10). The association between present tense and present time is strong enough to make the term 'present tense' plausibly appropriate, and at the same time, potentially misleading.

Time, tense, and the verb

- 4.2 It is therefore wise to begin by distinguishing three different levels on which the terms 'present' and 'past' can be interpreted. First, in abstraction from any given language, time can be thought of as a line (theoretically, of infinite length) on which is located, as a continuously moving point, the present moment. Anything ahead of the present moment is in the future, and anything behind it is in the past:

Fig 4.2a

This is an interpretation of past, present, and future on a REFERENTIAL level. But in relating this view of time to language and, more precisely, to the meaning of verbs, it is useful to reformulate the threefold distinction such that 'present' is defined in an inclusive rather than in an exclusive way: something is defined as 'present' if it has existence at the present moment, allowing for the possibility that its existence may also stretch into the past and into the future. Hence *Paris stands on the River Seine* may be correctly said to describe a 'present' state of affairs, even though this state of affairs has also obtained for numerous centuries in the past, and may well exist for an indefinite period in the future:

Fig 4.2b

On this second, or SEMANTIC level of interpretation, then, 'present' is the most general and unmarked category. In contrast to [1], which is a generic statement applicable to present, past, and future, [2] is a more limited statement, suggesting that the albatross, like the dodo, is extinct:

- Albatrosses *are* large birds. [1]
 Albatrosses *were* large birds. [2]

The author of [2] does not commit himself to the continuation of the past state of affairs it describes into the present. The same applies to sentences of more limited time span:

- John spends a lot of money. [true for past, present, and future]
 John spent a lot of money. [true for past only]

Note Nevertheless, a sentence like [2] does not exclude the possibility of such a continuation. It is possible to assert, without inconsistency: *Albatrosses were, are, and always will be large birds.*

The present tense as 'nonpast'

- 4.3 In 4.2 we distinguished past, present and future on a referential level, and also on a semantic level. It remains only to mention the familiar fact that 'present' and 'past' are also interpreted on a grammatical level, in reference to tense. Here, however, the threefold opposition is reduced to two, since morphologically English has no future form of the verb in addition to present and past forms. Some grammarians have argued for a third, 'future tense', maintaining that English realizes this tense by the use of an auxiliary verb construction (such as *will* + infinitive): but we prefer to follow those grammarians who have treated tense strictly as a category realized by verb inflection. In this grammar, then, we do not talk about the FUTURE as a formal category: what we do say is that certain grammatical constructions are capable of expressing the semantic category of FUTURE TIME (cf 4.41ff).

Some grammarians have gone further, avoiding the term 'present' in reference to tense, and preferring 'nonpast'. The terms PRESENT TENSE and PAST TENSE have this justification: that the tenses they name typically have reference to present and past time respectively:

She is quite well today. Yesterday she *was* sick.

But there is also some morphological justification for treating the present as the unmarked tense, since it is often realized by the base or uninflected form

of the verb (compare the present tense *I need a rest* with the past tense *I needed a rest*). There is also a semantic justification, to the extent that the present tense may be used to express not only present but future time. Contrast:

- Yesterday { **is* } Sunday. Today is Monday.
 { *was* } Tomorrow is Tuesday.

Notice we can use the present tense in questioning someone about a future activity as well as about a present one:

- *What are you doing yesterday? { What are you doing today?
 { What are you doing tomorrow?

And we can use the present form of the modal with future meaning, but not with past meaning:

- *I can help you yesterday. { I can help you today.
 { I can help you tomorrow.

We have good reason for arguing, therefore, that the semantic triad of past, present, and future is unequally separated into past and nonpast categories for the purposes of tense. Tradition and familiarity favour the retention of the label 'present' in place of 'nonpast'. But this concession places upon us the responsibility of continually maintaining a clear distinction between present and past TENSE, on the one hand, and present and past TIME on the other.

Situation types: stative and dynamic verb senses

- 4.4 The semantic categories of past, present, and future apply, in fact, not so much to time, as to happenings which take place in time, and which are denoted by verbs. The point may be made in the following way:

- Mary *hoped* for success. REFERS TO a *past hope* of Mary.
 Peter *knows* a great deal. REFERS TO Peter's *present knowledge*.
 The home team *will be defeated*. REFERS TO a *future defeat* of the home team.

Note that the same concept can be expressed both by a verb and by an abstract noun. Such words denote phenomena existing in time, variously called 'states', 'events', 'actions', 'processes', 'activities', etc. Regrettably there is no single generic term for such 'verb-denoted phenomena', but we shall distinguish different categories under the title of SITUATION TYPES (cf further 4.27ff).

Pursuing the analogy between nouns and verbs further, we observe that just as an abstract noun referring to an event can be singular or plural, so the corresponding verb can be 'pluralized' through the use of frequency adverbials:

- | | |
|-----------------------------------|-------------------------------------|
| A SINGLE EVENT | A PLURALITY OF EVENTS |
| Vesuvius <i>erupted</i> in 77 AD. | The country <i>was invaded</i> many |
| = In 77 AD there was an | times. = There were many |
| eruption of Vesuvius. | invasions of the country. |

Such verbs as *erupt* and *invade* are therefore comparable to count nouns. One sign of this is that when such verbs are used with the present perfective, they cannot indicate a single unbroken state up to the present:

I *have driven* sports cars for years. [1]

This does not refer to an uninterrupted state of car-driving, but rather to a sequence of separate car-driving events. On the other hand, there are verbs like (usually) *be*, *have*, and *know* which refer to states, and which indicate an unbroken state in sentences otherwise similar to [1]:

I *have known* the Penfolds all my life. [2]

Such verbs also occur less readily with frequency adverbials:

?The chair *has* beautiful carved legs *quite frequently*. [3]

On this basis, we draw a broad distinction between DYNAMIC (count) meanings and STATIVE (noncount) meanings of verbs. It should be noted, though, that we talk of dynamic and stative *meanings*, rather than dynamic and stative *verbs*. This is because one verb may shift, in meaning, from one category to another. Contrast, for example, the stative meaning of *have* [= 'possess'] in [3] with a dynamic meaning of *have* ['eat'] in [4]:

We *have* dinner at Maxim's *quite frequently*. [4]

Having carved legs is a state, while having dinner is an event (cf 3.34f).

One of the characteristics of dynamic verb senses is that they often (but by no means always) imply agentivity (cf 10.19); *ie* they imply an active doer (initiator, performer) of the action concerned. Hence dynamic verb meanings can regularly occur with the imperative, but stative verb meanings cannot:

Learn how to swim. *Know how to swim.

Verbs with dynamic meanings moreover can generally occur following *do* in a pseudo-cleft sentence (cf 18.29f):

What she did was (to) *learn* Spanish.

*What she did was (to) *know* Spanish.

The dynamic/stative distinction is not clear-cut, however. When we come to study aspect (see esp 4.25ff) we shall need to look critically at this distinction, and to suggest various subdivisions of each category. But a coarse binary contrast is all that is required for the study of tense.

The distinction between stative and dynamic verb meanings is therefore a rough-and-ready one which will be refined later (cf 4.27ff). There are some verbs (eg: *stand*, *lie*; cf 4.32) whose meanings cannot be adequately described in terms of this dichotomy.

- Note [a] In some cases, the same verb can be either dynamic (referring to an event) or stative (referring to the state resulting from that event). Hence the virtual equivalence, in some contexts, of *I've got the idea* and *I get the idea*; also of *I've forgotten* and *I forget*.
[b] *Know* can be used abnormally in the sense of 'make sure that you know' in imperatives such as:

Know this poem by heart by next week.

There is also an exceptional dynamic use of *know* in the archaic imperative *Know thyself!*

Meanings of the simple present tense with reference to present time

(a) State present

- 4.5 With stative verb senses, the present is used without reference to specific time: *ie*, there is no inherent limitation on the extension of the state into the past and future (unless such a limitation is indicated by adverbials or other elements of the clause). The STATE PRESENT, as we may call this category, includes general timeless statements, or so-called 'eternal truths':

Honesty *is* the best policy.

Water *consists* of hydrogen and oxygen.

Two and three *make* five.

The earth *moves* round the sun.

Whereas proverbial, scientific, or mathematical statements like these represent the extreme of temporal universality, geographical statements are equally likely to be examples of the 'timeless present':

The Nile *is* the longest river in Africa.

Peru *shares* a border with Chile.

We can also include with the state present examples such as the following, where our knowledge of the world tells us that the time span of the state is to a greater or lesser degree restricted:

Margaret *is* tall.

Everyone *likes* Maurice.

He *does not believe* in hard work.

This soup *tastes* delicious.

She *knows* several languages.

We *live* near Toronto.

- Note [a] Authors often use a kind of 'timeless present' in addressing their readers about the contents of their book. In the present book, for example, we use such expressions as:

The last example *shows* that...

[b] Sentences such as **We live near Toronto since 1949*, in which the simple present is combined with an adverbial of duration, do not normally occur. This is because the adverbial is interpreted as defining a period of 'living' leading up to the present moment, and hence as referring to time before the present (cf 4.20ff). Therefore, even though the state referred to may well continue in the future, the present perfective rather than the present is used. Particularly in AmE, however, this requirement is sometimes relaxed, and sentences like *Since when do you read newspapers?* are quite often heard (cf further 14.26).

(b) Habitual present

- 4.6 When they are used with the simple present, dynamic verb meanings, like stative verb meanings, usually imply an inherently unrestricted time span. But in this case the verb refers to a whole sequence of events, repeated over the period in question:

We *go* to Brussels every year.

Bill *drinks* heavily.

She *makes* her own dresses.

Water *boils* at 100°C.

As the last example shows, the HABITUAL PRESENT also resembles the state present in being used for 'timeless' statements. It is a sign of the habitual present that one can easily add a frequency adverbial to specify the frequency of the repetition: *Bill drinks heavily every night*, etc. Some habitual statements,

such as *We go to Brussels*, are contextually incomplete unless such an adverbial is added. Whereas the state present always refers to something which obtains at the time of speaking, this is not necessarily, or even usually, true of the habitual present.

- Note [a] Verbs of stative meaning may sometimes be used in a habitual sense when accompanied by a frequency adverbial: *She is seldom alone*.
 [b] A habitual use of the present tense occurs in a 'timeless' sense in authorial address to the reader on a book's content (cf 4.5 Note [a]): *We turn now to the question of ...* This may be alternatively viewed as a special case of the instantaneous present (cf the use of the present in demonstrations in 4.7 below).

(c) Instantaneous present

- 4.7 While the habitual present is the most common meaning of the simple present with a dynamic verb sense, a second possibility, the INSTANTANEOUS PRESENT, occurs where the verb refers to a single action begun and completed approximately at the moment of speech. We may thus add to the state present and habitual present, which respectively correspond to noncount and plural count nouns, a third meaning corresponding to that of singular count nouns. Figure 4.7 illustrates the three central uses of the simple present with reference to present time:

Fig 4.7

The instantaneous present, however, because it implies that the event has little or no duration, does not occur outside some rather restricted situations. Such situations include the following:

COMMENTARIES:

Black *passes* the ball to Fernandez... Fernandez *shoots*!

DEMONSTRATIONS AND OTHER SELF-COMMENTARIES:

I *pick* up the fruit with a skewer, *dip* it into the batter, and *lower* it into the hot fat.

I *enclose* (herewith) a form of application.

SPECIAL EXCLAMATORY SENTENCES (with initial adverbials):

Here *comes* the winner! Up you *go*. (cf 18.23)

PERFORMATIVES:

I *advise* you to withdraw. I *apologize*. We *thank* you for your recent inquiry.

The verb in performatives (cf 11.3) is often a verb of speaking (such as *request*, *advise*, *predict*) describing the speech act of which it is a part. Other

performatives such as *I resign* describe ritual acts and are accepted as the outward sign that such acts are taking place. In these cases, then, there is bound to be simultaneity between the event described and the speech event itself. In other cases, although such simultaneity does not obtain in any exact sense, there is an implication of simultaneity which gives the utterance with the instantaneous present a somewhat theatrical quality. Against the routine ordinariness of the present progressive in *Carlos is winning*, we may place the dramatic air of *Carlos wins!* which pinpoints the final and climactic moment of victory.

- Note [a] In older English, the simple present was used more widely with reference to a present event which would now be described by use of the present progressive: Shakespeare's *I go, I go* may be contrasted with the present-day *I'm going*. Some relics of this archaic usage are found in one or two fixed expressions such as *How do you do?* and *How goes it?*
 [b] On the closely related dramatic use of the present, cf 4.8, 4.10.

Special nonpresent uses of the present tense

(a) Simple present referring to the past

- 4.8 In the next three sections we bring together three additional uses of the simple present; these are best seen as transferred or extended interpretations of the basic meanings of 4.5–7.

The so-called historic present is characteristic of popular narrative style (cf also the fictional present, 4.10):

I couldn't believe it! Just as we arrived, up *comes* Ben and *slaps* me on the back as if we're life-long friends. 'Come on, old pal,' he *says*, 'Let me buy you a drink!' I'm telling you, I nearly fainted on the spot.

The historic present describes the past as if it is happening now: it conveys something of the dramatic immediacy of an eye-witness account.

A very different use of the present tense in reference to the past is that found with verbs of communication:

The ten o'clock news *says* that there's going to be a bad storm.
 Martin *tells* me the Smiths are moving from No. 20.

Such verbs include also verbs like *understand*, *hear*, and *learn*, which refer to the receptive end of the communication process:

I *hear* that poor Mr Simpson has gone into hospital.

These sentences would also be acceptable with the simple past or present perfective; but the implication of the present tense seems to be that although the communication event took place in the past, its result – the information communicated – is still operative. Thus:

The Book of Genesis *speaks* of the terrible fate of Sodom and Gomorrah.

suggests that although the Book of Genesis was written thousands of years ago, it still 'speaks' to us at the present time.

The notion that the past can remain alive in the present also explains the

optional use of the present tense in sentences referring to writers, composers, artists, etc and their extant works:

In *The Brothers Karamazov*, Dostoevsky *draws/drew* his characters from sources deep in the Russian soil.

Like Rubens, Watteau *is/was* able to convey an impression of warm, living flesh by the merest whiff of colour.

Again, it is something more than a figure of speech to suggest that the author is still able to speak to us through his works. The present can even be used, without respect to any particular work, for general artistic characterizations of the author:

Brahms *is/was* the last great representative of German classicism.

But biographical details of the artist's life must normally be reported through the past tense (cf however Note [b]). Hence there is an interesting contrast between:

Murasaki *writes/wrote* of life in 11th century Japan.

Murasaki *wrote* in 11th century Japan.

Note [a] The simple present is usually used in newspaper headlines to report recent events: *Trade unions back merger*; *'No sell-out' says P.M.*; *Economic think-tank seeks assurances*. (On headlines, cf further 11.46).

[b] Two further minor uses of the historic present are (i) in photographic captions, for which, however, the *-ing* participle is an alternative form:

The Queen *arrives/arriving* for the State Opening of Parliament.

and (ii) in historical summaries or tables of dates:

1876 – Brahms *completes* his first symphony.

[c] There is variation between past and present tenses in cross-references from one part of a book to the other: *This problem is/was discussed in Chapter 1*. The choice depends on whether the book is conceived of as existing at one time, like a static object; or whether it is imagined to progress in time, as it does for the reader who begins at Chapter 1 and moves from 'earlier' to 'later' parts of the book. Other verb constructions (eg the perfective construction or the modal construction with *will*) may also be used to imply progression in time: *This matter has been touched on in Chapter 2, but we will return to it in Chapter 5*.

(b) Simple present referring to the future

4.9 In main clauses, this typically occurs with time-position adverbials to suggest (cf 4.45) that the event is unalterably fixed in advance, and is as certain as it would be, were it taking place in the present:

The plane *leaves* for Ankara at eight o'clock tonight.

In dependent clauses, the future use of the simple present is much more common, particularly in conditional and temporal clauses (cf 14.22):

He'll do it if you *pay* him.

I'll let you know as soon as I *hear* from her.

Note [a] The use of the simple present in directions with a 2nd person subject might be considered a case of the present tense referring to the future:

You *test* an air leak by disconnecting the delivery pipe at the carburettor and pumping the fuel into a container.

You *take* the first turning on the left past the police station, then you *cross* a bridge, and *bear* right until you *see* the Public Library.

However, these may more justly be taken as examples of the habitual present (cf 4.6), the *you* being interpreted impersonally, as equivalent to generic *one* (cf 6.21).

[b] The simple present may be used in reference to later parts of a book (cf 4.5 Note [a], 4.8 Note [c]) in examples such as the following:

In the next chapter we *examine* in the light of this theory recent economic developments in the Third World.

(c) Simple present in fictional narrative

4.10 There is a close connection between the historic present of (a) above, and the simple present as used in fictional narratives. The only difference is that whereas the events narrated by means of the historic present are real, those narrated by the fictional 'historic present' are imaginary:

The crowd *swarms* around the gateway, and *seethes* with delighted anticipation; excitement *grows*, as suddenly their hero *makes* his entrance ...

This is stylistically marked in contrast to the normal convention of the past tense for story-telling. A special exception is the use of the present in stage directions:

Mallinson *enters*. The girls immediately *pretend* to be working hard.

William *assumes* a businesslike air, *picks* up two folders at random, and *makes* for the door.

Here the present is used by convention, as if to represent the idea that the events of the play are being performed before our eyes as we read the script. A similar convention is used in summaries of narratives.

Meanings of the past tense with reference to past time

4.11 As most commonly used, the past tense combines two features of meaning:

- (a) The event/state must have taken place in the past, with a gap between its completion and the present moment.
- (b) The speaker or writer must have in mind a definite time at which the event/state took place.

The first of these conditions is most clearly exemplified by a sentence like *I stayed in Africa for several months*, where the usual implication is that I am no longer in Africa. The second condition is most explicitly shown in cooccurrence relations between the past tense and past time-position adverbials such as *last week*, *in 1932*, *several weeks ago*, *yesterday*, etc:

Freda started school { last year. [1]
 in 1950. [2]

Prices slumped { last winter. [3]
 yesterday. [4]

With such adverbials, the simple present or present perfective would be virtually ungrammatical (cf, however, 4.8 Note [b] and 4.23 Note [a]):

*Freda { starts [1a]
 has started } school { last year. [2a]
 in 1950.

It is not necessary, however, for the past tense to be accompanied by an overt indicator of time. All that is required is that the speaker should be able to count on the hearer's assumption that he has a specific time in mind. In this respect, the past tense meaning of DEFINITE PAST time is an equivalent, in the verb phrase, of the definite article in the noun phrase. Just as with the definite article (cf 5.27–32), so with the verb phrase, an element of definite meaning may be recoverable from knowledge of (a) the immediate or local situation; (b) the larger situation of 'general knowledge'; (c) what has been said earlier in the same sentence or text; or (d) what comes later on in the same sentence or text.

Note A parallel may also be drawn, in terms of definite meaning, between the present and past tense, and the 'near' and 'far' reference of the demonstratives *this* and *that* (cf 6.40ff). Thus the present and past tenses can be added to other pairs of DEICTIC items (cf 6.43), such as *this/that*, *now/then*, and *here/there*.

Situational use of the past tense

- 4.12** The use of the past tense in relation to an immediate situation is illustrated by the sentence:

Did you lock the front door? [5]

in a domestic situation where it is known that the front door is locked at bedtime every night. In that case, [5] is more or less equivalent to *Did you lock the front door at bedtime?* (Incidentally, in [5], *the in the front door* is another case of situational definiteness; cf 5.28ff.)

Definiteness by virtue of the larger situation (or general knowledge; cf 5.29) may be invoked to explain the use of the simple past in historical or biographical statements which have specific people, places, or objects as their topics:

Byron *died* in Greece. [6]
I have a friend who *was* at school with Kissinger. [7]
This picture *was painted* by the owner's grandfather. [8]
Rome *was not built* in a day. [a proverb] [9]

It is a matter of general knowledge that Byron is a historical personage (and therefore that he must have died at some time or another). The past tense in [6] presupposes such common ground between speaker and hearer: it is as if the speaker had said: 'We all know that Byron died at some time or other; well, *when* he died, he died in Greece'. Similarly, [7] presupposes that most people spend a particular period at school, [8] presupposes that a picture one sees on the wall must have been painted at some time or another; and [9] presupposes that all cities (including Rome, the 'Eternal City') have to be built at some time or other.

Anaphoric and cataphoric use of the past tense

- 4.13** In line with the use of the term *anaphoric* with reference to the definite article (cf 5.30f), we may call the use of the past tense 'anaphoric' where the time in

the past to which the reference is made is already indicated by a previous use of the past tense. In this sense, *was* is anaphoric in [10]:

Then we *entered* the city ... the square *was* deserted ... [10]

In other cases, a preceding use of the present perfective in the indefinite past sense (cf 4.20f) provides a peg, so to speak, on which to hang a subsequent occurrence of the past tense:

They *have decided* to close down the factory. It *took* us completely
by surprise. [11]
There *have been* times when I *wished* myself safely home in bed. [12]

(In the latter sentence, the present perfective *have wished* would also be possible.) Again, this is similar to the case where the indefinite article (cf 5.30) prepares the way for a following coreferential definite article. In other cases, anaphoric reference is to an adverbial of time in the same clause:

Last Saturday, we *went* to the theatre.

When the adverbial follows the past tense, this may be called the *cataphoric* use of the definite past (cf 5.32):

We *went* to the theatre *last Saturday*.

Examples like [5–12] above show that for a verb phrase to be 'definite', the relevant time need not be specified: it matters only that the time should in principle be specifiable. This means that even very unspecific time adverbs such as *once* and *when* suffice to make the past tense appropriate:

When did she arrive? I *was once* a heavy smoker.

Finally, the use of a temporal conjunction such as *while* or *as soon as* with past reference is a sufficient condition for the use of the past tense in both main and subordinate clauses: *They left as soon as we arrived*.

Note [a] There are a few idiomatic constructions in which the element of definiteness seems to be absent from the meaning of the past tense: *eg* in comparative clauses containing the main verb *was/were*:

She's not so active *as she was*.

But here the past tense retains its other semantic feature: that the state no longer obtains; *ie*: *was* is equivalent to *used to be* (cf 4.15).

[b] In the following idiomatic examples, the past tense lacks both its implication of 'definiteness' and its implication of 'no longer obtaining':

I *always knew* you were my friend. [13]
Did you ever hear such nonsense? [14]

The past is here a colloquial alternative to the present perfective referring to a state or habit leading up to the present; *eg* [13] could be rephrased: *I've always known you to be my friend*. (In the ritual exclamation of astonishment *Well I never did!*, however, the perfective could not be substituted.) This usage is restricted to the occurrence of the past tense with *always*, *never*, or *ever*. Sentences such as [13] and [14] are to be distinguished from similar sentences containing a past time adverbial, such as: *In the past, I always thought you were my friend*. Here the regular interpretation of the past tense obtains, and so the implication is likely to be: '... but now I no longer think so'.

[c] On differences between AmE and BrE in the use of the simple past, cf 4.20 Note, 4.22 Note [a].

Event, state, and habit in the past

- 4.14 Having mentioned the pragmatic conditions for definiteness which are common to most examples of the past tense, we now have to distinguish three meanings of the past tense which match the three meanings of the present with reference to present time (4.5-7). For the past tense, however, it is better to place the three meanings in a different order. First we illustrate, as the most common sense, the **EVENT PAST**, which refers to a single definite event in the past:

The eruption of Vesuvius *destroyed* Pompeii. [1]

In [1], the dynamic verb sense of *destroyed* identifies a single event. But in [2], the verb *was* refers to a state, and is therefore an example of the **STATE PAST**:

Archery *was* a popular sport for the Victorians. [2]

In [3], we have an example of the **HABITUAL PAST**, since the verb *were held* refers to a sequence of four-yearly events:

In ancient times, the Olympic Games *were held* at Olympia in Southern Greece. [3]

We may present these three meanings, therefore, in a diagram corresponding to that used for the simple present (Fig 4.7):

T = time of orientation

Fig 4.14

In Fig 4.14, the three meanings are located by reference to a definite time in the past (a **SECONDARY TIME-ORIENTATION** or T_2), and only indirectly by reference to the **present moment** (the **PRIMARY TIME-ORIENTATION** or T_1). The diagram shows T_2 , like T_1 , as a point of time having no duration; but it should be noted that T_2 can sometimes refer to an extended time period. Compare *The agreement was signed at 7 p.m.* (where T_2 is a momentary point of time) with *The agreement was signed in 1972* (where T_2 is a whole year and the actual signing is understood to take place at some unspecified point within that period).

- 4.15 It is easy to see why the event past is more common than the corresponding meaning of the present tense, viz the instantaneous present. From a vantage

point in the present, we naturally see a happening in the past as a complete unit, with a beginning and an end; but it is more difficult to see a present event 'in close-up' in such a holistic way. With the past tense, there is a tendency to treat as holistic events even states of affairs persisting through an extended period, eg:

He *lived* and *died* in his native city of Padua.

It can thus be rather difficult, in practice, to distinguish the different meanings of the past tense. But one useful distinguishing mark is the fact that the habitual and state meanings can be paraphrased by means of *used to* (cf 3.44):

In those days we $\left\{ \begin{array}{l} \text{used to live} \\ \text{lived} \end{array} \right\}$ in the country. [4]

We $\left\{ \begin{array}{l} \text{used to get} \\ \text{got} \end{array} \right\}$ up at 5 a.m. every morning all through the summer. [5]

As it stands, the habitual past in [3] above in 4.14 is not formally distinguished from the event past: only general knowledge tells us that the Olympic Games were held more than once. If we wish to make sure that a sentence like [3] is given a habitual interpretation, we have to substitute the *used to* construction or else add an adverbial of frequency or duration, such as *every morning* and *all through the summer* in [5].

Another distinguishing feature is the tendency for dynamic verbs to have a sequential interpretation when they occur in textual sequence (especially in coordination):

She *addressed* and *posted* the letter. [6]

[\neq She *posted* and *addressed* the letter]

She *disliked* and *distrusted* her advisers. [7]

[= She *distrusted* and *disliked* her advisers]

In [6], the actions of addressing and posting are understood to take place in succession, while in [7] the emotions of dislike and distrust are understood to have existed side by side (cf 13.22ff).

Note Sometimes, however, two dynamic verbs in sequence are given a simultaneous interpretation, as in:

The explosion *wrecked* a car and *damaged* several shops.

Another relevant factor is that certain conjunctions, such as *before* and *after*, can overrule the normal order of temporal precedence:

Before the railroad gangs *arrived*, Dixon City $\left\{ \begin{array}{l} \text{was} \\ \text{had been} \end{array} \right\}$ nothing but a sleepy cattle town.

(On the alternative use of *had been* here, cf 4.24.)

Meanings of the past tense with reference to present and future time

- 4.16 Just as the simple present does not always refer to present time, so the past tense is not always confined to past time reference. There are again three special meanings to mention:

(a) In **INDIRECT SPEECH** (or **INDIRECT THOUGHT**; cf 14.30ff), the past tense in the reporting verb tends to make the verb of the subordinate clause past

tense as well. This phenomenon, known as backshift, is normally optional (cf 14.31), but can result in an apparently anachronistic use of the past tense for present time:

A: *Did you say you have/had no money?*

B: Yes, I'm completely broke.

A: How *did you know* that I am/*was* Max Wilson?

B: Well, I remembered that you are/*were* tall, and wear/*wore* glasses.

A different kind of backshift is observed when a sentence describing speech or thought in the future contains a reported speech clause referring retrospectively to the present:

My wife will be sorry that she *missed* seeing you this evening.

- (b) The ATTITUDINAL PAST, used with verbs expressing volition or mental state, reflects the tentative attitude of the speaker, rather than past time. In the following pairs, both the present and past tenses refer to a present state of mind, but the latter is somewhat more polite:

Do/*Did* you want to see me now?

I wonder/*wondered* if you could help us.

- (c) The HYPOTHETICAL PAST is used in certain subordinate clauses, especially *if*-clauses, and expresses what is contrary to the belief or expectation of the speaker (cf 14.23):

If you really *worked* hard, you would soon get promoted. [1]

It's time we all *took* a rest. [2]

I wish I *had* a memory like yours. [3]

The hypothetical past, as in [1–3], implies the nonoccurrence of some state or event in the present or future. The implication of [1], for example, is that the hearer does *not* work hard.

Note [a] The past subjunctive singular form *were* (cf 3.62) is often considered preferable to the past indicative form *was* in sentences such as:

He talks as if he *were/was* the most powerful politician in the country.

Further details are given in 14.24.

[b] The past tense forms of modal auxiliaries (*could*, *would*, etc) frequently occur with special hypothetical force, and are somewhat restricted in their application to past time. These will be considered in some detail in 4.59–64.

Perfective and progressive aspects

- 4.17 The term ASPECT refers to a grammatical category which reflects the way in which the verb action is *regarded* or *experienced* with respect to time. Unlike tense, aspect is not deictic (cf 6.43), in the sense that it is not relative to the time of utterance. For some purposes, the two aspect constructions of English,

the perfective and the progressive (cf 3.54), can be seen as realizing a basic contrast of aspect between the action viewed as complete (perfective), and the action viewed as incomplete, *ie* in progress (imperfective or progressive). But this is an oversimplified view, as is clear as soon as we observe that these two aspects may combine within a single verb phrase (eg: *I have been reading* is both perfective and progressive). In fact, aspect is so closely connected in meaning with tense, that the distinction in English grammar between tense and aspect is little more than a terminological convenience which helps us to separate in our minds two different kinds of realization: the morphological realization of tense and the syntactic realization of aspect.

We have seen (cf 3.54ff) that tense and aspect combine freely in the complex verb phrase, and so the following system of contrasts, with corresponding terminological distinctions, will form a useful starting point:

Table 4.17

SYMBOL	NAME	EXAMPLE
Type B	present perfective (simple) past perfective (simple)	<i>he has examined</i> <i>he had examined</i>
Type C	present progressive (simple) past progressive (simple)	<i>he is examining</i> <i>he was examining</i>
Type BC	present perfective progressive past perfective progressive	<i>he has been examining</i> <i>he had been examining</i>

We have already used the word 'simple' to describe a verb phrase totally unmarked for aspect (simple present, simple past). By extension, we may also, to avoid ambiguity, use the term 'simple' for verb phrases which are unmarked for one of the two aspects, as indicated in Table 4.17.

- Note [a] It has been traditional for grammars to refer to the above set of oppositions of tense and aspect as 'compound tenses', in which they would include such categories as the 'past perfect' (or 'pluperfect') tense. This terminology, modelled on that used for inflectional languages such as Latin, can be misleading when applied to English, and for this reason we prefer to limit, as mentioned before, the term 'tense' to the morphological opposition between present and past forms of the finite verb.
- [b] Because of the close connection between the perfective construction and time, the perfective is commonly termed the 'perfective tense' (or 'perfect tense').

Perfective aspect

- 4.18 The overlap of meaning between tense and aspect is most problematic in English in the choice that has to be made between simple past and present perfective:

simple past: John *lived* in Paris for ten years.
present perfective: John *has lived* in Paris for ten years.

Here both sentences indicate a state of affairs before the present moment, but the simple past indicates that the period of residence has come to a close, whereas the present perfective indicates that the residence has continued up to the present time (and may even continue into the future). This kind of difference, although by no means invariable, is often summarized in the statement that the present perfective signifies past time 'with current relevance'.

In order to appreciate why 'current relevance' is a common implication of the present perfective, it is as well to begin with the most general definition of the perfective aspect. In its broadest possible interpretation, the perfective indicates ANTERIOR TIME; *ie* time preceding whatever time orientation is signalled by tense or by other elements of the sentence or its context. To illustrate this definition, we take a preliminary look not only at the present perfective, but at cases where the perfective does not cooccur with the present tense:

- | | |
|---|-----|
| I have already met your sister. | [1] |
| The flight was cancelled after we had paid for the tickets. | [2] |
| If you had listened to me, you would have avoided mistakes. | [3] |
| By next week, they will have completed their contract. | [4] |
| I may have left the key at the office (last night). | [5] |
| I am/was sorry to have missed the concert. | [6] |
| She regrets/regretted having abandoned the plan. | [7] |

The common factor of meaning which the perfective brings to all these examples is sketched in Fig 4.18:

Fig 4.18 Anterior time zone

Note Perfective constructions are infrequent compared with nonperfective constructions. A corpus study of verb phrases has indicated that approximately ten per cent of finite verb phrases are perfective.

- 4.19 As the above figure shows, the perfective merely defines an anterior time zone (symbolized by the arrow \leftarrow) within which the action of the verb takes place. The time of orientation ($T?$) is not fixed: with the present perfective [1], $T?$ is equated with T_1 , while with the past perfective, $T?$ is equated with T_2 (a specifiable secondary time of orientation in the past). This is illustrated in [2] in 4.18 above, where $T?$ ($= T_2$) refers to the time of cancelling the flight. In [3], however, the past perfective relates the event not to T_2 , but to T_1 , since the past tense indicates in this case not a past event, but a hypothetical event (*cf* the hypothetical past, 4.16). The conditional clause could be expanded:

If you had listened to me before now . . .

In [4] and [5], the infinitive perfective occurs after a modal auxiliary, and the time orientation derives not from the infinitive itself (which is tenseless), but from the modal. *Will* in [4] sets up an ancillary time orientation T_2 in the future, so that the meaning of the whole construction *will have completed* is 'past in future':

Fig 4.19 Past in future

In [5], on the other hand, the modal *may* has a present orientation, and $T?$ is once again T_1 . In the last two examples of 4.18, the perfective occurs in a nonfinite verb phrase, which, because it has no inherent time orientation, takes its orientation from the main verb. Hence the paraphrases below, in which the nonfinite clauses of [6] and [7] are replaced by finite subordinate clauses, require variation in the verb construction of the subordinate clause in correspondence with a similar variation in the main clause:

- I $\left[\begin{smallmatrix} \text{'m} \\ \text{was} \end{smallmatrix} \right]$ sorry that I $\left[\begin{smallmatrix} \text{missed} \\ \text{(had) missed} \end{smallmatrix} \right]$ the concert. [6a]

- She $\left[\begin{smallmatrix} \text{regrets} \\ \text{regretted} \end{smallmatrix} \right]$ that she $\left[\begin{smallmatrix} \text{abandoned} \\ \text{(had) abandoned} \end{smallmatrix} \right]$ the plan. [7a]

The past perfective is optional in the second variant of [6a] and [7a], for reasons explained in Fig 4.24b. These distinctions are neutralized when a nonfinite clause is used.

The overlap in the time-indicating functions of the past tense and the present perfective is clearly seen in the choice of paraphrasing [5] above either by the past tense [5a] or by the present perfective [5b]:

- It is possible that I left the keys at the office (last night). [5a]

- It is possible that I have left the keys at the office. [5b]

On the other hand, this example also shows that the present perfective is to some extent limited by the fact that it shares the same past time 'territory' as the simple past. If a time-position adverbial like *last night* is added to [5], then the finite verb paraphrase has to be the past tense [5a] rather than the perfective [5b]. In other words, [5c] is unacceptable:

- *It is possible that I have left the keys at the office last night. [5c]

However, the rule of adverbial incompatibility which forbids [5c] is occasionally ignored; *cf* 4.23 Note [a] below.

Note The semantic overlap between the simple past and the present perfective gives rise to a further type of 'double marking' (*cf* 3.57, 4.24) where the perfective redundantly repeats the indication of anteriority present in the past tense: *We were glad to have seen you* can be used in a way which makes its meaning indistinguishable from that of *We were glad to see you*.

The present perfective

- 4.20 The examples in 4.18 have given evidence that 'past with current relevance' is not an adequate description of the meaning of the perfective aspect. Yet when we concentrate on the present perfective, there is indeed reason for such a description: the present perfective differs from the simple past in relating a past event/state to a present time orientation. Thus in situations (which are not unusual) where either the present perfective or the simple past can be appropriately used, it is generally felt that they are not interchangeable, but that the present perfective relates the action more directly to the present time. Compare:

Where did you put my purse? [1]
Where have you put my purse? [2]

The purpose of both of these questions may be to find the purse; but in [1] the speaker seems to ask the addressee to remember a past action; while in [2] the speaker apparently concentrates on the purse's present whereabouts. There are many such cases.

Leaving aside such virtual equivalences, we may now focus on the difference between the two constructions, contrasting the meanings of the simple past given in 4.14 with the following meanings of the simple present perfective:

(a) STATE LEADING UP TO THE PRESENT

That house *has been* empty for ages.
Have you *known* my sister for long?

(b) INDEFINITE EVENT(S) IN A PERIOD LEADING UP TO THE PRESENT

Have you (ever) *been* to Florence?
All our children *have had* measles.

(c) HABIT (ie recurrent event) IN A PERIOD LEADING UP TO THE PRESENT

Mr Terry *has sung* in this choir ever since he was a boy.
The province *has suffered* from disastrous floods throughout its history.

Of these meanings, (a) corresponds to the 'state past' use of the simple past, but differs from it in specifying that the state continues at least up to the present moment (cf: *That house was empty for ages – but now it's been sold*); (b) corresponds to the 'event past', but differs from it in that the past time in question is indefinite rather than definite (cf: *Did you go to Florence (last summer) ?*); (c) corresponds to the 'habitual past', but, as with (a), the period identified must continue up to the present. Compare:

The journal *has been published* every month since 1850. [3]
The journal *was published* every month from 1850 to 1888. [4]

These three meanings may be represented in a diagram, Fig 4.20, which parallels that of Figs 4.7 and 4.14. It is normal for meanings (a) and (c) to be indicated by adverbials. A duration adverbial is virtually obligatory for both (a) and (c), and a frequency adverbial may also occur with (c), as in [3] above. Adverbials occurring with the indefinite past meaning will be mentioned in 4.22 below.

Fig 4.20 Meanings of the present perfective

Note In AmE there is a tendency to use the past tense in preference to the present perfective, especially for the indefinite past; eg: *Did you ever go to Florence?* (cf 4.13 Note [b], 4.22 Note [a]).

Variants of the indefinite past meaning

- 4.21 In reference to a single event in the past (meaning (b) above), the present perfective, particularly in BrE, is associated with three implications or connotations, each of which may or may not be applicable in a given instance. These implications are (i) that the relevant time zone leads up to the present; (ii) that the event is recent; and (iii) that the result of the action still obtains at the present time. The first of these implications is simply a restatement of what was said about the anterior time zone of the perfective in 4.18. The point to be made here is that the choice between the present perfective and the simple past is often determined by whether the speaker has in mind an *implicit time zone* which has not yet finished:

Have you seen the Javanese Art Exhibition? [yet]
Did you see the Javanese Art Exhibition? [when it was here]

The first of these implies that the Exhibition is still open; the second that the Exhibition has finished. From this concern with a period still existing at the present time, it is only a short step to the second implication often associated with the present perfective, *viz* that the event is recent. The simple present perfective is often used to report a piece of news:

Have you *heard* } the news? The president *has resigned*.
Did you *hear* }

Because of this connotation of recency, B's reply in the following exchange must be considered absurdly inappropriate:

A: Has the postman left any letters? B: Yes, he did six months ago.

Since postmen in general deliver letters daily, the implicit time zone in this case would be no longer than a day.

- 4.22 The third connotation, that the result of the action still obtains, applies to dynamic conclusive verbs (cf 4.33–5), *ie* verbs whose meaning implies the accomplishment of a change of state:

The apples *have all been eaten*. [1]
My mother *has recovered* from her illness. [2]
Have any of the visitors *arrived*? [3]

The resultative connotation means, for example, that [1] implies 'There are no apples left'; that [2] implies 'My mother is now better'; and that [3] by implication asks the question 'Are any of the visitors here?'. This connotation is obviously closely connected with that of recency. Both the resultative and recency connotations can easily occur without adverbials. They do, however, underlie the tendency of the present perfective to cooccur with time adverbials such as *recently* and *just* (emphasizing recency), and with time relationship adverbials such as *already* and *yet* (cf 8.72):

- | | |
|---|-----|
| The plane has <i>just</i> landed. | [4] |
| I've <i>already</i> told Gillian about the party. | [5] |
| Have the children come home <i>yet</i> ? | [6] |

Significantly, time relationship adverbs such as *already* and *yet* can occur *either* with resultative verbs and the perfective aspect, as in [5] or [6], or with stative verbs referring to the results of such actions: eg [5] could be placed alongside *Gillian already knows about the party*, and [6] alongside *Are the children home yet*?

Note [a] In AmE, the simple past is often preferred to the present perfective for the variants of the indefinite past discussed in this section. Compare [6], for example, with *Did the children come home yet?* (esp AmE). Other AmE examples are: *I just came back*; *You told me already*; and without an adverb: *I'm tired* – *I had a long day*.

[b] The two perfective constructions for the verb *go*, namely *have gone* and *have been*, differ in that the former is resultative:

- | | |
|-----------------------------|--------------------|
| My sister has gone to Rome. | [She is there now] |
| My sister has been to Rome. | [at least once] |

Thus *have gone* cannot normally be used in a habitual sense:
?My sister has gone to Rome frequently.

The use of adverbials with the simple past and the present perfective

4.23 The choice between the simple past and the present perfective is associated with time orientation, and therefore with the choice and interpretation of time adverbials. (For the classification of the relevant types of adverbials, cf 8.4, 8.51ff, 8.97f.) Examples are:

(a) ADVERBIALS ASSOCIATED WITH THE PAST TENSE:

- | | | | |
|-------------|----------------------|-------------|------------------|
| I saw her { | yesterday (evening). | I saw her { | the other day. |
| | a week ago. | | at four o'clock. |
| | earlier this week. | | in the morning. |
| | last Monday. | | on Tuesday. |

(b) ADVERBIALS ASSOCIATED WITH THE PRESENT PERFECTIVE:

- | | |
|----------------------|--------------------|
| I haven't seen her { | up to now. |
| | since Monday. |
| | since I met you. |
| I haven't seen her { | so far. |
| | hitherto. <formal> |

(c) ADVERBIALS ASSOCIATED WITH BOTH:

- | | | | | | | | |
|-----|-----------|-------|-------------|-----|-----------|-------|------------|
| I { | saw | her { | today. | I { | saw | her { | before. |
| | have seen | | this month. | | have seen | | this June. |
| | | | this year. | | | | once. |
| | | | recently. | | | | already. |

Group (a) contains time position adverbials which indicate a specific point or period in the past, and therefore require the past tense. In Group (b) are adverbials which designate a period leading up to the present moment, and are therefore appropriate to the present perfective. Group (c) is a mixed group of adverbials, some of which, like *this month*, designate a period which includes the present moment, while others have meanings which vary according to whether a present or past time orientation is intended. For example, *I have seen him once* contains *once* in a frequency sense ('how often'), while *I saw him once* contains *once* in a time position sense ('when').

Note [a] One quite often meets (especially in BrE) sentences in which the present perfective cooccurs with time adverbials of Group (a); eg:

A: Have you ever seen *Macbeth* on the stage?

B: Yes, I've seen it *ages ago*, when I was a child.

Examples such as this may be explained as performance errors, induced by B's copying the form of A's question. Such explanations may not, however, be so readily available in other cases, such as *They asked me about something I've said years ago*.

[b] With phrases like *this week* and *this month* referring to a present period of time, the choice between the two verb constructions reflects merely a difference of focus or orientation:

Did you read *Punch* this week? Have you read *Punch* this week?

But expressions such as *this March* and *this morning* may refer to a past period of time ('the March of this year', 'the morning of today') rather than to a period containing the present moment. Some speakers feel that the present perfective with such expressions implies that the period referred to is not in the past; eg that *I have seen her this March* can be spoken appropriately only in March, and that *I have seen her this morning* can be spoken appropriately only in the morning. Other speakers, however, do not acknowledge this restriction.

The past perfective

4.24 The past perfective usually has the meaning of 'past-in-the-past', and can be regarded as an anterior version either of the present perfective or of the simple past. Consider the following examples:

- | | |
|---|-----|
| No wonder Miss Matthews' French was excellent – she <i>had lived</i> | |
| in Paris since childhood. | [1] |
| When we bought it, the house <i>had been</i> empty for several years. | [2] |

These can be diagrammed as in Fig 4.24a, which is a special case of the general perfective diagram Fig 4.18:

Fig 4.24a Meaning of the past perfective

More technically, the past perfective may be said to denote any event or state anterior to a time of orientation in the past. The three meanings of 'state', 'event' or 'habit' (as described in 4.14) can all occur. Whereas [1] and [2] have illustrated the 'state' meaning, [3] and [4] illustrate 'event' and 'habit' respectively:

The goalkeeper *had injured* his leg, and couldn't play. [3]

It was foolish to fire McCabe: in two seasons, he *had scored* more goals than any other player. [4]

When transposed into the 'past in the past' by means of the past perfective, the contrast between the simple past and the present perfective is neutralized:

My aunt *had lived* in Italy for four years. [5]

He *had died* in 1920, before his son was born. [6]

In [5], the four-year period could either be a period leading up to T_2 , or a period which had ceased before T_2 , as would be clear in:

In her youth, my aunt *had lived* in Italy for four years. That's why she spoke Italian so well.

Thus [5] could be a projection further into the past of either [7] or [8]:

My aunt *lived* in Italy for four years. [7]

My aunt *has lived* in Italy for four years. [8]

But of course, the past perfective does not have to refer to a more remote time than that referred to by the simple past. In some cases, particularly in a clause introduced by *after*, the two constructions can be more or less interchangeable:

Fig 4.24b

After places the eating (T₂) after Sandra's return (which we may call T₃), so the past perfective, which places T₃ before T₂, is redundant. What difference it does make is a matter of the 'standpoint' of the speaker. In [9] the 'past in past' time T₃ is identified as being earlier than T₂ by the past perfective; but in [10] it is left to the conjunction *after* to signal this temporal relation.

Fig 4.24c

Adverbials of time position, when used with the past perfective, can identify either T₂ or T₃. Placed initially, they often identify T₂:

When the police arrived, the thieves had run away. [11]

But in final position, the interpretation whereby the adverbial refers to T₃ is more likely:

The thieves had run away *when the police arrived*. [12]

Hence in [11], *when* is likely to be equivalent to *By the time that ...*, but in [12] the *when* clause is likely to be an answer to the question: 'When had the thieves run away?'

Note [a] *When* in the sense of 'immediately after' behaves like *after* in sentences [9] and [10]. The following are therefore virtually synonymous:

I ate my lunch when Sandra *had come* back from her shopping.

I ate my lunch when Sandra *came* back from her shopping.

[b] There is one construction in which the past perfective clearly could not be replaced, as a means of referring to past time, by the simple past. This is an indirect speech construction, in which the past perfective indicates backshift (cf 14.31) into the more remote past: *I told her the parcel had not arrived*.

[c] The past perfective can also be a backshifted equivalent of the present perfective in expressions like *I hadn't noticed*; *I'm leaving - had you heard?* In these cases, a past time of orientation T₂ is implied by context.

[d] As well as past-in-past, the past perfective can be used to indicate hypothetical past (cf 4.19, 14.23, 15.35).

Progressive aspect

4.25 As its name suggests, the PROGRESSIVE ASPECT (also sometimes called the DURATIVE or CONTINUOUS aspect) indicates a happening IN PROGRESS at a given time. Compare:

SIMPLE PRESENT: Joan *sings* well. [1]

PRESENT PROGRESSIVE: Joan *is singing* well. [2]

These two sentences have the same tense, but different aspects. Notice the difference this makes to the meaning: *Joan sings well* refers to Joan's competence as a singer (that she has a good voice - a relatively permanent attribute); *Joan is singing well* refers to her performance on a particular occasion or during a particular season. The same formal contrast could be made for the past tense:

SIMPLE PAST: Joan *sang* well. [3]

PAST PROGRESSIVE: Joan *was singing* well. [4]

But in this case, the semantic contrast (assuming a 'past event' interpretation of [3]) is different: the simple past makes us see the event as a whole, while the past progressive makes us see it as an activity in progress. The different effect of the progressive in [1-2] and in [3-4] can be explained as follows.

The meaning of the progressive can be separated into three components, not all of which need be present in a given instance:

- (a) the happening has DURATION
- (b) the happening has LIMITED duration
- (c) the happening is NOT NECESSARILY COMPLETE

The first two components add up to the concept of TEMPORARINESS. Thus in [2], the progressive signals that Joan's singing is a temporary rather than a permanent phenomenon; in [4], on the other hand, the progressive makes us see the event as enduring over a period, rather than as happening all at once. In [2], the progressive 'shrinks' the time span of *sings*; in [4] it 'stretches out' the time span of *sang*. This difference arises because component (a) is distinctive for single events; whereas component (b) is distinctive for states and habits. The component of incompletion (c) is distinctive chiefly in the case of certain types of dynamic verb meaning called CONCLUSIVE (cf 4.33–35):

I read a novel yesterday evening. [*ie* the whole novel]

I was reading a novel yesterday evening. [*ie* there is no implication that I finished the novel in the course of the evening]

Note [a] The progressive aspect is infrequent compared with the nonprogressive. A count of a large number of verb constructions has indicated that less than 5 per cent of verb phrases are progressive, whereas more than 95 per cent are nonprogressive. The same count shows that progressive forms are more frequent in conversation than in scientific discourse; also that they are marginally more frequent in conversational AmE than in conversational BrE.

[b] It may be argued that there is yet a fourth component in the meaning of the progressive: *viz* that the event described has an interrelationship or identity with another simultaneous event (cf 4.36 on 'temporal frames'):

Do you think he *was telling* the truth?

In this case, there is no suggestion of incompletion, but there does appear to be an unspoken implication '... when he said that'. This use of the progressive applies especially to verbs of speaking:

A: What did she mean by that?

B: I think she *was advising* you not to interfere.

State, event, and habit with the progressive

4.26 The three verb senses of state, event, and habit are differently interpreted with the progressive:

(a) STATE PROGRESSIVE

In many cases (cf 4.28–31) the progressive is unacceptable with stative verbs:

We *own* a house in the country.

*We *are owning* a house in the country.

*Sam's wife *was being* well-dressed.

This can be explained, in part, by the observation that stative verb meanings are inimical to the idea that some phenomenon is 'in progress'. States are 'like-parted' in that every segment of a state has the same character as any other segment: no progress is made. (Contrast *We are building a house in the country*.) Where the progressive does occur, it is felt to imply temporariness rather than permanence:

We *are living* in the country. [temporary residence]
We *live* in the country. [permanent residence]

(On the status of verbs such as *live*, cf 4.32).

(b) EVENT PROGRESSIVE

With event meanings (cf 4.33–5), the progressive conveys the idea that an event has duration, and has not yet come to an end. Contrast the instantaneous present (cf 4.7) meaning of [1] with the duration implied by [2] or [3]:

The referee *blows* his whistle. [1]

The referee *is blowing* his whistle. [2]

The train *was approaching*. [3]

Both [1] and [2] could be part of a radio commentary on a football match; but [1] would suggest a brief blast on the whistle, while [2] would tend to suggest a continuous or repeated blowing of the whistle. The present progressive is a more common way of referring to a present event than the simple present, because of the implication of duration that tends to accompany such events:

A: What { *is* Mary doing / *does Mary do } at this moment?

B: She { *is* watching / *watches } television.

(c) HABITUAL PROGRESSIVE

Combined with habitual meaning, the progressive implies that the repetition takes place over a limited period:

The professor *types* his own letters. [The habit is permanent.]

The professor *is typing* his own letters while his secretary is ill. [The habit is temporary.]

At that time she *was having* regular singing lessons.

Less frequently, the progressive combines with habitual meaning to suggest that every event in a sequence of events has duration/incompletion:

Whenever I see her, she's *working* in the garden.

The Chief Secretary rises at 6.15 every morning. By 7 o'clock he has taken a light breakfast, and *is* already *reading* the morning newspapers.

Remember that when *you're taking* a rest, someone else *is* always *working*.

To have this interpretation, the clause must contain an adverbial of time position or of frequency.

Note [a] In combination with *always*, *continually*, or *forever*, the progressive loses its semantic component of 'temporariness':

Bill is { *continually* / *always* / *forever* } working late at the office. [4]

The progressive in such cases often imparts a subjective feeling of disapproval to the action described. Thus in [4], the speaker seems to suggest that working late at the office is an irritating or deplorable habit. This suggestion is stronger when the adverb *forever* is used. In other cases there may be no such derogatory implication: *A child is always learning*.

[b] With reference to the event progressive (b), a different kind of contrast with the instantaneous present is illustrated by certain verbs (eg: *write, enclose, send, hasten*) used with a 1st person subject in letter writing:

I ^{write}
 { *am writing* } to inform you that. . .

The simple present in such cases has a force similar to that of a performative (cf 4.7) such as *I (hereby) promise . . .*, and this analogy is indeed confirmed by the occurrence of *herewith* (an adverb similar to the *hereby* which can accompany performatives) in, eg: *I enclose herewith . . .* The simple present in this context is formal or official in tone, whereas the progressive is more informal, and more appropriate to a private letter.

Situation types

- 4.27 To explain the constraints on the use of the progressive, as well as for other purposes, it is useful to reconsider the stative/dynamic distinction of 4.4, and to subdivide verb meanings into a larger number of categories. One such subdivision is given in Fig 4.27, where 11 categories are recognized, and labelled A–K. It is important to note, also, that verb meanings can be separated only artificially, in this respect, from their complementations. For example, the verb *write* occurring *in vacuo* cannot be classified; for we may observe an important difference between *Jill is writing*, which designates an ongoing activity, and *Jill is writing a novel*, which designates an activity for which a goal or objective is implied (and for which the name ‘accomplishment’ will be used). More detailed explanation must now be given of the categories in Fig 4.27 opposite, and their relevance to the progressive.

Stative types A and B: qualities and states

- 4.28 Among stative situation types, a rough distinction may be drawn between QUALITIES (Type A in Fig 4.27) and STATES (Type B in Fig 4.27). Qualities are relatively permanent and inalienable properties of the subject referent. The primary verbs *be* and *have* are preeminently quality-introducing verbs; but they can also introduce the less permanent situation types called states. Contrast:

QUALITIES		STATES	
Mary is Canadian.	[1]	Mary is tired.	[3]
Mary has blue eyes.	[2]	Mary has a bad cold.	[4]

Normally such stative situation types do not occur with the progressive (this is especially true of qualities):

*Mary is being a Canadian.	[1a]	?*Mary is being tired.	[3a]
*Mary is having blue eyes.	[2a]	?*Mary is having a bad cold.	[4a]

If sentences such as [1a–4a] do occur with the progressive, it is a sign that they have been in some sense reinterpreted as containing a dynamic predication. For example, *Peter is being awkward* signifies that ‘awkwardness’ is a form of behaviour or activity, not a permanent trait. If sentence [3a] were to occur, it would signify that Mary was *pretending* to be tired (ie indulging in a deceptive activity), rather than in a state of real lassitude.

Although verbs with stative meaning have sometimes been called ‘nonprogressive’, we should observe that the definition of stative verbs is not

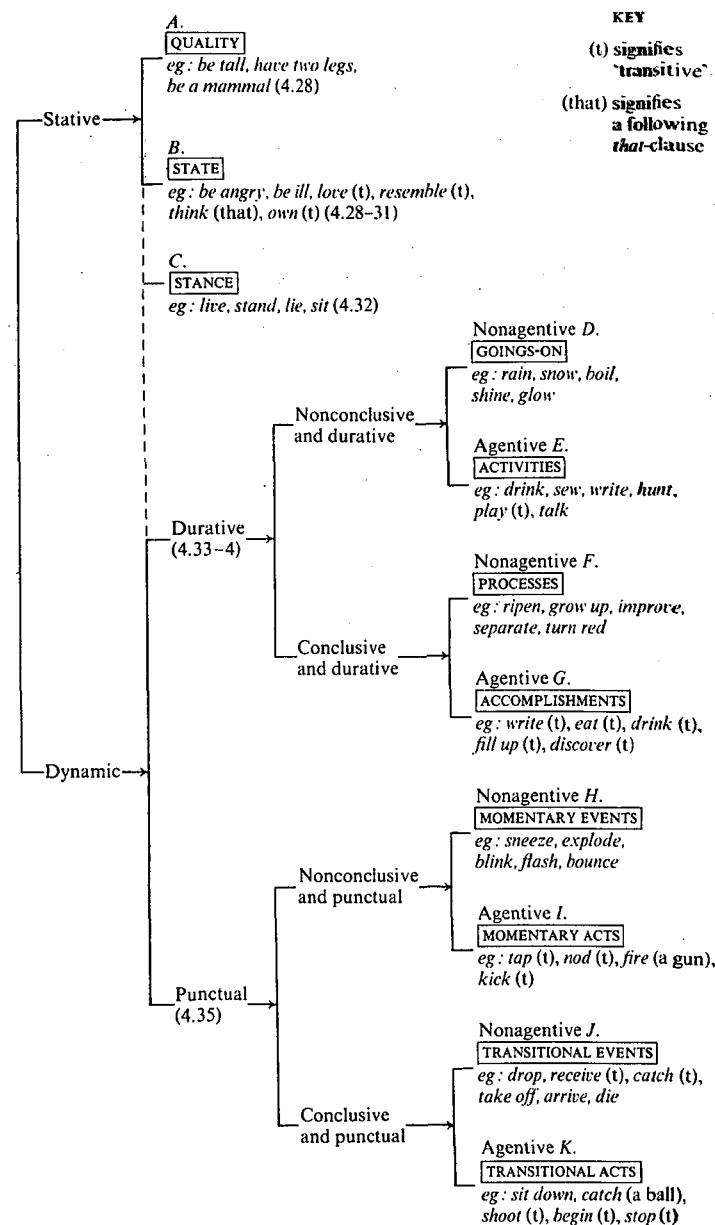

Fig 4.27 Situation types

so much that they are incompatible with the progressive, as that when they are combined with the progressive, some change of interpretation other than the addition of the 'temporary' meaning of the progressive aspect is required. This change of interpretation can usually be explained as a transfer, or reclassification of the verb as dynamic, *eg* as having a meaning of process or agentivity. The representative stative verbs *be*, *hope*, and *resemble*, are illustrated in Table 4.28:

Table 4.28

NORMAL NONPROGRESSIVE	NONNORMAL PROGRESSIVE	SPECIAL EFFECT OF PROGRESSIVE
The neighbours <i>are</i> friendly.	The neighbours <i>are being</i> friendly.	Suggests that 'friendliness' is a form of behaviour (perhaps insincere).
I <i>hope</i> you will come.	I <i>am hoping</i> you will come.	Makes the speaker's attitude more tentative and perhaps more polite (4.37).
Tina <i>resembles</i> her sister.	Tina <i>is resembling</i> her sister more and more.	With the comparative construction, the progressive turns the stative meaning into a process meaning (4.34).

Another characteristic of such verbs, when they are expressing states, is that they can be used in a 'temporary' sense in the simple present tense:

The manager *is* away this afternoon. [5]

The manager *works* this afternoon. [6]

For example, [5] is nonprogressive, and yet clearly refers to a limited period; in contrast, [6] cannot refer to a temporary state of affairs; instead, it has to be interpreted in a habitual sense ['The manager works this afternoon (being Tuesday) every week']. Equally, in [7]:

The music they *are playing sounds* like Mahler. [7]

the choice of the progressive with the dynamic verb *play* indicates the same limited time period as the use of the nonprogressive with the stative verb *sound*.

Note The constraints of the progressive cannot, it seems, be explained entirely in terms of meaning. Since the use of the progressive aspect has been undergoing grammatical extension over the past few hundred years, it is likely that its use is still changing at the present day, and that its description at any one time cannot be totally systematic. This would explain the difficulties faced by those attempting to account in every respect for the conditions for the use of the progressive in terms of semantic generalizations.

'Private' states

4.29 Many stative verbs denote 'private' states which can only be subjectively verified: *ie* states of mind, volition, attitude, etc. We may distinguish:

- (a) INTELLECTUAL STATES (*eg*: *know*, *believe*, *think*, *wonder*, *suppose*, *imagine*, *realize*, *understand*), especially when followed by a nominal clause as object:

I { *understand*
**am understanding* } that the offer has been accepted.

- (b) STATES OF EMOTION OR ATTITUDE (*eg*: *intend*, *wish*, *want*, *like*, *dislike*, *disagree*, *pity*), especially when followed by clausal complementation:

She { *likes*
**is liking* } to entertain the students.

Such verbs do, however, occur with the progressive when temporariness or tentativeness is being emphasized (*cf* 4.37), especially when the progressive is combined with the attitudinal past (*cf* 4.16):

What *were* you *wanting*?

I *was hoping* you would give me some advice.

The same applies to some verbs of Type (a) above (*eg think*).

- (c) STATES OF PERCEPTION (*eg*: *see*, *hear*, *feel*, *smell*, *taste*), with which we may also place appearance as expressed by *seem* and *appear*. Perception verbs are more fully discussed in 4.30 below.

- (d) STATES OF BODILY SENSATION (*eg*: *hurt*, *ache*, *tickle*, *itch*, *feel cold*). For predications belonging to this small but interesting category, the progressive and the nonprogressive are more or less interchangeable when referring to a temporary state:

My foot { *hurts*.
**is hurting*. } My back { *aches*.
**is aching*. }

Note The verb *feel* is versatile in that it can occur in all four categories above:

- (a) I *feel* that the play will be a success. (c) The ground *feels* soft.
(b) We *felt* very angry. (d) She *feels* sick.

Feel can also occur as a dynamic perception verb (*cf* 4.30).

Verbs of perception

4.30 In the sphere of perception, stative meaning can be expressed in two ways: we can either place the perceiver in subject position, as in [1a–5a] below, or we can place the percept (or 'thing perceived') in subject position, as in [1b–5b]:

(i) PERCEIVER AT S

- I *can see* the house. [1a]
We *could hear* singing. [2a]
I *could feel* vibrations. [3a]
Can you *smell* the soap? [4a]
I *could taste* the garlic in the soup. [5a]

(ii) PERCEPT AT S

- The house *looks* empty. [1b]
The singing *sounded* far away. [2b]

- The vibrations *felt* as if they could have been caused
by an earthquake. [3b]
It *smells* of lavender. [4b]
The soup *tasted* strongly of garlic. [5b]

To express the state of perception with Type (i), we use the modal *can/could* followed by the verb of perception. The simple present or past would express dynamic meaning, so that the act of perception would be seen as an event with a defined beginning and endpoint. Compare:

- I *heard* the bell ring. [event seen as a whole] [6]
I *could hear* the bells ringing. [perception continuing over a period] [7]

(A 'mixed-aspect' sentence *I heard the bells ringing* is also a possibility.) The present tense version of sentences like [6] is unusual:

- I *hear* the bell ring! Aha, I *see* you!

Such sentences sound histrionic or playful because *hear* and *see* in this context exemplify the instantaneous present (cf 4.7). More acceptable examples with the simple present are sentences like *I smell something burning* and *Do you see anything moving outside?*, where emphasis is given to the suddenness of a perception.

Sentences such as [1a-5a] and [1b-5b] cannot normally occur with the progressive aspect, even though they are likely to refer to temporary rather than permanent states. This may be contrasted, however, with sentences containing the perception verbs *look (at)* and *listen (to)*, which, being agentive and dynamic, describe an intentional activity, and occur quite commonly with the progressive:

- A: What are you doing? B: { *I'm *seeing*
I'm *looking at* } these photographs.
{ ?*I'm *hearing*
I'm *listening to* } a new record.

The English language lacks special agentive perception verbs for the other three senses of touch, smell, and taste, so that the stative verbs *feel*, *smell*, and *taste* must do duty here, as well as for the two stative meanings:

- What are you doing? { I'm *feeling* for the light switch.
I'm *smelling* the roses.
I'm *tasting* the wine, to see how sweet it is.

In summary, then, we may display the four distinct uses of perception verbs as in Table 4.30.

Other verbs of similar behaviour to *see*, *hear*, etc are *perceive* and *detect*.

Note [a] *Look* in sense 'percept at S' is exceptional in occurring commonly with the progressive:

- You { *look*
are *looking* } tired this evening.

There is little discernible difference between the progressive and nonprogressive variants here.

[b] Of course, there are nonperceptual uses of the verbs in Table 4.30. These include the use of *see* in the sense of 'meet': *I'm seeing the manager tomorrow*.

Table 4.30 Perception verbs

STATIC		DYNAMIC	
PERCEPT AT S	PERCEIVER AT S	NONAGENTIVE	AGENTIVE
<i>look</i>	can/could <i>see</i>	<i>see</i>	<i>look (at)</i>
<i>sound</i>	can/could <i>hear</i>	<i>hear</i>	<i>listen (to)</i>
<i>feel</i>	can/could <i>feel</i>	<i>feel</i>	<i>feel</i>
<i>smell</i>	can/could <i>smell</i>	<i>smell</i>	<i>smell</i>
<i>taste</i>	can/could <i>taste</i>	<i>taste</i>	<i>taste</i>

[c] Note the exceptional use of *see* and *hear* with the progressive (focusing on the process of perception) in:

I need some spectacles. I'm not *seeing* things so well these days.

A: Did you hear a bell ring just then?

B: No. I can't hear a thing.

A: There it goes again! { I am *hearing* it now.
I can *hear* it now.

In the following, too, the exceptional occurrence of the progressive seems to arise from perception being treated as an ongoing process: *Your soup's tasting better every day*; *My scarf is no longer smelling of lavender*. Such examples are very unusual, however.

Other states of 'being' and 'having'

- 4.31 The main verbs *be* and *have*, although they can both be used in dynamic senses, are the most central and characteristic of stative verbs, and can frequently be used in the paraphrasing of other stative verbs:

- We *agree* with you. ~ We *are in agreement* with you.
The water *tasted* bitter. ~ The water *had a* bitter taste.

Apart from the 'private' verbs discussed in 4.29-30, there are other verbs which are paraphrasable in this way, and can be fittingly called 'verbs of being and having':

- The box *contains* a necklace. [= 'A necklace is in the box']
The can *holds* two gallons. [= '... has a capacity of ...']
Your age *doesn't matter*. [= '... is not important']
It *depends* on the weather. [= '... is dependent on ...']
Jim *resembles* his sister. [= '... is like ...']
She *belongs* to the tennis club. [= '... is a member of ...']

These verbs also reveal their stative character in the above senses by their unacceptability with the progressive: **The box is containing a necklace*, etc.

Note Again, exceptional uses of these as 'process' verbs may be found; eg: *How much was the tank containing when you last inspected it?*

Type C: stance

- 4.32 In addition to the stative verbs noted above, there is a small but important class of verbs which express the situation type we will call STANCE, and which are intermediate between the stative and dynamic categories. The main stance verbs are *live*, *stand*, *sit* and *lie*, and they are characterized by their

ability to be used both (a) with the nonprogressive to express a permanent state, and (b) with the progressive to express a temporary state:

- { James *lives* in Copenhagen. [permanent residence]
- { James *is living* in Copenhagen. [temporary residence]
- { The city *lies* on the coast. [permanent position]
- { People *were lying* on the beach. [temporary posture]
- { His statue *stands* in the city square. [permanent position]
- { He *is standing* over there. [temporary posture]

Similar possibilities exist with the perfective aspect: the perfective progressive, as well as the simple perfective, can be used to refer to a state leading up to the present:

- I have *sat* here for over two hours. [1]
- I have *been sitting* here for over two hours. [2]

Speakers differ, however, in judging how to choose between the constructions of [1] and [2]. Some speakers feel that [2] suggests a more temporary state, whereas others feel there is little to choose between the two variants. There is also sometimes a feeling that [1] is different from [2] in implying that the 'sitting' is concluded at the present moment, while [2] implies that the posture may well continue into the future.

Because of its intermediate status, the stance action type illustrates an element of gradience (cf 2.60) in the stative/dynamic contrast. At one end of the stative/dynamic scale, as Fig 4.27 shows, there are acts which lack appreciable duration, such as *nod* and *arrive*; at the other end, there are permanent qualities such as *be tall*. To some extent, the stative/dynamic dichotomy is an artificial division of this continuum. We move now to the bottom part of Fig 4.27, in order to consider the different varieties of dynamic meaning.

Dynamic types D-K

- 4.33 Among dynamic situation types in Fig 4.27, we have to distinguish eight types according to three binary oppositions:

Table 4.33 Dynamic situation types

	Durative		Punctual	
Non-conclusive	<i>D</i> GOINGS-ON	<i>E</i> ACTIVITIES	<i>H</i> MOMENTARY EVENTS	<i>I</i> MOMENTARY ACTS
Conclusive	<i>F</i> PROCESSES	<i>G</i> ACCOMPLISHMENTS	<i>J</i> TRANSITIONAL EVENTS	<i>K</i> TRANSITIONAL ACTS
	Nonagentive	Agentive	Nonagentive	Agentive

The DURATIVE/PUNCTUAL distinction separates happenings which are capable of having duration from those which are not. Since durative situation types

take place over a (normally limited) period of time, they characteristically combine with the progressive. Punctual situation types, on the other hand, are theoretically incompatible with the progressive aspect: they can occur with the progressive, but only through a special interpretation (cf 4.35).

The CONCLUSIVE/NONCONCLUSIVE contrast draws a line between those situation types which result in a change of state and those which do not. For example, it is essential to the meaning of *opened* in *She opened the door* that the door ends up in a state of being open, which is different from the state in which it started. The notions of completion and incompletion apply to the conclusive situation types, but not to the nonconclusive ones. Conclusive situation types are those which allow a resultative interpretation of the perfective aspect (cf 4.22), eg: *The weather has improved* implies that 'the weather is now better'.

The AGENTIVE/NONAGENTIVE contrast is illustrated by *John was thinking* and *The sun was shining*. The first is agentive, in contrast to the second, because it implies that the subject refers to an agent or 'doer' of the action. The 'doer' is typically human, and is the deliberate or self-activating initiator of the action. To some extent, the agentive/nonagentive boundary is unclear; but agentive situation types are by definition dynamic rather than stative. The substitute verb *do* (cf 12.26) can substitute for an agentive situation type.

All dynamic situation types can combine with the progressive aspect, but they have various implications for the interpretation of the progressive, and it is to these that we now turn.

Durative situation types

4.34 Type D: GOINGS-ON

These are 'activities' carried out by inanimate forces; eg:

- It is raining.* The wind *is blowing* hard.
- Is your watch working?* The engine *was running* smoothly.

The difference between this type and Type E is that Type E is agentive.

Type E: ACTIVITIES

These (in contrast with Type G) are typically expressed by intransitive verbs with animate subjects:

- Jill was writing/working/singing/dancing/eating/sewing/swimming/ etc.

But they also occur with some (normally noncount) direct objects:

- The children are playing *chess*. Norman is reading *poetry*.

and occasionally with the passive: *The approaches to the city were being watched*.

Type F: PROCESSES

These denote a change of state taking place over a period:

- The weather is *getting* warmer.
- Our economic prospects *are now improving*.
- The sun *is ripening* our tomatoes nicely.

As with Type *G*, the progressive with this type indicates the *incompleteness* of the change.

Type *G*: ACCOMPLISHMENTS

These denote an action or activity which takes place over a period and has a goal or endpoint. Intransitive verbs placed under Type *E* 'Activities' generally become accomplishments when a direct object or an adverbial of destination is added:

Jill *is knitting* herself a sweater.

The boys *were swimming* across the estuary.

By these additions, an activity becomes a task with a defined conclusion.

But the progressive indicates, with both processes and accomplishments, that the task was not necessarily completed:

The boys *were swimming* across the estuary, but a giant wave made them turn back.

One of the boys *was drowning*, but I dived in and saved him.

(Cf: *One of the boys *drowned*, but I dived in and saved him.)

With accomplishments, there is a significant contrast between the constructions *finish V-ing* and *stop V-ing*:

They have *finished* widening the road. [The task is complete.]

They have *stopped* widening the road. [The task is not necessarily complete, but the activity has ceased.]

Punctual situation types

4.35 Types *H* and *I*: MOMENTARY EVENTS AND ACTS

The only difference between these two types is that *H* is *nonagentive*:

The tops of the trees *were waving* in the wind, and the branches *were shaking* and *knocking* against the side of the house. Downstairs, a door *was banging*.

In this description, the verbs *knock* and *bang* can be said to describe momentary events (*ie* events effectively without duration) and when they are used with the progressive, we cannot make sense of them except by supposing that some repetition of the event took place. The same is true with momentary acts, expressed by verbs such as *nod* (when transitive), *fire*, and *jump*:

John *was nodding* his head.

Someone *was firing* at us.

Kirov's horse *is jumping* well.

For example, *Someone was tapping on the window* would be inappropriate if there was only one tap. In this respect, momentary event verbs may be likened to count nouns such as *germ*, *pea*, *oat*, *hair*, *lentil*, which refer to small objects, and for which the singular count use (*a germ*, *a hair*, etc) is exceptional in comparison with the plural or noncount use. (On the analogy between noun and verb categories, cf 4.4.)

Types *J* and *K*: TRANSITIONAL EVENTS AND ACTS

These differ from Types *F* and *G* in that they have little or no duration, and

from Types *H* and *I* in that they involve a consequent change of state. Transitional events are *nonagentive*:

The train *is arriving* at platform 4.

The queen *was dying*.

Transitional acts are *agentive*:

I'm *stopping* the car at this garage.

It looks as if Juarez *is scoring* another goal.

Again, since the meaning of the predication effectively excludes duration, the progressive requires a special interpretation. In this case, the interpretation is likely to be anticipatory; *ie* that the progressive refers to a period LEADING UP TO the change of state: *eg*: *The Boeing 747 is taking off* refers to the accelerating of the plane preparatory to the actual take-off.

Note In other contexts, for example when the verb has a plural subject or object, a repetitive rather than anticipatory interpretation of such verb meanings is possible:

At the airport, several freight aircraft *were taking off* noisily.

Progressive aspect in relation to tense

4.36 The progressive generally has the effect of surrounding a particular event or point of time with a 'temporal frame', which can be diagrammed:

That is, within the flow of time, there is some point of orientation from which the temporary event or state described by the verb can be seen to stretch into the future and into the past. With the present progressive, the time of orientation is normally 'now', although it can also be a recurrent time or an imaginary time, in accordance with the interpretation of the habitual progressive or the historic or fictional present:

When the eight o'clock news comes on, I'm already *travelling* to work.

The gunfire *is growing* louder ahead of us, as suddenly a fearful hush descends upon our company.

With the past tense, again the 'temporal frame' is often implied, this time by reference to a past time of orientation T_2 (cf 4.11–12):

A moment later, we *were hurrying* for shelter beneath the trees.

Whereas the relationship between two simple past forms is normally one of TIME-SEQUENCE, the relationship between a past progressive and simple past form is one of TIME-INCLUSION:

When we *arrived*, Jan *made* some fresh coffee.

When we *arrived*, Jan *was making* some fresh coffee.

(Cf 14.27 Note [a] for exceptions.) The first example tells us that the coffee-making followed the arrival; the second, that the arrival took place during the coffee-making. The 'temporal frame', however, is not a necessary condition of the past progressive:

We *were watching* the match all afternoon.

Since the adverbial *all afternoon* here refers to a longish period, there is no implication that the match forms a 'temporal frame' around the afternoon.

Note The idea of a 'temporal frame' is related to that of 'interrelationship or identity' discussed in 4.25 Note [b]; cf: *If he said that, he was lying*.

Other uses of the progressive aspect

4.37 In addition to its major function of indicating temporariness, the progressive also has the following special uses:

- (a) It may be used to refer to the future or to the future in the past (cf 4.44, 4.48):

Are you going to the meeting (tomorrow)?
They were getting married the following spring.

On the future semi-auxiliary construction *be going to* + infinitive, cf 4.43.

- (b) It may be used with the attitudinal past tense or the present tense, to refer tentatively to a present wish or attitude:

I'm hoping to borrow some money.
I was wondering if you could help me.

Contrast these sentences with the less tentative, and potentially less polite, use of the simple present:

I hope to borrow some money.
I wonder if you can help me.

Particularly when combined with the attitudinal past tense (cf 4.16), such forms enable us to avoid the impoliteness which might well result from expressing one's attitude too directly, eg in making a request.

- (c) It may be used especially following the auxiliary *will* (or *shall*) with the special implication that the action will take place 'as a matter of course' in the future (cf 4.46):

I'll be seeing you next week.

Note The 'matter-of-course' implication of *will* (or *shall*) with the progressive is also found with other modal auxiliaries (cf 4.65 Note [a]), and possibly also with the past progressive in conversational contexts; eg: *I was talking to Ann, and she was telling me that the job is still vacant*. In contrast to the simple past *talked* and *told*, the progressive here suggests a casual chat rather than a purposeful discussion.

Perfective progressive

4.38 When the perfective and progressive aspects are combined in the same verb phrase (eg: *has been working*), the features of meaning associated with each of them are also combined. Nevertheless, the perfective progressive has a

semantic range that is not entirely predictable from the meanings of its components.

Of the three features associated with the main meaning of the progressive (cf 4.25), DURATION, LIMITATION OF DURATION, and POSSIBLE INCOMPLETENESS, the first two give the perfective progressive a sense of 'temporariness', seen in these examples:

I've been writing a letter to my nephew.
How have you been getting on?
It's been snowing again.

These sentences contain durative verbs which typically go with the progressive aspect, and the meaning of the construction is roughly that of TEMPORARY SITUATION LEADING UP TO THE PRESENT, comparable to the state-up-to-the-present use of the simple perfective (cf 4.18ff). With verbs such as *live*, *stand*, *lie*, etc, however, the limitation of duration is weak, and is not felt at all by some speakers:

We've lived in Europe all our lives. [1]
We've been living in Europe all our lives. [2]

Because of the lengthy time scale [2] is less likely than [1], but nevertheless [2] is by no means unacceptable.

The element of 'limited duration' makes it difficult to use the perfective progressive with punctual verbs:

He has been starting his car. [3]
 ?**He has been starting his book.* [4]

Of these, [3] makes sense, although it reflects on the reliability of the car. On the other hand, [4] is nonsensical because it assigns duration to something which cannot have duration: the only way to make sense of it is to construe it as an ironical remark 'He has been trying/intending to start his book', in accordance with the anticipatory (cf 4.35) or future (cf 4.37) interpretation of the progressive.

4.39 The feature of possible incompleteness becomes evident when the perfective progressive is combined with accomplishment and process predications:

*I've {cleaned
 been cleaning} the windows.*

The simple perfective here has a resultative meaning: 'The windows are now clean'. But the perfective progressive can be used even if the job is not finished:

{ A: Have you cleaned the windows?
 B: No, I haven't finished them yet.
 A: Have you been cleaning the windows?
 B: Yes, but I haven't finished them yet.
 *I've written a novel, but I haven't finished it.
 I've been writing a novel, but I haven't finished it.

Because of its resultative meaning, the simple perfective cannot be used with accomplishment verbs when the clause contains an adverbial of duration:

- They've been repairing the road for months.*
 **They've repaired the road for months.*

An exception to this, however, occurs where the duration adverbial applies to the resultant state itself or where the clause is negative (cf 8.57ff):

- They've gone to Spain for two weeks.*
They haven't repaired the road for years.

If a conclusive verb is not accompanied by an adverbial of duration, the implication is often that the effects of the happening are still visible:

- You've been fighting again. ['I can tell that from your black eye']*
It's been snowing. ['Look, the ground is white']
Have you been crying? ['Your eyes are red']

In such cases, the activity indicated by the verb is assumed to have recently ceased. When accompanied by an adverbial of duration, however, the meaning of the verb is assumed to be still operative up to the present, and possibly to persist in the future:

He's been losing money for years (and will probably continue to do so).

We may summarize the main use of the perfective progressive as follows:

- The happening (a) has (limited) duration
 (b) continues up to the present or recent past
 (c) need not be complete
 (d) may have effects which are still apparent.

- 4.40 As an additional possibility, the present perfective progressive may be used in the iterative sense of TEMPORARY HABIT UP TO THE PRESENT, comparable to the habitual use of the present perfective (cf 4.20):

Martin has been scoring plenty of goals (this season).
I've been working on the night shift for several weeks.

Again, it is implied that the repetition of the activity described may continue into the future.

The meaning of the perfective progressive may combine with those of the past tense and of the modal verbs:

- The fire *had been raging* for over a week. [1]
 You *should have been looking* after the baby. [2]
 By Friday, we *will have been living* here for ten years. [3]

[1] and [3] require an appropriate shift of the time of orientation from 'now' (T_1) to a point (T_2) in the past or the future. As has already been explained with reference to the simple perfective (cf 4.19), the perfective progressive when combined with the past tense or a modal verb loses its restriction to a period of time leading up to the point of orientation. It may thus, unlike the

simple present perfective, be followed by an adverbial of time position. Contrast:

- **I have been talking to him at the time of the murder.*
I had been talking to him at the time of the murder.
I must have been talking to him at the time of the murder.

Note [a] The perfective progressive does not, however, combine freely with the passive voice. The following sentence is felt to be awkward:

The road has been being repaired for months.

The awkwardness of the perfective progressive passive is probably due in part to the juxtaposition of two forms of the verb *be* (cf 3.56). (*The road has been getting repaired for months*, for example, is more acceptable.)

[b] The perfective progressive can be ambiguous between habitual and nonhabitual readings. Such ambiguities, however, are unlikely to cause genuine misunderstanding:

I have been cycling to work for the last three weeks.

The nonhabitual reading, implying that the speaker has been cycling continuously for three weeks, in this case is factually absurd, but might provoke the comic response: *So why don't you get a job nearer home?*

Some means of expressing future time

- 4.41 Although according to the analysis we have adopted (cf 4.3) there is no future tense in English, it is useful at this point to consider the most important constructions for expressing future time, particularly in independent clauses (concerning dependent clauses, cf 14.22). Futurity, modality, and aspect are closely interrelated, and this is reflected in the fact that future time is rendered by means of modal auxiliaries, by semi-auxiliaries, or by the simple present or present progressive forms.

Will/shall + infinitive

- 4.42 The most common way of expressing futurity is the modal auxiliary construction with *will*, *shall*, or *'ll*:

- He *will be* here in half an hour. [1]
 Will you *need* any help? [2]
 No doubt I *'ll see* you next week. [3]
 If the crop fails there *will be* a famine. [4]

The modal verb *will* (or the contracted form *'ll*; cf 3.39–40) is used with future meaning with subjects of all three persons. The infrequent modal *shall* is used (especially in Southern Standard BrE) to indicate futurity, but only with a first person subject:

- No doubt I *shall see* you next week. [3a]

Although *shall* and, particularly, *will* are the closest approximations to a colourless, neutral future, they do cover a range of meanings with modal colouring, from prediction to volition (cf 4.57f). A strong teaching tradition,

especially in BrE, has upheld the use of *shall* as the correct form, in preference to *will*, with a first person subject in formal style.

Predictive *will* is particularly common in the clause superordinate to conditional or temporal clauses:

You'll feel better if/when you take this medicine. [5]

Even where no conditional clause is present, there is nevertheless frequently an implication that the future event or state of affairs will result from, or depend on, the fulfilment of certain future conditions which may not be specified:

Take this medicine. You'll feel better in an hour or so.

How can you be sure that there will be a change of government at the next election?

Turning to the volitional examples, *will* and *shall* especially with the 1st and 2nd persons often express intention, eg in making agreements, promises, threats, etc:

How soon will you announce your decision?

We shall ensure that the repairs are carried out according to your wishes.

Other volitional and obligational uses are discussed in 4.57f.

- Note With a 2nd or 3rd person subject, *will* can also express an abrupt and quasi-military command:
You will do as I say.
Officers will report for duty at 0600 hours.

Be going to + infinitive

- 4.43 Another construction frequently used to express futurity, especially in informal speech, is *be going to* followed by the infinitive. Its general meaning is 'future fulfilment of the present'. Looked at more carefully, the construction has two more specific meanings, of which one, FUTURE FULFILMENT OF PRESENT INTENTION, is chiefly associated with personal subjects and agentive verbs:

When are you going to get married?

Leila is going to lend us her camera.

I'm going to complain if things don't improve.

The other meaning, FUTURE RESULT OF PRESENT CAUSE, is found with both personal and nonpersonal subjects:

It's going to rain.

She's going to have a baby.

There's going to be trouble.

You're going to get soaked.

As these examples suggest, the association of *be going to* with the present often leads to the assumption that it indicates the proximity of the future event. Unlike *will* and *'ll*, *be going to* is not generally used in the clause superordinate to a conditional clause:

If you leave now, you'll never regret it.

?If you leave now, you are never going to regret it.

- Note However, *be going to* does occur with conditional sentences like the following:

If you're expecting a first-class hotel, you're going to be disappointed. [1]
Since the time of orientation for *be going to* is the present, it is used in conditional sentences only when the causal or contingent link between the meanings of the two clauses exists at the present time. In the more usual case, this link is placed in the future, and so *will* is used instead. The special import of *be going to* in [1] can be emphasized by adding before the subject of the main clause: 'I can already tell you that ...'

Present progressive

- 4.44 The present progressive can refer to a future happening anticipated in the present. Its basic meaning is: FUTURE ARISING FROM PRESENT ARRANGEMENT, PLAN, OR PROGRAMME:

The orchestra is playing a Mozart symphony after this.

The match is starting at 2.30 (tomorrow).

I'm taking the children to the zoo (on Saturday).

We have seen that the progressive cannot normally be used with certain stative verb types (eg with the verb *be*) and this restriction also applies to the use of the progressive for future time:

*Strawberries are being more expensive next week.

(cf: Strawberries will be more expensive next week.)

Like *be going to*, the present progressive suggests that the future happening is imminent, unless this is contradicted by a more distant time mentioned in the context. Contrast:

That does it! I'm leaving. ['Soon' is understood]

I'm leaving the university in two years' time. [when I've finished my studies]

- Note [a] It is easy to confuse this future use of the present progressive with the anticipatory use of the present progressive with transitional events or acts (cf 4.35). In principle, however, the distinction is clear between a future event which is planned and imminent, and a future event for which preparations are already taking place. *I'm leaving*, for example, could be understood in either of these ways, but *The old man was dying* can only be understood in the anticipatory sense.
[b] The future use of the present progressive is limited to actions brought about by human endeavour. Hence a sentence such as **The trees are losing their leaves soon* is inappropriate, implying that a tree has control over its future. Similarly, *He's dying next week* could only refer to a planned death, eg an execution.

Simple present

- 4.45 The simple present is, after the *will/shall* construction, the next most common means of referring to future actions in English (cf 4.9). This future use of the simple present is frequent, however, only in dependent clauses, where it is regularly used after conditional and temporal conjunctions such as *if* and *when*, as well as in some *that*-clauses (see further 14.22):

What will you say if I marry the boss?

At this rate, the guests will be drunk before they leave.

In main clauses, the future use of the simple present may be said to represent a marked future of unusual definiteness, attributing to the future the degree of certainty one normally associates with the present and the past. It is used, for example, for statements about the calendar:

Tomorrow *is* Thursday. School *finishes* on 21st March.

Also to describe immutable events or 'fixtures', whether or not these are determined by human planning:

When *is* high tide? What time *does* the match *begin*?

The simple present, like the progressive (cf 4.44), is used with dynamic transitional verbs *arrive*, *come*, *leave*, etc; both constructions having the meaning of 'plan' or 'programme':

The plane $\left\{ \begin{array}{l} \text{takes off} \\ \text{is taking off} \end{array} \right\}$ at 20:30 tonight. [1a]
[1b]

The simple present, however, stresses the predetermined nature of the happening: while [1b] could well refer to a rescheduled take-off time (as a result, say, of a delay), this interpretation of [1a] would be unlikely.

Note [a] Although the simple present is the normal type of future construction to use in conditional clauses, the future use of *will* and *be going to* in such clauses is by no means impossible:

If the crops $\left\{ \begin{array}{l} \text{are} \\ \text{will be} \end{array} \right\}$ ruined by next month's drought, we'll have to buy in extra food.

If you're (*going to be*) playing tennis against Jenny, you'd better borrow my racquet.

On the differences of meaning here, cf 14.22.

[b] Corresponding to the future use of the simple present in adverbial clauses is the following use of the present perfective referring to the past in the future:

The winner will be declared when every competitor *has finished* the course.

Will/shall + progressive infinitive

4.46 The modal verb construction discussed in 4.42 can be used with the progressive infinitive in a way which simply combines reference to a future time with the 'temporal frame' (cf 4.36) associated with the progressive:

When you reach the end of the bridge, I'll *be waiting* there to show you the way.

This calls for no special comment. There is, however, a separate use of the *will/shall* + progressive construction to denote 'FUTURE AS A MATTER OF COURSE'. The use of this combination avoids the interpretation (to which *will*, *shall*, and *be going to* are liable) of volition, intention, promise, etc:

We'll *be flying* at 30 000 feet.

This, spoken by the pilot of an aircraft to his passengers, means '30 000 feet is the normal and expected altitude for the flight'. If, on the other hand, the pilot said:

We'll *fly* at 30 000 feet.

the impression might be quite different: it could well be that the pilot had just decided to fly at the specified height. Because of such differences, it is often an advantage to use this complex construction in situations where the nonprogressive with *will/shall* might be lacking in tact or consideration:

When *will* you $\left\{ \begin{array}{l} \text{pay back} \\ \text{be paying back} \end{array} \right\}$ the money? [1]
[2]

Whereas [1] may seem like a rather abrupt demand for repayment, [2] seems more tactful, since it implies that the repayment is something which will happen 'as a matter of course'. In describing future happenings in which there is no direct human involvement, however, the choice between the progressive and nonprogressive alternatives is less important:

The next train to London *will* $\left\{ \begin{array}{l} \text{arrive} \\ \text{be arriving} \end{array} \right\}$ at platform four.

The only difference that need be mentioned here is that the progressive construction tends to be more informal than the ordinary nonprogressive construction.

Note Verbs that do not normally take the progressive can do so after future *will/shall* in this 'matter-of-course' sense: *He'll be owning his own house next*.

Concluding comments on constructions expressing future time

4.47 The foregoing five constructions are the most important methods of referring to future time. It has been found that in BrE the simple *will/shall* construction is much the most usual, followed by the simple present construction. (But by far the majority of simple present examples with future reference occur in dependent clauses, and are syntactically conditioned.) Of the remaining three constructions, *be going to* is the most common, followed by the present progressive, and finally by the *will/shall* + progressive construction. Although this last construction is least frequent, it is quite common in conversational contexts, and appears to be becoming more common.

Among other constructions referring to the future, reference must be made to the two quasi-auxiliary constructions *be to* + infinitive (cf 3.45f) and *be about to* + infinitive (cf 3.47). *Be to* is quite often used to refer to a future arrangement or plan:

Their daughter *is to be* married soon.

There's *to be* an official inquiry.

In this use, *be to* + infinitive resembles the future use of the simple present (cf 4.45), except that the simple present cannot normally refer to the future unless accompanied by a time adverbial or some other future-referring expression.

Be about to, on the other hand, expresses near future:

The train *is about to* leave.

I'm *about to* read your essay.

The meaning of *be about to* could be alternatively expressed by *be on the point of* + V-ing, or by *be going to* together with the adverb *just* (meaning 'very soon'): *I'm just going to read your essay*.

This by no means exhausts the variety of verb constructions referring to future time. Futurity is often a secondary connotation of other modals than *will/shall*: eg with a dynamic verb, *may* or *must* usually locates the event in the future: *The weather may improve (tomorrow)*; *You must have dinner with us (sometime soon)*. The same secondary connotation of futurity is found with

semi-auxiliaries such as *be sure to*, *be bound to* (cf 3.47), not to mention lexical verbs such as *hope* and *intend*.

While it is valuable to note differences of meaning between different future constructions, these differences should not be exaggerated. There are occasions where the choice of one construction (say *will* + infinitive) rather than another (say *be going to* + infinitive) has a scarcely perceptible effect on meaning. At the same time, there are differences of acceptability and usage which should not be ignored. Particularly, regarding the choice between *will* and *be going to*:

- (a) *Will* is usually preferred to *be going to* in formal style.
- (b) *Be going to* tends not to be repeated in a text referring pervasively to the future. Thus a weather forecast may run as follows:

Tomorrow *is going to* be another cold day. There *will* be snow on high ground, and many mountain roads *will* be impassable. . . .

Note *Be to* + infinitive in referring to the future also conveys the connotations of 'requirement' and 'destiny' in examples such as:

You *are to be* back by 10 o'clock. ['... required to be ...']
If he's *to succeed* in his new profession, he must try harder.
The prisoner *is to be* handed over to the civil authorities for trial.

Future time in the past

- 4.48 Most of the future constructions just discussed can be used in the past tense to describe something which is in the future when seen from a viewpoint in the past.

- (a) MODAL VERB CONSTRUCTION with *would* <rare; literary narrative style>
The time was not far off when he *would* regret this decision.
- (b) *BE GOING TO* + INFINITIVE (often with the sense of 'unfulfilled intention')
You *were going to* give me your address. ['... but you didn't ...']
The police *were going to* charge her, but at last she persuaded them she was innocent.
- (c) PAST PROGRESSIVE (arrangement predetermined in the past)
I *was meeting* him in Bordeaux the next day.
- (d) *BE TO* + INFINITIVE <formal>; (i) = 'was destined to'; (ii) = 'arrangement'
(i) He *was eventually to* end up in the bankruptcy court.
(ii) The meeting *was to be* held the following week.
- (e) *BE ABOUT TO* + INFINITIVE ('on the point of'; often with the sense of 'unfulfilled intention')
He *was about to* hit me.

Of all these constructions, only (a) and (di) can be considered genuine expressions of future-in-the-past meaning, in that they alone can be understood to guarantee the fulfilment of the happening in question. For instance:

Few could have imagined at that time that this brave young

officer { was to be
would be } the first President of the United States of America.

This sentence implies that the young officer (George Washington) *did* eventually become president of the United States. The other constructions, however (especially (b) and (e)), favour an interpretation of nonfulfilment.

Note These future-in-the-past interpretations, whether or not they imply fulfilment, should be distinguished from those of the same constructions used in indirect speech or free indirect speech (cf 14.31ff); eg:

I was convinced that no one *would* interfere.
Surely no one *would* object, she thought.
He told us he *was going to* resign.

In these cases, *would* and *was going to* report what was said or thought to be the case, according to some explicit or implicit 'speaker' or 'thinker'.

Meanings of the modal verbs

- 4.49 Like other terms used in analysing meaning in the complex verb phrase, such as *mood* and *aspect*, MODALITY has been used in various senses. At its most general, *modality* may be defined as the manner in which the meaning of a clause is qualified so as to reflect the speaker's judgment of the likelihood of the proposition it expresses being true. As with terms like *present* and *past*, this semantic definition makes only an imperfect match with the correspondingly-named formal category, that of modal auxiliary verbs. None the less, it will serve to indicate in general terms the function which these verbs perform in the language.

In the modal verbs, the constraining factors of meaning mentioned above may be divided into two types:

- (a) Those such as 'permission', 'obligation', and 'volition' which involve some kind of intrinsic human control over events, and
- (b) Those such as 'possibility', 'necessity', and 'prediction', which do not primarily involve human control of events, but do typically involve human judgment of what is or is not likely to happen.

These two kinds, between which there is a gradient, may be termed INTRINSIC and EXTRINSIC modality respectively. One important observation about the modals is that each one of them has both intrinsic and extrinsic uses: for example, *may* has the meaning of permission (intrinsic) and the meaning of possibility (extrinsic); *will* has the meaning of volition (intrinsic) and the meaning of prediction (extrinsic). However, there are areas of overlap and neutrality between the intrinsic and extrinsic senses of a modal: the *will* in a sentence such as *I'll see you tomorrow then* can be said to combine the meanings of volition and prediction. Another point of significance is that the modals themselves tend to have overlapping meanings, such that in some

circumstances (but not in others), they can be more or less interchangeable. *Should* and *ought to*, for example, are more or less interchangeable with the meanings of 'obligation' and 'tentative inference'. *Can* and *may* overlap to a small extent in the areas of permission and possibility, but this overlap is almost entirely confined to written or formal English, and these modals are very far from being generally in free variation.

Note In place of *intrinsic* and *extrinsic* modality, other terminologies, such as *modulation* and *modality*, or *root* and *epistemic* modality, are widespread. An alternative practice, which we follow (cf 4.51, 4.53), is to regard the root/epistemic distinction as a subcategorization of extrinsic modality. Another term widely used for the modality of obligation and permission is *deontic*.

4.50 The above points help to show why the use of the modal verbs is one of the more problematic areas of English grammar, and one of the areas where many studies have been made. Other factors which impede easy generalization are the following:

- Certain modals such as *can* and *will* are extremely common, whereas others, such as *shall*, *ought to*, and *need* (*qua* auxiliary) are relatively rare (cf 3.39 Note).
- Although historically, most of the modals can be paired into past and nonpast forms (*can/could*, *may/might*, *will/would*, *shall/should*), the 'past tense' forms are only in some respects usefully classified as such from the point of view of meaning.
- The use of the modals varies significantly from one part of the English-speaking world to another. There are considerable differences in this respect between AmE and BrE: for example, the three verbs described as 'rare' above are in fact substantially rarer in AmE than in BrE; moreover, Scots, Irish, and Northern English varieties resemble AmE in some respects more than they resemble the 'standard' southern usage which tends to be treated as representative of BrE. Increasingly even in Southern Standard BrE the forms formerly associated with AmE are becoming the norm.

In view of such variations and complications, we can give only an outline of the semantics of the modals here. For the purposes of this outline, we consider the modal auxiliaries in groups with similar or overlapping meanings. We also relate the meanings of the central modals (cf 3.39), where useful, to the meanings of marginal auxiliaries such as *ought to*, *have (got) to*, and *need*. We shall give, where important, some idea of the frequency or stylistic range of a modal. We begin by treating the present and past forms (eg: *can* and *could*) together, and later (in 4.59–64) turn our attention to special aspects of the use of the past forms *could*, *might*, *should*, and *would*.

The modals are often associated with particular pragmatic uses, eg in requests, offers, etc, where the past forms tend to have implications of tentativeness or politeness. We deal with these aspects of modal usage mainly in the Notes, but cf also 4.63.

In the following sections (4.51–65) we concentrate primarily on the modals in declarative clauses. The negative and interrogative uses of the modals are dealt with in 10.67f and 11.13 respectively.

4.51

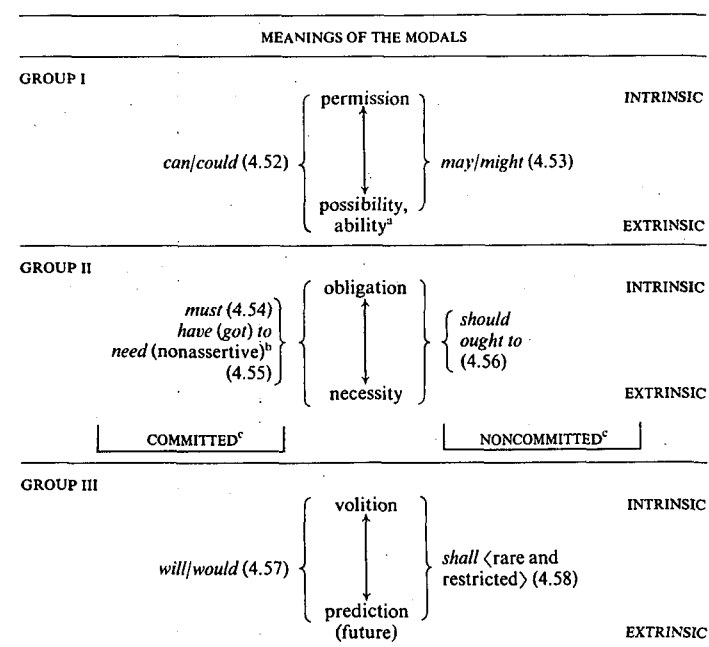

Fig 4.51

Notes to Fig 4.51:

- The 'ability' meaning of *can* is considered extrinsic, even though ability typically involves human control over an action. 'Ability' is best considered a special case of possibility (cf 4.52).
- On nonassertive restrictions in the use of *need* as an auxiliary, cf 3.42.
- The meaning of the labels 'committed' and 'noncommitted' with reference to *must*, *should*, etc is clarified in 4.54ff below, esp 4.56; cf also Fig 4.66.

Fig 4.51 gives a summary of the main modal meanings. The arrows separate intrinsic from corresponding extrinsic meanings, and are a reminder that the distinctions between these two are gradual rather than absolute. The Figure does not, however, distinguish the EPISTEMIC uses of *may*, *must* and *have (got) to* (cf 4.53–5); these form a clear-cut subcategory of the 'possibility' and 'necessity' meanings.

Can/could

4.52 Three major meanings of these modals may be distinguished:

- POSSIBILITY (especially in questions and negatives; cf 10.67f, 11.13)

- | | |
|---|-----|
| Even expert drivers <i>can</i> make mistakes. | [1] |
| Her performance was the best that <i>could</i> be hoped for. | [2] |
| If it's raining tomorrow, the sports <i>can</i> take place indoors. | [3] |

In this sense, *can* is generally paraphrasable by *it is possible* followed by an infinitive clause; for example, [1] may be paraphrased:

It is possible for even expert drivers to make mistakes. [1a]

Sometimes, *can* indicates a future possibility; thus, for [3] an appropriate paraphrase would be: *It will be possible*...

(b) ABILITY

Can you remember where they live? [4]

Magda could speak three languages by the age of six. [5]

They say Bill can cook better than his wife. [6]

For the 'ability' sense, *can/could* may be paraphrased by use of the *be able to* construction, or in some cases by *be capable of* or *know how to*. However, the same meaning can also be approximately captured by the *be possible* construction; eg:

I could swim all the way across the lake.

implies:

It $\left\{ \begin{array}{l} \text{was} \\ \text{would be} \end{array} \right\}$ possible for me to swim all the way across the lake.

For this reason, the 'ability' meaning of *can/could* can be considered a special case of the 'possibility' meaning, viz one in which the possibility of an action is due to some skill or capability on the part of the subject referent.

(c) PERMISSION

Can we borrow these books from the library? [7]

In those days only men could vote in elections. [8]

In this sense, *can/could* is less formal than *may*, which has been favoured by prescriptive tradition (cf 4.53). (However, *might* in the sense of past permission is so rare – cf 4.61 Note [a] – that not even traditionalists would favour its use in [8].) It is possible to paraphrase *can* in the sense of permission by *be allowed to*:

Are we allowed to borrow these books from the library? [7a]

Note [a] *Can/could* [= possibility] is often used in a quasi-imperative manner, to suggest a course of action to the addressee. The instruction can be made more polite by using *could* (cf 4.62f), or by adding a conditional clause such as *if you like*:

You can sit here until I get back (if you like).

You children could help me move these chairs.

By turning the statement into a question, the speaker changes the suggestion into a rather polite request:

Can/could you (please) check these figures?

[b] *Can* [= ability] occurs in certain informal negative verb phrases, such as *cannot/can't help*, *cannot/can't stand*, and *cannot/can't bear*. The negative orientation of these phrases means that their positive counterparts cannot be used, except in semantically negative contexts; eg in questions with a negative bias, or in 'second instance' contexts where a contrast with the negative is implied:

How *can* you bear that noise? [implies: 'It is unbearable']

A: I *can't help* singing out of tune.

B: Well, you *could help* it: you could simply be *quiet*.

[c] *Can* [= permission] is combinable with a future time adverbial (eg: *You can borrow my typewriter tomorrow*); but *can* [= ability] normally is not:

?*You can pass your driving test next time you take it.*

For future ability, the construction to use is *will be able to*:

You will be able to pass your driving test next time you take it.

except that *can* may be used in clauses, such as *if*-clauses, in which the present tense is normally used for future reference (cf 14.22):

If you can pass your driving test next month, you will be able to visit us more often during the summer.

[d] On the special stative use of *can/could* [= ability] with perception verbs (eg: *can see*), cf 4.30. There is a similar tendency to use this auxiliary with mental-state verbs such as *remember* and *understand*, as in [4] above, where *Can you remember*...? is scarcely distinguishable in meaning from *Do you remember*...?

May/might

4.53 (a) POSSIBILITY

We may never succeed. [It is possible that we'll never succeed] [1]

You may be right. [It is possible that you are right] [2]

There might be some complaints. [3]

As these examples suggest, the most common meaning of *may* [= possibility] is different from the possibility sense of *can*. To paraphrase *may*, we use *it is possible* followed by a *that*-clause, rather than an infinitive clause. *May* in this sense may also be paraphrased by *It may be that*..., or by the adverb *perhaps* or *possibly*. Thus [2] is equivalent to:

It may be that you are right. [2a]

Perhaps/possibly you are right. [2b]

This meaning of *may* is termed EPISTEMIC POSSIBILITY; ie it denotes the possibility of a given proposition's being or becoming true. *May* in the sense of epistemic possibility is normally stressed, and is often associated with fall-rise nuclear tone.

Might [= possibility] can be used as a (somewhat more tentative) alternative to *may* [= possibility], as in [3] (cf 4.63), and indeed is often preferred to *may* as a modal of epistemic possibility.

Less commonly, in formal English, *may/might* is used in the same possibility sense as *can/could*, a sense which may be distinguished by the label ROOT POSSIBILITY:

During the autumn, many rare birds may be observed on the rocky northern coasts of the island. [4]

May in [4] is a more formal substitute for *can*, and the whole sentence could be paraphrased *It is possible to observe*...

(b) PERMISSION

You may borrow my bicycle if you wish. [5]

Visitors may reclaim necessary travel expenses up to a limit of £50. [6]

Might I ask whether you are using the typewriter? [7]

As a permission auxiliary, *may* is more formal and less common than *can*, which (except in fixed phrases such as *if I may*) can be substituted for it.

However, *may* is particularly associated with permission given by the speaker. That is, a difference is sometimes felt between *You may leave when you like* [= 'I permit you ...'] and *You can leave when you like* [= 'You are permitted ...'], which can mean permission in a more general and impersonal sense. Not all English speakers acknowledge this distinction, however; and the prescriptive bias in favour of *may* leads to its use in official documents and notices, etc., as in [6] above, even where there is no restriction to 'speaker's permission'.

Again, *might* is used as a somewhat more tentative, and therefore polite, variant of *may* [= permission], as in [7] (cf 4.61). It is rare and apparently obsolescent in this usage.

Note [a] In interrogatives and in auxiliary negation, *may* in the sense of epistemic possibility is normally replaced by *can* (cf 10.67f, 11.13). Note the difference between:

She *may not* be serious. [It is possible that ... not ...]

She *can't* be serious. [It is not possible that ...]

[b] There is a rare use of *may* with subject-operator inversion (cf 18.24) in volitional sentences which parallel the function of the formulaic subjunctive (cf 3.60):

May the best man win! [= Let the best man win!]

May he never set foot in this house again!

May God bless you! [= God bless you!]

[c] Another 'quasi-subjunctive' use of *may/might* is observed in subordinate clauses of concession or purpose:

Strange as/though it *may* seem ... (cf 15.39)

Christ died, that we *might* live. (cf 15.48 Note [b])

Particularly in purpose clauses, this construction is formal and somewhat archaic.

[d] Related to the above use of *may* in concessive adverbial clauses, there is a tendency for main clauses containing *may* to have a concessive force preceding *but*:

We *may* have our differences from time to time, but basically we trust one another's judgment. [8]

The modal loses something of its 'possibility' sense here, as is shown by the paraphrase:

I admit that we have our differences ... but ...

ie the proposition expressed by the first clause of [8] is presumed to be true but (perhaps out of politeness) the modal construction is preferred to the alternative construction with the simple present.

[e] The idiomatic expression *may/might (just) as well* is typically used to make a somewhat reluctant or sardonic recommendation:

We *may as well* stay here the night (as look for a better place elsewhere). [9]

You *might as well* tell the truth (as continue to tell lies). [10]

The negative aspect of these recommendations is highlighted by the optional comparative clause, which is usually omitted. Their force could be expressed as follows:

'There's no point in looking elsewhere ...'

'There's no point in your continuing to tell lies ...'

Cf: *may/might/can/could well*, 8.103.

Must

4.54 (a) (LOGICAL) NECESSITY

There *must* be some mistake. [1]

You *must* be feeling tired. [2]

The Smiths *must* have a lot of money. [3]

The 'logical necessity' meaning of *must* is parallel to the use of *may* in the sense of epistemic possibility; it may, indeed, be called 'epistemic necessity',

since it implies that the speaker judges the proposition expressed by the clause to be necessarily true, or at least to have a high likelihood of being true. *Must* in this sense means that the speaker has drawn a conclusion from things already known or observed. For example, the speaker of [3] has observed the Smiths living in a large house, travelling in an expensive car, etc., and therefore draws the conclusion that they 'must' be rich. *Must* [= logical necessity] cannot normally be used in interrogative or negative clauses. The negative of *can* [= possibility] fills the gap, so that *You must be joking* ['It is necessarily the case that you are joking'] is synonymous with *You can't be serious* ['It is impossible that you are serious']. Similarly:

She *must* be asleep = She *can't* be awake.

In addition to epistemic necessity, there is a ROOT NECESSITY meaning of *must* in examples like:

To be healthy, a plant *must* receive a good supply of both sunshine and moisture. [4]

Must here can be glossed 'It is essential for ...' or 'It is necessary for ...'. There is, however, no implication in [4] of human control, and this distinguishes the root necessity use of *must* from its other root sense of obligation, to which we now turn.

(b) OBLIGATION or COMPULSION

You *must* be back by ten o'clock. ['You are obliged to be back ...'; 'I require you to be back ...'] [5]

We *must* all share our skills and knowledge. [6]

Productivity *must* be improved, if the nation is to be prosperous. [7]

In these examples, there is the implication, to a greater or lesser extent, that the speaker is advocating a certain form of behaviour. Thus *must*, unlike *have (got) to*, typically suggests that the speaker is exercising his authority. An apparent exception to this occurs where the subject is in the first person:

I *must* remember to write to Aunt Anna. [8]

I'm afraid I *must* go now: I promised to be home at ten. [9]

But this, we can say, is perfectly consistent with *must* [= obligation], because the meaning is one of self-admonishment, *ie* the speaker in this case exercises authority over himself, appealing to his own sense of duty, expediency, etc.

Note [a] On the use of obligating *must* in negative and interrogative clauses, cf 10.67f; 11.13.

[b] Occasionally, *must* [= logical necessity] does occur with negations:

His absence *must not* have been noticed.

This has the same meaning as *His absence can't have been noticed*. Such sentences have been regarded by many commentators as impossible, but are increasingly accepted and used, especially in AmE.

[c] There is a similarly rare occurrence of *must* [= logical necessity] in questions:

Must there be some good reason for the delay?

This assumes a positive answer, and might be glossed: 'Does there have to be some good reason ...?'

[d] *Must* [= root necessity] has a sarcastic use in some utterances with a 2nd person subject:

If you *must* smoke, at least you could use an ashtray.

Why *must* you always be finding fault with that girl?

Need, have (got) to

- 4.55 The close relationship between *must* and the quasi-modals *need*, *have got to*, and *have to* (cf 3.42, 3.45, 3.48) deserves comment at this point. *Need* (constructed as an auxiliary) is used (esp in BrE) as the negative and question form of *must* in root senses:

Need they make all that noise? [= 'Do they *need/have to* make all that noise?'] <esp BrE>

You *needn't* worry about the test. [= 'You *don't need/have to* worry about that test'.] <esp BrE>

As the above glosses show, however, it is possible, and indeed, more common even in BrE, to replace auxiliary *need* by *need to* or *have to* accompanied by *do*-support (cf 3.37).

Have (got) to can also be substituted for *must* with little or no difference of meaning. Compare the following with the parallel sentences in 4.54:

(a) (LOGICAL) NECESSITY

There *has (got) to* be some mistake. <esp AmE> [1]

To be healthy, a plant *has to* receive a good supply of both sunshine and moisture. [4]

(b) OBLIGATION OR COMPULSION

You *have (got) to* be back by ten o'clock. [5]

We *have all got to* share our skills and knowledge. [6]

Productivity will *have to* be improved, if the nation is to be prosperous. [7]

In the logical necessity sense of [1], *have (got) to* is rather more emphatic than *must*, and is found chiefly in AmE. In the obligation sense of [5–7], *have (got) to* is often felt to be more impersonal than *must*, in that it tends to lack the implication that the speaker is in authority. This is particularly noticeable with a 1st person subject:

I'm afraid I *have (got) to* go now. [8]

Where *must* implies 'self-obligation', *have (got) to* implies 'obligation by external forces'. Thus [8] might be used where, for example, another appointment compels the speaker to leave at a particular time.

Since *must* has no past tense form and no nonfinite forms, *have to* is used in many contexts where *must* is impossible (cf 3.30, 3.48), eg following a modal verb: *We'll have to be patient*.

Note [a] *Have to* and *have got to* are used in sarcastic utterances like those illustrated for *must* in 4.54
Note [d]:

Do you *have to* make that noise when you eat?

There is an equivalent past tense use of *had to*:

The rain was bad enough – but then it *had to* snow!

The author of this sentence jokingly blames the weather's perverse behaviour.

[b] Some native speakers do not recognize the distinction between 'self-obligation' (*If we must*) and 'obligation by external forces' (*If we have to*).

Ought to and should

- 4.56 Here we turn to another marginal auxiliary, *ought to*, and a synonymous use of *should*. Although differing from *must* and *have (got) to*, these verbs express the same basic modalities of 'necessity' and 'obligation'. Where they contrast with *must* and *have (got) to* is in not expressing the speaker's confidence in the occurrence of the event or state described. Hence [1] is nonsensical, but [2] is not:

*Sarah { *must* / *has to* } be home by now, but she isn't. [1]

Sarah { *should* / *ought to* } be home by now, but she isn't. [2]

(a) TENTATIVE INFERENCE

The mountains { *should* / *ought to* } be visible from here. [3]

These plants { *should* / *ought to* } reach maturity after five years. [4]

The term which best seems to characterize the 'noncommitted necessity' meaning of *should* and *ought to* is 'tentative inference'. That is, the speaker does not know if his statement is true, but tentatively concludes that it is true, on the basis of whatever he knows. Apart from this tentativeness, *should* and *ought to* differ from *must* in that they frequently refer to the future; eg:

The job *should/ought to* be finished by next Monday.

(b) OBLIGATION

You { *should* / *ought to* } do as he says. [5]

The floor { *should* / *ought to* } be washed at least once a week. [6]

Like *must* [= obligation], *should* and *ought to* generally imply the speaker's authority; but unlike *must*, they do not imply that the speaker has confidence that the recommendation will be carried out. In fact, with the perfective aspect, *should* and *ought to* typically have the stronger implication that the recommendation has *not* been carried out:

They { *should* / *ought to* } have met her at the station. [7]

The likely implication of [7] is '... but they didn't'. In both senses (a) and (b) *should* is more frequent than *ought to*.

Note Another difference between *should* and *ought to* (in the sense of tentative inference) and *must* is that the former modals tend to carry over from their obligational sense the suggestion that the proposition within their scope is desirable. Contrast:

There *should* be another upturn in sales shortly.

?There *should* be another disaster shortly.

The second sentence is decidedly odd, suggesting that the speaker takes a favourable view of disasters.

Will/would ('ll/'d)

- 4.57 From the semantic point of view, as well as from the historical point of view, 'll and 'd are to be regarded as contractions of *will* and *would* respectively, rather than of *shall* and *should*. To see this, we note that where *shall* and *should* are not interchangeable with *will* and *would*, the contraction does not substitute for *shall/should*, though it can for *will/would*. For instance, in [7] of 4.56 above, the contraction *They'd have met her at the station* is not possible in the sense of 'ought to'. Conversely, in:

You *will* feel better after this medicine. [1]

where *will* in the predictive sense could not be replaced by *shall*, the contraction to 'll is possible:

You 'll feel better after this medicine. [1a]

(a) PREDICTION

Under the heading of PREDICTION, three related uses of *will/would* are to be distinguished.

- (a1) The common FUTURE predictive sense of *will* illustrated in [1] above has already been discussed in 4.42 and 4.46. The corresponding 'prediction in the past' sense of *would* (cf 4.48) is illustrated by:

I was told I *would* feel better after this medicine. [2]

- (a2) The PRESENT predictive sense of *will*, which is comparatively rare, is similar in meaning to *must* in the 'logical necessity' sense:

She *will* have had her dinner by now. [3]

That 'll be the postman. [on hearing the doorbell ring] [4]

This meaning can be roughly paraphrased: 'It is (very) likely that ...'

- (a3) The HABITUAL predictive meaning often occurs in conditional sentences:

If litmus paper is dipped in acid, it *will* turn red.

or in timeless statements of 'predictability':

Oil *will* float on water.

In addition, it occurs in descriptions of personal habits or characteristic behaviour:

He'll talk for hours, if you let him. [said of a chatterbox]

She'll sit on the floor quietly all day. She'll just play with her toys, and you *won't* hear a murmur from her. [of a good baby]

Every morning he *would* go for a long walk. [ie 'it was his custom to go ...']

In past tense narratives, *would* in this sense is a popular means of describing habitual behaviour:

In the spring the birds *would* return to their old haunts, and the wood *would* be filled with their music ...

This use of *would* is rather more formal than the equivalent use of *used*

to, and unlike *used to*, needs to be associated with a time indicator, such as *In the spring* in the above example.

(b) VOLITION

Again, three different subsenses may be distinguished. The volitional range of *will* extends from the 'weak volition' of WILLINGNESS to the 'strong volition' of INSISTENCE. Between these two, there is the more usual volitional sense of INTENTION, which often combines with a sense of prediction (cf 4.42, 4.46):

(b1) INTENTION

I'll write as soon as I can.

We *won't* stay longer than two hours.

The manager said he *would* phone me after lunch.

(b2) WILLINGNESS

Will/Would you help me to address these letters?

I'll do it, if you like.

This meaning is common in requests and offers. On the greater politeness of *would*, cf 4.63.

(b3) INSISTENCE

If you 'will go out without your overcoat, what can you expect?

She 'would keep interrupting me.

This somewhat rare use implies wilfulness on the part of the subject referent. The auxiliary is always stressed, and cannot be contracted to 'll or 'd. In this case, the past form *would* expresses past time, rather than tentativeness or politeness.

Note [a] The predictive meaning of *will* is sometimes weakened, so that it resembles the ability meaning of *can*:

That's a fine car. How fast *will* it go?

The new grandstand *will* hold ten thousand spectators.

The negative of this 'potentiality' sense of *will* seems to have something of the personificatory force of 'refusal' (ie the negation of willingness):

It's a good piano, but it just *won't* stay in tune.

I tried to open the door, but the key *wouldn't* turn.

It is almost as if the piano or the key had a will of its own.

[b] In requests, the sense of willingness (b2) is often expressed more tentatively and politely by the use of the past tense form *would*:

Would you please be quiet?

Cf the comparable use of *could*, 4.52 Note [a].

[c] There is an idiomatic use of *would* with nuclear stress conveying a certain feeling of exasperation at the behaviour of another:

A: Of course, Ian spoiled the whole show with his feeble jokes.

B: Oh, he *would* (spoil the whole show).

The force is that Ian's foolish behaviour was utterly typical and predictable. There is no equivalent use of *will*.

Shall

- 4.58 *Shall* is in present-day English (especially in AmE) a rather rare auxiliary and only two uses, both with a 1st person subject, are generally current:

(a) PREDICTION (with 1st person subjects)

Shall is a substitute for the future use of *will* in formal style:

According to the opinion polls, I $\left\{ \begin{smallmatrix} \text{will} \\ \text{shall} \end{smallmatrix} \right\}$ win quite easily.

When $\left\{ \begin{smallmatrix} \text{will} \\ \text{shall} \end{smallmatrix} \right\}$ we know the results of the election?

Especially in BrE, prescriptive tradition forbids *will* as a future auxiliary with *I* or *we*, but this prescription is old-fashioned and is nowadays widely ignored.

(b) VOLITION (with 1st person subjects)

In the intentional sense, *shall* is again a formal (and traditionally prescribed) alternative to *will* after *I* or *we*:

We $\left\{ \begin{smallmatrix} \text{will} \\ \text{shall} \end{smallmatrix} \right\}$ uphold the wishes of the people.

In questions containing *shall I/we*, *shall* consults the wishes of the addressee, and thus moves from a volitional towards an obligational meaning. It is suitable for making offers:

Shall I/we deliver the goods to your home address? [= Do you want me/us to . . . ?] [1]

and for making suggestions about shared activities:

What *shall* we do this evening? *Shall* we go to the theatre? [2]

It is only in such questions that *shall* cannot regularly be replaced by *will*. Note that [1] illustrates the exclusive use of *we* (cf 6.7), while [2] illustrates the inclusive use, *ie* the use of *we* which includes reference to the addressee(s).

Note [a] The inclusive *we* following *shall* is also found in tag questions following a 1st person imperative (cf 11.10, 11.26 Note [a]):

Let's have dinner out tonight, *shall* we?

[b] *Shall* is in very restricted use with 2nd and 3rd person subjects as a way of expressing the speaker's volition, either in granting a favour:

You *shall* do just as you wish.

She *shall* get her money as soon as she has earned it.

or in giving orders;

You *shall* do exactly as I say.

He *shall* be punished if he disobeys.

In these cases *shall* is archaic and 'authoritarian' in tone.

[c] A further restricted use of *shall* with a 3rd person subject occurs in legal or quasi-legal discourse, in stipulating regulations or legal requirements. Here *shall* is close in meaning to *must*:

The vendor *shall* maintain the equipment in good repair.

Note in this connection the archaic use of *shalt* in the Biblical Ten Commandments; eg: *Thou shalt not kill*. (On the archaic 2nd person form *shalt*, cf 3.4 Note [b].)

[d] Although *should* cannot normally be regarded as a past tense form of *shall*, there are occasions when it is appropriately interpreted as such. In [3] below, *should* is a past tense equivalent of *shall* in indirect speech, and in [4], it appears to be a tentative past tense equivalent of *shall* in offers:

I felt sure that we *should* meet again. [3]

Should I type these letters for you? [4]

The use of *should* illustrated in [3] can have a flavour of preciosity.

[e] Even in 1st person questions, where *shall* has generally been recognized as normal, it is

nowadays frequently replaced by more common verbal constructions. Eg: in [1] *shall I* could be replaced by *would you like us to* and in [2] *shall* could be replaced by *should*. Both these substitutes are typically AmE.

The past tense forms of the modals: *could*, *might*, *would*, and *should*

4.59 The uses of the past tense modals *could*, *might*, *would*, and *should* have already been illustrated in 4.52–8, but there is a need to examine the ways in which their uses differ from the corresponding nonpast modals *can*, *may*, *will*, and *shall*. Five particular uses of the past tense modals are noted in 4.60–4.

'Past time' in indirect speech

4.60 The past tense modals *could*, *might*, *would*, and *should* are used quite regularly as past tense equivalents of *can*, *may*, *will*, and *shall* in indirect speech constructions (cf 14.34):

You *can/may* do as you wish. [= permission]

~ She said we *could/might* do as we wished.

The king *can* do no wrong. [= ability]

~ It was seriously argued that the king *could* do no wrong.

It *may* rain later. [= possibility]

~ We were afraid that it *might* rain later.

What *can* be done? [= possibility]

~ Nobody knew what *could* be done.

The plan *will* succeed. [= prediction]

~ I felt sure that the plan *would* succeed.

Will you help me? [= volition]

~ I wondered if he *would* help me.

Shall I open the window? [in offers]

~ She asked me if she *should* open a window.

Must, together with *need* (as auxiliary), *ought to*, and *had better*, has no present/past distinction. These verbs are therefore unchanged in indirect speech constructions (cf 14.34), even where they refer to past time.

Note In free indirect speech (cf 14.35) the reporting clause is absent, so that the modal verb may occur backshifted to the past tense even in main clauses:

Could he be imagining things? (said Ahmed to himself.)

'Past time' in other constructions

4.61 Outside indirect speech contexts, the behaviour of the past tense modal forms is less predictable. *Could* and *would* act as the 'past time' equivalents of *can* and *will*; but on the whole, *might* and *should* do not act as the 'past time' equivalents of *may* and *shall* (cf however Note [a]).

(a) CAN ~ COULD

There were no rules: we *could* do just what we wanted.

[= permission]

In those days, a transatlantic voyage *could* be dangerous.

[= possibility]

Few of the tourists *could* speak English. [= ability]

(b) *WILL ~ WOULD*

Later, he *would* learn his error. [= prediction; cf 4.48, 4.57]
 The old lady *would* sit in front of the television continuously.
 [= habitual prediction; cf 4.57 (a3)]
 We tried to borrow a boat, but no one *would* lend us one.
 [= willingness]
 He *'would* leave the house in a muddle. [= insistence]

Outside indirect speech, however, *would* is not used in the sense of intention; hence a sentence such as *He would meet me the next day* is almost inevitably interpreted as free indirect speech.

Note [a] There is a rare and archaic use of *might* outside indirect speech in the sense 'was/were permitted to':

We *might* leave the school only at weekends.

[b] Corresponding to *must*, which cannot normally be used in reference to past time outside indirect speech or indirect thought contexts, the past tense form *had to* can be used in main clauses. Compare:

I *must* confess her latest novels bore me. ~ I *had to* confess her latest novels bored me.

[c] In contrast to the past modals *could* [= ability] and *would* [= willingness], the constructions *was/were able to* and *was/were permitted to* (cf 4.66) emphasize not just the potentiality, but the fulfilment of an action. For instance, *We were able/permitted to leave the camp early* typically conveys the additional message: '... and, moreover, we *did* leave the camp early'. Hence *was able to*, but not *could*, is acceptable in contexts implying fulfilment:

I ran after the bus, and *was able to* catch it. [1]

*I ran after the bus, and *could* catch it. [2]

In the negative, however, this contrast between potential and fulfilled action is neutralized. Hence the following are both acceptable, and mean the same:

I ran after the bus, but *wasn't able to* catch it.

I ran after the bus, but *couldn't* catch it.

[d] On the other hand, *could* and *would* may refer to habitual fulfilment:

I *could* run after a bus and catch it twenty years ago, but I can't do that now.

Hypothetical meaning

4.62 The past tense modals can be used in the hypothetical (or unreal) sense of the past tense (cf 4.16) in both main and subordinate clauses. Compare:

If United *can* win this game, they *may* become league champions. [1]

If United *could* win this game, they *might* become league champions. [2]

Sentence [2], unlike [1], expresses an unreal condition; *ie* it conveys the speaker's expectation that United *will not* win the game, and therefore will *not* become league champions. For past hypothetical meaning (which normally has a contrary-to-fact interpretation), we have to add the perfective aspect:

If United *could have won* that game, they *might have become* league champions. [3]

The usual implication of this is that United *did not* win the game.

All past tense modals can be used in this way, to express the hypothetical version of meanings such as ability, possibility, permission, prediction, and volition. With the epistemic possibility of *might*, however, it is the meaning

of the following predication, rather than of the modal itself, that is interpreted hypothetically. This will be evident from the following paraphrases:

They *might* have become champions.

[= It is possible that they would have become champions.]

We *could* have borrowed the money.

[= It would have been possible for us to borrow the money. (usually with the implication '... but we didn't')]

On the hypothetical use of *would* here, cf 4.64 below. In some contexts, especially when referring to the future, the 'unreal' meaning of past modals becomes weakened to something like improbability:

Not even a professional *could* do better than that.

From such instances, it is easy to understand how the hypothetical use of past modals has become adapted to express tentativeness (cf 4.63).

Note *Could/might* (+ perfective) are used in complaints or rebukes:

You *could/might* try to be more civilized!

You *could/might* have warned me she was coming.

The meaning here is close to the same construction with *should* [= 'ought to']: *eg: You should have warned us ... Could and might are interchangeable in this type of utterance.*

Tentativeness or politeness: *could*, *might*, and *would*

4.63 Closely related to the hypothetical use above are specialized uses of *could*, *might*, and *would* in which the past tense form simply adds a note of tentativeness or politeness:

(a) TENTATIVE PERMISSION (in polite requests):

Could I see your driving licence?

I wonder if I *might* borrow some coffee?

(b) TENTATIVE VOLITION (in polite requests):

Would you lend me a dollar? [more polite than *will*, cf 4.57 (b2)]

I'd be grateful if someone *would* hold the door open.

(c) TENTATIVE POSSIBILITY

(I) in expressing a tentative opinion:

There *could* be something wrong with the light switch.

Of course, I *might* be wrong.

(II) in polite directives and requests (cf 4.52, Note [a]):

Could you (please) open the door?

You *could* answer these letters for me.

In these constructions, apart from the last-mentioned case of requests, *could* and *might* have the same meaning. In (cI), they both express the epistemic possibility associated with *may*. This is an exceptional case, in which *could* is the past tense equivalent of *may* instead of *can*.

Note There is a tendency for the difference between *may* and *might* (in a sense of tentative or hypothetical possibility) to become neutralized. Thus some speakers perceive little or no

difference of meaning between *You may be wrong* and *You might be wrong*. This neutralization occasionally extends, analogically, to contexts in which only *might* would normally be considered appropriate:

?An earlier launch of the lifeboat *may* [= might] *have averted* the tragedy. [1]
The fact that sentences such as [1] occasionally occur is a symptom of a continuing tendency to erode the distinctions between real and unreal senses of the modals.

'Mood markers': *would* and *should*

4.64 Under this last heading of 'mood markers' we consider special uses of *would* and *should* in which these modals have nothing to do with the cognate modals *will* and *shall*, but are instead used to mark the MOOD of the clause.

(a) *WOULD/SHOULD* AS A MARKER OF HYPOTHETICAL MEANING

Would (and sometimes, with a 1st person subject, *should*) may express hypothetical meaning in main clauses:

- If you pressed that button, the engine *would* stop. [1]
If there were an accident, we *would/should* have to report it. [2]

Would/should + infinitive contrasts in syntactic distribution, but not in meaning, with the past tense and the *were*-subjunctive, both of which express hypothetical meaning in many subordinate clauses. Hence the following cannot be interpreted as unreal conditions (although they might, with some difficulty, be interpreted in some other way; cf 15.35 on open and hypothetical conditions):

- ?If you *pressed* that button, the engine *stopped*. [3]
?If you *would press* that button, the engine *would stop*. [4]

In [3], the hypothetical past tense is wrongly used in the main clause, whereas in [4], the *would* construction is wrongly used in the subordinate clause.

Although the conditional sentence, as in [1] and [2], is the most typical context in which hypothetical *would/should* occurs, there are many other contexts in which hypothetical *would/should* is appropriately used:

- I'd hate to lose this pen. [5]
It *would* be impossible to estimate how many crimes went undetected last year. [6]
Don't bother to read all these papers. It *would* take too long. [7]

In such sentences, there is often an implicit *if* . . . ; for example, [7] could be expanded: *It would take too long if you did (try to read them all)*.

(b) *SHOULD* AS A MARKER OF 'PUTATIVE' MEANING

In this use (cf 14.25), *should* + infinitive is often equivalent to the mandative subjunctive (cf 3.59). In using *should*, the speaker entertains, as it were, some 'putative' world, recognizing that it may well exist or come into existence:

- She insisted that we *should* stay.
It's unfair that so many people *should* lose their jobs.
Let me know if you *should* hear some more news.
Why *should* anyone object to her enjoying herself?
I can't think why he *should* have been so angry.

Putative *should* is more common in BrE than in AmE (cf further 16.30ff, 16.59, 16.70).

Note [a] Hypothetical *would* as a 'mood marker' occurs in some types of subordinate clause; eg in nominal clauses (except some clauses which occur with the hypothetical past tense instead of *would*, eg clauses introduced by imperative *suppose* or by *wish*; cf 16.33) and in relative clauses:

I'm afraid the journey *would* be too expensive.

The journey was a disappointment to those who *would* have preferred to travel by road.

[b] An ironic or quasi-subjunctive use of *should* is current in certain Yiddishisms, especially in AmE:

I should talk. ['I shouldn't talk!']

I should worry. ['Why should I worry?']

I should be so lucky. ['I'm unlucky.']

[c] Hypothetical *would* when followed by a verb such as *like*, *love*, or *prefer* is used to indicate a tentative desire in polite requests, offers, or invitations:

A: *Would you mind* taking part?

B: No, I'd love to.

A: *Would you like* some tea?

B: Thanks; but I'd prefer coffee, if there is any.

Cf the use of *would* for tentative volition, 4.63 (b).

The modals with the perfective and progressive aspects

4.65 The perfective and progressive aspects are normally excluded when the modals express 'ability' or 'permission', and also when *shall* or *will* expresses 'volition'. These aspects are freely used, however, with extrinsic modal meanings other than ability; eg:

- | | |
|------------------|--|
| 'possibility' | He <i>may/might</i> have missed the train.
She <i>can't/couldn't</i> be swimming all day. |
| 'necessity' | He <i>must</i> have left his umbrella on the bus.
You <i>must</i> be dreaming. |
| 'prediction' etc | The guests <i>will/would</i> have arrived by that time.
Hussein <i>will/would</i> still be reading his paper. |

(On the meaning of the perfective aspect after a modal, and in particular the possibility of paraphrasing it by means of the simple past tense, cf 4.18f.)

'Obligation' can only be expressed with the perfective or progressive when combined with *should* or *ought* to:

- | | |
|--------------|---|
| 'obligation' | I <i>ought to be</i> working now. ['... but I'm not']
You <i>should have</i> finished it. ['... but you haven't']
She <i>shouldn't have</i> left him. ['... but she did'] |
|--------------|---|

As the glosses indicate, these modals, in contrast to *must*, often imply nonfulfilment of the obligation. There are also examples which do not have this counterfactual implication; eg:

Have you heard from Maria? She *should have* started her job on Monday.

The combination of both perfective and progressive constructions with the modals is also possible, subject to the conditions already mentioned:

- You *must have been* dreaming.
She *couldn't have been* swimming all day.
The guests *would have been* arriving by now.

(On the meaning of the perfective and progressive in this combination, cf 4.38f.)

Note [a] The use of *will* + progressive in the sense of 'future as a matter of course' (cf 4.46) is paralleled by other modals in the same construction:

Jill says she *might be calling* this afternoon.

[1]

means approximately 'It is just possible that Jill will be calling. . .'. In contrast to [1], *Jill says she might call this afternoon* implies that the visit will depend on Jill's decision.

[b] Note the use of *might/could* + perfective in certain colloquial speech acts:

They *could/might* have told me! [a complaint]

You *could/might* have been more careful. [a rebuke]

I *might* have *KNOWN* someone would upset her. [an expression of irritation]

The meanings of marginal auxiliaries

4.66 We may use the expression 'marginal auxiliaries' to apply to all four categories (marginal modals, modal idioms, semi-auxiliaries, and catenative verbs) discussed in 3.40–51. Some of these have also claimed our attention in this chapter; eg: *used to* (4.15), *be going to* (4.43), *ought to* (4.56). But it is worth noting how closely these verbs tend to follow the pattern of the auxiliary verbs in the kinds of meaning they convey. On the one hand, we have aspectual or time-indicating verbs such as *used to*, *be going to*, and *be about to* (4.47). On the other hand, the largest group of marginal auxiliaries are modal in their semantic function, eg: *had better* (3.45) and *be able to*.

The semantic groups displayed in the right-hand part of Table 4.66 show a remarkable similarity to those of the modal auxiliaries, as indicated in Fig 4.51. We use the same terminology here, to make the comparison more evident:

Table 4.66 Meanings of marginal auxiliaries

Temporal and aspectual	Modal			
	Necessity	Obligation	Possibility, Ability	Permission
Past	(Committed)	(Committed)		
<i>used to</i>	<i>need (to) have to have got to be bound to be certain to be sure to</i>	<i>need (to) have to have got to be bound to be certain to be sure to</i>	<i>be able to</i>	<i>be allowed to be permitted to</i>
Future	(Non committed)	(Non committed)	Volition	Other
<i>be going to be to be about to be due to be destined to</i>	<i>ought to be likely to be supposed to</i>	<i>ought to had better be supposed to</i>	<i>be willing to would rather would sooner be going to</i>	<i>dare (to) tend to be liable to happen to</i>

In Table 4.66, several verbal constructions occur more than once, since, like the modal verbs, their semantic ranges tend to stretch across more than one category. This is particularly true of the extrinsic/intrinsic contrast which not only applies to all modals (cf 4.49), but also to many of the marginal and catenative constructions. Just as *must* and *should*, for example, have both 'necessity' and 'obligation' meanings, so do the semi-auxiliaries *be bound to* and *be supposed to*:

The plan *is bound to* fail. [= 'must inevitably fail'; necessity]

You *are bound to* pay your debts. [= 'are compelled to . . .'; obligation]

Their team *is supposed to* be the best. [= 'should be'; this is the recognized view]

You *were supposed to* be here at nine. [= 'ought to have been'; obligation]

The fact that semi-auxiliaries and catenatives have nonfinite verb forms (cf 3.47–9) means that two or even more modal concepts can be combined in a sequence of verb phrases:

We *may have to* play it again. [possibility + obligation]

You *should be able to* find enough food. [tentative inference + ability]

She *must have been willing to* help. [necessity + volition]

The students *are going to have to be able to* play three different instruments. [prediction + necessity + ability]

It is normal, in such combinations, for an extrinsic modality to precede an intrinsic one, as the examples show.

Note The quasi-adverbial status of many semi-auxiliary or catenative verbs can be shown by paraphrases such as the following:

She *appears to* like the show. = She *apparently* likes the show.
She *is certain to* enjoy the meal. = She *will certainly* enjoy the meal.

Meaning in the nonfinite verb phrase

4.67 Our discussion of meaning in this chapter has concentrated on finite verb phrases, and in conclusion we must give some attention to nonfinite verb phrases. The same semantic distinctions apply to both finite and nonfinite verb phrases, in so far as the structural possibilities of the nonfinite verb phrase permit. We have seen, however, in 3.56 that the modal construction and the distinction between present and past tense do not apply to the nonfinite verb phrase; and in 4.18 f that the nonfinite perfective construction has the general meaning of anteriority. Distinctions of aspect are the only ones which are expressed within the constructional possibilities of a single

nonfinite verb phrase. Even then, the full range is only possible within an infinitive phrase:

Sir Topaz appears $\left\{ \begin{array}{l} \text{to be winning his race. [simple progressive]} \\ \text{to have won his race. [simple perfective]} \\ \text{to have been winning his race. [perfective progressive]} \end{array} \right.$

In an *-ing* participle phrase in adverbial clauses, the perfective/nonperfective contrast is sometimes available:

Eating a hearty breakfast, $\left. \begin{array}{l} \text{Having eaten a hearty breakfast,} \end{array} \right\} \text{we prepared for our long journey. [1] [2]}$

From [1], we understand that the eating and the preparation took place together, while from [2], we understand that the breakfast preceded the preparation.

But the progressive/nonprogressive contrast is not normally applicable here, since *-ing* participle phrases are incapable of expressing this distinction formally (cf 3.56). Moreover, the *-ing* participle itself is not, in spite of its appearance, necessarily associated with the progressive:

$\left. \begin{array}{l} \text{Being an enemy of the Duke's,} \\ \text{Realizing he was in danger,} \\ \text{Having no news of his wife,} \end{array} \right\} \text{he left the court immediately. [3]}$

(For further discussion of the semantics of such *-ing* participle constructions, see 16.40.)

To prove this point, the *-ing* participles in [3] are all stative and incompatible with the progressive:

- *He was being an enemy of the Duke's.
- ?*He was realizing he was in danger.
- *He was having no news of his wife.

Nevertheless, there are constructions in which the *-ing* participle construction has aspect contrast with the infinitive, and is progressive in meaning (cf 16.52f):

I $\left\{ \begin{array}{l} \text{saw} \\ \text{heard} \end{array} \right\} \text{them} \left\{ \begin{array}{l} \text{shoot at him.} \\ \text{shooting at him.} \end{array} \right.$

Whereas the infinitive *shoot* suggests a single shot, the *-ing* participle suggests a repetitive action lasting over a period of time, in accordance with the interpretation of the progressive aspect in finite verb phrases referring to momentary events (cf 4.35). In:

I watched them $\left\{ \begin{array}{l} \text{climb the tower.} \\ \text{climbing the tower.} \end{array} \right. [4] [5]$

the infinitive *climb* suggests that they reached the top of the tower, whereas the participle *climbing* connotes the potential incompleteness of the progressive.

The *-ed* participle phrase has no formal contrasts of aspect, and is therefore

the most restricted type of phrase in terms of semantic contrasts. Here again, however, there is a potential contrast with the passive *-ing* participle phrase:

I saw the tower $\left\{ \begin{array}{l} \text{climbed by a student.} \\ \text{being climbed by a student.} \end{array} \right. [6] [7]$

The participle *climbed* in [6] is the passive counterpart of the infinitive *climb* in [4]; it describes the climb as a completed event, whereas [7] describes it as in progress, and as possibly incomplete.

Note [a] The structural contrast between infinitive and *-ing* participle complementation occurs with categories of verb other than the perceptual verbs *see*, *hear*, etc illustrated above. In these other cases, however, there is almost no semantic contrast of aspect:

She started $\left\{ \begin{array}{l} \text{to eat.} \\ \text{eating.} \end{array} \right. [8]$

She likes $\left\{ \begin{array}{l} \text{to talk.} \\ \text{talking.} \end{array} \right. [9]$

Eating in [8] and talking in [9] are thus not to be classified as progressive (cf 16.40).

[b] With certain main verbs which imply anterior time in their complementation (cf 16.39), such as *admit*, *remember*, *regret*, there is no contrast of meaning between complementation by a perfective and by a nonperfective *-ing* participle phrase:

We $\left\{ \begin{array}{l} \text{admitted} \\ \text{remembered} \\ \text{regretted} \end{array} \right\} \left\{ \begin{array}{l} \text{leaving early.} \\ \text{having left early.} \end{array} \right. [10] [11]$

In spite of the difference of construction, [10] and [11] are virtually synonymous with each other.

- 4.68 Although nonfinite verb phrases have no modal verbs, the meanings of the modals can be added to them through the use of semi-auxiliaries such as *have to*, *be (un)able to*, *be allowed to*, *be about to*, etc:

I am sorry to *have to* repeat this warning.
Being unable to free himself, he lay beneath the debris until rescued.
 The suspects admitted *being about to* commit a crime.
 Many inmates hate not *being allowed to* leave the premises.

Bibliographical note

General treatments of the meaning and use of verb constructions: Coates and Leech (1980); Edmondson et al (1977); Leech (1971); Palmer (1974).

On tense and aspect in general, see Crystal (1966); G. Lakoff (1970b); Lyons (1977), Vol 2; Schopf (1984); Zandvoort (1962).

On the perfective aspect, see McCoard (1978); Sørensen (1964).

On stative, agentive, and other classes of verb meaning, see Bache (1982); Cruse (1973); Ikegami (1973); Jacobson (1980a); Mańczak (1979); Mourelatos (1978); Quirk (1970b); Sag (1973); Vendler (1957).

On expression of future time, see Aarts (1969); Close (1977, 1980); Haegeman (forthcoming a); Haegeman and Wekker (1984); Tottie (1974); Wekker (1976).

On modal meanings in general, see Coates (1982); Halliday (1969); Hermerén (1978); Hofmann (1979); Johannesson (1976); R. Lakoff (1972); Leech and Coates (1980); Lyons (1977), Vol. 2; Matthews-Bresky (1975); Palmer (1977, 1979); Standwell (1979); Von Wright (1951); Wells (1979).

Studies of particular modal auxiliaries include: Coates (1980); Haegeman (1981a, 1981b, 1983); Jacobsson (1962, 1977b); Palmer (1980); Quirk (1981); Stubelius (1962); Zandvoort (1963).

5 Nouns and determiners

5.1	Types of noun phrase	245
5.2-9	Noun classes: count, noncount, and proper nouns	245
.3	Concrete and abstract nouns	247
.4	Nouns with dual class membership	247
.5	Reclassification	248
.6-8	Partitive constructions	249
.6	Partition in respect of quality	249
.7	Partition in respect of quantity	249
.8	Measure partitive nouns	251
.9	Noncount nouns and their count equivalents	251
5.10-25	Determinatives	253
.11-14	Central determiners	253
.11	The articles	253
.12	Other central determiners	254
.13-14	Central determiners and noun classes	255
.15-19	Predeterminers	257
.16	<i>All, both, half</i>	258
.17	<i>All and whole</i>	259
.18	The multipliers <i>double, twice, etc</i>	260
.19	The fractions <i>one-third, two-fifths, etc</i>	261
.20-25	Postdeterminers	261
.21	(a) Cardinal numerals	261
.22	(b) Ordinal numerals and 'general ordinals'	262
.23-24	(c) Closed-class quantifiers	262
.25	(d) Open-class quantifiers	264
5.26-51	The use of articles with common nouns	265
.26	Specific and generic reference	265
.27-51	Specific reference: definite and indefinite	265
.27-35	Uses of the definite article	265
.28	(a) Immediate situation	266
.29	(b) Larger situation (general knowledge)	266
.30	(c) Anaphoric reference: direct	267
.31	(d) Anaphoric reference: indirect	267
.32	(e) Cataphoric reference	268
.33	(f) Sporadic reference	269
.34	(g) The 'logical' use of <i>the</i>	270
.35	(h) The use of <i>the</i> with reference to body parts	270
.36-38	Uses of the indefinite article	272

.37	Nonreferring uses of the indefinite article	273
.38	The indefinite article and the numeral <i>one</i>	273
.39–51	Uses of the zero article	274
.39–40	The zero article compared with unstressed <i>some</i>	274
.41	The zero article with definite meaning	276
.42	Noun phrases in a copular relation	276
.43–49	Noun phrases with sporadic reference	277
.44	(a) Some 'institutions' of human life and society	277
.45	(b) Means of transport and communication	278
.46	(c) Times of day and night	278
.47	(d) Seasons	278
.48	(e) Meals	279
.49	(f) Illnesses	279
.50	Parallel structures	280
.51	Fixed phrases involving prepositions	280
5.52–59	The articles in generic reference	281
.53	The generic use of the indefinite article	281
.54	The generic use of the zero article	282
.55–57	The generic use of the definite article	282
.55	With singular noun phrases	282
.56	With plural noun phrases	283
.57	Some nationality words	284
.58–59	The articles with abstract noncount nouns	286
5.60–72	Proper nouns	288
.61–64	Proper nouns behaving as common nouns	288
.62	(a) Number	288
.63	(b) Determination	289
.64	(c) Modification	289
.65–69	Names with no article	290
.66	Personal names	291
.67	Temporal names	292
.68	Geographical names	293
.69	Other locative names consisting of proper noun + common noun descriptor	294
.70–72	Names with the definite article	294
.71	Structure of names with <i>the</i>	295
.72	Classes of names typically preceded by <i>the</i>	296
5.73–103	Number	297
.73–74	Number classes	297
.75	(A) Singular invariable nouns	298
.76–78	(B) Plural invariable nouns	300
.76	(Ba) Summation plurals	300

.77	(Bb) Pluralia tantum ending in -s	301
.78	(Bc) Unmarked plural nouns: <i>people, police</i> , etc	303
.79–81	(C) Regular plurals	304
.80	The pronunciation of the regular plural	304
.81	The spelling of the regular plural	304
.82–91	(D) Irregular plurals	305
.83	(Da) Voicing and -s plural	305
.84	(Db) Mutation	306
.85	(Dc) The -en plural	307
.86–91	(Dd) Zero plural	307
.87	(I) Animal names	307
.88	(II) Nationality nouns	308
.89–90	(III) Quantitative nouns	308
.91	(IV) Nouns with equivocal number	309

.126	The 'post-genitive'	330
	Bibliographical note	331

Types of noun phrase

- 5.1 The noun phrase typically functions as subject, object, and complement of clauses and as complement of prepositional phrases. Consider the different subjects in the following sentences:

<i>The girl</i>	} is my sister.	[1]
<i>The blonde girl</i>		[2]
<i>The blonde girl in blue jeans</i>		[3]
<i>The blonde girl wearing blue jeans</i>		[4]
<i>The blonde girl who is wearing blue jeans</i>		[5]
<i>She</i>		[6]

Sentences [1–5] are alike in having the same noun (*girl*) as noun-phrase head (cf 2.28, 17.2). The noun phrase in [1] has the simplest structure, consisting of only the definite article and the head; in [2] it also has a premodifying adjective (*blonde*); in [3–5] the noun phrase has, in addition, postmodification: in [3] a prepositional phrase (*in blue jeans*); in [4] a nonfinite clause (*wearing blue jeans*); and in [5] a relative clause (*who is wearing blue jeans*). In [6] the noun phrase consists of only one word (*she*), which is one of a closed class of grammatical words called personal pronouns. Such pronouns can 'deputize' for noun phrases and hence cannot normally occur with determiners such as the definite article, premodification, or (normally) postmodification:

**the blonde she* ?*she in blue jeans*

Since noun phrases of the types illustrated in [2–5] include words and structures that will be dealt with in later chapters (adjectives, prepositional phrases, clauses), it will be convenient to reserve the treatment of 'complex' noun phrases incorporating such items until Chapter 17, which deals with the noun phrase as a whole. The present chapter will be restricted to the constituency of the 'basic' noun phrase, *ie* the classes of nouns together with articles or other closed-class determinative elements that can occur before the noun head, including predeterminers like *all*, central determiners like *these*, and postdeterminers like *last* and *few*:

all these last few days

The closed class of pronouns as in [6] is dealt with in Chapter 6.

Noun classes: count, noncount, and proper nouns

- 5.2 It is necessary, both for grammatical and semantic reasons, to see nouns as falling into different subclasses. That this is so can be demonstrated by taking the four nouns *Sid*, *book*, *furniture*, and *brick* and considering the extent to which it is possible for each to appear as head of the noun phrase functioning as object in the sentence *I saw ...*: without any determiner (a); with the lightly stressed determiners *the* /ðə/ (b), *a* /ə/ (c), *some* /səm/ (d); and in the plural (e). The result of this test can be seen in Table 5.2:

Table 5.2 Test table for noun classes

	(1)	(2)	(3)	(2 + 3)
(a)	<i>Sid</i>	*book	furniture	brick
(b)	*the <i>Sid</i>	the book	the furniture	the brick
(c)	*a <i>Sid</i>	a book	*a furniture	a brick
(d)	*some <i>Sid</i>	*some book	some furniture	some brick
(e)	* <i>Sids</i>	books	*furnitures	bricks

The difference between column 1 (with only one possibility) and column 2 + 3 (with all possibilities) indicates the degree of variation between the noun classes. Nouns that behave like *Sid* in column 1 (*Confucius, Paris, Sierra Leone*, etc) are PROPER NOUNS, which will be further discussed in 5.60ff.

The nouns in the other columns are COMMON NOUNS, but there are important differences between them. Those which, like *book* in column 2 (*bottle, chair, forest, idea*, etc), must be seen as denoting individual countable entities and not as an undifferentiated mass, are called COUNT nouns. Nouns which, like *furniture*, conform to the pattern of column 3 (as do *bread, grass, warmth, music*, etc), must by contrast be seen as denoting an undifferentiated mass or continuum. These are called NONCOUNT nouns.

Finally we have nouns in column 2 + 3 which can be either count or noncount nouns (eg: *brick, cake, paper, stone*), in that we can view a noun like *brick* either as the noncount material [1], or as constituting the countable object [2]:

- The house is built of *brick*. [1]
He used *bricks* to build the house. [2]

The type headed 2 + 3 may be classified grammatically in two ways: (a) either as a lexical class of noun which combines the characteristics of count nouns and noncount nouns, or (b) as two separate items, one count and the other noncount. The former mode of analysis is convenient for nouns like *brick* and *cake* with little difference in meaning between count and noncount uses. Therefore such nouns will be said to have 'dual class membership' (cf 5.4).

Although in sentences such as *I like music, I like Sid*, the two nouns look superficially alike in terms of article usage, we will say that *music* has ZERO ARTICLE but that *Sid* has NO ARTICLE. The label 'zero' is appropriate in the case of common nouns which have article contrast, eg: *music* as opposed to the *music* (cf 5.52ff) in:

- I like *music* and dancing.
I think *the music* is too loud in here.

If, however, we disregard special grammatical environments like *the Sid I mean is tall* (cf 5.64), proper nouns have no article contrast (*Sid*/**the Sid*), and will therefore be said to have 'no article'.

Note COUNT nouns, as they are termed in this book, are by some grammarians called 'countable' nouns; similarly, our term NONCOUNT nouns corresponds to 'mass' nouns or 'uncountable' nouns in other grammars.

Concrete and abstract nouns

- 5.3 Cutting across the grammatical and semantic count/noncount distinction, there is a semantic division into nouns like *pig* which are CONCRETE (ie accessible to the senses, observable, measurable, etc) and nouns like *difficulty* which are ABSTRACT (typically nonobservable and nonmeasurable). But while abstract nouns may be count (like *remark/remarks*) or noncount (like *warmth*/**warmths*), there is a considerable degree of overlap between abstract and noncount (cf 5.58). Figure 5.3 shows the noun classes introduced so far.

Fig 5.3 The most important noun classes

Nouns with dual class membership

- 5.4 The division of nouns according to countability into count nouns and noncount nouns is basic in English. Yet the language makes it possible to look upon some objects from the point of view of both count and noncount, as in the case of *cake*:

- A: Would you like a *cake*? B: No, I don't like *cake*.

Such nouns may be said to have dual class membership. In other cases, eg: *paper*, there is no readily perceptible parallelism but a notable difference in meaning between the two nouns:

- I want an evening *paper*. ['newspaper'] [1]
Wrap the parcel up in brown *paper*. ['wrapping paper'] [1a]

Note also the variation of quantifiers (eg: *much*/**many*) in some of the following examples of count and noncount nouns:

- | | | |
|---|------------|------|
| She was a <i>beauty</i> in her youth. | [COUNT] | [2] |
| She had great <i>beauty</i> in her youth. | [NONCOUNT] | [2a] |
| She's had many <i>difficulties</i> . | [COUNT] | [3] |
| She's not had much <i>difficulty</i> . | [NONCOUNT] | [3a] |
| He's had several odd <i>experiences</i> . | [COUNT] | [4] |
| He hasn't had much <i>experience</i> . | [NONCOUNT] | [4a] |
| There were bright <i>lights</i> and harsh <i>sounds</i> . | [COUNT] | [5] |
| <i>Light</i> travels faster than <i>sound</i> . | [NONCOUNT] | [5a] |
| She will give a <i>talk</i> on Chinese art. | [COUNT] | [6] |
| That's foolish <i>talk</i> . | [NONCOUNT] | [6a] |
| The <i>lambs</i> were eating quietly. | [COUNT] | [7] |
| There is <i>lamb</i> on the menu today. | [NONCOUNT] | [7a] |

In many other cases, the type of distinction to be seen in the count noun *lamb*

(the animal, as in [7]) and the noncount noun *lamb* (the meat from the animal, as in [7a]) is achieved by separate lexical items, as in:

- They raise a great many *calves*, *pigs*, and *sheep*. [8]
We eat a great deal of *veal*, *pork*, and *mutton*. [8a]

Other count/noncount pairs realized by different lexical items are the following:

- | | |
|---|---|
| <i>a garment</i> ~ <i>clothing</i> | <i>a job, a task</i> ~ <i>work</i> (cf 5.9) |
| <i>a laugh</i> ~ <i>laughter</i> | <i>a suitcase</i> ~ <i>luggage</i> |
| <i>a 'permit</i> ~ <i>permission</i> | <i>a poem</i> ~ <i>poetry</i> |
| <i>a weapon</i> ~ <i>arms</i> (cf 5.77) | <i>a machine</i> ~ <i>machinery</i> |

Note also the contrast between the noncount noun *money* and the count nouns naming different units of money:

- We haven't much *money* left. We've only got a few *coins*/two dollar *bills*/some pound *notes*.

Note The distinction between count nouns and noncount nouns is not fully explainable as necessarily inherent in 'real world' denotata. This is clear when we compare the words of languages closely related to English (cf 5.9). Rather, the justification for the count/noncount distinction is based on the grammatical characteristics of the English noun.

Reclassification

- 5.5 Nouns may also be shifted from one class to another by means of conversion (cf App I.53). Thus a noncount noun like *cheese* can be 'reclassified' as a count noun involving a semantic shift so as to denote quality partition 'kind/type/form of', eg:

- A: What *cheeses* have you got today?
B: Well, we have Cheddar, Gorgonzola, and Danish Blue.

Similarly, a noun like *coffee*, which is normally noncount, as in [1], can be reclassified as a count noun to mean an 'appropriate unit of' as in [1a] and [1b], or a 'kind/sort/brand of' as in [1c] and [1d]:

- | | |
|--|------|
| Do you want <i>tea</i> or <i>coffee</i> ? | [1] |
| Can I have a <i>coffee</i> , please. ['a cup of coffee'] | [1a] |
| Two <i>coffees</i> , please. ['two cups of coffee'] | [1b] |
| This is a <i>nice coffee</i> . | [1c] |
| I like <i>Brazilian coffees</i> best. | [1d] |

Note There is a special case of reclassification in cases like the following:
Are you *cosmetics*?

Here there is no coreference relation between subject and complement as in *Are you a teacher*? The complement represents instead a compressed form of the predication; eg: *Are you (selling) cosmetics*? In this use of the noun there is an implied contrast: 'cosmetics as opposed to toys, jewellery, etc in a department store'. Similarly:

Are you *103*? ['the occupant of room number 103, as opposed to 104, etc']
The contrast may also be more explicit, as in:

Are you *church* or *chapel*? ['a member of the Church of England or a nonconformist']
In these last cases we may argue that the noun has been reclassified as an adjective (cf App I.51), as in *They're very Oxbridge*.

Partitive constructions

Partition in respect of quality

- 5.6 Both count and noncount nouns can enter partitive constructions, ie constructions denoting a part of a whole. Such constructions express both quality partition (eg: *a kind of paper*) and quantity partition (eg: *a piece of paper*). Quality partition is expressed by a partitive count noun like *kind*, *sort*, or *type* followed by an *of*-phrase, eg:

- | SINGULAR PARTITIVES | PLURAL PARTITIVES |
|----------------------------------|---------------------------------|
| a new <i>kind of</i> computer | new <i>kinds of</i> computers |
| a delicious <i>sort of</i> bread | delicious <i>sorts of</i> bread |
| another <i>type of</i> research | other <i>types of</i> research |

Quality partition of noncount nouns may thus be expressed either by a partitive construction or by reclassification (cf 5.5):

- a nice *kind of* coffee ~ a nice *coffee*
English *types of* cheese ~ English *cheeses*

Note Whether we are dealing with count or noncount nouns, we can express the quality partition in the form *a* + adjective + noun, such that a sentence like the following is superficially ambiguous:
We are importing a new *Italian shirt*.
It may mean either 'a new type of' or 'a new item' (the former interpretation naturally being more likely in this case).

Partition in respect of quantity

- 5.7 (a) Noncount nouns

Noncount nouns are seen, as we have said, as denoting an undifferentiated mass. However, the expression of quantity and thus countability may be achieved by means of certain GENERAL PARTITIVE NOUNS, in particular *piece*, *bit*, *item*, followed by an *of*-phrase:

- | SINGULAR PARTITIVES | PLURAL PARTITIVES |
|------------------------|------------------------------|
| a <i>piece of</i> cake | two <i>pieces of</i> cake |
| a <i>bit of</i> chalk | some <i>bits of</i> chalk |
| an <i>item of</i> news | several <i>items of</i> news |

Quantity of noncount nouns may thus often be expressed either by partitive nouns or by reclassification (cf 5.5): *two lumps of sugar* = *two sugars*.

The most widely used partitive expression is *a piece of*, which can be combined with both concrete and abstract nouns, eg:

- Concrete: *a piece of* bacon/chalk/coal/land/paper
Abstract: *a piece of* advice/information/news/research/work

Bit generally implies a small quantity: *a bit of* rice/news/fun/research. With abstract nouns, *item* is used (besides *piece*):

- an *item of* business/information/news ['a news item']

Item is not generally used with concrete nouns: *an *item of* oil/cake (BUT an *item of* clothing).

In addition to these general partitives there are some more restricted and

descriptive TYPICAL PARTITIVES which form expressions with specific concrete noncount nouns, such as the following:

an *atom*/grain of truth
 a *bar* of chocolate/soap/gold/iron
 a *blade* of grass
 a *block* of ice/flats <BrE>/seats [in a theatre]/shares [in a business]
 a *cut* of lamb/meat; a *joint* of meat <BrE>
 a *drop* of water/oil/whisky
 a *grain* of corn/rice/sand/salt
 a *loaf* of bread
 a *lump* of coal/lead/sugar
 a *sheet* of paper/metal/ice
 a *slice* of bacon/bread/cake/meat
 a *speck* of dust/dirt
 a *stick* of chalk/dynamite/celery/rock [a sweet] <BrE>/candy <AmE>
 a *strip* of cloth/land/paper
 a *suit* of clothing/clothes/armour

(b) Plural count nouns

Whereas the general partitive *a piece of* can be used with many of the noncount nouns (*a piece of paper/bacon/news*, etc), it cannot be used with plural count nouns (including invariably plural nouns like *cattle*; cf 5.76ff). Other partitives are used with them, eg:

a (large) *crowd* of people
 a (huge) *flock* of birds/sheep
 a (small) *herd* of cattle
 a *packet* <BrE>/*pack* <esp AmE> of cigarettes
 a *series* of incidents/concerts/lectures
 a *bunch* of flowers/keys [In informal style, *bunch* is also used about people, like 'group': *a bunch of teenagers*.]

(c) Singular count nouns

Partition can also be expressed in reference to singular count nouns, eg:

a *piece* of a loaf
 a *branch* of a tree
 a *page* of a book
 a *section* of a newspaper
 a *verse* of a poem

Fractional partition can also be expressed by such general quantitative items as *half*, *all*, *whole* + *of* + noun (cf 5.16f):

I'd like $\left\{ \begin{array}{l} \text{half of} \\ \text{a quarter of} \\ \text{all of} \\ \text{the whole of} \\ \text{the rest of} \\ \text{the remainder of} \end{array} \right\}$ that piece (of meat).

Note [a] When we modify a partitive noun sequence, the modification applies to the group as a whole: an expensive *cup of coffee* ['The *cup of coffee* cost a lot.']

But, of course, since in many cases the adjective modifying the whole group could equally apply to the second noun, we have some instances like the following where the meanings of the two phrases differ little, if at all:

a hot [*cup of tea*] = a cup of hot tea
 a good [*stroke of luck*] = a stroke of good luck
 a beautiful [*pair of legs*] = a pair of beautiful legs

The premodifiers (*hot*, etc) in such cases often apply more appropriately to the second noun than to the first; *ie* it is not the cup but the tea that is hot in *a hot cup of tea*. In *a nice glass of whisky*, *nice* is roughly equivalent to 'welcome' and offers only implicit comment on the quality of the liquor.

(b) Typical partitives sometimes have a negative intensifying force (cf 8.111):

A: Did you sleep well?

B: No, I didn't get *a wink* (of sleep).

(c) When the two partitive constructions combine, the quantity partitive is included in the scope of the quality partitive:

[*two kinds of* [*loaves of bread*]]

but not: **two loaves of kinds of bread*

Measure partitive nouns

5.8 The measure partitives relate to precise quantities denoting length, area, volume, and weight, for example (note the compulsory *of*):

Length: a *foot* of copper wire
 a *metre* <BrE>/a *meter* <AmE>/a *yard* of cloth
 a *mile* of cable
 Area: an *acre*/a *hectare* of land
 Volume: a *litre* <BrE>/a *liter* <AmE> of wine
 a *pint*/a *quart* of milk
 Weight: an *ounce* of tobacco a *pound* of butter
 a *kilo* of apples a *ton* of coal

Measure partitives can be either singular or plural:

$\left\{ \begin{array}{l} \text{a/one gallon} \\ \text{two/several gallons} \end{array} \right\}$ of water

If count, the second noun must be plural:

$\left\{ \begin{array}{l} \text{one kilo of} \\ \text{two kilos of} \end{array} \right\} \left\{ \begin{array}{l} \text{apples} \\ \text{*apple} \end{array} \right\}$

Noncount nouns and their count equivalents

5.9 It may be noted that, apart from a tendency for concrete nouns to be count and for abstract nouns to be noncount, there is no necessary connection between the classes of nouns and the entities to which they refer. In some related languages, the nouns corresponding to *information*, *money*, *news*, and *work*, for example, are count nouns, but in English they are noncount:

He didn't give us *much information*.
 Do you need *all this money*?
 The *news* is rather bad today.
 She doesn't like *hard work*.

Some noncount nouns with count equivalents are given below:

NONCOUNT NOUN

This is important *information*.
 Have you any *news*?
 a lot of *abuse*
 some good *advice*
 warm *applause*
 How's *business*?
 There is *evidence* that ...
 expensive *furniture*
 The *interest* is only 5 per cent.
 What (bad/good) *luck*!

COUNT EQUIVALENT

a *piece/bit/word* of information
 a *piece/a bit/an item* of good news
 a *term/word* of abuse
 a *piece/word* of good advice
 a *round* of applause
 a *piece/bit* of business
 a *piece* of evidence
 a *piece/an article/a suite* of furniture
 a (low) *rate* of interest
 a *piece* of (bad/good) luck

Since such differences between languages can be adequately treated only in contrastive grammars, we will restrict the list below to a sample of some nouns (in addition to those mentioned earlier) which are noncount in English but correspond to count nouns in some other languages:

<i>anger</i>	<i>behaviour</i>	<i>cash</i>
<i>chaos</i>	<i>chess</i>	<i>'conduct</i>
<i>courage</i>	<i>dancing</i>	<i>education</i>
<i>equipment</i>	<i>fun</i>	<i>harm</i>
<i>homework</i>	<i>hospitality</i>	<i>leisure</i>
<i>moonlight</i>	<i>music</i>	<i>parking</i>
<i>photography</i>	<i>publicity</i>	<i>'refuse</i>
<i>research</i>	<i>resistance</i>	<i>safety</i>
<i>scenery</i>	<i>shopping</i>	<i>smoking</i>
<i>sunshine</i>	<i>traffic</i>	<i>violence</i>

Note [a] Some of the noncount nouns can be count nouns with special meanings, eg: *moneys* 'amounts of money', as can be seen in a dictionary.

[b] It can be argued that some nouns, like *weather*, are neither count (**a weather*) nor noncount (**a lot of weather*), but these nouns share features belonging to both classes. Noncount noun features include the premodified structures *a lot of good weather*, *some bad weather*, *what lovely weather*. On the other hand, count noun features include the plural *go out in all weathers*, *in the worst of weathers*.

[c] On the use of *fun* as adjective, cf 7.14 Note [c].

[d] Some noncount nouns accept the indefinite article when they are modified (cf 5.59), eg:

They are doing *a brisk business*. (NOT **a business*)

In some cases no modification seems to be required. In the following example, however, modification is in fact implied:

She has had *an education*. ['*a good education*']

[e] Names of languages are all noncount, eg:

She speaks *good English*. [~ '*a good English*']

Occasionally, however, they are count, as in the partitive sense described in 5.6:

She speaks *a dialectal French*. ['*a dialectal form of French*']

Determinatives

- 5.10 When used in discourse, noun phrases refer to the linguistic or situational context. The kind of reference a particular noun phrase has depends on its DETERMINATIVE element, ie the item which 'determines' it. This function is typically realized by a set of closed-class items, or DETERMINERS, which occur before the noun acting as head of the noun phrase (or before its premodifiers) (cf 2.28ff). Thus we say that the noun phrase in [1] has indefinite reference, whereas the noun phrase in [2] has definite reference:

Have you seen $\begin{cases} \text{a bicycle?} & [1] \\ \text{the bicycle?} & [2] \end{cases}$

Indefinite reference is typically indicated by the indefinite article *a/an*, and definite reference is typically indicated by the definite article *the*, but, as we shall see, there are also other determiners with a similar function.

We distinguish three classes of determiners:

- (I) PREDETERMINERS, eg: *half, all, double*;
- (II) CENTRAL DETERMINERS, eg: the articles *the, a/an*;
- (III) POSTDETERMINERS, eg: cardinal and ordinal numerals, *many, few*.

The three classes of determiners have been set up on the basis of their position in the noun phrase in relation to each other. Thus we do not find central determiner + predeterminer (**their all trouble*), or postdeterminer + central determiner + predeterminer (**five the all boys*), but only the order I + II + III given above: *all their trouble, all the five boys*.

We begin by discussing the articles and other central determiners (5.11–14), and then go on to predeterminers (5.15–19), and postdeterminers (5.20–25).

Central determiners

The articles

- 5.11 The most common and typical central determiners are the definite and indefinite articles, *the* and *a/an*, respectively. We have seen in 5.2 that different noun classes require different articles. For the two classes of common nouns, the count and noncount nouns, the distribution into number (singular/plural) and definiteness (definite/indefinite) can be stated as follows:

Table 5.11 Use of the articles with count and noncount nouns

		COUNT	NONCOUNT
SINGULAR	definite	<i>the book</i>	<i>the furniture</i>
	indefinite	<i>a book</i>	<i>furniture</i>
PLURAL	definite	<i>the books</i>	
	indefinite	<i>books</i>	

The forms of the articles depend on the initial sound of the following word.

In its unstressed (and normal) use, the definite article is always written *the* but pronounced /ðə/ before consonants and /ði/ before vowels. The unstressed indefinite article is *a* /ə/ before consonants and *an* /ən/ before vowels. Note that it is the pronunciation, not the spelling, of the following word that determines their form:

the /ðə/ } *boy, usage, hole* *the* /ði/ } *understanding, hour*
a /ə/ *an* /ən/

The use of the articles is discussed in 5.26ff.

Note [a] The indefinite article *a/an* can be regarded as an unstressed numeral, equivalent to stressed *one*. Compare:

a pound or two *one or two pounds*

A/an cannot cooccur with *one* (except, in limited cases, when *one* is the head of a noun phrase: *You are a one!*, cf 6.55 Note [b]), and may sometimes replace *one* (cf 5.38).

[b] There is fluctuation in the form of the indefinite article before some words that are written with initial *h*, depending on whether the *h* is pronounced or not:

a } *hotel, herb*
an } *historical novel* BUT: *a history*
 habitual drunkard BUT: *a habit*

[c] The initial *h* is not pronounced in *hour* (hourly), *honest*, *honour* (honourable), *heir* (heirress, heirloom). Thus: *an hour ago*, *an honour's degree*.

[d] Note words which are spelled with an initial vowel but pronounced with a consonant: *a European car*, *a UNESCO official*; and, conversely, words which are spelled with an initial consonant but pronounced with a vowel: *an MP*, *an RP accent*.

[e] The articles are stressed only for very special emphasis. Here the distinction between the pre-vowel and pre-consonant form is neutralized for the definite article:

'the /ði:/ *boy, usage, understanding, hour*
'a /eɪ/ *boy, usage*
'an /æn/ *understanding, hour*

In writing, emphasis is often indicated by italics or underlining: *'the man*.

The stressed definite article is often used to indicate excellence or superiority in some respect [1, 2], or the identity of somebody well-known [3] (cf 5.63):

He would be *'the* /ði:/ *man* for the job. [1]
 The demonstration will be *'the* /ði:/ *event* this week. [2]
 You don't mean *'the* /ði:/ *Professor Hart*? [3]

There is some criticism of the overuse of stressed articles for expected unstressed articles, especially on radio and TV (cf overuse of stressed prepositions, 9.9 Note, 18.14 Note [b]).

[f] The indefinite article means 'a certain', 'a person giving his name as' (cf: *one* 5.63 Note [b]), in such cases as:

A Mr Johnson came to see you last night.

[g] On *a/an* in distributive expressions of frequency like *twice a day*, cf 5.18.

Other central determiners

- 5.12 The use of the articles is not the only possibility for 'determining' nouns. Instead of *a* or *the* with *book* we may have eg: *this/that/very/each/no book*. Like the articles, these words, and some others, are called central determiners. They form a set of closed-class items that are mutually exclusive with each other, ie there cannot be more than one occurring before the noun head: **a the boy* and **a some boy*. Thus, the central determiners are in a 'choice relation', ie they occur one instead of another. In this respect they are unlike eg: *all, many*, and *white*, which are in a 'chain relation' (cf 2.5), ie they occur one after another in the noun phrase: *all the many white houses*.

The articles have no function independent of the noun they precede. Most

other determiners have the additional function of pronouns, eg: *some, that*, and *either*:

DETERMINER FUNCTION

A: I want *some ice*.

A: What's *that thing* over there?

Either book will do.

PRONOUN FUNCTION

B: Here's *some* for you.

B: *That's* our computer.

You can have *either* (of the books).

On pronouns like *either* with or without the alternative *of*-construction, cf 6.48.

No and *every* are exceptional: like the articles, they cannot function independently as pronouns. They can, however, form part of compound pronouns when followed by (-)one, -body, or -thing (cf 6.45ff):

no one *nobody* *nothing*
everyone *everybody* *everything*

Unlike other central determiners, the articles have no lexical meaning but solely contribute definite or indefinite status to the nouns they determine. Yet the dependence is not unilateral. For example, a count noun like *boy* is, on its own, only a lexical item. To assume grammatical status, it requires an 'overt' determiner of some kind. The use of the articles will be discussed in 5.26ff, and the use of other central determiners in Chapter 6.

Note [a] There are two exceptions to the rule that count nouns cannot occur without a determiner. One occurs in parallel structures (cf 5.50):

Man or boy, I don't like him.

The other exceptional case is that of vocatives (cf 10.52f):

Look here, *man*!

Man is also used generically without the article (cf 5.54 Note).

[b] Coordinated noun-phrase heads can share a determiner placed before the first head (cf 13.67):

the boys and *(the) girls*
the radios, *(the) tape recorders*, and *(the) television sets* in this store
a knife, *(a) fork*, and *(a) spoon*

Central determiners and noun classes

- 5.13 We have noted in 5.2 that there are certain cooccurrence restrictions between articles and common nouns. The definite article can occur with all three noun classes (singular count, plural count, and singular noncount), but the zero and indefinite articles cannot do so. When we consider determiners as a whole, we will find that there are many more restrictions. For *no*, for example, we have all three possibilities:

no pen *no pens* *no music*

But there are incomplete paradigms for *this*, *either*, and *enough*:

this pen **this pens* *this music*
either pen **either pens* **either music*
 **enough pen* *enough pens* *enough music*

- 5.14 The central determiners can be divided into five types with respect to their cooccurrence with the noun classes singular count (*chair, problem*, etc), plural count (*chairs, problems*, etc), and noncount nouns (*furniture, information*, etc).

Type	SINGULAR COUNT	PLURAL COUNT	NONCOUNT
(a)	+	+	+
(b)	—	+	+

Fig 5.14 Cooccurrence of central determiners and noun classes

Type (a): Determiners of singular count, plural count, and noncount nouns.

- (i) The definite article *the* (cf 5.27ff):

Where do you want me to put *the chair/the chairs/the furniture*?

- (ii) The possessive pronouns as determiners: *my, our, your, his, her, its, their* (cf 6.29):

Have you seen *my suitcase/my suitcases/my luggage*?

- (iii) The relative determiners *whose* (cf 6.34) and *which* (cf 6.35 Note [c]):

The lady *whose car* you hit was furious.

Call again at 11, by *which time* the meeting should be over.

- (iv) The *wh*-determiners in *-ever* (cf 14.20):

Vote for *whichever proposal* you think most favourable.

For *whatever reason*, don't be late again.

Whosever idea this may be, I don't like it.

- (v) The interrogative determiners *what, which, whose* (cf 6.36ff):

What colour?

Which information?

Whose ideas are these?

- (vi) The negative determiner *no* (cf 6.62):

We have *no problem/problems* with violence here.

The sign said '*No parking*'.

Type (b): Determiners of plural count nouns and noncount nouns.

- (i) Zero article (cf 5.39ff):

There were *people* everywhere.

Do you want to play *chess*?

- (ii) The assertive determiner *some* (unstressed: /səm/) and the nonassertive determiner *any* (cf 6.59ff):

I want *some rolls/bread*, please.

Have we got *any rolls/bread* for breakfast tomorrow?

- (iii) The quantitative determiner *enough* (cf 6.57):

I haven't got *enough equipment/tools* to do the job.

Type (c): Determiners of singular count nouns and singular noncount nouns. The demonstrative determiners *this* and *that* (cf 6.40ff):

Have you read *this/that book*?

Type (d): Determiners of plural count nouns. The demonstrative determiners *these* and *those* (cf 6.40ff):

Have you seen *these/those plays*?

Type (e): Determiners of singular count nouns.

- (i) The indefinite article *a/an* (cf 5.36ff):

Have you got *a pen*?

- (ii) The universal determiners *every* and *each* (cf 6.51):

I want to interview *every/each student* individually.

- (iii) The nonassertive determiner *either* (cf 6.59ff):

You can park on *either side*.

- (iv) The negative determiner *neither* (cf 6.62):

Neither party accepted the arbitration proposal.

Note [a] Strongly stressed *some* can occur also with certain singular count nouns, especially temporal nouns (cf 6.52):

'Some day he will get his scholarship.

With the meaning 'a certain', etc, stressed *some* can also cooccur with other singular count nouns:

'Some odd person asked for you on the phone.

[b] Stressed *any* can occur also with singular count nouns under certain conditions (cf 6.61):

I will consider *'any offer/offers*. ['it doesn't matter which']

[c] *Every* is exceptional among central determiners in occasionally allowing a genitive or a possessive determiner to precede it:

His every action shows that he is a very determined young man. BUT NOT: **the/an every action*

Predeterminers

5.15 Predeterminers, which can occur before certain central determiners, include:

- (i) *all, both, and half* (cf 5.16f):

all (the) girls, both those cars, half an hour

- (ii) the multipliers *double, twice, three times*, etc (cf 5.18):

double the sum, twice my salary

- (iii) the fractions *one-third, one-fifth*, etc (cf 5.19):

one-third the time

- (iv) *such, what* (cf 7.63, 17.96):

Such a surprise!

What a fine day!

Predeterminers are mutually exclusive:

all girls, *both* girls BUT NOT: **all both* girls
half the sum, *double* the sum BUT NOT: **half double* the sum

Note The combination *all such*, as in [1], is an exception to the rule, just noted, that predeterminers are mutually exclusive:

Although every attempt is made to find suitable foster-homes for the children, it cannot be assumed that *all such* placements will be successful. [1]

The predeterminer *such*, used in this way as a pro-form (cf 2.44, 6.44 Note [b]), can also follow quantifiers such as *any*, *no*, and *many*, as well as cardinal numerals:

Outbreaks of small-arms fire along the frontier became more frequent in May,

$\left\{ \begin{array}{l} \text{but} \\ \text{and} \end{array} \right\} \left\{ \begin{array}{l} \text{no} \\ \text{hardly any} \\ \text{several} \\ \text{many} \\ \text{forty-one} \end{array} \right\} \text{ such incidents were officially investigated.} \quad [2]$

All, both, half

5.16 The predeterminers *all*, *both*, and *half* have restrictions on cooccurrence with determiners and noun heads. They can occur before the articles (*all the time*), possessive determiners (*all my time*, etc), demonstrative determiners (*all this time*). However, since they are themselves quantifiers, *all*, *both*, and *half* do not occur with the 'quantitative' determiners *every*, (*neither*, *each*, *some*, *any*, *no*, *enough* (but cf 5.17 Note [a])). *Both* can occur only with plural nouns and has dual number (see below):

<i>all (the) day</i>	<i>all (the) days</i>	<i>all (the) furniture</i>
<i>half a day</i>	<i>half my days</i>	<i>half the furniture</i>
	<i>both (the/my) eyes</i>	

In addition to this predeterminer function, *all*, *both*, and *half* as pronouns can take partitive *of*-phrases, which are optional with nouns and obligatory with pronouns (cf 'of-pronouns', 6.48):

<i>all (of) the students</i>	<i>all of them/whom</i>
<i>both (of) his eyes</i>	<i>both of them/which</i>
<i>half (of) the time/cost</i>	<i>half of it/this</i>

With a quantifier following, the *of*-phrase is preferred (esp in AmE):

all of the many boys

All three can be used as independent pronouns:

All/both/half passed their exams.

All and *both* (but not *half*) can occur after the head, either immediately or in the *M* adverb position (after the operator, cf 8.16). For *all* and *both* we have, then, the following possibilities:

<i>All students</i> were accepted.	[1]
<i>All the students</i> were accepted.	[2]
<i>All of the students</i> were accepted.	[3]
<i>The students</i> were all accepted.	[4]
<i>All</i> were accepted.	[5]
<i>All of them</i> were accepted.	[6]

<i>They</i> were all accepted.	[7]
? <i>They all</i> were accepted.	[8]

All is considered a pronoun in all these constructions except [1] and [2], where it is a predeterminer.

The predeterminer *both* and the central determiners *either* and *neither* are not plural proper but 'dual', ie they can refer to only two entities. Compared with the numeral *two*, *both* is emphatic:

$\left. \begin{array}{l} \text{Both (the)} \\ \text{The two} \end{array} \right\} \text{ students were excellent.}$

For the use of these items as pronouns, cf 6.50 (*all*, *both*), 6.57 (*half*).

All and whole

5.17 The form *all* + noun with no article usually has generic reference (cf 5.26):

All men are created equal. [generic reference]

Contrast: *All the men* in the mine wore helmets. [specific reference]

But *all* + noun is not necessarily generic, eg:

I will see *all (the) students* at 11 a.m.

All (the) men must leave their coats here, but (the) women may take theirs with them.

The predeterminer *all* and the quantity partitive *whole* (cf 5.7) appear in parallel expressions. In *the whole of*, the definite article is obligatory. The use of *all (of) (the)* and *the whole (of)* is far from straightforward.

(i) *All*, *all the*, or *the whole* is used with temporal nouns, eg:

$\left. \begin{array}{l} \text{all (the)} \\ \text{the whole} \end{array} \right\} \text{ day/morning/week}$

All of the + unit of time is rather uncommon:

?*all of the* day/hour/week

In the negated expression *I haven't seen him all day*, only the zero form is used. With indefinite reference, only *whole* can be used:

I spent $\left\{ \begin{array}{l} \text{a whole morning} \\ \text{the whole morning} \end{array} \right\}$ studying the script. ['full, entire']

(ii) *All the* or *the whole* is used with other count nouns that are understood to be divisible:

$\left. \begin{array}{l} \text{all the} \\ \text{the whole} \end{array} \right\} \text{ family/way/story}$

All + noun occurs occasionally with concrete singular count nouns [1, 2], and it is less rare with contrastive stress [1a, 2a], where *book* and *banana* are treated as a divisible mass:

?I haven't read *all the* book. [1]

The monkey ate *all the bananas*.
 I haven't read *ALL the book*.
 The monkey ate *ALL the bananas*.

[2]
 [1a]
 [2a]

The normal constructions would be:

all of the } *book/banana*
the whole }

Also with abstract nouns, *the whole* is often preferable to *all the*; eg:

the whole truth/distance/environment

(iii) With proper nouns and other nouns without the definite article, *all (of)* or *the whole of* is used:

all (of) } *Finland/London/next month*
the whole of }

The use of *all* + a geographical name to denote the population is rather formal:

All Paris welcomed the General.

In less formal contexts, *The whole of Paris* . . . would be normal in denoting the population, or (more likely) referring to the city area.

(iv) With noncount nouns *all (of) the* is used:

Have you used up *all (of) the coffee*?

All (of) the music on the programme was modern.

The whole of is less preferred and *the whole* is unacceptable here.

Note [a] There is also an adverb *half* which can cooccur with noun heads, as in:

It is *half wine, half water*.

In the colloquial negation *n't half* (esp BrE), *half* can precede *enough* (cf 8.107 Note [b]):

He hasn't *half enough* money.

[b] *Both* and *half* with the *of*-construction are sometimes (especially dialectally) preceded by the definite article:

You don't know *the half of it*.

I've had enough of *the both of you*.

[c] The postposed pronoun *all* in *They were all hungry* must not be confused with *all* as an informal intensifying adverb in *He is all upset* (cf 7.57).

[d] For the following uses of *quite*, *rather*, *such*, and *what*, cf 7.56 Note [b], 7.63:

It was *quite a party*. It's *rather an odd story*.

Such a fine present! *What a stupid idea!*

[e] 'Restrictives' like *just*, *only*, *especially*, etc also occur before determiners:

Only the best cars are exported.

However, they have no special relation to noun phrase structure, since they can also modify verbs, adverbs, and adjectives (cf focusing subjuncts, 8.116f):

He's *just* { a boy.
 feeling sick.
 a little sick.
 sleepy.

The multipliers *double*, *twice*, etc

5.18 The second type of predeterminer includes the multipliers which occur with nouns denoting quantity:

twice { his strength
 her age } *double* { the amount
 their salaries }

three times { this amount
 the usual cost
 the sum }

Once, *twice*, and *three*, *four*, etc *times* can cooccur with the determiners *a*, *every*, *each*, and (less commonly) *per* to form 'distributive' expressions of frequency with a temporal noun as head (cf 8.64):

once } { *a* } { *day*
twice } { *every* } { *week*
three } { *each* } { *month*
four } { *per* } { *year*
 } { } { *decade*

Such expressions can also occur with *every* + spatial nouns:

We stopped *once every mile*.

Both with temporal and spatial nouns, *every* can be followed by a numeral in such expressions as the above:

once every three months
twice every hundred miles

The fractions *one-third*, *two-fifths*, etc

5.19 The fractions can also be followed by determiners. Unlike the multipliers, the fractions have the alternative *of*-construction. The indefinite article can replace *one* (cf 5.38):

He did it in { *one-third* } { *of* } *the time* it took me.
 { *a third* }

Postdeterminers

5.20 Postdeterminers follow predeterminers or central determiners (if such determiners are present). But they precede any adjectives and other premodifying items (cf 17.2). Postdeterminers include:

- (a) Cardinal numerals (cf 5.21): *my three children*
- (b) Ordinal numerals and 'general ordinals' (cf 5.22): *the first day, the last month*
- (c) Closed-class quantifiers (cf 5.23f): *few people*
- (d) Open-class quantifiers (cf 5.25): *a large number of people*

(a) **Cardinal numerals**

5.21 *One* cooccurs with singular count nouns (*one sister*), and the other cardinal numerals (cf 6.63) cooccur with plural count nouns (*two, three*, etc *brothers*). In many contexts, *one* may be regarded as a stressed form of the indefinite article and may sometimes replace it (cf 5.19, 5.38):

I would like { *a* } photocopy of this article.
 { *one* }

Thus, the indefinite article normally cannot cooccur with *one*, but the definite article can:

**a one* book
the one ['only'] book } I like best
the two books

(b) Ordinal numerals and 'general ordinals'

- 5.22 The ordinal numerals have a one-for-one relation with the cardinals: *first/one, second/two, third/three, fourth/four, twentieth/twenty*, etc (cf 6.63f).

The 'general ordinals' include items like *next, last, past, (an)other, additional, and further* ['additional'], which resemble the ordinal numerals grammatically and semantically.

Ordinals cooccur with count nouns and usually precede any cardinal numbers in the noun phrase:

the first two days another three weeks

- Note [a] The general ordinals *last, past*, and *next* may precede or follow cardinals with a difference of meaning. For example: *the last two pages* would mean 'the last and penultimate page of a book', whereas *the two last pages* could mean 'the last page in each of two books'. On divided concord usage, eg: *The last two months is/are . . .*, cf 10.35 Note [b].
 [b] *Another* has two functions. It can be the unstressed form of 'one other' in contrast with *the other* (definite; cf 6.58), as in [1]; or it can have the meaning of 'further', 'additional', 'second', in which case there is no definite form, as in [2]:

I don't like this room. I'd prefer $\left\{ \begin{array}{l} \text{another} \\ \text{the other} \end{array} \right\}$ *one*. [1]

We need *another two rooms* for the meeting.

['two more rooms'; cf: *the other two rooms* 'the two different rooms'] [2]

Note that when it is followed by a plural cardinal number, *another* takes a plural noun as head.

(c) Closed-class quantifiers

- 5.23 There are two small groups of closed-class quantifiers which function as postdeterminers (cf 6.53ff).

- (i) *Many, (a) few*, and *several* cooccur only with plural count nouns:

There were $\left\{ \begin{array}{l} \text{too many} \\ \text{only a few} \\ \text{very few} \\ \text{several} \end{array} \right\}$ mistakes in your essay.

- (ii) *Much* and *(a) little* cooccur only with noncount nouns:

She hasn't got *much* money.

She has only got *(a) little* money.

There are restrictions on the use of *much* with singular and *many* with plural nouns, and the corresponding open-class postdeterminers are widely used instead (cf 6.53). Thus *much* is typically used in a nonassertive sentence like [1]; but in an assertive sentence like [2], usually *a lot of* (chiefly in informal style), or a similar colloquial postdeterminer, is used:

We don't have *much* time. [1]

We have $\left\{ \begin{array}{l} \text{plenty of} \\ \text{a lot of} \\ \text{lots of} \end{array} \right\}$ time. [2]

In the case of *(a) few* ['a small number'] and *(a) little* ['a small quantity'], there is positive/negative contrast according to whether the indefinite article is used or not. When *a/an* does not precede, *few* and *little* are stressed:

He wrote $\left\{ \begin{array}{l} \text{'a few' books. ['some, several']} \\ \text{'few' books. ['not many']} \\ \text{'a little' poetry. ['some']} \\ \text{'little' poetry. ['not much']} \end{array} \right\}$

The postdeterminers *(a) few* and *(a) little* (cf 6.53, 6.62), the determiners *any, no*, and *some* (cf 5.39f, 6.52), and the predeterminers *all* and *both* are all quantifiers although they belong to different syntactic classes.

- Note [a] *Few* and *little* may be preceded by central determiners other than *a*, eg: *these few days, that little money*, but we shall refer only to *a few* versus *few*, *a little* versus *little* where the distinction is clearest.

[b] *Several* can be preceded by a possessive determiner in the sense of 'separate', 'respective': *their several opinions*.

[c] *Many* and *few* can also be used predicatively in formal style (cf 6.53 Note [b], 6.62):

His faults were *many/few*.

Many can also function as a predeterminer with singular count nouns preceded by the indefinite article:

many a good student (rather formal) ['*many good students*']

[d] The quantifier *enough* is used with both count and noncount nouns:

There are (not) *enough* students.

There is (not) *enough* money.

Occasionally it follows the noun (especially noncount: *money enough*), but this use strikes many people as archaic or dialectal.

- 5.24 Since *a few* determines plural count nouns (*a few books*), and *a little* determines noncount nouns (*a little poetry*), neither of which noun classes cooccurs with the indefinite article, it will be clear that in these instances *a* belongs to the quantifier alone.

Few, little, much, and *many* are gradable, and also have comparative and superlative forms (cf 7.74ff):

few/fewer/fewest dollars *many/more/most* dollars
little/less/least money *much/more/most* money

There is a tendency to use *less* (instead of *fewer*) and *least* (instead of *fewest*) also with count nouns:

You've made *less* mistakes than last time.

This usage is however often condemned. *No less than* is more generally accepted:

No less than fifty people were killed in the accident.

Being gradable, *many, much, few*, and *little* can be modified by intensifying adverbs (cf 7.87ff): *too much, very few*, etc.

- Note The quantifier *little* ['not much'] should be distinguished from the homonymous adjective *little*

['small'], which cooccurs with singular or plural count nouns: *a little girl, five little girls*. Thus *a little cake* is ambiguous according to whether it means 'a small cake' [*little* = adjective] or 'a small amount of cake' [*little* = postdeterminer].

(d) Open-class quantifiers

- 5.25 There is also a large open class of phrasal quantifiers which function semantically like the closed-class quantifiers, but most of which consist of a noun of quantity (*lot, deal, amount*, etc) followed by *of* and often preceded by the indefinite article. Some of these, including *plenty of*, can cooccur equally with noncount and plural count nouns:

The room contained $\left\{ \begin{array}{l} \text{plenty of} \\ \text{a lot of} \\ \text{lots of} \end{array} \right\} \left\{ \begin{array}{l} \text{students.} \\ \text{furniture.} \end{array} \right\}$

These quantifiers (especially *lots*) are chiefly used informally.

Others are restricted to quantifying only noncount nouns [1], or plural count nouns [2]:

The chest contained $a \left\{ \begin{array}{l} \text{great} \\ \text{good} \\ \text{(large)} \\ \text{(small)} \end{array} \right\} \left\{ \begin{array}{l} \text{deal} \\ \text{quantity} \\ \text{amount} \end{array} \right\} \text{ of money.} \quad [1]$

The hall contained $a \left\{ \begin{array}{l} \text{(great)} \\ \text{(large)} \\ \text{(good)} \end{array} \right\} \text{ number of students.} \quad [2]$

As the examples suggest, it is usual for these open-class quantifiers to be modified by a quantifying adjective, the latter being obligatory in Standard English with *deal*. (On concord with open-class quantifiers, cf 10.43.)

Although the quantity nouns *lot, deal*, etc look like the head of a noun phrase, there are grounds for arguing that the whole expression (*a lot of, a good deal of*, etc) functions as a determiner. Notably, the verb regularly has number concord with the second noun, rather than the first, as in:

$\left\{ \begin{array}{l} \text{Lots of food was on the table.} \\ \text{= There was lots of food on the table.} \end{array} \right\}$

Note [a] As with *less* and *least*, there is a tendency (esp in AmE) to use *amount* for the more generally acceptable *number* also with count nouns, despite objections to this usage:

There were *large amounts of* tourists on the ferry.

This hall can seat *a large amount of* people.

[b] In familiar spoken English we find a wide range of quantifiers roughly synonymous with *lots of*, eg:

We've got *bags of* time.

She's got $\left\{ \begin{array}{l} \text{stacks of} \\ \text{heaps of} \\ \text{loads of} \end{array} \right\} \text{ money.}$

They have *umpteens* jazz records.

The use of articles with common nouns

Specific and generic reference

- 5.26 In discussing the use of the articles, we must distinguish between specific and generic reference. Compare sentences [1] and [2]:

A lion and *two tigers* are sleeping in the cage. [1]

Tigers are dangerous animals. [2]

In [1] the reference is SPECIFIC, since we have in mind particular specimens of the class 'tiger'. But if we say [2], the reference is GENERIC, since we are thinking of the class 'tiger' without specific reference to particular tigers.

The distinctions between definite and indefinite, and between singular and plural, are important for specific reference. They tend to be less crucial for generic reference, because generic reference is used to denote the class or species generally. Consequently, the distinctions of number which apply to this or that member, or group of members, of the class are neutralized, being largely irrelevant to the generic concept. Singular or plural, definite or indefinite, can often be used without appreciable difference of meaning in generic contexts:

$\left. \begin{array}{l} \text{A German is a good musician.} \\ \text{Germans} \\ \text{The Germans} \end{array} \right\} \text{ are good musicians.} \quad \left. \begin{array}{l} \text{A tiger} \\ \text{Tigers} \\ \text{The tiger} \end{array} \right\} \text{ can be dangerous.}$

A fourth possibility might even be included:

The German is a good musician.

But the slight differences between these various forms, and the reasons for preferring one to another, will be considered in 5.52ff.

The use of articles with specific reference is summarized in Table 5.26:

Table 5.26 Use of the articles with specific reference

	DEFINITE		INDEFINITE	
	COUNT	NONCOUNT	COUNT	NONCOUNT
SINGULAR	<i>the tiger</i>	the furniture	<i>a tiger</i>	(some) furniture
PLURAL	the tigers		(some) tigers	

Only those choices italicized in this table are used for generic reference. At present we will concentrate on the specific use of the articles, which is much more frequent than the generic.

Specific reference: definite and indefinite

Uses of the definite article

- 5.27 The definite article *the* is used to mark the phrase it introduces as definite, ie as 'referring to something which can be identified uniquely in the contextual or general knowledge shared by speaker and hearer'. The 'something' referred

to may be any kind of noun phrase referent: a person (*the girl*), a group of people (*the firemen*), an object (*the lamp*), a group of objects (*the roses*), an abstraction (*the plan*), a group of abstractions (*the fears*), etc. Moreover, the noun determined by *the* may have pre- or postmodification, by which the 'something' identified by *the* may be more precisely specified, eg:

the *tall* lamp the lamp *on the table*

Given that the use of *the* relies on shared knowledge, there are several ways in which the identity of the referent may be determined or 'recovered' by the hearer, as we shall see in 5.28ff.

Note As elsewhere, when no distinction is necessary in this discussion of articles, 'speaker' subsumes 'writer', and 'hearer' subsumes 'reader'.

(a) Immediate situation

5.28 The term SITUATIONAL REFERENCE may be used to describe cases where the reference of *the* is derived from the extralinguistic situation. We first distinguish *the* used with reference to the IMMEDIATE situation:

The roses are very beautiful. [said in a garden]
Have you visited *the castle*? [said in a given town]
I missed both *the lectures* this morning. [said by one student to another]
Have you fed *the cat*? [said in a domestic context]
These are *the pistons*. [explaining the engine of a car]

It is, of course, possible for the speaker to misjudge the knowledge of the hearer, in which case the hearer may need to seek clarification through a *which-* or *what-*question (with the nucleus on the *wh*-item):

Have you fed *the cat*? WHICH cat?
Aren't *the red roses* lovely? WHAT red roses?

Note In practice, since a speaker cannot always be sure of the hearer's state of knowledge, use of *the* involves a certain amount of guesswork. In fact, in some cases the assumption of shared knowledge is a palpable fiction. Notices such as *Mind the step* and *Beware of the dog*, for example, generally do not assume that the reader was previously aware of the hazards in question.

(b) Larger situation (general knowledge)

5.29 The identity of the referent may be evident from knowledge of the 'larger' situation which speaker and hearer share, eg:

the *Prime Minister* the *airlines* the *last war*

The larger situation may in fact be worldwide (*the Pope*), or be shared by all inhabitants of a country; eg in the United States, at a given time, virtually everyone will know which president is being referred to by the phrase *the President*. When it is as wide as this, the 'larger situation' is scarcely distinguishable from general knowledge and may extend, in extreme cases, to the whole planet or to the whole of human history. In the use of phrases like *the sun* there is the presupposition that, in our experience or fields of interest, there is only one such object. Similar examples are:

<i>the North Pole</i>	<i>the Equator</i>	<i>the earth</i>
<i>the moon</i>	<i>the sea</i>	<i>the sky</i>
<i>the stars</i>	<i>the universe</i>	<i>the cosmos</i>
<i>the zenith</i>	<i>the nadir</i>	<i>the Renaissance</i>
<i>the Greek gods</i>	<i>the Republic</i>	<i>the Church</i>

There is a tendency for some nominal expressions following *the* to be written with initial capitals. This is because such expressions in effect have UNIQUE DENOTATION, and in this respect resemble proper nouns (cf 5.60ff).

There is no clear dividing line between 'immediate' and 'larger' situations; instead, there is a scale of generality running from the most restricted to the least restricted sphere that can be envisaged: that of the whole universe of human knowledge.

Note [a] Singular noun phrases having unique denotation include phrases referring to classes, groups, etc of human beings such as the following (cf collective nouns, 5.108):

<i>the working class</i>	<i>the proletariat</i>
<i>the bourgeoisie</i>	<i>the aristocracy</i>

Similar plural phrases include those referring to clans, tribes, races, etc:

<i>the Romans</i>	<i>the Gordon Highlanders</i>
<i>the masses</i>	<i>the Italians</i>

The use of *the* in respect of the 'larger situation' overlaps with the generic use (cf 5.52ff).

[b] Contrary to normal practice, there is no article before *earth* in the following expressions (cf 5.41ff):

come back/down to *earth*
He's very down to *earth*. ['direct']
What on *earth* are you doing?

(c) Anaphoric reference: direct

5.30 The term ANAPHORIC REFERENCE is used where the uniqueness of reference of some phrase *the X* is supplied by information given earlier in the discourse (cf 12.6). We may distinguish two kinds of anaphora: direct and indirect. A definite noun phrase receives DIRECT anaphoric interpretation where the same noun head has already occurred in the text, and it is clear that a relation of coreference exists between the two noun phrases. (By COREFERENCE we understand a relation between the two noun phrases such that they have the same reference.) For example:

John bought a TV and a *video recorder*, but he returned *the video recorder*.

Here, as in other similar cases, there is a complementary role for the definite article and the indefinite article: the first reference to an object will ordinarily be indefinite; but once the object has been introduced into the discourse in this way, it can be treated as 'contextually known', and can thenceforward be referred to by means of the definite article.

(d) Anaphoric reference: indirect

5.31 INDIRECT ANAPHORA arises when a reference becomes part of the hearer's knowledge indirectly, not by direct mention, as in the example in 5.30, but by inference from what has already been mentioned:

John bought a *bicycle*, but when he rode it one of *the wheels* came off.

The wheels of the bicycle can be taken for granted in this sentence because (a) a bicycle has already been mentioned (ANAPHORA), and (b) we know that bicycles have wheels (GENERAL KNOWLEDGE). In this way, we can see that indirect anaphora combines two kinds of 'recoverability'. Another way to look at it is to say that indirect anaphora combines anaphoric reference with cataphoric reference (cf 5.32); eg we understand *the wheels* in [1] above to be an elliptical variant of *the wheels of the bicycle*. This latter explanation does not, as we shall see, apply to all such cases.

Some further examples of indirect anaphora are the following. Once we have introduced the topic of *a farm*, we can go on to talk about *the farmer, the farmhouse, the pigs, the barn*, etc; once we have introduced the topic of *an orchestral concert*, we can go on to talk about *the programme, the audience, the conductor, the second oboe*, etc.

Consider finally these examples:

I lent Bill *a valuable book*, but when he returned it, *the cover* was filthy, and *the pages* were torn. [2]

They got married in grand style. *The bride* wore a long brocade dress, and *the bridesmaids* wore pink taffeta. *The organist* played superb music, and *the choir* sang magnificently. [3]

In [3] the topic of 'a wedding' is introduced by means of the verb phrase *got married* (hence *the bride, the bridesmaids*); there is also the presumption of a church, and hence *the organist, the choir*. There is thus no easy way to explain the subsequent occurrences of *the* by means of ellipsis; to do so, it would be necessary to postulate such long-winded phrases as [3a]:

the bridesmaids who accompanied the bride when she got married [3a]

(e) Cataphoric reference

- 5.32 By the CATAPHORIC use of *the* may be understood the use of the definite article in a context where what follows the head noun, rather than what precedes it, enables us to pinpoint the reference uniquely. 'Cataphoric' is therefore the opposite of 'anaphoric' reference. In practice, however, the cataphoric use of the definite article is limited to cases where the modification of the noun phrase restricts the reference of the noun, so that its referent is, for the purpose of the discourse, uniquely defined. Thus, the italicized postmodifiers of the following nouns justify the use of *the*:

The President of *Mexico* is to visit China. [1]

The girls *sitting over there* are my cousins. [2]

The wines $\left\{ \begin{array}{l} \text{of France} \\ \text{that France produces} \end{array} \right\}$ are among the best in the world. [3]

In principle, however, there is no difference between postmodification and premodification as a means of specifying reference. Compare:

the President of *Mexico* [1a]

the *Mexican* President [1b]

Sometimes the definite noun phrase can be contrasted with an equivalent indefinite phrase. In such instances, the definite article is not in fact genuinely

cataphoric but entails some degree of anaphoric reference. Compare [4] and [4a]:

The bicycle John bought has been stolen. [assumes unique reference; cf: *John's bicycle*] [4]

A bicycle John bought has been stolen. [cf: *a bicycle of John's*, cf 17.46] [4a]

At other times, there is no such indefinite alternative, because the whole phrase has unique denotation, like *the Equator* (cf 5.29):

$\left\{ \begin{array}{l} \text{the height of Mont Blanc} \\ \text{*a height of Mont Blanc} \end{array} \right\}$ $\left\{ \begin{array}{l} \text{the parents of Elvis Presley} \\ \text{*(some) parents of Elvis Presley} \end{array} \right\}$

Note It is not necessary to postulate that the expression [5] presupposes some unspoken preamble such as [5a] but, rather, such as [5b]:

the mud on your coat [5]

There's *some mud* on your coat. [5a]

You know there's mud on your coat. [5b]

Contrast [6] with [6a]:

How did you get *the mud* on your coat? [6]

Did you know you have $\left\{ \begin{array}{l} \text{mud} \\ \text{*the mud} \end{array} \right\}$ on your coat? [6a]

(f) Sporadic reference

- 5.33 *The* is sometimes used in reference to an institution of human society. For example, in [1] there are two possible interpretations of *the theatre*:

My sister goes to *the theatre* every month. [1]

By situational reference, it may mean a particular theatre, say the Criterion Theatre, which my sister attends regularly. But a more likely meaning is that my sister does not necessarily confine her theatre-going to one building: *the theatre* refers, rather, to the theatre as an institution, so that it would be inappropriate to ask, in response to [1]: *Which theatre?* We call this the SPORADIC use of *the*, because reference is made to an institution which may be observed recurrently at various places and times.

There is a similar use of *the news, the radio, the television, the paper(s), the press*, etc, referring to aspects of mass communication:

Did you hear *the ten o'clock news*?

What's $\left\{ \begin{array}{l} \text{in the paper(s)} \\ \text{on the radio} \\ \text{on (the) TV} \end{array} \right\}$ this evening?

But with *television* or *TV*, there is also the possibility that the article will be omitted (cf 5.45).

The concept of sporadic reference also extends to expressions referring to modern transport and communication, such as *the bus, the train, the post* (esp BrE), *the mail* (esp AmE), *the telephone*:

Mary took *the bus/the train* to London. OR: *a bus/a train*
He promised that the letters would be in *the post/the mail* this evening.

In a temporal rather than spatial sense, sporadic reference may even be taken to apply to the optional use of *the* before words referring to seasons (eg: *the winter*, cf 5.47), and to festivals, etc (*the New Year*, cf 5.67).

Note [a] The sporadic use of *the* is in certain instances close to the generic use of *the* (cf 5.55ff). Compare the use of *the theatre* in [1] above with the generic sense of *the theatre* ['drama as an art form'] in [2]:

She's an expert on *(the) (Elizabethan) theatre*. [2]

Similarly: *the novel, the ballad, (the) drama*.

[b] The contrast between situational and sporadic use is manifest in this pair of examples:

There's a vase of flowers on $\left\{ \begin{array}{l} \text{the television (set).} \\ \text{*television.} \end{array} \right.$

There's an interesting play on *(the) television*.

[c] On the sporadic use of *the* in cases like *the barber's*, cf 5.125.

(g) The 'logical' use of *the*

5.34 We may reserve the term LOGICAL for cases where the uniqueness of the referent is to be explained not so much by knowledge of the world, as by appeal to the logical interpretation of certain words. These words are postdeterminers and adjectives whose meaning is inalienably associated with uniqueness: ordinals such as *first*; 'general ordinals' such as *next* and *last* (cf 5.22); also *same*, *only*, *sole*; and superlative adjectives like *best* and *largest*:

When is *the first flight* to Chicago tomorrow? [1]

This is *the only remaining copy*. [2]

Of the three newspapers we have in this city, this is *the best*. [3]

In these cases the indefinite article or the zero article would generally be absurd:

Ada and I have $\left\{ \begin{array}{l} \text{the} \\ \text{*a} \end{array} \right\}$ *same hobby*.

We must catch $\left\{ \begin{array}{l} \text{the} \\ \text{*a} \end{array} \right\}$ *next bus*.

Note [a] The 'logical' use of *the* is closely related to cataphoric reference. Compare [1] with [1a]:

When is *the flight that leaves first* for Chicago tomorrow? [1a]

[b] The occurrence of fixed phrases such as *a best friend* is possible in special contexts: eg if a child is always changing his or her best friend, one may refer to the current favourite as *a new best friend*. More freely, zero article may be used in front of fixed phrases such as:

He was *best man* ['groomsman'] at the wedding. (cf: He was $\left\{ \begin{array}{l} \text{the best man} \\ \text{*best man} \end{array} \right\}$ for the job.)

He won *first prize*.

(h) The use of *the* with reference to body parts

5.35 With reference to parts of the body and following a preposition, *the* is often used instead of possessive pronouns *my*, *your*, *her*, *their* (cf also the indefinite article, 5.36 Note), etc:

Mary banged herself on *the forehead*.

They pulled her by *the hair*.

Everyone gave us a pat on *the back*.

Don't keep digging me in *the ribs*.

In these examples, the personal pronoun or noun referring to the 'possessor' of the body part is the object, and the body part is a prepositional complement. There are virtually synonymous clauses in which the body part is preceded by a possessive pronoun, and functions as object:

I shook $\left\{ \begin{array}{l} \text{him by the hand.} \\ \text{his hand.} \end{array} \right.$ [1]
[1a]

It is often possible, though sometimes unidiomatic, to use a possessive pronoun in place of *the*:

I shook *him* by *his hand*. [1b]
He kissed *her* on *her cheek*.
She patted *him* on *his shoulder*.

In other cases the 'possessor' phrase is subject of the clause:

My mother complains of a pain in *the/her hip*.
The wanted man has a scar on *the/his left cheek*.

Alternatively, the 'possessor' may be implied rather than stated:

The doctor diagnosed a fracture of *the collarbone*.
Many patients in the hospital suffered from a disease of *the liver*.

But such constructions are not exceptions to the general rule that *the* refers to what is uniquely identified by shared knowledge. There is no unclarity in any of these cases as to the identity of the body in question.

The restriction of this use of *the* to prepositional complements means that the possessive pronoun, rather than *the*, has to be used in such examples as:

Have you broken *your arm*? NOT: *Have you broken *the arm*?

A further restriction is that the possessive pronoun must be used if the body part does not refer to what is denoted by the direct object:

She throws the ball $\left\{ \begin{array}{l} \text{with her left hand.} \\ \text{?with the left hand.} \end{array} \right.$ [2]
[2a]

One factor which could make [2a] acceptable, and indeed normal, is the interpretation 'she is left-handed'. Similarly:

She kicks the ball *with the left foot* (because she is *left-footed*).

With such an interpretation, *the* is normal, but the rule is not absolute.

Note [a] There can be a slight difference of meaning between the construction illustrated by [1] and by [1a]. The following appear to be synonymous:

They grabbed $\left\{ \begin{array}{l} \text{him by the arm.} \\ \text{his arm.} \end{array} \right.$ [3]
[3a]

But one can imagine a grisly context in which [3a] refers to an arm severed from the body; this context could not apply to [3].

[b] It is difficult to generalize about cases of the above constructions. Some are purely idiomatic: She looked me in the eye and told me the whole story. [but not here: *looked in my eye*, although this is what a doctor will do at an examination of the eye]

Further semantic factors are the following:

(i) The use of *the* is preferred when the reference is to unpleasant conditions of the body (eg aches, pains, wounds):

have a cold in the head have spies on the brain
be red in the face be armed to the teeth

(ii) This use applies only to parts of the body, and cannot usually be extended to things which are worn:

They seized him by the throat/the beard/the collar/?the jacket.

Moreover, only those verbs which can take the personal direct object without the prepositional phrase can occur in this construction:

He kicked/hit/tapped me on the shin. ['He kicked etc my shin.' But not: *He stepped me on the toes; *He stepped my toes.]

[c] Outside the above conditions, *the* is sometimes used instead of possessives in a masculine style of speech:

How's the back? [referring to an injury]

Let's have a look at the arm. [This is also what a doctor, of either sex, might say to a patient.]

Related to this usage is the habit of some men of referring to their wives, or children, by the (informal):

How's the wife? [normally: your wife]

Wait till I tell the wife about it! [normally: my wife]

How are the children/kids?

Note also (familiar):

How's the old man? ['your husband/father']

[d] On other uses of *the* (eg: *the more the merrier*; *40 miles to the gallon*), cf 11.43.

Uses of the indefinite article

- 5.36 The indefinite article is notionally the 'unmarked' article in the sense that it is used (for singular count nouns) where the conditions for the use of *the* do not obtain. That is, *a/an X* will be used where the reference of *X* is not uniquely identifiable in the shared knowledge of speaker and hearer. Hence *a/an* is typically used when the referent has not been mentioned before, and is assumed to be unfamiliar to the speaker or hearer:

An intruder has stolen a vase. *The intruder* stole the vase from a locked case. *The case* was smashed open.

As we see from this (unusually explicit) example, the indefinite article, in contrast to the definite article, makes no assumptions about an earlier mention. But in actual usage the distinction may be less overt. For example, a conversation may begin as [1] or as [1a]:

A house on the corner is for sale. [1]
The house on the corner is for sale. [1a]

The only difference in meaning is that, in [1a], the speaker presupposes that the hearer will know which house is meant (perhaps because there is only one such house), whereas, in [1], no such assumption is implied.

Unlike the definite article, the indefinite article does not signal coreference with a preceding indefinite noun phrase. In sentence [2], the speaker does not claim that the two watches are the same (although he may be obliquely suggesting that such is the case):

Bob lost a gold watch yesterday, and Bill was wearing a gold watch this morning. [2]

But if the second *a gold watch* is changed to *the gold watch*, the claim is made that the two watches are indeed identical, and that (probably) Bill is a thief.

Note The indefinite article, like the definite article (cf 5.35), is sometimes used with body parts:

Sally has sprained an ankle. [3]

He's broken a leg. [4]

BUT NOT: *Roger has hurt a nose. [5]

A/an cannot be used unless the body has more than one of the body parts mentioned; hence [5] is absurd in implying that Roger has more than one nose. Even when the body part is not unique, the possessive pronoun is the usual choice (cf 5.35):

Sally has sprained her ankle. [3a]

He's broken his leg. [4a]

I've cut my finger.

Nonreferring uses of the indefinite article

- 5.37 The indefinite article is strongly associated with the complement function in a clause, or more generally with noun phrases in a copular relationship (cf 2.22, 10.8). Here it has a descriptive role (similar to that of predicative adjectives), rather than a referring role:

Paganini was a great violinist.

My daughter is training as a radiologist.

We found Lisbon (to be) a delightful city.

What a miserable day (it is)! (cf 11.31)

Whereas the indefinite article is required in the previous examples, there is vacillation in the following cases (cf 'unique role', 5.42):

her duties as (a) hostess

my appointment as (a) lecturer

Jung as (a) thinker

Sometimes *a/an* is nonreferring in a stronger sense; it may not refer to anything in reality at all:

Leonard wants to marry a princess who speaks five languages.

From this sentence, we cannot tell whether Leonard knows a certain princess and wants to marry her, or whether he has simply laid down exceptionally stringent qualifications for his future wife. For all we know, there may be no princess who speaks five languages in existence.

Note Although *a/an* is used for descriptive exclamations such as *What a fool (he is)!*, there is also an exclamatory use of *the* in *The fool!*, *The silly boy!*, etc. Such expressions often accompany a declarative clause, and are added as a parenthesis (intonation remaining at a low pitch):

John is getting into DEBT, the idiot!

My DAUGHTER the little DÄRLING has broken the TV (ironic)

There is a related type of descriptive exclamation in which a noun phrase with *the* or zero article is followed by *that* and a subject and verb (normally *be*):

(The) fool that he is!

On the exclamatory use of pronouns (*Silly me!*, *You fool!*, etc), cf 6.20.

The indefinite article and the numeral one

- 5.38 The indefinite article derives historically from the unstressed form of *one*, and in present-day English there are still many contexts in which this numerical function is uppermost. Thus *one* could be substituted as a slightly emphatic equivalent of *a* in the following coordinate constructions (cf 5.21):

a mile or two cf: *one or two miles* (10.41 Note [b])

The Wrights have *two daughters and a son*.

a foot and a half of water cf: *one and a half feet* (5.73 Note [b])

The following are other examples in which *one* could replace *a/an*, and where the adjective *single* can add an intensifying force to the indefinite article (or *one*):

Mungo can walk forty miles *in a (single) day*.

They didn't stop talking *for a (single) moment*.

There's *not a (single) pickled onion* in the house.

A/an often occurs in this quasi-numerical sense following a negative (cf 10.62).

Note [a] The use of the indefinite article in a numerical or quantifying function is perhaps most obvious in its occurrence in such expressions as (cf 6.65):

a hundred, a dozen, a score, a thousand, a million, a million and a half ['1,500,000'], *a quarter/a twelfth of + noun*

Other uses are seen in quantifiers (cf 5.23ff, 6.53) such as *a few, a little, a great many, a large number of*, etc; also in measure phrases (cf 5.18) such as:

half an hour, ten dollars a day, sixty miles an hour, three times a minute, etc

[b] In addition to being a numeral, *one* also has substitute and generic functions. But in the use of the indefinite article in a generic sense (*A tiger can be dangerous*), *a/an* cannot be replaced by *one* (cf 6.56).

Uses of the zero article

The zero article compared with unstressed *some*

5.39 With plural count nouns and with noncount nouns, the indefinite article does not occur (cf 5.13f). The zero article is used instead:

Have you ever eaten *roasted chestnuts*?

Milk is good for you.

Do you like *folk music*?

But the plural or noncount equivalent of *a/an* is sometimes the unstressed determiner *some* /səm/. Contrast:

I've just bought { *a melon.*
some melons.
some melon.
?melons. } [1]

She has become *a vegetarian*.

They have become { *vegetarians.*
**some vegetarians.* } [2]

In the negative, unstressed *any* is the equivalent of *some* (but cf 10.59 Note [b]), so that a contrast may be observed between [3] and [4]:

I haven't bought { *any books.*
?books. } [3]

They haven't become { *vegetarians.*
**any vegetarians.* } [4]

The difference between the uses of zero and of *some* may be summarized as follows. Unstressed *some*, although it is sometimes considered a plural article, actually keeps its quantifying function, and indicates reference to a specifiable (though indefinite) quantity or amount. (Thus in [1], the speaker does not tell us the number of melons, but in principle the number could be found out.) The zero article, in contrast, indicates simply the category of the objects, etc referred to. So *vegetarians* in [4] names a category of persons, and the sentence simply indicates that the people referred to by *they* belong to that category.

Note The zero article may be used instead of *some*, particularly if a contrast is implied prosodically:
I've just bought *MELONS* (but not grapes). [1a]
I haven't bought *BOOKS* (but I've bought magazines). [3a]

5.40 Sometimes *some* and zero are both acceptable; in other cases one of them is less acceptable, or even quite unacceptable. In the following two examples, *some* would be unacceptable:

These shoes are made of *leather*. [1]
I've always preferred *coffee* to *tea*. [2]

In [1], the speaker is merely interested in the type of material of which the shoes are made: the quantity is irrelevant. In [2], the interest focuses on the two types of drink, and it is irrelevant to consider particular quantities.

In other cases, the introduction of *some* would necessitate a sharp difference in meaning, eg:

Joe's been chasing *women* ever since he was young. [3]

In [3], *some women* would produce the incongruous impression that Joe has been steadfastly chasing the same group of women, rather than that he is an incorrigible Don Juan.

The distinction we have to draw, then, is between the CATEGORIAL meaning of zero, and the QUANTITATIVE meaning of *some*. It can now be seen that the generic meaning of the zero article, as in *Tigers are fierce animals* (cf 5.26), is no more than a special variant of this categorial meaning. But it is still worth separating generic reference, where we could substitute *all tigers* with little change of effect, from the specific categorial reference of sentences like [3], where clearly there is no claim that all women have been chased by Joe (cf 5.56).

As has already been hinted, the choice between zero and *some* is sometimes more a matter of focus than of clear contrast of meaning. There are many situations in which either choice could be made, with only a minor alteration of the force. Compare:

Would you like *(some) coffee* or *(some) tea*? [4]
I've been writing *(some) letters* this morning. [5]
We have just received *(some) news* from Moscow. [6]

The variant without *some* will focus on the category as a whole; eg [4] is

asking about two kinds of drink, and [5] is concerned with a kind of activity, viz the activity of writing letters. But when *some* is added, the focus changes to whatever quantities of tea and coffee, or of letters, that the speaker has in mind.

The zero article with definite meaning

- 5.41 Apart from proper nouns, nouns take the zero article with definite meaning only in rather special circumstances, as described in 5.42ff.

Noun phrases in a copular relation

- 5.42 Unlike many other languages, English normally requires an article with a singular count noun as complement (cf 5.37):

Bill is { *an engineer.*
**engineer.* } Mary is { *the secretary.*
**secretary.* }

There is, however, one circumstance in which the zero article occurs in such constructions: this is where the complement (or an equivalent appositive noun phrase) names a UNIQUE ROLE or task. As the following examples show, in such cases the zero article alternates with *the*:

- Maureen is *(the) captain of the team.* [1]
John F. Kennedy was *(the) President of the United States* in 1961. [2]
As *(the) chairman of the committee*, I declare this meeting closed. [3]
They've appointed Fred *(the) treasurer*, and no doubt he will soon become *(the) secretary.* [4]
Anne Martin, *(the) star of the TV series* and *(the) author of a well-known book on international cuisine*, has resigned from her post on the Consumer Council. [5]

The copular relation signalled by *as* (cf 9.48) is illustrated in [3], and the copular relation of apposition (cf 17.65ff) is illustrated in [5]. In each of these examples, it is implied that only one person holds the particular position mentioned.

- Note [a] Here we may also place examples where the appositional noun phrase indicating a unique role or task is placed first:

FBI Chief J. Edgar Hoover [6]
Chelsea centre-forward Milton Smith [7]

With restrictive apposition [6, 7], the article is generally omitted, whereas in nonrestrictive apposition [7a] (cf 17.68), it is not:

the Chelsea centre-forward, Milton Smith [7a]

There is a gradient linking the former construction to the institutional use of titles, as in *King George*, *Chairman Mao*, *Doctor Smith*. But the use of more elaborate phrases of this kind preceding a name is characteristic of the journalistic style sometimes known as 'Timestyle', because of its association with *Time* magazine.

- [b] The complement of *turn* (cf 16.22) is exceptional in having zero article even where there is no implication of uniqueness:

Jenny started out as a music student before she *turned linguist*. BUT: ... before she *became a linguist*.

- [c] Because a unique role is implied, the definite article is generally omitted following expressions such as *the post of*, *the position of*, and *the role of*:

After declining the post of *Secretary of State*, he nevertheless found himself taking on the role of *unofficial adviser to the President*.

- [d] Determiners (*the*, *your*, etc) are frequently omitted in official forms, eg:

Please send the stipulated items, viz:

- (i) *birth certificate*
(ii) *passport*
(iii) *correct fee*

Compare the omission of articles in headlines (11.45f).

Noun phrases with sporadic reference

- 5.43 We have already mentioned (cf 5.33) the use of *the* in noun phrases with 'sporadic' definite reference, as in *the radio*, *the theatre*. In other cases, however, the sporadic use has become so institutionalized that the article is not used. We distinguish, under this heading, a number of different categories of zero article usage which are 'frozen' as part of idiomatic usage.

(a) Some 'institutions' of human life and society

- 5.44 Certain nouns have the zero article, especially as complement of *at*, *in*, and *on* in quasi-locative phrases: thus someone may be *in church*, but not **in library*. We call them 'quasi-locative' because, although they appear to have locative meaning, their function is rather more abstract (cf: *the theatre*, 5.33). In such contexts, nouns such as *college*, *church*, etc do not refer to actual buildings or places, but to the institutions associated with them: to *be in prison*, for example, is to be a prisoner, not a casual visitor; to *go to sea* is to follow the occupation of a sailor; see the left-hand column below. In the right-hand column we illustrate the same nouns as used with *the* in situational or cataphoric reference:

be in { *town*
bed
go to { *hospital* <BrE>
prison, jail
class <esp AmE>
be at { *school* (cf 9.17)
go to { *sea*
be in/be at *church*
go to *college*

Compare:

The town/the city is very old.
lie down on *the bed*
redecorate *the hospital*
walk around *the prison/the jail*
The class works hard.
visit *the school*
look out towards *the sea*
admire *the church*
the gates of *the college*

- Note [a] Other related phrases are the following, some of which show variation in the use of article:

get out of *bed*
during (the) *break/recess*
be in/return to *camp*
live on/off (the) *campus*
be on/off (the) *stage*
at (the) *court* [royal palace]; in (the) *court* [law court]; The case was settled out of *court*; take someone to *court*
come/go/leave *home*; be (at) *home*; feel at *home* (cf 5.51)

With *university*, the article is optional in BrE in the expressions *be at/go to (the) university*, whereas AmE requires the definite article (as also with *hospital* in AmE: 'He's in the hospital.').

- [b] The article is sometimes left out also when the reference is to the building, not the institution:
I walked straight back *into/to school*.

She's *at church*, arranging flowers.

In AmE, and increasingly in BrE, the article is often omitted in expressions like:
in the center of *town*, the business part of *town*

(b) Means of transport and communication

- 5.45 This type is confined to zero article following *by*; but the same nouns can be used elsewhere with 'sporadic' *the* (cf 5.33):

travel leave come go	by	<i>bicycle</i>	Compare: take <i>the</i> bicycle
		<i>bus</i>	be on <i>the</i> bus
		<i>car</i>	prefer <i>the</i> car
		<i>boat</i>	choose <i>the</i> boat
		<i>train</i>	take <i>a/the</i> train
		<i>plane</i>	be on <i>the</i> plane

communicate/communication by	<i>radio</i>
	<i>telephone, telex</i>
	<i>post</i> <esp BrE>
	<i>mail</i> <esp AmE>
	<i>satellite</i>

Compare:

a talk on *the* radio
Jill is on *the* telephone.
put a letter in *the* post
send it through *the* mail
The satellite is replacing cable TV.

Also: *by hand* (cf 5.51, 9.49 Note [a]).

(c) Times of day and night

- 5.46 These take a zero article particularly after *at*, *by*, *after*, and *before*:

<i>at dawn/daybreak</i>	Compare: watch <i>the</i> dawn
<i>when day breaks</i>	during <i>the</i> day
<i>at sunrise</i> [AmE also: <i>at sunup</i>]	<i>The</i> sunrise was splendid.
<i>at sunset</i> [AmE also: <i>at sundown</i>]	We admired <i>the</i> sunset.
<i>at/around noon/midnight</i>	in <i>the</i> afternoon
<i>at dusk/twilight</i>	see nothing in <i>the</i> dusk
<i>at/by night</i>	wake up in <i>the</i> night
<i>(by) day and night</i>	in <i>the</i> daytime
<i>before morning came</i>	in/during <i>the</i> morning
<i>Evening approached.</i>	in <i>the</i> evening
<i>after nightfall/dark</i>	all through <i>the</i> night
<i>Day/Night came; day by day</i> (cf 5.50);	
<i>all day/night/week/year (long)</i> (cf	
8.63 Note [b])	

(d) Seasons

- 5.47 The article is usually, but not always, omitted when referring to seasons generally, as distinct from referring to a particular part of a particular year (cf temporal names, 5.67):

(The) *winter* is coming.

in (the) *spring/summer*
in (the) *autumn* <esp BrE> [*Fall* in AmE has the article: *in the fall*]

But with reference to a particular season, the article is included:

The spring of last year was cold.
The fall <AmE>
The autumn <esp BrE> } *before last* was unusually busy.

Note the difference between [1] denoting calendar time and [2] denoting seasonal climate:

The winter of 1963 was an exciting time. [1]
Winter in 1963 was not like this last winter. [2]

(e) Meals

- 5.48 The zero article is in general use for meals as an institution [1], but *the* can be used for meals that need to be singled out [2]:

Where are we having *dinner* tonight? [1]
The dinner after his retirement party was quite lavish. [2]

Examples of the zero article for the meal as an institution which recurs day by day:

stay for	{	<i>breakfast</i>
have		<i>brunch, cocktails</i> <both esp in US>
before		<i>tea</i> <esp in UK>
after		<i>lunch, dinner</i>
at/for		<i>supper</i>

Often, however, *the* and the zero article are virtually interchangeable:

That day, (the) *lunch* was served on the terrace.

The indefinite article is used for a particular meal:

We had *a nice dinner*, just the two of us.

(f) Illnesses

- 5.49 The zero article is normally used for illnesses, eg: *anaemia, appendicitis, diabetes, influenza, pneumonia*. But *the* is often used, in a more traditional style of speech, for some well-known infectious diseases: (the) *flu*, (the) *measles*, (the) *mumps*, (the) *chicken pox*; also (the) *hiccups*. On the plural form of *mumps*, etc, cf 5.75.

Note [a] The article cannot normally be omitted with *the/a plague*, nor with some popular, nontechnical expressions such as *the bends, the jitters, the/a bellyache* <familiar>. Except in the fixed expression *catch cold*, the indefinite article is required with *cold, fever, and temperature*:

Our daughter had *a terrible cold* last week.

I have { *a fever,*
 a temperature, } so I'm staying in bed today.

[b] *Headache* is always a count noun:

I have *a splitting headache* this morning.

Other nouns formed from *ache* are treated as noncount when they denote a condition:

Nuts give me *toothache*.

When they denote a single attack or pain, they are usually count in AmE and noncount in BrE:

On and off she suffers from $\begin{cases} \text{a stomachache. (esp AmE)} \\ \text{(the) stomachache. (esp BrE)} \end{cases}$

Parallel structures

- 5.50 There is a tendency to omit the article, even with singular count nouns, where two nouns are placed together in a parallel structure:

arm in arm face to face day by day
hand in hand eye to eye teaspoonful by teaspoonful
mile upon mile back to back side by side

Sometimes the same noun is repeated after a preposition, as in the above examples; at other times, one noun is balanced against another noun of contrasting meaning:

from father to son
husband and wife
from right to left OR: *from the right to the left*
from west to east OR: *from the west to the east*
from beginning to end OR: *from the beginning to the end*

Phrases with the noun repeated typically have an adverbial function:

They talked $\begin{cases} \text{face to face.} \\ \text{man to man.} \end{cases}$ They stood $\begin{cases} \text{toe to toe.} \\ \text{eyeball to eyeball.} \end{cases}$

It can be argued that the nouns have no article because they have largely lost their independent nominal status. We note, in support of this, that variation in the number, determination, or modification of these nouns is normally impossible:

- *They talked *old man to young man*.
- *They stood *toes to toes*.

Such parallel structures are, therefore, virtually idioms exemplifying 'frozen' article use.

There is one construction, however, in which the parallel structure with zero article is productive of new instances. This is where the two nouns are coordinated, and particularly where the coordination is emphasized by a correlative such as *both . . . and* or *neither . . . nor* (cf 13.35ff):

The birth took place this morning, and both *(the) mother* and *(the) child* are doing well.

They pitched camp between a small winding river and a ridge covered with brushwood; but neither *(the) river* nor *(the) brushwood* afforded the protection they needed in the event of attack.

Fixed phrases involving prepositions

- 5.51 In addition to adverbial phrase idioms such as *hand in hand*, *face to face*, there are other idioms in which nouns with a zero article occur before or after a preposition. Some of the prepositional phrases considered in 5.44ff (such as *at home*, *by hand*) fall into this category, and to them we may add further examples such as *on foot*, *in turn*, *out of step*.

Many complex prepositions (cf 9.11) also contain nouns without an article: *on top of*, *by way of*, etc; and there are also idioms in which a verb is followed by a noun with zero article and (often) by a preposition: *take advantage of*, *set fire to*, *get word of*, etc (cf 16.58). Such uses of nouns are fixed phrases, as can be seen in their lack of article and number contrast:

He took $\begin{cases} \text{advantage} \\ \text{*an advantage} \\ \text{*advantages} \end{cases}$ of the situation.

The articles in generic reference

- 5.52 Earlier (cf 5.26) it was noted that all three major forms of article (*the*, *a/an*, and zero) may be used generically to refer to the members of a class *in toto*:

The bull terrier makes an excellent watchdog. [1a]
A bull terrier makes an excellent watchdog. [1b]
Bull terriers make excellent watchdogs. [1c]

Of the possible combinations of the articles with singular and plural, the one which does not occur with count nouns – that of the zero article with the singular form – is the only possibility which occurs with noncount nouns:

Velvet makes an excellent curtain material. [2]

It should not, however, be assumed that the three options [1a], [1b], and [1c] are in free variation. One difference between them is that, whereas *the* [1a] keeps its generic function in nonsubject positions in the sentence, *a/an* [1b], and to a lesser extent zero [1c], tend to lose their generic function in these positions:

Nora has been studying $\begin{cases} \text{the medieval mystery play.} \\ \text{a medieval mystery play.} \\ \text{medieval mystery plays.} \end{cases}$ [3a]
[3b]
[3c]

Of these, only [3a] refers to mystery plays as a genre; [3b] refers to only one play; and [3c] is most likely to refer only to a subset of them. We consider other differences below.

Note One cannot replace *a* in the generic sense, as in [1b] (cf 5.38 Note [b]).

The generic use of the indefinite article

- 5.53 The generic use of *a/an* picks out ANY REPRESENTATIVE MEMBER OF THE CLASS. Thus any can be substituted for *a/an* in examples like:

The best way to learn *a language* is to live among its speakers.

Generic *a/an* is therefore restricted in that it cannot be used in attributing properties which belong to the class or species as a whole. Thus:

The tiger is } becoming almost extinct.
Tigers are }

BUT NOT: **A tiger* is becoming almost extinct.

The generic use of the zero article

- 5.54 The generic use of zero article with both plural nouns and noncount nouns identifies the class considered as an UNDIFFERENTIATED WHOLE (cf 5.39f):

Cigarettes are bad for your health.

Hydrogen is lighter than *oxygen*.

Necessity is the mother of *invention*.

Research shows that it is the elderly who are the prime victims of *inflation*.

Hunger and *violence* will continue to mark the future of *mankind/humanity*.

We consider the use of the zero article with noncount abstract nouns in 5.58f.

- Note When it has the meaning of 'the human race' rather than 'a male human being', *man* and its synonym *mankind* are used generically without the article:

This book is an attempt to trace the history of *man*.
mankind.

Man meaning 'human being' (antonym: *beast*) and its plural *men* may also be used in the same way. Thus:

Man } is a social animal.
A man }

Men have been on this planet for over a million years.

Man and *woman* meaning 'the male/female part of the human race' are now less often used in a generic sense:

Woman is the glory of all created existence. (S. Richardson)

Because of objections to the generic use of *man*, other expressions are often preferred: *humankind*, *the human race*, etc.

Parallel structures make a special case (cf 5.50); note that *man* and *woman*, *man* and *wife* do not refer to the human race:

Man and *rabbit* display remarkably similar features in mating behaviour.

But the following is unacceptable except in technical, scientific use:

**Rabbit* displays similar features to *man*.

The generic use of the definite article

With singular noun phrases

- 5.55 *The* is rather limited in its generic function. With singular heads, it is often formal or literary in tone, indicating THE CLASS AS REPRESENTED BY ITS TYPICAL SPECIMEN:

A great deal of illness originates in *the mind*.

No one knows precisely when *the wheel* was invented.

My colleague has written a book on *the definite article* in Spanish.

Marianne plays *the harp* very well.

As the last example shows, names of musical instruments and also dances usually take the definite article:

play the violin [but: *play baseball*], *dancing the samba*

When the noun refers to a class of human beings, the typifying connotation of generic *the* can sound inappropriate:

?*The Welshman* is a good singer. [cf: *Welshmen* are good singers.]

?*The doctor* is well paid. [cf: *Doctors* are well paid.]

?*As the child* grows, it develops a wider range of vocabulary.

It is more appropriate when used to identify the typical characteristics of a class in terms of personality, appearance, etc:

He spoke with the consummate assurance and charm of *the successful Harley Street surgeon*.

- Note [a] Another determinative word sometimes used with a typifying generic force is *your* (cf 5.63 Note [c]):

Your average football supporter is not interested in comfort.

In contrast to *the*, this use of *your* is associated with familiar speech; but it resembles *the* in its focus on the 'typical specimen' of the class.

- [b] Ambiguity may occur over the generic/specific interpretation:

A: *The president* is too powerful.

B: Which president?

A: No, I mean presidents in general.

With plural noun phrases

- 5.56 Generic *the* occurs with plural noun phrases in two special cases:

- Nationality nouns, *ie* noun phrases referring to the people of a nationality, an ethnic group, etc, eg: *the Chinese*, *the English* (cf 7.25)
- Phrases with an adjective head referring to a group of people, eg: *the unemployed* ['people who are unemployed'], *the blind*, *the rich*, etc (cf 7.24)

In other cases, *the* + plural noun cannot be used for generic reference. Thus the following sentences are not acceptable in a generic sense:

**The wolves* are carnivorous. ~ *Wolves* are . . .

**The hydrogen* is lighter than *the oxygen*. ~ *Hydrogen* is . . .

In scientific descriptions, however, we may find expressions like *the rodents* (referring to the whole order Rodentia).

It is arguable, in fact, that instances of (a) and (b) are not truly generic, either. Rather, they are plural phrases with unique denotation because (like *the masses*, *the fairies*, *the clergy*, *the Saints*, etc) they designate a uniquely identifiable group of people. Hence there is a marked contrast between *the* (generic plural) in [1] and *the* (generic singular) in [1a]:

The Romans defeated *the Carthaginians* in 202 BC. [1]

?*The Roman* defeated *the Carthaginian* in 202 BC. [1a]

[1] is acceptable in comparison with [1a], because *the Romans* and *the Carthaginians* refer collectively to a group of people, rather than to a typical specimen. *The Romans* is thus a generalization (like *the mathematicians*, *the teenagers*, *the birds*, etc in similar use), whereas *the Roman* implies a generic statement. Nevertheless, it will be convenient to apply the term 'generic' to both the singular and plural uses.

With nationality nouns, there is a distinction to be drawn in many cases between the generic nouns (with invariable plural) ending in *-ish*, *-sh*, or *-ch*,

and the nongeneric nouns ending in *-man* in the singular and *-men* in the plural (both forms pronounced /mən/). Compare:

<i>The Welsh</i> are fond of singing.	[generic]	[2a]
<i>Welshmen</i> are fond of singing.	[generic]	[2b]
<i>The Welshmen</i> are fond of singing.	[specific]	[2c]

The forms ending in *-men* are subject to the general tendency to disfavour words of masculine bias (cf 5.105), and if a sexually neutral expression is sought, *Welshmen* in [2b], for example, may be replaced by *Welsh people*. There is also the feminine term *Welshwomen*, etc but this type of word is rare or nonexistent in some cases, eg: **firewoman*, **freshwoman*.

With other nationalities, the distinction between generic and specific nationality nouns does not arise:

<i>The Finns</i> are fond of sport.	[generic]
<i>Finns</i> are fond of sport.	[generic]
<i>The Finns I know</i> are fond of sport.	[specific]

In the following section, we give specimens of the various kinds of words for people and nationality.

5.57 Some nationality words

NAME OF COUNTRY, ETC	ADJECTIVE	SPECIFIC REFERENCE		GENERIC REFERENCE
		SINGULAR	PLURAL	PLURAL
(i)				
China	Chinese	a Chinese [a]	Chinese	the Chinese
Japan	Japanese	a Japanese	Japanese	the Japanese
Portugal	Portuguese	a Portuguese	Portuguese	the Portuguese
Switzerland	Swiss	a Swiss	Swiss	the Swiss
Vietnam	Vietnamese	a Vietnamese	Vietnamese	the Vietnamese
(ii)				
Iraq	Iraqi	an Iraqi	Iraqis	the Iraqis
Israel	Israeli	an Israeli	Israelis	the Israelis
Pakistan	Pakistani	a Pakistani	Pakistanis	the Pakistanis
(iii)				
Africa	African	an African	Africans	the Africans
America	American	an American	Americans	the Americans
Asia	Asian	an Asian	Asians	the Asians
Australia	Australian	an Australian	Australians	the Australians
Belgium	Belgian	a Belgian	Belgians	the Belgians
Brazil	Brazilian	a Brazilian	Brazilians	the Brazilians
Europe	European	a European	Europeans	the Europeans
Germany	German	a German [b]	Germans [b]	the Germans
Greece	Greek [c]	a Greek	Greeks	the Greeks
Hungary	Hungarian	a Hungarian	Hungarians	the Hungarians
India	Indian	an Indian	Indians	the Indians
Italy	Italian	an Italian	Italians	the Italians
Norway	Norwegian	a Norwegian	Norwegians	the Norwegians
Russia	Russian	a Russian	Russians	the Russians

NAME OF COUNTRY, ETC	ADJECTIVE	SPECIFIC REFERENCE		GENERIC REFERENCE
		SINGULAR	PLURAL	PLURAL
(iv)				
{ Argentina	Argentinian	an Argentinian	Argentines	the Argentinians
{ (the) Argentine	Argentine	an Argentine	Argentines	the Argentines
(v)				
Denmark	Danish	a Dane	Danes	the Danes/Danish
Finland	Finnish	a Finn	Finns	the Finns/Finnish
Poland	Polish	a Pole	Poles	the Poles/Polish
Saudi Arabia	Saudi (Arabian)	a Saudi (Arabian)	Saudis/ Saudi Arabians	the Saudis/ Saudi Arabians
Spain	Arab [d] Spanish	an Arab a Spaniard	Arabs Spaniards	the Arabs the Spaniards/ Spanish
Sweden	Swedish	a Swede	Swedes	the Swedes/ Swedish
(vi)				
England	English	c/Note [e] an Englishman	Englishmen	the English
France	French	a Frenchman	Frenchmen	the French
Holland, the Netherlands	Dutch	a Dutchman	Dutchmen	the Dutch
Ireland	Irish	an Irishman	Irishmen	the Irish
Wales	Welsh	a Welshman	Welshmen	the Welsh
(vii)				
Britain	British	a Briton [f]	Britons	the British
(viii)				
Scotland	Scots [g] Scottish (Scotch)	a Scotsman [e] a Scot (a Scotchman)	Scotsmen Scots (Scotchmen)	the Scots (the Scotch)

Note [a] *Chinaman* is rare in educated use.

[b] The segment *-man* in *German* is not a gender suffix (as in *Englishman*); consequently there are no **Germen* or **Gerwomen*.

[c] *Grecian* is chiefly used of Ancient Greece, and tends to refer to objects or abstractions, rather than to people: a *Grecian urn*.

[d] *Arab* is the racial and political term (the *Arab nations*, etc). *Arabic* is used of language and literature, as well as in *Arabic numerals* (as opposed to Roman numerals). *Arabia(n)* is associated with the geographical area of the Arabian peninsula (cf: *Saudi Arabia*).

[e] Terms such as *Englishman/Englishmen* are included here because of their ability to be used generically for the inhabitants of the country (but cf 5.56); there are corresponding feminine terms *Englishwoman*, etc, but these are rarely used.

[f] *Britisher* and *Brit* are colloquial variants of *Briton*. The use of *Briton* is more restricted than *Englishman*, *Scot*, and *Welshman* with specific reference. Because of the homophony of *Briton* and *Britain*, a spoken sentence beginning eg: 'An old Briton . . .' is likely to be misunderstood.

[g] The inhabitants of Scotland themselves prefer *Scots* and *Scottish* to *Scotch*, which however is commonly used in such phrases as *Scotch terrier*, *Scotch whisky*, *Scotch eggs*, *Scotch pancakes*. In contrast, *Scottish* denotes nationality and geographical area, rather than type: the *Scottish universities*, the *Scottish Highlands*, a *Scottish/Scots accent*.

[h] In cases where there is a language with a name related to a nationality word, the adjective form is used for the language (cf 5.58 Note):

She speaks *Chinese, Norwegian, Polish, Irish*, etc.

The articles with abstract noncount nouns

- 5.58 Abstract nouns tend to be count or noncount according to whether they refer to unitary phenomena (such as events) on the one hand, or to states, qualities, activities, etc on the other. The following illustrate typical count abstract nouns:

meeting ~ meetings
arrival ~ arrivals
discovery ~ discoveries

The following are typical noncount abstract nouns (cf also the list in 5.9):

employment, happiness, honesty, literature, sleep

But the same abstract nouns can often switch between count and noncount use (cf dual class membership, 5.4):

She showed me $\begin{cases} \text{much kindness.} \\ \text{many kindnesses.} \end{cases}$

Society must be changed by $\begin{cases} \text{revolution.} \\ \text{a revolution.} \end{cases}$

In English, noncount abstract nouns usually have no article when used generically:

My favourite subject is *history/French/mathematics/music* . . .
Happiness is often the product of *honesty* and hard work.
Theory must go hand in hand with *practice*.

Normally the zero article also occurs when the noncount abstract noun is premodified:

She's studying *European history*. [1]

But when the same noun is postmodified, especially by an *of*-phrase, the definite article normally precedes it:

She's studying $\begin{cases} \text{*history of Europe.} & [1a] \\ \text{the history of Europe.} & [1b] \end{cases}$

We thus find typical contrasts of the following kind:

human evolution ~ *the evolution of man*
medieval art ~ *the art of the Middle Ages*
Oriental philosophy ~ *the philosophy of the Orient*
18th century morality ~ *the morality of the 18th century*

It appears that the cataphoric *the* is added in examples like [1b] because the effect of the *of*-phrase is to single out a particular subclass of the phenomenon denoted by the noun, and thereby to change a generic meaning into a specific or partitive one. In this connection, we notice a slight difference

between [1] and [1b]: whereas [1b] implies that she is studying the history of Europe as a whole, [1] allows the interpretation that she is studying only some aspects of European history or a particular college course.

The type of contrast illustrated above by [1] and [1b] can also be noted with concrete noncount nouns, and with plural nouns:

This museum specializes in $\begin{cases} \text{18th century furniture.} & [2] \\ \text{the furniture of the 18th century.} & [2a] \end{cases}$

Alice is engaged in research on $\begin{cases} \text{South American butterflies.} & [3] \\ \text{the butterflies of South America.} & [3a] \end{cases}$

But in these cases it is to a greater or lesser degree acceptable to omit *the*:

The museum specializes in *furniture of the 18th century*. [2b]
 ?Alice is engaged in research on *butterflies of South America*. [3b]

Note There are expressions in which the definite article is optional with the name of a language (cf 5.57 Note [h]), as in:

a word borrowed from *(the) French/(the) Italian*
 examples from *(the) Sanskrit/(the) Hebrew*

The following expression is now archaic except in, for example, Irish English:

He has *the French*. [4]

The meaning of [4] is 'He knows French', to be contrasted with the regular curricular sense of [5]:

He has *French and English*. [5]

- 5.59 The partitive effect of the definite article in *the history of Europe* (example 5.58 [1b]) finds a parallel in the use of the indefinite article in such examples as these:

Mavis had *a good education*. [1]
 My son suffers from *a strange dislike of mathematics*. <ironic> [2]
 She played the oboe with *(a) remarkable sensitivity*. [3]

The indefinite article is used exceptionally here with nouns which are normally noncount. The conditions under which *a/an* occurs in such cases are unclear, but appear to include the following:

- (i) the noun refers to a quality or other abstraction which is attributed to a person;
- (ii) the noun is premodified and/or postmodified; and, generally speaking, the greater the amount of modification, the greater the acceptability of *a/an*.

In confirmation of (ii), notice that *a* would have to be omitted from [3] if the adjective were omitted:

She played the oboe with $\begin{cases} \text{*a sensitivity.} & [3a] \\ \text{sensitivity.} & [3b] \end{cases}$

However, *a* would become more acceptable than zero if the noun were modified:

She played the oboe with $\begin{cases} \text{(a) charming sensitivity.} \\ \text{a sensitivity that delighted the critics.} \end{cases}$

Proper nouns

- 5.60 Proper nouns are basically names of specific people (*Shakespeare*), places (*Milwaukee*), months (*September*), days (*Thursday*), festivals (*Christmas*), magazines (*Vogue*), and so forth. As we saw in 5.2, proper nouns do not generally share the formal characteristics of common nouns. In particular, they lack articles, or rather article contrast:

Paris ~ **the Paris* ~ **a Paris* *The Hague* ~ **Hague* ~ **a Hague*

Within a given universe of discourse, proper nouns generally have unique denotation, and are usually written with initial capital letters (though not all nouns so written are proper nouns). Proper nouns often combine with descriptive words which we will call **DESCRIPTORS**, and which also begin with a capital letter, to make composite names like *Senator Morse*, *Dallas Road*. We may therefore draw a distinction between a **PROPER NOUN**, which is a single word, and a **NAME**, which may or may not consist of more than one word. A name normally functions as a single unit with respect to grammar. This means that, even if a composite name has an internal structure that is grammatically analysable (eg as *King's College* is analysable as genitive noun + head noun), that structure cannot normally be varied by the insertion of words, by change of inflection, etc. For example, *The Hague* has a built-in definite article, but *The* does not act as a variable determiner, nor is it capable of being followed by adjectives: **The beautiful Hague*. Equally unacceptable is **King's famous College*.

Note [a] Like other grammatical categories, the class of proper nouns has unclear boundaries. For example, a number of common nouns with unique denotation are close to proper nouns, and are sometimes spelled with a capital letter (cf 5.29), eg:

Fate, Fortune, Heaven, Hell, Nature, Paradise, Earth

Compare also, in their generic sense, *Man* and *Woman* (cf 5.54 Note). On another level, we might wonder whether *King's* in *King's College* is to be classed as a genitive common noun which is part of a composite name.

[b] In *The Hague Convention*, the article may be called 'conflated', since the definite article also occurs with premodifying names without built-in article: *The Paris Peace Talks*. As for loss of article in names, as in *my native Hague*, cf 5.72 (e).

Proper nouns behaving as common nouns

- 5.61 Having unique denotation, proper nouns may also be expected to lack number contrast, determination, and modification. In general they do, but there are also circumstances in which they take on the characteristics of common nouns.

(a) Number

- 5.62 Proper nouns normally lack number contrast. Most proper nouns are singular, and do not have a plural (*Indonesia* ~ ?*Indonesias*), or else they have a plural but no singular (*the West Indies* ~ **a West Indy*). There are, however, special circumstances in which proper nouns are reclassified as common nouns, so that they no longer have unique denotation (cf App I.53):

Shakespeares ['authors like Shakespeare']
Smiths ['people whose name is Smith']

Londons ['cities called or resembling London']

When a surname is made plural and preceded by the definite article, it takes on the meaning 'the family called X':

the Wilsons, the Joneses [-ɪz/], *the Prideaux* [-z/]

The rules for making proper nouns plural are the same as for common nouns (cf 5.79ff): but note the rules for exceptional spellings in 5.81 III).

(b) Determination

- 5.63 Some types of proper nouns are customarily preceded by the definite article (eg: *the Andes*, cf 5.72), but they lack article contrast, since the article cannot normally be varied (**an Ande*, **some Andes*). If reclassified as common nouns, however, proper nouns can have their meaning varied by articles and other determiners:

a Shakespeare ['an author like Shakespeare']
his new Shakespeare ['his copy of the works of Shakespeare']

Other examples are:

I used to know *a Mary Roberts*, too. ['a person called Mary Roberts']
 She is *the second Mrs White* – the first one died.
 Lu Xun has been known as '*the Chinese Gorki*'.

The definite article with nuclear stress placed before a name has the special meaning of 'the well-known person/place named X' (cf 5.11 Note [e]):

A: I used to know John Lennon quite well.
 B: Surely you can't mean *THE* /ði:/ *John LÉNnon*?

By contrast, the indefinite article placed before a personal name can have the meaning 'a certain person called X but otherwise unknown':

A Mrs Robertson was trying to contact you this morning.

Note [a] There is a disparaging use of *that/those* in expressions like *that Mary, those Joneses*:
That Mr Phillips has been on the phone again. Isn't he a nuisance!

But stressed *that* is not disparaging in:

Oh, you mean *THAT Mr Phillips*. ['that particular person']

This has no such overtones in:

Who's *this Mrs Robertson* that phoned?

[b] The fact that the pronoun *one* can substitute for a name is strong evidence of its conversion to the status of a common noun in examples like this (cf 6.55):

I knew { *a John Lennon*, but not the famous one.
 ONE (person called) John Lennon.

Note the nuclear stress on, and the pronunciation of, the indefinite article /ə/.

[c] Possessives and genitives can be used to denote close family relationships (cf 5.55 Note [a]):

Is your *Jennifer* still at school? ['your daughter Jennifer']
 Did you know that *your Mrs White* ['the one you know'] has been arrested for shoplifting?
 John and Mary are very anxious about *their Tom*. [ie their son]
 Granny is delighted with *Peter's Jane*. [eg Peter's girlfriend]

(c) Modification

- 5.64 When they have the normal unique denotation, proper nouns can only be

modified by nonrestrictive modifiers, such as a nonrestrictive relative clause (cf 17.22ff) or nonrestrictive apposition (cf 17.68):

Dr Brown, *who lives next door*, comes from Australia.
Theseus, *a Greek hero*, killed the Minotaur.

Nonrestrictive premodifiers are limited to adjectives with emotive colouring, such as:

old Mrs Fletcher *dear little* Eric *poor* Charles
beautiful Spain *historic* York *sunny* July

In a more formal and rather stereotyped style, the adjective is placed between *the* and a personal name:

the beautiful Princess Diana ['Princess Diana, who is beautiful']
the inimitable Henry Higgins ['Henry Higgins, who is inimitable']

Proper nouns show that they can temporarily take on features of common nouns (cf 5.63), and accept restrictive modification of various kinds:

The Dr Brown I know comes from Australia.
The flower arrangement was done by *a Miss Phillips in Park Road*.
Do you mean *the Memphis* which used to be the capital of Egypt, or *the Memphis in Tennessee*?
I spoke to *the younger Mr Hamilton*, not *Mr Hamilton the manager*.

In such cases, a determiner (especially *the*) is usual. But in addition, cataphoric *the* with restrictive modification can have the effect of splitting up the unique referent of the proper noun into different parts or aspects. We may therefore classify this as a PARTITIVE meaning:

UNIQUE MEANING PARTITIVE MEANING

during <i>Easter</i>	during <i>the Easter of that year</i>
in <i>England</i>	in <i>the England of Queen Elizabeth</i>
in <i>Denmark</i>	in <i>the Denmark of today</i>
<i>Chicago</i>	<i>the Chicago I like</i> ['the aspect of Chicago']
<i>Shakespeare</i>	<i>the young Shakespeare</i> ['Shakespeare when he was young']
<i>Bradford</i>	<i>the Bradford she grew up in</i>

Note [a] Compare the 'partitive' use of the genitive in *James Joyce's Dublin* ['the Dublin which James Joyce knew'], etc.

[b] In the names of monarchs, etc, an adjectival cognomen is placed after the proper noun, and is prefaced by *the*, eg: *Charles the Great*, *Ivan the Terrible*. This type of appellation is similar to an appositional type of name, in which the by-name is nominal: *William the Conqueror*. But in these latter cases, the article is sometimes omitted: *Richard (the) Lionheart*, *Richard Crookback*.

[c] On nonrestrictive premodification as in *an embarrassed Ben Miles*, etc, cf 17.3 Note.

Names with no article

5.65 We now turn to regular examples of names without an article. The following list summarizes the main classes of name that take no article, in accordance with the main rule (cf 5.60):

PERSONAL NAMES (with or without titles; cf 5.66)

TEMPORAL NAMES (cf 5.67):

- (i) Festivals, religious periods, etc
- (ii) Months, and days of the week

GEOGRAPHICAL NAMES (cf 5.68):

- (i) Continents
- (ii) Countries, counties, states, etc
- (iii) Cities, towns, etc
- (iv) Lakes
- (v) Mountains

OTHER LOCATIVE NAMES consisting of proper noun + common noun descriptor (cf 5.69)

Personal names

5.66 Whether or not they are accompanied by titles, personal names normally have no article (cf apposition 17.88). The name itself may consist of:

given (first, or Christian) name alone: *Margaret*, *Jack*, etc
the surname (family name, or last name) alone: *Smith*, *Wilson*, etc
given name(s) and surname together: *Margaret Jane Smith*,
Jack Wilson

In addition, one or more given names (in American usage regularly the middle one) may be reduced to initials:

M. J. Smith; *J. Wilson*; *Charles R. Maguire*

Names such as these may be prefaced by the normal title of *Mr* for a man, or *Mrs*, *Miss*, *Ms* for a woman, or a courtesy title indicating the person's status. Among the titles ascribing status are those indicating royalty (eg: *Queen*), rank of nobility (eg: *Lord*), political, clerical, or judicial office (eg: *President*), military rank (eg: *Major*), or academic or professional status (eg: *Doctor*). Some examples:

<i>Mr and Mrs Johnson</i>	<i>General MacArthur</i>
<i>Ms Waterhouse</i>	<i>Professor Smith</i>
<i>Dr Brown</i>	<i>Cardinal Spellman</i>
<i>Private Walker</i>	<i>Inspector Harris</i>
<i>Captain O'Connor</i>	<i>Chancellor Brandt</i>
<i>Lord Nelson</i>	<i>Governor Rockefeller</i>
<i>Lady Churchill</i>	<i>Judge Fox</i>

Fuller details of appositional titles are given in 17.91. On the use of titles and names as vocatives without the article, cf 10.53.

Note [a] *Ms*, usually pronounced /mɪz/, is now widely used as a female title which avoids making the distinction between married and unmarried (*Mrs* and *Miss*). On the plural of terms of address, cf 5.103.

[b] The title *Sir* is used for a knight or a baronet. It is exceptional in that it must be accompanied by the given name of the holder, but need not be accompanied by the surname. Thus *Sir Basil Spence* can be abbreviated as *Sir Basil*, but not as **Sir Spence*. With other titles, it is usually the given name that is omitted in an abbreviated version: *Ms (Julia) Waterhouse*.

[c] In naming monarchs and popes who have shared the same given name with others (eg: *King*

James I, Queen Elizabeth II), we normally write the appended numeral as a cardinal roman number. But in speech, this numeral is rendered as an ordinal (cf 6.63): *I* 'the first', *II* 'the second', *VII* 'the seventh', etc.

[d] The use of the article in the following is exceptional:

(i) imperial titles: *the Emperor Napoleon*; (*the*) *Emperor Haile Selassie*; (*the*) *Czar Alexander*; (*the*) *Archduke Ferdinand* [but: *Kaiser Wilhelm II*]

(ii) *the Lord* ['God']

(iii) (*the*) *Rev John Smith* [always *the Reverend John Smith* in the spoken form]

(iv) titles of peerage, when followed by an *of*-phrase: *the Duke of Wellington*, *the Countess of Derby*, etc

[e] In familiar style, kinship terms with unique reference behave like proper nouns in having no determiner, and often in beginning with a capital letter:

Where's *mother*? [also: *Mummy*, *Mum* (BrE familiar); *Mommy*, *Mom* (AmE familiar)]

You'll see *Uncle* on Saturday.

Father is here. [also: *Daddy*, *Dad*, *Pop* (familiar)]

Contrast: *My/The father* was the tallest of the family.

The following expressions are very informal, and used especially in a family environment by or to young children: (*my*) *Daddy*, (*your*) *Mom*, etc.

Temporal names

5.67 These have no article when they are used to refer to the period as a recurrent item in the calendar (cf sporadic reference, 5.43; seasons, 5.47):

(i) Names of festivals, religious periods, etc:

<i>Christmas (Day)</i>	<i>Independence Day</i>	<i>Easter (Sunday)</i>
<i>Passover</i>	<i>Good Friday</i>	<i>New Year</i>
<i>New Year's Day</i>	<i>New Year's Eve</i>	<i>Ramadan</i>

(ii) Names of months, and days of the week:

January, February, ... Monday, Tuesday, ...

However, these words behave more like common nouns when they refer to individual periods, or when they refer collectively to more than one occasion. Along with *next* and *last* + a noun, they have zero article when they are connected with a point of time implicit in the linguistic or situational context (on prepositional usage, cf 9.40). Contrast:

We'll leave $\left\{ \begin{array}{l} \text{on Sunday.} \\ \text{next month.} \end{array} \right.$

She left $\left\{ \begin{array}{l} \text{on the next Sunday.} \\ \text{the } \left\{ \begin{array}{l} \text{next} \\ \text{following} \end{array} \right\} \text{ day.} \end{array} \right.$

Days of the week also occur with the indefinite article, without reference to a particular Sunday:

He left *on a Sunday*.

Days of the week have a plural, but months of the year normally do not:

I hate *Mondays*. ?I hate *Januaries*.

Note In rather popular BrE usage (felt by some to be nonstandard), the days of the week have the definite article in cases like the following:

And *on the Thursday* she got worse. So, *on the Friday* we called the doctor. ['the Thursday, etc of the week concerned']

Geographical names

5.68 The following categories of names normally have no article, even with a premodifying adjective:

(i) Names of continents:

(<i>North</i>) <i>America</i>	(<i>medieval</i>) <i>Europe</i>	(<i>equatorial</i>) <i>Africa</i>
(<i>Central</i>) <i>Australia</i>	(<i>East</i>) <i>Asia</i>	<i>Antarctica</i>

Note that *Antarctica* refers to the continent, while *the Antarctic* refers more generally to the polar region (cf: *the Arctic*).

(ii) Names of countries, counties, states, etc:

(<i>Elizabethan</i>) <i>England</i>	(<i>West</i>) <i>Scotland</i>	(<i>industrial</i>) <i>Staffordshire</i>
(<i>modern</i>) <i>Brazil</i>	(<i>French</i>) <i>Canada</i>	(<i>northern</i>) <i>Arkansas</i>

Note the exceptional use of *the* for certain countries and regions, eg: (*the*) *Argentine* (but *Argentina*, without the article, is more common; cf 5.57). Other examples:

<i>the Crimea</i>	<i>the Punjab</i>	<i>the Ruhr</i>
<i>the Saar</i>	<i>the Sahara</i>	(<i>the</i>) <i>Sinai</i>
(<i>the</i>) <i>Sudan</i>	(<i>the</i>) <i>Ukraine</i>	(<i>the</i>) <i>Yemen</i>

The is sometimes used with French names, eg: *the Auvergne*; it is also used with plural names such as *the Everglades* (cf 5.72), and for names ending with a compass point:

the Near/Middle/Far East, the (Deep) South, the Midwest

(iii) Names of cities, towns, etc:

(<i>downtown</i>) <i>Boston</i>	(<i>central</i>) <i>Brussels</i>
(<i>ancient</i>) <i>Rome</i>	(<i>suburban</i>) <i>New York</i>

Note the exceptional article in *The Hague*; also the use of the article in certain districts of large cities: *the Bronx, the City, the West/East End (of London)*.

(iv) Names of lakes (cf 17.89):

(<i>Lake</i>) <i>Ladoga</i>	<i>Lake Michigan</i>	<i>Loch Ness</i>
<i>Silver Lake</i>	<i>Lake Nicaragua</i>	<i>Ullswater</i>

Note exceptions such as *the Great Salt Lake*.

(v) Names of mountains (cf 17.89):

<i>Mount Everest</i>	<i>Mont Blanc</i>	<i>Ben Nevis</i>
(<i>Mount</i>) <i>Snowdon</i>	<i>Vesuvius</i>	<i>Aconcagua</i>

Note As the examples above show, in the names of lakes and mountains, the descriptor usually precedes rather than follows the proper noun: *Lake Michigan*, not **Michigan Lake*. There are, however, some cases in which the descriptor follows: *Pikes Peak, Bassenthwaite Lake*.

Other locative names consisting of proper noun + common noun descriptor

- 5.69 The structure 'proper noun + common noun descriptor (or by-name)' is typical of the names of natural features (such as forests, woods, and hills) and man-made features (such as roads, streets, squares, buildings, airports, parks, and gardens). The article is normally omitted:

<i>Epping Forest</i>	<i>Park Lane</i>	<i>Paddington Station</i>
<i>Clapham Common</i>	<i>Madison Avenue</i>	<i>Kennedy Airport</i>
<i>Hampstead Heath</i>	<i>Times Square</i>	<i>Magdalen College</i>
<i>Kew Gardens</i>	<i>Portland Place</i>	<i>Canterbury Cathedral</i>
<i>Hyde Park</i>	<i>Scotland Yard</i>	<i>Windsor Castle</i>
<i>Bredon Hill</i>	<i>Westminster Bridge</i>	<i>Buckingham Palace</i>
<i>Piccadilly Circus</i>	<i>Hampton Court</i>	<i>Fountains Abbey</i>

There are, however, many exceptions. For example, in London, *the Albert Hall* and *the Mansion House* are buildings, and *the Mall* and *the Strand* are streets. More general exceptions are the names of theatres, museums, etc (cf 5.72).

- Note [a] Names of British universities where one element is a place-name can usually have two forms: *the University of London* (which is the official name) and *London University*. In names of American universities, there is a fairly regular contrast between the two types, as in *the University of California* and *California State University*. Universities named after a person have only the latter form: *Yale University*, *Brown University*, etc.
- [b] *The* can exceptionally occur with *Road* in the names of some urban thoroughfares: (*the*) *Edgware Road*, (*the*) *Old Kent Road* [but only: *Oxford Street*, *Fifth Avenue*]
- Large modern intercity highways also tend to have the article:
the San Diego Freeway, *the Merrit Parkway*, *the Pennsylvania Turnpike*, *the M1 (Motorway)*

Names with the definite article

- 5.70 There is a gradient between names like *Sir Walter Scott* and noun phrases which are termed DEFINITE DESCRIPTIONS, such as *the author of Waverley*. Both names and definite descriptions have (situationally) unique denotation; but one of them is grammatically 'frozen', while the other is formed according to the normal productive rules for constructing definite noun phrases. The most obvious indicator of a name is its spelling with initial capitals; while the most obvious indicator of a definite description is its initial definite article. Expressions which combine both these features, such as *the Eiffel Tower*, are neither completely name-like nor completely description-like, but somewhere between the two. We may therefore illustrate the gradient between descriptions and names roughly as follows:

Fig 5.70 The gradient between descriptions and names

(i) is a definite description ('the road to Oxford'); in (ii) that description is conventionalized to the extent that *Road* is capitalized, so that the whole makes a composite name; in (iii) the loss of the article has taken this conventionalization further. The purest example of a name is perhaps (iv),

the simple proper noun *Oxford*. Although native English speakers may be able to analyse this into two elements ('ford for oxen'), such an analysis plays no part in their understanding of *Oxford* as the name of a university city.

This 'scale of institutionalization' explains why there are many exceptions to the above categories of names which lack an article, and why there is sometimes vacillation between the use and omission of the definite article. It might be better, in fact, to regard names without articles as exceptions to the more general rule that definite noun phrases are introduced by the article *the*. But an even better way of looking at this problem is simply to acknowledge that what accounts for apparent exceptions is the absence of a clear-cut boundary between names and definite descriptions. Consider the following three cases:

In 1965–1968 she attended { *York University*.
(*the*) *Hatfield Polytechnic*.
the Paris Conservatoire.

The reason for using the article in the one case, and omitting it optionally or obligatorily in the other two, seems to be largely a matter of how far the name is an institutionalized name among English-speaking (and in this case particularly British) people.

In the following sections we deal with the in-between area of names preceded by the definite article. They might, indeed, be called 'descriptive names', since not only do they take the article, but they can be analysed, in terms of noun-phrase structure, into head and modifiers.

Structure of names with the

- 5.71 (i) Without modification:

<i>the Kremlin</i>	<i>the Koran</i>	<i>The Guardian</i>
<i>the Pentagon</i>	<i>the Bible</i>	<i>The Times</i>
<i>the Knesset</i>	<i>the Parthenon</i>	<i>the Dail</i>

- (ii) With premodification:

<i>the Suez Canal</i>	<i>the Washington Post</i>
<i>the National Gallery</i>	<i>the American Civil War</i>
<i>the Socialist Bookshop</i>	<i>the Ohio State University Press</i>
<i>The Ford Foundation</i>	<i>the British Broadcasting Corporation</i>
<i>the English Channel</i>	(<i>the BBC</i>)

- (iii) With postmodification:

<i>the House of Commons</i>	<i>the Institute of Psychiatry</i>
<i>the District of Columbia</i>	<i>the Bay of Fundy</i>
<i>the Cambridgeshire College of Arts and Technology</i>	

Virtually all names with postmodification like those above are postmodified by an *of*-phrase, and have an obligatory *the*.

- (iv) With ellipsis of elements:

The original structure of a name is sometimes unclear when one element has

been dropped and the elliptic form has become institutionalized as the full name:

<i>the Tate (Gallery)</i>	<i>the Mermaid (Theatre)</i>
<i>the Atlantic (Ocean)</i>	<i>the (River) Thames</i>
<i>the Mediterranean (Sea)</i>	<i>the Majestic (Hotel)</i>

Note When the article is written with a small *t*, it is not part of the name itself. Hence any modifier describing the referent follows, rather than precedes, the article: *the breathtaking Himalayas*, *the lower Mississippi*. In *The Hague*, however, *The* is part of the name (cf 5.72 e).

Classes of names typically preceded by *the*

- 5.72** (a) Plural names (in general), eg: *the Netherlands*, *the Midlands*, *the Great Lakes*, particularly including the following two categories.
- (i) Groups of islands: *the Hebrides*, *the Shetlands*, *the Canaries* (or *the Canary Islands*), *the Bahamas*
 - (ii) Ranges of mountains or hills: *the Himalayas*, *the Alps*, *the Andes*, *the Rockies* (or *the Rocky Mountains*), *the Pyrenees*, *the Pennines*. Also nonplural names of ranges: *the Caucasus*, *the Sierra Nevada*. Exceptions: *Kensington Gardens*, *Burnham Beeches*

(b) Other geographical names:

- (i) Rivers: *the Avon*, *the Danube*, *the Euphrates*, *the Potomac*, *the Rhine*. (The word *River* can sometimes be inserted after *the*: *the River Avon*, etc; but for some rivers it comes last: *the Potomac River*, etc; cf 17.89).
- (ii) Seas and oceans: *the Pacific (Ocean)*, *the Atlantic (Ocean)*, *the Baltic (Sea)*, *the Kattegat*
- (iii) Canals: *the Panama Canal*, *the Suez Canal*, *the Erie Canal*
- (iv) Other geographical features of coastline: *the Gulf of Mexico*, *the Cape of Good Hope*, *the Bay of Biscay*, *the Strait of Magellan*, *the Sound of Bute*, *(the) Bosphorus*, *the Isle of Man*, *the Isle of Wight*

Note that when there is premodification rather than postmodification in category (iv), *the* usually disappears. Thus:

the Isle of Wight BUT: *Long Island*
the Bay of Naples BUT: *Hudson Bay*

(c) Public institutions, facilities, etc:

- (i) Hotels and restaurants: *the Grand (Hotel)*, *the Waldorf Astoria*
- (ii) Theatres, opera houses, cinemas, and clubs: *the Criterion (Theatre)*, *the Globe (Theatre)*, *the Athenaeum*
- (iii) Museums, libraries, hospitals, etc: *the British Museum*, *the Bodleian (Library)*, *the Middlesex Hospital*

Probably because of their origin as place-names, *Drury Lane* and *Covent Garden* are exceptions to the rule that theatres and opera houses take *the*, as in *the Metropolitan*. When the name of a public institution begins with a genitive, *the* is not used: *White's*, *Gaylord's (Restaurant)*, *Brown's (Hotel)*, *Guy's (Hospital)*, *St John's (College)*.

- (d) Ships and planes, particularly when renowned in history, eg: *the Victory*, *the Spirit of St Louis*
- (e) Newspapers and periodicals: *The Economist*, *The New York Times*, *The Observer*, *The Providence Journal*, *The London Review of Books*. *The* is generally spelt with a capital letter in names of newspapers.

Irrespective of whether or not the article is part of the name itself, it is not used after an indefinite article or other determiner or genitive:

Have you got a *Times*? [not: *a *The Times*]
 She's a *Times* reporter.
 Have you seen today's *New York Times*?
 Malcolm lent me his *Guardian*.

Magazines and periodicals, on the other hand, often have a zero article: *Time*, *Punch*, *English Language Teaching Journal*, *New Scientist*, *Scientific American*.

Number

Number classes

- 5.73** The English number system constitutes a two-term contrast: SINGULAR, which denotes 'one', and PLURAL, which denotes 'more than one'. Each noun phrase is either singular or plural, and its number is determined in general by its head, which is typically a noun. In the following sections we will concentrate on number as a property of nouns, and as a basis for their classification.

Note [a] In addition to singular and plural number, we may distinguish dual number in the case of *both*, *either*, and *neither* (cf 5.16), since they can only be used with reference to two. *Both* has plural concord (cf 6.50); *either* and *neither* have singular concord (cf 6.59ff).

[b] Unlike some languages where plural implies 'two or more', English makes the division after 'more than one':

one half day, *one day* BUT: *one and a half days*, *two days*, *one or two days*
 However, the following remain singular:
a pound and a half, *a day or two* (cf 5.38), *more than one day*

- 5.74** We distinguish three main number classes of nouns:

- (A) SINGULAR INVARIABLE NOUNS, including noncount nouns (eg: *music*, *gold*), most proper nouns (eg: *Thomas*, *the Thames*). We may also consider here abstract adjective heads, eg: *the mystical* (cf 7.26).
- (B) PLURAL INVARIABLE NOUNS, ie nouns occurring only in the plural, eg: *people*, *scissors*. We may also consider here personal adjective heads, eg: *the rich* (cf 7.23f).
- (C/D) VARIABLE NOUNS, ie nouns occurring with either singular or plural number:

The dog is . . .
The dogs are . . .

We distinguish two subclasses: (C) REGULAR, with plurals predictable from the singular (like *dog*), and (D) IRREGULAR, where the plural is not predictable (eg: *foot* ~ *feet*, *child* ~ *children*). In this latter group we find a large number of nouns with foreign plurals, eg: *criterion* ~ *criteria*, *analysis* ~ *analyses*.

Figure 5.74 provides a summary of the classification with section references to the subsequent discussion.

	SINGULAR	PLURAL	NOUN CLASS
(A) SINGULAR INVARIABLE			
noncount nouns	<i>gold</i>		(Aa) (5.75)
abstract adjective heads	<i>the unreal</i>		(Ab) (7.26)
proper nouns	<i>Henry</i>		(Ac) (5.60ff)
(B) PLURAL INVARIABLE			
summation plurals		<i>scissors</i>	(Ba) (5.76)
pluralia tantum in -s		<i>thanks</i>	(Bb) (5.77)
unmarked plural nouns		<i>people</i>	(Bc) (5.78)
personal adjective heads		<i>the rich</i>	(Bd) (7.23f)
proper nouns		<i>the Alps</i>	(Be) (5.62)
(C) NOUNS WITH REGULAR PLURAL			
	<i>dog</i>	~ <i>dogs</i>	(C) (5.79ff)
(D) NOUNS WITH IRREGULAR PLURAL			
voicing and -s plural	<i>calf</i>	~ <i>calves</i>	(Da) (5.83)
mutation plural	<i>foot</i>	~ <i>feet</i>	(Db) (5.84)
-en plural	<i>child</i>	~ <i>children</i>	(Dc) (5.85)
zero plural	<i>sheep</i>	~ <i>sheep</i>	(Dd) (5.86ff)
	<i>stimulus</i>	~ <i>stimuli</i>	(De) (5.93)
	<i>larva</i>	~ <i>larvae</i>	(Df) (5.94)
	<i>stratum</i>	~ <i>strata</i>	(Dg) (5.95)
	<i>matrix</i>	~ <i>matrices</i>	(Dh) (5.96)
	<i>thesis</i>	~ <i>theses</i>	(Di) (5.97)
	<i>criterion</i>	~ <i>criteria</i>	(Dj) (5.98)
	<i>bureau</i>	~ <i>bureaux</i>	(Dk) (5.99)
	<i>tempo</i>	~ <i>tempi</i>	(Dl) (5.100)
	<i>cherub</i>	~ <i>cherubim</i>	(Dm) (5.101)
foreign plurals			

Fig 5.74 Number classes

(A) Singular invariable nouns

5.75 Noncount nouns are singular and invariable, ie they have no plural. Some concrete noncount nouns can be reclassified as count nouns with specific meanings, for example *butters* ['kind(s) of butter'] and *a beer* ['a glass of beer'] (cf 5.5).

Abstract noncount nouns normally have no plural: *music*, *dirt*, *homework*, etc. But some can be reclassified as count nouns where they refer to an instance of a given abstract phenomenon: *injustices*, *regrets*, *kindnesses*, *pleasures*, etc. Many abstract nouns are equally at home in the count and noncount categories (cf 5.4).

Proper nouns are typically singular and invariable: *Henry*, *the Thames*, etc (cf 5.62).

Some noncount nouns, particularly those denoting natural phenomena, may be pluralized, eg:

walking through the *woods* I have serious *doubts/grave fears*.
raise someone's *hopes* Let's play on the *sands*.

Some plurals express intensity, great quantity or extent, and have a literary flavour, for example:

the *snows* of Kilimanjaro
the *sands* of the desert
sailing on the great *waters*

Note the following classes of invariable nouns ending in -s which take a singular verb, except where otherwise mentioned:

(i) *News* is always singular (cf 5.9):

Here is the *news* from the BBC. What's the *news* today?

(ii) Nouns ending in -ics denoting subjects, sciences, etc are usually invariable and treated as singular, eg:

Mathematics is the science of quantities.

Other such nouns include:

acoustics *economics* *linguistics*
athletics *ethics* *phonetics*
classics *gymnastics* *physics*

Some, however, can be singular or plural, in particular when such words can denote both one's knowledge of the subject and the practical application of results:

Politics is said to be the art of the impossible. [the science of government] [1]
His *politics* are rather conservative. [political views] [1a]

In some cases, there are forms without -s for special uses:

Statistics is a branch of mathematics. [2]
These *statistics* show that exports are still low. [2a]
There is a surprising *statistic* in your latest report. [2b]
A new *ethic* is needed in the world today. [3]
Has the new coach found a *tactic* that works? [4]

(iii) Names of certain diseases ending in -s are usually treated as singular (but some speakers also accept plural), eg: (*German*) *measles*, *mumps*, *ricketts*, *shingles*:

A: Have you ever had *measles*?

B: Yes I had $\left\{ \begin{smallmatrix} it \\ them \end{smallmatrix} \right\}$ when I was a child.

(iv) The names of some games ending in *-s* have singular concord, eg: *billiards* (but usually: *a billiard table*), *checkers* <AmE>, *draughts* <BrE>, *craps*, *darts* (but: *a dartboard*), *dominoes*, *fives*, *ninepins*:

Darts is becoming very popular as a spectator sport.

(B) Plural invariable nouns

(Ba) Summation plurals

5.76 Summation plurals denote tools, instruments, and articles of dress consisting of two equal parts which are joined together:

A: How much are *those binoculars*? B: *They* are £60.

The most common summation plurals are the following:

(i) Tools and instruments:

bellows; *glasses*, *spectacles*, *binoculars*; *scales* ['a balance']; *clippers*, *forceps*, *pincers*, *scissors*, *shears*, *tongs*, *tweezers*

(ii) Articles of dress:

braces <BrE>, *breeches*, *britches* <AmE>, *briefs*, *flannels*, *jeans*, *knickers*, *pants*, *pajamas* <AmE>, *pyjamas* <BrE>, *shorts*, *slacks*, *suspenders*, *tights*, *trousers*, *trunks*

Number contrast can be achieved by means of a *pair of*. Thus *a pair of trousers* refers to one item, but *two pairs of trousers* refers to two (cf 5.7 Note [a]):

That's a *nice pair of slacks*.

As I'm shortsighted I always carry *two pairs of glasses*.

Plural pronoun concord is usual even with a singular determiner + *pair*:

I like $\left\{ \begin{smallmatrix} this \\ *these \end{smallmatrix} \right\}$ pair. How much $\left\{ \begin{smallmatrix} are they? \\ is it? \end{smallmatrix} \right\}$

Although nouns that are summation plurals require plural concord, they differ from ordinary plural nouns in that they are not generally thought of as denoting plural number. Yet usage varies. For many speakers, it is as follows (cf 10.43 Note [c]):

$\left. \begin{array}{l} \text{Both pairs of scissors} \\ (?) \text{Both of the scissors} \\ (?) \text{Both scissors} \end{array} \right\}$ need sharpening.

I want $\left\{ \begin{array}{l} \text{two pairs of trousers.} \\ (?) \text{two trousers. <informal>} \\ \text{a pair of trousers.} \\ * \text{one trouser.} \\ (?) \text{a scissors. <informal>} \end{array} \right\}$

Many of the summation plurals can take the indefinite article, especially

with premodification: (*a*) *new clippers*, (*a*) *garden shears*, (*an*) *old-fashioned curling tongs*. Forms are commonly singular when used attributively: *a spectacle case*, *a suspender belt*, *a trouser leg*, *a pajama/pyjama top* (cf 17.108).

Note *Compasses* can be used in the singular (*compass*) in the sense 'instrument for drawing circles':
She drew her circle with a *compass*.

In the sense of an instrument of navigation, it is a normal count noun:

$\left. \begin{array}{l} \text{A magnetic compass is} \\ \text{Magnetic compasses are} \end{array} \right\}$ necessary for navigation.

(Bb) Pluralia tantum ending in *-s*

5.77 Some 'pluralia tantum' (*ie* nouns that, in a given sense, occur only in the plural) end in *-s*, whereas others have no plural marking, eg: *people* (cf 5.78). They have plural concord, eg:

These damages have not yet been paid, *have they?* [*damages* = 'compensation in money imposed by law for causing loss or injury'] [1]

In many cases, pluralia tantum ending in *-s* also have singular forms, which however can be dissociated in meaning from the plural, eg:

That damage was repaired long ago. [*damage* = 'loss, harm'] [1a]

Other examples of pluralia tantum:

accommodations <AmE>: living accommodations

amends: make every/all possible amends for something

annals ['a historical record of events']: in the annals of history

archives: The documents should be kept in the archives. (BUT: archive administration)

arms ['weapons']: arms aid; arms control; the arms race; take up arms; ALSO: munitions

arrears: He's in arrears with his payments; the arrears of work

ashes: burn to ashes; Her ashes were scattered; the ash(es) of a burned letter (BUT: cigarette ash; ashtray; Ash Wednesday)

auspices ['support']: under the auspices of

banns [of marriage]: publish the banns

bowels, *entrails*, *intestines*: the movement of the bowels; an infection of the intestines (BUT singular count: the large intestine)

brains ['the intellect']: You should use your brains. (BUT singular count is more common generally, and particularly so when the meaning is anatomical: 'The average human brain weighs 14 oz.')

clothes /kləʊ(ð)z/: warm clothes; a clothes basket (BUT: *cloths* /klɒθs/ as plural of *cloth*: a table cloth)

clubs, *diamonds*, *hearts*, *spades* [playing cards]: the ace of clubs; the jack of hearts; BUT: I've only one diamond in my hand. NOTE singular concord in: Spades is the suit. It was hearts last game.

the Commons/Lords [the House of Commons/Lords in the UK]: The Commons are discussing the new bill.

communications ['means of communicating']: communications gap; telecommunications network

congratulations: Many congratulations on your birthday!
contents: a table of contents (BUT: the silver content of a coin; the style and content of a book)
credentials: evaluate the credentials of students
customs: pay customs duty; go through customs at the airport; a customs officer
dregs: coffee dregs/grounds; the dregs of society
dues ['fee']: pay one's dues to a society; harbour dues
earnings: Her earnings are higher this year. (BUT: earning power); ALSO: *proceeds, returns, riches*
funds ['money']: for lack of funds; be short of funds (BUT: a fund ['a source of money'])
goods ['property, merchandise']: leather goods; a goods train (BrE) (AmE = a freight train)
grassroots ['the rank and file']: grassroots opinion/revolt/support (BUT: at grassroot level)
guts ['bowels']; ALSO 'courage' (familiar): He's got the guts to do it. (BUT in premodification: a gut reaction; noncount: catgut)
heads ['front side of a coin']: Heads or tails?
heavens in the expression 'Good Heavens!' (BUT: go to heaven)
honours: an honours course/degree/list
humanities ['arts']: the humanities/arts faculty
letters ['literature']: a man of letters
lodgings: a lodgings bureau (BUT: a lodging house; a poor lodging); ALSO: *digs* (BrE informal): Many students move into digs instead of living on campus. ALSO: *quarters*: married quarters (BUT: the Latin quarter ['district'])
looks: He has good looks. (BUT: give somebody a hard look)
mains: turn the water off at the mains; NOTE in some phrases the -s is retained in premodification: mains adaptor; mains water supply
manners ['social behaviour']: Where are your manners?; manners and customs (BUT: Do it in this manner/way; I don't like his manner ['personal way of acting'])
minutes ['a record of proceedings']: the minutes of a meeting
odds: What are the odds?; be at odds with; odds and ends
outskirts: She lives on the outskirts of the city.
pains ['care, trouble']: take great pains with something; be at pains to do something
particulars ['details']: Take down the particulars of this event.
premises ['building'] (in official style): There is a suspect on the premises. (BUT in logic: a first premise)
regards ['good wishes']: Ann sends her regards. (BUT: win his regard ['respect'])
relations: an exercise in public relations
remains ['remainder']: the remains of the castle/the meal
savings ['money saved']: a savings bank; a savings account (BUT: a saving of £5)
spirits ['mood']: to be in good spirits (BUT: He showed a kindly spirit.)
stairs [inside a building]: a flight of stairs; downstairs (BUT: a staircase; a stairway)

steps [outside a building]: a flight of steps; on the church steps
surroundings ['environment']: These surroundings are not good for the child.
systems: a systems analyst; computer systems applications
thanks: Many thanks for . . . ; All my thanks are due to you.
troops ['soldiers']: Many troops were sent overseas. (BUT: troop movement; a troop carrier; a troop of scouts)
tropics: living in the tropics (BUT: the Tropic of Cancer)
valuables: Are my valuables safe here?
wages ['weekly pay']: What are his wages? (BUT often also singular: a wage earner; a minimum wage; a good/poor/high wage; a wage freeze)
wits: live by one's wits (BUT: She has a keen wit. Her speech had wit.)
writings ['literary production' (formal)]: His writings are not widely known.

(Bc) Unmarked plural nouns: *people, police, etc*

5.78 The following nouns have no plural marking but are used as plurals (cf also collective nouns like *clergy, staff*, etc, 5.108):

(i) *people*:

How many *people* are there in the world today?

People functions as the normal plural of *person*:

There was only *one person*
 There were *many people* } in the room.

Persons is often used instead of *people*, especially in official style: 'a person or persons unknown'. When *people* means 'nation', it is a regular count noun:

The Japanese are *an industrious people*.
 They are *a great people*.
 the English-speaking *peoples*

In this sense, however, the singular form *people* is normally constructed with plural concord:

The Portuguese *people* have chosen a new President.

(ii) *Folk* is more restricted in use than *people*: *country folk, fisher folk, island folk, folk art, folk music*. *Folks* is used in casual style (*That's all, folks!*) and often with a possessive determiner in the sense of 'family' (*my folks*).

(iii) *police*: 'The police have caught the burglar'.

To denote individual police officers we normally use *a police officer*, or *a policeman/policewoman* with the plurals *police officers, policemen, policewomen*:

Why don't you ask *a policeman*?

In a collective sense 'the police force', only *police* can be used:

He wants to join *the police*. [NOT, in this sense, *the policemen*]

- (iv) *cattle*: 'All his *cattle* were grazing in the field.'
- (v) *poultry* ['farmyard birds']: 'Where are your *poultry*?'
But it is treated as singular in the sense of 'meat': '*Poultry* is harder to come by nowadays than beef'.
- (vi) *livestock* ['animals kept on a farm']: 'Our *livestock* are not as numerous as they used to be.'
- (vii) *vermin*: 'These *vermin* cause disease.'

(C) Regular plurals

- 5.79 Variable nouns have two forms: singular and plural. The singular is the unmarked form that is listed in dictionaries. The vast majority of nouns are variable in this way and normally the plural is fully predictable both in pronunciation and spelling by the same rules as for the *-s* inflection of verbs (cf 3.5, 3.7), ie they form the regular plural. If the plural cannot be predicted from the singular, it is an irregular plural.

The pronunciation of the regular plural

- 5.80 The regular *-s* plural has three different pronunciations /tʃ/, /z/, /s/ depending on the final sound of the base.

- (i) /tʃ/ after bases ending in sibilants:

/s/ in <i>horse</i> ~ <i>horses</i> ; <i>box</i> ~ <i>boxes</i>	/tʃ/ in <i>church</i> ~ <i>churches</i>
/z/ in <i>size</i> ~ <i>sizes</i>	/ʒ/ in <i>mirage</i> ~ <i>mirages</i>
/ʃ/ in <i>rush</i> ~ <i>rushes</i>	/dʒ/ in <i>language</i> ~ <i>languages</i>

- (ii) /z/ after bases ending in vowels and voiced consonants other than sibilants: *day* ~ *days*, *bed* ~ *beds*

- (iii) /s/ after bases ending in voiceless consonants other than sibilants: *bet* ~ *bets*, *month* ~ *months*

The spelling of the regular plural

- 5.81 The plural suffix is written *-s* after most nouns: *hat* ~ *hats*, including nouns ending in silent *-e* (*college* ~ *colleges*). There are however several exceptions to this rule:

- (I) Unless the noun is written with a silent *-e*, the plural suffix is spelled *-es* after nouns ending in sibilants which are spelled *-s* (*gas* ~ *gases*), *-z* (*buzz* ~ *buzzes*), *-x* (*box* ~ *boxes*), *-ch* (*church* ~ *churches*), *-sh* (*bush* ~ *bushes*).

- (II) Nouns ending in *-o* have plurals in *-os* or *-oes*.

- (i) *-os*: When *-o* is preceded by a vowel (letter or sound), the spelling is *-os*: *bamboos*, *embryos*, *folios*, *kangaroos*, *radios*, *studios*, *zoos*.

When *-o* is preceded by a consonant, the spelling is also usually *-os*: *dynamos*, *pianos*, *quartos*, *solos*. Abbreviations are included in those nouns with *-os*: *kilos* (= kilograms), *memos* (= memoranda), *photos* (= photographs); and ethnic nouns: *Eskimos*, *Filipinos* (but also zero, cf 5.88).

- (ii) *-oes*: The following are among those nouns which have plurals

only in *-oes*: *domino* (plural: *dominoes*); also: *echo*, *embargo*, *hero*, *potato*, *tomato*, *torpedo*, *veto*.

- (iii) *-os* or *-oes*: In some cases there is variation between *-os* and *-oes* plurals, eg: *archipelago* (plural: *archipelagos* or *archipelagoes*); also *banjo*, *buffalo* (cf 5.87), *cargo*, *grotto*, *halo*, *innuendo*, *manifesto*, *motto*, *mulatto*, *tornado*, *volcano*.

- (III) Nouns ending in *-y* preceded by a consonant change *-y* to *-i* and add *-es*: *sky* ~ *skies*; *-y* is kept after a vowel: *day* ~ *days*, except for nouns ending in *-quy* /kwɪ/ (where *u* is only a spelling vowel required after *q*), which have the plural *-quies* (*soliloquy* ~ *soliloquies*). Proper nouns ending in *-y* have plurals in *-ys*: *the two Germanys*, *the little Marys*.

- (IV) The final consonant is doubled in a few words, eg: *fez* ~ *fezzes*, *quiz* ~ *quizzes*.

- (V) The apostrophe + *s* is used in some nouns of unusual form, eg letters: *dot your i's*; numerals: *in the 1890's* (or, increasingly, *1890s*); abbreviations: *three PhD's* (or, increasingly, *PhDs*).

Note In abbreviations, reduplication also occurs as a purely written convention, eg: *p* ~ *pp* [the plural = 'pages'], *l* ~ *ll* [= 'lines'], *MS* ~ *MSS* [= 'manuscripts'], *ex* ~ *exx* [= 'examples'], *c* ~ *cc* [= 'copies'], *f* ~ *ff* [= 'and following pages'].

(D) Irregular plurals

- 5.82 Irregular plurals are by definition unpredictable. Whereas the plural /tʃ/ in *horses*, /z/ in *dogs*, and /s/ in *cats* can be predicted from the final sound in the singular of the nouns, there is no indication in the written or spoken forms of, for example, *ox*, *sheep*, and *analysis* to suggest that their plurals are *oxen*, *sheep*, and *analyses*. The particular plurals of these nouns have to be learned as individual lexical units.

In many cases where foreign words are involved, it is of course helpful to know about pluralization in the relevant languages, particularly Latin and Greek. Thus, on the pattern of *analysis* ~ *analyses* we can construct the following plurals: *axis* ~ *axes*, *basis* ~ *bases*, *crisis* ~ *crises*, etc. But we cannot always rely on etymological criteria: unlike *larva* ~ *larvae*, for example, plurals like *areas* and *villas* do not conform to the Latin pattern (cf 5.94).

(Da) Voicing and *-s* plural

- 5.83 (i) Some nouns which, in the singular, end in the voiceless fricative /θ/ (spelled *-th*) form plurals with the corresponding voiced fricative /ð/ followed by /z/. The spelling of the plural is regular (*-ths*):

-th /θ/ ~ *-ths* /ðz/, eg: *path* ~ *paths*

There is considerable indeterminacy between voicing and nonvoicing in many nouns ending in *-th*. With a consonant letter before the *-th*, the pronunciation of the plural is regular /θs/:

berth ~ *berths*, *birth* ~ *births*, *length* ~ *lengths*

With a vowel before the *-th*, the plural has, again, often regular pronunciation /θs/, as with:

cloth, death, faith, heath, moth

In a few such cases, however, there are both regular and voiced plurals, eg:

truths /tru:θs/ or /tru:ðz/; similarly: *oaths, sheaths, youths* (/ju:θs/ <esp AmE>), *wreaths*

(ii) Some nouns which, in the singular, end in the voiceless fricative /f/ (spelled -f or -fe) form plurals with the corresponding voiced fricative /v/ followed by /z/. The spelling of the plural is -ves:

-f /f/ ~ -ves /vz/, eg: *calf* ~ *calves*
-fe /f/ ~ -ves /vz/, eg: *knife* ~ *knives*

Voiced plurals, spelled -ves and pronounced /vz/, occur with:

<i>calf</i> ~ <i>calves</i>	<i>life</i> ~ <i>lives</i>	<i>shelf</i> ~ <i>shelves</i>
<i>elf</i> ~ <i>elves</i>	<i>loaf</i> ~ <i>loaves</i>	<i>thief</i> ~ <i>thieves</i>
<i>half</i> ~ <i>halves</i>	<i>self</i> ~ <i>selves</i> (cf 6.23)	<i>wife</i> ~ <i>wives</i>
<i>knife</i> ~ <i>knives</i>	<i>sheaf</i> ~ <i>sheaves</i>	<i>wolf</i> ~ <i>wolves</i>
<i>leaf</i> ~ <i>leaves</i>		

Both regular and voiced plurals are found with:

dwarf (plural: *dwarfs/dwarves*), *hoof*, *scarf*, *wharf*

Other nouns ending in -f(e) have regular plural -f(e)s /fs/, for example: *belief* (plural: *beliefs*), *chief*, *cliff*, *proof*, *roof*, *safe*.

(iii) One noun (*house*) ending in the voiceless fricative /s/ in the singular has the plural /ziz/: *house* ~ *houses*.

Note [a] In BrE *bath* has the voiced plural /bɑ:ðz/ or /bɑ:θs/ when it means 'swimming pools', but usually /bɑ:θs/ when it means 'bathtubs'.

[b] *Cloverleaf* occurs with either *cloverleafs* or *cloverleaves* in the plural. Regular plurals occur in names, eg the Toronto icehockey team *Maple Leafs*.

[c] The painting term *still life* has a regular plural: *still lifes*.

(Db) Mutation

5.84 The plural is formed by MUTATION (a change of vowel) in the following seven nouns:

<i>man</i> /mæn/ ~ <i>men</i> /men/	<i>woman</i> /'wʊmən/ ~ <i>women</i> /'wɪmɪn/
<i>foot</i> /ʊ/ ~ <i>feet</i> /i:/	<i>tooth</i> /u:/ ~ <i>teeth</i> /i:/
<i>goose</i> /u:/ ~ <i>geese</i> /i:/	<i>louse</i> /aʊ/ ~ <i>lice</i> /aɪ/
<i>mouse</i> /aʊ/ ~ <i>mice</i> /aɪ/	

Note [a] Compounds with unstressed -man, as in *Englishman* ~ *Englishmen* (cf App 1.64), have no difference in pronunciation at all between singular and plural, since both are pronounced /mæn/. Similarly: *fireman* ~ *firemen*, *postman* ~ *postmen*, etc.

[b] *German* and *mongoose* are not compounds with *man* and *goose*, and thus have regular plurals: *Germans*, *mongooses*. However, the irregular plural can be found also in nouns that are not 'true' compounds with -man; eg: *dragoman* ~ *dragomans* or *dragomen*.

[c] Regular plurals are normal in names, such as *Mother Gooses*, and may occur when otherwise mutational nouns have derived meanings, eg: *Those louses!*, *Silly geeses!* (familiar use).

(Dc) The -en plural

5.85 The -en /ən/ plural occurs in three nouns:

brother ~ *brethren* (with mutation as well as the -en ending) is limited to *brother* meaning 'fellow member of a religious society'; otherwise regular *brothers*

child ~ *children* (with vowel change /aɪ/ ~ /ɪ/ and -r added)

ox ~ *oxen* (In AmE, the plural *oxes* is also sometimes found.)

(Dd) Zero plural

5.86 Some nouns have the same spoken and written form in both singular and plural. Note the difference here between, on the one hand, invariable nouns, which are either singular [1] or plural [2], but not both; and, on the other hand, zero plural nouns, which can be both singular and plural [3, 3a]:

<i>This music</i> is too loud.	[1]
<i>All the cattle</i> are grazing in the field.	[2]
<i>This sheep</i> looks small.	[3]
<i>All those sheep</i> are ours.	[3a]

We distinguish the following types of nouns with zero plural: (I) animal names (cf 5.87), (II) nationality nouns (cf 5.88), (III) quantitative nouns (cf 5.89f), and (IV) nouns with equivocal number (cf 5.91).

(I) Animal names

5.87 Animal names normally have the regular plural:

cow ~ *cows*, *eagle* ~ *eagles*, *monkey* ~ *monkeys*, etc

However, many animal names have two plurals: -s and zero plurals, eg: *duck*, *herring*. Zero tends to be used partly by people who are especially concerned with the animals, partly when the animals are referred to in the mass as game:

Have you ever shot *duck*?
We caught only a few *fish*.

The regular plural is used to denote different individuals, species, etc:

Can you see the *ducks* on the pond?
the *fishes* of the Mediterranean

In some cases usage is variable, eg:

He caught five {*fish*.
fishes.

The degree of variability with animal names is shown by the following examples:

(i) Regular plural, eg:

bird, cow, eagle, hen, hawk, monkey, rabbit

(ii) Usually regular plural:

elk, crab, duck (zero only with the wild bird)

(iii) Both regular and zero plurals:

antelope, reindeer, fish, flounder, herring, shrimp, woodcock

(iv) Usually zero plural:

bison, grouse, quail, salmon, swine (cf the normal word *pig* which always has regular plural)

(v) Always zero plural:

sheep, deer, cod

Note [a] *Swine* used as a word of abuse may also have a zero plural:

You swine! [about one or more persons]

He called them *swine*.

But it is occasionally used with a regular plural:

these *swines* with their big cars

[b] Some animal names, like *duck* and *goose*, refer to both game and food: *shoot/eat duck*. But in the latter case, the noun is noncount. For other animals there is a special word for the flesh of an animal considered as food, i.e. *shoot deer* but *eat venison* (cf 5.4: *pig/pork*, etc).

(II) Nationality nouns

5.88 Nationality nouns ending in *-ese* also have zero plurals (cf 5.57):

one *Chinese* ~ five *Chinese*; similarly: *Japanese, Lebanese, Portuguese, Sinhalese, Vietnamese*, etc; also: *one Swiss* ~ *two Swiss*

Certain nationality and ethnic names are sometimes used without *-s*:

Apache(s), Bantu(s), Bedouin(s), Eskimo(s), Navaho(s)

Sioux has the same written form for singular and plural, but the pronunciation /su:/ in the singular corresponds to either /su:/ or /suz:/ in the plural.

(III) Quantitative nouns

5.89 (i) The nouns *dozen, hundred, thousand, and million* have zero plurals when they are premodified by another quantitative word (cf 6.65):

three *dozen* glasses two *hundred* people
many *thousand* times several *million* inhabitants

Million can take plural *-s* if no noun head follows:

They want { *a few hundred.*
 ten thousand.
 several million(s).

The plural form is normally used with all four nouns when an *of*-phrase follows, with or without a preceding indefinite quantitative word:

(many) *dozens of* glasses
(many) *hundreds of* people
(several) *thousands of* spectators
(a few) *millions of* inhabitants

But the zero form is common enough:

a few *million of* us, several *hundred/thousand of* them

Note such combinations as:

tens of thousands of people
hundreds of millions of stars
hundreds (and hundreds (and hundreds)) of times

(ii) *Foot* denoting length and *pound* denoting weight often have zero plural, particularly when a numeral follows:

She's only { *five foot two.*
 five {foot/feet} tall.
 five feet. <usually>

(iii) Also *pound* denoting currency may have zero or regular plural when a numeral follows:

This ticket costs only { *two pound(s) fifty.*
 two pounds.

Note The more general use of singular for plural with measure nouns is nonstandard but widely current:

It weighs *five pound.* He's nearly *six foot.*

More widely acceptable is:

Five pound of potatoes, please.

The singular is however standard in quantitative expressions of the following type (cf 17.108): *a three-foot ruler.*

5.90 Other quantitative nouns (some of them rather rare) with zero plurals include the following when used with definite numbers and measurements:

brace [= 2]: 'five brace of pheasants'
gross [= 12 dozen]: 'ten gross of nails'
head [= 1]: '400 head of cattle'
horsepower, HP: 'This engine has only fifty horsepower.'
hundredweight [British weight = 112 pounds]: 'five hundredweight (of coal)'
(kilo)hertz: 'Two kilohertz equals 2000 hertz.'
p /pi:/ ['penny' <informal BrE>]: 'The paper costs 25*p* /pi:/' ['25 *pence*' <more formal>]. *Penny* is commonly used in BrE and AmE when referring to the actual coins as distinct from the value: 'Save your pennies and watch your dollars grow.'
quid ['pound' <BrE slang>]: 'You owe me *five quid*.' [= *five pounds*; written: £5]
score [= 20]: 'four *score* and ten years ago'; BUT always: 'scores (and scores) of people'
stone [British weight = 14 pounds]: 'He weighs 18 *stone(s)*.'
yen [Japanese currency]: 'one *yen*, 200 *yen*'
yoke [= 2]: 'two *yoke(s)* of oxen'

(IV) Nouns with equivocal number

5.91 The following nouns can be treated as singular or plural:

barracks: { This barracks is } new.
 { These barracks are }

Also *s*-less form: 'a *barrack square*'; 'an enormous *barrack of a place*' [informal metaphorical use]

craft in the sense of 'ship(s)' with compounds: 'one/several (air)craft/hovercraft/spacecraft' (BUT: 'arts and crafts')

crossroads: { This is a busy crossroads.
There are several crossroads here.

data ['information, especially information organized for analysis'] (from the Latin singular *datum*, plural *data*) is usually constructed as a plural [1]. But it is often constructed also as a singular, especially in scientific contexts [1a]:

Many of these data are inconclusive. [1]
Much of this data is inconclusive. [1a]

The regular English plural *datums* is used as a reference term in surveying.

dice: 'one/two dice' (or perhaps: 'one of the dice' for the singular). *Die* in the expression 'The die is cast' is no longer recognized as being the singular of *dice*. *Die* ['engraved stamp for coining, etc'] has the regular plural *dies*.

gallows: 'one/two gallows', 'gallows humour'

headquarters: 'a large headquarters', 'Where is/are the headquarters?'

innings (as a cricket term): 'a long innings', 'two innings' [The corresponding baseball term is regular: 'an inning/two innings']

kennels (as well as being plural of regular *kenel*) ['a collection of kennels where dogs are kept']: 'a/some famous kennels'

links: 'a fine but difficult golf links', 'We have several links here.'

means: 'a means of communication', 'use every/all means available', 'a means test'

mews <BrE>: { This mews is
These mews are } very fashionable.

oats: 'Is/Are oats grown here?'

offspring: { Is this
Are these } your offspring?

series: { This new series is
These new series are } beginning next month.

species: { This species is
These species are } now extinct.

works ['factory, plant'] with compounds (*steelworks*, *waterworks*):

a/two large works

An enormous steelworks was } built here in the thirties.
A number of steelworks were }

But *works* ['the moving parts of a machine'] is a plurale tantum, and *work* ['job'] is noncount (cf 5.9).

Note [a] Most of the nouns in this group are count nouns and display a semantic difference between singular and plural (eg: *one/two mews*). The exceptions are *data* and *oats*.

[b] In BrE the singular form of collective nouns may also have either a singular or a plural verb (cf 5.108):

Our team { has
have } lost again. But not a plural determiner: *these
this } team

Foreign plurals

5.92 Foreign plurals often occur along with regular plurals. They are more common in technical usage, whereas the *-s* plural is the most natural in everyday language. Thus: *formulas* (general) ~ *formulae* (in mathematics, linguistics, etc), *antennas* (general and in electronics) ~ *antennae* (in biology).

Our aim here will be to survey systematically the main types of foreign plurals that are used in present-day English and to consider the extent to which a particular plural form is obligatory or optional. Most (but by no means all) words having a foreign plural originated in the language mentioned in the heading.

(De) Nouns from Latin ending in *-us* /əs/

5.93 The foreign plural in most cases is *-i* /aɪ/, as in *stimulus* ~ *stimuli* (also /'stɪmjəli:/). Other nouns with *-i* plural only: *alumnus*, *bacillus*, *locus*. The plural of *corpus* is *corpora* or *corpuses*, and the plural of *genus* /'dʒi:nəs/ is *genera* /'dʒenərə/.

Nouns with only the regular plural (*-uses*) include:

apparatus, *bonus*, *campus*, *caucus*, *census*, *chorus*, *circus*, *impetus*,
minus, *prospectus*, *sinus*, *status*, *virus*

Nouns with both plurals include:

focus ~ *focuses* /'fəʊkəsɪz/, or *foci* /'fəʊkaɪ, 'fəʊsaɪ/
fungus ~ *funguses* /'fʌŋgəsɪz/, or *fungi* /'fʌŋdʒaɪ, 'fʌŋgaɪ, 'fʌŋdʒi:, 'fʌŋgi:/
also: *cactus*, *nucleus*, *radius*, *syllabus*, *terminus*

(Df) Nouns from Latin ending in *-a* /ə/

5.94 The foreign plural is *-ae* /i:/ as in *alumna* ~ *alumnae*. Other nouns with *-ae* plural only include: *alga*, *larva*.

Nouns with only regular plurals (*-as*) include: *area*, *arena*, *dilemma*, *diploma*, *drama*, *era*, etc.

Nouns with both plurals include: *antenna*, *formula*, *nebula*, *vertebra*.

(Dg) Nouns from Latin ending in *-um* /əm/

5.95 The foreign plural is *-a* /ə/ (in careful pronunciation, alternatively /ɑ:/), as in *curriculum* ~ *curricula*. Other nouns with the *-a* plural only include: *addendum*, *bacterium*, *corrigendum*, *desideratum*, *erratum*, *ovum*.

Nouns with only the regular plural include: *album*, *chrysanthemum*, *museum*, *premium*.

Nouns which are usually regular: *forum*, *stadium*.

Nouns with both plurals: *aquarium*, *candelabrum*, *curriculum*, *maximum*, *medium*, *memorandum*, *millennium*, *minimum*, *moratorium*, *podium*, *referendum*, *spectrum*, *stratum*, *symposium*, *ultimatum*.

Note [a] *Media* is often used in the sense of 'news media' with reference to press, radio, and television, when it is sometimes treated as a singular with a regular plural *medias*:

The media is } wrong about this.
All the medias are }

Both of these uses however are widely condemned, especially the second.

[b] *Strata* is the common plural of *stratum*. With reference to society *strata* is also sometimes used as singular:

This is an important strata of education in society.

But again this usage is widely criticized.

[c] On *data*, cf 5.91.

[d] Besides singular *candelabrum* with the plural *candelabra*, there is also singular *candelabra* with the regular plural *candelabras*.

[e] *Agenda* and *insignia* (plurals of Latin *agendum* and *insignium*) are used in English as singulars with the regular plurals *agendas* and *insignias*.

(Dh) Nouns from Latin ending in -ex, -ix

- 5.96 The foreign plural is *-ices* /sɪz/ as in *index* ~ *indices*. However, *index* and *appendix* have both regular and foreign plurals. The regular form *indexes* is used for reference to parts of a book or other publication; the plural *indices* is largely used for 'indicators'. *Appendix* has either plural for reference to parts of a book; it is regular for parts of the body. Other nouns that have both regular and foreign plurals are: *apex*, *vortex*, *matrix*. Only foreign plural: *codex*.

(Di) Nouns from Greek ending in -is /ɪs/

- 5.97 The foreign plural is *-es* /ɪz/, as in singular *basis* /ˈbeɪsɪs/, plural *bases* /ˈbeɪsɪz/. Other nouns which take this plural are *eg*:

analysis, *axis*, *crisis*, *diagnosis*, *ellipsis*, *hypothesis*, *oasis*, *paralysis*,
parenthesis, *synopsis*, *synthesis*, *thesis*

Metropolis has the regular plural: *metropolises*.

- Note *Bases* can be either the plural of *base*, *eg*: *naval bases* (pronounced /ˈbeɪsɪz/), or the plural of *basis*, *eg*: *bases of an opinion* (pronounced /ˈbeɪsɪz/). Similarly, *axes* can be the plural of *axe* or *axis*, and *ellipses* the plural of *ellipse* or *ellipsis*.

(Dj) Nouns from Greek ending in -on

- 5.98 The foreign plural is *-a*, as in *criterion* ~ *criteria*, *phenomenon* ~ *phenomena*, both of which regularly take the *-a* plural. Nouns with only regular plurals: *electron*, *neutron*, *proton*; chiefly regular: *ganglion*; both plurals: *automaton*.

- Note Informally, *criteria* and *phenomena* are sometimes used as singulars, and *criteria*s as plural. This usage is however widely condemned, and the objection to both these singular forms is stronger than to singular *data* (cf 5.91), *media* (cf 5.95 Note [a]), and *strata* (cf 5.95 Note [b]).

(Dk) Nouns from French: *bureau*, *corps*, etc

- 5.99 A few nouns ending in *-eau* and *-eu*, *eg*: *bureau* and *adieu*, may retain the French *-x* as the spelling of the plural (*bureaux*, *adieux*), beside the commoner *-s* (*bureaus*, *adieux*). In English, the plurals are however almost always pronounced as regular, *ie* /z/, irrespective of spelling. Similarly: *tableau*, *plateau*.

Some French nouns ending in *-s* or *-x* are pronounced without the final sibilant in the singular, *eg*: (*army*) *corps* /kɔː/, and with a regular /z/ in the plural, with no spelling change (*corps* /kɔːz/): *chamois* (*leather*), *chassis*, (*faux*) *pas*, *patois*, *rendezvous*.

(Dl) Nouns from Italian ending in -o /əʊ/

- 5.100 The foreign plural is *-i* /ɪ/ as in *tempo* ~ *tempi*; only regular plural: *solo*, *soprano*; both regular and irregular plural: *virtuoso*, *libretto*, *tempo*.

- Note *Confetti* (from Italian *confetto*, which is not used in English) and other Italian plurals like *macaroni*, *ravioli*, *spaghetti*, etc are usually treated as noncount nouns, and take a singular verb in English. *Graffiti* is usually treated as an invariable plural, but one also hears the singular *graffito*.

(Dm) Nouns from Hebrew: *kibbutz* ~ *kibbutzim*

- 5.101 The foreign plural is *-im*, as in *kibbutz* ~ *kibbutzim* beside the regular *kibbutzes*. Usually regular: *cherub*, *seraph*.

Compounds

- 5.102 Compound nouns, *ie* nouns which consist of more than one base (cf App 1.57ff), form the plural in different ways. It is most common, particularly in informal usage, to consider the compound as a simple noun and pluralize the last element (even when it is not a noun, as in *sit-ins*).

(i) Plural in the last element (normal):

assistant director ~ assistant directors

babysitter ~ babysitters

breakdown ~ breakdowns

close-up ~ close-ups

ALSO: grown-up, take-over, sit-in, take-off (NOTE spelling in: stand-by ~ stand-bys)

gin-and-tonic ~ gin-and-tonics; SIMILARLY: forget-me-not ~ forget-me-nots, mouthful ~ mouthfuls (OR sometimes: mouthfuls); SIMILARLY: bucketful, spoonful

(ii) Plural in the first element occurs especially when the compound includes a postmodifier or final particle:

notary public ~ notaries public

grant-in-aid ~ grants-in-aid

commander-in-chief ~ commanders-in-chief

man-of-war ~ men-of-war

coat-of-mail ~ coats-of-mail

passer-by ~ passers-by

The following occur with plural either in the first or last element:

attorney general ~ attorneys general (ALSO: attorney generals)

court martial ~ courts martial (ALSO: court martials)

mother-in-law ~ mothers-in-law (ALSO: mother-in-laws (informal))

(iii) Appositional compounds (*a woman doctor* ['The doctor is a woman']) whose first element is, or includes, *man* or *woman* pluralize both the first and the last element:

gentleman farmer ~ gentlemen farmers

manservant ~ menservants (old-fashioned)

woman doctor ~ women doctors

But the plural is in the last element (type i) when the compound is not appositional: *woman-hater(s)* ['x hate(s) women']. Similarly: *man-eater* ~ *man-eaters*.

Forms of address

- 5.103 The plural of *Mr Smith*, to denote two people with that name, is *the two Mr Smiths*. *Messrs* /ˈmesəz/ <BrE> is chiefly used in the names of firms: *Messrs Smith and Brown Ltd*.

The plural of *Miss Smith* is *the Miss Smiths*, eg: *the two Miss Smiths*. *The Misses Smith* is rather formal and old-fashioned.

The plural of *Mrs* /mɪsɪz/ *Smith* is *the two Mrs Smith(s)*; and, similarly, *Ms* /mɪz/ *Smith* (cf 5.66 Note [a]): *the two Ms Smith(s)*.

Gender

- 5.104** By GENDER is meant a grammatical classification of nouns, pronouns, or other words in the noun phrase, according to certain meaning-related distinctions, especially a distinction related to the sex of the referent.

In English, unlike many other related languages, nouns, determiners, and adjectives have no inflectionally-marked gender distinctions. Some 3rd person pronouns and *wh*-pronouns do, however, express natural gender distinctions:

<i>it, which, etc</i>	[NONPERSONAL] contrasts with the following:
<i>who, whom, etc</i>	[PERSONAL]
<i>he, himself, etc</i>	[MASCULINE, chiefly PERSONAL]
<i>she, herself, etc</i>	[FEMININE, chiefly PERSONAL]

Gender in English nouns may be described as 'notional' or 'covert' in contrast to the 'grammatical' or 'overt' gender of nouns in languages such as French, German, and Russian; that is, nouns are classified not inflectionally, but semantically, according to their coreferential relations with personal, reflexive, and *wh*-pronouns. We use the terms MALE and FEMALE in reference to the 'covert' gender of nouns, as distinct from the 'overt' gender of pronouns.

The patterns of pronoun coreference for singular nouns give us a set of nine gender classes as illustrated in Fig 5.104:

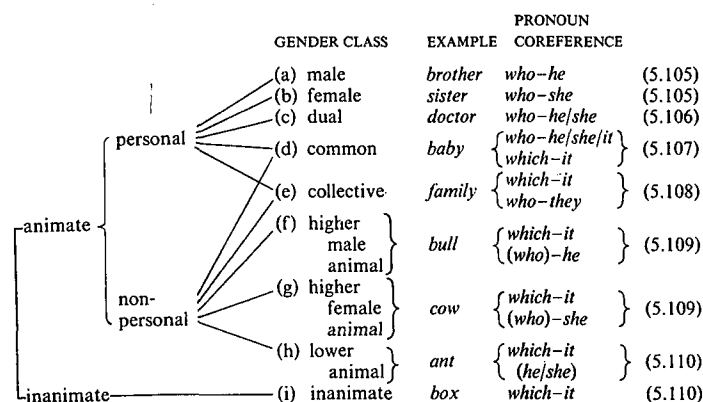

Fig 5.104 Gender classes

(a/b) Personal male/female nouns

- 5.105** Personal male nouns have pronoun coreference with *who-he* and female nouns with *who-she*. These nouns are of two types. Type (i) is morphologically unmarked between male and female, whereas in Type (ii) the two gender forms have a derivational relationship. The derivational suffixes are not productive, however. We cannot, except jocularly, for example, form *clerk* ~ **clerkess* on the *host* ~ *hostess* pattern (cf App I.33).

(i) Morphologically unmarked for gender, eg:

<i>bachelor</i> ~ <i>spinster</i>	<i>boy</i> ~ <i>girl</i>	<i>brother</i> ~ <i>sister</i>
<i>father</i> ~ <i>mother</i>	<i>king</i> ~ <i>queen</i>	<i>man</i> ~ <i>woman</i>
<i>Mr</i> ~ <i>Mrs, Miss, Ms</i>	<i>monk</i> ~ <i>nun</i>	<i>nephew</i> ~ <i>niece</i>
<i>uncle</i> ~ <i>aunt</i>		

(ii) Morphologically marked for gender, eg:

<i>host</i> ~ <i>hostess</i>	<i>waiter</i> ~ <i>waitress</i>
<i>prince</i> ~ <i>princess</i>	<i>hero</i> ~ <i>heroine</i>
<i>steward</i> ~ <i>stewardess</i>	<i>usher</i> ~ <i>usherette</i>
<i>god</i> ~ <i>goddess</i>	<i>emperor</i> ~ <i>empress</i>

In the following two pairs, it is the male noun that is marked:

<i>bridegroom</i> ~ <i>bride</i>	<i>widower</i> ~ <i>widow</i>
----------------------------------	-------------------------------

Some male/female pairs denoting kinship have dual gender terms, for example *parent* for *father* ~ *mother* and *sibling* (esp technical) for *brother* ~ *sister*. Some optional female forms (*poetess*, *authoress*, etc) are no longer in normal use, being replaced by the dual gender forms (*poet*, *author*, etc).

In order to avoid sexual bias in language, attempts have been made (esp in AmE) to introduce sex-neutral forms, such as *s/he* for both *she* and *he*, *wo/man* for *woman* and *man*, *flight attendant* for *airline hostess*. The prospect of wider acceptance of *s/he* and *wo/man* is reduced by the fact that these are written forms only. Other such examples are:

<i>supervisor</i> for <i>foreman</i>	<i>fisher</i> for <i>fisherman</i>
<i>firefighter</i> for <i>fireman</i>	<i>mail carrier</i> for <i>mailman</i>
<i>chair(person)</i> for <i>chairman</i>	<i>usher</i> for <i>usherette</i>
<i>spokesperson</i> for <i>spokesman</i>	<i>homemaker</i> for <i>housewife</i>
<i>Member of Congress</i> for <i>Congressman</i>	

(c) Personal dual gender

- 5.106** This class of nouns, which has *who-he* or *she* pronoun coreference, includes, for example, the following:

<i>artist</i>	<i>cook</i>	<i>doctor</i>	<i>enemy</i>
<i>foreigner</i>	<i>friend</i>	<i>guest</i>	<i>inhabitant</i>
<i>librarian</i>	<i>novelist</i>	<i>parent</i>	<i>person</i>
<i>professor</i>	<i>servant</i>	<i>singer</i>	<i>speaker</i>
<i>student</i>	<i>teacher</i>	<i>typist</i>	<i>writer</i>

If it is felt desirable to give information on the sex of the person, a gender marker may be added, such as *male student*/*female student*. The dual class is

on the increase, but the expectation that a given activity is largely male or female dictates the frequent use of gender markers: thus *a nurse*, but *a male nurse*; *an engineer*, but *a woman engineer*. No rational rules can be given for whether a noun should have dual gender distinction or not. It seems, for example, quite arbitrary that *guest* and *servant* should be dual in contrast to *host* ~ *hostess* and *waiter* ~ *waitress*.

(d) Common gender

- 5.107 Common gender nouns are intermediate between personal and nonpersonal. The wide selection of pronouns (*who/which-he/she/it*) should not be understood to mean that all these are possible for all nouns in all contexts. A mother is not likely to refer to her baby or child as *it*, but such nonpersonal reference may well be preferred by somebody who is emotionally unrelated to the child, or wishes to generalize across sex distinctions in scientific contexts:

A child learns to speak the language of *its* environment.

Other nouns that belong here (chiefly when the animals are treated as pets or otherwise 'personified') include *blackbird*, *cat*, *monkey*, *rabbit*.

(e) Collective nouns

- 5.108 These differ from other nouns in taking as pronoun coreferents either singular *it* and relative *which* or plural *they* and relative *who* without change of number in the noun (*the army: it/which-they/who*; cf plural *the armies: they-which*). Consequently, the verb may be in the plural after a singular noun, though far less commonly in AmE than BrE (cf 10.36):

The committee $\left\{ \begin{array}{l} \text{has met and it has} \\ \text{have met and they have} \end{array} \right\}$ rejected the proposal.

The difference reflects a difference in point of view: the singular stresses the nonpersonal collectivity of the group, and the plural stresses the personal individuality within the group. Here are examples of collective nouns:

(i) army	association	audience
board	cast	clan
class	club	college
commission	community	company
corporation	council	couple
crew	crowd	department
enemy	faculty <AmE>	family
federation	firm	flock
gang	generation	government
group	herd	institute
jury	majority	minority
opposition	party	population
staff	team	university

- (ii) The following usually occur in the singular only with the definite article:

the aristocracy	the bourgeoisie	the church
the clergy	the elite	the gentry

the intelligentsia	the laity	the press
the public	the rank and file	the youth (of today)

- (iii) Collective proper names, eg:

the Commons (UK)	Parliament	the Vatican
(the) Congress (US)	the United Nations	the United States

Note [a] Just as *association*, *company*, *corporation*, *federation*, *firm*, *team*, etc are included among the collective nouns, names of commercial firms are treated in the same way:

ICI $\left\{ \begin{array}{l} \text{has} \\ \text{have <BrE>} \end{array} \right\}$ increased $\left\{ \begin{array}{l} \text{its} \\ \text{their} \end{array} \right\}$ sales abroad.

[b] *Church* and *youth* in (ii) also occur of course as regular count nouns, the latter denoting a young male:

The police are looking for five *youths*. ['young men']

(f/g) Higher animals

- 5.109 Male/female gender distinctions in animal nouns are maintained by people with a special concern (for example with pets), eg: *cock* and *rooster* <AmE> for the male (with *which-it* or *who-he* coreference) and *hen* for the female (with *which-it* or *who-she* coreference). Other examples:

buck ~ doe	bull ~ cow	dog ~ bitch	gander ~ goose
lion ~ lioness	ram ~ ewe	stallion ~ mare	tiger ~ tigress

Note In general, in nonexpert contexts there is no need to make a gender distinction, such as *dog* ~ *bitch* and *stallion* ~ *mare*. We can then use one term to cover both sexes, as in the case of *dog* and *lion*, or use a different term, eg: *horse* to cover both *stallion* and *mare*.

(h/i) Lower animals and inanimate nouns

- 5.110 Both lower animals (eg: *beetle*, *butterfly*, *snake*, *toad*, *tadpole*) and inanimate nouns (eg: *box*, *car*, *idea*) have *which* and *it* as pronouns. However, lower animals may also be viewed as higher animals. Thus we may speak of 'goldfish who swim around', 'bees who are busy', etc.

Sex differences can be indicated by a range of gender markers for any animate noun where they are felt to be relevant, eg: *male* ~ *female frog*. Other examples:

buck-rabbit ~ doe-rabbit	cock-pheasant ~ hen-pheasant
dog-fox ~ bitch-fox	he-goat ~ she-goat
roe-buck ~ roe-doe	

We make no claim for the categories 'higher/lower animals' to parallel the biological classification. Some animals require finer gender distinctions in the language than others. This can be attributed to a number of factors. The layman normally has no knowledge about the sex of animals like *ant*, *herring*, *snake*, *spider*; or, even if he does, it may not be a fact that he wants or needs to indicate. *He* and *she* are only likely to be used for animals with which man, 'the speaking animal', has the closest connections (in particular the domesticated animals).

Names of countries

- 5.111 Names of countries have different gender depending on their use.

- (i) As geographical units, they are treated as class (i), *ie* inanimate:

Here is a map of France. *It's* one of the largest countries of Europe.

- (ii) As political/economic units, the names of countries are often feminine, *ie* class (b) or (g):

France *has* been able to increase *her* exports by 10 per cent over the last six months.

England *is* proud of *her* poets.

- (iii) In sports, the teams representing their countries can be referred to by the name of the country used as a personal collective noun, *ie* class (e) <esp BrE>:

France $\left\{ \begin{smallmatrix} \textit{has} \\ \textit{have} \end{smallmatrix} \right\} \langle \text{BrE} \rangle$ improved $\left\{ \begin{smallmatrix} \textit{its} \\ \textit{their} \end{smallmatrix} \right\} \langle \text{esp BrE} \rangle$ chances of winning the cup.

In AmE there may be number variation in the pronoun (but not in the verb, which is singular) in this construction.

Note Inanimate entities, such as ships, towards which we have an intense and close personal relationship, may be referred to by personal pronouns, *eg*:

That's a lovely ship. What is *she/it* called?

In nonstandard and Australian English, there is extension of *she* references to include those of antipathy as well as affection, *eg*:

She's an absolute bastard, this truck.

Case

Common case and genitive case

- 5.112 We shall distinguish between two cases of nouns: the unmarked COMMON CASE (*eg*: *boy* in the singular, *boys* in the plural) and the marked GENITIVE CASE (*eg*: *boy's* in the singular, *boys'* in the plural). Case in pronouns will be discussed in 6.2ff; on the genitive in relation to the *of*-construction, *cf* 5.115.

Distinctions of case mark the structural and semantic function of noun phrases within sentences. It is arguable, as we shall see, that even the common/genitive distinction in present-day English is not really a case distinction, although it is a relic of a former case system comparable to that of Latin or of modern Russian (*cf* 5.123). We adhere to established terminology in this respect, but since the common case is simply the form used when the genitive is not used, our attention in the following sections will be devoted to the genitive.

The 'central', but far from the only use of the genitive, is to express possession: to this extent the term 'possessive' is fittingly applied to genitive pronouns like *his*. We may compare:

The children's toys are new. ['the toys belonging to the children']

Their toys are new. ['the toys belonging to them']

But it should be borne in mind that the label 'possessive' does not adequately apply to all uses (*cf* 5.116).

The forms of the genitive inflection

- 5.113 The genitive of regular nouns is realized in speech only in the singular, where it takes one of the forms /ɪz/, /z/, or /s/, following the rules for the -s inflection of nouns (*cf* 5.80) and verbs (*cf* 3.5). In writing, the inflection of regular nouns is realized in the singular by apostrophe + *s* (*boy's*), and in the regular plural by the apostrophe following the plural -s (*boys'*).

As a result, the spoken form /spaɪz/ may realize three forms of the noun *spy* as follows:

The *spies* were arrested. [plural, common case]
The *spy's* companion was a woman. [singular, genitive case]
The *spies'* companions were women. [plural, genitive case]

Since the genitive adds nothing to a regular plural noun in speech, and nothing except the final apostrophe in writing, this plural genitive may be called the ZERO GENITIVE.

By contrast, some nouns with irregular plural like *child* preserve a number distinction independently of the genitive singular and genitive plural distinctions:

child ~ *child's*, *children* ~ *children's*

With such irregular plurals, as *Fig* 5.113 shows, the same genitive ending (spelled 's) occurs with both singular and plural nouns.

	REGULAR -S PLURAL		IRREGULAR PLURAL	
	singular	plural	singular	plural
SPOKEN				
common	/bɔɪ/		/tʃaɪld/	/tʃɪldrən/
genitive		/bɔɪz/	/tʃaɪldz/	/tʃɪldrənz/
WRITTEN	singular	plural	singular	plural
common	<i>boy</i>	<i>boys</i>	<i>child</i>	<i>children</i>
genitive	<i>boy's</i>	<i>boys'</i>	<i>child's</i>	<i>children's</i>

Fig 5.113 The genitive inflection with regular and irregular plurals

Note [a] In addition to representing different case forms of the noun *spy*, the pronunciation /spaɪz/ could of course also be the -s form of the verb, as in [1], or the noun with the contracted form of *is* [2], or *has* [3] (*cf* 3.32f):

He *spies* on behalf of an industrial firm. [1]

The *spy's* here. [2]

The *spy's* been cycling along the coast. [3]

[b] In postmodified noun phrases, there is a difference between the plural and the genitive endings, because the genitive ending is added to the end of the phrase, not to the end of the head noun (*cf* 'group genitives', 5.123):

The palace was the *King of Denmark's*.

They praised the *Kings of Denmark*.

The 'zero genitive'

- 5.114 In addition to its normal use with regular plurals such as *boys'*, the 'zero genitive' is used to avoid repetitive or awkward combinations of sounds in the following cases (cf Fig 5.114):

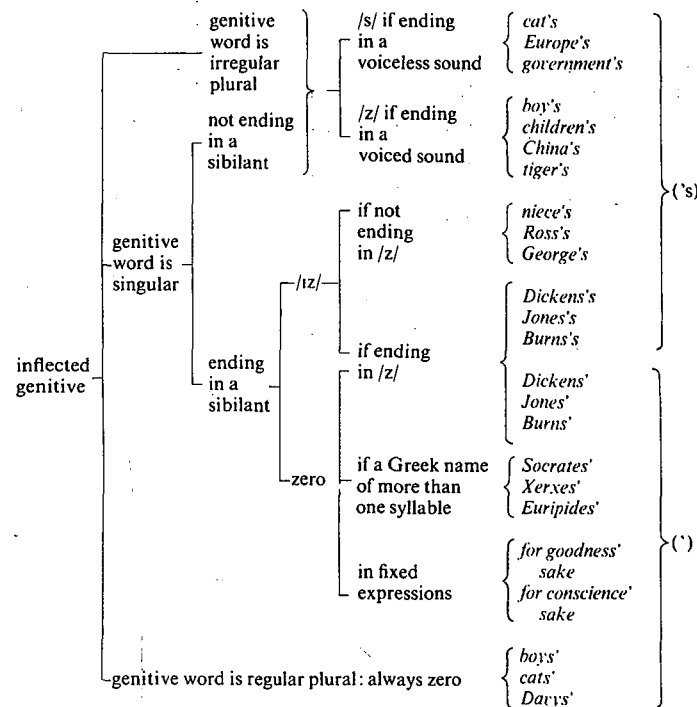

Fig 5.114 The forms of the inflected genitive

- (i) with Greek names of more than one syllable which end in -s, as in:

Euripides' /di:z/ plays, *Xerxes'* army, *Socrates'* wife

- (ii) with many other names ending in /z/ where, in speech, zero is a variant of the regular /iz/ genitive. There is vacillation both in the pronunciation and in the spelling of these names, but most commonly the pronunciation is /iz/, and the spelling is an apostrophe only. (In the following examples, the minority forms are given in parentheses.)

WRITTEN FORMS	SPOKEN FORMS
<i>Burns'</i> (<i>Burns's</i>) poem	/ˈbɜːnzɪz (bɜːnz)/
<i>Dickens'</i> (<i>Dickens's</i>) novels	/ˈdɪkɪnzɪz (ˈdɪkɪnz)/
<i>Jones'</i> (<i>Jones's</i>) car	/ˈdʒəʊnzɪz (dʒəʊnz)/

Names ending in other sibilants than /z/ have the regular /iz/ genitive: *Ross's*

/sɪz/ theories. However, *Jesus* and *Moses* normally have the zero form of the spoken genitive and are written *Jesus'* and *Moses'* (as well as *Jesus's* and *Moses's*).

- (iii) with fixed expressions of the form *for ... sake*, as in *for goodness' sake*, *for conscience' sake*, where the noun ends in /s/ (cf 5.120).

The genitive and the *of*-construction

- 5.115 In many instances there is a similarity of function and meaning between a noun in the genitive case and the same noun as head of a prepositional phrase with *of* (sometimes called the '*of*-genitive'). The genitive inflection of [1], where *ship's* precedes and determines the head noun *name*, corresponds to the *OF-CONSTRUCTION* of the prepositional phrase in [1a], where *of the ship* postmodifies the head *name*:

What is { *the ship's name?* [1]
 the name of the ship? [1a]

In many cases, like [1] and [1a], the two forms are equivalent in meaning and are both perfectly acceptable. In other cases, either the genitive or the *of*-construction is the only appropriate choice:

John's school BUT NOT: ?*the school of John*
the front of the house BUT NOT: **the house's front*

For further discussion of the *of*-construction, and its relation to the genitive, cf 5.116ff and, in particular, 17.38ff, where the *of*-construction is also compared with other types of postmodification. Our purpose in this chapter is to examine the genitive as a construction in its own right, and to indicate the semantic as well as the syntactic restrictions on its use.

The use of the genitive is determined by a combination of structural and semantic conditions. We will look in turn at

- the meanings expressed by the relation between the genitive noun and its head noun (cf 5.116)
- the type of noun taking the genitive (cf 5.117–119)
- the type of noun acting as head (cf 5.120)

Genitive meanings

- 5.116 The meaning expressed by the genitive can best be shown by sentential or phrasal analogues such as we present below. For comparison, a corresponding use of the *of*-construction is given where this is acceptable.

- | | |
|------------------------------------|------------------------------------|
| (a) POSSESSIVE GENITIVE | |
| <i>my wife's</i> father | My wife has a father. |
| <i>Mrs Johnson's</i> passport | Mrs Johnson has a passport. |
| <i>the earth's</i> gravity | The earth has (a certain) gravity. |
| <i>cf the gravity of the earth</i> | |
| (b) SUBJECTIVE GENITIVE | |
| <i>the boy's</i> application | The boy applied for ... |
| <i>her parents'</i> consent | Her parents consented. |
| <i>cf the decline of trade</i> | Trade declined. |

The genitive in relation to noun classes

5.118 The noun classes (a-c) frequently take the genitive (cf 17.38ff):

(a) PERSONAL NAMES (cf 5.66):

Segovia's pupil, George Washington's statue

(b) PERSONAL NOUNS (cf 5.105):

the boy's new bicycle, my sister-in-law's problems

(c) ANIMAL NOUNS, in particular those denoting 'higher animals' (cf 5.109):

the horse's tail, the dog's collar

(d) COLLECTIVE NOUNS. The genitive is also used with collective nouns (cf 5.108) which emphasize the aspect of 'organized individuals', in particular those denoting authoritative and other organizational bodies, eg:

the government's economic plans the nation's resources
the committee's decision the Company's directors

The genitive is further used with certain kinds of inanimate nouns (e-h):

(e) GEOGRAPHICAL NAMES (cf 5.68), eg:

continents: *Europe's future, Australasia's natural resources*
countries: *China's development, the United States' attitude*
states: *Maryland's Democratic Senator, Rhode Island's colonial period*
cities and towns: *Hollywood's studios, London's water supply*
universities: *Harvard's Department of Linguistics*

(f) 'LOCATIVE NOUNS' denoting regions, institutions, heavenly bodies, etc. They can be very similar to geographical names, and are often written with initial capital letter, eg:

the earth's interior the Church's mission
the world's economy the hotel's entrance
the nation's waterways a country's population
the Club's pianist the city's atmosphere
the Gallery's rotunda the school's history

(g) TEMPORAL NOUNS, eg:

the decade's events this year's sales
a day's work today's paper
a moment's thought the hockey season's first event

(h) OTHER NOUNS 'OF SPECIAL RELEVANCE TO HUMAN ACTIVITY', eg:

the brain's total weight the game's history
the mind's development science's influence
the body's needs love's spirit
my life's aim the play's philosophy
in freedom's name the book's true importance
the treaty's ratification the novel's structure
duty's call a word's function
the poll's results television's future

Note [a] It seems that semantic relations other than possession (cf 5.117) place stronger restrictions on the 'personal' quality of the genitive noun than does possession itself. For example:

Table 5.118 Possessive and objective genitive with personal and nonpersonal nouns

	POSSESSIVE GENITIVE	OBJECTIVE GENITIVE
PERSONAL	<i>the man's collar</i>	<i>the man's release from prison</i>
NONPERSONAL	<i>the dog's collar</i>	? <i>the dog's release from quarantine</i>

In combination with the objective genitive, a nonpersonal noun results in a less acceptable noun phrase than does a personal noun.

[b] With temporal nouns in the plural, the apostrophe is sometimes omitted (cf 17.108):

several $\left\{ \begin{smallmatrix} \text{weeks} \\ \text{weeks} \end{smallmatrix} \right\}$ vacation

The genitive with superlatives and ordinals

5.119 The genitive is particularly common with locative nouns of Class (f) above when it is followed by a superlative adjective or a 'general ordinal' (cf 5.22) such as *only*, *first*, and *last*. The corresponding prepositional phrase in these cases is introduced by *in* rather than by *of*:

the world's best universities ~ the best universities in the world
this country's only university ~ the only university in this country
Africa's first arts festival ~ the first arts festival in Africa

More generally, the genitive combines with superlatives, ordinals, and 'general ordinals' to express a meaning which is independent of all the meanings listed in 5.116 above, and which can best be paraphrased by a relative clause:

Paganini's last performance
~ the last performance *that Paganini gave*
the Cabinet's greatest mistake
~ the greatest mistake *that the Cabinet made*

Noun heads with the genitive

5.120 So far, genitive constructions have been identified by reference to certain classes of the genitive noun (personal, collective, temporal, etc). There are, however, some constructions with the genitive which can best be described in terms of specific lexical noun heads.

Expressions with *edge*, *end*, *surface*, *for . . . sake* permit the alternative *of*-construction (cf 9.12 Note [c]):

She stood at $\left\{ \begin{smallmatrix} \text{the water's edge.} \\ \text{the edge of the water.} \end{smallmatrix} \right.$ He did it $\left\{ \begin{smallmatrix} \text{for charity's sake.} \\ \text{for the sake of charity.} \end{smallmatrix} \right.$

Similarly: *at the river's edge, at his journey's end, for art's sake, the water's surface, for heaven's sake.*

The following expression does not permit the *of*-construction:

People don't get { *their money's worth.*
**the worth of their money.*

Similarly: *at one's wits' end, at arm's length, within arm's reach.*

Note the stress typical of compounds (cf 17.104), which indicates that the following are compounds: *our 'money's worth, a 'stone's throw.* Compare the relatively free syntactic constructions of, eg: *within/beyond/out of (her) reach.*

The grammatical status of the genitive

Genitive as determinative

- 5.121 Most commonly the genitive functions as a determinative (cf 5.10ff): it fills a slot in the noun phrase equivalent to a central determiner such as *the* [1]. This is so whether the genitive is a possessive pronoun (such as *her* [1a]), a single noun (such as *Jenny's* [1b]), or a noun accompanied by its own determiners and/or modifiers (such as *my daughter's* [1c]), as shown in Fig 5.121a:

DETERMINATIVE	HEAD	
<i>the</i> (new)	desk	[1]
<i>her</i> (new)	desk	[1a]
<i>Jenny's</i> (new)	desk	[1b]
<i>my daughter's</i> (new)	desk	[1c]

Fig 5.121a The genitive as determinative

It is obvious that in [1c], the genitive noun *daughter's* has its own determinative, viz the possessive pronoun *my*, which does not apply to *desk*, but to *daughter*. In other words, the genitive in this instance is not a single word, but a noun phrase in its own right. Such an analysis is even more compelling for phrases such as *many people's ambition*; *many*, requiring plural concord, must determine the plural noun *people*, rather than the singular noun *ambition*:

Many people's *ambition* is to own a house.

We therefore see the genitive construction as a noun phrase embedded as a definite determinative within another noun phrase (cf 2.8, 17.38 and Fig 5.121b):

SUPERORDINATE NOUN PHRASE		
GENITIVE NOUN PHRASE		
<i>a horse's</i>	hind leg	[2]
<i>some people's</i>	opinions	[3]
<i>the older boys'</i>	books	[4]
<i>every teacher's</i>	guide to child psychology	[5]
<i>the Italian government's</i>	recent decision	[6]

Fig 5.121b The structure of the superordinate noun phrase with a genitive noun phrase as determinative

That the genitive can be expanded into a phrase in this way is not surprising when we recall its equivalence to a prepositional phrase, in which *of* is followed by a noun phrase complement:

the hind leg *of* [a horse] [2a]
the opinions *of* [some people] [3a]
the recent decision *of* [the Italian government] [6a]

One implication of the determinative function of the genitive is that the genitive phrase is normally in initial position in the superordinate noun phrase, so that any words occurring in front of the genitive noun in the phrase belong to that noun rather than to the noun which is head of the superordinate noun phrase, as in [2-6].

One exception to this, however, arises when the genitive construction follows a predeterminer such as *all, both, or half* (cf 5.16). Since the genitive fills a position equivalent to that of a central determiner, these words preceding the genitive noun may apply either to that noun or to the superordinate head noun. In [7], the predeterminer *both* applies to *parents*, but in [8] *both* can only apply to *girls'*:

both [the girl's] parents [= both parents of the girl] [7]
[both the girls'] mother [= the mother of both the girls] [8]

Note The construction with genitive or possessive pronoun with determinative function will have definite reference, eg:

- (i) *Susan's son* (ii) *her son*

If we want the indefinite interpretation, we have to resort to the *of*-construction (cf 5.115):

- (i) { a son *of Susan*
a son *of Susan's* (cf the 'post-genitive', 5.126) (ii) a son *of hers*

Genitive as modifier

- 5.122 There are occasional examples where the genitive acts as a modifier rather than as a determinative. These are of the kind listed as 'descriptive genitive' in Class (e) of 5.116. They have a classifying role similar to that of noun modifiers and some adjective modifiers (cf 17.110):

There are several *women's universities* in Tokyo.

['several universities for women']

He wants to become a *ship's doctor* when he grows up.

['a doctor working on a ship']

There were ten { *farmer's*
farmers' } wives at the meeting.

Notice, in connection with the last example, that the expression *farmer's wives* does not imply polygamy: if this is a descriptive genitive, it is simply the plural of *farmer's wife*. The change to the plural genitive *farmers' wives* may, however, be preferred.

Another distinguishing mark of the descriptive genitive is the fact that any modifiers and/or determiners preceding it generally belong to the head noun, rather than to the genitive noun. The speaker who refers to a *quaint old shepherd's cottage* is passing a comment on the age and quaintness of the

cottage, not of the shepherd. Nevertheless, there are cases where the modifying genitive itself contains a modifier:

How much do *those* [*farm workers*'] cottages cost?

It was meant to be a PhD thesis, but to me it read like a [*first-year undergraduate's*] essay.

This china used to be regarded as [*poor man's*] Worcester porcelain. ['the sort of porcelain which resembled Worcester, but which a poor man could afford']

Note [a] As the examples above suggest, the descriptive genitive tends to have an idiomatic connection with the head noun. The fullest stage of lexical assimilation to the head is observed in expressions where the genitive and the head form a compound (cf App 1.57ff), as in *bull's-eye* and *cat's paw* (where the meaning is metaphorical). Between these and more freely constructed expressions such as *women's college* should be placed combinations where the two words are written separately, but where the stress is placed in the first (genitive) element, as in compounds:

'girl's school 'bird's nest 'cow's milk 'calves' liver

Thus *bird's nest* resembles compounds both in meaning and in stress pattern (cf: *foxhole*, *rabbit warren*). In many cases the first noun ends with an *s*, which can be written in three ways:

a girl's school [genitive singular]

a girls' school [genitive plural]

a girls school [common case plural]

The second variant is favoured in *an all girls' school* ['a school entirely for girls'].

[b] Modifying genitives may occasionally contain their own determiners:

my this year's examination questions ['my examination questions for this year']

By this means, the strange cooccurrence of two central determiners *my this* may take place, as in the above example.

The group genitive

5.123 The modifying genitive, however, is rare in comparison with the genitive in determinative function; and since we observed in 5.121 that the genitive construction in this latter function can be a noun phrase, not merely a single noun, it is necessary to revise the idea (with which we introduced the genitive in 5.112) that the genitive is a noun inflection. The *-s* ending is not a case ending in the sense which applies to languages such as Latin, Russian, and German. It can be more appropriately described as a 'postposed enclitic': *ie*, its function is parallel to that of a preposition, except that it is placed after the noun phrase. This view is inescapable if we take into account the so-called GROUP GENITIVE (or 'embedded genitive'), in which the genitive ending is affixed to a postmodifier:

the teacher of music's room ['the room of the teacher of music']

Obviously the 'possessor' in this example is the teacher, not the music; but the *'s* cannot be added to the head, as one would expect if *'s* could only be a noun inflection. Instead, it is regularly added to a prepositional postmodification which is part of a name or a compound noun phrase:

[[*the University of Minnesota's*]] President

[[*the Museum of Modern Art's*]] Director

[[*my son-in-law's*]] prospects

Since the group genitive fits most naturally into patterns of postmodification of the noun phrase, we defer further treatment of it until 17.119.

The independent genitive

5.124 The head of the superordinate noun phrase in a genitive construction may be omitted if the context makes its identity clear. The result is the so-called INDEPENDENT GENITIVE:

My car is faster than *John's*. [= John's car] [1]

Her memory is like *an elephant's*. [= an elephant's memory] [2]

This year's mixed doubles final was much better than *last year's*.
[= last year's mixed doubles final] [3]

If you can't afford a sleeping bag, why not borrow *somebody else's*? [= somebody else's sleeping bag] [4]

Mary's was the prettiest dress. [= Mary's dress] [5]

Don't touch those cards – they're *my partner's*. [= my partner's cards] [6]

As the examples show, this genitive is frequently an elliptical variant of a noun phrase in which the genitive has its usual determinative function. But note that a possessive pronoun used in this genitive construction requires the independent form (cf 6.29):

Hers was the prettiest dress. [5a]

Strictly, the pronoun illustrates quasi-ellipsis rather than ellipsis (for this distinction cf 12.40).

Note With the *of*-construction in comparable environments, a demonstrative pronoun *that/those* is normally required (cf 12.19):

The population of New York is greater than { *that of Chicago*.
Chicago's.

The 'local genitive'

5.125 The genitive is less clearly ellipted in expressions relating to premises or establishments (sometimes called the 'LOCAL GENITIVE'):

We'll meet *at Bill's*.

Here *at Bill's* normally means 'where Bill lives', but the hearer might not know whether the appropriate head would be *house*, *apartment*, *place*, etc. It is for this reason that the term 'ellipsis' is strictly not applicable (cf 12.32ff). The reference of a genitive proper noun could also be to a restaurant, a bar, etc, as in [1]:

Let's have dinner *at Tiffany's*. [1]

By contrast, where the genitive noun is a common noun, it would only refer to the dentist's professional establishment [2], and the same applies to proper nouns referring to commercial firms [3]:

I'm going to *the dentist's*. [2]

Wendy has just been shopping in *Harrod's/Foyle's/Macy's*. [3]

This usage is normal also in relation to 'one-person' businesses, as in [4]:

I buy my meat *at (Mr) Johnson's*. [4]

The 'local genitive' is used in the following three cases:

- (i) For normal residences:

She is staying at $\begin{cases} \text{my aunt's.} \\ \text{the Johnsons'. [BUT: with the Johnsons]} \end{cases}$

- (ii) For institutions such as public buildings (where the genitive is usually a saint's name):

St Paul's (Cathedral), *St James's* (Palace), *Queen's* (College)

- (iii) For places where business is conducted:

the barber's, the hairdresser's, the butcher's, the grocer's, W. H. Smith's, the chemist's <BrE>, *the druggist's* <AmE>; usually *the drugstore*

(On the 'sporadic' use of *the* here, cf 5.33.) The 's is often dropped:

at/to *the chemist* <BrE>, *the druggist* <AmE>, *the hairdresser, the greengrocer*

With large businesses, their complexity and in some sense plurality causes reinterpretation of the -s ending as a plural rather than genitive inflection (*Barclays, Harrods, Selfridges, Woolworths*). The genitive meaning – if it survives – is expressed by moving the apostrophe: *at Macys'*. This uncertainty over the status of the -s ending is matched by a vacillation in concord, reflecting the conflict between plurality and the idea of a business as a collective unity:

Harrods is/are very good for clothes.

In some cases, where the -s form cooccurs with the indefinite article, a genitive interpretation is unavoidable:

They have taken the rug to $\begin{cases} \text{a cleaner's.} \\ \text{a cleaners'.} \\ \text{*a cleaners.} \end{cases}$

Note In relation to commercial firms, all three forms (*Harrod's, Harrods, Harrod*) may be found and constructed as either singular or plural (plural is esp BrE, cf 10.36). Thus the following variants are used in the same document:

Liberty's are the wholesalers for this country.

Liberty's is probably best known for its beautiful printed silk.

This silk, for which *Liberty are* the wholesalers in this country, ...

It can be noted, however, that the *Harrod's* form is more likely than the *Harrods* form to be followed by a singular verb. The *Harrod* form, which has become fashionable relatively recently and still strikes many people as odd or pretentious, tends to be used only for very large enterprises. With titles of firms involving multiple names, however, the forms without -s are more current, especially in AmE, eg: *Sears Roebuck*.

The 'post-genitive'

5.126 An *of*-construction can be combined with a genitive to produce a construction known as the POST-GENITIVE (or 'double genitive'). In this construction, the independent genitive acts as prepositional complement following *of*:

some friends *of Jim's* ['some of Jim's friends']

that irritating habit *of her father's*
an invention *of Gutenberg's*
several pupils *of his*

But the independent genitive is not in this case elliptical. Rather, the post-genitive contrasts in terms of indefiniteness or unfamiliarity with the normal determinative genitive. Whereas [1] and [2] presuppose definiteness, the presupposition in [1a] and [2a] is one of indefiniteness:

<i>Jim's friend</i>	[1]	<i>a friend of Jim's</i>	[1a]
<i>Joseph Haydn's pupil</i>	[2]	<i>a pupil of Joseph Haydn's</i>	[2a]

Like the group genitive, the post-genitive belongs more closely to the subject matter of Chapter 17 than to that of this chapter. We accordingly postpone further discussion until 17.46.

Pronouns

Introduction

- 6.1 Pronouns share several characteristics, most of which are absent from nouns. Their name implies that they 'replace' nouns, but we have already seen (2.44) that this is to a great extent a misnomer. It is best to see pronouns as comprising a varied class of closed-class words with nominal function. By 'nominal' here we mean 'noun-like' or, more frequently, 'like a noun phrase'. Semantically, a pronoun may be a 'pro-form' in any of the three senses illustrated in the following example:

Margot longed for a bicycle, and at last (C) *somebody* gave (B) *her*
(A) *a brand new one*.

- (A) It may substitute for some word or phrase (as *one* may substitute for a noun, and therefore be a 'pronoun' in a quite literal sense).
(B) It may signal, as personal pronouns like *her* do, that reference is being made to something which is given or known within the linguistic or situational context (cf 19.33f).
(C) It may stand for a very general concept, so that its reference includes the reference of untold more specific noun phrases: *somebody*, for example, indicates a broad class of people including *a girl, a man, a secretary*, etc.

All three pronouns in italics in the example have this in common: their meaning in itself is general and undetermined; their interpretation therefore depends to an unusual extent on what information is supplied by context.

Syntactically, most pronouns function like noun phrases rather than nouns (cf 5.1). They combine in only a limited way with determiners and modifiers. We can say, indeed, that most pronouns, being intrinsically either definite or indefinite, incorporate their own determiner (cf 5.10ff). Contrast:

<i>the men</i>	<i>a tall man</i>
* <i>the they</i>	* <i>a tall he</i>

In addition, some pronouns have morphological characteristics that nouns do not have:

- (a) CASE: There is a contrast between subjective and objective cases: *I/me, she/her, who/whom*, etc (cf 6.2ff).
(b) PERSON: There is a contrast between 1st, 2nd, and 3rd persons: *I/you/she*, etc (cf 6.6).
(c) GENDER: There are overt grammatical contrasts between (i) personal and nonpersonal gender; and between (ii) masculine and feminine gender: *he/she/it*, etc (cf 6.8ff).
(d) NUMBER: There are morphologically unrelated number forms, as in *I/we, he/they*, as opposed to the typical regular formation of noun plurals: *girl/girls*, etc (cf 6.11f).

These special distinctions associated with pronouns are found most notably in the class of PERSONAL PRONOUNS, which may be regarded, by reason of their frequency and their grammatical characteristics, as the most important

and central class of pronouns. Accordingly, it is to personal pronouns above all that we turn in exemplifying these characteristics. In the following sections we examine the categories of case, person, gender, and number in more detail, before proceeding to a consideration of the various classes of pronouns.

Case

Case forms

- 6.2 Nouns and most pronouns in English have only two case forms: COMMON case (*children, someone*) and GENITIVE case (*children's, someone's*). However, the five personal pronouns *I, we, he, she, they* and the *wh*-pronoun *who* have a further distinction between SUBJECTIVE and OBJECTIVE cases.

Table 6.2 Personal pronouns with subjective, objective, and genitive case forms

SUBJECTIVE	<i>I</i>	<i>we</i>	<i>you</i>	<i>he</i>	<i>she</i>	<i>it</i>	<i>they</i>	<i>who</i>
OBJECTIVE	<i>me</i>	<i>us</i>		<i>him</i>	<i>her</i>		<i>them</i>	<i>who(m)</i>
GENITIVE determinative independent	<i>my</i> <i>mine</i>	<i>our</i> <i>ours</i>	<i>your</i> <i>yours</i>	<i>his</i>	<i>her</i> <i>hers</i>	<i>its</i>	<i>their</i> <i>theirs</i>	<i>whose</i>

As Table 6.2 shows, there are additionally two genitive forms, a determinative and an independent form (cf 6.29), for five of the pronouns.

There is a merger (syncretism) of case forms in the following pronouns: the determinative genitive and objective forms of *she* are identical, and the subjective/objective distinction between *who* and *whom* is not always maintained (cf 6.35, 6.38). The personal pronouns *you* and *it* do not have distinct subjective and objective case forms (cf 6.14).

The genitive forms of the personal pronouns are, in accordance with grammatical tradition, called POSSESSIVE pronouns.

The use of case forms

- 6.3 The use of the possessive pronoun forms corresponds largely to that of the genitive of nouns (cf 5.112ff), except that the two different possessive forms, where they exist, function as determinative and independent genitives (cf 6.29). The latter are, in effect, 'true pronouns'.

The choice between subjective and objective cases is made on the basis of a pronoun's function in the clause. As their name implies, subjective personal pronouns function as subject and sometimes as subject complement; objective personal pronouns function as object, prepositional complement, and sometimes as subject complement.

Table 6.3 opposite shows that both subjective and objective case forms can be used as subject complement. Although the prescriptive grammar tradition stipulates the subjective case form, the objective form is normally felt to be the natural one, particularly in informal style. We shall now examine this overlapping use of case forms more carefully.

Table 6.3 Case functions of personal pronouns

FUNCTION	SUBJECTIVE CASE	OBJECTIVE CASE
subject	<i>He</i> was late.	
subject complement	It was <i>he</i> . <formal>	It was <i>him</i> . <informal>
object		I saw <i>him</i> .
prepositional complement		I gave it to <i>him</i> .

Subjective and objective cases

- 6.4 We have noticed in Table 6.3 a discrepancy between the use of case in formal and informal English. In the main, formal English follows the normative grammatical tradition which associates the subjective pronouns with the nominative case of pronouns in inflectional languages such as Latin, and the objective case with the oblique cases (especially accusative and dative cases) in such languages. Hence the subjective form appears not only in subject position, but in that of subject complement, and also in constructions where it can be postulated that the predicate has been ellipted, leaving a 'stranded' subject. This last, however, may have different realizations in the short response:

A: *Who* is there? B: $\left\{ \begin{array}{l} \text{It's } I/me. \\ \text{(Only) } me. \\ Me - \text{John.} \end{array} \right\}$ [1]

He is $\left\{ \begin{array}{l} \text{more intelligent than} \\ \text{as intelligent as} \end{array} \right\}$ *she* (is). [2]

But in response forms and comparative constructions, the subjective pronoun on its own, such as *she* in [2], sometimes gives a stilted impression, and it is preferable to add the operator after it: *she is*.

In contrast to the traditionally 'correct' use of the subjective form *It's I* in [1] and . . . *than/as she* in [2], informal usage favours the objective form:

A: *Who's* there? B: *Me*. [1a]

He is $\left\{ \begin{array}{l} \text{more intelligent than} \\ \text{as intelligent as} \end{array} \right\}$ *her*. [2a]

We may say that, in informal English, *as* and *than* count as prepositions (and are therefore followed by an objective pronoun as prepositional complement) instead of counting as subordinating conjunctions (cf 9.4, 14.12).

- 6.5 This purely structural explanation, however, is not the whole story. To account for the general pattern of pronoun usage in informal style, it is reasonable to say that the traditional case distinctions do not operate here any more than they do with the genitive (cf 5.112ff). Instead, there is a broad division of the finite clause into 'SUBJECT TERRITORY' (the preverbal subject position) and 'OBJECT TERRITORY' (which includes all noun-phrase positions apart from that immediately preceding the verb). In informal English, that

is, the objective pronoun is the unmarked case form, used in the absence of positive reasons for using the subjective form. It is this which accounts for the use of *me*, *him*, *them*, etc in subject complement function in conversational contexts (*It's only me*, *That'll be them*, etc), and for the use of *me* informally in 'absolute' functions such as those of [1a] above. Pressing the point a little further, we may say that the same idea of 'object territory' explains an often condemned tendency for speakers to use the objective case even in the subject function where a pronoun is coordinated, and therefore is separated to some extent from the following verb, either by position or by failure of concord, as in the nonstandard:

Him and Mary } are going abroad for a holiday. [3]
Mary and him }

The nonstandard usage of [3] may become even more 'reprehensible', though not the less common, if the offending pronoun also violates the rule of politeness which stipulates that 1st person pronouns should occur at the end of the coordinate construction:

Me and Mary are going abroad for a holiday. [4]

The prescriptive bias in favour of subjective forms appears to account for their hypercorrect use in coordinate noun phrases in 'object territory': *between you and I*, *as for John and I*, etc. Another reason is that *x and I* is felt to be a polite sequence which can remain unchanged, particularly in view of the distance between the preposition and *I*. Compare also:

Let('s) *you and I* do it!
 He says he saw *John and I* last night.

These are examples of a type which is not uncommon in informal conversation.

In cleft sentences there is often felt to be unclarity about the grammatical function of a pronoun acting as 'focus' (cf. 18.25ff):

It was *she* who came. [5]

It was { *?she*
?her <informal> } (that) John criticized. [6]

It was *her* that came. <informal> [7]

It's not *me* who's proud. <informal> [8]

The focal pronoun has a Janus-like status, being a subject complement with respect to the preceding verb *be*, and an element of variable function with respect to the following verb.

In [5], where *she* is a complement with respect to *was* and a subject with respect to *came*, there is no conflict in formal usage, since the subjective pronoun is favoured for both functions. But in [6] there is a conflict of functions, and neither pronoun form is felt to be completely satisfactory. Since *her* is the object of *criticize*, however, the objective form is superficially more acceptable, and is preferred in informal usage. In familiar usage, the objective form is often used even where the pronoun is a subject with respect to the following verb:

It was *them* that did it.

After indefinite pronouns (*nobody*, *everyone*, *all*, etc) + *but* or *except*, usage is again divided between subjective and objective case forms (depending on whether *but* and *except* are considered conjunctions or prepositions):

nobody } { *but* } { *she*
 everyone } { *except* } { *her*

There seems to be a tendency (at least among prescriptivists) to favour the subjective case after *but* in subject territory [9], and the objective case in object territory [10]; in [11], *I* would be considered a hypercorrect form:

Nobody but *she* can solve our problems. [9]

Nobody can solve our problems but *her*. [10]

Nobody said anything but *me*. [11]

To avoid the issue, the alternative construction with *myself* can be used (cf. 6.27):

Nobody said anything but *myself*. [11a]

The objective form is the generally accepted form when the pronoun is in an object relation to the verb:

I want nobody but *him*. ['I want him and nobody else'] [12]

Note [a] See 10.44 Note [b] on the question of concord, as in:

{ It is *I* who am to blame.
 { It is *me* who's to blame. <informal>

[b] The theory of 'subject territory' and 'object territory' can also be extended to deal with the peculiar distribution of *who* and *whom* (cf. 6.35, 17.13f).

[c] In familiar speech, *us* may occur instead of *we* (cf. 6.18) in expressions like:

Us girls can always take a joke.

Person

6.6 Personal, possessive, and reflexive pronouns have (unlike nouns) distinctions of person. The three persons may be defined as follows:

1ST PERSON PRONOUNS:

I, me, my, mine, myself
we, us, our, ours, ourselves

The reference of these pronouns includes the speaker(s)/writer(s) of the message.

2ND PERSON PRONOUNS:

you, your, yours, yourself, yourselves

The reference of these pronouns includes the addressee(s), but excludes the speaker(s)/writer(s).

3RD PERSON PRONOUNS:

he, him, his, himself
she, her, hers, herself
it, its, itself
they, them, their, theirs, themselves

The reference of these pronouns excludes both speaker(s)/writer(s) and addressee(s); *ie* 3rd person pronouns refer to 'third parties' not directly involved in the origination or reception of the utterance in which they occur.

All noun phrases (except those having 1st and 2nd person pronouns as heads) are 3rd person for purposes of concord:

The man/*He* } has just arrived.
The car/*It* }

To clarify the implications of person, we use the symbols *s*, *h*, and *o* (mnemonic aids: 'speaker', 'hearer', 'other') as follows:

s: the originator(s) of the message, whether speaker or writer, and whether singular or plural

h: the addressee(s) of the message, whether hearer or reader, and whether singular or plural

o: any other referent(s) excluded from the definitions of *s* and *h*

Then the meanings of the three persons can be summarized as in Fig 6.6:

1st person	<table><tr><td>$+s$</td><td>$\pm h$</td><td>$\pm o$</td></tr></table>	$+s$	$\pm h$	$\pm o$
$+s$	$\pm h$	$\pm o$		
2nd person	<table><tr><td>$-s$</td><td>$+h$</td><td>$\pm o$</td></tr></table>	$-s$	$+h$	$\pm o$
$-s$	$+h$	$\pm o$		
3rd person	<table><tr><td>$-s$</td><td>$-h$</td><td>$+o$</td></tr></table>	$-s$	$-h$	$+o$
$-s$	$-h$	$+o$		

Fig 6.6 Meanings of 1st, 2nd, and 3rd person

The meanings of the singular pronouns are limited to the boxes with thick borders, while the meanings of the plural pronouns may include also the boxes with thin borders. These various possibilities are illustrated with reflexive pronouns in Table 6.6:

Table 6.6 1st, 2nd, and 3rd person pronouns

	<i>s</i>	<i>h</i>	<i>o</i>	PERSON	EXAMPLES WITH REFLEXIVE PRONOUNS
SINGULAR	+	-	-	1st	I gave <i>myself</i> up.
	-	+	-	2nd	You should be ashamed of <i>yourself</i> , Richard!
	-	-	+	3rd	Mary has hurt <i>herself</i> . John has hurt <i>himself</i> . The spider has hurt <i>itself</i> .
PLURAL	+	-	-	1st	We, the undersigned, pledge <i>ourselves</i> to . . .
	+	+	-	1st	We complemented <i>ourselves</i> too soon, John. ['inclusive <i>we</i> ']
	+	-	+	1st	The children and I can look after <i>ourselves</i> . ['exclusive <i>we</i> ']
	+	+	+	1st	You, Ann, and I are working <i>ourselves</i> to death.
	-	+	-	2nd	You ought to be ashamed of <i>yourselves</i> , children!
	-	+	+	2nd	You and John will have to cook for <i>yourselves</i> .
	-	-	+	3rd	They helped <i>themselves</i> to coffee and cakes.

- 6.7 The terms INCLUSIVE *we* and EXCLUSIVE *we* are sometimes used for 1st person plural pronouns which respectively include and exclude reference to the addressee. We should in addition distinguish a special type of exclusive *we* called COLLECTIVE *we* which indicates a plurality of speakers/writers, *eg* in petitions (*We, the undersigned, . . .*) or in prayers (*We thank Thee, O God, . . .*).

Unlike some languages, however, English does not make any formal distinction between 'inclusive' and 'exclusive' reference. The only circumstance in which inclusive *we* is grammatically distinct is in the 1st person imperative *Let's . . .* (*cf* 3.51 Note [b], 11.26). This contraction of *us* to *'s* (*cf* App II.9) is only possible where *us* has inclusive reference (*cf* 6.18). There is a corresponding question *shall we . . .?* in which *we* also has inclusive reference, and which may be added to the imperative as a tag question:

Let's enjoy ourselves, shall we?

Gender

- 6.8 Gender distinctions are largely restricted to 3rd person singular pronouns of the categories of personal, possessive, and reflexive pronouns, as shown in Table 6.8:

Table 6.8 Gender distinctions in pronouns

PERSONAL GENDER	masculine	<i>he</i>	<i>him</i>	<i>his</i>	<i>himself</i>
	feminine	<i>she</i>	<i>her</i>	<i>her hers</i>	<i>herself</i>
NONPERSONAL GENDER		<i>it</i>	<i>its</i>	<i>itself</i>	

These gender distinctions are neutralized in the plural: *they, them*, etc. No pronouns other than those in Table 6.8 manifest a masculine/feminine contrast, but the personal/nonpersonal contrast is also found in relative pronouns (*who/whom* contrasted with *which*) and in indefinite pronouns (*somebody* contrasted with *something*, etc). The 1st and 2nd person pronouns are inevitably of personal rather than nonpersonal gender.

The choice between personal and nonpersonal gender is determined primarily by whether the reference is to a 'person', *ie* to a being felt to possess characteristics associated with a member of the human race. So defined, 'persons' are not only human beings, but may also include supernatural beings (the Deity, gods, angels, fairies, etc), and higher animals (*cf* 5.109). Exceptional uses such as *it* referring to babies and *she* referring to ships have already been noted (*cf* 5.107, 5.111 Note). The occurrence of *he* and *she* in cases of outright personification is common in informal use: *he* may refer to a computer; *she* (or, for some women, *he*) to a car. In poetry and fiction (especially children's fiction) there are virtually no limits to the kinds of object which can be personified in this way.

In the use of 3rd person singular pronouns, the absence of a pronoun of personal gender which is neutral between *he* and *she* influences the boundary between *he/she*, on the one hand, and *it* on the other. Just as a baby may be designated *it*, so a member of a nonhuman species may be designated *he* or *she* (*cf* 5.109f):

The robin builds *its* nest in a well-chosen position . . . and, after the eggs have hatched, the mother bird feeds *her* young there for several weeks.

As this example shows, the pronoun usage can vacillate within a single paragraph or even a single sentence.

Masculine and feminine gender

- 6.9 The choice between masculine and feminine pronouns is primarily based on the sex of the person (or animal) referred to:

Fred looked at *himself* in the mirror.

Freda looked at *herself* in the mirror.

Difficulties of usage arise, however, because English has no sex-neutral 3rd person singular pronoun. Consequently, the plural pronoun *they* is often used informally in defiance of strict number concord, in coreference with the indefinite pronouns *everyone*, *everybody*; *someone*, *somebody*; *anyone*, *anybody*; *no one*, *nobody* (cf 10.50):

Everyone thinks *they* have a right to be here. [1]

Has *anybody* brought *their* racket? [2]

No one should *pride themselves* on this result. [3]

The plural is a convenient means of avoiding the traditional use of *he* as the unmarked form when the sex is not determined (cf: *man*, 5.54 Note), as in the formal:

Everyone thinks *he* has a right to be here. <formal> [1a]

The use of the plural is also a means of avoiding the cumbersome device of coordinating masculine and feminine:

Has *anybody* brought *his or her* racket? [2a]

And the same choice may be made in referring back to a singular noun phrase with a personal noun of indeterminate gender as head:

Every student has to make up *his* own mind.

The applicant is required to sign *his* name clearly on page four of this form.

The dilemma of concord also arises with coordinate subjects and with subjects of common gender, but here resort to the evasive tactic of the plural pronoun, though common in everyday speech, is less acceptable:

Either *he or his wife* is going to have to change *their* attitude.

Not *every drug addict* can solve *their* problem so easily.

They is particularly difficult to avoid in cases like [4], and in tag questions [5] (cf 10.50 Note [a]):

Everybody came to the party, but *they've* left now. [4]

Someone died here yesterday, didn't *they*? [5]

Sexual bias in the use of pronouns

- 6.10 In recent decades, the use of *he*, *him*, etc as an 'unmarked' pronoun when the sex of the referent is undetermined has been opposed, particularly in the United States, by those campaigning against sexual bias in language. Some of the methods proposed for avoiding the unmarked masculine are illustrated in the following examples and suggested revisions (quoted from the *TESOL Quarterly* Style Sheet, Vol 13):

- (a) The speaker must constantly monitor *his* listener to check that assumptions *he* is making are shared assumptions.

SUGGESTED REVISION (change to *the* and rephrase):

The speaker must constantly monitor *the* listener and check that the assumptions *the speaker is making* are shared.

- (b) Very often the writer does not monitor *his* arguments very well or get *his* narrative in the right order.

SUGGESTED REVISION (change to plural):

Very often writers do not monitor *their* arguments very well or get *their* narratives in the right order.

- (c) The students do almost all the interacting, the teacher taking a back seat.

That is to say, *he* is not under the pressure of acting as *chairman or host*.

SUGGESTED REVISION (change to *s/he* and rephrase):

. . . That is to say, *s/he* is not under the pressure of acting as classroom director.

The last example illustrates the use of an invented sex-neutral pronoun *s/he*. It is uncertain how far such experimental forms as this will come into general use, especially when *s/he* is only a written form with no corresponding spoken form (unlike *Ms*; cf 5.66 Note [a]); and, still more seriously, there is no objective or possessive form. Generally, it is not certain how far the advocacy of nonsexist language will succeed in discouraging such usages as the unmarked masculine pronoun. What is clear is that the feminist movement in language has made many language users aware of problems of sexual bias which were overlooked by earlier generations.

Number

- 6.11 As already indicated (6.1 and 6.6), the personal, reflexive, and possessive pronouns have singular and plural forms which are morphologically unrelated. It is also worth noting that the plurals of the 1st and 2nd person have a more specific meaning than do those of nouns. Except when it refers to, for example, collective authorship (cf 6.18), *we* means 'I plus one or more other persons'; and, similarly, *you* with plural reference normally means 'you (singular) and one or more other persons, but not me'. But contrast of number is neutralized with *you*: in current standard English, only the reflexive forms *yourself* and *yourselves* preserve a distinction between singular and plural:

Harry, behave *yourself*!

Harry and Susan, behave *yourselves*!

(On archaic and nonstandard forms of the 2nd person singular and plural pronouns, cf 6.12 Notes [b] and [c].)

Reflexive pronouns in general show number contrast in the manner of nouns. The suffix *-self* in the singular changes, by the addition of a sibilant suffix, to *-selves* in the plural (cf such nouns in *-f* as *calv* ~ *calves*, 5.83):

singular	<i>myself</i>	<i>yourself</i>	<i>himself/herself/itself</i>
plural	<i>ourselves</i>	<i>yourselves</i>	<i>themselves</i>

Fig 6.11 Reflexive pronouns

There is also the rare (royal) singular form *ourselves* (cf 6.18 Note [a]).

Pronouns belonging to other classes, such as interrogative, relative, and indefinite pronouns, do not in general have number contrast. Exceptions are the demonstratives *this/these* and *that/those*, and the indefinite pronoun *one* when used as a substitute. Other pronouns, like the corresponding determiners (cf 5.12), are invariable for number. The pronoun *both*, like the predeterminer *both*, has dual meaning, but is plural for purposes of concord.

- 6.12 There are formal grounds for saying that, just as the traditionally unmarked gender category is masculine, so the unmarked number category is singular. The compound indefinite pronouns *someone*, *everybody*, *nothing*, etc are singular, and have no plural counterparts (**someones*, **everybodies*, **nothings*); yet they themselves can refer to more than one entity, and be notionally plural:

A: Did you see *anyone* in the library?

B: { Yes, several people.
*No, several people.

Similarly, the substitute pronouns *any* and *none* are notionally often associated with plural number; but, according to prescriptive grammatical tradition, they are singular, and hence in formal English they are generally required to agree with a singular verb (cf 10.42).

The interrogative pronouns *who* and *what* are similar to *any* and *none* in that they are treated as singular for subject-verb concord, even though they may imply a plural answer:

A: *Who's* coming to the party? B: Most of our neighbours.

A: *What's* on the menu today? B: Lots of things.

- Note [a] In the absence of a singular/plural distinction in the 2nd person pronoun, plural reference is sometimes indicated by lexical additions, eg: *you people*, *you boys*, and (esp AmE) *you guys*.
[b] The low-prestige plural form *youse* /ju:z/ is current in Northern AmE and certain areas of Britain such as Liverpool and Glasgow. In Southern AmE, by contrast, the singular/plural distinction has been re-formed through suffixation of the originally plural form: *You-all* (y'all /jɔ:l/) is widely used on all social levels in Southern AmE (always with a plural meaning by those to whom the form is native, although often misunderstood as a singular by outlanders). There is also a colloquial genitive *y'all's* /jɔ:lz/, as in:

I really like *y'all's* new car. ['your family's new car']

[c] *You* in earlier English was a plural pronoun only, and was restricted to oblique cases. Although *you* has gained universal currency as a 2nd person pronoun which is neutral in case

and number, there is an archaic system of pronouns where other 2nd person pronouns survive in restricted situations, especially in religious language, as shown in Table 6.12:

Table 6.12 Archaic system of pronouns

	SUBJECTIVE	OBJECTIVE	REFLEXIVE	POSSESSIVE	
SINGULAR (<i>th</i> -forms)	<i>thou</i> /ðau/	<i>thee</i> /ði:/	<i>thyself</i>	<i>thy</i>	<i>thine</i>
PLURAL (<i>y</i> -forms)	<i>ye</i> /ji:/	<i>you</i> /ye/	<i>yourselves</i>	<i>your</i>	<i>yours</i>

While we present this system of religious usage, it should be pointed out that there is a great deal of variation in current religious practice. There is a trend towards the adoption of present-day pronoun forms (cf verb forms, 3.4 Note [b]). For example, the traditional use of *th*-forms in Quaker usage seems to be no longer current. In some dialects of BrE, particularly in the north of England, forms deriving from the earlier singular *thou/thee* are still current also in nonreligious contexts.

Subclasses of pronouns

- 6.13 The class of pronouns includes a number of heterogeneous items, many of which, as we have already seen, do not share all of the above contrasts. For example, *somebody* (being 3rd person) has no corresponding 1st and 2nd person distinction, no subjective/objective contrast, and no masculine/feminine contrast. Yet it is included among our pronouns, as it incorporates its own determiner, is a closed-class item, and has the kind of generalized meaning we associate with pronouns. The point we want to make here is that the characteristics which single out the pronoun class from the noun class are not shared by all its members. Figure 6.13 shows the different subclasses of pronouns and gives references to sections where they are discussed:

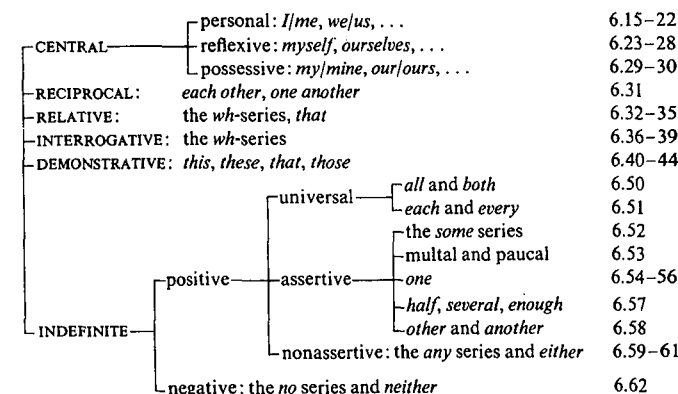

Fig 6.13 Pronoun subclasses

Personal, possessive, and reflexive pronouns may be called the **CENTRAL PRONOUNS**, since they share those features we have mentioned as being

particularly characteristic of pronouns, viz contrast of person, gender, and subjective/objective case. Although these central pronouns fulfil different syntactic functions, they have obvious morphological resemblances. This is also the reason why the possessives *my*, *your*, etc have been grouped with central pronouns, although such possessives, being determinative in function, cannot function alone instead of nouns, but only together with nouns (cf 6.29).

Central pronouns

- 6.14 The central pronouns have in common the distinctions of person (1st, 2nd, and 3rd), gender (masculine, feminine, and nonpersonal), and number (singular and plural) that have already been discussed. In addition, most personal pronouns have distinctions of case. The various forms of the central pronouns are displayed in Table 6.14:

Table 6.14 Personal, reflexive, and possessive pronouns

	PERSONAL PRONOUNS		REFLEXIVE PRONOUNS	POSSESSIVE PRONOUNS	
	subjective case	objective case		determinative function	independent function
1ST PERSON					
singular	<i>I</i>	<i>me</i>	<i>myself</i>	<i>my</i>	<i>mine</i>
plural	<i>we</i> cf Note [a]	<i>us</i>	<i>ourselves</i>	<i>our</i>	<i>ours</i>
2ND PERSON					
cf Note [b]					
singular	<i>you</i>	<i>you</i>	<i>yourself</i>	<i>your</i>	<i>yours</i>
plural	<i>you</i>	<i>you</i>	<i>yourselves</i>	<i>your</i>	<i>yours</i>
3RD PERSON					
singular masculine	<i>he</i>	<i>him</i>	<i>himself</i>	<i>his</i>	<i>his</i>
singular feminine	<i>she</i>	<i>her</i>	<i>herself</i>	<i>her</i>	<i>hers</i>
singular non-personal	<i>it</i>	<i>it</i>	<i>itself</i>	<i>its</i>	
plural	<i>they</i>	<i>them</i> cf Note [c]	<i>themselves</i>	<i>their</i>	<i>theirs</i>

- Note [a] On the 'editorial *we*' and other special uses of the 1st person plural pronoun, cf 6.18.
 [b] Apart from *you*, there are the rare and/or restricted 2nd person pronouns *thou*, *you-all*, etc (cf 6.12 Notes [b] and [c]).
 [c] *Them* is sometimes replaced by 'em /əm/ in familiar use, as in *Kick 'em out!*
 [d] *Us* is the only pronoun that has a contracted form ('s) in standard English (cf App II.9): *Let's go.*

Personal pronouns

With specific reference

- 6.15 The personal pronouns usually have definite meaning, and resemble the noun phrases introduced by the definite article in that they may have situational, anaphoric, or cataphoric reference (cf 5.28ff).

The 1st person and 2nd person pronouns, when they have specific reference, are used to refer to those directly involved in the discourse situation: viz the speaker(s)/writer(s) and the addressee(s) (cf 6.6).

The 3rd person pronouns may also be used situationally, to refer to some person(s) or thing(s) whose identity can be inferred from the extralinguistic context:

- Are *they* asleep? [spoken to his wife by a husband nodding his head towards the children's bedroom]
 Oh, how kind of you! May I open *it* now? [said by someone receiving a present from a guest]

Much more frequently, however, the identity of the referents of 3rd person pronouns is supplied by the linguistic context. As with the definite article, we distinguish between the ANAPHORIC and the CATAPHORIC uses of a 3rd person pronoun, according to whether the element with which it corefers (the ANTECEDENT) precedes or follows it (cf 5.30ff). The more common type of textual reference is anaphoric reference:

- We have an excellent museum here. Would you like to visit *it*?
 [= the museum] [1]
My brother is afraid that *he* will fail the test. [2]
The young girl stared at *Dan* and said nothing: *she* seemed offended by *his* manner, as if *he* had had the intention of hurting *her*. [3]
Dr Solway took the student's blood pressure that day. *He* also examined *his* lungs and heart. [4]

It will be noticed that in [4] *he* and *Dr Solway* are coreferential, and *his* and *the student's* are coreferential. We recover the appropriate antecedent by means of the content of the sentence. For example, the second sentence of [4] can be changed so as to enforce a different interpretation of the pronouns:

- Dr Solway* took the student's blood pressure that day. *He* had felt sick during the night and came for *his* help as soon as the clinic opened. [4a]

Now the content of the sentence suggests that *he* refers to *the student* and *his* to *Dr Solway*. If the use of the pronoun is felt to be ambiguous or confusing, the antecedent can be used again, or a lexical equivalent can be found:

- ... *The student* had felt sick during the night, and came for { *Dr Solway's* } help as soon as the clinic opened. [4b]
 { *the doctor's* }

'Referring it'

- 6.16 The neuter or nonpersonal pronoun *it* ('REFERRING *it*') is used to refer not

only to inanimate objects as in example 6.15 [1] above, but also to noncount substances (such as *some soup* in [1] below), to singular abstractions (such as *the sack of Rome* in [2]), and even to singular collections of people, such as *Parliament* in [3]:

- She made *some soup* and gave *it* to the children. [1]
The sack of Rome shook the whole of the Western World: in a sense, *it* was the end of the Roman Empire. [2]
Parliament's answer to all awkward problems is to establish a Royal Commission whose findings *it* can then ignore. [3]

In fact, in the personal/nonpersonal opposition, the nonpersonal gender is 'unmarked', in that for any antecedent for which *he* or *she* is inappropriate, *it* will be used instead. Hence, *it* can corefer to a whole clause or sentence, as in [4] and [5]:

- A: Who said *that I was crazy*?
 B: I said *it*. ['that you were crazy'] [4]
Rome was sacked by the Visigoths in 410 AD. It ['the sack of Rome'] was the end of civilization as the West had known it. [5]
Many students never improve. They get no advice and therefore keep repeating the same mistakes. It's a terrible shame. [6]

As is illustrated by [6], *it* can even corefer to a sequence of sentences.

It is the only personal pronoun which is almost always unstressed. *He* and *she*, for example, can be contrasted with one another by nuclear stress:

SHE earns more than *HE* does.

It, on the other hand, can only very rarely receive stress, for example when it is used as a citation form:

Is this word *it*? [looking at a manuscript]

One reason why *it* is rarely stressed is that when a stressed nonpersonal pronoun is needed, *it* is supplanted by *this* or *that* (cf 6.40ff, 12.10ff). Thus [5a] is identical to [5], except that *this*, a stressed and slightly more emphatic proform, replaces *it*:

- Rome was sacked by the Visigoths in 410 AD. This* was the end of civilization as the West had known it. [5a]

Note There are several restricted usages with nuclear stress on *it*. For example:

Is that *it*? ['Is that all you wanted me for?']

Also, with the sense of 'sex appeal', 'charisma', etc, *it* is stressed in:

She's got it.

In children's games, stressed *it* is used to indicate whoever is next to play, in expressions like the following:

You're *it*. She's *it*.

'Prop it'

- 5.17 Since *it* is the most neutral and semantically unmarked of the personal pronouns, *it* is used as an 'empty' or 'prop' subject, especially in expressions denoting time, distance, or atmospheric conditions:

- What time is *it*? *It's* half past five.
 How far is *it* to York? *It's* a long way from here to Cairo.
It's warm today. *It's* been fine weather recently.
It's getting dark. What day is *it* today?

This 'PROP *it*', if it has any meaning at all, refers quite generally to the time or place of the event or state in question (cf 10.26).

Even less meaning can be claimed for the *it* which occurs as an anticipatory subject in cleft sentences (cf 18.25ff) or in clauses with extraposition (cf 18.33ff), as in [1-3]:

- Isn't *it* a shame *that they lost the game*? [1]
It must have been here *that I first met her*. [2]
 I take *it* then *that you're resigning*. [3]

But here, too, it can be maintained that the pronoun is not quite void of meaning, since it arguably has cataphoric reference (forward coreference) to a clause (italicized in [1-3]) in the later part of the same sentence. One justification of this is the feeling of ellipsis in sentences such as [1a] and [2a], which are like [1] and [2] except that the antecedent of *it* has to be supplied from the linguistic context:

- A: They lost the game.
 B: Yes, so I hear. Isn't *it* a shame? [1a]
 A: Where did you first meet her?
 B: *It* must have been here. [2a]

In some cases, it is necessary to add words which do not precisely replicate those in the text, eg:

- The bell rang, and I went to the door. *It* was Dr Long. [4]

To make full sense of sentences like [4], we have to supply, for example:

It was Dr Long (*who had rung the bell*).

Note [a] Perhaps the best case for a completely empty or 'nonreferring' *it* can be made with idioms in which *it* follows a verb and has vague implications of 'life in general', etc:

At last we've made *it*. ['achieved success']
 have a hard time of *it* ['to find life difficult']
 make a go of *it* ['to make a success of something']
 stick *it* out ['to hold out, to persevere']
 How's *it* going?
 Go *it* alone.

You're in for *it*. ['You're going to be in trouble.']

[b] *It* can be used as a substitute for a predication, and especially for a characterizing complement (cf 10.20):

She was *a rich woman* and she LOOKED *it*. ['a rich woman', 'rich']

If there could ever be such a thing as a modest Roman, Augustus was not *it*.
 ['not a modest Roman']

This last example is exceptional in that *it* is stressed (cf 6.16). Other uses of *it* as a substitute form are discussed in 12.13, 12.24ff.

Special uses of *we*

6.18 The 1st person plural pronoun has a number of special uses:

- (a) One common use is the 'INCLUSIVE AUTHORIAL *we*' in serious writing, as in:

As *we* saw in Chapter 3, ...

Here *we* seeks to involve the reader in a joint enterprise. Besides not having this 'intimate' appeal, *you* here would also be felt to be too informal or authoritative for discursive or scholarly writing. Compare also [1] with the more informal *let's* in [2]:

- | | |
|---|-----|
| { <i>We</i> now turn to a different problem. | [1] |
| { <i>Let's</i> turn now to a different problem. | [2] |

- (b) The so-called 'EDITORIAL *we*' is still common enough in formal (especially scientific) writing by a single individual, and is prompted by a desire to avoid *I*, which may be felt to be somewhat egotistical. For instance, the writer of a scholarly article may prefer [3] to [4]:

- | | |
|---|-----|
| { As <i>we</i> showed a moment ago, ... | [3] |
| { As <i>I</i> showed a moment ago, ... | [4] |

('Editorial' here is not applied to the fully justified use of *we* with reference to the consensus of an editorial board or other collective body.)

- (c) The 'RHETORICAL *we*' is used in the collective sense of 'the nation', 'the party', as in:

In the 19th century *we* neglected *our* poor as *we* amassed wealth.
Today *we* are much more concerned with the welfare of the people as a whole.

This may be viewed as a special case of the generic use of *we* (cf 6.21).

- (d) There is also a use of *we* in reference to the hearer (= *you*) which may occur for example when a doctor is talking to a patient:

How are *we* feeling today?

In the context, this use of *we* may be understood to be condescending, but it also has an implication of sharing the problem with 'you' in the situational context of a doctor/patient or teacher/student relation, for example. A teacher wishing to instruct without overtly claiming authority may use the 'inclusive' 1st person plural (cf 6.7):

Now then, let's have a look at that project, shall *we*?

This can be an evasively polite equivalent of:

Now then, let *me* have a look at that project, will *you*?

- (e) *We* may occasionally be used also in reference to a 3rd person (= *he*, *she*). For example one secretary might say to another with reference to their boss:

We're in a bad mood today.

Note [a] The virtually obsolete 'royal *we*' (= *I*) is traditionally used by a monarch, as in the following examples, both famous dicta by Queen Victoria:

We are not interested in the possibilities of defeat. *We* are not amused.

[b] In nonstandard use, plural *us* is commonly used for the singular *me*, as in:
Lend *us* a fiver.

[c] On the generic use of *we* and other personal pronouns, cf 6.21.

Anaphoric and cataphoric reference

- 6.19 Examples already given in 6.15-16 have illustrated the anaphoric use of personal pronouns. Cataphoric reference occurs less frequently, and under limited conditions. Where it does occur, anaphoric reference is also possible, so that we can equate two synonymous sentences such as [1] and [1a] in which the positions of pronoun and antecedent are reversed:

- | | |
|---|------|
| { Before <i>he</i> joined the Navy, <i>Gerald</i> made peace with his family. | [1] |
| { = Before <i>Gerald</i> joined the Navy, <i>he</i> made peace with his family. | [1a] |

On the whole, cataphoric reference such as that in [1] is associated with formal written English. Also, it generally occurs only where the pronoun is at a lower level of structure than its antecedent (where 'level' is understood by reference to levels of branching on a tree diagram, as in 2.7 ff). Thus, in [2] and [3] the pronoun is a constituent in a relative clause:

- | | |
|--|-----|
| Those who most deserve <i>it</i> rarely seem to suffer defeat. | [2] |
| Melville well knew that to the men who sailed in <i>her</i> , a whaler was anything but a pleasure boat. | [3] |

And in [4], the cataphoric pronoun appears as part of the complement of an initial prepositional phrase:

- | | |
|---|-----|
| On <i>his</i> arrival in the capital, the Secretary of State declared support for the government. | [4] |
|---|-----|

When this condition of subordination is not fulfilled, there is no equivalent of the kind illustrated in [1] and [1a]:

- | | |
|---|------|
| { <i>Jacqueline</i> thinks <i>she</i> understands me. | [5] |
| { ≠ <i>She</i> thinks <i>Jacqueline</i> understands me. | [5a] |

While *she* can easily corefer to *Jacqueline* in [5], such coreference is impossible in [5a], so that here *she* and *Jacqueline* must be understood to refer to two different people.

The conditions under which a pronoun can have coreference to another constituent can be summarized as follows. The constituent to which coreference is made must have precedence over the pronoun in one of two senses:

- (i) It must precede the pronoun, or

- (ii) it must have a higher position in the constituent structure (cf 2.7) of the sentence than the pronoun.

With cataphoric pronouns, the first condition fails, and so the second condition must obtain.

Note [a] The above summary is not without exceptions. In journalistic writing, in particular, there is occasional use of cataphoric pronouns which appear in noninferior positions:

Failure of *his* latest attempt on the world record has caused heavy financial loss to the backers of daredevil balloonist *Felix Champ*.

[b] Personal pronouns cannot make cataphoric reference to part or all of a subsequent sentence, except for debatable cases such as:

It should never have happened. *She* went out and left the baby unattended.

Here, it appears that *it* refers to the whole content of the succeeding sentence. But perhaps this is not true cataphoric reference, but a special rhetorical device, found in popular narrative, whereby the writer assumes the reader is already 'in the know' at the beginning of the story.

Modification and determination of personal pronouns

6.20 Another use of pronouns which may be called cataphoric is illustrated in:

He who hesitates is lost. ['The person who . . .'; a proverb]

She who must be obeyed. ['The woman who . . .']

Here *he* and *she* are cataphoric in that their meaning is defined by the following postmodifier, which is a restrictive relative clause (cf 17.13). Their function is hence parallel to that of the cataphoric definite article (cf 5.32). *He* or *she* followed by a relative clause belongs to a literary and somewhat archaic style. Present-day English prefers the use of the plural demonstrative in such contexts (cf 12.19). *They* cannot be used:

Those } who work hard deserve some reward.
**They* }

There is no similar use of cataphoric *it* for nonpersonal reference; a nominal relative clause (cf 15.8f) is used instead:

What } stands over there is a church.
**It that* }

In modern English, restrictive modification with personal pronouns is extremely limited. There are, however, a few types of nonrestrictive modifiers and determiners which can precede or follow a personal pronoun. These mostly accompany a 1st or 2nd person pronoun, and tend to have an emotive or rhetorical flavour:

(a) Adjectives:

Silly *me*!, *Good* *old* *you*!, *Poor* *us*! <informal>

(b) Apposition:

we *doctors*, *you* *people*, *us* *foreigners* <familiar>

(c) Relative clauses:

we *who* have pledged allegiance to the flag, . . . <formal>

you, *to* *whom* I owe all my happiness, . . . <formal>

(d) Adverbs:

you *there*, *we* *here*

(e) Prepositional phrases:

we *of the modern age*

us *over here* <familiar>

you *in the raincoat* <impolite>

(f) Emphatic reflexive pronouns (cf 6.28):

you *yourself*, *we* *ourselves*, *he* *himself*

Personal pronouns do not occur with determiners (**the she*, **both they*), but the universal pronouns *all*, *both*, or *each* may occur after the pronoun head (cf 5.16, 6.50):

We *all* have our loyalties.

They *each* took a candle.

You *both* need help.

Note [a] The *he* *who* . . . and *she* *who* . . . constructions can in principle be varied by the substitution of other forms of personal and relative pronouns. But such variations strike the modern reader as decidedly unidiomatic:

?I dedicate this work *to him* *to whom* it owes its conception.

[b] Informally, *he* and *she* are converted to nouns when *he* = *male* and *she* = *female*. This accounts for the cooccurrence of the article with *he* and *she* in:

What a darling puppy! Is it *a* *he* or *a* *she*?

Generic uses of personal pronouns

6.21 Apart from the stylistically limited construction *he/she* *who* . . . in 6.20, a number of generic uses of personal pronouns need to be discussed and illustrated.

First, 3rd person pronouns can be used in anaphoric and cataphoric reference to generic noun phrases, in the normal way. The following example shows the generic use of *he* in coreference with a singular generic noun phrase (cf 5.54 Note, 6.9f):

Ever since *he* found a need to communicate, *man* has been the 'speaking animal'.

It is the pronoun which is used if we want to corefer to a singular generic noun phrase with zero article, whereas *they* is used if the zero article accompanies a plural:

A: Do you like *caviar*? B: I've never tasted *it*.

Music is my favourite subject. Is *it* yours?

Truffles are delicious, but *they*'re very expensive.

Second, apart from the special generic pronoun *one* (cf 6.56), plural pronouns of all persons can function generically with reference to 'people in general':

Science tells *us* that the earth goes round the sun. [1]

We live in an age of immense changes. [2]

You can never tell what will happen. [3]

These days *you* have to be careful with *your* money. [4]
They say it's going to snow today. [5]

Although used generically, these personal pronouns *we*, *you*, and *they* retain something of the specific meaning associated with the 1st, 2nd, and 3rd persons respectively. They are therefore not wholly interchangeable. Potentially, *we* and *us* in [1] and [2] have the widest meaning, because they may include reference to speaker, addressee, and 'third parties' (cf 6.6). The reference of 'inclusive *we*' can be progressively enlarged (as already illustrated by the 'rhetorical *we*' discussed in 6.18(c)) from those involved in the immediate speech situation to the whole human race. In this fully generic sense, a sentence with *we* as subject can be replaced by a passive sentence with unspecified agent (cf 3.71):

{ *We* now know that the earth is round.
 = It is now known that the earth is round.

Generic *you*, on the other hand, is typically an informal equivalent of *one*:

You
One } can always tell what she's thinking.

But *you* again retains something of its 2nd person meaning: it can suggest that the speaker is appealing to the hearer's experience of life in general, or else of some specific situation, as in:

This wine makes *you* feel drowsy, doesn't it?

Sometimes, the reference is to the speaker's rather than the hearer's life or experiences:

It wasn't a bad life. *You* got up at seven, had breakfast, went for a walk ...

Like generic *you*, generic *they* is informal, and retains something of its specific quality as a personal pronoun. Being a 3rd person pronoun, it excludes reference to the speaker and the addressee. Consequently, it tends to designate, in a sometimes disparaging way, the mysterious forces which appear to control the ordinary citizen's life: 'the authorities', 'the media', 'the government', etc:

I see *they're* raising the bus fares again. Whatever will *they* be doing next?

They don't make decent furniture nowadays.
 (cf: *You* can't get decent furniture nowadays.)

Note The ordinary citizen's awareness of this use of *they/them* as a denial of personal responsibility can be seen in expressions like:

The members took up a *them* and *us* attitude to the Union.

Pronouns with coordinated antecedents

6.22 When a pronoun has as its antecedent two or more noun phrases coordinated by *and*, the pronoun itself must be plural, even if each of the noun phrases is singular:

John and Mary stole a toy from my son. *Their* mother told *them* to return it to *him*, but *they* said it was *theirs*.

The conditions of concord here, in fact, are the same as those which govern subject-verb concord (cf 10.34ff).

If the antecedent phrases governed by *and* contain noun phrases or pronouns of different persons, the choice of pronoun is determined by the criteria discussed in 6.6f. This means that there is an order of precedence whereby the 1st person outweighs the 2nd person, which in turn outweighs the 3rd person:

PERSONS IN ANTECEDENT	PERSON OF PRONOUN
1 + 2	-----→ 1
1 + 3	-----→ 1
2 + 3	-----→ 2
1 + 2 + 3	-----→ 1

Fig 6.22 Pronouns with coordinated antecedents

Examples:

We have a lot to talk about, *you and I*. [2 + 1 → 1]

Freda and I have finished *our* work. Can *we* start lunch now? [3 + 1 → 1]

You and John can stop *your* work now, if *you* like. *You* can both eat *your* lunch in the kitchen. [2 + 3 → 2]

The same order of precedence applies where three or more noun phrases are combined in the antecedent:

If *you, Mary, and I* have already finished, *we* can have lunch. [2 + 3 + 1 → 1]

You, Mary, and John will meet at the station. *You* can then go together to the party. [2 + 3 + 3 → 2]

Note [a] A somewhat different situation arises when the antecedent noun phrases do not include the person appearing in the pronoun:

If *you and John* have already finished, *we* can have lunch. [1]

Mary and John will be at the station. *You* can then go together to the party. [2]

In spite of appearances, the italicized phrases and pronouns in these examples can be understood to be partly coreferential. But this interpretation requires the implication of a third omitted conjoin; eg: *we* in [1] is understood to mean 'you, John, and I'.

[b] In addition to a coordinated antecedent, the 3rd person plural pronoun may also have multiple antecedents, such as *She* and *an Indian* in:

She married *an Indian*, and *they* went to live in Delhi.

Reflexive pronouns

6.23 Reflexive pronouns end with *-self* (singular) and *-selves* (plural). These suffixes are added to the determinative possessive forms for the 1st and 2nd person (a), and to the objective form for the 3rd person (b) (cf Table 6.14):

- (a) *myself yourself ourselves yourselves*
 (b) *himself herself itself themselves*

There is also an indefinite generic reflexive pronoun *oneself* (cf 6.56), and a very rare 'royal we' singular reflexive pronoun *ourselves* (cf 6.18 Note [a]).

As the name implies, reflexive pronouns 'reflect' another nominal element of the clause or sentence, usually the subject, with which it is in a coreferential relation:

Table 6.23 Functions of reflexive pronouns

ANTECEDENT	REFLEXIVE PRONOUN	EXAMPLE	
subject	direct object	<i>They helped themselves.</i>	[1]
subject	indirect object	<i>She allowed herself a rest.</i>	[2]
subject	subject complement	<i>He is not himself today.</i>	[3]
subject	prep. complement	<i>The café pays for itself.</i>	[4]
subject	appositional phrase	<i>{ We couldn't come ourselves. We ourselves couldn't come.</i>	[5] [5a]

The reflexive pronoun has two distinct uses: basic and emphatic. The basic use is illustrated by [1-4] above: here, the reflexive pronoun functions as object or complement and has the subject of its clause as its antecedent. In the emphatic use, illustrated by [5] and [5a], the pronoun is in an appositional relation to its antecedent.

Note [a] As subject complement (but not normally as object) the reflexive pronoun receives nuclear stress:

He is not *himself*. ['He does not feel well.]

There is consequently an ambiguity only in writing between the object and complement interpretations when a reflexive pronoun comes after the verb:

He *felt* himself. [S V C] He felt *himself*. [S V C_i]

[b] Very occasionally a reflexive pronoun precedes the subject with which it has coreference (cf fronting, 18.20ff):

For *yourselves* you have done a great deal, but for others nothing.

It was understood that getting *herself* married to an aristocrat was *Henrietta's* first duty to her family.

In emphatic use (cf 6.28), front position of *myself* is common:

Myself, I feel quite happy about the plan.

Basic use

- 6.24 The basic reflexive pronoun takes the function of a noun phrase in the structure of the clause or phrase: it may be an object, a complement, or a prepositional complement. Since it corefers to the subject, however, the reflexive pronoun cannot itself be a subject. In this, it shows that it belongs to 'object territory' (cf 6.5), and has affinities with the objective personal pronoun. But it contrasts with the objective pronoun in meaning in examples such as this:

He saw *{ himself
him }* in the mirror. [1]

In [1], *himself* is necessarily coreferential to the subject *he*, while *him* necessarily refers to some other person. We have to use the reflexive rather than the ordinary objective pronoun. The reflexive pronoun must agree with the subject in terms of gender, number, and person:

She saw *{ herself
himself } in the mirror.

For an object, complement, or prepositional object which is coreferential with the subject, the reflexive pronoun is obligatory.

The basic reflexive pronoun always corefers to the subject of its own clause, even though that subject may be 'understood'. For example, the implied subject of the *-ing* participle clause in [2] is *Vincent*, and *himself* is therefore the appropriate reflexive pronoun:

Freeing *himself* with a sharp knife, *Vincent* lurched towards the door. [2]

In [3], it is *John* who is understood to be the subject of the infinitive clause, and the appropriate reflexive is therefore *himself*, even though the subject of the main clause is *she*:

She asked *John* to invite *{ himself
herself }. [3]

Similarly, as the implied subject of a normal 2nd person imperative is *you* (cf 11.25), it would be ungrammatical for such an imperative clause to contain as its object any other reflexive than a 2nd person pronoun:

Help *{ yourselves!
*ourselves!
themselves!

Note [a] In a noun phrase which is a nominalization of a clause (cf 17.51), the antecedent of the reflexive will be an embedded noun phrase which functions as 'subject' of the nominalization:

Philip's boundless admiration of himself is well known.
Your confidence in yourself

As in these examples, the antecedent is normally a subjective genitive (cf 5.116).

[b] When a nonfinite clause or a nominalization has an implied human subject of the most indefinite kind ('someone or other'), the reflexive *oneself* (or its informal equivalent *yourselves*) may be used:

Voting for *{ oneself
yourself }* is unethical.

Pride in *{ oneself
yourself }* was considered a deadly sin.

[c] In informal AmE we can find uses of a personal instead of a reflexive pronoun as indirect object which is coreferential with the subject, eg:

He got *him* ['himself'] a new car. We're going to elect *us* a new president next year.

Obligatory reflexive pronoun as object

- 6.25 We may distinguish the following types of construction in which the reflexive pronoun, when coreferential with the subject, is always used in preference to the objective case pronoun:

(a) With REFLEXIVE VERBS, ie verbs which always require a reflexive object, such as *pride oneself* on:

She always *{ prides herself
prides } on her academic background.

Examples of other reflexive verbs:

absent oneself (from) *avail oneself (of)*
demean oneself (formal) *ingratiate oneself (with)*
perjure oneself

- (b) With SEMI-REFLEXIVE VERBS, *ie* verbs where the reflexive pronoun may be omitted with little or no change of meaning, such as *behave (oneself)*, *shave (oneself)*:

Behave yourself } now!
Behave

He has to { *shave himself* } twice a day.
 shave

Other semi-reflexive verbs are:

adjust (oneself) to *dress (oneself)*
hide (oneself) *identify (oneself) with*
prepare (oneself) for *prove (oneself) (to be)*
wash (oneself) *worry (oneself)*

- (c) With NONREFLEXIVE VERBS, *ie* verbs which are transitive, but are not particularly associated with the reflexive pronoun. Compare [1] and [1a]:

Williams publicly blamed *himself* for the accident. [1]
 Nobody *blamed* him for the accident. [1a]

Other such nonreflexive verbs are, for example:

accuse, admire, amuse, dislike, feed, get, hurt, persuade

It is with reflexive verbs (type a) and nonreflexive verbs (type c) that the choice between reflexive and objective pronoun, as in 6.24 [1] may be made. Compare also *dress* (semi-reflexive verb) in [2] with *get up* (nonreflexive verb) in [3] (*herself* = the mother, *her* = Jane):

Jane's mother dresses { *her* } before 8 a.m. [2]
 (*herself*)

Jane's mother gets { *her* } up before 8 a.m. [3]
 (*herself*)

Note [a] Many verbs can have different constructions, eg: *enjoy*:

I enjoyed { *myself*. ['had a good time']
 the party. ['took pleasure in']
 the guests. ['liked'] (esp AmE)

In AmE this verb is also used intransitively as an imperative: *Enjoy!*, equivalent to 'Bon appétit'.

[b] *Feel* is semi-reflexive in a complex-transitive construction [4], but nonreflexive in copular use [5]:

She always *felt* (*herself*) { a stranger in their house. } [4]
 wounded by his remarks.

She *felt* cold. [5]

[c] In complex-transitive complementation (cf 16.46ff), the coreferential item is the noun phrase that is object of the finite verb clause and subject of the nonfinite verb clause:

The hosts really want us to enjoy *ourselves*.

Nobody insisted on *your* sacrificing *yourself*.

Obligatory reflexive pronoun after a preposition

- 6.26 The following types of construction require a reflexive pronoun after the preposition, if the subject is the intended antecedent:

- (a) With prepositional objects, *ie* prepositional complements which have a close connection with the preceding verb (cf 16.5):

Mary stood *looking at herself* in the mirror.

Do *look after yourselves*!

We did not know what to *do with ourselves*.

He *thinks* too much of *himself*.

They *take* too much *upon themselves*.

- (b) With prepositional phrases following a noun which refers to a work of art, a story, etc:

Every writer's first novel is basically *a story about himself*.

Rembrandt painted *many remarkable portraits of himself*.

Do you have *a recent photograph of yourself*?

Optional reflexive pronoun

- 6.27 The basic reflexive pronoun is sometimes optional, in the sense that it may acceptably be replaced by the more usual ordinary objective pronoun. The *self*-forms are chosen to supply special emphasis:

- (a) In some spatial prepositional phrases:

She's building a wall of Russian books *about her(self)*.

Holding her new yellow bathrobe *around her(self)* with both arms, she walked up to him.

Mason stepped back, gently closed the door *behind him(self)*, and walked down the corridor.

They left the apartment, pulling the spring lock shut *behind them(selves)*.

- (b) In 'semi-emphatic' use. Here the reflexive pronoun normally receives nuclear stress. It does not have the subject as its antecedent, but is commonly used as a more emphatic equivalent of the 1st and 2nd person personal pronouns. Especially, however, when it replaces *I* and *me*, *myself* is felt by many to be a hyperurbanism, a genteel evasion of the normal personal pronoun. The reflexive pronoun in these contexts can be reasonably called 'semi-emphatic' because it can be regarded as an abbreviated version of a sequence of the personal pronoun followed by the emphatic reflexive pronoun (*you yourself, him himself, etc*). Thus there are three possibilities in:

Anyone but { *YOU*
 yourSELF
 you yourself } would have noticed the change.

The latter repetition of the pronoun (*you yourself*) is avoided, however, outside the subject position (cf 6.4f).

The constructions in which the 'semi-emphatic' reflexive occurs are the following:

(i) After the prepositions *like*, *than*, (*as . . .*) *as*, *but* (*for*), *except* (*for*), and *as for* (cf 9.7ff):

For someone *like me/myself*, this is a big surprise.
Except for us/ourselves, the whole village was asleep.
 According to the manager, no one works *as hard as him(self)*.
 Sandra's sister is even taller *than her(self)*.
 No composer enjoyed a better family background than Mozart. *Like him(self)*, both his father and sister were remarkable musicians.
 Guerrero's friends made their peace with the gang. *As for him(self)*, there was little he could do but await the inevitable bullet in his back.

(ii) When a reflexive pronoun (particularly a 1st person pronoun) is coordinated with another phrase:

They have never invited *Margaret and me/myself* to dinner.
 This is a great tribute to *the Scout Movement, and to you/yourself* as its leader.

In this construction, the reflexive pronoun is not limited to 'object territory' (cf 6.5); it can replace a subjective pronoun:

My sister and I/myself went sailing yesterday.

Note [a] Unlike the prepositional phrases of (a) above, many prepositional phrases expressing a spatial (or temporal) relationship require the objective personal pronoun rather than the reflexive pronoun, in spite of coreference with the subject:

He looked <i>about him</i> .	She pushed the cart <i>in front of her</i> .
She liked having her grandchildren <i>around her</i> .	They carried some food <i>with them</i> .
Have you any money <i>on you</i> ?	We have the whole day <i>before us</i> .
She had her fiancé <i>beside her</i> .	

A possible explanation of this (historically older) use of the personal pronoun instead of the compound form in *-self* is that the personal pronoun is not normally in semantic contrast with any other pronoun, and therefore needs no emphasis:

*Have you any money *on me*?

The objective form is normally unstressed, so that the stress is thrown onto the preposition. In some cases the pronoun may in fact be omitted altogether:

Pat felt a sinking sensation *inside (her)*.

The reflexive pronoun, on the other hand, will usually (except in the case of inherently reflexive verbs like *pride oneself*; cf 6.25(a)) imply a contrast between coreference to the subject and reference to something else.

[b] In the following metaphorical use of the preposition, the reflexive pronoun is required:

She was *beside* $\left\{ \begin{array}{l} \textit{herself} \\ \textit{*her} \end{array} \right\}$ with rage.

(cf: 'She placed the attaché case *beside her*'.)

[c] For phonological reasons, sequences like *her herself* would be avoided by many speakers. Compare restrictions on verb sequences such as *be being* (3.73).

[d] In some dialects of English, especially Irish English, reflexive pronouns are common in expressions like:

Is *herself* in? ['Is the lady of the house in?']

Also in more general use we find, eg:

I went to see Mary and John but there was only *himself* at home.
 She was, he knew, a very good secretary and always loyal to *himself*.

Emphatic use

6.28 Reflexive pronouns in emphatic use occur in apposition and have heavy

(nuclear) stress. Unlike basic reflexive pronouns, they may have positional mobility:

$\left\{ \begin{array}{l} \textit{I myself} \text{ wouldn't take any notice.} \\ \textit{I} \text{ wouldn't take any notice } \textit{myself}. \\ \textit{Myself}, \text{ I wouldn't take any notice of her.} \end{array} \right.$

Here the meaning of the pronoun is 'speaking personally'. In other contexts, the pronoun has a meaning better captured by the paraphrase 'X and nobody else':

Do you mean that you spoke to *the Pope himself*?

A: Who told you that Jill was leaving? B: *She herself* told me.

Sometimes there is an explicit contrast between the referent and some other thing or person:

I'd prefer *you* to do the job *yourself*, rather than to leave it to Tony.

On the positioning of the emphatic reflexive pronoun, cf 18.39f.

Note [a] Emphatic reflexives with cataphoric reference are generally literary in tone:
Himself a fervent believer, Newman was nonetheless able to sympathize with those who . . .
 [b] Emphatic reflexives sometimes occur sentence-initially in rather mannered or literary uses:
Myself is thus and so, and will continue thus and so. (Bellow)
Oneself did not die; that, like the very quiddity of otherness, was for others. (Burgess)

Possessive pronouns

Determinative and independent possessives

6.29 Possessive pronouns consist traditionally of two series: the first, 'weak' set of possessive pronouns has a determinative function (cf 5.12ff), while the second, 'strong' set has an independent function as a noun phrase (cf 5.124):

DETERMINATIVE:	<i>my</i>	<i>our</i>	<i>your</i>	<i>his</i>	<i>her</i>	<i>its</i>	<i>their</i>
INDEPENDENT:	<i>mine</i>	<i>ours</i>	<i>yours</i>	<i>his</i>	<i>hers</i>	<i>(its)</i>	<i>theirs</i>

As the genitive forms of personal pronouns (cf 6.2), the possessive pronouns behave very much like the corresponding genitive noun constructions, and they have already been illustrated in that connection (cf 5.117ff).

But whereas the genitive noun does not change its form in moving from determinative to independent function, five of the possessive pronouns change by the addition of a consonant (either /n/ or /z/) to the determinative form:

my /maɪ/ → *mine* /maɪn/
your /jɔː/ → *yours* /jɔːz/, *our* → *ours*, *her* → *hers*, *their* → *theirs*

His already ends in /z/ and therefore does not add a further sibilant; compare [1] and [1a]:

This is <i>MY</i> bike and that is <i>HIS</i> bike.	[1]
This bike is <i>MINE</i> and that is <i>HIS</i> .	[1a]

Its is extremely rare in independent function (but cf Note [a]):

*The collar is *its*.

One reason for this gap is that the pronoun *it* is very rarely stressed (cf 6.16), and this conflicts with the phonological status of the independent possessive, which is always stressed. Another and related reason seems to be that there is rarely semantic motivation for an independent nonpersonal possessive pronoun.

Parallel to the independent genitive, the independent possessive can occur as any of the following nominal elements: subject, object, complement, or prepositional complement. But it is particularly common in complement function. Compare:

DETERMINATIVE	INDEPENDENT
Mary's my daughter's her	The book is { Mary's. my daughter's. hers.

The independent possessive in other functions generally has a quasi-elliptical role, replacing a noun phrase with a determinative possessive:

If you need a bicycle, I'll lend you { mine.
my bicycle.

It also occurs regularly as prepositional complement in the 'post-genitive' construction described in 5.126:

I have been talking to a friend of yours. ['one of your friends']

A: Do you know Wagner's operas?

B: No, the only opera of his I've seen is 'Lohengrin'.

Note [a] Independent *its* may occasionally be found in parallel constructions, such as:

History has *its* lessons and fiction has *its*.

She knew the accident was either her husband's fault or the car's: it turned out to be not *his* but *its*.

[b] Like genitives and *of*-constructions (cf 5.115), constructions with possessive pronouns can be ambiguous, eg: *my* in *Give me back my photograph* may have at least three interpretations:

the one { I own
I took
taken of me

[c] Note the following expressions where the *of*-construction, rather than the possessive, is used:

I can't understand it { for the life of me.
*for my life.

On the face of it, } it seems a good idea.
*On its face, }

I don't trust the likes of him.

This will be the death of me.

Possessives and the 'emphatic determinative *own*'

6.30 The possessive cannot be accompanied by any modifiers or determiners, except for the 'emphatic determinative *own*'. Just as the emphatic reflexive pronoun (cf 6.28) intensifies the meaning of a personal pronoun, so *own* intensifies the meaning of a possessive pronoun. For example, *my own* carries the force of 'mine and nobody else's' in:

This book doesn't belong to the library – it's *my own copy*.

Elsewhere *own* emphasizes coreference between the possessive and the subject of the clause:

Sam cooks *his own dinner* every evening. ['cooks dinner for himself'] [1]

But whereas the reflexive pronoun is often obligatory where coreference with the subject is intended, the addition of *own* to the possessive is optional. Thus, in [1a], *his* could corefer to Sam, but it could also refer to someone quite different:

Sam cooks *his dinner* every evening. [1a]

Similarly, [2] is ambiguous according to whether *their* corefers to *the Housing Associations* or to *people*:

The Housing Associations are encouraging *people* to buy
their houses. [2]

But only the second interpretation, the 'reflexive' one, is possible with:

The Housing Associations are encouraging *people* to buy
their own houses. [2a]

In its turn, *own* can be intensified by the adverb *very*:

Do you like this cake? It's *my very own* recipe. ['a recipe I made
up myself'] [3]

The independent genitive cannot combine with *own*: **yours own*, **mine own*; instead, *own* added to the determinative possessive can serve as an independent noun phrase:

The recipe is *my (very) own*. [3a]

Floyd sometimes plays other musicians' arrangements, but *his own* are much better.

In a similar way, the combination *your own*, *her own*, etc can follow *of* in a 'post-genitive':

I'd love to have a *home of my (very) own*. ['a home which belongs to me
and nobody else']

We're resigning from the firm, and starting a *business of our (very) own*.

Note [a] *Own* can also occur with a genitive noun:

You must try these cookies: it's *Jill's (very) own* recipe.

Own cannot cooccur, however, with an indefinite determiner. Compare:

Have you got { *your own* car?
a car of *your own*?
*an *own* car?

[b] Unlike many other languages, English uses possessives to refer to parts of the body and personal belongings, as well as in a number of related expressions:

He stood at the door with *his* hat in *his* hand.

Mary has broken *her* leg.

Don't lose *your* balance.

They have changed *their* minds again!

The definite article is, however, required in:

She took me by *the* hand.

For a discussion of this use of *the*, cf 5.35.

Reciprocal pronouns

- 6.31 The RECIPROCAL PRONOUNS *each other* and *one another* are related to the reflexive pronouns in that they can be said to express a 'two-way reflexive relationship' (cf 13.46, 13.60). Yet there are important differences between reflexive and reciprocal pronouns. Compare:

REFLEXIVE PRONOUN	RECIPROCAL PRONOUN
Adam and Eve blamed <i>themselves</i> .	Adam and Eve blamed <i>each other</i> .
['Adam blamed himself, and Eve blamed herself.']	['Adam blamed Eve, and Eve blamed Adam.']

Other examples of typical functions of reciprocal pronouns:

All the children trust *one another*.
The party leaders promised to give *each other* their support.
Meg and Bill are very fond of *each other*.

Each other and *one another* are both written as word sequences, but it is better to treat them as compound pronouns rather than as combinations of two pronouns. At the same time, they correspond to the correlative use of *each* ... *other* and *one* ... *another* (cf 6.58) in sentences such as:

They *each* blamed *the other*.
The passengers disembarked *one after another*.

The reciprocal pronouns have the genitive forms *each other's* and *one another's*:

The students can borrow $\left\{ \begin{array}{l} \text{each other's} \\ \text{one another's} \end{array} \right\}$ books.

There is no difference in the use of the two pronouns *each other* and *one another*. Although in prescriptive tradition, *each other* is sometimes preferred for reference to two and *one another* to more than two, this distinction seems to have little foundation in usage. There is, however, a stylistic difference between the two reciprocals in that *each other* is more common in informal style and *one another* in more formal contexts.

Unlike the reflexive pronouns, the reciprocals can corefer only to plural noun phrases (or noun phrases that have a plural quality), since reciprocity presupposes more than one participant:

Bill shaved $\left\{ \begin{array}{l} \text{himself.} \\ \text{*each other.} \end{array} \right\}$

With verbs like *embrace*, *meet*, and *kiss*, which are reciprocal and symmetrical in character (cf 13.60), the reciprocal pronoun is optional:

$\left\{ \begin{array}{l} \text{Anna and Bob met each other in Cairo.} \\ \text{= Anna and Bob met in Cairo.} \end{array} \right\}$

With verbs which are not necessarily symmetrical, the reciprocal pronoun is required in order to express reciprocity:

$\left\{ \begin{array}{l} \text{Anna and Bob wrote letters to each other.} \\ \neq \text{Anna and Bob wrote letters.} \end{array} \right\}$

Each other and *one another* resemble reflexive pronouns in that they cannot be used naturally in subject position. Instead of [1], [1a] is preferred:

?The twins wanted to know what *each other* were/was doing. [1]
Each of the twins wanted to know what *the other* was doing. [1a]

There appears to be no such constraint on reciprocals as subject in nonfinite verb clauses:

The twins wanted *each other* to be present at all times.

However, the rule which excludes occurrence in subject position holds not only for independent pronominal use but also for genitival reciprocals in subject noun phrases. The reciprocals must have coreference with antecedent phrases which have some other genitive or possessive modification. Compare:

**Each other's letters*
?The letters to *each other*
Their letters to *each other* } were delivered by a servant.

- Note [a] The plural genitive forms **each others'* and **one anothers'* are not used (although these forms sometimes occur as erroneous spellings of *each other's* and *one another's*).
[b] The reciprocal pronouns are rather infrequent items. In the million-word Brown corpus of printed AmE, for example, there are only 114 instances of *each other* and 45 instances of *one another*.

Relative pronouns

- 6.32 Relative pronouns introduce relative clauses, eg:

The book *which* you ordered last month has arrived. [1]

In [1], the relative pronoun *which* introduces the relative clause *which you ordered last month*. Relative pronouns differ from personal pronouns in that the element which contains or comprises the relative pronoun is always placed at the beginning of the clause, whether it is subject, complement, adverbial, postmodifier, prepositional complement, or object (as in [1]). Compare the position of *it* as object:

The book has arrived. You ordered *it* last month. [1a]

Relative pronouns resemble personal pronouns in that they have coreference to an antecedent (cf 6.15). In [1], the antecedent of *which* is *book*. Here, as in most relative clauses, the antecedent is the preceding part of the noun phrase in which the relative clause functions as postmodifier:

[the book [which you ordered last month]]

Unlike personal pronouns, relative pronouns have the double role of referring to the antecedent (which determines gender selection, eg: *who/which*) and of functioning as all of, or part of, an element in the relative clause (which determines the case form for those items that have case distinction, eg: *who/whom*). Further details of relative clause formation are given in 17.10ff.

Restrictive and nonrestrictive

- 6.33 The semantic relation between the clause and its antecedent may be either

restrictive or nonrestrictive, and this is the basis of an important distinction between RESTRICTIVE and NONRESTRICTIVE relative clauses.

Restrictive relative clauses are closely connected to their antecedent or head prosodically, and denote a limitation on the reference of the antecedent, eg:

This is not something *that would disturb me ANYway*.

Nonrestrictive clauses are parenthetic comments which usually describe, but do not further define, the antecedent, eg:

They operated like politicians *who notoriously have no sense of humour at ALL*.

The differences between restrictive and nonrestrictive relative clauses will be further discussed in 17.13ff. For the present, we only need to mention this difference in order to indicate how it affects the choice of relative pronoun, as appears in Table 6.33:

Table 6.33 Relative pronouns

	RESTRICTIVE		NONRESTRICTIVE	
	personal	nonpersonal	personal	nonpersonal
SUBJECTIVE CASE	<i>who</i> <i>that</i>	<i>which</i> <i>that</i>	<i>who</i>	<i>which</i>
OBJECTIVE CASE	<i>whom</i> <i>that</i> zero	<i>which</i> <i>that</i> zero	<i>whom</i>	
GENITIVE CASE	<i>whose</i>			

Wh-pronouns, *that*, and zero

6.34 Relative pronouns include two series:

- (a) *wh*-pronouns: *who*, *whom*, *whose*, *which*
- (b) *that* and zero

Compare:

I'd like to see the car $\left\{ \begin{array}{l} \textit{which} \\ \textit{that} \\ () \end{array} \right\}$ you bought last week.

(Zero is indicated by '().') Neither series has number or person contrast. However, the *wh*-series has gender contrast between personal *who* and nonpersonal *which*, and case contrast between subjective *who*, objective *whom*, and genitive *whose*.

As Table 6.33 shows, *whose* – unlike *who* and *whom* – can have personal reference (cf 5.117), as in [1], and also nonpersonal reference, as in [2], although there is a certain reluctance to use *whose* for nonpersonal antecedents:

The lady *whose* daughter you met is Mrs Brown. [1]

The house *whose* roof was damaged has now been repaired. [2]

Nevertheless relative clauses such as that of [2] are quite frequently attested. If a speaker or writer wishes to avoid the use of *whose* with nonpersonal reference, this can be done, often with some awkwardness, by using *of which* (cf 17.14):

The house $\left\{ \begin{array}{l} \textit{of which} \text{ the roof} \\ \text{the roof of which} \end{array} \right\}$ was damaged ... [2a]

Note [a] *Whose* cannot always be substituted for *of which* or *of whom*. When the *of*-phrase functions as an adverbial, there is no parallel with the genitive [3], but other constructions are available, eg [3a]:

*The poem *whose* I am speaking ... [3]

The poem *of which* I am speaking ... [3a]

[b] *Which* can have a personal noun phrase as its antecedent when the head is a complement with the role of characterization (cf 10.20 and the parallel use of *it*, 6.17 Note [b]):

They accused him of being a traitor, $\left\{ \begin{array}{l} \textit{which} \\ \textit{*who} \end{array} \right\}$ he was.

In restrictive relative clauses, *that* is used in a similar function:

She's not the brilliant dancer $\left\{ \begin{array}{l} \textit{that} \\ () \\ \textit{*who} \end{array} \right\}$ she used to be.

Compare the exclamatory construction with identificatory *that*:

Fool *that* I was! ['I was such a fool']

In none of these sentences could *who* be used.

[c] If the antecedent contains a mixture of personal and nonpersonal elements, *that* can be used as a pronoun which is 'neutral' with respect to *who* and *which*:

The generals complained that the Defence Department had not sent the extra men and equipment *that* they needed.

Who and whom

6.35 In many ways the opposition between *who* and *whom* does not parallel the subjective/objective distinction in the personal pronouns. *Whom* is largely restricted to formal style, and can be avoided altogether in informal style, through the use of *who*, *that*, or zero.

It seems odd that the pronoun *whom* is decidedly 'marked' in relation to *who*, while elsewhere, with *I/me*, *she/her*, etc, the objective form is the 'unmarked' choice (cf 6.4). The best way of accounting for this seems to be to return to the concept of 'subject territory' (cf 6.5), which was defined, for colloquial English, simply as the position preceding the verb, ie the customary position of the subject. In relative clauses, because of the fronting of the *wh*-element, this is the only position of the relative pronoun, whether it is functioning as subject, object, or some other element. Hence, in informal English, there is a tendency to avoid *whom* altogether, and to replace it by the subjective form *who*. In formal style, on the other hand, the tendency is to use *whom* in accordance with the traditional prescriptive rule that *who* is the form for subject and subject complement functions, and *whom* is the form for other functions. When the relative pronoun is object, we meet all the following possibilities:

This is a person $\left\{ \begin{array}{l} \text{whom} \\ \text{who} \\ \text{that} \\ (\quad) \end{array} \right\}$ you should know.

If the relative pronoun is a prepositional complement, we meet yet a further possibility, that of the preposition followed by *whom*:

This is the person $\left\{ \begin{array}{l} \text{to whom you spoke.} \\ \text{whom} \\ \text{who} \\ \text{that} \\ (\quad) \end{array} \right\}$ you spoke to.

However, the further theoretical possibility does not occur, namely *who* following the preposition:

*This is the *person to who* you spoke.

The reason is that there is a stylistic incompatibility between the preposition + relative pronoun construction (*to whom*), which is rather formal, and the use of *who* rather than *whom* as prepositional complement (*who ... to*), which is informal.

Thus the behaviour of *who* and *whom*, which would otherwise appear irregular and puzzling, can be explained in terms of the different notions of case operating in formal and in informal usage.

Note [a] The hypercorrect use of *whom* is common in examples of pushdown relative clauses (cf 17.63) such as this:

*The Ambassador, *whom* we hope will arrive at 10 a.m., ...

Here the relative pronoun is the subject of *will arrive* but is felt to be in object territory in relation to *we hope* embedded in the relative clause (cf: *We hope that she will arrive at 10 a.m.*). On the other hand, no hypercorrection is involved in the following:

The Ambassador, *whom* we expect to arrive at 10 a.m., ...

This is evident, again, if we compare the relative clause with a corresponding construction with a personal pronoun (cf 6.38 Note [b]):

We expect her to arrive at 10 a.m.

The following example represents a case where the hypercorrection has been institutionalized, and where in fact there is no alternative relative pronoun:

Here is Captain Morse than *whom* there is no braver soldier.

[b] The relative pronouns discussed above have been those used in adnominal relative clauses (cf 17.9). We should briefly mention here also the pronouns *what*, *whatever*, *whichever*, and *whoever*, which are used to introduce nominal relative clauses (cf 15.8f, 17.12), eg:

You can do *whatever you like*. ['that which you like']

[c] Very occasionally nonrestrictive relative clauses are introduced by the relative determiner *which*, rather than by a relative pronoun (cf 17.24):

We arrived at noon, *by which time* the demonstration was over.

Again, nominal relative clauses permit a different set of determiners: *which*, *whichever*, *whatever* (cf 15.8f), eg:

You should wear *whichever dress suits you best*.

Interrogative pronouns

6.36 These are formally identical with the *wh*-series of relative pronouns, but have a different function. They correspond closely to interrogative determiners (cf

5.14), and we shall discuss the use of both types of interrogative word together, *ie* the following items:

PRONOUN FUNCTION: *who whom whose what which*
 DETERMINATIVE FUNCTION: *whose what which*

Who, *whom*, and *whose* are subjective, objective, and genitive case forms respectively, and have personal gender. The other interrogatives are not distinctive for case or gender. Note in particular that, unlike relative *which*, interrogative *which* can be used not only with nonpersonal but also with personal reference:

RELATIVE: The author $\left\{ \begin{array}{l} \text{who} \\ \text{*which} \end{array} \right\}$ is my favourite is ...
 INTERROGATIVE: $\left\{ \begin{array}{l} \text{Which} \\ \text{Who} \end{array} \right\}$ is your favourite author?

In meaning, however, interrogative *who* and *which* differ, *who* being indefinite and *which* definite, as explained in 6.37.

Indefinite and definite interrogatives

6.37 There are two groups of interrogatives: those with INDEFINITE and those with DEFINITE reference.

(a) Interrogative pronouns referring to persons:

INDEFINITE: *Who* is your favourite conductor?

DEFINITE: *Which* is your favourite conductor? (Von Karajan or Stokowsky?)

(b) Interrogative pronouns not referring to persons:

INDEFINITE: *What's* the name of this tune?

DEFINITE: *Which* do you prefer? (Classical or popular music?)

(c) Interrogative determiners with personal nouns:

INDEFINITE: *What* conductor do you like best?

DEFINITE: *Which* conductor do you like best? (Von Karajan or Stokowsky?)

(d) Interrogative determiners with nonpersonal nouns:

INDEFINITE: *What* newspaper do you read?

DEFINITE: *Which* newspaper do you read? (*The Times* or *The Guardian*?)

In these pairs, *which* implies that the choice is made from a limited number of alternatives which exist in the context of discussion. The alternatives may be made explicit (as they are by the words in parentheses in the above examples), or they may be implicit. Thus a speaker who asks the question [1] assumes that there is a definite set of dictionaries from which a choice can be made:

Which is the best English dictionary?

[1]

A person looking at an old photograph may say *Which is you?*, asking for the

identification of one member of the definite set of persons in the picture. Sometimes the relevant definite set is indicated by a following *of*-phrase, as in [2]:

Which of the three girls is the oldest? [2]

Note [a] The definite meaning of *which* is reflected in the fact that the definite article could not be omitted from [2] above:

**Which of three girls ...?*

[b] In this and in the following sections, we illustrate the interrogative pronouns by their use in direct questions. However, they can equally well occur in subordinate *wh*-interrogative clauses. Compare [3] and [3a]:

What was she wearing? I don't remember. [3]

I don't remember *what she was wearing*. [3a]

[c] The indefinite interrogatives *what*, *who*, and *whose* can be postmodified by *else* (cf 7.69):

What else? Who else?

[d] We can select *who* or *what* rather than *which* even in cases where the number of alternatives is strictly limited by the context:

Who/Which do you like best – your father or your mother?

What/Which will it be – tea or coffee?

Conversely, *which* can be used when there is no limited set of alternatives from which a choice is made:

After all, *which* American has not heard of someone who, a few days after his or her annual check-up, suffered a heart attack?

Who, whom, and whose

6.38 The interrogative determiners *what* and *which* can be personal or nonpersonal:

What { candidate will you vote for?
Which { party are you in favour of?

But the interrogative pronouns *who* and *whom* are personal only:

Who told you where I was? *Who(m)* do you admire most?

In objective use, *who* is informal and *whom* is formal. The distinction is parallel to that between *who* and *whom* as relative pronouns (cf 6.35). Similarly, interrogative *whom* functions like relative *whom*, except that interrogative *whom* strikes most people as even more formal than relative *whom*.

As a prepositional complement, only *whom* can normally follow the preposition, as in [1], whereas both *who* and *whom* can take initial position, as in [1a], leaving the preposition deferred at the end of the clause (cf 9.6):

For whom is she working? (BUT NOT: **For who* is she working?) [1]

Who(m) is she working for? [1a]

As the possessive form of *who*, *whose* can occur in either a determinative function, as in [2], or an independent function, as in [2a] (cf 5.124):

Whose jacket is this? [2]

Whose is this jacket? [2a]

But, unlike relative *whose*, interrogative *whose* cannot have nonpersonal reference. For example, we can say *That ship's funnel was damaged*, but we cannot ask a question with *whose* for which *That ship's* would be an

appropriate answer (even though ships are typically referred to as *she*; cf 5.111 Note):

A: *Whose* funnel was damaged? B: **That ship's*.

Note [a] *Who* has both singular and plural reference, but when neither is explicit in the linguistic context, singular concord is the unmarked term. Thus, even though several voices are heard outside, the natural question will be *Who's there?* rather than ?**Who're there?*

[b] When *who* occurs in noninitial position in clause structure (cf 11.19), the objective use of *who* is acceptable colloquially even after a preposition:

History is written *about who*? Who sleeps *with who*?

In contrast to these, there is a tendency towards hypercorrection in the replacement of *who* by *whom* in noninitial position:

A: Janet was at the party. B: (?)Janet *whom*?

What and which

6.39 *What* and *which* can also occur in prepositional complements with the preposition either in initial or in final (deferred) position; but with an initial preposition, the construction is formal and rather rare:

What are you talking *about*? [1]

On what is he lecturing? <formal> [1a]

Which (girl) are you talking *about*? [2]

On which of the topics is he lecturing? <formal> [2a]

What has a wide range of use, either as a determiner or as a pronoun, and either with personal or with nonpersonal reference:

A: *What's* your address? B: (It's) 18 Reynolds Close.

A: { *What* nationality is she?
What is her nationality? } B: (She's) Finnish.

A: *What* date is it? B: (It's) the 15th of March.

A: *What's* the time? B: (It's) five o'clock.

A: *What* is he doing? B: (He's) mending the phone.

A: *What* was the concert like? B: (It was) excellent.

When it refers to a person, however, *what* as a pronoun is limited to questions about profession, role, status, etc. Contrast:

A: *What's* her husband? B: He's a film director. [3]

A: *Which* is her husband? B: He's the man on the right smoking a pipe. [3a]

A: *Who* is her husband? B: He's Paul Jones, the famous art critic. [3b]

In this last function in [3], *what* elicits an identificatory noun phrase as complement, and so it is the interrogative counterpart of relative *which* (cf 6.34 Note [b]) and of the personal pronoun *it* (cf 6.17 Note [b]) in corresponding contexts.

Note Interrogative pronouns do not accept modification or determination, except for the occurrence of intensifying postmodifiers *What ever ...?*, *Who on earth ...?* (cf 11.14 Note [b]).

Demonstrative pronouns

- 6.40 The demonstrative pronouns *this*, *that*, *these*, and *those* exactly match the form of the four demonstrative determiners (cf 5.14). With the demonstratives, as with the interrogatives, we shall find it convenient to consider together the uses of the determiners and of the pronouns.

The demonstratives have number contrast in both determiners and pronouns. They also have a contrast between 'near' and 'distant' reference:

Table 6.40 Demonstrative pronouns

	SINGULAR	PLURAL
'NEAR' REFERENCE	<i>this</i> (student)	<i>these</i> (students)
'DISTANT' REFERENCE	<i>that</i> (student)	<i>those</i> (students)

Like the definite article and the personal pronouns, demonstratives have definite meaning, and therefore their reference depends on the context shared by speaker/writer and hearer/reader. Also, in the same way, their use may be considered under the headings of SITUATIONAL reference (reference to the extralinguistic situation), ANAPHORIC reference (coreference to an earlier part of the discourse), and CATAPHORIC reference (coreference to a later part of the discourse). As before, we will call the part of the text to which coreference is made the ANTECEDENT.

First, however, let us consider the purely grammatical aspects of the demonstratives.

Number and gender

- 6.41 The singular demonstratives *this* and *that* are used for both count and noncount meaning:

This { *room* / *water* } is too cold. *That* { *loaf* / *bread* } is stale.

Both the singular and the plural pronouns can be used as pro-forms as substitutes for a noun phrase (cf 12.19):

This chair is more comfortable than *that*. [= *that chair*] [1]
Those apples are sweeter than *these*. [= *these apples*] [2]

The same meaning is conveyed by the demonstrative followed by *one(s)* (cf 6.55):

This chair is more comfortable than *that one*. [1a]
Those apples are sweeter than *these ones*. [2a]

In addition, the pronouns can refer to some unspecified object(s):

Come and have a look at *this*. ['this thing, this substance', etc]
Have you heard *this*? ['this piece of news, this joke', etc]
Leave *that* alone! ['that thing, that machine', etc]
Can I borrow *these*? ['these books, these screwdrivers', etc]

But especially in this use, the pronouns are nonpersonal. Thus instead of [3],

which would be an insult (as if the person indicated is not human), we would have to say [3a]:

?Is she going to marry *THAT*? [3]
Is she going to marry *THAT man*? [3a]

Instead of [4] we would have to say [4a]:

*Come and meet *these* over here. [4]
Come and meet *these people* over here. [4a]

An exception to this is the introductory use of a demonstrative pronoun as subject of a clause; in this position the pronoun can have both personal and nonpersonal reference:

This is Mrs Jones. [introducing an acquaintance]
That's my stepmother. [pointing to a photograph]
Are *these* the students who have registered? [pointing to a list of names]
This is Sid. Is *that* Geoff? [on the telephone]

Note *That* refers to degree or measurement in contexts such as:

My brother is six feet tall, but yours must be even taller than *that*. ['taller than six feet']

In spite of appearances, therefore, such examples are not exceptions to the rule that, as a pronoun, *that* does not have personal reference (except in subject position; cf 12.19).

Modification and determination

- 6.42 The demonstrative pronouns are limited as to determination and modification. Like the demonstrative determiners (cf 5.14), they can be preceded by predeterminers, but the *of*-construction is often preferred:

All (of) this is mine.
Could you give me *half (of) that*?
Would you like *both (of) these*?
All (of) those are sold.

They are sometimes postmodified by place adverbials: *these over here*, etc. They can also be postmodified by restrictive relative clauses and other restrictive modifiers:

Those who try hard deserve to succeed. [1]

These watches are more expensive than *those* { *which* / *that* } *we saw* in New York. [2]

That which { *upsets me most* } is his manner. [3]
What

Of these, *those* is personal ['the people'] in [1], and nonpersonal in [2], like *that* in [3]. In fact, *that which* ... is rare and formal, and is generally replaced by *what*.

There is no personal singular **that who* ... , but other constructions are used instead, eg: *anyone who* ... , *the person who* ... ; *he who* ... and *she who* ... are archaic (cf 6.20).

Note [a] On the use of *that* and *those* as substitute forms ('the one, the ones'), as in the following example, cf 12.19:

The song by Schubert is more tuneful than *that* by Britten.

[b] The determiner *those* loses its deictic quality (cf 6.43) in cases like [4] where it is an emphatic equivalent of cataphoric *the* (cf 5.32):

Those memories which we acquire in early childhood rarely lose their vividness. [4]

Situational reference

6.43 When the demonstratives refer to the extralinguistic situation, they are often compared with other DEICTIC or 'pointing' items, which also contrast in terms of 'near' and 'distant' reference:

here ~ there, now ~ then, today ~ yesterday/tomorrow, etc

In the simplest cases, *this* and *that* contrast in terms of the nearness of the referent to the speaker:

This is my friend Charlie Brown. [introducing someone]

That is my friend Charlie Brown. [pointing out someone in a crowd]

The measurement of spatial proximity is a matter of psychological rather than real distance. It can easily be extended to the more abstract sphere of time:

this morning ['the morning of today']

that morning ['the morning of a day some time ago']

It can be extended to an even more abstract and subjective level of interpretation:

Have you seen *this* report on smoking?

['the one I have recently been thinking about'] [1]

Have you seen *that* report on smoking?

['the one I was looking at some time ago'] [2]

In practice, however, [1] and [2] could occur in the same situation, the only difference being the speaker's subjective concept of 'nearness'.

In reference to time, *this* is typically associated with 'what is before us', and *that* with 'what is behind us'. Hence with reference to days and months, *this* Friday or *this* September means 'the Friday/September to come' (cf 9.40). Also, a person about to demonstrate some skill, such as using a can opener, could say [3], but after the demonstration is finished, [4] would be more appropriate:

This is how you do it. [3]

That's how you do it. [4]

Another extension of the near/distant polarity is for *that* to imply dislike or disapproval:

Janet is coming. I hope she doesn't bring *that* husband of hers.

She's awful, *that* Mabel.

Note [a] In this connection, notice a familiar use (considered nonstandard by some speakers) of *this/these* to introduce some new thing or person into a narrative:

There were *these* three men ...

Then I saw *this* girl ...

I was walking home when *this* man came up to me and said ...

Uncharacteristically *this* introduces new information here, instead of referring back to shared information, as is usual. One sign is the occurrence of *this* as a focus of a clause with existential *there* (cf 18.44ff) in a typical beginning of a joke, eg:

There was *this* man/place ...

[b] On the other hand, *that/those* are used informally to 'point back' in a vague way to some shared experience:

I used to enjoy *those* enormous hotel breakfasts.

It gives you *that* great feeling of clean air and open spaces. ['the feeling we all know about']

Anaphoric and cataphoric reference

6.44 The anaphoric and cataphoric uses of the demonstratives are extensions of their situational use.

ANAPHORIC:

I hear you disliked his latest novel. I read his first novel, and *that* was boring, too.

He asked for his brown raincoat, insisting that *this* was his usual coat during the winter months.

CATAPHORIC

He told the story like *this*: 'Once upon a time ...' [1]

The 'near' demonstratives *this/these* can have both anaphoric and cataphoric reference, while the 'distant' demonstratives *that/those* can have only anaphoric reference. The following is therefore decidedly odd (but cf Note [a]):

?He told the story like *that*: 'Once upon a time ...' [1a]

The antecedent of a demonstrative may be either a noun phrase or a larger segment of discourse, viz a clause, sentence, or sequence of sentences. We call this larger segment a 'sentential antecedent':

They will probably win the match. *That* will please my mother.

Many years ago their wives quarrelled over some trivial matter, long forgotten. But one word led to another, and the quarrel developed into a permanent rupture between them. *That's* why the two men never visit each other's houses.

This should interest you, if you're keen on boxing. The world heavyweight championship is going to be held in Chicago next June, so you should be able to watch it there live.

Anaphoric and cataphoric reference can also be illustrated with demonstrative determiners:

I longed to play the piano when I was a child; but in *those* days my parents could not afford an instrument.

These language options are open to our students: Spanish, French, and German.

Note [a] In very limited contexts, eg in expressions of indignation, *that* can be used cataphorically:

What do you think of *THAT*? Bob smashes up my car, and then expects me to pay for the repairs.

[b] *Such* as a pro-form is similar to the demonstratives. It can have anaphoric reference both as a pronoun and as a predeterminer:

No one in his senses would dream of taking an innocent maiden aunt (if *such* exist) to Seneca's *Medea*. It is doubtful, indeed, if *such* plays should be performed at all on the modern stage. [... if innocent maiden aunts exist], [... if plays *such* as Seneca's *Medea* ...]

In [1], *such* occurs first as a pronoun and second as a predeterminer. In [2], *such* has a whole sentence as its antecedent, and could be replaced by *this* or *that* with virtually no change of meaning:

If officialdom makes mistakes, officialdom deserves to suffer. *Such*, at least, was Mr Boyd's opinion.

The anaphoric pronoun *such* can also occur after indefinite determiners such as *all*, *few*, and *many* (cf 5.15 Note) in rather rare and restricted use:

Some reactions to the proposal may be hostile, but { there will surely not be *many such*.
?we can afford to ignore *any such*.
*no *such* have yet been reported. }

As [3] shows, the acceptability of this construction varies according to the determiner which precedes *such*. For the unacceptable *no *such*, postmodification of *none* by *such* is an acceptable alternative:

... but *none such* { has
have } yet been reported.

Indefinite pronouns

- 6.45 The remaining classes of pronouns are termed INDEFINITE: they lack the element of definiteness which is found in the personal, reflexive, possessive, and demonstrative pronouns, and to some extent also in the *wh*-pronouns. Although they are themselves indefinite, however, these pronouns can sometimes combine with elements of definite meaning, such as the definite article: *the ones*, *the few*, *the other*, etc. The indefinite pronouns are, in a logical sense, QUANTITATIVE: they have universal or partitive meaning, and correspond closely to determiners of the same or of similar form (cf 5.14). See Table 6.45 opposite for a list of the main ones.

Compound pronouns

- 6.46 The indefinite pronouns divide into two main categories according to their morphology and their syntactic behaviour. The COMPOUND PRONOUNS are those which are composed of two morphemes, viz a determiner morpheme *every-*, *some-*, *any-*, or *no-*, and a nominal morpheme *-one*, *-body*, or *-thing*. The remaining indefinite pronouns belong to a category which we shall call *OF-PRONOUNS*, because they can be followed by a partitive *of*-phrase: *many (of)*, *some (of)*, etc.

The compound pronouns in Table 6.46a opposite are divided into four classes (universal, assertive, nonassertive, and negative) corresponding to the four classes in Table 6.45.

The twelve compound pronouns are perfectly regular in their formation, the only anomalies being the spelling of *no one* as two words, and the pronunciation of *nothing* with the vowel /ʌ/ rather than /əʊ/.

The pairs of pronouns with personal reference (eg: *everybody*, *everyone*) are equivalent in function and meaning but the pronouns in *-one* are regarded

Table 6.45 Major indefinite pronouns and determiners

	NUMBER	FUNCTION	COUNT		NONCOUNT
			personal	nonpersonal	
UNIVERSAL	singular	pronoun	<i>everyone</i> <i>everybody</i>	<i>everything</i>	(it (. . .)) <i>all</i>
			<i>each</i>		
	plural	determiner	<i>every</i> <i>each</i>		<i>all</i>
		pronoun	(they (. . .)) <i>all/both</i>		
determiner	<i>all/both</i>				
ASSERTIVE	singular	pronoun	<i>someone</i> <i>somebody</i>	<i>something</i>	<i>some</i>
		determiner	<i>a(n)</i>		
	plural	pronoun and determiner	<i>some</i>		
NONASSERTIVE	singular	pronoun	<i>anyone</i> <i>anybody</i>	<i>anything</i>	<i>any</i>
		determiner	<i>either</i> <i>any</i>		
	plural	pronoun and determiner	<i>any</i>		
NEGATIVE	singular	pronoun	<i>no one</i> <i>nobody</i>	<i>nothing</i>	<i>none</i>
			<i>none</i>		
		pronoun and determiner	<i>neither</i>		
	plural	pronoun	<i>none</i>		
	singular or plural	determiner	<i>no</i>		

Table 6.46a Compound pronouns

	PERSONAL REFERENCE		NONPERSONAL REFERENCE
UNIVERSAL	<i>everybody</i>	<i>everyone</i>	<i>everything</i>
ASSERTIVE	<i>somebody</i>	<i>someone</i>	<i>something</i>
NONASSERTIVE	<i>anybody</i>	<i>anyone</i>	<i>anything</i>
NEGATIVE	<i>nobody</i>	<i>no one</i>	<i>nothing</i>

as more elegant than those in *-body*. All the compound pronouns are singular, and have concord with a singular verb even though notionally they may denote more than one thing or person:

Everybody
Everyone } over eighteen now has a vote.

I tried *everything* but *nothing* works.

Somebody
Someone } was telling me you've been to America.

Has { *anybody*
 anyone } got anything to say?

There was { *nobody*
 no one } at the office.

On the use of the plural in coreference to compound pronouns (eg: *Everybody has their off days*), cf 10.43.

Note [a] The frequencies of compound pronouns with *any-*, *every-*, and *some-* that have personal reference are as follows in the LOB and Brown corpora of printed BrE and AmE, respectively:

Table 6.46b Frequencies of compound pronouns with *any-*, *every-*, and *some-*

	BrE	AmE
<i>anybody</i>	32	42
<i>anyone</i>	141	140
<i>everybody</i>	33	72
<i>everyone</i>	106	94
<i>somebody</i>	27	57
<i>someone</i>	117	94

The table shows that, in both corpora, the compounds in *-one* are consistently more frequent than the corresponding compounds in *-body*; but also that compounds in *-body* are more frequent, and compounds in *-one* are less frequent, in AmE than in BrE.

[b] The compound pronouns are pronounced with initial stress, and are thereby minimally distinct in speech from combinations of a determiner and an independent word *body*, *one*, or *thing*. We must be careful, therefore, to distinguish pronouns from the superficially similar sequences of determiner + head: the pronoun *'no one* from *no 'one*, as in *no 'one answer* ['no single answer']; the pronoun *'everyone* from *every 'one*, as in *every 'one of the students*; and the pronoun *'everybody* ['any person'] from *every 'body*, as in *Every (human) body needs vitamins*.

- 6.47 The compound pronouns are the least problematic of the indefinite pronouns, since they behave in general like noun phrases of very general meaning:

everybody, everyone ['all people']
everything ['all things', 'all matter']

There is no pronoun corresponding to the universal singular determiner *every*. In nominal functions, the determiner combines with the pronoun *one* (with the stress pattern *every 'one* or *'every 'one*):

Every 'one of us will be present.

We played several matches against the visitors, but unfortunately lost *every 'one*.

To emphasize the all-inclusive meaning, *single* is inserted: '(We lost) *every single one*'.

Unlike *every 'one*, which has both personal and nonpersonal reference, the compound pronoun *'everyone* (with stress on the first syllable) can refer only to persons:

I want { *'everyone*
 'everybody } to feel at home.

To the compound pronouns of personal gender we can add the singular genitive ending 's:

This will put *everyone's* mind at rest.
Could you borrow *anybody's* overcoat?
There's *somebody's* glove on the floor.
It was absolutely *nobody's* fault.

A postmodifier *else* can be added to the compound pronouns. Its meaning is illustrated by these paraphrases (cf 7.69):

everyone 'else ['every other person']
nobody 'else ['no other person']
anything 'else ['any other thing']

The genitive ending is added to *else*, and not to the pronoun itself (cf 'group genitive', 5.123):

I must be drinking *someone else's* coffee.
(NOT: **someone's else* coffee)
His hair is longer than *anybody else's*.
(NOT: **anybody's else*)

In addition, the compound pronoun can be postmodified freely by normal restrictive noun-phrase postmodifiers (cf 17.9ff), such as prepositional phrases and relative clauses:

somebody I know *something for dinner*
everyone (that) you meet *anything made of silver*

The compound pronouns cannot be premodified by adjectives (**new nothing*), but instead, adjectival modification is added after the pronoun (cf 17.57):

somebody very tall
nothing new
something nice for dinner
anyone kinder and more considerate than Janice

Of-pronouns

- 6.48 The remaining indefinite pronouns, here called OF-PRONOUNS (cf Table 6.48 over page) are distinguished by the following characteristics:

- (a) They can be followed by a partitive *of*-phrase:

Some *of us* were tired and hungry.

- (b) They can be used as substitutes for noun phrases or other nominal constructions:

Many children learn to read quite quickly, but *some* [= *some children*] need special instruction.

On the classification of pronouns as substitutes, cf 12.10ff.

- (c) They are all (with the exception of *none*) identical in form to the corresponding determiner (cf 5.14).

Table 6.48 Indefinite pronouns which take the partitive *of*-construction

	COUNT		NONCOUNT
	singular	plural	singular
UNIVERSAL (6.49–51)	<i>all (of)</i> <i>each (of)</i>	<i>all (of)</i> <i>both (of)</i>	<i>all (of)</i>
ASSERTIVE (i) <i>some</i> (6.52)	<i>some (of)</i>	<i>some (of)</i>	<i>some (of)</i>
(ii) <i>multal</i> (6.53)		<i>many (of)</i> <i>more (of)</i> <i>most (of)</i>	<i>much (of)</i> <i>more (of)</i> <i>most (of)</i>
(iii) <i>paucal</i> (6.53)		<i>a few (of)</i> <i>fewer/less (of)</i> <i>fewest/least (of)</i>	<i>a little (of)</i> <i>less (of)</i> <i>least (of)</i>
(iv) <i>one</i> (6.54–56)	<i>one (of)</i>	<i>(ones)</i>	
NONASSERTIVE (6.59–61)	<i>any (of)</i> <i>either (of)</i>	<i>any (of)</i>	<i>any (of)</i>
NEGATIVE (6.62)	<i>none (of)</i> <i>neither (of)</i>	<i>none (of)</i> <i>few (of)</i>	<i>none (of)</i> <i>little (of)</i>

Note All the *of*-pronouns can be interpreted as substitutes; but in addition, some of them can be used without the *of*-construction to refer to people in general. The following famous quotations from earlier English illustrate this use, which today is somewhat literary and archaic:

Many are called, but *few* are chosen. [St Matthew's Gospel]

Some are born great, *some* achieve greatness, and *some* have greatness thrust upon them.

[Shakespeare, *Twelfth Night*]

In each case the meaning can be elucidated by inserting *people*: *some* = 'some people', etc.

Universal pronouns

- 6.49 Our plan now is to look at each of the categories of compound pronouns and *of*-pronouns in turn, beginning with the UNIVERSAL pronouns. With each

category, we shall draw attention to parallels between pronouns and determiners.

The relation of universal pronouns to their determiners is shown in Table 6.49. The compound pronouns *everyone*, *everybody*, and *everything* have already been discussed (cf 6.46f).

Table 6.49 Universal pronouns

		COUNT		NONCOUNT
		personal	nonpersonal	nonpersonal
		<i>everyone</i> <i>everybody</i>	<i>everything</i>	<i>all</i> (?everything)
SINGULAR	pronoun	<i>all</i> <i>each</i>		
	determiner	<i>every</i> <i>each</i>	boy/pen	
PLURAL	pronoun and determiner	<i>all</i> <i>both</i>	((of) the boys/pens)	<i>all</i> ((of) the furniture)

All and both

- 6.50 *All* is used with plural nouns for quantities of more than two, and *both* is used with plural nouns for quantities of two only (dual number):

The club is open to people of *both sexes* and *all nationalities*.

Both (of) his parents died young.

All (of) the children were working hard.

When *all* and *both* are followed by a determiner such as *the* (but not by the zero article: **all of boys*), there is a choice between the insertion of *of* and its omission:

All (of) } *the boys* want to become football players.
Both (of)

Technically, *all* or *both* is a pronoun when followed by *of*, and a predeterminer when followed by another determiner (cf 5.15ff).

All, unlike *both*, can also be followed by a singular count noun, as in [1], or by a noncount noun, as in [2]:

His action was condemned by *all (of) the civilized world*. [1]

All (of) that money you gave them has been spent. [2]

Before a singular count noun, however, *all* is somewhat formal, and is frequently replaced by a construction with *whole* as an adjective or noun:

The whole (of the) civilized world denounced the invasion.

Similarly, *both the boys* can be replaced by *the two boys* or *both boys*.

Unless followed by the *of*-phrase, *all* and *both* follow a personal pronoun rather than precede it:

All of us } like Peter.
We all }

I've met { *both of them* } before.
 { *them both* }

When *all*, *both*, and *each* (cf 5.16) are postposed in this way, and apply to the subject, they appear in the position of a medial adverb (cf 8.16). According to the rules for adverb placement, this means that they occur immediately after the subject if there is no operator [3], otherwise after the operator [4, 5]:

They { *all* } won their matches. [3]
 { *both* }

We were { *all* } { fast asleep. } [4]
 { *both* } { working. }

The villages have { *all* } been destroyed. [5]
 { *both* }

As [5] shows, the postposed universal pronoun may also occur after a nonpronominal noun phrase as subject. In other positions in the sentence, however, the postposed pronoun occurs immediately after its head, and the head can only be a personal pronoun:

They told { *us* } { *all* } to wait.
 { **the men* } { *both* }
 { *each* }

Note [a] Used alone, *all* can be equivalent to *everything*:

All } is not lost.
Everything }

In this sense, *all* can be preceded by a possessive pronoun:

He gave *his all*. ['everything he had']

[b] *All* can be premodified by degree adverbials and by modifiers of negative implication: *nearly all*, (*not*) *quite all*, *not all*, *by no means all*, etc.

[c] *Both* is intrinsically definite, and in this differs from the cardinal numeral *two*, even when it is not followed by the definite article:

{ *Both* } her eyes were closed. { *Both* } eyes were closed.
 ?Two of ?Two

The statements containing *two* do not make sense when applied to an individual person, because they imply that there are more than two eyes in question. But determiner + unstressed *two* + noun can be used in:

Her two eyes were like saucers.

Compare also:

the/my/these two boys It was just the two of us.

Each and every

- 6.51 Words like *each*, *every*, and the compounds with *every-* can be termed DISTRIBUTIVE, because they pick out the members of a set singly, rather than considering them in the mass. They are therefore singular in number. Apart from this difference, *each* and *every* as determiners are often equivalent to *all*:

All good teachers study *their* subject carefully. [1]

Every } good teacher studies *his* subject carefully. [1a]
Each }

(On the use of *his* in [1a], cf 6.9.)

All, *each*, and *every one* can also be equivalent in a pronominal function, except that *each* (unlike *every one* and *all*) can refer to just two people or things:

Several cars arrived.

{ *Each (one) of them* was mud-stained. } [2]
 { *Every one of them* was mud-stained. } [2a]
 { *All of them* were mud-stained. } [2b]

There is also a noticeable difference between [3] and [3a, 3b]:

All (of) the girls } received a magnificent prize. [3]
Each one of the girls } [3a]
Every one of the girls } [3b]

While [3] might mean that the girls shared a single prize, [3a] and [3b] both mean that there were as many prizes as girls. Note that *each* as a pronoun [4] is equivalent to *each* as a determiner followed by *one* [4a], and to *each* as a determiner followed by a noun [4b]:

Each of the states } has its own flag. [4]
Each one of the states } [4a]
Each state } [4b]

Note [a] The distributive use of *each* is further discussed in reference to coordination in 13.61. On concord with *each*, cf 10.37 Note [b].

[b] All of the quantitative pronouns have a distributive use (cf 10.47), as in [5]; usually the plural has the same meaning and is preferred to the singular, as in [5a]:

All the children have their own bicycle. [5]
All the children have their own bicycles. ['one bicycle for each'] [5a]

Assertive pronouns

The *some* series

- 6.52 The term ASSERTIVE applies to pronouns and determiners which are associated with 'assertive territory' rather than 'nonassertive territory' (cf 2.53ff). The clearest case of this distinction is to be found in the contrast between *some* and *any*, and between their corresponding compound pronouns *somebody*, *anybody*, etc (cf 6.46).

Some as a determiner [1, 2] and as a pronoun [1a, 2a] occurs most typically with plural and noncount nouns:

Some rolls have been eaten. [1]
Some bread has been eaten. [2]
Some (of the rolls) have been eaten. [1a]
Some (of the bread) has been eaten. [2a]

In these examples, *some* as a plural form contrasts with *one*, which is singular (cf 6.54ff):

One } of the rolls has been eaten.
**Some* }

But as a determiner, *some* also occurs with singular count nouns, especially temporal nouns:

"*Some 'day*, I'll tell you a great secret. ['one day']
 They've been staying in the village for '*some* "time.

With other singular nouns, *some* is less usual, and has the meaning 'a certain' or 'some . . . or other':

Did you see *some strange man* (or other) looking over the hedge?
 I hear that *some rare animal* (or other) has escaped from the zoo.

The addition of *or other* underlines the indefinite or 'unknown' quality of the referent.

Some of followed by a singular count noun is used in a partitive sense:

Some of the loaf has been eaten. ['part of the loaf']

Note [a] On *some* as a substitute pronoun, cf 12.17f.

[b] *Or other* can also be added to compounds beginning with *some*:
 It's time you got *somebody or other* to help you.

[c] Especially in AmE, *some* is strongly stressed with a singular count noun in exclamatory sentences such as:

That was "*some* 'meal! ['a very good meal'] (very informal)

[d] On unstressed *some* in comparison with zero article, cf 5.39f.

Multal and paucal quantifiers

6.53 The multal and paucal group of pronouns, with their matching postdeterminers (cf 5.23), are antonyms with a similar distribution. *Many* ['a large number'] contrasts with *a few* ['a small number'], and *much* ['a large amount'] contrasts with *a little* ['a small amount']:

I know { *many* / *a few* } people in Boston.

{ *Many* / *A few* } (of my friends) were there.

I have eaten { *too much* / *a little* } (of the food).

Much has been said about the cost of medicine.

Much and, to a lesser extent, *many* have acquired some nonassertive force (cf 10.61 Note [b]), with the result that they are rarely used, at least in informal English, without some negative or interrogative implication. Sentences like [1] are uncharacteristic of modern idiomatic English, and there is a preference for open-class quantifiers such as *a great deal* (*of*), as in [1a]:

We have endured { *?much* / *a great deal* }. [1]
 [1a]

Similarly, rather than [2] with *many*, informal English shows a preference for [2a] with *plenty of* and *a lot of* (cf 5.25):

She has { *many* good ideas. / *plenty of* / *a lot of* } good ideas. [2]
 [2a]

As postdeterminer and substitute pronoun, *many* can be preceded by the definite article:

the many dangers we face

The quantifier is followed in this construction by a restrictive relative clause; the quantifier itself, however, has the meaning of a nonrestrictive modifier, so that [3] can be paraphrased as [3a]:

I am well aware of *the many dangers* (that) we face. [3]

I am well aware of the dangers we face – and there are many of them. [3a]

These quantifiers are gradable, and can be accompanied by degree adverbs such as *very*, *too*, *so*, *as*, *enough*. Notice that *quite* precedes the indefinite article in *quite a few* ['a considerable number'], but that *very* follows it in *a very few*:

A: Have you seen (*very*) *many* houses for sale?

B: { Yes, I've seen *quite a few*. / (BUT NOT: **quite many*, **quite several*) / No, I've seen *only a very few*.

There are also comparative and superlative forms as shown in Table 6.53. As

Table 6.53 Comparative and superlative forms of multal and paucal quantifiers

	MULTAL		PAUCAL	
	count	noncount	count	noncount
ABSOLUTE	<i>many</i>	<i>much</i>	<i>a few</i>	<i>a little</i>
COMPARATIVE	<i>more</i>		<i>fewer</i> (<i>less</i>)	<i>less</i>
SUPERLATIVE	<i>most</i>		<i>fewest</i> (<i>least</i>)	<i>least</i>

in the case of determiner function (cf 5.24), there are prescriptive objections against the use of *less* and *least* with plural nouns. Yet they are widely used in informal English. Hence alongside *fewer changes* and *less noise*, the table allows for the possibility of *less changes*. Examples:

There used to be *more* women than men in the country,

but now there are { *fewer* / *less* }.

Most of us enjoy reading.

The is optionally added to *most* in the sense 'the greatest number (of)' (cf 7.84):

In this constituency, the Labour Party often polls *(the) most votes*, and the Tory Party *(the) fewest/least*. But this time, the Tories had *more success than usual*.

Note [a] We keep *a few* and *a little* distinct from *few* and *little*, which are dealt with in 6.62.
[b] *Many*, like *few* (cf 6.62), has a predicative use ['numerous'] in formal and literary English (cf 5.23 Note [c]):

His sins were *many*, and his friends were *few*.

[c] The absolute forms *many/much* and *a few/a little* can precede the comparative forms *more*, *fewer*, and *less* in the comparison of different totals or amounts:

We have had $\left\{ \begin{array}{l} \text{many } \left\{ \begin{array}{l} \text{more} \\ \text{fewer} \end{array} \right\} \text{ (apples)} \\ \text{a few more (plums)} \\ \text{much less (rain)} \end{array} \right\}$ this year than last year.

One

(a) Numerical *one*

6.54 *One* in its numerical sense fits into the list of indefinite pronouns at this point; but it is a versatile word with a number of different functions, which can conveniently be considered together. Three types of pronoun *one* can be distinguished morphologically:

(a) NUMERICAL <i>ONE</i> <i>one</i>	(b) SUBSTITUTE <i>ONE</i> <i>one, ones</i>	(c) GENERIC <i>ONE</i> <i>one, one's, oneself</i>
--	---	--

Fig 6.54 Three types of the pronoun *one*

The cardinal numeral *one* is, naturally enough, singular and count. It is invariable, but can occur, like other cardinals, either as a determiner or as the head of a noun phrase:

DETERMINATIVE FUNCTION	HEAD FUNCTION
$\left\{ \begin{array}{l} \text{(the) one} \\ a \end{array} \right\}$ boy/pen	<i>one of the boys/pens</i>

One can be the stressed equivalent of the indefinite article (cf 5.38), and is also the singular equivalent of the indefinite pronoun *some* in a context like this:

I've made some cakes. Would you LIKE $\left\{ \begin{array}{l} \text{one} \\ \text{some} \end{array} \right\}$ (of them)?

One also occurs in contrast to *the other* or *another* in correlative constructions. *One* (or *the one*) ... *the other* is used with reference to two:

I saw two suspicious-looking men. *(The) one* went this way,
the other that.
One of his eyes is better than *the other*.

One ... *another* or *one* ... *the other* is used with reference to more than two:

We overtook *one* car after $\left\{ \begin{array}{l} \text{another.} \\ \text{the other.} \end{array} \right.$

I've been busy with *one* thing or *another*.

There is an adverbial use of these correlatives in the construction *one* + preposition + *another* [1] or, more usually, preposition + the reciprocal pronoun *one another* [1a], or *one* + preposition + *the other* [1b]:

They talked $\left\{ \begin{array}{l} \text{one with another. (literary)} \\ \text{with one another.} \end{array} \right.$ [1]
[1a]

She stacked the books *one on top of the other*. [1b]

Note On the use of *one* meaning 'a certain' before a name, eg: *one Charlie Brown*, cf 5.63 Note [b].

(b) Substitute *one*

6.55 The substitute pronoun *one* has the plural *ones*, and is used as a substitute for a count noun, or for an equivalent nominal expression (cf 12.15f):

A: I'm looking for a book on grammar.

B: Is this *the one* you mean? ['the book on grammar']

A: Yes, I'd like a drink, but just *a small one*. ['a small drink']

B: I thought you preferred *large ones*. ['large drinks']

Substitute *one* can be easily combined with determiners and modifiers:

those ones I like *the old one* in the kitchen

However, it is only exceptionally that *one* immediately follows the indefinite article: *a one*. *One* alone is used as a substitute for *a/an* + noun:

I'm having *a drink*. Would you like *one* too? ['a drink']

Note [a] *A one* as a numeral can occur when *one* is used as a noun:

I couldn't make out whether the number was a seven or *a one*. ['a number one']

[b] The indefinite article with *one* is also heard more widely in casual speech, as in [1], in the sense of exclamatory 'a single one'; and, as in [2], in coy nonstandard usage in the sense of 'an amusing person':

I had lots of pencils, and now I haven't got *a one*! [1]

You are *a one*! [2]

(c) Generic *one*

6.56 Generic *one* occurs chiefly in the singular and with personal gender. It has the genitive *one's* and the reflexive *oneself* (cf 6.23). The meaning of generic *one* is 'people in general', often with particular reference to the speaker, eg:

I like to dress nicely. It gives *one* confidence. [1]

The use of generic *one* is chiefly formal, and is often replaced colloquially by *you* (cf 6.21):

$\left\{ \begin{array}{l} \text{One would} \\ \text{You'd} \end{array} \right.$ think they would run a later bus than that! [2]

In AmE, the coreferential use of *one* (or genitive *one's* or reflexive *oneself*) is characteristically formal, *he/his/himself* being preferred in regular usage:

One must be careful about $\begin{cases} \text{one's investments. (esp BrE)} \\ \text{his investments. (esp AmE)} \end{cases}$

However, concern over sexual bias (cf 6.10) has caused AmE in effect to move towards adoption of the BrE pattern. On the other hand, in both AmE and BrE the use of generic *one* has never occurred in natural informal use. In consequence, people who embark on sequences involving *one* mix the pronoun *one* with those more natural to informal use. Hence discourse in both AmE and BrE may show vacillation, eg:

It's difficult if *your* house gets burgled, when *one* is out late at work.

Note Generic *one* does not accept determiners or modifiers:
*The cautious *one* can't be too careful, can the *one*?

Half, several, enough

6.57 A miscellaneous group of pronouns may be illustrated at this point. They all have corresponding determiners:

Half (of) the class/children were girls.

I've only read *half* (of) the book.

We had to wait for *half an hour*.

Several (of my friends) attended the conference.

I have *several books* on folklore.

I've had *enough* (of your tantrums/misbehaviour).

Tom is *enough of a sportsman* to accept defeat gladly.

There is *enough* (of the) water to last several weeks.

Several is always plural, and indicates a number slightly greater than *a few*. *Enough* contrasts with *too little* and *too few* (cf 15.73). As determiner, it usually occurs in front of the head noun, but can also (rarely) follow it:

There was $\begin{cases} \text{enough food} \\ \text{food enough} \end{cases}$ to last a whole year.

Note *Half*, normally a predeterminer, as in *half a loaf*, *half an hour* (cf 5.16), also occurs occasionally as a postdeterminer: *a half loaf*, *a half hour*.

Other and another

6.58 *Other* as a postdeterminer follows the other determiners, including quantifiers and (sometimes) numerals (cf 5.20ff):

all the <i>other</i> women	that <i>other</i> colour	several <i>other</i> trees
her <i>other</i> sister	many <i>other</i> ideas	two <i>other</i> letters

As a pronoun, it can follow the same wide range of determiners; it also occurs in a plural form *others*:

Some people complained, but *others* were more tolerant.
Where are *all the others*? ['people, books', etc]
I have one sock, but I've lost *the other* (one).

Others is used in an absolute sense in:

We should be considerate to *others*. ['other people generally']

Another, although spelt as a single word, is to be considered a fusion of the two words *an* and *other*, or alternatively as a reduced version of *one other*:

I've sold my bicycle and bought *another* (one).

I have a/one sister in New York, and *another* in Canberra.

Apart from its usual meaning, *another* also has an incremental meaning of 'a further' or 'one more':

May I borrow *another* piece of paper? ['an additional piece of paper']

In this sense, *another* can be followed by a numeral and a plural noun:

The farm already has ten cows, but they are buying *another five* (cows).
['five more cows']

Although comparatively rare with the *of*-construction, *other/others* and *another* may be classed with the *of*-pronouns. Examples of their use with this construction are:

Some members of our expedition wanted to climb to the summit, but
others of us thought it too dangerous.

I saw *another of* those yellow butterflies yesterday.

The genitive of *another* and *other* is rare when the reference is general:

She has $\begin{cases} \text{*another's} \\ \text{another person's} \\ \text{somebody else's} \end{cases}$ coat.

We are not interested in $\begin{cases} \text{'others'} \\ \text{other people's} \end{cases}$ problems.

But with narrower reference:

Each looked after $\begin{cases} \text{the other's bag. [two people]} \\ \text{the others' bags. [several people]} \end{cases}$

Note *Other* and *another* tend to occur as the second item in correlative combinations (cf 6.31, 6.54), eg:
some people . . . others, the one . . . the other, each . . . other, one . . . other, another.

Nonassertive pronouns

6.59 In addition to the compound pronouns *anybody*, *anyone*, and *anything*, there are two nonassertive *of*-pronouns *any* and *either*. With reference to the distinction (made in 2.53ff) between assertive and nonassertive forms, we can see that there is a parallel between assertive *some* and nonassertive *any*:

Assertive:

Pam bought *some* apples.

Nonassertive, interrogative, positive:

Did Pam buy *any* apples?

Nonassertive, interrogative, negative:

Didn't Pam buy *any* apples?

Nonassertive, negative:

Pam didn't buy *any* apples.

Besides *not*, the negative forms whose scope favours nonassertive forms include for example the following (cf 10.60ff):

(a) Words negative in form: *never, no, neither, nor*

(b) Words negative in meaning:

(i) the adverbs and determiners *hardly, little, few, only, seldom, etc*

(ii) the 'implied negatives' *just, before, fail, prevent, reluctant, hard, difficult, etc*; and comparisons with *too*

Compare the following assertive/nonassertive pairs of sentences:

{ Jean will *always* manage to do *something* useful.

{ Jean will *never* manage to do *anything* useful.

{ There was *a good* chance *somebody* would come.

{ There was *little* chance *anybody* would come.

{ John was *eager* to read *some* (of the) books.

{ John was { *reluctant*
too lazy } to read *any* (of the) books.

Some and any series

- 6.60 The main 'superficial' markers of nonassertion are negative, interrogative, and conditional clauses, but it is the underlying or basic meaning of the whole sentence which ultimately conditions the choice of the *some* or the *any* series (cf 10.61). For example, in sentence [1], the basic meaning is negative and nonassertive, as appears in the paraphrase [1a]:

Freud contributed more than *anyone* to the understanding of dreams.

[1]

Nobody contributed as much to the understanding of dreams as Freud.

[1a]

Conversely, *some* is often used in negative, interrogative, and conditional sentences, when the basic meaning is assertive ('positive orientation', cf 11.6):

Did { *somebody*
anybody } telephone last night?

The difference between these last two can be explained in terms of different presuppositions: *somebody* rather suggests that the speaker expected a telephone call, whereas *anybody* does not. In making an invitation or an offer, it is for the same reason polite to presuppose an acceptance:

Would you like *some* wine?

The following sentences illustrate further the use of the *some* series in superficially nonassertive contexts:

If *someone* were to drop a match here, the house would be on fire in two minutes.

But what if *somebody* decides to break the rules?

Will *somebody* please open the door?

Why don't you ask *some* other question?

Note The primary difference between *some* and *any* is that *some* is specific, though unspecified, while *any* is nonspecific (cf 10.60).

Any and either

- 6.61 *Any* is distinguished from *either* in representing a choice between three or more, while *either* limits the choice to two; thus *either*, like *both* (cf 6.50) and *neither* (cf 6.62), has dual meaning. This difference obtains whether the determiner or the pronoun is used:

I haven't written to { *any of my relatives*
either of my parents } about the marriage.

Can you see { *any part* of the roof?
either end of the tunnel?

Any is also used for plural and noncount phrases:

Have you seen *any* (of the) *men* working on this site?

Don't spill *any* (of the) *wine*.

On concord of verbs and pronouns with *any*, cf 10.42.

Any in its stressed form occurs in 'assertive territory' with the meaning 'it doesn't matter which/who/what'. This is uncommon except (a) where the clause contains a modal auxiliary (especially *will, can, or may*), or (b) where the noun phrase introduced by *any* contains restrictive postmodification (especially a relative clause):

He *will* eat *any* kind of vegetables.

Any dog *might* bite a child if teased.

Any offer *would* be better than this.

I advise you to accept *any* offer *you receive*.

The compound pronouns *anybody, anyone, and anything* are similarly used:

He *will* eat *anything*.

Anyone who tells lies is punished.

And a parallel use of *either*, where the hearer is offered a choice between two, is exemplified in:

You *can* ask *either* of us to help you.

Either of the other offers *would* be preferable to this.

The following sentences illustrate yet another superficially assertive use of *any*:

Please return *any* overdue books to the library.

We are grateful for *any* aid the public can give.

The meaning of *any* is nonassertive here in that its force is conditional: 'overdue books, if there are any'; 'aid, if any can be given'.

Note Any and its compounds can be intensified by the postmodifier *at all*:
Any offer *at all* would be better than this.

Negative pronouns

- 6.62 Corresponding to the negative determiners *no* and *neither*, the negative pronouns are the *of*-pronouns *none* and *neither*, and the compound pronouns *nobody*, *no one*, and *nothing* (cf 6.46). In addition, *few* and *little*, although not morphologically negative, are negative in meaning and in syntactic behaviour. Examples are:

I have received *no* urgent message(s).

None (of the students) $\left\{ \begin{array}{l} \text{has} \\ \text{have} \end{array} \right\}$ failed.

Neither $\left\{ \begin{array}{l} \text{of the accusations} \\ \text{accusation} \end{array} \right\}$ is true.

That's *none* of your business!

I said *nothing* about it.

Nobody $\left\{ \begin{array}{l} \\ \text{No one} \end{array} \right\}$ has sent an apology so far.

Neither differs from *no* and *none* as *either* differs from *any*: it is restricted to a set of two people or things, while *none* applies to three or more entities, and *no* to any number.

Few and *little*, as distinct from *a few* and *a little* (cf 6.53), are negative quantifiers corresponding to *many* and *much*:

There were *few* visitors at the exhibition. ['not many visitors']

Few of the animals will survive the winter. ['not many of the animals']

They have many supporters, while we have *few*.

There was *little* enthusiasm for the project. ['not much enthusiasm']

Little of the original building remains today. ['not much']

They have plenty of money, but we have comparatively *little*.

Few and *little* may be used attributively following *the* and also predicatively:

What we have is but *little*. the *little* money I have left
His faults are *few*. the *few* friends he has

In the attributive construction, *few* follows a determiner such as *the*, *those*, and *what*. The predicative construction is rather literary.

- Note [a] On the choice of singular and plural concord with *no*, *neither*, *none*, etc, cf 10.42.
[b] The relation between the negative and the nonassertive forms, eg the equivalence of *I have none* and *I haven't any*, is discussed in 10.58.
[c] The negative quantifiers *few* and *little* can be intensified by *very*, *extremely*, etc:
extremely few (visitors) *very little* (food)
No, *none*, and the compound negative pronouns, on the other hand, can be intensified by the postmodifiers *at all* and *what(so)ever* (cf also 10.62): *none at all*, *nothing at all*, etc:
A: Did she have an excuse for being late? B: *None at all/what(so)ever*.

Numerals

Cardinal and ordinal numerals

- 6.63 Numerals have both open-class and closed-class characteristics (cf 2.42). They can function either as determinatives or as heads in the noun phrase. The numeral system of cardinals (*one*, *two*, etc) and ordinals (*first*, *second*, etc) will be clear from Table 6.63 below:

0 nought, zero	
1 one	1st first
2 two	2nd second
3 three	3rd third
4 four	4th fourth
5 five	5th fifth
6 six	6th sixth
7 seven	7th seventh
8 eight	8th eighth
9 nine	9th ninth
10 ten	10th tenth
11 eleven	11th eleventh
12 twelve	12th twelfth
13 thirteen	13th thirteenth
14 fourteen	14th fourteenth
15 fifteen	15th fifteenth
16 sixteen	16th sixteenth
17 seventeen	17th seventeenth
18 eighteen	18th eighteenth
19 nineteen	19th nineteenth
20 twenty	20th twentieth
21 twenty-one	21st twenty-first
22 twenty-two	22nd twenty-second
23 twenty-three	23rd twenty-third
24 twenty-four	24th twenty-fourth
25 twenty-five	25th twenty-fifth
26 twenty-six	26th twenty-sixth
27 twenty-seven	27th twenty-seventh
28 twenty-eight	28th twenty-eighth
29 twenty-nine	29th twenty-ninth
30 thirty	30th thirtieth
40 forty	40th fortieth
50 fifty	50th fiftieth
60 sixty	60th sixtieth
70 seventy	70th seventieth
80 eighty	80th eightieth
90 ninety	90th ninetieth
100 a/one hundred	100th (one) hundredth
101 a/one hundred and one	101st (one) hundred and first
102 a/one hundred and two	102nd (one) hundred and second
1,000 a/one thousand	1,000th (one) thousandth
1,001 a/one thousand (and) one	1,001st (one) thousand and first
2,000 two thousand	2,000th two thousandth
10,000 ten thousand	10,000th ten thousandth
100,000 a/one hundred thousand	100,000th (one) hundred thousandth
1,000,000 a/one million	1,000,000th (one) millionth

- Note [a] *One thousand million* (1,000,000,000) is called *one billion* in the American system of numeration. In the UK, *billion* has traditionally been used for 1,000,000,000,000 (10^{12}), corresponding to *one trillion* in the US. However, the American usage where *billion* = 10^9 is now often used also in the UK by people who are ignorant of the double meaning of the word. It is not used by scientists, engineers, and mathematicians according to the British Standards Institution, which recommends that the use of *billion*, together with the equally ambiguous *trillion* (10^{12} or 10^{15}) and *quadrillion* (10^{15} or 10^{18}), should be avoided.
- [b] The convention for separating the thousands in writing varies. In finance it is still normal to use a comma in the UK, eg: £50,000. However, since the comma is used to indicate the decimal point in most non-English-speaking countries, the comma is often avoided also in English, as it would cause confusion. In science and engineering a space is used, eg: 50 000, and there are signs that this practice (which accords with the recommendation of the International Organization for Standardization) is beginning to be accepted for money as well, eg: £3 982.

6.64 The typographical distinctions in the table draw attention to the fact that cardinal numerals for 1 to 13, and 20, 30, 50, 100, 1000, etc are unsystematic, and have to be learned as individual items. Cardinal numerals from 14 to 99 are largely systematic, since they are formed by adding endings to the other numbers. There are two sets of such derivative numerals: 14 to 19 are formed by the ending *-teen*; 40, 50, 60, 70, 80, 90 are formed by the ending *-ty*. Compare the series:

six ~ six^{teen} ~ 'sixty
seven ~ seven^{teen} ~ 'seventy

Note however the spelling shift in:

four ~ four^{teen} ~ 'forty

Note also the pronunciation and spelling changes in:

five /aɪ/ ~ fif^{teen} /ɪ/ ~ 'fifty /ɪ/

Ordinal numerals for 1 to 3 are unsystematic: *first*, *second*, *third*. The rest are formed by adding *-th* to the cardinal numerals. (But note the change in *five* ~ *fifth*.) Cardinal numerals ending in *-y* change to *-ie* before *-th*:

four ~ fourth fourteen ~ fourteenth forty ~ fortieth
five ~ fifth fifteen ~ fifteenth fifty ~ fiftieth
six ~ sixth sixteen ~ sixteenth sixty ~ sixtieth

Both cardinal and ordinal numerals can function like pronouns [1–4] or like postdeterminers [5–6]:

- Five* is an odd number. [1]
There are *nine* (of them). [2]
I was the *tenth* on the list. [3]
She was only *five*. ['five years old'] [4]
There are 57 people on board. [5]
He referred to the *Fifth* Amendment. [6]

On the appositive use in *number five*, *page nine*, etc, cf 17.88 Note.

The ordinals in pronominal use are usually preceded by the definite article [7], and thus resemble superlatives with ellipted heads [8]:

Today is the *fourteenth* (day) (of July). [7]
This is the *best* (runner) of them all. [8]

- Note [a] Unlike the change of *-y* to *-ie(s)* in nouns (cf 5.81) and verbs (cf 3.10), the change from cardinals ending in *-y* to ordinals ending in *-ie(th)*, adds a syllable. Compare:
sixty ~ the *sixties* /'sɪkstɪz/ ~ the *sixtieth* /'sɪkstɪəθ/
[b] Numerals in word-form between 21 and 99 (except the multiples of ten) are hyphenated: *twenty-one*, *eighty-six*, etc (on written fractions, cf 6.67). Small numerals – variously taken as under 20 or under 100 – are usually spelled as words in connected writing. Even large numerals are spelled out at the beginnings of sentences.
[c] The sign 0 is frequently read as /nɒt/, especially in BrE, where it is spelt *nought*. In AmE *zero* /'ziərəʊ/ is more commonly used. In both varieties, *zero* is normal in scientific contexts and also for temperature:

It's five degrees below zero.

Oh /əʊ/ is most frequent in reading out large sequences such as telephone and house numbers:

Extension 5076 'five oh seven six'

(James Bond) 007 'double oh seven'

When one is not talking about number values but quantities, there is a wide range of expressions, eg:

Italy won 4–0. 'four nil', 'four (to) *nothing*' [football]

It's Georgia over Alabama, 7–0. 'seven *zip*' [AmE sports reporting]

The score is 30–0. 'thirty *love*' [racket sports]

Also expressions with the pronouns *no* and *none* are used (cf 6.62), eg:

We had five lectures last week but *none* this week.

There will be two lessons tomorrow but *no* lesson on Tuesday.

[d] Note the following informal ways of indicating approximate numbers:

some eighty people [some unstressed]
80-odd people [BUT NOT: *85-odd people]
80 people or {so thereabouts} } ['about eighty']
80 or so people
a good eighty people ['at least 80']

An example of approximate time:

I'll be there *eightish*. ['about eight o'clock']

Hundred, thousand, million

6.65 With *hundred*, *thousand*, and *million*, *one* has an unstressed variant *a* (cf 5.38):

\$100 is read as 'one (or a) hundred dollars'

However, only *one* can be used after another numeral [1], and usually in the low year dates [2]:

1100 is read as {one} thousand {one} hundred' [1]
169 BC is read as 'one hundred (and) sixty-nine BC' [2]

Since *one* is a numeral, it can be preceded by a determiner:

the/a/that 100 ('one hundred') metre race

Hundred, *thousand*, and *million* are used both as numerals, as in [3], and as quantity nouns with plural *-s* and followed by *of* (cf 5.89), as in [4] and [5]:

Ten million viewers saw the title fight on TV. [3]
 Millions (of people) are starving. [4]
 Hundreds of thousands (of people) are homeless. [5]

In technical contexts, *thousand* is sometimes abbreviated *k* and *million m*:

That's a job which pays \$25k.
 \$25m 'twenty-five million dollars'

Dates

6.66 We always read year dates as hundreds:

in 1985 { 'nineteen eighty-five'
 'nineteen hundred and eighty-five' <formal>
 *'one thousand nine hundred and eighty-five'
 in the 1600s 'sixteen hundreds'

Other examples:

in the 17th century 'seventeenth century'
 in the 1980s read (but rarely written) as: 'nineteen-eighties' (cf: in the
 early eighties; a woman in her (early/mid/late) thirties; a girl in her
 early/mid/late teens)

Day and month are usually indicated thus:

7(th) February or February 7(th) read as 'the seventh of February',
 'February the seventh', also 'February seven', or 'February seventh'

In date abbreviations, numerals are normally separated by an oblique, or
 a period:

7/2/82 or 7.2.82

Both could be used for '7(th) February 1982' <BrE> or 'July 2(nd), 1982'
 <AmE>.

Numerals in abbreviations for times of day contain a colon <esp AmE> or
 a period <BrE>, as in:

6:30 or 6.30 'six-thirty' or 'half past six'

Fractions

6.67 Vulgar fractions are written and read thus:

$\frac{1}{2}$	'a/one half'	$\frac{2}{3}$	'two-thirds'
$\frac{1}{3}$	'a/one third'	$\frac{7}{8}$	'seven-eighths'
$\frac{1}{4}$	'a/one quarter'	$3\frac{1}{2}$	'three and three-quarters'
$\frac{1}{5}$	'a/one fifth'	$\frac{8}{10}$	{ 'eight over seventy-six' 'eight seventy-sixths'

Hyphens are often used, particularly in premodification:

a three-quarter mile; three(-)quarters of a mile [fourths is a less common
 alternative to quarters here]

Hyphens are not used with the indefinite article: thus *one-third* but *a third*.
 Note the different read forms for $\frac{1}{2}$ and $\frac{2}{3}$ in premodification:

a three-quarter majority a two-thirds majority

Compare:

He won the race by { a/one hundredth of a second. [= $\frac{1}{100}$]
 a/one two hundredth of a second. [= $\frac{1}{200}$]

He got three hundredths of the money. [= $\frac{3}{100}$]

The point at which integers cease and decimal fractions begin is indicated
 by a period (sometimes raised above the line in BrE). In decimal fractions,
 the whole numerals are read out in the usual way ('seventy-one', etc), but the
 numerals to the right of the decimal point are read out as single digits ('five
 three', etc):

71.53 'seventy-one point five three'

0.426 { 'zero'
 'nought' } point four two six'

Note South African English follows the practice in most Continental European languages of writing
 decimal fractions with a comma (and reading it as 'comma') instead of a period:

1,2% 'one comma two per cent'

Mathematical symbols

6.68 Small numerals are usually spelled out, as it is not usual to introduce
 mathematical symbols into ordinary writing; but such symbols as the
 following are normally flanked only by numerals, not words:

=	'equals'	+	'plus'
-	'minus'	x	'times' or 'multiplied by'
÷	'divided by'	√	'the (square) root of'

Thus:

$$(17 - \sqrt{9 + \frac{64}{9}}) - (4 \times 3) = 15$$

would be read as 'seventeen minus the square root of nine, plus sixty-five
 over five, minus four times three, equals fifteen'. (Mathematical symbols
 make the relationships unambiguous.)

On concord in expressions like '2 and 2 is/are 4', cf 10.37 Note [e].

Currency statements

6.69 The dollar sign (\$) and the pound sign (£) are written before the numeral but
 said after the numeral:

\$475 'four hundred (and) seventy-five dollars'
 £7.3m 'seven point three million pounds'

The abbreviations *p*, for both singular *penny* and plural *pence* (cf 5.90), and *e*,
 for *cent(s)*, are written solid after the numeral:

87*p* 'eighty-seven pence' (informal: /pi:/)
 75*c* 'seventy-five cents'

In currency statements, the period is usually ignored in reading. The combinations of £ and *p* and of \$ and *c* are pronounced as follows (from most to least formal):

£8.25 { 'eight pounds twenty-five pence'
 'eight pounds twenty-five'
 'eight twenty-five'
 \$3.40 { 'three dollars (and) forty cents'
 'three dollars forty'
 'three forty'

Bibliographical note

General on pronouns: Bolinger (1977b, 1979); Dušková (1965); Jackendoff (1968); Jacobsson (1970); Langacker (1969); Lees and Klima (1963); Storms (1964).

On personal, possessive, and reflexive pronouns, see Erdmann (1978); Helke (1979); Jacobsson (1968a); Seppänen (1980); Wales (1980); Wood (1955/6); on reciprocal pronouns, see Kjellmer (1982); on demonstrative pronouns, see R. Lakoff (1974).

On indefinite pronouns, see Bald (forthcoming); Bolinger (1976); Close (1976); Conrad (1979); Sahlén (1979).

On numerals, see Peters (1980); Seppänen (forthcoming b).

ADJECTIVES

Characteristics of the adjective

- 7.1 We usually cannot tell whether a word is an adjective by looking at it in isolation, because the form of a word does not necessarily indicate its syntactic function. Some suffixes are indeed found only, or typically, with adjectives (cf App I.38ff), eg:

-able: comfortable	-al: seasonal
-ful: playful	-ic: scientific
-ish: greyish	-less: useless
-ous: dangerous	-y: dirty

However, many common adjectives have no identifying form, eg: *good, hot, little, young, fat*.

Nor can we identify a word as an adjective merely from its potentialities for inflection. It is true that many adjectives inflect for the comparative and superlative, eg:

great ~ greater ~ greatest

But many do not allow inflected forms (cf 7.81), eg:

*disastrous ~ *disastrouser ~ *disastrousest*

Moreover, a few adverbs can be similarly inflected (cf 7.83), eg:

(He worked) *hard ~ harder ~ hardest*

Many adjectives provide the base from which adverbs are derived by means of an *-ly* suffix (cf 7.46, App I.41), eg:

adjective *great* ~ adverb *greatly*

Nevertheless, some do not allow this derivational process; for example, there is no adverb **oldly* derived from the adjective *old*. And there are a few adjectives that are themselves derived from an adjective base in this way, eg: *kindly*, an item functioning also as an adverb.

Four criteria for adjectives

- 7.2 Four features are commonly considered to be characteristic of adjectives (but cf 7.4 Note):

(a) They can freely occur in ATTRIBUTIVE function (cf 7.20), ie they can premodify a noun, appearing between the determiner (including zero article) and the head of a noun phrase:

an ugly painting, the round table, dirty linen

(b) They can freely occur in PREDICATIVE function (cf 7.20), ie they can function as subject complement, as in [1], or as object complement, as in [2], eg:

The painting is <i>ugly</i> .	[1]
He thought the painting <i>ugly</i> .	[2]

(c) They can be premodified by the intensifier *very* (cf 7.56), eg:

The children are *very happy*.

(d) They can take COMPARATIVE and SUPERLATIVE forms (cf 7.75). The comparison may be by means of inflections (*-er* and *-est*), as in [3-4], or by the addition of the premodifiers *more* and *most* ('periphrastic comparison'), as in [5-6]:

The children are <i>happier</i> now.	[3]
They are the <i>happiest</i> people I know.	[4]
These students are <i>more intelligent</i> .	[5]
They are the <i>most beautiful</i> paintings I have ever seen.	[6]

Central and peripheral adjectives

- 7.3 However, not all words that are traditionally regarded as adjectives possess all of these four features. It is, for example, only in exceptional cases that *afraid* can occur attributively (feature (a) above) and *utter* can occur predicatively (feature (b)):

?**afraid* people ~ People are *afraid*.

utter nonsense ~ ?*That nonsense is *utter*.

Neither premodification by *very* (feature (c)), nor comparison (feature (d)), applies to, for example, *infinite* in:

God's infinite mercy ~ God's mercy is infinite.

BUT: *God's mercy is very infinite. *It's more infinite than . . .

We analyse adjectives with respect to these four features. To illustrate the types, we have selected eight words, including among them instances that are on the borderline between the adjective and adverb classes.

For testing predicative position, we use the following frame with *seem* as copular verb: '(The) noun *seemed* ____'. Since words can belong to more than one class, we place them in the context of a sentence, so that it should be clear which use of the words is being tested (cf Table 7.3):

John is <i>hungry</i> .	[1]
The universe is <i>infinite</i> .	[2]
Susan is an <i>old</i> friend.	[3]
The prisoners were <i>afraid</i> .	[4]
Bob is an <i>utter</i> fool.	[5]
The patient was <i>asleep</i> .	[6]
The meeting is <i>soon</i> .	[7]
Anna is <i>abroad</i> .	[8]

Table 7.3 Criteria for establishing adjective classes

- (a) = attributive use
 (b) = predicative use after the copula *seem*
 (c) = premodification by *very*
 (d) = comparison

	(a)	(b)	(c)	(d)	
[1] <i>hungry</i>	+	+	+	+	CENTRAL
[2] <i>infinite</i>	+	+	-	-	
[3] <i>old</i>	+	-	+	+	
[4] <i>afraid</i>	?	+	+	+	
[5] <i>utter</i>	+	-	-	-	PERIPHERAL
[6] <i>asleep</i>	-	+	-	-	
[7] <i>soon</i>	-	-	+	+	ADVERBS
[8] <i>abroad</i>	-	-	-	-	

7.4 If we examine Table 7.3, we see that [1] *hungry* alone satisfies all four criteria; [2] *infinite* accepts (a) and (b); [3] *old* accepts (a), (c), (d); [4] *afraid* accepts (b), (c), (d); [5] *utter* satisfies only (a), and [6] *asleep* only (b); [7] *soon* accepts (c) and (d); while [8], finally, satisfies none of the four criteria.

Criterion (c), acceptance of premodification by *very*, and criterion (d), the ability to take comparison, have no diagnostic value in distinguishing adjectives from adverbs. These two features generally coincide for a particular word, and are determined by a semantic feature, gradability, which cuts across word classes (cf 7.42). Thus, as we can see in the table, the adverb *soon* is gradable, just like the central adjective *hungry*. Many adverbs are gradable, just as many adjectives are gradable. And these two word classes use the same features to realize the gradability of an item, in particular premodification by *very* and comparison (cf 7.74ff). Hence, these two features neither distinguish adjectives from adverbs, nor are they found in all adjectives.

In this book the first six words in the table (*hungry*, *infinite*, *old*, *afraid*, *utter*, *asleep*) are regarded as ADJECTIVES, whereas *soon* and *abroad*, at the bottom of the table, are assigned to the ADVERB class.

We consider the ability of functioning both attributively and predicatively to be a central feature of adjectives. Words like *hungry* and *infinite*, which satisfy both these criteria (a and b), are therefore called CENTRAL adjectives.

Words like *old*, *afraid*, *utter*, and *asleep*, which satisfy at least one of these first two criteria (a or b), are called PERIPHERAL adjectives.

Note The use of the criteria for testing adjective status of words like *infinite* is complicated by the fact that there is a prescriptive tradition forbidding the use of *very* or the comparative with intensifying adjectives like *perfect*, *absolute*, *unique* (cf 7.33f), and also with the corresponding adverbs (*perfectly*, *absolutely*, *uniquely*) (cf 8.106).

The adjective in relation to other word classes

7.5 We now consider some other examples of overlapping between the adjective class and other word classes. The overlapping may be due to syntactic features that are characteristic of other classes but displayed by some

adjectives, or to features characteristic of the adjective class but displayed by some members of other classes. The three relevant word classes are adverbs (7.6–11), nouns (7.12–14), and participles (7.15–19).

Adjectives and adverbs

Adjective and adverb homomorphs

7.6 There is a certain overlap between the adjective and adverb classes. Compare the adjective function of premodification in the left-hand column and the adverb function of adverbial in the right-hand column:

a *rapid* car ~ drive $\left\{ \begin{array}{l} \text{rapidly} \\ *rapid \end{array} \right\}$ [1]

a *fast* car ~ drive $\left\{ \begin{array}{l} *fastly \\ fast \end{array} \right\}$ [2]

a *slow* car ~ drive $\left\{ \begin{array}{l} slowly \\ slow \end{array} \right\}$ [3]

Example [1] represents the normal case, where there is regular variation between form and function of the adverb and adjective, and where the adverb is formed by the derivational suffix *-ly* (cf 7.46, Type (c)).

Fast in [2] has identical form in both adjective and adverb functions. Similarly, *long* and *short*, for example, can be used as both adjective and adverb:

Did you have to wait $\left\{ \begin{array}{l} \text{a long time?} \\ long? \\ *longly? \end{array} \right\}$ She $\left\{ \begin{array}{l} \text{had short hair.} \\ \text{cut her hair } \left\{ \begin{array}{l} short. \\ *shortly. \end{array} \right. \end{array} \right\}$

Whereas there is no adverb **longly*, there is an adverb *shortly*, but with a different meaning 'soon', as in *I'll be back shortly*. Adjective/adverb homomorphs are exceptional, and many such uses in adverb function occur chiefly in fixed expressions (cf 7.8).

7.7 In 7.6 [3], both *slow* and *slowly* function as adverb. Adjective forms like *slow* differ from the corresponding adverb forms in several ways. The adjective form, if admissible at all, is restricted to a position after the verb or (if present) the object:

He $\left\{ \begin{array}{l} slowly \\ *slow \end{array} \right\}$ drove the car into the garage.

He drove the car $\left\{ \begin{array}{l} slowly \\ ?*slow \end{array} \right\}$ into the garage.

In those cases where there is variation (eg: *drive slow* ~ *slowly*, *buy cheap* ~ *cheaply*), the adjective form and a corresponding *-ly* adverb form can be used interchangeably, with little or no semantic difference, except that some people prefer the adverb form, particularly in formal style.

In standard use, only a limited number of adverbs are formally identical to adjectives. Thus there are no acceptable sentences:

*He came back *sudden*.

*She buys her clothes *careful*.

By contrast, in nonstandard or very familiar English, the use of the adjective for the adverb form is widespread, eg:

Don't talk *daft*.

She pays her rent *regular*.

They played *real good*.

He spoke to John *sharp*.

However, unlike the absolute form, the comparative and superlative forms of some adjectives are common also in standard English. Compare:

?Speak *clear*. [1]

Speak *clearer*. ['more clearly'] [2]

This newsreader speaks *clearest* of all. ['most clearly'] [3]

Whereas *clear* in [1] is nonstandard for *clearly*, [2] and [3] are both acceptable standard English variants of *more clearly* and *most clearly*, respectively. Other examples:

It's *easier* said than done. ['more easily'] [4]

Ami ran (the) *slowest*. [5]

The car went *slower and slower*. [6]

(The warning 'Danger, go *slow*' is however fully acceptable also to speakers who reject 'Drive the car *slow*'.)

Example [6] with coordination illustrates a factor which helps to make the adjective form particularly acceptable. Whereas *speak clear* is nonstandard, *speak loud and clear* is fully acceptable in standard English. Other examples of coordination are the following:

lose *fair and square*

be brought up *short and sharp*

be tangled up *good and proper* (nonstandard)

Note [a] Cf 7.20 for the use of adjectives expressing the result of the process denoted by the verb, eg:
That powder washed the clothes *white*.

[b] Cf 7.27 for the use of adjectives as the sole realization of a verbless clause, eg:
Nervous, the man opened the letter.

Adverbs without -ly

7.8 There are some other words which, like *fast* in 7.6, have the same form (without the -ly suffix) in adjective and adverb functions, eg:

She arrived in the *late* afternoon. [adjective]

She arrived *late* in the afternoon. [adverb]

Late also has an -ly form, *lately*, but with a different meaning:

Have you seen her *lately*? ['recently']

Other examples are the following (adjective uses are given first):

clean clothes; play the game *clean*; The knife cut *cleanly*.

a *close* friend; stay *close* together; He watched her *closely*.

This ring must be *dear* [(esp BrE) 'expensive']; I paid *dear(ly)* for my mistake; She loved him *dearly*.

a *deep* breath; live *deep* in the woods; breathe *deep(ly)*

a *direct* flight; We flew *direct(ly)* to Paris; Reply to me *direct(ly)* ['direct to me']; I'll see you *directly* ['immediately'] after lunch.

a *fine* view; It works *fine*; The parsley was chopped *fine(ly)*.

a *flat* country; I'm *flat* broke (informal); He's *flatly* opposed to it.

a *high* building; The plane flew *high* above; They were praised *highly*.

light weapons; She travels *light*; They were *lightly* armed.

a *sharp* turn; She turned *sharp(ly)* left; She turned the car *sharply*.

The scar was an inch *wide*; The door was *wide* open; He seems to be

widely known here.

Adjectives and adverbs in -ly

7.9 Some words in -ly can function both as adjectives and adverbs:

ADJECTIVE	ADVERB
an <i>early</i> train	We finished <i>early</i> today.
A <i>likely</i> story!	He'll very/most <i>likely</i> succeed. (esp BrE)
a <i>monthly</i> visit	She visited him <i>monthly</i> .

Words in -ly like *monthly*, which denote time, can also function as time adverbs: *daily*, *fortnightly* (esp BrE), *hourly*, *nightly*, *quarterly*, *weekly*, and *yearly*.

When we require adverbs corresponding to -ly adjectives such as *friendly*, *grisly*, *kindly*, *kingly*, *lively*, *manly*, and *masterly*, we normally use an adjective construction, thus avoiding the double suffix -lily:

She received us in a *friendly* way.

She gave us a *friendly* welcome.

[BUT NOT: *She received us *friendlily*.]

Verbs with *percept* as subject (*smell*, *feel*, *look*, *sound*) have an adjective phrase as complement (cf 4.29f). But there is some uncertainty in the use of adjective and related adverb forms:

The flowers smell { *good*/**well*.
 sweet/?*sweetly*.

There are prescriptive objections to the adverb form for these items with *smell* in this use, and to *badly* with *feel*. With *feel* and *smell*, the adverb form is used to express intensity of feelings:

He felt { *badly* [1]
 keenly [2]
 strongly [3]
 deeply [4] } about it.

It smells *strongly* of garlic.

Note [a] Note the difference in meaning between the adjective and adverb form in the following:

She feels $\begin{cases} \text{bad} & \text{today. [health]} \\ \text{bad/badly} & \text{about it. ['guilty', 'uneasy']} \end{cases}$ [1a]
[1b]

The adjective *keen* has the different sense of 'enthusiastic':

He $\begin{cases} \text{felt} \\ \text{was} \end{cases}$ *keen* about/on it. [2a]

Contrast with the intensifying adverb *strongly* in [3] the physical sense of *strong* in [3a]:

He $\begin{cases} \text{felt} \\ \text{was} \end{cases}$ *strong*. [3a]

[b] The use of adverb forms after *taste* seems much less common and would be unacceptable to many speakers:

The food tastes $\begin{cases} \text{good/?well.} \\ \text{marvellous/?*marvellously.} \end{cases}$

[c] Note the distinction in meaning between the adjectives *good* and *well* (cf 7.38) after *look*:

She looks *good*. [appearance]
She looks *well*. [health]

Adjectives and adverbs beginning with *a-*

7.10 Certain words beginning with *a-* (like *asleep* in 7.3f) have constituted a problem in classification for grammarians, some assigning them to the adjective class, and others to the adverb class. These *a*-words function predicatively, but only a few can be freely used attributively.

Only a relatively small number of adverbs can function predicatively, namely certain place adverbs, eg: *aboard*, *upstairs* (cf 8.41) and time adverbs, eg: *now*, *tonight* (cf 8.76). But even these adverbs are used predicatively only after *be*, while adjectives can be used with other copular verbs as *well* (cf 7.3f). Compare the different patterns with the copular *be* and *seem*:

The patient $\begin{cases} \text{was} & \text{asleep/hungry/abroad/there.} \\ \text{seemed} & \begin{cases} \text{asleep/hungry. [adjectives]} \\ \text{*abroad/*there. [adverbs]} \end{cases} \end{cases}$

Another difference between *a*-adjectives and *a*-adverbs is that *a*-adjectives refer to temporary states and cannot be part of the predication after verbs of motion; *a*-adverbs, on the other hand, denote direction after such verbs. Contrast:

She went $\begin{cases} \text{aboard/abroad/around/away. [adverbs]} \\ \text{*afraid/*alert/*asleep/*awake. [adjectives]} \end{cases}$

The sentences with *a*-adjectives are acceptable only if the adjectives can be interpreted not as part of the predication but as supplementary adjective clauses (cf 7.27f). For example, we might be able to interpret *He went afraid* as 'He was afraid as he went'.

Examples of some other *a*-adjectives:

<i>ablaze</i>	<i>alike</i>	<i>ashamed</i>	<i>adrift</i>	<i>aghost</i>
<i>alive</i>	<i>afire</i>	<i>ajar</i>	<i>alone</i>	<i>averse</i>
<i>afloat</i>	<i>alert</i>	<i>aloof</i>	<i>awake</i>	<i>aware</i>

7.11 *A*-adjectives vary as to whether they can be attributive. Most *a*-adjectives are only marginally acceptable in attributive function, unless they are premodified:

?an *afraid* look ?an *alive* eye

Aloof and *alert*, however, are fully acceptable in attributive function, eg:

an *aloof* character an *alert* manner

Most *a*-adjectives can occur attributively when they are modified:

a *somewhat afraid* soldier
the *fast asleep* children
a *really alive/lively* student
the *wide awake* patient

Some *a*-adjectives have parallel *a*-less forms or synonyms in attributive function:

Their ambitions are *alike*. [cf: They have *similar* ambitions.]
The soldier was *alone*, patrolling. [cf: a *lone/solitary* soldier]
The animals are *alive*. [cf: They are *live/living* animals.]
The woman is *afraid*. [cf: a *frightened* woman]
The children were *asleep*. [cf: the *sleeping* children]
She was not *aware* of the consequences. [cf: a *conscious/deliberate* action]

Some *a*-adjectives freely take premodification by *very* and comparison, eg: *afraid*, *alert*, *alike*, *aloof*, *ashamed*, and *awake*. Others do so marginally, eg: *asleep* and *aware*. *Alive* to in the sense 'aware of' can be premodified by *very* and can be compared. Some of the *a*-adjectives can also be premodified by *very much* (particularly *afraid*, *alike*, *ashamed*, *aware*), and *aware* can be premodified by (*very*) *well*, too. There is vacillation between *so/too alike* and *so much/too much alike*. Since the modifiers *much* and *well* are characteristically taken by many adverbs (cf 7.16 Note), these *a*-words show themselves to be particularly marginal to the adjective class.

Note [a] Adverbs which cannot be used predicatively with *seem* can occur after *seem to be* (a construction which is also available for adjectives):

They seem to be $\begin{cases} \text{aboard, abroad, around. [adverbs]} \\ \text{afraid, alert, asleep. [adjectives]} \end{cases}$

[b] Like the adverbs in *She was downstairs/outside*, *abroad* can be a response to a question introduced by the interrogative adverb *where*:

A: Where is he? B: *Abroad*.

Other *a*-adverbs, eg: *around* and *away*, are less likely to be the sole response to a *where*-question, though they can supply the information requested by *where*:

A: Where is he? B: He is *around/away*.

[c] Notice the contrast between the *a*-adjective in *They looked asleep* and the *a*-adverb in *They looked away*. With *asleep*, *looked* is a copular verb, synonymous with *seemed*. With *away*, it is an intransitive verb, similar in meaning and use to *glanced*.

[d] *Alike* requires reference to coordinated noun phrases or to a plural noun phrase, a constraint identical with that for reciprocal pronouns (cf 6.31). Compare:

John and Mary $\begin{cases} \text{are} \\ \text{like} \end{cases}$ *alike*.
The children $\begin{cases} \text{are} \\ \text{like} \end{cases}$ *each other*.

[e] *Alone* can refer either to a permanent characteristic 'solitary by nature', or to a temporary feature 'without companionship'. In the former sense, it is acceptable, at least to some speakers, in constructions with *seem* and *very*:

(?) She *seemed alone*. (?) She is *very alone*.

[BUT: ?*She *seemed very alone* in the house that morning.]

Adjectives and nouns

- 7.12 Nouns are commonly used attributively, and are thus superficially similar to peripheral adjectives in satisfying criterion (a) (7.3f), eg:

the *bus* station, a *business* friend, *lamb* chops

However, nouns do not satisfy any of the other criteria (b, c, d) for adjective status. Compare:

- | | |
|--------------------------------------|---------------------------------|
| (a) the <i>large</i> station | the <i>bus</i> station |
| (b) The station seems <i>large</i> . | *The station seems <i>bus</i> . |
| (c) a very <i>large</i> station | *a very <i>bus</i> station |
| (d) a <i>larger</i> station | *a <i>busser</i> station |

Furthermore, nouns have other features which distinguish them from adjectives. Compare, for example:

- | | |
|----------------------------------|--------------------------------------|
| I saw a <i>bus</i> . | *I saw a <i>large</i> . |
| The <i>bus</i> is here. | *The <i>large</i> is here. |
| one <i>bus</i> /two <i>buses</i> | *one <i>large</i> /two <i>larges</i> |

The relation of nouns to adjectives is further discussed in 7.13f, and premodification by nouns in 17.104ff.

- 7.13 Some items can be both adjectives and nouns. For example, *criminal* is an adjective in that it can be used both attributively and predicatively:

a *criminal* attack
The attack seemed *criminal* to us.

But the word *criminal* can also be a count noun, since it can:

- (i) take determiners:
The *criminal* pleaded guilty.
He is probably a *criminal*.
- (ii) be inflected for number:
one *criminal* ~ several *criminals*
- (iii) be inflected for the genitive case:
the *criminal's* sentence, the *criminals'* views
- (iv) be premodified by an adjective:
a *violent* criminal

Of course, the attributive use of an item such as *criminal* is not a sufficient criterion for calling it an adjective. As we have seen in 7.12, nouns, as well as adjectives, can be used as premodifiers of nouns. In [1], *criminal* is undoubtedly an adjective, since there is no article or number contrast [1a, 1b]:

- | | | |
|----------------|--------------------------|------|
| His attack was | { <i>criminal</i> . | [1] |
| | *a/the <i>criminal</i> . | [1a] |
| | * <i>criminals</i> . | [1b] |

Similarly, *criminal* in a *criminal* attack is also an adjective, since the phrase is

equivalent to 'a brutal attack' and not to, say, 'an attack by a criminal' (cf 7.14). Moreover, *criminal* is gradable in that phrase:

a *very/rather* criminal attack

It is also an adjective in *criminal law* ('law relating to crime'; cf: *civil law*, *commercial law*) and in both senses of *criminal lawyer* ('a lawyer specializing in criminal law' and 'a lawyer who is criminal'; cf 7.37).

We will therefore say that *criminal* is a homomorph (cf 2.38), ie both an adjective and a noun, and that the relationship between the adjective *criminal* and the noun *criminal* is that of conversion (cf App I.43ff). Here are some other examples of conversions from adjective to noun:

ADJECTIVES	NOUNS
an <i>ancient</i> custom	She is investigating the <i>ancients'</i> conception of the universe.
a <i>black</i> student	There was only one <i>black</i> in my class.
a <i>classic</i> book	You won't find many <i>classics</i> in our library.
<i>intellectual</i> interests	She considers herself an <i>intellectual</i> .
a <i>noble</i> family	The king greeted his <i>nobles</i> .
a <i>natural</i> skier	He's a <i>natural</i> for the job.
a <i>six-year-old</i> boy	Our <i>six-year-old</i> is at school.

- Note Items like *medical*, *physical*, and *oral* are also used without a noun head:
Have you had a *medical/physical* yet?
When is your *French oral*?

They differ, however, from the previous group in that speakers tend to feel that a noun like *examination* is implied, which is not the case with, say, an *intellectual*. On the other hand, *oral* has a plural *orals*, which is an indication of full conversion. *Medical* and *physical* do not have plurals (at least not in general use), and are therefore instances of partial conversion.

- 7.14 Nouns functioning attributively also possess other features which distinguish them from adjectives (cf 7.12). The basically nominal character of a premodifying noun, such as *garden* in *garden tools*, is shown by its correspondence to a prepositional phrase with the noun as complement: *tools for the garden*. Compare also:

the 'city' council ~ the council for the city
a 'stone' wall ~ a wall (made) of stone
'August' weather ~ weather (usual) in August

Such a correspondence is not available for attributive adjectives:

a 'long' poem a 'thick' wall
the 'urban' council 'hot' weather

However, we can sometimes use a postmodifying prepositional phrase with a related noun as complement, eg:

a long poem ~ a poem of considerable length

As indicated, the normal (noncontrastive) stress for both groups is even stress. The stressing of noun + noun sequences and their relation to compounds and prepositional phrases are discussed in 17.104ff.

Like adjectives, nouns can function as subject complement after copular verbs, in particular after *be* (cf 2.17):

That man is *a fool*.
The noise you heard was *thunder*.
She became *a nurse*.

Some nouns can also be used within the subject complement after *seem* (esp BrE). These are indeed very close to adjectives:

He seems *a fool*. [= *foolish*]
Your remark seems (complete) *nonsense* to me. [= *nonsensical*]
My stay there seemed *sheer bliss*. [= *blissful*]
His friend seems very much *an Englishman*. [= *very English*]

Note however the change of premodifier in: *very much an Englishman* ~ *very English*.

The closeness is of course greatest for noncount nouns such as *nonsense* and *bliss*, since, like adjectives, they do not take number contrast. However, they can appear without an overt determiner (unlike adjectives functioning as heads of noun phrases, cf 7.23ff):

She doesn't like *nonsense*. [noncount noun]
She admires *the mystical*. [adjective as head of a noun phrase]

Some noun forms can function both attributively and predicatively, in which case we can perhaps regard them as adjectives (cf App I.51). They denote style or material from which things are made:

that *concrete* floor ~ That floor is *concrete*.
Worcester porcelain ~ This porcelain is *Worcester*.
those *apple* pies ~ Those pies are *apple*. (informal)

Note [a] Attributive nouns can be coordinated with nongradable adjectives, eg: *weekly and morning newspapers*, *city and suburban houses*, but it seems that such conjoinings are normally possible only when there is an ellipted head, but not otherwise:

weekly newspapers and morning newspapers
city houses and suburban houses
*a city and pleasant house

Where both premodifiers are nouns, ellipsis need not be involved, eg:

a glass and concrete house ['a house made of glass and concrete']
a cheese and cucumber sandwich ['a sandwich containing cheese and cucumber']

These become ambiguous in the plural (cf 13.68), eg:

cheese and cucumber sandwiches ['each of the sandwiches contains cheese and cucumber']
or 'cheese sandwiches and cucumber sandwiches']

[b] The nouns that can most easily appear as complement after *seem* are those that are gradable, that is to say the nouns that can be modified by intensifying adjectives (cf 7.33f). However, some speakers, while accepting in this function noncount nouns and singular count nouns, find plural nouns dubious:

?They seem *fools*. ?His friends seem very much *Englishmen*.

Material nouns, which are not gradable, are also dubious after *seem*:

?That floor seems *concrete*. ?Those pies seem *apple*.

[c] *Fun* is primarily a regular noncount noun: *a great deal of fun*, *great fun*, *some fun*. However, in informal usage (esp AmE), *fun* has been fully converted into an adjective:

The party was *fun*; *a fun person*; *a very fun party*

[d] On the use of nouns in cases like *Are you cosmetics?*, cf 5.5 Note.

Adjectives and participles

7.15 There are many adjectives that have the same suffixes as participles in *-ing* or *-ed* (including the variants of *-ed*). These will be called PARTICIPIAL ADJECTIVES:

PREDICATIVE USE

His views were very *surprising*.
The man seemed very *offended*.

ATTRIBUTIVE USE

~ his *surprising* views
~ the *offended* man

They include forms in *-ed* that have no corresponding verbs:

The results were *unexpected*. ~ the *unexpected* results
Her children must be *downhearted*. ~ her *downhearted* children
All his friends are *talented*. ~ his *talented* friends
His lung is *diseased*. ~ his *diseased* lung

When there are no corresponding verbs (**to unexpect*, **to downheart*, **to talent*, **to disease*), the forms are obviously not participles (cf Note below).

When there is a corresponding verb, attributively used *-ed* forms usually have a passive meaning (cf 17.29), eg:

lost property ~ property that *has been lost*

In some cases, however, the *-ed* participle is not interpreted as passive. The passive interpretation is excluded if the corresponding verb can be used only intransitively:

the *escaped* prisoner ['the prisoner who has escaped']
the *departed* guests ['the guests who have departed']

But even in other instances, the participle relates to the intransitive use of the verb; thus the passive interpretation is impossible in:

a *grown* boy ['a boy who has grown (up)']

It is unlikely in:

the *faded* curtains ['the curtains which have faded']
the *retired* manager ['the manager who has retired']

Predicative use occurs only with some of these participial adjectives:

The curtains are *faded*.
Her father is now *retired*.
Her son is *grown*. [dubious in BrE, but *full-grown* or *grown-up* is fully acceptable]
The guests are *departed*.

The last example is archaic, unlike the acceptable *the departed guests* (cf the reverse situation with *go*: *The guests are gone*, **the gone guests*). But contrast:

*The prisoner is *escaped*.

Sometimes there is a corresponding verb, but it has a different meaning. We can therefore have ambiguous sentences where the ambiguity depends on whether the word is a participle or a participial adjective:

- { ADJECTIVE: She is (very) *calculating* (but her husband is frank).
 PARTICIPLE: She is *calculating* (our salaries). ['... so don't disturb her while she is doing the arithmetic.']
- { ADJECTIVE: They were (very) *relieved* (to find her at home).
 PARTICIPLE: They were *relieved* (by the next group of sentries).

Notice that we can replace *be* by *seem* only with the adjectives (cf 3.77 on pseudo-passives):

She seems very *calculating*.

*She seems *calculating* our salaries.

Note [a] *Unexpected* corresponds to the *-ed* participle of *expect* plus the negative particle: *unexpected* ~ *not expected*. However, such *un-* + verb + *-ed* forms are not participles, since there is no verb *un-* + verb, eg: **unexpect* (unlike *undress*, etc). Unlike *expected*, *unexpected* can be premodified by *very*, so that the morphological change has been accompanied by a semantic/syntactic change. The situation is less clear for the morphologically negative forms *unwritten* (eg: *unwritten law*) and *unbroken* (eg: *unbroken succession*), which resemble the positive forms in not accepting *very* (but cf 7.16 Note and App I.21).
 [b] Nouns can also have adjective derivatives in *-ed* (cf App I.38), eg: *hard-hearted*, *talented*, *four-legged*, *flat-bottomed*, *bearded*.

- 7.16 Often the difference between the adjective and the participle is not clear-cut (cf 17.98ff). The verbal force of the participle is explicit for the *-ing* form when a direct object is present. Hence, the following *-ing* forms are participles that constitute a verb phrase with the preceding auxiliary (cf 3.52ff):

Her views were *alarming* her audience.

You are *frightening* the children.

They are *insulting* us.

Similarly, the verbal force is explicit for the *-ed* form when a *by*-agent phrase with a personal agent (cf 3.63ff, 8.80f) is present, indicating the correspondence to the active form of the sentence:

The man was *offended* by the policeman.

He is *appreciated* by his students.

She was *misunderstood* by her parents.

For both participle forms, premodification by the intensifier *very* is an explicit indication that the forms have achieved adjective status:

Her views were very *alarming*.

You are very *frightening*.

The man was very *offended*.

BUT: He is { ^{?very}
very much } *appreciated*.
highly

We might therefore expect that the presence of *very* together with an explicit indicator of verbal force would produce an unacceptable sentence. This is certainly so for the *-ing* participle form:

*His views were very *alarming* his audience.

However, with the *-ed* participle, there appears to be divided usage, with increasing acceptance of the cooccurrence of *very* with a *by*-agent phrase containing a personal agent:

?The man was very *offended* by the policeman.

In the absence of any explicit indicator, the status of the participle form is indeterminate:

The man was *offended*.

For the *-ed* form in this example, the participle interpretation focuses on the process, while the adjective interpretation focuses on the state resulting from the process. For the *-ing* form the difference is perhaps clearer. In the sentence *John is insulting*, with no object present, the participle interpretation is implausible because the verb is normally transitive. If, however, the participle interpretation is selected, then the sentence expresses that John is in the process of giving insults and we expect an object, while in the adjective interpretation, the sentence points to a characteristic of John (cf: *John is rude*). A participle interpretation is similarly unlikely for the following sentences:

She is *surprising*. ~ ?She *surprises*.

He is *interesting*. ~ ?He *interests*.

It is *exciting*. ~ ?It *excites*.

It is *tempting*. ~ ?It *tempts*.

Note Whereas gradable adjectives and adverbs are intensified by *very*, verbs are intensified by other intensifying adverbs such as *much* and *well* (cf 8.104ff), which themselves are often premodified by *very*, eg: *very much*, *very well*. The applicability of this criterion depends on whether the words are gradable, since (as we have seen in 7.3f) not all adjectives are gradable. Hence, if the corresponding verb allows (say) *very much* while the participle form disallows *very*, we have a good indication that the form in question is a participle rather than an adjective:

She loved him *very much*.

~ He was *very much* loved (by her).

~ He was loved *very much* (by her).

~ (?*)He was *very* loved.

Generally, *-ed* participle forms accepting *very* can retain *very* when they cooccur with a *by*-phrase containing a nonpersonal semi-agent (cf 3.76):

I'm *very disturbed* by your attitude.

We were *very pleased* by his behaviour.

Also, as we have seen, personal agents sometimes occur in this construction, as in:

?I was *very influenced* by my college professors.

- 7.17 The participle sometimes reaches full adjective status when it is compounded with another element:

The eggs are *boiled hard*. ~ The eggs are (very) *hard-boiled*.

It is *breaking my heart*. ~ It is (very) *heart-breaking*.

He was *bitten* (by a snake). [cf: He was *frost-bitten*.]

When an adjective or adverb is the first element of the compound, as in *hard-boiled*, an intensifier such as *very* can be interpreted as related to the first element rather than to the compound as a whole.

Note Sometimes the *-ed* participle cannot be used in environments where the adjective compound is admitted. For example, the verb *speak* does not allow a personal noun such as *man* as direct object, and hence we cannot have in the passive:

*That man is *spoken*.

But we can have *well-spoken* in place of *spoken*. Compare:

That man $\left\{ \begin{array}{l} \text{speaks well.} \\ \text{is well-spoken.} \end{array} \right\}$ ['has a good manner of speaking']

He $\left\{ \begin{array}{l} \text{dresses well.} \\ \text{is well-dressed.} \end{array} \right\}$

Similarly, the verb *behave* does not take a direct object (except the reflexive), and therefore we cannot have a passive:

*The boy was *behaved*.

But we can have an adjective compound:

The boy was *well-behaved*.

7.18 Not only participial adjectives allowing the intensifier *very*, but also stative *-ing* and *-ed* participles can be attributive (cf 17.98ff), as the following examples show:

her <i>crying</i> children	a <i>married</i> couple
a <i>winning</i> team	his <i>published</i> work
<i>boiling</i> water	the <i>captured</i> prisoner

Note That the sense is stative can be seen in the meaning of, for example, *a winning team*: 'a team that has won (a lot of matches lately)', ie 'a strong team' rather than 'a team that is winning'; *a married couple* is 'a couple who are not single'.

7.19 Some verbs have different participle forms for verbal and adjectival use (cf 3.13ff):

You have <i>drunk</i> too much.	~ <i>drunk(en)</i> driving/driver
Have you <i>shaved</i> ?	~ a <i>clean-shaven</i> young man
The shirt has <i>shrunk</i> .	~ a <i>shrunk</i> shirt

Note the pronunciation /ɪd/ of the ending *-ed* in some adjectives, eg: *beloved* /brɪ'lʌvɪd/. Other examples:

<i>crooked</i>	<i>dogged</i>	<i>jagged</i>	<i>learned</i>
<i>naked</i>	<i>ragged</i>	<i>wicked</i>	<i>wretched</i>

The suffix of *aged* is pronounced as a separate syllable /ɪd/ when the word is predicative or is attributive of a personal noun (*The man is aged*; *an aged man* 'old'), but not, for example, in *an aged wine* or *a man aged fifty*.

Syntactic functions of adjectives

Attributive and predicative

7.20 The adjective functions as the head of an adjective phrase, with or without modification (cf 2.28). For the sake of simplicity, we refer to the functions of the 'adjective' when, strictly speaking, we should refer to the functions of the

'adjective phrase'. For the same reason, we generally exemplify the functions of the adjective phrase with the adjective alone.

Adjectives are attributive when they premodify the head of a noun phrase (cf 17.96):

a *small* garden
popular *ballads*

Adjectives are predicative when they function as subject complement or object complement. There is a copular relationship between subject and subject complement (cf 10.8):

The children are *happy*.
He seems *careless*.

Adjectives are subject complement not only to noun phrases, but also to clauses, which may be finite clauses [1, 2] or nonfinite clauses [3, 4]:

That you need a car is <i>obvious</i> .	[1]
Whether he will resign is <i>uncertain</i> .	[2]
To drive a car is <i>dangerous</i> .	[3]
Playing chess is <i>enjoyable</i> .	[4]

There is a copular relationship between direct object and object complement (cf 10.8):

I find him *careless*.
He made the children *happy*.

Adjectives can also be object complement to clauses:

I consider $\left\{ \begin{array}{l} \text{what he did} \\ \text{playing so hard} \end{array} \right\}$ *foolish*.

The adjective functioning as object complement often expresses the result of the process denoted by the verb (cf 16.21):

He pulled his belt <i>tight</i> .	[5]
He pushed the window <i>open</i> .	[6]
He writes his letters <i>large</i> .	[7]

The result can be stated for each sentence by using the verb *be*:

His belt is <i>tight</i> .	[5a]
The window is <i>open</i> .	[6a]
His letters are <i>large</i> .	[7a]

Note The verbs in [5-7] have a causative meaning. For example, [5] can be paraphrased:

He caused his belt to be tight by pulling it.

Some verbs used in this type of construction primarily express cause:

She made him *happy*. ['She caused him to be happy.']

The news turned his hair *white*. ['The news caused his hair to be white.']

The analogy with adverbs can be seen in the resultative effect of an adverb such as *out*. Compare [6] with [8]:

He pushed the window $\left\{ \begin{array}{l} \text{open.} \\ \text{out.} \end{array} \right\}$	[6]
['He caused the window to be open/out by pushing it.']	[8]

Postpositive

- 7.21 Adjectives can sometimes be postpositive, *ie* they can immediately follow the noun or pronoun they modify. We may thus have three positions of adjectives:

PREDICATIVE:	This information is <i>useful</i> .	[1]
ATTRIBUTIVE:	<i>useful</i> information	[2]
POSTPOSITIVE:	something <i>useful</i>	[3]

A postpositive adjective (together with any complementation it may have; cf 7.22) can usually be regarded as a reduced relative clause:

something *that is useful* [3a]

Compound indefinite pronouns and adverbs ending in *-body*, *-one*, *-thing*, *-where* (cf 6.46f, 17.57) can be modified only postpositively:

Anyone (who is) *intelligent* can do it.
I want to try on *something* (that is) *larger*.
We're not going *anywhere very exciting*.

Of course, adjectives that can occur only attributively (cf 7.32ff) are excluded:

*something (which is) *main* *somebody (who is) *mere*

Postposition is obligatory for *proper* meaning 'as strictly defined', *eg*:

the City of London *proper*

In several institutionalized expressions (mostly in official designations), the adjective is postpositive (cf 17.59), *eg*:

the president <i>elect</i>	vice-chancellor <i>designate</i>
['soon to take office']	postmaster <i>general</i>
heir <i>apparent</i>	court <i>martial</i>
attorney <i>general</i>	notary <i>public</i>
from time <i>immemorial</i>	body <i>politic</i>

Note also:

the person *opposite* [BUT: the *opposite* direction]
all of us, me *included* [BUT: *including* me]
Monday to Friday *inclusive* <AmE also: Monday *through* Friday;
cf 9.37>

Longman Group Limited/Ltd <UK>; Harcourt Brace Jovanovich,
Incorporated/Inc <US>

Asia <i>Minor</i>	Poet <i>Laureate</i>
devil <i>incarnate</i>	all things <i>English</i>
the best car <i>going</i>	B <i>flat/sharp/major/minor</i>

Adjectives ending in *-able* and *-ible* can have postposition when the noun is modified by another adjective in the superlative degree (cf 7.74ff), by *only*, or by the general ordinals *last*, *next*, etc (cf 5.22). We thus have either attributive position or postposition in:

the best <i>possible</i> use	~ the best use <i>possible</i>
the greatest <i>imaginable</i> insult	~ the greatest insult <i>imaginable</i>

the best *available* person
the only *suitable* actor

~ the best person *available*
~ the only actor *suitable*

The deverbal suffix *-able/-ible* combines with transitive verbs to produce gradable adjectives: 'of the kind that can be V-ed' (cf App 1.40). Some postpositive adjectives, especially those ending in *-able* or *-ible*, retain the basic meaning they have in attributive position but convey the implication that what they are denoting has only a temporary application. Thus, *the stars visible* refers to stars that are visible at a time specified or implied, while *the visible stars* more aptly refers to a category of stars that can (at appropriate times) be seen. We have a similar distinction between the temporary and the permanent in *rivers navigable* and *navigable rivers*.

Appointed, desired, required; following, past, preceding; and positive also occur in either position:

at the <i>appointed</i> time	~ at the time <i>appointed</i>
in <i>past</i> years	~ in years <i>past</i>
the <i>preceding</i> years	~ the years <i>preceding</i>
<i>positive</i> proof	~ proof <i>positive</i>

Postposition is usual with the set phrase *pure and simple*, as in *the answer/truth pure and simple*.

Postposition (in preference to attributive position) is usual for a few *a-*adjectives (cf 7.10f) and for the four adjectives *absent, present, concerned, involved* when they designate 'temporary' as opposed to 'permanent' attributes (cf 17.7):

The house (which is) *ablaze* is next door to mine.
The boats (which were) *afloat* were not seen by the bandits.
The men (who were) *present* were his supporters.
The people (who were) *involved* were not found.
[cf: *the involved people*, which designates a permanent attribute, but
cf Note [b]]

Postposition is used with *net* and *gross* when the precise amounts are stated:

He was paid a fee of £12 *gross*, on which he had to pay £4 tax, leaving the sum of £8 *net*. [BUT: *The gross sum* was £12. *The net sum* was £8.]

Compare *total*:

The { *sum total* / *total sum* } was £12.

Note [a] The postpositive adjective, as in *the president elect* and *vice-chancellor designate*, reflects a neoclassical style based on Latin participles and much in vogue in Elizabethan times. Cf the normal attributive position of English participles; 17.98ff:

the *elected* president, the *acting* professor

[b] Attributive *present* normally has temporal meaning (*eg*: *at the present time*); but it has the same sense as postpositive *present* (*ie* the antonym of *absent*) in the fixed expression *present company excluded* (where perhaps it has been transposed from its usual position because the participle has occupied that position) and in expressions that seem to be based on it, *eg*: *excluding present company* ('if we exclude present company').

In AmE, attributive and postpositive *involved* and *concerned* may have the same sense if the head of the noun phrase is *party* or *parties*:
the *involved* party, the *concerned* parties

Adjectives with complementation

7.22 Adjectives with complementation (cf 16.68ff) normally cannot have attributive position but require postposition. Compare:

a *suitable* actor BUT NOT: *a *suitable* for the part actor

The complementation can be a prepositional phrase or a *to*-infinitive clause:

- | | |
|--|-----|
| I know an actor <i>suitable</i> for the part. | [1] |
| They have a house <i>larger</i> than yours. | [2] |
| The boys <i>easiest</i> to teach were in my class. | [3] |
| Students <i>brave</i> enough to attempt the course deserve to succeed. | [4] |

The postpositive structures can of course be regarded as reduced relative clauses:

I know an actor *who is suitable* for the part. [1a]

If the adjective is alone or merely premodified by an intensifier, postposition is not normally allowed:

- *They have a house (*much*) larger.
- *The soldiers (*rather*) *timid* approached their officer.

However, if the noun phrase is generic and indefinite, coordinated adjectives, or adjectives with some clause element added, can be postposed, though such constructions are formal and rather infrequent:

- | | |
|---|-----|
| Soldiers <i>timid</i> or cowardly don't fight well. | [5] |
| Soldiers <i>normally timid</i> don't fight well. | [6] |
| A man <i>usually honest</i> will sometimes cheat. | [7] |

The more usual constructions are premodification or a relative clause:

- | | |
|---|------|
| <i>Timid</i> or cowardly soldiers ... | [5a] |
| Soldiers <i>who are timid</i> or cowardly ... | [5b] |
| Soldiers <i>who are normally timid</i> ... | [6a] |
| A man <i>who is usually honest</i> ... | [7a] |

Like relative clauses, postposed adjectives may be restrictive or nonrestrictive, eg:

- | | |
|--|------|
| <i>Soldiers normally timid</i> don't fight well. | |
| ['Soldiers who are ...'] [generic and indefinite noun head] | [6] |
| <i>The soldiers, normally timid</i> , fought bravely. | |
| ['The soldiers, who were ...'] [specific and definite noun head] | [6b] |

The adjective of an adjective phrase can often be attributive, leaving its complementation in postposition. Thus, equivalent to sentences [2] and [3] are the somewhat more informal sentences [2a] and [3a]:

- | | |
|--|------|
| They have a <i>larger</i> house than yours. | [2a] |
| The <i>easiest</i> boys to teach were in my class. | [3a] |

An adjective modified by *enough*, *too*, or *so* can be separated from its complementation if the modified adjective is placed before the indefinite (or zero) article of the noun phrase [8, 9]:

- | | |
|---|-----|
| She is <i>brave enough</i> a student to attempt the course. | [8] |
| It was <i>too boring</i> a book to read. | [9] |

With *enough*, the construction is more common if the adjective is premodified by *not*, as in [8a]:

She is *not brave enough* a student to attempt the course. [8a]

But with *enough* and *too*, this construction seems to be possible only if the adjective phrase is part of the subject complement or object complement (compare [8] and [8b]):

**Brave enough* a student to attempt the course deserves to succeed. [8b]

With *so*, the construction is also possible if the adjective phrase is part of the subject or object [10]:

- | | |
|--|------|
| A man <i>so difficult</i> to please must be hard to work with. | [10] |
| <i>So difficult</i> a man | |

Exceptionally, certain short prepositional phrases may also premodify an adjective in attributive position:

- a *by no means* irresponsible action
- ~ an action (which is) by no means irresponsible

Compound modifiers usually denoting measurements may have either attributive or postpositive position (note also the *foot* ~ *feet* shift):

a *5000-foot high* mountain ~ a mountain (which is) 5000 feet high

Note We find the postposition of adjectives in poetry in cases where attributive position is the norm elsewhere in the language, eg:

Ben Battle was a *soldier bold* ... (Thomas Hood)

Adjectives as heads of noun phrases

7.23 Adjectives can function as heads of noun phrases, which (like all noun phrases) can be subject of the sentence, complement, object, and prepositional complement. Adjectives as noun-phrase heads, unlike nouns, do not inflect for number or for the genitive case and they usually require a definite determiner (cf 5.56, App I.45).

Adjectives are typically used as heads of noun phrases to refer to certain fairly well-established classes of persons, eg: *the brave*, *the weak*, *the maladjusted*, *the elderly*, *the underprivileged*.

There are three types of adjectives functioning as noun-phrase heads:

- (a) *The innocent* are often deceived by *the unscrupulous*. (7.24)
- (b) *The industrious Dutch* are admired by their neighbours. (7.25)
- (c) She admires *the mystical*. (7.26)

Type (a): the innocent

7.24 Adjectives which can premodify personal nouns (*the young people*) can be noun-phrase heads (*the young*) with plural and generic reference denoting classes, categories, or types of people. The adjective can itself be premodified [3-5] or postmodified [6-7]:

- The poor* are causing the nation's leaders great concern. [1]
 There is a lack of communication between *the young* and *the old*. [2]
The extremely old need a great deal of attention. [3]
The emotionally disturbed and *the physically and mentally handicapped* need the aid of society. [4]
The very wise avoid such temptations. [5]
The young in spirit enjoy life. [6]
The old who resist change can expect violence. [7]

Notice that these adjectives are restricted to generic reference and take plural concord. Hence, *the poor* cannot denote one person. (*The poor person, man, woman*, etc can have either specific or generic reference.) It is often possible to add a general word for human beings such as *people* and retain the generic reference, in which case the definite determiner is normally omitted (eg: *old people*), but the use of the adjective as head of the noun phrase (eg: *the old*) is also common. We must distinguish the noun phrases from cases of textual ellipsis (cf 12.33ff):

The young students found the course difficult, *the older* found it easy.

Here, *the older* is elliptical for *the older students*.

The adjective can itself be modified, usually by restrictive modification, eg [5]: *the very wise*. Inflected comparison forms of the adjective are also possible (*the wiser*). Comparative inflection and adverb modification are indications of the adjective status of these noun-phrase heads, while modification by adjectives is more typical of nouns, and modification by relative clauses is normally an indication of noun status. Avoidance of modification by adjectives is probably related to the fact that this type of adjective as noun-phrase head tends to accept only restrictive modification. Premodifying adjectives with this noun-phrase head are normally interpreted as nonrestrictive. For example, *the wretched poor* would not normally be taken as a subclass of poor people, whereas with its premodifying adverb *the wretchedly poor* would be so taken.

In *the young of London*, the prepositional phrase is postmodifying a general noun that has been ellipted:

[those who are young] [in London]

By contrast, in *the young in spirit* [6], it is clear that the adjective itself is postmodified by a prepositional phrase, since the general noun cannot be postmodified by *in spirit*: **the people in spirit who are young*. We then have the structure:

[those who are [young [in spirit]]]

Similarly, we can argue that the relative clause in [7]:

the old who resist change

is postmodifying an ellipted general noun:

the people who resist change and who are old

Since *people* is not the only noun we can supply (for example we could insert *persons* instead), such ellipsis must be weak ellipsis (cf 12.38).

The definite determiner is normally the generic definite article *the*. Note however the use of the possessive determiner in:

We will nurse *your sick*, clothe *your naked*, and feed *your hungry*.
 It is the duty of the Government to care for *our poor*, *our unemployed*.

Other types are: *we rich*, *these dead*. On the other hand, the following examples with *those* are instances of postposition which can be analysed as reduced relative clauses (cf 7.21):

those present ~ *those who are present*
those assembled ~ *those who are assembled*

Those dead is ambiguous between 'those dead ones' (adjective as head of a noun phrase) and 'those who are dead'.

Although adjectives functioning as noun-phrase heads generally require a definite determiner, they can function as such without a determiner if they are conjoined (cf 5.50):

*He is acceptable to *old/young*.
 He is acceptable to *both (the) old and (the) young*.

Also in some *of*-constructions:

The number of jobless/unemployed is rising.

Note [a] Adjectives functioning as heads of noun phrases should be distinguished from nouns that are converted from adjectives (cf 7.13), eg: *an editorial*, *two blacks*. There is a great deal of varying usage in this area, eg:

the world's greats the party's faithful(s)
 the undecided(s) the retired(s)

[b] Adjectives which do not denote fairly well-established classes are less likely to be used as heads of noun phrases with generic reference, eg: *the agitated*, *the bored*, *the resentful*, *the sleepy*, *the dirty*. This is a norm, not a rule, as can be seen in sentences like the following:

The alert will notice my irony, *the sleepy* may not.

Type (b): *the Dutch*

7.25 Some adjectives denoting nationalities (cf 5.56f) can be noun-phrase heads:

The industrious Dutch are admired by their neighbours.
You French and we British ought to be allies.

The adjectives in question are virtually restricted to words ending in *-(i)sh* and *-ch*:

British, Cornish, Danish, English, Irish, Spanish, Turkish, Welsh; Dutch, French

As with type (a) in 7.24, these noun phrases normally have generic reference and take plural concord. Unlike type (a), type (b) cannot be modified by adverbs: *the very wise*, but not **the very English*, with generic plural reference. However, they can be modified by adjectives, which are normally nonrestrictive, ie:

the industrious Dutch ['the Dutch, who are industrious']

Postmodifying prepositional phrases and relative clauses can be either restrictive or nonrestrictive (cf 17.3ff):

The Irish (who live) in America retain sentimental links with Ireland.
The Dutch, for many of whom speaking English is second nature, have
 produced many of the greatest grammarians of the English language.

Note [a] Easily confused with adjectives denoting nationalities of type (b), but distinct from them, are ethnic names (cf 5.88), eg: *Eskimo, Navaho, Bantu*. These, however, show their nominal character by the possibility of being modified by determiners and numerals (*two Eskimo, several Navaho*) and, optionally, taking plural -s: *two Eskimo(s)*.

[b] Nationality adjectives are sometimes used not to refer to the nation as a whole but to some part of it, for example, teams and troops representing their country (cf 5.111):

The English lost against *the Welsh* in the final.

In 1796 *the French* invaded northern Italy.

[c] *You British* and *you French* can also be analysed as having *you* as head and the names of the nationalities as noun phrases in restrictive apposition (cf 17.88).

[d] As stated above, adjectives denoting nationalities that can be noun-phrase heads normally have generic reference. There are, however, many exceptions, eg: *two Boston Irish* ['Irishmen/Irishwomen'] and *the other English*, as in

?Now tell me about *the other English* at the villa, especially the one who has disappeared.

Type (c): the mystical

7.26 Some adjectives can function as noun-phrase heads with abstract reference. They include, in particular, superlatives, in which case we can sometimes insert a general noun like *thing* in its abstract sense:

The latest (thing/news) is that he is going to run for re-election.

Unlike types (a) and (b), type (c) adjectives functioning as noun-phrase heads take singular concord:

They ventured into *the unknown*, which was . . .

The best is yet to come.

They can be modified by adverbs:

The very best (thing) is yet to come.

He went from *the extremely sublime* to *the extremely ridiculous*.

Type (c) is restricted chiefly to certain fixed expressions. Thus, for example, *the supernatural*, *the exotic*, *the unreal* are more likely to occur than *the lovely*, *the foreign*, *the exciting*, with abstract, generic reference.

Note There are a number of set expressions in which an adjective with abstract reference is complement of a preposition (cf 9.1 Note [c]), eg:

It's for the good of everyone.	He enjoyed it to the full.
He left for good.	from bad to worse
in public/private/secret	out of the ordinary
in the nude/in the wild	in the extreme
in short	above (the) normal
into the open	on the loose
on the sly	in common

In many of these examples, the word-class status of the word following the preposition (or *the*) is indeterminate between adjective and noun.

Supplementive adjective clauses

7.27 Adjectives can function as the sole realization of a verbless clause (cf 14.9) or as the head of an adjective phrase realizing the clause:

The man, *quietly assertive*, spoke to the assembled workers. [1]

Unhappy with the result, she returned to work. [2]

Glad to accept, the boy nodded his agreement. [3]

Anxious for a quick decision, the chairman called for a vote. [4]

Long and untidy, his hair played in the breeze. [5]

As the following examples demonstrate, the supplementive adjective clause (cf 15.60ff) is mobile, though (partly to avoid ambiguity) it usually precedes or (less usually) follows the subject of the superordinate clause:

{ *Rather nervous*, the man opened the letter. [6]

{ The man, *rather nervous*, opened the letter. [6a]

{ The man opened the letter, *rather nervous*. [6b]

When it follows the subject, as in [6a], it is in some respects like a nonrestrictive relative clause (cf 17.22ff):

The man, *who was nervous*, opened the letter.

But the adjective clause suggests that the man's nervousness is related to the content of the sentence, whereas the relative clause does not necessarily convey that implication. Another difference is that the adjective clause is related to the predication as well as to the subject. Furthermore, unlike the relative clause, the adjective clause is mobile and (with the exception discussed below) its implied subject is the subject of the sentence. Thus, while we have [7], we do not have as its equivalent [7a]:

The man restrained the woman, *who was aggressive*. [7]

*The man restrained the woman, *aggressive*. [7a]

However, if the supplementive adjective clause contains additional clause constituents, it can be related to a noun phrase other than the subject of the sentence:

She glanced with disgust at the cat, { *quiet (now) in her daughter's lap*.
now quiet.
 **quiet*.

Compare participle clauses, where the implied subject can also be other than the subject of the sentence (cf 15.62):

She glanced with disgust at the cat, { *stretched out on the rug*.
mewing plaintively.

Under certain conditions, and with little change of meaning, an adjective functioning as a supplementive adjective clause may be replaced by an adverb. Thus, instead of [6] we might have

Nervously, the man opened the letter. [6c]

Like the adjective, an adverb with this function (cf 8.92ff) refers to an attribute or state of the subject, though it normally does so specifically in relation to the action that he is performing. This is typically expressed by adverbs in medial position (cf 8.16):

The man *nervously* opened the letter. [6d]

The adjective refers to the subject without explicit reference to the action, but unless otherwise stated, the characterization is only temporary.

Note [a] An adverb can (obviously) not be substituted if there is no corresponding adverb (cf 7.6), eg: long in [5]:

*Longly } his hair played in the breeze. [5a]
Untidily }

[b] Nor can replacement by an adverb take place if the complementation or modification of the adjective is disallowed for the adverb, eg [1a] *quietly assertively, [3a] *gladly to accept, [4a] *anxiously for a quick decision. If unhappy with the result in [2] is replaced by unhappily, the likely meaning will be 'I'm sorry to say that ...' (rather than 'She was unhappy'), ie a disjunct interpretation.

7.28 The implied subject of a supplementary adjective clause can be the whole of the superordinate clause:

Strange, it was she who initiated divorce proceedings. [1]

Most important, his report offered prospects of a great profit. [2]

More remarkable still, he is in charge of the project. [3]

For example, [1] is semantically equivalent to [1a]:

(The fact) that it was she who initiated divorce proceedings
is strange. [1a]

These supplementary adjective clauses relate to the superordinate clause like comment clauses introduced by *what* (cf 15.53ff). For example, for [1] we have [1b]:

What is (even more) strange, it was she who initiated divorce proceedings. [1b]

The few adjectives that can be used for this purpose convey the attitude that what is being said is in some measure strange, eg: *curious, funny, odd, strange, surprising*. A few others seem possible if they are premodified by *more* or *most*, as in [2] and [3]. This type of adjective clause must precede its superordinate clause.

Note [a] A corresponding adverb can be substituted for the adjective with little or no difference in meaning, as with *strangely* for *strange* in [1] (cf content disjuncts in 8.127ff):

Strangely, it was she who initiated divorce proceedings. [1c]

The adjective, unlike the adverb, allows a *that*- or *how*-clause to follow:

Strange { that it turned out that way. [4]
 { how she still likes him. [5]

*Strangely, { that it turned out that way. [4a]
 { how she still likes him. [5a]

This is because the adjective is elliptical for an extraposed construction (cf 18.33ff) [5b], or perhaps a pseudo-cleft construction (cf 18.29) [5c]:

It is strange how she still likes him. [5b]

What is strange is how she still likes him. [5c]

[b] Objections have been voiced against both *most important* (as in [2] above) and *most importantly*. Some usage books recommend the one construction, some the other.

Contingent adjective clauses

7.29 A special type of supplementary adjective clause is the contingent adjective clause, which expresses the circumstance or condition under which what is

said in the superordinate clause applies. The contingent clause is elliptical (cf 12.31ff) with ellipsis of an appropriate form of *be*, and (sometimes) of the subordinator:

Whether right or wrong, he always comes off worst in an argument
because of his inability to speak cogently. [1]

When fit, the Labrador is an excellent retriever. [2]

If wet, these shoes should never be placed too close to the heat. [3]

As with other supplementary adjective clauses (cf 7.27f), the implied subject of the contingent adjective clause is normally the subject of the superordinate clause, but the clause is not equivalent to a nonrestrictive relative clause. Unlike other supplementary adjective clauses, contingent adjective clauses often have a subordinator present. It is sometimes omitted, so that we can have [1a]:

Right or wrong, he always comes off worst ... [1a]

When the implied subject is the subject of the superordinate clause, it is normal to put the adjective initially, as in [1–3], but it is not uncommon to put it finally in spoken English. If a subordinator is present, there is no problem in positioning the clause finally even in written English:

These shoes should never be placed too close to the heat if wet. [3a]

The contingent clause can also refer to the object of the superordinate clause, though only a few adjectives are available for this use:

He sells them new. [4]

I can't drink it hot. [5]

You must eat it when fresh. [6]

The adjective then usually comes finally and could be regarded as a complement in [4] and [5] (cf 10.16). A subordinator is also often present, as in [6]. As with all complements, the normal position of the adjective is final, whether it is in a copular relation to the object of an active clause [7] or to the subject of a passive clause [8]:

To make good tomato chutney, you should pick the tomatoes green. [7]

The tomatoes should be picked green. [8]

*Green you should pick the tomatoes. [7a]

*Green the tomatoes should be picked. [8a]

In informal spoken English, an adjective clause which refers to the object of the superordinate clause can occur initially, though the position would be avoided if ambiguity resulted, as in:

Hot, I can't drink coffee. ['When I'm hot ...' or 'I can't drink
coffee hot.'] [5a]

The adjective clause can also refer to the whole of the superordinate clause (which would be realized in the subordinate clause by the pro-form *it*). In such cases the subordinator cannot be omitted:

If (it is) possible, the puppy should be fed four times a day.

When (it is) necessary, he can be taken to the doctor.
You must come as soon as (it is) possible.

Note [a] Cf 14.9ff for further discussion of adjective clauses and other verbless clauses, as well as of nonfinite clauses that require similar treatment.

[b] Corresponding adverbs cannot replace adjectives in contingent adjective clauses. [1] is ambiguous between the more probable interpretation of the adjective clause as conditional ('Whether he is right or wrong ...') and the other possibility that it is a noncontingent supplementary clause with the superordinate clause as its implied subject (cf 7.28) ('Whether it is right or wrong ...'). In the latter interpretation, adverbs can replace the adjectives:

Whether rightly or wrongly, he always comes off worst in an argument ... [1b]

Exclamatory adjective clauses

- 7.30 Adjectives (especially those that can be complement when the subject is eventive, eg: *That's excellent!*) can be exclamations, with or without an initial *wh*-element (cf 11.14f, 12.31ff):

Excellent! (How) wonderful! (How) good of you!

Such adjective phrases need not be dependent on any previous linguistic context, but may be a comment on some object or activity in the situational context.

Syntactic subclassification of adjectives

- 7.31 We turn now to consider the characteristics of the peripheral adjectives, those that are restricted to attributive or to predicative use (cf 7.3f). The restrictions are not always absolute, and sometimes vary with individual speakers.

Attributive only

- 7.32 In general, adjectives that are restricted to attributive position, or that occur predominantly in attributive position, do not characterize the referent of the noun directly. For example, *old* can be either a central adjective or an adjective restricted to attributive position. In *that old man* (the opposite of *that young man*), *old* is a central adjective, and can thus also be predicative: *That man is old*. On the other hand, in the usual sense of *an old friend of mine* ['a friend of old, a long-standing friend'], *old* is restricted to attributive position and cannot be related to *My friend is old*. In this case, *old* is the opposite of *new* ['recently acquired']. The person referred to is not being identified as old: it is his friendship that is old. Outside such well-established phrases as *old friend*, *new friend*, the contrast *old/new* requires the adjective to be stressed:

I'll take my 'old car tonight.

Similarly, the attributive adjective in *the wrong candidate* does not refer to the wrongness of the person but to the mistake in identifying the person as a

candidate. Adjectives that characterize the referent of the noun directly (*that old man*, *My friend is old*) are termed INHERENT, those that do not (*an old friend of mine*) are termed NONINHERENT (cf 7.43, 7.73).

Note However, some noninherent adjectives occur also predicatively. In part, noninherent adjectives appear to be excluded from predicative position because of pressure from homonyms that commonly occupy that position, as with *old*. But the reasons for the restriction are not always clear. For example, both *a new student* and *a new friend* are noninherent, yet only the former can be used predicatively:

*That student is new. *My friend is new.*

Some of the factors that are involved in the restriction will emerge in the course of an identification of the types of adjective that are restricted to attributive position.

A few adjectives with strongly emotive value which will not be further discussed are restricted to attributive position, though the scope of the adjective clearly extends to the person referred to by the noun, eg: *you poor man*, *my dear lady*, *that wretched woman*. These all involve nonrestrictive modification (cf 17.3ff).

Intensifying adjectives

- 7.33 Some adjectives have a heightening effect on the noun they modify, or the reverse, a lowering effect. At least three semantic subclasses of intensifying adjectives can be distinguished (cf 8.99ff):

- (a) *emphasizers*
- (b) *amplifiers*
- (c) *downtoners*

(a) EMPHASIZERS have a general heightening effect and are generally attributive only, eg:

<i>a true scholar</i>	[1]	<i>plain nonsense</i>	[7]
<i>a clear failure</i>	[2]	<i>the simple truth</i>	[8]
<i>pure</i> ['sheer'] <i>fabrication</i>	[3]	<i>an outright lie</i>	[9]
<i>a real</i> ['undoubted'] <i>hero</i>	[4]	<i>sheer arrogance</i>	[10]
<i>a certain winner</i>	[5]	<i>a sure sign</i>	[11]
<i>a definite loss</i>	[6]		

(b) AMPLIFIERS scale upwards from an assumed norm, and are central adjectives if they are inherent and denote a high or extreme degree:

a complete victory ~ *The victory was complete.*
great destruction ~ *The destruction was great.*

On the other hand, when they are noninherent, amplifiers are attributive only:

a complete fool ~ **The fool is complete.*
a firm friend ~ **The friend is firm.*

Complete refers to the completeness of the folly, and *firm* to the firmness of the friendship (in which sense it is asterisked here).

Amplifiers are only attributive also when they are used as *emphasizers*, conveying principally emphasis rather than degree. For example, *total* in *total nonsense* is an *emphasizer*, while in *total destruction* it is an *amplifier* and has a literal application ('the destruction of everything'). Hence the contrast:

total nonsense ~ *The nonsense was *total*.
total destruction ~ The destruction was *total*.

Further examples of adjectives as amplifiers that are attributive only:

<i>utter</i> folly	the <i>absolute</i> limit
a <i>close</i> friend	a <i>complete</i> stranger
an <i>extreme</i> enemy	his <i>entire</i> salary
a <i>great</i> supporter	a <i>perfect</i> stranger
a <i>strong</i> opponent	<i>total</i> irresponsibility

(c) DOWNTONERS have a lowering effect, usually scaling downwards from an assumed norm. They are relatively few (eg: *slight* in a *slight effort*, *feeble* in a *feeble joke*) and can be ignored for our present purpose, since they are generally central adjectives.

7.34 Many of the intensifying adjectives in 7.33 can be related to intensifying adverbs (cf 8.104):

He is a <i>true</i> scholar.	~ He is <i>truly</i> a scholar.
It was a <i>clear</i> failure.	~ It was <i>clearly</i> a failure.
It is <i>utter</i> folly to do that.	~ It is <i>utterly</i> foolish to do that.

Notice that several intensifying adjectives have homonyms that can occur both attributively and predicatively. Compare:

I drank some *pure* ['clean'] water. [central adjective]
 ~ The water is *pure*.
 That is *pure* ['sheer'] fabrication. [emphasizer]
 ~ *The fabrication is *pure*.
 Those are *real* flowers. [central adjective]
 ~ Those flowers are *real*, not artificial.
 He's a *real* ['undoubted'] hero. [emphasizer]
 ~ *The hero is *real*.

Examples of intensifying adjectives which can occur predicatively include:

His condemnation was <i>extreme</i> .	Their victory is <i>certain</i> .
His folly was <i>great</i> .	The earthquake was <i>strong</i> .

Note Many adjectives which can be used as intensifiers and are restricted to attributive position have severe restrictions on the nouns they modify, eg: a *great/big* baby ['very babyish'], a *big* fool ['very foolish']; also a *great* friend rather than a *big* friend in the sense of 'very friendly'.

Restrictive adjectives

7.35 Restrictive adjectives restrict the reference of the noun exclusively, particularly, or chiefly. Examples, within noun phrases, include:

a <i>certain</i> person	his <i>chief</i> excuse
the <i>principal</i> objection	the <i>exact</i> answer
the <i>same</i> student	the <i>sole</i> argument
the <i>only</i> occasion	the <i>specific</i> point
a <i>particular</i> child	the <i>very</i> man

Again, some of these have homonyms. For example, *certain* in a *certain person* is a restrictive (equivalent to 'a particular person'), while in a *certain winner* it is (as we saw in 7.33, example [5]) an intensifier (equivalent to 'a sure winner').

Some restrictive adjectives can be related to restrictive adverbs (cf 8.118):

It is the <i>main</i> reason.	~ It is <i>mainly</i> the reason.
That was the <i>precise</i> reason.	~ That was <i>precisely</i> the reason.

Note [a] Notice the use of *very* as a restrictive adjective rather than as an intensifying adverb (cf 7.89):
 You are *the very* man I want.

The same meaning can be conveyed by restrictive adverbs outside the noun phrase (whereas *very* occurs within the noun phrase):

You are *precisely/exactly/just* the man I want.

[b] 'Universal' adjectives like *whole* (cf 5.17), *entire*, *full* are similar to restrictive adjectives:

The *whole* situation is ridiculous.

I'm in *entire/full* agreement with the committee.

Other adjectives related to adverbs

7.36 Some noninherent adjectives that are attributive only can be related to adverbs but do not always fall within the intensifying or restrictive types of adjectives. These noninherent adjectives (cf 7.43, 7.73) include:

my <i>former</i> friend	['formerly my friend']
an <i>old</i> friend	['a friend of old']
<i>past</i> students	['students in the past']
a <i>possible</i> friend	['possibly a friend']
the <i>present</i> king	['the king at present']
an <i>occasional</i> visitor	['occasionally a visitor']

The adverbial nature of these adjectives can be seen in their correspondences with a verb of general meaning and an adverb, eg:

<i>rapid</i> calculations	'make calculations <i>rapidly</i> '
<i>occasional</i> showers	'showers occur <i>occasionally</i> '

These verbs (*make, perform, act, occur, happen, take place*, etc) can be seen as lexical realizations of the predication force that is inherent in the nouns. Even a noun like *friend* in *my former friend* signifies an activity, as appears in the correspondence of 'acting as a friend'. Some adjectives require implications additional to the adverbial:

the *late* president ['the person who was formerly the president (but is now dead)']

But compare:

the *late* bus ['the bus that leaves late (in the evening)' where *late* is a central adjective]
 the *former* reason ['the reason stated formerly']

Many of these adjectives have a temporal meaning. We might include with them *acting* ['for the time being'], as in the *acting* chairman.

If the adjectives premodify agentive nouns, the latter also suggest a relationship to an associated verb (*cf* nominalization, 17.51ff):

a <i>big</i> eater	['someone who eats a lot']
a <i>clever</i> liar	['someone who lies cleverly']
a <i>hard</i> worker	['someone who works hard']
a <i>heavy</i> smoker	['someone who smokes heavily']
a <i>sound</i> sleeper	['someone who sleeps soundly']

Note Not all instances like a *clever liar* involve a restriction to attributive position. Possible conflict with homonyms seems a contributory factor. Thus a *clever liar* is analogous to a *clever writer*, a *clever student*, or a *clever detective*. In all four instances, *clever* refers to the ability of the person in respect of the reference of the noun – clever as a liar, clever as a writer, etc. However, these instances could be used predicatively, and so can antonyms of *clever*:

That writer is *clever/lazy*.

That student is *clever/weak*.

That detective is *clever/inefficient*.

Nevertheless, we normally cannot use these adjectives predicatively in the intended sense when the noun is pejorative:

a *clever* liar [≠ 'That liar is clever.']

a *bad* liar [≠ 'That liar is bad.']

On the other hand, one thief might well say of another *That thief is good*, but in that case he is not using *thief* pejoratively. *Cf*: *He is good at stealing, but bad at lying*.

Adjectives related to nouns

7.37 Some adjectives are derived from nouns by means of suffixes (*cf* App I.38f), *eg*:

-ar: <i>polar</i> bear	-an: <i>urban</i> population
-en: <i>earthen</i> pottery	-al: <i>tidal</i> wave
-ic: <i>atomic</i> scientist	-ly: <i>yearly</i> income

Many such denominal adjectives are nongradable and restricted to attributive position:

- an *atomic* scientist ['a scientist specializing in the theory of atoms']
- a *criminal* court ['a court dealing with crime']
- a *criminal* lawyer ['a lawyer specializing in cases of crime']
- a *polar* bear ['a bear living near the pole']
- a *medical* school ['a school for students of medicine']
- musical* comedy ['comedy accompanied by music']
- a *tidal* wave ['a wave produced by the tide']

The examples contain nouns with a denominal adjective referring to the activity of the agent or expressing an adverbial relation. In other uses, the same item may also be a central adjective, for example *criminal* in a *criminal lawyer* ['a lawyer who is criminal'] (*cf* 7.13).

Predicative only

7.38 Adjectives that are restricted, or virtually restricted, to predicative position (*cf* 7.3f) are most like verbs and adverbs. They tend to refer to a (possibly temporary) condition rather than to characterize. Perhaps the most common are those referring to the health (or lack of health) of an animate being:

He felt *ill/poorly* <both esp BrE>/*well/faint/unwell*.

However, many people use such adjectives as attributives too, for example:

A *well* person need see a doctor only for a periodic checkup.

Note *Sick* is the exception among these 'health' adjectives in that its attributive use is very common: the *sick* woman ['The woman is sick.']

Be sick is especially AmE corresponding to *be ill* in BrE. *Be sick* can also mean 'vomit' in both AmE and BrE, especially with a verb in the progressive or an adverbial interpretable as a goal:

She is being *sick*.

The dog was *sick* on the new carpet.

This use of *sick* is euphemistic, and *ill* is occasionally used in the same way. For comparative forms of *ill*, *cf* 7.77.

7.39 A large group of adjectives that are restricted to predicative position comprises adjectives which can take complementation:

I'm *aware of that*.

She was *glad that everything was all right*.

Other adjectives which take complementation include (*cf* 16.68ff):

<i>able</i> (to + infinitive)	<i>fond</i> (of)
<i>afraid</i> (that, of, about)	<i>happy</i> (that, to, with, about)
<i>answerable</i> (to)	<i>loath</i> (to)
<i>averse</i> (to, from)	<i>subject</i> (to)
<i>conscious</i> (that, of)	<i>tantamount</i> (to)

Some of these adjectives must take complementation (*eg*: *subject to* and *tantamount to*), and many normally do.

Many of these adjectives closely resemble verbs semantically:

He is *afraid* to do it. ['He *fears* to do it.']

They are *fond* of her. ['They *like* her.']

That is *tantamount* to an ultimatum.

['That *amounts* to an ultimatum.']

Some constructions like *be willing to* and *be able to* function like modals where the modal auxiliary paradigm is defective (*cf* 3.39ff). Compare:

She <i>can</i> do it.	~ She <i>is able</i> to do it.
She <i>could</i> do it.	~ She <i>was able</i> to do it.
_____	She <i>has been able</i> to do it.
_____	She <i>might have been able</i> to do it.

Some of these adjectives that are restricted to predicative position have homonyms that can occur both predicatively and attributively, *eg*:

the *conscious* patient ~ The patient is *conscious*. [= 'awake']

Cf: He is *conscious* of his faults. [= 'aware']

With some adjectives that take complementation there appears to be no semantic distinction, and we must say that they can freely occur in both positions, *eg*: *eager*, *indignant*, *surprised*.

Note [a] Most of the adjectives beginning with *a-* are predicative only (*cf* 7.10f). As we have seen above, several of them can take complementation, *eg*: *afraid*, *averse*.

[b] It is not usually possible for the adjective to be complement if the subject is indefinite, and hence the oddness of [1] (cf 19.70f) compared with [2]. An exception occurs with the generic use of the indefinite article (cf 5.52f), as in [3]:

- * *A street* is wide. [1]
The street is wide. [2]
A tiger is dangerous. [3]

Semantic subclassification of adjectives

- 7.40 Some of the semantic distinctions that we are about to make have already been mentioned because they have syntactic correlates.

Three semantic scales are applicable to adjectives: STATIVE/DYNAMIC, GRADABLE/NONGRADABLE, and INHERENT/NONINHERENT. It is important to realize that we are dealing with scales rather than with a feature that is present or absent. That is to say, not all the realizations of a feature are available in each case. Furthermore, there may be idiolectal variations in the recognition of a feature or in the acceptability of its realizations.

Stative/dynamic

- 7.41 Adjectives are characteristically stative. Many adjectives, however, can be seen as dynamic (cf 2.43). In particular, most adjectives that are susceptible to subjective measurement (cf 7.74) are capable of being dynamic. Stative and dynamic adjectives differ syntactically in a number of ways. For example, a stative adjective such as *tall* cannot be used with the progressive aspect or with the imperative:

- * *He's being tall.* * *Be tall.*

On the other hand, we can use *careful* as a dynamic adjective:

- He's being careful.* *Be careful.*

(For other differences, cf 3.66.) A general semantic feature of dynamic adjectives seems to be that they denote qualities that are thought to be subject to control by the possessor and hence can be restricted temporally.

Adjectives that can be used dynamically include:

abusive	adorable	ambitious
awkward	brave	calm
careful	careless	cheerful
clever	complacent	conceited
cruel	disagreeable	dull
enthusiastic	extravagant	faithful
foolish	friendly	funny
generous	gentle	good
greedy	hasty	helpful
impatient	impudent	irritable

irritating	jealous	kind
lenient	loyal	mischievous
naughty	nice	noisy
obstinate	patient	playful
reasonable	rude	sensible
serious	shy	slow
spiteful	stubborn	stupid
suspicious	tactful	talkative
thoughtful	tidy	timid
troublesome	unfaithful	unscrupulous
untidy	vain	vicious
vulgar	wicked	witty

Gradable/nongradable

- 7.42 Most adjectives are gradable. Gradability is manifested through comparison (cf 7.74ff):

tall	~ taller	~ tallest
beautiful	~ more beautiful	~ most beautiful

Gradability is also manifested through modification by intensifiers, *ie* adverbs which convey the degree of intensity of the adjective:

very tall so beautiful extremely useful

Gradability applies to adverbs as well as adjectives, and hence it is considered below in relation to both classes (cf 7.74ff).

All dynamic and most stative adjectives (*eg: tall, old*) are gradable; some stative adjectives are not, principally denominal adjectives like *atomic scientist* and *hydrochloric acid* (cf 7.37), and adjectives denoting provenance, *eg: British* (cf 7.45; but cf the qualitative use of nationality adjectives in 7.87).

Inherent/noninherent

- 7.43 The distinction between inherent and noninherent adjectives has been discussed in 7.32. Most adjectives are inherent, that is to say, they characterize the referent of the noun directly. For example, the inherent adjective in *a wooden cross* applies to the referent of the object directly: a wooden cross is also a wooden object. On the other hand, in *a wooden actor* the adjective is noninherent: a wooden actor is not (presumably) a wooden man. Some other examples:

INHERENT	NONINHERENT
<i>a firm handshake</i>	<i>a firm friend</i>
<i>a perfect alibi</i>	<i>a perfect stranger</i>
<i>a certain result</i>	<i>a certain winner</i>
<i>a true report</i>	<i>a true scholar</i>

Modification of a noun by means of a noninherent adjective can be seen as an extension of the basic sense of the noun. Thus *a firm friend* is 'a friend whose friendship is firm', and *a perfect stranger* is 'a stranger who is perfectly strange'.

If the adjective is inherent, it is often possible to derive a noun from it (cf 17.51ff):

her *soft* touch ~ the *softness* of her touch

However, with a noninherent adjective no such derivation is possible. Compare:

{ a <i>firm</i> handshake	~ the <i>firmness</i> of the handshake
{ a <i>firm</i> friend	~ *the <i>firmness</i> of the friend
{ a <i>true</i> report	~ the <i>truth</i> of the report
{ a <i>true</i> scholar	~ *the <i>truth</i> of the scholar

There are, however, exceptions to this generalization, since we find instances like:

a *wooden* actor ~ the *woodenness* of the actor

Patterns of semantic subclassification

- 7.44 Gradable adjectives are either inherent, as in *a black coat*, or noninherent, as in *a new friend*. Dynamic adjectives are generally inherent, though there are exceptions; for example, *wooden* in *The actor is being wooden* is both dynamic and noninherent.

Table 7.44 gives examples of adjectives that illustrate the various possibilities with respect to the three semantic distinctions that we have been discussing.

Table 7.44 Semantic subclassification of adjectives

GRADABLE	INHERENT	STATIVE	
+	+	+	That's a <i>big</i> boat; She is a <i>brave</i> woman. [central adjectives]
+	+	-	She is being very <i>brave</i> . [dynamic use of central adjective]
+	-	+	He is a <i>firm</i> friend; He is a <i>wooden</i> actor. [peripheral adjectives: noninherent]
+	-	-	This actor is being <i>wooden</i> tonight. [dynamic use of stative adjective]
-	-	+	She is a <i>medical</i> student. [peripheral adjective: nongradable and noninherent]

Note In *a dull teacher*, the adjective *dull* is noninherent, since a dull teacher is not necessarily a dull person. However, in the following sentence *dull* is being used dynamically and is now inherent:

The teacher is being *dull*.

In this case the process of being dull is ascribed to the teacher, but the same quality is ascribed to the referent of the subject if we replace *the teacher* by another designation for the person:

That man } is being *dull*.
Mrs Jones }

Ordering of adjectives in premodification

- 7.45 When there are two or more adjectives cooccurring in attributive position, the order of the adjectives is to a large extent determined by their semantic properties. The principles for the order of items in premodification are discussed in 17.113ff. Here we will only mention the major zones, or positional ranges, of adjectives in premodifying position in relation to the semantic and syntactic subclassification provided in this chapter.

In the premodification structure of the noun phrase, adjectives are placed between the determinatives (including predeterminers, central determiners, and postdeterminers) and the head of the noun phrase (cf 5.1ff). We distinguish four zones:

(I) PRECENTRAL

Here, after the determinatives, is where peripheral, nongradable adjectives are placed, in particular the intensifying adjectives (emphasizers, amplifiers, and downtoners; cf 7.33), eg: *certain, definite, sheer, complete, slight*.

(II) CENTRAL

This zone is the place of the central adjectives, ie the 'most adjectival items', which satisfy all four criteria for adjective status (cf 7.3f), eg: *hungry, ugly, funny, stupid, silent, rich, empty*.

(III) POSTCENTRAL

This zone includes participles, eg: *retired, sleeping*, and colour adjectives, eg: *red, pink*.

(IV) PREHEAD

This zone includes the 'least adjectival and the most nominal' items, such as denominal adjectives (cf 7.37) denoting nationality, ethnic background, eg: *Austrian, Midwestern*, and denominal adjectives with the meaning 'consisting of', 'involving', 'relating to', eg: *experimental, statistical, political, statutory*. In the prehead zone we also find nouns in attributive position (cf further 17.113ff).

On the basis of this classification, we can expect the following order:

- | | |
|-------------|--|
| I + II | <i>certain important people</i> |
| I + III | <i>the same restricted income</i> |
| I + IV | <i>your present annual turnover</i> |
| II + III | <i>a funny red hat</i> |
| II + IV | <i>an enormous tidal wave</i> |
| I + II + IV | <i>certain rich American producers</i> |

ADVERBS

Characteristics of the adverb

- 7.46 The adverb functions as the head of an adverb phrase, with or without modification (cf 2.31). For the sake of simplicity, we refer to the functions of the 'adverb' when, strictly speaking, we should refer to the functions of the 'adverb phrase'. For the same reason, we generally exemplify the functions of the adverb phrase with the adverb alone.

Because of its great heterogeneity, the adverb class is the most nebulous and puzzling of the traditional word classes. Indeed, it is tempting to say simply that the adverb is an item that does not fit the definitions for other word classes. As a consequence, some grammarians have removed certain types of items from the class entirely, and established several additional classes rather than retain these as subsets within a single adverb class.

Morphologically, we can distinguish three types of adverb, of which two are closed classes (simple and compound), and one is an open class (derivational):

- (a) SIMPLE adverbs, eg: *just, only, well*. Many simple adverbs denote position and direction, eg: *back, down, near, out, under* (cf further 8.39ff).
- (b) COMPOUND adverbs, eg: *somehow, somewhere, therefore*; and (the very formal) *whereupon, hereby, herewith, whereto*
- (c) DERIVATIONAL adverbs. The majority of derivational adverbs have the suffix *-ly*, by means of which new adverbs are created from adjectives (and participial adjectives):

odd ~ *oddly*
interesting ~ *interestingly*

Other, less common, derivational suffixes (cf App I.41) are:

-wise: clockwise *-ways*: sideways
-ward(s): northward(s) *-style*: cowboy-style
-fashion: schoolboy-fashion

- Note [a] Corresponding to the prepositional phrase *towards the south (east/north/west)* there are the adverbs *south, southward*, and *southwards*, etc. The *s*-less form *southward*, etc is common, especially in printed AmE (cf: *towards/toward*, 9.17):

The window faces { *south* <most common>
 southwards
 southward <esp printed AmE>

Compare other adverb expressions:

We walked { *home/up* <most common>
 homewards/upwards
 homeward/upward <esp printed AmE>

- [b] The creation of adverbs from adjectives by adding the *-ly* suffix is closely related to the dynamic quality in the adjective (cf 7.41). Thus we have, for example:

cheerful ~ *cheerfully* *suspicious* ~ *suspiciously*
jealous ~ *jealously* *reasonable* ~ *reasonably*

But we do not find *French* ~ **Frenchly*, etc. It appears that *-ly* adverbs are not formed from typically stative adjective classes, such as adjectives denoting:

dimension: *big* ~ **bigly* *tall* ~ **tally*
 colour: *red* ~ **redly* *blonde* ~ **blondely*
 age: *old* ~ **oldly* *young* ~ **youngly*

- 7.47 Rules for forming open-class *-ly* adverbs from adjectives:

- (a) Adjectives ending in consonant + *-le* form adverbs by replacing *-le* by *-ly*: *simple* ~ *simply*. Exception: *whole* ~ *wholly*.
- (b) In adjectives ending in consonant + *y*, *y* is usually replaced by *i* before *-ly*: *happy* ~ *happily*. In some cases there exist alternative spellings:

dry ~ *drily/dryly* *sly* ~ *slily/slyly*

In other cases, *-y* is kept in the adverb:

spry ~ *sprily* *wry* ~ *wryly*

Note the spellings: *coy* ~ *coyly* but *gay* ~ *gaily*; *due* ~ *duly*, *true* ~ *truly*.

- (c) Adjectives ending in both *-ic* and *-ical* have corresponding adverbs in *-ically*:

economic } ~ *economically* *tragic* } ~ *tragically*
economical }

Exception: *public* ~ *publicly*

- (d) *-ed* participles form adverbs in *-edly* with the pronunciation /ɪdli/ (cf 7.19):

marked /mɑːkt/ ~ *markedly* /mɑːkɪdli/
learned /lɜːnɪd/ ~ *learnedly* /lɜːnɪdli/
assured /əʃʊəd/ ~ *assuredly* /əʃʊədli/

- (e) Adjectives in *-ary* form adverbs in *-arily* with shift of stress, in AmE, to the antepenultimate syllable. This stress shift is now frequent also in BrE (cf App II.5 Note):

'secondary { ~ *ˌsecon'darily* <esp AmE>
 ~ *'secondarily*

'primary { ~ *ˌpri'marily* <esp AmE>
 ~ *'primarily*

Adverb as clause element

- 7.48 There are two types of syntactic functions that characterize the traditional adverbs, but an adverb need have only one of these:

- (a) clause element adverbial:

He *quite* forgot about it.

(b) premodifier of adjective and adverb:

They are *quite* {happy.
happily married.

An adverb may function in the clause itself as adverbial, *ie* as an element distinct from subject, verb, object, and complement. As such it is usually an optional element and hence peripheral to the structure of the clause (*cf* 2.15):

Perhaps my suggestion will be accepted.
John *always* loses his pencils.
They may *well* complain about his appearance.
He has *nevertheless* refused to accept our excuse.
I spoke to her *outside*.

There are, of course, differences between the adverbials in the above sentences, most obviously the differences in their position and in their relationship to other elements of the sentence (*cf* Chapter 8).

Note [a] Certain adverbs may function as subject (*cf* 10.15 Notes [a] and [b]), *eg*:
Tomorrow will be fine. ['It will be fine tomorrow.']

[b] The adverb may itself be modified, in which case the adverb phrase as a whole functions as adverbial or premodifier:

John *nearly always* loses his pencils. *so very* helpful
They may *very well* complain about his appearance. *far too* often

Adjuncts, subjuncts, disjuncts, and conjuncts

7.49 The functions of the adverb as the clause element adverbial are examined in Chapter 8. For the present, we merely outline the four grammatical functions that are discussed in that chapter: adjuncts, subjuncts, disjuncts, and conjuncts.

ADJUNCTS and SUBJUNCTS are relatively integrated within the structure of the clause (*cf* 8.25ff, 8.88ff). Examples of adjuncts:

Slowly they walked back home.
He spoke to me about it *briefly*.

Examples of subjuncts:

We haven't *yet* finished.
Would you *kindly* wait for me.

By contrast, disjuncts and conjuncts have a more peripheral relation in the sentence. Semantically, DISJUNCTS (*cf* 8.121ff) express an evaluation of what is being said either with respect to the form of the communication or to its meaning. We identify disjuncts with the speaker's authority for, or comment on, the accompanying clause:

Frankly, I'm tired.
Fortunately, no one complained.
They are *probably* at home.
She *wisely* didn't attempt to apologize.

CONJUNCTS (*cf* 8.134ff) express the speaker's assessment of the relation between two linguistic units, *eg*:

She has bought a big house, *so* she must have a lot of money.

We have complained several times about the noise, and *yet* he does nothing about it.

All our friends are going to Paris this summer. We, *however*, are going to London.

If they open all the windows, *then* I'm leaving.

I didn't invite her. She wouldn't have come, *anyway*.

Adverb as modifier

7.50 An adverb may function as a modifier of an adjective or of another adverb. (In the examples, the modifier is indicated by italics and the modified constituent is indicated by angle brackets.) Examples of adverbs as modifiers of adjectives [1, 2, 6] and adverbs [3–5]:

They are *very* <happy>. [1]
It was a *remarkably* <good> show. [2]
She drives *too* <fast>. [3]
They play *so* <very> well. [4]
He gave a *far* <more easily> acceptable explanation. [5]
He is <stupid> *enough* to do it. [6]

In this function, the adverb generally *premodifies*, except that *enough*, as in [6], can only *postmodify*. The item being modified may itself function as a modifier. For example, the adjective *good* premodifies the noun *show* in [2], while *more easily* modifies *acceptable* in [5], and the adverb *very* premodifies the adverb *well* in [4]. In both [2] and [5], the adverb is within a noun phrase.

Adverbs functioning as modifiers of adjectives and adverbs will be further discussed in 7.56ff. However, not all adverbs that modify adjectives also modify adverbs (*cf* 7.60), and some adverbs may modify phrases, *viz* noun phrases and prepositional phrases. The most conspicuous example of an adverb that functions only as a modifier of adjectives and adverbs, and not as a clause element, is *very*. (For *very* as an adjective, *cf* 7.35 Note [a].)

The adverb and other word classes

7.51 We now briefly consider some examples of overlap between the adverb class and other word classes. Similarities between adverbs and adjectives have been discussed earlier (*cf* 7.6ff). The other relevant word classes are conjunctions, prepositions, and interjections. We also take into account certain words (other than conjunctions and some conjunct adverbs) that must be positioned initially, but these are not traditionally recognized as separate word classes.

Conjunct adverb and conjunction

- 7.52 A few conjunct adverbs, such as *so* and *yet*, resemble coordinators (coordinating conjunctions) both in being connectives and in having certain syntactic features (cf 13.11). In particular, these adverbs cannot be transposed with their clause in front of the preceding clause. Thus, the order of the following two clauses (with the conjunct adverb *so* in the second clause) is fixed:

We paid him a very large sum. *So* he kept quiet about what he saw. [1]

If we invert the order of the clauses, the relationship between the two clauses is changed, and *so* must now refer to some preceding clause:

So he kept quiet about what he saw. We paid him a very large sum. [2]

However, the conjunct adverbs differ from coordinators in that they can be preceded by a coordinator:

We paid him a very large sum, *and so* he kept quiet about what he saw. [1a]

The restriction on the order of clauses also distinguishes the conjunct adverbs from subordinators, another type of connective. For example, a clause introduced by the subordinator *because* can follow or precede the matrix clause without disturbing the relationship between the two clauses (cf 14.4ff):

{ He will help us *because* we offered to pay him. [3]
 { *Because* we offered to pay him, he will help us. [3a]

Adjunct adverb and conjunction

- 7.53 A few subordinators can be seen to be a fusion of conjunction and pro-adjunct (cf 15.8), in particular *when* [time], *where* [place at or place to], *how* [manner], *why* [reason].

Where and *when* introduce adverbial clauses (cf 15.31):

He saw them { *when*
 at the time(s) at which } they were in Rome.

I'll go { *where*
 to the place(s) to which } they go.

We'll go { *where*
 to the place(s) at which } the food is good.

He'll stay { *where*
 at the place(s) at which } it is comfortable.

Where and *when*, and to a lesser extent *why*, are also used as relatives (cf 17.18ff):

the place { *where*
 at which } he is staying [1]

the time { *when*
 at which } she was here [2]

Where, *when*, *why*, and *how* are all used to introduce nominal clauses (cf 15.8f):

I know { *where*
 at which place } he is staying. [1a]

I wonder { *when*
 at which time } she was here. [2a]

I realize { *why*
 the reason for which } he did it. [3]

That was { *how*
 the way in which } they treated her. [4]

These four *wh*-words are also used as interrogative pro-forms (cf 11.14):

Where
 At what place } is he staying? [1b]

When
 At what time } was she here? [2b]

Why
 For what reason } did he do it? [3a]

How
 In what way } did they treat her? [4a]

The function of *where*, *when*, and *how* as pro-forms for adjuncts is clearly demonstrated in the few cases where a verb requires complementation by an obligatory predication (cf 8.27ff):

*She put it. [5]

*He lived. [6]

*They treated her. [unacceptable in the sense 'behaved towards her'] [7]

These sentences become acceptable if an adjunct of the appropriate type is added:

She put it *there*. [5a]

He lived *then*. [6a]

They treated her *well*. [7a]

But complementation can also be provided by the appropriate subordinators, evidence that they are functioning as pro-adjuncts:

He found it *where* she put it. [5b]

I wonder *when* he lived. [6b]

I saw *how* they treated her. [7b]

In a sentence such as [5c], one could argue that *where* is functioning as an adjunct in both clauses, which have been made to overlap by the subordinator:

She put it *where* he could find it. [5c]
 = { She put it *there*.
 There he could find it.

On the other hand, it is equally possible to argue that the obligatory complementation of a place adjunct is satisfied by the whole clause of place rather than by *where*. The same reasoning applies to the obligatory complementation for *treat* provided by clauses of manner and comparison (cf 15.22):

She treated him $\left\{ \begin{array}{l} \text{as he deserved.} \\ \text{as though he were a stranger.} \end{array} \right.$

Note Most of the other *wh*-words are pro-forms for noun phrases and can clearly function as clause elements: *who*, *whom*, *which* (cf 10.6 Note [e]).

Reaction signal and initiator

- 7.54 Apart from conjunctions and some conjunct adverbs, certain other items must be positioned initially. They are important because of their high frequency in spoken English. Some are restricted to the spoken language. These can be assigned to two small classes (cf 11.54f):

- (i) 'reaction signals', eg: *no*, *yes*, *yeah*, *yep*, *m*, *hm*, *mhm*
- (ii) 'initiators', eg: *well*, *oh*, *ah*; *oh well*, *well then*, *why* (esp AmE)

Here is an example from a conversation (cf App II for the prosodic notation):

[OH] | WELL | of | course he'll be working with overseas ↑STUDENTS|. |well ↑
YES| |but ↑he's WORKING with ↑DIBBLE| |well NO| he's in the department
of English Literature|

Adjunct and preposition

- 7.55 There are several different types of combinations of verbs plus particles (cf 16.2ff). If the verb is intransitive, we can recognize the particle as a prepositional adverb (cf 9.65f) functioning as adjunct, eg:

The men looked *on*.
She is growing *up* quickly.
The airliner has taken *off*.
The prisoner broke *down* after many hours of interrogation.

When a noun phrase follows the particle, it sometimes appears as if we have a prepositional phrase, with the particle as preposition:

He took *in* the dog. [1]

However, the adverbial nature of the particle in such phrasal verbs (cf 16.3ff) is generally shown by its mobility, its ability to follow the noun phrase:

He took the dog *in*. [1a]

Similarly:

$\left\{ \begin{array}{l} \text{They turned } \textit{down} \text{ the suggestion.} \\ \text{They turned the suggestion } \textit{down}. \end{array} \right. \quad \begin{array}{l} [2] \\ [2a] \end{array}$

$\left\{ \begin{array}{l} \text{They turned } \textit{on} \text{ the light.} \\ \text{They turned the light } \textit{on}. \end{array} \right. \quad \begin{array}{l} [3] \\ [3a] \end{array}$

In contrast, a preposition must be directly followed by its complement:

$\left\{ \begin{array}{l} \text{They took } \textit{to} \text{ John quickly.} \\ \text{*They took John } \textit{to} \text{ quickly.} \end{array} \right. \quad \begin{array}{l} [4] \\ [4a] \end{array}$

The instances we have mentioned so far are not to be confused with examples like [5] and [6]. Compare:

$\left\{ \begin{array}{l} \text{He walked } \textit{past}. \text{ [prepositional adverb]} \\ \text{He walked } \textit{past the car}. \text{ [preposition]} \\ \text{*He walked the car } \textit{past}. \end{array} \right. \quad \begin{array}{l} [5] \\ [5a] \\ [5b] \end{array}$

$\left\{ \begin{array}{l} \text{He was moving } \textit{about}. \text{ [prepositional adverb]} \\ \text{He was moving } \textit{about the town}. \text{ [preposition]} \\ \text{*He was moving the town } \textit{about}. \end{array} \right. \quad \begin{array}{l} [6] \\ [6a] \\ [6b] \end{array}$

Past in [5] and *about* in [6] are prepositional adverbs, which can be regarded as prepositions with some generalized ellipsis of the noun phrase (cf 9.65f).

Syntactic functions of adverbs

Adverb as modifier

Modifier of adjective

- 7.56 An adverb may premodify an adjective. Most commonly, the modifying adverb is a scaling device called an intensifier, which cooccurs with a gradable adjective. We first distinguish two sets of intensifiers: amplifiers and downtoners (for further discussion and subclassification, cf 8.104ff).

(a) AMPLIFIERS scale upwards from an assumed norm, eg 'a *very* funny film', as compared with 'a funny film'. Other examples:

<i>absurdly</i> fussy	<i>amazingly</i> calm
<i>awfully</i> sorry	<i>deeply</i> concerned
<i>downright</i> ridiculous	<i>entirely</i> free
<i>extremely</i> dangerous	<i>highly</i> intelligent
<i>irretrievably</i> lost	<i>perfectly</i> reasonable
<i>sharply</i> critical	<i>strikingly</i> handsome
<i>terribly</i> nervous	<i>too</i> bright
<i>totally</i> anonymous	<i>unbelievably</i> smart

(b) DOWNTONERS have a generally lowering effect, usually scaling downwards from an assumed norm, eg 'It was *almost* dark', as compared with 'It was dark'. Other examples:

<i>a bit</i> dull	<i>a little</i> extravagant
<i>almost</i> impossible	<i>barely</i> intelligible
<i>fairly</i> small	<i>hardly</i> noticeable
<i>nearly</i> dark	<i>pretty</i> rare
<i>quite</i> normal	<i>rather</i> late
<i>relatively</i> small	<i>somewhat</i> uneasy

A similar set of intensifiers is used for both adjectives and adverbs (cf 7.87). For intensifiers which premodify comparatives and superlatives, cf 7.89f.

Note [a] *Quite* can have two different meanings (cf 8.111 Note [c]), as in:

She's *quite* right. ['absolutely', 'completely', ie an amplifier]
That's *quite* good. ['fairly', 'rather', ie a downtoner; in AmE *quite* here is also used in the sense of 'very', ie as an amplifier]

[b] *Fairly*, *pretty*, and *rather* can all be used as intensifiers of adjectives and adverbs, eg:

She is $\begin{Bmatrix} \text{fairly} \\ \text{pretty} \\ \text{rather} \end{Bmatrix}$ tall. She drives $\begin{Bmatrix} \text{fairly} \\ \text{pretty} \\ \text{rather} \end{Bmatrix}$ fast.

However, these downtoners have different uses. *Fairly* is typically used to modify an adjective or adverb which denotes a desirable quality. If we feel comfortable in a warm room, we can intensify the adjective by saying *It's fairly warm in here* ['warm enough'], whereas *rather warm* implies that the room is warmer than we desire ('too warm'). We would usually say *fairly clean* but *rather dirty* to denote, respectively, a desirable and an undesirable quality.

Pretty is the most informal and strongest of the three. Like *rather*, it can be used with both favourable and unfavourable import: *pretty clean/dirty*. Note that *pretty*, when used as an intensifier, is normally unstressed (or weakly stressed) – unlike the adjective *pretty*:

a 'pretty' dark DRĒSS ['a rather dark dress']

a 'pretty' dark DRĒSS ['The dress was pretty.']

Rather differs from *pretty* and *fairly* in that it alone can intensify:

(i) a comparative or *too*-construction (cf the implication 'too warm' above):

$\begin{Bmatrix} \text{rather} \\ * \text{fairly} \\ * \text{pretty} \end{Bmatrix} \begin{Bmatrix} \text{better} \\ \text{too small} \\ \text{too quickly} \end{Bmatrix}$

(ii) certain noun phrases denoting adjectival qualities (cf 7.63 Note [b]):

$\begin{Bmatrix} \text{rather} \\ * \text{fairly} \\ * \text{pretty} \end{Bmatrix} \begin{Bmatrix} \text{a pity} \\ \text{a fool} \\ \text{a crowd} \end{Bmatrix}$ BUT: $\begin{Bmatrix} \text{rather} \\ * \text{fairly} \\ * \text{pretty} \end{Bmatrix} \begin{Bmatrix} \text{pitiful} \\ \text{foolish} \\ \text{crowded} \end{Bmatrix}$

(iii) certain verbs (cf 8.112):

It *rather*/**fairly*/**pretty* annoys me that ...

(iv) With other nouns, *rather* alone has variable position in relation to the indefinite article (cf 7.63 Note [b]):

a $\begin{Bmatrix} \text{rather} \\ \text{pretty} \\ \text{fairly} \end{Bmatrix}$ difficult task $\begin{Bmatrix} \sim \text{rather} \\ \sim * \text{pretty} \\ \sim * \text{fairly} \end{Bmatrix}$ a difficult task

[c] In informal speech, *kind of* and *sort of* are used as downtoners for adjectives and adverbs (cf 8.111):

He is *sort of* clever. She spoke *kind of* proudly.

[d] The following intensifiers are typical of informal speech (esp AmE):

real nice | *awful* good
plain silly | *mighty* helpful

Most people prefer *really* to *real*, and *awfully* to *awful*, particularly in formal style (cf 7.7):

She's *really* nice. That was *awfully* good.

Especially in informal AmE, *sure* is similarly used:

That's *sure* kind of you. ['certainly']

Surely, unlike *really*, is however a disjunct (cf 8.127), in which function *sure* is also used in informal AmE. Note also the use of *sure* in Irish English:

Surely, she's right. [persuasive: 'you surely agree']

Sure, she's right. [AmE = agreement: 'of course']

Sure, she's right. [Irish English = asseveration: 'I assure you']

Sure and *surely* (unlike *real*, *really*, and *truly*) cannot premodify another premodifier:

She's a $\begin{Bmatrix} \text{real(ly)} \\ \text{truly} \\ * \text{sure(ly)} \end{Bmatrix}$ <nice> girl.

Sure cannot occur after other verbs than *be*:

She's *sure* nice. <esp AmE>

*She looks *sure* nice.

She *sure* is nice. <esp AmE>

She *sure* looks nice. <esp AmE>

But:

He'll *sure* fail. <informal>

He *sure* can play football. <informal>

[e] Two informal intensifiers, *any* and *that*, are particularly associated with nonassertive contexts:

Is the team *any* different from last year? ['really very much different']

It's not (all) *that* unusual for women nowadays to join the police force, is it? ['so, very']
Outside nonassertive contexts, this usage of *that* is dialectal or nonstandard:

She's *that* clever! ['very']

I was *that* tired I couldn't walk. ['so']

[f] As downtoners of adjectives in the absolute degree, *a bit* and *a little* can only occur in predicative position and with adjectives with 'unfavourable' meaning and an implication of 'more than wanted':

The weather's *a bit* (too) hot.

*The weather's *a bit* lovely.

**a bit* hot weather

[g] Some amplifiers are restricted to a small set of lexical items, eg:

dead tired [BUT NOT: **dead* exhausted]

fast asleep

dead drunk [BUT NOT: **dead* intoxicated]

wide awake

Nouns may also function as such restricted amplifiers:

stone cold *rock* hard *brand* new

[h] One difference between the set of downtoners *almost*, *nearly*, and *practically* (cf approximators, 8.111f) is that only *nearly* can be used after *not*, *very*, *pretty* (cf 7.62):

It's $\begin{Bmatrix} \text{nearly} \\ \text{almost} \\ \text{practically} \end{Bmatrix}$ dark. BUT: It's $\begin{Bmatrix} \text{not} \\ \text{very} \\ \text{pretty} \end{Bmatrix} \begin{Bmatrix} \text{nearly} \\ * \text{almost} \\ * \text{practically} \end{Bmatrix}$ dark.

7.57 As in the treatment of adjectives, it may be possible to distinguish another class of adjective modifiers called EMPHASIZERS, which add to the force (as distinct from the degree) of the adjective:

She has a *really* <beautiful> face.

The play is <very good> *indeed*.

That's *just* <impossible>.

He looked *all* <confused>.

Unlike intensifiers, emphasisers cooccur with nongradable adjectives, but the effect is often similar to that of intensifiers:

You are *certainly* welcome. ['You are *very/most* welcome.']

Indeed can have either pre- or postposition (cf 8.103 Note [a]):

The play was $\begin{Bmatrix} \text{indeed} <\text{excellent}>. \\ <\text{excellent}> \text{indeed}. \end{Bmatrix}$

Compare:

Indeed, the play was excellent.

This example shows how the function of many emphasisers is similar to that of disjuncts (cf 8.121ff). Similarly *frankly*:

I'm *frankly* surprised at your behaviour. [emphasiser]

Frankly, I'm surprised at your behaviour. [disjunct]

Note *Too* can be a synonym of *extremely* in informal speech:

It's *too* <kind> of you. That's *too* <true>.

In informal style it is also commonly used (especially in AmE) as a synonym of *very* in negative sentences:

I'm not *too* <sure> about that.
 I'm not *too* <keen> on his paintings.
 I don't feel *too* <good>. ['very well']

This use of *too* is given wide extension in Australian English, where *too* is common in the sense 'absolutely' in responses:

A: He's clever. B: *Too* right, he is. ['That is absolutely true.']

Compare informal AmE usage:

A: You can't do it. B: I can *too*. ['I certainly can.']

- 7.58** Adjunct adverbs (cf 7.49, 8.25ff) are sometimes converted into premodifiers of adjectives. In this position they tend to retain their general meaning of manner, means, etc, though they also acquire some intensifying effect:

an *easily* <debatable> proposition ['a proposition that can be easily debated']
 an *openly* <hostile> attack
 his *quietly* <assertive> manner
 a *readily* <available> publication

On the other hand, disjunct adverbs (cf 7.121ff) tend to become intensifiers, eg:

surprisingly <good> *unnaturally* <long>
incredibly <beautiful> *unusually* <easy>

Thus *surprisingly good* in the following sentence can be paraphrased as 'He made a speech that was good to a surprising extent':

He made a *surprisingly* <good> speech.

Note We need to distinguish the adverb as premodifier of an adjective from the adjunct adverb constructed with a verb participle. For example, a *surprisingly worded* letter is 'a letter that is worded in a surprising manner', since *worded* is an *-ed* participle and not an adjective. Ambiguity arises when the form can be either a participle or an adjective. Thus, a *divinely inspired* work can be either 'a work that has been inspired in a divine manner (or by God)', in which case *inspired* is verbal and *divinely* an adjunct adverb, or 'a work that is inspired to a divine extent', in which case *inspired* is adjectival and *divinely* its intensifier. Cf the difference in aspect and implied 'permanence'; 17.28.

- 7.59** Apart from intensifiers, premodifying adverbs may be 'viewpoint' subjuncts (cf 8.88ff), eg:

politically <expedient> ['expedient from a political point of view']

Similarly:

artistically <justifiable> *economically* <weak>
theoretically <sound> *technically* <possible>
ethically <wrong>

Modifier of adverb

- 7.60** An adverb may premodify another adverb. Similar sets of intensifiers are used for adverbs and adjectives (cf 7.56ff):

I expect them *pretty* <soon>.
 I have seen *so* <very> many letters like that one.

They didn't injure him *that* <severely>. <informal>
 They are *smoking very* <heavily>.
 He spoke *extremely* <quickly>.
 He played *surprisingly* <well>.

As with adjectives (cf 7.50, 7.57), the only postmodifiers are *enough* and *indeed*:

He spoke <clearly> *enough*. ['sufficiently clearly']

Indeed usually goes with *very*:

She spoke <very clearly> *indeed*.
 ?She spoke <clearly> *indeed*.

Adverbs modifying other adverbs can only be intensifiers. Thus, though we have the manner modification by *quietly* in *quietly assertive*, we cannot have it in:

*He spoke *quietly* <assertively>.

And, similarly, the modification by a viewpoint adverb (cf 8.89) in *theoretically sound* does not have a corresponding

*He reasoned *theoretically* <soundly>.

Notice that this is not merely a stylistic objection to the juxtaposition of two words ending in *-ly*, since the following sentence, where *extremely* is an intensifier, is acceptable:

He reasoned *extremely* <soundly>.

Modifier of particle, prepositional adverb, and preposition

- 7.61** A few intensifying adverbs, particularly *right* and *well*, can premodify particles in phrasal verbs (cf 16.4), as well as prepositions, or (perhaps rather) prepositional phrases (cf 9.64):

He knocked the man *right* <out>.
 They left her *well* <behind>.
 The nail went *right* <through> the wall.
 He made his application *well* <within> the time.
 Her parents are *dead* <against> the trip. <informal>

Modifier of pronoun, predeterminer, and numeral

- 7.62** Intensifying adverbs (including downtoners) can premodify:

(a) indefinite pronouns (6.45ff):

Nearly <everybody> came to our party.

(b) predeterminers (5.15ff):

They recovered *roughly* <half> their equipment.
 He received *about* <double> the amount he expected.
Virtually <all> the students participated in the discussion.

(c) cardinal numerals (6.63):

They will stay *fully* <ten> weeks. ['for ten full weeks']
Over/under <two hundred> deaths were reported.
 I paid *more/less than* <ten> pounds for it.
 They will make a charge of *up to* <as much as one million> yen.
As many as <fifty> candidates had applied for the post.

(d) Noun phrases with the indefinite article can be intensified when *a(n)* is equivalent to the unstressed cardinal *one* (5.38):

I didn't have *more than* <a dollar> on me. ['I had no more than ...']
 They will stay for *about* <a week>.
Nearly/almost <a thousand demonstrators> attended the meeting.

More than, about, etc are here not prepositions but intensifiers as part of the noun phrase, as can be seen by the occurrence of prepositions before such items:

There's a cover charge of *more than* \$3.

(e) With the ordinals and superlatives, a definite determiner is obligatory for premodification:

We counted *approximately* <the first> thousand votes.
 She gave me *almost* <the largest> piece of cake.

(f) Modification can also apply to larger units, *eg*:

The acceleration fell to *less than* <ten metres per second>.

Note [a] We might add here the premodification of *the same* by (*very*) *much*:

They did it in (*very*) *much* <the same> way.

[b] Some of the items that are intensifying adverbs can also function as prepositions, *eg*: *over, about* (cf 9.7).

[c] Both the downtoners *almost* and *practically* can intensify all indefinite pronouns, whereas *nearly* can intensify only assertive pronouns (cf 8.113 on downtoners with verbs). Compare:

Almost
Practically
Nearly } {everybody
 } {all } came.

Almost
Practically
 **Nearly* } {nobody came.
 } {any time will do.
 } {no compensation was given.

Modifier of noun phrase

7.63 A few intensifiers may premodify noun phrases and precede the determiner in doing so. The most common of these among adverbs are *quite* and *rather* <esp BrE>:

We had *quite* <a party>.
 They will be here for *quite* <some time>.
 He was *quite* <'some player>.

They were *quite* <'some players>.

[*Quite* 'some with count nouns is informal; note the stress on 'some.]

It was *rather* <a mess>. <esp BrE>

Though not adverbs but predeterminers (cf 5.15), *such* and *what* have a similar function (cf 17.96):

He is *such* <a fool>.

What <a mess> they made!

They are *such* <fools>.

What <babies> they are!

Note [a] Other adverbs may be interpreted as not specifically modifying the noun phrase, since they are mobile. Compare the following two examples:

He was *really* 'some PLAYER' <informal> [1]

He *really* was 'some PLAYER' [2]

Transposition of *really* in [1] to pre-verb position in [2] does not seem to affect the meaning, provided that the appropriate intonation pattern is given. A similar transposition of *quite* is not possible.

[b] For many people, plural noun phrases cannot be premodified by *rather*:

He is *rather* a fool. ['rather foolish'; cf 7.56 Note [b]]

*They are *rather* fools.

If the noun is nongradable, *rather* cannot be used unless a gradable adjective is present, in which case *rather* is intensifying the adjective. Positions before the adjective and before the determiner are both possible, with little or no semantic difference:

*It is *rather* a table. [not acceptable unless in the sense '... a table rather than ...']

It is { *rather* a } big table.
 { a *rather* }

[c] For the relationship between adverbs like *only* and *also* and noun phrases, cf focusing subjuncts, 8.116ff.

7.64 With *kind of* and *sort of* there are several possible constructions in informal style:

This must be { *a sort of* joke.
 sort of a joke. <informal>
 a sort of a joke. <more informal>
 a joke, *sort of*. <most informal>

Other *of*-phrases precede the determiner, if present:

I had *a bit of* <a shock>.

They asked *a heck of* <a lot>. <familiar>

They gave me *a hell of* <a time>. <familiar>

In familiar style, the *wh*-words as interrogatives (cf 11.14 Note [a]) can be postmodified by certain set prepositional phrases, *eg*:

{ <who>
 <what>
 <where> } { *on earth*
 (in) the heck <familiar>
 (in) the hell <familiar>

Omission of the preposition in the last two examples is preferred by some and obligatory for others.

Ever can be an intensifier. It normally occurs as a separate word and only with interrogative *wh*-words, for example:

<Why> *ever* should she apply for such a post?

Else**7.69** Else can postmodify:

- (a) compound indefinite pronouns (cf 6.46f) and compound adverbs (cf 7.46) in *-body*, *-one*, *-place*, *-thing*, and *-where*:

<Somebody> else must have done it. ['some other person']

<Anybody> else for tennis?

<Nothing> else happened.

You must have left the keys { <somewhere> else.
 <someplace> else. <esp AmE> }
 ['elsewhere']

You'll have to borrow <someone> else's car. [on the genitive, cf 6.47]

- (b) *wh*-pronouns and *wh*-adverbs in interrogative clauses (cf 11.14ff):

<Who> else would do such a thing? ['which other person']

<Who> else did you meet?

<What> else can we do?

<Where> else have you looked?

<How> else could it have happened?

<When> else can we meet?

The genitive 's is usually placed after *else* (cf the group genitive, 5.123):

Who else's } fault could it be?
 ?Whose else }

- (c) singular *all* (= *everything*), *much*, a *great/good deal*, a *lot*, *little*:

We will take this step only if *all else* fails.

There's { little
 not much
 not a great deal } else we can do now.

Adverb as complement of preposition

- 7.70** A number of adverbs signifying place and time function as complement of a preposition. Of the place adverbs, *here* and *there* take the most prepositions, eg:

Come over *here*!

Do you live *near here*?

Yes, I live *over there*.

How do we get out *of here*?

Other prepositions that take *here* and *there* as complements are:

along	around	down	from	in
on	round	through	under	up

Home (which may alternatively be considered a noun; cf 5.51) can be the complement of *at*, (*away*) *from*, *close to*, *near*, *toward(s)*, eg:

I want to stay *at home* tonight.

The other place adverbs are restricted to the preposition *from*, eg:

You've got a letter *from abroad*.

Other adverbs that function as complement of *from* are:

<i>behind</i>	<i>above/below/beneath/underneath</i>
<i>downstairs/upstairs</i>	<i>indoors/outdoors</i>
<i>inside/outside</i>	<i>within/without</i>

The time adverbs that most commonly function as complement of a preposition are shown in the figure below.

Fig 7.70 Time adverbs that most commonly function as complements of prepositions

- Note [a] The preposition *of* also occurs in the phrase *of late* ['recently'].
 [b] *Forever* is also written as two words: *for ever*. The expression *forever and ever* is typical of Biblical and liturgical styles of English. It is curious that analogous reduplicated phrases are virtually restricted to informal use: *for months and months*, *for years and years*.

Correspondence between adjective and adverb

- 7.71 We have earlier observed (7.46) that open-class adverbs are regularly, though not invariably, derived from adjectives by suffixation. There is another sense in which adjectives and adverbs are related, apart from this morphological relationship. A correspondence often exists between constructions containing adjectives and constructions containing the corresponding adverbs. The simplest illustration is with adverbs equivalent to prepositional phrases containing a noun or noun phrase that is a generic term and the corresponding adjective as premodifier:

He liked Mary *considerably*.
 ~ He liked Mary *to a considerable extent*.
 He spoke to John *sharply*.
 ~ He spoke to John *in a sharp manner*.
 He wrote *frequently*.
 ~ He wrote *on frequent occasions*.
Politically, it is a bad decision.
 ~ *From the political point of view*, it is a bad decision.

- 7.72 We have also noted some instances where either the adjective or the adverb forms appear, with little or no semantic difference (cf 7.6). But normally, the adjective and its corresponding adverb appear in different environments:

his *frequent* visits
 ~ His visits are *frequent*.
 ~ He visits *frequently*.
 her *brilliant* explanation of the process
 ~ Her explanation of the process was *brilliant*.
 ~ She explained the process *brilliantly*.
 her *incredible* beauty
 ~ Her beauty is *incredible*.
 ~ She is *incredibly* beautiful.

As the examples show, the adjective in nominalizations is equivalent to the adverb in a corresponding clause.

- 7.73 There are many other cases of nominalization where a construction with the adverb form seems basic to an understanding of the corresponding construction with the adjective form (cf 17.51ff):

(a) The adjective-noun sequence may imply a process or a time relationship, a corresponding clause containing an adverb:

a *hard* worker ~ somebody who works *hard*
 an *eventual* loser ~ somebody who will *eventually* lose
 a *frequent* visitor ~ somebody who visits *frequently*
 a *heavy* eater ~ somebody who eats *heavily*
 a *light* sleeper ~ somebody who sleeps *light(ly)*

We should include here cases where the agential noun lacks an agential suffix: *a former student*, *a clever liar*. Similarly, there are instances where the

noun normally lacks a corresponding verb, but where the reference is to the process part of the noun's meaning:

a *poor* soldier ['one who acts poorly in his role as a soldier']
 a *good* mother ['one who cares well for her children']
 a *faithful* friend ['a friend who acts in a faithful way']

Many of these adjectives can occur only attributively in this use. They belong to the noninherent class of adjectives (cf 7.43).

(b) Analogous correspondences do not have this restriction to attributive position:

He loved her <i>deeply</i> .	She answered <i>quickly</i> .
~ his <i>deep</i> love for her	~ her <i>quick</i> answer
~ His love for her was <i>deep</i> .	~ Her answer was <i>quick</i> .
He writes <i>legibly</i> .	<i>Surprisingly</i> , he decided to leave.
~ his <i>legible</i> writing	~ his <i>surprising</i> decision to leave
~ His writing is <i>legible</i> .	~ His decision to leave was <i>surprising</i> .

(c) The adjective may refer to an implied process associated with a concrete object:

a *fast* car ['a car that can go *fast*']
 a *slow* road ['a road on which one can only drive *slowly*']
 a *neat* typewriter ['a typewriter which types *neatly*']

(d) Most intensifying adjectives (cf 7.33f) can be seen as related to adverbs:

<i>total</i> nonsense	~ It is <i>totally</i> nonsense.
a <i>clear</i> failure	~ It is <i>clearly</i> a failure.
a <i>true</i> scholar	~ He is <i>truly</i> a scholar.
a <i>real</i> idiot	~ He is <i>really</i> an idiot.

Many of these can occur only attributively in this use.

(e) Many restrictive adjectives (cf 7.35) can be seen as related to adverbs:

the <i>main</i> reason	~ The reason was <i>mainly</i> that . . .
the <i>precise</i> argument	{ ~ The argument was <i>precisely</i> that . . .
	~ The argument was <i>precise</i> .

Note [a] We can point to differences in grammar and meaning in the interpretation of a *beautiful dancer*:

a *beautiful* dancer
 ~ a dancer *who is beautiful*
 ~ a person *who dances beautifully* ['who does a beautiful dance' or 'beautiful dances']

In the second interpretation, the adjective refers to the process part of an agential noun.

[b] Note also the relations between adjectives and adverbs in the following examples:

an <i>apparent</i> enemy	~ He is <i>apparently</i> an enemy.
a <i>possible</i> meeting	~ They will <i>possibly</i> meet.
a <i>slight</i> disagreement	~ They disagreed <i>slightly</i> .
the <i>current</i> manager	~ She is <i>currently</i> the manager.

Comparison of adjectives and adverbs

7.74 With gradable adjectives and adverbs three types of COMPARISON are possible (cf 7.42), *ie* comparison in relation

- (a) to a higher degree
- (b) to the same degree
- (c) to a lower degree

The three types of comparison are expressed by the following means;

(a) Comparison in relation to a higher degree is expressed by the inflected forms in *-er* and *-est* or their periphrastic equivalents with *more* and *most*:

Anna is $\left\{ \begin{array}{l} \text{cleverer} \\ \text{more clever} \end{array} \right\}$ than Susan.

Anna is the $\left\{ \begin{array}{l} \text{cleverest} \\ \text{most clever} \end{array} \right\}$ student in the class.

(b) Comparison in relation to the same degree is expressed by *as* (or sometimes *so*) ... *as*:

Anna is *as tall as* Bill.

Anna is not $\left\{ \begin{array}{l} \text{as} \\ \text{so} \end{array} \right\}$ tall as John.

(c) Comparison in relation to a lower degree is expressed by *less* and *least*:

This problem is *less difficult* than the previous one.

This is the *least difficult* problem of all.

For higher degree comparisons, English has a three-term inflectional contrast between ABSOLUTE, COMPARATIVE, and SUPERLATIVE forms for many adjectives and for a few adverbs, the absolute being realized by the base form of the item. This can be seen in Table 7.74 which also gives the parallel periphrastic constructions (cf comparative clauses, 15.63ff):

Table 7.74 Comparison of adjectives and adverbs

	ABSOLUTE	COMPARATIVE	SUPERLATIVE
INFLECTION			
adjective	<i>high</i>	<i>higher</i>	<i>highest</i>
adverb	<i>soon</i>	<i>sooner</i>	<i>soonest</i>
PERIPHRAISIS			
adjective	<i>complex</i>	<i>more complex</i>	<i>most complex</i>
adverb	<i>comfortably</i>	<i>more comfortably</i>	<i>most comfortably</i>

Comparison of adjectives

Irregular forms of comparison

7.75 A small group of highly frequent adjectives have comparative and superlative forms with stems which are different from the base:

good ~ better ~ best
bad ~ worse ~ worst
far $\left\{ \begin{array}{l} \sim \text{further} \\ \sim \text{farther} \end{array} \right\}$ ~ furthest ~ farthest

The two sets *farther/farthest* and *further/furthest*, which are both adjectives and adverbs, are used interchangeably by many speakers to express both physical and abstract relations. In fact, however, the use of *farther* and *farthest* is chiefly restricted to expressions of physical distance, and, in all senses, *further* and *furthest* are the usual forms found:

Nothing could be *further* from the truth.

My house is *furthest* from the station.

Note The most common uses of *further* are not as comparative form of *far* but in the sense of 'more', 'additional', 'later':

That's a *further* reason for deciding now. [BUT NOT: *a *far* reason]

Any *further* questions?

The school will be closed until *further* notice.

We intend to stay for a *further* two months.

Comparison of old

7.76 *Old* is regularly inflected as *older* ~ *oldest*. In attributive position, particularly when referring to the order of birth of members of a family, the irregular forms *elder* ~ *eldest* are normally substituted (especially in BrE):

My *elder/older* sister is an artist.

His *eldest/oldest* son is still at school.

However, *elder* is not a true comparative in that it cannot be followed by *than*:

My brother is three years $\left\{ \begin{array}{l} \text{older} \\ \text{*elder} \end{array} \right\}$ than me.

Note [a] There is a special use of *elder* in, for example, *William Pitt the elder*, *the elder Pitt*. In the honorific expression *elder statesman*, *elder* has no comparative meaning, and there is no corresponding use of *old* or *oldest*.

[b] *Elder* and *eldest* require personal reference:

This viola is the *older*/**elder*.

Comparison of good, well, and ill

7.77 *Well* ['in good health'] and *ill* ['in bad health'] (esp BrE), cf 7.38] are inflected like *good* and *bad*, respectively, for the comparative: *He feels better/worse*. *He is better* is ambiguous between (a) 'He is well again' and (b) 'He is less ill'. In the first use (a), we can have intensifiers expressing absolute degree:

He is *completely better*.

In the second use (b), we can have expressions with a comparative sense:

He is $\left\{ \begin{array}{l} \text{a little} \\ \text{a bit} \\ \text{somewhat} \end{array} \right\}$ better.

There is no superlative *best* in the health sense: **He is best. He is worse* corresponds to the second use (b), *ie* = 'less well'. There is no positive periphrastic comparison corresponding to the negative comparison *less well*:

**He is more well* today. [= 'better' in its second use]

He is less well denotes that his state of health is not as bad as would be suggested by *worse*.

Compounds with *good*, *well*, and *ill* + participle can have either form of comparison (cf 7.83b):

good-looking { *~ better-looking* *~ best-looking*
 ~ more good-looking *~ most good-looking*

Comparison of *little* and *small*

- 7.78 *Little* shares the comparative forms with *small*, *ie*: *smaller* and *smallest*, as an adjective modifying count nouns:

Anna is only a { *little* } child.
 { *small* }

She is *smaller* than Susan.

She is the *smallest* child in her playgroup.

Lesser is used attributively in the sense of 'less important':

to a *lesser degree/extent*
lesser men than Churchill

Least in the sense of 'slightest' is common with abstract nouns in nonassertive contexts:

She did it without *the least/smallest hesitation*.
I haven't *the least idea*.

Least can also be the head of a noun phrase (cf 7.26):

That is *the least we can do*.

- Note [a] *Little* and *littlest* occur occasionally, typically in familiar use:

She is my *littlest* child.

Have you read the Christmas story called 'The *Littlest* Angel'?

The black dress was *littler* and subtler than volumes of *Vogue* could imply.

- [b] *Lesser* also denotes 'of smaller size': *the Lesser Antilles* [in contrast to *the Greater Antilles*].

Changes in spelling

- 7.79 With adjectives taking the regular inflections, certain changes in spelling or pronunciation may be introduced in the base of the adjective when the suffixes are added.

(a) A single consonant at the end of the base is doubled before *-er* and *-est* when the preceding vowel is stressed and spelled with a single letter (cf the spelling of verb forms, 3.8):

big *~ bigger* *~ biggest*
sad *~ sadder* *~ saddest*

But contrast:

neat *~ neater* *~ neatest*
thick *~ thicker* *~ thickest*

There is a variant spelling in:

cruel { *~ crueller* *~ cruellest*
 ~ crueler *~ cruelest* (esp AmE)

(b) In bases ending in a consonant followed by *-y*, *y* changes to *-i* before *-er* and *-est*:

angry *~ angrier* *~ angriest*
early *~ earlier* *~ earliest*

(c) If the base ends in a mute (unpronounced) *-e*, this *e* is dropped before the inflection:

pure *~ purer* *~ purest*
brave *~ braver* *~ bravest*

The same applies if the base ends in *-ee*:

free *~ freer* *~ freest* /'fri:st/

Changes in pronunciation

- 7.80 (a) A disyllabic base ending in /l/ normally loses its second syllable before the inflection:

simple /sɪmpl/ *~* /'sɪmpl̩/ *~* /'sɪmplɪst/

humble /ˈʌmbəl/ *~* /'hʌmb̩l̩/ *~* /'hʌmbɪst/

(b) Even for speakers that do not give consonantal value to a final *r* in spelling, the /r/ is pronounced before the inflection:

rare /reə/ *~* /'reərə/ *~* /'reərɪst/

(c) Final *ng* /ŋ/ in the absolute forms *long*, *strong*, and *young* is pronounced /ŋg/ before the inflection:

long /lɒŋ/ *~* /'lɒŋg̩/ *~* /'lɒŋgɪst/

Choice between inflectional and periphrastic comparison

- 7.81 The choice between inflectional and periphrastic comparison is largely determined by the length of the adjective.

(a) Monosyllabic adjectives normally form their comparison by inflection:

low *~ lower* *~ lowest*

Real, *right*, *wrong*, and the preposition *like* (cf 9.4) take only periphrastic forms:

She is { *more like* } her grandmother.
 **likier*

However, most other monosyllabic adjectives can take either inflectional or periphrastic comparison.

(b) Many disyllabic adjectives can also take inflections, though they have the alternative of the periphrastic forms:

Her children are { *politer/more polite*.
(the) *politest/(the) most polite*.

Disyllabic adjectives that can most readily take inflected forms are those ending in an unstressed vowel, /ɪ/ or /ə/, eg:

-y: early, easy, funny, happy, noisy, wealthy, pretty
-ow: mellow, narrow, shallow
-le: able, feeble, gentle, noble, simple
-er, -ure: clever, mature, obscure

(c) Trisyllabic or longer adjectives can only take periphrastic forms:

beautiful
~ *more beautiful* [BUT NOT: **beautifuller*]
~ *the most beautiful* [BUT NOT: **beautifullest*]

Adjectives with the negative *un*-prefix, such as *unhappy* and *untidy*, are exceptions:

~ *unhappier* ~ *unhappiest* ~ *untidier* ~ *untidiest*

(d) Participle forms which are used as adjectives regularly take only periphrastic forms:

interesting ~ *more interesting* ~ *most interesting*
wounded ~ *more wounded* ~ *most wounded*
worn ~ *more worn* ~ *most worn*

Note [a] Within the first group of (b), we may distinguish between adjectives ending in *-ly* and other adjectives ending only in *-y*. For *-ly* adjectives (cf 7.9), comparison with periphrasis is common, eg with *friendly*, *likely*, *lonely*, and *lively*:

lively { ~ *livelier* ~ *liveliest*
~ *more lively* ~ *most lively*

However, among other adjectives ending only in *-y*, inflectional comparison is favoured, eg:
easy ~ *easier* ~ *easiest*

[b] Among adjectives ending in *-er*, *eager* and *proper* can take only periphrastic comparison. In addition, the following disyllabic adjectives can occur with inflectional forms (as well as periphrastic forms, which seem to be gaining ground): *quiet*, *common*, *solid*, *cruel*, *wicked*, *polite*, *pleasant*, *handsome*.

7.82 Most adjectives that are inflected for comparison can also take the periphrastic forms with *more* and *most*. With *more*, they seem to do so more easily when they are predicative and are followed by a *than*-clause:

John is *more mad* than Bob is.
It would be difficult to find a man *more brave* than he is.
He is *more wealthy* than I thought.

Periphrastic forms are, however, uncommon with a number of monosyllabic adjectives (including those listed in 7.75 as forming their comparison irregularly):

<i>bad</i>	<i>big</i>	<i>black</i>	<i>clean</i>
<i>fair</i> [colour]	<i>far</i>	<i>fast</i>	<i>good</i>
<i>great</i>	<i>hard</i>	<i>high</i>	<i>low</i>
<i>old</i>	<i>quick</i>	<i>small</i>	<i>thick</i>
<i>thin</i>	<i>tight</i>	<i>wide</i>	<i>young</i>

Note [a] There seem to be fewer restrictions on using the periphrastic forms with adjectives in the comparative construction formed with the correlative *the ... the* (cf 15.51):

The { *more old* } we are, the { *more wise* } we become. [BUT NOT: **a more old man*]

Good and *bad*, however, require nonperiphrastic forms (*better*, *worse*) even here.

[b] The suffix *-most* is used to express the highest degree in *her innermost feelings*. Also: *foremost*, *hindmost*, *outermost*, *uppermost*. These words are sometimes used also as adverbs: *They did their utmost*.

[c] A study of adjectives at the Survey of English Usage gives the following statistics:

- The comparative is, on average, more frequent than the superlative.
- Only 25 per cent of the comparatives, as against 52 per cent of the superlatives, are accompanied by an explicit basis of comparison (cf 7.86).
- er* is more frequent than *more*, which is more frequent than *less*; *-est* is more frequent than *most*, which is far more frequent than *least*.
- Many of the occurrences of *-er/-est* adjectives represent a small number of relatively frequent adjectives. The following distribution is probably typical also for a larger corpus ('types' = different lexical items; 'tokens' = total number of instances):

Table 7.82 Frequencies of comparative forms

	<i>-er/-est</i>	<i>more/most</i>	<i>less/least</i>	TOTAL
TYPES	56	246	42	344
TOKENS	553	345	49	947

Comparison of adverbs

7.83 For a small number of adverbs, the inflected forms used for comparison are the same as those for adjectives. As with adjectives, there is a small group with comparatives and superlatives formed from different stems. The comparative and superlative inflections are identical with those for the corresponding adjectives *good*, *bad*, and *far* (cf 7.75), and the quantifiers *much* and *little* (cf 5.23):

<i>badly</i>	~ <i>worse</i>	~ <i>worst</i>
<i>well</i>	~ <i>better</i>	~ <i>best</i>
<i>little</i>	~ <i>less (lesser)</i>	~ <i>least</i>
<i>far</i>	{ ~ <i>further</i> ~ <i>farther</i>	~ <i>furthest</i> ~ <i>farthest</i>
<i>much</i>	~ <i>more</i>	~ <i>most</i>

(a) *Worse* as the comparative of *badly* is used in eg:

He behaves even *worse* than his brother.

With *need* and *want*, however, the periphrastic form is required in BrE:

I really need that job *more badly* than you. [AmE also: *worse*]

Here *badly* is not a process adverb, as also indicated by position:

I *badly* need that job. *He *badly* behaves.

In nonstandard use, one may find *iller/badder ~ baddest*. In very formal English, *ill* is synonymous with *badly* (cf: *ill-behaved*):

He behaved *ill* towards his parents.

(b) Compounds of *well* and *ill* + participle have both types of comparison (cf 7.77):

well-behaved { *~ better-behaved* *~ best-behaved*
 ~ more well-behaved *~ most well-behaved*

The forms *better- ~ best-behaved* are more formal than *more ~ most well-behaved*. Compare *best-known* which is preferred to *most well-known*.

(c) *Lesser* is sometimes used in comparison to a lower degree: *lesser-known*, in the same way as *less well-known*. There is also a lower degree comparative *less well* [= *worse*], as in

He reads *less well* than she does.

Less well here indicates that his reading is not as bad as *worse* does (cf 7.77). There is no corresponding higher degree comparative **more well* = *better*.

(d) On the forms *farther/further ~ farthest/furthest*, cf 7.75, 8.48.

(e) Adverbs that are identical in form with adjectives (cf 7.9) take inflections: *fast, hard, late, long, quick*. They follow the same spelling and phonological rules as for adjectives, eg: *early ~ earlier ~ earliest*:

You have to work *harder/faster/longer*.

The *-er ~ -est* inflections cannot be added to open-class adverbs ending in *-ly*:

quickly { *~ more quickly* *~ most quickly*
 *~ *quicklier* *~ *quickliest*

When *earlier* is synonymous with *before (that)* or *previously*, and when *later* is synonymous with *after (that)*, they are not comparatives of the adverbs *early* and *late* (cf 8.55 Note [a]).

(f) *Soon*, which has no corresponding adjective, is frequently used in the comparative (*sooner*). Some find the superlative (*soonest*) unacceptable, or at least very informal, but it seems perfectly acceptable as a premodifier of certain adjectives, eg:

the *soonest* possible date, the *soonest* available time

It is also used in the proverb 'Least said, *soonest* mended', and in telexes and telegrams:

Send prices *soonest*. ['as soon as possible']

(g) Similarly, *often* has the comparative forms *oftener* and *oftenest*, although they are less commonly used than the comparative *more often* and, in particular, the superlative *most often*.

(h) Sometimes the comparative *-er* form of the adjective can function as the comparative of the *-ly* adverb:

That's *easier* said than done. [= 'more easily']
Speak *clearer*! [= 'more clearly']

The use of the comparative is generally considered less objectionable than the use of the adjective instead of the adverb in the absolute form (cf 7.7):

?Speak *clear*! [= Speak *clearly*!]

(i) Comparative adverbs are involved in modal idioms (cf 3.45f):

I *had'd better* go now.
You *had best* forget all about the whole thing.
I *would'd sooner* stay at home tonight.
He *would/had'd rather* not commit himself. [There is of course no absolute form of *rather* in present-day English.]

Article usage with comparatives and superlatives

7.84 In general, the comparative and the superlative express comparison between two sets. In the following examples [1, 2], the comparative is used to compare Jane with the others. There is no article with a *than*-construction, as in [1]:

Jane is *cleverer* than all the other girls in the class. [1]

With the superlative, Jane is included in the group and compared with all the others. The definite article is used with an *of*-phrase following, as in [2]:

Jane is *the cleverest* of all the students in the class. [2]

The superlative is often used for a comparison between two persons, items, etc [3], though this is avoided in careful usage where the comparative [3a] is preferred:

He is *the youngest* (of the two brothers). [3]
He is *the younger* (of the two brothers). [3a]

If the superlative is used attributively, the definite article (or other definite determiner) is required, as in [4] and [5]:

Anna is { *the* } *youngest* child. } [4]
 { *their* }
 { **youngest* child. }

Della is { *the most efficient* publisher in the office. } [5]
 { *our most efficient* publisher. }
 { **most efficient* publisher. }

But if the adjective is not attributive, *the* is optional:

Anna is *(the) youngest* (of all). [4a]

Della is *(the) most efficient* (of all). [5a]

Without a definite determiner, the construction with *most* is always ambiguous between superlative and intensifier interpretation when the adjective is evaluative:

Della is *most efficient*. ['the most efficient of all' or 'extremely efficient'] [5b]

With the indefinite or zero article, *most* is always interpreted as an intensifier:

She is *a most efficient* publisher. } ['extremely'] [5c]
They are *most efficient* publishers.

When *most* functions as an intensifier, there is of course no parallel construction with the inflected form:

You are very helpful and { *most kind*.
**kindest*.

I find this whole situation puzzling and { *most odd*.
**oddest*.

There is a tendency to use *most* with a preceding definite article to express intensification:

Isn't she *the most beautiful woman*? ['an extremely beautiful woman',
ie = *a most beautiful woman*]

The inflectional superlative is occasionally used in the same way, eg:

Lucille wears *the oddest clothes*, my dear.

Other expressions of comparison

7.85 In addition to the normal expression of comparison mentioned, there are some other, related expressions. Some Latin comparatives, eg: *senior* and *major*, retain their comparative force:

A is *senior* to B.

However, they are not true comparatives in English, since they cannot be used in comparative constructions with *than* as explicit basis of comparison (cf 7.86):

A is { *older* }
**senior* } *than* B.

Such Latin comparatives may be called IMPLICIT. (Another term that occurs is 'absolute'.) Implicit comparatives include the following:

A is *senior* to B. ['of higher rank', 'older than'; cf: *a senior minister*;
senior citizens 'old people', 'old age pensioners']

B is *junior* to A. ['of lower rank', 'younger than'; cf: *a junior minister*]
inferior management ['inadequate' rather than 'less good'; cf: X is
inferior to Y.]

superior quality [a 'good' rather than 'better' quality; cf: Y is *superior* to X.]

a *prior* claim over X ['previous', 'more important'; cf: *prior* to 'earlier than']

the *major* political parties ['larger' or 'rather large']

a *minor* point ['less important' or 'quite unimportant']

anterior and *posterior* positions [technical terms in biology: 'near(er) the head' and 'near(er) the tail']

A more or less 'absolute' comparative may occasionally be found also with other adjectives, as in:

an *older* man ['rather old'], the *better* hotels, *finer* restaurants

Repeated and coordinated comparatives, as in the following examples, indicate gradual increase:

She is getting *better and better*. ['increasingly better']

They are becoming *more and more difficult*.

Too in the sense 'more than enough' might also be mentioned here:

It's *too long*. ['longer than it should be']

He speaks *too quickly*. ['more quickly than he should speak']

Enough (postpositive) and *sufficiently* (attributive) express sufficient degree:

The message is { *clear enough*. } ['as clear as is necessary']
**sufficiently clear*.

Note [a] Grading is a semantic process which may be expressed not only by means of comparison of adjectives and adverbs, but also by means of verbs that denote grading. We can distinguish three types of verb corresponding to the three types of comparison (cf 7.74):

(i) Verbs expressing comparison in relation to a higher degree, eg:

Demand *exceeds* supply. ['is greater than']

(ii) Verbs expressing comparison in relation to the same degree, eg:

The length of this boat *equals* the width of that boat. ['This boat is *as long as* that boat is wide.']

(iii) Verbs expressing comparison in relation to a lower degree, eg:

This action *diminishes* the possibilities of an early settlement of the dispute. ['makes the possibilities smaller']

Other such verbs containing a comparative element include the following:

increase, intensify, exaggerate, maximize, lengthen, enlarge, amplify; lessen, curtail, lower, abridge, impair, minimize, decline

[b] *More* and *most* have other uses in which they are not equivalent to the comparison inflections (cf 8.105). Notice the paraphrases in the following two uses of *more*:

He is *more than happy* about it. ['He is happy about it to a degree that is not adequately expressed by the word *happy*.']

He is *more good than bad*. ['It is more accurate to say that he is good than that he is bad.']

She is *more keen than wise*. ['She is keen rather than wise.']

The inflected form cannot be substituted in this function (cf 15.69f):

*He is *better* than bad. ?*She is *keener* than wise.

But compare:

It's *worse* than useless. He is *worse* than bad.

[c] *Upper* and *lower* have no comparative force in *upper case* ['capital letters'] and *the lower leg* ['the bottom part of the leg']. They are not comparatives of *up* and *low*, since we cannot say **up case*, **the low leg*, etc. A similar pair is *outer* and *inner*, eg in an *inner meaning*.

Basis of comparison

- 7.86 We can make the basis of comparison explicit. The most common ways of doing so include correlative constructions introduced by *than* (correlative to *-er, more, less*) and by *as* (correlative to *so, as*; on comparative clauses, cf further 15.63ff):

John is $\left\{ \begin{array}{l} \text{politer} \\ \text{more polite} \\ \text{less polite} \end{array} \right\}$ than Bob (is). [1]

John behaves $\left\{ \begin{array}{l} \text{more} \\ \text{less} \end{array} \right\}$ politely than Bob (does). [1a]

The basis of comparison to the same degree is *as* and, in nonassertive contexts, also *so* (both having the correlative *as*):

John is $\left\{ \begin{array}{l} \text{as polite} \\ \text{not } \left\{ \begin{array}{l} \text{so} \\ \text{as} \end{array} \right\} \text{ polite} \end{array} \right\}$ as Bob (is). [2]

John $\left\{ \begin{array}{l} \text{behaves as politely} \\ \text{does not behave } \left\{ \begin{array}{l} \text{so} \\ \text{as} \end{array} \right\} \text{ politely} \end{array} \right\}$ as Bob (does). [2a]

Bases of comparison to a higher or lower degree may also be expressed in other ways, as illustrated below in (a–e).

- (a) A restrictive relative clause (full or ellipted):

John is the best player $\left\{ \begin{array}{l} \text{(I've ever seen)} \\ \text{(we have)} \\ \text{(they have)} \\ \text{(there is)} \\ \text{(that plays)} \end{array} \right\}$ on the team. [3]

- (b) An *of*-phrase (not derivable from a relative clause):

$\left\{ \begin{array}{l} \text{John is the more polite of the (two) boys.} \end{array} \right\}$ [4]

$\left\{ \begin{array}{l} \text{Of the (two) boys, John behaves the more politely.} \end{array} \right\}$ [4a]

$\left\{ \begin{array}{l} \text{John is the most polite of the (three) boys.} \end{array} \right\}$ [5]

$\left\{ \begin{array}{l} \text{Of the (three) boys, John behaves the most politely.} \end{array} \right\}$ [5a]

The prepositional phrases can be either final, as in [4] and [5], or initial, as in [4a] and [5a]. Final position is more frequent, especially when the construction contains an adjective. Note the obligatory presence of *the* before *more* and *most* (cf 7.84).

- (c) The noun (or its replacement *one*) which the adjective premodifies:

John is the more stupid $\left\{ \begin{array}{l} \text{boy.} \\ \text{one.} \end{array} \right\}$ <formal>

[more commonly: John is more stupid than the other boy.]

John is the most stupid $\left\{ \begin{array}{l} \text{boy.} \\ \text{one.} \end{array} \right\}$

- (d) A determiner with definite reference. With comparatives, either the definite article or demonstrative determiner (cf 5.14) is possible:

$\left\{ \begin{array}{l} \text{The} \\ \text{That} \end{array} \right\}$ taller boy is John.

Unlike comparatives, however, superlatives cannot normally cooccur with demonstrative determiners:

$\left\{ \begin{array}{l} \text{The} \\ \text{My} \\ \text{*That} \end{array} \right\}$ youngest daughter is a dentist.

- (e) A genitive construction or possessive determiner:

John is $\left\{ \begin{array}{l} \text{Mary's} \\ \text{her} \end{array} \right\}$ older/oldest brother.

Note Some basis of comparison may be implicit in the use of the absolute form of the adjective, and in such cases the basis of comparison can also be made explicit (cf: for, 9.62):
He is tall for a child (of) his age. [ie 'taller than normal']

Intensification**Restrictions on intensification**

- 7.87 The types of intensifiers modifying adjectives and adverbs have been mentioned earlier (cf 7.56ff). Here we are concerned with restrictions on their use analogous to those for comparison. In general, amplifiers and comparatives are allowed by the same range of adjectives and adverbs, *ie* those that are gradable. The range for emphasizers and those downtoners not expressing degree (eg: *virtually*) is much wider, as we can see from their cooccurrence with a nongradable adjective such as *nonChristian*:

He is $\left\{ \begin{array}{l} \text{definitely} \\ \text{virtually} \\ \text{*more} \\ \text{*very} \end{array} \right\}$ nonChristian.

There are also restrictions on the use of particular intensifiers, and these can sometimes be stated in semantic terms:

most $\left\{ \begin{array}{l} \text{happy [subjective; 'extremely happy']} \\ \text{?tall [objective]} \end{array} \right\}$

utterly $\left\{ \begin{array}{l} \text{wrong [negative evaluation]} \\ \text{?right [positive evaluation]} \end{array} \right\}$

perfectly $\left\{ \begin{array}{l} \text{natural [positive evaluation]} \\ \text{?unnatural [negative evaluation]} \end{array} \right\}$

Amplifiers and comparatives are available for adjectives that refer to a quality that is thought of as having values on a scale. Thus, in *John is English*,

the adjective *English* does not allow amplifiers or comparatives if it refers to John's nationality, which is not a quality of John's. However, if the adjective refers qualitatively to the way he behaves or to his racial background, they are admitted:

John is $\begin{cases} \text{very English.} \\ \text{more English than the English.} \end{cases}$

She is $\begin{cases} \text{thoroughly} \\ \text{three quarters} \end{cases}$ Irish.

Similarly, *original* in the sense of 'not copied' cannot normally be intensified or compared, as in *the original manuscript*, where it does not refer to a quality and there can be only one original manuscript. On the other hand, if *original* refers to the quality of the work, meaning 'of a new type', it may be intensified or compared: *a more original book*. We may compare the two uses with those of the corresponding adverb:

She always writes $\begin{cases} \text{originally. ['in an original manner']} \\ \text{very originally.} \end{cases}$

She came from Cleveland $\begin{cases} \text{originally. ['in the first place']} \\ \text{*very originally.} \end{cases}$

In the last example, *originally* is a respect adjunct (cf 8.85) and cannot be intensified or compared.

Note [a] There are exceptions to the cooccurrence of a particular intensifier with a semantic class of adjective. For example, though *utterly* tends to cooccur with 'negative' adjectives, *utterly reliable* and *utterly delightful* are common.

[b] With reference to the use of *original*, we note that the following sentence has two possible meanings:

This is *the more original* manuscript.

It can mean either 'This manuscript was written with more originality' or 'This manuscript is closer to the original'.

The unmarked term in 'measure' expressions

7.88 When we want to state the age of a person, we will normally use the expression *x years old*, for example:

Mr Jespersen is 75 years old.

We will not say (except jokingly, as a compliment):

*Mr Jespersen is 75 years young.

However, the choice of adjective here has nothing to do with the number of years, and we would use the same expression for somebody very young, eg:

His granddaughter is two years $\begin{cases} \text{old.} \\ \text{*young.} \end{cases}$

Similarly:

The water is two metres $\begin{cases} \text{deep.} \\ \text{*shallow.} \end{cases}$ Susan is only five feet $\begin{cases} \text{tall.} \\ \text{*short.} \end{cases}$

'Measure' adjectives like *old*, *deep*, and *tall* cover a scale of measurement. Such adjectives have two terms for the opposite ranges of the scale (*old/young*, *deep/shallow*, *tall/short*), but use the upper range as the 'unmarked' term in measure expressions (*old*, *deep*, *tall*). The 'measure' adjectives which are used in this way, preceded by a noun phrase of measure, include the following set with the marked term given in parenthesis:

deep (shallow) *high (low)* *long (short)* *old (young)*
tall (short) *thick (thin)* *wide (narrow)*

This set of 'measure' adjectives is used in the same way in *how*-questions and, again, the use of the unmarked term does not assume that only the upper range is applicable:

A: *How old* is your daughter? ['What is her age?']

B: She is *ten years old*. ['Her age is ten years.']

There are also adjectives outside the set listed above which are used in *how*-questions, in the same way as the 'measure' adjectives. Thus, if we want to know the size of something, we would normally use *big* or *large*, rather than *small* or *little*, eg:

How big is your computer?

Similarly, we use *bright* rather than *dim*, *strong* rather than *weak*, *heavy* rather than *light*, etc:

How strong is the engine of this car?

How accurate is your digital watch?

However, such adjectives are used in this way only in *how*-questions, not with noun phrases of measure:

A: *How heavy* is your suitcase?

B: *It is only 20 kilos heavy.

Some adverbs also use an unmarked term in *how*-questions. They include the italicized words in the following examples:

A: *How much* does she like him?

B: She likes him a lot.

A: *How often* did they complain?

B: Every day after school.

A: *How quickly* does he do

his homework?

B: Usually in less than an hour.

A: *How far* did you drive today?

B: Over 200 miles.

Compare the following expressions of distance:

A: *How* $\begin{cases} \text{far} \\ \text{*near} \end{cases}$ is it to the village?

B: $\begin{cases} \text{The village is only five miles} \\ \text{*far.} \\ \text{away.} \end{cases}$

B: $\begin{cases} \text{It's} \\ \text{*long} \end{cases}$ $\begin{cases} \text{a long way} \\ \text{*long} \end{cases}$ to the village. [assertive]

B: $\begin{cases} \text{It's} \\ \text{not far} \\ \text{not a long way} \end{cases}$ to the village. [nonassertive]

Compare time expressions:

A: *How long* did the concert last?

B: { Only 40 minutes.
It was only 40 minutes } $\begin{cases} \text{long.} \\ *short. \end{cases}$

Note [a] If we use the marked term, as in *How young is John?*, we are asking a question that presupposes that the relevant norm is towards the lower end of the scale, *ie* that John is young, whereas the unmarked term in *How old is John?* does not presuppose that John is old. Notice that neither term is neutral in exclamations:

How young he is! ['He is extremely young!']

How old he is! ['He is extremely old!']

[b] We use neither the marked nor the unmarked term of a measure adjective in:

*He is *five pounds* $\begin{cases} \text{heavy.} \\ \text{light.} \end{cases}$

The following constructions are however normal with the unmarked term:

A: *How heavy* is he?

B: He is $\begin{cases} \text{five pounds too heavy.} \\ \text{too heavy by five pounds.} \\ \text{five pounds heavier than John is.} \end{cases}$

But, in specific contexts, either of two pairs of adjectives like *heavy/light*, *long/short* can be considered unmarked. The choice of term is determined by our point of orientation. When we want to relate a javelin throw to a specific purpose (to win, qualify, etc), we may say:

His last javelin throw was *a few inches short*.

Short here is not the antonym of *long*, and there is no implication that it was a short throw.

Compare an example like the following:

How *high/low* is the water level now?

Here, the item selected (particularly the marked *high*) suggests the expectation that the level is getting higher and lower, respectively.

[c] In the case of 'nonliteral' measure items, *far* is also unmarked, as in:

How *far* do you agree with the proposal?

[d] *Full* and *empty* can be used equally, although *How full?* is commoner than *How empty?*:
half full, half empty, three-quarters full, three-quarters empty

Premodification of comparatives

7.89 Adjectives and adverbs in the absolute degree can be premodified by intensifiers like *very*, *quite*, *so*, etc (cf 7.56ff):

The job was *very* $\begin{cases} \text{easy.} \\ \text{difficult.} \end{cases}$

She writes *very* $\begin{cases} \text{well.} \\ \text{easily.} \end{cases}$

Comparatives of both adjectives and adverbs, whether inflected or periphrastic, can be premodified by amplifiers, such as *much* or *very much*:

The job was (very) *much* $\begin{cases} \text{easier} \\ \text{more difficult} \end{cases}$ than I thought.

She writes (very) *much* $\begin{cases} \text{better} \\ \text{more easily} \end{cases}$ than she used to.

Note the restriction on premodification of adjectives and adverbs in the absolute and comparative degrees:

That's $\begin{cases} \text{very} \\ *much \end{cases}$ *good*. She works $\begin{cases} \text{very} \\ *much \end{cases}$ *hard*.

That's $\begin{cases} \text{much} \\ *very \end{cases}$ *better*. She works $\begin{cases} \text{much} \\ *very \end{cases}$ *harder*.

Other intensifiers (and intensifying noun phrases) that are common with comparatives include the following:

somewhat easier
rather better

a lot
lots <informal> } shorter

a great
a good } *deal* } more/less difficult
a good bit <informal> }

a hell of a lot
a heck of a lot } better <very familiar>
a damn sight }

Some intensifiers can be repeated for emphasis:

very very good ['extremely good']
very very . . . much sooner
much much . . . more careful
far far . . . more carefully
so so . . . much better [repeated *so* in BrE only]
so very very . . . much better

Generally, however, the repetition is permissible only if the repeated items come first or follow *so*:

so very very . . . much better
**very much much* . . . better

Repetition of intensifiers is a type of coordination that is always asyndetic (cf 13.102): **very and very good*.

Only *much* and *far* are used as intensifiers of premodifying adjectives. Compare:

That was a $\begin{cases} \text{much} \\ \text{far} \\ *great \text{ deal} \end{cases}$ *easier* job.

~ That job was $\begin{cases} \text{much} \\ \text{far} \\ \text{a great deal} \end{cases}$ *easier*.

Much can be premodified by *so*, *very*, and *that*:

$\begin{cases} \text{(so) (very)} \\ \text{that} \end{cases}$ *much easier*

Premodification of superlatives

7.90 The nonperiphrastic superlative may be premodified by the intensifier *very*:

They arrived only at *the very last* moment.
She put on *her very best* dress.

When *very* premodifies the superlative, a determiner is obligatory (cf 7.84):

Anna is { *(the) youngest.*
the very youngest.
**very youngest.*

The periphrastic superlative is not premodified by the intensifier *very* (**the very most successful candidate*) but by other expressions, eg:

the most successful candidate *of all*
the most remarkable election *ever*
far (and away) } the best solution
by far

Note the different positions of intensifiers in:

It was { *(by) far* the best (film) } that I've seen
the best (film) { *by far*
**far*
**far and away* } for a long time.

-----------------------------	------------

Introduction

- 8.1 The adverbial element (A) differs considerably from the other elements of clause structure (S, V, O, C), as we have already seen in 2.15. Differences in the following respects are especially notable:

- (i) range of semantic roles;
- (ii) propensity for multiple occurrence in the same clause;
- (iii) range of realization forms;
- (iv) range of possible positions in the clause;
- (v) distinctive grammatical functions;
- (vi) flexibility for use in information processing (*cf* 18.3*ff*) and in displaying textual connections (*cf* 19.53*ff*).

Since to some extent these variables are independent of each other, we shall outline each of (i) to (iv) separately. But since it is the grammatical aspects that concern us, we shall reserve most of the description and discussion of adverbials, in all their respects, for treatment under (v), 8.24*ff*. In any case, although the variables are indeed to some extent independent, they are also to a large extent interdependent. It is because there are different grammatical functions (v) as well as different semantic roles (i) that we can have more than one A-element in a clause (ii). It is because there is a range of possible positions for the A-element (iv) that this element lends itself to information processing (vi). Certain realization forms (iii) are especially associated with certain grammatical functions (v) and with certain positions in the clause (iv). We shall frequently be drawing attention to interactions like these. In particular, it must be stressed that a given semantic role (*eg* time) is not tied to a single grammatical function; time, for example, is expressed by both adjuncts and subjunctors.

We make a sharp and principled distinction in this book according as an adverb phrase, prepositional phrase, or other unit functions outside a clause element (*ie* is grammatically separate from it) or inside a clause element (*ie* is grammatically a part of it). Thus the units *very beautifully*, *in the garage*, and *really* are adverbials in [1], [2], and [3] respectively, but are not adverbials in [4], [5], and [6], where they operate grammatically as part of phrases which as a whole realize other elements, O in [4] and [5], C in [6]:

- The girl was dressed *very beautifully*. [1]
- I keep a spare bicycle *in the garage*. [2]
- She *really* is an intelligent child. [3]
- I saw a *very beautifully* dressed girl. [4]
- I keep the bicycle *in the garage* well oiled. [5]
- She is a *really* intelligent child. [6]

(See further 8.24.)

Note Of the clause elements S, V, O, C, A, the A-element is the next most frequent after S and V. The vast majority of clauses, dependent or independent, contain at least one adverbial, and in the Survey of English Usage corpus there are on average 15 adverbials in every 100 running words of material, spoken and written alike.

Outline of semantic roles

- 8.2 We shall distinguish seven main categories of semantic role, in most cases with further subdivisions as shown in the table below. We begin with the category SPACE, since the expression of other categories is often achieved in terms of figurative extension of spatial relations.

SPACE	<i>position</i> <i>direction</i> <i>distance</i>	{ with interrelated subdivisions, <i>goal</i> ['to'] and <i>source</i> ['from'] }
TIME	<i>position</i> <i>duration</i> <i>frequency</i> <i>relationship</i>	{ with interrelated subdivisions <i>forward span</i> ['until'] and <i>backward span</i> ['since'] }
PROCESS	<i>manner</i> <i>means</i> <i>instrument</i> <i>agentive</i>	
RESPECT		
CONTINGENCY	<i>cause</i> <i>reason</i> <i>purpose</i> <i>result</i> <i>condition</i> <i>concession</i>	
MODALITY	<i>emphasis</i> <i>approximation</i> <i>restriction</i>	
DEGREE	<i>amplification</i> <i>diminution</i> <i>measure</i>	

Detailed discussion of these categories will be reserved for the sections dealing with the expression given them by the various classes of adverbials, 8.39*ff*. But since to some considerable extent the same semantic roles are performed by quite different grammatical classes of adverbial, we provide in 8.3–10 a preliminary discussion and illustration of the semantic categories listed above.

Space

- 8.3 We can readily distinguish five semantic relations expressed by adverbials in relation to physical SPACE, including the ordinary senses of 'place', a term we shall also use when this is convenient. First, there is POSITION, normally associated with verbs referring to stasis:

He lay on *his bed*.

But they can occur also with verbs referring to motion:

They are strolling *in the park*.

Secondly, we have DIRECTION, which may refer to directional path without locational specification, as in:

They drove *westwards*.

Or it can refer to direction along with a locational specification, as in:

She walked *down the hill*.

Their house faces *towards the sea*.

Thirdly, involving a positional aspect of direction, we can distinguish GOAL, as in:

She walked (down the hill) *to the bus stop*.

The interrelationship of the three is shown by the fact that, in particular contexts and with particular verbs, they can all be readily elicited by questions with *Where*:

Where was he lying? *On his bed*. [position]

Where was she walking? *In the park*. [position]

Where was she walking? *Down the hill*. [direction]

Where was she walking? *To the bus stop*. [goal]

But with the latter two, there are alternative question forms that are more role-specific:

Which way was she walking? [direction]

Where was she walking *to*? [goal]

A question with a more general verb as in 'Where was she going?' would be entirely open as to direction or goal use.

Fourthly, again involving direction and position, we have the obverse of goal in SOURCE; for example:

She walked (down the hill) *from the school*.

Questions concerning source would usually be expressed through a more general verb of motion than *walk*, especially one that is oriented to the speaker, and the 'source' preposition (eg: *from*) would have to be expressed:

Where was she coming *from*?

(On the grounds for seeing direction, goal, and source as involving the same basic grammatical category, see 8.46).

Finally, there is spatial measure, expressed as DISTANCE:

They had travelled *a long way*.

She had driven (*for*) *fifty kilometres*.

He hadn't gone *far*.

Such adverbials are elicited by *How far* ...?

One further semantic factor should be mentioned. Sentences which superficially differ only in so far as one has a position adverbial and the other a direction, goal, or source adverbial are found on closer inspection to involve a considerable difference in the meaning of the verb concerned, triggered by the different prepositions:

He is travelling in Yorkshire. [1]

He is travelling to Leeds (*or* from Halifax). [2]

Sentence [1] seems to give equal weight to what he is doing (travelling) and where he is doing it (in Yorkshire), whereas sentence [2] seems to give weight only to the direction: 'Where is he travelling to/from?' 'Where is he going (to)?' 'Where is he coming from?' This is confirmed both by the plausibility of the paraphrases (*go, come*) and by the absence of an acceptable question:

*What is he doing from Halifax? Travelling?

beside:

What is he doing in Yorkshire? Travelling?

This suggests that, in addition to the semantic distinctions, the position adverbial is different from the others grammatically as well (cf 8.44ff):

Note In some very formal and stylistically mannered usage, we find the otherwise archaic *wh-* forms *whither* (direction and goal) and *whence* (source).

Time

- 8.4 Temporal relations are especially dependent for their expression upon figurative extension of locative items such as *in* and *at* (cf 9.34). As with space, several subroles can be distinguished, some of them closely analogous to those of space.

First, there is time seen as a fixed POSITION on a temporal scale: time as stasis – the time *when* an action took place or the time to which a state applies. For example:

She drove to Chicago *on Sunday*. He was there *last week*.

The relation is elicited by *when* and is often referred to as 'time *when*':

When did she drive to Chicago? *On Sunday*.

Secondly, DURATION. Since time is conceived as being linear and unidimensional, the analogy of spatial direction makes little impact on the conceptualization of time. But the concept of measure is as important to the consideration of time as it is to space, and temporal measure is seen as duration. Linking duration to specific positions on the linear time scale, we have the concept of SPAN, itself subdivided to correspond to the only rudimentary analogue to spatial direction that is conceptualized with respect to time, the FORWARD SPAN ['until, up to a specified point of time': cf spatial 'goal'] and the BACKWARD SPAN ['since, from a specified point of time': cf spatial 'source'].

FORWARD SPAN extends from the point of time to which the speaker and hearer are oriented, forward to some point which is 'future' in relation to the orientation point. For example:

I shall be staying here *till next week*.

Washington delayed his counter-attack *until the following spring*.

The converse of this, BACKWARD SPAN, indicates the stretch of time back from the speaker-hearer orientation point. For example:

I've been staying here *since last week*.

Washington's attack that spring was his first action *since the previous September*.

Then there are more general expressions of duration, without necessary relation to a particular point of orientation. For example:

I am staying (*for*) *three weeks*.

Here the reference of the adverbial may extend both into the past and into the future from the time point of utterance; equally, it may refer to a three-week period at some unspecified time in the future, just as in the following example it can refer to an unspecified period in the past:

I stayed (*for*) *three weeks*.

The elicitation of duration as well as forward and backward span is usually achieved by the same question form, *How long ...?* But for future and past extent, alternative forms are generally available, such as *Till when ...?* and *Since when ...?* respectively.

Thirdly, we have expressions of FREQUENCY, elicited by *How often ...?* For example:

A: *How often* do you go to the theatre?

B: Well, I like to go *frequently*, but in fact I've been only *three times* this year.

The two adverbials in the answer draw attention to the fact that frequency is a complex notion (as is 'direction' in its interaction with 'goal'), and we shall explore it in more detail in 8.64f below.

Fourthly, there is the expression of RELATIONSHIP between one time and another, again a complex notion, and in this case with no role-specific question form. For example:

I was already writing my novel in 1980 and I'm afraid it is *still* in progress.

He had visited his mother *already* when I saw him yesterday.

Process

- 8.5 Here it is possible to distinguish four subclasses: MANNER (*casually, with deference, carefully, slowly, like John, just as John does*, etc); MEANS (*by bus, in mathematics, through insight*, etc); INSTRUMENT (*with a fork, using a dictionary, by means of interrogation*, etc); AGENTIVE (*by John*, with passive; corresponding to *John* as subject, with active). Since the last three subclasses seem to overlap, it is necessary to demonstrate their independence by a cooccurrence test (cf 8.11f), and it may well be that the distinction tends to be made in actual language use only when such cooccurrence obtains. Consider the four adverbials in each of the following sentences:

The student was *politely* [A₁] assessed *by the teacher* [A₂], *impressionistically* [A₃] *by means of an interview* [A₄].

The patient was *carefully* [A₁] treated *by the nurse* [A₂] *medically* [A₃] *with a well-trying drug* [A₄].

In each sentence, A₁ is manner, A₂ agent, A₃ means, and A₄ instrument. But although the distinction may seem especially close only between means and instrument, it should be noted that manner is not necessarily always distinguished clearly from them. In principle, the distinction is clear enough: manner is relatively subjective and hence gradable (cf 7.4): *quite politely, very carefully*; means and instrument are objective and hence nongradable: **very surgically*. But consider the following sentence:

The teacher assessed the student *impressionistically*.

Here we may be unsure whether the adverbial means 'in a quite impressionistic manner', 'subjectively', or 'by means of an impression-forming technique'. And even if the means sense seemed to be endorsed by cooccurrence with an 'instrument' adverbial, cooccurrence with a manner adverbial like *casually* would interact semantically (cf 8.80) so as to make *impressionistically* equivocal between means and manner:

He *casually* [A₁] assessed the student *impressionistically* [A₂] *by interviewing him* [A₃].

Again, we are very dependent on the wider context in interpreting a sentence such as:

She did it *legally*.

The adverbial here may be manner (*quite legally, not illegally*), means (*by invoking the law*), instrument (*with legal arguments*), or – as in 8.6 – respect (*in respect of law*). See further 8.85.

Respect

- 8.6 This is a much broader and more abstract semantic category than time and place. We are here concerned with the use of an adverbial to identify a relevant point of reference in respect of which the clause concerned derives its truth value. For example:

So far as travelling facilities are concerned, we have obviously made a popular decision; but *with respect to the date*, many people are expressing dissatisfaction.

She helped him a little *with his book*.

She talked *learnedly about Kant*.

He has always been frightened *of earwigs*.

They are advising me *legally*. [where the adverbial does not mean 'lawfully, not illegally' (cf 8.5), but 'on points of law, with respect to law']

As we see from this last example, the respect role is often expressed by means of an adverbial form which could be used equally to express a different semantic relation. Moreover, the respect role may interact with another clause element such that it is expressed in the verb. Such interaction can be seen especially perhaps with adverbials basically relating to place. For example, the sentence:

He is working *in a (nearby) factory*.

seems concerned with *where* he is working, and the adverbial expresses the

locative relation: there is a specific factory in mind. But equally, without the option of including an indication (such as *nearby*) that a specific factory is in mind, the adverbial in the following could rather serve to answer the question 'What is he doing?' than 'Where is he working?':

He is working *in a factory*.

If the adverbial does indeed answer *What?* rather than *Where?* it is being predicated of a respect relationship: 'So far as his work is concerned, it is in a factory', 'He is a factory worker'.

There are analogous interactions with time, process, result, and degree adverbials as well as with the quasi-object (especially cognate object) that occurs with certain verbs. Compare:

She died *a peaceful death*.

[She died *peacefully*; *As for her death*, it was peaceful]

They split their sides *laughing*.

He's busy *writing*.

Contingency

8.7 The chief semantic relations in this important class of adverbials are:

- | | |
|-----------------|--|
| (i) CAUSE | She died <i>of cancer</i> .
She helped the stranger <i>out of a sense of duty</i> . |
| (ii) REASON | He bought the book <i>because of his interest in metaphysics</i> . |
| (iii) PURPOSE | He bought the book <i>so as to study metaphysics</i> . |
| (iv) RESULT | He read the book carefully, <i>so he acquired some knowledge of metaphysics</i> . |
| (v) CONDITION | <i>If he reads the book carefully</i> , he will acquire some knowledge of metaphysics. |
| (vi) CONCESSION | <i>Though he didn't read the book</i> , he acquired some knowledge of metaphysics. |

In contrast to cause, which is concerned with causation and motivation seen as established with some objectivity, reason involves a relatively personal and subjective assessment. As well as between these and the means adverbials of 8.5 (the adverbial in 'She got the job *through her experience*' could be seen as means or as cause), it will be apparent that there are close ties between these six adverbial types. Whether we perceive an adverbial as reason or purpose depends in large measure upon point of view. Thus the adverbial in:

He bought the book (*so as*) *to study metaphysics*.

can be seen as indicating his purpose in buying the book and equally his reason for buying it. So too, result is closely related to purpose in frequently (though not necessarily) indicating the fulfilment of a purpose (cf 8.86). Condition is linked to result in indicating the circumstances in which the result would be achieved. Concession, in turn, can be seen as an 'inverted' condition – indicating circumstances in which a result would ensue irrespective of the content of the concessive clause. But concession can also be seen as a 'blocked' or inoperative cause; compare:

Because of his enthusiasm, he won.

[cause]

In spite of his enthusiasm, he didn't win.

[concession]

Through his lack of enthusiasm, he didn't win.

[cause]

Despite his lack of enthusiasm, he won.

[concession]

Note There is a detailed consideration of contingency relationships including subcategories such as motivation in 15.30ff.

Modality

8.8 The truth value or force of a sentence such as:

She has been enthusiastic about her work.

can be enhanced or diminished by adverbials. On the one hand, there can be EMPHASIS on the positive or negative poles of the statement:

She has *certainly* been enthusiastic about her work.

She hasn't been enthusiastic *at all* about her work.

On the other hand, the middle ground between these poles can be indicated by APPROXIMATION, which may take various guises:

She has *probably* been enthusiastic about her work.

She has *not* $\left\{ \begin{array}{l} \text{really} \\ \text{exactly} \end{array} \right\}$ been enthusiastic about her work.

She has *hardly* been enthusiastic about her work.

Cf also 'I've *almost* finished painting the bathroom.'

Approximation can include comment on the form of or authority for the statement:

She has *allegedly* been enthusiastic . . .

She has been, *if I may say so*, enthusiastic . . .

She has been, *as she puts it*, enthusiastic . . .

A third aspect of modality is RESTRICTION, especially with a view to directing focus upon a particular part of the statement:

She has been enthusiastic *only* about her work.

She *ALONE* has been enthusiastic . . .

The negative particle *not* (*n't*) serves the function of denying truth value and it must therefore be viewed as being central to the semantic role, modality. But although *not* (*n't*) has been traditionally regarded as an adverb, it does not realize an adverbial as defined in this book; rather, it is seen as a particle functioning in clause negation (cf 2.43, 10.54ff).

Degree

8.9 Though often similar to modality adverbials in their semantic effect, degree adverbials are concerned with the assessment of gradable constituents in relation to an imaginary scale. One of the subroles is AMPLIFICATION, which is concerned with asserting a generalized high degree; and another is its opposite, DIMINUTION. For example:

I *badly* want a drink. } [amplification]
 She is *increasingly* adding to her work load. }
 He doesn't like playing squash (*very*) *much*. } [diminution]
 She helped him *a little* with his book. }

Thirdly, there is the expression of MEASURE, without implication that the degree is notably high or low:

He likes playing squash *more than his sister does*.
 She had worked *sufficiently* that day.

Degree is sometimes blended with time relations (frequency or duration); *eg* 'He doesn't play squash (*very*) *much*'.

Note Adverbial expressions of modality and degree, as well as the interrelation between them, will be examined in detail in the treatment of subjuncts, 8.9ff.

8.10 We have noted from time to time certain affinities between the semantic categories. It is doubtless because of these affinities that the same items such as prepositions, adverbs, and conjunctions can be used for different semantic relations. Thus *for* can indicate purpose (*He did it for money*), cause (*What did you do it for?*), and respect (*The doctor treated me for pleurisy*). Likewise *if* can be both conditional and concessive (*Come tomorrow if possible*; *He is lazy if intelligent*), and *still* often blends concessive with temporal implications:

Still, you should have visited them. [concession only]
 There is *still* work to do. ['at the present time']
 There is *still* work to do. ['despite the amount already done']

In 'He plays squash *a great deal*', degree and frequency are both involved (*cf* 8.9); again, *never* is both temporal (*cf* 8.4) and modal (*cf* 8.8). The interrelation of the semantic categories and the ease with which we see the same adverbial expressing one or another (or more than one simultaneously) is not, of course, a weakness but rather one of the great sources of the adverbial's communicative strength.

But although the same item can express different meanings, and although the different meanings shade one with another, there are good grounds for asserting the validity of the semantic distinctions we are making. We shall look presently (8.11, *cf* also 8.149) at the argument based upon cooccurrence, but we may note here that some semantic relations are so deeply entrenched, so well institutionalized, and so individually perceptible as to have special question forms to elicit them. Thus the *yes-no* question corresponds to the modality function:

A: (Are you going?) B: Yes/No/Probably/Never!

So too the question forms with *when*, (*for*) *how long*, *where*, *which way* (direction), *how*, *in which way* (process), *why* are directed to eliciting responses realizing some of the principal semantic relations that we have distinguished. (But *cf* 8.79f.)

Note [a] In pointing out the semantic overlap with certain conjunctions and prepositions, we must

nonetheless note that prepositional phrases and (especially) finite clauses are considerably more explicit and consistent with respect to their *general* semantic functions than are adverbs, whose form (notably *-ly*) conveys little and whose semantic role is typically particular, being determined largely by the lexical meaning of the individual item.

[b] Adverbial semantics can be seen not only in respect of question forms but also with deictic pro-forms (*cf* 12.1ff). On this basis, one might conclude that space, time, and process are central, in that simplex pro-forms exist: *there*, *then*, *thus*, and *so* (*cf* 2.43f). The first two are fairly discrete and precise (*cf* also *here* and *now*). But *thus* and *so* are broader and more vague, overlapping, and subject to style restrictions (commoner expressions are *like this*, *like that*). For example:

He spoke *in the big hall* assuming that more people would hear him *there*.

He spoke *at 9.00 p.m.*, assuming that more people would be free *then*.

He spoke *in great detail* assuming that, if he explained matters *thus*, his words would have a more lasting effect.

Deictic pro-forms for other semantic relations are either morphologically complex words (*therefore*, *thereby*) or prepositional or noun phrases (*that way*, *by such means*, *for this purpose*, etc). All these forms reflect the fact that the relationships concerned are not as unequivocally discrete semantically as those that have been expressed by a single morpheme.

On the specific semantic functions of conjuncts, see 8.136ff.

Multiple occurrence

8.11 Despite the considerable overlapping of the semantic roles and the affinities we can see between them, those that we have distinguished can be given discrete grammatical expression. The basis of establishing separate categories of clause element is their potentiality for acceptable cooccurrence in the same clause. In consequence, our need to have two types of O-element is testified by the cooccurrence of direct and indirect object in such a sentence as:

They gave *their leader* [O₁] *strong support* [O₂]. [1]

In a directly comparable way, we must recognize several types of A-element and these different types clearly correspond in part to the various semantic roles that we have been considering. For example:

He *still* [A₁] *often* [A₂] works on *Sundays* [A₃] *for hours on end* [A₄]. [2]

where A₁ expresses time relationship, A₂ time frequency, A₃ time position, and A₄ time duration (*cf* 8.4).

Types of A-element are much more numerous than types of O and C, and they are much less dependent upon the clause concerned containing items of a specific class (such as ditransitive verbs). But in principle the grounds on which we establish the A types that we shall treat as grammatically distinct in 8.24ff are precisely analogous to those on which we distinguish O₁ and O₂. That is, we note their propensity to cooccur in noncoordinate and nonappositive structures without tautology, contradiction, or unacceptability. This plainly applies to the cooccurrence of the four A-elements in example [2] above, though all of them concern *time*. Consider a further example, containing adverbials with a greater range of semantic roles:

Next Tuesday [A₁] I shall *probably* [A₂] visit her mother *in London* [A₃] *briefly* [A₄] *to see if she's feeling better* [A₅], *unless she telephones me before that* [A₆].

That these six adverbials are each expressing a different relation is shown not merely by their acceptable cooccurrence in the example sentence, but by

testing the unacceptability of treating any pair as either coordinate or appositive:

*I shall visit her mother *in London* [A_3] and *to see if she's feeling better* [A_5].

*I shall *probably* [A_2] *ie briefly* [A_4] visit her mother.

While it is on such essentially *grammatical* grounds as cooccurrence and position in clause structure that we establish classes of adverbials, we shall give the classes so established the labels plausibly suggested by their *semantic* roles.

- 8.12 At the same time, it must be noted that the affinities that we have discussed (cf 8.10) between some of the semantic roles frequently allow adverbials to interact with each other and with the other clause elements in a way and to a degree that is fairly rare with the relatively discrete types of O (O_1 , O_2) and C (C_1 , C_2). Thus (cf 8.6):

Martin is working *in the garden*.

This could be interpreted as indicating the place where Martin is working or indicating the type of work he is doing ('gardening'). Let us now add a further adverbial:

Martin is working *in the garden* [A_1] *on his sermon* [A_2].

Martin is working *in the garden* [A_1] *on his roses* [A_2].

We have now made clear the first and second interpretation respectively. Compare also the following pair of sentences:

He spoke *about Shakespeare*.

He spoke *about Shakespeare* [A_1] *sneeringly* [A_2].

Note that while the first might be paraphrased as 'The subject of his discourse was Shakespeare', a paraphrase of the second would be more like 'He had a contemptuous attitude to Shakespeare'. Consider now the sentence:

Mr Ahmed *proudly* accepted the award.

This might imply something like 'Mr Ahmed was proud to receive the award', or equally that he gave the appearance of pride in his manner as he received it. On the other hand, compare:

Proudly, Mr Ahmed accepted the award.

Mr Ahmed accepted the award *proudly*.

The variant orders here will influence us in favour of the first and second interpretation respectively.

Finally, as an example of interaction, consider the two sentences:

Frank *seldom* worked.

Frank worked *in his bedroom*.

Each is very different from:

Frank *seldom* worked *in his bedroom*.

In this connection, cf 2.54-5 on focus and scope.

Realization

- 8.13 The A-element can be realized by a great variety of linguistic structures:

Adverb phrase (cf 2.28) with closed-class (cf 2.36) adverb as head:

She telephoned (*just*) *then*.

Adverb phrase with open-class adverb (cf 7.47) as head:

She telephoned (*very*) *recently*.

Noun phrase (cf 17.1ff):

She telephoned *last week*.

Prepositional phrase (cf 9.1ff):

She telephoned *in the evening*.

Verbless clause (cf 14.10):

She telephoned *though obviously ill*.

Nonfinite clause (cf 14.7ff):

She telephoned *while waiting for the plane*.

She telephoned *hoping for a job*.

She telephoned *to ask for an interview*.

She telephoned *angered at the delay*.

Finite clause (cf 14.6):

She telephoned *after she had seen the announcement*.

We shall draw attention from time to time to the considerable degree of correspondence between the form of realization on the one hand, and semantic, positional, and grammatical properties on the other hand. Thus, for example, noun phrases as A chiefly realize A time position (cf 8.4); conditional adverbials are chiefly realized by finite clauses; an A occurring between S and V is likely to be one realized by an adverb phrase.

The different types of adverbial realization are textually distributed with widely different frequencies. In a fairly large sample of the Survey of English Usage corpus, where we examined approximately equal quantities of written material and impromptu spoken material, the distribution was found to be as presented in the table below. In the total of 75 000 words (40 000 words of transcribed impromptu speech and 35 000 words of written English), there were nearly 11 000 adverbials (cf 8.23):

Total number of adverbials	10981
Realization types:	
Prepositional phrases	4456
Closed-class items	3915
Open-class adverbs and adverb phrases	1063
Finite clauses	977
Nonfinite and verbless clauses	346
Noun phrases	224

The distribution between the two broad categories of material, impromptu speech on the one hand and written English on the other, was as follows, expressing this distribution as an average per text of the SEU corpus, where a 'text' is a homogeneous stretch of material, 5000 running words in extent:

	Speech	Writing
Total number of adverbials	712	753
Realization types:		
Prepositional phrases	258	336
Closed-class items	278	246
Open-class adverbs and adverb phrases	76	66
Finite clauses	70	60
Nonfinite and verbless clauses	12	33
Noun phrases	18	12

It is worth drawing attention to some salient features in these figures:

- (i) There are two forms in which the vast majority of A-elements are expressed: prepositional phrases on the one hand, and the (usually short) closed-class items such as *well*, *still*, *of course*, on the other hand.
- (ii) Spoken and written materials do not greatly differ either in the gross occurrence of A-elements or in the distribution of realization types.
- (iii) But while speech has a higher proportion of noun phrases as A (1:1.5), written material has a higher proportion of prepositional phrases (1:1.3) and nonfinite/verbless clauses (1:2.75). This last point is unsurprising, given the fact that the numerically strongest subtype is the *-ing* participle clause, as in:

Finishing her work early, Margaret decided to go for a swim.

- (iv) Less expected perhaps is the higher proportion of finite clauses as A in spoken material (1:1.2). This runs counter to the widespread belief that the frequency of 'subordinate clauses' (typically adverbial clauses with finite verbs) is a good indication of relative 'syntactic complexity', and that impromptu speech is less complex syntactically than written English.

There are important differences between speech and writing that do not emerge from these broad statistics, and we shall explore these and other details of textual distribution at appropriate points below.

Position

- 8.14 There is a sharp difference between A and other elements in the relative freedom with which A can be put in different positions in a sentence. The following examples illustrate this freedom, and we add the positional notation which will be explored in 8.15ff:

<i>By then</i> the book must have been placed on the shelf.	<i>I</i>
The book <i>by then</i> must have been placed on the shelf.	<i>iM</i>
The book must <i>by then</i> have been placed on the shelf.	<i>M</i>
The book must have <i>by then</i> been placed on the shelf.	<i>mM</i>
The book must have been <i>by then</i> placed on the shelf.	<i>eM</i>
The book must have been placed <i>by then</i> on the shelf.	<i>iE</i>
The book must have been placed on the shelf <i>by then</i> .	<i>E</i>

Some of these positions are less likely than others for the A in this sentence, but none is unacceptable. Of course, the availability of different positions does not imply that the choice of position makes no difference to the meaning of the sentence. The selection of one position rather than another is influenced

by several factors, but chief among them is the information structure of the sentence, and the relation of adverbials to information structure will require special attention both in this chapter and in Chapter 18. But not all A-elements have the same range of possible positions. The type of realization (cf 8.13) has a strong influence on where an adverbial is placed (in general, single-word adverb phrases are most mobile and finite clauses least), and of even greater influence are the semantic typology outlined in 8.2ff and the grammatical typology on which we shall concentrate in this chapter (8.24ff).

Initial

- 8.15 INITIAL position (symbol *I*) is that preceding any other clause element. In effect, this generally means the position immediately before S, as in:

Suddenly, the driver started the engine.

But in direct questions (cf 11.4ff), it is the position immediately before the operator or *wh*-element:

Seriously, do you believe in ghosts?

Anyhow, since when has she been ill?

On the other hand, in subordinate or coordinated clauses, it is the position following the conjunction:

(I had scarcely got into the taxi) when *suddenly* the driver started the engine.

(Are you afraid of the dark,) and, *to be blunt*, do you believe in ghosts?

(I know you are very charitable,) but, *seriously*, how can he be innocent?

If a clause has two *I* adverbials, it is of interest to note the order, *I*₁ and *I*₂ (cf 8.150f):

Anyhow [*I*₁], *by then* [*I*₂] she was very ill.

Most types of adverbial realization can occur at *I* and the same is broadly true of the different semantic roles as well. Among the exceptions, degree adverbials are unlikely at *I*. With respect to grammatical functions (cf 8.24ff), *I* is associated with those adverbials that can readily constitute the ground, theme (cf 18.8ff), or 'scene-setting' for what follows. It is thus particularly appropriate for sentence adverbials (cf 8.36), disjuncts (cf 8.121ff), and conjuncts (cf 8.134ff). Semantically, *I* has a strong association with expressions of time.

- Note [a] In the Survey of English Usage sample (cf 8.13, 8.23), there was found to be a striking contrast within the dominant realization type, prepositional phrases. Twenty-six per cent of all *I*-placed prepositional phrases were temporal where only four per cent were spatial. By contrast, of all *E*-placed prepositional phrases fourteen per cent were temporal, thirty-one per cent spatial.
[b] On adverbials in nonfinite and subjectless finite clauses, cf 8.20 Note [b].

Medial

- 8.16 MEDIAL position (symbol *M*) can be preliminarily described as that between S and V:

The driver *suddenly* started the engine.

[1]

- The soprano *really* delighted her audience. [2]
 They *seriously* considered him for the post. [3]

But when the V-element is realized by a verb phrase involving an operator, we see that this first approximation to a definition of *M* is inadequate. In the following variants of [1], [2], and [3], any native speaker would feel that the adverbials are still in the same position:

- The driver has *suddenly* started the engine. [1a]
 The soprano had *really* delighted her audience. [2a]
 They are *seriously* considering him for the post. [3a]

In consequence, we must refine the definition and say that *M* is the position immediately after the subject and (where there is one) the operator. This formulation will provide for interrogative sentences:

- Did the driver *suddenly* start the engine? [1b]
 Had the soprano *really* delighted her audience? [2b]
 Why are they *seriously* considering him for the post? [3b]

It will also provide for imperative sentences:

- Don't *suddenly* start the engine!
 Do *seriously* consider him for the post!

In view of these examples, we see that an 'initial' adverbial in an imperative such as:

- Never* } remove the cover.
Carefully }

must properly be regarded as 'medial'; cf 'We *never* remove the cover', *'Never we remove the cover'. One further complication can be seen in comparing the following examples with [2], [2a] and [2b]:

- The soprano *was really* at her best tonight.
 The soprano *hasn't really* been at her best for weeks.
 Was the soprano *really* at her best tonight?
 Has the soprano *really* been at her best recently?

We recognize that *really* seems to be in the 'same' position in all cases. The description of *M* must therefore be further clarified to accommodate the fact that, in this grammar, we treat BE as an operator even when it is the sole realization of V. So also HAVE, in those dialects of English that would not introduce *got* in [5] and [7]; cf 3.34f. Thus:

- She has *really* a different approach to the subject. [4]
 She has *really* (got) a different approach to the subject. [5]
 She has *really* had a different approach to the subject. [6]
 Has she *really* (got) a different approach to the subject? [7]

Note The claim that the position is the same (i) between operator and main verb as in [8], and (ii) between finite form of BE and complement as in [9] is strikingly confirmed by the fact that when the following was read aloud, it was perceived as [8] by some hearers, and as [9] by others:

- The expression on her face was *seldom* { discussed. [main verb] [8]
 { disgust. [complement] [9]

- 8.17 By reason of its being between two closely associated constituent elements, S and V, or between two constituent parts of the phrase realizing V (operator and main verb), the *M* position tends to determine the type of A realization. Only for a heavily special effect would a clause or lengthy prepositional phrase be placed at *M* (and it would then be clearly marked off by commas in writing, or by prosody in speech):

- You have, *though you may say it was accidental*, ruined this man's chances of a happy life.
 She had not, *despite years of anxious endeavour*, succeeded in living down that initial mistake.

In more general use, the adverbials at *M* are for the most part rather short adverb phrases, especially solitary adverbs – and for these (as the tables in 8.23 show) *M* is a numerically dominant position. Semantically, *M* is especially associated with modality and degree, such that adverbials tend to take on a tinge of these even when they purport to be expressing other relations ('time', 'space', 'respect', 'means', for instance). Thus:

- I have *at all times* indicated my willingness.
 He has *nowhere* stated this explicitly.
 I have not, *by word or deed*, betrayed your trust.

Grammatically, *M* is freely used for focusing and intensifying subjuncts (cf 8.88ff), and fairly freely for optional predication adjuncts (cf 8.24, 8.34), as well as for some disjuncts (eg: *obviously*; cf 8.121ff) and conjuncts (eg: *also*; cf 8.134ff).

Variants of medial

- 8.18 Consider again an example given earlier:

The driver *suddenly* started the engine.

This sentence conceals the fact that *M* position is the one immediately after an operator (cf 8.16), just as it obscures the fact that there are three exceptional variants of *M*, each with its domain of contrast with *M* and with each other. Compare:

- { She *really* delighted her audience. [1]
 { She *completely* delighted her audience. [2]
 { She had *really* delighted her audience. [1a]
 { She had *completely* delighted her audience. [2a]
 { She *really* had delighted her audience. [1b]
 { *She *completely* had delighted her audience. [2b]

In running through this set, we recognize when we come to [2b] that *completely* was at *M* in [2], though this neutralized a distinction that emerges with [1b]. By contrast, we equally recognize that [1] is ambiguous as between *M*, distinguished in [1a], and a position in [1b] that we may regard as a fronted medial or INITIAL MEDIAL position, symbol *iM*. This may be defined as the position between the subject and the operator.

There are several possible paraphrases of [1b], but one of them might be

stated thus: 'I wish to emphasize the fact that she had delighted her audience.' A comparable paraphrase of [1a] might be: 'I wish to emphasize the degree of delight she gave her audience'. There is not in fact much substantial difference *semantically* between these two, however much difference there may be *grammatically* between the intensifier (*cf* 8.104ff) in [1a], and the disjunct (*cf* 8.121ff) in [1b]. Where the predication is negative, however, the semantic distinction is clear:

She hadn't *really* delighted her audience. [M]
 She *really* hadn't delighted her audience. [iM]

In consequence we find that while many disjuncts are freely placed at *M* (and less commonly at *iM*) in positive sentences, they must be at *iM* in negative ones:

{ They can *probably* find their way here. [M]
 { (?) They *probably* can find their way here. [iM]
 { *They can't *probably* find their way here. [M]
 { They *probably* can't find their way here. [iM]
 { He was *probably* unhappy. [M]
 { He *probably* wasn't unhappy. [iM]

We thus see that *iM* can be used when it is necessary to exclude the adverbial from the scope of negation (*cf* 10.64) and when there is prosodic focus on the following item:

I have *frankly* been seriously interested.
 I *frankly* haven't been seriously interested.
 I *frankly* HAVE been seriously interested.

Note One notable use of *iM* occurs when the focused verb is BE; for example:

Well, you *never* WERE fond of work! That's where she *usually* is at this time of day.

8.19 Let us now consider the following example:

They *seriously* considered him for the post. [1]

Here we understand the meaning to be 'His suitability for the post was given serious consideration'. It is now clear that such an adverbial (apparently at *M*, but there is no operator) occupies a position that neutralizes both of what we have seen (*cf* 8.16) as the valid conditions of *M*. Thus it is not distinct from *M*:

They have *seriously* considered him for the post. [2]

Nor is it distinct from *iM*, which would be disallowed for *seriously* if the sentence had the meaning given above:

They *seriously* have considered him for the post. [3]

If, however, we expand the verb phrase to *will have considered*, we find that example [2] has also neutralized a contrast, since although *seriously* seems in [2] to be at *M*, the expanded form of [4] shows that the true *M* position will not yield the interpretation we have given to [1]:

They will *seriously* have considered him for the post. [4]

If, however, we place the adverbial immediately before *considered*, we have the required meaning:

They will have *seriously* considered him for the post. [5]

We now see that what is common to the sentences [1], [2], and [5] is that the adverbial is immediately before the main verb of the verb phrase in each case. This is the END MEDIAL position (symbol *eM*). It is associated with degree and manner adverbials (from a semantic viewpoint), with optional predication adjuncts (from a grammatical viewpoint), and with realizations by adverb phrases or prepositional phrases:

The room must have been *quite carefully* searched by the police.
 My answer may have to *some extent* displeased them.

8.20 There is yet a further variant of *M*. It is to be found only rarely, and this is in part because it depends upon the occurrence of a verb phrase with three or more auxiliaries (*cf* 3.21ff):

They must have *often* been listening at the door.
 The car may have *sometimes* been being used without permission.
 The car may have been *indeed* being used without permission.

Adverbials that occur at the places occupied by *often*, *sometimes*, and *indeed* in these examples are said to be at MEDIAL MEDIAL position (symbol *mM*), and we see the validity of making this distinction by comparing the following:

*This bridge may have *badly* been designed by Brunel.

This bridge may have { *actually* } been designed by Brunel.
 { *partly* }

But even the emphasizers and intensifiers that can, as we see, appear at *mM* would more usually be placed elsewhere, the emphasizer *actually* at *M* and the downtoner *partly* at *eM*:

This bridge may *actually* have been designed by Brunel.
 This bridge may have been *partly* designed by Brunel.

It is unusual but not actually ungrammatical to have adverbials at *iM*, *M*, *mM*, and *eM* in the same clause, though the resultant sentence would be regarded as grossly unacceptable from a stylistic point of view, as in:

The new law *certainly* may *possibly* have *indeed* been *badly* formulated.
 [= 'It is certainly true that what I say now is possible: the new law may indeed have been badly formulated']

Note [a] Since, as we have seen, a simple verb phrase neutralizes the distinction between *M* and *iM*, and a verb phrase consisting only of an operator and the main verb neutralizes the distinction between *M*, *mM*, and *eM*, the variants of *M* must be ignored in describing the position of most adverbials, reference usually being made only to *M*.

[b] With nonfinite clauses and finite clauses where the subject or the subject and an auxiliary are absent, it is still of course possible to distinguish *M* position and sometimes also variants of *M*. For example:

Being *often* in Paris, I enjoy ... [M]
 Having *carefully* studied the problem, he ... [M]
 To have been (so) *thoroughly* beaten by John was ... [eM]
 I had met her and may have *already* been influenced by her. [mM]
 On the other hand, *IM* can be indistinguishable from *I*; consider:
 I had met her and *already* had come to like her.
 Here we cannot tell whether a fuller version of the second conjoin would have had the subject before or after the adverbial:
 ... and I *already* had come to like her.
 ... and *already* I had come to like her.
 Indeed it is often impossible to distinguish *M* or any of its variants from *I*; for example:
 I had been introduced to her and *already* influenced by her. [?I, ?IM, ?M, ?eM]
Already influenced by her, I had lost my former objectivity.
 In such cases, it is best to acknowledge the neutralization of positional contrast by regarding the adverbials as at *I/M*, ie initial or medial position.

The 'split infinitive'

8.21 Quite strong stylistic objections are made to adverbials at (e)*M* when this position involves their being placed between *to* and the infinitive (the so-called 'split infinitive' construction), as in:

She ought to *seriously* consider her position. [1]
 For me to *suddenly* resign my job is unthinkable. [2]
 He wasn't able to *even* move his fingers. [3]

It should be noted that if the verb phrase is made perfective or if a modal not involving *to* is used in these examples, the adverbial remains immediately before the main verb:

She ought to have *seriously* considered her position. [1a]
 She should *seriously* consider her position. [1b]
 For me to have *suddenly* resigned ... [2a]
 He couldn't *even* move his fingers. [3a]

Since the position of the adverbials in [1a-3a] is perfectly acceptable and natural, it is easy to see why the closely parallel [1-3] should seem equally natural - however guiltily - despite generations of disapproval by teachers and stylists.

In comparing *ought to* in [1] and *should* in [1b], we might also note that there are several auxiliary sequences providing phonological evidence, matched by evidence from informal spellings, that the *to* has a closer link with the preceding than with the following word (cf 3.44ff):

used to /'ju:stə/
 have to /'hæftə/
 (have) got to, gotta /'gɒtə, -də, -rə/
 (be) going to, gonna /'gɒnə/

In consequence, it would sound intolerably awkward to insert an adverbial before the *to*:

?*You have (got) *really* to be here early.

Again, where there is ellipsis of the predication, both with such sequences and more widely with verbs taking *to*-clause complementation (cf 16.38,

16.41, 16.50ff, 16.63), retention of *to* shows the leftward binding which encourages a split infinitive elsewhere:

A: Did you ever visit her after she had retired?
 B: { I used to *sometimes*, but not recently.
 I intended to *often enough*, but seldom managed to.
 (Compare: ?I used *sometimes* to, but ...
 ?I intended *often enough* to, but ...)

Nonetheless, the widespread prejudice against split infinitives must not be underestimated, especially with respect to formal writing, and indeed there is no feature of usage on which critical native reaction more frequently focuses. In consequence, it is by no means unusual to detect awkward and unidiomatic usage that clearly results from conscious avoidance:

They are *regularly* to attend all classes that have been arranged for the present semester.

Troops continue *heavily* to outnumber the normal residents in the area.

She was forced *apologetically* to interpose a question at this point.

In this last example, avoidance has produced ambiguity, since one cannot tell whether it was 'she' who was apologetic or those who 'forced' her. Consider similarly:

She has tried *consciously* to stop worrying about her career.

Here we cannot decide whether it was her trying that was conscious or whether she wished the *stopping* to be conscious. On the other hand, with an alternative avoidance:

She has tried to stop *consciously* worrying ...

we do not know whether the sentence refers to 'a conscious stop' or to 'a conscious worry'. If the former were intended, defiance of the prejudice against the split infinitive would at least make the meaning clear:

She has tried to *consciously* stop worrying ...

Compare also:

His hardest decision was to *not* allow the children to go to summer camp.

It will be noted that if the *not* had preceded the *to* in the last example it would have been difficult, even in speech, to prevent misinterpretation as 'To allow the children to go to summer camp was not his hardest decision.'

Split infinitives are commonest with subjuncts of 'narrow orientation' (cf 8.92ff) and hence perhaps especially where the infinitive is a 'gradable' verb. The subjuncts would not of course be those that most usually appear at *IM* or at *E* (cf 8.24) such as *too* or *as well*. Some further examples will illustrate these points:

Your task is to *really* understand your students' problems.

I do TRY to understÁND - to TRÜly understand.

We tended to *rather* sit back and wait for developments.

People who are in genuine need ought to have priority; but to *so* organize the service is administratively difficult.

To *further* prolong discussion beyond the present meeting would be very undesirable.

To *even* reprimand a member of staff, it is important to ensure that the agreed procedure is strictly followed.

Colloquially, the split infinitive is frequently associated with a following focus, as in:

Well, you ought to *at least* TRY.

As soon as I get the word, I'm going to *really* HURRY.

Such preparation for focus may be expletive, as in:

I told them to *darned well* think for themSELVES.

Compare 8.100, App I.16 Note [d]. More generally the focus is intensified by superlatives or other expressions of real or implied comparison:

She was the first person to *ever* live in that house.

My grandson was the latest person to *either* discuss this with me or even allude to it.

She would be the last person to *even* THINK of plagiarizing.

No one invited me to *so much as* have a glass of water.

He is now reluctant to *so much as* SPEAK to her.

Note In a Survey of English Usage text of circa 1980 involving four educated British adults (three women and one man) in a professional psychiatric discussion lasting three-quarters of an hour, there were nineteen 'split infinitives':

... to <i>actually</i> V ...	7x
... to <i>not</i> V ...	3x
... to <i>sort of</i> V ...	2x
... to <i>simply</i> V ...	1x
... to <i>openly</i> V ...	1x
... to <i>suddenly</i> V ...	1x
... to <i>emotionally</i> V ...	1x
... to <i>perhaps</i> V ...	1x
... to <i>always</i> V ...	1x
... to <i>all</i> V ...	1x [... it's going to <i>all</i> ruin things.]

End position

8.22 END POSITION (symbol *E*) is the position in the clause following all obligatory elements; it is also the position of the obligatory adverbial when this follows the other obligatory elements. For example:

The light was fading <i>rapidly</i> .	[after SV]
Dr Blackett is <i>in Tokyo</i> .	[A in SVA]
She was digging a trench <i>in the garden</i> .	[after SVO]
He gives his car a wash <i>every week</i> .	[after SVOO]
They became teachers <i>in the end</i> .	[after SVC]
He put the vase in the cabinet <i>without a word</i> .	[A in SVOA]

It is by no means rare to find more than one adverbial in this position:

She kept writing letters *feverishly* [A₁] *in her study* [A₂] *all afternoon* [A₃].

In such a case, all three of the adverbials are said to be at *E*, though of course their order relative to each other is of considerable significance (cf 8.150f).

The tendency for such *optional* adverbials to follow all *obligatory* elements can be readily ignored, however, in certain circumstances. Putting an adverbial at a subtype of *E* is found convenient when end-focus (especially associated with end-weight; cf 18.9) makes preferable an obligatory element in clause-final position despite the presence of an adverbial. This is called INITIAL END position (symbol *iE*); for example:

She kept writing *in feverish rage* long, violent letters of complaint.
[S + V + A + O]

This position seems least disturbing of normal order when an adverbial comes between a direct object and obligatory adverbial, as in:

She placed the book *offhandedly* on the table.

In some cases *iE* is essential if clarity is to be achieved. Consider:

She herself interviewed *with hurtful disdain* the student I had turned down.

If we compare this with a version putting the same adverbial at *E*, we shall see that there is little chance that a reader would make the same interpretation:

She herself interviewed the student I had turned down *with hurtful disdain*.

As we might expect from these examples, *iE* is especially necessary when the last obligatory element is a clause, since otherwise the adverbial would seem to be an element in the subordinate clause. Compare:

He urged her dismissal *secretly*. [1]

Here it is clear that it was the urging that was done secretly.

He urged that she be dismissed *secretly*. [2]

But here, retention of *E* for the adverbial implies that it is the dismissing that is to be done secretly. To combine the meaning of [1] with the construction of [2], we must move the adverbial to *iE* or *M*:

He urged *secretly* that she be dismissed.

He *secretly* urged that she be dismissed.

Compare also:

He said *suddenly* that he had earlier lost his temper.

He hoped *fervently* to be applauded.

in contrast to:

He said that he had earlier lost his temper *suddenly*.

He hoped to be applauded *fervently*.

It should be noted, of course, that in these examples the choice is not merely

between *E* and *iE*, but between either of these and *M*:

He *secretly* urged . . .

He *suddenly* said . . .

He *ferently* hoped . . .

But there is one important type of adverbial where the *M* option is not available. The adverbials in phrasal verbs (cf 16.3f, 16.16) may be placed at *iE* except when the *O₃* is a pronoun:

She waved *away* the offer of help.

She waved *it away*.

*She waved *away* it.

Most semantic roles can be expressed at *E*, though this is rarely true of modality; there is a particularly strong association of *E* with spatial expression: cf 8.15 Note [a]. Grammatically, *E* is the position for obligatory adjuncts unless there is an optional adjunct, in which case it would usually be this that appeared at *E*. As for realization, *E* is used for prepositional phrases and clauses rather than short adverb phrases.

Note With prepositional verbs, where we have the option (cf 16.13ff) of regarding them as transitive or intransitive (cf 8.24), as in:

He + looked at + the picture. [SVO]

He + looked + at the picture. [SVA]

it is best for present purposes to adopt the second of these but to regard the A-phrase as obligatory. This will account for native reaction to the apparent 'preposing' of an adverbial at *iE*, as well as accounting for the ease of tolerating discontinuity between the verb and its associated preposition. Hence:

He paid for the book *immediately*. [E]

She looked at the picture *in astonishment*. [E]

He paid *immediately* for the book. [iE]

She looked *in astonishment* at the picture. [iE]

Contrast with SVO interpretation the impossibility of *iE*:

*She looked at *in astonishment* the picture.

Positional norms

8.23 Although semantic and grammatical roles have a crucial influence on the position of A in a clause, the overwhelming majority of adverbials occur at *E*. There is however considerable variation, and there is a direct correlation in most cases between the semantic/grammatical category on the one hand and the realization form on the other. It is therefore of interest to study the distribution of some major realization types in relation to their position. We present below an analysis based on the Survey of English Usage corpus of which numerical data were given in 8.13, but now without the rather heterogeneous category of nonfinite and verbless clauses. In Table 8.23, the right-hand part of each line shows the *percentage* of each realization type at each of the positions distinguished in 8.14ff.

As with the general distribution of realization types (cf 8.13), so with the positions adopted, there is little difference between the norms of spoken and written English. The biggest difference is with noun phrases, and since this is numerically the smallest of the types, this difference is of little statistical importance. What is of greater moment is the difference between preposi-

tional phrases and closed-class items which together constituted three-quarters of the many thousands of adverbials in the SEU sample. The lower proportion of closed-class (and open-class) adverbs at *E* doubtless reflects their relative lack of 'weight' (cf 18.9), while the higher proportion of closed-class items at *I* reflects the tendency to begin sentences with one of a small number of short conjuncts (cf 8.134ff) such as *then*, *now*, *yet*, and above all (in speech) *well*. The twenty-five per cent of closed-class items at *M* constitutes no less than nine per cent of all adverbials in the sample and this draws attention to the numerical importance of 'narrow orientation' subjuncts like *really* (cf 8.96ff).

Table 8.23

Whole SEU sample	10635	<i>I</i>	<i>iM</i>	<i>M</i>	<i>m/eM</i>	<i>iE</i>	<i>E</i>

Grammatical functions

8.24 Since the purpose of this book is to describe present-day English from the viewpoint of grammar, it is on the grammatical functions that we shall concentrate in our discussion of adverbials. There are four broad categories of grammatical function: ADJUNCT, SUBJUNCT, DISJUNCT, and CONJUNCT. We shall deal in turn with each of these and their subcategories, as set out in Fig 8.24 below.

When adverbs, prepositional phrases, and other structures are functioning as part of an element in the sentence structure, they cannot of course be regarded as 'adverbials' in terms of the sentence in question (cf 8.1):

Her *beautifully* manicured nails plucked at the harp strings. [1]

The man *in the corner* seems to be ill. [2]

She answered in a *quietly* assertive way. [3]

Though you may leave *when ready*, you are asked not to disturb other candidates.

[4]

In [1], *beautifully* is functioning as part of the noun phrase realizing the subject; contrast [1a]:

She had manicured her nails *beautifully*.

[1a]

where the same item is functioning as A. In [2], *in the corner* is likewise part of the noun phrase that is subject in the example; contrast [2a]:

The man was *in the corner*.

[2a]

In [3], *quietly* is functioning within a prepositional phrase which as a whole constitutes the adverbial of the sentence; contrast [3a]:

She asserted her answer *quietly*.

[3a]

In [4], *when ready* functions as an adverbial within a finite clause which itself constitutes the adverbial in the sentence as a whole; compare [4a]:

You may leave *when ready* if you wish.

[4a]

Here, the same verbless clause is functioning as one of two adverbials within a sentence.

But although the structures operating within elements in [1-4] are functionally quite distinct from the same items functioning as A in [1a-4a], the distinction is not always so clear. Out of context, there may be ambiguity, as with *in the next house* in:

I could hear *the man in the next house*. [part of a noun phrase]

(perhaps continuing: 'singing to his children, as he often does')

I heard the man *in the next house*. [predication adjunct, cf 8.27]

(~ 'In the next house I heard the man', but rather perhaps continuing: 'but he ran out at the back as I approached')

I heard the man *in the next house*. [sentence adjunct, cf 8.36]

(~ 'In the next house, I heard the man', and perhaps continuing: 'but I could no longer hear him when I left it and walked round outside')

In these examples, *in the next house* must be understood as one or other of the three possibilities; there is no grammatical or semantic blurring. With other examples, there may be multiple analyses. One can justify treating:

He approved of the idea.

as having a predication adjunct of *the idea* or as comprising a prepositional verb *approved of* with a noun phrase as object *the idea* (cf 16.13ff). Equally, one can justify treating alike the two sentences:

He couldn't bring the changes *into effect*.

He couldn't bring the changes *about*.

with the italicized portions regarded as obligatory predicational adjuncts. From other points of view, it is preferable to regard *bring about* as a phrasal verb (cf 16.3f, 16.13ff), since this analysis captures syntactic features that would otherwise be ignored.

But there are uses of adverbs and adverb phrases where the status depends on neither ambiguity nor multiple analysis. The adverb *today* in the following example seems to be part of the subject noun phrase:

The [pace of 'life toDĀY] is [proving 'too FĀST]

Yet on the one hand there seems to be little difference beyond the nuances of emphasis in versions of the sentence in which *today* is certainly functioning as the A-element:

toDĀY the pace of 'life is 'proving 'too FĀST

The pace of 'life is toDĀY proving 'too FĀST

The pace of 'life is 'proving 'too FĀST toDĀY

And on the other hand the position of *today* in the original version is not one that excludes the occurrence of A; cf:

Mr Jones toDĀY must be heartbroken.

[A at iM]

Consider also the following textual example:

A raw recruit to the police service at the beginning of this century was expected to be little more than physically fit and mindlessly obedient.

Thus punctuated, it appears as though the whole sequence before *was expected* is the subject; but it is perfectly possible that *at the beginning of this century* is an A at iM. Compare:

At the beginning of this century, a raw recruit to the police service was expected to be . . .

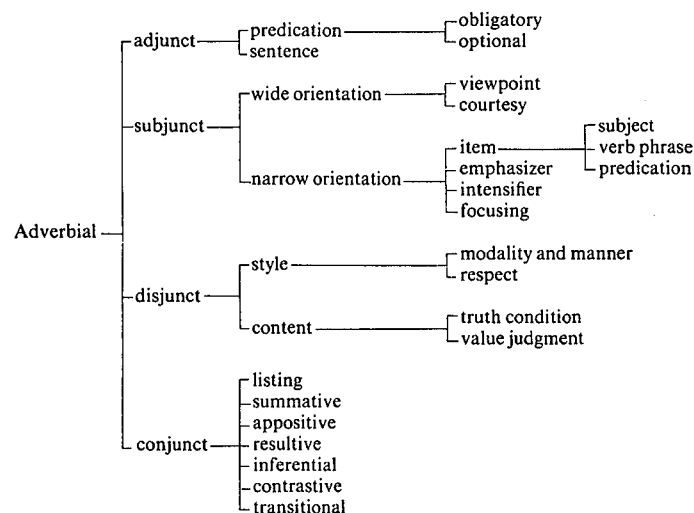

Fig 8.24

- 8.28 In fact, the number of verbs having sufficient semantic weight in themselves to require no further complementation is quite small. At one extreme, we have the class of copular verbs (*cf* 16.21*ff*) like *BE* and *turn* which, as their designation indicates, must link one element (the S) to another (the C or A_{oblig}):

She was <i>a teacher</i> .	[C]
She was <i>in a hurry</i> .	[A]
The chrysalis slowly turned <i>green</i> .	[C]
The chrysalis slowly turned <i>into a butterfly</i> .	[A]

At the other extreme, we have intransitive verbs like *disappear* or *apologize* which fairly freely occur without complementation:

The rabbit disappeared.
John apologized.

Even in these examples, however, there would be considerable dependence on a context which in fact provided the unexpressed adjunct:

The rabbit *suddenly* disappeared.
The rabbit disappeared *behind a bush*.
John apologized *to his host*.
John apologized *for being late*.

Still more so, between the extremes of *BE* and *apologize*, adjunct-less intransitive clauses are rare, and we must note that the addition of an adjunct reduces the semantic weight and 'communicative dynamism' (*cf* 18.3) of the verb. Compare:

The Queen arrived.	[<i>ie</i> the arrival is all important]
The Queen arrived <i>in a blue gown</i> .	[<i>ie</i> her dress is more important than the arrival]
The Queen arrived <i>in a blue car</i> .	

This is particularly noticeable in the case of certain verbs of broad meaning in respect of posture or motion: *sit*, *stand*, *come*, *go* (*cf* 16.24). These can take an obligatory adjunct of respect (*cf* 8.6) in the form of an *-ing* clause, with consequent weakening of the primary meaning of the main verb (*cf* 3.49):

He stood *waiting (patiently)*.
She sat *reading (to the children)*.
They went *hurrying (breathlessly)*.
She came *running (in great haste)*.

Such examples are, of course, superficially ambiguous. Prosodic adjustment can give fuller lexical meaning to the finite verb, at the same time transferring the *-ing* clauses from obligatory to optional adverbial status:

He stòod [waiting pÀtiently]
She sat with her chÍldren[RÉAding to them]

- 8.29 The nonfinite clause as obligatory adjunct in examples like 'He stood waiting' may be compared with the effect that perfective or progressive aspect has in conferring a plausible completeness of predication:

- (?)He stood.
He stood waiting.
(?)She hitchhiked.
She was hitchhiking.
(?)They went.
They have gone.

Indeed, the progressive seems clearly able to combine the expression of a verbal inflection and of an obligatory adjunct of respect:

She was hitchhiking (to London).
She was (engaged in the activity of) hitchhiking.

Compare also:

She is teaching.

This last may refer either to current activity ('She is teaching in the next room at this moment') or to membership of a profession ('She is teaching for a living', 'She is in teaching', 'She is a teacher'), reminding us that historically the aspectual value seems to have been added to an original adverbial function (*cf* 'He's gone *a-hunting*', a dialectal or archaic form, derived historically from a prepositional phrase) which is still not entirely superseded.

- 8.30 A similar phenomenon to that observed with 'He stood waiting' is the obligatory adjunct with *come* and *go* in the form of an infinitive clause:

She'll come *to see you (about it)*.
I went *to visit my mother*.

Again the lexical force of the main verb is reduced and the adjunct, while having the form common in the semantic role of purpose, is predominantly concerned with the respect role. This applies even more obviously to the obligatory adjunct following *try*:

He must try *to do better (next time)*.
[≠ ... 'so as to do better', 'in order to do better']

These adjuncts are noteworthy in that the semantic relation is alternatively realized by coordinated clauses, especially in rather informal usage (*cf* 13.98*f*, on pseudo-coordination):

She'll come *and see you (about it)*.
I went *and visited my mother*.
He must try *and do better (next time)*.

- Note [a] When the coordinated clause is finite, the sense of the preceding verb is tilted towards its full lexical meaning. Compare:

I'll go *and visit my mother*.
I went *and visited my mother*.
I went *and I visited my mother*.

It is only in the first of these that the coordinated part has the resemblance to obligatory adjunct. With *try*, no finite verb coordination is possible:

Did he try *and see you*?
*Yes, he tried *and saw me*.

[b] Since *go*, *sit*, *try*, etc with infinitive clauses as obligatory adjunct seem to subordinate their lexical meaning to the verb in the adjunct, it is of interest to compare them with auxiliary verbs. Cf the treatment of *be going to* as a semi-auxiliary (3.47f).

- 8.31 Closely analogous to the obligatory adjunct, again frequently with the semantic role of respect (cf 8.6), are the structures in complementation of adjectives (cf 16.68ff). In some instances, without such complementation, the adjectives cannot constitute a predication:

*She is fond.	BESIDE	She is fond <i>of books</i> .
*This is tantamount.	BESIDE	This is tantamount <i>to an insult</i> .
?He is likely.	BESIDE	He is likely <i>to succeed</i> .

In others, the adjective has a different or at any rate much greater semantic weight when it is without complementation, serving more of an auxiliary role (cf 8.30 Note [b]) when complementation is present. Compare:

They are anxious.	~ They are anxious <i>to see you</i> . (cf 'They want to see you.')
They are (very) able.	~ They are able <i>to fly helicopters</i> . (cf 'They can fly helicopters.')
He is capable.	~ He is capable <i>of resigning over this</i> . (cf 'He may well resign.')
She is keen.	~ She is keen <i>on fishing</i> .
He is good.	~ He is good <i>at mathematics</i> .

Note As with the verbs with reduced meaning when accompanied by obligatory adjuncts (cf 8.28), some of the adjectives in informal usage take complementation in the form of a coordinate structure:

The room is good *and warm*.
He's nice *and generous*.

As with the verbs, too, the adjective requiring complementation can take on a subordinate role, as though it were a modification of what follows rather than being complemented by it. We may note that the following pairs are closely synonymous:

{ The coffee is <i>nice and hot</i> .	{ He got <i>good and angry</i> . <esp AmE>
{ The coffee is <i>nicely hot</i> .	{ He got <i>very angry</i> .

(Cf pseudo-coordination, 13.98f)

- 8.32 In 8.27 obligatory adjuncts were compared with direct objects, and in 8.28 we considered intransitive verbs which appeared to have a different or somewhat weakened meaning when they were complemented by an adjunct. Both these factors come together in the consideration of prepositional verbs (cf 16.5ff, 16.13ff). Compare:

He went outside and *looked*; the evening sky was both radiant and peaceful. He came back in thoughtfully.

Here *looked* is fully intransitive and could be replaced by *gazed*. On the other hand, in:

He looked at the picture.

we seem to have as interdependent a tripartite sentence as we do in:

He lived *in Chicago*.

As with the latter, we may regard the prepositional phrase *at the picture* as an obligatory adjunct; cf:

It was *at the picture* that he looked.

But equally we may regard *look at* as a transitive verb, with *the picture* as O_d ; cf:

It was the picture that he looked at.
The picture was looked at in admiration by him and several other visitors.

Note On the descriptive reasons for having multiple analyses for the same linguistic phenomenon, cf 2.61.

- 8.33 Just as prepositional verbs may be regarded either as transitive with obligatory O_d or as intransitive with obligatory adjunct, so sequences like *put away* can be regarded as potentially discontinuous transitive (phrasal) verbs:

She *put* the money *away*.
She *put away* the money.

or as simple transitive verbs requiring both an O_d and an obligatory adverbial (amplifier subjunct; cf 8.105). The former is convenient when we are considering the cooccurrence of closed-class particles (such as *away*) with verb items, as in 16.2ff. The latter is convenient when the verb item is accompanied by a wide range of phrases describable in terms suited to adverbial abstractions, as in this chapter. Thus we consider the italicized portion of the following sentences as obligatory predication adjuncts:

She put the money *into her purse*. (cf *She put the money.)
She put the money (*entirely*) *out of her mind*.
She placed *before me* a curiously ornate vase.

So also, while the adverb particle in the sentence:

He *stared* me *out*.

will be treated as part of a phrasal verb, the sentence:

He looked me (*straight*) *in the eye*.

is regarded as having an obligatory adjunct, susceptible of modification, as is shown by the parenthesized *straight*. The same verbs can occur, with a considerable difference in meaning according as they require or do not require an obligatory adjunct:

My father kept me.	['supported me financially']
My father kept me <i>in bed</i> .	['made me stay']
They have a cottage.	['own']
They have a cottage <i>for sale</i> .	['are selling']

(Cf the discussion of clause patterns, 10.1ff.)

Finally, just as we saw that copular verbs could have either C_s or an obligatory A (8.28), so there are a few verbs that can have either C_o or an obligatory A:

She made him <i>happy</i> .	[C _o]
She made him <i>into a braver man</i> .	[A]
He keeps his car <i>clean</i> .	[C _o]
He keeps his car <i>in the street</i> .	[A]

Optional predication adjuncts

- 8.34 Although it is often clear when an adjunct is obligatory, this is not always so. We noted in 8.28 that the mere addition of an adjunct after an intransitive verb reduced the verb's semantic weight. Nonetheless, it can be seen that the relation between S and V in:

The Queen arrived. [1]

is not radically altered when an A is added as in:

The Queen arrived *in a blue gown*. [2]

To the extent that [1] can obviously occur without the adjunct as in [2], or any other adjunct, while at the same time the relation between S and V in [2] is not at variance with the relation between the same S and V in [1], we can say that the adjunct in [2] is optional. Compare also further intransitive items where the optional status of A is indicated by parentheses:

The rabbit vanished (*behind a bush*).
She disappeared (*with the purse*).

The instrument has been tested { (*by a technician*).
(*electronically*).

They are emigrating (*to South America*).
He protested (*vigorously*).

The optional status of adjuncts in SVO clauses can similarly be tested by observing that the relations (eg between V and O) remain constant irrespective of the presence or absence of the adjunct:

He defended his client (*with vigour*).
I found the letter (*in the kitchen*).
John forced open the door (*by means of a lever*).
They sent off the parcel (*to Australia*).
Grip the handle (*tightly*).
She kissed her mother (*on the cheek*).

Note Verbs that can be both monotransitive (16.25ff) and complex-transitive (16.43ff) enter into constructions of superficial similarity which are in fact very different. Compare:

She found him on the floor. [3]

[= 'He was on the floor when she found him.']

[≠ 'She found that he was on the floor.']

She found him of little help. [4]

[≠ 'He was of little help when she found him.']

[= 'She found that he was of little help.']

With *She found him in a coma*, the structure might parallel that in either [3] or [4].

Position of predication adjuncts

- 8.35 All predication adjuncts, obligatory and optional alike, are normally placed

at *E*, as in most of the examples presented in 8.25–34. They may however be advanced to *iE* if an O or C is lengthy and complex or requires prosodic focus. Such positioning characterizes written rather than spoken usage, and it reflects some care in sentence planning.

With an obligatory adjunct at *iE*:

She keeps *in the garden* some of the most lovable little rabbits you ever saw.

They want to bring *into force* a new regulation about passengers in buses.
She made *into a braver man* the unfortunate and terrified victim of terrorism.

With an optional adjunct at *iE*:

I found *in the kitchen* the letter I thought I had burnt.
She kissed *on the cheek* her tearful and trembling mother.

We saw in 8.27 an example of exceptional fronting to *I* of an obligatory adjunct. Such fronting would be equally exceptional with most optional predication adjuncts, and although an accompanying subject-operator inversion is now largely confined to formal or emotive style, its continued existence demonstrates the severity of the dislocation. Cf:

By no properly qualified technician has this instrument ever been adequately tested.

In no circumstances must this door be left open.

With discontinuity:

So vigorously did he protest that the authorities reconsidered his case.

Note Negative adjuncts such as *in no circumstances* might be said to be obligatory since the meaning is different when they are omitted:

You should *in no circumstances* leave the door unlocked.

[≠ 'You should leave the door unlocked.']

Contrast:

You should not, *in any circumstances*, leave the door unlocked.

Here the adjunct can of course be omitted without serious change of meaning. Significantly in this connection, it is chiefly the negative adjuncts that can be fronted. Compare:

In no circumstances should you leave the door unlocked.

?*By several qualified technicians* was the instrument tested.

(cf 10.65, 18.24.)

Sentence adjuncts

- 8.36 The most obvious way in which sentence adjuncts mark themselves off from predication adjuncts is by their relative freedom to occur at *I* position as well as *E*. In this way they demonstrate what we can intuitively feel: that they relate to the sentence as a whole rather than solely or predominantly to the V and post-V elements. Thus *on the cheek* and *on the platform* both possess the adjunct characteristics presented in 8.25:

She kissed her mother *on the cheek*. [1]

She kissed her mother *on the platform*. [2]

But the relative centrality (cf 2.13) of the adjunct in [1] as compared with the

more peripheral orbit of that in [2] is shown by the awkwardness of:

?On the cheek, she kissed her mother. [1a]

as compared with:

On the platform, she kissed her mother. [2a]

If we combine fronting as in [1a] and [2a] with a truth-focusing paraphrase, the difference is brought out more sharply, though even [2b] is rather unidiomatic:

*On the cheek, { it is a fact
the fact is } that she kissed her mother. [1b]

On the platform, { it is a fact
the fact is } that she kissed her mother. [2b]

If we combine the adjuncts of [1] and [2] at *E*, the adjunct in [1] would normally precede that in [2]; in other words, we expect the sentence adjunct *on the platform* to be located further from the centre of the clause (cf 2.13) than the predication adjunct *on the cheek*:

{ She kissed her mother *on the cheek* [A₁] *on the platform* [A₂].
On the platform, she kissed her mother *on the cheek*.
?* { She kissed her mother *on the platform* [A₂] *on the cheek* [A₁].
On the cheek, she kissed her mother *on the platform*.

A further indication of the relatively peripheral status of the sentence adjunct is that it can be separated from the rest of the clause by a comma (and analogously occupy a separate tone unit in speech). Contrast the fronting of a predication adjunct (which requires a context of special motivation; cf 18.21) with a quite normally *I*-placed sentence adjunct:

In Chicago he LIVED (and in Chicago . . .)

In ChicÁgô he studied metaphýsics

*In Chicago, he lived.

In Chicago, he studied metaphysics.

We should note also that an *I*-placed sentence adjunct has the potentiality to relate to the *whole* sentence, even where the sentence comprises two coordinate clauses, while the same *E*-placed adjunct will normally be interpreted as predication adjunct and hence related only to the clause in which it is placed. Compare:

He travelled a great deal and eventually settled down in Australia.

In Australia, he travelled a great deal and eventually settled down.

(Cf 18.20–25).

Subject- and object-related

- 8.37 If we compare the identical adjuncts in the following sentences, we detect an obvious difference in their relations:

I found the letter in the kitchen. [1]

I typed the letter in the kitchen. [2]

Both [1] and [2] respond to the question 'Where did you . . .?', just as both can be framed in a cleft sentence 'It was in the kitchen that I found/typed the letter'. Again, both can be paraphrased in terms of 'I was in the kitchen when I . . .'. But whereas [1] can be paraphrased as 'The letter was in the kitchen when I found it,' [2] cannot be paraphrased as 'The letter was in the kitchen when I typed it.' This test helps us to see that in [2] *in the kitchen* is a sentence adjunct, but it also helps us to see that example [1] is ambiguous as to whether the adjunct is more object-related ('The letter was in the kitchen') or more subject-related ('I was in the kitchen'). If we now reorder these examples:

In the kitchen, I found the letter. [1a]

In the kitchen, I typed the letter. [2a]

we seem to have done more than foreground the adjuncts to make them the informational point of departure for what follows (cf 18.21). We have in addition skewed the relations of the adjunct in [1a] to make the hearer predisposed to interpret it as subject-related ('I searched the kitchen and found the letter there') whereas in [1] the predisposition was to interpret it as object-related ('I went into the kitchen and there was the letter').

A strictly analogous skewing between a presumed object-related interpretation and a presumed subject-related one occurs on moving the adjuncts from *E* to *I* in such sentences as the following:

{ She saw my brother in the garden.
[probably ~ 'My brother was in the garden']
In the garden, she saw my brother.
[probably ~ 'She was in the garden']
I heard a noise in the bathroom.
[probably ~ 'The noise was in the bathroom']
In the bathroom, I heard a noise.
[probably ~ 'I was in the bathroom']

Compare subject orientation of space adjuncts (8.49), of time adjuncts (8.76), of process adjuncts (8.78), and the subjuncts of 8.92. Cases of subject-object skewing are clearly analogous to complex transitivity (cf 16.43ff). Cf also:

We foresaw a disaster in June.

[probably ~ 'We foresaw that it was in June that there would be a disaster']

In June, we foresaw a disaster.

[probably ~ 'It was in June that we foresaw that there would be a disaster']

- 8.38 We have noted that sentence adjuncts are more peripheral to the structure of the sentence in which they function than are predication adjuncts. The relatively peripheral character is shown positionally in the fact both that sentence adjuncts will normally follow predication adjuncts at *E* and that they can more readily be placed at *I*:

She had lived in poverty [A_{pred.oblig}] for thirty years [A_{sentence}].

I had found the letter in the kitchen [A_{pred.opt}] by searching carefully [A_{sentence}].

For thirty years, she had lived in poverty.
By searching carefully, I had found the letter in the kitchen.

By contrast, the predication adjuncts in these examples could be placed at *I* only with a striking disruption of normal expectations.

But a further indication of the greater mobility of sentence adjuncts is that – in contrast to predication adjuncts – they can usually appear at *M* without giving any impression of radical word-order dislocation:

She had *for thirty years* lived in poverty.
 ?*She had *in poverty* lived for thirty years.
 I had *by searching carefully* found the letter in the kitchen.
 (?)I had – *in the kitchen* – found the letter *by searching carefully*.

Where sentence adjuncts are moved from *E*, however, their 'scene-setting' role for the sentence is often pointed by punctuation and is in speech regularly marked by terminating the adjunct with a tone-unit break:

For thirty YÉARS| she had lived in PÖverty|
 I HÄD| by searching CÄREfully| found the letter in the KItchen|

GRAMMATICAL REALIZATION OF SEMANTIC ROLES

Adjuncts of space

- 8.39 We saw in 8.2 that five semantic subroles were to be distinguished within the category of space. Where a verb (eg: *be, live, put*) takes an obligatory predication adjunct, this is in almost all cases concerned with POSITION or DIRECTION:

They are *on the Continent*. He kept it *in the safe*.
 She lives *in a cottage*. He put it *on(to) the table*.

When a spatial predication adjunct is optional, on the other hand, it is less likely to express position than DIRECTION (including GOAL and SOURCE):

The children were running very fast { *towards the park.*
 to the swings.
 from the school.

The DISTANCE relation is given two kinds of expression, SPECIFIC and GENERAL. The former is expressed solely by predication adjuncts, and these have only noun-phrase realization:

They ran *two miles* in ten minutes.
 We climbed *a further thousand feet* before dusk.

General distance can also be realized by noun phrases, in which case the adjuncts are again predicational:

We hurried *a few miles* and then rested.
 They had travelled *a long way* and were exhausted.

But prepositional phrases can also be used, and in this form the adjuncts can be predicational or sentential:

We hurried *for a few miles* and then rested.
For the next two miles, the road had a very poor surface, making speed impossible.

Distance phrases can be treated as singular despite their 'internal' plurality: 'another/a further two miles'. But cf Note.

Position and source adjuncts readily assume a sentential role, especially when there is a direction or goal adjunct in the same clause:

People move to a new house quite frequently *in America*.
 (cf: *In America*, people move to a new house quite frequently.)
 Mary went to Brussels *from London*.
 (cf: *From London*, Mary went to Brussels.
 ?*To Brussels, Mary went *from London*.)

To a limited extent, position adjuncts can be realized by noun phrases:

Which side of the street does she live? She lives *this side*.
Whichever district you live, try to do some walking every day.
 *We lived *this street* at one time.

Direction adjuncts involving a general reference item (especially *way*) are often realized as noun phrases introduced by *which, this, that*:

He went *that way*.
 Come *this way* please.
Which direction did she run?

Cf also (informal, esp AmE) 'My hair was blowing *every which way*' [ie 'in every direction'].

Note Noun phrases expressing specific distance are often treated as O_d rather than A , thus permitting passivization (cf 16.4ff, 16.27ff):

They ran *the distance* in record time. *The distance* was run in record time.
 There can be vacillation over concord: 'The remaining ten metres was/were completed in record time.'

Realization

- 8.40 Apart from the use of noun phrases for some predication adjuncts of distance (cf 8.39), space adjuncts are most commonly in the form of prepositional phrases, thus conveying with a given noun phrase (*the road, the house, the room, . . .*) the spatial discriminations set out in 9.16ff (*at, in, on, . . .*). Where the lexical form of the head noun is unimportant but where the location needs to be specified in detail, a postmodified noun phrase can be used, as in:

I saw Joan at the { *office* } { *at which* }
 place *where* } *her father works*.

But a head noun that is of little semantic weight (as *place* above) would more usually be omitted and the whole adjunct expressed with only the *where*-clause:

I saw Joan *where her father works*.

Clausal realization is especially convenient where the actual location is indefinite:

They must go $\left\{ \begin{array}{l} \text{where} \\ \text{wherever} \end{array} \right\}$ we send them.

So too with abbreviated clause forms:

Keep the keys $\left\{ \begin{array}{l} \text{where} \\ \text{wherever} \end{array} \right\}$ convenient.

Position in relation to animates (especially persons) may be expressed by prepositional phrases introduced by *with*:

A: Where is Mildred?

B: $\left\{ \begin{array}{l} \text{She is (staying) with her brother.} \\ \text{She is with the horse that was injured last week.} \\ \text{She is with the vet but I don't know exactly where.} \end{array} \right.$

Such answers to *where* are obviously relative to the position (known or unknown) of the entity mentioned; contrast 'She is *at her brother's*' (cf 5.124). In consequence, *with*-phrases establish little more than a conjunction with the person or animal named and they are often used as almost equivalent to conjoiners with *and*:

Mildred is with her brother, discussing the horse's injury.

Mildred, with her brother, is discussing the . . .

Mildred along with her brother is/are discussing the . . . [cf 10.40]

Mildred and her brother are discussing the . . .

- 8.41 But in addition to the spatial pro-forms, *here* and *there* (cf 7.67), there are numerous common adverbs realizing spatial relations. Some of the following are atrophied prepositional phrases (eg: *overseas*), some can themselves be used prepositionally as well as adverbially (cf 9.5). Most can be used for both position and direction:

aboard, about, above, abroad, across, ahead, aloft, alongside, anywhere, around, ashore, astern, away, back, behind, below, beneath, between, beyond, down, downhill, downstairs, downstream, downwind, east, eastward(s), and other directions with the suffix -ward (esp AmE), -wards (esp BrE), elsewhere, everywhere, far, here, hereabouts, home, in, indoors, inland, inshore, inside, locally, near, nearby, north, nowhere, off, offshore, on, opposite, out, outdoors, outside, overboard, overhead, overland, overseas, somewhere, south, there, thereabouts, through, throughout, under, underfoot, underground, underneath, up, uphill, upstairs, upstream, west, within

Some items denote direction but not position:

after, along, aside, before, by, downward(s), forward(s), inward(s), left, outward(s), over, past, right, round, sideways, skyward(s), upward(s)

Note [a] The compass points used for both position and direction can be compounded; eg: *northwest, east-northeast*.

[b] There are some nautical terms used for both position and direction that are normally part of a technical vocabulary, but are found in literature dealing with the sea; eg: *aft, larboard* (now rare), *port, starboard*.

[c] For *here, above*, and *below* as signals in discourse reference, cf 19.46f.

[d] Several of the closed-class adverbs listed here can be regarded as abbreviated prepositional phrases. Cf 'He looked *outside* (the house)'.

Cooccurrence restrictions

- 8.42 Direction adjuncts of both goal and source can normally be used only with verbs of motion or with other verbs used dynamically (cf 4.33ff) that allow a directional meaning:

I think you should now turn *left*. ['to the left']
He jumped *over the fence*.
He kicked the ball *into the goal*.
She was whispering softly *into the microphone*.
He came *from America* last week.
It jumped *out of the cage*.

With very general directions, however, we find cooccurrence even with verbs used statively:

They $\left\{ \begin{array}{l} \text{live} \\ \text{are living} \end{array} \right\}$ *to the south of us*.
My house faces $\left\{ \begin{array}{l} \text{toward(s)} \end{array} \right\}$ *the park*.
My car is facing $\left\{ \begin{array}{l} \text{toward(s)} \end{array} \right\}$ *the park*.
This road is *to the north*.
Our course was *due south*.

Some direction adjuncts can also be used with the copular verb BE when they have a resultative meaning, indicating the state of having reached the goal (cf 9.7, 9.46):

They are *past* by now. ['have gone past']
The men will be *along* soon. ['will have arrived']
We will soon be *over the border*. ['have crossed over the border']
I've never been *to London*. ['never visited London']

On the other hand, position and distance adjuncts can be used with all verbs, including those in stative use (cf 4.27ff):

stative $\left\{ \begin{array}{l} \text{I heard about it in London.} \\ \text{I have the key here.} \\ \text{He lives a long way from here.} \\ \text{The ground seems very soft locally.} \end{array} \right.$
dynamic $\left\{ \begin{array}{l} \text{They're staying in a nearby hotel.} \\ \text{Was she swimming near the boat?} \\ \text{He's travelling further this year.} \end{array} \right.$

Position adjuncts can also be used with the copular verb BE:

It's much warmer $\left\{ \begin{array}{l} \text{inland.} \\ \text{where we now live.} \end{array} \right.$

Indeed, they frequently occur as the obligatory element with BE clauses, though not with copular verbs other than BE:

The birthday party is *in the next room*.
 All our men are *abroad*.
 The meeting will be *upstairs*.
 The house you want is *on the other side of the street*.
 *They will become *in Paris*.

The progressive is of course excluded:

*Charles is being *in the next room*.

Contrast (cf 3.76):

Charles is being boisterous (*in the next room*).

Spatial adjuncts can equally be obligatory adjuncts with verbs other than BE:

We don't live *here*.
 I'll get *below*.
 You should set that dish *in the middle*.
 I'll put the kettle *on the stove*.
 They keep their car *further from the house* now.

Note [a] Informally, *seem* and *appear* permit spatial adjuncts as sole complementation, especially those relating to distance or with general rather than specific reference:

They seem *further away* now.
 ?The children *seem upstairs*, to judge from the noise.

Note that 'She seems *at home*' could be freely used but only in the sense 'at ease', without spatial reference.

[b] Figurative use of basically spatial items is of course common with time adjuncts (cf 8.51ff below). On the nonspatial use of adverbial particles, as in 'The light is *on*', 'The car blew *up*', 'Drink *up* your milk, darling', cf 16.2ff.

Potential ambiguity

8.43 Given that the same items can be used in quite different semantic roles with the same verbs, it is easy for ambiguity to arise. Cf:

Did you drive the car *near the police station*?
 The dog is not allowed to run *outside*.
 The baby was crawling *upstairs*.

Each of the italicized adjuncts could be intended or interpreted as either directional ['towards the police station', etc] or positional ['in the vicinity of the police station', etc]. In the former sense, the adjunct would be predicational, in the latter sentential and hence susceptible (in declarative sentences) of being placed at *I*, removing ambiguity; eg:

Outside, the dog is not allowed to run.

In speech, the sentential (*ie* positional) interpretation could also be conveyed prosodically, without moving the adjunct from *E*:

The dog is not allowed to RUN| outside|

As predicational adjunct, however, the ambiguity can be removed only by rephrasing; eg (assuming that this is appropriate in the context):

The dog is not allowed to run *out (into the garden)*.

Position and direction adjuncts in the same clause

8.44 Position and direction (or goal) adjuncts can cooccur, with the position adjunct normally following the other adjunct in *E*, for the reasons given in 8.39:

The children are running *around upstairs*.
 He fell *overboard near the shore*.

With two prepositional phrases, there is often a superficial ambiguity in the status of the second phrase, which might be either an adverbial of the clause or a postmodifier of the noun head in the first phrase:

Some of the children are walking *to the lake in the park*.
 ['They are walking to the lake and are walking in the park' or 'They are walking to the lake which is in the park']
 Middle-class people move *to a new house in the suburbs* every few years.
 ['They move to a new house every few years; they do this in the suburbs' or 'They move every few years to a new suburban house']

The position adjunct can be put in *I* position to avoid giving it end-focus (cf 18.3f): 'In the park, the children are feeding the ducks.' Where the final phrase is a positional sentence adjunct, we can avoid ambiguity by placing it at *I*:

In the park some of the children are walking *to the lake*.
In the suburbs, middle-class people move *to a new house* every few years.

Depending on the structure of the sentence, there are other ways of avoiding such ambiguities; eg:

Some of the children are *in the park* and are walking *to the lake*.

Hierarchical relationship

8.45 It often happens that two spatial adjuncts enter into a contextual relation of hierarchy. This can occur where both adjuncts are of the same semantic class but of different grammatical functions (the one being a sentence adjunct, the other a predication adjunct). For example, with two position adjuncts:

Many people eat *in restaurants in London*.

The order here satisfies both the grammatical requirement (that the sentence adjunct be more peripheral than the predication one) and the logical requirement (that the smaller location be stated before the larger in which it is placed). But if the sentence adjunct is expressed with an adverb indicating that it is relatively 'given' (cf 18.8ff), the order may be reversed:

Many people eat $\left\{ \begin{array}{l} \text{here} \\ \text{there} \end{array} \right\}$ *in restaurants*.

Just as on grammatical grounds, it can only be the sentence adjunct that can

appear at *I* ('*In London*, many people ...'), so also on logical grounds, the lower member in the hierarchy cannot dominate the higher:

**In restaurants*, many people eat *in London*.

Source adjuncts can also cooccur with goal or direction adjuncts in a hierarchical relationship:

We came *to London* *from Rome*.
We went *from Rome* *to London*.

These examples illustrate the normal order of the adjuncts, which is of course directly related to the semantics of the respective verbs, *come* (with orientation to goal) and *go* (with orientation to source, the point of departure). Nonetheless, in each case it is the source adjunct that alone is sentential and hence susceptible of positioning at *I*:

From Rome we {came
went} *to London*.

Unless overridden by the pressure of orientation (as with *come*), the two adjuncts will be ordered with respect to the sequence of events referred to (thus source before goal), but if one is relatively 'given' (cf 18.8) and therefore expressed by a closed-class adverb, this will normally precede the other adjunct. Compare:

They flew *over (the city)* *towards the border*.
They flew *west over the city*.

Coordination

- 8.46 Two adjuncts can be coordinated if they are of the same grammatical function and semantic class; eg position adjuncts:

Soldiers were on guard *inside* and *outside*.
We can wait for you *here* or *in the car*.

Equally with direction adjuncts:

They went *up the hill* and *towards the station*.
They ran *across the field* and *past the farmhouse*.

But a position and a direction or goal adjunct normally cannot be coordinated. Hence in:

The baby was crawling *upstairs* and *into his parents' bedroom*.

upstairs can be interpreted only as a direction adjunct (cf 8.43), since it is coordinated with a prepositional phrase that cannot have a positional function.

On the other hand, source and direction adjuncts admit coordination:

They were hurrying *from the capital* and *towards the border*.

But directional path and specific goal cannot normally be coordinated without an additional adverbial such as *on* or *eventually*:

We walked *up the hill* and so (on) *to the station*.

Contrast:

I drove *up Gower Street* and *into the College*.

Positions of space adjuncts

- 8.47 Irrespective of grammatical function or semantic role, space adjuncts favour *E*:

position	{ I'll meet you <i>downstairs</i> . We're eating <i>in the kitchen</i> . You'll find the sugar <i>where the coffee is</i> .
source	{ We moved the furniture <i>out of the room</i> . They travelled slowly <i>from Hong Kong</i> .
direction	{ I'll go <i>downstairs</i> . They shouldn't be going <i>south</i> .
goal	{ She hadn't yet moved <i>to Liverpool</i> . I'll go <i>downstairs to the kitchen</i> .
distance	{ By dawn, we had come <i>a long way</i> . Try to fly <i>the whole distance</i> .

Position adjuncts, particularly prepositional phrases, often appear in *I*. They may be put there to create a 'scene-setting' (cf 8.15), or to avoid end-focus (cf 18.11), or to avoid ambiguity (cf 8.43), or to avoid a clustering of adjuncts at *E*, though it is often impossible to isolate any one reason. Cf:

On the tree there were some very large oranges.
Outside children were jumping and skipping.
In the nursery the children were playing happily but noisily.
On the stage men were fighting, and *in the body of the hall* women were screaming.

The expressions *Here* ... BE and *There* ... BE with a personal pronoun as subject, and the verb in the simple present or (with *there*) past, are commonly used to draw attention to the presence of somebody or something:

Here it is, just where I left it.
There she is, by the phone box.
There they were, cold and miserable.

Source adjuncts can also be in *I* position and occasionally (though with more impression of disturbing the normal sequence of elements) in *M*:

From Liverpool, you can't often get international flights.
You could, *from Manchester*, get a plane to Amsterdam.

Speakers sometimes put position adjuncts in *M* and more rarely (and only with short items) in *iM*:

Life is *everywhere* so frustrating.
We are *here* enjoying a different kind of existence.
The poor had not *in this country* been left destitute.
As you proceed east along the side aisle, you *there* may notice a very curious statue.

Direction and goal adjuncts cannot usually be in *M*:

*They are $\left\{ \begin{array}{l} \text{(to) there} \\ \text{into the kitchen} \end{array} \right\}$ moving some new furniture.

But they can take the position between verb and object (*iE*), especially if the object phrase is long:

They moved *into the kitchen* every stick of furniture they possessed.

Occasionally, however, some direction adjuncts occupy *I*. As predication adjuncts, they have a dramatic impact and a rhetorical flavour in that position; normally the verb is in the simple present or simple past:

Down they flew.

Away he goes.

On they marched.

If the subject is not a personal pronoun but a noun (with therefore a greater information value) or indefinite pronoun, subject-verb inversion is normal when a predication adjunct is in *I* (cf 18.23). This applies to intransitive verbs (**In the doorway saw me my brother*) without auxiliaries (**Up the hill has been climbing my brother*). Examples:

Down flew the jets.

Away goes my chance of winning!

Ah, *here* comes somebody – at last!

Along the road rolled the wagons.

Over the bridge marched the soldiers.

Ahead sat an old man.

Below is a restaurant.

In the doorway stood my brother.

On the very top of the hill lives a hermit.

On the presence of *there* (as in: '*Below, there is a restaurant*'), cf 18.50.

Here ... BE and *There* ... BE with the verb in the simple present (or – with *there* – the past) are common in speech:

Here are the tools. ~ *Here* they are.

There's your brother, over by the bar. ~ *There* he is ...

I turned the corner and *there* were my parents! ~ ... *there* they were!

Direction adjuncts are put in *I* virtually only in literary English and in children's literature (stories, poems, and nursery rhymes). A few exceptions occur in informal speech, mainly with *go*, *come* and (more restrictedly) *get*; where the subject is *you*, such sentences often have imperative force:

$\left. \begin{array}{l} \text{Up (the hill)} \\ \text{Down (the stairs)} \\ \text{In (the bath)} \\ \text{Out (of the water)} \\ \text{Off (the table)} \\ \text{Over (the fence)} \\ \text{On (the horse)} \\ \text{Under (the bridge)} \end{array} \right\} \text{you} \left\{ \begin{array}{l} \text{come.} \\ \text{go.} \end{array} \right.$

$\left. \begin{array}{l} \text{On} \\ \text{Under} \\ \text{Round} \end{array} \right\} \text{you go. } \left. \begin{array}{l} \text{There they} \\ \text{go.} \\ \text{come.} \end{array} \right\} \text{Here } \left\{ \begin{array}{l} \text{I} \\ \text{we} \end{array} \right\} \text{go. Here he comes.}$

Note [a] Particles in phrasal verbs (cf 16.3ff) cannot be in *I*:

**Down* the car broke. **Up* cracked the soldier.

[b] There are some idiomatic expressions with *here* and *there*:

$\left\{ \begin{array}{l} \text{Here} \\ \text{There} \end{array} \right\} \text{you ARE [= 'This is for you']}$

HERE we ARE [= 'We've arrived at the expected goal']

$\left\{ \begin{array}{l} \text{Here} \\ \text{There} \end{array} \right\} \text{you ARE [= 'That supports or proves what I've said']}$

[c] For *here* as time indicator, cf 19.36. For the use of *here* in discourse reference, cf 19.47.

Syntactic features of space adjuncts

8.48 As predication adjuncts, direction and goal adverbials are normally the focus of negation in a negative sentence. They therefore normally do not precede clause negation:

Across the park he walked, hand in hand with his elder daughter.

but:

**Across the park* he didn't walk ...

**Towards the fort* the soldiers did not march.

On the other hand, as sentence adjuncts, those of position can readily precede clausal negation:

Indoors, we could not hear ourselves speak.

Nearby, the farmyard animals hadn't even begun to stir.

Most space adjuncts, including prepositional phrases, accept intensification (cf 7.87ff, 9.5); this can involve combining measure indicators with adverbials in other semantic roles:

They drove (*due*) east.

They climbed (*straight*) to the top.

He went (*right*) into the house.

She was sitting (*right*) at the door.

He turned (*sharp*) left.

He went (*a long way*) up (*the mountain*).

They are staying (*far*) inland.

A type of clause comparison can be achieved by the use of $\left\{ \begin{array}{l} \text{further} \\ \text{farther} \end{array} \right\} \dots \text{than}$:

They are $\left\{ \begin{array}{l} \text{further} \\ \text{farther} \end{array} \right\} \left\{ \begin{array}{l} \text{ahead} \\ \text{downstream} \end{array} \right\} \text{than we are.}$

He went $\left\{ \begin{array}{l} \text{further} \\ \text{farther} \end{array} \right\} \left\{ \begin{array}{l} \text{up the mountain} \\ \text{through the wood} \end{array} \right\} \text{than I did.}$

Many space adjuncts accept questioning with *How far*:

How far $\left\{ \begin{array}{l} \text{across} \\ \text{away} \end{array} \right\}$ are they?

while *here* and *there* accept questioning with *How near* instead:

How near { *here*
 to us } are they?

The following are among the space adverbs that do not allow premodification by *far*:

here, there; the compounds in *-where*; *about, around, between, hereabouts, locally, opposite, throughout*

But *cf* the common expression *few and far between*, meaning 'rare': 'Trains on a Sunday are few and far between.'

Note Two space adjuncts are inflected for comparison, *near* (*nearer, -est*) and *far* (*further, -est, farther, -est*), and can be the focus of clause comparison. These can be premodified by *very* and by other premodifiers of degree. (But ?**very nearby*.)

Position adjuncts in relation to subject and object

8.49 Position adjuncts normally indicate the place of the referent of the subject and (if there is one) of the object; usually the place is the same for both referents:

I met John *on a bus*. [This implies that John and I were on the bus]

But sometimes the places can be different, as we saw in 8.37; in such cases, the adjunct is predicational:

I saw John *on a bus*. [This implies that John was on the bus but it does not imply equally that I was on the bus]

With certain verbs, the reference of an adjunct in *E* or *iE* is always to the place of the object, and normally that will differ from the place of the subject (*cf* 8.75 Note [a] for an analogous point with time adjuncts). These verbs denote 'owning' or 'placing':

I { *have*
 keep
 put
 park
 shelter } my car *in a garage*.

With certain verbs, position adjuncts are resultative and are like object-related adjuncts (resembling indeed complex-transitive complementation; *cf* 16.43ff):

I want my car [O] *in the garage* [A]. [*Cf* 'My car will be *in the garage*']
I expect a leak [O] *in that pipe* [A]. [*Cf* 'A leak may occur *in that pipe*']

The verbs are verbs of arranging, saying, expecting, or wanting, where the predication has future reference. Not all such constructions allow an expansion simply by *BE*, but they usually have an analogue with a *that*-clause:

I expected a riot [O] *in the city* [A]. ['there to be a riot *in the city*']
They are threatening a riot [O] *somewhere* [A]. ['that there will be a riot *somewhere*']

He suggested a picnic [O] *on the island* [A]. ['that a picnic be arranged *on the island*']

They are planning a meeting [O] *at my house* [A]. ['that a meeting should be held *at my house*']

In some cases, another verb (such as *have*) rather than *BE* may be implied (as in the last example above: 'planning to hold a meeting'). *Cf*:

They offered a barbecue [O] *nearby* [A]. ['to have a barbecue *nearby*']
I like my dinner [O] *in the kitchen* [A]. ['to have my dinner *in the kitchen*']
She enjoys tea [O] *on the lawn* [A]. ['having tea . . .']
The doctor advised a few days [O] *off work* [A]. ['advised taking . . .']

In all such cases, the position adjunct is restricted to *E* and can sometimes be interpreted as a noun-phrase postmodifier:

He suggested a picnic *on the island*. ~ A picnic *on the island* was suggested.

The position adjunct may sometimes refer to the object in a contingency relationship:

We ought to condemn such activities [O] *here* [A].
I only like barbecues [O] *by the sea* [A]. [≠ 'By the sea, I only like barbecues'; *cf* 8.117]

These can be paraphrased by clauses with *if* or *when*: *such activities if they take place here; barbecues when they are held outdoors*. These adjuncts are also restricted to *E*, and again they can be interpreted as part of a noun phrase ('*Such activities here* ought to be condemned').

If any such adjunct is intended to be sentential, it has to be in *I* for the distinction to be clear:

At my house, they are planning a meeting.
Here we ought to condemn such activities.

Direction adjuncts as commands

8.50 Certain direction adjuncts can be used as brusque or very familiar directives, with an implied verb of motion (*cf* 11.42):

Waterloo, please. [for 'Drive me to Waterloo, please'], *Out(side)!*, *In(side)!*, *(Over) Here!*, *(Over) There!*, *(Right) Back!*, *Down!*, *Off!*, *Up!*, *Under!*, *Left!*, *Right!*, *Away with him!* ['Take him away'], *Upstairs with you!* ['Go upstairs'], *Out with it!* ['Tell me about it'], *Out of the house!*, *To bed!*

Note [a] Some other adjuncts can also be used as directives, *eg*: *Quickly!*, *Slowly!*, *Carefully!*
[b] Expressions like *Well*, *we'll to bed* and *I must away* are sometimes used in BrE with an implied verb of motion ('I must go away'); they have an archaic or dialectal flavour. But the following is wholly current:

After being treated at the hospital for shock, Mr Toyota was allowed *home*.
The adverbial here is equivalent to *to go home*; in the active, the verb of motion would be explicit:

They allowed Mr Toyota { *to go home*.
 ?home.

Adjuncts of time

- 8.51 Obligatory predication adjuncts of time occur in BE clauses where the subject refers to an event (cf 10.10, 10.25):

The wedding was *on Thursday*.
The concert is *from seven till nine*.
Guided tours are *twice a day*.

Just as *live* in the sense 'reside' has an obligatory space adjunct, so in the sense 'be alive' it has an obligatory time adjunct:

Chaucer lived *in the fourteenth century*.

Verbs such as *last* take obligatory time adjuncts of duration:

The concert lasts *two hours*.
My mother-in-law is staying *for three weeks*.

Time adjuncts are readily predicationals when a verb lacks other complementation:

The guests arrived *in the early evening*.
I waited *till 4.30*.
She is coming *this afternoon*.

But when there is alternative complementation, most types of time adjunct just as readily assume a sentential function:

I waited patiently enough for an interview *till 4.30*.
Till 4.30, I waited patiently enough for an interview.
She is coming for a tutorial *this afternoon*.

In many cases, moving a sentential adjunct from *E* to *I* has no effect on interpreting the scope of negation:

She isn't coming for a tutorial <i>this afternoon</i> .	[1]
<i>This afternoon</i> , she isn't coming for a tutorial.	[1a]
We didn't speak to each other { <i>during the entire afternoon</i> . <i>the whole day</i> . }	[2]
{ <i>During the entire afternoon</i> , <i>The whole day</i> , } we didn't speak to each other.	[2a]

Realization

- 8.52 No other type of adjunct has such a wide range of grammatical realizations available as has the adjunct of time. Especially notable is the use of noun phrases and prepositional phrases. The noun phrase occurs for position, duration, and frequency:

We were in France *last year*.
They lived (*for*) *several years* in Italy.
She writes an article or a review *every month*.

The conditions for noun-phrase realization, however, vary according to the semantic type. So far as time position is concerned, the noun phrases frequently have determiners:

She met him	{ <i>that afternoon</i> . <i>the following afternoon</i> . * <i>the afternoon</i> . <i>in the afternoon</i> .
They put on the play	{ <i>last month</i> . <i>a month ago</i> . ?* <i>a month I well remember</i> .

What time did he get there?

It is to be noted that, although a preposition can sometimes be inserted ('*At what time* did he get there?'), it often cannot; this is especially so before *next* or *last*. Compare:

We hoped to see Veronica	{ <i>on Monday</i> . <i>Monday</i> . <AmE> <i>next Monday</i> . <i>last Monday</i> . <i>on the following Monday</i> . * <i>on next</i> /* <i>on last Monday</i> . <i>on Monday next/last</i> .
--------------------------	--

A pinpointed time position cannot usually be realized by a noun phrase:

He arrived this morning *at ten-fifteen*.

But the prepositions are sometimes omitted, especially in AmE or informally:

?He arrived *ten-fifteen*.

It would seem that noun-phrase realizations typically imply a span and correspond to adjuncts introduced by *on*, *in the course of*, or *during*. Indeed it is with duration adjuncts that we have greatest freedom to use noun phrases, though for the most part they can be regarded as abbreviated prepositional phrases and can be made more explicit and rather more formal by the introduction of *for*:

They stayed (*for*) *a while*.
They lived (*for*) *several years* in Italy.

With or without *for*, time units can be postposed by *round* (with years) or *through*, especially when the reference is habitual:

The Stewarts now stay in Italy	{ <i>the whole summer through</i> . <i>the whole winter long</i> . <i>the whole year round</i> . <i>all the year round</i> .
--------------------------------	---

Without a numeral or other quantifier, the *for* can often not be omitted:

?*He put up *the night* at a hotel.

But:

He stayed *the night* (at a hotel).

['He put up *that night* at a hotel' has a time position adjunct]

Nor can the prepositionless adjunct comfortably occur in *I*:

?*Some time*,
For *some time*, } he waited anxiously at the hospital.

[In '*Which afternoon* did he wait patiently?' the adjunct refers to time position]

As frequency adjuncts, noun phrases are virtually limited to 'every/each + N', where N is a unit of time (*hour, day, year*, etc), or 'X + times' where X is a quantifier or numeral (*several, four*, etc):

He takes risks { *every day*.
**in every day*.
**on every day*.
(*in*) *every period*.
(*in*) *every lecture*.
(*in*) *every game*.

She visited me { *four times*.
**on four times*.
?**four occasions*.
on four occasions.

Note also the use of plurals without determiner:

She went to the theatre { *Saturdays*. [= 'every Saturday']
?*Saturday*. <BrE> }
Saturday. <AmE> } [= 'on Saturday']

They work *nights/days*. [= 'they do night work/day work']

They worked *days* on the production before they were satisfied.
[= 'for several days']

- 8.53 As implied in discussing the limitations on noun-phrase realizations, time adjuncts much more usually take the form of prepositional phrases. The prepositions concerned have the values described in 9.33ff, and these are flexible and various enough to express all the semantic roles set out in 8.4. For example:

Time position: He visited her { *on Monday*.
in the evening.
at night.

Forward span: She is staying *till Thursday*.

Backward span: The house has been empty *since the war*.

Duration: They worked steadily *for two hours*.

Frequency: There are no lectures *on Saturdays*.

Relationship: He practises the piano *at every opportunity*.

I had confidence in her *up to that time*.

It should be noted, however, that this last semantic role is only inadequately expressed by prepositional phrases (cf 8.72 below).

Several of the prepositions used in the above examples can also function as conjunctions. We thus have a range of finite and nonfinite clause realizations of time adjuncts (cf 14.14):

She is staying *till she feels better*.

The house has been empty *since the war ended*.

The wall has been like this *since being damaged by a bomb*.

Above all, there are *when*-clauses. These express time position, as in:

I bought the car *when I received my first salary*.

but also other relations, such as duration:

She can write only *when the baby is asleep*. [= 'while...']

Indefinite frequency is commonly realized by clauses introduced by *when(ever)*:

They come here *when(ever) they feel like it*.

Do your breathing exercises *when(ever) possible*.

Vaguer expression of time relation is often achieved by conjunctionless nonfinite and verbless clauses:

Travelling on the Continent, I get the impression of a greater affluence there. [frequency, 'whenever']

Travelling home last night, I suddenly had a bright idea.

[position, 'when'; or duration, 'while']

I eventually had a chance to read her letter, *quietly alone at last*.
[position, 'when']

- 8.54 But the shortest and frequently the most convenient realization of time adjuncts is the adverb. There is a wide range of these items, formally falling into two classes, closed-class adverbs and open-class adverbs. Semantically, the closed-class items can be subdivided into three sets. There are those like *then, before, since* which are essentially anaphoric, referring to a time contextually 'given' ('at that time', 'before that time', 'since that time'). Then there are those like *now, today, tomorrow, yesterday* that refer to very specific points of time. Finally there are those like *often, always, seldom* which are general and conveniently vague in their reference.

By contrast, the open-class adverbs are lexically specific and therefore idiosyncratic. They are for the most part *-ly* formations on adjective bases (*subsequently, eventually, immediately*, etc) or *-to* to express frequency – on noun bases (*hourly, monthly*, etc). Cf App I.41.

We shall look at some of the commoner adverbs used as time adjuncts as we examine the expression of each major semantic role in turn.

Time-position adjuncts

- 8.55 Just as position in space may be as narrowly located as a pinpoint or as broadly as a continent, so position in time may be equally variable, and, in the case of prepositional-phrase adjuncts, the preposition's quasi-figurative

use helps to distinguish the narrowness or broadness of the time 'location' (cf 9.34ff):

She arrived *at nine-fifteen*. He lived *in the fourteenth century*.

In these two examples, of course, the verbs also endorse the narrowness and broadness respectively. But a time position adjunct may be broad yet cooccur with a verb that rules out a broad time span:

He was born *in the fourteenth century*.
She arrived *on Monday*.

The adjuncts here refer to a span of time within which, at some *point* of time, the events took place.

But whether narrow or broad, position adjuncts typically serve as a response to a potential *when* question (and they can be referred to as 'time-when' adjuncts):

A: When did she arrive? B: { *Quite recently*.
Last night.
At five o'clock.
While you were at the library.

When in its various uses (cf 7.53) is in effect partly a pro-form for the time adjuncts in this class. For *then* as a pro-form for these time adjuncts, cf 19.55. Note that *now* can also be used with reference to the past:

They had been courting for two years and he *now* felt she knew his worst faults.

Time-position adjuncts can be divided into two sets, largely determined by two modes of orientation (cf 4.18ff):

- (a) those denoting a point or period of time, especially 'before';
- (b) those which in addition imply attention to another period of time, especially 'after'.

Though the distinction is often negligible, it helps to explain cooccurrence as in 'She went there *again* (a) *afterwards* (b)'.

Common adverbs realizing adjuncts in these two groups include:

Group (a):

again ['on a subsequent occasion'], *early* ['at an early time'], *late* ['at a late time'], *now* ['at this time'], *sometime* ['at an unspecified time'], *nowadays* ['at the present time'], *presently* ['at the present time' (esp AmE)], *simultaneously* ['at the same time'], *immediately*, *instantly*, *then* ['at that time']; *today*, *tomorrow*, *tonight*, *yesterday*.

For example:

They lived in London for the first few years of their marriage and were *then* very happy.
Come and see us *again*.
I was in New York *last year* and am *now* living in Baltimore.
Frank *immediately* hurried away to find a doctor.
Nowadays, Patricia cycles to work.

Does he want us to be here *early tonight*?

The meeting starts *tomorrow at eight o'clock*, *after we've had dinner*.

I was awarded my Bachelor of Arts degree *in 1980*.

I suggest that we see him *tomorrow night* or at the very latest *on Sunday*.

I'll tell you all the news *when I get back home*.

Note that the *when*-clause in:

Tell me *when you're ready*.

may be a noun-clause object or a time adjunct, the latter equivalent to:

Tell me *as soon as you're ready*.

By contrast, the *when*-clause in:

Tell me *when you'll be ready*.

can only be object ['Tell me *the time at which you'll be ready*'].

Group (b):

afterwards, *before*, *earlier* ['before'], *eventually* ['in the end'], *finally* ['in the end'], *first* ['before all else', 'before that', 'at first'], *formerly*, *initially* ['in the beginning', 'at first'], *last* ['after all else', 'in the end'], *late* ['a short time ago'], *later* ['afterwards'], *momentarily* ['in a moment' (AmE)], *next* ['after that'], *once* ['at some time in the past'], *originally* ['in the beginning', 'at first'], *previously* ['before'], *presently* ['soon'], *recently* ['a short time ago'], *shortly* ['soon'], *since* ['after that'], *soon*, *subsequently*, *then* ['after that'].

For example:

He's going to the barber but will be back here *later*.

I went into my room and *soon afterwards* started to work.

I haven't got any time at the moment but I'll see you *shortly*.

She *once* owned a dog.

Take a hot drink and *then* go to bed.

Originally, that building was a school.

He *recently* had an accident.

A preliminary investigation seemed to indicate that he was implicated in the fraud, but a fuller investigation has *since* proved beyond all doubt that he was innocent.

I left the factory *before the strike*.

Will you be there *after lunch*?

He owed me a lot of money and wouldn't pay me back until I got my lawyer to write to him. He has paid me back in full *since then*.

The appointment was made *a month ago*.

I wrote to him about it *a (good) while back*. } (cf 9.35, 9.66)

She left him *after he struck her*.

The Prime Minister announced her resignation *before the votes were counted fully*.

There is a difference in the use of *once* according as the meaning is [1] 'on one single occasion' or [2] 'at a certain but unspecified time in the past'. Thus:

- I *once* bought a fur hat. (*I *once* bought this fur hat) [1]
 I *once* visited this city. [2]

If the reference is future, *sometime* is used instead of *once*:

- I'll buy a fur hat *sometime*. [1a]
 I'll visit this city (again) *sometime*. [2a]

The prepositional-phrase variant, *at some time*, is less vague and suggests a particular occasion; here *some 'time* (two words) is a noun phrase, in contrast to the adverb *'sometime* (**at 'sometime*) which is written and accented as a single word.

Most time-position adjuncts in Group (a) normally occur at *E*, but (as sentence adjuncts) *nowadays* and *presently* commonly occur at *I*; and *immediately* is common at *M*. Those in Group (b) commonly occur at *I* or *M*. The *iM* position is open to most of Group (b) and to *now*, *nowadays*, and *then* in Group (a).

Note [a] *Earlier* (*on*) and *later* (*on*) are synonymous with *before* (*that*), *beforehand*, and *after* (*that*), *afterwards* respectively:

He remembered the many insults that he had *earlier* experienced.
 He handed in his resignation, and *later* (*on*) regretted his hasty action.
 They are not the comparatives of *early* and *late* respectively and we cannot substitute (*more*) *early* and (*more*) *late* for them:

*He remembered the many insults that he had (*more*) *early* experienced.
 *He handed in his resignation and (*more*) *late* regretted his hasty action.
 The true comparatives of *early* and *late* (but only with *-er* forms) are exemplified in:

We are eating $\left\{ \begin{array}{l} \text{late} \\ \text{later} \end{array} \right\}$ today. Today we'll be leaving home $\left\{ \begin{array}{l} \text{early} \\ \text{earlier} \end{array} \right\}$.

[b] *Presently* is synonymous with *soon*, in *a short time* where there is a modal auxiliary or (for some) when the verb is in the past:

They $\left\{ \begin{array}{l} \text{will presently call on him. [= 'in a short time from now'] \\ \text{presently called on him. [= 'in a short time from then']} \end{array} \right\}$

Some find the latter use of *presently* unacceptable. On the other hand, when the verb is in the present, it is synonymous with *at present* and occurs especially in AmE:

They $\left\{ \begin{array}{l} \text{are presently in London.} \\ \text{are presently calling on him.} \end{array} \right\}$

[c] *After*, *before*, and *since* are prepositions (cf 9.38) and conjunctions (cf 14.12) as well as adverbs. When used as adverbs, they could be regarded as prepositions in abbreviated prepositional phrases, though *after* as an adverb is not as common as its synonym *afterwards*, which cannot function as a preposition:

A preliminary investigation seemed to indicate . . . , but a fuller investigation has *since* (*that time*) proved . . .

He has been unhappy for a long time, but I've never seen him so unhappy *before* (*this time*).
 The meeting is at six. I'm leaving now, but I'll see you *after* (*the meeting*) *afterwards*.

[d] Some adjuncts seem to be a blend of time position with manner, reason, or space (cf 8.81):
 He told them *secretly* of his intention to resign. ['in a covert manner', 'when they were by themselves']

They criticized him *publicly*. ['in a public place', 'when they were in public']

(In 'Mary hid it *secretly*' the adverb may connote both 'in a secret manner' and 'in a secret place').

They visited him *on their way to the country*. ['where they were going', 'when they were going']

As soon as the light went off, $\left\{ \begin{array}{l} \text{he sounded the alarm. ['Because . . . he immediately . . .'] \\ \text{When the light didn't go off,} \end{array} \right\}$

[e] For the use of many Group (b) adjuncts for time relationship, cf 8.72; on their correlative use as conjuncts, cf 8.145.

[f] Time position in the future can be expressed as in [3] by prepositional phrases introduced by *for*, or as in [4] by clauses or prepositional phrases introduced by *until* or *till* (cf 8.58); for example:

- We have invited her *for 8 p.m.* [3]
 She will not leave $\left\{ \begin{array}{l} \text{until 8 p.m.} \\ \text{till her brother gets there.} \end{array} \right\}$ [4]

8.56 Time-position adjuncts can be in a hierarchical relationship:

- They were here *late* [*A*₁] *last night* [*A*₂].
 I'll see you *at nine* [*A*₁] *on Monday* [*A*₂].
 I spoke to her *earlier* [*A*₁] *today* [*A*₂].
 We'll meet *tonight* [*A*₁] *after the show* [*A*₂].

The order of the adjuncts at *E* depends in part on information focus (cf 18.9ff), but the tendency is for the superordinate adjunct (the one denoting the more extended period) to come last. However, as in the last example above, the order may be reversed if the other adjunct is longer, nonetheless preserving the essential partitive relation between the two. Compare also:

- I was in New York *last year* [*A*₁] *before the first snow fell* [*A*₂].
 They became drunk *today* [*A*₁] *within a very short time* [*A*₂].

So far, however, we have looked at hierarchically related adjuncts which are both predication adjuncts. If the superordinate item is a sentence adjunct, it can appear in *I*, and the relation is no longer so essentially partitive, as can be seen from the parenthesized additions in the following:

- Last night* they were here *late* (again).
On Monday I'll see you *at nine* (as usual).

Adjuncts of span and duration

- 8.57 In contrast to the adjuncts which relate to time conceived as a fixed point or static span, there are three types of adjunct which relate to time as a linear dimension (cf 4.2ff, 4.23). Two of these have an orientation to the speaker's 'now' (that is, the time of primary concern to the speaker/writer within a given context), the one referring to a span in the past, the other to one in the future:

Fig 8.57

Thirdly, there are the adjuncts of more general temporal measure, requiring no orientation to a particular 'now'. In view of the similarity of purpose, it is not surprising that some of the same forms serve for all three types of adjunct.

Forward span

- 8.58 The key items in realizing adjuncts of forward span are *until* and *till* introducing either clauses or prepositional phrases. In the Survey of English

I shall be in Chicago { *all (next) week.*
the whole month.
(part of) next year.

Consider, finally, the following dispositions of forward-span reference, taking the 'now' of speaker's concern as 6 o'clock:

I'm *not* ready *yet*; the work will take me { *another half hour.*
till 6.30.

I think I'll be ready *by 6.30.*

I won't keep you waiting *beyond 6.30.*

Note [a] Forward-span adjuncts can be evoked by means of questions with *Until when . . .*, *Till when . . .*, *How long . . . (for)*. Postposition of *till* is awkward and of *until* almost unacceptable:
 ?When are you working *till*? ?*When are you working *until*?

[b] Noun phrases can be ambiguous between time position and forward span:

He'll be staying here *next month*. [EITHER 'he will arrive *next month* and stay for an unspecified time' OR 'he will be staying here *for the whole of next month*']

That is, the adjunct could be forward span but would normally be interpreted as time position. On the other hand, the prepositional-phrase variant can refer only to forward span:

He'll be staying here *for the next month*.

But phrases with *during* are ambiguous within the forward span itself:

He'll be staying here *during the next month*.

The adjunct here could either mean 'for some period falling within the month' or 'for the whole of the month'.

[c] For forward span, there are nonfinite -ed clauses with *until* and *till*, but not -ing clauses:

I shall stay here *until ordered to move*.

?I shall stay here *until getting further instructions*.

Cf also the idioms *until further notice* [= 'until you hear further'], where *notice* cannot be replaced by (for example) *information*; and *in future* [KBrE] 'from now onwards', as opposed to *in the future* which as well as being available for span [= 'in future'] is more usually used for time position ['at some time in the future'].

Backward span

8.60 The key item in realizing adjuncts of backward span is *since* introducing either a prepositional phrase or a clause, or used alone as an adverbial (by ellipsis):

She has not lived in America *since her graduation from high school*.

She has been trying to make a living as a writer *since her first novel was published*.

I spent some time in the National Gallery last year but I haven't been there *since*.

In the Survey of English Usage corpus, instances as conjunction (excluding causal use) and as preposition are roughly equal in number, but adverbial use accounts for only about 15 per cent of occurrences.

Backward span is elicited by such questions as *How long have you . . .*, *How long is it since you . . .*, *When . . .*, or *Since when . . .* (not **When . . . since*: cf 8.59 Note [a]). For example:

A: { *When* did you start giving the orders?
Since when have you been giving the orders?

B: *Since I was made foreman.*

Regularly with perfective aspect in the clause of which the *since*-element is A, the span indicated by the adjunct reaches up to the 'now' of primary concern to the speaker (which may of course be 'then' if it is a past time that is of primary concern):

He has worked in the same office *since (he came here) in 1980*.

Fig 8.60a

When I came to know him in 1982, he had worked in the same office *since 1980*.

Fig 8.60b

The speaker can show that he thinks the span is long by using the intensifier *ever*: 'worked there *ever* since 1980', '... *ever* since he came here'.

Both *since*- and *for*-adjuncts specify a span of time, but *since* marks in addition the starting point. If the clause with a *for*-adjunct has its verb in the perfective, the span extends to the 'now', and the hearer is able to count back and calculate the initial point in the span:

He has worked in the same office *for two years*.

But, unlike adjuncts with *since* (cf 8.61), *for*-adjuncts do not require the perfective in the clause in which they function as A, and the time span may therefore be 'unlocated' in the past, the hearer knowing only that the span does not extend to 'now':

Mary was writing that play *for three years*.

Fig 8.60c

Such backward-span adjuncts can be expressed without *for* if they are placed not at E but at eM and if the verb has progressive form:

Mary was *three years* writing that play.

Mary has been *three years* writing that play.

*He has *two years* worked in the same office.

Note [a] Noun phrases of the form *this/these + last/past + N* can express backward span:
 A: How long have you worked here?

B: { *This past year.*
Only this last month.
This/These past three years.

Without *past* or *last* such quantified noun phrases are somewhat archaic:

He has worked on the play *these two years*.

[b] A noun phrase that would indicate time position with past or perfective will indicate backward span with the progressive (cf 4.25ff):

I visited my mother *this morning*. [position]
 I have visited my mother *this morning*. [position]
 I have been visiting my mother *this morning*. [span]

- 8.61 The time span indicated by *during*-, *since*- and *while*-adjuncts may correspond either to a continuous state or activity, as in:

He has been sleeping *since two o'clock*.

Fig 8.61a

or to a period within which one or more discrete actions took place, as in:

She has got married *since you saw her in June*.

Fig 8.61b

Within the adjunct too it is possible to be specifying a continuous activity through the time span, as in:

Since they have lived in London, they have been increasingly happy. [= 'during that time'] [1]

Alternatively, we may refer to a period dating from a discrete event, as in:

Since they went to live in London, they have been increasingly happy. [= 'from that point in time'] [2]

There is thus a contrast between [1] and [3]:

Since they lived in London, they have been increasingly happy. [3]

This is because, while the span involved is the same, [1] defines their living in London as coterminous with that span (*ie* as still being true 'now', which is as far as the speaker can commit himself), but [3] makes no claim on how long they lived in London beyond the entailment that they no longer live there 'now':

Fig 8.61c

On the other hand, if the verb in the *since* clause is not one of continuous activity (like *live*), a nonperfective carries no such entailment as [3]. Consider the following set:

He's been getting bad headaches { *since he has been in the army.* [4]
since he joined the army. [5]
since he was in the army. [6]

In [4] he must still be in the army 'now'; in [6] he cannot be still in the army; in [5] he may or may not be still in the army.

Note [a] Adjuncts with *since* are to be viewed as prepositional phrases with nonfinite *-ing* clauses as complement (cf 8.59 Note [c], 14.20):

He's been getting bad headaches { *since having been in the army.* [4a]
since joining the army. [5a]
since being in the army. [6a]

In [4a], an unusual form, it would be implied that he was no longer in the army: contrast [4]. In [5a], it would be implied that he was still in the army: contrast [5]. In [6a], he might or might not be still in the army: contrast [6]. It should be noted that (despite its form) *having been* in [4a] is not an expression of aspect but of tense, *-ing* + *-ed* being the only means of expressing past with nonfinites (cf 4.55, 4.66). We therefore expect the *since*-clause in [4a] to mean 'Since he *was* in the army'. With nonfinite *-ed* clauses, the rare instances of *since*-adverbials would be causal, not temporal: 'I will not, *since so bitterly criticized*, continue in office any longer' (cf 8.124). Note that in 'The minister, *since returned*, has refused to comment', *since* is an adverb used here as a time adjunct in the nonfinite clause: 'who has returned *since*', *ie* 'subsequently'.

[b] Apparent exceptions to the requirement of a perfective verb occur when a phrase or clause introduced by *since* correlates with a superlative or ordinal:

Yesterday was the hottest day *since* I came to live here.

Joan came to work in her car last week for (only) the second time *since* October.

Such *since*-constructions are best regarded as postmodifications in noun-phrase structure and not as adjuncts. More substantial exceptions occur in AmE, especially where the clause in which the *since*-adjunct operates refers to the present; and increasingly, these exceptions apply to BrE as well (cf 14.26):

It is ages *since* she was (last) here. [NB '... *since* she's been here', '... **since* she's been last here']

It is a long time *since* I saw him.

Since the accident { *she walks* with a limp.
she can no longer be left alone.

I'm doing well *since* I bought those oil shares.

Things *are* much worse *since* you left.

Since I came to college, I *realize* how little I knew.

But in AmE we also have:

Since I last saw you, my mother *died*.

Since when *did* you own a word processor?

I *was* here *since* before 8 a.m.

[c] Indefinite or long backward span can be expressed by *for* ages or (esp AmE) *in* ages:

She hasn't been here { *for*
in } ages.

- 8.62 Other adverbials for indicating backward span include *up to* (date or time), *till/until* (date or time), *so far*, *subsequently*, *recently*, *lately*, *in all* (N's) *life*, *from*, correlatively *from* (time) ... *to* (time), *before*. For example:

I worked in America $\left\{ \begin{array}{l} \text{up to 1979.} \\ \text{till/until 1979.} \end{array} \right.$

She has not finished her novel *so far*.

We moved to Chicago in 1980 and have lived there *subsequently*.

I have not been sleeping well $\left\{ \begin{array}{l} \text{recently.} \\ \text{lately.} \end{array} \right.$

He hadn't seen such a disaster *in all his life*.

He taught at Yale *from 1975*.

[contrast 'He has taught ... *since* ...']

They were on vacation $\left\{ \begin{array}{l} \text{from June to September.} \\ \text{from June through September.} \end{array} \right.$ [$\langle \text{AmE} \rangle$ cf 8.59]

I have never written a play *before*.

Adverbs such as *subsequently*, *recently*, *lately* would of course refer to time position if the V-element were not marked for perfective aspect. The same is true for *before*, though informally (and especially in AmE) this item can express backward span with the simple past in nonassertive clauses:

She never kissed a man *before*. Did you (ever) see her *before*?

In nonassertive clauses also, we have (*for*) *long* expressing backward span:

How long did you work there? They didn't wait (*for*) *long*.

Cf also forward span:

These shoes probably won't last $\left\{ \begin{array}{l} \text{long.} \\ \text{for long.} \end{array} \right.$

Duration

- 8.63 Just as several of the items discussed in 8.58ff can be used for both forward and backward span, so several of them can also be used to express measures of time that are not specifically confined to future or past. For example:

She writes *for an hour* every day.

It takes me *only ten minutes* to clean my car.

They spend *ages* just sitting in the garden.

Toshiko works *far into the night* at her thesis.

I have some time off *during the week*.

Certain adverbs are used for general measures of time: for example, *always*, *briefly*, *indefinitely*, *momentarily* ['for a moment'], *permanently*, *temporarily*. When used with the present perfective, the otherwise time-position adverbs *lately* and *recently* are used for duration:

His visits used to be rare, but $\left\{ \begin{array}{l} \text{lately} \\ \text{recently} \end{array} \right.$ he has been here quite a lot.

Time-duration adjuncts are sometimes elicited by questions with *How*

long ... and are normally placed at *E* or *iE*. Single-word adverb realizations, however, would be unusual at *E* and are commonly at *M*:

She is *temporarily* working in a different building.

- Note [a] With some verbs, noun phrases as expressions of time duration can be treated as direct objects (cf 8.39 Note). For example:

The committee $\left\{ \begin{array}{l} \text{took (up)} \\ \text{spent} \end{array} \right.$ *an hour* on mere preliminaries.

An hour was $\left\{ \begin{array}{l} \text{taken (up)} \\ \text{spent} \end{array} \right.$ on mere preliminaries.

- [b] In expressions of duration, the intensified prepositional sequences *all through*, *all round* (but not the synonymous *right through*, *right round*) can be discontinuous:

He now sleeps *all night through*. [= 'right through the night']

She works there *all year round*. [= 'right round the year']

Cf also *all* (day etc) *long*; in BrE, *the* may precede the time noun: *all the day long*, *all the night through*, etc.

- [c] Uninflected and unmodified *long* is normally a nonassertive form and positioned at *E*; this applies also to *very long*. Thus:

?The monsoon lasts *long*. [cf The monsoon lasts *a long time*]

The monsoon doesn't last *long*.

Does the monsoon last *long*?

?The journey took *very long*. [cf The journey took *a very long time*]

When inflected or modified other than by *very*, the item *long* can be either nonassertive or assertive and is also positioned at *E*:

The monsoon lasts $\left\{ \begin{array}{l} \text{longer.} \\ \text{too long.} \end{array} \right.$

The journey took *long enough* for everyone to get to know each other.

Uninflected *long* can be an assertive form when it cooccurs with the perfective and is then usually positioned at *M*. The verbs involved seem to be mainly verbs of belief or assumption, attitudinal verbs, and some verbs of speaking:

I have *long* thought of retiring at the age of 55. He has *long* admired my style of writing.

The merits of the scheme will be *long* discussed.

Long behaves like *much* and *far* in many respects (cf 8.104-7).

Time-frequency adjuncts

- 8.64 Frequency can sometimes be conceived in absolute terms without concern for the period of time over which the recurrence in question took place. For example:

A: How many times did you ring the bell? B: Twice.

More usually, however, we are concerned with frequency with respect to a specified or implied span of time. In other words, a frequency that responds to 'How often?'. Thus:

A: How often do you wash your car?

B: Pretty rarely/Infrequently/Not very often.

Monthly/Weekly.

Once a week.

Every Sunday.

From time to time.

As often as I can.

Whenever it gets very dirty.

Of course, even questions of the form 'How many times?' would not usually be satisfactorily answered with a simple numerical value that took no account

of 'the rate of occurrences per unit of time'. That is, a question such as:

How many times have you had a driving accident?

is likely to be answered with reference to a period:

Four times, { over the past dozen years.
in the course of twenty years' driving experience.

That is, the respondent would reasonably conclude that the questioner was less interested in the absolute total than in that total related to the time span within which accidents could have occurred. Indeed the questioner might have framed his question as:

How often { have you had } driving accidents?
do you have

Again, we may be concerned not with numerical indications of frequency but with more general or impressionistic frequency, as in [II] below. Here, the type of recurrence in which we are interested depends both on the semantics of the verb and also on its aspect. Compare:

She *usually* smiles. [recurrent activity; eg 'When she sees me . . .']
She is *usually* smiling. [continuous activity; eg 'Whenever one sees her . . .']

Apart from nonnumerical expressions of frequency (such as *whenever*-clauses) and some prepositional phrase patterns, time adjuncts of frequency are mostly realized by noun phrases or by adverbs. We can look in more detail at realizations in considering the semantic subclasses of frequency adjuncts. There are two major subclasses:

(I) those naming explicitly the times by which the frequency is measured: DEFINITE FREQUENCY;

(II) those not doing so: INDEFINITE FREQUENCY.

Each of these subclasses can in turn be subdivided:

(I) DEFINITE FREQUENCY

(A) PERIOD FREQUENCY

hourly, daily, nightly, weekly, fortnightly (esp BrE), *monthly, quarterly, annually, yearly, biannually* ['twice a year'], *biennially* ['every two years'], *semi-annually, twice a week/month, etc, (n) times a week/month, etc, every (n) week(s)/month(s), etc, every other week/month, etc* ['on alternative weeks/months, etc']

For example:

Committee meetings take place *weekly*. [= once a week]
I shall be in my office *every other day*. [= on alternate days]
Each summer I spend my vacation in Bermuda.
Take three pills *twice a day*.

Phrases of the form *per n* are occasionally used with reference to periodic money payments:

If so desired, rent can be paid *per week* instead of *per month*.

(B) OCCASION FREQUENCY

once ['one time only'], *twice*; *thrice* <archaic>; otherwise noun phrases or prepositional phrases, eg: *a time or two, three times, on five occasions*

For example:

Veronica has been to Singapore (*only*) *ONCE*.
Bob phoned *twice* today.
I visit England *three times a year*.
I perform operations *three days each week*.
On (the) average, I see them *once every three weeks*.

8.65 (II) INDEFINITE FREQUENCY

(C) USUAL OCCURRENCE

commonly, customarily, generally, habitually, invariably, normally, ordinarily, usually

For example:

He *generally* leaves home at seven.
Does Jenny *usually* stay up so late?
We *normally* go to bed before midnight.
As a rule it's very quiet here during the day.
For the most part, we play tennis on Sunday morning.

(D) CONTINUOUS/CONTINUAL/UNIVERSAL FREQUENCY

always, constantly, continually, continuously, incessantly, permanently, perpetually

For example:

Does she *always* dress well?
He is *continually* complaining about the noise.
He *incessantly* asks for more money.
They are *perpetually* in debt.

(E) HIGH FREQUENCY

frequently, often; regularly, repeatedly

For example:

I have *often* told them to relax more.
They *regularly* take their dog for a walk in the evening.
Have you been drunk *many times*?
He leaves the door unlocked *time after time*.
They explained *again and again* that they couldn't help it, but she didn't believe them.

(F) LOW FREQUENCY

infrequently, irregularly, (very) little, occasionally, periodically ['from time to time'], *rarely, seldom, never*

For example:

We are *occasionally* invited to their house for a party.
We (*very*) *seldom* see our elder son these days.
I have driven *a few times*.

She visits us *once in a while*.

You should phone them *now and again*. ['occasionally']

Do you visit your parents *from time to time*? ['occasionally']

We play cards $\left\{ \begin{array}{l} \text{on and off.} \\ \text{off and on.} \end{array} \right\}$ ['occasionally' <informal>]

I have been in his office *on several occasions*.

Most time frequency adjuncts are normally positioned at *E*. However, those realized by adverbs and referring to indefinite frequency (Groups (C–F)) are normally positioned at *M*, while those realized by prepositional phrases and denoting usual occurrence (Group (C)) are normally positioned at *I*:

Mary has *sometimes/often* acted in Shakespeare plays.

On most days, I begin work at 8 a.m.

Adjuncts in some groups (especially in (C), (E), and (F)) can be inside or outside the scope of negation, and this coincides with their potentiality to appear at *iM*. Compare:

The students should $\left\{ \begin{array}{l} \text{normally} \\ \text{occasionally} \end{array} \right\}$ be given homework. [1]

The students should be given homework $\left\{ \begin{array}{l} \text{normally.} \\ \text{occasionally.} \end{array} \right\}$ [2]

The students $\left\{ \begin{array}{l} \text{normally} \\ \text{occasionally} \end{array} \right\}$ should not be given homework. [1a]

$\left\{ \begin{array}{l} \text{Normally,} \\ \text{Occasionally,} \end{array} \right\}$ the students should not be given homework. [2a]

(Cf 8.67f)

Note The adverb *once*, especially at *M*, also functions as a time position adjunct, 'at one time, on one occasion, at some time or other' (but *at once* means 'immediately'). Informally the corresponding noun phrase is likewise used for time position ('He came to see me one time and complained about his job'), as also when modified by *more*:

If you say that $\left\{ \begin{array}{l} \text{one more time} \\ \text{once more} \end{array} \right\}$, I'm leaving.

8.66 Adjuncts of definite frequency in Group (A) denote the period of time by which the frequency is measured and are normally sentence adjuncts. Those in (B) express the measurement in number of times (cf 5.18) and are normally predication adjuncts. Items from each group can cooccur, normally with the item from (B) coming first:

You should take the medicine *twice* (B) *daily* (A). [= 'twice a day']

Those in (A) can also cooccur with each other in a hierarchical relationship:

She felt his pulse $\left\{ \begin{array}{l} \text{hourly (A) each day (A).} \\ \text{each hour (A) daily (A).} \\ \text{daily (A) every couple of hours (A).} \end{array} \right.$

The order of the adjuncts in *E* depends in part on information focus or end-weight (cf 18.9ff), but only the one denoting the longer period can occur in *I* (cf 8.45, 8.56):

$\left[\begin{array}{l} \text{Each day} \\ \text{Daily} \end{array} \right]$ she felt his pulse $\left[\begin{array}{l} \text{hourly.} \\ \text{each hour.} \end{array} \right]$
 * $\left[\begin{array}{l} \text{Hourly} \\ \text{Each hour} \end{array} \right]$ she felt his pulse $\left[\begin{array}{l} \text{each day.} \\ \text{daily.} \end{array} \right]$

Cooccurrence of the adverb forms, however, is odd for stylistic reasons even if the one denoting the longer period is in *I*:

?*She felt his pulse *hourly daily*.

?Daily she felt his pulse *hourly*.

Those in (B) can likewise cooccur with each other in a hierarchical relationship, where the subordinate adjunct denotes the number of times for each of the times denoted by the superordinate adjunct, which assumes sentence-adjunct function. The verb must be one referring to a momentary event (cf 4.33, 4.35), such as *beat* 'to overcome (someone) in a contest':

I beat him *twice on two occasions*. ['I won two contests on each of two occasions']

As in this example, the superordinate adjunct tends to follow the subordinate adjunct, but it can be in *I* position:

On two occasions I beat him *twice*.

?Twice I beat him *on two occasions*.

While the adverb and the noun phrases *X times* are ambiguous between superordinate and subordinate function in such a hierarchy, the prepositional phrases *on X occasions* are unambiguously superordinate. Adjuncts in (B) can often be the response to the question *How many times?* The question is used to elicit the adjunct when only one item from (B) is involved, but it can also elicit the subordinate or superordinate adjunct when two items from (B) are involved:

A: How many times did you beat him?

B: *Twice*.

A: How many times did you beat him on the two occasions?

B: *Twice*.

A: How many times did you beat him twice?

B: $\left\{ \begin{array}{l} \text{On two occasions.} \\ \text{Twice.} \end{array} \right.$

Adjuncts of definite frequency can also cooccur with items from each of the subclasses of adjuncts of indefinite frequency:

You should $\left\{ \begin{array}{l} \text{normally (C)} \\ \text{always (D)} \\ \text{regularly (E)} \\ \text{(only) occasionally (F)} \end{array} \right\}$ take the medicine *twice* (B) *daily* (A).

Note In the hierarchical relationship, repetition of the same adverb is avoided for stylistic reasons (cf 8.149):

?I beat him at chess *twice twice*. [ie there were two games on each of two occasions]
?Twice I beat him at chess *twice*.

- 8.67 Adjuncts of indefinite frequency in Group (C) denote usual occurrence. They differ from those of (especially) Group (D) in that they can precede the clausal negative, in which case they express that it is normal for something not to occur:

Generally,
Normally,
Usually, } he doesn't take medicine.

They differ from those in (E) and (F) that can precede negation in that it is a contradiction to assert both that it is usual for something to occur and also that it is usual for it not to occur:

[**Generally,*
**Normally,*
**Usually,*] he doesn't take medicine, but [*generally,*
normally,
usually,] he does (take medicine).

On the other hand, those in (E) and (F) that precede negation express a high or low frequency. Here, we encounter a phenomenon that parallels multal and paucal items in noun-phrase quantifiers: 'Many arrows have hit the target but many have not' (cf 6.53, 8.71). Thus, it is not contradictory to assert that it is frequent (or infrequent) for something to occur and at the same time that it is frequent (or infrequent) for it not to occur:

[*Often*
Occasionally] he doesn't take medicine, but [*often*
occasionally] he does (take medicine).

We can see from this example that *often* does not necessarily imply the majority of times, and the same is true for *frequently*. However, those in (C), like *generally*, do imply the majority of times. Items in (C) not entailing exhaustiveness can obviously (unlike *invariably*, *habitually*) allow for exceptions. We can therefore say, for example:

Generally,
Normally,
Usually, } he doesn't take medicine, but *sometimes* he does (take medicine).

Note [a] *Invariably* (commonly used in the sense 'usually') and *habitually* are the only ones in Group (C) that deny the possibility of exceptions:

**Invariably*, he doesn't take medicine, but *sometimes* he does (take medicine).

[b] *Generally speaking* and (occasionally) *normally speaking* are used as frequency disjuncts corresponding to the adjuncts *generally* and *normally* respectively (cf 8.125 Note [a]).

[c] The commonest frequency adverbials are in some ways more like time subjuncts (cf 8.98) than adjuncts:

She *usually* saw her patients in the mornings.

*It was *usually* that she saw her patients in the mornings.

It was *usually in the mornings* that she saw her patients.

Compare:

She used to see her patients *in the mornings*.

It was *in the mornings* that she used to see her patients.

- 8.68 Frequency adjuncts like *usually* in (C) as well as *often* and *frequently* in (E) can be the focus of negation:

He doesn't { *Usually*
Often
Frequently } speak from notes.

But for those in (C), apart from 'exhaustive' items like *invariably*, there is as a general rule no logical difference resulting from whether the adjunct is within the scope of negation or not (cf 10.64ff). Somebody agreeing with a previous speaker could remove a frequency adjunct of (C) from the scope of negation:

A: He doesn't *usually* speak from notes.

B: That's true. He *usually* DOESN'T (speak from notes).

To take the paraphrases of *usually*, there is no logical difference between the two sentences:

It's usual for him *not* to speak from notes.

It's not usual for him to speak from notes.

On the other hand, there is a logical difference between positioning *often* or *frequently* within the scope of negation and positioning them outside it. Where, as we saw in 8.67, we can say:

Often he doesn't take medicine, but *often* he does.

we cannot say:

*He doesn't *often* take medicine, but *often* he does (take medicine).

This is because, when *often* or *frequently* come within the scope of negation, we deny the frequency, and we obviously cannot then assert it.

If frequency adjuncts in (C) cooccur with duration adjuncts (cf 8.63), there can be a difference according to whether one of the adjuncts is or is not to be understood as within the scope of negation:

Usually he doesn't sleep for two days at a time.

['The usual thing is for him to go without sleep for two days at a time'
or 'It is not usual for him to go to sleep for two days at a time']

He doesn't *usually* sleep for two days at a time.

['It's rare for him to sleep for as long as two days at a time' or 'For two days at a time it is quite usual for him to go without sleep']

The same distinction applies for *often* and *frequently*.

Most frequency adjuncts can be the focus of a cleft sentence, particularly if they are modified or are in a negative or interrogative focal clause:

(?)It's *very frequently* that he loses money.

It's *not often* that I have a chance to speak to him.

Is it *often* that she drives alone?

For some speakers, the same is possible when the *that*-clause is negative:

It's *all too frequently* that people don't offer to help.

Is it *very often* that she doesn't speak to him?

It isn't *very often* that she doesn't speak to him.
It's *not often* that he doesn't help.

Rarely and *seldom* of Group (F) can sometimes be the focus of a cleft sentence, even unmodified, denoting negative frequency ('not often'):

It's $\left\{ \begin{array}{l} \text{rarely} \\ \text{seldom} \end{array} \right\}$ that he loses any money.
that people don't offer to help.

- 8.69 Indefinite-frequency adjuncts can cooccur in a hierarchical relationship (cf 8.45, 8.56, 8.66):

Normally (C), committee meetings are held *infrequently* (F).

Usually (C), he *constantly* (D) complains of headaches when he is assigned a responsible task.

They *seldom* (F) put on plays *again and again* (E).

I have *often* (E) telephoned him *a few times* (F) on the same day.

Some adjuncts even in the same group can cooccur where the verb is momentary (cf 4.33, 4.35) and we are thus able to distinguish between 'repeated action' and 'number of occasions' (cf 8.64):

They have *often* (E) pressed his bell *repeatedly* (E) without getting an answer.

Contrast:

?They have *often* (E) beaten him *frequently* (E).

Nonassertive *ever* ['at any time'] is sometimes used to intensify the negative forms *rarely*, *seldom* in (F), and it is especially common with the corresponding subjuncts (cf 8.98), though its use with *never* is considered nonstandard by some speakers:

(?)I *seldom ever* play squash now.

(Contrast the fully acceptable 'seldom if ever', which is not an intensified *seldom* but offers an alternative to it).

(?)I *never ever* go there.

Note Compare the following:

He $\left\{ \begin{array}{l} \text{always} \\ \text{never} \end{array} \right\}$ collects the groceries on Tuesday.

We could mean *either* that he collects (or never collects) them on Tuesday, *or* that whenever he collects them it is always (or never) on Tuesday.

- 8.70 Whereas frequency adjuncts in (C), such as *usually*, can precede negation (cf 8.67), those in (D) normally cannot:

?*He $\left\{ \begin{array}{l} \text{always} \\ \text{constantly} \end{array} \right\}$ doesn't pay his debts on time.

*He $\left\{ \begin{array}{l} \text{continually} \\ \text{incessantly} \end{array} \right\}$ didn't drink whisky.

Instead we use *never*, *not . . . ever*, or *not . . . at all*:

He $\left\{ \begin{array}{l} \text{never pays} \\ \text{doesn't ever pay} \end{array} \right\}$ his debts on time.

He *didn't* drink whisky *at all*.

Note, however, in ironic 'second instance' use:

A: Sorry; I haven't enough money.

B: You $\left\{ \begin{array}{l} \text{always} \\ \text{perpetually} \end{array} \right\}$ haven't enough money.

Adjuncts in (E), such as *frequently* and *repeatedly*, denote a high frequency and those in (F), such as *occasionally* and *never*, denote a low or zero frequency.

When the negative forms in (F), *rarely* and *seldom*, are in *I* position, they cause subject-operator inversion (cf 18.24), such usage being literary or oratorical in tone:

Seldom had I seen such confusion.

- Note [a] The following items in (E) and (F) do not normally precede negation: (E) *regularly* (cf 'He regularly doesn't agree' beside the more usual 'He regularly disagrees'); (F) *infrequently*, *irregularly*, and other negative forms, including *seldom* and *rarely*.
[b] *Regularly* can denote high frequency as well as 'at regular intervals'.

Time-frequency adjuncts and quantifiers

- 8.71 If the subject is generic (cf 5.26ff), many adjuncts of indefinite frequency, particularly when positioned at *I* or *M*, are equivalent to quantitative determiners (cf 5.14, 5.16) or pronouns (cf 6.45ff) in the noun phrase realizing the subject. For example, in:

Students play squash *often*. ['on many occasions']

often is included in the predication and refers to the frequency of the games of squash. However, the effect of either of the versions with sentence adjuncts:

$\left\{ \begin{array}{l} \text{Often students} \\ \text{Students often} \end{array} \right\}$ play squash. ['it often happens that . . .']

is very similar to:

Many students play squash.

Other examples where there is often loose equivalence:

Good novels are *always* worth buying.

~ *All* good novels are worth buying.

Policemen are *usually* unarmed in Britain.

~ *Most* policemen are unarmed in Britain.

Universities *often* have linguistics departments.

~ *Many* universities have linguistics departments.

A dog is *sometimes* a dangerous animal.

~ *Some* dogs are dangerous animals.

Students *occasionally* fail this course.

~ A few students fail this course.

Englishmen *rarely* talk to strangers in trains.

~ Few Englishmen talk to strangers in trains.

Officers $\left\{ \begin{array}{l} \text{almost never} \\ \text{very seldom} \end{array} \right\}$ get drunk while on duty.

~ Almost no officers get drunk while on duty.

If the direct object is generic, the adjunct may be roughly equivalent to a predeterminer or quantifier in the noun phrase realizing this direct object:

Our university *always* welcomes well-motivated students.

~ Our university welcomes *all* well-motivated students.

The most highly trained soldiers *often* guard government buildings.

~ The most highly trained soldiers guard *many* government buildings.

A good listener *seldom* makes enemies.

~ A good listener makes *few* enemies.

- Note At least two of the above sentences have alternative interpretations to those given above:
- Policemen are *usually* unarmed in Britain.
 - ~ It is usual for policemen to be unarmed in Britain, but they are sometimes armed.
 - Englishmen *rarely* talk to strangers in trains.
 - ~ On rare occasions Englishmen talk to strangers in trains.

Time-relationship adjuncts

- 8.72 Time adjuncts expressing a relationship between two time positions that are both being considered in an utterance are realized by forms that serve more than one function. In consequence, most of them have already been considered under other headings. There are three chief subclasses:

Group (a):

Many of these denote temporal sequence and are also used for time position (cf 8.55):

afterwards, before, eventually, finally, first, later, next, originally, previously, subsequently, then

For example:

Did she *first* see him when he was a child?

I've been considering what to do since he *last* discussed his problems with me.

She broke her leg *for the first time* while she was skiing in Switzerland.

These techniques were *originally* used in the Second World War.

It wasn't until the end of the party that I was *finally* introduced to her.

Group (b):

Many of these imply something of the concessive relation (cf 8.7):
(*even*) *by that time, (even) before that time, (even) up to that time*

For example:

We hadn't eaten (*even*) *by that time*.

Even now, we don't know where we are going to live.

I have *so far* bought two shirts and a pair of shoes.

They have finished their work *by now*.

Group (c):

Here the tendency is to compare one time with another:
again, once more, afresh

For example:

I feel better *again*.

Millicent is revising her book *once more*.

The carpet is still dirty so you'd better scrub it *afresh*.

- Note On *already, still*, and the time relationships (notably Groups (b) and (c)) that are chiefly expressed by subjuncts, cf 8.97.

Relative positions of time adjuncts

- 8.73 In the preceding sections we have specified, as the occasion arose, the normal positions of time adjuncts in the various subclasses. We now take a summary glance at the relative positions of adjuncts from the three major subclasses that can cooccur at *E* position: time position (cf 8.55), time duration (cf 8.63), and time frequency (cf 8.64). These tend to occur in the order:

time duration [d] – time frequency [f] – time position [p]

The following sentences exemplify the normal order (but cf 8.87):

I was there *for a short while* [d] *every day or so* [f] *in January* [p].

He played for us *very frequently* [f] *last year* [p].

I'm paying my rent *monthly* [f] *this year* [p].

Our electricity was cut off *briefly* [d] *today* [p].

We'll discuss the matter *during lunch* [d] *tomorrow afternoon* [p].

He'll be staying here *for the summer* [d] *every year* [f].

He does exercises *for several hours* [d] *every weekend* [f].

Coordination

- 8.74 Time adjuncts in the same subclass can be coordinated:

TIME POSITION

today and tomorrow

now or later

before or after

in 1990 and (in) 1991

when we were there and afterwards

eg I'll be working *today and tomorrow*.

TIME DURATION

permanently or temporarily

during the summer and (during the) winter

for the week or (for the) month

(for) three weeks or (for) longer

eg She'll be staying here *for three weeks or longer*.

Usage corpus of (largely) British English, *until* occurs twice as often as *till*, and is used approximately equally as conjunction and as preposition, and equally too in spoken and written materials. On the other hand, *till* occurs chiefly in spoken texts, and is predominantly a preposition. For example:

They will live in Chicago *until* William finishes his thesis.
She will be working *till* nine o'clock.

Forward-span adjuncts are usually sentential, though they can be predica-tional especially in association with verbs which make their use virtually obligatory:

The performance lasted $\left\{ \begin{array}{l} \text{until the actors were exhausted.} \\ \text{until 2 a.m.} \end{array} \right.$

Phrases and clauses with *until/till* interact with verb semantics. A positive clause requires a verb of durative (*ie* nonmomentary) meaning and the span extends up to the reference of the time adjunct. Thus:

He waited *until* I returned.

Fig 8.58a

With negative clauses and a verb of durative meaning, the span will also extend from the speaker's 'now', though not of course (by reason of the negative) up to the reference of the time adjunct:

He didn't wait *until* I returned.

Fig 8.58b

On the other hand, with negative clauses and a verb of momentary meaning (*cf* 4.33, 4.35) the span denoted by the time adjunct marks the extent of the nonoccurrence of the momentary action:

He didn't arrive *until* I returned.

Fig 8.58c

The sentence can thus be referentially equivalent to 'He delayed his arrival

until my return', though this of course implies a contingency relation and is thus not precisely a rhetorical equivalent. *Cf* also:

He did not arrive *before* I returned.
He arrived *when* I returned.

So also, 'She slept *till* nine' implies 'She *stopped* sleeping at nine', whereas 'She didn't sleep *till* nine' implies 'She *started* sleeping at nine'.

- 8.59 Other modes of realizing forward span involve the use of *up to*, *over*, *for*, *before*, *by*, *by the time (that)*. For example:

We'll be there *up to* midday; then we'll be out for lunch.
Can you stay *over* the weekend?
Can you stay *for* a month?
I have to leave *before* midday.
I have to leave *by* midday.
I shall be away $\left\{ \begin{array}{l} \text{by the time (that) the clock strikes twelve.} \\ \text{by that time.} \end{array} \right.$

The phrase *in time* can be used both in the sense of 'by the due time' and also in the sense of 'eventually':

He wants to leave at midday but he doesn't think I shall be ready *in time*. [= 'by that time']
She's promised to finish the painting *in time* but she can't say when.
[= 'in the course of time']

(Contrast *on time*, which refers to time position, 'at the time required')

Prepositional phrases with *to* function like those with *until/till* provided they are correlated with *from*-phrases (expressed or implied: *cf* 9.37) marking the beginning of the time span:

She will be working from May $\left\{ \begin{array}{l} \text{to September.} \\ \text{till September.} \end{array} \right.$

Neither phrase makes clear whether September is within or beyond the span, but in AmE we have complete clarification, as in:

She will be working from May $\left\{ \begin{array}{l} \text{through August.} \\ \text{through September.} \end{array} \right.$
[*ie* until the end of the month named]

where BrE achieves such precision only with more periphrastic expressions such as *to the beginning of*, *to the end of*. Noncorrelative phrases with *through* occur in both AmE and BrE:

She will be working *through* September. [*ie* 'for the whole month of September' or 'from now until the end of September']

Noun-phrase realizations of forward-span adjuncts involve quantifiers as in:

Would you like to stay with us $\left\{ \begin{array}{l} \text{a few days?} \\ \text{a day or so?} \end{array} \right.$

TIME FREQUENCY

once or twice
often and regularly
each day and (each) night
every Tuesday and (every) Thursday
a few times or many (times)

eg You should take exercise *often and regularly*.

Note *Now and then* and *now and again* are common coordinated expressions used for time frequency ('from time to time', 'occasionally'). Similarly, *again and again* and *over and over* are used to denote frequent repetition and not just one or two repetitions.

Time adjuncts and time reference

8.75 Time adjuncts play a part in specifying the time reference of the verb. Thus, it is the adjuncts that determine that the time reference in:

He is playing *now*.

is present, whereas in:

He is playing *tomorrow*.

it is future. Because of their temporal significance, some time adjuncts cannot cooccur with particular forms of the verb. Thus, *tomorrow* does not cooccur with the simple past:

*He played *tomorrow*.

and *yesterday* does not cooccur with the modal auxiliaries (unless they refer to past time, including their occurrence in a dependent clause with backshift; cf 14.31):

*He $\left\{ \begin{array}{l} \text{may} \\ \text{will} \\ \text{should} \end{array} \right\}$ play *yesterday*.

By contrast, cf:

We couldn't leave town yesterday. ['We *were* not able ...']

He may have played *yesterday*.

I told him he should play *yesterday*.

(Cf 4.11ff)

Note [a] An apparent exception to the need for harmony between tense and adjunct is with verbs of saying, arranging, expecting, or wanting where the object is concerned with a future event (cf 8.49, 8.76). In such cases, though the expressed verb is in the past (*ie* the past for the speaker), there may be a time adjunct with future reference (though this may already be past for the hearer), since the adjunct's reference is the object:

He called for a meeting *next week*. ['He called for a meeting to be held next week', where *next week* referred to future at the time when 'He called']

She wanted the book *tomorrow*. ['She wanted to have the book tomorrow']

They predicted a crisis *next month*. ['They predicted that there would be a crisis next month']

There can also be an adjunct with past reference that relates to the verb in the past (cf 8.76):

As far back as *March*, they predicted a crisis *in a month's time*. [*ie* 'Their prediction of a crisis next month was made as far back as March'; but here the sentence is equivocal as to

whether the crisis was to come a month after the prediction or a month after the speaker of the sentence tells us about it]

Cf also 'They predicted a crisis *last month*', which could mean 'They predicted a crisis in what is now "last month".'

[b] Where an adjunct is functioning within a dependent clause, it need not of course have any relation to the tense of the verb in the main clause, though where the dependent clause is nonfinite there may appear to be a time-reference contradiction:

We arranged (yesterday) to go *tomorrow*.

With *forget*, we can have complementation with *-ing* informally, provided (i) there is a time-position adjunct referring to the past, and (ii) the action of the dependent clause was fulfilled:

I forgot meeting her *in 1980*. [*ie* 'I met her, but the meeting subsequently escaped my memory']

Contrast:

I forgot to meet her *in 1980*. [*ie* 'I did not meet her because I forgot that I had arranged to do so']

Condition (i) may be relaxed if the nonfinite verb phrase is perfective. Thus 'I forgot having met her' need have no past-time adjunct (cf 16.38ff).

Time adjuncts as subject- and object-related

8.76 Time adjuncts can cooccur with all verbs including BE:

It's much warmer $\left\{ \begin{array}{l} \text{now.} \\ \text{when the wind drops.} \end{array} \right.$

Many of them can also be used as subject-related adjuncts with BE when the subject is an eventive noun (cf 10.25):

TIME POSITION

The meeting will be *tomorrow*. [*ie* 'will take place']

Lunch will be *in ten minutes*.

I hope coffee is *soon*.

TIME DURATION

I'm afraid the noise will be *for the whole summer*. ['it will last for ...']

The show is *from nine till twelve*.

TIME FREQUENCY

Interviews are *every hour*.

Guided tours around the museum are *twice a day*.

The next appointments will be *when the doctor returns from vacation*.

The verb BE in such cases (rather informal) is often equivalent to *take place*, and so:

The opera will be *tonight*.

is interpreted as 'The performance of the opera will take place tonight'.

The progressive is of course excluded when time adjuncts are used as subject-related adjuncts with BE (cf 8.42):

*Interviews are being *every hour*.

Contrast:

Interviews are $\left\{ \begin{array}{l} \text{taking place} \\ \text{being held} \end{array} \right\}$ *every hour*.

Some adverbials of time cannot be subject-related adjuncts; this applies, for

example, to frequency adjuncts in (C), eg: *as a rule*, and in (D), eg: *always* (cf 8.64f).

We saw that with certain verbs the reference of the space adjunct may be to the place of the object rather than to that of the subject (cf 8.49). Similarly, the reference of the time adjunct may also be concerned with the object. We can sometimes express the relationship by a sentence in which the object of the original sentence is subject and the time adjunct is subject-related with BE. The effect is that of the predication with complex-transitive verbs (cf 16.43ff). There are two types of such references to the object:

(i) Where the verbs denote the placing or movement of the object, and a cooccurring space adjunct indicates the relevant resulting place, a time adjunct denotes duration; for example:

They threw him in prison *for life*. ['He will be in prison for life']

He's moving the family into a hotel *temporarily*. ['The family will be in a hotel temporarily']

We're sending her to London *for the summer*. ['She will be in London for the summer']

They left the car in the street *for an hour*. ['The car was in the street for an hour']

(ii) Where the verbs refer to saying, arranging, expecting, or wanting and the object has future reference, the time adjunct denotes time position, time duration, or time frequency; for example:

TIME POSITION

He expected the guests *next week*. ['that the guests would be here next week']

They arranged the meeting *for later today*. ['that the meeting would be held later today']

He set the alarm *for seven o'clock*. ['so that the alarm would go off at seven o'clock']

TIME DURATION

He predicts a state of tension *for a long time*. ['that there will be a state of tension for a long time']

They offered us the house *for the summer*. ['(their offer was) that we could use the house for the summer', 'the offer of the house was for the summer']

TIME FREQUENCY

They promised her a party *every Saturday night*. ['that she would have a party every Saturday night']

I suggest an informal discussion *occasionally*. ['that there should be an informal discussion occasionally']

Note Where the time adjunct can also refer to the action of the verb, there may be ambiguity. For example, the sentence:

They promised her a party *every Saturday night*.

can also mean that the promise was made every Saturday night. If the adjunct is moved from *E* position, interpretation of it as such a sentence adjunct would be the natural one:

Every Saturday night they promised her a party.

Syntactic features of time adjuncts

8.77 Most time adjuncts have syntactic characteristics that are general to adjuncts. However, time-frequency adjuncts in 8.65 (C), eg: *usually, as a rule*, allow only the following: they can be the focus of a question, they can be the focus of negation, and they can come within the scope of predication pro-forms or predication ellipsis.

Most time adverbs cannot be premodified by *very* or take analogous modification (such as *so ...*, *however ...*, *more ... than*). Time adjuncts allowing such modifications are;

TIME POSITION: *early, late, recently*

TIME DURATION: *long, briefly, recently*

TIME FREQUENCY: *commonly* (C), *constantly* (D), *incessantly* (D), *often, frequently* (E); several in Group (F): *infrequently, irregularly, little, occasionally, rarely, seldom*

Some adverbs that cannot be premodified by *very* can be premodified by other intensifiers; for example:

(very) much	} {	later ['afterwards']
somewhat		before
a((very) long) while		earlier ['before']
a lot (informal)		

Others in the same semantic group do not easily allow at least some of these intensifiers:

*(very) much	} previously	*(very) much	} subsequently
?somewhat		*somewhat	
?a lot		?*a lot	
?a little		?*a little	

*very
(?)quite } usually [but fully acceptable: *very unusually*]

But cf time subjuncts, 8.97f.

Note [a] With respect to ability to be focused by a cleft sentence, by *only*, or by *also*, some general statements can be made for frequency adjuncts in 8.65 (D), eg: *constantly*, (E), eg: *often*, and (F), eg: *occasionally*. None of the three groups allow focusing by *also*, (D) and (E) cannot be focused by *only*, and (D) cannot be focused by a cleft sentence. There are also individual differences within the groups and acceptability in a cleft sentence is often improved if the item is modified or the focal clause is interrogative or negative.

[b] *Again, last, and instantly* cannot be the focus of *only* or of a cleft sentence, and except *again*, none of them can be the focus of *also*.

[c] Naturally, time adjuncts with past reference cannot cooccur with imperatives. It is less obvious that time frequency adjuncts in subclass (C) (cf 8.65) do not idiomatically cooccur with imperatives, especially at *E*; they are more acceptable at *I*. For example:

?Stay in this hotel *usually*, when you're in London!

Normally cut the grass every week, please.

Moreover, although imperatives cooccur with adjuncts meaning 'now, immediately', near paraphrases implying a longer extent of present time seem odd with imperatives, unless these are negative:

Buy new clothes	} {	now.	} ?Buy new clothes at the present time.
		immediately.	
		this moment.	

[but fully acceptable: 'Don't buy new clothes at the present time']

Process adjuncts

Realization

- 8.78 All four semantic types of process adjunct (cf 8.5) can be realized by prepositional phrases:

She uttered the words *with cold deliberation*. [manner]
 She spoke *from notes*. [means]
 The speech was made audible *with an amplifying system*. [instrument]
 It was heard *by millions*. [agentive]

Manner and means adjuncts can be realized by noun phrases though these are usually expandable to constitute prepositional phrases, so as to make it natural to regard the noun phrase as having an omitted preposition:

They were walking *single file* through the wood. ['in single file']
 I'd like to send this parcel *air mail*. ['by air mail']

Manner adjuncts especially, and those of means and instrument to some extent, are also realized by adverb phrases:

He glanced at her (*very*) *lovingly*. [manner]
 Some patients ask to be treated *homoeopathically*. [means, 'by homoeopathic medicine']
 She was examining a fossil *microscopically*. [instrument, 'with a microscope']

Finally, manner adjuncts can be expressed by clauses (cf 15.17ff), though the forms concerned strongly imply comparison as distinct from a direct reference to manner or mode of action:

I try to cook vegetables *as the Chinese do*. ['in the Chinese way']

All process adjuncts are normally predicationals. When fronted, the adverbial concerned tends to become a subject-oriented subjunct (cf 8.92), no longer corresponding to an inquiry 'How . . .?', 'In what way . . .?' Compare:

She replied to the listeners' questions *obligingly/courteously*. ['in an obliging/courteous manner']

Obligingly,
Courteously, } she replied to the listeners' questions.

['She was obliging/courteous enough to reply . . .'] Less claim is made that her *replies* were obliging or courteous]

Adjuncts of means or instrument, however, can be sentence adjuncts, especially when their reference is specific rather than generic and when there is adequate alternative complementation in the clause. Compare:

He chopped the parsley *with a knife*. [predication adjunct]
With a knife like that, you couldn't cut through this salami. [sentence adjunct]

Note [a] Although noun phrases as process adjuncts can be regarded as elliptical prepositional phrases (as with space adjuncts, 'jump (*over*) a fence'), they are apprehended in part as direct objects by

virtue of their noun-phrase form. Hence, they may have a corresponding passive. Compare:

He's travelling *a different route* to Minneapolis ['by a different route', which is spatial ('along . . .') as well as process].

It is a route that has not been travelled before by car.

Has this particular route been travelled before?

[b] On common pro-forms for process adjuncts (eg: (*in*) *that way*, *like that*, *thus*, etc), cf 19.47. The form *thus* is largely formal, and as well as being a process adjunct pro-form it operates as a conjunct. In the latter role it tends to be at *M* and the reference is anaphoric; in the former it tends to be at *E*, especially if the reference is cataphoric:

She *thus* addressed herself to their problems. [= 'As you see from what has preceded': conjunct]

She addressed herself to their problems *thus*. [= 'in the following way': process adjunct] (C/8.144).

Manner adjuncts

8.79 EXAMPLES OF THE USE OF MANNER ADJUNCTS:

She spoke to him *coldly*.
 They sprayed tear gas *indiscriminately* on the protesters.
 They were *categorically* told that no more oil would come from the wreck.
 My little boy loves dressing up *cowboy-style*.
 They are deluded if they think *otherwise*.
 His influence showed itself *more obviously* in the choice of the furniture and curtains.
 They began arguing *loudly*.
 He failed to question the witness *thoroughly*.
 She repaired the house *like an expert*.
 He spoke *in a way that reminded me of his father*.
 They played the game (*in*) *a different way*.
 She dances (*in*) *the same way as I do*.
 They cook (*in*) *the French style*.
 He always writes *in a carefree manner*.
 You should write *as I tell you to*.

Noun phrases with *way*, *manner*, and *style* as head tend to have the definite article:

She cooks chicken { *the way I like*.
 in { *the*
 a } *way I like*.

An adverb manner adjunct can usually be paraphrased by *in a . . . manner* or *in a . . . way* with its adjective base in the vacant position. Where an adverb form exists, it is usually preferred over such a corresponding cognate prepositional phrase with *manner* or *way*. Hence:

He always writes *carelessly*.

is more usual than:

He always writes *in a careless* { *manner*.
 way.

But the latter, periphrastic form is preferred where the adjunct requires modification. Successive *-ly* adverbs are avoided, partly for stylistic reasons

and partly because a sequence of adverbs leads one to expect the first to be a modifier of the second (as in 'He runs incredibly carelessly'). Thus, for the former reason, we would not say:

?He always writes *deliberately carelessly*. [but rather: 'in a deliberately careless way']

and for the latter reason, we would tend to avoid:

He spoke *stupidly frequently*. [but rather 'He frequently spoke *stupidly*'; if we meant 'He spoke with *stupid frequency*', this would again be preferable to the succession of adverbs]

Other examples of adverbs replaced by alternative forms of cognate adjunct:

He prayed $\left\{ \begin{array}{l} \text{fervently.} \\ \text{with profound but dignified fervour.} \end{array} \right.$

She spoke $\left\{ \begin{array}{l} \text{animatedly.} \\ \text{with (a) youthful animation.} \end{array} \right.$

(Cf 5.58).

In careful usage, clausal adjuncts with *as* are sharply distinguished from semantically equivalent phrasal adjuncts with *like*:

Please try to write $\left\{ \begin{array}{l} \text{as I do.} \\ \text{like me.} \end{array} \right.$

But informally (and especially in AmE), *like* is often used as a conjunction and one has:

Please try to write *like I do*.

Adverbs as manner adjuncts can sometimes serve as the response to a *How*-question:

A: *How* was your little boy dressed up that so amused the policeman?
B: Oh, *cowboy-style*.

But other units as manner adjuncts can more easily serve as responses:

A: *How* does she dance? B: *The same way as I do.*
A: *How* should I write to him? B: *As a friend would write.*
A: *How* do they prefer to cook? B: *In the French style.*

It should be noted however that *How*-questions usually elicit means or instrument adjuncts (cf 8.80):

A: *How* did he clean his room? B: $\left\{ \begin{array}{l} \text{?*Carefully.} \\ \text{With a vacuum cleaner.} \end{array} \right.$

It is because *how* is only rarely expected to elicit a manner adjunct that we can have a joke like the following where the reply evades in supposed innocence a difficult question:

Teacher: Now, Henry, how does a quartz watch work?
Henry: Oh, marvellously!

Note On the formation of manner adverbs, cf App 1.41.

Means, instrument, and agent adjuncts

8.80 EXAMPLES OF THE USE OF MEANS ADJUNCTS:

These linguistic units were separated *intonationally*.
He decided to treat the patient *surgically*.
I go to school *by car*.

(On the use of the zero article in such examples as the last, cf 5.45.)

He gained entry into the building *by means of a bribe to the guard*.
You can best influence them *by your own example*.
You can stop the machine *by pressing this button*.
We are travelling to Washington (*by*) *first class*.
Fly *Air India*/by *Air India*/with *Air India*.

EXAMPLES OF THE USE OF INSTRUMENT ADJUNCTS:

He examined the specimen *microscopically*. [= 'with a microscope']
You can cut the bread *with that knife*/**by that knife*.
He was killed *with a bullet*.

EXAMPLES OF THE USE OF AGENTIVE ADJUNCTS:

He was killed *by a terrorist*/**with a terrorist*.
The royal wedding was seen *by millions* on television.
Her speech could not be heard *by those sitting at the back*.

On the distinction between means and instrument, cf 8.5.

Most of the adverbs that can realize means and instrument adjuncts can also function as manner adjuncts; in consequence, there is some danger of misunderstanding, as with:

He examined the specimen *microscopically*.

Since the instrumental meaning ('with a microscope') would entail the manner meaning ('in great detail'), and since the latter might involve the former, it is not easy to ensure that the addressee understands the precisely intended adjunct. Unless it has been previously established in the context, it may be necessary to ensure clarity by expressing instrumentality by a prepositional phrase, and manner by implementing the gradability which manner (but not instrument) permits: '... quite microscopically'.

The examples of instrument and agent adjuncts illustrate the point of intersection between these categories. When accompanying the passive, instrument can often be expressed by *with* + NP or *by* + NP (the latter reflecting a corresponding active, as in *A bullet killed him*) but the agentive adjunct cannot be expressed by *with* + NP. See further 3.65f.

Means adjuncts are generally elicited by *how*-questions, instrument by *how* or *what* ... *with*:

Means:

A: *How* are you flying to Europe?
B: (*By*) *British Airways*.

Instrument:

How shall we prop the door open?
What shall we prop the door open *with*?

Agent adjuncts can be elicited by *who/what* + active or (less usually, except in a context where the passive has already been used) by *who(m)/what* + passive + *by* or *by whom/what* + passive:

A: Who killed him?

B: He seems to have been killed *by a terrorist*.

A: You say she was cheated: { who (was she cheated) by?
by whom (was she cheated)? <formal>

B: (*By*) *her own brother*, apparently.

Semantic blends

8.81 Some adjuncts express a blend of manner with some other relation:

(i) MANNER WITH RESULT, AND SOMETIMES INTENSIFICATION

She fixed it *perfectly*. ['in such a way that it was perfect' – manner and result]

He grows chrysanthemums *marvellously*. ['in such a way that the results are good' – manner and result]

The soldiers wounded him *badly*. ['in such a way and to such an extent that it resulted in his being in a bad condition' – manner, intensifier, and result]

(ii) MANNER WITH TIME DURATION

He's walking *slowly*. ['in a way that will prolong the time']

He stopped the car *suddenly*.
She gave me an answer *rapidly*. } ['in such a way that it took a very short time']

They broke the news to him *gradually*. ['in such a way that it was spread over a period of time']

Such items are likely to be solely time adjuncts when they appear in *I* or *M* positions:

Suddenly, he stopped the car.
Suddenly I felt free again. } ['In an instant, ...']
Suddenly, it was night.

She *rapidly* gave me an answer. ['She soon ...']

My brother *quickly* came to despise his school. ['soon']

We *gradually* appreciated his contribution to society. ['We gradually came to appreciate']

Noun phrases and prepositional phrases that seem at first sight to be equivalent to adverbs may be less flexible than the adverbs in this respect:

All of a sudden, I felt free again. ['it suddenly happened']

?He stopped the car *all of a sudden*. [queried in the sense 'in a way that took a very short time']

It is now going *at a fast rate*. ['very quickly']

**At a fast rate*,
Very quickly, } my brother came to despise his school.

We note that *very quickly* here means 'in a short space of time', a meaning that cannot be attributed to 'at a fast rate'.

(iii) AGENT WITH RESPECT OR SPACE

Their house was destroyed *by/in an earthquake*.

She couldn't be heard *by/in the back rows of the auditorium*.

The *in*-variant in each case makes possible a lack of direct agency: 'in floods consequent upon the earthquake', 'by a test microphone in the (empty) back rows' (cf also 8.80).

Note There are some adverbials with semantic blending where the 'process' admixture is rather vague but where manner, means, space, and respect seem to be involved:

He announced the agreement *publicly*. [in part = 'by means of a public statement', in part = 'openly'; cf also *secretly*, *privately*, and 8.55 Note [d]]

They approved the contract *generally* [or *in general*], but objected to a few clauses.

She directed the work *personally* [or *in person*].

'It's empty,' he announced *superfluously*.

These proposals come *strangely* from someone in his position.

He bought it *cheaply*.

In the last example, *cheaply* is regarded by some as a hypercorrection and is often replaced by the adjective form *cheap* (cf 7.9).

Cooccurrence restrictions on process adjuncts

8.82 Adverbials that function only as process adjuncts cannot cooccur with verbs in stative use:

He likes them } { **skilfully*.
He owns it } { **awkwardly*.

Nor can process adjuncts be used as adverbials with copular verbs:

He is a teacher } { **skilfully*.
They seem happy } { **awkwardly*.
She looks angry }

Of course, if the meaning is 'deliberate imitation', the verb's use is nonstative, and we then have fully acceptable sentences like 'She looks angry *skilfully*'.

The different types of process adjunct can cooccur with each other; for example:

He *frugally* travelled *economy* (class). [manner + means]

He travels *economy* (class) *by air* but *first* (class) *by train*. [means + instrument]

She was *accidentally* struck with a racket *by her partner*. [manner + instrument + agent]

Syntactic features of process adjuncts

8.83 Process adjuncts can be contrasted with one another in alternative interrogation and negation and can come within the scope of predication pro-forms or predication ellipsis. They can be the focus of *also* and of *only*. Normally, when manner adjuncts are realized by adverbs, they cannot be the focus of a cleft sentence (cf 8.25), but their acceptability is increased if they are modified or if the focal clause is interrogative or negative:

*It was *categorically* that they were told that no more oil would come from the wreck.

?Was it *categorically* that they were told that no more oil would come from the wreck?

?It's *in the French style* that they cook.

It isn't *in the French style* that they cook.

??It was $\left\{ \begin{smallmatrix} \text{violently} \\ \text{loudly} \end{smallmatrix} \right\}$ that they argued.

(?)It was *so very* $\left\{ \begin{smallmatrix} \text{violently} \\ \text{loudly} \end{smallmatrix} \right\}$ that they argued.

It was *with the utmost care/precision/caution* that the last girder was laid in place.

On the other hand, means, instrument, and agent adjuncts can readily become the focus of a cleft sentence, even as realized by single adverbs (though less idiomatically in these circumstances):

It was *with a bullet* that he was killed.

It was *by a terrorist* that he was killed.

It was *intonationally* that these linguistic units were separated.

It was *surgically* that he treated the patient.

Adverbs that are manner adjuncts can be the focus of clause comparison (as in 'She writes more clearly than I do') and can be premodified by *however*, *how*, and *so* (as in 'How cautiously he drives'). Adverbs expressing means or instrument do not allow these features, since they cannot of course be modified at all, derived as they are from nongradable adjectives (cf App I.41).

Positions of process adjuncts

- 8.84 Process adjuncts are usually placed at *E*, since they usually receive the information focus. Indeed, no other position is likely if the process adjunct is obligatory for the verb:

$\left\{ \begin{smallmatrix} \text{They live frugally.} \\ * \text{They frugally live.} \end{smallmatrix} \right.$

$\left\{ \begin{smallmatrix} \text{They treated his friend badly.} \\ * \text{They badly treated his friend.} \end{smallmatrix} \right.$

Since the passive is often used when the need is felt to focus attention on the verb, process adjuncts are commonly placed in *eM* rather than in *E* when the verb is in the passive:

Discussions have been *tentatively* begun (and it is hoped that they will be fruitful).

Tear gas was *indiscriminately* sprayed on the protesters.

Contrast also:

$\left\{ \begin{smallmatrix} \text{He put the point well.} \\ * \text{He well put the point. [but cf 'As he well knows']} \end{smallmatrix} \right.$

$\left\{ \begin{smallmatrix} \text{The point was put well.} \\ \text{The point was well put.} \end{smallmatrix} \right.$

However, *eM* is odd for means and instrument adverbials even in the passive, presumably because they have a higher priority for information focus than does the accompanying verb:

?These linguistic units should be *intonationally* separated.

?The specimen was *microscopically* examined. ['with a microscope']

The latter example would not of course be queried if the adjunct were manner [= 'meticulously'].

On process adverbials at I, cf 8.78.

Adjuncts of respect

- 8.85 Just as we saw that respect as a semantic category (cf 8.6) was parasitic on associated categories, so respect adjuncts show their parasitic character in being realized formally by expressions whose primary function is to realize other classes of adjunct. The point is illustrated by *formally* in the preceding sentence. Compare:

They are realized *formally*. [respect: 'so far as form is concerned']

He greeted the bishop *formally*. [manner: 'in a way that respected proprieties of form']

Not surprisingly in view of this, there is no category-specific question form that elicits adjuncts of respect. Besides nongradable adverbs, various types of prepositional phrase are used for respect adjuncts, some of them lexically specific (for example, *with reference to N*, *in/with respect to N*, *on the matter of N*), others based upon spatial phrases, especially those relating to 'position' and 'source':

She's advising them $\left\{ \begin{smallmatrix} \text{legally.} \\ \text{on legal issues.} \\ \text{with respect to law.} \\ \text{from a legal standpoint.} \\ \text{about matters of law.} \end{smallmatrix} \right.$

Adjectives take complements of respect with phrases introduced by such common and polysemous prepositions as *of*, *at*, *on*:

They are $\left\{ \begin{smallmatrix} \text{fond/frightened} \dots \text{of cats.} \\ \text{good/skilled} \dots \text{at drawing.} \\ \text{keen/adamant} \dots \text{on moral standards.} \end{smallmatrix} \right.$

(Cf 9.57, 16.68ff).

Adjuncts of respect are normally predicational (and hence tend to be placed at *E*), but it should be noted that respect is often expressed by means of subjuncts and disjuncts; cf 8.88, 8.124.

Note [a] Some verbs may take *O_a* or an adjunct of respect with little difference in meaning:

Having seen this sample, you may $\left\{ \begin{smallmatrix} \text{judge} \\ \text{judge of} \end{smallmatrix} \right\}$ the remainder.

['assess or form an opinion about']

[b] Rather formal titles of essays and the like may comprise prepositional phrases relating to respect:

Of dreams and their significance. <archaic>
 On (the question of) Disarmament.
 In Pursuit of Happiness.

Adjuncts of contingency

- 8.86 Of the contingency relationships that are expressed by adjuncts (as distinct from disjuncts: cf 8.132), reason and the semantic correlate purpose are outstanding. Significantly, the same question forms are used to elicit either of these adjunct types:

A: { *Why* did he do it? B: { *Because* he was angry. [reason]
 What did he do it for? *To* relieve his anger. [purpose]

It is rare to find either reason or purpose adjuncts realized by adverbs (but see Note [a] below). Prepositional phrases introduced by *because of*, *on account of*, etc are common for cause adjuncts; for example:

She returned home early *because of* his insistence.
 They want a better job *on account of* their high mortgage payments.
 He did it *for* his son.
 They've both stopped smoking *for fear of* heart disease.
 She performed a recital *out of* charity.
 There were several deaths *from* malnutrition.

Prepositional phrases expressing purpose adjuncts are chiefly introduced by *for*, indicating the relation not only to reason but to goal (ie space):

How many actors will you need *for* this production?
 He set a trap *for* the intruding fox.
 She's applying *for* a better job.
 They attacked the police *as a* protest.

Clauses also realize these types of adjunct. For cause, there are finite clauses introduced by *because* (cf 15.21) and (especially informally) nonfinite clauses introduced by *with*:

She returned home early *because* he insisted.
With him being so bad-tempered, I was reluctant to tell him of the car accident.

The latter are resistant to adjunct criteria, and are more usually realized as disjuncts; cf 8.132. For purpose (cf 15.48), the commonest type of clause is the nonfinite (infinitive) type, as in:

They need a bigger apartment *to accommodate* their elderly parents.
 She has gone alone to her room *so as to study* for her exams.
In order to stop the machine, press the red button.
 The police stopped the traffic *for me to get across* the street.

Finite clauses are more formal:

The chairman hurried the meeting *in order that* it might end before dark.
 One member had been suggesting an adjournment of the meeting *so that* matters need not be hastened.

But the finite purpose clause introduced by *so* alone is rather informal:

He's getting a new car *so he can impress* his mother-in-law.

By contrast, the clause introduced by *that* alone is exceptionally formal:

He died *that others might* live.

Equally formal (as well as rather archaic) is the negative purpose clause with *lest*:

The animals must be destroyed *lest the disease (should) spread*.

(Cf 3.61). In BrE, there is an informal alternative:

The animals must be destroyed *in case the disease spreads*.

On the mood in finite purpose clauses, cf 15.48. One further contingency relation is expressed by the adjunct, and that is concession when realized by prepositional phrases introduced by *in spite of* and *despite*. For example:

He won the race { *in spite of* / *despite* } his injured leg.

Except where they are obligatory (as in *He lived for his work*), adjuncts of cause, purpose, and concession tend to be sentential rather than predicational. Moreover, though more commonly at *E*, this is largely a matter of where information focus is required. They can equally well be placed at *I* and even (though less usually) at *M*:

On account of their high mortgage payments, they want a better job.
 One member had, *so that* matters need not be hastened, been suggesting an adjournment of the meeting.

- Note [a] In the following sentences the adverbs could be regarded as purpose adjuncts:
 They were *symbolically* burying a new car in protest against pollution. ['for symbolic purposes']
 The teacher addressed the students by their first names *experimentally*. ['for experimental purposes']
 [b] Clauses of cause or reason introduced by *since* and *as* are disjuncts: cf 8.124, 8.132.

Relative positions of adjuncts

- 8.87 In the relevant sections, we have given indications of the norms of position in respect of each class of adjunct. We turn now to consider the positions of adjunct classes in respect of each other. Two general principles can be stated, applying to relative order whether within a class or between classes:

- The relative order, especially of sentence adjuncts, can be changed to suit the demands of information focus; cf 18.9ff.
- Shorter adjuncts tend to precede longer ones, and in practice this often means that adverbs precede noun phrases, which precede prepositional phrases, which precede nonfinite clauses, which precede finite clauses.

Subject to these general principles, where adjuncts cluster in *E* position, the normal order is:

respect – process – space – time – contingency

It would be highly unusual to find all such five at *E* (or indeed all such five in the same clause), but for the purposes of exemplification we might offer the improbable and stylistically objectional (*cf* 8.20):

John was working *on his hobby* [respect] *with the new shears* [process] *in the rose garden* [place] *for the whole of his day off* [time] *to complete the season's pruning* [contingency].

The same point could be made more acceptably (but at greater length) by forming a series of sentences, each with any two of these adjuncts:

Adjuncts that can occur at *I* are usually those that *either* have relatively little information value in the context (*eg* in reflecting what can be taken for granted) *or* are relatively inclusive or 'scene-setting' in their semantic role (*eg* an adjunct of time). Thus:

That whole morning, he devoted himself to his roses.

Not only is the adjunct at *I* one of time, but the anaphoric *that* indicates that the period concerned has already been mentioned. It is unusual to have more than one adjunct at *I* except where one is realized by a pro-form (especially *then*), but they would tend to be in the reverse order to that observed at *E*. In practice, this usually means:

space – time *or* process – time

For example:

In America [*A*₁], *after the election* [*A*₂], trade began to improve.

Slowly [*A*₁] *during this period* [*A*₂] people were becoming more prosperous.

Subjuncts

- 8.88 We apply the term SUBJUNCTS to adverbials which have, to a greater or lesser degree, a subordinate role (see below) in comparison with other clause elements. This is made manifest by the fact that they cannot usually be treated grammatically in any of the four ways stated in 8.25 as being applicable to adjuncts. Let us consider the matter in respect of two very different subjuncts, *visually* as in [1] and *fairly* as in [2]:

This play presents *visually* a sharp challenge to a discerning audience. [1]

He *fairly* SPRANG at her with his questions. <esp BrE> [2]

Notice that for the subjunct reading we must understand *visually* as operating in the semantic role of respect (*cf* 8.6), 'as a visual experience'. The same adverb in a different sentence might be grammatically an adjunct, operating in the semantic role of process (means, *cf* 8.5), 'with his eyes (alone)':

He studied the play *visually* (but scarcely listened to a word). [3]

Likewise we must understand the subjunct *fairly* in [2] as having the semantic role of modality (*cf* 8.8), 'it is no exaggeration to say', though the same adverb can also be grammatically an adjunct in the semantic role of process (manner, *cf* 8.5), 'in a just and impartial way':

He questioned her (*quite*) *fairly*. [4]

If we now attempt the processes of 8.25 with [1] and [2], we either move away from the subjunct to the adjunct reading or produce an incomprehensible sequence:

It is *visually* that this play achieves a sharp challenge ...

Does this play achieve a sharp challenge ... *visually* or ... ?

This play achieves *only visually* a sharp challenge ...

How did this play achieve a sharp challenge ... ?

[Perhaps, however, 'From what point of view ... ?']

*It was *fairly* that he sprang at her ...

*Did he spring at her *fairly* or ... ?

*He *only fairly* sprang at her ...

*[How did he spring at her ... ?] *Fairly.

The 'subordinate role' to which we referred at the beginning of this section may apply to the whole clause in which the subjunct operates: this is what appears as 'wide orientation' in Fig 8.88. Alternatively, the subjunct may be subordinated to an individual clause element (usually the S) or even to an item forming part of a clause element (the V): this is what appears as 'narrow orientation' in Fig 8.88, where the relationships of the subjunct class are shown in some detail.

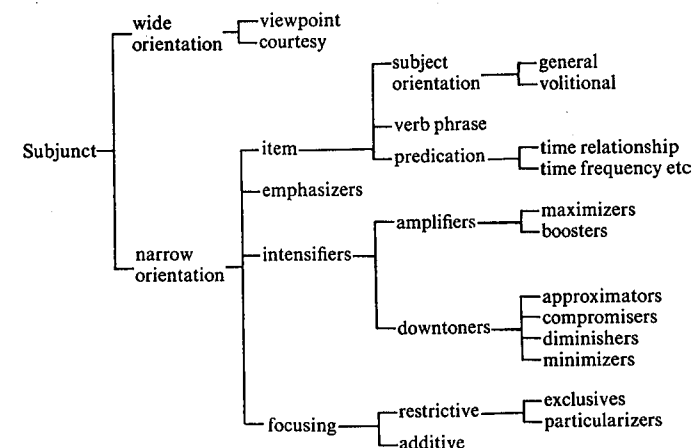

Fig 8.88

It is doubtless easier to appreciate the subordinateness of the role in relation to the subjuncts of narrow orientation. Some paraphrases for those

of wide orientation (such as 'from a visual point of view') seem rather to raise the items so as to be superordinate to the other sentence elements; and they can even seem to have the scope of disjuncts (cf 8.121ff). In fact, however, even subjuncts of wide orientation typically relate specifically to an individual element or even to a constituent of an element, and alternative paraphrases can demonstrate this:

Visually, a film should present experience of a kind not assimilable by the ears alone.

~ A film should be a *visual* presentation of experience...

Economically, a nation can be bankrupt while still flourishing *intellectually*.

~ An *economically* bankrupt nation may still be an *intellectually* flourishing one.

Wide orientation

Viewpoint subjuncts

- 8.89 Viewpoint subjuncts can be roughly paraphrased by 'if we consider what we are saying from an [adjective] point of view' or 'if we consider what we are saying from the point of view of [noun phrase]'.

Adverbs realizing viewpoint subjuncts are most commonly derived from adjectives by the addition of an *-ly* suffix. Examples are:

Architecturally, it is a magnificent conception.

Morally, *politically*, and *economically*, it is urgent that the government should act more effectively on aid to developing countries.

Geographically, *ethnically*, and *linguistically*, these islands are closer to the mainland than to their neighbouring islands.

To tap a private telephone line is not *technically* a very difficult operation.

It could have been a serious defeat, not only *militarily* but *psychologically* and *politically*.

Viewpoint subjuncts can also be formed from nouns by the addition of the suffix *-wise* (especially in AmE), though these are considered informal:

Program-wise, the new thing on TV last night was the first part of a new Galsworthy dramatization.

Weatherwise, we are going to have a bad time this winter.

All *-ly* adverbs realizing viewpoint subjuncts have a corresponding participle clause with *speaking* that is also a viewpoint subjunct, eg: *visually* ~ *visually speaking*, and a corresponding prepositional phrase with the frame *from* a [adjective] *point of view* that also has the same function, eg: *morally* ~ *from a moral point of view*. Other examples of viewpoint subjuncts include:

Many of these people have suffered, *economically speaking*, because of their political affiliations.

He has done better *from a personal point of view* than any other executive in the firm.

They behave *with respect to their morals* as they always have done.

As far as mathematics is concerned, he was a complete failure.

Looked at politically, it was not an easy problem.

If we consider the financial position, the country is going to have a bad year.

Viewpoint subjuncts, whatever their structure, tend to be put in *I* position. As distinct from when they are used as process adjuncts, adverbs functioning as viewpoint subjuncts are nongradable. Hence they do not accept clause comparison or the modification possible for many adjuncts (cf 8.88):

**Very economically (speaking)*, these people have suffered a great deal.

- Note [a] The corresponding clause with *speaking* resembles one of the correspondences for speech-related disjuncts (cf 8.124). However, the other correspondences for such disjuncts do not constitute correspondences for viewpoint subjuncts. For example, *to speak morally* (ie 'not immorally') does not correspond to the viewpoint subjuncts *morally* and *morally speaking* (ie 'from the standpoint of morals').
[b] Most viewpoint subjuncts in *-wise* are written without hyphens as single words, unless they are in 'nonce' usage; cf App I.41.

Courtesy subjuncts

- 8.90 Courtesy subjuncts are chiefly realized by a small group of adverbs used in rather formulaic expressions of politeness and propriety. The most common are exemplified below:

He *kindly* offered me a ride.

We *cordially* invite you to our party.

She announced that she will *graciously* consent to our request.

Take a seat *please*.

Will you *kindly* address a few words to the new students? [ie 'be kind enough to...']

(On the comparably formulaic use of adjectives, cf 17.97.) This is clearly distinct from the normal adjunct of manner, as in:

She spoke *kindly* to the new students.

He offered me a ride *kindly*. ['He offered me a ride and he did so *kindly*']

Needless to say, however, it would be expected that if the subject was kind in undertaking an action he would perform the action in a kind manner as well. Greater distinction in role can be seen with such courtesy subjuncts in requests with question form:

Will you *kindly* take your seats?

Here the meaning can only be 'Will you be so kind (ie agreeable) as to take your seats?' (since one could hardly *sit* in a kind manner). So too in asking:

Will she *graciously* consent to his request?

one is asking if she will be gracious and not if she will do something in a gracious fashion.

The commonest courtesy subjunct, *please*, is irregular in form and irregular also in not having a corresponding adjunct function: no function, that is, other than this present formulaic one (cf 8.91).

Courtesy subjuncts differ from adjuncts having the same form in that they are restricted to (e)M position except in imperative clauses, where the two that are commonest in such utterances differ from each other. With *kindly*, *I* is then obligatory (but cf 8.20 Note [b]):

Kindly leave the room. *Kindly* don't make a noise.
*Leave the room, *kindly*. *Don't *kindly* make a noise.

With *please*, *I* is usual but eM is possible for some speakers; iE is by no means unusual, and *E* is quite common:

Please leave the room.
Leave the room, *please*.
Please don't make a noise.
(?)Don't *please* make a noise.
Write on this form, *please*, your full address.
Don't make a noise, *please*.

Courtesy subjuncts require the active subject or the passive agent (whether present or implied) to be of personal reference. When courtesy subjuncts appear in questions, the questions constitute a request. There are therefore restrictions on the person of the subject in questions; it is normally first for *cordially*, *humbly*; and second or third for *kindly* and *graciously*. Consider the following rather ceremonious examples:

May we *cordially* invite you to our party?
May I *humbly* offer my apologies?
Will you *kindly* take a seat?
Will you *graciously* consent to our request?
Will passengers *kindly* refrain from smoking?

Please, however, allows all persons:

May I *please* explain my reasons?
Could {you
Mr Brandt} *please* move to one side?

Both *kindly* and *cordially* (but not *please*) commonly cooccur with the passive in formally official usage:

Passengers are *kindly* requested to refrain from smoking.
Members of the public are *cordially* invited to submit their views on the project.

8.91 Courtesy subjuncts do not usually carry a nucleus or occupy a separate tone unit:

Kindly help yourself|
?**Kindly* help yourself|
**Kindly* help yourself|

A form such as:

Kindly be quiet|

would suggest both irritation and a repetition of a more normally uttered request. Again, however, *please* is exceptional, and this subjunct frequently has a tone unit to itself, especially in final position with a rising tone. There is a discourse contrast between the following:

Help yourself *please*|
Help yourself *PLEASE*|

The former is more casual, the speaker taking for granted the courtesy subjunct; in the latter, the speaker seeks more deliberately (as perhaps with people he does not know so well) to emphasize the courtesy. But as the sole carrier of intonation nucleus, the courtesy disjunct conveys not merely emphasis but some urgency, insistence, or annoyance:

PLEASE be quiet| Be quiet *PLEASE*|

Kindly and *please* are the only courtesy subjuncts to appear freely with imperatives, though *graciously* occasionally does so too (in very ceremonious usage):

Graciously accept this gift from your admirers.

Indeed, unlike the other courtesy subjuncts, *please* is generally confined to imperatives or to sentences constituting a request or containing a reported one:

Will you *please* leave the room? <rather coldly formal>
You will *please* leave the room. <admonitory>
I wonder whether you would mind leaving the room *please*. <polite>
I asked him whether he would *please* leave the room.
*He *please* left the room.
A box of matches, *please*.
May I *please* have my book back?

Please and (to a lesser extent) *kindly* are very commonly used to tone down the abruptness of a command.

With the exception of *please*, courtesy subjuncts can be modified by *very*. However, *kindly* cannot usually be so modified in questions and requests (whether or not these are grammatically imperatives). Compare:

He *very kindly* offered me a seat.
**Very kindly* take a seat.
?Will you *very kindly* take a seat?
Kindly take a seat.
?You will *very kindly* leave the room.

The queried examples above are perhaps possible when they are said in a tone of exasperation.

With *please* must be contrasted the courtesy formula *thank you* and its more informal variant *thanks* (the form with subject, *I must thank you for . . .*, *I thank you*, is capable of being a main clause but as such the latter is used as a courtesy marker only facetiously). These are normally at *E* (except as disjuncts of the form *thanks to X*, which can be at *I*, *M*, or *E*; cf 8.127ff), unless they are operating as verbless clauses (cf 15.58ff). In either case they

normally carry a nucleus. For example:

- A: Let me show you the way|
 B: Oh I can manage alone| {THANKS|
 THANK you|

Though normally opposites, *please* and *thank you* can be alternative ways of responding gratefully (normally to something that is being accepted):

A: Will you have another glass?

- B: { (Oh) YÈS, { PLÉASE| [a falling tone on *please*, *thanks*,
 THANKS/THANK you| and *thank you* (often without *yes*)
 would show added enthusiasm]
 (Oh) NÒ, { *please| [No THANKS or No THANK you
 THANKS/THANK you| would be so emphatic as to sound
 rude]

But while the response *please* alone can pass for 'yes please', *thanks/thank you* cannot be used alone to mean 'no thank you'.

Note [a] The subjunct *please* is sharply different from the other items discussed above because of course it still retains some connection with the impersonal verb phrase ('it pleases N') from which it is historically derived and which is reflected in more formal expansions:

Come this way, *if you please*. [where *you* is historically the object]

I shall now call my last witness, *if it please your Lordship*. (BrE: law court usage)

In this latter example, the third person 'your Lordship' is of course a very formal and largely archaic way of indicating respect for a person addressed. But true 3rd-person involvement with *please* still occurs as a brief prayer in fervent wishes:

The war will be over soon, *please God*. [= 'if it pleases God [to end the war]']

[b] English differs from several other languages (such as German and Russian) in not using the same courtesy subjunct to accompany both requests and acknowledgements of thanks. For the latter in English, we have *not at all*, *don't mention it*, *you're welcome* (esp AmE), (*it's my pleasure*, and some variants of these. Thus:

A: Here is the book you lost.

B: Oh thank you very much.

A: { *Please.
 Not at all.

Again unlike many other languages, English lacks an institutionalized courtesy item for use in offering. It is difficult to make *HERE YOU ARE* sound courteous, and impossible to make it sound formal.

[c] Compare also the adverbs used in epistolary formulas:

Yours followed by *faithfully*, *sincerely*, *truly*, or *ever* (esp BrE)

Cordially, *Sincerely*, *Truly* followed by *yours* (esp AmE)

We also find *Yours* alone as well as (especially in informal use) *Sincerely* or *Affectionately* without *Yours*.

Narrow orientation

Item subjuncts

Subject-orientation

8.92 We saw in 8.88 that a subjunct might be in a sense subordinate to an element in clause structure or even to a constituent of the phrase or clause realizing an element. These subjuncts we call ITEM subjuncts.

If we move a sentence adjunct from *E* position to *I* or *M*, we can do more than allow another element to be highlighted by end-focus (cf 18.9). We may appear to narrow the application of the adverbial from the sentence as a whole so that it now seems to have a special relation with the subject. This is particularly true with process adverbials of the manner subclass (cf 8.5). Compare [1] where *casually* is such an adverbial, functioning as a sentence adjunct, with [2] where the function has been narrowed to subjunct status:

Leslie greeted the stranger *casually*. ['in a casual offhand manner',
 his *greeting* was casual] [1]

Casually, Leslie greeted the stranger. ['Leslie was casual, offhand,
 when he greeted the stranger'] [2]

That the relations of the adverbial in [1] and [2] are different is demonstrated not merely by the plausibility of the different glosses but by the fact that we can retain the item at *I* and also include a sentence adjunct of the same semantic value as that in [1] (though paraphrasing it, to avoid unwanted stylistic complications) without undue tautology:

Casually, Leslie greeted the stranger *in an offhand way*. [3]

Of course, such a combination as in [3] is unusual for the simple reason that to some extent [2] presupposes [1] and [1] presupposes [2]: it is natural for us to expect that in making a casual greeting the person doing so was casual. But it is by no means necessary for the two to go together.

A more convincing demonstration that the adverbials in [1] and [2] function differently, therefore, is provided if we polarize them semantically and show that we do so without seeming to be contradictory. If we imagine Leslie doing an action while studiously trying to show that he feels otherwise than his action implies, we have:

Carefully, Leslie greeted the stranger { *casually*.
 in an offhand way. } [4]

To assume subject-orientation, an adverbial must be derived from an adjective that can be predicated of the subject concerned. Thus, *there is* subject-orientation in [2]:

Casually, Leslie greeted . . .

This is because it is possible to say:

Leslie was *casual*.

But consider the following, with adverbs such as *unintentionally* or *accidentally*:

Accidentally, Bernadette dropped the plate.

Here the adverbial remains a sentence adjunct and it is impossible to parallel [3] or [4], as in:

**Accidentally*, Bernadette dropped the plate *on purpose*. [5]

This is because it is impossible to say:

*Bernadette was *accidental*.

The apparent intention behind [5] is of course perfectly possible to express with a contingency adjunct:

As though accidentally, Bernadette dropped the plate *on purpose*.

There is, indeed, a stereotyped joke in which the two adverbs are juxtaposed: 'I suppose you did that *accidentally on purpose*.'

Note If we experiment in the manner of 8.25 with many subject-oriented subjuncts, we find that in doing so we have to understand them as adjuncts. For example:

It was *casually* that Leslie greeted the stranger.

Did Leslie greet the stranger *casually* or . . . ?

Furthermore some subjuncts, like *casually* in [2], can be outside the scope of negation while manner adjuncts cannot. Thus it makes perfectly good sense to say both of the following:

Casually, Leslie greeted the stranger.

Casually, Leslie didn't greet the stranger.

This last would not mean that he did not greet the stranger casually, but rather that he was so casual in his behaviour that he did not bother to make a greeting. But we cannot say both of the following, because *slowly* is an adjunct:

Slowly, the nun walked up the hill.

**Slowly*, the nun didn't walk up the hill.

- 8.93 Subject-orientation thus effects a characterization of the referent of the subject with respect to the process or state denoted by the verb. Most of the subjuncts concerned are manner adverbials, and all are either adverbs or prepositional phrases. Two groups can be distinguished: [A] a general group, and [B] a volitional group.

Group [A]: GENERAL GROUP

Group [A] appears to be an open class; for example:

Resentfully, the workers have stood by their leaders.

['The workers have stood by their leaders and were resentful about it' or - in context - '... but were nonetheless resentful']

With great pride, he accepted the award. ['He was very proud to accept ...']

For once, they have *frankly* admitted their mistakes. ['For once they have been frank and admitted their mistakes']

Manfully, they insisted that the situation was not too bad. ['It was manful of them to insist ...']

She has *consistently* overruled the lawyer's objections. ['She has been consistent in overruling ...']

Bitterly, he buried his children. ['He was bitter when he ...']

Sadly, she wandered through the library. ['She was sad when she ...']

With great unease, they elected him as their leader. ['They were very uneasy when they ...']

Group [B]: VOLITIONAL GROUP

Common volitional subject-oriented adverbials include:

deliberately, (un)*intentionally*, *purposely*, *reluctantly*, *voluntarily*, *wilfully*, (un)*willingly*, *without intention*, *on purpose*, *with reluctance*; for example:

Intentionally, they said nothing to him about the matter.

['It was their intention not to ...']

On purpose, he left his proposals vague. ['It was his purpose to ...']

With great reluctance, she called the police to arrest her guest.

['Though she was very reluctant to do so, she called the police ...']

- 8.94 Many of these subjuncts, particularly those in Group [A], show their relationship to the subject by the paraphrase they allow, in which their adjective base is in predicative relationship to the subject (cf 8.92). For example, we must provide a different paraphrase for the subject subjunct *bitterly* as compared with the same item as manner adjunct or booster intensifier:

Bitterly, he buried his children. ['He was bitter when he ...']

He spoke *bitterly* about the treatment he received. ['He spoke in a bitter way ...']

He *bitterly* regretted their departure. ['He very much regretted ...']

But similarly, with an example from Group [B]:

She refrained *deliberately* from joining the party. ['She was quite deliberate in refraining ...']

She spoke *slowly* and *deliberately*. ['in a deliberate manner']

The volitional subjuncts differ from the others in several respects:

(I) Volitional subjuncts have in common that they express the subject's intention or willingness, or the reverse.

(II) Volitional subjuncts can often occur with copular verbs if (i) the adjective as complement is being used dynamically, or (ii) if the noun-phrase complement implies activity, or (iii) if there is a space adjunct:

He is being foolish *intentionally*.

He is being a nuisance *deliberately*.

He was in London *reluctantly* for his daughter's wedding.

Contrast:

*He is $\left\{ \begin{array}{l} \text{wealthy} \\ \text{foolish} \end{array} \right\}$ *intentionally*.

*He is an adult *deliberately*.

On the other hand, subjuncts in the general class, Group [A], cannot cooccur with intensive verbs:

*He was in London *proudly*.

**Sadly*, he is being foolish. [asterisked as subject-oriented subjunct: 'He is sad when he is ...'; the sentence is fully acceptable if *sadly* is a content disjunct: cf 8.129]

(III) Volitional subjuncts can more easily appear before clause negation than the general subjuncts (cf 8.92 Note):

He *purposely* didn't write to me about it.

Deliberately, they didn't send him the money.
 ?*Proudly*, he didn't write to them about it.
 ?*Resentfully*, they didn't send him the money.

Subject subjuncts cannot cooccur with a nonpersonal subject in an intransitive or active-voice clause:

**Consistently*, the water kept boiling.
 **Reluctantly*, the avalanche destroyed the chalet.

However, in the passive form it is the agent (whether present or not) that must not be nonpersonal:

The chalet was *reluctantly* destroyed { (by the developers).
 *(by the avalanche).

The lawyer's objections were *consistently* overruled.

The presence or implication of a personal agent does not in itself ensure acceptability of a subject subjunct. For example, the sentence:

?*The house was *resentfully* built last year.

is odd, presumably because building a house takes too long for resentment to be maintained. Contrast:

The house was *resentfully* sold last year.

Passive sentences with personal subject and agent leave an adverbial equivocal:

John was *willingly* sent to friends for the summer (by his mother).
 [either 'John was willing' or 'his mother was willing']

Contrast:

The parcel of valuables was *willingly* sent to the charity organizers.
 [only 'the sender was willing']

Nonetheless, even where a personal agent is well understood, subject subjuncts are often regarded as awkward with the passive. Although the following textual example in a recent book would be widely acceptable, it was criticized by a reviewer, presumably because with the agentless passive the adverbial could not easily be linked with a subject ('Someone *foolishly* destroyed the letters') and hence invited interpretation as an implausible manner adjunct:

The letters were *foolishly* destroyed.

Note [a] The analogy of regarding adjectives and clauses as restrictive or nonrestrictive (cf 17.3ff) provides another way of looking at the distinction between process adjuncts and subject subjuncts. The subjunct in, for example:

Bitterly, he buried his children.

can be paraphrased as in the italicized part below:

He buried his children *and I tell you that he was bitter when he did so.*

The nonrestrictive relative clause can similarly be paraphrased by a coordinate clause:

Alan, *who is my teacher*, has joined the army. ['Alan has joined the army and I tell you that he is my teacher']

[b] The volitional subject subjuncts are similar to purpose adverbials both semantically and in their grammar, resembling as they do purpose disjuncts (cf 8.121ff). Cf also the subject-oriented disjuncts such as *foolishly* and *wisely* (8.129).

8.95 Subjuncts in Group [A] of 8.93 tend not to precede clause negation:

**Sadly*, she didn't wander through the library. [asterisked in the sense
 'She was sad when she . . .']
 ?*With great unease*, they didn't elect him as leader.

Similarly, subject subjuncts in Group [A] tend for the most part not to precede a negative subject:

**With great unease*, nobody elected him as leader.

However, if we can interpret the negated sentence as conveying the meaning of a volitional action, we can sometimes add a subject subjunct of Group [A]. For example, in comparing the following:

?**Proudly*, he didn't accept the award.
Proudly, he wouldn't accept the award.

we note that, while the former is odd, the latter is acceptable, because 'wouldn't accept' means 'refused', and a refusal can be done with pride.

The volitional subjuncts allow alternative interrogation (cf 8.25), though with a decided shift towards adjunct interpretation (cf 8.92 Note):

Did he leave his proposals vague *on purpose* or did he do so
unintentionally?

Subjuncts from both groups can come within the scope of predication pro-forms or ellipsis:

She has *consistently* overruled the lawyer's objections and *so has* her
 colleague (consistently overruled the lawyer's objections). [*ie* 'They
 were both consistent in overruling . . .']
 He *deliberately* misled us and *so did* she (deliberately mislead us).

Subject subjuncts often cannot cooccur with imperatives:

**Uneasily* elect him as your leader. **Sadly* tell them about it.

It should be noted that, in such cases, it is equally odd to say:

*Elect him as your leader *and be uneasy when you do so.*
 *Tell them about it *and be sad when you do so.*

(If *be* is interpreted as equivalent to *seem* or *pretend to be*, the sentences become acceptable, of course.)

On the other hand, we can have:

Gladly reveal what you know.
With full confidence in your success, make your views known to them.

just as we can have:

Reveal what you know *and be glad when you do so.*

Make your views known to them *and have full confidence in your success when you do so*.

Subject subjuncts, like process adjuncts, do not seem to be acceptable before an emphatic auxiliary:

**Proudly* he *did* accept the award.

**On purpose*, he *did* leave the proposals vague.

In this respect they can be contrasted with the otherwise somewhat similar subject disjuncts such as *wisely* and *rightly* (cf 8.129, 8.94 Note [b]):

Wisely, he *did* accept the award.

Rightly, he *did* leave the proposals vague.

Subject subjuncts tend to occur in *I* and *M* positions, but can appear at *E* where an adjunct interpretation is excluded, as in:

He was in London *reluctantly*.

Verb-phrase and predication subjuncts

- 8.96 In 8.1, attention was drawn to the distinction between grammatical units functioning as clause element A and the same units functioning as a *part* of a clause element. The distinction is not, however, always self-evident. Between [1], where *really* is part of C, and both [2] and [3], where *really* is not, the distinction is clear enough; but it is not easy to establish whether [4] is more like [1] or more like [2] in this respect:

- | | |
|--|-----|
| She is a <i>really</i> intelligent child. | [1] |
| She <i>is really</i> an intelligent child. | [2] |
| She <i>really</i> is intelligent. | [3] |
| She <i>is really</i> intelligent. | [4] |

Semantically, there is little to choose between regarding *really* in [4] as part of C or as a separate subjunct; nor are there convincing grammatical grounds, since (for example) it is possible for some people to front a subjunct plus C just as it is possible for everyone to front an adverbially modified C:

Really intelligent, she is! *Really* an intelligent child, she is!

But while it is significant to see the relational similarities, we shall take the position here that if, as in [4], an adverb can be interpreted as part of a structure realizing a clause element, it is not to be regarded as falling within the purview of this chapter – any more than *very beautifully* in 'a very beautifully dressed girl' or *in the garage* in 'The car in the garage is Joan's'. By contrast, *really* in [2] is a predication subjunct.

The V-element has to be treated differently from S, O, C, and A in that subjuncts must be seen both as A and as simultaneously functioning within V. We can illustrate this by contrasting two sentences with a superficially similar beginning:

- | | |
|---|-----|
| Freda is { able.
an able speaker. } | [5] |
| SVC: 'Freda is (a) competent (speaker)' | |

Freda is able to address the meeting.

[6]

SVO: 'Freda can address it'

In each case, we can introduce adverbs before *able*. But whereas in [5] they relate to the regular accretion of phrase structure within an element, in [6] they function as subjuncts, affecting the modality of the V-element. It will be noticed that some adverbs acceptable in the one are significantly disallowed in the other:

- | | | | |
|----------------------------|--|----------------------------|------|
| [Freda is
Freda is a] | { very
really
quite
?perfectly
*well
*totally } | [able.
able speaker.] | [5a] |
|----------------------------|--|----------------------------|------|

- | | | | |
|----------|--|------------------------------|------|
| Freda is | { *very
really
quite
perfectly
well
totally } | able to address the meeting. | [6a] |
|----------|--|------------------------------|------|

Subjuncts in some verb phrases have become so institutionalized as to cause the whole sequence to be regarded as a separate unit. On modal idioms, cf 3.45f. Compare:

I would go ~ I would { *rather*
 sooner } go.

I had *better* see a doctor.

This last example is especially clear because there is no '*I had see a doctor'.

Analogously, the subjuncts in phrasal verbs are sometimes thoroughly incorporated as part of an idiomatic whole. Contrast:

He drank (*up*) the rest of the milk.

He made *up* the rest of the story.

(Cf 16.3f)

Time-relationship subjuncts

- 8.97 The items to consider here are especially *already*, *still*, and *yet*, corresponding in semantic force to the time relationship adjuncts of Group (b) in 8.72. Positionally, *already* and *still* normally occur in *M*, and *yet* in *M* or *E*. These three adverbs differ from each other in usage with respect to negation and other sentence processes normally requiring nonassertives (cf 10.57ff). *Yet* is usually a nonassertive form, but it can occur in assertive verb phrases comprising modals or semi-auxiliaries (cf 3.21, 3.47f):

The first snowdrops are *yet* to appear.

I have *yet* to find out what he wants.

We may *yet* see her elected to the Senate.

Yet can be used as an assertive form also when it is closer in meaning to *still* ['even now']:

- | | |
|-----------------------------|--------------------------------------|
| I can see him <i>yet</i> . | There's plenty of time <i>yet</i> . |
| I can <i>still</i> see him. | There's <i>still</i> plenty of time. |

Still can precede negation, but normally cannot lie within the scope of clause negation (cf 10.54ff) except in questions. On the other hand, *already* cannot come within the scope of clause negation except in questions, and it normally cannot precede negation. The possibilities for the three adverbs in declarative, negative, and interrogative sentences are given below, where the paraphrases or suggestions for context indicate semantic similarities and differences between the adverbs. Note also the cooccurrence of perfective aspect in three of the five sets.

DECLARATIVE POSITIVE

- I *already* like him. ['I have by this time come to like him']
 *I *yet* like him.
 I *still* like him. ['I continue to like him']

DECLARATIVE NEGATIVE (adverb preceding negation)

- *I *already* haven't spoken to him.
 *I *yet* haven't spoken to him.
 I *still* haven't spoken to him. ['I haven't spoken to him so far',
 implying 'even after all this time']

DECLARATIVE NEGATIVE (adverb following negation)

- *He can't *already* drive.
 He can't {drive *yet* / *yet* drive}. ['He can't drive up to this time' implying
 'even after all this time']
 ?He can't *still* drive. ['He can't continue to drive' or 'Surely it is not true
 that he can still drive?']

INTERROGATIVE POSITIVE

- Have you *already* seen him? [expecting that you have or implying that
 you have done so earlier than expected]
 Have you seen him *yet*? ['by now': *even yet* would imply 'after all this
 time', balancing *already* in the previous example; thus 'I've kept
 asking you to see him for weeks: have you seen him *even yet*?']
 Do you *still* see him? ['Do you continue to see him?']

INTERROGATIVE NEGATIVE

- Haven't you seen him *already*? ['Surely you have seen him by now?']
 Haven't you seen him *yet*? ['Surely you should have seen him by now?']
 Don't you *still* see him? ['Surely you continue to see him?' ie expecting
 that you do]

On the nonassertives *any more* and *any longer* and the negatives *no more*, *no longer* as time-relation subjuncts, consider the following examples:

- Do you see him *any more/any longer*? } [expecting that you do not]
 Do you *any longer*/**any more* see him? }

I see him *no more/no longer*. <formal>

I do not see him *any more/any longer*.

- Note [a] The difference between *already* and *yet* in questions is that *already* expects an affirmative answer whereas *yet* leaves open whether the answer is negative or positive (cf 11.6ff), except in 'conducive' (negative) questions such as 'Haven't you seen him *yet*?'

- [b] *Yet* and *still* come close in meaning in modal verb phrases:

- | | |
|--|------|
| I have <i>yet</i> to meet him. | [1] |
| We may <i>yet</i> see her elected to the Senate. | [2] |
| I have <i>still</i> to meet him. | [1a] |
| We may <i>still</i> see her elected to the Senate. | [2a] |

Both of the sentences [1] and [1a] mean 'It remains for me to meet him', but the examples with *still* both carry the implication of an objective that is likely to be fulfilled.

- [c] *Still*, *yet*, and *already* often blend concessive and temporal meanings. For example, in:

- It's 11.30 p.m. and he's {*still* at work.
 at work *yet*. <esp dialectal>
 It's 5.30 a.m. but he's *already* at work.

The effect of *still* and *yet* is to express not only the continuance of the action but also to suggest that the continuance is surprising ('He's continuing even so to work'). So too, *already* expresses both the time relation ('by now') and some surprise at its realization. See also the concessive conjunct *still* (8.137).

- [d] The subjunct *still* can be endorsed by *yet* at E, as in:

- She's *still* there (even) *yet*. [but not the converse: *She's *yet* there *still*]

Sometimes *as yet* is a more formal variant of *yet*:

- I have not *as yet* decided to accept the appointment.

In other situations, *yet* and *as yet* have a quite distinct distribution:

- I have {*yet* / ?*as yet*} to meet him.

- Hasn't she arrived {*yet*? / ?*as yet*?

- As yet*, he was only a minor official. [≠ 'Yet, he was...']

- [e] Informally in AmE (especially in the Mid-West), *yet* at E can occur in assertive clauses, especially of an exclamatory kind and with *yet* having something of the function of a focusing subjunct; cf 8.116. For example:

- Ah, so you've bought new slippers *yet*!

- Everyone else turned discreetly away, but not John: John just had to turn and look *yet*!

Again in some varieties of AmE there is an exclamatory use of *any more*, with various meanings: '(even) yet; (even) now; more and more; would you believe it?' Frequently this usage amounts to little more than an expression of surprise:

- Did you say 'encephalate'? What's that supposed to mean *any more*? [approximately:

- 'What on earth does that mean?']

- They're dancing in the street *any more*!

- She's looking better and better *any more*!

Other time subjuncts

- 8.98 As well as being used for focusing and intensification (cf 8.116ff, 8.104ff) but in close relation to such uses, *just* (always at M) can express time position. With the perfective or progressive, it can mean either 'at this/that precise moment' or 'very recently':

He's *just* stopped talking.

I'm *just* finishing an article on the subject.

When I saw her, she had *just* come back.

In informal AmE, this is true also with the simple past ('Where's John?' 'He *just* went out'). More generally with the simple past, *just* means 'recently',

and with the future or present progressive it means 'very soon', in both cases frequently in association with more specific time adverbials:

She *just* spoke to me about it (a moment or so ago).
He's *just* coming (in a moment or so).

On *just* as a downtoner (diminisher), cf 8.111.

The combination *just now* is used at *E* for either 'very recently' or 'very soon':

I saw her *just now*. I'm } seeing her *just now*.
 I'll be }

(Contrast *just* + *then*, *right* + *now/then*, 8.116.)

Time duration is expressed (by implication) in the use of some intensifiers such as *enough*:

Have you talked to him *enough* now? ['sufficiently long']
We played cards *a little* last night. ['for a short time']
I hate having to wait *a lot* at the bank. ['a long time']

But it is time frequency that especially involves the use of subjuncts. For example:

She { doesn't *ever* come }
 { *never* comes } to see me.
 { *hardly ever* comes }

[Cf informally *never ever*: 'They *never ever* clean their windows'.]

They are *forever* complaining.

I am *ever* open to new ideas. <formal> [*always* would be more usual,
and *ever* is normally nonassertive; cf 10.60]

I have { *rarely* } reviewed a more dishonest book.
 { *seldom* }

They should *sometimes* give their dog a bath.

Several intensifiers (cf 8.104ff) are also used for time frequency, as in:

I used to play squash *very often* but now I don't play *much/a lot/a great deal*.

... but now I *barely/hardly/scarcely* play (at all).

... but now I { *hardly* }
 { *scarcely* } ever play.

... and I *still* play *a little/a bit*.

Positional norms are as illustrated, but *sometimes* may also occur at *I* or *E*; *rarely* and *seldom* at *I* would usually require subject-operator inversion (cf 18.24) and at *E* would normally be rather heavily modified:

I play squash *very seldom indeed*.

Note [a] Several of these subjuncts have some of the character of adjuncts, especially when premodified or focused:

It is *very seldom* that I write poetry these days.
It was *only just now* that I remembered our appointment.
?It is *only a little* that we play bridge.

[b] In very informal use, *hardly* can be at *E* without prosodic weight:

(She used to write a lot but now) she doesn't write at ALL *hardly*. [more usual: 'she *hardly* writes at all']

There is also an informal double negative as in: 'You *can't hardly* move in this office'. [more acceptably: 'You can *hardly* move ...']

Emphasizers

8.99 There is a range of subjuncts concerned with expressing the semantic role of *modality* (cf 8.8) which have a reinforcing effect on the truth value of the clause or part of the clause to which they apply. In adding to the force (as distinct from the degree) of a constituent, *emphasizers* do not require that the constituent concerned should be gradable. When, however, the constituent emphasized is indeed gradable, the adverbial takes on the force of an intensifier (cf 8.104). Compare the use of *really* in the following:

He *really* may have injured innocent people. [1]
He may *really* have injured innocent people. [2]
He may have *really* injured innocent people. [3]

In [1] and [2] we have a pure *emphasizer* and we might paraphrase as follows:

It is *really* possible that he has injured ... [1a]
It is possible that it is *really* true that he has injured ... [2a]

With [3], however, the implication is of a high degree of injury as well as the assertion of certainty; *ie* both [3a] and [3b]:

It is possible that he has *really* [*ie* actually, indeed, certainly] injured ... [3a]
It is possible that he has *really* [*ie* seriously, to a severe extent] injured innocent people. [3b]

Note The typical *emphasizer really* illustrates both the structural equivocation discussed in 8.96 and also the inherent nature of the subjunct in being subordinated semantically to another unit in the clause (cf 8.88, 8.25). Thus individual speakers will vacillate as to how the emphasis may be grammatically realized, as in:

He's in a real corner. He's *really* in a corner. (?) He's in *really* a corner.
He's in real difficulties. He's *really* in difficulties.

8.100 Common *emphasizers* include:

(a) *actually, certainly, clearly, definitely, indeed, obviously, plainly, really, surely, for certain, for sure, of course*
(b) *frankly, honestly, literally, simply, fairly* <esp BrE>, *just*

Group (a) consists mainly of items that can also function as *disjuncts* expressing the comment that what is being said is true (cf 8.127). Group (b) consists mainly of items that can also function as *disjuncts* conveying the speaker's assertion that his words are the unvarnished truth (cf 8.124). Since it is normally expected that a person intends his hearer to accept what he says as true, the addition of the comment or assertion in no way alters but merely emphasizes the truth of the communication. When these *emphasizers*

are positioned next to a part of the communication, without being separated intonationally or by punctuation, their effect is often to emphasize that part alone, though there may be ambivalence as to whether the emphasis is on the part or on the whole.

Examples of the use of emphasizers:

She *plainly* likes the dress.
 I *honestly* don't know what he wanted.
 I can't *really* believe him.
 He *actually* sat next to her.
 I *just* can't understand it.
 They will *surely* object to his intervention.
 They *literally* tore his argument to pieces. [cf 8.126]
 They *obviously* don't want it.
 He *fairly* jumped for joy. <esp BrE>
 I *simply* don't believe it.
 They will warn us *for sure*.

With Group (a) should be considered responses to requests:

A: Please get me the file on Robert Schultz.

B: CÉRTAINLY
 SÛRE <esp AmE informal>
 SÛRELY <esp AmE>
 ALL RÍGHT
 RÍGHT
 ÒK
 WÍLL DÓ <BrE informal>
 Very GÓOD

A: Are you willing to help her?

B: (Yes) CÉRTAINLY
 SÛRE <esp AmE informal>
 SÛRELY <esp AmE>
 Yes INDEED
 Yes YÉS
 ÒK
 RÍGHT <esp AmE>
 ALL RÍGHT [implies lack of enthusiasm]
 HÁRDLY
 No INDEED
 Certainly NÒT
 (No) NÒ

Only a few of these responses, of course, correspond directly to subjuncts in full clauses; eg 'I *certainly* will', 'I will *indeed*', 'I *sure* will'. It is especially with Group (a) that we should associate the asseveratives of very informal speech. Consider the following rather angry exchange:

A: You altered the clock.
 B: I didn't! I *never even* touched it.
 A: You DÍD.

As well as this last response we might find:

You did *sò*. <informal, esp by children>
 You *certainly* DÍD.
 You *darned well* DÍD. <very informal>

Cf also the following, all very informal:

Who	} { + question + } { for goodness' sake } ? { for pity's sake }
What	
Where	
Why	
How	

the hell
 the blazes
 on earth
 in heaven
 in (the) hell

For example:

Why on earth did you alter the CLÖCK *for goodness' sake*?

Other types of utterance with subjunct asseveratives include the very informal:

I told them to *darned well* go. [cf 8.21]

I told them to get their car { *the hell* } out of my drive.
 { *to hell* }

Note [a] For some speakers, *plain* can informally function as a subjunct ('He's *plain* dishonest'), but more usually the informal version would be *just plain*, as in 'He's *just plain* dishonest' (cf 8.96).
 [b] The subjunct *sure* in 'I *sure* will' <esp AmE> is to be distinguished from the two adjectival uses:

I am *sure* of winning. ['I feel confident that I shall win']
 I am *sure* to win. ['There is widespread confidence that I shall win']

[c] In Group (a), *for certain* and *for sure* cannot function as disjuncts of comment (among other things, they are only rarely positioned initially) but are obviously related to *certainly* and *surely* respectively in their emphasizer uses. In Group (b), *fairly* <esp BrE> and *just* cannot function as speaker's authority disjuncts. However, *fairly* can be related to the set of such disjuncts to be *fair*, to put it *fairly*, etc, for which there happens to be no corresponding adverb, while an association can be seen between *simply* in *Simply tell him he's wrong*, disjunct; *I am speaking simply*, process adjunct, 'in a simple manner'; *I simply say*, restrictive focusing subjunct (cf 8.116ff), 'merely', 'only', 'just'; and *just* in *I just say*, restrictive subjunct.

[d] On the use of *literally*, cf 8.126.

Cooccurrence restrictions on emphasizers

8.101 While emphasizers in Group (a) seem to be free to cooccur with any verb or predication, those in Group (b) tend to be limited. For example, *fairly* <esp BrE> and *absolutely* require some suggestion of exaggeration in the predication:

In her anger, she { *fairly* <esp BrE> } screamed at him.
 { *absolutely* }

*In her anger, she { *fairly* <esp BrE> } spoke to him.
 { *absolutely* }

On the other hand, *honestly* tends to cooccur with verbs expressing attitude or cognition:

They *honestly* admire her courage.

He *honestly* believes their accusation.

?*In her anger, she *honestly* screamed at him. [\neq disjunct (cf Note) as in 'I am honestly telling you . . .']

When some emphasizees are used with gradable verbs they may also have a scaling effect akin to that of boosters (cf 8.105):

He *really* likes her. ['He likes her very much']

I *indeed* appreciate your help. ['I *greatly* appreciate your help']

He *definitely* impressed them. ['He impressed them *greatly*']

But unlike the boosters, these have of course a reinforcing and emphatic effect with nongradable verbs too:

He *really* was there.

We *definitely* saw it.

She *indeed* sat next to them.

Other emphasizees tend to have a scaling effect more readily with gradable words that are adjectives and nouns (cf 7.4):

She is *certainly* intelligent. ['She is *very* intelligent']

I was *frankly* appalled at his attitude. ['I was *absolutely* appalled']

He's *obviously* a fool. ['He's a *big* fool']

He's *clearly* a dangerous man. ['He's a *very* dangerous man']

The scaling effect of *really* and *indeed* is more obvious with adjectives:

It was *really* funny.

He's dangerous *indeed*. [mannered without a correlating *very*: 'very dangerous *indeed*']

Speakers may vary in the extent to which they feel that all or some of these emphasizees have a scaling effect.

Note If *honestly* is used as in 'Honestly, she screamed at him', the adverbial is a disjunct (cf 8.124), asserting the speaker's good faith in making the statement rather than emphasizing the particular choice of words in the predication. A move to *I* would likewise change the relationship in respect of several other items illustrated in the examples (eg: *frankly*); so too would a move to *E*, where the disjunct would require a separate intonation nucleus: 'She SCREAMED at him FRANKLY', 'She SCREAMED at him HONESTLY.'

Syntactic features of emphasizees

- 8.102 Most emphasizees normally precede the item they emphasize (*iM*, *M*, *eM* positions in respect of verb phrases, cf 8.14ff), and for *certain* and for *sure* are exceptional in being at *E*. As subjunctors, emphasizees differ from adjuncts in several ways. They cannot be contrasted with one another in alternative interrogation or alternative negation; they cannot be the focus of focusing subjunctors or of a cleft sentence, nor (in the case of the adverbs) can they be the focus of clause comparison or be premodified by *however*, *how*, or *so*. Many can, however, come within the scope of predication pro-forms or ellipsis; for example:

Joan will $\left\{ \begin{array}{l} \text{certainly} \\ \text{surely} \end{array} \right\}$ object and so will Mary.

[= 'it is equally *certain/sure* that Mary will object']

As several of the examples in 8.100 show, most emphasizees can precede a negated verb phrase, except for *fairly* (esp BrE):

They *fairly* danced for joy at the news. (esp BrE)

*They *fairly* didn't dance for joy at the news.

Several items tend to cooccur with clausal negation and precede the verb phrase in such a case, in particular *honestly*, *just*, *simply*.

Five emphasizees can lie within the scope of clause negation, and the last two listed are normally thus, since they are placed at *E*:

actually, *definitely*, *really*, for *certain*, for *sure*

All of them can become the focus of negation:

I don't *REALLY* know him.

He didn't *ACTUALLY* sit next to her.

They don't *DEFINITELY* want it.

They don't know for *CERTAIN*.

I can't tell you for *SURE*.

Since *actually*, *definitely*, and *really* can also lie outside the scope of clause negation, we have a contrast between the two possibilities, the scope of negation being marked by the horizontal bracket (cf 10.64):

I really don't know him. ['The real truth is that I don't know him',
ie 'I don't know him at all']

I don't really know him. ['It's not the real truth that I know him',
ie 'I don't know him well']

He actually didn't sit next to her. ['The actual fact is that he didn't sit
next to her']

He didn't actually sit next to her. ['It's not an actual fact that he sat next
to her']

They definitely don't want it. ['It's definite that they don't want it']

They don't definitely want it. ['It's not definite that they want it']

All the emphasizees except *certainly* and *surely* (and for most speakers *fairly* too) can appear in a question; compare:

Do they $\left\{ \begin{array}{l} \text{certainly} \\ \text{*surely} \\ \text{definitely} \\ \text{really} \end{array} \right\}$ want him to be elected?

In general, the emphasizees do not appear with imperatives, but some people use *actually*, *definitely*, and *really* with imperatives:

Don't *actually* hate him for it – it wasn't really his fault.

Definitely buy one now.

Make an effort this time; but *really* make an effort.

Note The informal phrase *all right* can be a process adjunct (cf 8.79) as in 'Did she manage to find the place *all right*?'; a content disjunct (cf 8.127ff) as in 'All *RIGHT*, she's a good student' (ie 'I grant you'); and also an emphasizee subjunctor as in: 'She's a good student, *all RIGHT*, ['She's certainly a good student']

The subjunct may relate to a specific element, as to the time adjunct in:
She won't worry unless you hurt yourself. THÌN she'll worry all RIGHT.

[= 'Then {^{CERTAINLY}_{INDEED} } she'll worry']

- 8.103 The emphasizeers either cannot be modified or are unlikely to be modified; an exception is *definitely*, which is sometimes premodified by *quite* or *very*.
Certain emphasizeers not listed in 8.100 appear in restricted environments:

- (i) *Always* when preceded by *can* or *could* must be in a positive declarative clause:

You can "always sleep on the FLÖÖR. ['You can certainly ...']

The possibility of adding to this sentence an adverbial referring to a specific future time such as *tonight* or *just for one night* rules out the temporal meaning of *always*. By contrast, if the clause is negative, the temporal meaning alone is activated and the item is no longer a subjunct:

You can't always sleep on the FLÖÖR.

[= 'You can't sleep on the floor on all occasions']

- (ii) Unmodified *well* when preceded by *can*, *could*, *may*, or *might* must be in a positive declarative clause; the effect is to imply probability where the auxiliary alone connoted only possibility:

It {^{may}_{might}
can
could } well be true that he beat her. [= 'It may indeed ...' or even
'It is quite likely to be true ...']

Note also with fronting (cf 18.20):

She hopes they will respond gratefully {^{and}_{as} } well they may.
which they may well do.

This would imply 'should', and (especially with *as*) there would be little difference in meaning if the example ended '... as well they ought/should' - although, without fronting, *well* does not thus cooccur with *ought* or *should*:

*He {^{should}_{ought} } well ...

With some verbs, there are other restrictions on the auxiliaries admitted:

He {^{may}_{*can}
might
could } well attend the meeting instead of me.
['He may surely ...', 'He can very easily ...']

On the other hand, intensified by *very*, the subjunct usage has no such restriction to positive clauses or to certain verbs:

He {^{can}_{can't} } very well attend the meeting.

['He surely can ...', 'He surely can't ...', 'He can't very easily ...']

- (iii) *Necessarily* is an emphasizeer when preceded by *must*:

A school teacher who wishes to be honest *must necessarily* prepare her lessons. ['must inevitably']

Otherwise, *necessarily* is an adjunct of contingency which tends to cooccur with the clausal negative particle:

That doesn't {^{necessarily}_{follow necessarily} } ['That doesn't follow inevitably']

- (iv) *Needs* (rare, literary) has to be preceded or followed by *must* in a positive declarative or interrogative clause:

That *must needs* be their intention. ['must inevitably']

Note [a] *Indeed* can be postposed:

I appreciate your help *indeed*. (rather formal or old-fashioned)

This is more common with adjectives (particularly if they are modified by another intensifier) and nouns with indefinite article:

He was very happy *indeed*.

It was a sacrifice *indeed*.

She became a much abler doctor *indeed*.

In some of these examples, *indeed* is functioning as an intensifier: 'very happy indeed'.

Contrast, with *indeed* as conjunct:

He was very happy, *indeed*. (or ... happy, indeed.)

She became a much abler doctor, *indeed*. (or ... , indeed.)

It was a sacrifice, *indeed*. (or ... , indeed.)

[b] *Readily*, *easily*, *with ease*, and *comfortably* (especially when in *M* position) come close to being emphasizeers. *Easily* tends to cooccur with the modal auxiliaries. For example:

They *readily* admitted their guilt.

They might *easily* have been arrested. [cf 'might well ...']

We will *comfortably* finish on time.

Contrast these with the manner adjunct *easily* and the manner/result adjunct *comfortably* in:

He answers questions *readily*. ['in a ready and cooperative way']

Are you sitting *comfortably*? ['in such a way that you are comfortable']

Intensifiers

- 8.104 The intensifier subjuncts are broadly concerned with the semantic category of DEGREE (cf 8.9). It should be noted that the term 'intensifier' does not refer only to means whereby an *increase* in intensification is expressed. Rather, an intensifying subjunct indicates a point on an abstractly conceived intensity scale; and the point indicated may be relatively low or relatively high. The scale is seen as applying to a predicate or to some part of a predicate, such as the predication, the verb phrase, or even an item within the verb phrase (cf 8.96). The verbs in question are largely expressive of attitude.

It is useful to distinguish two subsets of intensifiers:

- (I) AMPLIFIERS { Maximizers (eg: *completely*)
Boosters (eg: *very much*) }

- (II) DOWNTONERS
- { Approximators (eg: *almost*)
 - { Compromisers (eg: *more or less*)
 - { Diminishers (eg: *partly*)
 - { Minimizers (eg: *hardly*)

Amplifiers scale upwards from an assumed norm; downtoners have a lowering effect, usually scaling downwards from an assumed norm. Such scaling requires that the item or unit to which the intensifier applies is gradable. The subtypes provide nothing more than a rough guide to semantic distinctions, because (i) the varying effects of intensifiers represent a semantic gradient, which is obscured by a clear-cut division into classes; (ii) some intensifiers are sometimes used for different effects; and (iii) speakers vary in their use of intensifiers.

Intensification is realized for the most part by adverbs, but occasionally also by noun phrases and prepositional phrases.

- Note [a] On the relation between 'fully approve' and 'full approval' etc, cf App 1.71 Note [b]. For intensifying adjectives, cf 7.33f. For modifying adverbs as intensifiers, cf 7.87ff.
[b] For gradability with reference to adjectives and adverbs, cf 7.4.

Amplifiers

- 8.105 Amplifiers scale upwards. They are divided into (a) MAXIMIZERS, which can denote the upper extreme of the scale, and (b) BOOSTERS, which denote a high degree, a high point on the scale. Both subsets, but especially boosters, form open classes, and new expressions are frequently created to replace older ones whose impact follows the trend of hyperbole in rapidly growing ineffectual.

Most amplifiers can be contrasted in alternative negation with *to some extent*, and this propensity is a semantic test for their inclusion in the class of amplifiers:

He didn't ignore my request *completely*, but he did ignore it *to some extent*.

They don't admire his music *greatly*, but they do admire it *to some extent*.

By contrast, *emphasizers* (cf 8.99ff) cannot be so used:

*He didn't *really* ignore my request, but he did ignore it *to some extent*.

*They don't *definitely* admire his music, but they do admire it *to some extent*.

Common amplifiers, within the two subclasses (cf 8.104), include:

(a) MAXIMIZERS

absolutely, altogether, completely, entirely, extremely, fully, perfectly, quite (contrast compromiser use, 8.111), *thoroughly, totally, utterly; in all respects*; the intensifying use of *most* (cf 7.87). For example:

They *fully* appreciate our problems.

They *thoroughly* disapprove of his methods.

They *totally* believed in the leader's integrity.
He has *completely* ignored my request.
I can *perfectly* see why you are anxious about it.
She *entirely* agrees with you.
We *utterly* deplore his tactics.
I enjoyed the play *extremely*.
I must *absolutely* refuse to listen to your grumbling.
She will *altogether* reject such views.
I *quite* forgot about her birthday.
He paid for the damage *fully*.
She hasn't closed the door *completely*.
I *most* appreciate your kindness.

(b) BOOSTERS

badly, bitterly, deeply, enormously, far, greatly, heartily, highly, intensely, much, severely, so, strongly, terribly, violently, well; a great deal, a good deal, a lot, by far; exclamatory *how*; the intensifying use of *more* (cf 7.85 Note [b])

Cf also *actively* (engaged in), *hard* (at work), 'working hard', where '(She's) at work' would connote spatial position.

For example:

They *greatly* admire his music.
I need a drink *badly*.
They like her *very much*.
They resent him *deeply*.
He must have *bitterly* regretted his mistake many times.
I *much* prefer the old methods.
I *so* wanted to see her. ['I wanted to see her very much']
His results will have *far* exceeded his expectations.
We all know him *well*.
They annoy me *a great deal*.
We miss our old friends *a lot*. <informal>
How they suffered! ['How very much they suffered!']
I used to concentrate on Brahms but now I *more* enjoy Beethoven.

The distinction between maximizers and boosters is not a hard and fast one. In particular, when maximizers are in *M* position they often express a very high degree, whereas when they are in *E* position they are more likely to convey their absolute meaning of extreme degree. For example, many speakers may see very little difference in force between the maximizer *utterly* and the booster *violently* when these are in *M* position:

They { *utterly*
 violently } detested him.

Speakers vary in the extent to which they give a seriously hyperbolic reading to the maximizer. The tendency to use the maximizer for merely a high degree is especially great for attitudinal verbs such as *detest*.

- Note In somewhat old-fashioned informal BrE, *rather* functions as an exclamatory booster: 'Did you enjoy the party?' 'Rather!' (sometimes 'RATHER').

amplifiers tend to cooccur with semantically-definable classes of verbs.

But the situation can be even more complicated. Sometimes there are syntactic conditions for certain types of lexical cooccurrence. *Much* is largely used in nonassertives, unless premodified:

*She likes him *much*.

She likes him $\left\{ \begin{array}{c} \text{very} \\ \text{so} \\ \text{too} \end{array} \right\}$ *much*.

I don't *much* care for Max Bruch.

Do you like him *much*?
I don't like him *much*. } [though 'very much' would be more usual]

Yet with some verbs, unpremodified *much* can be used, but only in *M* position:

We *much* $\left\{ \begin{array}{l} \text{prefer his offer.} \\ \text{admire your technique.} \\ \text{appreciate your invitation.} \\ \text{regret the inconvenience.} \end{array} \right.$

*We $\left\{ \begin{array}{l} \text{prefer his offer} \\ \text{admire your technique} \\ \text{appreciate your invitation} \\ \text{regret the inconvenience} \end{array} \right\}$ *much*. [where 'very much' would be fully acceptable]

Note [a] *Very much* is another example of where it is possible to select the gradable sense of a verb. While:

They missed her.
is ambiguous between the 'emotive' sense ('feel sorry or unhappy at the loss or absence of') and the sense of 'arriving too late for', the addition of *very much* allows only the emotive sense:

They *very much* missed her.

They missed her *very much*.

Where the emotive sense would not be normal, *very much* cannot be added:

*They got up late, and so they $\left\{ \begin{array}{l} \text{very much missed the bus.} \\ \text{missed the bus very much.} \end{array} \right.$

Compare also:

He *very much* expected trouble at the meeting.

?*He *very much* expected a 14 bus but it turned out to be a 73.

She *very much* appears to be in trouble.

?*She *very much* appears in public.

[b] The colloquial *n't half* (esp BrE) tends to cooccur with predications already implying high or low intensification:

She doesn't *half* swear. ['She swears a great deal']

It's not *half* cold today.

It hasn't *half* been cold today.

As well as being an amplifier, this phrase can be used (noncolloquially and more literally) as a downtoner; compare:

I'm not *HALF* 'satisfied. ['I am only partially satisfied']

I'm not *half* sAtisfied. ['I am highly satisfied']

Your new suit isn't half bAd. ['I like it'] } (informal, esp dialectal)

8.108 Amplifiers cooccur only with gradable verbs, and when adverbial items of the same form cooccur with nongradable verbs they do not function as

amplifiers, but as quantifiers, duratives, or frequentatives (cf 8.115), or as process adjuncts (cf 8.78ff):

She drinks milk *a lot*. ['often']

He will judge us *severely*. ['in a severe manner']

However, a nongradable verb can become gradable when the focus is on the result of the process rather than on the process itself. For example, if the perfective particle *up* is added to *drink* or the perfective aspect of the verb is used, the focus is on the result, and an amplifier such as *completely* can cooccur with *drink*:

He drank up his beer *completely*.

He has *completely* drunk his beer.

Similarly, while *judge* is nongradable, *misjudge* is gradable, since *misjudge* is concerned with the result of the judging and is also susceptible of an evaluative meaning:

*He $\left\{ \begin{array}{c} \text{very much} \\ \text{badly} \end{array} \right\}$ judged the situation.

He $\left\{ \begin{array}{c} \text{very much} \\ \text{badly} \end{array} \right\}$ misjudged the situation.

And if *badly* is used with *judge*, it is interpreted as a process adjunct (perhaps expressing a blend of process with result) and must be put in *E* position:

He judged the situation *badly*. ['in a way that was bad and with bad results']

Note [a] The perfective particles with certain verbs function as amplifying subjuncts (cf also 8.33):
He drank (*up*) his beer.

[b] The gradable/nongradable distinction (cf 7.4) between *judge* and *misjudge* is found in other morphologically-related verbs:

NONGRADABLE	GRADABLE
calculate	miscalculate
estimate	overestimate, underestimate
rate	overrate, underrate
represent	misrepresent
behave	misbehave
manage	mismanage

Positions of amplifiers

8.109 *M* and *E* positions are open to most adverbs that are amplifiers; noun phrases and prepositional phrases are restricted to *E* position. In positive declarative clauses, *M* position is favoured for both boosters and maximizers when we want to express a scaling upwards, but *E* position is preferred for maximizers when we want to denote the absolute upper extreme of the scale. Hence, the effect of the maximizer *completely* in *M* position is:

He *completely* denied it.

is close to that of the booster *strongly* or the emphazier *really*, which can have a scaling effect similar to that of boosters (cf 8.101):

He $\left\{ \begin{smallmatrix} \text{strongly} \\ \text{really} \end{smallmatrix} \right\}$ denied it.

On the other hand, when *completely* is in *E* position:

He denied it *completely*.

the intention seems to be closer to:

He denied it *in every respect*.

Where the absolute meaning is expected, some people find only *E* position acceptable:

?He *completely* dissected the animal.

?They *completely* divided up the money.

He dissected the animal *completely*. ['into all the prescribed parts']

They divided up the money *completely*. ['the whole of the money']

We can also contrast the probable interpretations of *violently* in the two positions shown in:

They *violently* attacked him.

They attacked him *violently*.

In *M* position, *violently* is likely to be interpreted as a booster ['strongly'] and *attacked* will then be equivalent to 'condemned', a verbal assault. On the other hand, when *violently* is in *E* position, we are likely to interpret it literally ['with violence'] as a manner process adjunct (cf 8.79), with *attacked* now referring to physical assault.

In negative, interrogative, and imperative clauses, *E* position is normal in all cases.

Note [a] The subjuncts *extremely*, *most*, and (when no comparative clause follows) *more* are usually in *E* position. Exclamatory *how*, of course, appears only at *I*.

[b] Some boosters (including *well*) occasionally appear in *IM* position, usually (but not necessarily) when they are themselves intensified or before an emphatic auxiliary and especially when the utterances follow an associated statement; these subjuncts might thus be seen as subject-oriented (cf 8.92):

A: I'd prefer to see them tomorrow.

B: And I *very much* would prefer to see them tomorrow.

Cf also:

I *so* did want to meet them.

I *well* can understand your problem.

For some speakers, *IM* position is common for *very much* in *very much would like*, though others find it odd:

?I *very much* would like to speak to you sometime today.

In all these examples, *M* would be far more usual as in: 'I would *very much* prefer ...', 'I did *so* want ...' etc.

Syntactic features of amplifiers

- 8.110 Amplifiers can be contrasted with other intensifiers in alternative interrogation and negation, and they can come within the scope of predication pro-forms or ellipsis. On the other hand, they cannot be the focus of a cleft sentence:

*It was *completely* that he ignored your request.

But for some people, they can be the focus of a cleft sentence if they are modified or if the focal clause is interrogative or negative (cf 8.113, 8.83):

?Was it *completely* that he ignored your request?

?I know that it wasn't *entirely* that he agreed with us.

?I wonder how *fully* it was that they appreciated your problems.

Most boosters accept comparison and modification, but maximizers vary in this respect (cf 8.106).

Amplifiers do not usually serve as a response to a *How*-question, though they can if the verb in the question has to do with general evaluation:

*How do they admire his music? (They admire it) $\left\{ \begin{smallmatrix} \text{Very much.} \\ \text{Greatly.} \end{smallmatrix} \right.$

How do you like it? (I like it) $\left\{ \begin{smallmatrix} \text{Very much.} \\ \text{?Greatly.} \end{smallmatrix} \right.$

They can often be evoked by *How much*:

How much do they admire his music? (They admire it) *Greatly*.

Note Other question forms eliciting amplifiers are *To what extent ... ? How far (do you think ...)? What do you think of ... ?*

Downtoners

- 8.111 Downtoners have a generally lowering effect on the force of the verb or predication and many of them apply a scale to gradable verbs. They can be divided into four groups (cf 8.104):

- APPROXIMATORS serve to express an approximation to the force of the verb, while indicating that the verb concerned expresses more than is relevant.
- COMPROMISERS have only a slight lowering effect and tend, as with (a), to call in question the appropriateness of the verb concerned.
- DIMINISHERS scale downwards and roughly mean 'to a small extent'.
- MINIMIZERS are negative maximizers, '(not) to any extent'.

Groups (a) and (b) should be compared with disjuncts of metalinguistic comment, cf 8.126.

The four groups represent semantic distinctions among downtoners, both in the force of downtoning and in combining this aspect with questioning the expression in (a) and (b) as distinct from a simpler grading of intensity in (c) and (d). But the assignment of individual downtoners to particular groups would vary from speaker to speaker.

Common downtoners include:

- APPROXIMATORS
almost, nearly, practically <informal>, *virtually, as good as* <informal>, *all but*
For example:

I *almost* resigned.
 He *virtually* dictated the terms of the settlement.
 They *practically* forced him to resign.
 They *as good as* ruined the school.
 She *all but* kissed us.

(b) COMPROMISERS

kind of <informal, esp AmE>
sort of <informal>
quite [contrast maximizer use with nongradables, cf 8.105]
rather
enough, sufficiently, more or less

For example:

I *kind of* like him. <informal, esp AmE> [on positioning of
kind of, cf 7.64]
 As he was walking along, he *sort of* stumbled and seemed
 ill. <informal>
 I *quite* enjoyed the party, but I've been to better ones. <esp BrE>
 I'm sure you'll like her *enough* to invite her to your party.
 He *more or less* resented their interference.

(c) DIMINISHERS

These may be divided as between (i) the EXPRESSION diminishers which seek to express only part of the potential force of the item concerned, and (ii) the ATTITUDE diminishers which seek to imply that the force of the item concerned is limited. With (ii) should be compared the restrictive subjuncts (cf 8.116).

- (i) *mildly, partially, partly, quite, slightly, somewhat; in part, in some respects, to some extent; a bit, a little, least (of all)*
 (ii) *only, merely, simply; just* <informal>, *but* <formal and rather archaic>

For example:

- (i) The incident *somewhat* influenced his actions in later life.
 We know them *slightly*.
 I *partly* agree with you.
 They have always *mildly* disliked him.
 I can admire his courage *to some extent*.
 (ii) I was *only* joking.
 It was *merely* a matter of finance.
 She'll *just* be out for a few minutes.
 It seems *but* yesterday.

(d) MINIMIZERS

negatives: *barely, hardly, little, scarcely*;
 nonassertives: *in the least, in the slightest, at all, a bit*

For example:

She *scarcely* knows me.
 I didn't enjoy it *in the least*.
 He *little* realizes what trouble he has caused.
 They don't support her *at all*.

I don't like his attitude *a bit*.
 We don't mind *in the slightest*.

There are several noun phrases that can be minimizers only in negative clauses eg:

I didn't sleep *a wink* last night. } <informal>
 I don't owe you *a thing*.

Cf 10.62 for other examples.

Note

- [a] For the distinction between *little* and *a little*, cf 5.23f.
 [b] Some speakers use *kind of* and *sort of* as approximators with nongradable verbs:
 He *sort of* smiled at us. ['You could almost say he smiled at us']
 He *kind of* grunted. ['You could almost say he grunted']
 When they are used as approximators, we can say (cf 8.112):
 He *sort of* smiled at us, but in fact it was more like a sneer.

For other speakers, they are always nearer to *more or less* than to *almost*. Both uses are very informal and *kind of* is especially common in AmE. Somewhat more informally still, these items can be at E: 'I'm puzzled, *sort of*'.

[c] As well as being a maximizer (cf 8.105), especially with units that are either nongradable or are seen as being at the end of the scale (*quite perfect*), we see that *quite*, apparently contradictorily, has two further roles, whether used as a modifier (cf 7.56, 7.63) or as an adverbial. As compromiser, it is usually stressed only lightly; as diminisher, it is heavily stressed or actually made nuclear; with verbs, the usage is especially BrE. For example:

The book is quite GOOD. [compromiser or amplifier]
 It seems that they quite LIKE her. [compromiser]
 The book is QUITE GOOD.
 It seems that they QUITE LIKE her. } [diminisher: cf 18.17]

There is however considerable variation idiolectally. Note that with negatives, only the maximizer use is found: 'She didn't *quite* approve'.

8.112 Approximators differ from most other downtoners in that they imply a denial of the truth value of what is denoted by the verb. Hence we can say, with the approximator *almost*:

I *almost* resigned (but in fact I didn't resign).

But we cannot deny in this way the truth value of what is said when we use most other downtoners:

- *I *kind of* like him (but in fact I don't like him).
 *We know them *slightly* (but in fact we don't know them).

The minimizers differ from other downtoners in providing a modification towards a version that is more strictly true rather than a denial of the truth value of what has been said:

She { *scarcely* } knows me (- in fact she doesn't know me).
 hardly }

I can *barely* understand him (- in fact I can't understand him).
 He *little* realizes the trouble he has caused (- in fact he doesn't realize it).

In each case, the second clause turns the partial denial in the first clause into admitting a full denial.

Compromisers reach out towards an assumed norm but at the same time reduce the force of the verb. Consider the following:

I *kind of* like him. <informal, esp AmE>

I *rather* like him. <esp BrE>

In saying either of these, we do not deny liking him. But we seem to be rather deprecating and grudging: 'I might go as far as to say I like him'.

The difference between diminishers and minimizers is not the nearness to the bottom of the scale, though most minimizers are indeed near the bottom. They are distinguished in their behaviour with respect to negation. The effect of negation is to deny the truth value of what is denoted by the verb:

They didn't praise him *in the SLIGHTest*. ['They didn't praise him']

We don't like it *a bit*. ['We don't like it']

Diminishers are not usually the focus of negation, but when they are, the effect is to push the scaling towards the top. For example, with fall-rise nuclei:

They didn't praise him *SLIGHTly*. ['They praised him a lot']

We don't like it *a Little*. ['We like it a lot']

Four of the minimizers – *barely*, *hardly*, *little*, *scarcely* – form a subgroup. They are themselves negative (cf 10.59, 10.64) and cannot be negated. On the rare occasions when they are positioned initially, there is subject-operator inversion. Of these four, *hardly*, *scarcely*, and *barely* can cooccur with nonassertives or with minimizers like *a thing*:

They $\left\{ \begin{array}{l} \textit{scarcely} \\ \textit{hardly} \\ \textit{barely} \end{array} \right\}$ need $\left\{ \begin{array}{l} \textit{it at all.} \\ \textit{a thing.} \end{array} \right.$

I *scarcely* slept *a wink*.

For some people, the cooccurrence of these nonassertives or minimizers is marginally acceptable with *barely*.

Certain minimizers not listed above appear in restricted environments (cf 8.103):

(i) *possibly* and *conceivably*, when they operate upon *can* or *could* in nonassertive clauses:

They *can't possibly* leave now. ['They can't under any circumstances leave now']

Can he *conceivably* want to see me? ['Is it possible to imagine that he wants ...?']

This use of *possibly* and *conceivably* is to be distinguished from their use as disjuncts (cf 8.127). Contrast:

They *can't possibly* leave now. [minimizer]

They *possibly* can't leave now. [disjunct – 'It's possible that they can't leave now']

(ii) *never* is a negative minimizer in:

You will *never* catch the train tonight. ['You will not under any circumstances catch the train tonight']

The presence of an adverbial referring to a specific future time such as *tonight* rules out the temporal meaning of *never* (cf: *always* in 8.103). In nonassertive clauses *ever* (with some retention of temporal meaning) can replace *never* as minimizer; this is common, for instance, in rhetorical questions:

Will they (*n*)*ever* stop talking? Won't they *ever* learn?

(*Won't they *never* learn?)

I wondered if the train would (*n*)*ever* arrive.

Note Informally, in some AmE, we have *like to* as an approximator, especially in past-tense environments:

When he saw all the blood, he *like to* fainted. ['he nearly fainted']

Cf in more widespread informal use: 'They *damn near* killed themselves in that accident.'

Syntactic features of downtoners

8.113 Some downtoners can lie within the scope of clause interrogation and negation, but not the compromisers *kind of*, *sort of*, *rather*, *more or less*; the minimizer negatives; or most approximators. The focus of clause negation can be on the compromiser *quite*, the diminishers, and the approximators *almost* and *nearly*, but only when the negation is a denial of a previous assertion. For example:

A: He almost crashed his car.

B: He didn't ~~ALmost~~ crash! He CRASHED!

Contrast in alternative interrogation or negation seems possible only for the compromisers *enough* and *sufficiently*, for the diminishers, and for the approximators *almost* and *nearly*.

Downtoners come within the scope of predication pro-forms and of ellipsis. Some downtoners can be focused by *only*; these include all the diminishers of subset (ci) in 8.111 (excluding *least*), and the minimizers *barely* and *a bit*. The same downtoners can be the focus of a cleft sentence under the same conditions as for amplifiers (cf 8.110). None of the downtoners can be the focus of *also*. Only diminisher adverbs and the minimizer *little* can be the focus of clause comparison or be premodified.

A few downtoners can precede a negative verb phrase:

I *almost* didn't meet him.

She *kind of* wasn't listening.

He *sort of* didn't want to say anything about it. } <informal, esp AmE>

Many downtoners can serve as the response to a question introduced by *how much*, etc (cf 8.110 Note). These include *enough* (but only a few of the compromisers), the nonassertive minimizers (unless preceded by *not*), and none of the approximators.

On a use of *rather* as a booster, cf 8.105 Note.

Positions of downtoners

8.114 Most downtoners favour *eM* position and some are restricted to it:

quite, rather, as good as, all but

Thus:

He must have been *rather* in a difficulty.

She may have *as good as* finished the painting by now. <informal>

She had *all but* finished the painting when the burglary took place.

*She may *all but* have finished . . .

Others tend to be restricted either to *M* or *iM*:

barely, hardly, scarcely, practically, virtually

For example:

He could *hardly* be described as an expert.

She will *virtually* have finished by the time they arrive.

She *scarcely* has had any sleep. [less usual than 'has *scarcely* had']

On the other hand, *iM* is unacceptable to many people:

?He *hardly* could be described as an expert.

?She *virtually* will have finished by the time they arrive.

A few downtoners are restricted to *M* in a positive clause, but can be at *iM* in a negative one (cf 8.113):

kind of, sort of, almost, nearly

A few others favour *E* position:

a bit, at all

or are largely restricted to *E*:

enough, a little, and the emphatic "one bit"

For example:

She didn't like the play $\left\{ \begin{array}{l} \text{"one"} \\ a \end{array} \right\}$ *BIT*.

I will try and help them *a little*.

On the other hand, a few diminishers can be placed at *I*:

partly, in part, in some respects, to some extent

Intensifier items as quantifiers, frequentatives, duratives

8.115 Many items that are intensifiers are also used to denote a measure of quantity or of duration or of frequency in time (cf 8.98). These intensifiers include:

most of the minimizers;

the compromisers *enough, sufficiently*;

the boosters *much, a lot* <informal>, *a good deal, a great deal*;

the diminishers *a bit* <informal>, *a little, least, somewhat, to some extent*.

We can therefore contrast several uses of, for example, *a lot*:

I like them *a lot*. ['to a great extent' – booster intensifier]

I paid him *a lot* for his work. ['a large amount' – quantifier]

I see him *a lot*. ['often' – frequency]

I slept *a lot* last night. ['a long time' – duration]

In all of these uses, *a lot* can be evoked as an answer to the question *how much?* But in addition the frequency subjunct can be a response to a *how often* question ('How often do you see him?'), and the duration subjunct to a *how long* question ('How long did you sleep last night?').

There can be ambiguities as a result of more than one of these uses being allowed in a given instance:

He doesn't drink *very much*. ['a very large amount' – quantifier; or 'very often' – frequency]

She suffered *very little*. ['to a small extent' – diminisher intensifier; or 'rarely' – frequency]

They *scarcely* listened to him. ['to a minimal extent' – minimizer intensifier; or 'rarely' – frequency]

Did the singers please you *enough* last night? ['to a sufficient extent' – booster intensifier; or 'sufficiently often' – frequency; or 'for a sufficiently long time' – duration]

Some of the quantifiers must be regarded as direct objects rather than as subjuncts, because they can be made the subject of the passive form of the sentence:

The new owner paid him *a lot* for his work. ~ *A lot* was paid him (by the new owner) for his work.

The students have eaten *enough*. ~ *Enough* has been eaten (by the students).

An ex-mayor wrote *a bit* about conditions in the city. ~ *A bit* was written (by an ex-mayor) about conditions in the city.

Others cannot be made subject:

After their walk, the two friends ate and drank *somewhat*.

~ **After their walk, somewhat* was eaten and drunk (by the two friends).

Those that can be made subject can also be evoked by a *what* question and they can take the position normally occupied by the head of a noun phrase with postmodification by a prepositional phrase; they may be regarded as pronouns like *all* (cf 6.50):

In fact, $\left\{ \begin{array}{l} \text{very little} \\ \text{enough} \\ a \text{ lot} \\ a \text{ bit} \\ a \text{ good deal} \end{array} \right\}$ of the work has been successfully completed.

Note [a] For the relationship between quantitatives and frequency subjuncts, cf 8.71.

[b] Many intensifiers, particularly boosters, can also function as process adjuncts (cf 8.78ff):

He *bitterly* regretted his mistake. [booster intensifier]

He spoke *bitterly* about the way he had been treated. ['in a bitter manner' – manner process adjunct]

Cf also 8.81 for the possibility of a blend of intensifier with process adjunct.

Focusing subjuncts

- 8.116 Focusing subjuncts can draw attention to a part of a sentence as wide as the predication or as narrow as a single constituent of an element (such as a premodifying adjective in a noun phrase as subject, or an auxiliary within a verb phrase). They are realized by a fairly limited set of items, mostly adverbs, but including also some prepositional phrases. Functionally, there are two main subdivisions, **RESTRICTIVES** and **ADDITIVES**.

RESTRICTIVE subjuncts indicate that the utterance concerned is true in respect of the part focused. There are two subsets:

- (a) **EXCLUSIVES** restrict the application of the utterance *exclusively* to the part focused:
alone, exactly, exclusively, just, merely, only, precisely, purely, simply, solely
- (b) **PARTICULARIZERS** restrict the application of the utterance *predominantly* to the part focused:
chiefly, especially, largely, mainly, mostly, notably, particularly, primarily, principally, specifically; at least, in particular

ADDITIVE subjuncts indicate that the utterance concerned is *additionally* true in respect of the part focused:

again, also, either, equally, even, further, likewise, neither, nor, similarly, too; as well, in addition

Examples of the use of focusing subjuncts (with the part that is focused placed in angle brackets):

I was *simply* <taking my dog for a walk>.
 We judge them *purely* <on the final examination>.
 You can get a B grade *just* <for that answer>.
At least <ten workers> reported sick yesterday.
 <The girls> *especially* objected to his manners.
 <The workers,> *in particular*, are dissatisfied with the government.
Even <Bob> was there.
 We bought <some beer> *as well*.
 She *merely* forgot to give her husband <a kiss>.
 He favours *particularly* <the young women>.
 She is charming *only* to her <wealthy> clients.

Where a focusing subjunct precedes the item focused (immediately or otherwise), it is usually associated with an intonation nucleus on the item concerned. Where this item is lengthy (eg a predication), the intonation nucleus will be in the unmarked final position; cf 18.4ff. For example:

I was *simply* <taking my dog for a walk>.

Where the focused item is a prepositional or noun phrase, the intonation nucleus will be on the last stressed syllable of the phrase; eg:

Even <some of her friends> criticized her.

Where the focused item is part of a phrase, the intonation nucleus will be on the stressed or only syllable of the phrase:

She is charming *only* to her <wealthy> clients.

On the other hand, if the focusing subjunct follows the item focused, it is the subjunct that receives the associated intonation nucleus:

<The girls> *especially* objected to his manners.

Contrast:

The girls *especially* objected to <his manners>.

The item selected for being focused is generally 'new' information (cf 18.8).

Note [a] The clausal negative particle *not* could be regarded as a negative restrictive subjunct, excluding the part of the clause that is focused. For clausal negation, cf 10.54ff. The phrasal use of *not* is frequently correlated (cf 13.33) with *but* when it is used as a focusing subjunct:

He had seen *not* her <younger> brother *but* her <elder> one.

[b] Among the exclusive restrictive subjuncts, *but* has a minor role. As well as its archaic (but also current dialect) use for focusing an E-placed element (?I saw *but* William; I saw William *but* once), it appears at *M* after modal auxiliaries, especially *can*. For example:

When I asked if she thought she would win, she replied 'Well, I can *but* try.'

Position and focus

- 8.117 Whether restrictives or additives, focusing subjuncts are most frequently placed at *M* unless the item focused is the subject, a part of the subject, or an auxiliary verb. But with the subjunct at *M*, one has the choice of focusing the main verb, another part of the predication, or the whole predication. Compare the following, first with the restrictive *only*, second with the additive *also*:

- | | |
|---|-----|
| John could <i>only</i> <SEE> his wife from the doorway. | [1] |
| [eg he could not talk to her] | |
| John could <i>only</i> see <his wife> from the doorway. | [2] |
| [eg he could not see her brother] | |
| John could <i>only</i> see his wife <from the doorway>. | [3] |
| [eg he could not see her from further inside the room] | |
| John could <i>also</i> <SEE> his wife from the doorway. | [4] |
| [eg as well as being able to hear her] | |
| John could <i>also</i> see <his wife> from the doorway. | [5] |
| [eg as well as her brother] | |
| John could <i>also</i> see his wife <from the doorway>. | [6] |
| [eg as well as from further inside the room] | |

Perhaps because the clear discrimination made by intonation leaves no room for ambiguity, no objection is made on stylistic grounds to any of these examples in speech. When it comes to writing down such sentences within the normal conventions of English punctuation, however, we see at once that the identification of the focused item is quite uncertain:

- | | |
|--|------------------|
| John could only see his wife from the doorway. | [1], [2], or [3] |
| John could also see his wife from the doorway. | [4], [5], or [6] |

Notice that if *not*, *never*, *hardly* were to replace *only* and *also*, the same degree of indeterminacy would obtain, though of course – given the norms of English

sentence intonation – we would most naturally assume a reading like [3] or [6]; cf 18.3ff. In any event, written sentences do not occur in isolation any more than spoken sentences do, and if the context made a reading like [1], [4] or [2], [5] appropriate, we would unhesitatingly read the sentences accordingly. Nonetheless, the prescriptive grammatical tradition has left a strong prejudice against placing *only* at *M* for readings [2] and [3]; instead many would insist that the 'correct' form would be:

John could see only his wife from the doorway. [= 2]
John could see his wife only from the doorway. [= 3]

Illogically, no comparable objection is made to *also* at *M*; nor of course would it be conceivable to object to *hardly*, *never*, or *not* at *M*, since although precisely the same range of possibilities exists as to the item focused, these subjuncts and *not* do not have the range of possible positions to adopt.

Thus not only would the following sentence be most naturally understood as having the subjuncts focusing upon the final time adjunct, but in most cases the subjunct could not for this purpose be moved to a position immediately preceding or following the focused adverbial:

You could $\left. \begin{array}{l} \text{also} \\ \text{always} \\ \text{even} \\ \text{hardly} \\ \text{never} \\ \text{not} \\ \text{only} \end{array} \right\}$ leave her car at the airport for a month.

Cf You could leave her car at the airport *only* for a month.
You could leave her car at the airport for a month *only*.
but *You could leave her car at the airport *hardly* for a month.

The parallelism between *not* and *only*, both grammatical and semantic, is in fact endorsed by placing *only* at *M*, despite the continuing aversion. There are occasions when it has been found useful to express a kind of correlation between *not* and *only* as in the following regulatory example:

Students are advised that they can *only* attempt examinations after their full programme of study. They *cannot* attempt examinations, for example, after completing two out of three prescribed courses.

At the same time, there are undoubtedly cases where the normal *M* position for *only* (and other subjuncts) leaves a sentence unnecessarily difficult to interpret, especially in writing:

The body of the church could *only* at that time be lit by candles.

This example in the Survey of English Usage corpus has the added complication of a time adjunct at *M* which seems on first reading to be the focus of *only*, though scrutiny of the context suggests that the writer's intention was in fact *only* . . . *by candles*.

Note [a] About half the examples of *only* in the Survey of English Usage corpus are at *M* with the focused item at *E*.

[b] When the focus of *only* is a time or space adjunct, two interpretations are possible, 'at [time/place] and nowhere else' or with the modality sense present in diminisher downtoners:

John *only* phoned Mary (an hour ago).
[either 'at no other time' or 'as recently as an hour ago']

John *only* lives (in Islington).
[either 'nowhere else' or 'as close as Islington' or 'in as humble a place as Islington']

[c] Consider the following sentence:

He's only thinking about marrying a fellow doctor.

This could conceivably express four different meanings:

He's *only* (THINKING) about . . . [7]

[ie nothing has yet been decided]

He's *only* thinking about (marrying a fellow doctor). [8]

[ie he is thinking of nothing else these days]

He's *only* thinking about marrying (a fellow doctor) [9]

[ie he would not consider a wife in any other profession]

The situation is *only* (ie: *merely*) that (he's thinking about marrying a fellow doctor). [10]

[ie you mustn't imagine, for example, that he is worried about a difficult patient]

In [10], we have as it were 'advanced' the subjunct from a 'preceding' (but unspoken) clause; cf informal utterances like 'Go on – you're *only* jealous', which can be glossed as 'It is *merely* the case that you're jealous'. Compare also the clause relations implied by disjuncts: 'He was *frankly* rude' ~ 'I tell you *frankly* that he was rude' (cf 8.121f). In [9], by contrast, we have 'retracted' the subjunct from the clause in which it semantically operates and placed it in a preceding clause.

This phenomenon commonly occurs also with *ever*, as in:

I can't *ever* recall that I told you about it.

[= I can't recall that I *ever* told you about it]

I don't *ever* remember seeing her here.

[= I don't remember *ever* seeing her here]

But cf also a newspaper example:

Hopes of finding the body were *virtually* said to be nil.

In this case, the context showed that this was intended to be understood as 'Hopes of finding the body were said to be *virtually* nil'. Such leftward movement of an item has a significant relation to transferred negation (cf 14.36). Cf also 'She didn't so much as say that she'd ever *LOVED* him.'

Positions of restrictive subjuncts

8.118 Most restrictive subjuncts can either precede or follow the item on which they are focused, provided this is a complete clause element, though it is more usual for them to precede. *Just*, *merely*, *purely*, and *simply* must normally precede the focused part and precede it immediately; ie they can be at *M* only when the whole predication is focused, but they can also readily appear at *iE*. Thus:

You can $\left\{ \begin{array}{l} \text{*just} \\ \text{*merely} \\ \text{*purely} \\ \text{*simply} \end{array} \right\}$ get a B grade (for that answer).

You can get a B grade $\left\{ \begin{array}{l} \text{just} \\ \text{merely} \\ \text{purely} \\ \text{simply} \end{array} \right\}$ (for that answer).

Compare:

I had $\left\{ \begin{array}{l} \text{just} \\ \text{merely} \\ \text{simply} \end{array} \right\}$ (typed a letter to a friend on his typewriter).

The subjunct *alone* normally must follow the focused item:

You can get a B grade <for that answer> *alone*.

and hence *alone* as a restrictive subjunct does not occur in *I* position:

**Alone* <ten workers> reported sick yesterday.

though the virtually synonymous *only* can take either position:

Only <ten workers> } reported sick yesterday.
<Ten workers> *only* }

When the item focused is part of a clause element, the restrictive subjunct must usually precede:

He *only* <MAY> come – I didn't say he would.

I { *only* saw } his <ELDER> brother – not the younger one.
{ saw *only* }

though in speech (not in writing) a part of a noun phrase like the foregoing could have the restrictive following:

I saw his <ELDER> brother *only*.

Contrast:

I saw <his elder brother> *ONLY*.

where the whole noun phrase is focused.

Note [a] *In particular* favours a position after the focused part.
[b] *Exactly* commonly focuses on *wh*-items, and *precisely* does so too, but less commonly; this can mean that the focused part is discontinuous:

Exactly <who> is asking for me?

<What> *exactly* <do you mean>?

I know *exactly* <where to find him>.

Otherwise, *exactly* does not precede the subject unless it focuses on a noun phrase with a quantifier, fraction, multiplier, or cardinal numeral:

Exactly <ten people> were present.

Just also focuses on *wh*-interrogatives, but can only precede them:

Just <why do you want it>?

Just can also focus on *exactly* and *precisely*:

Just <*exactly*> <what do you expect>?

or on a *wh*-item also focused by *exactly* or *precisely*:

Just <<who> *exactly*> <are you>?

Just <<where> *precisely*> <do you want to go>?

It will be noticed that both discontinuity and embedding are involved in these examples.

[c] The restrictives *just*, *merely*, *simply* can freely appear in front of imperative sentences:

You don't have to be present. { *Just*
{ *Merely* } <send a letter of explanation>.
{ *Simply* }

[d] When focusing noun phrases, *only* and *alone* are to some extent treated as though they formed part of the noun phrases concerned. Cf:

Only two persons } witnessed the accident.
Two persons *alone* }

~ The accident was witnessed by { *only* two persons.
{ two persons *alone* }

Positions of additive subjuncts

8.119 The following additives normally precede (either at *M* or immediately) a focused part if this is the whole or part of the predication; but they may follow the focused part, then carrying an intonation nucleus; and if the focused part is subject, they must follow it. *Even* is exceptional in possibly preceding the subject and in not taking a nucleus if it follows the focused part. The items are:

again, also, equally, even, similarly, in addition

Compare:

I've noticed the fox in my garden and

John has { *also*
{ *even* } seen it <near his back DOOR>.
{ *similarly*
{ *in addition* }

John has seen it { *also*
{ *even* } <near his back DOOR>.
{ *similarly*
{ *in addition* }

John has seen it <near his back DOOR> { *ALSO*.
{ *similarly*.
{ *in addition*.

John has seen it <near his back DOOR> *even*. <informal>

<John> { *ALSO*
{ *similarly* } has seen it.
{ *in addition* }

even <JOHN> has seen it.

The subjuncts *too* and *as well* normally follow the focused part and do not appear at *M*:

... John has seen it <near his back DOOR> { *TOO*.
{ *as well*.

In rather 'prepared' usage, these may precede the focused part:

She has invited { *TOO*
{ *as well* } <some of her own FAMILY>.

In speech, especially informally, the additives can be at *E* and still focus even on the subject:

... <JOHN> has seen it { *TOO*.
{ *even*. <informal>
{ *in addition*.

Neither and *nor* must precede the focused part, and when they are at *I*, there is subject-operator inversion (cf 18.24):

His father wouldn't give the money $\left\{ \begin{array}{l} \text{and} \\ \text{but} \\ \text{nor} \\ \text{?and} \\ \text{?but} \end{array} \right\} \begin{array}{l} \text{neither} \\ \\ \\ \text{nor} \end{array} \right\}$ would he
 (LEND) it.

For some speakers *nor* is treated as a coordinating conjunction, and it cannot therefore be preceded by a conjunction.

Neither and *nor* can also be correlative as additive subjuncts:

He had *neither* seen (the FILM) *nor* (even) read (the BOOK).

She $\left\{ \begin{array}{l} \text{had neither read} \\ \text{had read neither} \end{array} \right\}$ (the BOOK) *nor* (the reviews).

Neither (SHE) *nor* (HE) had read the book.

The subjunct *further* is placed at *M* whether it focuses upon the whole predication or only a part of it:

She had studied metaphysics and she had *further* (taken a degree in linguistics).

He has argued the case on behalf of John and has *further* argued it on behalf of John's (BRÖTHER).

- Note [a] Additives are often positionally tied, such that 'As well as/along with X, Y admires Z' means 'X and Y admire Z'. If the order were switched (perhaps to achieve focus on X; cf 18.3), 'Y admires Z, as well as/along with X', this would be interpreted as 'Y admires Z and X'.
- [b] The additive *also* can be used like *only* when focusing upon a part of a noun phrase (cf 8.118):
 I *also* saw his (ELDER) brother. ~ I saw his (ELDER) brother *also*.
- [c] A further additive, *besides*, is less frequent:
 ... I saw his (ELDER) brother, *besides*.

Syntactic features of focusing subjuncts

- 8.120 Focusing subjuncts cannot normally focus upon other focusing subjuncts (on *just*, however, cf 8.118 Note [b]). They cannot be the focus of a cleft sentence or of clause comparison, nor can they be premodified by *however*, *how*, or *so* (cf 8.25). While some focusing subjuncts can come within the scope of both interrogation and negation and be the focus of both question and negation, it is not usually possible to frame alternative interrogation or negation with focusing subjuncts.

Other syntactic features applying to focusing subjuncts include the fact that they cannot be modified (**very only*, **extremely also*). Moreover, most of them cannot be coordinated: **just and exactly*, **equally and likewise*. But we have one cliché coordination:

He is making the suggestion *purely and simply* (for your benefit).

Focusing subjuncts are the focus of the question in:

Did she see him *only* (once)?

Will they release (the major) *as well*?

and of negation in:

They won't punish *merely* (John).

They won't release (the major) *as well*.

But most additive subjuncts cannot be the focus of negation. Indeed, *too* cannot even be within the scope of negation, while *neither* and *nor* themselves effect the negation. An example of alternative interrogation with a restrictive subjunct:

Did she see him *only* (once) or did she see him *MÖRE than* (once)?

And with a different type of contrastive interrogative:

Did she invite *merely* (girls) or did she invite *also* (BOYS)?

Alternative interrogation does not seem plausible with most additive subjuncts, and alternative negation seems implausible with both types of focusing subjuncts.

Certain restrictives can be the focus of an initial *not* with consequent subject-operator inversion. Besides the normal:

He *not only* (protested): he (also) (refused to pay his taxes).

we can also have:

Not only did he (protest): he (also) (refused to pay his taxes).

(On *not only* ... *but*, cf 13.42.)

Restrictives allowing this subject-operator inversion are:

not + just, merely, only, simply

of which *not only* and *not merely* do so most commonly. The construction implies a correlative construction, with (*but*) *also* as common correlatives in the second clause. *Not only* can appear initially in such a sequence without subject-operator inversion when the focus is on the subject:

Not only (HE) protested: several others joined in.

Focusing subjuncts can appear in a construction resembling a cleft sentence:

It was $\left\{ \begin{array}{l} \text{only} \\ \text{particularly} \\ \text{also} \\ \text{even} \end{array} \right\} \left\{ \begin{array}{l} \text{(John) who protested.} \\ \text{(on Thursdays) that he visited her.} \end{array} \right.$

We should distinguish this construction from a similar one which is different in being correlative:

It was *not* that (John protested); it was *rather* that (he was RUDE).

In this example, the subjuncts are functioning within the superordinate clause to which the *that*-clause is complement. Restrictives, additives, and some disjuncts (eg: *possibly*, *probably*) commonly occur in such a correlative structure. Other examples:

It's *partly* that (he's good-looking); it's *partly* that (he's clever).

It's *not* that <they object to him>; it's *more probably* that <they have no interest in him>.

It's *not* just that <she's young>; it's $\left\{ \begin{smallmatrix} \textit{surely} \\ \textit{more} \end{smallmatrix} \right\}$ that <she's inexperienced>.

Note [a] *Exactly* and *precisely* are used as comment utterances on a previous declarative sentence:

A: That was the day she was referring to.

B: $\left\{ \begin{smallmatrix} \textit{Exactly.} \\ \textit{Precisely.} \\ \textit{Right.} \end{smallmatrix} \right\}$ (esp AmE)

But these seem to be related to some implied sentence such as 'That was *exactly/precisely* the day' or 'You are *exactly/precisely* right'. *Quite* ['I quite agree'] is used in the same way in BrE. *Right* is used, especially in AmE, to express agreement, and is more common than *exactly* or *precisely*; but it cannot be related like these to focusing subjunct use. Especially in BrE, *quite* ['I quite agree'] commonly expresses agreement with something said by another speaker, whether the preceding clause is positive or negative (cf 8.130 Note [c]):

A: She should (not) have told you!

B: *quite*.

[b] Like *not only*, but without a corresponding correlative, *not even* can focus upon the subject: *Not even* <H> protested.

Disjuncts

8.121 Like subjuncts, the adverbials that we call DISJUNCTS are grammatically distinct from adjuncts in terms of the features set out in 8.25. Consider in this connection the adverbials in the following sentences:

Sadly, the storm destroyed the entire tobacco crop. [1]

Your son is not, *in all frankness*, succeeding in his present job. [2]

Since she ran out of money, she had to defer buying a new car. [3]

We note, first of all, that it is not the *form* of these adverbials that makes them different from adjuncts or even from subjuncts:

Dr Fox sat *sadly* in her room. [4]

The arrested man answered *in all frankness* the rather awkward personal questions. [5]

She has been living in great hardship *since she ran out of money*. [6]

Nor yet is it the *positions* in which the adverbials are placed in [1], [2], and [3]. We could move the adverbials to *I* in [4] and [6]; we could move *in all frankness* to *M* in [5]; we would leave their grammatical relations broadly unchanged and still sharply different from the grammatical relations of the adverbials in [1], [2], and [3]. The adverbials in [4], [5], and [6] can be made the focus of a cleft sentence; can be the basis of contrast in alternative interrogation or negation; can be focused by focusing subjuncts; and can come within the scope of predication pro-forms or ellipsis. These propensities

are those of their adjunct status (cf 8.25). But the adverbials in [1], [2], and [3] cannot, without producing absurdity or requiring a different interpretation, undergo any of these processes:

*Did the storm destroy the crop *sadly* or . . . ?

*It is *in all frankness* that your son is not succeeding . . .

*It is *since she ran out of money* that she had to defer buying a new car. [asterisked except as a time adjunct of backward span, whereas in [3] the adverbial concerns not time but *reason*]

Similar observations hold true for subjuncts, as we saw in 8.88, but it should not be thought on that account that disjuncts are especially akin to subjuncts. Rather, we have a three-fold distinction that can be set out informally as follows:

ADJUNCTS are similar in the weight and balance of their sentence role to other sentence elements such as subject and object.

SUBJUNCTS have in general a lesser role than the other sentence elements; they have for example less independence both semantically and grammatically and in some respects are subordinate to one or other of the sentence elements.

DISJUNCTS, by the same analogy, have a superior role as compared with the sentence elements; they are syntactically more detached and in some respects 'superordinate', in that they seem to have a scope that extends over the sentence as a whole.

We shall now scrutinize the general semantic roles of disjuncts in order to understand why they appear to have such a grammatical function in relation to the clauses in which they operate.

8.122 It is very difficult to make a wholly objective utterance, and almost everything we say or write conveys the impress of our attitude. Thus, a sentence such as

Mr Forster neglects his children. [1]

entails assumptions about the 'authority' on which the statement is made. It is unlikely that the speaker has heard Mr Forster say, 'I neglect my children', but if this were the source of authority, the speaker would have been more likely to make the sentence:

Mr Forster says (that) he neglects his children. [2]

This might well imply that the speaker cannot himself confirm it:

Mr Forster says (that) he neglects his children (*though I've seen no evidence of this*). [3]

If, indeed, he had such evidence, the sentence would be likely to be different again, both in the statement of the authority and the implication of the speaker's own view:

Mr Forster admits (that) he neglects his children (*as I myself have suspected*). [4]

By contrast with [2] and [4], the 'unattributed' sentence [1] is likely to mean and to be interpreted as meaning:

From things I have heard and seen, I claim it to be a fair and true assessment that *Mr Forster neglects his children*. [5]

It need hardly be pointed out that such detailed specificity is rarely made explicit, though it is worth noting that in a court of law it would be by no means unusual for the speaker of [1] to be obliged either to expand it to [5] or at least to acknowledge that by his [1] he intended to mean neither more nor less than [5].

But even in ordinary speech and writing, it is not uncommon to find some overt indication of authority accompanying the bald statement [1], such as:

I think } (that) Mr Forster neglects his children.
I gather }
It seems }
I tell you ... }
I tell you *frankly* ... } [6]
I tell you *privately* ... }
I put it to you *crudely* ... }
I say, *if you will allow me (to do so)*, that ... }

Each of the italicized sections in the various alternate forms of [6] is an adverbial in a clause which has the speaker as subject and *Mr Forster neglects his children* as its object. Thus:

I | tell | you | *frankly* | that Mr Forster neglects his children. [7]
S | V | O_i | A | O_d

But even the degree of overt authority in [7] can be abbreviated:

Frankly, Mr Forster neglects his children. [8]

It is where sentences like [8] have the same meaning as [7], that we speak of the adverbials as disjuncts, and it can now be seen why such adverbials have in some sense a superordinate role in relation to the sentences in which they function.

Note [a] Not all disjuncts can be so straightforwardly related to adverbials in superordinate clauses. For example, the disjunct in:

Presumably, Alison has bought a new car.
cannot be related to:

*I tell you *presumably* that Alison ...

But plausible paraphrases will nonetheless place 'Alison has bought a new car' as a clause functioning as an element in a superordinate clause, eg:

I presume that Alison has bought a new car.

That Alison has bought a new car *is widely presumed*.

It *is widely presumed* that Alison has bought a new car.

It is a matter of interesting speculation to account for the processes by which we can express the meaning of these finite verb phrases in terms of verbless adverbials.

[b] Many conjuncts also correspond to a construction containing a verb of speaking; cf 8.138.

[c] Note the following examples of formal stereotyped expressions of authority:

I hereby declare that I shall ...

Stop – *in the name of the law*.

No flowers *by request*.

8.123 Disjuncts can be divided into two main classes: STYLE disjuncts (by far the smaller class) and CONTENT disjuncts. Style disjuncts convey the speaker's comment on the style and form of what he is saying, defining in some way under what conditions he is speaking as the 'authority' for the utterance. Content disjuncts (also known as attitudinal disjuncts) make observations on the actual content of the utterance and its truth conditions. These two classes and their subclasses are displayed in Fig 8.123.

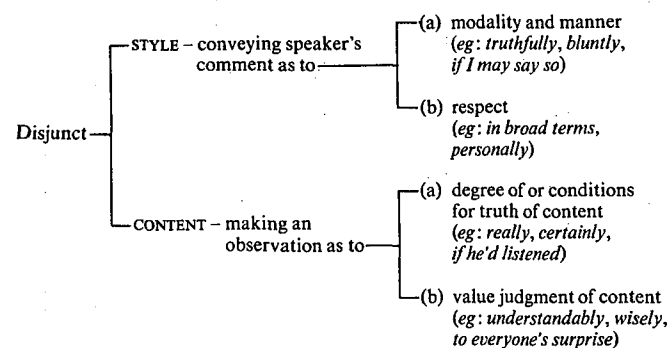

Fig 8.123

Style disjuncts

8.124 The relationship between a style disjunct and the clause to which it is attached can often be expressed (as we explained in 8.122) by a clause in which the same formal item as the style disjunct is a process adjunct (cf 8.78ff), with a verb of speaking, the subject of which is 'I'. Thus, *frankly* in:

Frankly, I am tired.

is equivalent to *I tell you frankly* or *I say frankly*. If the clause is a question, the disjunct may be ambiguous:

Frankly, is he tired?

In this example, the adverbial may correspond to *I ask you frankly* or to the more probable *Tell me frankly*. Often the disjunct is quite overt about the verb of speaking and the adverbial may take the form of a finite clause:

If I may say so without offence, your writing is immature.

In thus drawing attention not only to what is said but to how it is being said, the style disjunct is often an implicit comment on language itself (cf 8.126). Adverbs commonly used as style disjuncts include:

Type (a): Modality and Manner

candidly, flatly, honestly, seriously, strictly, truly, truthfully; confidentially, privately; approximately, bluntly, briefly, broadly, crudely, frankly, generally, roughly, simply

For example:

Briefly, there is nothing more I can do about it.
 I don't want the money, *confidentially*.
Very seriously, do you intend to resign?
 You ask me what he wants. *Quite simply*, he wants to move to a better climate.

Style disjuncts of Type (a) are also realized by prepositional phrases and by clauses. For example:

In short, he is mad but happy.
Putting it bluntly, he has little market value.
As a rough approximation, you can expect a group of fifteen.
 There were twelve people present, *to be precise*.

Type (b): Respect

figuratively, generally, literally, metaphorically, personally, strictly

For example:

She was *strictly* out of order in adjourning the meeting at that point.
Generally, the rainy season has already begun by September.
Personally, I find the music too arid.

Frequently, however, respect disjuncts are realized by longer phrases or by clauses, thus making more explicit the respect in which a comment is being 'hedged':

Generally speaking, the rainy season has already begun by September.
Strictly speaking she was out of order.
Speaking purely for myself, I find the music too arid.
 Mildred seemed to enjoy the concert, $\left\{ \begin{array}{l} \text{to judge from her remarks.} \\ \text{from what her brother told me.} \\ \text{since her brother told me himself.} \end{array} \right.$
 It was not a very difficult job to persuade him to go, *if you understand me*.
If I may say so, $\left\{ \begin{array}{l} \text{none of you are competent to make the legal} \\ \text{With respect,} \end{array} \right.$ judgment required.

Because-clauses can also be style disjuncts of this type (and as such they must be placed at E):

He was drunk, *because he had to support himself on a friend's arm*.

In this type of usage (cf 15.21), *if* and *since*-clauses (normally *content* disjuncts) occur commonly as style disjuncts; these may occur at I, M, or E. Note, however, the prosody:

If you ask MĒ, he was DRŪNK.
 He was DRŪNK, *if you ask* $\left\{ \begin{array}{l} \text{MĒ.} \\ \text{MĒ.} \end{array} \right.$
Since you 'want to KNÓW, I saw him with your sister.

I saw him with your sister, *since you 'want to KNÓW*.

When a speaker wishes to emphasize that he or she alone is the authority, a style disjunct may be reinforced by another, even though a listener may find the cooccurrence objectionably tautologous (or obtrusively egotistical):

((*Speaking*) *for*) *mySELF*, I find the work here quite PLÉasant, *PERSONALLY*.

It will be noted that *-self* disjuncts in their truncated form can be identical with appositives (cf 17.65ff):

I *mySELF* find the work here quite PLÉasant.

(Cf 8.125 Note [b]).

Note [a] Informally, a somewhat indignant use of an *if*-disjunct not uncommonly occurs on its own, leaving the situational context to make obvious what the unspoken statement would have been. Note the exaggerated emphasis on *if*:

"If you don't MIND $\left\{ \begin{array}{l} \text{(that is my seat).} \\ \text{(your umbrella is in my way).} \end{array} \right.$

The *if*-clause is understood as short for something like 'If you don't mind my saying so/my pointing this out'.

Another stereotyped expression of indignation by means of an *if*-disjunct occurs when we call attention, for example, to the words used by someone else (cf 8.126):

She said I was \uparrow CHILDish, *if you please*.

[b] Use of the disjunct *personally* normally requires that the subject of the clause is the authority for it:

Personally I regard this music as boring.

Fred said that *personally* he found concentration increasingly difficult.

?**Personally*, Fred finds concentration increasingly difficult.

8.125 Corresponding to some adverbs as style disjuncts, a series of longer disjuncts may be used, often involving the same item or its lexical base. For example, in place of *frankly* in:

Frankly, he hasn't a chance.

we could have:

prepositional phrase: *in all frankness*

infinitive clause: *to be frank, to speak frankly, to put it frankly*

-ing clause: *frankly speaking, putting it frankly*

-ed clause: *put frankly*

finite clause: *if I may be frank, if I can speak frankly, if I can put it frankly*

Not every style disjunct will allow so full a range. Thus, we have *in all fairness* but not the disjunct *fairly*; *in short* but not *shortly*. Conversely, we have *flatly* but not *flatly speaking*.

But for almost all of the adverbs listed in 8.124, corresponding participle constructions with *speaking* are available as style disjuncts; eg: *frankly* ~ *frankly speaking*, *seriously* ~ *seriously speaking*. Many have infinitive clauses of the form *to be* plus the base adjective, eg: *bluntly* ~ *to be blunt*, *personally* ~ *to be personal*. Those allowing such infinitive clauses have a corresponding finite clause with *if*; for example: *if I may be blunt*, *if I may be personal*.

Note [a] The order of adjunct and verb in the disjunct participle construction with *speaking* is more or less stereotyped. *Speaking frankly* is far less likely than *frankly speaking*. On the other hand, *speaking generally* is the participle construction equivalent to the adverb style disjunct *generally*, as in:

The committee interviewed several writers and publishers. *Generally*, the writers were against censorship.

The style disjunct use of *generally* (with its corresponding prepositional phrase *in general*) is to be distinguished from the time adjunct use of the same word *generally*, synonymous with *normally* or *usually* (cf 8.66, 8.67 Note [b]). Perhaps because the time adjunct has an alternative form in the corresponding participle clause *generally speaking*, it is the inverted form *speaking generally* that is used as the expanded form of the disjunct.

[b] The style disjunct *personally* is to be distinguished from the intensifier *personally* that is synonymous with the appropriate reflexive form of the pronoun:

I $\left\{ \begin{array}{l} \text{personally} \\ \text{myself} \end{array} \right\}$ have never been to New York.

These are both to be distinguished from the adjunct *personally* that is synonymous with *in person*:
He signed the document *personally*.

[c] *Truly* has been included among style disjuncts. It corresponds to *I tell you truly* and also, in many environments, to *It is true (that)*, the latter type of correspondence being common to many content disjuncts (cf 8.128). However, unlike such content disjuncts but like other style disjuncts, it can appear before a question:

I think he has no right to be there. *Truly*, what is your opinion?

Truly here can be replaced neither by *It is true* nor *Is it true*; it is perhaps to be seen as an abbreviation of *Tell me truly*.

Metalinguistic comment

8.126 Overt reference to the linguistic medium, such as in the selection or coining of an appropriate expression, is not of course peculiar to adverbials (cf App I.15):

Let us call this concept 'pre-impressionist'.

The only word for it is *banal*.

The look on his face was what I would call, not *baleful*, but *bileful*.

Nonetheless, adverbials lend themselves very conveniently to incorporating metalinguistic comment into a sentence whose purpose is not itself merely metalinguistic. There is, for instance, a subclass of conjuncts ('reformulatory', cf 8.141) whose chief function this is. But the style disjunct lends itself peculiarly well to such a role:

Hawkins was not, *strictly speaking*, a traitor.

In this sentence, we should notice that we are concerned both with the issue of whether or not Hawkins was a traitor and also with the issue of whether the word 'traitor' is a fitting term to express his behaviour.

Other disjuncts commonly used as 'hedges' in this way are illustrated by:

They have not, *so to say*, 'combined' their resources; } *rather* they have
They have not 'combined' their resources, *exactly*; }

agreed to make some joint decisions.

(In this example, the reformulatory conjunct *rather* appears; cf above)

He has an idea, a hypothesis, *if you will*, that you may find interesting.

You ought to seize this opportunity, *if I may so put it*, with more grace than you are showing.

Cf also *so to speak*, *if you like*, *to quote X*, *as X puts it*, *in the immortal words of X*.

Frequently, however, metalinguistic comment is inextricably mixed up with expression of degree. The compromiser subjuncts *kind of* and *sort of* play a similar role; as do approximators (cf 8.104ff). Consider, for example, the subjunct usage in:

They have an idea, $\left\{ \begin{array}{l} \text{almost a theory.} \\ \text{a theory, almost.} \end{array} \right.$

She *just about* alienated her audience on that occasion.

It is not easy here to know whether we are to understand the latter as meaning *almost but not entirely alienated* or as *what I might almost call 'alienated'*, and we have no reason to believe that the originator of the sentence was making a distinction between these. So too when we are told that:

He $\left\{ \begin{array}{l} \text{almost} \\ \text{virtually} \\ \text{very nearly} \end{array} \right\}$ STOLE the money.

we cannot be sure whether it means that he came close to stealing it or acted in such a way that it could almost be called 'stealing'. In consequence, some comment adverbials like *actually*, *frankly*, and others come to be used as subjuncts (emphasizers), cf 8.100ff. This is especially true of *literally*, as in:

The police *literally* left no square inch unexamined.

It was a tiny room – *literally* a 'one-man' office.

I could *literally* feel the earth shaking.

The car *literally* somersaulted off the road.

It would seem that the speaker wishes to emphasize the extraordinary nature of what he is describing – 'Believe it or not!' – , as well as to draw attention to the hyperbolic language used to describe it. The insertion of *literally* seems often to acknowledge that people tend to use the expression concerned (*somersault*, *earth shaking*) as merely figurative or exaggeratedly colourful whereas in the present instance the word is to be taken in its literal meaning. But in careless and informal speech, and even indeed in writing, the adverb comes to be used in ways that are 'literally' absurd:

She *literally* FLEW out of the room.

I *literally* split my SIDES laughing.

Note [a] On the same page of a recent novel, a policeman is described as parking his vehicle thus:

He literally threw his car into the last available space.

And in tackling a hoodlum:

He literally threw the man down from the stage.

A few pages further on, some criminals on motorcycles 'were, literally, using their machines as weapons'. In the second and third instance, the use of *literally* seems justified if hyperbolic; in the first it is absurd.

[b] With the comment adverbials, we can focus on individual items in the verb phrase (cf 8.96) as well as on the main verb or predication. Compare:

I *actually/frankly/literally* HAD to crawl through the fence.

I had *actually/frankly/literally* to CRAWL through the fence.

[... to *actually/frankly/literally* CRAWL ...; cf 8.21]

In the former, it is the obligation that has to be understood as literally and seriously expressed; in the latter, it is the act of *crawling*.

[c] In colloquial style, some predications are conventionally used in a nonliteral way, and this is frequently indicated by intonationally highlighting the verb:

The boy was *ASKING* for trouble. ['... was *virtually* asking ...']

They went out of their way to be helpful. ['went *as it were* out of ...']

Content disjuncts

- 8.127 The speaker's comment on the content of what he is saying is of two principal kinds, which can in turn be subdivided.

Type (a): Degree of truth

These disjuncts present a comment on the truth value of what is said, expressing the extent to which, and the conditions under which, the speaker believes that what he is saying is true. Here belong the great classes of hypothetical clauses on which closely reasoned discourse depends. Disjuncts realized by concessive, conditional, reason, and other adverbial clauses will be given special attention in 15.32, and we shall concentrate here on shorter realizations, particularly by adverbs. Indeed, adverbs falling in Type (a) constitute what is virtually a closed class, and most items will be cited below. There are three main groups.

Group (i) These express conviction, either as a direct claim (eg: *undeniably*) or as an appeal to general perception (eg: *evidently*):

admittedly, assuredly <rare, formal>, *avowedly* <formal>, *certainly, decidedly* <rare, formal>, *definitely, incontestably* <rare, formal>, *incontrovertibly* <formal>, *indeed, indisputably* <formal>, *indubitably* <formal>, *surely, unarguably* <formal>, *undeniably, undoubtedly, unquestionably; clearly, evidently, manifestly* <formal>, *obviously, patently* <formal>, *plainly*

Group (ii) These express some degree of doubt:

allegedly, arguably, apparently, conceivably, doubtless, likely <informal>, *maybe* <informal>, *most likely, perhaps, possibly, presumably, purportedly* <formal>, *quite likely, reportedly, reputedly* <formal>, *seemingly* <formal>, *supposedly, very likely*

Such items as *perhaps* and *by any chance* politely reduce the impact and urgency of questions and conditions, or convey an apologetic tone:

Is Mary at home, { *perhaps?*
 by any chance?

If Mary is (*perhaps*) at liberty, I could see her for a moment (*perhaps*).
 Mary is not free for a moment, *by any chance?*

Cf the similar effect by alternative means in:

Is Mary at home, { *I wonder?*
 would you (happen to) know?
 Mary is not free for a moment, I suppose?

Group (iii) These state the sense in which the speaker judges what he says to be true or false. There is often a reference to the 'reality' or lack of 'reality' in what is said. Some assert the reality of what is said:

actually, really, factually <rare, formal>

Several express a contrast with reality:

only apparently, formally, hypothetically, ideally, nominally, officially, ostensibly <formal>, *outwardly, superficially, technically, theoretically*

A few claim that what is being said is true in principle:

basically, essentially, fundamentally

The distinction is often a fine one between content disjuncts and viewpoint subjuncts (cf 8.89), particularly when the same formal item is involved:

Technically, our task is to recycle the waste products. [disjunct]

Technically, recycling the waste products will be easy. [subjunct;
 cf 'Recycling ... will be technically easy']

Some further examples of Type (a) disjuncts:

Mr Hasegawa seemed to enjoy the concert, *although Wagner is not one of his favourite composers.*

Since she had no time to have the car fixed, Mildred telephoned for a taxi.
 The proposal would have been accepted *if the manager had been more tactful.*

Type (b): Value judgment

Disjuncts of this type convey some evaluation of or attitude towards what is said. As with Type (a), we concentrate on realization by adverbs and some of the more common items are listed below. Those with a participle base (cf App I.2) in *-ing* (eg: *surprisingly*) are the most productive class of adverbs as content disjuncts. There are two main groups.

Group (i) These express a judgment on what is being said as a whole and they normally apply the same judgment simultaneously to the subject of the clause. For example:

Rightly, Mrs Jensen consulted her lawyer. [She was right and her action was right]

With *some*, as in this example, judgment is passed on whether what is said is right or wrong:

correctly, incorrectly, justly, unjustly, rightly, wrongly

With *others*, judgment is passed on the wisdom or manner of what is described:

artfully, cleverly, cunningly, foolishly, prudently, reasonably, sensibly, shrewdly, unreasonably, wisely, unwisely

Group (ii) With these, the judgment carries no implication that it applies to the subject of the clause. For example:

Remarkably, Mrs Jensen consulted her lawyer. [Her action was

remarkable; the speaker is not suggesting that Mrs Jensen was remarkable]

As with this example, some items judge what is said to be strange or unexpected (and items listed are frequently followed by *enough*):

amazingly, astonishingly, curiously, funnily <BrE>, *incredibly, ironically, oddly, remarkably, strangely, suspiciously, unexpectedly*

With other adverbs, what is said is judged to be appropriate or expected:

appropriately, inevitably, naturally, not unnaturally, predictably, understandably

What is said is judged to cause satisfaction or the reverse:

annoyingly, delightfully, disappointingly, disturbingly, pleasingly, refreshingly, regrettably

What is said is judged to be fortunate or unfortunate:

fortunately, unfortunately, happily <formal>, *unhappily* <formal>, *luckily, unluckily, sadly* <formal>, *tragically*

Other judgments:

amusingly, conveniently, hopefully (cf 8.129 Note [b]), *mercifully, preferably, significantly, thankfully*

Some examples of Type (b) disjuncts:

Certainly, he had very little reason to fear their competition.

Obviously, nobody expected us to be here today.

Really, the public does not have much choice in the matter.

Understandably, we were all extremely annoyed when we received the letter.

He is *wisely* staying at home today.

As well as by adverbs, content disjuncts of Type (b) are realized by prepositional phrases and clauses (cf 9.57f, 15.20f). For example:

To my regret, he did not accept our offer.

They arrived, *to our surprise*, before we did.

With justice, they have assumed their place among the nation's heroes.

To the great admiration of all the onlookers, he plunged into the water and rescued the struggling child.

On paper, she ought to have won, but *in fact* she lost.

Of course, nobody imagines that he will repay what he borrowed.

It was *no doubt* clever of him to offer his resignation at that point in the proceedings.

To be sure, we have heard many such promises before.

They are not going to buy the house, *which is not surprising in view of its exorbitant price*.

Even more important, she has control over the finances of the party.

What is even more remarkable, he manages to inspire confidence in the most suspicious people.

The use of *more* in the last two examples shows how content disjuncts can be adapted to conjunct use (cf 8.137).

Note [a] Several adverbs with *-ed* participle bases imply that the view not only of the speaker but of others is being quoted: *allegedly, reportedly, reputedly, supposedly*. Among common formulas by which the speaker identifies such an authority, however, the following two may be mentioned: *According to (Mary, the Government, the morning paper . . .)*, and *By (their, her, his, Mary's, the Government's . . .) own admission*.

[b] *Doubtless* is not synonymous with 'without doubt'. Like *no doubt*, it in fact implies some doubt and is synonymous with 'very probably'. *Undoubtedly*, on the other hand, expresses conviction. *Apparently* is for most speakers equivalent to 'it appears' or 'it seems', and these do not express certainty. However, some speakers equate *apparently* with 'it is evident'. Prosody and phrasal form combine to make a distinction in the degree of commitment to a statement of authority:

The fire had already started, $\left\{ \begin{array}{l} \text{to my KNOWLEDGE. [some doubt]} \\ \text{to my certain KNOWLEDGE. [no doubt]} \end{array} \right.$

[c] *Admittedly* and *certainly* imply concession as well as certainty. Concession applies still more strongly to two disjuncts which take the form of nonfinite clauses:

$\left. \begin{array}{l} \text{That SAID,} \\ \text{Having SAID THAT,} \end{array} \right\} \text{I have to agree that there are great difficulties.}$

Although the latter normally obeys the subject-attachment rule (cf 15.58f), the disjunct has become so stereotyped that one often finds examples like:

Having said that, the economy seems unlikely to show marked improvement for some time.

[d] Just as the verb *see* can be used for both visual and mental perception (cf: *I see* ['understand'] *what you mean*), so adverbs as disjuncts can be used for both types of perception. In:

Obviously, he doesn't want us to help him.

the speaker's conviction may well be based on what the person has said rather than anything that has been perceived visually. On the other hand, in:

Obviously, he is in very poor health.

it may be based largely on the person's appearance.

[e] Style disjuncts such as *truthfully* and *honestly* (cf 8.124) and content disjuncts such as *certainly* and *definitely* alike express conviction about what is said. But the style disjuncts assert that the speaker is saying something sincerely, while the content disjuncts assert the truth of what is said.

8.128 We have seen that adverbs as style disjuncts correspond to a clause with a verb of speaking (cf 8.122). Many adverbs as content disjuncts, though not all, also correspond to other structures. The set of correspondences presented below for adverbs of one or other type applies only to adverbs of the type concerned, and even so not necessarily to all the items of that particular type. For example, many adverbs of content Type (a), such as *evidently*, have the following correspondences:

Evidently, he doesn't object.

It is evident (that) he doesn't object.

That he doesn't object *is evident*.

But these correspondences do not apply, for example, to *perhaps*. To avoid repetition, we use only the variants with extraposition and anticipatory *it* (cf 18.33). Hence, we give the correspondence for *evidently* in Type (a) as simply:

It is evident that he doesn't object.

The semantic distinction between adverbs of Type (a) (eg: *admittedly, clearly*) and Type (b) (eg: *fortunately, wisely*) is reflected in the fact that it is possible to use putative *should* (cf 4.64, 14.25, 16.70ff) in the correspondences of Type (b). If *should* is inserted in correspondences of Type (a), it conveys obligation (cf 4.56ff) and alters the meaning of the sentence radically, since this group is concerned with the factual basis of what is asserted or questioned:

Type (a)

$\left[\begin{array}{l} \text{Certainly,} \\ \text{Clearly,} \end{array} \right]$ she consults her lawyer regularly.

= It is $\left[\begin{array}{l} \text{certain} \\ \text{clear} \end{array} \right]$ that she consults her lawyer regularly.

but:

\neq It is $\left[\begin{array}{l} \text{certain} \\ \text{clear} \end{array} \right]$ that she *should* consult her lawyer regularly.

[this would mean 'She *ought* to consult her lawyer regularly']

By contrast, putative *should* enters the Type (b) correspondences, since here we are concerned with the expression of an opinion:

Type (b)

$\left[\begin{array}{l} \text{Fortunately,} \\ \text{Wisely,} \end{array} \right]$ she consults her lawyer regularly.

= It is $\left[\begin{array}{l} \text{fortunate} \\ \text{wise} \end{array} \right]$ that she $\left\{ \begin{array}{l} \text{consult(s)} \\ \text{should consult} \end{array} \right\}$ her lawyer regularly.

Most of the adverbs of Type (b) allow also a correspondence with an infinitive clause (commonly a replacement for a *that*-clause with putative *should*; cf 15.48f):

Foolishly, Bill declined the invitation.

= It was *foolish* of Bill to decline the invitation.

But this is not possible with adverbs of Type (a):

$\left. \begin{array}{l} \text{Certainly,} \\ \text{Admittedly,} \end{array} \right\}$ John declined the invitation.

*It was $\left\{ \begin{array}{l} \text{certain} \\ \text{admitted} \end{array} \right\}$ of John to decline the invitation.

Note [a] *Assuredly* and *decidedly* are roughly synonymous with *surely* and *undoubtedly* respectively. They do not correspond to such structures as:

It is $\left\{ \begin{array}{l} \text{assured} \\ \text{decided} \end{array} \right\}$ that ...

$\left\{ \begin{array}{l} \text{I am} \\ \text{One has} \end{array} \right\} \left\{ \begin{array}{l} \text{assured} \\ \text{decided} \end{array} \right\}$ that ...

Surely is commonly used to challenge the addressee and implies disbelief or disagreement as to previously expressed assumptions, as well as the self-evident plausibility of what is being said. [b] *Naturally* and the equivalent understatement, *not unnaturally*, are paraphrasable by 'as might have been expected' or 'of course'. They do not correspond to *it is natural* or *it is not unnatural*.

8.129 The semantic distinction between the groups (i) (eg: *rightly*, *wisely*) and (ii) (eg: *surprisingly*, *understandably*) of Type (b) in 8.127 is reflected in the fact

that only in (i) is it normal to have a correspondence in which the judgment is predicated of the subject. Thus:

Group (bii)

$\left[\begin{array}{l} \text{Surprisingly,} \\ \text{Understandably,} \end{array} \right]$ John returned the money.

\neq *John was $\left[\begin{array}{l} \text{surprising} \\ \text{understandable} \end{array} \right]$ to return the money.

But:

Group (bi)

$\left[\begin{array}{l} \text{Rightly,} \\ \text{Wisely,} \end{array} \right]$ John returned the money.

= John was $\left[\begin{array}{l} \text{right} \\ \text{wise} \end{array} \right]$ to return the money.

(Compare the discussion of subject orientation with subjuncts: especially 8.94.) The predication automatically applies to the subject in an active sentence and to the agent in a passive sentence, whether the latter is present or recoverable or indefinite (cf 3.63ff). Hence, we can still set up these correspondences for items in Group (bi) in the following instances:

$\left[\begin{array}{l} \text{Rightly,} \\ \text{Wisely,} \end{array} \right]$ the money was returned by John.

= John was $\left[\begin{array}{l} \text{right} \\ \text{wise} \end{array} \right]$ to return the money.

$\left[\begin{array}{l} \text{Rightly,} \\ \text{Wisely,} \end{array} \right]$ the money was returned.

= (Someone) was $\left[\begin{array}{l} \text{right} \\ \text{wise} \end{array} \right]$ to return the money.

These adverbs can be used wherever a personal agent is implied, though it may not always be possible to state the correspondences as systematically as in the above instances:

$\left[\begin{array}{l} \text{Rightly,} \\ \text{Wisely,} \end{array} \right]$ the meeting ended early today.

= X $\left\{ \begin{array}{l} \text{was} \\ \text{were} \end{array} \right\} \left\{ \begin{array}{l} \text{right} \\ \text{wise} \end{array} \right\}$ to end the meeting early today.

Here 'X' cannot be specified or identified but obviously cannot be the subject of the earlier sentence, *the meeting*.

$\left[\begin{array}{l} \text{Rightly,} \\ \text{Wisely,} \end{array} \right]$ the book costs only five dollars.

= X $\left\{ \begin{array}{l} \text{was} \\ \text{were} \end{array} \right\} \left[\begin{array}{l} \text{right} \\ \text{wise} \end{array} \right]$ to fix the price of the book at only five dollars.

Again, the former sentence makes it impossible to identify a subject for the latter. Contrast:

[*Rightly,*
Wisely,] Bill's car is in a garage overnight throughout the winter.
= Bill is [*right*
wise] to keep his car in a garage overnight throughout the winter.

Since some adverbs in content Type (b) allow correspondence with a personal subject (usually, however, not the speaker as an individual but as a representative of what can be taken as a general view), it is useful to distinguish a FACTIVE type from a PERSONAL type:

FACTIVE:

Understandably, James refuses to speak.
That James refuses to speak is understandable.
It is understandable that James refuses to speak.
≠ { I understand
One understands } that James refuses to speak.
[but rather: 'One understands why James refuses to speak'; cf:
**Understandably*, the weather was appalling]

PERSONAL:

Regrettably,
Sadly, } James refuses to speak.
That James refuses to speak is { regrettable.
sad.
It is { regrettable } that James refuses to speak.
sad
= { I regret/One regrets } that James refuses to speak.
I am sad/One is sad
[Cf: *Regrettably*, the weather was appalling]

Within the personal type, however, there is a subset for which the first two of the above paraphrases cannot occur:

Happily
Thankfully, } James refuses to speak.
≠ *That James refuses to speak is { happy.
thankful.
*It is { happy } that James refuses to speak.
thankful

but rather:

= { I am } { happy } that James refuses to speak.
One is } { thankful }

With most of the personal type, it is possible to add *to say* in the paraphrases:

I regret (I am sad/happy, etc) *to say* that James . . .

We note, however, that beside 'Hopefully, the weather is improving', we have no '*I am hopeful to say that the weather is improving'.

Note [a] In '*Sadly*, I resigned the chairmanship', the adverbial may be close in meaning to a subject-oriented adjunct or subjunct (cf 8.78, 8.93); thus 'I was sad to resign', 'I was sad when I resigned'. But the meaning may be that corresponding to a style disjunct ('Sad to say, I resigned') or to a content disjunct: 'One is sad (People are sad, It is sad news *for you*) that I resigned'.

[b] Stylistic objections are raised to the use of the personal type of disjunct above, notably *thankfully* and above all *hopefully*. Strength of feeling concerning *hopefully* may be attributable in part to its lack of total fit with the others, as noted above ('*I am hopeful to say'). Since, however, the 'general' view' in *hopefully* is usefully distinguished thereby from the purely individual viewpoint in *I hope*, the disjunct has considerable convenience, as can be seen in the following textual example from an administrator's note put before a committee:

My assistant has arranged for the matter to be considered by an ad hoc working party, and *hopefully* a proposal will be ready in time for our next meeting. *I hope* this approach will be acceptable to members.

The two italicized parts are not identical in force and could not in fact be interchanged; the former ventures to express a general hope, attributed by the writer to the committee as a whole, or even a general assessment of probability ('It is likely that a proposal . . .'); the latter expresses the writer's personal hope that his action will be approved.

Syntactic features of disjuncts

8.130 Clausal realizations of content disjuncts occur fairly freely with questions:

If it stops raining, may we go out and play in the wood?
(*What is*) *even more interesting*, did you hear her reply to that second question?

When realized by adverbs, however, most content disjuncts cannot appear in any position in a direct or indirect question (cf Note [a]):

*Does he *fortunately* know about it?
*He asked whether, *fortunately*, they knew anything about it.

On the other hand, most style disjuncts can be freely used in direct and indirect questions, even initially:

Frankly, does he know about it?
They want to know whether, *strictly speaking*, they're trespassing.

But cf:

**Personally*, is she very clever?

Most content disjuncts cannot appear with imperatives:

**Fortunately*, don't tell him.

(But cf: '*Perhaps* tell him now.')

On the other hand, some style disjuncts (including most of 8.124 Type (a)) can do so, even in *I* position:

Seriously, go and see her about it.
Frankly, don't tell him.

While disjuncts can appear at almost any place in clause structure, the normal position for most disjuncts is *I*. However, some content disjuncts of

Type (ai), eg: *probably*, *possibly*, and all of Type (bi), eg: *rightly*, *wisely*, normally occur at *M*, and often at *iM*. Note also the potentiality of *eM*:

You would have $\begin{Bmatrix} \text{probably} \\ \text{certainly} \end{Bmatrix}$ missed the plane.

If the clause is negative, *iM* would be more usual though *M* is perfectly possible with the same meaning:

I *frankly* don't know.
I don't *frankly* know.

If prosodic focus is on the operator, *iM* would be usual:

I *frankly* WAS annoyed.

Disjuncts can appear (though often with some awkwardness) in dependent finite clauses:

He was a man who, *unaccountably*, had few friends.
What, *interestingly enough*, pleased them most was her enthusiasm.
Though he was *quite rightly* dismissed, he was given six months' salary.

Note [a] Certain content disjuncts of Type (ai) expressing some doubt (eg: *perhaps*, *possibly*, *conceivably*) are marginally acceptable in direct and indirect questions, but not at *I* position. Cf 'Can you *possibly/perhaps* see her now?' Some of Type (aiii) are acceptable in questions perhaps even initially, eg: *basically*, *essentially*, *fundamentally*, *ideally*.

[b] It seems that content disjuncts can appear within a clause that is loosely attached to a question:

Did they refuse the first offer, expecting, *naturally*, a better offer?

[c] Some content disjuncts can be responses to questions or can be used as a comment on a previous utterance, usually accompanied by *yes* or *no*:

A: They have returned to San Francisco.

B: *Very wisely*. ['They were very wise to do so']

A: They won't be coming back.

B: *Unfortunately*, no. ['It's unfortunate that they won't']

A few style disjuncts (*honestly*, *literally*, *seriously*, *truly*, *truthfully*) are used as verbless questions:

A: I'm going to resign.

B: *Seriously*? ['Were you speaking seriously when you said that?']

The content disjunct *really* is commonly used in this way:

A: I'm going to resign.

B: *Really*? ['Is that so?']

A particular intonation contour is not obligatory, but certain adverbials have a characteristic intonation when used as responses; for example, following 'I hear you may soon be emigrating', someone might reply with one of the following (cf 8.120 Note [a]):

certainly	quite <BrE>	Yes, indeed	ABSOLUTELY
Well, possibly	Quite so <BrE>	RATHER <esp old-fashioned BrE>	HARDLY

(Cf App II.11f).

8.131 Most disjuncts can be modified. Common premodifiers are *very* and *quite*. For some content disjuncts of Type (bii), the postmodifier *enough* is common, particularly for those evaluating the communication as odd (*bizarrely*, *curiously*, *eerily*, *funnily*, *oddly*, *strangely*):

Oddly enough, he hasn't said anything about it.

Several content disjuncts can be premodified by *not*, in particular *surprisingly*,

and some with negative prefixes (*unexpectedly*, *unreasonably*, *unusually*, *unwisely*):

Not surprisingly, he protested strongly about it.
Not unreasonably, she refused him.

Other common premodifiers include (in intensifier use) *more*, *most*, *less*, *least*:

More personally, I have to tell you that my wife is pregnant.
Less strangely, he has been avoiding me lately; and (even) *less strangely still*, he has not given me a phone call.
More amusingly than wisely, he kept on insisting on his right to speak.
Most unexpectedly, Toshiko had to return to Japan before her studenthip had expired.

Note [a] Content disjuncts with -ed participle bases (eg: *undoubtedly*, *allegedly*) cannot usually be modified; cf however *most assuredly*, *most decidedly*, *most unexpectedly*.

[b] *Enough* as a modifier of disjuncts does not so much intensify as draw attention to the meaning of the item. Thus, *oddly enough* is paraphrasable by 'odd though it may seem'.

[c] Negation of the disjunct can cooccur with clause negation:

Not surprisingly, they were *not* happy with their results.

8.132 When the semantic relations of condition, concession, reason, and result are realized by clauses, the adverbials concerned are normally content disjuncts. For example:

Unless you have a valid passport, I cannot book your ticket.
Although John is so hard up, he refuses to look for a better-paid job.
Since she remained adamant in her diagnosis, her fellow doctors considered the case afresh.
He went on arguing in a nasty tone, *so that in the end I lost my patience*.

Along with result disjuncts, we may consider the somewhat vaguer 'outcome' disjuncts, often realized by nonfinite (*to*) clauses (cf 15.25):

Mary drove all the way to Maine, (*only*) *to find that her friends had moved to Florida*.

Contrast the superficially similar purpose adjunct:

Mary drove all the way to Maine (*only*) *to visit some friends*.
~ It was (*only*) *to visit some friends* that Mary drove all the way to Maine.

As distinct from *because*-clauses, which indicate a cause or reason so essential that they are integrated into the sentence as adjuncts, nontemporal *since*-clauses have a looser relation, more resembling nonrestrictive relative clauses, and they function grammatically as disjuncts:

It is *because you are lazy* that you lost your job.
~ *It is *since you are lazy* that you lost your job.

On *if*-, *since*-, and *because*-clauses as style disjuncts, cf 8.124.

A contingency relationship can be expressed by a content disjunct in the form of a verbless or nonfinite clause introduced by *with(out)*:

With friends like that, who needs enemies?

With the audience making so much noise, I couldn't hear the opening of the concerto.

Without some indication of her approval, we shouldn't make up our minds on this occasion.

- 8.133 A specification of range can be added for content disjuncts of Type (bii) in 8.127, normally a prepositional phrase introduced by *for*:

Luckily for Herbert, the gun was not loaded. ['Herbert was lucky that ...']

For Herbert specifies that *luckily* is not to be generalized, but applies specifically to Herbert. Specification can also be made by *from X's point of view*, or *from the point of view of X*:

Understandably enough from her point of view, Susan does not want the news to reach her family before she tells them herself.

An equivalent effect is obtained in prepositional phrases as content disjuncts, where the range is specified by the genitive or *of*-construction. Compare:

Annoyingly for Jack,	} his brother was late arriving.
To Jack's annoyance,	
To the annoyance of Jack,	

Cf also: *to my regret, to her displeasure, to their disappointment, to John's surprise, to the delight of all present*. Adverbs of Type (bii) with participle base in *-ing* (eg: *annoyingly*) generally have a corresponding prepositional phrase in this form. The prepositional phrases are indeed more commonly used than the adverbs. We can achieve the same effect by sentential relative clauses (*cf* 15.57, 17.9), eg: *which annoyed Jack* or *which I regret*; or by comment clauses (*cf* 15.53ff), eg: *what delighted all present* or *what disappoints them*.

Note [a] *Surprisingly* and its synonyms can take a *for*-specification only if it refers to a noun or pronoun coreferential with a noun phrase later in the clause; even so, such examples as the following are unusual:

Surprisingly for him [ie for John], the altitude affected John adversely.

Surprisingly for him [ie for John], John failed the exam.

**Surprisingly for his father*, John failed the exam.

Contrast the last sentence with

Annoyingly for his father, John failed the exam.

Whereas *surprisingly for him* means others are surprised about him, *annoyingly for his father* means his father is annoyed.

This distinction does not apply to the corresponding prepositional phrases. *To my surprise* is equivalent to 'I am (or 'was') surprised'.

[b] Corresponding sentential relative clauses can be found for content disjuncts in all groups having corresponding clauses of the form 'it is adj that ...' except Type (ai):

Certainly,	} Mrs Macdonald didn't want to have anything to do with them.
Obviously,	
Understandably,	
Wisely,	

Mrs Macdonald didn't want to have anything to do with them,

which was	*certain.
	(painfully) obvious.
	understandable.
	wise.

On the other hand, all have corresponding comment clauses, though often a modifier such as *very* or *more* is required. Hence, we can have:

What was even

{	wiser,
	more certain,
	more obvious,

he didn't speak at the meeting.

[c] Adverbs of content Type (bii) that express an opinion as to whether what is said is fortunate or not (eg: *fortunately, luckily*) allow the interpretation that the referent of the subject is fortunate or otherwise. But this is not an essential implication of their use. For example:

Fortunately, Bill keeps his car in a garage overnight during the winter.

does not necessarily mean that Bill is fortunate, though out of context this sentence conveys that implication strongly. But we can add to the sentence in such a way as to make it clear that it is someone else that is fortunate:

Fortunately, Bill keeps his car in a garage overnight during the winter. Susan was therefore able to start the car very easily when she needed to borrow it in a hurry early this morning.

From this context, it is clear that it is Susan who is fortunate. Compare also:

Fortunately for me, ['I am fortunate that'] Bill keeps his car in a garage overnight during the winter.

In contrast, adverbs of Type (bi), such as *rightly* or *wisely*, do not allow *for* prepositional phrases specifying the range of the adverb.

Conjuncts

- 8.134 Like subjuncts and disjuncts, the adverbials that we call CONJUNCTS are grammatically distinct from adjuncts in terms of the features set out in 8.25. Consider *nonetheless* in the following example:

She may be unable to attend the meeting. You should *nonetheless* send her the agenda.

The adverbial cannot be the focus of a cleft sentence; cannot be the basis of contrast in alternative interrogation or negation; cannot be focused by subjuncts; and cannot come within the scope of predication pro-forms or ellipsis. Compare:

... **It is nonetheless* that you should send her the agenda.

... *Should you send her the agenda *nonetheless* or *therefore*?

... *You should *only* <nonetheLESS> send her the agenda.

Conjuncts are more like disjuncts than adjuncts in having a relatively detached and 'superordinate' role as compared with other clause elements. But they are unlike disjuncts in not typically filling the semantic roles characteristic of adjuncts. Conjuncts, as part of their even greater distinctness from the closely interrelated clause elements such as S, C, and O, often have semantic roles that are conjunct-specific. That is, they have the function of conjoining independent units rather than one of contributing another facet of information to a single integrated unit (*cf* 8.136).

Thus, in considering conjuncts, we find it necessary to look beyond the particular grammatical unit in which they appear. Whereas, in the case of disjuncts, we related them to the speaker's 'authority' for (or the speaker's

comment on) the accompanying clause, we relate conjuncts to the speaker's comment in one quite specific respect: his assessment of how he views the connection between two linguistic units. The units concerned may be very large or very small: sentences, paragraphs, or even larger parts of a text at one extreme (cf 19.86); at the other extreme, they may be constituents of a phrase realizing a single clause element. For example:

The candidate is a fine teacher, a broadcaster of some experience, and a respected drama critic. *In addition*, she has written a successful novel. [1]

The candidate has written a successful, lengthy, popular, and *in addition* highly original novel. [2]

As in [2], it is common for a conjunct to have a focusing role along with the conjoining one, especially when it is conjoining relatively small units. In this way, the extreme of conjoining words within a phrase can be taken one stage further: to conjoining constituents of a word:

The patient was carefully observed in the pre- and *likewise* <POST>-operative phase of treatment.

Like disjuncts, such conjuncts can often be seen as equivalent to adverbials in clauses having the speaker as subject:

... a respected drama critic. I tell you *in addition* that she has written ... [1a]

Some conjuncts include a pronominal reference to the unit which is to be related:

in addition to *this* (ie what I have mentioned)
first of *all* (ie of what I shall list)
best of *all* (ie of what I have listed)
for all *that* (ie what I have said)

In the case of the informal conjunct *though*, we seem to have an abbreviation of a concessive clause (cf 8.145). Thus with:

I'm afraid he doesn't eat much these days – but he looks pretty fit, *though*.

we are expected to understand something like the clausal disjunct (cf 8.143):

... pretty fit, *though I have said that he doesn't eat much*.

Note Disjuncts and conjuncts are sometimes called 'sentence adverbials' by grammarians on the double ground that they can concern a sentence as a whole (rather than a particular part of a sentence such as the predication) and – in the case of conjuncts – can relate one sentence to another. We do not follow this convention, partly because the double motivation involves two quite separate considerations; partly because other adverbials (our 'sentence adjuncts', cf 8.36) also relate to the sentence as a whole; partly because both disjuncts and conjuncts can also relate to quite specific units within sentences, as in:

I object to his hearty and, ^{frankly,}_{above all,} crude behaviour.

A further reason is that conjuncts can relate units much larger than sentences: *nonetheless* at the beginning of a paragraph or section of a text will indicate a conjoining contrast with the whole preceding paragraph or section.

8.135 Although we have said (cf 8.134) that conjuncts indicate how the speaker 'views the connection between two linguistic units', such an indication does not conversely entail the use of a conjunct. The semantic role of expressing a relation between two units can frequently be fulfilled by an adjunct. Compare the following (where a pronoun, as frequently, functions as a linking device):

It was snowing, *and in spite of this* Mona went cycling.

The adverbial here which conjoins and indicates a concessive relation is an adjunct, as we see from its propensity to be focused in a cleft sentence:

... and it was *in spite of this* that Mona went cycling.

By contrast, in:

It was snowing, *and nonetheless* Mona went cycling.

the same conjoining function with the same concessive relation is fulfilled grammatically by a conjunct:

*... and it was *nonetheless* that Mona went cycling.

Conjuncts thus *both* indicate the relation *and* are demonstrably outside the syntactically integrated clause structure which admits adjuncts.

Moreover, there is one significant respect in which we must relax the semantic characteristic concerning the conjoining of linguistic units. It is possible for conjuncts to be used as discourse-initial items. Thus speech may actually begin, in the following way, given a particular context of situation:

So you're LEAVING, *then*!

Both *so* and *then* are conjunctive comments of an inferential nature, but in this example the speaker's inference is based on extralinguistic evidence, which has been treated just as though the person addressed had been heard to say 'Well, I'll see you tomorrow' or even merely 'Now, where's my coat?'

Discourse-initiating items can be less easy to account for plausibly, but it seems significant that such items are usually those that have a well-established conjunctive role in mid-discourse use. Consider the following as each being the first words in a discourse; they would normally occupy a separate tone unit, with a falling nucleus, though solitary initial *well* may be exceptional in having a rising nucleus or none at all:

Well, how are you this morning?

Why then (esp AmE), how shall we spend the evening?

Well now, I wonder if I could begin by asking you a few questions.

Right (then),

OK now (esp AmE, informal), } how many of you know each other?

Now, the subject of my talk is ... [≠ 'The subject of my talk now, ie at this moment']

Compare some of the same expressions occurring *between* linguistic units:

You didn't feel so good yesterday; *well*, how are you this morning?

I've been looking forward to this meeting for months; *why then*, how shall we spend the evening?

Thank you for welcoming me here; *now* the subject of my talk is . . .

It would seem that, in discourse-initial use, these items seek to enforce by implication some continuity with what *might* have gone before. Silence is difficult to break without some such convention.

- Note Items like *well, oh, ah* have conventional values in discourse that are related to subjuncts, disjuncts, and conjuncts. On *well* cf 19.54; this typically prefaces a part of discourse which, though having perhaps something in common with what has gone before, introduces a difference of some sort. In consequence, it is convenient as a frequent discourse initiator.

The semantics of conjuncts

- 8.136 Much more than with disjuncts, the conjunct function entails a conjunct-specific set of semantic relations. They are connected with, but are frequently rather remote from, the adverbial relation we must assume in the speaker-related clause to which they correspond. It is necessary, therefore, to set out the conjunctive meanings concerned, although we shall return to them in 19.53*ff* where they can be seen in the wider context of inter-sentence relations and discourse structure.

We can distinguish seven conjunctive roles, in some cases with fairly clear subdivisions; see Fig 8.136.

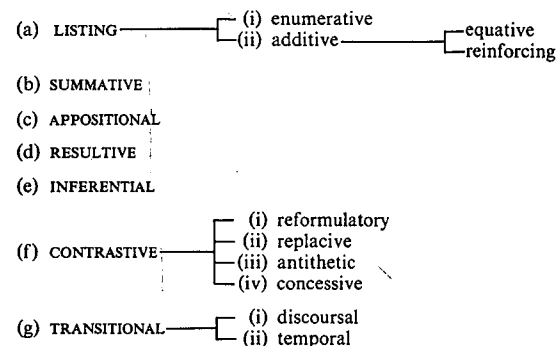

Fig 8.136

- 8.137 Some of the common conjuncts are listed below according to their role classes and subclasses. Except for enumerative conjuncts (which are an open class), all adverb realizations are given, as well as some frequently occurring prepositional phrases and noun phrases.

- (a) LISTING
 (i) ENUMERATIVE
first, second, third . . .
first(ly), secondly, thirdly . . .
one, two, three . . . <esp in learned and technical use>
a, b, c . . . <esp in learned and technical use>
in the first place, in the second place . . .

first of all
second of all <AmE>
on the one hand . . . on the other hand [cf (fiii)]
for one thing . . . (and) for another (thing)
for a start <informal>
to begin with, to start with
next, then
to conclude
finally, last, lastly, last of all

(ii) ADDITIVE

EQUATIVE

correspondingly <formal>, *equally, likewise, similarly, in the same way, by the same token*

REINFORCING

again <formal>, *also, further* <formal>, *furthermore* <formal>, *more* <rare, formal>, *moreover, in particular, then* <informal, esp spoken>, *too* <rare, AmE>, *what is more, in addition, above all*; and the following informal expressions: *on top of it all, to top it (all), to cap it (all)*

(b) SUMMATIVE

altogether, overall, then, therefore, thus <formal>, *(all) in all*; and the following largely formal expressions: *in conclusion, in sum, to conclude, to sum up, to summarize*

(c) APPOSITIVE

namely (often abbreviated as *viz* in formal written English), *thus, in other words, for example* (often abbreviated to *eg* or *e.g.* in written English and sometimes spoken as /i:'dʒi:/), *for instance, that is* (often abbreviated to *ie* or *i.e.* in specialized written English and sometimes spoken as /a:'i:/), *that is to say, specifically*; cf 17.73.

(d) RESULTIVE

accordingly, consequently, hence <formal>, *now, so* <informal>, *therefore, thus* <formal>; *as a consequence, in consequence, as a result, of course*; cf also *somehow* ['for some reason or other']

(e) INFERENTIAL

else, otherwise, then;
in other words
in that case

(f) CONTRASTIVE

(i) REFORMULATORY

better, rather, more accurately, more precisely; alias, alternatively, in other words

(ii) REPLACIVE

again, alternatively, rather
better, worse;
on the other hand

(iii) ANTITHETIC

contrariwise <formal>, *conversely* <formal>

instead [blend of antithetic with replative]

oppositely <rare>, *then*;

on the contrary, *in contrast*, *by contrast*, *by way of contrast*, *in comparison*, *by comparison*, *by way of comparison*, *(on the one hand . . .) on the other hand*

(iv) CONCESSIVE

anyhow <informal>, *anyway* <informal>, *anyways* <AmE informal>, *besides* [blend of reinforcing with concessive], *else*, *however*, *nevertheless*, *nonetheless* <formal> [also written *none the less*], *notwithstanding* <formal>, *only* <informal>, *still*, *though*, *yet*, *in 'any case*, *in 'any event* <formal>, *at 'any rate*, *at 'all events*, *for 'all that*, *in spite of that*, *in spite of it all*, *after all*, *at the same 'time*, *on the other hand*, *all the same*, *admittedly*, *of course*, *still and all* <informal AmE>; *that said*

(g) TRANSITIONAL

(i) DISCOURSAL

incidentally, *now* <informal>

by the way

by the by(e) <not commonly used>

(ii) TEMPORAL

meantime, *meanwhile*, *in the meantime*, *in the meanwhile*; note also the set: *originally*, *subsequently*, *eventually*

- 8.138 LISTING (role a) is of course a basic language function and we have structures of coordination for this purpose (cf 2.9), involving above all the conjunction *and*:

I did this *and* I did this *and* . . . I saw John *and* Mary *and* . . .

Conjuncts are used to give a particular structure or orientation to a list. At its simplest, the structure shows order by having items performing an ENUMERATIVE function:

First the economy is beginning to recover, and *second(ly)* unemployment figures have not increased this month.

The relation of such items to adjuncts in the speaker's assessment of what he is saying can be seen in paraphrases:

I tell you first that the economy . . . and *I tell you secondly* that unemployment figures . . .

The enumerative function does more than merely assign numerical labels to the items listed: it connotes relative priority and endows the list with an integral structure, having a beginning and an end. The idea of an integral relation is especially conferred by the ADDITIVE conjuncts. By the use of the EQUATIVE subtype, we indicate that an item has a similar force to a preceding one:

She has high responsibilities and, *equally*, a high salary.

We might regard the conjunct here as a fragment of a speaker's comment in which the adverb functions as an adjunct: perhaps 'I assess (or rate) this *equally*'.

The REINFORCING subtype of additive conjunct typically assesses an item as adding greater weight to a preceding one:

He has the opportunity, the motivation, and *above all* the courage to do it.

Here again we might postulate the conjunct as related to some such comment as 'I rate this *above all* that I have said.'

- Note [a] The *-ly* forms of ordinal numerals are chiefly used as conjuncts. Contrast:

He arrived *first* (**firstly*) and she arrived *second*. [adjuncts]

First(ly), he is my friend, and *secondly* he is in desperate need. [conjuncts]

Ordinals as conjuncts occur with or without *-ly*, but for many people *firstly* is objectionable. Note that *first* (also *initially*, *originally*) can also have a subjunct use, especially when associated with such verbs as *invent* and *discover*. Thus:

Hormones were *first* identified by Starling at University College London. [1]

The statement would be a different one if instead of the subjunct we had *first* as a conjunct:

First, hormones were identified by Starling at University College London. [2]

Nor of course does [1] permit us either to replace *first* by *firstly* or to predict a further sentence:

Hormones were *secondly* identified by . . .

[b] Conjuncts like *more* and *something else* must remind us that these truncated speaker-assessments are not necessarily related to adjuncts but (as in these instances) are more plausibly seen as objects: '(I will say) more'.

[c] The cardinal and ordinal numerals may be represented in writing by their symbols in the various systems:

1, 2, 3, . . . I, II, III, . . . i, ii, iii, . . .

Similarly, the alphabetic letters may be represented either as minuscules ('lower case', *a, b, c, . . .*) or as majuscules ('upper case' or 'capitals', *A, B, C, . . .*). These different systems allow the writer to choose a hierarchy of listings and sublistings. In general, no clear conventions have been established for which sets of symbols are to be subordinate to other sets, and the writer is therefore free to choose a hierarchy of sets for his own purpose. One would of course observe consistency and rationale; one would not subordinate capitals to lower-case letters, for example.

[d] *Too* as reinforcing conjunct (rare, AmE) occupies 1 position:

She's had her novel published this year; but *too*, she's written some interesting articles on acupuncture.

- 8.139 SUMMATIVE (role b) and APPOSITIVE (role c) conjuncts have this much in common: they precede an item which is to be looked at in relation to all the items that have gone before. SUMMATIVE conjuncts introduce an item that embraces the preceding ones:

He lost his watch, his car broke down, and he got a letter of complaint from a customer: *all in all*, he had a bad day.

APPOSITIVE conjuncts are concerned rather to express the content of the preceding item or items in other terms (cf 17.65):

She has some assistance – *for instance*, a secretary.

Where the apposition applies to more than one preceding item there is usually a summative implication:

They took with them some chocolate, cans of beer and fruit juice, a flask of coffee, a pack of sandwiches: *in other words*, enough refreshments.

By contrast, when the apposition itself consists of several items, the conjunct has the effect of specifying a list:

They took refreshments – *that is*, sandwiches, coffee, beer, fruit juice, and chocolate.

- 8.140** RESULTIVE (role d) and INFERENTIAL (role e) conjuncts again have something in common with each other, as well as with additive, summative, and appositional conjuncts. The more structured a list of items is, the more the final item will tend to be a conclusion in more ways than one: a mere termination, a reinforcement, a summary, a result, and a basis for further inference. This is reflected in the fact that the same conjuncts are listed under several heads. RESULTIVE *of course* and *so* are illustrated in:

She arrived late, gave answers in an offhand manner, and *of course* displeased the interviewing panel.

He was irritable, unjust, unreliable, and *so* became increasingly unpopular.

Result can be tentatively expressed by a coordinate clause with a vague reason item, *somehow* (cf Note):

I argued that it wasn't my fault and *somehow* they let me go.

INFERENTIAL conjuncts indicate a conclusion based on logic and supposition:

You haven't answered my question; *in other words*, you disapprove of my proposal.

Especially in formal usage, an *if*-clause can be followed by a correlating inferential *then* ('If this is agreed, *then* we may proceed ...'). See further, 8.144f.

But the conjunct *then* is especially used in an inferential response to another speaker (cf also 8.135):

A: Give my regards to John. B: *Then* you're not coming with me?

Note *Somehow* has been included among conjuncts because it fits the criteria for the class (cf 8.134), and it is mentioned in the context of resultive conjuncts because it is often close to them semantically: 'and so, in some way that I don't fully understand'. It differs from all other conjuncts in not indicating a relationship between its clause and what precedes; in this respect it resembles a reason disjunct:

Somehow I don't trust him. ['for some reason or other']

Somehow is in fact used when the reason is not made explicit in the preceding context. In contrast, pure resultive conjuncts (eg: *therefore* ['for that reason']) require the reason or cause to be given in the preceding context. Hence the clause to which they are attached states the result or consequence.

- 8.141** CONTRASTIVE conjuncts (role f) present either contrastive words or contrastive matter in relation to what has preceded. The former type is obviously close to the appositive and differs in seeking less to add another formulation ('in other words') than to replace what has been said by a different formulation ('in other words'). Compare:

He was exceedingly inebriated – hopelessly drunk, *in other words*.
[appositive]

She has applied for a transfer – she is tired of her present job, *in other words*. [reformulatory]

Such REFORMULATORY conjuncts are, therefore, frequently preceded by *or*:

He invited several friends, or *better*, several people that he THOUGHT were friends. [*ie* 'it would be better if I were to say']

Similarly, *rather* ['I should rather say'].

The item *alias* precedes proper nouns; for example:

He went to Constantinople, *alias* Istanbul.

She married Eric Blair, *alias* George Orwell.

With REPLACIVE conjuncts, contrastive matter may again be prefaced by *or*. The speaker withdraws an item, not to express it better but to replace it by a more important one. Examples of the REPLACIVE conjuncts:

He was opposed by his mother or, *rather*, by BOTH his parents.

Please suit yourself. You can move in at once; (or) *again*, you may prefer to do so next week.

But an item may be contrasted with a preceding one by introducing a direct antithesis; this is effected by means of ANTITHETIC conjuncts, as in:

You promise to help me; *then* you let me down!

He expected to be happy but *instead* he felt miserable.

One item in this group is often used as part of a correlation: *on the one hand* ... *on the other (hand)*.

Where one unit is seen as unexpected in the light of the other, we have the use of CONCESSIVE conjuncts, as in:

She didn't get the award after all. *Still*, her results were very good.

He had worked hard but *all the same* he failed the exam.

Concessive *of course* makes a conjoin resemble a subordinate clause: 'Of course he's a bit lazy; all the same I'd like to give him the job'. (Cf 'Although he's a bit lazy, I'd like to give him the job all the same'.)

Note An example of the antithetic conjunct *oppositely* (rare):

Any normal person is depressed when given proper cause for depression. *Oppositely*, normal people become very excited when, for example, they have won a big prize.

- 8.142** TRANSITIONAL conjuncts (role g) serve to shift attention to another topic or to a temporally related event. We refer to the former as DISCOURSAL:

I want to tell you about my trip, but, *by the way*, how is your mother?

Among the other discursal conjuncts, note that *now* has a function as discourse-initial; cf 8.135. Such conjuncts do not necessarily seek to change the subject of the discourse; they are frequently used merely to indicate a rather adventitious relation:

She is studying physics, astronomy, and, *incidentally*, meteorology.

This last is intended to mean not 'She is studying meteorology as a minor and incidental component of her work' but 'I regard it as an incidental fact worth passing on to you'. Often, however, *incidentally* is used as a polite way of changing the subject; in this usage, it resembles 'by the way' and is *incidental* to what has preceded only to the extent that something has been said that reminds the speaker of the other topic.

TEMPORAL transition similarly seeks to indicate a move away from the normal sequence in narrative:

He saved a great deal of money but *in the meantime* his house deteriorated badly.

The speaker here is not, of course, concerned to report on two simultaneous happenings but to relate them (in this case, ironically: the money in the bank should have been used to repair the house).

Correspondences to other structures

- 8.143 We may now look more closely at the way conjuncts correspond to other structures. Almost all, indeed, are like style disjuncts in that the correspondence incorporates a verb of speaking and usually the subject is the speaker (*cf* 8.122). The conjunct is normally represented lexically in the correspondence by a cognate adverbial. We therefore consider the correspondences according to the class of the adjunct or other adverbial concerned.

(i) TIME AND SPACE ADJUNCTS AND SUBJUNCTS

The succession in time or space conveyed by the adverbial is converted into the logical succession of discourse when there is the implication of a verb of speaking. The corresponding clause has as its subject the speaker, but it is sometimes possible to envisage an indefinite pronoun instead (*eg* indefinite *one, we, or you*). The correspondence can usually be given the form:

One [etc] can
I will } *say + adverbial*

We can include here most listing conjuncts (role a in 8.136), the conjuncts *now* and *then* (whatever their subclass), and a few conjuncts scattered through other subclasses; *eg: by the way, yet, still, after all, at the same time*. Examples:

There are two things that the Government can do: *First* ['I will say' + *first*], it can cut spending on defence; *second* ['I will say' + *second*], it can reduce the number of civil servants.

If astronauts have landed on the moon, *then* ['one can say' + *then*] there is no reason why they can't land on Venus.

(ii) PROCESS ADJUNCTS

The same types of correspondence can be established here. The conjuncts involved are scattered through the various subclasses of conjuncts. Examples:

Incidentally ['I tell you' + *incidentally*], he didn't want the book.

To conclude ['I tell you' + (*in order*) *to conclude*], it was a great success.

(iii) ADDITIVE SUBJUNCTS

Here, too, the correspondence incorporates a verb of speaking and usually

the subject is the speaker. We can include here the additive conjuncts (role a(ii) in 8.136). Examples:

Most of us see no reason why capital punishment should not be abolished. *Further* ['I will *further* say'], the arguments in favour of corporal punishment seem trivial to most of us.

The acts of a parish council must be confirmed by the parish meeting.

Likewise ['I will *likewise* tell you'] decisions of a parish meeting must be confirmed by a referendum of all the electors in the parish.

The additive subjuncts (*cf* 8.116) can themselves often function also as time, space, or process adjuncts.

Miscellaneous correspondences that can be postulated for other conjuncts:

- (iv) The enumerative conjuncts (role a(i) in 8.136) that are cardinal numerals and alphabetic letters:

'I will say' + $\begin{cases} \text{one, two, ...} \\ \text{a, b, ...} \end{cases}$

- (v) The conjunct *only* (informal); role f(iv):

I intended to read the book, *only* ['I would *only* say'] I felt too tired.

- (vi) The conjunct *rather*, role f(ii):

What unites the party is the absence of a policy. Or *rather* ['I should *rather* say'], there is a policy but it has not been properly formulated.

- (vii) Reformulatory *better*, role f(i); in the example given for *rather* in (vi) above, *rather* could be replaced by *better* in the sense 'It would be *better* for me to say'.

- (viii) Replacive conjuncts *better* and *worse*, role f(ii):

You can write to him about it. *Better still* ['It would be *better still* to say'], write to his father.

- (ix) Concessive conjunct *however*, role f(iv):

He didn't like the food. *However* ['*However* true that may be'], he didn't complain about it.

- (x) The conjunct *though* in role f(iv) is related to the conjunction *though* (*cf* 8.134). Often it is an informal equivalent to an abbreviated subordinate clause with the conjunction *though* as subordinator:

His food is rather a problem. He looks fit, *though*.

The sentence is interpreted as:

His food is rather a problem. He looks fit, *though* his food is rather a problem.

The implied subordinate clause need not be identical with the content of a previous clause:

Singapore must now be one of the most enviably prosperous cities in

- Note [a] Informally, *so* and *but* can be at *E* in Irish English, and *but* can be at *E* in Australian English: 'He has gone, *so*' (where *so* means roughly 'I gather'), 'I didn't do it, *but*' (where *but* means 'all the same').
- [b] Despite their potentiality for cooccurrence, conjuncts cannot usually be coordinated. Enumerative conjuncts provide some stereotyped exceptions: *First and foremost*, *Last but not least*, *(Sixthly) and finally*.
- [c] *So*, *yet*, *only*, and *else* are distinguished by the punctuation convention that allows them to be separated from the previous clause by a comma where other conjuncts would require a more major mark of punctuation (cf App III.6ff, III.12f, III.17). However, *else* is normally preceded by the coordinator *or*.
- So*, *yet*, and *else* usually occur without intonation or punctuation separation from what follows. However, when *so* signals a general inference from the previous linguistic context and might be paraphrased by 'it follows from what we have said', it is often marked by punctuation and intonation:
- So*, you think you know best. <informal>
- For *so* and *yet* in relation to coordinators, cf 13.18f.

Conjuncts as correlatives

- 8.145 As we saw in 8.144, some conjuncts can correlate with the subordinator of a preceding clause to reinforce the logical relationship between the parts of a sentence. This is because a similar logical relationship is effected by both the subordinator and the conjunct. The difference is that whereas a subordinate clause may often either precede or follow its superordinate clause, a conjunct must always operate anaphorically (cf 5.30). For example, the following sentences are similar in meaning (cf 8.143):

Though (he is) poor, he is satisfied with his situation. [1]
He is poor, yet (he is) satisfied with his situation. [2]

The major difference is that [2] states his poverty as a fact, whereas in [1] his poverty is presupposed as a given assumption (cf 18.8). It is when we combine both subordinator and conjunct in one sentence that we have correlation:

Though he is poor, yet he is satisfied with his situation.

Indeed, with concessives we can endorse the concession by having more than one concessive conjunct in the second clause (cf 8.144, 13.20, 13.33ff), though this is stylistically undesirable:

Though he is poor, yet he is nevertheless satisfied with his situation.

The conjuncts that endorse particular subordinators by correlation are shown below. It should be noted, however, that it is less usual to endorse cause and time subordinators than condition and concession subordinators.

In sharp contrast to the objectionable redundancy to which attention was drawn in 8.144, formal correlation contributes both to stylistic elegance (through rhetorical balance; cf 19.18) and to textual clarity (especially where the two parts to be connected are long and complex).

Examples of correlatives:

CONDITION:	if	then
CONCESSION:	although (even) though while whilst <esp BrE> granted (that) even if	{ yet still however nevertheless nonetheless notwithstanding anyway } <esp informal> anyhow
CAUSE:	because seeing (that)	{ therefore hence <unusual> accordingly consequently
TIME:	while	{ meanwhile meantime

- Note [a] The two instances of *while* listed above are different. *While* in the concessive list of subordinators is synonymous with the subordinator *though*, and the other *while* is equivalent to 'during the time that'. There is a further pair of time correlatives, sometimes used admonitorily: 'When you've done your homework, *then* you'll get your pocket money.'
- [b] Certain other expressions with concessive force may correlate with a concessive conjunct; for example, *true*, *clearly*, or *certainly*, cf 19.56.

Conjunctions with conjuncts

- 8.146 A clause containing a conjunct may be linked to a preceding clause by one of the coordinators (*and*, *or*, *but*; cf 8.144), but not all conjuncts cooccur with all coordinators. The following conjuncts seem to be limited to the coordinators indicated:

<i>and so</i>	{ <i>however</i> (?)
<i>but</i>	{ <i>then</i> [antithetic] <i>though</i>
<i>or</i>	{ <i>else</i> <i>again</i> [replative]
<i>and</i>	{ <i>besides</i> <i>then (again)</i> [antithetic]
<i>but</i>	{ <i>still</i> <i>yet</i> <i>nevertheless</i>

One of these conjuncts – *though* – cannot follow the conjunction immediately (cf 8.143, Note [b]), and the same is true for *however* with many speakers. The reasons are different. When at *I*, *though* is used as a subordinator and the conjunct's nearest place to *I* is *M*. In the case of *however*, many people feel the sequence *but however* to be tautologous. Indeed, some speakers object to the cooccurrence of *but* and *however* even when they are not in immediate sequence. Compare:

John doesn't look very happy { *but* Mary seems all right, *though*.
but Mary, *though*, seems all right.

(?) You can phone the doctor if you like, *but* I very much doubt, *however*, whether you will get him to come out on a Saturday night.

You can phone the doctor if you like. *However*, I very much doubt whether you will get him to come out on a Saturday night.

On the other hand, we cannot have:

*John doesn't look very happy, *but though* Mary seems all right.

For many speakers the following would also be unacceptable:

*You can phone the doctor if you like, *but however*, I very much doubt whether you will get him to come out on a Saturday night.

So, *only*, *yet*, replace *again*, and antithetic *then* cannot be preceded by subordinators.

Note The concessive conjunct *only* (informal) is a marginal case. Some speakers allow the coordinator *but* to precede it:

?I intended to go, *but only* I didn't feel well.

For those who do not allow *but* to precede *only*, the latter item has a status similar to that of the subordinators causal *for* and resultative *so that* (cf 13.8ff). Some speakers can begin a question with *only*:

I'd like to come with you; *only*, would I be all right in these clothes?

Other syntactic features of conjuncts

- 8.147 Except chiefly for *only* and *somehow*, conjuncts can occur in questions. They can do so with similar range of position to that obtaining in declarative sentences:

Anyway, do you know the answer?

So will you be going?

Did he, *in other words*, cheat his employer?

The same is broadly true for indirect questions:

He asked whether they would *nonetheless* remain.

But conjuncts restricted to *I* are excluded:

*He asked whether *so* they would stay.

Unlike most disjuncts, most conjuncts occur freely in imperative sentences:

All the same, try to explain it.

Don't try, *what's more*, to justify yourself.

There are severe constraints on the gradability of conjuncts (as distinct again from disjuncts):

*Very incidentally, ... *Accordingly enough, ...

But we find *better still*, *even worse*, and several conjuncts can be intensified by *quite*:

I hoped he would go early but, *quite on the contrary*, he stayed till midnight.

And, *quite by the way*, how is your sister?

Conjuncts can indicate relations between two clauses even where one is subordinate to the other:

I will see him tonight because he will *otherwise* feel hurt. [cf I will see him tonight; *otherwise* he will feel hurt]

Where such a subordinate clause can be initial in the sentence, the conjunct – despite its normally anaphoric reference (cf 5.30) – may maintain its relating function:

Because he will *otherwise* feel hurt, I will see him tonight.

This is, however, exceptional. Normally, a conjunct in an *I*-placed subordinate clause will relate that clause not to the following matrix clause but to a clause in a preceding sentence:

I can explain it orally. If, *however*, you insist, I will put it in writing.

Transposing the *if*-clause here, we would put the conjunct into the matrix clause to show its constant relation to what has preceded:

I can explain it orally. I will, *however*, put it in writing, if you insist.

Adverbials in conspectus

- 8.148 We have seen repeatedly that the same item can operate in radically different grammatical functions. Normally, the semantic function is constant, as we may illustrate with the process (manner) adverb *frankly*:

He admitted his mistakes <i>frankly</i> .	[1]
He <i>frankly</i> admitted his mistakes.	[2]
<i>Frankly</i> , he was contemptuous of the pardon.	[3]
His <i>frankly</i> admitted mistakes were pardoned.	[4]
His <i>frankly</i> extraordinary attitude dismayed his friends.	[5]

In [1] we have a sentence adjunct (cf 8.36), in [2] a subjunct with subject orientation (cf 8.92), in [3] a disjunct (cf 8.121). In [4] and [5] we have noun phrases incorporating adverbs that can be related to an adjunct and a disjunct respectively.

With some adverbials, notably the closed-class items, there can be a considerable range of meanings according as the grammatical function shifts: for example, *then* as an adjunct concerned with time, and as a conjunct concerned with enumeration, reinforcement, summation, inference, or

antithesis; again, *so* can be an intensifying subjunct, a process adjunct pro-form, and a conjunct. But even with such items, a central core of meaning remains constant: 'in that event' is close enough to 'at that time' to justify the use of *then* for both; with *so*, we are never far from the meaning 'in that way'.

It is such facts as these that justified the basic separation of semantic roles (cf 8.22ff) and grammatical functions (cf 8.24ff), but they also have a bearing on cooccurrence and position.

Constraints on cooccurrence

- 8.149 It was argued in 8.11 that the grounds for distinguishing different classes of adverbial were basically the same as those for distinguishing two different types of object or complement. To this extent, therefore, we are committed to the principle that one (and only one) member of any one class of adverbial can cooccur in a clause with a member of any other class. But we have already drawn attention to infringement of this principle both ways. On the one hand, we have seen more than one member of the same class operating in a sentence without tautology or contradiction:

I'll meet you *downtown* [A-S1] *at the drugstore* [A-S2]
on Monday [A-T1] *at five* [A-T2]. [where S and T refer to space
 and time respectively] [1]
 We travelled *from Paris* [A1] *to Cologne* [A2] *via Liège* [A3]. [2]
 Yet [A1] he succeeded *nevertheless* [A2]. [3]

In [1] we have two space (position) adjuncts and two time (position) adjuncts; in both cases we would account for the cooccurrence by invoking the principle of hierarchical relationship (cf 8.45). So also the source, goal, and path adjuncts of space in [2]. In [3] we have two conjuncts of the same concessive subclass and we may invoke the principle of semantic endorsement and reinforcement (cf 8.144).

On the other hand, we found that cooccurrence of quite distinct types of adverbial was often precluded: space-direction with space-position, for example, where the verb in the clause connoted stasis (cf 8.42). There are other grounds for the preclusion of cooccurrence. For example, although disjuncts and subjuncts with subject orientation are in sharply distinct classes, their cooccurrence in the same clause requires the hierarchically superior disjunct to be placed earlier than the subjunct.

Frankly, they have *deliberately* been keeping him without news.

With the converse order, they cannot cooccur:

**Deliberately*, they have *frankly* been keeping him without news.

Nor does it seem easy to have a style disjunct and a content disjunct in the same clause:

(?)*Wisely*, they have – *to be blunt* – kept him uninformed.

More generally, there are severe constraints on the same formal item appearing more than once in a clause, even when it is realizing distinct grammatical roles. This stylistic restriction is doubtless influenced by our

unavoidable awareness of a common meaning despite the grammatical difference, and hence a correspondingly unavoidable feeling that there is tautology. Compare the following versions of the 'same' sentence:

Obviously [disjunct], Ned can see *perfectly*. [predication adjunct]
Obviously, Ned can see *clearly*.
Clearly, Ned can see *perfectly*.
 ?*Clearly*, Ned can see *clearly*.

- Note Avoiding double occurrence of the same formal item is of course general and has nothing specifically to do with adverbs or indeed with items having related meanings. One is embarrassed (or amused) to hear:
 I like most animals but I can't bear bears.
 (Cf also 4.67, 13.78, 13.101, 17.61).

Relative positions of adverbials

- 8.150 Style affects also the positioning of adverbials, just as do other interacting factors: realizational, grammatical, and semantic.

Juxtaposition of *-ly* items is widely held to be stylistically objectionable. Thus, while the following is perfectly acceptable:

In the end it is probable that John alone will be chosen.

a paraphrase like the following would not be:

?**Finally probably only* John will be chosen.

(There is little or no objection to *-ly* sequences if the first is an intensifier: 'She drove *extremely slowly*.' Similarity of form in other respects also militates against juxtaposition: thus while 'I kissed her *on the cheek*' [predication adjunct] and 'I kissed her *on the plane*' [sentence adjunct] are equally acceptable, 'I kissed her *on the cheek on the plane*' would be avoided.

It is partly on stylistic grounds that other realizational factors come into play. Since clause-final position is associated with prosodic and semantic 'weight' (cf 18.9), it is usually desirable to put adverbials realized by relatively long structures (such as clauses) at the end and have them preceded by adverbials whose realization is shorter (adverb or prepositional phrases); cf 8.87. Thus:

He studied them *carefully* [A process] *that night* [A time].

but:

He studied them *that night* [A time] *with the kind of care his wife had suggested* [A process].

In this instance, as frequently, such an order is determined in the interests not only of end-weight but of simple clarity: if *that night* were to follow the A process in the last example, it would seem to be functioning as an adjunct in the clause whose subject is *his wife*.

The notion of centre and periphery (cf 2.12) also has an important bearing on the relative position of adverbials. Thus if a predication adjunct and a

sentence adjunct are required in one clause, the former would normally precede the latter in thus preempting a more central place:

He used to keep them *in his garage* [predication A] *in America* [sentence A]. [1]

He cut the string *with his penknife* [predication A] *with great care* [sentence A]. [2]

If as in [1] there is danger of ambiguity, or if there is stylistic objection to having two adverbials of similar structure in juxtaposition, then the more peripheral adverbial is moved to *I*:

In America, he used to keep them *in his garage*. [1a]

With great care he cut the string *with his penknife*. [2a]

Cooccurring adjuncts of the same grammatical class, subject to the stylistic and realizational factors already mentioned, will have their sequence determined by semantics and will normally appear in the order:

process – space – time

For example:

He worked *quietly* [process] *at home* [space].

He worked *at home* [space] *that day* [time].

The plane arrived *uneventfully* [process] *at Honolulu* [space] *by midnight* [time].

Thus within the same class of adjuncts, those concerned with time are seen to be relatively peripheral and this explains the ease with which they can be moved to *I*:

By midnight, the plane arrived *uneventfully* *at Honolulu*.

- 8.151 But if it is reasonable from one viewpoint to regard both *E* and *I* as appropriate locations for peripheral adverbials, it must be recognized

- (i) that *E* and *I* are in no way to be equated in their communicative effect; and
- (ii) that 'peripheral' implies different things for different types of adverbial.

On (i) we shall have more to say in Chapter 18, but for the present we should note that *E* and *I*, so far from being similar, are polarized in some respects – notably in that *E* usually indicates a climax to which all that has preceded contributes, while *I* usually indicates a general premise or background of which the hearer/reader needs to be aware as we proceed to communicate the real stuff of our message. This means that space as well as time adjuncts can be naturally placed at *I* when realized by pro-forms, since these reflect information that is 'given' (cf 18.8). Compare:

Hot and flustered, the two Congressmen anxiously arrived *at the airport*; *there* [space] they waited *all morning* [time].

The two Congressmen arrived *at midday*; *then* [time] they had been told the plane would be landing.

So far as (ii) is concerned, we need to note that for some adverbials

peripheralness depends less on their grammatical relations than on their propensity (as we have noted with time adverbials in 8.150) to act as 'background', whereas with other adverbials – notably disjuncts and conjuncts – peripheralness depends on their grammatical relation to another clause whose subject is the speaker. On the face of it, we might expect the latter to be more peripheral than the former, and hence to be placed still closer to the sentential 'rim'. At *E* our expectations seem to be supported. This is not a position frequently occupied by disjuncts or conjuncts, and of course we would not normally want to cluster adverbials in a single position, preferring to put one at *I*, one at *M*, and a third at *E*. But if we had to juxtapose adverbials of different classes, we would be inclined to do so at *E* in the order:

adjunct – conjunct – disjunct

Awkward and implausible as are the following examples, they are comprehensible and unambiguous:

The old lady declined to see me *last night* [Ad], *however* [Con], *unfortunately* [Dis].

My assistant will be away again *tomorrow* [Ad], *what's more* [Con], *probably* [Dis].

At *I*, however, a corresponding attempt to move from 'rim' to 'centre' would be frustrated in more than one respect. A matching peripheralness order would give us:

Unfortunately [Dis], *however* [Con], *last night* [Ad] the old lady declined to see me.

Probably [Dis], *what's more* [Con], *tomorrow* [Ad] my assistant will be away again.

But first, the triple juxtaposition would be even more stylistically clumsy as well as being a little obscure from the viewpoint of information structuring. Secondly, there can be confusion as to whether both disjunct and conjunct are independently related to the following clause or whether the disjunct and conjunct are themselves related as though to mean 'There is the additional probability'. Thirdly, an adjunct at *I* has greater propensity to be the ground for the sentence that follows than has a speaker's comment, and it is thus liable to displace a disjunct or conjunct from *I*. Put differently, disjuncts and conjuncts easily preserve their *grammatical* peripheralness even when located at *M*:

Last night [Ad], she was *clearly* [Dis] unable to remember anything.

In America [Ad], he had *moreover* [Con] kept chickens in his garage.

Until recently [Ad], she was *in other words* [Con] obliged to fend entirely for herself.

- 8.152 Another factor conditioning the placement of adverbials is similar to the subject-attachment rule (cf 'unattached participle': 15.59) and hence affects especially those adverbials that have a close if elliptically expressed relation to a particular element of clause structure. Compare:

?In search of a new house, the evening papers turned out to be of little use to Patricia and her husband.

To Patricia and her husband, in search of a new house, the evening papers turned out to be of little use.

The misplacement of adverbials is particularly serious where the result happens to be a perfectly acceptable and comprehensible sentence, but not with the meaning that was intended. An example from an official letter:

Entirely in the spirit of protective support, could I suggest you pass on an appropriate comment to the personnel concerned?

Enquiry showed that the writer had not intended a suggestion that might protect and support either her or the addressee: she was suggesting that the addressee extend his 'protective support' to the 'personnel concerned'.

As in this example, misplacement often occurs where the originator is actually taking some care to achieve a certain balance in a fairly complicated sentence. The following example (from a newspaper review) is another illustration of this:

Along with Aristotle, Shaw, and William Golding, Bob Dixon finds it impossible to approve writers like Leon Garfield, in my view one of the best children's authors.

Although the syntax suggests quite otherwise, what the reviewer apparently intended was:

Bob Dixon finds it impossible to approve writers like Leon Garfield, along with Aristotle, Shaw, and William Golding. Yet in my view, Garfield is one of the best children's authors.

It is easy to understand why the writer would have found this version less satisfying than his own, which seeks to achieve a fine irony by fronting the list of great writers who are apparently dismissed by Dixon. By this fronting, moreover, it was apparently the writer's hope to append his own opinion neatly, economically, and even climactically after the first (and by this device, the only) mention of Garfield.

Realization and role

- 8.153 It was pointed out in 8.13 that adverbials could have widely differing types of realization, and we have seen that broadly speaking a particular semantic role or grammatical function does not determine a particular type of realization structure. This seems true of the sentence adjuncts relating to time (position) in the following:

He spoke to me	{	<i>then.</i> <i>recently.</i> <i>on a recent occasion.</i> <i>when last Thursday's meeting was over.</i>
----------------	---	---

In other words, for the most part, the choice of realization type is a direct function of the degree of specificity required, and the foregoing examples have ranged from a purely anaphoric reference (*then*), indicating a time

which the speaker can assume has been adequately specified elsewhere, to a precise indication of a particular point on a particular day.

But we have seen evidence of a direct tie between realization and role such that (for instance) adjuncts of process (manner) are normally realized by an adverb phrase with an adjective-derived (*-ly*) adverb as head (cf 8.78), while adjuncts relating to space (position) are usually realized by prepositional phrases (cf 8.40).

There is a still more general relation between role and realization to which attention has been given only implicitly. We have noted that, the longer the adverbial, the more weight of information it rather obviously carries.

The corollary of this is that the adverb phrase (the more especially when this, in turn, is realized by an unmodified adverb) is relatively low in information content and that the adverbial roles that are most frequently so realized are presented to the hearer/reader as a rather minor contribution to the content of a sentence. This assessment we clearly endorse when we choose to place an adverbial at *M*:

John has *recently* been offered promotion.

Bibliographical note

There are major studies of adverbials as a whole by Buysschaert (1979, 1982); Greenbaum (1969b); Huang (1975); Nilsen (1972).

For some notable theoretical proposals, see Bartsch (1976); Dik (1975); Emons (1974); Haegeman (1985); Schlesinger (1979); Schreiber (1972).

On specific subsets of English adverbials, see Bolinger (1972a); Hartvigson (1969); Heny (1973); Hindle and Sag (1973); Jacobson (1978, 1981); Lewis (1975); Svartvik (1980); Swan (1982).

On adverbial collocations, see Bäcklund (1970); Crystal (1966); Greenbaum (1970).

For the positions of adverbials in sentence structure, see Greenbaum (1976b, 1977a); Jacobson (1964, 1975).

On intonational aspects of English adverbial usage, see Allerton and Cruttenden (1974, 1976, 1978); Halliday (1967); Taglicht (1983).

Other studies relevant to this Chapter include Anderson (1976); Crystal (1980); Halliday and Hasan (1976); Kolár (1975); G. Lakoff (1975); Menz (1981); Schreiber (1971).

Introduction

Syntactic functions of prepositional phrases

- 9.1 In the most general terms, a preposition expresses a relation between two entities, one being that represented by the prepositional complement, the other by another part of the sentence. The prepositional complement is characteristically a noun phrase, a nominal *wh*-clause, or a nominal *-ing* clause:

PREPOSITIONAL PHRASE	
PREPOSITION	COMPLEMENT
on	the table
from	what he said
by	signing a peace treaty
in terms of	money
at variance with	the official reports

Fig 9.1 Examples of prepositional phrases

Prepositional phrases have the following syntactic functions:

- (I) POSTMODIFIER in a noun phrase (cf 17.37ff):
The people *on the bus* were singing.
- (II) ADVERBIAL
- (a) Adjunct (cf 8.24ff):
The people were singing *on the bus*.
In the afternoon, we went to *Boston*.
- (b) Subjunct (cf 8.88ff):
From a personal point of view, I find this a good solution to the problem.
- (c) Disjunct (cf 8.121ff):
In all fairness, she did try to phone the police.
- (d) Conjunct (cf 8.134ff):
On the other hand, he made no attempt to help her.
- (III) COMPLEMENTATION
- (a) Complementation of a verb (cf 9.60ff; also prepositional verbs, 16.3ff):
We were looking *at his awful paintings*.
- (b) Complementation of an adjective (cf 9.60ff, 16.68ff):
I'm sorry *for his parents*.
- As complementation of a verb or an adjective, the preposition is more closely related to the preceding word (*look at, sorry for*), which determines its choice, than to the prepositional complement.

The positions and functions of prepositional phrases as adverbial are discussed in Chapter 8. The functions of prepositional phrases as modifiers in noun phrases are further dealt with in 17.37ff.

Note [a] Like adverbs (cf 7.46ff), prepositional phrases may occasionally take a nominal function, for example as subject of a clause (cf 10.15):

A: When are we going to have the next meeting?

B: $\left\{ \begin{array}{l} \text{On Tuesday} \\ \text{In March} \\ \text{During the vacation} \\ \text{Between 6 and 7} \end{array} \right\} \left\{ \begin{array}{l} \text{will be fine.} \\ \text{suits me.} \\ \text{is what we decided.} \\ \text{may be convenient.} \end{array} \right.$

Such nominal uses can be viewed as related to sentences that have been restructured so as to leave only the adverbial prepositional phrase:

(The proposal that we meet) *on Tuesday* ...

(To meet) *in March* ...

(Meeting) *during the vacation* ...

The preposition can be omitted under the same conditions as stated in 9.40ff:

$\left\{ \begin{array}{l} \text{Tuesday} \\ \text{*6 and 7} \end{array} \right\}$ suits me.

With the preposition omitted, however, there is ambiguity (cf 10.15 Note [b]), as in:

Tuesday will be fine. $\left\{ \begin{array}{l} \text{'Meeting on Tuesday'} \\ \text{'The weather on Tuesday'} \end{array} \right\}$ will be fine.

[b] In addition to the functions of prepositional phrases mentioned in this chapter, we have a quasi-adjectival function as complement (cf 10.11), eg:

This machine is (very) *out of date*.

This dress seems *out of fashion*.

The adjectival nature of these prepositional phrases is evident from:

(i) their semantic similarity to adjectives, eg:

out-of-date ['obsolete'; cf: an *out-of-date* machine, 17.111]

(ii) their possibility of being coordinated with, or appositional to, adjectives, eg:

They're happy and in good health.

an old and *out-of-order* telephone

(iii) their use as complementation also for copular verbs other than *be* (cf 16.23), eg:

They seem in good health. ['healthy']

[c] Exceptionally (mainly in fixed phrases), an adverb or an adjective may function as prepositional complement (cf 7.26 Note):

$\left\{ \begin{array}{llll} \text{at last} & \text{at least} & \text{at once} & \text{at worst} \\ \text{by far} & \text{in brief} & \text{in there} & \text{since when} \end{array} \right\} \left\{ \begin{array}{l} \text{before long} \\ \text{until now} \end{array} \right.$

[d] Prepositional phrases can themselves act as prepositional complements, so that two prepositions may occur in sequence:

He picked up the gun $\left\{ \begin{array}{l} \text{from under the table.} \\ \text{from behind the counter.} \end{array} \right.$

We didn't meet *until after* the show.

Food has been scarce *since before* the war.

The weather has been fine *except in* the north.

[e] Some prepositions form a correlative construction with a conjunction or another preposition, eg:

$\left\{ \begin{array}{l} \text{between Boston and New York} \\ \text{from six to seven} \end{array} \right.$

[f] The function of verb complementation (IIIa above) may alternatively be regarded as adverbial (cf 16.5).

A definition of 'preposition'

9.2 There are several points of similarity between prepositions and other word classes and constructions in English grammar, in particular conjunctions and adverbs, but also participles and adjectives. Before discussing the marginal cases, it will be useful to try to define central prepositions.

CENTRAL prepositions in English can be defined negatively with three criteria. They *cannot* have as a complement:

(i) a *that*-clause

(ii) an infinitive clause

(iii) a subjective case form of a personal pronoun:

He was surprised $\left\{ \begin{array}{l} \text{*at (that) she noticed him.} \\ \text{*at to see her.} \\ \text{*at she.} \end{array} \right. \left\{ \begin{array}{l} [1] \\ [2] \\ [3] \end{array} \right.$

That-clauses and infinitive clauses, although they frequently have a nominal function in other respects (cf 15.4), do not occur as prepositional complements in English. Alternations between the presence and absence of a preposition are observed in cases like the following:

He was surprised $\left\{ \begin{array}{l} \text{that she noticed him.} \\ \text{to see her.} \\ \text{at her.} \\ \text{at her attitude.} \\ \text{at what he saw.} \end{array} \right. \left\{ \begin{array}{l} [1a] \\ [2a] \\ [3a] \end{array} \right.$

They convinced him $\left\{ \begin{array}{l} \text{of the need for more troops.} \\ \text{of how many troops they needed.} \\ \text{that} \\ \text{*of that} \\ \text{to} \\ \text{*of to} \end{array} \right\} \left\{ \begin{array}{l} \text{they needed more troops.} \\ \text{send for more troops.} \end{array} \right.$

Such alternations show that the preposition that normally cooccurs with certain verbs and adjectives is omitted before a *that*-clause or infinitive clause. Further examples of verbs and adjectives which can have either prepositions or *that*-clauses are (cf 16.3ff, 16.68ff):

$\left\{ \begin{array}{llll} \text{ask (for)} & \text{inform (of)} & \text{be bad (at)} & \text{be sorry (about)} \\ \text{decide (on)} & \text{tell (of/about)} & \text{be aware (of)} & \text{be interested (in)} \end{array} \right.$

When omission of the preposition is impossible, some construction other than a *that*-clause or infinitive clause must be used, eg:

I'm looking forward to $\left\{ \begin{array}{l} \text{the meeting with you.} \\ \text{meeting you.} \\ \text{what you will say.} \end{array} \right. \left\{ \begin{array}{l} \text{[noun phrase]} \\ \text{[-ing clause]} \\ \text{[wh-clause]} \end{array} \right.$

That-clauses can often become in effect prepositional complements through the use of an appositive construction with a 'general' noun such as *fact* (cf 17.26), often resulting in a rather clumsy expression:

They convinced him of *the fact that* they needed more troops.

Note The preposition preceding a *wh*-clause is optional in certain circumstances (cf 16.35, 16.73):
I wasn't certain (of) *what to do*.

Prepositions, conjunctions, and verbs

9.3 Both prepositions and conjunctions have a relating or connecting function. Compare:

the day $\left\{ \begin{array}{l} \text{when she arrived} \\ \text{of her arrival} \end{array} \right. \left\{ \begin{array}{l} \text{[when = conjunction]} \\ \text{[of = preposition]} \end{array} \right.$

In certain cases, the same items can function both as prepositions and conjunctions, eg: *after, as, before, since, until*:

the day $\begin{cases} \text{before she arrived} & [\text{before} = \text{conjunction}] \\ \text{before her arrival} & [\text{before} = \text{preposition}] \end{cases}$

One distinguishing criterion between the two word classes is that prepositions introduce complements which are nominal or nominalized, whereas the corresponding conjunctions (subordinators) introduce a subordinate clause (cf 14.11ff).

The situation is however complicated in the case of nonfinite clauses, since *-ing* clauses are permitted after a preposition in English (cf 14.6ff):

On arriving she took a taxi.

Compare *after*, which can be used either as a conjunction or a preposition, with on the one hand *when*, which can only be a conjunction, and on the other *by*, which can only be a preposition:

Table 9.3 Constructions after prepositions and conjunctions

	<i>when</i> = conjunction only	<i>after</i> = conjunction or preposition	<i>by</i> = preposition only
(a) + FINITE CLAUSE	<i>when she spoke</i>	<i>after she spoke</i>	<i>*by she spoke</i>
(b) + NONFINITE CLAUSE	<i>when speaking</i>	<i>after speaking</i>	<i>by speaking</i>
(c) + NOUN PHRASE	<i>*when her speech</i>	<i>after her speech</i>	<i>by her speech</i>

Some *-ing* and *-ed* participial forms can function both as marginal prepositions (cf 9.8), as nonfinite verb forms, and as conjunctions, eg: *considering* and *given*:

PREPOSITIONS:

Considering his age, he has made excellent progress in his studies. ['If one considers his age . . .', 'In view of his age . . .']

Given the present conditions, I think she's done rather well. ['If one takes into account . . .']

PARTICIPLES:

Considering the conditions in the office, she thought it wise not to apply for the job. ['When she considered the conditions . . .']

Given the chance, I'd do it again. ['If I were given the chance . . .']

CONJUNCTIONS:

Considering that he is rather young, his parents have advised him not to apply.

Given that this work was produced under particularly difficult circumstances, the result is better than could be expected.

Other *-ing* and *-ed* forms that can be used as conjunctions are *seeing (that)* and *provided (that)* (cf 14.12).

Note [a] *Instead of* may be classified as a marginal preposition. It fulfils the third criterion for a preposition (cf 9.2) in requiring the oblique case form:

I propose you *instead of* $\begin{cases} \text{me.} \\ *I. \end{cases}$

It fails the first criterion since it can have an infinitive clause as complement:

It must be so frightful to have to put things on in order to look better, *instead of to strip things off*. (Margaret Drabble, *A Summer Bird-Cage*)

Although *instead of* + infinitive has been attested in good written English, many would here prefer: '... *instead of stripping* ...' (which, however, would spoil the parallelism with *to put* that may have motivated the use of *to strip* here).

Instead of also introduces a finite *as*-clause, thus violating also the second criterion:

He pictures people as he sees them *instead of as they are*.

[b] *On account of* is also used in familiar style as a conjunction, especially in AmE, violating the first condition in 9.2:

I was sitting over there wishing I could write, *on account of* I've thought up what I think's a pretty good spy story. (Kurt Vonnegut, Jr, *Mother Night*).

The directly corresponding standard English construction *on account of my having thought up* is generally clumsy and unidiomatic in the colloquial style here; *because* or *seeing (that)* would be the common alternative constructions.

[c] Combinations such as *except that*, *save that*, *but that* [= *except that*], and *in that*, which introduce finite clauses, are complex subordinators, not preposition + *that* (cf 14.12).

Functions of *than* and *like*

9.4 The gradience between prepositions and conjunctions also appears in comparative constructions (cf 15.63ff), such as:

He's bigger *than* $\begin{cases} I \text{ am.} & [1a] \\ I. & [1b] \\ \text{me.} & [1c] \end{cases}$

With the definition of preposition given in 9.2, *than* is a conjunction in [1a] and [1b], and a preposition in [1c]. However, the choice between [1b] and [1c] is a well-known prescriptive issue in traditional grammar, and it may be argued that *than* is both a conjunction in [1a] and a preposition in [1c], and that *than I* in [1b] is not a reduction of [1a] *than I am* but a hypercorrect variant of [1c] *than me*.

As and *like* are two other items which have functions that are difficult to classify in terms of traditional word classes. The following examples with *like* illustrate the need for a gradient rather than a discrete form of classification:

She looks rather *like* $\begin{cases} \text{me.} \\ *I. \end{cases}$ [2]

Like $\begin{cases} \text{me.} \\ *I. \end{cases}$ she's a blonde. [3]

She's a teacher, just *like you and* $\begin{cases} \text{me.} \\ ?*I. \end{cases}$ [4]

No one can write *like* $\begin{cases} \text{her.} \\ *she. \end{cases}$ [5]

(?)She can't write *like she used to*. [6]

Like in [2] is adjective-like in accepting the intensifier *very* and comparison (cf 7.2):

She looks more *like* me. ['She resembles me more.'] [2a]

In [3], the prepositional use of *like* has a quasi-coordinative function (cf: *with*, *along with*; 10.40):

She's a blonde, and so am I. [3a]

In [4], the hypercorrect subjective form is avoided by many, although it occurs commonly enough when not immediately preceded by *like*. Compare:

She's a teacher { **like I and you.* } [4a]
 ?like you and I.

In [5], the meaning of *like* is similar to that in adverbial clauses 'in the same manner as (she does)', 'as well as (she does)', but the normal form is the objective *like her*; **like she* is generally considered unacceptable.

In [6], *like* introduces a finite clause with obligatory subjective pronoun form (*like she used to*), and thus functions as a conjunction. This use of *like* instead of *as* is widely criticized but common in informal style, especially in AmE. The situation is similar with *like* in clauses of comparison, such as [7]:

(?)He treats me *like I was his sister.* [7]

Here, many would prefer *as if* or *as though*, since *like* is widely regarded as nonstandard in this function. By contrast, out of hypercorrectness, *as* is sometimes used instead of *like* even as a preposition where a useful distinction should be kept between them (cf 9.48), as in:

He spoke { *as a leader of mankind.* ['in the capacity of']
 like a leader of mankind. ['in the manner of']

Note Another group of items with fuzzy borders between word classes includes *but*, *except*, and *besides* (cf 9.58).

Prepositions and adverbs

- 9.5 Prepositions are items which are often formally identical with and semantically similar to adverbs. Compare the following pairs:

{ She looked *up* the hill. [1]
 She looked *up* the word. [1a]
 She walked *across* the street. [2]
 She walked *across*. [2a]

Both *up* in [1] and *across* in [2] are prepositions with prepositional complement (*up the hill*, *across the street*). However, in [1a], *up* is an ADVERB PARTICLE in a phrasal verb *look up* with, for example, positional mobility. Compare:

She looked the word *up*. [1b]
 *She walked the street *across*. [2b]

Phrasal verbs are discussed in 16.3f. *Across* in [2a] with the complement omitted is called a PREPOSITIONAL ADVERB (cf 9.65f).

The distinction between preposition and adverb is not clear in expressions like the following:

He is *near to* (being) mad. ['nearly']
 This seems *next to* impossible. ['almost']
Close to 200 people came. ['almost']
 She is *far from* (being) weak. ['anything but']

The simple preposition *near* and the complex prepositions *near to* and *close to* (all locative; cf 9.20) satisfy all three criteria for prepositions. At the same time, they have certain affinities with adjectives and adverbs. *Near (to)* and *close to* are the only prepositions which have both comparison and intensification:

She sat { (very) *near (to)*
 (quite) *close to*
 (much) { *nearer (to)*
 closer to
 nearest (to)
 next to
 closest to } me.

About is an adverb in the following use:

She is *about* forty. [3]

That the function is adverbial appears from the possibility of omission [3a], substitution by adverbs [3b], and postposition [3c]:

She is (*about*) forty. [3a]

She is { *about*
 roughly
 approximately } forty. [3b]

She is forty { *about*. <informal>
 approximately. } [3c]

Note Some phrases consisting of preposition + noun have become fixed and function as closed-class adverbs (cf 7.46), eg: *of course* ['naturally'], *in fact* ['actually']. Sometimes the combination is spelled as a single word: *indeed*, *instead*.

Deferred prepositions

- 9.6 Normally a preposition must be followed by its complement, but there are some circumstances in which this does not happen.

In the following three cases the DEFERMENT of the preposition is obligatory.

(a) Passive constructions with a prepositional verb where the subject corresponds to the prepositional complement in the active (cf 3.69, 16.14):

Has the room been paid *for*?
 ~ Has X paid *for* the room?
 ~ *Has *for* the room been paid?

She was sought *after* by all the leading impresarios of the day. [also in premodification: 'a much *sought-after* singer']

He was not paid attention *to*.

(b) Infinitive clauses with thematization of the prepositional complement (cf 18.36):

He's impossible to work *with*.

(c) *-ing* clauses with thematization:

He's worth listening *to*.

With interrogative and relative pronouns as prepositional complement, there are often alternative positions available: one formal with the preposition in its normal place before the complement [1, 2], the other informal with the preposition deferred to final position [1a, 2a]:

WH-QUESTIONS (cf 11.14ff, 16.15):

- | | |
|--|------|
| { At which house did you leave the car? <formal> | [1] |
| { Which house did you leave the car at? | [1a] |

Usually (cf 11.14 Note [e]):

- | | |
|-------------------------------|------|
| Where did you leave your car? | [1b] |
|-------------------------------|------|

RELATIVE CLAUSES (cf 17.16):

- | | |
|--|------|
| The old house { about which I was telling you is empty. <formal> | [2] |
| { (which) I was telling you about is empty. | [2a] |

A prejudice against such deferred (or 'stranded') prepositions [1a, 2a] remains in formal English which, for direct or indirect questions and for relative clauses, offers the alternative of an initial preposition [1, 2]. The alternative construction is often felt, however, to be stilted and awkward, especially in speech. In some cases, such as the following, the deferred preposition has no preposed alternative:

What did she look *like*?

What I'm convinced *of* is that the world's population will grow to an unforeseen extent.

All she could talk *about* was her dog.

In general, it is the most common and the short prepositions which can be deferred, in particular spatial prepositions (9.15ff), compare:

He left his coat *in* the car.

- | | |
|--|-----|
| ~... the car { in which he left his coat } | [3] |
| { (that) he left his coat in } | |

He left politics *because of* the election results.

- | | |
|---|-----|
| ~... the election results { because of which he left politics } | [4] |
| { *(that) he left politics because of } | |

The plane was destroyed *through* the pilot's carelessness.

- | | |
|---|-----|
| ~... the pilot's carelessness { through which the plane was destroyed } | [5] |
| { *(that) the plane was destroyed through } | |

Simple and complex prepositions

Simple prepositions

9.7 Most of the common English prepositions, such as *at*, *in*, and *for*, are SIMPLE, ie they consist of one word. Other prepositions, consisting of more than one word, are called COMPLEX (cf 9.10ff). The following is a list of the most common simple prepositions. In view of the different stress patterns (cf 9.9), they have been divided into mono- and polysyllabic. References are given to sections in this chapter where the uses of the prepositions are discussed.

(a) Monosyllabic prepositions

- | | |
|------------------|--|
| <i>as</i> | Basis of comparison 7.86; Role 9.4, 48 |
| <i>at</i> | Space 9.15ff; Time position 9.34; Goal, target 9.46; Stimulus 9.51; Standard 9.62; Reaction 9.63 |
| <i>but</i> | Exception 9.58 |
| <i>by</i> | Space 9.20; Time 9.34, 39; Means and instrument 9.49; Agentive 9.50; Stimulus 9.51; Reaction 9.63 |
| <i>down</i> | Movement 9.26, 32; Orientation 9.27 |
| <i>for</i> | Duration 9.36, 38, 42; Cause, etc 9.44; Purpose, intended destination 9.45; Recipient 9.46; Support 9.53; Standard 9.62 |
| <i>from</i> | Space 9.15ff; Orientation 9.27; Resultative 9.28; Originator 9.32; Duration 9.37; Cause, etc 9.44; Source, origin 9.47; Substance 9.61 |
| <i>in</i> | Space 9.15ff, 32; Time position 9.34; Measurement into the future 9.35 |
| <i>like</i> | Manner 9.4, 48 |
| <i>near (to)</i> | (also comparative and superlative: <i>nearer (to)</i> , <i>nearest (to)</i>) Space 9.20 |
| <i>of</i> | Cause, means 9.49 Note [b]; various relations 9.54f; Subject matter 9.60; Material 9.61 |
| <i>off</i> | Space 9.15ff |
| <i>on</i> | (cf: <i>upon</i>) Space 9.15ff, 32; Time position 9.34; Target 9.46 Note [b]; Means and instrument 9.49 Note [a]; Respect 9.57; Subject matter 9.60 |
| <i>out</i> | <esp AmE> Negative position 9.18 Note |
| <i>past</i> | Passage 9.25; Orientation 9.27; Resultative 9.28, 32 |
| <i>per</i> | Distributive frequency 5.18, cf 8.64 |
| <i>pro</i> | (see Note [a]) |
| <i>qua</i> | (see Note [a]) |
| <i>re</i> | Respect 9.57, (see Note [a]) |
| <i>round</i> | <esp BrE> Space 9.22; Movement 9.26; Orientation 9.27 |
| <i>sans</i> | (see Note [a]) |
| <i>since</i> | Time 9.38 |
| <i>than</i> | Basis of comparison 9.4, 7.85 |
| <i>through</i> | <in informal AmE also spelt <i>thru</i> > Relative position 9.22; Passage 9.25; Orientation 9.27; Pervasive 9.29; Perseverance 9.32; Duration 9.36f; Intermediacy 9.50 |
| <i>till</i> | (cf: <i>until</i>) Duration 9.37f |
| <i>to</i> | Space 9.15ff; Movement 9.26; Recipient 9.32; Duration 9.37; Reaction 9.63 |

up Movement 9.26, 32; Orientation 9.27
via (see Note [a])
with Space 9.20; Pervasive 9.29; Manner 9.48; Means and instrument 9.49f; Accompaniment 9.52; Support and opposition 9.53; 'Having' 9.55; Ingredient 9.61

(b) Polysyllabic prepositions

a'bout Space 9.22; Respect 9.57; Subject matter 9.60
a'bove Relative position 9.19, 32
a'cross Relative position 9.22; Passage 9.25, 28; Movement 9.26; Orientation 9.27
'after Relative position 9.19; Time 9.38
a'gainst Position 9.17 Note [b]; Opposition 9.53
a'long Movement 9.26; Orientation 9.27; Pervasive 9.29 (also *a'longside*)
a'mid(st) <formal> Space 9.21, 32
a'mong(st) <amongst esp BrE> Space 9.21; Relation 9.32
'anti (see Note [a])
a'round <esp AmE for some uses> Space 9.22; Movement 9.26; Orientation 9.27; Pervasive 9.29
a'top <esp AmE; literary> Relative position, cf 9.19
be'fore Relative position 9.19; Time 9.38
be'hind Relative position 9.19; Relative destination 9.23; Passage 9.24
be'low Relative position 9.19, 32
be'neath <formal> Relative position 9.19, 32
be'side Space 9.20
be'sides Addition 9.20, 58
be'tween Space 9.21; Relation 9.32; Time 9.39
be'yond Orientation 9.27, 32; Exception 9.58
'circa (see Note [a])
de'spite Concession 9.56
'during Time position 9.34; Duration 9.36
ex'cept Exception 9.58
in'side Space 9.15 Note [a], 9.55 Note
'into Space 9.15ff; Movement 9.26, 32
,notwith'standing <formal> Concession 9.56
'onto Space 9.15ff
'opposite Space 9.20
out'side Space 9.15 Note [a], 9.55 Note
'over Survey of different senses 9.30; Relative position 9.19; Relative destination 9.23; Passage 9.24; Movement 9.26; Orientation 9.27; Resultative 9.28; Pervasive 9.29; 'more than' 9.32 Note [a]; Duration 9.36; Subject matter 9.60
'pace (see Note [a])
'pending Duration 9.38 Note [b]
through'out Pervasive 9.29; Duration 9.36

to'ward(s) <to'ward esp AmE> Movement 9.17, 26
'under Relative position 9.19; Relative destination 9.23; Passage 9.24; Subjection, etc 9.32; 'less than' 9.32 Note [a]
,under'neath <formal> Relative position 9.19; Relative destination 9.23; Passage 9.24
un'like Manner 9.48
un'til Duration 9.37f
u'pon <formal> (see on above)
'versus (see Note [a])
'vis-à-vis (see Note [a])
with'in Space 9.15 Note [a], 9.55 Note
with'out Means and instrument 9.49f; Accompaniment 9.52; 'Having' 9.55

Note [a] Some of the prepositions listed above are restricted in terms of frequency, style, or usage. The following are foreign borrowings that are restricted to certain contexts, usually formal or technical. Those that have not yet been fully anglicized are often italicized in print.

Latin origin: *anti*, *circa*, *pace*, *pro*, *qua*, *re*, *versus* [abbreviated *v* (BrE), *vs* (AmE)], *via*
 French origin: *sans*, *vis-à-vis*

[b] The prepositions *agin* and *anent* are rare and stylistically restricted; *agin* is common in Scots and so is *outwith* /*autwith* /['except', 'outside']. Also (BrE dialectal): *while* ['till'].

[c] In poetic style, the reduced forms *'tween* and *'twixt* ['between'] may occur.

[d] *'Unto* ['to'] is archaic and biblical.

[e] As indicated in the lists above, there are differences between AmE and BrE in the use of some prepositions. One such example is *toward/towards* (cf 7.46 Note [a]).

Marginal prepositions

9.8 In addition to the prepositions listed in 9.7, there are some words which behave in many ways like prepositions, although they also have affinities with other word classes such as verbs or adjectives (cf 9.3f), eg:

Granted his obsequious manner, I still think he's ambitious enough to do the job.

He gave Mary all *bar* ['except'] three of the sketches.

Two gold-hilted swords, each *worth* £10,000, were sold at Sotheby's last Monday.

Here is a list of some marginal prepositions with verbal affinities:

bar, *'barring*, *ex'cepting*, *ex'cluding*; *save* <formal> (Exception 9.58)
con'cerning <formal>, *con'sidering* (cf 9.3, 57), *re'garding*, *re'specting*,
'touching <formal or literary> (Respect 9.57)

'failing, *'wanting*

'following, *'pending* <formal> (Time 9.38 Note [b])

'given, *'granted*, *in'cluding* (cf 17.73)

Less, *minus*, *plus*, *times*, and *over* form a special group in their use with numerals (cf 6.68), eg:

6 + 2 is read as 'six plus two'.

In informal style, *minus* and *plus* can also occur in nonnumerical contexts:

I hope he comes *minus* his wife. ['without']
 She's had mumps *plus* measles. ['and']

Plus can even be used as a conjunction (cf 13.5 Note [b]):

You can get what you want, *plus* you can save money. <esp AmE> ['and in addition', 'also']

Stressing of simple prepositions

9.9 As regards stress, simple prepositions can be divided into two groups:

(a) Prepositions which have no reduced form in their pronunciation (cf App II.9), eg: *like*, *round*, *since*, *through*. For example:

A: What's its *SHAPE* like /laɪk/? B: It's *like* /laɪk/ a sàʊsage.

(b) Prepositions which have reduced forms, eg: *from* /frɒm, frəm, frm/ and where the choice of phonetic form varies according to function. For example:

A: Where's he *FRÒM* /frɒm/? B: He's *from* /frəm/ New JÉRsey.

Monosyllabic prepositions are normally unstressed; polysyllabic prepositions are normally stressed. However, stressed monosyllabic prepositions are by no means uncommon, especially in coordination:

Trains both *'to* and *'from* London are late this morning.
 ... government *'of* the people, *'by* the people, and *'for* the people

Stressing of prepositions also occurs in repeated patterns where the stress shifts from a 'given' item to a 'new' item (cf 19.25), as in:

A: Why don't you borrow the book from the Library?
 B: It's not *IN* the library.

Yet stressing takes place not only in such contrastive use, but also in some other cases where the prepositional complement is unstressed or is the 'tail' of the tone unit (cf App II.15), eg:

Where are you *FRÒM*? He's *PÀST* it.
 They took it *ÒFF* him. What's it *FÒR*?
 What *ÒF* it?

The stress shift from the complement of the preposition, as in [1], to the preposition, as in [2], is clearly conditioned by the desire to avoid stressing the pronoun *it* (cf 6.16):

There's nothing $\left\{ \begin{array}{l} \text{to this stòry.} \\ \text{tò it.} \end{array} \right.$ [1]
 [2]

Special stress patterns are used for special effects. Note the different meanings according to whether the preposition *by* is stressed or not in:

She wants to have a book $\left\{ \begin{array}{l} \text{bÿ her. ['near herself'; place] <esp BrE>} \\ \text{by HÉR. ['written by'; agentive; cf 9.50]} \end{array} \right.$

Note also the different meanings of *for* with varying stress in the following set:

Our vote is *FÒR* /fɔː/ the students. ['in favour of the students']
 The exams are *for* /fə/ the stÜdents. ['are designed for the students to take']

Note Stressing monosyllabic prepositions has become rather fashionable, although some people regard it as annoyingly affected. Public speakers and radio commentators tend to stress monosyllabic prepositions where weak forms are expected. Speakers may stress them when searching for the appropriate complement, eg:

FRÒM ... /ɔh/ ... the Palace GÀTES ... the Royal carriage proceeds ...

However, some speakers do it when there is no such motivation, eg:

ÒN this record| Benny plays beautiful vİBES|

Complex prepositions

Two-word sequences

9.10 Complex prepositions may be subdivided into two- and three-word sequences.

In two-word sequences, the first word (which usually is relatively stressed) is an adverb, adjective, or conjunction, and the second word a simple preposition (usually *for*, *from*, *of*, *to*, or *with*). For example:

Except for Margaret, everybody was in favour of the idea.
 We had to leave early *because of* the bad weather.
 I sat *next to* an old lady on the train.

Here is a list of some two-word prepositions:

'up against	'as per
'as for (9.57) except for (9.58)	'but for (9.59)
a'part from (9.58) a'way from (9.15ff)	a'side from <esp AmE> (9.58) 'as from
a'head of 'back of <informal AmE> (9.11 Note) exclusive of in'stead of 'off of <informal AmE> out'side of 'upwards of	'as of be'cause of (9.44) de'void of in'side of irre'spective of (9.57 Note) 'out of (9.15ff, 28, 32, 61) re'gardless of (9.57 Note) 'void of
ac'cording to (9.57, 63) 'close to (9.20) 'due to 'next to (9.20) 'owing to pre'paratory to prior to 'subsequent to 'up to (9.37)	'as to (9.57) 'contrary to 'near(er) (to) (9.20) 'on to [cf: 'onto] (9.7, 15 Note [b]) pre'liminary to 'previous to pur'suant to <formal> 'thanks to
a'long with	to'gether with

Note As with simple prepositions (cf 9.7 Note [a]), there are also complex prepositions of French origin which have not yet been fully anglicized and are often italicized in print, eg: *à la* (cf 17.60 Note) and *apropos (of)* ['with regard to'] (cf 9.57).

Three-word sequences

9.11 The most numerous category of complex prepositions is the type consisting of three words, as in:

Prep1 + Noun + Prep2: *in view of* the election [1]

Other examples:

In terms of money, her loss was small.

Two men were interviewed at Bow Street Police Station *in connection with* a theft from an Oxford Street store.

How many delegates are *in favour of* this motion?

His biography of Eisenhower is in many places *at variance with* the official reports.

In line with latest trends in fashion, many dress designers have been sacrificing elegance to audacity.

With three-word sequences we also include complex prepositions where the noun is preceded by a definite or indefinite article:

in the light of } the election [1a]
as a result of

Complex prepositions may be subdivided according to which prepositions function as Prep1 and Prep2, eg:

in + noun + *of*:

<i>in aid of</i>	<i>in back of</i>
<i>in behalf of</i> <AmE>	<i>in case of</i>
<i>in charge of</i>	<i>in consequence of</i>
<i>in (the) face of</i>	<i>in favour of</i>
<i>in front of</i> (9.19)	<i>in (the) light of</i>
<i>in lieu of</i>	<i>in need of</i>
<i>in place of</i>	<i>in (the) process of</i>
<i>in quest of</i>	<i>in respect of</i>
<i>in search of</i>	<i>in spite of</i> (9.56)
<i>in view of</i>	

in + noun + *with*:

<i>in accordance with</i> (9.63 Note)	<i>in common with</i>
<i>in comparison with</i>	<i>in compliance with</i>
<i>in conformity with</i>	<i>in contact with</i>
<i>in line with</i>	

by + noun + *of*:

<i>by dint of</i>	<i>by means of</i>
<i>by virtue of</i>	<i>by way of</i>

on + noun + *of*:

<i>on account of</i> (9.44)	<i>on behalf of</i>
-----------------------------	---------------------

on (the) ground(s) of
on pain of
on the strength of

on the matter of (9.57)
on the part of
on top of (9.19)

Other types:

<i>as far as</i> (9.17)	<i>at variance with</i>
<i>at the expense of</i>	<i>at the hands of</i>
<i>for (the) sake of</i>	<i>for/from want of</i>
<i>in exchange for</i>	<i>in return for</i>
<i>in addition to</i> (9.58)	<i>in relation to</i>
<i>with/in regard to</i> (9.57)	<i>with/in reference to</i> (9.57)
<i>with/in respect to</i> (9.57)	<i>with the exception of</i> (9.58)

Note Some complex prepositions consisting of three-word sequences tend to be shortened to two-word sequences in casual speech, eg: (*in*) *back of*, (*by*) *way of*, (*by*) *means of*, (*on*) *pain of*, (*for*) *sake of*, (*in*) *spite of*:

Spite of this, I think we should go right ahead.
Let's do this *sake of* consistency.

Gradience between complex prepositions and free noun-phrase sequences

9.12 In the strictest definition, a complex preposition is a sequence that is indivisible both in terms of syntax and in terms of meaning. However, there is no absolute distinction between complex prepositions and constructions which can be varied, abbreviated, and extended according to the normal rules of syntax. Rather, there is a scale of 'cohesiveness' running from a sequence which behaves in every way like a simple preposition, eg: *in spite of* (*the weather*), to one which behaves in every way like a set of grammatically separate units, eg: *on the shelf by (the door)*. Nine indicators of syntactic separateness are listed below.

- Prep2 can be varied:
on the shelf at (the door) [but not: **in spite for*, etc]
- The noun can be varied as between singular and plural:
on the shelves by (the door) [but not: **in spites of*]
- The noun can be varied in respect of determiners:
on a/the shelf by; on shelves by (the door) [but not: **in a/the spite of*]
- Prep1 can be varied:
under the shelf by (the door) [but not: **for spite of*]
- Prep + complement can be replaced by a possessive pronoun (cf Note [c] below):
on the surface of the table ~ on its surface
[but: *in spite of the result ~ *in its spite*]
- Prep2 + complement can be omitted:
on the shelf [but not: **in spite*]
- Prep2 + complement can be replaced by a demonstrative:
on that shelf [but not: **in that spite*]

- (h) The noun can be replaced by nouns of related meaning:
on the ledge by (the door) [but not: **in malice of*]
- (i) The noun can be freely premodified by adjectives:
on the low shelf by (the door) [but not: **in evident spite of*]

In all these respects, *in spite of* 'qualifies' as a complex preposition, whereas *on the shelf by* does not. To these syntactic criteria of cohesiveness, a lexical criterion may be added: unlike syntactic constructions, the complex preposition *in spite of* has a synonymous simple preposition *despite*.

As examples of sequences which lie between these two poles, we may take *in quest of*, *in search of*, *in comparison with*, and *in defence of*, as showing progressively less of the character of a preposition and more of the character of a free syntactic construction.

In quest of is slightly less cohesive than *in spite of* in that it has property (h) (*cf: in search of*).

In comparison with goes further, in that it has property (d) (*cf: by/through comparison with*), as well as properties (f) (*cf: in comparison*) and (h) (*cf: in common with*). *In defence of* goes yet further, having four of the properties of a free construction, viz (c) *in the defence of*, (e) *in her defence*, (h) *in support of*, and (i) *in keen/stubborn/bold defence of*.

On the other hand, all these types might reasonably be considered 'complex prepositions', in that they have more in common with *in spite of* than with *on the shelf by*.

Note [a] The cohesiveness of complex prepositions (as compared with free constructions) should be related to complex subordinators like *in that*, *in order that*, *as long as* (*cf* 14.12ff), and to phrasal lexicalization (*cf* App 1.9ff).

[b] Legal English is notable for complex prepositions, the following being among those found mainly in legalistic or bureaucratic usage: *in case of*, *in default of*, *in lieu of*, *in pursuance of*, *in respect of*, *on pain of*.

[c] Some complex prepositions ending in *of* have an alternative genitive construction (*cf* (e) above and 5.120), *eg*:

for the sake of the people ~ *for the people's sake*
on behalf of Jim ~ *on Jim's behalf*
at the expense of Susan ~ *at Susan's expense*

[d] Occasionally there appear variants of complex prepositional sequences, *eg: in light of* for the regularly used *in the light of*, and the rather idiosyncratic *for dint of* (obviously based on *by dint of*) in the following example from Norman Mailer, *Marilyn*:

... unable to put down a word *for dint of* listening to her ... ['because he was listening']

Boundary between simple and complex prepositions

- 9.13 The boundary between simple and complex prepositions is also an uncertain one. Orthographic separation is the easiest test to apply, but anomalies such as writing *into* as one word but *out of* as two, and *instead of* as two words but *in lieu of* as three, merely emphasize the arbitrariness of the distinction between one and more than one word in writing.

A test that can be applied to many cases is that a preposition when simple is identical in form to its corresponding prepositional adverb (*cf* 9.65f), *eg*: *by* in:

{ She stood *by* the door.
 { She walked *by*.

A complex preposition, on the other hand, loses its final element when transferred to the function of adverb (*cf* 9.66):

She put the skis { *on top of the car*.
 { *on top*.

Note In colloquial AmE use, *on top* occurs also as a preposition (*on top the car*), perhaps just by syncope of /ə/ to which *of* is reduced.

Prepositional meanings

- 9.14 As we said in 9.1, a preposition expresses a relation between two entities, one being that represented by the prepositional complement. Of the various types of relational meaning, those of SPACE and TIME are easiest to describe systematically. Other relationships such as INSTRUMENT and CAUSE may also be recognized, although it is difficult to describe prepositional meanings systematically in terms of such labels. Some prepositional uses may be elucidated best by seeing a preposition as related to a clause, *eg*:

the man *with the red beard* ['the man who has the red beard'; *cf* 9.55, 17.37]

my knowledge *of Hindi* ['I know Hindi'; *cf* 17.41]

We shall relate semantic categories to their most usual syntactic functions, but one semantic category often has more than one syntactic function (*cf* 9.1). For example, prepositional phrases of place can postmodify in nominalizations (*cf* 17.51ff), as in [1], as well as in their more usual adverbial function [2]:

his departure *from Paris* [1]
 He departed *from Paris*. [2]

In the survey of prepositional meanings, to which most of this chapter is devoted, space and time relations will be dealt with first, and will be followed by a more cursory exemplification of other relations such as 'cause', 'goal', and 'origin'. So varied are prepositional meanings that no more than a presentation of the most notable semantic similarities and contrasts can be attempted here.

Prepositions denoting spatial relations

Dimension

- 9.15 When we use a preposition to indicate space, we do so in relation to the dimensional properties, whether subjectively or objectively conceived, of the location concerned. Consider *at* in example [1]:

My car is *at the cottage*. [1]

Here the use of *at* treats *cottage* as a dimensionless location, a mere POINT in relation to which the position of the car can be indicated. This is dimension-type 0. Compare *on* in [2]:

Our cottage is *on that road*. [2]

In [2], the road is viewed as a LINE ['along that road'], *ie* dimension-type 1. But *on* can also be used to denote an area, as in [3] and [4]:

There is some ice *on that road*. [3]

There is a new roof *on the cottage*. [4]

In [3] and [4], the road and the cottage are viewed as two-dimensional areas, *ie* as SURFACES.

Finally, compare *in*, as in [5]:

There are only two beds *in the cottage*. [5]

In [5], the cottage is viewed as the three-dimensional object which in reality it is. *In* is also capable of being used with objects which are essentially two-dimensional, as in [6]:

The cows are *in the field*. [6]

Here *field* is conceived of as an enclosed space (contrast: 'We walked on the beach'). *In* therefore belongs to dimension-type 2 or 3. Figure 9.15 below sets out the dimensional orientation of the chief prepositions of space:

destination	position	destination	position	
<i>to</i>	<i>at</i>	<i>(away) from</i>	<i>away from</i>	DIMENSION-TYPE 0 (point)
				
<i>on(to)</i>	<i>on</i>	<i>off</i>	<i>off</i>	DIMENSION-TYPE 1 or 2 (line or surface)
				
<i>in(to)</i>	<i>in</i>	<i>out of</i>	<i>out of</i>	DIMENSION-TYPE 2 or 3 (area or volume)
				
POSITIVE		NEGATIVE		

Fig 9.15 Space and dimension

Note [a] Some of the prepositions in the above figure can be replaced by other prepositions with the same meaning. *Upon* is a formal equivalent of *on* where a surface is referred to, or is the basis of, the metaphor concerned. When used metaphorically in archaic expressions, *upon* is obligatory: *upon! on my word, upon! on my soul*, etc. In some cases, *inside* and *within* can substitute for *in*, and *outside* for *out of*, but only *within* (not *in*) can be used in the following expressions: *within shooting distance, within these four walls*.

[b] *Onto* is sometimes spelled as two words, especially in BrE:

She jumped $\left\{ \begin{smallmatrix} \text{onto} \\ \text{on to} \end{smallmatrix} \right\}$ the horse.

I think you're $\left\{ \begin{smallmatrix} \text{onto} \\ \text{on to} \end{smallmatrix} \right\}$ something there. <informal>

The particle *on* + the preposition *to* are always written as two words:

From Lancaster we *went on to* York. ['continued to']

[c] *Into* is obligatory in fixed metaphorical expressions like *get into trouble, get into debt* (cf 9.32).

Positive position and destination: *at, to, on, onto, in, into*

9.16 Prepositional phrases of place are typically either adjuncts (relating an event or state of affairs to a location) or postmodifiers (relating some 'object' to a location).

Between the notions of simple position (or static location) and destination (movement with respect to an intended location) a cause-and-effect relationship obtains:

DESTINATION

Ann went *to* Oxford.

Ann climbed *onto* the roof.

Ann dived *into* the water.

POSITION

AS A RESULT: Ann was *at* Oxford.

AS A RESULT: Ann was *on* the roof.

AS A RESULT: Ann was *in* the water.

A prepositional phrase of 'position' can accompany most verbs, although this meaning is particularly associated with verbs of stative meaning (cf 2.43, 4.28ff), such as *be, stand, live*, etc. The meaning of 'destination' generally (but by no means always, cf 9.24ff) accompanies a verb of dynamic 'motional' meaning, such as *go, move, fly*, etc.

In many cases (especially in colloquial English), *on* and *in* may be used for both position and destination when *onto* and *into* make an unnecessary emphasis on the combination of destination + dimension:

She fell *on* the floor.

He put his hands *in* his pockets.

Note There are various restrictions, especially in BrE, on the interchangeability of *on* with *onto* and *in* with *into*: most verbs of motion such as *walk, slide, swim* require *onto* and *into* for destinational meaning. Note the difference between:

Don't run *in* the school. ['when you are inside the building']

Don't run *into* the school. [ie from outside it]

Causative verbs such as *place, stand, lay, sit*, on the other hand, usually permit combinations both with and without *to, onto, and into*:

She put the typewriter case *on(to) the top shelf* and the key *in(to) the drawer*.

But there appear to be some restrictions:

The mother sat the baby $\left\{ \begin{smallmatrix} \text{on} \\ \text{?onto} \end{smallmatrix} \right\}$ the chair.

9.17 Here are some more examples of each dimension-type.

Dimension-type 0:

at the bus stop

at the North Pole

at the end of the road

Dimension-type 1 and 2:

line: The city is situated $\left\{ \begin{array}{l} \textit{on the River Thames.} \\ \textit{on the boundary.} \\ \textit{on the coast.} \end{array} \right.$

surface: A notice was pasted { *on the wall.*
on the ceiling.
on my back.

Dimension-type 2 and 3:

area: *in the world*
in the village
in a park

volume: *in a box*
in the bathroom
in the cathedral

The contrast between *on* ['surface'] and *in* ['area'] has various implications according to context, as these examples show:

The frost made patterns *on the window*. [*window* = glass surface]
 A face appeared *in the window/mirror*. [*window/mirror* = framed area]
 The players were practising *on the field*. [*field* = surface for sports]
 Cows were grazing *in the field*. [*field* = enclosed area of land]
 She was sitting { *on the grass*. [*surface, ie the grass is short*]
 in the grass. [*volume, ie the grass is long*]

In is used for sizeable territories such as:

continents, countries: *in Asia, in China*
 provinces, counties: *in British Columbia, in Cheshire*
 city districts: *in Brooklyn, in Hampstead*

But for towns, villages, etc, either *at* or *in* is appropriate, according to point of view: *at/in Stratford-upon-Avon*. A very large city (such as New York, London, or Tokyo) is generally treated as an area:

He works *in London*, but lives *in the country*.

But even a large city may be treated as a point on the map if global distances are in mind:

Our plane refuelled *at London* on its way from New York to Moscow.

Note the following difference between *at* and *in*:

She's $\left\{ \begin{array}{l} \text{at Oxford. ['She's a student at Oxford University.']} \\ \text{in Oxford. ['She's staying, etc in the City of Oxford.']} \end{array} \right.$

With buildings also, both *at* and *in* can be used. The difference here is that *at* refers to a building in its institutional or functional aspect, whereas *in* refers to it as a three-dimensional structure:

Ann works $\left\{ \begin{matrix} at \\ in \end{matrix} \right\}$ a publishing house.

With *school*, we can find the following three constructions:

Sid is $\begin{cases} \text{at school.} \\ \text{in school.} \\ \text{in the school.} \end{cases}$ [1]
[2]
[3]

The meaning 'enrolled in' is expressed by [1] in BrE and by [2] in AmE; the meaning 'at the place, not at home' is expressed by [1] or [2] in BrE, and by [1] in AmE; the meaning 'within the building' is expressed by [3] in both BrE and AmE. On the zero article with *school*, cf 5.44.

To denotes completive movement in the direction of a place, as in:

The Smiths drove *to Edinburgh*. [suggests actual arrival]

Towards expresses movement without the idea of completion (cf 9.26; on the choice of the *-ward/-wards* forms, cf 7.46 Note [a]):

They drove *towards Edinburgh*.

Compare *to*, with progressive aspect, and *set out for*, neither of which express the idea of completion:

They were driving *to Edinburgh*.
They set out *for Edinburgh*.

As far as stresses the length of the journey (space only, not time):

They drove *as far as Edinburgh*.

With the perfective aspect, *to* may also be used in a way which appears to make it interchangeable with *at* or *in*:

Ann has been $\begin{cases} \text{to/at Oxford. ['as a student']} \\ \text{to/in Oxford. ['as a visitor']} \end{cases}$

This occurrence of *been* followed by *to*, however, is a result of the substitution of the *-ed* participle of *be* for the *-ed* participle of *go* (*gone*) in order to convey the resultative sense of *go* (cf 4.22 Note [b]).

Note [a] When a place is being regarded as a destination rather than a position, it is more natural to see it vaguely as a geographical point than as an area. Hence the more frequent use of *to* than of *into* in reference to countries, etc:

The gypsies *came to England* in the fifteenth century. [Contrast: The gypsies *were in England*.]
Against is commonly used as a preposition of simple position or destination in the sense of 'on the side of' or 'touching the side surface of':

He's leaning *against* the wall.

[c] Additional uses of *on* as a preposition of position:

Humpty Dumpty sat *on the wall*. ['on top of']

There are still apples *on* the tree. ['hanging from']

We may see these as extending the basic meaning of *on* to include the most obvious static relationship of contiguity between a smaller and a larger object.

[d] Prepositions denoting position (not destination) are used with the verb *arrive* and the noun *arrival*:

She arrived } { *in London/Kenya/British Columbia*
on her arrival } { *at the shop/bus stop/seaside*

Source or negative position: *away from, off, out of*

9.18 There is a cause-and-effect relation with negative destination and position parallel to that of positive destination and position:

Ann *drove (away) from* home. ~ Ann *is away from* home.
 The book *fell off* the shelf. ~ The book *is off* the shelf.
 Tom *got out of* the water. ~ Tom *is out of* the water.

The negative prepositions *away from*, *off*, and *out of* may be defined simply by adding the word *not* to the corresponding positive preposition: *away from* ['not at'], *off* ['not on'], *out of* ['not in'].

Note In AmE, *out* is more commonly used than *out of* in such an expression as:

She looked $\begin{cases} \text{out the window.} <\text{AmE and informal BrE}> \\ \text{out of the window.} <\text{BrE or AmE}> \end{cases}$

In this usage, there needs to be a reference to an opening or aperture:

The children gathered some bluebells before they went

$\begin{cases} \text{out of} \\ \text{*out} \end{cases}$ the wood and returned home.

Relative position: *over*, *under*, etc

9.19 Apart from simple position, prepositions may express the RELATIVE POSITION of two objects or groups of objects. *Above*, *over*, *on top of*, *under*, *underneath*, *beneath*, and *below* express relative position vertically, whereas *in front of*, *before*, *behind*, and *after* represent it horizontally. Figure 9.19 depicts the relations expressed by *above X*, *behind X*, etc.

Fig 9.19 Vertical and horizontal direction

The antonyms *above* and *below*, *over* and *under*, *in front of* and *behind* are converse opposites:

$\begin{cases} \text{The picture is above the mantelpiece.} \\ \text{= The mantelpiece is below the picture.} \end{cases}$

$\begin{cases} \text{The bus is in front of the car.} \\ \text{= The car is behind the bus.} \end{cases}$

Over and *under* as place prepositions are roughly synonymous with *above* and *below*, respectively. The main differences are that *over* and *under* tend to indicate a direct vertical relationship or spatial proximity, while *above* and *below* may indicate simply 'on a higher/lower level than':

The castle stands on a hill $\begin{cases} \text{above} \\ \text{?over} \end{cases}$ the valley.

Keep this blanket $\begin{cases} \text{over} \\ \text{*above} \end{cases}$ you.

The doctor and the policeman were leaning $\begin{cases} \text{over} \\ \text{*above} \end{cases}$ the body when we arrived.

Underneath and *beneath* <formal> are less common substitutes for *under*. *Underneath*, like *on top of*, generally indicates a contiguous relation:

The police found the stolen money *under/underneath* the carpet.
 We placed the skis *on top of* the car.

The following prepositional adverbs (cf 9.65f) or fixed phrases correspond to the prepositions of position:

PREPOSITIONAL ADVERBS	PREPOSITIONS
<i>overhead</i>	<i>over</i>
<i>underneath</i> <formal>	<i>under</i> , <i>underneath</i> <formal>
<i>in front</i>	<i>in front of</i>
<i>on top</i>	<i>on top of</i> (cf 9.13)
<i>above</i>	<i>above</i>
<i>below</i>	<i>below</i>
<i>behind</i>	<i>behind</i>
<i>beneath</i> <formal>	<i>beneath</i> <formal>

Example:

Would you like to sit $\begin{cases} \text{in front?} & [\text{Prepositional adverb}] \\ \text{in front of us?} & [\text{Preposition}] \end{cases}$

Note [a] The actual use of the prepositions relating to relative position varies considerably. The frequencies for the bottom vertical set in Fig 9.19 are as follows in the LOB and Brown printed corpora (note the similar frequencies in BrE and AmE):

Table 9.19 Frequencies of *under*, *below*, *beneath*, and *underneath*

	Total	<BrE>	<AmE>
<i>under</i>	1352	645	707
<i>below</i>	295	150	145
<i>beneath</i>	117	60	57
<i>underneath</i>	22	11	11

[b] *Beneath* is obligatory in fixed metaphorical expressions like *beneath her dignity*, *beneath contempt* (cf 9.32).

Space: *by*, *beside*, *with*, *near (to)*, *close to*, *opposite*

9.20 Other prepositions denoting space are *by*, *beside*, and *with*:

He was standing *by/beside* the door. ['at the side of']
 I left the keys *with* my wallet. ['in the same place as']

Beside is usually a locative and *besides* a nonlocative preposition:

Beside Mary there stood a young man. ['at the side of']
Besides Mary there were several other students in the hall. ['in addition to']

However, the preposition *beside* is often used, especially in AmE, to mean 'in comparison with', 'apart from'. Unlike *beside*, *besides* may also be an adverb meaning 'in addition' (cf 8.137, 9.58):

She is intelligent. *Besides*, she is good-looking.

As a locative preposition, the simple preposition *near* meaning *close to* can be replaced by the complex preposition *near to*:

She was sitting $\left\{ \begin{array}{l} \text{near (to)} \\ \text{close to} \end{array} \right\}$ me.

Near (to) and *close to* are the only prepositions which inflect for comparison (cf 9.5). Unlike the absolute form, *nearer* and *nearest* usually require *to*. *Next* always does so:

She was sitting $\left\{ \begin{array}{l} \text{nearer (to)/nearest (to)/next to me.} \\ \text{closer to/closest to me.} \end{array} \right\}$

Opposite means 'facing' and has optional *to*:

Her house is *opposite (to)* mine.

Space: *between*, *among*, *amongst*, *amid*, *amidst*

9.21 *Between* relates the position of an object to a definite or exclusive set of discrete objects, whereas *among* relates to nondiscrete objects. Thus:

The house stands $\left\{ \begin{array}{l} \text{between two farms.} \\ \text{among farms.} \end{array} \right\}$

Switzerland lies $\left\{ \begin{array}{l} \text{between} \\ \text{*among} \end{array} \right\}$ France, Germany, Austria, and Italy.

$\left\{ \begin{array}{l} \text{He likes getting among people. ['likes mixing with']} \\ \text{I saw Bill standing (in) between Mrs Bradbury and the hostess.} \end{array} \right\}$

Amid and *amidst* (which are both formal) mean 'in the midst of' and, like *among*, can apply to an indefinite number of entities:

The deserted house stood *amid* snow-covered fir trees. <formal>

Note [a] The frequencies in the LOB and Brown corpora of printed English indicate that some of the prepositions in 9.21 are rare; in the case of *amongst* there is also a clear difference in usage between AmE and BrE. See Table 9.21, which, however, includes all uses, not just spatial.

Table 9.21 Frequencies of *between*, *among(st)*, and *amid(st)*

	Total	<BrE>	<AmE>
<i>between</i>	1597	867	730
<i>among</i>	683	313	370
<i>amongst</i>	49	45	4
<i>amid</i>	23	9	14
<i>amidst</i>	~8	5	3

[b] It is common, but not accepted by all speakers, to say *between each house* instead of *between each house and the next*.

Space: *around*, *round*, *about*

9.22 *Around* and *round* refer to surrounding position or to motion:

We were sitting (a)round the campfire.
 The spaceship is travelling (a)round the globe.

About and *around* often have a vaguer meaning of 'in the area of' or 'in various positions in':

The guests were standing about/around the room.
 There are very few taxis about/around here.

In AmE, *about* is rarer and more formal in this sense than *around*. In general, BrE often tends to use *about* or *round* where AmE uses *around*.

Relative position can also be expressed by prepositions which usually denote passage or path (cf 9.25f), eg:

The tree lay across the road.
 The road runs through the tunnel.

Note The frequencies of *around* and *round* in the LOB and Brown corpora of printed English are as follows (all uses):

Table 9.22 Frequencies of *around* and *round*

	Total	<BrE>	<AmE>
<i>around</i>	806	245	561
<i>round</i>	410	336	74

Relative destination: *over*, *under*, *behind*, etc

9.23 As well as relative position, the prepositions listed in 9.19ff (but not, generally, *above* and *below*) can express RELATIVE DESTINATION:

He threw a blanket over her.
 The bush was the only conceivable hiding place, so I dashed behind it.
 When it started to rain, we all went underneath the trees.

This use is distinct from that denoting 'PASSAGE over, under, behind', etc (cf 9.24).

Passage: *over*, *under*, *behind*, etc

9.24 With verbs of motion, prepositions may express the idea of PASSAGE (ie movement towards and then away from a place), as well as destination. With the prepositions listed in 9.19ff, this occurs in sentences like [1-3]:

He jumped over a ditch. [1]
 Someone ran behind the goalposts. [2]
 The ball rolled underneath the table. [3]

In sentences such as [2] and [3], there is an ambiguity. In [3], we can supply either the meaning of 'passage' (= 'the ball passed under the table on the way

to some other destination') or the meaning of 'destination' (= 'the ball rolled under the table and stayed there').

Note A triple ambiguity may in fact arise with the above sentences, or more clearly with:

A mouse scuttled *behind* the curtain.

This sentence may be interpreted not only in the senses of 'passage' and 'destination', but also (less plausibly) in the static sense, implying that the mouse stayed (scuttling back and forth) behind the curtain all the time.

Passage: *across, through, past*

- 9.25 The sense of 'passage' is the primary locative meaning attached to *across* (dimension-type 1 or 2), *through* (dimension-type 2 or 3) and *past* (the 'passage' equivalent to *by* which may also, however, be substituted for *past* in a 'passage' sense). Note the parallel between *across* and *on*, *through* and *in* in Fig 9.25:

DIMENSION-TYPE 1 OR 2  on the grass  across the grass

DIMENSION-TYPE 2 OR 3  in the grass  through the grass

Fig 9.25 *On* and *across*, *in* and *through*

The upper pair treat the grass as a surface, and therefore suggest short grass; the lower pair, by treating the grass as a volume, suggest that it has height as well as length and breadth – that is, that the grass is long. There is a meaning of *over* corresponding to *across* in this sense:

The ball rolled $\left\{ \begin{array}{l} \text{over} \\ \text{across} \end{array} \right\}$ the lawn.

- 9.26 Movement with reference to a directional path: *up, down, along, across, etc*
Up, down, along, across (in a slightly different sense from that of 9.25) and *(a)round*, with verbs of motion, make up a group of prepositions expressing movement with reference to an axis or directional path, as illustrated in Figs 9.26a and 9.26b:

Fig 9.26a *up* and *down*

Fig 9.26b *along* and *across*

Up and *down* contrast in terms of vertical direction, eg:

We walked *up* the hill and *down* the other side.

But *up* and *down* are also used idiomatically in reference to a horizontal axis:

I walked *up* and *down* the platform.

She went $\left\{ \begin{array}{l} \text{up/down the road.} \\ \text{up/down the coast.} \end{array} \right.$

Up and *down* here express the notion of 'along', and need not have any vertical implications (cf 19.32).

Along denotes 'from one end towards the other' or 'in a line parallel with', eg:

We walked *along* the streets, just looking at people.

I took my dog for a walk *along* the river.

Along contrasts with *across* ['from one side to another'] in terms of a horizontal axis:

Be careful when you walk *across* a street.

With *(a)round*, the directional path is an angle or a curve:

We ran *(a)round* the corner.

Towards indicates both 'real' and 'implied' motion, 'in the direction of':

We walked *towards* the old farmhouse.

The window faces *towards* the south.

The concept of 'implied' motion also accounts for the use of other prepositions, eg: *to*, *over*, and *into*:

Is this the bus *to* Oxford?

She glanced *over* her shoulder.

He spoke *into* the microphone.

Note On the adverbs (walk) *home/homeward(s)*, etc corresponding to some prepositional phrases above, cf 7.46.

Orientation: *beyond, over, past, up, across, etc*

- 9.27 Most prepositions which express relative destination, passage, and movement with reference to a directional path (cf 9.26) can be used in a static sense of orientation. This brings in a third factor apart from the two things being spatially related: viz a POINT OF ORIENTATION, at which (in reality or imagination) the speaker is standing.

Beyond ['on the far side of'] is a preposition whose primary meaning is one of orientation. *Over, past, across*, and *through* combine the meaning of 'beyond' with more specific information about dimension, as described in 9.26:

They live *across* the moors. [ie 'from here']

The village is $\left\{ \begin{array}{l} \text{past the bus stop.} \\ \text{through the wood.} \end{array} \right.$

Up, down, along, across, and *(a)round* are used orientationally with reference to an axis in:

the shop *down the road* ['towards the bottom end of . . .']

Her office is $\begin{cases} \text{up the stairs. ['at (OR towards) the top of . . .'; = upstairs]} \\ \text{down the stairs. ['at (OR towards) the bottom of} \\ \text{. . .'; = downstairs]} \end{cases}$

There's a hotel *across/along* the road. ['on the other side/towards the other end of . . .']

We live just *(a)round the corner*.

We can, if we like, specify the viewpoint by using a *from*-phrase:

He lives up/down/along/across the road *from me*.

Resultative meaning: *from, out of, over, past, etc*

- 9.28 Prepositions which have the meaning of motion, as in [1], can usually have also a static resultative meaning when combined with *be*, indicating 'the state of having reached the destination', as in [2] (cf 8.42):

The horses *jumped over the fence*. [1]

The horses *are over the fence*. ['have now jumped over'] [2]

Out of context, resultative meaning is not always distinguishable from other static meanings. Its presence, however, is often signalled by certain adverbs (*already, just, at last, (not) yet*, etc). Resultative meaning is characteristically found with negative prepositions *from, out of*, etc, or with prepositions of 'passage' such as *across, through*, and *past*:

At last we *are out of the forest*. [3]

When you're *past the next obstacle*, you can relax. [4]

Pervasive meaning: *over, throughout, with, etc*

- 9.29 *Over* (dimension-type 1 or 2) and *through* (dimension-type 2 or 3), especially when preceded by *all*, have pervasive meaning (either static or motional):

That child was running *(all) over the flower borders*.

Throughout meaning *(all) through* is the only preposition whose primary meaning is 'pervasive':

Chaos reigned *(all) through the house*.

The epidemic has spread *throughout the country*.

Occasionally the 'axis' type prepositions of 9.26 are also used in a pervasive sense:

There were crowds *(all) along the route*.

They put flowers *(all) around the statue*.

With also has pervasive meaning in expressions such as the following:

The ground was *covered with snow*.

The garden was *buzzing with bees*.

Similarly: *loaded with, paved with, surrounded with, dotted with*, etc.

Eight senses of *over*

- 9.30 Let us now see how one preposition (*over*) may be used in some different senses:

POSITION (9.19):	A lamp hung <i>over the door</i> .
DESTINATION (9.23):	They threw a blanket <i>over her</i> .
PASSAGE (9.24):	They climbed <i>over the wall</i> .
ORIENTATION (9.27):	They live <i>over the road</i> . ['on the far side of']
RESULTATIVE (9.28):	At last we were <i>over the crest of the hill</i> .
PERVASIVE [STATIC] (9.29):	Leaves lay thick (all) <i>over the ground</i> .
PERVASIVE [MOTION] (9.29):	They splashed water (all) <i>over me</i> .
ACCOMPANYING CIRCUMSTANCES:	We discussed it <i>over a glass of wine</i> .

Verbs incorporating prepositional meaning

- 9.31 When a verb contains, within its own meaning, the meaning of a following preposition, it is often possible to omit the preposition. The verb then becomes transitive, and the prepositional complement becomes a direct, locative object (cf 10.27). The following examples have mainly spatial meaning, but other examples are included to show that this process is not restricted to spatial uses of prepositions:

<i>roam (about/around)</i> the city	<i>ponder (on)</i> a question
<i>pass (by)</i> a house	<i>turn (round)</i> a corner
<i>flee (from)</i> the country	<i>attain (to)</i> a position
<i>cross (over)</i> a street	<i>climb (up)</i> a mountain
<i>jump/leap (over)</i> a fence	<i>pierce (through)</i> the defences

In many cases there is a difference in meaning between the two constructions. The construction with preposition draws attention to the process, whereas the direct object construction has perfective meaning, indicating that the objective is achieved. Compare:

{ Let's <i>swim across the river</i> .
{ She was the first woman to <i>swim the Channel</i> .

Metaphorical or abstract use of place prepositions

- 9.32 Many place prepositions have abstract meanings which are clearly related, through metaphorical connection, to their locative uses. Very often prepositions so used keep the groupings (in terms of similarity or contrast of meaning) that they have when used in a literal reference to place. This is often true for example of temporal usage (cf 9.33ff).

One may perceive a stage-by-stage extension of metaphorical usage in such a series as (a) to (d):

- in shallow water* [purely literal]
- in deep water* [also metaphorical: 'in trouble']
- in difficulties* [The noun is not metaphorical, but the preposition is.]
- in a tough spot* ['in a difficult situation'; The preposition is analogous to that of (c), but another locative metaphor is introduced by the noun. The result is a phrase that could not occur in a literal sense, because *spot* would then require *at* or *on* (dimension-type 0).]

Examples in relation to the literal meanings are the following:

in/out of; amid, amidst (both formal and rare) (cf 9.21 Note [a])

position → state, condition:

to be <i>in/out of</i> danger	to keep <i>out of</i> trouble
to be <i>in/out of</i> office	to be <i>out of</i> a job
to be <i>in</i> difficulties	<i>amidst</i> many troubles

enclosure → abstract inclusion:

<i>in</i> books/plays	<i>in/out of</i> the race
<i>in</i> a group/party	

into/out of

destination → abstract condition or circumstance:

He got *into* difficulties/trouble/debt/a fight.
Can you get me *out of* this mess?

in/on

position → membership, participation:

<i>in</i> the army
<i>on</i> the board/committee/project

above/below/beneath

vertical direction → abstract level:

to be *above/below* someone on a list
above/below [not: **beneath*] one's income
Such behaviour is *beneath* [not: **below*] him.
He's *above* [not: **over*] such behaviour.
above (the) average
above suspicion

under

vertical direction → subjection, subordination; process:

under suspicion/orders/compulsion
He has a hundred people working *under* him.
The bridge is *under* construction.

up/down

movement on vertical axis → movement on list or scale:

move *up/down* the scale
climb *up/down* the social ladder

from/to

starting point/destination → originator/recipient:

a letter/present *from* Browning to his wife (cf 9.46f)

beyond/past/over

resultative meaning; physical → abstract:

<i>beyond</i>	} belief endurance hope recovery
<i>past</i>	

We are *over* the worst.

between/among/amongst (cf 9.21 Note [a])

relative position → abstract relation between participants:

a fight/match *between* X and Y
We quarrel/agree *among* ourselves.
relationship/contrast/affinity *between* two things

through

passage → perseverance, endurance:

She came *through* the ordeal. We put him *through* his paces.
We are *through* the worst.

Note [a] *Over* and *under* act as 'intensifying prepositions' with the meanings 'more than' and 'less than' in expressions of measure (cf intensifiers in 7.87ff):

The car was travelling (at) $\left\{ \begin{array}{l} \text{over} \\ \text{under} \end{array} \right\}$ sixty miles per hour.

Cf: *overage*; *overconfident* ['overly confident']

For denoting temperature, *above* and *below* are also used:

The temperature is $\left\{ \begin{array}{l} \text{above/over} \\ \text{below/under} \end{array} \right\}$ 30°.

But with zero degrees only: *above/below* zero.

[b] A few prepositions (chiefly *in* and *out of*) can operate in an apparently converse relationship.

For example:

The horse is *in* foal. ['There is a foal in the horse's womb.']
The office is *out of* envelopes. ['There are no envelopes in the office.']
We are *in* luck/*out of* luck.

[c] The infinitive marker *to* may be viewed as related to the spatial preposition *to* through metaphorical connection. Compare the series:

John went	
$\left\{ \begin{array}{l} \text{to the pool.} \\ \text{to the pool for a swim.} \\ \text{for a swim in the pool.} \\ \text{for a swim.} \\ \text{to swim.} \\ \text{swimming.} \end{array} \right\}$	$\left\{ \begin{array}{l} \text{[Direction: 'Where did he go?']} \\ \text{[Direction + purpose: 'Why did he go to the pool?']} \\ \text{[Purpose + location]} \\ \text{[Purpose: 'Why did he go there?']} \\ \text{['Metaphorical connection' of infinitive marker (in} \\ \text{to-infinitive clause)]} \\ \text{[Nonfinite verb clause]} \end{array} \right\}$

Prepositions denoting time

9.33 A prepositional phrase of time usually occurs as adjunct (*He came on Friday*), postmodifier (*the party on Friday*), or predication adjunct (*That was on Friday*); but it can occasionally be itself the complement of a temporal preposition (cf 9.1 Note [d]):

a voice *from out of the past*

The temporal uses of prepositions frequently suggest metaphorical extensions from the sphere of place similar to the metaphorical extensions discussed in 9.32.

Time position: *at, on, in, by*

9.34 *At, on, and in* as prepositions of 'time position' are to some extent parallel to the same items as positive prepositions of position (cf 9.16), although in the time sphere there are only two 'dimension-types', viz 'point of time' and 'period of time' (cf 8.51ff).

At is used for points of time (chiefly clock-time [1]) and also, idiomatically, for holiday periods [2]:

- at ten o'clock, at 6.30 p.m., at noon [1]
at the weekend (BrE; but in AmE: *on the weekend*), at Christmas, at Easter [2]

The reference is to the season of Christmas/Easter, not the day itself. *At* can be used for periods when conceived of as points of time, as in:

at the/that time, at breakfast time, at night

On is used for referring to days as periods of time:

on Monday, on the following day, on May (the) first, on New Year's Day

Also in the expression:

Trains leave the station *on the hour*. ['hourly', ie 1 o'clock, 2 o'clock, etc]

In or, less commonly, *during* is used for periods longer or shorter than a day:

in the evening	in summer
in August	during Holy Week
in 1969	in the eighteenth century
in the months that followed	

On Monday morning, *on Saturday afternoon*, *on the following evening*, etc illustrate an exceptional use of *on* with a complement referring to a PART of a day, rather than a WHOLE day. This use also extends to other cases where the time segment is a part of a day which is actually mentioned: *on the morning of 1 June*, etc. But with phrases like *early morning* and *late afternoon* it is normal to use *in*: *in the late afternoon*.

When we want to refer to a period of the night we use *in*. Compare:

I woke up several times *in the night*.

At night I usually have the window open. ['during the night'; as opposed to *in the evening*, *in the day*]

By occurs in the idioms *by day* and *by night*, which replace *during the day/the night* with some activities such as travelling:

We preferred travelling $\left\{ \begin{array}{l} \text{by night.} \\ \text{during the night.} \end{array} \right.$

We stayed up *during the night*.

Measurement into the future: *in*

- 9.35 To denote measurement from the present time, the postposed adverb *ago* is used for a span back to a point of time in the past, and *in* for a similar span ahead into the future (cf 8.58f):

- We met *three months ago*. [1]
We'll meet $\left\{ \begin{array}{l} \text{in three months' time.} \\ \text{(in) three months from now.} \end{array} \right.$ [2]
[3]

The construction in [2-3] is only acceptable with the meaning of 'at the end of a period of three months starting from now'. In measuring forwards from a point of time in the past, only the following construction is normal:

- He finished the job $\left\{ \begin{array}{l} \text{in three months. ['in the space of three months} \\ \text{from when he started it']} \\ \text{?(in) three months from then.} \\ \text{*in three months' time.} \end{array} \right.$ [4]
[5]
[6]

Duration: *for*, *during*, *over*, (all) *through*, *throughout*

- 9.36 Phrases of duration answer the question *How long?* Duration is usually expressed by *for*. Compare duration and time-position:

A: How long did you camp in Scotland?

B: We camped there *for the summer*. ['all through, from the beginning to the end of the summer']

A: When did you camp in Scotland?

B: We camped there *in the summer*. ['at some time during the summer']

The duration phrase *for the summer* indicates that the stop lasted AS LONG AS the summer period; the time-when phrase *in the summer* indicates that the stop was INCLUDED in the summer period. *During the summer* could be used here with the same meaning as *in*, although *during* usually suggests duration:

We managed to stay awake *during the whole meeting*.

Without such durative markers as *stay* and *whole*, *during* refers to a point or period WITHIN DURATION rather than duration itself:

She spoke *during the meeting*.

During our $\left\{ \begin{array}{l} \text{stay in} \\ \text{visit to} \end{array} \right.$ Japan we met several old friends.

For is also used in idiomatic phrases like *forever*, *for good* ['forever'], *for years* (and *years*).

Over, (all) *through*, and *throughout* have a durational meaning parallel to their pervasive meaning in reference to place (cf 9.29):

We camped there *over the holiday/over Christmas/over the weekend/over the Sabbath/over night*.

We camped there *through(out) the summer*.

Over normally accompanies noun phrases denoting special occasions (such as holidays and festivals), and so generally refers to a shorter period of time than *through(out)*. Since Saturday and Sunday are 'special' compared with other days of the week, we have *over Saturday and Sunday* whereas *?over Wednesday* is not generally used. Expressions like *over the last three years*, *over the last generation* seem to have become increasingly common.

Note *For* has different meanings in the following two sentences:

- I've done that *for years*. [1]
I've not done that *for years*. [2]
In the positive [1], the action is included in the *for* time span, ie included duration. In the

negative [2], on the other hand, the action is excluded from the *for* time span, *ie* excluded duration ('It's years since I've done that', 'I haven't done that in years'). Note that, here, *in* (esp AmE) can be used only in negative sentences:

I { *haven't* / **have* } done that in years.

Duration: from ... to, until, up to

- 9.37 *From ... to* (or *till*) is another pair of prepositions whose locative meaning is transferred to duration. The AmE alternative expression (*from*) ... *through* avoids the ambiguity as to whether the period mentioned second is included in the total span of time (cf: *between ... and*, 9.39; cf also 'forward span'; 8.58f):

We camped there (*from*) June *through* September. <AmE>
[*up to* and including September]

We camped there *from* June { *to* / *till* } September.

[*up to* (?and including) September]

But with *from* absent, only *until*, *till*, *up to* (but not always simple *to*), and *through* <AmE> can be used:

We camped there { *until* / *till* / *up to* / *through* <AmE> / **to* } September.

On the other hand, *to* can be used alongside *till* in:

You can *stay to/till* the end of September.
The meeting can be *postponed to/till* September.
There are only a few days *to/till* September.
I have only a few years *to/till* retirement.

From and *up to* are used to denote, respectively, starting and ending points of a period. *Up to* normally specifies that the longer period does not include the period named in the prepositional complement:

From 1982 (onwards) the rules were changed.
We worked *up to* Christmas (but not over Christmas).

Informally, *until* and *till* are also sometimes preceded by *up*:

I worked (*up*) { *until* / *till* / *to* } last week.

Till and *until* can only cooccur with durative verbs, *ie* verbs that denote a period of time (such as *camp* and *work*). Contrast:

My girlfriend { worked / **arrived* } there *till* Christmas.

The situation for *until* and *till* is thus the reverse of that for *by* denoting an end point, which cooccurs only with momentary verbs (cf 9.39):

She { **worked* / *arrived* } *by* Christmas.

In negative contexts, *until* and *till* are acceptable with both durational and momentary verbs, as for example:

She didn't arrive there *till* Christmas.

The two meanings of *till* and *until* are, however, different with positive and negative predications. With positive predications, *till* and *until* specify a terminal point ('up to'), whereas, with negative predications, they specify a starting point ('before'):

We slept *until* midnight. ['We stopped sleeping then.']
We didn't sleep *until* midnight. ['We started sleeping then.']

Before, after, since, till, until

- 9.38 These words are conjunctions as well as prepositions (cf 14.12ff). As prepositions, they occur almost exclusively as prepositions of time, and are followed by either

- (a) a temporal noun phrase (*after next week*);
- (b) a subjectless *-ing* clause (*since leaving school*); or
- (c) a noun phrase with a deverbal noun (cf App I.34f) or some other noun phrase interpreted as equivalent to a clause:

before the war ['before the war started or took place']
till/until the fall of Rome ['until Rome fell']
since electricity ['since electricity was invented']

To express the stretch of time (after the starting point denoted by *since*) we use *for* (cf 9.36):

We have lived in New York { *since* 1980. / *for* 4 years.

We lived in Chicago *for* 15 years.

For verb forms with *since*-clauses, cf 14.26.

Before and *after* indicate relations between two times or events and have opposite meanings (cf 9.19, 9.35ff):

{ *The meeting will take place after the ceremony.* / *= The ceremony will take place before the meeting.*

Note [a] As a preposition, *until* is more frequent than *till* (cf 8.58).

[b] *Pending* is used in formal, especially legal style:

The decision must wait *pending* his trial. ['until']

Pending negotiations, the two parties should stop further action. ['during and till the end of']
Thus *pending* can also include a sense of 'during'.

Between ... and, by

- 9.39 *Between ... and* is used for periods identified by their starting and ending points but, in contrast to *from ... to* (cf 9.37), does not refer to the whole time span:

We'll probably arrive some time *between 5 and 6 o'clock*.
I'll phone you *between lunch and dinner*.

Between X and Y can include *X* and *Y*, as in:

I'll ring *between Thursday and Saturday*.

This expression does not mean that the call will be on Friday, but could also be Thursday or Saturday. Thus *between ... and* here means 'about', ie 'some time on Thursday, Friday, or Saturday'. *Between* is further required to indicate intervals between similar objects or events which occur repeatedly:

between meals/dances/acts/classes

By refers to the time at which the result of an event is in existence:

Your papers are to be handed in *by next week*. ['not later than']
She should be back *by now* (but I'm not sure).

By specifies an end point. *Already*, *still*, *yet*, and *any more* are related in meaning:

By the time we'd walked five miles, he was already exhausted.

Contrast:

By that time he was already exhausted. ['He was then exhausted.']
Until then he was not exhausted. ['Before then he was not exhausted.']

Thus *by*-phrases do not cooccur with durative verbs (cf 9.37):

The troops remained there $\left\{ \begin{array}{l} \text{until} \\ \text{*by} \end{array} \right\}$ *midnight*.

Note As with prepositions of place (cf 9.32), prepositions and prepositional adverbs of time can have metaphorical uses, eg in viewing life as a journey:

At birth ... from the age of two ... reaching the age of 16, he left school days behind, and adulthood was in front of him ... all through middle age ... up to 1945.

Absence of preposition in point in time expressions

9.40 In many cases, a preposition of time is absent, so that the time adverbial takes the form of a noun phrase instead of a prepositional phrase.

Prepositions of time-when are always absent immediately before the deictic words *last*, *next*, *this*, *that*, and before the quantitative words *some* and *every*:

I saw her $\left\{ \begin{array}{l} \text{last Thursday.} \\ \text{*on last Thursday.} \end{array} \right.$

I'll mention it *next time* I see her.

This year, plums are more plentiful than *last*.

Some day you'll regret this decision.

Every summer she returns to her childhood home.

Also nouns which have 'last', 'next', or 'this' as an element of their meaning lack prepositions:

I saw her $\left\{ \begin{array}{l} \text{today.} \\ \text{yesterday (morning).} \end{array} \right.$ I'll see her *tomorrow (evening)*.

The prepositions which are absent in point in time expressions seem to be restricted to *at*, *on*, *in*; *before* and *since*, for example, are obligatory:

I'll see you $\left\{ \begin{array}{l} \text{on Monday.} \\ \text{Monday.} \\ \text{before Monday.} \\ \text{Monday.} \end{array} \right\} =$
 $\left\{ \begin{array}{l} \text{Monday.} \\ \text{Monday.} \end{array} \right\} \neq$

I haven't seen her *since last week*.

The preposition is usually optional with deictic phrases referring to times at more than one remove from the present, such as:

(on) *Monday week*
(on) *the day before yesterday*
 $\left\{ \begin{array}{l} \text{in the January before last} \langle \text{BrE} \rangle \\ \text{the January before last} \langle \text{AmE and BrE} \rangle \end{array} \right.$

The preposition is also optional in phrases which identify a time before or after a given time in the past or future:

(in) *the previous spring* ['the spring before the time in question']
(at) $\langle \text{BrE} \rangle$
(on) $\langle \text{AmE} \rangle$ $\left\{ \begin{array}{l} \text{the following weekend} \\ \text{the next day} \end{array} \right.$

Thus, there are alternatives in cases like the following:

We met $\left\{ \begin{array}{l} \text{on the following day.} \\ \text{the following day.} \end{array} \right.$ We met $\left\{ \begin{array}{l} \text{on that day.} \\ \text{that day.} \end{array} \right.$

On the whole, the sentence without the preposition tends to be more informal and more usual.

Postmodified nondeictic phrases containing *the* often have the preposition in BrE whereas it is optional in AmE:

We met $\left\{ \begin{array}{l} \text{on the day} \\ \text{the day} \\ \text{in the spring} \\ \text{the spring} \langle \text{esp AmE} \rangle \end{array} \right\}$ of the conference.
 $\left\{ \begin{array}{l} \text{the spring} \\ \text{the spring} \end{array} \right\}$ of 1983.

But without postmodification, the preposition is always obligatory:

We met *in the spring*. \neq We met *the spring*.

The preposition is usually present in phrases like the following when the word order (*next Sunday*, *last January*) is inverted ($\langle \text{in BrE} \rangle$):

(on) *Sunday next* (in) *January last*

Note Within a given week, if we refer to the name of the day that is yet to follow, the expression *next x-day* (eg: *next Friday*) will be used by some to mean 'x-day of the same week', by others 'x-day of the week to follow'. On the other hand, *this x-day* (eg: *this Friday*) will always mean 'x-day of the present week'. The same applies to months of the year, as in *next September* and *this September*.

Absence of preposition in frequency expressions**9.41** There is no preposition in frequency phrases like:

Every Sunday we usually go for a walk.

Without a frequency indication such as *every*, the preposition is optional, and nouns denoting weekdays may be either singular or plural. The construction without a preposition is informal in style (esp AmE):

<i>On Sunday(s)</i>	} we usually go for a walk.
<i>Sunday(s)</i>	
* <i>On every Sunday</i>	
<i>Three times a week</i>	} we play darts.
* <i>At three times a week</i>	

But other frequency constructions always require the preposition:

<i>with</i> + adjective + frequency:	<i>with regular frequency</i>
<i>at</i> + adjective + intervals:	<i>at irregular intervals</i>
<i>on</i> + adjective + occasions:	<i>on specific occasions</i>
<i>from time to time</i> :	We saw each other <i>from time to time</i> .
<i>at a/the rate of</i> + noun:	<i>at the rate of \$20 an hour</i>
<i>between/at</i> + <i>each</i> + singular noun, or <i>all</i> + plural noun:	He had dropped the habit of drinking coffee <i>at all hours</i> .

Absence of preposition in duration expressions**9.42** *For* refers to a stretch of time. The preposition is often absent in phrases of duration with a verb used with stative meaning:

We stayed there (*for*) *three months*.
 The snowy weather lasted (*for*) *the whole time* we were there.
 (*For*) *a lot of the time* we just lay on the beach.

The preposition is obligatorily absent in phrases which begin with *all*, such as *all (the) week*, *all day*. But compare the synonymous *whole* (cf 5.17):

We stayed there { *all (the) week*.
 (*for*) *the whole week*.
 **for all week*.

I haven't seen her *all day*.

However, the preposition is obligatory with dynamic verbs where the action of the verb is clearly not continuously coextensive with the period specified. Compare:

I lived there { *for three years*.
 three years.
 I taught her { *for three years*.
 **three years*.

Similarly:

I haven't spoken to her { *for three months*.
 **three months*.

The preposition is also required in initial position in the clause:

{ *For 600 years*, the cross lay undisturbed.
 { The cross lay undisturbed (*for*) *600 years*.

Similarly, when they occur initially, the preposition is usually required in *for*-phrases: *for ages*, *for days*, *for years*, etc. However, coordination in the time expression improves acceptability. Compare:

{ *For years*
 { (?) *Years and years* } we have all been expecting this event.
 { *Years*

Ranges of meaning other than place and time**9.43** We now survey the more important prepositional usages apart from those of place and time. Fields of prepositional meaning are notoriously difficult to classify, and in some cases it is better to think of a range or spectrum of meaning, first as a single category, then as broken up into separate overlapping sections. First, therefore, we deal with two important spectra which may be referred to, for brevity, as CAUSE/PURPOSE and MEANS/AGENTIVE. In part, our reason for putting various meanings under a single heading is that some of them have, as a linking element, association with particular prepositions and *wh*-words: *for* and *why* in the case of cause/purpose, and *with* and *how* in the case of means/agentive. Here are the two ranges with an illustration of each meaning:**THE CAUSE/PURPOSE SPECTRUM (9.44–47)**

Cause (9.44):	She lost her job <i>because of her age</i> .
Reason (9.44):	He was fined <i>for drunken driving</i> .
Motive (9.44):	She did it <i>out of kindness</i> .
Purpose (9.45):	Everyone ran <i>for shelter</i> .
Destination (9.45):	I'm leaving <i>for Seattle</i> .
Target (9.46):	This novel is aimed <i>at a young audience</i> .

THE MEANS/AGENTIVE SPECTRUM (9.48–51)

Manner (9.48):	She performed the operation <i>with great skill</i> .
Means (9.49):	They left <i>by plane</i> .
Instrument (9.49):	She tried to open the lock <i>with a knife</i> .
Agentive (9.50):	They were noticed <i>by no one</i> .
Stimulus (9.51):	I'm astonished <i>at your reaction</i> .

The cause/purpose spectrum**Cause, reason, motive: *because of*, *on account of*, *for*, *from*, etc****9.44** At one end of the cause/purpose spectrum, we have prepositions expressing either the material cause or the psychological cause (motive) for a happening. Phrases of cause, reason, and motive answer the question *Why* ... ? Some examples:

We had to drive slowly *because of the heavy rain*.
On account of his wide experience, he was made chairman.

The survivors were weak *from exposure and lack of food*.
 Some support charities *out of duty*, some *out of a sense of guilt*.
 I hid the money, *for fear of what my parents would say*.
 The plane was destroyed *through the pilot's carelessness*.

On account of is a more formal alternative to *because of* as an expression of cause or reason. *Out of* and *for* are mainly restricted to the expression of motive, *ie* psychological cause: *out of gratitude/kindness*, etc.

For is found with a relatively small number of expressions, eg:

for fear/love/joy/sorrow

He offered to fix my sink *for* $\begin{cases} \text{nothing. <informal>} \\ \text{free. <informal, esp AmE>} \end{cases}$

Purpose, intended destination: *for*

9.45 *For* is used to express PURPOSE in the following examples:

He'll do anything *for money*.
 Everyone ran *for shelter*.
For the journey, they packed three large picnic baskets of food.

In this use of *for*, there is a corresponding paraphrase with a clause (*in order to* (cf 15.48)):

for money = *in order to gain money*
for shelter = *in order to reach shelter*

To express INTENDED DESTINATION, *for* is used with verbs such as *run*, *start*, *head*, *leave*, and *set out*. For example:

He *set out for London*.

With *to*-phrases, the assumption is that the destination will be reached. Compare:

He $\begin{cases} \text{went to} \\ \text{left for} \end{cases}$ London. Is this *the train* $\begin{cases} \text{to} \\ \text{for} \end{cases}$ London?

Phrases of purpose or destination answer the questions *Why ... ?*, *What ... for?*, *Where ... for?*, or *Who ... for?* They occur as postmodifiers [1], as well as adjuncts [2], and complements in copular clauses [3-4]:

The scenery *for the play* is splendid. [1]
 She came *for the play*. [2]
 This present is *for you*. [3]
 This machine is *for washing dishes*. [4]

Note Note the difference in meaning between *for fun* and *in fun*:
 He did it *for fun*. ['with the object of getting amusement']
 He said it *in fun*. ['jokingly', 'in jest']

Recipient, goal, target: *for*, *to*, *at*

9.46 When *for* is followed by noun phrases denoting persons or animals, the meaning is rather one of INTENDED RECIPIENT:

He laid a trap *for his enemies*. [1]
 She made a beautiful doll *for her daughter*. [2]
 He cooked a dinner *for her*. [3]

Denoting intended recipient (her daughter may or may not have actually received the doll), the *for*-phrase can often be equated with an indirect object (cf 10.7, 16.56):

She made *her daughter* a beautiful doll. [2a]
 He cooked *her* a dinner. [3a]

In contrast to the notion of intended recipient expressed by *for*, the preposition *to* expresses ACTUAL RECIPIENT in sentences such as:

She gave a beautiful doll *to her daughter*.

Here again, there is often a relationship with the indirect object construction:

I $\begin{cases} \text{gave} \\ \text{lent} \\ \text{sold} \end{cases}$ the book *to my friend*. ~ I $\begin{cases} \text{gave} \\ \text{lent} \\ \text{sold} \end{cases}$ *my friend* the book.

But not, for example:

I delivered the book *to my friend*. ~ *I delivered *my friend* the book.

At, in combinations such as *aim at* (where the prepositional phrase is complementary to the verb), expresses INTENDED GOAL or TARGET:

After *aiming carefully at* the bird, he missed it completely. [4]
 A vicious dog was *snapping at* her ankles. [5]
 She *smiled at* me. [6]

As sentence [4] shows, the intended goal need not be achieved. A contrast in many cases (*kick at*, *charge at*, *bite at*, *catch at*, *shoot at*, *chew at*) may be drawn between this use of *at*, in which some idea of 'aim' is implied, and the direct object construction, which indicates attainment of the goal or consummation of the action as planned. *She shot at him* means something very different from *She shot him*: to the first one could add 'but missed him', whereas one could not to the second. In other cases, where the verb is intransitive, *to* must be used if the attainment of the goal is to be stressed:

She ran *at me*. [denotes hostility: 'attacked']
 She ran *to me*. [denotes movement to a goal]

Similarly: *point at/to*, *throw at/to*

Note [a] There is a comparable difference between *at* and *to* when combined with verbs of speaking such as *roar*, *bellow*, *shout*, *mutter*, *growl*. Sentence [7] suggests that I am being treated merely as a target (eg of abuse), while [8] implies that the shouter is communicating with me, *ie* that I am the recipient of the message:

He *shouted at me*. [7]
 He *shouted to me*. [8]

At here usually suggests hostility. Similarly, *laugh at* indicates hostility [9], unless the object is something intended to provoke laughter, such as a joke [10]:

They *first laughed at us*. [9]
 They *laughed heartily at our jokes*. [10]

[b] With *work* + target the preposition is *on* in AmE but either *on* or *at* in BrE:

She is *working* $\left\{ \begin{array}{l} \text{on} \\ \text{at} \end{array} \right\}$ $\langle \text{BrE only} \rangle$ her new play.

Source, origin: *from*

9.47 The converse of *to* ['goal'] is *from* ['source'] (cf 18.31 Note):

Bill lent the book *to me*. ~ I borrowed the book *from Bill*.

From is also used with reference to 'place of origin':

He comes *from Scotland/Glasgow*. ['He is a Scot/a Glaswegian.']

This type of prepositional phrase occurs not only as an adjunct, but also as a complement in copular clauses [1] and as a postmodifier [2]:

I'm *from Madrid*. [1]
This is a friend of mine *from London*. [2]

The means/agentive spectrum

Manner: *in* ... *manner*, *like*, *with*

9.48 Manner can be expressed by *in* ... *manner* and *with*. For example:

The job was done *in a workmanlike manner*.
We were received *with the utmost courtesy*.

With transitive or intransitive verbs, *like* can have the meaning of 'in a manner resembling'; with copular verbs, its meaning is purely that of 'resemblance':

The army swept through the city *like a pestilence*.
Life is *like a dream*.

This meaning of 'resemblance' is common with disjuncts (cf 8.121ff) in sentences whose main verb may be noncopular. Contrast:

Bill writes poetry *like his BROTHER*. ['in a manner resembling that of his brother's poetry']

Like his BROTHER, Bill writes POETRY. } [resemblance]
Bill writes POETRY, *like his BROTHER*.

The last pair of examples show that the difference in meaning is not entirely a matter of ordering.

Unlike is used with the meaning of negative resemblance 'not like':

$\left\{ \begin{array}{l} \text{Unlike his brother (who writes poetry), Bill writes science fiction.} \\ \text{Bill writes science fiction, unlike his brother (who writes poetry).} \end{array} \right.$

As distinct from *like*, the preposition and conjunction *as* refers to actual role (cf 9.4):

She spoke $\left\{ \begin{array}{l} \text{like a LAWYER. ['in a manner resembling']} \\ \text{as a LAWYER. ['in that capacity']} \\ \text{as a LAWYER does. ['in that manner']} \end{array} \right.$

There is frequently commutability between manner phrases and manner adverbs: *with courtesy* ~ *courteously*. Manner phrases and manner adverbs can both sometimes be evoked by the question *How ... ?*, especially if the sense of 'means' is excluded by the context or the meaning of the verb:

A: How did she speak? B: She spoke $\left\{ \begin{array}{l} \text{competently.} \\ \text{with great skill.} \end{array} \right.$

BUT: A: How did you travel? B: $\left\{ \begin{array}{l} \text{By air.} \\ \text{*Comfortably.} \end{array} \right.$

Means and instrument: *by*, *with*, *without*

9.49 Phrases of means and instrument answer the question *How ... ?* By can express the meaning 'by means of' (note the omission of the article; cf 5.45):

I usually go to work *by bus/train/car/boat*. [mode of transport]
Communication took place *by letter/telex/radio/post* $\langle \text{BrE} \rangle$ / *mail* $\langle \text{AmE} \rangle$. [means of communication]
The thief must have entered and left the house *by* (= *through*) *the back door*.
By working the pumps, we kept the ship afloat for another 40 hours.

With, on the other hand, expresses instrumental meaning (cf 9.50):

Someone had broken the window *with a stone*. [1]
He caught the ball *with his left hand*. [2]

There is a correspondence between sentences [1–2] (which normally require a human subject and a direct object) and sentences [1a–2a] containing the verb *use* + a phrase with (*in order*) *to* + infinitive:

Someone had used *a stone* to break the window. [1a]
He used *his left hand* to catch the ball. [2a]

There is also an alternative construction in which the noun phrase denoting the instrument becomes the subject (on 'instrumental' subjects, cf 10.21):

A stone had broken the window. [1b]
His left hand caught the ball. [2b]

For most senses of *with*, including that of instrument, *without* expresses the equivalent negative meaning:

I drew it *without* (*using*) *a ruler*. ['I did not draw it with a ruler.']

Note [a] Mode of transport is expressed by *on* as well as *by*: *on the bus/the train/a ship/a plane*. These are not purely locative phrases – location in such cases would be expressed by *in* rather than *on* (cf 9.16f) – but rather indicate a condition of being 'in transit'. Compare sentences [3–6]:

I go to work *on the bus*. [3]
I go to work *by bus*. [4]
I met Peter *on the bus*. [5]
*I met Peter *by bus*. [6]

Sentence [3] is a less common alternative to [4]; but although one can say [5], one cannot say [6]. Absence of the article is normal with the unmodified noun phrase after *by*, but not obligatory:

It's easier to go to town *by the bus* (rather than *by the train*).

On is used instead of *by* in the phrases *on foot*, *on horseback*. Notice the absence of the article in these phrases, as well as in *by bus*, etc (cf 5.45). Modification of the noun phrase is not allowed after *by* unless a determiner is added:

by { *the last bus*
the 2 o'clock bus
**last bus*

[b] *Of* is used with the verb *die* in *He died of hunger*, etc. This meaning is poised between 'cause' and 'means': on the one hand, one speaks of the 'cause of death' (cf: *He died from exposure*); on the other hand, this type of phrase would be evoked by the question *How did he die?* (or *What did he die of?*) rather than *Why did he die?*

Instrument and agentive: *with*, *by*

9.50 In 9.49 we had the following example [1], where *with* expresses the meaning of INSTRUMENT:

Someone had broken the window *with a stone*. [1]

We saw that [1] has correspondences with sentences [1a] and [1b]:

Someone used a stone to break the window. [1a]

A stone had broken the window. [1b]

Sentence [1] is also related to the passive sentence [1c]:

The window had been broken with a stone *by someone*. [1c]

In the passive sentence, the AGENTIVE is expressed with a *by*-phrase (cf 3.65): *by someone*. However, in most passive sentences, the agent *by*-phrase is actually omitted, as in [1d]:

The window had been broken *with a stone*. [1d]

In a passive sentence like [1c], the *by*-agent has the agentive role (cf 10.19), corresponding to the agentive role of the subject in an active sentence [1]. The agentive is the initiating cause and typically animate, usually personal, as also in:

{ *A passing stranger* observed us. [2]
 { We were observed *by a passing stranger*. [2a]

However, we may also find inanimate *by*-phrases, as in [3a]:

{ *Frost* has ruined the crops. [3]
 { The crops have been ruined *by frost*. [3a]

In cases like [1d], the instrument can also be expressed with a *by*-phrase:

The window had been broken *by a stone*. [1e]

Either of the sentences [1d] and [1e] could describe the same incident, but there can be a difference in meaning, as appears more clearly in the following two sentences:

My car had been damaged { *by the branch of a tree*. [4]
 { *with the branch of a tree*. [4a]

By in [4] would exclude a human agency: a storm may have caused the branch to cause the damage. By contrast, *with* in [4a] would exclude the natural cause and would suggest that human agents had used the branch broken from a tree to inflict the damage.

We thus make a distinction between AGENTIVE, *ie* the animate being instigating or causing the happening denoted by the verb, and the INSTRUMENT, *ie* the entity (generally inanimate) which an agentive uses to perform or instigate a process. Both agentive and instrument may be said to denote the semantic role of AGENCY.

The *by*-phrase also occurs as a postmodifier to denote authorship (cf 17.46 Note [c]):

a picture *by Degas* ['painted by Degas'] [5]

a novel *by Tolstoy* ['written by Tolstoy'] [6]

a five-year-old horse *by Willwin out of Lady Barle*
 [parentage of a horse] [7]

Through implies intermediacy in:

They are related *through their grandmother*.

The presidents had to communicate *through an interpreter*.

through Jesus Christ Our Lord [used as a formula at the end of a prayer]

Note [a] One reason why we distinguish 'instrument' and 'agentive' is that they cannot be coordinated, or collapsed, by coordination, into a single prepositional phrase (cf 13.40):

*He was killed *by a man and (by) an arrow*.

If however different processes are involved, coordination is possible, though with an effect similar to that of zeugma (cf 13.87):

The area was ravaged *by floods and by guerilla forces*.

[b] Outside the passive clause proper, agentive and instrumental *by*-phrases can occur after -ed participial adjectives with passive meaning (cf 3.74ff):

I was very *alarmed by the news* he brought. [8]

The child was *unwanted by its parents*. [9]

His services to the community have not gone *unnoticed by those who have benefited*. [10]

The intensifier *very* in [8], the prefix *un-* in [9] and [10], and the copular use of *go* in [10] (cf 16.21) are indicators of the adjectival status of the participle (7.15ff).

[c] The *by*-phrase may indicate either 'means' or 'instrument' in a sentence such as:

The news was confirmed by a telegram. [either 'Someone confirmed it by means of a telegram' or 'A telegram confirmed it']

Since the instrumental sense is tied to a passive clause, only the 'means' interpretation is possible in an active clause:

The news came *by (a) telegram*.

Stimulus: *at*

9.51 The relation between an emotion and its stimulus (normally an abstract stimulus) can often be expressed by *at* or by the instrumental *by* (cf 9.50):

I was alarmed { *at* } his behaviour. [1]
 { *by* }

Both of these can be treated as passive equivalents of:

His behaviour alarmed me. [1a]

The noun phrase following *at* may be treated as a semi-agent. Further exemplification of this use of *at* is given in 9.63 and 16.69.

The idea of 'stimulus' is sometimes expressed by other prepositions, in place of *at*, which function as semi-agents (cf 3.76):

I'm *worried about* this. ['This worries me.]
He's *interested in* history. ['History interests him.']
His plans were *known to* everyone. ['Everyone knew his plans.']

- Note In BrE, *with* rather than *at* is used when the stimulus is a person or object rather than an event:
I was *furious with* John.
I was *delighted with* the present.
But in AmE, *at* is quite usual:
I was *furious/angry/liuid/mad at* Christine.
With abstract nouns, *at* is equally acceptable in BrE and AmE:
I was *furious at* Christine's behaviour.
At has a common alternative in *about*: *annoyed at/about*, *pleased at/about*, etc. (Cf further examples in 16.69.)

Accompaniment: *with*

- 9.52 Especially when followed by an animate complement, *with* has the meaning 'in company with' or 'together with' (comitative function):

I'm so glad you're coming *with us*. [1]
Jack, *(together) with several of his noisy friends*, was drinking till
after 2 in the morning. [2]

In [2], the *with*-phrase serves a function very close to coordination with *and*. Note however that, unlike *and*, *with* has a singular verb (cf 13.103):

Jack and several of his noisy friends *were* ... [2a]

An example of a phrase of accompaniment occurring as postmodifier is:

Curry *with rice* is my favourite dish.

In this sense, as in most other senses (but cf 9.53), *without* is the negative of *with* (ie 'unaccompanied by'):

You never see him *without his dog*.
She was *without her children*.
Without you, I'm not going.

With is also used to express 'accompanying circumstances', as in [3], and to introduce a subject (cf 9.55, 14.15ff), as in [4]:

With all the noise, she was finding it hard to concentrate. [3]
It all started *with John(s) being late* for dinner. [4]

In both these uses, *with* implies cause: [3] 'Because of all the noise ...'; [4] 'It all started as a result of John(s) being late ...'.

Support and opposition: *for*, *with*, *against*

- 9.53 *For* conveys the idea of support ['in favour of'] and *with* that of solidarity or movement in sympathy:

Are you *for or against the plan*? ['Do you support or oppose the plan?']
Remember that every one of us is *with you*. ['on your side']

In this use, there is no negative *without* contrasting with *with*. The contrary idea of opposition is conveyed by *against*:

It is prudent to go *with* rather than *against the tide of public opinion*.
the movement *against nuclear arms* ['anti-nuclear'; cf prefixes of attitude, App I.25]

However, *with* conveys the idea of opposition between people in *fight with*, *quarrel with*, *argue with*, etc. Compare:

He's always *arguing* { *with* his sister.
 against nuclear power.

The verb *fight* is used with the preposition *with* to denote opposition in *fight with somebody*, which can mean *fight somebody* (cf 9.31) or *fight against somebody*; however, *with* in *fight with X against Y* denotes support ['on X's side']. But there is no prepositional form in: *fight a bad cause*, *fight an illness*. *Play* can be constructed in two ways, as in:

I played { *(a game of) chess with Sam*.
 Sam at chess.

Other prepositional meanings

Various relations indicated by *of*

- 9.54 The most common preposition, *of*, occurs chiefly as a postmodifier in noun phrases in a function similar to that of the genitive (cf 5.115ff), eg:

the gravity *of the earth* ~ *the earth's* gravity

The correspondence between the genitive and the *of*-construction is most conveniently discussed in the chapter dealing with the noun phrase (17.38ff).

However, postmodifying *of*-phrases also have a wide range of other uses (cf 5.6ff), eg:

(a) <i>part of the city</i>	[partition]
<i>a kind of wood</i>	[quality]
<i>a lot of people</i>	[quantity]

Here are some more examples with *of*-phrases:

the courage *of the man* ['the courage that the man shows']
a typewriter *of my father's* ['a typewriter that my father has']
the envy *of the world* ['the envy that the world feels']
the trial *of the conspirators* ['the trial that the conspirators face']
the virtue *of thrift* ['the virtue that consists in thrift']
a flock *of sheep* ['a flock that is made up of sheep']
a glass *of water* ['a glass that contains water']
seven *of my friends* ['seven from among my friends']
people *of the Middle Ages* ['people who lived in the Middle Ages']
the house *of my dreams* ['the house which I see in my dreams']
the College *of Surgeons* ['the college to which surgeons belong']
a boat *of fibreglass* ['a boat made of fibreglass']

'Having': of, with, without

9.55 The meaning of [1] is related to all the noun phrases [1a-d]:

The man has courage.	[1]
the man having courage	[1a]
the man's courage	[1b]
the courage of the man	[1c]
a man of courage	[1d]

Both [1c] and [1d] have postmodifying *of*-phrases. They differ in that the head of [1c] (*the courage*) is the notional object, whereas the head of [1d] (*the man*) is the notional subject. In the latter type of construction, *of* is limited to the expression of abstract attributes, as in:

a pianist *of great talent* ['a very talented pianist']
a performance *of distinction* ['a distinguished performance']

The notion of 'having' is more generally expressed by *with*, especially with concrete attributes:

a man *with a red nose* ['who has a red nose'; 'a red-nosed man']
an industrialist *with a house on the Costa Brava* ['who has a house . . .']
a woman *with a large family*
a box *with a carved lid*

Compare the following constructions: [2] can have either *of* or *with*, but only *with* is generally accepted in [3]:

a woman { <i>of</i> / <i>with</i> } <i>with strong feelings</i> [abstract]	[2]
a woman { ? <i>of</i> / <i>with</i> } <i>strong hands</i> [concrete]	[3]

The negative of *with* is *without* (cf 9.52):

a play *without any faults* ['a play with no faults']
women *without children* ['childless women']
the house *without a porch* ['... which has no porch']

The correspondence between phrases with *with* or *without* and relative clauses with *have* applies also to *have*-existential sentences (cf 18.54):

the girl *who has a boyfriend in the navy*
~ the girl *with a boyfriend in the navy*

With and *without* can also introduce a nonfinite or verbless clause as postmodifier in a noun phrase:

the factory *with its smoking chimney*
a room *with its door open*

Furthermore, they can introduce finite and verbless clauses as adverbial:

He wandered in *without shoes or socks on*.
With so many essays to write, I won't have time to go out tonight.

The fuller clausal equivalent is a participial adverbial clause expressing contingency (cf 15.46):

Having so many essays to write, I won't have time to go out tonight.

Since *with* and *without* in these functions introduce clauses, they are subordinators, not prepositions. The nonfinite clause may also be a *to*-infinitive. Compare:

<i>With Mary being away</i> <i>With no one to talk to</i> <i>With Mary away</i> <i>With the house empty</i> <i>Without anyone to talk to</i>	} John felt miserable.
--	------------------------

In this construction, *with* and *without* require a noun phrase (not necessarily a subject):

**With being away* : . .

This is a further indication that they function here not as prepositions but as subordinators (cf 14.15). Prepositions can have *-ing* clauses but not *to*-infinitive clauses as complement (cf 9.2):

<i>On arriving</i> <i>*On to arrive</i>	} Mary took a taxi.
--	---------------------

The clause-introducing function of *with* and *without* is similar to that of *for* in cases like the following (cf 14.6):

I bought a car *for Mary to drive to work in*.

At the same time, we must recognize a relationship between their uses as conjunction and preposition. Compare:

With Mary I always feel happy.
Without Mary I always feel miserable.
I bought a car *for Mary* (so that she could drive to work in it).

Note In this group, *without* has two meanings: (a) 'not with' and (b) 'outside':

- (a) They work both *with* and *without* assistance from me.
(b) They operate both { *within* and *without* / *inside* and *outside* } the organization.

Note, however, that there is an imbalance in that *without* in the second sense can be used only when coordinated with *within*:

- (a) They work { *with* / *without* } assistance from me.
(b) They operate { *within* / ?*without* } the organization.

Concession: in spite of, despite, for all, with all, etc

9.56 *In spite of* is a general-purpose preposition of concession; *despite* is rather more formal:

I admire him, *in spite of* his faults.

Despite strong pressure from the government, the unions have refused to order a return to work.

With all and *for all* 'despite' are more colloquial and rather restricted in their use:

With } *all his boasting and ostentatious training*, he was knocked out
For }
 in the first round.

In concessive use, *all* must be present after both prepositions: *with all* and *for all*. In causal use, *all* is optional: *with* or *with all*. Compare:

With all } this noise I managed to get some sleep. [concessive: 'in spite of']
For all }
With all } this noise, I couldn't sleep. [causal: 'because of']
With }

Notwithstanding ['in spite of'] is formal and rather legalistic in style, particularly when postposed:

Thomas Carlyle, { *notwithstanding his tedious rhetoric*,
his tedious rhetoric notwithstanding, }
 is a master of the sublime in prose style.

Compare the adverbial use of *notwithstanding*, as in:

Notwithstanding, the case must be prosecuted. ['notwithstanding any conditions']

Respect: *with reference to*, *with regard to*, *as for*, etc

9.57 Some of the prepositions denoting respect are used in rather formal contexts, typically business letters, eg:

With reference to [less usual: *In reference to*] *your letter/request/enquiry of April 29th*, I confirm my Directors' agreement to advance a further sum of £2000. <formal>
With regard to *the date of delivery* . . . [less usual: *In regard to* or *Re* /rɪz/; typically introducing a secondary or tertiary topic in such a letter]

Re functions like *with regard to* but is more common in notes than in formal letters, eg:

Re your idea of extending the canteen . . .

Other prepositions within the same general area of meaning are *regarding*, *with respect to*, *in respect of*, *respecting*, *on the matter of*, *about*, *concerning*, *as to* (cf subject matter, 9.60).

As to functions like *with regard to*, *as regards*, etc:

As to the question you raise in your last letter, I think that . . .

As to is also used in the sense of *according to*, eg: *correct as to size and colour*.

As for, on the other hand, introduces a topic transition, so it cannot normally occur at the beginning of a discourse. It has the meaning of

'returning to the question of', and is less formal than the other complex prepositions denoting respect:

We had a delightful weekend in the country. *As for the traffic*, we had no difficulty.

There is a predisposition for initial *as for* to indicate a contemptuous attitude:

As for his book, I suppose you've read the reviews!

There are a number of marginal prepositions that have affinities with verbs which belong here: *concerning*, *regarding*, and *touching* <formal> (cf 9.8), eg:

Concerning the recent proposal by the chairperson, I suggest we . . .

Considering is used like *in view of* ['taking into consideration'], often 'if one takes into account the rather surprising fact that':

Considering the job situation, there were surprisingly few applications this year.

Prepositional phrases as adverbials denoting respect are chiefly used as disjuncts or conjuncts. Most of them can also function as postmodifiers in noun phrases:

Has the candidate expressed *an opinion* { *on*
about
concerning
with regard to } legal abortion?

We await *your decision as to whether* these repairs are to be carried out immediately.

Note The use of *irregardless* (of) for *regardless* (of) is widespread, especially in AmE, but is considered nonstandard by most people. It appears to be the result of a confusion between *regardless* and *irrespective*, or perhaps a choice of a double negative (*ir* + *less*) which is felt to be suitably emphatic.

Exception and addition

9.58 The most common prepositions denoting exception are: *except for*, *with the exception of*, *apart from*, *aside from* <esp AmE>, *except*, *excepting*, *excluding*, *but*, and *save* <formal>. When used in adverbials, prepositions denoting EXCEPTION function primarily as disjuncts (cf 8.121ff):

We had a pleasant time, *except for the weather*.

With the exception of James, none of us had any money.

The worst period of my life, { *apart from the war*,
aside from the war <esp AmE> }, was
 when I was out of work.

Except and *excepting* function normally, and *but* exclusively, in postmodifying phrases:

All { *but*
except(ing) } the captain were rescued.

Finally we had packed everything $\left\{ \begin{smallmatrix} \text{but} \\ \text{except} \end{smallmatrix} \right\}$ the typewriter.
Any time *but* now. ['any other time']

Thus *but* cannot occur initially as a preposition:

**But*
Except for $\left\{ \right.$ me, everyone was tired.

The prepositional phrase, in such constructions, is often separated from its noun head, and postposed to the end of the clause (cf discontinuous noun phrases, 18.39):

Everyone but me was tired. ~ *Everyone* was tired *but me*.

Further, the noun phrase with *but*-modification must contain a determiner or indefinite pronoun of absolute meaning (positive or negative): *no*, *all*, *any*, *every*, *each*, *nobody*, *anywhere*, *everything*, etc or an interrogative *wh*-word (*who?*, *where?*, etc). Hence one may say *all but one*, but not, eg: **some but one*, or **many but one*. Other examples:

This car is *anything but* slow.
We've bought *everything but* milk.
Who should turn up *but* our old friend Tom.

Bar and *barring* are rarer substitutes for *except* and *excepting*:

This is the most versatile microcomputer on the market, *bar none*.
Barring accidents, we'll be there on time.

Beyond is sometimes used in nonassertive contexts in the sense of *except (for)*:

Beyond the press release, there are no further comments.
He didn't help, *beyond showing a mild interest*.

ADDITION can be expressed by the prepositions *besides*, *as well as*, and *in addition to*. For example:

There were three people present $\left\{ \begin{smallmatrix} \text{besides} \\ \text{in addition to} \end{smallmatrix} \right\}$ the committee.

As well as learning to swim he has been taking Spanish lessons this summer.

Compare the difference in meaning between *except* and *but* (both denoting exception), on the one hand, and *besides* (denoting addition), on the other, in the following examples:

Everyone passed $\left\{ \begin{smallmatrix} \text{except} \\ \text{but} \end{smallmatrix} \right\}$ Richard. ['Richard did not pass but everyone else did.']

Everyone passed *besides Richard*. ['Everyone passed, in addition to Richard.']

In the negative, the difference is cancelled out, so that the following two sentences are synonymous:

No one passed $\left\{ \begin{smallmatrix} \text{except} \\ \text{besides} \end{smallmatrix} \right\}$ Richard.

Note [a] *But* as a preposition has to be distinguished from *but* as a conjunction (cf 13.5ff). Both the resemblance and the contrast between the two functions are brought out in:

Everyone had a good time *but* John. [preposition = 'with the exception of', 'except for']

The students had a good time $\left\{ \begin{smallmatrix} \text{but not John.} \\ \text{but John did not.} \end{smallmatrix} \right\}$ [conjunction]

However, there is often indeterminacy between the preposition and conjunction status of *except* and *but*, as can be seen in the variability of constructions such as:

He does everything in the house $\left\{ \begin{smallmatrix} \text{except} \\ \text{but} \end{smallmatrix} \right\}$ $\left\{ \begin{smallmatrix} \text{put} \\ \text{putting} \end{smallmatrix} \right\}$ the children to bed.

[b] As we have seen above, prepositions of exception and addition quite often have a prepositional phrase or clause as complement (cf 9.1 Note [d]):

except in the southeast
apart from when I last spoke to you
except for what I ordered
in addition to being a fine colleague

[c] The combination *all but* is used colloquially as an intensifier:

He *all but* ['very nearly'] strangled me.
Cf: She is *but* ['only'] a child. [where *but* is a restrictive subjunct, cf 8.116 Note [b]]

Negative condition: *but for*

9.59 *But for* is not used in the sense of exception, but rather that of 'negative condition':

But for Gordon, we would have lost the match. ['If it hadn't been for Gordon . . .', 'If Gordon hadn't played as he did . . .', etc]

Many people use *except for* in the same way as *but for* to denote negative condition. However, *except for* normally denotes exception (cf 9.58). Note the difference in meaning between the following two sentences:

Except for John they $\left\{ \begin{smallmatrix} \text{would all have died. ['If it hadn't been for John} \\ \text{. . .'} \\ \text{all died. ['With the exception of John . . .'} \end{smallmatrix} \right\}$

Prepositional phrases used chiefly in complementation of verbs and adjectives

Subject matter: *about*, *on*

9.60 With the meaning 'on the subject of', 'concerning', *about* and *on* can combine with a considerable range of verbs and adjectives (cf 16.28, 16.69), eg:

She is *lecturing* $\left\{ \begin{smallmatrix} \text{about} \\ \text{on} \end{smallmatrix} \right\}$ new techniques of management.

He *told me* $\left\{ \begin{smallmatrix} \text{about} \\ \text{*on} \end{smallmatrix} \right\}$ his adventures.

Other examples:

ABOUT/ON	ABOUT
<i>argue about/on</i>	<i>find out about</i>
<i>be knowledgeable about/on</i>	<i>hear about</i>
<i>communicate about/on</i>	<i>inform (someone) about</i>
<i>confer about/on</i>	<i>learn about</i>
<i>hold forth about/on</i>	<i>keep quiet about</i>
<i>preach about/on</i>	<i>quarrel about</i>
<i>speak about/on</i>	<i>read about</i>
<i>write about/on</i>	<i>teach (someone) about</i>

On is chiefly reserved for deliberate, formal linguistic communication (public speaking, lecturing, writing, etc), and is therefore inappropriate for verbs like *chat* or *quarrel*. Thus [1] would suggest she was making a formal speech ['gave a lecture on'], whereas [2] could refer equally to an informal conversation or casual allusion:

<i>She spoke</i> { <i>on butterflies.</i> [1]
{ <i>about butterflies.</i> [2]

This difference of meaning occurs also with postmodifying phrases where *on* and *about* mean 'on the subject of':

<i>a book about/on butterflies</i>	<i>a story about a princess</i>
<i>a talk about/on antiques</i>	<i>ignorance about sex</i>
<i>a discussion about/on drugs</i>	<i>the facts about nuclear power</i>
<i>a word about/on the garden</i>	<i>a fuss about nothing</i>

Prepositional phrases introduced by both *about* and *on* may function as obligatory predication adjuncts with the verb *be*:

This book is { *on* } stamps.
 { *about* }

A less usual, and more formal, alternative to *about* and *on* is *concerning* (cf 9.57): *a dispute concerning land rights*.

Over is also used to denote 'on the subject of', 'in connection with':

They quarrelled over money.
It's no use crying over spilt milk.

Of is a somewhat rarer and more literary alternative to *about* in *tell*, *speak*, *talk*, *inform* . . . *of*, etc. Both *about* and *of* are frequently used with *think*, but with a difference of meaning:

He thought { *about the problem.* ['He pondered/considered the problem.']
 { *of the problem.* ['He brought the problem to his mind.']}

Of can also be used in variation with *about* in noun phrases (cf above), as in:

a story of a princess *ignorance of sex* *the facts of nuclear power*

Material, ingredient: *with*, *of*, *out of*; substance: *from*

9.61 With verbs of 'making', *with* indicates an ingredient; *of* and *out of* signify the

material or constituency of the whole thing; and *from* indicates a substance from which something is derived:

This cake is *made with* lots of eggs. ['Eggs are an important ingredient.']
He *made* the frame (*out*) *of* wood. ['Wood was the only material.']
Beer is *made from* hops.

With also enters into such pervasive expressions as *paved with brick*, *filled with water*, *loaded with hay* (cf 9.29).

Of (used with nouns denoting 'material') is found in a postmodifying function as well as in adverbials:

a bracelet of solid gold ['made out of', 'a solid gold bracelet']
a table of polished oak ['made/consisting of polished oak', 'a polished oak table']

It may also be used metaphorically:

a man of steel
a heart of stone [cf 'a woman of/with strong feelings', 9.55]

Standard: *for*, *at*

9.62 A comparative adjective must be related, explicitly or implicitly, to a basis of comparison (cf 7.86). Thus we cannot say [1], without some such implicit relation:

This boy is bigger. [1]

Similarly, a gradable adjective without the comparative form implies some standard or norm; *big* in [2] means something different from *big* in [3]:

This elephant is big. [2]
This cat is big. [3]

The reason is that 'big for an elephant' presupposes a larger scale, and a larger norm, than 'big for a cat'.

We can make the norm explicit by a *for*-phrase [4-5]:

He's not bad *for a youngster*. ['considering that he is a youngster'] [4]
That dog is long-legged *for a terrier*. [5]

A further way in which one may specify the meaning of a gradable adjective or noun is to use *at* to indicate the respect in which the adjective is appropriate to the subject (cf 16.69), as in [6-7]:

He's good/clever/brilliant/an expert *at organizing things*. [6]
He's bad/better/terrible/no good *at games*. [7]

The use of *for* and *at* is not restricted to adjectival complementation: these prepositions occur also in a number of other grammatical roles, as the following examples show:

I'm a complete dunce *at mathematics*.
She's getting on very well *at her job*.
For an Englishman, he speaks foreign languages remarkably well.
It's a dreadfully expensive toy *for what it is*.

Reaction: at, to

9.63 Consider these three sentences:

- | | |
|---|------|
| Their rejection of the offer <i>surprised</i> me. | [1] |
| I was <i>surprised</i> by their rejection of the offer. | [1a] |
| I was <i>surprised at</i> their rejection of the offer. | [1b] |

Sentence [1] presents, by means of a straightforward subject-verb-object construction, the relationship between an event, an emotional reaction, and the person who undergoes the reaction. The same relationship can be expressed by the passive [1a] (cf 3.63ff), or, alternatively, by the passive with the preposition *at* replacing the agentive preposition *by* [1b]. Here *at* (as we saw in 9.51) signals the relation between the emotive reaction and its stimulus. *Surprised* in this context is a participial adjective (note that it can be preceded by *very*; cf 7.15), and it is with such adjectival forms that *at* ['stimulus'] characteristically combines (cf 3.76, 16.69):

<i>alarmed at</i>	<i>disgusted at</i>
<i>amused at</i>	<i>delighted at</i>

Less commonly, verbs and nonparticipial adjectives have this construction:

laugh/stare/gaze/glance/aim/rejoice ... at
be angry/glad ... at

Another way to state the same idea is to let the main clause represent the event acting as a 'stimulus', and to let the REACTION be expressed by the preposition *to* followed by an abstract noun of emotion, eg: *to my regret*, *to my annoyance*, *to my relief*, *to my surprise*, *to my horror*, *to my delight*:

To my regret, they rejected the offer.

To my regret in this context is a content disjunct, comparable with adverbs such as *regrettably* (cf 8.127).

The reaction can also be expressed by *to* + personal pronoun or a phrase with *to* + possessive pronoun + *mind*, *in* + possessive pronoun + *opinion*, etc, to identify the person reacting:

<i>To me,</i>	} their rejection was a surprise.
<i>To my mind,</i>	
<i>In my opinion,</i>	

In this sense, *to* is not limited to emotive reactions but applies equally to intellectual or perceptual responses:

To a mind based in common sense, his ideas are utterly absurd.
 It looked *to me* like a vast chasm.

However, in this last case the *to*-phrase is not a disjunct, but an adjunct.

According to is used to identify not so much a reaction to, as an interpretation of, events. It is used chiefly for a 3rd person (cf 8.127 Note [a]):

<i>To him/you/me</i>	} this is quite unexpected.
<i>According to him/?you/?me</i>	

Note This use of *according to* should be distinguished from the different sense of *in accordance/agreement/conformity with*:

<i>in accordance with</i>	} the new regulations
<i>according to</i>	

Modification of prepositional phrases

9.64 Prepositional meanings (particularly of time and place) are subject to modification as regards degree and measure, and prepositions may therefore (like many adjectives and adverbs) be preceded by intensifiers (cf 7.61). For example:

I left it *just* <inside> the garage. ['a little way']
 He had wandered *right* <off> the path. ['completely']
 Now their footsteps could be heard *directly* <above> my head.
 I got up *just/soon* <after> ten.
 There was rubbish *all* <over> the place.
 They followed *close* <behind> me.
 This cake mix comes *straight* <out of> the packet.
 The dog was lying *right* <in the middle of> the floor.

There is doubt in such cases as to whether the intensifier should be treated as applying to the whole prepositional phrase, or to the preposition alone. In the examples above, however, the intensifiers can modify the prepositional adverbs: *right in the middle*, etc.

Prepositions and prepositional adverbs

9.65 A prepositional adverb is a particle which is formally identical to or related to a preposition, and which often behaves like a preposition with ellipted complement:

A car drove	{ <i>past the door</i> . [<i>past</i> is a preposition]
	{ <i>past</i> . [<i>past</i> is a prepositional adverb]

Thus a prepositional adverb shares the form, but not the syntactic status, of a preposition. It is capable of standing alone as an adjunct, conjunct, postmodifier, etc without the addition of a prepositional complement:

Despite the fine weather, we stayed *in* all day.
Besides, I don't feel like a walk just now.
 The day *before*, I had spoken to her in the office.

Prepositional adverbs normally receive stress, whereas simple prepositions (especially monosyllables, cf 9.9) normally do not. In each of the following pairs, *in* is a stressed preposition in the first and an unstressed preposition in the second example:

- | | |
|---|------|
| { She stayed <i>IN</i> . | [1] |
| { She stayed <i>in</i> the <i>HOUSE</i> . | [1a] |
| { He thrust <i>IN</i> his <i>HAND</i> . | [2] |
| { He swam <i>in</i> the <i>LAKE</i> . | [2a] |
| { Which prisoner did they march <i>IN</i> ? | [3] |
| { Which uniform did they <i>MARCH in</i> ? | [3a] |

Both prepositions and adverbs commonly appear in idiomatic combinations with a preceding verb, eg: *make for*, *make up*, *make up for*. Here, however, we shall pay attention only to their meaning and syntactic behaviour as individual items, idiomatic usage being a concern of the dictionary rather than of the grammar. Phrasal verbs and prepositional verbs, ie combinations of verb + adverb and verb + preposition which behave syntactically or semantically as a single unit, are discussed in 16.2ff.

- Note The relation between prepositional adverbs and prepositional phrases [4] may be compared to that between intransitive and transitive use of certain verbs [5] (cf 16.19):
- | | |
|-----------------------------------|-----|
| She stayed <i>in</i> (the house). | [4] |
| She ate (breakfast). | [5] |

- 9.66 (a) The following list includes some prepositional adverbs related to simple prepositions (cf 9.7), as in:

Why didn't you come { *before* 7 o'clock?
 before?

<i>a'board</i>	<i>a'bout</i>	<i>a'bove</i>
<i>a'cross</i>	<i>'after</i>	<i>a'long</i>
<i>a'longside</i>	<i>a'round</i>	<i>be'fore</i>
<i>be'hind</i>	<i>be'low</i>	<i>be'neath</i>
<i>be'sides</i>	<i>be'tween</i>	<i>be'yond</i>
<i>by</i>	<i>down</i>	<i>in</i>
<i>in'side</i>	<i>near</i> ('nearer, 'nearest)	<i>off</i>
<i>on</i>	<i>'opposite</i>	<i>out'side</i>
<i>'over</i>	<i>past</i>	<i>round</i>
<i>since</i>	<i>through</i>	<i>through'out</i>
<i>'under</i>	<i>,under'neath</i>	<i>up</i>
<i>with'in</i>	<i>with'out</i>	

All, with the exception of *without* and the conjunct *besides*, are primarily adjuncts of time or space.

- (b) The following list includes some prepositional adverbs that are related to complex (two-word) prepositions (cf 9.10), as in:

Paul wants to go to the Zoo { *instead of* going to a museum.
 instead.

<i>a'head</i>	<i>a'way</i>	<i>back</i>
<i>close</i>	<i>east, etc</i>	<i>'eastward(s), etc</i>
<i>in'stead</i>	<i>out</i>	<i>over'head</i>
<i>to'gether</i>		

- (c) The following list includes some prepositional adverbs related to complex (three-word) prepositions (cf 9.11), as in:

Why don't you put the trunk { *on top of the car?*
 on top?

<i>at variance</i>	<i>in addition</i>	<i>in aid</i>
<i>in case</i>	<i>in charge</i>	<i>in common</i>
<i>in comparison</i>	<i>in context</i>	<i>in exchange</i>
<i>in favour</i>	<i>in front</i>	<i>in lieu</i>
<i>in line</i>	<i>in need</i>	<i>in relation</i>
<i>in return</i>	<i>on top</i>	

- Most of the common prepositions listed in 9.7ff can also act as prepositional adverbs, for example:

Position (9.16):	Is your sister <i>in</i> ? – No, she's <i>out/away</i> .
Destination (9.16):	She went <i>out/away/in</i> .
Passage (9.24):	The dog jumped <i>over/through</i> .
Path (9.26):	Move <i>along</i> .
	She came <i>round</i> to see me.
Orientation (9.27):	The man (who sat) <i>opposite</i> kept looking at her.
Resultative (9.28):	The price of oil is <i>up</i> again today.
Pervasive (9.29):	There were lots of people <i>around</i> .

Prepositional phrases and prepositional adverbs can be seen as the extremes on a scale with a stepwise reduction in explicitness as we proceed from [1] to [5]. In the sentence pattern 'They are all ...' we can have:

- | | |
|---|-----|
| <i>in</i> (great) <i>favour of</i> the proposal | [1] |
| (greatly) <i>in favour of</i> the proposal | [2] |
| (greatly) <i>in favour of</i> it | [3] |
| (greatly) <i>in its favour</i> | [4] |
| (greatly) <i>in favour</i> | [5] |

We have in [1] a free syntactic noun phrase with *favour* as head which admits adjectival premodification; in [2] a complex preposition *in favour of* with *the proposal* as complement; in [3] the pronominal substitute for the nominal complement in [2]; in [4] a possessive determiner *its*; and in [5] the prepositional adverb *in favour*, which relies for its interpretation on previous mention in the linguistic or situational context. The reduction in [4] (premodification) as compared with [2] and [3] (postmodification) is dealt with in connection with the noun phrase. The step from [4] to [5] is one step beyond premodification structure.

- Note [a] *For* and *against* are used as prepositional adverbs only in phrases such as *votes for and against*.
[b] *To* is used as a prepositional adverb in *set 'to* (and *finish*), *turn 'to* (and *help*), and in a few idioms such as (walk) *to and fro*. Compare the prepositional phrase in *walk to and from work*.

[c] There is no prepositional adverb corresponding to *contrary to* (cf 9.10). But note the similar use of the reduced expression *to the contrary*.

His vote was $\begin{cases} \text{contrary to mine.} \\ \text{to the contrary.} \end{cases}$

Compare also the conjunct adverbial (8.137):

$\begin{cases} \text{On the contrary,} \\ \text{To the contrary (AmE),} \end{cases} \text{ what I said was this year, not next.}$

Bibliographical note

A general analytical bibliography of prepositions can be found in Guimier (1981).

Theoretical treatments of the roles of prepositions are provided by Bennett (1975); Bugarski (1969); Fillmore (1969); Rosenbaum (1967a); Vestergaard (1977).

Studies of other aspects of English prepositions can be found, for example, in Christophersen (1979); Hill (1968); Jacobsson (1977a); Lee (1969); Leech (1969a); Lindkvist (1950, 1972, 1976, 1978); Poutsma (1926–29), Part II.2; Quirk and Mulholland (1964); Sørensen (1979a, 1979b); Turner (1972); Zandvoort and Doodkorte (1962).

Frequencies have been taken from Hofland and Johansson (1982).

Clause patterns

Simple and multiple sentences

10.1 Sentences are either SIMPLE or MULTIPLE. A simple sentence consists of a single independent clause. A multiple sentence contains one or more clauses as its immediate constituents. Multiple sentences are either COMPOUND or COMPLEX. In a compound sentence the immediate constituents are two or more COORDINATE clauses. In a complex sentence one or more of its elements, such as direct object or adverbial, are realized by a SUBORDINATE clause (cf further 14.1ff).

Elements such as subject and verb are constituents of sentences and also of clauses within sentences. We shall speak of CLAUSES and CLAUSE STRUCTURE whenever what we say applies both to sentences and to the clauses of which sentences are composed. Thus a complex sentence with one subordinate clause can be analysed twice over, once for the sentence as a whole and once for the subordinate clause included within the sentence:

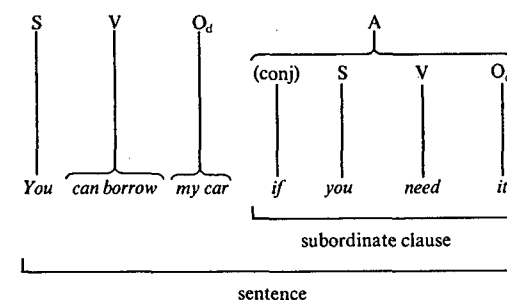

Fig 10.1 Sentence and clause elements

In the present chapter we are primarily concerned with simple sentences. Discussion of coordinate clauses is deferred to Chapter 13 and of subordinate clauses to Chapters 14 and 15. The present chapter is further restricted to aspects of the simple sentence chiefly involving the elements subject, verb, object, and complement. The adverbial, as a clause element that is generally more detachable and more mobile than the others, receives detailed consideration in Chapter 8.

Note [a] We use the term 'simple sentence' for an independent clause that does not have another clause functioning as one of its elements. Thus, [1] is a complex sentence in which *if you need it* functions as an adverbial:

You can borrow my car *if you need it*. [1]

However, a simple sentence may have a clause functioning within a phrase. In that case the complexity is at the level of the phrase, not at the level of the sentence or clause. Thus [2] is a simple sentence:

You can borrow the car *that belongs to my sister*. [2]

In [2] the relative clause *that belongs to my sister* is a postmodifier within the complex noun phrase constituting the object element *the car that belongs to my sister*. Clauses functioning as modification of noun phrases are discussed in Chapter 17. Clauses functioning in the complementation of adjective phrases are discussed in Chapter 16.

The term 'simple sentence' is frequently used elsewhere, but not in this book, for an independent clause that does not contain another clause, regardless of whether the contained clause is an immediate constituent of the sentence or not. In some grammars, nonfinite constructions (which have a nonfinite verb as their verb element) are considered phrases rather than clauses. We treat such constructions as clauses because they can be analysed into clause elements (*cf* 14.5). Nonfinite clauses themselves are intrinsically subordinate and therefore do not constitute simple sentences in the canonical forms (*but cf* 11.41).

[b] A simple sentence is not necessarily simple in a nontechnical sense. For example, a simple sentence may be very complicated because its phrases are complex:

On the recommendation of the committee, the temporary chairman, who had previous experience of the medical issues concerned, made the decision that no further experiments on living animals should be conducted in circumstances that might lead to unfavourable press publicity.

Other factors apart from the complexity of phrases are mentioned in 14.2.

Clause structures

- 10.2 We now turn to a further consideration of the clause structures outlined in 2.13ff. We there distinguished five functional categories of clause constituents, three of which were further subcategorized.

subject	(S)
verb	(V)
object	(O)– direct object (O _d) – indirect object (O _i)
complement	(C)– subject complement (C _s) – object complement (C _o)
adverbial	(A)– subject-related (A _s) – object-related (A _o)

By eliminating optional adverbials, we established seven major clause types, based on the permissible combinations of the seven functional categories, the clause elements. *Table 10.2* opposite exemplifies the major clause types in their normal order in a simple declarative sentence, the canonical form of the sentence.

The clause types are determined by the verb class to which the full verbs within the verb constituent belong. Different verb classes require different complementation (O_d, O_i, C_s, C_o, A) to complete the meaning of the verb, or (in the case of *SV*, where the verb is intransitive) no complementation.

Multiple class membership of verbs

- 10.3 It must be borne in mind that a given verb can belong, in its various senses, to a number of different classes (*cf* App I.54), and hence enter into a number of different clause types. The verb *get* is a particularly versatile one, being excluded only from Type *SV* (and even then not universally; *cf* Note):

<i>SVO</i>	He'll get a surprise.
<i>SVC</i>	He's getting angry.
<i>SVA</i>	He got through the window.
<i>SVOO</i>	He got her a splendid present.
<i>SVOC</i>	He got his shoes and socks wet.
<i>SVOA</i>	He got himself into trouble.

Table 10.2 Major clause types

Type	S(subject)	V(erb)	O(object)(s)	C(omplement)	A(dverbial)
<i>SV</i>	<i>The sun</i>	intransitive <i>is shining</i>			
<i>SVO</i>	<i>That lecture</i>	monotransitive <i>bored</i>	direct object <i>me</i>		
<i>SVC</i>	<i>Your dinner</i>	copular <i>seems</i>		subject complement <i>ready</i>	
<i>SVA</i>	<i>My office</i>	copular <i>is</i>			subject-related adverbial <i>in the next building</i>
<i>SVOO</i>	<i>I</i>	ditransitive <i>must send</i>	indirect object <i>my parents</i> direct object <i>an anniversary card</i>		
<i>SVOC</i>	<i>Most students</i>	complex-transitive <i>have found</i>	direct object <i>her</i>	object complement <i>reasonably helpful</i>	
<i>SVOA</i>	<i>You</i>	complex-transitive <i>can put</i>	direct object <i>the dish</i>		object-related adverbial <i>on the table</i>

Note One minor clause type is the bare existential sentence (18.44ff): *There is no need for apologies: there must have been some misunderstanding.*

Through the multiple class membership of verbs, ambiguities can arise: *I found her an entertaining partner*, like *She called him her favourite waiter*, could be interpreted either as belonging to the *SVOC* or *SVOO* types.

The complementation of verbs receives detailed treatment in Chapter 16.

Note In informal (especially dialectal) AmE, *ger* is used even as an intransitive verb (= 'leave at once') in Type *SV*: *She told him to get*.

Verb complementation

- 10.4** The elements, O_d , C_s , C_o , and A in the patterns exemplified in 10.2 and 10.3 are obligatory elements of clause structure in that they are required for the complementation of the verb. Given the use of a particular verb in a particular sentence, the sentence is incomplete if one of these elements is omitted, eg: **Your dinner seems* (type *SV* C) and **You can put the dish* (type *SVOA*) are unacceptable. In some cases, however, a direct object or an object complement could from one point of view be considered grammatically optional:

They're eating. [S V] ~ cf They're eating lunch. [S V O]
 We elected her. [S V O] ~ cf We elected her our delegate. [S V O C]
 He's teaching. [S V] ~ cf He's teaching chemistry. [S V O]
 He's teaching them chemistry. [S V O O]

We regard these as cases of conversion, whereby a word such as *eat* is transferred from the transitive to the intransitive category. Thus, *They're eating* is an instance of type *SV* rather than of *SVO* (with optional deletion of the object). We adopt this approach because there is to a greater or lesser extent a shift in meaning.

To justify treating object omission as a matter of conversion, we may notice that it applies to some transitive verbs but not to others:

They're hunting deer. ~ They're hunting.
 They're chasing cats. ~ *They're chasing.

Also, one can find nonce object omissions, which again points to a word-formation process rather than a syntactic process. Thus (*)*John is licking today* is a highly improbable sentence for which one could (as with all nonce-formations) find a plausible use if one tried hard enough (eg a situation in which two people are alternatively employed in licking and sticking stamps on letters). Conversions from one verb category to another, including from transitive to intransitive verbs, are exemplified in App I.54.

A similar approach may be made to instances where the indirect object is omissible:

She gives expensive presents. [S V O_d]
 cf She gives her friends expensive presents. [S V O_i O_d]

But here the case for conversion is not so strong, and one may regard the indirect object with many verbs as an optional element similar in status to an optional adverbial.

We should in principle distinguish different types of omission of objects, though the distinction may be blurred in particular instances:

- (1) A specific object is recoverable from the preceding linguistic context:

A: Show me your essay. B: I'll *show* you later.
 Let's do the dishes. I'll *wash* and you *dry*.

In such instances the verb may be analysed as genuinely transitive with ellipsis of the direct object.

- (2) A specific object is understood from the situational context:

Keep off [sign on grass] *Shake well* before use.
Watch! *Don't touch.*
 The tie doesn't *fit*.

- (3) A specific reflexive object is understood when the verb allows such an object (cf 6.25):

I'm *shaving*. They're *dressing*.

Some verbs allow omission of either a reflexive or a nonreflexive object: *She's washing* (*herself* or *the clothes*).

- (4) A nonspecific object is semantically entailed (cf 16.19):

Are you *eating* again? Do you *drink*?
He teaches. I don't want to catch you *smoking* again.
 They can't *spell*. I can't come now, because I'm *cleaning*.
 I don't want to *read*.

The range of understood nonspecific objects is restricted with some verbs when they are used intransitively. For example, *Do you drink?* refers to the drinking of alcoholic drinks, *I'm cleaning* refers to domestic cleaning and not (say) to cleaning teeth or cleaning a pipe, and *to catch you smoking again* normally excludes (say) smoking fish. In other instances, the intransitive verb may lack the causative meaning of the transitive verb: Contrast *He walked* and *He walked the dog* (cf 10.22).

Note In some instances the omission of a sentence element radically changes the sense of the verb. Contrast the use of the verb *find* and *run* in these examples:

I have found her reasonably helpful. [S V O C] I have found her. [S V O]
 He is running a business. [S V O] He is running. [S V]

Syntactic functions of clause elements

- 10.5** A partial characterization of the clause elements based on formal criteria is given in 2.24. Formal criteria usually suffice to identify the verb element within a clausal context, since the verb element is always realized by a verb phrase. We have also noted its syntactic importance in determining what other elements may or must occur in the clause (cf 10.3f). We now give further consideration to the other clause elements.

Distinctions between the elements – and between types within the elements – are based on (i) forms (noun phrase, verb phrase, adjective phrase, finite clause, etc), (ii) position, (iii) syntactic function other than positional potentialities, and (iv) semantic role. It is primarily on the basis of (iii) and (iv) that a distinction is made between O_d and O_i , C_s and C_o . The following sentences contain final phrases that are identical in form and position:

- | | |
|---------------------------|--------------------------------|
| { They told the mayor. | { They told his life story. |
| { They admired the mayor. | { They admired his life story. |

But the identity stops there. While the process of admiring the mayor is parallel to that of admiring his life story, telling the mayor involves something very different from telling his life story. The difference is confirmed by coordination:

- They admired the mayor and his life story.
 *They told the mayor and his life story.

Equally, if we attempt to introduce apposition, we can contrast:

- They admired the mayor, *ie* his life story.
 *They told the mayor, *ie* his life story.

In other words, *the mayor* and *his life story* are realizations of the same type of O with *admire* but are realizations of different types of O with *tell*. Consequently, we cannot have:

- *They admired the mayor his life story.

But we can have:

- They told the mayor his life story.

Hence it is necessary (for this last sentence) to distinguish O_i (*the mayor*) from O_d (*his life story*).

Note If the verb is in the simple present, it may be indistinguishable from a noun in a sentence in block language (cf 11.45), where determiners are commonly omitted:
 Mail leaves tomorrow. ['Mail the leaves tomorrow.' or 'The mail leaves tomorrow.']

Subject

- 10.6 Of the clause elements other than the verb, the subject is the most important in that (except for the verb) it is the element that is most often present. It is also the element for which we can find the greatest number of characteristic features. In characterizing the subject and the other clause elements, we identify the four types of distinction listed in 10.5. Because of its conspicuousness we treat position separately from other syntactic functions.

(a) FORM

The subject is normally a noun phrase (cf Chapters 5, 6, and 17) or a nominal clause (cf 15.3ff).

(b) POSITION

The subject normally occurs before the verb in declarative clauses, and after the operator in *yes-no* interrogative clauses (cf 11.5ff):

- Everybody* [S] *has left* [V] *for the day*.
Has [op] *everybody* [S] *left for the day*?

In *wh*-interrogative clauses, subject-operator inversion also occurs except where the *wh*-element is itself the subject:

- What *have* [op] *you* [S] *seen today*?
 What [S] *has* [op] *kept you so long*?

(c) SYNTACTIC FUNCTION

- (i) A subject is obligatory in finite clauses except in imperative clauses, where it is normally absent but implied (cf 11.24ff).
 (ii) In finite clauses the subject determines the number and person, where relevant, of the verb (cf 10.34ff):

- Nancy* [S] *knows* [V] *my parents*. [singular number concord]
Nancy and David [S] *know* [V] *my parents*. [plural number concord]
I [S] *am* [V] *your new colleague*. [singular number and 1st person concord]

- (iii) The subject normally determines number of the subject complement when that is a noun phrase (cf 10.46):

- Caroline* [S] *is my sister* [C].
Caroline and Vanessa [S] *are my sisters* [C].

- (iv) The subject determines the number and, where relevant, the person and gender of the reflexive pronoun as direct object, indirect object, subject complement, or prepositional complement (cf 6.23, 10.48, 10.50). The same concord relation generally applies when the emphatic genitive *my own*, etc is used (cf 6.30):

- I* [S] *shaved myself* [O] *with my own razor*.
He [S] *shaved himself* [O] *with his own razor*.

- (v) The subject requires the subjective form for pronouns that have distinctive case forms (cf 6.4):

- I* [S] *like him*.
He [S] *likes me*.

- (vi) There is a systematic correspondence between active and passive clauses in that the direct or indirect object of an active clause becomes the subject of a passive clause while the subject of the active clause is either omitted or made the complement in a *by*-agent phrase (cf 16.26):

- My son* [S] *has prepared lunch* [O] *today*. [active]
 ~ *Lunch* [S] *has been prepared by my son* *today*. [passive]

- (vii) The subject is repeated in a tag question by a pronoun form (cf 11.8ff):

- The milk is sour, isn't it?*

- (viii) The implied subject of a subjectless nonfinite or verbless clause is normally identical with the subject of the superordinate clause:

- Susan telephoned before coming over*. ['... before Susan came over']

(d) SEMANTIC PROPERTIES

- (i) The subject is typically the theme (or topic) of the clause (*cf* 18.9ff).
- (ii) It typically refers to information that is regarded by the speaker as given (*cf* 18.8ff).
- (iii) In a clause that is not passive, the subject is agentive if the agentive role is expressed in the clause (*cf* 10.33).

- Note [a] For adverbial forms functioning as subject, *cf* 10.15. On adjectives functioning as heads of noun phrases (*the young*), *cf* 7.23ff.
- [b] For declarative clauses with subject-operator or subject-verb inversion, *cf* 10.58f, 15.36, 18.22ff.
- [c] For the question of *there* as a subject in existential sentences, *cf* 18.46.
- [d] The implied subject of a postmodifying participle clause is the head of the noun phrase:
 I haven't yet seen *the friends staying with you*.
 ['The friends are staying with you.']
 These are *the flowers given to us by our children*.
 ['The flowers were given to us by our children.']
- [e] The identity of the subject can be tested in an independent declarative clause through a *wh*-question with *who* or *what*. The subject is the element that can be replaced in its normal position by the *wh*-item:
 Joan [S] wants a piece of cake. ~ *Who* [S] wants a piece of cake?
 The bright light [S] is disturbing Percy. ~ *What* [S] is disturbing Percy?
- Other clause elements require fronting and subject-operator inversion:
 Joan wants *a piece of cake* [O]. *What* [O] does Joan want?

Object: direct and indirect

- 10.7 Direct and indirect objects have some characteristics in common, and this fact justifies their sharing the term *object*:

(a) FORM

Like the subject, the object is normally a noun phrase or a nominal clause. There are constraints on the types of nominal clauses that can be indirect object: generally, only nominal relative clauses (*cf* 15.8f).

(b) POSITION

The object normally follows the subject and verb (but *cf* 10.58f, 11.14f, 18.20). If both objects are present, the indirect object normally comes before the direct object (but *cf* 18.38):

I gave *him* [O_i] *my address* [O_d].

(c) SYNTACTIC FUNCTION

- (i) The object function requires the objective form for pronouns that have distinctive case forms:

They amuse *me* [O_d]. They gave *me* [O_i] some chocolate.
 I amuse *them* [O_d]. I gave *them* [O_i] some chocolate.

- (ii) If an object is coreferential with the subject, it usually requires a reflexive pronoun which agrees with the subject in person and, where

relevant, in number and gender. Similar agreement is required for an emphatic genitive (*my own*, etc) within the object (*cf* 6.30):

You [S] can please *yourself* [O_d].
I [S] have given *myself* [O_i] a treat.
They [S] type *their own letters* [O_d].

- (iii) The object of an active clause may generally become the subject of the corresponding passive clause (but *cf* Note [c] below, 16.27):

We have finished *the work* [O_d]. ~ *The work* [S] has been finished.

If both objects are present, it is often possible to make either the subject in a corresponding passive clause:

We sent *Jack* [O_i] *a copy of the letter* [O_d].
 ~ *Jack* [S] was sent *a copy of the letter* [O_d]. [1]
 ~ *A copy of the letter* [S] was sent *Jack* [O_i]. [2]

But [1] is far more common than [2]. Instead of the retained indirect object in [2], the prepositional paraphrase is more usual:

A copy of the letter was sent to *Jack*. [2a]

- (iv) The indirect object generally corresponds to a prepositional phrase, which is generally placed after the direct object:

I'll send *Charles* another copy. ~ I'll send another copy to *Charles*.
 Pour *me* a drink. ~ Pour a drink for *me*.

- (v) The indirect object can generally be omitted without affecting the semantic relations between the other elements:

David saved *me* a seat. ~ David saved a seat. ~ David saved *me*.

Hence, if there is only one object present, it is generally the direct object. But with a few verbs that are normally ditransitive, the indirect object may be retained while the direct object is omitted. In that case the only object present is the indirect object:

Bob is teaching *the older children*.
 You can pay *me* instead.

(d) SEMANTIC PROPERTIES

- (i) The direct object typically refers to an entity that is affected by the action denoted in the clause (*cf* 10.19, but *cf* also 10.27ff):

Norman smashed *a window* in his father's car.

- (ii) The indirect object typically refers to an animate being that is the recipient of the action (*cf* 10.19, but *cf* also 10.32).

- Note [a] We do not, as some do, apply the term 'indirect object' to the corresponding prepositional phrases (*eg*: for *me* in *Pour a drink for me*), though we use the term 'prepositional object' for the complement in such phrases (*cf* 16.56, 16.60). Some apply the term 'direct object' to an indirect object if it is the only object (*eg*: you in *I'll show you or his children* in *He's teaching his children*). Others again apply the term 'object' exclusively to the first (or only) object.

[b] Speakers vary in their acceptance of *wh*-questions in which the *wh*-interrogative pronoun replaces an indirect object. The corresponding prepositional phrase is fully acceptable:

?*Who* did the detective show his badge?

~ *Who* did the detective show his badge *to*?

~ *To whom* did the detective show his badge? <formal>

Similar variation applies to relative clauses:

?The person I sent the book has not acknowledged receiving it.

~ The person I sent the book *to* has not acknowledged receiving it.

~ The person *to whom* I sent the book has not acknowledged receiving it. <formal>

It also applies to retained indirect objects in passive clauses:

?No reply has been given *me*.

~ No reply has been given *to me*.

Retained indirect objects are generally restricted to pronouns.

All three constructions have been exemplified by indirect objects with corresponding prepositional phrases introduced by *to*. The constructions are less acceptable with other correspondences (eg: *for*-phrases) or no correspondences.

[c] In instances where the passive is inapplicable because the object is a clause, we can test for the presence of an object by adding a coordinate clause with a *pro*-form and making the second clause passive.

I asked whether he was there and his parents asked *that too*.

~ *That* was asked by his parents.

[d] The identity of the direct object can be tested in an independent declarative clause through a *wh*-question with *who* or *what*; fronting of the *wh*-item and subject-operator inversion are required:

The buzzer signals *the end of the game* [*O_d*].

~ *What* [*O_d*] *does* [*op*] the buzzer [*S*] signal?

On the difficulty of applying this test to the indirect object, cf Note [b] above.

Complement: subject and object

- 10.8 Both complements are in a copular relationship with another clause element. The subject complement relates to the subject, and the verb is copular (cf 16.21ff):

My glass is *empty*. [1]

Their daughter has become *an accountant*. [2]

The object complement relates to the direct object:

We find them *very pleasant*. [3]

Carol made Joshua and Peter *her assistants*. [4]

The implied relationship between the object and the object complement can be expressed by means of a corresponding *SVC* sentence with a copular verb, *be* if the object complement is a current attribute and *become* if it is a resulting attribute (cf 10.20):

They are *very pleasant*. [3a]

Joshua and Peter became *her assistants*. [4a]

(a) FORM

The complement is normally a noun phrase or an adjective phrase, but it may also be a nominal clause (cf 15.4ff). It is a defining characteristic of complements, in contrast to objects, that they may be adjective phrases.

(b) POSITION

The subject complement normally follows the subject and the verb. The

object complement normally follows the direct object. (But cf 11.15, 11.31, 18.20ff, 18.37).

(c) SYNTACTIC FUNCTION

(i) If it is a noun phrase, the subject complement normally has concord of number with the subject, and the object complement normally has concord of number with the direct object (but cf 10.46). Contrast [2] and [4].

(ii) If it is a reflexive pronoun, the subject complement has concord of number, person and, where relevant, gender with the subject:

She is not *herself* today.

(iii) Unlike the object, the complement cannot become the subject of a corresponding passive clause. There is no corresponding passive clause for the *SVC* type. With the *SVOC* type, the direct object can of course be made the subject of a passive clause:

His friends call him *Ted*. [*Ted* is *C_o*] [5]

~ He is called *Ted* by his friends. [*Ted* is *C_s*] [5a]

The object complement becomes the subject complement in the passive clause.

(iv) The complement can be questioned, but there is no one general way of doing so (cf 11.5 Note [e], 11.15 Note [i]).

(v) If the subject complement is a pronoun, there is a distinction between subjective and objective forms; the subjective form is more prevalent in formal use (especially in AmE):

This is *he*. <formal> That's *him*.

(d) SEMANTIC PROPERTIES

The complement typically identifies or characterizes the referent of the clause element to which it is related (cf 10.20).

Note [a] With some verbs, object complements can be omitted (cf 16.44ff):

We appointed her *our delegate to the convention*. ~ We appointed her.

They have named their baby *Roger*. ~ They have named their baby.

[b] The object complement cannot be the normal reflexive pronoun, but it can have a corresponding form with *self/selves*:

I prefer George *his normal self*. I did not find them *their usual selves*.

Adverbial

- 10.9 Adverbials are the most diverse of the clause elements, and we therefore distinguish several major types (cf Chapter 8, 15.17ff).

(a) FORM

The adverbial is normally an adverb phrase, prepositional phrase, or adverbial clause. It may also be a noun phrase (cf 8.13).

(b) POSITION

In general, the adverbial is capable of occurring in more than one position in the clause. Constraints on its mobility depend on the type and form of the adverbial. The adverbial in the *SVA* type normally follows the subject and

verb, and the adverbial in the *SVOA* type normally follows the direct object (cf 10.10, also 8.27). Other predication adjuncts (cf 8.34f, 15.22) normally appear at the end of the clause.

(c) SYNTACTIC FUNCTION

(i) Except for the obligatory adverbial in the *SVA* and *SVOA* types (cf 10.10), adverbials are optional: they may be added to or removed from the clause without affecting its acceptability and without affecting the relations of structure and meaning in the rest of the clause.

(ii) Other syntactic potentialities depend crucially on the type of adverbial. At the most general level, the adverbial may be characterized negatively: it does not have the syntactic features listed for the other clause elements (cf 10.6ff).

(d) SEMANTIC PROPERTIES

The adverbial refers to the circumstances of the situation (adjunct and subjunct), comments on the form or content of the clause (disjunct), or provides a link between clauses (conjunct). A more specific semantic characterization relates to the semantic subtypes of adverbials (cf Chapter 8 and 15.24ff).

Note The term 'adjunct' is sometimes applied by others to all types of adverbial.

10.10 **Obligatory adverbials: subject-related and object-related adverbials**

Obligatory adverbials are a subclass of predication adjuncts (cf 8.27) that belong to the *SVA* and *SVOA* types. Inasmuch as they are obligatory, they are central elements of the clause (cf 2.13), part of the clause nucleus. They may be adverb phrases, prepositional phrases, or adverbial clauses. In 10.11 we suggest that some obligatory adverb phrases and prepositional phrases may be analysed as complements, belonging to the *SVC* and *SVOC* types.

Obligatory adverbials are commonly required as complementation for the verb *BE* in the *SVA* type, but they are also found as complementation for other verbs. The adverbials in this type are subject-related. Many are space adjuncts that designate the position of the referent of the subject:

Your children are *outside*.
Our car isn't *in the garage*.
We are now living *in a small village*.
The plane's *off the ground*.
Dorothy is remaining *at Oxford*.
Sam is staying *at a nearby motel*.
Your scarf is lying *on the floor*.
The road begins *in Denver*.

Some express other types of space relations:

We got *off the train*.
We all got *into my car*.
I stole *into her room*.
All roads lead *to Rome*.
The lawn goes *all the way around the house*.
The hills extend *from here into the next county*.

Others express metaphorical extensions of space relations:

They're *into yoga*. ['are keen on yoga'] (informal)
We got *into a heated argument*.
He's *off cigarettes*.

Time adjuncts commonly cooccur with an eventive subject (cf 10.25):

Their holiday extended *through the summer*.
The next meeting is *on Monday*.
The last performance was *at eight o'clock*.
The play lasts *for three hours*.

On the conditions for omitting the prepositions in the last three examples, cf 9.40ff.

We briefly exemplify other semantic types of obligatory adverbials in the *SVA_s* type:

The two eggs are <i>for you</i> .	[recipient, 9.46]
The drinks are <i>for the journey</i> .	[purpose, 9.45]
If fruit prices are higher this year, it's <i>because of the bad harvest</i> .	[reason, 9.44]
Transport to the mainland is <i>by ferry</i> .	[means, 9.49]
Entrance was <i>by special invitation only</i> .	[means]
Payment is <i>by cash only</i> .	[means]
Melvin's main interest is <i>in sport</i> .	[stimulus, 9.51]
Jack and Nora are <i>with me</i> .	[accompaniment, 9.52]
The painting was <i>by an unknown artist</i> .	[agent, 9.50]
How much is this jacket? It's <i>£60</i> .	[measure, 8.9]

The connection of subject-related adverbial with subject is parallel to that of subject complement with subject:

Ronald is *off cigarettes*. [S V A_s]
Ann is *happy*. [S V C_s]

Similarly, the connection of object-related adverbial to direct object parallels that of object complement with direct object:

We kept Ronald *off cigarettes*. [S V O_d A_o]
We kept Ann *happy*. [S V O_d C_o]

Here are examples of object-related adverbials:

I put the kettle *on the stove*. ['The kettle is now on the stove.']
They are placing the blame *on us*.
I'm keeping most of my money *in the bank*.
I stuck the wallet *in the drawer*.
He set the typewriter *on the table*.
You should have your hands *on the wheel*.
He directed his speech *at the workers*.
She wants the payment *in dollars*.

Like optional adverbials of the same semantic types, most obligatory adverbials can be questioned with *wh*-interrogative adverbials such as *where*,

when, how long, why. The exceptions include the metaphorical extensions of space relations, but also the semantic relations of recipient, means, agent, stimulus, and accompaniment.

Note [a] In certain instances, a verb of motion is implied before the obligatory adverbials:

She asked them *in*. Truth will *out*. I let the cat *out*.
I'll show you *out*. I want you *inside*.

The construction with the intransitive verb is common in some varieties of colloquial AmE and Scottish English, especially with *want*:

The dog wants *out*. I want *off* at Sixth Street.

[b] The obligatory manner adverbial with *behave* in *He's behaving badly* is related to the subject, though we do not have a corresponding sentence with the copula (**He is badly*) because of the adverb form. We similarly lack corresponding sentences when the prepositional phrase begins with directional *into*, as in *We all got into my car*, though we have the metaphorical informal *They're into yoga*. Compare also the metaphorical *They're on to his machinations* ['aware of'].

[c] The obligatory manner adverbial in *They treated him badly* seems to be related both to the subject ('They are behaving badly.') and to the object ('He is in a bad way.').

Gradience and multiple analysis

Prepositional phrases and adverbs as complement

10.11 Some clause structures and clause elements can be analysed in more than one way. In this and the following sections we examine instances that are best treated through gradience and multiple analysis (cf 2.60f).

The distinction between obligatory adjunct and complement is not clear-cut for all prepositional phrases. Some prepositional phrases are semantically similar to adjective or noun phrases functioning as complement:

<i>They were out of breath.</i>	~ <i>They were breathless.</i>
<i>That is of no importance.</i>	~ <i>That is unimportant.</i>
<i>He is under suspicion.</i>	~ <i>He is a suspect.</i>
<i>She is in good health.</i>	~ <i>She is healthy.</i>
<i>They are not at ease.</i>	~ <i>They are not relaxed.</i>

More importantly, such prepositional phrases can be coordinated with, or placed in apposition with, adjective phrases that undoubtedly function as complement:

She is young and *in good health*.
They were *out of breath* and extremely tired.
They are not *at ease*, ie not relaxed.

Furthermore, unlike clear instances of obligatory adjuncts, they can be used as complementation for copular verbs other than BE, a characteristic of adjective phrases functioning as subject complement:

They appear *out of breath*.
That seems *of no importance*.
She feels *in good health*.

Here are other examples of prepositional phrases functioning as subject complement:

They are *in love*.
We're *over the worst*.
The demonstration got *out of hand*.
He feels *at home*.
That child seems *in trouble*.
I don't feel *up to it*.
The house seems *in good condition*.
He sounds *in great danger*.

We similarly find prepositional phrases functioning as object complement:

They put me *at my ease*. ['I'm at my ease.']
I don't consider myself *at risk*.
He didn't feel himself *at home*.
She didn't want me *in any danger*.
He imagined himself *on the point of death*.
I found him *in trouble*.

Some adverbs can also be complements:

The milk seems *off*. ['sour'] (informal)
The performance is *over*.
In technology we are *ahead*.
I am *behind* in my rent.
The television is still *on*.
He imagined himself *ahead*.
I declare this meeting *over*.
They let us *off*.

The adverbs and prepositional phrases that function as complement are metaphorically related to space adverbials. Unlike the latter, however, they cannot be questioned by adverbial *where*. Contrast in this respect:

A: Where are they? B: { They're *out of town*.
*They're *out of breath*.

On the other hand, *how* may be used in some instances to question these complements, as it is for adjective phrases functioning as complement:

A: How does she feel? B: { She feels *very happy*.
She feels *in good health*.

Note [a] Speakers may vary in particular instances as to whether a copular verb other than BE is acceptable; for example, in *I'm on time* (cf: *I'm early*) or *You're on your own* (cf: *You're alone*). Contrast: (?) *I seem on time* and, with *look* as a copular verb, (?) *You look on your own*.

[b] *Off* in *The milk is off* has moved into the adjective class for those who accept its premodification by *very*.

[c] There may be semantic differences between prepositional phrases and parallel adjective phrases. For example, *She is healthy* suggests a more permanent condition than *She is in good health*.

Particles and clause types

10.12 We have so far considered the verb element as realized only by a verb phrase.

That assumption requires us to analyse [1] as SVA, with *looked* as verb and *into the recent complaints* as adverbial:

The board looked into the recent complaints. [1]

But there are also grounds for analysing *looked into* as the verb, parallel to *investigated in*:

The board investigated the recent complaints. [2]

In that case *the recent complaints* would be direct object in both [1] and [2]. One of the reasons for the alternative analysis is the possibility of making *the recent complaints* the subject of a corresponding passive clause:

The recent complaints were looked into by the board. [1a]

Another is that *the recent complaints* can be questioned by a *what*-question, whereas *into the recent complaints* cannot be so questioned:

What did the board look into?

*What did the board look?

This alternative analysis views combinations of verbs and particles (whether the particles are prepositions or adverbs) as multi-word verbs. Examples can be found for six of the seven major clause types, the exception being type SVOA. We here give an example of each type, with the verb element (sometimes discontinuous) indicated in italics:

- (1) SV The soldiers *gave in*.
- (2) SVO Randolph is *paying for* the meal.
- (3) SVC It *turned out* a huge success.
- (4) SVA: We are *putting up* at a motel.
- (5) SVOO They *spoke to* us *about* the problem.
- They *provided* her *with* everything she needed.
- (6) SVOC They *looked on* me *as* their role model.
- They *mistook* him *for* the new supervisor.

For this alternative analysis, cf 16.2ff.

- Note [a] A similar multi-word analysis can be posited for verb-plus-adjective combinations (*make clear, cut short*) and for combinations of verb plus noun phrase plus preposition (*make fun of, put a stop to*) (cf 16.17, 16.58). Compare also *take a look at, give a jump* (10.30).
- [b] Some particles provide obligatory complementation for the verb in the SV type, in that the verb otherwise cannot be used intransitively (*make up, give in*). Others are required for the SVO type (*look at, listen to*). Similarly, while *consider* can be used with or without the particle *as* in the SVOC type – *I consider them (as) acquaintances* – other verbs require a particle for this type, eg: *regard as, mistake for*. In a pattern with close analogies (cf 16.56f), a few verbs in the SVOO type have alternatives in which one of the objects requires a particle: *She blamed us for the failure, She blamed the failure on us*.
- [c] In a sentence such as *I won't put up with such nonsense*, the multi-word verb is *put up with* and is monotransitive under this analysis, *such nonsense* being a direct object. In *They put the mistake down to my inexperience*, the analysis is less clear. We might consider the multi-word verb to be *put down to*, in which case the verb is ditransitive with two objects. We can support that analysis by noting that *wh*-pronominal questions apply for both noun phrases: *What do they put down to my inexperience?*; *What do they put the mistake down to?* On the other hand, only the first noun

phrase can be made subject of a corresponding passive: *The mistake was put down to my inexperience*. Furthermore, the indirect object in a ditransitive construction normally has personal reference, the exceptions occurring only when it takes an affected role (cf 10.32), but here neither noun phrase is personal. If we still wish to treat *put down to* as a multi-word verb, we must consider both noun phrases as direct objects; we should perhaps do the same for *They ascribed the mistake to my inexperience*, ascribe to being the multi-word verb, since both noun phrases here too may be questioned by *what*.

Extent and measure phrases: object or adverbial

10.13 Noun phrases of measure after certain verbs denoting measure and phrases of extent in space are indeterminate between direct object and adverbial:

EXTENT	MEASURE
He ran <i>a mile</i> .	It costs <i>ten dollars</i> .
I hobbled <i>a few feet</i> .	In length it measures <i>seven feet</i> .
She jumped <i>ten feet</i> .	It weighed <i>almost a ton</i> .

Both types do not generally permit the passive, but we occasionally find the extent phrase as passive subject in a generic sentence:

A mile can't be run in two minutes.

Both types allow adverbial questions:

How far did he run? *How much* does it cost?

But the measure phrases can also be questioned by *what*:

What does it cost?

The adverbial question indicates that the structure is SVA. On the other hand, the pronominal question and the possibility of passivization are indications that the structure is SVO. One further difference between the two types is that the measure phrases are obligatory complementation.

- Note [a] If the phrases other than those of extent follow motion verbs, passivization is generally possible and the phrases can only be questioned by *what*; the structure is therefore SVO (cf 10.27):

The French team climbed *the mountain*. ~ The mountain was climbed by the French team.

In some cases, passivization is possible only if the agentive *by*-phrase is absent:

Once that corner was turned, the road was easy to drive on.

- [b] The indeterminacy applies also to some clauses in the SVOO pattern which allow both the *What* and *How much* questions, though they also allow the passive:

She charged me *twenty dollars*. I paid her *three pounds*.

In *I bet him a large sum that the horse would win*, we have either three objects (the first of which is O₁) or two objects and an adverbial (*a large sum*).

Middle verbs

10.14 A small group of apparently transitive verbs, the most common of which is *have*, normally occur only in the active. They are all stative relational verbs, and therefore normally do not occur in the progressive (but cf Note [c]):

Jack doesn't *possess* a life insurance policy. [*A life insurance policy isn't possessed by Jack.]

They *have* a small house.
 Dennis *lacks* confidence.
 Will this course *suit* them?
 This dress doesn't *become* you.
 The coat doesn't *fit* me.
 Five times six *equals* thirty.

Because of their other characteristics (cf 10.7) these could be considered transitive verbs complemented by a direct object. Notice, for example, that the noun phrase following the verb requires the objective form in pronouns that have that form. On the other hand, the verbs are sometimes treated as a special class termed MIDDLE VERBS. The final element may then be assigned a general term such as VERB COMPLEMENT. The same analysis may be extended to clauses that contain obligatory measure phrases (cf 10.13).

Note [a] For most speakers, *resemble* is a middle verb; for some it can occur in the passive:

(?)Geoffrey is resembled by his eldest child.

[b] *Strike*... as in *She struck me as happy* and *consist of* in *The group consists of ten men and eight women* cannot occur in the passive, and therefore may also be considered middle verbs.

[c] *Marry* is a middle verb in the sense 'enter into a marriage', but it is dynamic and can therefore occur in the progressive:

My sister is marrying Ron.

Marry in the senses 'give in marriage' (more usually *marry off*) or 'perform the marriage ceremony for' is a transitive verb occurring in the passive:

David and Judith are marrying off their eldest son next week.

Father Brown will be marrying Ron and Joan.

Adverbial forms as subject

10.15 The subject is normally realized by a noun phrase or a nominal clause. In certain restricted contexts (all informal) prepositional phrases, adverbs, and adverbial clauses – all of which normally realize the adverbial element in the clause – function as subject. Two conditions allow this use of adverbials:

- (i) the adverbial is a fragment of an understood clause (cf 15.16), or
- (ii) the sentence can be related to one with *prop it* (cf 10.26):

Slowly is exactly how he speaks. ['Speaking slowly is exactly how ...']

Out on the lake will be splendid. ['A trip out on the lake will be splendid']

Whenever you are ready will be fine. ['It will be fine whenever ...'];

cf: *Sunday will be fine*, 10.26]

Will after the show be soon enough?

Because Sally wants to leave doesn't mean that we have to.

Note [a] An adverb may be subject in the stereotyped construction with the predicate *does it*:

Carefully
Slowly
Gently } *does it.*

Easy may be subject in this construction too; although it has the same form as the adjective, it is presumably an adverb in this stereotyped construction. Compare *easy* in other stereotyped constructions: *Easy come, easy go; Take it easy; Go easy on ...*

In this construction we cannot substitute a prepositional phrase (**With great care does it*) or change the form of the verb (**Carefully did it*).

[b] *Today, yesterday*, etc regularly function as subject. But these are on the gradient from adverb to noun. Clauses such as *Today will be fine* illustrate blurring of nominal and adverbial functions.

The sentence is ambiguous between 'Today, the time you stipulated, will be a suitable time' and 'The weather will be fine today'.

Subject complement or verbless clause

10.16 There is a gradient relating the functional categories of complement and adverbial. The copula at its purest, *ie* a verb having merely a linking function, is the verb *BE*. Other copular verbs combine pure linking function with other meanings. For example, *become* has a resultative meaning, *grow* (*He grew angry*) usually adds a notion of gradual change, and *look* (*She looked happy*) adds a notion of inference from appearance.

The element following the verb is clearly a complement if the verb can acceptably be replaced by *be* with the final element retaining its sense and if the verb cannot be intransitive. Thus *very quiet* in *He became very quiet* is a complement because we can have *He was very quiet* and we cannot have **He became*. The final element is a complement also when the verb cannot be intransitive in the same sense. Thus *very quiet* in *He grew very quiet* is a complement, since we cannot have *He grew* in the same sense.

At the other extreme of the gradient, the final element is a verbless clause with adverbial status where the independence of the construction is marked by intonation or punctuation:

He waited, *anxious for a reply*. ['He waited', 'He was anxious for a reply.']

She was standing, *a picture of innocence*.

Here, we can substitute *be*, but the verb retains its full sense without the final element. The adverbial status of the final element is shown by the possibility of omitting it without affecting the acceptability of the sentence. Adverbial status is confirmed when the element can readily be fronted:

Anxious for a reply, he waited.

Along the gradient from that extreme, we find similar instances without intonation or punctuation separation:

He died *a poor man*. ['He was a poor man when he died.']

They married *young*.

He came in *drunk*.

They parted *good friends*.

Further along the gradient we find greater collocational restrictions between the final element and the verb, *ie* fewer adjective or noun phrases can provide complementation for the verb, showing a closer connection between the final element and the verb. The first set readily allows omission of the final element without affecting the meaning of the verb:

The fire is burning *low*.

The sun shone *bright*.

He blushed *scarlet*.

The door banged *shut*.

In the second set, complementation of the verb is more usually required in the same sense:

The weather is continuing *mild*.
 They are pleading *guilty*.
 This detergent washes *whiter*.

We come next to instances where the verb cannot be intransitive, at least in the same sense. These are more clearly copular verbs, with the final element as subject complement. Some verbs are restricted in the complements they allow, restricted either syntactically (to adjective phrases only or to noun phrases only) or collocationally (to a relatively few lexical items) or in both respects:

Jane will make a *good doctor*.
 The children are going *hungry*.
 They turned *conservative*.
 Bob's explanation doesn't ring *true*.
 Your hands feel *cold*.
 The room smells *musty*.
 Mary fell *silent*.
 Dan's hair is wearing *thin*.
 The well ran *dry*.

Some verbs are somewhat less restricted, though noun phrases are less usual in AmE:

She seemed the *right choice*. [also: *She seemed to be the right choice*.]
 Max appears *upset*. [also: *Max appears to be upset*.]
 Nora looked *sober*.

The verbs *become* and *remain* are closest to the pure copula in that they impose no restrictions on the choice of the complement.

- Note [a] In this section we are concerned with adjective and noun phrases functioning as complement or as adverbial. The distinction between adjective and adverb is discussed in 7.6ff.
 [b] In some idiomatic collocations the final element may be considered a complement even though we cannot readily replace the verb with *be* and retain a similar sense-relationship; for example, *His jokes fell flat*.
 [c] Verbless adverbial clauses realized solely by adjective phrases can follow subject complements (type SVC):

They are happier *free*. He will be no use *dead*.

They can also follow other clause types:

We took a swim <i>naked</i> .	} [type SVO]
She ran the business <i>single-handed</i> .	
She gave us our coffee <i>black</i> .	[type SVOO]
He came home <i>miserable</i> .	[type SVA]
They sent him home <i>sober</i> .	[type SVOA]

While the implied subject of the verbless clause is usually the subject of the superordinate clause, it can also be the direct object, as two of these sentences demonstrate ('Our coffee was black', 'He was sober').

[d] The verbless clause can often be preposed, a further indication of its adverbial status (cf further 15.58ff).

He drove the damaged car home *completely undismayed*.

~ *Completely undismayed*, he drove the damaged car home.

[e] In the rare pattern SVO_C, we have a combination of optional indirect object with subject complement: *He made her a good husband* ['He was a good husband for her.'].

Order of clause elements

- 10.17 The order of the clause elements is relatively fixed, in general following the sequence in the designation of the clause types (SVC, SVOO, etc). But a number of factors may interfere with the order:

(a) Optional adverbials may intervene between the elements in the clause pattern. Although most multi-word adverbials occur finally, certain types of adverbials realized by adverbs or short prepositional phrases regularly occur medially (cf 8.23); and initial position is typical for conjuncts:

Does it *often* rain in London?
 You have *perhaps* heard the story before.
 They may *in fact* be at home now.
On the other hand, we aren't going either.
In any case, why should I make the first move?

(b) The basic order is that of the canonical declarative clause. But the order may be affected by variations in the syntactic form of the clause:

(i) In *yes-no* questions, the operator precedes the subject (cf 11.5):

Have [op] you [S] heard from Roger?

(cf 12.49f for elliptical questions such as *You seen Roger?*)

(ii) In *wh*-questions, the questioned part (the *wh*-interrogative or the whole phrase of which it is a constituent) and the operator precede the subject, if the questioned part is not identical with the subject (cf 11.14ff):

What [O_d] *did* [op] *they* [S] tell you?
Where [A] *are* [op] you [S] staying?

(iii) In relative clauses, the relative word or the whole phrase of which it is a constituent precedes the subject if it is not itself the subject (cf 17.10ff):

I know the food *that* [O_d] *they* [S] like.
 Can you please show me the room *where* [A] *the lecture* [S] is being held?
 This is the friend *about whom* [A] *you* [S] have heard so much.

Contrast, with the relative item as subject:

Let me introduce you to someone *who* [S] has been wanting to meet you for a long time.

(iv) In exclamative sentences, the *what*- or *how*-phrase precedes the subject, except in the rare instances where the *what*-phrase is identical with the subject (cf 11.31f):

What a good time [O_d] *we* [S] had! *How polite* [C_s] *they* [S] are!

(v) Second-person imperative sentences normally have no expressed subject (cf 11.24ff):

Show [V] *me* [O_i] *your paper* [O_d] *now* [A].

(c) Considerations of informational highlighting and emphasis may prompt the movement of elements from their normal position, usually to initial or final position (cf 18.20ff):

That question [O_d] I won't answer. *In* [A] you go.
Sheila wants to leave, and so does *Henry* [S]. Here comes *Ethel* [S].

(d) A longer element in the predication, particularly if it is a clause, tends to be placed after a shorter element (cf 18.37f):

The discovery has made *possible* [C_d] *new techniques for brain surgery* [O_d].
She told *him* [O_i] *calmly* [A] *what she thought of him* [O_d].

(e) It is stylistically preferable for the part following the verb to be longer than the part preceding it (cf 18.39):

A petition [S] was circulated [V] *asking for a longer lunch break* [S].

In this example the subject is *a petition asking for a longer lunch break*, but the postmodifier of *a petition* is placed after the verb.

- Note [a] A study of part of the Brown Corpus revealed that in 9 out of 10 cases the subject was immediately followed by the verb in clauses containing both S and V, and the verb was immediately followed by the direct object in clauses containing both V and O_d.
[b] For the alternative BrE order in which the direct object precedes the indirect object (eg: *She gave it me*), cf 18.38 Note [a].

Semantic roles of clause elements

Participants

- 10.18 In terms of meaning, every clause describes a situation in which a number of participants are involved. By PARTICIPANTS we understand entities realized by noun phrases, whether such entities are concrete or abstract. Thus, we have three participants in:

John found a good spot for the magnolia tree.

The sentence *The child tore my book* contains a verb describing the nature of the action, a subject denoting an agentive participant (the agent or doer of the action), and a direct object denoting an affected participant.

Clause elements denote semantic roles in the situation apart from the participants. Thus, the verb – or the copular verb in combination with a complement – is the primary device for distinguishing situation types as stative or dynamic and as subtypes of these two types (cf 4.27ff and the summary in Fig 4.27). The subject complement and the object complement denote attributes of the subject and direct object respectively. Adverbials denote such circumstances of the situation as time, place, and manner of action, express the speaker's evaluation of the situation, or provide logical connections across clauses or sentences.

Analysis of participant roles has not achieved a general consensus, nor has it fully explored all distinctions. Our description must therefore be considered tentative.

- Note [a] The term CASE is often used for participant roles. This semantic use of the term is to be distinguished from its use as a grammatical category realized (usually through inflections) in varying forms of nouns and pronouns (cf 5.112ff, 6.1ff).
[b] We do not deal in this chapter with the semantics of adverbials or of subordinate clauses in general. See Chapter 9 for prepositional phrases, Chapter 8 for adverbials, and Chapters 14 and 15 for subordinate clauses.

Agentive, affected, and recipient roles

- 10.19 The most typical semantic role of a subject in a clause that has a direct object is that of the AGENTIVE participant: that is, the animate being instigating or causing the happening denoted by the verb:

Margaret is mowing the grass.

The most typical role of the direct object is that of the AFFECTED participant: a participant (animate or inanimate) which does not cause the happening denoted by the verb, but is directly involved in some other way:

Many MPs criticized *the Prime Minister*.
James sold *his digital watch* yesterday.

The most typical role of the indirect object is that of the RECIPIENT participant: ie of the animate being that is passively implicated by the happening or state:

I've found *you* a place. We paid *them* the money.

- Note [a] Other terms used for AFFECTED are PATIENT and OBJECTIVE. Another term for RECIPIENT is DATIVE.
[b] Some distinguish a benefactive or beneficiary role ('intended recipient') from the recipient role:
I've found *you* a place. She made *her son* a scarf.
The benefactive indirect object is paraphrasable by a *for*-phrase:
I've found a place *for you*. She made a scarf *for her son*.
The two roles can cooccur in the same clause if the benefactive role is expressed by a *for*-phrase:
She gave *me* a scarf *for her son*.
[c] Although *I've found a place for the magnolia tree* and *I've found a place for Mrs Jones* appear to be equivalent utterances, only the second can be transformed into a clause with indirect object: *I've found Mrs Jones a place*, not *?I've found the magnolia tree a place*. This is because the magnolia tree is not animate and therefore does not qualify for the recipient role (cf also 8.32).

Attribute

- 10.20 The typical semantic role of a subject complement and an object complement is that of ATTRIBUTE. We can distinguish two subtypes of role for the attribute: identification and characterization:

IDENTIFICATION:

Kevin is *my brother*.
Brenda became *their accountant*.
His response to the reprimand seemed *a major reason for his dismissal*.
Henry's room is *the one next to mine*.

CHARACTERIZATION:

Dwight is <i>an honest man</i> .	The soup is <i>too hot</i> .
Martha was <i>a good student</i> .	Daniel remains <i>helpful</i> .
The operation seemed <i>a success</i> .	

Three syntactic features are associated with this semantic distinction:

(a) Only identification attributes normally allow reversal of subject and complement without affecting the semantic relations in the clause, if the copula is BE:

Kevin is *my brother*. ~ *My brother* is Kevin.

If the copula is other than BE we can test for reversal by substituting BE.

(b) Only characterization attributes can also be realized by adjective phrases.

(c) Identification attributes are normally associated with definite noun phrases. Noun phrases used as characterization attributes are normally indefinite.

The same semantic distinction applies to object complements. The subject-complement reversal cannot take place, but we can test for its possibility by forming a clause from the object and the complement.

I made Maurice *my assistant*.
 ~ Maurice is *my assistant*.
 ~ *My assistant* is Maurice.

IDENTIFICATION:

They called their daughter *Edna*.
 She considers Susan *her role model*.
 We made John *our representative*.

CHARACTERIZATION:

The teacher called their daughter *a good student*.
 I consider the operation *a success*.
 She made them *comfortable*.

We can further subdivide attributes into current or existing attributes (normally with verbs used statively) and resulting attributes, resulting from the event described by the verb (with verbs used dynamically) (cf 16.21f). Here are examples of the distinction for both subject and object complements:

CURRENT ATTRIBUTE:

He's <i>my brother</i> .	She remained <i>silent</i> .
He seems <i>unhappy</i> .	I want my food <i>hot</i> .
We lay <i>quiet</i> .	I prefer my coffee <i>black</i> .
We felt <i>cold</i> .	They consider me <i>their closest friend</i> .

RESULTING ATTRIBUTE:

We became <i>restless</i> .	They elected him <i>president</i> .
He turned <i>traitor</i> .	The heat turned the milk <i>sour</i> .
He felt <i>ill</i> .	He drives me <i>mad</i> .
She'll make <i>a good worker</i> .	

Note [a] If the identification attribute is a noun phrase with an optionally omitted determiner, subject-complement reversal cannot occur:

Joan is *president of the company*.

Contrast:

Joan is *the president of the company*. ~ *The president of the company* is Joan.

[b] A subject complement may be realized by a genitive noun phrase:

That writing must be <i>Tom's</i> .	[subjective genitive]	[1]
That newspaper is <i>mine</i> .	[possessive genitive]	[2]
The idea was <i>Kathy's</i> .	[genitive of attribute]	[3]

The phrases express various genitive meanings (cf 5.116). In [1] the complement has the agentive role (cf: *That writing must be by Tom*), in [2] and [3] the role of recipient (cf: *That newspaper belongs to me*; *Kathy had that idea*).

[c] The notion of characterization extends to various measure and extent phrases:

Now she is <i>thirteen (years old)</i> .	The paperback is <i>three dollars</i> .
He is <i>six foot (tall)</i> .	The envelope is <i>one ounce</i> .

Similar to these are expressions that denote time or period:

It's <i>five o'clock</i> .	I'm <i>your age</i> .	The house is <i>seventeenth century</i> . ['seventeenth-century style']
----------------------------	-----------------------	---

Subject as external causer, instrument, and affected

10.21 We now turn to the roles of the subject, apart from its typical role as agentive (cf 10.19).

The subject sometimes has the role of EXTERNAL CAUSER; that is, it expresses the unwitting (generally inanimate) cause of an event:

The avalanche destroyed several houses. *The electric shock* killed him.

It may also have the role of INSTRUMENT; that is, the entity (generally inanimate) which an agent uses to perform an action or instigate a process:

A stone broke his glasses.
A car knocked them down.
The computer has solved the problem.

With intransitive verbs, the subject also frequently has the AFFECTED role elsewhere typical of the direct object:

Jack fell down (accidentally). *The pencil* was lying on the table.

The term 'affected' has been extended generally to subjects of copular verbs:

The pencil was on the table.

But we can make some further distinctions within the affected role for subjects according to whether the subject complement as attribute identifies or characterizes (cf 10.20). Thus, the subject is IDENTIFIED in [1] and CHARACTERIZED in [2]:

<i>Kevin</i> is my brother.	[1]
<i>Martha</i> was a good student.	[2]

The assignment of the affected role to the subject of an intransitive verb seems clearest when there is a corresponding transitive verb with which the same noun phrase is a direct object in the affected role:

I am frying <i>the fish</i> . [<i>O_d</i> as affected]	[3]
<i>The fish</i> is frying. [<i>S</i> as affected]	[3a]

We can also make [3] passive:

The fish is being fried. [S as affected] [3b]

But there is a difference between [3a] and [3b]: [3a] focuses on the process, without implying (as in the passive) human agency. In being given the subject function, *the fish* acquires a status that appears to assign it some responsibility for the process. Hence, there is greater constraint on what can appear as subject in the intransitive construction than in the corresponding passive construction. Contrast:

We raised *an alarm*.
 ~ *An alarm* was raised.
 ~**An alarm* rose.

In certain intransitive constructions, an adverbial is generally required:

Her books translate *well*. The sheets washed *easily*.
 The sentence reads *clearly*. My teapot pours *without spilling*.
 My shirts have dried *very quickly*.

The adverbial imputes a characteristic to the referent of the subject ('Her books are of the type that are good in translation'). The construction therefore does not correspond to a transitive construction. For example, *Tom translates her books well* imputes the characteristic to Tom and not to the books ('He is a good translator of her books'). The same imputation applies even when an adverbial, though usual, may be omitted. Thus *My books sell well* implies that the selling well is not being necessarily ascribed to the effect of an agent of the selling.

In some cases the *SV* clause may diverge from a corresponding *SVO_a* clause when an optional adverbial is added if an agent is required only for the initiation of the action:

The water is boiling *vigorously*.
 ≠ Someone is boiling the water *vigorously*.
 The water has been boiling *for five minutes*.
 ≠ Someone has been boiling the water *for five minutes*.

The boundary between agentive and affected subjects depends on whether an element of causation or volition is present. Some verbs allow both interpretations: *Suddenly he jumped* might suggest an involuntary action (eg after being stung by a wasp) or a deliberate one. A purpose adverbial (eg: *in order to attract attention*) or a volitional adverbial (eg: *deliberately, on purpose*) can be added only to the agentive type. The subject must be agentive in, for example, *Jack fell down on purpose*.

One of the reasons for distinguishing the roles is that we generally cannot coordinate subjects with different roles. We can say *The gamekeeper wounded him* (agentive subject) and *A gun wounded him* (instrumental subject), but not **The gamekeeper and a gun wounded him*. Coordination is possible if two events are involved, as in the combination of external causer and agentive in *Hurricanes and marauding bands devastated the region (at different times)*. On the other hand, when an instrument or external causer is the subject of a transitive verb it acquires metaphorically some notion of agency. We can

therefore occasionally find combinations where the same event seems to be involved: *Clumsy musicians and poor instruments (together) spoiled the performance of the symphony*.

Note

- [a] The role of external causer has also been termed 'force'.
 [b] The tendency towards a metaphorical perception of agentiveness in nonagentive subjects, as used in everyday language, is conspicuous in examples such as *Guns kill*; *Matches start fires*; *A car drove by*; *The door refused to open*.
 [c] A different analysis allows more than one role for one element and allows for the repetition of the same role in one clause. In one such analysis, the external causer and affected roles can be combined with the agentive role. Here are examples of such an analysis:
 Hurricanes [external causer] devastated the region [affected].
 Marauding bands [agentive/external causer] devastated the region [affected].
 The soldiers [agentive/external causer] paraded.
 The warden [agentive/external causer] paraded the prisoners [agentive/affected].
 Where two agentives cooccur in the same clause, the first has sometimes been distinguished as the 'initiator' of the action.
 [d] The situation described with an agentive subject may be the result of an implied action: *She blew a fuse* ['She did something which caused a fuse to blow.'], *He burnt the food*.
 [e] Animate subjects of copular verbs followed by an emotive complement might be assigned the role of 'experiencer':
 The workers are angry. He is unhappy.
 The same applies to animate subjects of certain transitive verbs used in nonvolitional sense:
 I've hurt my knee. ['My knee is hurt.']
 Here *I* is experiencer and *my knee* affected.
 [f] In *The kettle's boiling*, the affected subject is related by metonymy to *The water's boiling*.

10.22 There is sometimes a regular relation, in terms of clause function, between transitive verbs expressing CAUSATIVE meaning and corresponding intransitive verbs or adjectives. In the first three groups below, the subject may be agent, external causer, or instrument; in the last group, it is agent.

- | | |
|---|---------------------------|
| (i) <i>SVO</i> | <i>SV</i> |
| Tom is cooking the dinner. | The dinner is cooking. |
| Geoffrey/The wind/My key opened the door. | The door opened. |
| Brenda is improving her writing. | Her writing is improving. |
| (ii) <i>SVO</i> | <i>SV</i> |
| Someone raised an arm. | An arm rose. |
| The frost has killed the flowers. | The flowers have died. |
| My axe has felled that tree. | That tree has fallen. |
| (iii) <i>SVO</i> | <i>SVC</i> |
| They have dimmed the lights. | The lights became dim. |
| The sun (almost) blinded him. | He (almost) went blind. |
| His manner angered me. | I got angry. |
| (iv) <i>SVO</i> | <i>SV</i> |
| The sergeant paraded the company. | The company paraded. |
| I am exercising my dog. | My dog is exercising. |

While in many cases (Group (i)) the identical verb performs both transitive and intransitive roles without a change of form, in other cases (Group (ii)) the intransitive verb has to be replaced by another verb, which may resemble

it in spelling and pronunciation. In Group (iii), an adjective X is matched by a causative verb (of the same, or slightly different, form) with the meaning to 'cause to be X'. Group (iv), on the other hand, shows that the subject of an intransitive verb may itself be agentive, in which case the switch to a causative construction may entail changing the role of the subject to affected. Thus, *He paraded the soldiers* does not necessarily imply any volition on the part of the soldiers; rather, it suggests the opposite.

In Groups (i-ii) the intransitive subject of the SV type generally has the affected role. In the sentence *The dinner is cooking*, however, *the dinner* is resultant, as in the object of *Tom is cooking the dinner* (cf 10.28). Other examples of resultant subject:

The cake is baking. *A new type of camera is developing.*

Note There are some triplets showing a combination of the relations in Groups (i) and (ii); eg: *open* (adjective); *open* (intransitive verb) [= 'become open']; *open* (transitive verb) [= 'cause to be open'].

Recipient subject

10.23 The subject may have a recipient role with verbs such as *have*, *own*, *possess*, *benefit* (from), as is indicated by the following relation:

Mr Smith has given his son a radio. [So now his son has a radio.]

The perceptual verbs *see* and *hear* also require a recipient subject, in contrast to *look at* and *listen to*, which are agentive. The other perceptual verbs *taste*, *smell*, and *feel* have both an agentive meaning corresponding to *look at* and a recipient meaning corresponding to *see*:

Foolishly, he tasted the soup. [1]
*Foolishly, he tasted the pepper in the soup. [1a]

The adverb *foolishly* requires the agentive; hence [1a], which can only be understood in a nonagentive manner, does not make sense. *The soup* in [2] has the affected role, just as in [1]:

The soup tasted good. [2]

Verbs indicating cognition or emotion may also require a recipient subject:

I thought you were mistaken. [cf: It seemed to me you were mistaken.]
I liked the play. [cf: The play pleased me/gave me pleasure.]

Normally, recipient subjects go with verbs used statively (cf 4.28ff). Some of them (notably *have* and *possess*) have no passive form (cf 10.14): *They have a beautiful house*, but not **A beautiful house is had by them*.

Note [a] A passive form of HAVE occasionally occurs in idioms: *A good time was had by all*; *Have you ever been had?* (informal) [= tricked; also with sexual meaning]. *Possess* has a passive in *He was possessed by the fear that she would leave him*.
[b] Alternatively, subjects with perceptual, cognitive, and emotive verbs might be assigned the role of 'experiencer' (cf 10.21 Note [e]).

Positioner subject

10.24 The subject may have the role of POSITIONER with intransitive stance verbs (cf 4.23) such as *sit*, *stand*, *lie*, *live* ['dwell'], *stay*, *remain*, and with transitive

verbs related to stance verbs such as *carry*, *hold*, *keep*, *wear*. The transitive verbs are causative and the direct objects that follow them have an affected role. In this positioner role the participant is in control, but the situation is not resultative in that no change is indicated in the positioner during the period in which the situation lasts:

I have lived in London most of my life. *The hijacker was holding a revolver.*
They are staying at a motel. *He kept himself upright.*
My friend is sitting in a chair near the door.

Contrast the role of subjects in these two sentences:

Your sister [positioner] is lying on the bed. [stance]
Your book [affected] is lying on the bed. [state]

Note [a] As with the agentive type, a purpose adverbial (*to rest*) or a volitional adverbial (*reluctantly*) can be added to the positioner type.
[b] *Sit down* is a punctual verb. *Sit* may also be an action verb when it is used in the same sense as *sit down*, in which case the subject is agentive.
[c] Contrast the three uses of *hold* in these sentences:
Carol was holding a passenger's arm. [1]
They were holding the passengers against their will. [2]
Do you hold a British passport? [3]
In [1] *hold* ['keep in grasp'] is a transitive verb related to stance verbs and *Carol* is positioner; in [2], *hold* ['detain'] is an activity verb and *they* is agentive; and in [3] *hold* ['have'] is a verb denoting relation and *you* is recipient (cf 10.23). In *Mary held a New Zealand passport*, *hold* is ambiguous between the meanings in [1] and [3] and therefore *Mary* may be either positioner or recipient.

Locative, temporal, and eventive subjects

10.25 The subject may have the LOCATIVE role of designating the place of the state or action, or the TEMPORAL role of designating its time:

Los Angeles is foggy. ['It's foggy in Los Angeles.']
My tent sleeps four people. ['Four people can sleep in my tent.']
This path is swarming with ants. ['Ants are swarming all over this path.']
This jar contains coffee. ['There's coffee in this jar.']
Yesterday was a holiday. ['It was a holiday yesterday.']

Verbs following locative subjects normally have no passive or progressive form:

The bag holds seven pounds.
~*Seven pounds are held by the bag.
~*The bag is holding seven pounds.

An important role of the subject is EVENTIVE. The noun at the head of the noun phrase is commonly deverbal (cf App. I.47) or a nominalization (cf 17.51):

The match is tomorrow.
The Norman invasion took place in 1066.
The explosion caused many casualties.

The dispute over the inheritance lasted a decade.
There has been *an accident*.

Prop it subject

- 10.26 There are clauses in which no participant is required. In such cases, the subject function may be assumed by the 'prop' word *it* (cf 6.17), which has little or no semantic content.

Prop *it* mainly occurs in clauses signifying (a) time, (b) atmospheric conditions, and (c) distance:

(a) time

It's ten o'clock precisely.	It's already midnight.
It's very late.	It's Sunday tomorrow.
It's our wedding anniversary next month.	

(b) atmospheric conditions

It's too windy in Chicago.	It's getting dark.
It's very hot in here.	It was sunny yesterday.
Is it raining?	It's freezing outside.

(c) distance

It's not very far to York.
It's a long way to Denver.
It's just one more stop to Toronto.
It's only a hundred miles from here to Philadelphia.

In many cases a clause with prop *it* subject corresponds to a clause in which a locative or temporal phrase is the subject (cf 10.25). The correspondence applies for the (a) set when the subject complement refers to a period of time and an adverbial is present that is a noun phrase:

It's Sunday tomorrow.	[1]
~ Tomorrow is Sunday.	[1a]

Sentences [1] and [1a] differ from the seemingly analogous [2] and [2a]:

It's our wedding anniversary next month.	[2]
~ Next month is our wedding anniversary.	[2a]

The difference is clearer for [1a] and [2a]. In [1a] *tomorrow* is identified as *Sunday*, the latter having the function of subject complement and the role of identifying attribute. In [2a], on the other hand, *next month* appears to be a fronted adverbial with consequent subject-verb inversion ('Our wedding anniversary takes place next month', cf: *Our wedding anniversary is in January*. ~ *In January is our wedding anniversary*.)

With one type of exception, the correspondence also applies for the (b) set when an adverbial is present that is a noun phrase or a prepositional phrase containing a noun phrase:

It's too windy in Chicago. ~ Chicago is too windy.
It was sunny yesterday. ~ Yesterday was sunny.

The exception is when the verb is not a copula (for example, *rain* or *snow*):

It's raining in Manchester. ~ *Manchester is raining.

The correspondence generally applies for the (c) set:

It's not far to York.
~ York is not far.
It's only a hundred miles from here to Philadelphia.
~ Philadelphia is only a hundred miles from here.

The (c) set readily allows prepositional phrases as subject (cf 10.15):

To York is not very far.
From here to Philadelphia is only a hundred miles.

Note [a] Prop *it* has also been termed 'ambient' *it*, in accordance with the view that it has some generalized reference to the environment in a given context. Thus, we can use *it* for a more restricted environment in *It's too muddy to walk*. In clauses of time and weather the environment may be general and unspecified, but it may be specified by a locative or temporal phrase, as in *It was very chilly in my bedroom* or in some of the examples given above. Another term for prop *it* is 'expletive' *it*, the term indicating the view that this *it* merely fills a syntactic gap (that of subject) and is otherwise meaningless.

[b] On other uses of *it* as a personal pronoun, cf 6.15f. The prop subject *it* here should be distinguished from the anticipatory *it* of sentences like *It was a great pleasure to see you again* (cf 18.33ff), where it has cataphoric reference to a postponed clausal subject (*To see you again was a great pleasure*).

Locative object

- 10.27 We turn now to roles of the direct object. The most typical role of the direct object, that of the affected participant, has been mentioned in 10.19. The direct object may have a LOCATIVE role with such verbs as *walk*, *swim*, *pass*, *jump*, *turn*, *leave*, *reach*, *surround*, *cross*, *climb* (cf further examples in 9.31):

We walked *the streets*. ['We walked *through* the streets.']
She swam *the river*. ['She swam *across* the river.']
He passed *a cyclist*. ['He passed *by* a cyclist.']
The horse jumped *the fence*. ['The horse jumped *over* the fence.']

Superficially, these objects may seem to be adverbials with an omitted preposition (cf: *We stayed three days*, 9.40ff). In most cases their status as objects is clear, however, from their ability to assume subject role in a corresponding passive clause, eg: *The fence was jumped by the horse*.

Note [a] We should include here locative objects after such verbs as *occupy* and *inhabit*, where no preposition can be inserted:

We occupy *a spacious apartment*.
They had inhabited *the island* for over a century.

BrE may have a locative object after *visit*:

They are visiting *Amsterdam*.

AmE, on the other hand, restricts the direct object to personal reference, and requires *visit in* for places. In informal AmE, *visit with* is used in the meaning 'chat with':

I was *visiting with* Carol yesterday outside the bank.

[b] A related category of object consists of phrases of extent (*He ran a mile*; cf 10.13).

Resultant object

- 10.28 A RESULTANT object is an object whose referent exists only by virtue of the activity indicated by the verb:

Baird invented *television*. They are designing *a new car*.
 John has painted *a new picture*. She made *a fire*.
 I'm writing *a letter*. I baked *a cake*.

With an agentive subject and an affected object, one may always capture part of the meaning of a clause (eg: *X destroyed Y*) by saying 'X did something to Y'; but this does not apply to a resultant object: *Baird invented television* does not imply 'Baird did something to television'. Contrast the affected object in *I'm digging the ground* with the resultant object in *I'm digging a hole*.

In one type of resultant object, the activity recreates the referent:

She acted *the part of Ophelia*. They are playing *the Egmont Overture*.

- Note [a] Other terms for the resultant object are 'object of result' and 'effected object'.
 [b] We should distinguish between *I baked a cake*, where *a cake* is resultant, and *I baked some potatoes*, where *some potatoes* is affected. Contrast similarly:
 She cooked *a meal*. [resultant]
 She cooked *some carrots*. [affected]
 He's frying *an omelet*. [resultant]
 He's frying *an egg*. [affected]
 [c] In some cases it may be unclear whether the activity creates or recreates the referent:
 Janet told me *a joke*.

Cognate object

- 10.29 A COGNATE object is similar to a resultant object in that it refers to an event indicated by the verb:

Chris will sing *a song* for us. She lived *a good life*.
 They fought *a clean fight*. He breathed *his last breath*.
 He died *a miserable death*.

In this type of object, the noun head is semantically and often morphologically related to the verb. The object can therefore not be considered a participant. Its semantic function is to repeat, wholly or partially, the meaning of the verb. Most cognate objects tend to convey a rather orotund style.

The noun is generally modified. The verb and the object are then equivalent to the verb and a corresponding adverbial:

They fought *a clean fight*. They fought *cleanly*.

- Note [a] The object of *ran a race* might also be classed as a cognate object, although it is like a locative object in being replaceable by a prepositional phrase: *ran in a race*.
 [b] There are rare cases in which it is the meaning of the subject that is presupposed by the verb: *The frost froze hard*, *Day dawned*, *The wind is blowing*.

Eventive object

- 10.30 A frequent type of object generally takes the form of a deverbal noun preceded by a common verb of general meaning, such as *do*, *give*, *have*, *make*, *take*. This EVENTIVE object (cf 10.25) is semantically an extension of the verb and bears the major part of the meaning. Compare:

They are *arguing*. [verb only]
 They are *having an argument*. [verb + eventive object]

The more frequent eventive object can sometimes be related to a cognate object in that it substitutes for the major lexical meaning of the verb whereas the cognate object repeats the lexical meaning. Compare:

They *fought for a long time*. [verb + adverbial]
 They *fought a long fight*. [verb + cognate object]
 They *had a long fight*. [verb + eventive object]

The construction with the eventive object provides greater weight than the corresponding SV type, especially if there are no optional adverbials, and is often preferred to the SV construction in informal English.

Some noun heads in eventive objects are not derived from verbs. For example there is no verb *effort*, although *an effort* is eventive in *I'm making an effort*, and whereas *work* in *He did some work* is deverbal, there is no related verb for *homework* in *He did some homework*; other examples: *have a game*, *have a haircut*, *make fun (of)*, *make peace (with)*, (cf: *make war (on)*). In some instances, the verb is not normally used intransitively: *I made a mistake/an attempt/a correction*. In other instances, the combination clearly does not have the same meaning as the verb alone, eg: *make love (to)*, *take trouble (over)*, *make a difference*. In a few instances, the combination has (or may have) a passive meaning, particularly with *have*:

I had *a fright*. ['I was frightened.']
 The baby's *having a bath*. ['The baby is being bathed.']
 I'll *have a shampoo*, if I may. ['I want my hair to be shampooed.']
 He took offence at my remarks. ['He was offended by my remarks.']

Here are some common collocations of verb and eventive object where the noun heads in the object are derived from verbs:

DO	a dance	a left/right turn	a somersault
	a dive	a report	a translation
	a drawing	a sketch	some work

Verbal nouns are commonly used as objects, eg:

some cleaning	some repairing
some drawing	some sewing
some knitting	some thinking
some painting	some writing

GET a glance (at), a look (at), a shot at (informal), a view (of)

GIVE advice, an answer, a cheer, consideration (to), a cough, a cry, a definition, a description, encouragement, an explanation, help (to), a kick, a kiss, a laugh, a nod, permission, a push, a reply, a sigh, a smile, a wash, a wave

HAVE an argument, a bash (informal), a bath, a bite (informal), a chat (informal), a dream, a drink, an effect, a fight, a guess (esp BrE), a holiday (esp BrE), an influence (on/over), a lie down (informal BrE), a look (at), a meeting, a nap (informal), a quarrel, a rest, a seat, a shave, a shower, a sleep, a smoke, a swim, a talk, a taste, a walk, a wash

MAKE an accusation (against), an agreement (with), allowances (for), an attack (on), a bargain (with), a call (on), a choice, a comment, a contribution (to), a copy (of), a criticism (of), a decision, a discovery (that), an escape, a fuss, a guess, (an) inquiry (into/of), an impression (on), an improvement (on), an investigation (into/of), a note (of), an objection (to), an observation (that), an offer (that), a payment, a promise (that), a proposal (that), a recommendation (that), a reduction in, a reference to, a report (on), a request (that/for), a start, a suggestion, a turn, use of

OFFER an apology, one's resignation, a suggestion

PAY attention (to), a call (on), a visit (to)

PUT emphasis on, an end to, a question to, a stop to

TAKE a bath, a bite (informal), a breath, care (of), a dislike to, a dive, a drink, a glance (at), a guess, a look (at), a nap, (a) note (of), notice (of), offence (at), a photograph (of), pity (on), a rest, a risk, a seat, a shower, a shave, a sleep, a smoke, a swim, a vacation (esp AmE), a walk, a wash

It will be noticed that several noun phrases collocate with both *have* and *take*. In such cases, *have* is the typical British verb and *take* is the typical American verb.

Most of the subjects in clauses with an eventive object are agentive. But some are recipient (or experiencer, 10.21 Note [e]): *Bill got a view of the candidate, I had a wonderful dream, Sally took an instant dislike to the new tenant*. Others are affected: *Saul took a fall, The team has taken a beating, At the sudden noise Bob gave a jump*. The verbs *do*, *make*, *offer*, *pay*, and *put* always take agentive subjects.

- Note [a] *Have* can more easily take an affected subject than *take*: *The baby's having a bath* (also in AmE), generally not ?**The baby's taking a bath*. *Do* and *make* overlap in the eventive objects they can take, but only *do* takes -ing verbal nouns.
- [b] The verbs *vacation* (esp AmE) and *holiday* (esp BrE) are less usual than the expanded constructions.
- [c] Contrast:
- She gave a shriek. [an involuntary shriek]
 - She had a good shriek. [voluntary and for own enjoyment]
 - She did a (good) shriek. [a performance before an audience]

Instrumental object

10.31 The object may occasionally be instrumental (cf 10.21):

We employ a *computer* for our calculations.
She is playing *the piano*.
He nodded *his head*.

- Note Occasionally the notion of instrument is incorporated into the verb:
He *headed* the ball into the goal. ['He hit the ball with his head...']
He *kicked* the ball into the goal. ['He hit the ball with his foot...']
This applies to *nod*, too: *his head* in the example in the text would be implied if omitted.

Affected indirect object

10.32 The indirect object normally takes the role of recipient (cf 10.19, and Note [c] below). It occasionally takes an affected role with a few of the verbs that combine with an eventive object (cf 10.30). The most common verb in the latter construction is *give*:

She gave *me* a push. ['She pushed me.']
I gave *Helen* a nudge. ['I nudged Helen.']
We gave *the baby* a bath. ['We bathed the baby.']
I should give *the car* a wash. ['I should wash the car.']
Give *the car* a push. ['Push the car.']
Judith paid *me* a visit. ['Judith visited me.']
Derek owes *us* a treat. ['It's Derek's turn to treat us.']

The indirect object has the same role as the affected direct object in the paraphrases. Unlike the recipient indirect object, the affected indirect object is not normally paraphrasable by a prepositional phrase:

I gave *Helen* a nudge.
~ ?I gave a nudge *to Helen*.

The reason is that this type of construction is intended to focus on the nominal equivalent of the verb (*nudge* in this example) and therefore the direct object should receive end-focus (cf 18.3f).

- Note [a] In this use, *give* may be compared with *get*, *have*, and *receive* in a parallel passive sense: *I got a surprise, The car has had a polish, I received a shock*. There is also an interesting equivalence of *They gave (or shot) each other glances* and *They exchanged glances* ['They glanced at each other.'].
[b] We should include here metaphorical uses of other verbs, where paraphrases indicate that the indirect object has an affected role: *I taught him a lesson* [roughly 'I disciplined him.'].
[c] The indirect object has the role of 'comitative' ['together with'] or perhaps 'opposition' in this example:
I played *Sam* a game of chess. ['I played a game of chess with/against Sam.']

Summary

10.33 As a summary, we present in Table 10.33 over page the chief semantic functions for each clause type, with example sentences. Although, as the table shows, the semantic functions of the elements (particularly S and O_d) are quite varied, there are certain clear restrictions, such as that the object cannot be agentive; a subject (except in the passive) cannot be resultative; an indirect object normally has only two functions – those of affected and recipient. The following system of priorities generally obtains:

If there is an agentive, external causer, or positioner, it is S; if not,
If there is an instrument, it is S; if not,
If there is an affected, it is S; if not,
If there is a temporal, locative, or eventive, it may be S; if not,
The prop word *it* is S.

Naturally, in passive clauses the role of the direct or indirect object is assigned to the subject.

Table 10.33 Semantic roles

Type	S	O _i	O _d	C _s	C _o	A	Example
SVC	aff			attrib			<i>She's happy.</i>
	agent			attrib			<i>He turned traitor.</i>
	loc			attrib			<i>The Sahara is hot.</i>
	temp			attrib			<i>Last night was warm.</i>
	event			attrib			<i>The show was interesting.</i>
	it			attrib			<i>It's windy.</i>
SVA	aff					loc	<i>He was at school.</i>
	agent					loc	<i>She got into the car.</i>
	pos					loc	<i>He is lying on the floor.</i>
	event					temp	<i>The meeting is at eight.</i>
SV	agent						<i>He was working.</i>
	pos						<i>She is standing.</i>
	aff						<i>The curtains disappeared.</i>
	ext						<i>The wind is blowing.</i>
	it						<i>It's raining.</i>
SVO	agent		aff				<i>He threw the ball.</i>
	ext		aff				<i>Lightning struck the house.</i>
	pos		aff				<i>He is holding a knife.</i>
	instr		aff				<i>The stone broke the window.</i>
	recip		aff				<i>She has a car.</i>
	agent		recip				<i>We paid the bus driver.</i>
	instr		recip				<i>The will benefits us all.</i>
	agent		loc				<i>They climbed the mountain.</i>
	loc		aff				<i>The bus seats thirty.</i>
	agent		cog				<i>They fought a clean fight.</i>
	agent		result				<i>I wrote a letter.</i>
	agent		event				<i>They had an argument.</i>
	agent		instr				<i>He nodded his head.</i>
SVOC	agent		aff		attrib		<i>He declared her the winner.</i>
	ext		aff		attrib		<i>The sun turned it yellow.</i>
	instr		aff		attrib		<i>The revolver made him afraid.</i>
	recip		aff		attrib		<i>I found it strange.</i>
SVOA	agent		aff			loc	<i>He placed it on the shelf.</i>
	ext		aff			loc	<i>The storm drove the ship ashore.</i>
	instr		aff			loc	<i>A car knocked it down.</i>
	recip		aff			loc	<i>I prefer them on toast.</i>
SVOO	agent	recip	aff				<i>I bought her a gift.</i>
	agent	aff	event				<i>She gave the door a kick.</i>
	agent	recip	result				<i>She knitted me a sweater.</i>

Subject-verb concord

General rule

10.34 CONCORD (also termed 'agreement') can be defined as the relationship between two grammatical units such that one of them displays a particular feature (eg plurality) that accords with a displayed (or semantically implicit) feature in the other. The most important type of concord in English is concord of 3rd person number between subject and verb. The normally observed rule is very simple:

A singular subject requires a singular verb:

My daughter *watches* television after supper. [singular subject + singular verb]

A plural subject requires a plural verb:

My daughters *watch* television after supper. [plural subject + plural verb]

When the subject is realized by a noun phrase, the phrase counts as singular if its head is singular:

The CHANGE in male attitudes is most obvious in industry.

The CHANGES in male attitude are most obvious in industry.

Finite and nonfinite clauses generally count as singular:

How you got there *doesn't* concern me.

To treat them as hostages *is* criminal.

Smoking cigarettes *is* dangerous to your health.

Prepositional phrases and adverbs functioning as subject (cf 10.15) also count as singular:

In the evenings *is* best for me. Slowly *does* it!

An apparent exception for clauses is the nominal relative clause. Nominal relative clauses are on the continuum from clause to noun phrase (cf 15.8f). For the purpose of concord, their number depends on the interpretation of the number of the *wh*-element. With the determiners *what* and *whatever*, the concord depends on the number of the determined noun. Contrast [3] and [4] below:

- What were supposed to be new proposals *were* in fact modifications of earlier ones. [1]
 What was once a palace *is* now a pile of rubble. [2]
 Whatever book a *Times* reviewer praises *sells* well. [3]
 What ideas he has *are* his wife's. [4]

A verb counts as singular if the first verb in a finite verb phrase has a singular form:

My son *has* } no intention of spending a vacation with me.
 My sons *have* }

A letter *has* } *been sent* to every applicant.
 Two letters *have* }

The application of the general rule is restricted in several general respects:

(1) Except for the verb BE, the verb shows a distinction of number only in the 3rd person present. Hence, the verb generally does not show concord in the past:

My daughter } *watched* television after supper.
My daughters }

The verb BE displays concord also in the 3rd person past:

My daughter *was* watching television in my bedroom.
My daughters *were* watching television in my bedroom.

(2) Number concord is displayed only in the indicative. Nonfinite verbs, imperatives, and subjunctives make no number distinctions.

(3) Modal auxiliaries (cf 3.39ff) make no number distinctions:

My daughter } *may* watch television after supper.
My daughters }

Note [a] It is possible to generalize the rule of concord to 'A subject which is not clearly semantically plural requires a singular verb'; that is, to treat singular as the unmarked form, to be used in neutral circumstances, where no positive indication of plurality is present. This would explain, in addition to clausal subjects, the tendency in informal speech for *is/was* to follow the pseudo-subject *there* in existential sentences such as *There's hundreds of people on the waiting list* (cf 18.44ff). Similarly, interrogative *who* and *what* as subjects normally take a singular verb even when the speaker has reason to believe that more than one person or entity is involved: *Who is making all that noise?* However, a plural verb may be used if other words in the sentence indicate that a plural subject is expected in the answer (*Who have not received their passes?*).

On the other hand, the principle of proximity (cf 10.35) effects a change from singular to plural more often than the reverse, perhaps because the plural is the form that is morphologically unmarked.

[b] Apparent exceptions to the concord rule arise with singular nouns ending with the -s of the plural inflection (*measles, billiards, mathematics*, etc, cf 5.75), or conversely plural nouns lacking the inflection (*cattle, people, clergy*, etc, cf 5.78):

Measles is sometimes serious. Our *people are* complaining.

[c] Plural phrases (including coordinate phrases) count as singular if they are used as names, titles, quotations, etc (cf further 17.90):

Crime and Punishment is perhaps the best constructed of Dostoyevsky's novels, but *The Brothers Karamazov* is undoubtedly his masterpiece.

'The Cedars' has a huge garden.

'Senior citizens' means, in common parlance, people over sixty.

Such noun phrases can be regarded as appositive structures with an implied singular head: the book '*Crime and Punishment*', the expression '*senior citizens*'. The titles of some works that are collections of stories, etc, may be counted as either singular or plural:

The Canterbury Tales { *exists* / *exist* } in many manuscripts.

[d] On the treatment of *data, media, criteria*, and *phenomena* as singular nouns, cf 5.91, 5.98 Note.

[e] Zero plural nouns (cf 5.86) do not display number. Hence, when they are subject and the verb is a modal or simple past, number differences manifest themselves only covertly through pronoun reference (cf covert gender, 5.104):

The sheep jumped over the fence, didn't { *it?* / *they?* }

[f] It is a peculiarity of English that -s is the regular inflection for singular in the verb but for plural in the noun.

Principles of grammatical concord, notional concord, and proximity

10.35 The rule that the verb matches its subject in number may be called the principle of GRAMMATICAL CONCORD. Difficulties over concord arise through occasional conflict between this and two other principles: the principle of NOTIONAL CONCORD and the principle of PROXIMITY.

Notional concord is agreement of verb with subject according to the notion of number rather than with the actual presence of the grammatical marker for that notion. In British English, for example, collective nouns such as *government* are often treated as notionally plural:

The government *have* broken all *their* promises. <BrE>

In this example, the plural notion is signalled not only by the plural verb *have*, but also by the pronoun *their*.

The principle of proximity, also termed 'attraction', denotes agreement of the verb with a closely preceding noun phrase in preference to agreement with the head of the noun phrase that functions as subject:

?No one except his own supporters *agree* with him.

The preceding plural noun *supporters* has influenced the choice of the plural verb *agree*, although the subject *No one except his own supporters* is grammatically singular, since the head *no one* is singular. On the other hand, the proximity principle is here reinforced by notional concord ('Only his own supporters agree with him'), making the sentence somewhat more acceptable than if the proximity principle alone applied. The choice of the verb may also be influenced by preceding coordinated noun phrases, even if they are singular:

?*A good *knowledge* of English, Russian, and French *are* required for this position.

Conflict between grammatical concord and attraction through proximity tends to increase with the distance between the noun phrase head of the subject and the verb, for example when the postmodifier is lengthy or when an adverbial or a parenthesis intervenes between the subject and the verb. Proximity concord occurs mainly in unplanned discourse. In writing it will be corrected to grammatical concord if it is noticed.

The three principles and their interaction will be illustrated below in three areas where concord causes some problems: where the subject contains (a) a collective noun head; (b) coordination; and (c) an indefinite expression.

English speakers are often uncertain about the rules of concord. Prescriptive teaching has insisted rather rigidly on grammatical concord, with the result that people often experience a conflict between this rule and the rule of notional concord, which tends to prevail over it. When the proximity principle is followed in defiance of the other principles, the result is likely to be condemned as an error.

Note [a] The principle of notional concord accounts for the common use of a singular with subjects that are plural noun phrases of quantity or measure. The entity expressed by the noun phrase is viewed as a single unit:

Ten dollars *is* all I have left. ['That amount is . . .']
 Fifteen years *represents* a long period of his life. ['That period is . . .']
 Two miles *is* as far as they can walk. ['That distance is . . .']
 Two thirds of the area *is* under water. ['That area is . . .']

Cf: *Sixty people means a huge party.* ['That number of people means . . .']

[b] We also find a type of number concord at the phrase level in that certain determiners agree in number with their noun heads *that idea, those ideas*. There are apparent exceptions with measure noun phrases:

<i>that five dollars</i> (also: <i>those five dollars</i>)	<i>every few miles</i>
<i>this last two weeks</i> (also: <i>these last two weeks</i>)	<i>each ten ounces</i>
<i>another two days</i>	<i>another five per cent</i>
<i>a happy three months</i>	

A few and *a good many* function as units:

a good many friends *a few days*

[c] Grammatical concord is usually obeyed for *more than* and *many a*, though it may conflict with notional concord:

More than a thousand inhabitants <i>have</i> signed the petition.	[1]
More than one member <i>has</i> protested against the proposal.	[2]
Many a member <i>has</i> protested against the proposal.	[3]

Although the subject is notionally plural in [2] and [3], the singular is preferred because *member* is analysed as head of the noun phrase. Contrast:

More members than one	} <i>have</i> protested against the proposal.
Many members	

Collective nouns and notional concord

10.36 Singular collective nouns may be notionally plural. In BrE the verb may be either singular or plural:

The audience <i>were</i> enjoying every minute of it.	[1]
The public <i>are</i> tired of demonstrations.	[2]
England <i>have</i> won the cup.	[3]
Our Planning Committee <i>have</i> considered your request.	[4]

The choice between singular or plural verbs depends in BrE on whether the group is being considered as a single undivided body, or as a collection of individuals. Thus, in BrE plural is more likely in [1] than singular, because attention is directed at the individual reactions of members of the audience. On the other hand, the singular is more likely in these sentences:

The audience <i>was</i> enormous.	[1a]
The public <i>consists</i> of you and me.	[2a]
The crowd <i>has</i> been dispersed.	[5]

In contrast to [1a], *The audience were enormous* might be interpreted to refer to an audience of enormous people. On the whole, the plural is more popular in speech, whereas in the more inhibited medium of writing the singular is probably preferred. It is generally safer in BrE to use the singular verb where there is doubt, in obedience to grammatical concord.

AmE generally treats singular collective nouns as singular. Terms for the government and for sports teams are nearly always treated as singular in AmE, but other terms may (less commonly than in BrE) take plural verbs:

The administration *has* announced its plans for stimulating the economy.
 America *has* won the cup.
 The public *has* a right to know. [also in AmE: The public *have* a right to know.]

But, as in BrE, plural pronouns are often used in AmE to refer to singular collective nouns:

The committee *has* not yet decided how *they* should react to the Governor's letter.

Note [a] If the collective noun subject occurs in the plural, the verb is of course plural in both BrE and AmE: *The various committees are now meeting to discuss your proposal.*

[b] When a noun referring to a collection of people has plural concord, the pronouns for which it is antecedent tend to be *who/whom/they/them* rather than *which/it*. Compare:

a family *who* quarrel amongst themselves

a family *which* dates back to the Norman Conquest

[c] *Couple* in the sense of two persons normally has a plural verb even in AmE: *The couple are happily married.* When it denotes a unit, the singular verb is used: *Each couple was asked to complete a form.*

Coordinated subject

Coordination with *and*

10.37 When a subject consists of two or more noun phrases (or clauses) coordinated by *and*, a distinction has to be made between coordination and coordinative apposition (cf 10.39).

Coordination comprises cases that correspond to fuller coordinate forms. A plural verb is used even if each conjoin is singular:

Tom and Alice *are* now ready. ['Tom is now ready and Alice is now ready.']

What I say and what I think *are* my own affair. ['What I say is my own affair and what I think is my own affair'; but cf: *What I say and do is my own affair*, 10.38]

A plural verb is similarly required in asyndetic coordination (without a coordinator):

His camera, his radio, his money *were* confiscated by the customs officials.

Conjoints expressing a mutual relationship (cf 13.60), even though they can only indirectly be treated as reductions of clauses in this way, also take a plural verb:

Your problem and mine *are* similar. ['Your problem is similar to mine and mine is similar to yours.']

What I say and do *are* two different things. ['What I say is one thing and what I do is another thing.']

Note [a] If a singular noun phrase is followed by *etc* and similar abbreviatory expressions (*and so on, and so forth*), a plural verb is normal:

The size *etc are* less important for our purposes.

[b] Preposed *each* or *every* has a distributive effect and requires a singular verb:

Every adult and every child *was* holding a flag.

Each senator and congressman *was* allocated two seats.

Contrast:

Each of them *has* signed the petition. They *have* each signed the petition.

[c] The coordination markers *respective* and *respectively* (cf 13.62f) occur in coordination, but not in coordinative apposition.

[d] The principle of notional concord explains:

The hammer and sickle *was* flying from the flagpole.

Danish bacon and eggs *makes* a good solid English breakfast.

The Bat and Ball *sells* good beer.

Despite the coordination, the subject names a single flag, a single meal, and a single pub respectively. Contrast:

Danish bacon and eggs *sell* very well in London.

[e] Arithmetical sums may be used with a singular or plural verb:

Two and two $\begin{cases} \text{is} \\ \text{are} \end{cases}$ four.

So also *Ten times five is (or are) fifty*; *Two fives make (or makes) ten*. But *Two fives are ten*; *Ten minus two is eight*; *Ten into fifty is five*.

Coordination within a singular subject

10.38 A singular noncount noun head may be premodified by phrases coordinated by *and*. As subject, the resulting noun phrase may imply two (or more) separate sentences, and may then be legitimately followed by a plural verb:

American and Dutch beer *are* (both) much lighter than British beer.

['American beer is . . . and Dutch beer is . . .]

White and brown sugar *are* (equally) acceptable for this recipe.

But a singular verb is often used in this context, and is required when the phrases are postmodifying:

Beer from America and Holland *is* much lighter than British beer.

When the subject is a nominal relative clause, coordination reduction allows some variation in number interpretation:

What I say and do *are* my own affair. ['What I say is . . . and what I do . . .'; cf 10.37]

What I say and do *is* my own affair. ['That which I say and do . . .']

A generic noun phrase with a singular count head requires a plural verb when the head is premodified and the premodification contains coordination by *and*:

The short-term and (the) long-term loan *are* handled very differently by the bank.

A first-language and (a) second-language learner *share* some strategies in their acquisition of the language.

These noun phrases are notionally plural ('short-term and long-term loans'; 'first-language and second-language learners').

Coordinative apposition

10.39 With the less common COORDINATIVE APPPOSITION, no reduction is implied, since each of the coordinated units has the same reference. Hence, a singular verb is required if each noun phrase is singular:

This temple of ugliness and memorial to Victorian bad taste *was* erected in the main street of the city.

The two opening noun phrases here both refer to one entity (a statue). The following example, however, could have either a singular or plural verb, depending on the meaning:

His aged servant and the subsequent editor of his collected papers

$\begin{cases} \text{was} \\ \text{were} \end{cases}$ with him at his deathbed.

Singular *was* is used if the servant and the editor are the same person, and plural *were* if they are two different people.

Some latitude is allowed in the interpretation of abstract nouns:

Your fairness and impartiality $\begin{cases} \text{has} \\ \text{have} \end{cases}$ been much appreciated.

Her calmness and confidence $\begin{cases} \text{is} \\ \text{are} \end{cases}$ astonishing.

Law and order $\begin{cases} \text{has} \\ \text{have} \end{cases}$ been established.

Invoking the principle of notional concord, we may use either singular or plural, depending on whether qualities are seen as separate or as a complex unity.

Note [a] The correlatives *both . . . and . . .* (cf 13.35) mark coordination in subject noun phrases: *Both her calmness and her confidence are astonishing*. With subject complements they mark coordinative apposition: *She is both secretary and treasurer*. Contrast:

Both my wife and my secretary *were* there. [two persons]

She *was* both my wife and my secretary. [one person]

[b] Noun phrases are usually apposed without a coordinator. If they are subject, a singular verb is of course required if the noun phrases themselves are singular:

This temple of ugliness, a memorial to Victorian bad taste, *was* erected in the main street of the city.

[c] A repeated determiner biases the choice to plural:

Your fairness and your impartiality *have* been much appreciated.

Quasi-coordination

10.40 Subject noun phrases may be linked by quasi-coordinators (cf 13.103), *ie* prepositions (such as *along with*, *rather than*, and *as well as*) that are semantically similar to coordinators. Grammatical concord requires a singular verb if the first noun phrase is singular:

The captain, as well as the other players, *was* tired.

One speaker after another *was* complaining about the lack of adequate sanitation.

Occasionally the principle of notional concord (sometimes combined with the proximity principle) prompts the plural, especially in loosely expressed speech:

?One man with his wife, both looking very anxious, *were* pleading with a guard to let them through.

?The President, together with his advisors, *are* preparing a statement on the crisis.

If an adverbial is attached to a second noun phrase linked to the first noun phrase by *and*, the construction is considered parenthetical, and grammatical concord similarly requires the verb to agree in number with the first noun phrase:

A writer, and sometimes an artist, *is* invited to address the society.
The ambassador – and perhaps his wife too – *is* likely to be present.

The same grammatical rule applies when the second phrase is negative, whether or not linked by *and*, though here the principle of notional concord reinforces the use of the singular:

The Prime Minister, (and) not the monarch, *decides* government policy.

Coordination with *or* and *nor*

- 10.41 The rules are different for subject phrases or clauses which are coordinated with (*either* . . .) *or*:

Either the Mayor or her deputy $\left\{ \begin{smallmatrix} is \\ *are \end{smallmatrix} \right\}$ bound to come. [1]

What I say or what I think $\left\{ \begin{smallmatrix} is \\ *are \end{smallmatrix} \right\}$ no business of yours. [2]

Either the strikers or the bosses $\left\{ \begin{smallmatrix} *has \\ have \end{smallmatrix} \right\}$ misunderstood the claim. [3]

Either your brakes or your eyesight $\left\{ \begin{smallmatrix} is \\ ?are \end{smallmatrix} \right\}$ at fault. [4]

Either your eyesight or your brakes $\left\{ \begin{smallmatrix} are \\ ?is \end{smallmatrix} \right\}$ at fault. [5]

All these involve *nonappositional* coordination. Grammatical concord is clear when each member of the coordination has the same number: when they are both singular (as in [1] and [2]), the verb is singular; when they are both plural (as in [3]), the verb is plural. A dilemma arises when one member is singular and the other plural (as in [4] and [5]). Notionally, *or* is disjunctive, so that each member is separately related to the verb rather than the two members being considered one unit, as when the coordinator is additive *and*. Since the dilemma is not clearly resolvable by the principles of grammatical concord or notional concord, recourse is generally had to the principle of proximity: whichever phrase comes last determines the number of the verb, as in [4] and [5].

Where the disjunctive force is weak and *or* approaches the meaning of *and*, the plural verb is sometimes found with singular subject phrases, especially in informal usage:

Jogging or swimming $\left\{ \begin{smallmatrix} is \\ ?are \end{smallmatrix} \right\}$ supposed to be good for the heart.

When *or* is used for coordinative apposition (cf 10.39), grammatical concord requires the number of the verb to agree with the first appositive if the two appositives differ in number:

The hero, or main protagonist, *is* Major Coleman.

The hawks, or bellicose officials, *are* in the ascendancy.

Gobbledygook, or the circumlocutions of bureaucratic language, *is* intentionally difficult to understand.

The circumlocutions of bureaucratic language, or gobbledygook, *are* intentionally difficult to understand.

The rules for the negative correlatives *neither* . . . *nor* are the same as for *either* . . . *or* in formal usage. In less formal usage, they are treated more like *and* for concord. Thus, [6] is more natural in speech than [7]:

Neither he nor his wife *have* arrived. [6]

Neither he nor his wife *has* arrived. [7]

This preference is probably connected with the use of the plural verb with *neither* as a determiner or pronoun (cf 10.42), but it may also reflect notional concord in that logically 'neither X nor Y' can be interpreted as a union of negatives: 'both (not-X) and (not-Y)'.

If the number alternatives for the verb are both felt to be awkward, speakers may avoid making a choice by postposing the second noun phrase or sometimes by substituting a modal auxiliary (cf 10.44):

Either your brakes are at fault *or* your eyesight *is*.

He hasn't arrived, *nor* has his wife.

Either your brakes or your eyesight *may* be at fault.

Note [a] The coordinating correlatives *not* . . . *but* and *not only* / *just* / *merely* . . . *but* (also / *even*) behave like *or* with respect to number concord:

Not only he but his wife *has* arrived.

Not (only) one but all of us *were* invited.

Not just the students but even their teacher *is* enjoying the film.

Where the noun phrases differ in number, the principle of proximity determines the concord.

[b] The mixed expressions *one or two* and *between one and two* follow the principle of proximity in having plural concord:

One or two reasons *were* suggested.

Similarly *one and* plus a fraction or percentage has plural concord, since the notion of plural applies not to at least two but to more than one:

One and a half years *have* passed since we last met.

The selection of the plural is reinforced also by the principle of proximity. But note:

A year and a half *has* passed.

The conjoint phrase is treated like 'a period of a year and a half', though the singular verb may be reinforced by the immediately preceding *a half*.

Indefinite expressions as subject

- 10.42 Another area of ambivalence for subject-verb number concord is that of indefinite expressions of amount or quantity, especially with the determiners and with the pronouns *no*, *none*, *all*, *some*, *any*, and fractions such as *half*. They have both count and noncount uses.

With noncount nouns (present or implied), the verb is of course singular:

So far no money *has* been spent on repairs.

None (of the money) *has* been spent on repairs.

Some cement *has* arrived.

Some (of the cement) *has* arrived.

With plural count nouns (present or implied) the verb is plural:

No people of that name *live* here.
Some books *have* been placed on the shelves.

Some
Hardly any
All
Half

(of the books) *have* been placed on the shelves.

None with plural count nouns is in divided usage:

None (of the books) $\left\{ \begin{array}{l} \text{has} \\ \text{have} \end{array} \right\}$ been placed on the shelves.

Prescriptive grammars have tended to insist on the singular verb, but notional concord invites a plural verb, which tends to be more frequently used and is generally accepted even in formal usage. With *either* and *neither* the singular is generally used:

The two guests have arrived, $\left\{ \begin{array}{l} \text{and either} \\ \text{but neither} \end{array} \right\}$ *is* welcome.

But a plural verb sometimes occurs in informal usage when *either* or (particularly) *neither* is followed by a prepositional phrase with a plural complement, both because of notional concord and because of the proximity rule:

Either
Neither } of them *are* welcome. ['Both are (not) welcome.'] <informal>

The plural is even more favoured in such constructions with *none*:

None of them *have* been placed on the shelves.

- 10.43 The proximity principle may lead to plural concord even with indefinites such as *each*, *every*, *everybody*, *anybody*, and *nobody* (or indefinite phrases such as *every one*, *any one*), which are otherwise unambivalently singular:

Nobody, not even the teachers, $\left\{ \begin{array}{l} \text{was} \\ \text{?were} \end{array} \right\}$ listening.

Every member of the vast crowd of 50 000 people $\left\{ \begin{array}{l} \text{was} \\ \text{?were} \end{array} \right\}$ pleased to see him.

Although these sentences might well be uttered in casual speech, or inadvertently written down, most people would probably regard them as ungrammatical, because they flatly contradict grammatical concord.

Other, more acceptable, instances arise with expressions involving kind and number. The number choice in the verb is usually influenced by notional concord:

These
Those } $\left\{ \begin{array}{l} \text{sort} \\ \text{kind} \\ \text{type} \end{array} \right\}$ of parties *are* dangerous. <informal> [1]

A (large) number of people *have* applied for the job. [2]
The majority *are* Moslems. [3]
Lots of the stuff *is* going to waste. <informal> [4]

[1] illustrates an idiomatic anomaly: there is a discrepancy in number between the noun and the determiner *those*, as well as with the verb. Rephrasing can avoid the anomaly:

Those kinds of parties *are*
That kind of party *is*
Parties of that kind *are* } dangerous.

[2] and [3] show seemingly singular phrases being treated as plural; notionally they are equivalent to *many* and *most*. Use of the singular in these sentences would be considered pedantic in [2], and unacceptable in [3] because of the plural complement (*cf* the pedantic but acceptable *The majority agrees with me*). The opposite phenomenon, attraction to the singular, is observed in [4] where *lots of* is treated as if equivalent to singular *plenty of* and *much of*; but the singular is also influenced by the proximity of singular *stuff*. Contrast:

Lots of people *are* coming to our party.

Notional concord ('many people') is reinforced by the proximity of plural *people*.

- Note [a] For the analysis of quantifiers like *a number of*, *cf* 5.25.
[b] Determiners other than *those* or *these* are found in plural concord with the nouns in [1], *eg*: *some*, *any*. Like *a (large) number of* in [2] are locutions such as *a lot of*, *a (whole) set of*, *a spate of*, *plenty of*; analogous to *the* (or *a*) *majority* in [3] is *the* (or *a*) *minority*, and to *lots* in [4] are many other informal quantifiers, such as *loads of*, *heaps of*.
[c] The proximity principle may be extended to mean that concord is determined by whatever immediately precedes the verb, the position of the subject (which normally determines concord). The principle can then explain a singular verb in cases of inversion or of an adverbial quasi-subject: *?Where's the scissors?*; *?Here's John and Mary*; *?There's several bags missing*. As what precedes the subject here is not marked for plural (*cf* 10.34 Note [a]), the singular verb follows by attraction. The occasional use of the singular verb in instances such as *?*Is the scissors on the table?* and *?*Has my glasses ['spectacles'] been found?* may be explained by a combination of two factors: these summation plurals (*cf* 5.76) are notionally singular, though morphologically and syntactically plural; since the verb precedes the subject, the influence of the subject on number is somewhat reduced. Compare the greater unacceptability of **My glasses has been found*. All these are colloquial examples; in formal English plural forms of the verb would be substituted.
[d] If a relative clause follows a noun phrase containing *one of* plus a plural noun phrase, there is often a choice as to whether the verb in the relative clause should agree in number with *one* or with the plural noun phrase:
He's one of those students who never *get(s)* a piece of work done on time.
The choice of singular or plural can depend on whether attention is directed to the generality or to the uniqueness. Compare:
Charlatanry is one of the many words in English that *are* of French origin.
[=Of the many words in English that *are* of French origin, *charlatanry* is one.]
Charlatanry is one of the common vices that *is* particularly contemptible.
[=Of the common vices, *charlatanry* is one that *is* particularly contemptible.]

Concord of person

- 10.44 In addition to 3rd person number concord with the subject, the verb in the present tense may have person concord (*cf* 3.2, 3.52) with the subject – 1st

and 3rd person concord with BE and only 3rd person concord with other verbs:

I *am* your friend. [1st PERSON SINGULAR CONCORD]

He *is* your friend.
He *knows* you. } [3rd PERSON SINGULAR CONCORD]

Are is the unmarked form for the present of BE with persons other than 1st and 3rd singular; in all other verbs the base form is used in the present for persons other than the 3rd singular. Only the past of BE has further distinctions:

I *was* your friend.
He *was* your friend. } [1st and 3rd PERSON SINGULAR CONCORD]

The unmarked past form of BE – *were* – is used with the 2nd person singular and all the plural persons. Like number concord, person concord applies only to the indicative; the subjunctive has one form for all persons.

A coordinate subject with *and* as coordinator requires a plural verb. Person concord does not apply, since there are no person distinctions in the plural (*You and I know the answer*; *She and I are in charge*). If the coordinator is *or*, *either* ... *or*, or *neither* ... *nor*, in accordance with the principle of proximity the last noun phrase determines the person of the verb:

Neither you, nor I, nor anyone else *knows* the answer.
Either my wife or I *am* going.

Because of the awkwardness of this choice, a speaker may avoid it by using a modal auxiliary which is invariable for person (eg: *Either my wife or I will be going*) or by postposing the last noun phrase (eg: *Either my wife is going or I am*) (cf 10.41).

Note [a] In archaic English, there is also concord of 2nd person singular pronouns and verbs in the present and past (cf 6.14 Note [c]) *Thou, Lord, hast redeemed us; Thou didst hear my prayer.* (Cf 3.4 Note [b] for archaic 2nd and 3rd person forms of verbs.)

[b] In relative clauses and cleft sentences, a relative pronoun subject is usually followed by a verb in agreement with its antecedent: *It is I who am to blame, It is Kay who is in command, It is they who are complaining.* But 3rd person concord prevails in informal English where the objective case pronoun *me* is used: *It's me who's to blame.* Similarly, 3rd person singular may be used in informal English in these constructions when the pronoun *you* has singular reference: *It's you who's to blame.*

In the archaic *Our Father, which art in Heaven*, agreement is with the 2nd person status of the vocative *Our Father*, ie: *Our Father, thou which art in heaven.* Contrast a modern version *Our Father, who is in Heaven* ('he who is in Heaven').

Summary

10.45 We suggest that the following generalizations apply to the system of subject-verb concord in English.

- The principle of GRAMMATICAL CONCORD tends to be followed in formal usage and has the sanction of teaching and editorial tradition.
- The principle of NOTIONAL CONCORD is most natural to colloquial English.
- The principle of PROXIMITY, despite its minor decisive role in cases where the other two provide no guidance, is generally felt to lack validity on its

own, and has more of an auxiliary role in supporting notional concord in colloquial speech.

Grammatical and notional concord generally work in harmony together. It is only occasionally that these principles are in conflict.

Other types of concord

Subject-complement and object-complement concord

10.46 Between subject and subject complement and between direct object and object complement, there is usually concord of number (but not of person):

My child is an angel. I consider my child an angel.
My children are angels. I consider my children angels.

This type of concord arises naturally from the semantic role of the two complements (cf 10.20). There are, however, exceptions:

My only hope for the future is my children. [also <i>are</i>]	[1]
More nurses is the next item on the agenda. [also <i>are</i>]	[2]
Their principal crop is potatoes.	[3]
That man is nuts. (slang) ['insane']	[4]
Good manners are a rarity these days. [also <i>is</i>]	[5]
The younger children are a problem.	[6]
The next few bars are pure Tchaikovsky. [also <i>is</i>]	[7]
Dogs are good company.	[8]

The complement in [1] seems condensed, with perhaps an implied preposition: *My only hope for the future is in my children.* The subject of [2] may similarly be analysed as condensed (something like 'the question of more nurses') or may perhaps be treated as a title (cf 10.34 Note [c]). In [3] the subject complement is a generic noun phrase, which might equally be singular: *Their principal crop is the potato.* Sentences [4–8] contain a subject complement which, although nominal in form, has a characterizing function closer to that of an adjective. There is often no singular/plural contrast; for example, we do not have **The houses are bricks*, only *The houses are brick*.

Note [a] The complements in [1], [2], and [3] are identifying (cf 10.20), as is shown by the potentiality for subject-complement reversal: *My children are my only hope for the future; The next item on the agenda is more nurses; Potatoes are their principal crop.*

[b] Pseudo-cleft constructions with a fronted object *what* may have a plural subject complement (cf 10.34):

What we need most *is* books.
But *what* is ambivalent in number, often interpreted as equivalent to either 'the thing that' or 'the things that', so that we also find a plural verb in concord with the subject *what*-clause:

What we need most *are* books.
Some prescriptive teaching requires the singular both for the verb within the *what* clause and for the verb that is in concord with the clause:

What *is* needed most *is* books.

We also find a singular verb when the *what*-clause is subject complement, but there are objections to this infringement of the concord rule:

?*Books *is* { what we need most.
what is needed most.

[c] If the subject is singular there is no subject-complement concord with the idioms *be all ears*, *be all elbows*, *be all fingers and thumbs*. For example: *I'm all ears* ['I'm listening with all my attention.'].
 10.47

Distributive number

The distributive plural is used in a plural noun phrase to refer to a set of entities matched individually with individual entities in another set:

Have you all brought your *cameras*? ['Each has a camera.']

Hand in your *papers* next Monday. ['Each has to hand in one paper.']

While the distributive plural is the *norm*, the distributive singular may also be used to focus on individual instances. We therefore often have a number choice:

The students raised their *hand(s)*.

Some children have { understanding *fathers*.
an understanding *father*.

We all have { good *appetites*.
a good *appetite*.

Pronouns agree with their *antecedent(s)*.

Their { *noses need* } to be wiped.
nose needs

The exercise was not good for their *back(s)*.

The singular is sometimes obligatory or preferable with idioms and metaphors:

We are *keeping an open mind*. [?open *minds*]

They *vented their spleen on him*. [*their *spleens*]

They can't *put their finger on* what's wrong. [*their *fingers*]

The distributive singular is sometimes used to avoid ambiguity:

Students were asked to name their favourite *sport*.

The singular makes it clear that only one sport was to be named. Similarly:

Children must be accompanied by a *parent*.

Pronoun reference

- 10.48 Agreement between a pronoun and its antecedent (cf 12.8ff) should probably be considered coreference rather than grammatical concord, but it is appropriate to treat the phenomenon here.

Concord of number, person, and gender is necessary between subject on the one hand, and object or complement on the other hand, if the second element is a reflexive pronoun (cf 6.23ff):

He injured *himself* in both legs.

She bought *herself* a raincoat.

I haven't been *myself* for weeks. ['I haven't felt well.']

The same concord relation holds when the reflexive pronoun occurs in other functions (eg as prepositional complement), or when the emphatic genitive *his own*, etc is used:

She's making a sweater for *herself*.

I wrote to them about *myself*.

They're ruining *their own* chances.

For coreference relations of the type exemplified by *Everybody . . . their*, cf 10.50.

Note [a] In BrE, collective noun subjects permit, as one might expect, plural concord: *The navy congratulated themselves on, if not a victory, at least an avoidance of defeat*. In both BrE and AmE, plural reflexives often follow the indefinite pronouns (cf 10.50): *Everybody behaved themselves*; some, however, avoid the construction.

[b] The concord relation may be with an element other than the subject, notably an object:
I wrote to my brother about himself. *I drove them in their own car.*

- 10.49 This type of concord may extend beyond clause boundaries. Thus the relative pronouns *who*, *whom*, and *which* agree with their antecedent in the superordinate clause in gender, the first two being personal, and the last nonpersonal:

Here's the hammer *which* I borrowed yesterday.

That's the man *who(m)* I saw talking to your parents.

Whose is used with either personal or nonpersonal antecedents:

The man *whose* wallet he stole. The house *whose* rafters were burned.

There is a feeling, however, that *whose* is more appropriate to personal antecedents, presumably because of its morphological relationship to *who* and *whom*, and some speakers feel uneasy about its use with nonpersonal antecedents.

Personal and possessive pronouns in the 1st and 3rd persons agree with their antecedents in number. Those in the 3rd person singular (*he*, *she*, *it*) also agree with their antecedents in gender:

Tom hurt *his* foot. [1]

Beatrice knows that *she* is late. [2]

The books were too heavy, so I left *them*. [3]

The violation of concord in the case of nonreflexive pronouns does not lead (as it does in the case of reflexive pronouns) to an unacceptable sentence, but to a different interpretation. One may compare [1] with [4]:

Tom hurt *her* foot. [4]

In [4] the pronoun must refer to someone else, someone mentioned or known from the situational context. Of course, in both [1] and [2] the pronoun may also refer to somebody other than the subject.

Note In phrases denoting body parts and close personal belongings (cf 5.35), possessive pronouns refer back to the subject where some languages prefer the definite article:

John shook *his* head. *She* dirtied *her* shoes.

So also in [1], if the reference is to the subject.

- 10.50 The pronoun *they* is commonly used as a 3rd person singular pronoun that is neutral between masculine and feminine. It is a convenient means of avoiding the dilemma of whether to use the *he* or *she* form. At one time restricted to informal usage, it is now increasingly accepted even in formal usage, especially in AmE. (On sexual bias in pronoun usage, cf 6.10.)

Rather than use *he* in the unmarked sense or the clumsy *he* or *she*, many prefer to seek gender impartiality by using a plural form where possible in reference to the indefinite pronouns *everyone*, *everybody*, *someone*, *somebody*, *anyone*, *anybody*, *no one*, *nobody*:

- Everyone* thinks *they* have the answer. [1]
 Has *anybody* brought *their* camera? [2]
No one could have blamed *themselves* for that. [3]

A similar use of the plural occurs with coordinate subjects referring to both sexes, as in [4], and with a singular noun phrase subject having a personal noun of indeterminate gender as head, as in [5]:

- Either he or she* is going to have to change *their* attitude. [4]
Every student has to hand in *their* paper today. [5]

In formal English, the tendency has been to use *he* as the unmarked form when the gender is not determined. The formal equivalent of [1], though increasingly ignored now, is therefore:

- Everyone* thinks *he* has the answer. [1a]

A more cumbersome alternative is the conjoining of both masculine and feminine pronouns:

- Every student* has to hand in *his or her* paper today. [5a]

This device is particularly clumsy if the pronouns have to be repeated:

- If a *student* does not hand in *his or her* paper today, *he or she* will not be allowed to continue the course. [5b]

One way of avoiding the dilemma is to make the subject plural:

- All students* have to hand in *their* paper today. [5c]

Similar methods can usually be employed for the indefinite pronouns too:

- All of them* think *they* have the answer. [1b]
 Have *any of you* brought *your* camera? [2a]

For [4] the only alternative in formal English is to rephrase the sentence:

- Either he* is going to have to change *his* attitude or *she hers*. [4a]

The indefinite pronoun *one* is followed in formal usage by the same pronoun for subsequent references:

- One* should choose *one's* friends carefully. [6]

But AmE may also use the masculine pronoun:

- One* should choose *his* friends carefully. [6a]

In accordance with the tendency to avoid the use of the masculine pronoun to subsume both male and female references we may expect that AmE will increasingly replace indefinite *one* with indefinite *we*, *you*, or *they*, as appropriate:

- We* should choose *our* friends carefully. [6b]

We have noted (cf 10.36) that, especially in BrE, singular collective nouns have plural subject-verb concord in cases where the speaker thinks of the group as made up of separate individuals. The same principle extends to pronoun concord:

- The government *are* cutting *their* losses. <BrE> [7]
 The government *is* cutting *its* losses. [8]

Although there is no number contrast in relative pronouns, the number distinction can be reflected in the choice of personal *who* (ie the group thought of as a set of individuals) as opposed to nonpersonal *which* (ie the group as an indivisible abstraction). Thus corresponding to [7] and [8], we may have:

- the government, *who are* cutting *their* losses <BrE> [7a]
 the government, *which is* cutting *its* losses [8a]

Hybrid forms are rare, and seem odd:

- ?the government, *who is* cutting *its/their* losses
 ?the government, *which are* cutting *its/their* losses

Note [a] Informally, with indefinite pronoun subjects, *they* is commonly used in subsequent tag questions: *Everybody is leaving, aren't they?*, *Nobody is leaving, are they?*

[b] For introductory *it*, *that*, and *this*, cf 6.17. Examples:

- Somebody opened the door. *It* was David.
 Hello! *This* is Susan. *Is that* Geoffrey? <on phone>

Semantic restrictions

- 10.51 Apart from concord, there are other ways in which the choice of one clause element may affect the choice of another:

- The *men* scattered.
 not *The *man* scattered.
 The police contingent dispersed the *rioters*.
 not *The police contingent dispersed the *rioter*.
 John and Mary collided.
 not { *John } collided.
 { *The car }
 but John collided with Mary.
 The *workers* assembled.
 not *The *worker* assembled.

Each of the above pairs shows how a particular verb requires a particular type of subject or object: *collide* requires a plural subject, a collective singular subject (*The team collided*), or a prepositional phrase entailing notional plurality with the subject (*I collided with her*); *scatter*, *disperse*, and *assemble* require a plural affected participant – ie a plural subject or a collective singular subject (*The crowd scattered*) when used intransitively, or a plural or collective object when used transitively (*The police contingent dispersed the rioters/the mob*).

Rules of this kind differ from rules of concord in that they do not involve two elements sharing the same feature, but one element projecting on to another a feature which is necessary for its meaningful use. That it is 'plurality' as a semantic feature rather than as a strictly grammatical feature that is in question here is shown by the possibility of substituting a collective singular for the plural noun.

Other features commonly entering into such semantic restrictions include:

'concrete' vs 'abstract': { The glass contains water.
*The glass contains kindness.

'animate' vs 'inanimate': { A pedestrian saw me.
*A lampshade saw me.

'human' vs 'nonhuman': { Finally we got married.
*Finally the snakes got married.

These restrictions are frequently violated in poetry and in other imaginative uses of languages. The incongruity, in such cases, indicates that the speaker intends us to make sense of his words at some deeper level, eg by metaphorical interpretation. In poetry, *leaves may dance*, *stars may bless*, *fears may lurk* or *linger*, and *a look may contain kindness*.

Semantic restrictions apply not only to verbs, but also to other word classes, notably adjectives and prepositions. The oddity of **The music is too green* is explained by the requirement that *green* should be in a copular relationship with a concrete noun (unless the noun is a superordinate term as in *The colour (I like best) is green* or unless *green* has the metaphorical sense 'immature'). The oddity of **They ran until the town* is accounted for by a rule that *until* requires a prepositional complement or a clause with temporal meaning (*They ran until six*; *They ran until it was dark*).

Note [a] Semantic requirements of the types that have been exemplified have sometimes been called 'selectional restrictions'.

[b] Semantic restrictions apply of course within phrases and not just between clause elements: **those married snakes*, **the green music*.

[c] There are semantic restrictions that apply to particular lexical items. For example, the two verbs *eat* and *feed*, used intransitively, tend to require personal and nonpersonal subjects respectively; whereas *Janet and Joe are eating* implies that Janet and Joe are persons, *Janet and Joe are feeding* implies that they are animals. Similarly, *elder* (unlike *older*) requires a personal subject or head noun: *Carol is the elder*, but not **This building is the elder*. To take a very different example, many speakers do not accept that *unique* can be modified by an intensifier or comparative: *?Her play is very unique*.

[d] There are also restrictions that hold between lexical items. Both *want* and *wish* may be intensified (for example, by *very much*), but we can say *I badly wanted to see them* and not **I badly wished to see them*. Such restrictions have been termed 'collocational restrictions'.

Vocatives

- 10.52 A vocative is an optional element, usually a noun phrase, denoting the one or more persons to whom the sentence is addressed. It is either a CALL, drawing the attention of the person or persons addressed, singling them out from others in hearing, as in [1], or an ADDRESS, expressing the speaker's relationship or attitude to the person or persons addressed, as in [2] and [3]:

JÖHN, DINNER's ready. [voc S V C₃] [1]
And THÄT, my FRÍENDS, concludes my SPÉECH. [voc S V O_d] [2]
My BÄCK is aching, DÓCTOR. [S V voc] [3]

Sentences [1–3] show that a vocative may take initial, medial, or final position in the sentence; in its optionality and freedom of position, it is more like an adverbial (or, more precisely, like a disjunct; cf 8.121ff) than any other element of clause structure.

Intonationally, the vocative is set off from the rest of the clause either by constituting a separate tone unit or by forming the tail of a tone unit (cf App II.15). The most characteristic intonations are shown above: fall–rise for an initial vocative functioning as a call, and otherwise rise; rise for a vocative functioning as an address (cf also Note [b]).

Note [a] When *you* precedes the vocative, the distinction between a vocative and an appositive may be neutralized in writing, though not in speech:

You, Robert, will have to work harder.

I have been looking for you, my friend.

[b] There are forms of address that are general in character and therefore have low informational value. They form the tail of a tone unit when they are medial as well as when they are final. Such addresses rarely occur initially:

I shall send you a CÁRD, sir, when the suit is RÉADY.

We mustn't be LÄTE, dear, MÜST we?

Don't be SÍLLY, darling.

Forms of vocatives

- 10.53 Vocatives may be:

(a) Names: first name, last name, full name, with or without a title, or a nickname or pet name: *David*, *Caldwell*, *Sarah Peterson*, *Mrs Johnson*, *Dr Turner*, *Ginger*

(b) Standard appellatives, usually without modification:

(i) terms for family relationships (sometimes with initial capitals): *mother*, *father*, *son*, *uncle*, *aunt*, *grandfather*, *grandmother*; or more familiar forms like *mom(my)* <AmE>, *mum(my)* <BrE>, *dad(dy)*, *auntie*, *granny*, *grandma*, *grandpa*.

(ii) titles of respect (sometimes with initial capitals for *your*): *madam*, *ma'am* <esp AmE>, *sir*, *my Lord*, *your Honour*, *your Excellency*, *your Majesty*, *your Ladyship*.

(iii) markers of status (sometimes with initial capitals even for those not so marked here): *Mr President*, *Prime Minister*, *Father* [for priest], *Sister* [for a nun], *Bishop*, *professor*, *doctor*, *general*, *major*, *vicar*.

(c) Terms for occupations: *waiter, driver, cabbie* (informal), *barmaid* (BrE), *bartender* (AmE), *attendant, conductor, nurse, officer* [for a member of the police force].

(d) Epithets (noun or adjective phrases) expressing an evaluation:

(i) favourable (some also preceded by *my*): (*my*) *darling, (my) dear, (my) dearest, (my) love, honey* (esp AmE), (*my*) *friend, handsome, beautiful, (my) sweetie-pie* (esp AmE).

(ii) unfavourable (also preceded by *you* in noun phrases): *bastard, coward, fatty, idiot, imbecile, liar, pig, rotter* (BrE), *skinny, slowcoach* (BrE), *slowpoke* (AmE), *stupid, swine*.

(e) General nouns, but which are often used in more specialized senses: *brother, buddy* (AmE), *girl, guys, lady, ladies and gentlemen; man, mate* (BrE), *partner* (AmE), *son*. Except for *ladies and gentlemen*, these are usually familiar and considered impolite when addressed to persons with whom one is not familiar. *Boy* is avoided in the US because of its racial connotations.

(f) The personal pronoun *you* (*You, why haven't you finished yet?*); it is markedly impolite. An indefinite pronoun; eg: *Get me a pen, somebody* is abrupt.

(g) Nominal clauses (very occasionally): *Whoever said that, (come out here)*. Other examples: *whoever you are, what's your name*.

(h) Items from (a), (d), (e), and (f) may be expanded by the addition of modifiers or appositive elements of various kinds:

(a) *my dear Mrs Johnson; young David*

(d) *my very dearest; my old friend; you silly bastard; you filthy liar*

(e) *old man, young man; old boy* (BrE); *old chap* (BrE); *old fellow* (BrE); *my dear fellow* (BrE)

(f) *you over there; you with the red hair*. Less impolite and more jocular in tone are appositives like *you boys, you people, you chaps* (BrE), *you (young) fellows. You-all* (Southern AmE) and *you guys* (esp AmE) are not impolite.

Items in (bi) and (bii), unless the terms have unique reference (as in *mother* or *Mr President*), may be combined with names in (a): *Uncle David, grandma Peterson, Professor Johnson*.

Terms for occupations in (c) differ from markers of status (biii), which also denote occupations, in that occupation terms are normally used as vocatives only when the person addressed is functioning in that role, whereas status markers may be used at all times. For example, we may address a person as *professor* or *doctor* when we do not have a professional relationship with that person, but we only address a person as *waiter* or *nurse* in situations when we are interacting with the person in that particular role.

Some vocatives are listed in more than one set. For example, *son* in (bi) is used by a parent, but in (e) it is used by a superior who is not a parent. Similarly, *father* in (bi) is a kinship term, but in (biii) it is a status marker. Moreover, some items in (di) may express a varying degree of evaluation: *love* may be used between intimates, but in BrE it may be used generally for

strangers by a female bus conductor; and *bastard* may also convey the speaker's admiration for the addressee's ingenuity.

In addressing somebody one knows by name, last name preceded by title (*Mr Jones, Miss Smith, Mrs Brown, Dr Robinson*) is a politely formal manner of address, while first name (*John, Mary*) indicates friendly familiarity. It is now much easier to be 'on Christian name terms' (BrE) or 'on a first name basis' (esp AmE) than formerly; address by family name alone (which used to indicate male comradeship, as in *Holmes and Watson*) is rarely heard today, except in special situations (armed forces, school).

Vocatives addressed to strangers are not neutral, since they always express some relationship or attitude. Their effect and frequency also vary considerably in AmE and BrE. For example, *miss, ma'am, mister, and sir* are used far more extensively in AmE as vocatives addressed to strangers; *mister* is considered nonstandard in BrE, and *miss* is unacceptable to some, while *sir* is much more formal in BrE than in AmE. Professional vocatives are also used sparingly nowadays, mainly *Doctor, Father, Vicar, Counsellor* (AmE). In most neutral interchange with strangers, no vocative is used, nor is one felt to be necessary. To gain the attention of strangers, speakers often rely on *Excuse me* or *I beg your pardon* (AmE) rather than a vocative. *Hey* is often used for the same purpose, but it is impolite when addressed to strangers.

Most vocatives that are realized by unmodified common nouns – except for the family relationship terms in (bi) – are syntactically different from the same nouns in other functions in that they do not require a determiner. Hence we can use *dear* as a vocative in *Come here, dear*. But we cannot of course say **Dear came here*. Adjectives such as *handsome*, and *stupid* cannot be used in such contexts either.

Note It is conventional to place a salutation above the body of the letter. The salutation, which is on a line of its own, is generally introduced by *Dear*:

Dear Ruth Dear Dr Brown Dear Madam Dear Sir

When the sex of the addressee is unknown, it is customary in business letters to use *Dear Sir or Madam*. When the family name of a woman is known but her marital status is unknown or is considered to be irrelevant, many use *Ms* (*Dear Ms Wright*), but women differ strongly on whether they wish to be addressed, or referred to, by *Ms* (cf 5.66 Note [a]). When there is doubt over who should be the addressee, it is customary to write *To whom it may concern* (formal). *Dear* is often omitted in informal notes. Occasionally it is omitted in very formal letters addressed to a large number of people (*Friends; Gentlemen*).

Negation

Types of negation

10.54 We distinguish three types of negation:

- CLAUSE NEGATION, through which the whole clause is syntactically treated as negative (cf 10.55ff, 10.67f);
- LOCAL NEGATION, in which one constituent (not necessarily a clause element) is negated (cf 10.66);
- PREDICATION NEGATION, a minor type applying only after certain auxiliaries, in which the predication is negated (cf 10.69).

- Note [a] This chapter deals only with negation as a syntactic process within the clause. On affixal negation, cf App I.21. In certain contexts, clauses with affixal negation are approximately synonymous with clauses negated by the clause negator *not* (eg: *That is not true* ~ *That is untrue*).
 [b] For negative questions, cf 11.7f, 11.17; for negative directives, cf 11.28. Transferred negation is treated in 14.36.
 [c] The difference between positive and negative has been termed a difference in POLARITY.

Clause negation

Clause negation through verb negation

- 10.55 A simple positive sentence (or a positive finite clause within a complex sentence) is negated by inserting the clause negator *not* between the operator and the predication (cf 2.48):

POSITIVE	NEGATIVE
I have finished.	I have not finished.
The children are playing.	The children are not playing.
They have been told.	They have not been told.
He may be working.	He may not be working.

The operator here (as for questions) is the first auxiliary verb of a complex verb phrase, or either *BE* or (especially in BrE) stative *HAVE* (cf Note [a]) as the verb in a simple verb phrase. Thus the negation of *They are noisy* is *They are not noisy*, and one negation (especially BrE) of *He has enough money* is *He has not enough money*.

If an operator is not present in the positive sentence, the dummy (or substitute) auxiliary *DO* is introduced. Like modal auxiliaries, it is followed by the bare infinitive:

She works hard.	She does not work hard.
They know you.	They do not know you.
I paid the porter.	I did not pay the porter.

Except in formal English, the negator more usually occurs also in the enclitic contracted form *n't*:

I haven't finished.	They don't know you.
The children aren't playing.	I didn't pay the porter.

Contracted negative forms of auxiliaries are listed in 3.32f, 3.36, 3.39.

The uncontracted form is of course required when the nucleus is on the negator for emphasis: *I did NOT say that*.

- Note [a] The dynamic main verb *have* requires *DO* as operator:
 We didn't have a party last week. ~ *We hadn't a party last week.
 They don't have an argument every day. ~ *They haven't an argument every day.
 I didn't have a look at your material. ~ *I hadn't a look at your material.
 The stative main verb *have* usually has *DO* as operator, though (especially in BrE) it does not need to. In BrE especially, *got* is often added in informal style:
 He has enough money {He doesn't have enough money. <esp AmE>
 {He hasn't (got) enough money. <esp BrE>
 For the distinction between dynamic and stative verbs, cf 4.4, 4.27ff.
 [b] For the restricted occurrence of certain negative forms, especially *mayn't*, cf 3.23.

- [c] If the verb is subjunctive, the negator is positioned immediately before the verb, but without an operator:

It is important that he not stay beyond the end of the month.

I requested that they not interrupt me.

This use of the subjunctive is more common in AmE. In BrE putative *should* (cf 4.64, 14.25) or (to a lesser extent) the indicative are more likely with the consequent normal negation with the operator:

It is important that he {shouldn't / doesn't} stay beyond the end of the month.

I requested that they {shouldn't / (?)didn't} interrupt me.

- [d] For examples such as *If I mistake not*, cf 3.22 Note [c].

- [e] Some positive clauses are likely to be negated only in denials of previous statements:

A: He is {sure / bound} to succeed. B: No, he {isn't / is NOT} {sure / bound} to succeed.

Contracted forms of negator and auxiliaries

- 10.56 If the operator can be contracted to a form enclitic to the subject, there are two possibilities for contraction in negative clauses (though neither is used in formal English)—negator contraction and auxiliary contraction:

Jane isn't responsible.	Jane's not responsible.
We aren't ready.	We're not ready.
He wouldn't notice anything.	He'd not notice anything.
She won't object.	She'll not object.
They haven't caught him.	They've not caught him.

For the factors determining the choice between negator and auxiliary contraction, cf 3.23.

- Note There is no standard negator contraction to parallel *I'm not ready*. For the status of *ain't*, cf 3.22 Note [b].

Syntactic features of clause negation

- 10.57 Certain syntactic features differentiate negative clauses from positive clauses:

- (i) They are followed by positive checking tag questions (cf 11.8ff):

She doesn't work hard, *does she?*
 [cf: She works hard, *doesn't she?*]

- (ii) They are followed by negative tag clauses, with additive meaning:

I haven't finished, {and *neither* / *nor*} have you.

[cf: I've finished and *so* have you.]

Like positive clauses, however, they may be followed by positive tag clauses that do not have subject-operator inversion:

I haven't finished, but 'you *HAVE*.
 [cf: I've finished, and 'you *HAVE* TOO.]

On *neither* and *nor*, cf 13.36.

(iii) In discourse, they are followed by negative agreement responses:

A: He doesn't know Russian. B: NÒ, he *DÔESN't*.
[cf: A: He knows Russian. B: YÈS, he *DÔES*.]

(iv) They are followed by nonassertive items (cf 10.60):

A: He won't notice *any* change in you.
B: She won't notice *any* change in you, *either*.
[cf: She'll notice *some* change in you, *too*.]

(v) They do not cooccur with items that have positive orientation (cf 10.62):

*It isn't *pretty* late. [cf: It's *pretty* late.]

Features (i-iii) apply only to independent declarative clauses, whereas features (iv-v) apply also to subordinate finite and nonfinite clauses. Features (iv-v) do not differentiate negative from positive clauses in other nonassertive contexts, particularly questions and conditionals (cf further 10.60 Note.):

Don't you want $\left\{ \begin{smallmatrix} \text{something} \\ \text{anything} \end{smallmatrix} \right\}$ to eat?

Isn't it *pretty* late?

If you *ever* want my advice, don't hesitate to ask for it.

If you see her *at all*, give her my best wishes.

Note [a] Features (iv-v) do not apply to denials of positive statements previously stated or implied:

A: I understand she showed him $\left\{ \begin{smallmatrix} \text{some} \\ \text{*any} \end{smallmatrix} \right\}$ photographs.

B: No, she *didn't* (show him $\left\{ \begin{smallmatrix} \text{some} \\ \text{any} \end{smallmatrix} \right\}$ photographs).

[b] Like (ii) are tags with *either* or (in suitable contexts) *not even*:

I haven't finished, and you haven't *either*.

[cf: I have finished, and you have *too*.]

The baby couldn't walk, *not even* crawl.

[c] There are other features in discourse, apart from (iii), that differentiate negative from positive sentences; for example, disagreement responses:

He doesn't know Russian. - Oh yes, he *DÔES*.

He knows Russian. - Oh no, he *DÔESN't*.

Clause negation other than through verb negation

Words negative in form and meaning

10.58 Clausal negation may be accomplished by negating a clause element other than the verb with *no* or *not*, or by using a negative word such as *none* or *never*. We then sometimes have a choice between verb negation and negation of some other element (cf also 10.60):

VERB NEGATION

That was *not* an accident.

He is *not* a friend of yours.

She *isn't* any different.

NEGATION OF OTHER ELEMENT

That was *no* accident.

He is *no* friend of yours.

She is *no* different.

An honest man would *not* lie.

Dogs are *not* permitted here.

She *isn't* a fool.

I *don't* see any clouds.

He *wouldn't* say a word.

We *didn't* leave one bottle behind.

They are *not* staying with us any longer.

I *won't* make that mistake ever again.

No honest man would lie.

No dogs are permitted here.

She is *no* fool.

I see *no* clouds.

He would say *not* a word.

We left *not* one bottle behind.

They are *no* longer staying with us.

I will *never* make that mistake again.

If the negated subject is not generic (in contrast to the subject in *No honest man would lie*), there is no corresponding negation with an operator:

Not one guest arrived late.

None of us were ready.

Neither of them wanted to stay.

Not many people came to the

No one listens to me.

party.

Where negation with an operator is also possible, it has a different meaning because the scope of negation (cf 10.64) is different. For example, *Many people did not come to the party* implies the absence of many people, whereas *Not many people came to the party* implies the presence of few people. In other instances, negation with an operator is not possible because a nonassertive form would be required to replace the negated subject, but it cannot precede *not* in the sentence *No one listens to me* ~ **Anyone doesn't listen to me*.

In formal style, the negative element may be moved out of its usual position to the initial position, in which case subject-operator inversion is often required (but cf 10.66 for some initial negative adverbials that do not require inversion):

Not a word would he say.

Not a moment did she waste.

Not one bottle did we leave behind.

No longer are they staying with us.

Never will I make that mistake again.

Under no circumstances will she return here.

Not until yesterday did he change his mind.

To no one will they admit their guilt.

All the examples in this section have clausal negation, as shown by their acceptance of the criteria listed in 10.57; for example they require the positive tag question:

No dogs are permitted here, *are they*?

Under no circumstances will she return here, *will she*?

They also require nonassertives:

Neither of us has *ever* had a university education.

Negation with *no* may have different implications than verb negation with *not*. While *He is not a teacher* denotes that his occupation is not teaching, *He is no teacher* indicates that he lacks the skills needed for teaching. The

determiner *no* converts the usually nongradable noun into a gradable noun that characterizes the person. Contrast *I'm not a youngster* ['I'm not young.'], with *I'm no youngster* ['I'm quite old']; cf the idiom *I'm no chicken*, *She's not a fool* with *She's no fool* ['She's very intelligent.'], and *They didn't pay any tax this year* with *They paid no tax this year* ['They certainly should have done so.'], *He's not a diplomat* with *He's no diplomat* ['He's not diplomatic.']. A straightforward negation is *She isn't a politician*, but *She is no politician* evaluates her role and introduces gradability (cf: *She is no politician by any stretch of the imagination*).

Except for a few fixed phrases (*no good*, *no different*), the adverb *no* modifies adjectives only when they are comparatives (by inflection or by periphrasis): *no worse*, *no tastier*, *no better behaved*, *no more awkward*, *no less intelligent*. (Compare the positive with *the*: *He is the worse for it*.) For *no* as a modifier in local negation, cf 10.66.

- Note [a] If an initial negative adverbial does not cause subject-operator inversion, the negation is not clausal but local (cf 10.66). Notice the negative tag question in such instances:

Not long ago, they lived in Montreal, didn't they?

Not surprisingly, he is on a diet, isn't he?

There is no inversion with negative conjuncts (eg: *nevertheless*; *no doubt*) and negative disjuncts (eg: *not unreasonably*; *not to my surprise*).

- [b] *Not yet* does not occur initially in a finite clause: **Not yet have I seen him*. The combination can occur initially in nonfinite or verbless clauses, where there is a neutralization of *I* and *M* positions (cf 8.20 Note [b]):

Not yet having received her visa, she was unable to make arrangements for the tour.

Not yet sixteen, he has never been to an X-rated movie.

- [c] Some speakers position *no more* initially, with subject-operator inversion, as a response in discourse following a negative sentence:

A: I don't play tennis.

B: *No more* do I. ['Indeed, I don't either.']

The usual equivalent responses are *Neither do I* or *Nor do I*. In a BrE construction that some find archaic or dialectal, *no more* also occurs initially without subject-operator inversion:

A: I thought you didn't play tennis.

B: *No more* I did, until this year.

Words negative in meaning but not in form

- 10.59 There are several adverbs and determiners which are negative in meaning but not in form. They include:

seldom, *rarely*

scarcely, *hardly*, *barely*

little, *few* (in contrast to the positive *a little* and *a few*)

These can effect clause negation: for example they are followed by nonassertive forms, and sentences in which they appear generally require a positive tag question:

I seldom get *any* sleep.

Hardly *anyone* wants the job.

Few changes have *ever* taken so many people by surprise.

I can barely speak to *any* of my colleagues.

They scarcely seem to care, *do they*?

They hardly have *any* friends, *do they*?

As with other initial negative adverbials (cf 10.58), the adverbs normally cause subject-operator inversion when they are positioned initially as adverbials or as modifiers within an adverbial in literary and oratorical style:

Rarely does crime pay so well as many people think.

Scarcely ever has the British nation suffered so much obloquy.

Little did I expect such enthusiasm from so many.

As well as the determiners, the adverbs *scarcely*, *hardly*, and *barely* function within a noun phrase subject, effecting clause negation:

Scarcely any wine has yet arrived, *has it*?

Barely any arms were accumulated before the war.

Little help can be expected from Peter.

Hardly fifty people were in the vast hall.

Only is to some extent negative. When it focuses on a subject noun phrase, the latter is followed by nonassertive items:

Only two of us had any experience in sailing.

And when it focuses on a fronted initial element other than the subject, it may occasionally (but need not) take subject-operator inversion:

Only his mother will he obey.

Only on Sundays do they eat with their children.

Contrast:

Only his mother he will obey. ['It's only his mother that he will obey.']

Verbs, adjectives, and prepositions with negative meaning may be followed by nonassertive items, particularly *any* and its compounds:

He *denies* I *ever* told him.

I *forgot* to ask for *any* change. [also: *some change*; The meaning would then be 'I wanted some change, but forgot to ask for it.']

She *avoided* *ever* speaking to us.

We are *unaware* of *any* hostility.

They were *unwilling* *ever* to accept our help.

I'm *against* going out *anywhere* tonight. [also: *somewhere*]

They decided to leave *without* telling *any* of their friends. [also: *some of their friends*]

Nonassertive items also follow implied negation:

Take it before he says *anything*. ['... so that he doesn't say anything'; also: *something*]

- Note [a] *Rarely* may be positive when placed initially, in which case it does not cause subject-operator inversion:

Rarely, crime pays well. ['On rare occasions, crime pays well.']

- [b] The noun phrase on which *only* focuses may contain an assertive item, but not a nonassertive item:

Only { *some*
**any* } of us had any experience in sailing.

Contrast:

Scarcely
Hardly
Barely

{ *some
 any } of us had any experience in sailing.

[c] Informally, *hardly* and (to a lesser extent) *scarcely* sometimes cooccur with the clause negator, although there are prescriptive objections to this usage on the grounds that these adverbs are negative in themselves. The most common combinations are *can't hardly* and *couldn't hardly*:

?I can't hardly see the words.

[d] Speakers vary in the extent to which they accept negative tag questions following these negative words. The tag questions seem most acceptable when positioned close to the end of the sentence:

He sees his parents rarely, *doesn't he?*

Hardly seems most resistant to a negative tag question:

?*He was hardly audible, *wasn't he?*

[e] *Just* is the positive adverb that is closest semantically to these negative adverbs. Compare *hardly* and *just* in these sentences:

{ He *hardly* slept a wink.
 He *just* slept a little.

{ I could *hardly* see her.
 I could *just* see her.

{ She had *hardly* arrived when the orchestra started.
 She had *just* arrived when the orchestra started.

Nonassertive items and negative items

10.60 As has already been pointed out (cf 10.57ff), clause negation is frequently followed (not necessarily directly) by one or more nonassertive items. Common nonassertives are listed below in the third column, and the corresponding assertive and negative items are given in parallel columns. (On nonassertive pronouns, cf further 6.59ff).

SYNTACTIC CLASS	ASSERTIVE	NONASSERTIVE	NEGATIVE
(1) determiner	<i>some</i>	<i>any</i>	<i>no</i>
(2) determiner	<i>(either one or the other)</i>	<i>either</i>	<i>neither</i>
(3) pronoun	<i>some</i>	<i>any</i>	<i>none</i>
(4) pronoun	<i>(one or the other)</i>	<i>either</i>	<i>neither</i>
(5) pronoun	<i>something</i>	<i>anything</i>	<i>nothing</i>
(6) pronoun	<i>somebody</i>	<i>anybody</i>	<i>nobody</i>
(7) pronoun	<i>someone</i>	<i>anyone</i>	<i>no one</i>
(8) process adverb	<i>somehow</i>	<i>(in any way)</i>	<i>(in no way)</i>
(9) place adverb	<i>somewhere</i>	<i>anywhere</i>	<i>nowhere</i>
	<i>someplace</i>	<i>anyplace</i>	<i>no place</i>
	<informal AmE>	<informal AmE>	<informal AmE>
(10) time adverb	<i>sometime(s)</i>	<i>ever</i>	<i>never</i>
	<i>always</i>	<i>anytime</i>	
		<informal AmE>	
(11) time adverb	<i>already</i>	<i>yet</i>	—
(12) time adverb	<i>still</i>	<i>any more</i>	<i>no more</i>
		<i>any longer</i>	<i>no longer</i>
(13) degree adverbial	<i>(to some extent)</i>	<i>at all</i>	—
(14) degree adverbial	<i>somewhat</i>	<i>any (the)</i>	<i>no, (none the)</i>
			(cf [14] below)
(15) additive adverbial	<i>as well, too</i>	<i>either</i>	(cf Note [a])

The combination of *not* with a nonassertive form can be replaced, in most instances, by the negative word in the right-hand column; there are consequently two negative equivalents of each positive sentence:

- [1] We've had some lunch. ~ { We haven't had any lunch.
We've had no lunch.
- [2] He saw one man or the other. ~ { He didn't see either man.
He saw neither man. <unusual>
- [3] We've had some. ~ { We haven't had any.
We've had none.
- [4] He saw one or other of the men. ~ { He didn't see either of the men.
He saw neither of the men.
- [5] I've bought something for you. ~ { I haven't bought anything for you.
I've bought nothing for you.
- [6] I was speaking to somebody. ~ { I wasn't speaking to anybody.
I was speaking to nobody.
- [7] I was speaking to someone. ~ { I wasn't speaking to anyone.
I was speaking to no one.
- [8] They'll finish it somehow. ~ { They won't in any way finish it.
They won't finish it at all.
They will in no way finish it.
- [9] He'll meet us somewhere. ~ { He won't meet us anywhere.
He'll meet us nowhere. (cf Note [b])
- [10] He sometimes [or *always*] visits us. ~ { He doesn't ever visit us.
He never visits us.
- [11] They've arrived already. ~ They haven't arrived yet.
- [12] He's still at school. ~ { He's not at school any longer.
He's no longer at school. more.
- [13] I can help (to some extent). ~ I can't help at all.
- [14] I'm (somewhat) wiser now. ~ { I'm not any (the) wiser now.
I'm { no
none the } wiser now.
- [15] Her mother's coming, too. ~ Her mother's not coming either.

In all cases (except possibly that of *never*), the combination of *not* (-n't) and the nonassertive word is more colloquial and idiomatic than the negative variant. The absence of a negative word for *yet*, *at all*, and *either* means that there is only one negative version in examples 11, 13, and 15 (but cf Note [a]).

Assertive items may follow a negative if they fall outside the scope of negation (cf 10.64).

The primary difference between *some* and *any* (and between the *some*- and *any*- compounds) is that *some* is specific, though unspecified, while *any* is nonspecific. That is, *some* implies an amount or number that is known to the

speaker. This difference tends to correlate with the difference between positive and negative contexts:

I have *some money* on me. [a specific, though unspecified amount of money]

I don't have *any money* on me. [an unspecified, and also nonspecific amount of money; no limit on the amount is assumed]

Note [a] It is not quite true to say that there is no negative word corresponding to the adverb *either*; *neither* and *nor* both occur as negative additive subjuncts, but only in an initial position with negative inversion:

He couldn't speak, (and) *neither* could he walk.

He couldn't speak, *nor* could he walk.

He couldn't speak, and he couldn't walk *either*.

He couldn't speak or walk *either*.

All these sentences mean the same, but the first two are somewhat literary in tone, while the last two are decidedly colloquial.

[b] *Nowhere* is more usual when a modal auxiliary is present. Compare *I can find it nowhere* with the unusual *I found it nowhere* and *I've found it nowhere*. But *cf* the usual *It's nowhere to be found* ['It can't be found anywhere.'].]

Nonassertive contexts

10.61 Apart from negative contexts, nonassertive items appear in a number of other contexts. They include:

(i) *Yes-no* questions that expect a negative response or are neutral in expectation (11.6f):

Do you know any of the teachers here?

(ii) *wh*-questions (11.14ff):

Who has ever read the play?

(iii) putative *should*-clauses (14.25):

It's odd that he should ever notice it.

(iv) conditional clauses (15.33ff):

If anyone ever says that, pretend not to hear.

(v) comparative clauses (10.63ff):

I have more stamps than I've yet shown you.

(vi) restrictive relative clauses modifying generic noun phrases, where the clauses have conditional meaning:

Students who have any complaints should raise their hands.

['If students have any complaints, they should raise their hands.']

All that he has ever said confirms my suspicions of his motives.

(vii) after words that are morphologically negative or that have negative import:

It's *unlikely* that she has ever been to Scotland.

You still have time *before* you have any need to register.

['You don't have any need to register now.']

He's *too* old to play any rigorous games.

['He doesn't play any rigorous games.']

They can *prevent* any demonstrations.

I *fail* to see any force in your arguments.

I'm *reluctant* to give her any advice.

It's *hard* to do any work under these conditions.

Note [a] Some verbs (sometimes in combination with certain modal auxiliaries) tend to occur in negative or other nonassertive contexts:

I { *can't* / *couldn't* } { *bear* / *stand* / *abide* } that type of music. [*cf* ?*I can bear that type of music.*]

They don't *mind* waiting. [*cf*: **They minded waiting.*]

I wouldn't *care* to be in his shoes.

My parents didn't *budge* from their first offer.

I won't *let* on what I saw.

On the other hand, *would rather* cannot be negated in a declarative sentence (*cf* 3.45):

I'd rather have an apple. [*cf*: ~ *I wouldn't rather have an apple*; acceptable only as a denial sentence]

Would(n't) you rather have an apple?

The lexical verb can be negated: *I'd rather not tell you about it.*

When used as modal auxiliaries, *need* (esp BrE as a modal) and *dare* are restricted to nonassertive contexts. Stereotyped *I daresay* is an exception.

[b] *Much*, *many*, and *far* tend to be restricted to nonassertive contexts when unmodified:

I don't like them (very) *much*.

I don't have (very) *much* money.

We didn't see (very) *many* on our last visit.

They don't live (very) *far* from us.

On the other hand, other items that are semantically similar tend to be restricted to assertive contexts:

I like them { *a great deal* / *a little* }. We saw { *a good many* / *a great many* / *a few* } on our last visit.

Contrast:

They { *live* / *don't live* } { *very far* / *too far* / *a long way* } from us.

Temporal *long* and *very long* tend to be restricted to assertive contexts:

I can't stay (very) *long*.

Contrast:

I can(t) stay { *longer* / *a long time* }.

Negative intensification

10.62 There are various ways of giving emotive intensification to a negative, some examples of which are given here. Nonassertive expressions of extent besides *at all* include:

by any means *in any way*
in the slightest *a bit* <informal>
in the least

Negative determiners and pronouns are given emphasis by *at all*, *whatever*, and *whatsoever*:

I found nothing *at all* the matter with him.

You have no excuse *whatever*.

Never is repeated for emphasis, or else combined with an intensifying phrase such as *in (all) my life*:

I'll never, never go there again.
I've never in all my life seen such a crowd.

Never itself may serve for some as an emphatic informal negative in denials:

(?)I never stayed there last night. ['I certainly didn't stay there last night.']

The combinations *not one* and *not a (single)* are emphatic alternatives to *no* as a countable determiner (cf 10.58):

Not a word came from her lips. We left not a single bottle behind.

Other emotively coloured expressions include:

He didn't give me *a thing*. <informal>
I don't care *a damn* whether we win or lose. <familiar>
She didn't say *a word* about it. <informal>
No way will I accept such an offer. <familiar>

Some expressions are formed in combination with specific verbs:

He won't *lift a finger* to help you. I won't *drink a drop*.
I didn't *sleep a wink*. He didn't *move a muscle*.
She didn't *bat an eye(lid)*. We didn't *see a soul*.
They won't *budge an inch*.

On the other hand, the intensifiers *quite*, *pretty*, and *rather* are assertive:

They drive $\left\{ \begin{array}{l} \text{quite} \\ \text{pretty} \\ \text{rather} \end{array} \right\}$ fast.

Contrast the unacceptability (except in denial sentences) of:

*They don't drive $\left\{ \begin{array}{l} \text{quite} \\ \text{pretty} \\ \text{rather} \end{array} \right\}$ fast.

Similarly, *far* as intensifier of comparatives is assertive:

The food was *far* better than I expected.
*The food *wasn't far* better than I expected.

Other assertive intensifiers include *no end (of)*, which intensifies noun phrases as well as verbs:

She praised the play *no end*. It was *no end* of a mess.

For assertive *rather* in *would rather*, cf 10.61 Note [a], and for assertive *much*, cf 10.61 Note [b].

Note [a] *To speak of* is an informal nonassertive downtoner (8.111ff):
They haven't any money, *to speak of*.

[b] *Quite* is acceptable in a negative sentence when it modifies a phrase with the postmodifier *enough*:

They don't drive *quite* fast enough. It wasn't *quite* long enough.

[c] In informal style, *too* may be synonymous with *very*; hence, there may be a shift of meaning in negation or when *too* modifies words with negative meaning:

They drive *too* fast. ['They drive faster than they should'; 'They don't drive slowly enough.']
They don't drive *too* fast. ['They don't drive very fast'; the sentence can also be a denial of the positive statement.]

That's *too* bad. ['That's very bad.']

[d] *Could care less* (esp AmE) is sometimes used in the same sense as *couldn't care less*, but there are prescriptive objections to the locution.

[e] *Ever* is sometimes used as an intensifier in combination with *never*: *I'll never ever stay with them again*.

More than one nonassertive item

10.63 If a clause is negative, it is usually negative throughout, or at least until the beginning of a final adjunct (cf 10.64). Nonassertive items must normally be used after the negative element in place of *every* assertive item that would have occurred in the corresponding positive clause:

I've never travelled *anywhere* by air *yet*.
I haven't *ever* been on *any* of the big liners, *either*.
No one has *ever* said *anything* to *either* of us.
Not many of the refugees have *anywhere* to live *yet*.

Notice that negative items (normally only one) must always precede the nonassertive items, as in this series of corresponding clauses:

I *don't* give *any* pocket money to *any* of my children at *any* time.
I give *no* pocket money to *any* of my children at *any* time.
I give pocket money to *none* of my children at *any* time.
I give pocket money to my children at *no* time.

The further the negative word is postposed, the more questionable the sentence is, because the sentence is at first perceived as positive and then has to be reinterpreted as negative.

Note In nonstandard English, a negative item can be used wherever in standard English a nonassertive item follows a negative:

STANDARD: No one *ever* said *anything* to *anybody*.

NONSTANDARD: No one *never* said *nothing* to *nobody*.

Such double or multiple negatives are condemned by prescriptive grammatical tradition (cf further 10.70).

Scope of negation

10.64 A negative item may be said to govern (or determine the occurrence of) a nonassertive only if the latter is within the SCOPE of the negative, *ie* within the stretch of language over which the negative item has a semantic influence. The scope of the negation normally extends from the negative item itself to the end of the clause, but it need not include an end-placed adverbial. In a clause with the clause negator *not* or a negative word such as *never* or *hardly* in the same position after the operator, adverbials occurring before the negative normally lie outside the scope. There is thus a contrast between:

She definitely didn't speak to him.

[It's definite that she didn't speak to him.]

She didn't definitely speak to him.

[It's not definite that she spoke to him.]

(The scope is marked by the horizontal brackets.)

When an adjunct is final, it may or may not lie outside the scope:

I wasn't Listening all the TIME. [1]

I wasn't listening all the TIME. [2]

The difference of scope, which is here marked by intonation, reflects an important difference of meaning: [1] means 'For the whole time, I wasn't listening', whereas [2] means 'It is not true that I was listening all the time'. If an assertive form is used in the adjunct, the adjunct must lie outside the scope; therefore [3] and [4] below parallel [1] and [2]:

I didn't listen to some of the speakers. [3]

[There were some of the speakers that I didn't listen to.]

I didn't listen to any of the speakers. [4]

[There were not any speakers that I listened to.]

Disjuncts and conjuncts (cf 8.121ff) always lie outside the scope of clause negation, whatever their position:

She doesn't know him, unfortunately.

She doesn't know him, however.

The scope can sometimes extend into a subordinate clause:

She didn't know I would come to her *whenever she needed any advice*.

I wouldn't like you *to disturb anyone*.

Note When a negative adverbial is positioned initially, the subject and operator follow the negative item. In that case, the subject may have a nonassertive form:

Never have any of them been interested in music.

Very occasionally, the scope of negation may extend to an adjunct that has been fronted from its normal position, in which case a nonassertive may occur in the adjunct (without subject-operator inversion):

To any of those speakers I wouldn't listen. <rare>

A more common fronting (with subject-operator inversion) is:

To none of those speakers would I listen.

The normal form is:

I wouldn't listen to any of those speakers.

Focus of negation

10.65 We need to identify not only the scope, but also the FOCUS of negation. A special or contrastive nuclear stress falling on a particular part of the clause indicates that the contrast of meaning implicit in the negation is located at that spot, and also that the rest of the clause can be understood in a positive sense. To distinguish the parts that are to be understood negatively and positively, we need to refine our notion of scope to allow for DISCONTINUOUS SCOPE and also to allow for the part preceding the negative item to come within the scope of negation. Different placements of the focus distinguish the following sentences. The parts that are not within the scope are understood positively:

I didn't take Joan to swim in the PÖÖL today. – I forgot to do so.

I didn't take JÖÄN to swim in the pool today. – It was Mary.

I didn't take Joan to swİM in the pool today – just to see it.

I didn't take Joan to swim in the PÖÖL today. – I took her to the seaside.

I didn't take Joan to swim in the pool toDÄY. – It was last week that I did so.

I didn't take Joan to swim in the pool today. – It was my brother who took her.

The positive implications can be made explicit by alternative negation:

I don't like cÖRfee, but I do like TËÄ.

I don't mind the NÖISE, but I do mind the HËÄT.

or by focused negation:

It's not cÖRfee that I like (, but tea).

It's not the NÖISE that I mind (, but the heat).

Scope and focus are interrelated such that the scope must include the focus. From this it follows that one way of signalling the extent of the scope is by the position of the focus. Indeed, since the scope of the negation is often not otherwise clearly signalled, we can indicate it by where we place the information focus. One example of this is when the scope of the negation is atypically extended to include a subordinate clause, with a contrastive fall-rise to emphasize this:

I didn't leave HÖME because I was afraid of my FÄTHER. [1]

[= Because I was afraid of my father, I didn't leave home.]

[12] exhibits local negation, not clause negation. On the other hand, sentences [10] and [11] do not correspond to negative sentences, because the adjective phrases are not clause elements, but are embedded in noun phrases that are elements. The adjective phrases correspond to an antonymous adjective modified by a downtoner: 'rather tame dogs' [10], 'a somewhat unsympathetic report' [11].

Not may also modify adverbial expressions of extent in distance or time:

- | | |
|---|------|
| They live <i>not far</i> from us. | [15] |
| I saw Dave <i>not long ago</i> . ['fairly recently'] | [16] |
| We were there <i>not many years</i> after the war. ['just a few years'] | [17] |

Since the modified phrase is a clause element in [15], the sentence corresponds to a negative sentence ('They don't live far away from us.').

The quantifiers *a few* and *a little* may be negated by *not* and the quantifier *little* by *no*:

- They have *not a few eccentrics* in their family.
 I sensed *not a little hostility* in his manner.
 They displayed *no little interest* in her progress. <formal>

These negative quantifiers have the clear force of understatement. A similar effect is conveyed by the comparatives *more*, *less*, and *fewer* when they are negated by either *not* or *no*:

- You may take *no more* than an hour's break for lunch.
 They'll pay you *not less* than ten dollars an hour.
 I have been able to collect *no fewer* than sixty signatures for the petition.

No is somewhat more emphatic than *not* in these contexts.

Prepositional phrases may also be negated, whether as adjuncts or as postmodifiers in noun phrases, by a negative word within the complement:

- He was decorated by *none other than the President*.
 I'll give it to you *for nothing*.
 We cleared the table *in no time*.
 She replied *with not a moment's hesitation*.
 [cf: *without a moment's hesitation*]
 The brothers set out on their hike *with never a worry in the world*.
 Our house has one wall *with no windows*.
 It was a decision *of no consequence*.

An unusual type of local negation appears in noun phrases that express a compressed predication:

- No news is good news.
 ['Receiving no news is good news.']
 The company promised no victimization.
 ['The company promised that there would be no victimization.']
 Something is better than nothing.
 ['Having something is better than having nothing.']
 The children want nothing but television.
 ['The children want to do nothing but watch television.']

In local negation, an initial negative adverbial does not cause subject-operator inversion (cf 10.58f). We may therefore contrast local negation in the [a] sentences below with clause negation in the [b] sentences. The [a] sentences are distinctly less usual:

- | | |
|---|-------|
| In no time we cleared the table.
['We cleared the table within a short time.'] | [18a] |
| At no time was war as imminent as now.
['War wasn't as imminent as now at any previous time.'] | [18b] |
| Not even ten years ago you could see such a film.
['You could see such a film as recently as ten years ago.'] | [19a] |
| Not even ten years ago could you see such a film.
['You couldn't see such a film even ten years ago.'] | [19b] |
| (Even) with no coaching he will pass the exam.
['He will pass the exam (even) without coaching.'] | [20a] |
| With no coaching will he pass the exam.
['Whatever coaching is provided will not enable him
to pass the exam.'] | [20b] |

The paraphrases show that semantically the [a] sentences are positive and the [b] sentences are negative. The [a] sentences take a negative tag question (*In no time we cleared the table, didn't we?*) whereas the [b] sentences take a positive tag question (*At no time was war as imminent as now, was it?*)

It is convenient to refer briefly here to the uses of the negative response word *no*. The selection of *no* is determined by whether it negates the implied or given statement:

- | | | |
|--------------------------------------|--------------------|------|
| A: I didn't do too good a job today. | B: No, you DIDN't. | [21] |
| A: I did a good job today. | B: No you DIDN't. | [22] |

Notice that the use of *no* is not determined by the speaker's disagreement with a previous speaker's statement, since in [21], unlike [22], speaker B agrees with speaker A. Contrast:

- | | | |
|--------------------------------------|------------------|------|
| A: I didn't do too good a job today. | B: Yes, you DID. | [23] |
| A: I did a good job today. | B: Yes, you DID. | [24] |

Yes is used in [23] even though speaker B disagrees with speaker A. The same principle applies to responses to *yes-no* questions:

- | | |
|-------------------|---------------------|
| A: Is it raining? | B: { Yes (, it IS). |
| | { No (, it ISN't). |

But since the *yes-no* question typically asks for a response on the truth value of the corresponding statement ('Is it or is it not true that it's raining?'), the responses coincide with an assertion (*yes*) or a denial (*no*) of its truth value.

Note [a] Local negation also occurs in correlation with *but* when *not* is positioned before a clause element (cf 13.42):

- They want not your pity but your help.
 [cf clause negation: They don't want your pity but your help.]

You should pay attention not to what they say but to what they do.

I saw not ONE official, but THREE.

A tone unit boundary is normal before *not*.

[b] *They argued about nothing* is ambiguous under clause and local negation: 'They didn't argue about anything' or 'They argued, but the argument was about nothing (of significance)'.

[c] For *not* as a pro-form for a negative direct object clause (as in *I believe not, I hope not, I guess not*), cf 12.28.

Negation of modal auxiliaries

Present forms of modals

- 10.67 The scope of negation may or may not include the meaning of the modal auxiliaries. We therefore distinguish between AUXILIARY NEGATION and MAIN VERB NEGATION. The contrast is shown in the two following sentences with *may not*, where the paraphrases indicate the scope of negation:

AUXILIARY NEGATION

You may not smoke in here. ['You are not allowed to smoke in here.']

MAIN VERB NEGATION

They may not like the party.

['It is possible that they do not like the party.']

We give examples below of the modal auxiliaries, according to whether the scope of negation usually includes the auxiliary or excludes it. The senses of the modal auxiliaries are discussed in 4.49ff.

AUXILIARY NEGATION

may not [= 'permission']

You may not go swimming. ['You are not allowed ...']

cannot, can't [in all senses]

You can't be serious. ['It is not possible that ...']

You can't go swimming. ['You are not allowed to ...']

He can't ride a bicycle. ['He is not able to ...']

need not, needn't <both esp BrE>

You needn't pay that fine. ['You are not obliged to ...']

It needn't always be my fault. ['It is not necessary that ...']

dare not, daren't

I daren't quarrel with them.

['I haven't got the courage to quarrel with them.']

MAIN VERB NEGATION

may not [= 'possibility']

They may not bother to come if it's wet.

['It is possible that they will not bother to come ...']

shall not, shan't <all senses; esp BrE; *shan't* rare even in BrE>

Don't worry. You shan't lose your reward.

['I'll make sure that you don't lose your reward.']

I shan't know you when you return. ['I predict that I will not know ...']

must not, mustn't ['obligation']

You mustn't keep us waiting.

['It is essential that you don't keep us waiting']

ought not, oughtn't [both senses; for *ought* with the bare infinitive, cf 3.43
Note [a]]

You oughtn't to keep us waiting. ['obligation']

He oughtn't to be long. ['tentative inference']

The distinction between auxiliary and main negation is neutralized for *will* in all its senses, as the paraphrases below indicate:

Don't worry. I won't interfere. ['I don't intend to interfere'; 'I intend not to interfere.']

He won't do what he's told. ['He refuses to do what he's told'; 'He insists on not doing what he's told.']

They won't have arrived yet. ['It's not probable that they've arrived yet'; 'I predict that they haven't arrived yet.']

The auxiliary negation of *must* in the logical necessity sense is usually achieved through *can't*:

They *must* be telling lies. ['It is certain that they are telling lies.']

~ They *can't* be telling lies. ['It's not possible that they are telling lies.']

But *must not* and *mustn't* occur in this sense occasionally in AmE and, still more occasionally, in BrE. This use (instead of *can't*) seems to be gaining favour. A less emphatic negation of *must* in the same sense may be achieved with *needn't* and *don't have to* <esp AmE>, both of which have the epistemic meanings of 'not necessary' and 'not obliged to':

It *must* be hot now in Florida.

~ It { *doesn't have to* / *needn't* } be hot in Florida now.

['It's not certain that it is hot in Florida now' or 'It's not necessarily the case that it is hot in Florida now.']

The auxiliary negation of *must* in the obligation sense is *needn't* or *don't have to*:

A: Must we pack now?

B: No, we $\left\{ \begin{array}{l} \text{don't have to} \\ \text{needn't} \end{array} \right\}$ pack till tomorrow.

['It is not necessary for us to pack till tomorrow'; 'We are not obliged to pack till tomorrow.']

Because of the diametric opposition of meaning between 'permission' and 'obligation', an odd-seeming equivalence exists between *may not* ['not permitted to'] and *mustn't* ['obliged not to']:

You mustn't go swimming today.

= You may not go swimming today.

In the possibility sense, *cannot* and *can't*, which take auxiliary negation, contrast with *may not*, which takes main verb negation:

She can't be serious. ['It's not possible that she's serious.']

She may not be serious. ['It's possible that she's not serious.']

Past forms of modals

- 10.68 The past tense negative auxiliaries (*mightn't*, *couldn't*, *wouldn't*, *shouldn't*) follow the same negative pattern as their present tense equivalents (but cf 4.61ff):

AUXILIARY NEGATION

could not, *couldn't* [in all senses]

She couldn't be serious. ['It is not possible . . . , is it?']

We couldn't smoke in the restaurant. ['We were not allowed to . . .']

He couldn't drive a car. ['He was not able to . . .']

MAIN VERB NEGATION

might not, *mightn't*

They might not be telling lies. ['It is possible that they are not . . .']

should not, *shouldn't* [all senses]

You shouldn't say anything. ['You are advised not to say anything.']

We shouldn't be long. ['According to my information, we won't be long'.]

They shouldn't be there yet. ['It is probable that they are not there yet.']

As is the case with *will* (cf 10.67), the distinction between auxiliary and main verb negation is neutralized for *would* in all senses:

He wouldn't carry the baby. ['refused to carry' or 'insisted on not carrying']

He usually wouldn't drive to work. ['was not in the habit of driving' or 'was in the habit of not driving']

That wouldn't be the doorbell. ['It's not probable that it's the doorbell' or 'I predict that it's not the doorbell.']

The past tense negative auxiliaries display contrasts in the scope of negation similar to those for the present tense form. *Could not* and *couldn't* contrast with *might not* and *mightn't*:

She couldn't be serious. ['It's not possible that she is serious' or 'She was not able to be serious.']

She might not be serious. ['It's possible that she is not serious.']

Similar contrasts are found between *shouldn't*, on the one hand, and *couldn't*, *needn't*, and *don't have to*, on the other hand:

It shouldn't be hot in Florida now. ['It's likely that it's not hot in Florida now.']

It couldn't be hot in Florida now. ['It's not possible that it's hot in Florida now.']

It $\left\{ \begin{array}{l} \text{needn't} \\ \text{doesn't have to} \end{array} \right\}$ be hot in Florida now.

['It's not certain that it's hot in Florida now.']

Note [a] *Might* and *might not* in the permission sense are rare, occurring chiefly in polite questions:

Might I (not) have a word with you?

I wonder whether I might (not) have a word with you.

[b] The marginal modal auxiliary *need* forms its past equivalent with *have* (esp BrE):

You needn't have paid that fine. ['You didn't need to pay . . . (BrE and AmE)']

The marginal modal auxiliary *dare* has a past form *dared* (esp BrE):

I dared not quarrel with them.

Negation with *do* and the bare infinitive is usual both for the present and the past:

I $\left\{ \begin{array}{l} \text{don't} \\ \text{didn't} \end{array} \right\}$ dare quarrel with them.

The lexical verbs are more commonly used: *didn't need to*, *didn't dare to* (cf 3.40ff for a more detailed discussion).

Predication negation

- 10.69 Very rarely, PREDICATION NEGATION occurs in the context of denials and permission. In predication negation, a modal auxiliary is used with a different scope of negation than is normal for that auxiliary. With a special emphatic pause before *not*, one might say:

They may not go swimming. ['They are allowed not to go swimming.']

You can (simply) not obey the order. ['It's possible for you not to obey the order.']

In such instances of main verb negation, the clause is not negated (*cf* 10.57), since we can say (though it is unusual to do so):

A: They don't want to go swimming.

B: I suppose so. OK, let's agree that they may 'not go swimming.

A: YÈS, they MÀY.

You can 'not obey the order, can't you?

On the other hand, this predication negation differs from local negation (*cf* 10.66) in that it can extend over several clause elements beginning with the main verb.

Predication negation may also be followed by nonassertive forms:

You could 'not attend any of the meetings. ['It's possible for you not to attend any of the meetings.']

Because both kinds of negation may occur with the same auxiliary, acceptable instances of two negators in the same clause sometimes arise:

I can't 'not obey her. ['It's not possible for me not to obey her', 'I have to obey her.']

You can't 'not admire him. ['It's not possible for you not to admire him', 'You have to admire him.']

More natural ways of expressing a corresponding negation would be:

I can't help obeying her.

I can't help but obey her. ['The only thing I can do is to obey her.']

You can't help admiring him.

You can't (help) but admire him.

On the subjunct use of *but*, *cf* 8.111.

Occasionally, two negators may be used with auxiliaries other than modals:

She didn't 'not like them. ['She didn't dislike them.']

They don't often 'not remember her birthday.

['They don't often fail to remember her birthday.']

He hasn't ever 'not understood a lecture.

['He hasn't ever failed to understand a lecture.']

Double negation

10.70 As we have seen in 10.69, two negatives occasionally occur in the same clause. Our example there involved a combination of auxiliary and main verb negation, but other combinations occur:

Not many people have nowhere to live. ['Most people have somewhere to live.']

No one has nothing to offer to society. ['Everyone has something to offer to society.']

Nobody has nothing to eat. ['Everyone has something to eat.']

Not all imperatives have no subject. ['Some imperatives have a subject.']

Never before had none of the committee members supported the mayor.

['Some of the committee members had always supported the mayor before.']

None of us have never told lies. ['All of us have told lies at some time.']

These sentences are somewhat similar to the double negative of logic: each negative has its separate value, and it is possible to find paraphrases, like those just given, which cancel out each negative, leaving an entirely positive sentence in meaning. Syntactically, however, the sentences are negative; for example, they require positive tag questions (*cf* 11.8ff):

Not all imperatives have no subject, *do they?*

The double negation in standard English is very different from the double or multiple negation in nonstandard English, where the additional negatives are used in place of nonassertive words in standard English (*cf* 10.63 Note). The additional negatives in nonstandard English do not cancel out previous negatives.

Sentence types

Formal classification

- 11.1 In Chapter 10 we described the simple sentence primarily in terms of declarative sentences. We now turn to the other major types of sentences. These are more easily described in relation to the declarative, since to describe them we require additional rules; for example, we need rules for the insertion of DO as operator in many *yes–no* interrogatives, for the initial positioning of the *wh*-element in *wh*-interrogatives and in exclamatives, and for the presence or (generally) absence of a normally obligatory subject in imperatives.

Simple sentences may be divided into four major syntactic types differentiated by their form. Their use correlates largely with different discourse functions (*cf* 11.2).

(I) DECLARATIVES are sentences in which the subject is present and generally precedes the verb:

Pauline gave Tom a digital watch for his birthday.

On exceptional declaratives not containing a subject *cf* 12.46*ff*.

(II) INTERROGATIVES are sentences which are formally marked in one of two ways:

(i) *yes–no* interrogatives: the operator is placed in front of the subject:

Did Pauline give Tom a digital watch for his birthday?

(ii) *wh*-interrogatives: the interrogative *wh*-element is positioned initially:

What did Pauline give Tom for his birthday?

(III) IMPERATIVES are sentences which normally have no overt grammatical subject, and whose verb has the base form (*cf* 3.2):

Give me a digital watch for my birthday.

(IV) EXCLAMATIVES are sentences which have an initial phrase introduced by *what* or *how*, usually with subject–verb order (*cf* 11.31*f*):

What a fine watch he received for his birthday!

There are also some minor sentence types, which will be considered in 11.38*ff*.

- Note [a] For (II) above, the operator need not be placed immediately in front of the subject (*cf* 11.7).
[b] For dependent interrogatives, *cf* 15.5*f*; for dependent exclamatives, *cf* 15.7; for correspondences in indirect speech, *cf* 14.33.

Discourse functions

- 11.2 Associated with these four sentence types are four classes of discourse functions:

(a) STATEMENTS are primarily used to convey information.

- (b) QUESTIONS are primarily used to seek information on a specific point (cf 11.4ff).
 (c) DIRECTIVES are primarily used to instruct somebody to do something (cf 11.24ff).
 (d) EXCLAMATIONS are primarily used for expressing the extent to which the speaker is impressed by something (cf 11.31f).

Direct association between syntactic class and semantic class is the norm, but the two classes do not always match, as the following sentences illustrate:

Pauline gave Tom a digital WATCH?	[1]
What do I care?	[2]
I'd love a cup of TEA.	[3]
Isn't Christine CLÉver!	[4]

[1] is a declarative question (cf 11.12); it is syntactically declarative but semantically a question. On the other hand, the rhetorical question (cf 11.23) in [2] is syntactically an interrogative but semantically a statement ('I certainly don't care'). In [3] the declarative is semantically a directive suggesting that the hearer bring the speaker a cup of tea. Finally, [4] is syntactically interrogative but semantically an exclamation; contrast *How clever Christine is!*, which is syntactically exclamative as well as semantically an exclamation.

Note A traditional term for directive is 'command', but that has a more restricted meaning in this book, cf 11.29.

Illocutionary acts

- 11.3 The four semantic classes of discourse functions constitute a closed class of sentence categories that distinguish discourse functions at the most general level. But we can make many more refined distinctions. For example, a statement can be used to make an assertion [1], to make a prediction [2], or to offer an apology [3]:

Engineers are building massive hydroelectric projects in China.	[1]
It's going to rain any minute now.	[2]
I'm sorry about the delay.	[3]

Assertion, prediction, and apology are pragmatic categories that indicate how the semantic classes of sentences are used in actual utterances.

Utterances of sentences are SPEECH ACTS, *ie* acts of verbal behaviour (spoken or written). When a person performs a speech act, that person at one and the same time utters a particular utterance, namely a LOCUTIONARY ACT. We use ILLOCUTIONARY ACT to refer to a speech act identified with reference to the communication intention of the hearer. The intended effect of an illocutionary act is its ILLOCUTIONARY FORCE. Occasionally, the speaker explicitly refers to the illocutionary act being performed by using a PERFORMATIVE VERB:

I apologize for my remarks.
 Your presence at the meeting *is requested*.

I promise you a bicycle for your birthday.
 Smoking in this compartment *is forbidden*.

But generally, performative verbs are not present in speech acts.

Illocutionary acts are typically associated with particular semantic classes of sentences – for example, inquiry with questions; and requests, commands, and invitations with directives – though statements are related to a very large range of illocutionary acts. But semantic and pragmatic classes are not always directly associated, any more than semantic classes and syntactic types (cf 11.2). Sentences from one semantic class are very often used to express an illocutionary act typically associated with sentences from a different semantic class. In such instances, the sentence retains its normal semantic status but is at the same time indirectly used to perform another type of illocutionary act. Here are some examples of such INDIRECT SPEECH ACTS:

I think you'd better leave at once. [request by statement]
 Dinner is ready. [request to come to eat by statement]
 Could you please make less noise? [request by question]
 Do you happen to have a pencil? [request to be given a pencil by question]
 Tell me what you want. [inquiry by directive]
 I'd like to know the name of your last employer. [inquiry by statement]
 Do you want another cup? [offer by question]
 Remember that I'm always ready to help. [offer by directive]
 Why don't you take an aspirin? [advice by question]
 I'd sell your car if I were you. [advice by statement]

The illocutionary force of an utterance is dependent on the context, and a particular utterance may have different illocutionary force in different contexts. For example, the sentence *My husband will be back soon* may be intended, among other possibilities, as a promise, a threat, or a warning. Furthermore, the categorization of illocutionary acts might suggest discrete distinctions that we often cannot make. Thus *Why don't you take an aspirin?* is indeterminate, in the same context, between advice and recommendation, and *Would you like to come outside and sit in the sun?* is poised between invitation and suggestion.

Note [a] Some performative verbs may be required or may be usual in ritual or legal situations:

I sentence you to one year's imprisonment. I name this ship Dreadnought.
 The possible insertion of *hereby* is an indication of the performative use of the verb:
 I hereby name this ship Dreadnought.

The same verb may be used in sentences which merely report the performative speech act:
 She named that ship Dreadnought.

[b] One type of indirect speech act involves HEDGED PERFORMATIVES, which refer to the performance of a speech act indirectly, even though a performative verb is present:

I must apologize for my behaviour.
I can swear that I locked the door.
I would like to thank you for your hospitality.
I am happy to inform you that you have passed the examination.

For example, in *I must apologize for my behaviour* the sentence merely refers to an obligation to perform an apology, but the implication is that the acceptance of the obligation is equivalent to the performance.

[c] The indirectness of a speech act is commonly due to tact on the part of the speaker, who leaves it to the hearer to make the appropriate inferences. Thus, *It's cold in here* may indirectly convey a request to close a window or door or to turn on a heater, or it may indirectly convey a suggestion for those present to move elsewhere. The hearer is given a choice of responses. Similarly, *Your tie is not straight* allows the hearer to draw inferences, and is therefore more polite than *Straighten your tie*.

Questions

Major classes

- 11.4 Questions can be divided into three major classes according to the type of reply they expect:

- (1) Those that expect affirmation or negation, as in *Have you finished the book?*, are **YES-NO** questions (cf 11.5ff);
- (2) Those that typically expect a reply from an open range of replies, as in *What is your name?* or *How old are you?* are **WH-** questions (cf 11.14ff);
- (3) Those that expect as the reply one of two or more options presented in the question, as in *Would you like to go for a WALK or stay at HOME?*, are **ALTERNATIVE** questions (cf 11.20f).

Logically well-formed replies, responses that conform with expectations, are a subset of pragmatically appropriate answers. Many answers that are apparently irrelevant become relevant in terms of the implicatures they convey:

A: Have you seen my chocolates?

B: Well, the children were in your room this morning.

It is therefore possible for a question to be answered by another question:

A: Are you going to watch television again?

B: What else is there to do?

A: Is that your baby?

B: What do YOU think? [sarcastic: 'Of course it's my baby.']

Any utterance of a question that has the illocutionary force of an inquiry may be answered by *I don't know* or *I'm not sure*, or by a refusal to answer, eg: *It's none of your business* (impolite), or by an evasion, eg: *Good question*, or by a challenge to a presupposition of the question, eg: *Do you like Joan Parker?* – *I don't know any Joan Parker*.

Questions primarily have the illocutionary force of inquiries. But they are often used as directives conveying requests, offers, invitations, and advice (cf 11.3, 11.16f). For exclamatory and rhetorical questions, cf 11.22f.

- Note [a] Affirmation and negation may be conveyed by words or expressions other than *yes* or *no*, eg: *certainly*; *of course*; *not at all*; *never*. *Yes-no* questions may also be answered by replies that lie somewhere along the affirmation-negation scale, eg: *probably*; *perhaps*; *It appears so*; *to some extent*; *occasionally*; *very often*.

- [b] An answer may be truthful and yet misleading:

A: Did you enjoy the play?

B: No.

B's answer is truthful even if B has not seen the play, but it is misleading in that both the question and the answer imply that B had seen the play.

[c] While questions generally imply that the speaker does not know the answer, they are also used in certain contexts where the speaker knows the answer but wants to know whether the hearer also knows it. Examples of such contexts are written examinations, exercises in textbooks, and questioning by teachers, parents, and interviewers to test the hearer's knowledge.

Yes-no questions

Form of yes-no questions

- 11.5 *Yes-no* questions are usually formed by placing the operator before the subject and giving the sentence a rising intonation:

The boat has LÈFT.	~ Has the boat LÉFT?
Ann is writing a PÀPer.	~ Is Ann writing a PÁPer?
Our team was BÈAten.	~ Was our team BÉAten?
He could have broken his LÈG.	~ Could he have broken his LÉG?
She'll be waiting outside.	~ Will she be waiting outside?

If there is no item in the verb phrase that can function as operator, **DO** is introduced, as with negation (cf 10.55):

They live in Sydney.	~ Do they live in Sydney?
Her efforts proved successful.	~ Did her efforts prove successful?
He likes driving.	~ Does he like driving?

Again as with negation, main verb **BE** functions as operator; in **BrE** main verb **HAVE** often acts as operator, but informally **HAVE ... got** is more common:

Patrick was late.	~ Was Patrick late?
She has a cold.	~ { Does she have a cold? <esp AmE> Has she (got) a cold? <esp BrE>

- Note [a] Obviously, 1st and 2nd person pronouns are exchanged for one another when a question is converted into an equivalent statement in a logically well-formed reply:

Have I met you before? ~ Yes, you have.

Do you like this climate? ~ Yes, I do.

[b] Declarative questions (cf 11.12) are exceptional in not requiring subject-operator inversion.

[c] Rising intonation is the norm for *yes-no* questions, but falling intonation occurs quite frequently. In a collection of *yes-no* questions taken from the files of the Survey of English Usage, chiefly in surreptitiously recorded unscripted spoken material, 430 questions ended in a rise and 290 in a fall. Further analysis showed that *yes-no* questions with the modal operators *can*, *could*, *may*, *might*, and *would* tended to have almost as many falling tones as rising tones.

[d] By placing the nuclear stress in a particular part of a *yes-no* question, we are able to focus the interrogation on a particular item of information which, unlike the rest of the sentence, is assumed to be unknown (cf focus of negation, 10.65). Thus the focus falls in different places in the following otherwise identical questions:

Was he a famous actor in THOSE days?

['I know he was once a famous actor – but was it then or later?']

Was he a FAMOUS actor in those days?

['I know he was an actor in those days – but was he a famous one?']

[e] Yes-no questions have also been called POLAR QUESTIONS (cf 10.54 Note [c]).

Positive yes-no questions

- 11.6 Like negative statements, yes-no questions may contain nonassertive forms such as *any* and *ever* (cf 10.60). The question containing such forms is generally neutral, with no bias in expectation towards a positive or negative response.

STATEMENT

Someone called last night.

The boat has left *already*.

I live *somewhere* near Dover.

I suppose *some* of the class will ask
some boring questions.

QUESTION

Did *anyone* call last night?

Has the boat left *yet*?

Do you live *anywhere* near
Dover?

Do you suppose *any* of the class
will ask *any* boring questions?

But questions may be CONDUCTIVE, *ie* they may indicate that the speaker is predisposed to the kind of answer he has wanted or expected. Thus, a positive question may be presented in a form which is biased towards a positive answer. It has positive orientation, for example, if it uses assertive forms rather than the usual nonassertive forms:

Did *someone* call last night? ['Is it true that someone called last night?']

Has the boat left *already*?

Do you live *somewhere* near Dover?

A positive question may also have negative orientation. Notice the effect of *really* in:

Do you *really* want to leave now? ['Surely you don't want to.']

A question that is not conducive, *ie* that has no bias for eliciting a positive or negative response, can be said to have NEUTRAL POLARITY.

Note Assertive forms in offers such as *Would you like some cake?* make the offer more polite, because of the assumption of a positive reply.

Negative yes-no questions

- 11.7 Negative questions are always conducive. Negative orientation is found in questions which contain a negative form of one kind or another:

Don't you believe me?

Have they never invited you home?

Aren't you joining us this evening?

Has nobody called?

Hasn't he told you what to do?

Negative orientation is complicated by an element of surprise or disbelief. The implication is that the speaker had originally hoped for a positive response, but new evidence now suggests that the response will be negative. Thus, *Hasn't he told you what to do?* means 'Surely he has told you what to do, hasn't he? I would have thought that he had told you.' Here there is a combining of a positive and a negative attitude, which one may distinguish as the OLD EXPECTATION (positive) and NEW EXPECTATION (negative). Because

the old expectation tends to be identified with the speaker's hopes or wishes, negatively orientated questions often express disappointment or annoyance:

Can't you drive straight? ['I'd have thought you'd be able to, but apparently you can't.']

Aren't you ashamed of yourself? ['You ought to be, but it appears you're not.']

Notice the nonassertive items in the next two examples of negative orientation:

Hasn't the boat left *yet*? ['I'd hoped it would have left by now, but it seems it hasn't.']

Didn't he recognize you *either*? ['I'd thought he would, but it seems he didn't.']

If a negative question has assertive items, it is biased towards positive orientation:

Didn't *someone* call last night?

Didn't he recognize you *too*?

Hasn't the boat left *already*?

Such questions are similar in effect to type (i) tag questions (cf 11.8), or alternatively to statements showing disbelief: 'Surely someone called last night!'

The position of the negative particle varies according to whether the full or enclitic negative particle is used; *n't* precedes the subject, whereas *not* generally follows it:

Didn't they warn you?

Haven't they left?

Did they *not* warn you?

Have they *not* left?

The construction with *not* after the subject is generally considered rather formal, and therefore the enclitic is usually preferred in spoken English. The formal alternative is particularly unlikely if the subject is lengthy. Both orders obey the general rule of subject-operator inversion, but since enclitic *n't* is fused with the operator into one grammatical word, it necessarily moves with the operator in subject-operator inversion.

Some speakers accept a third construction, also rather formal, in which the full particle is in the same position as the enclitic:

Is *not* history a social science?

This construction is especially likely in formal contexts where the subject is lengthy:

Does *not* everything we see about us testify to the power of Divine Providence?

The construction is an apparent exception to the regular placement of the subject immediately after the operator, but in print it may merely represent the printed equivalent of the attached enclitic. Focusing subjuncts (cf 8.116ff) can also appear between operator and subject, and their presence makes a preceding full particle more likely in formal contexts:

Did *not* even a single student come to the lecture?

Note [a] If the subject is or contains a quantifier, there is a difference in meaning according to whether the negative particle precedes or follows the subject:

Doesn't anyone know the answer? ['Surely someone knows the answer.']

Does anyone not know the answer? ['Is there anyone who does not know the answer?']

[b] Negative exclamatory questions are discussed in 11.22, and negative rhetorical questions in 11.23.

[c] Although a negative subject of a statement cannot be replaced by *not* + nonassertive form (cf 10.58), the same restriction does not apply to negative questions, where the subject follows the clause negator *not*. Two question forms therefore correspond to the single positive form *No one believes me*: *Does no one believe me?* and *Doesn't anyone believe me?*

[d] Negative questions sometimes occur as elliptical responses. The negative question affirms the speaker's agreement with what another speaker has just said:

A: Her performance in *Rigoletto* was outstanding. B: Yes, wasn't it?

Compare a fuller response in which the tag question might also have a falling tone:

Yes it was, wasn't it?

The positive question as response here (*wasn't it?*) would suggest that the speaker was not present at the performance and therefore cannot express an opinion. The positive question is also used to express disagreement, often ironically:

A: Isn't it a lovely day? B: Is it?

Tag questions

11.8 Maximum conduciveness is expressed by a further type of *yes-no* question which conveys positive or negative orientation – a tag question appended to a statement:

The boat hasn't left, *has it?*

Joan recognized you, *didn't she?*

The general rules for forming the most common types of tag question are:

(a) The tag question consists of operator and subject in that order (enclitic *n't*, if present, is attached to the operator, cf 11.7): *is he?*, *didn't she?*, *can't I?*, *will you?*. In formal English the negative particle is placed after the pronoun: *did they not?*, *is she not?* That position is usual in informal English in Northern BrE dialects.

(b) The operator is generally the same as the operator of the preceding statement (cf Note [c] below):

I haven't seen you before, have I?

If the statement has no operator, the dummy auxiliary *DO* is used, as for *yes-no* questions in general (cf 11.5):

She knows you, doesn't she?

(c) The subject of the tag must be a pronoun which either repeats, or is in coreference with, the subject of the statement, agreeing with it in number, person, and gender.

(d) If the statement is positive, the tag is generally negative, and vice versa (but cf 11.9).

(e) The nuclear tone of the tag occurs on the auxiliary, and is either rising or falling.

Four main types of tag question emerge from the observance of these rules. (The formula $+\hat{S} - \hat{T}$ represents a positive statement with falling nuclear tone followed by a negative tag with rising tone. The other formulae are similarly explicable.)

POSITIVE + NEGATIVE

RISING TONE

(i) $+\hat{S} - \hat{T}$

He likes his job, DOESN't he?

FALLING TONE

(iii) $+\hat{S} - \hat{T}$

He likes his job, DOESN't he?

NEGATIVE + POSITIVE

RISING TONE

(ii) $-\hat{S} + \hat{T}$

He doesn't like his job, DOES he?

FALLING TONE

(iv) $-\hat{S} + \hat{T}$

He doesn't like his job, DOES he?

The meanings of these sentences, like their forms, involve a statement and a question; each of them, that is, asserts something, then invites the listener's response to it. Sentence (i), for example, can be rendered 'I assume he likes his job; am I right?', (ii) means the opposite: 'I assume he doesn't like his job; am I right?' (cf also 11.11). Clearly these sentences have a positive and a negative orientation respectively. A similar contrast exists between (iii) and (iv). But it is important, again, to separate two factors: an ASSUMPTION (expressed by the statement) and an EXPECTATION (expressed by the question). On this principle, we may distinguish the four types as:

- (i) Positive assumption + neutral expectation $+\hat{S} - \hat{T}$
- (ii) Negative assumption + neutral expectation $-\hat{S} + \hat{T}$
- (iii) Positive assumption + positive expectation $+\hat{S} - \hat{T}$
- (iv) Negative assumption + negative expectation $-\hat{S} - \hat{T}$

The tag with a rising tone invites verification, expecting the hearer to decide the truth of the proposition in the statement. The tag with the falling tone, on the other hand, invites confirmation of the statement, and has the force of an exclamation rather than a genuine question. In this respect, types (iii) and (iv) are like (though not as emphatic as) exclamatory *yes-no* questions with a falling tone (cf 11.22). Compare, for example, *Isn't it wonderful WEATHER!* with *It's wonderful WEATHER, isn't it?* and *Wasn't she ANGRY!* with *She was ANGRY, wasn't she?*

Note [a] The tag normally mirrors the subject and auxiliary of the main clause of a complex sentence. There are exceptions, however, with verbs like *suppose* when they are introduced by a 1st person subject and followed by a *that*-clause:

I suppose you're not serious, are you? [not *I suppose you're not serious, don't I?]

A further stage of irregularity is introduced in cases of transferred negation (cf 14.36): *I don't suppose he's serious, is he?* Here, the subject of the tag is taken from the *that*-clause, but the absence of negation from the tag is explained with reference to the negative particle of the main clause, which applies *semantically* to the *that*-clause, since *I don't suppose he's serious* is equivalent to *I suppose he isn't serious*.

[b] If the sentence is long, the tag question is occasionally inserted in the middle, but between constituents:

It's true, *isn't it*, that you're thinking of giving up your job?

[c] The negative tag question following a positive statement with modal auxiliary *may* poses a problem because the abbreviated form *mayn't* is rare (virtually not found in AmE). There is no obvious solution for the tag question, though some speakers will substitute *mightn't* or *can't*, or – when the reference is future – *won't*:

?I may inspect the books, { mightn't I?
can't I?

?They may be here next week, { mightn't they?
won't they?

The unabbreviated form is fully acceptable, but limited to formal usage:

I may inspect the books, may I not?

They may be here next week, may they not?

In a tag question following a statement with *used to*, the operator is *did*:

They used to write to you, { didn't they?
did they not?

They { usedn't <esp BrE> (cf 3.44)
used not
didn't use <esp AmE> } to write to you, did they?

Shouldn't is sometimes substituted for *oughtn't* as an abbreviated form:

We ought to go now, { shouldn't we?
oughtn't we?

(On *aren't I*, cf 3.32).

[d] When the focus of a positive sentence is on a gradable unit, a negative tag question with a falling tone can be used as a response utterance to express agreement:

A: Their daughter is very clever.

B: (Yes.) Isn't she? ['I agree']

Otherwise, the tag response with a rising tone expresses surprise, the tag being in constant polarity with the preceding statement:

A: Their daughter isn't very clever.

B: Isn't she? ['I thought she was.']

A: They're moving to New York.

B: ARE they? ['I didn't know that.']

A: They aren't moving to New York.

B: AREN't they? ['I thought they were.']

11.9 There is a further, less common, type of tag question in which both statement and question are positive:

Your car is outside, is it?

You've had an accident, HAVE you?

The tag typically has a rising tone, and the statement is characteristically preceded by *oh* or *so*, indicating the speaker's arrival at a conclusion by inference, or by recalling what has already been said. The tone may sometimes be one of sarcastic suspicion:

So THAT's your little, game, is it?

We may therefore add a fifth, less usual, type of tag question to the earlier four types:

POSITIVE + POSITIVE

RISING TONE

(v) + \tilde{S} + \uparrow

So he likes his JòB, DòES he?

The tag of this type sometimes has no nucleus, but is part of the preceding tone unit. Its effect may be scolding (*Oh, you've had another accident, have you?*), sarcastic (*So that's your game, is it?*), or sarcastically contradictory (*So your car is outside, is it?*).

Note Logically we should expect an equivalent sixth type in which both statement and tag are negative:

NEGATIVE + NEGATIVE

RISING TONE

(vi) - \tilde{S} - \uparrow

So he doesn't like his JòB, DòESN't he?

This type, however, has not been clearly attested in actual use.

Tag questions with imperatives and exclamatives

11.10 Tag questions can be appended also to imperative sentences (cf 11.24ff), where they invite the listener's consent. For positive imperatives, types (i), (iii), and (v) are available. The auxiliary in the tag is usually *won't* for the negative and *will* for the positive, and the subject is usually *you*:

(i) Open the DÒOR, WÒN'T you?

(iii) Open the DÒOR, WÒN'T you?

(v) Open the DÒOR, WÌLL you?

Type (i) tag is least insistent, and type (v) tag is most insistent. Other auxiliaries and subjects also occur:

Open the door, can't you?

Hand me a knife, won't somebody?

Turn on the light, will somebody or other?

Save us a seat, can one of you?

Have another one, why don't you?

Negative imperatives are less commonly followed by tag questions. The only type that seems possible is *will you?* in type (iv), with a falling tone on the tag:

(iv) Don't make a NÒISE, WÌLL you?

The tag is a persuasive softener of the imperative. However, if the *will you?* is nonnuclear, it increases the peremptoriness of the directive.

First person plural imperatives (cf 11.26) may take *shall we?* as a tag question:

Let's play another game, } shall we?
Let's not discuss it now, }

Type (iii) tag and the (only occasionally used) type (i) tag are appended to exclamatives (cf 11.31f). The tag questions invite the hearer's agreement:

(iii) How THÌN she is, Isn't she?

(i) What a beautiful PÀINTING it is, Isn't it? ['Or don't you agree?']

The tag may also be appended to abbreviated verbless exclamations:

What a beautiful painting, isn't it?

How odd, isn't it?

Note The imperatives and the tag may be positive and have falling tones, but the sentence is then very peremptory and is considered ill-mannered:

Open the DÒOR, WÌLL you?

Invariant tag questions

- 11.11 Several other tag questions inviting the listener's response may be appended to statements and exclamations. They have the same form whether the statement is positive or negative, and take a rising tone:

They { forgot
didn't forget } to attend the lecture, { *am I right?*
isn't that so?
don't you think?
wouldn't you say?

She passed the exam, } { *right?* <informal>
She didn't pass the exam, } { *eh?* / *et?* <casual, may be impolite>

Again the falling tone is more insistent than the rising tone.

Note Comment clauses (such as *you know* and *I hope*, cf 15.54) may in general be considered invariant tags, though they are usually not questions.

Declarative questions

- 11.12 Not all *yes-no* questions have subject-operator inversion. The declarative question is a type of question which is identical in form to a declarative, except for the final rising question intonation. It is rather casual in tone:

You've got the **exPLóSive**?
They've spoken to the **ambÁssador**, of course?
You realize what the **rÍSKS** are?
Boris will be **THÉRE**, I suppose?
He didn't finish the **RÁCE**?

Declarative questions are conducive (cf 11.6), and resemble tag questions with a rising tone in that they invite the hearer's verification. Positive questions have positive orientation (cf 11.6), and can therefore accept only assertive forms (cf 10.60f):

He wants something to eat?
Somebody is with you?

When followed by a comment clause, the declarative may have a fall:

You realize what the **rÍSKS** are, I { *GÁther.*
 { *HÓPE.*
 { *TRÚST.*

Negative questions have negative orientation, and nonassertive forms may be used following the negative:

You didn't get anything to eat?
You want nothing to eat yet?
Nobody ever stays at your place?

Note [a] A second interrogative use of the statement construction is for echo questions (cf 11.34ff).
[b] A tag question may be added to a declarative question:
You've got the **exPLóSive**, **HÁVE** you?
In that case the declarative usually has a falling tone.

Yes-no questions with modal auxiliaries

- 11.13 The formation of *yes-no* questions with modal auxiliaries is subject to certain limitations and shifts of meaning. (For the negation of modal auxiliaries, cf 10.67f). The modals of permission (*may* <esp BrE>, and *can*) and of obligation (*must* <esp BrE>, and *have to*) generally involve the speaker's authority in statements and the hearer's authority in questions:

A: { *May*
 Can } I leave now? ['Will you permit me . . .']

B: Yes, you { *may*
 can } . ['I will permit you . . .']

A: { *Must I*
 Do I have to } leave now? ['Are you telling me . . .']

B: Yes, you { *must*
 have to } . ['I am telling you . . .']

This means that the question form anticipates the form appropriate for the answer.

A similar switch from hearer to speaker takes place with *shall* [volition], which (esp in BrE) involves the speaker's will in statements, but the hearer's will in questions:

You shall suffer for this! [rare; 'I intend to make you suffer . . .']
Shall I switch off the television? ['Do you want me to . . .?']

Shall is rare with *you* as subject, and generally infrequent in AmE, except for inviting or requesting agreement (*Shall we eat now?*). It is unlike the other modals in two respects. First, its use in questions is virtually restricted to first person subjects. Secondly, its declarative use is not symmetrical with its interrogative use; hence, *shall* is not repeated in the response to a question with *shall*. The expected response after *shall I* and exclusive *shall we* is agreement, and may be a 2nd person imperative. After inclusive *shall we* it is a 1st person imperative:

A: Shall we carry your suitcases? ['Would you like us to . . .?']

B: Yes, please do (so).

A: Shall we have dinner? ['Would you like us (including you) to . . .?']

B: Yes, let's.

May in the possibility sense is not often used in questions:

May we be doing him an injustice?

Can or (more commonly in AmE) *could* replaces it:

A: { *Can*
 Could } they have missed the bus?

B: Yes, they { *may* have.
 might have.

The hypothetical uses (cf 4.62) of the auxiliaries *might* [permission], *would* [volition], and *could* [volition] require special treatment, since in *yes-no*

questions these past forms are regularly used for politeness. If modal auxiliaries are retained, the present forms are generally substituted for *might* and *would* in responses, and the present form is usual for *could*:

- A: Might I call you by your first name?
 B: Yes, you may. [1]
 A: Would you pay for me?
 B: Yes, I will. [2]
 A: Could I see you for a moment?
 B: Yes, you can. [Also *may* (esp BrE), and less usually, *could*] [3]

A more common response for [1–3] would be (*Yes*), *of course*. Other responses might be (*Yes*), *please do* for [1] and *I'll be glad to* for [2]. The questions have the polite past forms appropriate to their illocutionary force as requests.

Need (esp in BrE) is used as a nonassertive modal auxiliary, although (esp in AmE) the main verb *need* (cf 3.41f) and *do have to* are common substitutes:

Need they leave now? (esp BrE)

Do they $\left\{ \begin{array}{l} \text{need to} \\ \text{have to} \end{array} \right\}$ leave now?

But the corresponding positive forms are *must*, *have to*, or the main verb *need*:

Yes, they $\left\{ \begin{array}{l} \text{must} \\ \text{have to} \\ \text{need to} \end{array} \right\}$.

On the other hand, *must* in the necessity sense has positive orientation:

Why must it always rain when we want to have a picnic?

(On this last example, cf the discussion of rhetorical questions in 11.23.) Notice the assertive *always* after *must*, in contrast to the possible nonassertive *ever* after *need*:

Must it always happen this way?
 Need it ever [also: always] happen this way?

Dare is occasionally used as a nonassertive modal auxiliary, especially in BrE. Common substitutes are the main verb *dare* and (esp in AmE) the blend construction with *dare* (DO and the bare infinitive, cf 3.42):

Do you dare to cast aspersions on my character?
 Dare I suggest a compromise between your two positions? (esp BrE)
 Do we dare tell them the truth? (esp AmE)

Negative responses may repeat the same verbs, but positive forms require the main verb *dare*:

Yes, they dared to complain.

Note As with the negative, *ought* may occur either with the *to*-infinitive or with the bare infinitive (cf 3.43).

Wh-questions

Form of wh-questions

- 11.14 *Wh*-questions are formed with the aid of one of the following simple interrogative words (or *wh*-words):

who/whom/whose, what, which, when, where, how, why

Unlike *yes-no* questions, *wh*-questions generally have falling intonation. As a rule,

- the *wh*-element (*ie* the clause element containing the *wh*-word) comes first in the sentence (apart from some conjuncts, such as *on the other hand*);
- the *wh*-word itself takes first position in the *wh*-element.

The only exception to the second principle occurs when the *wh*-word is within a prepositional complement. Here English provides a choice between two constructions, one being formal. In formal style, the preposition precedes the complement, whereas otherwise the complement comes first and the preposition is deferred to the end of the sentence:

On what did you base your prediction? (formal)

What did you base your prediction *on*?

We may perhaps express this difference more neatly by saying that neutral style generally requires that the *wh*-word comes first, but formal English requires that the *wh*-element as a whole comes first.

Note [a] *Wh*-questions are also called INFORMATION QUESTIONS.

[b] The *wh*-words are sometimes modified (except in formal style) by the intensifier *ever*, which emphasizes the bafflement or emotional involvement of the speaker. Usually they are spelled as two separate words, and *why ever* is invariably spelled so. They are thereby distinguished from the subordinating *wh*-words *whenever*, *whoever*, *however*, etc.

Why ever didn't he tell me? How ever did you find the key?

What ever are you doing? Who ever would want such a magazine?

Various other ways exist of intensifying the emotive effect of a *wh*-question:

Who *on earth* opened my letter? (informal)

Who *the hell* are you? (casual)

What *in heaven's name* do you think you're doing? (casual)

[c] In a collection of 858 *wh*-questions from the files of the Survey of English Usage, chiefly in surreptitiously recorded spoken unscripted material, 775 had falling intonation.

[d] On factors affecting the choice between *who* and *whom*, cf 6.35, 6.38, 7.14ff.

[e] The construction with a preposition in final position (cf 9.6) is less desirable when the preposition is remote from its complement or when it is syntactically bound closer to the complement than to the verb. Awkward sentences like *What time did you tell him to meet us at?* are generally avoided. A sentence like that would be replaced by *At what time did you tell him to meet us?* in formal style or, more generally, by *When did you tell him to meet us?* or prepositionless *What time did you tell him to meet us?* The awkwardness reaches comic proportions when several final particles cooccur: *What did you bring this book to be read out of up for?*

The prepositions *since* and *during* occur only at the beginning of the question: *Since when do I have to explain my actions to you?* *During which years were you living in Germany?* *Until* is also usually placed initially, although *till* can be regularly deferred: *?When are you staying until?*, *When are you staying till?* (cf also 11.15 Note [a]).

[f] There are occasional declarative *wh*-questions, where the *wh*-element remains in the position normal in declaratives for that item. They are associated with interviews and interrogations:

A: So you boarded the train *where*? B: At Los Angeles.

A: And you got off *at what station*? B: At San Diego.

These declarative *wh*-questions are to be distinguished from echo questions (cf 11.34ff).

Functions of *wh*-element

- 11.15 The following sentences exemplify the various clause functions in which the *wh*-element operates:

<i>Who</i> ever opened my LÈTTER? [<i>wh</i> -element: S]	[1]
<i>Which</i> books have you LÈNT him? [<i>wh</i> -element: O _d]	[2]
<i>Whose</i> beautiful <i>ANTIQUES</i> are these? [<i>wh</i> -element: C _s]	[3]
<i>How</i> wide did they make the BÒOKcase? [<i>wh</i> -element: C _o]	[4]
<i>When</i> will you be PROMÔTÉd? [<i>wh</i> -element: A]	[5]
<i>Where</i> shall I put the GLÀSSES? [<i>wh</i> -element: A]	[6]
<i>Why</i> are they always COMPLÀINing? [<i>wh</i> -element: A]	[7]
<i>How</i> did you MÈND it? [<i>wh</i> -element: A]	[8]
<i>How</i> much does he CÀRE? [<i>wh</i> -element: A]	[9]
<i>How</i> long have you been WÀITing? [<i>wh</i> -element: A]	[10]
<i>How</i> often do you visit New YÒRK? [<i>wh</i> -element: A]	[11]

We see above that normal statement order of elements is altered in *wh*-questions not only by the initial placing of the *wh*-element, but by the inversion of subject and operator in all cases except when the *wh*-element is subject, where the rule that the *wh*-element takes initial position applies, overriding the rule of inversion.

Subject-operator inversion is the same in its application to *wh*-questions as in its application to *yes-no* questions; if there is no operator in the equivalent statement, DO is introduced as operator in the question. The main verb BE and (occasionally, esp in BrE) HAVE act as operator: *Where is she?* *What kind of car have they?*

Note [a] Adjuncts of instrument, reason, and purpose are normally questioned by the prepositional constructions:

What shall I mend it *with*? *What* did you do that *for*?

Although the latter could be replaced by *Why* *did you do that?*, it has no alternative with a preposed preposition: **For what did you do that?* In this respect it is like informal questions with BE followed by a final preposition: *What was it like?* (but not **Like what was it?*); *What was it in?* (but not **In what was it?*).

[b] Abbreviated questions consisting of a *wh*-word and a final preposition (which in this construction regularly bears nuclear stress), eg: *What FÒR?*, *Where FRÒM/TÒ?*, *What WITH?*, *Who WITH/BI?*, are as popular in informal speech as questions consisting of the *wh*-word only: *Where?*, *Why?*, *Who?* There is a common abbreviated negative question *Why NÒT?* (cf 11.17), and an informal abbreviated reason question (esp in AmE) *How CÔME?* (cf also 11.40 Note [a]).

[c] Although there is no *wh*-word for the verb, the content of the predication can be questioned by *what* as the object of the generalized agentive verb *do* or as subject of the generalized event verb *happen*:

A: What are you doing?	B: I'm reading.
A: What have you done with my book?	B: I've hidden it.
A: What's happening?	B: It's snowing.

[d] Many speakers do not accept an indirect object as *wh*-element: ?*Who(m) did you give the present?* They use the equivalent prepositional complement construction instead: *Who(m) did you give the present to?* or (in formal style) *To whom did you give the present?* Some speakers, however, find the construction acceptable if there is no ambiguity as to which object is direct and which indirect. (There is ambiguity in **Who did you show your daughter?*)

[e] In *wh*-questions of the SVC pattern, it is possible to distinguish between noun phrases as S and C by signals of case and concord, where these apply: *Which is me?* (*wh*-element as S – said, for example, when looking at a photograph) contrasts with *Which am I?* (*wh*-element as C). *Whose* in the SVC sentence pattern must be C: *Whose is that book?*

The potential response may also indicate the clause elements:

A: Who was Hamlet?	B: My brother was.
[<i>Who</i> is S, identifying a character in a play]	
A: Who was Augustus?	B: Augustus was a Roman Emperor.
[<i>Who</i> is C, referring to identity]	
A: What was your brother?	B: He was Hamlet.
[<i>What</i> is C, characterizing a role in a play, cf 6.39]	

Notice the ambiguity of *Who* in the following:

A: Who is the captain?	
[B: My brother is. [<i>Who</i> is S]	
[B: The captain is my brother. [<i>Who</i> is C]	

[f] *Why* (esp AmE) and *what* are used in informal speech as introductory words to express surprise, both with questions and with statements:

Why, what did she say?	What, is the bus here already?
Why, they won't object.	What, he couldn't have passed.

Why is also used informally after conditional clauses, especially in AmE. It is a more emphatic conjunct than *then* (cf 8.135):

If *HE* doesn't want to press charges, *why* *YOU* should.

[g] For irregular *wh*-questions – such as those beginning with *how* *come*, *how* *about*, and *what* *about* – cf 11.40.

[h] *How* *goes it?* is a surviving common example of a *wh*-question that lacks the usual operator and inversion (cf: *How* *did it go?*).

[i] Interrogative *how* has various senses. Notice the ambiguity of *How* *does it work?*, where *how* may refer to process or effect. *How* is also used as a *wh*-word for a complement as current attribute (cf 10.20):

A: How is she?	B: Fine. [evaluation of health or some other aspect]
A: How was the book?	B: Excellent. [evaluative]

For *how* in the nonhealth evaluative sense, *What ... like?* is available as an informal synonym (cf Note [a] above). *How*, *how* *much*, *how* *far*, and *to what* *extent* are used with gradable verbs as intensifying *wh*-elements: *How* *did you like her?*, *How* *much* *do you miss him?*, *How* *far* *do they agree with us?*, *To what* *extent* *would you trust them?*

Positive *wh*-questions

- 11.16 A *wh*-question may generally be matched with a statement called its presupposition. This is a statement which, in place of the *wh*-element, contains an indefinite expression such as *somebody*. The presupposed statement, which is assumed to be true by whoever uses the question, preserves of course normal statement ordering. Hence, if we list the presuppositions corresponding to some of questions [1–11] in 11.15, we can clarify the syntactic ordering of *wh*-questions in relation to statements:

PRESUPPOSITIONS

Someone opened my letter.	[1a]
You have lent him <i>some</i> of the books.	[2a]
You will be promoted <i>sometime</i> .	[5a]
You mended it <i>somehow</i> .	[8a]
You visit New York <i>sometimes</i> .	[11a]

Modifying *what* and *which* (cf 6.39) have different presuppositions:

<i>What</i> <i>composer(s)</i> do you like best?
~ You like <i>some</i> <i>composer(s)</i> best.
<i>Which</i> <i>composer(s)</i> do you like best?

~ You like $\left\{ \begin{array}{c} \text{some} \\ \text{one} \end{array} \right\}$ of the *composers* best.

In some cases there is no sensible presupposition:

- How does he feel? ~ *He feels somehow or other.
 Where was she born? ~ She was born somewhere.
 What time is it? ~ It's some time or other.
 How should I know?
 Why should I?

As the above examples indicate, a positive *wh*-question may generally be matched with a positive presupposition. There may, however, be no presupposition if nonassertive items (cf 10.60) are present:

- When will we ever win any prizes?
 What help have they ever given us?
 Who has any money?

The questions are conducive, having a negative orientation. Questions introduced by *Why do you* have a positive presupposition, but a negative orientation when they have the illocutionary force of directives:

- Why do you bother to reply? ['You are replying but shouldn't bother to reply.']
 Why do you make so much fuss? ['You are making a lot of fuss but shouldn't make so much fuss.']

As a directive, it cannot have a past form. Thus *Why did you bother to reply?* is an inquiry, not a directive, though the overtone is still negative.

The abbreviated form with the bare infinitive is always a directive:

- Why bother to reply?
 Why make so much fuss?

Note On rhetorical *wh*-questions, cf 11.23.

Negative *wh*-questions

11.17 *Wh*-questions can also be negative:

- Who hasn't had any coffee? [1]
 Why didn't you tell me? [2]
 When shouldn't I call? [3]
 Which books don't you want? [4]
 Where didn't you clean? [5]
 How long haven't you heard from them? [6]
 How often didn't he pay his rent? [7]

The presuppositions can be listed just as for positive questions (cf 11.16):

- Somebody hasn't had any coffee. [1a]
 You didn't tell me for some reason. [2a]
 I shouldn't call at some time. [3a]
 You don't want some books. [4a]
 You didn't clean in some place. [5a]
 You haven't heard from them for some time. [6a]
 He didn't pay his rent a number of times. [7a]

In [1a-7a] the presupposed particular unknown is outside the scope of negation (cf 10.64). Thus [4a] may be paraphrased by 'There are some books that you don't want'.

Questions beginning with *Why don't you* and the abbreviated *Why not* are commonly used as directives (cf 11.16). The directives are invitations or (more commonly in AmE) suggestions or instructions:

- Why don't you shave?
 Why don't you clean your teeth?
 Why don't you come for a meal one day next week?
 Why don't you make yourself an egg?
 Why don't you revise this paper?
 Why not ignore their remarks?
 Why not go by train?

Why don't you conveys advice, but it frequently has a critical and irritable tone, since it is used when the hearer has not performed or is not performing the recommended activity:

- Why don't you take sleeping tablets? ['Anyone else would.']
 Why don't you see a doctor?

Why don't you, unlike *Why not*, may also be used as an inquiry. Like the inquiry, the directive allows nonassertive items (*Why don't you ever write?*), but unlike the inquiry, the directive does not allow a past form of the verb (*Why didn't you write?*). On the other hand, the directive takes the operator *do* before *be*: *Why don't you be quieter?* (cf the inquiry *Why aren't you quieter?*). In these syntactic features, directives beginning with *Why don't you* and *Why not* resemble imperative sentences, which normally have the illocutionary force of directives.

Especially in AmE, *Why don't I* is used for offers (*Why don't I give you a hand?*), or *Why don't we* for offers (*Why don't we give you a hand?*) or suggestions (*Why don't we have a rest now?*).

Pushdown *wh*-element

11.18 In 11.15, the *wh*-element was shown to operate in various clause functions. But it can also operate indirectly in the main clause, as part of another clause element. We call the *wh*-element in such cases a **PUSHDOWN** element. Here are instances in which the *wh*-element is a pushdown element, the presuppositions being given in parentheses.

(I) *wh*-element as prepositional complement within a noun phrase:

(i) the prepositional phrase as adjunct:

- { What side of the road was he driving on?
 { On what side of the road was he driving? <formal>
 [He was driving on one side of the road.]

(ii) the prepositional phrase as modifier of a noun phrase:

- { Which country is Caracas the capital of? <informal>
 { Of which country is Caracas the capital?
 [Caracas is the capital of some country.]

(II) *wh*-element as element in a nominal *that*-clause or a *to*-infinitive or *-ing* clause; the clause functions as direct object in the main clause:

How long did he tell you (that) he waited?

[He told you (that) he waited *for some length of time*.]

What would you like me to buy?

[You would like me to buy *something*.]

What kinds of novels do you enjoy reading?

[You enjoy reading *some kinds of novels*.]

(III) *wh*-element as prepositional complement within a noun phrase, the noun phrase in turn functioning as element in a nominal clause – a combination of (I) and (II):

Who did the textbook say (that) Queen Elizabeth was the daughter of?
<informal>

[The textbook said that Queen Elizabeth was the daughter of some person]

(IV) *wh*-element as element (or part of an element) in a clause that is complementation to an adjective:

{ *What* is he ready to confess to?
To *what* is he ready to confess? <formal>

[He is ready to confess to *something*.]

How much is she ready to pay? [She is ready to pay *something*.]

- Note [a] There are limits to what can be a pushdown *wh*-element. Among the exclusions are:
- (i) the complement of a prepositional phrase functioning as disjunct (*to my regret*) or conjunct (*on the contrary*), cf 8.121ff.
 - (ii) the complement of many prepositional phrases functioning as adjunct, when the complement refers to a specific time (*Monday*), place (*Denver*), or process (*great firmness*). The complement can, however, often be questioned by a *wh*-element with a general noun (*What day did you meet on?*, *What city did you go to?*, *In what manner did you speak to them?*)
 - (iii) an element in a relative clause or an adverbial clause.
 - (iv) an element in a nominal interrogative or nominal relative clause. This restriction is sometimes relaxed for nominal interrogative clauses in unscripted speech, particularly for *yes-no* interrogative clauses introduced by *whether* and functioning as direct object; a pronoun is inserted in the subordinate clause if the preposed *wh*-element functions as subject in the subordinate clause. These are felt to be deviant, but they are sometimes used because there is no obvious alternative:
?Which exam did you ask whether he would pass?
?Who else did you notice whether they passed the exam?
 - (v) an element in a coordinated phrase or clause.
- [b] In complex sentences a pushdown *wh*-element may be ambiguous, functioning either in the main clause or in a subordinate clause:
When did she promise to meet him?
When may refer to the time of promising or to the time of meeting.

More than one *wh*-element

- 11.19 Ordinary questions can have more than one *wh*-element (for echo questions, cf 11.34ff):

I heard that Sylvia and Jane accused their husbands of various misdeeds, but *who* accused *whom* of *what*?
Which present did you give to *whom*?

If one of the *wh*-elements is subject, it must be initial:

Who said *what* to *whom*?

Otherwise, there is a choice as to which *wh*-element is fronted, so that the same question may be put in more than one way. Consider the presupposition:

You have hidden something somewhere.

We can move from it to either of these questions:

What have you hidden *where*? *Where* have you hidden *what*?

Generally, only one *wh*-element is fronted, but adverbial *wh*-elements may be coordinated:

When and where did they meet? *How and why* did it happen?

Alternatively, the second coordinated *wh*-element may be appended (cf 13.94):

When did they meet, and *where*?

If only one *wh*-element is adverbial and the other is direct object, only appended coordination is fully acceptable:

What does she teach, and *where*? *Who* did he hit, and *why*?
? *What and where* does she teach? ? *Who and why* did he hit?

- Note Declarative *wh*-questions (cf 11.14 Note [f]) may rarely also have more than one *wh*-element:
Well now, you say your wife is a teacher. She teaches *what where*?

Alternative questions

- 11.20 There are two types of alternative questions. The first resembles a *yes-no* question, and the second a *wh*-question:

Would you like CHÓcolate, vanÍlla, or STRÀwberry (ice cream)? [1]
Which ice cream would you LIke? CHÓcolate, vanÍlla or STRÀwberry? [2]

The first type differs from a *yes-no* question only in intonation; instead of the final rising tone, it contains a separate nucleus for each alternative: a rise occurs on each item in the list, except the last, on which there is a fall, indicating that the list is complete. The difference of intonation between alternative and *yes-no* questions is important, in that ignoring it can lead to misunderstanding – as the contrast between these replies indicates:

alternative: A: Shall we go by BÚS or TRÀin? B: By BÚS.
yes-no: A: Shall we go by bus or TRÁin? B: No, let's take the CÀr.

The second type of alternative question is really a compound of two separate questions: a *wh*-question followed by an elliptical alternative question. Thus [2] might be taken as a reduced version of:

Which ice cream would you LIke? Would you like CHÓcolate, vanÍlla, or STRÀwberry?

An alternative question presupposes the truth of only one of the propositions:

Are you a DÉMOCRAT or a REPUBLICAN?

[You are either a Democrat or a Republican.]

Do you want SHÉRBET, YÓGHURT, or FRÛIT?

[You are being given a choice of only one of the three.]

A *yes-no* question presupposes that one of two mutually exclusive possibilities is true:

Are you RÉADY?

Converting a *yes-no* question into an alternative question introduces this tautology into the presupposition:

ÁRE you ready or ÀREN't you ready?

[Either you are ready or you are not ready.]

The second conjoin may be reduced to *or not*:

ÁRE you ready or NÒT?

The tautology gives a petulant tone to the question and explains why such questions are not normal.

Note [a] An alternative question corresponding to a *yes-no* question is distinctly odd in certain sentences; for example, if the question has the illocutionary force of an invitation or a request:

?Would you have some more coffee or not?

?Will you open the door please or not?

There is no tautology if there is a nontrivial alternative:

Will you open the door please, or { should I
would you rather not?

[b] The second part of the *wh*-alternative question may be considered a kind of appositive to the *wh*-element:

Who
Which of them } do you like best, Tom or Derek?

11.21 The structure of alternative *yes-no* questions follows the pattern of coordination (cf 13.43ff), the ellipted forms generally being preferred, where they are possible:

Did Ítaly win the World Cup or did BRAZIL win the World Cup?

Did Ítaly win the World Cup or did BRAZIL?

Did Ítaly win the World Cup or BRAZIL?

Often the remaining part of a second or subsequent alternative question is fronted to the appropriate position in the first question:

Did Ítaly or BRAZIL win the World Cup?

This type of fronting is also possible for the vacuous negative alternative:

Are you CÓMING or ÀREN'T you (coming)?

ÁRE you or ÀREN'T you coming?

There is no fronted version of *Are you coming or not?* (**Are you or not coming?*) because fronting would violate the requirement of structure equivalence of conjoins (cf 13.49).

Minor types of questions

Exclamatory questions

11.22 The exclamatory question is interrogative in structure, but has the illocutionary force of an exclamatory assertion. Typically it is a negative *yes-no* question with a final falling instead of rising tone:

Hasn't she GRÒWN!

Wasn't it a marvellous CÒNCERT!

These invite the hearer's agreement to something on which the speaker has strong feelings. The meaning, contrary to the appearance of the literal wording, is vigorously positive.

A positive *yes-no* question, also with a falling tone, is another (but less common) way of expressing a strong positive conviction:

'Am 'I HÙNGRY! 'Did 'he look ANNÓYED! 'Has 'she GRÒWN!

Both operator and subject usually receive emphatic stress. In written English an exclamation mark is usual at the end of the sentence for both kinds of exclamatory question.

The falling tone for negative and positive exclamatory questions has an effect similar to, but more emphatic than, the falling tone in tag questions (cf 11.8).

It seems odd that pairs of sentences which contrast in positive-negative polarity should have roughly the same effect: *Has she grown! Hasn't she grown!* There is, however, a slight difference: the negative question has, as a feature of its meaning, an appeal for the listener's confirmation; the positive question, on the other hand, implies that the positive response is self-evident, and would therefore be more appropriate where the listener's agreement would normally not be solicited, as in *Am I hungry!* (The experience reported here is of course not shared by the listener.) In situations where both the negative and the positive questions are possible, the difference is roughly represented by these paraphrases:

Wasn't it a marvellous CÒNCERT! = 'What a marvellous CÒNCERT it was!

Has she GRÒWN! = 'She HÁS grown!

Exclamatory questions do not admit nonassertives: *Hasn't she yet grown?* is an inquiry. Negative exclamatory questions must take enclitic *n't*; *Has she not grown?* is an inquiry, not an exclamation.

Note In AmE an exclamatory question can be pronounced with a rising tone:

Wasn't the concert terrÍfic?

But in this case, the expectation of a response is stronger.

Rhetorical questions

11.23 The rhetorical question is interrogative in structure, but has the force of a strong assertion. It generally does not expect an answer.

A positive rhetorical *yes-no* question is like a strong negative assertion, while a negative question is like a strong positive one.

POSITIVE:

Is that a reason for *despáir*? ['Surely that is not a reason . . .']
 Can anyone doubt the wisdom of this action? ['Surely no one can doubt . . .']

NEGATIVE:

Isn't the answer *óbvious*? ['Surely the answer is obvious.']
 Haven't you got anything better to *dó*? ['Surely you have something better to do.']

Unlike exclamatory questions, these rhetorical questions have the normal rising intonation of a *yes-no* question, and are distinguished chiefly by the range of pitch movement.

There are also rhetorical *wh*-questions. The positive question is equivalent to a statement in which the *wh*-element is replaced by a negative element:

Who *KNÓWS*/*CÁRES*? ['Nobody knows/cares' or 'I don't know/care.']
 What *DÍfference* does it make? ['It makes no difference.']
 How should I know? ['There is no reason why I should know.']
 What *SHÓULD* I say? ['There is nothing that I should say.']
 What makes *YÓU* think you can do better? ['Nothing should make you think you can do better.']
 How can I help it? ['There is no reason why I can help it.']

Nonassertives may occur:

What has *HÉ* ever done for you?
 Who has any *MÓney* to spare these days?

The less common negative question is equivalent to a statement in which the *wh*-element is replaced by a positive element:

Who *DÓESn't* know? ['Everybody knows.']
 How *CÓULDN't* you remember? ['You certainly should have remembered.']

Wh-questions generally have a rise-fall tone, less commonly a simple falling tone.

Rhetorical questions may also be responses to previous questions:

A: Do you want to eat? B: Do I look *HÚngry*?

Note Some questions, termed *RATIOCINATIVE QUESTIONS*, are self-addressed. They are like rhetorical questions in not expecting an answer from others:

Let me see. Should I take the car or go by bus?

But the speaker may answer such a question:

What do I want to *EAT*? Well, a roll will do.

Directives

Directives without a subject

11.24 Directives typically take the form of an imperative sentence, which differs from a declarative sentence in that:

- (i) it generally has no subject, but *cf* 11.25;
- (ii) it has either a main verb in the base form or (less commonly) an auxiliary in the base form followed by the appropriate form of the main verb.

Otherwise, the clause patterns of imperative sentences show the same range and ordering of elements as declaratives (*cf* 10.2):

- (S) *V*: Jump.
 (S) *VO*: Open the door.
 (S) *VC*: Be reasonable.
 (S) *VA*: Get inside.
 (S) *VOO*: Tell me the truth.
 (S) *VOC*: Consider yourself lucky.
 (S) *VOA*: Put the flowers on the table.

The imperative verb lacks tense distinction and does not allow modal auxiliaries. The progressive form is rare, and the perfective even rarer:

Be listening to this station the same time tomorrow night.
 Be doing your homework when your parents arrive home.
 Start the book and have finished it before you go to bed. (*cf* Note [a])

Passives with *be* occur chiefly in negative directives, where they generally have the meaning 'Don't allow yourself to be . . .':

Don't be deceived by his looks. Don't be made to look foolish.
 Don't be bullied into signing. Don't be told what to do.

They are less common in positive directives:

Be guided by what I say.
 Be reassured by me.
 Hire a Rolls Royce and be driven around by a uniformed chauffeur.

What might be treated as passives occur with *get* (*cf* 3.66 on the *get*-passive):

Get washed. Get transferred. Get known.
 Get dressed. Get weighed. Get introduced.
 Don't get misled by their promises.
 Get lost. ['go away' (informal)]
 Don't get dressed yet.

Imperatives are restricted to predications that allow a dynamic interpretation, hence the incongruity of **Need a car*, **Be old*, **Sound louder*. Many predications that are stative with respect to disallowing the progressive (*cf* 4.27ff) are easily available with a dynamic interpretation for imperatives: *Forgive us*, *Love your enemies*, *Owe nobody anything*, *Be early*, *Be glad that you*

escaped without injury, Don't be a stranger, Be a pilot, Know the poem by heart by the next lesson.

Imperatives refer to a situation in the immediate or more remote future and are therefore incompatible with time adverbials that refer to a time period in the past or that have habitual reference: **Come yesterday, *Usually drive your car*. Imperatives also do not cooccur with comment disjuncts (cf 8.127), since these disjuncts comment on propositions (cf the same constraint with questions): **Unfortunately, pay your rent now*. On tag questions with imperatives, cf 11.10.

- Note [a] The rare perfective construction *Have finished it before you go to bed* is to be contrasted with the common causative complex-transitive *Have it finished before you go to bed*, where *have* is an active imperative and *finished* is a simple passive in the dependent clause; cf: *Get it finished before you go to bed*. The two sentences, however, are closely similar in meaning. The idiomatic *Have done with it* is presumably to be analysed as having a perfective imperative verb.
- [b] The perfective passive may very occasionally be found with past time reference in a private prayer referring to information not yet known to the speaker: ?*Please, dad, don't have been in that plane*.
- [c] For reported imperatives in indirect speech, cf 14.33.
- [d] *Be seated and be prepared* are examples of pseudo-passives (cf 3.77).

Directives with a subject

- 11.25 It is intuitively clear that the meaning of a directive implies that the omitted subject is the 2nd person pronoun *you*. The implication can be demonstrated by the occurrence of *you* as subject of a following tag question (*Be quiet, will you?*), by the occurrence of only *yourself* or *yourselves* as the reflexive (*Behave yourself* or *Behave yourselves*, not **Behave myself*, etc), and by the occurrence of only the emphatic possessive *your own* (*Use your own comb*, not **Use her own comb*, etc):

There is, however, a type of directive in which the stressed subject *you* is added. *You* may be noncontrastive and admonitory:

'You be QÜet!
'You 'mind your own BÜsiness, and 'leave this to MÈ!
'You 'show me what to DÒ.
'You 'take the BÖÖk.

They frequently express strong irritation or (as in the last two examples) merely insistence. On the other hand, noncontrastive *you* may be persuasive:

I know you can do it if you try hard enough. 'You 'show me what you can DÒ.

You may also be contrastive in the sense of addressee-distinguishing, singling out one person or one set of persons. The identity of the persons may be made clear by a vocative or by some gesture such as pointing:

Don't tell MÈ to be quiet. YÖU be quiet!
Here! YÖU take the book!
'You take THÍS chair, and I'll take THÀT one.

Vocative *you*, as opposed to imperative subject *you*, is very impolite:

YÖU| 'come HÈRE|

Third person subjects are also possible:

Somebody open this door.
Everybody shut their eyes.
Parents with children go to the front.
Nobody move.
Men in the front row take one step forward.

It is easy to confuse the subject, in these commands, with a vocative noun phrase (cf 10.52f). But whereas the subject always precedes the verb, the vocative is an element that can occur in final and medial, as well as initial, positions in the sentence. Another difference is that the vocative, when initially placed, has a separate tone unit (typically fall-rise); the subject merely receives ordinary word stress:

VOCATIVE: MÄRY, play on MY side.
Play on MY side, MÄRY.
SUBJECT: 'Mary play on MY side.

The distinctness of vocative and imperative subject is confirmed by the possibility of their cooccurrence:

JÖHN, 'you listen to MÈ!

- Note [a] Apart from *will you?*, other tag questions heard with an imperative are *would you?*, *could you?*, *can you?*, *won't you?*, *can't you?*, *wouldn't you?*, *couldn't you?* Also the familiar *wh-question why don't you?* is sometimes appended: *Take a rest, why don't you?*
- [b] Directives with 3rd person subjects take either 2nd or 3rd person pronouns in the tag question: *Somebody open this door, will you?/will they?*
- [c] There is similar uncertainty about the person of a reflexive pronoun after a 3rd person subject: *Everyone behave yourselves* and *Everyone behave themselves* both seem acceptable. (On the use of a plural substitute pronoun for *everyone*, cf 10.43.) With a vocative, in contrast, only the 2nd person reflexive, in agreement with the understood subject, is allowable: *Behave yourselves, everybody*.
- [d] Another confusion easily made is that between a directive with *you* as subject and a statement with *you* as subject as used, for example, in giving street directions: *You go up there until you reach the bridge, then you turn right* ... It is the unstressed subject of the statement that distinguishes it formally from the directive, since the subject of a directive is always stressed, even if a pronoun: *'You go up there*. Needless to say, the admonitory tone of the directive would be quite unsuitable in giving street directions. (The negative *don't you* is less peremptory.)

Directives with let

- 11.26 First person imperatives can be formed by preposing the verb *let* followed by a subject in the objective case (cf 3.51):

Let us all work hard.
Let me think what to do next.
Let me see now. Do I have any money on me?

(Cf also ratiocinative questions, 11.23 Note). The same applies to 3rd person subjects:

Let no one think that a teacher's life is easy.
Let each man decide for himself.
If anyone shrinks from this action, *let him* speak now.

Except for the *let me* type, these are generally rather archaic and elevated in tone. A colloquial alternative to *let us*, however, is the common abbreviated form *let's*:

Let's have a party.
Let's enjoy ourselves.

In very colloquial English, *let's* is sometimes used for a 1st person singular imperative as well: *Let's give you a hand*. There are no 2nd person imperatives with *let*: **Let you have a look*.

- Note [a] This type of imperative, in which *let* is no more than an introductory particle, should be kept separate from the ordinary 2nd person imperative of *let* as a transitive verb. That they are distinct is shown by the fact that *Let us go* in the sense 'Permit us to go' cannot be abbreviated to *Let's go*. Furthermore, the full verb *let* is followed by a tag question with *you* as subject (*Let us go, will you?*), whereas the 1st person imperative is followed by a tag question with *we* as subject (*Let's go, shall we?*). In *Let's don't forget* (esp AmE), the particle is institutionalized (cf 3.51 Note [b]).
- [b] *Let's have a look* can refer to the speaker alone. Compare *Give us a hand to get the car started*, where *us* can also refer merely to the speaker.

Summary of forms of imperatives

11.27 We can now summarize the structural types of imperative:

		1st PERSON	2nd PERSON	3rd PERSON
without subject		—	(i) Open the door.	—
with subject	without <i>let</i>	—	(ii) You open the door.	(iii) Someone open the door.
	with <i>let</i>	(iv) Let me open the door. Let's open the door.	—	(v) Let someone open the door.

By far the most common type is the subjectless 2nd person imperative (class (i)).

Negative imperatives

11.28 To negate the first three classes of imperative, one simply adds an initial *Don't* or *Do not*, replacing assertive by nonassertive items where necessary:

- (i) { Open the door.
 Consider, my friends, that all is lost.
 ~ { *Don't* open the door.
Do not, my friends, consider that all is lost. <formal>
- (ii) You open the door. ~ { *Don't you* open the door.
You don't open the door. <less common>
- (iii) Someone open the door. ~ { *Don't anyone* open the door.
No one open the door.

First person imperatives, on the other hand, are generally negated by the insertion of *not* after the pronoun following *let*:

- (iv) { *Let's not* say anything about it.
Let us not say anything about it.
 (iv) *Let me not* believe such accusations. <formal, rare>

Informally, however, the negation with *Don't* is frequently heard:

- (iv) *Don't let's* say anything about it. <esp BrE>
 (iv) *Let's don't* say anything about it. <esp AmE>
 (iv) *Don't let me* disturb you. <esp BrE>

Third person imperatives with *let* are negated by *not* after *let* or (more informally) by an initial *don't*:

- (v) *Let not anyone* fool himself that he can get away with it. <formal, rare>
 [Also: *Let no one* fool himself that he can get away with it.]
 (v) *Don't let anyone* fool himself that he can get away with it.

The distinction that we have noted (cf 11.25) between contrastive and noncontrastive *you* in positive directives applies also to negative directives:

Don't "yöu say anything. [contrastive]
Don't you say Anything. [noncontrastive]

- Note [a] The more formal full particle *do not* cannot replace *don't* in classes (ii) and (iii), though it can in classes (i), (iv) and (v).
 [b] Negative directives are seldom followed by tags. The only operators that seem possible are the positive auxiliaries *will* and *can*: *Don't make a noise, will you?* *can you?* The tag has a falling tone.

Illocutionary force of imperatives

11.29 Imperative sentences are used for a wide range of illocutionary acts. It is not, however, always possible to make precise distinctions because the illocutionary force depends on the relative authority of speaker and hearer and on the relative benefits of the action to each. Here are some examples of sentences that may be used for different illocutionary acts, but we should be aware that illocutionary force depends in most cases on the situational context. (For verbless directives, cf 11.42, 11.53.)

ORDER, COMMAND

Fire! [*fire* as verb] Make your bed at once.

PROHIBITION

Don't touch.

REQUEST

Shut the door, please.

PLEA

Help!

ADVICE, RECOMMENDATION

Take an aspirin for your headache.
 Lock the door before you go to bed.

WARNING

Look out! Be careful! Mind your head!

SUGGESTION

Ask me about it again next month.
Let's have a party.

INSTRUCTION

Take the first street on the left.

INVITATION

Make yourself at home. Come in and sit down.

OFFER

Have a cigarette.

GRANTING PERMISSION

Help yourself.

GOOD WISHES

Enjoy your meal. Have a good time.

IMPRECATION

Go to hell!

INCREDULOUS REJECTION

Oh, come now. ['You don't really mean that.']

SELF-DELIBERATION

Let me see now. ('Should I go straight home?')

Note [a] Imperative clauses joined by *and* or *or* to a following clause may have a conditional implication (cf 13.25, 13.30). The illocutionary force of the construction varies:

REQUEST

Sit next to Joan and she'll explain what you have to do.

PROMISE

Finish your homework and I'll give you some ice cream.
Don't make any noise and I'll take you inside.

THREAT

Make a move and I'll shoot.
Don't make a move or I'll shoot.

[These two sentences convey the same meaning, but the positive imperative carries a stronger expectation of the hearer's readiness to move.]

WARNING

Join the committee and you'll regret the waste of time.
Don't eat so much or you'll be sorry.

In *Give him enough rope and he'll hang himself*, the sentence is close to being a pure conditional construction. For verbless directives of this type, cf 11.53 Note.

[b] Instructional imperatives are often used in writing:

Take one tablespoonful three times a day after meals.

Remove the bolt from the handle socket and slide the cord retainer into the slot at the back of the handle socket.

Written instructions are often in abbreviated form (cf 11.48).

[c] *Please* and (to a lesser extent) *kindly* (cf 8.90f) may be added to imperative sentences with the illocutionary force of a request to convey greater overt politeness: *Please eat up your dinner; Kindly move to the next seat*. Requests are often expressed by questions and statements, eg: *Will you shut the door, please?; Would you mind shutting the door?; Could you shut the door for me?; I wonder whether you would mind shutting the door*. Questions that convey indirect requests need not have a question mark (cf App III.23 Note [b]).

Do with positive imperatives

11.30 A positive imperative can be made more persuasive or insistent (esp in BrE) by adding *do* (with a nuclear tone) before the verb. *Do* reinforces the positive sense of the imperative. For many people this persuasive use of *do* seems more typical of female than male speech:

DO have some more tea. DO let's go for a walk.

This use of *do* applies only to classes (i) and (iv), and we therefore do not have **Do you have some more tea*.

Note [a] *Do*, like *don't* and *let's*, acts as an introductory imperative marker, and is not identical with the emphatic *do* of statements (cf 18.56). To see this, notice that neither *do* nor *don't* in imperatives fulfils the strict conditions of *do*-support (cf 3.37): they are not introduced to make good the lack of an operator, but indeed are added to the front of an operator if one is present: *Do be seated; Don't be silly*. (Contrast the unacceptability of **He does be silly*.) This peculiarity of imperative *do* is also found in the quasi-imperative *Why don't you* construction: *Why don't you be more careful?*

[b] *Do*, *don't*, *let's*, and *let's not* are used in isolation as elliptical directives:

A: Should I open the door?	B: { Yes, do. No, don't.
A: Should we watch the game?	B: { Yes, let's. No, let's not.

Exclamatives

11.31 Exclamatives as a formal category of sentence are restricted to the type of exclamatory utterance introduced by *what* or *how*. For exclamatory questions, cf 11.22.

Exclamatives resemble *wh*-questions in requiring the initial placement of an exclamatory *wh*-element. The syntactic order is therefore upset to the extent that the *wh*-element (which may be object, complement, or adverbial as well as subject) may be taken from its usual (statement) position and put into a position of initial prominence. On the other hand, in contrast to *wh*-questions, there is generally no subject-operator inversion:

wh-element as subject:

What an enormous crowd came! [S V – the rarest type] [1]

wh-element as object:

What a time we've had today! [O_d S V A] [2]

wh-element as complement:

How delightful her manners are! [C_s S V] [3]

wh-element as adverbial:

- | | |
|---|------|
| { How I used to hate geography! [A S V O _a] | [4a] |
| { What a long time we've been waiting! [A S V] | [4b] |
| { How quickly you eat! [A S V] | [4c] |

In addition, the *wh*-element, like the *wh*-element of the *wh*-question, can act as prepositional complement:

What a mess we're in!

It can occur even as a pushdown element of an indirect statement (again like the interrogative *wh*-element, cf 11.18):

How foolish you must have thought I was!

It is possible (but again rare) for the prepositional phrase as a whole to occur initially as *wh*-element:

In what poverty these people live!

For how many years did I live in that dreamworld of fantasies and false hopes!

This latter example and the following sentences illustrate the occasional inversion of subject and operator in literary English, particularly with a preposed adverbial, subject complement, or direct object:

How often have I bitterly regretted that day!

How strange is his appearance!

What magnificent characters does she present in her latest novel!

Inversion is preferred with negative *rarely*:

How rarely do I see you! <rare and rhetorical>
