For tag questions with exclamation, cf 11.10.

- 11.32 Only two *wh*-words can be used to form the *wh*-element in exclamatory sentences: *what* as predeterminer in a noun phrase, cf [1], [2], and [4b] in 11.31; and *how* as intensifier of an adjective, adverb, or clause, cf [3], [4a], and [4c] respectively in 11.31. The limitation to these functions is not surprising when one realizes that the *wh*-word indicates an extreme position on some scale of value, and therefore can only appear at points in the sentence where an expression of degree is possible. Exactly the same functions are fulfilled (especially in some women's speech) by the emphatic degree items *such* (as a determiner) and *so* (as an intensifier) in statements and questions (cf 18.57):

We've had *such* a time. Why did they tease you *so*?

Her manners are *so* delightful.

Exclamation is very frequently indeed reduced by ellipsis to the single *wh*-element: *What a terrible wind!*, *How encouraging!*

Note [a] *How* is like *so* (in exclamatory utterances) in that when it is an intensifier, it cannot modify an adjective which itself has a premodifying function. Instead of:

*a *how/so* noisy party

We must prepose *how* *noisy* or use *what* or *such* as intensifiers of the noun phrase:

how *noisy* a party

what/such a noisy party.

[b] The generalized exclamatory *and how* (esp AmE) is used informally to refer to a previous statement or question by the same or another speaker:

He can argue, and how! ['How he can argue!']

A: We had a cold winter last year. B: And how!

Echo utterances

- 11.33 Echo utterances are utterances which repeat as a whole or in part what has been said by another speaker. They may take the form of any utterance or partial utterance in the language, but in their discourse function they are either questions (cf 11.34ff) or exclamations (cf 11.37). Echo questions are either recapitulatory (cf 11.34f) or explicatory (cf 11.36).

Recapitulatory echo questions

- 11.34 A recapitulatory echo question is simply a question which repeats part or all of a message, as a way of having its content confirmed. The simplest type is a *yes-no* question which merely repeats, with rising intonation, what has just been said:

A: I didn't like that meal. B: You didn't *LÍKE* it?

A: The Browns are emigrating. B: *Émigrating*?

A: Switch the light off, please. B: Switch the *LÍGH*T off?

To make the meaning explicit, one could prefix to each of these questions the words 'Did you say ...?' Sometimes, indeed the invariant tag clause (*did you say?*) is added: *Switch the LIGHT off, did you say?* (cf 11.11).

There is also a *wh*-echo question which indicates, by the *wh*-word, which part of the previous utterance the speaker did not hear or understand:

A: It cost five dollars. B: *HÓW* much did it cost?

A: He's a dermatologist. B: *WHÁT* is he?

A: We're leaving him here. B: *WHÁT* are you doing with him?

In this case '... *did you say?*' could be supplied immediately after the *wh*-element: *HÓW much did you say it cost?* These *wh*-echo questions, as we see above, have a characteristic intonation pattern: a rising intonation with the nucleus on the *wh*-word itself.

In the examples above, the *wh*-element is fronted as in normal *wh*-questions and inversion takes place according to the regular rule for *wh*-questions (cf 11.14f). In a variant type of *wh*-echo question, the statement order is retained:

A: I'll pay for it. B: You'll *WHÁT*?

A: I saw Ted Dawson today. B: You saw *WHÓ*?

The order where no fronting takes place is obligatory for directives:

A: Switch the light off. B: Switch WHÁT off?

What and *who* are not restricted in echo questions to their normal functions, but may replace a single noun or an adjective phrase. There is a declining acceptability the further one gets away from the normal functions of *who* and *what*:

A: His son is a macroengineer.

B: His son is a WHÁT?

A: She always wears a quizzical expression.

B: She always wears a WHÁT expression?

Furthermore, *what* may be made plural:

A: Astronomers have discovered some more black holes.

B: They've discovered some more WHÁTS?

It may even replace a verb:

A: She sat there and ratiocinated.

B: She sat there and WHÁTted?

Although recapitulatory echo questions are ostensibly requests for the repetition of information, they frequently have other functions, such as to express irony, incredulity, or merely to fill in a conversational gap. They are familiar, or even impolite, in implication unless accompanied by an apology:

Sorry, WHÁT was his job?

Note [a] The generalized recapitulatory *wh*-question *WHÁT did you say?* is sometimes truncated to the monosyllable *WHÁT?* (impolite except among friends), just as the alternative formula *I beg your pardon?* can be reduced simply to *Pardon?* Other abbreviated requests for repetition are *Pardon me?* (AmE), *Excuse me?* (AmE), and *Sorry?* (BrE).

[b] *What?* on its own can also express general incredulity:

A: I paid £1000 for that picture. B: WHÁT? You must be mad.

Questions about questions

11.35 Since an echo question can refer back to any type of utterance, a special case of it is a question about a question, sometimes called a question raised to the second power:

A: Have you borrowed my PÉN? B: (Have I) borrowed your PÉN?

This is a *yes-no* question about a *yes-no* question. In addition, there are three further types:

Yes-no question about *wh*-question:

A: What do you think of the picture?

B: What do I THÍNK of it? ['Did you say what do I think of it?']

Wh-question about *yes-no* question:

A: Have you ever been to Valladolid?

B: (Have I ever been) WHÉRE?

Wh-question about *wh*-question:

A: How did you enjoy the carnival?

B: How did I enjoy WHÁT?

Explicatory echo questions

11.36 The second main category of echo question is the explicatory echo question, which asks for the clarification, rather than the repetition, of something just said. It is always a *wh*-question, and is identical to the recapitulatory *wh*-question, except for the substitution of a falling tone for the rising tone on the *wh*-word:

A: Take a look at this!

B: Take a look at WHÁT?

A: He's missed the bus again.

B: WHÒ's missed the bus?

A: Oh dear, I've lost the letter.

B: WHÍCH letter have you lost?

The last example could be paraphrased 'Which letter do you mean – [rather than 'did you say'] – you have lost?' The *wh*-word replaces some definite item of information meaning (eg a personal pronoun) that needs clarification in the context.

Note [a] There are abbreviated forms of these as of other *wh*-echo questions – A: *Look over there!* B: *WHÉRE?* The general explicatory echo question *WHÁT* may also be noted. Its meaning is roughly 'What do you want?' – A: *John!* B: *WHÁT?*

[b] An explicatory echo question may follow an incomplete question:

A: How did you enjoy the er er ...?

B: How did I enjoy the WHÁT?

Echo exclamations

11.37 The echo exclamation, like the echo question, repeats part or all of a preceding utterance; but in contrast to the rising tone of the echo question, it is characterized by a rise-fall (or high fall) tone. The form of the utterance to be repeated may be declarative, interrogative, imperative, or even exclamative:

A: I'm going to London for a holiday.

B: *To LÓNdon!* That's not my idea of a rest.

A: Have you been to Paris?

B: *Been to PÁris!* I'll say I have!

A: Open the door, please.

B: *Open the DÓOR!* Do you take me for a doorman?

A: What a beautiful day!

B: *What a beautiful DÁr!* You must be joking.

A: He must be the only applicant.

B: *Must be the Ónly applicant!* That can't be true.

Such exclamations, expressing astonishment at what has been said, are very similar in role to the incredulous type of echo question. Indeed, the repetitions italicized above could be spoken either with an exclamatory falling nucleus, or with the rising tone of the echo question.

Either in the echo question or the echo exclamation, one could repeat the earlier utterance with varying degrees of completeness. Thus, rather than *To*

London! in the first example, one could have said *You're going to London!*, *Going to London!*, or simply *London!* Some irregular subject-predicate constructions in which the finite verb is omitted are produced in these exchanges:

A: I hear you're a linguist.

{ B: I a linguist! <formal>

{ B: Me a linguist!

A: Ted's going to write the music.

B: Ted write the music? What a splendid idea!

Irregular sentences

- 11.38 Some sentences do not conform to the regular patterns of clause structures (cf 10.2) or to the variations of those structures in the major syntactic classes (cf 11.1). It is not possible to make precise distinctions, but we can mention several ways in which sentences are **IRREGULAR**:

(a) They contain forms not found in regular sentence structures, for example the subjunctive in the main clause of *Long live the Queen* (cf 11.39).

(b) They are marked as subordinate, for example by the subordinator *if* in *If only I had been there!* (cf 11.41).

(c) They are **FRAGMENTARY**, lacking constituents that are normally obligatory. The ellipsis may be recoverable from the linguistic form of the sentence (cf 12.46ff), for example the omission of the subject *I* and the verb *am* in:

Sorry to hear about your father.

Or it may be recoverable from the preceding linguistic context, as in B's reply in the following exchange:

A: When can I see you?

B: Tomorrow morning. [*You can see me tomorrow morning?*]

On ellipsis, cf Chapter 12.

There are other instances where it is less convincing to postulate ellipsis and we shall not attempt to do so. We consider such instances to be **NONSENTENCES**, since we cannot analyse them with confidence in terms of clause elements. For example, we would not want to suggest that the sign *Exit* is elliptical for *This is the exit*, and that therefore *Exit* is a subject complement, though defective because it lacks a determiner such as *the*. We would not want to do so because it is equally possible to say that the sign stands for (among other possibilities) *The exit is here* (where *The exit* is subject). Other cases are more arguable; for example, *A good idea!* might reasonably be considered to be a subject complement, because of the tag question that we could add to it: *A good idea, isn't it?*

Irregular sentences may occur also as independent clauses in a compound sentence. For example:

Not bad, that JOKE, but I've heard better.

A: Are you coming with us?

B: *Of course*, and so is Daniel.

Some irregular types are commonly used as parts of sentences, for example *Please God* as in:

Please God, there hasn't been an accident.

In the sections that follow we generally group irregular sentences by their form, but it is sometimes convenient to treat together certain features that are characteristic of a variety of the language. We deal separately (cf 11.54) with common formulae, most of them nonsentences, used for stereotyped communicative situations.

Sentences with optative subjunctive

- 11.39 One type of irregular sentence contains the optative subjunctive, used to express a wish (cf 3.51). The optative subjunctive survives in a few expressions of a fairly fixed type. It is combined with subject-verb inversion in:

Far be it from me to spoil the fun.

So be it.

Suffice it to say we lost.

So help me God.

Long live the Republic!

It is found without inversion in:

God save the Queen!

{ God } { bless you!
 { The Lord } { forbid!
 { Heaven } { help us!

The devil *take* you. <archaic>

A less archaic formula (also with subject-verb inversion) for expressing wishes, usually blessings, is *may* + subject + predication:

May the best man win!

May you always be happy!

May all your troubles be small!

May you break your neck!

Another archaic formula is *would* (to God) followed by a *that*-clause with past forms of verbs:

Would (to God) that I'd never heard of him!

Irregular *wh*-questions

- 11.40 There are several types of irregular *wh*-questions, which occur mainly in conversation:

(i) *How about* and *what about* are generally followed by noun phrases or *-ing* clauses. They are principally used as directives:

How about another kiss?
What about following us in your car?

But they are also used as inquiries:

How about your parents? Are they well?

(ii) *How come* is used in informal speech (esp in AmE) to introduce reason questions:

How come you're so late? ['How does it come about (that) you're so late?']

The stereotyped *how come* is followed by a clause that follows the normal subject-verb order.

(iii) An irregular *why*-question is formed without subject or auxiliary: *why* (+ *not*) + predication, the verb being the base form. It is used as a directive (cf 11.16f):

Why (not) listen to him? ['Why should(n't)/do(n't)/did(n't) you listen to him?']

(iv) There is a verbless *why*-question, which is used as an inquiry. The questions correspond to existential sentences (cf 18.44ff):

Why no classes today? ~ Why are there no classes today?
Why all the noise? ~ Why is there all the noise?

(v) *Wh*-questions (except for *why*-questions) without a subject and with a *to*-infinitive as the verb are occasionally found as inquiries:

What to do next? ['What should I/we do next?']
Who to see?
Which way to go?

(vi) Dependent finite *wh*-interrogative clauses are used as directive headings in written English for suggestions:

How you can make your fortune
Where you should eat in Los Angeles

A dependent *why*-clause is used as a statement heading:

Why you should have a medical examination once a year

(vii) Dependent infinitive *wh*-clauses of the same form as those in (v) are more commonly used than the finite clauses in (vi) as directive headings:

What to do in an emergency ['What one should do in an emergency.']
Where to go for help ['Where one can go for help']
Who to phone after office hours
When to send in your application
How to mend a puncture
How to learn a foreign language

(viii) *What if* and *how if* introduce questions used as inquiries:

What if it rains? ['What happens if it rains?']

The questions are also used as directives:

What if you join us for lunch? [invitation]
What if you don't join us for lunch just this once? [suggestion]

What if and (occasionally, esp in BrE) *What though* may have the meaning 'What does it matter if . . .?':

What if they ARE illiterate? What though they ARE filthy?

Note [a] *What about it?*, *What of it?*, and *So what?* are used as responses to question the significance of what has been said by another speaker ('What difference does it make?'). *How about that?* is used (esp in AmE) to express surprise combined with approval or disapproval:

A: Fred and Pam have just got married. B: Well, how about that?

[b] On verbless exclamatory sentences such as *How very thoughtful!* and *What a good idea!* cf 7.30.

Subordinate clauses as irregular sentences

11.41 Apart from the subordinate *wh*-clauses discussed in 11.40, several other kinds of clauses that are subordinate in form are used as irregular sentences. They generally have the illocutionary force of exclamations, the omission of the matrix clause (cf 14.4) being mimetic of speechless amazement.

(i) *That*-clauses generally contain the putative *should* that may accompany expressions of surprise (cf 14.25). They typically convey disapproval or regret:

That he should have left without asking me!
That you could ever want to marry such a man!
That it should come to this!
That I should live to see such ingratitude!

But they may also convey approval or relief:

That all your friends should be so sympathetic!

These sentences are distinctly more formal than the infinitive sentences in (ii) below.

(ii) *To*-infinitive clauses convey kinds of illocutionary force similar to those for *that*-clauses. A common type begins with *To think (that)*, and is very similar in its illocutionary force to the *that*-clauses in (i), though less formal:

To think that she could be so ruthless!
To think that I was once a millionaire!
To think that they would turn me down!
To think that he should be so mean!
To think that you might have been killed!

The implied subject in such sentences is the first person pronoun (cf Note [b] below). When the infinitive clause begins with some other verb than *think*, its subject is understood from an introductory subject (cf 18.58) or vocative, or it may be apparent from the previous context:

That brother of yours, to be so uncouth!
 You fool, to forget your wedding anniversary!
 You're going to be in trouble. To say something like that!

(iii) Infinitive clauses introduced by *oh* express an exclamatory wish. The style is poetic or archaic, except when jocular:

Oh to be in England! ['I wish I were in England.']
 Oh to be free! ['I wish I were free.']

(iv) Negative *if*-clauses, usually preceded by *well* or *why*, are used to express surprise:

Well, if it isn't the manager himself! ['It is indeed the manager himself!']
 Why, if it isn't Susan! ['It is indeed Susan!']

(v) Subordinate clauses beginning *if only* and containing the form of the verb appropriate to conditional clauses (cf 15.36) also express an exclamatory wish:

If only I'd listened to my parents! ['I wish I had listened to my parents.']
 If only he were not so timid!
 If only I could make them understand my point of view!

A similar construction has *only*, *just*, or *but* before the main verb:

If I'd *only* listened to my parents!
 If I could *just* make them understand my point of view!
 If I could *but* explain!

(vi) Subordinate clauses beginning with *supposing* may have the same force as *What if* (cf 11.40) or, indeed, of the imperative *suppose*:

Supposing I don't see her. [inquiry: 'What would happen if I...?']
 Supposing you come with us. [invitation]
 Supposing they ARE poor? ['What does it matter if they...?']
 <impatience or scepticism>

Note [a] Verbless clauses consisting of *Oh for* followed by a noun phrase also express an exclamatory wish. Like the analogous infinitive clauses, they are poetic or archaic unless used jocularly:

Oh for a drink! Oh for another glimpse of her!

On the other hand, the stereotyped exclamation *Oh for*... 's sake expresses impatience or anger:

Oh, for heaven's sake! <casual> Oh, for Christ's sake! <familiar>

In AmE, *for heaven's sake* and *for goodness' sake* are used by some speakers to express surprise.

Exclamatory *Now for*... is used to express gratified anticipation that something wished for is indeed available immediately:

Now for a good hot bath!

[b] Infinitive clauses introduced by *To think* (*that*) may be interpreted as something like *It surprises me to think*... or *It surprises one to think*..., though the fuller forms are not exclamatory.

[c] Stereotyped *Not to worry!* is an informal friendly directive ('Don't worry!'). It is often self-addressed.

Adverbials as directives

11.42 Adverbials may have the illocutionary force of commands. Generally a verb of motion is implied:

Forward!	On your feet!	Faster!
Left, right!	At the double!	To the left!
At ease!	Inside!	That way!

Two adverbials may be combined:

Full speed ahead! Back to work!

Or a noun phrase subject and an adverbial:

Everybody inside! All aboard! Citizens to the left!

The implied verb of motion may be causative, the noun phrase being a direct object:

Backs to the wall!	['Put your backs to the wall!']
Hands up!	Shoulders back!
Heads up!	Eyes down!
Hands on heads!	Thumbs up!

One kind of verbless command is constructed with an adverbial followed by a *with*-phrase:

On with the show! ['Begin or continue the show.']
 Off with his head! ['Cut off his head!']
 Off with your jacket! ['Take off your jacket!']
 Out with it! [set expression: 'Tell me about it.']

Constructions with *up* and *down* are generally used to express approval and disapproval respectively:

Up with democracy! Down with racism!

Note [a] In two stereotyped verbless sentences a verb of motion is implied after the auxiliary:
 Murder will out. ['Murder will come out'; 'Murder will become known']
 Truth will out.

[b] Occasionally adjective phrases functioning as subject complement may be directives:
 Careful! ['Be careful!'], Quiet!

Aphoristic sentences

11.43 The aphoristic sentence structure is found in many proverbs. The common structural feature is the balancing of two equivalent constructions against each other:

- | | |
|---|------------------------------------|
| (i) The more, the merrier. | The sooner, the better. |
| The less said, the better. | |
| (ii) Least said, soonest mended. | Easy come, easy go. |
| Nothing ventured, nothing gained. | Here today, gone tomorrow. |
| Once bitten, twice shy. | First come, first served. |
| (iii) Spare the rod, and spoil the child. | Marry in haste, repent at leisure. |
| Love me, love my dog. | Waste not, want not. |
| (iv) More haste, less speed. | In for a penny, in for a pound. |
| No work, no money. | Out of sight, out of mind. |
| Like father, like son. | So far, so good. |

All are to some extent anomalous. Items in set (i) appear to be elliptical. Thus, the first example may be considered elliptical (depending on the context) for something like *The more there are of us, the merrier we are*, a pattern which, although still on the aphoristic model, is more productive than those of any of the other sets. This pattern is dealt with under proportional clauses (cf 15.51).

In (ii) the verb is nonfinite; the first part is semantically subordinate (mostly conditional). In (iii) the verbs may be analysed as imperatives, the two clauses being in a conditional relationship similar to that in the regular structure exemplified in *Spare the rod, and you (will) spoil the child* (cf 13.25). In (iv) both parts are verbless.

Note [a] A single verbless comparative clause introduced by *the* may occur as a response:

A: I didn't call her. B: The more fool you!

It may be further reduced by the omission of *the*: *More fool you!* Similarly, *The more haste, the less speed* is equivalent to the form found in the saying *More haste, less speed*.

[b] Other sayings of anomalous form:

Better late than never. First things first.

No sooner said than done. Handsome is as handsome does.

In the last example, the adjective *handsome* is used in both positions as if it were a noun.

[c] New formations on the model of *No ... no ...* are occasionally produced:

No dinner, no dessert. ['If you don't eat your dinner, I won't give you any dessert.']

No homework, no TV.

Subject-plus-complement constructions

11.44 Several types of verbless sentences or clauses, most of them existential, have the basic structure of subject and subject complement, or of complement alone.

(i) In one colloquial type, the subject is appended like a noun-phrase tag (cf 18.59):

Not BÂD, that SÂLmon.

ÔDD sort, those NÉIGHbours of yours.

Just our LÜCK, SÜE finding out.

(ii) A verbless clause consisting of subject and subject complement (in that order) may be linked by *and* to a preceding clause with regular clause structure. Various logical relationships may be expressed:

How could you be so spiteful and her your best friend? ['... seeing that she is your best friend?']

You could have left before the speeches, and nobody the wiser.

[conditional relationship: '... and if you had done so, nobody would have been the wiser.']

Less commonly, the subjective case is used for a subject pronoun:

They left without a word, and he so sensitive. ['... though he was so sensitive.']

(iii) A more colloquial pattern contains an existential verbless clause consisting of complement alone. The clause is a comment on the preceding clause, and is linked to it by *and*:

They are thick as thieves, and no mistake.

['They are thick as thieves, and that is no mistake.']

She left him, and a good thing too. ['... and it's a good thing too']

He finally begged for help, and no wonder.

(iv) A literary and somewhat archaic type of verbless rhetorical *wh*-question (cf 11.23) is followed by *but* in the second clause. The *wh*-clause consists of subject followed by subject complement or of subject complement alone. The sentence, also existential, expresses a comparative relationship:

What belief so foolish but some will embrace it?

['There is no belief so foolish but that there will be some who will embrace it.']

Who so honest but some will doubt his integrity?

['There is none so honest but that there will be some who will doubt his integrity.']

(v) Another version of the rhetorical *wh*-question, but less formal, contains a comparative:

What better than a hot shower? Who more fitting than you?

Note A stereotyped subject-complement sentence occurs in *All clear*. Similar stereotyped sentences, but with an adverbial instead of a complement, are *All in good time* and *All over* ['It's finished'].

Block language

11.45 Block language appears in such functions as labels, titles, newspaper headlines, headings, notices, and advertisements. Simple block language messages are most often nonsentences, consisting of a noun or noun phrase or nominal clause in isolation; no verb is needed, because all else necessary to the understanding of the message is furnished by the context. Here are some examples:

Entrance	50 mph limit
No entry	No dogs without leash
National Forecast	Danger: falling rocks
English Department	The New York Times
Fresh Today	Pure Lemon Juice
For Sale	All the News That's Fit to Print
A Comprehensive Grammar of the English Language	
The First Luxury Bound Collector's Edition of Agatha Christie's Work to be Available in This Country	

Some forms of block language have recognizable clause structures. Those forms deviate from regular clause structures in omitting closed-class items of low information value, such as the finite forms of the verb BE and the articles, and other words that may be understood from the context.

Newspaper headlines

11.46 Newspaper headlines commonly contain block language because of pressure on space. They can generally be analysed in terms of clause structure, though

frequently scrutiny of the text below a headline obliges us to reinterpret the structure.

FILM STAR MARRIES EX-PRIEST [S V O_d]
 OIL SPILL THREAT DECREASING [S V]
 PRESIDENT CALLS FOR CALM [S V A]
 SHARE PRICES NOW HIGHER THAN EVER [S A C_s]
 STUDY LINKS DEATHS TO CROWDING IN PRISONS [S V O_d A]
 THREE JOCKEYS HURT [S V]
 CAMP HELPS ADULTS REDISCOVER WILDS [S V O_d C_s]

The regular structure of the last two examples, for instance, would be *Three jockeys are hurt* and *The camp helps adults rediscover the wilds*.

In addition to those mentioned for block language in 11.45, certain other syntactic features are characteristic of newspaper headlines:

(i) The simple present is used instead of the present perfective, which in other styles (for example in conversation) would be normal for recent news:

MEAT PRICES RISE AGAIN ['Meat prices have risen again.']

(ii) *To* is commonly used to express the future or a predicted arrangement (cf: *be to*, 3.45f):

SENATOR TO SEEK REELECTION ['The Senator is to seek reelection.']

(iii) Asyndeton (cf 13.1) is more common:

WOMAN CLAIMS DRUG CAUSED CANCER, SUES ['A woman has claimed that a drug had caused her cancer, and she has sued somebody.']
 UTILITY POLE FALLS, KILLS PHONE COMPANY WORKER
 ['A utility pole has fallen and has killed a phone company worker.']

(iv) Verbs that are generally transitive are used intransitively:

BRITISH VICTORY SURPRISES ['The British victory has surprised (?) experts.']

Note [a] The use of past *caused* in the headline *WOMAN CLAIMS DRUG CAUSED CANCER, SUES* follows the normal backshift rule in indirect speech (cf 14.31). Substitution of present *causes* changes the time reference of the verb to habitual.

[b] The example in (iv) is structurally ambiguous. In addition to the interpretation given above, which presupposes a noun phrase as subject with *surprises*, *surprises* may be a noun head of the noun phrase that comprises the whole of the title.

Personal letters, cables, diaries

11.47 Block language is common on postcards, where space is restricted, and is also often used in informal personal notes. The first person pronoun and perhaps also an obvious auxiliary are often omitted:

Sorry about Jane. ['I'm sorry about the news about Jane.']
 Wish you were here. ['I wish you were here.']
 Having wonderful time. ['I'm having a wonderful time.']
 Weather marvellous. ['The weather is marvellous.']
 Know who I saw? ['Do you know who I saw?']

Elliptical sentences like the last example are also common in informal conversation (cf 11.49).

The language tends to be even more abbreviated in cables. The sender is likely to omit whatever can be understood by the receiver from a knowledge of the situation:

NO MONEY SEND HUNDRED ['I have no money. Send me a hundred dollars.']

NEGOTIATIONS PROGRESSING RETURNING END JULY STOP LETTER

FOLLOWING ['The negotiations are progressing well. I am returning at the end of July. A letter will follow this cable.']

MANUSCRIPT RECEIVED CHANGES ACCEPTED PRINTING JANUARY ['Your manuscript has been received and your corrections have been accepted. Printing of the book will take place in January.']

The language used in diaries is also abbreviated:

Got up at 6, phoned Bill. Bill said he was ill, so had to cancel meeting.
 Went to office instead. Worked till 12 on government contract.

Note [a] *STOP* is used in cables in place of punctuation to indicate the ends of sentences if there is a danger of ambiguity.

[b] Notes taken from lectures, books, or articles are likely to be abbreviated, the form and extent of the abbreviation varying with the individual writer.

[c] The increasing use of telex instead of cable has rendered the extreme condensed form of cable language less common.

Abbreviated sentences in instructional writing

11.48 Abbreviated structures are typical of instructional writing, such as technical manuals, consumer leaflets on assembling or using products, instructional labels on products, and recipes. As in newspaper headlines, articles are often omitted. It is characteristic of this style to omit direct objects that can be understood from the context.

Tighten to hold bracket snugly against wall, but without excessive tightening of screws.

Disconnect cleaner from electrical outlet before replacing belt.

Add one can of cold water to the contents of this can. Heat to boiling point. Allow to simmer a few minutes and serve.

When mixing is finished, turn mixer off, unplug cord from outlet and eject beaters.

Cook to golden brown.

Beat egg lightly with fork.

Keep away from heat.

Just heat and serve.

Lay flat.

Occasionally the subject is omitted:

Makes four servings, $\frac{1}{2}$ cupful each

Contains whiteners and brighteners

Note [a] Ostensive identification indicates that a direct object has been omitted and that it refers to the article on which the sentence is written:

- Refrigerate after opening [1]
 Keep cool [2]
 Keep out of reach of children [3]
 Stand upright [4]

Out of context, sentences [1-4] would be interpreted to refer to the addressee's keeping cool, etc.
 [b] Spoken demonstrations, for example of cooking, sometimes adopt these characteristics of instructional writing.

Abbreviated sentences in informal conversation

- 11.49 Initial words in a sentence are frequently omitted in informal conversation:

Don't know where they are. ['I don't...']
 Want another cup? ['Do you...?']
 Lost something? ['Have you...?']
 Serves them right! ['It serves...']
 Good to see you again. ['It's good...']
 Anything wrong? ['Is anything...?']
 Hot? ['Are you (feeling)...?']

The pronouns and auxiliaries to be understood are partially cued by the words that begin the sentence and in case of ambiguity are dependent on the situational context. For example, *Hot?* could be interpreted as either *Are you hot?* or *Is it hot?*

For further discussion of such sentences in conversation, cf 12.46ff.

Abbreviated sentences in broadcast commentaries

- 11.50 Commentaries on radio and television often contain abbreviated sentences, usually with the omission of *there is*, *it is*, or a form of the verb BE:

The first lap is over. Five more to come.
 Sport, and we have the latest from Wimbledon.
 Another batsman out.
 Two players wounded.
 And now a band of the marines.
 And again the sound of bugles.

Elliptical sentences in dialogue

- 11.51 In conversation and in written dialogue, it is common to find ellipsis in sentences that respond to, comment on, or question previous sentences spoken by another speaker. The ellipsis is interpreted from a preceding sentence; it avoids repetition so as to focus on the new material. The resultant fragmentary sentences can be analysed for clause functions through a reconstruction, based on preceding sentences, of the full forms:

A: Is your daughter at home?
 B: Probably. [A - She is *probably* at home.]
 A: Who sent you?
 B: The manager. [S - *The manager* sent me.]
 A: I'm leaving.
 B: Why? [A - *Why* are you leaving?]
 A: I can't play baseball.
 B: I know. [S V - *I know* you can't play baseball.]

A: Nobody's here.
 B: Obviously. [A - *Obviously*, nobody's here.]
 A: When will you leave?
 B: With luck, on Tuesday. [A A - *With luck* I'll leave on *Tuesday*.]

Elliptical sentences without change of speaker

- 11.52 Fragmentary elliptical sentences may also occur without change of speaker or writer. In writing, they appear especially in certain styles of fiction and advertising:

Two strange figures approached. *Martians!*
 Janet felt uncomfortable. *Yes, very uncomfortable.*
 It has a very distinctive taste. *Crisp and fresh.*
 Designed in Sweden, this teak desk is a terrific buy. *Shown with our exceptionally priced desk chair.*

Note These fragmentary sentences are to be distinguished from the sentence fragments that are merely the result of a punctuation device to indicate a dramatic pause for emphasis. They are also common in fiction and advertising:

He was drunk. *And penniless.*
 We have all kinds of contemporary furniture. *For every room in the house.*

Nonsentences

- 11.53 Nonsentences, usually but not exclusively noun phrases, occur frequently in speech, mostly in informal conversation. We can do no more than give some examples with their illocutionary force. (An optional vocative can frequently be added.)

(i) Exclamatory noun phrases modified by a restrictive relative clause (in most instances with the zero relative) generally express disapproval:

The clothes she wears! [cf: What clothes she wears!]
 The things they get up to!
 The way he complained about the food!
 The fuss they made!

(ii) Also expressing scornful disapproval are exclamatory phrases consisting of a noun phrase, generally a pronoun, followed by *and* and another noun phrase with a matching possessive pronoun:

You and your statistics! ['I deplore the way you so frequently resort to statistics.']
 Him and his malicious gossip!
 Pat and her childish hobbies!

The subjective case is less commonly used for the first pronoun: *He and his malicious gossip!*

(iii) Exclamatory prepositional phrases beginning with *Of all* express strong disapproval:

Of all the impudence! Of all the stupid things to say!

(iv) Exclamatory noun or adjective phrases may express approval or disapproval:

Charming couple!	Dirty place!	Stupid!
Excellent meal!	Very interesting!	Poor thing!
(A) good idea!	Disgusting!	Big baby! ['What a helpless person you are!']

Notice that articles are often omitted.

If the phrase is directed at the person addressed, it may be prefaced by *you*; eg: *You angel!* ['You're an angel!'], *You poor thing!*, *You idiot!* To express a more familiar – and more affectionate – relationship *my* is used; eg: *My poor baby!*, *My silly boy!*

(v) Noun phrases may have the force of commands or requests. Where appropriate, an adverbial such as *please* may accompany the noun phrase:

Attention!	Patience!	A pound of butter, please.
Action stations!	Lights!	Another coffee, if you
Taxi!	Phone!	don't mind.
Your turn.	Just a drop more!	The letter, please.
Scalpel!	My hat, please!	The door!
Scissors, somebody!	Next slide, please.	

In some instances, the interpretation depends on the situational context. For example, *The door!* might mean 'Shut the door!', 'Watch the door!', 'Open the door!', or even 'Leave the room!' For other verbless commands, cf 11.42.

(vi) Noun phrases may have the force of offers or invitations, particularly when they are spoken with rising intonation:

Cigarette?	My apartment?
More coffee, anyone?	Another round?

Again the interpretation may depend on the situational context. Alternative questions may have the same force: *TÉA or CÔFEE?*, *My PLÂCE or YÔURS?*

(vii) Noun and adjective phrases with rising intonation may have the force of inquiries. They may function as *yes-no* questions:

New hat?	Good flight?	Boring?
Your book?	Any luck, Ron?	Tasty?
Next slide?	False alarm?	

In place of these questions, it is possible to use a noun phrase followed by a tag question, eg: *Too hot, are you?*, *New hat, is it?*, *Good flight, was it?*.

They may also function as alternative questions:

YÓUR car or your MÔTher's? HÓT or CÔLD?

or as an inquiry having the force of *wh*-questions:

Your NÁME? ['Your name is . . .?'] Your ÁGE? Your RÁNK?
Your occUPÁtion?

These can be analysed as corresponding to (for example) *What is your name?*, *Tell me your name*, *Could you tell me your name?*

(viii) Noun phrases may make assertions, conveying information:

False alarm	No news
No luck	That way ['They went that way.']
Business call	['The phone call was a business call.']

(ix) Exclamatory noun phrases may convey a warning:

Fire! [noun] The police! Timber! Avalanche!

(x) Exclamatory negative noun phrases may convey a prohibition:

No smoking! No more noise! No pushing!

(xi) Noun phrases (with possible expansions) may merely convey sociability:

Nice day again. Good weather we're having. Lovely evening.

(xii) Exclamatory noun phrases may be self-addressed, expressing the hearer's alarm or frustration after a period of forgetfulness:

The cake! ['I should have taken the cake out of the oven.']
My husband's birthday! ['I've forgotten my husband's birthday.']
My interview!

(xiii) Vocatives (cf 10.52f) are used alone for a variety of purposes: for example, to summon, to rebuke, to question whether the person addressed is present, or to remind of an order or a request.

(xiv) Names or noun phrases referring to persons are used in verbless introductions, generally with a vocative:

Ladies and gentlemen, the next president of the United States of
América! ['I present the next president . . .!']
My mother and FÁther, sŭsan. ['These are my . . .']
DÁD – John RÔbin, a good friend of mine. ['Dad, let me introduce . . .']

Two or more persons may be introduced to each other, gestures perhaps indicating the different persons:

JÓAN, my sÍster – JÔHN, a good FRÍEND of mine

Other examples of verbless sentences appear in the list of formulae (cf 11.54).

Note Verbless clauses appear as the first clause in coordinated constructions that express a conditional relationship (cf 11.29 Note [a], 13.25).

(a) The construction may have the force of a directive:

One more step and I'll shoot. [cf: Take one step more and I'll shoot.]

Twenty pounds and you can have the radio. [cf: Give me twenty pounds and you can have the radio.]

Another drink or I'll die of thirst. [cf: Give me another drink or I'll die of thirst.]

A stereotyped sentence has verbless clauses in both parts:

Your money or your life! [*cf.* Give me your money or I'll take your life.]

Trick or treat! <AmE> ['Give me a treat or I'll play a trick on you.']

(b) The construction may have the force of a statement:

A minute more and we would have missed the train.

['If we had arrived a minute later, we would have missed the train']

Another such storm and the river would have overflowed its banks.

A few more feet and you would have gone over the cliff.

Notice the use of *would have*, typical in conditional sentences (*cf.* 15.36).

Formulae

11.54 Most formulae used for stereotyped communication situations are grammatically irregular. Only in a very limited way can they be analysed into clause elements. In the following list, we give a few examples of the major types:

GREETINGS: Good morning, Good afternoon, Good evening <all formal>; Hello; Hi <familiar>

FAREWELLS: Goodbye, Good night, All the best <informal>, Cheers, Cheerio <BrE, familiar>, See you <familiar>, Bye-bye <familiar>, So long <familiar>

INTRODUCTIONS: How do you do? <formal>, How are you?, Glad to meet you, Hi <familiar>

REACTION SIGNALS:

(a) *assent, agreement*: Yes, Yeah /je/; All right, OK <informal>

Certainly, Absolutely, Right, Exactly, Quite <BrE>, Sure <esp AmE>

(b) *denial, disagreement*: No, Certainly not, Definitely not, Not at all, Not likely

THANKS: Thank you (very much), Thanks (very much), Many thanks, Ta <BrE slang>, Thanks a lot, Cheers <familiar BrE>

TOASTS: Good health <formal>, Your good health <formal>, Cheers <familiar>, Here's to you, Here's to the future, Here's to your new job

SEASONAL GREETINGS: Merry Christmas, Happy New Year, Happy Birthday, Many happy returns (of your birthday), Happy Anniversary

ALARM CALLS: Help! Fire!

WARNINGS: Mind, (Be) careful!, Watch out!, Watch it! <familiar>

APOLOGIES: (I'm) sorry, (I beg your) pardon <formal>, My mistake

RESPONSES TO APOLOGIES: That's OK <informal>, Don't mention it, No matter <formal>, Never mind, No hard feelings <informal>

CONGRATULATIONS: Congratulations, Well done, Right on <AmE slang>

EXPRESSIONS OF ANGER OR DISMISSAL (familiar; graded in order from expressions of dismissal to taboo curses): Beat it <esp AmE>, Get lost, Blast you <BrE>, Damn you, Go to hell, Bugger off <BrE>, Fuck off, Fuck you

EXPLETIVES (familiar; likewise graded in order of increasing strength): My Gosh, (By) Golly, (Good) Heavens, Doggone (it) <AmE>, Darn (it), Heck, Blast (it) <BrE>, Good Lord, (Good) God, Christ Almighty, Oh hell, Damn (it), Bugger (it) <esp BrE>, Shit, Fuck (it)

MISCELLANEOUS EXCLAMATIONS: Shame <familiar>, Encore, Hear, hear, Over my dead body <familiar>, Nothing doing <informal>, Big deal <familiar, ironic>, Oh dear, Goal, Checkmate

Note *That's OK* <informal>, *Don't mention it*, *You're welcome* <esp AmE>, and *No problem* <esp AmE> are also used as responses to thanks.

Most of the formulae allow for little or no change in their form. The greeting formula (appropriate to a first meeting) *How do you do?* has a regular clause structure, but in the formulaic sense the verb cannot be made past (**How did you do?*), the subject cannot be changed from *you* (**How do they do?*), the sentence cannot be subordinated as an indirect question (**They asked him how he did.*) or answered in equivalent statement form (**I do very well*). The appropriate response to the greeting is the repetition *How do you do?*

Some imprecations are imperative in form, but they do not have the structural potentialities of imperatives. For instance, there are no negative forms **Don't blast you*, **Don't bugger it*, and an indefinite object, such as *some students*, is not possible: **Blast some students!* Similarly, the formulaic *Don't mention it* cannot be made positive (**Mention it*).

Interjections

11.55 Interjections are purely emotive words which do not enter into syntactic relations. Some of them have phonological features which lie outside the regular system of the language. *Whew*, for instance, contains a bilabial fricative [ɸu], [ɸ]; *tut-tut* consists of a series of alveolar clicks, [ɽ]. What we produce below are the spelling conventions for a wide range of sounds. Secondary pronunciations are derived from the spelling conventions (*cf.* Note [c] below). In addition, many interjections may be associated with nonsystematic features such as extra lengthening and wide pitch range.

Ah (satisfaction, recognition, etc); *Aha* (jubilant satisfaction, recognition); *Ahem*, [əʔəm] (mild call for attention); *Boo* (disapproval, usually for a speaker at gathering; also surprise noise); *Eh?* [eɪ] (impolite request for repetition, but *cf.* 11.11); *Hey* (call for attention); *Mm* (casual 'yes'); *Oh* (surprise); *Oho* (jubilant surprise); *Ooh* (pleasure or pain); *Oops* (mild apology, shock, or dismay); *Ouch* [aʊtʃ], *Ow* [aʊ] (pain); *Pooh* (mild disapproval or impatience); *Sh* [ʃ] (request for silence or moderation of noise); *Tut-tut* [ɽ] (mild regret, disapproval); *Ugh* [ʌx] (disgust); *Uh-huh*, also *Uh-uh* (agreement or disagreement); *Wow* (great surprise)

Note [a] The above is not intended as a complete list. Some interjections are less frequent, *eg.* *Yippee* (excitement, delight), *Psst* [ps] (call for attention, with request for silence). The archaic interjection *Alas* (sorrow) may be encountered in literature.

[b] Interjections are sometimes used to initiate utterances: *Oh, what a nuisance*; *Ah, that's perfect*.

[c] There are also some spelling pronunciations: [ʌg] for *ugh*; [tʌt tʌt] for *tut-tut*, often with an ironic tone; [həʊ həʊ] and [hɑː hɑː], both representing laughter, are always ironic.

Bibliographical note

On speech acts see Austin (1962); Cole and Morgan (1975); Leech (1980), esp Chapter 4, and (1983); Lyons (1977); Searle (1969, 1979).

On questions see Huddleston (1971) Chapter 2; Hudson (1975b); Malone (1967); Pope (1976); Stockwell et al (1973) Chapter 9; on tag questions Bald (1979), Cattell (1973), Millar and Brown (1979); on alternative questions Bolinger (1957, 1978a); on more than one *wh*-element Bolinger (1978b); on negative questions Kontra (1980).

On directives see Bolinger (1967c), and (1977a) Chapters 8 & 9; Downes (1977); Stein (1976); Stockwell et al (1973), Chapter 10; Thorne (1966); on stative verbs in directives Mańczak (1979).

On anomalous utterances see Bowman (1966); Leech (1963); Morgan (1973); Straumann (1935); Yanofsky (1978).

-----------------------------	-----

Introduction

- 12.1 The preceding chapters have been concerned with the basic structures of English sentences. We turn in this and the following chapters to the ways in which these basic constituent structures can undergo elaboration (or expansion) and reduction (or abbreviation). In 2.9–10 SUBORDINATION and COORDINATION were introduced as two principles whereby the structure of a simple sentence can enter into a more complex structure. In the case of subordination, one clause is embedded in another, while in the case of coordination, one clause, or part of a clause, is combined with another constituent of equivalent status in the structure of the sentence. In principle, both these processes, if they are used iteratively, allow a limitless complexity of grammatical structure.

In contrast to subordination and coordination, REDUCTION (*cf* 2.52) is a grammatical principle whereby the structure of a sentence is abbreviated, avoiding redundancy of expression. We have so far (*cf* 2.51–2) recognized two kinds of reduction, the use of PRO-FORMS, and ELLIPSIS:

MEANS OF STRUCTURE REDUCTION

Pro-forms (12.8–30)

Ellipsis (12.31–70)

MEANS OF STRUCTURE EXPANSION

Coordination (Chapter 13)

Subordination (Chapters 14 and 15)

These devices of expansion and abbreviation will now be more thoroughly investigated; but it will be convenient to divide the whole topic into three, concentrating in this chapter on reduction, turning in the next chapter to coordination, and leaving until Chapters 14 and 15 the detailed study of subordination.

Reduction and coordination

- 12.2 There is good reason, apart from convenience, for dealing with reduction and coordination in neighbouring chapters. When we coordinate two or more units, we duplicate the same kind of structure; for example, Clause + Clause; Noun Phrase + Noun Phrase + Noun Phrase. This kind of duplication does not normally occur without a parallelism of meaning or function between the conjoins. Such parallelism, in turn, implies an overlap of content and structure. For example, two clauses which apparently have no connection of meaning, like those of [1], are not likely to be juxtaposed or coordinated:

Pushkin was Russia's greatest poet.
Special terms are available for senior citizens. } [1]

But more commonly juxtaposed are sentences like [2], which share some common ground:

Pushkin was Russia's greatest poet.
Tolstoy was Russia's greatest novelist. } [2]

This common ground, moreover, often shows itself in the sharing of a common structure; *eg* each sentence of [2] has the structure *SVC*. It shows itself further in the repetition of the words themselves: thus both sentences of [2] contain the word sequence *was Russia's greatest*. This sharing of common lexical content is a typical condition under which the reduced alternative is chosen. Not only can [2] be expressed as a single unreduced sentence by the device of coordination:

Pushkin was Russia's greatest poet, and Tolstoy was Russia's
greatest novelist. [2a]

It can also be reduced to a more compact form by, for example, the combination of ellipsis of the second verb with the pro-form *her*:

Pushkin was Russia's greatest poet, and Tolstoy her greatest
novelist. [2b]

So close is the association between coordination and ellipsis that we cannot very well understand the one phenomenon without understanding the other (*cf* further 13.44ff).

Reduction as a syntactic phenomenon

- 12.3 Although reduction may in general be regarded in semantic or pragmatic terms as a means of avoiding redundancy of expression, what kinds of reduction are permitted is largely a matter of syntax. English permits, for example, no reduction of the form of [1], whereby the repetition of all three words *was Russia's greatest* is avoided:

*Pushkin was Russia's greatest poet, and Tolstoy novelist. [1]

One of the major tasks of this chapter will be to explain the conditions for ellipsis and the use of pro-forms, whereby, for instance, 12.2 [2b] is grammatical and [1] above is not. Such an explanation must give an account, also, of the different degrees and types of reduction which may be available to the language user as synonymous alternatives. For example, [2a–f] are reduced alternatives to [2]:

The girls swam faster than it was expected that the girls would
swim. [2]
The girls swam faster than it was expected that they would swim. [2a]
The girls swam faster than it was expected that they would do.
<BrE> [2b]
The girls swam faster than it was expected that they would. [2c]
The girls swam faster than it was expected they would. [2d]
The girls swam faster than was expected. [2e]
The girls swam faster than expected. [2f]

Motivation for reduction

- 12.4 Such synonymous possibilities as are illustrated in 12.3 [2a–f] are not equally acceptable. Whatever grounds there may be in any given case for expressing oneself with maximum explicitness, there are generally strong preferences

for the most economical variant, *viz* the one which exhibits the greatest degree of reduction. Other things being equal, language users will follow the maxim 'reduce as much as possible'. This generally means preferring ellipsis to the use of pro-forms, where there is a choice between them. Thus [2c] is slightly more economical than, and to that extent preferable to, [2b]; similarly the ellipsis allowed in [1a] below is slightly more economical than the use of pro-forms in [1b]:

- She might sing tonight, but I don't think she will (sing tonight). [1a]
 She might sing tonight, but I don't think she will *do so*. [1b]

Such preference for reduction is not merely a preference for economy: it can also contribute to clarity, by reducing items which are shared as 'given information', so that attention will be focused on fresh material, or 'new information' (cf 18.8), as in the dialogue below:

- A: Have you spoken to Bob? B: Δ Not yet Δ . [2]

From here on we use, when convenient, the convention of marking ellipsis by the symbol Δ . Although the full, unreduced version of a sentence is often stylistically unfavoured, we shall also, from time to time, follow the practice, already introduced in [1a], of showing optionally ellipted words in parentheses:

- A: Have you spoken to Bob? B: (I have) Not yet (spoken to Bob).

We have mentioned above a maxim 'reduce as much as possible'; but it should be added that reduction is avoided, at least in careful written style, where it would lead to ambiguity or some other kind of difficulty for the interpreter:

- After Her Royal Highness had named the ship, *she* slid smoothly and gracefully down the slipway, hitting the water with barely a splash. [3]
 In the course of the play, Atreus kills his wife Aerope, Aegisthus his uncle Atreus, and Pelopia herself. [4]
 Only my cousin, the housekeeper, and Mrs Baldwin were in the house at the time of the burglary. [5]

Ill-advised reduction can have various effects; *eg* the amusement caused by [3], where *the ship* is clearly the intended antecedent of *she* (cf 5.111 Note); and the confusion or puzzlement which is likely to be a reader's first reaction to [4], where the double ellipsis of the verb *kills* adds to the comprehension problems caused by the Greek names. Further, sentence [5] exhibits ambiguity, since it is not clear whether *the housekeeper* is coordinated or appositive. This ambiguity could be avoided by using a relative clause instead of apposition (*my cousin, who is the housekeeper*), or by inserting an additional *and* (*my cousin and the housekeeper ...*; cf 13.17).

Note Unreduced forms are used for rhetorical effect in cases of 'expressive repetition'; cf 19.23. In addition, repetition may sometimes be avoided by the substitution of coreferential expressions (cf 19.49), such as the coreferential noun phrase *the teacher* in:

Peter Sand denied he ever neglected his students: *the teacher* claimed that the school administration had a grudge against him.

Coordination and reduction as cohesive devices

- 12.5 There is a further reason, apart from the fact that coordination often involves ellipsis, for including reduction and coordination in neighbouring chapters. The two processes of reduction and coordination, although dissimilar in that one expands whereas the other contracts structure, actually have related functions, in that they provide cohesion in discourse (cf 19.11, 19.44ff, 19.57). When we examine how a sequence of sentences can be combined to form a spoken or written text, the two devices which most pervasively mark the connections between one idea and another are, on the one hand, the overt linkage of conjunctions and conjuncts, and, on the other hand, the covert linkage of coreference and substitution which exists by virtue of pro-forms and ellipsis. The phenomena we shall be discussing in this chapter can be illustrated not only through connections *within* sentences, but through connections *between* them, as in 12.4 [2]. Nevertheless, our treatment of coordination and reduction in this chapter will be largely confined to single sentences. The role of coordination and reduction in intersentence connection will be taken up in Chapter 19.

Recoverability

- 12.6 One aspect of reduction as a cohesive device in texts is the fact that the full form of what has been reduced is generally RECOVERABLE FROM CONTEXT. The relevant 'context' is often the linguistic context: *ie* a neighbouring part of the text; but (as noted in 5.28–31) there are other sources from which what has been reduced can be recovered. We shall first mention the most important type of recoverability from the grammatical point of view:

- (i) TEXTUAL RECOVERABILITY: the full form is recoverable from a neighbouring part of the text.

To this we add two lesser kinds of recoverability, which do not contribute directly to cohesion of text:

- (ii) SITUATIONAL RECOVERABILITY: the full form is recoverable from the extralinguistic situation.
 (iii) STRUCTURAL RECOVERABILITY: the full form is recoverable not through knowledge of context, but simply through knowledge of grammatical structure.

A reduced form such as the pronoun *she* may be said to presuppose knowledge on the part of the hearer, as well as of the speaker, of its intended referent. We can recover the identity of the referent either from the situation outside language [1], or from the linguistic context [2–3], *ie* from information given in the discourse itself:

- Is *she* badly hurt? [1]
The poor girl did not complain, although *she* was badly hurt. [2]
 Although *she* was badly hurt, *the poor girl* did not complain. [3]

One can imagine someone saying [1] on arriving at the scene of an accident in which a girl has been struck by a car. It would be evident from the situation, without further elaboration, which person was meant by *she*. In [2] and [3], on the other hand, the identity of 'she' is given by the linguistic

context. We recognize two kinds of textual recoverability: [2] is an example of the ANAPHORIC use of the pronoun and [3] is an example of the CATAPHORIC use (cf 6.19). We should, moreover, make the same point here as in Chapters 5 and 6: textual recoverability is best regarded as a special case of situational recoverability; *ie* the information given elsewhere in the text is, for the purpose of the discourse, the explicit part of the situational knowledge which is available to addresser and addressee. It is natural, then, that anaphoric reference (reference to some antecedent which has already been mentioned) should be much more common than cataphoric reference (reference to some 'antecedent' to be mentioned later). Although the term ANTECEDENT (cf 2.44) literally means 'going before', we apply it, as others have done, to items which follow the pro-form or ellipsis, as well as items which precede it.

The third kind of recoverability, structural recoverability, is illustrated by the optional omission of the conjunction *that* in:

It is strange (*that*) nobody heard the noise. [4]

Since the word *that* is uniquely recoverable in [4], it is reasonable to include it under the heading of ellipsis. But in this case, contextual information is irrelevant: the optionality of *that* is purely a matter of grammatical structure (cf 15.4).

- 12.7 Recoverability is crucial to the use of pro-forms. Pro-forms such as personal pronouns have very unspecific meanings; *eg*: *she* means simply 'the female person we know about', *it* 'the thing we know about', etc. Therefore it is necessary, for the interpretation of these words, to have information from which we can uniquely predict their intended referents. This information is usually found in a preceding or following part of the text, but it may also be found in the situation. The task of interpretation is the same for pronouns such as *he*, *she*, *it* as for definite noun phrases such as *the old lady* (cf 5.28ff), except that since the meaning of a 3rd person pronoun is less specific, there is consequently more dependence on context. In the case of 1st and 2nd person pronouns, on the other hand, the referents are usually easily recoverable from the situation.

Essentially the same distinctions apply to ellipsis. The normal understanding of the term ELLIPSIS is that words are omitted where understanding can be achieved without word repetition, as in:

She might sing tonight, but I don't think that she will (sing tonight). [1]

This is a case of textual recoverability, specifically of ANAPHORIC ELLIPSIS, since the antecedent occurs earlier in the text. The other possibility, that of CATAPHORIC ELLIPSIS, is illustrated in:

If you want (me to (buy the tickets)), I'll buy the tickets. [2]

(On the omission or retention of *to* in such cases, cf 12.64.) As with pro-forms, however, the redundancy need not relate to words implied by the linguistic context. The words may be obvious from the situation. For example, a host may invite a guest to eat a sandwich with the words: *Like one?* In this case, the sentence may be regarded as an elliptical variant of *Would you like one?* (cf 12.49).

Pro-form substitution

The difference between coreference and substitution

- 12.8 The bond between a pro-form and its antecedent may be of two different kinds: COREFERENCE and SUBSTITUTION. These relationships are in principle quite distinct, but in practice they overlap, as will be seen in 12.9.

Coreference, as the name implies, means the bond of 'cross-reference' between two items or expressions which refer to the same thing or set of things. It is, as we have seen, a typical function of personal pronouns such as *she* and *they*, as well as a common function of definite noun phrases containing *the*, *this*, *that*, *these*, and *those* (cf 5.30f, 6.44). In this chapter, however, we shall be more concerned with the relation of substitution than with that of coreference.

Substitution, as its name suggests, is a relation between pro-form and antecedent whereby the pro-form can be understood to have 'replaced' a repeated occurrence of the antecedent. A major test of substitution, therefore, is whether the antecedent can be copied, without change of meaning, into the position taken by its pro-form substitute. For example *one* substitutes for *a first prize* in [1], as the equivalence of [1], grammatically and semantically, with [1a] shows:

Bill got *a first prize* this year, and I got *one* last year. [1]

Bill got *a first prize* this year, and I got *a first prize* last year. [1a]

It is clear that the pronoun *one* is grammatically and semantically equivalent to *a first prize* in [1], but it is also clear that it does not refer to the same prize as does *a first prize*. In other words, the substitution relation between a pro-form and its antecedent is not necessarily a relation of coreference.

Conversely, a relation of coreference between two items is not necessarily a relation of replaceability:

Two players injured *themselves* during the match. [2]

In [2], the two phrases in italics are coreferential, in that the set of persons denoted by *two players* is the same set of persons as that denoted by *themselves*. We could not, however, replace *themselves* by *two players* without a change of meaning:

Two players injured *two players* during the match. [2a]

(In other cases of coreference, on the other hand, such replacement is possible; cf 12.9.)

Substitution does not imply an exact copying of an expression. When the repeated expression is restored in the position of the substitute, it may differ morphologically from the antecedent:

This *coat* is more expensive than the $\left\{ \begin{matrix} \text{ones} \\ \text{coats} \end{matrix} \right\}$ I saw in the market.

In this respect, substitution is analogous to what we later call standard ellipsis (cf 12.38).

Note On the other hand, substitution brings with it the requirement that the repeated expression have

the same meaning in both of its occurrences. Thus it would be impossible, except in joking, to substitute *one* for the repetitive occurrence of *a nail* in [3]:

- * { I hurt my *nail* while hammering a *nail* into the wall. [3]
 { I hurt my *nail* while hammering *one* into the wall. [3a]

Characteristics of substitution

- 12.9 Although there are points at which coreference and substitution overlap, we should in general treat them as distinct kinds of cohesive relation. The main characteristics which distinguish substitution from coreference are:

- (i) As already shown by examples 12.8 [1] and [1a], a substitute pro-form can be replaced by the antecedent without unacceptability on structural grounds and without change of meaning. This, of course, is subject to structurally predictable variation, as mentioned in 12.8.
- (ii) A substitute pro-form (eg: *one*, *ones*, *some*) can be either definite or indefinite, while a coreferential pro-form (eg: *he*, *she*, *they*) is always definite.
- (iii) Coreferential pro-forms are always pronouns or pronoun-related adverbs (eg: *there*, *then*; cf 12.10f), but substitute pro-forms may be outside the pronoun category (eg the substitute verb *do*).
- (iv) A substitute pro-form is normally highly dependent on its linguistic context for interpretation; eg it is difficult to make sense out of context of:

I've never met *one*. Did you *do any*?
 Agnes said *so*. I hope *not*.

Coreferential pro-forms, on the other hand, can be placed on a scale of text-dependence in this sense. Pronouns such as *he* and *she* tend to be highly dependent on linguistic context, whereas other words (such as *the*, *this*, and *that*) often point to something which is known or observed in the situational context.

While these distinctions will be illustrated in the following sections, it is as well to begin with a commonly arising example of the difficulty of distinguishing between these two relations:

George was the best runner in our school, and so everyone expected that *he* would win the prize. [1]

This is a straightforward case of coreference by personal pronouns: unless the context suggests another antecedent, it will generally be understood that *George* and *he* refer to the same person. But in this case, unlike 12.8 [2], the substitution of the antecedent for the pronoun will normally leave the meaning of the sentence unchanged:

George was the best runner in our school, and so everyone expected that *George* would win the prize. [1a]

In fact, the distinction between coreference and substitution as specified in criterion (i) above becomes indistinct wherever both the pro-form and the

antecedent are definite. For this reason, it is important to consider the whole set of criteria (i-iv) above, rather than to rely on the first criterion only.

Note Even so, it is sometimes argued that the failure to reduce a noun phrase to a pronoun, as in [1a], invites a different interpretation from that of the reduced equivalent [1]. It is argued, that is, that the two *Johns* in *John thinks John will win* are not coreferential, and that therefore *John thinks John will win* and *John thinks he will win* have different meanings, only the latter involving coreference. More realistically, however, we can admit that both these sentences are ambiguous in that they may or may not be interpreted as containing coreference. For example, the two *Johns* in *John thinks John will win* may be coreferential, if the use of a pro-form is avoided for some special rhetorical effect, such as the irony of: *John's greatest admirer is John*.

Lists of pro-forms

- 12.10 In illustrating criteria (i-iv) in 12.9, we may take it that criterion (i) has been, and will continue to be, exemplified without the need for any further discussion. Criterion (ii), that of definiteness, can best be explained by a listing of the main pro-forms in each category:

LIST 1: PRO-FORMS USED FOR COREFERENCE

- (a) PERSONAL PRONOUNS (6.15ff) such as *he*, *she*, *it*, *they*; *her*, *them*
- (b) REFLEXIVE PRONOUNS (6.23ff) such as *myself*, *himself*, *themselves*
- (c) POSSESSIVE PRONOUNS (6.29f) such as *my*, *his*, *her*; *mine*, *hers*, *theirs*
- (d) DEMONSTRATIVE PRONOUNS (6.40ff) *this*, *that*; *these*, *those*
- (e) DEFINITE ADVERBS of time (8.51ff) *then*; and of place (8.39ff) *here*, *there*
- (f) the DEFINITE PRONOUN AND PREDETERMINER *such* (6.44 Note [b]).

LIST 2: PRO-FORMS USED FOR SUBSTITUTION

- (a) INDEFINITE PRONOUNS (6.45ff) *one(s)*, *some*, *any*, *none*, *either*, *neither*, *few*/*fewer*/*fewest*, *many*/*more*/*most*, (a) *little*/*less*/*least*, *much*/*more*/*most*, *several*, *enough*, *each*, *all*, *half*, *both*, *other(s)*, *another*. These are indefinite (quantitative) pronouns of the kind which enters into the *of*-construction (6.48).
- (b) DEMONSTRATIVE PRONOUNS (6.40ff) *that*, *those*
- (c) PRO-PREDICATE and PRO-PREDICATION *do* (12.21ff)
- (d) PRO-COMPLEMENT, PRO-PREDICATION, and PRO-CLAUSE *so* (12.27ff)
- (e) PRONOUN and PRO-COMPLEMENT *the same*, *likewise*, *similarly* (12.20)
- (f) ADVERBS of process (8.78ff) *so*, *thus*; and of degree or intensity (8.104ff) *so*, *that*.

From these lists, it is evident that pro-forms used in coreference are all items of definite, rather than of indefinite meaning. A large proportion of the items in the list of substitute forms, however, are indefinite.

Many of the pronouns which occur in List 1 are functionally parallel to noun phrases introduced by definite determiners, such as *the bag*, *this time*, *those new boots*. Coreference is a general feature of definite noun phrases, as has already been made clear in Chapters 5 and 6 (cf 5.30f, 6.19, 6.44), and as will be further discussed in 19.44ff.

List 2 includes *do* only as a main verb. The auxiliary *do*, and parallel 'stranded' modal auxiliaries, are sometimes analysed as substitute forms in examples such as:

A: $\left[\begin{array}{c} \textit{Did} \\ \textit{Will} \end{array} \right]$ you leave early? [1]

B: Yes of COURSE we $\left[\begin{array}{c} \textit{did} \\ \textit{will} \end{array} \right]$. [2]

In fact, we will not analyse such auxiliaries in terms of substitution, but rather in terms of ellipsis; for further discussion of this point, cf 12.60.

The items in List 3 consist of more than one pro-form, in some cases bringing together aspects of coreference and substitution:

LIST 3: COMPLEX PRO-FORMS *which are substitutes for* PREDICATES
or PREDICATIONS
do so, do it, do (just) that, do the same, do likewise (12.23ff)

Note *That* and *those* are exceptional in occurring in both List 1 and List 2. They can obviously be coreferential. On the use of these items as substitute forms, cf 12.19.

Adverbs with a coreferential or substitute function

- 12.11 Criterion (iii) in 12.9 makes the point that coreference is primarily a characteristic of pronouns. Yet in List 1, not only pronouns but adverbs occur. This apparent anomaly will now be explained. The concept of *reference* involves the naming of some object or set of objects in the world, and this referential function is characteristically performed by noun phrases. Pronouns, which have a noun-phrase-like character, are therefore the primary instruments of coreference. On the other hand, substitution can in principle apply to any type of constituent:

Please *sign your name* if you haven't already *done so*.

Here *done so* acts as a substitute for the predication *signed your name*.

However, the adverbs (e) and the predeterminer *such* (f) which appear in List 1 belong here because they contain definiteness as part of their meaning, and can be easily paraphrased by means of noun phrases: *then* can often be paraphrased by 'at/after that time', *here* and *there* by 'at this/that place', and the predeterminer *such* (as in *such a day*) can similarly be paraphrased by 'like this' or 'like that'. These items are typical of coreferential pro-forms in that they lend themselves to situational as well as to anaphoric or cataphoric interpretation.

The coreferential use of these items is illustrated in the following:

One morning the captain invited us to the bridge. He told us *then*
about his secret orders. [1]

Between London and Oxford there is *a famous inn called the*
George and Dragon. *Here* we stopped for lunch. [2]

With the above examples, as with previous examples of coreference, the pro-form cannot be replaced by the antecedent without some change of reference. For example, if we replace *then* by *one morning* in [1], it is not clear whether the morning mentioned in the first sentence is the same as the one mentioned in the second sentence. On the other hand, such replacement would be possible in [3], where both pro-form and antecedent are definite:

If you look *in the top drawer*, you'll probably find it *there*. [3]

The adverbs in List 2, however, are best classified as substitutes:

Professor Sands was *attending to one of the routine laboratory tasks*.

While he was *thus/so* engaged, however, he observed that one
of the rats was behaving oddly. <formal> [4]

To the Greeks, Pan was *a herdsman god, half-man, half-goat*; and
he is *thus/so* represented in their sculpture. <formal> [5]

Though Bairstow designed the car to exceed 400 miles per hour, few
people believed that it would go $\left\{ \begin{array}{l} \textit{so fast.} \\ \textit{that fast.} \end{array} \right.$ <formal> [6]

(cf further 7.89, 19.50.)

Here, although paraphrase with such phrases as 'in that manner' or 'to that extent' is possible, the meaning is more abstract than in the case of *here*, *then*, etc. For example, [5] is paraphrased by:

To the Greeks, Pan was *a herdsman god, half-man, half-goat*; and
he is represented *as a herdsman god, half-man, half-goat* in their
sculpture. [5a]

Even though the repetition in [5a] maintains synonymy with [5], the italicized phrases in [5a] contain indefinite rather than definite noun phrases. We may therefore regard these adverbial uses of *so* and *thus* as instances of substitution rather than of coreference.

At the two poles of coreference and substitution the distinctiveness of these two cohesive relations is clear, but it is in the adverb category in particular that there tends to be a middle ground of overlap, as indicated in Fig 12.11.

Fig 12.11 Pro-form-Antecedent Relations

Anaphoric, cataphoric, and situational use of substitution

- 12.12 Criterion (iv) of 12.9 is that the substitute pro-form almost always requires textual recoverability, whereas this is not generally true of coreferential pro-forms. For example, the forms *this* and *that* frequently have extralinguistic reference, as in *Is this/that my plate?* The same is true, less frequently, of 3rd person pronouns such as *he*, *she*, and *it* (cf 6.15, 12.6). On the other hand, substitutes such as the pronoun *one* and the pro-predication *do so* normally require an antecedent. The relation with the antecedent may be anaphoric, as in [1], or, occasionally, cataphoric, as in [2]:

There's *a clean towel* in the cupboard, if you need *one*. [1]

If you need *one*, there's *a clean towel* in the cupboard. [2]

Even with substitute forms, however, situational reference cannot be entirely excluded. Examples such as *Would you like one?* may be heard, where the meaning of *one* is only recoverable from the situation (eg where the speaker is carrying a bowl of peaches, so that *one* is interpreted as synonymous with *a peach*).

Note The conditions governing the cataphoric use of substitute forms are the same as those governing the cataphoric use of personal pronouns (cf 6.19) or of ellipsis (cf 12.45).

Cross-reference of *it*, *this*, *that*, and *so* to clauses and sentences

- 12.13 We turn now to a further respect in which coreference and substitution are sometimes difficult to distinguish. In both kinds of cross-reference, there can be a lack of correspondence in the grammatical status of the pro-form and its antecedent. This is clearly illustrated in the following examples, where the pronouns *it*, *this*, and *that* refer respectively to a clause, a sentence, and a sequence of sentences (cf further 19.44ff):

If you don't study for the examination, you'll regret it. [ie: you'll regret not studying for the examination] [1]

A: *She's expecting twins.* B: How do you know *THAT*? [2]

After many weeks of rain the dam burst. Millions of gallons of water plunged into the valley, and villages were swept away in the flood. In a short time, thousands of square miles of low-lying ground were covered with water. This was a disaster on a scale which no one had foreseen. It led to loss of life, and widespread damage to livestock and crops. [3]

Similarly, *so* as a substitute pro-form can substitute for a whole clause or sentence:

A: *The Finance Minister has resigned.*

B: Who said *so*? [ie: Who said that the Finance Minister has resigned?] [4]

The difference between *it*/*this*/*that* and *so* in this connection is discussed in 12.28. For the kinds of cross-referential relation illustrated here, the term 'pro-clause' is appropriate.

The present section shows that, in the case of substitution, it is necessary to distinguish three different grammatical expressions: (i) the substitute item itself; (ii) the expression which it replaces, and which in turn could replace it; and (iii) the antecedent which supplies the textual recoverability condition for the substitution. This may be illustrated with reference to [4] above:

- (i) The substitute pro-form: *so*
- (ii) the expression it replaces (a clause): *that the Finance Minister has resigned*
- (iii) the antecedent (a sentence): *The Finance Minister has resigned.*

When a substitute form is referred to as a 'pro-*X*', *X* identifies the item for which the pro-form substitutes, and not necessarily the antecedent.

Substitution for noun phrases and their constituents

- 12.14 Substitute pro-forms will be considered in the following order:

Pro-forms replacing noun phrases and their constituents (12.15–20)

Pro-forms replacing clauses and their constituents (12.21–30)

We begin with noun phrases. Parentheses will be used to indicate the possibility of ellipsis where both substitution and ellipsis are possible.

One as substitute form

- 12.15 There are two substitute pro-forms *one*: one has the plural *some*, and the other has the plural *ones*. Both are invariably unstressed, and are thereby distinguished from the numeral *one* (cf 6.54). Both types of *one* are restricted to substitution for phrases with count nouns as heads.

- (i) *one/some* is a substitute for an indefinite noun phrase:

A: Can you give me *a few nails*? I need *one*.

B: I'll get you *some* soon.

Compare:

I need $\begin{cases} \text{a nail.} \\ \text{one.} \end{cases}$ I need $\begin{cases} \text{some nails.} \\ \text{some.} \end{cases}$

The antecedent of *one*, however, may be definite:

The clean towels are in the drawer – if you need *one*. [= 'a clean towel']

Note Only stress distinguishes the numeral *one* from the substitute pronoun *one* in contexts such as the following:

Have you any postage stamps? I only want to $\begin{cases} \text{borrow ONE. [numeral]} & [1] \\ \text{BORROW one. [pronoun]} & [2] \end{cases}$

In [1] *one* is a reduced version of *one stamp* (in contrast to *two*, *three*, etc). In [2], *one* is a reduced version of *a stamp*, and the nucleus on *borrow* implies the contrast 'I want you merely to lend me a stamp, not to give me one'.

- 12.16 (ii) *one/ones* has as its antecedent a noun phrase head with or without one or more modifiers. We call this unit a NOMINAL EXPRESSION: it acts as a single constituent for purposes of substitution and ellipsis (cf 13.75):

A: Have you any *knives*? I need a sharp *one*.

B: I can get you several very sharp *ones*, but this is the best (*one*) I have.

Unlike *he*, *it*, etc which stand for noun phrases, *one/ones* is more literally a 'pro-noun'.

In the above example, *one* substitutes twice for *knife*, and *ones* for *knives*. In all three instances *one/ones* is a substitute for a single word – the noun head. In other cases *one* may substitute for a nominal expression including premodification, as well as a head:

If you want to buy an *electric heater*, you may be interested

in this $\left\{ \begin{array}{l} \text{electric heater} \\ \text{one} \end{array} \right\}$ in the window. [1]

or for head + postmodifier:

I wish I'd bought a few *jars of honey*. Did you notice

the $\left\{ \begin{array}{l} \text{jars of honey} \\ \text{ones} \end{array} \right\}$ they were selling by the roadside? [2]

or for premodifier + head + postmodifier:

He goes about interviewing *retired sailors who served in the pre-1914 navy*. The *one* that he met in Devon last week was a fascinating storyteller.

One as a pro-form for a noun phrase is not accompanied by determiners or modification, whereas *one* as a pro-form for a nominal expression must have an overt determiner or modifier. The former *one* can be regarded as a merger of the latter *one* with a preceding indefinite article: *a + one*. This simplifying assumption has two advantages: (a) it explains why **a one* does not occur (but cf 6.55 Note); and (b) it reduces the two homomorphic forms *one* (i) and *one* (ii) to a single substitute form.

For noncount nouns, the noun phrase substitute is *some*:

Shall I pass the *butter*? Or have you got $\left\{ \begin{array}{l} *one \\ some \end{array} \right\}$ already?

Note Ellipsis can be used instead of substitution both for count and noncount nouns:
Which mustard would you prefer? English or French Δ ?
Which heater(s) do you use? Electric or gas Δ ?

Some, none, etc as substitute forms

- 12.17 The indefinite or quantifier pronouns *some, none, any, few/fewer/fewest, many/more/most, little/less/least, much, several, enough, each, either, neither, all, both, half* can all act as substitutes for noun phrases introduced by the corresponding determiners (cf 5.10ff). For example:

Can you give me $\left\{ \begin{array}{l} \text{a few nails?} \\ \text{a little oil?} \end{array} \right\}$ I NEED *some*. [= some nails/oil] [1]

When the *children* entered, *each* [= each child] was given a small present. [2]

Some *equipment* has been damaged, but *none* [= no equipment] has been lost. [3]

I'd like *some more coloured paper*, if you HAVE *any*. [= any more coloured paper] [4]

Both the aircraft's *engines* had been hit, and *neither* [= neither engine] could be relied upon to bring us safely home. [5]

John and I went looking for *mushrooms*. He found *a few* [= a few mushrooms], I found *several* [= several mushrooms], and we soon had *enough* [= enough mushrooms] for breakfast. [6]

I asked for a dozen *tickets*, but they couldn't spare *many*. [= many tickets] [7]

This year we produced more *coal*, but we sold LESS. [= less coal] [8]

This year we produced more *coal*, but we didn't SELL SO MUCH. [= so much coal] [9]

His *sons* go to the same school as he did, and *all* [= all his sons] want to become doctors. [10]

With some quantifiers, the substitute may be preceded by another word, which determines or modifies it:

I asked for a dozen tickets, but they couldn't

SPARE $\left\{ \begin{array}{l} \text{as/so many as THAT.} \\ \text{'that MANY. (rather informal)} \end{array} \right\}$

John found a few mushrooms, and I found *several MORE*.

In *that many*, the adverb *that* modifies the pronoun *many*; and in *several more*, the determiner *several* determines the pronoun *more*. (*That many* is sometimes regarded as 'bad English', *so many* being preferred.)

With some other quantifiers, *neither, either, and both*, it is reasonable to regard the substitute pronoun as replacing a phrase beginning with a corresponding correlative conjunction:

Proust and James are great novelists, but I like Tolstoy better than *EITHER*. [= either Proust or James]

Proust and James are great novelists, but *neither* [= neither Proust nor James] is easy to read.

- 12.18 It is difficult to tell, in these cases, whether the pronoun is to be considered an example of substitution or ellipsis. *None* is the only quantifier pronoun whose form is different from that of its corresponding determiner (*no*). In all other cases, the pronoun and the determiner (or coordinator) are homomorphic (cf 2.38), and it seems reasonable to treat the construction as one of ellipsis rather than of substitution. For example:

I'd like *some more coloured paper*, if you HAVE *any* Δ .

However, we shall propose to deal with cases like this as 'virtual ellipsis' (cf 12.40), ie as cases of a substitution of *X* for *Y*, where *Y* contains a homomorph of *X*. There is particular justification for this in the case of *some*, since *some* as a determiner can be reduced to an unstressed form /səm/ or /sm/, whereas the pronoun *some* cannot.

- Note [a] Accepting this analysis will still, however, lead to uncertainty as to whether a reduction is to be treated as substitution or ellipsis. This is because many examples will accept a different type of analysis, if the antecedent is a definite noun phrase. Compare 12.17 [1-3], for example, with:
- Can you give me a few of *these nails*? I NEED *some* (of these nails). [1a]
When the *children* entered, *each* (of the children) was given a small present. [2a]
Some of the *equipment* has been damaged, but *none* (of the equipment) has been lost. [3a]
- The problem of classification is highlighted by [3] and [3a]: it is clear that the sentence as analysed in [3] is a case of substitution, where *none* substitutes for *no equipment*, and it is equally clear that the sentence as analysed in [3a] is a case of ellipsis. These two types of reduction are so

similar, however, that ellipsis has sometimes been considered a kind of substitution, viz 'substitution by zero'. In this light, the problem of distinguishing between substitution and ellipsis may seem a mere technicality. But it is a technicality which, as will be shown in this chapter, is important in enabling us to make generalizations about grammatical reduction.

[b] A further uncertain case is that of an antecedent consisting of coordinated proper names:

Manjit and Sherif applied for a scholarship. *Each* was able to present excellent references.

Each here can be treated as an elliptical variant of *Each of Manjit and Sherif*, but in other cases such an analysis would mean postulating a source sentence of limited acceptability:

John, Bob, and Susan were at the party last night.

All (?of John, Bob, and Susan) are good dancers.

[c] There are restrictions of countability and number on the use of the indefinite pronouns we have been considering. Some are count, some noncount, some singular, etc. The details are given in 6.48.

[d] On problems of concord involving some of these pronouns, cf 10.42f.

That and those as substitute forms

- 12.19 As demonstrative pronouns, *that* and *those* can function not only as coreferential pro-forms (cf 6.44) but as substitute pro-forms. In this latter function, they are always followed by restrictive postmodification, and are equivalent to *the one* and *the ones* respectively:

Towards the end of his life, Schubert wrote two remarkable trios: *that*

[= the trio] in B flat, and *that* [= the trio] in E flat. <formal>

The paintings of Gauguin's Tahiti period are more famous than *those*
[= the ones] he painted in France.

That can also be used as a substitute with a noncount noun, where *the one* could not be used:

The victim's own blood was of a different blood group from *that* [= the blood] found on the floor.

But whereas *that* is less restricted than *those* in this respect, it is more restricted in that it cannot have a personal antecedent:

The blonde girl I saw was older than $\left\{ \begin{array}{l} \text{the one} \\ *that \end{array} \right\}$ you were dancing with.

The blonde girls I saw were older than $\left\{ \begin{array}{l} \text{the ones} \\ \text{those} \end{array} \right\}$ you were dancing with.

It follows that the combination **that who*... is unacceptable, whereas *those who* is perfectly acceptable. Another restriction on *that* as a substitute is that it cannot normally precede a zero relative clause:

The $\left[\begin{array}{l} \text{problem} \\ \text{problems} \end{array} \right]$ confronting us today $\left[\begin{array}{l} \text{is} \\ \text{are} \end{array} \right]$ not dissimilar

from $\left[\begin{array}{l} \text{that which} \\ \text{those (which)} \end{array} \right]$ the nation confronted in the 1930s.

Perhaps this restriction is due to a potential confusion of the demonstrative *that* with the relative *that*. This use of *that* is decidedly formal, and tends to be restricted to written English. *Those*, on the other hand, is only slightly formal.

Note [a] Once again, the distinction between substitution and ellipsis, while important in principle, is difficult to draw in practice. Although the above cases of *that* and *those* can only be analysed as substitutes (for insertion of the relevant head noun would not produce an appropriate noun phrase), there are other, similar instances for which the postulation of an ellipted noun or nominal expression would yield a reasonable analysis:

The topic of cellular physiology is regrettably among *those* _A which lie outside the compass of this book.

The possibility of inserting topics after *those*, and thereby analysing this as an instance of ellipsis, has to be accepted in the stylistic context of formal written English, since in this variety of the language *that* and *those* are used as 'strengthened' equivalents of cataphoric *the* (cf 5.32). There is little difference between *the* and *those* in the following sentence, except that *those* is more emphatic:

Cellular physiology is regrettably among *the/those* topics which lie outside the compass of this book.

[b] A further restriction on *that* as a substitute form is that it rarely combines with the relative pronoun *that*; the combination *those that*, on the other hand, is acceptable:

$\left[\begin{array}{l} \text{More modern methods} \\ \text{A more modern method} \end{array} \right]$ of horticulture $\left[\begin{array}{l} \text{have} \\ \text{has} \end{array} \right]$ replaced $\left\{ \begin{array}{l} \text{those that} \\ ?that that \\ \text{the one that} \end{array} \right\}$

prevailed at the time of the College's foundation.

Note, in this connection, other instances of avoiding repetition where one item fully or partially echoes a preceding one which has a different function (cf 3.5 Note [d], 4.40 Note [a]).

The same as substitute form

- 12.20 *The same* can be a substitute for a noun phrase:

A: Can I have a cup of black coffee with sugar, please?

B: Give me *the same*, please.

It can sometimes also be a substitute for an adjective phrase or prepositional phrase acting as a complement expressing a current attribute (cf 10.20):

Yesterday I felt *under the weather*, and today I feel *the same*.

The soup smells *delicious*, and the turkey smells *the same*.

A further function of *the same* is as substitute for a nominal clause, especially after *say*:

A: (I say) Oxford is likely to win the next boat race.

B: I say *the same*. [= that Oxford is likely to win the next boat race, too]

In both these latter functions, *the same* partially overlaps with *so* (cf 12.29); in a similar way, *do the same* overlaps with *do so* (cf 12.23).

In all substitute uses, however, *the same* rather perversely implies that the two events being referred to by the antecedent and by the substitute are *not* the same event. For example, *the same* could not replace *so* in the following sentence:

Tom *phoned for the doctor*, but didn't tell his mother he had *done so*.

But *the same* could replace *so* in the following:

Tom *phoned for the doctor*, but didn't realize that his mother had just *done so*.

As illustrated in this example, there is an additive element of meaning in *the same*, which is not present in otherwise equivalent substitute forms.

Consequently, *Give me the same, please* can be roughly paraphrased *Give me one too please*; *Joan said the same* can be paraphrased *Joan said so too*; and *The same goes for me* can be paraphrased *That goes for me, too*. *The same* implies a comparison between two objects or events.

Note [a] But *the same* was formerly used coreferentially without any implication of comparison: *I invited Dr Jones to see me, and was visited by the same* [= him] at 3 p.m. This use is now rare and possibly nonstandard. It is associated with legal or bureaucratic jargon:

I recovered the weapon and delivered (the) *same* to the sergeant.

The variant in which *the* is omitted is felt to be especially objectionable.

[b] The use of *the same* as a noun phrase substitute should be distinguished from its use with a following ellipsis:

A: Is that a new bicycle?

B: No, it's *the same* (one) as (I had) before.

In such constructions, where identity of reference is implied, the addition of the pro-form *one* is preferred. Ellipsis is felt to be less acceptable particularly when a postmodifying clause follows:

A: We're staying at the Excelsior Hotel.

B: ?Is that the same *as/that you stayed in last summer*?

Substitution for clauses and clause constituents

The verb *do* in substitution and ellipsis

12.21 When we turn from the noun phrase to substitutive processes in the clause, the units to which primary attention must be given are the predicate and the predication. The two most important and versatile items to consider in this connection are the pro-predicate or pro-predication *do*, and the pro-clause, pro-complement, or pro-adverbial *so*.

A careful distinction must be made, however, between *do* as an auxiliary verb with the status of dummy operator, and *do* as a main verb (cf 3.36ff). It is in the latter function that *do* is a substitute form.

As an auxiliary, on the other hand, *do* is structurally parallel to other operators:

Martin drives a car, and his sister does _Δ, TÒO.

Martin can drive a car, and his sister can _Δ, TÒO.

In such cases, we will talk of ellipsis of the predication, rather than of substitution for the predicate. Further discussion and exemplification will be given in 12.60.

In the following sections 12.22–6, on the other hand, we examine the substitute role of *do* as a main verb. In this role, it is necessary to distinguish a transitive use of *do* from an intransitive one. There is also a problematic function of *do* in the expression *do so*: this is problematic in the sense that it is difficult to determine (partly because of variation between BrE and AmE) whether *do* is in this case transitive or intransitive (cf 12.26 Note).

Do as main verb

Do as intransitive verb

12.22 In BrE many allow the possibility of adding after the operator an optional *do* as an intransitive substitute verb. This can take place only rarely after *do* as an operator (a), but is more common after a modal (b), or after perfective *have* (c):

(a) Bob says he is going to join the Labour Party. It will be interesting to see whether he *DÖES* (*do*).

(b) The Americans are reducing their defence expenditure this year. I wonder if the RÜSSians will (*do*) TÒO.

A: Will you be attending the meeting this evening?

B: I MÄY (*do*).

(c) I didn't touch the television set; but PĚrcy might have (*done*).

As the last example shows, this *do* form can also occur after a sequence of auxiliaries.

The intransitive substitute *do* must be distinguished both from the transitive substitute verb (cf 12.25) and from the general-purpose activity verb *do* (as in *Have you done the dishes?* cf 3.38).

Note [a] In some Northern varieties of BrE, it is also possible for the *-ing* form of the substitute verb *do* to be used after progressive *be*:

A: Why don't you sit quietly? B: I AM (*doing*). [= sitting quietly]

[b] This use of *do* does not occur in nonfinite clauses:

A: Peter hunts rabbits. B: *Yes, he wanted me *to do*, too.

Similarly, because this use of *do* is intransitive, it cannot occur in a passive construction.

The combination *do so*

12.23 The combination of pro-forms *do so*, seen as a unit, acts as a substitute for a predicate or predication, and contains the main verb *do*, rather than the operator *do*. We therefore find that the combination occurs not only in the finite form of *does so*, *do so*, and *did so*, but also in nonfinite forms following a modal, *be*, or *have*, or in infinitive and *-ing* participle clauses. (Unlike the intransitive *do* of 12.22, the *do* in *do so* is usually stressed, and the *so* is always unstressed.) Examples representative of these various contexts are:

They planned to reach the top of the mountain, but nobody knows if they *did* (*so*). [= reached the top of the mountain] [1]

You can take the train back to Madrid, but I shouldn't (*do* (*so*)) until tomorrow morning. [= take the train back to Madrid] [2]

The American team will have to think of some new tactics, and are probably *doing so* at this very minute. [= thinking of some new tactics] [3]

Would you mind feeding the dog, if you haven't already (*done* (*so*))? [= fed the dog] [4]

As no one else has succeeded in solving the mystery, I shall attempt to (*do so*) myself. [= solve the mystery] [5]

As no one else has succeeded in *doing so*, I shall attempt to solve the mystery myself. [= solving the mystery] [6]

The *do so* construction is somewhat formal, and in general there is an alternative ellipsis of the predication (cf 12.59) which is preferred in informal use, and which is indicated by the brackets in the above examples. In [2] and [4], also, the use of a main verb *do* without *so* is possible (as described in 12.22) in BrE.

There are some cases where the elliptical alternative is not possible (eg in the *-ing* participle clause of [6]), and other cases where the elliptical alternative is avoided, (eg in [3]), perhaps because ellipsis of the predication would leave the meaning unclear, especially when the ellipsis is medial (cf 12.62).

?The American team will have to think of some new tactics, and are probably Δ at this very minute. [3a]

Note [a] There is one further major instance of the construction in which *do so* occurs: *do so* may follow another occurrence of *do*, this time as operator:

They planned to reach the top of the mountain, but nobody knows if they did ((do) so).
[= reach the top of the mountain]

The repetition of *do* here, however, is felt to be awkward, and tends to be avoided. Again, the option with *do* but without *so* is associated with BrE.

[b] The combination *doing so*, whether in finite progressive constructions, or in *-ing* participle clauses, can be inverted to *so doing*:

Roberts was rounding up the cattle. When asked why he was *so doing*, he replied: 'Orders are orders.'

The rescue crew attempted to land a helicopter on the platform; but the fire and the fierce wind prevented them from *so doing*.

[c] There is a similar inversion (rare and formal) of *do* and *so* in a *to*-infinitive construction: Newspapers should not include editorial comment in their news columns.

$\left\{ \begin{array}{l} \text{'To do so'} \\ \text{'So to do'} \end{array} \right\}$ is to betray the confidence of their readers.

When it is fronted in this way, *so* receives stress. Another variant of the same construction involves placement of *so* between *to* and *do*: *to 'so do*. This is particularly rare, perhaps because of the prescriptive objection to a 'split infinitive' (cf 8.21).

Comparison of *do so* with *do it* and *do that*

12.24 The predication-substitute *do so* is similar to two other combinations, *do it* and *do that*. All three can be used in:

A: Rover is *scratching the door*.

B: Yes, he always $\left\{ \begin{array}{l} \text{'does so'} \\ \text{'does it'} \\ \text{'does that'} \end{array} \right\}$ when he wants attention.

Mr Brown goes to the hospital for treatment every week:

in fact, he has been $\left\{ \begin{array}{l} \text{'doing so'} \\ \text{'doing it'} \\ \text{'doing that'} \end{array} \right\}$ ever since I have known him.

On more careful inspection, however, these expressions are used somewhat differently.

Do that and *do it* are combinations of the transitive main verb *do* (cf 3.38) with the demonstrative *that* and the pronoun *it*. As such, they combine the substitute function of *do* with the coreferential function of *it/that*.

In the following, a subtle difference between these and the *do so* construction is highlighted:

Martin is painting his house. I'm told he *does it* every four years. [1]

Martin is painting his house. I'm told this is merely because his neighbour *did so* last year. [2]

Although *do it* and *do so* could be interchanged in these examples, the use of *do it* is favoured in [1] because the same action (the painting of Martin's house) is being described on both occasions; while the use of *do so* is favoured in [2] because it is merely the same general *type* of action (painting of houses) that is being described.

Do it and *do that*, on the other hand, differ in that *do that* gives more prominence to the object (*that*), which often receives nuclear stress, and is treated to some extent as new or contrastive information (cf 18.8). The *it* of *do it*, on the other hand, is always unstressed:

Is Connie still trying to light the stove? She should have *DONE it* by *NOW*. [3]

Are you trying to light the stove with a match? I wouldn't *do THAT*. [4]

In [3] the nature of the task described by *done it* is entirely given, and so the focus of information comes upon the completive implication of *done*. But in [4] the nature of the task itself is a cause of surprise, and so emphasis falls on *that*.

Note In addition, *do that* and *do it* differ for some speakers to some extent in meaning, in that *do it* substitutes for a narrower set of predications, those which convey volition on the part of the subject:

A: When you chop off a chicken's head and it's already dead, it still *kicks a few times*.

B: Why does it *do THAT*? [B: *Why does it *DO it*?]

But *do it* is acceptable where the reason is not asked:

A: When you chop off a chicken's head and it's already dead, it still *kicks a few times*.

B: I wonder how it *DOES it*.

The *do it* pro-forms appear to be acceptable only where *kick* implies agency on the part of the chicken. In the last example, B talks as if the chicken were still alive and had control over its movements.

12.25 Both *do it* and *do that* are straightforward verb + direct object constructions, and are parallel to other constructions in which a pro-form acts as object of the pro-verb *do*:

What is she *doing*? She's *making some coffee*.

What I *did* next was (to) *open the window*. (cf 18.29f)

She asked me to make some coffee, *which I did*. (cf 15.57)

It is possible for *it* or *that* to become the subject of the corresponding passive clause:

A: Have you noticed that the front wheel is buckled?

B: *That was done* ages ago.

For *do so*, however, there is no corresponding passive **So was done ages ago*. The *do it/that* constructions are also typical of the use of *do* as a transitive

verb. In general, transitive *do* is (i) dynamic and (ii) agentive; *ie* it refers to some action that is performed or voluntarily initiated by the referent of the subject (cf 4.33ff, 4.4). It is hence abnormal (in spite of the case described in 12.24 Note) for *do* as a transitive main verb to be associated with stative predications, or with involuntary process predications, as in:

A: They think he is mad.
B: *WÈ *do it* TÒO. [1]

A: He owns a Cadillac.
B: *Yes, his BRÒTHER does $\left\{ \begin{smallmatrix} \text{that} \\ \text{THAT} \end{smallmatrix} \right\}$ TÒO. [2]

(Here as elsewhere, however, *do* as operator is acceptable: *Yes, his brother does, too.*)

With regard to *do so*, there is divided usage. Some speakers, particularly in AmE, treat the *do* in *do so* as agentive and therefore find replies such as those in [1] and [2] odd, even if *do so* is substituted for *do it/that*. Attitudinal verbs are doubtfully acceptable with *do so*:

?*A: Peter *likes work*.
B: I think BÒB *does (so)* TÒO.
?*A: She will hate the way he goes on about his prizes.
B: PÈTER will *do (so)* TÒO.
?*A: David might have wanted his food now.
B: MÀRY might have *done (so)* TÒO.

Again, *do* as operator or as an intransitive main verb (in BrE) is acceptable in these examples. Other verbs in this class seem to allow the substitutions in BrE, but they are odd to varying degrees in AmE:

A: They think he is mad.
B: WÈ $\left\{ \begin{smallmatrix} \text{do} \\ \text{?do so} \end{smallmatrix} \right\}$ TÒO.
A: I can smell perfume.
B: ?I can *do so* TÒO.
A: Bob might have heard the strange noises.
B: (?) He might WÈLL have *done so*.

However, even in the least acceptable of such examples, *do so* is more acceptable than *do it* and *do that* would be. Contrast:

All the children resemble their mother's relations more closely than they do their father's. They are thought to *do* $\left\{ \begin{smallmatrix} \text{so} \\ \text{*it/that} \end{smallmatrix} \right\}$ on account of the genetic effects of this curious kinship system.

Note *Do the same, do likewise, do similarly* are alternatives to *do that* when a comparison is involved. Just as *the same* cannot normally refer to the identical thing referred to by its antecedent (cf 12.20), *so do the same* cannot refer to the identical event. It not only is a substitute, but also has the additive meaning of *too*:

I'll contribute ten dollars, if you'll *do the same* [= *do so, too*].

The above observations on *do the same* also apply to *do likewise* and *do similarly*.

Do as substitute verb: a summary

12.26 By way of summary, we may now give the following list of uses of *do*. To avoid confusion, it is important to distinguish *do* functioning as an operator (where it is not a substitute, but a dummy operator) and *do* functioning as a main verb. The major criterion for distinguishing these two is that the main verb *do* has nonfinite forms (*doing* and *done*) as well as finite forms (*do, does, did*).

DO AS:	FOLLOWED BY:	SUBSTITUTING FOR:	RESTRICTIONS
operator <i>do</i>	—	—	not a substitute but used with quasi-ellipsis (12.60)
main verb <i>do</i> (intransitive)	—	predication	BrE only (12.22)
main verb <i>do</i> (transitive?) (cf Note)	+ <i>so</i>	predication	in AmE, and to some extent in BrE, dynamic meaning only (12.23ff)
main verb <i>do</i> (transitive)	+ <i>that</i>	predication	dynamic meaning only (12.24f)
main verb <i>do</i> (transitive)	+ <i>it</i>	predication	dynamic agentive meaning only (12.24f)

Note Whereas the *do* preceding *it/that* is clearly transitive, the status of *do* preceding *so* is not so clear. This reflects the uncertain nature of the *do so* construction both grammatically and to some extent semantically. What kind of word is *so*? If it is a pronoun, then it functions as direct object, like *it/that*, and the *do* preceding it is transitive, and has dynamic meaning. This analysis seems to accord with the facts of usage in AmE fairly well, but not with those in BrE, where there is, to complicate matters, an intransitive main verb (cf 12.22) pro-form which is not restricted to dynamic meaning. Perhaps it is association with this *do* which accounts for the less restricted use of *do so* in BrE. These observations suggest that *so* is more of an adverb than a pronoun, as would be supported by the paraphrase of *do so* as *behave in that way*. A similar conclusion is supported by the absence of a passive construction **so was done*... It seems safest, all in all, to treat this word as a unique substitute form which does not easily fit into any of the word classes. Further uses of this anomalous word will now be examined.

So as pro-form

So as complement substitute

12.27 *So* is a versatile pro-form. Apart from its use as an adverb (cf 7.89, 12.10), it can substitute for an adjective, an adjective phrase, or a noun phrase functioning as complement:

Prices at present are reasonably *stable*, and will probably remain *so*.
If he's a *criminal*, it's his parents who have made him *so*.
Brett's work is not yet *consistent in style and quality*, but will no doubt become *so*.

On the other hand, *so* cannot easily be retained following *be*, the usual form of reduction here being ellipsis, or (informally) the substitutes *like that* or *that way*. Compare:

The plants are healthy enough now, but I wonder how long they

will $\left\{ \begin{array}{l} \text{be (?so).} \\ \text{remain so.} \end{array} \right.$

La Gioconda is *so* called because of her enigmatic smile.

Prices at present are *reasonably stable*, and will probably stay *that way*.

The combinations *more so* and *less so* substitute for a comparative adjective expression:

Although the poor girl was *exhausted*, she was *less so* than we feared.

The weather was *hot* in Cairo, but at Luxor it was even *more so*.

Other combinations of this kind are *too much so* and *so much so*:

The weather was *hot* in Cairo – *so much so*, that we stayed indoors all day.

Note [a] *So* as pro-complement can also appear in initial position in the clause:

We hoped that the programme would be a success, and *so* it turned out.

[b] Following the verb *be* in sentences such as *That is so*, *so* is not a substitute form, but a synonym for *true* or *the case*. Other comparable examples are:

It may be *so*. This must be *so*, because...

It is perhaps this construction that occurs with subject-verb inversion in the literary archaisms *So be it* and *Be it so*.

[c] *Otherwise* can be a negative counterpart of *so* as pro-complement:

They promised that the vessel would be in good condition $\left[\begin{array}{l} \text{and} \\ \text{but} \end{array} \right]$ we found it $\left[\begin{array}{l} \text{so.} \\ \text{otherwise.} \end{array} \right]$

So and *not* as substitutes for *that*-clauses

12.28 A more frequent use of *so* is as a pro-clause substituting for a *that*-clause as direct object. The antecedent is often an entire sentence:

Oxford is likely to win the next boat race. All my friends say *so*. [= ... that Oxford will win the next boat race]

Jack hasn't found a job yet. He told me *so* yesterday. [= ... that he hasn't found a job yet]

This use of *so* applies both to reported speech (cf 14.30ff) and to reported beliefs or assumptions:

Many people believe that the international situation will deteriorate.

My father thinks *so*, but I believe *not*.

As this example shows, the negative substitute equivalent to *so* in this construction is *not*. Unlike *so*, however, the substitute *not* usually receives nuclear stress:

A: *Has the news reached home yet?*

B: I'm **afraid** *so*.
B: I'm **afraid** *NOT*.

Apart from the adjective *afraid*, this use of *not* is restricted mainly to verbs of belief or assumption, while the corresponding use of *so* is also found in some verbs of saying such as *say* and *tell*. Verbs that commonly allow both *so* and *not* (cf 16.31–2) include:

appear	expect	hope	presume	seem	suspect
believe	guess	imagine	reckon	suppose	think

In this list, *appear* and *seem* occur with an initial anticipatory *it* (cf 16.34, 18.33ff): *it appears so/not*, *it seems so/not*.

The pro-form *not* is occasionally used with the verbs *say* and *tell*, but the use of the positive pro-form *so* is much more frequent with such verbs of saying. With other verbs and adjectives, such as *know* and *(be) sure*, neither of these forms can normally be used, but the whole *that*-clause can be ellipted (*I know*; *I am sure*; cf 12.65), or else the pronoun *it* can be used: *I know it* <AmE>; *I am sure of it*. For other examples of ellipsis in place of *so* (eg: *Who says? I agree*) cf 12.65.

So as a pro-clause occasionally occurs in initial position, with or without subject inversion:

A: Oxford will win the boat race; at least, *so* all my Oxford FRIENDS say.

B: $\left\{ \begin{array}{l} \text{And } \textit{so} \text{ say most of the SPÖRTS writers, TOO.} \\ \text{So most of the SPÖRTS writers say, TOO.} \end{array} \right.$

When the subject is a pronoun, however, no inversion is possible:

A: Most people are backing the Oxford crew.

B: *So* I believe; but that doesn't mean they'll win. [**So* believe I]

The fronting of *so* does not occur with *afraid* (**So I'm afraid*), and occurs only marginally with certain verbs (?*So I guess*; ?*So we are hoping*). On the other hand, *So it appears* and *So it seems* are common expressions.

Note [a] The idiomatic clause *so they say* (where *they* refers to 'people in general'; cf 6.21) is often added to the end of a sentence, and has a status similar to that of a final comment clause (cf 15.55 Note [a]):

The town hall is going to be rebuilt, *so they say*.

[b] With verbs taking transferred negation (eg: *think*, *suppose*; cf 14.36), the use of *not* as a clause substitute is rather formal, and is often replaced by the use of *so* preceded by negation in the main clause:

I don't think *so*. (~ I think not.)

I don't suppose *so*. (~ I suppose not.)

I don't believe *so*. (~ I believe not.)

This construction with *so* is especially common when *I* is subject. With verbs not taking transferred negation, this alternative construction is not possible:

I don't hope *so*. + I hope not.

[c] There is sometimes a contrast between *so* and *it/that* as pro-forms following verbs such as *believe* and *say*:

$\left\{ \begin{array}{l} \text{I } \left\{ \begin{array}{l} \text{can't} \\ \text{don't} \end{array} \right\} \text{ believe } \left\{ \begin{array}{l} \text{it} \\ \text{that} \end{array} \right\}. \text{ [on receiving a piece of news; NOT *I can't believe so]} \\ \text{I really believe } \textit{so}. \text{ [confirming an opinion]} \end{array} \right.$

(A: Come in!)

B: $\left\{ \begin{array}{l} \text{Who says } \textit{so}? [= \text{Who gives permission?}] \\ \text{Who said } \textit{that}? [= \text{Who said 'Come in'?}] \end{array} \right.$

In such cases *it/that* refers to an actual utterance, while *so* refers to the content of an utterance. Compare the similar contrast between *do so* and *do it/that* (cf 12.24f).

[d] Exceptional combinations of a verb with the substitute *so* or *not* occasionally occur. For example, *I know so* is sometimes acceptable if it is used contrastively in a 'second instance' utterance:

A: Do you think Tom will succeed?

B: I don't **think** *so*, I **KNOW** *so*!

Equally, a verb such as *claim* or *tell* may occur exceptionally with *not* as substitute when the context demands contrastive emphasis:

I thought they had agreed to write an indemnity into the contract. But THEY CLAIM NOT.

Initial *so*

- 12.29 Three constructions with initial *so* have already been noted: the one in which *so* precedes *do* in nonfinite clauses (eg: *in so doing*, cf 12.23 Notes *b* and *c*), the one in which *so* is a pro-complement (cf 12.27), and the one in which *so* is a *that*-clause substitute (cf 12.28). But here we need to consider particularly two superficially similar constructions in which stressed *'so* precedes a subject and operator:

So + *op* + *S* CONSTRUCTION WITH SUBJECT-OPERATOR INVERSION

YŌU asked him to leave, and *'so* did I. [= I asked him to leave, too]

The corn is ripening, and *'so* are the Apples. [= the apples are ripening too]

You've spilled coffee on the table, and *'so* have I. [= and I've spilled coffee on the table, too]

So + *S* + *op* CONSTRUCTION WITHOUT SUBJECT-OPERATOR INVERSION

You asked me to leave, and *'so* I DID. [= and I DID leave]

A: It's starting to snow. B: *'So* it is!

A: You've spilled coffee on your dress. B: Oh dear, *'so* I HAVE.

In the former construction (*So* + *op* + *S*) *so* is not a pro-form at all, but an additive adverb, equivalent in meaning to *too* or *also* (cf 8.116). Notice, in confirmation of this, that the construction is elliptical, and that the missing predication can be supplied (cf 12.21):

YŌU asked him to leave, and *'so* did wē (ask him to leave). [1]

In fact, the nonelliptical variant in [1] is rarely used, because it involves needless repetition. But the fact that it is possible implies that the connection between the clause *so did we* and its antecedent clause is made by ellipsis, rather than by a substitute form. A further pointer to this conclusion is that *so* in this construction is precisely parallel to the negative additive adverbs *neither* and *nor*, which similarly take subject-operator inversion (cf 13.36ff):

The corn isn't ripening, and *neither/nor* are the apples (ripening).

It is possible to apply a rule whereby *So* + *op* + *S* is changed into *S* + *op*, *too* (without change of meaning) for all clauses of this pattern.

- Note [a] In spite of the parallel with the negative constructions *Neither/Nor* + *op* + *S*, *So* + *op* + *S* is occasionally used (in very informal style) with a negative operator, and in this case it refers back to a negative clause:

A: My sister can't drive a car.

B: *So* can't a lot of other people, but that doesn't prevent them from trying.

[= Neither can ...]

The simpler construction of **So don't I* or **So can't she*, on the other hand, would be extremely unlikely as an alternative to *Neither do I* or *Neither can she*.

[b] Although we have described *so* in this construction as an additive adverb, it actually has the value of a conjunct, and may be compared with *so* as a resultive conjunct (cf 8.140).

So as pro-predication

- 12.30 For the second construction with initial *so*, that without subject-operator inversion, the possibility of supplying an ellipted predication is extremely doubtful:

A: You've spilled coffee on your dress.

B: **Oh* dear, *'so* I HAVE spilled coffee on my dress.

and therefore it seems more reasonable to consider *so* in this construction to be not an adverb, but rather a predication substitute, equivalent to the *so* in *do so*. There is therefore little difference, except for the inversion, between:

I told Bob to eat up his dinner, and *'so* he DID. [= indeed he DID]

I told Bob to eat up his dinner, and he DID so.

The only change of meaning brought about by the initial *so* here is an emphasis which might otherwise be conveyed by *indeed* or *in fact*. In replies, *So* + *S* + *op* expresses surprised confirmation of what the previous speaker has asserted:

A: It's past midnight. B: [looks at watch] *'So* it is!

- Note [a] In some varieties of popular speech, for example in dialects of Scotland and Northern England, *that* is used as a predication substitute rather like *so*, both in the initial and final positions:

A: He'll regret what he said. B: *'That* he WILL.

A: Have you been working here long? B: I have *THAT*.

When in final position, *that* carries the nucleus. The meaning of this construction is stronger than that of the *so* construction, and tends to be one of emphatic confirmation or agreement.

[b] In some regional varieties, particularly Irish English, a clause of the construction *so* + *S* + *op* (pronounced at a low pitch) can be added to a statement as a comment clause, by way of general emphasis:

He spoils those children to DEATH, *so* he does.

[c] In another restricted variety of speech, the pro-form *so* is given nuclear emphasis:

A: They didn't hurt her. B: They did *SO*.

[d] Yet another regionally restricted variant is the use of *nor* as a negative pro-predicate with inversion (corresponding to the positive *so*) in:

A: I couldn't do anything for her.

B: *Nor* you COULD - but you might have got someone else to help.

[e] On the initial intensifier *so* in constructions like *So angry was she* ... cf 15.74 Note [b], 18.24 Note [a].

Ellipsis

The nature of ellipsis

- 12.31 Ellipsis may be more strictly described as 'grammatical omission', in contrast to other kinds of omission in language. There is, for example, the phonological loss (aphaeresis) of a syllable in the familiar form of *because* (often spelled '*cos*'). In word formation (cf App I.74), the clipping of words (eg: *flu* from *influenza*) may well be regarded as a process of this kind: the omission is

describable in terms of phonological units (syllables) rather than in terms of morphological units (morphemes) or grammatical units (words). There is also, arguably, semantic omission. In:

Frankly, he is very stupid.

The disjunct *frankly* implies a comment by the speaker on the way he is speaking (cf 8.124f). But there is no one set of missing words that can be supplied. We can expand *frankly* to (among many forms) *I am speaking frankly when I say . . .* or *If I may put it frankly I would tell you . . .* Similarly, in:

He's drunk, because I saw him staggering. [1]

there is an implicit meaning (cf 15.21) that might be expressed by:

He's drunk, and I claim this because I saw him staggering. [2]

But equally we can express this understood meaning in other forms, such as *and I know, and I am sure of it, and I am convinced of it, and the proof is that . . .* In such cases it is difficult to pin down in exact words what has been omitted, so it is more appropriate to describe this phenomenon as SEMANTIC IMPLICATION rather than as ellipsis.

Criteria for ellipsis

- 12.32 To distinguish ellipsis from other kinds of omission, it is important to emphasise the principle of VERBATIM RECOVERABILITY that applies to ellipsis; that is, the actual word(s) whose meaning is understood or implied must be recoverable. Even so, like those of so many other grammatical categories, the boundaries of ellipsis are unclear, and it is best to recognize different degrees of 'strength' in the identification of examples of ellipsis. To be ellipsis in the strictest sense, an example must satisfy all the criteria specified in 12.33–6.

(a) The ellipted words are precisely recoverable

- 12.33 This means that in a context where no ambiguity of reference arises, there is no doubt as to what words are to be supplied:

She can't sing tonight, so she won't Δ. [1]

Examples like this contain an ellipsis that presupposes words in a previous part of the same sentence. It is clear that in [1] it is the word *sing* that has been ellipted. But by 'precisely recoverable' we do not necessarily mean 'unambiguously recoverable'. Consider the following:

If he works hard, I won't have to Δ. [2]

In one context, the assumption will be made that *work hard* is ellipted at the end of the sentence; but in another context, this assumption can prove false:

A: You ought to speak to James about his laziness.

B: If he works hard, I won't have to (speak to James about his laziness).

There are also cases of simultaneous ambiguity, such as:

The suspect admits stealing a car from a garage, but he can't remember which Δ.

where *which* could mean either 'which car' or 'which garage'.

This ambiguity of anaphora is parallel to the ambiguity of pronoun anaphora noted in 12.4 [3] above. In saying that with ellipsis the omitted words are precisely recoverable, we do not mean to exclude from ellipsis such cases of genuine ambiguity. Rather, we exclude indeterminate cases like 12.31 [1] above, where there is no clear-cut choice between one verbalization and another.

Note Verbatim recovery does not necessarily mean that the items replaced are morphologically identical to the items constituting the antecedent; cf 12.36 below.

(b) The elliptical construction is grammatically 'defective'

- 12.34 Typically, ellipsis is postulated in order to explain why some normally obligatory element of a grammatical sentence is lacking. If such 'gaps' did not occur, there would be no obvious grammatical motive for invoking the concept of ellipsis in the first place. For example, in 12.33 [1] above, the auxiliary *won't* occurs without a following main verb (cf 2.27). Similarly, in [2] the infinitive marker *to* occurs without the infinitive verb which it normally introduces. While we might agree that such cases involve some structural 'gap', however, there are many other cases for which this is less clear. Would we decide, eg, that [3] below is deficient if the optional infinitive clause is omitted?

Visit me tomorrow, if you wish (to visit me tomorrow). [3]

This depends on whether we accept as 'normal' the occurrence of *wish* as an intransitive verb. Here, as in many other cases, the recognition of a structural 'deficiency' depends on a prior descriptive decision of grammar. The merits of each case must be argued on the basis of available evidence (cf for example 10.3 on intransitive and transitive verbs).

Some structures are clearly in some sense 'defective' but do not match the condition of precise recoverability. *Thanks*, for example, can act as a complete utterance, but lacking a clause structure, it does not fulfil the normal requirements of sentencehood (cf 11.38). It is not clear, however, what missing elements are left unexpressed. We could expand *Thanks* in various ways, for example:

I owe you my thanks. I give you thanks.

Thanks is therefore not properly elliptical according to criterion (a) (12.33). Rather, it resembles examples like *Hello* in that it has a formulaic status, and cannot be readily analysed according to any productive grammatical pattern (for further examples cf 11.54). This suggests that the criterion of structural 'deficiency' cannot be usefully applied in isolation from that of precise recoverability.

Another kind of grammatical 'deficiency' which is not included in the category of ellipsis is illustrated by some postmodifying clauses:

- Her hair is not so black *as it was*. [black] [4]
 Mrs Trent is very charming *to speak to*. [Mrs Trent] [5]

For the completion both of the sense and of the grammatical complementation of the verb in the subordinate clauses of [4] and [5], it would be necessary to add the words in square brackets. But if we add these words, [4] and [5] become ungrammatical. This brings us to criterion (c).

(c) The insertion of the missing words results in a grammatical sentence (with the same meaning as the original sentence)

- 12.35 This third condition of ellipsis is met by all the examples we have so far considered except for [4] and [5] of 12.34. But it distinguishes between the following comparative constructions:

- He always wakes up earlier than *I*. <formal> [1]
 He always wakes up earlier than *me*. <informal> [2]

To [1] could be added the ellipted words *wake up*, but not to [2]:

- He always wakes up earlier *than I wake up*. [3]
 *He always wakes up earlier *than me wake up*. [4]

This difference means that [1] is a more definite example of ellipsis than [2], and indeed partly explains why prescriptive teaching has favoured [1] as the 'more correct' form (cf 15.67). Another contrast in terms of this criterion is provided by participial clauses (cf 4.67, 14.19, 15.58) such as:

- While (I was) eating my lunch, I heard a loud noise. [5]
 (*Since I was) Knowing no French, I could not express my thanks. [6]

The insertion is not possible in [6] because *know* belongs to a category of verbs of stative meaning which lack progressive forms: **I am knowing French* (cf 4.4). Thus while [5] can by this criterion be classified as ellipsis, [6] is not.

The bracketed part of criterion (c) above – 'with the same meaning as the original sentence' – is needed because there is always the assumption that whatever is 'understood' through ellipsis is part of the meaning of the elliptical sentence. In fact, without the proviso of synonymy between the full and ellipted forms of the sentence, there would be no way of confining the concept of ellipsis within reasonable limits. This proviso excludes from ellipsis such cases as the following, in which the insertion leads to a grammatical sentence, but the meaning is slightly altered:

- The poor (people) need more help. [7]

Noun phrases such as *the poor* presuppose, for their interpretation, some such general noun as *people*; but if we add such a noun, as in [7], the noun phrase changes its generic meaning into a specific meaning (cf 5.26, 5.52–9). Generic meaning requires that we delete the article: *Poor people need more help*.

Note The following observation lends some confirmation to the argument for not treating *the poor* as having an ellipted noun:

- The poor in spirit need more help.
 *The poor people in spirit need more help.
 The people poor in spirit need more help.

Where *poor* is postmodified, but not otherwise, the noun *people* must be inserted before the adjective if the result is to be a grammatical sentence. A different form of ellipsis must therefore be posited according to whether a phrase like *in spirit* is added or not:

- the poor Δ
 The Δ poor in spirit

But there is yet a further complication: with prepositional phrases that can be analysed as reduced relative clauses, the general noun can appear only after the adjective:

- The poor (people) in the ghettos need more help.

While *in spirit* postmodifies *poor*, *in the ghettos* postmodifies *poor (people)*.

Since no consistent account of ellipsis can be given for this construction, it is just as well that our analysis regards it as nonelliptical.

**(d) The missing word(s) are textually recoverable, and
 (e) are present in the text in exactly the same form**

- 12.36 Of these two related criteria, the latter is dependent on the former. It may be held that textual recoverability is the surest guarantee of ellipsis, since without it, there is usually room for disagreement on what particular word or expression has been ellipted. To return to an example similar to that of *Like one?* in 12.7: it would be difficult to insist, for a situation in which a guest is offered peanuts with the words *Like some?* that it is *peanuts* that is ellipted after *some* rather than (say) *nuts* or *of these peanuts*. However, within the textually recoverable category there is an even stronger criterion, which distinguishes [1] from [2]:

- She might *sing tonight*, but I don't think she will (sing tonight). [1]
 She rarely *sings*, so I don't think she will (sing) tonight. [2]

The ellipted expression in [1] is an exact copy of the antecedent (*sing tonight*), while in [2] the ellipted verb is morphologically different from its antecedent. Criterion (e) might be trivially subsumed under that of (c) if we simply noted the ungrammaticality of the following:

- *She rarely *sings*, so I don't think she will *sings* tonight. [2a]

But it is important to recognize that [1] and [2] illustrate what, for most grammatical purposes, is the same kind of ellipsis: it remains true, in particular, that the ellipsis of *sing* is 'precisely recoverable' in the sense of 12.33. It is only in some cases (eg some types of coordination; cf 12.68) that criterion (e) is significant. Compare these superficially similar cases of coordination:

- The club always has *paid its way*, and always will (pay its way). [3]
 ?The club always has (paid its way) and always will *pay its way*. [4]

Both these sentences violate the 'exact match' criterion (e), in that different forms of the verb *pay* are required in the two clauses. But whereas the ellipsis of [3] is widely treated as quite acceptable, that of [4] is widely regarded as incorrect (cf 13.88). A similar pair of examples is:

- This is one of the oldest buildings in town,
 if not (actually) the oldest Δ . [5]
 ?This is one of the oldest Δ , if not the oldest, building(s) in town. [6]

Hence the technicalities of ellipsis, which we have been exploring in 12.33–6, are not mere technicalities, but have importance in enabling us to make

different generalizations about what kinds of reduction are possible in English grammar.

- Note [a] In [6], both the singular *building* and the plural *buildings* would be open to stylistic criticism, but *buildings* would be the more acceptable alternative.
[b] The disfavoured types of ellipsis illustrated in [4] and [6] are liable to occur, but will generally be avoided in careful spoken and written use.

Ellipsis defined in terms of gradience

- 12.37 In view of the variable application of the above criteria (a–e) for ellipsis, it is reasonable to use the term ‘ellipsis’ in a way which acknowledges different degrees of strictness in its interpretation. Table 12.37 illustrates that the kinds of omission discussed above show various kinds of family resemblance to one another, and may be loosely ranged on a gradient extending from the strictest form of ellipsis (1) to semantic implication (9):

Table 12.37 Criteria for ellipsis

(a)	(b)	(c)	(d)	(e)	
+	+	+	+	+	(1) I'm happy if you are (happy).
+	+	+	+	–	(2) She sings better than I can (sing).
+	?	–	+	(+)	(3) She works harder than him (*works).
+	+	+	–	0	(4) (I am) Glad to see you.
–	+	+	+	–	(5) { (Since he was) (Being) } Angry, he stalked out.
+	?	+	–	0	(6) I believe (that) you are wrong.
–	+	+	–	0	(7) The man (that/who/whom) I saw was half asleep.
–	?	+	–	0	(8) Houses (that/which are) owned by Mr Smith . . .
–	–	+	–	0	(9) The door opened and (then/after that/. . .) Mary entered.

Criteria

- (a) The missing expression is precisely recoverable.
(b) The elliptical construction is ‘defective’.
(c) The insertion of the missing expression results in a grammatical sentence with the same meaning as the elliptical sentence.
(d) The missing expression is recoverable from the neighbouring text (rather than from the structural or situational context).
(e) The missing expression is an exact copy of the antecedent.

KEY

- + The criterion is satisfied.
– The criterion is not satisfied.
? There is doubt about the criterion's satisfaction.
(+) With the required grammatical change, the criterion would apply.
0 The criterion is not applicable.

Types of ellipsis

- 12.38 To show how the criteria operate with respect to the specimen constructions (1–9), we add a few comments on each example, and also introduce the terms which will be used where necessary to describe the various subcategories or marginal categories of ellipsis.

- (1) This is STRICT ELLIPSIS, to which all five criteria apply, and which is applicable mainly to coordination (cf 13.44ff).
- (2) This is STANDARD ELLIPSIS, to which only the ‘exact copy’ criterion need not apply (we cannot expand the sentence to **She sings better than I can sings*, since only the infinitive may follow *can*). We shall use the term ‘standard ellipsis’ in cases where criterion (e), that the ellipted word(s) be an exact copy of the antecedent, is not required, but may well be incidentally satisfied as a result of constraints of constituent structure. For example, we may say that *She sings better than I can* (*sings) and *She can sing better than I can* (sing) both exemplify standard ellipsis, and that the latter also happens to exemplify strict ellipsis. Standard ellipsis applies to those cases studied under the heading of ‘general ellipsis’ in 12.53–65.
- (3) This is less strict than example (2), because the full form of the sentence cannot be recovered without changing the objective pronoun *him* to *he*. It is preferable to treat this as a case of substitution rather than ellipsis, and we shall call it QUASI-ELLIPSIS (cf 12.40).
- (4) As an example of SITUATIONAL ELLIPSIS, this does not satisfy criteria (d) and (e) (cf 12.46ff).
- (5) This example falls short of the criterion of unique recoverability (a), because various conjunctions, or alternatively a nonfinite verb, could be inserted: *Since he was angry*, *As he was angry*, *Being angry*, etc: (On verbless clauses such as (5), cf 14.9, 15.61.)
- (6) Being structurally recoverable (cf 12.6), this may be termed STRUCTURAL ELLIPSIS.
- (7) This might similarly be regarded as structural ellipsis; however, it does not quite match up to the ‘precise recoverability’ criterion, since an alternative relative pronoun, *who* or *whom*, could have been used.
- (8) This is a nonfinite clause (cf 14.6ff) which can be analysed as a reduced version of a finite relative clause, with ellipsis of the relative pronoun and the verb *be*. Like (7), however, this example just falls short of standard ellipsis by criterion (a), since an alternative relative pronoun, *which*, could have been inserted.
- (9) This example illustrates the endpoint of the ellipsis gradient, and indeed is more fittingly classified not as ellipsis at all, but as a case of SEMANTIC IMPLICATION (cf 12.31). Although the concept of sequence in time (expressed by *then*) is understood in the sentence *The door opened and Mary entered*, we cannot easily maintain that this is ellipsis, for there is no reasonable way of choosing between different adverbials conveying roughly the same concept: *then*, *after*, *afterwards*, *after that*, *thereupon*, etc.

Because the boundaries of ellipsis cannot be easily defined, we shall use the term quite generally for grammatical reduction through omission. For cases

like (5), (7), and (8), where the choice of what to insert, although not unique, is restricted to a small number of grammatical alternatives, the term **WEAK ELLIPSIS** may be used.

Note The 'fuzziness' of the concept of ellipsis goes with an unclarity, in many cases, as to the acceptability of certain types of ellipsis (*cf* for example, 13.88–9).

Ellipsis and substitution

- 12.39 One consequence of the gradience of ellipsis is that it is sometimes difficult to distinguish between ellipsis and the use of pro-forms as substitutes. The phenomenon of pro-form substitution (*cf* 12.8–30) closely parallels ellipsis, in that a pro-form may be regarded as a replacement for a unique expression:

- Our house is quite different from *theirs*. [*ie* their house] [1]
 Many buildings were damaged, but *none* [*ie* no building] was destroyed. [2]

In these examples, however, the substitute pro-form is morphologically related to one of the replaced items. If we had chosen *his* rather than *theirs* in [1], and *few* rather than *none* in [2], the result would seem to fit the criteria of strict ellipsis:

- Our house is quite different from *his* (*house*). [3]
 Many buildings were damaged, but *few* (*buildings*) were destroyed. [4]

The reason for this technical difference between [1] and [3] is that *he* is exceptional as a personal pronoun in that it has the same genitive form in the determinative and head functions (*his/his*), in contrast to *my/mine*, *your/yours*, etc. Thus the choice between substitution and ellipsis seems to rest at this point merely on an irregularity of English pronoun morphology: the neutralization of *his* and *his*. (A similar point can be made about *few* and *few* in [4].) But there is another way of looking at this demarcation problem: a case can be made, despite appearances, for treating [3] as substitution.

The argument is that *his* [determinative] and *his* [head] are different words, in the sense that they are different grammatical forms which happen to be homomorphic (*cf* 2.38). On this basis, we may distinguish them as *his*₁ and *his*₂, and maintain that the contraction of [3] by the omission of *house* amounts to the substitution of *his*₂ for *his*₁ *house*, just as that of [1] amounts to a substitution of *theirs* for *their house*. A similar analysis may be made of [4], involving the substitution of *few*₂ [pronoun] for *few*₁ [determiner] *people*.

Quasi-ellipsis and virtual ellipsis

- 12.40 According to the argument in 12.39, we subsume under substitution:

- (a) Examples such as *theirs* for *their house* [1] and *none* for *no person* [2], where the substitute form is a grammatical variant of the word or construction which appears in the replaced expression (we may call this **QUASI-ELLIPSIS**).
 (b) Examples such as *his* for *his house* in [3] and *few* for *few people* in [4], where the substitute form is a homomorph of a grammatical form in the replaced expression (we may call this **VIRTUAL ELLIPSIS**).

Quasi-ellipsis may reasonably include not only cases such as *their/theirs*, in which there is a replacement by a different morphological form of the same lexical item, but also cases such as the DO-support construction, where the unstressed dummy operator fills the position of a 'stranded' operator (*cf* 3.26, 12.60):

- SHĒ understands the problem better than HĒ does. [5]

Compare the modal auxiliary as operator in:

- SHĒ would understand the problem better than HĒ would. [6]

It is possible to regard *understand the problem* as ellipted in [6], but it would not be possible to regard *understand(s) the problem* as ellipted in the parallel case of [5]:

- SHĒ understands the problem better
 than HĒ { *does understand } the problem.
 { *does understands }

We may, however, view [5] as a case of quasi-ellipsis, in which the DO-support construction occurs as a regular variant of the present or past tense verb construction in circumstances (such as that of operator 'stranding') where the grammar of English requires an operator (*cf* further 12.60).

Whether quasi-ellipsis or virtual ellipsis are to be treated as cases of ellipsis or as cases of substitution is a matter of definition. We classify them technically as substitution, but at the same time, their labels are a reminder of the close interconnection between substitution and ellipsis.

- Note [a] In other cases, the operator DO is followed by standard ellipsis (*cf* 12.60).
 [b] Certain pronouns which exemplify quasi-ellipsis and virtual ellipsis in [1–4] above (*none*, *his*, *few*) would in other contexts provide instances of standard ellipsis. For example:

Many of the buildings were damaged, but *none/few* _Δ were destroyed.

Here we can postulate a straightforward ellipsis of the prepositional phrase *of the buildings*, since in both the elliptical and the antecedent constructions the quantifier is a pronoun. Such an explanation could not have worked for [2] and [4], however, because to match the antecedent, the noun phrase in its unreduced form would have to contain a pronoun in the determinative position, and would thereby become ungrammatical:

*Many buildings were damaged, but *none/few*₂ buildings were destroyed.

Hence for these sentences, explanation in terms of quasi- and virtual ellipsis is required.

An attempt to analyse [2] and [4] as standard ellipsis of *of the buildings* would come to grief because *of* would have to be added and *the* would add a meaning of definiteness not warranted by the antecedent. Once this addition of meaning were allowed, it would be impossible to adhere to the requirement of unique recoverability, since the ellipted expression could as easily be *of those buildings* or *of these buildings*, etc, instead of *of the buildings*.

The classification of ellipsis

- 12.41 In examining instances of ellipsis, we find it necessary to distinguish three major factors: (a) RECOVERABILITY TYPE; (b) FUNCTIONAL TYPE; and (c) FORMAL TYPE. Unless all three of these factors are taken into account, it is impossible to say exactly how and where ellipsis can take place.

Recoverability type

- 12.42 We have already made the relevant distinctions in 12.6f:

Fig 12.42

Functional type

- 12.43 When examining instances of textual ellipsis, whether anaphoric or cataphoric, it is often necessary to consider the relation of the antecedent construction to the elliptical construction within the larger construction of which they are both a part. For example, ellipsis in coordinate and comparative constructions is in some respects freer than in other kinds of construction, and merits separate treatment. Notice, in this connection, the difference between [1–2] and [3]:

- Mary can beat Ann and Δ Phyllis easily. [1]
 [ie Mary can beat Ann easily and Mary can beat Phyllis easily.]
 Mary can beat Ann more easily than Δ Phyllis. [2]
 [ie Mary can beat Ann more easily than Mary can beat Phyllis.]
 *Mary can beat Ann if Δ Phyllis easily. [3]
 [ie Mary can beat Ann easily if Mary can beat Phyllis easily.]

In the second coordinate clause of [1] and the comparative clause of [2], it is possible to omit the subject and verb if these repeat the subject and verb of the other clause. But the parallel ellipsis cannot be carried out within the subordinate *if*-clause of [3].

Similarly, ellipsis is relatively free in response forms in dialogue (cf 11.51ff).

- A: Whom can Mary beat most easily?
 B: (Mary can beat) Phyllis (most easily).

Here, as in [1] and [2], the subject and verb *Mary can beat* may be ellipped.

The freer categories of ellipsis illustrated are possible only in certain constructions. On such grounds, we distinguish between GENERAL ELLIPSIS, where the functional relation between the elliptical and antecedent constructions is not important, and SPECIAL ELLIPSIS, where the possibilities of omission are closely determined by the relation (eg a coordinative or comparative relation) between these two constructions. In the present chapter

we shall confine ourselves chiefly to general ellipsis, since special ellipsis is more appropriately handled in the chapters dealing with special relations such as coordination or comparison.

Fig 12.43 Functional types of ellipsis

Formal type

- 12.44 Formally speaking, elliptical constructions divide into three main categories. We shall distinguish INITIAL ellipsis, where initial elements are ellipped, from FINAL ELLIPSIS, where final elements are ellipped. For example, in [1] the *if*-clause is an example of initial ellipsis ('ellipsis on the left'), whereas in [2] the comparative clause is an example of final ellipsis ('ellipsis on the right'):

- He will come later, if (he comes) at all. [1]
 I have eaten more than you (have eaten). [2]

The conjunction *if*, because of its peripheral introductory role (cf 13.54), may be disregarded in judging an example like [1] as initial ellipsis. There is also a category of MEDIAL ellipsis, where only medial elements of a unit are omitted. But often it is better to argue that 'medial ellipsis' is a structural illusion which results from looking at too large a constituent in the sentence. If we examine conditions of ellipsis more carefully, medial ellipsis can often be treated as a special case of either initial or final ellipsis.

For example, within the clause it is often convenient to represent initial and final ellipsis as follows:

INITIAL (ellipsis on the left)		FINAL (ellipsis on the right)	
Subject Operator	Predication	Subject Operator	Predication
_____		_____	

Fig 12.44a

That is, initial ellipsis applies to the subject and operator, and final ellipsis applies to the predication. But this scheme applies primarily to the more central elements of the clause. The more peripheral elements (cf 2.13) such as introductory conjunctions and optional adverbials are in general less essential features of the clause; and conversely, under ellipsis, it is these elements which are permitted to occur when others do not:

- I know we have not yet set the record straight, but we will Δ (some day). [3]

Just as in [1] the conjunction remains as a clause introducer, so in [3] the adverbial *some day* remains when the rest of the clause after the operator is omitted. Note that by contrast, the object or object complement in [3] could not be retained except as part of the whole predication:

- *... but we will Δ the record straight some day.
 *... but we will Δ straight some day.

It may therefore be proposed that optional elements such as optional adverbials do not enter into the process of ellipsis:

Fig 12.44b

On this basis, the ellipsis in [3] will be classified as final rather than medial.

Ellipsis which is definitely medial is also found, but in rather restricted circumstances (it will be discussed, with reference to coordination, under the heading of GAPPING in 13.92f). In general, final ellipsis predominates over both initial and medial ellipsis. It is a general condition that final optional elements (adverbials or postmodifiers) may be retained under conditions where final ellipsis operates. To conclude this general consideration of categories of ellipsis, we summarize the types mentioned in 12.41–4 in Fig 12.44c:

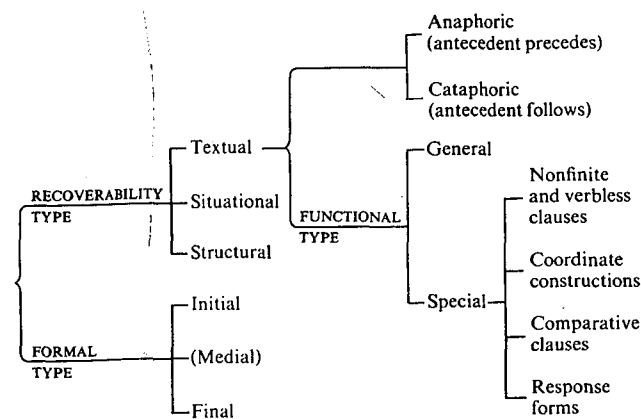

Fig 12.44c Main categories of ellipsis

Categories of ellipsis: recoverability

Anaphoric and cataphoric ellipsis

- 12.45 Returning to the recoverability types of ellipsis (cf 12.42), we begin with textual ellipsis, and the distinction between ANAPHORIC and CATAPHORIC reference (cf 12.6). Just as final ellipsis is the dominant formal type of ellipsis, so anaphoric ellipsis is the dominant type of textual ellipsis. In fact, ellipsis is governed in this respect by the same restrictions as pronoun reference (cf 6.19): the antecedent must normally have 'precedence' over the elliptical construction, by taking either an earlier position in the sentence, or a higher position (where 'higher' refers to a higher position in the tree diagram specifying the constituent structure of the sentence). Typically, cataphoric ellipsis occurs in a clause which is subordinate in relation to the clause in which the antecedent occurs.

If you want me to Δ , I'll lend you my pen.
We try, whenever we can Δ , to leave a window open.
Those who prefer (to) Δ can stay indoors.
Don't ask me why Δ , but the stone has been moved.

(Both the elliptical clause and the antecedent expression are italicized in these examples.)

- Note [a] It is difficult to specify the limits of acceptability for cataphoric ellipsis. Some kinds of ellipsis (including many cases of what we call general ellipsis) are acceptable if anaphoric, but only marginally so if cataphoric. For example, ellipsis of a noun head after an adjective:

I'll buy the red wine if you'll buy the white Δ .
?If you'll buy the white Δ , I'll buy the red wine.

The following valedictory sentence regularly used by a humorous broadcaster (John Ebdon, BBC Radio Four) illustrates the stylistically marked effect that often results from cataphoric ellipsis:

If you have been Δ , thanks for listening.

- [b] However, when two noun phrases are in a parallel relationship similar to that of coordination, cataphoric ellipsis of the head (and postmodifiers) of the first phrase is quite usual: *I can't tell real Δ from imitation jewellery; the change from a feudal Δ to a democratic way of life.* This type of ellipsis appears to be modelled on a similar type of ellipsis in coordinated noun phrases; eg: *real or imitation jewellery* (cf 13.79).

Situational ellipsis

- 12.46 We have already seen that some types of ellipsis are not dependent on the linguistic context for their interpretation. In such cases, the interpretation may depend on knowledge of a precise extralinguistic context. For example, *Get it?* in one situation might be understood to mean the same as *Did you get it?* (eg 'Did you get the letter/shopping/etc?'), and in another situation *Do you get it?* (ie 'Do you understand?'). Similarly, *Told you so* might be expanded in one context to *I told you so*, and in another to *We told you so*. In still other contexts, the exact words ellipsed might be unclear. The term SITUATIONAL ELLIPSIS can apply to such cases of weak ellipsis, and also to other cases where it happens to be quite clear what has been omitted; eg only *it* can be the ellipsed subject in *Looks like rain*.

Situational ellipsis is sometimes final; for example, the weakly recoverable ellipsis *How could you Δ* said as a rebuke to someone who has just committed

some situationally known folly. But more typically, situational ellipsis is initial, especially taking the form of omission of subject and/or operator; eg: (*Do you*) *Want something?* In such cases, which are restricted to familiar (generally spoken) English, the ellipted words are those that normally occur before the onset of a tone unit (cf App II.11), and hence have weak stress and low pitch. It may therefore be more appropriate to ascribe the omission to subaudible utterance or some other reductive process on the phonological, rather than on the grammatical level (cf Note [b] below).

In what follows, declarative sentences are treated separately from *yes-no* questions, since the operator is obligatory in the full form of *yes-no* questions.

Note [a] Imperative sentences without a subject (eg: *Sit down*) cannot be considered comparable to declarative and interrogative sentences with initial ellipsis. The implied subject of the imperative verb is *you* (cf 11.24), but absence of the subject is the norm with imperatives, and where the imperative subject *you* does occur (cf 11.25), it receives stress; eg: *'You sit down.* These factors, together with the fact that it is not restricted to familiar style, distinguish the subjectless imperative from the types of situational ellipsis we are now considering.

[b] The explanation of situational ellipsis in terms of phonological reduction is favoured by the occurrence, in recorded speech, of 'phrasal aphaeresis' in such examples as:

- 'k you. /kju/ [= Thank you]
- 's it matter? /sɪt/ [= What does it matter?]
- 'd you rather . . . ? /dju/ [= Would you rather?]
- 's anyone there? /zɛni/ [= Is anyone there?]
- 's all right. /sɔ:l/ [= It's all right]

It is difficult to say whether the missing syllables are lost because their utterance is subaudible, or because of more abstract phonological processes. In other cases, however, it is less realistic to talk in terms of subaudibility, since more than one syllable is lost:

- Δ Your name?
- Δ Two loaves of white bread, please.

Whatever the correct explanation of such initial ellipsis may be, it seems unquestionable (a) that the omissions are at least in part phonologically determined; and (b) that habits of rendering such omissions in writing (eg in popular fiction) have helped to conventionalize them in the form of omission of certain unstressed words.

Ellipsis in declarative sentences

(a) Ellipsis of subject alone

12.47 Either no auxiliary is available for ellipsis (eg: Δ *Serves you right*) or one is included in the sentence (eg: Δ *Can't see*). The element ellipted can be:

(i) the 1st person pronoun, normally *I*:

- Δ Beg your pardon. Δ Told you so.
- Δ Wonder what they're doing. Δ Hope he's there.
- Δ Don't know what to say. Δ Think I'll go now.

Most of the verbs in such elliptical constructions can take a clause as object.

(ii) the 2nd person pronoun:

- Δ Turned out all right? Δ Had a good time, did you?
- Δ Want a drink? Δ Want a drink, do you?

The 2nd person pronoun is ellipted, as the examples on the left show, in declarative questions (cf 11.12). It is ellipted in statements only if a tag

question is added. (*Want a drink?* can also be interpreted as an ordinary *yes-no* question with *Do you* ellipted, cf 12.49).

(iii) the 3rd person pronouns *he, she, they*:

(*He/She*) Doesn't look too well.

(*He/She/They*) Can't play at all.

(iv) *it*:

- Δ Serves you right. Δ Looks like rain.
- Δ Doesn't matter. Δ Must be hot in Panama.

The *it* ellipted from the two examples on the left is related to the anticipatory *it* (cf 18.33) found in sentences with extraposition, as in *It serves you right that you fell*. In the sentences on the right, *it* is the 'prop' subject in sentences like *It is cold* (cf 10.26). These ellipted sentences could refer directly, however, to an action in the situational context; for example *Serves you right* might be said to a child immediately after a fall, if the child had been warned not to act in a dangerous way. On the other hand, *it* may be used in reference to something identified in the situation:

- Δ Seems full. Δ Makes too much noise.

And some other expressions may be interpreted out of context as having ellipsis of either type of *it*:

- Δ Sounds fine to me. Δ Won't be any use.

(v) *there*:

- Δ Ought to be some coffee in the pot.
- Δ Must be somebody waiting for you.
- Δ May be some children outside.
- Δ Appears to be a big crowd in the hall.

This is the existential subject *there* (cf 18.44ff), as distinct from the 'true subject' following the verb. The elliptical construction is unlikely to contain the modal *will*, but *won't* is common:

(*There*) Won't be anything left for supper.

Note In category (i) above, (*I bet you . . .*) is sometimes rendered nonstandardly in writing as *Betcha . . .*; eg: *Betcha don't know what this is!*

(b) Ellipsis of subject plus operator

12.48 If the main verb BE is ellipted, the elliptical sentence begins with what would be a subject complement in the full form:

(i) the 1st person pronoun (particularly *I*) plus BE:

- (*I'm*) Sorry I couldn't be there.
- (*I'm/We're*) Afraid not.

We alone cannot be ellipted, eg: **Are afraid not*. For many speakers, the same applies to the singular pronoun *I*: for them *Afraid not* is acceptable, but not **Am afraid not*.

(ii) *it* plus *is*:

- | | |
|-------------------------|-------------------------|
| △ Good to see you. | △ Odd he won't help us. |
| △ No wonder she's late. | △ (A) Shame he's late. |
| △ No use worrying. | △ Not that I mind. |

The ellipted *it* here is generally the anticipatory *it* just mentioned in 12.47. The last example *Not that I mind*, however, exemplifies the empty 'prop word' *it*.

(iii) the 1st person pronoun followed by an operator other than *be*:

- | | |
|-----------------------|------------------------|
| (I'll) See you later. | (We've) Got to go now. |
|-----------------------|------------------------|

- Note [a] In familiar style the common elliptical phrases (*I've*) *got to* and (*I'm*) *going to* have acquired semi-institutionalized nonstandard spellings *gotta* and *gonna* respectively: *Gotta go now*; *Gonna go now* (cf 3.47f).
 [b] *Had* is commonly ellipted in spoken English in the semi-auxiliary *had better* (cf 3.45f): *You better try it again*. It is also possible to ellip the subject: *Better try it again*.
 [c] There is also the possibility of medial omission of the operator alone in *You gotta be careful*, *I gonna do what I like*, where the nonstandard written form, including the omission, reflects phonological processes of reduction, as in Notes [a] and [b].

Ellipsis in interrogative sentences

(a) Ellipsis of subject plus operator

- 12.49 If the subject and a main verb BE are omitted in a *yes-no* question, the resulting elliptical sentence begins with a subject complement or an adjunct:

- | | |
|--|-----------------------|
| (Are you) Happy? | (Are you) In trouble? |
| (Are you) Afraid of him? | (Is it) Hot? |
| (Are you) Hot? | (Are they) Torn? |
| Why can't he get up? (Is he) Too weak? | |
| (Is there) Anyone in? | |
| (Is there) Any coffee left? | |

If the operator is auxiliary BE, HAVE, or DO, the elliptical sentence may begin with a nonfinite main verb, sometimes preceded by an adverbial:

- | | |
|-------------------------------|------------------------------------|
| (Do you) Want some? | (Are you) Looking for anybody? |
| (Have you) Got any chocolate? | (Have you) Ever seen one of these? |

In such questions, the ellipted subject is generally *you*, but other interpretations would be possible in context; eg: (*Are they*) *Happy*? (*Is she*) *In trouble*?

- Note [a] *Wanna*, as a nonstandard spelling of *want to* (especially in AmE), occurs in such sentences as *Wanna have a go?* with subject + operator ellipsis (cf 12.48 Note [c]).
 [b] Some questions in category (a) above could alternatively be classified as declarative questions (cf 11.12) with ellipsis of the subject only. For example, *Want some?* could be a reduced version of *You want some?* rather than of *Do you want some?*

(b) Ellipsis of operator alone

- 12.50 There are also elliptical *yes-no* questions in which, although the operator is omitted, the subject is pronounced. This will be the case if, for any reason, the subject receives stress:

- | | |
|----------------------------|----------------------------------|
| (Is) 'Anything the matter? | (Does) 'Anybody need a lift? |
| (Are) 'You hungry? | (Has) 'Joanna done her homework? |
| (Is) 'That you, Shirley? | (Is) 'Nothing coming? |
| | (Would) 'You rather I waited? |

The examples on the left illustrate the omission of BE as main verb, while those on the right show the omission of an auxiliary.

- Note [a] There are also comparable sentences in which the subject is partially ellipted:
 Why isn't he here today? (Is his) 'Car still not working?
 Here the determiner of the subject noun phrase is ellipted, while the head is realized.
 [b] There is occasionally medial omission of the operator in *wh*-questions: *Where you going?* *What you want?* (cf 12.48 Notes [b] and [c]). This is characteristic of casual speech, but is often felt to be nonstandard in its written form. *You* in such questions is readily reduced to /jə/, and additional phonological simplification and assimilation following *What* can result in an affricated pronunciation represented in nonstandard spellings such as *Whatcha?* *Wotcher*.

Other cases of situational ellipsis

- 12.51 There are several other variants of the familiar initial type of situational ellipsis illustrated in 12.47–50. However, these further examples are less productive, and tend to occur only in idiomatic expressions:

- (a) Ellipsis of an article:
 (The) Trouble is there's nothing we can do about it.
 (The) Fact is I don't know what to do.
 (A) Friend of mine told me about it.

The omission of the indefinite article is common in the construction '*a(n)* + noun phrase + *of* prepositional phrase', as in (a) *friend of mine*. The omission of *a/an* or *the* may also combine with other ellipses:

- (It is a) Pity he won't help.
 (It is a) Shame they won't be there.
 (Is the) Television not working?

- (b) Ellipsis of a preposition:
 (Of) Course he's there.

Such cases as these provide further evidence that initial situational ellipsis is a phonological, rather than a grammatical process. It is clear that in cases like *Pity he won't help* or *Car still not working?* (cf 12.50 Note [a]) the ellipsis cuts across the boundaries of grammatical constituents, and is terminated by the first stressed syllable of the fully-realized sentence. The truncation of *of course* to *course* is prevalent for the same reason. Such omissions relate to the fact that the ellipted syllables have a low information value within the situation.

- Note There are also cases where the initial syllable of a word is omitted:
 (I am a-)Fraid I won't be there.
 The apocryphal spelling '*Fraid*', in this particular case, is semi-institutionalized. A less common case is '*Deed*' in '*Deed I do* (for *Indeed*)'. On the other hand, the analogous spelling of *because* as '*'cause*' or '*'cos*' (BrE) probably does not belong to the same category. This truncation, although also restricted to familiar style, is not necessarily found at the beginning of a sentence:
 He did it 'cause he wanted to.

A parallel, though less common, example is the spelling of *except* as 'cept. These cases of aphaeresis, together with the many examples of word clipping in English (eg: (tele)phone, photo(graph), (in)flu(enza)), belong more to the lexical processes of word-formation than to grammar (cf App I.74).

Structural ellipsis

- 12.52 There is no clear dividing line between situational ellipsis and structural ellipsis (cf 12.6), where the ellipted word(s) can be identified purely on the basis of grammatical knowledge. Without entering into arguments on this score, we can illustrate structural ellipsis by citing the zero conjunction *that* (cf 15.4) in [1], and the ellipted prepositions (cf 9.40ff) in [2] and [3]:

- | | |
|---|-----|
| I believe (that) you are mistaken. | [1] |
| The Club meets (on) Monday evenings. <familiar> | [2] |
| We're staying there (for) another three weeks. <informal> | [3] |

Further examples are provided by the common omission of determiners, pronouns, operators, and other closed-class words in block language (cf 11.45ff); eg in headlines, book titles, notices; also in lecture notes, diaries, telegrams, etc:

US heading for new slump. [ie: *The US is heading for a new slump.*]

Such structural ellipsis is confined to written style, and contrasts with the initial situational ellipsis characteristic of familiar spoken English, and discussed in 12.47ff. Both styles of ellipsis function as devices of economy, through the omission of items of little informational value. In the written elliptical styles known as 'headlines' and 'telegraphese', however, closed-class items are often suppressed not only in initial position but also in the middle of sentences.

Categories of ellipsis: function

General ellipsis

- 12.53 General textual ellipsis is typically (i) final and (ii) anaphoric, and it is on such regular cases that we concentrate in the following sections. We find it convenient to distinguish three major formal categories: (a) elliptical noun phrases, (b) elliptical clauses, and (c) other elliptical constructions.

Elliptical noun phrases

- 12.54 Elliptical noun phrases (except in coordinate noun phrases) result from final ellipsis. This means that postmodifiers (if any) and heads tend to be ellipted:

- | | |
|--|-----|
| <i>My own camera</i> , like <i>Peter's</i> Δ , is Japanese. | [1] |
| He had to admit that <i>Sarah's drawings</i> were as good as <i>his own</i> Δ . | [2] |
| You can't tax <i>one set of people</i> without taxing <i>the other</i> Δ . | [3] |
| <i>The first expedition to the Antarctic</i> was quickly followed by <i>another two</i> Δ . | [4] |

- | | |
|--|-----|
| <i>Tomorrow's meeting</i> will have to be <i>our first</i> Δ and <i>our last</i> Δ . | [5] |
| Although <i>Helen is the oldest girl in the class</i> , <i>Julie is the tallest</i> Δ . | [6] |

In these examples, the second noun phrase in italics is noteworthy in that its head is a word that elsewhere normally acts as a premodifier. In [1] the head is a genitive noun; in [2] and [3] it is a postdeterminer; in [4] it is a cardinal numeral; in [5] it is an ordinal numeral; and in [6] it is a superlative adjective.

Noun phrase ellipsis, like clause ellipsis (cf 12.59ff), involves some degree of parallelism between the elliptical construction and the antecedent. By virtue of this, some item(s) in the elliptical construction can be said to REPUDIATE, or semantically cancel out, some item(s) in the antecedent. Thus *the tallest* in [6] may be said to repudiate *the oldest*. This term is especially appropriate where the two constructions are in a contrastive relationship.

The shift of function from modifier to head in these examples is to be explained by the obvious fact that an 'understood' noun has been ellipted; eg: the noun *camera* in [1] and the noun *meeting* (twice) in [5]. In some examples, viz [3-6], postmodifiers are also ellipted; eg: *set of people* is ellipted in [3] and *girl in the class* in [6]. There is considerable variety in the structural relation between the elliptical noun phrase and its antecedent noun phrase. This variability is the hallmark of what we have termed *general ellipsis*.

- Note [a] Although the reduced genitive constructions *Peter's* [1] and *his own* [2] are examples of ellipsis, similar constructions with a possessive pronoun as head (eg: *his*, *hers*) are treated as virtual ellipsis or quasi-ellipsis (cf 12.40), and therefore, strictly speaking, as substitution.
- [b] Examples of genitives or possessive pronouns functioning as heads, but without an antecedent, may sometimes be treated as situational ellipsis. For example:
- Let's go round to *Mona and Fred's* Δ tonight.
- It's about time you went to the *barber's* Δ . (cf 5.125)
- [c] Cataphoric ellipsis of the head occurs somewhat exceptionally in examples such as: *Her first* Δ was bad enough, but *this second husband* is an absolute bore.

Adjectives and nouns as heads

- 12.55 Not all premodifying elements can readily act as heads of elliptical noun phrases. Comparative adjectives, and (even more so) absolute adjectives (cf 7.74) are restricted in this function. The following, however, are acceptable:

- Helen is the older girl*, but *Julie is the taller* Δ .
- This recipe requires *plain flour*, not *self-raising* Δ .
- We've put *some chocolate* aside for you: six bars of *plain* Δ and six Δ of *fruit and nut* Δ .

For reasons which are not totally clear, these are much more acceptable than examples such as:

- ?**Those plastic containers* will last longer than *those wooden* Δ .
- ?*As the centuries went by, *the devout monks* were replaced by *more worldly* Δ .

Even less acceptable is ellipsis of the head of a noun phrase when preceded by the indefinite article and another modifier:

- | | |
|--|-----|
| *We turned off <i>the (main) road</i> on to a <i>quieter</i> Δ . | [1] |
| *This (previously unprotected) <i>species</i> is now classified as an <i>endangered</i> Δ . | [2] |

As [1] and [2] show, the existence of a parallelism between the 'stranded' modifier and a modifier in the antecedent noun phrase plays little role in the acceptability of the ellipsis. In this, general ellipsis of the noun phrase differs from ellipsis associated with coordination (cf 13.64ff). Noun modifiers (cf 17.104ff), which are normally closely associated with the head noun, can rarely act as head of an elliptical phrase. Different degrees of acceptability are illustrated in:

- Do you prefer *silver rings* to *gold* Δ ? [3]
 (?)The recipe requires *wine vinegar*, not *malt* Δ . [4]
 *One tends to look after *personal books* better than *library* Δ . [5]

This limitation may be partly due to the ambiguity which arises, in the case of a noun head, as to whether the noun phrase is elliptical or not. Thus in [4], *malt* might be taken to refer simply to malt, rather than to malt vinegar. But more generally, there appears to be a principle that the closer a modifier is linked, by position and meaning, to its head, the less acceptable is the ellipsis of the head without the modifier.

- Note [a] As observed in 12.35, we do not always regard noun phrases with adjectives as head as cases of ellipsis; eg: *the rich*, *the French*, *the absurd* are not elliptical.
 [b] Similarly, we do not count cases like these as ellipsis:
 I'd like a pint of *bitter*. [= *bitter beer*]
 This apple is *my favourite*. [= *my favourite apple*]
 In spite of appearances, *bitter* and *favourite* here are not adjectives, but nouns derived from adjectives by conversion (cf App 1.48). We note, in support of this, that such words can be inflected for plural number, like count nouns: *Two bitters, please! These apples are my favourites*.
 [c] Cataphoric ellipsis with adjectives (eg: *You should never mix old Δ with new wine*) in contrast to anaphoric ellipsis, requires a parallelism between the adjectives:
 ?*Never mix *old Δ* with *chilled wine*.
 Such ellipsis (as already noted in 12.45 Note [b]) shows a close connection with coordination.

Ellipsis of modifiers

- 12.56 The dominance of final ellipsis in the noun phrase means that ellipsis will tend to take place according to the following order of precedence:

Thus we find:

- (a) ellipsis of postmodifier(s) alone:

Stan spent *PART of his winnings*, and *the rest Δ* he saved.
 If you need any *of that firewood*, I can give you *plenty Δ* .

Since postmodifiers are in general optional, it is difficult to recognize ellipsis in this position. The postmodifiers most readily omitted (as in the above examples) are partitive *of*-phrases.

- (b) ellipsis of head + postmodifier(s) as in [3], [4], and [6] in 12.54 above:

The *second novel she wrote* was very different from the *FIRST Δ* .

- (c) ellipsis of premodifier(s) + head + postmodifier(s):

The *second historical novel she wrote* was very different from the *FIRST Δ* .

Here it is understood that the whole expression *historical novel she wrote* is ellipted, including the premodifying adjective.

As postmodifiers are optional in any antecedent noun phrase, we may also find cases of final ellipsis which correspond to (b) and (c), except that no postmodifier is ellipted.

- (d) ellipsis of head alone, as in [1], [2], and [5] in 12.54:

Her *second novel* was very different from her *FIRST Δ* .

- (e) ellipsis of premodifier(s) + head:

Liebkecht's best pentathlon performance is well ahead of *Lessing's Δ* .

- Note [a] Although ellipsis of type (a) is limited because of potential ambiguity, the meaning of an elliptical rather than a nonelliptical construction can be singled out by the contrastive use of intonation, as already indicated in examples above. In the following case, the contrastive nucleus on *novel* is obligatory if the elliptical interpretation is intended:

Hardy's novels about Wessex are better known than his *poems Δ* .

Compare the nonelliptical interpretation of:

Hardy's novels about Wessex are better known than his *poems*.

- [b] In appearance, type (b) above may be indistinguishable from type (c), and type (d) from type (e). The following are thus ambiguous, according to whether we read the italicized premodifier(s) as part of the meaning of the elliptical noun phrase or not:

The last *two stanzas* of the poem imitate the *first ((two) stanza(s) of the poem)*.

My uncle built a *little wooden house* next to my father's (((little) wooden) house).

The nonoccurrence of initial general ellipsis

- 12.57 As one would expect with final ellipsis, it is possible to omit postmodifiers alone, as in type (a) above, but not (in general ellipsis) to omit premodifiers without omitting the head. If initial ellipsis of premodifiers were permitted, we should expect that the second occurrence of *Wessex* or *digital* could be ellipted in:

Hardy's Wessex novels are better known than his *Wessex poems*.
Digital wristwatches are as cheap as *digital alarm clocks*.

However, if *Wessex* or *digital* is omitted, the meaning of the sentence is different:

Hardy's Wessex novels are better known than *his poems*. [1]
Digital wristwatches are as cheap as *alarm clocks*. [2]

We may contrast this with the initial ellipsis of *Wessex* and *digital* which can occur in noun phrases in coordination (cf 13.67):

Hardy is best known for his Wessex novels and poems. [3]
 This shop specializes in *digital wristwatches and alarm clocks*. [4]

Sentences [3] and [4] are ambiguous according to whether the adjective is understood to modify the second conjoin of the noun phrase. But no such ambiguity occurs in [1] and [2]. The contrast between general ellipsis, which

is final, and the initial ellipsis which can occur in coordinate constructions is clearly illustrated by these two examples.

It also follows that ellipsis of every part of a noun phrase except for postmodifier(s) is impossible in general ellipsis:

*Joan prefers the trios of Mozart, while I prefer Δ of Haydn.

(Contrast the acceptability of *Joan prefers Mozart's trios, while I prefer Haydn's Δ .*)

Here, as often elsewhere, ellipsis is in complementary distribution with substitute forms: the sentence above becomes grammatical if we insert the substitute head *those* before *of Haydn* (cf 12.19). In addition there is, of course, the option of replacing the final prepositional phrase by a genitive:

Joan prefers the trios of Mozart, while I prefer Haydn's.

Medial ellipsis

- 12.58 However, like clauses (cf 12.44), noun phrases can occur with medial ellipsis. This arises if an optional postmodifier is retained while the head of the phrase is ellipsed:

They claim that *Danish butter* is the finest Δ (in the world).

That letter was the last Δ (I ever received from her).

A bird in the hand is worth two Δ (in the bush). [a proverb]

In other cases of medial ellipsis, one or more modifiers, as well as the head, may be ellipsed:

His recent *performance of Macbeth* is the best Δ he has ever done. [1]

That *new thick plastic rope* that they sell is stronger than *any other Δ you can get*. [2]

Once again, the elliptical phrase in [1] and [2] is ambiguous, according to whether the italicized modifiers are assumed to be an implicit part of the elliptical phrase. In fact, the ambiguity may be multiple. In [2], *any other you can get* might be regarded as an elliptical variant of any of the following:

any other rope you can get

any other plastic rope you can get

any other thick plastic rope you can get

any other new thick plastic rope you can get

To avoid such ambiguity, one has to repeat the words of the antecedent rather than ellipsis them.

Elliptical clauses

Ellipsis of the predication in finite clauses

- 12.59 General ellipsis in the finite clause is similar to general ellipsis in the noun phrase, in that the dominant type of ellipsis is final. Typically, the clause is divided into two parts: subject and operator (which remain), and predication (which is ellipsed). In terms of V, O, C, and A (cf 2.12ff), the constituency of the ellipsed predication can be varied. For example:

SUBJECT COMPLEMENT only (the verb BE being the operator):

I'm *happy* if you are Δ .

SUBJECT COMPLEMENT + ADVERBIAL:

If they're not *ready by lunchtime*, they ought to be Δ .

ADVERBIAL only:

His father was *at Oxford* when Harold Wilson was Δ .

NONFINITE PART OF VERB only:

Tom will be *playing*, but I don't think Martin will (be) Δ .

I'll *do* what I can Δ .

NONFINITE PART OF VERB + ADVERBIAL:

When Shirley *resigns from the committee*, I'm sure that a number of other people will Δ .

NONFINITE PART OF VERB + OBJECT + ADVERBIAL:

Who is *cooking dinner today*? John is Δ .

All these, and many other possibilities, are summed up in the generalization that predication can be ellipsed.

Note [a] Other possibilities, however, do not occur. Thus the lexical verb cannot remain 'stranded' preceding the ellipsis of an object, complement, or adverbial:

*I'll open *an account* if you'll open Δ .

*He always becomes *tired* faster than anyone else becomes Δ .

*As soon as the one aircraft had taken *off*, the other one took Δ .

Nor can an auxiliary alone be ellipsed, nor an entire verb phrase:

*Susan *was* happy because Alice Δ miserable.

*Tom *will* play the guitar if Mary Δ sing.

[b] On the other hand, in special constructions such as the zero relative clause (cf 14.20, 17.14), the object can be ellipsed: *the girl (whom) I met*. This, however, is structural rather than textual ellipsis.

[c] An auxiliary in its reduced form cannot precede ellipsis:

*Ned is as keen on boxing as $\left\{ \begin{array}{l} \text{I am} \\ *I'm \end{array} \right\} \Delta$ (on football).

DO as 'stranded' operator

- 12.60 Ellipsis of the predication is one of the constructions of English which require DO-support. That is, if the clause in its unreduced form has no operator, to create the conditions for omission of the predication it is necessary to introduce the dummy operator DO:

Sam kicked the ball harder than Dennis $\left\{ \begin{array}{l} \text{did.} \\ \text{kicked the ball.} \end{array} \right.$

This is strictly, however, not ellipsis, but quasi-ellipsis (cf 12.40), since the insertion of the omitted predication after *did* would result in an unacceptable sentence:

*Sam kicked the ball harder than Dennis *did kick the ball*. [1]

[1] is unacceptable because DO occurs in a context where the dummy operator cannot occur. But there are other constructions (eg clause negation, subject-

operator inversion, emphatic operator constructions) in which the operator would occur for independent reasons, and in these cases DO fulfils the conditions of standard ellipsis of the predication:

- Rupert wanted to attend the bullfight, although his wife *didn't*
(want to attend the bullfight). [2]
I don't like living in the country. *Do* you (like living in the
country)? [3]
A: Does she like playing with dolls?
B: Yes, she *DÔES* (like playing with dolls). [4]

In [4], where DO has nuclear stress, the conditions for ellipsis are met even in a positive declarative sentence, since DO is used as an emphatic operator in the equivalent unreduced form.

Note It has been argued, contrary to the view presented here, that (like *do*) *can*, *would*, *have*, etc are substitute forms (ie pro-predicates) when they are 'stranded' operators.

Ellipsis of the predicate

12.61 Ellipsis of the predicate means in general that the only part of the clause to remain is the subject. This type of ellipsis is not widespread: it comes under the heading of special ellipsis, and occurs only in certain special constructions, such as comparative, coordinate, and response constructions:

- Nigel finished the exam at the same time as George Δ . [1]
Nigel finished the exam first, then George Δ . [2]
A: Who finished the exam first? B: George Δ . [3]

The restricted distribution of this kind of ellipsis is evident if we compare [1] with [4]:

- *I finished the exam when George Δ . [4]
I finished the exam when George *did*. [5]

In the comparative clause [1], the whole predicate can be ellipted, but this is not possible in the adverbial clause in [4]. To make [4] grammatical, we have to add the dummy operator *did*, as in [5].

Note [a] When the 'stranded' subject of the elliptical clause is a pronoun, in informal use an objective form of the pronoun is preferred (for further discussion cf 6.4). Thus *George* in [1-3] could be replaced by either *I* <formal> or *me* <informal>. The use of the objective form is, however, traditionally regarded as an error. Structurally, *as me* replacing *as George* at the end of [1] would be classified as a prepositional phrase (cf 15.67).

[b] The statement that it is impossible to ellip the whole predicate of an adverbial clause appears to be contradicted by the following:

- Nigel finished the exam $\left\{ \begin{array}{l} \text{after} \\ \text{before} \end{array} \right\}$ George finished the exam. [6]
Nigel finished the exam $\left\{ \begin{array}{l} \text{after} \\ \text{before} \end{array} \right\}$ George. [7]

The acceptability of [7], in contrast to [4], appears to be due to the fact that unlike *when*, the words *after* and *before* are prepositions, as well as conjunctions (cf 9.38). Strictly, therefore, *after/before George* in [7] may be described not as an elliptical clause, but as a prepositional phrase with *George* as its complement. In support of this analysis, note that a subjective pronoun in the position of *George* is unacceptable:

*Nigel finished the exam $\left\{ \begin{array}{l} \text{after} \\ \text{before} \end{array} \right\}$ I.

It is striking, however, that despite this difference of analysis, [7] is interpreted as if it were an elliptical variant of [6].

Medial ellipsis

12.62 As noted earlier (cf 12.44), an optional adverbial can easily be added after an ellipted predication, so that the ellipsis becomes apparently medial rather than final:

When Shirley *resigns from the committee*, I'm sure that a number of
other people will Δ , (too).

There are more *hungry people in the world* today than there were Δ (in
1900).

This last example shows how an adverbial in the elliptical clause can REPUDIATE (cf 12.54), or cancel the meaning of, one in the antecedent clause. In this case, where one adverbial of time (*in 1900*) repudiates another (*today*), the ellipsis is genuinely medial. In the same category we may place the following, where only the lexical verb is omitted:

I'll gladly *pay* for the hotel, if you will Δ for the food.

Since *for the hotel* is in this case repudiated by *for the food*, the only part of the antecedent clause that is recovered by ellipsis is the verb *pay*.

Medial quasi-ellipsis also occurs with auxiliary DO. The dummy operator can be followed by an adverbial (for example an adjunct of time or space) repudiating a similar adverbial in the antecedent clause:

We paid more for the tickets ~~THIS~~ year than we

$\left\{ \begin{array}{l} \text{did LAST year.} \\ \text{have in PRÉvious years.} \end{array} \right.$

A: Did Sato take the plane to TÔkyo today?

B: NÔ, I don't think he DID. But his WIFE did to Ôsaka.

In the last example, *will* could replace *did*: there is no difference, in respect of such repudiatory constructions, between DO and other auxiliaries.

Unlike adjuncts, disjuncts and conjuncts (cf 8.121ff) are excluded from the antecedent when they occur after a 'stranded' operator. We can contrast in this respect the adjunct *usually* with the disjunct *wisely*:

A: Does Bob usually walk to work?

B: No, but his sister *does*. [= usually walks to work]

A: Bob wisely walks to work, doesn't he?

B: Well, at least he CLÄIMS he *does*. [= walks to work]

Similarly, a 'stranded' operator such as *do* or *have* excludes from the antecedent other, contrasting auxiliaries:

Not many people could have *enjoyed that trip* as much as your mother
did.

In this example, *did* is interpreted to mean 'enjoyed that trip' rather than 'could have enjoyed that trip'.

Note There is also a less usual form of repudiatory medial ellipsis, in which the predication is omitted except for an object. Such ellipsis is of variable acceptability:

(?)I'll gladly *lend him* the clothing, if you will Δ the money.

She was examining the pictures while I was Δ the sculptures.
(C/gapping, 13.92f).

Ellipsis in *wh*-clauses

- 12.63 A more thorough-going reduction of a clause by ellipsis involves ellipsis of the whole clause, or the whole clause except for an introductory word. One such clause is a *wh*-clause which is reduced, by ellipsis, to the *wh*-word alone. In such circumstances, the stranded *wh*-word normally receives nuclear stress:

Somebody had hidden my notebook, but I don't know

WHÒ/WHÝ/WHÈRE Δ .

Have you ever wanted *to start a successful business*? This book tells you
HÒW Δ .

This type of ellipsis is restricted to *wh*-interrogative clauses (cf 15.5). It does not apply to the relative type of nominal *wh*-clauses (cf 15.8f), nor to clauses introduced by *if* or *whether* (cf 15.6):

*Somebody *has hidden my notebook*, and I'll punish whoever Δ .

*They say *the treasure was buried*, but no one is sure whether Δ or not.

The elliptical *wh*-question is found not only in dependent, but also in independent interrogative clauses (cf 11.14):

A: We're bound to *win the prize some day*.

B: Yes, but WHÈN Δ ?

There is also a reduced negative *wh*-question, but this occurs only with *why* and with *wh*-infinitive clauses (cf 15.5):

Why NÒT? I don't KNÒW *why* not.

I don't want *to accept*, but I don't know *how not (to)*.

Note [a] Elliptical *wh*-questions are discussed further in 11.15 Note [b].

[b] The following are idiomatic examples of informal elliptical *wh*-interrogative clauses, in which the ellipsis is situational: *I'll tell you what*; *Say when*. Their meanings, roughly, are: 'I'll tell you what we can/should do'; and 'Say when you have enough to drink in your glass' (said by the person serving a drink). *I'll tell you what* can be ellipted still further, by initial ellipsis (cf 12.44), to *Tell you what*:

(I'll) Tell you what - let's meet again when all the results are in.

Ellipsis in *to*-infinitive clauses

- 12.64 Like the elliptical *wh*-clause just described, the elliptical *to*-infinitive clause normally consists of just one word: in this case, the introductory unstressed particle *to*. Since *to* is unstressed, the nucleus of the tone unit normally falls on the preceding verb or noun:

You can *borrow my pen*, if you WÁNT *to* Δ . [1]

You will *speak to who(m)ever* I TÈLL you *to* Δ . [2]

Somebody ought to *help*. Shall I ask PÈter *to* Δ ? [3]

A 'stranded' *to* also occurs as a result of ellipsis following the marginal modals

ought to and *used to*, and following semi-auxiliary constructions such as *be able to*, *be going to*, *have to*, and *be supposed to* (cf 3.47):

We don't *save* as much money these days as we $\left\{ \begin{array}{l} \text{used to } \Delta. \\ \text{ought (to) } \Delta. \end{array} \right.$

I won't *disturb you again* unless I have *to* Δ .

As with *to*-infinitive clauses in general, these abbreviated clauses are made negative by placing *not* before *to*:

She borrowed my pen, although I told her NÒT *to*.

Both the elliptical dependent *wh*-clause and the elliptical *to*-infinitive clause are normally restricted to a function of complementation (cf 16.35ff). For example, in [1] *to* is the complementation of *like*; in [2], *to* is part of the complementation of *want*; and in [3] *to* is part of the complementation of *ask*. It is for this reason that it is rare to find ellipsis of these types in nonfinal position in the sentence. However, it is possible for *to* to be followed by medial ellipsis with a final optional adverbial:

The committee did not *discuss your proposal*, but it hopes *to* Δ
(next month). [4]

Note Whether or not *to* is in a final position in the clause, if it is followed by an ellipsis it is normally pronounced in an unreduced form /tu:/ or /to/ rather than as a fully reduced or weak form /tə/. In this respect it resembles auxiliary verbs, which also remain unreduced in these circumstances (cf 12.59 Note [c]). Compare the unacceptability of:

*The committee did not discuss your proposal, but $\left\{ \begin{array}{l} \text{they'll next month.} \\ \text{they hope /tə/ next month.} \end{array} \right.$

In very informal AmE, however, reduction of *to* to /tə/ occurs finally in examples like:
Well, I don't *wanna*. So there!

Ellipsis of an entire clause

- 12.65 One stage further, in clause ellipsis, is the ellipsis of an entire clause, including introductory words, if any. This total clause ellipsis is limited, obviously enough, to dependent clauses, and mainly to *to*-infinitive clauses. It is also limited to clauses acting as complementation of other clauses. For example, the *to* in 12.64 [1] and [3] can be ellipted, so that no trace remains of the infinitive clause:

You can borrow my pen, if you WÁNT Δ . [1a]

Somebody ought to help. Shall I ask PÈter Δ ? [3a]

Normally the word whose complementation clause is ellipted is either a verb of saying or thinking, such as *ask*, *know*, *wish*, or an adjective such as *eager*, *sure*, and *willing*. Contrast:

Whole <i>to</i> -infinitive clause omissible	<i>To</i> not omissible
I was <i>willing</i> (to (come)).	I would <i>hate</i> you to (see this).
She <i>begged</i> us (to (help)).	I would <i>love</i> you to (stay).
They <i>forced</i> him (to (recant)).	He <i>advised</i> us to (leave).

Other clauses which may be ellipsed are some *-ing* clauses, some *that*-clauses, and some *wh*-clauses:

If I am going too fast, { please warn me (that I am going too fast).
please stop me (going too fast).

I asked *when she was leaving*, and she said she didn't know Δ .

It may be argued, however, that precise recovery of an ellipsed clause cannot be insisted on here; and that therefore this is a case of weak ellipsis only.

- Note [a] Certain subordinate clauses with an ellipsed infinitive clause, such as *if you like*, are formulaic, and resemble comment clauses (cf 15.53). One sign of their idiomatic status is an inability to be expanded by the addition of *to*: instead of *if you like to*, speakers would say *if you'd like to*. Conversely, *if you'd like to* cannot normally be reduced to *if you'd like*.
[b] There is some variation between AmE and BrE in the use of ellipsis or a pro-form in colloquial sentences such as *I know* and *I suppose so* (cf 12.28). For example, possible variants in AmE, but not in BrE, are *I know it* and *I suppose*.
[c] There can be total clause ellipsis in comparative constructions (eg: *He's older than I thought*) and in dialogue (eg: *I know*; *Who told you?* and *Why do you ask?*) cf 15.65f.

Special types of ellipsis

- 12.66 We now turn from general ellipsis to the special types of ellipsis (cf 12.43) which are defined by a particular structural relation between the elliptical construction and the antecedent construction. Unlike general ellipsis, all cases of special ellipsis allow initial ellipsis.

In nonfinite and verbless clauses

- 12.67 Since these will be discussed fully in Chapter 14 (14.6–9), it is sufficient to note that typically nonfinite and verbless clauses lack both subject and operator, and that their relation to their main clause can be explained if we postulate, in many cases, an ellipsis of these elements, the identity of the subject being recoverable from the main clause. (The ellipsis may be either anaphoric or cataphoric.) The clearest cases of such ellipsis are adverbial clauses such as the following (cf 14.18f, 15.34, 15.39):

NONFINITE CLAUSES:

Although (he was) exhausted by the climb, he continued his journey.
Dogs will learn fast if (they are) working in reasonable conditions.

VERBLESS CLAUSES:

While (she was) at Oxford, she was active in the dramatic society.
Though (he was) already middle-aged, he took a swim every morning.
Whether (it is) right or wrong, the government always wins the argument.

In coordination

- 12.68 When clauses are coordinated by *and*, *or*, or *but*, a second clause or other noninitial clause is often reduced by general ellipsis, the antecedent being a parallel construction in the preceding clause:

I told him to go home, but he wouldn't Δ . [1]

But there is also a special kind of ellipsis associated with coordination. Coordination is essentially a relation between two or more structurally parallel units, which may be whole clauses or sentences, but which are often smaller units such as noun phrases or predications:

Margaret is [selling her bicycle] and Δ [buying a car]. [2]
She has bought [a green dress] and Δ [a silver necklace]. [3]

There is no structural reason for postulating ellipsis in such cases. Instead we recognize that units may be coordinated in conjoint units which function, as far as clause structure is concerned, in the same way as one of their conjoins (cf 2.10). However, from a semantic point of view, [2] and [3] are generally equivalent to [2a] and [3a] respectively:

Margaret is selling her bicycle and Margaret is buying a car. [2a]
She has bought a green dress and she has bought a silver necklace. [3a]

For this reason, it may be claimed that coordination allows both initial ellipsis, as in [2] and [3], and final ellipsis, as in [1]. In one respect, however, coordination is more restrictive than general ellipsis: coordination normally requires strict ellipsis rather than standard ellipsis (cf 12.37–8). Hence the following are usually regarded as ungrammatical (although they occur readily enough in the casual unconsidered use of language):

?*The city always has Δ and will be proud of its achievements. [4]
?*The product is as good Δ or even better than its competitors. [5]

For further discussion, cf 13.44f, 13.88.

In comparative clauses

- 12.69 Like coordinate constructions, comparative constructions show a parallelism between one structure and another, and hence lend themselves to ellipsis. Although comparative clauses will be described later (cf 15.63ff) it is to be noted here that, as in coordination, so in comparative clauses, both final and initial ellipsis is allowed. Hence the ambiguity illustrated by:

My uncle loved that dog more than his family (loved that dog).
My uncle loved that dog more than (my uncle loved) his family.

The resemblance between coordination and comparison accounts for the existence of quasi-coordinators such as *rather than*, which share in the characteristics of both (cf 13.103). There is, however, a major difference between coordination and comparison: in the latter case the ellipsis-antecedent relation obtains between a subordinate clause and a matrix clause, rather than between two constructions of the same level of constituent structure.

In appended clauses

- 12.70 An appended clause can be regarded as an elliptical clause (usually parenthetical or an afterthought) for which the whole or part of the preceding or interrupted clause constitutes the antecedent:

I caught the train – just. [1]
 He told them (presumably with his tongue in his cheek) how he
 came to be late. [2]

These two sentences presuppose that two separate assertions are being made. The usual form for [1] is *I (only) just caught the train*, so to explain the unusual word order of [1] we suppose it to be an elliptical version of:

I caught the train – I just caught the train.

Compare:

I caught the train, but Δ only just Δ .

The same sort of analysis applies if the items added as an afterthought are in their normal order:

The train arrived – on time, for a change.

Whereas in these examples the whole of the initial clause acts as an antecedent for the elliptical parenthesis or afterthought, another kind of appended clause repudiates part of the original clause, so that only part (the part italicized below) acts as an antecedent:

They are meant to wound, perhaps Δ to kill.

He is playful, Δ even mischievous.

Her performance will be judged by her superiors – and even more importantly – Δ by her colleagues.

On the related construction of appended coordination, cf 13.94.

Note [a] A clause involving quantifiers interestingly illustrates how the appended clause sometimes has to be interpreted as repudiating part of the preceding clause:

They visit many schools, sometimes in an official car.

This does not mean the same as:

They sometimes visit many schools in an official car.

Rather, it presupposes two assertions:

{ They visit many schools. [3]
 { They sometimes visit schools in an official car. [4]

The second assertion [4] does not imply that they visit many schools.

[b] Appended clauses consisting of an adverbial only are closely related to nonrestrictive adverbials (cf 15.23):

I only met him once – at your place. [5]

In [5], *at your place* is nonrestrictive ('I only met him once – and that was at your place'), in contrast to *I only met him once at your place* ('but I've met him many times elsewhere').

[c] An appended clause sometimes contains a repetition of some part of the antecedent clause:

I found their behaviour odd – very odd, in fact.

[d] Appended clauses resemble some types of apposition (cf 17.65ff), in which there is a duplication of an element structurally and semantically parallel to an element of the preceding clause:

We – that is to say, John and I – intend to resign.

You could have given them to a charity – to Oxfam, for example.

He tried to make treaties with the Indians: first with the Sioux, and then with the Cheyenne.

Bibliographical note

On reduction generally, see Allerton (1975); Halliday and Hasan (1976).

On pro-forms and substitutes, see Allen (1961); Bolinger (1977b); Bouton (1969); Crymes (1968); G. Lakoff (1970a).

On ellipsis, see Greenbaum and Meyer (1982); Gunter (1963); Karlson (1959); Kypriotaki (1970).

Syndetic and asyndetic coordination

- 13.1 The term COORDINATION is used by some grammarians for both syndetic (or linked) coordination, and asyndetic (or unlinked) coordination. The difference between the two constructions is that syndetic coordination is marked by overt signals of coordination (*and*, *or*, *but*), whereas asyndetic coordination is not overtly marked. Sentence [1a] exemplifies syndetic coordination, with *and* as explicit marker, while [1b] exemplifies asyndetic coordination, with *and* omitted:

Slowly and stealthily, he crept towards his victim. [1a]
 Slowly, stealthily, he crept towards his victim. [1b]

Linking words which explicitly indicate coordination are termed COORDINATING CONJUNCTIONS, or (more simply) COORDINATORS. Not all juxtaposed words, phrases, or clauses are manifestations of asyndetic coordination. The possibility of inserting the coordinator *and* with little alteration of meaning is evidence that a construction is one of asyndetic coordination. It is this that distinguishes [1b] from other types of construction, for example the appended clauses of 12.70.

Syndetic coordination is the more usual form, and we shall therefore generally exemplify coordination with a coordinator present. Asyndetic coordination is usually stylistically marked. It is used for dramatic intensification, as in [1b], or to suggest an open-ended list:

Mrs Varley sold sweets, chocolate, toffee apples – anything a child could desire.

In asyndetic coordination, the conjoins are generally separated by a tone-unit boundary in speech, or by a punctuation stop in writing. In the spoken form, the conjoins are typically marked by a parallelism in the tone of the nucleus; for example:

SLÓwly, STÉALTHily . . . or: SLÓwly, STÉALTHily . . .

Note In the present chapter we restrict our attention to coordination within the sentence. Coordination as a link between sentences is discussed in 19.57ff.

Coordination and subordination

- 13.2 Explicit indicators of subordination are termed SUBORDINATING CONJUNCTIONS or SUBORDINATORS. (They are more fully discussed in 14.11ff.) Both coordination and subordination (cf 14.1–4) involve the linking of units of the same rank; but in coordination the units are constituents at the same level of constituent structure, whereas in subordination they form a hierarchy, the subordinate unit being a constituent of the superordinate unit (cf 14.2f for the relevant tree diagrams). Coordination and subordination are special cases of two types of syntactic arrangement traditionally known as PARATAXIS ('equal arrangement') and HYPOTAXIS ('underneath arrangement'). Thus, to

take an example within a phrase (cf 17.116), in *his first and best novel*, the coordinate adjective phrase *first and best* functions as a premodifier of *novel*, and in that phrase *first* and *best* are equal constituents. On the other hand, in *his first successful novel*, the adjective *first* does not modify *novel* directly; it modifies *successful novel*, and *successful* in turn modifies *novel*. Thus there is a hierarchy in relationships, and *first* and *successful* are in a hypotactic rather than a paratactic relation.

The opposition between coordination and subordination, and that between parataxis and hypotaxis, are often treated as equivalent. But we may distinguish them as follows. Parataxis applies not only to coordinate constructions, but to other cases where two units of equivalent status are juxtaposed: for example, an appended clause as discussed in 12.70 is in a paratactic relation to the clause preceding it; and a tag question is in a paratactic relation to the statement preceding it. But in neither of these cases could we insert an overt coordinator. Similarly, there are other hypotactic relations (such as the embedding of one phrase in another, cf 2.8), quite apart from the relation between a subordinate clause and the clause of which it is a part.

Semantic differences between coordination and subordination

- 13.3 A major difference between coordination and subordination of clauses is that the information in a subordinate clause is often placed in the background with respect to the superordinate clause (cf 19.60). Thus the syntactic inequality of subordination tends to bring with it a semantic inequality which is realized by syntactic hierarchization, as well as by position. This is particularly noticeable in the case of certain adverbial clauses, which present information as if it is presupposed as given (cf 18.8) rather than asserted as new:

{ He has quarrelled with the chairman *and* has resigned. [1a]
 { Since he quarrelled with the chairman, he has resigned. [1b]
 { He tried hard, *but* he failed. [2a]
 { Although he tried hard, he failed. [2b]
 { He tried hard, *although* he failed. [2c]

The cause–result relationship between the two events is expressed by a coordinator in [1a] and by a subordinator in [1b]; the semantic difference, however, is that in [1b] the hearer is assumed to know about the quarrel already. A similar observation applies to the concessive relationship expressed by *but* in [2a] and *although* in [2b] and [2c].

A third means of expressing the same relationship is a linking sentence adverbial, or conjunct (cf 8.134ff), such as *yet*:

He tried hard, *yet* he failed. [2d]

Unlike the other two words, however, *yet* can be preceded by a coordinator:

He tried hard, *and yet* he failed. [2e]

Despite its appearance, therefore, [2d], in contrast to [2e], illustrates asyndetic coordination (but cf further 13.11).

- 13.4 It is sometimes said that an important difference between coordination and subordination is that only in the former case can the relation between the two linguistic units be reversed without a change of meaning; *ie* (in symbolic terms):

A + conjunction + B = B + conjunction + A

This is no more than a half-truth. It is true that the order can be reversed in certain cases of coordination:

{ Mary studies at a university *and* John works at a factory.
= John works at a factory *and* Mary studies at a university.

But this potentiality is dependent on many factors, only one of which is the relationship of meaning between the coordinated units. Some of these factors are syntactic, others are a matter of semantic or pragmatic asymmetry (*cf* 13.22–7). For example, the following are obviously not synonymous:

He died *and* he was buried in the cemetery.
He was buried in the cemetery *and* he died.

Note When two coordinated units are placed in sequence, the second unit gains focal prominence from its position (*cf* 18.3*ff*). This prominence in terms of information focus also attaches to the final element in a subordination relation, but in the latter case the positional highlighting is combined with a highlighting based on the formal inequality of subordination.

Coordinators

Coordinators identified

- 13.5 We regard these conjunctions as clearly coordinators: *and*, *or*, and *but*. *And* and *or* are central coordinators, but *but* differs from them in some respects. On the gradient between 'pure' coordinators and 'pure' subordinators are *for* and *so that* (meaning in this chapter, unless otherwise stated, 'with the result that'). There is also a gradient relating coordinators to conjuncts: for example, *yet* and *so* are two words which we shall classify as conjuncts, but which nevertheless resemble coordinators in some respects. *Nor* is not a clear case of a coordinator, since for many speakers it can be preceded by another coordinator (a potentiality not available to the central cases *and*, *or*, and *but*, as we shall see). *Nor* also contains a negative feature, which introduces some syntactic differences (*cf* 13.36*ff*).

Both, *either*, and *neither* are used as the first item in a correlative pair with *and*, *or*, and *nor* respectively. These anticipatory words are optional endorsements of the coordination, and are obviously closely related to the corresponding determiners *both*, *either*, and *neither* (*cf* 5.12*ff*). Such ENDORSING ITEMS are not in themselves coordinators, since, like *nor*, they can be preceded by a central coordinator (*and* or *or*).

Note [a] We class the conjunctions *for* and *so that* as subordinators in this book; but *cf* below 13.8, 13.10.

[b] Another coordinator in marginal use is *plus*:

Mainframe computers are becoming less expensive, *plus* the best software is available for desktops which of course are cheaper still.

Thus used, *plus* is normally stressed, and is an emphatic alternative to *and* in an additive sense (*cf* 13.27).

Syntactic features of coordinators

- 13.6 In 13.3 we showed how the same semantic linking function could be performed not only by coordinators, but by subordinators and conjuncts:

He tried hard, *but* he failed.
He tried hard, *although* he failed.
He tried hard, *yet* he failed.

Since all three of these word classes can in a general sense be termed LINKERS, it is important to understand the syntactic basis of the distinctions between them, and at the same time to appreciate that these distinctions are gradient (*cf* 2.60) rather than clear-cut.

We shall therefore examine six features which apply to the central coordinators, *and* and *or*. For each feature, we note whether it is applicable not only to *and* and *or*, but also to items which resemble them. At this stage we restrict ourselves mainly to central coordinators as CLAUSE LINKERS.

(a) Clause coordinators are restricted to clause-initial position

- 13.7 *And*, *or*, and *but* are restricted to initial position in the clause:

John plays the guitar, *and* his sister plays the piano.
*John plays the guitar; his sister *and* plays the piano.

This is generally true of both coordinators and subordinators, but it is not true of most conjuncts:

John plays the guitar; his sister, *moreover*, plays the piano.

Note [a] There are two or three subordinators which are exceptional in that they can occur noninitially (*cf* 15.39):

Though he is poor, he is happy. Poor *though* he is, he is happy.

[b] In colloquial Australian English (*cf* 1.26) *but* can occur in noninitial position; this indicates that in this variety, it resembles conjuncts (*cf* 8.134*ff*).

(b) Coordinated clauses are sequentially fixed

- 13.8 Clauses beginning with *and*, *or*, and *but* are sequentially fixed in relation to the previous clause, and therefore cannot be transposed without producing unacceptable sentences, or at least changing the relationship between the clauses:

They are living in England, *or* they are spending a vacation there.
**Or* they are spending a vacation there, they are living in England.

This is true for coordinators and conjuncts, but not for most subordinators. Contrast the unacceptability of [1a], containing the conjunct *nevertheless*, with the acceptability of [1b], containing the subordinator *although*:

- *Nevertheless John gave it away, Mary wanted it. [1a]
 Although Mary wanted it, John gave it away. [1b]

In this respect, however, the subordinators *for* and *so that* resemble coordinators. Contrast:

- *For he was unhappy, he asked to be transferred.
 Because he was unhappy, he asked to be transferred.

and the resultative *so that* in [2] with the purposive *so that* (cf 15.48f) in [3]:

- *So that we arrived home late, the rush hour traffic delayed us. [2]
 So that he could buy a car, he sold his stamp collection. [3]

- 13.9 Related to the fixed position of the coordinate clause is the fact that when clauses are linked by the coordinators *and*, *or*, and *but* (also by *for* and *so that*), a pronoun in the first clause cannot normally have cataphoric reference to a noun phrase in the second clause. For example, *she* in [1a] and [1b] does not corefer to *my mother*:

- She* felt ill, and *my mother* said nothing. [1a]
She felt ill, but *my mother* said nothing. [1b]

On the other hand, a pronoun can (but need not) have cataphoric reference when it occurs in an initial subordinate clause (cf 6.19):

- Although *she* felt ill, *my mother* said nothing. [1c]

But the most common position for a subordinate clause is final, in which case a coreferring pronoun will be anaphoric:

- My mother* said nothing, although *she* felt ill. [1d]

Again, as with cataphoric reference, the antecedent must be in the superordinate clause:

- She* said nothing, although *my mother* felt ill. [2]

In [2], *She* cannot cataphorically refer to *my mother*.

- Note There are both apparent and real exceptions to the rule that a pronoun cannot have cataphoric reference to an element in a following coordinate clause. Consider:

No one who met *her* on social occasions could imagine a harsh word passing *her* lips – but *Liz Pettigrew* was notorious for speaking her mind on matters of business. [3]

The two occurrences of *her* in the first clause appear to corefer cataphorically to *Liz Pettigrew*; but this sentence would normally occur in a context in which *Liz* was already being discussed. These pronouns could then be explained as anaphorically coreferring to part of an earlier sentence. Exceptionally, however, a sentence such as [3] could occur without preceding anaphoric reference – eg at the beginning of a novel.

(c) Coordinators are not preceded by a conjunction

- 13.10 *And* and *or* do not allow another conjunction to precede them. This is also true for *but*, *for*, and *so that* (of which the latter two will be treated as subordinators; cf 13.18f). On the other hand, subordinators as well as conjuncts can usually be preceded by conjunctions:

He was unhappy about it, *and yet* he did as he was told.

In [1] and [2] two subordinate clauses are linked by *and*, which precedes the second subordinator *because* and the second subordinator *so that* (with purposive meaning):

- He asked to be transferred, *because* he was unhappy *and because* he saw no prospect of promotion. [1]
 She saved money *so that* she could buy a house, *and so that* her pension would be supplemented by a reasonable income after retirement. [2]

In contrast, the conjunctions *but*, *for*, and resultative *so that* (cf 15.49) cannot be preceded by *and* in this way:

- *He was unhappy about it, *and but* he did what he was told.
 *He asked to be transferred, *for* he was unhappy *and for* he saw no possibility of promotion.
 *We paid her immediately, *so (that)* she left contented *and so (that)* everyone was satisfied.

- Note A subordinate clause cannot normally be coordinated with a superordinate clause; but this is what appears to happen in the following case:

She wouldn't do it – and (all) because I didn't ask her in person.

The explanation of this example, however, is that the coordinated construction in italics is an elliptical appended clause (cf 12.70), the *because* clause being subordinated to this appended clause, rather than to the initial clause *She wouldn't do it*.

- 13.11 In initial position, some conjunct adverbs resemble coordinators in that they commonly occur with asyndetic coordination, and therefore provide a link similar to coordination:

- I told her to go home, *yet* she refused to move. [cf: *but* she refused . . .]
 The rain fell, *so* we all went home. [cf: *and* we all . . .]
 Tom doesn't drink, *neither* does he use bad language.
 The car turned suddenly, *then* screeched to a halt.

The ease with which the coordinator is omitted in these cases suggests that not only the possibility of adding a coordinator, but the probability of its being omitted should be considered a factor in comparing the behaviour of linkers. One way of explaining the unexpected likelihood of asyndeton in such cases is to postulate an optional merger of the coordinator *and* with the adverb; eg: *and* + *yet* merge into *yet*; *and* + *so* merge as *so*. This is a more convincing analysis where, as in all the examples except *then* above, the adverb is immobile in initial position. Other adverbs which behave similarly are *nor* (cf 13.18), *otherwise*, *neither*, *only* (as a conjunct), and *hence*.

On the use of comma punctuation with this set of adverbs, cf App III.6.

(d) Coordinators can link clause constituents

- 13.12 *And* and *or* may link constituents smaller than a clause; for example, they may link predicates, thus in effect allowing ellipsis of a second or subsequent subject (on the treatment of ellipsis in such cases, cf 13.44ff, 13.52f):

- [I may see you tomorrow] *or* [I may phone later in the day].
 [I may see you tomorrow] *or* Δ [may phone later in the day].

Less frequently, this feature also applies to *but*:

The Polish athletes [have succeeded today], *but* Δ [may not repeat their success tomorrow].

However, it does not apply to *for* and *so that*:

*He [did not want it], *for* Δ [was obstinate].

*He [did not spend very much], *so that* Δ [could afford a trip abroad].

Nor does it apply to other conjunctions or to most conjuncts. But this construction seems to be acceptable with the conjunct *yet* and (to a lesser extent, at least in informal spoken English) with the conjunct *so* and the time adverb *then* (meaning 'after that'):

They didn't like it, *yet* (they) said nothing.

They were tired, *so* (they) left early.

They went home, *then* (they) went straight to bed.

- 13.13 A subordinator, on the other hand, does not allow ellipsis of the subject even when its clause is linked by a coordinator:

*She didn't say anything about it *because* he was new and *because* looked unwell. [1]

If the second subordinator of [1] is omitted, ellipsis is possible:

She didn't say anything about it *because* he was new and (he) looked unwell. [1a]

This is allowed, being a regular case of coordination of predicates (cf 13.52), whereas that of [1] is an ungrammatical type of ellipsis (cf 12.44). For the same reason, ellipsis is possible preceding or following a conjunct (such as *nevertheless*) if the ellipted subject is itself preceded by a coordinator:

He went to bed early, but $\left\{ \begin{array}{l} \Delta \text{ nevertheless} \\ \text{nevertheless } \Delta \end{array} \right\}$ felt tired.

(e) Coordinators can link subordinate clauses

- 13.14 As well as linking two main clauses, *and* and *or*, as we saw in 13.10 [1] above, can link subordinate clauses:

He asked to be transferred, *because* he was unhappy, (*because*) he saw no prospect of promotion, *and* (*because*) conditions were far better at the other office. [1]

I wonder *whether* you should go and see her *or whether* it is better to write to her. [2]

Usually, as in [1], the second and any subsequent subordinators may be omitted. Such linking is not possible for conjuncts or for the other conjunctions except *but*. *But*, however, is restricted to linking a maximum of two clauses (cf 13.16):

She said *that* John would take them by car *but* (*that*) they might be late. [3]

Even so, *but* can link only certain types of subordinate clauses:

- (a) *That*-clauses (cf 15.4) as in [3] above; only with *that*-clauses can the second subordinator, the one following *but*, be omitted.
(b) Temporal adverbial clauses:

I spoke to him *after* the conference was over, *but before* he started work.

- (c) Clauses introduced by the same conjunctions, such as *in order that*, *so that*, and *because*, or by the same *wh*-words. In such cases the first part of the sentence has to be negative, so that it contrasts with the positive meaning of the part which follows *but* (cf 13.42):

She didn't see who MET the ambassador, *but* who took him away.

He didn't save in order to go to school, *but* in order to buy a car.

- 13.15 *But* cannot link most other subordinate clauses, because such clauses normally lie outside the scope of negation (cf 2.55, 10.64f), and so cannot contrast with the negative implication of the first conjunct:

?They won't help you *if* you pay them, *but if* you promise to help them in return.

*They didn't stay *although* they were happy, *but although* they were bored.

An example with *if*-clauses, such as the one above, is marginally acceptable in a context which enables it to be interpreted as a reformulation of what someone has said or implied. Moreover, if the negation is outside the verb phrase, *but* can more easily link adjunct and subjunct clauses, including such *if*-clauses as:

It might have turned out all right, *not if* he had been more forceful *but if* he had been more tactful.

On further aspects of the *not* . . . *but* construction, cf 13.42.

(f) Coordinators can link more than two clauses

- 13.16 *And* and *or* can link more than two clauses, and the construction may then be called one of MULTIPLE COORDINATION. All but the final instance of these two conjunctions can be omitted. Thus:

The battery may be disconnected, the connection may be loose, *or* the bulb may be faulty. [1]

is interpreted as:

The battery may be disconnected, *or* the connection may be loose, *or* the bulb may be faulty. [2]

In this respect, *and* and *or* differ from subordinators and conjuncts. They differ even from *but*, since *but* semantically speaking can only link two conjuncts at the same level. While it is possible (though unusual) to construct a sentence such as:

John played football, Mary played tennis, *but* Alice stayed at home. [3]

such a sentence is interpreted as if the first two clauses had been linked by *and*:

John played football, *and* Mary played tennis, *but* Alice stayed at home. [4]

An indefinite number of clauses can be linked by *and* or *or*. But there is another way in which more than two elements can be combined by coordination: one set of coordinate clauses may become the conjoin of a higher-level coordinate construction. This is indeed what happens in [4], where the coordination by *but* is at a higher level than the coordination by *and*. The constituent structure can be conveniently shown by bracketing: $[[A] \text{ and } [B]] \text{ but } [C]$. When two different coordinators occur, like this, in the same complex construction, structural ambiguities are liable to arise. The ambiguity can be demonstrated by different bracketings. For example, in the following sentences, [A], [B], and [C] represent three clauses:

[A] I'll pay for the meal *and* [B] you pay for the taxi, *or* [C] perhaps I'll pay for both. [5]

The relationship between the clauses can be represented as follows:

$[[A] \text{ and } [B]] \text{ or } [C]$.

On the other hand, the sentence:

[A] His parents live in New York *and* [B] he writes to them from time to time *or* [C] (he) phones them. [6]

can be represented by a bracketing in which [B] and [C] make up a single conjoin of *and*:

$[A] \text{ and } [[B] \text{ or } [C]]$.

The contrast between [5] and [6] can be also represented by tree diagrams:

Note Punctuation is often used to make clear which is the major constituent structure boundary in mixed multiple coordinate constructions such as [5] and [6]. Thus, the potential ambiguity of the above two constructions can be eliminated by placing a comma before the main coordinator:

$[[A] \text{ and } [B]], \text{ or } [C];$ $[A], \text{ and } [[B] \text{ or } [C]].$

A similar distinction can be made prosodically, by placing a tone-unit boundary before the major coordinator, and using additional forms of prosodic emphasis if required.

Polysyndetic coordination

- 13.17 When a construction with *and* or *or* has more than two conjoins, the ellipsis of all but the last coordinator is customary. Hence 13.16 [1] above, rather

than [2], illustrates the usual pattern. In this way, the insertion of the coordinator between two conjoins signals that the last conjoin is about to be added. But where a coordinator occurs between each pair of conjoins, *eg* in [A] *and* [B] *and* [C], the construction is traditionally termed POLYSYNDETON:

The wind roared, *and* the lightning flashed, *and* the sky was suddenly as dark as night. [7]

Polysyndetic coordination thus contrasts both with asyndetic coordination and with ordinary syndetic coordination (*cf* 13.1). Since it transgresses the principle 'reduce where possible' (*cf* 12.4), polysyndeton tends to be reserved for stylistically marked effects; for example, in [7] above it is used to emphasize a dramatic sequence of events, and in 13.16 [2] it suggests (in contrast to [1]) that the list of three possibilities may not be complete.

Note On the use of a punctuation mark as a separator of nonfinal conjoins of multiple coordinate constructions, *cf* App III.7-9.

Coordination-subordination gradient

- 13.18 Table 13.18 displays the gradient from the central coordinators *and* and *or* to subordinators like *if* and *because*, with *but*, *for*, and *so that* on the gradient. The conjuncts *yet*, *so*, and *nor* are added to the Table, because, as we have seen, they in some respects resemble coordinators. The six features of *and* and *or* noted in 13.7-17 have provided six criteria used in constructing the matrix. If an item satisfies a criterion, this is indicated by a '+' in the relevant cell. If it fails to satisfy the criterion, '-' is entered. The combination '+-' takes care of cases, explained in the previous discussion, where the item satisfies the criterion only under certain conditions. The six criteria to be applied to each item are:

- It is immobile in front of its clause.
- A clause beginning with it is sequentially fixed in relation to the previous clause, and hence cannot be moved to a position in front of that clause.
- It does not allow a conjunction to precede it.
- It links not only clauses, but predicates and other clause constituents.
- It can link subordinate clauses.
- It can link more than two clauses, and when it does so all but the final instance of the linking item can be omitted.

Table 13.18 Coordination-conjunct-subordination gradients

	(a)	(b)	(c)	(d)	(e)	(f)
coordinators						
<i>and</i> , <i>or</i>	+	+	+	+	+	+
<i>but</i>	+	+	+	+	±	-
conjuncts						
<i>yet</i> , <i>so</i> , <i>nor</i>	+	+	×	+	-	-
<i>however</i> , <i>therefore</i>	-	+	-	-	-	-
subordinators						
<i>for</i> , <i>so that</i>	+	+	+	-	-	-
<i>if</i> , <i>because</i>	+	±	-	-	-	-

The cross 'x' in column (c) records the fact, already noted in 13.11, that words like *yet*, *so*, and *nor*, although they allow a preceding coordinator, also allow the omission of the coordinator more readily than other conjuncts. In other words, they favour asyndeton, and to that extent resemble coordinators with respect to column (c) as much as they resemble conjuncts.

Note [a] When *because* introduces a disjunct clause (cf 8.124, 15.21), it resembles *for* and *so that*, in that the clause which it introduces cannot be moved to initial position in the sentence:

She PAID for the book, *because* I SAW her. ≠ *Because* I saw her, she paid for the book.

This explains the '±' in column (b).

[b] For many speakers, especially in AmE, *nor* cannot be preceded by a coordinator. In BrE, the combination *but nor* is somewhat more acceptable than *and nor*.

- 13.19 Although Table 13.18 demonstrates the absence of a clear divide between coordinators and other linking items, we can justify the traditional inclusion of *but* among the coordinators and the exclusion of *for* and *so that* or *yet* and *so* by pointing to two facts which distinguish *but* from these words: (i) it behaves like a coordinator with respect to subject ellipsis (cf 13.12 and criterion (d) above), and (ii) it resembles coordinators in its ability to link two clauses subordinate to the same main clause (criterion (e)). The latter potentiality, in particular, reflects its status as a coordinator, in that it links constituents at the same level. By the same criteria, *for* and *so that* are shown to be subordinators rather than coordinators; and yet they are more coordinator-like than the more typical subordinators *if* and *because*. Similarly, *yet*, *so*, *neither*, and *nor* are best treated as conjuncts which are nevertheless more coordinator-like than more typical conjuncts such as *however* and *therefore*. These words which share some of the distinguishing features of coordinators may be called SEMI-COORDINATORS (cf also QUASI-COORDINATORS, 13.103).

Coordination of clauses and of lesser constituents

- 13.20 In the above comparisons, we have assumed in general that the units to be linked are clauses. This has meant ignoring (except with reference to criterion (d)) an important distinguishing characteristic of coordinators: that they can be used to link elements which are parts of clauses, rather than whole clauses. Thus the conjoints in the following examples are adjectives acting respectively as subject complement and premodifier:

The weather will be *cold and cloudy*.

~ *cold and cloudy* weather

The weather will be *rainy or changeable*.

~ *rainy or changeable* weather

The weather will be *warm but windy*.

~ *warm but windy* weather

Here again, however, we note that linking words which are not coordinators nevertheless resemble coordinators. Certain concessive subordinators and conjuncts, in particular, are capable of replacing *but* in the above types of construction:

Tim's *squat yet ferocious* bulldog could be heard growling on the patio.
I immediately recognized Sarah's *bold if barely legible* handwriting.
Martin was inclined to boast about his *rich though disreputable* ancestors.

(On the concessive use of *if* here, cf 15.40.)

These concessive items can link not only adjectives, but other clause constituents, such as adverbials:

The admiral walked clumsily, $\left\{ \begin{array}{l} \text{yet} \\ \text{if} \\ \text{though} \end{array} \right\}$ with dignity.

Similarly, *nor*, in its capacity as a correlative conjunction after *neither* (cf 13.37), can link constituents such as adjectives or adverbials:

They were *neither able nor willing* to provide the necessary capital.

The gradience and overlap between coordinators, subordinators, and conjuncts has not, therefore, been exhausted by Table 13.18.

- 13.21 We shall note such in-between cases as they arise; but even with coordination, it is sensible to begin with the conjoining of clauses as the most basic construction. This is because in many cases (but by no means all; cf 13.45–6) the coordinating of smaller units may be elucidated as an elliptical reduction of clause coordination. For example, the coordinating of predications as in:

Sam has *trimmed the hedge* and *mowed the lawn*.

can be analysed as an elliptical coordination of clauses in which the initial subject and operator are repeated:

Sam has *trimmed the hedge*, and Sam has *mowed the lawn*.

Similarly, the following sentence with verb-phrase coordination:

I *washed and ironed* the clothes.

can be seen as a reduced version of:

I *washed* the clothes and I *ironed* the clothes.

In this analysis, we can treat ellipsis as a relation of SYSTEMATIC CORRESPONDENCE in the sense of 2.20, rather than attempting to explain it as a process of deriving the reduced construction from the fuller one. Nevertheless, it will be helpful to concentrate largely on clause coordination in the following sections, 13.22–32, therefore confining our attention to COMPOUND SENTENCES as defined in 14.2. It should be noted, however, that the semantic relations to be discussed apply to coordination of clause constituents, as well as of entire clauses.

The use of coordinators

The uses of *and*

- 13.22 *And* is the coordinator which has the most general meaning and use. The only restriction on the use of *and* as coordinator is the pragmatic one that the clauses should have sufficient in common to justify their combination. Thus the following is odd simply because it would be difficult to find any connection between the content of the clauses:

The youngsters went off to a dance *and* the equator is equidistant from the two poles.

In logical terms, *and* merely conveys (for declarative clauses) that if the whole sentence is true, then each of its conjoined clauses is true. But the pragmatic implications of the combination vary, according to our presuppositions and knowledge of the world. The relation connoted by the link between the two or more conjoins can generally be made explicit by the addition of an adverbial. By using the term 'connotation', we intend to indicate that the relations of meaning between conjoins are not hard and fast: they vary in strength, and more than one can coexist in the same occurrence of *and*. For each connotation that we exemplify in the following sections, we insert (wherever possible) an adverbial that would make the relationship explicit (cf 19.20). For simplicity, we illustrate the connotation with sentences containing just two clauses.

Of the eight types of connotation, in only three – (c), (f), (g) – can the sequence of clauses perhaps be reversed without changing the relationship between the clauses. Even in these cases, the sequence is rarely random.

Note Thus the general principle of communicative dynamism (cf 18.3ff) determines that when two units are coordinated, the second is placed in focus against the background of the first.

- 13.23 (a) The second clause is a **CONSEQUENCE** or **RESULT** of the first; *ie*, the first conjoin presents the circumstances (frequently the circumstantial background) enabling the event described in the second conjoin to take place. This entails that the order of the clauses also reflects chronological sequence:

He heard an explosion *and* he (*therefore*) phoned the police.

- (b) The second clause is chronologically **SEQUENT** to the first, but without any implication of a cause–result relationship:

I washed the dishes *and* (*then*) I dried them.

In (a) and (b), the verb of each clause is normally dynamic rather than stative.

Note [a] There can obviously be no implication of chronological sequence if the clauses are given in a sequence contrary to chronological order. Thus, if the second clause is tense-marked to indicate that its content is prior chronologically, coordination of the two clauses is unacceptable in the intended meaning:

?I dried the dishes *and* I had washed them.

This also applies when there is the additional implication of a cause–result relationship:

?He phoned the police *and* he had heard an explosion.

Such sequences, however, can be quite acceptable without linking by *and*:

He phoned the police; he had heard an explosion.

As such examples show, parataxis differs from coordination in allowing a relation between two clauses whereby the second gives the **REASON** or **EXPLANATION** for the event described in the first:

Bader's car dropped out of the race: the engine was overheating.

[b] The association of *and* with chronological sequence does not rule out the possibility that the two clauses linked by *and* refer to simultaneous events or states; *eg*:

Mother was reading *and* (at the same time) I was having a bath.

In this case, where the relation of meaning is **ADDITIVE** (cf 13.27), there would be no difference of meaning if the clauses were placed in the opposite order:

I was having a bath *and* mother was reading.

- 13.24 (c) The second clause introduces a **CONTRAST**:

Robert is secretive *and* (*in contrast*) David is candid.

- (d) The second clause is felt to be surprising in view of the first, so that the first clause has a **CONCESSIVE** force:

She tried hard *and* (*yet*) she failed.

In both (c) and (d), *and* could be replaced by *but*.

- 13.25 (e) The first clause is a **CONDITION** of the second:

Give me some money *and* (*then*) I'll help you escape. [1]

Let's give him some money *and* (*then*) he won't tell anybody what we did. [2]

The implication of the first sentence is shown by the paraphrase:

Give me some money. If you give me some money (*then*) I'll help you escape.

This illustrates a pattern which is usual with the conditional use of *and*: the first clause is a directive and the second clause describes the consequence which will ensue if the directive is obeyed. It is not necessary, however, for the first clause to be in the imperative mood, or for the second clause to contain *will* or *shall*. One idiomatic pattern consists of two imperatives:

Go by air, *and* save time. [3]

Join the navy *and* see the world. [4]

Another pattern is illustrated by the following:

One more word from you, *and* I phone the police. [5]

Here the first clause is verbless, and the second illustrates the dramatically 'instantaneous' use of the present tense (cf 4.7).

Like the corresponding conditional use of *or* (cf 13.30), this use of *and* is associated with certain directive speech acts, such as promises (*eg* [1]) and threats (*eg* [5]).

Note [a] Since it is normal for the first clause to retain some directive force, there is no exact paraphrase relation between (say) [1] above and the following sentence with an *if*-clause:

If you give me some money, I'll help you escape.

On the other hand, there is a proverbial type of sentence in which the imperative clause lacks a directive meaning, and where the conditional sentence with *if* would offer a suitable paraphrase:

Ask me no questions, *and* I'll tell you no lies.

Give a dog a bad name, *and* he'll live up to it. [= 'If you give ...']

[b] A quasi-conditional use of *and* in prohibitions is illustrated in the slogan: *Don't drink and drive* [= 'If you drink, don't drive']; cf 13.48.

- 13.26 (f) The second clause makes a point SIMILAR to the first:

A trade agreement should be no problem, *and (similarly)* a cultural exchange could be easily arranged.

- 13.27 (g) The second clause is a 'pure' ADDITION to the first, the only requirement being that the two statements are congruent in meaning:

He has long hair *and (also)* he often wears jeans.

- (h) Similar to (g) is a sentence in which the second clause adds an appended COMMENT ON OR EXPLANATION of the first:

They disliked John – *and* that's not surprising in view of his behaviour.

There's only one thing to do now – *and* that's to apologize.

A sentential relative clause, *eg*: ... *which is not surprising* ... (cf 15.57), can replace the second clause here.

Note In type (h), if the first clause is long, the second is sometimes inserted parenthetically within it. Such parenthetical coordination gives the impression of being an *ad hoc* or unplanned interpolation:

Many students at our university – *and* it is difficult to explain this – reject the proposed reforms in university administration.

For a different kind of interpolated coordination, cf 13.95ff.

The uses of *or*

- 13.28 *Or* introduces an alternative. Logically, in contrast to *and* (cf 13.22) it conveys the meaning (with declarative clauses) that if one of the individual conjoins is true, then the whole sentence is true. But as with *and*, there is the pragmatic requirement that the contents of the two clauses should have sufficient in common to justify their juxtaposition as alternatives. Typically *or* is EXCLUSIVE; that is, it excludes the possibility that both conjoins are true, or are to be fulfilled:

You can sleep on the couch in the lounge *or* you can go to a hotel.

The person who makes the above suggestion does not expect the hearer to reply 'Thanks, I'll do both'. But even when both alternatives are clearly possible, as in:

You can boil yourself an egg *or (else)* you can make some sandwiches.

or is normally interpreted as exclusive. The meaning of *or* in such cases can be strengthened by the conjunct *else* or *alternatively*.

There can also occur, however, an INCLUSIVE interpretation of *or*, where it is implied that both conjoins may be true. This inclusive meaning is clearly

signalled where a third clause is added to make it explicit, as in the following example:

You can boil an egg, *(or)* you can make some sandwiches, *or* you can do both.

In written varieties of the language where precision is required (*eg* in official instructions), the third possibility can be explicitly included by the combination of coordinators *and/or*:

If the appliance is defective, write directly to the manufacturer *and/or* complain to your local consumer protection service.

Note The exclusive meaning of *or* acquires a specialized use in alternative questions (cf 11.20ff), in alternative interrogative clauses introduced by *whether* or *if* (cf 15.6), and in alternative conditional-concessive clauses (cf 15.41).

- 13.29 The alternative expressed by *or* may also be a restatement or a CORRECTIVE to what is said in the first conjoin:

They are enjoying themselves, *or* $\left\{ \begin{array}{l} \text{(at least)} \\ \text{(rather)} \end{array} \right\}$ they appear

to be enjoying themselves.

In such cases the second conjoin is, or purports to be, added as an afterthought. Such constructions are discussed under the heading of INTERPOLATED COORDINATION in 13.95ff.

- 13.30 In addition to introducing alternatives as indicated above, *or* may imply a NEGATIVE CONDITION. Thus in:

Give me some money *or (else)* I'll shoot.

the implication can be paraphrased by the negative conditional clause:

Give me some money. *If you don't give me some money* I'll shoot.

The conditional use of *or* is thus the negative analogue of the conditional use of *and* (cf 13.25). Unlike *and*, however, *or* typically follows a negative imperative clause:

Don't be too long, *or* you'll miss the bus.

In this case, the most appropriate paraphrase with an *if*-clause is positive instead of negative:

... if you are too long, you'll miss the bus.

Another difference between conditional *and* and conditional *or* is that the latter can readily occur after declarative, as well as imperative clauses:

They (must have) liked the apartment, *or* they wouldn't have stayed so long.

[1]

Here *or* may be viewed as the negative counterpart of *because* used as an inferential disjunct (cf 15.21):

They (must have) liked the apartment, *because* they stayed there the whole summer. [1a]

The implication of *or* in [1] can be emphasized by adding the conjunct *else* (cf 8.137, 8.144, 8.146): ... *or else they wouldn't have stayed so long*. *Or* can also be replaced by the conjunct *otherwise*: ... *otherwise they wouldn't have stayed so long*.

The negative conditional *or* and the conditional *and* described in 13.25 are contrastingly related in meaning, as can be seen from the virtual synonymy of:

Make a move, *and* I'll shoot!
Don't make a move, *or* I'll shoot!

Note As with conditional *and*, the first conjoin with conditional *or* may be a verbless clause: *Your money or I shoot*. There is even the possibility that both conjoins are verbless: *Your money or your life* [= 'Give me your money, or I'll take your life'] (cf 11.53 Note).

And in relation to or

- 13.31 Because *and* and *or* contrast with one another in meaning, *or* following a negative is in some respects equivalent to *and*. Thus:

He doesn't have long hair *or* wear jeans. [1]

is logically equivalent to the combination of two negative statements '*He doesn't have long hair AND He doesn't wear jeans*'. Conversely:

He doesn't (*both*) have long hair *and* wear jeans. [2]

is logically equivalent to the inclusive disjunction of two negative statements: '*EITHER He doesn't have long hair OR He doesn't wear jeans (or both)*'. The reversal of meaning arises because in [1] and [2], the coordinator is within the scope of negation (cf 10.64).

Hence *or* tends to replace *and* in contexts which we have called NONASSERTIVE (cf 2.53), and more generally in subordinate positions in the sentence:

Soldiers who mutinied *or* deserted were punished by death.
[= 'Soldiers who mutinied were punished by death, *and* soldiers who deserted were punished by death.']

If we complain *or* demand compensation, nothing happens.

[= 'If we complain nothing happens, *and* if we demand compensation nothing happens.']

He is good at painting with watercolours *or* with oil paints.

The same replacement takes place following *can*, *may*, and other expressions of permission or possibility:

You can go swimming *or* simply sit on the beach.

Permission has been granted for the play to be performed in public *or* private theatres.

In this last sentence, *and* could be substituted for *or* without effective change of meaning.

The use of but

- 13.32 *But* expresses a contrast which could usually be alternatively expressed by *and* followed by *yet*. The contrast may be in the unexpectedness of what is said in the second conjoin in view of the content of the first conjoin:

John is poor, *but* he is happy. ['... *and yet* he is happy']

This sentence implies that his happiness is unexpected in view of his poverty. The unexpectedness depends on our presuppositions and our experience of the world. It would be reasonable to say:

John is rich, *but* he is happy.

if we considered wealth a source of misery.

The contrast expressed by *but* may also be a repudiation in positive terms of what has been said or implied by negation in the first conjoin (cf 13.42):

Jane did *not* waste her time before the exam, *but* studied hard every evening. [1]

In such cases the force of *but* can be emphasized by the conjunct *rather* or *on the contrary* (cf 8.137):

I am *not* objecting to his morals, *but rather* to his manners. [2]

With this meaning, *but* normally does not link two clauses, but two smaller constituents; for example, the conjoins are two predicates in [1] and two prepositional phrases in [2]. The conjoins cannot be regarded as formed simply by ellipsis from two full clauses, since the *not* in the first clause conjoin is repudiated in the second. Thus the expansion of [2] into two full clauses must be as follows:

I am *not* objecting to his morals, *but (rather)* I am objecting to his manners.

Correlatives

- 13.33 To reinforce or clarify the conjoining function of *and*, it is frequently possible to place the word *both* in front of the first conjoin:

He has met (*both*) her mother *and* her father.

Similarly, *either* can be placed in front of the first conjoin to reinforce *or*, and there is a further correlative pair *neither* ... *nor*:

He has met (*either*) her mother *or* her father.
He has met *neither* her mother *nor* her father.

This last construction is equivalent to:

He hasn't met *either* her mother *or* her father.

where *either* and *or* are within the scope of negation (cf 13.31).

These pairs *both ... and*, *either ... or*, and *neither ... nor* are termed CORRELATIVES, composed of an endorsing item (cf 13.5) and a coordinator. We may add to them two correlatives with *but*: *not ... but* and *not only ... but* (cf 13.42). Attention will first be given to *either ... or* as the most straightforward correlative pair.

- Note [a] On correlative subordinators such as *if ... then*, *whether ... or*, cf 14.13.
[b] On the 'misplacing' of the endorsing item, cf 13.40.

Either ... or

- 13.34 *Either ... or* emphasizes the EXCLUSIVE meaning of *or* (cf 13.28):

Either the room is too small *or* the piano is too large.

The conjoins may be complete clauses, as above, or else smaller constituents which are often related by ellipsis to complete clauses:

You may *either* [stand up] *or* [sit down].

Either [Sylvia] *or* [her sister] will be staying with us.

These sentences illustrate coordinated predications and coordinated subjects respectively.

Both ... and

- 13.35 *Both ... and* emphasizes the ADDITIVE meaning of *and* (cf 13.27). It separates the conjoins and puts them on the same footing, thereby dissociating the conjoins from the *consequential* or *sequent* relation (cf 13.23) that might otherwise be implied. Contrast:

David loves Joan *and* (therefore) wants to marry her.

David *both* loves Joan *and* wants to marry her.

Both ... and also singles out the segregatory meaning of *and* (cf 13.59–63) rather than the combinatory use. Note the difference between:

David and Joan got divorced. [*ie* 'from each other']

Both David and Joan got divorced. ['so now they can get married']

At first sight, *both ... and* appears to stand in the same relationship to *and* as *either ... or* does to *or*. But in fact, *both ... and* is not admissible where the conjoins are full finite clauses. There must be some kind of ellipsis. Hence, while we can have:

Mary washed the dishes *and* Peter dried them.

we cannot have:

**Both* Mary washed the dishes *and* Peter dried them.

On the other hand, *both* can be inserted if the conjoins are predicates or predications:

Mary *both* washed the dishes *and* dried them.

This new machine will *both* accelerate the copying process *and* improve the quality of reproduction.

or if the conjoins are phrases:

Both Mary *and* Peter washed the dishes.

The regulations are *both* very precise *and* very detailed.

- Note *Both ... and* can be awkward when they coordinate subordinate (finite or nonfinite) clauses, especially when those clauses have an overt subject:

We want someone *both* who is able *and* whom we can trust.

They have asked *both* for the floor to be repolished *and* for the lighting to be improved.

The second of these sentences is less objectionable than the first.

Nor, neither

- 13.36 *Nor* and *neither* can be used as negative additive adverbs (cf 8.116) without being a correlative pair. They generally presuppose that a previous clause is negative either explicitly, as in [1], or implicitly, as in [2] and [3]:

He did *not* receive any assistance from the authorities *nor* did he believe their assurance that action would soon be taken.

<rather formal>

[1]

Many people are *only* dimly aware of the ways in which the environment can be protected. *Nor* have governments made sufficient efforts to educate them. <formal>

[2]

All the students were obviously very *miserable*. *Nor* were the teachers satisfied with the conditions at the school. <formal>

[3]

Notice that *nor* in these examples is not the equivalent of *or* plus *not*, as might be thought from its morphological composition. Rather, it is nearer to being the equivalent of *and* plus *not* (cf 13.31). Thus:

They *never* forgave him for the insult, *nor* could he rid himself of feelings of guilt for having spoken that way. <formal>

[4]

has much the same meaning as the more informal:

They *never* forgave him for the insult, *and* he could *not* rid himself of feelings of guilt for having spoken that way *either*.

[4a]

In all the sentences [1–4], *neither* can replace *nor* without change of meaning. For many speakers (cf 13.18 Note [b]) both *neither* and *nor* can be linked to preceding sentences by *and* or *but*:

They never forgave him for the insult, $\left\{ \begin{array}{l} \text{(and)} \\ \text{(but)} \end{array} \right\} \left\{ \begin{array}{l} \text{neither} \\ \text{nor} \end{array} \right\}$ could he rid

himself of the feelings of guilt for having spoken in that way. [4b]

This possibility excludes them from the class of central coordinators (cf 13.10, 13.19). Moreover, as the above examples show, *neither* and *nor* require subject-operator inversion when they introduce a clause, a feature which they share with negative adjuncts such as *never* and *nowhere* when they occur initially (cf 18.24).

On the other hand, by the criteria of meaning (*and* + *not*), of immobility, and susceptibility to asyndetic use (cf 13.11), *neither* and *nor* show themselves to be among that class of linking adverbs which most resemble coordinators.

Note In a formal and elevated style *nor* can be used where there is no negative implication at all in the first clause:

This unique product carries a brand name that represents an entire country; *nor* is this an accident. [= 'and this is no accident']

The correlatives *neither* . . . *nor*

- 13.37 When *neither* . . . *nor* constitutes a correlative pair, on the other hand, *nor* functions as a central coordinator, like *and* and *or*, and *neither* as an endorsing item, like *both* and *either*. For example, the coordinated predicates of:

David loves Joan and wants to marry her.

can be negated either by adding the negator *not* in each predicate:

David doesn't love Joan, and (so) doesn't want to marry her. [1]

or by substituting the correlatives *neither* . . . *nor*:

David *neither* loves Joan, *nor* wants to marry her. [2]

Whereas [1], however, tends to connote a consequential relation between the clauses, the correlatives in [2] emphasize that the negation applies to both conjoins. Correlative *neither* is mobile, its position reflecting the scope of negation (cf 10.63):

Sam *neither* [has long hair], *nor* [wears jeans].

Mary was *neither* [happy] *nor* [sad].

Neither [Peter] *nor* [his wife] wanted the responsibility.

The same restriction applies to *neither* . . . *nor* as to *both* . . . *and* (cf 13.35); these correlatives cannot be used to negate whole clauses, as in:

**Neither* Peter wanted the responsibility, *nor* his wife did.

Note The correlative *neither* . . . *nor*, being the negative counterpart of *both* . . . *and*, conveys a correspondingly additive meaning. Thus the use of *and* for other than additive purpose (eg to express a contrast or a condition; cf 13.24–5) has no parallel in *neither* . . . *nor*.

A 'mixed' construction with *neither* . . . *nor*

- 13.38 In 13.36–7 we have discussed *neither* and *nor* first as additive adverbs and second as correlative coordinators. These two grammatical roles are in principle quite distinct, but in practice are often superficially similar. It is not surprising that there exists a 'mixed' construction, in which *neither* and *nor* behave like additive adverbs, but are at the same time correlative, and have the 'segregatory' meaning associated with *both* . . . *and* (cf 13.59ff):

Sam *neither* has long hair, *nor* does he wear jeans.

Mary was *neither* happy, *nor* was she sad.

?Peter *neither* wanted the responsibility, *nor* did his wife.

They have *neither* replied to my letters, *nor* have they answered my telephone calls.

Here, *neither* appears in a medial adverbial position in the first clause, and *nor* appears in initial position in the second clause, followed by subject-operator inversion. The meaning of this construction is the same as that of the corresponding construction with correlative coordination (cf 13.37). But the units which follow them in each clause are not equivalent, as one would expect them to be if this were a construction of coordination. This is clear when square brackets are inserted in the examples above, enclosing putative conjoins:

Sam *neither* [has long hair], *nor* [does he wear jeans].

Careful users of the language may indeed prefer to recast such a sentence in accordance with the principles outlined in 13.40:

Sam *neither* [has long hair], *nor* [wears jeans].

Restrictions on correlatives

- 13.39 According to a didactic tradition, the use of correlative coordinators is unacceptable when there are three or more conjoins:

?We are *both* willing, able, *and* ready to carry out the survey. [1]

?*Either* the Minister, *or* the Under-secretary, *or* the Permanent Secretary will attend the meeting. [2]

?Tompkins has *neither* the personality, the energy, *nor* the experience to win this election. [3]

(This restriction is felt especially strongly in the case of *both*.) *Both*, *either*, and *neither* (like *whether*; cf 15.6) are all historically associated with dual constructions, and these words have dual meaning when they occur as determiners in noun phrases (cf 6.50, 6.61, 6.62). The parallel between examples such as the following suggests that the initial word in [4] is in fact a determiner just as it is in [5]:

Both { her mother *and* her father } are alive. [4]
her parents [5]

But *both* cannot be classed as a determiner in sentences where the conjoins are not noun phrases:

He is a well-known writer *both* in Britain *and* on the Continent.

It is perhaps understandable, then, that the use of correlatives with more than two conjoins is judged if anything a more obvious stylistic 'fault' in [6], where the conjoins are noun phrases, than in [1], where they are not:

?**Both* her mother, her father, *and* her brother are still alive. [6]

Although commonly stigmatized, multiple correlatives such as [1–3] can add clarity to constructions whose complexity might otherwise cause confusion. For this reason, such constructions are sometimes used even in careful written English, eg in the rubric of an examination paper:

Candidates are required to answer *EITHER* Question 1 *OR* Question 2 *OR* Questions 3 and 4.

- 13.40 Grammatical tradition also holds that correlative coordinators should introduce constituents of equivalent function and status. (This reflects a general constraint that the conjoins of a coordinate construction must be equivalent; cf 13.88.) Hence in written English [1a] is preferred to [1b], and [2a] to [2b]:

- { ?Evelyn is *either* [stupid], *or* [pretends that she is]. [1a]
 { *Either* [Evelyn is stupid], *or* [she pretends that she is]. [1b]
- { ?I admire *both* [the drawings of Rembrandt] *and* [of Rubens]. [2a]
 { I admire *both* [the drawings of Rembrandt] *and* [those of Rubens]. [2b]

The bracketed portions of the above sentences are the conjoins which are marked off by the correlatives. The conjoins are comparable units in [1b] (where they are whole clauses) and [2b] (where they are noun phrases), but not in [1a] and [2a].

With *both* ... *and* and *either* ... *or*, the constraint that the conjoins delimited by the correlatives should be constituents of the same kind of status is frequently violated in speech, but is generally observed in careful written English. With *neither* ... *nor*, as we saw in 13.37f, the constraint is more frequently ignored, because there is a tendency to treat *nor* as an adverb (with subject-operator inversion; cf 18.24) rather than as a coordinator.

- 13.41 A further restriction on correlatives is that the first correlative word *both*, *either*, etc can occur only at a point which is the beginning of a phrase. Hence in the following examples, the [a] sentence is acceptable, whereas the [b] sentence is not:

- { The building is *both* [very old] *and* [very decrepit]. [1a]
 { *The building is very *both* [old] *and* [decrepit]. [1b]
- { The car's disappointing performance is due to *either* [faulty steering] *or* [faulty suspension]. [2a]
 { *The car's disappointing performance is due to faulty *either* [steering] *or* [suspension]. [2b]

(Again the conjoins are marked by square brackets.) The unacceptable feature of [1b] and [2b] is the placement of the initial coordinator between the modifier and the head, rather than at the beginning of the phrase. To avoid this, we can place (as in [1a] and [2a]) the coordinator in front of the modifier, and repeat the modifier in the second conjoin. This restriction means that the ambiguity of *old men and women* (cf 13.67) cannot occur with a correlative such as *both* ... *and*.

Not (only) ... but

- 13.42 The negator *not/n't* or the combination *not/n't only* may be correlative with a following *but*:

He didn't come to help, *but* to hinder us.
 They *not only* broke into his office and stole his books, *but* (they) (*also*) tore up his manuscripts.

The repudiatory meaning of *not/n't ... but* has already been noted (cf 13.32). The meaning of *not only ... but* is essentially additive, like that of *both ... and*: it distinguishes rather than equates the conjoins, forcing us to look at the first conjoin as 'given' ground. But with *not only ... but* the emphasis is greater, suggesting that the content of the first clause is surprising, and that that of the second clause, often reinforced by an adverb such as *also* or *even*, is still more surprising. What particularly makes these combinations resemble correlatives is the option of moving the negative particle out of its normal position following the operator, so as to mark the parallelism between the two conjoins:

- Not* [Henry], *but* [his wife] is the owner. [1]
 He came *not* [to help], *but* [to hinder us]. [2]
Not only [did they break into his office and steal his books], *but* [they also tore up his manuscripts]. [3]

The more dramatic effect achieved by positioning *not only* initially, with subject-operator inversion (cf 18.24), is illustrated by [3], where the two conjoins are entire clauses.

Note [a] The *not ... but ...* construction frequently occurs in a cleft sentence (cf 18.26ff): *It isn't the players, but the supporters, that are responsible for football hooliganism.*

[b] The correlatives (*just*) *as ... so*, which have an emphatic effect similar to that of *not only ... but (also)*, are correlative subordinators rather than correlative coordinators (cf 14.13):

Just as they must put aside their prejudices, *so* we must be prepared to accept their good faith.

Cf also the correlatives *rather ... than* and *not so much ... as* (13.103, 15.52).

[c] Once *not* is moved out of its post-operator position, as in [1-3] above, it cannot of course occur in its enclitic form.

[d] There is a type of repudiatory coordination *and not ... in* which the relation between the clauses is the reverse of that of *not ... but* described above: *He came to help, and not to hinder us*. In this type, where the negative occurs in the second conjoin, a repudiatory force can also be expressed *asyndetically*, by omitting the coordinator: *He came to help, not to hinder us*.

Coordination of clause constituents

- 13.43 Although we regarded the clause as the most appropriate unit to start with in considering the use of coordinators (cf 13.20), the exemplification of correlatives in 13.33-42 has shown that the conjoins of a coordinate construction in many instances are, and in some instances have to be, smaller than a clause. In the following sections we deal in detail with single clauses or clause constituents which may be coordinated by means of *and*, *or*, or *but*. We will call this usual kind of coordination SIMPLE COORDINATION, and will distinguish it from less straightforward and less common types of coordination, *viz* COMPLEX COORDINATION or coordination of groups of constituents (cf 13.90-93), and APPENDED COORDINATION (cf 13.94). For the purpose of simple

coordination, a conjoin may be any constituent such as a predicate, a predication, a phrase, or a word. The important point, however, is that the conjoins of each construction are parallel to one another in meaning, function, and also (generally) in form (cf 2.12).

Ellipsis and simple coordination

- 13.44 There are two different ways of examining simple coordination of clause constituents. On the one hand, we may examine a construction as an elliptical version of clause coordination, noting what elements are ellipted; and on the other hand, we may examine the construction in terms of the conjoins themselves – viz the elements which are left intact. These two different approaches are reflected in different principles of analysis. For example, the coordinate construction in:

They have already [finished their work] and Δ [gone home]. [1]

can be viewed as a clause coordination in which a subject, operator, and adverbial have been ellipted; or it can be viewed as a single clause containing two coordinate predications. For simple coordination (though less so for other kinds of coordination) there are advantages in adopting the latter method as the major one (cf especially 13.47, 13.60). Thus in [1] we shall be interested in the fact that the conjoins (marked here, and in subsequent examples, by square brackets) are predications, and less interested in what elements have been omitted at the point marked by the symbol Δ .

Note We regard ellipsis as a relation of systematic correspondence (cf 2.20) between sentences. We therefore do not consider the explanations of [1] in terms of ellipsis and in terms of coordination of clause constituents as in competition with one another. Rather, they are complementary accounts: one focusing on sentence structure, and the other on intersentential relations (cf 2.20, 2.46).

Limits of ellipsis

- 13.45 Not all cases of coordination can be explained in terms of ellipsis. Although [1] in 13.44 could be expanded into:

They have already finished their work and they have already gone home. [1a]

a similar expansion could not be attempted for such cases as:

- Many young wives [go to work] and [put their children in a playgroup]. [2]
I have never grown [apples] or [pears]. [3]
The national flag of Japan is [red] and [white]. [4]
[My sister] and [her husband] live in Texas. [5]
[Your house] and [mine] are similar (to each other). [6]

In the first place, [2] cannot be seen as an elliptical version of:

Many young wives go to work, and many young wives put their children in a playgroup. [7]

since [2] has a different meaning from [7]. The same applies if we try to expand [3] to:

I have never grown apples or I have never grown pears. [8]

The lack of synonymy, in these two examples, can be explained in terms of scope (cf 2.55ff): the scope of the quantifier *many* includes *and* in [2] but not in [7]; similarly, the scope of the negative word *never* includes *or* in [3] but not in [8].

It is for a semantic reason, too, that [4] cannot be regarded as a reduction of the self-contradictory sentence:

*The national flag of Japan is red, and the national flag of Japan is white. [9]

On the other hand, it is grammatical concord that prevents the expansion of [5] into:

*My sister live in Texas and her husband live in Texas. [10]

- 13.46 The last example in 13.45 is a reminder that two or more singular noun phrases, when coordinated by *and*, become plural, and therefore require concord with a plural verb (cf 10.37). With [6] in 13.45 above, the difficulty of the explanation of coordination by ellipsis is compounded: not only does grammatical concord fail in the unelliptical version [6a], but also the reciprocal pronoun *each other* cannot make sense in the absence of a plural noun phrase:

*Your house are similar (to each other), and mine are similar (to each other). [6a]

This nonsensical sentence also illustrates the more general point that, in addition to *each other*, there is a whole range of expressions (*be similar*, *be different*, *be the same*, *be in love*, *play chess*, *get married*, etc) which, when predicated of a noun phrase coordinated by *and*, can be interpreted in a reciprocal or symmetric manner (cf 13.60):

Margot and Dennis are in love. [11]

Thus in one obvious interpretation, [11] expresses a mutual relation ('... in love with each other') which is not suggested by the sentence:

Margot is in love and Dennis is in love. [12]

We return to such differences under the heading of combinatory and segregatory coordination (cf 13.59–63), but for the present we simply note the problems of concord, meaning, and scope that arise when a general attempt is made to interpret constituent coordination in terms of ellipsis.

Semantic implications of constituent coordination

- 13.47 These observations, and others, may be looked at from the opposite point of view – as evidence in favour of regarding simple coordination as what it appears to be on the surface – viz as a formation of a compound unit which is functionally analogous to each of its conjoined members. To understand the verb phrase coordination of *Peter washed and dried the dishes*, for example, we do not have to postulate a rather complex ellipsis of the object in the first clause and the subject in the second:

Peter washed (the dishes) *and* (Peter) dried the dishes.

but instead can treat *washed and dried* in [1] below as a verb element functionally comparable to *washed* in [2] and *dried* in [3]:

Subject	Verb	Object	
Peter	<i>washed and dried</i>	the dishes	[1]
Peter	<i>washed</i>	the dishes	[2]
Peter	<i>dried</i>	the dishes	[3]

This analysis is strengthened by the fact that in [1] *washed and dried* is typically interpreted as a single combined activity (*What are you doing to the dishes? I'm washing and drying them*), rather than as two separate activities.

A further example, this time of verb-words coordinated to form a single verb phrase of complex construction, shows the same principle at work at a lower level in the hierarchy of grammatical units:

Adam is *checking and revising* his manuscript. [4]

There is, in other words, a close correspondence between the structural aspect of coordination and the semantic aspect which accompanies it. This matching of meaning to form applies more strikingly in cases where the difference of meaning between clause coordination and constituent coordination is more obvious, as in questions with coordinated predications:

Did Peter [tell lies] *and* [hurt his friends]?

This is a single question about two events in combination; but:

[Did Peter tell lies], *and* [did he hurt his friends]?

is interpreted as two separate questions. Similarly:

Did John [break the window] *but* [refuse to pay for it]?

is a single question about John's past behaviour, which may be answered *yes* or *no*. But in this case a corresponding example of clause coordination would be impossible, because there is no intelligible way in which *but* can serve as a link between two questions:

*Did John break the window, *but* did he refuse to pay for it?

This difference may be explained in terms of the scope of interrogation (cf 2.55).

Note In similar questions containing *or*, there is an ambiguity, signalled by intonation, between interpretation as an ordinary *yes-no* question and as an alternative question (cf 11.20-21):

Did you [play football] *or* [go for a walk]?

Did you [play football] *or* [go for a walk]?

Only in the latter case can the sentence be expanded into a coordination of two complete clauses: [Did you play football] *or* [did you go for a walk]?

13.48 There is a similar implication of combined process when the two conjoined predications are within the scope of negation (cf 13.45). For example:

John *didn't* [break the window] *but* [refuse to pay for it]. [1]

This is a denial of the statement:

John [broke the window] *but* [refused to pay for it]. [2]

As a negation of a combined process, [1] could evoke the retort *Yes, he did*. On the other hand, two separate processes are expressed by the clause and predicate coordinations of [3] and [4], and the scope of negation in the first conjoin does not extend to the second conjoin:

John *didn't* break the window, *but* he offered to pay for it. [3]

John *didn't* break the window, *but* he refused to pay for it. [4]

[= 'The claim is *not* that John broke the window, *but* that he refused to pay for its repair.']

Clearly [4] cannot be regarded as a semantically-equivalent unreduced version of [1].

There is a similar effect of negation in the slogan *Don't drink and drive*, the force of which is not to forbid either activity, but only to forbid both in combination. This directive therefore has a different meaning from the more severe prohibition: *Don't drink and don't drive*.

13.49 There is no doubt that ellipsis is important to the understanding of coordination, particularly with respect to meaning and style. But in the first instance, there is more to be gained from a purely structural view of coordination. This means that we regard coordination as a type of linkage whereby the resulting CONJOINT construction is equivalent, structurally speaking, to each of its members. For example, a noun phrase may act as subject of a clause; and likewise, a coordinated construction (or CONJOINT NOUN PHRASE) whose conjoins are noun phrases may also act as subject. Equally, if an adjective may act as head of an adjective phrase, then a coordinated construction whose conjoins are adjectives may also act as head of an adjective phrase. In more formulaic terms:

If [A], [B], ... are conjoins of the conjoint construction X, then any structural function which may be taken individually by [A] or [B] or ... may also be taken by X.

This generalization applies to all cases of simple coordination, and after slight extension will also apply to other cases of coordination.

Note [a] The generalization above should not be understood to deny that the privilege of occurrence of X may be different from those of [A], [B], ... with regard to concord; eg [A] may be singular, and X may be plural, as in [*John and Mary*] *are* friends (cf 13.46).

[b] Apart from coordination, there are other types of construction for which the whole construction has the same privilege of occurrence as its members; eg some types of apposition (cf 17.65f):

We have been invited to meet *the Principal, Mrs Joyce*.

Types of simple coordination

Coordination of clauses

- 13.50 We have already illustrated the coordination of complete independent clauses:

[The winter had come at last], *and* [snow lay thick on the ground].
 [Who are you], *and* [where do you live]?
 [Have a look at the engine], *but* [don't take it to pieces].

Dependent clauses may also be coordinated, so long as they belong to the same function class:

- If you pass the examination and (if) no one else applies*, you are bound to get the job.
 [COORDINATE ADVERBIAL CLAUSES] [1]
- The Minister believes *that the economy is improving*, and *(that) unemployment will soon decrease*.
 [COORDINATE NOMINAL THAT-CLAUSES] [2]
- I didn't know *who she was*, or *what she wanted*.
 [COORDINATE NOMINAL WH-CLAUSES] [3]
- Someone *who knows the area*, but *whose home is outside it*, is more likely to be a successful representative.
 [COORDINATE RELATIVE CLAUSES] [4]

In [1–2], the repetition of the introductory subordinator could be avoided by ellipsis of the second subordinator. However, against the principle of 'reduce where possible' must be set the opposite tendency to avoid ellipsis where it leads to ambiguity. It is more likely that the second *if* would be omitted in [1] than the second *that* in [2], because in [2] the sentence would be ambiguous, the second conjoin . . . *and unemployment will soon decrease* being interpretable as a main clause.

Nonfinite dependent clauses (cf 14.6–8) may also be coordinated:

- I've asked him *to come this evening*, or *(to) phone us tomorrow*.
 [COORDINATE TO-INFINITIVE CLAUSES] [5]
- Samantha is fond of *working at night* and *getting up late in the morning*.
 [COORDINATE -ING PARTICIPLE CLAUSES] [6]
- All the villagers helped to rebuild the houses *damaged by the storm* or *washed away by the floods*.
 [COORDINATE -ED PARTICIPLE CLAUSES] [7]

Again, if the initial subordinating word (such as the *to* in [5]) is common to both clauses, it may be omitted in the second and subsequent occurrences. A final category to be illustrated is that of coordinate verbless clauses (cf 14.9, 15.60):

With George ill and *(with) the children at home*, Jenny is finding life very difficult.

- 13.51 As noted earlier (cf 13.47, 13.49), the members of coordinate constructions tend to be parallel both in their structure and in their meaning. It is therefore quite usual for coordinate subordinate clauses to belong to the same semantic as well as functional category, or to share the same subordinator (as in [1–2]). Conversely, it is unusual for adverbial clauses to be coordinated if they belong to different categories, such as those of time and place (cf 8.2ff). The following are therefore unusual:

In order that you may submit a claim without delay and because you did not receive the form we sent earlier, I suggest that you write again giving the fullest details.

The book will be dispatched *as soon as the payment is received* and *unless the order is cancelled*.

When the pale sun rose briefly over the horizon, and *wherever they looked*, the desert of ice seemed to stretch out to infinity.

A preferred construction in the last case would be one in which the two clauses functioned as adverbials of the same clause, but in different positions, and without being coordinated:

When the pale sun rose briefly over the horizon, the desert of ice seemed to stretch out to infinity *wherever they looked*.

On the other hand *wh*-clauses introduced by different *wh*-words, such as those of 13.50 [3], can be coordinated with relative ease.

It is scarcely acceptable for different types of nonfinite clause to be coordinated, or for finite dependent clauses to be coordinated with nonfinite clauses, even where there is a strong semantic affinity between the two clauses. Occasional examples such as the following occur:

The empress, *nearing her death* and *surrounded by doctors and necromancers*, was no longer in control of her ministers.

The curfew bell rang at sunset every evening, *to warn the citizens that it was time for bed*, and *so that secret defensive measures could be taken by the army*.

But it seems impossible, for example, to coordinate a nominal infinitive with an *-ing* clause:

*George likes *going to the races* and *to bet on the horses*.

Nor is it normal to coordinate a postmodifying relative clause with a post-modifying nonfinite clause:

?Charles was longing to talk to the girl *sitting in the corner* and *who had smiled at him*.

Instead of such hybrid coordinations, means have to be found to preserve equivalence of both the form and function of the conjoins:

Charles was longing to talk to the girl *who was sitting in the corner* and *who had smiled at him*.

or else we have to juxtapose the modifiers without coordination, thus including the first modifier in the scope of the second:

Charles was longing to talk to the girl *sitting in the corner who had smiled at him*. (= [[the girl sitting in the corner] who had smiled at him])

Note [a] When clauses are conjoined, the noninitial conjoins often contain general ellipsis of the kinds dealt with in 12.59–65:

[Bob seemed angry], *and* [Eva certainly was Δ].

[Mary's parents did their best to protect her], *but* [[she wished that they wouldn't Δ], *and* [finally she asked them not to Δ]].

This does not affect the status of the conjoins as clauses (cf also appended coordination, 13.94).

[b] On the coordination of subordinators (*if and when, when and where*, etc) cf 13.83.

Coordination of predicates

13.52 In coordination of predicates (cf 2.47), which is very common, the conjoined predicates may be described as sharing the same subject:

Peter *ate the fruit and drank the beer*. [1]

I *send you my very best wishes, and look forward to our next meeting*. [2]

Margaret *is ill, but will soon recover*. [3]

The predicates may, of course, have varied structures in terms of clause elements. For example, [1] and [2] have structures which can be represented as follows:

[1]: S [V O] and [V O] [2]: S [V O_i O_d] and [V A A]

Such sentences may be seen as elliptical alternatives to coordinated clauses, for example:

Peter ate the fruit, and Peter/he drank the beer. [1a]

But, on the whole, repetition of the subject is avoided where possible. In other cases (cf 13.45f), no elliptical explanation of the sentence is possible:

Two young men *ate the fruit and (also) drank the beer*. [4]

[\neq Two young men ate the fruit, and two young men drank the beer]

This is because for coordination of two predicates to take place, the subject of the one predicate must be coreferential with the subject of the other. Thus [4] is synonymous with the sentence which differs from it only in that a coreferential *they* is inserted before the second verb:

Two young men ate the fruit and *they* (also) drank the beer. [4a]

Note [a] It is common to insert a comma (or other punctuation) before the coordinator in conjoined clauses, but it is much less common to insert a comma before the coordinator in conjoined predicates. Hence [1] above is written with no comma, whereas in [1a] the comma is inserted. (The commas inserted in [2] and [3] are optional; cf App III.7.) This characteristic difference is one sign of the greater cohesiveness of the coordinated predicate: something which accords with the view that the major constituent boundary in such cases is between the subject and a conjoint predicate, rather than between the end of one clause and the beginning of another. Putting it more simply, we may say that in [1a] there are two clauses, while in [1] there is one clause with a conjoint predicate; this is shown in Fig 13.52 opposite. This constituent-structure account of predicate coordination does not, of course, prevent the postulation of ellipsis where criteria (cf 12.32–38) of ellipsis apply; cf 13.44 Note.

[b] The distinction between coordinate predicates and other coordinate constructions is sometimes neutralized. In the coordination of imperative clauses, eg: *Sit down and listen to this*,

Fig 13.52

where there is no overt subject, this construction could be equally described as a coordination either of clauses or of predicates. (Contrast the imperative with a subject: *You sit down and listen (to this)* is likely to be one clause with coordinate predicates, whereas *Sit down and just you listen (to this)* has to be two coordinate clauses.) In *Mary skipped and jumped*, on the other hand, there is a different type of neutralization: this example could be analysed as containing two conjoined predicates, *skipped* and *jumped*, or alternatively as containing a single predicate (*skipped and jumped*) within which two verb phrases are conjoined. Yet a third possibility is that *skipped and jumped* is a single verb phrase, within which the main verbs are conjoined. Similar alternative analyses arise with coordination in relation to the scope of adverbials (cf 13.54–5).

Coordination of predications

13.53 Coordination of predications (cf 2.48), as of predicates, is very common, and often involves ellipsis. Consider the following examples:

Most people will have *read the book or seen the film*. [1]

They should have *washed the dishes, dried them, and put them in the cupboard*. [2]

You must *take the course and pass the examination*. [3]

They were *married in 1960, but divorced in 1970*. [4]

Are you *working or on holiday*? [5]

Why couldn't she *have finished work late and still be travelling home*? [6]

In all cases it is possible to regard the auxiliary or auxiliaries preceding the predication as ellipted. Thus [1], although we cannot regard it as equivalent to two coordinated clauses, can be regarded as an ellipted version of predicate coordination:

Most people will have read the book or ((will) have) seen the film. [1a]

As with predicate coordination itself, however, the most reduced form of the sentence will tend to be preferred; hence the omission of *will have* will be preferred in [1a]. As [2] shows, more than one auxiliary can be ellipted in the second and subsequent conjoins; and as [6] shows, it is also possible (though rare) for the coordinated predications to contain auxiliaries. What is not possible, however, is the omission of a repeated operator combined with the realization of a repeated or coreferential subject:

*You must take the course and *you* Δ pass the examination.

*Are *you* working or Δ *you* on holiday?

This would no longer be a case of simple coordination, since the conjoins would consist of two separate constituents which are not coconstituents of a larger constituent: *viz* subject and predication (cf 13.90f).

Note [a] For the same reason, it is not possible for the second of two repeated auxiliaries to be ellipted without the ellipsis of the first:

*Most people will have read the book or will seen the film.

[b] As with coordinate clauses, so with coordinate predicates and predication, general ellipsis (cf 12.43) often occurs in a second or subsequent conjoin of the construction. In the following, for example, the head of the object noun phrase is ellipted in the second predication:

We wanted fried fish, but were unfortunately given boiled Δ .

And in the following, medial ellipsis (cf 12.62) occurs in the second conjoin:

My brother is using his car this morning, and will be Δ again this afternoon.

Coordination and the scope of adverbials

- 13.54 In the types of coordination we have discussed, adverbials, as more peripheral elements of the clause (cf 2.13), often stand outside the structure of coordination:

Yesterday [the sun was very warm] and [the ice melted]. [1]

Although this example can reasonably be called coordination of clauses, the initial adverbial actually stands outside the two conjoins, and its meaning applies simultaneously to both of them. The structure of this sentence may be represented: A [S V C] + [S V]. Just as in 13.45 and 13.47 we noted that coordination could take place within the scope of interrogation and negation, so here we may say that the two conjoins are within the scope of the adverbial *yesterday*. The role of *yesterday* in [1] is therefore rather different from that which it has in the following:

[*Yesterday* the sun was very warm] and [*during the morning* the ice melted]. [2]

[*Yesterday* the sun was very warm] and [the ice has melted]. [3]

In [2], the appearance of an adverbial of the same semantic class in the second clause limits the scope of the first adverbial. In [3], for reasons of tense and aspect (cf 4.23), *yesterday* cannot apply to the second clause, and so it is restricted to the first conjoin. The formulae for these two examples are:

[2]: [A S V C] + [A S V] [3]: [A S V C] + [S V]

There is good reason for saying that in a clause with an initial adverbial, as in *Yesterday the sun was very warm*, the whole of the clause including and following the subject is in the scope of the adverbial. This is partly on semantic grounds, and partly on grounds of punctuation and prosody: it is notable that if a prosodic or punctuation boundary occurs in such a clause, it will normally be located between the adverbial and the rest of the clause. The remainder of the clause, which thereby becomes a constituent in its own right (rather than a sequence of subject and predicate), may be termed the **KERNEL** of the clause. The type of coordination illustrated by [1] is classified as a coordination of two clause kernels. It is less common for a coordinate construction to come within the scope of a final adverbial; eg the analysis of:

The train arrived and we met our guests on time. [4]

would be [S V] + [S V O A] (where *on time* applies only to the second clause), rather than [S V] + [S V O] A.

Note The second interpretation of [4] could be obtained, however, if the sentence were a case of interpolated coordination (cf 13.95-7), with intonational or punctuational separation of the second conjoin:

The train ARRIVED, and we met our GUESTS, on TIME.

- 13.55 It is more usual, however, for a coordinate construction to be within the scope of adverbials where the conjoins are predicates or predication; eg:

Unfortunately we [missed the train] and [had to wait six hours]. [1]

The guests were [walking], [talking], and [drinking wine] *in the garden*. [2]

In [1], an example of predicate coordination, both the missing of the train and the long wait are regarded as *unfortunate*; and in [2], an example of predication coordination, all three activities are assumed to take place *in the garden*. (There is another possible interpretation of [2], however, whereby only the wine-drinking takes place in the garden.)

In the following more complex example of predicate coordination, the coordination takes place within the scope of three adverbials, one in initial, one in medial, and one in final position:

In those days they often used to [shoot the birds], [bring them home], [cook them] and [eat them] *on a single day*. [3]

Although the scope of the adverbial *on a single day* is ambiguous here, perhaps the more likely interpretation is the one in which it applies to all four actions, as shown by the square brackets. But it is clear that the initial time adverbial has within its scope the whole of the rest of the sentence, and that *often* includes within its scope the whole of the predicate which follows it. Therefore a representation of the more likely interpretation of this sentence, with square brackets marking scope relations as well as the individual conjoins, is as follows:

In those days they [often used to [[shoot the birds,] [bring them home,] [cook them] and [eat them] on a single day]].

For an example of this complexity, it is obvious that no postulated elliptical conjoins could lead to a plausible correspondence with clause coordination:

?In those days they often used to shoot the birds on a single day,
in those days they often used to bring them home on a single day,
in those days they often used to cook them on a single day, *and*
in those days they often used to eat them on a single day.

Coordination of noun phrases and their constituents

Noun phrase coordination

- 13.56 In all positions where a noun phrase occurs (eg as subject, object, complement) there is also the possibility of a conjunction of two or more noun phrases, making up a **CONJOINT** noun phrase (cf 2.10, 13.49):

[Some of the staff], *and* [all of the students,] have voted for these changes. [SUBJECT]

On this farm, they keep [cows,] [sheep,] [pigs,] *and* [a few chickens.] [OBJECT]

Lucy Godwin is [a well-known broadcaster] *and* [winner of the Novelist of the Year Award for 1978]. [SUBJECT COMPLEMENT]

The plan was opposed by [Frederick,] [Mary,] and [me]. [PREPOSITIONAL COMPLEMENT]

Jane plays three instruments: [the piano,] [the viola,] and [the French horn]. [NOUN PHRASES IN APPPOSITION]

These examples show how the conjoined noun phrases may be simple or complex, and may have a noun or a pronoun as their head. In fact, the structural possibilities of the conjoins are the same as for individual noun phrases (*cf* 2.25). One of the implications of this is that noun phrases in coordination may contain general ellipsis of the kinds discussed in 12.54–58. The first conjoin will often contain the antecedent for ellipsis in subsequent conjoins:

Which do you prefer: [the red dress,] [the green Δ ,] or [the white Δ]?
It's [the longest single-span bridge in this country,] and [the second longest Δ in the world].
That must be either [John's writing] or [Bridget's Δ].
There's little to choose between [that method] and [the other Δ].

- Note [a] When one of the conjoins is a personal pronoun, it is considered polite to follow the order of placing 2nd person pronouns first, and (more importantly) 1st person pronouns last: *Jill and I* (not *I and Jill*); *you and Jill*, (not *Jill and you*), *you, Jill, or me* (not *me, you, or Jill*), etc.
[b] A complication arises if any of the coordinated noun phrases exemplified above is accompanied by one or more adverbials; eg:

Jane plays three instruments: the piano, the viola, and $\left\{ \begin{array}{l} \text{occasionally,} \\ \text{now and then,} \\ \text{last but not least,} \end{array} \right\}$ the French horn.

We can then no longer, strictly speaking, talk of noun phrase coordination; rather, this falls into a category of *complex coordination* to be discussed in 13.90ff.

But as a noun phrase coordinator

- 13.57 The use of *but* as a coordinator between noun phrases is restricted. *But* is seldom used in subject position, except where it has a repudiatory force following *not*, or an additive force following *not only*:

Not only [the students,] *but* [some of the staff] have voted for these changes.
We were disappointed to learn that *not* [a thousand,] *nor* [a hundred,] *but* [a mere twenty-three] had turned up for the inaugural meeting.

Even with these constructions, however, a nonsubject position is much more usual:

They applauded *not* the players *but* the referee.

Coordination of noun phrases by *but* in a nonsubject position is also liable to occur when *but* is followed by the adverb *only*, or by the clause substitute *not* (*cf* 12.28):

On this farm, they keep [[cows] and [sheep,]] *but* [only a few chickens]. [1]
[The plan was opposed by Frederick,] *but* [not Maria]. [2]

Strictly, this last example is again a case of clause coordination, not noun

phrase coordination. Elsewhere, *but* is frequently inappropriate as a phrase coordinator:

*On this farm, they keep cows *but* sheep, *and* only a few chickens.

When the conjoint noun phrase follows a preposition, as in [2], it is often stylistically preferable, for reasons of parallelism and clarity, to repeat the preposition, thereby replacing a conjoint noun phrase by a conjoint prepositional phrase, as in [3]:

The plan was opposed *not* [by Frederick] *but* [by Maria]. [3]

- Note Another reason for repeating the preposition in [3] is the oddity of placing *not* between a preposition and its complement: ?*The plan was opposed by not Frederick but Maria*.

Multiple coordination of noun phrases

- 13.58 In noun phrase coordination, as in clause coordination (*cf* 13.16f), we have seen that it is possible to form constructions which are of more than two conjoins:

She asked me to buy [four oranges,] [a pound of plums,] *and* [a melon].

Asyndetic coordination (*cf* 13.1) of more than two noun phrases is also possible:

We had no friends, no family, no material resources.

and noun phrases may have polysyndetic coordination (with more than one coordinator; *cf* 13.17):

She asked me to buy [four oranges,] *and* [a pound of plums,] *and* [a melon].

There may also be, as in clause coordination, more than one level of coordination:

She asked me to buy [four oranges,] *and* [[one large melon] *or* [two small ones]].

Combinatory and segregatory coordination of noun phrases

- 13.59 When phrases linked by *and* function in the clause, they may express COMBINATORY or SEGREGATORY meaning. Combinatory coordination is coordination for which it is inappropriate to provide a paraphrase in terms of coordinated clauses; this is because the conjoins function 'in combination' with respect to the rest of the clause. When phrase coordination is segregatory, on the other hand, we can paraphrase it by clause coordination. The distinction applies to various kinds of coordinate construction, but is clearest with noun phrases. For example:

[John] *and* [Mary] make a pleasant couple.
[≠ *John makes a pleasant couple, and Mary makes a pleasant couple]
[John] *and* [Mary] know the answer.
[= John knows the answer, and Mary knows the answer]

Many conjoint noun phrases are ambiguous between a combinatory and a segregatory interpretation:

[John] *and* [Mary] won a prize.

This may mean either (a) that John and Mary each won a prize, or (b) that the prize was awarded jointly to them both. Reading (b), however, is preferred unless the insertion of *each* makes it clear that reading (a) is intended. (On the related topic of distributive number, cf 10.47.)

13.60 We may distinguish three kinds of combinatory meaning:

(a) JOINT PARTICIPATION

The conjoins are interpreted as jointly constituting a single participant (cf 10.18ff) in the process or relationship described by the clause. The sentence:

John and Mary played tennis against Susan and Bill. [1]

may refer to a single combined process, viz a game of doubles, as shown in Fig 13.60a; but the same sentence might also have a segregatory interpretation, referring to four games of singles as shown in Fig 13.60b.

A further segregatory interpretation involving two singles games, as represented in Fig 13.60c, is the one that would be selected if the adverb *respectively* were added to [1] (cf 13.63):

KEY
J John
M Mary
S Susan
B Bill
X } other players
Y }

(b) MUTUAL PARTICIPATION

The conjoins are interpreted as entering into a symmetric or reciprocal relation to each other, as indicated in Fig 13.60d. This is one interpretation of:

John and Mary played tennis.

But this sentence also allows a segregatory interpretation 'John and Mary each played tennis (with somebody)' as suggested by Fig 13.60e. The symmetric interpretation can be made explicit by adding or substituting some expression containing *each other* or *one another*.

Further examples of mutual participation are:

Peter and Bob separated.
Paula and her brother look alike.
Mary and Paul are just good friends.
John and Peter have different tastes.

Note the use of the plural nouns in complement position to indicate reciprocity:

Mary and Susan are sisters/cousins/colleagues (of each other).

The corresponding singular complement cannot be used with reciprocal meaning: ?*Mary is a cousin and Susan is a cousin*. But with the segregatory meaning of *Mary and Susan are teachers*, the corresponding conjoined singular constructions make an acceptable paraphrase: *Mary is a teacher and Susan is a teacher*. The same meaning of mutual participation occurs with three or more conjoins: *Smith, Brown, and Robinson became partners*.

(c) UNITARY PARTICIPATION

In some cases the conjoins are so closely linked in meaning that they participate in the meaning of the clause as if they referred to a single object. The whole phrase may behave as a singular noun phrase for purposes of concord (cf 10.37ff):

Law and order is a primary concern of the new administration.

Other examples are *fish and chips*, *a ball and chain*, *bread and butter*, *the Stars and Stripes*, and titles and names such as *Fathers and Sons* (a novel by Turgenev) and *the Fox and Hounds* (a public house). It is a characteristic of such unitary phrases that the order of the conjoins cannot be varied, and that no determiner precedes the second conjoin (cf 13.67).

Note [a] The distinction between combinatory and segregatory meaning applies not only to conjoint noun phrases, but to plural noun phrases in general. Thus the combinatory meanings of:

They are married. *The three girls look alike.*
We haven't met before. *He painted the cars in two colours.*

contrast with the segregatory meanings of *They are feverish*; *The three girls have a cold*.

[b] A special case of mutual participation is the use of *and* as a noun phrase coordinator following *between* (cf 9.39).

Indicators of segregatory meaning

13.61 Certain markers explicitly indicate that the coordination is segregatory:

<i>both</i> (... <i>and</i>)	<i>neither</i> ... <i>nor</i>	<i>respectively</i> <formal>
<i>each</i>	<i>respective</i> <formal>	<i>apiece</i> <rather rare>

While *John and Mary have won a prize* is ambiguous, we are left in no doubt that two prizes were won in:

John and Mary have *each* won a prize.
John and Mary have won a prize *each*.
Both John and Mary have won a prize.
John and Mary have *both* won a prize.

However, because of the distributive meaning of *each* (cf 6.51), there is a potential difference of meaning between [1] and [2]:

- John and Mary have *each* won prizes. [1]
 John and Mary have *both* won prizes. [2]

Both permits the distributive interpretation of *prizes* which occurs in [1] (= *John has won prizes and Mary has won prizes*), but also permits the nondistributive interpretation whereby *prizes* might refer to one prize won by John and another prize won by Mary.

Corresponding to the positive correlative *both ... and* is the negative correlative *neither ... nor*, which likewise has segregatory force:

- John and Mary didn't win a prize. [3]
 Neither John nor Mary won a prize. [4]

Whereas [3] is ambiguous, [4] is unambiguously segregatory, making it clear that two prize-winnings were involved. *Or* following a negative (cf 13.31) has a similar effect, seen in the contrast between the combinatory/segregatory ambiguity of [5] and the segregatory meaning of [6]:

- He wouldn't lend his books to *Tom and Alice*. [5]
 He wouldn't lend his books to *Tom or Alice*. [6]

Note [a] *Apiece*, a less common adverb which marks segregatory meaning, is normally placed finally after a direct object:

John and Mary have won a prize apiece.

It is restricted to clauses with an object, to which it gives the distributive interpretation of *each*.

[b] The ambiguity observed in [2] above remains when the coordinate subject is replaced by a plural noun phrase: *My children have both won prizes*. (Cf 13.66 Note [d] and 10.47 on distributive number.)

Respective

- 13.62 The adjective *respective* premodifies a plural noun phrase, *eg* as object, to indicate segregatory interpretation of a preceding conjoint noun phrase. In this function, it is normally preceded by a plural possessive pronoun:

Jill and Ben visited their uncles.

This could mean:

- (a) Jill visited her uncle(s) and Ben visited his uncle(s).
 (b) Jill and Ben together visited the uncles they have in common.
 (c) Jill and Ben together visited Jill's uncle(s) and also Ben's.

On the other hand:

Jill and Ben visited their *respective* uncles.

can only mean (a). The use of *respective* does not, however, help us distinguish the number of uncles, since *respective* cannot be used with a singular noun-phrase head:

*Jill and Ben visited their *respective* uncle.

The related noun phrases do not have to be in a subject-object relationship:

We interviewed *the Director and the Producer* in their *respective* offices.
Mary and Susan went to their *respective* homes.

They can even be in different clauses or sentences:

Bob and his best friend have had some serious trouble at school lately.
 Their *respective* parents are going to see the principal about the complaints.

Note Like other markers of segregatory meaning, *respective* can be used analogously with preceding plural noun phrases: *The boys visited their respective uncles*.

Respectively

- 13.63 The adverb *respectively* is used to indicate segregatory meaning, and also tells us which constituents go with which when there are two parallel coordinate constructions. For example, if there are two sets of conjoins [A] and [B] ... [C] and [D], *respectively* makes it clear that [A] goes with [C], and [B] goes with [D]. It can be added to the front or end of the second coordinate construction. Some illustrations follow:

John, Peter, and Robert play football, basketball, and baseball *respectively*.

[= John plays football, Peter plays basketball, and Robert plays baseball]

Arnold and his son were *respectively* the greatest educator and the greatest critic of the Victorian age.

[= Arnold was the greatest educator of the Victorian age, and his son was the greatest critic of the Victorian age]

Smith and Jones are going to Paris and to Amsterdam *respectively*.

The *respectively* construction is generally limited to formal discourse. In other contexts it smacks of pedantry.

Coordination of parts of noun phrases

- 13.64 When coordination takes place *within* a single noun phrase, it is often possible to postulate ellipsis from a full form in which coordination takes place *between* noun phrases:

They sell [manual] and [electric] typewriters. [1]

Your [son] and [daughter] look so much alike. [2]

These may be expanded *respectively* to:

They sell [manual typewriters] and [electric typewriters]. [1a]

[Your son] and [your daughter] look so much alike. [2a]

There is a further type of coordination within the noun phrase which allows no ellipsis at all. Thus [3] is not usually paraphrasable by [3a], or [4] by [4a]:

{ They made [salmon] and [cucumber] sandwiches. [3]

{ ≠ They made [salmon sandwiches] and [cucumber sandwiches]. [3a]

{ [Spacious] and [well-furnished] apartments to let. [4]

{ ≠ [Spacious apartments] and [well-furnished apartments] to let. [4a]

Here again, there is a distinction to be made, with *and*, between COMBINATORY and SEGREGATORY coordination. Combinatory coordination is associated with nonelliptical interpretation, and segregatory with ellipsis or quasi-ellipsis (cf 12.40). In the combinatory interpretation illustrated most clearly by [3], the conjoins act semantically 'in combination' with respect to the rest of the sentence. In the segregatory interpretation illustrated by [1], however, the parts of the noun phrase, and even of the clause, which are outside the conjoins can be regarded as the antecedents of an ellipsis or quasi-ellipsis, so that the noun phrase can be paraphrased by means of a coordination of noun phrases and ultimately of clauses. A test of segregatory coordination is whether the endorsing word *both* can be inserted before the first conjoin (cf 13.35): [1] means *They sell both manual and electric typewriters*, but [3] does not normally mean *They made both salmon and cucumber sandwiches*.

Note For some cases, it is possible to postulate yet a further stage of ellipsis, and to expand the conjoint noun phrase into a conjoint clause:

[They sell manual typewriters] *and* [they sell electric typewriters]. [1b]

But such an analysis leads to results which are both nonsensical and ungrammatical for other examples:

*[Their son look alike] *and* [their daughter look alike]. [2b]

13.65 As can be seen from the comparison of 13.64 [1] and [3] above, the combinatory/segregatory distinction may be made at various levels for the same construction. For example, the italicized phrase in:

Those are *the shelves for books on [skills,] [trades,] and [hobbies]*.

permits a combinatory interpretation of *skills, trades, and hobbies* whereby each of the books in the whole set is assumed to deal with all three subjects; but if we assume a segregatory interpretation at this level (ie, 'books on skills, books on trades, and books on hobbies'), there is still another level at which the combinatory interpretation is possible: viz the shelves in question could each contain a mixture of the three types of book. In contrast, a segregatory interpretation on this level would mean that each shelf is reserved for one kind of book [= 'shelves for books on skills, shelves for books on trades, and shelves for books on hobbies']. In this way coordination creates possibilities of multiple ambiguity, and in general, the further down the tree of constituent structure the coordination occurs, the greater are the opportunities for ambiguity, in the manner indicated by Fig 13.65:

Fig 13.65

To avoid confusion, then, it is best to use the terms 'combinatory' and 'segregatory' in respect to a given contrast of interpretation, rather than with more general reference to a grammatical construction.

Coordination and number

13.66 Essentially the question of whether a given noun phrase (simple or conjoint) is singular or plural depends on whether it refers to one or more than one member of a class of denotata. (For special problems of concord, cf 10.37ff.) For instance, two noun phrases, even when both are singular, form a plural conjoint phrase when they are coordinated by *and*:

[Jane is well] *and* [Susan is well]. BUT: [Jane] *and* [Susan] are well.

Similarly with more complex noun phrases:

[The King of Denmark] *and* [the Queen of Denmark] have arrived. [1]

The plural *have* is appropriate in [1], because the subject refers to more than one person. The same is true when the determiner and modifier are ellipted, so that *King* and *Queen* are coordinated within a single noun phrase:

The [King] *and* [Queen] of Denmark have arrived. [1a]

If on the other hand the modifiers are coordinated, the noun head changes from singular to plural, thus indicating the plurality of the whole expression:

The Presidents [of Greece] *and* [of Austria] were present at the ceremony.
(= '[the President of Greece] *and* [the President of Austria]')

If the head, in such a case, is noncount, it cannot change to the plural, and there arises the oddity of a singular noun acting as head of a plural noun phrase (cf 10.38):

[Indian] *and* [Chinese] tea *smell* totally different from each other.

(The plural *teas* would also be possible here, but would have the slightly different meaning of 'kinds of tea'.) Another example is:

[Red] *and* [white] cabbage *are* (both) useful ingredients for a salad.

(Here the plural *cabbages* would be ludicrous, suggesting that each salad should contain whole cabbages; while the singular *is* would suggest that the variety of cabbage in question is particoloured red and white.)

Note [a] An apparent exception which proves the rule is the case of coordinative apposition (cf 10.39), where two singular count noun phrases are placed in apposition to form a *singular* noun phrase:

[Tom's father] *and* [Suzanne's uncle] is waiting for you.

The only possible interpretation of this is that Tom's father and Suzanne's uncle are the same person. A similar conclusion must be drawn when two singular nouns are coordinated as heads of a singular noun phrase:

The [owner] *and* [editor] of the *Daily Post* was a member of the club.

[b] On the singular or plural number of noun phrases containing coordination by *or*, cf 10.41.

[c] There is uncertainty over number where the *many a* construction (cf 5.23 Note [c]) is followed by singular heads conjoined by *and*:

Many a boy *and* girl $\left\{ \begin{array}{l} ?are \\ ?is \end{array} \right\}$ left homeless.

[d] A further uncertainty arises when a noun is postmodified by a prepositional phrase, the complement of which contains coordinated nouns or noun phrases with segregatory meaning: *in the case(s) of France and Germany; at the back(s) of the stores and offices*. Normally the singular will indicate combinatory meaning (eg: *at the back of the stores and offices* will suggest that the stores and offices comprise a single building or block of buildings). But where the singular is to

some degree a 'frozen' part of a complex preposition (cf 9.11), the plural would not be acceptable: *in cases of fire and theft; *on the parts of all concerned. Yet even in idioms of this kind the ability to pluralize is exercised in other constructions (cf 10.47):

We must all play $\left\{ \begin{array}{l} \text{a part} \\ \text{our } \left\{ \begin{array}{l} \text{part} \\ \text{parts} \end{array} \right\} \end{array} \right\}$ in achieving victory.

Coordinated noun heads

- 13.67 It is evident from what has been said in 13.64/ that various ambiguities arise when the constituents of noun phrases are coordinated.

When coordinated heads are preceded by a determiner, the usual interpretation is that the determiner applies to each of the conjoins:

a [knife] and [fork] (= *a* knife and *a* fork)
the [head] and [shoulders] (= *the* head and *the* shoulders)
his [wife] and [child] (= *his* wife and *his* child)

(On the interpretation of quantifiers such as *many* in *many girls and boys*, cf 13.76.)

A similar analysis in terms of segregatory coordination (cf 13.59) usually applies when the coordinated heads are preceded or followed by modifiers:

old [men] and [women] (= [old men] and [old women])
 some [cows,] [pigs,] and [sheep] from our farm (= *some* cows from our farm, *some* pigs from our farm, and *some* sheep from our farm)

But then there is also the possibility of interpreting these phrases as conjoint noun phrases:

[Old men] and [women] were left to organize the community.
 At the market were [some cows,] [pigs,] and [sheep from our farm].

If the determiner is not repeated in the noninitial conjoins, however, an ellipsis of the determiner is normally assumed:

the [boys] and [girls] staying at the hostel (= [the boys staying at the hostel] and [the girls staying at the hostel])

Coordinated premodifiers

- 13.68 If modifiers are coordinated, there may again be ambiguity according to whether the construction is understood to be segregatory. Thus:

He specializes in selling [old] and [valuable] books.

may mean 'books which are old and valuable' (combinatory meaning) or 'old books and valuable books' (segregatory meaning). Only the segregatory meaning is possible when the coordinated modifiers denote mutually exclusive properties:

old and *new* furniture *one-pound* and *two-pound* jars

Exceptions to this are colour adjectives (as in *red*, *white*, and *blue* flags), which allow the combinatory sense of 'partly one colour, partly another'. On the other hand, only the combinatory interpretation is available if the head is a singular count noun:

He is a *dishonest* and *lazy* student.

Another sign of combinatory meaning is the possibility of replacing *and* by asyndetic coordination:

He's a *dishonest*, *lazy* student.
 They sell *old*, *battered* furniture.

This is not normally acceptable with segregatory meaning:

?*They sell *old*, *new* furniture.

In fact, for a combinatory interpretation of modifiers, asyndetic coordination is generally preferred to syndetic coordination. Again, however, colour adjectives are exceptional: *and* in such expressions as *a red and green uniform* cannot be omitted, even though the meaning is combinatory.

The endorsing item *both* placed at the beginning of a noun phrase identifies coordination of premodifiers as segregatory:

both young and old people [= *both* young people and old people]

But when the adjectives are placed in a predicative position, the converse applies, and the combinatory interpretation is selected:

*Men who were *both* young and old were invited.
 Students who are *both* honest and clever always succeed.

- Note [a] If the adjective phrase is postpositive (7.21), *both* ... *and* is possible with either type of meaning, but the segregatory meaning is often marked by pitch movement, as indicated below:
 Men *both* ↑ *old* and ↓ *young* were invited.
 Students *both* honest and clever always succeed.
 [b] With a series of adjectives, the final *and* is occasionally omitted even with segregatory meaning:
 Old, young, wise, foolish, tall, (and) short men were invited without distinction.
 [c] Occasionally a noun modifier is coordinated with an adjective modifier, as in *country and western music*.
 [d] With *or* and *either* ... *or*, the segregatory interpretation of premodifiers occurs even with singular heads; eg: *It's a Georgian or Regency sofa*.

Coordinated postmodifiers

- 13.69 Coordinated postmodifiers, like coordinated premodifiers, afford the possibility of either a segregatory or a combinatory interpretation of *and*. The following is likely to have a combinatory interpretation:

The bus for the Houses of Parliament and (for) Westminster Abbey leaves from this point.

But if the phrase is in the plural, an ambiguity results:

the buses for the Houses of Parliament and (for) Westminster Abbey

This could in theory mean either: 'the buses which go both to the Houses of Parliament and to Westminster Abbey' or 'the bus(es) for the Houses of Parliament and the bus(es) for Westminster Abbey'. The singular head *bus* does not allow the second segregatory interpretation with *and*.

The second preposition in examples such as these may be readily omitted,

so that the coordination becomes one of prepositional complements rather than of prepositional phrases. But then a combinatory meaning is favoured; whereas if the preposition is repeated, a segregatory meaning is more probable. Hence these are likely to have different interpretations:

Elsa Graham's books on [reptiles] and [amphibians]
(probably combinatory)

Elsa Graham's books [on reptiles] and [on amphibians]
(almost certainly segregatory).

Note Here again (cf 13.68 Note [d]), the segregatory interpretation is possible with a singular head and with or as coordinator:

You have to take a bus for the Houses of Parliament or for Westminster Abbey.

Further ambiguities of coordination in the noun phrase

13.70 If a phrase containing modifiers coordinated by *and* has a singular count noun head, only one interpretation, the combinatory one, is possible. But if it has a plural head, there are four possible segregatory interpretations for a noun phrase containing two conjoiners:

the meetings on Monday and on Tuesday

[= 'the meeting on Monday and the meeting on Tuesday']

OR 'the meetings on Monday and the meeting on Tuesday'

OR 'the meeting on Monday and the meetings on Tuesday'

OR 'the meetings on Monday and the meetings on Tuesday']

Every time an extra conjoiner is added (as in *the meetings on Monday, Tuesday, and Wednesday*) the number of interpretations is doubled. The ambiguities can be avoided, if desired, by the use of the nonelliptical equivalents.

In addition, this phrase allows a combinatory interpretation: *viz* that the meetings, or some of the meetings, lasted for both days. The combinatory interpretation would, however, be more likely if the second preposition were ellipted: *the meetings on Monday and Tuesday*.

A similar set of readings is possible for:

bills for gas and (for) electricity

the taxes on earned and (on) unearned income

Since *tax* is sometimes a noncount noun, it is also possible to read the segregatory readings into the corresponding singular phrase: *the tax on earned and (on) unearned income*.

Note The following example shows how the segregatory reading of *tax on earned and unearned income* can be associated with the mutual participation (cf 13.60 Note [b]) of *between*:

There is no difference between the tax on earned and [= 'that on'] unearned income.

Although the occurrence of a singular noun phrase as complement of *between* seems irregular, this sentence is in fact constructed regularly according to the principles outlined in preceding sections.

Coordination of determiners and numerals

13.71 The coordination of determiners is comparatively rare. The following are possible, but are unidiomatic: *this or other books, these and those chairs, a few*

or many students, and there is a preference for a synonymous construction with conjoint noun phrases, such as *this book and that (one), a few students or many*, where the second conjoiner is a noun phrase reduced by substitution or ellipsis. Comparative forms are more easily coordinated:

Would you prefer *MORE* or *LESS* sugar?

[= '... more sugar or less sugar?']

but even here the equivalent noun-phrase coordination, with reduction of the second conjoiner by standard ellipsis, may be preferred:

Would you prefer *MORE* sugar or *LESS* Δ ?

There are some instances of idioms in which determiners are coordinated; *eg* the redundant and emphatic conjoining of *each* and *every* in:

The secret was kept by *each and every* one of us.

Cardinal numerals are frequently coordinated with *or*, but here again there is an idiomatic function. *Five or six* means, for example, 'approximately in the range of five and six'; *ten or twenty* means 'a number in the region of 10 or 20'; and the most frequently-occurring coordination of this type, *one or two*, has the special idiomatic sense 'a small number'. This approximative use of numerals does not apply when the correlative *either ... or* is used:

I am inviting *one or two* students to a party.

does not mean the same as:

I am inviting *either one or two* students to a party.

Note [a] Occasionally a postdeterminer such as *few* or *many* may be coordinated with an adjective: *his few but intelligent remarks*. Note also the idiom *few and far between*.

[b] The coordination of a singular with a plural determinative leads to an anomaly of concord: logically, the head of the noun phrase could be either singular or plural. The difficulty is resolved (cf 10.41) by making the head agree with the last conjoiner: *one or two students* (NOT **one or two student*); *this and other arguments* (NOT **this and other argument*).

[c] Mention should be made of the rarity and *ad hoc* quality of coordinations of the definite and indefinite articles: *She is the (or a) professor in the department*; *He may be a, or even the, Vice-Chairman of the party*. Such coordination takes place only with *or*, and the unreduced pronunciations of the articles (/eɪ/ and /ði:/) are normally required.

Coordination of genitives

13.72 Like determiners, genitives, when used in determinative function, are not often coordinated, and there is some uneasiness about the appropriate construction to use. A coordination of genitives such as *John's and Mary's children* resembles a coordination of modifiers in that it may be interpreted in either a combinatory or a segregatory fashion:

- | | | |
|-----------------------|--|-----|
| combinatory meaning: | 'the children who are joint offspring of
John and Mary' | (A) |
| segregatory meanings: | 'John's child and Mary's child' | (B) |
| | OR 'John's children and Mary's child' | (C) |
| | OR 'John's child and Mary's children' | (D) |
| | OR 'John's children and Mary's children' | (E) |

And as in the case of postmodifiers, a further ellipsis is common if the combinatory meaning is intended. The following can be given only reading (A) above:

[John] and [Mary]'s children (*cf* the children of John and Mary)

Here the 's is outside the coordinate construction, and is added to the whole conjoint noun phrase *John and Mary*. In this, it resembles the 's of group genitives (*cf* 5.123), which is a suffix to a phrase rather than to a single word.

Note The group genitive construction of *John and Mary's children* is characteristic of informal speech. In formal English, this construction is sometimes felt to be incorrect, and the construction of *the children of John and Mary* or (less commonly) *John's and Mary's children* might be preferred instead. The latter construction, however, is forced and awkward, especially if the conjoiners are strongly associated with one another: *?Laurel's and Hardy's hilarious screen comedies*.

Coordination of possessive pronouns

13.73 Another problem of usage arises over the coordination of possessive pronouns. Two alternative constructions are the following:

- (a) [POSSESSIVE] + [POSSESSIVE] + ... HEAD
eg: your and my problems; their and our students
 (b) [POSSESSIVE + ... HEAD ...] + [POSSESSIVE]
eg: your problems and mine; their students and ours

In (a) both possessives have a determinative function, while in (b) the second possessive pronoun has an independent function (*cf* 6.29f), so that strictly this is a conjoining of noun phrases rather than of possessives. Construction (b) is often preferred to construction (a), which can seem to be awkward. All these constructions, however, suggest a segregatory interpretation, and if a combinatory meaning is intended, a periphrasis may be preferred; *eg: her and my policy/policies* may be replaced by *the policy/policies which she and I share*. Yet another construction is sometimes encountered, but is not fully acceptable:

- (c) [POSSESSIVE] + [POSSESSIVE + ... HEAD ...]
eg: ?yours and my problems; ?theirs and our students

This differs from (a) in that the first conjoiner is an independent possessive pronoun such as *yours*, or *hers*, and differs from (b) in that the order of the conjoiners is reversed. Of course, in many situations the awkwardness of this coordination of pronouns can be avoided by an inclusive use of *our* or *your*: *our problems*, etc.

Note [a] The polite order of conjoined personal pronouns (*cf* 13.56 Note [a]) may be applied to possessive pronouns, as well as to pronouns in the subjective or objective case: *your, his, and my reports; your and my books*; etc.
 [b] The difference between constructions (b) and (c) above is neutralized in the case of *his*, since there is no contrast in this pronoun between the determinative and independent form of the possessive pronoun: *his and my favourite drink*.

Coordination of genitives with possessive pronouns

13.74 Three constructions corresponding to (a–c) above are also available when mixed coordinations of genitives and possessives are required. Here again,

some uneasiness is felt in the choice of construction. For (a) and (b), there are variant orders: the possessive may precede the genitive, or vice versa:

- (a) { [GENITIVE] + [POSSESSIVE] ... + HEAD
 [POSSESSIVE] + [GENITIVE] ... + HEAD
eg: ?my husband's and my names; ?your and your wife's bank account

This construction is rarely used, and is felt to be awkward.

- (b) { [GENITIVE + ... HEAD ...] + [POSSESSIVE]
 [POSSESSIVE + ... HEAD] ... + [GENITIVE]
eg: my husband's name and mine; your bank account and your husband's

This construction is less awkward than (a), but is clearly associated with segregatory coordination. Thus *your bank account and your husband's* could not normally refer to a joint bank account shared by husband and wife. Also, since (b) is technically a coordination of noun phrases rather than of determinatives, this construction does not permit a 'segregatory singular' interpretation of a plural noun as head. For instance, *Jack's and my dogs* could mean 'Jack's dog and my dog'; but *Jack's dogs and mine* would tend to imply that Jack has more than one dog.

A construction corresponding to (c) in 13.73, where the independent possessive pronoun (*cf* 6.29) precedes the genitive, is a further possibility, which however has limited acceptability:

- (c) [POSSESSIVE] + [GENITIVE] ... + HEAD
?yours and your husband's bank account

Note There is yet one further option, which corresponds to the construction of *John and Mary's children* (*cf* 13.72), and which resembles it in being associated with informal style and combinatory meaning: *you and your husband's bank account*. This will often be felt to be unacceptable where the first conjoiner is a noun, or a phrase with a noun head, or a pronoun in the subjective case: *?they and their friends' surprise; ?John and her book*. The use of an objective pronoun for the first conjoiner is also possible, but is nonstandard: *?me and my husband's bank account*.

Other elliptical coordinations within the noun phrase

13.75 We have already noted (*cf* 13.67) that when heads of noun phrases are conjoined, the determiner is often ellipted, resulting in a coordination at word level rather than at phrase level, with two nouns sharing a single determiner:

- a [boy] or Δ [girl]
 that [butter] and Δ [milk]
 the [house] and Δ [gardens]
 my [father] and Δ [mother]

The same kind of ellipsis may be observed when the determiner is accompanied by one or more modifiers:

- those delicious [pies] and Δ [pastries]

Yet another kind of ellipsis takes place when one or more modifiers are included in the conjoiners. The units thus coordinated are neither words nor

phrases, but the intermediate units we earlier called NOMINAL EXPRESSIONS (cf 12.16):

- those [mince pies] and [Danish pastries]
- those delicious [mince pies] and [Danish pastries]
- those delicious [mince pies] and [Danish pastries] that you bought

In such constructions, the limits of the conjoins are variable, and this leads to ambiguity. *My elder brother and sister*, for example, may be interpreted as *my elder [brother] and [sister]* (= 'my elder brother and my elder sister'), or as *my [elder brother] and [sister]* (= 'my elder brother and my sister'). Of these two interpretations, the former is preferred, for the latter meaning would be singled out by the repetition of *my* before *sister*. The following illustrates a similar but more complex kind of ambiguity of construction:

The Municipal Art Gallery is famous for *its still life paintings and drawings by Van Gogh*.

Four interpretations are possible:

- (a) its still life [paintings] and [drawings] by Van Gogh
- (b) its [still life paintings] and [drawings] by Van Gogh
- (c) its [still life paintings] and [drawings by Van Gogh]
- (d) its still life [paintings] and [drawings by Van Gogh]

Other things being equal, an interpretation which preserves a parallelism between the conjoins will be preferred to one which does not. On this ground, (a) and (c) are more likely readings of the above example than (b) and (d); reading (b) is quite possible, however, because of the close association between *still life* and *paintings*.

Scope of quantifiers and numerals in the noun phrase

- 13.76 In 13.45 we studied the way in which quantifiers within the clause include coordinate constructions in their scope. A similar phenomenon occurs in the noun phrase, when quantifying determiners or numerals include within their scope the coordination of nominal expressions such as those discussed in 13.75 above. In such cases, the noun phrase cannot be expanded in the regular fashion, by repetition of the determinative item:

- They have *no books or magazines* for sale.
- [= *no books and no magazines* . . .]
- [≠ *no books or no magazines* . . .] (cf 13.31)
- They're going to plant several flowering trees or shrubs.
- [≠ *several flowering trees or several flowering shrubs*]
- There are ten boys and girls in the playgroup.

In the last example, *ten* may or may not include *boys and girls* in its scope. Hence it is possible that this phrase refers to a group of children adding up to a total of ten, rather than to a group of ten boys and ten girls. The former interpretation is not always selected, however, since *ten husbands and wives* or *ten knives and forks* would invite the contrary reading 'ten of the one and ten of the other'. This is because a husband and wife, or a knife and fork, form a unit in a way in which a boy and a girl do not.

Coordination of other constituents

- 13.77 All the main variations of construction we have noted in connection with clauses and noun phrases are also found in verb phrases, adjective phrases, adverb phrases, and prepositional phrases. The central coordinators *and* and *or*, and to a lesser extent *but*, are used as linkers. In the cases of *and* and *or*, there may be more than two conjoins in a given construction. Coordination is asyndetic, syndetic, or polysyndetic. When *and* is the coordinator, there is a further choice between combinatory and segregatory readings. Some representative examples of other phrases are given below.

Coordination of verbs and verb phrases

- 13.78 Verb phrase coordination is illustrated in:

- Heinrich Schmidt [*was born,*] [*lived,*] and [*died*] in the city of Vienna. [1]
- Good cooking [*can disguise,*] *but* [*cannot improve,*] the quality of the ingredients. [2]
- Yesterday we [*bought*] and [*sold*] ten paintings. [3]

The implication of chronological sequence which is found in clause coordination (cf 13.23) is also found, if the main verb has dynamic meaning, in verb phrase coordination. We may contrast, in this respect, the stative verb meanings of *She knows and admires your work* and the dynamic verb meanings of *George repaired and sold the car*.

Coordination of main verbs, with shared auxiliary verb(s), is common:

- I have *washed and dried* the dishes.
- The guests were *sitting or lounging* around in the front room.
- Quite a large number of people might have been *killed or injured* by the explosion.

Coordination of auxiliary verbs is less common and somewhat formal:

- The country *can and must* recover from its present crisis.
- Staffordshire pottery always *was, is, and will be* prized by collectors.

It is perhaps less rare when the auxiliaries are conjoined by *or*:

- He *may, or (certainly) should,* resign.

But coordination then has the character of an interpolation (cf 13.95ff).

- Note When two dynamic verbs of opposite meaning are conjoined, especially when combined with the progressive, the meaning of the construction is often iterative (cf 13.101): *He lay there opening and shutting his eyes* [ie repeatedly]; *Visitors came and went throughout the summer*.

Coordination of adjectives and adjective phrases

- 13.79 Adjective phrases are coordinated in:

- The journey was *long and extremely arduous*.
- Our team is *very fit, very keen, and ready to face the strongest competition* in the world.

In the following, there is a coordination of adjective heads:

- I'm feeling *younger and healthier* than I have felt for years.

But in the following, there is an ambiguity, according to whether the premodifier belongs to the first conjoin or to both conjoins:

The souvenirs they bought were *very cheap and gaudy*.

It is unclear whether the analysis should be:

[*very cheap*] and [*gaudy*] OR *very* [*cheap*] and [*gaudy*]

But the second reading, in which the premodifier applies to the whole sequence, is preferred. A change in the order of the words will eliminate the ambiguity:

The souvenirs they bought were [*gaudy*] and [*very cheap*].

Adjectives can be coordinated either in predicative position, as above, or in attributive position:

His *clear and forceful* delivery impressed his audience. [1]

In attributive position (cf 13.68), the coordinator *and* is often omitted:

His *clear, forceful* delivery impressed his audience. [2]

The asyndetic construction in [2] is combinatory, and is associated with nonrestrictive modification (cf 17.95). It also suggests, more than the syndetic one, that the two epithets are meant to contribute to the same general effect: ie '... clear and, I may go so far as to say, forceful'. The syndetic construction of [1], on the other hand, has the additional possibility of a segregatory interpretation if the head noun is plural or noncount:

old and dilapidated buildings wet and windy weather

These phrases, in contrast to those of [1] and [2], are ambiguous.

Coordination of adverbs and adverb phrases

- 13.80 Coordinated adverbs and adverb phrases are normally of the same semantic class (eg of time, of place, of manner):

She made the announcement *quietly but quite confidently*.

The Governor never arrives *earlier or later* than the time of an appointment.

The piston moved *up and down* with increasing speed.

I have only spoken to her *once or twice*.

In this last example, *once or twice* is likely to have the vague meaning 'a few times', comparable to the use of *one or two* as discussed in 13.71. The rarer case of coordination, in which the adverbs or adverb phrases are of different semantic classes, is illustrated by:

He complained *strenuously and often*.

They met *somewhere and sometime*, but I have forgotten *how or why*.

Coordination of prepositions and prepositional phrases

- 13.81 The following illustrate coordination of prepositional phrases:

He spoke *for the first motion* but *against the second motion*.

John complained both *to Mary* and *to Peter*.

They are going *to France, to Germany, or to Switzerland*.

The talks held *in 1951, in 1952, and in 1955* met with only limited success.

If the two or more prepositions are identical, all but the first preposition can be ellipted; eg: *to Mary and Peter*; *in 1951 and 1952* (but a combinatory meaning is then allowed; cf 13.70). Further possibilities are the ellipsis of part of the prepositional complement in the first or subsequent conjoin (the former, cataphoric option being more formal):

He spoke *for the first* Δ but *against the second motion*.

He spoke *for the first motion* but *against the second* Δ .

or the ellipsis of the prepositional complement altogether, in which case the construction is simply one of coordinated prepositions:

He climbed *up and over* the wall.

[= He climbed *up the wall* and *over the wall*]

Did you speak *for or against* the motion?

Do you like your coffee *with or without* milk?

- Note Also possible is a construction synonymous with the above in which ellipsis occurs in the second conjoin:

Did you speak *for the motion or against* Δ ?

Do you like your coffee *with milk or without* Δ ?

These appear to resemble cases where a prepositional adverb replaces a prepositional phrase (cf 9.65-6); but in fact they belong to a different category, because they occur with words (*without* and *against*) which cannot normally be used as prepositional adverbs. We must therefore describe these as unusual cases of ellipsis in which a preposition appears without its prepositional complement. This analysis may be further extended to cases like *Asparagus is expensive out of season and in*, where, although *in* may be a prepositional adverb, in this instance it is obviously a preposition parallel to *out of*. The effect of placing *in* at the end, with ellipsis, in this way is to give it the emphasis associated with end focus (cf 18.9ff).

Mixed coordination of adverbials

- 13.82 The general principle governing the coordination of phrases and words is that the conjoins must belong to the same category, formally, functionally, and semantically. Sometimes, however, the normal formal parallelism is not maintained, so that there is coordination of different adverbial categories. In the following, adverb phrases are coordinated with prepositional phrases, and noun phrases with adverbial clauses. In each case, however, a close semantic parallel between the conjoins is maintained:

The enemy attacked *quickly* and *with great force*.

You can wash them *manually* or *by using a machine*.

They can call *this week* or *whenever you wish*.

I prefer the sentences *below* and *on the next page*.

Coordination of subordinators

- 13.83 If two subordinate clauses are identical except for their conjunctions, one of the clauses can be omitted, normally the first, so that coordination takes place between the conjunctions:

I am prepared to meet them *when* and *where* they like.

[= . . . *when* they like and *where* they like]

They will be arriving either *before* or *after* the show begins.

Note [a] On the formulaic coordination *if and only if*, cf 15.35 Note [i].

[b] *If and when* is a stereotyped expression weakening the expectation (conveyed by *when* alone) that the condition in the clause will be realized:

If and when he buys a car, I'll try to persuade him to buy the insurance from me.

With *if and when* ellipsis may be disregarded, since *if and when* has become a unit. Other institutionalized conjunctions are: *as and when*; *unless and until*.

Coordination of interrogative words and relative pronouns

- 13.84 Coordination can also take place between other clause-introducing words, such as interrogative words, whether they introduce an independent or a dependent clause (cf 11.14f):

I am determined to find out *who* or *what* caused this uproar.

How and *why* did you break into my room?

A coordination of *wh*-words is not possible if the *wh*-words function as different elements of structure. For example, it is impossible to coordinate a subject *who* with an adverbial *why*:

**Who* and *why* broke into my room?

But such a sentence becomes grammatical if the second *wh*-word is appended to the clause:

Who broke into my room, and *why*?

This is because the appended *why*? counts as an elliptical clause (cf 12.63) (= 'why did they break into my room?'), and so the structural equivalence between the first conjoin and the second is restored.

The same principle of structural and functional equivalence prevents coordination of relative pronouns, but the coordination of prepositional phrases containing a relative pronoun is quite common at the beginning of relative clauses:

I want to know *by whom* and *for whom* it was ordered.

Additional constraints on coordination

Restrictions on coordination of word-parts

- 13.85 The minimal unit which can normally be coordinated is the word. There are, however, occasional exceptions to this limitation. Some derivational prefixes which tend to be contrasted and which tend to be loosely attached to their base can be conjoined; eg: *ante-* (or *pre-*) and *post-natal*; *pro-* and *anti-establishment*; *sub-* and *super-human*. Tightly-attached prefixes do not permit such coordination: **im-* and *ex-*ports.

Similarly, constituents of a compound can sometimes be coordinated, with ellipsis of the other constituent; eg: *factory- and office-workers*, *sons- and daughters-in-law*, *hand-made and -packed*, *out- and in-patients*, *psycho- and sociolinguistics*. Once again, these constituents are loosely attached, and we do not find linking in more cohesive compounds such as *toothache* and *headache*: **tooth- and headaches*.

Order of conjoins in word and phrase coordination

- 13.86 Apart from semantic factors such as chronological sequence (cf 13.23) the order of conjoins in word and phrase coordination is relatively free. The order of conjoined words can, however, be influenced by a tendency for the longer word to come second (perhaps a variant of the end-weight principle; cf 18.9). This is particularly noticeable in so-called BINOMIALS, ie relatively fixed conjoint phrases having two members; eg: *big and ugly*, *cup and saucer*. One principle at work here appears to be a principle of rhythmic regularity: eg the dactylic rhythm of '*ladies and gentleman*', and the trochaic rhythm of '*men and women*', are preferable to the less balanced rhythm of *'*gentlemen and ladies*' and *'*women and men*'. It has also been argued that semantic factors play a role; eg that other things being equal, the first position is given to the semantically salient or culturally dominant member, as in *father and son*, *gold and silver*, *great and small*, *this and that*. Phonological constraints have also been suggested: that low vowels come after high ones; that back vowels come after front ones, etc. Whatever the constraints may be, they lead to stereotyped coordinations where the conjoins are virtually in an irreversible order; eg: *odds and ends*, *bread and butter*, *law and order*, *by hook or by crook*, *through thick and thin*; *knife, fork, and spoon*.

- Note [a] Arguably 'cultural dominance' can be extended to include the traditional sexual bias (cf 6.10) shown in the tendency to place male terms before female ones in cases like *men and women*, *boys and girls*, (if) *he or she* (*wishes*). This tendency is reversed in *mother and father* (where cultural dominance works in the opposite direction) and in *ladies and gentlemen* (influenced by the courtesy convention of 'ladies first').
- [b] On the ordering of *you and I*, etc, cf 13.56 Note [a].

'ill-assorted' coordination: (a) semantic

- 13.87 The requirement that the conjoins match one another in form, function, and meaning is observed with varying degrees of strictness. The following are apparently examples of a semantic violation of the constraint, but nevertheless such constructions can be used for humorous or rhetorical effect:

She made up *her mind* and then *her face*.

I drove home in *a hurry* and *a borrowed car*.

Such examples can be expanded, by supplying ellipted elements, into grammatical sentences; eg:

She made up her mind and then she made up her face.

But it is clear from this that the ellipsis is based on an incongruous association of two homonymous idioms, *make up (one's mind)* and *make up (one's face)*. It is to such examples of semantically ill-assorted coordination that the traditional term ZEUGMA is applied.

'ill-assorted' coordination: (b) grammatical

13.88 A different kind of 'ill-assorted' coordination is illustrated by the following:

- We have washed, dried, and put the dishes away. [1]
 By giving the police a pay rise, the Minister hopes to strengthen
 and make the force more efficient. [2]

There is no difficulty in understanding such sentences; this time the anomaly is a matter of structure. They contain a false parallel, in that *away* in [1] and *more efficient* [2] are structurally outside the coordinate construction, and yet semantically apply only to the last conjoin. Sentence [1] ought to be a reduced form of:

- *We have washed the dishes away, we have dried the dishes away, and
 we have put the dishes away.

but clearly this does not make sense. Such sentences are likely to occur in the impromptu use of language, but will be 'corrected' in the more considered and especially in the written use of language; [1], for example, can be changed to:

- We have [washed,] [dried,] and [put away] the dishes. [1a]

(On the ordering of the verb *put* and the adverb *away* here, cf 16.4ff.) The term 'corrected' above has been advisedly enclosed in quotation marks, since it is not clear how far such examples are to be regarded as sentences which are ungrammatical in a descriptive sense, or as acceptable sentences stigmatized merely because of prescriptive tradition. Other instances of a similar kind are:

- The spy [was in his forties,] [of average build,] and [spoke with a
 slightly foreign accent]. [3]
 Had the queen [lived five years longer] or [had given birth to an
 heir], the subsequent history of the nation would have been
 very different. [4]
 Either [the children did not know what had happened], or [were
 trying to protect their parents]. [5]
 ?Our ancient city [has], and [always will], be proud of its
 achievements. [6]
 I am fond *both* [of dogs] and [cats]. [7]

The anomalous structure of such sentences can be discovered by expanding each coordination construction to a postulated unreduced version, *ie* by repeating before or after each conjoin the parts of the sentence which lie outside the coordinate construction. The result will be an unacceptable sentence in each case. By way of illustration, the unreduced versions of [3] and [7] are:

- *The spy was in his forties, the spy of average build, and the spy
 spoke with a slightly foreign accent. [3a]
 *I am fond of dogs and I am fond cats. [7a]

The expansion in example [7a] is based on the principle that correlatives such as *both* ... *and* mark the beginning of each conjoin. In fact, *both* cannot

introduce clause coordination (cf 13.35), and would therefore be omitted from an unreduced sentence such as [7a].

- Note Grammatically ill-assorted coordination can also occur at the morphological level:
 The reader is invited to try the experiment for *his* or *herself* before reading on.
 The problem with this example is revealed if we expand the first conjoin to *himself* (which is not grammatical in standard English) by assuming, as the construction seems to require, an ellipsis of *-self*. Compare a related difficulty of coordinated possessive pronouns in 13.73.

'ill-assorted coordination': (c) lexical

13.89 A third type of 'ill-assorted' coordination is illustrated by the following:

- He was *ashamed* and *alarmed* at the vengeful attitude of the
 War Cabinet.

Here the speaker confuses the prepositions of the two combinations *ashamed of* and *alarmed at*. The cause of the false parallel in this case is lexical, in the specific combinations of adjective and preposition (cf 16.69), rather than grammatical. Such confusions, which are not unusual, can be remedied by an insertion of the appropriate first preposition: *He was ashamed of and alarmed at* ...

Less common types of coordination**Complex coordination**

13.90 Up to this point we have been concerned with simple coordination: that is, the coordination of single grammatical constituents such as clauses, predications, phrases, and words. We turn now to three less regular and less common types of coordination, *viz* complex coordination, appended coordination, and interpolated coordination: these types of coordination may be seen as related, by ellipsis, to the coordination of clauses.

We apply the term COMPLEX COORDINATION to coordinate constructions of which the conjoins are combinations of units, rather than single units. In the clause, for example, it is possible not merely to coordinate objects or to coordinate complements; but also to coordinate one combination of object and complement with another combination of object and complement.

13.91 Our first examples illustrate coordination of contiguous combinations of elements in final position in the clause. (We reserve noncontiguous cases until 13.92.)

- (i) INDIRECT OBJECT + DIRECT OBJECT
 We gave [William a book on stamps], and [Mary a book on painting].
 (ii) OBJECT + OBJECT COMPLEMENT
 Jack painted [the kitchen white] and [the living room blue].

(iii) OBJECT + ADVERBIAL

You should serve [the coffee in a mug] and [the lemonade in a glass].

(iv) ADVERBIAL + ADVERBIAL

Paula is flying [to Madrid tonight] and [to Athens next week].

Such coordination usually establishes a strong parallelism between the conjoins, and for this reason it tends to be associated with a premeditated, written style of English, rather than with informal conversation.

But there is another type of complex coordination where there is no strong parallelism. In this type, the conjoins are unequal because one conjoin contains one or more adverbials where the other does not:

I found the music [unexciting] and – [frankly – discordant].

He wears [smart clothes], and [sometimes a yachting cap at weekends].

Such examples are more likely to occur in informal speech.

Gapping

- 13.92 The phenomenon known as GAPPING occurs when a second or subsequent conjoin of a complex coordination contains a medial ellipsis. This happens whenever the elements being coordinated are noncontiguous elements in the clause. For example:

(i) SUBJECT + OBJECT

[One girl has written a poem], and [the other Δ a short story].

(ii) SUBJECT + ADVERBIAL(S)

[Smith completed the course in thirty-five minutes], and [Johnson Δ in thirty-seven].

(iii) SUBJECT + COMPLEMENT

[Jane has looked more healthy], and [Maurice Δ more relaxed], since their holiday.

There is normally prosodic separation of the conjoins, and in addition, the 'gap' or medial ellipsis is often marked by the end of a tone unit:

Maggie ordered a banana SPLiT] and Mŷra] an ice-cream SUNDae.]

Coordination with gapping is apparently more difficult to decode and comprehend than coordination without gapping. An indication of this is that nongapped interpretations are preferred to gapped interpretations in cases where a sentence permits both kinds of interpretation. In a sentence such as [1], for example, the interpretation indicated by [1a] will be chosen in preference to that of [1b]:

Barbara gave Sue a magnolia and Ada a camellia. [1]

[= Barbara gave Sue a magnolia and Barbara gave Ada a camellia] [1a]

[\neq Barbara gave Sue a magnolia and Ada gave Sue a camellia] [1b]

- Note [a] An additional, rather rare, kind of gapping is that in which the conjoins consist of a subject followed by a predication (the finite verb being ellipted):

John can clean the shed and Sidney Δ feed the chickens.

The fortress had been attacked and its commander Δ killed.

[b] The first element of a gapped coordination is normally the subject of the clause; but exceptions to this occur with fronting (cf 18.20), if the first element is an object or an adverbial, and the subject is ellipted:

The towns they attacked with tanks, and the villages Δ with aeroplanes.

To God he committed his soul, and to the fire Δ his body.

[c] Coordinations of nonfinal sequences of clause elements, eg subject + verb, will be viewed not as complex coordination, but as interpolated coordination (cf 13.95).

- 13.93 For a construction to count as an acceptable gapping, it is necessary that each conjoin consist of a sequence of units at the same level of structure: viz at the level of clause structure. It is not possible, for instance, for each conjoin to consist of a verb phrase together with the first word (a preposition) of a prepositional phrase. Thus:

Roberts won in 1979 and Dingwall in 1980.

is grammatical, but not:

*Roberts won in 1979 and Dingwall 1980.

- Note This applies even to clauses where the verb and the preposition form a 'prepositional verb' (cf 16.5ff), and where the prepositional complement resembles a direct object. Although the preposition in such cases appears to be more closely related to the verb than to its complement, the ellipsis of the preposition is not permissible:

*I looked at Agnes, and she me.

Contrast:

I saw Agnes, and she me.

Appended coordination

- 13.94 There is a loose kind of coordination in which the second conjoin is appended to the clause in which the first conjoin occurs (cf appended clauses, 12.70). In fact, it is preferable to regard all such cases as clause coordination with ellipsis:

John writes extremely well – and SALLY, too. [1]

My mother plays badminton, and sometimes even tennis. [2]

He got a bike for his birthday, and a book and a fountain pen. [3]

His left hook could fell the champion, and indeed any other boxer in his class. [4]

Unlike complex coordination, this type of coordination is characteristic of informal speech. We could argue that [1a] is a case of noun phrase coordination, and is a variant of [1] without a discontinuous subject:

John and Sally write extremely well. [1a]

But this does not account for the singular verb in [1], and it is more realistic to classify such a construction as a coordination of clauses in which the second conjoin, which is elliptical, is added as an afterthought. This latter description also accords better with examples like [2] in which the appended subject is accompanied by an adverbial. In [2] it is the object of an elliptical clause which is appended, rather than a subject.

With *and*, appended coordination has the air of a makeshift improvisation, sometimes accompanied by rhetorical emphasis (as in [4]). But with *or* and

but, it is more likely to occur in careful and/or written types of language:

I am not sure whether JĀNE wrote the letter, or SĀLLY. [5]
PĚTER plays football, but not JŌHN. [6]

In [5] the alternative interrogative clause (cf 15.6) allows the possibility of a postponed conjoin. The same applies to direct alternative questions, and alternative conditional-concessive clauses (cf 11.20f, 15.41). In [6] the repudiatory use of *but* (cf 13.32, 13.42 Note [d]) allows a postponed negative conjoin. These are special constructions in which appended coordination occurs freely.

Interpolated coordination

13.95 Another less regular type of coordination may be called INTERPOLATED, because one of the conjoins behaves as if it is inserted, as a parenthesis, in the middle of the clause. Once again, the coordination can be regarded as an elliptical reduction of clause coordination, and in some cases there is a direct parallel between interpolated coordination and clause coordination with general ellipsis in the second conjoin:

He is, {or WĀS at any rate, } a major composer. [1]
 {or at least he WĀS, }

He is a major composer, or at least he WĀS Δ. [1a]

Similarly, appended coordination such as that of [1] of 13.94 can be reordered so as to produce an example of interpolated coordination:

John – and Sally, too – writes extremely well. [2]

If we attempt to analyse [2] as having a coordinated subject, we have to deal with the curiosity of a plural subject with a singular verb; but if we treat it as a case of interpolated coordination, we accept that the subject-verb concord will be unaffected by interpolated elements.

Note The coordination of the definite and indefinite articles (cf 13.71 Note [c]) may be treated as a case of interpolated coordination.

13.96 Two main distinguishing marks of interpolated coordination are these:

- The second conjoin is normally separated by prosody (in speech) or punctuation (in writing) from the rest of the clause, and thereby shows itself to be syntactically dislocated.
- There is no requirement that the interpolation acting as second or subsequent conjoin should constitute a grammatical unit, or even a sequence of grammatical units of the same rank. For example, the second conjoin in [1a] in 13.95 is *at least he was* [A S V], whereas in [3] below the second conjoin consists of an adverbial *at least*, a main verb *believes*, and the first part of a subordinate clause *that he is*:

He is, or *at least believes that he is*, a major composer. [3]

He may be, and (*certainly*) *believes that he is*, a major composer. [3a]

This sequence of words has no autonomy as a grammatical unit, and does not

match the grammatical form of the first conjoin, *is*. But with interpolated coordination this does not matter: the only important requirement is that the second conjoin (or interpolation) be capable of replacing the first conjoin, so that the result of the substitution is a grammatical sentence. This condition, which is less exacting than that which applies to simple coordination (cf 13.43, 13.49, 13.88) is fulfilled in 13.95 [1a] and 13.96 [3]:

{He is a major composer.
At least he was a major composer.} (cf [1a])

{He is a major composer.
He at least believes that he is a major composer.} (cf [3])

Like complex coordination, interpolated coordination is a device of restricted use, normally associated with the premeditated, primarily written, use of English. Further examples are:

The folk music of his native Romania [inspired], and [provided the thematic material for], his greatest work.

She [can], and [probably will,] beat the world record.

Sam [often thought about,] but [never revisited,] the haunts of his childhood.

In these days, few people [learn,] or [indeed see any point in learning,] the languages of Homer and Virgil.

Stylistically, such interpolated coordination is often awkward, and is best avoided if a more straightforward construction can produce the same meaning and effect. Thus instead of the first sentence above one could write:

The folk music of his native Romania inspired his greatest work, and provided the thematic material for it.

Note Interpolated coordination may be distinguished from PARENTHETICAL COORDINATION, where an unreduced coordinate clause is inserted parenthetically within another clause:

They asked Bill Judd – and he's one of the best managers in the country – if he would take over the team next season.

Compare also PARENTHETICAL PARATAXIS, where the parenthetically included clause is completely independent of the other clause:

Enterprising businessmen sell earthworms (they are one of the best soil conditioners) in hundreds of retail stores across the United States and Canada.

13.97 Some types of coordination which, on purely formal grounds, belong with complex coordination seem to belong with interpolated coordination in terms of prosody and style. These are coordinations where the conjoins consist of a sequence of nonfinal clause elements:

- SUBJECT + VERB

[Richard admires], but [Margaret despises], the ballyhoo of modern advertising.

- ADVERBIAL + VERB

Gregory Peck [always was], and [always will be], her favourite Hollywood star.

(iii) VERB + OBJECT (when the object is not at the end of the clause)

Mrs Symes [gave a thousand dollars], and [promised several thousand more], to the fund for disabled athletes.

To see that these have the character of interpolated coordination, we note firstly the strength of the intonation boundaries enclosing the second conjoin:

Gregory Peck always WÁS| and always WÍLL be| her favourite
Hollywood STÀR|

and secondly, the ease with which these examples could be changed by inserting or subtracting words from either conjoin. For example, if we add or subtract adverbials from one or the other conjoin in the above example, this is only a superficial variation within the basically versatile pattern of interpolated coordination:

Gregory Peck { was,
always was, } and (no doubt) always will be,
her favourite Hollywood star.

Idiomatic and expressive uses of coordination

Pseudo-coordination: *try and come*, etc

- 13.98 When they precede *and*, members of a small class of verbs or predications have an idiomatic function which is similar to the function of catenative constructions (cf 3.49) and which will be termed PSEUDO-COORDINATION. The clearest example is *try*:

I'll *try and* come tomorrow.

This is roughly equivalent to *I'll try to come tomorrow*, but is more informal in style. Further:

They sat *and* talked about the good old times.

is similar in meaning to *They sat talking about the good old times*. Pseudo-coordination belongs to informal style, and many examples have a derogatory connotation:

Don't just stand there *and* grin. [= stand there grinning]
He went *and* complained about us.
They've gone *and* upset her again.
Run *and* tell him to come here at once.
Why did you go *and* do a silly thing like that?

Like *try* in being followed by a *to*-infinitive in the corresponding regular form are *stop*, *go*, *come*, *hurry up*, and *run*. Like *sit* are *stand* and (positional) *lie*.

This quasi-auxiliary use of *try* appears to be limited to the base form of the verb. Contrast the acceptability of:

Try *and* see him tomorrow.
He may try *and* see us tomorrow.
They try *and* see us every day.

with the unacceptability of:

*He tried *and* saw us yesterday.
*She has tried *and* spoken to him.
*He tries *and* sees us every day.

Instead of coordination, in such cases, we have to use the *to*-infinitive; eg:

He tried to see us every day.

- Note [a] Of the two *-ed* participle forms of *go* (cf 3.19 Note [b]) both *gone* and *been* occur in pseudo-coordination in BrE, but only *gone* occurs in pseudo-coordination in AmE:

They've *gone* and spilled wine on the floor. <BrE and AmE>

They've *been* and spilled wine on the floor. <BrE>

The normal meaning of *go* is lost in these sentences. There is no aspectual difference between them, of the kind normally associated with *gone* and *been* (cf 4.22 Note [b]), and both usages are informal and derogatory. BrE has a humorous usage in which both *been* and *gone* are conjoined with a third verb: *Look what you've been and gone and done*.

[b] In familiar speech we also find the idiom:

He { *up*
upped } and hit me. She { *up*
upped } and left him.

Pseudo-coordination: *nice and warm*, etc

- 13.99 Again in informal speech, there is a special use of some commendatory adjectives as first conjoin of a coordination by *and*. The most common adjective of this type is *nice*:

This room is *nice and warm*. [= 'warm to just the right degree']

The semantic role of the first adjective is more like that of an intensifier than that of an adjective, hence this, too, may be regarded as *pseudo-coordination*. Other examples include:

His speech was *nice and short*.
It was *lovely and cool* in there. [= 'comfortably cool']

Some speakers (esp in AmE) use *good* in the same way:

The road is *good and long*.

even where the adjectival form following *and* is used as an adverb:

I hit him *good and hard*. She drove *good and fast*.

- Note [a] In attributive rather than predicative function, adjectives of the kind just illustrated commonly occur without *and* (cf 17.114):

It's a *lovely warm* day. He made a *nice short* speech. It was a *good long* way to the corner.

[b] A comparable construction is the stereotyped use of the conjoined adverbs *well and truly* as in:

Some of the guests were *well and truly* drunk.

The intensifying use of coordination

- 13.100** There are a number of circumstances in which a word or phrase is coordinated with itself. With comparative forms of adjectives, adverbs, and determiners, the effect is to express a continuing increase in degree. The comparative forms *more* and *less*, or else the inflected forms in *-er*, are often coordinated in this way:

She felt *more and more* angry. } [⇒ She felt increasingly angry.]
 She felt *angrier and angrier*.

The car went *more and more* slowly. } [= The car went increasingly
The car went *slower and slower*. } slowly.]

Coordination of this kind with more than two conjoins also occasionally occurs:

The noise got *louder and louder and louder*, until it sounded as if a whirlwind had entered the house.

Asyndetic coordination is rare, but not impossible here: *The noise got louder, louder, louder...*

The iterative or continuative use of coordination

- 13.101** Another kind of expressive repetition with *and* conveys the idea of a repeated or continuing process. This iterative use of coordination may be found with verbs:

He *talked and talked and talked*. [= He talked for a very long time.]
They *knocked and knocked*. [= They knocked repeatedly.]

They *knocked and knocked*. [= They knocked repeatedly.]

both with and without the conjunction:

They kept *talking, talking, talking* all night long.

It also occurs with adverbs, especially with *again* and the prepositional adverbs *over*, *on*, *around*, *up*, *down*, etc:

I've said it *again and again* [= repeatedly], but she still takes no notice.

He kept repeating the name *over and over*.

She talked *on and on and on*. [= continuously]

The balloon went *up and up* into the sky. [= continuously upwards]

Again, asyndetic coordination can be used for special dramatic emphasis:

The balloon went *up, up, up*, until it was a tiny speck in the sky.

A similar effect of iteration or alternating movement is sometimes achieved by coordinating contrasting prepositions or prepositional adverbs: *on and off, off and on, in and out, up and down, backwards and forwards*, etc:

Jill and Eric have been seeing one another *off and on* for the last five years. [= intermittently]

We watched the mother bird going *in and out* of the nest [= repeatedly in and out] trying to satisfy the appetite of the hungry fledglings.

The combination of this type of coordination with the repetitive coordination above produces a more vivid and emphatic effect:

The soldiers marched *up and down, up and down* to the music of the band.

The repetitive types of coordination mentioned in this and the preceding sections, and especially the last type, are particularly characteristic of popular narrative style.

Other expressive uses of coordination

- 13.102** The coordination of identical items also occurs with nouns. The effect, if the noun is repeated once, may be to suggest that different types, especially good and bad, can be distinguished:

There are *teachers and teachers*. [roughly: 'good and bad teachers']

You can find *doctors and doctors*. [roughly: 'good and bad doctors']

But if the noun is repeated more than once, the effect is to suggest a large number or quantity:

We saw *dogs and dogs and dogs* all over the place.

There was nothing but *rain, rain, rain* from one week to the next.

Somewhat similar to these last examples is the intensifying effect of repetition of attributive adjectives and of degree intensifiers:

an *old, old* man [= 'a very old man']

very, very, very good [= 'extremely good']

But this type of coordination is always asyndetic.

In informal speech, the coordination of a noun phrase with . . . or so is used to express approximation. The noun phrase is normally a phrase of measurement. Compare the following with the coordination of numerals (cf 13.71):

I liked $\left\{ \begin{array}{l} \text{the year or } \left\{ \begin{array}{l} \text{two} \\ \text{so} \end{array} \right\} \text{ I spent there.} \\ \text{*the man or } \left\{ \begin{array}{l} \text{two} \\ \text{so} \end{array} \right\} \text{ I saw there.} \end{array} \right.$

I liked { *the man or { two } I saw there.
so }

The limitations become clear with additional examples; thus although we can speak of:

a dollar or so to spend a glass { of beer or so
a pound or so of butter or so of beer

a pound or so of butter a glass } or so of beer

we cannot speak of **a chair or so*, **a child or so*, and still less of **the chair or so*, though '*another chair or so*' is acceptable. Hence the head nouns preceding the *or so* approximation must be units of measurement (*year, pound*) or items contextually rendered units of measurement (*another N*). It may be worth mentioning that 'a glass of beer or so' has the structure:

a [glass [of beer]] or so.

- Note [a] The stereotyped coordination in *out and out* has an intensifying effect in premodification of nouns:

He's an *out and out* liar. [= an utter, thoroughgoing liar]

Out-and-out is often hyphenated.

- [b] In informal speech, expressions like *yes, no, well, OK, all right* are often repeated for emphasis (cf 18.58 on repetition).

Quasi-coordinators

- 13.103 In addition to the semi-coordinators *nor, so, and yet* mentioned in 13.19, there are several linking items which we may call QUASI-COORDINATORS, because they behave sometimes like coordinators, and at other times like subordinators or prepositions. The most prominent of them are clearly related to comparative forms (cf 15.63ff):

as well as, as much as, rather than, more than

Others are *if not, not to say*, and the correlative *not so much . . . as*.

In the following examples, the quasi-coordinators do not introduce clauses or noun phrases, and resemble coordinators in that they link 'conjoins' of varying grammatical constituency:

He [publishes] *as well as* [prints] his own books.

The speech was addressed [to the employers] *as much as* [to the strikers].

It was [how well] *more than* [how loud] she sang that impressed me.

He is [to be pitied] *rather than* [to be disliked].

Her manner was [unwelcoming] $\left\{ \begin{array}{l} \text{if not} \\ \text{not to say} \end{array} \right\}$ [downright rude].

His latest play is *not so much* [a farce] *as* [a burlesque tragedy].

In other sentences, however, they clearly have a prepositional or subordinating role, and have the mobility of adverbials, in that they can be placed in initial or final position (cf 15.52):

$\left\{ \begin{array}{l} \text{As well as printing the books,} \\ \text{He publishes the books,} \end{array} \right.$ *as well as printing them.*

$\left\{ \begin{array}{l} \text{Rather than cause trouble,} \\ \text{I'm going to forget the whole affair.} \end{array} \right.$ *rather than cause trouble.*

$\left\{ \begin{array}{l} \text{Rather than cause trouble,} \\ \text{I'm going to forget the whole affair,} \end{array} \right.$ *rather than cause trouble.*

Another reason for not treating these items as fully coordinative is that in subject position, they normally do not bring about plural concord if the first noun phrase is singular:

John, *as much as his brothers*, was responsible for the loss.

In this they resemble prepositions such as *with, in addition to, and after* more than coordinators like *and*; compare:

John, *with his brothers*, was responsible for the loss.

One senator *after another* has protested against the ban.

Compare, however, interpolated coordination (cf 13.95), where there can be a similar lack of plural concord, even with *and*. These observations remind us that coordination is related by gradience to subordination (cf 13.18f), and suggest that just as semi-coordinators such as *for* and *so that* are placed on the scale between coordinators and subordinators, so quasi-coordinators such as *as well as* may be regarded as taking their place on a scale between coordinators and prepositions.

- Note [a] Nonrestrictive relative clauses have also been considered semantically equivalent to coordinated clauses. Such a classification seems particularly appropriate in the case of sentential relative clauses (cf 15.57), where the relative clause has the rest of the superordinate clause as its antecedent:

Pam didn't go to the show, *which is a pity*. ['... and that is a pity']

- [b] Less common examples of quasi-coordinators are *still less* and its informal synonym *let alone*:

I've not even read the first chapter, $\left\{ \begin{array}{l} \text{still less} \\ \text{let alone} \end{array} \right\}$ finished the book.

To these may be added the infinitive construction *not to mention*, which is, however, more restricted in that it requires a following noun phrase:

He wrote twenty novels, *not to mention* six thick volumes of verse.

- [c] The parallels between interpolated coordination ([1] cf 13.95f), quasi-coordination ([3]), prepositional phrases ([2]), and adverbial clauses ([4] cf 15.17ff) is illustrated in the following:

The next meeting, $\left\{ \begin{array}{l} \text{and} \\ \text{like} \end{array} \right\}$ *the one after it*, will be very important. [1]

The next meeting, *as well as the one last month*, will be very important. [2]

The next meeting will be very important, *as was the one last month*. [3]

Whereas [5] is unacceptable because of the requirement that conjoins should be mutually substitutable, [6] is acceptable because of the status of *like* as a preposition:

*The next meeting, *and the one last month*, will be very important. [5]

The next meeting, *like the one last month*, will be very important. [6]

Abbreviations for coordination

- 13.104 The tags *and so on, and so forth, and et cetera* (Latin = 'and others', abbreviated in writing as *etc*) are abbreviatory devices which are added to a coordinated list, to indicate that the list has not been exhaustively given:

He packed his clothes, his books, his papers, *etc*.

And so on and *and so forth* (and their combination *and so on and so forth*) are

used in the same way, but are restricted to informal use, and tend to occur after coordinated clauses rather than coordinated phrases. A less common phrase of the same kind is *and the like*.

Note [a] Another abbreviatory device used in a similar way to *etc* is the Latin *et al* (in full *et alii/aliae/alia* = 'and others'), which indicates incompleteness of a list of names. It is most common in legal documents and in scholarly writing or lecturing, in the latter case to avoid repeating a list of coauthors:

J C Brown *et al*.

[b] Mention should also be made of the learned abbreviation *et seq* (Latin *et sequens*) meaning 'and the following (page)'. This sometimes has a plural form with letter reduplication *et seqq*, paralleling the use of reduplication of (final) letters to indicate plurality in other abbreviations such as *ff*, *MSS*, *pp* (cf 5.81 Note).

[c] The abbreviation *iff* in logical and mathematical discourse means 'if and only if'.

Bibliographical note

General studies of coordination include: Dik (1968); Dougherty (1970–71); Gleitman (1965); Schachter (1977); Stockwell *et al* (1973), Ch. 6.

Coordination and subordination

- 14.1 In Chapters 10 and 11 we studied the simple sentence, a sentence consisting of a single clause in which each of its elements (subject, object, adverbial, etc) is realized by a subclausal unit – a phrase. The multiple sentence, on the other hand, consists of more than one clause. One of the two major devices for linking clauses within the same sentence is coordination, which we discussed in Chapter 13. We there distinguished coordination from the other major device, subordination (*cf* 13.2*ff*). In this chapter we examine the complex sentence, a sentence in which one of the elements is realized by a subordinate clause. Here we discuss the structural types of subordinate clauses, the formal indicators of subordination, and the choices affecting the verb phrases of subordinate clauses.

Compound and complex sentences

- 14.2 The major types of multiple sentences are the compound and the complex sentence. A compound sentence consists of two or more coordinated main clauses; the clauses of a compound sentence provide classic instances of a paratactic relationship (*cf* 13.2), that is they have equivalent function, as diagrammatically indicated in *Fig* 14.2a overpage. The two main clauses in the Figure are equal constituents of the sentence, and are linked by the coordinator *but*.

A complex sentence is like a simple sentence in that it consists of only one main clause, but unlike a simple sentence it has one or more SUBORDINATE clauses functioning as an element of the sentence. Subordination is an asymmetrical relation: the sentence and its subordinate clauses are in a hypotactic relationship (*cf* 13.2), that is they form a hierarchy in which the subordinate clause is a constituent of the sentence as a whole – an adverbial in the example diagrammed in *Fig* 14.2b overpage.

Subordination is not the only factor that enters into either the length or the complexity of sentences, when 'complexity' is understood in a nontechnical sense. Phrases may be complex in the degree of their modification; the vocabulary may be obscure; because of their compression, nominalizations (*cf* 17.51*ff*) may be more difficult to understand than corresponding subordinate clauses; the coherence of the sentence as a whole may be difficult to understand; the content of the sentence may presuppose knowledge that is not generally available.

With respect to its function, a subordinate clause may be viewed as downgraded to a subclausal unit, such as a prepositional phrase:

Although I admire her reasoning, I reject her conclusions.
 ['Despite my admiration for her reasoning, I reject her conclusions']

Both the subordinate clause and the prepositional phrase in the paraphrase are functioning as adverbials within their sentence.

A clause that is not subordinate to another clause is an INDEPENDENT clause. Hence the two main clauses in *Fig* 14.2a and the main clause (identical with the sentence) in *Fig* 14.2b are independent clauses.

Fig 14.2a Compound sentence: coordination

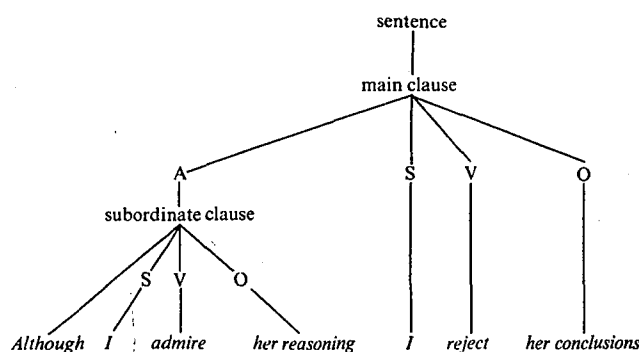

Fig 14.2b Complex sentence: subordination

- Note [a] Main clauses have also been called 'principal clauses' or (less commonly) 'head clauses'.
 [b] Subordinate clauses (sometimes abbreviated to 'sub-clauses') have also been called 'dependent', 'embedded', 'included', 'constituent', and 'syntactically bound' clauses.
 [c] Some grammarians have extended the term *sentence* to cover what we have termed *clause*.
 [d] Main clauses are generally also independent clauses. But if a coordinated main clause when it is isolated from the rest of the sentence is unacceptable as a simple sentence, it is not an independent clause. For example, the second clause below is structurally deficient as a simple sentence because of the ellipsis, the acceptability of the clause depending on its relationship to the first clause:

The plot was exciting and *the characterization plausible*.

Subordinate and superordinate clauses

- 14.3 Figures 14.2a and 14.2b present uncomplicated examples involving just two clauses. In Fig 14.2b the two clauses in the complex sentence are the subordinate clause and the SUPERORDINATE clause, of which the subordinate clause is a constituent; the superordinate clause is therefore also the main clause. But a clause may enter into more than one relationship; it may be subordinate to one clause and superordinate to another, as indicated in Fig 14.3a opposite.

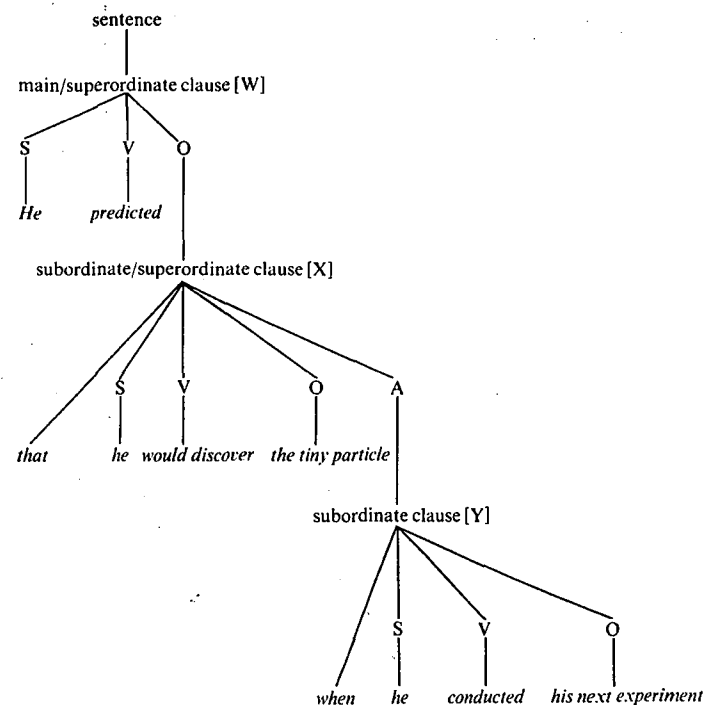

Fig 14.3a Superordinate and subordinate clauses

Clause [W] is superordinate to clause [X], which is in turn superordinate to clause [Y]. Conversely, clause [Y] is subordinate to clause [X], which is in turn subordinate to clause [W]. Clause [X] is therefore both superordinate to clause [Y] and subordinate to clause [W]. The relationships may be further clarified by labelled bracketing:

W- X-
 (He predicted [that he would discover the tiny particle
 Y- -Y-X-W
 {when he conducted his next experiment}])

In each instance the subordinate clause is included in its superordinate clause: [X] functions as object in [W], while [Y] functions as adverbial in [X].

The device of subordination enables us to construct a multiple hierarchy of clauses, one within the other, sometimes resulting in extremely involved sentences (cf 14.37ff). Further complexity and structural variability are provided by the interrelation of subordination and coordination. Each main clause in a compound sentence may include one or more subordinate clauses,

each of which may in turn include subordinate clauses. An example, by no means unusually complicated, appears in Fig 14.3b, where the labelling has been abbreviated:

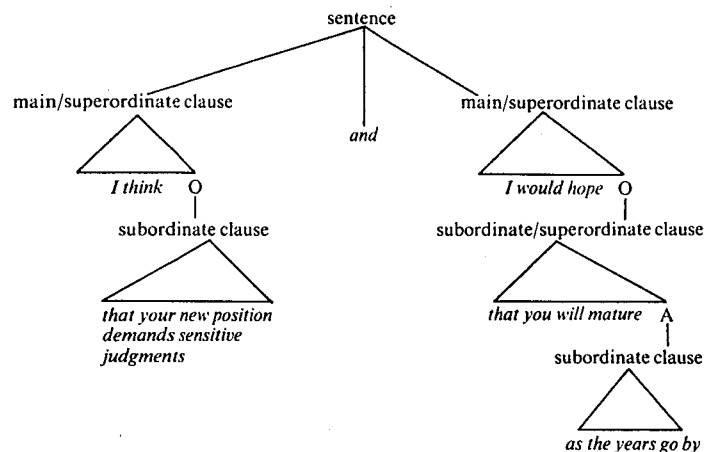

Fig 14.3b Compound sentence with subordinate clauses

Similarly, coordination may occur at any level. In Fig 14.3c the two subordinate clauses of the complex sentence are coordinated:

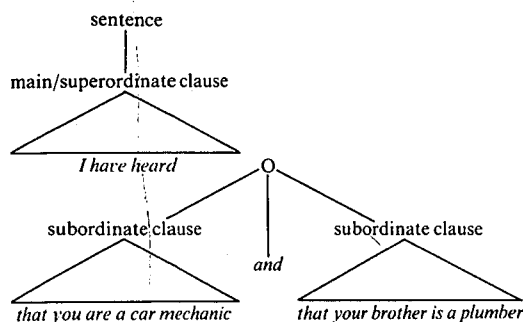

Fig 14.3c Complex sentence with coordinated clauses

A subordinate clause may function not only as a clause element of a superordinate clause but also as a constituent of a phrase, for example as a relative clause postmodifying a noun phrase:

The school *which my children attend* is within walking distance.

We consider such noun phrases to be complex, but we do not consider a sentence with a complex noun phrase to be a complex sentence merely on the grounds that it contains a complex phrase (cf 10.1 Note [a]).

Subordinate and matrix clauses

- 14.4 We have pointed out that a subordinate clause is a part of its superordinate clause, functioning as one of its elements. Thus, we can match clauses with phrases or words in the same function, direct object in [1] and adverbial in [2]:

We noticed	{ that they were nervous. their nervousness.	[1]
One matures	{ as the years go by. eventually.	[2]

We have no more reason to designate *We noticed* and *One matures* as clauses in their own right when they are followed by subordinate clauses than when they are followed by phrases or words. For both alternatives in [1] and [2] the clause that begins the sentence concludes the sentence.

Nevertheless, we find many occasions in this chapter, particularly in discussing adverbial clauses, when it is useful to distinguish between a subordinate clause and the rest of the superordinate clause of which it is part. When we have needed to do so, we have used the term **MATRIX** clause to designate the superordinate clause minus its subordinate clause. For example, we have referred to the situation described in the matrix clause as contingent on that of the subordinate conditional clause (cf 15.35):

I'll lend you some money if you don't have any money on you. [3]

The matrix clause *I'll lend you some money* conveys an offer that is consequent on the fulfilment of the condition expressed in the subordinate clause *if you don't have any money on you*. Similarly, we have referred to the matrix clause in discussing the time reference of adverbial clauses of time. For example, subordinators such as *before* and *until* indicate that the situation described in the matrix clause occurred before or led up to that in the subordinate clause (cf 15.27).

We illustrate in Fig 14.4 what we have termed a matrix clause.

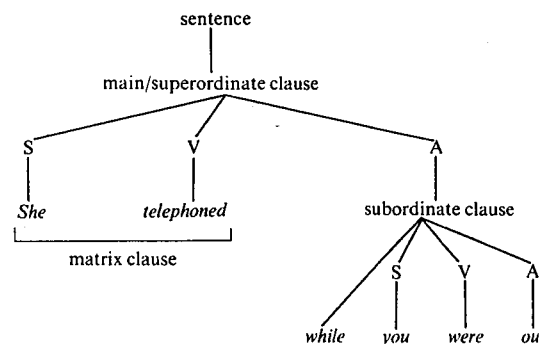

Fig 14.4 Matrix and subordinate clause

Note Some have used the term 'main clause' for what we term matrix clause.

Finite, nonfinite, and verbless clauses

14.5 We recognize three main structural types of clauses:

FINITE CLAUSE: a clause whose verb element is finite (such as *takes, took, can work, has worked, is writing, was written*; cf 3.52ff), eg:

I can't go out with you *because I am studying this evening*.

NONFINITE CLAUSE: a clause whose verb element is nonfinite (such as *to work, having worked, taken*; cf 3.53), eg:

Knowing my temper, I didn't reply.

VERBLESS CLAUSE: a clause that does not have a verb element, but is nevertheless capable of being analysed into clause elements, eg:

Although always helpful, he was not much liked.

We recognize nonfinite and verbless structures as clauses because we can analyse their internal structure into the same functional elements that we distinguish in finite clauses. Consider, for example, the analysis of the nonfinite clause in:

Knowing [V] my temper [O_d], I didn't reply.

The analysis depends on the analogy with the corresponding finite clause:

I [S] know [V] my temper [O_d].

Similarly, the verbless clause *although always helpful* in:

Although [conj] always [A] helpful [C_s], he was not much liked.

It is analysed as in the corresponding finite clause:

Although [conj] he [S] was [V] always [A] helpful [C_s], he was not much liked.

One structural type of clause may be embedded within another:

Too nervous to reply after other speakers had praised her devotion to duty, Margaret indicated that she would speak later. [1]

The italicized subordinate clause in [1] is a verbless clause that contains a subordinate nonfinite clause (beginning *to reply*) that in turn contains a subordinate finite clause (beginning *after other speakers*).

Note We recognize a structure as a clause only when it is describable in terms of clausal rather than phrasal structure. Hence the subject in [2] is considered a noun phrase because it has the structure of a noun phrase with *conquest* as its head:

William's conquest of England brought about a change in the status of the English language. [2]

Compare *William's conquests of other countries*, where the head of the phrase shows that it can take the number contrast that is characteristic of most nouns. On the other hand, the phrase structure of *William's conquest of England* is related to clause structure (*William conquered England*) through nominalization (cf 17.51ff). Both the clause and the phrase can be described

semantically as a sequence of agentive, activity, and affected, but semantic grounds are not sufficient for syntactic analysis. Only the clause do we analyse syntactically as a sequence of subject, verb, and object. For example, consider *part-time teaching* in:

I enjoy *part-time teaching*.

It has the structure of a noun phrase with *teaching* as head and *part-time* as premodifier. Contrast *teaching undergraduates* in:

I enjoy *teaching undergraduates*.

It has the structure of a clause (as in *I teach undergraduates*) with *teaching* as verb and *undergraduates* as object. On the other hand, there is structural ambiguity in:

I enjoy *teaching*.

Teaching may be a noun phrase with only a head or a clause with only a verb (cf 15.13).

Nonfinite clauses

14.6 The nonfinite clause may be with or without a subject. The classes of nonfinite verb phrase (cf 3.53) serve to distinguish four structural classes of nonfinite verb clauses:

(i) TO-INFINITIVE

without subject: The best thing would be *to tell everybody*.

with subject: The best thing would be *for you to tell everybody*.

The infinitive clause with *to* plus a subject is found characteristically in constructions with anticipatory *it* (cf 18.33ff), for being used to introduce the subject: *It would be better for you to tell everybody*.

(ii) BARE INFINITIVE

without subject: All I did was *hit him on the head*.

with subject: *Rather than you do the job*, I'd prefer to finish it myself.

The bare infinitive is found characteristically in pseudo-cleft sentences (cf 18.29f), where the infinitival *to* is optional:

What they did was (to) *dig a shallow channel around the tent*.

(iii) -ING PARTICIPLE

without subject: *Leaving the room*, he tripped over the mat.

with subject: *Her aunt having left the room*, I asked Ann for some personal help.

When the subject of *-ing* clauses is expressed, it is often introduced by a preposition (cf 14.19 Note [b]):

With the audience turning restive, the chairman curtailed his long introduction.

On the question of genitive subjects, cf 15.12.

(iv) -ED PARTICIPLE

without subject: *Covered with confusion*, they apologized abjectly.

with subject: *The discussion completed*, the chairman adjourned the meeting for half an hour.

Categories (i) and (iii) are used most frequently; category (ii) is relatively rare.

Except for the *-ed* clause, which is inherently passive (cf 14.7), all types of nonfinite clauses have both active and passive forms, for example:

It would be possible *for my son to drive you to the airport*.

~ It would be possible *for you to be driven to the airport by my son*.

Rather than *Michael guarantee the loan*, it can be done by his father.

~ Rather than *the loan be guaranteed by Michael*, it can be done by his father.

The parents having paid for the damaged window, the police were not called.

~ *The damaged window having been paid for by the parents*, the police were not called.

Progressive and perfective forms may function in the verb phrase of nonfinite clauses, though the nonfinite verb paradigm is somewhat defective (cf 3.56). But modal auxiliaries are excluded, since they have neither infinitives nor participles.

In negative nonfinite clauses, the negative particle is generally positioned before the verb or the *to* of the infinitive:

It's his fault *for not doing* anything about it.

The wisest policy is (for us) *not to interfere*.

Adverbs and brief prepositional phrases that intervene between *not* and the verb in finite clauses may also come between *not* and the verb:

It's his fault *for not ever doing* anything about it.

When *not* is inserted, there is often some aspectual marking:

The purse *not having been found*, } we went to the police.
The purse *not yet found*, }

On the split infinitive, cf 8.21.

14.7 The normal range of clause types (cf 10.2) is available for most nonfinite clauses, as in this set of *to*-infinitive clauses:

SV I expect *them to come*.

SVO They wanted *us to learn economics*.

SVC Joe supposed *the stranger to be friendly*.

SVA It's great *for everybody to be here*.

SVOO It's best *for you to give him a call*.

SVOC Paul prefers *me to make the difference clear*.

SVOA He got *her to put the car in the garage*.

The subject of nonfinite clauses, however, is commonly absent.

Because it is generally both syntactically and semantically passive, the *-ed* participle clause is restricted to the four types of passive clauses. In [1] the subordinator *when* introduces the *-ed* clause:

(S)V_{pass} ~ active SVO

When questioned, she denied being a member of the group.

[1]

(S)V_{pass}C ~ active SVOC

Considered works of art, they were admitted into the country without customs duties.

[2]

(S)V_{pass}A ~ active SVOA

Kept in the refrigerator, the drug should remain effective for at least three months.

[3]

(S)V_{pass}O ~ active SVOO

Allowed unusual privileges, the prisoner seemed to enjoy his captivity.

[4]

14.8 Because nonfinite clauses lack tense markers and modal auxiliaries and frequently lack a subject and a subordinating conjunction, they are valuable as a means of syntactic compression. Certain kinds of nonfinite clause are particularly favoured in written prose, where the writer has the leisure to revise for compactness. We recover meanings associated with tense, aspect, and mood from the sentential context. We can also normally see a correspondence with a finite clause with a form of the verb BE and a pronoun subject having the same reference as a noun or pronoun in the same sentence (cf 15.58ff). For examples 14.7 [1-4], one might make the following insertions:

When (she was) questioned, she denied being a member of the group.

[1a]

(Since/Because/As they were) *considered works of art*, they were admitted into the country without customs duties.

[2a]

(If it is) *kept in the refrigerator*, the drug should remain effective for at least three months.

[3a]

(Since/After he was) *allowed unusual privileges*, the prisoner seemed to enjoy his captivity.

[4a]

On the other hand, [5] shows how the advantage of compactness must be balanced against the danger of ambiguity; for the absence of a subject leaves doubt as to which nearby nominal element is notionally the subject:

We met you (*when you?/we? were*) leaving the room.

[5]

With infinitive clauses, a corresponding finite clause also enables one to identify an understood subject:

I asked *to go*. ~ I asked *if I could go*.

I asked *him to go*. ~ I asked *if he would go*.

When no referential link with a nominal can be discovered in the linguistic context, an indefinite subject may be inferred, or else the 'I' of the speaker:

To be an administrator is to have the worst job in the world. ['For a person to be . . .']

The prospects are not very good, *to be candid*. [' . . . if I am to be candid']

Contrast:

It's hard work *to be a student*. [indefinite subject; cf 10.42f]

It's hard work, *to be honest*. [I as subject; cf 8.125]

Verbless clauses

- 14.9 Verbless clauses take syntactic compression one stage further than nonfinite clauses and like them are also commonly subjectless. Once again (cf 14.8), it is often possible to postulate a missing form of the verb BE and to recover the subject, when omitted, from the context:

Whether right or wrong, he always comes off worst in argument.

['whether *he* is right or wrong']

One should avoid taking a trip abroad in August *where possible*. ['where *it* is possible']

Verbless clauses can also sometimes be treated as reductions of nonfinite clauses:

Too nervous to reply, he stared at the floor. ['*Being* too nervous to reply ...']

(Here the verbless clause itself contains a subordinate nonfinite clause, *to reply*.)

When the subject is present, only the verb has to be recovered, though it is not always possible to insert it without juxtaposing the clause (cf [2] below):

73 people have been drowned in the area, *many of them children*.

['many of them being children'] [1]

There he stood, *a tray in each hand*. ['a tray was in each hand'] [2]

The subject is often introduced by *with* (cf 14.15):

With the children at school, we can't take our vacations when we want to. [3]

Since it is usually possible to interpret the clause as having an omitted BE, the verbless clause is limited to the two clause-types SVC and SVA, with or without a subordinator (*sub*):

She looked at him expectantly, *her eyes full of excitement and curiosity*. [S (V) C] [4]

I do not wish to describe his assertions, *some of them offensive*.

[S (V) C] [5]

He looked remarkably well, *his skin clear and smooth*. [S (V) C] [6]

Though somewhat edgy, she said she would stay a little longer.

sub [S (V) C] [7]

We can meet again tomorrow, *if necessary*. sub [S (V) C] [8]

Mavis sat in the front seat, *her hands in her lap*. [S (V) A] [9]

While at college, he was a prominent member of the dramatic society. sub [(S V) A] [10]

It is also possible in [9] to view the understood verb as HAVE ('having her hands in her lap', cf 'with her hands in her lap'), in which case the structure is [(S V) O A].

Optional adverbials may also be added, either initially or finally:

'Thank you very much,' said Raymond, *ever mindful of his manners*.

[(S V) A_{frequency} C_s]

Loath to reply for fear of offending her parents, she strode out of the room. [(S V) C_s A_{reason}]

Though now frail, they were quite capable of looking after themselves.

sub [(S V) A_{time} C_s]

When the verbless clause is reduced to its minimum of a single complement or adverbial, it may not be easy to distinguish it from an appositive construction (cf 17.65ff), a nonrestrictive postmodifier (cf 17.48f), or an adverbial which is a direct constituent of the main clause. The initial prepositional phrase below is an adverbial of the sentence:

Of humble parentage, he began his working life in a shoe factory.

It might be regarded as an adverbial realized by a verbless clause consisting of just a complement, because its analysis is directly parallel to nominal or verbless clauses like:

A man of humble parentage, ... ~ Born of humble parentage, ...

Similarly, if the final noun phrase below had been placed next to the subject we would have recognized it as full apposition:

The river lay in its crescent loop entirely without movement, *an artifice of green-black liquescent marble*.

As it is, we could regard it as a verbless clause functioning as an adverbial. Indeed, many instances of partial apposition with noun phrases (cf 17.66) could be equally regarded as verbless clauses, eg:

Judge Clement Turpin, *now a federal appeals court judge*, is being considered for appointment to the US Supreme Court.

Formal indicators of subordination

- 14.10 Subordination is generally marked by a signal in the subordinate clause. The signal may be of various kinds:

- (i) The clause is initiated by a subordinating conjunction (14.11ff).
- (ii) The clause is initiated by a *wh*-element (14.20).
- (iii) Initial elements in the clause are inverted (14.20).
- (iv) The presence of certain verb forms in finite clauses is determined by the type of subordinate clause (14.21ff).
- (v) The verb element of the clause is either nonfinite or absent (14.20).

More than one subordination signal may cooccur in the same subordinate clause. For example, a nonfinite or verbless clause may be introduced by a subordinating conjunction (cf 14.15ff).

- Note [a] The verb form in the superordinate clause may also be affected by the type of subordinate clause. The clearest example is in the hypothetical condition relationship (cf 15.36).
[b] For nonfinite and verbless clauses that are not part of a superordinate clause, cf 11.40f.

Subordinators

- 14.11** SUBORDINATORS (or more fully SUBORDINATING CONJUNCTIONS) are the most important formal device of subordination, particularly for finite clauses. Like prepositions, which they resemble in having a relating function, subordinators forming the core of the class consist of a single word, but there is a larger range of complex subordinators which function, to varying degrees, like a single conjunction. In addition, there is a small class of correlative subordinators, which combine two markers of subordination, one being a subordinator.

Subordinators may be restricted to particular types of clauses, as the following sections show.

Subordinators for finite clauses

- 14.12** Most subordinators may introduce finite clauses. Here is a list of those subordinators. They are divided into simple, complex, and correlative subordinators. The correlative subordinators are listed and discussed in 14.13.

SIMPLE SUBORDINATORS

after, although, as, because, before, directly <informal, esp BrE>, *if, immediately* <informal, esp BrE>, *lest* <esp AmE>, *like* <informal, esp AmE>, *once, since, that, though, till, unless, until, when(ever), where(ver), whereas, whereupon, while, whilst* <a minority alternative to *while*, esp BrE>

COMPLEX SUBORDINATORS

ending with *that*:

but that, in that, in order that, insofar that <formal, rare>, *in the event that, save that* <literary>, *such that*

ending with optional *that*:

- (a) participle form:

assuming, considering, excepting, given, granted, } (that)
granting, provided, providing, seeing, supposing

- (b) others:

except, for all, } (that)
now, so

ending with *as*:

according as, as far as, as long as, as soon as, forasmuch as <formal>, *inasmuch as* <formal>, *insofar as, insomuch as* <formal>

Others:

as if, as though, in case

Note [a] The distinction in form between the simple and complex subordinators is in part orthographic, since some of the simple subordinators are internally (that is morphologically) complex. But their orthographical unity points to the central place of the simple subordinators in the system.

[b] In addition, the following archaic subordinators still have a limited currency: *albeit, whence, whereat, wherefore, whither*.

[c] Many of the subordinators indicate more than one logical relationship. The relationships are discussed in subsequent sections of this chapter.

[d] The omission of an optional *that* in the complex subordinators tends to lower the level of formality. On the other hand, the inclusion of *that* may avoid ambiguity (cf 14.41).

[e] *About* and *without* are used as subordinators for finite clauses in informal style, but are not generally considered acceptable:

?She explained to us *about there's nothing for teenagers to do in the village*.

?We can't even read in our bedroom *without one of the children comes barging in wanting something*.

They are among recent examples of a continuing trend to use prepositions also as subordinators. *On account (of)* <esp AmE>, another recent example, has achieved somewhat greater acceptability in informal style:

I can't come now *on account (of) I have to look after my baby brother*.

[f] *But that* is a subordinator in the sense 'except (that)':

She would have ignored Edward *but that* she knew he would have complained to her sister.

Occasionally *that* is omitted:

It never rains *but* it pours.

Except is used without *that* in the sense 'unless' (cf 15.34):

I wouldn't be here *except* I had to.

But *that* is often added when *except* has the sense 'only' (cf 15.44):

I'd lend you my car *except (that)* I may need it later this afternoon.

[g] The temporal subordinators, interrogative *whether* and *if*, and conditional *if* can alone serve as truncated subordinate clauses functioning as exclamation tags:

A: Brian will attend the class { *if* / *when* } it suits him.

B: (Ah, yes) { *if!* / *when!* }

Virtually any conjunction can function alone as an echo question:

A: I'll let you know *if* there are going to be refreshments.

B: *if?* But surely you promised you would arrange it.

A: We're arriving in New York *after* you leave.

B: *After?* But I was hoping to see you there.

Correlative subordinators

- 14.13** The correlative subordinators are divided into five sets, listed below. The second correlative endorses the meaning of the first. For correlative coordinators, cf 13.33ff.

CORRELATIVE SUBORDINATORS

- | | |
|----------------------|----------------------------------|
| (a) <i>as</i> | ... <i>so</i> |
| (b) <i>as</i> } | ... <i>as</i> |
| <i>so</i> } | |
| <i>such</i> } | ... (that) |
| <i>so</i> } | |
| <i>such</i> } | ... <i>than</i> |
| <i>less</i> } | |
| <i>more (-er)</i> } | ... <i>than, when</i> <informal> |
| <i>no sooner</i> } | |
| <i>barely</i> } | ... <i>when, than</i> <informal> |
| <i>hardly</i> } | |
| <i>scarcely</i> } | |
| (c) <i>the</i> | ... <i>the</i> |
| (d) <i>whether</i> } | ... <i>or</i> |
| <i>if</i> } | |

- (e) subordinator plus
optional conjunct

<i>although</i>	}	} ... yet, nevertheless, etc
<i>even if</i>		
<i>(even) though</i>		
<i>while</i>		
<i>if</i>	}	} ... then, in that case
<i>once</i>		
<i>since [reason]</i>		
<i>unless</i>		
<i>because</i>	}	} ... therefore
<i>seeing (that)</i>		

The (a) set consists of the unique proportional correlative *as ... so* (cf 15.51), also typical of formal and deliberative style. The conjunct emphasizes the relationship indicated by the initial subordinator:

As the strength of the defenders failed, *so* the courage of the attackers grew.

The omission of *so* tends to give a temporal interpretation ('all the while that') to the subordinator *as*.

The (b) set contains comparative correlatives (cf 15.63ff). In this set the subordinate clause is positioned finally. The first element functions as degree modifier in the superordinate clause, while the second is a subordinator introducing the final subordinate clause:

I was { *more ashamed* } *than* I have ever been.
 { *angrier* }

He had *no sooner* arrived *than* he asked for food.

The (c) set consists of the unique pair of proportional correlatives *the ... the* (cf 15.51):

The harder they worked, the hungrier they became.
['As they worked harder, so they became hungrier.']

If the order of the two clauses is reversed, the meaning relationship is changed (cf Note [d] below):

The hungrier they became, the harder they worked.
['As they became hungrier, so they worked harder.']

The (d) set contains the *whether ... or* correlatives used in two different types of subordinate clauses: alternative interrogative clauses (cf 15.6) and alternative conditional-concessive clauses (cf 15.41). In the interrogative construction the *or*-clause is optional:

They didn't tell me *whether* I should write to the manager (*or whether* I should see him personally).

In the conditional-concessive construction, on the other hand, the *or*-clause is obligatory. In both instances, the correlative *or* coordinates two subordinate clauses (cf the *either ... or* correlative, 13.33f), unlike the previous sets, where only one correlative is attached to the subordinate clause. *Or* is also an

optional correlative in the alternative interrogative clause introduced by *if* (cf 15.6).

The (e) set combines a subordinator in an initial subordinate adverbial clause with an optional conjunct (cf 8.134ff) in the superordinate clause. The conjunct emphasizes the relationship indicated by the subordinator:

Though the workers were unhappy with some aspects of the proposed new contract, *nevertheless* they overwhelmingly voted in favour of it.
[CONCESSIVE CLAUSE; cf 15.39ff]

If this year's harvest is good, *then* they will not need to import wheat.
[CONDITIONAL CLAUSE; cf 15.33ff]

Because you have not replied to my formal letter of May 1, I am *therefore* withdrawing my offer.
[REASON CLAUSE; cf 15.45ff]

Some writers avoid the conjunct as redundant in these examples. Its insertion is more usual in an insistent persuasive argument or in a formal and deliberative style of writing, especially if the initial subordinate clause is lengthy and the relationship then needs to be recalled. The effect is to balance the two parts of the system, an effect akin to parallelism (cf 19.7), and to remind the reader or hearer of the force of the argument.

Note [a] The range of correlative subordinators can be extended somewhat in literary style to include, for example, *where ... there* and *when ... then*:

When her imagination was stirred, *then* there descended upon her a frenzy to inscribe her thoughts.

[b] The following occur with subject-operator inversion (cf 18.24) in the first clause:

no sooner ... than *barely/hardly/scarcely ... when/before*

There is traditional objection to the use of *when* as correlative with *no sooner* and to the use of *than* as correlative with the three negative adverbs.

[c] Since subordinate adverbial clauses are usually in *E* position, the correlative in sets (a), (b), and (c) can be seen as providing the condition for the clause to be in *I* position and subsequently endorsing the force of the clause.

[d] *The* may be used in two ways to introduce a final subordinate clause without a preceding initial correlative *the*. In the first use, it correlates with a comparative in the superordinate clause, the construction then belonging to set (c):

They became (*the*) hungrier *the* harder they worked.

The construction is equivalent in meaning to the correlative *the ... the* construction:

The harder they worked, *the* hungrier they became.

[cf *Harder they worked, hungrier they became.]

The equivalence provides an argument for suggesting that the first clause is semantically subordinate, as in sets (a) and (b).

In the second use, *the* is noncorrelative. It combines with a comparative, chiefly to introduce a final subordinate clause of purpose, especially a *to*-infinitive clause:

They moved to the front, *the* better to hear the speaker.

Less formally:

They moved to the front in order to hear the speaker better.

In formal style, the purpose clause may be initial:

The more easily to induce witnesses to testify, we are conducting our hearings in private.

Marginal subordinators

- 14.14 As with complex prepositions (cf 9.10ff), it is difficult to distinguish categorically between complex subordinators and free syntactic constructions. Several marginal types require discussion.

Type 1 consists of a habitual combination of a subordinator with a preceding or following adverb; for example *even if* and *if only*. We regard these as subordinators because the meaning of the subordinator is affected by the presence of the adverb. In contrast, combinations such as *only if* and *just as* consist of a premodifier preceding a subordinator.

Type 2 consists of noun phrases that commonly function as temporal adverbials; for example, *the moment (that)* and *every time (that)*. We consider these to be more like free syntactic constructions than like complex subordinators. The relationship between *the moment* and the following clause, for example, can be explained as the head of a noun phrase modified by a restrictive relative clause, the noun phrase functioning as adverbial of time. Compare:

I recognized him *that moment*. I recognized him *the moment I saw him*.

The phrase permits the range of structural variations that one would expect from that analysis. For example:

at } (just) the { first } { moment } { that } I saw him, I recognized him.
from } { next } { instant } { when }
 { last } { minute }
 { precise } { time }
 { very }

Other examples of such free constructions include *during the period when*, *until such time as*, *since the days that*.

Type 3 consists of prepositional phrases ending in *the fact that*. They express relationships of reason or concession. Because they can be replaced more concisely by a simple conjunction, they are considered to be stylistically clumsy. Examples include:

because of the fact that }
due to the fact that } ['because']
on account of the fact that }
in (the) light of the fact that }
in spite of the fact that } ['although']
regardless of the fact that }

These allow some variation of the preposition and considerable variation of the head of the noun phrase. Compare:

In spite of { the fact }
 { the news } that they were sick, I went to visit them.
 { your report }
 { my belief }

Only *in spite of the fact that* can be replaced by a simple conjunction (eg: *although*), yet it is clear that all the phrases have a similar function. We should therefore regard them as prepositional phrases followed by a clause in apposition to the noun-phrase complement.

Type 4 consists of participle forms such as *supposing (that)* and *provided (that)*. The participles form a gradient. Some retain certain properties characteristic of verbs, while those that are most like simple conjunctions

have lost all such properties. Thus, like other participles, *supposing* and *assuming* can be expanded by adverbials:

supposing } { for the sake of argument }
assuming } { as a result of your advice } that

But such expansion is not permitted for some of the other participle forms:

*seeing } { for the sake of argument }
*provided } { as a result of your advice } that

On the other hand, like many verbs, *seeing* and *considering* can be followed by conjunctions other than *that*:

Seeing }
Considering } how he reacted . . .

But most important of all, the conjunctive *seeing*, *provided*, *providing*, and *given* are now distinct from the participles in meaning and in not requiring subject identification (cf 15.58f), so that they cannot be viewed as the verb in a participle clause.

- Note [a] The premodifier in the free constructions of type 1 may be focusing (cf 8.116), as in *even when* and *only if*; intensifying (cf 8.104), as in *ever since* and *just as* (in the similarity sense); or specifying further the time relationship, as in *just when* and *a few days before*.
[b] There are other conjunction-like prepositional phrases similar to those in type 3, but not ending in *the fact that*; for example, *in the event that*, *on the grounds that*, *in the sense that*.

Subordinators for nonfinite and verbless clauses

- 14.15 Nonfinite and verbless clauses are subordinate by virtue of the absence of a finite verb as the verb element of the clause. They are, however, sometimes introduced by a subordinator, which generally signals the clause to be adverbial.

The structural classes of clauses vary in the subordinators that they admit. However, all the classes except for that of the bare infinitive clauses may be introduced by the subordinators *with* and *without*. A noun phrase (not necessarily the subject) is required after the subordinator:

Without you to consult, I would be completely lost.

With the mortgage paid, they could afford to go abroad for their vacation.

Don't walk around *with your shirt hanging out*.

With you as my friend, I don't need enemies.

- Note *Rather than* is found with all types of clauses, including finite clauses, but it is generally best treated as a quasi-coordinator (cf 13.103), with matching forms in the clauses (but cf 4.19 Note [c]):

They were *screaming* rather than *singing*.

She *telephoned* rather than *wrote*.

He wanted to *sunbathe* rather than (to) *swim*.

The part after *rather than* refers to an earlier assumption that is rejected; *rather than* is here equivalent to 'and not'.

Subordinators for bare infinitive clauses

- 14.16 Bare infinitive clauses are limited to the two synonymous subordinators *rather than* and *sooner than* (cf 14.15 Note for the function of *rather than* as

quasi-coordinator). The matrix clauses express the subject's preference (cf 15.52):

He paid the fine *rather than* appeal to a higher court.
Sooner than wait for a reply to your letter, I would telephone her.

The bare infinitive clause occasionally takes a subject:

Rather than Robert drive in his present state, I'd prefer to drive him home myself.

Note [a] In contrast to the constraints on the quasi-coordinator *rather than*, when clauses are introduced by the subordinators *rather than* and *sooner than* the verb forms do not need to match and the subordinate clause may be initial as well as final.

[b] If *would* or *should* is in the matrix clause, *rather* and *sooner* may be moved into that clause when the subordinate clause is final:

He would *rather* pay the fine *than* appeal to a higher court.

Such sentences have an obvious resemblance to comparative constructions and admit various comparative adverbs:

He would more $\left\{ \begin{array}{l} \text{readily} \\ \text{willingly} \\ \text{cheerfully} \end{array} \right\}$ pay the fine *than* appeal to a higher court.

Subordinators for *to*-infinitive clauses

- 14.17 *To*-infinitive clauses may be introduced by several subordinators: *as if*, *as though*, *for*, *in order*, *so as*, *whether* ... (*or*), *with*, and *without*. *For* in this function is restricted to infinitive clauses with their own subject, and indeed is often obligatory (cf 15.10):

It would be an absurd idea *for them to move to another house at this stage of their careers*.

Since *for* may be combined with the subordinator *in order to*, it seems to be a device for introducing the subject rather than to be a true subordinator:

In order for you to be eligible for a student grant, your parents must receive less than a stipulated annual income.

Whether (with or without correlative *or*) introduces a subordinate interrogative clause:

I don't know *whether to put on the air-conditioning today*.

In the absence of a subject in the subordinate clause, the subject is understood as identical with that of the matrix clause.

Subordinators for *-ed* clauses and verbless clauses

- 14.18 Clauses with an *-ed* participle and verbless clauses may be introduced by some subordinators that are also used for finite clauses (cf 14.12):

although, *as* [manner], *as if*, *as soon as*, *as though*, *even if*, *if*, *once*, *though*, *unless*, *until* [only *-ed* participle clauses], *when(ever)*, *where(ver)*, *whether* ... *or* [conditional-concessive], *while*, *whilst* (esp BrE)

These clauses can be related to finite clauses for which the subject and the verb BE are supplied (cf 14.9):

When taken according to the directions, the drug has no side effects.

['When the drug is taken ...'] [1]

Although not yet six months old, she was able to walk without support. ['Although she was not yet ...'] [2]

Unless told otherwise, be here every night. ['Unless you are told ...'; you is implied subject of the imperative superordinate clause] [3]

If necessary, he will take notes for you. ['If his taking notes is necessary, ...'] [4]

The subject of the subordinate clause must generally be understood as identical with that of the matrix clause, but for verbless clauses such as *if necessary* and *where possible* it may refer to the matrix clause as a whole, as in example [4].

Note [a] The *if*-clauses may be used for hypothetical conditions (cf 14.19 Note [a], 15.35):

The milk would not turn sour *if boiled*. ['if it were boiled']

I would have typed your manuscript for you *if necessary*. ['if it had been necessary to do so']

[b] There is a stereotyped construction in which the *-ed* participle follows *no sooner than*: (It was) no sooner said *than done*.

Subordinators for *-ing* clauses

- 14.19 Clauses with an *-ing* participle may be introduced by any of the subordinators for *-ed* participle clauses (cf 14.18), except that the subordinators *where*, *wherever*, *as* [manner], and *as soon as* are excluded (cf Note [a] below):

although, *as if*, *as though*, *even if*, *if*, *once*, *though*, *unless*, *until*, *when(ever)*, *whether* ... *or* [conditional-concessive], *while*, *whilst* (esp BrE)

Unlike *-ed* participle and verbless clauses, however, these *-ing* participle clauses cannot be regarded as strictly elliptical clauses, since the *-ing* participle does not necessarily represent a progressive form in the equivalent finite clause. The *-ing* participle neutralizes that aspectual distinction:

When returning merchandise, be sure to bring your receipt. ['When you return ...' or 'When you are returning ...']

The nonequivalence of the *-ing* participle in these clauses with the finite progressive is most conspicuous when the progressive aspect is ruled out, as with the perfective or a verb used statively (cf 4.27ff):

Once having left the premises, you must buy another ticket to reenter. ['Once you have left ...']

Though understanding no Spanish, she was able to communicate with the other students. ['Though she understood no Spanish, ...']

Note [a] *-ing* clauses introduced by *if*, *even if*, and *unless* are restricted to open conditions (cf 15.35), in which they are roughly equivalent to 'in cases where'. Even so, *if* sounds somewhat stilted:

If coming by car, take the A10 and turn off at the A414.

Even if and *unless* are relatively more acceptable in such contexts:

Even if receiving visitors, patients must observe normal hospital rules.
Unless receiving visitors, patients must observe normal hospital rules.

[b] *After*, *before*, and *since* (subordinators with finite clauses) differ from subordinators such as *when* or *while* in that they are followed by *-ing* clauses but not by *-ed* clauses or verbless clauses:

He took a shower $\left\{ \begin{array}{l} \text{before} \\ \text{after} \end{array} \right\}$ returning home. [1]

Since moving here, I have felt more relaxed. [2]

These three also differ from the subordinators listed above in 14.19 in that they allow a subject in the *-ing* clause:

Since my coming here, life has become more comfortable for my parents. [3]

The differences suggest that *after*, *before*, and *since* are better classed with prepositions such as *on* and *through* (both of which permit a subject in the *-ing* clause) rather than with subordinators:

He took a shower *on returning home*. [1a]

Through my moving here, life has become more comfortable for my parents. [3a]

[c] Like *as well as* and *instead of*, *rather than* is a preposition, not a quasi-coordinator (cf 13.103), when it is followed by an *-ing* participle clause that does not match the verb in the matrix clause (cf 14.15 Note):

Their actions precipitated the war *rather than averting it*.

As well as visiting Niagara Falls, we spent a day in Toronto.

He intends to go as he is, *instead of changing into his best clothes*.

Other indicators of subordination

14.20 We now turn to other indicators of subordination apart from subordinators.

(i) *Wh*-elements are initial markers of subordination in subordinate interrogative clauses (cf 15.5f) and subordinate exclamative clauses (cf 15.7), in *wh*-relative clauses (cf 15.8f, 17.9ff), and in conditional-concessive clauses (cf 15.41f). The subordinating *wh*-words are:

who, whom, whose, which

when, where, what, why, how

whoever, whomever <rare>, *whichever*

wherever, whenever, whatever, however

whosoever, whomsoever, wheresoever, whatsoever, howsoever <all rare;
legal and religious>

(ii) The relative pronoun *that*, which can often replace *wh*-pronouns, is a subordination marker in restrictive relative clauses (cf 17.9ff):

The style *that we are examining in this exhibition* was an unusual one.

The relative pronoun is to be distinguished from the subordinator *that*, which does not operate as an element in the subordinate clause.

(iii) Subject-operator inversion is a marker of subordination in some conditional, similarity, and comparative clauses (cf 15.36, 15.50 Note, 15.74). It is typical of a literary and elevated style of persuasion. The operators that permit the inversion are *had*, *were*, *should*, and (less commonly) *could* and *might*:

Had I been less forthright, I would have acquired more support.

Were she here, she would support the motion.

Inversion of a different kind – the fronting of the whole or part of the predication – may occur with the subordinators *as*, *though*, and *that* (cf 15.39, 15.47):

Eloquent though she was, she could not persuade them.

(iv) The absence of a finite verb is itself an indicator of subordination, since nonfinite and verbless clauses are necessarily subordinate:

Denying any interest in politics, she claimed that she wished to continue in forensic medicine.

There are only two types of subordinate clauses that have no clear indicator of subordination within them:

(a) Nominal *that*-clauses allow the omission of *that* in certain contexts (cf 15.4), but they may be said to be recognizable as subordinate through the potentiality for the insertion of *that*:

I suppose *I can use your phone*.

~ I suppose *that I can use your phone*.

Compare also the omissibility of relative *that*, 17.13ff.

(b) Some comment clauses (cf 15.54) have no overt mark of subordination, but – as with the zero relative clauses mentioned in (a) – they generally lack an obligatory verb complementation:

I have no alternative, *I suppose*.

It could be worse, *you know*.

= *You know*, it could be worse.

≠ *You know* (that) it could be worse.

The verb phrase in subordinate clauses

14.21 In general the rules for the uses of forms and categories of the verb phrase – such as tenses, aspects, and modal auxiliaries – apply both to subordinate and independent clauses. Nevertheless, there are cases in which choices affecting the verb phrase of a subordinate clause are determined by the particular type of subordinate clause it belongs to. With temporal *since*-clauses, on the other hand, it is the choice of verb phrase in the matrix clause that is more obviously affected.

Such determinations constitute a signal of subordination additional to other signals, such as initial subordinators. They are a particularly conspicuous signal when the verb phrase in the subordinate clause prevents that clause from constituting an independent sentence, even with the omission of the subordinator, as in (*Though*) *he be the President himself*. Less obviously, the meaning of the verb phrase would be different in an independent clause, as in (*When*) *the game ends*.

Note Dependency relations of this kind are not necessarily found in disjunct clauses, particularly style disjunct clauses (cf 15.21), where verb choices are primarily dependent on the circumstances of the speech act. Contrast, for example, the matching tenses in [1], where the *since*-clause is an adjunct, with the absence of matching in [2], where the *since*-clause is a style disjunct:

Since they really *wanted* to know, they *conducted* their own investigation. [1]

Since you really *want* to know, they *conducted* their own investigation. [2]

The present tense in adverbial and nominal clauses

- 14.22 The simple present is commonly used in preference to the auxiliary *will* or (in BrE, optionally with *I* and *we*) *shall* in certain types of adverbial clauses to express future meaning (cf also 14.26):

When	} he <i>arrives</i> , the band will play the National Anthem.
After	
Before	
As	
If	
As soon as	
Once	

Even if tomorrow's match *is* cancelled, Lancashire will still be at the top of the league.

He'll come in case he's wanted.

While I *am* away, the children will look after the house.

Whether or not they *win* this battle, they won't win the war.

Whatever they *say*, I won't pay.

Wherever she *goes*, I'll go.

The subordinators involved belong to the temporal, conditional, and conditional-concessive categories (cf 15.25, 15.34, 15.41f). Temporal *since*, however, is excluded (cf 15.26).

Clauses of similarity (cf 15.50) and proportion (cf 15.51) may also have the simple present to express future meaning:

Next time I'll do as he *says*.

The harder you *exercise*, the better you'll feel.

Nominal *that*- and *wh*-clauses tend to contain the simple present when the matrix clause (as well as the subordinate clause) refers to the future; but when the matrix clause refers to the present, *will* is likely to be used in the subordinate clause. Contrast:

In a few minutes I'll ask him what he *wants* tomorrow.

The question is what he *will want* tomorrow.

However, there are exceptional verb constructions like *hope*, *bet*, *see (to it)*, *take care*, *be careful*, and (both in the imperative) *suppose* and *assume*, after which the simple present is often or (for *take care* and *be careful*) regularly used:

I hope that the parcel *comes* in time. [also *will come*]

Suppose he *loses* his way.

Let's assume our opponents *win* the election. [also *will win*]

I'll see that nobody *disturbs* you. [also *will disturb*]

Take care that she *doesn't* fall.

Will and *won't* occur in adverbial clauses, particularly in *if*-clauses, in certain uses. In general, the difference between the simple present and the modal is that the simple present refers to an assumed future actual situation whereas the modal refers to the assumed predictability of a situation or of situations. More specifically, *will* and *won't* are commonly used:

- (i) where the modals have a volitional meaning:

If you'll *help* us, we can finish early. ['are willing to'] [1]

If you *won't help* us, all our plans will be ruined. ['refuse to'] [2]

If he'll *pay*, I'll go with him. [3]

If you'll *use* it, you can have it. [4]

The use of the simple present in [1–4] would suppress the volitional meaning. In [5] the volitional meaning is metaphorically transferred to inanimate objects:

If your car *won't start*, call me any time and I'll help. ['refuses to'] [5]

- (ii) where the modals express timeless and habitual prediction:

If drugs *will cure* him, this drug should do the job. [6]

If sugar *will dissolve* in a hot liquid, this chemical will do so too. [7]

Will can be replaced by *can* in [6] and [7]. In both sentences, the conditional clause does not refer to a specific actual situation.

- (iii) where the modals express the present predictability of the occurrence or nonoccurrence of a future situation:

If you *won't arrive* before six, I can't meet you. ['If you won't be arriving before six'] [8]

If the game *won't be finished* until ten, I'll spend the night at your place. ['If the game is not going to be finished until ten'] [9]

If the water *will rise* above this level, then we must warn everybody in the neighbourhood. ['If the water is going to rise above this level, then we must now plan to warn everybody in the neighbourhood'] [10]

If she *won't be* here before midnight, there's no need to rush. [11]

If we definitely *won't win*, why should we bother to play? ['If we definitely aren't going to win, ...'] [12]

The simple form is less usual in [8–12] than the progressive.

In [8–12] the matrix clause expresses the present consequence of the present predictability. In [8–9] the consequence is a present decision to take a future action, while in [10–12] it is a present decision that affects present action.

The modal *can* be replaced by the simple present in [8–9], but with a different implication. Contrast [8] with [8a]:

If you *don't arrive* before six, I can't meet you. ['in the event of your arrival after six'] [8a]

The situation in the conditional clause of [8a] is viewed as possibly occurring. In [10] replacement of the modal by the simple present yields the implausible sentence [10a]:

If the water *rises* above this level, then we must warn everybody. [cf 'when the water rises above this level, if it does so'] [10a]

Replacement of the modal by the simple present in [11] and [12] produces uninterpretable sentences.

- Note [a] The simple present may be used for future reference in relative clauses that together with their antecedent express similar relationships to those expressed in the adverbial clauses:
I'll speak to her the first opportunity *I have*.
And similarly in appositive *that*-clauses modifying an appropriate noun phrase head:
We'll be there tomorrow on the assumption that it *doesn't rain*.
[b] The simple present in a conditional clause may refer to a state in present time:
If you *like* it, I'll give it to you.
For dynamic situation types, the present progressive is used to refer to present time:
If she's *working*, I won't interrupt her.

The hypothetical past and past perfective

- 14.23 The verbs in hypothetical conditional clauses are backshifted, the past tense form being used for present and future time reference and the past perfective form for past time reference (cf 15.36). When these forms have such hypothetical implications we term them HYPOTHETICAL PAST and HYPOTHETICAL PAST PERFECTIVE. The general rule for verbs in both clauses of hypothetical conditions may be expressed thus:

Table 14.23 Verbs in hypothetical conditions

	conditional clause	matrix clause
present and future reference	HYPOTHETICAL PAST	PAST MODAL
past reference	HYPOTHETICAL PAST PERFECTIVE	PAST PERFECTIVE MODAL

The modal most commonly used in the matrix clause is *would*. It is used to express the hypothetical implication, without necessarily any other modal implications:

- If she $\left\{ \begin{array}{l} \text{tried} \\ \text{were to try} \end{array} \right\}$ harder next time, she *would pass* the examination.
[future reference: 'but I expect she won't try harder']
If they *were* alive, they *would be* moving around.
[present reference: 'but I assume they are not alive']
If they *had invited* him to the conference, he *would have attended*.
[past reference: 'but they didn't invite him']

As the bracketed implications indicate, the hypothetical meaning is more absolute in the past, and amounts to an implied rejection of the condition; whereas with present and future reference the meaning may be merely one of negative expectation or assumption, the positive not being ruled out completely. Depending on the lexical verb, the progressive might be necessary to convey present reference, as is indeed the case for *try*:

If she *were trying* harder, her parents *wouldn't* be so anxious.

When modal auxiliaries are used in hypothetical conditional clauses they combine with past and past perfective. In the matrix clause they replace

would, since two modal auxiliaries cannot cooccur. Modals in hypothetical conditions, apart from hypothetical *would*, are *would* in other uses, *could*, *might*, and *should*:

- If they *would help* us, we *could finish* early. [volitional *would*, 'would be willing to']
If we had enough money, we *could buy* a typewriter.
If you *could type*, you *might save* a lot of time.
I *might have married* her if she *would have agreed*.
If they had asked me, I *would have had to speak*. [*have* to as substitute for *must*, which lacks a past form]
If he had apologized, you *should have done* so too. [obligational *should*]

Some BrE speakers maintain a distinction between *would* and *should* in the matrix clause parallel to that between *will* and *shall* (cf 4.42):

If I had been at home last night, I *should have heard* the noise.

Hypothetical past or past perfective are obligatory in certain other constructions that have hypothetical meaning:

- It's time you *were* in bed.
I wish this bus *went* to the university.
If only I *had listened* to my parents!

They are optional with other constructions that also have hypothetical meaning (on the subjunctive *were*, cf 14.24):

- He acts as if he *knew* you.
It's not as though we *were* poor.
Suppose we *told* her the truth.
Imagine your child *played* truant.
I'd rather we *had* dinner now.

Generally a negative inference can be drawn, which is more strongly negative with the hypothetical past perfective. Thus *If only I had listened to my parents* implies 'I did not listen to my parents', and *He acts as if he knew you* implies the expectation 'He doesn't know you'. In *I'd rather we had dinner now*, the hypothetical past may express tentative politeness rather than hypothetical meaning.

- Note [a] The hypothetical past is also used after an archaic *Would that*, which expresses a wish:
Would that everyone treated me as considerably.
[b] Restrictive relative clauses modifying generic noun phrases (cf 15.34 Note [i]) and their matrix clauses take the same forms as hypothetical conditionals if they refer to a hypothetical situation:
Any person who *had behaved* in that way *would have been dismissed*.
[c] We have shown that the rules for past reference in a hypothetical condition require a past perfective in the conditional clause and a past perfective modal, generally *would have*, in the matrix clause:
If I *had seen* her, I *would have told* her.
The operators are frequently contracted in informal style:
If I'd seen her, I'd *have told* her.
In informal speech, the *have* in the second phrase is frequently reduced to /əv/ or /ə/, so that *I would have* may be rendered /aɪdə/. Informal AmE speech may have matching modals in both clauses:
If I'd *have seen* her, I'd *have told* her.

The first part of both clauses may then be rendered /aɪdə/. The contraction for the operator in the conditional clause is sometimes misinterpreted as replacing *had* rather than *would*, giving rise to an error that is found in uneducated writing and its fictional representation:

If I *hadda* seen her, I *woulda* told her.

The nonstandard spelling *I'da* is similarly found as a representation of /aɪdə/, and *of* is a frequent misspelling of *have* when *have* follows a modal.

[d] In informal AmE the hypothetical past is sometimes used for past reference in place of the hypothetical past perfective:

If they *invited* her to the conference, she would have attended.

[e] Ambiguities are occasionally found between open and hypothetical conditions (cf 15.35), since open conditions take the full range of verb forms:

If he *found* a patient listener, he *would pour* out his troubles.

This sentence may be a hypothetical condition referring to the future ('I don't think he'll find a patient listener') or an open condition referring to the past (*would* having a habitual meaning).

[f] In subordinate clauses following *I wish* (*that*), the hypothetical past may be replaced by hypothetical *would* or by a *to*-infinitive:

I wish $\left\{ \begin{array}{l} \text{she visited} \\ \text{she would visit} \\ \text{her to visit} \end{array} \right\}$ me more often.

The present and past subjunctive

14.24 The present subjunctive (cf 3.58ff) is used very occasionally in formal style in open conditional clauses (cf 15.33 Note [d], 15.36) and in concessive clauses (cf 15.41 Note [b], 15.42 Note [b]):

If any person *be* found guilty, he shall have the right of appeal.

Whatever *be* the reasons for their action, we cannot tolerate such disloyalty.

Whether *she be* right or wrong, she will have my unswerving support.

More usually, the simple present indicative is used.

Clauses of concession (cf 15.39ff) and purpose (cf 15.48) may also very occasionally in formal style contain a present subjunctive (esp in AmE) to express putative rather than factual meaning (cf 14.25):

Though he *be* the President himself, he shall hear us.

They removed the prisoner in order that he *not disturb* the proceedings any further.

The more usual verb forms for the *though*-clause are the simple present indicative or putative *should* followed by the infinitive. Clauses of purpose require modal auxiliaries, and therefore only the *should*-construction is a possible alternative.

The present subjunctive is also used in *that*-clauses (esp in AmE) after verbs, adjectives, or nouns that express a necessity, plan, or intention for the future:

Congress has voted that the present law *be* maintained. [1]

We insisted that $\left\{ \begin{array}{l} \text{he} \\ \text{they} \end{array} \right\}$ *leave* at once. [2]

They expressed the wish that $\left\{ \begin{array}{l} \text{she} \\ \text{I} \end{array} \right\}$ *accept* the award. [3]

It is essential that a meeting *be* convened this week. [4]

Notice that this mandative subjunctive (cf 3.59) is used even when the matrix verb is past (cf 14.25 Note [c]). If the matrix verb is present, the distinction between subjunctive and indicative is neutralized except in the third person singular or if the verb is *be*. In BrE, putative *should* with the infinitive is far more common. In both AmE and BrE, indicative forms are also occasionally used in this construction; for example, *left* in [2] and *is* in [4].

In general, the present subjunctive occurs more frequently in AmE than in BrE; in BrE it occurs chiefly in formal style.

The past (or *were*-) subjunctive (cf 3.62), which is a form distinct from the past indicative only in the first and third person singular forms of *be*, is used in formal style in hypothetical conditional clauses and in other constructions with hypothetical meaning exemplified in 14.23:

I wish *she were* not married. [5]

If only *I were* not so nervous. [6]

If *she were* here, she would speak on my behalf. [7]

The stuffed dog barked as if it *were* a real one. [8]

Suppose he *were* lost. [9]

I'd rather *I were* in bed. [10]

In nonformal styles, hypothetical past or indicative forms replace subjunctive *were*:

I wish *she was* not married. [5a]

If only *I was* not so nervous. [6a]

If *she was* here, she would speak on my behalf. [7a]

The stuffed dog barked as if it *was* a real one. [8a]

Suppose he $\left\{ \begin{array}{l} \text{was} \\ \text{is} \end{array} \right\}$ lost, what would you do? [9a]

I'd rather *I was* in bed. [10a]

The present indicative is a possible alternative after *as if* and *as though* when the reference is to present time (eg: 'The stuffed dog *barks* as if it is a real one') and after imperatives *suppose* and *imagine*.

Note [a] The use of the present subjunctive seems to be increasing in BrE in *that*-clauses. There is a greater use of the subjunctive than the indicative if the agentive (perhaps implied) in the *that*-clause is shown to be willing to perform the action. Contrast:

The committee was impressed by the candidate, but recommended that she *reapply* when she had been awarded her PhD.

He was *very reluctant* to leave, but I recommended that he *went*.

But in both instances the usual form for BrE is the *should*-construction, here *should go*.

[b] The *were*-subjunctive cannot replace the hypothetical past in constructions introduced by *It's time* (*that*), eg: *It's time I was* in bed.

[c] *May* and *might* are alternatives, also in formal style, to the present subjunctive in purpose clauses (cf 15.48), in concessive clauses with *though*, *even though*, and *even if* (cf 15.39ff), and in conditional-concessive clauses (cf 15.41f):

Poor though you *might be*, you cannot live all your life on charity.

Let us fight on, that the light of justice and freedom *may* not die in our land.

Whatever *may be* the justification for their actions, we cannot tolerate such disloyalty.

But there may be a difference in meaning between the subjunctive and the modal auxiliaries. In the last example, the subjunctive does not cast doubt on the factuality of its clause; that is, *Whatever be the justification for their actions* presupposes that there is justification, whereas the sentence with *may* allows the possibility that there is no justification.

[d] Present subjunctive *come* is used in a temporal clause. (generally initial) without a subordinator:

Come winter, we'll have to pay a good deal more for vegetables and fruit. ['When winter comes, ...']

Putative *should*

14.25 The modal auxiliary *should* is used extensively (esp in BrE, cf 14.24) in *that*-clauses to convey the notion of a 'putative' situation, which is recognized as possibly existing or coming into existence. Contrast:

I'm surprised that he *should feel* lonely. [1]

I'm surprised that he *feels* lonely. [2]

While [1] questions the loneliness, [2] accepts it as true. Here, as often, the difference is mainly one of nuance, since the factual bias of the matrix clause overrides the doubt otherwise implicit in the *should*-construction. On the other hand, the nonfactuality is clearer in these examples:

It's unthinkable that they *should deny* my request.

I prefer that she *should drive*.

I'm anxious that I *shouldn't be* in the way.

They've arranged that I *should absent* myself for part of the committee meeting.

I can understand their eagerness that you *should be* the main speaker.

It worries me that their children *should travel* alone.

The nonfactual bias of the *should*-construction emerges most clearly in instances where the construction is close in meaning to a conditional *if*-clause:

It's a pity *that* they *should be* so obstinate.

It's a pity *if* they *are* so obstinate.

In a further stage of remoteness, the conditional clause has putative *should*:

It's a pity *if* they *should be* so obstinate. ['It would be a pity if they turned out to be so obstinate']

Putative *should* is used in *that*-clauses when the matrix clauses contain verbs, adjectives, or nouns that convey an emotional reaction or that express a necessity, plan, or intention for the future. In the latter case, a *that*-clause with *should* is frequently replaceable by an infinitive clause:

I prefer *her to drive*.

They've arranged *for me to absent myself for part of the committee meeting*.

It is also frequently replaced (esp in AmE) by a present subjunctive (cf 14.24):

I prefer that she *drive*. [3]

We insisted that the meeting *be adjourned*. [4]

It was intended that you *be* the candidate. [5]

Indicative forms are occasionally used in BrE instead for [3] and [4].

A past verb in the matrix clause does not necessarily affect the form of *should* in the subordinate clause, even though the subordinate clause refers to a past situation:

I was surprised that he *should feel* lonely when he was in California.

But it is also possible to use a perfective form:

I was surprised that he *should have felt* lonely when he was in California.

Note [a] *Should* is also used in a subject *that*-clause when the matrix clause contains such verbs as *show*, *indicate*, *prove*, *demonstrate*, *require*, and *demand*:

That they *should refuse* to sign the petition required great courage.

It shows how considerate she is that she *should drive* you all the way to the airport.

[b] Putative *should* also occurs in some idiomatic questions and exclamations:

How *should* I know?

That he *should dare* speak in that tone of voice to me! [cf 11.41]

Who *should* come in but my youngest sister!

[c] The use of the present subjunctive or putative *should* in the subordinate clause evokes clearly the suasive meanings (cf 16.32) of the matrix verbs *insist* and *suggest*:

I insisted ['required'] that he $\left\{ \begin{array}{l} \text{change} \\ \text{should change} \end{array} \right\}$ his clothes. [6]

I insisted ['asserted'] that he *changed* his clothes. [7]

She suggested ['recommended'] that I $\left\{ \begin{array}{l} \text{be} \\ \text{should be} \end{array} \right\}$ responsible for the arrangements [8]

She suggested ['said tentatively'] that I *am* responsible for the arrangements. [9]

While [6] and [8] are unambiguously suasive, [7] and [9] may also be suasive for those who use the indicative even after suasive verbs.

The putative and obligational meanings of *should* sometimes merge:

The report recommended that education for the over-sixteens *should be* improved. ['... that education for the over-sixteens *be* improved' or '... that education for the over-sixteens *ought to be* improved']

[d] Similar to putative *should* is the tentative *should* used in open conditions with *if*-clauses (cf 15.36):

If she *should be* interested, I'll phone her.

It is also used in somewhat literary style, with inversion:

Should she *be* interested, I'll phone her.

The perfective with temporal clauses

The perfective with temporal *since*-clauses

14.26 A temporal *since*-clause generally requires the present perfective in the matrix clause when the whole construction refers to a stretch of time up to (and potentially including) the present:

I *have lost* ten pounds since I started swimming. [1]

Since leaving home, Larry *has written* to his parents just once. [2]

The perfective is also required when the clause contains a prepositional phrase introduced by *since* or the prepositional adverb *since*, just as it is required for certain other prepositional phrases and adverbs (cf 4.23):

Scholars *have been writing* English grammars since the sixteenth century.

They called to see us three years ago, but I *haven't seen* them since.

In informal AmE, and increasingly in informal BrE, nonperfective forms are commonly used in matrix clauses with *since*-clauses and in clauses with preposition or adverb *since*:

I *lost* ten pounds since I started swimming. <informal> [1a]
 Since leaving home, Larry *wrote* to his parents just once.
 <informal> [2a]

There are some exceptions to the general rule for matrix clauses. In most cases, both perfective and nonperfective forms are possible.

(i) Verbs used statively (cf 4.28ff) – particularly *be* and *seem* – may take nonperfective forms when the predication is durative:

It's OK since I had it fixed.
 Things *are* different since you've gone.
 Since Pat left, it *seems* dull here.
 I'm *feeling* much better since I had an operation.

In all these instances, perfective forms may also be used, eg: *Things have been different since you've gone.*

The most common pattern that falls under this exception is *It + BE + a time expression*, in which the verb may be in the simple present or simple past, or have the *will*-future. Nonperfective forms are normal here:

It's ten years since they were last here.
 How long *is* it since you last spoke to them?
 It *was* ages since they last paid their bills on time.
 Next Tuesday it *will be* six years since I became an American citizen.

Other verbs, particularly *seem*, also fit into this pattern:

It *seems* a long time since we last met.
 It *feels* like ages since I was last here.

Perfective forms may also be used here too, eg: *It's been ten years since they were last here; It had been ages since they last paid their bills on time; Next Tuesday it will have been six years since I became an American citizen.*

(ii) Modal auxiliaries, particularly *can* and *could*, or semi-auxiliaries occur in the matrix clause in nonperfective forms. *Ever* is usual here:

(Ever) since my teeth were pulled out I *can't* eat anything solid. [3]
 I *have to* use crutches (ever) since I had a car accident. [4]
 They *won't* smoke (ever) since they saw a film on lung cancer.
 [*won't* ≠ 'refuse to'] [5]

The modals cannot be used here in perfective forms, but perfective forms are available for semi-auxiliaries or equivalent lexical verbs:

(Ever) since my teeth were pulled out I *haven't been able to* eat anything solid. [3a]
 I *have had to* use crutches (ever) since I had a car accident. [4a]
 They *have* { *refused to*
 decided not to } smoke (ever) since they saw a film
 on lung cancer. [5a]

Perfective modals may be used when the matrix clause refers to a situation in the past:

Since he *left* home, Larry *may have written* to his parents just once.

(iii) The simple present or the present progressive is sometimes used in the matrix clause when that clause has habitual reference:

(Ever) since we bought that car we *go* camping every weekend.
 I'm *doing* well since I invested in the money market.

When the whole period under consideration is distanced in past time, the past perfective is generally used in the matrix clause:

Since the country had achieved independence, it *had revised* its constitution twice. [6]
 Ever since they had joined the organization, they *must have had* little time for leisure activities. [7]

The past perfective may be replaced by the simple past, eg:

Since the country achieved independence, it *revised* its constitution twice. [6a]

When the period in the matrix clause refers to a future situation, a modal perfective (generally *will have*) is used in the matrix clause:

If the promotion is confirmed, you *will have been* promoted three times since you joined the company.
 By tomorrow Daniel *will have been* in bed for a week since he caught the flu.
 Their car *should soon have run* 100,000 miles since they bought it second-hand.

When the period in the matrix clause refers to a future time in the past, ie a future from the viewpoint of a past period (cf 4.48), a past modal perfective (generally *would have*) is used in the matrix clause. The construction is rare:

A: By next Sunday Harry will have completed 1200 miles since he started his walk.
 B: At that rate, he *would have covered* 1000 miles by last Sunday.

We now consider the verb in the *since*-clause. When the whole construction refers to a stretch of time up to (and potentially including) the present, the general rule for the temporal *since*-clause is that the simple past is used when the clause refers to a point of time marking the beginning of the situation referred to in the matrix clause and the present perfective is used when the clause refers to a period of time lasting to the present:

POINT OF TIME

She has been talking since she *was* one year old.
 Since I *started* swimming, I have lost five pounds.
 Since I *saw* her last, she has dyed her hair.
 Derek hasn't stopped talking since he *arrived*.

Similarly:

By tomorrow Daniel will have been in bed for a week since he *caught* the flu.

PERIOD OF TIME

Max has been tense since he's *been taking* drugs.
 Since I *have been* here, I haven't left my seat.
 Since I've *known* Caroline, she has been interested in athletics.
 I've had a dog ever since I've *owned* a house.
 I've gone to concerts ever since I've *lived* in Edinburgh.

Similarly:

By next year Mary will have written her second book since she's *been* at this university.

The present perfective may also be used in the pattern *It + BE + time expression*, when there is no explicit indication of point of time, such as *last: It's been a long time since I've seen Gerald* (cf: *I haven't seen Gerald for a long time*). The present perfective is similarly used occasionally for other *since*-clauses that refer to a point of time, eg: *I've been lonely since you've left*.

When the whole period is placed in past time, the past perfective or the simple past is used in the *since*-clause (cf backshift, 14.31). The past perfective corresponds to a past of the simple past or a past of the present perfective. It tends to be used more commonly for periods of time, corresponding to the use of the present perfective in the constructions previously discussed:

Since the country (*had*) *achieved* independence, it (*had*) revised its constitution twice.

Since he $\left\{ \begin{array}{l} \text{had known} \\ \text{knew} \end{array} \right\}$ her, she $\left\{ \begin{array}{l} \text{had been} \\ \text{was} \end{array} \right\}$ a journalist.

Similarly:

By last Sunday he would have covered 1000 miles since he (*had*) *started* his walk.

Note [a] The nonperfective forms *can remember* and *could remember* are used in *since*-clauses to indicate the span over which personal memory extends:

My parents have spent their summer vacations in France ever since I *can remember*.

Ever since she *could remember*, the winters in her home town had been severe.

Ever is commonly used with this collocation.

[b] When we say that the construction refers to a stretch of time up to the present, we mean that the situation occurred within a period of time leading towards, but not necessarily up to, the moment of utterance:

I've read ten books since I left college (but I haven't read any books in the last couple of months).

Since we've owned a car we've gone camping every year except last year (and I'm afraid we're going to have to miss this year again).

On the anterior time zone, cf 4.18f.

The perfective with other temporal clauses

14.27 When an *after*-clause refers to a past event, the verb may be in the past perfective, though it is more commonly in the simple past:

We ate our meal after we $\left\{ \begin{array}{l} \text{returned} \\ \text{had returned} \end{array} \right\}$ from the game. [1]

If a construction with a *when*-clause refers to a sequence of two past events, the clause allows the same choice:

We ate our meal when we $\left\{ \begin{array}{l} \text{returned} \\ \text{had returned} \end{array} \right\}$ from the game. [2]

All four forms of these sentences are acceptable, and mean roughly the same. The only difference is that *when* and the simple past (probably the most popular choice) suggests that the one event follows immediately on the other in sequence.

There may, however, be a contrast if the subordinator is *when* and the predication in the subordinate clause is durative rather than punctual (cf 4.33ff):

They walked out when I $\left\{ \begin{array}{l} \text{gave} \\ \text{had given} \end{array} \right\}$ the lecture. [3]

The variant with the simple past would normally mean 'as soon as I started giving the lecture' or 'during the time I was giving the lecture', whereas that with the past perfective means 'after the lecture was over'.

If the sequence of events is habitual, the verb in the *after*- or *when*-clause may be in the present perfective, though it is more commonly in the simple present:

Every day we eat our main meal $\left\{ \begin{array}{l} \text{after} \\ \text{when} \end{array} \right\}$ we $\left\{ \begin{array}{l} \text{return} \\ \text{have returned} \end{array} \right\}$ from the game. [4]

Again, there may be a contrast when the predication is durative:

The audience claps when she $\left\{ \begin{array}{l} \text{sings} \\ \text{has sung} \end{array} \right\}$. [5]

The differences in the interpretations of the *when*-clauses in [4] and [5] parallel those for the *when*-clauses in [2] and [3] respectively.

The present perfective is sometimes used in both clauses of a temporal construction to imply the repetitiveness of the situation:

In the past, when(ever) I've *visited* London, I've *seen* them.

My usual practice is that as soon as I've *taken* a shower, I've *eaten* breakfast.

The use of the present perfective rather than the simple present suggests that the situation may not apply in the future (for example, that I'm no longer going to visit London).

The present perfective is common in temporal as well as conditional clauses for a future event that precedes the future event referred to in the matrix clause (cf 14.22):

When I've *read* the chapter, I'll put the kettle on. [6]

When they've *scored* their next goal, we'll go home. [7]

As soon as I've *retired*, I'll buy a cottage in the country. [8]

After they *have left*, we can smoke. [9]

If I've *written* the paper before Monday, I'll call you. [10]

A common alternative for [7–10] is the simple present, which is excluded from [6] because the *when*-clause is durative. A less common alternative, permitted also for [6], is *will* or (in BrE optionally with *I* or *we*) *shall* plus the perfective, eg: *When I'll have read the chapter, I'll put the kettle on.*

The use of the past perfective in *before*-constructions requires special consideration. These four sentences seem to be equivalent in meaning:

- | | |
|---------------------------------------|------|
| I saw him before he saw me. | [11] |
| I had seen him before he saw me. | [12] |
| I saw him before he had seen me. | [13] |
| I had seen him before he had seen me. | [14] |

Sentence [13] appears to be paradoxical in that the second in the succession of events is marked with the past perfective, contrary to what we have noted above in *after*- and *when*-clauses. The explanation (cf 15.27) is that the *before*-clause in [13], and perhaps also in [14], may be nonfactual; that is to say, the event in the *before*-clause may not have taken place ('He did not get a chance to see me, because I evaded him').

- Note [a] If the verb phrase in the matrix clause is progressive, or contains a verb used statively, *when* generally indicates simultaneity, rather than successivity, of the events:
 When Paul returned home, his children *were using* the computer.
 We *were* asleep when Norma telephoned.
- However, *when* may sometimes have the meaning of 'after' even if the verb is used statively:
 When I returned home, I *heard* my children playing in my bedroom.
 I *didn't know* what to do when they left.
- When* always indicates simultaneity when the conditions apply to both clauses:
 Pamela *was* always popular when she *was* at school.
 The sun *was* shining when we *were playing*.
 They *were working* when I *was* there.
- [b] *Whenever* requires the verbs in the matrix and subordinate clauses to be matched in both tense and aspect. Hence if *whenever* replaced *when* in [2] and [3] above, both verbs would be in the simple past, and in [4] and [5] both would be in the simple present.

Reporting the language of others

- 14.28 There are several modes in which other people's language may be reported. The most explicit modes are introduced by a REPORTING CLAUSE referring to the speaker and the act of communication in speech or writing (*Caroline said*; *Caroline wrote*), and perhaps also to the person or persons spoken to (*Caroline told us*), to the manner of speaking (*Caroline said hesitantly*), or to the circumstances of the speech act (*Caroline replied*; *Caroline explained*; *Caroline said while washing her hair*).

If a reporting clause introduces the report of the communication, the REPORTED CLAUSE (which refers to the utterance itself) may take the form of

DIRECT SPEECH (cf 14.29) or INDIRECT SPEECH (cf 14.30ff). Direct speech purports to give the exact words that someone (who may be the reporter) utters or has uttered in speech or in writing. Indirect speech, on the other hand, conveys in the words of a subsequent reporter what has been said or written by the original speaker or writer (who again may be the same person as the reporter). Contrast the direct speech in [1] with the indirect speech in [1a]:

- | | |
|--|------|
| David said to me after the meeting, 'In my opinion, the arguments in favour of radical changes in the curriculum are not convincing.' | [1] |
| David said to me after the meeting that in his opinion the arguments in favour of radical changes in the curriculum were not convincing. | [1a] |

Two secondary modes related to the primary modes of reporting are FREE INDIRECT SPEECH and FREE DIRECT SPEECH. In both these secondary modes there is no reporting clause; the act of communication is signalled by, for example, shifts in the tense forms of verbs (cf 14.35).

The report may be a representation of mental activity (internal communication), which by its nature is unspoken. Thus, [2] and [2a] contain direct speech and indirect speech respectively:

- | | |
|---|------|
| 'Should I tell them now,' I thought to myself, 'or should I wait until they're in a better mood?' | [2] |
| He asked himself whether he should tell them then or wait until they were in a better mood. | [2a] |

Obviously, this type of direct or indirect speech normally involves a report of the supposed mental activity of the speaker of the reporting clause. The notable exception is in prose or verse fiction, where by convention the narrator is often assumed to have access to the thoughts and feelings of the characters.

Indirect speech frequently involves paraphrase or summary, and therefore the hearer or reader cannot uniquely recover the original speech or writing. The original utterance of [1] might well be reported as in [1b]:

- | | |
|--|------|
| David told me after the meeting that he remained opposed to any radical changes in the curriculum. | [1b] |
|--|------|

Indeed, the act of communication may not be indicated at all:

- | | |
|--|------|
| I saw David after the meeting. It's a pity that he remains opposed to any radical changes in the curriculum. | [1c] |
|--|------|

While [1b] is indirect speech, although a paraphrase of the original, [1c] does not have the recognizable form of a reported communication, and is irrelevant to the present discussion.

- Note [a] Direct speech is also termed 'oratio recta', and indirect speech is also termed 'oratio obliqua' and 'reported speech'. Free indirect speech is also known by the German term *erlebte Rede* and by the French term *style indirect libre*.
 [b] For the omission of reporting clauses with direct speech in certain written styles, cf 14.29.

Direct speech

- 14.29 Direct speech is usually signalled by being encloseded in quotation marks (cf App III.21):

The President said, 'A failure by Congress to approve new taxes will lead to larger budget deficits, higher interest rates, and higher unemployment.' [1]

The reporting clause may occur before, within, or after the direct speech. Medial position is very frequent. When the reporting clause is positioned medially or finally, subject-verb inversion may occur if the verb is in the simple present or simple past:

'I wonder,' $\left\{ \begin{array}{l} \text{John said} \\ \text{he said} \\ \text{said John} \end{array} \right\}$, 'whether I can borrow your bicycle.' [2]

'The radio is too loud,' $\left\{ \begin{array}{l} \text{Elizabeth complained.} \\ \text{she complained.} \\ \text{complained Elizabeth.} \end{array} \right\}$ [3]

Inversion is most common when the verb is *said*, the subject is not a pronoun, and the reporting clause is medial, as in [2]. It is unusual and archaic, however, when the subject of the reporting clause is a pronoun, even when the verb is *said* (eg: *said he*).

Direct speech may extend over many sentences. The reporting clause is then usually positioned within the first sentence.

Reporting clauses are often omitted, however, in the representation of conversation in fiction writing when the identity of the speakers is obvious from the context; quotation marks are sometimes omitted too. Reporting clauses and quotation marks are regularly omitted in written plays, in formal reports of meetings, and in some types of headlines; instead the name of the speaker (usually in capitals or italics and followed by a colon or period) prefaces the direct speech.

The structural relationship between the reporting clause and the direct speech poses some analytical problems. In some respects the direct speech functions as a subordinate clause:

Dorothy said, '*My mother's on the phone.*' [4]

In [4] the direct speech seems to be a direct object. We can ask a *what*-question and elicit the direct speech as a response:

A: What did Dorothy actually say?
B: '*My mother's on the phone.*' [5]

We can make it the subject complement in a pseudo-cleft construction (cf 18.29f):

What Dorothy said was '*My mother's on the phone.*' [6]

Furthermore, in both [4] and [6] the structure is defective without the direct speech, which obligatorily complements *said* in [4] and *was* in [6]. Compare also:

The words that Dorothy actually used were '*My mother's on the phone.*'

Here *were* requires complementation by a subject complement. Then, the direct speech may be appositive to a unit that is clearly a part or the whole of the direct object:

Dorothy used *the following* words: '*My mother's on the phone.*'

Finally, coordination with a following clause suggests that the reporting clause is an obligatory part of the first clause, in that coordination would otherwise not be possible:

'The radio is too loud,' *Elizabeth complained*, and she then stalked back to her room.

On the other hand, we can view the reporting clause as subordinate, functioning as an adverbial. Thus, like most adverbials it can be positioned variously and can – at least sometimes – be omitted. Both syntactically and semantically, it resembles the most important type of comment clause (cf 15.54). Compare the reporting clause in [7a] with the comment clause in [7b] and the adverb in [7c]:

'Generals,' *they alleged*, 'never retire; they merely fade away.' [7a]

Generals, *it is alleged*, never retire; they merely fade away. [7b]

Generals, *allegedly*, never retire; they merely fade away. [7c]

Moreover, the direct speech clause behaves like a main clause in that it can, for example, be a question or a directive:

Dorothy said, 'Is my mother on the phone?' [8]

Dorothy said, 'Tell my mother I'll be over soon.' [9]

But, of course, the reporting clause behaves likewise:

Did you really say to Ronald, 'You're my best friend'? [10]

Tell Richard, 'You're my best friend.' [11]

Finally, we may note the usual punctuation separation of the reporting clause (though this is not necessarily reflected intonationally), which suggests another parallel with comment clauses and many other adverbials. Indeed, if the direct speech clause is analysed as an object, this is the only construction where the subject and verb are separated from the object by a comma (cf App III.9, App III.21). Contrast the punctuation of [11] for direct speech with that of [11a] for indirect speech:

Tell Richard (that) he's my best friend. [11a]

It is best to recognize that there is a gradient from direct speech that is clearly independent to direct speech that is clearly integrated into the clause structure. At the most independent extreme we have direct speech without a reporting clause. Next along the gradient are instances where the reporting clause is medial or final and it exhibits subject-verb inversion:

'I wonder', *said John*, 'whether I can borrow your bicycle.'

Here there are severe restrictions on the form of the verb, and pronouns are

generally excluded as subject. Further along the gradient are instances where the reporting clause is medial or final but without subject-verb inversion. Notice that the reporting clause is restricted also here to some extent in that it cannot readily be a question or a directive, a restriction that applies also when there is subject-verb inversion. There follow sentences like [4], where the reporting clause is initial and suffers from fewer restrictions. Most integrated are the partial quotations, as in this version of [1]:

The President said that a failure by Congress to approve new taxes would lead to 'larger budget deficits, higher interest rates, and higher unemployment.' [1a]

Here we have a mixture of indirect and direct speech, the direct speech being only a part of a clause, and the reporting clause being implicit: '... would lead to what he said were larger budget deficits, higher interest rates, and higher unemployment'.

Here are some reporting verbs of speaking or thinking that are frequently used with direct speech, the most common of which is *say*:

<i>add</i>	<i>comment</i>	<i>object</i>	<i>say</i>
<i>admit</i>	<i>conclude</i>	<i>observe</i>	<i>shout (out)</i>
<i>announce</i>	<i>confess</i>	<i>order</i>	<i>state</i>
<i>answer</i>	<i>cry (out)</i>	<i>promise</i>	<i>tell</i>
<i>argue</i>	<i>declare</i>	<i>protest</i>	<i>think</i>
<i>assert</i>	<i>exclaim</i>	<i>recall</i>	<i>urge</i>
<i>ask</i>	<i>explain</i>	<i>remark</i>	<i>warn</i>
<i>beg</i>	<i>insist</i>	<i>repeat</i>	<i>whisper</i>
<i>boast</i>	<i>maintain</i>	<i>reply</i>	<i>wonder</i>
<i>claim</i>	<i>note</i>	<i>report</i>	<i>write</i>

In addition, there are numerous other verbs indicating the manner of speaking that are occasionally used with direct speech; for example, *falter*, *mumble*, *murmur*, *mutter*, *snap*, *sneer*, *sob*.

Note [a] Pronunciation and other speech features may be imitated in a spoken rendering of direct speech. In writing it may be indicated by irregular spelling or, to a limited extent, by italics or underlining. In both media, the reporting clause may have indications of the manner of speaking (*Tom lisped*, *Jacqueline whispered*, *Charles hinted darkly*, *John said casually*). Such indications are common in some fiction writing.

[b] In conversation, *says you*, *says he*, etc (with the invariant -s) are sometimes used in casual style as an impolite retort meaning 'That's what you say', 'That's what he says', etc:

A: I'm going to win this game. B: *Says you!*

In old-fashioned speech, the nonstandard inversion *says I* sometimes occurs. The historic present (cf 4.8) is occasionally used in spoken narrative.

[c] In journalistic writing, a reporting clause with inversion sometimes occurs even in initial position: *Declared tall, nineteen-year-old Napier: 'The show will go on'.*

[d] Unlike indirect speech, direct speech may acceptably contain grammatical errors or even be in another language if it purports to give a record of the communication of another person:

He said, 'I know not well English.'

[e] It is common in newspaper reporting to omit quotation marks in what appears to be direct speech, as exemplified in the first sentence in the following:

New horses *will* strengthen the breed, Mr Steiner claimed. He said the newcomers *would* arrive after the epidemic was halted.

The second sentence switches to indirect speech, as indicated by the tense backshifts (cf 14.31).

Indirect speech

14.30 Typically, indirect speech is used to report statements, and takes the form of a nominal *that*-clause (cf 15.4):

Neighbours said *that as a teenager he had earned his pocket money by delivering newspapers.* [1]

In [1] the indirect speech is a direct object, but in [2] it is an extraposed subject and in [3] a subject complement:

It was said *that as a teenager Max had earned his pocket money by delivering newspapers.* [2]

What neighbours said was *that as a teenager he had earned his pocket money by delivering newspapers.* [3]

Reporting verbs that are used with indirect speech include those listed as frequently used with direct speech (cf 14.29). Lists of verbs of speaking and thinking used with indirect speech may be found in 16.31. Among the common verbs are *believe*, *feel*, *imagine*, *know*, *mention*, *realize*, *recognize*, *suppose*.

We have observed earlier (cf 14.28) that a reporter using indirect speech may paraphrase or summarize; changes may be made from the original wording without affecting the essential truth of the report. For example, the original wording may be as in [4]:

'My first task today,' said the teacher, 'will be to examine current views on the motivations for armed conflicts.' [4]

The indirect speech in [4a] approximates as closely as possible in that mode to the original wording:

The teacher said that his first task that day was to examine current views on the motivations for armed conflicts. [4a]

The hearer or reader, however, cannot be sure how close the indirect speech of [4a] is to the original wording, since [4a] could legitimately report the wording in [4b] instead:

'What I want to do now,' said the teacher, 'is to look at contemporary theories of the causes of wars.' [4b]

If, however, the report had been conveyed by [4c], there is no clear correspondence with the reported clause in direct speech:

The teacher announced his intention of discussing the causes of wars. [4c]

When the report is conveyed through indirect speech as in [4a], we can specify the changes in wording that are required because the situation of the utterance by the reporter may differ in certain respects from that of the utterance by the original speaker. The differences affect the use of deictic features of the language, those features that relate to the time and place of the utterance and to the persons referred to in the utterance. They include:

- tense forms of the verb
- other time references, eg: *yesterday*, *now*, *last week*, *next Monday*

- (iii) place references, *eg: here, there*
- (iv) personal pronouns
- (v) the demonstratives *this* and *these*

Changes in tense forms are discussed in 14.31 and the other changes in 14.32. Further changes may be required to identify references in the original utterance that may not be known to the person receiving the report, for example the identity of persons or things referred to by pronouns.

Note As with other *that*-clauses, the conjunction *that* is frequently omitted from the reported clause in less formal indirect speech.

Backshift in indirect speech

14.31 The reporting verb may be in the present tense for communications in recent past time, as in [1] and [2]:

- Joan *tells* me she's going to the airport in an hour's time. [1]
- She *says* she *was* too busy to join us last night. [2]

The present tense is also used for reports attributed to famous works or authors which have present validity, as in [3] and [4]:

- The Bible says* there's no end to the writing of books. [3]
- Chaucer somewhere writes* that love is blind. [4]

The choice of verb form in the reported clause depends on the time reference of the verb. Thus, the verbs in [1], [3], and [4] exemplify the state present (*cf* 4.5), while *was* in [2] refers to a time previous to the time of reporting as well as to the time of the original utterance.

Verbs of cognition may also be used in the reporting clause in the present tense:

- I *know* they *don't* care.
- Sylvia *thinks* Paul *went* to Lancaster last night.

When the time reference of the original utterance (or mental activity) no longer applies at the time that the utterance (or mental activity) is reported, it is often necessary to change the tense forms of the verbs. Such a change of verb forms in indirect speech is termed BACKSHIFT. The resulting relationship of verb forms in the reporting and reported clauses is known as the SEQUENCE OF TENSES (*cf* 19.39). The changes can be illustrated best if we postulate an exact correspondence for the reporting clauses of direct and indirect speech.

DIRECT SPEECH	BACKSHIFTED IN INDIRECT SPEECH
(i) present	~ past
(ii) past	~ past or past perfective
(iii) present perfective	~ past perfective
(iv) past perfective	

Thus, if the present deictic references in the direct speech become past deictic references in the indirect speech, there is a corresponding shift of

verb forms into the past, or if necessary into the past perfective. Examples of each part of the rule are:

- 'I *am being paid* by the hour,' she said. [5]
- ~ She said she *was being paid* by the hour.
- 'The exhibition finished last week,' explained Ann.
- ~ Ann explained that the exhibition $\left\{ \begin{array}{l} \text{finished} \\ \text{had finished} \end{array} \right\}$ the preceding week. [6]
- 'I've *been waiting* over an hour for you,' she told him.
- ~ She told him that she *had been waiting* over an hour for him. [7]
- 'I *had studied* French for four years at school,' I said.
- ~ I said that I *had studied* French for four years at school. [8]

The choice in [6] represents the usual choice of a simple past in place of a past perfective when the context makes the relative time references clear, in this instance by the use of *the preceding week*. There is no change in [8] because the past perfective already expresses 'past in the past' and no further backshift to 'past in the past in the past' can be expressed. As [5] and [7] illustrate, the rule is not affected by combinations of the simple and perfective forms with progressive and passive forms.

Backshift is optional when the time-reference of the original utterance is valid at the time of the reported utterance, *cf* [5], [7], and [8]. Thus, the shift is obligatory in [9], but optional in [10]:

- 'I *am* a citizen, not of Athens, but of the world,' said Socrates.
- ~ Socrates said that he *was* a citizen, not of Athens, but of the world. [9]
- 'Nothing *can* harm a good man,' said Socrates.
- ~ Socrates said that nothing $\left\{ \begin{array}{l} \text{could} \\ \text{can} \end{array} \right\}$ harm a good man. [10]

Since the statement by Socrates in [9] deals with what is now past, it has to be reported by application of the backshift rule. The statement in [10], on the other hand, is a universal rule which, if it was true for Socrates' lifetime, should also be true today; the backshift rule is therefore optional.

Here are other examples where present forms may be retained in indirect speech:

- Their teacher had told them that the earth *moves* around the sun. [11]
- Sam told me last night that he *is* now an American citizen. [12]
- I heard her say that she *is* studying Business Administration. [13]
- A Yale professor has said that the Brooklyn Bridge *is* the most majestic embodiment of the American experience of the road. [14]
- They thought that prison conditions *have* improved. [15]
- I didn't know that our meeting *is* next Tuesday. [16]
- She said that they *are* being discriminated against. [17]
- The waiter told me that lunch *is* now being served. [18]

In all these sentences, past forms may also be used, by optional application of the backshift rule. Sentence [11] has the simple present in its timeless use, whereas the verbs in the subsequent sentences have a limited time-reference.

The appropriateness of the present forms in [12-18] therefore depends on their reference at the time of the reported utterance. For example, if at that time Sam had changed his citizenship, or if his citizenship was then in doubt, an appropriate form of [12] would be, for example:

Sam told me in 1970 that he *was then* an American citizen. [12a]

Similarly, if a long time had elapsed between the original utterance reported in [15] or if there was doubt as to its present validity, the past perfective would be used:

They thought that prison conditions *had* improved. [15a]

Again, if [18] were reporting what the waiter had said not five minutes ago but five days ago it would have read:

The waiter told me that lunch *was* then being served. [18a]

Note [a] If the indirect speech itself contains a subordinate clause, then the verb of that subordinate clause may be in the present tense because of current validity even though both the main verb of the sentence and the superordinate verb are in the past:

They reminded us that they *had* frequently *denied* that the drug *has* any therapeutic value.
She thought she *had* told me that breakfast *is* served between seven and ten.

[b] Backshift from simple past to past perfective is necessary when the simple past in the indirect speech may be misinterpreted as representing a simple present:

She said, 'I *was* married (, but my husband died last year).'

~ She said that she *had been* married.

Contrast, where there is no possibility of misinterpretation:

She said, 'I *was* married in church.'

~ She said that she $\left\{ \begin{array}{l} \text{was married} \\ \text{had been married} \end{array} \right\}$ in church.

[c] Backshift is normal if the proposition in the indirect speech is considered to be false:

The ancients *thought* that the sun *moved* around the earth, but from the time of Galileo it *was known* that the reverse is true.

[d] When *can't* or *couldn't* is combined with *say* or *tell* in a reporting clause, one meaning of the combination is roughly the same as *don't know* or *didn't know*:

I *can't* $\left\{ \begin{array}{l} \text{say} \\ \text{tell you} \end{array} \right\}$ where she *is*. ['I don't know']

They *couldn't* $\left\{ \begin{array}{l} \text{say} \\ \text{tell me} \end{array} \right\}$ who *called*. ['They didn't know']

[e] Since the simple past in indirect speech may represent either the simple past or the simple present of direct speech, it may give rise to ambiguity where both interpretations are plausible:

A: She told me the game *started* at seven.

B: $\left\{ \begin{array}{l} \text{It didn't.} \\ \text{It doesn't.} \end{array} \right.$

Other changes in indirect speech

- 14.32 If the identities of the person speaking and the person addressed are not identical in the situations of the original and reported utterances, the personal pronouns need to be changed. PRONOUN SHIFT requires the shift of 1st and 2nd person pronouns to 3rd person pronouns or to nouns, when the persons referred to in the original utterance are absent in the reported utterance:

'I'll behave *myself*,' he promised.

~ He promised that *he'd* behave *himself*.

'I like *your* tie,' she told John.

~ She told John that *she* liked *his* tie.

'You know *my* family,' she said.

~ She told *him* [or *Tom*, for example] that *he* knew *her* family.

'You are too noisy,' Pamela told them.

~ Pamela told *them* that *they* were too noisy.

1st and 2nd person pronouns are used as appropriate to the reporting situation:

'You should be ashamed of *yourself*,' she told me.

~ She told me that *I* should be ashamed of *myself*.

'I am *your* friend, *Bob*,' he said to me.

~ He said to me that *he* was *my* friend.

Similarly, in reporting to Margaret a statement about herself:

'*Margaret* is very clever,' Tom said to me.

~ Tom told me that *you* are very clever.

'*Margaret* is in *my* class,' I said to him.

~ I told him that *you* were in *my* class.

We mention briefly other shifts that may be necessary. If the time relationship between time references in the indirect speech and the time of the utterance has changed between the original utterance and the reported utterance, it is necessary to make adjustments. Time references are changed variously according to the time of the reported utterance: for example, *yesterday* to *the day before yesterday*, *last Monday*, or *June 10*; *now* to *then*; *next Monday* to *last Monday* or *Monday two weeks ago*. If the places of the utterances are different, place references are changed accordingly: for example, *here* to *there*, or (if the reference is to the place of the reporting utterance) *there* to *here*, or the places may need to be specified by name. Demonstratives are also changed if the relative distancing has changed: *this* and *these* to *that* and *those*, but again the reverse if there is greater proximity at the time of the reported utterance.

Indirect statements, questions, exclamations, and directives

- 14.33 Our examples have so far been of indirect statements; but all the main sentence types (questions, exclamations, directives, as well as statements) may be converted into indirect speech. The constructions are as follows:

INDIRECT STATEMENT: *that*-clause (15.4)

INDIRECT QUESTION: dependent *wh*-clause (15.5f)

INDIRECT EXCLAMATION: dependent *wh*-clause (15.7)

INDIRECT DIRECTIVE: $\left\{ \begin{array}{l} \text{that-clause (15.10f)} \\ \text{to-infinitive clause (without subject) (15.10f)} \end{array} \right.$

Here are examples of the last three categories:

'Are you ready yet?' asked Joan. [YES-NO QUESTION]

~ Joan asked (me) *whether* I was ready yet.

'When will the plane leave?' I wondered. [WH-QUESTION]

~ I wondered *when* the plane would leave.

'Are you satisfied or not?' I asked her. [ALTERNATIVE QUESTION]

~ I asked her *whether or not she was satisfied*.

'What a brave boy you are!' Margaret told him. [EXCLAMATION]

~ Margaret told him *what a brave boy he was*.

'Tidy up the room at once,' I said to Tom. [DIRECTIVE]

~ I insisted that Tom $\left\{ \begin{array}{l} \text{tidy} \langle \text{esp AmE} \rangle \\ \text{should tidy} \langle \text{esp BrE} \rangle \end{array} \right\}$ *up the room at once*.

~ I told Tom to *tidy up the room*.

'Have another apple,' Carol suggested (to me). [DIRECTIVE]

~ Carol suggested that I $\left\{ \begin{array}{l} \text{have} \langle \text{esp AmE} \rangle \\ \text{should have} \langle \text{esp BrE} \rangle \end{array} \right\}$ *another apple*.

~ Carol asked me to *have another apple*.

All the types of changes outlined in 14.31f apply to questions and exclamations as well as statements. With directives, there is no tense backshift in the verb forms exemplified above: mandative subjunctive, putative *should*, *to*-infinitive (cf 14.24f).

Directives in fact involve the summary type from which it is not possible to reconstruct the exact words of the direct speech.

If the *to*-infinitive construction is used for an indirect directive, the reporting clause normally requires an indirect object or a prepositional object:

'Eat your food up,' she begged him.

~ She begged him to eat his food up.

'Sit down,' I snapped at him.

~ I snapped at him to sit down.

'Don't say anything,' he whispered to her.

~ He whispered to her not to say anything.

Note [a] If the subject of the infinitive is not present in an indirect directive, it is understood to be identical with the indirect object or prepositional object when it is present:

She told me *to call again tomorrow*. ['that I should call again tomorrow']

I whispered to them *to be quiet*. ['that they should be quiet']

The subject may be introduced by *for*, especially in AmE, except when the reporting verb is ditransitive *tell*:

She said *for us to sit down*. I shouted *for them to clear the way*.

If the verb is *say* and the *for*-construction is not used, the subject is understood from the situational context:

She said *to sit down*.

[b] Echo questions occasionally occur in indirect speech:

A: Are you going home? B: Am I going home? A: Yes, that's what I asked.

The second sentence might appear in indirect speech as *I asked if you asked if I was going home*. There are, however, no indirect constructions for echo exclamations.

The subjunctive and modal auxiliaries in indirect speech

14.34 There is no indirect speech construction for the optative subjunctive (cf 11.39), but when it is used to express a wish the construction with *may* (with a possible backshift to *might*) is sometimes a near-equivalent:

'God *bless* America!' she said.

~ She expressed the wish that God *might bless* America.

There is no backshift for the mandative subjunctive (cf 3.59):

'We insisted that he *leave* at once,' she said.

~ She said that they (had) insisted that he *leave* at once.

The past subjunctive (cf 14.24) or hypothetical past (cf 14.23) is backshifted to hypothetical past perfective if there is a change in time reference:

'If he *were* here, he would vote for the motion,' she said.

~ She said that if he *had been* there, he would have voted for the motion.

'If she *stayed* another day, he would drive her home,' he said.

~ He told me the following week that if she *had stayed* another day, he would have driven her home.

Backshift is optional if the proposition in the indirect speech is still valid:

'If I *were* in New York, I *would* visit the current exhibition at the Metropolitan Museum,' he said.

~ He said that if he $\left[\begin{array}{l} \text{were} \\ \text{had been} \end{array} \right]$ in New York, he $\left[\begin{array}{l} \text{would visit} \\ \text{would have visited} \end{array} \right]$ the current exhibition at the Metropolitan Museum.

If there is a change in time-reference, a modal auxiliary is backshifted from present tense forms to past tense forms even if the past tense forms do not normally indicate past time in direct speech:

'You *may* be able to answer this question,' he told her.

~ He told her that she *might* be able to answer that question.

'I *won't* pay another penny,' I said.

~ I said that I *wouldn't* pay another penny.

If a modal auxiliary in the direct speech is already in the past tense form, then the same form remains in the indirect speech:

'You *shouldn't* smoke in the bedroom,' he told them.

~ He told them that they *shouldn't* smoke in the bedroom.

'We *could* be wrong,' I told them.

~ I told them that we *could* be wrong.

'I *could* speak Spanish when I was young,' I said.

~ I said that I *could* speak Spanish when I was young.

'When I was in college I *would* study till two or three in the morning,' she recalled.

~ She recalled that when she $\left\{ \begin{array}{l} \text{was} \\ \text{had been} \end{array} \right\}$ in college she *would* study till two or three in the morning.

In the last two examples (with *could* and *would*), the modal auxiliaries have past time reference in the direct speech, and therefore backshift entails changing to the perfective.

Several modal auxiliaries or marginal modals have only one form: *must*, *ought to*, *need*, and *had better*. That form remains in indirect speech:

'You *must be* hungry,' he said.

~ He said that they *must be* hungry.

'You *had better* not say anything about this,' he warned me.

~ He warned me that I *had better* not say anything about that.

In its obligational sense, however, the past of *must* may be replaced by *had to* in indirect speech:

'You *must be* in by ten tonight,' his parents told him.

~ His parents told him that he $\left\{ \begin{array}{l} \text{must} \\ \text{had to} \end{array} \right\}$ be in by ten that night.

As always, backshift (where possible) is optional if the proposition in the indirect speech is valid at the time of utterance:

'Persistence *can* overcome all obstacles,' she said.

~ She said that persistence $\left\{ \begin{array}{l} \text{can} \\ \text{could} \end{array} \right\}$ overcome all obstacles.

Note [a] If they are followed by a perfective infinitive, modal auxiliaries in the reporting clause are counted, for purposes of backshift, as past tense forms:

'What *are* you doing?' I ought to have asked.

~ I *ought to have asked* what he *was* doing.

[b] Backshift normally occurs in the subordinate clause after an attitudinal past used for politeness (cf 4.16):

What did you say your name $\left\{ \begin{array}{l} \text{is?} \\ \text{was?} \end{array} \right\}$

I wondered if you *would* lend me some flour.

We were hoping you *would* stay with us.

There is no implication in these examples of past time reference.

Free indirect speech and free direct speech

- 14.35 FREE INDIRECT SPEECH is used extensively to report speech or (particularly in fiction) the stream of thought. It is basically a form of indirect speech, but (a) the reporting clause is omitted (except when retained as a parenthetical clause, as in direct speech), and (b) the potentialities of direct-speech sentence structure are retained (for example, direct questions and exclamations, vocatives, tag questions, and interjections). It is therefore only the backshift of the verb, together with equivalent shifts in personal pronouns, demonstratives, and time and place references, that signals the fact that the words are being reported, rather than being in direct speech. The italicized verbs below are backshifted to the past tense:

So that *was* their plan, *was* it? He well *knew* their tricks, and *would show* them a thing or two before he *was* finished. Thank goodness he *had* been alerted, and that there *were* still a few honest people in the world!

FREE DIRECT SPEECH is also used in fiction writing to represent a person's stream of thought. It is basically a form of direct speech, but it is merged with the narration without any overt indication by a reporting clause of a switch to speech. It is distinguished from the past time reference of the narration by its use of present-tense forms. In the following examples the parts in free direct speech are italicized:

I sat on the grass staring at the passers-by. Everybody seemed in a hurry. *Why can't I have something to rush to?*

A fly kept buzzing around, occasionally trying to settle on me. I brushed it off. It came back. *Keep calm! Wait until it feels safe. There! Got it.* On my hand was a disgusting flattened fly, oozing blood. I wiped my hand on the grass. *Now I can relax.*

We understand these as if there were quotation marks around the free direct speech.

Note For direct speech with a medial reporting clause but without quotation marks, cf 14.29 Note [e].

Transferred negation

- 14.36 TRANSFERRED NEGATION, particularly common in informal style, is the transfer of the negative from a subordinate clause (generally a *that*-clause), where semantically it belongs, to the matrix clause. For example, *I don't think it's a good idea* can have two meanings, one in which the negation applies to the matrix clause, and one in which it applies through transferred negation to the subordinate clause ('I think it isn't a good idea'). It is the difficulty of distinguishing the first meaning from the second that in part accounts for the transfer. Another explanatory factor is that generally the focus is on the content of the subordinate clause, which is pragmatically more important: the meaning of the sentence approximates to 'It's probably not a good idea'. The first meaning, however, becomes prominent if the focus is on *think*: *I don't THINK it's a good idea*; *I KNOW it is*. In this context, transferred negation does not take place. Because of the presence of the two meanings of the matrix clause, the negative force of the transferred negation in *I don't think it's a good idea* is weaker for the subordinate clause than in the less common *I think it isn't a good idea*, where the negative is actually present in the clause.

The matrix verbs that allow transferred negation fall into several semantic groups:

- (a) OPINION: *anticipate, be supposed to, believe, calculate, expect, figure* (informal AmE), *imagine, reckon* (informal, esp AmE), *suppose, think*

I don't believe I've met you before. ['I believe I haven't met you before']

She didn't imagine that we would say anything. ['She imagined we wouldn't say anything']

He didn't expect to win. ['He expected not to win']

- (b) PERCEPTION: *appear, seem; feel as if, look as if, sound as if* [these three verbs are also used informally, especially in AmE, with *like* in place of *as if*]

It doesn't seem that we can get our money back. ['It seems that we can't get our money back']

The baby doesn't appear to be awake. ['The baby appears not to be awake']

It doesn't look like it's going to rain. ['It looks like it isn't going to rain']

Transferred negation is an unclear phenomenon: intuitions may differ as to whether and to what degree two sentences with differently placed negatives are synonymous. Consider, for example, negative sentences with *likely* and *probable*:

It isn't $\left\{ \begin{array}{l} \text{likely} \\ \text{probable} \end{array} \right\}$ that oil prices will fall this year. [1]

It is not clear to what extent [1] is synonymous with [2]:

It's $\left\{ \begin{array}{l} \text{likely} \\ \text{probable} \end{array} \right\}$ that oil prices won't fall this year. [2]

A lack of synonymy becomes evident if the adjectives are intensified:

It isn't very $\left\{ \begin{array}{l} \text{likely} \\ \text{probable} \end{array} \right\}$ that oil prices will fall this year. [1a]

It's very $\left\{ \begin{array}{l} \text{likely} \\ \text{probable} \end{array} \right\}$ that oil prices won't fall this year. [2a]

Not all verbs in the same semantic field allow transferred negation. For example, *assume*, *presume*, and *surmise*, though similar to some of the verbs listed in (a) above, do not generally allow the transfer (cf Note [e]). The following two sentences, for example, are not equivalent in meaning:

I didn't assume that he knew me.

I assumed that he didn't know me.

The addition of modal auxiliaries or adverbials in the matrix clause may prevent transferred negation with verbs that otherwise allow it:

I can't believe that they are married.

You mustn't think he's stupid.

I wouldn't have imagined that Sandra would be here.

I didn't ever suppose they were happy.

It just didn't seem that it would rain.

Note [a] Transferred negation has also been termed 'negative raising' and 'negative transportation'.

[b] *Wish* allows transferred negation in infinitive clauses, but not in finite clauses:

I don't wish to be rude. ['I wish not to be rude']

[c] *Say* allows transferred negation if it is used with some modal auxiliaries (principally *wouldn't* and *couldn't*):

I wouldn't say I trust them. ['I would say that I don't trust them']

[d] In *can't seem* and *couldn't seem*, the meaning of the modal auxiliary is also transferred:

They can't seem to concentrate. ['They seem not to be able to concentrate']

[e] Verbs like *assume* sometimes allow transferred negation:

I don't assume it need happen under those circumstances.

I don't presume it would be in your best interest to acknowledge the insulting remarks.

[f] Many of the matrix verbs that allow transferred negation appear also in comment clauses (cf 15.54). In comment clauses they do not permit the transfer of negation:

My parents won't say anything about it, I think.

It won't rain today, I (don't) believe.

They don't care, I (don't) suppose.

But verbs not otherwise allowing the transfer also appear in comment clauses, eg: *know*, *see*.

[g] The subordinate clause is under the scope of negation (cf 10.64) and therefore accepts nonassertive items (cf 10.60f):

They didn't think I'd ever met you before.

I don't suppose you've paid for it yet.

But this feature applies to subordinate clauses when transferred negation does not apply:

They didn't know I'd ever met you before.

When the subject of the matrix clause is *I*, the tag question corresponds with the subordinate clause:

I don't imagine he CÀRES, DÔES he? [~ I imagine he doesn't CÀRE, DÔES he?]

I don't think she knows FRÈNCH, DÔES she? [~ I think she doesn't know FRÈNCH, DÔES she?]

The use of the positive tag question with a falling tone is another indication that the subordinate clause is under the scope of negation. But again this feature is not limited to transferred negation:

I'm not sure he CÀRES, DÔES he?

Sentence complexity and comprehensibility

Combining subordination devices within a sentence

14.37 For simplicity of illustration, most of our examples in this chapter have been of sentences with just one subordinate clause. We now give some examples that illustrate how several devices of subordination can be combined in sentences. The sentences are fairly brief and not unduly complicated. All of them consist of one main clause, and none of the subordinate clauses are coordinated.

A B C
[They point out [that India has not had the luxury, [as the United States
C D E
did,] of [finding a fresh, virgin land at its disposal at the moment [when its
EDBA
modern development began.]]]]

(The New York Times, August 16, 1982, 1.4) [1]

AB B
[[To keep dirt roads even marginally useful,] barrier gates are swung shut
C C D
[when drops begin to fall,] [lest the roads become churned into
DA
impassability.]]]

('Paraguay' by Gordon Young, National Geographic, August 1982, p. 259) [2]

A B C
[He was irritated at [Edwin taking [what seemed to him like an unfair
CB D E advantage]], [though [where the advantage lay] he could not have
DA said.]]

(*Quartet in Autumn* by Barbara Pym, Perennial Library, 1980, Harper & Row, p. 95; first published 1977) [3]

A B B C
[In Kowloon he hired a car from the biggest outfit [he could find], [using
D E E the escape passport and driving licence [because marginally [he thought]
F FDCA the false name was safer [if only by an hour.]]]]

(*The Honourable Schoolboy* by John Le Carré, Bantam Books 1978, p. 462; first published 1977) [4]

A B
[A House-Senate conference committee agreed today [to preserve a feature
C D of the tax code [that allows businesses [to deduct the cost of certain meals
DCB E F]]] [as it moved toward final agreement on a bill [to raise taxes by \$98.9
FEA billion over three years.]]]

(*The New York Times*, August 16, 1982, 1.1) [5]

One of the factors which determine the order in which the constituent clauses of a sentence are arranged is the principle of RESOLUTION, the principle that states that the final clause should be the point of maximum emphasis (*cf* communicative dynamism, 18.3). In reading aloud, the resolutive effect of the final clause is often pointed by intonation. A typical reading of [1] would put rising or falling-rising tones on all points of information focus (18.9ff) except the last:

... ÓUT ... LÚxury ... STÀTES DÍD ... dispÓsal ... beGÀN

As rising and falling-rising tones have implications of nonfinality, the effect of this pattern is to build up a continuing sense of anticipation, which is at last resolved by the finality of the falling tone. This principle of resolution is the counterpart, on the sentence level, of the principle of end-focus (*cf* 18.3f) in the tone unit.

The principle of resolution is illustrated effectively in sentences [1–4]. It is infringed, however, in [5], since the *as*-clause is peripheral: *meals*, indeed, would probably receive a falling tone, although it is not the last point of information focus. This sentence was the first in this particular news item, and perhaps its arrangement accords with the journalistic practice (in contravention of the resolution principle) of presenting the most important information at the very beginning of the lead sentence. Nevertheless, the sentence would read more smoothly if the *as*-clause were positioned initially.

Note [a] The letters in sentences [1–5] serve to keep track of the bracketing. They do not always

indicate a superordinate-subordinate relationship. For example, in sentence [2], clauses [B], [C], and [D] are all adverbials that are immediately subordinate to the complex sentence [A].

[b] The principle of resolution, along with the intonation pattern associated with it, is generally applicable only to restrictive adjunct clauses (*cf* 15.23). It does not apply to other syntactic types of adverbial clauses.

Positions of subordinate clauses

- 14.38 Subordinate clauses may be positioned initially, medially, or at the end of their superordinate clause (*cf* 8.14ff for adverbial positions). Initial position and end position are here taken to be the very beginning and the very end of the superordinate clause, except that a subordinate clause cannot of course precede the conjunction (if present) of the superordinate clause. For example, the *if*-clause in the following sentence is in *I* position in the superordinate *that*-clause:

I suspect that *if it rains* we won't go.

We visually represent the three arrangements in Fig 14.38a. The triangle marked 'M' represents the matrix clause and the triangle marked 'S' represents the subordinate clause.

Fig 14.38a Placement of subordinate clauses

The lower clause is the subordinate clause, and its relative position in the superordinate clause (the combination of matrix and subordinate clauses) is indicated by the point from which the line leading to the lower triangle branches downward. Initial clauses are said to be LEFT-BRANCHING, medial clauses NESTING, and final clauses RIGHT-BRANCHING.

Examples of these three arrangements:

INITIAL: *When you're ready*, we'll go to my parents' place.

MEDIAL: We'll go, *when you're ready*, to my parents' place.

END: We'll go to my parents' place *when you're ready*.

We can now diagram in Fig 14.38b overpage the relative positions of the subordinate clauses in the five sentences in 14.37. If a subordinate clause is not an immediate constituent of its superordinate clause, we have inserted the triangle representing it within that for the superordinate clause; for example in [1], clause [D] is a complement of the preposition *of* and clause [E] is a postmodifier of *the moment*.

Clauses that are constituents of phrases almost always occur at the end of the phrases. If we consider the clauses that are immediate constituents of their superordinate clauses in [1–5], we see that most of the triangles in Fig 14.38b are right-branching. It is, in fact, a dominant tendency of syntactic

Fig 14.38b Structures of sentences 14.37 [1-5]

structure that the greatest depth of subordination is reached in the final part of the sentence.

- 14.39 Right-branching clauses are the easiest to comprehend. Considerable left-branching is possible in the noun phrase, as illustrated in the following genitive construction, although comprehension becomes more difficult as the complexity of left-branching increases:

12345 5 4 3 2 1'
 [Tom's] sister's] husband's] mother's] house]

But in clause structure, left-branching tends to be limited to two degrees of embedding:

1 2 3 4 4 3
 [He said [that [if [when you've finished] you'd close the door] he'd be
 very grateful.]] [1]

In [1] the *when*-clause is initial in the *if*-clause, and the *if*-clause in turn is initial in the *that*-clause. However this extent of embedding becomes extremely awkward and indeed incomprehensible if the clauses are positioned initially in the sentence, where the length and complexity of the clauses contravenes the principle of end-weight (cf 18.9):

* That if when you've finished you'd close the door he'd be very grateful was
 obvious to everyone present. [1a]

In initial position in the sentence, one degree of left-branching is possible, though still awkward:

12 3 3 2 1
 [[That [if you could] you would help me] is of small comfort] [2]

We can reduce the awkwardness of [2] through extraposition of the subject (cf 18.33ff), thereby converting left-branching into right-branching:

1 2 3 321
 [It is of small comfort [that you would help me [if you could]]] [2a]

Extraposition is usual, and the resulting sentence [2a] is much more acceptable than [2]. The change from [2] to [2a] brought about by extraposition is visually presented in Fig 14.39.

Fig 14.39 Structure of sentences [2] and [2a]

Nesting (medial branching) causes the most awkwardness, if the nested clause is long and is itself complex:

Vanessa, whose brother Jim likes to tell at great length how he used to play tennis with famous movie stars when he lived in Los Angeles, is my best friend. [3]

Although the subordinate clauses within this nested relative clause are all right-branching, the nesting of just the one superordinate relative clause is sufficient to reduce the acceptability of the sentence. Contrast [3] with [3a], where by a switch of subject and subject complement the relative clause becomes right-branching, resulting in a much more acceptable sentence:

My best friend is Vanessa, whose brother Jim likes to tell at great length how he used to play tennis with famous movie stars when he lived in Los Angeles. [3a]

There is a further factor contributing to the awkwardness of [3]: it violates the principle of end-weight. At the sentence level, this principle requires that the part of the sentence following the verb should be as long as, and preferably longer than, the part that precedes the verb.

Posing particular difficulties for comprehension is SELF-EMBEDDING, the medial subordination of one constituent within another constituent of the same kind. While the sentence (found in a well-known nursery story) *This is the . . . rat that ate the malt that lay in the house that Jack built* is tolerable and easily intelligible regardless of the number of relative clauses, the self-embedded alternative:

?* This is the house¹ [that the malt² [that the rat² ate] lay in]¹

is extremely awkward and not easy to understand, even though there is only one layer of self-embedding. We need add only a second layer of self-embedding to render the sentence completely baffling:

* This is the house¹ [that the malt² [that the rat³ [that the cat³ killed] ate] lay in]¹

The various arrangements of subordinate clauses, therefore, do not just concern stylistic options and their relative merits, but also the more basic question of what constitutes a possible English sentence.

Note Despite the overall tendency towards final subordination, certain types of adverbial clauses favour initial position. They include conjuncts (cf 15.18), subjuncts (cf 15.19), most style disjuncts (cf 15.21), and sentence adjuncts (cf 15.22). Moreover, adverbial correlative constructions with a correlative adverbial in the second clause (cf 14.13) not merely favour but require initial placement of the subordinate clause.

Subordination versus coordination

14.40 Coordination is the kind of link most used for optimum ease of comprehension. At the same time the link, especially with *and*, is vague in that it leaves the specific logical relationships to the inference of the speaker (cf 13.22ff).

In the following examples we seek to demonstrate correspondences between coordination and subordination, while preserving the information ordering. This ordering, however, has the effect of suggesting an initial positioning of subordinate clauses that is more frequent than usual.

SUBORD: Reaching for the phone, he asked for the operator. [1]
COORD: He reached for the phone and (then) asked for the operator. [1a]

SUBORD: Although admission was free, few people attended the lecture. [2]
COORD: Admission was free, but (nevertheless) few people attended the lecture. [2a]

SUBORD: If you push the door hard, it will open. [3]
COORD: Push the door hard, and (then) it will open. [3a]

SUBORD: Unless you give it back to me, I'll tell your mother. [4]
COORD: Give it back to me or (else) I'll tell your mother. [4a]

SUBORD: Over fifty demonstrators were arrested, some of them women. [5]
COORD: Over fifty demonstrators were arrested, and some of them were women. [5a]

SUBORD: When the ship arrived at Naples, the sailors were given shore leave for twelve hours. [6]
COORD: The ship arrived at Naples, and the sailors were (then) given shore leave for twelve hours. [6a]

SUBORD: I lent my bicycle to Robert, who lent it to David. [7]
COORD: I lent my bicycle to Robert, and he (then) lent it to David. [7a]

SUBORD: Whereas the Northeast and the Midwest are rapidly losing population, the Sun Belt states are receiving more people than they can cope with. [8]

COORD: The Northeast and the Midwest are rapidly losing population, and/but (at the same time) the Sun Belt states are receiving more people than they can cope with. [8a]

SUBORD: Mortimer exploded a firecracker during the lesson, as a result of which he was suspended from school for a week. [9]
COORD: Mortimer exploded a firecracker during the lesson, and as a result of that he was suspended from school for a week. [9a]

SUBORD: Discovered almost by accident, this substance has revolutionized medicine. [10]
COORD: This substance was discovered almost by accident, and it has (since) revolutionized medicine. [10a]

SUBORD: As Jane was the eldest, she looked after the others. [11]
COORD: Jane was the eldest, and (so) she looked after the others. [11a]

The conditional uses of *and* and *or* exemplified in [3a] and [4a] are rarely encountered in written English. On the other hand, the adverbial participle clauses in [1] and [10] (cf 15.58ff) are rarely encountered in spoken English.

Parataxis without a coordinator (cf 13.2) is also a common substitute for subordination. The clauses may be punctuated as separate sentences or they may be separated by semicolons or (in restricted circumstances, cf App III.6) by commas within the same orthographic sentence. The three examples are based on the last three pairs above:

- Mortimer exploded a firecracker during the lesson; as a result he was suspended from school for a week. [9b]
 This substance was discovered almost by accident. It has since revolutionized medicine. [10b]
 Jane was the eldest, so she looked after the others. [11b]

Structural ambiguity

14.41 Ambiguities may arise in complex sentences when two interpretations are plausible. If a complex sentence contains two final subordinate clauses, as in [1], the last subordinate clause may be interpreted as subordinate (a) to the sentence as a whole or (b) to the preceding subordinate clause. The two paraphrases are given in [1a] and [1b] respectively.

- I'll let you know whether I'll need you here when the doctor arrives. [1]
 When the doctor arrives, I'll let you know whether I'll need you here. [1a]
 I'll let you know whether, when the doctor arrives, I'll need you here. [1b]

The two structures are shown in Fig 14.41a.

Fig 14.41a Structural ambiguity of [1]

If the (a) interpretation is intended, the last subordinate clause should be preposed, as in the paraphrase in [1a], since generally a final subordinate clause is interpreted as subordinate to the immediately preceding clause. But the final placement in [1] for the (a) interpretation is not uncommon. In conversation, any misinterpretation can be immediately corrected, but in writing the misplacement in [1] for the (a) interpretation is a stylistic error. The same ambiguities may occur with phrases as well as clauses:

- Doris watched her children doing their homework for a short time.
 I remembered having told Tom soon afterwards.

A similar ambiguity occasionally arises with two coordinated clauses followed or preceded by a subordinate clause:

- John reported to me and I informed Bob that everything was ready. [2]
 If Mary has recovered from the flu she is in the supermarket and the children are at a play centre. [3]

The interpretation of the sentences depends on whether the subordinate clause belongs (a) to both main clauses or (b) to only one of them. Punctuation (and in speech, intonation) can distinguish the two interpretations of [2]:

- John reported to me, and I informed Bob, that everything was ready. [2a]
 John reported to me, and I informed Bob that everything was ready. [2b]

For the [2a] interpretation of [3], separation by punctuation or intonation of only the subordinate clause may be sufficient:

- If Mary has recovered from the flu, she is in the supermarket and the children are at a play centre. [3a]

A clearer alternative is to subordinate the second clause:

- If Mary has recovered from the flu, she is in the supermarket while the children are at a play centre. [3a']

For the (b) interpretation, the main clauses may be switched:

- The children are at a play centre and, if she has recovered from the flu, Mary is in the supermarket. [3b]

Alternatively, the subordinate clause may be placed at the end of the first main clause:

- Mary is in the supermarket, if she has recovered from the flu, and the children are at a play centre. [3b']

Yet a further type of ambiguity involves a final coordinated clause which follows a subordinate clause. The ambiguity depends on whether the final clause (a) is a main clause or (b) is coordinated with the preceding subordinate clause:

- I know (that) he's cheating and I can't do anything about it. [4]

If a relation of coordination is represented as $\triangle \triangle$, then the two interpretations of [4] can be represented as in Fig 14.41b.

Fig 14.41b Structural ambiguity of [4]

To make it clear that interpretation (b) is intended, we could insert *that* at the beginning of the final clause as well as at the beginning of the first subordinate clause:

I know that he's cheating and that I can't do anything about it. [4b]

If we do not change the wording of [4] there is no sure way of insisting on interpretation (a), but the major syntactic break after *cheating* can be indicated at that point by a semicolon, or by a tone unit boundary and a pause. A clearer alternative requires in addition the omission of *and*:

I know that he's cheating; (however) I can't do anything about it. [4a]

In our discussion of structural ambiguity we have considered five devices that can be used to avoid ambiguity:

- (1) changing the order of the clauses, as in [1a] [1b], [3b], [3b']
- (2) using punctuation to mark the major (*ie* least embedded) clause boundary, as in [2a], [2b], [3a]
- (3) using intonation, if necessary endorsed by pause, to mark the major clause boundary, as in [2a], [2b], [3a]
- (4) supplying ellipted elements, as in [4b]
- (5) changing the structural relationship of the clause, *eg* from coordinate to subordinate, as in [3a'], or from coordinate to paratactic without a coordinator, as in [4a].

Bibliographical note

On the terminology for sentence and clause, see Greenbaum (1980).

On the complex sentence and subordination in general see Haegeman (1985); Hudson (1971); Nakajima (1982); Smaby (1974). On nonfinite and verbless clauses beginning with a subordinator, see Bäcklund (1984).

On the overlap of conjunction and preposition, see Jacobsson (1977a); Matthews (1981), esp 174–81.

On the choice of verb in subordinate clauses, see Palmer (1974; 1979), both *passim*. On more specialized topics, see Close (1980); Haegeman (forthcoming b); Johansson (1979); Quirk (1981). The last three cite evidence from elicitation experiments or from corpus analysis on the preferences for the mandative subjunctive, the *should*-construction, and the indicative.

On backshift in indirect speech, see Palmer (1974; 1979), both *passim*.

On transferred negation, see Cattell (1973); Horn (1978b); Lakoff (1969); Lindholm (1969).

On sentence complexity and comprehensibility, see Chomsky (1965), especially pp 10–14; Huddleston (1965); Rosenbaum (1967b); Williams (1979); Yngve (1961).

Syntactic functions of subordinate clauses

15.1 Subordinate clauses may function as subject, object, complement, or adverbial in a superordinate clause:

subject: *That we need a larger computer* has become obvious.

direct object: He doesn't know *whether to send a gift*.

indirect object: You can tell *whoever is waiting* that I'll be back in ten minutes.

subject complement: One likely result of the postponement is *that the cost of constructing the college will be very much higher*.

object complement: I know her *to be reliable*.

adverbial: *When you see them*, give them my best wishes.

In addition, subordinate clauses may function within these elements, eg:

postmodifier in noun phrase: (Few of the immigrants retained) the customs *that they had brought with them*.

prepositional complement: (It depends) on *what we decide*.

adjectival complementation: (We are) happy *to see you*.

Note There are constraints on the functioning of clauses as indirect objects or as object complements. Among the finite clauses, only nominal relative clauses function as indirect object (but cf 15.4 Note [a]) or as object complement.

Functional classes of subordinate clauses

15.2 On the basis of their potential functions, we distinguish several major categories of subordinate clauses: NOMINAL, ADVERBIAL, RELATIVE, and COMPARATIVE. The functional classification resembles to some extent that of subclausal units such as noun phrases and adverbs.

NOMINAL CLAUSES have functions that approximate to those of noun phrases: subject, object, complement, appositive, and prepositional complement. Every nominal clause may function in some or all of these functions. Unlike noun phrases, however, nominal clauses may also function as adjective complementation without a preposition (cf 16.70):

I'm not sure that I can remember the exact details.

The privilege of occurrence of nominal clauses is more limited than that of noun phrases because semantically the clauses are normally abstract; *ie* they refer to such abstractions as events, facts, dates, and ideas rather than to perceptible objects. The one exception to this generalization is the nominal relative clause (cf 15.8 f), which may refer to objects (including persons) and which has some of the properties of a noun phrase consisting of head and postmodifying relative clause, the head and relative pronoun coalescing to form a single *wh*-element. Compare the equivalent sentences:

What pleases one party infuriates the other.

That which pleases one party infuriates the other. <formal>

Since indirect objects normally refer to persons, we can see why the nominal relative clause is the only type of clause that can normally function as an indirect object. Nominal clauses that are involved in the complementation of verbs and adjectives are examined in detail in Chapter 16.

ADVERBIAL CLAUSES (*cf* 15.17*ff*) function mainly as adjuncts or disjuncts (*cf* 15.20*f*). In those functions they are like adverb phrases, but in their potentiality for greater explicitness, they are more often like prepositional phrases:

We left *after the speeches ended*.
We left *after the end of the speeches*.
We left *afterwards*.

RELATIVE CLAUSES generally function as restrictive or nonrestrictive modifiers of noun phrases and are therefore functionally parallel to attributive adjectives. Compare:

a man *who is lonely* ~ a lonely man

But they are positioned like postmodifying prepositional phrases:

tourists *who come from Italy* ~ tourists *from Italy*

These adnominal relative clauses are discussed in detail in Chapter 17, the chapter concerned with noun phrases. Two types of relative clauses, however, are discussed in this chapter: the nominal relative clause (15.8*f*) and the sentential relative clause (15.57). The status of the nominal relative clause is indeed equivocal between noun phrase and nominal clause, but its resemblance to nominal clauses proper is sufficient to justify its treatment together with them. The sentential relative clause does not function as a modifier of a noun phrase; its relative item refers anaphorically to a unit larger than a phrase, usually to a clause but sometimes even to a series of sentences. The inclusion of the sentential relative clause in this chapter is warranted by its resemblance in certain respects to adverbial clauses.

COMPARATIVE CLAUSES (*cf* 15.63*ff*) resemble adjectives and adverbs in their modifying functions:

He's not *as* clever a man *as I thought*.
I love you *more* deeply *than I can say*.

Semantically, the comparative clauses together with their correlative element (*eg: more, as, -er*) are equivalent to degree adverbs.

Nominal clauses

- 15.3 Nominal clauses (clauses approximating in function to noun phrases) fall into six major categories:

that-clauses, or subordinate declarative clauses (15.4)
subordinate interrogative clauses (15.5*f*)

subordinate exclamative clauses (15.7)
nominal relative clauses (15.8*f*)
to-infinitive clauses (15.10*f*)
-ing clauses (15.12*ff*)

Nominal clauses may take *it* or *that* as pro-forms:

I know *that you mean well*, but THEY don't know *it*.
How a book sells depends on the author, but *it* also depends on the publisher.
I hope *to see you tomorrow*, but *that* depends on the weather.
Collecting stamps was her hobby, but she has given *that* up.

That-clauses

- 15.4 Nominal *that*-clauses may function as:

subject: *That the invading troops have been withdrawn* has not affected our government's trade sanctions.
direct object: I noticed *that he spoke English with an Australian accent*.
subject complement: My assumption is *that interest rates will soon fall*.
appositive: Your criticism, *that no account has been taken of psychological factors*, is fully justified.
adjectival complementation: We are glad *that you are able to join us on our wedding anniversary*.

They may not, however, function as object complement or (but *cf* 9.2) as prepositional complement.

When the *that*-clause is direct object or complement, the conjunction *that* is frequently omitted except in formal use, leaving a zero *that*-clause:

I know *it's late*.

It is similarly omitted frequently when a subject *that*-clause (with anticipatory *it*) is extraposed (*cf* 18.33*ff*):

It's a pity you don't know Russian.

But otherwise *that* cannot be omitted in a subject clause, since without the subordinate marker the clause would be initially misinterpreted as a main clause:

**You don't know Russian* is a pity.

Subject *that*-clauses are usually extraposed. Extraposition is particularly preferred when the superordinate clause is interrogative or passive:

Is it possible *that they can't afford to rent that apartment*?
It was thought *that the cease-fire still held*.

If the superordinate clause is exclamatory, extraposition is obligatory:

How strange *it is that the children are so quiet*!

Object *that*-clauses are normally extraposed when they cooccur with an object complement:

Their daughter's success makes it very likely *that she will return to California*.

Note [a] A nominal *that*-clause functioning as indirect object is marginally acceptable and rare:
They would not give *that she passed her examination with distinction* any consideration in determining her salary.

[b] The zero *that*-clause is particularly common when the clause is brief and uncomplicated. Retention of *that* is necessary under certain conditions other than when the clause is an unextraposed subject:

(i) to clarify whether an adverbial belongs to the matrix clause or the *that*-clause:

They told us once again *that the situation was serious*.

They told us *that once again the situation was serious*.

(ii) to prevent a coordinated *that*-clause from being misinterpreted as a coordinated main clause (cf 14.41):

I realise that I'm in charge and *that everybody accepts my leadership*.

~ I realize that I'm in charge, and everybody accepts my leadership.

(iii) when the object *that*-clause is fronted (as with an initial subject clause):

That she ever said such a thing I simply don't believe.

(iv) when a clause or a long phrase intervenes between the verb and the *that*-clause:

We decided, in view of his special circumstances, *that we would admit him for a probationary period*.

[c] Like most other nominal clauses, nominal *that*-clauses cannot be object complements, but alternative *to*-infinitive constructions are available with some verbs (cf 16.50f):

*I thought his argument *that we should pay*.

~ I thought his argument *to be that we should pay*.

Also a finite construction:

~ I thought (*that*) his argument was (*that*) we should pay.

[d] If the subject of the *that*-clause is a pushdown *wh*-element (cf 11.18) and is therefore moved to the front of the superordinate clause, the subordinator *that* must be omitted, perhaps to prevent *that* being initially misinterpreted as subject of the following verb:

Who did she hope would be the winner? [1]

**Who* did she hope *that* would be the winner? [1a]

They pointed out the damage *which* they supposed had been done by last night's storm. [2]

*They pointed out the damage *which* they supposed *that* had been done by last night's storm. [2a]

Contrast [1b] with [1] and [1a]:

Who did she hope (*that*) *that* would be? [1b]

In [1b], the second *that* is indeed the subject of the *that*-clause; *who* is the subject complement and therefore the subordinator *that* may be optionally retained, the presence of a subject *that* before the verb preventing misinterpretation.

Here are several other examples of optional *that* when the *wh*-element is not the subject and hence a subject appears before the verb in the *that*-clause:

Who do you expect (*that*) they have chosen?

She told me *how* she thought (*that*) the machine worked.

They mentioned the name of the men (*who*) they knew (*that*) you had spoken to.

Wh-interrogative clauses

15.5 Subordinate *wh*-interrogative clauses occur in the whole range of functions available to the nominal *that*-clause (cf 15.4) and in addition may function as prepositional complement:

subject: *How the book will sell* depends on the reviewers.

direct object: I can't imagine *what they want with your address*.

subject complement: The problem is *who will water my plants when I am away*.

appositive: Your original question, *why he did not report it to the police earlier*, has not yet been answered.

adjectival complementation: I'm not sure *which she prefers*.

prepositional complement: They did not consult us on *whose names should be put forward*.

These subordinate clauses resemble *wh*-questions semantically (cf 11.14 ff) in that they leave a gap of unknown information, represented by the *wh*-element. Contrast the known information expressed in the *that*-clause with the unknown information in the *wh*-clause:

I know (*that*) *Caroline* will be there.

Do you know *who* will be there?

I'm sure (*that*) *Ted* has paid.

I'm not sure *who* has paid.

The type of subordinate *wh*-interrogative clause that most closely resembles *wh*-questions is the indirect *wh*-question (cf 14.33):

She asked me *who would look after the baby*.

Compare the direct question:

She asked me, 'Who will look after the baby?'

But we can claim a chain of resemblance from the request for an answer to a question (as in the indirect question) through uncertainty about the answer (as in *I'm not sure who will look after the baby*), certainty about the answer (*It's obvious who will look after the baby*), expressions of other mental states or processes about the answer (*I found out who will look after the baby*, *It's irrelevant who will look after the baby*), and informing about the answer (*I told you who would look after the baby*). In all instances a question is explicitly or implicitly raised, a question focused on the *wh*-element.

There are also grammatical similarities to independent *wh*-questions:

(i) the *wh*-element is placed first in its clause, as in all the examples in this section. If the *wh*-element is a prepositional phrase, we have the same choices as for the *wh*-element in *wh*-questions (cf 11.14, and Note [a] below):

I asked them *on what* they based their predictions. <formal>

I asked them *what* they based their predictions *on*.

(ii) The *wh*-elements have the same range of functions as the *wh*-elements in *wh*-questions (cf 11.15).

(iii) Although the subordinate clause usually does not have subject-operator inversion, such inversion may occur, particularly when the clause functions as complement and the superordinate verb is BE or when it functions as appositive:

The problem is *who can we get to replace her*.

Your original question, *why did he not report it to the police earlier*, has not yet been answered.

Furthermore, the superordinate predications that allow *wh*-clauses will generally also allow *yes-no* interrogative clauses:

Whether the book will sell depends on the reviewers.

I'm not sure *whether she prefers coffee*.

They did not consult us on *whether our names should be put forward*.

An infinitive *wh*-clause can be formed with all *wh*-words, though instances with *why* are rare:

I don't know *what to say*. ['... what I should say.']

You must explain to them *how to start the motor*.

['... how one/they should start the motor.']

I never know *who to speak to*. ['... who one/I should speak to.']

I'm wondering *where to put my coat*. ['... where I should put my coat.']

I'm wondering *why to go at all*. ['... why I should go at all.']

The infinitive clause has an obligational sense.

Note [a] As with *wh*-questions (cf 11.15 Note [a]), the final preposition following BE in certain informal questions must be deferred:

I can imagine *what it is like*. [*like what it is]

I'm not sure *who it's for*. [*for whom it is]

The preposition is generally deferred in:

I can't understand *what you did that for*. [*for what you did that]

[b] In literary style, subject-verb inversion occasionally occurs when the *wh*-element is the subject complement or an obligatory adverbial, particularly if the subject is lengthy:

She told us *how strong was her motivation to engage in research*.

It took me some time to discover *in which village stood the memorial to our fallen comrades*.

In addition subject-operator inversion is common in Irish English and dialectally:

Whenever I see her, she asks *when will I be visiting her mother*.

[c] Prepositions are optionally omitted before *wh*-clauses:

We have solved the problem *(of) who was at fault*.

I'm not sure *(about) what to do*.

[d] There may be more than one *wh*-element in the clause:

I don't know *who wants what*.

Compare the multiple *wh*-elements in *wh*-questions (cf 11.19).

[e] The case distinction in formal contexts between subjective *who* and objective *whom* depends on the function of the *wh*-word in its clause:

I do not know *who wants you*.

I do not know $\left\{ \begin{array}{l} \text{who you want.} \\ \text{whom you want.} \end{array} \right.$ (formal)

The distinction applies regardless of a governing preposition in the superordinate clause, since the complement of the preposition is the whole clause, not the *wh*-word:

It depends on *who wants you*.

It depends on $\left\{ \begin{array}{l} \text{who you want.} \\ \text{whom you want.} \end{array} \right.$ (formal)

Nevertheless, the preceding preposition sometimes influences speakers to use objective *whom* as a hypercorrection even when it has the function of subject in the *wh*-clause. Except in formal contexts, *who* is used for all functions.

What we have said in this Note applies equally to the case distinction between subjective *whoever* and formal objective *whomever* in nominal relative clauses.

[f] Some noun phrases correspond semantically to subordinate *wh*-clauses, in contexts where such clauses are also appropriate:

He explained the way to the park. ['... how to get to the park.'] [1]

We found out the time it takes to get there. ['... how long it takes to get there.'] [2]

I don't know the $\left\{ \begin{array}{l} \text{culprit. ['... who the culprit is'.]} \\ \text{person you want.} \end{array} \right.$ [3]

She asked the reason for the delay. ['... why there was a delay.'] [4]

Example [3] can also mean 'I am not acquainted with the culprit/the person you want'.

Yes-no and alternative interrogative clauses

15.6 Subordinate *yes-no* interrogative clauses (cf 11.5ff) and subordinate alternative interrogative clauses (cf 11.20f) occur in the whole range of functions available to subordinate *wh*-interrogative clauses (cf 15.5), and may include infinitive clauses. The *yes-no* clause is introduced by the subordinators *whether* or *if*:

Do you know *whether the banks are open*?

I wonder *if you can help me*.

The alternative clauses are formed with the correlatives *whether ... or* or *if ... or*:

I can't find out $\left[\begin{array}{l} \text{whether} \\ \text{if} \end{array} \right] \text{the flight has been DELAYED or}$
 $\left[\begin{array}{l} \text{whether} \\ \text{if} \end{array} \right] \text{it has been CANCELLED.}$ [1]

If, as in [1], the second unit is a full clause, the subordinator is repeated. It is not repeated in [2-4], where the second unit is an abbreviated form:

They didn't say *whether it will RAIN or be SUNNY*. [2]

I asked them *if they wanted MEAT or FISH*. [3]

I don't care *if they JOIN us or NOT*. [4]

The abbreviated forms parallel those for independent alternative *yes-no* questions (cf 11.21). Repetition is optional with *to*-infinitive clauses:

He didn't tell us *whether to wait for him or (whether) to go on without him*.

But the subordinator is not repeated if the second clause is abbreviated by the omission of the infinitival *to*:

He didn't tell us *whether to wait for him or go on without him*.

Whether-clauses pose alternatives more obviously than *if*-clauses, which can be ambiguous between this construction and that of conditional clauses. *Whether*-clauses, unlike *if*-clauses, may be used where there is little resemblance to an indirect question:

It's irrelevant $\left\{ \begin{array}{l} \text{whether} \\ \text{?if} \end{array} \right\} \text{she's under sixteen.}$

You have to justify $\left\{ \begin{array}{l} \text{whether} \\ \text{*if} \end{array} \right\} \text{your journey is really necessary.}$

If tends to be more frequent than *whether* in informal style for *yes-no* clauses.

On the other hand, *if* is more restricted syntactically than *whether*. It must occur as complementation of verbs and adjectives, in consequence of which it is excluded from certain contexts:

(i) *If* cannot introduce a subject clause unless the clause is extraposed:

Whether she likes the present
**If she likes the present* } is not clear to me.

It's not clear to me { *whether*
 if } *she likes the present.*

(ii) *If* cannot introduce a subject complement clause:

My main problem right now is *whether I should ask for another loan.*
?*My main problem right now is *if I should ask for another loan.*

(iii) The *if*-clause cannot be the complement of a preposition:

It all depends on *whether they will support us.*
?*It all depends on *if they will support us.*

(iv) The *if*-clause cannot be an appositive:

You have yet to answer my question, *whether I can count on your vote.*
?*You have yet to answer my question, *if I can count on your vote.*

In addition:

(v) *If* cannot introduce a *to*-infinitive clause:

I don't know *whether to see my doctor today.*
*I don't know *if to see my doctor today.*

(vi) *If* cannot be followed directly by *or not*:

He didn't say *whether or not he'll be staying here.*
*He didn't say *if or not he'll be staying here.*

But *or not* can be postposed:

He didn't say *if he'll be staying here or not.*

Note [a] There is a close connection between conditional *if* and interrogative *if*; both convey doubt about the truth value of the clause. Compare:

If she wants you, (then) she will say so.

Does she want you? (Then) she will say so.

Where ambiguity may arise, intonation or punctuation separation may sometimes be necessary to distinguish the interrogative from the conditional clause:
interrogative [SV₀O₀]:

I'll tell you later *if I can find the time.* [*if* = *whether*]

conditional [SV₀O₀A]:

I'll tell you later, *if I can find the time.* ['If I can find the time, I'll tell you later.']

[b] As with *either* (cf 13.39ff), *whether* or *if* can be used for more than two choices, despite a tradition of binary association (cf 15.41 Note [d]):

I don't care *whether* you do your homework *or* play outside *or* go to bed.

[c] On *whether*- and *if*-clauses as complementation of verbs such as *doubt*, cf 16.73.

[d] There is some prescriptive objection to *or not* as redundant.

Exclamative clauses

15.7 Subordinate exclamative clauses generally function as extraposed subject, direct object, or prepositional complement:

extraposed subject: It's incredible *how fast she can run.* ['It's incredible that she can run so fast.']

direct object: I remember *what a good time I had at your party.*

['I remember that I had such a good time at your party.']

prepositional complement: I read an account of *what an impression you had made.* ['I read an account that you had made an excellent (or a terrible) impression.']

As in independent exclamative clauses (cf 11.31f), the exclamative element is formed with *what* as predeterminer in a noun phrase and *how* as intensifier of an adjective, adverb, or clause; the exclamative element is positioned initially regardless of its normal position in a declarative clause.

Subordinate exclamative clauses generally have the same form as subordinate interrogative clauses introduced by *what* or *how* (cf 15.5). However, in exclamative clauses *what* is a predeterminer (preceding the indefinite article), while in interrogative clauses *what* is either a central determiner or a pronoun. Thus [1] with predeterminer *what* is unambiguously exclamative, while [2] with central determiner *what* and [3] with pronoun *what* are unambiguously interrogative:

They didn't know *what a crime he had committed.*

['... the terrible crime he had committed.']; cf: *What a crime he had committed!* [1]

They didn't know *what crime he had committed.*

['... the identity of the crime he had committed.']; cf: *What crime had he committed?* [2]

They didn't know *what the crime was.*

['... the identity of the crime'; cf: *What was the crime?*] [3]

The distinction between predeterminer and central determiner *what* is neutralized for noncount nouns (*what foolishness*) and plural nouns (*what crimes*).

If the superordinate clause has a predication appropriate for both types of clauses and the *wh*-words are *how* or *what* with a noncount or plural noun, the subordinate clause may be ambiguous:

You can't imagine *what difficulties I have with my children.*

exclamatory interpretation: You can't imagine the great difficulties I have with my children.

interrogative interpretation: You can't imagine the kinds of difficulty I have with my children.

I told her *how late she was.*

exclamatory interpretation: I told her she was very late.

interrogative interpretation: I told her the extent to which she was late.

We all saw *how strange a look she gave him*.

exclamatory interpretation: We all saw that she gave him an extremely strange look.

interrogative interpretation: We all saw the extent to which the look she gave him was strange.

Nominal relative clauses

- 15.8 Nominal relative clauses resemble *wh*-interrogative clauses (cf 15.5) in that they are also introduced by a *wh*-element. Indeed, a major reason for including nominal relative clauses in this chapter is that it is often difficult to distinguish them from the interrogative clauses.

On the other hand, in some respects nominal relative clauses are more like noun phrases, since they can be concrete as well as abstract and can refer even to persons. In fact, we can paraphrase them by noun phrases containing a noun head with general reference that is modified by a relative clause:

Whoever did that should admit it frankly.

['The person who did that . . .']

I took *what they offered me*.

[' . . . the thing(s) that they offered me.']

Macy's is *where I buy my clothes*.

[' . . . the place where I buy my clothes.']

Compare also the paraphrase when the *wh*-element is a determiner:

I took *what books she gave me*. [' . . . the books that she gave me.']

Furthermore, nominal relative clauses share with noun phrases a wider range of functions than are available to other nominal clauses (see below). In addition, like noun phrases, they may display number concord with the verb of the sentence (cf 10.34). Contrast for example:

Whatever book you see is yours to take.

Whatever books I have in the house are borrowed from the public library.

The nominal relative clause is basically a noun phrase modified by an adnominal relative clause (cf 17.9ff), except that its *wh*-element is merged with its antecedent (the phrase to which the *wh*-element refers). In that respect the nominal relative clause is more self-contained than the adnominal relative clause and can function as an element in a superordinate clause. Compare the nominal relative clause in [1] with the noun phrase in [1a]:

I eat *what I like*.

[1]

I eat *that which I like*. <formal>

[1a]

In [1a], which has approximately the same meaning as [1], the antecedent of the adnominal relative clause is *that*.

The *wh*-item may be a pronoun, such as *what* in [2], a determiner, such as *what* in [3], or an adverb, such as *where* in [4]:

She tasted *what I bought*.

[2]

She saw *what food I bought*.

[3]

Here is *where I bought the food*.

[4]

On the *wh*-items that function as nominal relatives, cf 6.35 Note [b].

The *wh*-element may function within the nominal relative clause as subject, direct object, subject complement, object complement, adverbial, or prepositional complement:

subject: *What* happened (upset him).

(They welcomed) *whatever visitors* came their way.

direct object: *What* he saw (upset him).

(She took) *what* she needed.

subject complement: *What* she became in later life (distressed her friends).

(I'm happy with) *what* I am.

object complement: (That's) *what* she calls her sister.

adverbial: *Where* she went (was Manchester).

(Now is) *when* I need you.

prepositional complement: (I'll show you) *what* you can open the bottle with.

There are some restrictions on the use of the *wh*-element:

- (a) The determiner *what* is only marginally acceptable when the *wh*-element is subject. Contrast [5] with [5a]:

?(They gladly accepted) *what money* came their way.

[*wh*-element as S]

[5]

(They gladly accepted) *what money* people gave to them.

[*wh*-element as O_d]

[5a]

Contrast [5] also with [5b], where the determiner *whatever* is fully acceptable:

(They gladly accepted) *whatever money* came their way.

[5b]

- (b) *Which*, *whom*, and *who* (in its nonspecific meaning, cf 15.9) are restricted to cooccurrence with a small semantic class of verbs (*choose*, *like*, *please*, *want*, *wish*):

She can marry { *whom(ever)* she pleases. <formal>
 who(ever) she pleases.

[' . . . anyone that/who/whom she pleases.']

You can take *which(ever)* you like.

[' . . . any (that) you like.']

In this environment, the three relatives have a nonspecific meaning (cf 15.9).

- (c) *Who* in its specific meaning (cf 15.9) is most frequently found in a clause functioning as subject complement, particularly after *that's*:

You're not *who I thought you were*. [' . . . the person I thought you were.']

So that's *who he's working for*.

I'm *who you're looking for*.

How and *why* are generally restricted to the same environment (cf also Note [b] below):

That's *how she works*. ['... the way (that) she works.']

That's *how long it takes*. ['... the length of time (that) it takes.']

This is *how big it was*. ['... the size (that) it was.']

That's *why I don't go there anymore*. ['... the reason (that) I don't go there anymore.']

Nominal relative clauses have the same range of functions as noun phrases. In addition to the functions available generally to nominal clauses, they can function as indirect object and object complement:

subject: *What I want* is a cup of hot cocoa.

direct object: You should see *whoever deals with complaints*.

indirect object: He gave *whoever asked for it* a copy of his latest paper.

subject complement: April is *when the lilacs bloom*.

object complement: You can call me *what(ever) you like*.

appositive: I'll pay you the whole debt: *what I originally borrowed and what I owe you in interest*.

prepositional complement: You should vote for *which(ever) candidate you think best*.

Like noun phrases, nominal relative clauses require prepositions in adjective complementation:

He's aware of $\left\{ \begin{array}{l} \text{what I write.} \\ \text{the books I write.} \end{array} \right.$

Contrast the optionality of the preposition with *wh*-interrogative clauses (cf 15.5 Note [c]).

To-infinitive clauses may be nominal relative clauses, but they seem to be restricted to the functions of subject complement and prepositional complement:

subject complement: That's *where to go for your next vacation*.

['... the place to go ...']

prepositional complement: The book is *on how to use a computer*.

['... the way to use ...']

Excluded as relatives in *to*-infinitive clauses are all the *-ever* compounds and *which*, *why*, and the determiner *what*. The pronominal relatives *who(m)* and *what* do not function as subject within the infinitive clause, but otherwise have the same range of functions as in the finite clauses:

direct object: Here's *what to eat*. ['... the thing to eat.']

indirect object: That's *who(m) to ask*. ['... the person to ask.']

subject complement: That's *who to be*. ['... the role to be.']

object complement: Here's *what to call your dog*. ['... the name to call your dog.']

adverbial: This is *where to be*. ['... the place to be.']

prepositional complement: This is *what to season the rice with*. ['... the spice to season the rice with.']

Note [a] Nominal relative clauses have also been called 'independent' or 'free' relative clauses.

[b] *Why* is sometimes used in a pseudo-cleft sentence with a correlative *because* in the superordinate clause (cf 15.46 Note [h]):

Why we left early was because we were tired.

[c] There may be occasional ambiguity between a nominal relative clause and a universal conditional-concessive clause (cf 15.42):

Come here, *whoever you are*.

relative interpretation: Come here, you (I don't know your name).

concessive interpretation: Come here, no matter who you are.

[d] On the choice between subjective *whoever* and formal objective *whomever*, cf 15.5 Note [e].

[e] When a verb can be used transitively or intransitively, there may be ambiguity with time or place adverbials both with nominal relative clauses and corresponding noun phrases with relative clauses:

She remembered $\left\{ \begin{array}{l} \text{when she saw me.} \\ \text{the time she saw me.} \end{array} \right.$ [direct object or time adverbial]

15.9 The *wh*-element may express either a SPECIFIC meaning (generally indicated by the absence of the *-ever* suffix) or a NONSPECIFIC meaning (generally indicated by the presence of the *-ever* suffix):

SPECIFIC:

I took *what was on the kitchen table*. ['... that which was on the kitchen table.'] [1]

May is *when she takes her last examination*. ['... the time when she takes her last examination.'] [2]

NONSPECIFIC:

Whoever breaks this law deserves a fine. ['Anyone who breaks this law ...'] [3]

I'll send *whatever is necessary*. ['... anything that is necessary.'] [4]

As the paraphrases indicate, the *wh*-element in [1] and [2] is specific, while in [3] and [4] it is nonspecific. The contrast is highlighted in:

Quality is *what counts most*. ['... is that which counts most.']

Quality is *whatever counts most*. ['... is anything that counts most.']

The first sentence, with specific *what*, is a pseudo-cleft sentence (cf 18.29f) corresponding to *Quality counts most* ['Quality is supremely important.']; the second sentence, with nonspecific *whatever*, purports to define *quality*. The two meanings parallel those conveyed by specific *some* (and its compounds) and nonspecific *any* (and its compounds); cf 6.59ff.

There are problems in some instances in distinguishing nominal relative clauses from *wh*-interrogative clauses. They differ syntactically in several respects:

(a) While an interrogative clause as subject must take a singular verb, a nominal relative clause may take either a singular or a plural verb, depending on the meaning of the *wh*-element:

What money I have *is* yours. ['The money (that) I have is yours.']

What possessions I have *are* yours. ['The possessions (that) I have are yours.']

What were left behind *were* five empty bottles. ['The things (that) were left behind were five empty bottles.']

For the number choice, cf 10.34, 10.38. As we have suggested earlier (cf 15.8), the number variation is indicative of the gradience between the *wh*-element of a nominal relative clause and a noun phrase.

(b) While an interrogative clause allows a choice in the placement of the preposition in a *wh*-element (cf 15.5), a nominal relative clause requires the *wh*-word to be placed first and the preposition to be deferred:

They ate *what they paid for*.

~*They ate *for what they paid*.

(cf: They ate the things *for which they paid*. [adnominal relative clause])

Whoever they lend the money to must be trustworthy.

(cf: *Anybody to whom they lend the money* must be trustworthy)

Make sure you include in the examination paper *whatever questions they didn't know the answers to* last time.

[pushdown nominal relative clause, cf 11.18]

(c) *Who*, *whom*, and *which* are common in interrogative clauses, but in nominal relative clauses they are restricted to cooccurrence with a small semantic class of verbs (*choose, like, please, want, wish*); cf 15.8.

(d) The compound forms in *-ever* are used in nominal relative clauses, but not in interrogative clauses. Thus while *They asked me what I didn't know* is ambiguous (see below), *They asked me whatever I didn't know* is unambiguously relative ('They asked me those things that I didn't know.') (cf Note [c]).

(e) Unlike in interrogative clauses, determiner *what* in nominal relative clauses has a paucal meaning:

What friends she has are out of the country.

['The few friends she has are out of the country.']

He collected *what information he could find*.

['He collected the little information he could find.']

In this function, *what* can be followed by only the paucal quantifiers *few* and *little* (*what few friends, what little information*) and not by the multal quantifiers *many* and *much* or by cardinal numerals. For some speakers the determiner *whatever* does not necessarily have a paucal meaning. Like *what* it cannot be followed by numerals or the multal quantifiers, but for some speakers it cannot be followed by the paucal quantifiers either.

The semantic distinction between the interrogative *wh*-clause and the nominal relative clause is easier to exemplify than to define. The interrogative clause contains a gap of unknown information, expressed by the *wh*-element, and its superordinate clause expresses some concern with the closing of that gap, with supplying the missing information. The nominal relative clause does not contain a gap in information, and therefore the superordinate clause is not concerned with the closing of that gap. The information may indeed be known to both speaker and hearer, as in *I took what was on the kitchen table*. Since only the nominal relative clause can be concrete, when semantic restrictions indicate that the clause is a physical object, the clause is unambiguously relative: *I sent them what they needed*. In other instances the clause may be ambiguous:

Do you remember *when we got lost*?

relative interpretation: Do you remember the occasion, the time we got lost?

interrogative interpretation: Do you remember when it was we got lost?

['When did we get lost? Do you remember?']

They asked me *what I knew*.

relative interpretation: They asked me things that I knew.

interrogative interpretation: They asked me, 'What do you know?'

What she wrote was a mystery.

relative interpretation: She wrote a mystery story.

interrogative interpretation: I don't know what she wrote.

Note [a] The nonspecific meaning of the *wh*-element often implies plurality of persons, things, or situations:

Write to *who(m)ever* you want. ['any persons']

Give me back *whatever* you took from my desk. ['the various objects']

He was happy with *whatever* she did. ['any actions']

The specific meaning leaves the number undetermined, except through context:

I took in *what* I found outside the door. ['the thing' or 'the things']

[b] Nonspecific *who* is occasionally found in nominal relative clauses that are not functioning as subject complement:

Who should run the business is me. [clause as S]

I've found *who you were looking for*. [clause as O_d]

[c] We distinguish the compound *wh*-words in *-ever* (eg: *whoever, whatever*) from the informal intensifying combinations that are normally spelled as two words (eg: *who ever, what ever*), which occasionally occur in subordinate interrogative clauses: *I can't imagine who ever would marry him* ['... who on earth ...'] (cf 11.14 Note [b]).

To-infinitive clauses

15.10 Nominal *to*-infinitive clauses may function as:

subject: *To be neutral in this conflict* is out of the question.

direct object: He likes *to relax*.

subject complement: The best excuse is *to say that you have an examination tomorrow morning*.

appositive: Your ambition, *to become a farmer*, requires the energy and perseverance that you so obviously have.

adjectival complementation: I'm very eager *to meet her*.

The presence of a subject in a *to*-infinitive clause normally requires the presence of a preceding *for*. When the subject is a pronoun that distinguishes subjective and objective cases, it is in the objective case:

For your country to be neutral in this conflict is out of the question.

For us to take part in the discussion would be a conflict of interest.

I'm very eager *for them to meet her*.

When the clause is a direct object, however, *for* is generally absent before the subject:

He likes *everyone to relax*.

But, especially in AmE, certain verbs of wanting and their antonyms allow an optional *for* in the object clause (cf 16.41):

He didn't like *me to be alone at night*.
He didn't like *for me to be alone at night*. <AmE only>

Prepositional verbs with *for* and adjectives complemented by a prepositional phrase with *for* allow *for* to have the additional function of introducing a *to*-infinitive clause with a subject:

I am waiting *for her to say something*. (cf: I am waiting for her reply.)
She must be impatient *for me to be appointed*. (cf: She must be impatient for my appointment.)

As with *that*-clauses (cf 15.4), extraposition is more usual for subject clauses:

It's important (for us) to agree on our position before the meeting.

Object clauses are obligatorily extraposed when they cooccur with an object complement:

I think it wiser *(for me) to leave at once*.
They consider it their duty *to speak to his parents*.

For other types of nominal *to*-infinitive clauses, see also the sections dealing with *wh*-interrogative clauses (cf 15.5), *yes-no* and alternative interrogative clauses (cf 15.6), and nominal relative clauses (cf 15.8f).

Note [a] When the infinitive clause is not functioning as direct object, *for* is generally available. Contrast:

Every employee in my company would prefer *for me to retire now*. <AmE only>
For me to retire now would be preferred by every employee in my company.
For is obligatorily omitted, however, in certain constructions where the focus is on the subject of the infinitive clause. Thus, *for* is optional in the sentence

He didn't like *for me to be alone at night*. <AmE only>

But the cleft sentence focusing on the subject of the clause is:

It was *me* he didn't like to be alone at night.

And thematic fronting of the subject (cf 18.20f) produces:

Me he didn't like to be alone at night.

Similarly, *for* is omitted in a question focusing on the subject:

Who(m) didn't he like to be alone at night?

On the other hand, in a pseudo-cleft sentence that focuses on the whole infinitive clause *for* may be retained, and is indeed more usual even in BrE:

What he didn't like was *(for) me to be alone at night*.

[b] Some AmE speakers also use *for* with the subject in an object clause following *want*:

He wants *for me to go with him*.

[c] Where the subject of the infinitive clause can be made passive in the superordinate clause, the construction is complex transitive complementation of the superordinate verb (cf 16.50f):

They considered *her to be the best candidate*.

~She was considered *to be the best candidate*.

By analogy with *They considered her the best candidate, to be the best candidate* may be analysed as object complement of *her*.

[d] For sentences such as *It was clever of her to stay away*, cf 16.75ff. For *with* and *without*, cf 14.15.

15.11 The nominal *to*-infinitive clause often indicates that the proposition it expresses is viewed as a possibility or a proposal rather than something

already fulfilled (cf: *-ing* clauses, 15.12). The infinitive clause is then closest semantically to a *that*-clause with putative *should* (cf 14.25):

It's natural *for them to be together*. [1]
It's natural *that they should be together*. [1a]

This putative feature of the infinitive clause may often be paraphrased by a conditional clause:

I prefer *them to stay with us*. [2]
I prefer it *if they stay with us*. [2a]
It would be unwise *for you to marry him*. [3]
It would be unwise *if you were to marry him*. [3a]

On the other hand, the infinitive clause may also refer to an actual fact. Thus [1] can also be paraphrased by [1b]:

It's natural *that they are together*. [1b]

Indeed, the infinitive clause may refer clearly to a proposition that is assumed to be true or (through the use of perfective *have*) to a situation that is assumed to have already occurred:

They found *him to be mentally competent to stand trial*.
I'm happy *to have met you*.

The subject and the subject complement may both be *to*-infinitive clauses, in which case the second clause expresses a characterization of the first:

To be human is to err. ['If one is human, one will err.']
To be a member of the Space Club is to belong to one of the most exclusive clubs in the world.

***-ing* clauses**

15.12 Nominal *-ing* clauses (or more fully, nominal *-ing* participle clauses) may function as:

subject: *Watching television* keeps them out of mischief.

direct object: He enjoys *playing practical jokes*.

subject complement: Her first job had been *selling computers*.

appositive: His current research, *investigating attitudes to racial stereotypes*, takes up most of his time.

adjectival complementation: They are busy *preparing a barbecue*.

prepositional complement: I'm responsible *for drawing up the budget*.

If the *-ing* clause has a subject, the item realizing the subject may be in the genitive case or otherwise in the objective case (for pronouns having a distinctive objective case) or common case (for all other noun phrases). In general, the genitive is preferred if the item is a pronoun, the noun phrase has personal reference, and the style is formal (cf 16.42):

I intend to voice my objections *to their* receiving an invitation to our meeting. [1]

Contrast the preference for the common case in [2], where the item is a nonpersonal noun phrase and not a pronoun and the style is not formal:

I didn't know about *the weather* being so awful in this area. [2]

Traditional stipulation of the genitive case is based on the assumption that the *-ing* form in such clauses is a verbal noun (cf 17.52ff). That assumption is incorrect, as we can see from the direct object (*an invitation to our meeting*) that follows the *-ing* form in [1], which demonstrates that the *-ing* form has the force of a verb. On the other hand, the use in [1] of the genitive (which is a determiner in noun phrases) itself provides the *-ing* form with a nominal characteristic (cf also 15.13.)

The genitive is avoided when the noun phrase is lengthy and requires a group genitive (cf 17.119):

Do you remember *the students and teachers protesting against the new rule*?

On the other hand, the genitive case is preferred when the item is initial in the sentence:

My forgetting her name was embarrassing.

Some are troubled by the choice of case here. In some instances, an acceptable alternative is a *that*-clause, which is normally extraposed:

It was embarrassing that I forgot her name.

Unlike subject *that*-clauses (cf 15.4) and *to*-infinitive clauses (cf 15.10), subject *-ing* clauses are not normally extraposed. The superordinate clause can be interrogative or passive without the extraposition:

Will *our saving energy* reduce the budget deficit?

Postponing the proposed legislation is being considered by the subcommittee.

Note [a] Nominal *-ing* clauses are sometimes called 'gerundive' or 'gerundival clauses'. Their verb is commonly called a 'gerund'.

[b] For monotransitive and complex-transitive complementation with *-ing* clauses, cf 16.39, 16.42. For adjectives that allow complementation by an *-ing* clause, cf 16.83.

[c] The prepositional status of *worth* (cf 9.6) is confirmed by the fact that it can govern a noun phrase, a nominal *-ing* clause with a genitive subject, and a nominal relative clause (but not a *that*-clause or a *to*-infinitive clause):

San Francisco is worth $\left\{ \begin{array}{l} \text{frequent visits.} \\ \text{your visiting frequently.} \end{array} \right.$

The bicycle is not worth *what you paid for it*.

[d] The *-ing* form in the *-ing* clause occasionally takes determinatives other than the genitive:

I'm tired of *all that feeding the animals every day*.

This smoking your pipe on every possible occasion will ruin your health.

On *no* and *any* as determiners in this construction, cf 15.14.

15.13 A nominal *-ing* clause may refer to a fact or an action:

fact: *Your driving a car to New York in your condition* disturbs me greatly. [1]

action: *Your driving a car to New York* took longer than I expected. [2]

When an *-ing* form occurs alone or preceded just by a genitive noun phrase, the construction is syntactically ambiguous between an *-ing* clause and a noun phrase with a verbal noun in *-ing* as its head (cf 17.52ff):

My hobby is *swimming*. [3]

I hate *lying*. [4]

They liked *our singing*. [5]

Our singing in [5] can refer either to the action of singing or to the mode of singing. Without further expansion by an object or an adverbial, the genitive biases towards a mode interpretation. In contrast, the objective in [5a] allows only an action interpretation:

They liked us *singing* (while they worked). [5a]

Since the *-ing* clauses in [1] and [2] do not allow a mode interpretation, it appears that this interpretation belongs to the noun phrase structure rather than to the clause structure. Similarly, when we expand [5] by adding an object and thereby making the *-ing* construction unambiguously a clause, the mode interpretation is no longer available. In [5b] the *-ing* clause refers to an action:

They liked *our singing folk songs*. [5b]

Conversely, where only the mode interpretation is available, we may assume that the construction is a noun phrase:

Your driving has improved considerably since I last saw you. [6]

Contrast also [7] and [8], distinguished only by the position of *fast*:

I warned him against *fast driving*. [7]

I warned him against *driving fast*. [8]

In [7] *fast* is an adjective premodifying the noun *driving*, which is the head of the noun phrase. In [8] the adverb *fast* is an adverbial in the *-ing* clause *driving fast*. Compare the analogous contrasting pair in [7a] and [8a]:

I warned him against *careless driving*. [7a]

I warned him against *driving carelessly*. [8a]

When the *-ing* form is alone and is the direct object, as in [4], two interpretations of the implied subject are often possible. Thus, *I hate lying* may mean 'I hate it when I lie', linking the action specifically to the subject of the superordinate clause, or it may generalize ('I hate it when people lie'). When the *-ing* construction contains a direct object or an adverbial and is therefore unambiguously clausal, the usual interpretation is that there is an implicit link to the superordinate subject:

I hate telling lies. ['I hate it when I tell lies.']

They enjoy singing while playing the guitar. ['They enjoy it when they sing while playing the guitar.']

But this restriction is not absolute. It does not apply after verbs of speaking, where the generic interpretation holds:

She condemned *attacking defenceless citizens*.

['... that people attack defenceless citizens.']

They recommend *not paying taxes*. ['... that people not pay taxes.']

In other instances, the implied subject of the *-ing* clause may be taken from the context of the sentence:

Writing that letter was *his* downfall. [He wrote that letter]

Driving in heavy traffic makes *me* nervous. [I drive in heavy traffic]

But it may also be drawn from the previous linguistic context or even from the situational context:

Borrowing such a large sum was a big mistake.

And some sentences may allow a generic interpretation:

Borrowing large sums is a big mistake.

Note [a] An *-ing* form may also be a concrete noun (cf the discussion in 17.54).

[b] In *That was a plan of his friend's devising*, the *-ing* form is an *-ing* nominalization (cf 17.51ff). Compare *His friend devised the plan*.

[c] On the distinction between *They liked our singing* and *They liked us to sing*, cf 16.40, 16.42.

- 15.14 An *-ing* clause may be the subject of a bare existential clause (cf 18.47), in which case it normally appears in nonassertive contexts (cf 10.61). As with the *-ing* clause that has a genitive as its subject (cf 15.12), this construction is anomalous because the *-ing* form is preceded by a determiner, generally *no* but less commonly *any*:

There's *no mistaking that voice*. ['One could not mistake that voice.'] [1]

There was *no lighting fireworks that day*. ['One could not have lit fireworks that day.'] [2]

There isn't *any telling what they will do*. ['One could not tell what they will do.'] [3]

There must be *no standing beyond the yellow line*. ['One must not stand beyond the yellow line.'] [4]

If the *-ing* construction contains a direct object, it is generally paraphrasable with modal auxiliaries, as in [1–3]. In [4], where the construction lacks an object, a modal auxiliary is present in the sentence. Abbreviated forms with just the negative *-ing* clauses generally have the force of a prohibition:

No smoking. No parking here. No playing loud music.

The nonmodal interpretation is occasionally found, usually in certain fixed expressions:

There was *no turning the other cheek*. ['No one turned the other cheek.']

It is encouraged by the *-ing* nominalization (cf 17.51ff):

There was *no shooting of prisoners*. ['No one shot prisoners.']

If there is no direct object or *of*-construction, the *-ing* construction is ambiguous between the *-ing* clause and the *-ing* nominalization:

There was no smoking in the corridors.

(i) 'Smoking was not allowed in the corridors.'

(ii) 'No one smoked in the corridors.'

Note [a] Only the *-ing* nominalization occurs in the positive:

There was *shooting of prisoners*. ['They shot prisoners.']

There was *smoking in the corridors*. ['They smoked in the corridors.']

[b] The following sentence is triply ambiguous:

There's no writing on the blackboard today.

(i) *-ing* clause with modal interpretation:

'We can't write on the blackboard today (because we have no chalk).'

(ii) nominalization with nonmodal interpretation:

'We're not going to write on the blackboard today (because there's going to be an exam).'

(iii) deverbal noun:

'There's nothing written on the blackboard today.'

Bare infinitive clauses

- 15.15 The nominal bare infinitive clause (without *to*) is severely limited in its functions. It may be the subject complement or (rarely) subject in a pseudo-cleft sentence (cf 18.29ff):

subject complement: What the plan does is *ensure a fair pension for all*.

subject: *Mow the lawn* was what I did this afternoon. <rare and informal>

It may also be the subject or subject complement of a variant of the pseudo-cleft sentence, where a noun phrase of general reference replaces *what*:

Turn off the tap was all I did.

The best thing you can do now is *write her an apology*.

The *to* of the infinitive is obligatorily absent when the infinitive clause is subject in these constructions, but it is optionally present when the clause is subject complement:

What they must do is (*to*) *propose an amendment to the resolution*.

The thing you should do is (*to*) *show them your diploma*.

The bare infinitive requires the substitute verb *DO* in the other subordinate clause. Contrast the obligatory *to* in [1] with the optional *to* in [2]:

All I wanted was *to help him*. [1]

All I wanted *to do* was (*to*) *help him*. [2]

A bare infinitive clause may function as object complement with a relatively few superordinate verbs (cf 16.52):

They made *her pay for the damage*.

Finally, the bare infinitive clause may follow prepositions of exception (cf 9.58):

She did everything but *make her bed*.

Verbless clauses

- 15.16 The nominal verbless clause is a more debatable category than the other nominal clauses. The category seems to be required to account for constructions which, although superficially noun phrases, have some of the semantic and structural characteristics of clauses:

<i>A friend in need is a friend indeed.</i> [proverb]	[1]
<i>Wall-to-wall carpets in every room</i> is their dream.	[2]
Are <i>bicycles wise in heavy traffic?</i>	[3]

These may be paraphrased by nominal nonfinite existential clauses (cf 18.44ff):

<i>To be a friend in need</i> is <i>to be a friend indeed.</i>	[1a]
<i>Having wall-to-wall carpets in every room</i> is their dream.	[2a]
Is it wise <i>to have bicycles in heavy traffic?</i> [or: '... for there to be bicycles in heavy traffic?']	[3a]

Various syntactic features differentiate these constructions from noun phrases:

(i) The prepositional phrases in [1] and [2] are not of the kind that postmodify the head in a noun phrase. *A friend in need* as a noun phrase, for example, would mean 'a friend who is in need', whereas [1] means '(to be) a friend when another is in need' (ie 'Friendship in a time of need is indeed friendship').

(ii) The verb in [2] is singular, which would be difficult to explain if the subject were a plural noun phrase.

(iii) Semantic restrictions (cf 10.51) would make it anomalous to combine the noun-phrase head *bicycles* as subject with the attributive or predicative adjective *wise* (**wise bicycles*; **The bicycles are wise*). In the paraphrase [3a], *wise* complements the infinitive clause *to have bicycles in heavy traffic*. The proximity principle (cf 10.35) may account for the plural verb. The structure SVC, on the other hand, biases the syntax of the sentence towards clausal grammar and the consequent singular number concord (cf 10.15):

Bicycles in heavy traffic is sheer madness.

Syntactic functions of adverbial clauses

- 15.17 In Chapter 8 we distinguished four broad categories of syntactic functions for adverbials: adjuncts, subjuncts, disjuncts, and conjuncts. Adverbial clauses, however, function mainly as adjuncts and disjuncts.

In the next two sections we briefly consider adverbial clauses functioning as conjuncts and subjuncts. They will not be treated further in this chapter.

Conjuncts

- 15.18 The syntactic status of conjuncts is discussed in 8.134ff. They are peripheral to the clause to which they are attached. Only a few adverbial clauses

function as conjuncts. They are stereotyped or virtually stereotyped, and can be comprehensively listed.

One finite clause type, the nominal relative clause (cf 15.8ff), functions as a reinforcing conjunct:

What is more,	} ...
What is most worrying,	
What interests me more,	

In addition, *that is (to say)* is an apposition marker.

A number of *to*-infinitive clauses function as listing or summative conjuncts:

to begin (with), to cap it (all) <informal>, to conclude, to continue, to recap <informal>, to recapitulate, to start (with), to summarize, to sum up

These allow a direct object or prepositional complement, eg: *to summarize the argument so far; to begin our discussion*. In addition, there are two *to*-infinitive clauses which require a prepositional complement:

to return to [eg] my earlier discussion
to turn to [eg] the next point

All of these *to*-infinitive clauses have corresponding *-ing* clauses, but most of them require complementation of the verb. Only a few can be used without complementation: *capping it all, continuing, recapitulating, recapping <informal>, summarizing, summing up*.

Note The nonfinite conjuncts imply as subject the *I* (or authorial *we*) of the speaker. In this respect, they resemble style disjuncts (cf 8.124) such as *to put it bluntly* and *frankly speaking*. Indeed, they could alternatively be analysed as style disjuncts.

Subjuncts

- 15.19 The syntactic status of subjuncts is discussed in 8.116. Subjuncts are generally not realized by clauses, the exception being viewpoint subjuncts.

Both finite and nonfinite (participle) clauses function as viewpoint subjuncts. The verbs in the clauses constitute a restricted semantic set, principally *be concerned* and *go* (only in the finite clauses *as far as ...* and *so far as ...*), *consider*, *look at*, *view*:

As far as the economy { *is concerned,*
goes, } the next six months are critical.

If we look at it from an historical point of view, they have little claim on the territory.

Looking at it objectively, } he is definitely at fault.
Viewed objectively, }

Note As with the conjunct clause (cf 15.18 Note), the *-ing* clause as viewpoint subjunct implies as subject the *I* of the speaker. On the other hand, the subject of the *-ed* clause is implicitly the matrix clause itself. Compare the anaphoric reference of the pronoun *it* in the corresponding *if*-clause: *If it is viewed objectively, he is definitely at fault*.

Adjuncts and disjuncts

- 15.20 Adjuncts and disjuncts tend to differ semantically in that adjuncts denote circumstances of the situation in the matrix clause, whereas disjuncts comment on the style or form of what is said in the matrix clause (style disjuncts) or on its content (content or attitudinal disjuncts). The primary difference is that they differ syntactically in that disjuncts are peripheral to the clause to which they are attached.

The syntactic difference does not manifest itself in differences in form or position. For example, finite clauses that function as adjuncts and disjuncts may share the same subordinator, and in both functions the clauses may be positioned initially or finally. The peripheral status of disjuncts is indicated mainly negatively: they do not allow a number of syntactic processes to apply to them that are allowed by adjuncts, processes that reflect a measure of integration within the superordinate clause.

In this section we consider the differences between adjunct and disjunct clauses. Below we exemplify the contrasts between adjunct clauses in the [a] sentences and content disjunct clauses in the [b] sentences:

temporal *since* [a] and reason *since* [b]:

- I have been relaxing *since the children went away on vacation.* [a]
He took his coat, *since it was raining.* [b]

temporal *while* [a] and concessive *while* [b]:

- He looked after my dog *while I was on vacation.* [a]
My brother lives in Manchester, *while my sister lives in Glasgow.* [b]

purpose *so that* [a] and result *so that* [b]:

- They took a plane *so that they could get there early.* [a]
We know her well, *so that we can speak to her on your behalf.* [b]

conditional *if* [a] and conditional *unless* [b]:

- They'll send it to you *if you ask them politely.* [a]
I'll get lost *unless I can find my compass.* [b]

temporal *as* [a] and reason *as* [b]:

- The policeman stopped them *as they were about to enter.* [a]
I went to the bank, *as I had run out of cash.* [b]

The syntactic difference between adjunct and content disjunct clauses will be illustrated by two finite clauses, an adjunct *because*-clause and a disjunct *since*-clause. Both are incorporated within the same superordinate clause, and both are clauses of reason:

- He likes them because they are always helpful. [1a]
He likes them, since they are always helpful. [1b]

Both can be positioned initially, although the adjunct clause is more usual finally:

- Because they are always helpful, he (really) likes them. [2a]
Since they are always helpful, he (really) likes them. [2b]

The syntactic differences between the two types of clauses mainly involve focusing devices:

- (i) Only the adjunct clause can be the focus of a cleft sentence:

- It's because they are always helpful that he likes them. [3a]
*It's since they are always helpful that he likes them. [3b]

- (ii) Only the adjunct clause can be the focus of a variant of the pseudo-cleft sentence:

- The reason he likes them is because they are always helpful. [4a]
*The reason he likes them is since they are always helpful. [4b]

- (iii) Only the adjunct clause can be the focus of a question, as we can test with alternative interrogation:

- Does he like them because they are always helpful or because they never complain? [5a]
*Does he like them since they are always helpful or since they never complain? [5b]

- (iv) Only the adjunct clause can be the focus of negation, as we can test with alternative negation:

- He didn't like them because they are always helpful but because they never complain. [6a]
*He didn't like them since they are always helpful but since they never complain. [6b]

Contrast similarly:

- He liked them, not because they are always helpful but because they never complain. [7a]
*He liked them, not since they are always helpful but since they never complain. [7b]

- (v) Only the adjunct clause can be focused by focusing subjuncts (cf 8.116 ff) such as *only*, *just*, *simply*, and *mainly*:

- He likes them only because they are always helpful. [8a]
*He likes them, only since they are always helpful. [8b]

Contrast also:

- Only because they are always helpful does he like them. [9a]
*Only since they are always helpful does he like them. [9b]

- (vi) Only the adjunct clause can be the response to a *wh*-question formed from the matrix clause:

- Why does he like them? Because they are always helpful. [10a]
*Why does he like them? Since they are always helpful. [10b]

Here are some further examples of content disjunct clauses (cf 8.127):

- He brought me a cup of coffee *although I had asked for tea.*
William has poor eyesight, *whereas Sharon has poor hearing.*
You can return to a normal diet *now that you have lost enough weight.*

I'll take you for a ride *provided that your parents give you permission*.
 He paid for a seat, *when he could have entered free*. [concessive *when*]
 They ridiculed him *until she felt obliged to come to his aid*. [result *until*]
 They will starve *before they will surrender unconditionally*. [negative
 result *before*]

In final position, content disjunct clauses tend more commonly than adjunct clauses to be separated from their matrix clauses by intonation or punctuation, though punctuation usage varies. Such separation is particularly common when the subordinator of a disjunct clause is frequently used as the subordinator of an adjunct clause, a condition that applies to reason *since* and *as*, concessive *while*, and result *so that*. In initial position, all adverbial clauses, regardless of form or function, are separated by intonation and (usually) by punctuation from their matrix clause.

Style disjuncts and content disjuncts

- 15.21 The syntactic differences enumerated in 15.20 apply equally to style disjuncts and content disjuncts. Style disjuncts are distinguished semantically in that they generally imply a verb of speaking and the subject *I*. The style disjuncts implicitly refer to the circumstances of the speech act, while the content disjuncts refer to the content of the matrix clause. The style disjuncts are therefore more peripheral to their superordinate clause than are the content disjuncts.

Here are some contrasts between either adjuncts or content disjuncts [a], and style disjuncts [b]:

adjunct *because* [a] and style disjunct *because* [b]:

We have no electricity, *because there's a power failure*. [a]
 I have nothing in my bank account, *because I checked this morning*. [b]

adjunct *if* [a] and style disjunct *if* [b]:

We'll take along Sharon, *if she's ready*. [a]
 We can do with some more butter, *if you're in the kitchen*. [b]

content disjunct *since* [a] and style disjunct *since* [b]:

Since you know Latin, you should be able to translate the inscription. [a]
 What does the word mean, *since you're so clever*? [b]

content disjunct *though* [a] and style disjunct *though* [b]:

She enjoys driving, *though she doesn't like to drive in heavy traffic*. [a]
 He deserved the promotion, *though it's not my place to say so*. [b]

We exemplify the semantic and syntactic differences by two finite clauses, a content disjunct *although*-clause and a style disjunct *since*-clause:

Elizabeth enjoyed last night's concert *although part of the programme included Wagner*. [1a]
 Elizabeth enjoyed last night's concert, *since her brother told me so*. [1b]

The concession in [1a] refers to the content of the matrix clause, but the reason in [1b] refers to the speaker's motivation for the assertion ('I tell you

this since her brother told me so'). The more peripheral status of the style disjunct is shown in its greater independence with respect to pro-forms. Thus, the style disjunct more readily allows the repetition of a noun phrase, whereas the content disjunct normally requires pronoun substitution:

Elizabeth enjoyed last night's concert *although the programme was not entirely to { ?Elizabeth's / her } taste*. [2a]

Elizabeth enjoyed last night's concert, *since { Elizabeth's / her } brother told me so*. [2b]

Style disjuncts realized by clauses are always separated from the matrix clause by intonation and punctuation.

Here are some further examples of style disjuncts:

While we're on the subject, why didn't you send your children to a public school?
If you will allow me to say so, your attitude is equally racist.
 The latest unemployment figures are encouraging, *as it were*.
Before you leave, where can I reach you?
Since you don't seem to know, all further negotiations have been suspended.
Before you say anything, you have the right to be silent.
 I'm in charge here, *in case you don't know*.
If you're so clever, what's the answer?
Speaking of the devil, here comes my nephew.
Stated bluntly, I have legal control over their estate.

- Note [a] The same form of clause can be a style disjunct in a statement and an adjunct when it is a response to a question. Style disjuncts can be the response to a question if the implied superordinate clause is made explicit. Compare the adjunct clause in [3], [3a], and [4a] with the style disjunct clause in [4]:

We have no electricity, *because there was a power failure*. [3]

~ A: *Why do you have no electricity?*

B: *Because there was a power failure*. [3a]

I have no money in my bank account, *because I checked this morning*. [4]

~ A: *Why do you say that you have no money in your bank account?*

B: *Because I checked this morning*. [4a]

The sentence relating to the question-response set in [5a] is [5], which (like [5a]) contains an adjunct *because*-clause; the question asks for some verification of the claim in the matrix clause in [5]:

I know that I have no money in my bank account, *because I checked this morning*. [5]

~ A: *How do you know that you have no money in your bank account?*

B: *Because I checked this morning*. [5a]

Notice that the adjunct *because*-clauses in [3] and [5] can be positioned initially, but not the *because*-clause in [4], cf Note [c] below.

[b] In [6] the *because*-clause is an adjunct, while in [7] it is a style disjunct:

He likes them *because they are always helpful*. [6]

He likes them, *because his wife told me so*. [7]

Since two clauses with different syntactic functions cannot be coordinated, the two *because*-clauses cannot be coordinated:

*He likes them *because they are helpful and because his wife told me so*.

They can cooccur in the same sentence, though the juxtaposition is stylistically clumsy in written

English. The disjunct clause is then positioned peripherally:

?He likes them because they are helpful, because his wife told me so.

[c] The style disjunct *because*-clause is exceptional in that it must follow the matrix clause:

I have nothing in my bank account, *because I checked this morning*.

**Because I checked this morning*, I have nothing in my bank account.

Contrast:

I'm up to my ears in debt, *since you ask me*.

Since you ask me, I'm up to my ears in debt.

[d] We have noted the analogies between clauses functioning as conjuncts (cf 15.18 Note) and viewpoint subjuncts (cf 15.19 Note), on the one hand, and style disjuncts, on the other hand. With respect to their integration within their superordinate clause, conjuncts are most like style disjuncts. Viewpoint subjuncts are closer to content disjuncts, as shown by the test involving repetition of a noun phrase:

As far as { ^{?Germany's} _{its} } economy is concerned, Germany shows signs of improvement.

[e] The style disjunct *as it were* ['as if it were so'] is roughly synonymous with *so to speak*.

Predication and sentence adjuncts

15.22 For adjunct clauses, a major distinction can be made between PREDICATION ADJUNCTS and SENTENCE ADJUNCTS. Predication adjuncts can in turn be divided into obligatory and optional adjuncts (cf 8.26ff). All obligatory adjuncts are predication adjuncts.

Predication adjunct clauses are normally positioned finally; fronting of a predication adjunct exceptionally occurs for rhetorical purposes. Obligatory adjunct clauses resemble direct objects and subject complements in providing complementation to the verb. Sentence adjunct clauses are more mobile than predication adjunct clauses: they may appear initially as well as finally, and occasionally even medially.

Obligatory adjunct clauses (cf 10.10) may provide complementation for the verb BE in the SVA type:

Your coat is *where you left it*.

Dinner will be *when everybody has arrived*.

The traffic jam was *because there was an accident*. <informal>

The water is *in case you feel faint*. <informal>

The purpose of the inquiry was *so that all complaints would be made public*.

And they may provide complementation for other verbs in the SVA type:

The water will last *until you return*.

My grandparents lived *before television was invented*.

He looks *as if he's tired*.

Jane looks *as if she doesn't know me*.

You may live *wherever you like*.

They are coming *to see us next week*.

They may also function as the adverbial in the SVOA type:

I put it *where I found it*.

He treated them *as if they were young children*. ['He behaved to them . . .']

They wanted the money *where it would earn the highest interest rates*.

Even when they are optional, direction adjuncts (cf 15.31) depend on the

semantic category of verbs with which they cooccur – verbs denoting direction:

They moved *where the climate was milder*.

Throw it *where you wish*.

Similarity adjuncts (cf 15.50) are a blend of similarity with manner when they cooccur with verbs used dynamically:

She walks *exactly as her mother used to*.

Pronounce the word { *as I do*.
like I do. <informal, esp AmE>

Likewise, comparison clauses (cf 15.50) are a blend of comparison with manner when they cooccur with verbs used dynamically:

He talks *as if he has a hot potato in his mouth*.

She is running *as if her life depended on it*.

Calvin laughed *as though he really understood the joke*.

They talk *like they know what they're doing*. <informal, esp AmE>

Other optional predication adjuncts relate solely or predominantly to the verb complementation rather than to the matrix clause as a whole. The most common are position adjuncts:

I found the book *where you said it would be*. ['The book was where you said it would be.']

She hit him *where it hurts*. ['She hit him in that part of him where it hurts.']

Sentence adjunct clauses are not dependent on the predication and are therefore more mobile. The examples that follow are placed in initial position to show their ready acceptability in that position; these types of adjunct clauses could just as easily (and most would more usually) be at E.

Before I could sit down, she offered me a cup of tea.

When he saw us, he smiled.

To emphasize her point, she invited me to visit her village.

Because it is near Madrid, tourists come for the day.

If they achieve independence, conditions will improve.

As we ran toward the beach, it started to rain.

Whenever I come here, the hotels have new owners.

Where he stood, he could see sand dunes stretching for miles.

While she was in school, she became friendly with a boy whom she later married.

Note The subordinate clause in *He treated them as if they were young children* is an obligatory adjunct only if *treated* has the meaning 'behaved toward' in which case *treated* requires to be complemented by a manner adjunct. If *treated* is interpreted as 'gave medical treatment to' or 'gave a treat (or treats) to', the *as if*-clause is an optional predication adjunct.

Restrictive and nonrestrictive adverbial clauses

15.23 Some linguists have attempted to apply the distinction between restrictive and nonrestrictive modification in noun phrases (cf 17.3) to adverbials,

thereby distinguishing between RESTRICTIVE and NONRESTRICTIVE adverbial clauses. The semantic analogy with modification in the noun phrase is that the restrictive adverbial restricts the situation in the matrix clause to the circumstances described by the adverbial. The nonrestrictive adverbial, on the other hand, makes a separate assertion, supplying additional information.

The restrictive/nonrestrictive distinction overlaps with some of the distinctions that we have made earlier. All disjunct clauses have been earlier characterized as peripheral because they do not give circumstantial information about the situation in the matrix clause (cf 15.20); they are therefore necessarily nonrestrictive. The same applies to the limited range of conjunct clauses (cf 15.18) and subjunct clauses (cf 15.19). On the other hand, obligatory adjunct clauses must be restrictive, since they are required to complete the description of the situation in the matrix clause. The restrictive/nonrestrictive distinction therefore applies only to optional adjunct clauses.

Perhaps the clearest parallel to a nonrestrictive adjunct clause is the type that has been characterized as an appended clause, a type of clause that is usually parenthetical or an afterthought (cf 12.70):

Susan sees her father – *when her mother insists on it.* [1]

Utterance of the sentence in [1] conveys two separate assertions: Susan sees her father; she does so when her mother insists on it. On the other hand, the *when*-clause in [2] is normally interpreted as restricting the circumstances in which Susan sees her father (Susan sees her father only on those occasions):

Susan sees her father *when he comes to London.* [2]

The nonrestrictive clause is marked by intonation separation whether it follows or precedes its matrix clause. Punctuation practice is less consistent. In particular, punctuation may be omitted when the nonrestrictive clause is preposed. But, in fact, punctuation is a redundant signal when the nonrestrictive clause is preposed, since a preposed clause is always nonrestrictive. Thus, both [1a] and [2a] are nonrestrictive:

When her mother insists on it, Susan sees her father. [1a]

When her father comes to London, Susan sees him. [2a]

The semantic difference between restrictive and nonrestrictive adjunct clauses manifests itself when the matrix clause contains a focusing device. Nonrestrictive clauses cannot be the focus of such devices, and in this respect are syntactically similar to disjuncts (cf 15.20). For example, the focus of the negation can be on the restrictive *when*-clause in [2b], but not on the nonrestrictive clause in [1b]:

Susan doesn't see her father *when he comes to LONDON.*

['Susan sees her father, not when he comes to London, but at other times.] [2b]

Susan doesn't see her father – *when she can avoid it.*

['Susan doesn't see her father – the times she does are when she can't avoid it.] [1b]

Notice that if the *when*-clause in [2b] is preposed, it is outside the scope of negation:

When her father comes to London, Susan doesn't see him. [2c]

The semantic difference is even sharper for *because*-clauses. Contrast the restrictive clause in [3a] with the nonrestrictive clauses in [3b] and [3c]:

Raven didn't leave the party early *because CAROL was there.* [3a]

['Raven left the party early, not because Carol was there, but for some other reason.']

Raven didn't leave the party EARLY, *because CAROL was there.* [3b]

['Raven didn't leave the party early, and the reason he didn't was that Carol was there.']

Because CAROL was there, Raven didn't leave the party EARLY. [3c]

[= [3b]]

We can now distinguish three *because*-clauses: restrictive adjunct [4a], nonrestrictive adjunct [4b], and style disjunct [4c]:

Raven didn't leave the party early *because CAROL was there.* [4a]

Raven didn't leave the party EARLY, *because CAROL was there.* [4b]

Raven didn't leave the party EARLY, *because I CHECKED.* [4c]

Similarly, we can distinguish four *while*-clauses: predication (and restrictive) adjunct [5a], sentence (and nonrestrictive) adjunct [5b], content disjunct [5c], and style disjunct [5d]:

I didn't send my children to a boarding school *while I was in India.* [5a]

While I was in India, I didn't send my children to a boarding school. [5b]

My children enjoy jazz, *while I prefer classical music.* [5c]

While we're on the subject, I prefer classical music. [5d]

Semantic roles of adverbial clauses

15.24 We now turn to the semantic roles of adverbial clauses. The roles may be related to those for adverbials in general (cf Chapter 8) and for prepositional phrases in particular (cf 9.144ff).

For each semantic set, we first discuss finite clauses and then turn to nonfinite and verbless clauses introduced by a subordinator or (in some instances) a preposition (cf 15.25ff). We then consider separately nonfinite and verbless adverbial clauses that do not begin with a subordinator or preposition (cf 15.58ff). We conclude by discussing the verb phrase in those cases where the choice of form is linked to particular types of subordinate clauses.

Semantic analysis of adverbial clauses is complicated by the fact that many subordinators introduce clauses with different meanings; for example a *since*-clause may be temporal or causal. Furthermore, some clauses combine meanings, for example time with purpose or result (cf 15.48f); in such cases, we treat the clauses under sections that deal with what appears to be their primary meaning.

Clauses of time

Subordinators and structural types of clauses

- 15.25 Adverbial finite clauses of time are introduced by one of the following subordinators: *after, as, before, once, since, till, until, when, whenever, while, whilst* (esp BrE), *now (that), as long as, so long as, as soon as, immediately* (informal, esp BrE), *directly* (informal, esp BrE):

Buy your ticket *as soon as you reach the station*.
When I last saw you, you lived in Washington.
 My family, *once they saw the mood I was in*, left me completely alone.
 Drop by *whenever you get the chance*.
 All applications, *when they are received before the deadline*, are dealt with promptly.
While I was asleep, I dreamed about you.
 We came in *just as it started to rain*.
As I drove away, I saw them waving goodbye.
 Wait *until you're called*.
Since I saw her last, she has dyed her hair.
 I'll give you an answer *immediately I've finished reading your file*.
 (esp BrE)

Adverbial *-ing* clauses of time are introduced by one of the following subordinators: *once, till, until, when, whenever, while, whilst*:

He wrote his greatest novel *while working on a freighter*.
 Be careful *when crossing streets*.
Once having made a promise, you should keep it.

In addition, they are introduced by the prepositions *after, before, on*, and *since* (cf 14.19 Note [b]):

They washed their hands *before eating*.
Since coming here life has been much more pleasant.
 I took a bath *after working in the garden all day*.
On becoming a member, you will receive a membership card and a badge. ['When you become a member, ...']

Some speakers find *until* only marginally acceptable with *-ing* clauses:

?*Until meeting your parents*, I had no idea that you were annoyed with me.
 ?I'll wait here *until hearing from you again*.

Adverbial *-ed* clauses of time are introduced by one of the following subordinators that are also used with finite clauses: *as soon as, once, till, until, when, whenever, whilst* (esp BrE):

Spinach is delicious *when eaten raw*.
 The dog stayed at the entrance *until told to come in*.
Once seen, that painting will never be forgotten.
 He slept *while stretched out on the floor*.
Whenever known, such facts should be reported.

As soon as is only occasionally possible as a subordinator for *-ed* clauses:

The documents will be returned *as soon as* $\left\{ \begin{array}{l} \text{completed.} \\ \text{signed.} \\ \text{required.} \end{array} \right.$

Verbless clauses of time are introduced by the same subordinators as *-ed* clauses: *as soon as, once, till, until, when, whenever, while, whilst* (esp BrE):

When in difficulty, consult the manual.
 Complete your work *as soon as possible*.
While in Rome, be sure to see the Colosseum.

Clauses with *as soon as* seem to be limited to a few adjectives that are used predicatively with nominal clauses and convey the modal meanings of possibility or necessity, principally *available, feasible, necessary, possible*. The implied subject of the verbless clause is *it*, referring to the matrix clause ('as soon as it is possible'). The same implication is common, though not required, for the other subordinators.

Some speakers find *until* and *till* only marginally acceptable with verbless clauses:

?Margaret stayed with her parents *until well*.
 ?Sam watched TV *until too tired to do so any more*.

They seem acceptable in instructional language:

Beat the mixture *until fluffy*.
 File the edges *until smooth*.

To-infinitive clauses without a subordinator or a subject may have temporal function, expressing the outcome of the situation:

I rushed to the door, *only to discover that it was locked and barred*.
 He left, *never to return*.
 I awoke one morning *to find the house in an uproar*.
 She turned around, *to find the car gone*.
 The curtains parted, *to reveal a market scene*.
 He survived the disgrace, *to become a respected citizen*.
 Leech rose above the University College defence *to bullet the header a fraction over from a free kick*.

These clauses are restricted to final position, suggesting an analogy between them and result clauses (cf 15.49), which they resemble in meaning. The sentences can usually be paraphrased by reversing the relationship of subordination (cf 15.28 Note [a]), and using a *when*- or *after*-clause:

When I awoke one morning, I found the house in an uproar.
After he survived the disgrace, he became a respected citizen.

With durative verbs in the matrix clause, the construction expresses duration of time together with outcome:

She lived *to be 100*. ['She reached 100 years of age.']
 You'll live *to regret it*. ['You'll eventually regret it.']
 The show went on *to become a great success*. ['The show eventually became a great success.']
 He lingered on *to see his daughter's wedding*.
 She grew up *to be a successful actress*.

Some of the verbs in this type of construction have become catenatives (cf 3.49): *grow to, come to, turn out to*.

Finally, *-ing* clauses without a subordinator or a subject may also express time relationship:

Returning to my village after thirty years, I met an old schoolteacher.

['When/After I returned . . .']

The stranger, *having discarded his jacket*, moved threateningly toward me. [' . . . after he had discarded . . .']

Adverbial clauses of time are adjuncts. Since they are commonly sentence adjuncts (cf 15.22), they often appear initially and occasionally medially, as the examples in this section indicate.

Note [a] Noun phrases (sometimes introduced by a preposition) modified by a relative clause may have a semantic role similar to adverbial clauses of time (cf 14.14):

Every time (that) the telephone rings, he gets nervous.

Remain in your seats until such time as you are told that you can leave.

By the time the alarm went off, I was awake.

They made me feel at home the moment I arrived.

Things have changed a great deal since the last time you were here. (cf: since you were here last time)

Throughout the period I was in London, it rained heavily.

These noun phrases and prepositional phrases are adverbials of time, though not adverbial clauses.

[b] The correlatives *no sooner . . . than* (cf 14.13 Note [b]) express time relationship:

The meeting had no sooner started
No sooner had the meeting started } than there was an uproar.

The meaning is similar to that of an *as soon as* clause, but it additionally expresses surprise. Syntactically, the *no sooner* clause is the matrix clause.

Time relationships

- 15.26 An adverbial clause of time relates the time of the situation denoted in its clause to the time of the situation denoted in the matrix clause. The time of the matrix clause may be previous to, subsequent to, or simultaneous with, the time of the adverbial clause. The situations in the clauses may be viewed as occurring once or as recurring. The time relationship may additionally convey duration and the relative proximity in time of the two situations.

Some of these time relationships are expressed not only by the choice of subordinator, but also by other devices in the two clauses: tense and aspect, the semantic category of the verbs, adverbs and prepositional phrases of time, and adjectives and nouns expressing time (cf 19.35). Temporal relationships between clauses may be implied by their semantic relationships in juxtaposed or coordinated clauses (cf 13.22ff). Here we are concerned mainly with the temporal subordinators.

Time before

- 15.27 *Until, till, and before* indicate that the situation in the matrix clause occurred before or leading up to the situation in the subordinate clause. *Till* is used in the same way as *until*, but is far less frequent as a subordinator. *Until* marks the time up to which the situation in the matrix clause applies:

I disliked Maurice *until I got to know him*.

The children were noisy *until told to be quiet*.

The matrix clause must be durative, the duration lasting to the time indicated by the *until*-clause. A negative clause is always durative, even though the corresponding positive clause is not durative (cf 8.58), since the absence of the event extends throughout the indicated period:

I didn't start my meal *until Adam arrived*.

*I started my meal *until Adam arrived*.

Before also marks the time from which the situation in the matrix clause applies, but the matrix clause need not be durative:

I started my meal *before Adam arrived*.

The situation in *until*-clauses is generally presupposed to be true, but that is not always so for *before*-clauses. Nonfactual *before*-clauses may imply preference, as in [1], or implausibility, as in [2]:

He'll beg for food *before he'll ask his parents for money*. ['He won't ask his parents for money'; 'He would rather beg for food than ask his parents for money.'] [1]

Pigs will fly *before he'll become a mathematician*. ['He'll never become a mathematician.'] [2]

Or the situation in the matrix clause may prevent that in the *before*-clause from taking place:

He died *before writing a will*.

Sally stopped Ted *before he had a chance to reply*. (cf 14.27)

Some *before*-clauses may be interpreted as either factual or nonfactual:

I sent a donation *before I was asked to*.

Before-clauses may imply purpose (cf 15.48) and result (cf 15.49) as well as time:

I had to put my complaint in writing *before they would take any action*. [' . . . so that they would take some action and with the result that they took action'; also 'They wouldn't take any action until I put my complaint in writing.']

Until-clauses may imply result as well as time:

She massaged her leg *until it stopped hurting*. [' . . . with the result that it stopped hurting.']

The *until*-clause expresses the result of the activity described in the matrix clause.

When the matrix clause is imperative, the sentence with a *before*-clause may imply a conditional relationship as well as time:

Go before I call the police. ['Go! If you don't go, I'll call the police.']

Compare the coordinate constructions implying the same relationship:

Go or I'll call the police. Go and I won't call the police.

Nonassertive items (cf 10.60) can appear in *before*-clauses, perhaps because *before*-clauses, like conditional clauses (cf 15.33ff), inherently relate to matters unfulfilled in respect of the matrix clause:

I spoke to them before I ever heard any gossip about them.
 ['At the time I spoke to them I had not heard any gossip about them']

Contrast:

**I spoke to them after I had ever heard any gossip about them.*

Before may be modified to indicate relative proximity of time (cf: *after*, 15.29) by a range of modifiers, eg: *just*, *right*, *immediately*, *sometime*, *a long time*, *many days*:

I took the examination a year before my brother did.

Until is restricted to the modifiers *just* and *right*.

Note [a] Constructions with *before* and *after* are not necessarily converses. If we designate the first situation as 'X' and the second as 'Y', then in the factual use of *before*:

X *before* Y = X happened before Y happened.

On the other hand, the *after* construction has two interpretations:

Y *after* X = (i) Y happened after X happened. [converse]

(ii) Y continued to happen after X began to happen. [not converse]

If Y is nondurative, the two constructions are converses:

I shaved [X] *before* I went to the party [Y]. [3]

= I went to the party [Y] *after* I shaved [X]. [4]

However, if Y is durative, the two constructions need not mean the same:

I knew Cathy [X] *before* she practised medicine [Y]. [5]

≠ Cathy practised medicine [Y] *after* I knew her [X]. [6]

Sentence [6] allows the possibility that Cathy practised medicine even before I knew her.

Nonfactual *before*-clauses rule out an equivalent *after*-clause:

Sally stopped Ted [X] *before* he had a chance to reply [Y]. [7]

≠ Ted had a chance to reply [Y] *after* Sally stopped him [X]. [8]

Sentence [7] implies that Ted did not have a chance to reply.

When the *after*-clause implies cause, there is no equivalent *before*-clause:

After Norma spoke, she received a standing ovation.

≠ Norma spoke *before* she received a standing ovation.

[b] When both matrix and subordinate clause differ only in their subjects, a prepositional phrase corresponds to the *before*- or *after*-clause:

Janet left $\left\{ \begin{array}{l} \text{before} \\ \text{after} \end{array} \right\} \text{I} \left\{ \begin{array}{l} \text{left} \\ \text{did} \end{array} \right\}$ [9]

= Janet left $\left\{ \begin{array}{l} \text{before} \\ \text{after} \end{array} \right\} \text{me.}$ [10]

Notice the use of the objective case in [10]. In some contexts there may be ambiguity between temporal and positional *before*:

They should stand up *before* me. ['before I do' or 'in front of me'] [11]

Positional *before* is used infrequently.

[c] Similar to the subordinators are prepositional phrases with *until*, *till*, and *before* followed by noun phrases modified by relative clauses, eg: *till the moment (that)*, *before the time (that)*, cf 15.25
 Note [a]. But the *before*-phrases cannot be used in place of nonfactual *before*-clauses.

[d] *Until*-clauses, like *before*-clauses, may express a combination of time, purpose, and result. Contrast:

Larry polished the table until $\left\{ \begin{array}{l} \text{he} \\ \text{you} \end{array} \right\}$ could see his face in it.

If the subject of the matrix clause and the *until*-clause are here coreferential (for example *Larry* and *he*), all three meanings are combined. If they are not coreferential, the *until*-clause conveys only time and result.

Same time

15.28 Several subordinators indicate the simultaneity of the situations in the matrix and subordinate clauses, or at least an overlap in time of the two situations: *as*, *as long as*, *so long as*, *while*, *whilst*. *When*, *whenever*, and *now (that)* may have the same function.

As, *as long as*, *so long as*, *while*, and *whilst* always denote simultaneity when they are used as temporal conjunctions. Temporal clauses introduced by the last four of these subordinators are duration adverbials.

As denotes merely simultaneity of two situations:

Just as she was about to speak, she was handed a note.

As it grew dark, we could hear the hum of mosquitoes.

For *as long as* and *so long as*, both clauses must be durative. Generally, these subordinators imply that the situations begin and end at the same time:

As long as I live here, I do it my way.

He'll continue working *so long as he has the strength*.

They emphasize more strongly than the other subordinators both simultaneity and duration. *While* and the less frequent *whilst* require that their clause must be durative, but the matrix clause need not be:

They arrived *while I was sunbathing*.

He cut himself *while shaving*.

Whenever is primarily used to introduce a frequency adverbial, denoting that the situation is repeated. It may also imply that the two situations overlap in time if at least one of the clauses is durative:

It rains *whenever we're camping*. ['... at any time we're camping.']

She visits her parents *whenever possible*.

Like *whenever*, *when* may imply simultaneity if one of the clauses is durative:

When I dream I see angels running up and down a ladder.

Be careful *when crossing streets*.

When may also imply repetitiveness, in which case it is synonymous with *whenever*:

When I read I like to be alone.

As long as and *so long as* may imply condition ('provided that') as well as time:

I'm happy *as long as my children are*.

Now that combines reason with temporal meaning, in present or past time. It may be used to indicate simultaneity:

We are happy *now that everybody is present*.
Now that she could drive, she felt independent.

- Note [a] A type of *when*-clause, obligatory at *E* position, represents climactic information in narrative: The last man was emerging from the escape tunnel *when a distant shout signalled its discovery by the guards*. [1]
 I was playing the piano, *when there was a knock at the door*. [2]
 I was watching the television, *when suddenly the lights went out*. [3]

The more important information is given in the subordinate clauses, which indicate that an event happened within a period referred to in the matrix clause. Notice that the matrix verb is in the progressive and that the *when*-clause is positioned finally. The effect is to provide a dramatic and emphatic climax. The *when*-clause is nonrestrictive (cf 15.23), and is usually separated by intonation and punctuation from the matrix clause.

[b] Certain noun and prepositional phrases combine with relative clauses to convey a meaning similar to that of these subordinators, cf 15.25 Note [a]. They include *every time (that)*, *as often as*, *at the very moment (that)*, *during the period (that)*, *throughout the time (that)*.

Time after

- 15.29 Several subordinators indicate a sequence in which the situation in the matrix clause occurs after that in the subordinate clause: *after*, *as soon as*, *directly* (esp BrE), *immediately* (esp BrE), *once*, *since*, *when*, *whenever*. *Now (that)* may have the same function.

As soon as, *immediately*, *directly*, and *once* add the notion of proximity in time of the two situations:

As soon as I left, I burst out laughing.
 We'll eat *once I finish preparing the meal*.

Immediately and *directly* particularly emphasize proximity:

She returned *immediately she heard the good news*.

A similar effect is obtained by adding appropriate modifiers to *after* and *as soon as*, eg: *immediately after*, *just as soon as*.

After merely marks the sequence of the clauses. Modifications (cf: *before*, 15.27) may indicate relative proximity, eg: *just*, *right*, *immediately*, *moments*, *some time*, *a long time*, *soon*, *three days*, *a year*:

Come over *right after you've finished working*.
 I went to sleep *soon after hearing the news*. [*after* as preposition]

Unlike the proximity subordinators, *after* allows the possibility that the situation in the matrix clause applied before the event:

He was still tired (*even*) *after he had had eight hours of sleep*.
 *He was still tired *immediately he had had eight hours of sleep*.

Since marks the beginning of the period after which the situation in the matrix clause applies (cf 8.60f, 14.26):

He feels much more relaxed *since he left school*. [1]
Since returning home, Carol has been working in her parents' business. [*since* as preposition] [2]

Since I last saw you, I have given birth to a beautiful daughter. [3]
 They had not read any books *since they left school*. [4]

The period marked by *since* may extend to the moment of utterance, as in examples [1–3], or to the past time of narration, as in [4]. But *since* does not rule out an extension beyond the period. The matrix clause may be durative, as in [1], [2], and [4], in which case we can premodify *since* by *ever* and ask a *How long?* question to elicit the *since*-clause. On the other hand, it may be nondurative, as in [3]. The matrix clause (*it* followed by BE) may merely specify the time period:

It has been two years *since I last saw you*. ['I last saw you two years ago.']

The period, however, may be left vague:

It's been {a long time / ages} *since you were here*.

When and *whenever* may indicate a sequence when the two clauses are nondurative:

She was shocked *when she heard his story*. [5]
When(ever) I cry, my eyes get puffy. [6]
 I drink coke *when(ever) I feel sick*. [7]

Now (that) does not have that restriction, but it combines circumstantial (cf 15.45) with temporal meaning:

Now that they've moved, we won't see them very often.

The sequential meaning of *after*, *when*, and *whenever* may induce an implication of cause, as in [5] and the following:

He felt better *after he had a short nap*.
 I hit him back *when he hit me*.
 My heart leaps *whenever I see you*.

When, *whenever*, and *once* may combine time with condition, as in [7] and the following:

When / Whenever / Once } I make up my mind to do something, I do it immediately.

When and *whenever* may also combine time, cause, and condition, as in [6].

When may imply concession as well as time. Like *whereas* (cf 15.43), it requires antithesis between two situations, but additionally has the meaning 'in that same situation' or 'in those same situations':

They were gossiping, *when they should have been working*.
 ['... whereas they should have been working.']
 She cleans the house by herself, *when she could easily have asked her children to help her*.

In this use, the *when*-clause is nonrestrictive and is usually in final position.

Note [a] The preposition *until* may introduce *after*-clauses:

Don't leave *until after I've spoken to you*.

[b] Several prepositions may combine with relative *when*, which is not to be confused with the subordinator: *by, since* (esp BrE), *till, until*:

Two years ago I bought a packet of your razor blades, *since when* I have used no others.
['since which time']

They settled in Seattle, *by when* she had obtained a master's degree in economics. ['by which time']

These constructions are sentential relative clauses (cf 15.57).

[c] Proximity may also be conveyed by phrases such as *the (very) moment that* and *from the minute (that)* followed by a relative clause, cf 15.25 Note [a]. Other phrases that combine with relative clauses to convey a meaning similar to that of subordinators in this section include *from the very first time (that)*, *by the time (that)*, *since the days (when)*.

[d] See 15.25 for *to*-infinitive clauses that blend time with outcome.

Clauses of contingency

- 15.30 The meaning of several subordinators that primarily express time, place, or condition may be neutralized in certain contexts to convey a more abstract notion of recurrent or habitual contingency: *when, whenever, once; where, wherever; if*. The subordinators may then be paraphrased by such prepositional phrases as 'in cases when' or 'in circumstances where':

<i>When(ever)</i>	{	<i>there's smoke, there's fire.</i>	[1]
<i>Where(ver)</i>		<i>children are involved, divorces are</i>	
<i>If</i>		<i>particularly unpleasant.</i>	
<i>Once</i>		<i>known, such facts have been reported.</i>	

<i>When(ever)</i>	{	<i>necessary, send up a flare.</i>	[2]
<i>Where(ver)</i>		<i>in doubt, see me.</i>	
<i>If</i>		<i>possible, you should test all moving parts.</i>	

<i>When(ever)</i>	{	<i>conscious of an infringement of his rights, he always</i>	[3]
<i>Where(ver)</i>		<i>protested to the manager.</i>	
<i>Once</i>			
<i>If</i>			

She always wrote an encouraging remark, *even* { *when* / *where* / *if* } *the essay paper was poor.* [4]

Once, whenever, and wherever cannot be focused by focusing adverbs such as *even*, and are therefore excluded from [4].

Nonfinite and verbless clauses without a subordinator may also express recurrent contingency:

Driving at high speed, one may well miss direction signs.

The sentence is ambiguous, *taken out of context*.

Fresh from the oven, rolls are delicious.

We can supply the subordinator *when* for these clauses, and *if* for the *-ed* and verbless clauses.

The correlative construction with *the*-clauses (cf 15.51) sometimes expresses

a meaning similar to that of a contingent relationship, the first *the*-clause roughly corresponding to a *when*-clause or an *if*-clause:

The harder he worked, the happier he felt.

When he worked harder, he felt happier.

Clauses of place

- 15.31 Adverbial clauses of place are introduced mainly by *where* or *wherever*. *Where* is specific and *wherever* nonspecific (cf 15.9). The clause may indicate position [1] or direction [2]:

Where the fire had been, we saw nothing but blackened ruins. [1]

They went *wherever they could find work*. ['to any place where'] [2]

The meaning of place merges with the general contingency meaning 'in cases where' (cf 15.30) in the following:

He put colons *where(ver) he should have put semicolons*.

Where-clauses may combine the meanings of place and contrast:

Where I saw only wilderness, they saw abundant signs of life.

Notice that the contrast subordinator *whereas*, which can replace *where* above, is a compound with *where* as one of its members.

Several temporal subordinators may have primarily a place meaning in descriptions of scenes, when the scenes are described dynamically in terms of movement from one place to another:

Take the right fork *when the road splits into two*.

The river continues winding *until it reaches a large lake*.

The building becomes narrower *as it rises higher*.

The road stops *just after it goes under a bridge*.

Once the mountains rise above the snow line, vegetation is sparse.

Note [a] *Where* and *wherever* also introduce *-ed* and verbless clauses (*where grown, wherever necessary*), but the clauses then convey the general contingency meaning.

[b] The same place relationship may also be expressed by prepositional phrases with relative clause postmodification (*at the place that ...*, *in the direction where ...*) or with a *where-* or *wherever*-clause as complement (*toward(s) where ...*, *to wherever ...*).

[c] The archaic forms *whence* ['from where'] and *whither* ['to where'] are occasionally found, particularly in religious language.

Clauses of condition, concession, and contrast

Overlap of semantic roles

- 15.32 We have seen that some clauses of time and place may express a general notion of a contingency relationship between the situations described in the subordinate and matrix clauses, a relationship also conveyed by conditional *if*-clauses (cf 15.30). We have also noted that some temporal clauses may imply relationships of condition (cf 15.27ff) and concession (cf 15.29), and that some clauses of place may imply contrast (cf 15.31). We now further note that many subordinators and conjuncts expressing those three logical

relationships of condition, concession, and contrast may otherwise convey meanings of time and place, as in the examples in Fig 15.32.

	subordinators	conjuncts
conditional	<i>as long as, in the event that</i>	<i>then, in that case</i>
concessive	<i>whereas, while</i>	<i>besides, yet</i>
contrastive	<i>whereas, while</i>	<i>on the other hand, instead</i>

Fig 15.32 Subordinators and conjuncts with overlapping roles

There is also considerable overlap in adverbial clauses that express condition, concession, and contrast. Conditional clauses (cf 15.33ff) convey that the situation in the matrix clause is contingent on that in the subordinate clause:

If the weather is fine, (then) we'll have a barbecue.

Clauses of contrast (cf 15.43) merely convey a contrast between two situations:

Whereas the US has immense mineral wealth, Japan (in contrast) has comparatively little.

Concessive clauses (cf 15.39ff) may also imply a contrast, but their main role is to imply that the situation in the matrix clause is unexpected in the light of that in the concessive clause:

Although admission was free, (nevertheless) few people attended the lecture.

The parenthesized items illustrate the different conjuncts that optionally correlate with the three clauses (cf 14.13).

The overlap between the three roles is highlighted by the overlapping use of subordinators: for example, *if* introduces all three types of clauses and *whereas* both contrast and concessive clauses. Furthermore, *even if* expresses both the contingent dependence of one situation upon another and the unexpected nature of this dependence:

Even if they offered to pay, I wouldn't accept any money from them.

All three types of clauses tend to assume initial position in the superordinate clause.

Conditional clauses

Direct and indirect condition

- 15.33 The central uses of conditional clauses express a **DIRECT CONDITION**: they convey that the situation in the matrix clause is directly contingent on that of the conditional clause. Put another way, the truth of the proposition in the matrix clause is a consequence of the fulfilment of the condition in the conditional clause. Here is an example:

If you put the baby down, she'll scream.

[1]

In uttering [1] the speaker intends the hearer to understand that the truth of the prediction 'she'll scream' depends on the fulfilment of the condition of 'your putting the baby down'. The hearer also in practice infers the converse:

If you don't put the baby down, she won't scream.

However, the speaker may cancel this implication by hedging (expressing some uncertainty, cf 8.124, 8.126):

If you put the baby down, she'll scream. But she may scream anyway.

More peripheral uses of conditional clauses express an **INDIRECT CONDITION**. The condition is not related to the situation in the matrix clause. Consider [2]:

She's far too considerate, if I may say so.

[2]

In uttering [2], the speaker does not intend the truth of the assertion 'She's far too considerate' to be dependent on obtaining permission from the hearer. Rather, the condition is dependent on the implicit speech act of the utterance: 'I'm telling you, if I may, that she's far too considerate'. In conventional politeness, the speaker is making the utterance of the assertion dependent on obtaining permission from the hearer, though the fulfilment of that condition is conventionally taken for granted. Here is another example:

She and I are just good friends, if you understand me.

The speaker warns the hearer that the correct interpretation of the utterance 'She and I are just good friends' depends on the hearer understanding what the speaker means by the utterance: 'I'm telling you that on the assumption that you understand me correctly'.

In direct conditions, the *if*-clause is an adjunct (cf 15.20ff); in indirect conditions, it is a style disjunct (cf 15.21).

Subordinators and structural types of clauses

- 15.34 The two simple subordinators for conditional clauses are *if* and *unless*. The most common and most versatile of the conditional subordinators is *if*; we therefore generally employ it in the sections that follow to illustrate the different uses of conditional clauses. The negative subordinator *unless* is the next most common. Other conditional subordinators are:

as long as, so long as, assuming (that), given (that) <formal>, in case, in the event that, just so (that) <informal>, on condition (that), provided (that), providing (that), supposing (that)

General recurrent contingency is expressed by *once, when, whenever, where, and wherever* (cf 15.30). In addition, several subordinators combine condition with time: *before* (cf 15.27), *as long as, so long as, when, whenever, once* (cf 15.28). *Except that* and conjunctive *only* combine exception with condition (cf 15.44).

All these subordinators are used with finite clauses:

If you want some more, you should ask me.

Unless the strike has been called off, there will be no trains tomorrow.

He doesn't mind inconveniencing others *just so he's comfortable*.
<informal>

She may go, *as long as he goes with her*.

You may leave the apartment at any time, *provided that you give a month's notice or pay an additional month's rent*.

In case you want me, I'll be in my office till lunchtime.

Given that $x = y$, then $n(x + a) = n(y + a)$ must also be true. <in formal argumentation>

Assuming that the movie starts at eight, shouldn't we be leaving now?

Supposing they won the raffle, what would they do with an extra car?

Of the subordinators that are specifically conditional, only *if* and *unless* introduce nonfinite clauses (mainly *-ed* participle clauses) and verbless clauses. They are marginally acceptable in *-ing* participle clauses (cf 14.19 Note [a]):

The grass will grow more quickly *if watered regularly*.

Unless otherwise instructed, you should leave by the back exit.

If wet, the pipe won't give you a good smoke.

It has little taste, *unless hot*.

Here belong the positive and negative conditional pro-clauses *if so* and *if not*. The implied subject is the matrix clause itself (or part of it) in some verbless *if*-clauses, including the common *if possible* and *if necessary*:

Marion wants me to type the letter *if possible*.

['if it is possible for me to type the letter']

I can discuss the matter with you now, *if necessary*.

['if it is necessary to discuss the matter with you now']

Nonfinite and verbless clauses with *with* or *without* as subordinator may express a conditional relationship:

Without me to supplement your income, you wouldn't be able to manage.

With them on our side, we are secure.

Cf 15.36 for finite conditional clauses without a subordinator but with subject-operator inversion:

Had Mark been in charge, it wouldn't have happened.

Note [a] The traditional terms PROTASIS for subordinate clause and APODOSIS for matrix clause are especially used for conditional relationships.

[b] *Unless*, *except* (informal AmE), and archaic *save* also combine exception with condition, cf 15.35 Note [f]:

I'm not going $\left\{ \begin{array}{l} \text{unless} \\ \text{except} \end{array} \right\}$ you go with me.

[c] Conditional relationships are also implied in certain kinds of clauses coordinated by *and* and *or* (cf 13.25, 13.30) and in paratactic constructions such as *waste not*, *want not* (cf 11.43).

[d] Among some common stereotyped conditional expressions without subordinators are:

(a) absolute clauses (cf 15.58; and 9.58 for expressions such as *barring bad weather*):

$\left\{ \begin{array}{l} \text{time} \\ \text{weather} \end{array} \right\}$ permitting God willing

Cf: for the time being

(b) subjectless clauses with a subjunctive verb:

come to that ['if it comes to that', 'if I may add to that']
please God ['if it pleases God']

[e] Cf 11.41 for *if*-clauses as sentences.

[f] Contingency relationships may also be expressed by various complex prepositions, eg:

on the $\left\{ \begin{array}{l} \text{assumption} \\ \text{supposition} \end{array} \right\}$ that in case of $\left\{ \begin{array}{l} \text{fire} \\ \text{a fire breaking out} \end{array} \right\}$
on condition that

with the $\left\{ \begin{array}{l} \text{proviso} \\ \text{stipulation} \end{array} \right\}$ that in the event of $\left\{ \begin{array}{l} \text{an accident} \\ \text{an accident occurring} \end{array} \right\}$

[g] Infinitive clauses sometimes combine condition with other contingency relations (cf 15.73) such as purpose or reason:

You must be STRONG to lift that weight. ['... in order to lift that weight', '... because you were able to lift that weight', '... if you were able to lift that weight']

You'd be a fool not to take the scholarship. ['if you didn't ...']

To be considered for admission, you must make a formal application. ['If you are to be considered ...', 'In order to be considered ...']

[h] Cf 15.6 Note [a] for the relationship between conditional *if* and interrogative *if*.

[i] Restrictive relative clauses modifying generic noun phrases (cf 5.26) may be paraphrased by means of a conditional clause:

People who want security shouldn't take a job in commerce. ['If people want security, they shouldn't take a job in commerce']

The same sometimes applies to other restrictive modifiers with generic noun phrases:

Careless drippers cause accidents. ['If drivers are careless, they cause accidents']

Cars manufactured abroad are less expensive. ['If cars are manufactured abroad, they are less expensive']

Direct condition

Open and hypothetical condition

15.35 A direct condition may be either an OPEN CONDITION or a HYPOTHETICAL CONDITION. Open conditions are neutral: they leave unresolved the question of the fulfilment or nonfulfilment of the condition, and hence also the truth of the proposition expressed by the matrix clause:

If Colin is in London, he is undoubtedly staying at the Hilton.

The sentence leaves unresolved whether Colin is in London, and hence it leaves unresolved whether he is staying at the Hilton.

A hypothetical condition, on the other hand, conveys the speaker's belief that the condition will not be fulfilled (for future conditions), is not fulfilled (for present conditions), or was not fulfilled (for past conditions), and hence the probable or certain falsity of the proposition expressed by the matrix clause:

If he changed his opinions, he'd be a more likeable person. [1]

They would be here with us *if they had the time*. [2]

If you had listened to me, you wouldn't have made so many mistakes. [3]

The conditional clauses in these sentences convey the following implications:

He very probably won't change his opinions. [1a]

They presumably don't have the time. [2a]

You certainly didn't listen to me. [3a]

The precise formulation of the speaker's belief depends on the time reference of the conditional clause. For future reference as in [1], the condition is

contrary to expectation; for present reference as in [2], it is contrary to assumption; for past reference as in [3], it is contrary to fact. *If* is the main subordinator used in hypothetical conditions.

The distinction between open and hypothetical conditions is important grammatically because the verbs in hypothetical conditions are backshifted (*cf* backshifting in indirect speech, 14.31).

	conditional clause	matrix clause
present and future reference	PAST <i>If I were younger,</i>	PAST MODAL <i>I would study Classical Greek.</i>
past reference	PAST PERFECTIVE <i>If I had seen you,</i>	PAST PERFECTIVE MODAL <i>I would have invited you home.</i>

Fig 15.35 Verb forms with hypothetical conditions

On the verb forms, *cf* further 14.23.

Conditional clauses – particularly clauses introduced by *if*, *in case*, and *in the event that* – are like questions in that questions are generally either neutral in their expectations of an answer or biased toward a negative response (*cf* 11.6*f*). Therefore, like questions, they tend to admit nonassertive forms (*cf* 10.60*f*):

In the event that he is *at all* interested, I'll speak to him.
If you *ever* touch me again, I'll scream.
If you had *ever* listened to *any* of my lectures, you would have known the answer.
She's taking a stick with her in case she has *any* trouble on the way.

Nonassertive items also appear in indirect conditions (*cf* 15.38):

They're going steady, if it's of *any* interest to you. ['I don't know if it's of any interest to you.']
I'll be in my office all DAY, in case you have *any* PROBLEM *at all*. ['I'm telling you this in case you have any problem at all.']

Most subordinators are not used, or rarely used, in hypothetical conditions. Their clauses tend to contain assertive forms:

I won't phone you, unless *something* unforeseen happens.

Second-instance *if*-clauses may have assertive forms:

A: I've got *something* to tell you later.
B: Well, if you've got *something* to tell me, tell me now.

Note [a] Open conditions have also been termed 'real', 'factual', and 'neutral' conditions. Hypothetical conditions have also been termed 'closed', 'unreal', 'rejected', 'nonfactual', 'counterfactual', and 'marked' conditions.

[b] *If and when* is sometimes used for future open conditions.

[c] *If only* is an intensified equivalent of *if*, typically used in hypothetical clauses to express what the speaker wishes would happen, would be happening, or would have happened:

If only you would help me next week, I would not be so nervous.

If only they were here now, we would be able to celebrate their wedding anniversary.

If only somebody had told us, we could have warned you.

When positive, the conditional clause generally contains assertive forms, and nearly always precedes the matrix clause. The clause is sometimes used on its own as a hypothetical wish (*cf* 11.41): *If only I hadn't lost it!* The combination *only if* is quite different: *if* is restricted by the focusing *only*.

[d] *Given (that)* and *assuming (that)* are used for open conditions which the speaker assumes were, are, or will be fulfilled, and from which a proposition is deduced. A clause introduced by *granted (that)* is also used as a premise for a deduction, but usually implies a previous statement on which the premise is based. *If* may be used in the same way: *If you were there (and you say you were)*, you must have seen her; and so also in *if*-clauses with clausal pro-forms: *if so*, *if not*, *if that's true*, *if that's the case*, and (with nonassertives) *if anything*, *if at all*. *Given (that)* and *granted (that)* tend to be used in formal written style, particularly in argumentation.

[e] *As long as* and *so long as* are less formal than the semantically similar but formal *provided (that)* and *providing (that)*. *Just so (that)* tends to appear in informal conversation. They all mean 'if and only if'.

[f] *Unless* introduces a negative condition; the *unless*-clause is usually roughly similar to a negative *if*-clause. With *unless* there is a greater focus on the conditions as an exception ('only if ... not'). There are therefore contexts in which the *unless*-clause cannot occur:

I'll feel much happier { *if he doesn't come with us.*
 **unless he comes with us.*

If you hadn't studied hard,
**Unless you had studied hard,* } you'd have failed the exam.

[g] *In case* (*cf* also 15.46) is used for open conditions, normally with future reference ('if it should happen that'):

I'll let you know *in case they come by here*.

In formal AmE it also has the meaning 'on condition that':

The verb is plural (*only/just*) *in case the subject is plural*.

[h] *In the event (that)* can generally replace *if* in open conditions. Because of its greater length, it is regarded as stylistically clumsy.

[i] The form *if and only if* is used in mathematics and formal logic to introduce a necessary and sufficient condition on the truth of the matrix clause. It is sometimes abbreviated *iff*.

The verb phrase in the conditional clause

15.36 The present subjunctive is sometimes used for open conditions in conditional clauses, instead of the normal present tense:

If any vehicle *be* found parked on these premises without written permission, it shall be towed away at the expense of the vehicle's owner.

This use is mainly confined to very formal, legal, or quasi-legal contexts.

Two ways of expressing future hypothetical conditions are occasionally used in formal contexts. They have overtones of tentativeness:

(i) *was to* or *were to* followed by the infinitive:

If it { *was*
 were } to rain, the ropes would snap. They're far too tight. [1]

(ii) *should* followed by the infinitive (*cf* putative *should* 14.25):

If a serious crisis *should* arise, the public would have to be informed of its full implications. [2]

In [1] *were* is the singular past subjunctive form of *be* and not the simple past form, *were* being used in the past subjunctive for the singular as well as

the plural (cf 3.62). As [1] illustrates, both the past subjunctive and the past indicative forms are possible for hypothetical conditions, the subjunctive being preferred by many, especially in formal written English:

If John $\left\{ \begin{smallmatrix} \text{was} \\ \text{were} \end{smallmatrix} \right\}$ here, we would soon learn the truth.

The idiom *if I . . . you* by convention usually contains the subjunctive *were*, though *was* also occurs frequently.

We may signal the conditional relationship, without using a subordinator, by subject-operator inversion. The most common use of this inversion in conditional clauses is with the operator *had*:

Had I known, I would have written before. ['If I had known, . . .']

For the negative, *not* is placed before the lexical verb, the enclitic *n't* not being possible:

Had I not seen it with my own eyes, I would not have believed it.

Inversion may also occur in a somewhat literary style with subjunctive *were* and tentative *should*:

Were it to reveal its secrets, that house would collapse in shame.

Were she in charge, she would do things differently.

Should you change your mind, no one would blame you.

Should she be interested, I'll phone her.

More rarely, the operator may be *could* or *might*:

$\left\{ \begin{smallmatrix} \text{Might} \\ \text{Could} \end{smallmatrix} \right\}$ *I but see my native land*, I would die a happy man.

For this construction, these two operators require an adverb such as *but* or *just* before the lexical verb.

On the choice of verbs in both the conditional and the matrix clause, cf 14.23.

Rhetorical conditional clauses

- 15.37 Rhetorical conditional clauses give the appearance of expressing an open condition, but (like rhetorical questions, cf 11.23) they actually make a strong assertion. There are two types of rhetorical *if*-clauses, one in which the assertion is derived from the conditional clause and the other in which it is derived from the matrix clause.

(a) If the proposition in the matrix clause is patently absurd, the proposition in the conditional clause is shown to be false:

If they're Irish, I'm the Pope. ['Since I'm obviously not the Pope, they're certainly not Irish.']

If you believe that, you'll believe anything. ['You certainly can't believe that.']

If she doesn't get first prize, she's no daughter of yours. ['She certainly will get first prize.']

(b) If the proposition in the conditional clause is patently true, the proposition in the matrix clause is shown to be true. This type is used with measure expressions with the implication of at least the measure stated in the conditional clause. The *if*-clause is positioned finally:

He's ninety *if he's a day*. ['If you'll agree that he's at least a day old, perhaps you'll take my word that he's ninety.']

The package weighed ten pounds *if it weighed an ounce*. ['The package certainly weighed ten pounds.']

The painting must be worth a thousand dollars *if it's worth a cent*. ['The painting must certainly be worth a thousand dollars.']

Note The matrix clause in type (a) has some fixed expressions which state patent falsehoods, with some variation in the person of the subject, such as *I'll eat my hat* and *He's a Dutchman*:
If Dave's younger than me, I'll eat my hat. ['Dave's certainly not younger than me.']
More stereotyped, because restricted to an *I*-subject, are *I'll be* (or *I'm*) *damned* and *I'll be* (or *I'm*) *hanged*, both familiar in style:

$\left\{ \begin{smallmatrix} \text{I'll be} \\ \text{I'm} \end{smallmatrix} \right\}$ *damned if I apologize*. ['I'll certainly not apologize.']

As a result, these can stand alone as expressions of amazement, eg: *Well, I'll be damned*. Taboo expressions also occur in the matrix clause with rhetorical conditional clauses (eg: *Fuck me if I'm going to lift a finger to help them*).

Compare also the stereotyped patterns in *She's nothing if not tough* ['She's certainly tough.'] and *He's nothing if not cruel* ['He's certainly cruel.'].

Indirect condition

- 15.38 Indirect conditions are open conditions (cf 15.35) that are dependent on an implicit speech act of the utterance (cf 11.3), and are therefore style disjuncts (cf 15.21). They are mainly realized by *if*-clauses. We can distinguish several classes of style disjuncts:

(a) The conditional clause is a conventional expression of politeness which makes the speaker's utterance seemingly dependent on the permission of the hearer (cf 8.124f):

If you don't mind my saying so, your slip is showing. ['If you don't mind my saying so, I'm telling you that . . .']

If I may be quite frank with you, I don't approve of any concessions to ignorance.

Other examples include:

if I may say so (without contradiction), *if I may put it bluntly*, *if I may be personal*, *if you can be serious for just this once*, *if you can keep a secret*, *if we can be practical for a moment*, *if I may put the matter as simply as possible*, *if I may interrupt*, *if I may change the subject*

(b) The conditional clause is a metalinguistic comment (cf 8.126) which hedges the wording of the utterance, either suggesting that the wording is not quite precise or that it should not be misunderstood in some sense not intended by the speaker. It explicitly or implicitly calls for the hearer's agreement:

His style is florid, *if that's the right word*. ['I'm not sure that *florid* is the right word.'] [1]

The Big Bang Theory of the origin of the universe bears a startling resemblance to the description of creation in Genesis, *if one may put it so*. ['I'm not sure that one may phrase the resemblance in that way.'] [2]

She is resigning, *if you know what I mean*. [Perhaps: 'You are to interpret that to mean that she has been asked to resign.'] [3]

In [1] and [2] the speaker is uncertain of the correctness of the wording. In [3] the speaker is uncertain whether the hearer will interpret the wording correctly and therefore warns the hearer to interpret it in the intended way. Other examples include:

if I may put it so, if that's the correct term, if that's the word for it, if you see what I mean, if I may phrase it delicately/loosely/crudely/figuratively, if you will <formal>, if you like

Although the clauses with *I* indicate explicitly the speaker's uncertainty, clauses such as *if I may put it so* may be used to convey a warning more indirectly.

(c) The conditional clause expresses uncertainty about the extralinguistic knowledge required for a correct interpretation of the utterance. The uncertainty may be the speaker's or the hearer's:

I met your girl friend Caroline last night, *if Caroline is your girl friend*. [4]

Chomsky's views cannot be reconciled with Piaget's, *if I understand both correctly*. [5]

The war was started by the other side, *if you remember your history lessons*. [6]

Einstein's theory of gravitation is based on a mathematical concept, *if you've not forgotten already*. <ironical> [7]

The conditional clauses in [4] and [5] hedge about the speaker's own knowledge, whereas those in [6] and [7] hedge about the hearer's knowledge. The possible clauses for this type are open-ended, particularly for those expressing the speaker's uncertainty. Other examples include:

if I'm correct, if I understand you correctly, if we can believe the experts, in case you don't remember, if you remember, if you know what I'm referring to, in case you don't know

(d) The conditional clause expresses the condition under which the speaker makes the utterance:

If you're going my way, I need a lift back. ['If you're going my way, will you please give me a lift back?'] [8]

In case he ever asks you, I don't know you. ['In case he ever asks you, tell him that I don't know you.'] [9]

If you want to borrow a shoebrush, there's one in the bathroom. ['If you want . . . use the one in the bathroom.'] [10]

Where did your parents go, *if you know*? ['If you know, tell me . . .'] [11]

Notice that the utterance of [8] and [9] has the illocutionary force of indirect requests, [10] of an indirect offer, and [11] of a direct question. The conditional clause expresses uncertainty. If the speaker is certain of the fulfilment of the condition, a *since*-clause is used instead:

Since you're going my way, I need a lift back. [8a]

For all four types the uncertainty of the condition provides a tentativeness which adds politeness to utterances.

Note Apart from *if*, other subordinators used to introduce indirect conditions are *in case (that)*, *assuming (that)*, *in the event (that)*, and *supposing (that)*.

Clauses of concession

Subordinators and structural types of clauses

15.39 Clauses of concession are introduced chiefly by *although* or its more informal variant *though*. Other subordinators used with concessive clauses are:

if, even if, even though, when, whereas <formal>, while, and whilst <sp BrE>.

Cf also below the exceptional concessive uses of *as* and *that <BrE>*.

Although he had just joined the company, he was treated exactly like all the other employees.

No goals were scored, though it was an exciting game.

While I don't want to make a fuss, I feel I must protest at your interference.

Whereas the amendment is enthusiastically supported by a large majority in the Senate, its fate is doubtful in the House.

She paid when she could have entered free.

He borrowed my mower even though I told him not to.

Except for *when* and *whereas*, the concessive subordinators may introduce *-ing*, *-ed*, and verbless clauses:

While not wanting to seem obstinate, I insisted on a definite reply.

Even though given every opportunity, they would not cooperate with us.

Though well over eighty, he can walk faster than I can.

The same types of clauses may also express concession without a subordinator though they then generally require a correlative conjunct to make the relationship clear:

Not wanting to give offence, they did so all the same.

Trained in karate, he nevertheless used a gun to defend himself.

Aware of the dangers to American citizens during the crisis, she still insisted on staying with the others.

Like conditional clauses (*cf* 15.36), concessive clauses sometimes have unusual syntactic orderings when the subordinator is *as* or *though*. In a rather formal style, the predication in the concessive clause may be fronted:

Genius though she was, she was quite unassuming.

Fail though I did, I would not abandon my goal.
Naked as I was, I braved the storm. ['Even though I was naked, ...']
Change your mind as you will, you will gain no additional support.
 ['Even though you change your mind, ...']

The ordering is optional for *though*, but obligatory for *as*, which would not be concessive if placed initially (but cf Note [d] below).

That is also used concessively with the same obligatory ordering as *as*, but in AmE only a noun phrase functioning as subject complement can be fronted:

Fool that he was, he managed to evade his pursuers. ['Even though he was a fool, ...']

The noun phrase has the role of a characterizing attribute (cf 10.20). On the other hand, in BrE an adjective phrase functioning as subject complement can also be fronted:

Poor that they were, they gave money to charity. <BrE> ['Even though they were poor, ...']

For a similar reordering of *as* and *that* in circumstantial clauses, cf 15.47.

Note [a] Concession may also be expressed by several prepositional phrases followed by a relative clause:

despite
 in spite of
 irrespective of
 regardless of
 notwithstanding } the fact (that)

Because of their greater length than the subordinators, they are considered stylistically clumsy.

[b] For *though* as a conjunct of concession, cf 8.137.

[c] In concessive clauses such as *greatly though I admire her* and *much as I would like to help*, only the adverb is in the obligatory initial position. This type is limited to the subordinators *though* and *as*.

[d] The noninitial placement of concessive *as* is perhaps to be related to *as ... as* in the following example of an infrequent type of concessive clause:

As widespread as the effects may be, the Midwest still bears the brunt of the recession.

['Even though the effects may be widespread, ...']

The noninitial *as* may therefore be regarded as a correlative to an omitted initial *as*. See also the similar omission of the initial comparative *as* (cf 15.71).

Concessive relationships

- 15.40 Concessive clauses indicate that the situation in the matrix clause is contrary to expectation in the light of what is said in the concessive clause. In consequence of the mutuality, it is often purely a matter of choice which clause is made subordinate:

No goals were scored, *although it was an exciting game*.
 It was an exciting game, *although no goals were scored*.

Often they also imply contrast between the situations described by the two clauses.

Although and the more informal *though* are the most versatile of the subordinators, since they may in fact relate clauses in which the situations are similar:

Although Sam had told the children a bedtime story, June told them one too (anyway).

While and *whilst* are more restricted, but they may relate clauses in which the contrast is muted, the concessive relationship arising from a contrary expectation:

While he has many friends, Peter is (nevertheless) often lonely.
While I admit I did it, (nevertheless) I didn't intend to.

Whereas is the most restricted of the four subordinators, requiring antithesis between two situations:

Whereas it would be naive to maintain that inflation is no longer of concern, (nevertheless) all the economic indicators suggest that the money supply can now be safely increased.

Even though and *even when* are more emphatic forms of *though* and *when*, the modifying *even* also expressing unexpectedness. *Even if*, on the other hand, combines the concessive force of *even* with the conditional force of *if*; hence the semantic contrast between [1] and [2]:

Even though you dislike ancient monuments, Warwick Castle is worth a visit. [1]
Even if you dislike ancient monuments, Warwick Castle is worth a visit. [2]

Whereas the *even though* clause in [1] presupposes 'you dislike ancient monuments', the *even if* clause in [2] leaves open whether that is so or not. The presupposition of [1] can be cancelled by adding modal *may* or a hedging adverbial such as *perhaps*.

If by itself may be used concessively:

If he's poor, he's (at least) honest. ['He may be poor, yet he's at least honest.'] [3]
If he's poor, he's (also) honest. ['He is poor, yet he's also honest.'] [3a]

In [3] it is paraphrased as synonymous with *even if* and in [3a] with *even though*. These two different uses of concessive *if* are frequently realized in abbreviated verbless clauses:

It's possible, *if difficult*. ['It may be difficult.']
 My car is as clean as yours, *if not cleaner*. ['It may be cleaner.']
 He spoke ungraciously, *if not rudely*. ['He may have spoken rudely.']
 They were in good health, *if somewhat fatter than desirable*. ['They were somewhat fatter than desirable.']
 Her salary was good, *if not up to her expectations*. ['Her salary was not up to her expectations.']

Note On *when* with concessive implications, cf 15.29.

Alternative conditional-concessive clauses

- 15.41 The overlap between condition and concession, already noted with *even if* (cf 15.40), is particularly marked in the two types of adverbial clauses termed

ALTERNATIVE CONDITIONAL-CONCESSIVE and UNIVERSAL CONDITIONAL-CONCESSIVE.

The correlative sequence *whether . . . or (whether)* is an alternative condition in that logically it combines the conditional meaning of *if* with the disjunctive meaning of *either . . . or* (cf also Note [a]). It is thus a means of coordinating two subordinate clauses. If the second unit is a full clause, *whether* may be repeated, as in [1]; cf 15.6:

- Whether Martin pays for the broken vase or (whether) he replaces it with a new vase, I'm not inviting him again.* [1]
You will have to face the publicity, whether you want to or not. [2]
Whether or not he finds a job, he's getting married. [3]

The concessive meaning emerges from the unexpected implication that the same situation applies under two contrasting conditions. Thus, [3] may be paraphrased 'Even if he finds a job or even if he doesn't find a job, he's getting married.' On alternative orderings for [2] and [3], cf Note [a].

The longer and more emphatic constructions *It doesn't matter whether* (initial only) and *No matter whether* can also be used to introduce clauses that are alternative conditional-concessive (cf 15.42).

- You will have to face the publicity, no matter whether you want to or not.* [2a]
It doesn't matter whether or not he finds a job, he's getting married. [3a]

The same subordinators also introduce nonfinite and verbless clauses:

- Sarah is always intense, whether working or playing.* [4]
Whether trained or not, Marilyn is doing an excellent job. [5]
No matter whether right or wrong, your son needs all the support you can give him right now. [6]

The subordinator may be omitted, but the clause is then normally initial:

- Working or playing, Sarah is always intense.* [4a]
Trained or not, Marilyn is doing an excellent job. [5a]

There are also verbless clauses introduced by *with*, which is then correlated with *without*:

- We'll buy the house, with a bank loan or without one.* [7]
With or without a bank loan, we'll buy the house. [7a]

The same meaning may be conveyed merely by the coordinated noun phrases if the second is negated by the determiner *no*:

- We'll buy the house, bank loan or no bank loan.* [8]

This construction is also available when the implied verb is *be* rather than *have*:

- I have to go to work, rain or no rain.* [9]
 [' . . . whether or not there is rain.']

A further reduction is possible, though less common, by the omission of the second noun phrase. The reduced clause is then usually placed initially:

Bank loan or no, we'll buy the house. [10]

In all the types exemplified by [7–10], the verbless clause may be either initial or final. In the types exemplified by [8–10], the indefinite article is omitted in the parallel structure before count nouns such as *bank loan*.

Note [a] We may see a relationship also with alternative interrogative clauses (cf 15.6). Compare [1] above with:

I don't know whether Martin will pay for the broken vase or whether he will replace it. I'm not inviting him again anyway.

The subordinate clause in [2] can be reordered as *whether or not you want to* and that in [3] as *whether he finds a job or not*. Cf alternative questions, 11.20f.

[b] Occasionally alternative conditional-concessive meaning is expressed by a finite clause without a subordinator, in which the verb is subjunctive (cf 15.34 Note [d], 15.42 Note [b]):

Rain or shine, we're having our party outside today. ['Whether it rains or shines, . . .']

Compare: *(Come) wind or rain* ['Whether wind or rain comes.']. A rarer and somewhat literary construction involves the use of subjunctive *be*:

(Be he) friend or foe, the law regards him as a criminal. ['Whether he is (or be) friend or foe, . . .']

[c] The alternative in the second clause may be parallel to only part of the first clause. Thus, the finite clause corresponding to [6] is:

No matter whether he's right or wrong, . . .

and a slightly amended version of [5] might be:

Whether trained as a nurse or as a radiologist . . .

[d] As with *either* (cf 13.39ff), some speakers allow more than two choices (cf 15.6 Note [b]):

Whether you do your homework or play or watch television, you must not disturb me.

[e] Like *no matter whether* are *regardless of whether* and *irrespective of whether* (cf 15.39 Note [a]):

Regardless of whether or not he finds a job, he's getting married.

Universal conditional-concessive clauses

- 15.42 The contrast between alternative clauses and universal clauses is parallel to that between alternative questions (cf 11.20f) and *wh*-questions (cf 11.14ff) or to that between their corresponding dependent clauses (cf 15.5f). The alternative conditional-concessive clause gives a choice between two (or occasionally more, cf 15.41 Note [d]) stated conditions, normally in sharp opposition, whereas the universal conditional-concessive clause indicates a free choice from any number of conditions. Compare:

- Whether I shout at them or plead with them, I can't keep them quiet.* [two stated alternatives] [1]
Whatever I say to them, I can't keep them quiet. [any number of choices] [2]

The concessive implication in [2] comes through the inference that, for example, I can't keep them quiet *even if* I promise them a treat.

The alternative clauses are introduced by the *wh*-words that are compounded with *-ever* and by the longer constructions *It doesn't matter* (initial only) and *No matter* (cf 15.41) followed by *wh*-elements. The clauses share with other *wh*-clauses the initial placement of the *wh*-element, and the consequent shift of that element (unless it is the subject) from its normal syntactic order:

Stand perfectly still, wherever you are. [A S V]

However much advice you give him, he does exactly what he wants.

[O_sS V O_i]

Don't let them in, *whoever they are*. [C_s S V]

There is a subtle semantic difference between the universal clauses and the apparently identical time and place clauses beginning *whenever* and *wherever*. The contrast can be shown in a sentence such as:

Wherever you live, you can keep a horse.

The locative meaning is 'You can keep a horse at any place where you may live' (cf specific locative *where*: *You can keep a horse where you live*). The conditional-concessive meaning (more applicable to a city-dweller) is 'It doesn't matter where you live, you can keep a horse (and the horse need not be in the same place as you live)'.

Note [a] The verb *be* can be omitted from a universal clause if the subject of an SVC clause is an abstract noun phrase:

Whatever your problems (are/may be), they can't be worse than mine.

However great the pitfalls (are/may be), we must do our best to succeed.

[b] Occasionally the universal meaning is expressed by a finite clause without a subordinator, in which case the verb is subjunctive and is initial (cf 10.34 Note [d], 15.41 Note [b]): *Come what may* ['Whatever may happen.'], *Be that as it may* ['However that may be.'].
 [c] AmE prefers the present subjunctive for the verb in the subordinate clause in [1], while BrE prefers putative *should* (cf 14.24f).

Clauses of contrast

- 15.43 Clauses of contrast are introduced by several of the subordinators that introduce concessive clauses (cf 15.39): *whereas*, *while*, and *whilst*. Indeed, there is often a mixture of contrast and concession. The contrastive meaning may be emphasized by correlative antithetic conjuncts such as *in contrast* and *by contrast* when the contrastive clause is initial:

Mr Larson teaches physics, *while Mr Corby teaches chemistry*.

I ignore them, *whereas my husband is always worried about what they think of us*.

The three subordinators are interchangeable, except that the less common *whilst* is found especially in BrE.

Clauses of contrast are very similar to clauses coordinated by *but*. This is particularly so when the contrastive clause is final. When the contrastive clause is initial, it is viewed as containing the subordinate information, the point of departure for the contrast.

Clauses of exception

- 15.44 Clauses of exception are introduced by several subordinators: *but that* <formal>, *except (that)*; less frequently *excepting (that)* and *save that* <formal>. Several of the subordinators also blend exception with condition. *Except (that)*, *excepting (that)*, and *save that* have very similar uses, apart from the stylistic restriction on *save that*:

I would pay you now, *except I don't have any money on me*.

No memorial remains for the brave who fell on that battlefield, *save that they will leave their image for ever in the hearts and minds of their grateful countrymen*. <formal>

But that, like the preposition *but*, requires that the matrix clause precede it and be negative:

Nothing would satisfy the child *but that I place her on my lap*.

<formal>

[1]

More usually an infinitive clause would be used:

Nothing would satisfy the child *but for me to place her on my lap*.

[1a]

In stereotyped sentences, *but* alone may occur:

It never rains *but it pours*.

Only, restricted to informal style, also expresses the meaning of exception (cf Note [a] below):

I would've asked you, *only my mother told me not to*.

Unless combines condition with exception ('except if'), hence the negative meaning; *provided (that)* and its synonyms are the positive equivalent.

For prepositions of exception that introduce bare infinitive and *to*-infinitive clauses, cf 9.58.

Note [a] *Only* is a borderline case between conjunct and conjunction. It is unclear whether a coordinating conjunction (for example, *but*) can be inserted between the clauses; if it can, it has one of the defining characteristics of the class of conjuncts (cf 8.134f), but if it cannot, its syntactic status is similar to *for*, which is on the gradient between coordinator and subordinator (cf 13.18f). It may be paraphrased 'The only thing is'.

[b] *Except (that)*, *excepting (that)*, and *save that* can usually be replaced by the coordinating conjunction *but*. They can also usually be replaced by longer, and hence stylistically clumsy, prepositional phrases followed by relative clauses, eg: *except for/apart from the fact (that)*. Contexts excluding replacement by the conjunction and the prepositional phrases are where *but that* is admissible.

[c] AmE prefers the present subjunctive for the verb in the subordinate clause in [1], while BrE prefers putative *should* (cf 14.24f).

Reason clauses

Direct and indirect reason relationships

- 15.45 We subsume under clauses of REASON several types of subordinate clauses that convey basic similarities of relationship to their matrix clauses. For all types there is generally a temporal sequence such that the situation in the subordinate clause precedes in time that of the matrix clause. As the paraphrases indicate, the word *reason* is a superordinate term available for all types:

(a) Cause and effect: the construction expresses the perception of an inherent objective connection in the real world:

The flowers are growing so well *because I sprayed them*. ['The cause for the flowers growing so well is that I sprayed them' or 'The reason that the flowers are growing so well is that I sprayed them.']
 He's thin *because he doesn't eat enough*.

(b) Reason and consequence: the construction expresses the speaker's inference of a connection:

She watered the flowers *because they were dry*. ['The reason that she watered the flowers was that they were dry.']

Since she's my friend, she must have put in a good word for me.

(c) Motivation and result: the construction expresses the intention of an animate being that has a subsequent result:

I watered the flowers *because my parents told me to do so*. ['My motivation for watering the flowers was that my parents told me to do so' or 'The reason that I watered the flowers was that my parents told me to do so.']

You'll help me *because you're my friend*.

Agency and intention are always involved in motivation.

(d) Circumstances and consequence: the circumstantial clause combines reason with a condition that is assumed to be fulfilled or about to be fulfilled, the construction expressing a relationship between a premise in the subordinate clause and the conclusion in the matrix clause:

Since the weather has improved, the game will be held as planned. ['In view of the fact that the weather has improved, the game will be held as planned' or 'The reason that the game will be held as planned is that the weather has improved.']

Seeing that it is only three, we should be able to finish this before we leave today.

The examples we have given so far express a DIRECT REASON relationship between the reason clause and the matrix clause. More peripheral uses of reason clauses express an INDIRECT REASON. The reason is not related to the situation in the matrix clause but is a motivation for the implicit speech act of the utterance:

Percy is in Washington, *for he phoned me from there*. ['Since he phoned from there, I can tell you that Percy is in Washington.']

As you're in charge, where are the files on the new project? ['As you're in charge, I'm asking you . . .?']

Vanessa is your favourite aunt, *because your parents told me so*. ['Since your parents told me so, I can say that Vanessa is your favourite aunt.']

As long as you're here, why don't we discuss our plans?

Since you seem to know them, why don't you introduce me to them?

['Since you seem to know them, I ask you to introduce me to them.']

Since and *because* are the most common subordinators for indirect cause. Clauses expressing an indirect cause are style disjuncts, cf 15.21.

Subordinators and structural types of clauses

- 15.46 Reason clauses are most commonly introduced by the subordinators *because* (also 'cause) and *since*. Other subordinators are *as* and (in somewhat formal style) *for*:

I lent him the money *because he needed it*.

As Jane was the eldest, she looked after the others.

Since we live near the sea, we often go sailing.

Much has been written about psychic phenomena, *for they pose fascinating problems that have yet to be resolved*.

In case combines reason with contingency ('because it may happen that'):

Take your umbrella *in case it rains*. ['Take your umbrella because it *may* rain', ' . . . because of the possibility that it will rain.']

You should write a will *in case something happens to you abroad*.

Circumstantial clauses (cf 15.45) are introduced by the simple subordinators *because*, *since*, and *as* and by several complex subordinators: *seeing (that)*; *as long as*; *inasmuch as* <formal>:

Seeing that it seems as if it will rain soon, we had better leave now.

As long as you're here, we might as well talk about your last game.

It is doubtful whether research proposals by Freud himself would have been approved by reviewers, *inasmuch as he was not affiliated to any academic institution*. <formal>

Clauses introduced by *with* may also be circumstantial:

With the exams coming next week, I have no time for a social life.

With so many children to support, they both have to work full time.

Cf also circumstantial *now (that)*, 15.28.

In that <formal> combines reason with point of view:

The evidence is invalid *in that it was obtained through illegal means*.

['The evidence is invalid in this respect: it was obtained through illegal means.'] <formal>

When *while* introduces a style disjunct, it blends time and reason:

While you're in the kitchen, bring me another drink.

Clauses without a subordinator may imply the meanings discussed in this section:

Knowing their tastes, she was able to bring a gift that they would like.

Constructed according to my specifications, the building was able to withstand the earthquake.

Assured of your support, he would not compromise.

It is a testimony of the close and obvious connection between reason and temporal sequence that *as* and *since* are conjunctions of time as well as of cause. This dual function can give rise to ambiguity:

As he was standing near the door, he could hear the conversation in the kitchen. ['Since he was standing near the door . . . ' or 'While he was standing near the door . . .']

- Note [a] A number of prepositional phrases are used to introduce reason relationships, but they are often considered to be stylistically clumsy because of their greater length:

because of
by virtue of
in (the) light of
in view of
on account of
owing to
due to

} the fact (that)

For prescriptive objections to the use of *due to* as a preposition, cf 15.59 Note [d]. For the use of *on account of* as a subordinator in informal style (esp AmE), cf 14.12 Note [e].

[b] Infinitive clauses may convey a meaning similar to that of reason in *that*:

He's foolish *to make such a fuss*. ['... in that he makes such a fuss.']

They may also blend reason with condition, cf 15.34 Note [g].

[c] The stereotyped clause *come to think of it*, with no subordinator and with a verb in the base form is similar to *now that I come to think of it*:

Come to think of it, shouldn't you write to her?

[d] The reason/contingency meaning of *in case* easily merges into a negative purpose meaning (cf 15.35 Note [g], 15.48). Compare:

Write a will *in case you die*. ['... because you may die.']

Write a will *in case you die without providing for your family*. ['... because you may die without providing for your family', 'in order that you do not die without providing for your family']

[e] Circumstantial *what with* refers to one or more given circumstances of an unspecified set, whereas circumstantial *with* implies only one:

What with the prices (being) so high, (and (with) my wife being out of work), I can't afford a new refrigerator.

Notice that it is possible to add informal *and all* if a coordinated *and (with)* ... is not present:

What with Carol (being) out of work and all, we didn't send any Christmas cards this year.

There is a stereotyped phrasal analogue:

What with one thing and another, I couldn't sleep last night.

[f] *As* followed by a noun phrase may correspond to a finite clause:

As I'm your mother, } I'll decide.
As your mother, }

But the restriction to noun phrases suggests that *as* is here a preposition.

[g] An adjunct *because*-clause, but not a style disjunct *because*-clause, corresponds to a prepositional phrase introduced by *because of*:

The flowers are growing well { *because I fertilized them.*
 because of my fertilizing them.

[h] A *because*-clause is sometimes used informally as equivalent to a *that*-clause:

(Just) *because I object to his promotion* doesn't mean that I'm vindictive. ['The (mere) fact that I object ...'] [2]

There are prescriptive objections to this use. Alternatives are:

My objection } to his promotion doesn't mean that I'm vindictive. [1a]
My objecting }

I can't be accused of being vindictive (just) *because I object to his promotion.* [1b]

There are also prescriptive objections against the alleged redundancy in the informal use of a *because*-clause that correlates with a previous *why* or *the reason (that)*:

Why } they didn't go to see the house is *because* they prefer to live in an
The reason (that) } apartment. [2]

Similar objections apply to the use of *the reason why* in place of *the reason (that)*. The fully acceptable alternative to [2] would replace *because* by *that*.

15.47 Most subordinators used for direct cause introduce content disjuncts, but *because*, *in case*, and *in that* introduce adjuncts (cf 15.20).

Adjunct *because*-clauses tend to be in *I* position, while style disjunct *because*-clauses are always at *E*. *For*, which is close to coordinator status, is always at *E*. Table 15.47 draws on an analysis of British English based on a

100 000-word sample from both the London-Lund corpus (which contains most of the SEU spoken texts) and the LOB written corpus to provide figures for the positions of clauses introduced by the major reason subordinators.

Table 15.47 Distribution of reason clauses in samples from the written LOB corpus and the spoken London-Lund corpus

	LL	LOB	Total
<i>as</i>			
initial	7	19	26
final	2	9	11
	5	10	15
<i>because (cos)</i>	355	70	425
initial	4	8	12
medial	4	2	6
final	347	60	407
<i>for (all final)</i>	0	64	64
<i>since</i>	5	33	38
initial	2	12	14
medial	1	0	1
final	2	21	23

When *as* is a circumstantial subordinator, the predication may optionally be fronted:

Writing hurriedly as she was, she didn't notice the spelling errors.

Tired as they were, they went to bed as soon as they came back.

That may be a circumstantial subordinator, when the subject complement is obligatorily fronted:

Clumsy idiot that he was, Michael completely ruined the dinner.

Cf 15.39 for a similar fronting with concessive clauses.

Clauses of purpose

15.48 Clauses of purpose, which are adjuncts, are more often infinitival than finite:

To open the carton, pull this tab.

I left early *to catch the train*.

My publisher sent it *for me to comment on (it)*.

More explicit subordinators of purpose are *in order to* (formal) and *so as to*:

They left the door open (*in order*) *for me to hear the baby*.

Students should take notes (*so as*) *to make revision easier*.

The committee agreed to adjourn (*in order*) *to reconsider the matter when fuller information became available*.

Finite clauses of purpose are introduced by *so that* or (less commonly and more informally) by *so*, and (more formally) by *in order that*:

The school closes earlier *so (that) the children can get home before dark*.
The jury and the witnesses were removed from the court *in order that they might not hear the arguments of the lawyers on the prosecution's motion for an adjournment*.

These finite clauses, which are putative (cf 15.49), require one of these modal auxiliaries: *can, could, may, might, should, would*.

Negative purpose is expressed in the infinitive clauses by *so as not to* and *in order not to*:

Turn the volume down *so as not to wake the baby*.
I ignored the remark *in order not to prolong the dispute*.

In finite clauses it is expressed by *in order that ... not*, but also by specific subordinators: *for fear (that)* <formal>, *in case* <BrE>, or the very formal *lest*:

They left early *for fear (that) they would meet him*. [1]
They evacuated the building *in case the wall collapsed*. [2]

For fear (that) conveys also the meaning of apprehension and requires a modal auxiliary, but *in case* need not have a modal auxiliary. In [2] there is an implicit negative purpose 'in order that, if the wall collapsed, they would not be affected.' Archaic *lest* tends to have a modal auxiliary or (esp in AmE) the present subjunctive:

Earthen mounds were being hastily erected *lest an attack*

*{ should be
be <esp AmE> }* launched that night.

Note [a] The implied subject of an infinitive clause may be the object (indirect or direct) of the superordinate clause:

I lent Paul a dollar *to get home*. ['... (for Paul) to get home.']

The purpose infinitive clause can be fronted when the implied subject is the subject of the superordinate clause:

To get home, I had to borrow money from Paul.

[b] As a subordinator for finite clauses of purpose, *that* is archaic:

The jury and witnesses were removed from the court *that they might not hear the arguments of the lawyers*.

Should not hear <esp BrE> and *not hear* <esp AmE> could also be used instead of *might not hear*.

[c] Purpose may be expressed by an *if*-clause containing the semi-auxiliaries *be to* or *be going to*:

If I'm to be there on time, I must leave at once.

Clauses of result

15.49 Clauses of result are introduced by the subordinators *so that* <formal> and *so*. These clauses overlap with those of purpose both in meaning and in subordinators. The chief semantic difference is that result clauses are factual rather than putative: both express result, but in the result clause the result is achieved, whereas in the purpose clause it is yet to be achieved – it is a desired or aimed-at result. Hence finite clauses of result do not require a modal auxiliary:

We paid him immediately, *so (that) he left contented*. [result] [1]
We paid him immediately *so (that) he would leave contented*. [purpose] [2]

As we see from these examples, *so* and *so that* express both purpose and result, but *so that* is more commonly used for purpose and *so* for result. When *that* is omitted in the result clause, the conjunction *so* is indistinguishable from the conjunct *so* in asyndetic coordination. If *and* is inserted, *so* is unambiguously the conjunct:

We paid him immediately, *and so* he left contented. [1a]

Result clauses differ syntactically from purpose clauses, in that result clauses are disjuncts whereas purpose clauses are adjuncts (cf 15.20). Furthermore, result clauses can only appear finally. Unlike the purpose clause, the result clause introduced by *so (that)* is separated by comma punctuation.

The result relation is the converse of that of motivation (cf 15.45). Consider the following sentence:

I took no notice of him, *so he flew into a rage*.

Its meaning can be expressed by reversing the matrix and subordinate clauses and using a conjunction such as *because*:

He flew into a rage *because I took no notice of him*.

That may introduce a final clause with resultative meaning in interrogative sentences:

What have I done, *that you should insult me?*

In one type of comparative clause, the clause expresses result. This type (cf 15.74) has the correlatives *so ... (that)* or *such ... (that)*, in which *so* and *such* are intensifiers:

Her parents gave her *so many toys (that) she couldn't possibly play with them all*. [cf Note [b]] [3]
She is *such a good lecturer (that) all her courses are full*. [4]

Such that <formal> combines result with manner:

The two halves of the human brain behave independently, *such that each half can be taught opposite solutions to simple problems*. ['... in a way that has the result that ...']

Note [a] Cf 15.25 for *to*-infinitive clauses that blend the meanings of time and outcome.

[b] If *that* is omitted in [3] and [4] above, an intonation break is normal at that place. If *so* intensifies a verb it may appear at the end of the clause, and an intonation break (or in writing, a comma) is normal after *so*:

They wanted it *so, (that) they agreed to pay more than the normal price*. [*so* = 'so much']

Compare the result clause with the complex subordinator *so that*:

They wanted it, *so (that) they agreed to pay more than the normal price*.

In formal style, *so* may be a manner adverb rather than an intensifier, in which case *that* must be retained:

They *so* arranged the seating *that all had a clear view of the stage*. [*so* = 'in such a way'] <formal>

Again, *so* may be postposed:

They arranged the seating *so, that all had a clear view of the stage*. <formal>

[c] In interrogative and negative sentences, *that* may introduce a result clause that is related to the correlative *so ... that* comparative clause exemplified in [3] and [4] above, except that the intensifier *so* is omitted. The style is formal and archaic:

Do you know her intimately, *that you presume to address her in such a casual manner?*

(Compare: *Do you know her so intimately that ...*)

They are not destitute *that they need your help*.

In the negative sentence, the result clause is counterfactual ('they do not need your help').

Clauses of similarity and comparison

- 15.50 Adjunct clauses of similarity are predication adjuncts (cf 15.22). They are introduced by *as* and *like* (informal, esp AmE). *As* and *like* are commonly premodified by *just* and *exactly*:

She cooks a turkey (*just*) *as her mother did*. ['... in a way that is similar to the way that ...'] [1]

Please do it (*exactly*) *as I said*. [2]

?Say the word (*exactly*) *like I did*. (esp informal AmE) [cf Note [b]] [3]

It was (*just*) *as I imagined*. ['... similar to what I imagined.'] [4]

When the verb is dynamic, as in [1–3], similarity is combined with manner. The clause in [4], on the other hand, expresses pure similarity.

If the *as*-clause is placed initially, as in [5], correlative *so* introduces the matrix clause in formal literary style:

(*Just*) *as a moth is attracted by a light, so* he was fascinated by her. [5]

The clause then expresses an analogy.

Adjunct clauses of comparison are also predication adjuncts. They are introduced by *as if*, *as though*, and *like* (informal, esp AmE). As with similarity clauses, when the verb is dynamic they also convey a manner meaning. If the comparison is factual, the verb in the comparison follows the normal rules for temporal reference:

He looks *as if he's getting better*.

If the comparison is hypothetical (implying lack of reality), a subjunctive or hypothetical past may be used as an alternative (cf 14.23f):

She treats me *as if* $\begin{cases} I'm \\ I was \\ I were \end{cases}$ a stranger.

He talks *as if* $\begin{cases} he has \\ he had \end{cases}$ a potato in his mouth.

She treated me *as though* $\begin{cases} I was \\ I were \\ I had been \end{cases}$ a stranger.

The subordinators *as*, *as if*, and *as though* introduce nonfinite and verbless clauses:

Fill in the application form *as instructed*.

He bent down *as if tightening his shoe laces*.

You should discuss the company with him *as though unaware that you were being considered for a job*.

As if and *as though* may also introduce *to*-infinitive clauses:

She winked at me *as if to say that I shouldn't say anything*.

Note [a] An *as*-clause that blends manner with similarity may allow subject-operator inversion if the clause consists only of the subject and the operator:

His conducting of the third movement shows the subtlety of his interpretation, *as does his earlier recording of the Mass in C*.

The present owner is a keen art collector, *as were several of her ancestors*.

[b] There are prescriptive objections to the use of *like* as a subordinating manner or comparison conjunction, but it is commonly used as such in informal style, especially in AmE. It is more acceptable when it expresses pure similarity, as does the preposition *like*, though it still tends to be confined to informal style:

It was (*just*) *like I imagined*. (informal) [4a]

Compare the casual:

?It was (*just*) *like what I imagined*. (casual) [4b]

[c] Adverbial clauses of comparison are not to be confused with the comparative clauses in 15.63f.

Clauses of proportion

- 15.51 Proportional clauses involve a kind of comparison. They express a proportionality or equivalence of tendency or degree between two situations. They may be introduced by *as*, with or without correlative *so* (formal), or by the fronted correlative *the ... the* followed by comparative forms:

As he grew disheartened, (so) his work deteriorated.

As the lane got narrower, (so) the overhanging branches made it more difficult for us to keep sight of our quarry.

The more she thought about it, *the less* she liked it.

The harder he worked, *the happier* he felt.

The fronting of the comparative elements results in the kind of syntactic ordering found in relative and *wh*-interrogative clauses:

The later you arrive [A S V], the better the food is [C_s S V].

The more you tell him [O_d S V O_i], the less notice he takes [O_d S V].

On the correlative *the*-clauses, cf further 14.13 and (as expressing a contingency meaning) 15.30.

Note [a] Correlative clauses of proportion are found in some aphoristic sentences such as *The more, the merrier* (cf 11.43).

[b] The subordinators *insofar as*, *inasmuch as* (formal), and *insofar that* (formal, rare) introduce adjunct clauses of extent or degree:

We agreed with the lecturer *only insofar as* she condemned the government's domestic policies. ['... only to the extent that ...']

Corresponding prepositions are *to the extent that* and *to the degree that*.

Clauses of preference

- 15.52 Clauses of preference are mainly introduced by the subordinators *rather than* and *sooner than*, with the bare infinitive as the verb of the clause:

Rather than go there by air, I'd take the slowest train. ['I'd prefer to take the slowest train.'] [1]

They'll fight to the finish sooner than surrender. ['They prefer to fight to the finish.'] [2]

The combination 'd *rather* [= *would rather* or *had rather*] is a modal idiom (cf 3.45f). Corresponding to [1] is [1a]:

I'd rather take the slowest train than go there by air. [1a]

The subordinate clause may very occasionally have its own subject:

Rather than you say anything, I would speak to the manager myself. ['I'd prefer to speak to the manager myself.'] [3]

A rare and formal finite clause of preference occurs with putative *should* (cf 14.25):

Rather than she should feel lonely, her friends arranged to take her with them on the trip. [4]

The subordinate clause expresses the rejected alternative. That negative meaning allows it to contain nonassertive items (cf 10.60), as in [3] and [5]:

Rather than ever admit that he has any pain at all, he'll suffer for weeks. [5]

The matrix clause expresses an implied conditional meaning ('if there's a choice'), and therefore the matrix verb tends to contain a modal auxiliary.

Note [a] On *rather than* as a quasi-coordinator, cf 14.15 Note, and as a preposition with *-ing* clauses, cf 14.19 Note [c].

[b] The preference construction extends the notion of priority in time to the notion of priority in choice. It is therefore not surprising that temporal expressions other than *sooner* are used to convey preference: notably the subordinator *before*, but also such comparative adverbs as *quicker*, *faster*, *more readily*, plus *than*. Both clauses take modal auxiliaries:

He'd sit alone in the dark *before* he'd watch television. ['He prefers to sit alone in the dark.']

She'll use the telephone *before* she'll put pen to paper.

They would volunteer their own work *more readily than* they would contribute money.

I'd buy a typewriter *faster than* I'd buy a television set.

In earlier periods of English, *rather* also had temporal meaning.

Comment clauses

15.53 Comment clauses are parenthetical disjuncts. They may occur initially, finally, or medially, and thus generally have a separate tone unit:

KINGston, [as you probably KNOW,] is the capital of JAMaica |

Comment clauses are either content disjuncts that express the speakers' comments on the content of the matrix clause, or style disjuncts that convey the speakers' views on the way they are speaking (cf 15.20f). Here we consider forms of these clauses that we have not discussed in the previous sections on the semantic roles of adverbial clauses.

We distinguish the following types:

(i) like the matrix clause of a main clause:

There were no other applicants, *I believe*, for that job.

(ii) like an adverbial finite clause (introduced by *as*):

I'm working the night shift, *as you know*.

(iii) like a nominal relative clause:

What was more upsetting, we lost all our luggage.

(iv) *to*-infinitive clause as style disjunct:

I'm not sure what to do, *to be honest*.

(v) *-ing* clause as style disjunct:

I doubt, *speaking as a layman*, whether television is the right medium for that story.

(vi) *-ed* clause as style disjunct:

Stated bluntly, he had no chance of winning.

In each category, there are idiomatic or cliché expressions: *you see*, *as I say*, *what's more to the point*, *to be fair*, *generally speaking*, *put bluntly*. Similarly, in each category there is at least some freedom to coin new expressions.

Comment clauses, many of which are characteristic of spoken English, are generally marked prosodically by increased speed and lowered volume.

15.54 Type (i) comment clauses, which are the most important, generally contain a transitive verb or adjective which elsewhere requires a nominal *that*-clause as object (cf 15.4). We can therefore see a correspondence between sentences containing such clauses and sentences containing indirect statements:

There were no other applicants, *I believe*, for that job. [1]

I believe that there were no other applicants for that job. [2]

To convert a sentence with a *that*-clause such as [2] into a sentence such as [1], we have to reverse the relationship of subordination between the two clauses, making the *that*-clause into the matrix clause, at the same time omitting the subordinator *that*, and making the matrix clause into the comment clause. Because of this reversal of syntactic roles, the two sentences [1] and [2] are not exact paraphrases; but the relationship between them illuminates the function of the comment clause. Furthermore, the verb in the comment clause may have only one of the meanings possible for the verb in the matrix clause. Verbs like *believe* and *think* may have a more definitive meaning or may merely hedge (express a tentative meaning); but only the hedging meaning is present in comment clauses. The possible difference is highlighted in the contrast between [3] and [4], and between [5] and [6]:

I believe that there is a God.

['I assert the belief that there is a God' or 'There may be a God.'] [3]

There is a God, *I believe*. ['There may be a God.'] [4]

You know that it belongs to me. ['You know that'] [5]

It belongs to me, *you know*. ['I want you to know that'] [6]

Since the *that* of an object *that*-clause is normally deletable (cf 15.4), only the intonation (reflected by comma separation in writing) distinguishes an initial comment clause from an initial matrix clause:

You KNOW, [I think you're WRONG]. } [You know is a comment clause]

You know, I [think you're WRONG]. } [You know is a matrix clause]

You [know (that)] I think you're WRONG. [You know is a matrix clause]

Comment clauses resemble main clauses in that they contain at least a

subject and a verb and are not introduced by a subordinator. However, they are not independent clauses, since they are defective syntactically: the verb or adjective lacks its normally obligatory complementation.

Many type (i) clauses are stereotyped, eg: *I believe, you know*. Outside this group, however, clauses can be fairly freely constructed, permitting variations of subject, tense, and aspect, or additions of adjuncts, etc:

The Indian railways (*my uncle was telling me some time ago*) have always made a profit.

Type (i) comment clauses that are stereotyped may have various semantic functions:

(a) They hedge, ie they express the speaker's tentativeness over the truth value of the matrix clause. Commonly, the subject is *I* and the verb is in the simple present, but the subject may be an indefinite *one* or *they* or (usually with a passive verb) *it* and the verb may (for example) have a modal auxiliary or be in the present perfective. Here are some examples:

I believe, I guess, I think, I expect, I feel, I hear, I presume, I assume, I understand, I suppose, I consider, I suspect, I'm told, I have read, I have heard, I have heard tell, I can see, I may assume, I daresay, I venture to say, one hears, they tell me, they allege, they say, it is said, it is reported, it is claimed, it is rumoured, it has been claimed, it seems, it appears

The comment clause may be negative (with *I* as subject) if the matrix clause is negative:

They aren't at home, *I don't believe*.

The matched negative expresses greater tentativeness than the positive. The verbs that commonly allow the negative are *believe, expect, suppose, think*.

Some comment clauses are added to questions:

What's he doing, *I wonder?*

Are they to get away with it, *I ask myself?*

(b) They express the speaker's certainty. Commonly, the subject is *I* and the verb is in the simple present. Here are some examples:

I know, I claim, I see, I remember, I agree, I admit, I'm sure, I'm convinced; I have no doubt; it's true, it transpires; there's no doubt; I must say, I must admit, I must tell you, I have to say

Certainty may also be expressed by negation of a verb that expresses rejection or lack of certainty, eg: *I don't deny, I don't doubt*.

(c) They express the speaker's emotional attitude towards the content of the matrix clause. Again, usually the subject is *I* and the verb is in the simple present. Some are followed by a *to*-infinitive verb of speaking. Here are some examples:

I'm glad to say, I'm happy to say, I'm pleased to say, I'm delighted to say, I'm happy to tell you; I hope, I wish, I fear, I regret, I'm afraid; I regret to say, I'm sorry to say; it pains me to tell you, it grieves me to say

Interjections such as *God knows* and *Heaven knows*, which express the speaker's lack of comprehension, perhaps belong here because they also imply an emotive attitude.

(d) They are used to claim the hearer's attention. Some also call for the hearer's agreement. At the same time, they express the speaker's informality and warmth toward the hearer. The subject is usually *you* or the implied *you* of the imperative. Here are some examples:

you know, you see, you realize; you can see, you may know, you may have heard, you must admit; mind you, mark you; it may interest you to know

Negative questions generally call for the hearer's agreement, eg: *wouldn't you say?, don't you think?, don't you agree?, can't you see?, don't you know?* They are attached to declarative sentences:

It's ethically wrong, *wouldn't you say?*

Positive questions generally call for the hearer's attention. They are attached to interrogative sentences:

What's she doing, *do you think?*

Is the heating on, *do you suppose?*

Note [a] The reporting clauses for direct speech (cf 14.29) are related to the semantic roles (a) and (b) of type (i) comment clauses, and may be considered an additional semantic category within type (i):

'It's time we went,' *I said*.

Like the other comment clauses, their verbs also normally require complementation.

[b] Tag questions (cf 11.8ff) are related to the semantic role (d) of type (i) comment clauses, and may also be considered comment clauses:

They're in a great hurry, *aren't they?*

They may alternatively be analysed as related to the matrix clause by parataxis (cf 13.2) rather than by subordination, parataxis being a relationship that might be postulated for all type (i) comment clauses.

[c] Although comment clauses are syntactically dependent in that their verbs lack the required complementation, some clauses identical in form to comment clauses may be used as independent utterances in responses:

A: Will you be leaving tonight? B: *I daresay*.

A: Your tie is undone. B: *I know*.

Other such responses require a clausal pro-form as complementation, eg: *I think so*.

[d] Notice the difference between [7] and [8]:

But is this RIGHT, $\begin{cases} I \text{ wonder?} \\ I \text{ wonder?} \end{cases}$ [7]

But is this RIGHT, *I wonder?* [8]

Where [7] expresses reservation, [8] expresses decided disagreement. The falling tone, as with tag questions, invites confirmation.

[e] In an informal use, *I don't think* is attached to a positive sentence to indicate that the sentence is being used ironically:

That's a masterpiece, *I don't think*.

I don't think has tail intonation (cf App II.15).

[f] Notice that some comment clauses in subtype (b) may have a concessive force, eg: *It's true, I must say, I admit, I must admit*.

15.55 Type (ii) comment clauses, which are next in importance, are introduced by *as*. *As* serves one of two syntactic functions in these clauses: as a relative or as a subordinator.

In its relative function, *as* introduces a type of sentential relative clause that may precede or be inserted in its antecedent, in this case the clause or sentence to which it is attached. In its mobility, this *as*-clause is intermediate between the relative and adverbial constructions. Like the sentential relative *which* (cf 15.57), *as* may function as a relative pronoun:

She is extremely popular among students, *as is common knowledge*.

(cf: *which is common knowledge*)

I live a long way from work, *as you know*. (cf: *which you know*)

Other examples of clauses with relative *as*: *as everybody knows*, *as you may remember*, *as you say*, *as I can see*, *as I have said*, *as I'm told*, *as you may have heard*.

As a subordinator, *as* introduces a clearly adverbial clause, and the sentential antecedent is replaced by *it*. It is roughly synonymous with *insofar as* ['to the extent that']:

He is the best candidate, *as it seems*. ['... insofar as it seems that he is the best candidate.']

Other examples of clauses with subordinator *as*: *as it appears*, *as it happens*, *as it transpired*, *as it may interest you to know*, *as I see it*, *as I interpret it*.

The two types of construction often merge, providing a choice whether or not to insert *it*. Thus, some of the examples with subordinator *as* allow an optional *it* when they are extended: *as (it) seems likely*, *as (it) often happens*. Other examples with optional *it*: *as (it) was pointed out*, *as (it) was said earlier*, *as I remember (it)*, *as I understand (it)*.

As (it) appears from her essay, she has read widely in Romantic literature.

Type (i) comment clauses can often be converted to type (ii) comment clauses by the addition of *as*:

The Indian railways, ((*as*) *my uncle was telling me some time ago*), have always made a profit.

But the addition changes the meaning. The type (ii) clause is affirmative, implying the truth of the matrix clause, whereas the type (i) clause is neutral. The difference may be clearer with another pair of sentences:

GEORGE, *as you SAID*, is a liar (*but I don't believe it).

GEORGE, *you said*, is a liar (but I don't believe it).

The affirmation of truth value is even more striking when the *as*-clause comes first:

As you said, George is a liar.

Many of the stereotyped type (i) clauses become unacceptable if *as* is added (**as I see*, **as I daresay*) or change their meaning radically (*as you know*).

Note [a] The clausal pro-form *so* may be used in parenthetical clauses that correspond to type (i) in their meaning, although they resemble type (ii) in their form: *so he says*, *so I understand*, *so it*

seems, *so I believe*. The semantic resemblance to type (i) comment clauses lies in their neutrality as to the truth value of the matrix clause.

[b] There are a few negative stereotyped comment clauses with *you* as subject, but they require a modal auxiliary, usually *may*, *might*, *will*, or *would*; eg: *as you may not remember*, *as you won't have heard*, *as you might not realize*.

[c] Relative *as* may have the function of subject in its clause, but only if the operator is *be* or another copular verb:

She has married again, *as* $\left\{ \begin{array}{l} \text{was/seemed natural.} \\ \text{was expected.} \\ \text{*delighted us.} \end{array} \right.$

Contrast with the sentential relative:

She has married again, *which delighted us*.

This condition does not apply to the merged constructions where a subject *it* is optionally omitted:

She has married again, *as (it) often happens*.

There appears to be the additional requirement that the *as*-clause must be semantically congruent with its matrix clause:

She has married again, $\left\{ \begin{array}{l} \text{*as was unexpected.} \\ \text{which was unexpected.} \\ \text{*as was disgraceful.} \\ \text{which was disgraceful.} \end{array} \right.$

This requirement suggests that relative *as* retains some reason implication that is normal for *as* when it is a conjunction of reason.

15.56 The other types of comment clauses can be dealt with more briefly.

Type (iii) comment clauses are nominal relative clauses introduced by *what* (cf 15.8f):

What's more surprising, he didn't inform his parents. [1]

The *what*-clause must be initial. As with type (ii) (cf 15.55), sentences containing them correspond to sentences in which the relationship of subordination between the two clauses is reversed. For example, [1] corresponds to [2]:

It's more surprising (that) he didn't inform his parents. [2]

It also corresponds to a sentential relative clause (cf 15.57) as in [3], except that a sentential relative clause must be final:

He didn't inform his parents, *which is more surprising*. [3]

It further corresponds to a sentence in which the nominal relative clause is subject and linked to the subject complement by the verb *be*, as in [4]:

What's more surprising is (that) he didn't inform his parents. [4]

Other examples of type (iii) comment clauses: *what's more serious*, *what's most significant of all*, *what's very strange*, *what annoys me*.

Types (iv), (v), and (vi) of the comment clauses are style disjuncts (cf 15.21). They are nonfinite clauses, differentiated by form. We give some examples of stereotyped clauses for each type.

Examples of type (iv) comment clauses, which have a *to*-infinitive: *to be honest*, *to be fair*, *to be frank*, *to be precise*, *to be truthful*, *to be serious for a moment*, *to speak candidly*, *to put it briefly*.

Examples of type (v) comment clauses, which have an *-ing* clause: *broadly speaking, loosely speaking, roughly speaking, figuratively speaking, speaking frankly, speaking generally, speaking personally, putting it mildly, putting it crudely*.

Examples of type (vi) comment clauses, which have an *-ed* clause: *put in another way, rephrased, worded plainly, stated quite simply*.

Sentential relative clauses

- 15.57 Closely related to comment clauses of type (ii) (*as you know*, cf 15.55) and type (iii) (*what's more surprising*, cf 15.56) are SENTENTIAL RELATIVE CLAUSES. Unlike adnominal relative clauses, which have a noun phrase as antecedent, the sentential relative clause refers back to the predicate or predication of a clause, [1] and [2], or to a whole clause or sentence, [3] and [4], or even to a series of sentences [5]:

- They say he *plays truant*, *which he doesn't*. [1]
He *walks for an hour each morning*, *which would bore me*. [2]

Relative clauses such as in [1] are used to affirm (if positive) or deny (if negative) an assertion or thought ascribed to others.

- Things then improved, *which surprises me*. [3]
Colin married my sister and I married his brother, *which makes Colin and me double in-laws*. [4]

In [3] the antecedent matrix clause is a single clause and in [4] it is two conjoined clauses. But one might equally imagine a storyteller coming to the end of the story with the words:

- *which is how the kangaroo came to have a pouch*. [5]

Here *which* could refer back to the whole length of the story.

Sentential relative clauses parallel nonrestrictive postmodifying clauses in noun phrases in that they are separated by intonation or punctuation from their antecedent. They are commonly introduced by the relative word *which*. In [1–5] *which* is a relative pronoun, but it may also be a relative determiner of general abstract nouns such as *fact, case, event, or situation*, or more specific verbal nouns such as *failure* or *claim*. The noun phrases, which may be prepositional complements, represent the antecedent:

- The plane may be several hours late, *in which case there's no point in our waiting*. [6]
They are said to have taught chimpanzees to use human language, *which claim has been disputed by some scholars*. [7]
(formal)

The rather formal construction in [7] is more commonly replaced by a noun phrase with a postmodifying relative clause, as in [8]:

- They are said to have taught chimpanzees to use human language, *a claim which has been disputed by some scholars*. [8]
The prosecutor charged him with lying, *an allegation which he vehemently denied*. [9]

In [8] and [9] the noun phrase, including the postmodifier, is in apposition to the predication of the matrix clause. The determiner *which* may be found with prepositions other than *in* (exemplified in [6]):

- They were under water for several hours, *from which experience they emerged unharmed*.
The last speaker assured the audience that the party would win the election, *on which optimistic note* the meeting ended.

Furthermore, the pronoun *which* may be a prepositional complement:

- Mortimer exploded a firecracker during a lesson, *as a result of which he was suspended from school for a week*.
Her brother snatched the letter away, *at which she was furious*.

In a rather formal style, the pronoun *which* may be the object of a nonfinite verb:

- There was a sudden increase in the readership of Sunday papers, *after noticing which several editors changed their policy*.
Profits had to be increased, *to achieve which object became the main occupation of business executives*.

Two special types of appositional clauses should be noted here, because they provide common alternatives to sentential relative clauses. Both types contain a noun head modified by an adnominal relative clause:

(a) RESUMPTIVE clauses repeat as the noun head a word or a morphological variant of a word:

- She expressed her *belief* in the economic recovery of the country, *a belief that was well founded*.
The President *announced* that he would run for a second term, *an announcement that was acclaimed by most members of his party*.

(b) SUMMATIVE clauses provide as the noun head a word that summarizes the matrix clause:

- Norman may be pretending to be sick to avoid going to school, *a possibility that we cannot ignore*.

Relative words other than *which* are used to introduce sentential relative clauses. *Whereupon* ['after which', 'in consequence of which'] and *whence* ['from which', 'in consequence of which'] are formal:

- At the annual meeting, the parishioners severely criticized the minister, *whereupon he resigned*.
The army has been mobilized, *whence we may deduce that an invasion is imminent*.

The combinations *since when* ['since which time' <esp BrE>], *until when*, *from*

when, and by when are also used as sentential relatives:

She joined the editorial staff of a local newspaper, *since when she has contributed to various monthlies*. <esp BrE>

The status of the sentential relative clause is somewhat anomalous. Semantically it is similar to comment clauses that are content disjuncts; compare *which surprises me* in [3] above with the comment clause *what surprises me*. However, the *which*-clause cannot be initial, while the *what*-clause must be. On the other hand, it is similar to other nonrestrictive relative clauses in that it follows its antecedent and in that it can be most nearly paraphrased by a coordinate clause in which the *wh*-word is replaced by a demonstrative such as *that*; for example the relative clause in [4] can be replaced by *and that makes Colin and me double in-laws*, and the one in [6] by *and in that case there's no point in our waiting*.

Note [a] There are several archaic compounds with *where-* that introduce sentential relative clauses. They have the meaning 'in consequence of which' or 'after which': *whereafter*, *whereat*, *wherefore*, *wherewith*.

[b] The sentential relative clause is closest to the continuative nonrestrictive relative clause such as:

Tom lent the book to Sue, who lent it to Pat, who returned it to Tom. ['... and she lent it to Pat, and she returned it to Tom.']

[c] Although the sentential relative clause is generally fixed in final position, it is occasionally found in medial position in informal conversation:

Marvin and Terry – *which is something I'll never understand* – were quarrelling within a month of their marriage and were separated within three months.

Nonfinite and verbless adverbial clauses

The attachment rule for identifying the subject

15.58 In our discussion of the grammatical functions and semantic roles of adverbial clauses, we have frequently cited examples of nonfinite and verbless clauses. We conclude our discussion of adverbial clauses with a consideration of matters that particularly affect nonfinite and verbless clauses.

Nonfinite and verbless adverbial clauses that have an overt subject but are not introduced by a subordinator and are not the complement of a preposition are ABSOLUTE clauses, so termed because they are not explicitly bound to the matrix clause syntactically. Absolute clauses may be *-ing*, *-ed*, or verbless clauses, but not infinitive clauses:

No further discussion arising, the meeting was brought to a close. [1]

Lunch finished, the guests retired to the lounge. [2]

Christmas then only days away, the family was pent up with excitement. [3]

Apart from a few stereotyped phrases (cf Note [b] below), absolute clauses are formal and infrequent.

When a subject is not present in a nonfinite or verbless clause, the normal ATTACHMENT RULE for identifying the subject is that it is assumed to be identical in reference to the subject of the superordinate clause:

The oranges, *when (they are) ripe*, are picked and sorted mechanically. [4]

In *-ed* and verbless clauses with a subordinator such as [4], an ellipsis of the subject and operator may be postulated. In other cases, a paraphrase by a finite clause reveals that the subordinate clause subject is identical with the superordinate clause subject. The attachment rule is commonly given for participle clauses, but it applies equally to infinitive and verbless clauses:

Persuaded by our optimism, he gladly contributed time and money to the scheme. ['Since he was persuaded ...']

Driving home after work, I accidentally went through a red light. ['While I was driving home after work ...']

Confident of the justice of their cause, they agreed to put their case before an arbitration panel. ['Since they were confident ...']

To climb the rock face, we had to take various precautions. ['So that we could climb ...']

Note [a] As we see from the examples above, tense, aspect, and mood are also inferred in nonfinite and verbless clauses from the sentential context, cf 14.8.

[b] Stereotyped absolute clauses include *present company excepted*, *all told*, *weather/time permitting*, *God willing*.

Unattached nonfinite and verbless clauses

15.59 It is considered to be an error when the understood subject of the clause is not identifiable with the subject of the matrix clause, and perhaps does not appear in the sentence at all:

?*Driving to Chicago that night*, a sudden thought struck me. [1]

?*Since leaving her*, life has seemed pointless. [2]

?*Walking down the boardwalk*, a tall building came into view. [3]

In these examples the implied subject of the clauses is presumably *I*, but *I* does not occur as the subject of the matrix clauses. If we wish to keep the nonfinite clauses as they are, we rephrase the matrix clauses to introduce *I* as subject; for example:

Driving to Chicago that night, I was struck by a sudden thought. [1a]

Since leaving her, I have felt that life seemed pointless. [2a]

Walking down the boardwalk, I saw a tall building. [3a]

Clauses involved in this type of error, as in [1–3], are UNATTACHED clauses. Here are some further examples of unattached clauses:

?*After serving on several committees*, the association elected her their secretary-treasurer.

?*Friend of statesmen and patron of the arts*, many honours were bestowed on him.

?*While in a hospital near the school*, her teachers visited her regularly.

- ?To see the procession, I put the child on my shoulders.
 ?Being the eldest, the responsibility fell particularly on my shoulders.
 ?Although the latest model, they didn't like the car.
 ?Advised to study anthropology, his choice was psychology instead.
 ?An author of considerable distinction, people flocked to her public lecture.

The same error may occur when an *-ing* clause is the complement of a preposition:

?On reaching the summit, the view delighted us all.

As with [1-3], we can interpret correctly the implied subject in these sentences, but these unattached clauses are frowned upon. Such clauses are totally unacceptable if the sentence provides no means for identifying the implied subject:

- *Reading the evening paper, a dog started barking.
- *Using these techniques, a wheel fell off.
- *A result of the rise in prices, our economy is suffering.

Sometimes the error suggests an absurd interpretation:

- *Opening the cupboard, a skeleton fell out.
- *Grilled on charcoal, everyone enjoyed the fish they caught.
- *Having eaten our lunch, the steamboat departed.

The attachment rule does not apply, or at least is relaxed, in certain cases:

- (a) The clause is a style disjunct (cf 15.21), in which case the implied subject is the subject of the implied clause of speaking, normally *I*:

Putting it mildly, you have caused us some inconvenience.
 His moral principles, to be frank, begin and end with his own interests.
 To say the least, their techniques are old-fashioned.

- (b) The implied subject is the whole of the matrix clause:

I'll help you if necessary. ['... if it is necessary.']
 Unknown to his closest advisers, he had secretly negotiated with an enemy emissary. ['It was unknown to his closest advisers that ...']
 The siren sounded, indicating that the air raid was over. ['... which indicated that ...']

- (c) If the implied subject is an indefinite pronoun or prop *it* (cf 10.26), the construction is considered less objectionable:

When dining in the restaurant, a jacket and tie are required. ['When one dines ...']
 Being Christmas, the government offices were closed. ['Since it was ...']

To-infinitive clauses are normal in this use:

To borrow books from this library, it is necessary to register as a member of the library. ['For one to borrow ...']

- (d) In formal scientific writing, the construction has become institutionalized

where the implied subject is to be identified with the *I*, *we*, and *you* of the writer(s) or reader(s):

When treating patients with language retardation and deviation of language development, the therapy consists, in part, of discussions of the patient's problems with parents and teachers, with subsequent language teaching carried out by them.

To check on the reliability of the first experiment, the experiment was replicated with a second set of subjects.

Note [a] The error of unattached clauses has traditionally been discussed in connection with participle clauses, particularly *-ing* clauses. Other traditional terms for the error are 'unattached', 'unrelated', 'pendant', and 'dangling' participle.

[b] The acceptability of unattached clauses perhaps varies according to how easily the particular hearer or reader can perceive the implied subject. Participle forms that are lexicalized as conjunctions or prepositions are of course exempt from the attachment rule:

Provided that a film entertains, few people care about its merits.

Considering its cost, this machine is not worth buying.

[c] As-phrases are sometimes placed initially when they are related to an element in final position or to no element at all. They then resemble unattached clauses:

?As a protection against inflation, we must seek increasingly to diversify our investments.

?As a professor of political science, it has been interesting to spend a year in Germany.

[Presumably: '... I have found it interesting ...']

[d] *Due* to is generally accepted as a complex preposition synonymous with *owing to*. Some speakers, however, consider that *due* functions as an adjective in that collocation and therefore object to its use in [4] as an infringement of the attachment rule for verbless clauses:

?Due to bad weather, classes have been cancelled today. [4]

For those who object to [4], [4a] provides an acceptable alternative:

Cancellation of classes today is due to bad weather. [4a]

Supplementary clauses

- 15.60 When adverbial participle clauses and adverbial verbless clauses are not introduced by a subordinator, there may be considerable indeterminacy as to the semantic relationship to be inferred. Infinitive clauses, although they exhibit a number of semantic relationships, present no particular problem in this respect, but cf 17.31f.

In their indeterminacy, adverbial participle and verbless clauses resemble the versatile relationships expressed by nonrestrictive relative clauses (cf 17.23) and the connective function of the coordinator *and* (cf 13.22ff). They are all capable of assuming, according to context, a more precise role:

Jason, told of his son's accident, immediately phoned the hospital. [1]

Jason, who was told of his son's accident, immediately phoned the hospital. [2]

Jason was told of his son's accident, and he immediately phoned the hospital. [3]

For all three sentences, although the mode of clause connection does not make this explicit, we infer a temporal sequence of events. On the other hand, in the next three sentences we infer that the logical connection between the clauses is primarily one of reason, although there is also a temporal sequence:

John, knowing that his wife was expecting a baby, started to take a course on baby care. [4]

- John, *who knew that his wife was expecting a baby*, started to take a course on baby care. [5]
 John knew that his wife was expecting a baby *and he started to take a course on baby care*. [6]

In [7] the connection is one of reason without temporal sequence:

Julia, *being a nun*, spent much of her life in prayer and meditation. [7]

Sentences [1], [2], [4], [5], and [7] all contain subordinate clauses, but only [1], [4], and [7] are adverbial clauses, since they can be positioned initially, medially, and (except for [1]) finally.

Adverbial participle and verbless clauses without a subordinator are SUPPLEMENTIVE CLAUSES; like nonrestrictive relative clauses and clauses in an *and*-coordination, they do not signal specific logical relationships, but such relationships are generally clear from the context. Subjectless supplementary clauses, *ie* those that (unlike supplementary absolute clauses, cf 15.58) do not have their own overt subject, resemble nonrestrictive relative clauses in another respect: the implied subject in the supplementary clause provides a link with the matrix clause rather as the relative pronoun provides a link in postmodifying relative clauses. The formal inexplicitness of supplementary clauses allows considerable flexibility in what we may wish them to convey. According to context, we may wish to imply temporal, conditional, causal, concessive, or circumstantial relationship. In short, the supplementary clause implies an accompanying circumstance to the situation described in the matrix clause. For the reader or hearer, the actual nature of the accompanying circumstance has to be inferred from the context. Here are some illustrations of process adverbials:

- Using a sharp axe*, Gilbert fought his way into the building. ['By using a sharp axe, ...']
 Marilyn crawled through the narrow tunnel, *hands in front*.
 We spoke *face to face*.
 They stood silently, *their eyes fixed on the horizon*.
 Elizabeth dived in *head first*.
 They strolled through the park *with their arms intertwined*.

Note [a] Clauses introduced by *with* and *without* often convey little more than a vague notion of accompanying circumstance:

- With tears of joy in her eyes*, she saw her daughter married.
Without anyone noticing, I slipped out of the room.

[b] In *-ing* clauses, verbs used dynamically tend to suggest a temporal link, and stative verbs a causal link:

- Reaching the river*, we pitched camp for the night. ['When we reached the river, ...']
Being a farmer, he is suspicious of all governmental interference.
 ['Since he is a farmer, ...']

Subjectless supplementary clauses

15.61 The formal characteristics of subjectless supplementary clauses are:

- (a) They are participle or verbless clauses.

- (b) Their most typical positions in the superordinate clause are initial, final, and immediately after their antecedent, *ie* the noun phrase in the superordinate clause which is identical with their implied subject.

The position immediately after the antecedent poses the most difficulties for analysis. When subjectless supplementary clauses occur in that position, they may be indistinguishable from postmodifying participle clauses or (in the case of verbless clauses) from noun phrases in apposition. Thus the two constructions may merge in that it is impossible (and semantically unimportant) to decide whether the participle clause in [1] is to be regarded as functionally equivalent to the nonrestrictive relative clause in [1a]:

- This substance, *discovered almost by accident*, has revolutionized medicine. [1]
 This substance, *which was discovered almost by accident*, has revolutionized medicine. [1a]

Alternatively, it may be equivalent to a subjectless supplementary clause:

- Discovered almost by accident*, this substance has revolutionized medicine.

There are, however, two types which in general may be unambiguously labelled supplementary:

- (a) *-ing* clauses containing auxiliary verbs or the verb *be*:

- The children, *having eaten their fill*, were allowed to leave the table.
 The old man, *being of sane mind*, dictated and signed his will.

Such *-ing* clauses generally cannot be postmodifiers of noun phrases.

- (b) verbless adjective clauses:

- Lawson, *implacable*, contented himself with a glare of defiance.

Adjective clauses can, however, be nonrestrictive postmodifiers of noun phrases in certain circumstances:

- (i) if the clause is lengthy and contains weighty information:

- We took Joe, *unable to stand because of weakness*, to the nearest hospital.
 I met Betty, *angry with me as always*, at the luncheon.

Contrast:

- *We took Joe, *weak*, to the nearest hospital.
 *I met Betty, *angry*, at the luncheon.

- (ii) if the adjective can be object complement in the complementation of the superordinate verb:

- I found George, *unconscious*, a few hours later.

Contrast:

- *I treated George, *unconscious*, at the hospital.

In initial position, the clauses are unambiguously subjectless supplementary clauses. For supplementary clauses in final position, cf 15.62.

Supplementive clauses in final position

- 15.62 In spite of their resemblance to nonrestrictive relative clauses, supplementive clauses need not be separated from their matrix clause intonationally when they occur in final position. The following are therefore alternative renderings of the same sentence, differing only in that [1] has two focuses of information, whereas [2] has only one:

The manager *APPROACHED* us, *SMILING*. [1]
 The manager approached us *SMILING*. [2]

One result of the alternative shown in [2] is the possible neutralization of the formal difference between nonfinite clauses functioning as supplementive clauses and those functioning as complementation of the verb. Thus [3] is ambiguous:

I saw Pam going home. [3]

On one interpretation (that of the supplementive clause), *I* is the implied subject of *going home*, whereas on the other (that of verb complementation), *Pam* is the overt subject.

Another result of the lack of intonation is illustrated in [4] and [5]. When the *-ing* participle immediately follows certain finite verbs with existential meaning, the latter seem close to being aspectual catenatives (cf 3.49):

Frank *sat reading* the newspaper. [4]
 Edith *came running* towards us. [5]

Further, a sentence such as [6] is ambiguous in more than one way:

I caught the boy *waiting for my daughter*. [6]

In addition to the two possible structures of [3], this may be interpreted as having a third structure, in which the nonfinite clause is a postmodifying clause:

'I caught the boy while I was waiting for my daughter.' [supplementive clause]
 'I caught the boy in the act of waiting for my daughter.' [verb complementation]
 'I caught the boy who was waiting for my daughter.' [postmodification]

On the analogy of [2], we may identify the final adjective phrases of the following examples (where there is no intonational separation) as verbless supplementive clauses:

The manager approached us *full of apologies*. [7]
 He drove the damaged car home *undismayed*. [8]

In each, the adjective phrase is in a copular relationship with the subject of the sentence, and is thus distinct from an object complement, which would be in a copular relationship with the direct object. Furthermore, an object complement could not normally be placed in initial position, whereas that position is perfectly natural for [7] and [8]:

Full of apologies, the manager approached us. [7a]
Undismayed, he drove the damaged car home. [8a]

Adjective phrases in final position that cannot be preposed are generally nonrestrictive postmodifiers of the preceding noun phrases (cf 15.61 for medial nonrestrictive postmodifiers), even though they are separated intonationally from the rest of the sentence:

The cows contentedly chewed the grass, *green and succulent after the rain*. ['which was green and succulent . . .']
 The drill quickly penetrated the layer of rock, *loose and crumbly with years of weathering*.

Noun phrases in final position that cannot be preposed are generally appositives of the preceding noun phrases:

Shirley sent us a gift, *a box of chocolates*.

There is a gradient relating the functional categories of subject complement and restrictive adjunct (cf 15.23) realized by a verbless supplementive clause. We therefore find sentences in which the final phrases cannot be preposed (at least without changing the meaning), because they are on the gradient towards subject complement status:

They ended the season *bottom of the league*.
 He came out of prison *a changed man*.
 He began life *a Protestant*.
 She emerged from the conflict *victorious*.

Note Prepositional phrases that may be construed as subject complement can also be viewed on the gradient between adverbial and complement (cf 10.11):

They ended the season *at the bottom of the league*.
 He began life *as a Protestant*.
 She emerged from the conflict *with a clear victory*.

Comparative clauses

- 15.63 In a comparative construction, a proposition expressed in the matrix clause is compared with a proposition expressed in the subordinate clause with respect to some STANDARD OF COMPARISON:

Jane is as healthy *as her sister (is)*. [1]

The standard of comparison in [1] is health.

Broadly conceived, comparison includes comparisons of EQUIVALENCE (cf 15.71), as in [1], and comparisons of SUFFICIENCY and EXCESS (cf 15.72ff), as in [2] and [3]:

Don is *sensitive enough to understand your feelings*. [2]
 Marilyn was *too polite to say anything about my clothes*. [3]

More narrowly considered, however, comparison concerns a standard measurable in terms of degree that is expressed by means of the correlative sequence *more*, *less*, or other comparative forms (cf 7.74ff) in the matrix clause, together with *than* in the subordinate clause. Such comparisons are COMPARISONS OF NONEQUIVALENCE:

Jane is $\left\{ \begin{array}{l} \text{more healthy} \\ \text{healthier} \\ \text{less healthy} \end{array} \right\}$ than her sister (is). [4]

The clause element in the matrix clause which specifies the standard of comparison (health in [1] and [4]) is the COMPARATIVE ELEMENT (abbreviated in our further discussion to 'comp-element'), in [1] and [4] as *healthy*, *more healthy*, *healthier*, *less healthy*. The BASIS OF COMPARISON is given in the COMPARATIVE CLAUSE, the correlative subordinate clause; it is Jane's sister in [1] and [4]. The basis of comparison need not be overtly expressed, but it is then implied from the context.

Comparative clauses of nonequivalence, equivalence, and excess may include nonassertive forms (cf 10.60):

They pleased me more than they can in any way imagine.
You have as much right to vote as you ever had.
I am too young to remember any of the events during the last war.

Note An alternative term for equivalence is 'equality'. Other terms for nonequivalence are 'inequality' and 'differentiation'.

The comp-element

15.64 We may imagine the semantics of the comparative construction arising from the answers [1a] and [1b], and [2a] and [2b] to the *how*-questions posed in [1] and [2]:

How old is Mary (compared with Jane)? [1]
How old is Jane (compared with Mary)? [2]
Mary is *older* than Jane (is). [1a]
Mary is *younger* than Jane (is). [1b]
Jane is *younger* than Mary (is). [2a]
Jane is *older* than Mary (is). [2b]

Of the four answers, [1a] and [2a] are synonymous, being converses of each other; and similarly [1b] and [2b]. Less frequently, comparison is expressed through *less*, which indicates a tendency to the negative pole of the standard of comparison:

Mary is *less old* than Jane (is). [1c]
Mary is *less young* than Jane (is). [1d]

Again, paraphrase relationships hold: [1c] is synonymous with [1b] and [2b], and [1d] with [1a] and [2a]. Sentences like [1d], in which the marked member of the pair of adjectives (cf 7.88) is combined with *less*, are rare. Sentences like [1c] are not common when the adjective is inflected for comparison rather than taking periphrastic *more*.

With other adjectives comparison with *less* is common enough when there is not an established pair of antonymous adjectives or when an available antonym sounds offensive:

Caroline is *less perceptive* than Rosemary (is). [3]
Violet is *less sophisticated* than Felice (is). [4]

Or a comparison of equivalence in the negative is substituted (cf 15.71):

Caroline is *not as/so perceptive* as Rosemary (is). [3a]
Violet is *not as/so sophisticated* as Felice (is). [4a]

Both types of comparison seem clearer than *more* with a negative adjective:

Caroline is *more imperceptive* than Rosemary (is). [3b]
Violet is *more unsophisticated* than Felice (is). [4b]

In the comparative constructions in [1a–1d], the comp-element (italicized) together with *than* forms a hinge by which the two *wh*-elements of the questions [1] and [2] could be said to be combined. This coalescence accounts for the appearance of defective structure in the comparative clause. For example, in [1a] the comparative clause *than Jane (is)* contains (optionally) a form of the verb *be*, but not a complement or adjunct such as the verb *be* normally requires for complementation. Some grammarians have postulated an omitted repetition of the standard of comparison in the comparative clause: *Mary is older than Jane is (old)*. But we do not follow this analysis. In the first place, the full form suggests that Jane is old and Mary even older. And obviously this is not necessarily the case for the comparative construction: both Mary and Jane may be babies. The standard of comparison involves a scale without commitment to absolute values. Furthermore, a comparative clause element corresponding to the comp-element in the matrix clause can occur only when the standards of comparison in the two clauses are different, two scales then being compared: *Mary is cleverer than Jane is pretty*. Further structural gaps arise through the optional ellipsis of other elements in the comparative clause, as discussed in 15.66ff.

More and the inflectional variant in *-er* are the typical COMPARATIVE ITEMS within comp-elements. We therefore use them to exemplify comparative constructions in the sections that follow.

Note [a] Constructions with *more ... than* and *less ... than* do not necessarily introduce comparative clauses. There is a type of nonclausal comparison in which *than* is followed by an explicit standard or yardstick of comparison, normally a noun phrase of measure, or a noun phrase implying degree:

I weigh *more than 200 pounds*.
It goes *faster than 100 miles per hour*.
The strike was nothing *less than a national catastrophe*.

Here *than* is best considered a preposition, and the phrase which follows it a prepositional complement, since there is no possibility of expanding the *than*-phrase into a clause:

*It goes *faster than 100 miles per hour goes*.

[b] There is a second type of *more ... than* construction not introducing a comparative clause. This is the quasi-coordinative type of construction illustrated by:

$\left\{ \begin{array}{l} \text{I was more angry than frightened.} \\ \text{I was angry more than frightened.} \end{array} \right\}$ ['It is more true to say that I was ...']

A distinguishing characteristic of this construction is the nonoccurrence of the suffixal form of comparison:

*I was angrier than frightened.

[c] The negative comparative clauses *more often than not* and *more likely than not*, with the pro-clause *not*, are idioms that occur quite frequently:

He was found out *more often than not*. ['More often than he was not found out.']

She was satisfied with her job *more likely than not*.

It is sometimes preposed:

More likely than not, she was satisfied with her job.

Otherwise negative comparative clauses are rare, because we have little occasion to use them.

Clause functions of the comp-element

15.65 Like the *wh*-element of a *wh*-question (cf 11.15), the comp-element of a comparative construction can be any of the clause elements, apart from the verb:

S: *More people* use this brand than (use) any other window-cleaning fluid.

O_d: She knows *more history* than most people (know).

My grandparents gave me *more money* than my parents (did).

O_i: That toy has given *more children* happiness than any other (toy) (has).

C_s: Lionel is *more relaxed* than he used to be.

C_o: She thinks her children *more obedient* than (they were) last year.

A: You've been working *much harder* than I (have).

Ann treats the children *more harshly* than George (does).

The comp-element may also be a prepositional complement:

She's applied for *more jobs* than Joyce (has (applied for)).

Like *wh*-elements of various kinds (cf 11.18), the comp-element may represent a pushdown element within a nominal *that*-clause subordinate to the comparative clause:

Derek caught *more fish* than I expected ((that) he would (catch)).

She is *better* than she thinks ((that) she is).

I felt *more miserable* than I can say ((that) I felt).

or within a subordinate *to*-infinitive clause:

You arrived *earlier* than (it was) necessary (for you to arrive).

Ellipsis in comparative clauses

15.66 Ellipsis of a part of the comparative clause is likely to occur when that part is a repetition of something in the matrix clause. Since it is normal for the two clauses to be closely parallel both in structure and content, ellipsis is the rule rather than the exception in comparative constructions. However, there is no necessary parallelism between the matrix and comparative clauses; the comparative clause, so long as it overlaps with the content of the matrix clause in respect of the comp-element, can be of independent structure. Thus we may take two *how*-questions of disparate clause types (*SV* and *SVO*) in [1] and [2] and use them to construct the comparative construction in [3]:

How quickly does he speak?

[1]

How quickly can his secretary take dictation?

[2]

He speaks more quickly than his secretary can take dictation.

[3]

The most characteristic type of comparative clause, on the other hand, is one which imitates the structure of the matrix clause, and repeats its whole content except for one element, the differing elements providing the contrast. This type of clause, as we see below, allows optional ellipsis and optional substitutions by pronouns and by pro-predication:

James and Susan often go to plays but

(i) James enjoys the theatre more than Susan enjoys the theatre.

(ii) James enjoys the theatre more than Susan enjoys it.

(iii) James enjoys the theatre more than Susan does.

(iv) James enjoys the theatre more than Susan.

(v) James enjoys the theatre more.

Ellipsis of the object generally cannot take place unless the main verb too is ellipsed, as in (iii) and (iv), where there is a choice between the retention of an operator and its omission:

*James enjoys the theatre more than Susan enjoys.

But if the object is the comp-element itself, then in addition to (i-v) the verb alone may be retained:

James knows more about the theatre than Susan *knows*.

Compare also the corresponding pseudo-cleft construction:

What James knows about the theatre is more than Susan knows.

The subject is omitted in the comparative clause below:

You spent more money *than was intended to be spent*.

The omission suggests that *than* is functioning like a relative pronoun. Compare:

You spent the money *that was intended*.

Cf also *as is common knowledge*, 15.55.

Note [a] Infinitive clauses with a pushdown element (cf 11.18) can be ellipsed fully or alternatively only the infinitive verb and what follows it can be ellipsed, leaving a stranded *to* (cf 12.64):

She enjoyed it much more than I expected (her to (enjoy it)).

They did more than we made them (do).

The verb *be* alone, however, cannot be so easily ellipsed in this context:

She was more beautiful than I imagined her *to be*.

[also: than I imagined *or* than I imagined her]

They wanted to be more playful than I let them *be*.

[b] *Different than* is a widely acceptable (esp AmE) sequence when a clause (particularly an elliptical clause) follows:

Schools are different than they used to be.

They are playing in a very different way than (they played) before.

There are, however, widespread objections to *different than* when only a noun phrase follows, on the grounds that *than* is inappropriate in contexts where it can be viewed as a preposition:

?Films are very different than plays.

Different from is the preferred form. Cf further 16.74.

Ambiguity through ellipsis

- 15.67 When normal ellipsis is taken to its fullest extent, we are often left with no more than the subject or object of the comparative clause:

I speak Greek better than *you* (speak Greek).

The photographs disappointed my parents more than (they disappointed) *me*.

Ambiguity can arise as to whether a remaining noun phrase is subject or object:

He loves his dog more than his children.

The above example could mean either [1] '... than his children love his dog' or [2] '... than he loves his children'. If *his children* is replaced by a pronoun, formal English makes the distinction:

He loves his dog more than *they*. [1]
He loves his dog more than *them*. [2]

In other styles, however, the objective case *them* is used for both [1] and [2]. Prescriptive grammar requires the subjective case in [1], both on grammatical grounds (that *they* is the subject of the elliptical clause) and on grounds of clarity, since it preserves a useful distinction that can occasionally avoid potential ambiguity. On the other hand, we may account for the use of the objective pronoun for [1] in other styles by pointing out that as *than* in this construction may be considered a preposition (cf 15.64 Note [a]), the pronoun falls within object territory (cf 6.5). Since both forms can be criticized (on account of stiffness on the one hand, and 'bad grammar' on the other), and since in any event we cannot be sure that the objective case in [2] represents choice in formal style and is therefore unambiguous, we may wish to evade a choice by expanding the clause (*than they do*; *than he does them*).

Multiple and partial contrasts

- 15.68 If the two clauses in a comparison differed solely in the comp-element (**I hear it more clearly than I hear it*), the comparison would of course be nonsensical; therefore, a contrast of at least one variable is required between the two clauses. While the single-variable comparison is the most common type, more than one clause element can be contrasted. For example, there are two contrasts in:

¹James knows ²more about ¹films than ²Susan does about ¹music.

Even three-variable and four-variable comparisons are possible:

¹Walter ²played the ³piano more skilfully than ¹his brother ²conducted the orchestra.

¹Walter ²played the ³piano more often in ⁴Chicago than ¹his brother ²conducted ³concerts in the ⁴rest of the States.

On the other hand, the contrast may affect only part of a clause element. For example, the verbs may be lexically identical and differ only in tense or in the addition of a modal auxiliary. In such cases it is normal to omit the rest of the comparative clause after the auxiliary:

I hear it more clearly than I *did*. ['than I used to hear it']

I get up later than I *should*. ['than I should get up']

If the contrast lies only in tense, it may be expressed in the comparative clause solely by an adverbial:

She'll enjoy it more than (she enjoyed it) last year.

This provides the basis for the total ellipsis of the subordinate clause in examples like:

You are slimmer (than you were).

You're looking better (than you were (looking)).

The only contrast may be in the modality expressed in the main clause or through a pushdown comp-element in the comparative clause (cf 15.65):

He's a greater painter than people suppose (he is).

She thinks she's fatter than she (really) is.

The comp-element itself may contain a partial contrast without the pushdown device:

She is a *better* psychologist than ((she is) a) *pathologist*.

The house is *much* taller than it is *wide*.

When the contrast involves two points on the same scale, one higher than the other, the part following *than* cannot be expanded into a clause. *Than* is then functioning as a preposition in a nonclausal comparison (cf 15.64 Note [a]):

It's hotter than just warm. (cf It's hotter than 90°.)

He's taller than tall.

She's wiser than merely clever.

She became prettier than just middling pretty.

We drove farther than (beyond) Chicago.

They fought harder than that.

We have to build it stronger than this.

When the contrasts are not on precisely the same semantic scale, the construction is comparative and can be expanded:

He's more shrewd than (he is) clever.

(*He's more shrewd than clever* can also be the quasi-coordinative type, 'He's shrewd rather than clever', cf 15.64 Note [b]).

It is perhaps the existence of this nonclausal comparison of degree that makes it necessary to repeat the subject and verb in sentences such as *The house is much taller than it is wide*, since **The house is much taller than wide* would suggest the absurdity of a semantic overlap between *tall* and *wide*. The

quasi-coordinative type, however, allows semantic disparity: *It's a big house, but more tall than wide* ['tall rather than wide'].

Note [a] There is a restriction on the partial contrast in the verb element. It is acceptable to say:

I stared at her more often than I $\begin{cases} \text{should (have).} \\ \text{should have done. } \langle \text{BrE} \rangle \end{cases}$

But it is odd to use the simple present or future *shall/will* alone as the partial contrast in the comparative clause:

*I liked her better than I *do*.

*Tom saw Betty more often than he *will*.

We need to add a temporal adverbial to point the contrast:

I liked her better than I *do now*.

Tom saw Betty more often than he *will in the future*.

[b] Analogous to the nonclausal comparison exemplified in *It's hotter than just warm* is another type of nonclausal comparison expressed by *more than* followed by one of a range of syntactic units:

I am *more than happy* to hear that.

He *more than complained*; he threw the whole book of rules at me.

They were *more than slightly wounded*.

She behaved *more than fairly* to him.

Semantically, *more than* expresses a higher degree, but it also conveys a comment on the inadequacy of the linguistic expression. For example, the last sentence could be rephrased '*Fairly* is an inadequate word to describe the way she behaved to him'.

[c] The contrast between the two clauses is, exceptionally, positive versus negative in the idioms *more often than not* and *more likely than not* (cf 15.64 Note [c]).

[d] There are two other contexts in which the comparative clause is omitted. One is where there is anaphoric reference to an implied or actual preceding clause or sentence:

I caught the bus from town; but Harry came home even *later*. [*ie* 'later than I came home']

The other is where the reference is to the extralinguistic situation:

You should have come home *earlier*. [*ie* 'earlier than you did']

Functions of comparative *more*

15.69 The comparative item (which, for present purposes, we identify with the word *more*) may have seven different functions within the comp-element:

- (i) determinative (cf 5.10ff):
Isabelle has *more books* than her brother (has).
- (ii) head of a noun phrase:
More (of my friends) are in New York than (are) here.
- (iii) subjunct (cf 8.88ff):
I agree with you *more* than ((I agree) with) Robert.
- (iv) modifier of an adjective head:
The article was *more objective* than I expected (it would be).
- (v) modifier of a premodifying adjective:
It was a *more heated discussion* than we thought it would be.
- (vi) modifier of an adverb:
The time passed *more quickly* than (it passed) last year.
- (vii) modifier of a premodifying adverb:
I am *more severely handicapped* than you (are).

In each of the above examples, the whole comp-element is in italics. It will be noticed that in some cases *more* can constitute the whole of the comp-element. *More* is a determiner in (i), a pronoun in (ii), and an adverb in all the others.

In functions (i) and (ii), *more* refers to quantity and can be replaced in count contexts by *a greater number of*, as in the first two sentences above, and in noncount contexts by *a greater amount of*.

Function types (iv) and (v) have to be distinguished because of the semantic implications of (v). Consider:

There are more intelligent monkeys than Herbert. [1]

In [1] we normally imply that Herbert is a monkey of a certain level of intelligence (cf: *How intelligent a monkey is Herbert?*). That is, by placing the comparative adjective before the noun, we imply that the noun is part of the comp-element and therefore is also implied in the comparative clause. On the other hand, by placing the comparative adjective after the noun, we readily admit the more plausible interpretation that Herbert is a man:

There are monkeys more intelligent than Herbert.

This difference of meaning accounts for the insult implied in:

I've never met a more intelligent monkey than our Chairman.

The same distinction applies to the difference between (vi) and (vii):

I've never seen a dog more obviously friendly than your cat.

*I've never seen a more obviously friendly dog than your cat.

This last sentence is semantically unacceptable because it implies that the dog is a cat.

The normal position for the adjective phrase is shown in the example for (v), but it can also be preposed [2], or (less usually) postposed [2a]:

It was *more heated* a discussion than we thought it would be. [2]

It was a discussion *more lively* than we thought it would be. [2a]

The adverb phrase in (vii) can also be postposed:

I am handicapped *more severely* than you (are).

Note [a] In its determinative function in (i) or as modifier of an adjective in (iv), *more* is the comparative of the quantifiers *many* or *much*. Thus, *more expensive clothes* is ambiguous in:

Morton has more expensive clothes than I have.

In one interpretation *more* modifies *expensive*, the adjective phrase then being comparative; in the other interpretation *more* determines the noun phrase ('a greater quantity of expensive clothes').

[b] The modifying sequences *more of a ...* and *less of a ...* occur with gradable singular or noncount noun heads:

He's more of a fool than I thought (he was).

It was less of a success than I imagined (it would be).

Cf the *how*-question, *How much of a fool is he?* ['To what an extent is he (in your view) a fool?']

[c] The comparative items *more*, *-er*, and *less* cannot be used in a definite noun phrase in the comparative construction:

*Sally has the better radio than Daniel (has).

Contrast:

Sally has the better radio (of the two).

In certain contexts we can use *compared with* or *relative to* instead:

The superior reception of Sally's radio accounts for its higher price tag *compared with* that for Daniel's radio.

Contrast:

Sally's radio has a higher price tag than Daniel's (radio) (has).

[d] The determiner *other* is used as a comparative item:

I don't have any *other cups* than those ((that/which) I have) in the sink.

It can be (less usually) postposed:

I don't have *cups other* than those ((that/which) I have) in the sink.

- 15.70 When *more* is a determinative or a head of a noun phrase – functions (i) and (ii) in 15.69 – the unit *no more* (...) *than* is synonymous with *only as many* (...) *as* in countable contexts or with *only as much* (...) *as* in noncountable contexts:

Paul has no more friends than I have. ['... only as many as ...']

I have no more money than you have. ['... only as much as ...']

Ted got no more (of the votes) than he needed. ['... only as many as ...']

She said no more than we expected. ['... only as much as ...']

But when *more* is an adverb (or its inflectional variant *-er* is used), as in the other function types in 15.69, *no more ... than* has special implications. Consider:

Rachel is no more courageous than Saul (is).

The sentence implies that both Rachel and Saul are not courageous ('Rachel is not courageous, any more than Saul is courageous'). Here are some further examples:

Tom is no more athletic than he ever was. ['Tom is not athletic, any more than he ever was athletic.']

I can no more apologize than I could kneel to them.

I would no more think of hitting a student than I would a policeman.

No more ... than has the same meaning when *more* modifies a gradable noun:

She is no more a fool than you (are). ['She is not a fool, any more than you are', 'She is not more foolish ...']

They are no more scholars than my baby (is). ['They are no more scholarly ...']

The rhetorical effect of the construction is not so much to make a comparison as to intensify the negation. That effect is most obvious when the comparison is absurd (cf rhetorical *if*-clauses, 15.37):

He's no more your friend than I'm your mother.

Not any more (...) *than* is an emphatic variant of *no more ... than*:

Paul hasn't any more friends than I have. ['only as many as ...']

Rachel isn't any more courageous than Saul (is). ['Rachel isn't courageous, any more than ...']

Not more ... than, on the other hand, is different from both *no more ... than* and *not any more ... than* when *more* is an adverb or modifies a gradable noun:

Rachel is not more courageous than Saul (is).

This last sentence allows for the possibility that Rachel is less courageous than Saul. It may also be merely a denial sentence in response to *Rachel is more courageous than Saul* (is).

Similar distinctions apply to *no less* (...) *than*, *not any less* (...) *than*, and *not less* (...) *than*, except that the double negative is less common and as a consequence the distinctions are somewhat blurred.

Comparisons of equivalence: *as ... as*

- 15.71 Broadening our discussion of comparison, we take into account not only comparisons of nonequivalence (lack of equivalence on some scale) such as those expressed by *more* and *less*, but also comparisons based on other relationships. One such relationship is that of equivalence, expressed principally by the correlatives *as ... as*.

The *as ... as* construction is grammatically parallel to the *more ... than* construction, except that the *as*-paradigm lacks the determinative, pronoun, and subjunct functions of *more*; these gaps are filled by *as many* (count) and *as much* (noncount). We can therefore parallel the functions of *more* listed in 15.69, substituting *as many* and *as much* where necessary:

(i) determinative: Isabelle has *as many books* as her brother (has).

(ii) head of a noun phrase: *As many of my friends* are in New York as (are) here.

(iii) subjunct: I agree with you *as much* as ((I agree) with) Robert.

(iv) modifier of an adjective head: The article was *as objective* as I expected (it would be).

(v) modifier of a premodifying adjective: It was *as lively a discussion* as we thought it would be.

(vi) modifier of an adverb: The time passed *as quickly* as (it passed) last year.

(vii) modifier of a premodifying adverb: I am *as severely handicapped* as you (are).

The reason for differentiating (iv) and (v) and also (vi) and (vii) are the same as in the *more ... than* construction (cf 15.69). Contrast *I've never seen a dog as friendly as your cat* with the unacceptable **I've never seen as friendly a dog as your cat*.

Notice that the adjective phrase precedes the determiner in (v). The phrase can also be postposed (cf 15.69):

It was a discussion *as lively as* we thought it would be.

The adverb phrase in (vii) can also be postposed:

I am handicapped *as severely as* you (are).

There are parallels between a positive *as ... as* sentence and negative *more ... than* and *less ... than* sentences:

Caesar was *as ruthless as* Attila. [1]

Attila was *not more ruthless than* Caesar. [2]

Caesar was *not less ruthless than* Attila. [3]

But they are not exactly synonymous, since [2] allows the possibility that Attila was less ruthless and [3] that he was more ruthless. Similar parallels exist between a negative *as ... as* sentence and positive *more ... than* and *less ... than* sentences, but the negative *as ... as* sentence (eg: *Caesar was not as ruthless as Attila*) encourages the interpretation of *less ... than*, though a heavy stress on the first *as* allows the interpretation of *more ... than* (eg: *Caesar was not as ruthless as Attila; indeed, he was more ruthless*).

In negative superordinate clauses, *as ... as* can be replaced by *so ... as*, especially when there is total or considerable omission in the subordinate clause:

He's not as naughty as he was.

He's not so naughty as he was.

He's not so naughty (now).

Some prefer to use *so ... as* with negative clauses. But for some people *so* tends to carry the absurd implication of a possibility that is then negated, and they therefore find it odd to say:

(?)Her baby is not so old as I thought.

The reason is that for them the sentence implies that a baby can be old. In other words, an unmarked term *old* (cf 7.88) cannot be used in this context to cover the whole scale.

The first *as* in the *as ... as* construction is sometimes omitted in two contexts: (a) after a copular verb; (b) where a copular verb is implied.

(a) The omission of *as* tends to occur particularly in more informal style, especially if only a noun phrase follows. The single *as* provides a less emphatic comparison and is closer to *like* when *as* is followed by a noun phrase:

They were good as gold while you were away.

At the sight, she turned pale as a ghost.

You look pretty as ever.

In informal speech the subject complement may be fronted as in [4], or it may be initial because the subject and copula are ellipted, as in [5]:

White as snow, it was. [4]

Proud as ever, isn't he? [5]

(b) In a rather literary style, the first *as* may be omitted in verbless and subjectless supplementary clauses:

Lawson, implacable as ever, contented himself with a glare of defiance. [6]

Cautious as the rest of her family, she would not give an immediate reply to my question. [7]

He climbed over the wall and dropped onto the ground on the other side, agile as a cat. [8]

The addition of a verb (where that is possible) would convert the clause

into a finite concessive or circumstantial clause with fronting of the subject complement (cf 15.39, 15.47):

Cautious as the rest of the family was, she seemed willing to give an immediate reply to my question.

Note [a] Count *as many (...) as* and noncount *as much (...) as* are equivalent to *more (...) than* when they are premodified by a *times*-phrase:

= Five times as many people came to the demonstration as (did) last time.

= Five times more people came to the demonstration than (did) last time.

= I paid three times as much for the meal as they did.

= I paid three times more for the meal than they did.

Other lexical comparatives can also be used:

= The Gross National Product is four times as much/high as (it was) a decade ago.

= The Gross National Product is four times more/higher than (it was) a decade ago.

Twice is used with *as many as* or *as much as* rather than with *more*.

Fractions are also used in the *as many (...) as* and *as much (...) as* constructions:

We have a third as many students in our class as we had last term. ['a third of the number']

I paid half as much for the meal as they did. ['half the price']

When *again* is added, the meaning is equivalent to *more (...) than*:

= Houses cost a third as much again this year as they did five years ago.

= ['The price is one third higher.']

= Houses cost one third more this year than they did five years ago.

= ['Houses cost a third more.']

= There were a third as many arrests again for assault this year as there were last year.

= There were a third more arrests for assault this year than there were last year.

But there is uncertainty and divided usage with the constructions when *again* is added. Some speakers find percentages odd in these constructions:

They cost { 50 per cent as much
?50 per cent as much again } as last year.

[b] The construction analogous to *more of a ... than* (cf 15.69 Note [b]) is *as much of ... as*:

It was as much of a success as I had imagined it would be.

He's as much of a fool as I thought (he was).

Analogous to *less of a ... than* is *as little of a ... as*:

It was as little of a success as I had imagined it would be.

There are no such constructions for plural nouns.

[c] *As ... as* is used like *more ... than* and *less ... than* in a nonclausal comparison containing an explicit standard of comparison after the second *as* (cf 15.64 Note [a]):

The car goes as fast as 100 miles an hour.

A reliable quartz watch can cost as little as ten dollars.

He drinks as many as three bottles of milk a day.

Our factory consumes as much as 500 tons of solid fuel per week.

Comparisons of sufficiency and excess

15.72 Comparative clauses of sufficiency and excess combine the notions of sufficiency or excess with the notions of purpose (cf 15.48) or result (cf 15.49). They differ from comparative clauses of nonequivalence and equivalence (cf 15.63ff) in that they do not match the matrix clause in terms of identical and contrasting elements, and therefore they do not lend themselves to ellipsis. Their structure is relatively independent of the structure of the matrix clause.

Enough and too

- 15.73 One type of comparative construction contains a word or phrase expressing the notion of sufficiency or excess followed by a *to*-infinitive clause of purpose, result, or condition (cf 15.34 Note [g]). The most common word for sufficiency is *enough* (as adverb, determiner, or pronoun) and the most common word for excess is the adverb *too*. Here are some examples of this type of comparison:

You're old *enough to look after yourself*. ['... so that you can look after yourself.']
 I'm *much too* tired *to go out*. ['... with the result that I won't go out.']
 Your teacher was *excessively* generous *to give you an A*. ['... if he gave you an A.']
 They must be *pretty* cruel *to do that*. ['... if they do that.']
 They worked *enough to be hungry*.
 He protested *too much to be sincere*.
 This coat is just the *right* length *to fit you*.
 There was *enough* food *to feed an army*.
 She knows *enough* about the topic *to explain it to you*.
 Four thousand dollars is an *excessive* amount *to charge even for a luxury cruise like this*.
 There isn't *sufficient* milk *to give everybody some*.

Paraphrase pairs may be constructed with antonymous items, in which one sentence is positive and the other negative; one sentence has *enough* or one of its synonyms, and the other *too* or one of its synonyms:

- = { They're rich enough to own a car.
 They're not too poor to own a car.
 = { The book is sufficiently simple to understand. <formal>
 The book is not excessively difficult to understand. <formal>

If the context allows, the infinitive clause may be omitted. *Sufficient(ly)* and *excessive(ly)* are more formal synonyms of *enough* and *too*.

The negative force of *too* is shown in the use of nonassertive forms (cf 10.60f). Contrast:

She's *old enough* to do some work. ['She is old enough so that she can do some work.']
 She's *too old* to do any work. ['She is so old that she can't do any work.']

Here are further examples of *too* followed by nonassertive forms:

He's *too weak* to help you at all.
 She's *too polite* to ever say anything like that.

The infinitive clause may also contain a subject:

It moves *too quickly for most people to see* (it).
 The television in the apartment above was loud enough *for us to hear* (it).
 My ambitions are modest enough *for me to fulfil* (them).
 He was old enough *for us to talk to* (him) seriously.

Her parents are sufficiently generous *for her to take a long vacation abroad at their expense*.

As the first four of these examples indicate, a direct object or the object of a prepositional verb in a *to*-infinitive clause may be omitted or retained if it substitutes for the superordinate subject. When there is no subject in the infinitive clause, it is identified with the superordinate subject or with an indefinite subject:

She writes quickly enough *to finish the paper on time*. ['for her to finish the paper on time']

The knife is sharp enough *to carve the turkey*. ['for it to carve the turkey']

And there may be ambiguity as to which identification to make:

She was too young *to date*. ['... to date others' or 'for others to date her']

When the subject of the superordinate clause is agentive (cf 10.19), it may be redundantly repeated:

She writes quickly enough *for her to finish the paper on time*.
 She's too polite *for her to ever say anything like that*.

A: Will John lend me money?

B: John's much too mean *for him to lend you money*.

That optional redundancy (sometimes justifiable for emphasis) parallels the optional redundancy that we have just observed for a direct object or prepositional object. The infinitive may be passive in form:

The writing is too faint *to be read*.

In that case the implied subject is identical with the superordinate subject and it is either the implied agent known from the situational context or previous linguistic context or it is indefinite ('to be read by anyone'). But the infinitive may be active without a subject or object (cf Note [b]):

The writing is too faint *to read*. ['for anyone to read']
 The food is good enough *to eat*.

When neither subject nor object is expressed in the infinitive clause, ambiguity is possible with verbs that may be used transitively.

She is friendly enough $\left[\begin{array}{l} \text{(for others)} \\ \text{(for her)} \end{array} \right]$ to help $\left[\begin{array}{l} \text{(her).} \\ \text{(others).} \end{array} \right]$

The lamb is too hot $\left[\begin{array}{l} \text{(for us)} \\ \text{(for it)} \end{array} \right]$ to eat $\left[\begin{array}{l} \text{(it).} \\ \text{(anything).} \end{array} \right]$

He is too good a person $\left[\begin{array}{l} \text{(for others)} \\ \text{(for him)} \end{array} \right]$ to swindle $\left[\begin{array}{l} \text{(him).} \\ \text{(others).} \end{array} \right]$

As we see from the last example, when an adjective phrase modified by *too* in turn modifies a singular count noun, the phrase precedes the indefinite article (cf 15.71: *as lively a discussion as ...*). There is no plural or noncount equivalent for this construction. Instead, we have to postpose the adjective phrase: *It's food too good to throw away; They are persons too good to swindle*.

The same problem does not arise with *enough*, which is usually a postmodifier; but *enough* usually premodifies when it is a determinative: *We have enough money to last*.

- Note [a] There is a threefold ambiguity in *It's too hot to eat*. Two of the meanings have been illustrated above: *The lamb is too hot (for it to eat (anything))* and *The lamb is too hot (for us/me/anyone) to eat (it)*. In the third meaning it is the prop-*it* used as a subject to refer to the weather. Both a subject and a direct object can then be supplied: *It is too hot (for anyone) to eat (anything)*.
 [b] Traditionally, grammarians have regarded the infinitive clause in *The writing is too faint to read* as having a passive meaning ('to be read'), but we analyse it as having an unexpressed subject and object ('for anyone to read the writing').
 [c] The constructions *enough of a ...* and *too much of a ...* should be compared with those mentioned in 15.69 Note [b] and 15.71 Note [b] (eg: *more of a ... than* and *as much of a ... as*):
 He's enough of a coward to do that.
 That's too much of a bother to think about.
 Cf also: *He was fool enough to go out without a coat*.

So ... (that) and such ... (that)

- 15.74 The pairs of correlatives *so ... (that)* and *such ... (that)* also introduce constructions that combine the notion of sufficiency or excess with the notion of result. The adverb *so* premodifies an adjective or adverb, whereas the predeterminer *such* precedes a noun phrase. The adjective premodified by *so* may itself premodify the head of a noun phrase. For both *so* and *such*, the noun phrase may have either the indefinite article or the zero article. *So* precedes the indefinite article together with the adjective it premodifies, but *such* (whose noun phrase need not have an adjective) does so alone.

I'm so happy to hear your good news *that* I could kiss you.
 They walked so quickly *that* I couldn't catch up.
 So few (people) came to the meeting *that* it was adjourned.
 The children had so good a time *that* they wouldn't leave.
 The soldiers encountered *such* (great) resistance *that* they retreated.
 The apartment has *such* a (beautiful) view *that* I intend to rent it.

The correlative *that* is sometimes omitted in informal style:

He polished the floor so hard you could see your face in it.

There is a close correspondence between *so ... that* and *such ... that* constructions, when the *that*-clause is negative, and constructions with *too* and an infinitive clause:

It's so good a movie *that* we mustn't miss it.
 ~ It's too good a movie to miss.
 It was such a pleasant day *that* I didn't want to go to school.
 ~ It was too pleasant a day to go to school.

There may also be a close correspondence between on the one hand *so ... that* and *such ... that* constructions, when the *that*-clause is positive, and on the other hand constructions with *enough* and an infinitive clause:

It flies so fast *that* it can beat the speed record.
 ~ It flies fast enough to beat the speed record.
 I had such a bad headache *that* I needed two aspirins.
 ~ I had a bad enough headache to need two aspirins.

But the correspondence often does not obtain, since *so* and *such* are not used with adjectives and adverbs in their unmarked sense (cf 7.88); they indicate a high degree. Thus, the *enough*-construction cannot replace the *so ... that* and *such ... that* constructions in the following contexts:

- The lion was so tame *that* the lionkeeper could enter its cage. [1]
 The lion was tame enough for the lionkeeper to enter its cage. [2]
 It was such a clear introductory lecture *that* we decided to take the course. [3]
 It was a clear enough introductory lecture for us to decide to take the course. [4]

While [1] asserts that the lion was very tame, [2] does not; and similarly [3] asserts that the lecture was very clear but [4] does not.

So expresses a high degree when used alone with a verb, and *such* does the same when its noun phrase does not contain an adjective premodifier:

- I so enjoyed it *that* I'm determined to go again.
 ['I so much enjoyed it ...']
 There was such a crowd *that* we couldn't see a thing.
 ['There was such a large crowd ...']

Compare exclamatory *how* and *what*: *How I enjoyed it!*, *What a crowd there was!* In a more formal variant, *so* and *such* may be positioned before correlative *that*; an intonation break (or in writing, a comma) is normal before *that*:

- I enjoyed it so, *that* I'm determined to go again.
 The crowd was such, *that* we couldn't see a thing.

Such can be positioned here only if the sentence is rephrased to make it follow a copular verb. It also differs here from *so* in that it identifies ('of that type') and does not intensify (cf also 15.49 Note [b]).

In another variant, found in informal style, the *that*-clause is positioned first, but *that* is omitted:

- I couldn't keep my eyes open, I was so tired. [5]

The first clause is semantically and intonationally subordinate, but it is preferable to regard the construction as paratactic. Compare:

- I was so tired, I couldn't keep my eyes open. [5a]

In a more formal variation of [5] the element containing *so* is fronted; subject-operator inversion is usual:

- He had no need to make speeches, so impregnable was his position. [6]
 She was exhausted by four, so hard had she worked. [7]

Another informal variant (with regional restriction) of [5] substitutes intensifier *that* for *so*:

- I was *that* tired I couldn't keep my eyes open. [5b]

But intensifier *that* is more common without the correlative clause:

- Why should you be (all) *that* tired in the morning? [8]

adverbial clauses of result are always positioned finally; adverbial clauses of purpose, though normally mobile, are restricted to final position in these comparative constructions because they are linked to a first correlative (eg: *as, too*).

Introduction

- 16.1 In 2.32 we defined COMPLEMENTATION as 'part of a phrase or clause which follows a word, and completes the specification of a meaning relationship which that word implies'. In this chapter, we examine the ways in which lexical verbs and adjectives determine, in this way, the grammatical patterns that follow them. We began this task in 2.19, where verbs were classified into various types (transitive, intransitive, copular, etc) according to their complementation. Now we must go further, and examine patterns of greater variety. But before doing so, we must analyse the phenomenon of multi-word verbs, a topic of peculiar importance in English. This study will occupy the first seventeen sections of the chapter, as a necessary prelude to the study of verb complementation.

Multi-word verbs

Verb-particle combinations

- 16.2 The main category of multi-word verbs consists of such combinations as *drink up*, *dispose of*, and *get away with*, which we will study under the headings of PHRASAL VERB, PREPOSITIONAL VERB, and PHRASAL-PREPOSITIONAL VERB respectively. However, these combinations are considered multi-word verbs only where they behave as a single unit.

Since the verb has been considered a class of word (cf 2.35), it may seem a contradiction to speak of 'multi-word verbs'. The term 'word' is frequently used, however, not only for a morphologically defined word class, but also for an item which acts as a single word lexically or syntactically (cf 9.10ff on complex prepositions). It is this extended sense of 'verb' as a 'unit which behaves to some extent either lexically or syntactically as a single verb' that we use in labels such as 'prepositional verb'. Thus in the sentence:

We disposed of the problem.

the word *disposed* remains morphologically a verb, being the item which has variable inflection (*dispose/disposes/disposed*, etc); but the sequence *disposed of* also functions in various ways as a single unit, such that for some purposes the sentence can be reasonably divided into:

[We] [disposed of] [the problem].

rather than into:

[We] [disposed] [of the problem].

The words which follow the lexical verb in expressions like *drink up*, *dispose of*, and *get away with* are morphologically invariable, and will be given the neutral designation PARTICLES. They actually belong to two distinct but overlapping categories, that of prepositions and that of spatial adverbs (though such adverbs are not necessarily used with spatial meaning). The term 'particle' will therefore apply to such words as these (see the fuller lists in 9.7 and 9.66), when they follow and are closely associated with verbs.

PARTICLES

- (A) *against, among, as, at, beside, for, from, into, like, of, onto, upon, with*, etc.
 (B) *about, above, across, after, along, around, by, down, in, off, on, out* <AmE>, *over, past, round, through, under, up*, etc.
 (C) *aback, ahead, apart, aside, astray, away, back, forward(s), home, in front, on top, out* <BrE>, *together*, etc.
 (On *out* as a preposition, cf 9.18 Note.)

Those grouped in list (A) are prepositions only; those in (C) are spatial adverbs only (unless they form part of a complex preposition, as in *out of*); and those in (B) can be either prepositions or spatial adverbs, and in the latter function are known as 'prepositional adverbs' (cf 9.65f). List (C) includes adverbs like *away* and *on top*, which correspond to complex prepositions such as *away from* and *on top of* and so are also known as prepositional adverbs (cf 9.66). Thus we include particles which form the first element of a complex preposition:

Come along (with us/me). *They moved out (of the house).*

The most obvious difference between the prepositions and the spatial adverbs is that where prepositions require a following noun phrase as a prepositional complement, there is no such requirement for adverbs (cf, however, the phenomenon of deferred prepositions, 9.6). Hence Classes (A), (B), and (C) can be distinguished as follows:

	PREPOSITIONAL CONSTRUCTION	ADVERBIAL CONSTRUCTION
(A)	The dog went <i>for me</i> .	*The dog went <i>for</i> .
(B)	Jack fell <i>down the hill</i> .	Jack fell <i>down</i> .
(C)	*We must not look <i>back the past</i> .	We must not look <i>back</i> .

Particles of Class (B) are the only ones which are acceptable in both constructions.

Not all multi-word verbs consist of lexical verbs followed by particles. We shall illustrate other types, such as those of *take pride in*, *cut short*, *see fit*, or *put paid to*, in 16.7-8 and 16.17.

- Note [a] Although the inflection of a multi-word verb is regularly attached to the lexical verb, the occurrence of 'slips of the tongue' such as the following (noted during a radio interview) deserves attention:

*The editor must do precisely as he *see fits*.

This anomalous shift of the inflection from the verb to the adjective testifies to a tendency for speakers to perceive the multi-word verb as a single grammatical unit.

- [b] On the exceptional use of some Class (A) words as adverbs (eg: *to*), cf 9.66 Notes [a] and [b].
 [c] The lexical verbs occurring in multi-word verbs are frequently the most common lexical verbs, and are typically associated with physical movement or state: eg: *come, fall, get, give, go, keep, make, put, and take*. At the other extreme, however, are words which occur as verbs only when combined with particles, eg: *beaver in beaver away, egg in egg on, and eke in eke out*:

She *egged him on*.

*She *egged (him)*.

Note also that some normally intransitive verbs can become transitive when combined with a particle, and that conversely some normally transitive verbs can become intransitive when combined with a particle:

They are *living it down*.

*They are *living it*.

The plane *took off*.

*The plane *took*.

Phrasal, prepositional, and phrasal-prepositional verbs

Type I (intransitive) phrasal verbs

- 16.3 Our procedure in 16.3-9 will be to illustrate the main categories of multi-word verbs, before the criteria for certain distinctions are considered more carefully in 16.11-16. One common type of multi-word verb is the *Type I* or intransitive phrasal verb consisting of a verb plus an adverb particle, as exemplified in:

The plane has just <i>touched down</i> .	Did he <i>catch on</i> ?
He is <i>playing around</i> .	The prisoner finally <i>broke down</i> .
I hope you'll <i>get by</i> .	She <i>turned up</i> unexpectedly.
How are you <i>getting on</i> ?	When will they <i>give in</i> ?
The plane has now <i>taken off</i> .	The tank <i>blew up</i> .

Such phrasal verbs are usually informal. The particles above come from Class (B) in 16.2, but similar examples can be given with particles from Class (C):

One of my papers has *gone astray*.
 The news made him *reel back*.
 The favourite *romped home*.
 The two girls have *fallen out*. [= 'quarrelled']

The particle functions like a predication adjunct (cf 8.26ff), and usually cannot be separated from its lexical verb:

?*The news made him *reel distractedly back*.

Although some of these are more idiomatic and cohesive than others, we will draw a distinction between such phrasal verbs, on the one hand, and FREE COMBINATIONS in which the verb and the adverb have distinct meanings on the other. In phrasal verbs like *give in* ['surrender'], *catch on* ['understand'], and *blow up* ['explode'], the meaning of the combination manifestly cannot be predicted from the meanings of verb and particle in isolation. But in free combinations the verb acts as a normal intransitive verb, and the adverb has its own meaning. For example:

He walked *past*. [= 'past the object/place']
 I waded *across*. [= 'across the river/water/etc']

Past and *across* here are adverbs (cf 9.65, 16.4 Note [d]), but their function is equivalent to that of a prepositional phrase of direction. The separability of verb and adverb in terms of meaning is shown by possible substitutions: for *wade in* *wade across*, for example, we could substitute *walk*, *run*, *swim*, *jump*, *fly*, etc; and for *across* we could substitute *in*, *through*, *over*, *up*, *down*, etc. In other cases, the particle may have an intensifying or aspectual force, as in *liven up*, *go on*, or *chatter away*.

There are also syntactic signs of cohesion. In free combinations, it is often possible to place a modifying adverb *right* (or sometimes *straight*) between the adverb particle and the verb:

Go *right/straight on*. Drink *right up*. Walk *straight in*.

This insertion is to differing extents unacceptable with phrasal verbs:

?The prisoner broke *right down*.
 *She turned *right up* at last.

Another sign of a free combination is the possibility of placing the adverb before the verb with subject-verb inversion (or without inversion where the subject is a pronoun):

Out came the sun.
Up you come.
On we drove into the night.

But with phrasal verbs this is not possible:

**Up blew* the tank.
 **Up it blew*. ['exploded']
 **Out he passed*. ['fainted']

However, in this as in other criteria, there is an unclear boundary between phrasal verbs and free combinations. With *They chattered away* the inversion is very marginally acceptable: ?**Away they chattered*. Some examples are more acceptable if the particle is reduplicated according to the pattern of iterative coordination (cf 13.101):

On and on he went about his wife and family.

And where the phrasal verb makes metaphorical use of spatial adverbs, inversion seems quite acceptable:

Down came the prices, and *up went* the sales.
 There was a gust of wind, and *out went* the light.

We examine the boundary between multi-word verbs and free combinations more generally in 16.12.

Type II (transitive) phrasal verbs

- 16.4 Many phrasal verbs may take a direct object, and may therefore be described as transitive. However, to simplify comparison with prepositional verbs, we will call them *Type II* phrasal verbs, as contrasted with *Type I* (or intransitive) phrasal verbs. Examples are:

We will <i>set up</i> a new unit.	He can't <i>live down</i> his past.
Shall I <i>put away</i> the dishes?	I can't <i>make out</i> what he means.
<i>Find out</i> if they are coming.	We <i>pushed home</i> our advantage.
She's <i>bringing up</i> two children.	She <i>looked up</i> her friends.
Someone <i>turned on</i> the light.	I've <i>handed in</i> my registration.
They have <i>called off</i> the strike.	They may have <i>blown up</i> the bridge.

Examples here and in 16.3 show that some combinations, such as *give in* and *blow up*, can be either *Type I* or *Type II*. In some cases, eg: *give in*, there is a substantial difference in meaning, and in others, eg: *blow up*, there is not (cf App I.18).

With most *Type II* phrasal verbs, as with free combinations of the same pattern, the particle can either precede or follow the direct object:

They *turned on* the light.

They *turned* the light *on*.

Bearing in mind the adverbial status of the particle, we would indeed expect the latter order (SVOA) to be the more usual, even though it means a separation of the particle from its verb. When the object is a personal pronoun, the SVOA order is in fact the only one allowable:

*They *switched on* it.

They *switched* it *on*.

The particle tends to precede the object if the object is long, or if the intention is that the object should receive end-focus (cf 18.3f).

As before, phrasal verbs have to be distinguished lexically from free syntactic combinations of verb and prepositional adverb. Contrast:

She *took in* the box. ['brought inside'] [FREE COMBINATION]
She *took in* her parents. ['deceived'] [PHRASAL VERB]

The verb and particle in *put out the cat*, for instance, preserve their separate meanings in that combination, as well as in a wide range of comparable combinations: *put + down/outside/away/aside; take/turn/bring/push/send/drag + out*. A highly idiomatic expression like *put off* ['postpone'] has no such variants at all, for the two words *put* and *off* are fused into a unit which allows for no substitution for the individual elements. Once again, there are unclear cases between these two extremes: some substitutions, but a limited number only, can be made in a 'semi-idiomatic' example such as *Turn out the light*:

Let's $\left\{ \begin{array}{l} \text{turn} \\ \text{switch} \\ \text{put} \end{array} \right\}$ it $\left\{ \begin{array}{l} \text{on.} \\ \text{off.} \\ \text{down.} \\ \text{up.} \end{array} \right\}$

With Type II phrasal verbs, there is no sensitive method of testing cohesion by placing the particle before the subject (cf 16.3), as this construction is scarcely possible even with free combinations: ?**Out he took a gun*. The other test of independence, insertion of an adverb before the particle, can however be used:

The pilot *jerked* the lever *right back*.

The dancer *threw* her hands *wildly about* above her head.

(Again, *right* is an intensifier of the particle, rather than an adverbial in itself.) Contrast the phrasal verb ?**They put the meeting hurriedly off*. Where there is an ambiguity between idiomatic and nonidiomatic interpretations of the same combination, insertion of an adverb will select the nonidiomatic one. Thus [1], unlike [2], can mean 'She reared the girls':

She *brought* the girls *up*. [1]
She *brought* the girls *right up*. [2]

But [2] can only have a spatial meaning 'She caused the girls to come up (the stairs, etc)'.
Like transitive verbs in general, Type II phrasal verbs can normally be turned into the passive without stylistic awkwardness (but cf Note [c]):

Aunt Ada *brought up* Roy. ~ Roy was *brought up* by Aunt Ada.

Note [a] Some Type II phrasal verbs do not easily allow the possibility of placing the particle after the object (unless the object is a pronoun):

They had *given up* hope. ~ ?They had *given* hope *up*.

They *laid down* their arms. ~ ?They *laid* their arms *down*.

This fixing of the SVAO order tends to occur, as the above examples illustrate, where there is a strong idiomatic bond (frequently matching a change from literal to metaphorical) between the phrasal verb and the object. In addition, the particle cannot normally be placed after a clausal object, such as an *-ing* clause, even when the clause is short:

She *gave up* trying. ~ *She *gave* trying *up*.

[b] Conversely, some phrasal verbs do not easily allow the placement of the particle before the object. In some cases the SVAO order is probably avoided because of ambiguity:

Get that parcel *off* right away! ~ Get *off* that parcel right away!

Here the transitive phrasal verb *get ... off* can be confused with the intransitive verb *get* followed by the preposition *off*. This latter construction occurs, for example, in *Get off that stool - it's just been painted!* but would suggest an inappropriate meaning in the above sentence. Other reasons for avoiding the SVAO order include coordination of particles:

I *switched* the light *on and off*. ~ ?I *switched on and off* the light.

Also, as in [a] above, the order tends to be fixed by idiomatic convention:

I was $\left\{ \begin{array}{l} \text{crying my eyes out.} \\ \text{laughing my head off.} \\ \text{sobbing my heart out.} \end{array} \right\}$ *I was $\left\{ \begin{array}{l} \text{crying out my eyes.} \\ \text{laughing off my head.} \\ \text{sobbing out my heart.} \end{array} \right\}$

In these cases of conventionalized hyperbole, the SVAO order is impossible.

[c] Another restriction on phrasal verbs is that some of them do not have a passive. These are principally combinations for which the object is idiomatically limited to a particular noun or pronoun:

The train *picked up* speed. ~ ?Speed was *picked up* (by the train).

Jill and her boss don't *hit it off*. ~ *It is not *hit off* (by Jill and her boss).

['are not good friends']

[d] As in intransitive combinations, so in transitive verb-adverb combinations the adverb may be semantically equivalent to a reduced prepositional phrase, from which the complement has been omitted:

They *pulled* the cart *along*. ['along the road, etc']

Move the furniture *out*. ['out of the house, etc']

These are clearly free combinations, not phrasal verbs.

[e] Expressions like *be fed up*, *be run down* appear to be passive phrasal verbs without a corresponding active:

I was *fed up* with the noise. ~ *The noise *fed me up*.

Yet these are not true passives, but rather 'pseudo-passives' (cf 3.77), as we see from their ability to combine with an intensifier such as *thoroughly*, and a copular verb such as *look*:

He *looked thoroughly* fed up.

and also by the impossibility of an agent *by*-phrase:

*I was fed up *by the noise*.

Type I prepositional verbs

16.5 Here, as in 16.3, we use *Type I* as a label for multi-word verbs without a direct object. A prepositional verb consists of a lexical verb followed by a preposition with which it is semantically and/or syntactically associated. The preposition, as is to be expected, precedes its complement:

Look *at* these pictures. Can you *cope with* the work?

I don't *care for* Jane's parties. I *approve of* their action.

We must *go into* the problem. His eyes *lighted upon* the jewel.

In these examples, the lexical verb is followed by a particle which is unequivocally a preposition (*ie* from Class (A) in 16.2).

In using the term PREPOSITIONAL VERB we indicate that we regard the

second noun phrase in a sentence like [1] as the complement of the preposition *at* and not as the direct object of a verb *look at*:

Many people looked *at the pictures*. [1]

This is despite the fact that the passive is frequently possible (with some stylistic awkwardness) as in [1a]:

The picture was *looked at* by many people. [1a]

The intransitive interpretation, on the other hand, is justified (for example) by the potentiality of adverbial insertion:

Many people looked *disdainfully* at the picture.

where insertion between V and O_d is usually avoided:

*?Many people examined *disdainfully* the picture.

The noun phrase following the preposition in such constructions is termed a PREPOSITIONAL OBJECT.

There are therefore two complementary analyses of a sentence like *She looked after* ['tended'] *her son*:

The former analysis is the one we follow if we call this kind of construction intransitive. Analysis 2, on the other hand, highlights the resemblance between *She looked after her son* and *She tended her son*. By naming this category of prepositional verbs 'Type I', we avoid the unclarity which results from the use of 'intransitive' or 'transitive' in this connection. The above analyses are discussed further in 16.13–15.

Note Whereas a sequence of verb and preposition like *live at* is a purely nonidiomatic free combination, in prepositional verbs like *look at*, *look for*, etc the verb word has a literal use, but has a fixed association with the preposition. These cases may, in their turn, be distinguished from other prepositional verbs, eg: *go into* ['investigate'] where both words form a semantically idiomatic (often metaphorical) unit (cf 16.12 for a further exploration of these categories and their relation to a scale of idiomaticity).

Prepositional verbs contrasted with phrasal verbs

16.6 We must now briefly attend to another distinction between similar-looking constructions. The following exemplify Type I prepositional verbs which contain particles of Class (B) in 16.2, and are therefore capable of confusion with Type II phrasal verbs (cf 16.4):

<i>She called on</i> her friends.	You should <i>invest in</i> property.
<i>We saw through</i> his imposture.	<i>She came by</i> a fortune.
<i>I've come across</i> a problem.	The car <i>ran over</i> a bump.

These are distinguished from almost all Type II phrasal verbs by the inability of the particle to be moved to a position after the following noun phrase:

(1) <i>She called on</i> her friends.	~ * <i>She called</i> her friends <i>on</i> .
[cf: (2) <i>She switched on</i> the light.	~ <i>She switched</i> the light <i>on</i> .]
(1a) <i>She came by</i> a fortune.	~ * <i>She came</i> a fortune <i>by</i> . ['acquired']
[cf: (2a) <i>She put by</i> a fortune.	~ <i>She put</i> a fortune <i>by</i> . ['kept']]

Similarly, the order of particle and pronoun is different:

(1b) <i>She called on</i> them.	NOT * <i>She called</i> them <i>on</i> .
(2b) <i>She switched on</i> it.	NOT * <i>She switched</i> it <i>on</i> .

Another criterion is stress. Both constructions generally permit the corresponding passive, but in the Type II phrasal verb (2), a higher degree of stress (including nuclear stress when the particle is in final position) usually falls on the adverb particle. In the prepositional verb (1), on the other hand, the stress normally occurs on the lexical verb preceding the particle:

(1c) He ' <i>called</i> on the dean.	~ The dean was <i>CALLED</i> on.
(2c) She ' <i>switched</i> on the light.	~ The light was <i>switched ON</i> .

The same contrast of stress is observed in other constructions with a postponed particle, eg relative clauses:

(1d) the fortune (that) he <i>CAME</i> by.	~ The dean was <i>CALLED</i> on.
(2d) the fortune (that) he <i>put BY</i> .	~ The light was <i>switched ON</i> .

Compare also:

(1e) This is a dangerous road to <i>GET</i> over. (<i>also</i> . . . to get <i>ò</i> ver)	~ That's a present I could have done <i>wìthòut</i> .
(2e) It's a loss she will never get <i>ò</i> ver.	~ It is a loss that she will never get <i>ò</i> ver.

However, the 'stress test' is not entirely reliable, as polysyllabic prepositions like *across*, *over*, and *without* usually receive stress, and other factors such as contrastive focus may affect the positioning of the nucleus:

I could have done *wìthòut* that *PRÉ*sent.
 ~ That's a present I could have done *wìthòut*.
 She will never get *ò*ver it.
 ~ It is a loss that she will never get *ò*ver.

We shall return to these distinctions in 16.16.

Note [a] It is not unusual for the same sequence of verb + particle to function either as a phrasal verb or as a prepositional verb:

He ' <i>turned</i> on his supporters. [phrasal verb: 'He excited them']	[1]
He ' <i>turned</i> on his supporters. [prepositional verb: 'He attacked them']	[2]

A reduced version of [1] would be *He 'turned them on*, while the correspondingly reduced version of [2] would be *He 'turned on them*.

[b] A special case of the above homonymy occurs where the phrasal and prepositional verbs are not only identical in form, but similar in meaning. Examples are *run through*, *run over*, and *look over*. Thus:

The car *ran him over*. The car *ran over* him.

These have virtually the same meaning, but the former (the phrasal verb) is reserved for the description of driving accidents, in which the object refers to a casualty.

The car *ran 'over* a *BÙMP*.

therefore has no corresponding phrasal verb construction:

*The car *ran* a 'bump *ò*ver.

Type II prepositional verbs

- 16.7 The Type I/Type II opposition applies not only to phrasal, but to prepositional verbs:

	TYPE I (without O _d)	TYPE II (with O _d)
PHRASAL VERB	Please <i>drink up</i> .	Please <i>drink</i> it <i>up</i> .
PREPOSITIONAL VERB	He <i>invested in</i> property.	He <i>invested</i> his money <i>in</i> property.

Type II prepositional verbs are followed by two noun phrases, normally separated by the preposition: the former is the direct object, the latter the prepositional object. Three subtypes may be distinguished; the italicized words indicate that the idiom has a different grammatical status in each case, as will be explained.

TYPE IIa

The gang *robbed* her *of* her necklace.
 He *deprived* the peasants *of* their land.
 They *plied* the young man *with* food.
 Please *confine* your remarks *to* the matter under discussion.
 This clothing will *protect* you *from* the worst weather.
 Jenny *thanked* us *for* the present.
 May I *remind* you *of* our agreement?
 They have *provided* the child *with* a good education.

TYPE IIb

They have *made* a (terrible) *mess* *of* the house.
 Did you *make* (any) *allowance* *for* inflation?
 Mary *took* (good) *care* *of* the children.

TYPE IIc

Suddenly we *caught sight* *of* the lifeboat.
 Give *way* *to* traffic on the major road.
 I have *lost touch* *with* most of the family.

The first and most numerous type has a passive of the regular kind, the direct object becoming subject of the passive verb phrase:

She was *robbed* *of* her necklace (by the gang).
 The peasants were *deprived* *of* their land.
 The young man was *plied* *with* food.

With Type IIb, there are two possible passives: the regular passive in which the direct object becomes subject (labelled (1) below), and a less acceptable passive construction in which the prepositional object becomes subject (labelled (2) below):

- { (1) A (terrible) *mess* has been *made* *of* the house.
 (2) (?) The house has been *made* a (terrible) *mess* *of*.
 { (1) Has (any) *allowance* been *made* *for* inflation?
 (2) ?Has inflation been *made* *allowance* *for*?

- { (1) (Good) *care* was *taken* *of* the children.
 (2) The children were *taken* (good) *care* *of*.

In Type IIc, on the other hand, the only acceptable passive is the irregular passive in which the prepositional object becomes subject:

The lifeboat was suddenly *caught sight* *of*.
 ?Traffic on the major road should always be *given way* *to*.
 (?) Most of the family has been *lost touch* *with*.

Note [a] For completeness, mention must be made of a fourth type of transitive prepositional verb which has no passive whatsoever; an idiomatic type in which the direct object is a reflexive pronoun (cf 3.70):

He *prided himself* on his craftsmanship.

**Himself* was *prided* on his craftsmanship.

[b] In the interests of end-focus or end-weight (cf 18.9), it is sometimes acceptable to place an elaborate direct object after the prepositional object. Contrast:

He had been known to *reduce* movie-stars to tears.

He had been known to *reduce* to tears some of the most seasoned and idolized movie-stars in Hollywood.

- 16.8 To a great extent, membership of Types IIa–IIc above depends on the idiomatic status of the prepositional verb.

In Type IIa the lexical verb and the preposition, although normally separated by the object, form an idiomatic combination. Here as elsewhere, the idiomatic 'cohesion' of the two may be of variable strength. Verbs such as *accuse* N *of* and *thank* N *for* (where 'N' symbolizes the direct object noun phrase) are not idiomatic in the sense that applies to phrasal verbs like *put* N *off*, for the lexical verb is used in its primary literal meaning. We may nevertheless speak of the verb GOVERNING the preposition, in the sense that the preposition is selected by reason of the verb, rather than by independent semantic choice. Thus despite similarity of meaning, different prepositions are selected with *accuse* and *blame*, viz: *of* and *for* respectively.

I *accused* him { *of* the crime.
 *for the crime. I *blamed* him { *of the crime.
 for the crime.

In less idiomatic cases, the verbs group themselves into restricted sets such as *rob* N *of*, *cheat* N *of*, and *deprive* N *of*, where *of* to some extent carries its own privative force.

In a further subcategorization of Type IIa we need to recognize that the prepositional phrase is optional in some cases, but not in others:

They { *cheated* } the boy *of* his savings. They { *cheated* } the boy.
 { *deprived* } { **deprived* }

In yet another sub-type, the prepositional object forms part of the idiom: *lick* N *into shape* (informal); *lull* N *to sleep*; *put* N *to rights*; etc.

In Type IIb as well as the verb word and the preposition, the head noun of the direct object forms part of the idiom:

make a *mess* *of* take *notice* *of* lose *hope* *of*
 pay *attention* *to* take *advantage* *of* make *mention* *of*

But the object is still variable to some extent: eg an open-class adjective or a determiner can be added:

make a <i>horrible</i> mess of	take <i>some</i> notice of
pay <i>careful</i> attention to	take <i>unfair</i> advantage of
lose <i>all</i> hope of	make <i>occasional</i> mention of

To this extent, the idiomatic bond is weakened, and it is easier, especially when the object contains a modifier or determiner, to separate the object from the rest of the construction by the regular passive transformation:

Some notice was taken ... *Careful attention* was paid ...

In Type IIc the direct object is more firmly welded in its idiomatic position, so that its separation by means of the regular passive construction is awkward if not impossible: ?**Sight was caught of the lifeboat*. The object is typically invariable, and cannot easily be augmented by an adjective or a determiner: *cross swords with*, *give rise to*, *keep pace with*, *keep tabs on*, etc. Hence the dubious acceptability of ?**cross violent swords with*, ?**keep fast pace with*, ?**keep watchful tabs on*, etc. Other combinations of this kind are far more acceptable, however: *keep close tabs on*, *give sudden rise to*.

Phrasal-prepositional verbs

16.9 There is a further major category of multi-word verbs which will be called PHRASAL-PREPOSITIONAL verbs, because they contain, in addition to the lexical verb, both an adverb and a preposition as particles. These combinations are largely restricted to informal English:

We are all *looking forward to* your party on Saturday.
He had to *put up with* a lot of teasing at school.
Why don't you *look in on* Mrs Johnson on your way back?
He thinks he can *get away with* everything.

A common sign of idiomatic status here, as with other categories, is the existence of a one-word paraphrase:

put up with = 'tolerate' *look in on* = 'visit'

The prepositional passive with such verbs is not too common, and is liable to sound cumbersome. Examples such as the following, however, are normal and acceptable:

These tantrums could not be <i>put up with</i> any longer.	['tolerated']
The death penalty has been recently <i>done away with</i> .	['abolished']
Such problems must be squarely <i>faced up to</i> .	['confronted']
They were <i>looked down on</i> by their neighbours.	['despised']

In addition to the Type I phrasal-prepositional verbs already illustrated, there are also Type II ones requiring a direct object:

<i>fob N off with</i> <esp BrE>	<i>put N down to</i>	<i>take N out on</i>
<i>fix N up (with)</i>	<i>let N in on</i>	<i>put N up to</i>

(where 'N' again identifies the object noun phrase). Examples:

Don't *take it out on* me! ['vent your anger']
The manager *fobbed me off with* a cheap camera. <esp BrE>
We *put our success down to* hard work. ['attribute to']
I'll *let you in on* a secret.

Only the regular passive occurs with these:

I was *fobbed off with* a cheap camera. <esp BrE>
Our success can be *put down to* careful planning.
Are you *fixed up with* a job yet?

Note There are two equivalent phrasal-prepositional verbs in which the two noun phrases following the verb exchange roles:

= { He *fobbed* a cheap camera *off on* the unsuspecting tourist.
He *fobbed* the unsuspecting tourist *off with* a cheap camera.

A summary of types of multi-word verb

16.10 We have now reached a point where it will be useful to summarize the various categories described in 16.3-9. The picture which emerges in Table 16.10 is a symmetrical one, with three binary contrasts, expressed in the formula:

verb ± direct object ± adverb ± preposition

Table 16.10 Principal types of multi-word verbs

	Lexical Verb	Direct Object	Particles		+ Prepositional Object
			Adverb	Preposition	
1 (free combination) Type I PHRASAL VERB	(A) <i>come</i> (B) <i>crop</i>	— —	<i>in</i> <i>up</i>	— —	— —
2 (free combination) Type II PHRASAL VERB	(A) <i>send</i> (B) <i>turn</i>	someone someone	<i>away</i> <i>down</i>	— —	— —
3 (free combination) Type I PREPOSITIONAL VERB	(A) <i>come</i> (B) <i>come</i>	— —	— —	<i>with</i> <i>across</i>	+ me + a problem
4 (free combination) Type II PREPOSITIONAL VERB	(A) <i>receive</i> (B) <i>take</i>	something someone	— —	<i>from</i> <i>for</i>	+ me + a fool
5 (free combination) Type I PHRASAL-PREPOSITIONAL VERB	(A) <i>run</i> (B) <i>come</i>	— —	<i>away</i> <i>up</i>	<i>with</i> <i>with</i>	+ it + an answer
6 (free combination) Type II PHRASAL-PREPOSITIONAL VERB	(A) <i>send</i> (B) <i>put</i>	someone someone	<i>out</i> <i>up</i>	<i>into</i> <i>for</i>	+ the world + election

[a] Examples (A) and (B) of each type illustrate respectively nonidiomatic and idiomatic variants. Thus (A) is a free combination, whereas (B) is a multi-word verb.

[b] The italicized words are those which make up the idiom or lexical unit.

Some semantic and syntactic distinctions

- 16.11 It will also be useful to analyse in a systematic manner three distinctions which underlie Table 16.10, and which have been found problematic by those dealing with this aspect of English grammar. The three distinctions, which have been touched on in preceding sections, are:

idiomatic versus *nonidiomatic* status (16.12)

prepositional verbs versus *free combinations of verb + prepositional phrase* (16.13–15)

phrasal versus *prepositional* verbs (16.16)

The first two of these are gradient rather than clear-cut.

Semantic criteria for idiomatic status

- 16.12 (A) The semantic unity of multi-word verbs can often be manifested in replacement by a single-word verb; eg: *visit* for *call for*, *summon* for *call up*, *omit* for *leave out*, *tolerate* for *put up with*. This criterion, however, is not always reliable. First, there are multi-word verbs, like *get away with* and *run out of*, which do not have one-word paraphrases. Second, there are nonidiomatic combinations, such as *go across* (= *cross*), *go past* (= *pass*), and *sail around* (= *circumnavigate*) which do have such paraphrases.
- (B) The fact that the meaning of an idiom is not predictable from the meanings of its parts can be verified by noting that the meaning of the verb or particle in the combination does not remain constant when other parts of the idiom undergo substitution. This criterion leads us to recognize three main categories:
- (i) Free, nonidiomatic constructions, where the individual meanings of the components are apparent from their constancy in possible substitutions:

<i>bring</i>	{ <i>in</i>	<i>walk</i>	{ <i>up</i>
<i>take</i>	{ <i>out</i>	<i>run</i>	{ <i>down</i>
...	{	{ ...

- (ii) 'Semi-idiomatic' constructions which are variable but in a more limited way. The relation between the verb and particle is similar to that between a stem and an affix in word formation (cf App I.5), in that the substitution of one verb for another, or one particle for another, is constrained by limited productivity. In phrasal verbs like *find out* ['discover'], *cut up* ['cut into pieces'] and *slacken off* ['reduce pace/energy'] the verb word keeps its meaning, whereas the meaning of the particle is less easy to isolate. In contrast, it is the particle which establishes a family resemblance in the following groups:

'persistent action'		'completion'	
<i>chatter away</i>	<i>fire away</i>	<i>drink up</i>	<i>break up</i>
<i>work away</i>	<i>beaver away</i>	<i>finish up</i>	<i>use up</i>
<BrE>			

'aimless behaviour'		'endurance'	
<i>play around</i>	<i>mess around</i>	<i>draw out</i>	<i>eke out</i>
<i>fool around</i>	<i>wait around</i>	<i>last out</i>	<i>hold out</i>

Completion can also be signalled by *out*, as in *find out*, *point out*, *seek out*, *figure out*, *work out*, etc.

- (iii) 'Highly idiomatic' constructions such as *bring up* ['rear'], *come by* ['acquire'], *turn up* ['make an appearance']. These are thoroughly idiomatic in that there is no possibility of contrastive substitution: *bring up/down*; *come by/past/through*; *turn up/down*; etc.

Putting a verb in the third category does not necessarily mean, however, that its meaning is completely opaque. We can see a metaphorical appropriateness in *bring up* for 'educate', and this is only one of many idiomatic verbs containing metaphors fairly clearly derived from their literal locative interpretations: *gloss over* (a difficulty); *hand down* (an heirloom), *piece together* (a story), etc. For our purposes it will be convenient in general to treat classes (II) and (III) as multi-word verbs.

Syntactic criteria for prepositional verbs

- 16.13 In distinguishing prepositional verbs such as *call on* ['visit'] in *He called on the dean* from other sequences of verb + preposition such as *called before* in *He called before lunch* (cf 16.5), the semantic criteria of idiomaticity must be supplemented by syntactic criteria.

We are chiefly concerned here with Type I verbs, whether these are prepositional verbs like *call on*, or phrasal-prepositional verbs such as *put up with*. How are we to choose between the two analyses of 16.5, that of SVO (with a prepositional object) and that of SVA (or in the case of phrasal-prepositional verbs, SVAA)? First, there are good reasons for arguing that even an idiomatic case like *He called on the dean* contains a phrase boundary between the verb and the particle:

- (A) The whole prepositional phrase may be fronted, eg in questions:

On whom did he call?

- (B) An adverb can be inserted between the verb and the particle:

He *called* unexpectedly *on the dean*.

- (C) The prepositional phrase can be isolated in other constructions; eg (optionally) in responses, in coordinate constructions, or in comparative constructions:

A: { On whom did he call? } B: (On) his mother.
Who(m) did he call on?

Did he call on the dean or (on) his friend?

He calls on the dean more often than (on) his friend.

We do not reject the SVA analysis, therefore, but rather we offer the SVO analysis as, to varying degrees, a suitable alternative.

The prepositional passive

16.14 We will accept the possibility of turning the prepositional complement into the subject of a passive sentence (cf 3.64) as one criterion favouring the SVO analysis. This construction, which leaves the preposition DEFERRED ('stranded') in its post-verbal position, will be called the PREPOSITIONAL PASSIVE. Contrast:

The dean *was called on*. *Lunch *was called after*.
The war *was put up with*. *Andy *was gone out with*.

Notice that ambiguous combinations like *arrive at* take the passive only when the preposition is part of an idiom:

We arrived at a station. ~ *A station was arrived at.
We arrived at a conclusion. ~ A conclusion was arrived at.

Combinations of verb and prepositional phrase which are awkward in brief sentences can, however, become more tolerable with an enlarged context:

*This office has *been called/phoned from*.

This office has *been called/phoned from* so many times that it was natural to assume that it was the source of the latest call.

Here are some more usual cases of the prepositional passive, where the passive verb is a Type I prepositional verb:

Though something very different from ordinary forest management *is called for*, the trees in the parks do need the forester's skilled consideration.

This matter will have to *be dealt with* immediately.

Other possibilities *are talked of* by many of our colleagues.

If a woman with a university degree rejects a career for marriage, her education is not to *be thought of* as thrown away unless we count the family arena of no importance.

Other prepositional passives are:

<i>be asked for</i>	<i>be done for</i>	<i>be shouted at</i>
<i>be believed in</i>	<i>be hoped for</i>	<i>be stared at</i>
<i>be talked to</i>	<i>be done away with</i>	<i>be sent away for</i>

However, the passive is also quite acceptable with prepositions which have a locative meaning, and which on other grounds (eg the *wh*-question criterion of 16.15) must be judged as introducing a prepositional phrase of place:

They must have <i>played on</i> this field last week.	[1a]
~ This field must have <i>been played on</i> last week.	[1b]
Visitors are not to <i>sit on</i> these Louis XV chairs.	[2a]
~ These Louis XV chairs are not to <i>be sat on</i> .	[2b]
Primitive men once <i>lived in</i> these caves.	[3a]
~ These caves <i>were once lived in</i> by primitive men.	[3b]

We cannot, therefore, invariably regard the prepositional passive as a marker of a prepositional verb. Rather, the passive is primarily an indicator of the fact that the prepositional complement is being treated as an *affected*

participant in the clause (cf 10.19, 10.21). For example, in [1b] and [2b] above, the function of the passive is not merely to obtain end focus, but to imply that the subject of the passive clause refers to an object affected by the (unspecified) agent's action. The acceptability of the passive is thus accounted for in terms of clause participant roles (10.18ff), as well as in terms of convention or idiomatic status. Both factors play a role in making the passive select the abstract metaphorical meaning in:

They went into the tunnel.	~ *The tunnel was gone into.
They went into the problem.	~ The problem was gone into.

We may, in fact, recognize a strong association between these factors, and therefore between prepositional passives and prepositional verbs.

Note The prepositional passive is paralleled by a similar prepositional use in *-ed* participle clauses:

The shop *broken into* last week has now been reopened.
'Prepositional participles' can also be converted into adjectives: *the hoped-for arrival of the relief force*; *the much-talked-about visit of the Pope*. There are also 'pseudo-passive' (cf 3.77) occurrences of prepositional verbs, as in *I was feeling got at* (informal). The hyphen, in predicative position, is generally omitted.

The criterion of question forms

16.15 The second criterion for prepositional verbs is the formation of *wh*-questions with the pronouns *who(m)* and *what* (for personal and nonpersonal prepositional objects respectively), rather than with adverbial question forms such as *where*, *when*, *how*, or *why*:

John called on her.	~ <i>Who(m)</i> did John call on?
John looked for it.	~ <i>What</i> did John look for?

Contrast:

John called from the office.	~ <i>Where</i> did John call from?
John called after lunch.	~ <i>When</i> did John call?

Once again, the criterion is not clear-cut. There is firstly considerable overlap between the two question types: *She died of pneumonia* could be an answer either to the question *How did she die?* or (more usually) to the question *What did she die of?* Secondly, there are many types of prepositional phrases which are classified as adjuncts (cf 8.13, 9.14 - 53) but which regularly correspond with questions in *who(m)* or *what*. These are classes of adjunct for which English lacks an interrogative adverb, such as adjuncts of accompaniment:

A: { With whom did Peter go fishing?	[1a]
Who(m) did Peter go fishing with?	[1b]
B: ((He went fishing) with) his brother.	[2]

The *with*-phrase in [2] can only be questioned by the interrogative pronoun *who(m)* in [1a] and [1b]; and yet the mobility and optionality of the *with*-phrase, as shown in [3], are signs of its adverbial status:

Peter (, with his brother,) went fishing.	[3]
---	-----

Since none of the criteria for prepositional or phrasal-prepositional verbs are

compelling, it is best to think of the boundary of these categories as a scale, such as that depicted in Fig 16.15:

V _{pass}	Q _{pro}	No Q _{adv}		
+	+	+	The police have <i>asked for</i> details.	[4]
+	+	—	The queen <i>slept in</i> this bed.	[5]
—	+	+	White wine <i>goes with</i> poultry.	[6]
—	+	—	She <i>died of</i> pneumonia.	[7]
—	—	+	His job also <i>comes into</i> the picture.	[8]
—	—	—	She <i>left before</i> noon.	[9]

V_{pass} = passive Q_{pro} = pronoun *wh*-word Q_{adv} = adverb *wh*-word

Fig 16.15

Of these, [4] is a clear case of a prepositional verb, while [5] and [6] are marginally in that class. The matrix is so arranged that the larger the number of pluses, the stronger the characteristics of the prepositional verb. For this reason, the *wh*-adverb criterion is expressed in a negative form, *ie* a plus in this column means 'the prepositional verb *CANNOT* be the answer to a *wh*-adverb'. *Ask for* in [4] is thus the combination which most clearly meets the requirements of the SVO analysis, and *left before* in [9], being least like a prepositional verb, is to be analysed with equal clarity as:

She [S] left [V] before noon [A].

It is perhaps surprising that [8], with its idiomatic character, scores so low on the prepositional verb scale. This is because in this sentence not only the verb and particle (*come into*) but also the object (*the picture*) is part of the idiom, a factor which inhibits the passive and interrogative transforms of the sentence.

An additional criterion for prepositional verbs is our unwillingness to have the preposition cut off from the lexical verb by fronting the whole prepositional phrase in (*eg*) *wh*-questions and relative clauses (*cf* 11.14ff, 17.9ff):

- A: ?* *After whom* did she look? } B: She looked after Jim.
 A: *Who(m)* did she look *after*? }
 A: *With whom* did she agree? } B: She agreed with Jim.
 A: *Who(m)* did she agree *with*? }

Similarly *What did she wish for?* is fully acceptable, but not ?**For what did she wish?* By this test, *look after* and *wish for* come closer to the ideal prepositional verb than does *agree with*.

Note In addition to the mentioned *wh*-pronouns *who(m)* and *what*, there are other question forms with the determiners *what* and *which*; *eg* [5] could answer the question:

Which bed did the queen sleep in?

This alternative construction is ignored for the purposes of the above matrix.

Criteria for distinguishing phrasal and prepositional verbs

- 16.16 The question here is not one of gradience, but of how to distinguish two superficially like constructions, that of a Type I prepositional verb like *call*

on in *He called on the dean*, and that of a Type II phrasal verb such as *call up* in *He called up the dean* (*cf* 16.6).

The differences are both syntactic and phonological:

- The particle of a phrasal verb can stand either before or after the noun phrase following the verb, but that of the prepositional verb must (unless deferred) precede the noun phrase.
- When the noun phrase following the verb is a personal pronoun, the pronoun precedes the particle in the case of a phrasal verb, but follows the particle in the case of a prepositional verb.
- An adverb (functioning as adjunct) can often be inserted between verb and particle in prepositional verbs, but not in phrasal verbs.
- The particle of the phrasal verb cannot precede a relative pronoun at the beginning of a relative clause.
- Similarly, the particle of a phrasal verb cannot precede the interrogative word at the beginning of a *wh*-question.
- The particle of a phrasal verb is normally stressed (*cf* 16.6), and in final position normally bears the nuclear tone, whereas the particle of a prepositional verb is normally unstressed and has the 'tail' of the nuclear tone which falls on the lexical verb (*cf* App II.15).

These criteria are displayed in Table 16.16:

Table 16.16 Diagnostic frames for phrasal and prepositional verbs

TYPE I PREPOSITIONAL VERB	TYPE II PHRASAL VERB
<i>call on</i> = 'visit'	<i>call up</i> = 'summon'
(a) They <i>called on</i> the dean. ~ *They <i>called</i> the dean <i>on</i> .	They <i>called up</i> the dean. ~ They <i>called</i> the dean <i>up</i> .
(b) They <i>called on</i> him. ~ *They <i>called</i> him <i>on</i> .	They <i>called him up</i> . ~ *They <i>called up</i> him.
(c) They <i>called angrily on</i> the dean.	*They <i>called angrily up</i> the dean.
(d) the man <i>on</i> whom they <i>called</i>	*the man <i>up</i> whom they <i>called</i>
(e) <i>On</i> which man did they <i>call</i> ?	* <i>Up</i> which man did they <i>call</i> ?
(f) Which man did they <i>CALL on</i> ?	Which man did they <i>call UP</i> ?

Other multi-word verb constructions

- 16.17 Apart from the types of multi-word verb summarized in Table 16.10, some other idiomatic verb constructions may be briefly noted.

(a) VERB-ADJECTIVE COMBINATIONS

These are similar to phrasal verbs. Compare:

Meg *put* the cloth *straight*. Meg *put* the cat *out*.

Like phrasal verbs, verb-adjective combinations form cohesive units; but unlike phrasal verbs, some of them allow comparative modification:

John didn't put { the cloth as straight
*the cat as out } as Meg.

They may be either copular (clause pattern *SVC*), or complex transitive (clause pattern *SVOC*):

SVC: break even, plead guilty, lie low

SVOC: cut N short, work N loose, rub N dry

Sometimes the idiom contains additional elements, such as an infinitive (*play hard to get*) or a preposition (*ride roughshod over . . .*).

(The 'N' above indicates a direct object in the case of transitive examples.)

(b) VERB-VERB COMBINATIONS

In these idiomatic constructions (cf 3.49-51, 16.52), the second verb is nonfinite, and may be either an infinitive:

make do with, make (N) do, let (N) go, let (N) be

or a participle, with or without a following preposition:

put paid to, get rid of, have done with

leave N standing, send N packing, knock N flying, get going

(c) VERBS GOVERNING TWO PREPOSITIONS

These are a further variant on prepositional verbs:

It developed from a small club into a mass organization in three years.

Similarly: *struggle with N for N, compete with N for N, apply to N for N, talk to N about N*. Normally either one or both prepositional phrases can be omitted; eg:

It developed into a mass organization in three years.

Note To end this survey of verb idioms and their grammatical characteristics, mention may be made of rare patterns such as *make sure/certain* followed by a *that*-clause; *see fit* followed by a *to*-infinitive; and verb + noun combinations such as *turn turtle* and *turn traitor*.

Verbs in relation to verb complementation

- 16.18 In 16.20-67 we survey types of verb complementation, before turning to adjective complementation (16.68-83), and (more briefly) to noun complementation (16.84-5). Many verbs are versatile enough to allow several complementation types (cf the discussion, for example, of *get* in 10.3). It is therefore likely to be misleading to talk of 'intransitive verbs', 'monotransitive verbs', 'complex transitive verbs', etc. Rather, it is often better to say that verbs have 'monotransitive use', 'monotransitive complementation', etc. Although one verb may belong to a number of different complementation types, it is usually possible to observe a common ground of meaning in the various uses.

For each type of complementation, we give a list of verbs belonging to that pattern. No claim of completeness is made for these lists: when the membership of a type is small, a fairly exhaustive list of verbs is given, whereas when the membership is very large (as in the case of intransitive

verbs, or monotransitive verbs with a noun phrase object), we can give only a sample of common verbs. In any case, it should be borne in mind that the list of verbs conforming to a given pattern is difficult to specify exactly: there are many differences between one variety of English and another in respect of individual verbs, and many cases of marginal acceptability.

Note The term 'valency' (or 'valence') is sometimes used, instead of complementation, for the way in which a verb determines the kinds and number of elements that can accompany it in the clause. Valency, however, includes the subject of the clause, which is excluded (unless extraposed) from complementation.

Verbs in intransitive function

- 16.19 Where no complementation occurs, the verb is said to have an INTRANSITIVE use. Three types of verb may be mentioned in this category:

- (I) 'PURE' INTRANSITIVE VERBS, which do not take an object at all (or at least do so only very rarely):

John has arrived. Your views do not matter.

Examples:

<i>appear</i>	<i>die</i>	<i>fall</i>	<i>happen</i>	<i>rise</i>
<i>come</i>	<i>digress</i>	<i>go</i>	<i>lie</i>	<i>wait</i>

- (II) VERBS WHICH CAN ALSO BE TRANSITIVE WITH THE SAME MEANING, and without a change in the subject-verb relationship. Informally, such verbs can be described as having an 'understood object' (cf App I.54):

He smokes (a pipe). I am reading (a book).

But in some cases the intransitive verb acquires a more specific meaning, so that a particular kind of object is 'understood'; eg: *John drinks heavily* ['drinks alcohol'].

Examples:

<i>approach</i>	<i>drive</i>	<i>help</i>	<i>pass</i>	<i>win</i>
<i>drink</i>	<i>enter</i>	<i>leave</i>	<i>play</i>	<i>write</i>

- (III) VERBS WHICH CAN ALSO BE TRANSITIVE, but where the semantic connection between subject and verb is different in the two cases; eg the intransitive use has an affected participant as subject (cf 10.21f), whereas the transitive use has an agentive as subject (cf App I.54):

The door opened slowly. cf: Mary opened the door.
The car stopped. cf: He stopped the car.

Examples:

<i>begin</i>	<i>close</i>	<i>increase</i>	<i>turn</i>	<i>walk</i>
<i>change</i>	<i>drop</i>	<i>move</i>	<i>unite</i>	<i>work</i>

Type (III) also includes intransitive verbs with MUTUAL PARTICIPATION (cf 13.60), as in:

I have met you. ~ We have met.
The bus collided with the car. ~ The bus and car collided.

Intransitive verbs are numerous, particularly in categories (II) and (III).

Note [a] The following are examples of intransitive (ie Type I) phrasal verbs (cf 16.3):

<i>fall out</i> ['quarrel']	<i>make off</i> ['escape']	<i>pass away</i> ['die']
<i>blow over</i> [of a storm, etc]	<i>fall back</i> ['retreat']	<i>catch on</i> ['understand']
<i>come off</i> ['succeed']	<i>make up</i> ['end a quarrel']	<i>pull up</i> ['stop']
<i>look up</i> ['improve']	<i>fall through</i> ['fail']	<i>crop up</i> ['occur']
<i>come out</i> ['bloom']	<i>pass out</i> ['faint']	<i>opt out</i> [of a choice]
<i>come to</i> ['become conscious']	<i>fall off</i> ['decline']	

Further examples are to be found in 16.3.

[b] Category (I) includes the intransitive verbs *lie* and *rise*, which are sometimes confused by native speakers with their transitive counterparts *lay* and *raise*, because of their formal similarity. A similar correspondence exists between *fall* (intransitive) and *fell* (transitive); eg: *They felled a tree*.

Types of verb complementation

16.20 There are four main types of complementation to consider:

- [A] Copular, eg: *John is only a boy*.
- [B] Monotransitive, eg: *I have caught a big fish*.
- [C] Complex transitive, eg: *She called him a hero*.
- [D] Ditransitive, eg: *He gave Mary a doll*.

Although these complementation types have already been generally discussed in 2.16 and elsewhere, it is necessary now to list the verbs of each type in more detail, paying particular attention to the active-passive relation (cf 3.69ff). In this survey, we shall also list variants on the above patterns; for example, cases where the verb is followed by a finite or nonfinite clause. Such variants will be distinguished by numbers: [A1], [B2], etc. The various sub-types of complementation under these headings are illustrated in Table 16.20.

In addition, we shall use where necessary the suffixes 'ph' (for phrasal verbs), 'pr' (for prepositional verbs), and 'ph-pr' (for phrasal-prepositional verbs). For example, [B4ph-pr] will refer to a class of phrasal-prepositional verbs taking a *wh*-clause as prepositional object (eg: *find out about whether ...*). It is not always necessary to recognize such detailed classifications, but it is useful to be able to do so when the occasion arises. Two points may be noted about complementation of multi-word verbs. First, a phrasal verb cannot normally be interrupted by a clause as object:

He left off *driving a car*. ~ *He left *driving a car* off.

Second, a Type I prepositional or phrasal-prepositional verb is appropriately classified, for the purposes of complementation, as monotransitive, since the prepositional object is analogous (eg with respect to the active-passive relation) to a direct object (cf 16.14). In general, multi-word verbs behave like other verbs of the same general type, and we will make a point of mentioning them or listing them separately only when they are numerous or where there is something special to be noted about them.

(Note: in Table 16.20, +S = 'with subject'; -S = 'without subject'.)

Table 16.20 Verb complementation types

Variants	Example	Section
COPULAR (Types SVC and SVA)		
[A1] Adjectival C _s	<i>The girl seemed restless.</i>	(16.21)
[A2] Nominal C _s	<i>William is my friend.</i>	(16.22)
[A3] Adverbial complementation	<i>The kitchen is downstairs.</i>	(16.24)
MONOTRANSITIVE (Type SVO)		
[B1] Noun phrase as O (with passive)	<i>Tom caught the ball.</i>	(16.26)
[B2] Noun phrase as O (without passive)	<i>Paul lacks confidence.</i>	(16.27)
[B3] <i>That</i> -clause as O	<i>I think that we have met.</i>	(16.30)
[B4] <i>Wh</i> -clause as O	<i>Can you guess what she said?</i>	(16.35)
[B5] <i>Wh</i> -infinitive as O	<i>I learned how to sail a boat.</i>	(16.37)
[B6] <i>To</i> -infinitive (-S) as O	<i>We've decided to move house.</i>	(16.38)
[B7] <i>-Ing</i> clause (-S) as O	<i>She enjoys playing squash.</i>	(16.39)
[B8] <i>To</i> -infinitive (+S) as O	<i>They want us to help.</i>	(16.41)
[B9] <i>-Ing</i> clause (+S) as O	<i>I hate the children quarrelling.</i>	(16.42)
COMPLEX TRANSITIVE (Types SVOC and SVOA)		
[C1] Adjectival C _o	<i>That music drives me mad.</i>	(16.44)
[C2] Nominal C _o	<i>They named the ship 'Zeus'.</i>	(16.46)
[C3] O + adverbial	<i>I left the key at home.</i>	(16.48)
[C4] O + <i>to</i> -infinitive	<i>They knew him to be a spy.</i>	(16.50)
[C5] O + bare infinitive	<i>I saw her leave the room.</i>	(16.52)
[C6] O + <i>-ing</i> clause	<i>I heard someone shouting.</i>	(16.53)
[C7] O + <i>-ed</i> clause	<i>I got the watch repaired.</i>	(16.54)
DITRANSITIVE (Type SVOO)		
[D1] Noun phrases as O ₁ & O ₂	<i>They offered her some food.</i>	(16.55)
[D2] With prepositional O	<i>Please say something to us.</i>	(16.56)
[D3] O ₁ + <i>that</i> -clause	<i>They told me that I was ill.</i>	(16.59)
[D4] O ₁ + <i>wh</i> -clause	<i>He asked me what time it was.</i>	(16.61)
[D5] O ₁ + <i>wh</i> -infinitive clause	<i>Mary showed us what to do.</i>	(16.62)
[D6] O ₁ + <i>to</i> -infinitive	<i>I advised Mark to see a doctor.</i>	(16.63)

Within the sub-types [A1], [A2], etc it is sometimes valuable to distinguish additional semantic sub-types, for which the roman numerals (i), (ii), etc will be used. Other distinguishing marks applied to verbs in the following sections will be explained where they occur.

Copular complementation

[A1] Adjective phrase as subject complement

- 16.21 A verb is said to have COPULAR complementation when it is followed by a subject complement (C_s) or a predication adjunct (cf 2.16, 2.22, 8.26ff), and when this element cannot be dropped without changing the meaning of the verb. The verb in such a clause is a COPULAR (or linking) verb, and is equivalent in function to the principal copula, the verb *be*. Copular verbs fall into two main classes, according to whether the subject complement has the role of CURRENT ATTRIBUTE or of RESULTING ATTRIBUTE (cf 10.20). This

distinction corresponds to that between CURRENT copulas and RESULTING copulas (cf conclusive verbs, 4.35). Normally, current copulas are stative (cf 4.28ff), and cannot cooccur with the progressive aspect.

The distinction is illustrated below with an adjectival complement, the first kind of complementation we will consider:

CURRENT: The girl *seemed* very restless.

RESULTING: The girl *became* very restless.

The following is a fairly full list of verbs regularly used in this pattern, together with typical adjectival complements:

CURRENT	RESULTING
(i) <i>be</i> (friendly) [N]	(iv) <i>become</i> (older) [N]
(ii) <i>appear</i> (happy) [N]	<i>come</i> (true)
<i>feel</i> (annoyed) [N]	<i>end up</i> (happy) [N]
<i>look</i> (pretty) [N]	<i>get</i> (ready)
<i>seem</i> (very restless) [N]	<i>go</i> (sour)
<i>smell</i> (sweet)	<i>grow</i> (tired)
<i>sound</i> (surprised) [N]	<i>prove</i> (rather useful) [N]
<i>taste</i> (bitter)	<i>turn</i> (cold) [N]
(iii) <i>remain</i> (uncertain) [N]	<i>turn out</i> (fortunate) [N]
<i>keep</i> (silent)	<i>wind up</i> (drunk) [N] <informal>
<i>stay</i> (motionless) [N]	

End up, *turn out*, and *wind up* are copular phrasal verbs. The verbs marked [N] in the list also occur with a noun phrase complement (though not all with the same freedom or acceptability; cf 16.22). The roman numerals in the list identify semantic groups which are discussed in 16.24 below.

In addition to the copular verbs above, there are verbs which have this function with severe restrictions on the words occurring in the complement (cf 10.16). The restriction may be a lexical restriction to certain idiomatic verb-adjective sequences such as *rest assured* (cf 16.17), or it may be a semantic restriction (eg the meaning of *blush* restricts the adjective to a subset of colour words; *blush scarlet*, but not **blush green*). Some examples are given below, with typical adjective complements:

CURRENT	RESULTING
(v) <i>burn</i> (low)	(vi) <i>blush</i> (bright red)
<i>lie</i> (flat)	<i>fall</i> (silent)
<i>loom</i> (large)	<i>fall down</i> (dead)
<i>play</i> (rough) [N]	<i>freeze</i> (solid)
<i>plead</i> (innocent)	<i>run</i> (wild)
<i>rest</i> (assured)	<i>slam</i> (shut)
<i>stand</i> (firm) [N]	<i>spring</i> (open)
<i>stand up</i> (straight)	<i>wax</i> (eloquent) <archaic>

Many of these verbs resemble intransitive verbs, the complement being added almost as an optional specifier.

Note [a] *Go* is current in *go hungry/naked*, but is normally resulting elsewhere, as in *go* [= 'become'] *sour/red/wild/mad*.

[b] *Die* as in: *He died young/poor*, etc does not fit easily into either of the categories listed. The verb *die* itself is conclusive, but the complement which follows it refers to a current attribute. The meaning is: 'He was young/poor, etc at the time of his death'.

[A2] Noun phrase as subject complement

16.22 Again, the verb *be* is the principal copula used in this pattern:

William *is* my friend. Oslo *seems* a pleasant city.

The verbs marked [N] in 16.21 can be used with noun phrase complements, as well as with adjective phrase complements. The following list of such verbs is fairly full. However, it should be noted that especially in American English, there is a tendency to avoid this construction with certain verbs. Instead, both AmE and BrE prefer an infinitive construction (Type [B6] in 16.38 below) with *to be* following the finite verb:

It appears the only solution. ~ It appears *to be* the only solution.

There is also, especially in informal AmE, a tendency to prefer a construction in which a copular verb is followed by *like* (cf 16.24 Note [a]):

It seems *like* the only solution.

CURRENT	RESULTING
(i) <i>be</i> (my friend)	(iv) <i>become</i> (an expert)
(ii) <i>appear</i> ¹ (the only solution)	<i>end up</i> (her slave)
<i>feel</i> ¹ (a fool)	<i>prove</i> ¹ (his equal)
<i>look</i> ¹ (a fine day)	<i>turn</i> (traitor)
<i>seem</i> (a genius)	<i>turn out</i> (a success/disaster)
<i>sound</i> ¹ (a reasonable idea)	<i>wind up</i> (a millionaire) <informal>
(iii) <i>remain</i> (good friends)	

The classes (i-iv) match those in 16.21. (On the omission of the article in the complement in *become president*, etc, cf 5.42.) The superscript '1' indicates that such verbs do not often occur in this pattern but (particularly in AmE) are preferred in the construction with *to be* or *like* (see above).

Note [a] With a noun phrase complement, *feel* has the meaning 'have the sensation of being ...'; but with an adjective complement, it has not only this meaning (as in *She felt ill*), but also the meaning of 'cause a sensation ...', as in *The table felt rough* (cf 4.29f).

[b] The noun phrase following *act as*, *count as*, *pose as*, *pass for* and similar combinations is in a copular relation with the subject, and these combinations may be reasonably described as 'copular prepositional verbs' on the analogy of intransitive and transitive prepositional verbs (cf 16.5-7; also 16.47). Corresponding to these constructions with current meaning are resulting copular prepositional verbs such as *change into*, *grow into*, and *turn into*, with the general meaning of 'become'. Note the near-synonymy of *He turned traitor* and *He turned into a traitor*.

[c] Some verbs occur more marginally in the above patterns; eg: *stay* in *They stayed good friends*. *Turn* as in *turn traitor* is formulaic, and is more or less restricted to a small number of combinations.

[d] One or two verbs such as *make* and *part* can appear with a noun phrase complement, but not with an adjective phrase complement:

They *parted* the best of friends.

They *make* a charming couple.

(In a sentence like *They parted friendly once more*, *friendly once more* would be not a complement, but a verbless clause; cf 10.16, 14.9.)

Semantic notes on copular verbs

- 16.23** The main verb *be* is the most central copular verb, and the most neutral in meaning. It is also overwhelmingly the most common. Although it generally has current and stative meaning, notice should be taken of its use also in reference to events and activities:

There was a roar as the ball bounced off the goalpost.
You're being very helpful. (cf 4.31)

In some cases, *be* is close in meaning to *become*:

Ann will *be* a qualified nurse next year.
Cora was angry when she heard about the accident.

As the lists in 16.21–2 show, copular verbs apart from *be* fall into three classes. First, there is the division between current and resulting verbs; then the current verbs divide further into 'verbs of *seeming*' (ii) (including *seem*, *appear*, and the perception verbs *look*, *sound*, etc), and 'verbs of *remaining*' (iii) such as *remain*, *stay*, and *keep*. The resulting verbs (iv) are in the main 'verbs of *becoming*', but their meanings differ in detail, as we shall now briefly show.

Become is a process verb (cf 4.34), placing emphasis on the duration of the change, whereas *get* places more emphasis on the agency behind the event or on the result of the change: *Get ready!* but not **Become ready!* *Go* and *turn* tend to refer to changes which happen in spite of human agency, and therefore are often used for deteriorations: *go mad*; *go wild*; *go sour*; *go stale*; *turn livid*; *turn white* [of hair]; *turn sour*. *Turn* more especially seems to apply to natural changes from one state to its opposite: *turn green/brown* [of leaves]; *turn fine/cold* [of weather]; *turn ripe* (BrE). *Grow* is also associated with natural changes, especially with gradual changes (*grow old*, *grow tall*), and is likely to occur with comparative adjectives as in *grow cooler*, *grow more content*. In many cases, more than one verb can occur with the same adjective, and it is difficult to give precise conditions for selecting one rather than another.

Note *Come* is very restricted as a copular verb, but it makes an interesting contrast with *go* in examples like *go wrong/come right*. The association of *go* with deterioration (*go rotten*, etc) is complemented by the association of *come* with improvement in *come true*, etc. These associations may be connected with the positive and negative direction (from the speaker's viewpoint) of *come* and *go* as verbs of motion.

[A3] Complementations by an adjunct

- 16.24** The principal copula that allows an adverbial as complementation is once again *be*. The complementing adverbials, termed predication adjuncts in this function, are mainly space adjuncts (cf 8.3, 8.39ff):

The children are *at the zoo*. The kitchen is *downstairs*.

but time adjuncts too are common with an eventive subject (cf 8.76):

The party will be *at nine*. The outing is *tomorrow*.

and other types of predication adjunct are grammatical (for further examples cf 10.10).

Get and *keep* are two more copular verbs which occur specifically with place adjuncts (or adjuncts metaphorically related to these):

At last we got *home*. Get off that chair!
They kept out of *trouble*. How did you get *here*?

Be, *get*, and *keep* are clearly copular verbs in this function because of their inability to occur without the adjunct: **The children are*; **At last we got*; **They kept*. More marginally, other verbs such as *live*, *come*, *go*, *remain*, *stay*, *stand*, *lie* belong to this category (cf 8.27). These also occur as intransitive verbs with roughly the same locative (or abstract locative) meaning, but are in many contexts felt to be incomplete unless some complementation is added:

My aunt *lives* in Shropshire.
?*My aunt *lives*.

The need for the verb to be followed by some complementation is perhaps strongest in pure locative statements such as *Cannes lies on the French Riviera*. Whereas verbs like *live* and *lie* show the resemblance of adverbial complementation to the 'zero complementation' of intransitive verbs, verbs like *remain*, *stay*, *come*, *go*, *turn*, and *grow* show its similarity to copular complementation by adjective phrases. The parallel is brought out by pairs such as:

{ He turned <i>red</i> .	{ She grew <i>tall</i> .
{ He turned <i>into a monster</i> .	{ She grew <i>into a fine woman</i> .

However, for our purposes it will be preferable to treat sequences such as *turn into* and *grow into* as copular prepositional verbs (cf 16.22 Note [b]).

Note [a] The verbs of 'seeming' (cf 16.23) *seem*, *appear*, *look*, *sound*, *feel*, *smell*, and *taste* are complemented by an adverbial clause beginning *as if* (or less frequently *as though*) in sentences such as the following:

Jill looked *as if* she had seen a ghost.

It seems *as if* the weather is improving.

(In a similar meaning, *appear* and *seem* can also be followed by a *that*-clause; cf 16.34.) An alternative construction is one in which the *as if* clause is replaced by a phrase introduced by *like*:

That music *sounds like* Mozart. [ie 'like the music of Mozart']

Bill looks (just) *like* his father.

After the same verbs, one also frequently hears clauses introduced by *like*, but these are often regarded as nonstandard: *It seems like the weather is improving*.

[b] There is also a curious idiomatic use of *feel like* (cf 16.22 Note [a]) meaning 'want':

I *feel like* a cup of coffee.

Arguably, this is not copular; it belongs rather to the category of monotransitive prepositional verbs [B1pr] (cf 16.28).

[c] More exceptional cases of verbs with adverbial complementation are:

(i) *behave* followed by an adverbial of manner:

He behaved { well.
like a prisoner of conscience.

(However, *behave* can also occur intransitively or reflexively as in: *Why don't you behave (yourself)?*)

(ii) *last* and *take* followed by an adverbial of measure (duration):

The haymaking { took
lasted (for) } a week.

In the case of *take* the duration adverbial is obligatory, since the verb entails the completion of the task. In the case of *last*, the adverbial is omissible in such examples as:
The hot weather won't last.

Monotransitive complementation

- 16.25 Verbs used in monotransitive function require a direct object, which may be a noun phrase, a finite clause, or a nonfinite clause. In addition to these categories the verb may be a Type I prepositional verb (cf 16.5) or phrasal-prepositional verb (cf 16.9), which for our present purposes will be treated as analogous to a verb with a direct object. We will begin by considering the straightforward case of verbs with a noun phrase as direct object, and then continue with variants of this basic pattern.

Complementation by a noun phrase as direct object

[B1] With the passive

- 16.26 Direct objects are typically noun phrases which may become the subject of a corresponding passive clause:

Tom *caught* the ball. ~ The ball *was caught* (by Tom).

(On the limitations of the passive transformation, cf 3.67ff.) Common examples of monotransitive verbs allowing the passive are:

<i>begin</i>	<i>desire</i>	<i>get</i>	<i>love</i>	<i>pass</i>	<i>support</i>
<i>believe</i>	<i>do</i>	<i>hear</i>	<i>make</i>	<i>produce</i>	<i>take</i>
<i>bite</i>	<i>doubt</i>	<i>help</i>	<i>marry</i>	<i>receive</i>	<i>use</i>
<i>bring</i>	<i>end</i>	<i>hold</i>	<i>mean</i>	<i>remember</i>	<i>visit</i>
<i>call</i>	<i>enjoy</i>	<i>keep</i>	<i>meet</i>	<i>require</i>	<i>want</i>
<i>carry</i>	<i>expect</i>	<i>know</i>	<i>mind</i>	<i>say</i>	<i>wash</i>
<i>close</i>	<i>feel</i>	<i>lead</i>	<i>move</i>	<i>see</i>	<i>waste</i>
<i>cut</i>	<i>find</i>	<i>like</i>	<i>need</i>	<i>start</i>	<i>watch</i>
<i>describe</i>	<i>follow</i>	<i>lose</i>	<i>obtain</i>	<i>study</i>	<i>win</i>

Some of these verbs, such as *end* and *move*, belong to types which can be either intransitive or transitive (cf 16.19). Something of the range of monotransitive verbs can be seen by dividing them into semantic groups according to the kinds of subject and object that they take:

- (i) Typically animate subject + typically concrete object:

Professor Dobbs *won* the prize.

~ The prize *was won* (by Professor Dobbs).

<i>carry</i>	<i>cover</i>	<i>examine</i>	<i>see</i>	<i>throw</i>	<i>win</i>
<i>clean</i>	<i>eat</i>	<i>lower</i>	<i>stop</i>	<i>watch</i>	<i>write</i>

- (ii) Typically animate subject + either concrete or abstract object:

Everybody *understood* the problem.

~ The problem *was understood* (by everybody).

<i>abolish</i>	<i>define</i>	<i>explain</i>	<i>invent</i>	<i>report</i>	<i>utter</i>
<i>cover</i>	<i>discuss</i>	<i>forget</i>	<i>lose</i>	<i>rule</i>	<i>win</i>

- (iii) Typically animate subject + typically animate object:

Mrs Wood *liked* the new neighbours.

~ The new neighbours *were liked* (by Mrs Wood).

<i>admire</i>	<i>despise</i>	<i>hug</i>	<i>kiss</i>	<i>reject</i>	<i>ridicule</i>
<i>beat</i>	<i>flatter</i>	<i>kill</i>	<i>meet</i>	<i>respect</i>	<i>support</i>

- (iv) Typically concrete or abstract subject + animate object:

The news *shocked* our family.

~ Our family *was shocked* (by the news).

<i>affect</i>	<i>bother</i>	<i>fascinate</i>	<i>incense</i>	<i>satisfy</i>	<i>trouble</i>
<i>appal</i>	<i>deceive</i>	<i>grieve</i>	<i>please</i>	<i>surprise</i>	<i>upset</i>

Note The following is a sample of monotransitive (or Type II) phrasal verbs [B1ph] with typical objects. Further examples are illustrated in 16.4.

<i>back up</i> ['support' someone]	<i>let down</i> ['disappoint' someone]
<i>blow down</i> (a tree)	<i>make up</i> (a story)
<i>break off</i> (negotiations)	<i>pass over</i> (a question)
<i>bring about</i> (a change)	<i>put across</i> (an idea)
<i>burn down</i> (a house)	<i>put off</i> (an appointment)
<i>draw up</i> (a contract)	<i>tell off</i> ['rebuke' someone]
<i>fill out</i> (a form)	<i>turn off</i> (the light)
<i>knock down</i> (someone)	<i>win over</i> ['convince' someone]

These, like the verbs in (i-iv) above, can be used in the passive voice.

[B2] Without the passive

- 16.27 A few stative monotransitive verbs, the most common of which is *have*, normally do not allow a passive transformation:

They *have* a nice house. ~ *A nice house *is had* (by them).

These so-called MIDDLE VERBS, including *have*, *lack*, *fit*, *suit*, and *resemble*, are discussed in detail in 10.14.

Note A related type of verb is found in expressions of measure such as *cost ten dollars*; *weigh 20 kilos*; but these can equally well be analysed as having an obligatory adjunct as complementation, since *How much ... ?* is an alternative question to *What ... ?* in eliciting this kind of expression as a reply:

A: <i>What</i>	} does it	{ cost?	B: <i>Ten dollars.</i>
A: <i>How much</i>		{ weigh?	B: <i>Twenty kilos.</i>

Variants of monotransitive complementation

Complementation by noun phrase as prepositional object

[B1pr] Prepositional verbs

- 16.28 Although verbs such as *look at* have been classified as 'Type I prepositional verbs' (those without a direct object; cf 16.5), in the analysis of complementation they fit more happily with monotransitive rather than intransitive verbs. This is partly because of the resemblance of the prepositional object to a direct object, eg in accepting a passive voice (cf 16.14), though usually with some awkwardness of style:

The management *paid for* his air fares.

~ His air fares *were paid for* by the management.

But also when a prepositional verb is followed by a *that*-clause or a *to*-infinitive clause, the preposition disappears, and the prepositional object merges with the direct object of the monotransitive pattern. Compare the following two series, (A) with a prepositional verb and (B) with an ordinary monotransitive verb:

(A) They *agreed* {
on the meeting.
on it.
on meeting each other.
on when to meet.
(that) they would meet.
to meet each other.

(B) They *remembered* {
the meeting.
it.
meeting each other.
when to meet.
(that) they had met.
to meet each other.

Yet the preposition omitted before a *that*-clause can reappear in the corresponding passive: *That they should meet was agreed (on)*, even in extraposition (cf 18.33ff), where the preposition immediately follows the passive verb phrase:

It was *agreed (on)* eventually that they should meet.

Examples of Type I prepositional verbs are:

<i>account for</i>	<i>concentrate on</i>	<i>look after/at/on/to</i>
<i>add to</i>	<i>conform to</i>	<i>object to</i>
<i>adjust to</i>	<i>consent to</i>	<i>part with</i>
<i>admit to</i>	<i>contribute to</i>	<i>pay for</i>
<i>agree with/on/to</i>	<i>deal with</i>	<i>pray for</i>
<i>aim at/for</i>	<i>decide on</i>	<i>preach about/on</i>
<i>allow for</i>	<i> dwell (up)on</i>	<i>provide for</i>
<i>apply for</i>	<i>enlarge (up)on</i>	<i>quarrel about/with</i>
<i>argue about</i>	<i>hear about/of</i>	<i>read about</i>
<i>arrange for</i>	<i>hint at</i>	<i>refer to</i>
<i>ask for</i>	<i>hope for</i>	<i>rejoice at</i>
<i>attend to</i>	<i>insist on</i>	<i>rely on</i>
<i>believe in</i>	<i>interfere with</i>	<i>resort to</i>
<i>call for/(up)on</i>	<i>learn about</i>	<i>run for</i>
<i>care for</i>	<i>lecture about/on</i>	<i>speak about/on</i>
<i>comment on</i>	<i>listen to</i>	<i>take to</i>
<i>complain about</i>	<i>live on</i>	<i>think about/of</i>
<i>conceive of</i>	<i>long for</i>	<i>wish for</i>

Note [a] When *to* precedes an infinitive, it is an infinitive marker (as in *forget to meet her*) and not a preposition; when it precedes an -ing participle, however, it is a preposition (as in *She consented to getting engaged*). Other examples of *to* in a prepositional verb preceding an -ing clause are:

He *admitted to* doing his bit.

This *amounts to* doing nothing.

I *confess to* telling a lie.

She *took to* playing golf.

[b] Prepositions may combine with *that* to form complex subordinators such as *in that*, *save that*, *except that* (cf 14.12).

[c] In general, choice of preposition is the same for morphologically related verbs and nouns: *refer to* ~ *reference to*; *believe in* ~ *belief in*, etc. There are exceptions, however: *hope* as a verb is followed by *for*, while the corresponding noun construction has *of*: *He hopes for success*, but *His hope of success*.

[B1ph-pr] Phrasal-prepositional verbs

16.29 Type I PHRASAL-PREPOSITIONAL VERBS also take a prepositional object. As we saw in 16.9, such verbs can, like prepositional verbs, occur in the passive (eg: *She dealt with the problem* ~ *The problem was dealt with*); but many of them are awkward, in fact barely acceptable, in this construction: ?**The discussion was walked out on* (by the principal negotiator). In the sample list below, the verbs marked [P] are among those that can fairly readily occur in the passive:

<i>break in on</i>	<i>keep away from</i> ['avoid']
(someone's conversation)	<i>keep up with</i> (the Joneses)
<i>catch up on</i> (my reading)	<i>look down on</i> ['despise'] [P]
<i>catch up with</i> ['overtake']	<i>look forward to</i>
<i>check up on</i> ['investigate'] [P]	['anticipate with pleasure'] [P]
<i>come down with</i> (a cold)	<i>look out for</i> ['watch for']
<i>cut down on</i> (expenses)	<i>look up to</i> ['respect'] [P]
<i>do away with</i> ['abolish'] [P]	<i>put up with</i> ['tolerate'] [P]
<i>face up to</i> ['confront'] [P]	<i>run away with</i>
<i>get away with</i> (a crime)	<i>stand up for</i> ['defend']
<i>get down to</i> (serious talk)	<i>turn out for</i> (a meeting)

Phrasal-prepositional verbs are rather informal, and many of them have idiomatic metaphorical meanings which are difficult or impossible to paraphrase (eg: *run away with*).

Complementation by a finite clause

[B3] *That*-clause as object

16.30 The conjunction in *that*-clauses which function as object may be zero, as in *I hope he arrives soon*; but when the clause is made passive, the *that* cannot be deleted, and thus obeys the same rules as other *that*-clauses as subject (cf 15.4). The normal passive analogue has *it* and extraposition, *that* being again optional:

Everybody hoped (that) she would sing.

~ That she would sing was hoped by everybody. (stilted)

~ *She would sing was hoped by everybody.

~ It was hoped by everybody (that) she would sing.

That-clauses have one of three types of verb phrase, depending on the 'governing' verb in the matrix clause:

- (A) indicative verb: I suppose that he
is coming alone.
will be coming alone.
will come alone.
has come alone.
- (B) putative *should*: I regret that he *should be* so stubborn.
- (C) subjunctive verb: I request that she *go* alone.

(A) with the indicative is the most usual type. The putative *should* type (cf 14.25) (B) is more common in BrE than AmE, and (C) the mandative subjunctive (cf 3.58–9) is more common in AmE than in BrE. In BrE the subjunctive is felt to be formal, and is found typically in official styles of writing. Corresponding to these three constructions, it is necessary to recognize only two main categories of superordinate verbs. *Type (i)* may be called FACTUAL, since it goes with the indicative verb (A), and introduces what one might generally describe as factual or propositional information. *Type (ii)* may be described as SUASIVE; such verbs imply intentions to bring about some change in the future, whether or not these are verbally formulated as commands, suggestions, etc. Suasive verbs can be followed in the *that*-clause by all three constructions (A–C), but the indicative (A) construction is restricted, and is not generally accepted in AmE.

There are two minor categories, *Type (iii)* emotive verbs (cf 4.29, 10.23) and *Type (iv)* hypothesis verbs, which are dealt with in 16.33. These types are displayed in Fig 16.30:

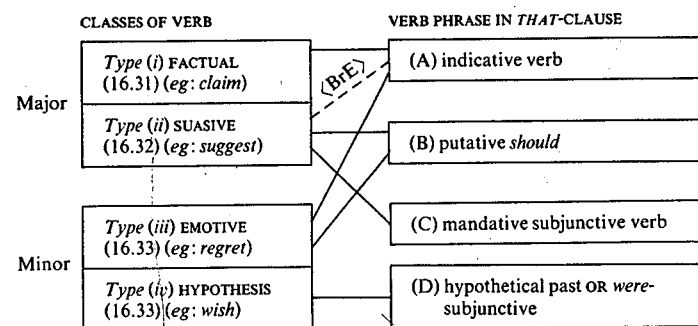

Fig 16.30 Monotransitive verbs with a *that*-clause as complementation (Class [B3])

Note In terms of the speech act classes of 11.2, *Type (i)* (factual) verbs are associated with the expression of speech acts concerned with STATEMENTS, while *Type (ii)* (suasive) verbs are associated with DIRECTIVES.

Type (i): Factual verbs

16.31 We may subdivide factual verbs into 'PUBLIC' and 'PRIVATE' types. The former consists of speech act verbs introducing indirect statements:

They *agree/admit/claim* that she was misled.

The superscripts 1–5 in the lists below are to be interpreted as follows:

- 1: The verb also occurs in the active with a *to*-infinitive directly following: *He promised to come* (cf 16.38).
- 2: The verb also occurs with a following noun phrase followed by a *to*-infinitive: *They supposed her to be dead* (cf 16.50).
- 3: The verb is also a member of the suasive group below, in 16.32.
- 4: The pro-form *so* can stand in place of the *that*-clause (cf 12.28); eg: *I think so*.
- 5: *Say* occurs with an infinitive, as in *She said to come before ten* in the directive sense of 'She told us to come before ten'.

Examples:

acknowledge ²	boast	declare ²	mention	report ²
add	certify ²	deny ²	object	retort
admit ²	claim ¹	disclose	predict ⁴	say ^{2,4,5}
affirm ²	comment	exclaim	proclaim ²	state ^{2,4}
agree ^{1,3}	complain	explain ²	promise ^{1,2,4}	submit
allege ²	concede ³	forecast	pronounce ²	suggest ³
announce ²	confess ²	foretell	prophecy	swear
argue	confide	guarantee ^{1,2}	protest	testify ²
assert	confirm ²	hint	remark	vow ¹
bet	contend	insist ³	repeat	warn ²
	convey	maintain ⁴	reply	write

The 'PRIVATE' type of factual verb expresses intellectual states such as belief and intellectual acts such as discovery. These states and acts are 'private' in the sense that they are not observable: a person may be observed to *assert that God exists*, but not to *believe that God exists*. Belief is in this sense 'private'. Examples of such verbs are:

accept	doubt	imagine ^{2,4}	realize
anticipate	dream	imply	reason
ascertain	ensure ³	indicate ⁴	recall
assume ^{2,4}	establish	infer ⁴	reckon ^{1,4}
believe ^{2,4}	estimate ²	insure	recognize ²
calculate	expect ^{1,2,4}	judge ²	reflect
check	fancy ²	know ²	remember
conclude	fear ^{1,4}	learn ¹	reveal ²
conjecture	feel ²	mean ^{1,2}	see
consider ²	find ²	note ²	sense
decide ^{1,3}	foresee	notice ^{2,4}	show ²
deduce	forget ¹	observe ²	signify
deem ²	gather ⁴	perceive ^{2,4}	suppose ^{2,4}
demonstrate	guess ⁴	presume ^{2,4}	suspect ^{2,4}
determine ^{1,3}	hear ⁴	presuppose ²	think ^{2,4}
discern	hold	pretend ¹	understand ^{2,4}
discover ²	hope ^{1,4}	prove ²	

Many of these verbs, especially the 'public' verbs, are also used for introducing direct speech; eg:

'Perhaps it's time to leave', *suggested* Tim.

For detailed discussion of this use of verbs of speaking and thinking, cf 14.30ff.

- Note [a] Not included in the first list above are verbs expressing manner of utterance, such as *mumble*, *mutter*, *shout*, *whimper*, *whisper*, and *yell*. These can introduce direct speech quotations (eg: 'I am ill', *she muttered*), but they can also introduce indirect or reported speech by means of a *that*-clause: *She muttered that she was ill*. The list of such verbs is large, and some verbs occur more easily with *that*-clauses than others do.
- [b] All the following phrasal verbs belonging to this 'factual' category are 'public' verbs: *chime in*, *let on*, *let out*, *make out*, *point out*, *report back*:
Tim *pointed out* that the train was often late.
- In this construction, the particle *has* to precede the *that*-clause.
- [c] Among the 'private verbs', *see*, *suppose*, and *assume* can be used with a *that*-clause in which the present tense refers to future time (cf 14.23):
See (to it) that they get something to eat.
See here means 'make sure'.
- [d] *Doubt*, being a verb of negative meaning, is typically followed by *whether/if* (cf 15.6, 16.35). But more especially when it is in a nonassertive context, *doubt* occurs with a *that*-clause:
I don't doubt (*but*) that they'll accept at once.
- Note that in this construction, *doubt* is sometimes followed by *but*. *Doubt* cannot be followed by an alternative *wh*-clause (cf 15.6):
*I doubt whether or not they'll accept.

Type (ii): Suasive verbs

- 16.32 These verbs can be followed by a *that*-clause either with putative *should* (cf 14.25) or with the mandative subjunctive. A third possibility, a *that*-clause with an indicative verb, is largely restricted to BrE:

People are demanding that she $\left\{ \begin{array}{l} \text{should leave} \\ \text{leave} \\ \text{leaves (esp BrE)} \end{array} \right\}$ the company. [1]

It is more difficult, in the case of suasive verbs, to make a subdivision between 'PUBLIC' and 'PRIVATE' verbs: for this reason, we present the verbs below in a single list. Nevertheless, generally it is useful to see a distinction between the 'public' verbs which describe indirect directives (such as *request*; cf 14.33), and the 'private' verbs which describe states of volition or desire, such as *intend*:

<i>agree</i> ¹	<i>demand</i> ¹	<i>intend</i> ^{1,2}	<i>recommend</i> ²
<i>allow</i> ²	<i>desire</i> ^{1,2}	<i>move</i> ⁴	<i>request</i> ^{1,2}
<i>arrange</i> ¹	<i>determine</i> ¹	<i>ordain</i> ^{2,4}	<i>require</i>
<i>ask</i> ^{1,2}	<i>enjoin</i> ²	<i>order</i> ²	<i>resolve</i> ¹
<i>beg</i> ^{1,2}	<i>ensure</i>	<i>pledge</i> ^{1,2}	<i>rule</i>
<i>command</i> ²	<i>entreat</i> ²	<i>pray</i> ^{1,2,4}	<i>stipulate</i>
<i>concede</i>	<i>grant</i>	<i>prefer</i> ^{1,2,4}	<i>suggest</i> ^{2,4}
<i>decide</i> ¹	<i>insist</i>	<i>pronounce</i> ²	<i>urge</i> ²
<i>decree</i> ⁴	<i>instruct</i> ²	<i>propose</i> ^{1,2}	<i>vote</i> ^{1,2}

The superscripts 1, 2 and 4 have the same meaning as in 16.31 above. The choice between the three constructions in the *that*-clause in [1] above varies between AmE and BrE. For detailed discussion of these preferences, cf 14.25.

It will be noted that the noun phrase + infinitive construction (cf 16.50) is a common alternative to the *that*-clause for suasive verbs:

They intended $\left\{ \begin{array}{l} \text{the news to be suppressed.} \\ \text{that the news (should) be suppressed. (more formal)} \end{array} \right\}$

With some verbs, such as *allow*, the infinitive construction is by far the more usual.

Other types of verb with *that*-clause complementation

Type (iii): Emotive verbs

- 16.33 This consists of a small group of verbs such as *regret*, *marvel*, *rejoice*, and *wonder*, which can occur with (A) the indicative or (B) the putative *should* construction, but not with the mandative subjunctive construction:

I regret that she $\left\{ \begin{array}{l} \text{worries about it.} \\ \text{should worry about it.} \\ \text{*worry about it.} \end{array} \right\}$

Semantically, this group belongs with adjectival constructions such as *be sorry*, *be anxious* (cf 16.71).

Type (iv): Hypothesis verbs

The two verbs *wish* and (in the imperative) *suppose* may be followed by a *that*-clause containing a verb in the hypothetical past or the *were*-subjunctive: *I wish (that) she were here*; *She wished she hadn't spent the money*; *Suppose (that) one of us died*. Cf 14.24 on the use of tense and mood following these verbs, which may also occur in a number of other patterns. In particular, for other uses of *wish*, cf 16.38, 16.41, 16.44, 16.46, 16.57.

The modal idiom *would rather* (or its contraction 'd rather) (cf 3.46) is a third example of a hypothesis verb:

I'd rather you didn't mention the price.

Many residents *would rather* that the bus service were subsidized.

Complementation by an extraposed subject *that*-clause

- 16.34 The *that*-clause in examples like *It seems that you are mistaken* is not an object of the verb, but rather an extraposed subject. Nevertheless, it resembles other *that*-clauses we have been examining (a) in having a deletable *that*, and (b) in being semantically associated with the preceding verb. Moreover, no nonextraposed *that*-clause is possible in this case (**That you are mistaken seems*), and so it seems appropriate to include this with *that*-clause complementation. The main verbs occurring in this pattern form two groups of synonyms: (i) *seem* and *appear*; and (ii) *chance*, *happen*, and *transpire*:

It *appears* that Frank lost his temper.

It *happened* that the weather was exceptionally cold.

The phrasal verbs *come about* [= 'happen'] and *turn out* [= 'transpire'] also belong here. *Appear* and *seem* can be followed by the pro-form *so*: *It seems/appears so*. The adverb *so* sometimes occurs before *happen* or one of its synonyms: *It so happens/happened that* . . .

- Note [a] A related construction with extraposed object (cf 18.35) occurs in the following transitive phrasal verbs:

let (it) out; *noise (it) about/abroad*; *put (it) about*; *rub (it) in*:
Jack *let (it) out* [= 'divulged'] that the animal had been stolen.

The *it* which occurs as preparatory object is in this case optional, although the omission is not usual. In the comparable construction *I take it that*, the *it* is obligatory: *I take it that you are enjoying yourselves.*

[b] Compare the complementation of *seem*, *appear*, etc by an *as if* clause (cf 16.24 Note [a]).

[c] On the related constructions *It strikes me that ...*, *It occurs/seems to me that ...*, cf 16.59 Note, 16.60 Note.

[B4] *Wh*-clause as object

16.35 Many of the verbs which take a *that*-clause as object can also take a *wh*-interrogative clause (cf 15.5ff):

I asked her to *confirm* whether the flight had been booked.

Can you *confirm* which flight we are taking?

They haven't yet *confirmed* how much the flight costs.

Notice that in all three illustrative sentences above, *confirm* occurs in what may be described as a nonassertive context (cf 2.53). The use of the *wh*-interrogative clause (which generally implies lack of knowledge on the part of the speaker) is particularly common where the superordinate clause is interrogative or negative. On the other hand, there are some verbs which themselves express uncertainty, such as *ask* and *wonder*: these occur with the *wh*-clause without this nonassertive constraint. Examples of verbs taking the *wh*-interrogative clause are:

<i>anticipate</i> [NA]	<i>doubt</i>	<i>note</i> [NA] ³
<i>argue</i> [NA] ²	<i>enquire</i> ^{2,3}	<i>notice</i> [NA] ³
<i>arrange</i> [NA] ³	<i>establish</i> ³	<i>observe</i> [NA] ³
<i>ascertain</i> ³	<i>explain</i> ³	<i>perceive</i> [NA] ³
<i>ask</i> ^{2,3}	<i>express</i>	<i>point out</i> [NA]
<i>beware</i> ²	<i>fathom</i> [NA]	<i>ponder</i> ³
<i>calculate</i> [NA] ³	<i>find out</i> ^{2,3}	<i>predict</i> [NA]
<i>care</i> [NA] ^{1,2}	<i>forget</i> ³	<i>prove</i>
<i>check</i> ^{2,3}	<i>guess</i>	<i>realize</i> [NA]
<i>choose</i> ³	<i>hear</i> [NA] ²	<i>record</i> [NA]
<i>confirm</i> [NA]	<i>imagine</i> [NA] ³	<i>reflect</i> ²
<i>consider</i> [NA] ³	<i>indicate</i> [NA] ³	<i>remember</i> [NA] ³
<i>decide</i> ^{2,3}	<i>inquire</i> ^{2,3}	<i>say</i> [NA] ³
<i>demonstrate</i> ³	<i>judge</i> ³	<i>see</i> [NA] ³
<i>depend</i> ²	<i>know</i> [NA] ³	<i>show</i> ³
<i>disclose</i>	<i>learn</i> [NA] ³	<i>tell</i> [NA] ^{1,3}
<i>discover</i> ³	<i>make out</i> [NA]	<i>think</i> [NA] ³
<i>discuss</i> ³	<i>mind</i> [NA] ¹	<i>wonder</i> ³

The symbol [NA] after a verb indicates that this complementation is particularly likely to occur in a nonassertive context. The superscripts 1–3 are interpreted as follows:

- 1: This verb is part of a negative or predominantly negative construction when combined with the *wh*-interrogative clause: *not care*; *not mind*; *can't fathom*; *can't tell*.
- 2: The verb is basically a prepositional verb, and has a preposition which may be optionally added (see below).

- 3: The verb can also occur with a following *wh*-infinitive clause (cf 16.37); eg: *I didn't know what to say.*

The preposition of a prepositional verb is optionally omitted before a *wh*-clause, and hence it is convenient to include in the above list verbs for which the *wh*-clause is basically a prepositional object. For example:

I inquired (about) whether the tickets were ready.

They haven't yet *decided (on)* which flight they will take.

For the corresponding passive, again, the preposition is optional, whether or not the nominal clause is in extraposition:

Which flight they will take has not yet been *decided (on)*.

It has not yet been *decided (on)* which flight they will take.

Sometimes there is a slight difference of meaning if the preposition is included; contrast:

She *asked* what he wanted.

≠ She *asked about* what he wanted.

Whereas *ask* introduces the question which the speaker actually asked and for which she requires an answer, *ask about* does not indicate what the question might have been. Other prepositional verbs in this class are: *argue (about)*; *beware (of)* (cf 3.54 Note); *not care (about)*; *check (on)*; *depend (on)*; *hear (about)*; *reflect (on)*. There is also the phrasal-prepositional verb *find out (about)*.

Note A few verbs are followed by a *wh*-exclamative clause (indirect exclamation; cf 10.104) beginning with *what* or *how*: *I realized what a fool I had been*; *I know how busy you are*. These clauses are difficult to distinguish from *wh*-interrogative clauses. Other verbs in the pattern include *exclaim*, *express*, *marvel*, *reflect*, *think*.

Complementation by a nonfinite clause

Nonfinite clauses in complementation

- 16.36 When a nonfinite clause follows the verb it is often difficult to separate three of the major types of complementation which we distinguished in 2.16. This is especially true if a noun phrase intervenes between the superordinate verb and the verb of the nonfinite construction:

They like *the children to visit them*. [1]

They supposed *the children to be guilty*. [2]

They asked *the children to bring some food*. [3]

On the face of it, all three of these sentences conform to the same pattern (verb + noun phrase + *to*-infinitive ...). But there are reasons for classifying them differently:

- [1] exemplifies MONOTRANSITIVE complementation (16.38ff)
(cf: *They like the children's visits* – SVO)
- [2] exemplifies COMPLEX TRANSITIVE complementation (16.43ff)
(cf: *They supposed the children guilty* – SVOC)

- [3] exemplifies DITRANSITIVE complementation (16.55ff)
(cf: *They asked the children a question* – SVOO)

We will return in 16.64ff to differences between examples such as these. At present, since we are dealing with monotransitive complementation, we are concerned only with the type illustrated by [1]. In nominal function, only two kinds of nonfinite clause normally occur: the *to*-infinitive clause and the *-ing* participle clause. Hence nonfinite clauses functioning as object can be distinguished, for the present purposes, in terms of the categories in Table 16.36:

Table 16.36 Nonfinite clauses as object

	Without subject	With subject
<i>to</i> -infinitive	[B6] Jack hates <i>to miss the train.</i>	[B8] Jack hates <i>her to miss the train.</i>
<i>-ing</i> participle	[B7] Jack hates <i>missing the train.</i>	[B9] Jack hates <i>her missing the train.</i>

In Table 16.36, the italicized parts are analysed as nonfinite clauses acting as direct object. The status of the infinitive clause and its subject in pattern [B8] is discussed in 16.41. Later, in 16.66, we consider the arguments for considering *her* an object in the [B8] and [B9] examples.

The following criteria confirm that the italicized portion of [B6–B9] is basically a nonfinite clause as direct object:

- (A) The nonfinite clause can be replaced by a pronoun *it* coreferring to a clause, or by a noun phrase nominalizing the meaning of a clause:
Everyone likes it; He likes her frequent visits.
- (B) The nonfinite clause can be made the focus of a pseudo-cleft sentence (cf 18.29):

What everyone likes (best) is *to talk to her.* [B6]
What everyone likes (best) is *talking to her.* [B7]
What he likes (best) is *for her to call often.* [B8]

In this version of [B8], as the infinitive clause is now in complement position, the introductory *for* has to make its appearance.

- (C) For [B8] the introductory *for* itself, where it appears, is a marker of the construction as a nonfinite clause.
- (D) Correspondingly, for [B9], a subject pronoun in the objective case can often be replaced, in formal style, by a possessive pronoun (cf 14.6):

He doesn't like *me/my coming often.*

This is what one would expect (cf 15.12) given that *me* and *my* can both be subjects of an *-ing* clause.

Not all verbs that we consider direct objects satisfy all these criteria. Nevertheless, it is on this basis that the verbs listed below are included in the classes [B6–B9].

[B5] *Wh*-infinitive clause as object

- 16.37 It is as well to begin the survey of nonfinite clauses as objects with clauses which happen to be immediately related to those dealt with in 16.35. These are *wh*-infinitive clauses (cf 15.5):

He learned *how to sail a boat* as a small boy.
You must not forget *when to keep your mouth shut.*
I couldn't decide (on) *which bicycle to buy.*

The last example illustrates the occurrence of the optional preposition with prepositional verbs, as already observed with finite clauses of the same type. The corresponding passive pattern also occurs:

The Curies discovered *how to isolate radioactive elements.*
~ *How to isolate radioactive elements* was discovered by the Curies.

The passive with extraposition (cf 16.30, 16.35) is also sometimes possible:

Early in the present century, it was discovered *how to isolate radioactive elements.*

The verbs marked '3' in the list in 16.35 above provide a sample of verbs occurring with the *wh*-infinitive clause as object.

Note Many verbs which introduce *wh*-infinitive clauses rarely if ever introduce *yes-no* interrogative clauses (introduced by *whether*) of the same type: *I have forgotten how to swim* but not **I have forgotten whether to swim.* Among such verbs are *demonstrate*, *discover*, and *explain*. Nevertheless in unusual contexts such sentences can be found:

I have forgotten whether to unfreeze this food before cooking it.

[B6] Subjectless infinitive clause as direct object

- 16.38 When a subjectless infinitive clause is direct object, the 'understood' subject of the infinitive clause is always the same as the subject of the superordinate clause. Verbs taking this kind of complementation are listed below, subdivided into semantic categories:

(i) <i>dread</i> [B7, B8]	(iv) <i>choose</i> [B7]	(vi) <i>ask</i>	(vii) <i>affect</i>
<i>hate</i> [B7, B8]	<i>hope</i>	<i>beg</i>	<i>claim</i>
<i>like</i> [B7, B8]	<i>intend</i> [B7, B8]	<i>decline</i>	<i>profess</i> [B7]
<i>loathe</i> [B7, B8]	<i>mean</i> [B7, B8]	<i>demand</i>	(viii) <i>afford</i> [B7]
<i>love</i> [B7, B8]	<i>need</i> [B7]	<i>offer</i>	<i>attempt</i> [B7]
<i>prefer</i> [B7, B8]	<i>plan</i> [B7]	<i>promise</i>	<i>contrive</i>
	<i>propose</i> [B7]	<i>refuse</i>	<i>endeavour</i>
(ii) <i>begin</i> [B7]	<i>want</i> [B7, B8]	<i>swear</i>	<i>fail</i>
<i>cease</i> [B7]	<i>wish</i> [B8]	<i>undertake</i>	<i>learn</i>
<i>commence</i> [B7]		<i>vow</i>	<i>manage</i>
<i>continue</i> [B7]	(v) <i>deign</i>		<i>neglect</i>
<i>start</i> [B7]	<i>disdain</i> [B7]		<i>omit</i>
	<i>help</i> [B7, B8]		<i>try</i> [B7]
(iii) <i>forget</i> [B7]	<i>scorn</i> [B7]		
<i>remember</i> [B7]	<i>venture</i> [B7]		
<i>regret</i> [B7]			

The symbols to the right of some verbs indicate that these verbs also occur with the subjectless *-ing* clause (Type [B7]) or with the infinitive clause with a subject (Type [B8]). From the latter group, however, verbs such as *ask* are excluded, because the construction of sentences like *He asked me to help* is ditransitive (cf 16.63) rather than monotransitive.

We now add a list of prepositional verbs belonging to the same pattern [B6pr]. The preposition is omitted before the infinitive clause object (cf 9.2), but is present where the prepositional object is a noun phrase or, for that matter, an *-ing* clause. Compare:

She didn't bother	{ about the baby.	[B1pr]
	{ about feeding the baby.	[B7pr]
	{ to feed the baby.	[B6pr]

In the following list, the verbs are placed in semantic groupings corresponding to some of those above (apart from an additional miscellaneous group (ix)), and the omitted preposition is placed in square brackets:

- | | |
|-------------------------------|-------------------------------|
| (i) long [for] [B8] | (vi) agree [to/on/about] [B8] |
| ache [for] | assent [to] |
| aim [for] [B8] | consent [to] |
| aspire [to] | |
| burn [for] | (vii) pretend [to] |
| burst [for] | |
| (not) care [for] | (viii) strive [for] |
| clamour [for] [B8] | seek [for] |
| itch [for] [B8] | (ix) arrange [for] [B7, B8] |
| yearn [for] [B8] | decide [on] [B7] |
| | resolve [on] [B7] |
| (iii) bother [about] [B7, B8] | prepare [for] [B7] |
| condescend [to] | serve [for] [B7] |
| delight [in] [B7] | |
| hesitate [about] [B7] | |

Examples:

Martin *longed* to leave home.
 They *sought* to make amends.
 I would *hesitate* to interfere.
 We've *decided* to move to a new house.

Note [a] We distinguish the verbs of Type [B6] from catenative verbs (cf 3.49) of 'seeming' and 'occurrence' preceding infinitive clauses which are not direct objects, but which relate semantically to a *that*-clause as subject: *He appears to like the show* ~ *That he likes the show appears [true]*. The verbs in this class correlate closely with those occurring with obligatory extraposition of the subject (cf 16.34) *appear, seem, chance, happen, turn out*:

It *appeared/chanced* that the children were asleep.

~ The children *appeared/chanced* to be asleep.

[b] Another group of verbs which are closely associated with a following infinitive but which do not belong to Type [B6] includes *hasten, conspire, and set out*:

I *hastened* to reassure her.

They *conspired* to murder Caesar.

He *set out* to conquer the world.

The *to*-infinitive here, however, has a resultative meaning which makes the construction resemble on the one hand that of a catenative verb, and on the other hand that of an intransitive verb followed by an adjunct. With *pay* and (to a lesser extent) *wait*, the adjunct status is more obvious, as is clear from the possibility of fronting the infinitive clause:

You have to pay to go in.

~ (In order) to go in, you have to pay.

He waited to see her.

~ ?(In order) to see her, he waited.

Similarly, unlike *begin* + infinitive, the infinitive following *stop* is purposive; contrast:

She [S] began [V] to eat lunch [O].

BUT: She [S] stopped [V] to eat lunch [A].

On the other hand, these two verbs have matching uses in complementation Type [B7]:

She { began
stopped } eating lunch.

[B7] Subjectless *-ing* participle clause as object

16.39 Again, with this type of complementation, the subject of the nonfinite verb is usually identical with the subject of the preceding verb:

I love *listening* to music.

The accused denied *having met* the witness.

['The accused denied *that he/she had met* the witness']

This rule accounts for the restriction that when the participle is followed by a reflexive pronoun, the pronoun normally has to agree (in number, person, and gender) with the subject of the superordinate clause:

{ She
He } enjoys singing to { herself.
himself. }

But with one small group of verbs (marked '2' in the list below) it is not the understood subject of the participle, but its understood object that is identified with the subject of the superordinate clause. In such cases, therefore, the participle construction matches in meaning the passive of the corresponding infinitive construction [B6]:

Your shoes *need* { mending.
to be mended. } That door *needs* { painting.
to be painted. }

(The above use of *need* is often replaced, in dialectally restricted usage, by an equivalent use of *want*.)

For an additional group of verbs (marked '3' in the list below), the subject of the participle is indefinite, and is independent of the subject of the preceding verb. For example, in *He recommended introducing a wealth tax*, it is clear that the person *recommending* the tax is likely to be different from the person(s) who would be responsible for *introducing* it. The meaning of this sentence is equivalent to that of *He recommended the introduction of a wealth tax*.

In the following list of verbs in the pattern of [B7], Types (i) and (ii) correspond to Type [B6(i)] ('emotive') and Type [B6(ii)] ('aspectual'). The verbs grouped under (iii) are however in this case a miscellany, since further semantic grouping is difficult.

(i) (can't) bear ¹	(not) fancy ¹	miss ¹
begrudge ¹	hate ¹	regret ^{1,4}
detest ¹	like ¹	relish ¹
dislike ¹	loathe ¹	resent ¹
dread ¹	love ¹	(can't) stand ¹
enjoy	(not) mind ¹	
(ii) cease	quit	start ¹
commence	resume	stop ¹
continue		
(iii) admit ⁴	forget ^{1,3,4}	recommend ^{1,3}
avoid	(can't) help ¹	remember ^{1,3,4}
confess ⁴	imagine ¹	repent
consider	involve ^{1,3}	require ²
deny ⁴	justify ^{1,3}	risk ^{1,3}
deserve ²	need ^{1,2}	save ^{1,3}
discourage ^{1,3}	permit ^{1,3}	try ⁵
envisage ^{1,3}	propose	want ¹ , <dialectal ² >
escape	recall ^{1,3,4}	

The verbs of Type (i) preceded by a negative (such as *can't bear*) have a built-in negative bias, so that they cannot occur in straightforward assertive contexts:

Cora doesn't mind waiting. ?**Cora minds waiting.*

They can, however, occur in nonassertive contexts:

Do you mind waiting?

How can anyone bear wearing clothes like that?

and also in 'second instance' contexts, *ie* where the construction refers back to a nonassertive occurrence of the same construction earlier in the discourse:

A: I *can't stand*
don't fancy working with that girl.

B: Well, I'm afraid you'll HAVE to *stand it*
fancy working with her.

Superscripts in the above lists are interpreted as follows:

- 1: The verb also occurs in pattern [B9], *ie* with a subject preceding the participle (*cf* 16.42).
- 2: The participle has a 'passive' interpretation (see above).
- 3: The participle has 'independent' interpretation; *ie* the subject of the participle clause is not necessarily coreferential with the subject of the preceding verb, and may have indefinite meaning.
- 4: The participle may occur with a perfective construction:

I admit having seen it. [1]

But with such verbs, the nonperfective construction can also be used with past meaning. Thus [1] is synonymous with [2]:

I admit seeing it. [2]

This paraphrase relation, however, exists mainly with verbs of dynamic meaning; contrast verbs of stative meaning:

I admit knowing him.

≠ *I admit having known him.*

5: On the construction with *try*, *cf* 16.40.

Examples of prepositional verbs belonging to this class ([B7pr]) are:

<i>bank on¹</i>	<i>decide on</i>	<i>play at</i>	<i>see about¹</i>
<i>count on¹</i>	<i>delight in¹</i>	<i>resort to</i>	<i>shrink from</i>

Examples of phrasal verbs ([B7ph]) are:

break off *give up* *leave off* *put off* *take up*

Examples of [B7ph-pr] are:

do away with *get around to* *go in for* *look forward to*

The following sentences illustrate these patterns:

We counted on getting there early.

[B7pr]

I've taken up playing tennis.

[B7ph]

Jim is looking forward to having the house to himself.

[B7ph-pr]

It is important to notice that the *to* in *get around to*, *look forward to*, and *resort to* is not an infinitive marker, but a preposition. Hence *I am looking forward to seeing you* is grammatical, but not **I am looking forward to see you*.

Note [a] The superscript '1' in the above lists is not added to verbs like *stop*, although a noun phrase can be inserted between the participle and the preceding verb in such cases:

They stopped (her) working all night.

This is because the construction containing the extra noun phrase (*her* in the above example) is arguably complex transitive (*cf* 16.53) rather than monotransitive (as is evident from the marginally acceptable passive ?*She was stopped working all night*).

[b] Also we exclude from the above lists catenative verbs such as *go* in *We went running* and *get* in *Get moving!* (*cf* 3.49).

Choice between the infinitive and participle constructions ([B6] and [B7])

16.40 Where both constructions [B6] and [B7] are admitted, there is usually felt to be a difference of aspect or mood which influences the choice. As a rule, the infinitive gives a sense of mere 'potentiality' for action, as in *She hoped to learn French*, while the participle gives a sense of the actual 'performance' of the action itself, as in *She enjoyed learning French*. In the case of *try*, the double meaning is particularly clear:

Sheila tried	<i>to bribe the jailor.</i>	[1]
	<i>bribing the jailor.</i>	[2]

[1] implies that Sheila attempted an act of bribery, but did not manage it; [2] implies that she actually did bribe the jailor, but without (necessarily) achieving what she wanted. With other verbs, the difference is more subtle, and may be overruled or neutralized by the meaning of the verb of the main clause. For example, the negative meaning of *avoid* and *escape* cancels out the sense of 'performance' in *He escaped/avoided being branded as a traitor*.

Let us consider more carefully three classes of verb which take both constructions:

- (i) EMOTIVE VERBS (see Type (i) in the lists in 16.38 and 16.39). With the verbs which take both constructions (*dread, hate, like, loathe, love, and prefer*) the bias of the infinitive towards 'potentiality' tends to favour its use in hypothetical and nonfactual contexts; *eg*:

Would you like $\left\{ \begin{array}{l} \text{to see} \\ ?*\text{seeing} \end{array} \right\}$ my stamp collection?

I hate $\left\{ \begin{array}{l} \text{to seem} \\ ?\text{seeming} \end{array} \right\}$ rude, but you're blocking the view.

On the other hand, the participial construction is favoured where the speaker is referring to something which definitely happens or has happened:

Brian loathed $\left\{ \begin{array}{l} ?\text{to live} \\ \text{living} \end{array} \right\}$ in the country.

(But with *would loathe*, the infinitive is just as acceptable as the *-ing* participle.)

Here *to live* implies that Brian could exercise choice about where to live, whereas *living* presupposes that he actually did live in the country, and probably had no choice in the matter. But in other contexts there is little appreciable difference between the two constructions:

Do you prefer $\left[\begin{array}{l} \text{to cook} \\ \text{cooking} \end{array} \right]$ for yourself, or $\left[\begin{array}{l} \text{to eat} \\ \text{eating} \end{array} \right]$ in a restaurant?

- (ii) ASPECTUAL VERBS of beginning, continuing, and ending also in many cases take both constructions:

Lucy started/continued/ceased $\left\{ \begin{array}{l} \text{to write} \\ \text{writing} \end{array} \right\}$ while in hospital.

In such examples as this, there is no observable difference of meaning between the constructions. But in other cases, a contrast between 'potentiality' and 'performance' may influence the choice:

He started $\left\{ \begin{array}{l} \text{to speak, but stopped because she objected.} \\ \text{speaking, and kept on for more than an hour.} \end{array} \right\}$

The association of the *-ing* participle with the progressive aspect may also influence a preference for the participle where multiple activities are involved:

He began $\left\{ \begin{array}{l} \text{to open all the cupboards.} \\ \text{opening all the cupboards.} \end{array} \right\}$

Here *opening* is more appropriate than *to open*. While some verbs in this group (*begin, continue, cease, start*), allow both constructions, others (*finish, stop*) allow only the participle construction. (*Go on* and *keep (on)* may be classified as catenative verbs (*cf* 3.49); on *finish/stop* followed by the infinitive, *cf* 16.38 Note [b].)

- (iii) RETROSPECTIVE VERBS. For three verbs *forget, remember, and regret*, the 'potentiality'/'performance' distinction becomes extended into the past so that there is a temporal (as well as in part modal) difference between the two constructions. The infinitive construction indicates that the action or event takes place after (and as a result of) the mental process denoted by the verb has begun, while the reverse is true for the participle construction, which refers to a preceding event or occasion coming to mind at the time indicated by the main verb:

$\left\{ \begin{array}{l} \text{I remembered to fill out the form. ['I remembered that I was to fill out the form and then did so']} \\ \text{I remembered filling out the form. ['I remembered that I had filled out the form']} \end{array} \right\}$

$\left\{ \begin{array}{l} \text{I forgot to go to the bank. ['I forgot that I was to go to the bank, and therefore did not do so']} \\ \text{I forgot (about) going to the bank. [rare without about; 'I forgot that I went to the bank' or '... that I should have gone ...']} \end{array} \right\}$

$\left\{ \begin{array}{l} \text{I regret to tell you that John stole it. ['I regret that I am about to tell you that John stole it']} \\ \text{I regret (about) telling you that John stole it. ['I regret that I told you that John stole it' or '... that I am now telling you ...']} \end{array} \right\}$

$\left\{ \begin{array}{l} \text{I regret to tell you that John stole it. ['I regret that I am about to tell you that John stole it']} \\ \text{I regret telling you that John stole it. ['I regret that I told you that John stole it' or '... that I am now telling you ...']} \end{array} \right\}$

$\left\{ \begin{array}{l} \text{I regret to tell you that John stole it. ['I regret that I am about to tell you that John stole it']} \\ \text{I regret telling you that John stole it. ['I regret that I told you that John stole it' or '... that I am now telling you ...']} \end{array} \right\}$

[B8] Complementation by *to*-infinitive clause (with subject)

- 16.41 The verbs in this group (as distinct from the apparently similar 'object + infinitive' construction; *cf* 16.50) are restricted to a small number chiefly denoting (not) liking or wanting: (*can't*) *bear, desire, hate, like, love, prefer, want, and wish*:

They don't like the house to be left empty.

I wouldn't want you to lose your way.

After these verbs, the noun phrase preceding the infinitive cannot be made the subject of a passive main clause: **The house isn't liked to be left empty (by them)*.

There is moreover an alternative construction (chiefly restricted to AmE) in which the noun phrase is preceded by *for* which marks it as the subject of an infinitive clause, rather than as object of the main clause:

Jack prefers *for* his wife to drive the truck. (esp AmE)

These two observations point in the direction of a monotransitive analysis of such verbs.

In the following, however, *for* has a different status and must occur in both AmE and BrE:

They arranged *for* Mary to come at once.

In this case the construction is that of a prepositional verb *arrange for* ([B8pr]), the infinitive clause acting as prepositional object. Other examples

where *for* occurs as part of a prepositional verb are: *ask for*, *call for*, *ache for*, *aim for*, *burn for*, *burst for*, *care for*, *clamour for*, *crave for*, *hope for*, *itch for*, *long for*, *plan for*, *prepare for*, *wait for*, *yearn for*:

We were all *aching/burning/bursting* for the performance to begin.
They *planned for* the mayor to arrive on the following day.

For some of the verbs in these clauses, the *that*-clause with *should* ([B3(ii)]) is an alternative form of complementation:

They planned that the mayor *should arrive* on the following day.

A further reason in favour of a monotransitive analysis of verbs of Type [B8pr] is the possibility (in some cases) of a passive, with or without extraposition:

For the administration to resign so quickly was not called for.
It had been arranged for the food to be served indoors.

Note [a] Some [B8pr] verbs, such as *arrange for*, *plan for*, and *prepare for*, also have a [B2] construction in which they are followed by a direct object. Compare: *Have you arranged the meeting?* *Have you arranged for the meeting?* Compare also *She asked for the children to leave* and *She asked the children to leave*.

[b] *Desire*, *expect*, and *intend*, although they fit into this category with respect to introductory *for* and the extraposed passive, also accept the passive of the 'raised object' which applies to [C4] (cf 16.50). Thus *expect*, for example, permits two associated passives:

It was not expected for the administration to resign.

The administration was not expected to resign.

The former of these, however, is felt to be awkward and of marginal acceptability. On such conflicts of classification cf 16.64ff.

[B9] Complementation by *-ing* participle clause (with subject)

16.42 Verbs which accept this pattern comprise a considerable subset of those verbs accepting the subjectless *-ing* clause as object: they include the verbs marked '1' in the list of 16.39. The genitive form of the subject is an option in formal English (cf 15.12), but is often felt to be awkward or stilted:

I dislike *him/his driving* my car.
We look forward to *you/your becoming* our neighbour.

In some cases, particularly when the subject of the participle is not a pronoun and does not have personal reference, the genitive option is rare:

Peter stopped the $\left\{ \begin{array}{l} \text{vehicle} \\ \text{?vehicle's} \end{array} \right\}$ crashing into the fence.

The genitive is also rare with a pronoun with nonpersonal reference:

I look forward to $\left\{ \begin{array}{l} \text{it} \\ \text{?its} \end{array} \right\}$ getting warmer in spring.

The verbs of negative meaning *stop*, *prevent*, and *prohibit* have a related ditransitive construction (cf 16.56f) in which the preposition *from* precedes the *-ing* clause as second object:

They tried to *prevent* the plane *from* landing on the runway.

Thus the *from* is optional.

In the very few cases where we have a choice between an *-ing* participle and a *to*-infinitive construction there is usually felt to be a difference of aspect or mood such as that described in 16.40:

I *hate* the children *to quarrel* [... they're ordinarily such good friends]. [1]

I *hate* the children *quarrelling* [... all the time]. [2]

[1] focuses on the children's 'potential' for quarrelling; [2] emphasizes their 'performance' – the point being that they do quarrel, rather often in fact. An aspectual difference is uppermost in:

I *hate* the clock $\left\{ \begin{array}{l} \text{chiming} \text{ (... all night long).} \\ \text{to chime} \text{ (... just when I'm going to sleep).} \end{array} \right.$

The infinitive suggests a single chime, while the participle suggests continual chiming (cf 4.35, 4.67f).

Note Verbs of the 'observational' type, eg: *notice* in *I noticed him writing a letter*, do not belong in this group, and are dealt with in 16.53. For such verbs, the genitive is not a possible alternative: **I noticed his writing a letter*.

Complex transitive complementation

16.43 In 2.16 we applied the term COMPLEX TRANSITIVE to verbs in the patterns *SVOC* and *SVOA*. In this chapter we extend the term to other clause patterns in which an object is followed by another element which is not an object (eg a nonfinite clause). A distinguishing characteristic of complex transitive complementation is that the two elements following the verb (eg object and object complement) are notionally equated with the subject and predication respectively of a nominal clause. For example:

MONOTRANSITIVE:	She presumed <i>that her father was dead</i> .	[1]
COMPLEX TRANSITIVE:	$\left\{ \begin{array}{l} \text{She presumed } \textit{her father to be dead.} \\ \text{She presumed } \textit{her father dead.} \end{array} \right.$	$\left\{ \begin{array}{l} [2] \\ [3] \end{array} \right.$

In [3], *her father* (O) and *dead* (C) are equivalent in meaning to a separate clause, viz the *that*-clause in [1]. This relationship remains where the object complement is expanded into an infinitive clause, as in [2]. Yet *her father to be dead*, in spite of its clause-like meaning and appearance, does not act syntactically as a single constituent, as is evident in the passive, where the O is separated from its complement:

Her father was presumed (by her) *to be dead*.

This divisibility into two elements of a semantically clausal construction following the verb is the defining property of complex transitive complementation.

We begin with three already familiar patterns of complex transitive complementation: those corresponding to [A1–A3] (cf 16.21–4).

Note On the similarities between complex transitive and ditransitive complementation, see 16.66ff.

16.44 [C1] Adjective phrase as object complement

The *SVOC* pattern (cf 2.16) in which the object complement is an adjective phrase is found with verbs which, like copular verbs, may be divided into CURRENT and RESULTING types:

- You should *keep* the cabbage *fresh*. [1]
That music *drives* me *mad*. [2]

The verb *keep* in [1] introduces the current attribute *fresh*, while the verb *drive* in [2] introduces the resulting attribute *mad*. These two verbs therefore exemplify the two main categories of complex transitive complementation in this pattern. The current verbs (cf 16.21ff) are usually stative, and the resulting verbs are always dynamic. Further examples of each type are:

CURRENT	RESULTING
(i) <i>hold</i> [C2]	(v) <i>drive</i> [C4]
<i>keep</i> [C2]	<i>get</i> [C4]
<i>leave</i> [C2]	<i>make</i> [C2, C4]
(ii) <i>call</i> [C2]	<i>prove</i> [B3, C2, C4]
<i>confess</i> [B3, C2, C4]	<i>render</i> [C4]
<i>profess</i> [B3, C2, C4]	<i>send</i>
<i>pronounce</i> [B3, C2, C4]	<i>turn</i>
<i>report</i> [B3, C4]	(vi) <i>certify</i> [B3, C2, C4]
(iii) <i>like</i>	<i>declare</i> [B3, C2, C4]
<i>prefer</i> [B3]	<i>proclaim</i> [B3, C2, C4]
<i>want</i>	
<i>wish</i> [B3, C2, C4]	
(iv) <i>believe</i> [B3, C2, C4]	
<i>consider</i> [B3, C2, C4]	
<i>deem</i> [B3, C2, C4]	
<i>find</i> [B3, C2, C4]	
<i>hold</i> [B3, C4]	
<i>imagine</i> [B3, C2, C4]	
<i>judge</i> [B3, C2, C4]	
<i>presume</i> [B3, C2, C4]	
<i>rate</i> [C2, C4]	
<i>reckon</i> [B3, C2, C4]	
<i>suppose</i> [B3, C2, C4]	
<i>think</i> [B3, C2, C4]	

Type (i) is a category of current verbs of general meaning; Type (ii) consists of factual speech act verbs (cf 16.31); Type (iii) of volitional verbs; Type (iv) of verbs of intellectual state; Type (v) of general resulting verbs; and Type (vi) of resulting verbs referring to speech acts which have the performative force of declarations. (*Hold* occurs twice in the above list: as a general verb [Type (i), as in *She held her head high*]; and as an intellectual state verb [Type (iv), as in *I hold you responsible*]). The symbols added after some verbs indicate other related complementation types to which those verbs belong:

[B3] The verb can also be used monotontransitively (cf Note [a]) with a *that*-clause.

[C2] The verb can also occur with a noun phrase as object complement.

[C4] The verb can also occur with an object + infinitive construction.

Examples:

- The secretary *left* all the letters *unopened*. (i)
The doctors *pronounced* her condition *utterly hopeless*. (ii)
I want my coffee *stronger than this*. (iii)
We've always *found* the assistants *very friendly*. (iv)
The long walk *made* us all *hungry*. (v)
They have *declared* the house *unfit for habitation*. (vi)

Note that the adjectival complement may contain modifiers and adjectival complementation (cf 16.68–83). A passive construction in which the direct object becomes subject is also an important criterion:

- All the letters *were left unopened* (by the secretary). (i)
Her condition *was pronounced utterly hopeless* (by the doctors). (ii)

Note [a] There is sometimes a meaning difference between the object complement construction and the corresponding *that*-clause [B3] or object + infinitive [C4] construction:

- I imagined myself severely ill. [3]
≠ I imagined myself to be severely ill. [4]

Sentence [3] suggests that the speaker is indulging in a flight of fancy; sentence [4] suggests that the speaker is deluding himself (eg that he is a hypochondriac). A difference is also to be observed between [5] and [6]:

- They *got* him angry. [5]
≠ They *got* him to be angry. [6]

where [5] suggests 'made him angry in spite of himself', and [6] suggests 'persuaded him to be angry'. (Yet a third meaning is represented by *Don't get me wrong* ['Don't misunderstand me']).

Two further contrasts are:

- We *found* the children undernourished. ['We encountered them in that condition'] [7]
≠ We *found* the children to be undernourished. [8]
['Our examination revealed their condition']

and:

- He *declared* the meeting official. [9]
He *declared* the meeting to be official. [10]

where [9] has a performative and resultative force ('The meeting became official as a result of his announcement') not regularly present in [10].

[b] *Have* in sentences such as *We have two employees sick* is not a member of the [C1] category, but belongs to a special *have*-existential construction to be discussed, with existential sentences in general, in 18.51. Since it has no passive, this clause construction lacks one criterial feature of complex transitive constructions: **Two employees are had sick*.

[c] There is a variant order in which the object complement precedes the object; eg: *He thought desirable most of the women in the room* (cf 18.37). This order tends to occur when the object is a long noun phrase.

16.45 In addition to the verbs listed in 16.44 above, there are many verbs which belong more peripherally to Type [C1]. Their membership is more peripheral in one or both of the following respects: (a) They occur only in restricted sequences such as *rub ... dry* (cf 16.17); (b) They can occur in the [B1] monotransitive construction without appreciable change of meaning; ie, the object complement is optional, and resembles an optional adverbial. In the following typical collocations, the object noun phrase is symbolized by N:

CURRENT

bring (a child) up healthy¹
 buy N cheap¹
 return (a letter) unopened¹
 serve (food) hot/cold¹
 sell N cheap/new¹

RESULTING

boil (an egg) soft¹
 crop (hair) short¹
 freeze N hard¹
 paint N red/blue/...¹
 roll N flat
 sweep (the floor) clean¹
 colour N blue/yellow/...¹
 dye N pink/green/...¹
 knock (someone) senseless
 polish N smooth¹
 scrape N clean¹
 swing (a door) open

For those combinations marked '1', the object complement could be easily omitted without a change in the basic sense of the verb.

Among resulting attributes, the adjectives *open*, *loose*, *free*, and *clean* are particularly common: *push N open*, *shake N loose*, *set N free*, *wipe N clean*.

The collocations *make sure* and *make certain* are peculiar in that the object is a *that*-clause and always follows the adjectival complement:

Please *make sure/certain* that you enclose your birth certificate.

There is no passive **be made sure/certain*... With other collocations, the *that*-clause object is postponed by extraposition (cf 18.35):

He *found it strange* that no one else had arrived.

I *think it very odd* that she left without saying goodbye.

The emperor *pronounced it illegal* for landlords to enfranchise their tenants.

Extraposition is optional with *make N clear*, and therefore the preparatory *it* may be omitted: *She made (it) clear that we were regarded as trespassers*.

Note [a] Some collocations require the object to be a reflexive pronoun: *I laughed myself sick*; *They roared themselves hoarse*. Here the object complement cannot be omitted: **I laughed myself*.

[b] The resultative pattern illustrated in this section is quite productive, and occurs with rare or newly-converted verbs such as *sellotape* and *scotchtape*: *sellotape N flat* (BrE); *scotchtape N flat* (AmE). Similarly:

I've *deepfrozen* the bread solid.

[C2] Noun phrase as object complement

16.46 Most of the verbs listed in 16.44 can occur also with a noun phrase complement. In addition, there are a few verbs which occur with a noun phrase, but not with an adjective phrase, as complement, *eg: appoint*. These verbs, marked '1' in the list below, can also occur with the object + infinitive construction:

The queen *appointed* William Cecil (to be) her personal secretary.

The list is subdivided into categories corresponding to those in 16.44:

(i) <i>hold</i> ²	(iv) <i>believe</i>	(v) <i>appoint</i> ^{1, 2, 3}
<i>keep</i> ²	<i>consider</i> ²	<i>choose</i> ^{1, 2, 3}
<i>leave</i> ²	<i>deem</i>	<i>elect</i> ^{1, 2, 3}
(ii) <i>call</i>	<i>esteem</i> ^{1, 2, 3}	<i>make</i>
<i>confess</i>	<i>find</i>	<i>prove</i>
<i>profess</i>	<i>imagine</i> ²	<i>vote</i> ¹
<i>pronounce</i>	<i>judge</i> ²	(vi) <i>baptize</i> ^{1, 3}
(iii) <i>wish</i>	<i>presume</i>	<i>certify</i> ^{2, 3}
	<i>rate</i> ²	<i>christen</i> ^{1, 3}
	<i>reckon</i> ²	<i>crown</i> ^{1, 2, 3}
	<i>suppose</i>	<i>declare</i>
	<i>think</i>	<i>proclaim</i>
		<i>name</i> ^{1, 2, 3}

The superscript '2' indicates that the *as*-construction (cf 16.47) is also possible. The superscript '3' indicates that the verb is also monotransitive, and that the verb retains the same meaning when the object complement is omitted. Hence *She appointed him secretary* implies that *she appointed him*. Examples of each sub-type follow. With *profess* and *wish*, which are used to illustrate sub-types (ii) and (iii) respectively, a reflexive pronoun as object is normal.

- She *held* her niece (a) captive for several years. (i)
 The prince *professed* himself a supporter of free speech. (ii)
 I have often *wished* myself a millionaire. (iii)
 Charles does not *esteem* him a trustworthy adviser. (iv)
 The committee has *elected* you its chairman. (v)
 Her parents *named* her Sophia after her grandmother. (vi)

Some verbs in this pattern are unlikely to occur in the active; *eg: think, believe, reckon*. The following are examples of the passive construction:

- Her niece *was held* (a) captive for several years. (i)
 She *was named* Sophia after her grandmother. (vi)

As with Type [C1], the object may be a clause postponed by extraposition:

We have made *it* a condition *that the new agreement be signed by all the original signatories*.
 He has proved *it* a fallacy *that old age brings wisdom*.

Note [a] The zero article occurs optionally with *captive* and *prisoner* as object complements, as in (i) above: *She held her niece (a) captive*. *Hold ... captive/prisoner* and *keep ... captive/prisoner* are unusual in that the omitted article is indefinite rather than definite. Examples of the zero article with definite meaning (cf 5.42) are:

Edgar was judged overall *winner*.

They appointed Sue *captain* of the athletics team.

[b] The object + infinitive construction with *to be*, as with Type [C1], is not always equivalent to the pattern with a phrasal object complement. For example, *name* can be used with *to be* only if the following noun phrase designates a future role or status:

Her parents named her (*to be*) Gladys.

The selectors named her (*to be*) a member of the touring team.

As can be used with *name* only on the same condition as applies to *to be*: **Her parents named her as Gladys* (cf 16.47 below).

[c] The copular relation can obtain not only between the object and complement as in [1], but also between subject and complement as in [2]:

She made him a good husband. (SVO₃C₀)

[1]

She made him a good wife. (SVO₃C₁)

[2]

[1] has the passive analogue *He was made a good husband*; but in the entirely different construction of [2], where the copular relation is between *she* and *a good wife*, no passive is possible. The meaning is: 'She was a good wife to him'. A prepositional verb of this same unusual pattern is *strike*... as in, for example:

He *struck* me as a brilliant strategist.

where *a brilliant strategist* is subject complement.

[C1pr] and [C2pr] Object complement following prepositional verb

16.47

The preposition *as* designates a copular relation, particularly in specifying a role or status associated with the direct object: *The church condemned the relic as a fraud*. Following a complex transitive verb and a direct object, the prepositional complement of *as* functions semantically as an attribute, and may be termed a 'prepositional object complement' in the same way as the noun phrase following a transitive prepositional verb is called a prepositional object:

We considered him { a genius. [C2]
as a genius. [C2pr]
to be a genius. [C4]

~ He was considered { (as) a genius.
to be a genius.

Consider *as*, like *regard as*, *class as*, etc, therefore exemplifies yet another type of prepositional verb: one that is followed by a prepositional object complement rather than a prepositional object.

Occasionally the preposition *for* occurs in this copular function, instead of *as*:

He took these words *as* evidence. He took me *for* a fool.

In the following list, for verbs in column (i) the preposition is optional, where for verbs in column (ii) the preposition is obligatory:

(i) <i>appoint</i> (as) ¹	(ii) <i>accept as</i>
<i>choose</i> (as)	<i>acknowledge as</i>
<i>consider</i> (as)	<i>characterize as</i>
<i>count</i> (as)	<i>class as</i>
<i>deem</i> (as)	<i>define as</i>
<i>esteem</i> (as) ¹	<i>describe as</i>
<i>rate</i> (as)	<i>intend as</i> ¹
<i>reckon</i> (as)	<i>mistake for</i>
<i>report</i> (as)	<i>regard as</i>
<i>elect</i> (as) ¹	<i>see as</i>
<i>certify</i> (as)	<i>take as/for</i>
<i>crown</i> (as) ¹	<i>treat as</i>
<i>make</i> (into) ¹	<i>use as</i>
<i>proclaim</i> (as)	

Most verbs in [C1pr] and [C2pr] can also introduce an adjective phrase in the function of prepositional object complement:

The experts *rated* his paintings (as) *poor but representative of their class*.

They *classed* Jane as *partially sighted*.

The media *described* the situation as *hopeless*.

~ The situation was *described* as *hopeless*.

Verbs not allowing this construction are marked '1' in the above lists. The construction is exceptional in allowing an adjective phrase to occur after a preposition. A more orthodox construction is obtained by adding the word *being* before the adjective phrase, and thereby converting the prepositional complement into a nominal *-ing* clause:

The media described the situation as *being hopeless*.

Note [a] *Count as* and *rate as* can also occur in an analogous *as*-construction without the object, as 'prepositional' copular verbs; eg: *This counts/rates as a notable success* (cf 16.22 Note [b]).
[b] Although *as* is classed as a preposition in the above pattern, it in some ways resembles the conjunction *as* which introduces clauses of comparison (cf 15.71). Consider the following curious examples, in which *as* introduces on the one hand a clause and on the other hand a noun phrase in an appositional relation to the clause:

Report me as *I am* - a superannuated don.
He described her as *he found her*, a liar.

[C3] Complementation by object and adjunct

16.48

Our next category, Type [C3], consists of verbs which occur in the *SVOA* pattern (cf 2.16), ie verbs which have as their complementation an object followed by a predication adjunct. The most characteristic adjuncts to occur in this pattern are prepositional phrases of space, and more particularly of direction; eg:

I slipped the key *into the lock*. [1]
He stood my argument *on its head*. [2]
Take your hands *out of your pockets*. [3]

The passive is illustrated by:

The key was slipped *into the lock*. [1a]

Sentence [2] exemplifies the abstract or metaphorical use of such verbs and adjuncts. Many of the verbs which fit into this pattern are causative verbs of motion: *put*, *get*, *stand*, *set*, *sit*, *lay*, *place*, *send*, *bring*, *take*, *lead*, *drive*, etc. The class is open-ended, since verbs normally without causative meaning can be adapted to this function; eg: *show*, *see*, *elbow*, etc in:

The attendant *showed* us to our seats. ['conducted us...']
May I *see* you home? ['escort you...']
He *elbowed* and *bribed* his way to fame.
They *talked* me into it. ['persuaded me...']

Other verbs are associated with space position adjuncts rather than direction adjuncts:

They *left* the papers *at my office*.
Always *keep* your eyes *on the road* when driving.

The attackers *caught us off our guard*.
He *wished them at the bottom of the sea*.

Again, the spatial meaning of the adjunct may be understood in some abstract or metaphorical sense, as in the third example above.

Adjuncts of other semantic types are less common, but instances are the adjunct of manner following *treat*:

Her parents *treated her* { badly.
as if she were a baby.
as/like a small child.

and the optional adjunct of duration following *last*:

This money will have to *last* you ((*for*) *six months*).

Note [a] *Treat* has a different meaning when the adjunct is omitted:

Her parents *treated* her. [= 'did something pleasant for her']

[b] Superficially similar to the above pattern is that illustrated by *remind* and *furnish* followed by an object and a prepositional phrase:

She *reminds* me of my sister.

They *furnished* all the passengers with life jackets.

These however are classed as transitive prepositional verbs (cf 16.7–8), and will be dealt with in 16.56f below. The difference between these prepositional verbs and verbs of complementation Type [C3] is that in the former case the lexical verb governs a particular preposition, *remind* ... of, *furnish* ... with. (Alternative prepositional constructions are sometimes available, however: *provide* ... with, *provide* ... for.)

Variants of complex transitive complementation

16.49 We now examine variants of complex transitive complementation in which the direct object is followed by a nonfinite clause acting as predication adjunct. All four kinds of nonfinite construction (cf 14.6–8) are possible:

[C4] <i>to</i> -infinitive: They knew him <i>to be a spy</i> .	[C6] <i>-ing</i> participle: I caught Ann <i>reading my diary</i> .
[C5] bare infinitive: I heard someone <i>slam the door</i> .	[C7] <i>-ed</i> participle: We saw him <i>beaten by the World Heavyweight Champion</i> .

The nonfinite clause in these patterns (in italics in the above table) has no subject itself, but its implied subject is always the preceding noun phrase, which is object of the superordinate clause. This noun phrase, which if a personal pronoun is in the objective case, is commonly termed a RAISED OBJECT (cf further 16.64ff): semantically, it has the role of subject of the nonfinite verb; but syntactically it is 'raised' from the nonfinite clause to function as object of the superordinate verb. Hence in general, this noun phrase (in italics in the table below) can become subject of the corresponding passive. (The passive of [C5] normally requires substitution of a *to*-infinitive for a bare infinitive; the passive of [C7] is of marginal currency; cf 16.54 Note [a].)

[C4] <i>He</i> was known to be a spy.	[C6] <i>Ann</i> was caught reading my diary.
[C5] <i>Someone</i> was heard to slam the door.	[C7] <i>He</i> was seen executed by a firing squad.

On the face of it, the patterns [C4] and [C6] are indistinguishable from the monotransitive patterns [B8] (eg: *She hates the train to be late*) and [B9] (eg: *She hates the train being late*), in which the nonfinite clause has a subject of its own. The ability of the noun phrase preceding the nonfinite verb to become subject of a passive is, however, an important distinction between them (see further 16.51 and 16.53).

Note These patterns [C4] and [C6] are distinguished from corresponding patterns in which the nonfinite clause is an adverbial by the fact that the implied subject of the nonfinite verb is O rather than S. Note the ambiguity of:

She left him *to finish the job*. She left him *holding the baby*.

[C4] Object + *to*-infinitive complementation

16.50 The verbs in this group are rather numerous, and may be subdivided, semantically, into the following categories:

- | | | |
|---|--|---|
| (i) announce
declare
proclaim
pronounce
report
repute [esp P]
rumour [P only]
say [P only]
tip <esp BrE> | (iii) intend
mean | (vii) assist
bother
bribe
condemn
dare
defy
encourage
help
induce
inspire
press
summon |
| (ii) assume
believe
conceive <formal>
consider
expect
feel
find
imagine
know
presume
reckon
see [P only]
suppose
take
think [esp P]
understand | (iv) appoint
elect
name
vote
(v) cause
drive
force
get [no P]
lead
prompt
(vi) allow
authorize
compel
constrain
enable
entitle
equip
fit
oblige
permit
require | |

[P = Passive]

Types (i) and (ii) correspond to the factual verbs of category [B3] discussed in 16.31: the nonfinite construction following these verbs can often be replaced by a *that*-clause with an indicative verb. Compare:

- | | |
|--|------|
| { The police reported that the traffic was heavy. | [B3] |
| = The police reported the traffic to be heavy. <formal> | [C4] |
| { John believed that the stranger was a policeman. | [B3] |
| = John believed the stranger to be a policeman. <formal> | [C4] |

With factual verbs such as these, the nonfinite clause normally contains the verb *be* or some other verb of stative meaning. Especially when the nonfinite main verb is other than *be*, the finite clause (of pattern [B3]) is preferred to the infinitive one, except that the infinitive construction provides a convenient passive form:

The traffic was reported to be heavy.
The stranger was believed to be a policeman.

Some verbs in this construction have no *that*-clause equivalent:

They tipped him to be the next president. <esp BrE>
~ He was tipped to be the next president.
(*They tipped that he would be the next president.)

Some verbs (marked [P only] in the list above) occur only in the passive version of this construction:

The field marshal *was said* to be planning a new strategy.
(*Someone *said* the field marshal to be planning a new strategy.)

Other verbs (marked [esp P]) occur chiefly in the passive:

The Broadway production *was thought* to have made Max's fortune.
(?Newsmen *thought* the Broadway production to have made Max's fortune.)

Of the two classes of factual verbs, Type (i) consists of public verbs (cf 16.31) referring to a speech act, and Type (ii) consists of private verbs expressing belief, etc.

- 16.51 Of the remaining semantic types, Type (iii) consists of verbs of intention (on *intend* itself cf 16.41 Note [b]); Types (iv) and (v) consist of causative verbs, where the infinitive clause identifies the resultant state (Type (iv) verbs also belong to class [C1]); Type (vi) consists of verbs with a modal character, expressing such concepts as enablement, permission, and compulsion; and Type (vii) consists of a variety of verbs of 'influencing' between which a common factor appears to be that the nonfinite clause has a purposive meaning. Examples are:

- (iii) They *intended* Mary to sing an aria.
 (~ Mary *was intended* to sing an aria.)
(iv) The meeting *elected* Mr Martin to be the next treasurer.
 (~ Mr Martin *was elected* to be the next treasurer.)

- (v) This optimistic forecast *led* the administration to promise tax cuts.
 (~ The administration *was led* (by this optimistic forecast) to promise tax cuts.)
(vi) My contract *allows* me to take one month's leave.
 (~ I *am allowed* to take one month's leave.)
(vii) Our teachers *encouraged* us to think for ourselves.
 (~ We *were encouraged* to think for ourselves.)

In Type (iv), the infinitive main verb is normally *be*, and can be omitted: *They appointed her (to be) the social secretary*. This type overlaps with Type (v), 16.46.

- Note [a] There are a number of multi-word verbs in this category: [C4pr]: *count on ... to ...; depend on ... to ...; rely on ... to ...*; [C4ph]: *make ... out to ...*; [C4ph-pr]: *keep on at ... to ...* (which has no passive). Examples are:
 I *am depending on* you to give us your full support.
 They *made him out to be* a monster of depravity.
 Why do you *keep on at* me to work harder?
[b] Some passives of pattern [C4] (eg: *be allowed, be supposed*) have a semi-auxiliary (cf 3.47f) interpretation in which they lose their connection with the corresponding active construction, especially as regards agency.

[C5] Object + bare infinitive complementation

16.52 This pattern occurs with a relatively small number of verbs:

- | | | | |
|-----------------|--------------------|----------------------|------------------------|
| (i) <i>have</i> | (ii) <i>feel</i> | <i>overhear</i> [P?] | (iii) <i>help</i> [P?] |
| <i>let</i> | <i>hear</i> [P] | <i>see</i> [P] | <i>know</i> [P] |
| <i>make</i> [P] | <i>notice</i> [P?] | <i>watch</i> | |
| | <i>observe</i> [P] | | |

Type (i) consists of verbs of coercive meaning; Type (ii) has perceptual verbs of seeing and hearing; and Type (iii) is a residual class of two verbs which are optionally followed by a *to*-infinitive. The marker [P] indicates that the passive (normally with a *to*-infinitive) is possible; [P?] indicates that the passive is of doubtful or limited acceptability.

- (i) You shouldn't *let* your family *interfere with* our plans.
 We must *make* the public *take notice of* us.
 (~ The public must *be made to take notice of* us.)
(ii) Did you *notice* anyone *leave the house*?
 The crowd *saw* Gray *score two magnificent goals*.
 (~ Gray *was seen to score two magnificent goals*.)
(iii) Sarah *helped* us (to) *edit the script*.
 I have *known* John (to) *give better speeches than that*.
 (~ John has been *known to give better speeches than that*.)

Know followed by the bare infinitive is confined mainly to BrE, and to the perfective aspect: *have known*. *Let* in group (i) is in other constructions classified as similar to an auxiliary (cf 3.51). *Let* has an apparent passive in combination with such verbs as *let go* and *let fall*, but these are best regarded as fixed expressions, in which *let* has an auxiliary or particle-like function:

They *let* the prisoner *go home*. ~ ?The prisoner *was let go home*.

Note that this apparent passive has the bare infinitive, in contrast, for example, to *make*, which has to have the *to*-infinitive in the passive:

They *made* him *understand*. ~ He was *made to understand*.

A third verb in group (i) is *have*, which (like *have* in monotransitive constructions) does not occur in the passive:

They *had* me *repeat the message*. ~ *I was *had (to) repeat the message*.

Note [a] The formulaic nature of *let him go* and similar expressions is illustrated by variants such as [1–3], which cannot be fitted into any regular complementation pattern:

They <i>let</i>	<i>go the rope.</i>	[1]
	<i>the rope go.</i>	[2]
	<i>go of the rope.</i>	[3]

[b] Of the two constructions with *help*, that with *to* is more common in BrE, and that without *to* is more common in AmE.

[c] A rare verb in category (i) is the now rather archaic *bid*, with a *to*-infinitive complementation in the passive:

They *bid/bade* me *sit down*. ~ I was *bidden to sit down*.

[C6] Object + -ing participle complementation

16.53 The verbs in category [C6] consist of verbs of perception (Type (i)), verbs of encounter (Type (ii)), and two verbs of coercive meaning (Type (iii)):

(i) <i>feel</i> [C5]	<i>see</i> [C5]	(ii) <i>catch</i>	(iii) <i>have</i>
<i>hear</i> [C5]	<i>smell</i>	<i>discover</i>	<i>get</i>
<i>notice</i> [C5]	<i>spot</i>	<i>find</i>	
<i>observe</i> [C5]	<i>spy</i>	<i>leave</i>	
<i>overhear</i> [C5]	<i>watch</i> [C5]		
<i>perceive</i>			

Perception verbs marked [C5] occur also with the bare infinitive pattern [C5]. With such verbs there is an aspect difference between [C5] and [C6], as described in 4.61f:

Tim watched Bill *mend/mending* the lamp.

The bare infinitive, having nonprogressive meaning, implies that Bill did the whole job while Tim was watching; the -ing clause, with progressive meaning, has no such implication.

This complementation pattern differs from that of [B9], not only in its progressive aspect, but also in that the noun phrase following the superordinate verb cannot take the genitive (or possessive) form (cf 16.42):

I saw *him* lying on the beach ~ *I saw *his* lying on the beach.

Another difference from pattern [B9] is that the -ing predication can normally be omitted without radically altering the meaning:

I saw him lying on the beach. [entails: *I saw him*]

Contrast:

I hate my friends leaving early. [does not entail: *I hate my friends*]

The passive with this pattern is regular:

We could *hear* the rain *splashing on the roof*.

~ The rain could be *heard splashing on the roof*.

A teacher *caught* them *smoking in the playground*.

~ They were *caught smoking in the playground* (by a teacher).

Prepositional verbs with this type of complementation ([C6pr]) include *come across*, *come upon*, *listen to*, and *look at*: *Look at those children climbing the wall*. But these [C6pr] prepositional verbs have no prepositional passive:

The guards had been

<i>seen</i>
<i>spotted</i>
? <i>watched</i>
* <i>looked at</i>

 searching the building.

Have in this construction (cf 18.51ff) also has no passive, in keeping with its use in other constructions:

She *had* us working day after day.

*We were *had* working day after day.

Note *Feel* occurs especially with a reflexive pronoun object: *She felt herself falling in love*.

[C7] Object + -ed participle complementation

16.54 We can distinguish three small groups of verbs complemented by a raised object followed by an -ed participle clause:

(i) CAUSATIVE verbs: *get*, *have*

She *got/had* the watch repaired immediately.

(ii) VOLITIONAL verbs: *want*, *need*, *like*

I *want/need* this watch repaired immediately.

(iii) PERCEPTUAL verbs: *see*, *hear*, *feel* (oneself), *watch*

Someone must have *seen/heard* the car stolen.

A fourth group is peripheral to this construction:

(iv) Verbs for which the -ed participle describes a resulting state: *find*, *discover*, *leave*

They *found/discovered/left* him worn out by travel and exertion.

In this construction, as in that of [C6], *have* can have either an agentive causative meaning, or a stative meaning. Hence *The guard patrol had two men shot* is ambiguous, meaning either 'The patrol caused two men to be shot', or 'The patrol suffered the loss of two men by shooting'. The latter meaning is that of the *have*-existential construction (cf 18.51ff). In general, this complementation type is semantically equivalent to one with an infinitive form of the verb *be*. Thus in Type (ii), *I would like my room cleaned* is synonymous with *I would like my room to be cleaned*; in Type (iii), *He saw the team beaten* is synonymous with *He saw the team be beaten*.

Note [a] There is no passive for most verbs in pattern [C7], and at best the passive is dubious: ?*The car must have been seen stolen*. The acceptability of the passive with Type (iv) is exceptional:

The car was found abandoned. This is, indeed, an indication that Type (iv) may not belong here so much as with the object complement construction [C1], the participle construction being adjectival (cf: *an abandoned car*).

[b] In addition to the two meanings of *have* + object + *-ed* participle above, a third meaning results if the *-ed* clause is analysed as a postmodifier of the object; eg: *She had a book (which was stolen from the library).*

Ditransitive complementation

[D1] Noun phrases as both indirect and direct object

- 16.55 Ditransitive complementation in its basic form involves two object noun phrases: an indirect object, which is normally animate and positioned first, and a direct object, which is normally concrete. The two noun phrases differ from those of [C2] in not being in a copular relationship:

He gave the girl a doll
S V O_i O_d

The difference between this and complex transitive complementation is seen in:

SVOC: He found her a loyal friend.
(~ She was a loyal friend)

SVOO: He found her an apartment.
(~ The apartment was for her)

The characteristics of indirect objects in contrast to direct objects are fully discussed in 10.7.

Some ditransitive verbs have two passive analogues, which we shall distinguish as 'first' and 'second':

The girl was given a doll. [FIRST PASSIVE]
A doll was given the girl. [SECOND PASSIVE]

Of these two, the first passive, in which the indirect object becomes subject, is the more common. The prepositional paraphrase is more usual, as an alternative, than the second passive: *A doll was given to the girl.* (For a list of verbs of Type [D1], cf 16.57 below.)

[D2] Object and prepositional object

- 16.56 In the ditransitive category, prepositional verbs form an important group with its own sub-divisions, and may therefore be given a separate category number [D2]. These verbs are those we have called Type II prepositional verbs (cf 16.7-8). Alongside the ordinary indirect object pattern, two main prepositional patterns may be distinguished:

Indirect object + direct object. [D1]
Direct object + prepositional object. [D2a]
Indirect object + prepositional object. [D2b]

The indirect object is normally animate, and is the recipient or beneficiary of the process described by the verb (cf 10.19). Unlike ditransitive verbs of category [D1] (eg: *give*), ditransitive verbs with prepositional objects normally have only one passive:

We addressed our remarks to the children. [D2a]
~ Our remarks were addressed to the children.
(*The children were addressed our remarks (to))

We reminded him of the agreement. [D2b]
~ He was reminded of the agreement.
(*The agreement was reminded him (of))

Some verbs have all three possibilities of construction in the active; many have two; for others there is only one possibility (in some cases the alternatives are not identical but very similar in meaning):

tell [D1 + 2a + 2b]	Mary told only John the secret. [D1]
	Mary told the secret only to John. [D2a]
	Mary told only John about the secret. [D2b]
offer [D1 + 2a]	John offered Mary some help. [D1]
	John offered some help to Mary [D2a]
envy [D1 + 2b]	She envied John his success. [D1]
	She envied John for his success. [D2b]
wish [D1]	They wished him good luck. [D1]
blame [D2a + 2b]	Helen blamed the divorce on John. [D2a]
	Helen blamed John for the divorce. [D2b]
say [D2a]	Why didn't anybody say this to me? [D2a]
warn [D2b]	Mary warned John of the dangers. [D2b]

The different constructional possibilities of certain verbs provide a means of achieving different focus (cf 18.37f). Compare the following pairs of sentences as pronounced with unmarked (end) focus:

{ Mary blamed the broken vase on JOHN.
Mary blamed John for the broken VASE.
(Cf: John was blamed . . . by MARY.)
{ The government supplied blankets for the HOMELESS.
The government supplied the homeless with BLANKETS.
(Cf: Blankets were supplied . . . by the GOVERNMENT.)

- Note [a] The above constructions are presented in the most typical syntactic ordering, but postponement of the direct or indirect object may take place in contexts where end-focus or end-weight is required (cf 18.37); eg: *John offered to Mary the help that she needed.*
[b] Additional prepositional verb patterns should be briefly mentioned. There is, for example, the double-prepositional-verb pattern noted in 16.17(c):

I am *applying to* the hospital *for* a job.
 There is a further possibility that two prepositional objects may follow a direct object:
 We are *paying \$100 to* the garage *for* the repairs.

Verbs of complementation types [D1] and [D2]

- 16.57 The following list gives some of the verbs that occur in Types [D1], [D2a], [D2b], organized according to the cross-classifications of 16.56 above. We are interested here only in synonymous or nearly synonymous constructions, in which the same participant roles (cf 10.18ff) occur. Hence many possible prepositional verbs are ignored. *Pay for*, for example, is ignored because it introduces a further participant (the commodity bought) not included in *pay (with)* and *pay (to)*.

Table 16.57

	Type [D1]	Type [D2a]	Type [D2b]
EXAMPLE	<i>serve</i> (Jack scampi)	<i>serve</i> (scampi) <i>to</i> (Jack)	<i>serve</i> (Jack) <i>with</i> (scampi)
[D1 + 2a + 2b]	<i>pay</i> <i>provide</i> <AmE> <i>serve</i> <i>tell</i>	<i>pay to</i> <i>provide for</i> <i>serve to</i> <i>tell to</i>	<i>pay with</i> <i>provide with</i> <i>serve with</i> <i>tell about</i>
[D1 + 2a]	(i) <i>bring</i> <i>deny</i> <i>give</i> <i>grant</i> <i>hand</i> <i>leave</i> <i>lend</i> <i>offer</i> <i>owe</i> <i>promise</i> <i>read</i> <i>send</i> <i>show</i> <i>teach</i> <i>throw</i>	<i>bring to</i> <i>deny to</i> <i>give to</i> <i>grant to</i> <i>hand to</i> <i>leave to/for</i> <i>lend to</i> <i>offer to</i> <i>owe to</i> <i>promise to</i> <i>read to</i> <i>send to</i> <i>show to</i> <i>teach to</i> <i>throw to</i>	
	(ii) <i>do</i> <i>find</i> <i>make</i> <i>order</i> <i>reserve</i> <i>save</i> <i>spare</i>	<i>do for</i> <i>find for</i> <i>make for</i> <i>order for</i> <i>reserve for</i> <i>save for</i> <i>spare for</i>	
	(iii) <i>ask</i>	<i>ask of</i>	

[D1 + 2b]	<i>envy</i> <i>excuse</i> <i>forgive</i>	<i>envy for</i> <i>excuse for</i> <i>forgive for</i>
[D1]	<i>allow</i> <i>charge</i> <i>fine</i> <i>refuse</i> <i>wish</i>	
[D2a + 2b]		<i>blame on</i> <i>supply for/to</i> <i>blame for</i> <i>supply with</i>
[D2a]		<i>address to</i> <i>announce to</i> <i>communicate to</i> <i>explain to</i> <i>say to</i>
[D2b]		<i>advise about</i> <i>punish for</i> <i>etc</i>

The membership of [D2b] is numerous. Here are further examples, arranged by prepositions:

<i>thank for</i>	<i>convince of</i>	<i>rob of</i>	<i>refer to</i>
<i>prevent from</i>	<i>deprive of</i>	<i>suspect of</i>	<i>sentence to</i>
<i>protect from</i>	<i>inform of</i>	<i>warm of</i>	<i>subject to</i>
<i>interest in</i>	<i>persuade of</i>	<i>congratulate on</i>	<i>treat to</i>
<i>accuse of</i>	<i>relieve of</i>	<i>confine to</i>	<i>charge with</i>
<i>convict of</i>	<i>remind of</i>	<i>introduce to</i>	<i>compare with</i>

Note that reflexive verbs (cf 6.25) sometimes occur with a prepositional object; eg: *We pride ourselves on the service we offer*. Some of the verbs above (such as *compare with*) can have two inanimate objects.

In Table 16.57, we have distinguished, under [D1 + 2a], verbs taking *to* as their preposition from those taking *for*; eg:

- (i) She sent Paul a present. ~ She sent a present to Paul.
 (ii) She made Paul a meal. ~ She made a meal for Paul.

Occasionally, a preposition other than *to* and *for* occurs in this function:

- (iii) She asked Paul a favour. ~ She asked a favour of Paul.

- 16.58 Distinct from [D2a] and [D2b] above is a kind of prepositional verb which has already been discussed in 16.7–8; a verb for which the direct object forms part of an idiomatic unit with the verb and the preposition. The syntactic properties of this type, which we label [D2c], have already been dealt with, and it is enough here to list a further sample of such idioms:

<i>catch sight of</i>	<i>make allowance for</i> ¹	<i>put a stop to</i>
<i>give place to</i>	<i>make fun of</i>	<i>set fire to</i>
<i>give way to</i>	<i>make a fuss over/about</i> ¹	<i>take account of</i> ¹
<i>keep pace with</i>	<i>make room for</i>	<i>take advantage of</i> ¹
<i>lose sight of</i>	<i>make use of</i> ¹	<i>take care of</i> ¹
<i>lose touch with</i>	<i>pay attention to</i> ¹	<i>take note of</i> ¹
<i>lose track of</i>	<i>put an end to</i>	<i>take notice of</i> ¹

Those marked with a raised '1' can take not only a prepositional passive (cf 16.7–8) but also can easily take a passive for which the idiomatically-fixed direct object becomes subject; eg: *(Some) allowance was made for loss of earnings*; *(Little) notice was taken of this event*. Other verbs can take the passive, but with greater difficulty; with these examples, as with prepositional verbs in general, idiomatic cohesion is a matter of gradience.

Variants of ditransitive complementation

[D3] Indirect object + *that*-clause object

- 16.59 Corresponding to monotransitive verbs of Type [B3] (cf 16.30) are ditransitive verbs for which the direct object is a *that*-clause:

John *convinced* me (that) he was right.

~ I *was convinced* (by John) (that) he was right.

The second passive is unacceptable when the direct object is a clause: **That he was right was convinced me*. Thus the first passive (cf 16.55) above is the only passive that can occur with this pattern. With some verbs, such as *convince* above, it is impossible to delete the noun phrase object:

*John *convinced* (that) he was right.

With other verbs, such as *show*, the indirect object is optional:

The professor of mathematics showed me that Pythagoras was mistaken.
~ The professor of mathematics showed that Pythagoras was mistaken.

Ditransitive verbs followed by a *that*-clause may be divided into a subtype introducing an indirect statement, and a subtype introducing an indirect directive (cf 14.33). In the indirect statement, the *that*-clause contains an indicative verb; in the indirect directive the verb may be indicative or subjunctive, and often contains putative *should* or another modal verb (cf 16.32 for the distribution of these options):

INDIRECT STATEMENT:

May I *inform* you that your order is ready for collection?

INDIRECT DIRECTIVE:

She *petitioned* the king that her father $\left\{ \begin{array}{l} \text{might be} \\ \text{should be} \\ \text{be} \end{array} \right\}$ *pardoned*.

In the following list, Type (i) verbs introduce indirect statements, and Type (ii) verbs introduce indirect directives. The indirect directive construction is

rare and formal in comparison with the similar infinitive construction (cf 16.63):

?I begged her that she $\left\{ \begin{array}{l} \text{would} \\ \text{should} \end{array} \right\}$ help. <formal>

I begged her to help. <more usual>

For those verbs marked 'O' the indirect object is obligatory; for those marked '(O)', the indirect object is optional; for those marked '((O))' the indirect object is not only optional, but unusual:

(i) <i>advise</i> (O)	<i>remind</i> O	(ii) <i>ask</i> ³ ((O))
<i>assure</i> O	<i>satisfy</i> O	<i>beg</i> ³ (O)
<i>bet</i> (O)	<i>show</i> ³ (O)	<i>charge</i> (O)
<i>convince</i> O	<i>teach</i> ³ (O)	<i>command</i> ((O))
<i>forewarn</i> (O)	<i>tell</i> O	<i>instruct</i> ((O))
<i>inform</i> O	<i>wager</i> (O)	<i>order</i> ((O))
<i>notify</i> ³ O	<i>warn</i> (O)	<i>petition</i> ³ (O)
<i>persuade</i> ¹ O	<i>write</i> ^{2,3} (O)	<i>tell</i> O
<i>promise</i> ³ (O)		

The superscripts are interpreted as follows:

- 1: *Persuade* in the sense of 'convince' belongs to Type (i); but it may also be used in a Type (ii) sense of 'persuade someone to do something'.
- 2: *Write* is found with an indirect object + *that*-clause especially in AmE.
- 3: With verbs so marked, the indirect object can be replaced by a prepositional object (cf 16.60).

Note Superficially similar to the [D3] pattern is the 'impersonal' construction *it strikes/struck me (that) ...*, as in:

It strikes me this work is for his own amusement.

But here the *that*-clause (as in 16.34) is the extraposed subject of the verb. Compare: *He strikes me as ...* (cf 16.46 Note [c]) and *It occurs to me that ...* (cf 16.34 Note [c]).

[D3pr] Prepositional object + *that*-clause object

- 16.60 The verbs marked '3' in the above list can be optionally followed by a preposition, thus forming a category similar to [D2a] in 16.56:

He *promised* ((to) me) that the debt would be repaid.

For most verbs of [D3] which permit a prepositional object, the preposition is *to*:

He *wrote* to me ... He *reported* to me that ... etc

Exceptions are *ask* and *beg*, which (in somewhat formal usage) are followed by the preposition *of*:

I *ask/beg* of you that you will keep this secret. <formal>

There is, in addition, a group of verbs which were classified in 16.31–32 as monotransitive, but which optionally allow the preposition *to* preceding a prepositional object. These may be distinguished as Type [D3pr], and subdivided into sub-types (i) and (ii), as in the parallel description of [B3] verbs:

Joan mentioned (to me) that her father was sick. [Type (i)]

Dr Day recommended (to her) that the treatment be continued. [Type (ii)]

For example:

(i) acknowledge	declare	remark	(ii) propose
admit	explain	report	recommend
announce	mention	say	suggest
complain	point out	signal	
confess	prove	state	

As before, Type (i) verbs introduce indirect statements, and the less numerous Type (ii) verbs introduce indirect directives. As before, too, some exceptional verbs take a preposition other than *to*:

She demanded *of* me that . . . She agreed *with* me that . . . etc

Unlike the nonprepositional verbs of [D3], these prepositional verbs allow the *that*-clause to become subject of a corresponding passive clause, an option which is more acceptable with extraposition:

That several ministers are resigning has been *admitted to* our correspondent.

~ It has been *admitted to* our correspondent that several ministers are resigning.

It has been *shown to* us all that Miss Jones was innocent.

Without the preposition, *ie* with an ordinary indirect object, such sentences are at best marginally grammatical: ?**It has been shown us all that Miss Jones was innocent.*

Note The constructions of *It appears/happens/occurs/seems to me that* . . . superficially appear to belong to the pattern [D3pr], but in fact these contain monotransitive verbs with an extraposed *that*-clause as subject:

It occurred/seemed to me that he was lying.

Cf similar patterns with extraposition in 16.34, 16.59 Note.

[D4] Indirect object + finite *wh*-clause object

16.61 This pattern of complementation is primarily found with the verb *ask*, which introduces a reported question:

John *asked me* what time the meeting would end.

~ I was *asked* (by John) what time the meeting would end.

Also used with this pattern are verbs which take an indirect object followed by a *that*-clause (Type (i) of [D3]), but for these the *wh*-clause tends to be limited to nonassertive contexts (cf 16.35). Compare:

George didn't *tell* them that the train was late. [1]

George didn't *tell* them whether the train was late. [2]

The difference of meaning between the *that*- and *whether*-constructions can be stated in terms of presupposition. Sentence [1] typically implies that the train was late, while [2] is noncommittal on the matter. [D4] verbs can also introduce other question words such as *where* and *how*:

Jim was reluctant to *inform us (of)* where he got the money.

Would you *remind me (about)* how we start the engine?

A preposition may always be placed before the *wh*-clause. In the above cases, the preposition is optional, but in the case of verbs like *enquire of* (Type [D4pr]) the preposition is obligatory: *I enquired of the clerk which documents were needed.* The complex preposition *as to* can be rather generally used for introducing the *wh*-clause; eg: *I enquired . . . as to which documents were needed.*

[D5] Indirect object + *wh*-infinitive clause object

16.62 This is yet another complementation pattern (comparable with [B5], 16.37) which may be taken by some verbs listed under [D3] in 16.59:

advise ask instruct remind show teach tell warn

The instructor *taught us how to land safely.*

~ We were *taught* (by the instructor) *how to land safely.*

They *advised him what to wear in the tropics.*

Please *remind me where to meet you after lunch.*

The equivalent prepositional verb pattern [D5pr] is illustrated by *suggest to*, *recommend to*:

Could you please *suggest to* the visitors *which museums to visit*?

Here, as in the [D4] type, a prepositional phrase introduced by *as to* can be used:

Helen *advised us (as to)* how to maintain the machine.

[D6] Indirect object + *to*-infinitive clause object

16.63 We have seen that the [D3] pattern may be used to introduce indirect statements, and that the [D4] pattern may be used to introduce indirect questions. Now we turn to the verbs of class [D6], which introduce indirect directives (cf 14.33):

I *told/advised/persuaded* Mark to see a doctor. [1]

~ Mark was *told/advised/persuaded* to see a doctor. [2]

This complementation category looks like those of [B8] and [C5], in that the verb is followed by a noun phrase and an infinitive construction. But the [D6] pattern differs from these in that the noun phrase following the verb is an indirect object, as will be clarified in 16.66 below. As with other verbs introducing indirect speech, the subject refers to the speaker of some speech act, and the indirect object refers to the addressee. Like [D3] verbs, [D6] verbs form only the first passive exemplified in [2] above: we do not find **To see a doctor was told Mark.* The following verbs belong to this class:

<i>advise</i>	<i>command</i>	<i>entreat</i>	<i>instruct</i>	<i>remind</i>	<i>teach</i>
<i>ask</i>	<i>counsel</i>	<i>exhort</i>	<i>invite</i> ¹	<i>request</i> ¹	<i>tell</i>
<i>beg</i>	<i>detail</i> ¹	<i>forbid</i>	<i>order</i>	<i>recommend</i>	<i>urge</i>
<i>beseech</i>	<i>direct</i>	<i>implore</i>	<i>persuade</i>		
<i>challenge</i> ¹	<i>enjoin</i> ¹	<i>incite</i> ¹	<i>pray</i> ¹		

Those verbs marked with a raised '1' do not have the equivalent construction with a *that*-clause containing a modal or a subjunctive verb (Types [B3(ii)], [D3(ii)]). Contrast:

They $\begin{cases} \text{begged} \\ \text{invited} \end{cases}$ her to stay another week.
 They $\begin{cases} \text{begged} \\ \text{*invited} \end{cases}$ (her) that she would stay another week.

The alternative *that*-clause construction, however, is more formal, especially when the indirect object is present.

Note [a] The verb *promise*, when it occurs with this kind of complementation, is exceptional in that the understood subject of the infinitive is identified with the subject rather than with the object of the main clause:

Sam promised me to get some food.

$\begin{cases} = \text{Sam promised me that he would get some food.} \\ \neq \text{Sam promised me that I would get some food.} \end{cases}$

The present pattern [D6] is, however, less common with *promise* than the [B6] pattern without the indirect object: *Sam promised to get some food*.

[b] Only *order* can be followed by a passive infinitive: *He ordered them to be imprisoned/released*.

Multiple analysis and gradience in verb complementation

16.64 Before we leave verb classification, it is important to reflect on the problems of dividing verbs into complementation types. The major division of complementation patterns into copular [A], monotransitive [B], complex transitive [C], and ditransitive [D] categories (introduced in 2.16) has been extended with little difficulty to include patterns in which the verb's complementation includes finite and nonfinite clauses. This is the basis for the classification of verbs into types in 16.20–63 above. But unavoidably, our aim of presenting a clear classification has obscured some problems of gradience and multiple analysis (cf 2.60ff), and to illustrate these we return to three superficially identical structures already discussed in 16.36. These are now illustrated with three new examples, each of which conforms to the pattern $N_1 V N_2 \text{ to } V N_3$, (where N = noun phrase, and V = verb phrase):

Table 16.64a

	N_1	V	N_2	$\text{to } V$	N_3	
[B8]	S	V	O			
	We	like	all parents	to visit	the school	[1]
[C4]	S	V	O	C_o		
	They	expected	James	to win	the race	[2]
[D6]	S	V	O_i	O_d		
	We	asked	the students	to attend	a lecture	[3]

Each of these sentences consists of the sequence $N_1 V N_2 \text{ to } V N_3$, and yet we have analysed them respectively as monotransitive (SVO), complex transitive (SVO C_o), and ditransitive (SVO $i O_d$). A different analysis, in some ways more revealing, would recognize an overlap between two competing descriptions of the intermediate noun phrase N_2 . There is little doubt that in [1] this is to be analysed as subject of the infinitive clause (cf 16.36); whereas in [3] there are equally strong reasons for regarding N_2 as (indirect) object of the main clause (cf 16.66):

Fig 16.64b Sentence [1]

Fig 16.64c Sentence [3]

Sentence [2], however, partakes of both these descriptions. From the semantic point of view, it requires the analysis of Fig 16.64b (cf: *They expected [that James would win the race]*). But from the structural point of view, the analysis in Fig 16.64c is more appropriate, reflecting N_2 's ability to become subject of the passive sentence: *James was expected to win the race*. We might reasonably say that in [2], N_2 behaves like an object (O_d rather than O_i) in relation to the first verb, but like a subject in relation to the second, infinitive verb. The term **RAISED OBJECT**, applied in 16.49ff to the intermediate noun phrase of patterns [C4 – C7], incorporates yet another way of recognizing this double analysis, by envisaging a process whereby the subject of the infinitive becomes the object of the preceding finite verb. This raised object will be symbolized, in what follows, S/O.

16.65 Given that the double analysis above provides some insight into clauses containing nonfinite complementation, we could take such an analysis further, and apply it to all complex transitive patterns, including the more straightforward *SVOC* and *SVOA* patterns of [C1 – C3]:

I consider $\begin{cases} \text{that John is a good driver.} & \text{[B3]} \\ \text{John to be a good driver.} & \text{[C4]} \\ \text{John a good driver.} & \text{[C2]} \end{cases}$

The parallelism of meaning and phrasal relations demonstrated in these three sentences recommends an analysis in which the complementation of pattern [C2], *John a good driver*, would be regarded as a clause in its own right: ie as a verbless clause consisting of $S = \text{John}$ and $C_s = \text{a good driver}$, without an intervening V . This description would not, however, displace the by now familiar *SVO $i O_d C_o$* analysis, but would rather be seen as an alternative way of looking at the same construction.

Gradience

- 16.66 The technique of multiple analysis still leaves some subtleties unexposed. What this technique has suggested is that there are the following three categories corresponding to [1–3] in 16.64:

$N_2 = S$:	We like <i>all parents</i> to visit the school.	[1]
$N_2 = S/O$:	They expected <i>James</i> to win the race.	[2]
$N_2 = O$:	We asked <i>the students</i> to attend a lecture.	[3]

But more than three categories can be appropriately distinguished if we recognize [1] and [3] as end-points of a gradient, with [2] at some point on the scale between them. This area of grammar affords a good example of gradience.

At the monotransitive end of the scale, [1] can be characterized by a number of criteria which suggest that N_2 to VN_3 (*all parents to visit the school*) constitutes the direct object of an *SVO* pattern:

- (a) It can be replaced by a pronoun referring to the clause or noun phrase nominalizing it: *We like it*; *We like all parents' visits*.
 (b) It can be an answer to a *what*-question:
 A: What do you like best?
 B: We like all parents to visit the school.
 (c) In some dialects, it can be preceded by the infinitive clause introducer *for*: *We like (it) for all parents to visit the school*.
 (d) It can easily (when preceded by *for*) be the focus of a pseudo-cleft sentence: *What we like (best) is for all parents to visit the school*.
 (e) When the sequence N_2 to VN_3 is turned into the passive form N_3 to be *Ved*₂ by N_2 , there is no change of meaning:
 We like all parents to visit the school.
 = We like the school to be visited by all parents.
 (f) In a reduced construction the infinitive marker *to* remains: *We like them* does not have the same meaning as *We like them to*.

At the other, ditransitive end of the scale, a contrasting set of criteria characterize [3], and support the analysis of N_2 (*the students*) as an indirect object and *to VN*₃, (*to attend a lecture*) as a clausal direct object:

- (a') *to VN*₃ can be replaced by a pronoun, a noun phrase, or a finite clause, with N_2 still functioning as indirect object:

We asked the students { *something*.
 a question.
 what they wanted.

- (b') *to VN*₃ can be the answer to a *wh*-question, while N_2 functions as indirect object:
 A: What did you ask the students?
 B: We asked them to attend a lecture.
 (c') When the sequence N_2 to VN_3 is turned into the passive sequence N_3 to be *Ved*₂ by N_2 , the meaning is always changed:
 They asked the students to attend a lecture.
 ≠ *They asked a lecture to be attended by the students.
 (In this case, indeed, the passive transform results in an absurdity.)

- (d') *to VN*₃ can marginally become the focus of a pseudo-cleft sentence: ?*What they asked the students was to attend a lecture*. (Contrast the decidedly unacceptable **What we like the parents is to visit the school*.)
 (e') N_2 , which like O_1 in general is usually 'personal', can be detached from its place after the first V to become subject of a corresponding passive sentence: *The students were asked to attend a lecture*.
 (f') In a reduced construction, the infinitive marker *to* can be omitted: *We asked them*; *We persuaded them*; etc.

Note [a] With some ditransitive verbs, criterion (a') has to be interpreted as the replacement of the infinitive clause by a preposition and prepositional object (cf 16.56–8):

They reminded him of his responsibilities.

One man challenged the other to a duel.

[b] Criterion (d') is less reliable than the others, since the pseudo-cleft sentence is unacceptable for many verbs. But a pseudo-cleft sentence in which the indirect object is replaced by a prepositional object tends to be more grammatical: *What they asked of the students was to attend a lecture*. (The alternative construction with the substitute verb *do*, which also occurs with [1], is always more acceptable: *What they asked the students to do was to attend a lecture*.)

- 16.67 To give a simplified illustration of the analysis of gradience in the sequence $N_1 VN_2$ to VN_3 , we now take a subset of the criteria listed above, and apply them to a range of verbs on the gradient connecting [1] and [3] of 16.66.

CRITERIA \ VERB CLASSES	(1) <i>ask</i> , <i>tell</i> , etc	(2) <i>elect</i> , <i>allow</i> , etc	(3) <i>intend</i> , <i>expect</i> , etc	(4) <i>want</i> , <i>like</i> , etc
(a') <i>to VN</i> ₃ can be replaced by a finite clause	+	–	–	–
(c') change of meaning in passive of N_2 to VN_3	+	+	–	–
(e') N_2 can become subject of passive	+	+	+	–

Fig 16.67 A complementation gradient

The matrix uses only three criteria, and thereby distinguishes only four categories. This is sufficient to indicate the principle, however, that the three categories [B8], [C4], and [D6] of our taxonomy could be broken down into a finer spectrum of categories between which the differences are small. In effect, Fig 16.67 distinguishes two subcategories of [C4]: one (including *elect* and *allow*) which is closer to the ditransitive type, and one (including *intend* and *expect*) closer to the monotransitive type. *Elect* and *allow* respond to criterion (c'):

They elected Miss Coe to succeed the present secretary.

≠ **They elected* the present secretary to be succeeded by Miss Coe.

We don't allow residents to entertain visitors.

≠ *We don't allow* visitors to be entertained by residents.

while *intend* and *expect* do not:

- They *intended* the students to see the professor.
 = They *intended* the professor to be seen by the students.
 They *expect* the students to enjoy the classes.
 = They *expect* the classes to be enjoyed by the students.

Note For verbs in group (3), the voice of the infinitive clause and the voice of the main clause may be independently varied, with the result that a sentence like *They expected the students to enjoy the classes* has three corresponding passives with the same meaning:

- = { They expected the classes to be enjoyed by the students.
 The students were expected to enjoy the classes.
 The classes were expected to be enjoyed by the students.

The last example has a passive verb phrase in both the superordinate clause and the infinitive clause.

Adjective complementation

16.68 Categories of complementation in adjective phrases (cf 2.28, 7.21–2) are similar in variety to those of verb complementation. We distinguish [E1–E5] as follows:

- [E1] Complementation by a prepositional phrase
 [E2] Complementation by a *that*-clause
 [E3] Complementation by a *wh*-clause
 [E4] Complementation by a *than*-clause
 [E5] Complementation by a *to*-infinitive clause
 [E6] Complementation by an *-ing* participle clause

These complementation patterns can occur after an adjective (and its modifiers, if any) in various syntactic functions. For example:

The violin is (rather) difficult to play.
 (adjective phrase as C_o)

Mary found the violin (rather) difficult to play.
 (adjective phrase as C_o)

The violin is an instrument (rather) difficult to play.
 (adjective phrase as postmodifier)

The only position in which an adjective cannot normally be followed by its complementation is the premodifying position in a noun phrase: **a keen child on chess*. But here, too, with certain constructions (Types [E5(i)] and [E5(v)]) the complementation can follow discontinuously after the head noun: *The violin is a difficult instrument to play* (cf discontinuity with comparative constructions, 15.75). For illustrative purposes, we will confine examples in the following sections to the subject complement function. The lists, like the verb lists in 16.20–63, will be selective.

Note There is a considerable parallel, as the categories [E1–E5] above demonstrate, between patterns associated with adjectives and those associated with monotransitive verbs. The chief difference is that adjectives cannot be followed by a noun phrase object. To bring out the parallel further, we could describe adjectives exemplified in 16.69 below (*averse to*, *conscious of*, etc) as 'prepositional adjectives' comparable with prepositional verbs. We could moreover identify 'phrasal adjectives' (derived from participial forms of phrasal verbs) such as *run down* ('exhausted, depressed') and 'phrasal-prepositional adjectives' such as *fed up (with)*. These latter variants, however, are rare enough to be disregarded in the following lists.

[E1] Adjective complementation by a prepositional phrase

16.69 Like prepositional verbs, adjectives often form a lexical unit with a following preposition: *good at*, *fond of*, *opposed to*, etc. The lexical bond is strongest with adjectives for which, in a given sense, the complementation is obligatory: *Max is averse to games* ~ **Max is averse*. Such adjectives are marked '1' in the following lists.

The lists make a distinction between participial (cf 7.15–19) and nonparticipial adjectives. The difference between participial adjectives and the *-ed* participle of the passive construction is discussed in 3.75–77. These lists provide only a small sample of the adjectives accompanying the prepositions concerned. In particular, it is often possible for the same adjective to go with two or more prepositions, as in *angry about*, *angry at* and *angry with*.

ABOUT: He was very worried about her reaction. (cf 9.60)

NONPARTICIPIAL		PARTICIPIAL	
angry	knowledgeable	aggrieved	frightened
glad	mad	annoyed	pleased
happy	reasonable	delighted	worried

AT: She was bad at mathematics. (cf 9.62)

NONPARTICIPIAL		PARTICIPIAL	
angry	good	alarmed	disgusted
brilliant	hopeless	amused	pleased
clever	terrible	delighted	puzzled

FROM: The village is remote from the bustle of city life. (cf 9.18, 9.47)
 different distant distinct free remote

OF: She was aware of his difficulties.

NONPARTICIPIAL			PARTICIPIAL	
afraid	conscious ¹	glad	convinced	
ashamed	empty	proud ¹	scared	
capable	fond ¹	short ¹	tired	
certain	full	worthy		

ON/UPON: Their plan was based on cooperation.

NONPARTICIPIAL			PARTICIPIAL	
contingent ¹	intent ¹	reliant ¹	based ¹	set ¹
dependent	keen	severe	bent ¹	

TO: All capital gains are *subject to* taxation.

NONPARTICIPIAL

answerable close¹ liable¹
averse¹ due¹ similar

PARTICIPIAL

accustomed¹ inclined¹
allied¹ opposed¹

WITH: This plan is not *compatible with* our principles.

NONPARTICIPIAL

angry happy
busy impatient
comfortable incompatible¹
compatible¹ sick
content uneasy
familiar
friendly
furious

PARTICIPIAL

annoyed drunk
bored enchanted
concerned obsessed
delighted occupied
depressed overcome
disappointed pleased
disgusted satisfied
dismayed taken¹
distressed

Note [a] In general, choice of preposition remains the same after morphologically related verbs, adjectives, and nouns: *different from*, *differ from*, *difference from*. But this correspondence is not always to be relied on: contrast *full of* with *filled with*; *proud of* with *pride in*.

[b] Other prepositions which less commonly enter into *adjective + preposition* idioms include *for* and *towards*: *grateful for*, *sorry for*, *inclined towards*.

[c] *Used* followed by the preposition *to*, a more informal synonym of *accustomed (to)*, is participial in spelling, but has the special pronunciation /'ju:stə/. Unlike *accustomed*, however, *used* does not occur with a following infinitive (cf 16.79). This adjectival *used to*, in spite of identity of spelling and pronunciation, is quite distinct from *used to* as a marginal modal (cf 3.44). Contrast: I'm *used to* hard work. I *used to* work hard.

[d] In the past, prescriptive objections have been made to the use of *to* rather than *from* after *averse* and *different*. However, *to* is the normal preposition to follow *averse*, and *different to* is quite widely used (esp in BrE) as an alternative to *different from*. On *different than*, cf 15.66 Note, 16.74.

[e] *With* can be omitted after (in)compatible if the subject is plural, cf 'mutual participation', 13.60:

*Carl is incompatible. BUT: Carl and Eva are incompatible.

[E2] Adjective complementation by a *that*-clause

16.70 Like *that*-clauses following a verb, *that*-clauses following an adjective may have:

(A) indicative verb: I am *sure* (that) he is here now.

(B) subjunctive verb: They were *insistent* (that) we *be* ready. <formal>

(C) putative *should*: I'm *sorry* (that) he *should have* left. <formal>

The uses of the mandative subjunctive and of putative *should* have been discussed in 3.59 and 14.25 respectively. Putative *should* often occurs after expressions of emotion (sorrow, joy, displeasure, surprise, wonder, etc), and is often accompanied by intensifying expressions such as *so*, *such*, *like this/that*, *ever*, or *at all*. The indicative *that*-clause, on the other hand, refers to an established fact. The following pairs illustrate choices of construction:

I am *sorry* { (that) I *have to* leave so early.
(that) you *should have* been (so) inconvenienced.

I am *surprised* { (that) you *didn't call* the doctor before.
(that) anyone of your intelligence *should swallow* a lie like that.

With some adjectives (those in category [E2b(ii)], 16.72) the *should*-clause can be paraphrased by an infinitive clause with a subject:

It was *natural* for him to go to London after the war.

= It was *natural* that he should go to London after the war.

That-clauses cannot be preceded by prepositions. Hence adjectives which are constructed with prepositions before noun phrases ([E1]) drop the preposition before a *that*-clause (cf 16.28). Compare the following:

I am *convinced* { of his innocence. [E1]
(that) he is innocent. [E2]

Many *that*-clauses following an adjective are actually subjects postponed by extraposition (cf 18.33):

It is lucky (that) you came. ~ That you came is lucky.

These are listed separately in 16.72.

[E2a] Adjectives with experiencer (cf 10.23 Note) as subject

16.71 (i) *THAT*-CLAUSE HAS INDICATIVE VERB ONLY (cf Note [a] below)

These adjectives express degrees of certainty or confidence: *aware*, *certain*, *confident*, *sure*:

We were *confident* that Karen was still alive.

(ii) *THAT*-CLAUSE HAS PUTATIVE *SHOULD*, OR SUBJUNCTIVE VERB (or marginally also an indicative verb)

The three principal adjectives in this class are *anxious*, *eager*, and *willing*:

Are you *willing* that { he *should be* permitted to resign?
he *be* permitted to resign?
?he *is* permitted to resign?

(On the distribution of these three alternatives, cf 16.30.)

(iii) *THAT*-CLAUSE HAS INDICATIVE VERB OR PUTATIVE *SHOULD*

These adjectives express emotions:

I'm so *thankful* that nobody was hurt.

Were you *surprised* that Ray *should win* the prize?

NONPARTICIPIAL

afraid hopeful
angry proud
glad sad
grateful sorry
happy thankful

PARTICIPIAL

alarmed depressed horrified
amazed disappointed irritated
amused distressed pleased
annoyed disturbed shocked
astonished frightened upset

There is a tendency to prefer the putative *should* construction in nonassertive contexts, or where the adjective has negative or unfavourable associations.

Note [a] The restriction of Type (i) above to 'indicative verbs only' is meant to allow for the use of modal auxiliaries, including *should* in a nonputative sense; eg: *I am aware that I should* [= 'ought to'] *have joined long ago.*

[b] *Afraid* is unique among adjectives in that it accepts the pronoun *so* (and its negative equivalent *not*) as a *that*-clause substitute (cf 16.31): *I'm afraid so/not.*

[E2b] Adjectives with anticipatory *it* as subject

16.72 The *that*-clause in this construction is an extraposed subject. Three types are again distinguished, matching those in 16.71.

(i) THAT-CLAUSE HAS INDICATIVE VERB ONLY (cf 16.71 Note [a])

These adjectives have to do with truth or knowledge:

It is true that she never comes on time.

<i>apparent</i>	<i>evident</i>	<i>likely</i>	<i>possible</i>	<i>untrue</i>
<i>certain</i>	<i>implicit</i>	<i>obvious</i>	<i>true</i>	<i>well-known</i>
<i>clear</i>	<i>indubitable</i>	<i>plain</i>	<i>unlikely</i>	

(ii) THAT-CLAUSE HAS PUTATIVE *SHOULD*, OR SUBJUNCTIVE VERB (or marginally, also, an indicative verb)

These adjectives express concepts concerned with modality or volition:

It is essential that the ban $\left\{ \begin{array}{l} \text{should be lifted tomorrow.} \\ \text{be lifted tomorrow.} \\ \text{(?) is lifted tomorrow.} \end{array} \right.$

<i>appropriate</i>	<i>essential</i>	<i>important</i>	<i>necessary</i>	<i>vital</i>
<i>compulsory</i>	<i>fitting</i>	<i>impossible</i>	<i>obligatory</i>	
<i>crucial</i>	<i>imperative</i>	<i>improper</i>	<i>proper</i>	

Various deverbal adjectives ending in *-able* also belong to this group, eg: *advisable, desirable, preferable.*

(iii) THAT-CLAUSE HAS INDICATIVE VERB OR PUTATIVE *SHOULD*

This group consists mainly of emotive adjectives, and includes a large number of participial adjectives ending in *-ing*:

It is $\left\{ \begin{array}{l} \text{strange} \\ \text{upsetting} \end{array} \right.$ *that* $\left\{ \begin{array}{l} \text{she is so late.} \\ \text{she should be so late.} \end{array} \right.$

NONPARTICIPIAL

<i>awkward</i>	<i>logical</i>
<i>curious</i>	<i>odd</i>
<i>disastrous</i>	<i>peculiar</i>
<i>dreadful</i>	<i>sad</i>
<i>extraordinary</i>	<i>silly</i>
<i>fortunate</i>	<i>tragic</i>
<i>irrational</i>	<i>unfortunate</i>

PARTICIPIAL

<i>alarming</i>	<i>perplexing</i>
<i>annoying</i>	<i>pleasing</i>
<i>depressing</i>	<i>shocking</i>
<i>disappointing</i>	<i>surprising</i>
<i>embarrassing</i>	
<i>frightening</i>	
<i>irritating</i>	

Various *-able/-ible* adjectives also belong to this group: *admirable, commendable, deplorable, despicable, incomprehensible, inconceivable, lamentable, remarkable, understandable, unjustifiable, etc.*

Note [a] Although the pro-forms *so* and *not* cannot be used after these [E2b] adjectives (cf 16.71 Note [b]), there is a possibility of replacing the adjective + *so/not* by a related adverb + *so/not*:

A: *It is apparent* that she lives/doesn't live here.

B: Yes, *obviously/fortunately so.*

B: No, *evidently/sadly not.*

[b] When an adjective of Type (iii) above occurs after a modal verb construction, the *that*-clause is commonly replaced by an *if*-clause. If the modal verb in the main clause is hypothetical (eg: *would*), the verb in the *if*-clause is placed in the hypothetical past. Compare:

$\left\{ \begin{array}{l} \text{It is sad that you have to leave.} \\ \text{It will be sad if you have to leave.} \\ \text{It would be sad if you had to leave.} \end{array} \right.$

[E3] Adjective complementation by a *wh*-clause

16.73 As with *that*-clauses, we have to distinguish those adjectives ([E3a]) which are predicated of an experiencer (normally a person) as subject, and those ([E3b]) which go with anticipatory *it*. In the latter case, the *wh*-clause is an extraposed subject. Examples are:

[E3a] I was *unsure* $\left\{ \begin{array}{l} \text{(of)} \\ \text{(about)} \end{array} \right.$ $\left\{ \begin{array}{l} \text{what I should say.} \\ \text{whether the problem was solved.} \end{array} \right.$ [1] [2]

[E3b] It was *unclear* what they would do. [3]

Type [E3a] consists of adjectives which are constructed with prepositions, and which therefore belong also to Type [E1]. The preposition is sometimes omitted before the *wh*-clause (cf 15.5 Note [c]). In Type [E3b], on the other hand, no preposition can be inserted: **It was unclear off/about what they would do.* Also no infinitive *wh*-clause is possible (cf 16.37): *It is unsure where to go* is unacceptable unless *it* refers to some animate being (such as a mouse), and is consequently not interpreted in terms of extraposition.

Returning to Type [E3a], we note that in some cases the adjective takes a *wh*-clause in assertive contexts: eg: *careful (about), doubtful (as to), fussy (about), puzzled (as to), unclear (about), uncertain (of), undecided (about), unsure (of), unaware (of).*

John is *careful (about)* what he does with his money.

Most of these adjectives are intrinsically negative in meaning. In other cases, although elsewhere it is associated with an indicative *that*-clause [E2a(i)], the adjective tends to occur with a *wh*-clause in nonassertive contexts (cf 16.35), eg: *aware, certain, clear, sure:*

Are you *sure (of)* how much the machine costs?

I wasn't altogether *clear (about)* what we had to do.

A similar division may be made among adjectives of the anticipatory-*it* type ([E3b]). Those which intrinsically express doubt, and therefore take this structure even in assertive contexts, include *doubtful, uncertain, unclear, unsure*, and *unknown*. Those normally occurring with an indicative *that*-clause (ie Type [E2b(i)]) include *apparent, certain, obvious, and plain*. They can take a *wh*-clause in nonassertive contexts. Each type is illustrated in:

It was unclear whether an amendment would be accepted.

It was not obvious how far the westernization process would go.

After adjectives of Type [E3a] there may also occur an infinitive *wh*-clause: *I was uncertain (of) what to do*. This is preferable to the finite clause in cases illustrated by [1–3] above, since the subject can remain unexpressed in the reduced nonfinite version.

[E4] Adjective complementation by a *than*-clause

- 16.74 There is an unusual construction in which a noncomparative adjective is followed by a comparative *than*-clause as complementation. *Different* is the only adjective which fits into this pattern, and even then there is a tradition which regards the use of *than* here as improper. There is, however, no felicitous alternative to the *different than* construction in examples such as:

She's quite a *different* girl *than she was five years ago*. [1]

The various stylistic variants of, and alternatives to, the *than*-clause after *different* are examined in 15.66 Note [b]. When the clause is reduced to a noun phrase, it becomes possible to use *from* as an alternative to *than*:

The unions are taking a very different attitude $\left\{ \begin{array}{l} \text{than} \\ \text{from} \end{array} \right\}$ the employers.

When the noun phrase following *than/from* cannot be derived by ellipsis from a clause, *than* is decidedly less acceptable than *from*:

The main languages of southern India are totally different in origin $\left\{ \begin{array}{l} \text{from} \\ \text{?*than} \end{array} \right\}$ those of the northern part of the country.

Note [a] On *different from* and *different to*, cf 16.69 Note [d].

[b] It is also possible for a *than*-clause to be used after the adverb *differently*:

In the west of the country, they pronounce their vowels quite *differently than (they do) in the east*.

The same prescriptive objections are made to *differently than* as to *different than*.

[E5] Adjective complementation by a *to*-infinitive clause

- 16.75 We distinguish seven kinds of construction in which an adjective is followed by a *to*-infinitive clause. They are exemplified in the following sentences, which are superficially alike:

- (i) Bob is *splendid* to wait.
- (ii) Bob is *slow* to react.
- (iii) Bob is *sorry* to hear it.
- (iv) Bob is *hesitant* to agree with you.
- (v) Bob is *hard* to convince.
- (vi) The food is *ready* to eat.
- (vii) It is *important* to be accurate.

In Types (i–iv) the subject of the main clause (*Bob*) is also the subject of the infinitive clause. We can therefore always have a direct object in the infinitive clause if its verb is transitive. For example, if we replace intransitive *wait* by transitive *build* in (i), we can have: *Bob is splendid to build this house*.

For Types (v–vii), on the other hand, the subject of the infinitive is unspecified, although the context often makes clear which subject is intended.

In these types it is possible to insert a subject preceded by *for*; *eg* in Type (vi): *The food is ready (for the children) to eat*.

Note Infinitive complementation following adjectives modified by *too* and *enough* is discussed elsewhere, in 15.73.

[E5(i)] *Bob is splendid to wait*

- 16.76 Type (i) has an analogue in a construction involving extraposition (cf 18.33): *It is splendid of Bob to wait*. This type of construction also permits a head noun between the adjective and the infinitive:

Bob must be a *splendid craftsman* $\left\{ \begin{array}{l} \text{to build} \\ \text{to have built} \end{array} \right\}$ this house.

As this example shows, the infinitive may be perfective. We may also compare constructions in which an evaluative noun with its determiner replaces the adjective:

You're $\left\{ \begin{array}{l} \text{foolish} \\ \text{a fool} \end{array} \right\}$ to spend so much.

You're $\left\{ \begin{array}{l} \text{wonderful} \\ \text{an angel} \end{array} \right\}$ to wait for me.

Adjectives in this group are evaluative of human behaviour. They include:

careful *crazy* *mad* *silly* *wise*
careless *greedy* *nice* *unwise* *wrong*

These adjectives can also occur with anticipatory *it* and an *of*-phrase as additional complementation (cf 16.82):

It was *foolish* of you to spend so much.

[E5(ii)] *Bob is slow to react*

- 16.77 In Type (ii), the sentence corresponds to one in which the adjective becomes an adverb, while the infinitive becomes the finite verb:

Bob is *slow* to react. ~ Bob reacts *slowly*.

In another analogue, the adjective is followed by *in* and an *-ing* participle: *Bob is slow in reacting*. The infinitive verb phrase must be simple: for example, unlike the infinitive phrase in [E5(i)], it cannot be perfective: **Bob is slow to have reacted*. Other adjectives in this small group are *quick* and *prompt*.

Note There is also a partial adverbial analogue (cf 8.127ff) for Type (i), but in Type (i), unlike Type (ii), the perfective infinitive, and even the *get*-passive (cf 3.66) can be used:

Joan was wise to resign. ~ Joan wisely resigned.
 $\left\{ \begin{array}{l} \text{Joan was careless to get beaten.} \\ \text{Joan is careless to have got beaten.} \end{array} \right.$ ~ Joan carelessly got beaten.

[E5(iii)] *Bob is sorry to hear it*

- 16.78 In Type (iii), the head of the adjective phrase is an emotive adjective (commonly a participial adjective), and the infinitive clause expresses causation:

I'm sorry to have kept you waiting. ['I'm sorry because I have kept you waiting']

I was *excited* to be there. [~ 'To be there *excited* me']

Adjectives in this group correspond closely to the adjectives followed by a *that*-clause in 16.71 (Type [E2a(iii)]):

NONPARTICIPIAL		PARTICIPIAL		
<i>afraid</i>	<i>happy</i>	<i>annoyed</i>	<i>disgusted</i>	<i>overwhelmed</i>
<i>angry</i>	<i>impatient</i>	<i>astonished</i>	<i>dissatisfied</i>	<i>perturbed</i>
<i>ashamed</i>	<i>indignant</i>	<i>bored</i>	<i>embarrassed</i>	<i>puzzled</i>
<i>content</i>	<i>jubilant</i>	<i>concerned</i>	<i>fascinated</i>	<i>relieved</i>
<i>furiously</i>	<i>thankful</i>	<i>delighted</i>	<i>frightened</i>	<i>surprised</i>
<i>glad</i>		<i>depressed</i>	<i>interested</i>	<i>worried</i>
		<i>disappointed</i>	<i>overjoyed</i>	

[E5(iv)] *Bob is hesitant to agree with you*

16.79 In Type (iv), the head of the adjective phrase expresses volitional meaning, or a modal meaning such as ability, possibility, or liability. Examples are:

NONPARTICIPIAL		PARTICIPIAL
<i>able</i>	<i>keen</i>	<i>determined</i>
<i>anxious</i>	<i>liable</i>	<i>disposed</i>
<i>apt</i>	<i>likely</i> [E2b]	<i>fated</i> [E2b]
<i>certain</i> [E2b]	<i>loath</i>	<i>inclined</i>
<i>curious</i>	<i>powerless</i>	<i>poised</i>
<i>due</i>	<i>prone</i>	<i>prepared</i>
<i>eager</i>	<i>ready</i> [E5]	<i>(all) set</i>
<i>eligible</i>	<i>reluctant</i>	<i>unqualified</i>
<i>fit</i> [E5]	<i>sure</i> [E2b]	
<i>free</i> [E5]	<i>unable</i>	
<i>greedy</i>	<i>welcome</i>	
<i>hesitant</i>	<i>willing</i>	
<i>impotent</i>	<i>worthy</i>	

The adjectives marked [E2b] occur with a corresponding construction with extraposition of a *that*-clause:

Jill is *likely* to attend.

~ It is *likely* that Jill will attend.

Those marked [E5] are capable of occurring with an infinitive construction of 'passive' meaning, *ie* with an indefinite implied subject and a coreferential implied object:

They are not *fit to eat*. = They are not fit to be eaten.

Some of the most common adjectives in this list have a tendency to coalesce with the preceding copula to form a semi-auxiliary verb (*cf* 3.47): *be able to*, *be willing to*, *be sure to*. In addition to modal and volitional adjectives, some adjectives of aspectual meaning, such as *accustomed* and *wont* may be placed here:

We are *accustomed* to take tea on the terrace. <formal>

He was *wont* to leave the office at 5 p.m. <formal, archaic>

[E5(v)] *Bob is hard to convince*

16.80 In Type (v), the subject of the sentence is identified with the unexpressed object of the infinitive clause, which must therefore have a transitive verb; hence the unacceptable **Bob is hard to arrive*. There is an analogous construction in which the adjective is complement to an infinitive clause acting as (extraposed) subject (*cf* 18.36):

Bob is *hard* to convince. { ~ To convince Bob is *hard*.
~ It is *hard* to convince Bob.

Adjectives so used refer to degrees of ease or comfort, and include:

<i>awkward</i>	<i>hard</i>	<i>tough</i> <informal>
<i>convenient</i>	<i>impossible</i>	<i>tricky</i> <informal>
<i>difficult</i>	<i>nice</i> <informal>	<i>unpleasant</i>
<i>easy</i>	<i>pleasant</i>	

Unless there is ellipsis, we cannot omit the infinitive clause, and so there is no semantic implication between (say) *The bread was hard to bake* and *The bread was hard*. Unlike the preceding types, Type (v) permits *for* + subject to be inserted at the beginning of the infinitive clause: *Those darts are tricky (for a beginner) to use*. Where the infinitive has no overt subject, its implicit subject is understood to have an indefinite meaning:

Jack is easy to fool. = Jack is easy for anyone to fool.

Note With some adjectives in this group, such as *nice* or *unpleasant*, the entailment relation between *be* + adjective to V and *be* + adjective is less easy to avoid; *eg*: *Jenny is nice to know* implies that *Jenny is nice*.

[E5(vi)] *The food is ready to eat*

16.81 Again, in this type the subject of the main clause is identified with the object of the infinitive clause. But unlike Type (v), Type (vi) has no analogous construction with an infinitive clause subject:

The food is ready to eat. ~ *To eat the food is ready.

Also, we can generally (a) omit the infinitive clause, or (b) substitute a passive infinitive clause without change of meaning:

Are these cups available (to use)?
= Are these cups available (to be used)?

Some adjectives of this type, such as *available*, *fit*, *free*, *ready*, and *sufficient*, belong additionally to Type (iv), so that a sentence like *The lamb is ready to eat* is ambiguous, in one sense (the most accessible) being equivalent to the passive *The lamb is ready to be eaten*. Then there is a wider set of adjectives which often occur without complementation at all:

The air is *frosty* (to breathe).

Its fur is *soft* (to touch).

In both Type (v) and Type (vi), the subject of the main clause can be equated with the prepositional object of the infinitive clause, so that the infinitive clause ends with a deferred preposition:

- She is pleasant *to talk to*. (~ It is pleasant to talk to her.)
 This paper is terribly flimsy *to write on*.
 Is the cloth sufficient *to make a dress out of*?

In Type (vi), as well as in Type (v), *for* + subject may be inserted before the infinitive verb: *Are these books free (for visitors) to borrow?* [= 'Are these books available . . . to borrow?'].

[E5(vii)] *It is important to be accurate*

16.82 We saw in 16.72 that a *that*-clause following an adjective may prove to be a subject postponed by extraposition (cf 18.33). A *to*-infinitive clause following an adjective may have the same source:

- It is *essential* to spray the trees every year.
 ~ To spray the trees every year is *essential*.

The infinitive clause can also be introduced by *for* + subject:

- It is *vital* (for the children) to be properly clad.
 It will be *strange* (for us) to be living alone.

Adjectives of Types (ii) and (iii) in 16.72 ([E2b]) may have this construction: *important, fortunate, lucky, surprising, etc. Possible* also belongs to this group.

An additional group of adjectives occurring after anticipatory *it* are those adjectives (chiefly naming evaluative attributes of persons) which occur in pattern [E5(i)] (cf 16.76). The adjective in this group is often followed by an *of*-phrase identifying the person(s) being discussed:

- It was *wrong* (of him) to tell lies. It is *nice* of you to phone.

[E6] Adjective complementation by an -ing participle clause

16.83 A number of sub-types of this pattern may be mentioned.

- (i) *Busy* is followed by an -ing participle clause without subject:
 Margery is *busy* writing letters.
 (ii) *Worth* and *worthwhile*, on the other hand, occur both with and without subject:
 It is scarcely *worth(while)* (you/your) going home.
 Here *worth(while)* follows preparatory *it*, and the participle clause is an extraposed subject (cf 18.34). Other adjectives of this pattern are *pointless* and *useless* (*It's pointless buying so much food*), and adjectives of Type [E2b(iii)] (cf 16.72) also sometimes have this complementation: *absurd, awkward, fortunate, annoying, etc.*
 (iii) Elsewhere *worth* and *worthwhile* accompany an -ing participle clause without subject, but with a passive meaning, comparable to that of the infinitive clause in pattern [E5(v)] (cf 16.80):

- The cartons are *worth(while)* saving.
 (~ It's *worth(while)* saving the cartons).

- (iv) There is a variant construction in which a preposition occurs between the adjective and the participle clause. In some cases the preposition is optional (cf (i) above):

- I'm *busy (with)* getting the house redecorated.
 We're *fortunate (in)* having Aunt Mary as a baby-sitter.

In other cases, the preposition is obligatory:

- We are *used to* not having a car (cf 16.69 Note [c]).
 I'm *hopeless at* keeping the garden tidy.
 She's not *capable of* looking after herself.

Note [a] The adjectival constructions in (ii) above may be compared, in some cases, with nominal constructions of equivalent meaning:

- It's *no good/use* telling him anything.
 There's *no point (in)* telling him anything.

Such constructions are introduced either by anticipatory *it* (cf 18.33) or by existential *there* (cf 18.45). AmE also has *There's no use telling him anything*.

[b] *Worthwhile* is sometimes spelled as two words. The vacillation between the spellings *worthwhile* and *worth while* reflects an unclarity about the status of this sequence, which may alternatively be regarded as the preposition *worth* (cf 9.6) followed by a noun. Compare:

- It's not *worth* your *while* staying. It's not $\left\{ \begin{array}{l} \text{worth while} \\ \text{worthwhile} \end{array} \right\}$ (your) staying.

Complementation of abstract nouns

- 16.84 In this concluding section we will show, as a connecting link between this chapter and the next, how the patterns of complementation described for verbs and adjectives in 16.20–83 are also to be found with abstract nouns which are morphologically related to those verbs and adjectives. (Cf nominalization, 17.51ff, and appositional constructions, 17.26, 17.35.) For example, the noun *likelihood* is derived from, and semantically related to, the adjective *likely*. It is therefore not surprising that a construction associated with the adjective is found with the corresponding noun:

- It is *likely* that Joan will get married. [1]
 ~ $\left\{ \begin{array}{l} \text{The likelihood is that Joan will get married.} \\ \text{the likelihood that Joan will get married} \end{array} \right.$ [2]
 [3]

But the assumption of correspondence cannot be automatic, for it may fail in both directions:

- Joan is *likely* to get married.
 ~ *Joan's *likelihood* to get married
 *It is *likely* of Joan's getting married.
 ~ the *likelihood* of Joan's getting married

In the following section, we illustrate how many of these patterns can be matched with corresponding patterns of noun complementation. Some fairly regular changes, it will be observed, take place in the conversion from the verb or adjective patterns to their nominalizations (*cf* 17.51ff). For instance, a preposition must be inserted between a head noun and an immediately following noun phrase or adjective. The list begins with monotransitive patterns, because there are no nominalized forms of copular verb complementation. (Many of the noun complementation patterns, particularly in categories [C] and [D], are stylistically awkward.)

16.85 Table 16.85 Verb/adjective and noun complementation compared

	VERB/ADJECTIVE COMPLEMENTATION	NOUN COMPLEMENTATION
[B1]	He <i>examined</i> the room.	his <i>examination</i> of the room
[B2]	Paul <i>lacks</i> confidence.	Paul's <i>lack</i> of confidence
[B2pr]	They <i>rely</i> on her.	their <i>reliance</i> on her
[B3]	I <i>predict</i> that it'll rain.	my <i>prediction</i> that it'll rain
[B4]	I <i>doubt</i> whether he will win.	my <i>doubt</i> (about) whether he will win
[B5]	We <i>enquired</i> (about) where to go.	our <i>enquiry</i> (about) where to go
[B6]	She <i>refused</i> to answer.	her <i>refusal</i> to answer
[B7]	He <i>denied</i> having taken it.	?his <i>denial</i> of having taken it (<i>cf</i> : his <i>denial</i> of the theft)
[B8]	X <i>needs</i> us to work harder.	the <i>need</i> for us to work harder
[B9]	She <i>resented</i> his/him losing.	her <i>resentment</i> of his/him losing
[C1pr]	They <i>elected</i> Joe (as) leader.	their <i>election</i> of Joe as leader
[C2pr]	X <i>certified</i> Max (as) insane.	the <i>certification</i> of Max as insane
[C3]	X <i>expelled</i> Sue from school.	the <i>expulsion</i> of Sue from school
[C4]	They <i>chose</i> Jim to be boss.	their <i>choice</i> of Jim to be boss
[C7]	We <i>got</i> her elected.	*our <i>getting</i> of her elected
[D1]	I <i>paid</i> him five pounds.	my <i>payment</i> to him of five pounds
[D2]	It <i>protected</i> Rio from attack.	the <i>protection</i> of Rio from attack
[D3]	X <i>warned</i> us that it would snow.	the <i>warning</i> to us that it would snow
[D3pr]	He <i>admitted</i> to me that he told lies.	his <i>admission</i> to me that he told lies
[D4]	X <i>reminded</i> us (of) who he was.	X's <i>reminder</i> to us of who he was
[D5]	X <i>advised</i> us (on) what to do.	the <i>advice</i> to us on what to do
[D6]	She <i>invited</i> me to stay.	her <i>invitation</i> to me to stay
[E1]	I was <i>impatient</i> with Freda.	my <i>impatience</i> with Freda
[E2]	It was <i>certain</i> that we would lose.	the <i>certainty</i> that we would lose
[E3]	I was <i>careful</i> (over) what to say.	my <i>care over</i> what to say
[E5]	Sam was <i>quick</i> to reply.	Sam's <i>quickness</i> to reply
[E6]	I was <i>lucky</i> meeting you.	my <i>luck</i> in meeting you

These structures with abstract nouns will be studied further in the next chapter.

Introduction

The indefinitely complex noun phrase

- 17.1 Just as the sentence may be indefinitely complex, so may the noun phrase. This must be so, since sentences themselves can be reshaped so as to come within noun-phrase structure. For example, the following sentences [1a-e], simple and complex, can become one simple sentence [2] with a very complex noun phrase as subject:

The girl is Mary Smith.	[1a]
The girl is tall.	[1b]
The girl was standing in the corner.	[1c]
You waved to the girl when you entered.	[1d]
The girl became angry because you knocked over her glass.	[1e]
<i>The tall girl standing in the corner who became angry because you knocked over her glass after you waved to her when you entered is</i>	
Mary Smith.	[2]

Moreover, starting from [2], we could reconstruct any of the sentences listed in [1a-e] – and in fact we could not understand the noun-phrase subject (printed in italics) of [2], unless we recognized its constituent parts as they are set out in [1a-e].

Yet [2] has introduced many changes. We have, for example, suppressed all or part of the verbs in [1c] and [1d]; we have put *tall*, which is complement in [1b], as a modifier before the noun *girl*; we have replaced *the girl* of [1e] by *who*.

After describing determinatives and nouns in Chapter 5, the purpose of the present chapter is to state the conditions governing the making of noun phrases by processes such as those indicated above.

Noun-phrase constituents

- 17.2 In describing noun phrases we need to distinguish the following constituent parts:

(A) The HEAD, around which (for the most part) the other constituents cluster and which dictates concord with other parts of the sentence:

- [The tall *girl* standing in the corner] is my sister.
 [The tall *girls* standing in the corner] are my sisters.
 [The tall *girl* in the corner $\left\{ \begin{smallmatrix} \text{who} \\ * \text{which} \end{smallmatrix} \right\}$ has a blue sweater] is my sister.
 I saw the tall girl in [the corner $\left\{ \begin{smallmatrix} \text{which} \\ * \text{who} \end{smallmatrix} \right\}$ was full of people].

(B) The DETERMINATIVE, which includes

- (a) predeterminers, *ie* all items which can precede any central determiner (including zero article) in a noun phrase, *eg*: *all*, *both*, *double* (cf 5.15 ff):

all the furniture *both* those musicians

- (b) central determiners, including those items listed in 5.11 ff, *eg* the articles, *this*, *some*:

some new office furniture *all* those fine musicians

- (c) postdeterminers, which follow central determiners but precede premodifiers, *eg* adjectives. Postdeterminers include *eg* numerals, *many*, *few*, *several* (cf 5.20 ff):

the *many* new offices the *few* survivors

(C) The PREMODIFICATION, which comprises all the items placed before the head other than determinatives, notably adjectives (or, rather, adjective phrases, cf 7.20) and nouns:

some furniture
some expensive furniture
some very expensive furniture
some very expensive office furniture
some very very expensive office furniture

(D) The POSTMODIFICATION, comprising all the items placed after the head, notably:

prepositional phrases: the car *outside the station*
 nonfinite clauses: the car *standing outside the station*
 relative clauses: the car *that stood outside the station*
 complementation (cf 15.63 ff): a bigger car *than that*

Restrictive and nonrestrictive modification

- 17.3 Modification can be restrictive or nonrestrictive. The modification is RESTRICTIVE when the reference of the head is a member of a class which can be identified only through the modification that has been supplied. The girl in example [2] in 17.1 is only identifiable as Mary Smith provided we understand that it is the particular girl who is tall, who was standing in the corner, and who became angry. Such modification would not have been actually necessary unless there had been other girls present, tall but not in the corner, or in the corner but not tall, or who had not become angry. Restrictiveness, then, indicates a limitation on the possible reference of the head.

Alternatively, the referent of a noun phrase may be viewed as unique or as a member of a class that has been independently identified (for example in the preceding context). Any modification given to such a head is additional information which is not essential for identification, and we call it NONRESTRICTIVE. For example, the relative clause *who is in the corner* in [1] is nonrestrictive:

Mary Smith, *who is in the corner*, wants to meet you. [1]

By reason of being designated by a proper name, Mary Smith's identity is independent of whether or not she is in the corner (though the information on her present location may be useful enough). If a man says [2], the daughter is identified as being one out of two daughters in the family and also as younger than the other daughter:

Come and meet my *younger* daughter. [2]

[2] is thus an example of restrictive premodification. If, on the other hand, a

man (in a monogamous society) says [3], the premodifier *beautiful* is understood as nonrestrictive:

Come and meet my *beautiful* wife. [3]

Another example:

I don't want him to put his *ugly* nose into my house again. [4]

Sentences [1], [3], and [4] are inevitably nonrestrictive since – being treated as unique – *Mary Smith*, *wife*, and *nose*, in these sentences will not admit restriction. But almost any head that can be restrictively modified is also susceptible of nonrestrictive modification, eg:

The tall girl, *who is a dentist*, is Mary Smith. [5]

Here the only information offered to identify the girl as Mary Smith is the allusion to her tallness; the mention of her work as a dentist is not offered as an aid to identification but for additional interest.

Other nouns which have nonrestrictive postmodification include those with generic reference:

The giant panda, *which is to be found in the remote parts of China*, lives exclusively on bamboo shoots.

Note In popular narrative style, there is a nonrestrictive use of premodifying adjective in cases like the following (cf cleft sentences, 18.26 Note (b)):

Reporters hounded an *embarrassed* Ben Miles over his TV gaffe last week and in reply to one questioner the *unhappy* Miles made things still worse by...

- 17.4 The fact that nonrestrictive relative clauses are not essential for identification enables us in [1] and [1a] to make different parts of the sentence into a relative clause:

My brother, *who is an engineer*, lives in America. [1]
My brother, *who lives in America*, is an engineer. [1a]

Semantic equivalence is still preserved in [1] and [1a] (although there is a difference in focus). A nonrestrictive relative clause may resemble an adverbial clause (cf simultaneous meaning, 15.28), eg:

My brother, *who has lived in America for over 30 years*, can still speak Italian. [2]

In [2], the relative clause is grammatically optional, like any other nonrestrictive item, but semantically obligatory as the correlate of *still* in the superordinate clause. The relative clause here can be paraphrased as an adverbial clause [2a], with initial position (unlike the relative clause) [2b], or as an adverbial prepositional phrase [2c]:

My brother can still speak Italian, *although he has lived in America for over 30 years*. [2a]
Although he has lived in America for over 30 years, my brother can still speak Italian. [2b]
After over 30 years in America, my brother can still speak Italian. [2c]

The predications of the two clauses [2a] and [2b] are contrastive.

Nonrestrictive relative clauses may also imply other adverbial functions, such as cause ('because he had been very helpful', 'for being very helpful') in [3]:

Ann thanked her teacher, *who had been very helpful*. [3]

By contrast, restrictive relative clauses with general antecedents (cf 17.21) express conditional relationship, eg:

Students *who work hard* pass their exams. ['If students work hard, they pass their exams.']

- 17.5 Proper nouns cannot have restrictive modification when they have the normal unique denotation. However, when the proper noun temporarily takes on features of a common noun, restrictive modification is possible (cf 5.64):

the Springfield that is in Illinois [1]
the Johnson who wrote the dictionary [2]

Nor are restrictive relative clauses possible with nonnominal antecedents (cf 'sentential relative clauses', 17.9):

He likes dogs, which surprises me. [3]

Nonassertive heads cannot have nonrestrictive modification:

*I won't see *{any person, anyone}* who has not made an appointment. [4]

By contrast, nonrestrictive modification is possible with assertive heads:

Someone, who sounded like your mother, called to say she wanted to see you. [5]

Nonspecific determiners like *any*, *all*, and *every* usually have only restrictive modification:

**Every book*, which is written to deceive the reader, should be banned. [6]
**All the students*, who had failed the test, wanted to try again. [7]

However we may occasionally find nonrestrictive as well as restrictive modification, as in:

All the students, who had returned from their vacation, wanted to take the exam. [8]

But positional variation of *all* is possible only with a nonrestrictive clause (cf 5.16, 6.50):

The students, who had *all* (of them) returned from their vacation, failed the test. [7a]
**The students who had all* (of them) failed the test wanted to try again. [8a]

- 17.6 We shall draw attention to the distinction between restrictive and nonrestrictive in the description of the modification types later on, but two general points may be of value now.

First, modification at its 'most restrictive' tends to come after the head:

Any person *who wishes to see me* must make an appointment.

By contrast, our decision to use an item as a premodifier (such as nonrestrictive *silly* in *a silly fool*) often reflects our wish that it be taken for granted and not be interpreted as a specific identifier.

Secondly, restrictive modification tends to be given more prosodic emphasis than the head, since there is a built-in contrast, as in (*cf* examples in 17.3):

Susan is my *ELDER* daughter.
John is my *LAZY* son.

Nonrestrictive modification, on the other hand, tends to be unstressed in prehead position:

my beautiful wife

In post-head position, its 'parenthetic' relation is endorsed by being given a separate tone unit (frequently with reduced prominence and narrow pitch range); or, in writing, by being enclosed by commas (*cf* 17.22).

Temporary and permanent modification

- 17.7 There is a second dichotomy that has some affinities with the distinction between restrictive and nonrestrictive but rather more with the contrast of nonprogressive and progressive in predication (*cf* 4.25ff), or permanent and temporary in agential nouns (*cf* App I.34f). Modification in noun-phrase structure may also be seen as permanent or temporary (*cf* 7.21), such that items placed in premodification position are typically given the status of PERMANENT or, at any rate, characteristic features. Although this does not mean that postmodification position is committed to either temporariness or permanence, those adjectives which have to be predicative have a notably TEMPORARY reference. Thus [1] would be understood as [1a]:

the *courteous* man [1]
the man *who is courteous* [1a]
[ie 'normally and not merely at this moment']

In contrast, [2] would be understood as having reference only to a specific time, and this corresponds to the nonoccurrence of [2a]:

The man is *ready*. [2]
*the *ready* man [2a]

(On the relevance of the distinction in determiners between indefinite and definite, *cf* 5.26ff.) On this basis, we see that timidity and fear are contrasted in part according as the first is seen as permanent [3], the second as temporary [4]:

a man *who is timid* ~ a *timid* man [3]
a man *who is afraid* ~ *an *afraid* man [4]

Just as some modifiers are too strongly identified with temporary status to appear in prehead position, so there can be modification constrained to prehead position because it indicates permanent status. Thus the toe which is characteristically (and permanently) big in relation to the rest is called *the big toe*, and we cannot say of it **The toe is big* without destroying this permanent characteristic and making the expression seem to refer only (for example) to a temporary swelling. Compare also *the original* ['first, earliest'] version beside *His work is quite original* ['of a new type'], which would permit adverbial indication of time span² (*now, always*, etc; *cf* 7.87).

The explicitness of postmodification

- 17.8 In general, premodification is to be interpreted (and, most frequently, can only be interpreted) in terms of postmodification and its greater explicitness. That is, *some tall college girls* will be interpreted as 'some girls who are tall and who are (studying) at a college'. The premodified noun phrase [1] may include, for example, all of the relations which are explicit in the postmodified noun phrases [1a-e]:

an oil man [1]
a man *who sells* oil [1a]
a man *who delivers* oil [1b]
a man *who produces* oil [1c]
a man *who investigates* oil [1d]
a man *who advocates the use of* oil [1e]

What normally happens, as in the case of *big toe* (in 17.7) and *oil man* [1], is that ambiguity does not arise since one sense is selected in a specific context (*cf* lexicalization, App I.9ff). Thus, for example, the question 'Will the oil man call today?' will normally carry only one interpretation in any given context.

Explicitness in postmodification varies considerably, however. It is greater in the finite relative clause [2] than in the nonfinite *-ing* clause [2a], from which the explicit tense (*is?/was?*) is absent, though this in turn is more explicit than the prepositional phrase [2b], from which the verb indicating a specific posture is absent:

the girl *who was standing* in the corner [2]
the girl *standing* in the corner [2a]
the girl *in the* corner [2b]

Reduction in explicitness in the noun phrase is closely related to the linguistic and situational context. There is, typically, a progression from 'more explicit' to 'less explicit' in a discourse. One instance of such sequential and gradual reduction from sentence [3], via relative clause [3a], via prepositional phrase [3b], to pro-form [3c], can be seen in Anthony Burgess's novel *Inside Mr Enderby*. When flying to Rome, the main character of the novel is warned by an American passenger:

'Your ticket does not entitle you to undisputed monopolization of the john.' [ie the lavatory] [3]

The fellow passenger who issued this warning is subsequently referred to as:

- the American who had ousted Enderby from the john* [3a]
 to be further reduced to:
the American from the john [3b]
 and finally:
 an American, not *the john one*, poised his camera to shoot [3c]

The order of presentation in this chapter will be from most explicit to least explicit. We therefore start with the most explicit type of noun-phrase modification, *ie* postmodification by finite clause.

Postmodification by finite clauses

Types of postmodifying finite clauses

- 17.9 We distinguish two major types of finite clauses as noun-phrase postmodifiers, RELATIVE clauses [1] and APPOSITIVE clauses [2]:

- The news *that appeared in the papers this morning* was well received. [1]
 The news *that the team had won* calls for a celebration. [2]

Although superficially similar, the difference between these two types of finite clause becomes apparent, for example if we try to replace *that* by *which* in the two examples:

- The news *which appeared in the papers this morning* was well received. [1a]
 *The news *which the team had won* calls for a celebration. [2a]

Thus *that* is not replaceable by a *wh*-pronoun in appositive clauses, as it is in relative clauses. More significantly from a general point of view, *that* in [2] has no function as clause element within the *that*-clause, as it has in relative clause structure. Thus in [1], the relative pronoun is subject; in [1b] it is object:

- The news *which we saw in the papers this morning* was well received. [1b]

Appositive clauses will be further discussed in 17.26f. The type of relative clause represented by [1] is called an ADNOMINAL relative clause, and will be discussed below.

In addition to adnominal relative clauses, we distinguish NOMINAL relative clauses, as in [3], and SENTENTIAL relative clauses, as in [4]:

- What surprises me* is that they are fond of snakes and lizards. [3]
 They are fond of snakes and lizards, *which surprises me*. [4]

Nominal relative clauses are unique among relative clauses in that they 'contain' their antecedents. They are discussed, with other nominal dependent clauses, in 15.8f.

In sentential relative clauses, the antecedent is not nominal but clausal, *ie* in [4] the whole clause *They are fond of snakes and lizards* is postmodified by *which surprises me*. That this is so can be seen in the choice of singular verb concord (*surprises*). The sentential relative clause has affinities with, on the one hand, nominal relative clauses, and, on the other hand, with coordinate clauses (*cf* 13.50f):

- They are fond of snakes and lizards, *and that surprises me*. [4a]

The adnominal relative clause is the central type of relative clause, and, unless indicated otherwise, 'relative clause' here means 'adnominal relative clause'. Within such relative clauses we make a distinction between restrictive [5] and nonrestrictive [6] (*cf* 17.3ff):

- Snakes *which are poisonous* should be avoided. [5]
 Rattlesnakes, *which are poisonous*, should be avoided. [6]

Among those two types, the restrictive is the more common, and will be treated before the nonrestrictive.

Characteristics of relative clauses

- 17.10 Part of the explicitness of relative clauses lies in the specifying power of the relative pronoun. It may be capable of

(i) showing concord with its antecedent, *ie* the preceding part of the noun phrase of which the relative clause is a postmodifier [external relation]; and

(ii) indicating its function within the relative clause either as an element of clause structure (S, O, C, A), or as a constituent of an element in the relative clause [internal relation].

Gender concord

- 17.11 Concord is on the basis of a two-term 'gender' system, personal and nonpersonal (*cf* 5.105ff, 6.8f), and applies only to the *wh*-series:

- | | |
|----------------------------------|------------------------------------|
| Joan, <i>who</i> . . . | London, <i>which</i> . . . |
| the boy/people <i>who</i> . . . | the fox/animals <i>which</i> . . . |
| the human being <i>who</i> . . . | the human body <i>which</i> . . . |
| the fairy <i>who</i> . . . | the unicorn <i>which</i> . . . |

It will be seen from these examples that 'personality' is ascribed basically to human beings but extends to creatures in the supernatural world (angels, elves, etc) which are thought of as having human characteristics such as speech. Pet animals can be regarded as 'personal' (at least by their owners; *cf* 5.109f):

- Rover, *who* was barking, frightened the children.

On the other hand, human babies can be regarded (though rarely perhaps by their parents) as not having developed personality:

- This is the baby *which* needs inoculation.

Though ships may take the personal pronoun *she*, the relative pronoun is regularly nonpersonal (cf 5.111 Note):

Is $\left\{ \begin{array}{l} it \\ she \end{array} \right\}$ the ship which is due to leave for a Caribbean cruise tomorrow?

Collective nouns (cf 5.108) are normally treated as personal when they have plural concord (esp in BrE), and as nonpersonal when they have singular concord:

The committee $\left\{ \begin{array}{l} who \text{ were} \\ which \text{ was} \end{array} \right\}$ responsible for this decision . . .

The gender contrast is neutralized when the *wh*-series is replaced by *that* or a zero relative:

She must be *the nicest person that* ever lived.
That must be *the nicest thing that* ever happened.

With coordinated antecedents of mixed gender, the choice of relative pronoun may create a problem. It does not arise when zero relative is possible or when *that* is chosen, eg:

the people and things $\left\{ \begin{array}{l} she \text{ likes most} \\ that \text{ amuse her most} \end{array} \right\}$

With *wh*-pronouns, the principle of proximity seems to be favoured (cf 10.35):

the people and things *which* $\left\{ \begin{array}{l} \\ \end{array} \right\}$ amuse her most
the things and people *who* $\left\{ \begin{array}{l} \\ \end{array} \right\}$

Which can have a personal noun as its antecedent when the relative is a complement with the semantic role of characterization attribute (cf 10.20):

He imagined himself to be an artist, *which* he was not.

Note [a] Other nonhuman creatures besides pets may take *who* even in sentences where this involves an apparent clash with the neuter pronoun *it*; thus, from a recent work of nonfiction:
the chameleon *who* changes *its* colours

This is less likely however when the relative pronoun is object in its clause, as we see from the following examples on two successive pages of a work on zoology:

the black rhinoceroses *who* live in the park
the white rhinoceros *which* we saw in the wilds outside the park

On the factors involved in this difference, cf 17.16.

[b] It so happens that, in familiar speech, the word *character* can be used in the sense of 'person', and the word *personality* can be used for somebody who has achieved notoriety. In consequence, we may have not only [1] and [2] but also [1a] and [2a]:

Charles has a fine character *which* he inherits from his father. [1]
Smith has a strange personality *which* repels many people. [2]
Charles is a strange character *who* dislikes parties. <familiar> [1a]
Smith is now a famous personality *who* is often interviewed on television. [2a]

17.12 The nominal relative clause is common with definite nonpersonal reference (though with a different pronoun from that used in adnominal relative clauses; cf 15.8f, 6.35 Note [b]): *what*, *whatever*, *whichever*.

What is most highly valued in the tribe is valour. [1]

This is *what I can't understand*. [2]
She'll do *whatever you say*. [3]
Choose *whichever you like best*. [4]

In the case of definite personal reference, the only pronoun is *whoever*:

**Who* $\left\{ \begin{array}{l} \\ \end{array} \right\}$ helped me has gone. [5]
Whoever $\left\{ \begin{array}{l} \\ \end{array} \right\}$

A personal pronoun + a relative pronoun, on the other hand, is possible only in archaic or very formal contexts:

He who made this possible deserves our gratitude. [6]

It is more acceptable if *he* has generic reference, as in [7], which however also sounds archaic:

He who helps the handicapped deserves our support. [7]

The normal expressions are [7a] and [7b]:

Anyone $\left\{ \begin{array}{l} \\ \end{array} \right\}$ *who* helps the handicapped deserves our support. [7a]
Anybody $\left\{ \begin{array}{l} \\ \end{array} \right\}$

Those who help the handicapped deserve our support. [7b]

Replacement is impossible with plural **they who/which*, and also with singular **it which*:

What $\left\{ \begin{array}{l} \\ \end{array} \right\}$ I can't understand is this: . . . [2a]
**It which* $\left\{ \begin{array}{l} \\ \end{array} \right\}$

That is acceptable with *which* only in very formal style:

That which is most highly valued in the tribe is valour. [1a]

Note In relation to **it which* . . ., there is a similar constraint on postmodification by some other structures:

?*He in the corner* is my new boss. [8]

**It in the corner* is an antique. [8a]

Postmodification following *you* is possible in informal and peremptory vocatives (cf 10.53):
You in the corner, stop chattering! [8b]

Restrictive relative clauses

17.13 The choice of relative pronoun is dependent, in particular, on the following three factors:

(a) the relation of the relative clause to its antecedent: restrictive [1] or nonrestrictive [2], eg:

The woman *who is approaching us* seems to be somebody I know. [1]
The Bible, *which has been retranslated*, remains a bestseller. [2]

(b) the gender type of the antecedent: personal [3] or nonpersonal [4] (cf 17.11 f), eg:

the person *who* I was visiting [3]
the book *which* I was reading [4]

- (c) the function of the relative pronoun as subject, object, complement, or adverbial (including its role as prepositional complement) or as a constituent of an element in the relative clause, *ie* as a determiner (*in whose house*; cf 17.14).

In the following discussion of choice of relative pronoun, we will first make a division into restrictive and nonrestrictive relative clauses, and then consider other factors, such as medial or final position of the relative clause in relation to the superordinate clause, and length of the relative clause.

The set of relative pronouns has been given in 6.32ff. It is in the nonrestrictive relative clauses that the most explicit forms of relative pronoun, *ie* the *wh*-series (*who*, *whom*, *which*, *whose*) are typically used (cf 17.22). In restrictive clauses, frequent use is made of the *wh*-pronouns and also *that* or 'zero' relative. *That* differs from the *wh*-series:

- (a) in not having gender marking and thus being independent of the personal or nonpersonal character of the antecedent;
- (b) in not having an objective form (like *who/whom*);
- (c) in not having a genitive (like *whose* of *who* and *which*), thus not being able to function as a constituent of an element in the relative clause.

- 17.14 In restrictive relative clauses, the pronouns given in the survey below are used. When we indicate a parenthesized relative pronoun, it means that there is the option between *that*-relative and 'zero':

This is the book (*that*) I bought at the sale.

When we use parentheses only '()', this is to indicate 'zero':

This is the book () I bought at the sale.

S, O, C, A in the survey below means that the relative pronoun functions respectively as subject, object, complement, and adverbial (or complement in a prepositional phrase functioning as adverbial) in the relative clause with personal and nonpersonal antecedents:

- S: They are delighted with { the person { $\begin{matrix} who \\ that \\ *() \end{matrix} \}$ has been appointed.
the book { $\begin{matrix} which \\ that \\ *() \end{matrix} \}$ has just appeared.
- O: They are delighted with { the person { $\begin{matrix} who(m) \\ that \\ () \end{matrix} \}$ we have appointed.
the book { $\begin{matrix} which \\ that \\ () \end{matrix} \}$ she has written.
- C: She is the perfect accountant { $\begin{matrix} which \\ *who \\ *that \end{matrix} \}$ her predecessor was not.

C: This is not the type of modern house { $\begin{matrix} which \\ *that \\ *() \end{matrix} \}$ my own is.

A: He is the policeman { $\begin{matrix} at whom \\ who(m) \\ that \\ () \end{matrix} \}$ the burglar fired the gun *at*.

A: She arrived the day { $\begin{matrix} on which \\ that \\ () \end{matrix} \}$ I was ill (*on*).

A: I make cakes the way { $\begin{matrix} in which \\ that \\ () \end{matrix} \}$ my mother made them.

With a personal antecedent, the relative pronoun can show the distinction between *who* and *whom*, depending on its role as subject of the relative clause, or as object, or as prepositional complement:

the person	$\begin{matrix} who \\ to whom \\ who(m) \\ who(m) \end{matrix}$	$\begin{matrix} spoke to him \\ he spoke \\ he spoke to \\ he met \end{matrix}$	$\begin{matrix} [subject] \\ [prepositional complement] \\ [prepositional complement] \\ [object] \end{matrix}$	$\begin{matrix} [1] \\ [2] \\ [2a] \\ [3] \end{matrix}$
------------	--	---	---	---

When the governing preposition precedes its complement, as in the rather formal [2], the choice of *whom* is obligatory. When it does not, as in [2a], or when the relative pronoun is the object of the verb, as in [3], there is some choice between *who* or *whom*: the latter is preferred in formal English, the former is preferred in informal use, where however the zero form is by far the most common.

If the pronoun is a possessive determiner of the noun phrase, the form is *whose*:

The woman *whose* daughter you met is Mrs Brown. ['The woman is Mrs Brown; you met her daughter.'] [4]

The house *whose* roof was damaged has now been repaired. ['The house has now been repaired; its roof was damaged.'] [5]

In cases like [5] where the antecedent is nonpersonal, there is some tendency to avoid the use of *whose* (presumably because many regard it as the genitive only of the personal *who*), but avoidance involves stylistic difficulty. There is the stiffly formal and cumbersome of *which*:

The house *the* roof of *which* was damaged . . . [5a]

Other variants are clumsy or unacceptable in standard English:

?The house *that* they damaged *the* roof of . . . [5b]

*The house *that* *the* roof was damaged of . . . [5c]

Satisfactory alternatives can however be found, such as [5d], or even [5e]:

The house *that* had its roof damaged . . . [5d]

The house *with* the damaged roof . . . [5e]

In any case, in some fields of discourse such as mathematics, no evasion is felt to be necessary:

Let ABC be a triangle *whose sides* are of unequal length. [6]

The *of which* construction is sometimes placed before its head (like *whose*). Thus we have [7] besides the more usual [7a] and [7b]:

The investigation { *of which the results* will soon be published . . . [7]
 { *the results of which* will soon be published . . . [7a]
 { *whose results* will soon be published . . . [7b]

Relative pronoun as subject and object

- 17.15 When the antecedent is personal and the pronoun is the subject of the relative clause, *who* is favoured, irrespective of the style and the occasion; thus [1] rather than [1a], though there is nothing wrong or odd about the latter:

People *who* live in new houses . . . [1]
 People *that* live in new houses . . . [1a]

Zero cannot replace the subject in a relative clause such as [2] and [3]:

*The table () stands in the corner has a broken leg. [2]
 *The man () stands over there I know. [3]

However, constructions are encountered that are arguably exceptions; for example, in very informal speech where the antecedent is an indefinite pronoun:

?Anybody () does that ought to be locked up. [4]

The reason for putting a question mark in [4] is, first, that it is of doubtful acceptability; secondly, that many speakers would condemn it as slovenly; thirdly, that it may result from the subaudibility of a relative pronoun *who* or *that* and thus not strictly be zero at all.

A commoner type of example is to be found in existential and cleft sentences (cf 18.44ff, 18.25ff):

There's a table () stands in the corner. [5]
 It's Simon () did it. [6]

Sentences [5] and [6] would again be very colloquial, and the use of *that* or a *wh*-item would be regarded as more acceptable:

There's a table { *that* / *which* } stands in the corner. [5a]

It was Simon { *that* / *who* } did it. [6a]

However, there are good reasons for distinguishing such *that/which*-clauses from adnominal relative clauses. The obligatory nature of such portions of existential or cleft sentences would argue against our equating them with postmodifications in noun-phrase structure (cf 18.48).

That as subject and *that* or zero as object are preferred to *which* when the antecedent is nonpersonal *all, anything, everything, nothing, little, or much*:

All { *that* strikes you as odd . . .
 Anything { *(that)* you find odd . . .
 Everything }

There was *little that* ['not much that'] interested him at the motor show.

Much that ['much of what'] has been said tonight will soon be forgotten.

When the antecedent is modified by a superlative or by one of the post-determiners *first, last, next, only*, the relative pronoun as subject is usually *that*, and, as object, *that* or zero rather than *which* or *who(m)* (cf 5.22):

She must be one of the most remarkable women *that ever* lived.

They eat the finest food { *that* is available.
 { *(that)* money can buy.

In such sentences, an alternative to a postmodifying copular relative clause with an adjective as complement is pre- or postposition of the adjective (cf 7.21):

They eat the finest { *available food*.
 { *food available*.

Note [a] The pronunciation of *that* as a relative pronoun is generally reduced to /ðæt/, whereas the demonstrative *that* (cf 6.40) has the full form /ðæt/.

[b] One reason why zero relative subject is unacceptable may be related to perception. In example [2], it is only when encountering the verb *has* (the seventh word in the sentence) that the reader/hearer can interpret this sequence as a relative construction, instead of an expected *SV*A structure ending with *corner*, as in [2a]:

The table stands in the corner. [2a]

Compare the situation with the acceptable zero construction of nonsubject function in [2b], where it is clear on reaching *you* (the third word) that *you* begins a new construction:

The table you see standing in the corner has a broken leg. [2b]

Relative pronoun as object and prepositional complement

- 17.16 With the antecedent still personal but with the pronoun now object of a verb or prepositional complement, there is a much stronger preference for *that* or zero, perhaps to avoid the choice between *who* and *whom*. Thus [1] rather than [1a]:

People (*that*) I { visit . . .
 { speak to . . . } [1]

People *who(m)* I { visit . . .
 { speak to . . . } [1a]

Again, there is nothing actually wrong about [1a]; but *whom* here would seem pedantic to many people, while *who* as object in relative clauses is informal and tends to be regarded as incorrect. Since, therefore, neither *who* nor *whom* is wholly satisfactory, *that* (and particularly zero) is frequently used despite a personal antecedent.

Avoidance of *whom* may not be the only factor influencing *that* as object with personal antecedent. Grammatical objects are more likely to be nonpersonal, or to carry nonpersonal implication, than subjects.

There are several other factors influencing the selection of a pronoun that is object or prepositional complement in the relative clause, especially when the antecedent is nonpersonal. One is the proximity of the relative clause to the head of the antecedent phrase; another is the degree of complexity of the subject of the antecedent phrase.

When complex phrases or clauses intervene between the antecedent head and the relative pronoun, *which* is generally preferable to *that* and very much preferable to zero:

I have [[*interests* outside my immediate work and its problems] *which* I find satisfying].

When the antecedent of the relative clause is no more complex than determiner + head, *that* is by many preferred to *which* and zero:

I'll take you to [the building [*that* all elderly university teachers prefer]].

On the other hand, when the subject of the relative clause is a personal pronoun, zero is preferred to either *which* or *that*, especially if the relative clause itself is fairly short and simple:

Who's drunk [the milk [() I bought]]?

Finally, other things being equal, more informal discourse will tend to have a preference for zero. In the following example from an informal conversation, the zero construction could not appropriately have been replaced by any of the other relative pronouns that are available in the system (*who*, *whom*, *that*):

You learn a lot about [authors [you didn't know too much about to start with]].

Relative pronoun as adverbial

- 17.17 When the relative pronoun is the complement of a preposition (and, together with the preposition functioning as A), some choice exists in placing a preposition which has a *wh*-pronoun as its complement. No such choice exists with *that*, where postposition with deferred preposition represents the sole pattern:

the lady	{	towards <i>whom</i>	}	the dog ran
		<i>that</i>		
		()		
the table	{	under <i>which</i>	}	the boy crawled
		<i>that</i>		
		()		

The choice of relative clause structure involves stylistic distinctions. In

general, it is certainly true that *wh*-pronouns with initial preposition are used predominantly in formal English:

The person *to whom* any complaints should be addressed is . . . [1]

Initial prepositions are normally avoided in more informal use, where they would be felt to be stilted or pompous. A deferred preposition is more generally used with prepositional verbs:

That's the book () he's been looking *for*. [2]

But many prepositions (especially those dealing with temporal and other abstract relations) cannot easily be deferred (*cf* 9.6):

?That was the meeting (*that*) I kept falling asleep *during*. [3]

One might find [3a], but in familiar speech an adverbial relative with *when* or *where* (*cf* 17.18) would be preferred to *during which*:

That was the meeting *during which* I kept falling asleep. [3a]

Prepositions expressing spatial relations allow a deferred preposition even when the preposition is complex:

This is the house he stood *in front of*. [4]

However, clarity of expression would often influence us in the direction of a construction otherwise regarded as formal if a final preposition leads to clumsiness. Consider the following sentence:

It was in a book that a former teacher of mine thought of at one time presenting me with some quotations from. [5]

Hearing or reading it, we may successively have to reject the interpretations, first, that the former teacher thought of the book; second, that the teacher thought of presenting me with the book, before the belated *from* enables us to achieve the correct interpretation ('. . . *from which* a former teacher . . .').

A deferred preposition may be the only natural choice when there is coordination of one prepositional and one nonprepositional construction in the relative clause. Thus instead of the clumsy [6], zero relative and a deferred preposition would be far more natural, as in [6a]:

You should restrict yourself to words *with which* you are familiar and *which* you can use confidently. [6]

You should restrict yourself to words () you are familiar *with* and can use confidently. [6a]

But note that [6a] requires subject ellipsis, since coordination with zero relatives is not fully acceptable:

?You should restrict yourself to words () you are familiar *with* and () you can use confidently. [6b]

- 17.18 In adverbial expressions of place, time, and cause, there is a wide range of choice in addition to what was stated in 17.17 for the relative pronoun as adverbial. The preposition + pronoun can be replaced by special adverbs (*cf* 7.53), *eg*:

- That's *the place* $\left\{ \begin{array}{l} \text{in which} \\ \text{where} \end{array} \right\}$ she was born. [1]
- That was *the period* $\left\{ \begin{array}{l} \text{during which} \\ \text{when} \end{array} \right\}$ she lived here. [2]
- That's *the reason* $\left\{ \begin{array}{l} \text{?for which} \\ \text{why} \end{array} \right\}$ she spoke. [3]

Note that *for which* in [3] has limited acceptability.

However, there are considerable and complicated restrictions on these *wh*-forms which operate in relative clauses expressing place, time, and cause. Many speakers find their use along with the corresponding antecedent somewhat tautologous – especially the type *the reason why* – and prefer the *wh*-clause without antecedent, *ie* a nominal relative clause (*cf* 15.8f):

- Is this *where* she was born? [1a]
 That was *when* she lived here. [2a]
 That's *why* she spoke. [3a]

There is no relative *how* parallel to *where*, *when*, and *why* to express manner with an antecedent noun [4], but only [4a]:

- *That's *the way how* she spoke. [4]
 That's $\left\{ \begin{array}{l} \text{how} \\ \text{the way (that)} \end{array} \right\}$ she spoke. [4a]

The following patterns can be distinguished for time expressions in a sentence such as '... was Thursday':

Pattern 1: antecedent + preposition + *wh*-pronoun:

the day on which she arrived

Pattern 2: antecedent + *wh*-pronoun + deferred preposition:

the day which she arrived *on*

Pattern 3: antecedent + *that* + deferred preposition:

the day that she arrived *on*

Pattern 4: antecedent + zero relative + deferred preposition:

the day she arrived *on*

Pattern 5: antecedent + *wh*-adverb:

the day when she arrived

Pattern 6: antecedent + zero relative + zero preposition:

the day she arrived

Pattern 7: antecedent + *that* + zero preposition:

the day that she arrived

Pattern 8: *wh*-clause without antecedent (*ie* a nominal relative clause, *cf* 15.8f):

when she arrived

- 17.19 There are also restrictions on the antecedent nouns. With relative clauses where the antecedent denotes cause or reason, *reason* is virtually the only possible antecedent; where the antecedents denote place and time, the most generic nouns (*place*, *period*, *time*, etc) also seem to be preferred. Thus pattern 5 is acceptable:

the office *where* he works

However, many would prefer alternative expressions (patterns 1, 2, 3, 4, where pattern 1 is most formal and pattern 4 least formal):

- | | | | |
|------------|---|-------------------------------------|-------------|
| the office | { | <i>at which</i> he works | [pattern 1] |
| | | <i>which</i> he works <i>at</i> | [pattern 2] |
| | | <i>that</i> he works <i>at</i> | [pattern 3] |
| | | () <i>he works at</i> | [pattern 4] |
| the day | { | <i>on which</i> she was born | [pattern 1] |
| | | <i>which</i> she was born <i>on</i> | [pattern 2] |
| | | <i>that</i> she was born <i>on</i> | [pattern 3] |
| | | () <i>she was born on</i> | [pattern 4] |

Place adjuncts in relative clauses admit of two further patterns: one with *where* and omission of the preposition (pattern 5), the other with the deferred preposition *at* (pattern 9):

- | | | | |
|-----------|---|-----------------------------------|-------------|
| the place | { | <i>where</i> she works | [pattern 5] |
| | | <i>?where</i> she works <i>at</i> | [pattern 9] |

Pattern 5 is acceptable, whereas pattern 9 is of doubtful acceptability. It requires a fairly specific antecedent, *eg*:

the government building where she works *at*

With a general antecedent, such as *place*, we may find the following patterns, which however are not acceptable to all speakers:

- | | | | |
|----------------------------|---|--|-----|
| (?)That's <i>the place</i> | { | <i>she stays</i> when she's in London. | [1] |
| | | <i>she works</i> . | [2] |
| | | <i>she studies</i> . | [3] |

However, a final *at* (pattern 4) would be fully acceptable, at least in familiar usage:

- | | | | |
|-------------------------|---|---|------|
| That's <i>the place</i> | { | <i>she stays at</i> when she's in London. | [1a] |
| | | <i>she works at</i> . | [2a] |
| | | <i>she studies at</i> . | [3a] |

With a generalized antecedent such as *way*, expressing direction, we usually have zero rather than *that*:

Was that *the way she went*? ['Was that where she went?']

- 17.20 In expressions of time, omission of the preposition is usual whether the pronoun is *that* or zero:

What's *the time* $\begin{cases} \text{(that) she normally arrives (at)?} \\ \text{when she normally arrives?} \\ \text{*when she normally arrives at?} \end{cases}$

What was *the day* (that) she left (on)?

When (less frequently and more formally) the pronoun is *which*, however, the preposition must be expressed in all three instances, and it would be usual to make it precede the pronoun (pattern 1):

5.30 is *the time at which* she normally arrives.

I don't remember *the day on which* she left.

He worked for the whole three months *during which* he lived there.

With expressions of manner and reason, the zero construction is usual (occasionally *that*), and there is no preposition (patterns 6 and 7):

That's *the way* (that) he did it. ['That's how he did it.'] [4]

Is this *the reason* (that) they came? ['Is this why they came?'] [5]

In more formal style, we might find pattern 1:

That's *the way in which* he did it. [4a]

The rare use of *for which* after *reason* strikes most people as clumsy and unnatural, while *the reason why* seems tautologous; there is general preference for zero [5a] or a nominal relative clause [5b]:

Is that $\begin{cases} \text{the reason they came?} \\ \text{why they came?} \end{cases}$ [5a]
[5b]

However, after other nouns which express adverbial-related meanings similar to *reason* and *way*, no *that* or zero construction without preposition is possible. Thus not [6] and [7] but only [6a] and [7a]:

$\begin{cases} \text{*This is the style he wrote it.} \\ \text{This is the style he wrote it in.} \end{cases}$ [6]
[6a]

$\begin{cases} \text{*Is this the } \begin{cases} \text{cause} \\ \text{motive} \end{cases} \text{ she came?} \\ \text{Is this } \begin{cases} \text{the cause of} \\ \text{motive for} \end{cases} \text{ her coming?} \end{cases}$ [7]
[7a]

There is a tendency to favour *when* or *where* if the antecedent is already the complement of a prepositional phrase, ie [8] rather than [8a] (to avoid repetition of the preposition):

He died *on the day* $\begin{cases} \text{when his son arrived.} \\ \text{on which his son arrived.} \end{cases}$ [8]
[8a]

Occasionally plural antecedents can be met with, as in:

It would be wise to leave doctors *ways* () they could add personal touches to their treatment.

Note Constructions with time nouns + zero relative clause (eg: *The moment you do something...*) may be ambiguous up to a certain point in the sentence, in that the noun phrase can be either adverbial, as in [9], or subject, as in [10]:

The moment () *you do something they disagree with* they are at your throat... [9]

The moment () *you realize the importance of animal psychology* will be embarrassing to you. [10]

Type [9] is normal; type [10] seems to be rare when, as here, the subject is 'heavy', but compare [11]:

The day she arrived at the congress was sunny. [11]

Telescoped relative clauses

17.21 The distinction between restrictive and nonrestrictive is valuable, but we should be prepared to view it as a gradient rather than as a dichotomy between two homogeneous categories. One type of relative construction which demonstrates the need for this approach can be illustrated by the following example of TELESCOPED relative construction:

All this I gave up for *the mother who needed me*. [1]

In [1], *mother* may be seen as having an appositional relation to a noun phrase whose head is a general noun such as *person*, accompanied by a relative clause as postmodifier:

All this I gave up for *a person who needed me*, ie *my mother*. [1a]

Another example:

This book is about *a Bloomsbury I simply don't recognize*. ['about a place I simply don't recognize; but I ought to recognize because I know Bloomsbury and the book says it is Bloomsbury'] [2]

Nonrestrictive relative clauses

17.22 In nonrestrictive relative clauses, the most explicit forms of relative pronouns, ie the *wh*-series, are typically used. The relative pronoun can be subject, object, complement, or adverbial. Here is a survey of the different forms for personal and nonpersonal antecedents:

S: I spoke to Dr Spolsky, $\begin{cases} \text{who} \\ \text{*that} \\ \text{*()} \end{cases}$ was unwilling to give further details.

S: This excellent book, $\begin{cases} \text{which} \\ \text{?*that} \\ \text{*()} \end{cases}$ has only just been reviewed, was published a year ago.

O: I spoke to Dr Spolsky, $\begin{cases} \text{whom} \\ \text{?who} \\ \text{*that} \\ \text{*()} \end{cases}$ I met after the inquest.

O: This excellent book, $\begin{cases} \text{which} \\ \text{?*that} \\ \text{*()} \end{cases}$ Freda has only just received for review, was published a year ago.

C: Anna is a vegetarian, $\left\{ \begin{array}{l} \text{which} \\ * \text{who} \\ * \text{that} \\ * () \end{array} \right\}$ no one else is in our family.

C: She wants low-calorie food, $\left\{ \begin{array}{l} \text{which} \\ * \text{that} \\ * () \end{array} \right\}$ this vegetable curry certainly is.

A: This is a new type of word processor,

$\left\{ \begin{array}{l} \text{about which there has been so much publicity.} \\ \text{which} \\ * \text{that} \\ * () \end{array} \right\}$ there has been so much publicity about.

As can be seen, the choice of pronouns is restricted to *who(m)* and *which*. Nonsubject *who* is thought by many to be more objectionable in nonrestrictive than in restrictive clauses (cf 17.14). Zero cannot occur, and *that* is very rare.

With nonrestrictive relative clauses, we usually have a tone unit boundary, often accompanied by a pause, before the relative clause; and, often, a repetition at the end of the relative clause of the nuclear tone of the tone unit preceding the relative clause. In writing, nonrestrictive relationship is usually marked off by commas (cf App III.19). Compare:

WRITTEN: Then he met Mary, *who invited him to a party.*

SPOKEN: Then he [met MARY] – *who invited him to a PARTY*

By contrast, with restrictive relative clauses, there is usually no tone unit boundary or pause before the relative clause; nor in writing is the relative clause separated by a comma from what precedes. Compare:

WRITTEN: That's the girl (*that*) he met at the party.

SPOKEN: [That's the girl (*that*) he met at the PARTY]

It must be emphasized that these are typical rather than obligatory prosodic features. The following example is exceptional in having a prosodic boundary before the relative clause though it is unquestionably restrictive:

but in the [LÔNG RÚN] – [these are FÓRCES] that will [ÚLTIMATELY] – [win SUPPÓRT] from the majority of the people in this COUNTRY]

- 17.23 Nonrestrictive relationship is often semantically very similar to coordination, with or without conjunction (cf 13.1ff), or adverbial subordination (cf 15.17ff). Both types are indicated by paraphrases in the following examples:

Then he met Mary	{	<i>who</i> invited him to a party.	[1]
		<i>and she</i> invited him to a party.	[1a]
		<i>she</i> invited <i>him</i> to a party.	[1b]
Here is John Smith	{	<i>who(m)</i> I mentioned the other day.	[2]
		<i>I</i> mentioned <i>him</i> the other day.	[2a]
		<i>who(m)</i> I talked <i>about</i> the other day.	[2b]
		<i>I</i> talked about <i>him</i> the other day.	[2c]

He got lost on Snowdon	{	<i>which</i> was enveloped in fog.	[3]
		<i>it</i> was enveloped in fog.	[3a]
		<i>when it</i> was enveloped in fog.	[3b]

She read a paper on lampreys	{	<i>which</i> she has studied.	[4]	
		<i>she</i> has studied <i>them</i> .	[4a]	
		<i>which</i> she has done research <i>on</i> .	[4b]	
		<i>on which</i> she has done research.	[4c]	
			<i>she</i> has done research <i>on them</i> .	[4d]

My brother, *who* has lived in America since boyhood, can still speak fluent Italian. [5]

My brother can still speak fluent Italian, *and he* has lived in America since boyhood. [5a]

My brother can still speak Italian *although he* has lived in America since boyhood. [5b]

Note A nonrestrictive interpretation is occasionally introduced by *that* when a premodifier or determiner would make a restrictive clause absurd, but when *which*, on the other hand, might imply too parenthetic a relation:

I looked at *Mary's sad face*, *that* I had once so passionately loved. [6]

In [6] we seem to have an elliptical form of an appositive expression:

I looked at *Mary's sad face*, *a face that* I had once so passionately loved. [6a]

Here the appositive *a face* justifies the restrictive clause that follows.

Usually the use of nonrestrictive *that* shows that a writer has muddled what he has wanted to set down, as in the following example from a serious article:

One of the most important recent developments in neutral hydrogen studies of our Galaxy has been the discovery of high velocities in the centre and in regions away from the plane, *that* I have mentioned.

Despite the comma – and the corresponding prosodic separation if this is read aloud (a separation that is essential if *plane* were not to be thought the antecedent head) – it seems likely that the writer originally wanted the relative clause to be restrictive, as it could readily have been if placed earlier:

... has been *the discovery that* I have mentioned of high velocities ...

However, this position of the relative clause violates the rule that prepositional phrases precede relative clauses as postmodifiers, producing a rhetorically unacceptable sentence (cf 18.39f).

- 17.24 Where the relative pronoun is a determinative in a noun phrase, there is again less choice than in restrictive clauses. Expressions with *which* tend to be uncommon except in formally precise writing. The preposition usually precedes *which*, and explicitness often extends to completion of the prepositional phrase by a general noun, locative or temporal, as the case may be (making *which* a relative determiner, cf 5.14):

In 1960 he came to London, *in which city* he has lived ever since. [1]

He came in 1960, $\left\{ \begin{array}{l} \text{at which time} \\ \text{in which year} \end{array} \right\}$ there was ... [2]

More commonly, we find *where* or *when* instead of the *which* expression:

... to London, *where* ... [1a]

... in 1960, *when* ... [2a]

This is a point at which there is little distinction between adnominal relative

clauses and adverbial clauses of place and time in complex sentence structure (cf 15.25ff).

Note the possible variations in word order with *of*-pronouns (*some, each, all, both*, etc; cf 6.48ff):

There are two schools here, $\left\{ \begin{array}{l} \text{both of which} \\ \text{of which both} \end{array} \right\}$ are good.

There are several schools here, $\left\{ \begin{array}{l} \text{all/some of which I can recommend} \\ \text{of which I can recommend all/some} \end{array} \right\}$.

For *both* there is also the possibility of the order *which are both good* (but hardly *?*which I can all recommend*).

Note also the use of the construction with *of*-pronouns when they modify the complement of a preposition:

The hospital admitted several patients *that month*,
 $\left\{ \begin{array}{l} \text{for all of whom chemotherapy was the appropriate treatment.} \\ \text{*of whom chemotherapy was the appropriate treatment for all.} \\ \text{*whom chemotherapy was the appropriate treatment for all of.} \end{array} \right\}$

Relative pronoun as complement

- 17.25 When the relative pronoun functions as nonprepositional complement in the relative clause, the choice is limited to *which* for both personal and non-personal antecedents, in both restrictive clauses (cf 17.14) and nonrestrictive clauses (cf 17.22):

He is a teetotaller, *which* I am not.
 This is a powerful car, *which* my last car was not.

Appositive clauses

- 17.26 The remaining type of finite verb clause that plays a part in postmodification is the appositive (cf 17.35, 17.65ff). This resembles the restrictive relative clause in being capable of introduction by the unstressed *that* /ðət/:

She objected to the fact *that a reply had not been sent earlier*. [restrictive appositive clause]

The appositive clause differs from the relative clause in that

- (i) the particle *that* is not an element in the clause structure (functioning as subject, object, etc, as it must in a relative clause) but a conjunction, as is the case in nominal *that*-clauses generally;
- (ii) the nonrestrictive appositive clause has the same introductory item as the restrictive, ie: *that* (cf 17.33):
 She rejected *their excuses*, even this last one, *that* investigations had taken several weeks. [nonrestrictive]
- (iii) the head of the noun phrase must be a general abstract noun such as *fact, idea, proposition, reply, remark, answer*, and the like (cf 16.84):
The fact that he wrote a letter to her suggests that he knew her. [1]
The belief that no one is infallible is well-founded. [2]

I agree with the old saying that absence makes the heart grow fonder. [3]

He heard the news that his team had won. [4]

As with apposition generally (cf 17.65ff), we can link the apposed units with *be* (where the copula typically has nuclear prominence):

The [fact /s/ that he] wrote a letter to her! [1a]

The belief is that no one is infallible. [2a]

The old saying is that absence makes the heart grow fonder. [3a]

The news was that his team had won. [4a]

We should also note that nouns like *belief* with *that*-clauses correspond to verbs with object clauses (cf 16.30ff):

He believes that no one is infallible. [2b]

With both restrictive and nonrestrictive appositive clauses, an antecedent noun is often a nominalization (cf 17.51ff):

The police reported that the drugs had been found. [5]

The police report that the drugs had been found (appeared in the press yesterday). [5a]

These restrictive examples have the definite article before the head noun. This is normal, but by no means invariable (except with a few nouns referring to certainty, especially *fact*):

A message that he would be late arrived by special delivery. [6]

The union will resist any proposal that Mr Johnson should be dismissed. [7]

Stories that the house was haunted angered the owner. [8]

Plural heads, as in [8], are also rare with appositive postmodification, and are usually regarded as unacceptable with *belief, fact, possibility*, etc. We may contrast [9] with the perfectly acceptable plural head with relative clause postmodification [9a]:

?Her mother was worried at the possibilities that her daughter was lazy and (that she) disliked school. [9]

The possibilities that she was now offered seemed very attractive. [9a]

However, we occasionally find examples of plural nouns with appositive postmodification, such as *facts* in the following:

The reason probably lies in the facts that the Intelligence Service is rather despised, that the individual members change rapidly and are therefore inexperienced, and that they feel bound to put their own special interests first.

We have seen in 16.70 that certain verbs with *that*-clauses have a construction with putative *should* or with a mandative subjunctive, eg:

They recommended that she (should) be promoted. [10]

When such verbs are nominalized (cf 17.51ff), the object clause becomes an appositive clause, retaining the putative *should* or the mandative subjunctive:

There was a recommendation that she (should) be promoted. [10a]

The nominalized verb may be separated from the appositive clause under the conditions for discontinuous noun phrases (cf 17.122, 18.39):

The suggestion that the new rule (should) be adopted came from the chairman. [11]

The suggestion came from the chairman that the new rule (should) be adopted. [11a]

- 17.27 Despite the limited number of noun head types that may be postmodified by an appositive clause, the superficial similarity to relative clause postmodification can sometimes cause momentary difficulty. Total ambiguity, however, is rare since so many factors of selection have to be involved before anything like [1] can occur:

A report that he stole was ultimately sent to the police. [1]

The two interpretations ('he stole a report' or 'the report was that he stole') depend upon the possibility that a report can be a physical object or an abstraction (that is, nominalizing the verb *report*); upon *steal* being permissibly transitive or intransitive; and several other factors: *made* in place of *sent*, for example, would prevent the ambiguity (though it might not prevent the hearer or reader from having temporary difficulty).

Nonrestrictive appositive clauses like [2] can less easily resemble relative clauses since, irrespective of nonrestrictiveness, they still involve the particle *that*, in sharp contrast with nonrestrictive relative clauses:

This last fact, (namely) that *that* is obligatory, should be easy to remember. [2]

In illustrating the previous point, example [2] also illustrates the next point, (namely) that appositive indicators *namely* or *viz* can be optionally introduced in the nonrestrictive appositions, as can *that is (to say)* or *ie* (cf 17.73). It also illustrates the fact that with this type of clause, the antecedent head noun may be freely premodified by adjectives and with a choice of determiners. It will be recalled that, with restrictive appositives, *the* was obligatory before *fact*, and it may now be added that the only adjectives admissible would be nonrestrictive in scope (cf 17.3ff). Contrast [3], where the restrictive clause permits only the nonrestrictive adjective, with [3a], where the nonrestrictive clause permits a restrictive adjective:

The ugly fact that he was holding a gun indicated his guilt. [3]

The more relevant fact, that the gun had not been fired, was curiously ignored. [3a]

Note The nonrestrictive apposition may be closely related to a nonrestrictive relative clause (cf appositive *wh*-interrogative clauses, 15.5). Compare:

His last request, $\left\{ \begin{array}{l} \text{which was} \\ \text{(ie)} \\ \text{(viz)} \end{array} \right\}$ that his wife should come and visit him, was never granted.

Postmodification by nonfinite clauses

Postmodification by *-ing* participle clauses

- 17.28 Postmodification of the noun phrase is possible with all three of the nonfinite clause types: *-ing* participle, *-ed* participle, and infinitive clauses. The correspondence between *-ing* clauses and relative clauses is limited to those relative clauses in which the relative pronoun is subject:

The person $\left\{ \begin{array}{l} \text{will write} \\ \text{will be writing} \\ \text{writes} \\ \text{is writing} \\ \text{wrote} \\ \text{was writing} \end{array} \right\}$ reports is my colleague. [1]

The person *writing reports* is my colleague. [1a]

The nonfinite clause *writing reports* in [1a] may be interpreted, according to the context, as equivalent to one of the more explicit versions in [1]. Other examples of postmodifying *-ing* clauses:

The dog *barking next door* sounded like a terrier. ['which was barking next door']

A tile *falling from a roof* shattered into fragments at his feet. ['which fell from a roof']

You should look for a man *carrying a large umbrella*. ['who will be carrying a large umbrella']

It must be emphasized that *-ing* forms in postmodifying clauses should not be seen as abbreviated progressive forms in relative clauses. Stative verbs, for instance, which cannot have the progressive in the finite verb phrase, can appear in participial form (cf 4.4, 14.19):

This is a liquid with a taste *resembling* that of soapy water. ['which resembles'; *not*: '**which is resembling'] [2]

It was a mixture *consisting* of oil and vinegar. ['that consisted of'; *not*: '**that was consisting of'] [3]

In all instances, the antecedent head corresponds to the implicit subject of the nonfinite clause. There is no nonfinite postmodifier, therefore, corresponding directly to the relative clause in [1b], without recourse to the passive [1c]:

Reports that my colleague is writing will be discussed tomorrow. [1b]

Reports being written by my colleague will be discussed tomorrow. [1c]

There are sharp constraints upon aspect expression in the participle clauses used in postmodification. We have just noted that *resembling* in [2] (*a taste resembling that of soapy water*) obviously could not represent the progressive, and the neutralization of the aspectual contrast can further be seen in [4] in contrast with [4a]:

the man $\left\{ \begin{array}{l} \text{who works} \\ \text{who is working} \end{array} \right\}$ behind the desk [4]

the man $\left\{ \begin{array}{l} \text{working} \\ * \text{being working} \end{array} \right\}$ behind the desk [4a]

On the loss of this aspectual distinction in nonfinite verb phrases, cf 3.56. Similarly the perfective aspect cannot usually be expressed in the nonfinite clause. Compare [5] and [5a]:

The man *who has won the race* is my brother. [5]
 ?*The man *having won the race* is my brother. [5a]

However, in a structure with an indefinite noun phrase as head, as in [6], perfective aspect is more acceptable:

?Any person or persons *having witnessed the attack* is under suspicion. [6]

The tense to be attributed to the *-ing* clause will usually be that of the finite clause in which the noun phrase occurs, especially if the noun phrase is object:

Do you know *the man talking to my sister*? ['who is talking to my sister']
 Did you know *the man talking to my sister*? ['who was talking to my sister']

The tense of the nonfinite clause can also be inferred from the context:

The man sitting next to her (now) was speaking on the radio (last night). ['who is sitting'] [7]

In a sentence like [7], the tense of the *-ing* clause would be assumed to be the present tense [8], unless the context suggests otherwise, as in [8a]:

the man sitting next $\left\{ \begin{array}{l} \text{to her} \text{ ['who is sitting']} \\ \text{to her on that occasion} \text{ ['who was sitting']} \end{array} \right\}$ [8]
 [8a]

In [9], the past tense *was* indicates the tense of *being questioned* and does not mean that he was no longer my brother, ie [9] = [9a]:

The man *being questioned* by the police *was* my brother. [9]
 The man *that was (being) questioned* by the police *is* my brother. [9a]

Note In some cases, *-ing* participles occur in frozen expressions with no relative clause alternative, eg: *for the time being* (not: '*for the time that is').

Postmodification by *-ed* participle clauses

17.29 As with *-ing* clauses, there is correspondence only with relative clauses that have the relative pronoun as subject. The nonfinite *-ed* participle clause in [1] can be related to the finite relative clauses in [1a]:

The car *(being) repaired* by that mechanic . . . [1]
 The car *that* $\left\{ \begin{array}{l} \text{will be repaired} \\ \text{is (being) repaired} \\ \text{was (being) repaired} \end{array} \right\}$ by that mechanic . . . [1a]

The *-ed* participle clause [1] will be interpreted, according to the context, as equivalent to one of the finite clauses in [1a]. Thus:

The car $\left\{ \begin{array}{l} \text{being repaired by that mechanic now . . .} \\ \text{repaired by that mechanic when it breaks down . . .} \\ \text{repaired by that mechanic before he left . . .} \end{array} \right\}$

Other examples:

A report *written by my colleague* appeared last week. ['that *was/has been written* . . .'] [2]
 Any coins *found on this site* must be handed to the police. ['that *are found* . . .'] or, more precisely, 'that *may be found* . . .'] [3]

The antecedent is always identical with the implied subject of the *-ed* postmodifying clause, as it is with the *-ing* construction. Also, postmodifying *-ed* and *-ing* participle clauses are both usually restrictive (but cf 17.34f). However, in the case of the *-ed* construction, the participle concerned is as firmly linked with the passive voice as that in the *-ing* construction is linked with the active. Since *-ed* participles can never be passive with intransitive verbs, there is no *-ed* postmodifier [4a] corresponding exactly to the relative clause in [4]:

The train *which has arrived at platform 1* is from York. [4]
 ?*The train *arrived at platform 1* is from York. [4a]

Exceptions occur where the *-ed* participle is preceded by certain adverbs, as in:

The train *recently arrived at platform 1* is from York. [4b]
 A man *just* $\left\{ \begin{array}{l} \text{gone to India} \\ \text{come from the meeting} \end{array} \right\}$ told me about it. [5]

This phenomenon is related to our ability also to premodify nouns with participles which, unless themselves premodified, can only postmodify.

There are constraints on aspectual expression in *-ed* postmodifying clauses, though they are not identical with those for *-ing* clauses. Unlike *-ing* clauses, *-ed* clauses can indicate progressive aspect. A progressive contrast is possible, as in [6a], which reflects the aspectual contrast in [6]:

The food *which* $\left\{ \begin{array}{l} \text{was/has been eaten} \\ \text{is being eaten} \end{array} \right\}$ was meant for tomorrow. [6]
 The food $\left\{ \begin{array}{l} \text{eaten} \\ \text{being eaten} \end{array} \right\}$ was meant for tomorrow. [6a]

As with *-ing* clauses, there is usually no perfective aspect in *-ed* clauses:

The food *which has been eaten* was meant for tomorrow. [6b]
 ?*The food *having been eaten*

Postmodification by infinitive clauses

17.30 Unlike *-ing* and *-ed* clauses, infinitive clauses as postmodifiers in noun phrases allow correspondences with relative clauses where the relative pronoun can be not only subject, but also object or adverbial and, to a limited extent, complement:

- S: The man *to help* you is Mr Johnson. ['who can help you'] [1]
 O: The man (*for you*) *to see* is Mr Johnson. ['who(m) you should see'] [2]
 C: The thing (*for you*) *to be* these days is a systems analyst. ['the thing that people will try to be these days is a systems analyst'; cf pseudo-cleft sentences 18.29ff] [3]
 A: The time (*for you*) *to go* is July. ['at which you should go'] [4]
 A: The place (*for you*) *to stay* is the university guest house. ['where you should stay'] [5]

Unlike [1], [2] can have an optional subject of the infinitive clause introduced by *for* (cf 14.6f). Without such a subject, the infinitive clause in [2] could be understood, according to context, as '(The man) that you/he/everyone, etc should see'.

Similarly, in [3-5] the subject of the infinitive may also be omitted. A less common and more formal alternative is then to introduce the relative pronoun and retain the infinitive clause:

- The time *at which* *to go* is . . . [4a]
 The place *at which* *to stay* is . . . [5a]
 A good place *at which* *to eat* is the pub round the corner. [6]

Compare also the formal [7] beside the informal [7b] (note that the preposition cannot be deferred in [7a]; nor can *in* be kept in [7c]):

- the way { *in which* *to do it* [7]
 **which* *to do it in* [7a]
to do it [7b]
 **to do it in* [7c]

Alternatively, we might have fully explicit relative clause constructions with preposition + relative pronoun, or adverbial relative (without preposition; cf 17.18f):

- The time { *at which* } *everyone should go* is July. [4b]
 The place { *at which* } *you should stay* is the university guest house. [5b]
 A good place { *at which* } *anyone can eat* is the pub round the corner. [6a]

As stated above, there is no *-ing* or *-ed* clause as postmodifier which allows correspondences with relative clauses where the pronoun is adverbial. Compare the syntactic flexibility and the possibility of different degrees of reduction in infinitive clauses compared with *-ing* clauses:

- the place { *at which* } { **staying*
to stay
you should stay
 (for you) *to stay* (at)

- She is not a person { *on whom* } { **relying.*
to rely.
one can rely.
 (for one) *to rely on.*

- This is a good instrument { *with which* } { **measuring*
to measure
they measure
 (for them) *to measure vibration with.*

- 17.31 Under certain conditions, functional ambiguity may arise, as when the subject is not expressed by *for* . . . *to* and the verb can be used both intransitively and transitively. In the latter case there are no semantic restrictions to exclude the antecedent from being interpreted as either subject or object. Consider sentence [1]:

- He is the best man *to choose*. [1]

It can then mean either [1a], *ie* subject interpretation and no equivalent finite relative clause possible, or [1b], *ie* object interpretation and with a corresponding finite relative clause alternative:

- He is the best man { *to do the choosing.* } [1a]
 { *to make the choice.*
that we (etc) can choose.
for us (etc) to choose.
to be chosen (by us, etc). } [1b]

As the examples have now shown, it is by no means only tense that has to be inferred in the infinitive clause. Mood is a far more variable factor, and the range accounted for in the adverbial infinitive clause is available also for noun-phrase postmodification (cf also [2-4] below and 17.32), *eg*:

- The time *to arrive* is . . . ['at which you *should* arrive']

With infinitive clauses, aspect is also less restrained than with other nonfinite clauses:

- The man { *to meet*
to be meeting
to have met } is Wilson.

The postmodifying infinitive clause can be active or passive:

- He is the best man { *to choose.*
to be chosen.

Beside the active examples already given, we may consider the following passives, which also further illustrate the variety of implicit tense and modality:

- The case *to be investigated tomorrow* . . . ['that will, or is to, be investigated'] [2]
 The animals *to be found in Kenya* . . . ['that can be, or are, found'] [3]

The procedure *to be followed* . . . ['that must, or should, or will, be followed'] [4]

In some cases, only active infinitives postmodifying clauses are natural, eg [5]; in some, only passive [6]:

I've got letters *to write* tonight. [5]
?I've got letters *to be written* tonight. [5]

The animals *to be found* in Kenya . . . [6]
?The animals *to find* in Kenya . . . [6]

In other cases, either active or passive infinitives seem equally possible with no or little change of meaning:

Give me a list of the people $\left\{ \begin{array}{l} \text{to invite.} \\ \text{to be invited.} \end{array} \right\}$ [7]

The procedure $\left\{ \begin{array}{l} \text{to follow} \\ \text{to be followed} \end{array} \right\}$ is this: . . . [8]

The best thing $\left\{ \begin{array}{l} \text{to do} \\ \text{to be done} \end{array} \right\}$ is as follows: . . . [9]

This is true also for the existential sentence pattern *there + be + noun phrase + to-infinitive clause* which is allied to relative clauses (cf 18.44ff):

There are letters $\left\{ \begin{array}{l} \text{to write.} \\ \text{to be written.} \end{array} \right\}$ [10]

There is no time $\left\{ \begin{array}{l} \text{to lose.} \\ \text{to be lost.} \end{array} \right\}$ [11]

There is no passive equivalent if *for* is used to introduce a subject:

The man $\left\{ \begin{array}{l} \text{to consult} \\ \text{to be consulted} \end{array} \right\}$ is Mr Johnson. [12]

The man $\left\{ \begin{array}{l} \text{for you to consult} \\ \text{*for you to be consulted} \end{array} \right\}$ is Mr Johnson. [13]

Nor does a passive always sound plausible when the head is a quantifier:

We have $\left\{ \begin{array}{l} \text{a lot to do.} \\ \text{?a lot to be done.} \end{array} \right\}$ [14]

We have $\left\{ \begin{array}{l} \text{plenty to eat.} \\ \text{?plenty to be eaten.} \end{array} \right\}$ [15]

We have $\left\{ \begin{array}{l} \text{a large number of pages} \left\{ \begin{array}{l} \text{to write.} \\ \text{(?to be written.} \end{array} \right\} \end{array} \right\}$ [16]

With a *there*-construction there is no voice restriction:

There is $\left\{ \begin{array}{l} \text{a lot} \left\{ \begin{array}{l} \text{(for everybody) to do.} \\ \text{to be done (by everybody).} \end{array} \right\} \end{array} \right\}$

plenty $\left\{ \begin{array}{l} \text{to do.} \\ \text{to be done.} \end{array} \right\}$

17.32 Postmodifying *to*-infinitive clauses can have either a modal or a nonmodal sense, but the modal interpretation seems to be normal, as indicated by most of the examples given so far. If the antecedent corresponds to the object of the infinitive, the modal interpretation is the only possible one:

The thing *to do* is . . . ['The thing we should do is . . .'; *not* = 'The thing we do is . . .'] or 'The thing we are going to do is . . .']

If the antecedent corresponds to the subject of the infinitive, the interpretation may be nonmodal, particularly if the antecedent has a 'restrictive' marker such as *last* and the infinitive is equivalent to a relative clause:

They were the *last* guests *to arrive*. ['They were the last guests who arrived.']

Such 'restrictive' markers include adjectives in the superlative degree, general ordinals (*next, last, only, first*, or other ordinal numeral (cf 5.22).

Blurred relationships in postmodification

17.33 The sharply reduced explicitness in the *-ing, -ed*, and infinitive clauses allows us to blur or neutralize the distinction between noun-phrase postmodification and certain other types of construction. It is interesting, for example, that native English speakers confronted by sentence [1] are likely to agree that they see little or no difference in meaning between [1] and either of [1a-b]:

I noticed $\left\{ \begin{array}{l} \text{a man hidden behind the bushes.} \\ \text{a man who was hidden behind the bushes.} \\ \text{that a man was hidden behind the bushes.} \end{array} \right\}$ [1]
[1a]
[1b]

So also with two other sentences of obviously different structure:

He was warned by $\left\{ \begin{array}{l} \text{the fact that a light flashed repeatedly.} \\ \text{a light that flashed repeatedly.} \end{array} \right\}$ [2]
[3]

Grammatical rules for nominalization (cf 17.51ff) can readily provide for the relation of [2] to [4] and for the relation of both [2] and [3] to [5]:

He was warned by $\left\{ \begin{array}{l} \text{the repeated flashing of a light.} \\ \text{a light flashing repeatedly.} \end{array} \right\}$ [4]
[5]

Sentence [5] can be a variant of the rarer form with genitive noun (*a light's*) corresponding to the subject of [2] (cf 15.12). The fact that [4] and [5] are virtually indistinguishable semantically means that, despite our ability to relate [4] grammatically to [2] rather than to [3], it is pointless to speculate on whether [5] is to be grammatically related primarily to [2] or to [3].

The infinitive clause occurs in similar merged constructions, but with additional possibilities. Example [6] is broadly unambiguous:

She expects somebody *to repair the TV set*. [6]

However, it can be related to more than merely noun-phrase postmodification [7]:

She expects somebody *who will repair the TV set*. [7]

It can also be related to a complementation type described in 16.30ff, the nonfinite clause corresponding to a finite clause:

She expects *that somebody will repair the TV set*. [8]

There are relations also with two possible adverbial purpose clauses [9] and [10]:

She expects somebody *in order that he will repair the TV set*. [9]

She expects somebody *in order that she can repair the TV set (with his help)*. [10]

However, both [9] and [10] should be seen as rather cumbersome circumlocutions of the natural expression in [6]. Another and more natural alternative to [10] would be [11]:

She expects somebody *to help her repair the TV set*. [11]

It is doubtless convenient to have a structural type like [6] that has such flexibility. For example, the possibility of postmodifying the head (*somebody*) is crucially important if we wish to expand such a sentence into the more explicit form [7] rather than [9]. Example [6a], with a proper noun as head, rules out a nonrestrictive clause [7a] as an analogue to [7]:

She expects *Jonathan to repair the TV set*. [6a]

*She expects *Jonathan who will repair the TV set*. [7a]

So also, we can reduce [12] to the nonfinite form [12a] without perceptible change or loss of meaning:

She has somebody $\left\{ \begin{array}{l} \text{who checks the TV set regularly.} \\ \text{(to) check the TV set regularly.} \end{array} \right.$ [12]
[12a]

However, we must not assume that any sentence of the form [13], and still less of the form [14], can have the nonfinite clause expanded as a relative:

She has *X to do Y*. [13]

She has *X do Y*. [14]

Nonrestrictive postmodification by nonfinite clauses

17.34 Nonrestrictive postmodification can also be achieved with nonfinite clauses:

The apple tree, *swaying gently in the breeze*, was a reminder of old times. ['which was swaying gently in the breeze . . .'] [1]

The substance, *discovered almost by accident*, has revolutionized medicine. ['which was discovered almost by accident . . .'] [2]

This scholar, *to be found daily in the British Museum*, has devoted his life to the history of science. ['who can be found daily in the British Museum . . .'] [3]

As with restrictive nonfinite clauses (cf 17.28ff), nonrestrictive *-ing* and *-ed* clauses only correspond to relative clauses where the relative pronoun is subject. But also infinitive clauses have this constraint when they are nonrestrictive:

*This scholar, *to find* . . .

*This place, *to stay* . . .

Nonrestrictive nonfinite clauses can be moved to initial position without change of meaning:

Discovered almost by accident, the substance has revolutionized medicine. [2a]

But this mobility in fact implies that nonfinite nonrestrictive clauses are equivocal between adnominal and adverbial role. Thus, the nonfinite clause in sentence [4] could be a reduction of a relative clause [4a], but equally of a causal clause [4b], or a temporal one [4c]:

The man, *wearing such dark glasses*, obviously could not see clearly. [4]

The man, $\left\{ \begin{array}{l} \text{who was wearing . . .} \\ \text{because he was wearing . . .} \\ \text{whenever he wore . . .} \end{array} \right.$ [4a]
[4b]
[4c]

So too, we can make the relative clause in [5] nonfinite:

The cost, *which includes meals*, is 290 francs. [5]

However, we must then recognize that the result, *including meals*, may be regarded by a reader or hearer as a reduction of a conditional clause, 'if we include meals', or *including* may be regarded as a preposition (cf 9.8).

Note [a] The range of semantic possibilities and the mobility to initial position (before the noun phrase) of nonrestrictive nonfinite clauses make such clauses equivocal between noun modifiers and adverbials (cf 8.150ff).
[b] Compare the discussion in this section with that of finite nonrestrictive clauses in 17.22ff and supplementary clauses in 15.60ff.

Appositive postmodification by infinitive and *-ing* clauses

17.35 Appositive postmodification by nonfinite clause occurs with infinitive and *-ing* clauses; *-ed* clauses cannot enter into appositive postmodification. Appositive postmodification is fairly common by means of infinitive clauses. A restrictive example like [1] would correspond to the finite *that people (should) give blood*, though such a use of the subjunctive or of putative *should* (cf 4.64, 16.70ff) is uncommon:

The appeal *to give blood* received strong support. [1]

There are also nonrestrictive examples, eg [2]:

This last appeal, *to come and visit him*, was never sent. [2]

A common feature of infinitive clauses, applying to restrictive and nonrestrictive alike, is that they leave the subject of the infinitive clause to be inferred from the context (as in [1] and [2]), unless there is a prepositionally introduced subject, as in [1a] and [2a]:

The appeal $\left\{ \begin{array}{l} \text{to us} \\ \text{for us} \end{array} \right.$ to give blood received strong support. [1a]

This last appeal $\left\{ \begin{array}{l} \text{to us,} \\ \text{for us} \end{array} \right.$ to come and visit him, was never sent. [2a]

The *-ing* clause functions as appositive postmodification in examples like [3-5]:

- I'm looking for a job *driving cars*. ['a job as a driver'] [3]
 We can offer you a career *counselling delinquents*. [4]
 There is plenty of work (for us) *shovelling snow*. [5]

The typical postmodifying function of *-ing* clauses is as complement of a preposition (*the job of driving cars, the problem of learning English*; 17.37ff).

In appositive structures, *-ing* clauses have prepositions which are absent in the corresponding finite clauses:

the hope $\left\{ \begin{array}{l} \text{of winning} \\ \text{that } X \text{ will win} \end{array} \right\} \sim X \text{ hopes that } X \text{ will win.}$

Constructions with *to*-infinitive or *of*-phrase

- 17.36 Appositive postmodification by means of an infinitive clause [1] may have no corresponding finite clause as apposition [1b], but instead an alternative construction with a prepositional phrase [1a]:

He lost the ability $\left\{ \begin{array}{l} \text{to use his hands.} \\ \text{of using his hands.} \\ \text{*that he could use his hands.} \end{array} \right\}$ [1] [1a] [1b]

Similarly:

Any attempt $\left\{ \begin{array}{l} \text{to leave early} \\ \text{at leaving early} \\ \text{*that one should leave early} \end{array} \right\}$ is against regulations.

However, the choice between *to* + infinitive clause and preposition (usually *of*) + *-ing* clause as noun postmodification is also strictly limited. We may distinguish three main types of construction:

- (a) *To*-infinitive only:

Anna has the will $\left\{ \begin{array}{l} \text{to win.} \\ \text{*of winning.} \end{array} \right\}$

- (b) Either *to*-infinitive or *of* + *-ing*:

Their chance $\left\{ \begin{array}{l} \text{to go} \\ \text{of going} \end{array} \right\}$ abroad was lost.

- (c) *Of* + *ing* only:

She found the risk $\left\{ \begin{array}{l} \text{*to lose} \\ \text{of losing} \end{array} \right\}$ money too great.

Type (a) with *to*-infinitive is found chiefly after nouns which have intrinsic uses (cf 4.49), ie those nouns which express modal meanings that involve human control over events, eg:

agreement	decision	determination
disinclination	inclination	invitation
proposal	readiness	refusal
resolution	(un)willingness	will

We may distinguish two types: one where the constituent expressing modality and the following verb share the implied subject. Compare:

Anna $\left\{ \begin{array}{l} \text{wants to} \\ \text{'will [stressed]} \\ \text{is willing to} \end{array} \right\}$ do the job.

\sim Anna's willingness $\left\{ \begin{array}{l} \text{to do} \\ \text{*of doing} \end{array} \right\}$ the job

A second type is found after nouns where the constituent expressing modality and the following verb have different subjects (irrespective of whether or not the infinitive has an expressed subject), as in:

Her father permitted her to do the job.

\sim her father's permission (for her) $\left\{ \begin{array}{l} \text{to do} \\ \text{*of doing} \end{array} \right\}$ the job

The subject may be implicit or explicit (introduced by *for*) in cases like the following (where there is an open choice of subject):

Here's an invitation $\left\{ \begin{array}{l} \text{(for me)} \\ \text{(for her)} \end{array} \right\}$ to visit the motor show.

Type (c) with *of* + *-ing* clause seems to occur chiefly after nouns expressing extrinsic modality, ie after nouns whose meanings do not primarily involve human control of the action itself, but typically involve human judgment, eg: *hope, possibility, prospect, risk*. Compare (on the choice of genitive *Anna's*, cf 15.12):

It is probable that Anna will do the job.

\sim the probability $\left\{ \begin{array}{l} \text{of (Anna's) doing} \\ \text{*for Anna to do} \end{array} \right\}$ the job

Other examples:

The team is running the risk of (us/our) losing another game.
 There is actually no hope of (them/their) winning the war.

In type (b) there is variation between the two kinds of construction, but certain nouns tend to have predominantly postmodification by *to*-infinitive, such as:

chance	freedom	need
obligation	opportunity	plan
power		

The following are examples of nouns that have predominantly *of* + *-ing* construction:

aim	impossibility	intention
necessity	possibility	responsibility

One reason for the choice among the two alternatives may be found in the contrast between root and epistemic possibility (cf 4.49), as in:

The possibility for man to coexist with man is slight.

[cf: 'It is possible for man to coexist . . . ' with subject introduced by *for*; root possibility]

The possibility of (them/their) coexisting is slight.
[cf: 'It is possible that . . .'; epistemic possibility]

The construction with *to*-infinitive is especially suitable for cases where the subject of the infinitive is expressed:

Such schemes leave $\left\{ \begin{array}{l} \text{the worker some freedom} \\ \text{some freedom for the worker} \end{array} \right\}$ to regulate the
relationship between effort and reward.

The construction with *of* + *-ing* clause is especially convenient when no expressed subject is present or implicit (generalizing function):

The freedom of holding an opinion and expressing it is a human right.

Postmodification by prepositional phrases

Relation to more explicit modifiers

- 17.37 In addition to reduction of sentences into noun phrases (cf 17.1) by means of postmodification by finite and nonfinite clauses, we have the further possibility of reduction of postmodification by prepositional phrases, as in the last item of the following series:

The car was standing outside the station.
the car *which was standing outside the station*
the car *standing outside the station*
the car *outside the station*

A prepositional phrase (cf 9.1ff) is by far the commonest type of postmodification in English: it is three or four times more frequent than either finite or nonfinite clausal postmodification. The full range of prepositions is involved, including complex prepositions (eg: *on board* in [4] and *in case of* in [5]; cf 9.10ff):

the road <i>to Lincoln</i>	[1]
this book <i>on grammar</i>	[2]
a man <i>from the electricity company</i>	[3]
passengers <i>on board the ship</i>	[4]
action <i>in case of fire</i>	[5]
the meaning <i>of this sentence</i>	[6]
the house <i>beyond the church</i>	[7]
two years <i>before the war</i>	[8]
a delay <i>pending further inquiry</i>	[9]
a tree <i>by a stream</i>	[10]

It is natural to relate such prepositional postmodifiers as (*the car*) *outside the station* to *be*-sentences ('The car is outside the station'), though in some instances the phrase seems to correspond with more than merely the finite

verb *be*. For example, we presumably need to regard [11] as related to a somewhat fuller predication [11a]:

the university <i>as a political forum</i>	[11]
The university is acting/regarded as a political forum.	[11a]

Again, although there is no problem with [12], the interpretation is not so straightforward for [13], where an additional component has to be understood [13a]:

The present <i>for John</i> costs a great deal. ['The present is for John.']	[12]
The man <i>for the job</i> is John.	[13]
The man is right/best for the job.	[13a]

This is seen still more clearly in [14], which is a more explicit form of sentence [13]:

The <i>right</i> man <i>for the job</i> is John.	[14]
--	------

Just as we do not wish to postulate [13b] in relation to [13], so we do not wish to postulate [14a] in relation to [14]:

*The man is for the job.	[13b]
*The right man is for the job.	[14a]

This problem will be seen in its more general context when we discuss *discontinuous modification* (cf 17.122).

The preposition *with* is another that we cannot fully account for unless we consider more than *be*-sentences; that is to say, these are adequate to explain [15], and even the idiomatic (and old-fashioned) [16]:

The woman <i>with the child</i> is Joan. ['The woman <i>is</i> with the child.']	[15]
The woman <i>with child</i> is Joan. ['The woman is with child, <i>ie</i> pregnant.']	[16]

But, in general, this is true only where *with* can be glossed as 'accompanied by'. No such gloss is possible in [17–18]:

the man <i>with a red beard</i>	[17]
the girl <i>with a funny hat</i>	[18]

Here we need to connect the prepositional phrase with a *have*-sentence: 'The man *has a red beard*', and hence with a relative clause: 'the man *who has a red beard*' (cf 9.55). The commonest preposition in noun-phrase postmodification, *of*, has a close correspondence to *have*-sentences (cf 17.38).

Note Among the prepositions used in postmodification, we should mention *like* (cf 9.4) which has the two senses of 'resembling in appearance' in [19] and 'resemblance in character' in [20]:

The man <i>like John</i> is over there.	[19]
A man <i>like John</i> would never do that.	[20]

The choice between the *of*-construction and the genitive construction

- 17.38 In many cases there is a regular correspondence between an *of*-phrase and the genitive (cf 5.115). Compare:

The ship has a funnel. It is red.

~ The ship has a red funnel.

~ The ship's funnel is red. [genitive construction]

~ The funnel of the ship is red. [of-construction]

The GENITIVE CONSTRUCTION consists of two noun phrases: one a noun phrase marked for the genitive case by inflection; the other a succeeding and superordinate noun phrase unmarked for case in which the genitive noun phrase is embedded with a determinative function (cf 5.121). 'Determinative' function means that the genitive noun phrase functions like a definite determiner: it plays a role in the superordinate noun phrase equivalent to that of a determiner such as *the* or *our* (cf 5.11ff):

the
our
the city's } population

In the OF-CONSTRUCTION, which is often equivalent in meaning to the genitive construction, the superordinate noun phrase precedes a noun phrase introduced by *of*. The genitive phrase and the *of*-phrase thus occur in different order in the two constructions:

{ [(the city's) population] [N1's N2]
[the population of the city] [N2 of N1]

In each construction, the two noun phrases may be expanded by modifiers, eg:

{ [(the large city's) growing population]
[the growing population of the large city]

However, the grammatical status of the genitive noun phrase is different from that of the *of*-phrase in that the former has the function of a definite determinative, whereas the second has the function of a postmodifier with the superordinate noun phrase either definite or indefinite. Thus, [1] shows direct correspondence with [1a]; [2] corresponds to [2a]; [3] has no correspondence with a genitive construction:

the funnel of the ship	[1]	~ the ship's funnel	[1a]
the funnel of a ship	[2]	~ a ship's funnel	[2a]
a funnel of the ship	[3]		

More distinctions can be made in post- than premodification generally, and this, as we can see here, is true also for the *of*-construction.

The only type of genitive where indefinite reference is permitted is the 'post-genitive', where the genitive and *of*-constructions are combined (cf 17.46):

a friend of my brother's

Note that the function of the genitive is not determinative in two uses: descriptive genitive, eg: *a girl's school* (cf 5.122, 17.110) and genitive of measure, eg: *an hour's delay* (cf 5.116).

We will now discuss other factors which influence the choice of construction:

- (a) Lexical factors (17.39)
- (b) Relational factors (17.40)
- (c) Objective and subjective relation (17.41-43)
- (d) Syntactic factors (17.44)
- (e) Communicative factors (17.45)

(a) Lexical factors

17.39 As we have seen in 5.117, the genitive is favoured by those gender classes which are highest on the gender scale, in particular where N1 is a personal name, a personal noun, and a noun with personal characteristics, ie animal nouns and collective nouns:

<i>Ann's car</i>	~ *the car of <i>Ann</i>
<i>the lady's car</i>	~ *?the car of <i>the lady</i>
<i>the dog's collar</i>	~ ?the collar of <i>the dog</i>
<i>the family's car</i>	~ ?the car of <i>the family</i>

With inanimate, in particular concrete, nouns, the *of*-construction is normally required:

the roof of this house ~ ?**this house's roof*

There is, however, a group of inanimate nouns which permit the genitive, especially geographical nouns and nouns denoting location and time (cf 5.118), eg:

<i>China's population</i>	~ the population of <i>China</i>
<i>the world's economy</i>	~ the economy of <i>the world</i>
<i>last year's profit</i>	~ the profit for <i>last year</i>

What has been said so far about lexical factors relates to gender in the determinative noun (N1). Specific lexical noun heads (N2) like *edge*, *length*, etc also influence the choice of construction (cf 5.120). The 'personal connection' of the genitive can be seen in a scale like the following where, without previous mention, N2 nouns that have the closest relation to the people of the country are most likely to be acceptable in the genitive:

* <i>China's map</i>	the map of <i>China</i>
? <i>China's climate</i>	the climate of <i>China</i>
(?) <i>China's roads</i>	the roads of <i>China</i>
<i>China's economy</i>	the economy of <i>China</i>

Note Whereas *the car of the lady* is unacceptable when unmodified, it becomes acceptable when there is postmodification of the whole noun phrase, or part of it (cf 17.44). Compare:

He crashed into { *?the car of the lady.
the car of the lady in front of him.
the car of the girl he hoped to marry.

(b) Relational factors

17.40 The relation between the two nouns, as described by means of sentential and phrasal analogues in 5.116, is a powerful conditioning factor in the choice of

Correspondingly, the genitive construction will probably be interpreted as subjective in the absence of a counter-indication, as in [2a] and [3a]:

- the fireman's examination [2a]
the tenants' scrutiny [3a]

But a lexical counter-indication very easily swings interpretation in the other direction, as in [5]:

- the student's examination [5]

A clear indication of the relationships in the genitive construction is achieved by adding a prepositional phrase beginning with *of* (after a construction of subjective relationship) and one beginning with *by* (after a construction of objective relationship). Such postmodifiers overrule any lexical pressure in the direction of a particular interpretation:

- the man's examination of the student [S V O] [6]
the man's examination by the doctor [O V S] [6a]
the tenants' scrutiny of the landlord [S V O] [7]
the tenants' scrutiny by the landlord [O V S] [7a]

Here, we are dealing with transitive 'verbs' which can tolerate deletion of their objects more easily than other verbs. The verb *possess* would scarcely yield a noun phrase in which the subject could be expressed without the object:

- ?The man's possession worried me. [8]
?The possession of the man worried me. [8a]

If we knew (from the context) that *the man* was subject, we would be inclined to ask 'What does he possess?' as a condition of trying to assimilate either of these sentences. Contrast:

- The pills came into the possession of some children. ['Some children possess pills.'] [9]
Some children came into possession of the pills. [9a]

English speakers would be inclined not to interpret the italicized portion of [9] as a noun phrase because there would not be a sentence having it as subject and preserving the subject-relation in the *of*-phrase:

- *The possession of some children would be dangerous.

The analogous portion of [9a] would be more readily regarded as a unit with noun-phrase structure:

- Possession of the pills would be dangerous.

In both [9] and [9a], however, (*the possession* seems to enter into construction with *came (into)* rather than with the subsequent part of each sentence: compare the construction *take a rest* and the phrasal verb type *take advantage of* (cf 16.58).

The subjective relation is indicated by the article (*the charge/control of*) in the following *of*-construction [10], which has a genitive alternative [10a]:

- The children are in {the {charge} control} of John. [10]
John's {charge.} control. [10a]

The objective relation, however, cannot be expressed by the genitive without change of word order [11a], and the *of*-construction requires the complex preposition *in charge of* without article [11]:

- The children are in {charge} control of John. [11]
~ John is in the children's {charge.} control. [11a]

Note In nouns with regular plural, the formal distinction in writing between the genitive plural (*boys'*), the genitive singular (*boy's*), and also the common gender plural (*boys*) does not exist in the pronunciation /bɔɪz/ (cf 5.113). In order to preclude ambiguity, the use of the genitive of nouns with regular plural tends to be avoided in speech, unless the number appears from the context (*the two boys' teacher*, etc). However, there is no problem with irregular plurals: *the children's teacher*.

(d) Syntactic factors

- 17.44 We have said that noun phrases may be indefinitely complex (cf 17.1). Since both the genitive and *of*-construction consist of two noun phrases each of which, at least theoretically, admits indefinite expansion, the minimal structures [1] and [1a] may be expanded to, for example, [2] and [2a]:

- his daughter's arrival [1]
~ the arrival of his daughter [1a]
his 19-year-old daughter's arrival from Hamburg [2]
~ the arrival from Hamburg of his 19-year-old daughter [2a]

There are some types of expansion of noun-phrase heads that are of particular interest to the present discussion: left-branching structure by premodification, and right-branching structure by postmodification, apposition, and coordination (cf 17.121f).

Heavy restrictive postmodification of the head of the noun phrase constrains the choice of the *of*-construction, *eg*:

- the arrival of a friend which had been expected for several weeks [3]

In such cases, the postmodification of the head is likely to be understood as nonrestrictive:

- the arrival of a friend, which . . .

With restrictive modification, the genitive is compulsory or greatly preferred, in order to avoid awkwardness, discontinuity, or ambiguity:

- a friend's arrival which had been expected for several weeks [3a]

The choice of construction is the converse when the other noun phrase is postmodified, in which case the *of*-construction is the natural choice:

- the arrival of a friend who had been studying for a year at a
German university [4]
*a friend's arrival who had been studying for a year at a German
university [4a]

Such 'split genitives' as in [4a] are not acceptable. In some cases, the 'group genitive' can be used, in which the genitive marker is affixed to the last item of the postmodification, in particular prepositional phrases (cf 17.119), as in [5]:

- the King of Spain's armada [5]
*the King's of Spain armada [5a]

Genitives after postmodification by finite clause, as in [6], would not be normally acceptable, but could well occur and be understood in a colloquial context:

- *?the lady I met in the shop's hat [6]

The same principles that have been illustrated for postmodification also hold for other heavy right-branching structures like apposition and coordination. Thus, when the determinative noun head is coordinate [7] or has appositive expansion [8], the genitive construction is often impossible:

- the arrival of his daughter and his German friend } [7]
?*his daughter's and his German friend's arrival }
the arrival of his daughter, a student of German } [8]
?*his daughter's, a student of German, arrival }

(e) Communicative factors

- 17.45 The choice between the genitive and the *of*-construction is also conditioned by the linear organization of utterances in discourse, in particular factors (such as end-focus and end-weight, cf 18.3f) that encourage the placing of more complex and communicatively more important constituents towards the end of the superordinate noun phrase. The genitive (N1's N2) is generally favoured when N2 has a higher communicative value than does N1 (example [1]), whereas the *of*-construction (N2 *of* N1) is preferred when the thematic distribution is the reverse (example [2]):

- The speaker said that, among the global problems that face us
now, the chief one is *the world's economy*. [*economy* is in focus] [1]
He went on to say, however, that in order to succeed we must first
tackle *the economy of the industrialized nations*, which is the
basis for *the sound economy of the world*. [*world* is in focus] [2]

We have seen that there are a number of factors which, singly or in combination, influence the choice of the *of*-construction. The most severe constraints on variation seem to be (i) the lexical constraint imposed by the choice of inanimate, especially concrete, noun (N1); and (ii) the use of the construction to express an objective relation. In both these cases, the *of*-construction is obligatory or widely preferred.

The 'post-genitive'

- 17.46 We may return now to example [6] in 17.42 and consider the peculiarities of this 'post-genitive' usage (cf 5.126). It will be observed that the postmodifier must be definite and human:

- an opera *of Verdi's* BUT NOT: *an opera *of a composer's*
an opera *of my friend's* BUT NOT: *a funnel *of the ship's*

There are conditions that also affect the head of the whole noun phrase. The head must be essentially indefinite; that is, the head must be seen as one of an unspecified number of items attributed to the postmodifier. Thus [1-3] but not [4]:

- A friend of the doctor's has arrived. [1]
A daughter of Mrs Brown's has arrived. [2]
Any daughter of Mrs Brown's is welcome. [3]
*The daughter of Mrs Brown's has arrived. [4]

As a consequence of the condition that the head must be indefinite, the head cannot be a proper noun (cf 5.60ff). Thus while we have [5], we cannot have [6] and [7]:

- Mrs Brown's Mary [5]
*Mary of Mrs Brown [6]
*Mary of Mrs Brown's [7]

The post-genitive thus involves a partitive as one of its components. The two constructions *a friend of his father's* and *one of his father's friends* are usually identical in meaning. One difference, however, is that the former construction may be used whether *his father* had one or more friends, whereas the latter necessarily entails more than one friend. Thus:

- Mrs Brown's daughter [8]
Mrs Brown's daughter Mary [9]
Mary, (the) daughter of Mrs Brown [10]
Mary, a daughter of Mrs Brown's [11]

[8] implies 'sole daughter', whereas [9] and [10] carry no such implication; [11] entails 'not sole daughter'.

Since there is only one composition called the *War Requiem* by Britten, we have [12] but not [13] or [14]:

- The *War Requiem* of/by Britten (is a splendid work.) [12]
*The *War Requiem* of Britten's [13]
*One of Britten's *War Requiems* [14]

Yet, we are able, in apparent defiance of this statement, to use demonstratives as follows:

- that wife of mine [15]
this *War Requiem* of Britten's [16]

In these instances, which always presuppose familiarity, the demonstratives are not being used in a directly defining role; rather, one might think of them as allowing us to see *wife* and *War Requiem* as appositional, as members of a

class of objects: 'This instance of Britten's works, namely, *War Requiem*'. Even where more than one object exists corresponding to the noun, the post-genitive phrase preceded by *this* should be regarded as having a generic partitive, eg:

this hand of mine [17]

Example [17] should be interpreted not as 'this one of my (two) hands' but rather as 'this part of my body that I call "hand"'.

- Note [a] So too, when a *daughter of Mrs Brown's* [11] is already established in the linguistic context, we could refer to *the/that daughter of Mrs Brown's (that I mentioned)*.
 [b] The use of *this* and *that* in such constructions parallels their use elsewhere, the former directing immediate and often sympathetic attention, the latter often having a negative or even contemptuous ring: *that son of yours* (cf 6.41).
 [c] Note the different meanings in the following set (cf 9.50, 17.54):
 a painting of my sister's ['done by my sister' or 'belonging to my sister']
 a painting of my sister ['representing my sister']
 a painting by my sister ['done by my sister']
 a painting of my sister by my brother ['representing my sister and done by my brother']
 Compare also:
 He's a student of Jespersen. ['one who studies Jespersen's writings']
 He was a student of Jespersen's. ['one who studied under Jespersen']
 [d] In earlier English, an appositional structure was obvious in such a variant of *this hand of mine* as *this my hand*. It is a variant still occasionally used with oratorical tone:
 Today, sadly, there is no room for humour in *this our country*. ['this country of ours']

Apposition with of-phrases

- 17.47 Some noun phrases have a prepositional phrase component, eg: *the city of Rome*, which is not a regular postmodifier, as in *the people of Rome* (cf 17.37). Such expressions are relatable to *be*-sentences whose subjects are put into *of*-phrases, when an indefinite complement is made definite:

Rome is a city.
 ~ The city (that I mean) is Rome.
 ~ the city of Rome

Similarly we might postulate such a relation as the following (cf 17.26f):

The team's victory was (announced as) news.
 ~ The news was the team's victory.
 ~ the news of the team's victory

We have here a basis for the prepositional postmodification which corresponds directly to the clausal appositive (on *the team* versus the *team's*, cf 15.12):

the news { that the team had won
 of the team(s) having won

Because of the obvious relation between, for example, *The city is Rome* and *the city of Rome*, it is common to regard such noun phrases as simply nominalizations of *be*-sentences in which the implied subject has become the head of the noun phrase.

A special case of prepositional apposition is offered by singular count nouns where the *of*-phrase is subjective (cf 17.41ff), eg:

the fool of a policeman [1]
 an angel of a girl [2]
 this jewel of an island [3]

This structure consisting of determiner + noun (N2) + *of* + indefinite article + noun (N1) is not a regular prepositional postmodification, since N1 is notionally the head, as can be seen in the paraphrases:

The policeman is a fool. (note the AmE informal variant *some fool policeman*) [1a]
 The girl is an angel. [2a]
 This island is a jewel. [3a]

The whole part N2 + *of* + *a* corresponds to an adjective:

the foolish policeman [1b]
 an angelic girl [2b]
 this jewel-like island [3b]

The natural segmentation is reflected in variant spellings, as in the familiar AmE expression *a hell of a guy* (nonstandard spelling: *a helluva guy*).

In this construction, the determiner of N1 must be the indefinite article, but there is no such constraint on the determiner of N2:

a }
 the } fool of { a policeman
 this } *the policeman
 that } *policeman

Also, N2 must be singular:

?*those fools of policemen

The possessive determiner actually notionally determines N1, not N2:

her brute of a brother ['Her brother was a brute.']

Both N2 and N1 can be premodified:

a little mothy wisp of a man
 this gigantic earthquake of a piece of music
 a dreadful ragbag of a British musical
 this crescent-shaped jewel of a South Sea island

Restrictive and nonrestrictive prepositional postmodification

- 17.48 Prepositional phrases may be restrictive or nonrestrictive in both appositional and nonappositional functions:

The course on English grammar starts tomorrow.
 [nonappositional, restrictive] [1]
 This course, on English grammar, starts tomorrow.
 [nonappositional, nonrestrictive] [1a]
 The question of student grants was discussed yesterday.
 [appositional, restrictive] [2]
 This question, of student grants, was discussed yesterday.
 [appositional, nonrestrictive] [2a]

But we must mention some limitations: [1a] and [2a] are rare and rather awkward. Nonrestrictive appositives could equally have no preposition, as with:

This question, student grants, was discussed yesterday. [2b]

On the other hand, the noun phrase in [3] is ambiguous:

the issue of student grants [3]

It can either have appositional or nonappositional meaning. In the latter sense [objective of: 'Someone issued student grants'], nonrestrictive function would be rare and unnatural, plainly suggesting a parenthetical afterthought:

?*The issue, of student grants,* was slow because there were so many applicants.

Similarly:

One man, of around forty years, was convicted of bigamy.

?*A party, of children,* entered the theatre.

?*The end, of the world,* is at hand.

An appositional interpretation is impossible when the postmodification is clearly restrictive:

**The man, of property,* was Soames Forsyte.

Nonrestrictive, nonappositive modification is more usual with other prepositions than *of*:

This textbook, by a colleague of mine, will be out shortly.

The passage, from a famous speech by Churchill, has become proverbial.

By contrast, complex prepositions (cf 9.10f) seem to lend themselves less readily to restrictive postmodification:

His resignation, *on account of a bribery scandal,* was deeply regretted.

?His resignation *on account of a bribery scandal* was deeply regretted.

Position and varied functional relationship

- 17.49 As with nonfinite postmodifiers when nonrestrictive, so with prepositional phrases: the nonrestrictive function merges with adverbial expressions (cf 8.44). Compare [1] and [1a]:

The children $\left\{ \begin{array}{l} \text{behind the fence} \\ \text{on the bus} \end{array} \right\}$ jeered at the soldiers. [1]

The children, $\left\{ \begin{array}{l} \text{behind the fence} \\ \text{on the bus} \end{array} \right\}$, jeered at the soldiers. [1a]

Example [1] means 'Those children who were ...'; example [1a] may mean 'The children, who (by the way) were ...' or 'The children, now that they were (safely ...)' (cf similar vacillation in nonfinite clauses, 17.34f). It is rather this latter implication that becomes uppermost if the prepositional phrase is moved into initial position, as in [1b]:

$\left. \begin{array}{l} \text{Behind the fence,} \\ \text{On the bus,} \end{array} \right\}$ the children jeered at the soldiers. [1b]

Again, the prepositional phrase in [2] is poised between interpretation as nonrestrictive postmodifier and as adverbial:

Money, *in aid of the refugees,* was collected from the students and staff. [2]

In the former interpretation, the money collected was in aid of the refugees, and in the latter, the act of collecting money was in aid of the refugees, since in this case the adverbial modifies the whole predication just as it would in initial position:

In aid of the refugees, money was collected ... [2a]

Despite the similarity in meaning in the examples discussed here, we do indeed have different constructions and not merely the additional possibility of placing a prepositional postmodifier in front of the noun-phrase head. This becomes clear when it is shown that, unless a given phrase can be an adjunct, it cannot be moved from its postmodifying position. For example, the restrictive postmodification in *this leap right across the fissure* can be made nonrestrictive:

This leap, right across the fissure, was shown on television. [3]

But as the phrase cannot be adjunct in this sentence, it cannot be made initial [3a]:

**Right across the fissure,* this leap was shown on television. [3a]

- 17.50 The restriction on initial position naturally applies also to the *of*-postmodifiers that are almost solely restrictive:

**Of children,* a party entered the theatre. [1]

But there is an apparent exception with partitive expressions. Thus beside [2] we may thematically prepose the *of*-phrase with no obvious difference in meaning [2a]:

Only a few *of the ten reviewers* praised his play. [2]

Of the ten reviewers, only a few praised his play. [2a]

This example is misleading, however, in giving the impression that the initially placed phrase of [2a] is identical with the postmodifying phrase of [2]. They are not identical, as can be seen when we substitute zero article; this is acceptable when the phrase is in initial position, as in [3] and [4], but not in postmodification, as in [3a] and [4a]:

Of ten reviewers, only a few praised his play. [3]

Of fourteen women, ten were highly critical of the proposal. [4]

?*Only a few *of ten reviewers* praised his play. [3a]

?*Ten *of fourteen women* were single. [4a]

The fact that [4a] becomes acceptable if the postmodifying phrase is introduced by *out of* (as in *Ten out of fourteen women*, where the phrase can

also be initial) confirms that the initially placed *of*-phrase is functionally different, although semantically similar to the postmodifying phrase.

In other words, we should regard the initial prepositional phrase in such examples as [3] and [4] as adverbial and not as displaced postmodification; indeed, *as for* and *as to* phrases, when denoting respect (cf 9.57), must always be initial. Perhaps better, we should see the initial phrase in [3] as directly related to an existential statement [3b] (cf 18.44ff):

Of ten reviewers that there were, } only a few praised his play. [3b]
There were ten reviewers, but }

Nominalization

- 17.51 We should not exaggerate the difference between (a) the prepositional phrase as adverbial and (b) the prepositional phrase as postmodifier (cf 17.37ff). The second of these should rather be regarded as a special instance of the first, depending for its interpretation on our ability to relate it to a sentence in which it is adjunct. In [1], for instance, both the prepositional phrases are introduced as adjuncts:

In the morning, a quarrel broke out *over pay*. [1]

If now we wish to refer again to the quarrel, we may do so in relation to either of these adjuncts, which now become postmodifiers:

The quarrel *in the morning* ruined their friendship. [1a]
The quarrel *over pay* was the reason for his resignation. [1b]

The relation of postmodifier to adjunct may be even clearer if, instead of [1], we take a sentence like [1c]:

In the morning, they quarrelled *over pay*. [1c]

In [1c], *quarrel* does not occur as a noun but as a verb, to which we also relate [1a] and [1b], but in this case through the process of word formation called conversion (cf App I.43ff). Conversion should be distinguished from nominalization.

A noun phrase such as *the quarrel over pay* in [1b] which has a systematic correspondence with a clause structure will be termed a **NOMINALIZATION**. The noun head of such a phrase is normally related morphologically to a verb [2], or to an adjective [3] (ie a deverbial or deadjectival noun, cf App I.34ff):

his *refusal* to help ~ He *refuses* to help. [2]
the *truth* of her statement ~ Her statement is *true*. [3]

But the correspondence may also sometimes be based on a concrete noun and a denominal abstract noun:

her *friendship* for Chopin ~ She was a *friend* of Chopin. [4]

By describing such phrases as having a systematic correspondence with a clause structure, we do not wish to imply that for every clause there is a corresponding noun phrase; the correspondence is best seen as obtaining in a less regular fashion, and as depending on whether, for example, there is a suitable nominal lexicalization of the verb's meaning (cf App I.8ff). The claim is, however, that we can match elements of the noun phrase (head, modifiers, determinatives) with elements of clause structure, considered semantically in terms of the verb and its associated participant roles (cf 10.18ff) of agentive, affected, etc.

We can also distinguish, in the case of deverbal noun heads, between active and passive nominalization patterns:

the critics' hostile *reception* of the play
~ The critics *received* the play in a hostile manner.
[subjective, cf 17.41ff] [5]

the play's hostile *reception* by the critics
~ The play *was received* in a hostile manner by the critics.
[objective, cf 17.41ff] [6]

- 17.52 The term nominalization may apply not only to noun phrases with an abstract noun head, as in [5] and [6] in 17.51, but also to concrete noun phrases with an agential noun head (cf 7.73), as in:

She is a good *writer*. ~ She *writes* well. [1]
He is a clever *liar*. ~ He *lies* cleverly. [2]

The relation between a nominalization and a corresponding clause structure can be more or less explicit, according to how far the nominalization specifies, through modifiers and determinatives, the nominal or adverbial elements of a corresponding clause. In this respect we may compare [3] with [3a-f]:

The reviewers criticized his play in a hostile manner. [3]
the reviewers' hostile criticizing of his play [3a]
the reviewers' hostile criticism of his play [3b]
the reviewers' criticism of his play [3c]
the reviewers' criticism [3d]
their criticism [3e]
the criticism [3f]

These noun phrases are ordered from most explicit [3a] to least explicit [3f], but each of them could occupy the function of a nominalization as prepositional complement in the following:

Lanzarotti was disappointed by . . .

The extreme of inexplicitness is reached with an abstract or agential noun standing on its own as a noun phrase:

Criticism is always helpful. [3g]

Some verbs have no corresponding deverbal noun: for example, corresponding to *lie* ['tell untruths'] there is no deverbal abstract noun, although

there is the agential noun *liar*. In such cases, however, we can usually make use of a verbal noun ending with *-ing* (cf App 1.35):

Lying is all too common.

His firing of William was a mistake.

(Contrast: *His dismissal* of William was a mistake.)

Some such *-ing* nouns can also be used in the plural:

The number of reported *sightings* of UFOs since 1980 is relatively small.

- 17.53 Verbal and deverbal nouns differ in their acceptance of modification by prepositional phrases. Compare the following:

their arriving <i>for a month</i>	[1a]
?the(ir) arrival <i>for a month</i>	[1b]
their behaving <i>with courtesy</i>	[2a]
?the(ir) behaviour <i>with courtesy</i>	[2b]
their acting <i>in a nasty manner</i>	[3a]
*the(ir) action <i>in a nasty manner</i>	[3b]
their contributing <i>out of kindness</i>	[4a]
*the(ir) contribution <i>out of kindness</i>	[4b]

It appears that adjuncts relating to duration, manner, or cause are awkward or inadmissible as postmodifiers. Deverbal nouns (especially from punctual verbs like *arrive*; cf 4.33) might be described as mere records of an action having taken place rather than as descriptions of the action itself. Thus the postmodifiers are the adjuncts that can occur in sentences like the following:

They arrived <i>on Thursday</i> .	[5]
The arrival took place <i>on Thursday</i> .	[6]

Contrast:

They arrived <i>for a month</i> .	[5a]
*The arrival took place <i>for a month</i> .	[6a]

The gradience from deverbal nouns via verbal nouns to participles

- 17.54 As well as distinguishing between deverbal nouns like *quarrel*, *arrival*, *behaviour*, *action*, and *contribution* (cf App 1.35) and the corresponding verbal nouns in *-ing* (*quarrelling*, *arriving*, etc), we need to recognize a complex gradience, as in the following example, from the pure count noun in [1], *some paintings of Brown's*, to the purely participial form in a finite verb phrase in [14], 'Brown is painting his daughter':

<i>some paintings of Brown's</i> [[a] 'some paintings that Brown owns'; or [b] 'some paintings painted by Brown']	[1]
<i>Brown's paintings of his daughter</i> [[a] 'paintings depicting his daughter and painted by him'; or [b] 'paintings depicting his daughter and painted by someone else but owned by him']	[2]

<i>The painting of Brown</i> is as skilful as that of Gainsborough. [[a] 'Brown's mode of painting'; or [b] 'Brown's action of painting']	[3]
<i>Brown's deft painting of his daughter</i> is a delight to watch. ['It is a delight to watch while Brown deftly paints his daughter.']	[4]
<i>Brown's deftly painting his daughter</i> is a delight to watch. [= [3b] or [4] in meaning]	[5]
I dislike <i>Brown's painting his daughter</i> . ['I dislike either [a] the fact or [b] the way that Brown does it.']	[6]
I dislike <i>Brown painting his daughter</i> (when she ought to be at school). [= [6a]]	[7]
I watched <i>Brown painting his daughter</i> . [[a] 'I watched Brown as he painted'; or [b] 'I watched the process of Brown('s) painting his daughter.']]	[8]
<i>Brown deftly painting his daughter</i> is a delight to watch. [= [3b] or [4]; cf 14.6ff]	[9]
<i>Painting his daughter</i> , Brown noticed that his hand was shaking. ['while he was painting'; cf 5.12ff]	[10]
<i>Brown painting his daughter</i> that day, I decided to go for a walk. ['since Brown was painting'; cf 5.12ff]	[11]
<i>The man painting the girl</i> is Brown. ['who is painting'; cf 17.28]	[12]
<i>The silently painting man</i> is Brown. ['who is silently painting'; cf 17.98f]	[13]
<i>Brown is painting his daughter</i> . [cf 4.25ff]	[14]

In [1] and [2] we have the DEVERBAL NOUN *paintings* with a plural ending. It could be replaced by *pictures* or *photos*; it is thus a perfectly regular concrete count noun, related only to the verb *paint* by word formation.

In [3] and [4] *painting* is also a noun, as can be seen by the definite article in [3], and in [4] not only by the genitive construction but also by the adjective premodifier *deft* (as compared with the adverb *deftly* in [5]). Yet *painting* here could not be replaced by *picture* or *photo*, but only by abstract nouns like *representation*, *portrayal*, *portraiture*, *depiction*, etc. Thus *painting* in [3] and [4] is an abstract noncount noun of the kind that can be formed from verbs by adding *-ing* and inserting *of* before the noun phrase that corresponds to the subject if the object is not expressed (cf 17.41):

<i>the painting of Brown</i>	~ Brown paints.
<i>the writing of Smith</i>	~ Smith writes.

This construction can also occur before the noun phrase that corresponds to the object, if this is expressed:

<i>their polishing of the furniture</i>	~ They polish the furniture.
<i>the writing of novels</i> (by Smith)	~ Smith writes novels.

Forms like *painting* in [3] and [4] are VERBAL NOUNS (cf 17.51, App 1.3 Note).

In [5] and [6], the genitive *Brown's* is used, but in place of the adjective *deft* in [4] we have the adverb *deftly* in [5]; in place of the *of*-phrase *of his daughter* (in [4]), we have in [5] and [6] the noun phrase *his daughter* directly following *painting*, exactly as does the object of a finite verb phrase in [14]. Traditionally this mixture of nominal and verbal characteristics in the *-ing* form has been

given the name 'gerund', while the uses of *painting* in [7-14] have been distinguished as those of the '(present) participle'.

Note [a] Where no premodifier appears, genitive or otherwise, the traditional view held *painting* to be 'gerund', as in [15], where the item is in a structure functioning nominally (in this case as subject); but it was considered a participle if the same structure functioned adverbially, as in [16]:

Painting a child is difficult. [15]

Painting a child that morning, I quite forgot the time. [16]

However, no analogous categorial distinction was made between *to paint* in [17] and [18]:

To paint a child is difficult. [17]

To paint a child, I bought a new canvas. [18]

Here the tradition was content to regard *to paint* as an 'infinitive' in both.

For reasons that will now be plain, we do not find it useful to distinguish a *gerund* from a participle, but terminologically class all the *-ing* items in [5-14] as PARTICIPLES. In [5-12], the participle is in each case the nonfinite verb of a nonfinite clause, in [13] a premodifier, and in [14] the head of a finite verb phrase. By avoiding the binary distinction of gerund and participle, we seek to represent more satisfactorily the complexity of the different participial expressions as we move along the gradient to the 'most verbal' end at [14].

One indication of the complexity of the *-ing* form is that what others have called the gerund carries in English both nonmodal meanings, as in [19], and modal meanings, as in [20]:

There was *no shouting*, *no merry-making*, *no waving of flags*. ['No shouting, merry-making, or waving of flags took place.'] [19]

There was *no mistaking that scream*. ['No one could mistake that scream.'] [20]

Thus in [19] the *-ing* form corresponds to the Latin gerund, but in [20] to the Latin gerundive which, unlike the gerund, typically manifests a modal meaning such as possibility or contingency. This lack of correspondence between the English gerund and the traditional use of the term can be advanced as a further reason for rejecting the term gerund in English.

Furthermore, there is potential ambiguity not only along the modal/nonmodal dimension but also along the (traditional) gerund/deverbal-noun dimension (cf 15.14 Note [b]). For example, sentence [21] can be interpreted in three ways [21a, b, c]:

There's *no writing on the blackboard* today. [21]

as a modal 'gerund' [21a]:

'We can't write on the blackboard today (because we have no chalk).' [21a]

as a nonmodal 'gerund' [21b]:

'We are not going to write on the blackboard today (since all our work is going to be oral).' [21b]

as a nonmodal deverbal noun [21c]:

'There's nothing written on the blackboard today (because we haven't used this classroom).' [21c]

The sense of [21c] is doubtless more expected than either [21a] or [21b].

[b] One expects the name in [3] to be that of an artist of some reputation if the *of*-construction is to be used; otherwise the genitive would be more natural to convey this meaning:

Jack's painting is nearly as good as *his wife's*.

[c] There is an aspectual difference between verbal nouns, which tend to denote activity that is in process, and abstract deverbal nouns, which denote completed activity (cf App 1.35 Note).

Minor types of postmodification

Postmodification by adverb phrase

17.55 Some typical examples of postmodification by adverb phrases (cf 7.67) are the following:

The road back is dense with traffic. [1]

The way out was hard to find. [2]

The people behind were talking all the time. [3]

In [1], we recognize some such paraphrase as '*The road* which leads *back* to London' from which everything except an important adjunct has to be understood from the context. Similarly, for [2]: '*The way* which leads *out* of the auditorium'; and for [3]: '*The people* who were sitting *behind*'. In some cases, the postmodifying item could be regarded alternatively as a preposition with omitted complement: '*The people* who were sitting *behind* us'.

There are indeed a few cases where a prepositional interpretation is forced on us (cf 9.53), eg:

The votes for far outnumber those *against*. [4]

In [4], the related explicit structure has no alternative to the prepositional phrase:

The votes are for the motion.

But since most examples can be explained as adverbial and few as prepositional, it seems best to regard the few that must be prepositional as being modelled upon the adverbial ones.

As indicated in 7.67 (where more examples are given), adverbs which postmodify nouns signify time or place. In some phrases, the adverb can be used either as a pre- or postmodifier:

his *homeward* journey ~ his journey *homeward*

Some noun phrases of measure, denoting size, age, etc, can also be postposed:

A man *the size of a giant* came up to me.

Somebody *her age* shouldn't do such strenuous exercises.

Note *O'clock* is an adverb optionally added after numbers from 1 to 12 to denote time of day:

What time was the accident?

– At 10 (o'clock) in the morning/at night.

– At 12 (o'clock) noon/midnight.

O'clock is not used together with *a.m.* ['before midday'] or *p.m.* ['after midday']:

9 o'clock in the morning [= 9 a.m.]

9 o'clock in the evening [= 9 p.m.]

O'clock is used only in mentioning the exact hour, not the hour and a particular number of minutes:

at 7 o'clock, at 7 a.m./p.m.; at 7.15 a.m./p.m. BUT NOT: *at 7.15 o'clock, *at 15 past 7 o'clock

Postposed adjectives

17.56 Postposed adjectives (cf 7.21) can be divided into three main types, depending on whether the postposition is required by:

(a) the head of the noun phrase (cf 17.57), eg:

I want to try *something different* [as opposed to a *different approach*] [1]

(b) the postmodification or complementation of the adjective (cf 17.58), eg:

a play popular in the 1890s [as opposed to a popular play] [2]

(c) the particular noun-adjective combination (cf 17.59), eg:

the heir apparent [as opposed to the apparent reason, the rich heir] [3]

Types (a) and (b) are central constructions and can be seen as reductions of relative clauses:

something (that is) different [1a]
a play (that was) popular in the 1890s [2a]

Type (c) is restricted to idiomatic phrases.

Type (a): *somebody bigger*

17.57 This type includes noun-phrase heads consisting of indefinite pronouns in *-body*, *-one*, *-thing*, and the adverb *-where*, plus one or two *wh*-forms (*what* else, *who* next, etc), which can only be modified postpositively (cf 7.69):

Anybody younger would have done better.

However, we cannot postpose with indefinites every modifying item that can be preposed with ordinary noun heads. While we have both *a tall girl* and *an office girl*, we have *somebody tall* but not **somebody office* (cf 7.12).

Even adjectives need generally to be 'permanent' and hence eligible for attributive use (cf 17.7); thus *somebody timid* rather than **somebody afraid*.

Note [a] We not infrequently come upon noun phrases which defy the conditions described; for example, beside the regular *something nasty* we have:

That nasty something has reappeared.

In such instances (which are almost always familiar, playful, or ironic), the head items are not being used as compound indefinite pronouns (cf 6.45ff) but as nouns. The motivation for the deviation will vary from one example to another, but a possible explanation for the example just provided would find ready parallels. We might paraphrase it thus: 'You mentioned seeing something nasty; well, the thing you called "something" has reappeared'.

[b] The type of postmodification consisting of pronoun in *-thing* + adjective has an alternative construction with *a* + adjective + *thing* as head:

Something nasty } happened to me on the way to work this morning.
A nasty thing }

Some nasty things has the somewhat different sense of 'certain nasty things'. There is no **some things nasty*.

There is a possibility of using *one* (but not *body*) as a head in this way:

I'd like { someone young
a young one
somebody young
*a young body } for the job.

Any young body ['anybody young'] is dialectal.

Type (b): *a mistake typical of beginners*

17.58 This type includes adjective phrases which are heavy in relation to the head, usually by having a prepositional phrase or a nonfinite verb phrase as complement. Whereas we have only the normal order in [1], postposition is required in [2]:

a typical mistake [1]
a mistake typical of beginners [2]

Thus English accepts neither [2a] (unless used ad hoc and specially marked by hyphens: 'That could be described as a typical-of-beginners mistake') nor [2b]:

*a typical of beginners mistake [2a]
*an of beginners typical mistake [2b]

With coordinated adjectives, either pre- or postposition is possible:

{ a both typical and common mistake [3]
a mistake both typical and common [3a]

When a head is nonrestrictively modified by a coordinate string of adjectives, it is common to postpose them:

A man, timid and hesitant, approached the official. [4]

However, the potential mobility of the string allows it to be detached from the noun phrase altogether (cf 7.27, 17.49) and shows it to be an adverbial rather than part of the noun phrase:

{ Timid and hesitant, a man approached the official. [4a]
A man approached the official, timid and hesitant. [4b]

Even a restrictively modifying adjective can be postposed if it is itself modified (by an adjunct, not by the intensifier *very*; cf 7.87ff):

A man always timid is unfit for this task. [but not: *A man very timid . . .] [4c]

This construction is particularly common where the modification expresses a 'temporary' attribute (cf 17.7). Thus beside the dubiousness of **somebody afraid* (cf 17.49), complementation of the adjective (*somebody afraid of the dark*) results in complete acceptability. Comparison involving nouns of different gender classes requires postposition of the adjective as in [5]:

a man taller than Mary }
~ *a taller man than Mary } [5]

Where the nouns are of the same class, postposition is optional (cf 17.122):

a man taller than John }
~ a taller man than John } [6]

Type (c): *the president elect*

17.59 This type of postposed adjective consists chiefly of the sprinkling of fixed noun-plus-adjective phrases (modelled on French) like *the president elect*, *heir apparent*, *blood royal* (cf further examples in 7.21). These are of little importance in themselves, being infrequently used (though our ability to form names like *Hotel Majestic* suggests that they are more than mere fossils), and it is likely that native speakers feel them to be very similar to compound nouns. Unlike the adjectives in free combinations, these postposed adjectives cannot be modified:

- *The president newly elect
The president newly elected
The newly elected president } will take office next Monday.
*The heir still apparent was being well educated.
?She had blood wholly royal in her veins.

With a quantifier we can say 'A lot of royal blood flowed in the French revolution', but not '*A lot of blood royal . . .'. In some cases, a sequence has obviously been reanalysed as premodifier plus head; this can be seen in the plural *court-martials* (alongside *courts-martial*; cf 5.102):

Postposed 'mode' qualifier: *Lobster Newburg*

- 17.60 There is another French model of postposition in English that we may call postposed 'mode' qualifier, as in *Lobster Newburg*. Though virtually confined to cuisine (rather than mere cooking), it is moderately productive within these limits, perhaps especially in AmE. In BrE one finds *veal paprika* and many others, but there is some resistance to this type of postposition with other than French lexical items, as in *pâté maison*, *sole bonne femme*. Nevertheless (perhaps partly because, in examples like the latter, the French and English head nouns are identical), the language has become receptive to hybrids like *poached salmon mayonnaise*, *English scallops provençal*.

Note The prepositional phrase involving *à la* (cf 9.10 Note) is a related phenomenon. It appears in culinary formations like *chicken à la king*, but is very general in informal or facetious use to designate style, 'in the manner of':

Multiple postmodification

- 17.61** Multiple modification arises through any or all of the following three conditions (a, b, c):

The usual type of construction is with no conjunction. But, without a conjunction, there is ambiguity (though often with little difference in meaning in practice) between a coordinated relation of the postmodifiers as in *Fig 17.61a* and a hierarchical relation as in *Fig 17.61b*.

Fig 17.61a

Fig 17.61b

(b) A modification is applicable to more than one head. Thus [4] can be brought together by multiple-head rules which permit the determiner to apply to both heads (*cf* 13.67) as [5]:

identical items (eg a sequence of prepositional phrases or relative clauses) is perhaps as objectionable in a lengthy postmodification as is the danger of losing the thread. Objections to the following sentence are obvious:

?He was [the man [who wrote the letter [which Mary found in the house [which she rented from the man [who knew her uncle]]]]].

Ambiguity and constraints on multiple postmodification

- 17.62 The instances of multiple modification so far considered have raised problems of style but hardly of actual ambiguity or structural unacceptability. Frequently, however, careful ordering of constituents in a noun phrase is essential to communicate one's intention. To take an example, the following pair [1] and [2] differ in meaning and are not mere stylistic variants:

the man *in black* talking to the girl [1]
the man talking to the girl *in black* [2]

One of the reasons for preferring the *of*-phrase to the genitive is to avoid discontinuity (with unwanted grotesque ambiguity, cf 17.44); thus [3] but not [4]:

the ears *of the man* in the deckchair [3]
*the man's ears in the deckchair [4]

Pushdown elements

- 17.63 A special type of multiple postmodification that requires careful ordering occurs when the modifying clause becomes itself embedded in a clause ('pushdown relative clause'; cf 11.18, 15.4 Note [d]). Consider the following series:

John will send you a memo. [1]
Pat hopes (that) John will send you a memo. [2]
I will read the memo (which) Pat hopes (that) John will send you. [3]

In [3], the relative pronoun *which* is object in the relative clause *which ... John will send you*. When, however, a relative pronoun is subject under analogous conditions, the conjunction *that*, which remained optional in [3], is obligatorily absent in [3a]:

A memo will be sent to you. [1a]
Pat hopes (that) a memo will be sent to you. [2a]
I will read the memo (which) Pat { hopes will
*hopes that will } be sent to you. [3a]

Since verbs in nominal clauses may be nonfinite or absent, variations in structure can be very considerable. Related to [4–6] we have the noun phrases [4a–6a]:

We thought { (that) the boy was honest. [4]
the boy to be honest. <rather rare> [5]
the boy honest. [6]
the boy (that) we thought { was honest [4a]
to be honest [5a]
honest [6a]

Nonfinite and verbless postmodification is less acceptable when the adjective is 'temporary' (cf 17.7):

The boy (that) we thought { was ready [4b]
?to be ready [5b]
?ready [6b] } is not, after all.

Clause embedding in postmodification can sometimes result in anacoluthon through the insertion of the personal pronoun, especially in speech (cf 11.14ff on *wh*-questions):

?*I'm going to a party *that* I don't know when it will end. [7]
?*The computer *which* you said you would teach me how it works has now arrived. [8]
?*There is in this country a trend *which* I don't know how strong it is towards a disintegration of the traditional party system. [9]

The relative clauses in [7–9] are deviant since they introduce a double pronominalization of the antecedent (*that* or *which*, *it*), but avoidance of the deviance involves rather radical reorganization, eg:

I'm going to a party { which will end I don't know when. [7a]
and I don't know when it will end. [7b]
The computer { which you said you would teach me how to use has now arrived. [8a]
the operation of which you said you would teach me has now arrived. [8b]
There is in this { which I don't know the strength of ... [9a]
country a trend of which I don't know the strength ... [9b]
whose strength I don't know ... [9c]

Note [a] There is no problem, of course, if the clauses concerned are made paratactic:

I'm going to a party; I don't know when it will end. [7c]
The computer has arrived; you said you would teach me how it works. [8c]
There is in this country a trend towards a disintegration of the traditional party system; I don't know how strong it is. [9d]

[b] Confusion of the finite with the nonfinite forms of embedded clause produces hypercorrect deviant sentences (cf 6.35 Note [a]) like [10]:

*That is the man *whom* we thought was not coming. (Cf: That is the man *whom* we thought to be difficult.) [10]

Relative clauses may be complicated more than we have illustrated so far, though one tends to avoid multiple embeddings with successive 'pushdown' clauses:

?I have read the book *which* you thought I had asked John whether he would lend me. [11]

In [12], the use of *whom* may seem odd:

... this Lady Macbeth is lumbered with such an alarming husband whom Harold Carter plays ... on the brink of madness. [12]

The reason may be that the actor actually plays the *part* of the husband. However, the following construction [12a] may have been consciously avoided as being awkward and too heavy (and hardly necessary anyway):

... an alarming husband { whose part
which part } Harold Carter plays ... [12a]

[c] There are also signs that relative clauses, by involving transposition of lexical items, weaken the ties between lexical items and their appropriate complement-forming prepositions. Even reputable newspapers will occasionally print sentences like [13]:

The authorities, against whom increasing numbers of refugees are fleeing across the sea, have not changed their policy. [13]
 Although the oddity of the construction may well pass unnoticed by journalist and reader alike, neither would have accepted the verb + preposition sequence in [13a]: [13a]
 *The refugees are fleeing against the authorities.

- 17.64 Even with simpler examples and more careful ordering, we may find clarity and acceptable grammar difficult to maintain in multiple modification. An example:

She recalled the smiles of delight on all the faces. [1]

A noun phrase based on sentence [1] and having *smiles* as its head may be ambiguous in one ordering (Was it the smiles or the faces that she recalled?):

the smiles of delight on all the faces that she recalled [1a]

Another ordering [1b] may be grammatically awkward, since it introduces discontinuity (cf 17.122) to avoid ambiguity:

?the smiles that she recalled of delight on all the faces [1b]

When we go on from this same sentence to attempt a noun phrase which has *faces* or *delight* as head, the problems increase:

?all the faces that she recalled the smiles of delight on [1c]

One solution to this problem is to replace the relative clause by a construction with preposition + *-ing* participle clause (although the subject then has to be merely implicit):

On recalling the smiles of delight on all the faces (she was reminded of birthday parties in her own childhood). [1d]

Note The objection in [1c] is not merely to the final preposition (cf 17.16), as is shown by the awkwardness also of [1e]:

?all the faces on which she recalled the smiles of delight [1e]

Noun phrases with *delight* as head are no less problematic:

?the delight that she recalled the smiles of on all the faces [1f]

*the delight of which she recalled the smiles on all the faces [1g]

*the delight on all the faces that she recalled the smiles of [1h]

*delight on all the faces { of which she recalled the smiles } [1i]
 whose smiles she recalled

All these examples, however, involve discontinuous structures, which will be discussed in 17.122 and 18.39.

Apposition

The nature of apposition

- 17.65 In 17.26 we looked at appositive postmodification by *that*-clauses, in 17.35 at appositive nonfinite clauses, and in 17.47 at appositive prepositional phrases. We now consider the nature of apposition itself. Apposition is primarily, and

typically, a relation between noun phrases, and this is the reason for treating apposition in this chapter.

For linguistic units to be APPOSITIVES, *ie* in apposition, they must normally be identical in reference. Thus in [1], *Anna* and *my best friend* are coreferential, and similarly, in [2], *Paul Jones* and *the distinguished art critic* refer to the same person:

Anna, my best friend, was here last night. [1]

Paul Jones, the distinguished art critic, died in his sleep last night. [2]

Alternatively, the reference of one must be included in the reference of the other, *eg* [3], where *a neighbour* is identified as *Fred Brick*:

A neighbour, Fred Brick, is on the telephone. [3]

The relationship denoted by apposition is therefore analogous to a copular relationship (cf 2.16):

Paul Jones was the distinguished art critic. [2a]

Fred Brick is a neighbour. [3a]

Such examples of apposition may be compared with nonrestrictive postmodification, in particular nonrestrictive relative clauses:

Anna, who is my best friend, was here last night. [1a]

The noun phrase *my best friend* in [1] may be considered to be a reduction of the relative clause in [1a]. Indeed, some grammarians have included nonrestrictive relative clauses among appositives. Presumably this assignment is motivated

- by the frequent possibility of expanding a second appositive into a relative clause;
- by the loose attachment of the nonrestrictive relative clause to the sentence; and
- by the requirement for coreference between the *wh*-word in the clause and an antecedent noun phrase.

However, in this grammar we make a distinction between a noun phrase with its relative clause and apposition, the latter being primarily a relation between two noun phrases. One reason for this is that, unlike relative clauses where a relative pronoun is an element or constituent in the clause (cf 17.10), apposition has no such item. The similarity between nonrestrictive relative clauses and apposition is in fact limited to relative clauses of the *SVC* type that have a noun phrase as complement, as in [1a]. There is no appositional construction [4a] parallel to clauses like [4] (cf 17.22):

Here is a letter from John, *who wants a job in London*. [4]

*Here is a letter from John, *a job in London*. [4a]

Thus, apposition differs from relative clauses in that it involves the linking of units of the same rank.

Apposition resembles coordination (cf 13.1ff) in that not only do coordinate constructions also involve the linking of units of the same rank, but the

central coordinators *and* and *or* may themselves occasionally be used as explicit markers of apposition (cf 13.22ff).

Full and partial apposition

- 17.66 Grammars vary in the freedom with which they apply the term 'apposition' even in the quite specific sense adopted here. Some have restricted it more narrowly to cases where the following conditions are met:

- (i) Each of the appositives can be separately omitted without affecting the acceptability of the sentence.
- (ii) Each fulfils the same syntactic function in the resultant sentences.
- (iii) It can be assumed that there is no difference between the original sentence and either of the resultant sentences in extralinguistic reference.

For example, by omitting each appositive in turn from [1] we obtain the two sentences [1a] and [1b]:

- A neighbour, Fred Brick, is on the telephone.* [1]
A neighbour is on the telephone. [1a]
Fred Brick is on the telephone. [1b]

The apposition in [1] meets the three conditions:

- (i) The resultant sentences are acceptable.
- (ii) Both noun phrases are subject of their sentence.
- (iii) Since *Fred Brick* and *a neighbour* are coreferential in [1], we can assume the reference of the two resultant sentences to be the same.

Apposition meeting these three conditions we term FULL APPPOSITION.

On the other hand, we cannot exclude consideration of sequences which resemble such full apposition but nonetheless do not meet these three conditions entirely. If condition (i) alone is unfulfilled, the difference from full apposition is comparatively trivial. For example, from [2] only the second appositive can be omitted, as in [2a]:

- An unusual present was given to him for his birthday, a book on ethics.* [2]
An unusual present was given to him for his birthday. [2a]

Omission of the first appositive results in an unacceptable sentence [2b], unless we reposition it initially [2c]:

- *Was given to him for his birthday, a book on ethics.* [2b]
A book on ethics was given to him for his birthday. [2c]

The type of partial apposition where the position of the appositive is the sole difference might be considered 'discontinuous full apposition'.

Condition (ii) is not met in [3]:

- Norman Jones, at one time a law student, wrote several best-sellers.* [3]

Norman Jones is subject in [3a], but *at one time a law student* cannot be subject in [3b]:

- Norman Jones wrote several best-sellers.* [3a]

- *At one time a law student wrote several best-sellers.* [3b]

However, the prepositional phrase may precede the subject in adverbial function with the same meaning as [3]:

- At one time a law student, Jones/he wrote . . .* [3c]

The pair [3] and [3c] illustrate the general feature of grammar that a paraphrase relation often obtains between structures that are viewed as grammatically different.

Finally, condition (iii) is not met in [4]:

- The reason he gave, that he didn't notice the car till too late, is unsatisfactory.* [4]

We can omit each of the appositives in turn, and each fulfils the function of subject in the resultant sentences:

- The reason he gave is unsatisfactory.* [4a]
That he didn't notice the car till too late is unsatisfactory. [4b]

However, [4b] is different from both [4] and [4a] since it does not assert that a particular reason is unsatisfactory but that a particular fact is unsatisfactory:

- (The fact) that he didn't notice the car till too late is unsatisfactory.*

To designate the structures in [2], [3], and [4], we use the general term PARTIAL APPPOSITION.

Note Coreferential relationships where the units fulfil distinctly different syntactic functions are not considered to be appositional, eg:

John washed himself. [subject + object of pronoun, cf 6.23ff]

Jane likes her own car best. [subject + determiner, cf 5.10ff]

Susan does whatever she wants. [subject + subject of embedded clause, cf 14.4ff]

Strict and weak apposition

- 17.67 The appositives may belong to the same general syntactic class (eg the central type noun phrase + noun phrase), as in [1]:

- Football, his only interest in life, has brought him many friends.* [1]

In such a case we term the construction STRICT APPPOSITION.

On the other hand, appositives from different syntactic classes are said to be in WEAK APPPOSITION (cf 17.92), for example, noun phrase + -ing-clause in [2]:

- His only interest in life, playing football, has brought him many friends.* [2]

Nonrestrictive and restrictive apposition

- 17.68 Apposition may be NONRESTRICTIVE or RESTRICTIVE (cf 17.3ff). So far, all our examples have shown nonrestrictive apposition. The appositives in nonrestrictive apposition are in separate information units (cf 18.3ff). This fact is indicated, in speech, by their inclusion in separate tone units (cf App II.16ff);

in writing, by their separation by commas or heavier punctuation. For example, the apposition is nonrestrictive in [1] but restrictive in [1a]:

- Mr Campbell, a lawyer*, was here last night. [1]
Mr Campbell the lawyer was here last night. [*ie* Mr Campbell the lawyer as opposed to any other Mr Campbell we know] [1a]

In nonrestrictive apposition, the two appositive units contribute relatively independent information, with the first appositive acting as the DEFINED expression, and the second appositive having a DEFINING role ('the definer'). The defining role is reflected in the fact that the second appositive is marked as parenthetical by punctuation [2] or intonation [2a]:

- The President of the company*, Mrs Louise Parsons, gave a press conference after the board meeting. [2]
 The [PR]E[sident of the company] [Mrs Louise P]AR[sons] [gave a press conference after the B]OARD meeting [2a]

In [2] and [2a], *the President of the company* is the defined and *Mrs Louise Parsons* the defining expression. On the other hand, in [2b], the roles are reversed:

- Mrs Louise Parsons, the President of the company*, gave a press conference after the board meeting. [2b]

In [2b], *Mrs Louise Parsons* is the defined expression, and *the President of the company* the defining expression, the latter constituting a separate information unit.

Note [a] The first (*ie* defined) appositive determines concord:

Land, brains, wealth, technology – in other words *everything we need* – {*are* / *is*} plentiful in our country.

Everything we need – *land, brains, wealth, technology* – {*is* / *are*} plentiful in our country.

[b] A defining appositive is not the same as a tag exclamation (*cf* 18.59 Note [a]). An aside such as *the utter fool* in [3] is an irregular insertion and can come anywhere in the sentence:

- John (*the utter fool*) insisted on staying with them. [3]
 Compare an interpolation such as in [3a]:
 John (*can you believe it?*) insisted on staying with them. [3a]
 The difference between the two constructions is highlighted in the ambiguity of [4]:
 Richard (*the villain*) forced his sister into marriage. [4]

In one interpretation, *the villain* is intended as a critical term, 'the bad character in the play', and is appositive to *Richard*; in the other interpretation, it is an evaluative comment synonymous with 'the wicked man', and is an exclamatory aside. The two interpretations can be distinguished intonationally:

- Apposition:
 [R]ichard [the v]i[l]lain [forced his sister into m]arriage [4a]
 Exclamatory aside:
 [R]ichard the v[i]l[ain] [forced his sister into m]arriage [4b]

The aside in [4b], as well as being in the same tone unit as *Richard*, is also marked by a lowering of its pitch relative to that of the rest of the sentence.

[c] The most common type of separator used in delimiting a nonrestrictive apposition in writing is the comma; but dashes or parentheses are also used (as they are for other types of parenthetical items, *cf* App III.16ff):

- Only one person {*Susan Long*,
 – *Susan Long* – } voted against me.
 (*Susan Long*)

Defined/defining relationships

- 17.69 When apposition is full apposition (*cf* 17.66), it may not be clear which of the appositives is the defining one:

- My friend Anna* was here last night. [full + strict] [1]
The question whether to confess or not troubled the girl. [full + weak] [2]

In partial restrictive apposition, on the other hand, one of the appositives is definer of the other. In [3], the definer is *financial expert*:

- Next Saturday, *financial expert Tom Timber* will begin writing a weekly column on the national economy. [partial + strict] [3]

(On the stylistic aspect of this example, *cf* 17.88.) Similarly, in [4], the definer is *that he couldn't see the car*:

- The explanation that he couldn't see the car* is unsatisfactory. [partial + weak] [4]

The syntactically subordinate role of one of the appositives is clear with partial apposition, since only the definer can be omitted (*cf* 17.66).

Combinations of appositional types

- 17.70 The three types of distinction we have made apply in combination, as illustrated below:

APPOSITION	{ full	[either omissible]
	{ partial	[only one omissible]
	{ strict	[same syntactic class]
	{ weak	[different syntactic class]
	{ nonrestrictive	[different information unit]
	{ restrictive	[same information unit]

(i) FULL, STRICT, NONRESTRICTIVE

Paul Jones, the distinguished art critic, died in his sleep last night.

(ii) FULL, WEAK, NONRESTRICTIVE

Playing football, his only interest in life, has brought him many friends.

(iii) FULL, STRICT, RESTRICTIVE

My friend Anna was here last night.

(iv) FULL, WEAK, RESTRICTIVE

The question whether to confess or not troubled the girl.

(v) PARTIAL, STRICT, NONRESTRICTIVE

An unusual present was given to him for his birthday, *a book on ethics*.

(vi) PARTIAL, WEAK, NONRESTRICTIVE

His explanation, that he couldn't see the car, is unsatisfactory.

(vii) PARTIAL, STRICT, RESTRICTIVE

Next Saturday, *financial expert Tom Timber* will begin writing a weekly column on the national economy. [typical of journalistic style]

(viii) PARTIAL, WEAK, RESTRICTIVE

His claim that he couldn't see the car was unconvincing.

More than two units in apposition

- 17.71 Though we have found it convenient to exemplify apposition with merely two appositives, there may occasionally be more than two units in apposition at the same level, as in [1]:

They returned to *their birthplace, their place of residence, the country of which they were citizens.* [1]

In [1], there seems to be no reason for combining any two of the noun phrases as one unit in the appositional relationship. On the other hand, we often find cases in which two or more noun phrases function as one appositive:

She had a *splendid vacation: a Mediterranean cruise and a trip to the Bahamas.* [2]

In this case, the coordinated noun phrases are together appositional to the general term *a splendid vacation* in relation to which *a Mediterranean cruise* and *a trip to the Bahamas* are the particulars. But the units functioning as a single appositive need not be coordinated by *and*:

We have *everything we need: land, brains, wealth, (and) technology.* [3]

In [3], the second appositive is an asyndetic series of juxtaposed units which, taken together, are included under the general first appositional unit *everything we need*. There is yet another possibility: a hierarchy of appositional relationships, as indicated here by bracketing:

We now find [*a new type of student: [the revolutionary - [the radical bent on changing the system and the anarchist bent on destroying it]]]*.] [4]

A new type of student is the first appositive, while all that follows it in the sentence constitutes the second appositive. But within the second appositive there is further apposition: *the revolutionary* is the first appositive, while what follows in the sentence is appositive to it.

Ambiguity between apposition and other constructions

- 17.72 In 17.68 we noted the use of intonation and punctuation separation for the appositive in nonrestrictive apposition. Where the lexical items and syntactic construction allow for potential ambiguity, intonation or punctuation separation may or may not resolve the ambiguity. The pair of noun phrases in [1] is interpreted as indirect object and direct object, respectively, synonymous with [1a]:

They sent *Joan a waitress from the hotel.* [1]
They sent *a waitress from the hotel to Joan.* [1a]

On the other hand, the pair in [2] is interpreted as direct object and object complement, respectively, synonymous with [2a]:

They considered *Miss Hartley a very good teacher.* [2]
They considered *Miss Hartley to be a very good teacher.* [2a]

However, if the second noun phrase in each sentence is separated from what precedes by a tone unit boundary in spoken English or by a comma in written English, then the interpretation is weighted in favour of taking the first noun phrase as direct object with the second noun phrase in apposition to it:

They sent *Joan, a waitress from the hotel.*
['They sent Joan (who was a waitress from the hotel).'] [1b]
They considered *Miss Hartley, a very good teacher.*
['They considered Miss Hartley (who was a very good teacher).'] [2b]

Explicit indicators of apposition

- 17.73 Numerous expressions are available for explicitly indicating nonrestrictive apposition. They can be inserted between appositives, for example *namely* in [1]:

How can a solution be found to the current disease of contemporary society, *namely* the international economic crisis? [1]

If we add an explicit indicator of apposition such as *namely*, *that is*, *ie*, we do not regard this as changing full apposition into partial apposition, even though the presence of the indicator may affect the ability of the construction to meet the conditions for full apposition (cf 17.66).

The indicators express certain semantic relationships between the appositives, and therefore cannot be used for all cases of apposition. Some, however, have the same semantic function, though they may be associated with different varieties of the language. Common indicators are listed below, those marking the same, or similar, relationship being grouped together (cf 8.137):

that is to say, that is, ie <formal and written>
namely, viz <formal and written>
to wit <formal, esp legal>
in other words
or, or rather, or better
and
as follows
for example, for instance, eg <formal and written>, *say, including, included, such as*
especially, particularly, in particular, notably, chiefly, mainly, mostly
of

Some of these indicators either precede or (less commonly) follow the second appositive: *that is, that is to say, for example, for instance, in particular, in other words*:

Dickens's most productive period, *{ that is (to say) the 1840s, }* was a time when public demand for fiction was growing at a tremendous rate.

But other indicators can only precede the second appositive: *namely, and, or, or rather, or better, as follows, including, such as, of*; and the abbreviated forms *ie, viz, eg*. *Included* can only follow the second appositive (cf 9.8):

Many people, {including my sister,
my sister included,} won't forgive him for that.

The scale of strict nonrestrictive apposition

- 17.74 In addition to the relationships we have subsumed so far under our definition of apposition, we recognize a semantic scale running from equivalence (*ie* 'most appositive') to loose and unequal relationship ('least appositive'), such as exemplification. These semantic relationships are illustrated in Fig 17.74:

Fig 17.74 A scale of semantic relationships in strict nonrestrictive noun-phrase apposition

Of the three major semantic types (equivalence, attribution, and inclusion), inclusion is the most peripheral to the concept of apposition, in that this construction alone requires an indicator, such as *particularly* in [3]. Compare:

- My best friend*, (that is to say) *Anna*, was here last night. [1]
The house, (which is) *an imposing building*, dominates the street. [2]
 The children liked *the animals*, particularly *the monkeys*. [3]

On the other hand, equivalence is the only type that allows either order of the appositives, as in [1] and [1a]:

- Anna*, that is to say *my best friend*, ... [1a]
 **An imposing building*, which is *the house*, dominates the street. [2a]
 *The children liked *the monkeys*, particularly *the animals*. [3a]

Thus, in terms of these two criteria, the scale from 'most to least appositive' is in the order equivalence → attribution → inclusion.

Appositive-like relations exist also between other units than noun phrases, such as clauses [4], predications [5], and adjectives [6]:

- Although she was reluctant, although she felt an understandable hesitation*, she eventually agreed. [4]
 They had *summoned help* – *called the police and fire brigade*. [5]
 She is *better*, *very much better*, than she used to be. [6]

However, to talk about apposition of units other than noun phrases makes the concept of apposition too weak. Such apposition-like constructions will be treated as exceptional.

(A) Equivalence

- 17.75 Appositives in an equivalence relationship allow the insertion of *that is (to say)* and, less commonly, of *in other words*. As Fig 17.74 shows, there are four

types of equivalence relationship: appellation, identification, designation, and reformulation. The types can be partly differentiated by the different optional indicators they admit.

(Ai) Appellation

- 17.76 With APPELLATION, *ie* a 'naming relation', both appositional noun phrases are definite, and the second is typically a proper noun. The second appositive is more specific than the first, and hence the use of *namely*, an indicator that introduces a more specific appositive. *Or* is less commonly used than the other indicators, *that is (to say)* and *in other words*:

- The company commander*, that is to say *Captain Madison*, assembled his men and announced their mission. [1]
My best friend, in other words *Anna*, was here last night. [2]
My best friend was here last night – *Anna*. [3]

Sentence [3] is an example of partial apposition.

There is a one-to-one correspondence between the references of the two appositives with appellation. The second appositive can be replaced by a corresponding relative clause:

- The company commander*, who is *Captain Madison*, assembled his men and announced their mission. [1a]

(Aii) Identification

- 17.77 With IDENTIFICATION, the first appositive is typically an indefinite noun phrase and the second appositive is more specific. Hence the optional relator *namely* may be inserted. If we make the first appositive of [1] in 17.76 indefinite, we now have identification:

- A company commander*, (namely) *Captain Madison*, assembled his men and announced their mission. [1b]

In [1b] there is no longer a one-to-one correspondence, as there was with [1]. The second appositive identifies what is referred to in the first appositive. A similar relationship obtains if the first appositive is, or contains, a pro-form coreferring to the second appositive:

- We* – that is to say *John and I* – intend to resign. [2]
 She still enjoys *such books*: *science fiction, detective stories, historical novels*. [3]
 We have *everything we need*: *land, brains, wealth, technology*. [4]

In partial apposition, the second appositive may be preceded by a colon as a graphological indicator of identification, as in [3], [4], and [5]:

- An unusual present* was given to him for his birthday: *a book on ethics*. [5]

Note There are other grammatical constructions which are somewhat similar to apposition in meaning. Compare examples [3] and [4] with, respectively, the correlative *such ... as* in [3a] and the complex preposition in [4a]:

- She still enjoys *such books as* science fiction ... [3a]
 We have everything we need *in the way of* land, brains, ... [4a]

Postponed and anticipated identification

- 17.78 As a special subtype of identification, we might consider the phenomenon of 'postponed' and 'anticipated' identification.

Postponed identification involves placing a pro-form earlier in the sentence while the noun phrase to which it refers is placed finally as an amplificatory tag (cf 18.59). This construction, which is sometimes termed 'right dislocation', is restricted to informal spoken English, where it is very common:

He's a complete idiot, that brother of yours. [1]

Such utterances are usually spoken with divided focus (cf 18.17), with a rise on the 'tag' confirming its 'given' status:

It went on far too LONG! [your GAME] [2]

In informal spoken English we also have the reverse process, 'anticipated identification' (also called 'left dislocation'), where a noun phrase is positioned initially and a reinforcing pronoun stands 'proxy' for it in the relevant position in the sentence:

Your friend John, I saw him here last night. [3]

That play, it was terrible. [4]

- Note [a] In even more informal style, the operator is sometimes included with postponed identification (cf 18.58):

It went on far too long, your game did. [2a]

In some dialects, there may be inversion when the verb is *be*:

He's a complete idiot, {John is. / is John.} [1a]

- [b] In the following sentences, postponed identification in [5] contrasts in intonation and article usage with apposition in [6], where the definite article may be zero:

He's [had a lot of bad LÜCK] the [new MECHANIC] [5]

He's [had a lot of bad LÜCK] (the) poor man [6]

(Aiii) Designation

- 17.79 DESIGNATION is the converse of appellation and identification. The second appositive is less specific than the first, and hence the optional insertions cannot include the indicator *namely*. Both appositives are commonly definite noun phrases:

Captain Madison, (that is to say) the company commander,
assembled his men and announced their mission. [1]

Anna, (that is to say) my best friend, was here last night. [2]

Land, brains, wealth, technology – in other words everything we
need – are plentiful in our country. [3]

He sent ahead the sergeant, in other words the most experienced
scout in the company. [4]

Replacement of the second appositive by a corresponding relative clause is possible:

He sent ahead the sergeant, who was the most experienced scout in
the company. [4a]

Designation may also include matching indefinite noun phrases:

We are using Sirius – a new microcomputer with a large memory. [5]

Examples of partial apposition:

Anna was here last night, my best friend. [2a]

Have some Harveys with your Christmas *the most distinguished*
sherries you can buy. [6]

(Aiv) Reformulation

- 17.80 REFORMULATION is a rewording in the second (defining) appositive of the lexical content of the first (defined) appositive. Four groups of reformulation may be distinguished:

- (a) Reformulation based on linguistic knowledge
- (b) Reformulation based on factual knowledge
- (c) More precise formulation
- (d) Revision

(a) Reformulation based on linguistic knowledge

In reformulation based on linguistic knowledge, the defining appositive is a synonymous expression:

This is what is sometimes referred to as an intentional
terminological inexactitude, in other words a lie. [1]

Sound units of the language, technically phonemes, are usually
surrounded by slant lines: /p/. [2]

You should have consulted an ophthalmologist, that is (to say) an
eye doctor. [3]

A synonymous word or phrase may replace the first formulation in order to avoid misinterpretation or provide a more familiar or a more technical term. In addition to the markers it shares with other types of reformulation (in particular *or*), this type admits a large range of expressions that specifically mark linguistic reformulation (cf 8.89, 8.137), eg:

<i>(more) simply</i>	<i>in more difficult language</i>
<i>in simple(r) words</i>	<i>in scientific terminology</i>
<i>in simple(r) terms</i>	<i>in more technical terms</i>
<i>put (more) simply</i>	<i>technically (speaking)</i>
<i>to put it (more) simply</i>	<i>in words of one syllable</i>

Partial apposition involving linguistic reformulation includes translations from foreign languages: "*savoir* ('know' in English)".

(b) Reformulation based on factual knowledge

In this group, the reformulation is based less on linguistic knowledge than on knowledge about the external world:

Fred – or Ginger as he is usually called – ... [4]

The Nordic countries, or Denmark, Finland, Iceland, Norway,
Sweden, ... [5]

The United States of America, or America for short, ... [6]

The distinction between linguistic and factual knowledge is not absolute as, for example, in:

Alligator pears, or *avocados* as they are usually called, . . . [7]

It can be argued that it is our knowledge of the external world that is responsible for our awareness of the greater frequency of the synonymous *avocados* in [7].

Reformulation can also be negative, *ie* the modifying appositive is not a synonymous expression:

You should have consulted *an ophthalmologist*, *not* (that is) *an optician*, for your eyes. [3a]

Without context, such a sentence as the following is potentially ambiguous in writing:

Anna Wilson, *not my best friend*, voted against me. [8]

It either has a negative appositive meaning, 'Anna Wilson, who happens not to be my best friend, . . .' or a denial sense (*cf* 10.66): 'It was Anna Wilson who voted against me, not the other person'.

(c) More precise formulation

This type conveys a more precise reformulation, or a correction in the defining appositive of what was said in the first appositive:

They started going to *the church*, *the Catholic Church*. [9]

But the intention may be rhetorical (as indeed in [9]) to provide a climactic effect by repetition and expansion of the first noun phrase:

You could cut the atmosphere with *a knife*, *a blunt knife* at that. [10]

At that attached to the end of the modifying appositive in [10] is an explicit marker of rhetorical intention. When it is present, *and* can be inserted (*cf* appended coordination, 13.94; coordinative apposition, 10.39):

You could cut the atmosphere with *a knife*, *and a blunt knife* at that. [10a]

Perhaps under this type of reformulation we should include other instances of more precise formulation, some of which do not involve repetition but which have a constraining and antithetical force:

<i>this and just this</i>	<i>these and these alone</i>
<i>the women and only the women</i>	<i>those and no others</i>
<i>then and not before</i>	

(d) Revision

Under this heading we may include the form of 'editing' or 'self-correction' that is typical of impromptu spoken English where execution and planning, at least to some extent, take place simultaneously. Such editing is of course not limited to noun phrases. We may distinguish some different types:

'Reference editing' by the use of *that is* (*to say*) as in:

His party controls *London*, *Greater London* that is to say. [11]

This type is very similar to the previous one in [9], in providing more precise information. It is used when the speaker wants to achieve greater accuracy and precision.

'Nuance editing' by the use of *or rather* before a substituted expression, as in:

She puts such *vitality* (*or rather virility*) into her play. [12]

'Mistake editing' by the use of *I mean* in order to correct a phonological or semantic mistake (which is common enough in impromptu speech), *eg*:

The thirst thing, I mean *the first thing* to remember is that . . . [13]

Then you add *the peaches* – I mean, *the apricots* . . . [14]

'Claim editing' by the use of *well* when a speaker wants to modify a claim he finds excessive, *eg*:

All families, well (at least) *those who can afford to*, will be going away for their holiday. [15]

(B) Attribution

- 17.81 Attribution involves predication rather than equivalence, and the equivalence indicators *that is* (*to say*) and *in other words* are not admitted. On the other hand, we can replace the defining appositive by a corresponding nonrestrictive relative clause. The defining appositive is commonly an indefinite noun phrase:

Captain Madison, *a company commander*, assembled his men and announced their mission.

The house, *an imposing building*, dominates the street.

Ron Pall, *a blatant liar*, claimed that he had won first prize.

But the defining appositive can also be definite, with cataphoric *the* introducing a definite description (*cf* 5.32):

He introduced me to *the young woman*, *the heir to a fortune*.

Many students, *the cream of the school*, died in the war.

'I don't know what I would have done if I had seen him', exclaimed

Mary, *the prey of violent and obscure emotions*.

Defining appositive with article omitted

- 17.82 In a type of partial apposition expressing attribution (particularly a unique role), an article (definite or indefinite) is absent from the defining appositive (*cf* 5.42):

Mary Cordwell, *25-year-old singer on television shows*, is being invited to the reception. [1]

The omission of the article is optional in the defining appositive which may be seen as a reduced relative clause:

Robinson, (who is) *(the) leader of the Democratic group on the committee*, refused to answer questions. [2]

Note [a] The omission of the article is one of the devices used in headlines, where a sentence such as [2a] would not be unusual:

Democratic leader refuses to answer questions. [2a]

[b] If the defining appositive is short enough, it can be preposed in restrictive apposition (cf 17.68, 17.88):

Democratic leader Robinson refused to answer questions. [2b]

25-year-old television singer Mary Cordwell is being invited to the reception. [1a]

This usage is generally associated with the journalistic style of magazines, especially in AmE. It is to be distinguished from cases where the first element is an official title, e.g. *Vice-President Durney*, though, here too, their use is commoner in AmE than BrE; thus *Secretary of State Smith* (but hardly *Foreign Secretary Brown*).

The relation of apposition to verbless adverbial clause

- 17.83 An adverbial (*then, obviously, also, normally*, etc) that is an element in a verbless clause may occur with the defining appositive:

Norman Jones, *then a student*, wrote several best-sellers.

Your brother, *obviously an expert on English grammar*, is highly praised in the book I'm reading.

They elected as chairman Edna Jones, *also a Cambridge graduate*.

Jones and Peters, *both of unknown address*, were charged with the murder of Williamson.

At the entrance there are two pillars, *one on each side*.

A somewhat different construction is where the defining appositive is a verbless clause comprising the structure subject + complement:

The two men, *one a Norwegian and the other a Dane*, were awarded medals. [1]

In each case, the participle *being* can be inserted between the two internal constituents of the defining appositive:

The two men, *one (being) a Norwegian and the other (being) a Dane* . . . [1a]

They can also be seen as reduced relative clauses:

The two men, *one (of whom was) a Norwegian and the other (of whom was) a Dane*, . . . [1b]

Defining appositive with adverbial

- 17.84 An attribution appositive is to be distinguished from a verbless adverbial clause. Verbless adverbial clauses (cf 14.9) often occur initially and are characteristically interpreted as concessive or causal:

An even-tempered man, Paul nevertheless became extremely angry when he heard what had happened. [1]

The heir to a fortune, her friend did not care about passing examinations. [2]

The verbless clause in [1] is interpreted as concessive: 'Though he was an even-tempered man'. (Notice that *nevertheless* refers back to the content of the initial clause: 'in spite of his being an even-tempered man'.) The verbless clause in [2], on the other hand, is interpreted as causal: 'Since she was the heir to a fortune'. These constructions differ from identification apposition (cf 17.77) in that, when they occur initially, the second noun phrase is the

subject of the sentence, and is not marked off from the predicate by intonation or punctuation separation.

However, the verbless adverbial clause can occur after the subject and is then, like apposition, marked off by intonation or punctuation:

Her friend, the heir to a fortune, did not care about passing examinations. [2a]

Bob Rand, a notorious burglar, found it easy to force open the lock. [3]

In such cases, the lexical content of the sentence suggests the more probable interpretation. For example in [4], *a blatant liar* can be interpreted as a (verbless) adverbial causal clause, since it is reasonable to ascribe the expulsion to Pall's being a blatant liar:

Ron Pall, a blatant liar, was expelled from the group. [4]

In [4a], on the other hand, *a blatant liar* would normally be understood as a case of apposition:

Ron Pall, a blatant liar, used to be in my class at school. [4a]

In [4a], there is no motivation for assuming that Pall's presence in the class had anything to do with his being a blatant liar. If, however, the order of the appositives were reversed [4b], one would assume that there is such a causal or explanatory intention:

A blatant liar, Ron Pall, used to be in my class at school. [4b]

(C) Inclusion

- 17.85 Inclusion applies to cases of apposition where the reference of the first (defined) appositive is not identical with that of the second (defining), but rather includes it. The inclusion relationship applies only to partial apposition since the omission of the first appositive brings about a radical semantic change.

There are two types of inclusion: (i) exemplification, and (ii) particularization. Exemplification need not be indicated by explicit relators, while particularization must have them (cf 8.116).

(Ci) Exemplification

- 17.86 In EXEMPLIFICATION, the second appositive exemplifies the reference of the more general term in the first appositive:

They visited *several cities*, for example *Rome and Athens*.

His excuses, such as *the breakdown of his car*, never seemed plausible.

Many people, including *my sister*, won't forgive him for that.

The explicit indicators of exemplification apposition are those in the group headed by *for example* in 17.73.

Sometimes there may be ambiguity between exemplification and identification (cf 17.77) if no indicator is present:

Famous men – *Henry James, Gandhi, Saul Bellow* – have visited this university.

Presumably the men referred to in the second appositive are not the only famous men to visit the university, but are mentioned as examples of such visitors (*ie* the list of names is open-ended, and is usually marked as such in speech by rising intonation; *cf* asyndetic coordination, 13.1). On the other hand, it is not impossible for the relationship to be interpreted as one of identification (*ie* the list is closed, which is indicated by falling tone). If one of the indicators for identification – namely, *that is (to say)*, in other words, all of which are optional – is inserted, the apposition must be an instance of identification; if the indicators *for example*, *for instance*, *eg*, *say*, or *including* are inserted (which is the norm), then we have an unambiguous case of exemplification.

- Note We should perhaps include here instances like the following, where a numeral or quantifier in the second appositive indicates the inclusion:
- The two men, one a Dane, were awarded medals.*
The soldiers, some drunk, started fighting each other.
Several sailors, one looking like someone I know, stepped up to the bar.

(Cii) Particularization

- 17.87 PARTICULARIZATION is the marked form of inclusion and requires an explicit indicator which shows that the particularization has been chosen because it is in some way prominent:

The book contains *some fascinating passages*, notably *an account of their trip to North Africa*.
 The children liked *the animals*, particularly *the monkeys*.
 We want to invite *a number of friends*, especially *Joan and Betty*.

Other indicators of particularization are *in particular*, *chiefly*, *mainly*, and *mostly*.

Strict restrictive apposition

- 17.88 There are three types of strict restrictive apposition of noun phrases. In type (a), the first appositive is preceded by a definite determiner (and possibly premodifier) and is more general than the second appositive:

that famous critic Paul Jones	the number three
the soprano Janet Baker	the year 2000
the novel 'Great Expectations'	your brother George

The type *friend Anna* usually implies criticism:

Our friend Anna here doesn't think so, however.

Type (b) is the reverse of (a), *ie* the second appositive is preceded by the determiner *the*, and is more general than the first:

Paul Jones the critic	Thompson the plumber
Janet Baker the soprano	Wright the lawyer

Type (c) is like (a) but with omission of the determiner (*cf* 17.76, 17.82 Note [b]); the examples in the right-hand column are especially AmE:

Brother George	Soprano Janet Baker <esp AmE>
Farmer Brown	Lawyer Wright <esp AmE>

Type (a) is the most common. Type (c), with omission of the determiner, produces partial apposition, with the first appositive becoming premodifier and resembling a title (*Lord Nelson*, *Mrs Johnson*, etc; *cf* 5.66). Generally, such reduction of the first appositive occurs only when the second is the name of a person. Hence we do not find **novel 'Great Expectations'* or **year 2000*.

Pronouns followed by noun phrases, such as *you girls* (*cf* 10.53), *you British* (*cf* 7.25 Note [c]), and *we men*, can also be analysed as restrictive apposition.

- Note Determiners are regularly omitted in proper noun use, as is observed not only in personal and geographical names, but also in, *eg*:

Operation Abolition, Hurricane Edna, Mission Impossible

Postposed numerals and letters perhaps imply the ellipsis of the words *number* or *letter*:

line (number) 12 room (number) 10A

equation (number) 4 Ward (letter) C

If that is so, the phrases contain appositional constructions, with the number or letter being in apposition to the ellipted word *number* or *letter*, *eg*: *number 10A* ~ *The number is 10A*. We also find premodifying numbers and letters, particularly on signs like *No 2 Platform*, *G Block*. The following constructions are fully acceptable in onomastic use:

Number 3, No 3, <esp AmE> # 3

Ch(apter) 6, Class 2b, Fig(ure) B, Section 10, Table 8, Type A

There is no type (a) with a definite determiner possible in the following use:

Are you in { *Number 103?* [NOT: *the number 103]
 Room 103? [NOT: *the room 103]

Geographical names

- 17.89 Geographical names (*cf* 5.68) merit separate treatment because the proper noun is often preceded or followed by a descriptor (*cf* 5.60) which has an appositive function. Certain names of individual mountains and lakes take *Mount* and *Lake*, respectively, as a title, *ie* type (c) (*cf* 17.88):

Mount Everest	Lake Michigan
Mount Vesuvius	Lake Windermere

We do not prefix them with a determiner. Most other geographical names take a determiner, the general term being preceded by the proper noun as premodifier:

the Atlantic Ocean	the Rocky Mountains
the Mediterranean Sea	the Nile Valley

Some rivers allow either strict apposition type (a) or premodification (*cf* 5.72):

the (River) Rhine/Thames/Seine/Rhône/Nile

New-world rivers have the proper noun before the descriptor:

the { Ohio
 Mississippi } (River)
 Potomac

In names of some districts and a few cities and villages, there is no article and the descriptor comes second. These examples of the 'name first'

construction are especially common and in North America have a restrictive implication, *ie*: *New York City* is distinguished from, for example, *New York State*:

New York City	Milwaukee County
Quebec Province	Dulwich Village

In a name like *Kansas City*, *City* is in fact part of the name and can hardly be omitted. In other cases both orders are possible: *County Cork* or *Cork County* (and other Irish counties).

Instead of type (a) of strict restrictive apposition, the two appositives are more commonly linked by *of*, in which case there is no implication of restrictiveness, for the names of months and for the names of villages, cities, districts, counties, and regions:

the Borough of Camden	the State of Guatemala
the City of Westminster	the Island of Cyprus
the State of Washington	the Continent of Australia

In some cases we have a choice between the forms exemplified in *Washington State* (as distinct from *Washington, D.C.*) and *the State of Washington*. But, in many cases, the former option is not available:

the City of London [not *London City]
the District of Columbia [not: *Columbia District]
the month of December [not: *December month]
the Continent of Africa or the African Continent [not: *Africa Continent]
the Republic of France or the French Republic [not: *France Republic]

Note Books of the Bible normally have the *of*-construction:
the book of Genesis the book of Job
For other uses of the appositive indicator *of*, cf 17.47ff.

Citations

- 17.90 An important use of type (a) of restrictive apposition (cf 17.68) is found with citations and titles of books, films, etc:

the term 'heavy water'
the expression 'do your own thing'

The first appositive is often absent:

(The word) *if* is a conjunction.
(The noun) *men* is an irregular plural in English.
I'm reading (the novel) *Crime and Punishment*.
(The verb) *hiss* expresses by its very sound the meaning it conveys.
The book and the papers is a coordinated noun phrase.

We may assume a weak form of ellipsis (cf 12.38) in such cases, an ellipsis of some general phrase such as *the expression* or *the citation form*, or of an appropriate term in the case of titles, such as *the book*, *the film*, *the play*. Notice the singular number concord with *men* and *the book and the papers* (cf 10.34 Note [c]), which can be explained if we assume the ellipsis of a singular first appositive.

Appositives with names of persons

- 17.91 With names, type (b) of restrictive apposition (cf 17.88) is restricted to cases where the first appositive is the name of a person and the second is the designation of an occupation, relationship, etc: *Bill Johnston the architect*.

In type (c) of restrictive apposition, the first appositive is used as if it were a title in *Architect Johnston* (esp journalistic AmE). This use should be compared with institutionalized titles (cf 5.66):

President Kennedy	Judge Harris (esp AmE)
Dr Smith	Vice-president Johnson (esp AmE)

With appositives, a preposed determiner is normal (type a), along with type (c):

the critic Paul Jones the architect Bill Johnston

But a determiner is not used with titles like *queen* and *professor* unless the noun phrases are modified:

(the present) Queen Elizabeth
(the sprightly) Professor Brown
(the) Mr Porter (who lives next door to you)

With appositives, postposition with *the* (type b), as in *Paul Jones the critic*, is more common than pre-position without *the* (type c), as in *critic Paul Jones* (cf 17.88).

Brown the farmer is perhaps on the borderline in this respect. Since we have *my brother George*, and hence *George my brother*, the in **George the brother* and analogous constructions with family relationships are ruled out, unless the is cataphoric: *George, the brother of James*.

Pre-position is normal for titles, and those phrases that are nearest to being exclusively titles do not allow postposition at all: *Sir John Cartwright, Mr Porter*.

We can now show the gradience from apposition in *critic Paul Jones* to full title in *Mr Porter* with the following examples:

(1)	(2)	(3)
critic Paul Jones (esp journalistic AmE)	Farmer Brown	Brother George
the critic Paul Jones	the farmer Brown	my brother George
Paul Jones the critic	Brown the farmer	?the brother George
the critic	the farmer	*George the brother
*critic [vocative]	*farmer [vocative]	the brother
		brother [vocative]
(4)	(5)	(6)
Professor Brown	Dr Smith [nonmedical]	Mr Porter
*the professor Brown	*the doctor Smith	*the Mr Porter
?Brown the professor	*Smith the doctor	*Porter the mister
the professor	*the doctor	*the mister
Professor [vocative]	Doctor [vocative]	mister [vocative; in nonstandard usage]

Note [a] Most appositive descriptors and titles can be used with a determiner and without the proper noun:

the farmer, the judge, the President, the doctor [when used for a medical practitioner]
But *sir* and *mister* are not used in this way: **the sir*. *The mister* occurs as nonstandard use: 'my husband'; cf *the missus* ['my (or your) wife']. *The Lord* (with a capital *L*) refers to God. On the use of initial capital letter for appositive titles, cf App III.29.

[b] Most titles can be used as vocatives (cf 10.52f) and so can some appositives such as *Farmer* and *Brother*. The title *Miss* is used in the vocative (esp AmE and familiar or nonstandard BrE), but otherwise is generally followed by a name. The accompanying name must be the last name (eg: *Miss Jones* and not *Miss Alice*), except in archaic or minority use (especially southern AmE and old-fashioned BrE).

On the other hand, *sir* when used as a title is followed by the first or full name: *Sir John (Spencer)* and not **Sir Spencer* (cf 5.66 Note [b]). The vocative *sir* (*This way, sir!*) is not an abbreviated form of the title found in *Sir John* but the general polite vocative for address to all adult males. The vocative *mister* occurs only in nonstandard use: *You come here, mister*.

The appositive *Esq* ['Esquire'] is used in BrE, but virtually only in writing (chiefly in addressing letters), and is postposed to a name consisting of a family name with either a first name or initials:

John Porter, Esq or J. Porter, Esq

This is a more formal alternative to:

Mr John Porter or Mr J. Porter or Mr Porter

Mr and *Esq* are not combined: **Mr J. Porter, Esq*. *Esq* cannot occur with surname alone (**Smith, Esq*) nor can it cooccur with other titles (**Sir Sidney Marx, Esq*).

[c] In certain titles, the proper noun is followed by an article and adjective (cf 5.64 Note [b]): *Catherine (the Great)*; or numeral: *Henry VIII* ['the eighth']. In such designations there is occasionally a reordering with the modification preposed:

Pitt the Younger or the Younger Pitt

Weak apposition

17.92 In weak apposition, the appositives come from different syntactic classes (cf 17.67). The optional indicator *namely* may be used if the second appositive is more specific, which is the case when the second appositive is a clause (finite or nonfinite). Normally the noun phrase comes first, as in these instances of full apposition:

She has a problem: namely *should she charge them for the damage or should she forget about it?*

Their solution, namely *to appoint a committee*, is deplorable.

But the clause, particularly if it is a nonfinite clause, can come first:

For them to pay him a commission – his own suggestion – seemed an acceptable idea.

However, it would be more natural to have a relative clause: 'a commission, which was his suggestion . . .'. The second appositive, whether a noun phrase or a clause, can indeed be regarded as a reduced relative clause:

She enjoyed { *her job*, (which was) *teaching English*.
teaching English, (which was) *her job*.

Again, when the first appositive is a nonfinite clause, the relative clause construction would be preferable: ' . . . *teaching English*, which was her job'.

In partial weak apposition between noun phrase and clause, the noun phrase appears first:

His explanation, that is to say *that he couldn't see the car*, is unsatisfactory.

He gave them *the news*: namely *that the troops would be leaving*.

The first appositive cannot be omitted without producing an unacceptable sentence (cf 17.66). *That is* (*to say*) and *namely* are the (optional) indicators for this type of apposition. The clause can be regarded as a reduced relative clause.

The first appositive may be part of the clause:

If the government had known what was going to happen, *it would not have increased credit facilities – a move that accelerated inflation*.

Apposition with general nouns

17.93 Restrictive apposition is common with such general nouns as *the fact*, *the view*, *the question*, *your duty*:

The fact that she wouldn't betray her friends is very much to her credit. [1]

I don't agree with *the view that there is no advantage in being patient*. [2]

The question whether to confess or not troubled her. [3]

Your duty to report the accident takes precedence over everything else. [4]

Finite appositive clauses like [1–2] are further discussed in 17.26f, infinitive clauses like [3–4] in 17.35.

With participle clauses, and sometimes with *wh*-clauses, *of* is used as an indicator (cf 17.47):

The thought of playing against them arouses all my aggressive instincts.

He didn't accept *the idea of working while he was studying*.

Her account of what she had done that year did not satisfy her colleagues.

Premodification

Types of premodifying item

17.94 In addition to determinatives that cooccur with the head of a noun phrase (cf 5.10ff), lexical and grammatical items of a wide range and indefinite complexity and interrelationship can precede a noun head to form a noun phrase whose modification is generally less explicit than that of postmodification (cf 17.8). A relationship has already been inferred between the predicative adjective (*The girl is tall*) and premodification (*the tall girl*), and in 17.3ff it was shown that such premodification can be restrictive or nonrestrictive.

The major types of premodifying items are the following (the head indicated by angle brackets):

(a) ADJECTIVE (17.96-97):

We also met her *delightful* <family>. ['Her family is delightful.']

(b) PARTICIPLE (17.98-103):

They never found the *missing* <report>. ['The report was missing.']
Have you reported the *stolen* <car>? ['The car has been stolen.']

(c) NOUN (17.104-109):

I hate *city* <traffic>. ['traffic in the city']

In addition, there are some minor, *ie* less frequent and less productive, types of premodification:

(d) GENITIVE (17.110):

I visited his *fisherman's* <cottage>. ['The cottage belongs to a fisherman' or 'belonged to a fisherman' or 'resembles the cottage of a fisherman.']

(e) ADVERB AND OTHER PHRASES (17.111):

We have *round-the-clock* <service>. ['The service is round the clock, *ie* all day and night.']

(f) SENTENCE (17.112):

She has asked *I don't know how many* <people> to the party. ['I don't know how many people she has asked to the party.']

Restrictive and nonrestrictive premodification

- 17.95** Before looking in more detail at the major types of premodification, there are two generalizations to be made about the restrictive/nonrestrictive and temporary/permanent distinctions.

Although there are few formal cues as to whether a premodification is restrictive or not, it may be noted that, by their improvised nature itself, types (e) and (f) tend to be restrictive and to be given more prosodic prominence (*cf* App II.2ff) than the head of the noun phrase. Now, it is a general rule that, where there is no postmodification, it is the head of a noun phrase that is given prosodic prominence. Although restrictive premodifiers need not affect this rule, it is interesting to note that where prominence is given to a premodifier (as it normally is to a postmodifier), the item concerned must be restrictive. Compare [1] and [2]:

my ugly NÒSE	[1]
*my ùGly nose	[2]

The noun phrase [1] is not nonsensical, but [2] normally is, unless in the special context of, for example, drawing attention to someone else's unkind allusion. In this connection it should be noted that, although proper names do not normally need restrictive modification (cf 17.3ff), they can have it when a distinction is being made between more entities bearing the same name:

Do you mean *the Kentucky Richmond* or *the Virginia* { *Richmond?*
one?

Typically, nouns and adjectives are stative, and verbs are dynamic (*cf* 2.43).

It follows that, as modifiers, most adjectives and nouns describe permanent characteristics while most participles describe temporary ones. Since, as we saw in 17.7, prehead position in the noun phrase is strongly associated with relatively permanent characteristics, it further follows that premodification by participles is frequently subject to constraint but that premodification by adjectives and nouns is rarely so.

Premodification by adjectives

- 17.96** A premodifying adjective (or, more strictly, a premodifying adjective phrase; cf 7.20), especially when it is the first item after the determinative, can itself be premodified, as in [1], in the same way as it can in predicative position, as in [1a]:

Her family is [*really* [*quite* [*unbelievably*]]] <delightful>. [1]
her [*really* [*quite* [*unbelievably*]]] <delightful> family [1a]

Some intensifiers tend however to be avoided with premodifying adjectives. Thus the predicative phrase in [2] would seem a little gushy in premodification [2a]:

her daughter who is *so beautiful* [2]
her *so beautiful* daughter [2a]

With indefinite determiners, including zero, *so* would be replaced by *such*. Thus, in place of *so* in postmodification, as in [3] and [4], we can have *such* in premodification [3a] and [4a]:

{ a daughter who is <i>so beautiful</i>	[3]
{ BUT: <i>such a beautiful</i> daughter	[3a]

{ daughters who are <i>so beautiful</i>	[4]
{ BUT: <i>such beautiful</i> daughters	[4a]

However, in rather formal contexts, *so* plus adjective can be placed before the indefinite article [3b]:

so beautiful a daughter [3b]

There is resistance also to transferring clause negation to a structure of premodification, which is possible only in limited circumstances (usually *not* plus intensifier or negative affix); thus [5] and [6] allow the formation of [5a] and [6a]:

His behaviour was *not* $\left\{ \begin{array}{l} \text{very courteous.} \\ \text{unpleasant.} \end{array} \right.$ [5]
[6]

~ his *not* $\begin{cases} \text{very courteous behaviour} & [5a] \\ \text{unpleasant behaviour} & [6a] \end{cases}$

This gives a slight impression of improvisation (note that replacing *his* by *the* in [5a] and [6a] makes the noun phrase slightly less acceptable). Thus many might prefer to reformulate by lexicalization (cf App I.8f), *ie* replacing the free, analytic negation *not* by an affixal negation (cf App I.21), as in [5b], or by selecting a positive instead of two negatives [6b]:

his <i>rather discourteous</i> behaviour	[5b]
his <i>quite pleasant</i> behaviour	[6b]

However, we have now changed the meaning in the direction of making the behaviour less courteous and more pleasant, respectively.

Nonpredicative adjectives

- 17.97 There are a few peripheral adjectives that cannot be used in premodification, and, conversely, some that cannot be predicative. Both types are discussed in 7.20ff, and here we will only give some further illustrations of adjectives which are restricted to attributive position.

First, consider the small group (cf 7.33ff) exemplified as follows:

the <i>mere</i> mention	BUT NOT: *The mention is <i>mere</i> .
the <i>only</i> trouble	BUT NOT: *The trouble is <i>only</i> .

These adjectives behave irregularly also in not allowing intensification by *very*, though some will allow superlative use:

The *merest* word was enough to upset him.

Most of them are clearly related to adverb intensifiers:

The mention was *merely* of . . .
It was *utterly* disgraceful.

Some items in this class, however, have homonyms that are central adjectives (cf 7.3). Compare:

This is *pure* nonsense. [peripheral adjective]
The air is (very) *pure*. [central adjective]

Secondly, there is a group posing a special problem in that they are related to nouns (cf 7.12ff). While adjectives normally refer to quality or to resemblance with substance, some refer to the possessing of substance (cf 7.37). Thus *poetic* can mean 'having the qualities of poetry' or 'consisting of poetry'; in the latter sense, it cannot be predicative or be intensified or graded:

this very *poetic* image ~ This image is very poetic.

his *poetic* output { ~ his output of *poetry*
 ~ *His output is (very) *poetic*.

Another example:

her rather *nasal* pronunciation ~ Her pronunciation is rather *nasal*.

the *nasal* cavity { ~ the cavity of the *nose*
 ~ *The cavity is (rather) *nasal*.

Predicative usage with *nasal*, *oral*, *poetic*, etc is however possible in specialized contexts:

His output is exclusively *poetic*. ['consists . . . of poetry']

Other conditions of nonpredicability (at any rate, without introducing some difference of connotation) are to be seen in formulaic expressions, eg:

'grateful thanks' [but not: *His thanks are *grateful*]; cf 8.90f on courtesy subjuncts]. Similarly: *humble* (apologies), *kind* (regards).

We should also mention items which fall both outside the closed-class postdeterminers discussed in 5.20ff and also outside the class of adjectives as normally understood. Numerals, for example, cannot be freely predicated: beside *the twenty men*, the predicative *The men are twenty* would normally mean that they were *aged* twenty. (However, 'How many are you?' 'We are three', 'We are five', etc is a possible, if unusual, sequence for the normal 'There are three of us.') Again, absolute comparatives (cf 7.85) like *latter* (the latter question) and *upper* (the upper storeys) must be in premodification position.

Predication of the adjective is blocked when the noun head is agential and the adjective refers to the activity (cf 7.36; 'noninherent adjectives', 7.43):

He works *hard*. { ~ He is a *hard* worker.
 ~ The worker is *hard*.

Where the noun can only refer to activity, there is of course no difficulty:

his *good* writing ~ His writing is *good*.

Compare also *an old friend*: 'He has been a friend for a long time' cannot be turned into *that friend of mine is old*, which only refers to the friend's age.

Note Special contexts create their own usage where the general rules of the language may be waived. Someone addicted to the game of bridge, for example, may well ask: 'Good, now we are four, so let's start' without running the risk of being understood as referring to age.

Premodification by -ing participles

- 17.98 The possibility of modification by a present participle depends on the potentiality of the participle to indicate a permanent or characteristic feature. To a lesser extent, gradability (especially as indicated through intensification by *very*) is involved. Sentence [1] shows *interesting* as fully adjectival (cf 7.2, 7.15ff), despite the direct relation to the verb *interest* [2]:

She has a very *interesting* mind. [1]
Her mind *interests* me very much. [2]

But an item can be a premodifier and yet disallow *very*:

a *roaring* bull [BUT NOT: *very roaring]

And the converse can be true, viz a participle will have limited acceptability unless accompanied by an intensifier such as *very*:

He was a very { *reassuring*
 shocked
 surprised } person.

?He was a { *reassuring*
 shocked
 surprised } person.

This last example will illustrate the crucial significance of the 'permanence'

characteristic; such participles can freely premodify nouns such as *look* and *smile*:

He greeted me with a very $\left\{ \begin{array}{l} \text{reassuring} \\ \text{shocked} \\ \text{surprised} \end{array} \right\}$ expression.

The man himself cannot have shock or surprise attributed permanently to him (though cf: *shell-shocked*), but a particular look can of course be permanently associated with such a value. So too we may speak of a *smiling face* more often than of a *smiling person*. It is thus necessary to realize that we are not here concerned with particular participles so much as with their contextual meaning. A *wandering minstrel* is one habitually given to wandering, but if we saw a man wandering down the street, we could not say [3] but only [4]:

*Who is the *wandering* man? [3]
Who is the man *wandering* down the street? [4]

Again, someone who told good stories could be a (*very*) *entertaining person* but one would not say this of someone who happened at the moment of speaking to be entertaining his friends with a good story.

Note The tendency towards permanence in the interpretation of premodifying participles is also seen in the nonprogressive interpretation of the participle in eg: a *working man*, ie 'one who does especially manual work', or 'one who works, especially manually'.

17.99 The indefinite article favours the habitual or permanent, the definite article the specific or temporary (cf 5.26). Thus some people find [1] strange, especially in BrE:

?The *approaching* train is from Liverpool. [1]

On the other hand, [2] is fully acceptable:

He was frightened by an *approaching* train. [2]

Here, we are concerned perhaps with what is characteristic in 'approaching trains'. Similarly, some find [3] odd, compared with [4]:

?The *barking* dog is my neighbour's. [3]
I was wakened by a *barking* dog. [4]

On the other hand, after an indefinite head has been postmodified by an *-ing* clause, the *-ing* participle can premodify the same head with the definite article (cf the similar conditions for noun premodification, 17.104):

a proposal *offending* many members
the *offending* proposal

In addition, the definite article may be used generically and hence evoke the same generality and permanence as the indefinite article:

The *beginning* student should be given every encouragement.
['beginners in general', not = 'a particular beginner']

This last example represents what may be a current trend in journalism and

in technical writing (especially in the social sciences) to admit *-ing* participles rather more freely in premodification: *the developing countries*, *the (partially) hearing child*, *a continuing commitment*, *an ongoing concern*, *a voting member*.

Premodification by *-ed* participles

17.100 Much of what has been said of *-ing* participles (cf 17.98f) applies to *-ed* participles also, but there are additional issues. In the first place, the *-ed* participle can be active or passive but, as with postmodification (cf 17.29), the active is rarely used in premodification. Contrast:

the immigrant who has *arrived*
BUT NOT: *the *arrived* immigrant

The following are exceptional:

the *vanished* treasure ['the treasure which has vanished']
a *retired* teacher
reduced/fallen/increased prices; *risen* costs (in the technical language of economics)

Premodification is somewhat more common when an active participle is modified by an adverb:

the *newly-arrived* immigrant ['the immigrant who has arrived recently']
our *recently-departed* friend ['our friend who has departed recently']
a *well-read* woman ['a woman who has read a lot']
a *soft-spoken* person ['a person who speaks softly']
?a *recently-arisen* problem ['a problem which has arisen recently']

Within the passive, we must distinguish the passive which refers to process from the passive which refers to state (cf 'statal passive', 3.77). A statal example:

some *complicated* machinery
~ The machinery is *complicated*.
~ The machinery was *complicated* by the designer.

With the statal type belong also *born* and some uses of *hidden*, *married*, *troubled*, *darkened*, etc, but in premodification they must either have 'permanent' reference or be modified by an adverb:

a *born* musician ['a natural musician'], a *newly-born* child
a *married* man, *married* life

The *carefully hidden* spy illustrates the general contrast between *-ing* and *-ed* participles. They are similar in postmodification:

The spy, carefully *hidden* in the bushes, } kept watch on the house.
The spy, carefully *hiding* in the bushes, }

But the *-ing* participle, unlike the *-ed* participle, resists premodification: *the *carefully-hiding* spy.

Note With the acceptability of a *recently-arrived* plane beside *an *arrived* plane, compare a *brown-eyed* girl beside *an *eyed* girl (cf 17.102).

- 17.101 Most *-ed* participles have passive meaning, and only a few will easily admit the permanent reference that will permit premodifying use. We may contrast the participle of the stative verb in [1] with that of the dynamic verb in [2]:

The wanted man was last seen in Cambridge.
[the man goes on being wanted by the police] [1]
**The found purse* was returned to its owner.
[the purse was found at a particular moment] [2]

But *a lost purse* is acceptable, because, although a purse is no longer regarded as 'found' after it has been retrieved, a purse will be regarded as 'lost' throughout the period of its disappearance. This aspectual relation corresponds to that of the perfective of conclusive verbs (cf 4.33), as can be seen in the possible paraphrase: *a lost purse* ['a purse that has been lost']. Other examples:

the defeated army, a damaged car, a broken vase

Contrast:

a wanted man ['a man who is wanted by the police']

But not, except in special contexts, such as second instances (cf 17.109), which we must ignore here:

*a sold car *a built house
*the mentioned article *a described man

Exceptions to the general rule suggest that the semantic and aspectual factors are more complicated than we have indicated. For example, although a sum of money can go on being needed, one does not normally say *?the needed money*; although a car is stolen at a moment of time, one can speak of *the stolen car* ['the car that has been stolen'].

The premodifying participle usually characterizes a type rather than an instance: *a muttered reply* is a type of reply, and *a drawn sword* describes a typical posture. With *an organized tour* we may perhaps explain the premodification through the continuing and professional nature of the organization (*ie* 'a package tour', as distinct from a tour privately organized on a specific occasion); or perhaps we should supply an omitted adverb 'an (officially or specially) organized tour', since we must remember that all of the starred participial phrases become acceptable when modified by adverbs (on the tendency, esp in BrE, to hyphenate such premodifiers, cf App III.4f):

a recently sold car a well-built house
the above-mentioned article a carefully described man

- 17.102 Modifiers in *-ed* may be directly denominal and not participles at all (cf App I.38):

a bearded man ['a man with a beard', 'a man who has a beard']
the vaulted roof ['a roof with vaults']
a wooded hillside ['a hillside covered with woods']

- 17.101 Most *-ed* participles have passive meaning, and only a few will easily admit the permanent reference that will permit premodifying use. We may contrast the participle of the stative verb in [1] with that of the dynamic verb in [2]:

<i>The wanted man</i> was last seen in Cambridge. [the man goes on being wanted by the police]	[1]
* <i>The found purse</i> was returned to its owner. [the purse was found at a particular moment]	[2]

But *a lost purse* is acceptable, because, although a purse is no longer regarded as 'found' after it has been retrieved, a purse will be regarded as 'lost' throughout the period of its disappearance. This aspectual relation corresponds to that of the perfective of conclusive verbs (cf 4.33), as can be seen in the possible paraphrase: *a lost purse* ['a purse that has been lost']. Other examples:

the *defeated* army, a *damaged* car, a *broken* vase

Contrast:

a *wanted* man ['a man who is wanted by the police']

But not, except in special contexts, such as second instances (cf 17.109), which we must ignore here:

*a <i>sold</i> car	*a <i>built</i> house
*the <i>mentioned</i> article	*a <i>described</i> man

Exceptions to the general rule suggest that the semantic and aspectual factors are more complicated than we have indicated. For example, although a sum of money can go on being needed, one does not normally say ?*the needed money*; although a car is stolen at a moment of time, one can speak of *the stolen car* ['the car that has been stolen'].

The premodifying participle usually characterizes a type rather than an instance: *a muttered reply* is a type of reply, and *a drawn sword* describes a typical posture. With *an organized tour* we may perhaps explain the premodification through the continuing and professional nature of the organization (ie 'a package tour', as distinct from a tour privately organized on a specific occasion); or perhaps we should supply an omitted adverb 'an (officially or specially) organized tour', since we must remember that all of the starred participial phrases become acceptable when modified by adverbs (on the tendency, esp in BrE, to hyphenate such premodifiers, cf App III.4f):

a <i>recently</i> sold car	a <i>well-built</i> house
the <i>above-mentioned</i> article	a <i>carefully described</i> man

- 17.102 Modifiers in *-ed* may be directly denominal and not participles at all (cf App I.38):

a *bearded* man ['a man with a beard', 'a man who has a beard']
the *vaulted* roof ['a roof with vaults']
a *wooded* hillside ['a hillside covered with woods']

But constraints occur: while we have *a powerful engine*, and *a leggy spider*, we do not have

*a <i>powered</i> engine	BUT: a <i>diesel-powered</i> engine
*a <i>legged</i> spider	BUT: a <i>long-legged</i> spider

These constraints on unmodified *-ed* forms can be explained by the simple but communicatively relevant principle that what one says should carry useful, nontrivial information. Thus all engines will produce power and all spiders have legs. However, *-ed* denominals which provide new information, *an engine powered by diesel*, *a spider with long legs*, etc, become fully acceptable.

By the same principle, both the unmodified *a bearded man* and the modified *a white-bearded man* are acceptable, since not all men have beards and even fewer have white ones. A common feature of acceptable *-ed* adjectives is that they express the notion of 'inalienable possession', ie they are normally thought to be permanent attributes (cf: *I've lost my car*, but not normally: **I've lost my beard*). Those which express alienable possession, eg: **a carred man* ['a man with a car'], **a two-carred man* ['a man with two cars'], are not acceptable and productive formations.

It finally remains to explain the acceptability of adjectives not ending in *-ed*, but in eg: *-ful*, *-y*, *-ous*, *-ic*, *-ish*. Such formations express an unusual degree, amount, etc:

a <i>powerful</i> engine ['an engine with unusual power']
a <i>hairy</i> caterpillar ['a caterpillar with an unusual amount of hair']
a <i>leggy</i> spider ['a spider with unusually long legs']
a <i>pimpley</i> face ['a face with an unusually large number of pimples']

Thus this type obeys the same principle that we invoked for *a bearded man* as well as *a diesel-powered engine*: to carry useful, nontrivial information.

Intransitive verbs rarely yield premodifying *-ed* participles (cf: **an arrived plane*, 17.100 Note).

- 17.103 If the *-ed* participle has a *by*-agent or other prepositional construction, only postmodification is possible (cf adjective complementation, 16.69). Thus we have 'the *defeated army*', but:

the army <i>defeated by the enemy</i> [NOT: *the by the enemy defeated army]
the army <i>defeated for lack of ammunition</i> [NOT: *the for lack of ammunition defeated army]

However, some unmodified *-ed* participles in fixed expressions have postposition (cf 7.21):

the amount <i>demande</i> d/asked for services rendered	the earliest inventions <i>known</i> money well <i>spent</i>
---	--

Prepositional verbs normally follow the head:

the sum *agreed upon*
the pages *referred to*
an event *unheard of* [but also: 'an *unheard-of* event']

Some *-ed* participles have pre- or postmodifying position with different meanings, eg:

the people <i>concerned</i>	a <i>concerned</i> expression
['the people in question']	['worried, anxious']
the students <i>involved</i>	an <i>involved</i> question
['the students in question']	['complicated']
jobs <i>wanted</i>	<i>wanted</i> persons
['jobs wanted by individuals']	['persons wanted by the police']

Premodification by nouns

- 17.104 Noun premodifiers are often so closely associated with the head as to be regarded as compounded with it, as indicated by the stress on the premodifying noun instead of the head:

his 'life story a 'dish cloth a 'Sussex man

On the other hand, we say:

an ,iron rod ,life im'prisonment a ,Sussex 'village

The conditions under which the different stress patterns are adopted are by no means wholly clear, but are connected with the degree to which a sequence is 'institutionalized' as a lexical item, *ie* a compound (*cf* App I.57ff).

In most cases, premodifying nouns correspond to postmodification with prepositional phrases:

his <i>life</i> story	~ the story <i>of his life</i>
a <i>dish</i> cloth [NB singular]	~ a cloth <i>for dishes</i>
a <i>Sussex</i> man	~ a man <i>from Sussex</i>
an <i>iron</i> rod	~ a rod <i>of iron</i>
<i>life</i> imprisonment	~ imprisonment <i>for life</i>
a <i>Sussex</i> village	~ a village <i>in Sussex</i>
a <i>gift</i> tax [NB singular]	~ a tax <i>on gifts</i>

In accordance with the general tendency noted earlier (*cf* 17.8), the premodifying structure has reduced explicitness in relation to the postmodifying structure, and if the relationships between the nouns become unclear or unpredictable, premodification is unacceptable. This becomes apparent if examples [1-10] in 17.37 with the range of prepositions involved in prepositional phrase postmodification are tested for noun premodification:

the road <i>to Lincoln</i>	[1]	~ the <i>Lincoln</i> road	[1a]
this book <i>on grammar</i>	[2]	~ this <i>grammar</i> book	[2a]
a man <i>from the electricity company</i>	[3]	~ ?an <i>electricity company</i> man	[3a]
passengers <i>on board the ship</i>	[4]	~ ? <i>ship</i> passengers	[4a]
action <i>in case of fire</i>	[5]	~ ? <i>fire</i> action	[5a]
the meaning <i>of this sentence</i>	[6]	~ ?this <i>sentence</i> meaning	[6a]

the house <i>beyond the church</i>	[7]	~ the <i>church</i> house	[7a]
two years <i>before the war</i>	[8]	~ two <i>war</i> years	[8a]
a delay <i>pending further inquiry</i>	[9]	~ a <i>further inquiry</i> delay	[9a]
a tree <i>by a stream</i>	[10]	~ *a <i>stream</i> tree	[10a]

In this set, only [1a] and [2a] are fully possible premodification alternatives to postmodification by prepositional phrase; [3a], [4a], [5a], and [6a] have an unusual ring about them as equivalents of [3], [4], [5], and [6] respectively; [7a], [8a], and [9a] do not carry the respective meanings of [7], [8], and [9]; [10a] is unacceptable.

As observed in connection with premodifying nouns in the plural (*cf* 17.109), a phrase like [3a] is somewhat more likely to be used in second instances, *ie* after the explicit relationship has been fully clarified:

A: Today *a man from the electricity company* called.

B: Oh, so what did *the electricity company man* say?

Also, [3a] might conceivably be used in technical jargon where explicit relations need not be indicated or in headline language where the explanation follows.

Note An example similar to [7a] whose interpretation was indeed tried legally is the following:
Dock work is arduous.

It should be interpreted as 'work in or on the docks', not as 'work near the docks'. A British Court of Appeal upheld the above linguistic statement, and *The Times* law report had the following headline in consequence:

Work near docks is not dock work.

- 17.105 One noteworthy constraint against using nouns from postmodifying phrases as premodifiers is the relative impermanence of the modification in question. Thus [1] will readily yield [1a]:

<i>The table in the corner</i> was laid for dinner.	[1]
<i>The corner table</i> . . .	[1a]

But we cannot do the same with [2]:

<i>The man in the corner</i> spoke to me.	[2]
* <i>The corner man</i> . . .	[2a]

However, this is not a property of the lexical item (in this instance, *corner*) but of the semantic relation. Premodification confers relative permanence, and because a table is not free to move of itself, we can premodify *table* but not *man by corner*.

Conversely, not all noun premodifiers have prepositional phrase analogues, *eg*:

<i>consumer</i> goods	~ goods <i>of the consumer</i>
a <i>welfare</i> state	~ a state <i>of welfare</i>

There is also an analogous relation between some types of premodification and coordination:

The plane is *both a fighter and a bomber*.
~ *a fighter-'bomber*

Bernard Miles was *both actor and producer*.
 ~ *the actor-producer* Bernard Miles

Similarly between premodification and apposition:

Smith is *a sergeant*. ~ *Sergeant* 'Smith
 My friend is *a girl*. ~ *my girlfriend*

However, the kind of apposition found in titles is severely restricted by convention and style (cf 5.66, 17.91).

In some cases, both constructions are acceptable but have different meaning, eg:

{ a glass <i>of</i> wine	['a glass containing wine']
{ a wine glass	['a glass for wine']
{ a box <i>of</i> matches	['a box containing matches']
{ a matchbox	['a box made to hold matches']

- 17.106** The main types of prepositional paraphrase of noun + noun combinations, including both free syntactic phrases and compounds, are the following, arranged according to semantic relations.

Source-result: a *metal* 'sheet ~ a sheet *of* metal
 Part-whole: a *clay* 'soil ~ soil *with* clay
 Place: a *top* 'drawer 'a drawer *at the top*
 a *garden* 'fence ~ a fence *round the* garden
 Time: a *morning* 'train ~ a train *in the morning*
 a *night* 'sky ~ a sky *at night*
 Whole-part: a *board* 'member ~ a member *of the* board

With the following class we are closer to lexical compounds, thus the main stress on the first element. (The combinations above could equally occur with the main stress on the first element in other semantic relations.):

' <i>sea</i> food	['food from the sea']
a ' <i>fire</i> place	['a place for fire']
a ' <i>bullet</i> head	['a head like a bullet']

It should be emphasized that the semantic relations illustrated in this section indicate no clear boundary between noun phrases and noun + noun compounds (cf App I.57ff). Stress on the first element is usually indicative of compounding, eg: '*fire*place but *top* 'drawer. Conversely, the possibility of substituting *one* for the second constituent indicates that the first is a premodifier in a noun phrase:

She wants an oak table but I'd prefer *a* *teak one*.
 BUT NOT: *That's not an oak tree but *an elm one*.

- 17.107** In most cases, the constructions with both prepositional postmodification and with premodification are available, but the change from postmodification

to premodification may have consequences other than a possible loss in explicitness. One such consequence is loss of the definite article, as in:

officials *in the Pentagon* ~ *Pentagon* officials

The use of articles is identical in the following:

a sheet *of* metal ~ a *metal* sheet

But it differs in:

life *in a* village ~ village life
 the shooting *of* tigers ~ tiger shooting

Another consequence is the use of a prefix in premodification corresponding to the preposition in postmodification (cf App I.21ff):

demonstrations *against the* war ~ *anti-war* demonstrations
 the period *after the* war ~ the *postwar* period

Plural attributive nouns

- 17.108** Attributive nouns are normally number-neutral. As a further illustration of the principle that postmodification is relatively explicit as compared with premodification, nouns which are plural in postmodification are singular (number-neutral) in premodification:

a chair *with arms* ~ an *arm*chair
 decay *of teeth* ~ *tooth* decay
 the picking *of hops* ~ *hop*-picking

A hyphen before the singular form is normal in expressions denoting age, time, weight, size, etc of the following type:

a girl (who is) ten years old ~ a ten-year-old girl
 a pause lasting three seconds ~ a three-second pause
 inflation amounting to two digits ~ two-digit inflation
 an agreement between four powers ~ a four-power agreement
 a bill worth ten dollars ~ a ten-dollar bill

However, in quantitative expressions of the following type there is possible variation (cf 5.118 Note [b]):

a ten day absence	[singular]
a ten-day absence	[hyphen + singular]
a ten days absence	[plural]
a ten days' absence	[genitive plural]

The use of singular holds even for some nouns that otherwise have no singular form (cf 5.76):

a sharpener *for scissors* ~ a '*scissor* sharpener
 a press *for trousers* ~ a '*trouser* press

However, the plural attributive construction is on the increase, particularly in BrE where it is more common than in AmE, eg:

careers guidance
 a *grants* committee

a new *systems* analyst
 an *appointments* officer
 the policy and *resources* working party

The choice of premodifying nouns in the plural rather than the singular may be attributed to a number of factors, but predominantly to the fact that an entity has been institutionalized in plural form. Since the plural attributive construction is relatively rare in AmE, the statements in the following section apply, for the most, only to BrE.

17.109 (i) 'Exclusive plurals'

One difference between *branch supervisor* and *branches supervisor* is that the singular is more vague and may be interpreted as 'supervisor of a branch or branches', whereas the plural can be interpreted only as 'supervisor of several branches' and thus excludes the ambiguity of number. The semantic distinction seems to be institutionalized in *career girl* 'a girl who puts advancement in her profession before other things' and *careers girl* 'a girl who has had several careers' or (more usually) 'a girl who deals with careers'. Such 'exclusive plurals' tend to occur with collective nouns and names of institutions as heads, and the stress tends to be on the premodifying plural:

parks department
courses committee
examinations board
 the heavy *chemicals* industry
 Scotland Yard's Obscene *Publications* Squad
 Chesterfield *Hospitals* Management Committee
 the British Museum *Prints* and *Drawings* Gallery

Highly institutionalized plurals are always retained, in particular when the singular form might lead to ambiguity:

an *Arts* degree ['a degree in the humanities', as opposed to *an art degree* 'a degree in fine art']

Pluralia tantum (cf 5.77) retain their plural since they have no singular:

a *customs* officer ~ a *custom* officer
 a *goods* train ~ a *good* train

(ii) Plural denoting variety

There is a tendency for more generic terms to be plural and more specific terms to be singular:

soft '*drinks* manu,facturer [*drinks* = 'kinds of drink';
 BUT: 'car manu,facturer]
enter'tainments guide [*entertainments* = 'kinds of entertainment';
 BUT: 'theatre guide]
 surgical *appliances* manu,facturer [*appliances* = 'kinds of appliance';
 BUT: 'baby carriage manu,facturer]

(iii) 'Temporary institutionalization'

As we have seen, in most cases there is variation available between

premodification by noun and postmodification by prepositional phrase, with certain syntactic and semantic constraints. When such variation is freely available, the choice may be seen as conditioned by the explicit/inexplicit distinction or simply by a desire for stylistic variation. However, it should also be seen in terms of communicative factors, as in the case of the variation between the genitive and the *of*-construction (cf 17.38ff). In a book on linguistics we may find the italicized part of [1] resumed later, as a 'second instance', in the discussion by [1a] (cf 17.8):

The *idea of levels* has been a major issue for a long time. [1]
 the *levels* idea [1a]

A special instance of 'temporary institutionalization' is the use of plurals in headlines. A topical issue will cause the plural to be retained in premodification when it is associated with a widely discussed public issue. If there is controversy over the wearing of crash helmets by motorcyclists, this can become referred to in the media as *the helmets issue*. In this way, during the internationally discussed crisis of President Nixon's administration concerning tape-recordings, we became habituated to read expressions such as:

the *tapes* issue the Watergate *tapes* affair
 the *tapes* compromise the White House *tapes* mystery

The frequent use of attributive structure in newspaper headlines, eg: *jobs cut* for 'cut in jobs', would seem to contradict the given/new principle (cf 18.8). Other examples:

PHONES ORDER HEADACHE PROBLEM
 PRIORITY PROJECT NUMEROUS WAR OFFICE STAFF RESIGNATIONS

The flouting of the given/new principle may be explained not only as a striving for brevity in a headline with limited space but also as 'premeditated inversion' of the given/new sequence in order to arouse the reader's interest in going on to read the fully explicit text of the news item.

Premodification by genitive

17.110 The illustration of the genitive as premodifier with restrictive function in 17.94 was the following example:

I visited *his fisherman's cottage*. [1]

The meaning is 'The cottage belongs/belonged to a fisherman' or 'resembles/resembled the cottage of a fisherman'. It should be noticed that if we had used another noun in the genitive, eg: *his friend's cottage*, we would have moved from nonrestrictive to restrictive function and, above all, changed the relationship of the constituents from premodification to determinative. The difference in structure is clearly brought out if further premodifying items are added:

I visited { *his old fisherman's cottage*. [1a]
 his old friend's cottage. [1b]

The structures can be seen in a tree diagram (Fig 17.110):

Fig 17.110

Thus, in [1a], *old* modifies *fisherman's cottage*, whereas, in [1b], *old* modifies the determinative genitive head *friend's*. In [1a], no item can intervene between *fisherman's* and *cottage* and the premodifying genitive may be replaced by, for example, a noun (cf 17.104ff): *his old country cottage*. In [1b], the head of the superordinate noun phrase (cf 5.121f) can be further modified in the usual way:

his old friend's *delightful but crumbling* cottage

Example [1b] is, then, a fully syntactic structure of the type discussed in 5.112ff and 17.38ff where the genitive has a determinative function; in [1a], on the other hand, the genitive acts as a descriptive premodifier (cf 5.122), and is related to the use of the genitive in compounds, such as *bull's-eye*.

Premodification by adverb and other phrases

- 17.111 Another minor type of premodification is the adverb phrase, as in:

She travelled to many *far-away* places. ['The places are far away.']
I have this strange *under-the-weather* feeling. ['I feel under the weather.']

There is a medley of other premodifying phrases, some of which are common expressions, eg:

round-the-clock service
an up-to-date timetable
a tongue-in-cheek remark

Apart from a few institutionalized examples such as *an away match* ['the match is being played away from the home ground', in contrast with *a home match*], the flexibility of this type of premodification tends to be exploited only colloquially, and most examples have (and seem deliberately to have) a flavour of originality, convention-flouting, and provisional or nonce awkwardness:

their *day-after-day* complaints
her *too-simple-to-be-true* dress
a *come-and-fight-me* attitude

Examples like the following are more fully lexicalized, and may be regarded as cases of conversion (cf App I.43ff):

She's wearing a *with-it* dress.
That is the *in* thing at present.

Premodification by sentence

- 17.112 What was said of adverb phrases applies at least equally to premodification by a sentence:

(?)I visited his *what-do-you-call-it* cottage [cf: What do you call it when a cottage has walls made from overlapping pieces of timber?
Claphoard.]

A few institutionalized examples retain a colloquial or slang flavour: *a whodunit story* is one about crime, and the nonstandard grammar and spelling are preserved as part of the ironic slang. *Do-it-yourself* as in *a do-it-yourself job* has become so often used as to pass out of the area of slang (and sometimes be reduced (esp in BrE) to *DIY*).

Somewhat more widely acceptable are noun phrases which can be interpreted either as having a sentence as premodifier or as being object (usually of *know*) in an embedded nominal clause:

He asked { *I don't know how many people.* [1]
 I don't know how many people. [1a]

With either intonation, the meaning is 'He asked a relatively large number of people, though I don't know precisely how many'. The meaning is somewhat different if the sentence is reordered, enforcing a different grammatical structure:

I don't know *how many people he asked*. ['I don't know the number of people he asked.']

For the most part, however, sentence premodifiers have an air of the outrageous and improvised. Part of a political leader's election campaign was described by a journalist as

today's meet the people (if they can find you) tour

Far more remarkable is the following quotation from a literary comment in which the sentence premodification itself has highly irregular and sophisticated punctuation to convey highly irregular coordination devices:

His other comments ignore . . . the obvious fallacies inherent in the
'*But the poem (play, novel) was meant to be tedious/pretentious/
pointless*' line of critical argument.

Relative sequence of premodifiers

- 17.113 When a head has more than one premodifier, there arises the question of relative order; why either [1] or [1a]?:

a *thin dark* face [1]
a *dark thin* face [1a]

But why only [2] and not [2a]?:

a *cardboard detergent* carton [2]
*a *detergent cardboard* carton [2a]

The problem becomes even more acute with longer strings of premodifiers.

Although there is, theoretically, no grammatical upper limit to the number of premodifiers, it is unusual to find more than three or four. Premodification is an area of English grammar where there is considerable variation among the varieties of the language. To a large extent, such variation, as well as the existence of an upper limit, can be given a psycholinguistic explanation. For example, a technical manual, written exclusively for space research scientists, may have very long and complex structures of premodification, as in:

Apollo Block II fuel cell voltage current VI characteristics

Nothing comparable is likely to be used by the same scientist in a casual coffee-break chat where new topics will turn up unexpectedly and where concentration and perhaps audibility are low. There is indeed evidence of a higher proportion of three-or-more item sequences in written than in spoken English.

A sequence such as [3] may be unlikely. Yet, unlike [3a], it will be recognized as acceptable by a native speaker:

- all the many other small inconspicuous carved jade idols [3]
 *other the all jade carved inconspicuous small many idols [3a]

In order to describe the rules for the relative order of premodifiers, it will be helpful to divide the territory between DET (the determinative) and HEAD (the head) into four premodification zones (I, II, III, IV), for example:

DET	I	II	III	IV	HEAD
this	first	important	long	French	novel

Precentral, central, postcentral, and prehead position

17.114 The four zones are largely correlated with the semantic classes discussed in 7.45.

(I) Zone I: PRECENTRAL

In the precentral zone we find peripheral nongradable adjectives (cf 7.42), in particular intensifying adjectives (cf 7.33f):

- (i) *emphasizers*, eg: *certain, definite, plain, pure, sheer*
- (ii) *amplifiers*, eg: *absolute, entire, extreme, perfect, total*
- (iii) *downtoners*, eg: *feeble, slight*

(II) Zone II: CENTRAL

The central zone includes the central, gradable adjectives, ie the 'most adjectival items', which satisfy all four criteria of adjectival status (cf 7.3f), eg: *big, funny, intelligent, keen, powerful, slow, thick*. Central adjectives admit intensifiers (*a very cold day*), comparison (*It's colder than yesterday*), and alternative predicative position (*Last summer was very cold*). Their function is to describe or characterize and, consequently, they often form contrastive pairs like *big/small, good/bad, hot/cold*. They are typically inherent (cf 7.43) and include both nonderived adjectives (like those just mentioned) and derived adjectives, which are either deverbal (like *interesting, interested, hesitant*) or denominal (like *angry, rainy, peaceful*).

This morphological classification has a bearing on the internal structure of the zone of central adjectives in that the usual order is NONDERIVED + DEVERBAL + DENOMINAL:

a tall attractive woman
 this green hilly slope
 a satisfied sleepy look

Within the class of nonderived adjectives, the order is largely arbitrary, but adjectives denoting SIZE, LENGTH, and HEIGHT normally precede other nonderived adjectives. Thus we usually prefer:

a small round table to a round small table;
 long straight hair to straight long hair; and
 a tall angry man to an angry tall man

Among adjectives in zone II, we may further distinguish a group of emotive, evaluative, or subjective adjectives (*lovely, nice, wonderful, terrible, horrible, nasty*, etc), which usually precede other central adjectives. Thus we prefer *beautiful long hair* to *long beautiful hair*. Such emotionally tinged adjectives often have an adverbial, subordinated relation as indicated by their notional similarity with adverbs:

beautiful warm weather ~ *beautifully warm weather*

The statements made about the relative order of zone II premodifiers should however be understood to be tendencies rather than absolute rules.

The relation of premodifiers in 'unbroken' sequences, ie without commas or coordinators, tends to be one of hypotaxis (cf 17.116).

(III) Zone III: POSTCENTRAL

This zone includes, in particular, participles and colour adjectives, eg:

a retired colonel a working theory
 a deserted village blue skies

(IV) Zone IV: PREHEAD

This zone includes the 'least adjectival and most nominal' premodifiers:

- (i) *Adjectives with a proper noun basis denoting nationality* (cf 5.57), provenance, and style: *American, Gothic*
- (ii) *Other denominal adjectives with a relation to nouns* (cf 7.37), often with the meaning 'consisting of', 'involving', or 'relating to': *annual, economic, medical, social, political, rural*
- (iii) *Nouns*: *tourist* (attraction), *Yorkshire* (women), *college* (student)

Adjectives in zone IV are normally not central but peripheral adjectives, ie they do not generally admit intensifiers, comparison, or predicative position:

all those *medical* examinations for military service
 *all those *very medical* examinations
 *The examinations are *more medical* than ...

Similarly, *political* and *rural* in the following uses will normally be interpreted as nongradable adjectives (cf 7.42):

all the *political* parties of this country
 the backward *rural* areas in the north

When items from the same group cooccur, there is a tendency for those modifiers which denote place and time to take precedence:

local economic interests
the *annual linguistic* meeting

Premodifiers in the prehead zone cannot usually be coordinated:

the *local waterboard* authorities
*the *local and waterboard* authorities

Premodifying nouns, which are normally placed immediately before the head of the noun phrase, may form a compound or quasi-compound with the head, as is suggested in the compound stress pattern on the first item as in '*telephone call*, '*fireplace*'. This is where noun-phrase structure impinges upon compounding (cf 17.104ff, App 1.57ff), with two nouns forming a new conceptual unit.

In some cases there is little or no difference in meaning between denominal adjectives and nouns as premodifiers:

a *Liverpudlian* accent ~ a *Liverpool* accent
an *icy* patch ~ an *ice* patch
a *glamorous* girl ~ a *glamour* girl
a *beautiful* spot ~ a *beauty* spot
a *grassy* strip ~ a *grass* strip

One general distinctive feature is that the information provided by the adjective is felt to be temporary or subjective, whereas that provided by the noun premodifier is permanent, or objective, *ie* has a 'classifying' function.

Some examples of sequences of premodifiers are given in Table 17.114.

Table 17.114 Examples of sequences of premodifiers

DETERMINATIVE	PREMODIFIERS				HEAD
	Zone I: PRECENTRAL	Zone II: CENTRAL	Zone III: POSTCENTRAL	Zone IV: PREHEAD	
				tourist	attractions
				London tourist	attractions
		splendid		African tourist	attractions
our	numerous	splendid		African tourist	attractions
all this			costly	social	security
a	certain		grey	church	tower
these			crumbling grey	Gothic church	towers
some		intricate	old interlocking	Chinese	designs
all the		small	carved	Chinese jade	idols
both the	major			Danish political	parties

General principle for the order of premodifiers

17.115 In part, the preferences seem clearly to correspond to the 'natural' order of recursive qualification. Thus [1] would be more usual than [1a]:

the two *typical large* country houses [1]
the two *large typical* country houses [1a]

In order to be typical, country houses must be large; but it would scarcely be true that, in order to be large, they must be typical. This is factual, not linguistic, information. The preferred order in the two noun phrases in [1] and [1a] thus reflects reality in showing that the speaker had been obliged to specify the houses as country houses and the country houses as large, before it became meaningful to specify the large country houses as typical. Again, the preferred orders *beautiful long hair* and *long straight hair* perhaps reflect the nonlinguistic world: length of hair may be a condition of its being adjudged beautiful, and the straightness of hair would tend to be a condition of its seeming long.

Attempts to explain preferences of premodifier ordering have invoked rhythm (*eg* short items before longer ones); common items before rare ones; restrictive before nonrestrictive. We suggest one principle accounting for all premodifiers: a subjective/objective polarity. That is, modifiers relating to properties which are (relatively) inherent in the head of the noun phrase, visually observable, and objectively recognizable or assessable, will tend to be placed nearer to the head and be preceded by modifiers concerned with what is relatively a matter of opinion, imposed on the head by the observer, not visually observed, and only subjectively assessable.

One need hardly add that, with criteria that are themselves so subjective, there is plenty of room for difference of opinion. The writers and speakers will naturally arrange premodification semantically, *ie* according to their communicative intentions. However, there is no total freedom.

Note Though there are many exceptions and few firm constraints, it seems that, to some extent, the order of premodifying adjectives is the inverse of predicative order:

beautiful long hair ~ hair that is *long and beautiful*
long straight hair ~ hair that is *straight and long*

With this we may compare the adverbial + object + head order in premodification with the inverse order of clause elements:

a *gas cigarette lighter* ~ It lights *cigarettes by gas*.

Also adjunct + subject + head:

Euston train arrivals ~ The *trains* arrive at *Euston*.

Similarly, the sequence of modifiers with subjective and objective genitive (cf 17.41ff) where, although inversion is not always involved, the same principle of ordered clustering in relation to the head is maintained:

the men's examination of the student ~ The men examined the student.
the men's examination by the doctor ~ The men were examined by the doctor.
the examination of them by him ~ They were examined by him.

Hypotactic relations and order of premodifiers

17.116 Different hypotactic relations of premodifiers will upset the normal order described in 17.113ff. Thus while *dirty British books* could be understood as books that had become grimy, *British dirty books* could only mean books that 'consisted of' or 'were characterized by' dirt (*ie* obscenity).

When two nouns premodify, one which corresponds to the head as object to verb will follow one relating to material, means, instrument, space, or any comparable adverbial relation:

- { a detergent carton and a cardboard carton
- ~ a cardboard detergent carton ['The carton contains detergent.']
- ~ *a detergent cardboard carton ['*The carton contains cardboard.']
- { my cigarette lighter and my gas lighter
- ~ my gas cigarette lighter
- ~ *my cigarette gas lighter
- { a city bread delivery
- ~ *a bread city delivery
- { a diesel passenger train
- ~ ?a passenger diesel train
- { a jet freight aircraft
- ~ ?a freight jet aircraft

Where an adverbial + verb sequence has prior institutionalized status, as with *pressure cooker*, this unit may be premodified by an object such as *vegetable*:

a vegetable pressure cooker ['which cooks vegetables by pressure']

Multiple adjective/noun premodification

- 17.117 The noun premodifier can be itself premodified by either an adjective or a noun and, if the latter, this can in turn be recursively premodified:

Fig 17.117a

It should be noted, however, that if we introduce an adjective in this last noun phrase, already clumsy and improbable, the adjective has to come immediately after the determiner and would normally be interpreted as relating directly to the head *furniture*:

Fig 17.117b

However, such straightforward left-to-right ordering of premodifiers is not common. Compare the structure of the following two examples from a newspaper:

- the [[food price] rise] [warning system]] 'a system for warning against rises in the price of food'
- the [voluntary [[price rise] [warning system]]] 'a system which is voluntary for warning against rises in prices'

The two examples look superficially alike but are in fact radically different in noun-phrase structure. The identical positioning of *food* and *voluntary* must not obscure the fact that the former modifies *price* and the latter *system*.

However, there is potential ambiguity with multiple noun modification. Consider:

a new giant size cardboard detergent carton

where *size* does not premodify *cardboard* and *cardboard* does not premodify *detergent* but where the linear structure is rather as in:

a [new [giant size] [cardboard [detergent carton]]]

Fig 17.117c

Such an example is not, of course, obscure. Indeed, it is generally the case that obscurity in premodification exists only for the hearer or reader who is unfamiliar with the subject concerned and who is not therefore equipped to tolerate the radical reduction in explicitness that premodification entails.

Take even a fairly simple example like the following:

He had some French onion soup.

If we are unfamiliar with this type of soup, there is nothing about the grammatical, orthographic, or prosodic form that will tell us whether it is soup made from French onions, or French soup made from onions, or onion soup made in the French manner.

- 17.118 There are other special types of multiple premodification that should be mentioned. A friendship between a boy and a girl becomes:

a boy and girl friendship

A committee dealing with appointments and promotions can readily be described as (on the plural, cf 17.108f):

the appointments and promotions committee

A committee whose business is the allocation of finance can be:

the allocation of finance committee

A noun phrase in which there is noun premodification can be given the denominal affix which puts it into the 'consisting of' class of adjectives (cf 7.37, 17.114) while retaining the noun premodifier; hence, from *party politics* we have:

a *party political* broadcast

Similarly, a noun phrase having a denominal adjective may itself take a denominal affix to become a premodifier in a noun phrase. For example, beside *cerebral palsy* ['palsy of the cerebrum'], we have *cerebral palsied children* which has the following structure:

[[[*cerebral palsi*ed] *children*] NOT: *[*cerebral* [palsied *children*]]

We see two types of modification with modified modifier in [1] and [2]. The premodifying adjective *delightful* is itself premodified by the adverb phrase *really quite unbelievably*:

his *really quite unbelievably delightful* cottage [1]

In [2], the genitive premodifier *women's* is itself premodified by *these chic*, and the whole genitive phrase could premodify another genitive:

[[[these *chic women's*]] *employer's*] clothing [2]

Fig 17.118

Although there is no theoretical limit to such sequences of genitives, there seems to be a practical limit of two – anything more being stylistically objectionable, comic, and difficult to comprehend:

?these *chic women's employer's wife's* clothing

Note With a singular genitive there may be ambiguity, in that *chic* may modify *woman's* [3] or *clothing* [3a]:

this [[*chic woman's*] *clothing*] [3]
 this [*chic* [*woman's clothing*]] [3a]

The 'group genitive'

17.119 One important type of multiple premodification is the 'group genitive' (cf 5.123):

someone else's car *The Wife of Bath's* Tale
Elizabeth the Second's heir *a man of distinction's* influence

While the affixing to a noun of the genitive inflection and the plural inflection follows similar rules for regular nouns in general, the rules for the two inflections are different if the noun is postmodified (cf Fig 17.119):

singular	{ <i>the teacher</i> <i>the teacher of music</i>	<i>the teacher's</i> (room) <i>the teacher of music's</i> (room)
plural	{ <i>the teachers</i> <i>the teachers of music</i>	<i>the teachers'</i> (room) <i>the teachers of music's</i> (room)

Fig 17.119

Other examples involve coordinations:

an *hour and a half's* discussion
 a *week or so's* sunshine

The group genitive is not normally acceptable when the postmodification is a clause, though in colloquial use one sometimes hears examples like:

Old man what-do-you-call-him's house has just been sold.
 ?Have you seen *that man standing at the corner's* hat?
 ?Someone has stolen *a man I know's* car.

In normal use, especially in writing, such genitives would be replaced by *of*-constructions:

Have you seen *the hat of that man standing at the corner*?
 Someone has stolen *the car of a man I know*.

The group genitive is tolerable even with prepositional phrases provided it encourages no unwanted interpretation. Thus [1] might pass muster:

the *man in the car's* ears [1]

But [2] would obviously be avoided if the meaning 'the ears of the man with the cat' was intended:

the *man with the cat's* ears [2]

Multiple heads

17.120 Modification may apply to more than one head (cf 13.68):

the new table } ~ *the new table and chairs*
 the new chairs }

The multiple head thus produced (*table and chairs*) can now be subject to recursive modification or coordination:

the beautiful new table and chairs
the new (but) ugly table and chairs

The reduced explicitness naturally makes ambiguity possible. Since we can coordinate two noun phrases only one of which is premodified, the resulting string will suggest that the modifier applies to both heads if it comes first:

He writes *long papers*. } ~ He writes *long papers and books*.
 He writes *books*.

In these circumstances, we may disambiguate by reordering, by introducing separate determiners, etc:

He writes *books and long papers*.
 He writes *some long papers and some books*.
 He writes *long papers* { *as well as* } *books*.
 { *and also* }

Noun phrases with separate premodification can however be jointly premodified, as in:

books and long papers ~ *excellent books and long papers*

Spoken with one tone unit, this noun phrase can be interpreted as having the structure of Fig 17.120:

Fig 17.120

This interpretation would be almost inescapable if a determiner such as *some* preceded *excellent*. It follows that if we wish to coordinate noun phrases both of which are premodified, we must introduce either prosodic or punctuation separators, or separate determiners, if maximal clarity is required:

excellent books, and long papers
some excellent books and some long papers

Alternatively, the order can be reversed:

long papers and excellent books

Special relations between heads and modifiers

Some problems of coordination

17.121 Coordination provides some points of interest in relation to multiple modification. Consider the phrase [1]:

children *who have speech that is impaired* [1]

This can be reduced to [1a] or [1b]:

children *who have impaired speech* [1a]

children *with impaired speech* [1b]

The normal premodified form (cf App I.38) is then [1c]:

speech-impaired children [1c]

But if the impairment is in *speech and language* (a conventional conjoining recognized in speech therapy), the premodification form becomes:

speech and language impaired children [1d]

The hyphen is omitted after *language* since this would entail one after *speech* as well, a type of ellipsis indication reserved for rather stiff and technical writing (cf App III.5 Note [b]):

speech- and language-impaired children [1e]

Ellipsis provides difficulties in noun phrases involving comparison also. The following is unobjectionable:

an *equally serious or more serious* situation [2]

The sequence becomes objectionable when postmodifying complementation is added [2a]:

?an *equally serious or more serious* situation *than before* [2a]

The phrase [2a] wrongly suggests that we have a possible sequence (cf 17.122):

*an *equally serious* situation *than before* [2b]

A somewhat similar difficulty arises through coordination and rather careless ellipsis, as in [3]:

?the similarity of his houses in New York and Connecticut [3]

A more fully explicit form without ellipsis will help to show what has gone wrong:

the similarity of his house¹ in New York *to his house*² in Connecticut [3a]

The rules for ellipsis (cf 12.31ff) have to distinguish between identity of lexical item and identity of reference: if we have only the first without the second, there are constraints on ellipsis. Such constraints are not sufficient, however, to block ellipses like the following which retain complete acceptability:

more than one lecturer *some book or other* *one or two* books

Discontinuity between head and modifier

- 17.122** It is not uncommon for the noun phrase to be interrupted by other items of clause structure. Note, for instance, the placing of the time adjunct between the head and postmodifier in the following noun phrase:

I met a *man* this morning *carrying a heavy parcel*.

Although there is nothing wrong with this structure, to avoid discontinuity, the adverbial can be moved to initial position:

This morning I met a *man carrying a heavy parcel*.

Further examples of discontinuities in noun-phrase structure are presented in 18.39f, together with some discussion of the consequences for information processing.

Noun-phrase modifiers which have their own complementation can often occupy alternative positions. The structure is either continuous (noun head + adjective with complement) or discontinuous (adjective + noun head + adjective complement). We can distinguish the following types of complement:

- (a) Adjective with a prepositional phrase as complement (cf 17.58):

facilities *comparable* } *to ours*
comparable facilities }

- (b) Adjective with an infinitive clause as complement (cf 16.75ff):

a plan *difficult* } *to carry out*
a difficult plan }

- (c) Adjective in comparative degree with a comparative clause as complement (cf 15.63ff):

a person *more qualified* } *than anybody else*
a more qualified person }
a plan *better* } *than the previous one*
a better plan }
in a time *shorter* } *than five microseconds*
in a shorter time }

With the following types it should be noted that alternative adjective position also entails change, compared with types (a-c), in the position of the indefinite article, such that it always immediately precedes the noun head.

- (d) *As* + adjective + *as* with comparative clause:

a fact *as strange as* } anything you've ever heard of
as strange a fact as }

- (e) *So* + adjective + *that-* or *as to-* clause:

an idea *so odd* } { that you won't believe it
so odd an idea } { as to be unbelievable

- (f) *Too* + adjective + infinitive clause:

an accusation *too serious* } *to be left unanswered*
too serious an accusation }

In some of these examples, the variation is not stylistically free; for example, in relation to (a), many would prefer (at least in a more formal context) the continuous order [1] to the discontinuous [1a]:

{ facilities *comparable to ours* } [1]
{ *comparable facilities to ours* } [1a]

The prepositional phrases and other structures function here as complements to adjectives, not as modifiers of noun-phrase heads, as in *new roads to London*. Thus we have *roads to London* but not **facilities to ours*.

Compare now the following pairs:

{ the *handsome* man that she kissed } [2]
{ the *first* man that she kissed } [2a]
{ an *extraordinary* discovery that I made } [3]
{ an *early* discovery that I made } [3a]
{ The *most recent* play I know well is *Bedroom Farce*. } [4]
{ The *most recent* play I've seen is *Hamlet*. } [4a]

The superficial resemblance within each pair must not prevent us from seeing that, in each case, the second member has an adverbial relation in what is a plausible corresponding sentence:

the man was the { *first*
 **handsome* } that she kissed

a discovery that I made { *early*
 **extraordinary*

The play I { 've seen } *most recently* is *Hamlet*.
 **know*

Note Comparatives of adjectives with comparative clause complements like [5] and [6] can have as ad hoc 'compounds' the normally postponed comparative constructions in [5a] and [6a] (cf 17.111; regarding the use of hyphenation, cf App I.17):

Her salary is *higher than average*. [5]
His car looks *worse than ever*. [6]
her *higher-than-average* salary [5a]
his *worse-than-ever-looking* car [6a]

Note that with a copular verb other than *be* [6a], the verb is included in the premodification. But:

**her higher-than-average-being salary* [6b]

Conclusion**Reduced explicitness and increased economy structure**

- 17.123** The noun phrase, then, is potentially very complex indeed. It is hoped that by now enough has been said to give some clear indication of the relationship that exists between types of noun-phrase structure and the forms of

predication to which they appear to have an essential if often indirect correspondence. By means of the structures that have been developed in the noun phrase, we can take an indefinitely wide range of grammatical and semantic data which have either been previously established in the discourse or which can be assumed as knowledge held in common between speaker/writer and hearer/reader, and then express them, or refer to them, with greatly reduced explicitness, and consequently increased economy. To illustrate the degree of complexity that occurs quite readily in English prose, here are three examples:

At the mouth of the respiratory tube is *a series of velar tentacles, corresponding exactly in position to those of amphioxus, and serving to separate the mouth and oesophagus from the respiratory tube while the lamprey is feeding.* [1]

It was the beginning of an operation in which the power of the Holy Spirit was fulfilled in the person and words and actions of a human character, Jesus of Nazareth. [2]

Subsequent work by Huisgen (1951) and Hey, Stuart-Webb and Williams (1951, 1952) on the dependence of the rate of rearrangement on both the aryl and acyl groups of the acylarylnitrosamine, and on the catalysis of the reaction by bases such as piperidine, has led to the formulation of the rearrangement as an intramolecular process, as indicated in equation (6), involving nucleophilic attack, by an internal S_N2 mechanism, of the oxygen of the . . . nitrosyl group on the carbonyl carbon atom. [3]

In the italicized noun phrase of [1], we are expected to understand that the tentacles form a series and that they correspond to the tentacles found in the species amphioxus. More interestingly, we are expected to relate the tentacles to the velum without prejudice as to whether they are appended to it (a partitive relationship) or actually constitute it (an appositive relationship), on which distinction some biologists would not wish to commit themselves.

17.124 Types of noun-phrase structure in relation to variety

It must be emphasized that anything approaching full exploitation of the potentiality existing in noun-phrase structure is relatively rare and relatively confined to specific fields of discourse. A sample of some 17 000 noun phrases in the Survey of English Usage files yielded the striking contrasts that are summarized in Table 17.124.

'Simple' is here defined as nouns without modification, *ie* simple noun phrases (*eg: John, she, the man*). In view of their numerical and distributional importance, pronouns and names are distinguished as a subclass of 'simple'. 'Complex' embraces all other noun phrases, but a subclass is distinguished comprising those having multiple modification (more than merely a single adjective premodifier or prepositional phrase postmodifier). Table 17.124 shows that:

- (a) Less than one-third of the 17 000 noun phrases in the sample are 'complex', even within these modest limits of 'complexity'.

Table 17.124 Noun-phrase structure and distribution

		TOTAL	SIMPLE NOUN PHRASES		COMPLEX NOUN PHRASES	
			All	Names and pronouns	All	Multiple modification
Whole sample	subject	7898 46.6%	6749 39.8%	5821 34.3%	1149 6.8%	456 2.7%
	not subject	9063 53.4%	4753 28.0%	2193 13.0%	4310 25.4%	1777 10.5%
	total	16961 100%	11502 67.8%	8014 47.2%	5459 32.2%	2233 13.2%
Informal speech	subject	2984	2064	1941	148	62
	not subject	2220	1169	677	811	327
Fiction	subject	4466	2220	1943	211	92
	not subject	3991	1682	754	1121	434
Serious talk	subject	3693	1745	1478	343	127
	not subject	3602	1273	599	1238	492
Scientific writing	subject	1831	720	459	447	175
	not subject	2456	629	163	1140	524

- (b) Less than one-eighth have multiple modification.
 (c) Nearly one-half of the sample consists of pronouns or names.
 (d) The majority of simple noun phrases – and the overwhelming majority of names and pronouns – are subjects of clauses or sentences, but only rather less than a quarter of complex noun phrases are subjects.
 (e) When the whole sample is broken down into four types of text, one such type ('serious talk and writing') very closely follows the pattern of distribution for the sample as a whole.
 (f) In respect of these particular noun-phrase parameters, prose fiction and informal spoken English agree closely and are sharply distinct from the other two varieties represented in the sample; they have a much higher proportion of simple to complex and a much stronger association of simple with subject, and complex with nonsubject, than the other varieties.
 (g) Scientific writing differs greatly from the other varieties in having a distinctly higher proportion of noun phrases with complexity (and multiple complexity); a distinctly lower proportion of names and pronouns among its simple noun phrases; and the weakest association of simple with subject and complex with nonsubject.

A survey of prepositional phrases highlighted a difference between speech and writing. In a corpus of half a million words, prepositional phrases were found to be considerably more frequent in written than in spoken material, respectively about 140 and 100 phrases per 1000 words. Also, in written texts, 40 per cent of the prepositional phrases functioned as postmodification in noun phrases, as compared with only 33 per cent in speech.

Even such coarse-grained comparisons as these make clear how sensitive is the noun phrase as an index of style and how responsive it can be to the basic purpose and subject matter in varying types of discourse.

Introduction

18.1 In earlier chapters, we have examined the construction of sentences in terms of the way in which units (such as subject, verb, and predication) are brought together to form grammatical sequences, and we have treated the order of such units in terms of positional norms. We shall now look upon the construction of a sentence from the viewpoint of constructing a message: segmenting the material into effective prosodic units and ordering the parts so as to achieve the desired result. This means studying the devices by which we lead our hearer/reader to recognize unmistakably the piece of information that we see as the highpoint of our message, at the same time providing enough additional material to ensure that the message is complete. If the message is heard, the highpoint will be marked in utterance by prosodic prominence; but even if the message is written and is silently read by the recipient, the writer must still ensure that the reader will identify the highpoint by being able to give it an internal or 'imagined' prosodic prominence. Intonation and other prosodic features are therefore essential in the processing and receiving of information, whether written or spoken, and we shall be constantly referring to the phonological distinctions described in Appendix II.

But lexical choice and grammatical organization have an important role. Consider these examples:

- Will the new law help old people? [1]
- The road will ultimately be repaired. [2]
- I'll visit them occasionally. [3]
- The honeymoon couple returned to Edinburgh in bright sunshine today. [4]

In the following variants, the truth value is unchanged, but the presentation is very different:

- In your view, will the new law give old people the help they need? [1a]
- It will be some time before the road is repaired. [2a]
- I don't think I can do more than pay them an occasional visit. [3a]
- It was bright sunny weather that welcomed the honeymoon couple back to Edinburgh today. [4a]

It is not merely that the variants are more verbose. In each case, an introduction has been provided which puts the utterance in a communicative context, as in [1a] and [3a], or which highlights an aspect of the utterance that is communicatively effective, as in [2a] and the journalistic [4a]. Moreover, care has been taken in [1a], [3a], and [4a] to make the ending an appropriate climax. But before we consider other modes of information processing we must look closely at the fundamental role of intonation and other aspects of prosody.

Prosodic aspects

18.2 Let us imagine that we know the answer to the question 'When shall we know what Mary is going to do?' Our reply might take the form:

She will de|cide 'next wEEK|

The theme (*cf* 18.9), which in this sentence is the subject *she*, would be uttered without emphasis, since it functions as a mere cue that the speaker is cooperating in making a reply which has the expected subject with a known identity. The verb phrase *will decide* is given somewhat more prominence, since although it is semantically congruent with the form of the question, it is by no means wholly predictable in deflecting attention from 'our' knowledge to Mary's decision. If, for example, the question had been 'When will Mary decide?', the reply might have been:

She will do so |next wEEK|

The verb phrase in this case would have little more prominence than the subject. But the main prominence is given to the time adjunct, *next week*, and this prominence is conveyed by the intonation nucleus on the head noun *week*.

Such prosodic data do not concern speech alone. If we had received the inquiry in writing and had scribbled the reply on paper also, 'She will decide next week' would have been given the prosodic values of our spoken response as the receiver glanced at the written message. And if the receiver were to read it aloud to a friend, it would normally be read with these prosodic values. If this were not so, our message might be distorted or replaced by some other that we had not intended, such as:

She will de|cide next week|

Information and communicative dynamism

- 18.3 COMMUNICATIVE DYNAMISM refers to the variation in communicative value as between different parts of an utterance. The subject, verb, and adjunct in:

She will de|cide 'next wEEK|

were described in 18.2 as being uttered with sequentially increasing prominence, with the S conveying least information, the V rather more (for the reasons stated), and the A conveying most – as is natural since it conveys (or implies that it conveys) the information sought by the *wh*-element of the question 'When (shall we know what Mary is going to do)?' A TONE UNIT is defined in Appendix II.13 as a stretch of speech containing one intonation nucleus, and since each such nucleus serves to highlight a piece of information, it follows that a tone unit is coextensive with an INFORMATION UNIT.

But although an information unit highlights one item, this does not mean that the rest of the unit is devoid of information. As in the present example, the 'communicative dynamism' can range from very low (corresponding to weak stress, as with the subject *she*), through medium (corresponding to nonnuclear stress, as with the verb phrase, *will decide*), to very strong stress (corresponding to intonation nucleus, as with the adverbial, *next week*). And, again as in this example, it is common – though by no means necessary – for the range of such communicative dynamism to increase from low to high in accordance with the linear progression of the information unit. To put it

another (and better) way, it is common to process the information in a message so as to achieve a linear presentation from low to high information value (*cf* 19.12). We shall refer to this as the principle of END-FOCUS.

- 18.4 Though there is a one-for-one correspondence between tone unit and information unit, the correspondence is less direct between prosodic prominence and information value. Prominence by stress or intonation is realized on a *syllable*, a unit that has no necessary correlation with meaning, let alone information value. This is the case with the stress on *-cide* in:

She will de|cide 'next wEEK|

The effect of prosodic prominence is to draw attention to the semantic unit within which the prominent syllable occurs (in this case the verb phrase *will decide*) and hence to give that unit information prominence. So also with the information climax in this example. The noun phrase, *next week*, which realizes the adverbial, would have the main stress on the head, *week*. It is therefore this syllable which carries the nuclear tone, though of course it is not the item *week* itself which is informationally prominent but the whole adverbial *next week*. Compare the parallel distribution of information in the following examples, noting the relation between the prosodically prominent *syllables* and the informationally prominent *semantic units*:

He will de|liver it on TUESday|

He should have re|plied to my LÉtter|

If, on the other hand, *my letter* had already been established in the context, it would no longer be appropriate to make the prepositional phrase informationally prominent. Instead, the nucleus would probably occur on *replied* and the adverbial might be lightened and abbreviated by pronominalization:

He should have re|PLIED { to my 'letter|
to it|

It is such circumstances that lead some to define end focus in terms of the (stressed syllable of the) last open-class lexical item of the last clause element (but *cf* 18.12 Note [a]).

Note In all the examples so far, the 'semantic units' identified by prosodically prominent syllables have also been grammatical units (V, A), but the broader term 'semantic unit' is necessary as a reminder that the informationally prominent unit need not be a syntactic element:

It was [neither an AUTOCRATIC nor entirely a DEMOCRATIC government|
(See further 18.15.)

Tone units and grammar

- 18.5 Every sentence has at least one tone/information unit, and it is usual for such a unit to be coextensive with a grammatical unit. Sometimes this is the sentence itself, as in the example we have been considering:

She will de|cide 'next wEEK|

But far more commonly, the tone unit corresponds to a grammatical unit within a sentence. This may be:

(a) An initially placed optional adjunct (*cf* 8.36), other than closed-class items:

[After my ÍLLness] I |went to FRÂNCE|

contrast:

[Then I went to FRÂNCE|

(b) An initially or finally placed disjunct or conjunct, especially when realized by a polysyllabic item:

[FRÂNkly] it has been dis|GRÁCEful|
More|ðver| the |chairman may not be wÍLLing|
It was dis|GRÁCEful| [FRÂNkly|

(c) An initially placed vocative:

|JÓHN| are you |all rÍGHt|
|DÓctor| I'm |very ÁNXious|

A vocative in end position will also occupy a separate tone unit if it is given a rising nucleus, whether for politeness or to single out the addressee more specifically (*cf* App II.15), following a different type of nucleus:

I'm |much BÉTter| |DÓctor|
But I |don't think you're rÍGHt| |MÁry|

Contrast:

Are you |all rÍGHt| 'John|
I'm |very ÁNXious| 'Doctor|

(d) The subject, if this element is realized by a clause or a long noun phrase, especially one with postmodification (*cf* 17.1*ff*, 17.61):

|What we wÁNT| is |plenty of RÁIN|
The |tall 'lady by the DÓOR| |spoke to JÓHN|

Contrast:

|John 'spoke to the 'tall 'lady by the DÓOR|

(e) A fronted object or complement (*cf* 18.20*ff*):

Her |WRÍting| I |find unintÉLLigible|

(f) The coordinate clauses in a compound sentence, especially when the clauses have different subjects:

She |won the RÁCE| and he was de|LIGHted|
They |WÁLKED| they |swÁM| they |played GÓLF|

Contrast coordinated predicates and predications (*cf* 13.52*f*):

He |went out and 'slammed the DÓOR|
I have |seen them and 'offered my HÉLP|

On the segmentation of tone units, *cf* App II.18.

18.6 It will be noticed that, in each of the cases mentioned in 18.5, the remainder of the sentence is both a tone unit and a grammatical unit: the predicate in (d), a well-formed clause in (a), (b), (c), and (f). An untidier situation, with no one-to-one relation between tone units and major grammatical units, occurs when such items as those specified in (a), (b), and (c) are placed medially. The items concerned may then continue to be given prominence by an intonation nucleus, but – especially in conversational English – the resultant division of the sentence into tone units will not correspond to the grammatical units that we find it useful to distinguish in this book. Thus:

(a') A sentence with medially placed optional adjunct:

You |should by NÓW| be |earning your LÍving|

(b') A sentence with medially placed disjunct or conjunct:

It has |FRÂNkly| been dis|GRÁCEful|
The |chairman 'may moreóver| |not be wÍLLing|

(c') A sentence with medially placed vocative:

You |should 'really JÓHN| be |earning your LÍving|

A further common circumstance in which tone units and sentence constituents do not completely coincide is where a noun-phrase postmodification takes the form of a nonrestrictive clause or appositional structure. For example:

The |JapanÉSE| whose |industry is THRÍving| are de|servedly PRÓsperous|
I ad|mire the JapanÉSE| whose |industry is THRÍving|
|Harriet SMÍTH| our |new RepresÉntative| |comes from AlabÁma|
|Let me 'introduce you to 'Harriet SMÍTH| our |new RepresÉntative|

Contrast (*cf* 18.5 (d)):

The |Japa'nese who 'live in Tókyo| can |see Ka'buki 'theatre RÈgularly|

18.7 The generalizations made in 18.5–6 provide only guidelines: no rigid rule can be made about the relation of grammatical to tone units or about the precise points at which tone units will form their divisions. Since tone units constitute information units, they are by their very nature variable stretches of language, readily adjustable to the demands of emphasis, grammatical complexity, speed of utterance, and other factors. For example, a sentence having a clausal object will generally form one tone unit, so long as all the elements are relatively short and simple. But if (i) we wish to highlight certain parts, or (ii) the length of the constituents goes beyond a certain point (very roughly, five or six words), the sentence will be split into two or more tone/information units:

The |man 'said we could 'park HÈRE|
The |man SÁID| we could |park HÈRE|
The |man ASSURED us| that we could |park our CÁR| |here 'opposite the
HOTÉL|

There are extreme cases where every single word can constitute a tone unit; thus, in emphatic irritation, we might say:

[hÉ] [sÁID] [wÉ] [CÓULD]

Note In a corpus of speech, it has been found that 80 per cent of all tone units had between one and seven words, with a median of five words.

Given and new information

- 18.8 When we construct a message, it is a courtesy to the receiver, as well as a convenience for ourselves, to provide the point of the message with enough context for this point to be both clearly identified and unambiguously understood, as well as being placed in a normal linguistic framework. To return to the question at the beginning of 18.2:

When shall we know what Mary is going to do?

The answer might have been:

We'll know *next week*.

Here the unitalicized portion replicates material from the question; so far as the receiver is concerned, it is entirely GIVEN. But as well as providing assurance that the answer is indeed attending to the question, it serves as a convenient introduction to the actual point of the message, the NEW information conveyed by *next week*. Of course, in this instance, the message would have been adequately comprehensible if it had been confined to the new information alone:

Next week.

But in 18.2, the answer we considered was:

She will decide *next week*.

The italicized portion again presents the main point of the message and the entirely new information, but the introduction is less obviously and directly 'given'. Nonetheless, it serves as the necessary background and by contrast with the 'new' information it is relatively 'given'. The subject *she* and the futurity expressed by *will* are indeed entirely given, and in replacing *we* and *know* by *she* and *decide* (with consequently increased communicative dynamism; cf 18.3) we oblige the receiver to infer that if, as we might expect, we learn of her decision when it is made, the new information – in the context of this specific given information – constitutes an adequate answer to the question.

Note [a] The subsidiary half of the complex fall-plus-rise nucleus (cf 18.17, App II.15) represents 'semi-given' information: eg. *Pass me my CÔAT, FRÉD* (where Fred is assumed to be present, although he has not been actually mentioned). Compare also *I went to FRÁNCE in nineteen FIFTY* with *I went to FRÁNCE last WEEK* (esp BrE) where 'last week' is not far from our minds, being recent history, and therefore need not bear the whole weight of new information. In AmE, *last week* in this sentence is likely to be treated as given information, and to receive no nuclear prominence at all:

I went to FRÁNCE last week.

[b] The notion of 'given' and 'new' isolates the two poles of least and most communicative dynamism (cf 18.3), such as *Joan* and *indigestible* in:

Joan finds seafood indigestible.

The item *seafood* is intermediate, but for the hearer who knows that Joan avoids seafood, it is towards the 'given' pole, while for the hearer who knows that Joan suffers from indigestion, it may be nearer the 'new' pole. If the hearer, on the other hand, is obliged to ask 'Who is Joan?', the speaker knows that he has misjudged even what he assumed to be 'most given'.

(Compare also:

Have you [been to the] nácon exhibition [on] [don't you like that kind of] painting [in]?)

In the second clause *that kind of painting* is presented as 'given', the speaker assuming that it will be known both which Bacon is meant and also the kind of work he did. Needless to say, a hearer is often in the position of needing to absorb the hint that has been presented as though it were unnecessary.

Theme and focus

- 18.9 There is commonly a one-to-one relation between 'given' in contrast to 'new' information on the one hand, and theme in contrast to focus on the other. THEME is the name we give to the initial part of any structure when we consider it from an informational point of view. When it occurs in its expected or 'unmarked' form (but cf 18.19), its direct relation to given information can be seen informally as announcing that the starting point of the message is established and agreed. In this sense, the definite article is thematic in relation to a noun phrase such as *the lecturer* in announcing that the identity has been established; but, comparably, in the noun phrase *the lecturer's name*, it is the genitive premodifier *the lecturer's* that is thematic. More usually, however, we apply the term 'theme' to the first element of a clause, such as the subject in *The lecturer's name wasn't announced*. Consider now these three examples as 'messages' in isolation:

The lecturer.

The lecturer's name.

The lecturer's name wasn't announced.

We should note a significant prosodic similarity between the italicized theme and the remainder of each structure. The theme's relative lack of stress mimes its status as 'given' and therefore in no need of emphasis. By contrast, the unitalicized portions are given greater prosodic prominence and it would be on these that the intonation nucleus would be placed if they were uttered as messages:

(Who led the discussion?) The [LÉCTURÉ]

(What did she want to know?) The [lÉcturer's NÁME]

(Didn't she know who was lecturing?) The [lÉcturer's 'name wasn't
ANNÓUNCED]

In other words, the new information in each case is the 'focus' of the message, and just as we saw in 18.8 that it seemed natural to place the new information after providing a context of given information, so we can regard focus (identified prosodically as we have explained in 18.4) as most neutrally and normally placed at the end of the information unit.

Since the new information often needs to be stated more fully than the given (that is, with a longer, 'heavier' structure), it is not unexpected that an

organization principle which may be called END-WEIGHT comes into operation along with the principle of end-focus. The principle of end-weight can be seen operating in the following examples:

- She visited him that very day.
 She visited her best friend that very day.
 She visited that very day an elderly and much beloved friend.

Even had the speaker/writer preferred to put the focus on the time adjunct and to locate this adjunct in its unmarked final position, the weight of the object noun phrase in the last example makes it preferable to have the adjunct at iE (cf 8.22). An even more preferred position might have been I: 'That very day, she visited ...'

Note In contrast to 'given' and 'new', which are contextually established and to that extent 'extralinguistic', 'theme' and 'focus' are linguistically defined, in terms of position and prosody respectively. With 'theme' there is an inviting alternative contrast, 'rheme', and the latter term (favoured by many linguists) will be used from time to time, especially in its adjectival form, 'rhematic', since it provides a convenient way of referring to degrees of communicative dynamism. Some linguists use the distinction 'topic'/'comment' for our 'theme'/'focus' or 'theme'/'rheme' (and sometimes for our 'given'/'new'). Others speak of given information as 'old', 'shared', or 'presupposed' information.

- 18.10** Although it is easy to see that the focus is in some obvious sense the most relevant part of a message, we must not underrate the theme, which is certainly the next most relevant. In clause structure, initial position is important for thematic presentation, and in this way it may be chosen for a wide range of items:

- (a) Subject in a statement:
He and I have studied the instructions.
- (b) Subject in a directive:
You study the instructions!
- (c) Operator in a *yes-no* question:
Is she studying the instructions?
- (d) *Wh*-element in a *wh*-question:
What is she studying?
- (e) A verb item in a directive:
Study the instructions!
Let's study the instructions!
Do study the instructions!
- (f) Adverbial (but cf 18.19) in a statement or directive:
Yet she studied the instructions.
Usually she studies the instructions.
Please study the instructions!
- (g) Conjunction:
 ... *although she studied the instructions.*

All the examples are concerned with a single issue, 'studying the instructions', with the focus on the object phrase prosodically identified by an intonation nucleus on the stressed syllable of the noun head in this phrase, which we leave unmarked as to nucleus so that it may be clear that no specific type of nuclear tone is demanded:

... the INSTRUCTIONS|

But the theme varies widely from example to example and in each case plays a semantically crucial part in stipulating, from the outset, a governing condition for the entire clause that follows. This may be an indication of the clause's structure (eg interrogative); or its structural relationship (eg subordinate); or it may indicate a semantic relation (eg concession).

The theme type (a), however, differs from the others in being given significantly less prosodic prominence. This reflects the fact that the subject of a clause or sentence (and especially a pronominal subject) is likely to be contextually 'given' information and hence to carry least communicative dynamism. It is doubtless also an acknowledgment that the declarative sentence with initial subject is grammatically the least 'marked' type of clause.

The noticeably greater prominence given to the thematic items in (b-g), therefore, appropriately gives notice that a clause is *not* beginning in the least marked form. The necessity for such a distinction can readily be seen with (b):

|You 'study the INSTRUCTIONS|

If we removed from *you* the stress implied by the 'onset' (cf App II.13), the utterance would be interpreted as a straightforward declarative, just as it would be in the following:

I notice that every time you set the alarm, you study the instructions. Is this because you keep forgetting them?

Where, as in (b-g), themes are significant enough to be given prominence at the tone unit's 'onset', they can be referred to as ONSET THEMES.

Note Onset theme should not be confused with 'marked theme', cf 18.19, though the distinction is ultimately gradient rather than absolute.

The relation between focus and new information

- 18.11** The focus indicates where the new information lies, and the intonation nucleus (which in turn signals the focus) occurs on the last appropriate syllable as determined by the prosodic rule outlined in 18.4.

It is necessary to state the correspondence in this rather broad and general way, since the new information can be anything from a syllable to a whole clause. If the nucleus falls on the last stressed syllable of the clause (according to the unmarked end-focus principle), the new element could, for example, be the entire clause, or the last element (eg complement) of the clause, or the predication of the clause. In the following sentence, we mark the extent of the new information for three possible uses of the same sentence:

Whole clause is 'new':

NEW

(What's on today?) We're going to the RACES. [1]

Predication is 'new':

NEW

(What are we doing today?) We're going to the RACES. [2]

Final adverbial is 'new':

NEW

(Where are we going today?) We're going to the RACES. [3]

The sentence as heard (and the same would of course apply to writing: cf 18.2) is neutral as to the three possible stretches of new information indicated by our marking, since the focus is at the same point in each case. Only the parenthesized questions (more broadly put, our knowledge of the context) provide the clue as to how much of the information is assumed as 'given' and how much is thus new.

When the nucleus occurs on a syllable earlier than that predicted by the principle of end-focus, however, no such openness of interpretation is possible:

NEW

(Who's going to the races?) WE'RE going to the races. [4]

(Have you decided whether you're going to the races?)

NEW

Yes, we ARE going to the races. [5]

This is an instance of 'marked' focus, to which we now turn.

Note [a] In conversation, where the sentences [2-5] were replies to the corresponding questions, it would be common of course for ellipsis (cf 19.44f) to permit only the new information to be uttered; cf 18.8. For example, in place of [2], [3], [4], and [5] we could have:

Going to the RACES. [2a]
To the RACES. [3a]
WE are. [4a]
We ARE. [5a]

[b] The contrast in the following is worth remarking:

Among those present were the Mayor and { (MIS(tz)) Martin. [6]
(mis(tz)) MArtin. [7]

In [7] the Mayor is accompanied by a woman having a different surname from his; in [6] the woman - his wife or daughter, perhaps - has the same surname as the Mayor and the speaker implies that the hearer knows already what this is.

[c] In examples like the following (especially with respect to items of personal wear), the final phrase is normally treated as given, being added only for informal clarification:

She's buying a SCARF for herself.

Contrast:

She's buying her mother a birthday present but she's also buying a SCARF for herself.

Marked focus

18.12 The principle of end-focus entails that we can confidently predict that a reader will interpret *blue* as the focal item in the written sentence:

I am painting my living room blue.

In other words, we are confident that he would read it aloud as:

I am |painting my 'living room BLUE| [1]

with an increasing degree of communicative dynamism from *painting* to *blue*. But as we have just seen in 18.11, *all* of the information in this sentence may be new, and when we reflect upon the sentence we must realize that in fact no part is necessarily more obvious or predictable than another. This means that it is perfectly possible to make the sentence informationally appropriate with the intonation nucleus (and hence the information focus) elsewhere:

I am |painting my Living room 'blue| [2]

I am |painting MY 'living room 'blue| [3]

I am PAINTING my 'living room 'blue| [4]

I AM 'painting my 'living room 'blue| [5]

I am 'painting my 'living room 'blue| [6]

It is when we move the focus from its predictable position as in [1] to another position as in [2-6] that we speak of MARKED FOCUS.

The condition for marked focus arises when special emphasis is required. Frequently this special emphasis is needed for the purposes of contrast or correction. Thus it would be easy to imagine [2] as following someone else's remark:

I am |painting my 'bathroom BLUE|

or question:

|Are you 'painting your 'kitchen BLUE|

Equally, [3] might follow on from:

|John is 'painting his 'living room BLUE|

or:

|Are you 'painting 'John's 'living room BLUE|

Again, [4] might follow on from:

I've |changed my 'mind about PAPering|

So, too, [5] might be a response to:

|Weren't you in'tending to 'paint your 'living room BLUE|

And [6] might follow on from:

|So 'John is 'painting your 'living room BLUE|

But contrast, in the sense of replacing one presumed item by another, is not the only occasion for the special emphasis of marked focus. More generally, it is a matter of adjusting the focus according to what is presupposed in a

given utterance; cf 18.8 Note [a]. The simple supply of required information may call for marked focus if the item supplying the information does not occur in the unmarked end position. This was the case with example [4] in 18.11:

[wɛ're going to the 'races]

It could also be the case in [6] above if this was in response to a *wh*-question:

[Who's 'painting your 'living room BLUE]

Note [a] Not all apparently open-class items at *E* are in end-focus. With the written version of the following sentence, we could not be confident about the assigning of the rhematic nucleus:

I am painting my living room at present.

Despite the fact that *present* can be an open-class lexical item (cf 18.4), there are good grounds for seeing unmarked focus as follows:

I am painting my living room at present

This is because the adverbial *at present* need have little more role than merely to endorse the present tense of the verb phrase.

[b] Since in reading we assign end-focus unless the context makes it unambiguously clear that the focus should be elsewhere, other devices than prosody are usefully invoked where end-focus would produce a miscue. For example, the cleft-sentence structure; cf 18.26. But for some instances of marked focus, as in [3], [4], and [5], considerable reworking is required. Thus in place of [3], we might have a written version:

The living room I am painting blue is { my own. } [3a]
mine. }

[c] Examples [3], [5], and [6] above illustrate the fact that, although focus is normally expected to fall on an open-class lexical item, exceptions can readily be made where a closed-class item requires special emphasis for contrastive or other purposes (cf 18.14). Even the articles may be thus focused:

Are you talking about THÉ 'Mrs 'Reagan (or only someone else of the same name)?

A: Did you see the po'liceman CONCERNED?

B: Well I saw A po'liceman [pronounced /ei/]

Compare also:

[yôu should worry] [= This shouldn't worry yôu]

- 18.13 In certain circumstances, it is quite normal to have the focus on a noun phrase as subject of a clause, in violation of the end-focus principle. This is frequently because, with the subject concerned, the predicate is relatively predictable and thus has lower communicative dynamism. More broadly, it reflects the fact that nouns generally convey more information than verbs. It is significant that the phenomenon in question is especially associated with intransitives, where (if English structure permitted it freely) we might expect the element order *VS*. Compare:

The [TÈLePhone's 'ringing]

The [SÛN is 'shining]

The [KÈTtle's 'boiling]

A [visitor called]

[Has your sîster 'come 'home]

Predictability is easy to see with the first two examples, but it is arguable analogously that, in a domestic context, the most obvious thing to announce about kettles is that they are boiling; a visitor cannot visit without 'calling'

at one's house; and what more predictable for a caller, interested in a person, than to ask whether she is at home? Contrast:

[Has your 'sister 'gone ÔUT]

But it is not only this extreme degree of predictability that makes a predicate carry less communicative dynamism. Consider the following sentences:

The [KÈTtle is 'missing]

The [TÈLePhone is 'out of 'order]

There seem in fact to be several possible factors that lead us to identify by focus a subject as more important than the predicate. First, the subject must be a known and named individual (*John, The President*) or else an entity or activity that has great generality or whose existence is well known (*A visitor, The kettle*). Second, the predicate denotes typically a very general or commonly associated activity (especially one that presents a starkly positive/negative choice), such as the act of appearing/disappearing; or it denotes demise or other misfortune, again of a general nature. Some examples:

The [BÈLL is 'ringing] contrast: The [bell is GLÎTtering]

My [ears are RÎNGing]

[JOHN has ar'rived] contrast: [John has FINISHED]

The [PRÉSident has 'died] contrast: [Someone has DÎED]

My [CÔAT is 'torn] contrast: My [coat is FÂWN]

[MÂRY is 'ill a'gain] contrast: [Mary is PRÊGnant again]

A [WÂSP has 'settled on you] contrast: A [wasp has 'settled on your BÂCK]

The [bÂby's 'crying] contrast: The [baby's SMÎLing]

Emphasis may be given to an initial noun phrase (or indeed to any nonfinal item) by interposing a parenthesis with its own tone unit:

[This in SHÔRT] is [why I REFÛSED]

The device is comparably valuable in writing, where this conjunct would be separately punctuated and thus allow *This* to have more weight than it otherwise would:

This, in short, is why I refused.

Although we have associated this phenomenon with noun phrases as *subject*, it arises more broadly with noun phrases in construction with succeeding verb phrases:

Joan has a PLÂNE to 'catch]

We have various PRÔblems to 'solve]

... STÛdents to 'teach]

... QUÊStions to 'answer]

... FÎGures to 'add 'up]

By contrast, where it is less congruent with or less predictably associated with the noun phrase, it is the verb phrase that might be focused:

... students to rePRÎMAND]

... texts to compÛTERize]

uttered with a wider pitch range than where it occurs in Miss Cronjager's question, with special prosodic marking also of the second repetition and of the word that is to replace it:

Was [that how you became a RÜStler]
A [RÜStler] ... [Not a RÜStler] ... a "WRÈStler]

Note [a] Radio and television announcers in both America and Britain are often accused of overusing marked focus on closed-class items (*cf* 19.34 Note).

[b] Where marked focus is required on a preposition, it is sometimes possible to achieve the required meaning with end focus by using a paraphrase. Thus beside:

... apart from his LAZiness]
we may have:

... aPÀRT from his 'laziness]

or:

... his 'laziness aPÀRT]

Compare also (in formal use, *cf* 9.56):

... notwithSTÀNDing his 'laziness] ... his 'laziness notwithSTÀNDing]

With the adverbial particle in phrasal verbs the same result is achieved merely by movement:

He's [bringing 'in the cÀses] He's [bringing the 'cases in]

This helps to explain why such particles are in final position when the object is a personal pronoun (*cf* 16.2*ff*) or is a noun phrase of very general meaning:

He's [bringing them in]
He's [bringing the thing in]
(*He's [bringing 'in the THING])
(*cf* *She's [bringing 'up the MÀtter])

Compare also:

They've [found a 'nice aPÀrtment to 'live in]
They've [found a 'nice 'place to LÌVE]

- 18.15** Just as marked focus frequently involves putting emphasis on an unexpected part of a phrase ('... ON the bed'), so also it may involve unexpected emphasis on part of a proper noun, a compound, or even an ordinary word. Whereas normally we put the main stress on a person's family name and not the first name:

Dylan THòMas

marked focus may reverse this, often but not exclusively with a view to making a correction:

But I [said DYlan 'Thomas was 'born in 1914] – [not ÉDward Thomas]
[Some 'readers pre'fer ÈMily 'Brontë] while [others 'favour CHÀrlotte
('Brontë)] but is there [anyone who 'still 'reads ÀNNE ('Brontë)]

Conversely, compound nouns with normal first-element stress (*cf* App II.7) can switch to second-element stress with marked focus:

I [just 'wanted a 'couple of PÌcture hooks] and he [started 'showing me
some 'picture Bòoks]

So also beside the normal:

He's an in[sÛrance 'agent]

we may find ourselves needing to say, 'Oh no, I'm sorry' and to correct ourselves with:

He's [not an in'surance ÁGent] He's an in[surance BRòker]

Equally, beside the normal:

It's a [chicken SÀNdwich]

we could have:

This is a [CHÌcken 'sandwich] and I'd preffer a CHÈESE 'sandwich]

As for marked focus altering the accentuation within a word, we had an example in 18.4 Note (*cf* also App II.10 on contrastive stress). This phenomenon is perhaps most familiar with negative prefixes, but it occurs with other word elements also:

(Happy?) I [thought she 'looked Ûnhappy]
(Agreeable?) I [thought he 'seemed DÌsagreeable]
It [didn't dÌscòUrage me] I [actually 'felt Èncouraged]
She [suddenly changed the subject from Èmigration] to [Ìmigration]

Focus on the operator

- 18.16** One type of marked focus that deserves separate treatment is focusing on the operator, which often has the particular function of signalling contrast between positive and negative meaning:

(A: Why haven't you had a bath?) B: I [HÀVE had a 'bath]
(A: Look for your shoes.) B: I [ÀM looking for them]
She [PRòMised] so she [MÙST 'take him 'with her]
They've ac[cepted the òffer] they [really HÀVE]

When the operator is positive, the meaning is 'Yes in contrast to No'; when the operator is negative, the meaning is contrastive in the opposite direction:

So you [HÀVEN't lost it] ['You thought you had']

It is not surprising that focus on the operator has this function, when we consider that the operator (in *yes-no* questions and in negatives) is the item most concerned in signalling the positive/negative polarity. Also, we may notice that the operator emphasizes positiveness or negativeness when it bears the focus (as it normally does) in elliptical replies:

(A: Have you seen my books?) B: [No, I HÀVEN't]
(A: Would you like black coffee?) B: [Yes, I WòULD]
(A: Does this bell work?) B: [Yes, it DòES]

This last example leads us on to the most significant point about focus on the operator, which is that when the finite verb phrase is in the simple present or past tense, and so would not otherwise have an auxiliary verb to function as operator, the 'dummy' operator DO is introduced to bear the nuclear stress. This, then, is a further example of DO-support (*cf* 3.37):

So you [DÌD go to the concert this 'evening]
[ie 'I thought you might, but ...]
But I [Dò think you're a 'good 'cook] [ie '... even if you imagine I don't]

With a rise or fall-rise as intonation nucleus, focus on auxiliaries indicating

past or future often draws contrastive attention to the tense or aspect rather than to the positive/negative polarity:

He [owns -- or DĪD own] a [Rolls RŌYCE]
 We've [sold ŌUT] but we [wĪLL be 'getting 'some]
 It [HĀS been] and [still ĩs] a [difficult TĪME]

Similarly, the nucleus on auxiliaries such as *may*, *ought to*, and *could* often signals a contrast between the supposed real state of affairs, and a state of affairs thought desirable or likely:

The opinion [polls MĀY be 'right] [ie 'but I suspect they're not']
 My [purse ŌUGHT to be 'here] [ie 'but it probably isn't']
 She [CŌULD drive you there] [ie 'but I don't think she has time']

But in courtesy enquiries about health and wellbeing, where there are in effect no information-bearing lexical items, focus on the operator carries no special emphasis:

How [ĀRE you 'these 'days]
 Well, how [ĀRE you 'now, 'Mr 'Brown]

With focus on the subject or the adverbial, some emphasis (as, for example, contrast) can be implied:

[How are YŌU 'these 'days] [How are you NŌW]

Thus we would not find:

... *these DĀYS ... *THESE 'days

If normally unstressed operators receive stress (especially nuclear stress), the effect is often to add exclamatory emphasis to the whole sentence:

That WĪLL be nice!
 What ĀRE you DŌING?
 We HĀVE enjoyed ourselves!

As noted above, DO-support is introduced where there would otherwise be no operator to bear the emphatic stress:

[You DŌ look a 'wreck]

Note On emotive emphasis, cf further 18.55f; on marked theme, with focus on the operator (as in *Stupid though he is*), cf 18.19.

Divided focus

- 18.17 It sometimes happens that we want to put nuclear focus upon two items in an information unit. An intonation pattern particularly associated with this in BrE is the fall-plus-rise contour (cf App II.17; see also 8.111 Note [c]). Compare the following:

He's [fairly CLĒver] [1]
 He's [FAIRly CLĒver] [2]

The implications differ in two ways. Semantically, [1] implies a positive

estimate, though cautiously worded, while [2] is relatively grudging and disparaging, calling in question the estimate of cleverness. Informationally, [1] is compatible with answering a general inquiry about the person ('What do you think of Alec?'), while [2] implies that the question of his cleverness has already been raised ('Alec is clever, isn't he?'). Where such DIVIDED FOCUS is realized by fall-plus-rise, therefore, the item carrying the rise is made subsidiary to the other focused item, accepts that it represents information that is to some extent 'given', but (compatible with the rise) calls its status in question. Again, compare the following possible responses to the same inquiry, 'Alec is clever, isn't he?'

I [THINK so] [3]
 I [THINK {sŌ} {he ĩs}] [4]

Compare also:

I'm [SŪRE he ĩs]

In [4] we have a strong note of reservation as compared with the relative confidence of [3]. The subsidiary item need not however carry such a reservation. Often it acts as merely confirmatory of 'given' status or confers a 'given' status where there happens to be no contextual warrant:

[William WŌRDSworth is my 'favourite 'English PŌet]

(which may be replying to the question 'Who is your favourite English poet?' or correcting a contrary statement 'I understand that John Keats is your favourite...').

[MĀNY 'people are disbe'lievers at the 'present TĪME]

In this example, the final adjunct is merely confirmatory of the tense in *are* and has no necessary connotation that the present time has been referred to; treating it with divided focus seems especially BrE; in AmE it would often be unmarked intonationally. Frequently indeed, the second focus conveys little more than courtesy, especially to one who has not been recently addressed in a particular discourse. Thus it is used with final vocatives and formulaic disjuncts:

[What's the TĪME, JŌHN] AtTĒNtion, PLĒASE]

In contrast to the fall-plus-rise, the rise-plus-fall contour is used to mark a divided focus where the first of the two focused items is made subsidiary to the second:

[HĒ is 'happy when SHĒ 'is] [She is HĀppy but 'he ĩsN't]

We can compare the two types of divided focus:

I [went to FRĀNCE in 'nineteen ĒIGHTy] [5]
 I [went to FRĀNCE in 'nineteen ĒIGHTy] [6]

[5] suggests a context in which there is discussion of what I had done in 1980, this part therefore being relatively given; [6] suggests one in which the

discussion concerns when I went to France, the rise again coinciding with the relatively given, but this time preceding the relatively new instead of following it. It might be said that $\lambda \hat{b}$ is informationally equivalent to $\hat{b} \lambda$ (or $\hat{b} \lambda$). Thus, in corrective response to 'I bet you enjoyed yourself in Spain in 1980', we might find either [5] or:

In [nineteen ÉIGHTY I went to FRÀNCE]

Note The prepositional highlighting mentioned in 18.14 frequently occurs with the pattern of divided focus discussed above:

... but in the NÓRTH [there'll be] further SNÓW]

Sometimes the first of the two focused items seems to be focused for no better reason than to slow up delivery, perhaps while the speaker is deciding exactly what to say:

... and the 'attitude RÓ (er) 'these PÉOP|e| is ap|PÁLL|ing|

But more generally the fall in such divided focus serves the purpose of making the whole phrase (and not of course merely the closed-class item) emphatic:

(He has written a book on African folklore, and he will be reading) 'extracts FRÒM his BÓOK (in the broadcast this evening).

(She hoped profoundly that they could enjoy a quiet dinner) and in'deed BÝ the ÉVENING (the quarrel had been forgotten).

The emphasis may, of course, be actually contrastive:

(They thought the weather would be better in the south) but 'actually in the SÓUTH (the snow and ice were more severe).

Compare also:

The [flight is 'now ex'pected RÒ DÉPÀRT| in [one HÓUR|

An alternative ('... 'now EXPÉCTED to DÉPÀRT') would tend to call in question the likelihood, where the relatively irregular prosodic focus on the preposition makes the departure seem more certain (cf 19.34 Note).

Concatenated focus

- 18.18 We saw in 18.17 that the rise in a rise-plus-fall divided focus sequence prepares us (with relatively 'given' material) for the fall that is to follow – on new material. It is in fact very common for a rise to function as preparatory for a climactic falling nucleus:

They |came 'last SÚNday| and they are |staying for a MÓNTH|

The phenomenon is particularly common with divided focus of the fall-plus-rise type:

I'm |not seeking BÚRglary insÚRance| but |FIRE insurance|

Compare also the following pairs:

{ They |captured 'three of our SÓLDiers|
 { They |captured THRÉE of ÓUR 'soldiers| and |we 'captured 'four of THÉIRS|
 { She ar|rived with her HÚSband|
 { She ar|rived WÍTH her HÚSband| but with|out the CHÍLDren|

Where a rise or fall-rise gives a general indication that a relevant fall is to follow, a fall-rise draws particular attention to an item that is actually to be contrasted:

Al|though 'G-'minor is a 'common 'key for MÓZart| in |BÉETHoven| it's
 |rather RÀRE|

Such anticipatory contrast may involve several focused items:

|DÝLan 'Thomas| was |born in 'nineteen-fourTÉEN| in |SWÁNsea| but
 |HÚGH 'Thomas| was |born in 'eighteen-'eighty THRÉE| in |Ánglesey|

But the contrast in such a concatenation may be anaphoric rather than anticipatory. This is the case with the fall-rise focus on *it* in the following playful exchange recorded between two friends. Notice also the repetition of the cliché 'one of God's little creatures', but without information focus when it is 'given', the point forcefully conveyed by the focus on *also*:

A: |Stop at'tacking that wÁSP| It's |one of 'God's 'little CRÉatures|

B: But |I am ÁLSo 'one of 'God's 'little 'creatures| and |it| was
 at'tacking MÉ|

Marked theme

- 18.19 The two communicatively significant parts of an information unit, the theme and the focus, are typically as distinct as they can be: one is the point of initiation, and the other the point of completion. The theme of an information unit, coming first, is more often 'given' information than any other part of it. Yet the two can coincide; for instance, when, as marked focus, the nucleus falls on the subject of a statement:

(Who gave you that magazine?) |BÍLL gave it to me| [1]

This is the extreme form of MARKED THEME, and we can compare [2] which has an unmarked theme (*He*) and minimum prosodic prominence:

He |gave me a magazÍNE| [2]

We use the term 'marked theme' to designate a theme which is given at least as much prosodic marking as that entailed by being at the point of 'onset' (cf App II.11) in a tone unit.

Clearly, theme and focus will always coincide in one-word utterances, whether these are replies, questions, or military commands. For example:

|CÓFFee| |THÁNKS|

Even so, many such short units have an initial portion that can be used as thematic preparation. A striking instance of this is found in the military order, 'Attention!' The word is typically uttered with considerable drawl on the first two syllables, and while the onset appears at the point of normal stress, in military use it is the final syllable that is given word stress and the climactic nuclear focus:

at|ten – TÍOn|

But between the extremes of a theme carrying no stress, as in:

She's |coming toNÍGHt|

and a theme coinciding with marked focus, as in:

|SHÉ's 'coming to'night|

there is a wide range of prosodic weight that can be assigned to the theme. One such point in this range we have referred to as 'onset theme' in 18.10 (cf also App II.13):

... al|though she's 'coming toNIGHT|
 |Yet she's coming toNIGHT|
 The |doctor is 'coming toNIGHT|

We perceive the theme as carrying greater prosodic weight when it is an item that is not (like subject or conjunction, for example) normally at initial position in a clause (cf 8.14f). Consider the following exchange:

A: Are you |going to in'vite tóHN| B: Oh |John I've al'ready invited|

In B's response, *John* is a marked theme and the term will be used for any such fronted item whether or not it carries (as such items commonly do) a marked focus (cf further 18.20; on fronting with amplificatory tags, see 18.59 Note [c]).

The value of marked theme in information processing can be seen in comparing the following, where [3-5] have SVC order but [6] has CSV:

John is LÁZy (but I think he will help me)	[3]
Al though 'John is LÁZy (I think he will help me)	[4]
Al though 'John is LÁZy ...	[5]
Lazy though John ís ...	[6]

In [3], *lazy* is new information; there is no assumption on the speaker's part that the listener knows. In [4], the fall-rise on *lazy* also implies that the information is new; the rise part of the complex nucleus is conditioned by the dependent status of the clause of which this is the focus. In [5] however, the simple rise on *lazy* is compatible both with the dependence of the clause concerned and the implication that the hearer already shares the speaker's view of John. In [6], making *lazy* a marked theme entirely implies the givenness of the information and additionally enables the speaker to focus upon the operator (cf 18.16) with consequent emphasis on its positive polarity (cf 15.39ff). A further example: 'Serious as has become the food shortage, worse news is to follow'; this embodies inversion of subject and verb (cf 18.22f).

Common short adverbials in initial position are often given the minimum (onset) thematic marking:

|Then he LÈFT|

Longer and semantically weightier adverbials at / will be somewhat more heavily marked themes:

"|Suddenly he LÈFT|

or they may actually be raised to the status of bearing a nuclear focus:

|sÚddenly| he |LÈFT|

Finally, we should note that marked theme can be used to draw attention to contrasting pairs, and this often involves separate tone units:

|vÈrdi| [1] is |splendid in his wÁY| [2] but |MóZart's operas| [3] I re|gard as
 'pure perFÈction| [4]

Notice the prosodic concord of the fall-rises at [1] and [3]; the one at [2] is anticipatory of the fall at [4] (cf 18.18).

Note [a] We are concerned, here as elsewhere, with the subjective perception of prosodic weight rather than what might be measured instrumentally. In the two following examples, the theme *Miami* would probably be given the same prosodic weight objectively:

(I have you considered a holiday in Miami?)

|Miami BÓRES me|

|Miami I've BÈEN to|

[7]

[8]

In recognizing *Miami* in [8] as marked theme, therefore, we are noting not only its prosodic prominence but its prominence by reason of its unusual position in the clause concerned (cf 18.20).

[b] Fronting of a relatively given predication in concessive clauses can be further seen in structures that have no directly corresponding form without fronting:

Criticize him as we may, he has some excellent qualities.

Genius as you may be, you have no right to be rude to your teachers.

A similar analysis might apply to:

Say what you will of them, ...

(See 15.39ff.) Further examples of marked theme: 'French he's quite good at', 'Now he tells me!', 'Tea I can drink at any time of day', 'I hope is all I can do'.

Grammatical aspects

Fronting

18.20 Fronting is the term we apply to the achievement of marked theme by moving into initial position an item which is otherwise unusual there. As we saw in 18.19, such a fronted item is frequently an entire sentence element. The reason for fronting may be to echo thematically what has been contextually given:

(You should take up swimming for relaxation)

|RelaxÁtion you 'call it|

Alternatively, the item fronted may be the one contextually most demanded:

|WíLson his NÁME is|

An |utter FÓOL she 'made me 'feel|

|Really 'good MÉALS they 'serve at that hotÉL|

It is as if the thematic element is the first thing that strikes the speaker, and the rest is added as an afterthought. The possible insertion of a comma in written English suggests that the nonthematic part is almost an amplificatory tag in status (cf 18.59): *Wilson, his name is*.

The foregoing have a distinctly informal flavour, but fronting is in no way confined to colloquial speech. It is very common both in speech and in conventional written material, often serving the function of so arranging clause order that end-focus falls on the most important part of the message as well as providing direct linkage with what has preceded:

That much the jury had thoroughly appreciated.

Most of these problems a computer could take in its stride.

This latter topic we have examined in Chapter 3 and need not reconsider.

To this list may be added ten further items of importance.

The definite items *that*, *this*, and *these* in these examples suggest that the marked theme in such cases most often expresses given information. It is common to find *-ing* participles fronted in similar information-processing circumstances:

Sitting at her desk in deep concentration was my sister Flora. She looked as though she had spent a sleepless night.

(Cf subject-verb and subject-operator inversion, 18.23f.)

Note [a] A fronted item, like a fronted pushdown *wh*-element (cf 11.14ff), is sometimes an element from a subordinate clause:

Everything – or nearly everything – that the Labour movement exists to stop the Tories from doing Labour will be asked to support the Cabinet in doing.

The whole of the italicized part of this example is the object of a nonfinite clause, itself a prepositional object within an infinitive clause within the main clause.

[b] Exceptionally, a part rather than the whole of a clause element may be fronted. *Yes-no* questions, for instance (as we have seen in 18.10), have part of the verb phrase only as their thematic component. In the following case, a prepositional phrase equivalent to a postmodifier of the subject complement (but cf 17.49f) acts as theme: *'Of all the early examples of science fiction, the fantastic stories of Jules Verne are the most remarkable.'*

[c] Sentences containing direct speech quotations seem to provide an example of a construction in which thematic fronting of the direct object is exceptionally easy (cf 18.23):

I said: 'That's a pity.' ~ 'That's a pity', I said.

But one may propose an alternative analysis, in which the reporting subject and verb (here *I said*) constitute a dependent comment clause (cf 15.53ff) rather than the subject and verb of the sentence. This analysis is urged by the possibility of placing them in the middle of the direct speech, as a parenthesis: *'That, I said, is a pity.'*

- 18.21 A more striking type of fronting is found in the heightened language of rather mannered rhetoric, including the strenuous colourfulness of journalistic writing. It is frequently employed to point a parallelism between two parts of a clause or between two related but contrasting parts of neighbouring clauses. The fronted parts may be prosodically marked as marked theme or marked focus, the latter typically with divided focus (cf 18.17), and they may be grammatically any of a wide range of units:

- (a) Direct object or prepositional complement:

His face not many {admired,
were enamoured of,} while *his character* still fewer
could praise.

- (b) Subject complement or object complement:

Traitor he has become and *traitor* we shall call him.

- (c) Predication adjunct:

Defiantly they have spoken but *submissively* they will accept my terms.
He might agree under pressure: *willingly* he never would.
In London I was born and *in London* I shall die.

- (d) Predication:

They have promised to finish the work, and *finish it* they will.

With predications and predication adjuncts in front position, we often find subjective-verb inversion (cf 18.23) if the subject is other than a personal pronoun:

Into the stifling smoke we plunged. [A S V]

Into the stifling smoke plunged the desperate mother. [V S]

In examples like the following, common in journalism, the fronting of the predication seems largely determined in fact by the desire to give end-focus to the subject, at the same time using (as is normal) the early part of the sentence to 'set the scene':

Addressing the demonstration was a quite elderly woman.

Shot by nationalist guerrillas were two entirely innocent tourists.

Even the cleft sentence, itself a grammatical focus device (cf 18.25ff), is subject to fronting:

They hoped that Herbert Frost would be elected and Frost indeed it was that topped the poll.

Note Parallelism in fronting often corresponds to contrastive focus in speech. For example:
I was BORN in London and I shall die in London.

Inversion

- 18.22 As we have just seen, the fronting of an element is often associated with INVERSION. We distinguish two types, consisting respectively in the reversal of SUBJECT and VERB and the reversal of SUBJECT and OPERATOR.

Since the verb BE as a copula can be simultaneously regarded as verb and operator, we have a choice of regarding its placement before the subject as an instance either of subject-verb or subject-operator inversion. As the examples in 18.23 and 18.24 show, the decision is made according to whether BE, in the given construction, is commutable with another main verb or with another operator.

Subject-verb inversion

- 18.23 The clause patterns SVC and SVA (cf 10.1ff) have their obligatory third element in large measure because the V is commonly of itself so lacking in communicative dynamism:

SVC: Her oval face was especially remarkable. [1]

SVC: The sound of the bell grew faint. [2]

SVA: His beloved body lies in a distant grave. [3]

In consequence, where information processing makes it desirable to front the third element concerned, the result would tend to be bathetic or misleading if normal order were preserved with the SV, suggesting that a nuclear focus be placed, inappropriately, on the verb (cf 18.13):

CSV: ? Especially remarkable her oval face was. [1a]

CSV: ? Faint the sound of the bell grew. [2a]

ASV: (?) In a distant grave his beloved body lies. [3a]

If these were not to be dismissed as merely bad style, we would tend to read [1a] as equivalent to '... certainly was'; [2a] as 'growing louder, though nonetheless faint'; [3a] as 'being in prone posture' (rather than, say, foetally curved). In consequence, such fronting naturally carries with it the inversion that puts S in final position, and indeed it is to achieve end focus on the S that the fronting is generally undertaken:

- CVS: Especially remarkable was her oval face. [1b]
 CVS: Faint grew the sound of the bell. [2b]
 AVS: In a distant grave lies his beloved body. [3b]

These particular examples have a rather mannered tone (poetic in the case of [2b] and [3b]), but the phenomenon is common enough in ordinary informal speech:

Here's the milkman.
 Here comes my brother.
 And there at last was the book I'd been looking for.
 (The jets caused a great gust of wind and) off flew their hats.
 Down came the rain.
 Up went the flag.

In these instances with *here/there + be*, indeed, it is not simply a matter of stylistic choice: there is a sharp difference of meaning from the alternatives with SVA order. Although we must distinguish these from existential *there* (cf 18.45), there is in fact a close similarity. In contrast to ASV, the SVA order invites us not merely to put the nuclear focus upon the A but to see these adjuncts as referring to specific places. Compare:

- { Here's the milkman – he's come at last.
- { The milkman is here – at the door: shall I get two pints?
- { There's the book I want – I've been looking for it all week.
- { The book is there – by the typewriter.

Further examples which are less common in ordinary speech but yet which equally seem less rhetorically unnatural than [1b], [2b], and [3b]:

There at the summit stood the castle in all its medieval splendour.
 By 'strategy' is meant the basic planning of the whole operation.
 Away ran the terrified boy.
 Slowly out of its hangar rolled the gigantic aircraft.
 Equally inexplicable was his behaviour to close friends.

Subject-verb inversion (as distinct from subject-operator inversion; cf 18.24) with fronted object is chiefly limited to the reporting clauses where the object represents direct speech (including speech that is 'thought') and usually where the subject is not a personal pronoun:

- 'Please go away' said one child. 'And don't come back', pleaded another.
 'Whatever shall I do now?' wondered Fred, remembering – too late – the appointment he had missed.

This is something of a literary convention, and in ordinary speech, VS would usually be replaced by SV (cf also 18.20 Note [c] and 14.20, 14.29). With the

verb *say*, it is possible to have OSV where the O is the substitute *so*, though this is felt by some to be archaic:

So say the rest of us.

More important are CVS, AVS, where the C and A make comparative reference to something that has preceded:

His answer was a disgrace; *equally regrettable* was his departure immediately afterwards.

Her face was stony and *even stonier* was the tone of her voice.

A year ago, two crashes occurred at the corner, and *more recently* has come the news of a third.

- Note [a] Subject-verb inversions occur with simple present and past tense verbs (contrast *Here comes my brother* with **Here is coming my brother*), and with certain verbs of stance (*be, stand, lie*, etc) or with very general verbs of motion (*come, go, fall*, etc).
 [b] Subject-verb inversion does not usually take place in a clause with a personal pronoun alone as subject; hence corresponding to some of the examples above we would have *Here he is, Here he comes, Away he ran*, rather than **Here is he*, etc. But with contrast of subject, note:
 There was *she*, on the tennis court, while *I* had to work.
 Here am *I*, ill in bed, and *you* don't seem to care.
 [c] There is inversion with a pronoun subject followed by post-modification in archaic English: *Happy is he who is reconciled with his lot*. There is an analogous inversion with verbless clauses: *Unlucky the man who hates his work*.

Subject-operator inversion

18.24 In addition to the inversion in questions, there are four common circumstances in which the operator precedes the subject.

(a) First we have elliptical clauses with initial *so* or the corresponding negatives *neither* or *nor* (cf 12.10, 12.17, 12.29):

John saw the accident and so did Mary. [cf ... and Mary did (so), too.]

John didn't see the accident and { *neither* } did Mary. [cf: ... and
 { *nor* } Mary didn't, either]

She was angry and so was I.
 She wasn't angry and neither was I.
 He would love to go and so would she.
 She must come and so must you.
 He might fail and so might she.

But inversion is less common with certain modal auxiliaries (notably *may, might, ought*), and alternative substitute expressions with normal order are preferred:

She might be ill and he might (be) too.

Initial *so* in elliptical clauses may be followed by normal order when focus is required on the operator rather than the subject, though *so* is then liable to be mistaken for a conjunct (cf 8.134ff):

(You asked me to leave) and *so* I did [undoubtedly conjunct in: 'and so I did']

Compare also the subjunct *so* in:

(He wanted to leave) and [so did I]

More formally '(He wanted to leave,) as did I'; cf (c) below.

(b) Secondly, we have S-op inversion where a phrase of negative form or meaning is fronted (cf 10.58f):

Least of all is it in our interest to open negotiations now.
At no time must this door be left unlocked.

Contrast:

At certain times this door may be left unlocked.
*At certain times may this door be left unlocked.

Further examples:

He refused to apologize. Nor would he offer any explanation.
Scarcely had he started speaking when heckling broke out.
(contrast: He had scarcely started speaking when heckling broke out.)
Only in this way } is it possible to explain their actions.
In this way alone }

As well as with adverbials, we may have inversion also with object phrases of negative form or meaning:

Not a single book had he read that month.
Only one more point will I make.

(c) Thirdly, we have S-op inversion in comparative clauses when the S is not a personal pronoun:

Oil costs less than would atomic energy.
(cf: Oil costs less than it did ~ *... did it)
I spend more than do my friends.
She looks forward, as does her secretary, to the completion of the building.

With *as*, inversion is possible with a pronoun subject, especially if there is no correlative *as*:

(?) She was as delighted with the suggestion as was he.
They go to concerts frequently, as do I.

(d) Finally, S-op inversion occurs in subordinate clauses of condition and concession (cf 15.33ff), especially in rather formal usage:

Were she alive today, she would grieve at the changes.
Were we to withdraw our support, they would be justifiably indignant.
Had I known, I would have gone to her.
Should you change your plans, please let me know.
Even had the building been open, we would not have entered.

It is to be noted that with negative clauses of this form we do not find contraction:

Were she not so handicapped, we would take her to the Alps.
(Cf: *Weren't she so handicapped...)

Note [a] With examples like the following, the inversion involves the main verb rather than the operator:

So absurd was his manner that everyone stared.
This is shown by the fact that a whole verb phrase could replace *was*:

So absurd *had been* his manner that everyone stared.

Yet S-op inversion can also occur here: 'So absurd *did* his manner *seem*...'. In older English in any event, S-op inversion occurred without a preceding negative and some instances continue to be used in very formal style:

He invested the money - and bitterly did he come to regret it.
Often had she intended to speak of this.

In addition, there are a few examples in more common use but where the inverted expression is frozen and idiomatic:

Far be it from me to condemn him in any way.

This example of course has a negative implication, as is shown by the nonassertive form of the final adverbial.

[b] If an initial negative item is the vehicle for only a local negation (cf 10.66), no S-op inversion is possible. Thus, with the sentence adjunct (cf 8.36) in:

Not without reason, Charles had flown into a rage.

[= 'He had flown into a rage and it was not without reason']

Contrast, with predication adjunct (cf 8.27):

Not without reason had Charles flown into a rage.

[= 'He hadn't flown into a rage without reason']

Analogously:

Very rarely, Mary received letters from her brother.

[= 'She received letters, but very rarely']

Very rarely did Mary receive letters from her brother.

[= 'She didn't receive letters very often']

[c] For many speakers (especially in AmE), the subjunct *nor* cannot follow *and* or *but*, though fewer object to its following the latter:

(?) We could not hear the soprano, but *nor* could some friends who were nearer the front.

The item *nor* (cf 13.40) usually follows a clause that is negative in form or meaning, but in very formal usage this restriction does not obtain:

Veronica Taubman's oration was magnificent. *Nor* could anyone fail to be impressed by both her learning and her wit.

Cleft and pseudo-cleft sentences

18.25 In 18.20, we looked at examples of fronting where no other grammatical change was involved beyond the movement of the fronted item. For example, the direct object in:

His callousness I shall ignore.

[1]

This might occur in a discussion of the bases on which the speaker proposes to criticize an opponent.

We now turn to devices for giving prominence to such an item as in [1] by more elaborate grammatical means, involving the division of the sentence into two clauses, each with its own verb:

It is *his callousness* that I shall ignore.

[2]

What I shall ignore is *his callousness*.

[3]

The thing I shall ignore is *his callousness*.

[4]

His callousness is something I shall ignore.

[5]

By reason of the division, these constructions have been called 'cleft sentences', though we shall distinguish the CLEFT SENTENCE proper, as in [2], from the PSEUDO-CLEFT sentence represented most typically by [3]. Although they are syntactically more complex than sentences with mere fronting, cleft sentences are in general less rhetorically obtrusive. It should not be thought, however, that they are merely stylistic variants. Each of the five examples, [1-5], carries distinct implications, especially in relation to given and new.

Cleft sentences

- 18.26 Of the four construction types [2-5] in 18.25, it is [2] that is the most flexible in what it will permit to be fronted. Moreover, its form, comprising the subject pronoun *it* as an empty theme, followed by the verb *be*, makes it natural to achieve focus on the item that follows: in effect, end-focus within an SVC clause:

It is his CALLousness.

For this reason, while very common in spoken English, the construction is particularly convenient in writing, since it provides unerring guidance to the reader in silently assigning appropriate prosody. But the cleft sentence does not of itself indicate what the appropriate prosody is. Essentially, the cleft sentence indicates divided focus (cf 18.17), and which of the two focused items is dominant (*ie* new) will depend on the context.

- A: You should [criticize his CALLousness]
 B: [No, it is his CALLousness] that I shall ignore!
 [callousness given, ignore new]
 A: You should ignore his DISHonesty!
 B: [No, it is his CALLousness that I shall ignore]
 [callousness new, ignore given]

- Note [a] Despite the obvious similarities between the *that*-clauses in cleft sentences and the nominal *that*-clauses of 15.3ff, the two are quite distinct (cf 18.28).
 [b] Objection is sometimes made to the habit (especially perhaps in BrE radio and television news) of using the cleft sentence structure with an item that might be less obtrusive with simple fronting. Thus, in place of the following, where a time adjunct is made thematic, not because it is given, but merely as scene-setting to the weightier information that is to come:

Late last night a group of terrorists attacked an army post.
 we might hear in a news broadcast:

It was late last NIGHT that a group of terrorists...

This conveys unwarrantably the impression that the fact of the attack was known to the hearer but not the time at which it had taken place. The habit can be defended in that an adjunct (especially of time or place) is a fitting scene-setting and that it is this function that the cleft structure emphasizes. There is a comparable stylistic cliché to be found in conventional narrative. In place of a straightforward sentence such as:

When Harry returned that night, he found that his wife was very troubled.
 a rather mannered form of writing might have (cf 17.3 Note):

It was a very troubled wife that greeted Harry on his return that night.

- [c] Subject pronouns other than *it* sometimes occur:

(No,) *that* was the doctor I was speaking to.

Those are my FEET you're treading on.

He was a real GENIUS that invented this.

In each of these, we could find divided focus (cf 18.17), with a rising tone on *speaking, treading, and this*.

- 18.27 The flexibility of the cleft sentence device can be seen in the ease with which different parts can be highlighted. Consider the sentence:

John wore a white suit at the dance last night.

From this, four cleft sentences can be derived. In the following, we shall assume that the aim in each case is to make the second focus subsidiary as relatively 'given':

S as focus:

It was JOHN { who / that } wore a 'white' suit at the DANCE 'last 'night'

O_i as focus:

It was a [white SUIT (that) 'John 'wore at the DANCE 'last 'night'

Λ_{time} as focus:

It was [last NIGHT (that) 'John 'wore a 'white 'suit at the DANCE]

Λ_{position} as focus:

{ It was at the [DANCE that 'John 'wore a 'white SUIT 'last 'night'
 It was the [DANCE (that) 'John 'wore a 'white SUIT at 'last 'night'
 <informal>

Two other clause elements can marginally act as the initial focus of a cleft sentence:

O_i as focus:

?It's *me* (that) he gave the book.

But more usually O_i would be replaced by a prepositional phrase:

It's *me* he gave the book *to*.

It's *to me* that he gave the book.

C_o as focus:

It's *dark green* that we've painted the kitchen.

There are severe restrictions (except informally in Irish English) on the use of C_s in this function, especially with the verb *be* at the end of the second clause and especially when C_s is realized by an adjective phrase:

?It's a *genius* that he is.

?It's a *lecturer* that I am now.

?It's *very tall* you are.

But, without these restrictions, C_s can be acceptable:

It was a *doctor* that he eventually became.

The V element does not occur at all as focus, just as it does not occur as a *wh*-element (cf 2.50):

*It's *wore* that John a white suit at the dance.

Informally, we sometimes find a predication fronted in a cleft sentence, the

V element made nonfinite and then subsequently replaced by *do* in the second clause; examples like the following are regarded, however, as stylistically awkward (again except in informal Irish English):

- ?It was *teach English in a school* that he did at that time.
 ?It was *teaching English in a school* that he was doing at that time.
 ?Is it *spying on us* he is?

Note [a] If the initial focal item is a personal pronoun, it may informally be in the objective case even though it is in fact a subject (of the *that*-clause) and the usage is hence widely condemned:

It was $\left\{ \begin{array}{l} \text{they} \\ \text{she} \\ \text{?her} \\ \text{?them} \end{array} \right\}$ that gave the signal.

Compare with fronting within the matrix clause: 'She it was that gave the signal'.

[b] Though the verb form in the first clause of a cleft sentence is usually simple present or past, forms with modals are perfectly possible:

It *may be* his father that you're thinking of.

It *would have been* at that time that he went to live in Wisconsin.

Decision between present and past, however, is somewhat complicated. Where the verb of the second clause is present, that of the first will be present:

It is novels that Miss Williams enjoys reading.

*It was novels that Miss Williams enjoys reading.

Cf: Was it novels that you said Miss Williams enjoys reading?

Where the second verb is past, the first can always be past:

It was novels that Miss Williams enjoyed as a pastime.

It was as a pastime that Miss Williams enjoyed reading novels.

But the first verb may be in the present where the persons concerned are still living or the objects concerned still familiar in the participants' experience:

It is Miss Williams that enjoyed reading novels as a pastime.

It is these very novels that Miss Williams enjoyed reading as a pastime.

*It is as a pastime that Miss Williams enjoyed reading novels.

[c] The cleft sentence structure can be used in questions, exclamations, and subordinate clauses; we italicize the first focal item:

Was it *for this* that we suffered and toiled?

Who was it who interviewed you?

What a *glorious bonfire* it was you made!

He told me that it was *because he was ill* that they decided to return.

[d] It should be clear that in singling out an item for highlighting in the cleft sentence, strong presuppositions are entailed. Thus beside 'Bill didn't come to the party', we can have:

It was Bill that didn't come to the party. [1]

It wasn't Bill that came to the party. [2]

In [1], it is suggested that a memory search is trying to identify a missing guest, while [2] is concerned with converse reflections on who had in fact been present.

- 18.28 The second clause in a cleft sentence is obviously similar in structure to a restrictive relative clause; and yet (as we shall see below) there are considerable differences. Examples above show that pronouns used in relative clauses (*who*, *that*, 'zero' pronoun) are also used to introduce cleft sentences. Also suggestive of the relative clause is the fronting of the pronoun; moreover, as in relative clauses, the pronoun can be fronted from a position in a prepositional phrase, or from a pushdown (cf 11.18) position in a noun clause as object:

It's *the girl* that I was complaining about. [*ie* not the boy]

It's *next week's match* that he's hoping to attend. [*ie* not this week's]

It's *this watch* I said I would let you have. [*ie* not that]

There are differences from relative clauses, however, in that the *wh*-forms are rare in cleft sentences in comparison with *that* and *zero*. Although *whose* is allowed in cleft sentences (*It's Uncle Bill whose address I lost*), *whom* and *which* are only marginally possible, and it is virtually impossible to use *whom* or *which* preceded by a preposition. Thus:

It was the dog to which I gave the water.

can be read only as a sentence containing a postmodifying relative clause (compare *She was the woman to whom I gave the water*), and not as a cleft sentence. Characteristic intonation is also different:

It was the DOG I gave the WATER to [cleft sentence]

It } was *the dog I gave the WATER to* [SVC sentence, the C being the
 That } italicized noun phrase incorporating a relative clause]

A further difference between the postmodifying relative clause and the clause following the first focused element in cleft sentences is the ability of the latter to have as its antecedent (*ie* the first focused element) not only an element realized by a noun phrase but an adjunct realized by a clause or prepositional phrase:

It was *because he was ill* (that) we decided to return.

It was *in September* (that) I first noticed it.

Indeed, such a construction, where there is no noun-phrase antecedent, makes inappropriate the use of the term 'pronoun' for the linking word *that*. It is noteworthy that a *wh*-relative pronoun cannot be used in cleft sentences where the focused element is an adjunct, and where consequently *that* does not have a strict 'pronominal' status:

*It was because he was ill *which* we decided to return.

Note Mention might be made of two further contrasts between relative clauses and the type of 'annex' clause that occurs in cleft sentences. One is the possibility, in familiar English, of omitting *that* as subject in a cleft sentence, but not as subject of a relative clause:

It was the President himself *spoke to me*.

The other is that cleft sentences may have a proper noun as a focus element, whereas restrictive relative clauses cannot have a proper noun as an antecedent. Thus *It's Chelsea (that) he lives in* is unambiguously a cleft sentence.

Pseudo-cleft sentences

- 18.29 The pseudo-cleft sentence is another device whereby, like the cleft sentence proper, the construction can make explicit the division between given and new parts of the communication. It is essentially an SVC sentence with a nominal relative clause as subject or complement (cf 15.8f). It thus differs from the ordinary cleft sentence in being completely accountable in terms of the categories of main clause and subordinate clause discussed in Chapter 10 (and cf 18.26, Note [a]). The following are virtually synonymous, assuming focus upon *rest*:

It's a good rest that you need most.
A good rest is what you need most.

The pseudo-cleft sentence occurs more typically, however, with the *wh*-clause as subject, since it can thus present a climax in the complement:

What you need most is a good rest.

It is less restricted than the cleft sentence (but cf 18.30) in one respect, since, through use of the substitute verb *do*, it more freely permits marked focus to fall on the predication:

What he's done is (to) spoil the whole thing.
What John did to his suit was (to) ruin it.
What I'm going to do to him is (to) teach him a lesson.

In each of these, we would have an anticipatory focus on the *do* item, the main focus coming at normal end-focus position. Thus: '... DÓNE ... THING'. The complement of these sentences is normally in the form of an infinitive clause (with or without *to*). When the verb in the *wh*-clause has progressive aspect, however, the complement (except in the case of *be going to*) matches it with an *-ing* clause (cf 18.27):

What I'm doing is teaching him a lesson.

The constraints are the same as for the pro-predicational *do*; cf 12.21. Occasionally, such matching of the two verbs is extended to verbs in the perfective aspect, which can have as their counterpart an *-ed* clause:

(?) What he's done is spoiled the whole thing.

This last type is, however, of doubtful acceptability, and instances of it may indeed be interpreted as ellipted forms of an alternative construction involving apposition:

What he's done is ((this): he's) spoilt the whole thing.

- 18.30 In some respects, the pseudo-cleft sentence is more limited than the cleft sentence proper. It is indeed only with *what*-clauses that we can make a direct comparison (or choice) between the two constructions. Clauses with *who*, *where*, and *when* are sometimes acceptable, but mainly when the *wh*-clause is subject complement:

Here is where the accident took place.
(In) Autumn is when the countryside is most beautiful.
(?) The police chief was who I meant.

Clauses introduced by *whose*, *why*, and *how* do not easily enter into the pseudo-cleft sentence construction at all:

* With a Scottish accent is how he talked.
?* Why we decided to return was because he was ill.

To compensate for these restrictions, there are numerous 'paraphrases' of the pseudo-cleft construction involving noun phrases of general reference in place of the *wh*-item. Thus beside the cleft:

It must have been the manager that spoke to you.

we have a noun phrase in place of the pseudo-cleft:

The person who spoke to you must have been the manager.

So also:

Somebody I particularly like is John.
The way you should go is via Cheltenham.
The way we make a cake is by following mother's recipe.
The reason we decided to return was {that because <informal>} he was ill.
The place (where) the accident happened is here.
The time when the countryside is most beautiful is (in) autumn.
The hour at which she must make her decision was fast approaching.

Compare:

The hour was fast approaching at which she must make her decision.

See further 18.39.

Note [a] The device of general antecedent is also found where a corresponding pseudo-cleft is fully available:

The thing {
What } I like about Joan is her sense of humour.

[b] The cleft and pseudo-cleft types can cooccur. For example:
What it was you asked for was a ticket to Brighton. Did you mean Birmingham?

Postponement

- 18.31 It will be clear from the examples in the foregoing sections that one important communicative difference between the two types of cleft construction is that while the cleft sentence with *it* is often used to put the main focus near the front of the sentence, the pseudo-cleft is chiefly used to postpone the focus to end position. In this respect it is often in competition with the passive (cf 18.32):

The manufacturers tested the device.

Focus is placed on the noun phrase *the manufacturers* by means of the passive in [1] and by means of the pseudo-cleft in [2]:

The device was tested by the manufacturers. [1]
The people who tested the device were the manufacturers. [2]

It should be noted that [2] presupposes that the hearer knows that testing has taken place; with [1] this is not so.

Given the importance of end focus (*cf* 18.3), it is not surprising that English has numerous resources to enable us to phrase a sentence in such a way as to ensure the distribution of information according to our wishes. There are, for example, lexical and grammatical devices which reverse the order of roles:

- { An uncle, three cousins, and two brothers *benefited from* the will.
- { The will *benefited* an uncle, three cousins, and two brothers.
- { An unidentified blue liquid *was in* the bottle.
- { The bottle *contained* an unidentified blue liquid.
- { A red sports car *was behind* the bus.
- { The bus *was in front of* a red sports car.

The items or sequences in italics are converses; *ie* they express the same meaning, but with a reversal of the order of participants. The second sentence in each pair will be generally preferable, since the element with the 'definite' meaning, containing given information, would normally not take end-focus.

Note A special case of converseness is the relation of reciprocity expressed by certain terms such as *similar to*, *different from*, *near (to)*, *far from*, *opposite*, *married to*, where reversing the order of the participants preserves the essential meaning without any other change in the construction:

My house is opposite the hotel. = The hotel is opposite my house.

A more complex relation of converseness is illustrated by:

- { The dealer *sold* the car *to* my friend.
- { My friend *bought* the car *from* the dealer.

Compare also *rent to/rent from*, *lend (to)/borrow from*, *give (to)/receive from*.

Voice and postponement

- 18.32** With transitive clauses, the passive voice provides a convenient way of postponing the agentive subject by turning it into the agent in a passive construction (*cf* 3.63ff). We thus reverse the active order of the agentive and affected elements (*cf* 10.19) where the agentive requires end focus:

A: Who makes these tablemats?

B: They are made by my sister-in-law.

A preference for end-focus (in this instance, coinciding with end-weight) can even override an aversion to passive constructions that are in themselves rather awkward (*cf* 16.14):

The regulations *were taken advantage of* by all the tramps and down-and-outs in the country.

A finite clause as subject is also readily avoided by switching from the active to the passive voice:

- { That he was prepared to go to such lengths astounded me.
- { I was astounded that he was prepared to go to such lengths.

It was pointed out in 18.27 that the V element cannot be focused in the cleft-sentence construction. Where such focus is desirable with an intransitive verb, end-focus is easily achieved; with a transitive verb, it can be achieved by the use of the passive, provided that the agent can be ignored as either given or otherwise dispensable (*cf* 3.71). Thus in place of:

But our [scientists 'finally SOLVED 'all 'these 'problems]

we can have, ignoring the noun phrase *our scientists*:

But [all 'these 'problems were 'finally SOLVED]

The passive can also ensure a smooth crescendo of communicative dynamism with ditransitive verbs by making the indirect object thematic. Thus, after 'Marion performed well for the judges', we might hear:

They a|warded her the PRIZE|

But both *they* and *her* are obviously 'given' and there is thus a break in the crescendo of new information between the subsidiary *awarded* and the focal *prize*. Such a break is avoided in the alternative passive, now ignoring the active subject *they*:

She was a|warded the PRIZE|

Note [a] It should be noted that the principle of end-focus applies just as much to the ordering of clauses within a sentence as to the ordering of elements within a clause. The principle of end-focus also has its analogue at sentence level in the principle of RESOLUTION (*cf* 14.37).

[b] The passive of *have* is rarely used, but when it occurs, the verb has a transitive meaning usually absent from the active. Compare:

(People) have little satisfaction from pop music.

with the following examples which combine existential *there* (*cf* 18.45) with the passive:

There's little satisfaction to be had from pop music.

I wanted to buy sherry but there was none to be had.

[c] Together with the phenomenon of discontinuous noun phrases (*cf* 18.39), the following textual example uses the passive to enable *no mention* to be thematized and *the police* to be focused (at some cost in possible misunderstanding of the written form of the sentence):

No mention is made in the report of the police.

[= They make no mention of the police in the report.]

Extraposition

Extraposition of a clausal subject

- 18.33** Postponement which involves the replacement of the postponed element by a substitute form is termed **EXTRAPOSITION**. It operates almost exclusively on subordinate nominal clauses. The most important type of extraposition is that of a clausal subject – *ie* a subject realized by a finite or nonfinite clause. The subject is moved to the end of the sentence, and the normal subject position is filled by the anticipatory pronoun *it*. The resulting sentence thus contains two subjects, which we may identify as the **POSTPONED SUBJECT** (the one which is notionally the subject of the sentence) and the **ANTICIPATORY SUBJECT** (*it*). A simple rule for deriving a sentence with subject extraposition from one of more orthodox ordering is:

subject + predicate ~ *it* + predicate + subject

Thus:

To hear him say that + surprised me ~ It + surprised me + to hear him say that

But it is worth emphasizing that for clausal subjects (though cf 18.34) the postponed position is more usual than the canonical position before the verb (cf 10.26). Examples are:

Type SVC: It is a pleasure *to teach her*.

Type SVA: It was on the news *that income tax is to be lowered*.

Type SV: It doesn't matter *what you do*.

Type SVO: It surprised me *to hear him say that*.

Type SVOC: It makes her happy *to see others enjoying themselves*.

Type SV_{pass}: It is said *that she slipped arsenic into his tea*.

[cf Note [a]]

Type SV_{pass} C: It was considered impossible *for anyone to escape*.

Note [a] For certain constructions which have all the appearance of clausal extraposition (*It seems/appears/happened/chanced/etc*), the corresponding nonextraposed version does not occur. For example, there is no sentence **That everything is fine seems to correspond with It seems that everything is fine*, nor do we find **That she slipped arsenic into his tea is said*. In such cases, we may say that the extraposition is obligatory. With *be*, this type of extraposition is used for expressions of possibility and (especially) for reflective questions:

It may be that she no longer trusts you.

Could it be that you left the keys in your office?

Other characteristics of the verbs entering into this category are presented in 18.36.

[b] Clauses with extraposed subject must be distinguished from superficially similar clauses in which it is a personal pronoun or empty 'prop' subject: *It's good to eat* (ie 'This (fish, etc) is good to eat'); *It's lovely weather to go fishing* (cf 10.32f).

[c] *If*- and *when*-clauses behave very much like extraposed subjects in sentences like:

It would be a pity if we missed the show.

[cf *It is a pity that we missed the show*]

It'll be a great day when you win the sweepstake.

It is doubtful in each case, however, whether the clause could act as subject, although it could act as initial adverbial clause: *If we missed the show, it would be a pity* (cf 10.9ff). On balance, therefore, these appear to be adverbials rather than extraposed subjects. Contrast: *For us to miss the show would be a pity* ~ *It would be a pity for us to miss the show*.

[d] Another marginal case is the 'phrasal extraposition' of *It's two hundred miles from Boston to New York*, where the prepositional phrase sequence, if fronted, could act either as subject or as adverbial: *From Boston to New York (it) is two hundred miles*.

Compare also: *It's Wednesday today*; *Today (it) is Wednesday* (cf 10.15).

[e] While the extraposed clause can only rarely be a nominal relative in type SV, it is even rarer with SVC: *Whoever said that was wrong* but **It was wrong whoever said that*. In examples like *It's a mystery why she did it/how he does it*, the *wh*-clauses are best regarded as indirect interrogatives; cf 14.33.

[f] The *it* used in extraposition is called 'anticipatory *it*', because of its pronominal correspondence to a later item. But informationally, this *it* is similar in effect to *prop it* (cf 6.17), as in '*It started to rain*' which likewise enables us to end the clause at a focal point. Contrast *Rain was starting*. Compare also *It was snowing beside Snow was falling*.

Extraposition of -ing clauses

18.34 Although we mentioned (18.33) that extraposition is usual for clausal subjects, there is an exception with -ing clauses which occur very naturally in ordinary subject position:

Teaching her to drive turned out to be quite enjoyable.
Getting the equipment loaded was easy.

Extraposition of -ing clauses is in fact uncommon outside informal speech. Compare:

It was easy *getting the equipment loaded*.

Some common informal examples are:

It's no use *telling him that*.

It wouldn't be any good *trying to catch the bus*.

The -ing clause often shows itself incompletely adapted to the extraposition construction, notably by being resistant to bearing the main information focus. Rather than:

It's [fun being a H₀stess]

we hear:

It's [F₀un being a H₀stess]

with main focus on the first element of the predicate. In writing, this example could well be punctuated as:

It's fun, being a hostess.

We might conclude from this that the participial clause has just as much affinity with a noun-phrase tag (cf 18.59; eg: *He's a friend of mine, that man*) as with a genuine extraposed subject.

Extraposition of a clausal object

18.35 When the object is an -ing clause in SVOC and SVOA clause types, it can undergo extraposition; when it is a *to*-infinitive clause or a *that*-clause, it must do so:

SVOC { You must find *it* exciting *working here*.
Cf: You must find *working here* exciting.
Working here is exciting.
I made *it* my objective *to settle the matter*.
Cf: *I made *to settle the matter* my prime objective.
To settle the matter was my prime objective.
Contrast: I made *settling the matter* my prime objective.
*I made *it* my prime objective *settling the matter*.

SVOA { I owe *it* to you *that the jury acquitted me*.
Cf: *I owe *that the jury acquitted me* to you.
Contrast: I owe *my acquittal* to you. [with corresponding nominalization]
Something put *it* into his head *that she was a spy*.
Cf: *Something put *that she was a spy* into his head.
Something put *the idea of her being a spy* into his head.

The construction type *She's a pleasure to teach*

- 18.36 Where the extraposed clause of 18.33 is of type *SVC* and comprises an object or prepositional complement, the noun phrase concerned can sometimes be fronted to become the theme in place of *it*. For example:

To teach Elizabeth is a pleasure.
 ~ It is a pleasure to teach Elizabeth. (cf 18.33)
 ~ Elizabeth is a pleasure to teach.

Compare also:

It's impossible to deal with him. ~ He's impossible to deal with.
 It's easy/difficult to beat them. ~ They're easy/difficult to beat.
 It's fun (for us) to be with Margaret. ~ Margaret is fun (for us) to be with.

This thematic fronting does not apply to all constructions of the same kind. For instance, with:

It's $\left\{ \begin{smallmatrix} \text{rare} \\ \text{odd} \end{smallmatrix} \right\}$ to $\left\{ \begin{smallmatrix} \text{find} \\ \text{lose} \end{smallmatrix} \right\}$ them.

there is no corresponding:

*They are $\left\{ \begin{smallmatrix} \text{rare} \\ \text{odd} \end{smallmatrix} \right\}$ to $\left\{ \begin{smallmatrix} \text{find} \\ \text{lose} \end{smallmatrix} \right\}$.

(See further 16.72f)

There is a similar construction for *be sure, be certain, seem, appear, be said, be known*, etc, except that in these cases the corresponding construction with anticipatory *it* requires a *that*-clause, not a *to*-infinitive clause, and except also that it is the *subject* of the extraposed clause that is fronted:

It's certain that we'll forget the address. ~ We're certain to forget the address.
 It seems that you've made a mistake. ~ You seem to have made a mistake.
 It is known that he's a coward. ~ He's known to be a coward.

Note [a] A combination of the movement explained in 18.33–34 permits a valuable range of sentence forms adjusting the development of communicative dynamism and the assignment of end-focus as desired. Thus along with the canonical *SVC* sentence:

To play 'Mozart on 'this viol'in is deLIGHTful
 we have three further possibilities. First, with ordinary *it* extraposition:

It is deLIGHTful to play 'Mozart on 'this viol'in

Secondly, with thematization of the object *Mozart* in the extraposed clause, we emphasize even more the properties of the violin:

[Mozart is deLIGHTful to 'play on 'this viol'in]

Thirdly, with thematization of the prepositional complement, we switch attention to the properties of Mozart's music:

[This viol'in is deLIGHTful to 'play MÓZart 'on]

The shifting relations of the adjective can perhaps be seen more clearly in the following:

This jug is dIfFicult to pour CRÉAM out of

[CRéam is dIfFicult to pour out of this JÚG]

The former implies difficulties with the jug (perhaps its spout is too narrow); the latter implies difficulties with cream (perhaps it is too thick).

[b] We must make a clear distinction between the type of thematic fronting discussed here (where the item assumes maximally 'given' status) and the fronting discussed in 18.20f, where the item retains its nonsubject status grammatically and is given greater rhetorical emphasis. Contrast the following pairs:

$\left\{ \begin{smallmatrix} \text{[Mozart is deLIGHTful to play on this viol'in]} \\ \text{[MÓZart] it is deLIGHTful to play on this viol'in]} \\ \text{[Elizabeth is a 'pleasure to TEACH]} \\ \text{[ELizabeth] it is a [pleasure to TÈACH]} \end{smallmatrix} \right\}$

A slighter but somewhat corresponding difference occurs between:

In the garden there is a sundial. In the garden is a sundial.

See 18.23, 18.45ff.

[c] With *be certain, be sure*, a personal subject can be followed by either a *to*-infinitive clause or an *-ing* clause, but there is a crucial difference in meaning:

Janet is $\left\{ \begin{smallmatrix} \text{certain} \\ \text{sure} \end{smallmatrix} \right\}$ $\left\{ \begin{smallmatrix} \text{to be put on the committee. [The speaker is confident]} \\ \text{of being put on the committee. [Janet is confident]} \end{smallmatrix} \right\}$

[d] The construction type 'She is a pleasure to teach' has been called 'Tough Movement' by reason of canonical (if rather informal) examples involving the adjective *tough*, as in *He's a tough man to argue with*.

Postponement of object in *SVOC* and *SVOA* clauses

- 18.37 When the object is a long and complex phrase, final placement for end-focus or end-weight is possible in *SVOC* and *SVOA* clause types. This does not involve an *it*-substitution.

(a) Shift from *SVO_dC_o* order to *SVC_oO_d* order:

They pronounced guilty *every one of the accused*.

He had called an idiot *the man on whose judgment he now had to rely*.

(b) Shift from *SVO_dA* to *SVAO_d*:

I confessed to him *all my worst defects*.

We heard from his own lips *the story of how he had been stranded for days without food*.

She dragged (right) in(side) *the two heavy boxes of chemicals*.

We cannot set (totally) aside *a whole system of rules devised by Congress itself*.

The fact that we are disturbing the normal order in such clauses is indicated by a tendency to adopt a different intonation pattern. Thus the movement forward of the C or A is usually accompanied by the assignment to it of a marked (subsidiary) focus (cf 18.17):

He had [called an idiot his 'best FRiEND]

She [pulled to 'one sIDE the 'heavy cÚrtain]

Compare:

He had [called his 'best 'friend an idiot]

She [pulled the 'heavy 'curtain to 'one sIDE]

Note The sentence *He had called an idiot his best friend* need not of course involve movement: with unaltered *SVOC* we would understand that an idiot was his best friend.

Objects and paraphrases

- 18.38 In ditransitive complementation (cf 16.55ff), the indirect object precedes the direct object:

She [gave { her 'brother
him } a signet 'ring] [1]

Thus whether or not the O_i is pronominalized, the implication is that it carries less communicative dynamism (is relatively 'given') as compared with the O_d . Where the converse is true, the O_i is replaced by a prepositional phrase and placed after O_d :

She [gave a 'signet ring to her BRÖTHER] [2]

But there is a third possibility; the prepositional paraphrase of the O_i can itself precede the O_d :

She [gave to her BRÖTHER a signet 'ring] [3]

Note that we cannot have: *She gave (to) her brother it (cf 10.7). The O_d in [3] has the same rhematic force as in [1] but the O_i has been replaced by a form that raises its communicative dynamism above that of the O_i in [1] though still below that of the paraphrase in [2].

Consider now the special type of ditransitive construction we find with eventive objects (cf 10.30):

We paid them a visit. [4]
He gave Helen a NUDGE. [5]

Here we have a device which is convenient when our communicative requirement is to put focal emphasis on the activity rather than on a human participant. Contrast:

We paid a visit to some old FRIENDS. [4a]
?He gave a nudge to HELEN. [5a]

But as we can see from the doubtful acceptability of [5a], it may be preferable not to use the eventive object construction at all when it is a human participant that is needed in end-focus:

We visited some old FRIENDS. [4b]
He nudged HELEN. [5b]

(See further 18.43).

Note [a] Where both O_d and O_i are pronouns, it would be usual to replace the latter by a *to*-phrase:

She GAVE it to him.
She gave it to HIM.

Alternatively, we could have:

She GAVE him it.
She GAVE it him. } <only BrE>
She gave it HIM. }

but not:

*She gave HIM it.
*She gave IT him.

[b] On the divided focus in example [3], compare the similar phenomenon in 18.37 accompanied by unusual positioning.

Discontinuous noun phrases

- 18.39 Sometimes only part of an element is postponed. The most commonly affected part is the postmodification of a noun phrase, and the units most readily postponed are nominal (in this case appositive) clauses (cf 17.122 and also 18.33f):

A rumour circulated widely that he was secretly engaged to the Marchioness. (Cf: 'A rumour that he was secretly engaged to the Marchioness circulated widely.')'

The problem then arose (of) what contribution the public should pay. (Cf: 'The problem (of) what contribution the public should pay then arose.')'

However, other postmodifying clauses, and even phrases, can be so postponed:

The time had come to decorate the house for Christmas. That loaf was stale that you sold me.

A steering committee had been formed, consisting of Messrs Ogawa, Schultz, and Robinson.

The postponement in each case results in a 'discontinuous' noun phrase (cf 17.122) which is italicized in the examples. Discontinuity often results, too, from the postponement of postmodifying phrases of exception (cf 9.58):

*All of us were frightened { but
except } the captain.*

As well as subject, the discontinuous noun phrase can be a complement or object:

What business is it of yours? (Cf: 'What business of yours is it?')

We heard the story from his own lips of how he was stranded for days without food.

I met a man this morning carrying an injured child.

But we may speak analogously of internal discontinuities: that is, where there is movement of parts of a noun phrase to achieve end-focus, without actual insertion of elements that do not form part of the noun phrase as a whole. Compare the following 'normal' example:

The discovery of new building materials in the course of this century (has revolutionized architecture).

Compare SVOA: 'They discovered the new materials this century'. In fact, the unedited example was as follows:

Architecture has been revolutionized by the discovery in the course of this century of new building materials.

This corresponds to SVAO: 'They discovered this century the new materials'. In 18.37, an agential phrase of our own was internally discontinuous:

... is usually accompanied by the assignment to it of a marked ... focus.

In such cases, as with the illustrative examples of 18.37-38, the item which

has in effect been fronted (*to it* in this example) is frequently given marked focus:

... by the assignment *TÖ it* of a [marked ... FOCUS]

Let us take one final example to illustrate the flexibility offered by nominalization in providing, through 'internal discontinuities', a varied ordering of constituents to suit specific informational goals. Bearing in mind the constraints on permuting the sequence of sentence elements, we indicate the greater freedom within the noun phrase by putting in quotation marks the analogies between sentence elements and the noun-phrase constituents. It will be seen that we can give end focus to constituents corresponding to all four of the elements in an *SVOA* sentence:

Lovell discovered the new star in 1960.	~	SVOA
Lovell's discovery of the new star in 1960...	~	'SVOA'
The discovery by Lovell in 1960 of the new star...	~	'VSAO'
The discovery of the new star in 1960 by Lovell...	~	'VOAS'
(?) Lovell's 1960 new star discovery...	~	'SAOV'

- 18.40** Whether we are reordering the constituents within a noun phrase or interrupting them to insert another sentence element, there appear to be two major motivations:

(a) The one is to achieve a stylistically well-balanced sentence in accordance with the norms of English structure; in particular to achieve *END-WEIGHT*. For example, it would be usual to avoid forming a sentence with a long subject and a short predicate. Thus we would prefer [1], with discontinuity, to [2], without discontinuity:

- The story is told of her phenomenal success in Australia.* [1]
 (?) *The story of her phenomenal success in Australia is told.* [2]

(b) The other is to achieve an information climax with *END-FOCUS*. For example:

- She rapidly spotted the book right on my desk that I had been desperately searching for all morning.* [3]

Not merely would the adjunct be more interruptive of the syntax if it followed the verb immediately (... *spotted right on my desk the book* ...), but the ordering found in [3] matches in a highly satisfying way the mounting communicative flow:

- She rapidly spotted the book.*
It was right there on my desk.
Yet I had been desperately searching for it all morning.

At the thematic end we have the rapidity of finding the book; at the rhematic end the long duration of the search; in the transition – the point of noun-phrase discontinuity – we have the ironic juxtaposition of the book and the desk.

In most of the examples given in 18.39, of course, the two factors (a) and (b) coincide, as indeed they do in [1] and [3] above. With another type of noun phrase, however, it is clearly to give end-focus rather than end-weight that the postponement takes place. This is the noun phrase with an emphatic reflexive pronoun (*himself*, etc) in apposition:

- The driver himself told me.* ~ *The driver told me himself.*
Did you yourself paint the portrait? ~ *Did you paint the portrait yourself?*

As the emphatic reflexive pronoun frequently bears nuclear stress, the postponement is necessary if the sentence is to have end-focus. Such postponement is possible, however, only if the noun phrase in apposition with the pronoun is the subject:

- I showed Ian the letter myself.*
 **I showed Ian the letter himself.*
 (But cf: *I showed Ian himself the letter*)

Note With some other cases of pronominal apposition, we may prefer to postpone the second element to a position immediately following the operator rather than to the end of the sentence. This is especially true with *all*, *both*, *each* (cf 6.50). For example:

The advisers had all been carefully selected.

We also find:

- My sisters don't either of them eat enough.*
They are none of them very enthusiastic. } <informal>

Correlative items in comparative sentences

- 18.41** Some degree of discontinuity is the rule rather than the exception in sentences containing comparative clauses, though where the comp-element (cf 15.63ff) is a degree adverbial, examples without discontinuity are fairly easy to find. For example:

- He has worked for the handicapped more than any other politician (has).*
He has worked more for the handicapped than any other politician (has).

Comparisons involving noun phrases as heads are rare without discontinuity and are frequently punctuated to indicate that they are regarded as ad hoc compounds (cf App 1.59):

- He is earning higher-than-average wages.*

In such cases, verb ellipsis is obligatory; compare:

- He is earning higher wages than (are) average.*

There is thus a minimum 'discontinuity' that we should take as the norm, with the correlative item following the head of the comp-element phrase (though we regard these as complementation structures: cf 2.32):

- She had more money than her father (had) by the time she was thirty.*
He is more skilled than his brother (is) in matters of finance.
They visit her more frequently than they used to now that she's ill.
He was too hot to do his work despite the air-conditioner.

But if nuclear focus were required on the correlative item, it could be moved to final position in each case even though the discontinuity would now normally require separation into different tone units:

She had [more 'money by the 'time she was THIRTY] than her [FATHER (had)]
 He is [more 'skilled in 'matters of FİNANCE] than his [BRÖTHER (is)]
 They [visit her 'more 'frequently 'now that she's H.I.] than they [USED to]
 He was [too 'hot DESPITE the AIR-con'ditioner] to [do his WORK]

Other discontinuities

- 18.42 Some adjectives that take complementation (cf 7.22, 16.68ff) can simultaneously function as premodifiers. Compare:

This result is { *different from yours.*
 similar to hers.

This is a { *different result from yours.*
 similar result to hers.

In cases like these last, discontinuity is felt to be quite normal and the position is similar to that of the correlative item in comparative sentences (cf 18.41). So also:

She works in the *opposite* room to *this*.
 It is a *timid* dog with *strangers*.

Despite superficial similarity with prepositional phrases postmodifying a head, there is rarely danger of ambiguity:

I was told by a man in the office.

The possible difference here ('A man told me in the office' or 'A man in the office told me') is unlikely to give rise to communicational difficulties, but the following example is more seriously ambiguous:

They made an embarrassing protest to the authorities.

In such instances, revision is essential to make it clear which of the two possible meanings is intended:

- They made a protest that was embarrassing to the authorities. [1]
 [ie 'Their protest embarrassed the authorities']
 They made a protest to the authorities that was embarrassing. [2]
 [ie 'They protested to the authorities in a way that was
 (generally) embarrassing']

If the meaning of [2] is intended but with the end focus on *the authorities* as in [1], further revision is necessary. Perhaps:

They embarrassed everyone by making a protest to the authorities. [2a]

Within the adjective complementation itself, discontinuity is possible, especially by the insertion of degree adverbials:

They were *fond* to some extent of Brecht's early work.
 It was *different* in many respects from what she had expected.

A similar type of discontinuity can occur within prepositional phrases:

He worked hard, *without for the most part any reward*.

Note In addition, of course, we have the prepositional phrase discontinuities of the type:
Which group shall we put him in?

Although we do not speak of discontinuity in the verb phrase, there is often comparable informational motivation in the insertion of adverbials at *AT*; cf 8.16. Doubtless the wish to avoid a 'split infinitive' (cf 8.21) is a wish to avoid a perceived discontinuity. Yet in writing, it is often convenient to use an adverbial along with the emphatic operator. For example:

They *did* indeed find a solution.
 The interposing of *indeed* here justifies the emphatic *did* (cf the discussion of inserting *in short*, 18.13), achieving an effect comparable to the use of prosody alone in speech:
 They [did find a solution]

Structural compensation

- 18.43 A major preoccupation in the phenomena we have been considering in 18.31ff has been the achievement of end-weight - whether phrasal, clausal, or sentential. The very nature of theme and focus, given and new information, leads to the expectation that the thematic item (typically the subject) will be shorter than the focal item (typically a part of the predicate). Given, moreover, that the V element is not normally expected to carry the maximum communicative dynamism in a sentence (cf 18.3), we develop the expectation that V will be at a transition point between a thematic low communicative dynamism and a focal high:

[Jill will de'cide next WEEK]
 The [boy 'broke the WINDOW]
 My [friend be'came ANgry]

All this has the effect of making the simplest realization of the *SV* clause type sound oddly incomplete:

[Mary SANG] My [friend COOKED]

In consequence, this type of *SV* realization is rather rare and it would be more usual to find an optional predication adjunct (cf 8.34):

Mary sang for hours. My friend cooked enthusiastically.

At the very least, we would make intransitive verbs bipartite, an auxiliary serving as a transition between theme and focus:

[Mary was SINGing] My [friend would COOK]

Such rephrasing is obviously context-dependent; it is not often, for example, that a verb phrase might equally well be progressive or nonprogressive. Other means have therefore had to be devised for 'stretching' the predicate into a multi-word structure. One of the most generally serviceable (though it tends to be rather informal in tone) is to replace the intransitive verb by a transitive one of very general meaning, taking as its eventive object a nominalization of the intransitive item (cf 10.30, 17.51ff). The general verbs *do*, *make*, *give*, *have*, *take* are widely used in this construction, though the choice is strictly limited in any individual case (**She took a shriek*, **She did a shriek* - unless the latter is in the sense '*She acted*')

performed a shriek', as on the request of the producer). Consider the following pairs:

{ My friend	{ cooks.	{ He ate.
	{ cooked.	{ He had a meal.
{ My friend	{ does some cooking.	{ She replied.
	{ did the cooking.	{ She made a reply.
{ Mary shrieked.		{ They strolled.
	{ Mary gave a shriek.	{ They took a stroll.
{ I bathed.		
	{ I had a bath. ['I took a bath' <esp AmE>]	

So also *solve* ~ *find a solution*, *agree* ~ *reach* (or *come to*) *an agreement*, *apply* ~ *submit an application*, *suggest* ~ *offer* (or *make*) *a suggestion*, *permit* ~ *grant* (or *give*) *permission*, *attend* ~ *pay attention*, etc (cf also 10.28, 18.38).

Existential sentences

- 18.44 We have seen in 18.8–9 that the organization of sentences in terms of theme and focus generally presumes that a sentence begins with reference to 'given' information and proceeds to provide 'new' information. But there are many occasions when we must make statements whose content does not fall neatly into these two categories:

A car is 'blocking my way	[1]
Many 'students are in financial trouble	[2]
Quite a 'few 'species of 'animals are in 'danger of extinction	[3]

Let us assume that the originator of these sentences has in each case put the focus where it was wanted. Nonetheless a certain awkwardness is sensed where the recipient is expected to interpret a theme as entirely new and unconnected with anything previously introduced. It is in these circumstances that it is convenient to have devices for providing some kind of dummy theme which will enable the originator to indicate the 'new' status of a whole clause, including its subject. Thus in place of [1], we might have:

There is	{ a car blocking		{ my way	[1a]
I have	{ a CÁR blocking			

Likewise, in place of [2] and [3]:

There are	{ many stúdents in f nancial tróUBLE	[2a]
We have	{ quite a 'few 'species of Ánimals in danger of	[3a]
One finds	{ extinction	

In serving to bring the existence of an entire proposition (such as those in [1], [2], and [3]) to the attention of the hearer, the resultant constructions are known as 'existential sentences', by far the commonest being the type introduced by unstressed *there*, accompanied by the simple present or past of *be*.

Note [a] Many other constructions than those illustrated above are invoked to serve the same purpose; for example, *it* with the proposition as extraposed subject (cf 18.33):

It is a fact that } many students are in financial trouble.
It has to be said that }

Alternatively again, the proposition can be made a clausal object:

One finds that } many students are in financial trouble.
We must recognize that }
I have to say that }

[b] Block language (cf 11.45ff) often consists of verbless sentences that can be regarded as existential:

DANGER!

MEN AT WORK OVERHEAD

Note that there are two types of negative directives and slogans:

No way out } = 'There is ...'
No exit }
No through way }

No arrest without warrant } = 'There must be ...'
No reduction in wages }
No discrimination }

[c] Sentences with entirely 'new' themes seem to be less awkward if combined with discontinuous postmodification of the noun phrase (cf 18.39), thus placing the focus of new information at the end. Compare:

{ ?A bird is in that tree.
{ A bird is in that tree which I've never seen around here before.
{ ?An idea is in his head.
{ An idea is in his head that the rest of us are against him.

Existential *there*

Correspondence with basic clause patterns

- 18.45 There is a regular correspondence between existential sentences with *there* + *be* and clauses of equivalent meaning as specified in terms of the basic clause patterns (cf 10.1ff), provided that the clause concerned

- has an indefinite subject (but cf Note [a]); and
- has a form of the verb *be* in its verb phrase.

Allowing for these two requirements, we may relate basic clauses to existential forms by means of a general rule:

subject + (auxiliaries) + *be* + predication
~ *there* + (auxiliaries) + *be* + subject + predication

The subject of the original clause may be called the 'notional' subject of the *there*-sentence, so as to distinguish it from *there* itself, which for most purposes is the 'grammatical' subject (cf 18.46). Examples of the seven clause types along with the existential correspondences are given below:

Type SVC

Something must be wrong. ~ There must be something wrong.

Type SVA

Was anyone in the vicinity? ~ Was there anyone in the vicinity?

Type SV

No one was waiting. ~ There was no one waiting.

Type SVO

Plenty of people are getting promotion.
~ There are plenty of people getting promotion.

Type SVO_C

Two bulldozers have been knocking the place flat.
~ There have been two bulldozers knocking the place flat.

Type SVOA

A girl is putting the kettle on. ~ There's a girl putting the kettle on.

Type SVOO

Something is causing my friend distress.
~ There's something causing my friend distress.

Passive versions of the correspondences are also to be noted:

Type SV_{pass}

A whole box has been stolen. ~ There has been a whole box stolen.

Type SV_{pass} C

No shops will be left open. ~ There'll be no shops left open.

The notional subject can be postponed (cf 18.31) if it is required to have focal prominence:

There was in the vicinity a helpful doctor.
There'll be left open no single well-stocked shop.

Especially in informal usage, there is an existential sentence with an *-ed* clause following the noun phrase:

There's a parcel come for you.
There's a book gone from my desk.
There's a tree fallen across our driveway.
There's a new history of Indonesia published.

Note [a] The rule that existential sentences should have an indefinite noun phrase as 'notional subject' prevents us from constructing sentences like **There's the money in the box* from *The money is in the box*. This limitation can be waived, however, where the definite noun phrase conveys new information, in answers to existential questions (actual or implied), such that the answer provides a specific (and hence definite) instance:

A: Have we any loose cash in the house?
B: Well, there's the money in the box over there.
A: Is there anyone coming to dinner?

B: Yes, there's Harry and there's also Mrs Jones.

Compare also: 'There are *several animals* commonly depicted in heraldry; for instance, there is *the lion*'.

Also acceptable is the definite *the* which is determined by the absolute superlative (cf 7.84), as in:

There's the oddest-looking man standing at the front door.

This corresponds to an indefinite article in the following alternative sentence:

There's *a* man of *the oddest appearance* standing at the front door.

[b] Where *he* is part of a semi-auxiliary construction, there are restrictions with existential *there*:

A man is to fix it tomorrow. + There is a man to fix it tomorrow.
A man is bound to arrive soon. ~ *There is a man bound to arrive soon.
A man is going to help me. ~ ?There is a man going to help me.

But:

A man is bound to be here soon. ~ There is *bound to be* a man here soon.
A man is going to be with her. ~ There is *going to be* a man with her.

[c] Noun phrases introduced by the 'universal' terms *all* or *every* are not so easily made 'notional subjects' of existential sentences (**There was everyone in the room*) as other types of indefinite expression. They act as such mostly in 'second instance' answers to existential questions:

A: What is there to be afraid of?

B: There's everything to be afraid of!

Negative universals are fully acceptable: 'There's nothing to worry about.'

[d] Existential *there* occurs freely in dependent clauses:

Let me know if there's anyone waiting.

[e] In SVC-related sentences, the C cannot usually denote a permanent property:

There were several students ill.

But:

?* There were several students tall.

[f] Some frozen existential clauses exist without *there*; for example (informal):

Time *was* when I'd have tackled it. [= 'There was (once) a time ...']

The status of existential *there* as subject

18.46 The *there* of existential sentences differs from *there* as an introductory adverb in lacking stress, in carrying none of the locative meaning of the place-adjunct *there*, and in behaving in most ways like the subject of the clause, doubtless reflecting the structural dislocation from the basic clause types:

(i) It often determines concord, governing a singular form of the verb (cf 10.34ff) even when the following 'notional subject' is plural:

There's some people in the waiting room. <informal>

occurs alongside:

There are some people in the waiting room.

(ii) It can act as subject in *yes-no* and tag questions:

Is there any more soup? There's nothing wrong, is there?

(iii) It can act as subject in infinitive and *-ing* clauses:

I don't want *there to be any misunderstanding*.

He was disappointed at *there being so little to do*.

There having been trouble over this in the past, I want to treat the matter cautiously.

Note [a] The absence of locative meaning is indicated by the acceptability of the existential sentence with *here* cooccurring with introductory *there*:

There's a screwdriver here.

By contrast, adjunct *there* with inversion (cf 18.23), as in 'There's the girl', would be contradictory with an added *here*:

*There's the screwdriver here! (But cf [There's the screwdriver] - [Right 'HERE])

[b] Existential *there* can be fronted in association with the type of *to*-clause discussed in 18.36:

It {appears
is certain} that there is something wrong with the engine.

~ There {appears
is certain} to be something wrong with the engine.

In such sentences, the catenative verb (*cf* 3.49) often agrees with the notional subject in number:

There {happens
happen} to be {only one apple
only two apples} left.

But often informally, 'There happens to be only two apples left.'

'Bare' existential sentences

- 18.47 Apart from sentences related to basic clause types in the manner described in 18.45, we have to consider various other types of sentence introduced by existential *there*. Among them is the 'bare' existential (sometimes called 'ontological') sentence, which simply postulates the existence of some entity or entities. It has a simple clause structure *there + be + indefinite noun phrase*:

There was a moment's silence.

There's nothing to do.

There was a sudden noise.

There are numerous species of edible fungi.

Undoubtedly, there is a God. ['God exists']

Is there any other business? [as spoken by the chairman at the end of a meeting]

There must be a more direct route.

Such sentences are perhaps to be explained as cases in which the final element is omitted as understood:

There is a God (in the Universe). [*ie* now as always]

Is there any other business (for the committee at this meeting)?

There must be a more direct route (than the one we're discussing).

Other sentences superficially like these are certainly to be so explained. For example, the sentence *There'll be trouble*, occurring on its own, implies a definite context: 'There'll be trouble at the match/at the party', etc. Alternatively, it seems significant that many textual examples of 'bare' existentials comprise complexities that provide for the required double prominence. Compare such paraphrases of foregoing examples as:

Edible fungi exist in numerous species.

There was [silence for a 'moment']

In 'There have always been wars', we have an *SVA* existential, though the A-element (*always*) is at *M* (*cf* 8.16); compare 'There have been wars in all periods of history'.

Existential sentences with relative and infinitive clauses

- 18.48 A more important additional type of existential sentence is that which consists of *there + be + noun phrase + relative clause*, and which resembles the cleft sentence (*cf* 18.25, example [2]) in its rhetorical motivation. Such sentences can be related to sentences of orthodox clause types without the

two restrictions mentioned in 18.45: the verb need not be a form of the verb *be*, and although there must be an indefinite element, it need not be subject:

Something keeps upsetting him. (*Cf* 'Something is repeatedly upsetting him')

~ There's something (that) keeps upsetting him. [1]

I'd like you to meet some people.

~ There's some people (that) I'd like you to meet. [2]

It is interesting that the relative pronoun *that* in the 'annex' clause of [1] can be omitted (especially in informal usage) even when it is subject of the relative clause; something not permissible according to the normal rule for relative clause formation (*cf* 17.15):

There's a man lives in China. ~ *I know a man lives in China.

This omissibility is a sign of the special status within the main clause of the annex clause here, as in cleft sentences (*cf* 18.28 Note).

As with cleft sentences, we can have different tenses in the two parts of the sentence. Compare:

There were some paintings that were admired by everyone.

There are some planets that were discovered by the ancients.

The existential-with-relative construction is particularly common as a means of emphasizing a negative (*cf* Note below):

There's *nothing* I can do about it. (~ nothing *that/which* I can do)

There was *no way* they could persuade her to try again. (~ no way in which they . . .)

Compare, without this construction, 'They could persuade her *in no way* to try again.'

Again, as with cleft sentences, we can negate either part:

There was a student who didn't pass the exam. [= one failed]

There wasn't a student who passed the exam. [= all failed]

But we can also negate both parts:

There wasn't a student who didn't pass the exam. [= all passed]

One may also mention a common existential sentence pattern *there + be + noun phrase + to + infinitive clause*, which is problematic to the extent that it cannot be directly related to the basic clause types of 10.1ff:

There was no one for us to talk to.

There's (always) plenty of housework to do.

Such infinitive clauses are allied to relative clauses (*cf* 17.9ff), as we see on comparing:

At last there was something to write home about.

with the <stiffly formal> relative clause construction:

At last there was something about which to write home.

This type of existential sentence sometimes has a definite noun phrase as notional subject (cf 18.45, Note [a]):

There's the man next door to consider.

Note This is a restricted idiomatic construction consisting of *there* + *be* + negative + *-ing* clause:
There's no telling what he'll do. There isn't any getting away from it.
On the peculiarities of this construction, cf 15.14.

Existential sentences with verbs other than *be*

- 18.49 The existential sentence has been described as 'presentative', in serving to bring something on to the discursive stage deserving our attention. This seems especially true of a rather less common, more literary type of existential clause in which *there* is followed by a verb other than *be*:

There rose in his imagination grand visions of a world empire.

There exist a number of similar medieval crosses in different parts of the country.

There may come a time when the Western Nations will be less fortunate.

Not long after this, there occurred a sudden revolution in public taste.

This construction, which may be related to other sentence forms by the simple correspondence $S + V \sim there + V + S$ (where *S* is usually indefinite), is equivalent in effect and style to subject-verb inversion after an initial adverbial (cf 18.23). Indeed, in all *there*-existential sentences, *there* can be regarded as a 'dummy element', which, placed before the subject and verb, provides the necessary condition for inversion to take place. Grammatically, *there* is a subject, as we saw in 18.46 above and as we see again here with the operator inversion that takes place when the statement pattern is turned into a question, eg: *Will there come a time...? Did there occur a sudden revolution...?*

But the present construction requires some expansion of the rule given above. In the first place, the verb must be intransitive (exceptions are idiomatic or dubious; cf Note [a]), and of fairly general presentative meaning: verbs of motion (*arrive*, *enter*, *pass*, *come*, etc), of inception (*emerge*, *spring up*, etc), and of stance (*live*, *remain*, *stand*, *lie*, etc); but cf 18.50. In the second place, while 'ontological' or 'bare' existentials are commoner with these verbs than with *be* (eg: *There sprang up a wild gale*), the normal sentence pattern concerned is *SVA* and the existential rule might be restated as follows (treating *sprang up* as a single verb unit and not as *V + A*):

$$S + V + A \sim \begin{cases} there + V + S + A & [1] \\ there + V + A + S & [2] \\ A + there + V + S & [3] \end{cases}$$

For example:

There sprang up a wild gale that night. [1]
There sprang up that night a wild gale. [2]
That night there sprang up a wild gale. [3]

Where the *S* is postponed (cf 18.31) as in [2], there is less constraint for the *S* to be indefinite, doubtless because the postponement itself implies the 'newness' of the item concerned:

There came to his mind her beautiful and intelligent face.

If however the transitive verb is one that forms a *V + N* multi-word verb (cf 16.58), such sequences are fully acceptable:

There took place an elaborate ceremony in honour of the visiting dignitaries.

Note [a] Transitive verbs in existential sentences are rare but would follow pattern [2] above in having the *S* in end position:

?There struck me a sudden idea. (cf *There struck me a tall man.)

(?) There then addressed the meeting the new leader of the party.
In view of the constraints upon transitive verbs, it is perhaps better to regard examples with passives as being special cases of *be* existentials (cf 18.45). Thus with the passive of:

The mayor presented a gold medal (to the winner).

we can have:

There was a gold medal presented (to the winner) by the mayor.

Less commonly:

There was presented (to the winner) by the mayor a gold medal.

So also with progressive forms:

A dozen hungry people were standing in the rain.

There were a dozen hungry people standing in the rain.

Less commonly:

There were standing in the rain a dozen hungry people.

[b] Examples like 'There's a parcel come' and 'There's a new history of Indonesia published' (cf 18.45) should not be regarded as an existential division of the verb phrase as in 18.49. Note, since without the *there*-construction we would have 'A parcel has come' (not 'is come') and 'A new history has been published' (rather than 'is published'). *There* can provide further anomalies with perfectives, both passive and active:

There's a new grammar been written. [*A new grammar is been written.]

There's a visitor been waiting to see you. [*A visitor is been waiting to see you.]

Although we cannot expand *is* to *has* (?*There has a visitor been waiting), examples like these are doubtless facilitated by the fact that 's is a contraction for *has* as well as *is* (and occasionally *does*: 'What's it matter?'; cf 3.36). Acceptability is reduced when 's is replaced by *are* and (still more) by *was* or *were*:

There are three visitors (?been) waiting to see you.

There was a new grammar (*been) published recently.

Existential sentences with initial space adjuncts

- 18.50 We should now consider the type [3] ordering of 18.49:

$A + there + V + S$

For example:

That night there sprang up a wild gale.

Let us look at an example that pairs a verb of stance with the usual existential verb *be*:

In the garden there $\left\{ \begin{matrix} was \\ stood \end{matrix} \right\}$ a sundial.

[1]

Since the place adverbial, *In the garden*, provides in itself the condition enabling us to position the subject after the verb (cf 18.23), there is no grammatical requirement for *there* to be present:

In the garden $\left\{ \begin{array}{l} \text{was} \\ \text{stood} \end{array} \right\}$ a sundial. [2]

It should be noted that the range of verb-phrases with this type of ordering is considerably wider than was specified in 18.49. Compare:

Into the room (there) had staggered a total stranger.
 ?There had staggered into the room a total stranger.
 ?*There had staggered a total stranger into the room.

We see from these examples that the wider choice of verb coincides with the choice between the presence or absence of *there*. In considering examples [1] and [2] above, we find that, despite the close similarity in meaning, the absence of *there* as in [2] is preferred when the final noun phrase is relatively concrete and specific, its occurrence relatively expected. We may say that the verb in [1] tends to connote 'chanced (to be)', 'happened (to stand)', while the noun phrase in [2] tends to connote 'a certain (sundial)'. Significantly, indeed, there is much less constraint upon indefiniteness in [2]:

In the garden lay $\left\{ \begin{array}{l} \text{Joan} \\ \text{his father} \\ \text{the old lady} \end{array} \right\}$ (fast asleep).

Table 18.50 shows the distribution of existential sentences in a large sample of SEU material. They are all of the type under consideration here; that is:

A + (there) + V + S

and they are analysed in terms of three variables:

- (i) whether the verb is *be* or not *be* (ie: *stand*, *lie*, *appear*, etc);
- (ii) whether *there* is present as in example [1] or absent as in example [2];
- (iii) whether the subject noun phrase is indefinite or definite.

Table 18.50

	Indefinite		Definite	
	<i>be</i>	not <i>be</i>	<i>be</i>	not <i>be</i>
+ <i>there</i>	160	23	28	7
- <i>there</i>	137	56	179	29

Among the interesting facts revealed by the figures, the most striking is doubtless the converse distribution (160:137, but 28:179) as between indefinite and definite with *be*, showing the greater tendency to omit *there* where the noun phrase is definite. It would seem that whereas the *AVS*

construction without *there* is motivated by the wish to achieve end-focus, the *there*-construction has the more general 'presentative' function; cf 18.49.

The *have*-existential device

- 18.51 Corresponding to the type of existential sentence introduced in 18.45 (*there* + *be* + S + predication), there is a type in which the thematic position is not occupied by a mere 'dummy' element but is filled by a noun-phrase subject preceding the verb *have* (or, especially in BrE, *have got*):

The porter has a taxi ready.

[Cf: *There is a taxi ready*; *A taxi is ready*. - Type SVC]

He had several friends in China.

[Cf: *There were several friends (of his) in China*; *Several friends (of his) were in China*. - Type SVA]

I have two buttons missing (on my jacket).

My jacket has two buttons missing.

[Cf: *There are two buttons missing*; *Two buttons are missing*. - Type SV]

They had a few supporters helping them.

[Cf: *There were a few supporters helping them*; *A few supporters were helping them*. - Type SVO]

As we show above, these clauses can be related to (and imply) some of the basic clause types; thus, for example, *The porter has a taxi ready* implies *A taxi is ready* [SVC].

But the correspondence with basic clause types is by no means as straightforward as it is with *there*-existentials. In the first place, an extra participant is introduced as theme (*The porter*, *He*, *I*, *They*, in the examples above). This is not merely absent from the corresponding basic clause but cannot usually be inferred from it. Consequently, in formulating the correspondence between *have*-existentials and the basic SVC type, we might postulate:

$$NP^1 + be + C(NP^1) \sim NP^2 + have + NP^1 + C(NP^1)$$

But while we are able to predict the tense of *have* (since it must correspond to that of *be*), we have no way of precisely predicting the NP² and usually no way of even imprecisely doing so:

$$A \text{ taxi } \left[\begin{array}{l} \text{is} \\ \text{was} \end{array} \right] \text{ ready.} \sim NP^2 \left[\begin{array}{l} \text{have} \\ \text{has} \\ \text{had} \end{array} \right] \text{ a taxi ready.}$$

Indeed, beyond saying that NP² will refer to a subject having considerable involvement in the existential proposition, we cannot specify what that involvement will be. Thus in:

The porter has a taxi ready.

there is a strong implication that the NP² has an *agentive* role, whereas in:

You have a taxi ready.

it is just as strongly implied that the NP² has a *recipient* or at any rate an

affected role (cf 10.19). Calling it 'affected' seems to state the involvement with a degree of generality that satisfactorily accounts for most cases. Compare:

{ A valuable watch was stolen. [SV_{pass}]
 { My friend had a valuable watch stolen.

Note the possibility of other relationships:

{ There are several oak trees in the garden.
 { They have several oak trees in the garden.

- Note [a] With a passive basic clause type, the verb generally has dynamic rather than stative (perfective) meaning: *My friend had his watch stolen* relates to *His watch was stolen* in the sense of 'Someone stole his watch' rather than of 'Someone had stolen his watch'.
 [b] In a further *have*-construction (especially, but not necessarily, with the passive: cf: *He had us all addressing envelopes*), the subject of *have* gives up its 'recipient' role for one of indirect agency: *He had all his enemies imprisoned* is most likely to mean 'He caused all his enemies to be imprisoned'. In thus involving specification of agency, this *have*-construction is more remote from the corresponding basic clause (*His enemies were imprisoned*) than the other examples we have been considering. Compare analogous causatives and agentives:
- | | |
|------------------------------|-----------------------------------|
| { John is in prison. | { The engine was repaired. |
| { (They) put John in prison. | { (They) got the engine repaired. |

- 18.52 But although we cannot in general predict from the basic clause the reference of the NP² in *have*-existentials (and still less its form – *John, He, My brother*, etc), the reference is often implied by nonexistential variants. For example:

{ Two of my buttons are missing. [SV]
 { I have two buttons missing.
 { A brother of his was working in Chicago.
 { He had a brother working in Chicago.

In some cases, reference (though not of course form) is not merely implied but actually specified in the nonexistential variant:

{ A few supporters were helping { Mary and Alice.
 { the three boys.
 { them. [SVO]
 { { Mary and Alice
 { The three boys } had a few supporters helping them.
 { They

{ John was working for Mary. [SVA]
 { Mary had John working for her.
 { Many apples were still on the trees.
 { The trees still had many apples on them.

Again, where a basic clause type is extended to indicate recipient or other participant role, the reference concerned may then be anticipated in the subject of *have*. For example:

A taxi is ready for you. [SVC]
 A valuable watch was stolen from him. [SV_{pass}]

beside:

You have a taxi ready for you.
 John } had a valuable watch stolen from him.
 He }

But the reference to a participant may be misleading, since the subject of *have* may be agentive:

They have a taxi ready for you.

Where the reference is the same, of course, pronoun identification works in the usual direction (cf 10.48ff); thus:

John had a valuable watch stolen from him.
 ≠ He had a valuable watch stolen from John.

Finally, it should be noted that in *have*-existentials, the 'notional subject' (ie the subject of the corresponding basic clause type) can freely be definite:

John's eldest son is helping him.
 John has his eldest son helping him. [assuming *has* as existential and not causative: cf 16.52ff]

By contrast:

*There is { John's } eldest son helping him.
 { his }

This would require a special context, such as 18.45 Note [a], to make it acceptable.

Have-existential sentences with relative and nonfinite clauses

- 18.53 Corresponding to *there*-sentences of the same character (cf 18.48), the following illustrate *have*-sentences containing relative and infinitive clauses:

I've something I've been meaning to say to you.
 He has a great deal to be thankful for.
 (Cf There is a great deal for him to be thankful for.)
 (?) They have a visitor come to see them. [= A visitor has come to see them]
 She has a guest staying with her. [= A guest is staying with her]

Compare also with passive nonfinite clauses (cf 18.52):

He had a book stolen. [= A book was stolen from him]
 She has had some poems published. [= Some poems (of hers) have been published]

In all these instances, the subject of *have* could be 'affected', but in some it could equally be agentive (cf 16.54, 18.51):

She has had some poems published. [= She has caused some poems (of her own or by someone else) to be published]

As with *have*-existentials in general, the subject of *have* may be totally unpredictable from the corresponding basic clause type or *there*-existential:

- { There is a great deal for John to do.
 { *Mary* has a great deal for John to do.

Nonfinite and verbless existential clauses

18.54 Consider again finite-verb clauses of basic type and their corresponding existentials:

- A taxi was soon available and Dr Lowe was able to catch the train.
 There was soon a taxi available and Dr Lowe was able to catch the train.
 Dr Lowe soon had a taxi available and was able to catch the train.

Corresponding to these finite clauses, nonfinite clauses can be formed, again existential as well as nonexistential:

- A taxi being soon available,
 There soon being a taxi available, } Dr Lowe was able to catch the train.
 Soon having a taxi available,

In this last case, the subject of the nonfinite clause would be identical with that of the main clause; if the subject is different, it can be supplied – at least in rather formal English:

The porter soon having a taxi available, Dr Lowe was able to catch the train.

There are also corresponding verbless clauses, especially introduced by *with* or its corresponding negative *without* (cf 9.49), and these prepositions may also occur in nonfinite clauses:

- With a taxi soon available, Dr Lowe was able to catch the train.
 Without a taxi soon enough available, Dr Lowe was unable to catch the train.
 With a taxi speedily summoned, ...
 With a taxi already waiting, ...

A further type of verbless existential clause is illustrated in 18.44 Note [b].

Emotive emphasis

18.55 Apart from the emphasis given by information focusing, the language provides means of giving a unit purely emotive emphasis. We have noted, in various sections of the grammar, a number of features of this type. They include exclamations (cf 11.31*f*), the persuasive *do* in imperatives (cf 11.30), interjections (cf 11.55), expletives and intensifiers (cf 7.87*ff*, 8.104*ff*),

including the general clause emphasizers such as *actually*, *really*, and *indeed*. A thorough study of emotive expressions would involve examining figures of speech such as simile, hyperbole, and irony. Here we confine ourselves to two devices which fall squarely within the province of grammar.

Emphatic operators

18.56 We are here concerned with the difference between pairs like the following:

- { I'm [SÒRry] } [1]
 { I [ÀM 'sorry] }
 { You [look PÀLE this 'morning] } [2]
 { You [bÒ 'look 'pale this 'morning] }
 { [Mary will be PLÉASED] } [3]
 { [Mary WÍLL be 'pleased] }
 { He [PRÒMised to 'go] } [4]
 { He [did PRÒMise to 'go] }
 { I [TÒLD you] } [5]
 { I [did TÈLL you] }

The second utterance in each case resembles prosodically the operator-stressed items discussed in 18.16. But as we see with [4] and [5], the operator, though emphasized, need not carry the nuclear force. More importantly, they all differ from the majority of those in 18.16 in not necessarily being contrastive. For example, in:

[Mary WÍLL be 'pleased]

the speaker is not here implying that someone has suggested that she will *not* be pleased. Rather, the speaker (in a style that is sometimes felt to be rather gushing and extravagant) is conveying enthusiasm: a personal conviction about the truth of what is predicated. But the emotion conveyed need not be enthusiasm: in [1] it is concern, in [2] sympathy, in [5] something like reproach or petulance. It is in this last connection that the *will/would* of 'insistence' (cf 4.57) is regularly stressed:

[John WÍLL 'keep|inter|RUPTing]
 I [WÓULD go and make a 'MÉSS of it]

Note [a] While it is obviously necessary to stress the difference between emotive and contrastive emphasis, we saw in 18.16 that not all operator-focusing was contrastive. Moreover, some similarity in principle needs to be seen between emotive emphasis and the distribution of given and new information. For example, in [3] above, the emotive emphasis on *will* implies that *pleased* is relatively given: we can take the fact of her being pleased for granted and attend instead to expressing a degree of enthusiasm about it.

[b] Further intensification, if desired, can be achieved by placing an emphasizer such as *really* or *certainly* in front of the operator, or *indeed* after it: *It really does taste nice*, *It does indeed taste nice*. Such adverbials are especially helpful in writing since they draw attention to the need to supply operator-stress; cf 18.42 Note.

[c] Despite its similar emotive connotations, the 'persuasive' *do* in imperatives (cf 11.30) is again distinct from the above use of *do*. The imperative *do* does not obey the rule of *do*-support: one can say *Do be quiet!* in imperatives, but there is no corresponding statement **He does be quiet!*

Noncorrelative *so* and *such*

- 18.57 In familiar speech of a style that strikes many people as extravagantly emphatic, the determiner *such* and the adverb *so* are stressed so as to give exclamatory force to a statement, question, or directive. In this usage, there is no accompanying correlative clause or phrase (cf 15.49):

She was [wearing 'such a lovely DRÈSS]
 I'm [so afraid they'll get LÒst]
 [Why are you 'such a BÀby]
 [Don't upSÈt yourself 'so]

In consequence, *so* and *such* become equivalent to *how* and *what* in exclamations (cf 11.31f):

{They were so cross!
 {How cross they were!
 {They're such delightful children!
 {What delightful children they are!

But *so* and *such* can also occur, as the earlier examples show, in questions and directives. Additional emotive emphasis is achieved by assigning a nucleus to *so* or *such*:

I'm [SÒ PLÉASED]

- Note Other words of strong emotive import may take a nuclear tone for special emotive force:
 I [wish you'd Lìsten]
 I [love that MÚsic] or I [LÓVE] that [MÚsic]
 I'm [RÈrribly SÓrry]

Reinforcement**Repetition and 'proxy' pronouns**

- 18.58 Reinforcement is a feature of colloquial style whereby some item is repeated (either completely or by pronoun substitution) for purposes of emphasis, focus, or thematic arrangement. Its simplest form is merely the reiteration (with heavy stressing) of a word or phrase for emphasis or clarity:

It's *far, far* too expensive. (Cf 7.89)
 I agree with *every word* you've said – *every single word*.

In very loose and informal speech, a reinforcing or recapitulatory pronoun is sometimes inserted within a clause where it stands 'proxy' for an initial noun phrase:

This man I was telling you about – well, *he* used to live next door to me.
The book I lent you – have you finished it yet?

It will be noticed that in each case a complete noun phrase is disjoined from the grammar of the sentence, its role (as subject and object respectively) being grammatically performed by subsequent pronouns. But in being thus fronted, as marked themes (cf 18.19), the disjoined noun phrases clearly set out the 'point of departure' for the utterance as a whole. It is not uncommon for long noun phrases which are nonfocal to be thus treated in familiar speech, a convenience alike to hearer (in receiving an early statement of a complex item) and speaker (in not having to incorporate such an item in the grammatical organization of his utterance).

- Note This phenomenon, along with that in 18.59, is sometimes termed 'left- and right-dislocation'; cf 17.78.

Amplificatory tags

- 18.59 In contrast to the fronting of items to be subsequently reinforced pronominally (as in 18.58), an amplificatory phrase may be informally added after the completion of a clause structure which contains a coreferential pronoun:

They're all the same, these politicians.
 I wouldn't trust *him* for a moment, *your brother-in-law*.

Such utterances are usually spoken with divided focus (cf 18.17), with a rise on the 'tag' confirming its relatively 'given' status:

They're [all the SÀME, these POLITICIANS]
 I [wouldn't trust him for a MÒment, your BRÒther-in-law]

The tag can be inserted parenthetically, as well as placed finally:

He's got a good future, your brother, if he perseveres.

An even more informal type of tag comprises a subject and operator:

That was a lark, *that was!*
 He likes a drink now and then, *Jim does*.

In some dialects of English (especially Northern BrE), the operator may precede the subject:

She's a lovely girl, is Ann.

Postposed nonfinite clauses, of the kind discussed in 18.35, sometimes closely resemble amplificatory tags; contrast:

It was tough getting the job finished on time.
 [[tough. . . . TIME]]
 It was tough, getting beaten in the last match.
 [[TÒUGH]/. . . . MATCH]]

- Note [a] The amplificatory tag should not be confused with either vocatives (cf 10.52f) or what may be called 'tag exclamations', such as *He ran away from schùòol, the idiot* (cf 17.68 Note [b]). Both these constructions are distinguished from it intonationally, in that they may form the 'tail' of a preceding nucleus, instead of having their own (usually rising) nucleus. The intonation marks the following as usually tag and vocative respectively:
 He's a [good CHÀP JÒHN]
 He's a [good CHÀP 'John]

The exclamatory tag is further distinguished by being capable of (i) referring back to a noun phrase other than a pronoun:

That brother of mine ran away from school, the idiot.

and (ii) occurring initially as well as finally:

The idiot, he ran away from school.

The exclamatory tag is usually evaluative and the noun is very general in meaning; when premodified by an adjective, there may be zero article. We may thus contrast:

He's had a lot of bad LÖCK, { (the) poor man
 { the new } CAREtaker
 { *new }

[b] Expletives (in the broadest sense) provide a common mode of amplification in extremely informal speech, serving as a rhetorical transition between theme and an emotionally coloured focus:

He's a [silly idiot]

They [lost their 'darned way]

His [work is 'bloody awful]

I [told them to 'darned 'well Listen]

Compare tmesis (App 1.76 Note [c]) where the inserted amplification is usually made just prior to the point of main emphasis:

fan'tastic ~ fan-flaming-'tastic

In 'She lost her darned way', it is not of course the final noun phrase as such that calls for expletive comment. The whole utterance is emotionally coloured, and in extreme cases such colouring (especially in exasperation) is expressed at additional points in the sentence structure:

These *blasted* people have *darned well* lost their *stupid* way!

Alternatively the 'scope' of the colouring as well as the colouring itself can be expressed by prosodic means, 'She's lost her way' being uttered with an exceptional intensity or other marking (cf App II.1ff).

Expletives also amplify the theme in *wh*-questions:

Who { on earth
What { in heaven
Where { (in) the hell
When { the blazes
Why { in the world
How { in God's name } + *op.*, etc

[c] In responses of a rejoinder kind, we find a combination of fronting (cf 18.20f) with amplificatory tagging:

A: Have I arranged to see anyone this afternoon?

B: Well, Mrs BLÄKE, you HÄVE. [~ 'You have arranged to see Mrs Blake']

A: Do you write poetry?

B: SÖMETimes I DÖ. [~ 'I write poetry sometimes']

Where such replies are negative, both parts are negated, though responses in this form are then restricted to rather informal usage:

A: Have I made this clear to you all?

B: Not to MÊ, you HÄVEN't. [~ 'To the others perhaps, but not to me']

A: May I go in?

B: Not YÊT, you CÄN'T. [~ 'You can't go in yet']

It will be noticed that the use of fall-plus-rise, putting the fall on the most salient part, the rise on the partly 'given', corresponds to the general use described in 18.17.

General: the notion of 'text'

- 19.1** Throughout this book, two interrelated acts of imagination have been demanded of the reader.

First, we have expected that examples, though inevitably appearing before the reader only in print, would be not only read but 'heard'. We have constantly stressed the primacy of speech, both in *mass* terms (the fact that far more language occurs in speech than in writing) and – much more significantly – in *linguistic* terms (the fact that the written form must evoke the oral form, just as though we heard the words read aloud). And we have sought to bring this home to the user of the book by repeated if clumsy reference to 'speaker/writer' and 'reader/hearer'.

Second, we have expected that examples would be placed in a suitable context. Thus, although we have presented forms and constructions as though they were fully explicated within isolated sentences, we have been aware that it would not have been possible to understand the presentation unless every structure and every exemplificatory sentence had been placed by or for the reader in an imagined context. Indeed we have made our awareness explicit in a large number of cases by providing cues to the type of context in which a given form was to be appropriately used and plausibly understood.

- 19.2** In the present chapter, we work in a converse way. We take TEXTS as our starting point and examine the language comprising them. In other words, we bring together all the grammatical processes already described but we do so now with a view to discussing their role in both the interpretation of a text and in the construction of a text. And we shall pay considerable attention to lexical and other features of textual structure in order to show that, important as is the role of grammar, many factors other than grammar are involved.

Moreover, as we are using the term, a text – unlike a sentence – is not a grammatical unit but rather a semantic and even a pragmatic one. A text is a stretch of language which seems appropriately coherent in actual use. That is, the text 'coheres' in its real-world context, semantically and pragmatically, and it is also internally or linguistically coherent. For this latter facet, the term 'cohesive' has been applied, referring to the actual forms of linguistic linkage.

A text may be spoken (as are the vast majority) or it may be in writing. It may be the product of a single speaker (as with an announcement on an airport public-address system) or of several speakers engaged in conversation. Textual structure relates to the concerns of this book – the grammar of English – by virtue of the fact that texts are realized in grammatical units. But the grammatical units occurring in a text are often very different from the corresponding grammatical units as they are described in terms of the English grammatical system. Consider for example, as part of a text, the response:

Me, too!

Among the possible texts in which this might occur, we could suggest:

- 'This noise is giving me a headache' [1]
 'Me, too!'
 'I wish I had a drink' [2]
 'Me, too!'
 'My feet are aching' [3]
 '? Me, too!'

but not:

- 'Would you like a drink?' [4]
 '*Me, too!'
 or:
 'It's starting to rain' [5]
 '*Me, too!'

In [1] the second speaker makes his response on the basis of a relatively straightforward elliptical form of what he has just heard (cf 12.1ff, 12.31ff, 12.46ff, 13.44ff):

(This noise is giving) *me* (a headache), *too*!

With [2], what is superficially the same response involves pronoun-replacement (cf 6.14ff, 10.48ff, 12.8ff):

I (wish I had a drink), *too*!

Only the respective *textual* structure as a whole can determine the *grammatical* structure in terms of which *Me, too* is being used. The role of the response in [3] is clear enough semantically ('My feet are also aching'), but grammatically its relation to what has preceded is vague and uncertain; though it might occur in familiar speech, many people would find it textually ill-formed.

But by contrast with [1], [2], and [3], the response 'Me, too' in [4] and [5] is a non sequitur textually and equally impossible to relate to a plausible structure in the grammatical system.

Context and the one-sentence text

- 19.3 It is natural to think of a text as being realized in a string of several sentences: that it is connected sentences that constitute a text. But in fact a text may be wholly realized in a single sentence, and if we consider such an example we shall see the significance of the point made in 19.2 that a text was not so much a grammatical as a semantic or pragmatic unit. Even a single word can be a text that is 'appropriately coherent in actual use' (cf 19.2): a road sign bearing the word DANGER, for example, as compared with one that read SINCERITY.

Imagine receiving a note bearing only the words:

Roger's finished the thesis!

The same text might of course be spoken: someone comes into the room and withdraws again having said only:

[Roger's finished the THESIS]

The grammatical properties of the sentence realizing this text and necessary for our understanding of it have been described in earlier chapters. The perfective *has finished* is understood (in contrast, for example, with *will finish*); the determiner *the* (in contrast to *a* or *his*); the singular *thesis*; the intonation nucleus on *thesis* (and not, for example, on *Roger*); the whole being declarative (and not interrogative, *Has Roger . . . ?*), etc. But as realizing a text, there is much more here. The text depends upon our knowing Roger (and knowing him as *Roger* and not as *Mr Taylor*), on knowing what a thesis is, on knowing about this particular thesis (a different text might have had *a thesis on aeronautics*). Less obviously, perhaps, the text depends on our knowing what *finishing* involves: Roger may have been writing his own thesis, typing (or binding) one for someone else, or completing his work as an examiner of the thesis. As well as conveying all this, the text will mean more to us. It is another instance of Roger's speedy efficiency, perhaps (as though the text had included the adverbial *already*). Or it conveys relief after an intolerably lengthy period (as though the text had included the adverbial *at last*). Or it may be a signal that Roger is now free to indulge (let us say) in a game of tennis.

These are all covert connections (that is, they are given no actual expression), but according as the situation determines, the piece of text could be expanded by some such comment as one of the following:

That's Roger TAYLOR, I suppose.
 Aha – so aeronautics takes a big step forward!
 Gosh – that was quick!
 And about time too!
 Oh, good: he can take on Frieda at the end of this set.

- 19.4 All of these additions have one thing in common: they each show a plausible interpretation of the original short text. They also form a close connection with it and with the wider context which determines the satisfactory coherence of the text. Clearly, not all of the interpretations involve grammar: the lexical meaning of *thesis*, for example, or the use of the text as an announcement that a game of tennis can start. But in the connections that texts manifest, it is equally clear that grammar plays a considerable role and it is on this connective potential of grammar that we shall be concentrating in this chapter. And 'potential' is a key word, since (as we have already seen) connection may be covert as well as overt.

Asyndetic connection

- 19.5 Just as a text realized by a single sentence has a complex of covert connections with its context, so any two neighbouring sentences will be perceived as being connected. Mere juxtaposition (parataxis rather than asyndeton) is an icon of connectedness, even where the juxtaposed parts have no grammatical or lexical feature in common:

Go and visit your father; it's New Year's Day.
 It's New Year's Day. Go and visit your father.

The perceived connection here is the same, whichever sentence comes first, just as we will connect a child seen in the park with an adult, whether the

child is running ahead or trailing behind. So too, the text in 19.3 might have been expanded as:

Roger's finished the thesis! Caroline arrived from New York last week.

These two sentences are grammatically asyndetic and quite unrelated. But as a text or as part of a text, they are connected, and – if the text is successful – the connection will be clear to the reader/hearer: Caroline's relation to Roger will already be known and doubtless also the connection between the thesis work and Caroline's arrival. Even if we are merely 'eavesdroppers' on this text, we find ourselves speculating on possible connections. Perhaps Caroline brought with her the last piece of material that Roger required for completing the thesis; perhaps Caroline's arrival spurred him on to completion; perhaps the connection with Caroline's arrival is merely that she brought the news. Any of these connections is fully compatible with the grammar of the two sentences but none is made linguistically overt. This would remain true if the two sentences were in converse order:

Caroline arrived from New York last week. Roger's finished the thesis!

Such sentences in text can be said to be truly asyndetic (*cf* 13.1), in allowing connection by *and*, should we so wish.

Note [a] It is tempting to draw an analogy between asyndetic connection and our familiarity with a situation such that overt expression can be curtailed. In 19.3, we noted that 'Roger's finished the thesis' might have covertly conveyed *at last*. If this interpretation is the correct one, then:

Roger's finished the thesis!

Roger's finished the thesis at last! [2]

After ten long years, Roger's finished the thesis at last! [3]

After ten long years, Roger finished the mess at last.¹ can be seen as synonymous but with decreasing degrees of 'asyndeton' with the context. In [1], the reference to duration is totally covert; in [2] it is overt but imprecise; in [3] it is still more overt with the specification of the length of time that is held to justify *at last*. We shall have occasion to use this extended sense of asyndeton in examining the grammatical potential of sentences in texts (for example, in relation to the absence of necessarily invoked performatives; cf 19.64).

[b] Some scholars use the term 'parataxis' for clauses without formal linkage; others would call this 'asyndetic parataxis', applying the unrestricted term to all clause relations that are not *hypotactic* (ie involving subordination). On our own use of these terms, cf 13.1f.

19.6 Consider now a variation on the two-sentence text given in 19.5:

Roger's finished the thesis! Caroline has gone out to the supermarket.

Although these sentences are asyndetic in the sense of 13.1, there is a slight but significant grammatical relation. The verb phrase is perfective in each case and while this does not enjoin a particular interpretation, it certainly helps to suggest a range of possible close connections: what Caroline has done seems to match in some way what Roger has done. The completion of the thesis has perhaps released her to go out on an errand; or it has caused her to go and buy celebratory wine.

Structural parallelism

19.7 Indeed, although they might formally be regarded as asyndetic (and they are

certainly paratactic), neighbouring sentences that share grammatical features of tense, aspect, clause structure, or word order give a strong impression of being connected thereby. Such grammatical parallelism is often endorsed lexically. Consider the relatively abstract frame, now illustrating both coordination and subordination:

The ___ was Ved in ___ {and/while
but/whereas} the ___ was Ved in ___

and compare the following where the blanks are filled:

The baseball game was cancelled in New Haven

{and/while the hockey match was postponed in Hartford. [1]

{ but/whereas the hockey match was (duly) played in Hartford. [2]

(where New Haven and Hartford are related as well-known cities in Connecticut).

The parallelism between sentences is more transparent, and hence the connection between the sentences is more strongly indicated, if the word order is not the normal one. The effect of fronting an element in such cases is to point to a contrast between the sentences. Indeed, in [3] the unusual order of the first sentence makes us expect a similar and related one to follow (*cf* 18.20):

My paintings the visitors admired. *My sculptures* they disliked. [3]

In New York it is hot and humid during the summer. *In Los*

Angeles it is hot and dry. [4]

From the ceiling hung a huge lamp. Along the wall were pikes. [5]

The direct objects and the space adjuncts in [3] and [4] respectively are in initial position instead of their normal final position. In [5] the nonnormal position is accompanied by subject-verb inversion. When constituents are fronted, then we can infer a connection between the sentences even where there is little or no other structural similarity:

Proudly, the captain hoisted the flag. *Softly*, a bugle sounded. [6]

Moreover, only an apparent similarity in structure is sufficient to suggest parallelism between sentences:

My paintings the visitors admired. *My sculptures* irritated them. [7]

Our impression of a link between the two initial noun phrases in [7] is given impetus by the fronted position of the direct object *my paintings* in the first sentence and the expectation that we are encountering a similar inversion when we reach *my sculptures*, though in fact the former is direct object and the latter is subject, in its normal position. The impression of a link between the two initial noun phrases is reinforced by the internal structure of the two phrases and the lexical set to which both *painting* and *sculpture* belong. The two sentences are further linked by a semantic parallelism, realized syntactically in two ways: a person has a feeling towards an object, an object arouses a feeling in a person. They are also linked, of course, by the use of the pro-form *them* in the second sentence which replaces *the visitors* in the first sentence.

Connection by sequence

- 19.8 Sentences with grammatical features in common, such as the same subject or the same tense, often imply temporal and causal connection. In other words, where we saw juxtaposition in 19.5 as iconic of mere connection, we now see it as iconic of connected sequence. As the two real-world events, a policeman holding up his hand and a car coming to a standstill, follow each other in time, so asyndetic narration of these events will preserve this sequence:

The policeman held up his hand. The car stopped.
[≠ The car stopped. The policeman held up his hand.]

This is well illustrated in the text attributed to Julius Caesar after his Pontic triumph:

I came. I saw. I conquered.

Even without the lexical meanings of the verbs, the sequence suggests:

I did something.
And then (in consequence; cf 13.23) I did something else.
And then (in further consequence) I did something else.

Moreover, given that (as we shall see) triadic sequences have special implications, the third of the above suggests not merely 'in further consequence' but 'as a still further and climactic consequence'. Yet the text could not work as a text unless the lexical meanings of the verbs were known; these not merely confirm the consequential structure but make the particular sequence of paratactic sentences obligatory. Compare the relative difficulty of seeing the following as a coherent text:

I conquered. I came. I saw.

On the other hand, even with formal asyndeton, if we alter grammatical features such as tense, we can then switch the order of sentences so that it is no longer iconic and no longer asyndetic in the sense of 13.1 (since *and*-connection is impossible). They are now merely paratactic:

The car stopped. The policeman *had held up* his hand.

We here achieve paratactically the sequence freedom that is readily possible syndetically:

The car stopped $\left\{ \begin{array}{l} \text{after} \\ \text{because} \end{array} \right\}$ the policeman held up his hand.

- 19.9 We have spoken of texts realized by one or more *sentences*. But just as we saw that it made no necessary substantial and inherent difference to a text when it was expanded by an adverbial (cf 19.5 Note [a]), so it makes little difference whether a text is punctuated as three sentences or one:

I came, I saw, I conquered.

Of course, a close relation between the parts is still more clearly implied when commas separate the first two and a period appears only after the third, and it is worth noting that a spoken form of this text (irrespective of

punctuation) would normally show the 'dependent' status of the first two by rising nuclei in contrast to a fall on the third:

I CÁME| I SÁW| I CÒNquered.

(Cf further 19.25)

- 19.10 We have seen (cf 19.5, 19.7) that asyndetic connection has the effect of making the structure of a text extremely dependent upon the sequence of sentences realizing it. There are obviously no grammatical constraints upon the order of:

Roger's finished the thesis! Caroline arrived from New York last week.
as compared with:

Caroline arrived from New York last week. Roger's finished the thesis!

This being so, we must scrutinize the actual sequence all the more carefully to find a textual reason for the particular juxtaposition we encounter. In fact, the absence of grammatical constraints seems quite rare, to judge from both the spoken and written material of the Survey of English Usage. More commonly, the order necessary for the presentation of the text is enjoined by grammatical factors such as the sequence of pronouns in relation to antecedents:

Roger's finished the thesis. *His* wife arrived from New York last week.

The appearance of *his* here doubly provides a formal link between the two sentences in showing that Roger has a relation to both, and in confirming their particular sequence. (Contrast *Roger's wife arrived from New York last week. He's finished the thesis.* Here the pronominalization is again in the second sentence but the two sentences are reversed in sequence.)

Syndetic connection

- 19.11 Another way of indicating both the relevance of sequence and the closeness of textual connection is to introduce an overt connecting item, most frequently the coordinator *and* (cf 13.5ff):

Roger's finished the thesis and Caroline arrived from New York last week.

But although *and* is the most neutral and semantically uncommitted of connecting items, it will be noticed that some of the options for interpreting the text (cf 19.5) are now precluded. Even the 'eavesdropper' who knows nothing of Roger and Caroline may now interpret the two parts as having a temporal sequence matching the textual sequence: perhaps Caroline has waited for the thesis to be completed before leaving New York. This may be brought out more clearly with an alternative set of examples:

The rain has stopped. She's gone for a walk.	[1]
The rain has stopped and she's gone for a walk.	[2]
She's gone for a walk. The rain has stopped.	[3]

?She's gone for a walk and the rain has stopped.

[4]

The dubious textual coherence of the [4] version makes clear that, with syndetic connection, sequence is likely to be crucial. In contrast, the coherence of [1], [2], and [3] is beyond question and in interpretation they are closely similar, even though [3] reverses the sequence (concluding with a reason, where [1] and [2] conclude with a consequence). Compare also:

The student was late for the lecture. He missed his train.
The student missed his train and he was late for the lecture.

Note [a] With *and* connecting two sentences, the relation is made to seem less close. Thus, if [4] above were punctuated as two separate sentences, we could delete the query since the effect would be more like [3]. The *and* in [4] could perhaps connote 'by the way' (cf 19.29), though in this case we might expect something to follow the second sentence:

She's gone for a walk. And the rain has stopped (so she'll really enjoy being out).

[b] Clauses with reciprocal pronouns (cf 6.31) as objects are very similar in meaning to coordinate clauses, but where the former suggest simultaneous actions, the latter is conducive to an interpretation involving sequence. Compare:

Geoff and Sue	$\left\{ \begin{array}{l} \text{greeted} \\ \text{spoke to} \\ \text{saw} \\ \text{kissed} \end{array} \right\}$	each other.		
Geoff	$\left[\begin{array}{l} \text{greeted} \\ \text{spoke to} \\ \text{saw} \\ \text{kissed} \end{array} \right]$	Sue and Sue	$\left[\begin{array}{l} \text{greeted} \\ \text{spoke to} \\ \text{saw} \\ \text{kissed} \end{array} \right]$	Geoff.

Thematic connection

19.12 In 19.3 we examined a text where the connections were extra-textual: our knowledge of Roger and the thesis in which he was involved. But although all texts necessarily have extra-textual connections (none would otherwise be understood), it is normal for them to generate internal connections as well. The basic way of doing this is by proceeding sequentially from the known ('given') to the unknown ('new'), thus forming a chain in which what was unknown becomes the known as a point of departure towards a further unknown item. We have already seen this process in Chapter 18, in relation to end focus. Consider now the following four-part text (truncated and idealized), which we may imagine being spoken over the public address system of a big organization:

[Here is an 'urgent MESSagE] It is for [visiting salesman Herbert BLACK]
Will [Mr Black please contact the third floor sUpervisor] She will be
[waiting for him at the inQuiry desk]

A further example:

[Mary invited me to her BIRTHday party] It was [held in a West End
HOTeL] where I [met her PARENTs] The [father is a retired DENTist]

It will be noticed that each part ends with a prosodic climax (as do the vast majority of clauses in the SEU spoken corpus), and begins with a thematic unit, shown in italics, the whole text having in consequence a rhythmic prosodic pattern that can be diagrammed thus to represent the sequence of crescendi:

Fig 19.12

It is easy to see how this mirrors the increase in what is sometimes called the 'communicative dynamism' (cf 18.3) of each successive part. Irrespective of whether or not they are explicitly linked, the parts are linked thematically in that the 'rheme' (cf 18.9 Note) introduced in the first part, *an urgent message*, is pronominalized as *it* (cf 6.14ff) to become the 'theme' (cf 18.9) of the second. Compare also *Herbert Black* and *him* (via *Mr Black*), *the supervisor* and *She*.

19.13 But thematic connection is often by no means as linearly straightforward as it is in these examples. The interpretation of text depends upon the recipient's common sense and his knowledge acquired independently of the text, as we saw in 19.3. Grammar has potential in establishing plausible interpretations, but it is not required to provide unequivocal cues. Compare the two following texts in both of which there is thematic connection by pronominalization but where the pairing of pronouns and referents is sharply different:

Mr Fraser¹ sent for the doctor²; he¹ listened anxiously for his²
arrival; he¹ asked him² to examine his¹ throat. [1]
Mr Fraser¹ sent for the doctor²; he² diagnosed his¹ complaint;
he¹ soon felt better. [2]

The thematic connections are linked inextricably with the lexical items that are in turn linked to the situational context. Thus *he* and *his* in the second part of [1], while following one of the grammatical patterns of pronoun coreference, are identified with their respective referents through our knowing that the person that sends for someone will be the one to listen for his arrival. Again, in [2] the order of antecedent-pronoun sequence is one of those grammatically permissible: *he* in the second part refers to the last-mentioned noun phrase in the first part. But the actual interpretation relates this grammatical possibility to the extra-linguistic probability that the diagnosis will be carried out by the doctor and not by Mr Fraser.

In the following example, *they* is thematic in both the alternative concluding parts, but identification depends on lexical congruence with the verb of which *they* is subject:

The police¹ prohibited the strikers² from demonstrating because
 $\left\{ \begin{array}{l} \text{they}^1 \text{ anticipated} \\ \text{they}^2 \text{ advocated} \end{array} \right\}$ violence.

Other types of thematic connection involve the fronting of adverbials or other elements more normally associated with end position:

After rejecting the advice of the specialist at the hospital, Mr Fraser
sent for the local doctor. *In him* he had the deepest confidence.
Mr Fraser sent for a different doctor. *His usual one* he no longer trusted.

- Note Commonly, a plural pronoun will refer back to antecedents each introduced as singular:
Mr Fraser¹ sent for the doctor² and they^{1,2} discussed his¹ complaint for nearly an hour.

Rhematic connection

- 19.14 Compare the two following texts:

Jan lives in Holland and he writes poetry. [1]
Caroline arrived on Tuesday and Roger finished the thesis on Friday. [2]

In both there is syndetic linkage, giving a superficial similarity to the cohesion in the two examples, but informationally the types of connection are very different. In [1] there is the thematic connection that we have considered in 19.12; we need see no connection between the rhemes here (*in Holland and poetry*): it is enough that Jan has a relation to both. In [2] on the other hand there is no *textual* connection between the two themes, Caroline and Roger: the parts are firmly connected through the rhemes. This is achieved syntactically (two adjuncts, *on Tuesday* and *on Friday*), in form (both adjuncts involving items from the lexical *x-day* series), and in meaning (both indicating time *when*). There is also a more generally pervading cohesion through parallelism of form; cf 19.7. In speech, the connection would be endorsed by prosodic contrast or parallelism through the nuclei on *Tues-* and *Fri-* with perhaps a wider pitch range (cf App II.20) on the latter:

[Caroline arrived on TUESday] and [Roger finished the thesis on FRIday]
... TUESday ...
... TUESday ...

An example of rhematic connection with pronominalization:

[Experts admire THIS picture] but the [general public prefer THAT (one)]

Textual orientation

- 19.15 In 19.1 we spoke of the need for every text to have a context. In particular we need an orientation in respect of *place*, *time*, *factuality*, and *participant relations*. Let us assume that a lecturer's opening words to an audience were as follows:

In this week's talk, I would like us to examine why some people allege a decline in religious faith.

The basic place and time orientation of the decline in religious faith is entirely covert, but the lecturer knows that his listeners will automatically relate this unlocated, undated decline to their own *here* and *now*. Individuals will naturally vary as to the broadness or narrowness with which they conceive *here* and *now*: this city, this part of the country, this country, here in the world as a whole; now in this present year, this decade, this century. But they will not normally exclude their narrowest concept of 'here' while embracing a wider one, and they will not exclude the present year while embracing the present century.

The same opening sentence could have begun a lecture that was part of a series on eighteenth-century France. In that case, the covert orientation would have been equally automatic and equally essential, but with a *there*

and *then* which would have located and dated the alleged decline, while at the same time giving this location and dating an orientation with respect to the (similar or contrasting) *here* and *now* of the audience.

- 19.16 The example in 19.15 has a bearing upon participant relations in two respects. First, the speaker's personal and functional relation to his audience: he calls his activity a *talk* rather than a *lecture* or *address*, and with polite diffidence (*I would like*) invites his listeners to join him in an inquiry (*I would like us to examine*: cf 6.7, 6.18). A more distant lecturer-audience relation would have been set up with:

In this week's lecture, I shall explain why ...

In either case he feels it relevant to specify the function of his text: cf 'Here is an urgent message', 19.12. Secondly, we have the speaker's relation to the rhematic *a decline in religious faith*: he does not commit himself to claiming a decline ('some people' might, but certainly need not, include the speaker) and indeed he hints at the insecurity of the claim by using the verb *allege*. Note the different relation he would have communicated between himself and his subject if he had said he would:

... examine why it is believed that there is a decline in religious faith.
or: ... examine why there is, as we all believe, a decline ...
or: ... examine why there is a decline ...

Basic relational structures

- 19.17 A text may have one (or more) of an indefinitely large number of purposes: description, persuasion, narrative, etc. Some of these correlate closely with particular connective devices and presentational styles, as we note throughout this book from time to time. Textual functions are too numerous, too fluid, and too interlocking for us to attempt separate treatment in terms of textual form. But irrespective of the various purposes and general intentions of a text, there are a few relationships within texts that constantly recur, which involve particular connective devices, and which are therefore useful to bear in mind as we consider the devices themselves. They can be seen as basic relational structures:

- (a) general and particular
- (b) progression
- (c) compatibility

- (a) It is common for a text to proceed from a general point to a particular:

Working in wood calls for great manual skill. The ordinary saw itself is not easy to handle. [1]

But we may equally proceed in the reverse direction:

The ordinary household saw is not easy to use. In fact, any sort of woodwork calls for great manual skill. [1a]

In conversational texts, the second part will often be supplied by another speaker who thus 'cooperates' in forming the text:

- A: I must go and do some shopping.
 B: Well, don't forget to buy a newspaper. } [general to particular] [2]
- A: This chair is a bit wobbly.
 B: Well, none of the furniture is very good. } [particular to general] [3]

(b) Whether we are giving instructions, telling a story, or conducting an argument, we are concerned to present the parts of our text so as to show the temporal or inferential relation of one to another:

- Get ready: set: go. [4]
 While Oscar was asleep, Mrs Pugh was sewing. [5]
 This must be the way. I remember that house on the corner. [6]

Some dialogue examples:

- A: My shoes are leaking.
 B: So you'll be getting them repaired, I suppose. [7]
 A: I spoke to Veronica on the phone last night.
 B: And? [8]

Conversational explanations often include verbal encouragement such as *you see*, or *if you follow me*, or the like.

(c) Again, irrespective of the type of text, interpretation depends on recognizing whether or not parts are compatible with each other. The relation may be one of *matching*, as in:

- The ordinary saw is not easy to use; a plane demands years of practice. [1b]
 A: That climb up the mountain was marvellous.
 B: The view from the top was glorious, too. [9]

Or the relation may be one of *contrast*:

- The ordinary hand drill is not easy to use; this electric type is something any novice can handle. [1c]

Reluctance or inability to recognize compatibility is often expressed by another speaker's interjection beginning 'Sorry, what about ...' or 'Well, I'm not sure ...'. We may distinguish 'Sorry!' and 'Sorry?':

sŏrry|

'Sorry!' indicates as here conviction about counter-compatibility. By contrast, 'Sorry?' as in:

sŏrry|

is a request for repetition or explanation, perhaps implying serious doubts about the compatibility between the parts of a text, or merely indicating that something was inaudible.

Likewise, a speaker may help to demonstrate compatibility between one part and another by an explanation or example beginning:

You KNŌw|

or by urging a hearer to acknowledge the compatibility with such an explanation or example preceded by:

YŌU KNŌw|

Discourse strategies

19.18 Relational structures can be realized by a number of discourse designs or strategies that have been well described within the rhetorical tradition since ancient times. Some of the most outstanding may be seen in terms of the following metaphors:

- (i) step
- (ii) chain
- (iii) stack
- (iv) balance

(i) The simplest type of exposition is a 'step by step' procedure. It is one that has an obvious appropriateness for instructional material but it is normal also in description, narrative, or argument. The strategy is adequately illustrated by many of the short examples of text already given, but compare also:

The 100-metre race was run immediately after lunch. This was followed by the 400-metre relay. After a brief interlude with an acrobatic display, spectators spread around the track to watch the first cycling event.

Informal spoken narrative of 'step' design often involves repetitious coordination with conjuncts such as *then* or *next*: 'and then ... and then ... next there was ...'

(ii) The chain resembles the step procedure in going from point to point, but whereas in a stepped text it is part of the technique to assure the hearer/reader in advance that the course is unidirectional and the goal planned, with the chain it is equally part of the technique to let it appear that though there are definite links (*cf* 19.11), the direction may curve, the course double back, and the ultimate point be unpredictable. The chain strategy is thus well suited to reflective or exploratory discourse:

Hamlet poignantly represents the indecisions that plague us all. Not that indecision is the worst of our ills. In some ways decisiveness can be more damaging. Many people have decided on their courses of action too rapidly, with disastrous results. Othello is a representative of this tendency, though here we have other factors to consider such as jealousy and the evil influence of a supposed friend. Friendship in itself, of course ...

Like the step format, the chain is often characteristic of informal speech, where the varied and uncertain progression is acknowledged by sections beginning 'But of course', 'By the way', and the like.

The 'chain' type of structure, while technically well-formed (*eg* in thematic

connection) characterizes desultory informal talk where one topic leads aimlessly to another. It is ridiculed in the following passage from Gilbert Sorrentino's *Mulligan Stew* (1980) where a character is musing on the reason for the late arrival of the police. He imagines their route blocked by a landslide so that they are forced to take the old road running beside the river:

The narrow bridges, slats missing, are considered by the natives hereabouts to be dangerous, fit only for carefree boys to fish off. They rarely catch any fish, according to Old Cash at the general store. What crackers he has!

While each transition is linguistically explicable, the text wanders helplessly away from the central question of the journey by the police.

(iii) As with the step technique, the stack has a predetermined unity, but instead of a linear progression we have something more like a vertical structure, with a sound foundation (often called the *topic* sentence), an accumulation of 'layers', finally capped by a neat 'roof', securely 'roped down' to the foundations. For example:

There is something very unsatisfactory about the maxim 'Honesty is the best policy'. It seems to equate virtue with profit, yet our common experience denies this. We could all cite instances of where an honest and virtuous action has brought disappointment and even ruin. We could equally point to people who have behaved with gross dishonesty and have become successful, powerful, wealthy. In any case it is surely rather immoral to incite people to honourable behaviour by seeming to promise reward. Honesty, if it requires a motive, must be valued for reasons other than 'policy'.

Carefully constructed stacks are frequently recommended for *paragraphing* and they cannot be expected in informal conversation, though we often try to impose such a structure by ending a description or argument with a part beginning with a summative conjunct (*cf* 8.137) such as *All in all* ... or *In short* ... Alternatively, the conclusion may be an exclamation like:

What fun it all was! So that's JOHN for you!

(iv) Like the chain, the balance strategy is particularly suited to reflective and exploratory discourse, but it resembles the stack in the care with which the parts are put together. Plus and minus, hot and cold, are set one beside the other so that the text seems to anticipate objections and crosscurrents raised in the mind of the reader/hearer. In the following example, the balance technique is used within a dominant stack procedure:

For a spring break, Cumbria is hard to beat. There is of course a strong risk of bad weather during the early months of the year. On the other hand, the early tourist is rewarded by empty roads and the feeling that he has the countryside to himself. Not all the hotels are open, it is true, and you may be obliged to drive on to the next village. But this is well offset by the welcome that awaits you in a guest house

where you may turn out to be the only resident. Early visitors to Cumbria rarely regret their initiative.

Balancing is common enough in ordinary conversation, using pointers like 'on the one hand ... but on the other hand', but ambitious attempts at balance often seem over-formal or even pompous. Informally, a balancing reservation is often introduced by 'Mind you':

I love Cumbria { . Mind yŏu, I don't like the weather!
-- not the weather, mind yŏu!

Connective devices

19.19 The relation between parts of a text is achieved by connective features that fall into four categories:

- (a) pragmatic and semantic implication
- (b) lexical linkage
- (c) prosody and punctuation
- (d) grammatical devices

Naturally, in a book on grammar, we shall be concentrating on (d), but grammatical devices need to be seen in the context of (a-c) from which they can never in practice be entirely separated. All four types of connective device not merely interact intimately but operate simultaneously. In principle, however, they can usefully be distinguished and we proceed here to examine each in isolation.

(a) Pragmatic and semantic implication

19.20 Consider the following sequence as constituting the beginning of a discourse:

Have you seen the paper? There's been a plane crash.

Interpretation depends on the institution of the (daily) *newspaper*, on the assumption that most of us regularly see some newspaper or other, and on our referring to it – irrespective of the particular newspaper we may have – as 'the paper' (*cf* 5.28). The connection between the two sentences depends in turn (i) on the convention that a question implies that there is something of special interest to which the speaker wants to draw attention, and (ii) on the plausibility that the following statement summarizes a news item that the speaker has read in the paper. On the other hand, if the second part had continued as:

... which has been completely ignored.

the implication would have been quite different: the speaker's announcement of the plane crash was not derived from the newspaper at all.

We may see the chain-like process of implication more clearly in a further example:

Mr Costello drove to London to take part in an antinuclear demonstration. [1]

As a complete text, this implies of course that Mr Costello did in fact take part in the demonstration and we would be unsurprised if the text continued:

He felt he had done something for peace. [2]

But in fact the continuation might well have been:

On the way, his wife suggested they go to the flower show instead. [2a]

This does not in itself frustrate our interpretation of [1]: it remains plausible, but we now recognize that whereas the direction adjunct (*to London*) in association with the past tense (*drove*) combine to entail in themselves actual arrival (contrast *was driving to London* or *set out for London*), the purpose adjunct in [1] (*to take part in . . .*) merely opens a possibility. He intended to take part in the demonstration and the fulfilment of this intention is implied only if nothing is said to the contrary.

Equally, [2a] merely opens an alternative possibility, and in view of this being given expression we are more cautious about assuming the fulfilment of either possibility now before us. With such a further continuation as the following, we conclude that the second possibility was fulfilled, the first tacitly excluded:

There were some of the loveliest chrysanthemums they had ever seen. [3]

But if, instead, [2a] were followed by:

But Mr Costello insisted. [3a]

there would be the implication (but nothing more) that our first interpretation of [1] was sustained. On the other hand, if the continuation were:

In the end, they went window shopping in Regent Street. [3b]

we would know, that neither of the possibilities that had been opened up was actually fulfilled, though both had been equally justified by the grammar and our knowledge of the language. With [3b], furthermore, we find an implication of the discussion and vacillation which led the couple to reject both the original intention [1] and the counter-proposal [2a] – a lengthy process of debate implied by the conjunct *in the end* [3b], at once enumerative, temporal, and summative (*cf* 8.136f).

(b) Lexical linkage

19.21 Contrast the following pairs of sentences:

- Steve and Deborah are both doctors. She is a New Zealander. [1]
Steve and Deborah are both doctors. She is a surgeon. [2]

In both texts there is thematic connection (*she*; *cf* 19.12), but in [2] there is rhematic connection as well (*cf* 19.14), and this is achieved lexically. The lexical items *doctor* and *surgeon* belong to the same semantic set, the former

being a superordinate term (hypernym) embracing *surgeon*, *pediatrician*, *gynecologist*, etc. Sometimes, lexical linkage is formally overt, as in:

Bill is an old friend of mine, but he shouldn't assume that friendship excuses rudeness. [3]

But more usually it involves, as in [2], semantic and pragmatic knowledge, not least a familiarity with words and allusions only covertly connected. Consider the relation in the following between *oven* and *baking* on the one hand, and between *fruit*, *Bramley's Seedlings*, and *apple* on the other:

Of all common fruit, Bramley's Seedlings are particularly suitable for baking. After only a short time in the oven, this apple becomes a light fluffy mass. [4]

As always (*cf* 19.19), there are relevant grammatical features as well: the demonstrative *this* links the generic singular *apple* with *Bramley's Seedlings* as though the latter were a singular generic noun phrase, *the (or a) Bramley's Seedling*.

In the following programme note heard on the radio, pragmatic and lexical linkage are combined in a tactful use of elegant variation which prompts interpretation while avoiding insult to the hearer's assumed knowledge and interpretive skill:

The zoological sequence is called *Cortège d'Orphée*, the music of Orpheus being so attractive that wild animals would follow him. [5]

The adjective *zoological* is related to the noun phrase (*wild*) *animals* in the next clause, while Poulenc's title *Cortège d'Orphée* is 'explained' by linking *sequence*, *attractive*, and *follow* as helpful glosses (like *Orpheus* beside the less familiar *Orphée*) on the French word *cortège*.

Note Lexical linkage involving the shared knowledge of allusion is illustrated in the following piece of dialogue from William Ash's novel *Incorporated* (1980):

'But life itself is like that. No man is an -'
'That's right,' interrupting her while he filled her wine glass. 'We're all isthmuses, and since I can still say "isthmuses", you obviously need a drink.'

The word *island* is so well known in the John Donne quotation that it is left unspoken, but we depend on it for the modified image involving the narrow connection between people expressed by the word *isthmus*. (The repetition of *isthmuses* does not in this case have lexical but phonological relevance, the wittiness of the switch in reference being further endorsed by the switch from the speaker's evident sobriety to the unsupported evidence that his woman companion is equivalently sober.)

Lexicon, shared knowledge, and grammar

19.22 We see, then, that discourse makes considerable use of words having quite general reference in relation to words denoting particularity (*cf* 19.17):

Some animals can be trained to use tableware. We have probably all seen a chimpanzee eating with a spoon or drinking from a cup. [1]
My spaniel was once a keen helper when I went rabbit shooting, but I suppose all dogs lose their hunting ardour as they get older. [2]

But lexical linkage can work through opposition and exclusion as well as through similarity and inclusion. Contrasts may be lexically realized by

reference to *waking* and *sleeping*, *requesting* (eg: *beg*) and *granting* (eg: *allow*), and in the context of childhood an important opposition exists between *school* and *home*. In the following example, *discrimination* is hypernymic with reference to sex, race, and religion, but the particular items included are related through mutual exclusion:

There has come to be increasing awareness of discrimination as a worldwide problem. Women have protested that they continue to have fewer rights than men. Blacks are conscious that their white neighbours get better jobs. Protestants in one community feel the odds are against them, while Catholics have a comparable feeling in another, as do Jews in yet another. [3]

As we also saw in 19.21, lexical links may be established not by our knowledge of the language but by additional information fed in by the speaker/writer. Such linkage can provide a chain-like course through a text (cf 19.18):

The Senate last week refused to confirm the nomination of *Judge Robert Palmer*. The *Judge* is a *Californian* with a sound reputation and enjoying state-wide support. The defeat of the *Californian*, well remembered in *Hollywood studios*, is seen as a rebuke to the President. He is known to have given the *ex-actor* a good deal of personal encouragement. [4]

Linkage of a superficially similar kind may depend on the general knowledge of the hearer/reader to fulfil its role:

In the 1960s the *Beatles* seemed a tightly knit group. The *quartet* developed a style of popular music that was not merely original but which was a product of their close relationship. Yet within a few years, the *Liverpool lads* had gone their separate ways. [5]

If the author had felt less confident about his audience's previously acquired knowledge, he could have prepared for the italicized links in the second and third sentences with an alternative opening such as:

In the 1960s, the *four Merseyside Beatles* seemed . . . [5a]

Compare also:

His opening remarks were directed to *flattering his audience by telling them how honoured he was to address such a distinguished gathering*. As he had expected, *this flattery* guaranteed him an attentive and appreciative hearing. [6]

The nominalization *this flattery* not only links with the same lexical base *flatter(ing)* in the preceding sentence: it provides a thematic connection (cf 19.12) by acting as a substitute for the whole nonfinite clause that is italicized in the preceding sentence. As such, it in fact requires no specific lexical linkage at all, as we see in the following alternative version:

In his opening remarks, he *told his audience how honoured he was to address such a distinguished gathering*. As he had expected, *this flattery* . . . [6a]

A combination of lexical meaning, word-formation, and such syntactic processes as nominalization is a valuable resource in textual structure and we return to it in 19.72ff.

Lexical recurrence

19.23 Lexical linkage by recurrence of form is generally avoided since lexical items can easily seem obtrusive. The second speaker's remark in the following draws ironic attention to the overuse of one word:

A: There was a delightful party at my office for the boss's fiftieth birthday. What I found particularly delightful were the speeches. They were *delightfully* witty. [1]

B: It all sounds a bit *too* delightful for my taste. [1]

On the other hand, a great deal of lexical recurrence is tolerated in legal language where misinterpretation is of more serious concern than adverse stylistic criticism. The following is from a current domestic insurance policy:

If at the time of any loss, destruction, or damage arising under this Policy there is any other insurance covering such loss, destruction, or damage, the Company shall not be liable for more than its ratable proportion of such loss, destruction, or damage. [2]

In ordinary language, we would expect the second use of *loss*, *destruction*, or *damage* to be replaced by some such hypernym as *misfortunes* (cf 19.21) and the third to be pronominalized (*them*). But even in language that is being used in a less specialized way, repetition is common enough to convey emphasis. A tone of impatience in rejecting an accusation is noticeable in the following exchange:

A: [Why weren't you kinder to your sister]

B: [But I *was* kind to my sister] I *gave* *Présents* to my sister] I *introduced* *FRIENDS* to my sister] I *washed* *CLÔTHES* for my sister] [3]

This example is presented in prosodic form to show the way in which the four repetitions of *my sister* have no nucleus, being treated as 'given' (cf 18.8), just as it would be if it had been replaced pronominally, (*to*) *her*. Repetition in ordinary discourse also occurs to indicate the repetition, extent, or confirmation of a phenomenon (cf 13.78, 13.101):

The only remedy is work, work, work. [4]

Everywhere I looked, there were children, children. [5]

She screamed and screamed for hours. [6]

She is very, very intelligent. [7]

A lovely, lovely chrysanthemum. [8]

Note Not only do we tend to avoid lexical repetition in dialogue but an attempt is often made to replace an item by one of heightened meaning, rather than by a mere synonym. This again illustrates 'cooperation' in dialogue texts. For example, note the way emphatic agreement and assertion are expressed in [9] and [10] respectively:

A: Isn't it a lovely day? B: *Gorgeous!* [9]

A: Are you sure you've got the key? B: *Positive!* [10]

General hypernyms

- 19.24 Many lexical items are used hypernymically rather in the manner of pronouns and other substitutes. They thus have a quasi-grammatical function, as can be seen in the italicized examples in the following:

- The mayor's procession is very colourful and attracts many tourists and other spectators. The *event* always occurs on a Saturday. [1]
 Thousands were out of work; there was hunger, anger, and unrest. The *situation* required careful handling. [2]
 The *thing* that amused me most was her remark about her brother's swimming. [3]
 The candidate decided to support the building of another atomic power station. This is what the party leader had *done* at the previous election. But it turned out to be an unpopular *issue*. [4]

Compare also *field*, *set-up*, *problem*, *subject*, *matter*, and such verbs as *happen*, *take place*.

- Note Being more obtrusive than closed-class items such as pronouns, demonstratives, and the proverb *do* etc. such hypernyms are liable to attract criticism when overused. This is particularly so of nouns like *issue*, *position*, *situation*, when premodified. Critics often feel (with some justification) that 'the weather situation', 'a strike situation', 'the women's lib issue', 'the Northern Ireland problem' mean little more than *the weather*, *a strike*, *women's lib*, and *Northern Ireland*. But if we consider the following comment in a radio broadcast:

In view of *the weather situation*, many flights are being postponed. [5]
 We see that the italicized phrase means much more than 'the weather' (ie what the weather actually is). It includes far more general allusion to the probabilities, the forecasts, the implications that have been set forth in an earlier part of the text.

Nonetheless, some uses of common hypernyms are avoidable clichés and are justified – if at all – only as a form of hackneyed 'elegant variation':

- Mabel told me with evident pride that she was pregnant again. The *happy event* will take place in March. [6]

(c) Prosody and punctuation

- 19.25 Consider the written sequence:

I smiled at the supervisor and she greeted me. [1]

It would be possible to utter this with two sharply different prosodic realizations reflecting different interpretations and different bases of linkage:

- ... and she GRÉETed me [1a]
 ... and SHEÉ greeted ME [1b]

In [1a], there is lexical contrast between the two parts; a verbal greeting is indicated: something actually heard in contrast to the silent smile in the first part of the text. In [1b], *greeted* is merely a lexical variant of *smiled*; the smile was a greeting and there was a similar silent greeting in response. This is prosodically indicated by *greeted* having no intonational prominence; it is 'given' informationally (cf 18.8), whereas in [1a] *greeted* is contrastive and 'new', as is indicated by the intonational nucleus. In [1b] what is new is neither the participants nor the verbal action but only the reciprocation; the roles are reversed and hence the subject and object pronouns are intonationally

highlighted. But the endings of both [1a] and [1b] are equally dependent in their different ways on the preceding parts to which they are linked.

While there is a direct relation between speech and writing, as also (broadly) between prosodic features of speech and the punctuation devices of writing, the former must be given precedence in each case. In fact, as we see from [1] above, it is impossible to understand a written text until we assign to it a prosody – whether we take it in silently or read it aloud.

Since such prosodic features as stress, rhythm, and intonation have to do with information processing (cf 18.2–19, App II), and since the linkage between the parts of a text reflects the buildup of information (cf 19.12), it follows that prosody is a vitally important factor in textual coherence.

- Note An example follows which shows the interaction of prosody with lexical linkage and which also demonstrates implication of a connection between meaning and linguistic form (alliteration and prosodic as well as grammatical shape: *grandest*, *greatest*):

It has been said that Schubert's Ninth Symphony is his *Eroica*. As in Beethoven's master work, we seem to hear the artist at his grandest if not greatest. [2]

The text depends of course on our knowing that the *Eroica* is a composition by Beethoven, and it consequently requires us to recognize a relation that may be represented as follows:

as Ninth is to Schubert so is *Eroica* to Beethoven
 The phrase *master work* is thus 'given' (cf 18.8) and is a replacement for *Eroica* (elegant variation and hypernymic; cf 19.24); as such, this phrase must be downgraded prosodically, the premodifier (*Beethoven's*) taking a nucleus to show the link with *Eroica* and the contrast with Schubert:

... is his *ERÓICA*. As in *BÉETHOVEN's* master work ... [2a]

The lexical independence of prosody

- 19.26 The central place of prosodic features is emphasized throughout this book, and in the present chapter they are best illustrated along with the grammatical features they accompany. But we should note that prosodic variables are to some extent quite independent of the particular words used – and indeed no actual words need be used.

It is a characteristic of even the most one-sided dialogue that the speaker expects a prosodic response, even if it is realized with oral support that does not include institutional 'words':

A: So I told him that it was none of his business and that I would do as I pleased.

B: [M] [1]

A: After all, it's not as if I still owed him money.

B: [M] [2]

A: I repaid him that money I borrowed – well, nearly all of it, so I'm no longer under any obligation to him.

B: [M] [3]

In [1], B is assuring A with his falling tone that he follows (and perhaps agrees with) what A is saying. In [2], however, the rising tone indicates surprise or a question or some form of challenge; it is apparently enough to divert A from his thread of discourse to tell B about the loan repayment. In [3], B's fall-rise indicates understanding, but with only qualified assent, and A's next utterance might well go further into the morality of the position as he sees it. All three of B's contributions are textually important and in some

circumstances their absence would bring the discourse to a halt: A would be puzzled, or he might be offended, at B's silence. On the telephone, he would have interrupted himself to ask 'Are you still there?' or 'Can you hear me all right?'

- 19.27 Irrespective of response-dependence (and in radio discourse, no response is usually possible), a speaker prosodically empathizes with the hearer in numerous ways. Pauses are helpfully introduced after completing a significant information unit; this indicates the end of what may be called a prosodic 'paragraph', and such a termination will be marked by being given a specially long curve to an intonation nucleus (usually a fall). Or a pause may be introduced immediately before a lexical item which the speaker feels may be unfamiliar or which he wishes to be heard clearly:

The library has hundreds of extremely valuable books including
several [pause] incUNABula. [1]

By contrast he may tactfully increase the tempo over parts of his discourse that he expects will be particularly familiar or which he modestly wishes to be treated as rather unimportant. As with B in [3] of 19.26, a speaker will use a fall-rise to hint at reservation and uncertainty, so that a contrast would be heard with the all-embracing summative conjunct (cf 8.139) in:

On the WHOLE my childhood was a happy one. [2]
On the WHOLE my childhood was a happy one. [3]

In [2] we have a confident statement, in [3] it is hedged with some doubt. A rising tone will especially be heard however to indicate clearly that something is to follow: a main clause, a further item in a list, and the like. It will also be used in direct appeals for the listener's cooperation and understanding, in such cases the rise being rather narrow (cf App II.15) and each appeal having lower prominence (cf App II.9) than the surrounding text.

For example:

I had no idea where she had gone, you [SÉE] – and I could hardly
wait there all night, [M] [4]

One final general point may be made. We saw in 19.26 that prosodic features could be used without actual words. In a similar way, prosody enables us to dispense with words that would be necessary for clarity in a written version of the same text. The two following utterances are obviously very different:

And so it's just possible that she's ill. [5]
And so she may be actually ill. [6]

A single string of fewer words could convey the difference by assigning different prosody:

And so she MÀY be ill [5a]
And so she may be ILl [6a]

Punctuation

The paragraph

- 19.28 Although in this book we repeatedly emphasize the primacy of speech over writing, and of prosody over punctuation, we have to recognize that many types of text take shape first on paper and have their normal realization in graphic form. Punctuation thus has a greater interest for the study of texts than for linguistics as a whole, where it can be generally looked upon as a surrogate and a rather inadequate substitute for the range of phonologically realized prosodic features at our disposal.

In considering the grammatical system of English, we think in terms of such units as sentence, clause, and phrase. We noted earlier (cf 19.9) that from a textual viewpoint, however, such distinctions are not particularly relevant: the difference between sentence and clause, for example. What is more significant is that there are textual units that cannot be recognized at all in grammar, and only the smallest of them can be recognized prosodically as units. Written texts may be in volumes, parts, chapters, sections; and few are so short as not to comprise more than one paragraph (itself a unit only uncertainly matched in prosodic terms). And this is to ignore such well-established genres of literary texts as the epic poem, the lyric, the play, the short story, the novel. Anthony Powell's novel, *Dance to the Music of Time*, comprises twelve volumes, each of which can itself be read as a complete novel.

We shall shortly come to consider sub-paragraph textual units, but first we should note that the decision as to where to impose paragraph boundaries is by no means self-evident or unequivocal. Yet a paragraph has on the one hand a relatively strong sense of internal coherence and on the other a relatively loose linkage with the textual material before and after it. Consider the following fragment of text:

... and that was how I came to have some weeks observing the
behaviour of their eight-year-old son. He broke eggs on the carpet.
He twisted his kitten's tail till it mewed in anguish. He put garbage
in his parents' bed and burned holes in his sister's clothes. (i) He was
extraordinarily [adjective]. (ii) His parents intended to send him to a
special school...

According to the adjective we supply at the bracketed segment, we can see that either (i) or (ii) could be a fitting place to begin a new paragraph.

If the adjective is *wicked, naughty, ill-behaved*, we might well start a new paragraph at (ii). The preceding part would have had a stack-like structure (cf 19.18) and the sentence 'He was extraordinarily ill-behaved' would fittingly round it off with a rather self-evident conclusion.

If, on the other hand, the adjective is *intelligent, gifted, musical*, or some other item not suggested by the account of his behaviour, then (i) would be a fitting – one might say essential – point at which to begin a new paragraph. This would reveal a totally different aspect of the boy and the text might go on to describe the special school at which his intelligence or other positive gifts could be suitably developed.

The sentence

- 19.29 In an analogous way, the decision to divide a paragraph into orthographic sentences depends on how the writer wishes these smaller sections of his text to be seen in relation to each other: intimately linked as though naturally indissociable (no punctuation); closely associated but separate (comma or semicolon, according to degree); relatively separate (pointed as independent sentences). Compare the different implications of the following:

- I saw Miriam and Walter. [1]
- I saw Miriam, and Walter. [2]
- I saw Miriam – and Walter! [3]
- I saw Miriam. And Walter. [4]

In [1], the normal and expected form, it seems to be suggested that Miriam and Walter are a couple who regularly appear together. This is not so in [2–4], where the punctuation may carry various implications according to the larger context. In [2], the two persons are being listed; in [3], the sight of Walter in addition to Miriam is given special and dramatic significance; in [4], the second person seems to be mentioned as an afterthought. But the suggested motivations for [3] and [4] might be expressed by either of the punctuation forms according to the taste of the writer or his belief in their communicative impact on the reader. Since (as we see in App III) punctuation is subject to fairly rigorous convention, many writers hesitate to show individuality, originality, or rhetorical effects by this means. Instead they will select grammatical constructions and carefully selected lexical items which they hope may achieve effects that in speech would be without difficulty indicated by prosodic features. In any event, aural realization cannot be disregarded. Even the silent reading of a typically paper-originating text (such as a legal document) demands the assignment of speech prosodies as an aid to understanding. The careful writer does not forget this, and punctuation choices are made (along with grammatical and lexical ones) in the hope of providing the reader with the cues necessary for assigning the prosody that the writer would himself have used in uttering his text aloud.

But as readers we have an obligation too. In listening to a spoken text, we automatically respond to the prosodic features that help to mould its structure. When we read, we have to create those prosodic features from the visual print. Stumbling as we read is a common experience: the further context then tells us of an earlier misinterpretation and we have to go back and reread a portion of the text, redistributing our imagined internal stresses and nuclei. Sometimes the fault is in the ineptness of the writer, but often it lies in our lack of sympathetic alertness to the textual structure in front of us.

Note Novelists and poets are more often prepared than other writers to be unconventional in their punctuation and hence to make their text easier to interpret prosodically. Consider the following passage from Peter Straub's *Ghost Story* (1979). A woman is announcing to a lover that she is returning to her husband (Ricky):

I think it is time I retired into respectability. And, if you cannot see that Ricky has four or five times your significance, then you are deluding yourself. [5]

The one-word sentence *And* functions as a heavy additive conjunct (cf. 8.138; perhaps equivalent to *moreover* in a formal style). It is only by making it a sentence that the writer is able to ensure that we read it in the way it would have sounded in speech:

... into respectability] [AND] If you 'cannot see] ... [5a]

(d) Grammatical devices

- 19.30 We shall deal with some of the many relevant aspects of grammar in textual structure under the following main heads:

- (i) Place and time relators
- (ii) Tense, aspect, and narrative structure
- (iii) Determiners, pro-forms, and ellipsis
- (iv) Discourse reference
- (v) The textual role of adverbials
- (vi) Coordination and subordination
- (vii) The part played by questions
- (viii) Participant involvement
- (ix) Information processing

Place and time relators

- 19.31 In 19.15 we stressed that textual structure requires firm orientation in respect to place and time. Let us assume that an acquaintance tells us:

Long ago, I lived in the Far East. My father worked at a naval base. I went back to look at our old home soon after the Navy had withdrawn. [1]

In addition to the *here* and *now* of the speaker and hearer, one other location in space and two other 'locations' in time are mentioned; and the speech participants relate themselves to these locations:

Fig 19.31

Taking A as 'here and now', this involves imagining a remote place where, for a relatively long time span in the past 'D', there had existed a naval base. Within that period, for a shorter but equally unspecified stretch of time 'B', the speaker had lived there. And between the times B and A, there is a time 'C' (narratively represented as without duration) when the speaker went back to the Far East but when the naval base no longer functioned.

In even so simple a narrative text, we should note the adequacy of the space and time references in providing the orientation, and yet the imprecision of these references: no actual locations that one could point to on a map, no actual dates. Note also the implicit relation to *here* and *now*: the 'Far East' is *far* only from (say) Britain, and is *east* only in relation to somewhere in the west; the time is 'long ago' only in relation to 'now' – it was itself 'now' when the speaker lived in the Far East.

Place relators

- 19.32 It is from the linguistic signs for spatial reference that we derive expressions for the most abstract relations such as time (cf 4.2ff, 8.75). Yet although physical location is essential for orientation in discourse, grammatical correlates to physical location are relatively meagre. Shifts or distinctions within space tend to be expressed by location-specific lexical items or even proper nouns (place-names, for example). Note the heavy dependence on lexical items in the following familiar spatial distinctions, where the relatively grammatical (*ie* generalizable) items are italicized:

within my apartment – *through* the hall – *into* the kitchen – *inside* the bedroom – *part of* the bedroom ceiling
 Hampstead – *out of* the underground station – *up* Heath Street – *beyond* White Stone Pond – *to* Jack Straw's Castle
 New York – *going upstate* – *along* the Hudson – *near* the Catskills – *from* Poughkeepsie – *all the way past* Kingston

Nonetheless, as we saw in 8.39ff, certain spatial relations are firmly linked to grammatical expressions which are heavily exploited in textual structure. Thus an opening question or statement will normally involve reference to location in space (as well as in time):

Where are you going tonight? [1]
 It's ages since I was *over there*. [2]
 On Tuesday evening, I was *at the front door* talking to a caller.
 Suddenly we heard a crash and two cars collided *just opposite*.
 We hurried *across* to see if we could help. One driver was
 scrambling *out*, bleeding profusely, and my visitor helped him
over to the pavement. Then *along* came some people, running
up the street. I dashed *back in* and phoned for help. When I
 went *out* again, the other driver was trying to move his car
down the road a little and *in to the side*. [3]

In all three examples, spatial reference is essential, as well as orientation to the participants' *here* (cf 19.31): *where* in [1] entails a *here* from which to set out; *over there* in [2] entails 'in contrast to here'. But let us look more closely at the part played by spatial reference in [3], both in respect to orientation and to the structure of the narrative.

Even totally out of context, the institutionalized phrase *at the front door* would be understood as referring to the main entrance of the speaker's home, whether this was a house or a small apartment. Likewise, *just opposite* is at once understood as *just opposite* to where the speaker and his visitor were standing. A road is implied by the car crash and in this context *across* means 'across the intervening space (of footpath and street)'. The *back in* signifies a return across this intervening space and *into* the speaker's home. The two instances of *out* are of sharply different reference: the first refers implicitly to emergence from the car, the second to re-emergence from the speaker's home (thus correlating with the earlier *back in*). The contrasting phrases *up (the street)* and *down (the road)* are interesting in making spatial reference not necessarily in terms of relative elevation (though this is not excluded). The immediate contrast is in terms of orientation again: *up* indicating an

approach towards the speaker (and his home), *down* indicating the converse (cf 9.24). The cluster of spatial references provides a continuous set of coordinates in relation to a base (the speaker's home, though this is merely a pragmatic implication) as well as a coherent account of the movements involved in the narrative.

Note In a text where it was known that a physical slope was involved, *up/down (the street)* would be used with respect to this absolute and objective physical feature, and it would outweigh personal orientation. The latter could then be expressed by alternative means: 'She went (*away*) up the street'; 'They came down the street'. Contrast also: 'They hurried *up* Fifth Avenue' (*ie* away from 'downtown' Manhattan); 'They sauntered *down* Fifth Avenue' (*ie* towards downtown Manhattan); 'They walked *along* Fifth Avenue' (neutral as to direction).

Elliptical, lexical, and grammatical indicators

- 19.33 Where place relators operate in text structure, ellipsis is often involved (cf 12.47ff):

He examined the car. The *front* was slightly damaged. [1]
 The building was heavily guarded by police. The windows
 { on the top storey }
 { at the top } were covered with boards. [2]

The ellipted items in [1] and [2] are *of the car* and *of the building* respectively. Often the ellipted items are not in the previous context, but are understood from the situational context (either accompanying the communication or established by the communication):

The traffic lights eventually changed. He walked *across* quickly. [3]

Across here implies *the road* or some similar noun phrase (cf 9.66, 19.32).

A few place adverbs do not involve ellipsis: *here*, *there*, *elsewhere*, the relative *where*, and (in formal contexts) *hence*, *thence*, *hither*, and *thither*. They are pro-forms:

The school laboratory reeked of ammonia. *Here*, during the first week of the term, an unusual experiment was conducted. [4]
 All my friends have been to Paris at least once. I am going *there* next summer for the first time. [5]

Here in [4] is a substitute for *in the school laboratory* and *there* in [5] for *to Paris*.

Note [a] *Elsewhere* differs from the other substitutes in indicating that the places under consideration are other than those previously mentioned.
 [b] In sentences like *Stand there* and *Here it is*, the pro-forms may refer directly to the situational contexts without any linguistic mention of location; cf 19.34.

- 19.34 Place relators often comprise two components. Most commonly these are a dimension or direction indicator plus a location indicator (cf 9.13ff). The latter is usually an open-class noun (or proper noun), but its locational use is often institutionalized, making the whole expression quasi-grammatical. Examples:

in town
off work
on board
on the way

(not) far	} +	$\left\{ \begin{array}{l} \text{in} \\ \text{out} \\ \text{off} \\ \text{away} \\ \text{from} \end{array} \right.$	nearer	+ {	in
further			to + Noun Phrase		
farther			high(er)	+ up	
			low(er)	+ down	
			close	+ {	by
			to + Noun Phrase		

I shouted to attract her attention and she brought the boat *close to* so that I was able to jump on. [1]

Are you coming $\begin{cases} \text{on board} \\ \text{aboard} \end{cases}$ or are you staying *ashore*? [2]

After being *out* for a couple of hours, I'm now
 $\left\{ \begin{array}{l} \text{going} \\ \text{staying} \end{array} \right\}$ *home* for the evening. [reference to personal residence] [3]

After $\left\{ \begin{array}{l} \text{living} \\ \text{being} \\ \text{going} \end{array} \right\}$ *abroad*, I like to $\left\{ \begin{array}{l} \text{come} \\ \text{be} \end{array} \right\}$ *home* for a year or so.
[reference to native country] [4]

I'm glad to welcome you *here* and I'd like to introduce two friends who are sitting (over) *there*. [5]

I |put it tO the 'President| [6]
There'll be some |black 'ice ON 'some 'roads| [7]

The practice is criticized in such instances for being vacuous at best, misleading at worst (in suggesting a contrastive denial: 'not just NEAR some roads but ON some roads'), but it is sometimes defended as conferring a liveliness and informality. What seems to be true, at any

The car was at the corner.	[8]
The car was at or near the corner.	[8a]
Trains to the city are delayed.	[9]
Trains to and from the city are delayed	[9a]

Here the speaker has chosen not to nominalize the second use of *Marion*, but the focus cannot be placed on the name since it has already been given. At the same time, the speaker has chosen wisely not to move the focus to the next preceding lexical item *give* since emphasis on this word might be understood as conferring the literal sense of 'make a gift'. A focus is needed, and we are left with no other option than to (cf. also 18.14).

19.35 Like space, time has its lexically specific and labelled 'areas' and 'locations'. Along with open-class nouns, some of them – like places – are treated as proper nouns: *century, decade, year, 1985, January, week, day, Thursday, evening*, etc. Again like units of space, these nouns have an institutionalized and hence quasi-grammatical use. Specifically, in addition to being used as subjects and objects in clause structure, they are used in (and indeed as) adverbials and they thus lend themselves to the connections and transitions of textual structure:

I've been working on this problem *all year* and I must find a solution *before January* when I'm due to go abroad *for a month or so*. [1]

I've been working *a long time*. [2]
I'm going abroad *for a while*. [3]
She hasn't visited me *for ages*. [4]

In addition, therefore, to closed-class items like *afterwards*, we take account here of numerous open-class words which, though with clear lexical meaning, are largely used in the constant process of keeping track of the many and complex references that are necessary in coherent text. Since time passes irrespective of location (which need not change), temporal cues to periods, and to references *before*, *after*, *within*, and *during* these periods, are more inherently essential than locational cues.

Once a time reference has been established, certain temporal adjectives and adverbs may order subsequent information in relation to the time

reference. Three major divisions of time relationship may be set up, and examples will be given of adjectives and adverbials that signal the relationships:

- (i) Temporal ordering previous to
(ii) Temporal ordering simultaneous with
(iii) Temporal ordering subsequent to
- } a given time reference

On all three, cf further 8.51ff, 8.97f, 8.134ff.

Temporal ordering

19.36 (i) Temporal ordering previous to a given time reference:

ADJECTIVES

earlier, former, preceding, previous, prior

For example:

He handed in a good essay. His *previous* essays were all poor. [1]

The implication of *previous* is 'previous to the good essay just mentioned'.

ADVERBIALS

already, as yet, before, beforehand, earlier, first, formerly, hitherto <formal>, *previously, so far, yet*; and phrases with pro-forms: *before that, before this, before now, before then, by now, by then, until now, until then, up to now, up to then*

For example:

I shall explain to you what happened. But *first* I must give you a cup of tea. [2]

First is to be interpreted here as 'before I explain to you what happened'. Compare also '*On the eve* (of the celebration)' [= 'on the day before'].

(ii) Temporal ordering simultaneous with a given time reference;

ADJECTIVES

coexisting <formal>, *coinciding* <formal>, *concurrent* <formal>, *contemporary, contemporaneous* <formal>, *simultaneous*

For example:

The death of the President was reported this afternoon on Cairo radio. A *simultaneous* announcement was broadcast from Baghdad. [3]

Simultaneous means 'simultaneous with the report of the death of the President on Cairo radio'.

ADVERBIALS

at this point, concurrently <formal>, *contemporaneously* <formal>, *here, in the interim* <formal>, *meantime, meanwhile, in the meantime, in the meanwhile, now, presently, simultaneously, then, throughout*, and the relative *when*

For example:

Several of the conspirators have been arrested but their leader is as yet unknown. *Meanwhile* the police are continuing their investigation into the political sympathies of the group. [4]

Meanwhile means 'from the time of the arrests up to the present'.

Note [a] The use of *presently* for time relationship (ii), with the meaning 'now', 'at present', is very common in AmE. In BrE, *presently* is more commonly synonymous with *soon*.

[b] An example of *here* as time indicator:
I've now been lecturing for over an hour. I'll stop *here* since you all look tired. [5]

19.37 (iii) Temporal ordering subsequent to a given time reference:

ADJECTIVES

ensuing <formal>, *following, later, next, subsequent* <formal>, *succeeding* <formal>, *supervening* <formal>

For example:

I left him at 10 p.m. and he was almost asleep. But at some *later* hour he must have lit a cigarette. [1]

Here *later* might mean 11 p.m., but equally 4 a.m., a time otherwise called 'the early hours of the morning'.

ADVERBIALS

after, afterwards, (all) at once, finally, immediately, last, later, next, since, subsequently <formal>, *suddenly, then*; and the phrases *after that, after this, on the morrow* ['the day after']

For example:

The manager went to a board meeting this morning. He was *then* due to catch a train to London. [2]

Then here means 'after the board meeting'. The temporal adverb *again* could be accommodated in this category. It is equivalent to 'another time', ie a time additional to one previously mentioned:

He told her what he thought of her. He didn't speak to her *again*. [3]

Words with temporal significance do not always have a connective function. Often the time reference is not explicitly mentioned in preceding sentences. Thus, if somebody says:

Mr Johnson's *previous* wife died last year. [4]

there need not have been any prior mention of the subsequent or present wife. The fact that Mr Johnson had been married before may be assumed as known to the hearer.

Note [a] *Anew* and *afresh* are synonyms of *again* and *once more*, but are rare and formal.
[b] Several compound adverbs that can be classed in (iii) are found only in certain formal varieties of contemporary English: *henceforth, henceforward, hereupon, thenceforward, thereafter, thereupon, whereupon*.

- 19.38 The ordinals constitute a temporal series of adjectives *first, second, third* ... with *next* as a substitute for any of the middle terms when moving up the series, and *final* or *last* as a substitute for the term marking the end of the series. There is a corresponding series of conjuncts with *first* (also *at first* and, less commonly, *firstly*) as the beginning of the set; *secondly*, etc; *next, then, later, afterwards*, as interchangeable middle terms; and *finally, lastly*, or *eventually* as markers of the end of the set (cf general ordinals, 4.22).

Tense, aspect, and narrative structure

- 19.39 The many lexical and grammatical items we have been considering in 19.35ff provide fine distinctions in time relationships. But, as a further indication of the importance of time in language, all finite clauses (and many nonfinite ones) carry a discrete indication of tense and aspect. Although the contrasts involved are severely limited in comparison with adverbial distinctions, they contribute to the textual cohesion and progression, and of course they cannot be absent. Compare the different implications in the second part of what follows:

She told me all about the operation on her hip. [1]
It seemed to have been a success. [2]
It seems to have been a success. [2]

In [1], in accordance with our expectations with respect to sequence of tenses and backshift (cf 14.31), the past ties the second part to the first, as though both parts derive their authority from the woman concerned: 'It seemed to her ...'; that is, 'She was of the opinion that the operation had been successful'. The possibility of repudiation is therefore open: 'Unfortunately, this is not so'. In [2], by contrast, the present disjoins the second part and implies an orientation to the 'I' narrator: 'It seems to me ...', 'I am of the opinion ...'.

Alternation of past and present in this way is a regular mode of switching reference from the 'then' of the narrative reference to the 'now' of both the narrator and the hearer or reader (some items like parenthetical *you see* being confined to this 'now'):

As a child, I lived in Singapore. It's very hot there, you *know*, and I never owned an overcoat. I *remember* being puzzled at picture books showing European children wrapped up in heavy coats and scarves. I *believe* I thought it all as exotic as children here *think* about spacemen's clothing, you *see*. [3]

Consider now the instances of past tense in this text: *lived, owned, thought*. Not merely are these verbs morphologically identical: the text actually represents the past as being referentially identical. All the verbs refer back to a stretch of time during which these things were true:

Fig 19.39

- 19.40 But past tenses need refer neither to the same time nor to stretches of time. With verbs which connote discrete actions, a narrative string of past tenses will be interpreted as referring to a sequence of events iconically represented by the sequence of verbs. For example:

Do you want to hear about my adventures last Thursday? I *got up* at six, *had* some coffee, *kissed* my wife goodbye, and *set off* for Rome. I *took* a taxi and then the underground, *arrived* at Heathrow, *started* to check in my case, *patted* my pocket and *found* - no ticket, no passport. *Picked up* my case, *caught* the underground, *got* another taxi, *arrived* at my front door, *rushed in*, and of course *gave* my poor wife the shock of her life. [1]

We now have a very different diagram:

Fig 19.40

- Note [a] While a sequence of past tenses implies sequential events if the lexical meaning of the verb makes this plausible as in [2], a sequence of past verbs with progressive aspect (cf 4.25ff) can imply simultaneity, as in [3]:

René *was raging* with anger. Janet *was going out* for the evening. [2]
René *was raging* with anger. Janet *was going out* for the evening. [3]

- [b] Use of the past perfective can enable us to reverse the order of sentences in a text (cf 4.24). Note the way in which 'Time One' [T₁] precedes T₂ in [4] where T₂ precedes T₁ in [5]:

There *was* a sudden violent noise outside [T₁]. John *telephoned* the police [T₂]. [4]
John *telephoned* the police [T₂]. There *had been* a sudden violent noise outside [T₁]. [5]

Tense complexity in narrative

- 19.41 More usually, however, texts comprise much greater time-reference complexity than the examples in 19.39f show. They will have a mixture of state verbs and discrete-action verbs; the narrative will weave backwards and forwards, a mixture of tenses and aspects, of finite and nonfinite clauses enabling the narrator to depart from the linear sequence of historical order so as both to vary the presentation and to achieve different (eg dramatic) effects:

I was reading Chaucer's *Troilus* the other night, and it suddenly occurred to me to wonder what Chaucer { expects } { expected } us to make of the fact that Criseyde { has } { had } been widowed whereas Troilus { has } { had } never even been in love. Surely this is significant, yet I had never thought of it before. [1]

Here we have the additional complication of a narrative about a narrative within a narrative:

Fig 19.41a

The account of the narrator's reading and reflection is itself of some complexity: within a period in the past, a durative activity (*reading*) is represented as being interrupted by a sudden thought. But the thought had significance not merely at the time of thinking it nor merely during the rest of the reading period; it is represented as being permanently significant. The appeal to the hearer ('Surely . . .') does not connote that *is* refers only to the *now* of the speaker and hearer; there is no room for some such adverbial as *present*:

*Surely this is *at present* significant.

The narrator is here using the present tense of timeless reference (cf 4.2ff). It is the potentiality for such a use of the present that made us give the two possibilities, 'Chaucer expects' and 'Chaucer expected'. The latter takes the historical view: a comment on the poet as he wrote in the fourteenth century. The former treats the Chaucer canon as timeless, permanently existing.

An analogous choice exists in referring to the fictional narrative of Chaucer's poem:

Fig 19.41b

'A' represents the (unknown) period during which Criseyde has been a widow when the poem begins; 'B' represents the longer period (in effect, Troilus's whole life) during which Troilus has never been in love. It will be noticed that in this commentary we have adopted the 'timeless' view of the fiction ('when the poem *begins*, Criseyde *has been* a widow for some time'). In

the original example [1], the past variant was also given, implying a retelling of the story ('When Troilus first *saw* Criseyde, she *had been* a widow for some time').

Special uses of present and past

- 19.42 We have seen that the present tense can cooccur in textual structure with two distinct types of time references: ordinary 'state present' and universal 'state present' ('timeless'; cf 4.5):

I think she had undergone an operation before I met her. [1]
Troilus *is* totally fancy-free until he *sees* Criseyde. [2]

A third type of present, 'habitual' (cf 4.6), is common in ordinary narrative, and it can readily cooccur with past tenses:

I had forgotten that they *dine* very early and I arrived at an awkward moment for both them and me. [3]

But there is a further use of the present tense: the so-called 'historic present' (cf 4.8). As well as occurring in rather mannered and formal prose of an old-fashioned tone, it is common in colloquial spoken narrative, especially at points of particular excitement. The time reference is unequivocally past. For example:

It was on the Merritt Parkway just south of New Haven. I was driving along, half asleep, my mind miles away, and suddenly there was a screeching of brakes and I catch sight of a car that had been overtaking me apparently. Well, he doesn't. He pulls in behind me instead, and it's then that I notice a police car parked on the side. [4]

Note In nonstandard speech, the reporting verb in narrative is often in the historic present: 'Where did you put my coat?' he says. 'I never touched it,' I says. [5]

- 19.43 As well as being able to use the present tense to refer to the past, we can conversely use the past to refer to a narrator's 'now', exploiting that form of backshift that is referred to as free direct and indirect speech (cf 14.28, 14.35). Textual cohesion and congruity of reference are maintained by careful consistency of tense and aspect usage, present replaced by past, past by past perfective, even in the prolonged absence of reminders to the hearer/reader in the form of reporting verbs ('He reflected . . .', 'She said . . .'). In the following example, an entire paragraph coheres in this way, but the end of the preceding paragraph is quoted with the reporting verb (*recalled*) as a cue. The past with this verb is the normal past used by any narrator for the story that is being told and which is necessarily in the past for both narrator and hearer/reader. From this point onwards, however, the past refers to the recreated 'present' of the character whose reflections are recalled: they are reasonably referred to as occurring 'now' (the final word of the introductory paragraph), in a sentence which we reconstruct for ourselves as 'Well, what does it work out to now?'

... He recalled vaguely that they had talked at one point in terms of debits and credits. Well, what did it work out to now?

Credits? Well, there was all that money in Switzerland. And Devon, of course, but he felt he was wearing her down with his moping. Would she stick it out with him? Debits? He was an accomplice to one murder; the near victim of an assassination; indirectly responsible, probably, for other deaths. Worse still, it had all turned out exactly opposite to the way he had expected. The crooks and fools were in solidier than ever. Which meant that he had in a way betrayed his country, if – as he most surely had done – helping to perpetuate the very monsters he had sought to extinguish was a betrayal. Not that he'd be tried or convicted for it; the country was fat and happy. The payment of the check had only been postponed; nothing had really changed. So much for deep thinking; so much for crusades.

(M. M. Thomas, *Green Monday*, 1980) [1]

It will be noticed that the novelist emphasizes the impression of actual present-tense self-communion by colloquial style, as for instance in the one-word questions which serve to provide a continuity to the reflections.

Now let us consider this text rewritten as *current* rather than *reported* self-communion:

I *recall* vaguely that we *talked* at one point in terms of debits and credits. Well, what *does* it *work* out to now?

Credits? Well, there's ... Devon, of course, but I *feel* I'm wearing her down with my moping. *Will* she *stick* it out with me? Debits? I'm an accomplice to one murder ... Worse still, it *has* all *turned* out exactly opposite to the way I *expected*. The crooks and fools *are* in solidier than ever. Which *means* that I *have* ... *betrayed* my country, if – as I most surely *have* done – helping to perpetuate the very monsters I *(have)* *sought* to extinguish *is* a betrayal. Not that I'll *be* *tried* or *convicted* for it; the country *is* fat and happy. The payment ... *has* only *been* *postponed*; nothing *has* really *changed* ... [1a]

We notice that, while simple past becomes simple present, and past progressive becomes present progressive (line 3 of [1a]), the past perfective corresponds in two cases to the past, in five to the present perfective. In one further instance, line 9 of [1a], the correspondence is debatable. The text is, in fact, typical in showing the tendency of present perfective to cooccur in discourse with present rather than past tense forms.

Determiners, pro-forms, and ellipsis

19.44 Let us consider the following independent sentences:

- An argument over unilateral disarmament broke out between them. [1]
An argument over unilateral disarmament finally put an end to their friendship. [2]

If we wished to make these sentences into a textual whole, there would be numerous possibilities, even keeping the first part unchanged:

... between them. { The } argument finally put an end to
 { This } their friendship. [3]
 { That }

... between them. { The } { dispute } finally put ... [4]
 { This } { controversy }
 { That }

... between them. { The } { issue } finally put ... [5]
 { This } { matter }
 { That } { affair }

... between them an argument that finally put ... [6]

... between them, which finally put ... [7]

... between them, and { this } finally put ... [8]
 { that }

... between them, and it finally put ... [9]

... between them and finally put an end to their friendship. [10]

All these versions have two things in common. They abbreviate the second part and they connect it with the first part. These two features are in principle independent. Abbreviation need not be connective: we can use ellipsis merely to suppress what can be taken for granted, as for instance in greetings (*cf* 12.46ff):

Nice day! [*cf* It's a nice day, isn't it!] [11]

Off to work? [*cf* Are you going off to work?] [12]

Nor need connection involve abbreviation:

The argument was long and the argument was bitter.

Nonetheless, connection is commonly accompanied by abbreviation, and we can even say that it is in part actually *achieved* by abbreviation. In [3–10], for example, the coherence of the two parts is indicated by the fact that all the devices serve to show identity of reference between the subjects of the two verbs: *broke (out)* and *put*.

In some ways the most straightforward is [6], where a simple and direct shortening of the first subject phrase is used appositively; *cf* 17.65ff. There is something similar in [3], where reduction retains the original head-word of the noun phrase *argument*, but here the coreference with the preceding subject is indicated not by apposition but by the anaphoric determiners *the*, *this*, or *that*; *cf* 6.13. In [4] and [5] coreference is again carried by deixis, but in [4] the original noun phrase is not merely abbreviated but its head-word is replaced by a semantic paraphrase; *cf* 19.21f on lexical linkage. In [5], on the other hand, the head-word is replaced not by a semantic paraphrase but by a quasi-pronominal noun of very general meaning; *cf* 19.22. In [8], anaphoric deixis again points to the coreference, as in [4] and [5], but this time with the head-word replaced by zero; the demonstrative *this* or *that* is used pronominally; *cf* 6.40ff. In [9], the vaguest possible pronoun (*it*) is used, while

in [7] a relative pronoun replaces the earlier noun-phrase subject (cf 17.15). Finally, in [10], there is total omission of the second subject (cf 13.12f).

All eight of [3-10] provide satisfactory coherence of the two parts. It is perhaps closest in [10], but only at the cost of muting the separate significance of the second part - in contrast to [3] and [4], for example, which insist on our considering the *beginning* of the argument on the one hand as well as its *result* on the other hand.

As we have indicated above by means of the cross-references, all of these devices are described elsewhere in the book in terms of grammatical rule. Here we have needed to add only some notes from a textual point of view.

- Note Neither pronouns nor appositive noun phrases are restricted to referring back to preceding noun phrases. Consider the possibility that the first of the original sentences had been:
- They argued bitterly over unilateral disarmament. [1a]
- In this event, the determiners and pronouns in the latter part of the combined text variants would have had sentential reference, and all would have been acceptable with the exception of version [10].

Limitations on pro-forms

- 19.45 What is grammatically tolerable has to be mediated by what is textually tolerable. Consider the following use of *do so* as a pro-form (cf 12.23ff):

There was a certain beautiful girl who occasionally walked past our house. Whenever she *did so*, my brother would tease me. [1]

If we expand upon the first sentence, *did so* is less appropriate:

There was a certain beautiful girl who occasionally walked past our house. Nothing particularly surprising in itself. We lived on a pretty lane, lined with rather attractive gardens. Yet whenever she *did so* ... [1a]

Such relative remoteness of the relevant predication requires that we find a weightier substitute than *do so* and *one* that can more readily establish the backward link, even if our alternative is no more precise semantically than:

... [Yet whenever] *this occurred* ... [1a']

(Cf 19.24). Again, where textual material puts identification of an antecedent even momentarily in doubt, a pro-form will be avoided - however 'grammatical' - and an alternative means of expression found. Consider the vagueness of the following hyperbole, contrasting one who is always very late for a flight with one who is always very early:

you chase the plane down the RÚNway. "I get to the airport while it is being BÜILT. [2]

In place of *it* (which might refer to *the plane*, *the runway*, or *the airport*), a fuller anaphoric expression would have been clearer if less satisfactory in reducing the wit:

... while { *the machine* / *the place* } is being BÜILT. [2a]

It is often indeed a desire for witty brevity that leads to the use of over-economical reductions. In a printed book review, after commenting on Swift's saying about 'the nation's representers' that 'I would hang them if I could', the writer went on:

The thing is said because he knows he can't; Swift doesn't 'mean it', though he doesn't not mean it either. The old bards apparently both meant it and *could*. [3]

The ellipsis after *can't* is clear: 'hang them'. The writer intends to echo this in the final *could* which he italicizes in the hope of taking us back to the quotation from Swift. But at that distance the ellipsis is unsatisfactorily vague.

- Note In the following anecdote, the impact and wit are primarily achieved by the ellipsis, but in part also by the satisfying order adopted (cf 19.68) in the achievement of climax by means of a triadic structure (cf 19.8):

Prisoner: As God is my judge, I am not guilty.

Judge: He *isn't*; I *am*; you *are*!

It is not uncommon to find rhetorical effectiveness resting on such manipulation of the most ordinary grammatical items. Note the way in which *one* and *no* are contrasted in a speech by a British politician:

We have to learn to be *ONE* nation or we shall become *NO* nation.

Discourse reference

- 19.46 There are numerous signals marking the identity between what is being said and what has been said before. The grammar of anaphoric and cataphoric substitution has been presented in 12.13ff. We concentrate here on devices that have a special value in referring less to concrete entities than to constituents or aspects of discourse itself. The signals can be divided into two groups, distinguished by the type of unit they refer to:

- (a) sentence or clause reference signals
- (b) noun-phrase reference signals

Many of them are adapted from their primary function of denoting temporal or spatial succession, eg: *former*, *above*, *here*, *the following*. Some signal both sentence/clause reference and noun-phrase reference.

Clausal reference

- 19.47 Common signals for sentence or clause reference include:

anaphoric and cataphoric: *here*, *it*, *this*
 anaphoric only: *that*, *the foregoing* (formal)
 cataphoric only: *as follows*, *the following*, *thus*

Anaphoric examples:

Many years ago their wives quarrelled over some trivial matter, now long forgotten. But one word led to another and the quarrel developed into a permanent rupture between them.

That's why the two men never visit each other's houses. [1]

Many students never improve. They get no advice and therefore they keep repeating the same mistakes. It's a terrible shame. [2]

Students want to be shown connections between facts instead of spending their time memorizing dates and formulas. Reflecting *this*, the university is moving away from large survey courses and breaking down academic fences in order to show subjects relating to one another. [3]

Cataphoric examples:

- This* should interest you, if you're still keen on boxing. The world heavyweight championship is going to be held in Chicago next June, so you should be able to watch it live. [4]
Here is the news. A diplomat was kidnapped last night in London ... [radio announcement] [5]
It never should have happened. He went out and left the baby unattended. [6]
 My arguments are *as follows* ... [7]

In some instances, we can replace the reference signal by a corresponding *that*-clause. For example, *that* in [1] could be said to refer to a *that*-clause which corresponds to the immediately preceding clause:

- ... That the quarrel developed into a permanent rupture between them is why the two men ... [1a]

In [2], on the *other* hand, *it* could be said to stand for the whole of the two preceding sentences. With cataphoric signals, the substitution might be inordinately long in practice. Certainly, *here* in [5] could refer forward to a following discourse of indeterminate length.

The pro-form may refer back to most, rather than all, of the sentence or clause:

- They will probably win the match. *That* will please my brother. [8]
 The more likely interpretation of *that* is *their winning the match* with the omission of auxiliary and disjunct but *that they will probably win the match* is also a possible interpretation.

Above and *below* are used for discourse reference to refer to units of varying length, and even to illustrations:

- ... the arguments given *below* [perhaps referring to several sentences]
 ... the question mentioned *above*
 ... the picture *above*
 The diagrams *below* illustrate ...

They need not refer to a unit of discourse which precedes immediately or which follows immediately. The furthest possible distance in the discourse between the unit referred to, on the one hand, and *above* or *below*, on the other hand, cannot be determined.

The above but not **the below* can be used as a noun phrase:

The above illustrates what we mean by ...

Note [a] The nonrestrictive relative clause with a previous clause or sentence as the antecedent of introductory *which* (cf 17.9) is sometimes made into a separate orthographic sentence in some

self-consciously 'lively' forms of writing. *Which* is then an anaphoric signal equivalent to *and that*:

She's borrowed a history book. Which suggests her teacher is having some influence on her. [9]

[b] In some (especially disapproving or ironic) contexts, *that* can be used cataphorically. [9]

I like *that*. Bob smashes up my car and then expects me to pay for the repairs. [10]

That's a thing I dislike - people whispering during a concert. [11]

That's what I like to see: a chap who enjoys his work. [12]

Otherwise, *that* is used anaphorically. It could of course be argued that [10-12] are illustrative of anaphoric use: *that* referring 'back' to something situationally presented as well as 'forward' to a linguistic description of it.

[c] In informal spoken English, *what* can have cataphoric reference when it is the direct object of *know* in a question, or *guess* in a directive, or *tell* in a statement:

(Do you) Know *what*? } He won't pay up. [13]
 Guess *what*.

(I'll) Tell you *what*: I've forgotten the keys! [14]

[d] In written texts, discourse reference can be made to page numbers, section numbers, or chapters. In some texts, provision is made to take note of line numbers. Such reference may be to preceding or following material, and although we are writing, we usually use verbs of speaking:

As was said in Chapter Four, ...

We will speak of this in Chapter Nine ...

Less specific reference is made in terms of *above* (or *earlier*) and *below* (or *later* in the text), and some spoken material of a formal kind, such as lectures, make similar use of *above* and *below*.

[e] In legal English *the said*, *the (aforementioned)*, and *the aforesaid* are used for anaphoric reference, the last two both as a premodifier ('the aforementioned provisions') and as a noun phrase. In the latter function, they would normally refer to a previous noun phrase with personal reference.

Formulaic utterance

19.48 While deictic reference and ellipted matter must, from a grammatical viewpoint, be recoverable (cf 12.6f), discourse permits a good deal of vagueness. This seems to be actively cultivated in propaganda and other persuasive material, but it is especially common in informal conversation, not least in the semi-formulaic responses to expressions of thanks, apology, inquiry, and the like. Consider how difficult it would be to specify the precise reference or the exact ellipsis in the following responses:

- A: Thank you very much.
 B: Not at all.
 Not a bit.
 Don't mention it.
 You're WELCOME. <esp AmE> } [1]

- A: I'm terribly sorry.
 B: Not at all.
 Not a bit.
 It's nothing. } [2]

- A: I wonder if you'd mind coming and taking some dictation?
 B: { Of course
 Surely <esp AmE>
 OK
 RIGHT O
 WILL DO } <esp BrE> } <informal> } Mrs Stewart. [3]

- A: Would you mind my asking if you've ever taken drugs, Mr Hoover?
 B: Absolutely NOT. [4]
 A: You wouldn't know a fortune-teller around here, I suppose?
 B: { TRY me. [5]
 Try ME. [6]

In [5] the implication is that B knows one ('Try asking if I know one'); in [6], B is saying that he himself can tell fortunes. In [4], only the context could clarify whether B is saying that he 'absolutely (does) not (mind)', or that it is 'absolutely not' true that he has taken drugs. In [3], the formulaic response *Will do!* is a conventional way of saying 'I will do as you request', and B has interpreted (correctly, of course) A's polite inquiry as a request. In [1] and [2], the reference of *it*, in *Don't mention it*, *It's nothing*, is doubtless anaphoric in some way. But in the first line of [7], *it* is cataphoric if almost equally vague in its reference; the initial imperative is little more than an informal attention-requesting signal, a more severe form of which includes a cataphoric *here*:

- A: By the way, Cynthia. It's awful of me, I know. But would you be able to look after my dog while I'm away next week?
 B: (Now look) (Here), this is the third time you've left me with your dog. [7]

Within sentence sequences that are strictly alike from a grammatical point of view, a discourse pronoun can have sharply different reference:

She hoped he would not mention her unfortunate marriage.

- It } would be very { COURTEOUS of him. [8]
 This } { COURTEOUS of him in a WAY, of course. [8a]
 That }

In [8], the reference is to the predication including the negative ('His not mentioning the marriage would be courteous'). In [8a], the reference excludes the negative ('His mentioning the marriage would be courteous'). It is only the pragmatic implications of the hedging adverbial *in a way* and the concessive *of course* that lead us to this interpretation.

- Note An interesting use of cataphoric *it* in textual structure is in the cleft sentence device (cf 18.26ff):
 It was at 9.15 this morning that the government proclaimed a state of emergency. [9]
 It was on their way from the airport that Gillian dropped the bombshell. In carefully casual tones, she asked him if he would agree to a divorce. [10]
 In [9], it is unlikely that the narrator wishes to highlight the time adjunct: rather, the textual device is pointing to the climax at the end of the sentence. In [10], the same applies, but with a double cataphora: *the bombshell* which ends the first sentence is climactically explained in the sentence that follows.

Noun-phrase reference

- 19.49 Certain determiners are used to signal that a noun phrase is referentially equivalent to a previous noun phrase (cf 5.27ff, 12.14ff):

the this - these that - those

Such noun phrases may be discourse abstractions, and the heads may either be identical as in [1] or nominalizations that add lexical variation (cf 19.22), as in [2]:

- She set up a hypothesis that chemotherapy destroyed the will to live as well as the unwanted cells. *This hypothesis* attracted the attention of . . . [1]
 Deconstructionism holds that knowledge about literature is strictly unattainable . . . *This doctrine* is puzzling in several respects. [2]

It is not always certain, however, when such a reference is to a previous noun phrase or is a nominalization of a wider, clausally expressed proposition. The text from which [2] is quoted is a case in point. As presented in the abbreviated form of [2], *doctrine* seems to refer back unambiguously to *deconstructionism* and be a lexical variant of it. But in the original, there are several lines where we have indicated the curtailment, and these include the following:

- We must therefore abandon the old-fashioned quest to discover what a given author was trying to communicate. [2a]

The reference of *this doctrine* must therefore include, not merely the specific abstract *deconstructionism*, but the speculated consequence which the author went on to state. A fuller version might therefore read:

- This doctrine of *deconstructionism* and the need to abandon the old-fashioned quest . . . is puzzling in several respects. [2b]

When *such* is used, the intention is often to indicate disapproval (which may be sympathetic):

- We visited the Browns yesterday and heard their complaints about the condition of the house they live in. I never heard such a sorry tale. [3]
 . . . such a rigmarole. [3a]
 . . . of such wretchedness. [3b]

In [3] and [3a], the reference is primarily to the *complaints*, [3a] lexically indicating impatience rather than sympathy; in [3b] the reference is rather to the *condition*, with an implication of the speaker's sympathy.

Use of *the former* and *the latter* is largely confined to (rather formal) noun-phrase reference:

- We heard their complaints that no one came to visit them and also that their roof was leaking. I helped them over *the latter* [*ie the complaint about the roof*] and promised to let some friends know about *the former* [*ie the complaint about loneliness*]. [4]

For broader reference, both phrases might be expanded to include a noun head:

- They were upset that no one came to visit them and also that their roof was leaking. I helped them over *the latter problem* and promised to let some friends know about *the former complaint*. [5]

- 19.50 *So* and *that* can have anaphoric reference when they are intensifiers premodifying an adjective (*that so* used is informal and often criticized):

There were two thousand people in the theatre. I didn't expect it to be $\left\{ \begin{smallmatrix} \text{so} \\ \text{that} \end{smallmatrix} \right\}$ full. [1]

I had a terrible headache yesterday and had to take some aspirins. I'm not feeling $\left\{ \begin{smallmatrix} \text{so} \\ \text{that} \end{smallmatrix} \right\}$ bad today. [2]

We took them to a circus and then to a zoo and gave them lots of ice cream and chocolate. They haven't had $\left\{ \begin{smallmatrix} \text{so} \\ \text{that} \end{smallmatrix} \right\}$ good a time for years. [3]

Such is used more commonly than *so* or *that* when (as in this last example) the adjective accompanies a noun phrase, but *such* is followed by normal noun-phrase order:

... They haven't had *such a good time* for years. [3a]

Note the different implications when *this*, *that*, and *so* are used as intensifiers. Compare:

I didn't expect it to be $\left\{ \begin{smallmatrix} \text{this full. [= as full as it is now]} \\ \text{that full. [= as full as it was then]} \\ \text{so full. [neutral in time implication]} \end{smallmatrix} \right\}$ <informal> [1a]

Personal pronouns

- 19.51 As explained in 6.7, 6.18, *we* has several possible noun-phrase references. In discourse, we are concerned chiefly with the 'inclusive' *we* (cf 4.58, as with the subject of the present sentence), and with the 'exclusive' *we* as in:

Will you stay here while *we* go for a policeman? [1]

In formal writing, and frequently indeed in the present book, *we* 'inclusive' and *we* 'exclusive' can cooccur. The former cooccurs with verbs implying shared knowledge (*understand*, *see*, *appreciate*, etc), the latter with verbs of communication (*say*, *state*, *write*, etc). It would be possible to use both in the same sentence, though this would usually be avoided:

We see now why *we* expressed reservations earlier. [2]

In [2], the second *we* is exclusive, the first inclusive or even (as often) indefinite and roughly equivalent to the more formal *one* or the *reader*.

The indefinite use of *you* and the *you* of direct 2nd person address (cf 6.2ff) can also cooccur. In [3], the first *you* is indefinite, the second makes direct address:

In fourteenth-century England, *you* had a very poor chance of being taught to read, *you* see. [3]

Unlike the two uses of *we*, however, *you* is rather rare in formal writing and

the indefinite use is virtually excluded. The same applies to the indefinite use of *they*; in formal styles, *they* in [4] would refer only to the council authorities, where informally it is more plausible with indefinite reference:

I intend to ask the council authorities why *they* are digging up the road again. [4]

In place of the informal indefinite *you*, there is *one*, but it can be used only sparingly without making a piece of writing (or even more so a spoken utterance) sound intolerably pompous. This is perhaps especially constraining in BrE, which lacks in general the facility (now in any case frowned on for social reasons) of replacing *one* by *he* in second and subsequent use:

One cannot control *one's* temper easily if *one* is discussing a matter over which *one* has feelings of guilt or great personal involvement. <esp BrE> [5]

Here, we could have in AmE: *One ... his ... he ... he ...* Other indefinite pronouns such as *anyone*, *everybody* can be followed by *he* in both AmE and BrE, but this is vulnerable to the objection of seeming to have a male orientation, while the use of *they* to refer back to these indefinites is open to the objection of seeming ungrammatical in the switch from singular to plural. It is therefore largely confined to spoken (especially informal) usage (cf also 19.64).

Note There is a further and rare use of *one*, perhaps to avoid the egocentricity of 'I':

A: Did you enjoy your school days?

B: Well, one can hardly remember; it's all so long ago. [6]

Comparison

- 19.52 Signals of comparison and contrast play a frequent part in providing textual coherence. Most can be regarded as involving ellipsis (cf 12.1ff, 12.31ff).

The most obvious comparison signal is found in adjectives and adverbs, whether in the inflected forms or in the periphrastic forms with *more*, *most*, *as*, *less*, *least* (cf 7.74ff). If the basis of comparison (cf 15.63) is not made explicit in the clause, it must be inferred from the previous context:

John took four hours to reach London. Bill, on the other hand, was driving *more slowly*. [1]

Mary used to listen to records most of the time. Sally was a *more enthusiastic* student. [2]

There were ten boys in the group. Bob was by far the *best*. [3]

Barbara dances beautifully. Jack dances *no less well*. [4]

Gwen always hands in a well-constructed and intelligent paper. I'm afraid Joan doesn't expend *as much* effort and time on her papers. [5]

We can demonstrate the anaphoric reference by supplying the basis of comparison:

... more slowly *than John (drove)*. [1a]

... a more enthusiastic student *than Mary (was)*. [2a]

... the best *(of the ten boys) (in the group)*. [3a]

- ... no less well *than* Barbara (dances). [4a]
 ... as much effort and time on her papers *as* Given (expends on her papers). [5a]

On comparative clauses, cf 15.63ff.

So too with expressions of similarity or difference; these may involve the use of equative and antithetic conjuncts (cf 8.137ff). For example:

- Mrs White was the victim of a confidence trick. Bill was tricked
 { *very differently.* } [6]
 { *in the same way.* }
 Tom gets ten dollars a week for pocket money. Bob receives a
 similar amount. [7]
 Mrs Hayakawa complained that the roof leaked and the windows
 fitted badly, so that the place was freezing cold. Her husband
 complained *likewise*. [8]
 Tom behaved himself at the party. However, the *other* boy had to
 be sent home. [9]
 John didn't like the car. He asked to see a *different* one. [10]

We can display the basis of similarity or difference:

- ... very differently *from the way in which*
Mrs White was (tricked). } [6a]
 ... in the same way *as Mrs White (was (tricked)).* } [7a]
 ... an amount similar *to what Tom receives.*
 ... complained *about the same things as Mrs Hayakawa*
(complained about). [8a]
 ... the boy *other than Tom* ... [9a]
 ... see one *different from the car he didn't like.* [10a]

Certain lexical items are used in a quasi-grammatical way to express identity, similarity, dissimilarity, and difference. Expressions involving *respective(ly)*, *mutual(ly)*, *converse(ly)*, *opposite* (-ly is rare), etc effect considerable neatness and economy in discourse:

- Brahms and Verdi wrote orchestral and operatic music,
respectively. [11]
 The chairman and the guest speaker expressed their *mutual*
 admiration. [12]
 Mary told Harry that she never wanted to see him again. He
reciprocated, but with even greater bitterness. [13]
 I thought that Oregon had a greater rainfall than British
 Columbia, but Caroline says *the opposite*. [14]

The textual role of adverbials

- 19.53 In 19.48 we saw in example [8a] the communicative impact of the inserted adverbials *in a way* and *of course*. While the basic functions of adverbials are fully expounded in Chapter 8, we need here to emphasize their dual role in textual structure: interpreting the text to the hearer/reader (eg in encouraging a particular attitude), and expressing the relevant connection between one

part of a text and another. The former is achieved primarily by subjuncts and disjuncts (cf 8.88ff), the latter by conjuncts (cf 8.134ff). Consider the following:

- My dog is fourteen { *months* } old and ▲ he is very frisky. [1]
 { *years* }

Given the appropriate general knowledge, the choice of *months* or *years* will determine the aptness of adverbials that might be inserted at the insertion sign: *of course* or *naturally* on the one hand; yet, still, surprisingly enough on the other. A further example:

- My next-door neighbour { is an entomologist.
 is a travelling salesman. } ▲ He knows
 works for an oil company. [2]
 more about treating mosquito bites than anyone I've ever met.

The second sentence of [2] might be preceded by *Not surprisingly*, but this would seem appropriate only if we knew what an entomologist was, or if we connected travelling salesmen or oil executives with experience of mosquito-ridden areas. Preceding the second sentence with *All the same* or *Nonetheless* would obviously have very different implications.

But the postulated insertions in [1] and [2] would serve not only to nudge the hearer in the direction of adopting a particular attitude or to let the hearer know something of the speaker's attitude: they would also indicate the nature of the connection between the two parts of each text. Without the adverbials, each text is presented as offering two pieces of information; in this spirit, the second parts might have read respectively:

- ... and he sleeps in the kitchen. [1a]
 ... He got married last week to a former girlfriend of mine. [2a]

In other words, the connection is thematic only, in the sense of 19.12. With the adverbials inserted, the second part of each text is shown to be (as the original versions might chance to be *interpreted* as being) specifically related to the preceding rheme, either as a natural consequence or as a surprising paradox.

Note Since *of course* can hint at incongruity (concession) instead of expressing congruity, [1] might still be a well-formed text as:

My dog is fourteen years old and of course he is very frisky (still) (, though I think he's beginning to show his age).

This use of *of course* commonly expresses superficial agreement with what has preceded while at the same time hinting at a more fundamental disagreement. For example:

The chairman is of course absolutely right to draw attention to the error in my presentation. On the other hand, I wonder whether he is not using this lapse of mine to prevent discussion of the serious issue involved.

Other adverbials that can convey such implications include *admittedly*, *certainly*, *doubtless*, *undeniably*, *undoubtedly*. Of these, *doubtless* is particularly barbed. [3]

- 19.54 Responses in dialogue often begin with an adverbial which indicates the direction of transition between what has just been said and what is about to be said. On transitional conjuncts, cf 8.137, 8.142.

A: That man speaks extremely good English.

B: $\left\{ \begin{array}{l} [1] \text{ Well,} \\ [2] \text{ Yet,} \end{array} \right\}$ he comes from a village in Mongolia.

In one sense, the content of B's response is identical whether it begins as [1] or [2]. It presents an additional fact about the man, and without the adverbial, B's response would have only a thematic link with A's statement. With either of the adverbials inserted, however, B is making a significant comment not merely on the man but on the propensity of villagers in Mongolia to speak good English. If he begins with *Well*, he implies that it is an established fact (*Well, of course!*) that Mongolian villages provide excellent bases for learning English. If he begins with *Yet*, he implies that the man's good command of English was *despite* his Mongolian upbringing.

Note [a] The use of *well* is itself context-dependent, however. It would be perfectly plausible to use *well* in [1] as a very different transition (*Well, now!*) so as to connote 'Well, I'll tell you something surprising: he actually comes from a village in Mongolia'. Such an antithetic-concessive transition (cf 8.141) is implicit in the frequent note of reservation struck by the use of *well*. Consider a converse exchange of remarks on the same subject:

A: That man is from Mongolia.

B: $\left\{ \begin{array}{l} [1a] \text{ Well,} \\ [2a] \text{ Yet,} \end{array} \right\}$ he speaks extremely good English.

Here, both [1a] and [2a] would connote 'Despite that . . .'. There is in fact no one-word adverbial to express the relationship of the original [1] at [1a]; we would have to resort to a fully clausal expression, as in:

So that explains why
Now I understand why } he speaks . . .

[b] Elliptical responses (cf 19.48) often contain an obligatory connective; for example (where in [4] intonation enables us to dispense with the use of an adverbial):

A: $\left\{ \begin{array}{l} \text{Have a good weekend!} \\ \text{How nice to see you again!} \end{array} \right\}$

[3]

B: $\left\{ \begin{array}{l} \text{You 7d0!} \\ \text{^nd y0U!} \end{array} \right\}$

[4]

Adverbials as structural indicators

19.55 The basic relational structures briefly outlined in 19.17 depend rather heavily on adverbial pointers, especially when any great degree of complexity is involved.

(a) *General to particular*: Any of the following would usefully assist the relationship at the insert mark in the accompanying example:

for example
thus
even
indeed

For example:

Many of the audience became openly hostile. ▲ My uncle wrote a letter to the management next day.

[1]

(b) *Progression*: According as the progression is locational, temporal, or logical, adverbials both help to indicate the direction and mark the successive stages. For example:

First, boil the rice in well-salted water; drain it *immediately*. *Next*, warm the lightly buttered base of a small pie dish. You may *now* put the rice in the dish. *Then* add the cheese, tomato and onion. *The pie is at last* ready to be put in the oven.

[2]

(c) *Compatibility*: It is frequently important to mark the match or mismatch between two parts of a text. Consider the presence or absence of (for example) *so too* in the following:

The ordinary saw is not easy to use. ▲ A plane demands years of careful practice.

[3]

Similarly, a contrastive conjunct (cf 8.141) such as *on the other hand* in a variant of this example:

The ordinary saw is not easy to use. ▲ A hammer is something that any novice can handle.

[3a]

19.56 The different discourse strategies (cf 19.18) will likewise call for different adverbial indicators. The 'step' technique is simplest, following as it does a progressive relation (cf 19.17). With the 'chain', however, it is particularly helpful to point to the existence and direction of transitions in the structure. Thus the illustrative text of 19.18 (ii) might have begun (though using adverbial linkage more densely than is usual or desirable):

Hamlet poignantly represents the indecisions that plague us all.

Admittedly, indecision is not the worst of our ills. *Indeed*, in some ways decisiveness can be more damaging. *At any rate* many people have come to grief that way . . .

[1]

In a text of 'stack'-like structure, the 'layers' may call for enumeration (*first, at the outset, fundamentally; secondly, next, . . .; still more importantly . . .*), but it is especially desirable to draw the hearer's attention to what is to be regarded as the most crucial point: *thus, all in all, finally, last but by no means least* (though this alliterative conjunct is too hackneyed for a resounding climax), *in conclusion*, and many others.

The balance strategy, like the chain, requires adverbial pointers both to assist the sense of rhetorical balance and to ensure that the author's presuppositions match those of his audience. For example, in place of the travel illustration in 19.18 (iv), we might begin another like this:

I am always thrilled at the prospect of having a mid-winter break in Switzerland. ▲ Frequently, the weather is quite warm . . .

[2]

It might not be at all clear whether the second sentence of [2] contributed to the pleasure (vision of deckchairs) or was a counterbalancing unwelcome aspect (poor weather for skiing); in other words, we have left inadequate indication of compatibility (cf 19.17). For the balance strategy, we need to insert at the marked place some such indicator as *granted, admittedly, true, of*

course, even so, etc. Most frequently the balanced movement is indicated by the items *on the one hand, on the other (hand)*, but there is usually a goal resembling that of the stack and so demanding a final summative such as *all in all* (cf 8.139).

Coordination and subordination

- 19.57 In 19.5ff, we pointed out that two utterances gave the impression of being textually related, even when juxtaposed without any formal indicator of connection. Asyndetic relation of this kind, moreover, raises the expectation that the second utterance followed the first as an iconic representation of being sequential in time or consequential in reasoning – and often both, as in:

He ate too much for dinner. He was ill the next day. [1]

A simple coordination (cf 13.43ff) of the two *not only* links them more firmly (since more formally); it can also enable us to show that a third utterance in the sequence is less closely linked to the second than the second is to the first; and, further, that the first and second form a sub-unity which as a whole has a relation to the third:

He ate too much for dinner and he was ill the next day. He decided to be less greedy in future. [2]

But since a result or conclusion seems in some sense more important than the factors leading to the result or conclusion, it is natural to seek a linguistic emblem of this hierarchical relation by subordinating one part to the other instead of coordinating the one with the other:

Because he ate too much for dinner, he was ill the next day. [3]

In [3], we have not merely made the first part of [1] the explicit reason for the second (*Because*), we have grammatically expressed the connection by making a totally new unit where the second part is the main clause of a complex sentence in which the original first part is reduced to the role of adjunct (cf 8.25ff).

- 19.58 English has four monosyllabic connective items which semantically belong together as constituting a symmetry of two related subsystems:

and : what precedes is congruent (cf 13.22ff)
but : what precedes is incongruent (cf 13.32)
so : what follows is a consequence
for : what follows is a reason (ie what precedes is a consequence)

For example (cf 19.11):

The rain has stopped, *and* she's gone for a walk. [1]
 The rain hasn't stopped, *but* she's gone for a walk. [2]
 The rain has stopped, *so* she's gone for a walk. [3]
 She's gone for a walk, *for* the rain has stopped. [4]

This last is rather unnatural where the conjoins are so short. In any case, the

symmetry is imperfect in several respects. In [1], [2], and [4], we have conjunctions (**and but, *and for*; but cf 13.8ff on *for*). In [3], we have a conjunct (*and so*); cf 13.18f, 8.137ff. Moreover, *and* and *but* are distributionally distinct, *and* demanding in some respects greater structural similarity between the coordinated parts. Compare:

?*The rain has stopped *and* let's go for a walk. [5]
 The rain hasn't stopped *but* let's go for a walk. [6]

In this respect, although we normally think of *and* and *but* as closely related converses, the converse of *but* is in fact *so*:

The rain has stopped (and) *so* let's go for a walk.

Thirdly and (from the viewpoint of text cohesion) most significantly, the symmetry is imperfect in that *for* is a much less frequently used connective than the other three. In other words, textual structure is resistant to stating a consequence in advance of the condition. In the event of this order being desirable, it is more usual to make the condition structurally subordinate to (rather than coordinate with) the consequence:

She's gone for a walk, { {because
 since } the rain has stopped. } [7]
 the rain having (at last) stopped. }

Even so, the prior condition would often be stated first:

Since the rain has stopped, she's gone for a walk. [8]

- Note [a] There is a further asymmetry in the fact that *and* can subsume the role of *but* (cf 13.24), though the converse does not hold:
 He's sixty-two *and* he plays squash like a twenty-year old.
 [b] Whereas *and* and *or* can be used to conjoin a sequence of several clauses, *but* and *for* can conjoin only two (cf 13.8f, 13.18f).

Pairs and triads

- 19.59 One of the ways in which coordination is exploited in textual structure is to assist the desire for parallelism and balance (cf 19.7). For example:

These terrorists have destroyed their own credibility. They resisted arrest and then they gave themselves up. They went on a hunger strike and then they started taking food. Some of them claim that they are all nationalists and some of them claim that they are all opposed to nationalism. [1]

We note that the last three sentences in [1], each with clauses coordinated by *and*, form a triad (cf 19.8), a rhetorical pattern that seems to be especially attractive. Coordination achieves the seemingly impossible task of giving three units equal status and yet of making the third climactic; for example:

She cleaned the room, (she) made a birthday cake, and (she) finished preparing a lecture. [2]

But the climax of the third part may be expressing a point which is strongly counter-consequential and concessive:

She works ten hours a day in the clinic, she spends ages helping him with his thesis, and he calls her lazy! [3]

The balanced units, whether in pairs or threes, may of course be coordinated *subordinate* clauses:

Because you're tired, because you're lonely, and because you're depressed, I want to insist on your coming to stay with us for a week or so. [4]

Subordinate coordination, however, is especially associated with alternatives rather than accretions. For this reason, pairing is very common since this gives the convenient impression of a total or very general polarization:

He doesn't know whether his wife is unhappy because the baby died or whether she's just no longer in love with him. [5]

When you're lonely or when you're unhappy for other reasons, listening to music can be a great consolation. [6]

Questions too can be linked to form a satisfyingly coherent sequence:

Did he jump or was he pushed? [7]

Will they arrive on time, will they listen carefully, and will they enjoy our performance? [8]

Of course, in ordinary unambitious writing and in familiar speech, coordination is used without striving for the balanced effects on which we have been concentrating in this section. But the momentum and implications of sequence, the relative cohesion of explicit coordination, and the contrasting entailments of the chief coordinating conjunctions are inherent in even the least self-conscious discourse.

Note Informal conversation is characterized by an overtly uncompleted pairing, especially through unfinished *but*-coordinations. These often occur where one speaker is effectively inviting another participant to speak. It can give a pleasantly apologetic and self-effacing tone:

A: My wife's not been feeling too well. She's seen the doctor, though, and he's told her it's nothing serious. But (er) [trails off into silence]

B: I'm sorry to hear about this. [9]

A voiced hesitation ('er') frequently follows such a use of *but*. A's speech might equally have ended: 'But I don't know...' or 'But don't let's talk about our little problems' or 'But how's the book going?' These all have in common: 'But': let's change the subject'.

Contrasting coordination and subordination

19.60 In several of the examples provided in 19.59, coordination has been used along with subordination. This is in fact textually representative. Although from the viewpoint of grammar these two types of clause relation are thought of as alternatives, and although coordination is a far more frequently occurring form of cohesive device, it is normal to find both types in any text of a few lines (or a few seconds) in extent. It is particularly rare to find a text with subordination but without coordination.

It is the flexible use of both devices that endows a text with variety of expression on the one hand and with a well-ordered presentation of information on the other. The combination also enables one to achieve a high degree of complexity within a single, unified whole. For example:

Although I know it's a bit late to call, seeing your light still on and needing to get your advice if you'd be willing to help me, I parked the car as soon as I could find a place and ventured to come straight up without ringing the bell because, believe me, I didn't want to add waking your baby to the other inconveniences I'm causing you. [1]

Taking nonfinite as well as finite clauses into account, there are nearly twenty clauses in this example, which, without any pretensions to elegance, is grammatically well-formed as well as being textually coherent. And although it is often thought that a single sentence of such complexity belongs only to the most formal styles of written English, the example [1] is in fact only slightly edited from the transcribed form of an actual spoken utterance in informal conversation. Again, it is sometimes put as a generalization that nonfinite clauses are characteristic of formal texts, finite clauses of less formal ones. There is some truth in this so far as *-ing* adverbial clauses are concerned, especially those with subject, and especially passive clauses with subject:

The rain having (at last) stopped, she's gone for a walk. [2]

The play now having been reviewed, no one can ignore it. [3]

Having now seen the play myself, I agree that it is rather weak. [4]

Contrast:

Since the rain has stopped, she's gone for a walk [2a]

Now that the play has been reviewed, no one can ignore it. [3a]

Now that I have seen the play myself, I agree that it is rather weak. [4a]

But it is not true for nominal *-ing* clauses, and the following:

Finding you at home is a great surprise. [5]

He didn't mind *waiting for them in the rain*. [6]

are decidedly less formal than:

That I (should) find you at home is a great surprise. [5a]

He didn't mind *that he waited [was waiting, had to wait] for them in the rain*. [6a]

Indeed, with *to*-infinitive clauses, the general statement could profitably be reversed: the finite verb correspondences (to the extent that they exist) are almost always more formal in tone. For example:

To close the doors, just press the green button. [7]

In order that you may close the doors, merely press the green button. [7a]

Note [a] There are exceptions to the exclusive formality even of nonfinite passive clauses with subject. In the most commonplace of discourse, a concessive disjunct like the following (cf 8.127 Note [c]) is frequent enough to be criticized as hackneyed:

We've got to help the poorer nations with their economic and health problems. But *that (having been) said*, it's reasonable to expect them to meet us half way - with military bases, for example. [8]

[b] The interaction of coordination and subordination is seen also in the fact that while it is the latter that contributes most to tight coherence of grammatical (and hence of textual) structure, as well as to verbal economy (particularly through the use of nonfinite clauses), it is coordination that permits far more drastic economies of ellipsis (cf 12.1ff, 12.31ff). Compare:

- I had been getting hungry and my wife _A anxious. } [_A = had been getting]
 *I had been getting anxious because my wife _A hungry.
 She was ill the next day and _A had to call a doctor. } [_A = she]
 *She was ill the next day when _A was particularly busy.

This is not of course to ignore elliptical forms of subordinate clauses such as *If any. When in doubt. Though anxious*, which can be used initially as well as later in a sentence: cf 14.18.

[c] Subordination usually (though by no means invariably) indicates grammatically the subordinate informational status of the part so expressed. Similarly, when *and* is replaced by *like* or *as well as* in conjoining phrases (cf 13.103), the effect is usually to downgrade the following item, implying that it has 'given' status. Among the clausal exceptions are the clauses expressing outcome or result (cf 15.25, 15.27): for example, the journalistic use of infinitive clauses:

Sunderland played an energetic game, to win four-two.

[= and they won . . .]

The part played by questions

- 19.61 There is a sense in which it is true to say 'I can't tell you anything till you've asked me something'. In other words, what we choose to talk about depends crucially on what we think our hearer does not know and wants to know. Even conversations in which a participant keenly wishes to talk and inform (rather than listen and be informed) will frequently begin with a question. For example, as a conversation-initial gambit:

Have you heard about Mr Malloy? [1]

The questioner will be alert to the reply in two quite separate respects: whether his companion has heard about Mr Malloy, and whether he seems to want to hear. Only if the questioner is satisfied on both counts, will he launch forth – and even so the tactful conversationalist will begin with a careful lack of dogmatism:

Well, apparently, if I got it right, Malloy was on his way home on Friday, when . . . [1a]

Moreover, without prompting by questions in the course of his account ('What was the weather like?' 'When did you hear this?' 'Why didn't Rita Malloy . . .?'), the speaker would soon falter – again, for fear that he had lost his companion's interest or in doubt as to which aspects of the narrative to develop and which to ignore.

Even in the absence of questions from a companion, a speaker will insert them for himself. In written materials, the author is naturally constrained to do so. This is partly in the interests of information processing (cf 19.66ff below), that is, providing a focus closely similar to that attained by the pseudo-cleft (cf 18.29f). Compare:

- What was he doing? He was trying to change a fuse. [2]
 What was he doing but trying to change a fuse. [2a]
 What he was doing was trying to change a fuse. [2b]

But in part the inserted question is to enliven and dramatize a narrative by supplying a query which the speaker thinks must be in his companion's mind – or which he thinks ought to be:

And that son of hers continues to be a big worry. And how do I know? She was in tears the other day – with a photo of him in her hand. She didn't think I saw the photo but I did. [3]

A question in discourse is often directed less to the hearer than to the speaker, though in seeming to reflect the speaker's self-questioning as to how he should proceed, the question equally directs the hearer's mind both to this point and to the tentativeness and spontaneity with which it is being made. For example:

The horses seemed strangely disturbed as we groomed them that morning. *How shall I put it?* It was as though they were aware that Mary and I had quarrelled. [4]

The book will be out in a couple of months. There's been some problem over the binding and this has been aggravated by shipping difficulties in Hong Kong where they've had this acrimonious seamen's strike. What a lot of unrest there is in the world, when you come to think of it. *But where was I?* When the book is finally published, I'm going to have a little party to celebrate. *And what was the other thing I wanted to tell you?* Oh yes . . . [5]

Note [a] Consider the part played by questions in the representation of internal reflection quoted in 19.43.

[b] Questions in dialogue are frequently uttered merely to elicit matter that was imperfectly heard or understood (cf 19.17):

HÖH?
WHAT? } <very informal>

WHÄT's that?
SÖRRY? } <informal>

I beg your PÄRDON?

Given the appropriate context, any of these question forms could equally express strong surprise at what has just been said; in effect, they are used to inquire both 'What did you say?' and 'What do you mean?' (By contrast, the question 'What's THAT?' seeks elucidation about a specific item – and 'Who's THAT?' about a specific person – just mentioned.)

Questions as directives

- 19.62 Questions, direct and indirect, have an important role in discourse as polite equivalents of requests. On entering someone's room, a visitor will begin with such a question even if he is a fairly close friend:

Are you free for a minute or two?
 Is this an awkward moment to see you about something?
 Am I disturbing you?
 Got a second? <informal>
 I wonder whether you could help me.

These opening gambits would preface discourse itself. But question forms may equally preface physical action by the speaker or seek it from the hearer:

Would you mind if I closed the window?
 Would you excuse me a moment? I must find a telephone.
 Do you think you could lock the door when you leave?
 Why don't you come and have dinner with me tonight?

The fact that such questions are not semantically interrogative is shown by

the fact that they can be coordinated (especially in AmE) with statements and combine a request with an expression of intention:

Why don't I go on ahead and you (can) come when you're ready?
Why don't you get a taxi and I'll be out in a minute?

In the conventional language of formal meetings, procedure is often couched in elaborately interrogative structures, each widely recognized as a formula disguising a statement:

Could I ask through you, Mr Chairman, whether the Secretary is thinking of the occasion under discussion?
[~ 'The Secretary has muddled the dates']
But may we not ask ourselves whether this is an appropriate time to raise taxes?
[~ 'I am opposed to raising taxes now']
I wonder if we might now turn to the next item.
[~ 'The present discussion is closed']
Am I {alone
right} in thinking the motion is out of order?

Rhetorical questions

- 19.63 The rhetorical question has in common with the formulaic questions discussed in 19.62 the fact that the answer is a foregone conclusion:

She said she had been too ill to come to work that day, and certainly she sounded pretty groggy on the phone. Anyway, who was I to argue? [1]
[= 'I wasn't in a position to doubt her word']
The prisoners were grumbling about their cold cells and several claimed they weren't getting enough to eat. But what could I do? [2]
[= 'I could do nothing']
Do I have to tell you everything? You're a fully qualified architect and these things should be at your fingertips! [3]

As we see from these examples, especially [3], the rhetorical question is by no means confined to the highly wrought prose of formal speeches of persuasion that we may think of in connection with 'rhetoric'. Rather, the tag question so common in the most informal speech is strictly similar to the rhetorical question in its communicative effect, since it essentially seeks confirmation of what the speaker has explicitly assumed (by the preceding declarative) to be agreed truth:

It's a glorious day, *isn't it*? [4]
Joan Sutherland was the best coloratura singer of her generation, *wasn't she*? [5]

Compare:

When have we had a better coloratura singer than Joan Sutherland? [5a]

Such a use of tags occurs in very informal speech (especially BrE and chiefly nonstandard) where the hearer cannot possibly be expected to know the answer or to take it for granted, but where the speaker seeks by such use of the question form to imply that the answer ought to be self-evident. These tags have a falling tone on the operator:

Well, I couldn't hear the phone, could I? It's in the next room and the door was shut. Besides, I was fast asleep, wasn't I? But I can't expect you to think of things from my angle, can I? [6]

Note Although *yes-no* questions are theoretically open to either response, it is striking that they normally occur when the speaker plainly expects 'yes'.

Participant involvement

- 19.64 Whether this is made explicit or not, every text is addressed *by* someone ('I') to someone else ('you'). In many cases, the relation of both participants is indeed explicit:

I tell *you* it's true! [1]

But equally both can be merely implicit:

Good luck! [= 'I wish *you* good luck'] [2]

In very formal communications, where the precise identity of the addressee is unknown and where the originator is making the communication on behalf of an organization, the participants may be referred to in the 3rd person:

The management regret(s) any inconvenience to *clients* during repair work to the premises. [3]

In a similar tone and often for similar reasons, mention of one or both of the participants is avoided altogether:

The management regrets any inconvenience during repair work to the premises. [3a]

Any inconvenience to *clients* is regretted during . . . [3b]

Any inconvenience is regretted during . . . [3c]

In some texts, both participants are referred to simultaneously by means of the inclusive *we* (cf 6.7):

So now we know why there was no traffic coming towards *us* on this road. Well, since the road is obviously blocked, we'll have to turn back and find a side road somewhere. *We'll* manage somehow. [4]

(Cf 19.51)

But in many texts, the addressee is unmentioned and the speaker or writer leaves it implicit as to who is the authority for the communication. This is natural enough in face-to-face speech where the source is obvious; so too in a personal letter or even in a printed text which is accompanied by the author's name:

Julian is going to Detroit next week. In fact, if he likes it and finds a job, he may decide to stay there. His wife, of course, comes from that part of Michigan. [5]

We notice, however, that in the use of the adverbial *of course* the speaker/writer is appealing to the addressee's shared knowledge (just as he might, with *clearly, obviously, of course*, etc., to the addressee's shared opinion). Nor would it be unusual in such a text for the author to make explicit his relation to the information conveyed:

Julian, *I gather*, is going to Detroit next week. In fact, if he likes it and finds a job, *he tells me* that he may decide . . . [5a]

Even in a signed letter, some amplification of identity may be necessary if the writer is unknown to (or may have been forgotten by) the addressee, or if it is otherwise necessary to specify his role:

As a Camden resident and also as a qualified accountant, I write to inform you of an error in the recently published expenditure figures of your Council . . . [6]

You may not remember me, but I hope you will allow me to congratulate you on your marriage. It must give all of your former colleagues like me great pleasure to know of your happiness . . . [7]

Not so much as your father, but as man to man, I do implore you to be more considerate . . . [8]

So too in speech (and cf 19.77 Note):

I am employed by a detective agency. I wonder if you could help me in some inquiries I am making about a person who used to be a neighbour of yours. [9]

On the telephone, identification of both speaker and addressee usually prefaces discourse:

Hello. Is that Peter? Marjorie here. What? Oh sorry! – Marjorie Wong, your wife's assistant. Is Valerie there? [10]

Hello. Am I speaking to the Controller? This is the Works Department. We are having to cut off your electricity supply for an hour or so, but if the interruption becomes very inconvenient will you please phone me, Ram Patel, on extension 2018. [11]

In this last example, personal identification is given only incidentally (at the end), since the caller is primarily phoning not as an individual but as an institution ('the Works Department').

The addressee may equally need to have his role specified in the particular context: *you* may be friend, wife, mother, doctor, neighbour, according to who is in communication and on what occasion:

I wonder if I can ask you – as a friend rather than as my doctor – if you think I ought to give up smoking. I know that you discourage your children – but is this as a mother or as a doctor or because you know it affects your husband's breathing? [12]

I am writing to you in your capacity as a volunteer helper at the South Boston Youth Center. You will have noticed . . . [13]

- Note [a] Identification and authority are made heavily explicit in legal documents. For example: I, the undersigned, being of sound mind, do this day hereby bequeath . . .
[b] Examples [10] and [11] illustrate the normal telephone use of *this/here* for the speaker, *that/there* for the hearer. Perhaps because of the unfavourable values associated with *that* (cf 5.63 Note [a]), there is some tendency to address the unseen hearer with the question 'Is this X?'

Speaker/hearer contact

19.65 But in addition to establishing identity of participants and to indicating authority for content, textual structure tends to be punctuated by periodic references to both participants. The hearer is addressed by name, not for clarity but out of courtesy and friendliness. The speaker may repeatedly refer to himself, often successfully giving thereby an impression of courtesy and modesty rather than of egocentricity:

I'd like you to know . . . I think . . . I hear . . . I seem to remember . . . it occurs to me . . . I mean . . . [1]

A communication from a body or organization may self-refer similarly:

Your union officials suggest . . . we acknowledge . . . we claim . . . we hope . . . [2]

Direct allusions and appeals to the addressee are especially characteristic of speech, informally with interspersed comment clauses *you see, you know, get it?, do you follow me?, yes? right?*; more formally *as you well know, as you may know, if I make myself clear (to you), if you will pardon the allusion*. In familiar speech, such asides may be excessive. For example:

I was just turning into Regent Street, *right?* And *you know* that Italian restaurant, Rachel. Well, *you see* I was trying to see if it was open, and *would you believe it*, coming out was Martha Goldberg. *You remember her*, Rachel, she used to work with me, *yes?* Well, *as you can imagine*, I pulled in and tried to attract her attention. She has remarried, *you know*. [3]

At this point, *if you will allow me*, I shall revert, ladies and gentlemen, to the aspect of the theory that I was explaining a few minutes ago. *As I am sure you will recall*, the central interest of the double helix . . . [4]

Addressee-involvement obviously serves two related functions, often distinguished by intonation. On the one hand, the speaker wants assurance that the addressee is following the communication in all its detail and allusion; in this spirit the involvement is essentially interrogative (cf 19.61) and the inserted items have a rising nucleus:

YÉS
you KNOW }
SÉE [5]

On the other hand, they are assurances to the addressee that he is not being

underestimated and that it is highly probable that he knows the facts already; the speaker is recalling them as much for the clarification of his own mind as anything else. In this spirit, the inserts have a falling nucleus or are uttered with low prominence carrying no nucleus at all:

[she has reMARRied you know] [6]

Confidence in shared knowledge not uncommonly permits the total replacement of an item of information by a heavily prominent *you know* with fall-plus-rise (cf 19.59 Note, on uncompleted *but*-conjoins):

I'd like to help him in any way I could, but YÔU KNÔW - [7]
[ie '... but there are notorious reasons for my not doing so, and these you know well']

A notable use of the 'shared knowledge' indicator, *you know* or *you see*, is where a participant breaks into discourse with a response or possibly a contrasting viewpoint (note the use of *well*; and cf 19.54):

A: Are you going to Warburton's? [8]
B: Well *you see* I no longer work there.

Again:

A: I find his explanation of relativity absolutely baffling. Isn't he an incredibly bad lecturer?
B: Well, *you know*, you missed the lecture before last and I think it was pretty crucial. [9]

The emphatic use of *you know* can serve as a connective within a continuous text:

I just couldn't bear going all the way to that place yet again.
[YÔU KNÔW] my [LÊGS were aching] the [CRÔWDS were thicker than ever] and I had a [HÊADache] [10]

Individuals differ in the extent to which they intersperse terms of address in discourse. In letters, they are used almost solely in the initial salutation: *Dear Mr Robinson*, *Dear Fred*; though between intimates, items like *darling* commonly accompany sentences throughout, as they would do in the corresponding speech. Letters to strangers can freely begin *Dear Sir* (less freely *Dear Madam*), and in formal style they may end *I remain, Sir, yours faithfully*. A general letter may begin *Gentlemen* (rather than ?*Dear Gentlemen*) or *Dear Sirs*, or *Ladies and Gentlemen*. On differences between AmE and BrE, cf App III.11.

In speech, it is normal to address a group as *Ladies and Gentlemen*; a group of men as *Gentlemen* (or, in military and analogous usage, as *Men*, though this would hardly be text-initial). At a formally constituted meeting, it is equally normal for individuals to be addressed as *Sir*, to or from the chair, less comfortably as *Madam*. But in chance encounters with strangers, severe constraints are felt over terms of address, especially in BrE. A request such as *I wonder if you could direct me to Pitt Street?* would in AmE (and especially in Southern AmE) be accompanied very widely by *Sir* or *Ma'am*, irrespective of the speaker's sex or an adult addressee's age. In BrE, *Sir* would be rather

rare, and would be used chiefly by younger men addressing older men; it would almost never be used by women. *Madam*, though the only fully acceptable form of address to a woman, is felt to be inappropriate in most informal circumstances (though it is used in addressing customers, clients, etc). In general, women can use neither *Sir* nor *Madam* except where the speaker is in a recognizably serving role, though women students occasionally so address a teacher.

A younger woman is sometimes addressed by men as *Miss*, but this is widely regarded as nonstandard or felt to be demeaning to the person addressed. In nonstandard use, *Lady*, *Mister*, and *Missus* occur freely in men's speech; and *lady* also has an ironic use which is not *uneducated* but informal (and addressed to a woman who is *not* a stranger):

Oh, you can't use that argument, lady. [11]

Man is also used to acquaintances (especially in AmE), but more familiarly than the foregoing use of *lady*. The use of *woman* in address is informal and usually impolite.

Note [a] Just as a speaker involves the addressee with insertions like *right*, *you know*, so the addressee reassures the speaker with similar short comments: *Oh I see*, *Yes I know*, *Right*.

[b] Although the inserts for involvement and authority are most frequently uttered with little prosodic prominence, *you know* is not alone in having a stressed variant. There is, for example, a triumphant or retributive *you see*, as in (uttered with a wide range of pitch, in contrast to that normal in comment clauses):

So I was RIGH[T] you 'SÉE[. [12]

Compare also:

She has reMARRied { I think }
{ I THINK } [13]

In [13] the first variant is little more than a conventional reluctance to seem dogmatic, but the second is meant to express serious reservations about the truth of what has preceded.

[c] Tag questions are much used to facilitate participant involvement, and it is notable that they are commonly placed well in advance of end position (cf 10.57ff, 11.7ff). For example:

She hadn't at that time, *had she*, been fully recognized as a serious writer?

Information processing

19.66 It is appropriate to treat this aspect of grammatical organization last since, being more centrally significant than any other, information processing has already to no small degree been seen as the motivation behind other specific features of grammar discussed elsewhere. It is paramount in the use of coordination and subordination (cf 19.57ff), and it was specifically mentioned in the treatment of questions (cf 19.61). Consider a sequence like the following:

Our economic troubles continue to resist solution. We have tried subsidizing our weaker industries. We have experimented with import controls. We have on occasion resorted to the drastic device of devaluation. To no avail. *How then are we to proceed?*

The answer lies in higher productivity and better products. [1]

The italicized question is pivotal in this text. It contains the conjunct *then* with anaphoric reference: the remedies already tried, which have been of 'no

avail', are put behind us. The question both points forward (and this is lexically matched by 'The answer' which follows) and prepares us for a climactic alternative strategy. A similar anticipation of the information focus would have been:

... To no avail. *The way forward* is to seek higher ... [1a]

The essence of such anticipation is to indicate in general terms what is to follow (we are going to 'proceed', there is a 'way forward') and hence both to prepare the hearer/reader and to arouse his interest. Note the comparable function of the italicized *where*-clause in the next example:

Robert Adam was in many respects typical of British architects of the eighteenth century. Like Inigo Jones and Lord Burlington, he drew eagerly on the inspiration both of the Renaissance and of Antiquity. He shared the enthusiasm of his contemporaries for collecting classical marbles. He was far from being alone in undertaking venturesome travel in the Mediterranean and in gazing with wonder at vase fragments and at sundrenched monuments. He was quintessentially a member of the Neo-classical movement. *Where he stands apart* is in his refusal to regard Antiquity as inviolable. It was an inspiration for new work, not a model for imitation. [2]

The major part of the paragraph is illustrative of the claim that Adam was typical of his time. The writer has one piece of counter-evidence, and he could have expressed this by the mere use of adversative *but*:

... a member of the Neo-classical movement. But he refused to regard ... [2a]

This would have made the point for an alert reader, though the exceptional feature would have been expressed rather tamely. The fact that we had come to an exception could have been more insistently expressed for the less alert reader by a further alternative:

... a member of the Neo-classical movement. But there is one respect in which he stands apart: he refused to regard ... [2b]

The writer might, however, have arrived at a compromise between [2b] and [2], as follows:

... a member of the Neo-classical movement. But he stands apart in his refusal to regard ... [2c]

We should note that, informationally, this is a subtle improvement over [2b] in seeming to assume (by the nominalization, *his refusal*) a significant item of shared knowledge. The writer credits his reader with being aware that Adam had this degree of creative independence. In fact, the original version [2] shows the writer going one better than this. He not merely achieves the objective of warning the reader that we have come to one respect in which Adam 'stands apart'; use of the pseudo-cleft enables him also to imply that the reader was well-informed enough to know that there was such a standing apart (as well as that Adam did not 'regard Antiquity as inviolable'), and

that in consequence we have now simply arrived at the point of restating it. In presenting what may well be new information as though it were given (cf 18.8), the writer treats his reader with flattering respect as well as enabling himself to make the main point with great force and economy.

- 19.67 The highlighting of the main information is associated with intonation nucleus. As explained in 18.2ff, speech enables us to do this independently of the grammatical structure. Guiding a reader to assign focus is more difficult, and Chapter 18 explores a range of grammatical devices that can be exploited. One such device is ellipsis. By omitting as much as is grammatically and semantically tolerable, the writer limits the reader's choice and thus guides his decision. Compare the following:

She felt trapped and frustrated. Whatever she said might so easily be misinterpreted. An idea crossed her mind, only ... [1]

In reading this text, one might plausibly assign a prosody as follows:

An i|dea crossed her m|ND| only ... [1a]

In other words, we have given ourselves the expectation (congruent with the preceding sentence) that the text might continue:

... only to be rejected the next minute. [1b]

But let us suppose the writer had intended it to be read as:

An i|DÊA crossed her mind| only ... [1c]

with the text continuing:

... only just in time. [1d]

The reader's momentary error could have been avoided in several ways. The risk that the third sentence of [1] was continuing the implication of the second would not have arisen if a thematic adverbial (*Suddenly* ..., *Then* ...) had implied a radical change. A nucleus would have been placed on *idea* if a rewording had placed this word at the end:

She had an idea. [1e]

But it might still have been given the wrong nucleus by a reader expecting a continuation like [1b]. With a more radical rewriting, we might have had a successful but highly elliptical verbless sentence, imperfectly suggesting the syntax but infallibly both conveying the semantics and pointing to the information focus:

She felt trapped and frustrated. Whatever she said might so easily be misinterpreted. Suddenly – an idea! Only just in time. [1']

Not merely would a reader unhesitatingly reconstruct this prosodically as:

... [Suddenly – an i|DÊA] ... [1'']

but he would react to the dramatic expression of the pivotal point between the woman's difficulties and the beginning of their possible resolution.

One further example. Imagine an argument conducted by correspondence.

A has written to B saying that a certain problem had nothing to do with her. B replies:

Let me set out the case as I see it and try to show you that the problem has something to do with you. [2]

A will probably read the last phrase as:

... the [problem has something to do with you] [2a]

whereas the words are in fact a paraphrase of a remark in A's own letter: they are 'given' information; all that is new is the positive (assertion) in place of A's original negative (denial). B has thus meant it to be read as:

... the [problem *HAS* something to do with you] [2b]

The required shift away from the normal (but here unwanted) end focus could have been achieved in the first place by some such device as emphatic *do* or an inserted subjunct (or both), thus drawing attention to the new polarity:

... the problem *does* (indeed) have something to do with you. [2']

which A would promptly have read with the required prosody:

... the [problem {does inDÈED / DOES} have something to do with you] [2'']

Information and sequence

- 19.68 Much of what we have been saying about the processing of information, not only here but in Chapter 18 and elsewhere in this book, concerns sequence. The order of presentation is clearly vital, whether we are concerned with premodifying adjectives, a group of noun phrases, a pair of independent clauses, a sequence comprising a matrix clause and a subordinate clause, or of course the elements within a single clause. We have choices such as:

- | | |
|---|------|
| { an intricate and arduous task | [1a] |
| { an arduous and intricate task | [1b] |
| { the cold night and the difficult journey | [2a] |
| { the difficult journey and the cold night | [2b] |
| { They cheered and they sang. | [3a] |
| { They sang and they cheered. | [3b] |
| { I saw the broken window when I arrived home. | [4a] |
| { When I arrived home, I saw the broken window. | [4b] |
| { Our memories of past crises were being added to our uncertainties for the future. | [5a] |
| { To our uncertainties for the future were being added our memories of past crises. | [5b] |

More is involved here than sequence, of course. As well as deciding on a pair (or longer set) of units, we have to decide on the actual choice of lexical items. Are they to be near-synonyms or are they to be in sharp contrast? In either

case, should they prosodically resemble each other (*eg* by alliterating, having the same number of syllables, the same stress pattern: *eg: arduous and intricate*), or should they differ in these respects (*eg: tough and intricate*)? Formal similarity often conveys a sense both of euphony and of a harmony between substance and meaning; formal dissimilarity, on the other hand, can convey a sense of richness and variety. Considerations of euphony enter also into the question of sequencing, but for the most part, both in the selection of items and in their placement, we are concerned with 'the right words in the right place'.

Whatever is placed first will seem relatively introductory and 'scene-setting'. Clearly, *preparing* our hearer or reader for what is to follow is of the greatest importance if the following part is to have the proper impact. The converse of this is that whatever is placed last will be expected to be relatively consequential, of greater importance, and possibly climactic. So in choosing between [1a] and [1b], our decision may depend on whether we wish to convey that the task was arduous *because* it was intricate; intricate and *above all* arduous; arduous in *being* intricate; arduous and *furthermore* intricate. In choosing between [3a] and [3b], we may wish to imply one or other chronological sequence: that they did one thing before the other. But if the two actions are but different aspects of the same celebratory behaviour, we have decisions to make on similar principles to those concerning us in [1a] and [1b], [2a] and [2b]. With [4a] and [4b], however, the order will probably be contextually determined: one or other, the arrival or the seeing, will be relatively 'given' (that is, the hearer/reader will already have been told or led to expect that the subject is going home or that a window has been broken), and whichever is in consequence the relatively 'new' item will be placed in final position if a feeble anticlimactic 'tail' is to be avoided. So again with [5a] and [5b]: the former will be preferred if the preceding part of the text has been dealing with 'past crises' and the intention is to go on to some discussion of the future; if the converse holds, [5b] will be selected.

We shall draw attention to sequencing and other modes of effectively presenting information in the annotated specimens that now follow.

Note Some matters of sequence are determined by courtesy, convention, or idiom. In formal circumstances, women are named in address before men, and the speaker is mentioned last:

Ladies and gentlemen! It gives me great pleasure ...

Harry and I were dismayed.

In 3rd person mention, however, sequence can freely depend upon the speaker's decision:

Joan and Peter } will be coming. I saw lots of { boys and girls.
Peter and Joan } { girls and boys.

On the other hand, we have a conventional mention of males first in (*the*) men and women, he and she, Mr and Mrs (Jones). Numerous other sequences are idiomatically fixed (as in *give and take*, *pots and pans*, *knife and fork*, (*Please pass the*) salt and pepper, (*Do you take*) milk and sugar?). Doubtless these have become fixed historically in response to the operation of prosodic or semantic pressures. Principles like 'Short before long' and 'General setting before specific object' combine happily in the journal title *Homes and Gardens* (ie private gardens - not public or zoological). Cf on binomials, 13.86.

The scrutiny of an example

- 19.69 We now present a fictional memoir, which will be analysed fairly closely in terms of textual structure as described in the earlier parts of this chapter.

As a child, one of my sisters was endlessly troubled by bad dreams and she could never be persuaded that they meant nothing. Boylike, of course, I was very scornful of this. On one occasion her screams awoke the whole house and so far as I can remember none of us had any more sleep that night. She sobbed; she was inconsolable; she could not be induced even to tell us what she had been dreaming. It had obviously been a nightmare. And a much worse one than the poor child usually suffered. By breakfast time, she seemed so ill that my parents decided she should stay home. Yet this upset her still more. It was then that she was coaxed into telling us what had frightened her.

A school friend had a little kitten and because this boy's parents were out at work all day, the teacher used to allow him to bring his pet to school and the caretaker used to look after it until the day's classes ended and the children went home again. In my sister's dream some Fearsome Creature with huge jaws was threatening the kitten's life and only she had the power to save it. So although as an added terror the Monster had some terrifying power over her too, she begged to be allowed to go to school as usual. Reluctantly my parents gave in but they insisted that since she was still scared and weepy I accompany her all the way.

I was very glad I did. Near the school we came upon another tearful youngster, her friend, frightened and harassed by a rather vicious dog that was jumping up and trying to molest the kitten in the lad's arms. I managed to chase it away with my sister's help and all was well. But, as you can imagine, she was more convinced than ever that dreams gave a dire glimpse of the future. And, secretly, I was no longer so sure she was wrong.

Text 19.69

The passage has both overall unity and a comprehensible 'natural' progression from part to part within it. Yet many of the parts are juxtaposed asynchronously (19.5); cf lines 5–6. Syndetic connection (19.11) is in fact less common, but cf lines 2 and 4. Thematic connection (19.12) occurs in lines 5, 6, 9, and elsewhere (in lines 5–6 with a triadic set; cf 19.8). There is a striking instance of rhematic connection (19.14) in line 17 where the rhyme *threatening the kitten's life* is matched by *save it* in the next clause. Textual orientation (cf 19.15) is shown in the dating of the narrative as a whole ('As a child, one of

my sisters . . .', line 1) in the early life of the narrator who is male (*boylike*, line 3) and its location in the family's home community; the narrator relates to his hearer/reader (cf 19.64) both through direct involvement (*as you can imagine*, line 26) and by drawing attention to his own fallible authority for the narrative (*so far as I can remember*, line 4). Not least, the example illustrates the extent to which the text depends on the knowledge of culture and language shared by narrator and hearer/reader (cf 19.20). The whole has the structure identified as progression (19.17); it is realized by the *step* strategy (19.18) but achieves a stack-like unity.

We shall now look at the passage in some detail, taking each of the four categories of 19.19 in turn. We shall try to show that every feature, whether minute or relatively extensive, quite local or quite pervasive, contributes to every other feature: endorsing and enhancing the textual structure.

Pragmatics and semantics

- 19.70 Consider first the implications in the clause sequence: *the teacher used to allow him to bring his pet to school and the caretaker used to look after it* (lines 13f). The definite determiner in *his pet* is of course anaphoric (cf 6.15), grammatically determined by *a little kitten* earlier in the sentence. But this is not true of the definite articles in *the teacher* and *the caretaker*, which are in turn different from each other. The latter depends on our 'knowledge of the world': that a school has a person (designated *caretaker* in BrE) performing duties that justify the situational *the* (cf 5.28) in the noun phrase *the caretaker*. If, in place of this, the clause had had *the lieutenant* or *the waiter*, our world view would not have sustained a situational interpretation of *the*, and we would probably have guessed at anaphora and scanned backward (in vain) for earlier mention of a person who might be so described. With *the teacher*, the case is different again, because we assume that any school has *several* teachers: situational interpretation in this case depends upon our knowledge that one particular teacher has special responsibility for a particular group of children, and for each member *the teacher* concerned is so designated.

Consider now the function of *even* in line 6. This is a focusing subjunct with additive-concessive meaning (cf 8.116ff), and in the present instance the item on which it focuses (the nonfinite clause *to tell us . . .*) is itself within the scope of the negative focusing item *not*. So much from grammar. But our interpretation depends on our judgment of what is implied by the asyndetic sequence in which *even* appears. The clauses *She sobbed; she was inconsolable; she could not be induced even to . . .* are not only thematically linked but also seem to form a series of statements closely similar semantically, and reaching a climax in the third. The *even* thus appropriately presents an added measure of the child's misery. But the series can be seen rather differently: a narrative sequence in temporal order. The child sobbed. Her parents tried to console her, but in vain. They then tried to persuade her to tell them about the dream – and *even* this less ambitious aim was frustrated. There are further possibilities, still fully compatible with our understanding of the grammar. The implication may be that they could not persuade her to talk *even though* she was normally very keen to tell the family what she had been dreaming.

- 19.71 One further part of the narrative is worth examining in the present

connection. The adjunct *on one occasion* (line 3) is temporal but very elastic in reference. Compare:

On one occasion as I was having breakfast ...
 On one occasion when I was sunbathing ...
 On one occasion as I was going to bed ...

It carries no necessary reference to a particular time, yet in line 3 we immediately understand it *in part* as 'one night' because dreaming entails sleep and the normal time to be asleep is at night. So the further time adjunct *that night* in the coordinate clause (line 5) is purely confirmatory and *that* is anaphoric. But in fact our chain of pragmatic reasoning has enabled us to make a still more precise interpretation of the phrase *on one occasion*. Although a child may scream on any occasion (and surely more often during waking hours), in the present context we do not need to be told that her screams were occasioned by a dream. We have automatically interpreted the adjunct as 'On one occasion *when she was being troubled by just such a bad dream*', taking the phrase to be thematic with reference to the rheme of the very first finite clause of the narrative.

Lexical features

- 19.72 When we want to sustain a reference between one part of a text and another, we usually resort to pro-forms (cf 12.1ff), but this is not always possible. We find the noun phrase *my parents* in line 9 and again in line 20. Clearly, the second reference could not be achieved by *they*, since the pronoun's antecedent would be too remote for correct identification. In any case, replacing lexical items by pro-forms is not always desirable: it may often be better to repeat the lexical item or to use another that is semantically appropriate. This is one of the means by which a text can be given added unity and coherence. The text under consideration concerns family life, with special reference to childhood, and more especially to the dreaming to which one little girl is prone. These matters are reflected in lexical sets as follows:

family: *parents, child, girl, boy, sister, home, house, breakfast* (perhaps also *coax, allow*)
 childhood: *child, girl, boy, lad, youngster, school, class, teacher, friend, kitten, pet* (perhaps also *sob, scream, beg, fear* etc; *monster*)
 dreaming: *dream* (four times), *nightmare, sleep, night*

But this is to consider subject matter; the plot connects childhood and dreaming in terms of horror, and again this is endorsed by clusters of lexical items:

scream, sob, inconsolable, suffer, ill, upset, bad, trouble; fearsome, frighten, terror, dire, vicious, monster, power, harass, molest

Most of the items in these sets have the semantic complementarity that confers an enrichment by lexical linkage, since we have not repetition so much as a wide selection from associated sets. But a valuable aspect of lexical distribution in texts is that items may be hierarchic as well as linear. A nightmare is hyponymic to (*ie* included within) the class of dreams; conversely, *child* is hypernymic to *boy* and *girl*.

These words, with their modest degree of repetition, do not of course entail the particular subject matter, still less the course of the narrative. The same lexical distribution might occur in a text concerned with a murder trial or even mountaineering. As with the potentiality of grammatical devices (cf 19.5f), it is the *compatibility* of the lexical items that matters, not so much evoking or endowing as confirming a textual coherence.

In any event there are limitations on actual repetition. Although there are exceptions (see below), we normally avoid repeated use of the same lexical item within short spans of text, especially in writing, since the effect can be unpleasant and clumsy. The required lexical reference and linkage can be achieved by the use of words that have the requisite closeness in meaning. This not merely has the negative advantage of avoiding monotony: it can enrich the text by presenting additional semantic facets. In line 12, a new character is introduced, *a school friend*, who is referred to in the next clause as *this boy*. The lexical items are complementary in the information they give us: a boy need not be a school friend; a school friend need not be a boy. Again, the *kitten* of line 12 is called *his pet* in line 14: very little meaning is added here, but we find it appropriate that it is in recognizing that the kitten is the boy's pet animal that the teacher permits him to bring it to school. Compare also the complementarity of *persuaded* (line 2), *induced* (line 6), and *coaxed* (line 10). From the examples of lexical linkage that have been cited, it will have become clear that the linkage transcends the syntactic function of the lexical items concerned. The same lexical item is present in *bad dreams* and *had been dreaming* (lines 2 and 6), in *to school* and *school friend* (lines 14 and 12), in *child* and *children* (lines 1 and 15), in *bad* and *worse* (lines 1 and 7), indeed even in *terror* and *terrifying* (line 18), to cite only examples from *Text* 19.69. Further, given that linkage operates through items of related meaning, we have comparable links between *sobbed* (line 5), *weepy* (line 21), and *tearful* (line 22). It is on these grounds that we are able to adduce a lexical contrast between waking and sleeping, though in the text this is realized by the noun *sleep* and the past-tense verb *awoke* (lines 5 and 4).

The text contains the clause *she was inconsolable* (line 5). This might have been related to a preceding clause (which is indeed perhaps implied), thus involving such a cross-grammatical linkage:

My parents tried to *console* her but she was *inconsolable*.

More indirectly, but with an overtness not present in the text:

My parents *cuddled* her and put her favourite teddy bear in her arms to *comfort* her, but she was *inconsolable*.

Now, there is an obvious semantic connection between *cuddling*, *comforting*, and *consoling*, but the predication *inconsolable* does more than conform to the linkage of a particular semantic chain: we understand it as an abbreviation of and substitute for something like '(She was) not consoled by the parental cuddling or by the comforting presence of the teddy bear'.

From punctuation to prosody

- 19.73 Our text is divided into paragraphs which in turn are divided into orthographic sentences, normally coinciding with the grammatical units of

the same name, but not necessarily so. Note the sentence in lines 7–8 which consists of only a noun phrase. Sentences are divided into parts that may be marked punctuationally in various ways: semicolons, colons, commas, dashes. Although the semicolon normally terminates a clause, the generalization is insecure and there are still fewer correlations between grammatical units and the textual units bounded by the other punctuation marks (cf App III.15).

The points at which a writer chooses to begin new paragraphs will vary from text to text and from writer to writer (cf 19.28). Each paragraph will have in some sense a self-contained unity, it is true. Thus the first paragraph of our sample text deals with the family commotion caused by the dream; the second with the content of the dream; the third with the event that parallels the dream. But the point at which a paragraph comes to an end has by no means a sense of finality; in our text, indeed, the first paragraph ends in a way that frustrates the reader's hopes and expectations. Equally, a new paragraph need in no way herald a new topic; in our text, the third paragraph begins with a sentence that has exceptionally close linkage with the final sentence of the preceding paragraph, and many writers might well have preferred to postpone the new paragraph accordingly:

... insisted that since she was still scared and weepy I accompany her all the way, and I was very glad I did.

Near the school we came upon another tearful youngster...

Nonetheless, the actual points chosen to terminate the paragraphs are by no means casual, still less arbitrary. The writer has doubtless felt that the first sentence of his second paragraph has more connection with the sentences that follow than with those that have preceded. Moreover, having to inject some background material, its textual discreteness is displayed more readily by beginning a new paragraph at that point. But even if no background material had been needed and the next sentence after line 11 had begun:

Some Fearsome Creature with huge jaws was...

the writer might still have felt it appropriate to begin a new paragraph, as though enforcing an expected pause after lines 10–11.

So too, beginning the third paragraph with *I was very glad I did* is readily justifiable. Not only does the alternative version suggested above entail a very long and rather clumsy end to the preceding paragraph, but again the typographic break at the point made in the original is textually superior in several ways. The gladness belongs to the content of the third paragraph and not the second: contrast an alternative wording, *I was perfectly happy to agree* which would more readily have belonged to the second paragraph. Moreover, this third paragraph is to be concerned as much with a change in the narrator's views as with the dog episode; and as the paragraph is to end with *I* as subject, it is fitting that it should so begin also. In addition, as with the division between the first and second paragraphs, this is a suitable point for a suspense-enhancing break.

The sentence units

19.74 As with paragraphs, so with sentences: their limits are determined by the

author in accordance with his idea of the text's shape. There are two fairly striking indications of this in the present text. Lines 5–6 (*She sobbed ... had been dreaming*) could have been three sentences and the writer made it one. Lines 7–8 (*It had obviously ... usually suffered*) could have been one sentence (as grammatically it has to be understood) and the writer made it two. But again as with the paragraphs, the decision made on the sentence division is readily interpreted as purposeful. In putting a period after *a nightmare* in line 7, the writer gives more weight to this noun phrase and obliges us to consider the full significance of the word 'nightmare': the reader will not pass over it lightly, treating it merely as a vague hyperbole. The effect on the *And*-sentence that follows is equally great: again the separation forces us to treat it separately and to read it as though in fuller form: 'Moreover, it was a much worse nightmare than ...'.

The converse process of punctuating three possible 'sentences' as one in lines 5–6 is justified on several grounds. The three parts constitute a single unit, developing the *screams* (line 4) and the reason for there being no more sleep that night. Grouping as a single sentence also brings out the triadic structure (cf 19.8) which would have been blurred if they had been punctuated as separate sentences, depending only on the common subject *she* to distinguish the triad from the next following sentence. On the other hand, if the three parts had been separated by commas instead of semicolons (cf App III.6ff), too great a homogeneity would have been imposed.

Consider now the two finite clauses in the text that are introduced by *but*. The first (line 20) runs straight on without even a comma; the second (line 26) begins a new sentence. In the first case, the two clauses have the same subject and this justifies a closer textual relation to some extent. But a probably stronger factor is the psychological one: the writer is able to imply that the 'giving in' is directly conditional upon the child being accompanied to school. By contrast, in the second case (line 26), not merely are the subjects of the two clauses different but the concessive link between them is more oblique (cf 19.80).

While only one sentence is divided into units with semicolons, the comma occurs rather frequently. In general, its use is unremarkable, indeed conventional (cf App III.6ff), but in one or two instances both its presence and its absence are of some interest. *Despite their similarity in form, position, and function* (in being subject-oriented), *Reluctantly* in line 19 and *secretly* in line 27 have different relations with their contexts (cf 19.80), and this is endorsed by the punctuation used. But it would be false to suggest that there must be convincing textual reasons behind every punctuation distinction: though possessing considerable discriminatory potential, the comma is especially prone to careless and inconsistent use. For example, there seems no good reason for the absence of a comma after some of the initial adverbials, such as the one in lines 15–16. But the same is not true for the commas after *But* (line 26) and *And* (line 27); justified by the parenthetic comment clauses, the commas conveniently emphasize the converse effect of these two conjunctions, encouraging a pause or even a nuclear focus in reading. Cf 19.29 Note.

One minor point that must undoubtedly be deliberate is the use of initial capitals for *Fearsome Creature* and *Monster* (lines 16 and 18). Bearing in

mind the conventions in this respect (*cf* App III.29), we must suppose that the writer's intention is to imply the unique, extra-generic nature of the creature in the dream: unique enough to merit the capitals suggestive of proper names. There is also, no doubt, the ironic suggestion of the grotesque importance the creature assumed in the child's mind.

Prosodic realization

- 19.75 From time to time in this book and especially in this chapter, we have used such clumsy expressions as 'speaker/writer' for the originator and 'hearer/reader' for the receiver of a text. The inelegance is perhaps justified if it has helped to keep both oral and written realizations of language in mind. We shall later look at texts that originated (and had their sole existence) in speech, and at others that originated (and have their main existence) on paper. But regardless of their origin, it is vital to understand that aural reception is rarely if ever to be disregarded. We must insist afresh that even silent reading of a typically paper-originating text (such as an insurance document) demands the silent assignment of speech prosodies as an aid to understanding. It is only on rare occasions that a punctuational device has no spoken analogue; initial capitals, as with *Fearsome Creature*, are perhaps among the exceptions, though even these could doubtless be expressed by ironic emphasis in speech. The careful writer makes his punctuation choices in the hope of giving his reader the cues necessary to assign the prosody that the writer would himself have used. For example, the use of semicolons in line 5 will induce us to read this as a triad and yet with more staccato separation of the members than if commas had been used. In other words, we are expected to impose some such prosody as this:

She |sóbbed| she was |inconsólable| she |could not be in'duced
'even to'tell us 'what she had been DREAMing| [1]

But cues to the most appropriate realization come not only or even chiefly from punctuation. They come pervasively from all aspects of lexical and grammatical selection and disposition. It will be our recognition of the semantics that will cause us to assign a narrower range of intonation (*cf* App II.20) on *secretly* in line 27 than on *Reluctantly* in line 19, in some way ironically miming the confidentiality of the confession that follows. Consider also the role played by the selection of and position assigned to the focusing subjuncts *only* in line 17 and *too* in line 18 (*cf* 8.116*ff*). We unhesitatingly realize the units concerned thus:

{and |only SHĒ| had the |power to SÁVE it| [2]
{the |Monster had 'some 'terrifying 'power over HĒR| |TÒO| [3]

Without the focusing subjuncts, we would not expect either pronoun to have a nucleus; replacement of noun phrases by pronouns normally connotes, indeed, that these repeated references need little or no prominence:

{and she had the |power to SÁVE it| [2a]
{the |Monster had 'some 'terrifying PÒwer over her| [3a]

If the author had been telling the story orally instead of writing it, he could have dispensed with the focusing items, or positioned them differently, or

selected different ones; he would nonetheless have achieved the desired effect by putting nuclear focus where he wanted it. Thus:

{and |SHĒ| had the |power to SÁVE it| [2b]
{and |she aLÒNE| had the |power to SÁVE it| [2c]
{the |Monster had 'some 'terrifying 'power over HĒR| [3b]
{the |Monster 'also had 'some 'terrifying 'power over HĒR| [3c]

Features of grammar

Determiners and connective reference

- 19.76 In our consideration of the text so far, it has been rather artificial to remain silent on grammatical devices, because it is so clear that they inescapably interact with all the other linkage features. To cite just one example: in 19.72, we noted the lexical relation between *a school friend* and *this boy* (line 12). But in fact the lexical link in this instance is significantly preceded by grammatical deixis (*this*) and the whole is embedded in the noun phrase *this boy's parents*. We see the relevance of these grammatical points when we note the relative prosodic weight assigned to the three constituents:

'this,boy's "parents

The noun-phrase structure assigns greatest prominence to the head, rightly, since this is the new information feature (*cf* 19.84); least is assigned to *boy*, which thus conveys the impression of being a lexical repetition, having the role of merely indicating the friend's sex; *this* is intermediate in weight as being the effective carrier both of connection between the two noun phrases and of contrast between the two sets of parents and between the two friends, 'my sister' and 'the boy'. Different grammatical choices with the same lexical items would achieve very different results:

the parents of this boy
the parents of the boy
the boy's parents
a boy's parents

In several instances, demonstratives, definite articles, and possessives have anaphoric reference to noun phrases previously introduced with indefinites. Thus *the poor child* of lines 7–8 links back to *a child* in line 1; *my sister* of line 15 and elsewhere links back to *one of my sisters* [= *a sister of mine*] in line 1. Other instances: *a little kitten* ~ *his pet* ~ *the kitten* ~ *the kitten* (lines 12–24); *a school friend* ~ *this boy* (line 12); *some Fearsome Creature* ~ *the Monster* (lines 16–18); *another tearful youngster* ~ *her friend* (lines 22–23). The treatment of *dream(s)* is different in a way that is interestingly significant for the structure of the whole text. The subject is introduced with a plural noun phrase but indefinite as one would expect: *had dreams* (lines 1–2). From that indefinite plurality we focus upon one specific dream, first mentioned in nominal form in line 7, again indefinite as we would expect: *a nightmare*. The

next time it is mentioned in nominal form, it is of course made definite: *my sister's dream* (lines 15–16). The narrative ends with placing this back again in the whole class of indefinite *dreams* (line 26), which forms an effective link back to lines 1–2, thus conveying the 'stacklike unity' to which we alluded in 19.70.

But there are other exceptions to the simple indefinite–definite progression. Reference has already been made (cf 19.70) to the situational use of *the* in *the teacher* and *the caretaker* (lines 13 and 14). Compare also *the day's classes*, line 15. A situational usage independent of a specific culture occurs with *the future* in line 27, and it is only through the semantic link with *never . . . meant nothing* (line 2) and *more convinced than ever* (line 26) that the phrase has a connective role.

Definiteness in several noun phrases is achieved by possessives, eg: *my parents* (line 9); *the kitten's life* (line 17); *the lad's arms* (line 24); and here again we are concerned with situational reference: we need look for no previous mention of *parents*, *life*, or *arms* since everyone can be expected to have them. But the possessives themselves of course perform a connective role: '*my parents*' with the '*I*' narrator; '*this boy's parents*' (line 12), '*the lad's arms*' with '*another tearful youngster*' (line 23). In *her friend* (line 23), however, we have both types of connection: (*her*) *friend* ~ *a school friend* (line 12) and *her* (*friend*) ~ *my sister* (line 15).

With deverbal nouns, definiteness with possessives works in yet another way. The phrases *her screams* (line 4) and *my sister's help* (line 25) are not determined by earlier references to *screams* or *help*. We seem to be expected to understand covert existentials like '(There were screams from my sister and) *her screams* . . .', '(There was help from my sister and) *my sister's help* . . .'. Alternatively, the definiteness may be interpreted as cataphoric with the nominalizations: '*the screams of my sister*', '*the help of my sister*'. There is an unquestionable cataphoric *the* in *the power to save it* (line 17). In two instances, definiteness is carried by demonstratives: *that night* (line 5) and *this boy* (line 12). Both are anaphoric and the latter is completely straightforward: *this boy* refers back to *a school friend*, and the use of *this* rather than *the* is merely to distinguish *this*, the more recently mentioned child, from the more central figure, *my sister*. The phrase *that night* (line 5) is more complicated. In the first place, the anaphoric reference is by no means explicit (*one occasion*, line 3); cf the discussion in 19.71. In the second place, the adjunct phrase admits no simple contrast (**the night*) and replacement of *that* would entail further alteration (*the whole night*, *for the night*). Yet the use of *that* as distinct from *the* is justified by the remoteness in time of the occasion in question from the 'now' of the narration.

Note Definiteness in *the whole house* (line 4) and *the children* (line 15) has clearly anaphoric effect, but through semantic implication: cf 19.71. Lines 1–4 imply a family household justifying the . . . *house*; *the children* are anticipated by *my sister* and *a school friend* as well as being implied by the school's existence.

Pro-forms and connective reference

- 19.77 First and second person pronouns differ from third in not normally having antecedent noun phrases (cf 12.47ff). *I* and *you* operate in most texts as they do in everyday conversation in being the most direct form of connection

between speaker and hearer. But in the text being analysed the *I* is complicated in having a double reference – the adult narrator, overt only in the second sentence, and himself at an earlier period: himself as brother and son in a family (*my sister*, *my parents*, *passim*; *none of us*, line 4); himself as actor in the story he is narrating. Though for the most part the roles of narrator and actor are simply distinct, it is not always clear when reference is to the one rather than to the other, and inevitably, this equivocation is caught up in tense. Thus it never emerges (and is irrelevant to the story) whether *one of my sisters* in line 1 implies '*I have sisters*' or '*I had sisters*'. Nor is it entirely clear (cf Fig 19.78) whether the concluding '*I was no longer*' applies only to the *I* actor (*ie* to the period HC) or whether it also applies to the *I* narrator (*ie* to the period HA). The use of *Boylike* in line 3 is partly to distinguish the two age-values of *I* (as well as to establish the sex). It should be noted in passing that a diachronic/synchronic complexity with *I* arises whether a text is fictional or factual.

Most of the other pronouns in the text are straightforwardly anaphoric, but the more striking are the *she/her* references which (from *one of my sisters*, line 1) form a strong thread that binds the entire text. Other anaphoric references:

bad dreams . . . they	(line 2)
this boy . . . him . . . his	(lines 12ff)
his pet . . . it	(line 14)
the kitten's life . . . it	(line 17)
my parents . . . they	(line 20)
a rather vicious dog . . . it	(lines 23–25)

With others the antecedent is less obvious. The *us* of line 4 connects with the singular noun phrase *the whole house* earlier in the sentence, where (as object of *awoke*) this is not the ordinary inanimate but a collective in which *house* means 'household', the semantic plurality being endorsed by *whole*. The 1st person involvement in the pronoun *us* is justified by *my* in line 1: its plurality by the implied conjunction of *I*, *one of my sisters*, and (a little later, as we expect) *my parents*.

The antecedent of *this* in line 9 is not a noun phrase at all but the clause *my parents decided she should stay home* (cf 19.47), while the *it* that begins the next sentence is that special cataphoric use that enables us to make an item (in this case the time adjunct *then*) rhematic in the first part of the cleft sentence (cf 18.26ff). Another instance of *it* is less clear: *It had obviously been a nightmare* (line 7). Superficially, it might be anaphoric to the interrogative *what* in the preceding indirect question. Compare:

A: *What* have you got there?

B: I don't know the proper name for *it*, but I think *it* is called an ammeter.

But that would imply the scarcely acceptable '*She had been dreaming a nightmare*'. Perhaps we have something more like the prop *it* of '*It's snowing*', '*Isn't it cold?*' Alternatively, the antecedent might be the whole clause *what she had been dreaming*, covertly nominalized as *the dream*, and this is perhaps the best interpretation, though there is the more remote possibility that the

reference of *it* is much more general: 'the cause of all her trouble, the screams and the sobbing'. In this interpretation, we would see *it* as cataphoric in an incomplete cleft sentence:

It had obviously been a nightmare *that had upset her*.

There are three other types of pro-form to consider in this text. In line 7, *one* stands for and replaces the noun which is head of the preceding noun phrase *a nightmare*. Another instance of *one* (line 1), together with its negative *none* (line 4), is more complex. Both forms are equivocal between their numerical and partitive indefinite-pronominal functions. Compare:

one of my sisters ~ two of my sisters
none of us ~ one of us ~ two of us

beside:

one of my sisters ~ a sister of mine
none of us ~ some of us

But it is in their partitive function that they play a connective role in the text, *one* anticipating *she* in line 2, *none* in a parallel but inverse way connecting with the preceding reference to *the whole house* (line 4).

The second type to mention is the predication pro-form *did* in line 22, connecting with the end of the preceding paragraph by replacing the predication *accompany her all the way*.

Thirdly, there is a rather similar use of some correlative expressions. A comp-element (cf 15.63ff) is usually followed by complementation introduced by *as* or *than*; there is an example in lines 7–8: *a much worse one than the poor child usually suffered*. But the complementation may be left implicit (cf 19.52). For example, in lines 9–10 we have *this upset her still more*, and just as *this* is a pro-form for the preceding clause, so *still more* requires us to understand something like *than her nightmare had done*. Again, in the final sentence the *so* has a totally ellipted correlative (*as I had been*) which has its connections right at the beginning of the narrative where *I was very scornful* connotes 'I was sure that dreams had no significance'.

Note A striking instance of *I* being used with reference to an individual at different periods is essential to the structure of Dan Jacobson's novel *The Rape of Tamar* (1970) where *I* is both the narrator, aware of contemporary addressees (*you*), but necessarily aware also – as the ghost of King David's nephew thousands of years earlier – of a temporal, locational, and cultural gulf separating the *I* whose memoirs are the point of the novel. On the references to time, cf 19.78; note also 'this part of the world' and cf 19.31. Addressing the present-day reader:

... allow me to introduce myself. My name is Yonadab.
Not a common name nowadays; at least in this part of the world. But some of you, a few of you, will have heard of me ... As I was saying, I am (or was) Yonadab ...

Tense and narrative structure

19.78 The narrator is *I*, giving a ready-made orientation (cf 19.15) to the hearer/reader, and a presumed identity with the 'here' and 'now'. Note *so far as I can remember* in line 4 and *as you can imagine* in line 26, where the present tenses relate precisely to this here and now shared by the narrator and his

hearer/reader. But the narrative as a whole of course relates temporally to the past and the narrative 'stage' is set for this in the opening sentence: *was*, *could*, *meant* are endorsed by the opening adverbial *as a child* which carries the implication that the sister is no longer a child; that the event is in the past but within living memory (at least the narrator's). Within this past, the narrative focuses upon a very short time span of perhaps nine hours and the general progression is straightforward: from the beginning of the period (*awoke*) to the end of the incident with the dog (*managed to chase it away*). But when we look at the text more closely we find considerable complexity, with several points and periods of time involved and some switches in the temporal order. The time structure can be represented as in Fig 19.78.

Fig 19.78

The point *A* is the 'now' shared by narrator and audience (*so far as I can remember*, line 4, applies to this point). The period *B* to *C* covers the sister's childhood and (so far as this text is concerned) is coterminous with her troubled dreams: the period of *was ... troubled* and *could never be persuaded* (lines 1 and 2). The text implies at first that it was coterminous too with *I was very scornful* (line 3), but the point of the final sentence is to challenge this. Within *B* to *C*, another relevant stretch of time is involved: *D* to *E* covers the period when the school friend took his kitten with him every day (lines 12 to 15). It is within this sub-stretch *D* to *E* that the main events of the narrative take place, and we are predominantly involved in the period from *F* to *H*: from *F*, when the girl's screams awoke the family (line 4), to *H*, when the dog was chased off (line 25). And, unlike *BC* and *DE*, *FH* is less treated as a stretch of time than as a series of point-to-point events, with some emphasis upon point *G*, breakfast time.

Yet we manage to understand the different types of time reference in terms of largely undifferentiated past-tense verb forms. This applies even to the passage when the narrator interrupts events at *G* to supply background information (lines 12–15) relating to the *DE* period which will be essential to our understanding of the dream: *had* and *were* (lines 12, 13) refer to a span and *went* (line 15) to an iterative series, all sharply different from *upset* and *was coaxed* (lines 9 and 10).

Moreover, when the content of the dream is narrated, the past tenses in *was threatening*, *had* (lines 16f) relate not to *G* but to an earlier point, namely

just before *F*. The only exceptions to the undifferentiated past are significant. The past perfective is used in line 6 (*had been dreaming*) and line 10 (*had frightened*). Both are in indirect questions and obey the rules for backshift (cf 14.31) to distinguish between the time reference of the superordinate verbs (post-*F* and *G* respectively) and that of the subordinate verbs (both pre-*F*). Replacing past perfectives by past tenses here would have made it seem that the girl *was dreaming* at the same time as she *could not be induced*, and that something *was frightening* her at the same time as she *was coaxed*.

One final point of interest. In the penultimate sentence, the past tenses refer clearly to point *H* in the narrative; but those in the final sentence refer to a span that begins at *H* and stretches to *C* or possibly even to *A*. It is perhaps significant that at the point where the time reference of the past tenses is switched, the narrator interposes the clause *as you can imagine* (line 26), not merely reestablishing the link with the here and now of *A* but helping to imply that the remaining past tenses connect the end of the adventure (*H*) with the present time.

The part played by marked aspect and voice

- 19.79 (a) ASPECT: The main uses of progressive aspect that form striking links relate to the dream ('what she *had been dreaming*', line 6); to the monster in the dream which '*was threatening* the kitten's life' (line 16); and to the corresponding dog next day which '*was jumping up and trying* to molest the kitten' (line 24). These progressive forms not merely link with each other but form a textual contrast with the accompanying punctual verbs which are aspectually unmarked; for example, *awoke* (line 4); *begged* (line 19); *gave in* and *insisted* (line 20); *came upon* (line 22); *managed* (line 25).

The occurrence of marked habitual aspect, though slighter, is also significant. At the point where the narrator has to interrupt the account of temporally sequential events to give necessary background information (lines 12–15), we have to be aware that the past tenses now have a different value; cf 19.78. The two verb phrases most relevant to the plot in this sentence are therefore marked for aspect and at the same time thus linked together: 'the teacher *used to allow her to bring* her pet to school and the caretaker *used to look after it*'.

(b) VOICE: Both morphologically and distributionally, the passive is the marked voice in relation to the active, and in consequence our attention is drawn to its use. There is a striking density of passives in this text. Their role in information processing in specific clauses and sentences will be the concern of 19.83. Our interest here is the part they play in the text as a whole. They are clearly associated with 'my sister' who is repeatedly the subject of passive verb phrases and indeed in almost no instance is she the subject of a transitive verb in the active voice. At the outset, we are told that she 'was troubled', that she 'could never be persuaded'. In the middle she was begging 'to be allowed'. At the end she 'was more convinced than ever', and the lowness of *convinced* on the passive gradient (towards adjectival status: cf 3.74ff; note also *scared*, line 20; *inconsolable*, line 5) does not diminish the strength of this final link in the continuous presentation of an 'affected' victim. Line 4 is interesting confirmation of this. If the narrator had said that

'She awoke the whole house with her screams', this might have implied an unwanted agentiveness: so it was *her screams* that awoke the house.

- Note The adjective *inconsolable* is passive not only in meaning (cf App 1.40) but in being juxtaposed and contrasted (*even*) with a formal passive in the next clause.

The cohesive role of adverbials

- 19.80 As we would expect in a narrative involving a sequence of events, time adverbials have a considerable role. In line 3, the sentence adjunct *on one occasion* (cf 8.36, 8.55) picks out the significant period for this text from the general time span (*BC* in Fig 19.78) in which this period is located; it is thus linked to but contrasted with *endlessly* and *never* in the preceding sentence. In turn it looks forward to the corresponding time-position adjunct, *that night* (line 5, cf 8.55). *By breakfast time* in line 8 takes us to the next temporal point to be distinguished, and in line 10 (still within the span (cf 8.57) covered by breakfast time) the adjunct *then* links back across an intervening sentence to the point at which the parents made the decision about staying home. For the rest, the progress of the narrative is managed without time adverbials, but it should be noted that the place adjunct *near the school* (line 22) is effectively temporal as well, marking the change of both place and time after the breakfast scene. In a similar way, within the background intermission of lines 12–15, the direction adjuncts (cf 8.39ff) *to school* and *home* look back to the time-duration adjunct *all day*, marking beginning and ending points (the *until* clauses of lines 14f) of the 'all day' span.

The course of the narrative depends in fact as much on place-sequences as on time-sequences. There are two polar locations, home and school, and references to these are frequent: (*stay*) *home* (line 9); (*bring . . .*) *to school* (line 14); (*went*) *home* (line 15); (*go*) *to school* (line 19); *Near the school* (line 22). Between these last two adjuncts, we find *all the way* (line 21), which elliptically links both: 'all the way (to school)' and '(on the way) near the school'.

Adverbial linkage is by no means limited to time and space. The second sentence begins with an adverbial verbless clause of respect (8.85; realized by the adjective *boylike*) which is obviously linked to the comparable item that begins the text, *As a child*, yet in balanced contrast to it: according to traditional stereotypes, a girl is easily frightened, a boy is not. The focusing subjunct (cf 8.116ff) *even* in line 6 links this clause with the previous one: 'not merely could she not be consoled, she could not *even* be induced . . .'. Another focusing subjunct, *only* in line 17, both helps linkage with the preceding clause and also underlines the contrast between them. There is a further contrast with the following clause that is again pointed by a focusing subjunct, *too* in line 18. The concessive conjunct (cf 8.136ff) *Yet* in line 9 again provides a close link with what has immediately preceded, as does the inferential conjunct *So* in line 17. The additive conjunct *as an added terror* (line 18) links the *although*-clause back to the fearsome threat of line 16 as well as itself being lexically linked – rather obtrusively – to the object in the *although*-clause. The disjunct *obviously* (cf 8.121ff) in line 7 is interestingly equivocal in its relations (cf the discussion of the clause concerned; 19.77). It invites connection with the hearer/reader ('You will think it obvious'), as well as working as a disjunct with respect to the participants in the narrative

('we thought it obvious'). But it has an additional, textual function, in working as an inferential-summative conjunct with reference to the seriousness implied in the previous sequence of clauses: 'So, obviously, it must have been a nightmare'.

Although it is natural to think of adverbials at *I* position in a clause (cf 8.14f) as having a linking role with what has preceded, and thus being thematic (cf: *In my sister's dream* in line 15, *Near the school* in line 22), there are two interesting exceptions in this text. The two subject-oriented adverbials (cf 8.92ff), *Reluctantly* in line 19 and *secretly* in line 27, are in a sense counter-conjoining and they derive their adversative, concessive force in part through thus interrupting what would otherwise be a natural and logical sequence:

The child begged to be allowed: the parents gave in.
She was more convinced than ever: and I no longer disagreed.

But in each case where we have now entered colons, there is a caveat in the actual text. In the first case, *Reluctantly* (ie: 'although with reluctance') constitutes a link, not with the preceding clause but with the reasons for parental anxiety which were presented in lines 4ff and which led to the decision of line 9, now to be reversed in the clause that follows *Reluctantly*. In the second case, *secretly* takes us right back to line 3: the reversal of the narrator's view of dreams has to be seen not only as a consequence of the sequence of events but as a reproach for his earlier scorn: *secretly* is an ironic parallel to *boylike* positionally, and invites us to see an (although) *secretly* as occasioned by a 'boylike' fear of losing face. The irony was in fact anticipated by the disjunct *of course* in line 3. This last example already illustrates the way in which adverbials can help shape a text's general structure. More directly in this connection, however, we have the adverbials relating to the consistency of the child's predicament throughout the whole *BC* period (cf 19.78) in which the narrative is placed. The text begins with the girl being 'endlessly troubled' and 'never ... persuaded'. It ends with her being 'more convinced than ever', and it is the narrator who is *no longer* the same. Between these two points, several adverbials sustain the theme of continuity in addition to their immediate contextual role: *usually* (line 8), *still more* (line 10), *as an added terror* (line 18), *as usual* (line 19), *still scared* (line 20).

Coordinate and subordinate clauses

- 19.81 The text comprises nearly fifty finite clauses, approximately half of which are independent. We begin with such an independent clause, and – disregarding this one, since by definition it cannot be linked to a preceding one – thereafter a majority of the independent clauses follow other clauses paratactically. The minority of independent clauses formally linked to preceding clauses (seven by *and*, two by *but*) thus present some contrast with the general pattern, and it is worth considering this briefly. As we saw in 19.5, asyndeton is open and uncommitted: there may be a quite intimate connection, and the very openness can fuel our expectations of more to come; for example, lines 5–6:

She sobbed; she was inconsolable; ...

On the other hand, the following part may be merely paratactic, comprising what is virtually a new topic. Compare the clause that begins line 12, or the sequence in line 22:

I was very glad I did. Near the school we came upon ...

By contrast, coordination with *and* or *but* is relatively committed, implying a very close connection, consequential in the case of *and*, contrastive in the case of *but*. Moreover, especially with *and*, we have the converse of asyndeton's openness in that there is an implied completeness with the *and*-member; it is of some interest that in a list of three or more items, all but the last will usually be uttered asyndetically, whereas the last is preceded by *and* (cf 13.1, 13.22ff, App III.11). These considerations are relevant in a straightforward way to the coordinated units linked by *and* in lines 4, 12, 14, 17, 25, and with specially striking force in line 27. But we need go no further than the opening sentence in the text (lines 1–2). The parts are not merely made to seem relevantly connected: they seem to have a completeness and finality about them – and this is then borne out by the text as a whole. Equally rightly, the sentence beginning '*Boylike ...*' (line 3) underscores the boy's detachment from his sister's troubles by being asyndetic.

The justification for the close but antithetic linkage in line 20 is obvious, but it is interesting to see how *but* endorses the *Reluctantly* with which the first member begins and is endorsed by the *since*-clause that follows. The need for *but* is just as clear in line 26. Despite the fact that *all was well* and the kitten was safe (which might have justified 'And therefore she was less afraid of dreams thereafter'), we are invited to reflect that the dog's attack has mirrored the attack by the dream monster so closely that the event has actually confirmed the child's fear of dreams. (It is to be noted that the initial *But* of line 26 is followed by significant address to the hearer/reader: *as you can imagine*.)

The fact that about half of the finite clauses in the text are subordinate might suggest that, unlike coordinate clauses, subordinate ones are so common as to call no attention to themselves. But we must distinguish subordination where the grammar gives us little or no choice from subordination available for deliberate selection. In the first category, we have clauses in verb complementation (cf 16.30ff), and there are more of these (seven) than of any other type of finite subordinate clause in the text: for example, *that they meant nothing* (line 2), *what she had been dreaming* (line 6). In the second category, we have primarily the five adverbial clauses, and we shall now look at some of these to note the effect that choice has had. In lines 8–9, there is the sequence:

... she seemed so ill that my parents decided she should stay at home.

Several alternatives were available. The two clauses could have been independent and asyndetic:

... she seemed (very) ill; my parents decided ...

independent and coordinated:

... she seemed (very) ill and my parents decided ...

independent but with an explicit conjunct:

... she seemed (very) ill; in consequence, my parents decided ...

It requires very little consideration to conclude that all of these alternative versions cause an undesirable severance between the two parts which are interdependently connected, just as the original version makes them seem. Moreover, this original version has another advantage: it alone injects the correlation between the degree of the illness and the decision to keep the girl from school.

19.82 Let us now look at the concessive adverbial clause in lines 17–18:

... only she had the power to save it. So although as an added terror the Monster had some terrifying power over her too, she begged to be allowed to go to school as usual.

Alternatives avoiding subordination are possible:

- (i) ... only she had the power to save it. So she begged to be allowed to go to school as usual. Yet as an added terror the Monster had some terrifying power over her too.
- (ii) ... only she had the power to save it. Yet as an added terror the Monster had some terrifying power over her too. Nonetheless, she begged to be allowed to go to school as usual.

The (ii) alternative is multiply unsatisfactory; it necessarily involves two concessive conjuncts, though the second cannot escape seeming like a desperate evasion of the obvious repetition, *yet*; and this version loses the resultative conjunct *so* which formed a logical link in the original. The (i) alternative is somewhat better than (ii), but in postponing the clause that has concessive meaning, the decisiveness of the original is lost and there is perhaps even an implication that the girl had second thoughts after begging to go to school. The original not merely avoids the defects of both (i) and (ii), but by interrupting the *so*-constituent and interposing the *although*-clause, it manages to capture the balancing of pro and con that preceded the girl's decisive and brave request.

Similar arguments hold for the use and position of the *since*-clause in lines 20–21. If it had been placed after, instead of within, the *that*-clause, the reason for the parents' insistence might have seemed relatively incidental.

The choice of a nonfinite clause in line 23 is also of interest. A different version with an independent clause might have seemed attractive in making the sequence less lengthy and clumsy:

Near the school we came upon another tearful youngster, her friend.
He was being frightened and harassed by a rather vicious dog that was jumping up ...

But this has the disadvantage of forcing a separation between the encounter with the boy and an account of what was happening to him. The version in the text is superior in that the use of the nonfinite clause (as a nonrestrictive postmodifier in a noun phrase of which *youngster* is head) has the effect of the narrator and his sister seeing the friend and the dog's attack as a single complex unit.

Information structure

- 19.83** Many of the features that we have been considering seem to have been selected by the narrator in order to place the semantic and prosodic climax of clauses where they would be most effective. Usually this has meant end focus (cf 18.11) in clauses, in the manner outlined in 19.12. One interesting instance of this is in line 7:

It had [obviously been a NIGHTMARE]

Here, end focus on what is undoubtedly a rhetorically satisfying item has been achieved even at the expense of a rather vague use of the subject pronoun *it* (cf 19.77).

In 19.79, it was noted that the above-average use of the passive had the effect of drawing attention to the 'affected' status of the central character. But undoubtedly the passive has a much stronger role in information processing. In the opening sentence, there are two textually important noun phrases, both of them indefinite: *one of my sisters* and *bad dreams*. In principle, either could have been thematic and either rhematic: both are equally 'new' and both are very much the concern of the narrative as a whole in that the narrator wishes us to know more about the little girl as well as to consider the nature of dreams. But he rightly makes *one of my sisters* thematic (anyone may have sisters; bad dreams are more newsworthy), and his choice of phrasing, in contrast to *a sister of mine*, has the effect of implying that the hearer/reader already knew he had sisters. Though this choice of theme causes the selection of the relatively marked voice, the passive has the advantage not only of reaching an informational climax with *bad dreams* but of setting the tone from the outset in respect of the girl as 'affected'. In this instance, the passive has focused attention on the agent. Elsewhere, the passive has enabled the narrator to compress information by leaving the agency unspecified; eg lines 2, 6, 10. But although the narrator clearly finds the passive useful, there are equally noteworthy examples of its absence. In line 9, we have

Yet this upset her still more.

The subject of the immediately preceding clause is *she* and it would have been easy to have retained *she* as the next subject:

Yet she was still more upset by this.

But informationally this is inferior, ending as it does with a 'given' item (*this*) where the original ends with the degree adverbial, intensified by *still*.

- 19.84** Care in organizing information can also be seen in noun-phrase structures (cf 17.2ff). In several instances, we have genitive premodifiers which provide needed information but which allow prosodic focus upon the head:

this boy's parents (line 12)
the day's classes (line 15)
my sister's dream (line 15)
the kitten's life (line 17)
my sister's help (line 25)

Alternatives with postmodification (as in *the parents of this boy; classes for the day; the life of the kitten*) might have caused the focus to shift to the final item as in:

the 'life of the "kitten

or at best have meant the focus being followed by anticlimactic afterthought:

the 'life of the 'kitten

A noteworthy resource in disposing information units is the use of initial 'scene-setting' adverbials (cf 8.15), as in:

As a child . . . (line 1)
On one occasion . . . (line 3)
By breakfast time . . . (line 8)
In my sister's dream . . . (line 15)
Reluctantly . . . (line 19)
Near the school . . . (line 22)

The information in such phrases is of sufficient weight to require an intonation nucleus, but as clause-initial the nucleus will normally be realized by a rise or fall-rise (cf App II.15f), thus both creating an expectation and forward-looking momentum, and also subordinating the information of these phrases to that of the clause rhemes that follow:

[As a CHILD] . . . by 'bad DRÉAMS]

One sentence beginning with such an adverbial merits further attention. After *Near the school* in line 22, we have a verb phrase with notably low semantic content; (*we came upon* is little more than a presentative device (cf 18.49) to introduce the focal point of the sentence: the friend in the course of being attacked. For reasons explored in 19.82, this focal point is presented as a single complex noun phrase with nonrestrictive postmodification. The postmodification itself makes use of a (nonfinite) passive, enabling rhematic weight to be given to the dog and at the same time structurally freeing this part of the nonfinite clause to accept its own postmodification in the form of a relative clause (*that was jumping . . .*).

Even our rather lengthy account of textual features (cf 19.70ff) has ignored several significant factors, such as modality (*should stay*, line 9; *accompany*, line 21; etc), and the connective role of adjectives such as *worse* in line 7, *added* in line 18. This very incompleteness of treatment, however, is a reminder of the indefinite complexity to be found in textual structure. We trust that the description offered and the points made will have demonstrated both this complexity and also the way in which grammatical features complement each other in conferring textual unity and in achieving a satisfying presentation.

Note The intensifier *still* functions in the text as a focusing subjunct ('even'). The part played in highlighting information by means of focusing items should be noted elsewhere in the text too: *even* (line 6); *only* (line 17); *too* (line 18).

Further illustrative texts

A personal letter

19.85 The following is the text of a handwritten letter from a middle-aged man to express thanks for hospitality. We reproduce the punctuation, capitalization etc, and we represent in *italic* what was underlined in the original.

Dear Phyllis and Bob

You really are the most marvellous of people. And the most charming of *hosts*. And the most enviable of *families*.

Since of course envy is prominent among the Deadly Seven, you severely jeopardize my immortal soul every time you admit me to that unbelievably delightful family circle of yours. On the other hand, the Faust in me fully recognizes that your parties do wonders for my *body*!

So, my sincerest thanks for yet another generous helping of good company, good talk, good drink, and good food. And may the New Year smile on your blessedly beautiful clan.

Yours ever
Jack

Note [a] The text depends upon two allusions: one to the Catholic Christian concept of there being Seven Deadly Sins, the other to the story of Faust who sold his soul to the Devil in return for temporal gain.
[b] The triadic structure of the first paragraph is made to seem spontaneous as well as weighty by the separate sentences and repeated coordinators, but the underlining of *hosts* and *families* as subsets of 'people' shows that the triad derives in fact from a bifurcation of the first part.
[c] There is a lexical link to the second paragraph, turning upon *enviable* (lightly used as a courteous compliment) and *envy* (ironically serious), the transition indicated by the concessive force of the conjunct *of course* in line 5; the second paragraph then moves from the joking mention of *soul* to *body*, ironically underlined as the more relevant in the context of good entertainment.
[d] The conjunct *so* (made weightier by the comma) links the second and third paragraph, returning to the main point of the first and of the letter as a whole. The expression 'generous helping' (line 13) is appropriate since it implies its normal use ('a generous helping of food'), justifying *food* being the last and climactic item in the coordinate string that follows.
[e] The phrase *your parties* (line 10) is a discourse reference (cf 19.46ff) to 'every time . . . circle of yours' (lines 7-9).
[f] The sequence in line 1 is conventional: *clan* in line 16 is a lexical variant on *family* (lines 3, 8), preceded by an alliterative premodifying phrase.
[g] The absence of punctuation at the opening and conclusion is informal and idiosyncratic.

Some paragraphs on food

19.86 This excerpt of a chapter on olives is from a book on cuisine written by a middle-aged woman for the nonspecialized family reader.

Before the war olives were imported in casks in the brine in which they were cured, and then packed on arrival into jars, which made them expensive. But the enormous increase during the last few years in the number of delicatessen shops throughout the country, and of delicatessen departments even in orthodox grocers' shops and supermarkets, means 5 that nowadays we buy the larger part of our olive imports loose, which makes them much cheaper, usually about half the price.

You can buy olives of every shape and size like this – big green ones with a bite to them; little ones stuffed with pimento or anchovy, hazelnuts or onion; smooth, shiny, bitter black olives, and the crinkly, 10 soft, fleshy ones; olives large and small, pointed or round, olives of every shade of green, brown, purple and black, and in flavour mild, sharp – or downright bitter like the special, and expensive, cracked olives from Cyprus.

In fact, the only olives you can't buy loose are the exquisite and 15 expensive little *kalamata* olives from Greece, which are packed in oil and vinegar after curing, sharply incised down one side to allow this marinade to penetrate. These, considered by olive fanciers to be the finest of all, are only to be found in cans.

(Margaret Costa *Margaret Costa's Four Seasons Cookery Book* London: Sphere 1972)

- Note [a] There is a three-fold temporal transition in the first paragraph: the thematic adjunct *Before the war* (line 1), the durational postmodifier *during ... years* (line 3), and then – matching line 1 – an *I*-placed *nowadays* in line 6. The main contrast in time is indicated by the *But*-sentence.
- [b] There are two relative clauses with a very short subject (*olives*, line 1), the second has an exceptionally long one, *the ... increase ... supermarkets* (lines 3–5).
- [c] Whereas the first sentence has a very short subject (*olives*, line 1), the second has an exceptionally long one, *the ... increase ... supermarkets* (lines 3–5).
- [d] The second paragraph is linked to the first by *like this* (line 8) which relates to *loose* (line 6), the third to the second by the contrast between *you can't buy loose* (line 15) and *You can buy (loose)* in line 8.
- [e] A number of passives occur, describing the fact but conveniently ignoring the agent: *cf* lines 1, 2, 9, 16, 17, 19; there is one instance where the agent is expressed (line 18) and where the passive allows this to be highlighted as well as permitting the clause to be nonfinite. Contrast 'These, which olive fanciers consider to be ...'
- [f] Participant involvement is expressed by the inclusive *we* (line 6) and rather informally by *you* (lines 8 and 15) which is probably addressed to the reader rather than being the still more informal indefinite (= 'one').
- [g] Punctuation has an informal touch as well; the dash in line 8 heralds the long appositive list that takes up the rest of the paragraph, and another within this list preceding the climactic third of a triad of properties (line 13).
- [h] The lexical item *olive* is used repeatedly, as a deliberate emblem of the profusion which is the subject matter of the second paragraph. Variety is provided (and indeed it is variety of olives that is being described), not only by the choice of lexical items describing the olives but by the varied syntax – notably the switch from premodifying triads of lines 10f to the postmodifying pairs in lines 11f.
- [i] In lines 17–18, *this marinade* is interesting in being anaphoric, hypernymic (*cf* 19.24), yet tactfully informative: the reader is in effect told that 'oil and vinegar function as a marinade'.

From a formal speech

- 19.87 The remaining samples are from unscripted spoken texts filed in the Survey of English Usage archive. The transcription has been simplified and the

material slightly abbreviated and edited (*eg* by omitting hesitation noises and syllable repetition) in order to make the excerpts more quickly and easily assimilable. We begin with the opening of an after-dinner speech (SEU S.11.2) to a large and distinguished gathering by the head of an institution (a man of about 60). Though prepared (in the sense that the content in general terms was thought out in advance), the speech was unscripted.

It's a [very CÚRIOUS speech I've got to make]
I remember last YÉAR| [when I SPÓKE on this
occÁsion| [sÁYing| that it was| really
a [very sig|NÍficant 'year this| because
it was the [year in which I didn't really have
to 'talk about 'Fínance| – we| had got

what we did in the " [fírst term| the [sÉcond TÉRM| of
[course we spent our [WHÓLE time| [making plans for
qcon" [TRÁction| q – be|cause of course the whole economic
CLÍmate| [had / totally CHÁNGED| /

m ... m: spoken with narrow pitch range

q ... q: spoken breathily

f ... f: spoken loudly

- Note [a] Among the prosodic points of interest, attention might be drawn to the higher proportion of tone units ending with a rise (two dozen) than of those ending with a fall (one dozen). This is in sharp contrast to the two informal conversations of 19.88–9 (and to linguistic usage in general, where falling nuclei are more than twice as frequent as all other types added together; *cf* App II.17). The high ratio of rises is partly a function of personal style and partly a function of the style determined by the occasion: the need to make one's voice carry in a large company, the need to give the impression of inviting the audience's interest (*cf*: *well*, line 15) and of not seeming dogmatic. In part, however, the distribution reflects the general rhetorical structure of the 'prosodic paragraph'. Up to line 15, the speaker is talking about the assumptions on which past planning had been based: from line 16, we are told of the way in which the assumptions proved baseless; things have turned out *differently* (line 16) because the economy had *changed*

(line 28), and the two quoted items significantly have falling nuclei. In this connection, note that the initial tone unit has a rising nucleus on *curious*; in line 17, we are reminded of this opening by the use again of *curious*, again carrying a nucleus despite its nonfinal and indeed premodifying status; but this time the nucleus is a fall. But even the second part, dealing with the change of fortunes, again postpones the critical conclusion by interposing a section on preparations (lines 18–24) that turned out to be wasted. And within the individual sections of each part, the pattern is to have a sequence of rises and fall-rises followed by a definitive fall. Note such falls at *finance* (line 6), *pounds* (15), *government* (23), *first* (25), *contraction* (27).

[b] We have mentioned in [a] that the *prosody* in part reflects the oratorical occasion. The style in question is commonly characterized by rather frequent and heavy nuclei, giving a distinctly deliberative impression to the succession of phrases: cf lines 19–20. The occasional unexpected nucleus is to be similarly explained; *spoke* (line 2), *saying* (3), *given* (23), above all *government* (23), for example. The level nucleus (on *directions*, line 24) is also characteristic of public speaking: it suggests an indefinitely long list, though in fact only one specific item is mentioned (the increase in student numbers).

[c] There is an interesting use of prosody to link and to contrast the three noun phrases with *term* as head (lines 18 and 25); in the formal reminder of the enumerative series, cf lines 23–26 in 19.90 where the prosodic contrast is similar. Note, however, the booster on *first* (25) and at other emotionally emphatic points (lines 4 and 26, for example).

[d] While the prosody is redolent of public speaking, the grammar seems to be almost self-consciously informal: the modal *got* (line 1) and perhaps especially the postposed appositive and identificatory *this* in line 4 (cf 18.59). The fact that the appositive is used offhandedly and not as genuinely emphatic, still less contrastive, is shown by its having less stress than the preceding noun head *year*. Compare:

He's an [odd CHÁP] [BÓHN] not a [bit like his BRÓTHÉR]

Informality is shown also by subjunct and conjunct usage (*really*, lines 3, 5; *well*, line 15; *of course*, lines 15, 25f, 27). A certain vagueness in syntactic relationship results from grammatical informality being used with the somewhat exaggerated prosody of oratory. Thus in line 6, *we had got* is merely existential, *come along* (lines 7f) is again existential (but also resultative), *the whole idea* (line 8) is an informal quantifier of purpose; in consequence, a short paraphrase of lines 6–9 might be 'The purpose of our development programme was to implement the Todd Report'; we might expect this to have two nuclei, one at *development programme*, the other at *Todd Report*, the only two informationally important points.

There is some vagueness too in the complementation of *we spent our time* (lines 19–20) by reason of two interposed tone units, though the prolonged silent hesitation (--) in line 21 warns us of the point at which complementation begins (*in getting agreement*).

Conversation among friends

- 19.88 A is a man, B a woman; both aged between 25 and 30 (SEU: S.2.13). The material is entirely unscripted and spontaneous.

A: [he's quite a good GUY] and [I'm on quite good
TÈRMS with him]
B: [YÉAH]
A: and I'm [sure I can DÓ him] for a [couple of weeks
of unlicensed LÉAVE] 5
B: I [THÍNK] [most people coming back off CÓURSES] [CÀN]
A: [M] [SÓ] I [should be able to get at least THRÉE
weeks]
B: [M] [M] – [WÉLL] we could [have anÓTHÉR 10
'holiday]
A: [M]
B: because [i shall have two weeks left] [TÓO]
A: I [rather fancy going down the LÓIRE] – [year after NÉXT]
B: [year after NÉXT]

A: [no NÉXT year] – [NÉXT year] – [YÉS] – for a [WÉEK] 15
B: [speaking to a third person present] [Kevin's a great PLÁNNER]
he [has to have everything done in great DÉTAIL] before
he'll embÁRK on anything [you SÍE] [hence his
absolute "HÓRROR" when [we got ready to go to FRÁNCE]
and I [suddenly RÉALIZED] that in [all our great 20
PLÁNNING] [I had taken down my little tin NÓX] to
my [MÚMMY] to [look ÁFTER] and I'd [PÁCKED it]
[all full of all GÓODIES] that [we couldn't leave
behind in the FLÁT] including the car [LOGbook]
so we [had to make a SPÉCIAL "and the Áutoroute"] 25
so we [had to make a SPÉCIAL TRÍP] [down to
↑ÉPSOM] to collect the bloody THÍNG] when we were [off
on our way to ↑FRÁNCE]

- Note [a] In view of what was said in 19.64f, we draw attention to B's confirmatory *yeah* (line 3), *m* (9), *A's m* (11). By contrast, A's rise on *m* (7) is relatively interrogative ('Is that what you think?'), as is B's more sharply questioning repetition in line 14, answered by A correcting himself at once. A's third tone unit in line 15 (*yes*) is partly a final confirmation that B was right to question him, partly an indication that what follows can resume the interrupted statement: 'I rather fancy going down the Loire (next year) for a week'. In line 18, B involves a third participant with *you see*. Conveying excitement helps to involve another participant, and we note the boosters at *horror* (19), *Epsom* (27), *France* (28); this last being in ironic parallel to *Epsom*.
[b] Informality is shown by lexical items (*guy* in line 1, *do* in 4, *Mummy* in 22, *goodies* in 23, *bloody* in 27, etc), by grammatical features like omission of article (*year after next*, 13), zero subordinator in nominal clauses (4, 6 – but with *that* in line 20 where *realized* ... *I had taken* is interrupted by an adverbial).
[c] Among other aspects of informality are the clear signs of unworried spontaneity. For example, the repeated *all* in line 23, resulting in a loose phrasing that the speaker might have intended to be 'all full of the goodies' or 'full of all the goodies'. Again, the anacoluthon in line 25 necessitated by B's remembering to mention the autoroute document which in turn makes her recapitulate the interrupted clause in line 26.
[d] The downtoners (*quite* twice in line 1, *rather* 13) and intensifying items (*great* 16, *absolute* 19, *bloody* 27) characterize conversation that is both informal and intimate. Note that *great* (*planner*) in 16 means 'enthusiastic' but *great* (*detail*) in 17 means 'minute'; *great* *planning* in 20f is an ironic lexical link with line 16 but this time uses *great* more in the sense of 'large-scale'. The expectation that an intimate companion sympathetically makes the semantic shifts enables a speaker to dispense with the search for the *mot juste*.

Telephone conversation

- 19.89 A and B are husband and wife respectively, both aged between 60 and 65 (SEU: S.7.2d). As in 19.88, the material is entirely unscripted and spontaneous.

B: [Listen] [Mother's CLÓCK] is [running ↑quarter
of an hour SLÓW] I've [slightly moved it to a faster
PÓZITION] but [how do I move the HÁNDs] does
[that FÁCE] [spring ÓFF]
A: [NÓ] [NÓ] you [look on the BÁCK] 5
B: the [three little brown SCRÉW things]
A: [no NÓ] if [you just [which clock do you
MÉAN] the eLÉCTric one]
B: the eLÉCTric [YÉAH]

- A: [wÉLL] you [unHÓOK it] 10
 B: [YÉS] I've [done TITÁt] and I've [moved it to slightly to a †fast pÓsition]
 A: to a †FÁSt position]
 B: [YÉS] because it's q^aLÓsing q a quarter of an HÓUR] 15
 A: [YÉAH] [but †if you want to ††RÉgulate it]
 B: [I've ††RÉgulated it] m I [want to 'move the q^aHÁnds]mq
 A: [wÉll there's a †KNÓB] I [can't sort of remember exÁctly] but it's 20
 B: [s there a knob]
 A: [wÉLL] there's [obviously †SÓME means of DÓing it] you [don't have to take the FRÓnt off]
 B: [ÓH] I [haven't been able to locÁTE the KNÓB] [òk] I'll [have a closer LÓOK]

q . . . q: falsetto

m . . . m: spoken with 'spiky' rhythm

- Note [a] Prosody is used to make *Mother's clock* in line 1 both new (as though it were predicative) and also the subject of a sentence. B uses a high booster in line 16 to justify the lexical repetition in the context of A's apparent obtuseness. Note also the boosters at *if* (15), *knob* (18), *some* (21). Excited emphasis is conveyed also by falsetto voice in lines 14 and 17, and by an impatiently 'spiky' rhythm in 16f. 'New' and 'given' are clearly polarized by prosody in lines 18 and 20: in the former *knob* has a nucleus, in the latter it has not.
 [b] Informal approximations are expressed in *things* (6) ['things like screws'], *sort of* . . . *exactly* (18f), *just* (7). Other aspects of informality include the transitivity of *does that face spring off?* (3f), meaning 'Is one supposed to be able to make the face spring off?'; the anacoluthon in line 7 as A wonders if he has the right clock in mind; A's repetition of the prepositional phrase (13), with shift of nucleus to show his uncomprehending surprise; the equivocal use of *you* (5, 10, 22) between reference to B and indefinite reference (in line 7, the first *you* is equivocal, the second obviously refers to B). B's *How do I move the hands* exemplifies a use of *I* which is comparably equivocal between 1st person and indefinite (cf 6.2ff) as well as an informal obligational modality (cf 4.49). The question is equivalent to 'How is one to move the hands?'
 [c] A begins with *well* three times: the first and second (lines 10 and 18) indicate that he has understood and is beginning a confident reply, but the former is made more deliberate and attention-seeking by occupying a tone unit; the third (21) is almost the converse, 'I don't care WHAT you say' and its forceful dismissiveness is emphasized by its having a separate tone unit.
 [d] B's peremptory-sounding imperative *Listen* (line 1) is used between friends as an indication that the speaker has something interesting or urgent to say; it is not accompanied by *please* in this usage.

Leaving a recorded message

- 19.90 A and B are conscious of being strangers to the person who will eventually listen to the recorded message; C seems to be very familiar with the office he is telephoning. All the speakers are men, ranging in age between 30 and 50 (SEU: S.9.3), and it is likely that their messages are prepared, perhaps with written notes on what they intend to say.

A: my [NÁME] is [GRÀNGE] [g r a n g É] [ÁND]
 I'm [speaking from †National GÁS Board] we've [got a de†VÉLopment department] in [HÁRlow] the [telephone NÚMBER] is [two four séVEN] – [two

four double FÓUR] [and my enQUIRY] concerns 5
 the †Greek word for †SCIENCE] – [this is a QÜESTion] that [we have been asked HÉRÉ] [none of us in this room being Greek SCHÓlars] [know the †ANSwer]

B: my [name is WaddÉLL] [Wadash SCHÓOL] I [want to contact Mister †VÍALing] – I will [phone a †GÁIN] between 10
 [two †TÉN] m and [two †TWÉNTY] m – if I [fail to get him THÉN] I'll [phone aGÁIN] m' [just after three forty †FIVE] m' [if it's unlikely that Mister Vialing will be †THÉRÉ] but could [leave a MÉSSage] could [he †THÉRÉ] [PHÓNE] [WÁDash] – [DÓUBLE] [nine four one TWÓ] which is the SCHÓOL 15
 number] [or in the †ÉVENing] [double seven two nine ÉIGHT] – aGÁIN a [Wadash NÚMBER] which is my [PÉRsonal number] and . . .

m . . . m: speaker uses a very precise articulation

m' . . . m': spoken in a regular rhythm

C: [this is sÍMON m Lessin SPÉAKing] [m] [good MÓRNING] 20
 [ró you] I [have a number of QUÉRIES] of [different KÍNDs] [to which I would †very much like the ÁNSwer] [if you could GÍVE it 'to me] [over the TÉLEphone] [late this MÓRNING] – [first of ÁLL] [some †small aca†DÉMIC QUÉRIES] – [is the SPÉLLing] – [on the TÍTLE] [u c i l] [or is it I u †c i] [DÓUBLE i] – [that is the FÍRSt point] 25
 – [NÓW] the [SÉcond one] [s] [I would †like to have the PÁGE RÉFERENCE] [from †LÁsky's] [HÍStory] of Greek LÍterature] [where he †talks about a character called m'ÁRÍstón] m . . .

m . . . m: speaker articulates slowly

- Note [a] The peculiar features of a medium in which there can be no reaction from the addressee are the main reason for the relative formality and careful articulation in these samples as compared with those in 19.87–89. This is less obvious in the case of C who apparently knows from experience the degree of clarity attained by the machine and who doubtless knows the actual person who will listen to the recording in due course. But even C seems to avoid using contracted forms (*I have* in 20, *I would* in 21 and 26, *that is* in 25), and we notice the uncolloquial syntax of line 21. A is especially cautious in speech, and it is doubtless this that leads him to make a tone unit of his introductory subject *my name*. With *my enquiry* (line 5), compare what was said about *Mother's clock* in 19.89 Note [a].
 [b] In both A's and B's messages telephone numbers are given: the prosodic phrasing in the former is usual with the widespread seven-digit phone numbers. Both speakers follow the common British habit of reading a sequence like '22' as 'double 2', '222' as '2 double 2'.
 [c] A's message ends with a syntactically muddled construction, involving a blend:
 Not being Greek scholars, none of us know(s) . . .
 None of us being Greek scholars, we do not know . . . } (cf 15.58ff)
 There is confusion of a more pragmatic kind in B's recording. Presumably the *message* (line 14) is to the effect that Mr Vialing should telephone B (lines 15ff), but this is a message for Mr Vialing, not one that B wishes Vialing to 'leave' for B. Even C seems to find the medium uncongenial and one might suspect that there is some confusion in his prosody. For example, the treatment of *to you* in line 20 is odd both in occupying a separate tone unit and in having a nucleus (especially, perhaps, a rising one) on the preposition. Again, putting a nucleus on the

first name (19), when the surname is also given, would normally suggest that there might be confusion with someone else of the same surname. Alternatively, we might suspect that 'Lessin' was added as an afterthought: perhaps it would turn out that it was not his usual colleague who would listen to the recording. (In fact, inspection of other recordings by the same speaker showed that it was a personal idiosyncrasy, frequently recurring.)

[d] The use of demonstratives and locative pro-forms is normal in telephoning: *this* and *here* referring to the speaker and his location (cf lines 7, 19), *that* and *there* to the addressee and his location (cf line 13, though it happens that our excerpts include no instance of *that*). But cf 19.64 Note [b].

Introduction

Grammar and lexicology

1.1 Both grammar and lexicology involve us in an indefinitely large number of superficially different units. In the case of grammar these are phrases, clauses, and sentences; in the case of lexicology the units are words, or more precisely (since some of the units comprise more than one word) *lexical items*. It is typical of grammar to make general and abstract statements about the units concerned, showing a common construction despite the formal differences. It is typical of lexicology to make specific statements about individual units. In consequence, while the grammar of a language is best handled in chapters devoted to different types of construction, it is normal to deal with the lexicon of a language in an alphabetic dictionary, each entry devoted to a different lexical item.

But there is an area in which grammar and lexicology share a common ground: where generalizations, as in grammar, are appropriate; but where the idiosyncrasies of individual units are also described. This area is word-formation. There are regularities of a similar nature in grammar and word-formation, and there are cases in which the two sets of regularities are directly connected. Consider the following (and cf 17.51ff):

[A]	[B]	
She <i>delegated</i> the work <i>speedily</i> .	Her <i>delegation</i> of the work was <i>speedy</i> .	[1]
He <i>communicated</i> the message <i>efficiently</i> .	His <i>communication</i> of the message was <i>efficient</i> .	[2]
They <i>fumigated</i> the house <i>thoroughly</i> .	Their <i>fumigation</i> of the house was <i>thorough</i> .	[3]

First the vertical dimension. The two columns exemplify the regularities of grammar, [A] with its three SVOA structures, [B] with its three SVC structures with S realized in each by a noun phrase having a genitive determiner and an *of*-phrase postmodifier. But the columns also illustrate the regularities of word-formation; in [A] the three verbs in *-ate* and the adverbs in *-ly*; in [B] the three nouns in *-ation*.

Next, the horizontal dimension. To grammar is referable the correspondence between *she* and *her* in [1], *he* and *his* in [2], *they* and *their* in [3], and the fact that we have adverbs in [A] but adjectives in [B]. But to word-formation are referable the form of the correspondence between the transitive *-ate* verbs in [A] and the abstract *-ation* nouns in [B], as well as the form of the correspondence between the adjectives in [B] and the adverbs in [A].

In proceeding to lengthen the columns, however, we would soon find that the regularities of word-formation are more limited in application than those of grammar:

She <i>used</i> the money <i>well</i> .	Her <i>use</i> of the money was <i>good</i> .
She <i>used up</i> the money <i>fast</i> .	Her <i>using up</i> of the money was <i>fast</i> .
He <i>rearranged</i> the furniture <i>with difficulty</i> .	His <i>rearrangement</i> of the furniture was <i>difficult</i> .

They dismissed his objections
in a hostile manner.

Their dismissal of his objections
was hostile.

These examples remind us that the products of word-formation are subject to the idiosyncrasies inherent in the lexicon, whereas the rules of grammar are far broader, transcending the individualities and unpredictabilities of the lexical items which the grammatical rules manipulate. Thus grammar can actually predict the basic synonymy of [4], [5], and [6]:

- John gave Peter the money. [4]
John gave the money to Peter. [5]
The money was given to Peter by John. [6]

But only our knowledge of individual lexical items enables us to equate [7] and [8] with [4-6], as well as with each other:

- John donated the money to Peter. [7]
Peter received the money from John. [8]

Again, grammar will predict the antonymy of [9] and [10] but not that of [9] and [11]:

- Mary felt happy. [9]
Mary didn't feel happy. [10]
Mary felt miserable. [11]

In studying word-formation, we seek to transcend the individuality of items that is typical of the lexicon as a whole and set out the very widespread regularities that make the constitution and grammatical distribution of one word similar to those of another.

The constituents of word-formation

- 1.2 To the native speaker, many words have an obvious internal structure. With *blackbird* and *monkey-like*, we can see that each word comprises parts that occur elsewhere in the language with the same meaning (*blackboard* and *ladylike*, for example). We shall refer to such items as COMPLEX words, in contrast to those words – long or short – which to the native speaker have to be learnt as arbitrarily contrived units, with no recognizable parts: *cat* or *rhinoceros*.

Superficially, a complex word like *depolarization* looks like a simple linear string of items:

de + pol(e) + ar + iz(e) + ation

consisting of the WORD *pole* with AFFIXES which may precede (PREFIXES) or follow (SUFFIXES). But some complex words are not analysable into words plus affixes:

jealous = jeal- + -ous
pious = pi- + -ous
(contrast *desirous* = desire + -ous)

To capture what is common to *pole*, *desire*, *jeal-* and *pi-*, therefore, we obviously cannot use 'word' and we shall speak instead of STEM (cf 2.4). We

can then say that the stems *desire* and *jeal-* combine with the affix *-ous* to yield the adjectives. But a further distinction is necessary, as this is inadequate when we want to describe *depolarization*, since if we said that the affixes *de-*, *-ar-*, *-ize-*, and *-ation* are combined with the stem, this might imply that *de-* can combine with *pole* or *polar* to yield the words **depole*, **depolar*. In fact, it is with the verb *polarize* or the deverbal noun *polarization* that *de-* can combine. We need to distinguish a unit that may be neither STEM nor word but of which we can say that it is with this unit that a particular affix is combined. We shall call this unit the BASE.

We can now make analogous statements like the following:

jealous = base *jeal-* + affix *-ous*

[the base here is identical with the stem, but neither is a word in English]

polarize = base *polar* + affix *-ize*

depolarize = affix *de-* + base *polarize*

[the base here is not identical with the stem in either case, the stem being *pole*; but both the bases and the stem are English words]

(be)spectacled ['wearing spectacles'] = base *spectacle-* + affix *-ed*

[here the base is identical with the stem, but although the word *spectacle* exists in English it is only the stem of the plural *spectacles* that constitutes the base in *spectacled*.]

The STEM is thus the form of a word stripped of all affixes that are recognizable as such in English; eg: *man*, *person*, *apply*, *abattoir*, *rhinoceros*. But with a large number of words there can be debate as to what the stem is in this sense. If *abattoir* is a stem, despite the existence in English of *reservoir* (with an identical ending, both words referring to physical constructions), how should we regard *reservoir* itself? Should we regard it as having a stem identical with the word *reserve*? Again, should we relate *reserve*, *preserve*, *deserve* as having a common stem, perhaps seeing this as identical with the verb *serve*?

Various arguments come into play: etymological, semantic, even phonological. We note, for instance, that the *s* in *reserve* is pronounced /z/, where that in *serve* is pronounced /s/. The more indications there are of the remoteness of connection between one word and another, as perceived by the native speaker, the more we must be influenced to regard polysyllabic words like *reservoir* and *reserve*, *deceive* and *conceive* as individual stems. The obverse is actual productivity (cf App I.13): where, beside *depolarize*, we find new words being currently created such as *decompress* and *deregulate*, the *de-* element having a similar relation in each, we know that we are not dealing with isolated polysyllabic stems but with complex words.

Note [a] Reference has been made to 'the native speaker', but native speakers themselves vary widely in their apprehension of stems and affixes. To the layman, *rhinoplasty* ['plastic surgery of the nose'] is as unanalysable as *rhinoceros*, but not to the medical scientist. Recent coinages by philosophers (*illocutionary*, *perlocutionary*) show that, for some speakers of English, an affix like *per-* is readily enough seen as manipulable in a formation and that *locutionary* is a base in such words.

[b] As we saw in 2.3ff, in some linguistic descriptions the minimal unit in morphology and word-formation is called 'morpheme', with the further distinctions 'inflectional morpheme' (eg plural

-s), 'free morpheme' or 'minimal free form' (eg: *pole*), 'bound morpheme' (eg: *un-*, *jeal-*), with the latter necessarily further subdivided between 'affixal morpheme' (eg: *un-*) and 'stem morpheme' (or 'root' or 'lexical morpheme', eg: *jeal-*). What we are calling *BASE* might in this framework be termed 'base morpheme'. It should be noted that linguists differ in their terminology for these distinctions, some reversing our use of *STEM* and *BASE*, others using 'root' for what in this book is called 'stem'.

Word-formation processes

- 1.3 There are four main types of word-formation, the first two of which can be referred to as 'affixation':

- [A] PREFIXATION: putting a prefix in front of the base, sometimes with, but more usually without, a change of word class; eg: *pre* + *determine* (cf App I.20ff).
- [B] SUFFIXATION: putting a suffix after the base, sometimes without, but more usually with, a change of word class; eg: *friend* + *less* (cf App I.31ff).
- [C] CONVERSION: assigning the base to a different word class with no change of form; eg: (*we shall*) *carpet* (*the room*) – verb from noun (cf App I.43ff).
- [D] COMPOUNDING: adding one base to another, such that usually the one placed in front in some sense subcategorizes the one that follows; eg: *blackbird*, *armchair*, *bottle-feed* (cf App I.57ff); but contrast, for example, 'bahuvrihi' compounds (cf App I.67) such as *heavyweight*.

Showing some similarities with [A] and [D], but fitting neatly into neither, is derivation by COMBINING FORMS such as *psycho-*, *Anglo-*, *socio-*, *vice-*. These have the semantic characteristics of the first constituent in a compound but they resemble prefixes in mostly (cf App I.32, App I.66) being obligatorily initial, in having little or no currency as separate words, and in not normally being the stressed part of a COMPLEX WORD (*psycho-therapy*), by which we mean not merely polysyllabic words but words comprising constituents that are recognizable as such to native speakers.

Constituents in complex words are sometimes identical in form with bases but yet resemble affixes in certain respects so that it is not always easy to justify regarding the resultant words as compounds. For example, *input*, *output*, *sit-in* (n), *drop-out* (n), *childlike* have components formally and functionally resembling separate items in corresponding phrases ('they put the data in', 'he dropped out of college', 'he is like a child') that make them like compounds. On the other hand, the items *in-*, *-like*, etc. have the type of wide distribution and nonlexical character that is typical of affixes. Given the historical fact that *-like* is cognate with the indisputably affixal *-ly* and the synchronic fact that *-ful* (with spelling difference) is closer in function to the adjective *full* in *cupful* (cf: *a full cup*) than in *eventful* (different in sound as well), it seems clear that the distinction is gradient rather than absolute. A certain amount of arbitrary assignment is therefore inevitable in the descriptive tables that constitute the body of this Appendix.

This is borne out by another borderline example, *-man*, as in *policeman*. Though the spelling suggests identity with the base *man*, the pronunciation suggests otherwise: /mən/ (contrast /mæn/ in *ice-man*, *ape-man*, which seem more obviously to be compounds). Moreover, despite etymology, spelling,

and inflection, *-man* (*-men*) in *woman* can no longer be regarded as even affixal: *woman* is itself a base. Yet, in response to sociopolitical pressures in recent years, we have come to recognize *-man* in *policeman*, *chairman*, etc (but not in *woman* itself) as effectively the base *man* and hence challenged for replacement by the sex-neutral *-person* (cf App I.64, 5.105).

Word-formation processes, as we saw already in App I.1, involve formal and semantic analogy. A pattern or paradigm of similar items becomes established, and to this pattern new coinings conform. On the basis of *psychotherapy* and *physiotherapy*, we could have a newly derived word *x-otherapy* which would mean 'treatment by means of *x*', where *x* would be filled by the name of the new treatment. DERIVATION, often used by linguists to mean only formation by the addition of affixes, is used in this book to embrace all the processes by which a new formation comes into existence, but clearly those that follow recognizable patterns are central to our concern as they are central to word-formation itself.

In numerous cases, word-formation rules (especially in suffixation) apply only to items of specific derivation. We shall find it convenient, therefore, to speak of DENOMINAL, DEVERBAL etc, so that DEVERBAL (nouns) will mean '(nouns) derived from verbs'. The term DEVERBAL applied to nouns is not synonymous with the term VERBAL NOUN which we use only for the 'gerund' class of nouns in *-ing* (cf further 17.52ff). On the distinction between inflectional and derivational suffixes, cf App I.31 Note.

- 1.4 We saw in 17.157 that the overt arrangement of a noun phrase having more than two constituents may express two quite different structures:

a local cookery class	
either = a [[local cookery] class]	[1]
or = a [local [cookery class]]	[2]

In [1] we are concerned with teaching about regional cuisine; in [2] with a cookery class taking place nearby. Since it is bases and not stems that enter into word-formation, whether by affixation or compounding, and since the bases themselves may have been produced by affixation or compounding, the linear form of a complex word may conceal alternative structures similar to those in [1] and [2]. Contrast (*an*) *ex-film star* and (*a*) *silent-film star*:

[ex-[film star]]	'a former star in films'
[[silent-film] star]	'a star in silent films'

Again, in the sentence 'The robber was *unmasked*', the final word may have one of two quite different structures:

[un[[mask]ed]]

ie 'he was not wearing a mask', negative *un-* (cf App I.21), with noun *mask* + *-ed* (cf App I.38); or

[[unmask]ed]

ie 'someone removed his mask', privative *un-* (cf App I.22), in the verb *unmask*, with *-ed* participle.

Word-formation rules

- 1.5 A rule of word-formation usually differs from a syntactic rule in one important respect: it is of limited productivity, in the sense that not all words which result from the application of the rule are acceptable; they are freely acceptable only when they have gained an institutional currency in the language. Thus there is a line to be drawn between 'actual English words' (eg: *sandstone*, *unwise*) and 'potential English words' (eg: (**lemonstone*, (**inexcellent*), both of these being distinct from 'non-English' words like **selfishless* which, because it shows the suffix *-less* added to an adjective rather than to a noun, does not even obey the rules of word-formation.

Rules of word-formation are therefore at the intersection of the historical and contemporary (synchronic) study of the language, providing a constant set of 'models' from which new words, ephemeral or permanent, are created from day to day. Yet on a larger scale, the rules themselves (like grammatical rules) undergo change: affixes and compounding processes can become productive or lose their productivity; can increase or decrease their range of meaning or grammatical applicability. In line with aims elsewhere in the book, we concentrate in this Appendix on productive or on marginally productive rules of word-formation, leaving aside 'dead' processes, even though they may have a fossilized existence in a number of words in the language. For example, the Old English affix *-th*, no longer used to form new words, survives in such nouns as *warmth*, *length*, *depth*, *width*, *breadth* (cf: *warm*, *long*, *deep*, *wide*, *broad*). A corollary of this approach is that the historical study of a word is irrelevant to its status as an illustration of present-day rules: the fact that the word *unripe* has existed in the English language since Anglo-Saxon times does not prevent us from using it as an example of a regular process of word-formation still available in the language.

- Note [a] New formations, invented casually for a particular occasion (as in 'She needs guidance, and the poor child is as *guidanceless* as she is *parentless*') are normally comprehensible, but are used at a certain cost to acceptability. They are often referred to as NONCE FORMATIONS and are liable to be criticized if too many are used. Cf also the jocular *coolth* on the pattern of *warmth*.
[b] History provides quite a number of examples where a derived form has preceded the word from which (formally speaking) it is derived. Thus *editor* entered the language before *edit*, *lazy* before *laze*, and *television* before *televize*. The process by which the shorter word is created by the deletion of a supposed affix is known as BACK-FORMATION, since it reverses the normal trend of word-formation, which is to add rather than to subtract constituents. 'Back-formation' so described is a purely historical concept, however, of little relevance to the contemporary study of word-formation. To the present-day speaker of English, the relationship between *laze* and *lazy* need be no different from that between *sleep* and *sleepy*, *choose* and *choosy*, etc.

Borrowing and neo-classical formations

- 1.6 A second restriction of this account is that it takes only passing notice of word-formation according to Latin and Greek, rather than English models. From the Renaissance to the early twentieth century, English word-formation, like English (or for that matter European) architecture, was dominated by neo-classicism. The vocabulary was augmented by borrowing and adaptation of Latin and Greek words, or, as time went on, by the formation of words in English-speaking countries according to the Latin and Greek models. The habit of neo-classical formation still flourishes in certain

learned areas of vocabulary, particularly in the natural sciences. However, English has adapted to her own purposes a large number of Latin and Greek word elements, and these, being productive in the 'common core' of the language, we must take into account. Moreover, some purely neo-classical affixes (*-ic*, *-ous*, etc) are so common that it would be perverse to exclude them from any account of English word-formation.

So great indeed has been the foreign or neo-classical influence on the English language, that the majority of prefixes (as distinct from suffixes) in the language are of Latin, Greek, or French origin. To give an illustration of the difference between native and neo-classical formation: *com-* (*col-/con-/cor-/co-*) is a Latin prefix in *collect*, *communication*, *conduct*, *coagulate*; but *co-*, one of its variants, has been appropriated by the English language and has developed a function of its own in such words as *co-author*, *co-chairman*, *co-education*. For our purposes, therefore, *co-* is an English rather than a classical or neo-classical prefix.

The 'ready-made' and the 'made to measure'

- 1.7 The words that we have just been considering come to us 'ready-made'. But this does not apply merely to words adopted from other languages: it is typical of the lexicon as a whole and underlines the distinction between lexicology and grammar to which attention was drawn in App 1.1.

In principle, and to a large extent in practice, the language user works on the assumption that every sentence encountered is entirely new, created and assembled specially for the occasion. By contrast, we expect every *lexical item* we hear or read to be already 'institutionalized' (cf App 1.5) and to have been selected from an existing stock of words, complete with its form and meaning.

We encounter widespread exceptions to both these generalizations. There are countless sentences that must have occurred before, even in the experience of a particular individual:

I'm feeling tired this morning.

How is your cold now?

She's gone out to see a patient.

But no one would seriously suggest that the next time we want to say such things, we recall and re-use these sentences in the form previously heard. There are more convincing exceptions, however. There are formulaic utterances, 'pre-fabricated' in entirety ('How do you do?' 'Pleased to meet you!'), and proverbs ('Too many cooks spoil the broth'); cf 11.54. There are ready-made parts of utterances ('Many thanks for ...', 'Far be it from me to ...', 'How come ...?', 'If only ...', 'By no stretch of the imagination ...'). Note also the many idiomatic phrases and collocations like 'eat ... out of house and home' or '(They're) home and dry' (informal BrE, meaning 'They've achieved their goal'). We interlard our discourse with snatches of familiar texts: 'a foregone conclusion', 'seven days shalt thou labour' (cf App 1.8 Note). In such cases, there is no question of our re-forming the phrases anew each time we use them. But numerous as these are, we must recognize that they are exceptional in a quite fundamental sense. In the lexicon, the converse is true. We encounter lexical items that we are content to believe

the user has invented; for example, *splooxing* in Jack Kerouac's 'I come splooxing to a no-good end'. But we find this striking in large measure precisely because it is exceptional; we do not expect words to have been specially coined for the occasion. It is in fact a common occurrence for someone to apologize for having coined a word ('what I may be allowed to call . . .') or even for using a word that we cannot be expected to know ('what some people have called . . .').

At the same time there is a paradox. While we expect every sentence to be newly formed for the occasion, we expect to understand it without difficulty, in the sense of perfectly apprehending its structure. A question like 'What does this sentence mean?' is apt to be an ironic criticism of the person who spoke or wrote it. But although we correspondingly expect every lexical item to have been taken from an existing stock, we by no means expect automatically to understand it or even recognize it. A question like 'What does this word mean?' is therefore commonplace, implying no criticism of anyone. We go through life learning new words continually. Sometimes (and rather rarely) they are as lacking in general currency as Kerouac's *splooxing* (and we depend on the context to guess its meaning) or as the word *googol* (and we depend on the context to guess its meaning) or as the word *googol* in the following:

There are probably more than a googol germs on the outside of this one cherry.

With the former we may rely on the context to help us guess the meaning, but with the latter we must have recourse to a dictionary or a mathematician if we are to learn that it refers to the numerical value *ten* raised to the power of one hundred. But usually, the new lexical experience has something familiar about it. The word may be a metaphorical extension of an item we know in a different sense ('You're not on my *wavelength*') or it may be imported from another but familiar language ('She struck me as *soignée*') or it may be composed of familiar items. When Coleridge in 1820 used the word *mammonolatry*, he knew that this would be understood in relation to *mammon* in the same way as the already long-established *idolatry* was understood in relation to *idol*. Subsequent coinages like *bardolatry* are formed with the same confidence of being understood on this analogical basis:

worship of mammon [= wealth] as though it were an idol
worship of the bard [= Shakespeare] as though he were an idol

Note The word *idolatry* is a compression of *idol* and *-latry*, not unlike the blends of App I.76.

- I.8** It is in its dependence upon analogies of this kind that the formation of words like *mammonolatry* somewhat resembles *grammar* or at any rate constitutes a grey area between the full generalizations of grammar and the specific idiosyncrasies of the lexicon. The difference (and hence the idiosyncrasy of the lexicon) lies in two factors: first, the relatively rare and special circumstances in which vocabulary construction takes place ('lexicalization', cf App I.9); second, the range of formation devices available and the constraints upon our using them ('productivity', cf App I.13). Consideration of both these factors throws into relief a third factor: every word-formation (or any other mode of lexical change) is a step in the historical development

of the language. Something has come into existence which did not exist before. Where the utterance of a new sentence (and we have argued that, for the purposes of grammatical description, we can regard virtually every sentence as newly formed) entails no change in the language, the utterance of a new word raises the possibility that an addition has been made to the total means of expression available in the language. Thus while a synchronic description of grammar or phonology is perfectly possible (even though historical allusions may be convenient in the description), a description of word-formation must of its nature be diachronic. The one is providing a blueprint as to how all new sentences will be freely constructed; the other providing a historical record (however short-term) of the formations that have taken place and venturing, on the basis of this, a tentative prediction of the lines along which further formations may take place in the future.

One indication of the diachronic orientation in word-formation can be seen in considering again the example *mammonolatry*. In grammar, a structural description is neutral as to the meanings that the structure can convey, whether or not the same words may be involved. Take the type *SVO*, for example, in:

John worshipped mammon.
John despised mammon.
John lit the gas.

But every new formation of the form 'x-olatry', despite ability to paraphrase it as 'the worship of x', will carry with it the memory of similar constructions (such as *idolatry*), so that (for example) *wife-olatry* would mean 'having the same kind of misplaced devotion for one's wife as pagans are said to have for idols'.

Note As we have already shown in App I.7, phrases and sentences can also be stored up as additional expressive resources; eg:

For only with such achievement could John expect the world to 'make a beaten path to his door', as Emerson put it.

Neither the quotation marks nor the authority need have been inserted, and many people's language is interlarded with re-used phrases and sentences in this way, where they have been found to be particularly memorable, effective, or merely a lazy convenience: 'Last but not least, and to make a long story short (if you'll pardon the clichés), it was Marjorie who helped me find my present job.'

Lexicalization

- I.9** However new and unfamiliar it is, an entity, activity, or quality can be stated and described in sentences:

Let us convert our railways from having steam-engines to
using engines powered by { diesel oil. } [1]
{ electricity. }

The nub of this suggestion might then be expressed by means of nominalization such as:

The use of { diesel-powered } engines (is being investigated). [2]
{ electrically-powered }

This already presupposes some discussion of and familiarization with the notion. But as the proposal becomes more widely accepted as viable, such a nominalization will seem too clumsy on the one hand and too under-committed on the other. At this stage, we will not be surprised to find the notion institutionalized by means of (as it happened) the word:

Dieselization } (is feasible). [3]
Electrification }

We can now conveniently marshal arguments for and against *dieselization* or *electrification*, discuss how much it will cost to *dieselize* or *electrify* suburban trains, and whether the new locomotives might co-exist for a time with *undieselized* or *unelectrified* services. We have now LEXICALIZED a notion that could previously be discussed only in sentences and periphrases which varied from person to person. In lay terms, we now 'have a word for it'.

But the precise form of the lexicalizations [3] could not have been predicted. When it became possible to split atomic nuclei (and the consequent lexicalization, *nuclear fission*, came into use), there was some vacillation and even public debate as to the most appropriate adjective to lexicalize the property of a substance in being capable of undergoing such fission. Competing forms included *fissible*, *fissile*, and *fissionable*. It turned out that two lexicalizations were necessary; one for the general capability, the other for the capability in consequence of slow neutron impact; physicists are apt to use *fissionable* for the former and *fissile* for the latter. In more extreme cases, the unpredictability of a lexicalization is even more obvious: for example, Kerouac's attempt to sum up the demise of a soft and flabby entity (for which the word *crash* was thus inappropriate) as *sploopse*; or the lexicalization by the mathematician Kasner of a particular numerical value as *googol*.

The other noteworthy point about such lexicalizations as [3] is that their meaning is not recoverable from the form. In this way, as in the unpredictability just discussed, it is sharply distinguished from the expressions in [1] and [2]. We can surmise that *dieselization* and *electrification* refer to inceptive action concerning diesel oil and electricity respectively, but there is nothing in the words as such that takes us much beyond that. With *fissile* and *fissionable*, it is inevitable from the discussion above that not merely do they not proclaim that they are inherently concerned with *nuclear fission*; it is impossible to tell from their form what their precise meaning may be, even when we are told that nuclear fission is involved.

This is no more than we should expect if we reflect upon the concentration of presupposition that is packed into a lexicalization by the time it is successfully institutionalized. The coinage *racism* (cf App I.32) reflects in two syllables the conscience and the agonized sensibilities of a whole generation.

Note Many coinages, however, seem on the face of it to be so transparent that – at least when we know their meaning – it would not occur to us to call their formation unpredictable. This is perhaps especially true of blends (cf App I.76). Yet when Wayne Oates coined *workaholic* around 1970, he apparently saw himself obliged to explain that the word was 'to describe those people so involved in their work that it interferes with their health, personal happiness, social functioning, and interpersonal relationships'. Oates felt it necessary to go further and hint at the reason for giving the coinage this particular form by referring to 'addiction to work'.

I.10 Of the two negative points just made about lexicalization, unrecoverability is far more endemic than unpredictability. Given the finite resources for lexicalization and the fact that some resources are more productive than others (cf App I.13), there are various highly likely ways in which a lexicalization will be realized, and it is on these that we concentrate in this Appendix. Thus in the lexicalization of concepts that can be given nominal properties, it is very common to adopt a strategy based on noun-phrase structure. Compare:

Some paper is shiny.
Paper that is shiny is difficult to write on.
Please don't buy me *shiny paper*.

We may postulate the way this strategy works in lexicalization:

[A] Oil comes from various sources, including vegetable matter. Such oil has functions and properties important for us and not shared with oil from other sources (eg mineral or animal matter). It is therefore worth distinguishing:

This oil is from a vegetable source.
Oil from vegetable sources is healthy for cooking.
Vegetable oil . . . [1]

[B] The engines of cars require oil; it has to be a special oil (eg from mineral sources, and of particular viscosity etc); since cars are relevant to our daily lives, such oil is worth distinguishing:

This oil is for engines.
Oil for engines is expensive.
Engine oil . . . [2]

But if such noun-phrase type premodification is so common in lexicalization as to challenge our earlier statement about predictability, it can readily be seen by comparing [1] and [2] that our statement stands concerning unrecoverability. Both [1] and [2] are of similar semantic and formal structure, but it is only by learning each as an idiosyncratic item that we can know that [1] 'means' oil *from* vegetables, [2] oil *for* engines. There is nothing inherently absurd about oil *for* vegetables, or oil *from* engines.

The latter point gains force in considering the lexicalizations that have in BrE clustered round *lighter* 'that which lights things' (itself a straightforward -er agential noun, based on the verb *to light*, cf App I.34). On the one hand, we have *fire-lighter* 'something that helps one to light fires'; on the other hand, *petrol-lighter*, 'something that helps one to light (tobacco) by means of petrol'. But two independent lexicalizations give us *gas-lighter*: the one like *fire-lighter*, 'something that helps one to light the gas'; the other like *petrol-lighter*, 'something that helps one to light (tobacco) by means of gas'.

I.11 The idiosyncrasy of lexicalization needs to be borne in mind when one is considering, for example, conversion (cf App I.43ff). When beside the noun *paper* there comes into use a verb *paper*, this is sometimes loosely referred to as the conversion of the noun into a verb. But this is not so. What normally happens (as in this instance) is the lexicalization of an action that is related

to one specific sense of the noun, the sense concerned being selected on purely pragmatic grounds. Consider four of the senses of *paper* as a noun:

- | | |
|---|-----|
| material in thin sheets made from wood or cloth | [1] |
| a newspaper | [2] |
| a piece of writing for specialists | [3] |
| wallpaper | [4] |

The transitive verb 'formed' from this noun by conversion (cf App I.49) relates only to [4]:

John has papered the bedroom.

There would be nothing inherently absurd in derivatives from other senses, such as [2]:

- (*)The Hearst organization has papered most of the mid-West.
 ['has supplied most of the mid-West with its papers']

or [3]:

- (*)I'm papering part of my research in a specialist journal.
 ['publishing a paper on part of my research']

The position is simply that the social need for derivatives from the other senses seems not to have been felt and in consequence no lexicalization of the actions concerned has taken place.

By contrast, beside the noun *paint* ['liquid colouring matter'], two verb senses have been separately lexicalized:

- | | |
|--|-----|
| Frank paints other people's windows but ignores his own.
['decorates with paint'] | [5] |
| Frank paints other people's children but ignores his own.
['makes pictures with paint'] | [6] |

To each of these lexicalized actions the agential noun *painter* could equally relate:

Frank is a painter.

This example illustrates further the idiosyncratic nature of the lexicon. A *painter* could be predicated of Frank in [6] even if his normal occupation was as a car salesman and he painted only in his spare time, as a hobby. It could not be predicated of Frank in [5] unless house-painting was his regular paid work. We must contrast with these institutionalized uses of *painter* the affixation of agential *-er* (cf App I.34) in the environment 'The X-er of Y' which is simply a regular nominalization of '(NP) X-ed Y': in other words, a grammatical correspondence with no necessary lexicalization. Compare:

- | |
|--|
| Augustus John was a painter of portraits. He was a well-known London painter. |
| Augustus John was a flouter of conventions. He was a well-known London *flouter. |

Note [a] Like a *painter* in [6], a *golfer*, an *angler*, or a *tennis-player* could also earn a living as a baker or a cleaner. But a librarian who bakes her own cakes, cleans her own room, and plays the violin will not normally be called a *baker*, a *cleaner*, or a *violinist*.

[b] The words *paint* and *paper* can, as we have seen, function as both noun and verb. Since as nouns both are concrete, and the verbs could be glossed as 'apply N', it is likely that native speakers feel that the verb is derived from the noun. In actual fact, this is true for *paper*, but false for *paint*, which was a verb for centuries before a nominal sense was lexicalized from it. The extent to which awareness of the 'direction' of derivation is relevant in language use is a matter of dispute, though the notion of 'back-formation' (cf App I.5 Note [b]) appeals directly to directionality. What is beyond dispute is the relevance of recognizing that a lexical relation exists; cf App I.2, and also App I.14 on 'analysability'.

- 1.12 As we have seen, conversion shows lexicalization having specific sense-orientation, in that only a particular sense of a word may be converted to another word class. But lexicalization also shows considerable item-orientation. Thus a conversion will apply to a specific formal item and not to any otherwise relevant synonym:

He offered her a $\left\{ \begin{array}{l} \text{cup} \\ \text{mug} \end{array} \right\}$ of coffee.

He *cupped* $\left\{ \begin{array}{l} \text{his hands} \\ \text{mugged} \end{array} \right\}$ and drank from the stream.

Compare also:

He has a $\left\{ \begin{array}{l} \text{carpet} \\ \text{rug} \end{array} \right\}$ in his bedroom.

He has $\left\{ \begin{array}{l} \text{carpeted} \\ \text{*rugged} \end{array} \right\}$ his bedroom.

It is noteworthy that, in both these examples, it is the lexical item of more general meaning that has lent itself to conversion.

Again, while the verb *burst* can be replaced by *bust* (nonstandard in BrE), the converse is not true where *bust* is a (slang or very informal) lexicalization corresponding broadly to 'bankrupt':

- Don't keep *bursting* in!
 Don't keep *busting* in! <nonstandard>
 The firm has gone *bust*. <slang>
 *The firm has gone *burst*.

The point is further made by another slang lexicalization where *bust* refers to sudden intervention (especially by the police) and where the detachment from *burst* is additionally marked by regularization of the morphology:

The police $\left\{ \begin{array}{l} \text{burst} \\ \text{*busted} \end{array} \right\}$ into the room.

The police *busted* him for possessing drugs. <slang>

Similarly, the verb *break* has two *-ed* participles, *broken*, and a largely nonstandard *broke*. But the latter is widely used adjectivally in the sense 'bankrupt', and though informal it is in educated use, even heard occasionally in broadcast news.

A comparable phenomenon of where two words are produced from one original is noticeable with 'back-formations' (cf App I.71). Despite the well-established correspondence between the verb *destroy* and the noun *destruction*,

the lexicalization of the concept *self-destruction* has led to the emergence of a new corresponding verb, as in:

The party is determined not to *self-destruct* on this issue.

Note that shortenings characteristically express in a specific form specific lexicalizations. Thus *lib* and *co-op* are not shortenings of *liberation* and *co-operative* respectively, as we see from

He advocated the **lib* of the prisoners.

She was very **co-op* and helpful.

but of (*women's/gay*) *liberation movement* and *co-operative (business organization)* respectively. Similarly, *exam* is a clipping of *examination* only in the sense of 'an (academic) test'.

Note Not all lexicalization falls within the tradition of 'word-formation' study that we follow here. It excludes, for example, lexicalization by adoption of items from other languages (such as *kung fu*). It also excludes metaphorical extension of meaning. Thus the compound *headache* is regarded as a word-formation phenomenon only in respect of its bringing together the two items *head* and *ache* to lexicalize 'a nagging anxiety' (as in 'The financial situation is the President's biggest headache'), this is regarded as outside word-formation. Nor is the lexicalization of 'best method of access' as *key* regarded as a word-formation from the concrete instrument sense ('A good degree is the key to success'), though the use of one part of speech as another – without change of lexical meaning – does indeed fall within word-formation ('He cheats' – 'He is a cheat'). Equally, we shall follow here the tradition of ignoring what one might call *phrasal lexicalization*, as when the sentence:

I was on the carpet again yesterday.

can be used in the literal sense and also in the sense 'My superior disciplined me' – though it is this latter sense (not permitting 'I was on the new brown carpet again yesterday'), that has led to the verb lexicalization as in:

I was *carpeted* again yesterday. (Cf App I.49)

We should add one further word on the limits within which we are operating in this Appendix. The formation of complex prepositions (*in aid of*), complex subordinators (*in the event that*), and phrasal and prepositional verbs (*give up, see to*) is treated as a grammatical phenomenon (cf 9.10ff, 16.3f, 16.5ff), though without ignoring the lexicalization aspect. The decision to treat such phenomena thus and not in this Appendix is in part a result of taking the WORD (defined in terms of an integrity that resists interruption of its parts) as the unit of lexicology and hence the sole remit of Appendix I. Phrasal lexical items consist of more than one word and although they have the semantic and often the grammatical integrity of words (cf: 'She mustn't lose sight of them' ~ 'They mustn't be lost sight of'), some degree of separateness continues to be recognized ('They lost at one time sight of their main goals'). Such phrases show many signs, however, of COALESCENCE, both orthographic (*instead of* beside *in place of, indeed* beside *in fact*) and semantic; cf also *because, altogether*. This illustrates the gradience between grammar and lexicon, including a gradience in lexicalization; cf 2.35 and the distinction there made between lexical items and grammatical words. On the one hand, *lose sight of* can be viewed as a single lexical item; on the other hand, it comprises three grammatical words, one of them (*lose*) with some morphological variation.

Even without the inherent difficulties presented by gradience and even without the present unsatisfactory state of word-formation studies, it would be impossible in this Appendix to cover the entire field of lexical creativity. Rather, as is appropriate in a grammar, we concentrate on those aspects that most resemble the regularities of grammar and are most closely interrelated with them.

Productivity

1.13 Any description of word-formation in the context of present-day grammar

should obviously be concerned with processes of word-formation that are productive at the present time. The fact that words have resulted from the past operation of word-formation processes is in itself irrelevant from a synchronic, monolingual point of view. Thus the word *gospel* cannot be seen as a modern English word-formation, though formed in earlier English from the words *good* and *spell* (in the obsolete sense 'news'). Nor, as an English word, can *abattoir*; though its constitution is clear enough in French, where the verb *abattre* exists as well as the common affix *-oir*. Nor, as an English word, can *karate* be seen as a 'formation', though in Japanese it is clearly a junction of *kara* 'empty' and *te* 'hand'. On the other hand, words like *ice-cream*, *conceptualize*, *psychosomatic*, *workaholic*, *motel*, and *bionic* have all been formed within English sufficiently recently as to be representative of currently productive processes. The native speaker operates daily in the implicit knowledge that the meaning of most adjectives can be negated by prefixing *un-* and that most adjectives will permit the formation of abstract nouns by suffixing *-ness*.

But the distinction between productive and nonproductive is by no means straightforward. In the first place, there are severe constraints of a sociolinguistic kind that inhibit any individual's freedom to make new words (cf App I.7f, I.15). Secondly, there are linguistic constraints. These may be phonological. When Kasner invited his child to invent a word for 10¹⁰⁰, it is unlikely that *sfoogol* would have been suggested in view of the rarity of /sf/ as an initial cluster; *mroogol* would have been unthinkable. Alternatively, linguistic constraint may be syntagmatic. A 'machine for transporting dodos' might be lexicalized as a *dodo-car* but not as a *car-dodo*; the absence of dodos might be lexicalized as *dodofree* or *dodoless* ('This part of Arkansas is . . .') but not as *freedodo* or *lessdodo*. Other linguistic constraints inhibit *untall* or *dishappy* or *thinkledge* (despite *knowledge*), or *carefreedom* (despite the existence of *carefree* and *freedom*). Thirdly, there are pragmatic constraints. We do not have *doorleg* (beside *doorknob*) because doors do not have legs. We do not have *legchair* (beside *armchair*) for the opposite reason: that it is normal for chairs to have legs (though many are designed without legs).

Obviously, pragmatic constraints are a primary bar to lexicalization, but even this statement is not as simple as it may seem. We have no word *snow-cream* (beside *ice-cream*), but that is hardly because there is 'no such thing'. Both from a linguistic and a pragmatic viewpoint, *snow-cream* is as possible and satisfactory as *ice-cream*; there are indeed fluffy varieties of ice-cream that resemble snow more than ice. Given the social urge to make a particular distinction, lexicalization can be seen as operating to some degree independently from the real-world constraints of pragmatics.

There is thus in word-formation no simple parallel to the use and non-use of the starred form in grammar. At best, we may assign a star to forms that are in some sense 'impossible':

- *mroogol [on phonological grounds]
- *fulgrace-dis [on syntagmatic grounds: *dis-* can only prefix]
- *emptyless [on semantic and grammatical grounds: *-less* cannot be added to adjectives]
- ?*thinkledge [*-ledge* is obsolete]

We can then distinguish these from words which for one reason or another are very unlikely to be formed in the course of using processes that are both familiar and currently active:

- (*)doorleg [pragmatically excluded in present world]
- (*)meep [a possible but unused word]
- (*)snow-cream [a possible but unused compound]
- (*)untall [unused perhaps because alternatively lexicalized]
- (*)psychophilatelic [unused because psychological aspects of stamp collecting have not called for lexicalization]

Finally, we have items that are in actual use like *motel*, *ice-cream*, *bionic*.

But the absence of an asterisk can only mean that the item concerned has been formed; it carries none of the implications of the unstarred sentence that we are invited to produce further items for ourselves on this pattern. Conversely, given the idiosyncrasies of lexicalization and the word-formation that may be used in response, the stars and parenthesized asterisks can do little more than assign degrees of improbability as to the form that new words may take.

- Note [a] Certain processes and affixes have spurts of productivity at certain periods; eg: *mini-* in the 1960s, *-gate* (as in *cattlegate*, *oilgate*, *Muldergate*, but all modelled on *Watergate*), following the White House crisis in the 1970s; cf App I.76. Others are especially productive in certain activities: eg initialisms in civil administration, acronyms in computer science, etc. Even a dormant affix like *-hood* can come into restricted use, as in *sentencehood*.
 [b] Word-formation was responsible for roughly half of the 6000 new words recorded by Merriam in the dozen years following the publication of the 1961 *Third International Dictionary*, about two-fifths of these by affixation, about three-fifths by compounding.

- I.14** From the viewpoint of productivity, therefore, the ordinary user of English who is neither a poet nor an experimental scientist must be seen as having a fairly passive role in word-formation – whereas in grammar he has conversely a wholly active role. He *must* construct new sentences: he need not construct new words (and he lays himself open to criticism when he does so, neologism being an aspect of language use most open to prescriptive censure). But this does not mean that word-formation is of no practical concern or interest to the ordinary user of the language. If we are only rarely called on to construct words, we are prone to analyse them and are inclined to expect that complex items are composed of a relatively small number of basic ones. This is indeed one respect in which we seem to regard words somewhat analogously to the way we regard phrases and clauses. That is not to say that we expect complex words to be self-explanatory. We cannot from their names identify or define *ice-cream* or a *blackbird*, but once we have experience of the entities concerned, we understand why they are so called: the words seem well-motivated. So, too, when we know the meaning of *selfish* and *selfishness*, *lordly* and *lordliness*, they make sense in relation to *self* and *lord*, even though we might not have predicted the meanings of *selfish* and *lordly* from their composition. Indeed, it is likely that a sound general awareness of the specificity and idiosyncrasy of lexicalization helps to inhibit us from coining (for example) *doctorly* and *doctorliness* by analogy with *lordly* and *lordliness*. We note, however, that literary theory in the 1980s gave some currency to *writerly* and *readerly* (adjectives).

The phenomenon of 'popular' (or 'folk') etymology testifies to the ordinary person's concern for analysability. For example, *salt-cellar* seems a clear example of an attempt to make sense of the word *salier*, adopted from the French. Even though its meaning was known, the opaqueness of the form seems to have led to a reasoning something like this: 'The object is a container for salt; a cellar is a place for storing things, so this must be what people mean when they use this strange word "salier"; the thing is a *salt-cellar*.'

With the inevitable changes in language over time (eg the phonological change that now distinguishes *holp* from the first part of *holiday*), analysability of long-established words is reduced. If the language has adopted large numbers of words from other languages (as English has from French, Latin, and Greek), analysability is further impaired. Compare the English *rhinoceros* with German *Nashorn* 'nose-horn', or the English *rhododendron* with German *Alpenrose*. Nonetheless, our propensity to analyse enables us to recognize and interpret recurrent parts of words even where other parts are not in themselves recognizable as meaningful. Thus in:

intermittent

we can link the first part with *international*, *interaction*, etc, and the *-ent* is recognizable as a possible adjective marker as in *different*, *innocent*, *prurient*, even if *-mit(t)-* remains totally opaque (since of course there is no reason why the ordinary user of English should connect this with the first syllable in *mission* or *missive*). So also with:

disparity

the negative force of *dis-* and the largely abstract noun marker *-ity* can be recognized even if *-par-* remains opaque. With:

bishopric

we of course see a connection with *bishop* even though the suffix *-ric* is obsolete. In some instances like *knowledge* (the suffix of which again is obsolete), it is the spelling alone that permits partial analysis. The word *gumption* is marked as a probably abstract noun by its ending; *postpone* and *precede* link up with other *post-* and *pre-* words such that both their meaning and pattern of distribution are recognizable though *-pone* and *-cede* are isolates (divorced from *position* and *-cession* respectively).

We may conclude these considerations of lexicalization and productivity by recalling what we have said about the degree to which new formations are predictable in form, with meanings that are recoverable (cf App I.10f). It will have emerged from the examples discussed that, rather than speak of interpretability, it is more relevant to look at a formation from the viewpoint of motivatedness. When we become acquainted with a new word, we can often judge it, with hindsight as it were, as obviously well-motivated in its formation: *workaholic* is an example. But sometimes the motivation may seem entirely opaque, and *googol* is an example. There are more formations of the former kind than of the latter, no doubt fortunately, since they carry an in-built mnemonic as to their meaning.

- Note The degree to which, independently of foreign language knowledge, the native speaker of English is able to analyse words and word-constituents of ultimately cognate form, is uncertain

and a matter for psycholinguistic research. Some common examples are *people* and *popular* (or); (trans)mit and (trans)mission; (pro)cede and (pro)cession; (con)demn and damnation; col(laborate) and companion; re(ject), re(view), and re(apply). Despite its spelling, a *euphord* does not concern cups and boards, and it does not sound as it does: /kabad/. What is beyond question is that most of the affixes in productive use are ultimately from languages other than English, and that these adopted and neo-classical constituents can be regarded as fairly well assimilated by English speakers as a whole. This extends even to some evidence of an aversion to 'hybrid' formations like *workious beside laborious. Compare our habit of adopting appropriate foreign-derived prosody (legal, legality beside lawful, lawfulness), and this even where hybrids occur: 'Milton, Miltonish, but Miltonic, cf App I.3f. Among the hybrids over which there was at one time strong protest, we may mention amoral, bureaucracy, cablegram, pacifist, and speedometer.

Individual creativity

- I.15 It follows from what we have been saying that we must exercise caution when we speak of 'rules' in word-formation. The idiosyncrasies of lexicalization and the inherent restraint upon making up new words remove the predictive and permissive implications that the notion of 'rules' conveys. In word-formation study we are involved rather in describing an accretion of individual historical events and making generalizations about them to show the extent of recurrent patterning that exists.

But there are some exceptions to the largely passive role of the individual in the word-formation process. These are of two broad kinds.

[A] First, there are cases where no semantic lexicalization is required, but merely some formal reorganization which leaves the semantics of the base unchanged. This is preeminently true of nominalizations. Thus instead of saying 'We ought to be able to punish whoever scribbled this foul message', we might say:

The scribbler of this foul message should be punished.
The scribbling of this foul message should be punishable.

Again, instead of saying 'They borrowed my typewriter', one may venture upon a nonce-formation as in:

They left me typewriterless.

(Contrast *penniless* which does not mean 'without pennies' but lexicalizes 'destitute, without money or other comparable resources'.) Other affixes (cf App I.13) that can also be used fairly freely include *un-*, *dis-*, *-ful*, *-ize*, *-able* ('Is this shirt *drippable-dry/drip-dryable*?' beside the simpler *drip-dry*), *pseudo-*, *mini-* ('I only want a *mini-loaf*'), *non-*, *-ness*, adjectival *-ish* and *-y* (both especially in the sense 'somewhat'), and several devices to form diminutives and the like, such as *-let*, *-y*, and <esp AustralE> *-o*; cf App I.77. We may convert one part of speech to another without affix with similar freedom, especially nouns to verbs ('You can *envelope* these letters now'), or verbs to nouns ('I'll have a *sit* for a few minutes'). We do not mean to imply that any given example would in actual historical fact be getting used for the first time, but rather that so far as the user is concerned the formation or conversion was his own.

[B] Secondly, as we saw in App I.7, there is the limited freedom to create new formations in order to satisfy by lexicalization a terminological need which may be as ad hoc and temporary as the formation concerned. Nonce-

formations of this kind are often preceded by an explicit indication of the coinage to come (which may simultaneously function as an apology for thus interfering with the implicitly-held finite state of the lexicon): 'what one might call', 'and I shall refer to this as'. The commonest process of word-formation of this kind is compounding (cf App I.57f). If we imagine a scientist describing a condition arising through weightlessness that may resemble the effect of alcohol, he may say 'I shall call this *space-inebriation*'. An international gathering discusses a special form of radio communication between ships or between ships and ports, and starts referring to this as *sea-speak*. Or compounding may coincide with abbreviation: a conference on communication between divers in off-shore oil exploration may speak of *subcom* (for 'submarine communication'), and the scientist who has coined *space-inebriation* may rapidly turn this into *SI* once he is assured that this will be understood by his audience. In the 1970s, *mediagenic* was used in a US journal to describe the qualities required of a presidential aide. It connoted broadly 'likely to promote good relations with press, radio, and TV', and it was obviously a blend involving the established *photogenic*. On the other hand, when a scientist at about the same time coined the term *supragenetic*, the second part was the adjectival form of the noun *gene*, and the formation referred to heredity above the level of the gene. It hardly needs to be said that the vast majority of such new formations remain uninstitutionalized attempts at lexicalization.

Note Although commercial brand names (like the names of places and persons) are obviously beyond the scope of this Appendix (except where they achieve currency as common nouns; cf App I.53), it should be noted that they display vigorous creativity, involving several of the processes to be studied below (especially perhaps combining-forms, blending, and the use of neo-classical affixes). Inasmuch as these are aimed at international markets, they bear witness to the widespread use of these processes and affixes in other languages.

- I.16 The two broad areas of individual creativity distinguished in App I.15 differ not only linguistically (in the forms and types of word-formation concerned) but in situational context. [B] implies a rather formal, serious, intellectual, or at any rate utilitarian setting. By contrast, [A] implies a rather informal, familiar, light-hearted setting. There seem indeed to be notable sociolinguistic correlates to the degrees of individual lexical creativity, such that on either side of a large conventional mass of people (on whom the constraints against creativity are most strongly felt), there are two areas in which such creativity is relatively frequent. On the one side, there is the world of new technology, learning, and research, where the coining of new terminology is almost endemic, and to a certain degree essential: eg: *maglev* (from 'magnetic levitation') in transport research; *paracharmonium* and *psi particle* in charm-theory physics. On the other side, there is the exuberance of slang talk between familiar (and especially young) friends: *lech* ['to lust after'], *knee-jerk* ['one who acts automatically'], *bird farm* ['aircraft carrier'], *mind-blowing* ['overwhelming'], *trendy* ['fashionable']. Many such lexicalizations are phrasal: *freak out* ['to undergo intense experience'], *do (one's) thing* ['to follow personal inclinations'], *get it together* ['to organize oneself'], *spaced out* ['drugged']. They include rather formal examples, such as *in the context of* ['as regards']. The willingness to be unconventional is sharply illustrated by

the habit of splitting words in very familiar speech so as to insert (usually taboo) asseveratives: *absobolylutely*; cf App I.76 Note [c].

But in the last analysis, individual creativity depends less on the social context than on the particular individual. We vary enormously in our desire (and in our ability) to be lexically innovative.

- Note [a] To a modest degree, creativity is going on continually, sometimes acknowledged, sometimes unnoticed. In a recent book on literary history, the author apologized for coining the word *canonical* in the sense of 'relating to the (authorial) canon'. It is noteworthy that he did not apologize (nor did he need to) for the ways in which he then proceeded to use it. These uses included: *canonical research* 'research towards identifying the canon', *canonical arguments* 'arguments about the extent of the canon', *canonical plays* 'plays that are recognized to be within the canon'.
- [b] Though constraints on deviation from norms in phonology, grammar, and style are commonly acknowledged in the form of public rebuke and ridicule, this is nowhere more pointed than in cases of excessive lexical neologism. An American statesman was severely criticized in both the American and British press in 1981 for what was thought an unacceptable degree of conversion (cf App I.43ff), and *The Guardian* even devoted a leader to satirizing his usage. This included: 'He technique'd a new way to vocabulary his thoughts so as to uncertain anybody listening.'
- [c] Our ability to operate correspondences between agential nouns in *-er* and abstract nouns in *-ing* from verbs, to make adverbs by adding *-ly* to adjectives (or, esp in AmE, *-wise* to nouns), to make ordinals by adding *-th* to cardinal numerals (even abstract ones as with 'to the *nth* degree') obviously resembles our comparable ability to make grammatical inflections like plural and past. For this reason, some theorists would regard such phenomena as being outside word-formation and as being rather a part of inflectional grammar. They would see a parallel between the 'formation' of the noun *driver* from *drive* and the 'formation' of the adjective *careful* from *carefully* in:

She *drives carefully*.

~ She is a *careful driver*.

Such a theoretical stance has far-reaching implications. For instance, just as *medical* in the phrase 'a medical student' is a nonpredicable adjective formed by derivation with the suffix *-al*, some would argue that *physics* in 'a physics student' is a nonpredicable adjective formed by conversion. One might adduce as parallels such informal adverbial uses of adjective forms as in 'Drive *slow*' (cf App I.46 Note). The controversial concept of a 'zero' suffix (cf App I.43 Note [a]) reflects just such an attempt to see conversion as parallel to the use of affixes such as *-al* and *-ly*.

[d] In connection with forms like *absobolylutely*, it is worth pointing out that the interposed intensifier in Eliza Doolittle's famous exclamation 'Not bloody likely' in Shaw's *Pygmalion* is in effect a similar phenomenon. It was not the *likeliness* that she was asseverating but the 'not-likeliness'; cf: *not in any way likely*; the intensifier was inserted, however, before the stressed syllable in the same way as explained in App. I.76 Note [c]. The informal *Not likely!* is a further instance of a phrase having the status of a single lexical item; cf App I.12 Note.

Spelling and hyphenation

- I.17 When suffixes are added to a base, spelling changes may occur, many of them parallel to those involved in inflection (cf 3.7ff, 5.11, 7.79). Thus:

y ~ i: *friendly ~ friendliness, happy ~ happily* (cf 7.46f, 7.80f, App I.41)
 doubling: *red ~ reddish* (cf also *-c ~ -ck-*: *panic ~ panicky*)
-e loss: *cause ~ causation*
 simplification: *full ~ fully* (= *full + ly*)

There are also foreign-derived assimilations *in-/im-/il-/ir-*, *con-/com-/col-*; cf App I.21. Although affixes are normally joined to bases without hyphens, hyphens may be used where the formation seems relatively unestablished;

where the affix (such as *-wise, non-, post-*) seems to be somewhat word-like (*construction-wise, ultra-reactionary*); in new formations with such prefixes as *co-, de-, re-*; or *-* especially in BrE *-* to prevent a double occurrence of a vowel (*re-emphasize*); cf App III.3ff.

With compounds, the constituents are often written as separate words when the collocation seems relatively unestablished:

(He has some) 'writing paper.

As the sequence of items becomes more established, it may be hyphenated (especially in BrE) as an intermediate stage before being written solid:

tax-exemption
 bloodtest

Where the first constituent is a combining form, however (cf App I.66), hyphenation is the first step (again especially in BrE) rather than the second, since there is no stage at which the first component can be written as a separate word (but see Note):

(Her interests are more) lexico-semantic.

Hyphenation is used also to mark sequences as ad hoc 'compounds' for typographical clarity (cf App III.4). There was an example of this in App I.4, a *silent-film star*. So also, beside 'He collects foreign stamps':

He is a foreign-stamp collector.

to distinguish this from a foreign collector of stamps; again,

his higher-than-average wages

but 'His wages were higher than average'. Idioms are often hyphenated irrespective of their position in a sentence. Thus not only 'a *root-and-branch* revision', but 'The revision will be quite *root-and-branch*'. Hyphens are used for clarity where a sequence becomes the base for suffixation. Thus, while we may write without hyphens:

She has *short sight*.

He is *colour blind*.

They are both *old maids*.

hyphens are preferred in:

She is *short-sighted*.

He is affected by *colour-blindness*.

They are rather *old-maidish*.

Prefixation raises a different problem, since with new formations or ill-established ones the prefix would itself be hyphenated; and (except in premodifying phrases like *higher-than-average wages*) we avoid introducing more than one hyphen into a compound. Thus when we prefix *ex-* in:

He is an *army officer*.

we have, despite the implication of incorrect constitution,

He is an *ex-army officer*.

rather than a sequence of hyphens as in 'an *ex-army-officer*'. The elements *non-*, *vice-*, *mini-* and a few others are sometimes written as separate words: 'the new *vice consul*'.

Relations between phrase and complex word

- I.18** We have noted earlier that we treat the formation of phrasal verbs, complex prepositions, and other types of word sequence, as a grammatical phenomenon, and therefore as falling outside word-formation (cf App I.12 Note). Informal spellings like *alright* for *all right*, *gonna* for *going to*, the uncertain division of *in so far* and *in as much*, the choice between *instead of him* and *in his stead* indicate the gradience that exists between words and phrases. When a phrasal verb is converted to another part of speech, the particle is sometimes treated like a prefix (cf: *income* 'earnings'):

- { They *spread out* their arms.
- { Their *outspread* arms . . .
- { His behaviour *put her off*. ['disconcerted', <informal>]
- { She felt rather *offput* at his behaviour. <BrE, very informal>
- { She found his behaviour *offputting*.
- { We are *taking in* more students this year.
- { Our *intake* will be four thousand.
- { Money is not *flowing in* fast enough;
- { *inflow* was better last year.
- { The rain *poured down* for hours,
- { and this *downpour* delayed us.

In other cases, the particle is treated like a suffix:

- { The plane *took off* at noon.
- { *Take-off* was at noon.

Phrases also readily become complex words with suffixation:

- { He could not *get at* the window.
- { The window was *unget-at-able*. <informal>
- { The shirt will *drip dry*.
- { The shirt is *drip-dryable*. <BrE, informal>

In such cases the suffix can be used as though it were an infix:

- { The window was *ungettable-at*.
- { The shirt is *drippable-dry*. <BrE> } <informal and 'nonce'>
- { I was merely passing by.
- { I was merely a passer-by.

Note The 'infix' of *passer-by* is paralleled in grammar by such plurals as *consuls-general* (and indeed the plural of *passer-by* itself: *passers-by*) and the alternative pattern *unget-at-able* by 'group genitives' like *a man of honour's influence*, *Elizabeth the Second's heir*. The overlap of word and phrase can be further seen in ordinals like 'one hundred and sixty-seventh' and the pseudo-coordinations in *try and come*, *come and see* (cf 13.98), where there is resistance to separate inflection (**tried and came*; ?*is coming and seeing*). Yet occasional (presumably accidental) utterances like 'He must do as he *see fits*' are heard in conversation. Unease and vacillation seem

to lie behind the (jokingly nonstandard) agential nouns as in 'Will you wash up? I'm sure you're a good *washer-upper*'. cf also *usher-inner*, *walker-onner*.

Phonological consequences of word-formation

- I.19** In the detailed description that follows, attention will be drawn to points of stress and pronunciation associated with particular affixes and processes. A series like:

'photograph	/fə'tɒɡrɑ:f/
photo'graphic	/fəʊtə'ɡræfɪk/
pho'tography	/fə'tɒɡrəfi/

illustrates the considerable stress variation (with consequent differences of vowel pronunciation) that accompanies the use of originally foreign affixes (cf App II.5). But vowel values can alter even where the stress remains constant:

'nation /ner-/
'national /næ-/

Prefixes and suffixes are usually unstressed in relation to the semantically weightier parts of words (cf App II.3ff), but:

[A] a few suffixes (eg: *-ette*) assume primary stress; and

[B] prefixes have secondary stress if:

- [i] they are disyllabic (eg: *inter-*), or
- [ii] the base begins with an unstressed syllable (eg: *unat'tractive*), or
- [iii] they are 'new' uses of 'old' items (eg: *pre-*, *re-*).

We shall draw attention to individual exceptions, but one general exception may be noted here. While many verbs have primary stress on the stem, as in:

She con'trasted her childhood with his.

the stress is moved on to the prefix when they are converted into nouns (cf App I.56, App II.6):

There is a 'contrast in meaning in the two uses of *painter*.

Moreover, noun compounds characteristically shift the stress to the first constituent where the corresponding phrase or clause has the primary stress on the second:

The *'sun* is rising.

The *'sun, rise* is . . .

This *'black 'bird* [*phrase*] is a 'black, bird. [*compound*; cf App II.7]

Affixation

- I.20** Although for ease of access to the information we shall present each set of affixes in alphabetical order, it should be noted that this obscures two important points. The first is that, within each set, it is usual that some affixes

have far more frequent productive use than others. The second is that there are often significant relations between affixes: especially antonymy, as with *pre-* and *post-*, *-ful* and *-less*.

So that the relation between competing and contrasting affixes can be better understood, we shall use broad semantic categories as the basis of presentation, offsetting by means of cross-reference the inevitable disadvantages of this approach in oversimplifying the description. The semantic basis means, of course, that items having a single form (eg: *un-*, or *sub-*) but distinct semantic or grammatical functions will be given two or more separate entries. Only the chief affixes in productive use will be dealt with (subject to the words of caution in App I.13ff), but from time to time it will be convenient to make notes of comparison with rarer or nonproductive items. Where the item normally carries secondary or primary stress, the head form is marked accordingly (eg: *NON-*, *MINI-*), and exceptions are noted in the main body of the entry. Pronunciation is given where it is thought necessary.

Note Though most prefixes cannot occur as independent words, they can on occasion be detached to permit coordination, as in *pre- and post-hysterectomy*: cf I.3.85.

Prefixation

Negative prefixes

- I.21 *A-* (/eɪ/ or /æ/), *AN-* (especially before vowels), 'lacking in', 'lack of', combines with adjectives, as in *amoral*, *asexual*, *anhydrous*, and is found in some nouns (eg: *anarchy*). Chiefly used in learned and scientific lexicon. Some items have the main stress on the prefix: *'anarchy*, *'atheist* /eɪ/, *'atrophied* /æ/.
- DIS-* (cf App I.22) 'not', 'the converse of', combines with open-class items including verbs: eg: *disobey*, *disloyal(ly)*, *disorder* (n), *disuse* (n), *disunity*, *discontent* (n).
- IN-* (and variants *IL-* before /l/, *IM-* before labials, *IR-* before /r/) 'not', 'the converse of', combines with adjectives of French and Latin origin, and is less common than *un-*; eg: *incomplete*. Cf also the noun *inattention*.
- NON-* 'not', combines (usually hyphenated) with nouns, adjectives, and open-class adverbs: eg: *non-smoker*; *non-perishable*; *non-trivially*.
- UN-* 'not', 'the converse of' (but cf App I.22), combines fairly freely with adjectives and participles; eg: *unfair*, *unwise*, *unforgettable*; *unassuming*, *unexpected*.

Note [a] Of these prefixes, *un-* is by far the most productive, and it typically involves less lexicalization than the other prefixes. With adjectives, *un-* can usually replace *in-* or *dis-* for ad hoc use, but with semantic consequences. Thus *unrepairable*, *unreplaceable*, *unmovable*, etc are more absolute and more literally related to the respective bases than *irrepairable*, *irreplaceable*, *immovable* etc. Converse replacement is not usually possible (**infaithful*, **dishappy*; cf App I.14 Note). It is noteworthy that several negative lexicalizations with *in-* and its variants have either no direct relation to the nonnegative base (*infirm* ~ *firm*, *infamous* ~ *famous*) or no nonnegative base at all (**apt*, **ert*). Cf also **couth*.

[b] *Non-* differs from *un-* in frequently expressing a binary contrast (without gradability) rather than the opposite end of a scale: eg: *non-scientific* (?**rather non-scientific*) as distinct from (*rather*) *unscientific*; *non-American* beside *unAmerican*.

[c] Because of the possibility of confusion with negative *in-*, the nonproductive *in-* of *inflammable* (cf: *ingredient*) tends now to be avoided and this word is increasingly replaced by *flammable*, with a negative *non-flammable*. The following press report (*Observer*, 9 July 1978) illustrates how easily the terms are confounded: 'BR switched from highly *flammable* to *inflammable* but slow-smouldering material... They rightly discarded the highly *flammable* materials and went for those which were *non-flammable* with a low combustion point.' The writer appears to be using *non-flammable* and *inflammable* as synonymous.

[d] The assimilation variants of *in-* are to some extent paralleled with *im-* (eg: *im'plezənt*) and other affixes, but with *un-* and most others, these variants are not established in such a way as to be reflected in spelling.

[e] *Un-* often confers lexicalized acceptability on a participial or other deverbal adjective form: contrast **a headed problem* with *an unheaded problem*, **a speakable condition* with *an unspeakable condition*. As compared with clausal negation, an *un-* item tends to connote 'frustrating the potential of the base'; eg:.

The building {wasn't occupied.
 was *unoccupied*.

[f] *Non-person* illustrates a pejorative and ironic type of noun-formation which has shown some productivity in recent years. The meaning here is 'a person who is not (ie does not count as) a person', 'a person of no consequence'; cf also *non-event*.

[g] Other prefixes apart from those above have negative implications: notably, the reversative prefixes discussed below (cf App I.22), and the prefixes of opposition, *anti-* and *counter-*, discussed in App I.25.

Reversative or privative prefixes

- I.22 *DE-* (/di:/) [i] 'reversing the action', combines fairly freely with (especially denominal) verbs and deverbal nouns; eg: *decentralize*, *defrost*, *desegregate*, *de-escalate*, *denationalization*;
- [ii] 'depriving of', combines fairly freely with verbs and deverbal nouns (eg: *decapitate*, *deforestation*), including one or two items already connoting deprivation (eg: *denude*, *defraud*).
- DIS-* (cf App I.21) [i] 'reversing the action', combines fairly freely with verbs; eg: *disconnect*, *disinfect*, *disown*; in some cases with privative force, as in *dishearten*, *dispossess*;
- [ii] 'lacking', combines limitedly with denominal adjectives; eg: *disinterested*; *discoloured* (also verb *discolour*) refers to unwelcome change of colour.
- UN-* (cf App I.21) [i] 'reversing the action', combines fairly freely with verbs; eg: *undo*, *untie*, *unzip*, *unpack*, *unwrap*;
- [ii] 'depriving of', 'releasing from', 'degrading', combines limitedly with nouns, turning them into verbs; thus *unseat*, *unhorse*, *unmask*, *unman*.

Note Both *de-* (pronounced /di/) and *dis-* occur also in words that already had the prefixes when adopted into English; in such cases they frequently have no meaning analysable by ordinary users of English. Eg: *depend*, *discern*.

Pejorative prefixes

- I.23 *MAL-* 'badly', 'bad', combines with verbs, participles, adjectives, and abstract nouns; eg: *maltrat*, *malformed*, *malodorous*, *malfunction*, *malnutrition*.
- MIS-* 'wrongly', 'astray', combines with verbs, participles, and abstract nouns; eg: *miscalculate*, *mishear*, *misfire*, *misinform*, *mislead(ing)*; *misconduct* (n).
- PSEUDO-* 'false', 'imitation', combines freely with nouns and adjectives, eg: *pseudo-Christianity*, *pseudo-classicism*, *pseudo-intellectual* (n or adj); *pseudo-scientific*.

- Note [a] Verbs prefixed by *mal-* and *mis-* tend to be gradable; cf 'He very much miscalculated the time required' beside '?He very much calculated ...'.
 [b] Both in form and in degree of independent lexical meaning, *pseudo-* resembles the combining forms (cf App I.66), as is further suggested by the existence of the informal abbreviation *psud* <BrE>. cf App I.74.
 [c] For other prefixes with pejorative overtones, see NON- (App I.21 Note [f]); ARCH-, OVER-, UNDER-, and HYPER- (App I.24).

Prefixes of degree or size

- I.24** ARCH- 'supreme', 'most', combines freely with nouns, chiefly with human reference (eg: *archduke*, *archbishop*), and usually with pejorative effect (eg: *arch-enemy*, *arch-fascist*, *arch-hypocrite*): note the hyphens with these relatively ad hoc items; *archangel* is an isolated case, with pronunciation /ɑːk/ and normally with the prefix stressed.
 CO- 'joint(ly)', 'on equal footing', combines freely with nouns and verbs: *co-education*, *co-heir*, *co-pilot*; *co-religionist*, *cohabit*, *cooperate* (also *co-operate* BrE); *co-opt*, *coordinate*, *coexist*. In some nouns, the prefix is stressed: 'co-driver'.
 HYPER- 'extreme' (sometimes pejorative, 'too'), combines freely with adjectives: *hypersensitive*, *hypercritical*, *hyperactive*.
 MINI- 'little', combines freely (and especially informally) with nouns: *mini-market*, *mini-skirt*, *mini-cab*; a rather contrived contrast is possible with 'maxi- 'large' (*maxi-length*) and less commonly 'midi- 'medium'. In ad hoc collocations, the stress is often on the base: 'They started a *mini(-)* factory.'
 OUT- (cf App I.26) 'surpassing', combines freely with nouns and intransitive verbs to form transitive verbs: *outnumber*, *outclass*, *outdistance*, *outgrow*, *outrun*, *outlive*.
 OVER- 'excessive' (hence pejorative), combines freely with verbs and adjectives; *overeat*, *overestimate*, *overreact*, *overplay*, *oversimplify*, *overwork*; *overconfident*, *overdressed*. In more locative senses, 'from above', it combines fairly freely with verbs (*overflow*, *overshadow*); cf App I.26 Note [b].
 SUB- 'below' (but cf also App I.26 Notes [a] and [b]), combines with adjectives: *subconscious*, *subnormal*.
 SUPER- 'more than', 'very special' (but cf also App I.26), combines freely with adjectives (eg: *supernatural*, *supersensitive*) and nouns (with prefix stressed, 'supermarket', 'superman', etc): 'on top', 'hierarchically superior', combines less freely with verbs (*super-impose*) and nouns (*superstructure*).
 SUR- 'over and above', combines with nouns and takes the stress: 'surcharge', 'surtax'.
 ULTRA- 'extreme', 'beyond', combines freely with adjectives (hyperboles like *ultra-modern*, *ultra-conservative*; technical items like *ultrasonic*, *ultraviolet*); and with nouns in technical usage, sometimes with the prefix stressed (*ultramicroscopic*, *ultrasound*, *ultracentrifuge*).
 UNDER- (cf App I.26 Note [b]) 'too little', combines freely with verbs and -ed participles (*undercharge*, *underestimate*, *underplay*; *underprivileged*, *underprovided*), and corresponding nouns (*underprovision*); with the meaning 'subordinate', it combines less commonly with nouns (eg: *undermanager*).

Note [a] Several of these prefixes were already incorporated into words before they were adopted and

in such cases they are frequently unanalysable semantically (*superficial*, *surrey*, *subject*, *ultramarine*, etc), as is sometimes shown by stressing that ignores the structure of the prefix (*superfluous*, *hyperbole*).
 [b] *Supervisor* and *overseer* seem to reflect their respective origins (neo-classical and native) by acquiring associations with nonmanual and manual work respectively; like *overseer* is *foreman*.
 [c] *Con-* (also *col-* and the original *com-*) has limited productivity in senses similar to those of *co-*: *combustion*, *collateral*, *compatriot*; but it chiefly occurs in words already incorporating it before they were adopted into English.
 [d] Implying 'minutely small', we have 'micro- in *microcomputer*, *microchip*, *microparticle*, *microfilm* etc; the antonymous prefix 'macro-' is also used.

Prefixes of orientation and attitude

- I.25** ANTI- (/æntɪ/ also /æntaɪ/ AmE) 'against', combines freely with denominal adjectives (*anti-social*, *anti-clerical*, *anti-clockwise*), and nouns (mainly to form premodifying adjectives; *the anti-war campaign*), as in *anti-missile*, *anti-war*.
 CONTRA- 'opposite', 'contrasting', combines with nouns, verbs, and denominal adjectives: *contradistinction*, *contraindicate*, *contrafactual*; with stress on the prefix, 'contraflow', noun, used of traffic.
 COUNTER- 'against', 'in opposition to', combines with verbs, abstract nouns, and denominal adjectives: *counter-espionage*, *counter-clockwise*; but often with main stress on the prefix: 'counteract (also counter'act)'; 'counter-revolution', 'countersink' (verb).
 PRO- (/prəʊ/) [i] 'for', 'on the side of', combines freely with denominal adjectives and nouns (mainly to form premodifying adjectives), eg: *pro-communist*, *pro-American*, *pro-student*.
 [ii] 'on behalf of', 'deputizing for', combines fairly freely with nouns, eg: *pro-consul*, *pro-provost*.

Note [a] *Anti-* (antonym, *pro-*) suggests simply an attitude of opposition, while *counter-* suggests action in opposition to or in response to a previous action. A *counterattack* can take place only if there has already been an *attack*.
 [b] In 'antibody' (exceptional in having initial stress), cf German *Antikörper*, -body does not have the ordinary sense of human or animate body, but rather the more technical sense of 'object' as in *foreign bodies*.
 [c] Where (as in the many adopted words like *provide*) *pro-* is not analysed as a prefix, it is usually unstressed, /prə/.

Locative prefixes

- I.26** These, like spatial prepositions (cf 9.14ff), may extend their meaning metaphorically to abstract spheres.
 FORE- (cf also App I.27) 'front part of', 'front', combines fairly freely with nouns such as *forearm*, 'foreshore', 'foreground'; 'foreleg', 'forename'.
 INTER- 'between', 'among', combines freely with denominal adjectives, verbs, and nouns; eg: *international*, *interlinear*, *inter-continental*, *intertwine* (v), *intermarry*, *interweave*. With nouns, the product is chiefly used in premodification: (the) *inter-war* (years), (an) *inter-school* (event), but cf also (with initial stress) 'interplay' (n).
 SUB- (cf also App I.24) 'under', combines fairly freely with adjectives, verbs, and nouns; eg: *subnormal*; *sublet*, *subdivide*, *subcontract*, *subsection* (, '... or '...'), 'subway'.

'SUPER- (cf also App 1.24) 'above' combines rather infrequently with nouns eg: 'superstructure, 'superscript.
'TRANS- 'across', 'from one place to another', combines freely with denominal adjectives and with verbs. Eg: *transatlantic, trans-Siberian; transplant, transship*; with initial stress where it was already present in adopted nouns: 'transport.

[a] In limited use we have 'in- and 'out- as in *inhouse* (adverb), *outhouse* and *outstation* (nouns).
[b] In nominalization of verbs along with their accompanying particles, the locative particles are frequently prefixed and stressed: 'overflow, 'overseer, 'outlook, 'output, 'outset, 'underpass, 'input, 'throughput.

[c] On the same prefixes already present in adopted words (*intermittent, translate*, etc), cf App 1.24 Note [a].

[d] Cf also *extra-* 'outside' and *intra-* 'within' which combine with adjectives in rather formal and technical use: *extra-territorial, intra-uterine*; these prefixes are sometimes pronounced with second syllable /a:/. The former is more productive: *extramural, extraterrestrial, extrasolar, extralinguistic*. The meaning is 'outside/inside the *N* from which the adjective is derived'.

Prefixes of time and order

I.27 EX- 'former', combines freely with (chiefly) human nouns, eg: *ex-president, ex-serviceman, ex-husband*. Cf the more general use of *ex-* in borrowed words with totally unstressed *ex-* (*expect*) and with voicing before a vowel (*examine* [gz/]).

FORE- 'before', combines fairly freely with verbs and nouns, eg: *foretell, forewarn, foreshadow; foreknowledge* ('... for some speakers), *foreplay, foretaste*.

POST- (/pəʊst/) 'after', combines freely with nouns (mainly as premodifiers) and denominal adjectives; eg: *post-war, post-election; post-classical*. Cf borrowed words: *postpone*, etc. Attributively there is often a stress switch (as with *pre-*, below): 'postwar (euphoria).

PRE- (/pri:/) 'before', 'in advance', combines freely with nouns (mainly as premodifiers) and denominal adjectives, eg: *pre-war, pre-school* (children), *pre-19th century, pre-marital*. More rarely, it combines with verbs, such as *pre-heat, pre-cook*. The more learned competing prefix *ante-* 'before' is found almost entirely in borrowed and neo-classical words (*antediluvian, antenatal*, etc). Cf unstressed /pri/ in borrowed words: *prevent*, etc. When *pre-* items are attributive, there is often a stress switch, as in 'pre-war (prices) (cf Note [a]).

RE- (/ri:/) 'again', 'back', combines freely with verbs and deverbal nouns such as *rebuild, reclaim, re-use, recycle, re-evaluate; re-analysis*. Occasionally, it combines with an adjective to yield a verb: *renew* (cf Note [b] below).

Note [a] Besides *pre-* there is, as we have seen, a more formal and rarer prefix *ante-* as in *antenatal*; even in technical use, its rarity is doubtless encouraged by the danger of confusion (in speech) with *anti-*.

[b] Several of these prefixes were already part of words in their adopted forms: eg: *prevent, postpone, expect, relieve*, etc; usually /t/, but /s/ in *represent* (cf App 1.24 Note [a]). In speech, the clearer enunciation of the productive prefixes (through secondary stress) usually makes them distinct, but in writing, ambiguity is possible between *recover* (/ri/) *my cushion* ['get it back again'] and *re(-)cover* (/ri:/) *my cushion* ['put a new cover on it']. In writing, a hyphen is usefully introduced after the productive prefix to make the distinction clear.

Neo-classical items

Number prefixes

I.28 Items that are originally Greek or Latin are widely used as the first constituent in a range of expressions dealing with numerical values. It is arguable that at least some should be treated as combining forms, ie as the first constituent in the class of compounds dealt with in App 1.66; cf the native analogues: *single-sex* (schools), *double-barrelled, three-sided*. But since some arbitrariness is involved in any case, we opt for treatment as prefixes, not least because unlike constituents entering into compounds - they are a regularly recurring and relatively closed set, with semantic affinities between them. The following combine fairly freely, especially in specialized terminology, with nouns and denominal adjectives:

BI-, DI- 'two', as in 'biplane, 'bicycle, 'biped, bi'lateral, bi'focal, bi'lingual; di'chotomy, 'diode, di'oxide, 'digraph, di'valent.

POLY-, MULTI- 'many', as in 'polyglot, 'polygon, poly'gamy, poly'andry, poly'semy, poly'technic; multi- items are used chiefly in premodification: multi'storey (building), 'multi-form, 'multi-lateral, 'multi-racial, 'multi-purpose.

SEMI-, DEMI- (less productive, HEMI-: chiefly scientific), 'half' as in 'semi-circle, 'semi-cowal, 'semi-quaver (music), 'semi-de'tached, 'semi-conscious, 'semi-automatic; 'demi-god, 'demi-john, 'demi-semiquaver, 'demi-tasse; 'hemi-sphere, 'hemi'algia, 'hemi'morphic.

TRI- 'three', as in 'tripod, 'tricycle, 'trima'ran, tri'mester, tri'partite, tri'nomial.

UNI-, MONO- 'one', as in 'unisex, 'univalve, uni'lateral, unidi'rectional; 'monorail, 'monoplane, mo'nogamy, 'monolith, 'monologue, monosyl'labic.

Note [a] Mono- is contracted in items like *monoxide*; note also the insertion of *n* in *bi'natural*. BI- with units of time (*bi'monthly, bi'weekly*) can be used both to mean 'every two (units)' or 'twice each (unit)'. A somewhat arbitrary distinction exists between *bi'ennial* 'every two years' and *bi'annual* 'twice each year', but this is ill-established and many people recognize no such distinction. Not surprisingly, alternative expressions are often used: 'two-yearly conferences' vs 'twice-yearly conferences'.

[b] The -(t)et ending in *quartet* has a native analogue, -some, as in 'two-some, 'four-some, 'a party of two, four'; cf also adjectival and adverbial -fold, as in *three-fold* ['three times'] etc.

[c] Higher numbers than three are less frequently involved: *quadril'ateral, pent'angle, sex'agonal, septuag'e'narian, oct'agonal*, etc. Note also sets like *di'et*, (*trio*), *quar'tet, quint'tet, sext'tet* etc. Du(o)- occurs also in *du'opoly, 'duo,tone*, etc.

Miscellaneous neo-classical prefixes

I.29 As was noted in App I.28, it is possible to regard such items as combining-forms (cf App I.66), effecting compounds; compare *self* in *self-denial, deputy* in *deputy-director, under* in *under-secretary*, etc.

AUTO- 'self', combines freely with nouns and adjectives; eg: *autosuggestion, autobiography, automation, 'autocrat*.

EXTRA- 'exceptionally', combines freely if informally with adjectives; sometimes written as a separate word: 'She was *extra affectionate* that day.'

NEO- 'new', 'revived', combines with nouns and adjectives, especially with reference to political, artistic, etc movements: *neo-classicism, neo-Gothic, neo-Nazi*.

PALEO- (also **-ÆO-**) 'old', chiefly in learned words like *paleography*, *paleolithic*.
PAN- 'all', 'world-wide', combines especially with nouns and premodifying
 denominal adjectives with reference to world-wide or continent-wide
 activities; eg: *pan-African*, *pan-Anglican*, *pan-American*.

PROTO- 'first', 'original', combines with nouns and adjectives such as *Proto-Germanic*, *prototype*.

TELE- 'distant', combines chiefly with classical bases to form nouns: *telescope*,
telegram, *telephone*; new items are largely concerned with electronic
 communication: *television* (or *tele-vision*), *telecommunications*; cf Blends, App
 I.76.

VICE- 'deputy', combines freely with nouns, as in *vice-chairman*, *vice-admiral*,
vice-president; cf also *viceroy*.

Conversion prefixes

- I.30** The following prefixes, with limited productivity in chiefly literary use, differ
 from those in other sections in having little discrete semantic value, their
 chief function being to effect a conversion (cf App I.43ff) of the base from
 one word class to another. In this respect they resemble suffixes, and, as the
 examples show, sometimes accompany suffixes in their conversion role. They
 are unstressed.

A- (/ə/) combines chiefly with verbs to yield predicative adjectives (cf 5.11);
asleep, *astride*, *awash*, *atremble*, *aglow*, *aloud*. The meaning is similar to
 that of the progressive; cf 'Her cheeks were aglow' ~ 'Her cheeks were
 glowing'.

BE- [i] functions along with *-ed* (cf App I.38) to turn noun bases into adjectives
 with somewhat more intensified force ('wearing or surrounded by') than is
 suggested by *-ed* alone: *bewigged*, *bespectacled*, *befogged*, *bedewed*;

[ii] intensifies the force of verbs: *bedazzle*, *bestir*;

[iii] combines with nouns to yield transitive verbs: *bewitch*, *bedevil*, *befriend*.
 Most such *be-* items have a pejorative or facetious tone.

EN-, **EM-** before /p/, /b/, combines chiefly with nouns to yield verbs ('to put
 into', 'to provide with'): *enmesh*, *empower*, *endanger*, *enflame*, *entrain*;
embitter.

Note In several *be-* words, change of meaning has made relations with the base obscure: eg: *belabour*,
beguile, *benighted*; moreover, compared with *beleaguer* ['besiege'], the base *leaguer* ['encamp'] is
 a rarely used word.

Suffixation

General

- I.31** As with prefixes, we shall concentrate on those suffixes that are in commonest
 productive use, but where our treatment of prefixes was on a generally
semantic basis, our treatment of suffixes is on a generally *grammatical* basis.
 This is because, while prefixes primarily effect a semantic modification of
 the base (but cf App I.30), suffixes have by contrast only a small semantic
 role, their primary function being to change the grammatical function (for
 example the word class) of the base; but cf Note below.

Thus, although suffixes are by no means uniquely associated with a

particular word class, it is convenient to group them according to the word
 class that results when they are added to a base. We therefore speak of **NOUN**
SUFFIXES, **VERB SUFFIXES**, etc. But, in addition, since particular suffixes are
 frequently associated with attachment to bases of particular word classes, it
 is also convenient to speak of them as **DENOMINAL SUFFIXES**, **DE-ADJECTIVAL**
SUFFIXES, etc. For example, *-ness* is a 'de-adjectival noun suffix' in that it
 forms nouns from adjectives such as *kind* or *gracious*. It is useful to extend
 this concept further and to speak of the derived words themselves as
DENOMINAL, **DEVERBAL**, etc: *graciousness* is a 'de-adjectival' formation.

The complications that we noted with prefixes, especially in the mixture
 of native and foreign, productive and nonproductive, are paralleled with
 suffixes, but in some ways they are more serious. It is true that, while we
 cannot semantically link the *pre-* of unitary adoptions like *prefer* with the
 productive *pre-* in *pre-heat*, the grammatical function of (for example,
-(a)tion) is recognizable as a noun ending whether or not English possesses a
 separate base (*nation*, *duration*, *ovation*, *portion*). It is true also that, in contrast
 with the variability of stress in prefixation, a suffix is more often an unstressed
 addition to a base. But unlike prefixation, suffixation with originally foreign
 items is often accompanied by stress shifts and sound changes determined
 by the foreign language concerned. Thus even where the spelling of the base
 remains constant, the stress differences in sets like the following involve
 sharply different vowel sounds; for example, in BrE, the *graph* element in the
 following is pronounced /ɑ:/, /ə/, and /æ/ respectively (cf App I.19):

'photograph ~ pho'tography ~ photo'graphic

Spelling as well as sound is affected in many sets; eg:

invade ~ invasion; persuade ~ persuasion, etc

permit ~ permission; admit ~ admission, etc

'drama ~ dra'matic, etc

able ~ a'bility, etc

infer ~ 'inference ~ infe'rential, etc

A further problem is that while productive prefixes can generally combine
 with bases of any origin, some of the originally foreign suffixes require
 originally foreign bases, and there has traditionally been some inhibition
 about forming 'hybrids'. This has resulted in pairs of (for example) nouns
 and denominal adjectives that are formally distinct:

mind ~ mental (*mindal)

nose ~ nasal (*nosal)

mouth ~ oral (*mouthal)

Note If suffixes had no more than a grammatical role, they would be like grammatical inflexions and
 have no place in word-formation. This indeed is how some linguists treat the adverb suffix *-ly*,
 and the line is not always clear. With *-ing*, it should be noted that, as well as appearing in
 lexicalized derivatives, it is also used in entirely predictable nominalizations; cf 17.51ff. Nouns
 in *-ing* are the 'verbal nouns' of 17.52ff (contrast 'deverbal' nouns):

He merely flouted the petty regulations.

~ His mere flouting of the petty regulations...

The situation is similar with agential *-er*, since for every verb (with a few exceptions such as
 copulas like *be*, *have*, *become*), a syntactic frame exists in which an *-er* form is predictable:

He merely flouted the petty regulations.

~ He was a mere *flouter* of petty regulations.

We have treated *-er* as a noun suffix because lexicalization is necessary before an *-er* formation (cf App I.34) can be used outside such a frame (**He is a flouter*). Although we have '*They watch/see/look at television a good deal*', it is *view* that has become the base for the lexicalized *viewer* as in '*Viewers will have noticed . . .*'. Note that although *bird-watcher* is thoroughly institutionalized, we do not say (**Watchers* may have noticed robins nesting in . . .).

It is significant that the fully and solely grammatical endings (like those for number, tense, comparison) always follow and cannot precede the derivational suffixes with which word-formation is concerned. This mirrors the way in which derivational affixes are part of the internal relations of a lexico-semantic unit, whereas inflections are concerned with the relations between this unit and the rest of the sentence or other grammatical construction. Exceptions ('two *spoonsful*', 'two *consuls-general*') attest to the general truth of this by their infrequency, by our tendency to move such 'infixes' inflexions ('two *spoonsfuls*', 'two *consul-generals*', but **passer-bys*), and by the normal deletion of plural *-s* in the first element of compounds ('a *trouser-leg*', 'trouser-seam'); but cf 17.108. Note also (*home*)ward journey, App I.41.

Noun suffixes

Denominal nouns: Abstract

- 1.32 Noun bases become largely noncount abstract, or aggregate nouns of status or activity, by means of the following suffixes:

- AGE (/ɪdʒ/) (cf App I.35) 'measure of', 'collection of', as in *baggage*, *frontage*, *mileage*.
- DOM, as in *officialdom*; this suffix, again not very productive, tends to convey pejorative overtones (though not perhaps in *stardom* and not in the old-established *kingdom*, which – in contrast to *kingship* – is concrete and countable).
- ERY, -RY (especially after /l/ and /t/):
 - [i] 'the condition or behaviour associated with', as in *drudgery*, *slavery*, *devilry* (also *deviltry*); often used in ironic nonce-formation: *nitwittery*, *take-over-biddery*, *day-trippery*, etc. There is some use of adjective bases: *bravery*;
 - [ii] 'location of', as in *nursery*, *rookery*, *refinery*, *bakery*, *numery*; these are used as concrete count aggregate nouns, and verb bases can be involved; there are occasional nonce-formations: *eatery* 'canteen';
 - [iii] noncount concrete aggregate nouns are rather freely formed, such as *machinery*, *rocketry*, *gadgetry*.
- FUL (/fʊl/, contrast App I.38), 'the amount contained in', as in *spoonful*, *glassful*, etc.; such freely formed nouns approach concreteness in meaning and are count; cf App I.31.
- HOOD, as in *boyhood*, *brotherhood*, *widowhood*; only mildly productive, though items like *sentencehood* can achieve limited currency; the base is occasionally an adjective, as in *falsehood*, which is both count and noncount.
- ING (cf also App I.35): [i] noncount concrete aggregates are fairly freely formed, such as *tubing*, *panelling*, *matting*, *carpeting*, all with reference to the material of which the base is made;
 - [ii] 'activity connected with', as in *cricketing*, *farming*, *blackberrying*. Such nouns, abstract and noncount, are fairly freely made (cf 15.13f, 17.53f).

-ISM 'doctrine of', 'practice of', as in *Calvinism*, *idealism*, *impressionism*, *fanaticism*, *absenteeism*, *racism*. The items concerning religion, politics, philosophy, and art usually have a corresponding item in *-ist* to denote adherents or practitioners: cf App I.37.

-OCRACY 'government by', as in *democracy*, *aristocracy*, *meritocracy*; they can be count and have corresponding personal nouns, *democrat*, etc. They might be seen as combining-form compounds; cf App I.66.

-SHIP, as in *friendship*, *membership*, *dictatorship*, *professorship*; most items with this limitedly productive suffix can also be count and some have an adjective base (as in *hardship*); *lectureship* is less common than the irregular *lectureship*.

Note [a] With *-ery* [ii], compare the ultimate cognates *-teria* (largely in commercial coinages, such as *cafeteria*, *washeteria*), *-(a)torium* (as in *auditorium*, but also commercially used as in *lubritorium*), and *-(i)ory* (as in *dormitory*).

[b] The suffix *-er* can also effect abstract nouns in the sense of 'instance, process of V': 'The two firms are arranging a *merger*.'

Denominal nouns: Concrete

- 1.33 In contrast with those in App I.32, the following noun suffixes combine with noun bases to yield concrete and individualizing items over a rather wide semantic range. Only *-er* is freely productive. Note that some items (rarely for suffixes) become the stressed syllable in the derived word: *-eer*, *-ette* invariably.

-EER 'skilled in', 'engaged in', as in *pamphleteer*, *profiteer*, *racketeer*; often pejorative (especially where this is suggested by the base), but not in *mountaineer*, *auctioneer*, *engineer*.

-ER (contrast App I.34), 'having as dominant characteristic', 'denizen of', as in *teenager*, *north-wester* (of wind), *three-wheeler*, *villager*, *Londoner*; in tone, this resembles the 'familiarity markers' of App I.77. In *cooker*, *roaster*, *boiler* ['cooking apple', 'boiling fowl' etc], the base seems to be a verb; but cf: *-ing* [ii] in App I.32.

-ESS as in *waitress*, *actress*, *lioness*, *manageress*, *stewardess*, *hostess* (the last four sometimes have stress on the suffix); adds feminine marking to animate nouns; sometimes the vowel of the preceding unstressed agential suffix is elided: cf: *wait* (at table) ~ *waiter*, *waitress*; cf also Note [a], and 5.105.

-ETTE [i] 'compact', fairly productive, as in *kitchenette*, *dinerette*;

[ii] 'imitation', as in *flannelette*, *leatherette*; formerly common in commercial coinages;

[iii] a feminine marker, as in *suffragette*, *usherette*; cf Note [a].

-LET 'small', 'unimportant', as in *booklet*, *leaflet*, *piglet*, *starlet*.

-LING 'minor', 'offspring of', as in *princeling*, *duckling*; other bases beside nouns are involved, as in *hireling*, *underling*. Where the referent is human, the formation is somewhat contemptuous.

-STER 'involved in', as in *trickster*, *gangster*, *gamester*; usually pejorative, but not in *roadster* (style of vehicle).

Note [a] Changing attitudes to women and to sex discrimination have much reduced the use of *-ess*, *-ette*, and compounds in *woman-*, *girl-*. Surviving usage would refer to the designation of an

activity (*hostess*, *stewardess*) rather than to the sex of the person performing it; thus the same woman might say 'I am an actress' and 'I am a bad actor'. Since there are roles that must be filled by women, *actress* is tolerated where *authoress* and *poetess* have no such justification and are now in consequence rarely used. For other but related social reasons, *Jewess* and *negress* are little used. Note that in 'The *master/mistress* of the house' different roles are involved; teachers referred to as *form-master*, *form-mistress* (chiefly BrE) are however in the same role. The use of *master* for role irrespective of sex is to be found in:

- She is giving *master* classes (**mistress*) in piano.
- She is now a *master* in the art of dodging work.
- She has now *mastered* the art of etching.
- She now has *mastership* of the whole matter.

- [b] Formations like *policeman*, *chairperson*, are treated as compounds; cf App 1.13, 1.61.
- [c] With *-let*, *-ling*, cf familiarity markers, App 1.77.

Deverbal nouns

- 1.34** The following suffixes combine with verb bases to produce concrete count nouns, largely of personal reference; *-er* is particularly productive.

- ANT**, a chiefly formal agential, as in *inhabitant*, *contestant*, *informant*; it often corresponds to verbs in *-ate*: *participate* ~ *participant*, *lubricate* ~ *lubricant*. As the last example shows, reference may be nonpersonal.
- EE** 'one who is object of the verb', as in *appointee*, *payee*; in some cases, as with *-ant*, it may replace the verb ending *-ate*: *nominnee*. There are examples without verb base or 'object' meaning: *absentee*, *refugee*. Stressing is exceptional in *employee*.
- ER, -OR** (contrast App 1.33), forms agential nouns (cf 17.51ff on nominalization), as in *singer* ['one who sings (especially) professionally'], *writer*, *driver*, *employer*, etc; used informally also with phrasal verbs (*washer-up*, *chucker-out*) and with object-verb compounds and some comparable compounds (*window-cleaner*, *high-flier*). Agentials may also be nonpersonal: *silencer*, *computer*, *thriller*. With neo-classical bases, the suffix is often spelled *-or* (*accelerator*, *incubator*; *supervisor*, *survivor*; *actor*); so too in cases where there is no free base (*author*, *doctor*, etc).

- 1.35** The following suffixes combine with verb bases to produce largely abstract nouns, nominalizations of the action expressed by the base:

- AGE** (/ɪdʒ/) (cf App 1.32), 'action of', 'instance of', abstract and usually noncount, as in *breakage*, *coverage*, *drainage*, *leverage*, *shrinkage*, *wastage*.
- AL** 'the action or result of', chiefly count, as in *refusal*, *revival*, *dismissal*, *upheaval*.
- ATION** [i] 'the process or state of', normally used as noncount, as in *exploration*, *starvation*, *ratification*, *victimization*; [ii] 'the product of', 'the institution produced by', aggregate count nouns, as in *foundation*, *organization*. This suffix freely combines with verb bases in *-ize*, *-ify*, *-ate*, with stress shift where necessary (cf: 'justify', 'educate'). Pronunciation and stress suggest that analogous endings already present in adopted nouns (often paired with adopted verbs: *decide* ~ *decision*, etc) are analysed as related even though they are not productive.
- ING** (contrast App 1.32 and the verbal noun, 17.52ff), concrete count nouns referring to what results from the action of the base, as in *building*, *opening*,

filling (in tooth); some are obligatory plurals: *earnings*, *savings*, *shavings*. Occasionally the formations are noncount: *stuffing*, *clothing*. The abstract count items *christening*, *wedding* refer rather to the occasion of the base verb's activity.

-MENT (/mənt/) 'the result of', as in *arrangement* (count), *amazement*, *puzzlement*, *embodiment*; in some cases the formation is concrete (eg: *equipment*, noncount), and *management* can be both abstract noncount and concrete aggregate count.

Note The glosses cannot capture the aspectual essence of the nominalizations in *-ation*, *-ment*, etc in contrast to those in the *-ing* verbal noun. Note the gradience presented in 17.54. The word-formations described in this section are relatively remote from the conduct of the action itself, and even at their 'most verbal' refer rather to the action as a whole event, including its completion. Compare:

- His *exploring* of the mountain is taking a long time.
- His *exploration* of the mountain took/will take three weeks.

De-adjectival nouns

- 1.36** There are two very common suffixes by means of which abstract (and normally noncount) nouns are formed from adjective bases:

-ITY, especially associated with adjectives of neo-classical or French origin, with stress shift wherever necessary, to place the stress on the last syllable before the suffix as in *elastic* ~ *elasticity*, *rapid* ~ *rapidity*; further examples: *sanity*, *falsity*, *diversity*, *banality*. The vowel of the stressed syllable is often changed from long to short: eg: *verbose* /əʊ/ ~ *verbosity* /ɒ/. The suffix is freely productive, especially with adjectives in *-able* (*respectability*), *-al* (*actuality*) and *-ar* (*regularity*). But there are examples in which the affix was already present when the word was adopted: eg: *eternity*, *humility*; these lack a direct adjective base in English (cf also App 1.39 Note [a]).

-NESS, fairly freely added to any type of adjective, as in *meanness*, *happiness*, *usefulness*, *kindness*, *selfishness*, *unexpectedness*, *stoutheartedness*, *accurateness*, *falseness*. Items (including phrases) in common premodifying or predicative use can equally take the suffix: *up-to-dateness*.

Note [a] Both suffixes occur also in 'frozen' items in which no base is identifiable (*leeriness*, *business*, *'biznis*).

[b] These two suffixes resemble *in-* and *im-* both in their predominant association with foreign and native bases respectively, and in the tendency for *-ity* and *in-* to be especially associated with greater lexicalization, *-ness* and *im-* with direct reference to the adjective bases in ad hoc formations. Compare *pompousness* and *pompacity*: it is even possible to imagine an occasion when the ad hoc *inflexibility* would be used rather than the institutionalized *inflexibility*. *Musicality* will tend to refer to technical properties in a piece of *music* (the base tending to be nongradable); *musicalness* to the degree to which the gradable quality *musical* obtains. Formations in *-ness* also exist beside other de-adjectival formations: *normalness* ~ *normality* ~ *normalcy* (esp AmE); *(un)justness* ~ *(in)justice*; *accurateness* ~ *accuracy*; *ineptness* ~ *ineptitude*; *infiniteness* ~ *infinitude* ~ *infinity*. The need for a *-ness* formation is clearer where the lexicalized item has developed a meaning relatively remote from the ordinary meaning of the adjective base: eg: *sensible* ~ *sensibility* ~ *sensibleness*. In any event, the *-ness* items are less lexicalized and can be conveniently used to refer directly to the adjective.

There is nothing particularly odd about him; he's perfectly normal, and in fact it's his very *normalness* that makes him seem boring.

Noun/adjective suffixes

- I.37 A number of suffixes yield items that can be used both as nouns and as (normally nongradable) adjectives. The formations basically relate to human beings, chiefly as members of a group, and may be both denominal and de-adjectival. On nationality names, cf also 5.56f.

- ESE (AmE usually -ESE) cf 5.88. [i] 'member of' (nationality or race), as in *Chi'nese*, *Portu'guese*, *Japa'nese*;
 - [ii] '(in) the language of, the style of', as in *Chi'nese*, *Canto'nese*, *Johnso'nese*, *journ'a'lese*; both nouns and adjectives, except those relating to style (such as *officia'lese*) which are nouns only and are pejorative.
 - (I)AN [i] 'adherent to', as in *Dar'winian*, *Eliza'bethan*, 'Chomskyan, (sub)urban (adjective only);
 - [ii] 'relating to', as in *Shake'spearian*, *re'publican*;
 - [iii] 'citizen of', as in *Pa'risian*, *Indo'nesian*, *Chi'cagoan*, *Glas'wegian* (of Glasgow);
 - [iv] '(in) the language of', *Indo'nesian*, 'Russian (where the base ends in -a). The stress falls on the last syllable before the suffix. Most items can be used both as nouns and as adjectives, not gradable in [iv], variably in other instances: *The place is (awfully) urban*; *She is an (*awfully) urban guerilla*.
 - IST 'skilled in', 'practising', as in *violinist*, *stylist*, *rac(ial)ist*, *masochist*, *Calvinist*, *socialist*, *loyalist*. Items relating to adherence as distinct from skill are normally paired with abstract nouns in -ism (cf App I.32) and may be adjectives or nouns, though adjectival endings, -ic(al), may be added; cf App I.39. A final vowel in the base is often omitted: *cello* ~ *cellist*. Skill items may have verb bases, as with *typist*, and are nouns only.
 - ITE [i] 'adherent to', 'member of (set)' as in *Benthamite*, *shamanite*, *Chomskyite*, *socialite*; these are primarily nouns but may be adjectives (*He is a Luddite*; *His views are rather Luddite*). The bases are chiefly personal names of those who have led movements;
 - [ii] 'denizen of', as in *Brooklynite*, *Hampsteadite*; these are nouns only.
- Formations of both types tend to be used disparagingly unless long-established (*Israelite*) or where a movement excites little hostility (*Benthamite*).

- Note [a] Some bases can take -ist, -ian, and -ite, equally. The first would suggest greatest commitment to the views or theory concerned: 'He is an out-and-out Darwinist'. It is used of ideas rather than of their proponents. The second would be more neutral and would lend itself in consequence to use more readily as a gradable adjective ('Isn't that approach rather Darwinian?'), but can also refer to the work of Darwin himself (as *Darwinist*, *Darwinite* cannot). The third tends to be disparaging and would be used chiefly by those who are not themselves adherents: 'He is a Darwinite', rather than 'Are you a Darwinite?' or 'I am a Darwinite'; a faction is implied.
- [b] With -ian should be compared the more restricted use of -arian to form personal nouns and adjectives as in *authori'tarian*, *vege'tarian*, *octoge'narian*.

Adjective suffixes

Denominal suffixes

- I.38 A wide range of suffixes exists having the function of forming adjectives, especially from nouns. We begin with those that retain a native flavour:

- ED (cf participial -ed, 3.2, 17.29), 'having', forms largely nongradable adjectives from nouns and especially from noun phrases: *wooded*, *pointed*, *walled*; *simple-minded*, *blue-eyed*, *blonde-haired*, *fuller-flavoured*, *odd-shaped*, *giant-sized*. These formations are to be distinguished from compounds like *much-travelled*, *self-styled* (cf App I.68f), where the second part is a verb. In some cases (eg: *three-legged*), the suffix is syllabic /ɪd/ under phonological conditions where inflexional -ed would not be; several formations are gradable: *aged*, *crooked*, *ragged*.
- FUL (usually /fəl/; contrast App I.32). 'full of', 'providing', combines with chiefly abstract nouns to form gradable adjectives, as in *useful*, *delightful*, *pitiful*, *successful*, *helpful*; sometimes the base is a verb: *forgetful*.
- ISH [i] freely used with largely concrete nouns, 'somewhat like', as in *childish*, *monkeyish*, *foolish*, *roguish*, *snobbish*; with adjective bases, the meaning is 'somewhat', as in *coldish*, *brownish*; with people's ages, 'approximately', as in *sixtyish*; cf also 'She'll arrive about tenish';
- [ii] with names of races, peoples, and languages, -ish forms nongradable adjectives and (with respect to languages) nouns: *Swedish*, *Cornish*, *Turkish*; cf -(i)an [iii], [iv], App I.37.
- LESS 'without', combines with both abstract and concrete nouns, formations with the latter being usually nongradable: *careless*, *restless*, *colourless*, *harmless*; *childless*, *homeless*. The suffix is often used as the antonym of -ful (*useful* ~ *useless*, *careful* ~ *careless*) but separate lexicalization makes some pairs nonantonymic (*pitiful* ~ *pitiless*, etc).
- LIKE 'like', freely used with largely concrete nouns, as in *childlike*, *statesmanlike*, *monkeylike*; such formations might be regarded as compounds, and the relation between base and suffix is very direct: *x-like* means 'like (an) x'.
- LY (cf App I.41) [i] with largely concrete nouns, 'having the qualities of', as in (wo)manly, soldierly, motherly, brotherly, friendly, cowardly, deathly; there is also some use of adjective bases: *deadly*. With *comely*, no relation to a base is semantically recognized;
- [ii] with nouns that are units of time, 'every', as *daily*, *weekly*, etc.
- Y 'somewhat like', 'characterized by', freely used with largely concrete nouns to form gradable adjectives, often of colloquial tone, as in *sandy*, *meaty*, *creamy*, *hairy*, *wealthy*, *filthy*; *comfy* (cf App I.77); the bases may also be verbs as in *gushy*, *runny* (nose). In *sandy hair* we have the 'somewhat like' sense; in *sandy beach* the 'characterized by' sense.

- Note [a] Among other denominal adjective suffixes, we may mention -some 'constituting', as in *burdensome*, *frolicsome*, *bothersome*; -worthy 'fit for', as in *praiseworthy*, *prizeworthy*, *seaworthy*.
- [b] Where -like and -ish occur with the same base, the latter is relatively pejorative and more remote from literal comparison. In *manly*, *manlike*, *mannish*, the first refers to physical or heroic qualities (in a male), the second is a simile, usually applied to nonhumans, the third refers to unwelcome masculine attributes (usually in a woman).

- I.39 The denominal adjective suffixes in our second group are of foreign origin and although some of them are among the commonest suffixes in use, they retain something of their foreign origin in relative formality and in being largely used with bases that have also been adopted. Correspondences both with bases and with further derivations often reflect patterns of Latin

morphology. All the suffixes have the meaning roughly paraphrasable as 'having the properties of' or more generally 'having a relation to (the base)'; the adjectives formed are usually gradable.

- AL, also -IAL (especially after bases in -or), -ICAL (especially replacing the final -y of bases), as in *accidental*, *dialectal*; *editorial*, *professorial*; *psychological*, *philosophical*. It will be seen that stress is affected, usually coming on the last syllable before the suffix (cf App I1.3ff); 'cultural', 'cynical', 'musical' are among the exceptions.
- ESQUE, apart from its use in words of which it already formed a part when adopted (*burlesque*, *arabesque*), now chiefly used with names prominently associated with artistic individuality: *romanesque*, *Kafkaesque*, *Daliesque*.
- IC (cf Note [c] below), with the same stress rule as for -al; eg: *atomic*, *heroic*, *oceanic*, *specific*; with some bases in -em, the suffix is -atic (*problematic*, *phonematic* beside *phonemic*). The suffix is also used for nongradable ethnic adjectives and for the names of the corresponding languages: *Celtic*, *Arabic* (contrast *Arabian*; cf 5.57 Note [d]).
- OUS (also -IOUS, especially when replacing -ion, -ity in bases so ending), as in *de'sirous*, *virtuous*, *grievous*, *ambitious*, *vi'vacious*, the stress usually placed on the last syllable before the suffix. Several formations are slightly irregular; eg: *courteous*, *erroneous* (cf 'courtesy', 'error').

- Note [a] The noun suffix -ity (cf App I.36) can be attached to -al, -ic, and -ous, but its addition entails certain changes. The suffix -al receives the stressed pronunciation /æ/ in place of /ə/ ('neutral' ~ 'neutrality'); -ic changes its pronunciation from /ik/ to /is/ (*electric* ~ *electricity*); -ous changes its spelling to -os-, and receives the stressed pronunciation /ɒs/ instead of /ʊs/ (*curious* ~ *curiosity*). [b] Nouns in -ite (cf App I.37) do not accept adjective suffixes (except -ish), but those in -ist accept -ic and -ical; indeed with an -ist item as a nongradable adjective, we have an interesting series in rare cases:

He is an atheist/egotist.
His views are (solidly) atheist/egotist.
His views are (rather) atheistic/egotistic.
His views are (slightly) atheistical/egotistical.

A diminishing degree of the -ism is implied; -istic, -istical also tend to be disparaging: cf *casuistical*.

- [c] In some adjectives, -ic alternates with -ical, with a difference of meaning:

a classic performance	~	classical languages
{ 'great', 'memorable' }		{ 'Latin and Greek' }
a comic masterpiece	~	his comical behaviour
{ 'of comedy' }		{ 'funny' }
an economic miracle	~	the car is economical to run
{ 'in the economy' }		{ 'money-saving' }
an electric light	~	an electrical fault
{ 'powered by electricity' }		{ 'of electricity' }
a historic building	~	historical research
{ 'with a history' }		{ 'pertaining to history' }
his politic behaviour	~	political parties
{ 'tactful' } (unusual)		{ 'concerned with politics' }

- [d] There are several less common neo-classical affixes, among which -ary, -ate, and -ory are particularly notable: *revolutionary*, *affectionate*, *obligatory*. Adjectives in -ory alternate (with or without stress shift) with nouns in -ion, *obligatory* ~ *obligation*, *satisfactory* ~ *satisfaction*. Both -ary and -ory are reduced in BrE to /əri/ or /rɪ/; in AmE they are often given a secondary stress, and are distinguished in pronunciation as /eri/ and /ori/ or /əori/.

Deverbal suffixes

- I.40 Two common suffixes are used to form adjectives (largely gradable) from verbs and they are in polar contrast in respect of verbal voice: -ive is fundamentally related to the active, 'of the kind that can V'; -able is fundamentally related to the passive, 'of the kind that can be V-ed'. Thus 'The idea attracts me' ~ 'The idea is attractive'; 'The text cannot be translated' ~ 'The text is untranslatable'; *supportive* 'can support', *supportable* 'can be supported'.

-ABLE fairly freely combines with transitive verbs to produce gradable adjectives, 'of the kind that is subject to being V-ed', as in *debatable*, *washable*, *drinkable*, *manageable*. In many adopted words the suffix was already present, sometimes in the variant forms -ible, -uible, which are not productive in English, but where the passive relation can still be found: *inevitable* 'cannot be avoided', *visible* 'can be seen', *soluble* 'can be dissolved'. As with passive verb phrases, the agent can sometimes be expressed with a *by*-phrase (though chiefly a general agent rather than a specific one: 'The comet was observable by anyone owning a powerful telescope' but '... observable by John'). With *visible* the instrument is indicated with *to* ('The naked eye cannot see this' ~ 'This is not visible to the naked eye'). Passive adjectives in -able are chiefly used in negative clauses or with negation by affixation: 'His story is not refutable' ~ '... is irrefutable' ~ '... is unrefutable'; instead of 'His story is refutable', we would normally use 'His story can be refuted'.

In addition, however, -able yields no passive meaning but rather has a sense paraphrasable as 'apt to V': *changeable* (weather), *perishable*, *suitable*, etc. Bases may also be nouns, sometimes implying a modalized passive sense (*marriageable*, *saleable*), sometimes not (*peaceable*, *fashionable*, *seasonable*, etc).

- IVE, as in *attractive*, *effective*, *possessive*. In many cases the relation between the verb and adjective reflects Romance morphology: *produce* ~ *productive*, *explode* ~ *explosive*, *expand* ~ *expansive*, *presume* ~ *presumptive*, etc. In others, on the pattern of *decorate* ~ *decorative*, a longer affix, -ative, is used: *talkative*, *affirmative*, *causative*. Occasionally the base is a noun (*secret* ~ *secretive*) and sometimes the relation to the base is obscured (as in *sensitive*, *emotive*). The stress pattern of the base is not usually affected by the addition of -ive.

- Note [a] Prefixal negation with adjectives in both -ive and -able treats the whole of what follows as the base: thus *untranslatable* has the structure *un(translatable)* and does not mean 'possible not to translate' but 'not possible to translate'. Contrast privative *un-* (cf App I.22): 'I found the equipment readily *unpackable* [to be understood as 'easy to unpack'] but certainly not *unbreakable* [easily breakable].

[b] Prepositional and phrasal verbs usually form -able adjectives with omission of the particle: 'We can rely on John' ~ 'John is *reliable*'; cf: *unspeakable*. This has the effect of making *washable* capable of two interpretations: 'This shirt is *washable*' [= 'can (safely) be washed']; 'This ink is *washable*' [may = 'can be washed out/away', though in fact it may indicate a guarantee that water can be applied without the writing being washed out]. But cf also phrasal items (informal): *unget-at-able*, *unliveable with*. With *agreeable*, there are three uses: 'companionable', 'willing to agree', 'can be agreed to': in this last sense it is predicative only:

I have *agreeable* friends.
Eventually, my friends were *agreeable*.

We must find a formulation that is *agreeable* to everyone.
 [c] Sometimes a passive *-able* adjective can be predicated only of an inanimate, where no such restriction obtains in the corresponding transitive clause:

The error } is *forgivable*/pardonable.
 •The man }

We can forgive/pardon { the error.
 the man.

[d] Although the modality of most passive *-able* adjectives is usually potential ('can be'), with some it is intentional or obligatory ('will be', 'must be'). Compare:

The deposit is *refundable*. ['will']
 The money is *payable* on delivery. ['must']
 The money is *payable* by cheque. ['can']

[e] Given that *-able* adjectives may be active (*changeable*) as well as passive, some items can be either:

The weather is *variable*. [must be active]
 The date is *variable*. [may be passive]

[f] Some adjectives in *-able* have front-shifted stress:

'*admirable* (ad'mire), 'preferable

[g] Since, like *-ly* (cf App I.41), *-able* can be fairly freely used in nonce-formation, an indication of spelling convention may be given. Bases in final *-y* have this replaced by *i* (as in *deniable*), but final *-e* is usually retained, especially where a misleading pronunciation might otherwise be suggested (thus *enticable*, **enticable*; *expungeable*, **expungeable*).

Adverb suffixes

I.41 *-LY* (cf 7.46f, App I.38) can be very generally added to an adjective in a grammatical environment requiring an adverb (gradable if the adjective concerned is gradable), so that it could almost be regarded as inflexional; cf App I.31 Note. The meaning can often be paraphrased as 'in a . . . manner', as in *calm* ~ *calmly*, or 'to a . . . degree', as in 'She looks *extremely* well', or 'in a . . . respect', as in 'Personally, he would be suitable'. The range of meanings is related to the range of adverbial functions: cf 8.2ff, 8.24ff. With adjectives in *-ic*, *-al* is usually added before the suffix (eg: *scenic* ~ *scenically*); cf App I.39 on the relation of adjectival *-ic* and *-ical*. No *-al* is inserted in *publicly*, but in any case the insertion is inaudible since there is elision: *scenically* is pronounced /sɪˈnɪklɪ/. The restrictions on the use of *-ly* may be summarized as follows: [i] there are some adjectives with no separate adverbial form (eg: *fast*, *hard*); [ii] *-ly* is not added to adjectives ending in *-ly* (cf 7.9, App I.38); **cowardlily*, though occasionally one finds *sillily*, *friendlily*; more usually, prepositional phrases or synonyms are used (*amicably*); [iii] there is avoidance of *-ly* also with adjectives ending in /l/, as with *hostile*, and it is usual to substitute a prepositional phrase such as 'with hostility'; exceptions include *wholly*, *solely*; [iv] *-ly* is not added to some miscellaneous adjectives (eg: *difficult*, but cf Note [a]). On the other hand, especially informally, *-ly* can be used with phrases, as in 'She spoke quite *matter-of-factly* on the subject'.

-WARD(S) forms nongradable directional adverbs where the base may be a noun as in *earthward(s)*, a prepositional adverb as in *onward(s)*, or a directional adverb as in *northward(s)*. Nonce-formations like *theatreward(s)* or *Chicago-ward(s)* are common if jocular. The forms without *-s* are usual in printed AmE, those with *-s* are usual in BrE and are common in spoken AmE. This type of adverb lends itself to premodification in its form without *-s*: 'Homeward journeys are the happiest'.

-WISE is used to form nongradable adverbs from noun bases: [i] in relation to manner, as in *clockwise*, *crabwise*, it is limitedly productive; [ii] in relation to dimension, as in *crosswise*, *lengthwise*, it has a variant, *-ways* (*lengthways*), which is in fact more usual with the item *sideways*; [iii] in the sense 'so far as [the base] is concerned', as in *education-wise*, *moneywise*, it is more freely productive in AmE than in BrE, but many people object to these formations.

Note [a] Occasionally one hears (hardly reads) such forms as *difficultly*, sometimes as a slip of the tongue with subsequent correction, sometimes unconsciously and uncorrected; but sometimes the usage is quite deliberate, as in the following:

The doctor explained her diagnosis expertly enough but *difficultly*. I mean, the explanation was hard to understand.

The speaker's addition suggests awareness that the prepositional phrase *with difficulty* would have been inappropriate here in implying that the doctor herself found explanation difficult to formulate. Cf also 'The staff find themselves *difficultly* placed', meaning 'placed in a difficult situation', not 'placed with difficulty'.

[b] Since *-ly* can be used with a freedom akin to that with inflectional endings, it may be mentioned that there are some generally observed spelling conventions. Bases in *-y* have this replaced by *i* (as in *sloppily*). Bases with final *-e* usually retain it (as in *solely*; *wholly* is exceptional), except where syllabic *l* is involved; here as in *simple*, *probable* etc. *e* is dropped and only *y* added, the *l* ceasing to be syllabic (*simply*, *probably*). Thus:

/sɪmpl/ ~ /sɪmplɪ/

In the rare cases of final *-ll*, no additional *l* is added but the consonant is lengthened in pronunciation: *fully*, *shrilly*.

[c] Nongradable adverbs are also formed by adding *-style* or *-fashion* to chiefly noun bases: 'He dresses *bank-manager-style*', 'He swims *dog-fashion*'. Such formations resemble compounds based on noun-phrase structure, and where the base is itself equivocal (as in 'She eats *American-style*') they can be related to 'the style/fashion of N' or 'the Adj style/fashion'. Here might be mentioned *fold* as in *three-fold*, *five-fold*, 'three (five) times as much'.

Verb suffixes

I.42 Only a few verb-forming suffixes occur with any great frequency in English, and only *-ize* is highly productive. All are concerned with forming transitive verbs of basically causative meaning.

-ATE (/eɪt/) combines with chiefly neo-classical noun bases, as in *orchestrate*, *hyphenate*: the suffix is especially productive in scientific English as in *chlorinate*, (*de*)*lamine*, etc.

-EN combines with adjectives as in *deafen*, *sadden*, *tauten*, *quicken*, *ripen*, *widen*, *harden*. As well as being causative, 'to make . . .', many of these can also be used intransitively, 'to become . . .': *The news saddened him* ~ *His face saddened*; this may be regarded as a conversion; cf App I.43ff.

-IFY, *-FY* (/fɪ, faɪ/), combines with adjectives and nouns, as in *simplify* 'to make simple', *amplify* 'to express more fully', *codify* 'to put into code', *beautify* 'to endow with beauty'. It is most commonly found with neo-classical bases (*certify*, *identify*, etc, sometimes with a difference in stem as in *electrify*, *liquefy* ['to put into liquid form']), and formations outside this type of lexicon are often facetious or pejorative: *speechify*, *dandify*, etc.

-IZE (-ISE) combines freely with adjectives and nouns, as in *modernize* ['to make modern'], *legalize* ['to make legal'], *symbolize* ['to act as a symbol of'], *hospitalize* ['to put into hospital' (for treatment)], *publicize* ['to make well known'], *dieselize* ['to convert to diesel-engined power'], *burglarize* <AmE>

['to subject to burglary']. Formations lend themselves readily to nominalization in *-ation*, as in *nominalization* itself. Over-use and new use of *-ize* items is often criticized on stylistic grounds. The dominant spelling is *-ize*. There is some confusion of *-ize* with the ending *-ise* in some verbs (eg: *advertise*).

Note Where there is a corresponding adjective, the ending *-ate* is usually unstressed /ə/, giving some contrasting pairs *appropriate* (verb) - *appropriate* (adjective)

Conversion

Conversion and suffixation

- I.43 Conversion is the derivational process whereby an item is adapted or converted to a new word class without the addition of an affix. In this way, conversion is closely analogous to suffixation (as distinct from prefixation). For example, the verb *release* (as in *They released him*) corresponds to a noun *release* (as in *They ordered his release*), and this relationship may be seen as parallel to that between the verb *acquit* (as in *They acquitted him*) and the noun *acquittal* (as in *They ordered his acquittal*):

	VERB		DEVERBAL NOUN
SUFFIXATION:	acquit	→	acquittal
CONVERSION:	release	→	release

Conversion is unusually prominent as a word-formation process, through both the variety of conversion rules and their productivity.

- Note [a] Other terms for conversion are 'functional conversion', 'functional shift', and 'zero derivation'. This last reflects the notion of a 'zero' suffix, analogous to the actual suffixes of App I.32ff.
[b] Conversion includes, in this treatment, cases where the base undergoes some slight phonological or orthographic change, eg: *shelf* ~ *shelve* (cf App I.56).

Direction of conversion

- I.44 Certain difficulties arise in describing conversion, in that one does not have the addition of a suffix as a guide when deciding which item should be treated as the base and which as the derived form. Of course, as with other types of word-formation discussed in this Appendix, we treat conversion not as a historical process, but rather as a process now available for extending the lexical resources of the language. From this point of view, it is irrelevant whether the verb *release* preceded the noun *release* as an acquisition of English vocabulary (cf App I.11 Note [b]).

Nevertheless, it is convenient to attempt to state such a precedence, and often the semantic dependence of one item upon another is sufficient ground for arguing its derivational dependence. For example, the verb *net* can be paraphrased in terms of the noun as 'put into a net', but no comparable paraphrase could be constructed for the noun; that is, to define *net* in some

such terms as 'an instrument for netting' would be to limit the meaning of the noun quite arbitrarily to exclude (for example) strawberry nets, mosquito nets, and hair nets.

This criterion cannot be easily applied to *release* above, but one may note that *release* as a noun is parallel to other nouns derived from verbs in dynamic use as regards semantic restrictions: that is, one may say *His release was sudden* (on Tuesday, etc just as one may say *His discovery/promotion etc was sudden* (on Tuesday, etc. Moreover, *release* behaves as a deverbal noun in structures of 'nominalization' (cf I.7.5ff): *his release by the government; the government's release of the prisoners*. On these grounds, we treat abstract and agential nouns (eg: *love*, *rebel*) as derived.

In the survey of types of conversion that follows, we resume the principle of classification that was adopted for suffixation: this means that we group words according to the class of the base and the class of the word derived. Thus *release* is to be classed as a deverbal noun in App I.47.

'Partial conversion'

- I.45 Some grammars make a distinction between 'full conversion' (ie conversion as already discussed) and 'partial conversion', where a word of one class appears in a function which is characteristic of another word class. One may argue, for instance, that in such structures as *the wealthy* [= 'wealthy people'], *the ignorant*, *the wicked*, the adjective is 'partially converted' to noun status, in that it is syntactically in a position (head of noun phrase) characteristic of nouns rather than adjectives (cf 7.2ff). That there is not full conversion in such cases is demonstrated by the inability of *wealthy*, as it occurs in sentences like *The wealthy are always with us*, to behave inflectionally like a noun (that is, to vary in terms of number and case). One cannot say **I met a wealthy*; **Those wealthies are my friends*; etc.

Indeed, it is doubtful whether this rather restricted use of adjectives should be treated as a word-formation process at all; not only is there no inflectional evidence of the word's status as a noun, but there is inflectional evidence of its unchanged status as an adjective: *the wealthier*, *the poorest*, etc. Moreover, there does not appear to be any of the partial productivity, or the distinction between actual and potential English words, that we have seen as one of the hall-marks of a word-formation process (cf App I.13). Rather, we can claim that almost any adjective of a permitted class (ie applicable to human beings or to abstractions) might be used in such a structure, with no constraints on productivity:

The {
wealthy
kind
well-dressed
foolish
ill-behaved
etc } are always with us.

The position adopted in this grammar, therefore, has been to treat such cases in purely syntactic terms, as 'adjective functioning as head of noun phrase', rather than to postulate that conversion, or the transfer of an item from one word class to another, has taken place.

- I.46** The words produced by conversion are primarily nouns, adjectives, and verbs. It will be seen from the sets presented below that the most productive categories are the denominal verbs and the deverbal nouns. Only the major semantic types are noted under each heading, but one general point deserves special attention. A converted item typically does not carry with it the semantic range it had in the word class from which it was converted. This seems to be especially relevant in the case of denominal verbs which commonly relate to only one of the meanings possessed by the noun (cf App I.11, on *paper*).

Note In colloquial usage (firmly regarded as nonstandard in BrE, less so in AmE), recourse to conversion is especially common (eg 'He *upped* and left on account of that she laughed at him'), one of the products being de-adjectival adverbs: 'She writes *good[nice/awful/quick]*' (cf 7.7). Some items of this kind occur in more general usage, as in official road signs, 'Drive *slow!*', and familiarly 'Come *quick!*' and (especially with the comparative and superlative) 'He is reading *quicker!*', 'She fought *strongest* for election'. In AmE, *sure* and *real* are widely used as intensifying adverbs: 'He's *sure* trying', 'She was *real* lucky'. Cf 8.100.

Conversion to noun

Deverbal

- I.47** [A] 'State' [generally 'state of mind' or 'state of sensation'] (from verbs used statively to count or noncount nouns):
desire, dismay, doubt, love, smell, taste, want
 [B] 'Event/activity' (from verbs used dynamically):
attempt, fall, hit, laugh, release, search, swim; shut-down, walk-out, blow-out (of a tyre)
 [C] 'Object of V':
answer ['that which answers'], *bet, catch, find, hand-out*
 [D] 'Subject of V':
bore ['someone who or that which bores/is boring'], *cheat, coach, show-off, stand-in*
 [E] 'Instrument of V':
cover ['something with which to cover things'], *paper, wrap, wrench*
 [F] 'Manner of V-ing':
walk ['manner of walking'], *throw, lie* (eg: in the *lie of the land*)
 [G] 'Place of V':
divide, retreat, rise, turn, lay-by, drive-in

Note It will be noticed that the examples above include nouns formed from phrasal and prepositional verbs. The type of informal deverbal coinage represented by *teach-in* belongs to Type [B] rather than to any other, but unlike *shut-down* it cannot be derived from a phrasal verb (there is no **We taught-in last night*). The vogue for such formations produced *sit-in, love-in, swim-in*, and others. They signify an activity (that denoted by the verb) being carried on corporately (typically within an institution and with overtones of social protest).

De-adjectival

- I.48** There is no very productive pattern of adjective → noun conversion (but cf 7.12f, 7.37, App I.45). Miscellaneous examples are:
 I'd like two pints of *bitter*, please. [= type of beer] <BrE>

As a football player, he's a *natural*. [= a naturally skilled player]
 They're running in the *final*. [= the final race]

Also *daily* ['daily newspaper'], *weekly, monthly, annual, perennial, comic* ['comic actor'], *regulars* ['regular customers'], *roast* ['roast beef'], (*young*) *marrieds* ['young married people' <informal>], *a wet, a red*. From these examples, it is seen that adjective → noun conversion can usually be explained in terms of a well-established adjective + noun phrase from which the noun has been ellipted. On conversions involving phrases containing adjectives, cf App I.52.

Conversion to verb

Denominal

- I.49** [A] 'To put in/on N':
bottle ['to put into a bottle'], *carpet* (a subordinate <BrE>), *corner, catalogue, floor, garage, position, shelf* (books: cf App I.56); common in nonce usages such as *rack* (the plates), *porch* (the newspaper).
 [B] 'To give N, to provide with N':
butter (bread), *coat* ['to give a coat (of paint, etc) to'], *commission, grease, mask, muzzle, oil, plaster*.
 [C] 'To deprive of N':
core ['remove the core from'], *gut, peel, skin, top-and-tail* <BrE>
 [D] 'To ... with N' (more precisely, the meaning of the verb is 'to use the referent of the noun as an instrument for whatever activity is particularly associated with it'):
brake ['to stop by means of a brake'], *elbow, fiddle, hand, finger, glue, knife*
 [E] 'To $\left\{ \begin{smallmatrix} \text{be} \\ \text{act} \end{smallmatrix} \right\}$ as N with respect to ...':
chaperon ['to act as chaperon to'], *father, nurse, parrot, pilot, referee*; occurs in nonce use such as 'He *Houdinied* himself out of the locked cell'.
 [F] 'To $\left\{ \begin{smallmatrix} \text{make} \\ \text{change} \end{smallmatrix} \right\}$... into N':
cash ['to change into cash'], *cripple, group*
 [G] 'To $\left\{ \begin{smallmatrix} \text{[i] send} \\ \text{[ii] go} \end{smallmatrix} \right\}$ by N':
[i] mail ['to send by mail'], *ship, telegraph*
[ii] bicycle ['to go by bicycle'], *boat, canoe, motor*
 Most of the verbs in this category are transitive, with the exception of Type G [ii], and a few members of Type D.

De-adjectival

- I.50** [A] (transitive verbs) 'to make adj' or 'to make more adj':
calm ['to make calm'], *dirty, dry, humble, lower, soundproof*

- [B] (intransitive verbs) 'to become adj'; generally adjectives in Type A can also have this function, and it may be seen as a secondary conversion (cf App I.54): *dry* ['to become dry'], *empty*, *narrow*, *weary* (of), *yellow*

Sometimes a phrasal verb is derived from an adjective by the addition of a particle: *smooth out* ['to make smooth'], *sober up* ['to become sober'], *calm down* ['to become calm'].

This category competes with *-en* suffixation (cf App I.42), and sometimes both derivations are available for the same adjective; eg: *black(en)*, *quiet(en)*:

He { *blackened* } his face with soot.

Conversion to adjective

Denominal

- 1.51 Membership of this category can be postulated only when the noun form occurs in predicative as well as in attributive position (cf 7.12ff) since the latter is freely available for nouns within the grammar of the noun phrase (cf 17.104ff). We may compare the discussion of adjectives and 'partial conversion' in App I.45 (cf also Note below and 7.14).

a brick garage ~ The garage is brick.
reproduction furniture ~ This furniture is reproduction. <BrE>
Worcester porcelain ~ This porcelain is Worcester.

Cf also 'This dress is cotton, this one is nylon, but this one is wool.' Denominal adjectives are normally nongradable, but informally (and especially with reference to style) we find examples like:

His accent is very Mayfair (very Harvard).
It was a funny story but not quite drawing-room.

Note Although, for the reasons stated, we do not treat nouns as converted just because they are used prenominal, it should be noted that premodifying nouns are used in strictly parallel ways to denominal adjectives. Thus in the absence of denominal adjectives based on *city* or *physics* with senses parallel to *suburban* (based on *suburb*) or *medical* (based on *medicine*), we find the nouns being used. Compare:

He's taking a { *medical* course. ['course in medicine']
 { *physics* course. ['course in physics']
She dislikes { *suburban* life. ['life in a suburb']
 { *city* life. ['life in a city']

The parallelism is endorsed by the fact that, although predicative use of the denominal adjectives has been illustrated, such usage is in no case as firmly acceptable as attributive use. A further parallel can be seen in our ability to coordinate premodifying nouns and denominal adjectives:

She likes both cotton and woollen dresses.
They detest both suburban and city life.

Minor categories of conversion

- 1.52 There are several anomalous and miscellaneous types of conversion, chiefly used informally; among them the following are noteworthy:

[I] Conversion to nouns

- [i] From closed-class words; there are some well-established examples:

His argument contains too many *ifs* and *buts*.
This book is a *must* for the student of aerodynamics.
It tells you about the *how* and the *why* of flight.

- [ii] From affixes; very occasionally, an affix may be converted into a noun:

Patriotism, nationalism, and any other *isms* you'd like to name.

- [iii] From phrases; sequences of more than one word are sometimes used as nouns, reduced to one-word status by conversion rather than by any of the normal patterns of compounding (cf App I.57ff):

Whenever I gamble, my horse is one of the *also-rans*. [*ie* one of the horses which did not win but merely 'also ran']

Cf also 'the *high-ups*', 'he is a *has-been*', 'a *been-to*' <West African English>, 'a *free-for-all*', 'some *down-and-outs*', 'give me the *low-down*' <slang>.

[II] Conversion to verbs

From closed-class and nonlexical items, chiefly informal:

They *downed* tools in protest.
She will *off* and do her own thing.
If you *uh-uh* again, I won't go on with my story.

[III] Conversion to adjectives

From phrases (such as that in 'The plane is up in the air'):

an *up-in-the-air* feeling ~ I feel very *up in the air*. [with reference to cheerful spirits]

an *upper-class* manner ~ His manner is very *upper-class*.

From closed-class items, we may cite examples like the following:

That's how the Fieldings next door do it, but it's not quite *us*. [=our style or standard]

Note [a] On adjectives used as adverbs, cf App I.46 Note, 7.6ff.

[b] Examples like 'There are too many *althoughs* in this paragraph', 'He has missed an *m* out of *accommodate*' might superficially suggest that *although*, *m*, and *accommodate* have been converted into nouns. Compare also the 'conversion' of proper nouns: 'There are two *Newcastles* in England'. Any item can, of course, be used nominally in this way, not by conversion but by an elliptical apposition ('the word *although*', 'letter *m*', 'towns called *Newcastle*'); cf 5.61, 5.64, 17.65ff. Contrast 'Men are mortal', 'Men is plural', 'Scissors is difficult to spell': the different status would normally be indicated in writing with italic or quotation marks: '*Suspenders* is the AmE equivalent of BrE *braces*'.

Change of secondary word class: nouns

- 1.53 The notion of conversion may be extended to changes of secondary word class, within the same major word category: for example, when noncount nouns are used as count nouns or vice versa (cf 5.4). Such transfers are only

partially productive, and yet can be explained systematically in terms of derivation. They are therefore parallel to the major conversion processes already discussed, though to the extent that they can be predicted as the regular products of grammatical processes, they might be considered as strictly lying outside the province of word-formation.

Types of conversion (or reclassification) within the noun category are:

[A] *Noncount noun* → *count noun*

[i] 'A unit of N':

two *coffees* ['cups of coffee']; two (huge) *cheeses*

[ii] 'A kind of N':

Some *paints* are more lasting than others.

This is a better *bread* than the one I bought last.

[iii] 'An instance of N' (with abstract nouns):

a *difficulty*; small *kindnesses*; a miserable *failure*;
home *truths*; a great *injustice*

[B] *Count noun* → *noncount noun*

'N viewed in terms of a measurable extent' (normally only when accompanied by expressions of amount):

An inch of *pencil*; a few square feet of *floor*

[C] *Proper noun* → *common noun*

[i] 'A member of the class typified by N' (cf 5.61ff):

a *Jeremiah* ['a gloomy prophet who denounces his age']

a latter-day *Plutarch* ['... chronicler of great men']

Edinburgh is the *Athens* of the north.

[ii] 'A product of N':

a *Rolls Royce* ['a car manufactured by Rolls Royce'], a pack of *Chesterfields* ['cigarettes with the brand name "Chesterfield"']

The museum has several *Renoirs*.

[D] *Stative noun* → *dynamic noun*

Nouns are characteristically stative (cf 2.43), but they can assume the dynamic meaning of 'temporary role or activity' as subject complement following the progressive of *be*:

He's being a $\left\{ \begin{array}{l} \text{fool.} \\ \text{nuisance.} \\ \text{hero.} \\ \text{etc} \end{array} \right\}$ ['He's behaving like a fool', etc]

Note The use of proper nouns as in [C] is to be contrasted with usages like 'An unhappy Susan was waiting for him' (cf 17.95) or 'There are two Susans in this office' [= 'persons called Susan'; cf App 1.52 Note], though the latter type closely resembles our [Cii]. See further 5.60ff.

Change of secondary word class: verbs

1.54 [A] *Intransitive* → *transitive*

'Cause to V' (cf 10.22):

run the water ['cause the water to run']; *march* the prisoners; *slide* the bolt back.

Likewise: *hudge*, *fly*, *slip*, *stop*, *turn*, *twist*

[B] *Transitive* → *intransitive*

[i] 'Be V-ed' (often with obligatory adverbial and with implied modality, 'can, must'), cf 10.21:

The clock *winds up* at the back ['is to be wound up'];

Your book *reads* well; The table *polishes* up badly;

The door *closed* behind him; You can close the door easily it just *pulls*. ['you just pull it']

Likewise: *divide*, *drive*, *sail*, *sell*, *steer*, *undo*, *unlock*, *wash*; from causative verbs: *dry*, *harden* (cf App 1.50)

[ii] 'To V oneself':

Have you *washed* yet? ['washed yourself']

Likewise: *bath* <BrE>, *bathe* <AmE>, *behave*, *dress*, *make up*, *shave*

[iii] 'To V someone/something/etc':

We have *eaten* already. ['eaten something, had a meal']

Likewise: *cook*, *drink*, *hunt*, *kill*, *knit*, *sew*, *write*. Contrast 'Please let me explain', where the object is understood from the context.

[C] *Intransitive* → *copular* (cf 16.21ff)

[i] Current meaning:

He *lay* flat; We *stood* motionless.

Likewise: *float* (free); *ride* (high); *arrive* (hungry)

[ii] Resulting meaning:

He *fell* flat; The sun was *sinking* low.

Likewise: *run* (cold); *boil* (dry); *wash* (clean)

[D] *Copular* → *intransitive*

What must *be*, must *be*. ['exist']

[E] *Monotransitive* → *complex transitive* (cf [C] and 16.44ff)

[i] Current meaning:

We *catch* them young. ['... when they are young']

Likewise: (*can't*) *bear*, *buy*, *find*, *hate*, *like*, *sell*

[ii] Resulting meaning:

I *wiped* it clean. ['made it clean by wiping it']

Likewise: *knock* (... unconscious); *lock* (... fast)

Note reflexive objects: *I laughed myself silly*.

Change of secondary word class: adjectives

1.55 [A] *Nongradable* → *gradable* (cf 7.86, App 1.51)

He's more *English* than the English.

Some people's behaviour is rather *incredible*.

I have a very *legal* turn of mind.

[B] *Stative* → *dynamic* (cf 7.41)

As noted in App I.54 [D] above, dynamic meaning is signalled by the progressive aspect of *be*:

He's just being *friendly*. ['acting in a friendly manner']
Your uncle is being *bigoted*, as usual.
He's being *awkward* about it.
Martha is being *desirable* this evening.

Conversion with formal modifications

- 1.56** In some cases, conversion is accompanied by certain nonaffixal changes affecting pronunciation or spelling or stress distribution. The most important kinds of alteration are [A] voicing of final consonants, and [B] shift of stress. Both kinds (like most phenomena of word-formation) are idiosyncratic in respect of the particular instances that occur, though they follow certain clear patterns.

[A] VOICING OF FINAL CONSONANTS

The unvoiced fricative consonants /s/, /f/, and /θ/ in some nouns are voiced to /z/, /v/, and /ð/ respectively in the corresponding verb forms:

NOUN	~	VERB	NOUN	~	VERB
house /-s/		house /-z/	thief /-f/		thieve /-v/
advice /-s/		advise /-z/	belief /-f/		believe /-v/
use /-s/		use /-z/	relief /-f/		relieve /-v/
abuse /-s/		abuse /-z/	mouth /-θ/		mouth /-ð/
grief /-f/		grieve /-v/	sheath /-θ/		sheathe /-ð/
shelf /-f/		shelve /-v/	wreath /-θ/		wreath /-ð/
half /-f/		halve /-v/			

It should be noted that, especially in BrE, the difference between *licence* (n) and *license* (v), like that between *practice* (n) and *practise* (v), is one of spelling only: both noun and verb are pronounced with a final /s/. In AmE, both noun and verb can have the same spellings (*license*, *practice*, respectively).

A substantial change of pronunciation, including modification of the final vowel, is observed in pairs such as: *breath* /e/ ~ *breathe* /i:/; *bath*, *glass* (/æ/ in AmE, /ɑ:/ in RP BrE) ~ *bathe*, *glaze* /eɪ/; cf also *blood* ~ *bleed*, *food* ~ *feed*.

[B] SHIFT OF STRESS (cf App II.6)

When verbs of two syllables are converted into nouns, the stress is sometimes shifted from the second to the first syllable. The first syllable, typically a Latin prefix, often has a reduced vowel /ə/ in the verb but a full vowel in the noun:

He was *con'victed* (/kən/) of theft, and so became a '*convict*' (/kɒn/)

The following is a fairly full list of words having end-stress as verbs but initial stress as nouns in BrE (in AmE, many have initial stress as verbs also):

abstract, *accent*, *combine*, *compound*, *compress*, *concert*, *conduct*, *confine* (the noun is plural only), *conflict*, *conscript*, *consort*, *construct*, *contest*, *contrast*, *convert*, *convict*, *decrease*, *dictate*, *digest*, *discard*, *discount*, *discourse*, *escort*, *export*, *extract*, *ferment*, *import*, *impress*, *incline*, *increase*, *insult*, *misprint*,

perfume, *permit*, *pervert*, *present*, *produce*, *progress*, *protest*, *rebel*, *record*, *refill*, *refit*, *refund*, *regress*, *reject*, *resit*, *retail*, *segment*, *survey*, *suspect*, *torment*, *transfer*, *transform*, *transplant*, *transport*, *upset*

Occasionally, a word of more than two syllables varies in this way: *overflow* (v) ~ '*overflow*' (n). Cf also *envelop* (v), '*envelope*' (n).

There are many examples of disyllabic noun-verb pairs which do not differ in stress; for example, *debate* (v) and *debate* (n) both have end-stress, and '*contact*' (v) and '*contact*' (n) both have initial stress (as is usual where the verb is derived from the noun).

Note that *discount* means 'to disregard', '*discount*' 'to give a discount'.

Compounds

- 1.57** A compound is a lexical unit consisting of more than one base (cf App I.2) and functioning both grammatically and semantically as a single word. In principle, any number of bases may be involved, but in English, except for a relatively minor class of items (normally abbreviated; cf App I.73), compounds usually comprise two bases only, however internally complex each may be.

Compounding can take place within any of the word classes, but – within the present framework – we shall in effect be dealing only with the productivity of compounds resulting above all in new nouns and, to a lesser extent, adjectives. These may involve the combination of the unchanged base (as in *taxfree*); or the first element may be in its special 'combining form' (as in the noun *trouserleg* or the adjective *socioeconomic*); or the second element may have a suffix required by the compound type (as in the noun *theatre-goer* or the adjective *blue-eyed*); or both elements may have a form that is compound-specific (as in the noun *laundromat*).

Before we consider the individual compound types, we shall give some attention to two issues: first, the conditions for lexicalization (cf App I.9) in respect of a particular collocation of bases; second, the formal characteristics of the composition thus made into an institutionalized whole.

- Note [a] Compounds which belong to word classes other than the three major classes considered in this Appendix include prepositions such as *into*, *instead of*, *by dint of* (cf 9.6), pronouns such as *each other*, *anybody*, *himself* (cf 6.46), and adverbs such as *country-style*, *headlong*, *upside down*, *inside out* (cf 7.46). The latter are productive in terms of recurrent use of a second element, making them resemble the products of suffixation; cf App I.41.
[b] Compounding is readily recursive, one compound itself becoming a constituent in a larger one; cf the structure of [*motor* + *cycle*] + *factory*.

Lexicalization conditions

- 1.58** In contrast to affixation, in which a base is typically altered in terms of certain very broad semantic or grammatical categories by the use of an effectively closed set of items, compounding associates bases drawn from the whole lexicon in a wide range of semantic relations. Nonetheless, although both bases in a compound are in principle equally open, they are normally in a relation whereby the first is modifying the second. In short, compounding

can in general be viewed as prefixation with open-class items.

But this does not mean that a compound can be formed by placing any lexical item in front of another. Consider the following:

Look at that dog in the street.
She put the glass on the table.
I heard an owl from my study last night.

Except on a 'nonce' basis, we cannot in response speak of 'another *street dog*' or 'another *table glass*' or 'Do you work much in your *owl study*?' Rather, given the general conditions for lexicalization discussed in App I.9ff, the relations between items brought together in compounding must be such that it is reasonable and useful to classify the second element in terms of the first. Thus a compound *XY* will be 'such a *Y* as may have *X* essentially predicated of it', whereas the same *XY* sequence as a noun phrase is more likely to be 'a *certain Y* that happens to have *X* predicated of it' (cf I.7.104ff). In terms of theme and focus (cf I.8.9), we therefore expect to find that the second constituent in a compound is thematic, with focus on the first constituent (as salient and categorizing), whereas the converse is true of premodifier and head in a noun phrase; cf App I.59. This distinction is endorsed by the widespread use of initial stress in compounds: a 'blackbird (contrast the phrase, a *grey* 'bird).

The relations consequently involved in compounding are frequently resemblance, function, or some other salient or defining characteristic. For example, *darkroom* is a lexicalization of something we might paraphrase as 'a room for [= purpose] photographic processing'. The item *dark* is used in the lexicalization not because such rooms happen to be dark, still less because one such room happens to be dark, but because the facility to make such rooms dark is a salient characteristic. For the reasons given in App I.10, we cannot expect the meaning of *darkroom* to be implicit in the meanings of the separate items (there are many 'dark rooms' which are not 'darkrooms' – nor need darkrooms always be in darkness): it is enough to make currency plausible that, when we know what it means, its constitution seems reasonable and mnemonic. Such reasonableness is somewhat more remote with *hothouse* (where the building concerned would not otherwise be called a 'house'), less so with *signature tune* (though even this equates music with writing for identification in only a very limited context); cf App I.12.

It is more remote still with *hot dog* where only the 'hot' can seem reasonable and where we use this as a subcategorization not within types of dog (alsatian, poodle, ...) but within meanings of dog. The semantic atypicalness of *hot dog* significantly corresponds to its prosodic atypicalness; cf App I.59.

Formal characteristics

- I.59 We have seen that the semantic structure of compounds tends to entail a focal first constituent. In consequence we have a contrast between the prosodic pattern of a noun phrase and that of a compound, the latter having primary stress (cf App II.4) on the first constituent:

a 'dark 'room	a 'dark,room
a 'hot 'house	a 'hot,house
a 'black 'bird	a 'black,bird

a,baby 'girl	a 'baby,-sitter
,motor 'transport	'motor,cars

As we shall see in the sections that follow, almost all compounds have this accentual pattern, whether they are nouns, adjectives, or verbs. Exceptions (cf especially App I.70) are on the whole equally explicable in terms of thematization. In the compounds

,ash-'blonde	,bottle-'green
--------------	----------------

we have the focus on *blonde* and *green* since the premodifiers merely denote degrees or shades. So too with 'combining-form' compounds like

,socio-eco'nomie

or 'coordinate' compounds like

,Swedish-A'merican

the prosody reflects the pragmatic facts: the referent of the 'head' is an admixture with that of the 'premodifier'. Given the pattern of such formations, however, only convention determines the selection, and pairs like *Anglo-French* and *Franco-British* are not necessarily in thematic contrast. Indeed, just as *Anglo-* corresponds to *-British* because there is no **Brito-*, so we find *American* as final item merely because ?**Americo-* is ill-established.

If prosody reflects the semantic structure, so too does orthography. The semantic unity of a compound is reflected in an orthographic unity:

a black bird but a blackbird

Spelling conventions are however less dependable than prosody. Practice varies in many words and some compounds may even occur in three different forms, 'solid', hyphenated, and 'open'; eg:

a flower pot a flower-pot a flowerpot

But in general there is a progression from open to solid as a given compound becomes established, and hence widely recognized and 'accepted as a 'permanent' lexical item.

In AmE, hyphenation is less common than in BrE, and instead we find the items open or solid (more usually the latter) where BrE may use a hyphen:

language retarded <esp AmE>, language-retarded <esp BrE>,
psychosomatic <esp AmE>, psycho-somatic <esp BrE>.

The open option does not normally occur with combining-forms (as in *psychosomatic*, *psychosomatic*), and where these are in compounds of proper names the initial capital of the second constituent inhibits solid spelling; hence even in AmE we find a hyphen in examples like *Sino-Russian*, *Anglo-American* (though even these may appear solid, with lower case for the second element: *Angloamerican*, and always in *Amerindian*). In both AmE and BrE, hyphens are usual for ad hoc premodifying compounds as in *a much-needed rest*, *his higher-than-average wages*, *their come-and-fight-me attitude*, *nineteenth-century novels* (where the sequences concerned are not of course compounds outside this premodifying position: 'his wages were higher than average', 'novels of

the nineteenth century', etc). Compare phrasal conversion, App I.52. For hyphen usage, see further App III.4f.

- Note [a] It may be useful to conceive of 'partial' compounding (cf 'partial' conversion, App I.45) to account for the formal and semantic gradience between phrase and compound:
- | | |
|--|-----|
| We need some furniture for the offices. | [1] |
| We need some office 'furniture. | [2] |
| Office 'furniture is getting more expensive. | [3] |
- In [2] we have an expression appropriate to phrase structure with no necessary lexicalization of 'office furniture' but merely referring to furniture that will be used in the office(s). In [3] however, the generic statement makes the beginning of lexicalization a more plausible interpretation: it is implied that there is furniture of a kind designed specifically for office use. 'Partial' compounding may be said to have taken place, though the stress pattern and spelling still lean in the phrasal direction.
- [b] With coordinate compounds (cf App I.70), we sometimes find an oblique stroke used instead of a hyphen in rather technical (as well as in rather informal) writing: 'an *aural/oral* approach', 'the *in/out* motion'. Cf our use in this book of *speaker/writer*, *hearer/reader*.

The treatment of compounds

- I.60 Although not all compounds are directly 'derived' from the clause-structure functions of the items concerned, we shall adopt a mode of presentation which (where possible) links compounds to sentential or clausal paraphrases. This is appropriate enough in the treatment of word-formation in the context of a general grammatical description, and it is in keeping with our policy in this Appendix of concentrating attention on the language's productive capacity.

As an example of this approach, we may take the two compounds *glow-worm* and *punch-card*, which are superficially similar, consisting of verb + noun. Yet the relations of their constituents, and hence the 'grammatical' meanings of the two compounds, are different:

glow-worm ~ *The worm glows*, ie verb + subject ['Some worms glow']

but

punch-card ~ *X punches the card*, ie verb + object

Similarly, *daydreaming* and *sightseeing* can be analysed in terms of their sentential analogues, thus capturing fundamental differences beside the superficial similarity:

X dreams during the day, ie verb + adverbial

but

X sees sights, ie verb + object

Within each of the major categories, therefore (notably Noun Compounds and Adjective Compounds), we shall distinguish subsets on the basis of a grammatical analysis of the elements involved in a canonical example, together with an informal indication of the relationship between them in terms of a syntactic paraphrase.

Noun compounds

Type 'subject and verb'

- I.61 [A] 'SUN,RISE: subject + deverbal noun (cf 'The sun rises'). This is a very productive type. For example:

bee-sting	catcall	daybreak	earthquake
frostbite	headache	heartbeat	landslide
nightfall	rainfall	sound change	toothache

- [B] 'RATTLE, SNAKE: verb + subject (cf 'The snake rattles'). This type is only weakly productive. For example:

crybaby	driftwood	drip coffee	flashlight
glowworm	hangman	playboy	popcorn
stinkweed	tugboat	turntable	watchdog

- [C] 'DANCING, GIRL: verbal noun in -ing + subject (cf 'The girl dances'); very productive. For example:

cleaning woman	firing squad	flying machine
investigating committee	wading bird	washing machine
working party		

Sequences with converse stress pattern (*flying 'saucer*, *working 'man*) show a lesser degree of institutionalization as compounds; contrast *'workman*.

Type 'verb and object'

- I.62 [A] 'BLOOD, TEST: object + deverbal noun (cf 'X tests blood'). This is a moderately productive type. *Self* is a common first constituent. Some compounds denote an activity (eg: *handshake*), some the result of an activity (eg: *book review*), and some could be either (*meat delivery*). For example:

birth-control	book review	crime report
dress-design	haircut	handshake
meat delivery	office management	suicide attempt
self-control	self-destruction	tax cut
word-formation		

- [B] 'FAULT, FINDING: object + verbal noun in -ing (cf 'X finds fault(s)'; cf also App I.68, *man-eating*). This type is very productive. For example:

air-conditioning	book-keeping	book-reviewing
brainwashing	dressmaking	housekeeping
letter-writing	oath-taking	sightseeing
story-telling	town-planning	

- [C] 'TAX, PAYER: object + agential noun in -er (cf 'X pays tax(es)'). This is a very productive type, and designates concrete (usually human) agents; note however *dishwasher*, *lawn-mower*, *penholder*, *record-player* (cf App I.34, I.63 [C]). For example:

cigar smoker	computer-designer	crime reporter
gamekeeper	hair-splitter	language teacher
matchmaker	radio-operator	songwriter
stockholder	window-cleaner	

- [D] 'PUNCH, CARD: verb + object (cf 'X punches the card'). For example:

call-girl	drawbridge	pin-up girl
punchball	push-button	scarecrow
treadmill		

[E] 'CHEWING,GUM: verbal noun in *-ing* + object (cf 'X chews gum'); very productive. For example:

cooking apple	drinking-water	eating apple
boiling fowl <BrE>	reading material	spending money
roasting joint	braising steak	

Note In [D] and [E], the syntactic paraphrase obscures the 'purpose' relationship (cf App I.58): 'The ball is for punching', 'The gum is for X to chew'.

Type 'verb and adverbial'

I.63 [A] 'SWIMMING,POOL: verbal noun in *-ing* + adverbial (consisting of a prepositional phrase; cf 'X swims in the pool'). This is a very productive type. Several adverbial relations are involved (but cf Note [b]). For example:

PLACE:	diving board	['dive from a board']
	drinking cup	['drink out of a cup']
	freezing point	['freeze at a point']
	frying pan <BrE>	['fry in a pan']
	hiding-place	['hide in a place']
	living-room	['live in a room']
	typing paper	['type on paper']
	waiting room	['wait in a room']
	writing desk	['write at a desk']
INSTRUMENTAL:	adding machine	['add with a machine']
	baking powder	['bake with powder']
	carving knife	['carve with a knife']
	sewing machine	['sew with a machine']
	walking stick	['walk with a stick']
	washing machine	['wash with a machine']

[B] 'DAY,DREAMING: adverbial + verbal noun in *-ing* (cf 'X dreams during the day'). This is a moderately productive type (cf App I.69, *ocean-going*). For example:

PLACE:	churchgoing	['going to church']
	horse riding	['ride on a horse']
	tight-rope walking	['walk on a tight-rope']
	sun-bathing	['bathe in the sun']
TIME:	sleepwalking	['walk in one's sleep']
INSTRUMENTAL:	fly-fishing	['fish with a fly']
	handwriting	['write by hand']
OTHER:	shadow-boxing	['box against a shadow']

[C] 'BABY,SITTER: adverbial + agential noun in *-er* (cf 'X sits with the baby'). This is a moderately productive type (cf App I.62[C]). For example:

PLACE:	backswimmer	['swim on the back']
	city-dweller	['dwell in the city']
	factory-worker	['work in a factory']
	gate-crasher	['crashes through a gate', ie 'uninvited guest']

housebreaker	['break into a house']
playgoer	['go to a play']
tight-rope walker	['walk on a <i>tight</i> rope']
sun-bather	['bathe in the sun']
theatre-goer	['go to the theatre']
daydreamer	['dream during the day']

[D] 'HOME,WORK: adverbial + deverbal noun (cf 'X works at home'). This is a moderately productive type. For example:

PLACE:	boat-ride	['ride in a boat']
	field-work	['work in the field']
	table talk	['talk at the table']
	moon walk	['walk on the moon']
TIME:	daydream	['dream during the day']
	night flight	['fly during the night']
INSTRUMENTAL:	gunfight	['fight with a gun']
OTHER:	smallpox vaccination	['vaccinate against smallpox']
	tax-exemption	['exempt from tax']
	telephone call	['message by the telephone']

So also *self-determination*.

[E] 'SEARCH,LIGHT: verb + adverbial (cf 'X searches with a light'). Several adverbial relations are involved (but cf Note [b]). For example:

PLACE:	dance hall	['dance in a hall']
	springboard	['spring from a board']
	workbench	['work at a bench']
INSTRUMENTAL:	grindstone	['grind with a stone']
	plaything	['play with a thing']

Some further examples: *cookbook* <esp AmE>, *fry-pan* <AmE>, *restroom* <esp AmE>, *swimsuit* <esp AmE>, *washroom* <esp AmE>. The labels indicate the popularity of this pattern in AmE; in BrE there is a corresponding preference for the pattern in App I.63 [A].

Note [a] Somewhat like items in [B] is *dry-cleaning* (but note the phrasal accentuation in BrE, *dry-cleaning*), 'cleaning (the clothes) when/though dry'. Cf: *sleep-walking* 'walking when/though asleep'. For the adjective form *dry-cleaned*, cf App I.69 [D].
[b] In [A] and [E], the 'purpose' relationship is lost in this presentation; compare 'The pool is for X to swim in', 'The light is for X to search with'.

'Verbless' compounds: Type 'subject and object'

I.64 [A] 'WIND,MILL: noun₁ + noun₂ (cf 'noun₁ [powers/operates] noun₂', 'the wind powers the mill'). For example:

air-brake	air rifle	cable car	coal fire (, ' in BrE)
motorcycle	steam engine	gas cooker (, ' in BrE)	
hydrogen bomb (, ' in AmE)			

[B] 'TOY, FACTORY: noun₁ + noun₂ (cf 'noun₂ [produces/yields] noun₁', 'the factory produces toys'). For example:

honey-bee	oil well	power plant	silk worm
tear gas	textile mill	water pistol	gold mine

[C] 'BLOOD, STAIN: noun₁ + noun₂ (cf 'noun₁ [produces/yields] noun₂', 'the blood produces stains'). For example:

bloodstain	cane sugar	eiderdown	food poisoning	gaslight
hay fever	sawdust	tortoise-shell	whalebone	

[D] 'DOOR, KNOB: noun₁ + noun₂ (cf 'noun₁ [has] noun₂', 'the door has a knob'). This is a very productive type. Noun₁ is inanimate. With animate nouns, we use a noncompound genitive phrase: compare the 'table leg with the boy's leg. For example:

arrowhead	bedpost	bottleneck <metaphorical>
cartwheel	piano keys	shirt-sleeves
table leg	telephone receiver	television screen
window-pane		

[E] 'SECURITY, OFFICER: noun₁ + noun₂ (cf 'noun₂ [controls/works in connection with] noun₁', cf 'The officer looks after security'). For example:

chairperson	deckhand	fireman	gasman
motorman <AmE>	police-officer	postman	

This is a very productive type, with the second constituent always a human agent. Indeed, so commonly has *man* been thus used (in its unmarked gender role, 'human adult') that in some compounds it has a reduced vowel, /mən/, as in *postman*, *draughtsman*, *fireman*, *workman*, *businessman*. This item and its gender-free alternative *person* might in fact be viewed as a suffix (cf I.3). Contrast the unreduced form of *man* in 'handyman' (cf App I.65), perhaps because in this case the compound does not refer to a regular occupational role.

Type 'subject and complement'

I.65 [A] 'GIRL, FRIEND: noun₁ + noun₂ (cf 'noun₂ [is] noun₁', 'the friend is a girl'). Noun₁ often refers to a subset of the class denoted by noun₂. For example:

blinker light	drummer boy	feeder bus	killer shark
manservant	oak tree	pine tree	tape-measure

Numerous sequences of this appositional type occur with phrasal prosody: *woman writer*, *toy factory* ['the factory is a toy']; contrast App I.64 [B] above). Cf App I.59 and the question of 'partial' compounds.

[B] 'DARK, ROOM: adjective + noun (cf 'noun [is] adjective', 'the room is dark'). For example:

blackboard	blackbird	blueprint	double-talk
dry dock (or, '.)	greyhound	grey matter (= brain)	handyman
highchair	hothouse	longboat	madman

The initial constituents in *knitwear* and *mincemeat* were originally -ed participle adjectives.

Along with this type should be considered many sequences with phrasal prosody:

,fancy 'dress	,hot 'dog ('., in AmE)	,ill 'omen	,ill re'pute
,ill 'wind	,risen 'costs		

Despite the apparent parallelism of:

He suffers from	{	bad health.
	{	poor health.
	{	ill health.

compounding is nonetheless suggested in the last by the fact that *ill* is not normally a premodifier in noun-phrase structures (cf 7.38), nor are past participles of intransitive verbs (*risen*). Semantically, moreover, some of these examples have a high degree of lexicalization; on *hot dog*, cf App I.58.

[C] 'FROG, MAN: noun₁ + noun₂ (cf 'noun₂ [is like] noun₁', 'the man is like a frog'). This is a very productive type. For example:

butter-bean	catfish	dragonfly	goldfish
kettledrum	sandwich man	tissue paper	

[D] 'SNOW, FLAKE: noun₁ + noun₂ (cf 'noun₂ [is of, consists of] noun₁', 'a flake of snow'). For example:

breadcrumb	chocolate bar	dustheap	raindrop
sand dune	soap flake		

[E] 'ASH, TRAY: noun₁ + noun₂ (cf 'noun₂ [is for] noun₁', 'the tray is for ash'). This is a highly productive type expressing purpose; cf Note [a]. For example:

birdcage	breakfast time	coffee time	cough drops
cowshed	doghouse	facecloth	fire engine
fish-pond	flowerbed	flypaper	safety belt
tearoom			

Note [a] The difference between *teacup* (~'cup for tea') [E] and *cup of tea* (~'cup containing tea') is paralleled in *flowerpot*, *matchbox*, *winebottle*, *soup plate*, etc. With the purpose factor in [E], and underlying some examples in [B], compare the Notes to App I. 62f.

[b] Like type [A] are the (largely colloquial) compounds of hypocoristic plus generic, as in *pussy-cat*, *puppy-dog*; cf App I.77.

Combining-form compounds

I.66 'PSYCHO-A'NALYSIS: noun₁ (in its 'combining form') + noun₂ (= 'noun₂ [in respect of] noun₁', 'the analysis of the psyche'). This is a highly productive type and various relations can be involved. Typically, the first constituent is neo-classical (cf App I.6, I.28) and does not occur as a separate noun base in English, but the model has been widely imitated with common bases, with a vowel (usually -o- but often -i-) as a link between the two parts: *crypt'ography*, *in'secticide*, etc. Cf also the use of combining-forms in adjective compounds, App I.70. Stress patterns are various and the primary stress often falls on the link vowel of the combining-form. Among common second constituents are -meter, -graph(y), -gram, -logy, and the formations are especially in the fields of science and learning. In consequence, many are in international currency, adopted or adapted in numerous languages. Some miscellaneous examples:

'agri,culture	ba'rometer	bio'physics
,biotech'nology	'Euro,dollar	'horti,culture
,microelec'tronics	,por'nography	,psy'chology
'stereo-,vision	,turbo-jet	

Cf also 'drama,turgy, 'metal,lurgy. On *pseudo-*, cf App I.23. With 'stereo,typed and ,stereo'phonic, we have adjectives that are more commonly used than the corresponding nouns.

Compounding may involve more than one combining-form; eg *nephrolithotomy*, *neurolymphomatosis*: cf App I.57 Note [b].

On the model of neo-classical combining-forms, we have compounds to whose initial base a connecting *-o-* is added; eg: ,spee'dometer.

There is vacillation between 'kilometre and ki'lometre.

'Bahuvrihi' compounds

- I.67 All of the compounds to be listed in this section are formed on one or other of the patterns already described. Most of them are like 'dark,room, others are like, for example, 'frog,man or 'snow,flake (cf App I.65 [B], [C], and [D] respectively). The term 'bahuvrihi' refers not to their pattern of formation but to the relation they have with their referents. Neither constituent of such a compound refers to the entity named but, with a semantic movement that may be thought of as 'lateral', the whole refers to a separate entity (usually a person) that is claimed to be characterized by the compound, in its literal or figurative meaning. Thus a 'high,brow means 'an intellectual', on the basis of the facetious claim that people of intellectual interest and cultivated tastes are likely to have a lofty expanse of forehead. Similarly 'heart,throb (cf App I.61 [A] for its non-bahuvrihi use) is someone who causes the heart to throb in a person of the opposite sex; ie 'a sexually attractive person'. Many bahuvrihi compounds are (like *highbrow*) somewhat disparaging in tone and are used chiefly in informal style. Some further examples:

birdbrain	blockhead	bluebell	butterfingers
egghead	fathead	featherbrain	featherweight
hardback	hardtop	heavyweight	hunchback
loudmouth	paleface	paperback	pot-belly
redcap	scarecrow	shellback	

Cf also *hardhat* 'construction worker' <esp AmE>.

Note The term *bahuvrihi* is from Sanskrit. Compounds of this type have also been called 'exocentric'.

Adjective compounds

Type 'verb and object'

- I.68 'MAN-EATING: object + -ing participle (cf 'X eats men'; also App I.62, *faultfinding*). This is a very productive type. *Self* is a frequent first constituent but takes secondary stress. For example:

breathtaking	fact-finding	heart-breaking	life-giving
record-breaking	self-de'feating	self-justifying	

In *mouth-watering*, there is a causative relation: 'X makes the mouth water'.

In informal AmE we have such a compound used to premodify an adjective in *finger-licking good*.

Type 'verb and adverbial'

- I.69 [A] 'OCEAN-GOING: adverbial + -ing participle (cf 'X goes across oceans'. Cf App I.63, *daydreaming*). For example:

fist-fighting law-abiding lip-sucking

[B] 'HEART,FELT: adverbial + -ed participle (cf 'X feels it in the heart'). The type is particularly productive when the noun has agential meaning and consists of *self*: *self-styled*, *self-appointed*, *self-employed*, *self-taught* (but a *self-addressed* envelope is one that is addressed to oneself). Examples are:

airborne	cost-led	custom-built	handmade
home-brewed	home-made	language-retarded	suntanned
typewritten	thunder-struck	town-bred	weather-beaten

Cf also *speech(-)* and *language(-)impaired*.

[C] 'HARD-WORKING: adverb/adjective + -ing participle (cf 'X works hard', 'X looks good'). For example:

easy-going	everlasting	far-reaching	good-looking
high-sounding	sweet-smelling	well-meaning	

[D] 'QUICK-FROZEN: adjective/adverb + -ed participle (cf 'X was frozen quickly'). For example:

dry-cleaned (cf App I.63)	far-fetched	fresh-baked
long-awaited	'new-,laid	true-born
'wide,spread		well-meant

- Note [a] The idiomatic isolation of some compounds of this type is evident in the replacement of lexical items in sentential analogues, eg: *NEW-laid* (eggs) ~ *X has laid* (the eggs) *RECENTLY*. But like this, several have closer analogues in phrases: 'The eggs are *newly laid* and the loaves *freshly baked*'. The absence of *-ly* is normal in such compounds.
[b] The superficially similar adjective compounds *well-meant*, *well-spoken* on the one hand and *well-behaved*, *well-spoken* on the other differ in respect of voice: a *well-meant remark* ~ a *remark that is meant well*, *She is well spoken of* ~ *People speak well of her* [passive], but a *well-behaved person* ~ a *person that behaves well*, a *well-spoken boy* ~ a *boy who speaks well* [active].
[c] It will be noted that compounds in [C] and [D] have phrasal stressing (though in [C] belongs also 'off-putting); cf App I.59.
[d] Fashionable ad hoc formations of type [B] include 'export-fed (*recovery*), (a) *weather-related* (*air-crash*).

Type 'verbless'

- I.70 [A] 'FOOT,SORE: noun-based adverbial of respect (cf 8.6) + adjective (cf 'sore in respect to (one's) feet'). This is a very productive type, especially with certain adjectives that have prepositional complementation (cf 16.68ff), such as *free (from)*, *proof (against)*, *weary (of)*. For example:

airsick	air-tight	camera-ready	carsick
dustproof	duty-free	fireproof	foolproof
homesick	oven-ready	tax-free	war-weary
watertight			

With some there is phrasal stress, as in *class-conscious*, *cost-effective*, *labour-intensive* and (involving a combining form), *stereophonic*.

[B] *GRASS-GREEN*: noun (denoting basis of comparison) + adjective (cf 'as green as grass'). This is a fairly productive type and the items formed can usually be used also as nouns: stress is variable, but phrasal stress is usual. Some examples:

age-old	ash-blonde	bottle-green	brick red
jet black	midnight blue	rock-hard	sea-green

[C] *GREY-GREEN*: adjective + adjective in a coordinating relation but where the phrasal stress pattern implies that the first is relatively thematic, the second focal and hence semantically dominant. Cf 'The colour is basically green but with a greyish tint'. Informally, this can be reflected in the first adjective having the suffix *-y* or *-ish* (cf App I.38), as in *reddish-brown*, *greeny-grey*. Coordinate compounds are, however, widely used with reference to international relations where (despite the phrasal stress) parity is theoretically fundamental: 'A *Japanese-American* trade pact is about to be signed'. In many coordinate compounds the first element assumes a combining form (cf App I.66). Some examples of various types:

Anglo-Polish	auditory-visual	aural-oral
deaf-mute	Franco-German	phonetic-syntactic
psychosomatic	Russo-Chinese	sensori-neural
Sino-Italian	socio-economic	Swedish-Brazilian
tragi-comic		

Note In compounds as premodifiers of *dictionary*, the first adjective indicates the language which is the basis or starting-point, hence again justifying the phrasal stressing in terms of thematization. For example, an *English-French Dictionary* is one that translates English words into French, a *French-English* one translates from French to English; but an *Anglo-French* dictionary would be one produced by a joint Anglo-French enterprise. Coordinating compounds are sometimes referred to by the Sanskrit term 'dvandva'.

Miscellaneous modes

Back-formation

- I.71 Pairs of words like *advise* ~ *advisor*, *burgle* ~ *burglar*, *inspect* ~ *inspector*, *edit* ~ *editor*, suggest an identical relationship between the members which from the synchronic viewpoint of the ordinary language user is perfectly correct. But as a matter of historical fact, while *advisor* and *inspector* were indeed formed from *advise* and *inspect* by suffixation, we have derived *burgle* and *edit* from *burglar* and *editor*, analysing these on the analogy of other agential nouns. Cf App I.12, I.34. This is the process known as 'back-formation', and in addition to well-established items, whether from long ago (like *laze* from *lazy*) or more recently (like *televize* from *television*), new formations of this kind continue to be made. The process is particularly

fruitful in creating denominal verbs. It should be noted that new formations tend to be used with some hesitation, especially in respect of the full range of verbal inflexions. For example, the textual instance cited in App I.12 was significantly in the base form, *self-destruct*, but although clearly used as a verb, there is less obvious clash with the well-established verb *destroy* than when (as occasionally) ordinary verb inflexions are added: '?The organization *self-destructed* in 1985'. So also we had the agential *baby-sitter* before the verb *baby-sit*, and the base form ('Will you *baby-sit* for me?') before inflected forms ('He *baby-sat* for them'). Other back-formations continue to display their lack of established acceptability: *(*They*) *sight-saw*, *(*She*) *housekept*.

A particularly productive type of back-formation relates to the noun compounds in *-ing* and *-er* (cf App I.62 [B], [C], App I.63 [B], [C]). For example, the verbs:

bottle-feed	brain-wash	chain-smoke	day-dream	dry-clean
fire-watch	house-hunt	house-keep	lip-read	sight-see
sleep-walk	spring-clean	window-shop		

Less commonly, we have nouns from adjectives by back-formation: eg *polymer* from *polymeric*.

Note [a] Compare also, from (a) *sing-song*, the nonce-formation *He sing-songed* (not **He sang-song*). It is likely that such regularizations of inflection result from that process of linguistic analogy known as *metanalysis* (word segmentation counter to etymology), of which back-formation may be seen as a special case. For example, from 'The fridge needs regular defreezing' we find 'They defreezed (*beside* defroze) the fridge that evening'. But regularization in such verbs can also indicate a synchronic failure to analyse in terms of their historical components; thus one occasionally hears 'This cannot be gainsayed' or 'I was overridden', and the like, a phenomenon of relexicalization which is again akin to back-formation.

[b] In connection with back-formation we might consider grammatically regular correspondences such as the following (cf 7.33f):

He completely refused ...	~	His complete refusal
She totally rejected ...	~	Her total rejection
They utterly despaired ...	~	Their utter despair
I fully endorse ...	~	My full endorsement
She absolutely disapproved ...	~	Her absolute disapproval
They entirely agree ...	~	Their entire agreement

It will be observed that the adjectives in the second column emerge only on nominalization of the clauses in the first column. The fact that they are to this extent derived from the corresponding adverbs is confirmed by their meaning, which directly reflects that of the respective subjunct.

Reduplicatives

- I.72 Some compounds have two or more constituents which are either identical or only slightly different, eg: *goody-goody* (chiefly noun, 'a self-consciously virtuous person', informal). The difference between the two constituents may be in the initial consonants, as in *walkie-talkie*, or in the medial vowels, eg: *criss-cross*. Most of the reduplicatives are highly informal or familiar, and many belong to the sphere of child-parent talk, eg: *din-din* ['dinner']. The most common uses of reduplicatives (sometimes called 'jingles') are:

- [i] to imitate sounds, eg: *rat-a-tat* [knocking on door], *tick-tock* [of clock], *ha ha* [of laughter], *bow-wow* [of dog];
 [ii] to suggest alternating movements, eg: *seesaw*, *flip-flop*, *ping-pong*;

- [iii] to disparage by suggesting instability, nonsense, insincerity, vacillation, etc: *higgledy-piggledy*, *hocus-pocus*, *wishy-washy*, *dilly-dally*, *shilly-shally*;
 [iv] to intensify, eg: *teeny-weeny*, *tip-top*.

Note With [iii] above, we may compare informal AmE sequences of the type *Boston-Schmoston*, which tend to be used with ironic or playful dismissiveness of the first constituent.

Abbreviations

- 1.73 It is of the essence in lexicalization that, however lengthy and complex the formation of an item, it comes to be regarded as a single unit in relation to the meaning so lexicalized. In consequence, it is not the constituents of the word in combination that are seen as conveying this meaning but its individuality as a whole. Provided any part of the item is itself sufficiently individual to call up the whole, it can be shortened to a form which is linguistically convenient but need not reflect the morphological make-up of the full form. For example, *bus* (from *omnibus*), *ad* (from *advertisement*), *bit* (in information processing, from *binary digit*); *TV* (from *television*). We distinguish three highly productive ways in which abbreviation is involved in English word-formation, giving us CLIPPINGS, ACRONYMS, and BLENDS.

Note Compare the related use of abbreviation as a graphic device: App III.27ff.

Clippings

- 1.74 Especially in informal usage, we tend to show our familiarity with polysyllabic words (especially nouns), by shortening them, often to a single syllable. The words (especially nouns), by shortening them, often to a single syllable. The 'clipping' seems often to start from the graphic form, since the surviving fragment is usually initial and need not constitute either prosodically or semantically the salient part of the original (but cf Note [a]):

ad	from	ad'vertisement (also advertisement in AmE)
'advert <BrE>	from	cosecant /kəu'si:kənt/ (in trigonometry)
'cosec /'kəusek/	from	demon'stration (but in BrE chiefly in the political sense; in AmE 'a demonstration car')
'demo	from	(academic) exami'nation (but not the verb e'xamine or exami'nation in the medical sense)
e'xam	from	French fried potatoes <esp AmE>
French fries <esp AmE>	from	gentlemen's (especially = gentlemen's lavatory)
gents	from	la'boratory <BrE>, 'labora'tory <AmE>
lab	from	libe'ration (but only in lexicalizations like Women's Liberation Movement)
lib	from	memo'randum
'memo	from	'micro'phone
mike	from	'photograph (but not pho'tography)
'photo	from	pro'fessor
prof	from	'pseudo- (intel'lectual)
pseud <BrE>	from	'public 'house
pub		

'stereo	from	'stereo'phonic
telly <BrE>	from	'tele'vision

Less commonly, the clipped form has resulted from discarding the initial part of a word, as in:

phone	from	'telephone (but not, eg, microphone)
plane	from	'airplane, 'aeroplane

Occasionally, syllables have been discarded at both ends of a word, as in:

flu	from	'influ'enza
fridge <esp BrE>	from	re'frigerator

Stress patterns have been indicated to show that the shortened form is not necessarily (indeed not usually) the stressed part of the word concerned and that it is given an independent stress pattern of its own (as in *'demo*). Even stronger evidence for the acquisition by clipped forms of a quite specific lexicalization is indicated by the parenthesized restrictions we have shown where relevant. Thus *lib* is not an abbreviated form of the word *liberation* as such, still less of the verb *liberate*, but only of very specific uses of *liberation*. The examination of a patient by a doctor is not an *exam*. A further sign of the lexical independence of clipped forms is that *mono* (with a meaning that was unlexicalized, of course, when sound-recording could be nothing else) came into existence by analogy with *stereo*, and in specific contrast to it; hence its immediate use in a parallel abbreviated form, and the fuller form *monophonic* remains relatively rare.

Note [a] The informality that is typical of clipped forms is frequently reflected in informal spellings; for example, *showbiz*, *fridge*, *mike*, *telly* <BrE>, *cos* or *'cos* <both BrE: 'because>, *praps* ['perhaps']. In these cases, the spelling has been adapted to suit the pronunciation of the original fragment. The converse holds for '(the student music) *soc*' <esp BrE>, where the original spelling of *soc(iety)* remains but the final /s/ of the fragment comes to be pronounced /k/. In '(meat and two) *veg*' <BrE> neither spelling nor pronunciation (/vedʒ/) has been changed, while in *bike* ['bicycle'] both have been changed. In *hanky* ['handkerchief'], we find an additional familiarity marker in the suffix -y (cf App I.77); cf also *nighty*, *undies*, *comfy* ['comfortable'].
 [b] Some clipped forms preserve a final s, as in *specs* ['spectacles'], *maths* <BrE> ['mathematics'], but AmE *math*, *gents*, *French fries*; some add an s, as in BrE *turps* ['turpentine'] (cf App I.77).
 [c] It is not uncommon to find clipped forms becoming so well-established as to lose their informal tone. This is true of *plane*, *stereo*, *taxi* (from *taxicab* - itself a clipping), *pram* <BrE> (note spelling, from 'perambulator'); and in many long-established cases the fuller form is rarely used (eg: *omnibus* for *bus*) or is not ordinarily known (eg: *mobile vulgus* for *mob*).
 [d] *Ozolid* (in reprography) is basically a reverse spelling of *diazo*; cf App I.15 Note.

Acronyms

- 1.75 Acronyms are words formed from the initial letters of words that make up a name. New acronyms are freely produced, especially by scientists and administrators (cf App I.15), and particularly for names of organizations. There are two main types:

[A] Acronyms which are pronounced as sequences of letters (also called 'alphabetisms'), eg *C.O.D.* /si: əu 'di:/, are most like ordinary abbreviations and hence most peripheral to word-formation. In writing, the more institutionalized formations have no periods between the letters. The use of

capitals is not determined solely by whether the items abbreviated are proper nouns.

[i] The letters represent full words:

c/o	(in) care of [used on envelopes]
C.O.D.	cash on delivery
DIY (informal BrE)	do-it-yourself [used of self-help repairs, etc]
EEC	European Economic Community
eg	exempli gratia [Latin, 'for example']
ESP	extra-sensory perception
FBI	Federal Bureau of Investigation
ie	id est [Latin, 'that is']
KL	Kuala Lumpur
LA	Los Angeles
MIT	Massachusetts Institute of Technology
p.c. (BrE)	postcard
UFO	unidentified flying object
UN	the United Nations
VIP	very important person

[ii] The letters represent constituents in a compound or just parts of a word:

GHQ	General Headquarters
ID	identification (card)
TB	tuberculosis
TV	television

Acronyms of Type [A] are sometimes given a quasi-phonetic written form. For example, *M.C.* ['Master of Ceremonies'] may be informally written as *Emcee*; *DJ* ['Disc Jockey'] as *Deejay*, *OK* as *Okay*. In AmE, *Jaycee* is used for *Junior Chamber of Commerce* (member).

[B] Acronyms which are pronounced as a word, eg *NATO* /neɪtəʊ/, are often used without our knowing what the letters stand for:

laser	lightwave amplification by stimulated emission of radiation
NATO	the North Atlantic Treaty Organization
radar	radio detecting and ranging
UNESCO	the United Nations Educational, Scientific and Cultural Organization
WASP	White Anglo-Saxon Protestant (AmE, informal)

Acronyms of this second type frequently derive from phrasal names specially devised for their acronymic convenience. For the same reason, initial syllables as well as initial letters may be involved, as in *binac* ('binary automatic computer').

Note Some abbreviations are read aloud in unabbreviated forms; eg: *c/o*, *p.c.* Others are normally (eg: *viz*) or sometimes (eg: *ie* and *eg*) read out as English phrases, 'namely', 'that is', and 'for example' respectively.

Blends

I.76 As the term suggests, blends are formations in which a compound is made by 'blending' one word with another. Enough of each is normally retained so that the complex whole remains fairly readily analysable (cf App I.14). To this end also, and preserving the normal attributes of the compound such that the end-part is the thematic base to which the new initial part is related, the blend tends to have as a whole the prosodic shape of the untruncated end-part. Thus on the basis of *hotel* we preface enough of *motor* both to achieve the new contrast with *hotel* (a hotel specially equipped for the needs of motoring guests), and to achieve the dominance of the base pattern: *mo'tel*.

So too with a special kind of *lunch* which has some of the features of *breakfast*, we have coined *brunch*; if the meal had been primarily conceived as a kind of *breakfast*, we might have had instead (*)*lunkfast*. Thus we may conclude that a *spork* (first recorded in 1976) is a fork like a spoon, rather than a spoon that looks like a fork (which might have given us (*)*foon*). Note the distinction between *tigon* (where the sire is a *tiger*) and *liger* (where the sire is a *lion*). In such formations, an attempt seems to be made at matching the pragmatic position with a linguistic form.

Blending is a very productive process, especially in commercial coinages, which suggests that its rather daring playfulness is popular. Where many types of neologism are criticized adversely (eg as 'unnecessary jargon'), blends seem rather to be enjoyed. Perhaps in consequence, many of them are short-lived or never achieve currency beyond the advertising copy in which they may originate. Eg: *swim'sation* of a *swimsuit* that will cause a *sensation*; *lubri'tection* of a new *lubricant* that will provide engine *protection*.

Others not merely become well-established but act as a highly productive model for new formations; cf: *'cheeseburger*, *'beefburger*, *'shrimpburger*; *'washe'teria*, *'candy'teria*, *'luncha'teria*, etc (and we note again that a matching in prosodic shape is a determining factor in establishing the blended form). Others again achieve a brief surge of productivity in response to an outstanding event. In the years following the Washington Watergate scandals, the name *'Watergate* became a model for such blends, being the thematic element in items like *'Muldergate*, *'Billiegate*, *'cattlegate*. All of these denoted specific cases of political crisis resulting from scandalous deception connoted by the underlying *Watergate*, the whole of which (with the associations) had to be understood in each alternative formation.

Some further and more general examples:

'breatha,lyser	[breath + 'analyser]
e'lectro,cute	[electro + 'exe,cute]
'Euro,vision	[European + 'tele,vision]
'heli,port	[helicopter + 'air,port]
'multi'versity	[multiple + ,uni'versity]
'news,cast	[news + 'broad,cast]
'para,troops	[para,chute + troops]
smog	[smoke + fog]
'tele,cast	[television + 'broad,cast]
'trave,logue	[travel + 'cata,logue]

There is rather more radical abbreviation in *bi'onic* (biological + electronic). Items like *bit* ('binary digit'), *interpol* ('international police'), *moped* ('motor pedal-cycle'), *telex* ('teleprinter exchange'), are outside the general pattern outlined above, both in the way in which the word-fractions are made up and in the disregard for the prosody of a thematic starting-point. In some respects, they more resemble acronyms of the [B] type in App I.75.

- Note [a] The ease with which word-fractions can be used in blends accounts for the way certain sounds and sound-sequences achieve a semi-morphological status; cf the many derogatory words in English beginning with /sn/ (eg: *sneer*, *snide*, *snoop*) or the frequentative verbs ending in a consonant plus syllabic /l/ (eg: *rattle*, *sizzle*, *tinkle*). In this connection, one notes that recurrent items in blends (eg: *tele-*, *Euro-*, *-teria*, *-burger*, *-gate*) come to be used like affixes.
- [b] The feminist movement has produced several blends, notably *Ms* (/mɪz/; *Miss* + /mɪstɪz/), and including purely graphic items like the pronoun *s/he* (*she* + *he*), or in the striking title of a book by Mary Daly, *gyn/ecology* (*gyn* + *ecology*). On the use of the oblique stroke, cf App I.59, Note [b].
- [c] It is a kind of blending that produces (especially in BrE) the very informal and usually scatological 'tnesis' or use of infixes in *absobloodylutely*, *stonygoddam'broke*, *alruddy'mighty*. Semantically, these combine an already emotional hyperbole with an extreme intensifier, and as the indicated stressing shows, there is a common essential prosodic pattern such that the infixed intensifier comes immediately before the most emphasized syllable (cf I.59 Note [b]).

Familiarity markers

- I.77 We bring together here types of abbreviation with affixation that have in common a highly informal tone and a mode of referring that indicates close community with (together with familiar, and often affectionate, knowledge of) what is referred to. In many instances they characterize the type of slang developed in close social groups such as families, schools, military institutions, etc. Thus, in Oxford the examination known as 'Divinity Honour Moderations' came to be called 'Divvers', St Stephens Hall 'Staggers', and a Professor Lightfoot 'Lighters'. Among other affixes for diminutives and analogous 'pet' forms (also known as *hypocoristics*), we have *-let*, *-ette*, *mini-*, and a few others (cf App I.24, I.33).

Along with abbreviation (and frequently syllabic modification as in 'Staggers'), certain affixes are recurrent: *-y*, *-o*, *-er*, *-s*:

- y*, *-ie*: *hippy*, *Aussy*, *telly*, *chevie*, *baddy*, *goalie*, *hanky*, *weirdie*, *druggy* (BrE), *nudie*, *chappie* (BrE), *chippie* [(BrE) 'carpenter']; particularly common in that type of intimate discourse called 'baby talk' (and note *baby* itself): *comfy*, *sweetie*, *drinky*, *auntie*, *daddy*, *mummy* (BrE), *mommy* (AmE). Familiar forms of personal names also frequently have *-y* or *-ie*: *Katie*, *Freddy*, *Charlie*, *Molly*, *Billy*, *Susie*
- o*: *ammo* ['ammunition'], *aggro* [(BrE) 'aggravation' in slang senses such as 'mob mischief'], *arvo* [(AustralE) 'afternoon'], *doggo* [(BrE) 'quiet'], *weirdo*
- ER*: chiefly BrE, as in *rugger*, *soccer*, *footer*, *tucker* [(AustralE) 'food'], *boner* ['blunder'], *fresher* ['freshman']
- s*: *Babs*, *Debs*, *nuts*, *bananas* ['mad'], *Moms*

These and other such informal affixes often occur in combination: *fatso*; *tootsies*, *Momsie*; *the willies*, *falsies*; *-ers* (BrE) as in *starkers*, *bonkers*, *Daffers* ['Daphne'], *shampers* ['champagne'], *preggers* ['pregnant'].

- Note [a] The above use of *-o* (unstressed) is to be distinguished from the equally informal but stressed *-o* after monosyllabic responses: *right'o*, *good'o* (both BrE).
- [b] Other informal (and especially AustralE) suffixes include *-oo* as in *shi'woo* ['party'], *ma'goo* ['important person'], *-eroo* as in 'It was a real' *'flope,roo*', though in AustralE the stress pattern would more usually be *'flope'roo*, *'socke'roo*.

Bibliographical note

For general accounts of English word-formation, see Jespersen (1909-49), vol VI; Koziol (1972); Marchand (1969). Stein (1973) provides an extensive bibliography.

On broad theoretical issues, see Adams (1973); Aronoff (1976); Bauer (1983); Greenbaum (1976a); Hansen et al (1982); Jackendoff (1975); Kastovsky (1982a, 1982b); Lipka (1972); Lipka and Günther (1981); Pennanen (1972, 1982); Siegel (1979); Stein (1977).

On noun compounds, see Brekle (1970); Levi (1978); Warren (1978); Zimmer (1971).

On adjective formation, see Hirtle (1970); Hudson (1975a); Levi (1973); Ljung (1970, 1976); Meys (1975); Stein (1971).

On affixation, see R. W. Brown (1927); Colen (1984); Isitt (1983); Stein (1984); Tottie (1980); Zimmer (1964).

On other specific topics in word-formation, see Algeo (1975); Biese (1941); R. W. Brown (1954); Lindelöf (1938); McMillan (1980); Pennanen (1966); Praninskas (1968); Soudek (1967); Thun (1963).

Other relevant studies include Algeo (1978, 1980); Burgschmidt and Cornell (1981); Danielsson (1948); Görska (1982); Panagl (1982); Vendler (1968).

Among dictionaries and other reference works of interest for current word-formation study are Barnhart et al (1973, 1980); Burchfield (1972-86); McDavid (1963); Urdang (1978); Webster (1976); Wentworth and Flexner (1975).

Introduction

- II.1** The study of stress, rhythm, and intonation is an extremely complex area of linguistics to which it is impossible to give adequate attention within the space of this Appendix. Our aim must here be strictly limited to presenting an outline of the part these features play in English grammar, to explaining the allusions that have been made to them in this book, and to guiding the reader to the selective bibliographical note at the end of the Appendix.

Stress, rhythm, and intonation are all concerned with the perception of relative **PROMINENCE**. We speak of **STRESS** when we are considering the prominence, usually perceived as greater loudness by the listener, with which one part of a word or longer utterance is distinguished from other parts. Thus we will say that *indignant* has stress on the second syllable; and we may also indicate that the word *like* is normally stressed in *Does he like it?* In such cases, we can show the stress by a raised vertical mark (cf further App II.3):

in'dignant Does he 'like it?

We speak of **RHYTHM** when we are considering the pattern formed by the stresses perceived as peaks of prominence or beats. These occur at somewhat regular intervals of time, the recurring beats being regarded as completing a cycle or 'measure'. Thus, as a language with a tendency for 'stress-timed' rhythm, English often shows an identity of rhythm in sentences like the following, provided that the number of syllables does not vary too widely:

'John is	'here	'now.
'John is at	'home	to'night.
The pro'fessor is in	'London this	'evening.

We speak of **INTONATION** when we associate relative prominence with **PITCH**, the aspect of sound which we perceive in terms of 'high' or 'low', 'falling' or 'rising', broadly as these terms are used with reference to a scale of musical notes. Thus we will say that the 'intonation nucleus' in the following utterance (using the notation explained in App II.12ff) has a 'falling tone', as is normal when a sentence is a statement:

The 'man has GÓNE

By contrast, if this nucleus had a rising tone, the sentence would usually have the value of a question:

The 'man has GÓNE

Finally, when we have occasion to indicate the **PRONUNCIATION** of vowels and consonants, we use the symbols listed in the pronunciation table (p. viii). By this means, we can show, for example, the different sounds that are represented by the letter *o* in forms of the verb *DO* (cf 3.36):

Do /du:/ they	} read much?
Don't /dəʊnt/ they	
Does /dʌz/ he	

The symbols follow a tradition of 'broad transcription' so as to represent English pronunciation on as wide a basis as possible, but where there are

differences between BrE (as represented by RP) and AmE (as represented by 'network English'; cf 1.27), our symbols seek to indicate these.

Physical properties

- II.2** The physics of these phenomena cannot concern us here, though we must utter a warning against simple equations such as regarding stress as identical with loudness. Stress is closely associated with loudness or amplitude on the one hand and articulatory force on the other, but other factors are or can be involved—notably duration and pitch. Pitch seems to be the most important factor when a stress is final in a phrase (or when a word is spoken in isolation): the stress is then associated with (or realized by) pitch prominence and often with pitch movement. But what matters is that the hearer expects sharp contrasts of prominence and expects peaks of prominence at particular places in a word or a phrase. Understanding is severely handicapped if such expectations are frustrated.

Again, we can agree on discriminations between various kinds (and even degrees) of 'rhythmicity' without committing ourselves to a definitive view on the physical nature of English rhythm itself. The stresses are regarded by speaker and hearer as 'beats' at more or less regular intervals of time. We thus have an accentual sequence analogous to the quasi-isochronous 'feet' in poetic metre, each foot consisting of a stressed syllable, usually with one or more unstressed syllables. Perception of the rhythmic base may involve observing variations in loudness or pitch, or measuring intervals of time—or a combination of these. But these are matters of controversial debate, to which we will not turn our attention here.

So far as pitch is concerned, we should recognize that, although 'fundamental frequency' is doubtless a more prominent component than anything else in providing cues to our perception, nevertheless loudness or intensity is a significant cooccurrent factor and can readily, in fact, replace fundamental frequency. Evidence of our ability to dispense with fundamental frequency is that, largely through amplitude variation (though other factors are no doubt involved), whispered speech is perceived as having the same intonation as normal voiced speech.

We need also to distinguish intonation from musical melody. In contrast to music, there is, in speech, no absolute pitch and there are no fixed intervals to be observed in intonation. All pitch distinctions are acoustically relative, however absolute they may be linguistically.

Lastly, it should be noted that the three interrelated factors of stress, rhythm, and intonation are not the only distinctions that are observed in the stream of speech modifying an utterance while the grammar and vocabulary are held constant. Other 'prosodic systems', as they are called, include for example tempo, *ie* the relative speed of utterance. It is widely agreed, however, that stress, rhythm, and intonation are the most pervasively important, and we shall virtually exclude the others from consideration in

this short description. They are however illustrated in the texts presented in 19.87ff, which depend on our recognizing some of these other distinctions.

Note The meaning attached by linguists to 'prosodic' is based on the use of this term in traditional rhetoric but with considerable difference in emphasis and specialization.

Stress within the word

Stress patterns in words

- II.3 As soon as an utterance is longer than a single syllable, the syllables are arranged in rhythmic patterns comprising a succession of strong-weak-strong-weak, and so on. This is true whether the polysyllabic stretch is a sentence, a phrase, or a single word. It is possible to distinguish several degrees of stress in a sequence of syllables. But it would seem that what is most linguistically relevant is a simple binary opposition: stress versus no stress. We mark PRIMARY stress with a high vertical stroke before the syllable carrying the stress, leaving lack of stress unmarked:

'friendship 'aperture
un'helpful de'parture

But it is often relevant to distinguish, from primary stress, an intermediate SECONDARY stress. When it is desirable to indicate secondary stress, this will be marked by a low vertical stroke before the syllable concerned:

'house,keeper ,contri'bution

When it is necessary to distinguish a specially HEAVY stress, we can make use of a double high vertical mark. Heavy stress can be used to mark sharp contrasts or to indicate relative stress in phrases without recourse to indicating intonation (cf App II.11ff), eg:

'several 'generous ,contri'butions

Although, as speakers, we have a good deal of freedom in assigning stresses in utterances longer than a word, the placing of the stress within English words is – save for relatively minor exceptions – so rigorously invariant that it is often difficult for the hearer to understand a word where the accentuation is deviant. Compare [1–3] with [1a–3a]:

im'portant	[1]	*'important	[1a]
e'mergency	[2]	*'emer.gency	[2a]
'energy	[3]	*e'nergy	[3a]

Moving the primary stress from the second syllable to the first (as in [1a] and [2a]), or from the first to the second (as in [3a]), could be enough to make the word incomprehensible or misunderstood.

But although the stresses are normally in a fixed position in a word, their position is unpredictable in the sense that – in contrast with some languages – there is no single position where the primary stress of a word can be expected to fall in English. For example, to count from left to right, it may fall on the

1st syllable: 'family	4th syllable: fa,mili'arity
2nd syllable: fa'miliar	5th syllable: ,nationali'zation
3rd syllable: ,natio'nality	6th syllable: in,dustriali'zation

Thus, to a large extent, the stress pattern of each polysyllabic word has to be learned separately, though we shall presently see that some valuable generalizations can be made. We shall also see that, with some classes of words, it is helpful and relevant to count syllables from the end rather than from the beginning.

- II.4 The generalizations that can be made about the stress pattern of English are complicated by the mixed nature of English vocabulary: a basic core of Germanic words is surrounded by a much larger number of words from foreign languages (notably French, Latin, and Greek). Native words and early French adoptions tend to have the primary stress on the stem syllable and to keep it there, regardless of the affixes that word-formation may add (FIXED STRESS):

'kingly	'passion	stand
'kingliness	'passionately	under'stand
un'kingliness	dis'passionate	misunder'stand

By contrast, with more recent adoptions, and with derivations based on foreign and classical elements (cf App. I.31), the place of the stress varies according to the affixation (MOVABLE STRESS):

	ANTEPENULTIMATE	PENULTIMATE
'telegraph	~ te'legraphy	~ tele'graphic
'photo(graph)	~ pho'tography	~ photo'graphic
'transport	~ trans'portable	~ transpor'tation
'argument	~ argu'mentative	~ argumen'tation

The items in the third column above exemplify two valuable generalizations. The stress falls on the syllable before adjectival -ic (cf App I.39), ie on the penultimate syllable:

e'conomy	~ eco'nomie
'phoneme	~ pho'nemic
'problem	~ proble'matic
'sympathy	~ sympa'thetic

All abstract nouns ending in -ion are stressed on the syllable preceding this ending, eg:

counter'action	sus'picion	tabu'lation
----------------	------------	-------------

This stress remains even after further affixes are added after -ion:

re'vision	~ re'visional	~ re'visionist
-----------	---------------	----------------

- II.5 But there are numerous other comparable generalizations which help us to predict the placing of English stress. Thus the stress falls on the last syllable before nominal -ity (cf App I.36):

'curious	~ curi'osity
pro'miscuous	~ promis'cuity
u'nanimous	~ una'nimity

The stress also falls on the last syllable before the nominal and adjectival suffix *-ian*:

'Cromwell	~ Crom'wellian
'grammar	~ gram'marian
'library	~ li'brarian
u'tility	~ utili'tarian
Greek	~ 'Grecian
'Asia	~ 'Asian
'Croat	~ Cro'a'tian
'Alsace	~ Al'satian

By contrast, the affix *-ite* leaves the place of the stress unchanged (cf App I.37). Compare:

'Jefferson	~ {Jeffersonite Jeff'er'sonian}
------------	------------------------------------

A fairly numerous set of words that can operate without affixal change as noun or adjective on the one hand, and as verb on the other, have a stress difference in the two functions (cf App I.56), for example:

NOUN	ADJECTIVE	VERB
'attribute		at'tribute
'conduct		con'duct
'contrast		con'trast
'convict		con'vict
'present	'present	pre'sent
	'perfect	perfect

In one of these (*contrast*) and in several of the other examples that might have been cited (eg: *export*), there is a tendency to discontinue a separate verb form and to use the form as stressed for the noun also in other functions.

Note In numerous words, interchange of primary and secondary stress would produce a comprehensible pronunciation. This is especially so with words where the native speakers themselves show variation, as in:

'abdomen	or ab'domen	finance	or 'finance
'controversy	or con'troversy <esp BrE>	'maga'zine	or 'maga,zine

In some words there are different stress patterns in the two major standards of English, with a tendency for BrE, especially among younger speakers, to adopt the AmE pattern. The two nouns *adult* and *ally* are examples of varying usage where the stress is often on the first syllable in BrE but usually on the second in AmE (cf App II.6 Note for a contrary tendency in some words).

Stress in compounds

II.6 Compound nouns (cf App I.61 ff) generally have a primary stress on the first element but with a secondary stress on the second constituent:

'earth,quake	'life,boat
'waiting,room	'fire-ex,tinguisher

Contrast here compounds with the corresponding noun phrases, eg:

That sounds like a 'black,bird. [compound]

A carrion crow is a completely 'black 'bird. [noun phrase]

Other examples:

COMPOUND		NOUN PHRASE
'black,board	but	'black 'board
'green,fly	but	'green 'fly
'hot,house	but	'hot 'house

When such a compound is made part of another compound, the primary stress and the secondary stress are redistributed to give the same rhythm:

'light,house but 'lighthouse-keeper

A smaller number of compounds do not have the primary stress on the initial element:

,vice-'chancellor ,first-'rate

As well as nouns, these compounds include:

verbs:	,back-'fire
adverbs:	,hence'forth
adjectives:	,knee-'deep, ,flat-'footed

In some cases we may be in doubt as to whether we should regard sequences with this stress pattern as compounds or free syntactic phrases, and we vacillate between writing them with hyphens or as separate words (cf App I.59, App III.4f), for example:

,lawn(-)'tennis ,country(-)'house

On the other hand, we vacillate in our stressing of some examples which are apparently in the process of becoming recognized as compounds of the 'black,bird type; for example:

,field 'marshal	or 'field ,marshal
,over'seas	or 'over,seas
,week'end	or 'week,end
,head'master	or 'head,master

In any case, the stress often shifts from the second to the first element when the compound is being used attributively in a noun phrase:

The room is ,down'stairs.	but a 'down,stair's room
His work is ,first 'class.	but his 'first, class 'work
The water is ,knee-'deep	but 'knee-deep in 'water

This is analogous to the redistribution that occurs in compounds like *lighthouse-keeper*.

Note In AmE, and quite often also in BrE, there is a strong tendency to give initial stress to many of these compounds, eg in:
lawn(-)'tennis, back-'fire, country(-)'house, apple-'sauce

Stress in phrases and other syntactic units

- II.7 The examples and the discussion have already taken us outside the limits of the word and into the distribution of stresses in phrases and other syntactic units. It is usual to emphasize the distinction between the word, where convention and semantic integration tend to produce a fixed stress and rhythm which the individual speaker cannot alter, and connected speech, where the disposition of stresses is subject to the speaker's will and the meaning he wishes to convey.

There is much validity in this but it must not be pressed too far, since it depends on a much sharper distinction between phrases and (compound) words than English grammar and lexicology in fact warrant. It will not do to say that initial stressing (as in *'black bird*) indicates compounds, and final stressing (as in *electric 'clock*) the syntactic phrases of connected speech. We have seen compounds like *down'stairs* which (despite similarity with phrases like *'down the 'street*) we would not wish to analyse as phrases. And *'still 'life* (in painting), which is usually stressed in BrE as though it were a phrase, shows that it is a compound in having a different plural (*still lifes*) from the noun *life* ~ *lives* (cf 5.83). So too there are initial-stressed phrases that linguists would not normally regard as compounds, since – as is not general in word-formation (cf App I.1 ff) – we are as free to form such sequences as we are to form any other kind of syntactic unit, especially with 'general nouns':

I was talking to the *'turkey man* about this *immuni'zation business*.

- II.8 The stress distribution provides a firm basis for distinguishing not so much between compound and phrase as between different semantic relations:

{ A 'bull- <i>fight</i> involves bulls.	[1]
{ A 'bull- <i>calf</i> is a young bull.	[1a]
{ A 'French- <i>teacher</i> teaches French.	[2]
{ A 'French- <i>teacher</i> is French.	[2a]
{ A 'slate- <i>quarry</i> yields slate.	[3]
{ A 'slate- <i>roof</i> is made of slate.	[3a]
{ A 'toy- <i>factory</i> produces toys.	[4]
{ A 'toy- <i>factory</i> is a model of a factory used as a toy.	[4a]

Thus the distribution of stresses in units higher than the word is subject to rule, just as it is within the word. Apart from 'object' premodifiers (as in *'French teacher*), there is a heavier stress (indicated by a double vertical mark) on the head of a noun phrase where the head is the last item in the phrase:

a rea'listic little toy 'factory
'several 'stale half-eaten 'currant "buns

Postmodified noun-phrases normally have the primary stress on the last stressable item (ie generally an open-class lexical item) in the postmodification:

the toy 'factory he 'got for his "birthday
the 'currant "buns that I 'tried to "eat

With equal regularity (and subject to the special factors explored in 18.1 ff), a noncontrastive primary stress falls on the main verb, or on the subsequent particle if the head is a phrasal verb (such as *wash up*; cf 16.3), or on the operator in an elliptical verb phrase:

- A: 'Will he have "gone? B: 'Yes, he "will.
A: He 'must be "working. B: Yes, he "must be.
She 'can't have been "washing "up.

In these last examples, the verb phrases come at the end of sentences. End position is a point where, in any case, a climax of prominence is expected and normally occurs on the last word unless it is a pronoun or (frequently) a preposition (cf 9.6). Compare the regular, noncontrastive shift of stress placement in the following two sentences:

He 'saw his "mother. ~ He "saw her.

Compare also the following sentences:

- It's the ad'dress he 'sent the "letter to. [5]
He 'sent the 'letter to the ad'dress he'd been "given. [6]

Final position of the preposition in [5] gives it a secondary stress and an unreduced vowel /u/, whereas in a syntactically analogous nonfinal use in [6], the preposition would be unstressed and the vowel reduced to /ə/.

Peaks of prominence in syntactic units of the kinds discussed in this and later sections would in actual speech be normally associated with pitch, and we shall shortly (cf App II.1 ff) reinterpret these peaks in terms of intonation. For the present purpose, however, this fact may be ignored without undue distortion.

Note We have previously (cf App II.6) noted the stress shift that occurs in compounds when used attributively. The same phenomenon also occurs in syntactic phrases:

after-noon	but after-noon 'tea
over-seas	but over-seas 'student
conti-nental	but a conti-nental 'climate
uni-versity	but the uni-versity 'library
Pic-ca-dilly	but Piccadilly 'Circus
prin-cess (esp BrE)	but Prin-cess 'Anne

In the case of polysyllabic words, other situations than the attributive position may trigger off the stress shift:

The 'princess fell in "love.

Contrastive stress

- II.9 Since the language determines stress location almost as rigidly in phrases and sentences as it does in individual words, we should not attempt to impose too sharp a distinction between 'words' and 'connected speech' on these grounds.

However, the individual speaker has the possibility of placing stress freely in units larger than the word by means of CONTRASTIVE STRESS which is capable of highlighting any word in a sentence. This is particularly striking

in the case of some closed-class words (cf 2.39) which, when unstressed, make use of the 'schwa' vowel /ə/ or other form of phonological reduction. Under contrastive stress, they assume the form that they have as isolated dictionary items:

	UNSTRESSED	STRESSED
<i>a</i>	/ə/	/eɪ/
<i>an</i>	/ən, n/	/æn/
<i>and</i>	/ənd, ən, n/	/ænd/
<i>but</i>	/bət/	/bʌt/
<i>not</i>	/nt, n/	/nɒt/
<i>he</i>	/hi/	/hi:/
<i>was</i>	/wəz/	/wɒz/
<i>would</i>	/wəd, əd, d/	/wʊd/
<i>does</i>	/dəz, dz, s/	/dʌz/

The unstressed form /s/ of *does* occurs for example in:

What's he mean? ['What does he mean?']

Examples of stressed *and* and *he* in sentences:

'John 'and his 'mother 'went. ['It is not true that only one of them went.']

Will 'he have 'gone? ['Granted that others have gone, is it true of him also?']

The focus device of contrastive stress (cf 18.12) involves pitch prominence and we shall therefore return to it when we are dealing with intonation. For the present we must observe, however, that contrastive stress is not limited to sequences longer than the word. The normal accentuation within the word can also be distorted at the speaker's will if he wants to make a contrastive point. Thus instead of *unhappy* one might say "*unhappy* in a context such as:

A: She was looking very happy tonight.

B: You thought so? *She seemed "unhappy to me.* [1]

Unstressed (or weak) forms represent phonological REDUCTION where there may be a wide range of variants, eg /ənd/, /ən/, /n/ of a stressed (or strong) form /ænd/. CONTRACTION, on the other hand, is the term used for institutionalized written representations of reduction, eg /aɪm/ represented in writing as *I'm*. Since contraction is institutionalized, we do not find variation in writing corresponding to the range of reduced forms in speech. For example, there is only one contracted form 'd of *would*, and there is no generally acceptable or widely used contraction of *and* in writing, compared with the range of reductions illustrated above.

The major types of contraction are the following:

- (i) Not-contraction, eg: *don't, haven't, shouldn't* (cf 10.55f)
- (ii) Auxiliary verb contraction, eg: *I'm, you've, they're; we'll, that'll; she's, one's, somebody's, there's; you'd, who'd* (cf 3.23)
- (iii) Personal pronoun contraction of *us* in *let's* (cf 3.51 Note [b])

In combinations of two potential contractions, the writer has a choice

between alternatives. In general, *have* and *will* favour *not*-contraction, whereas the auxiliary contraction predominates with *are*. Thus:

<i>I haven't</i>	rather than <i>I've not</i>
<i>I won't</i>	rather than <i>I'll not</i>
<i>we're not</i>	rather than <i>we aren't</i>

Double contractions are never allowed: **I'ven't*.

Note Contrastive stress can also override the distinction made in App II.8. Thus in the following sentence (cf example [2a] in App II.8), we could be making it clear that the teacher had been described as *French*, not *fresh*:

I said she was a "French teacher, not a "fresh teacher.

Rhythm

II.10 Broadly speaking, and disregarding the special case of contrastive stress, English connected speech has stresses on the open-class words, and absence of stress on the closed-class words accompanying them:

It's the ad'dress he 'sent the "letter ,to.

She was 'looking "happy to'night.

Just as word stress in rapid or informal connected discourse differs from stress on words in isolation, so the pronunciation of words is influenced by their linguistic surroundings. This is true not only of closed-class items but also of open-class words. The processes affecting the edges of words and syllables are referred to as 'assimilation', 'coalescence', and 'elision'. Thus we may find the following reductions in connected discourse:

	IN ISOLATION	IN CONNECTED DISCOURSE
<i>I'm going</i> (to York)	/aɪm 'gəʊɪŋ/	/aɪm'gəʊ/
<i>actually</i>	/'æktjuəli/	/'æktʃli/

The natural rhythm of English is a regular beat. When unaffected by such factors as hesitation, which may slow down the speaker, or excitement, which may speed him up, English rhythm provides roughly equal intervals of time between the stresses. Compare examples [1] and [2]:

He told his mother. [1]

He sent it to his mother. [2]

If these two sentences were spoken by the same person under similar conditions, they would have the same basic rhythmic pattern, would occupy roughly the same amount of time, and would thus oblige the speaker to utter the sequence *sent it to his* more rapidly than the sequence *told his* which occupies the same rhythmic unit:

He 'told his "mother.

He 'sent it to his "mother.

Absolute regularity of rhythm is, however, the exception rather than the rule.

When the intervals between stresses cease to be merely 'roughly equal' and achieve something like metronomic equality, the stylistic effect is oppressive. One exception is counting. When we have to count a fairly large number of items, it seems easier to prevent ourselves from getting lost if we adopt a strictly timed rhythm:

'one, . . . 'two, . . . 'three
'seventeen, . . . 'eighteen, . . . 'nineteen
seventy-'four, . . . seventy-'five, . . . seventy-'six
a hundred-and-'three, . . . a hundred-and-'four, . . . a hundred-and-'five

A regular rhythm is also used when we are compiling an inventory, giving a list of names, or the like. An insistent regularity may also be introduced for emphasis, especially when one is implying repetition of something which ought to be accepted without argument or when the speaker is expressing irritation or sarcasm:

You should 'never . . . 'move the . . . 'files of . . . 'papers . . . 'on my . . . "desk.

It is the requirements of rhythm rather than of the message which here causes the normally unstressed *on* to be emphasized, and we commonly find that the special use of regular rhythm distorts the normal stress patterns in this way. An earlier example was *a hundred-and-'three* in counting rhythm where this number in isolation would have two stresses: *a 'hundred-and-'three*. So too the numerals in *-teen*, eg: *'seventeen*, but in isolation, *seven'teen*.

But, for the most part, approximations to strictly timed rhythm are rare, brief, and rhetorical; for example in public speaking, such as appeals, sermons, and political speeches. More prolonged use occurs with the listener's full sanction in the reading of poetry and in forms of religious discourse, especially prayer.

Intonation

Tone unit, nucleus, and onset

- II.11 Spoken English is not produced in an undifferentiated stream, but is marked off into brief stretches, usually corresponding to units of information (cf 18.3ff). These stretches we shall refer to as **tone units**. Tone units, the terminal boundaries of which are here indicated by a thick vertical (|), consist of a sequence of stressed and unstressed syllables, in a broadly rhythmic alternation, and with each unit containing at least one syllable marked for pitch prominence. The peak of greatest prominence is called the **NUCLEUS** of the tone unit, and the syllable carrying the nucleus has been indicated in this book by being printed in small capitals. This practice will be followed from this point onwards in the present Appendix. Usually the tone unit consists of several words, eg:

Is she leaving **TODAY** |

But occasionally, a tone unit may consist of a single pitch-prominent syllable, eg:

YES |

The first prominent syllable in a tone unit is the **ONSET**, and it is commonly preceded by one or more syllables which are unstressed and pronounced on a low pitch. The position of the onset is indicated by a preceding thin vertical (|), eg:

He |told his **MOTHER** | [1]
It's the ad|dress he sent the **LETTER** to | [2]
She was |looking **HAPPY** tonight | [3]
You |**THOUGHT** so | [4]
She |seemed **UNhappy** to ME | [5]

Concerning the two nuclei in [5], cf II.15.

The falling tone

- II.12 Usually, pitch prominence is associated with pitch change, and the commonest change is a **FALL** in pitch (indicated by (') above the nuclear syllable). We would expect a fall on the nuclear syllable in, for example, both [1] and [2]:

He |told his **MOTHER** | [1]
It's the ad|dress he sent the **LETTER** to | [2]

Likewise, we expect a fall on the nuclear syllable in most questions beginning with a *wh*-word, as in [3] and [5], in one-word responses to questions on words or names [4], or even letters uttered in isolation, as in [6]:

|What's his **NÁME** | [3]
Phy|**LÁKt**is | [4]
|What's the first **LÈTTER** | [5]
|p | [6]

The falling tone is by far the most frequent. It might be said that it communicates an impression of completeness and that a tone unit has a falling nuclear tone unless there is some specific reason why it should not.

The rising tone

- II.13 When there is a reason for departing from the norm of a falling tone, the most frequently used tone is a **RISE** one (indicated by (') above the nuclear syllable). Broadly speaking, this is when we wish to indicate that our utterance is nonfinal or that we are leaving it open and inconclusive. This may be because we are counting or listing and have not come to the last item:

|**TWÉLVE** | |**THÍrteen** | |**FÓurteen** | |**FÍrteen** |
There are |**fíFTÉEN** |

(Notice again the difference between numerals in *-teen* in sequence and in isolation.)

It may also be because another clause is going to follow:

[When I CÁME] he [greeted me WÁRMly]
I [saw her this MÓRNING] and in[vited her to DìNner]

Alternatively, we may be seeking a response from someone (but not by means of a *wh*-question):

[Have I kept you WÁITing]
You're [leaving alRÉADy]

Some of the examples in App II.11 might well have a rising nucleus, for example [3]:

She was [looking HÁPPy tonight]

This would make it not a question but a polite suggestion that a (confirmatory) comment would be welcome. This might be expanded by adding a tag question (*cf* 11.8*ff*) with a falling nucleus:

She was [looking HÁPPy tonight] [wÁsn't she]

Elsewhere, the absence of dogmatic finality in the rise may enable us to make an imperative more gentle and persuasive:

[Don't be unPLÉASAnt]
[Please sit DÓWN]

II.14 Fall-rise, level, and rise-fall

There are no nuclear tones anything like so common as the fall and the rise, but four other tones are nevertheless important. The FALL-RISE (˘) occurs in many 'contingency' environments, for example in doubtfully expressing a condition:

I'll [see her if she CÔMES]

The fall-rise is especially common with initial adverbials (*cf* 8.15):

[FÍNally] we de[ecided not to GÔ]

The LEVEL tone (ˉ) may be viewed as a variant of the rise (*cf* App II.18 Note), and it is used to suggest (often somewhat pompously) the predictability of what is to follow:

He [DRÁNK] he [STÔLE] he was [soon desPÍSED]

The RISE-FALL (ˆ), on the other hand, is really a rather emotive variant of the falling tone, used to express, for example, a genuine or sarcastic warmth, as in:

[That's wÔNderful]

Equally it can express a feeling of surprise or shock:

He's a com[plete FÔOL]

Note We might also mention the rather rare rise-plus-fall pattern, in which the first nucleus draws attention to a (subordinate) point of information focus, and the second places a decisive fall on the main point of information focus, for example:
She refused both the BÓOK and the THÉatre tickets]

Fall-plus-rise

II.15 The remaining tone pattern is by no means rare, but we have left it till the end because, unlike the tones mentioned previously, this pattern has two nuclei. It is the FALL-PLUS-RISE, and (esp in BrE) it would be expected in an example such as the following:

She [seemed ùNhappY to MÉ]

[1]

The nucleus is always a peak of semantic or 'information' content in the tone unit; with the fall-plus-rise we have two such peaks of information interest, and they are related, the first being superordinate (*cf* 18.17). The subordinate nature of the rise in the fall-plus-rise tone pattern is indicated by a narrower pitch range (*cf* App II.18) than where a rise is sole nucleus in a tone unit. The fall-plus-rise pattern should be seen as related to contrastive stress (compare the example above with example [1] in App II.9).

Now, contrastive stress usually involves moving a tonal nucleus from its normal, unmarked position on to the contrasted item. But it does not require the tone unit concerned to have two nuclei:

A: Are you [HÁPPy] B: [No I'm ùNhappY]

Compare also the contrast between first and second mention expressed by different position of the nucleus in the noun phrase in [2], as opposed to [3]:

[This book cost 'twenty DÓLlars] and [this one THÍRty 'dollars]
[*... 'thirty DÓLlars]]

[2]

[This book cost 'twenty DÓLlars] and [this one 'ten PÒUNDS]
[*... TÈN 'pounds]]

[3]

But in all these variants, there remains a single point of information focus. By contrast, the fall-plus-rise allows the speaker to draw attention to two focal information points, for example:

She [seemed ùNhappY to MÉ]

Here the two nuclei enable us to say (a) that she seemed unhappy (contrary to the suggestion of someone else), and (b) that this is the speaker's personal view: of course there may be others.

In addition to its use in thus contradicting what a previous speaker has said, marked focus (*cf* 18.12*ff*) also commonly occurs with this intonation pattern in order to contrast two items within a single information unit. The fall is always on the marked focus and carries most prominence, the contrasting rise being relatively subordinate. Note the following example using the cleft sentence (*cf* 18.25*ff*):

It's his [wÍFE that I don't LÍKE] = The [one that I don't LÍKE] is his wÍFE]

Contrast the normal end-placed focus:

I [don't like his wÍFE]

A further pair of examples:

It's his [jÔB that's wÔRRying him]
His [job is wÔRRying him]

When, as in those two examples, the nucleus does not occur in the last word of the tone unit, the part of the tone unit after the nucleus is referred to as the TAIL.

Note The frequencies of the different tones will of course vary depending on a wide range of factors, such as the relation of the participants, the field of discourse, etc. In a BrE corpus of conversation, half the tone units had a single falling nuclear tone. The frequencies of occurrence for all intonation types were as follows:

Falling (ˋ)	51.2%
Rising (ˊ)	20.8%
Fall-rise (ˋˊ)	8.5%
Fall-plus-rise (ˋˊˊ)	7.7%
Rise-fall (ˊˋ)	5.2%
Level (ˊˊ)	4.9%
Rise-plus-fall (ˊˋˊ)	1.7%

Prosodic segmentation

II.16 Tone units are produced by the speaker and processed by the hearer as units of information. Compared with the sentence, which is essentially a conventional unit characteristic of written language, the tone unit is more individually variable and psycholinguistically responsive to the communicative needs of the individual speaker. Such variation is particularly noticeable in spoken language, where the conditions of planning and processing are radically different from those obtaining in writing and reading.

In spontaneous conversation, the mean length of the tone unit is around five or six words, or two seconds. But the length of the tone unit, in the individual case, depends on a number of factors such as grammatical structure, lexical realization, discourse structure in terms of given/new and theme/focus (*cf* 18.3*ff*), speech situation, speed of utterance, and the speaker's personality. Thus no rigid rule can be made about the relation of tone to grammatical units. However, it has been found that there is a strong tendency for breaks between tone units to occur at grammatical junctures. Thus there is considerable correlation between the length of the tone unit and its grammatical content. In one study, the major grammatical segments corresponding to a tone unit were found to be as follows (*cf* 18.5*ff*):

Two clauses, one of which is a nominal *that*-clause as direct object (*c* 8 words), *eg*:

I really think that he'll come tomorrow|

One clause (5–6 words), *eg*:

He'll arrive by train tomorrow|

Verb phrase plus adverbial (4–5 words), *eg*:

will arrive at ten thirty|

Noun phrase as subject (3–4 words), *eg*:

the train from London|

Prepositional phrase as adverbial (3–4 words), *eg*:

at this platform|

Miscellaneous noun phrases (2–3 words), *eg*:

and the south|

Adverb (1 word), *eg*:

Obviously|

The interdependence of grammar and prosody can be seen for example in the following two sentences:

The old man opened the elegant jewel case very slowly| [1]
The old man OPENED| very slowly| an elegant JEWEL case| [2]

(Note that *the . . . case* in [1] makes the noun phrase sufficiently 'given' to justify the end position of the adverbial; *cf* 18.8.) The different segmentation with prosodic focus in [2] is a result of the placing of the adjunct *very slowly* at *iE* instead of *E* in [1] (*cf* 8.14).

The grammatical status of different types of adjunct may be reflected in prosodic segmentation. Thus the relatively peripheral status of the sentence adjunct [3] (as compared with the predication adjunct [4]) can be indicated by different tone unit segmentation (*cf* 8.36):

In Chi|CAGO| he |studied ARCHITECTURE| [3]
In Chicago he LIVED| and |in Chicago he DIED| [4]

Intonation in relation to other features

Tone of voice, pitch, and music

II.17 'Intonation' must be distinguished from 'tone of voice' on the one hand and from 'intoning' on the other. One's tone of voice may be warm or cold, kind or harsh, happy or sad – irrespective of the intonation pattern, the length of the tone unit, the location of the nucleus, or the direction of the pitch movement. Indeed, while there can be no doubt that intonation is linguistically relevant, there must be considerable doubt as to whether tone of voice involves linguistic parameters at all. True, on hearing someone say:

I've |bought a CAR|

we can add to our understanding of this statement the inference that the speaker sounded happy or proud or perhaps nervous, but, merely because we deduced this from the way he spoke, we need not go to the lengths of regarding the deduction as springing from the linguistic form.

As to the distinction between intonation and intoning, something has already been said in App II.2. In sharp contrast to the specific intervals of a musical scale, the movements in linguistic pitch are purely relative. A person speaking with a high-pitched voice may end a fall at a point far higher than the point at which a fall began as uttered by a low-pitched voice: yet, despite total dissimilarity in fundamental frequency or acoustic quality, both falls would be instantly recognized as linguistically identical. Again, even where they begin at the same point in pitch, two speakers will differ very considerably in the amount of pitch movement that may constitute a rise, yet

both rises may be received by hearers as in some sense identical, so far as a purely linguistic interpretation is concerned. Nor indeed is it necessary for a speaker to be consistent in this width of pitch movement (*cf* App II.18), even in consecutive tone units.

Note The part played by musical tone in English is very slight, but it may be of interest to mention that calls to attract attention make considerable use of descending minor thirds. A wife may call jocularly to her husband down the garden when supper is ready:

Fig II.17a

The second bar would be the tune also in trying to attract the attention of a person some distance away: *Ro-ber-t!*, *Ma-ry!*. It appears also in the ending of the long-standing children's taunt, the words of course being freely varied:

Fig II.17b

II.18 Pitch height and pitch range

In the previous section, reference was made to the fact that it is possible to make what is linguistically the same nuclear tone with considerable variety in actual pitch and pitch movement. Without diminishing the validity of this, and without suggesting further comparison with the specific tonal intervals of music, we must note the existence of other relative systems in intonation which will allow certain broad differences in pitch height and pitch range to assume linguistic significance.

By **PITCH HEIGHT** we are referring to the point on the pitch scale at which a stressed syllable occurs in relation to the previous syllable. Most commonly, there is a gentle stepping down in pitch level from syllable to syllable, and against this expected pattern (particularly in assertive statements), variations stand out clearly. A step upwards in pitch, called a 'booster' and symbolized as (↑), or a marked step downwards (↓), can add considerably to the feeling that is being conveyed. Thus:

His |wife is |always ↑NÀsty| [1]

Such a use of pitch contrast as in [1] would be one way of achieving emphasis on both the adverbial and the complement of this sentence, while at the same time indicating that the nastiness has not been mentioned by either speaker before or is perhaps alleged as a matter of potential dispute between the speakers. A variant form is [2]:

His |wife is always ↓NÀsty| [2]

Sentence [2] might suggest that while the nastiness needs emphasis, it is of a

familiar kind. In conjunction with a pointedly regular rhythm, a regularly ascending or descending pitch height can be very effective in achieving climax, as in [3] and [4]:

And |all the ↑people of ↑this ↑great ↑CÓUNtry| ... [3]
|Why on ↓earth don't you ↓do some ↓WÓRK| [4]

By **PITCH RANGE** we are referring to the amount of pitch movement on the nucleus or from stress to stress in the course of the tone unit, irrespective of whether the starting point is high or low. An ingratiating, warmly interested, or excited attitude can be indicated by a wide range, while a narrow range (as well as being used to indicate boredom, for example) is frequent on the nucleus of subordinate clauses. But these are by no means the only contrasts we can imply by altering our pitch range.

The following question, for example, can be given two interpretations depending on the pitch range of its nuclear syllable:

Was it |MÝ fault|

Uttered with a narrow pitch range, it is a regular open question; with a wide pitch range, it is a rhetorical, exclamatory question (*cf* 11.23): 'Surely you are not suggesting that the fault is mine!'

Note It is through the prosodic property of pitch range that we should relate the association of level nuclei to rising ones (*cf* App II.13). That is, level nuclei occur most frequently where rising ones might be expected, and we could thus regard level as a very narrow rise. We need to note, however, that the nuclei in pre-final subordinate syntactic units may be not only narrow rises or levels but not infrequently narrow falls.

Pauses

II.19 In the course of this Appendix, we have been gradually developing a notation for expressing on paper the more important linguistic distinctions that are made not by words but by sound patterns affecting syllables and syllable sequences. There is one further parameter that we must not ignore. The **PAUSE** in speech is by no means of random occurrence. Together with the tone unit, it tends to divide up the stream of speech into grammatically and lexically relevant chunks and, although it is by no means essential to pause at the end of tone units marking completed syntactic constructions, lengthy pauses are more usual at such points than elsewhere. Speech is however more flexible than writing in allowing us to introduce a 'space', *ie* momentary silence, to suit the speaker's or hearer's needs, before (or perhaps after) a difficult or specially significant lexical item, even if this occurs in the middle of a grammatical phrase. Pauses are most relevantly measured in terms of a speaker's own rhythm and tempo, and we take the unit of pausing (denoted by a dash '-'), as equivalent in time to one rhythmic measure or cycle (*cf* App II.1). A pause shorter than such a unit is indicated by a period (.):

She is . un|hÁppy| - |VÈry un'háppy|

As for **TEMPO**, to which reference has just been made, we sometimes find it valuable to contrast, with a given speaker's normal speed of utterance, the relatively slow or fast stretches that occur from time to time, as he displays -

for example – special care or seriousness at one point, or an off-handed dismissal or cheerful levity at another point. Here, as with height and range or with tone of voice (*cf* App II.17f), we can easily slip beyond the normal bounds of linguistic description.

Prosodic marking compared with punctuation

- II.20 Even ignoring, as we must, several other features of spoken English, we now have a system of conventions capable of expressing on paper for spoken English what the system of punctuation marks does (on the whole, much less well) for written English. There are numerous respects in which conventional punctuation is inadequate (*cf* App III.5), but we need mention here only a few such points to show how our prosodic notation both explains and transcends the difficulty.

Since the early nineteenth century, institutionalized usage has disallowed any punctuation (except correlative punctuation, *cf* App III.2) between subject and predicate. Yet (as student essays show), users of English are still strongly motivated to put a comma between a long noun-phrase subject and the verb, *eg*:

*The newspaper article on the recent conflict, was utterly misleading.

There is a very good reason for this. After a long noun phrase, the coherence of the structure just completed is regularly marked in speech by a prosodic break, usually realized by the end of a tone unit, often by a pause as well:

The |newspaper article on the recent CÓNflict| (–) was |utterly misLÉADING|

- II.21 Again, although we can indicate emphasis in written English (usually by means of italics in print and underscoring in typescript or handwriting), we cannot distinguish emphases of radically different sound and value:

- You shouldn't give her *any* flowers. [1]
 ['You must give her no flowers at all.]
 You shouldn't give her *any* flowers. [2]
 ['You must give her only certain flowers.]

Our prosodic notation for spoken English, however, adequately represents the difference we hear:

- You |shouldn't give her |ÁNy flowers| [1a]
 You |shouldn't give her ÁNy flowers| [2a]

Unlike punctuation, prosody readily helps to identify focused items also in examples like the following (*cf* 8.117):

- |John could only sÉE his wife from the doorway| [3]
 |John could only see his wÍFE from the doorway| [3a]
 |John could only see his wife from the DÓORway| [3b]

The position of the nucleus and the type of tone are decisive for the interpretation of the following expressions with *there* and *here* (*cf* 8.47 Note [b]):

- |THÈRE you are| or |HÈRE you are| ['So I've found you!'] [4]
 |THÈRE you are| or |HÈRE you are| ['This is for you.'] [4a]
 |There you ÀRE| ['That supports or proves what I've said.'] [4b]
 |Here we ÀRE| ['We've arrived at the expected place.'] [4c]

The item focused on by a focusing subjunct is identified by the location of the nucleus (*cf* 8.116) in:

- The |girls espÉcially objected to his manners| [5]
 ['It was especially the girls who objected to his manners.']
 The |girls especially objected to his MÀnners| [5a]
 ['It was his manners that the girls especially objected to.']

Compare also:

- |Help yourSÉLF please| < informal > [the speaker takes for granted the courtesy subjunct *please*; *cf* 8.91] [6]
 |Help yourSÉLF PLÉASE| [the speaker seeks more deliberately to emphasize the courtesy] [6a]

Consider now some other prosodic realizations which give sharply different meanings to the various constituents within the following sets of sentences. In each case, we begin with the 'unmarked' and most neutral form the sentence might have.

- I should |GÓ| [7]
 I should |GÓ| ['Is that your advice?'] [7a]
 |I should go| ['Not you!'] [7b]
 I |SHÓULD go| ['... and I defy you to deny it.'] [7c]
 I |SHÓULD go| ['... but I don't think I will.'] [7d]

- |Somebody must have TÁken it| [8]
 |Somebody must have |TÁken it| ['surprising as it may seem'] [8a]
 |Somebody |MÚST have 'taken it| ['It's no use your arguing'] [8b]
 |SÓMEbody must have 'taken it| ['even if you didn't'] [8c]

- You |said he would CÒME| [9]
 |You said he would CÒME| ['... but I was personally doubtful'] [9a]
 You |said HÈ would come| ['You didn't say that his wife was coming as well.'] [9b]
 You |SÁID he would come| ['... but that doesn't mean he really will'] [9c]
 You |SÁID he would CÒME| ['... and, my goodness, there he is!'] [9d]

- |I'm not |half sÁtisfied| < informal > ['I am highly satisfied.']; *ie*: not half is an amplifier; *cf* 8.107 Note [b] [10]
 |I'm not HÁLF 'satisfied| ['I am only partially satisfied.']; *ie*: half is a downtoner [10a]

It seems that they quite LIKE her ['rather, kind of'; *ie*: quite is a compromiser; cf 8.111 Note [c]] [11]
 It seems that they QUITE LIKE her ['moderately'; *ie*: quite is a diminisher; the contrast between [11] and [11a] is especially BrE] [11a]

We |don't like it a bIt| ['We don't like it.'; *ie*: a bit is a minimizer; cf 8.112] [12]
 We |don't like it a LIttle| ['We like it a lot.'; *ie*: a little is a diminisher] [12a]

Now |LiSten| [*now* is a transitional conjunct; cf 8.137] [13]
 |Nòw listen| [*now* is *I*-placed time adjunct; cf 8.55] [13a]

She |didn't leave HòME| be|cause I've been watching the house all DÀY| [*because*-clause as disjunct; cf 8.132] [14]
 She |didn't leave 'home be'cause her father ↑TòLD her to| [*because*-clause as adjunct; cf 8.86] [14a]

All the examples presented in this Appendix have been of isolated tone units or very short sequences. The system of stress, rhythm, and intonation operate significantly, however, over considerably longer stretches of speech, indicating degrees of connection and providing significant cues to interrelationship of grammatical, semantic, and pragmatic units as 'text'. Some aspects of speech in these respects are described in 19.87ff along with transcriptions of both formal and informal varieties of spoken discourse.

Note [a] Because of our inability to express prosodic nuances in writing, we frequently find (especially in fiction) the use of verbs such as *sneer*, *mutter*, *whisper*, *whine* to assist the reader in assigning the appropriate prosodic and paralinguistic features. So also adverbial expressions accompanying verbs of saying, such as *inquiringly*, *indignantly*, *sneeringly*, *in a haughty tone*. Thus the written sentence [15] might be intended to equate with [15a] in speech:

'But you're going to answer his letter, I suppose' she said *inquiringly*. [15]
 But you are |going to answer his 'letter I supPòse| [15a]

[b] We may also find instances of the opposite state of affairs, *ie* when speech lacks distinctions that can be made in writing. One such case is the use of 'quote - unquote', or even a gesture with the fingers, to signal quotation marks.

Bibliographical note

On stress, see Arnold (1957); Chomsky and Halle (1968); Gimson (1980).
 On rhythm, see Abercrombie (1967); Chatman (1965); Leech (1969b); Uldall (1971).
 On contraction, see Black (1977); Forsheden (1983); Zwicky (1970); Zwicky and Pullum (1983).

On various aspects of intonation and prosody, see Bald (1975); Bing (1980); Bolinger (1972c); Brazil et al (1980); Brown (1977); Brown et al (1980); Cruttenden (1981); Crystal and Quirk (1964); Halliday (1967, 1970); Kingdon (1958); Liberman (1978); O'Connor and Arnold (1973); Pike (1945); Quirk and Crystal (1966); Quirk et al (1964); Waugh and van Schooneveld (1980).

A detailed account of prosodic systems is given in Crystal (1969) and these are related to style in Crystal and Davy (1969, 1975).

Introduction

III.1 In Appendix II we surveyed a set of prosodic devices that help to communicate grammatical and other distinctions in spoken English. The purpose of the present Appendix is to examine the visual devices that perform a similar role for written English. Since prosodic devices are acquired naturally by native speakers, they do not have to be taught them formally, and educational tradition has largely ignored them. With punctuation, on the other hand, the array of devices is well recognized; there are established names for the individual items; and their use is (to a considerable extent) equally institutionalized, through education and the practice of the publishing and printing organizations.

There are three stretches of written language formally recognized by name whose bounds are indicated visually: the *WORD*, the *SENTENCE* (consisting of one or more words), and the *PARAGRAPH* (consisting of one or more sentences). Words are delimited as orthographic units (*cf* I.12) by being preceded and followed either by a space or by one or more punctuation marks and a space, as illustrated for the italicized words in the following:

... the <i>grammar</i> of the <i>reader's</i> aim ...
... in <i>scorn</i> , when line (<i>usually</i> indented ...
... the <i>co-authors</i> are (or 'upper case') ...

Sentences begin with a CAPITAL letter and usually end with a PERIOD (*cf* App III.14). Less frequently, the termination point of a sentence is a QUESTION MARK or EXCLAMATION MARK, complex symbols that visually incorporate the period (*cf* App III.23). As we see later (*cf* App III.14), paragraphs are usually separated by spaces at their beginning and end. Apart from the termination points of sentences, the remaining punctuation marks – by far the majority – perform functions within the sentence (and a very few within the word) but do not mark off units as well-established as the sentence or the word. Their separating or specifying functions however are for the most part clear and readily describable.

III.2 The punctuation system serves two broad purposes, SEPARATION and SPECIFICATION, the former in turn inviting a twofold division.

SEPARATION

(a) Successive units

The punctuation mark separates units that are in a simple linear relation to each other (units in a series); for example, a space separates two successive words, or a period followed by a space separates two successive sentences.

(b) Included units

The punctuation mark is CORRELATIVE. It indicates the beginning and end of an included unit, a unit which is inserted within some larger unit; for example, the commas mark off the parenthetic clause in:

He is, *I think*, a teacher.

SPECIFICATION

The punctuation mark specifies a grammatical, semantic, or pragmatic function, sometimes in addition to the marking of separation. Thus the apostrophe in *the reader's* specifies the ending as genitive in contrast to the phonologically identical plural in *the readers*.

In respect of these purposes, punctuation practice is governed primarily by grammatical considerations and is related to grammatical distinctions. Sometimes it is linked to intonation, stress, rhythm, pause, or any other of the prosodic features which convey distinctions in speech, but the link is neither simple nor systematic, and traditional attempts to relate punctuation directly to (in particular) pauses are misguided. Nor, except to a minor and peripheral extent, is punctuation concerned with expressing emotive or rhetorical overtones, as prosodic features frequently are (*cf* App II.17*ff* for example). It follows that there is less room in punctuation than in prosody for personal decision in the use of the various devices: understandably so, since in writing, the originator of the message is not usually present to clear up any difficulty that may arise. Punctuation marks tend, therefore, to be used according to fairly strict conventions and even in the peripheral areas where universal convention does not obtain, each individual publishing house imposes one for all materials that it puts forth in print.

There are two important qualifications to the foregoing generalizations. In the first place, there is, as we shall see, a great deal of flexibility possible in the use of the comma: in its presence or absence, or in its replacement by other marks. The comma in fact provides considerable opportunity for personal taste and for implying fine degrees of cohesion and separation. Secondly, the conventions as a whole are not followed as rigorously in manuscript use (especially personal material, such as private letters), where there may be inconsistencies in their application that would not be permitted in most printed material.

Separation

Separation of successive units

Hierarchy of punctuation marks

III.3 We have a well-defined hierarchy of signs reaching from the word to the paragraph. The hierarchy can be illustrated from the following passage:

... and the chairman was careful to point out the help he had had from the secretary and from the members recently elected to the committee. He mentioned two other men, since co-opted: Smith and Fox; they had been very useful. Votes of thanks were proposed and unanimously carried.

Before the meeting closed, some further business was transacted. A motion proposed by Johnson sought to raise money by ...

Thus we have:

unseparated letters	... opted ...
hyphen (-)	... co-opted ...
word-space	... since co-opted ...
comma (,)	... men, since co-opted ...
colon (:)	... men, since co-opted: Smith ...
semicolon (;)	... men, since co-opted: Smith and Fox; they ...
period (.)	... men, since co-opted: Smith and Fox; they had been very useful. Votes of thanks ...
paragraph	... had been very useful. Votes of thanks were proposed and unanimously carried. Before the meeting closed, some further business was transacted ...

Two signs (which also have specifying function) not illustrated in the passage are generally (but *cf* App III.23) on the same level in the hierarchy as the period: the question mark (?) and the exclamation mark (!).

Parentheses and other types of bracketing, which are also not illustrated in the passage, are outside the hierarchy because their function is to represent a sharp interruption in the structure within which they are inserted (*cf* App III.16).

One other sign absent from the passage is the dash. The dash fits somewhat uneasily into the hierarchy, perhaps between the comma and the colon. It is often a substitute for the comma, but indicates a sharper separation:

They knew many of the ills that continue to affect us – and many of the remedies that we still use.

In general, punctuation marks are followed by a space, but there are several exceptions:

- (a) A space precedes (not follows) the opening quotation mark and the opening mark for parentheses and other bracketing.
- (b) There is a space on either side of the dash.
- (c) There is no space on either side of the hyphen.

The period, question mark, exclamation mark, and colon are generally followed (especially in printed material) by a longer space than that for other marks, notably the comma or semicolon. When closing quotation marks or closing parentheses cooccur with each other or with other marks, there is no space between the two marks. For example, a closing quotation mark may be immediately followed by a closing parenthesis, a comma or period by a closing quotation mark, or a closing parenthesis by a period. (For permissible and nonpermissible cooccurrences, *cf* App III.16.)

Our main concern in this Appendix is with punctuation marks in the hierarchy that are beyond the level of the word and up to the level of the sentence. In particular contexts, writers can choose whether to use one of these punctuation marks rather than another, whether to use (for example) a period or an exclamation mark, a period or a semicolon, a comma or a semicolon, a comma or a colon, a comma or a dash. But it is relevant to note

that by far the most frequent marks are the period and the comma, which are almost identical in frequency of use.

Note In samples from the Brown corpus of about 72 000 words drawn in equal proportions from *journalism, learned writing, and fiction*, the figures for punctuation marks were:

commas	4054	semicolons	163
periods	3897	question marks	89
dashes	189	colons	78
pairs of parentheses	165	exclamation marks	26

The hyphen

III.4 The hyphen marks divisions within a word for two main purposes. First, it is used for word division between lines, to separate a word into two parts between the end of one line of text and the beginning of the next. Since printers can vary the space between words, they prefer to avoid dividing words in this way, especially in books. When division is unavoidable, it is made at a natural point in the structure of a word. That is, one would not leave *str-* at the end of a line and begin the next line with *ucture*. But there can of course be a difference of opinion as to what constitutes a 'natural' point. AmE practice is to respect the phonologically natural points – in other words, syllable division; this would divide *structure* at *struc-*. BrE practice is to give more weight to morphological and etymological considerations, being thus more inclined to make a break in the word at *struct-*. With many words the different criteria give the same result, however, so that the divergence in usage is slight.

Secondly, the hyphen is sometimes used to mark the parts of a word: to separate the bases of a compound (*cf* App I.57ff) or to separate the prefix of a word from its base (*cf* App I.21ff). The rules for this use of the hyphen are subject to considerable variation in the practice of publishing houses and individual writers as well as in the guidance of dictionaries and style manuals. AmE inclines to fewer hyphens than BrE, preferring words to be written either OPEN (separated by a space) or SOLID (without separation) rather than hyphenated.

Types of compounds that are commonly hyphenated include:

- (1) noun compounds in which the second base is an adverb, *eg: runner-up, break-in*
- (2) adjective compounds in *-ed* that are formed from noun phrases, *eg: cold-blooded, brown-eyed*
- (3) adjective compounds in which the second base is a participle, *eg: far-fetched, habit-forming*

If the first base is an adverb, it is hyphenated when the participle is premodifying a noun (*well-established facts*) but not when the participle is a main verb (*The facts are well established*). In AmE (and often in BrE), however, hyphenation does not apply even when the participle is a premodifier if the adverb ends in *-ly*, *eg: carefully written* (report), *rapidly disappearing* (languages).

- (4) other modifying phrases and modifying clauses (which are generally written open when not modifying), *eg: on-the-spot* (investigation), *face-to-face* (meeting), *ten-item* (test), *right-to-life* (movement), *up-to-date* (news), *take-it-or-leave-it* (attitude), *do-it-yourself* (job)

- (5) coordination compounds (cf App I.70), eg: *Russian-English* (dictionary), *student-teacher* (relationships)
- (6) compounds expressing numerals and fractions (cf 6.63ff), eg: *twenty-five*, *three-fifths*
- (7) compounds in which the first base is a single capital letter eg: *U-turn*, *H-bomb*
- (8) compounds ending in *-in-law(s)*, eg: *mother-in-law*
- (9) relationships in which the first base is *great*, eg: *great-uncle*, *great-grandchildren*

The hyphen is usual after a prefix if the base begins with a capital letter as in *un-French* or with a figure as in *post-1984*. It is also common after certain prefixes, particularly *ex-* ['former'], *half-*, *quasi-*, *self-*, eg: *ex-husband*, *half-caste*, *quasi-judicial*, *self-sacrifice*. BrE tends to use the hyphen after other prefixes, where AmE tends to write the words solid, notably after *non-*, eg: *non-standard* (esp BrE), *nonstandard* (esp AmE). BrE often uses the hyphen where juxtaposition would suggest a misleading pronunciation such as *co-ordinate* or *pre-eminent*, whereas AmE generally writes such words solid (but *co-worker*, for example, is hyphenated in AmE too); however, BrE is increasingly conforming to AmE practice.

The hyphen is used both in compounds and after a prefix to avoid misinterpretation, even if the misinterpretation is only momentary, eg: *small-claims court* ['court for small claims'], *re-cover* ['cover afresh', cf: *recover* 'regain control'], *re-form* ['form again', cf: *reform* 'change for the better'], *co-op* [informal clipping of noun *co-operative*, also *cooperative* (esp AmE)].

Note [a] AmE occasionally favours the DIAERESIS in words such as *coöperate*. The diaeresis is also very occasionally used in both AmE and BrE to indicate separate syllables in words where juxtaposed vowels do not result from affixation and where the hyphen could not be used; for example, *naïve*. More commonly, however, such words are spelt without indication of the separate syllabification: *naive*.

[b] Despite a tendency to avoid the hyphen after prefixes, AmE prefers it to avoid doubling the vowel *i* (*anti-isolationist*) or tripling a consonant (*bell-like*).

[c] For two minor uses of the hyphen, cf App III.26 Note [b].

The word in speech and writing

- III.5 There are numerous respects in which we cannot reproduce in writing the distinctions made prosodically in speech (cf App II.20). In the visual indicators of word limits we have the converse. In informal speech, we do not normally attempt to make a difference in pronunciation between *a nice drink* and *an ice(d) drink*. In writing, such distinctions are absolute and must be regularly made. Similarly, irrespective of the sound we make in speech, we must indicate in writing what counts as an orthographic word (cf App I.11f), sometimes deciding between total separation, hyphenation, and total juxtaposition: *tax payer*, *tax-payer*, and *taxpayer*. Examples like these are a reminder (a) that, while the rules of punctuation are related to grammar and lexicology, they are by no means necessarily so related through an intermediate connection with speech; (b) that there is an element of arbitrariness in punctuation, and it is particularly conspicuous in the use of the hyphen; and yet (c) that consistency and regularity assume an importance in punctuation (as in spelling) quite unparalleled in the analogous signalling function of prosodic systems in speech.

Note [a] Hyphens are used to link syntactically-related premodifiers of noun phrases as in *Mexican-Cuban negotiations*. If one of the modifiers is itself a phrase, the hyphen may seem to connect illogically: *Mexican-San Salvador negotiations*, *New York-Miami flight*. Indeed, for such cases some printers use the en dash (—), which is half the length of the em dash — the form most commonly used for the dash punctuation mark — and is slightly longer than the printed hyphen. But it is doubtful whether most readers notice that the en dash is different from the hyphen. Should the position of the hyphen feel troublesome, the phrase can be reworded to avoid the premodification; for example, *negotiations between Mexico and San Salvador*.

[b] Coordination of hyphenated items, especially in formal or technical writing, frequently involves ellipsis with word-space following a hyphen, as in *pro- and anti-government opinion* or *those who are speech- and language-impaired*. Hyphens are similarly used after prefixes, even though the prefixes are not hyphenated in isolation, in which case the final item is generally not hyphenated; for example, *mono- and polysyllabic syllables*, *inter- and intranational uses*, *homo- and heterosexual relations* (cf also 13.85).

The comma

The comma with coordinated clauses

- III.6 Of all the punctuation marks the comma is the most flexible in the range of its use, and hence the most difficult to categorize.

One dominant use of the comma is to separate closely associated clauses within a sentence, a use that the comma shares with the colon and semicolon. But we cannot substitute a comma in either [1] or [2], because the comma is not normally used to separate independent clauses unless they are linked by a coordinator:

I've just had some good news: I've been offered a job in a law firm.

[1]

Schoolchildren have adopted the fund as one of their favourite charities; their small contributions have enabled the fund to reach its target.

[2]

In [1], where a coordinator would not be possible, the colon is serving its classic function of separating an independent clause that is in apposition to a previous unit, here *some good news*. In [2] we should need to insert *and* if we wished to replace the semicolon with a comma:

Schoolchildren have adopted the fund as one of their favourite charities, and their small contributions have enabled the fund to reach its target.

[3]

Sentence [3] illustrates the conditions favouring the use of the comma to separate independent clauses in compound sentences:

- (a) the parts are closely related semantically (both dealing here with the children's contributions to the fund);
- (b) they are linked by a coordinator (in this case by *and*).

If condition (a) did not apply, the two parts could scarcely be brought into one sentence at all. If condition (a) applied but not condition (b), a comma normally could not be used, though a semicolon would be appropriate, as in [2]. Punctuation marks are also usual if the clauses are linked by the conjunction *or* and the conjunction-like adverbs *nor*, *neither*, *so*, and *yet*.

If three or more clauses are coordinated but only the last is preceded by

and or, commas (or semicolons) are required between the clauses, including the last pair:

Prices fell, interest rates fell, and employment figures rose.

The comma in such instances is termed a SERIAL COMMA (cf App III.8).

Note Despite condition (b), coordinate clauses are occasionally separated *asynetically* only by commas, especially when the clauses are short, parallel, and (often) three in number (cf 19.5ff):

I must, I can, I will.

Sometimes he would chuckle softly to himself, sometimes he would grunt to some invisible onlooker.

III.7 Two further related considerations influence our decision over the punctuation of a series of independent clauses. First, punctuation marks are frequently omitted if the clauses are relatively short, provided they are linked by a coordinator:

The work was pleasant and the hours were short. [1]

On the other hand, if despite close semantic connection there is a contrast prompting the use of *but* (or *and yet*) rather than *and* as the appropriate conjunction, there is a greater tendency to use a punctuation mark, particularly the comma:

We are thinking of buying a short-wave radio, but we haven't made up our minds. [2]

This latter tendency emerged from an analysis of materials in the Survey of English Usage. The materials comprised coordinate full clauses, as in [1] and [2], and instances in which the subject (and perhaps also operator) of the second clause was absent, resulting in coordinated predicates or predications, as in [3] and [4]:

The hotel boasts a gourmet restaurant and offers a range of sports facilities. [3]

You can sit at my desk and write your letters. [4]

Three-quarters of the clauses coordinated with *but* had a comma ('+' in Fig App III.7a), whereas only about a half of the clauses coordinated with *and* had a comma.

Fig App III.7a Comma punctuation with *but* and *and*

For coordination with *and*, however, it was relevant to distinguish further according to whether the subject of the second clause was present ('*and* + S' in Fig App III.7b) or absent ('*and* - S'). Where the subject was absent as in [3] and [4], the comma appeared in only a third of the sentences, while a comma was inserted in three-quarters of the sentences that had an expressed subject in both clauses.

Fig App III.7b Comma punctuation with *and* according to presence or absence of subject in second clause

These results show that we are dealing with tendencies rather than rules. There are many sentences where despite coordination with *and* and despite subject ellipsis, a comma is nevertheless preferred. In such cases, it is probable that the generalization that punctuation conforms to grammatical rather than rhetorical considerations is in fact overridden. If we compare sentences [5] and [6] the extent to which we prefer a comma in [6] is a measure of our wish that the punctuation should endorse the meaning – the separation of the second clause matching the moment's pause that is mentioned:

He put on his spectacles and then picked up the phone. [5]

He paused for a moment, and then began to speak. [6]

The contrast between *and* and *but* is also shown in an analysis of samples from the Brown corpus (cf App III.3 Note), which counted coordinate clauses with an expressed subject in the second clause. Of 228 compound sentences with *and*, 72 (32 per cent) had no punctuation mark, and 147 (64 per cent) had commas, 5 (2 per cent) semicolons, and 4 (2 per cent) dashes. On the other hand, of 98 compound sentences with *but*, only 6 (6 per cent) had no punctuation mark while 74 (76 per cent) had commas and 18 (18 per cent) semicolons. In the same corpus, independent sentences were far more frequently introduced by *but* (87) than by *and* (47).

III.8 The comma with other coordinated units

We generally do not insert any punctuation mark if we coordinate two units within a sentence other than independent clauses:

The movie was long and boring.

The company may have branches in London or New York.

I argued for implementation of the report and against any further discussion.

All I know about them is that they work on a farm and that their
 parents live with them.
 You can and must tell us.
 She called me and invited me for dinner.
 I enjoy tennis but don't play it often.
 I'll read the book and then tell you whether it's worth reading.

In such instances a comma is occasionally inserted for rhetorical reasons, particularly when predicates or predication are coordinated (cf App III.7), as in the last three sentences.

We sometimes have a choice between asyndetic coordination (without a coordinator), in which case a serial comma (cf App III.6) is required, and syndetic coordination (with a coordinator), in which case a comma is not required. The most frequent occasions when this choice is available involve the coordination of premodifying adjectives or adverbs. Thus, for adjectives we may choose between [1] and [1a]:

He walked with long, slow strides. [1]
 He walked with long and slow strides. [2]

If we wish to add further coordinated adjectives to [1], we need to place a comma after each adjective except the last:

He walked with long, slow, steady, deliberate strides. [1a]

If we wish to add further adjectives to the syndetic coordination in [2], we generally insert *and* before the last adjective in the series as in [2a]:

He walked with long, slow, steady(,) and deliberate strides. [2a]

(For the possible omission of the comma, see below.) There are analogues for adverbs to [1-2a]:

She slowly, carefully moved the box. [3]
 She slowly and carefully moved the box. [4]
 She slowly, carefully, deliberately moved the box. [3a]
 She slowly, carefully(,) and deliberately moved the box. [4a]

The asyndetic coordination of [1] should be distinguished from the hypotactic relationship of adjectives in [5], cf 13.2:

I noticed a large rear hatch. ['a rear hatch that was large'] [5]

Since *large* and *rear* are not coordinated in [5], we cannot of course insert either *and* or a comma between the adjectives. Similarly, if we wish to indicate not that the strides were both long and slow as in [1] and [2], but that they were slow strides which were long, we omit punctuation and conjunctions, as in [6]:

He walked with long slow strides. [6]

An adverb analogue to [5] occurs with adverbs in a hierarchical relationship, cf 8.56:

She is expected later today. [7]

More stylistically-marked asyndetic coordination (in contrast to the more usual syndetic coordination) is found occasionally with noun phrases and prepositional phrases, particularly at the end of the clause:

The company provides pleasant working conditions, above-average salaries, numerous fringe benefits.
 They have been criticized for their business dealings, for their political views.

These phrases occur usually in a series of three or more units.

If we coordinate a series of three or more units, we normally omit the conjunction *and* or *or* before all but the last unit. We of course insert serial commas before all the units, except that there is a choice as to whether to insert or omit the comma before the conjunction. AmE generally favours the insertion of the comma, while AmE journalistic style favours its omission; in BrE, usage is divided:

Dogs, cats(,) and other animals can recognize friends by smell alone.
 Change in human biological history is slow, steady(,) and progressive.

In the next two sentences we see examples of the use of the serial comma in listing, irrespective of the linguistic status of the items listed. Again the comma before the last item is optional, provided that this is preceded by *and*:

She bought eggs, butter, cheese, bread, rice(,) and coffee.
 He wrote down 73, 12, 41, 9, 7(,) and 13, and added them up.

Note What has been said of the inclusive conjunction *and* applies also to the exclusive conjunction *or* (as in *to or from town*; *by, with(,) or to a person*; *butter, eggs(,) or fruit*).

Where separation by comma is disallowed

III.9 With regard to the central clause elements S, V, O, and C (but not A), there is a strict rule that they cannot be interrupted by punctuation except where 'inclusion' (cf App III.16) or 'specification' (cf App III.23) is involved, and with one or two additional but minor exceptions that we shall outline shortly. Thus whether such a sentence element consists of a phrase or a clause, it cannot be separated from the verb by a comma:

*The man over there in the corner, is obviously drunk. [1]
 *I know, that you are tired. [2]
 *It is perfectly natural, that men should go bald. [3]
 *He gave the leading lady, a bouquet. [4]

In speech, [1] and possibly [3] and [4] might have a tone unit break where the unacceptable comma has been inserted and we are sometimes tempted to match this with a comma in writing, an error particularly likely to arise with lengthy subjects as in [1] (cf also App III.16 Note). The rule, however, is clear enough and is strictly observed in print. Equally clear (and this time generally observed unhesitatingly even in manuscript) is the rule that phrases constituting any of the elements S, V, O, C, or A cannot be interrupted by noncorrelative commas, unless the commas are required for serial use (cf App III.8):

- *The old, man died.
- *He may, go there.
- *They emigrated after, the war.

One exception to these rules is that a comma may come between S and V when there might otherwise be momentary confusion, as for instance through two occurrences of the same word:

- What his name is, is of no interest to me.
- Whatever she does, does not concern me.
- What one person may think of, another may not.

Rarely, a comma may also come at the point of gapping (*cf* 13.92*f*) in an elliptical clause:

Rock aspires to recognition as art, and new classical music, to a larger following.

But more commonly no punctuation is used:

One bedroom was very large, and the other quite small.

Finally, a comma is placed between a subject-verb sequence and a direct object in direct speech (*cf* App III.21).

Note The need for easy recognition of structure determines the convention of using commas between thousands in numerals: 41,396,728. Spaces are sometimes used instead of commas for this purpose: 41 396 728 (*cf* 6.63 Note [b]).

The colon

- III.10** The colon makes a sharper separation than the comma. It was placed between the comma and the semicolon in App III.3 because it indicates a closer interdependence between the units separated than does the semicolon. Indeed, it sometimes indicates as close a relation as the comma does, but it is a different relation. The functions of the colon, a rather infrequent punctuation mark, can be summed up as follows: what follows (as in this sentence) is an explication of what precedes it or a fulfilment of the expectation raised (even if raised only by its own use). Thus:

- I've just had some good news: I've been offered a job in a law firm. [1]
- Those who lead must be considerate: those who follow must be responsive. [2]

In [1] the explication is a clause which can be viewed as being in apposition to a noun phrase in the preceding clause, if the notion of apposition is extended beyond noun phrases (*cf* 17.65*ff*). Compare:

The good news is that I've been offered a job in a law firm.

Such a relationship is typical between units separated by a colon. A further example:

- The man had been drinking heavily: this, not age, explained his unsteady walk. [3]

Here the pronoun *this* refers back to the whole of the preceding clause ('the fact that the man had been drinking heavily'). Sometimes the relationship is more indirect and subtle, however, as in:

- Joan and Mary were obviously weary: I got up to go. [4]

The colon in [4] helps to indicate that it was my observation of their weariness that made me decide to go.

In each of the examples, a semicolon could replace the colon, and with examples [2-4] a semicolon would be more usual. On the other hand, provided that a coordinating conjunction were introduced between the clauses, the colon could also be replaced in [2-4] by a comma or by no punctuation. In this respect, too, the [2-4] set is distinguished from [1], in which we have the more central use of the colon to imply 'as follows' or 'namely'. Related to that central use is the very frequent use of the colon (as in this book) to introduce examples, whether immediately following the colon or indented on the next line or lines.

Note The independent clause following a colon may begin with a capital letter, but generally not in BrE. A capital letter is in any case used if the part introduced by the colon consists of more than one sentence, or if it is a quoted sentence (*cf* App III.21):
I asked myself: Where was it all leading?

- III.11** So far, the illustrations have shown the colon separating only clauses. But it commonly separates smaller units such as phrases, and it was its potentiality to do so that justified its place between comma and semicolon in the hierarchy in App III.3. Notice that the semicolon in [1] marks the major division of the sentence:

- There remained one thing she wanted above all else: a room of her own; but she did not acquire her own room until she was eighteen. [1]

The use of the colon in examples like [1] resembles most closely the purpose it serves (especially in technical or specialized writing) when it precedes a formal list of items, often preceded by its verbal equivalents *for example*, *eg*, *namely* (sometimes written *viz*), *ie*, *as follows*, or the like (*cf* 17.73). For example:

- Please send the stipulated items (, namely):
- (i) birth certificate
- (ii) passport
- (iii) correct fee [2]

When it appears in such a formal or official use as [2] implies, it is sometimes followed in BrE by a short dash (:–), but this is generally regarded as rather heavy punctuation (*cf* App III.22). Certainly, when it introduces lists in nontechnical writing, as in the illustration of the hierarchy in App III.3, it is never followed by a dash.

Punctuation is generally omitted after the items in a formal vertical list as in [2], though sometimes all but the last item are followed by semicolons or commas and the last item (of course) by a period (but *cf* App III.23 Note [b]).

Contrast the required commas in the horizontal list in [2a]:

Please send the stipulated items: your birth certificate, your passport, and the correct fee. [2a]

The colon may be replaced by a comma when what follows is one item as in [1], or if the following list itself does not contain separating commas, as in [2b]:

Please send the stipulated items, namely your birth certificate and your passport. [2b]

In this connection – one of the few in which the colon and the comma seem to be interchangeable – it is of interest to note that, whereas the vocative formula at the beginning of letters is normally separated by a new line and sentence capitalization, it is additionally marked by a comma or (in AmE) by a colon:

Dear Mr Wilson,
Thank you . . . <BrE and informal AmE>
Dear Mr Wilson:
Thank you . . . <AmE>

The sentence following the vocative formula begins with a capital letter (*Thank you* . . . in the above examples); it is commonly indented as marking the beginning of the first paragraph in the body of the letter (cf App III.14).

Note If the horizontal list contains more than two items, unlike [2b], a colon is required if there is no apposition marker (cf 17.73), as in [2a]. If an apposition marker such as *namely* is inserted, it is usual to replace the colon by a semicolon (cf App III.13):
Please send the stipulated items; namely(,) your birth certificate, your passport, and the correct fee.

The semicolon

III.12 The semicolon is next below the period in the hierarchy, but it is particularly associated with formal writing. It is best regarded as the coordinating mark of punctuation (cf *asyndetic coordination*, 13.1), corresponding most nearly in value to the linguistic coordinating conjunction *and*. That is, when two independent clauses are regarded as being sufficiently related to belong to one sentence, this may be shown by prosody in speech (cf App II.13) – for example, narrow pitch range or a rising nucleus at the end of the first clause, with or without a coordinating conjunction. In writing, it may be shown by a comma followed by a coordinating conjunction as in [1]:

Taylor was, as always, a consummate actor, and with a few telling strokes he characterized King Lear magnificently. [1]

Or it may be shown *asyndetically* by a semicolon without a coordinating conjunction as in [2]:

Taylor was, as always, a consummate actor; with a few telling strokes he characterized King Lear magnificently. [2]

Thus if we represent a clause as SVOA, we can compare the use of commas and semicolons connecting such clauses as follows:

[a] SVOA(,) and (then) (S)VOA

[b] SVOA; (and) (then) SVOA

In the formulas [a] and [b], *and* represents the coordinators *and*, *but*, and *or*, while *then* represents any appropriate way of additionally linking the clauses. The coordinator cannot be omitted in [a], and the subject cannot be ellipted in the second clause of [b].

We have noted earlier that, especially when the clauses are short and parallel, there are exceptional uses of commas without a coordinator (cf App III.6 Note) and that the conjunction-like *nor*, *neither*, *so*, and *yet* may be preceded by a comma when they alone link independent clauses (cf App III.7).

III.13 In App III.12 we noted that the semicolon is primarily a coordinating mark, but we indicated that it may also be followed by a coordinator, as we now illustrate in [1] below:

I had been aware that they sometimes disagreed violently, particularly over how to raise their children, and that there were also periods when they would not speak to each other; but I had not realized that they were seriously contemplating divorce. [1]

Such a use (in effect, replacing a comma) is chiefly found in rather formal writing and in sentences whose complexity already involves the use of one or more commas and whose major divisions call for a hierarchically superior punctuation mark if the reader is not to be momentarily puzzled or misled. A simple but convenient application of this principle occurs in lists, where it is often desirable to show subgroupings:

The breakfast menu consisted of fruit juice or cereal; a boiled, fried, or poached egg; toast and marmalade; and a pot of tea or coffee. [2]

Somewhat related is the chief point at which the semicolon shows affinity of use with the colon; namely, the convention (as in this sentence and in [3]), of preceding such apposition indicators as *namely* or *that is* by a semicolon. Without such an indicator, as in [3a], a colon would usually be appropriate:

In one respect, government policy has been firmly decided; that is, there will be no conscription. [3]

In one respect, government policy has been firmly decided: there will be no conscription. [3a]

But other forms of punctuation may occur in such cases. For example, the appositive may be in a separate sentence (as in this sentence), or it may be enclosed in parentheses, or if it is not a clause the apposition indicator may be preceded by a comma (cf App III.11).

Punctuating for sentence and paragraph

III.14 The two highest separators constitute combinations of symbols. We mark off one orthographic sentence from the next by terminating it with a period, question mark, or exclamation mark, and by beginning the next with a capital letter; between the period and the capital, there will usually be a

somewhat wider space than we normally have between words. The paragraph (cf 19.28) is also marked off by a combination of symbols in most writing: leaving blank the remainder of the line in which it ends; indentation (also called 'indentation') of the line beginning the new one; and (especially in typescript) a slightly larger space between lines at this point. At the beginning of a chapter or section, the first paragraph normally (as in this book) begins without indentation, and in some styles of writing this practice (called 'block style') is followed with all paragraphs; as a result, if the end of the previous paragraph happens to coincide with the end of a line, the new one may not in effect be marked at all, unless the convention is adopted of a larger space between lines.

- Note [a] A period is usually called a 'full stop' in BrE. It is also called a 'full point' or (informally) a 'dot'.
 [b] Numbered sections of a chapter, as in this book, are sometimes called 'paragraphs' even where they comprise more than one 'punctuation' paragraph.
 [c] On capitals at the beginning of letters and direct speech, cf App III.11, App III.21.
 [d] Reverse indentation (indentation of all lines back from the first) is common for entries in reference books, for example dictionaries and encyclopedias, for entries in glossaries and indices of books, and for indented examples that require more than one line (like sentences [1], [2], [3], and [3a] in App III.13).
 [e] In official letters, paragraphs are often marked by a larger space without indentation.

III.15 It was stressed in App III.2 that punctuation was linked primarily to grammar rather than to prosody. This does not mean that the sentence and the paragraph, as punctuated, are obvious grammatical units. Although they are co-terminous with one or more grammatical units and hence no grammatical units extend beyond their limits, they do not necessarily consist in their entirety of a grammatical unit. The decision to coordinate several independent clauses within one sentence or to separate them as different sentences, with or without formal sign of their logical connection, is dependent largely upon the style of material one is handling or indeed upon the personal preference of the writer. Guidance on sentence limits which invokes criteria such as 'completeness', 'independence', 'intelligibility as a single whole' is essentially circular, since (a) the writer will necessarily have to decide for himself how 'complete' to make any part of his argument, and (b) punctuation of itself imposes the impression of completeness and independence on units marked off as sentences and conversely helps to show connection between units grouped within sentence limits.

Such points apply even more obviously in the case of paragraph limits. Rather than attempting to recommend an ideal size of paragraph or models for its ideal identity, we should note that the paragraph enables a writer to show that a particular set of sentences should be considered as more closely related to each other, and that those grouped within one paragraph are to be seen as a whole in relation to those that are grouped in the paragraphs preceding and following (cf 19.28).

- Note Short paragraphs provide convenient resting places during reading and aesthetically pleasing contrasts between print and white space. Both considerations account for the shorter paragraphs in the columns of newspapers and magazines, the more popular publications tending to have the shortest paragraphs.

Separation of included units

Included units and correlative marks

- III.16 A unit that is loosely attached to the rest of the sentence may be, and sometimes must be, marked off by punctuation, usually commas. The decision to mark off the adverbial in [1] requires not one comma but two:

Crocodiles, in fact, do not particularly like human flesh. [1]

The punctuation marks for inclusion are CORRELATIVE: the first sign indicates the beginning and the second the end of the included unit. But one of the correlative commas may be superseded by a punctuation mark above it in the hierarchy (cf App III.3), the punctuation system not permitting the cooccurrence of the comma with marks further up. Thus, one of the correlative commas is absent in [1a] and [1b]:

In fact, crocodiles do not particularly like human flesh.

[*, *In fact*, ...] [1a]

Crocodiles do not particularly like human flesh, in fact.

[* ... *in fact*,] [1b]

Examples [1a] and [1b] exemplify the general rule that one of the correlative marks is omitted if it coincides with a higher mark. Thus, there would not be an initial correlative comma in [1a] if *in fact* were preceded by a dash, colon, or semicolon; and similarly there would not be a final correlative comma in [1b] if *in fact* were followed by a dash, colon, or semicolon. Correlative dashes obey the same rule:

To change the subject, if I may – where are we eating tonight?

[* – To change the subject, if I may – ...] [2]

The universe is expanding – that is, the galaxies are receding from each other at immense speeds. [* ... at immense speeds –.] [3]

One theme represents the outer world – the world of battles and banquets; it is seen from a distance, and is quite distinct from the quieter spiritual life in the monastery. [* ... battles and banquets –:] [4]

It will be noticed that the final correlative comma after *if I may* in [2] and the initial correlative comma before *that is* in [3] are superseded by a dash.

On the other hand, parentheses (and other types of bracketing), which are outside the hierarchy of punctuation marks, must always be present in pairs. They represent a sharp interruption and therefore appear medially or finally within the interrupted unit, but not initially. For those reasons, parentheses may cooccur with other punctuation marks that follow them:

You should see Ruth (my niece), when you are next in Washington.

I spoke about the incident to Ted Wilson (the manager of the factory) – but he denied seeing anything unusual.

When the parentheses enclose one or more sentences, the final termination point is placed within the closing parenthesis (cf App III.20).

Any of the pairs of correlative marks may enclose any other pair, but different pairs tend to be used; otherwise it would be difficult to identify the pairs of commas, as in [5]:

?The operation, I was convinced, after some resistance, by my doctor, had now become essential. [5]

More understandable would be [5a] or [5b]:

The operation (I was convinced, after some resistance, by my doctor) had now become essential. [5a]

The operation, I was convinced (after some resistance) by my doctor, had now become essential. [5b]

One of the correlative marks, as we have also seen earlier in this section, may be superseded by a mark above it in the hierarchy:

Jason, during a hundred hours of testing – an hour a day, five days a week – expanded his powers of recall over ten times. [6a]

But the punctuation hierarchy would be clearer here if it corresponded with the grammatical hierarchy, thereby enabling the higher marks to be visible:

Jason – during a hundred hours of testing, an hour a day, five days a week – expanded his powers of recall over ten times. [6b]

Note A common error in manuscript punctuation by inexperienced writers is to omit the first correlative comma in a medial included unit, eg: *Crocodiles in fact, do not . . .* The error reflects the fact that in normal speech the medial included unit is not necessarily separated prosodically from the previous part of the sentence, though it may be so separated from the following part (cf App III.9).

Correlative commas

III.17 Commas with adverbials
Loose attachment of an adverbial to a sentence is linked to adverbial mobility: just as the least mobile are normally those with closest and most indispensable connection with the rest of the sentence, so the least mobile are those least requiring separation by commas:

He put the chair between you and me. [1]
?Between you and me he put the chair. [1a]
He failed the exam, between you and me. [2]
Between you and me, he failed the exam. [2a]

On the distinction between types of adverbials, cf 8.24.

Even those adverbial elements that are so closely related to the rest of the sentence as not to need commas in final position, however, often need to be thus separated when they are in initial or medial positions if they are clauses or phrases longer than two or three words:

Some scientists have succeeded in cloning human cells in experiments at Stanford University. [3]
In experiments at Stanford University(,) some scientists have succeeded in cloning human cells. [3a]
Some scientists, in experiments at Stanford University, have succeeded in cloning human cells. [3b]

You'll succeed if you try hard. [4]
If you try hard(,) you'll succeed. [4a]

Loosely attached adverbials are infrequent in medial positions, except for conjuncts (cf 8.134ff) such as *however*, or *moreover*.

As [3a] and [4a] show, the comma is often optional after many adverbials in / position, but it becomes obligatory with participle and verbless clauses, and is normal with infinitive clauses:

Knowing my views, they refrained from discussing the subject.
Out of breath, he slumped down in a chair.
To keep the star moving so quickly and in such a small orbit, its invisible travelling companion would have to be at least nine times more massive than the sun.

The comma is desirable on occasion where its absence might cause the reader to stumble. Thus, although the adverbial has identical function in [5] and [5a], it is necessary in the latter to avoid misleading the reader into thinking at first that the prepositional phrase is longer than it is:

After dark(,) I strolled around the square. [5]
After dark, men and women strolled around the square. [5a]

For a comparable reason, a comma would be preferable in

He tried in vain to find her, in his underclothes.

And although no ambiguity or comic overtones could affect the following example, the sequence 'in in' would seem less confusing with the separation provided by a comma (cf App III.9):

They hurried on in, in great excitement.

Note [a] Predication adjuncts (cf 8.26ff) are sometimes fronted. Since they are strongly integrated within clause structure, they cannot be followed by a comma (cf also App II.16):

*To the very top of the mountain, they climbed.

[b] Somewhat analogous to the use of the comma for preposed adverbials is its use in index entries to mark a surname moved from its normal end-position: cf: *John Quincy Adams*, but *Adams, John Quincy*.

III.18 In general, punctuation is determined less by the length of an adverbial or its structure (whether a single word, a phrase, or an entire clause) than by its function. Indeed, a finite clause may often need marking off to a lesser extent than a shorter nonfinite or verbless clause:

Though he was suffering great pain(,) he walked home alone.
Though suffering great pain, he walked home alone.
Weary and impatient, she left the meeting early.

Often, however, mere length of an adverbial will make it seem more loosely linked to the rest of the sentence than a short one and so seem to need marking off by a comma; and length may also make punctuation desirable for sheer clarity's sake:

If you prefer to wake up gradually with a cup of hot coffee rather than

with fifty laps in a cool pool, you should set aside some time for swimming before lunch or after work.

Function, however, is usually more important than length. Thus even where an initial adjunct needs no comma, as in [1], the same adverb as conjunct (*cf* 8.134*ff*) requires one, as in [1a]:

Again he felt hesitant. [= 'Once more . . .'] [1]
Again, he felt hesitant. [= 'It should be added that . . .'] [1a]

Here is another case where punctuation somewhat mirrors the prosodic difference, since [1] would usually constitute one tone unit in speech (*cf* App II.11) while there would be two for [1a]:

A|GAIN he felt 'hesitant| [1]
A|GAIN|he|felt HESitant| [1a]

Nonrestrictive adjunct clauses (*cf* 15.23) are punctuated in final position, though not invariably in initial position:

Betty will help you, when she has finished her own work.

Disjuncts (*cf* 8.121*ff*, 15.20*f*) tend to be punctuated with a comma in final position, particularly when the subordinator can also introduce an adjunct clause. Contrast the disjunct clause in [2] with the adjunct clause in [3]:

He's at home, because I've just spoken to him. [2]
He's at home because he's not feeling well. [3]

Clauses introduced by *for* are always preceded by a comma or a mark above it in the hierarchy, partly to differentiate the conjunction from the preposition *for* and partly because the conjunction is close to being a coordinator (*cf* 13.18*f*):

I am convinced that you will find none better to advise you, for she has had much experience in industrial negotiations.

III.19 Commas with other units

Adverbials are not, however, the only common types of included units. Others are nonrestrictive modifiers (*cf* 17.3), including nonrestrictive relative clauses (*cf* 17.22) and nonrestrictive appositions (*cf* 17.68), interpolated coordinate constructions (*cf* 13.95*ff*), and analogous parallel structures:

Susan Fenton, who used to work with me, has moved to New York.
The other man, David Johnson, refused to make a statement.
The portrait, painted by a local artist, was unveiled before a large audience.
The person we need, the person we have been waiting for, is someone adequately trained in business management.
She is a close friend to, and supporter of, the Republican candidate.
He should, or rather must, attend better to his studies.

So also with vocatives (*cf* 10.52*ff*):

John, I think you would be wiser not to go.

But how, ladies and gentlemen, are we to proceed to a freer society?
Help yourself, Carol.

Dashes and parentheses

III.20 Although commas are the only items so far illustrated, two other common sets of correlative punctuation marks can be used to mark the separation of included units when the units are positioned medially or finally. They are dashes and parentheses, the latter known in BrE also as 'brackets' (*cf* 'Note [a] below):

The other man – David Johnson – refused to make a statement.
The other man (David Johnson) refused to make a statement.
I have not yet obtained a statement from the other woman – Ann Taylor.
I have not yet obtained a statement from the other woman (Ann Taylor).

The comma is the least obtrusive correlative mark and for that reason is preferred unless there is a disruption of the syntactic structure of the clause, or the danger of confusion with other neighbouring commas or of failure to mark adequately a rather lengthy inclusion. In these cases dashes or parentheses are preferable, except that dashes tend to give a somewhat more dramatic and informal impression, suggesting an impromptu aside, rather than a planned inclusion:

At that time, the students – goodness knows for what reason – reversed their earlier, more moderate decision, and a big demonstration was planned. [1]

In [1] the inclusion is sufficiently informal an interruption to justify dashes rather than parentheses.

Under certain circumstances, even short included items tend to be enclosed by parentheses. In formal writing, for example, they are used for cross-references and figures denoting life span:

We shall see below (*p* 63) that Eleanor's first love was William Bevan (1812–73).

and for figures or letters used in lists or for examples.

Dashes or parentheses are used if the unit included in the sentence is an independent clause:

Enterprising businessmen sell earthworms and their castings
(they are one of the best soil conditioners) in hundreds of retail stores across the US and Canada. [2]

A period does not conclude a parenthetical sentence when that sentence is inserted within another sentence, as in [2], though a question or exclamation mark may do so (*cf* App III.23). If a sentence or set of sentences is included as a digression in a paragraph, parentheses are required and final punctuation marks precede the closing parenthesis, as in [3]:

They decided that it was impossible to recreate Vietnam battle

scenes, since the war was still on and they felt that the Philippines were an unacceptable substitute. (*Apocalypse Now*, made in the Philippines, did not change their feeling.) So they set to work on a home front drama.

[3]

- Note [a] In BrE usage parentheses are generally called 'brackets', a term reserved in AmE for what in BrE are called 'square brackets'; they are sometimes used when inclusions have to be made within inclusions:
 "... the other man (David Johnson [*alias* Wilson])"
 [b] 'Square brackets' are used in serious writing also to include the author's or editor's comment upon the form rather than the content:
 He said that *Thursday* was his normal visiting day [*italics mine*].
 It was stated that the heir to the property was Jon [*sic*] Roberts.
 They are also used for explanations of the reference of pronouns:
 Martin Tutin claimed that she [*the Prime Minister*] was chiefly responsible for the crisis.
 and to replace pronouns or other omitted items in quotations:
 The author claims that '[Jonathan Swift] advocated the establishment of a Language Academy to purify the English language and prevent its further deterioration'.
 [c] All forms of bracketing, including the braces used in mathematics and other technical writing, { }, differ from other inclusion marks except quotation marks (*cf* App III.21) in clearly distinguishing the opening (left-hand) and closing (right-hand) items in the correlative pair, and in requiring the presence of both items. The fact that each item thus indicates independently its correlative status and that both items must be present makes parentheses the clearest of the inclusion signs and especially appropriate for lengthy inclusions.

Quotation and quotation marks

- III.21 There is one further correlative pair of inclusion marks that is of great importance and in frequent use: the 'quotation marks', informally 'quotes', or 'inverted commas' (*esp* BrE). Opening and closing quotation marks are generally distinguished in print, but not in typed material and sometimes not in handwritten material.

Quotation marks may be single '...' or double "...". The latter are more usual in handwritten and typed material and in American printing; the former are more usual in British printing, but the choice lies primarily with individual printing houses. Whichever form is not used for ordinary quotation is then used for quotation within quotation:

- 'I heard "Keep out" being shouted,' he said. (*esp* BrE)
 "I heard 'Keep out' being shouted," he said. (*esp* AmE)

Like parentheses, quotation marks can cooccur with other marks of punctuation, but with some differences between AmE and BrE. AmE always puts a period or a comma inside the closing quotation marks.

- She enjoyed the article "Cities Are for Walking." (*AmE*)
 She enjoyed the article 'Cities Are for Walking'. (*BrE*)
 He couldn't spell "mnemonic," and therefore failed to reach the finals.
 (*AmE*)
 He couldn't spell 'mnemonic', and therefore failed to reach the finals.
 (*BrE*)

In BrE too the period and comma are inside the closing quotation marks for direct speech with reporting clauses (*cf* 14.29):

'You are just in time,' she said.

[1]

She said, 'You are just in time.'

[1a]

Although the quoted sentence in [1] begins with a capital letter, it does not end with a period because the including sentence is not complete.

Both [1] and [1a] infringe a rule given in App III.9. This exception to the rule is that when the direct object is a piece of direct speech it may be (and usually is) separated by punctuation from the verb and subject (but *cf* 14.29).

Quoted matter does not always require quotation marks. In dramatic dialogue and in newspaper reports of speeches or court proceedings, speakers' names are usually followed by a colon and the quotation:

Judge Harlan: If you do not answer frankly, the jury will draw its own conclusions.

I asked myself: Where was it all leading?

And in serious writing only short quotations from other writers are put in quotation marks; longer quotations are indented and given without quotation marks.

- Note [a] On the punctuation of quoted questions and exclamations, *cf* App III.24.
 [b] In some writing, a quotation extending over more than one paragraph will have opening quotation marks at the beginning of each new paragraph though closing marks will occur only at the end of the entire quotation.

Light and heavy punctuation and the grammatical hierarchy

- III.22 It was shown in App III.17f that an initial adverbial is often separated from the rest of the sentence by a comma. Consider, however, the following:

?Slowly, he strolled over and she smiled at him.

[1]

The punctuation in [1] suggests that *slowly* applies (almost nonsensically) to both clauses. If *slowly* is intended to apply to the first clause only, the punctuation seems illogical in making a break within the first clause where there is none between the two clauses. The principle that would here influence writers is that punctuation should not work against the hierarchy of grammatical units (*cf* 2.7ff). Given the constituents of [1], we may feel obliged to counteract the objections by adding more punctuation:

Slowly, he strolled over, and she smiled at him.

[1a]

Or we may insert the comma at the higher constituent boundary:

Slowly he strolled over, and she smiled at him.

[1b]

Or perhaps we will omit internal punctuation entirely:

Slowly he strolled over and she smiled at him.

[1c]

Sentence [1a] is a simple example of how once a little punctuation is admitted, more is necessary in order to preserve a consistent and logical ordering of hierarchical relationships. In preference to the heavy punctuation of sentences like [1a], writers often move in the opposite direction towards a light punctuation, just sufficient to make their sentences quickly and easily understood.

A similar tendency towards light punctuation is exemplified for adverbials in the next four sentences, but the consequences are very different:

Marilyn was the most persuasive speaker in the society, and *for that reason* was chosen to represent the society in the regional competition. [2]

The researchers say that *although the drug was successful experimentally*, it must be tested over a long period to discuss its possible side-effects. [3]

Bushes and undergrowth had blotted out the old path that led to the town, and *without the direct light of the sun to act as a compass*, I could no longer be sure of my direction. [4]

We expected an immediate reply but *in fact*, it was several months before we heard from him. [5]

In all four sentences the choices made for the light punctuation reflect the prosody rather than the grammar. The punctuation treats the part of the sentence following the conjunction as if it began a new sentence, in which case the initial correlative comma would be necessarily omitted (cf App III.16). In [2] correlative commas have not been used to separate the included unit *for that reason*, which would normally be so separated; instead the comma is inserted at the end of the first clause, thereby separating the coordinated predicates. In [3–5] initial correlative commas have been omitted in violation of an important punctuation rule (cf App III.16). Furthermore, the retention of the final correlative comma obscures the grammatical hierarchical relationships in the sentence. In each instance a conjunction (a subordinator in [3] and a coordinator in [4] and [5]) is separated from most of its clause by the comma at the end of the initial adverbial. In [3] the comma makes the major grammatical division seem to be in the middle of the *that*-clause. In [4] the coordinator *and* is thereby made to appear as if coordinating a prepositional phrase. Finally, in [5] the division between the coordinated clauses is bypassed in favour of a final correlative comma after the phrase *in fact*; here the motivation is primarily rhetorical, to place the greatest emphasis on this emphatic adverbial.

Although the light punctuation of [2–5] is incongruous grammatically, the incongruity does not lead to misinterpretation or ambiguity and the punctuation is acceptable. Indeed, heavy punctuation in [2], [4], and [5] would have the odd effect of enclosing the coordinator in commas, one for separating successive units and the other for separating included units. On the other hand, consider the effect of including the participle clause *seeing this* in the following example:

He smiled at Joan and Mary was cross. [6]
*He smiled at Joan and Mary, seeing this, was cross. [6a]

The punctuation in [6a] is unacceptable in seriously misrepresenting the hierarchy of grammatical relations: it would make the reader think at first that *and* was coordinating the two names rather than the two clauses, and so we must have:

He smiled at Joan, and Mary, seeing this, was cross.

So also, although a comma is optional in [7], it is obligatory when *in short* has been included, as in [7a]:

If this is what he seems to want(,) he can have it. [7]
If this, in short, is what he seems to want, he can have it. [7a]

Specification

Question and exclamation marks

III.23 Although in App III.2, specification was exemplified with the use of the apostrophe to mark the genitive, in many ways a more obvious example is the question mark. This indicates that the sentence it terminates is a question, whether it is interrogative or (less frequently) declarative in form:

What can be done to help these people? [1]
You are leaving already? [2]

In [1], as with other *wh*-questions, there is no necessary prosodic distinction from declarative sentences to match the punctuation contrast between period and question mark, since unmarked *wh*-questions generally have falling tones (cf App II.12). In [2], on the other hand, the question mark matches in writing the prosodic contrast between this sentence as question and the same sentence as statement (cf App II.13).

The exclamation mark (in AmE, also 'exclamation point') is more rarely used and indeed its excessive use is often taken as a sign of frivolous or immature writing. It is however quite normal in representing a sentence uttered with great emotive force, whether or not this has exclamative form:

How silly they are! Well done!
What a perceptive article she wrote! Fire!
Aren't they tall! (cf Note [b]) You don't say!

Both the question mark and the exclamation mark generally exclude the use of other separation punctuation and have the value of a period inasmuch as what follows begins with the capitalization of a new sentence. But when they co-occur with the end of quotation, they come within the quotation marks and if more of the including sentence follows, no capital letter is used:

'How tall they are!' she thought.

Both here and when they end a parenthetic sentence included within another sentence (cf App III.20), they differ from periods:

She paid 40 000 dollars (Isn't that over 20 000 pounds?) for a new sports car.

In this respect they are not hierarchically on the same level as the period, which could not occur in those environments. When they end an included parenthetic sentence, as above, they have only a specifying function, not a separating function.

- Note [a] Sentences with exclamative form (cf 11.31f) always end with an exclamation mark. The exclamation is used in environments where there is great urgency; it serves alone, for example, in road signs as a symbol of warning. Imperative sentences generally do not end with an exclamation mark unless they represent very peremptory and urgent commands:
 'Get outside!' he shouted angrily.
 Likewise, vocatives ordinarily do not take exclamation marks unless they are used alone as an urgent warning or command.
- [b] For pragmatic reasons, not all sentences which are interrogative in form end in a question mark. A period is often preferred if the interrogative form is operating as a request:
 Would the gentleman who left a silk scarf on the manager's desk care to retrieve it from the porter's office.
- On the other hand, an exclamation mark is used with exclamatory questions, such as *Aren't they tall!* (cf 11.22).
- When a formal list of items appears at the end of a question, the question mark is omitted, since its position at the end of the list might be misinterpreted as a query on the final item:
 What would you like me to send to the following people:
 Sam and Mary Paton
 Julian and Kate Coleman
 Robert Fowler
 Susan Goodman

Specification of included units

- III.24 The following illustrates the use of question and exclamation marks in relation to included material:

Did you see the words { 'Are you happy?' 'You fools!' } on the wall?	[1]
I saw the words { 'Are you happy?' 'You fools!' } Did you see them?	[1a]
Did you see the words { 'Are you happy?' 'You fools!' }	[1b]
Did you see the words 'Are you happy'?	[1c]
?Did you see the words 'Are you happy'?	[1d]
*I saw the words 'Are you happy'?	[1e]
These words ('Are you happy?') were on the wall,	[1f]
?These words, 'Are you happy?', were on the wall.	[1g]

Though logically correct, [1d] is less acceptable than either [1c] or [1b] as a means of handling the same problem. The general rule is that only one noncorrelative mark can occur at one place. The rule is infringed more severely in [1e] than in [1d] because two types of marks co-occur.

Although they are primarily used at the end of interrogative or exclamatory sentences, there is a consciously exceptional rhetorical use of question and exclamation marks to specify doubt or surprise about individual parts of a sentence; in such use, they are often enclosed in parentheses, following the relevant item:

A further semantic (?) problem may be formulated as follows.

The old woman insisted that her name was Shirley Temple (!) and muttered something about being born in what sounded like Abbis (?) Ababa.

The question mark may sometimes precede, our practice in this book when indicating doubtfully acceptable sentences, as in [1d] and [1g]:

I think she said (?) Abbis.

- Note The use of more than one question mark or exclamation mark or combinations of the two to suggest extreme doubt or surprise is confined to very informal writing such as stories for children.

Quotation marks, italics, and underlining

- III.25 Quotation marks are used far more widely in manuscript and typescript than is underlining, perhaps because underlining is firmly associated with emphasis. Only those involved in the writing and production of printed material are aware that underlining in manuscript and typescript is used to represent italics in print.

In print, italics are used for the titles of works such as books, magazines, journals, newspapers, films, musical compositions, and paintings; in typescript and manuscript these may be underlined or in quotation marks. Quotation marks are generally used in all written material for parts of larger works, for example articles in journals, chapters in books, short stories, and songs.

In print, italics represent cited words or expressions:

The plural of *woman* is *women*.

In other written material, underlining may be used for this purpose, but quotation marks are more common. We indicate that words are introduced from a different style by quotation marks, as with the colloquialism in [1]:

The stranded colonel was obliged to 'hitch' a ride from a passing motorist. [1]

Words from a foreign language are indicated by italics in print and by quotation marks (less frequently by underlining) in other written material:

His slightest *jeu d'esprit* was impressive. [2]

In all material, quotation marks are used to give the meaning of an expression, as in [3]:

The word *schadenfreude*, which means 'malicious enjoyment', is quite fashionable in English. [3]

Quotation marks, as in [1] above, may indicate a hesitant or apologetic introduction of a doubtful or discordant item. Or they may indicate a term that is not fully accepted. But elsewhere they may equally imply that the item is of doubtful validity because merely alleged; in this usage they may be sly or sarcastic and match a heavy prosodic marking in speech:

I told him that his 'wife' had come and let him know by the way I said it that I didn't think she really was his wife. [4]

As in [4], italics in print and underlining or wriggle underlining in manuscript and typescript can be used informally to indicate emphasis. Other devices occasionally used for emphasis are capitals and (in print) bold face and small capitals.

Dashes and other specifiers of breaks

- III.26** A syntactic break or anacoluthon is indicated by a dash, but naturally this device belongs largely to informal writing:

They gave him a prize for getting top marks – and a certificate as well. [1]
 'I hoped that you –' His voice broke. [2]
 John wasn't altogether – I thought he seemed a little unhappy. [3]

An analogous use of the dash is made to suppress (now rarely) a name or obscenity ('Mr B-'; 'F- off').

- Note** [a] An unfinished sentence is also frequently expressed by means of ellipsis or suspension dots or periods (normally three), which could replace the dash in [2] above, though perhaps giving the impression of trailing away rather than an abrupt break. In formal writing, the dots can indicate 'that which it is unnecessary to specify':

Take a sequence of prime numbers (1, 3, 5, 7, 11, 13, 17, ...) and consider ...
 or the omission of parts of quoted material:

The review of the book stated, 'The author is enthusiastic at the prospect of systems by which you can call up information on your television screen ... I can imagine governments of the future being worried about the use of such reference libraries and their influence on public opinion.'

In AmE an additional fourth period indicates that the ellipsis coincides with the end of a sentence.

- [b] Stammering is sometimes informally indicated by hyphens and reduplication of letters:

'P-p-p-please t-t-try', his teeth chattered through fear and cold.
 The same device is used to indicate prolongation of vowels:
 'He-e-elp!' she cried.

The apostrophe

- III.27** The apostrophe is most frequently used in serious writing to denote genitive singular and plural as in *the girl's* and *the girls'*; in speech these are indistinguishable from each other and from the nongenitive plural, *the girls*. In ordinary use, however, it also marks contractions in the verb phrase: *I'm*, *he's*, *we're*, *can't*, *won't*, etc. It is still very occasionally found marking the abbreviation at the beginning of such institutionalized clipped forms as *'cello* or *'flu* (cf App I.74). It is regularly used in *o'clock*, and it is found in such poetic contractions as *e'er* and *o'er*. In fiction or casual writing it is sometimes used to indicate nonstandard or casual pronunciation in such forms as *goin'*, *'cos* <BrE>, and *'cause*. It is similarly used informally for contraction of year numbers, especially in figures; thus for 1984 we have '84.
- The apostrophe is frequently used before the plural *s* with items which lack institutionalized spelling:

There are three i's in that word. [1]
 the late 1990's [2]

But more often the *s* is affixed without an apostrophe (*1990s*) if there is no danger of misreading (as there would be in example [1]).

- Note** The apostrophe is occasionally used (especially in manuscript) for written abbreviations that do not represent abbreviations in speech, eg: *pron'n* [pronunciation].

Abbreviations and the use of special symbols

- III.28** Abbreviation is marked most generally by a single period following an initial letter or shortened form of a word, as in *Gen. Bradley, U.K.*, i.e., e.g., etc. (but some printers, as in this book, conventionally italicize *ie* and *eg* without periods). When the abbreviation includes the final letter of the word abbreviated, there is a widespread convention in BrE of ignoring the need for a period: *Dr*, *Mr*, for example. Indeed, in much modern practice, abbreviation is carried out by means of word shortening without the use of periods: *etc* or *&c*, *cf*, *UN*, *USA*, *PTO*, for example (cf App I.73). Such abbreviations as *etc* are used sparingly in formal writing, though *RSVP* with or without periods is found almost only in formal use (on invitation cards).

The abbreviation period is never followed by a period, though it may be followed by another mark.

- Note** [a] For the use of numerical and mathematical expressions, cf 6.63ff.
 [b] A dash (an en dash in print, cf App III.5 Note [a]) is an abbreviating device for a sequence: pages 15–36 (read as 'pages fifteen to thirty-six'; in AmE, for inclusive numbering, as 'pages fifteen through thirty-six')
 1985–1995 9 a.m.–5 p.m.
 September 12–December 22 [also, BrE: September 12th–December 22nd]
 Further abbreviation may be possible:
 1985–95 pages 115–17

Cf also the following Note [c] and App III.30 for the use of the oblique stroke in abbreviation. Cf also 6.66f.

- [c] In date abbreviations, numerals are separated by the oblique stroke (cf App III.30), dash (an en dash in print, cf App III.5 Note [a]), colon, or period. Thus:
 7/2/84 7-2-84 7.2.84 7.ii.84 <BrE> 7:2:84 <BrE, least frequently>
 could all be used for '7th February 1984' <BrE> or 'July 2, 1984' <AmE>. Numerals in abbreviations for time of day use colon (esp AmE) or period (esp BrE), as in:
 6:30 6.30

- [d] AmE has the alternatives *O.K.*, *o.k.*, *OK*, and *okay*, while BrE prefers *O.K.* and *OK* and does not use *o.k.*

Capitals

- III.29** In addition to marking the beginning of a sentence, initial capitals are used for specifying proper nouns (cf 5.60ff); for example, persons, places, works of literature, days of the week, months of the year (but not usually the seasons), and the planets (but not the earth, the sun, or the moon). They are also used for accompanying appositional titles and descriptors and for status markers (cf 10.53) in vocatives:

John Mills is a colonel. BUT He is Colonel John Mills.
 These are the forms you wanted, Principal.

So also (but in AmE with periods at the ends of the abbreviations):

Those present included Mr Jones, Miss Graham, Dr Rabin, Mrs Willis, Professor Maisky, and Mrs McDonald.

Initial capitals are commonly used for the names of organizations and institutions:

the Home Office
 the Environmental Protection Agency

the Social Security System
 British Airways

the Congressional Budget Office the Mineworkers Union

They are occasionally used to mark key words in formal discourse, especially at the point where such words are introduced for the first time:

The next problem, that of Ultraviolet Radiation, is one on which considerable progress has been made.

An alternative, used in this book, is for the whole word to be printed in SMALL CAPITALS. Initial capitals for key words are a particular feature of legal usage:

The Company's Registrars must receive a copy of the Letter together with the Form of Renunciation.

At the opposite extreme, capitals are sometimes used in light or facetious writing to indicate spoken prominence for the words so specified:

'She Who Must Be Obeyed,' he growled ironically.

'I must certainly see the Man of the House,' she announced pompously.

'And what do YOU want?' he shouted.

Initial capitals are used as a sign of respect in *God* and very commonly in nouns (*Lord, Creator, Supreme Being, Almighty*) and 2nd and 3rd person pronouns referring to God.

Capital letters also appear in the specification of many abbreviations, as we saw in App III.28, whether the items abbreviated are proper nouns (where the use of initial capitals is normal) or not, as usually in *RSVP* or *PTO* ('Please turn over the page', <BrE>).

- Note [a] Initial capitals or capitals throughout the word are commonly used in block language (for example, telegrams, notices, headlines; cf 11.45ff).
- [b] Initial capitals are used in personification, thereby indicating that the words are to be considered as names:
- Discretion fought with Valour and was triumphant.
- [c] In the Middle Ages, the letters *i*, *j*, and *y* were used to some extent interchangeably and it is for complicated reasons of paleographical preference (rather than the egocentric immodesty it might suggest) that capital *I*, itself an alternant of *j*, emerged as the regular spelling of the 1st person singular pronoun.
- [d] Publishing houses have a strong tradition for distinguishing capitals in titles, generally excluding short closed-class words (cf 2.39):
- To the End of Time

Miscellaneous minor conventions

- III.30 Lesser punctuation conventions may be grouped as (a) chiefly technical, and (b) formulaic:

- (a) 1. Parenthesized figures or letters commonly distinguish parts of an exposition, like the (a) and (b) in this section; *a*) and *b*), and *a.* and *b.*, are common variants.
2. The oblique stroke (also called 'slant', 'slash', 'solidus', 'virgule') is used to indicate abbreviation and also to specify alternatives and subsectioning:

the academic year 1985/6

c/o [in postal addresses, read as 'care of']

students and/or staff
Rule A/32

Cf also App III.28 Note [c].

3. **Bold face** draws special attention to an item.

4. In manuscripts and typescripts a caret (^ or ^) indicates the place where material in the margin or between the lines is to be inserted.

- (b) A new line may specify the formulaic termination of a letter before the signature on a further new line. This convention requires a capital at the beginning of the formula and a comma at the end:

Yours sincerely, <esp BrE>

Sincerely yours, <esp AmE>

A new line (often indented) is also used to specify each major item in the structure of postal addresses, except that city and state appear as one line in AmE practice; again each line except the last may terminate with a comma, but a 'light punctuation' variant is also possible and is becoming more common:

26 Park Drive
Portsmouth, RI 02480
USA

53, Camden Gdns.,
London, NW11 9HY,
England.

- Note [a] The symbol ✓ is a tick <BrE> or check <AmE> used to check that an item or point has been noted or accepted. It is also used in BrE to indicate that a point is correct (for example, by a teacher on a student's paper), whereas in AmE it normally indicates that the point is incorrect. In BrE, and sometimes in AmE, the symbol × is used to indicate an incorrect point (read as 'cross' in BrE and as the name of the letter x in AmE).
- [b] Prefixing a name by a cross indicates a church dignitary. Suffixing a name by an obelisk (†) indicates that the person is dead.
- [c] The word *number* is abbreviated as *No.* <BrE> and symbolized as # <AmE>.

Bibliographical note

Accounts of AmE punctuation practice are given in Meyer (1983); Prentice-Hall (1974), pp 99–239; Summey (1949); University of Chicago Press (1982), pp 131–55; and US Government Printing Office (1973), pp 7–250; and of BrE practice in Carey (1957); Hart (1974); and Partridge (1977). AmE and BrE conventions are compared in a final chapter by John W. Clark in Partridge (1977). Frequency data for an AmE corpus is cited from Meyer (1983). Beaugrande (1983), pp 192–213, discusses the motives for punctuation.

Index

The alphabetical arrangement of the index is word-by-word. Three kinds of entry are included: abbreviations for grammatical categories used in the *Comprehensive*; lexical items which have been treated within classified lists, or which have been the focus of discussion; and general concepts. Where homonymy occurs, abbreviations precede lexical items, which precede general concepts. Head words are assigned word-class labels where necessary, to avoid ambiguity.

In all entries, references are to section numbers, not pages. A reference to a section implies reference to any Notes accompanying that section. Where *n* follows a section number, the reference is to the Note(s) alone. Major references are given in italics. Cross-reference to another entry is indicated by (→).

Within lexical entries, single word items are given first, sometimes followed by subheadings concerned with usage. Multi-word or inflectionally derived forms follow these in parentheses, the items being arranged alphabetically in run-on paragraphs. Parentheses within parentheses enclose optional elements.

In multi-word items, the symbol (~) is used to indicate the place of the head word or morpheme: for example, under *speak*, (~ *about*) should be read as *speak about*; (*so to* ~) should be read as *so to speak*; and (*to* ~ *of*) should be read as *to speak of*. The ~ symbol is also used before bound morphemes: for example, under *absolute*, (~ *ly*) should be read as *absolutely*. (...) refers to an unspecified part of a construction: for example, under *though*, (~ ...) refers to a construction beginning with the word *though* and followed by a wide range of possibilities; under *before*, (... ~) refers to a construction ending with the word *before* and preceded by a wide range of possibilities.

A

- A → adverbial
 A_o → adverbial (object-related)
 A_s → adverbial (subject-related)

 verb meaning
 stative verb meaning 3.34, 66, 68, 76;
 4.4, 5, 6n, 22, 26, 27–31, 32, 33, 44,
 52n, 67; 7.18; 8.42, 82, 149; 9.16,
 24n, 27–30, 32, 42; 10.14, 18, 20,
 23, 24, 55; 11.24; 12.25, 35; 13.23,
 78; 14.19, 26, 27n; 15.60n;
 16.21–24, 39, 44, 50, 53, 54; 17.28,
 101; 18.51n; 1.47
 status marker 10.53; 111.29
 stay (verb) 10.24; 16.21, 22n, 23, 24
 StE (= Standard English) → standard
 stead → instead
 steal 3.16
 stem 2.4, 37; 16.12; 1.2, 4; 11.4
 morpheme 1.2n
see also: base
 step, out of 5.51
 steps 5.77
 step (discourse strategy) 19.18, 56, 69
 -ster 1.33
 stereo 1.74
 stereo- 1.66
 stereotyped 5.64; 8.92, 122n, 124n, 125n,
 127n, 144n; 10.15n, 61n; 11.38, 40,
 41n, 42n, 44n, 53n, 54; 13.83n, 86,
 99n, 102n; 14.18n; 15.18, 34n, 37n,
 44, 46n, 54–55, 58; 16.22n; 17.97
see also: fixed phrase
 stick (verb) 3.18
 still (adjunct) 3.46n; 8.9, 72n; 9.39; 10.60
 (conjunct) 8.137, 141, 143–146
 (subjunct) 8.97, 98
 (~ and all) 8.137; (better ~) 8.147;
 (~ less) 13.103n
 still life 5.83n
 stimulus 5.92
 stimulus preposition 9.7, 43, 51, 63; 10.10
 sting 3.18
 stink 3.19
 stipulate 16.32
 stipulation (with the ~ that) 15.34n
 stole(n) 3.16
 stone (amplifier) 7.56n
 (noun) 5.90
 stood 3.18

stoop 3.7
 stop 3.7; 4.27, 34; 11.47n; 16.19, 26, 38n,
 39, 40, 42; (~ and ...) 13.98
 straight (adverb) 16.3
 stranding 2.51; 3.26, 45n; 6.4; 12.10, 40,
 55, 59n, 60–64; 15.66n; 16.14
see also: preposition (deferred)
 strange 16.82; (~ ly) 8.127, 131
 strata 5.95n, 98n
 strategy → discourse
 stratum(s) 5.95
 strength (on the ~ of) 9.11
 stress 1.12; 19.25; 11.1–9, 10–11, 18;
 111.2
 compounds and 5.120, 122n; 6.47;
